For this reason, the command link sent by the master to write data to the slave contains the address `ESP_SLAVE_ADDR << 1 | I2C_MASTER_WRITE` and looks as follows:

```c
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

Likewise, the command link to read from the slave looks as follows:

```c
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);
```

### Communication as Slave

After installing the I2C driver, ESP32 is ready to communicate with other I2C devices.

The API provides the following functions for slaves

- **`i2c_slave_read_buffer()`**
  
  Whenever the master writes data to the slave, the slave automatically stores it in the receive buffer. This allows the slave application to call the function `i2c_slave_read_buffer()` at its own discretion. This function also has a parameter to specify block time if no data is in the receive buffer. This allows the slave application to wait with a specified timeout for data to arrive to the buffer.

- **`i2c_slave_write_buffer()`**
  
  The send buffer is used to store all the data that the slave wants to send to the master in FIFO order. The data stays there until the master requests for it. The function `i2c_slave_write_buffer()` has a parameter to specify block time if the send buffer is full. This allows the slave application to wait with a specified timeout for the adequate amount of space to become available in the send buffer.

A code example showing how to use these functions can be found in `peripherals/i2c`.

### Interrupt Handling

During driver installation, an interrupt handler is installed by default.
Customized Configuration  As mentioned at the end of Section Configuration, when the function `i2c_param_config()` initializes the driver configuration for an I2C port, it also sets several I2C communication parameters to default values defined in the I2C specification. Some other related parameters are pre-configured in registers of the I2C controller.

All these parameters can be changed to user-defined values by calling dedicated functions given in the table below. Please note that the timing values are defined in APB clock cycles.

<table>
<thead>
<tr>
<th>Parameters to Change</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>High time and low time for SCL pulses</td>
<td><code>i2c_set_period()</code></td>
</tr>
<tr>
<td>SCL and SDA signal timing used during generation of start signals</td>
<td><code>i2c_set_start_timing()</code></td>
</tr>
<tr>
<td>SCL and SDA signal timing used during generation of stop signals</td>
<td><code>i2c_set_stop_timing()</code></td>
</tr>
<tr>
<td>Timing relationship between SCL and SDA signals when slave samples, as well as when master toggles</td>
<td><code>i2c_set_data_timing()</code></td>
</tr>
<tr>
<td>I2C timeout</td>
<td><code>i2c_set_timeout()</code></td>
</tr>
<tr>
<td>Choice between transmitting / receiving the LSB or MSB first, choose one of the modes defined in <code>i2c_trans_mode_t</code></td>
<td><code>i2c_set_data_mode()</code></td>
</tr>
</tbody>
</table>

Each of the above functions has a _get_ counterpart to check the currently set value. For example, to check the I2C timeout value, call `i2c_get_timeout()`.

To check the default parameter values which are set during the driver configuration process, please refer to the file `driver/i2c/i2c.c` and look for defines with the suffix _DEFAULT_.

You can also select different pins for SDA and SCL signals and alter the configuration of pull-ups with the function `i2c_set_pin()`. If you want to modify already entered values, use the function `i2c_param_config()`.

Note: ESP32’s internal pull-ups are in the range of tens of kOhm, which is, in most cases, insufficient for use as I2C pull-ups. Users are advised to use external pull-ups with values described in the I2C specification. For help with calculating the resistor values see TI Application Note

Error Handling  The majority of I2C driver functions either return ESP_OK on successful completion or a specific error code on failure. It is a good practice to always check the returned values and implement error handling. The driver also prints out log messages that contain error details, e.g., when checking the validity of entered configuration. For details please refer to the file `driver/i2c/i2c.c` and look for defines with the suffix _ERR_STR_.

Use dedicated interrupts to capture communication failures. For instance, if a slave stretches the clock for too long while preparing the data to send back to master, the interrupt `I2C_TIME_OUT_INT` will be triggered. For detailed information, see Interrupt Handling.

In case of a communication failure, you can reset the internal hardware buffers by calling the functions `i2c_reset_tx_fifo()` and `i2c_reset_rx_fifo()` for the send and receive buffers respectively.

Delete Driver  When the I2C communication is established with the function `i2c_driver_install()` and is not required for some substantial amount of time, the driver may be deinitialized to release allocated resources by calling `i2c_driver_delete()`.

Before calling `i2c_driver_delete()` to remove i2c driver, please make sure that all threads have stopped using the driver in any way, because this function does not guarantee thread safety.

Application Example

I2C examples: `peripherals/i2c`
Chapter 2. API Reference

API Reference

Header File

- components/driver/i2c/include/driver/i2c.h

Functions

**esp_err_t i2c_driver_install**(i2c_port_t i2c_num, i2c_mode_t mode, size_t slv_rx_buf_len, size_t slv_tx_buf_len, int intr_alloc_flags)

Install an I2C driver.

**Note:** Not all Espressif chips can support slave mode (e.g. ESP32C2)

**Note:** In master mode, if the cache is likely to be disabled (such as write flash) and the slave is time-sensitive, ESP_INTR_FLAG_IRAM is suggested to be used. In this case, please use the memory allocated from internal RAM in i2c read and write function, because we can not access the psram (if psram is enabled) in interrupt handle function when cache is disabled.

**Parameters**

- **i2c_num** – I2C port number
- **mode** – I2C mode (either master or slave).
- **slv_rx_buf_len** – Receiving buffer size. Only slave mode will use this value, it is ignored in master mode.
- **slv_tx_buf_len** – Sending buffer size. Only slave mode will use this value, it is ignored in master mode.
- **intr_alloc_flags** – Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver installation error

**esp_err_t i2c_driver_delete**(i2c_port_t i2c_num)

Delete I2C driver.

**Note:** This function does not guarantee thread safety. Please make sure that no thread will continuously hold semaphores before calling the delete function.

**Parameters**

- **i2c_num** – I2C port to delete

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t i2c_param_config**(i2c_port_t i2c_num, const i2c_config_t *i2c_conf)

Configure an I2C bus with the given configuration.

**Parameters**

- **i2c_num** – I2C port to configure
- **i2c_conf** – Pointer to the I2C configuration

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
Chapter 2. API Reference

```c
esp_err_t i2c_reset_tx_fifo(i2c_port_t i2c_num)
reset I2C tx hardware fifo

Parameters i2c_num - I2C port number

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
```

```c
esp_err_t i2c_reset_rx_fifo(i2c_port_t i2c_num)
reset I2C rx fifo

Parameters i2c_num - I2C port number

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
```

```c
esp_err_t i2c_set_pin(i2c_port_t i2c_num, int sda_io_num, int scl_io_num, bool sda_pullup_en, bool scl_pullup_en, i2c_mode_t mode)
Configure GPIO pins for I2C SCK and SDA signals.

Parameters
• i2c_num - I2C port number
• sda_io_num - GPIO number for I2C SDA signal
• scl_io_num - GPIO number for I2C SCL signal
• sda_pullup_en - Enable the internal pullup for SDA pin
• scl_pullup_en - Enable the internal pullup for SCL pin
• mode - I2C mode

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
```

```c
esp_err_t i2c_master_write_to_device(i2c_port_t i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, TickType_t ticks_to_wait)
Perform a write to a device connected to a particular I2C port. This function is a wrapper to i2c_master_start(), i2c_master_write(), i2c_master_read(), etc… It shall only be called in I2C master mode.

Parameters
• i2c_num - I2C port number to perform the transfer on
• device_address - I2C device’s 7-bit address
• write_buffer - Bytes to send on the bus
• write_size - Size, in bytes, of the write buffer
• ticks_to_wait - Maximum ticks to wait before issuing a timeout.

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
• ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
• ESP_ERR_TIMEOUT Operation timeout because the bus is busy.
```

```c
esp_err_t i2c_master_read_from_device(i2c_port_t i2c_num, uint8_t device_address, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)
Perform a read to a device connected to a particular I2C port. This function is a wrapper to i2c_master_start(), i2c_master_write(), i2c_master_read(), etc… It shall only be called in I2C master mode.

Parameters
• i2c_num - I2C port number to perform the transfer on
• device_address - I2C device’s 7-bit address
• read_buffer - Buffer to store the bytes received on the bus
• read_size - Size, in bytes, of the read buffer
```
ticks_to_wait – Maximum ticks to wait before issuing a timeout.

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

```c
esp_err_t i2c_master_write_read_device(i2c_port_t i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)
```

Perform a write followed by a read to a device on the I2C bus. A repeated start signal is used between the write and read, thus, the bus is not released until the two transactions are finished. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc. It shall only be called in I2C master mode.

Parameters
- `i2c_num` – I2C port number to perform the transfer on
- `device_address` – I2C device’s 7-bit address
- `write_buffer` – Bytes to send on the bus
- `write_size` – Size, in bytes, of the write buffer
- `read_buffer` – Buffer to store the bytes received on the bus
- `read_size` – Size, in bytes, of the read buffer
- `ticks_to_wait` – Maximum ticks to wait before issuing a timeout.

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

```c
i2c_cmd_handle_t i2c_cmd_link_create_static(uint8_t *buffer, uint32_t size)
```

Create and initialize an I2C commands list with a given buffer. All the allocations for data or signals (START, STOP, ACK, …) will be performed within this buffer. This buffer must be valid during the whole transaction. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete_static()`.

Note: It is highly advised to not allocate this buffer on the stack. The size of the data used underneath may increase in the future, resulting in a possible stack overflow as the macro `I2C_LINK_RECOMMENDED_SIZE` would also return a bigger value. A better option is to use a buffer allocated statically or dynamically (with malloc).

```c
i2c_cmd_handle_t i2c_cmd_link_create(void)
```

Create and initialize an I2C commands list with a given buffer. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete()` to release and return the resources. The required bytes will be dynamically allocated.

Returns Handle to the I2C command link or NULL if the buffer provided is too small, please use `I2C_LINK_RECOMMENDED_SIZE` macro to get the recommended size for the buffer.

```c
void i2c_cmd_link_delete_static(i2c_cmd_handle_t cmd_handle)
```

Free the I2C commands list allocated statically with `i2c_cmd_link_create_static()` function.

```c
Parameters cmd_handle – I2C commands list allocated statically. This handle should be created thanks to `i2c_cmd_link_create_static()` function
```
void i2c_cmd_link_delete (i2c_cmd_handle_t cmd_handle)

Free the I2C commands list.

Parameters

- cmd_handle - I2C commands list. This handle should be created thanks to i2c_cmd_link_create() function

esp_err_t i2c_master_start (i2c_cmd_handle_t cmd_handle)

Queue a “START signal” to the given commands list. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all the queued commands.

Parameters

- cmd_handle - I2C commands list

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
- ESP_FAIL No more memory left on the heap

esp_err_t i2c_master_write_byte (i2c_cmd_handle_t cmd_handle, uint8_t data, bool ack_en)

Queue a “write byte” command to the commands list. A single byte will be sent on the I2C port. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all queued commands.

Parameters

- cmd_handle - I2C commands list
- data - Byte to send on the port
- ack_en - Enable ACK signal

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
- ESP_FAIL No more memory left on the heap

esp_err_t i2c_master_write (i2c_cmd_handle_t cmd_handle, const uint8_t *data, size_t data_len, bool ack_en)

Queue a “write (multiple) bytes” command to the commands list. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all queued commands.

Parameters

- cmd_handle - I2C commands list
- data - Bytes to send. This buffer shall remain valid until the transaction is finished. If the PSRAM is enabled and intr_flag is set to ESP_INTR_FLAG_IRAM, data should be allocated from internal RAM.
- data_len - Length, in bytes, of the data buffer
- ack_en - Enable ACK signal

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
- ESP_FAIL No more memory left on the heap

esp_err_t i2c_master_read_byte (i2c_cmd_handle_t cmd_handle, uint8_t *data, i2c_ack_type_t ack)

Queue a “read byte” command to the commands list. A single byte will be read on the I2C bus. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all queued commands.

Parameters

- cmd_handle - I2C commands list
- data - Pointer where the received byte will the stored. This buffer shall remain valid until the transaction is finished.
- ack - ACK signal

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
• ESP_FAIL No more memory left on the heap

```c
esp_err_t i2c_master_read(i2c_cmd_handle_t cmd_handle, uint8_t *data, size_t data_len, i2c_ack_type_t ack)
```
Queue a “read (multiple) bytes” command to the commands list. Multiple bytes will be read on the I2C bus. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all queued commands.

**Parameters**

- `cmd_handle` - I2C commands list
- `data` - Pointer where the received bytes will be stored. This buffer shall remain valid until the transaction is finished.
- `data_len` - Size, in bytes, of the `data` buffer
- `ack` - ACK signal

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
- ESP_FAIL No more memory left on the heap

```c
esp_err_t i2c_master_stop(i2c_cmd_handle_t cmd_handle)
```
Queue a “STOP signal” to the given commands list. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all the queued commands.

**Parameters**

- `cmd_handle` - I2C commands list

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
- ESP_FAIL No more memory left on the heap

```c
esp_err_t i2c_master_cmd_begin(i2c_port_t i2c_num, i2c_cmd_handle_t cmd_handle, TickType_t ticks_to_wait)
```
Send all the queued commands on the I2C bus, in master mode. The task will be blocked until all the commands have been sent out. The I2C port is protected by mutex, so this function is thread-safe. This function shall only be called in I2C master mode.

**Parameters**

- `i2c_num` - I2C port number
- `cmd_handle` - I2C commands list
- `ticks_to_wait` - Maximum ticks to wait before issuing a timeout.

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

```c
int i2c_slave_write_buffer(i2c_port_t i2c_num, const uint8_t *data, int size, TickType_t ticks_to_wait)
```
Write bytes to internal ringbuffer of the I2C slave data. When the TX fifo empty, the ISR will fill the hardware FIFO with the internal ringbuffer’s data.

**Note:** This function shall only be called in I2C slave mode.

**Parameters**

- `i2c_num` - I2C port number
- `data` - Bytes to write into internal buffer
- `size` - Size, in bytes, of `data` buffer
ticks_to_wait – Maximum ticks to wait.

Returns
- ESP_FAIL (-1) Parameter error
- Other (>=0) The number of data bytes pushed to the I2C slave buffer.

```c
int i2c_slave_read_buffer (i2c_port_t i2c_num, uint8_t *data, size_t max_size, TickType_t ticks_to_wait)
```

Read bytes from I2C internal buffer. When the I2C bus receives data, the ISR will copy them from the hardware RX FIFO to the internal ringbuffer. Calling this function will then copy bytes from the internal ringbuffer to the data user buffer.

**Note:** This function shall only be called in I2C slave mode.

**Parameters**
- `i2c_num` – I2C port number
- `data` – Buffer to fill with ringbuffer’s bytes
- `max_size` – Maximum bytes to read
- `ticks_to_wait` – Maximum waiting ticks

**Returns**
- ESP_FAIL(-1) Parameter error
- Others(>=0) The number of data bytes read from I2C slave buffer.

```c
esp_err_t i2c_set_period (i2c_port_t i2c_num, int high_period, int low_period)
```

Set I2C master clock period.

**Parameters**
- `i2c_num` – I2C port number
- `high_period` – Clock cycle number during SCL is high level, high_period is a 14 bit value
- `low_period` – Clock cycle number during SCL is low level, low_period is a 14 bit value

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t i2c_get_period (i2c_port_t i2c_num, int *high_period, int *low_period)
```

Get I2C master clock period.

**Parameters**
- `i2c_num` – I2C port number
- `high_period` – pointer to get clock cycle number during SCL is high level, will get a 14 bit value
- `low_period` – pointer to get clock cycle number during SCL is low level, will get a 14 bit value

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t i2c_filter_enable (i2c_port_t i2c_num, uint8_t cyc_num)
```

Enable hardware filter on I2C bus Sometimes the I2C bus is disturbed by high frequency noise (about 20ns), or the rising edge of the SCL clock is very slow, these may cause the master state machine to break. Enable hardware filter can filter out high frequency interference and make the master more stable.

**Note:** Enable filter will slow down the SCL clock.

**Parameters**
- `i2c_num` – I2C port number to filter
Chapter 2. API Reference

- `cyc_num` - the APB cycles need to be filtered (0<=cyc_num <=7). When the period of a pulse is less than cyc_num * APB_cycle, the I2C controller will ignore this pulse.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t i2c_filter_disable(i2c_port_t i2c_num)`
Disable filter on I2C bus.

**Parameters**
- `i2c_num` - I2C port number

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t i2c_set_start_timing(i2c_port_t i2c_num, int setup_time, int hold_time)`
set I2C master start signal timing

**Parameters**
- `i2c_num` - I2C port number
- `setup_time` - clock number between the falling-edge of SDA and rising-edge of SCL for start mark, it’s a 10-bit value.
- `hold_time` - clock num between the falling-edge of SDA and falling-edge of SCL for start mark, it’s a 10-bit value.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t i2c_get_start_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)`
get I2C master start signal timing

**Parameters**
- `i2c_num` - I2C port number
- `setup_time` - pointer to get setup time
- `hold_time` - pointer to get hold time

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t i2c_set_stop_timing(i2c_port_t i2c_num, int setup_time, int hold_time)`
set I2C master stop signal timing

**Parameters**
- `i2c_num` - I2C port number
- `setup_time` - clock num between the rising-edge of SCL and the rising-edge of SDA, it’s a 10-bit value.
- `hold_time` - clock number after the STOP bit’s rising-edge, it’s a 14-bit value.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t i2c_get_stop_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)`
get I2C master stop signal timing

**Parameters**
- `i2c_num` - I2C port number
- `setup_time` - pointer to get setup time.
- `hold_time` - pointer to get hold time.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
Chapter 2. API Reference

```c
esp_err_t i2c_set_data_timing(i2c_port_t i2c_num, int sample_time, int hold_time)
```

set I2C data signal timing

**Parameters**
- `i2c_num` – I2C port number
- `sample_time` – clock number I2C used to sample data on SDA after the rising-edge of SCL, it’s a 10-bit value
- `hold_time` – clock number I2C used to hold the data after the falling-edge of SCL, it’s a 10-bit value

**Returns**
- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

```c
esp_err_t i2c_get_data_timing(i2c_port_t i2c_num, int *sample_time, int *hold_time)
```

get I2C data signal timing

**Parameters**
- `i2c_num` – I2C port number
- `sample_time` – pointer to get sample time
- `hold_time` – pointer to get hold time

**Returns**
- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

```c
esp_err_t i2c_set_timeout(i2c_port_t i2c_num, int timeout)
```

set I2C timeout value

**Parameters**
- `i2c_num` – I2C port number
- `timeout` – timeout value for I2C bus (unit: APB 80Mhz clock cycle)

**Returns**
- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

```c
esp_err_t i2c_get_timeout(i2c_port_t i2c_num, int *timeout)
```

get I2C timeout value

**Parameters**
- `i2c_num` – I2C port number
- `timeout` – pointer to get timeout value

**Returns**
- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

```c
esp_err_t i2c_set_data_mode(i2c_port_t i2c_num, i2c_trans_mode_t tx_trans_mode, i2c_trans_mode_t rx_trans_mode)
```

set I2C data transfer mode

**Parameters**
- `i2c_num` – I2C port number
- `tx_trans_mode` – I2C sending data mode
- `rx_trans_mode` – I2C receiving data mode

**Returns**
- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

```c
esp_err_t i2c_get_data_mode(i2c_port_t i2c_num, i2c_trans_mode_t *tx_trans_mode, i2c_trans_mode_t *rx_trans_mode)
```

get I2C data transfer mode

**Parameters**
- `i2c_num` – I2C port number
• **tx_trans_mode** — pointer to I2C sending data mode
• **rx_trans_mode** — pointer to I2C receiving data mode

**Returns**
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

**Structures**

```c
struct i2c_config_t

I2C initialization parameters.
```

**Public Members**

```c
i2c_mode_t mode

I2C mode
```

```c
int sda_io_num

GPIO number for I2C sda signal
```

```c
int scl_io_num

GPIO number for I2C scl signal
```

```c
bool sda_pullup_en

Internal GPIO pull mode for I2C sda signal
```

```c
bool scl_pullup_en

Internal GPIO pull mode for I2C scl signal
```

```c
uint32_t clk_speed

I2C clock frequency for master mode, (no higher than 1MHz for now)
```

```c
struct i2c_config_t::<anonymous>::::<anonymous> master

I2C master config
```

```c
uint8_t addr_10bit_en

I2C 10bit address mode enable for slave mode
```

```c
uint16_t slave_addr

I2C address for slave mode
```

```c
uint32_t maximum_speed

I2C expected clock speed from SCL.
```

```c
struct i2c_config_t::<anonymous>::::<anonymous> slave

I2C slave config
```

```c
uint32_t clk_flags

Bitwise of I2C_SCLK_SRC_FLAG_**FOR_DFS** for clk source choice
```
Macros

**I2C_APB_CLK_FREQ**
I2C source clock is APB clock, 80MHz, deprecated

**I2C_SCLK_SRC_FLAG_FOR_NORMAL**
Any one clock source that is available for the specified frequency may be choosen

**I2C_SCLK_SRC_FLAG_AWARE_DFS**
For REF tick clock, it won’t change with APB.

**I2C_SCLK_SRC_FLAG_LIGHT_SLEEP**
For light sleep mode.

**I2C_INTERNAL_STRUCT_SIZE**
Minimum size, in bytes, of the internal private structure used to describe I2C commands link.

**I2C_LINK_RECOMMENDED_SIZE** (TRANSACTIONS)
The following macro is used to determine the recommended size of the buffer to pass to `i2c_cmd_link_create_static()` function. It requires one parameter, `TRANSACTIONS`, describing the number of transactions intended to be performed on the I2C port. For example, if one wants to perform a read on an I2C device register, `TRANSACTIONS` must be at least 2, because the commands required are the following:

- write device register
- read register content

Signals such as “(repeated) start”, “stop”, “nack”, “ack” shall not be counted.

Type Definitions

typedef void *i2c_cmd_handle_t
I2C command handle

Header File

- `components/hal/include/hal/i2c_types.h`

Structures

**struct i2c_hal_clk_config_t**
Data structure for calculating I2C bus timing.

Public Members

- `uint16_t clkm_div`
  I2C core clock devider
- `uint16_t scl_low`
  I2C scl low period
uint16_t scl_high
    I2C scl high period

uint16_t scl_wait_high
    I2C scl wait_high period

uint16_t sda_hold
    I2C scl low period

uint16_t sda_sample
    I2C sda sample time

uint16_t setup
    I2C start and stop condition setup period

uint16_t hold
    I2C start and stop condition hold period

uint16_t tout
    I2C bus timeout period

**Type Definitions**

typedef `soc_periph_i2c_clk_src_t` i2c_clock_source_t
    I2C group clock source.

**Enumerations**

enum i2c_port_t
    I2C port number, can be I2C_NUM_0 ~ I2C_NUM_MAX-1.
    *Values:*

    enumerator I2C_NUM_0
        I2C port 0

    enumerator I2C_NUM_1
        I2C port 1

    enumerator I2C_NUM_MAX
        I2C port max

enum i2c_addr_bit_len_t
    Enumeration for I2C device address bit length.
    *Values:*

    enumerator I2C_ADDR_BIT_LEN_7
        i2c address bit length 7
enum **i2c_mode_t**

*Values:*

enum **I2C_MODE_SLAVE**
    I2C slave mode

enum **I2C_MODE_MASTER**
    I2C master mode

enum **I2C_MODE_MAX**

enum **i2c_rw_t**

*Values:*

enum **I2C_MASTER_WRITE**
    I2C write data

enum **I2C_MASTER_READ**
    I2C read data

enum **i2c_trans_mode_t**

*Values:*

enum **I2C_DATA_MODE_MSB_FIRST**
    I2C data msb first

enum **I2C_DATA_MODE_LSB_FIRST**
    I2C data lsb first

enum **I2C_DATA_MODE_MAX**

enum **i2c_addr_mode_t**

*Values:*

enum **I2C_ADDR_BIT_7**
    I2C 7bit address for slave mode

enum **I2C_ADDR_BIT_10**
    I2C 10bit address for slave mode

enum **I2C_ADDR_BIT_MAX**

enum **i2c_ack_type_t**

*Values:*

enum **I2C_MASTER_ACK**
    I2C ack for each byte read
enumerator I2C_MASTER_NACK
I2C nack for each byte read

enumerator I2C_MASTER_LAST_NACK
I2C nack for the last byte

enumerator I2C_MASTER_ACK_MAX

2.6.9 Inter-IC Sound (I2S)

Introduction

I2S (Inter-IC Sound) is a synchronous serial communication protocol usually used for transmitting audio data between two digital audio devices.

ESP32 contains two I2S peripheral(s). These peripherals can be configured to input and output sample data via the I2S driver.

An I2S bus that communicates in standard or TDM mode consists of the following lines:

- **MCLK**: Master clock line. It is an optional signal depending on the slave side, mainly used for offering a reference clock to the I2S slave device.
- **BCLK**: Bit clock line. The bit clock for data line.
- **WS**: Word (Slot) select line. It is usually used to identify the vocal tract except PDM mode.
- **DIN/DOUT**: Serial data input/output line. Data will loopback internally if DIN and DOUT are set to a same GPIO.

An I2S bus that communicates in PDM mode consists of the following lines:

- **CLK**: PDM clock line.
- **DIN/DOUT**: Serial data input/output line.

Each I2S controller has the following features that can be configured by the I2S driver:

- Operation as system master or slave
- Capable of acting as transmitter or receiver
- DMA controller that allows stream sampling of data without requiring the CPU to copy each data sample

Each controller supports single RX or TX simplex communication. As RX and TX channels share a clock, they can only be combined with the same configuration to establish a full-duplex communication.

I2S File Structure

Public headers that need to be included in the I2S application are as follows:

- **i2s.h**: The header file that provides legacy I2S APIs (for apps using legacy driver).
- **i2s_std.h**: The header file that provides standard communication mode specific APIs (for apps using new driver with standard mode).
- **i2s_pdm.h**: The header file that provides PDM communication mode specific APIs (for apps using new driver with PDM mode).
- **i2s_tdm.h**: The header file that provides TDM communication mode specific APIs (for apps using new driver with TDM mode).

**Note**: The legacy driver cannot coexist with the new driver. Include i2s.h to use the legacy driver, or include the other three headers to use the new driver. The legacy driver might be removed in future.
Public headers that have been included in the headers above are as follows:

- `i2s_types_legacy.h`: The header file that provides legacy public types that are only used in the legacy driver.
- `i2s_types.h`: The header file that provides public types.
- `i2s_common.h`: The header file that provides common APIs for all communication modes.

**I2S Clock**

**Clock Source**

- `i2s_clock_src_t::I2S_CLK_SRC_DEFAULT`: Default PLL clock.
- `i2s_clock_src_t::I2S_CLK_SRC_PLL_160M`: 160 MHz PLL clock.
- `i2s_clock_src_t::I2S_CLK_SRC_APLL`: Audio PLL clock, which is more precise than `I2S_CLK_SRC_PLL_160M` in high sample rate applications. Its frequency is configurable according to the sample rate. However, if APLL has been occupied by EMAC or other channels, the APLL frequency cannot be changed, and the driver will try to work under this APLL frequency. If this frequency cannot meet the requirements of I2S, the clock configuration will fail.

**Clock Terminology**

- **Sample rate**: The number of sampled data in one second per slot.
- **SCLK**: Source clock frequency. It is the frequency of the clock source.
- **MCLK**: Master clock frequency. BCLK is generated from this clock. The MCLK signal usually serves as a reference clock and is mostly needed to synchronize BCLK and WS between I2S master and slave roles.
- **BCLK**: Bit clock frequency. Every tick of this clock stands for one data bit on data pin. The slot bit width configured in `i2s_std_slot_config_t::slot_bit_width` is equal to the number of BCLK ticks, which means there will be 8/16/24/32 BCLK ticks in one slot.
- **LRCK / WS**: Left/right clock or word select clock. For non-PDM mode, its frequency is equal to the sample rate.

**Note:** Normally, MCLK should be the multiple of sample rate and BCLK at the same time. The field `i2s_std_clk_config_t::mclk_multiple` indicates the multiple of MCLK to
the sample rate. In most cases, \texttt{I2S\_MCLK\_MULTIPLE\_256} should be enough. However, if \texttt{slot\_bit\_width} is set to \texttt{I2S\_SLOT\_BIT\_WIDTH\_24BIT}, to keep MCLK a multiple to the BCLK, \texttt{I2S\_std\_clk\_config\_t::mclk\_multiple} should be set to multiples that are divisible by 3 such as \texttt{I2S\_MCLK\_MULTIPLE\_384}. Otherwise, WS will be inaccurate.

### I2S Communication Mode

#### Standard Mode

In standard mode, there are always two sound channels, i.e., the left and right channels, which are called “slots”. These slots support 8/16/24/32-bit width sample data. The communication format for the slots mainly includes the followings:

- **Philips Format**: Data signal has one-bit shift comparing to the WS signal, and the duty of WS signal is 50%.

  ![Standard Philips Timing Diagram](image)

- **MSB Format**: Basically the same as Philips format, but without data shift.

  ![Standard MSB Timing Diagram](image)

- **PCM Short Format**: Data has one-bit shift and meanwhile the WS signal becomes a pulse lasting for one BCLK cycle.
PDM Mode (TX)  PDM (Pulse-density Modulation) mode for the TX channel can convert PCM data into PDM format which always has left and right slots. PDM TX is only supported on I2S0 and it only supports 16-bit width sample data. It needs at least a CLK pin for clock signal and a DOUT pin for data signal (i.e., the WS and SD signal in the following figure; the BCK signal is an internal bit sampling clock, which is not needed between PDM devices). This mode allows users to configure the up-sampling parameters `i2s_pdm_tx_clk_config_t::up_sample_fp` and `i2s_pdm_tx_clk_config_t::up_sample_fs`. The up-sampling rate can be calculated by 
\[
\text{up_sample_rate} = \frac{i2s_pdm_tx_clk_config_t::up_sample_fp}{i2s_pdm_tx_clk_config_t::up_sample_fs}
\]
There are two up-sampling modes in PDM TX:

- **Fixed Clock Frequency**: In this mode, the up-sampling rate changes according to the sample rate. Setting \( fp = 960 \) and \( fs = \text{sample_rate} / 100 \), then the clock frequency (Fpdm) on CLK pin will be fixed to \( 128 \times 48 \text{ KHz} = 6.144 \text{ MHz} \). Note that this frequency is not equal to the sample rate (Fpcm).
- **Fixed Up-sampling Rate**: In this mode, the up-sampling rate is fixed to 2. Setting \( fp = 960 \) and \( fs = 480 \), then the clock frequency (Fpdm) on CLK pin will be \( 128 \times \text{sample_rate} \).

PDM Mode (RX)  PDM (Pulse-density Modulation) mode for RX channel can receive PDM-format data and convert the data into PCM format. PDM RX is only supported on I2S0, and it only supports 16-bit width sample data. PDM RX needs at least a CLK pin for clock signal and a DIN pin for data signal. This mode allows users to configure the down-sampling parameter `i2s_pdm_dsr_t::I2S_PDM_DSR_8S` and `i2s_pdm_dsr_t::I2S_PDM_DSR_16S`. There are two down-sampling modes in PDM RX:

- **i2s_pdm_dsr_t::I2S_PDM_DSR_8S**: In this mode, the clock frequency (Fpdm) on the WS pin is \( \text{sample_rate} (\text{Fpcm}) \times 64 \).
- **i2s_pdm_dsr_t::I2S_PDM_DSR_16S**: In this mode, the clock frequency (Fpdm) on the WS pin is \( \text{sample_rate} (\text{Fpcm}) \times 128 \).

LCD/Camera Mode  LCD/Camera mode is only supported on I2S0 over a parallel bus. For LCD mode, I2S0 should work at master TX mode. For camera mode, I2S0 should work at slave RX mode. These two modes are not implemented by the I2S driver. Please refer to LCD for details about the LCD implementation. For more information, see ESP32 Technical Reference Manual > I2S Controller (I2S) > LCD Mode [PDF].

ADC/DAC Mode  ADC and DAC modes only exist on ESP32 and are only supported on I2S0. Actually, they are two sub-modes of LCD/Camera mode. I2S0 can be routed directly to the internal analog-to-digital converter (ADC) and digital-to-analog converter (DAC). In other words, ADC and DAC peripherals can read or write continuously via I2S0 DMA. As they are not actual communication modes, the I2S driver does not implement them.
Functional Overview

The I2S driver offers the following services:

Resource Management There are three levels of resources in the I2S driver:

- **platform level**: Resources of all I2S controllers in the current target.
- **controller level**: Resources in one I2S controller.
- **channel level**: Resources of TX or RX channel in one I2S controller.

The public APIs are all channel-level APIs. The channel handle `i2s_chan_handle_t` can help users to manage the resources under a specific channel without considering the other two levels. The other two upper levels’ resources are private and are managed by the driver automatically. Users can call `i2s_new_channel()` to allocate a channel handle and call `i2s_del_channel()` to delete it.

Power Management When the power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will adjust or stop the source clock of I2S before entering Light-sleep, thus potentially changing the I2S signals and leading to transmitting or receiving invalid data.

The I2S driver can prevent the system from changing or stopping the source clock by acquiring a power management lock. When the source clock is generated from APB, the lock type will be set to `esp_pm_lock_type_t::ESP_PM_APB_FREQ_MAX` and when the source clock is APLL (if supported), it will be set to `esp_pm_lock_type_t::ESP_PM_NO_LIGHT_SLEEP`. Whenever the user is reading or writing via I2S (i.e., calling `i2s_channel_read()` or `i2s_channel_write()`), the driver guarantees that the power management lock is acquired. Likewise, the driver releases the lock after the reading or writing finishes.

Finite State Machine There are three states for an I2S channel, namely, registered, ready, and running. Their relationship is shown in the following diagram:

The `<mode>` in the diagram can be replaced by corresponding I2S communication modes, e.g., `std` for standard two-slot mode. For more information about communication modes, please refer to the I2S Communication Mode section.

Data Transport The data transport of the I2S peripheral, including sending and receiving, is realized by DMA. Before transporting data, please call `i2s_channel_enable()` to enable the specific channel. When the sent or received data reaches the size of one DMA buffer, the `I2S_OUT_EOF` or `I2S_IN_SUC_EOF` interrupt will be triggered. Note that the DMA buffer size is not equal to `i2s_chan_config_t::dma_frame_num`. One frame here refers to all the sampled data in one WS circle. Therefore, `dma_buffer_size = dma_frame_num * slot_num * slot_bit_width / 8`. For the data transmitting, users can input the data by calling `i2s_channel_write()`. This function helps users to copy the data from the source buffer to the DMA TX buffer and wait for the transmission to finish. Then it will repeat until the sent bytes reach the given size. For the data receiving, the function `i2s_channel_read()` waits to receive the message queue which contains the DMA buffer address. It helps users copy the data from the DMA RX buffer to the destination buffer.

Both `i2s_channel_write()` and `i2s_channel_read()` are blocking functions. They keeps waiting until the whole source buffer is sent or the whole destination buffer is loaded, unless they exceed the max blocking time, where the error code `ESP_ERR_TIMEOUT` returns. To send or receive data asynchronously, callbacks can be registered by `i2s_channel_register_event_callback()`. Users are able to access the DMA buffer directly in the callback function instead of transmitting or receiving by the two blocking functions. However, please be aware that it is an interrupt callback, so do not add complex logic, run floating operation, or call non-reentrant functions in the callback.

Configuration Users can initialize a channel by calling corresponding functions (i.e., `i2s_channel_init_std_mode()`, `i2s_channel_init_pdm_rx_mode()`, `i2s_channel_init_pdm_tx_mode()`, or `i2s_channel_init_tdm_mode()`) to a specific mode. If the configurations need to be updated after initialization, users have to first call `i2s_channel_disable()` to ensure that the channel has stopped, and then call corresponding ‘reconfig’
Fig. 11: I2S Finite State Machine
functions, like `i2s_channel_reconfig_std_slot()`, `i2s_channel_reconfig_std_clock()`, and `i2s_channel_reconfig_std_gpio()`.

**IRAM Safe** By default, the I2S interrupt will be deferred when the cache is disabled for reasons like writing/erasing flash. Thus the EOF interrupt will not get executed in time.

To avoid such case in real-time applications, you can enable the Kconfig option `CONFIG_I2S_ISR_IRAM_SAFE` that:

1. Keeps the interrupt being serviced even when the cache is disabled.
2. Places driver object into DRAM (in case it is linked to PSRAM by accident).

This allows the interrupt to run while the cache is disabled, but comes at the cost of increased IRAM consumption.

**Thread Safety** All the public I2S APIs are guaranteed to be thread safe by the driver, which means users can call them from different RTOS tasks without protection by extra locks. Notice that the I2S driver uses mutex lock to ensure the thread safety, thus these APIs are not allowed to be used in ISR.

**Kconfig Options**

- `CONFIG_I2S_ISR_IRAM_SAFE` controls whether the default ISR handler can work when the cache is disabled. See [IRAM Safe](#) for more information.
- `CONFIG_I2S_SUPPRESS_DEPRECATE_WARN` controls whether to suppress the compiling warning message while using the legacy I2S driver.
- `CONFIG_I2S_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enable this option increases the firmware binary size.

**Application Example**

The examples of the I2S driver can be found in the directory `peripherals/i2s`. Here are some simple usages of each mode:

**Standard TX/RX Usage** Different slot communication formats can be generated by the following helper macros for standard mode. As described above, there are three formats in standard mode, and their helper macros are:

- `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`
- `I2S_STD_PCM_SLOT_DEFAULT_CONFIG`
- `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`

The clock config helper macro is:

- `I2S_STD_CLK_DEFAULT_CONFIG`

Please refer to [Standard Mode](#) for information about STD API. And for more details, please refer to `driver/i2s/include/driver/i2s_std.h`.

**STD TX Mode** Take 16-bit data width for example. When the data in a `uint16_t` writing buffer are:

<table>
<thead>
<tr>
<th>data 0</th>
<th>data 1</th>
<th>data 2</th>
<th>data 3</th>
<th>data 4</th>
<th>data 5</th>
<th>data 6</th>
<th>data 7</th>
<th>...</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x0001</td>
<td>0x0002</td>
<td>0x0003</td>
<td>0x0004</td>
<td>0x0005</td>
<td>0x0006</td>
<td>0x0007</td>
<td>0x0008</td>
<td>...</td>
</tr>
</tbody>
</table>

Here is the table of the real data on the line with different `i2s_std_slot_config_t::slot_mode` and `i2s_std_slot_config_t::slot_mask`. 
### Chapter 2. API Reference

</tr>
</tbody>
</table>

**Note:** It is similar when the data is 32-bit width, but take care when using 8-bit and 24-bit data width. For 8-bit width, the written buffer should still use `uint16_t` (i.e., align with 2 bytes), and only the high 8 bits are valid while the low 8 bits are dropped. For 24-bit width, the buffer is supposed to use `uint32_t` (i.e., align with 4 bytes), and only the high 24 bits are valid while the low 8 bits are dropped.

Besides, for 8-bit and 16-bit mono modes, the real data on the line is swapped. To get the correct data sequence, the writing buffer needs to swap the data every two bytes.

```c
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
/* Get the default channel configuration by the helper macro. */
/* This helper macro is defined in 'i2s_common.h' and shared by all the I2S communication modes. */
/* It can help to specify the I2S role and port ID */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_MASTER);
/* Allocate a new TX channel and get the handle of this channel */
i2s_new_channel(&chan_cfg, &tx_handle, NULL);

/* Setting the configurations, the slot configuration and clock configuration can be generated by the macros */
/* These two helper macros are defined in 'i2s_std.h' which can only be used in STD mode. */
/* They can help to specify the slot and clock configurations for initialization or updating */
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
/* Initialize the channel */
i2s_channel_init_std_mode(tx_handle, &std_cfg);

/* Before writing data, start the TX channel first */
i2s_channel_enable(tx_handle);
i2s_channel_write(tx_handle, src_buf, bytes_to_write, bytes_written, ticks_to_wait);
```

(continues on next page)
/* If the configurations of slot or clock need to be updated, * stop the channel first and then update it */
// i2s_channel_disable(tx_handle);
// std_cfg.slot_cfg.slot_mode = I2S_SLOT_MODE_MONO; // Default is stereo
// i2s_channel_reconfig_std_slot(tx_handle, &std_cfg.slot_cfg);
// std_cfg.clk_cfg.sample_rate_hz = 96000;
// i2s_channel_reconfig_std_clock(tx_handle, &std_cfg.clk_cfg);

/* Have to stop the channel before deleting it */
i2s_channel_disable(tx_handle);
/* If the handle is not needed any more, delete it to release the channel_ 
→resources */
i2s_del_channel(tx_handle);

### STD RX Mode

Taking 16-bit data width for example, when the data on the line are:

<table>
<thead>
<tr>
<th>WS low</th>
<th>WS high</th>
<th>WS low</th>
<th>WS high</th>
<th>WS low</th>
<th>WS high</th>
<th>WS low</th>
<th>WS high</th>
</tr>
</thead>

</tr>
</tbody>
</table>

**Note:** The receive case is a little bit complicated on ESP32. Firstly, when the data width is 8-bit or 24-bit, the received data will still align with two bytes or four bytes, which means that the valid data are put in the high 8 bits in every two bytes and high 24 bits in every four bytes. For example, the received data will be 0x5A00 when the data on the line is 0x5A in 8-bit width, and 0x0000 5A00 if the data on the line is 0x00 005A. Secondly, for the 8-bit or 16-bit mono case, the data in buffer is swapped every two data, so it may be necessary to manually swap the data back to the correct order.

```c
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t rx_handle;
/* Get the default channel configuration by helper macro. * This helper macro is defined in 'i2s_common.h' and shared by all the I2S_ 
→communication modes. * It can help to specify the I2S role and port ID */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_ 
→MASTER);
/* Allocate a new RX channel and get the handle of this channel */
i2s_new_channel(&chan_cfg, NULL, &rx_handle);

/* Setting the configurations, the slot configuration and clock configuration can_ 
→be generated by the macros * These two helper macros are defined in 'i2s_std.h' which can only be used in_ 
→STD mode. * They can help to specify the slot and clock configurations for initialization_ 
→or updating */
```
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = I2S_GPIO_UNUSED,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
/* Initialize the channel */
i2s_channel_init_std_mode(rx_handle, &std_cfg);

/* Before reading data, start the RX channel first */
i2s_channel_enable(rx_handle);
i2s_channel_read(rx_handle, desc_buf, bytes_to_read, bytes_read, ticks_to_wait);

/* Have to stop the channel before deleting it */
i2s_channel_disable(rx_handle);
/* If the handle is not needed any more, delete it to release the channel resources */
i2s_del_channel(rx_handle);

PDM TX Usage  For PDM mode in TX channel, the slot configuration helper macro is:

- **I2S_PDM_TX_SLOT_DEFAULT_CONFIG**

The clock configuration helper macro is:

- **I2S_PDM_TX_CLK_DEFAULT_CONFIG**

Please refer to **PDM Mode** for information about PDM TX API. And for more details, please refer to driver/i2s/include/driver/i2s_pdm.h.

The PDM data width is fixed to 16-bit. When the data in an int16_t writing buffer is:

| data 0 | data 1 | data 2 | data 3 | data 4 | data 5 | data 6 | data 7 | ...
|--------|--------|--------|--------|--------|--------|--------|--------|-------
| 0x0001 | 0x0002 | 0x0003 | 0x0004 | 0x0005 | 0x0006 | 0x0007 | 0x0008 | ...

Here is the table of the real data on the line with different i2s_pdm_tx_slot_config_t: :slot_mode and i2s_pdm_tx_slot_config_t: :slot_mask (The PDM format on the line is transferred to PCM format for better comprehension).

Chapter 2. API Reference

```c
#include "driver/i2s_pdm.h"
#include "driver/gpio.h"

/* Allocate an I2S TX channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_0, I2S_ROLE_MASTER);
i2s_new_channel(&chan_cfg, &tx_handle, NULL);

/* Init the channel into PDM TX mode */
i2s_pdm_tx_config_t pdm_tx_cfg = {
    .clk_cfg = I2S_PDM_TX_CLK_DEFAULT_CONFIG(36000),
    .slot_cfg = I2S_PDM_TX_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_MODE_MONO),
    .gpio_cfg = {
        .clk = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .invert_flags = {
            .clk_inv = false,
        },
    },
};
i2s_channel_init_pdm_tx_mode(tx_handle, &pdm_tx_cfg);
...
```

PDM RX Usage For PDM mode in RX channel, the slot configuration helper macro is:

- `I2S_PDM_RX_SLOT_DEFAULT_CONFIG`

The clock configuration helper macro is:

- `I2S_PDM_RX_CLK_DEFAULT_CONFIG`

Please refer to PDM Mode for information about PDM RX API. And for more details, please refer to driver/i2s/include/driver/i2s_pdm.h.

The PDM data width is fixed to 16-bit. When the data on the line (The PDM format on the line is transferred to PCM format for easier comprehension) is:

```
| left | right | left | right | left | right | left | right |...
|------|-------|------|-------|------|-------|------|-------|------
| 0x0001 | 0x0002 | 0x0003 | 0x0004 | 0x0005 | 0x0006 | 0x0007 | 0x0008 | ... |
```

Here is the table of the data received in a `int16_t` buffer with different `i2s_pdm_rx_slot_config_t::slot_mode` and `i2s_pdm_rx_slot_config_t::slot_mask`.

```
<table>
<thead>

<td>0x0007</td>
<td>0x0008</td>
</tr>
</tbody>
</table>
```

```c
#include "driver/i2s_pdm.h"
#include "driver/gpio.h"

i2s_chan_handle_t rx_handle;

/* Allocate an I2S RX channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_0, I2S_ROLE_MASTER);
i2s_new_channel(&chan_cfg, NULL, &rx_handle);
```

(continues on next page)
/* Init the channel into PDM RX mode */
i2s_pdm_rx_config_t pdm_rx_cfg = {
    .clk_cfg = I2S_PDM_RX_CLK_DEFAULT_CONFIG(36000),
    .slot_cfg = I2S_PDM_RX_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_MODE_MONO),
    .gpio_cfg = {
        .clk = GPIO_NUM_5,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .clk_inv = false,
        },
    },
};
i2s_channel_init_pdm_rx_mode(rx_handle, &pdm_rx_cfg);

Full-duplex Full-duplex mode registers TX and RX channel in an I2S port at the same time, and the channels share the BCLK and WS signals. Currently, STD and TDM communication modes support full-duplex mode in the following way, but PDM full-duplex is not supported because due to different PDM TX and RX clocks.

Note that one handle can only stand for one channel. Therefore, it is still necessary to configure the slot and clock for both TX and RX channels one by one.

Here is an example of how to allocate a pair of full-duplex channels:

```c
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;

/* Allocate a pair of I2S channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_MASTER);

/* Allocate for TX and RX channel at the same time, then they will work in full-duplex mode */
i2s_new_channel(&chan_cfg, &tx_handle, &rx_handle);

/* Set the configurations for BOTH TWO channels, since TX and RX channel have to be same in full-duplex mode */
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(32000),
    .slot_cfg = I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
i2s_channel_init_std_mode(tx_handle, &std_cfg);
```
(continues on next page)
i2s_channel_init_std_mode(rx_handle, &std_cfg);
i2s_channel_enable(tx_handle);
i2s_channel_enable(rx_handle);

...

{i2s_channel_init_std_mode(rx_handle, &std_rx_cfg);
i2s_channel_enable(rx_handle);

Application Notes

How to Prevent Data Lost  

For applications that need a high frequency sample rate, the massive data throughput may cause data lost. Users can receive data lost event by registering the ISR callback function to receive the event queue:

```c
static IRAM_ATTR bool i2s_rx_queue_overflow_callback(i2s_chan_handle_t *handle, i2s_event_data_t *event, void *user_ctx)
{
    // handle RX queue overflow event ...
    return false;
}
```

i2s_event_callbacks_t cbs = {
    .on_recv = NULL,
    .on_recv_q_ovf = i2s_rx_queue_overflow_callback,
    .on_sent = NULL,
    .on_send_q_ovf = NULL,
};

TEST_ESP_OK(i2s_channel_register_event_callback(rx_handle, &cbs, NULL));

Please follow these steps to prevent data lost:

1. Determine the interrupt interval. Generally, when data lost happens, the bigger the interval, the better, which helps to reduce the interrupt times. This means \( \text{dma\_frame\_num} \) should be as big as possible while the DMA buffer size is below the maximum value of 4092. The relationships are:

   \[
   \text{interrupt\_interval (unit: sec)} = \frac{\text{dma\_frame\_num}}{\text{sample\_rate}}
   \]

   \[
   \text{dma\_buffer\_size} = \text{dma\_frame\_num} \times \text{slot\_num} \times \frac{\text{data\_bit\_width}}{8} < 4092
   \]

2. Determine \( \text{dma\_desc\_num} \). \( \text{dma\_desc\_num} \) is decided by the maximum time of \text{i2s\_channel\_read} polling cycle. All the received data is supposed to be stored between two \text{i2s\_channel\_read}. This cycle can be measured by a timer or an outputting GPIO signal. The relationship is:

   \[
   \text{dma\_desc\_num} > \frac{\text{polling\_cycle}}{\text{interrupt\_interval}}
   \]

3. Determine the receiving buffer size. The receiving buffer offered by users in \text{i2s\_channel\_read} should be able to take all the data in all DMA buffers, which means that it should be larger than the total size of all the DMA buffers:

   \[
   \text{recv\_buffer\_size} > \text{dma\_desc\_num} \times \text{dma\_buffer\_size}
   \]

For example, if there is an I2S application, and the known values are:

<table>
<thead>
<tr>
<th>sample_rate</th>
<th>144000 Hz</th>
</tr>
</thead>
<tbody>
<tr>
<td>data_bit_width</td>
<td>32 bits</td>
</tr>
<tr>
<td>slot_num</td>
<td>2</td>
</tr>
<tr>
<td>polling_cycle</td>
<td>10 ms</td>
</tr>
</tbody>
</table>

Then the parameters \( \text{dma\_frame\_num} \), \( \text{dma\_desc\_num} \), and \( \text{recv\_buf\_size} \) can be calculated as follows:

\[
\text{dma\_frame\_num} \times \text{slot\_num} \times \frac{\text{data\_bit\_width}}{8} = \text{dma\_buffer\_size} < 4092
\]

\[
\text{dma\_frame\_num} < 511
\]

\[
\text{interrupt\_interval} = \frac{\text{dma\_frame\_num}}{\text{sample\_rate}} = 511 / 144000 = 0.003549 \text{ s} = 3.549 \text{ ms}
\]

(continues on next page)
Chapter 2. API Reference

(continued from previous page)

dma_desc_num > polling_cycle / interrupt_interval = cell(10 / 3.549) = cell(2.818)...
recv_buffer_size > dma_desc_num * dma_buffer_size = 3 * 4092 = 12276 bytes

API Reference

Standard Mode

Header File

• components/driver/i2s/include/driver/i2s_std.h

Functions

esp_err_t i2s_channel_init_std_mode(i2s_chan_handle_t handle, const i2s_std_config_t *std_cfg)

Initialize i2s channel to standard mode.

Note: Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

Parameters

• handle - [in] I2S channel handler
• std_cfg - [in] Configurations for standard mode, including clock, slot and gpio The clock configuration can be generated by the helper macro I2S_STD_CLK_DEFAULT_CONFIG
• The slot configuration can be generated by the helper macro I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG/I2S_STD_PCM_SLOT_DEFAULT_CONFIG/I2S_STD_MSB_SLOT_DEFAULT_CONFIG

Returns

• ESP_OK Initialize successfully
• ESP_ERR_NO_MEM No memory for storing the channel information
• ESP_ERR_INVALID_ARG NULL pointer or invalid configuration
• ESP_ERR_INVALID_STATE This channel is not registered

esp_err_t i2s_channel_reconfig_std_clock(i2s_chan_handle_t handle, const i2s_std_clk_config_t *clk_cfg)

Reconfigure the I2S clock for standard mode.

Note: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

Parameters

• handle - [in] I2S channel handler
• clk_cfg - [in] Standard mode clock configuration, can be generated by I2S_STD_CLK_DEFAULT_CONFIG

Returns

• ESP_OK Set clock successfully

Note: The input channel handle has to be initialized to standard mode, i.e., ‘i2s_channel_init_std_mode’ has been called before reconfiguring
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not standard mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

```c
esp_err_t i2s_channel_reconfig_std_slot (i2s_chan_handle_t handle, const i2s_std_slot_config_t *slot_cfg)
```

Reconfigure the I2S slot for standard mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

**Note:** The input channel handle has to be initialized to standard mode, i.e., ‘i2s_channel_init_std_mode’ has been called before reconfiguring

**Parameters**

- `handle` - [in] I2S channel handler
- `slot_cfg` - [in] Standard mode slot configuration, can be generated by `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`, `I2S_STD_PCM_SLOT_DEFAULT_CONFIG` and `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`.

**Returns**

- ESP_OK Set clock successfully
- ESP_ERR_NO_MEM No memory for DMA buffer
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not standard mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

```c
esp_err_t i2s_channel_reconfig_std_gpio (i2s_chan_handle_t handle, const i2s_std_gpio_config_t *gpio_cfg)
```

Reconfigure the I2S gpio for standard mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

**Note:** The input channel handle has to be initialized to standard mode, i.e., ‘i2s_channel_init_std_mode’ has been called before reconfiguring

**Parameters**

- `handle` - [in] I2S channel handler
- `gpio_cfg` - [in] Standard mode gpio configuration, specified by user

**Returns**

- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not standard mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

**Structures**

```c
struct i2s_std_slot_config_t
```

I2S slot configuration for standard mode.
Public Members

*i2s_data_bit_width_t* data_bit_width

I2S sample data bit width (valid data bits per sample)

*i2s_slot_bit_width_t* slot_bit_width

I2S slot bit width (total bits per slot)

*i2s_slot_mode_t* slot_mode

Set mono or stereo mode with I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO. In TX direction, mono means the written buffer contains only one slot data and stereo means the written buffer contains both left and right data.

*i2s_std_slot_mask_t* slot_mask

Select the left, right or both slot

*uint32_t* ws_width

WS signal width (i.e. the number of belk ticks that ws signal is high)

*bool* ws_pol

WS signal polarity, set true to enable high lever first

*bool* bit_shift

Set to enable bit shift in Philips mode

*bool* msb_right

Set to place right channel data at the MSB in the FIFO

**struct i2s_std_clk_config_t**

I2S clock configuration for standard mode.

Public Members

*uint32_t* sample_rate_hz

I2S sample rate

*i2s_clock_src_t* clk_src

Choose clock source, see ‘soc_periph_i2s_clk_src_t’ for the supported clock sources. selected ‘I2S_CLK_SRC_EXTERNAL’ (if supports) to enable the external source clock input via MCLK pin.

*i2s_mclk_multiple_t* mclk_multiple

The multiple of mclk to the sample rate. Default is 256 in the helper macro, it can satisfy most of cases, but please set this field a multiple of ‘3’ (like 384) when using 24-bit data width, otherwise the sample rate might be inaccurate

**struct i2s_std_gpio_config_t**

I2S standard mode GPIO pins configuration.
## Public Members

`gpio_num_t mclk`
- MCK pin, output by default, input if the clock source is selected to ‘I2S_CLK_SRC_EXTERNAL’

`gpio_num_t bclk`
- BCK pin, input in slave role, output in master role

`gpio_num_t ws`
- WS pin, input in slave role, output in master role

`gpio_num_t dout`
- DATA pin, output

`gpio_num_t din`
- DATA pin, input

`uint32_t mclk_inv`
- Set 1 to invert the mclk output

`uint32_t bclk_inv`
- Set 1 to invert the bclk input/output

`uint32_t ws_inv`
- Set 1 to invert the ws input/output

`struct i2s_std_gpio_config_t::[anonymous] invert_flags`
- GPIO pin invert flags

### Macros

**I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG**

Philips format in 2 slots.

This file is specified for I2S standard communication mode Features:
• Philips/MSB/PCM are supported in standard mode
• Fixed to 2 slots

Parameters
• bits_per_sample - i2s data bit width
• mono_or_stereo - I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_STD_PCM_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)
PCM (short) format in 2 slots.

Note: PCM (long) is same as philips in 2 slots

Parameters
• bits_per_sample - i2s data bit width
• mono_or_stereo - I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_STD_MSB_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)
MSB format in 2 slots.

Parameters
• bits_per_sample - i2s data bit width
• mono_or_stereo - I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_STD_CLK_DEFAULT_CONFIG (rate)
i2s default standard clock configuration

Note: Please set the mclk_multiple to I2S_MCLK_MULTIPLE_384 while using 24 bits data width Otherwise the sample rate might be imprecise since the bclk division is not an integer

Parameters
• rate - sample rate

PDM Mode

Header File
• components/driver/i2s/include/driver/i2s_pdm.h

Functions
esp_err_t i2s_channel_init_pdm_rx_mode (i2s_chan_handle_t handle, const i2s_pdm_rx_config_t *pdm_rx_cfg)
Initialize i2s channel to PDM RX mode.

Note: Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

Parameters
• handle - [in] I2S rx channel handler
• pdm_rx_cfg - [in] Configurations for PDM RX mode, including clock, slot and gpio The clock configuration can be generated by the helper macro I2S_PDM_RX_CLK_DEFAULT_CONFIG The slot configuration can be generated by the helper macro I2S_PDM_RX_SLOT_DEFAULT_CONFIG
Returns

• ESP_OK Initialize successfully
• ESP_ERR_NO_MEM No memory for storing the channel information
• ESP_ERR_INVALID_ARG NULL pointer or invalid configuration
• ESP_ERR_INVALID_STATE This channel is not registered

\texttt{esp_err_t i2s\_channel\_reconfig\_pdm\_rx\_clock}\ (i2s\_chan\_handle\_t handle, const i2s\_pdm\_rx\_clk\_config\_t *clk\_cfg)

Reconfigure the I2S clock for PDM RX mode.

\textbf{Note:} Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started. This function won’t change the state. ‘i2s\_channel\_disable’ should be called before calling this function if i2s has started.

\textbf{Parameters}

• handle [in] I2S rx channel handler
• clk_cfg [in] PDM RX mode clock configuration, can be generated by I2S\_PDM\_RX\_CLK\_DEFAULT\_CONFIG

\textbf{Returns}

• ESP_OK Set clock successfully
• ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
• ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

\texttt{esp_err_t i2s\_channel\_reconfig\_pdm\_rx\_slot}\ (i2s\_chan\_handle\_t handle, const i2s\_pdm\_rx\_slot\_config\_t *slot\_cfg)

Reconfigure the I2S slot for PDM RX mode.

\textbf{Note:} Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started. This function won’t change the state. ‘i2s\_channel\_disable’ should be called before calling this function if i2s has started.

\textbf{Parameters}

• handle [in] I2S rx channel handler
• slot_cfg [in] PDM RX mode slot configuration, can be generated by I2S\_PDM\_RX\_SLOT\_DEFAULT\_CONFIG

\textbf{Returns}

• ESP_OK Set clock successfully
• ESP_ERR_NO_MEM No memory for DMA buffer
• ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
• ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

\texttt{esp_err_t i2s\_channel\_reconfig\_pdm\_rx\_gpio}\ (i2s\_chan\_handle\_t handle, const i2s\_pdm\_rx\_gpio\_config\_t *gpio\_cfg)

Reconfigure the I2S gpio for PDM RX mode.
Chapter 2. API Reference

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started. This function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

**Note:** The input channel handle has to be initialized to PDM RX mode, i.e., ‘i2s_channel_init_pdm_rx_mode’ has been called before reconfiguring

### Parameters
- `handle` - [in] I2S rx channel handler
- `gpio_cfg` - [in] PDM RX mode gpio configuration, specified by user

### Returns
- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

```c
esp_err_t i2s_channel_init_pdm_rx_mode (i2s_chan_handle_t handle, const i2s_pdm_rx_config_t *pdm_rx_cfg)
```

Initialize i2s channel to PDM RX mode.

**Note:** Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

### Parameters
- `handle` - [in] I2S tx channel handler
- `pdm_tx_cfg` - [in] Configurations for PDM TX mode, including clock, slot and gpio. The clock configuration can be generated by the helper macro `I2S_PDM_TX_CLK_DEFAULT_CONFIG` The slot configuration can be generated by the helper macro `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`

### Returns
- ESP_OK Initialize successfully
- ESP_ERR_NO_MEM No memory for storing the channel information
- ESP_ERR_INVALID_ARG NULL pointer or invalid configuration
- ESP_ERR_INVALID_STATE This channel is not registered

```c
esp_err_t i2s_channel_reconfig_pdm_tx_clock (i2s_chan_handle_t handle, const i2s_pdm_tx_clk_config_t *clk_cfg)
```

Reconfigure the I2S clock for PDM TX mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started. This function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

**Note:** The input channel handle has to be initialized to PDM TX mode, i.e., ‘i2s_channel_init_pdm_tx_mode’ has been called before reconfiguring

### Parameters
- `handle` - [in] I2S tx channel handler
- `clk_cfg` - [in] PDM TX mode clock configuration, can be generated by `I2S_PDM_TX_CLK_DEFAULT_CONFIG`

```c
esp_err_t i2s_channel_reconfig_pdm_tx_clock (i2s_chan_handle_t handle, const i2s_pdm_tx_clk_config_t *clk_cfg)
```
Returns

- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

```c
esp_err_t i2s_channel_reconfig_pdm_tx_slot(i2s_chan_handle_t handle, const
i2s_pdm_tx_slot_config_t *slot_cfg)
```

Reconfigure the I2S slot for PDM TX mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. `i2s_channel_disable` should be called before calling this function if i2s has started.

**Parameters**

- `handle` [in] I2S tx channel handler
- `slot_cfg` [in] PDM TX mode slot configuration, can be generated by `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`

**Returns**

- ESP_OK Set clock successfully
- ESP_ERR_NO_MEM No memory for DMA buffer
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

```c
esp_err_t i2s_channel_reconfig_pdm_tx_gpio(i2s_chan_handle_t handle, const
i2s_pdm_tx_gpio_config_t *gpio_cfg)
```

Reconfigure the I2S gpio for PDM TX mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. `i2s_channel_disable` should be called before calling this function if i2s has started.

**Parameters**

- `handle` [in] I2S tx channel handler
- `gpio_cfg` [in] PDM TX mode gpio configuration, specified by user

**Returns**

- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

**Structures**

```c
struct i2s_pdm_rx_slot_config_t
```

I2S slot configuration for pdm rx mode.
Public Members

*i2s_data_bit_width_t* data_bit_width
I2S sample data bit width (valid data bits per sample), only support 16 bits for PDM mode

*i2s_slot_bit_width_t* slot_bit_width
I2S slot bit width (total bits per slot), only support 16 bits for PDM mode

*i2s_slot_mode_t* slot_mode
Set mono or stereo mode with I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

*i2s_pdm_slot_mask_t* slot_mask
Choose the slots to activate

```c
struct i2s_pdm_slot_mask
```
I2S clock configuration for pdm rx mode.

Public Members

```c
uint32_t sample_rate_hz
```
I2S sample rate

```c
i2s_clock_src_t clk_src
```
Choose clock source

```c
i2s_mclk_multiple_t mclk_multiple
```
The multiple of mclk to the sample rate

```c
i2s_pdm_dsr_t dn_sample_mode
```
Down-sampling rate mode

```c
uint32_t bclk_div
```
The division from mclk to bclk. The typical and minimum value is I2S_PDM_RX_BCLK_DIV_MIN. It will be set to I2S_PDM_RX_BCLK_DIV_MIN by default if it is smaller than I2S_PDM_RX_BCLK_DIV_MIN

```c
struct i2s_pdm_rx_gpio_config
```
I2S PDM tx mode GPIO pins configuration.

Public Members

```c
gpio_num_t clk
```
PDM clk pin, output

```c
gpio_num_t din
```
DATA pin 0, input
Chapter 2. API Reference

```c
gpio_num_t dins[(1U)]
    DATA pins, input, only take effect when corresponding I2S_PDM_RX_LINEx_SLOT_xxx is enabled in i2s_pdm_rx_slot_config_t::slot_mask

uint32_t clk_inv
    Set 1 to invert the clk output

struct i2s_pdm_rx_gpio_config_t::[anonymous] invert_flags
    GPIO pin invert flags
```

```c
struct i2s_pdm_rx_config_t
    I2S PDM RX mode major configuration that including clock/slot/gpio configuration.
```

**Public Members**

```c
i2s_pdm_rx_clk_config_t clk_cfg
    PDM RX clock configurations, can be generated by macro I2S_PDM_RX_CLK_DEFAULT_CONFIG

i2s_pdm_rx_slot_config_t slot_cfg
    PDM RX slot configurations, can be generated by macro I2S_PDM_RX_SLOT_DEFAULT_CONFIG

i2s_pdm_rx_gpio_config_t gpio_cfg
    PDM RX slot configurations, specified by user
```

```c
struct i2s_pdm_tx_slot_config_t
    I2S slot configuration for pdm tx mode.
```

**Public Members**

```c
i2s_data_bit_width_t data_bit_width
    I2S sample data bit width (valid data bits per sample), only support 16 bits for PDM mode

i2s_slot_bit_width_t slot_bit_width
    I2S slot bit width (total bits per slot), only support 16 bits for PDM mode

i2s_slot_mode_t slot_mode
    Set mono or stereo mode with I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO For PDM TX mode, mono means the data buffer only contains one slot data, Stereo means the data buffer contains two slots data

i2s_pdm_slot_mask_t slot_mask
    Slot mask to choose left or right slot

uint32_t sd_prescale
    Sigma-delta filter prescale

i2s_pdm_sig_scale_t sd_scale
    Sigma-delta filter scaling value
```
```c
i2s_pdm_sig_scale_t hp_scale
    High pass filter scaling value

i2s_pdm_sig_scale_t lp_scale
    Low pass filter scaling value

i2s_pdm_sig_scale_t sinc_scale
    Sinc filter scaling value
```

```c
struct i2s_pdm_tx_clk_config_t
    I2S clock configuration for pdm tx mode.
```

**Public Members**

```c
uint32_t sample_rate_hz
    I2S sample rate, not suggest to exceed 48000 Hz, otherwise more glitches and noise may appear
```

```c
i2s_clock_src_t clk_src
    Choose clock source
```

```c
i2s_mclk_multiple_t mclk_multiple
    The multiple of mclk to the sample rate
```

```c
uint32_t up_sample_fp
    Up-sampling param fp
```

```c
uint32_t up_sample_fs
    Up-sampling param fs, not allowed to be greater than 480
```

```c
uint32_t bclk_div
    The division from mclk to bclk. The minimum value is I2S_PDM_TX_BCLK_DIV_MIN. It will be set to I2S_PDM_TX_BCLK_DIV_MIN by default if it is smaller than I2S_PDM_TX_BCLK_DIV_MIN
```

```c
struct i2s_pdm_tx_gpio_config_t
    I2S PDM tx mode GPIO pins configuration.
```

**Public Members**

```c
gpio_num_t clk
    PDM clk pin, output
```

```c
gpio_num_t dout
    DATA pin, output
```

```c
uint32_t clk_inv
    Set 1 to invert the clk output
```
struct i2s_pdm_tx_gpio_config_t {[anonymous] invert_flags
    
    GPIO pin invert flags

struct i2s_pdm_tx_config_t
    
    I2S PDM TX mode major configuration that including clock/slot/gpio configuration.

Public Members

i2s_pdm_tx_clk_config_t clk_cfg
    
    PDM TX clock configurations, can be generated by macro I2S_PDM_TX_CLK_DEFAULT_CONFIG

i2s_pdm_tx_slot_config_t slot_cfg
    
    PDM TX slot configurations, can be generated by macro I2S_PDM_TX_SLOT_DEFAULT_CONFIG

i2s_pdm_tx_gpio_config_t gpio_cfg
    
    PDM TX gpio configurations, specified by user

Macros

I2S_PDM_RX_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)
    
    PDM format in 2 slots(RX)

This file is specified for I2S PDM communication mode Features:

- Only support PDM tx/rx mode
- Fixed to 2 slots
- Data bit width only support 16 bits

Parameters

- bits_per_sample – i2s data bit width, only support 16 bits for PDM mode
- mono_or_stereo – I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_PDM_RX_CLK_DEFAULT_CONFIG (rate)
    
    i2s default pdm rx clock configuration

Parameters

- rate – sample rate

I2S_PDM_TX_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)
    
    PDM style in 2 slots(TX) for codec line mode.

Parameters

- bits_per_sample – i2s data bit width, only support 16 bits for PDM mode
- mono_or_stereo – I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_PDM_TX_CLK_DEFAULT_CONFIG (rate)
    
    i2s default pdm tx clock configuration for codec line mode

Note:  
TX PDM can only be set to the following two up-sampling rate configurations: 1: fp = 960, fs = sample_rate_hz / 100, in this case, Fpdm = 128*48000 2: fp = 960, fs = 480, in this case, Fpdm = 128*Fpcm = 128*sample_rate_hz If the pdm receiver do not care the pdm serial clock, it’s recommended set Fpdm = 128*48000. Otherwise, the second configuration should be adopted.

Parameters
**I2S_PDM_TX_CLK_DAC_DEFAULT_CONFIG** (rate)

i2s default pdm tx clock configuration for DAC line mode

**Note:** TX PDM can only be set to the following two up-sampling rate configurations: 1: \(fp = 960, fs = \text{sample rate hz} / 100\), in this case, \(F_{pdm} = 128*48000\) 2: \(fp = 960, fs = 480\), in this case, \(F_{pdm} = 128*F_{pcm} = 128*\text{sample rate hz} \) If the pdm receiver do not care the pdm serial clock, it’s recommended set \(F_{pdm} = 128*48000\). Otherwise, the second configuration should be adopted.

**Parameters**

- **rate** - sample rate (not suggest to exceed 48000 Hz, otherwise more glitches and noise may appear)

**I2S Driver**

**Header File**

- `components/driver/i2s/include/driver/i2s_common.h`

**Functions**

```c
esp_err_t i2s_new_channel(const i2s_chan_config_t *chan_cfg, i2s_chan_handle_t *ret_tx_handle, i2s_chan_handle_t *ret_rx_handle)
```

Allocate new I2S channel(s)

**Note:** The new created I2S channel handle will be REGISTERED state after it is allocated successfully.

**Note:** When the port id in channel configuration is I2S_NUM_AUTO, driver will allocate I2S port automatically on one of the i2s controller, otherwise driver will try to allocate the new channel on the selected port.

**Note:** If both tx_handle and rx_handle are not NULL, it means this I2S controller will work at full-duplex mode, the rx and tx channels will be allocated on a same I2S port in this case. Note that some configurations of tx/rx channel are shared on ESP32 and ESP32S2, so please make sure they are working at same condition and under same status(start/stop). Currently, full-duplex mode can’t guarantee tx/rx channels write/read synchronously, they can only share the clock signals for now.

**Note:** If tx_handle OR rx_handle is NULL, it means this I2S controller will work at simplex mode. For ESP32 and ESP32S2, the whole I2S controller (i.e. both rx and tx channel) will be occupied, even if only one of rx or tx channel is registered. For the other targets, another channel on this controller will still available.

**Parameters**

- **chan_cfg** - [in] I2S controller channel configurations
• **ret_tx_handle** - [out] I2S channel handler used for managing the sending channel (optional)
• **ret_rx_handle** - [out] I2S channel handler used for managing the receiving channel (optional)

**Returns**
- ESP_OK Allocate new channel(s) success
- ESP_ERR_NOT_SUPPORTED The communication mode is not supported on the current chip
- ESP_ERR_INVALID_ARG NULL pointer or illegal parameter in `i2s_chan_config_t`
- ESP_ERR_NOT_FOUND No available I2S channel found

```c
def i2s_del_channel(i2s_chan_handle_t handle)
```
Delete the i2s channel.

**Note:** Only allowed to be called when the i2s channel is at REGISTERED or READY state (i.e., it should stop before deleting it).

**Parameters**
- **handle** - [in] I2S channel handler

```c
def i2s_channel_get_info(i2s_chan_handle_t handle, i2s_chan_info_t *chan_info)
```
Get I2S channel information.

**Parameters**
- **handle** - [in] I2S channel handler
- **chan_info** - [out] I2S channel basic information

**Returns**
- ESP_OK Get i2s channel information success
- ESP_ERR_NOT_FOUND The input handle doesn’t match any registered I2S channels, it may not an i2s channel handle or not available any more
- ESP_ERR_INVALID_ARG The input handle or chan_info pointer is NULL

```c
def i2s_channel_enable(i2sChanHandle_t handle)
```
Enable the i2s channel.

**Note:** Only allowed to be called when the channel state is READY, (i.e., channel has been initialized, but not started) the channel will enter RUNNING state once it is enabled successfully.

**Note:** Enable the channel can start the I2S communication on hardware. It will start outputting bclk and ws signal. For mclks signal, it will start to output when initialization is finished.

**Parameters**
- **handle** - [in] I2S channel handler

```c
def i2s_channel_disable(i2sChanHandle_t handle)
```
Disable the i2s channel.

**Parameters**
- **handle** - [in] I2S channel handler

- ESP_OK Start successfully
- ESP_ERR_INVALID_ARG NULL pointer
- ESP_ERR_INVALID_STATE This channel has not initialized or already started
Note: Only allowed to be called when the channel state is RUNNING, (i.e., channel has been started) the channel will enter READY state once it is disabled successfully.

Note: Disable the channel can stop the I2S communication on hardware. It will stop bclk and ws signal but not mclk signal

**Parameters**
- **handle** - [in] I2S channel handler

**Returns**
- ESP_OK Stop successfully
- ESP_ERR_INVALID_ARG NULL pointer
- ESP_ERR_INVALID_STATE This channel has not stated

```c
esp_err_t i2s_channel_preload_data(i2s_chan_handle_t tx_handle, const void *src, size_t size, size_t *bytes_loaded)
```
Preload the data into TX DMA buffer.

Note: Only allowed to be called when the channel state is READY, (i.e., channel has been initialized, but not started)

Note: As the initial DMA buffer has no data inside, it will transmit the empty buffer after enabled the channel, this function is used to preload the data into the DMA buffer, so that the valid data can be transmitted immediately after the channel is enabled.

Note: This function can be called multiple times before enabling the channel, the buffer that loaded later will be concatenated behind the former loaded buffer. But when all the DMA buffers have been loaded, no more data can be preload then, please check the `bytes_loaded` parameter to see how many bytes are loaded successfully, when the `bytes_loaded` is smaller than the `size`, it means the DMA buffers are full.

**Parameters**
- **tx_handle** - [in] I2S TX channel handler
- **src** - [in] The pointer of the source buffer to be loaded
- **size** - [in] The source buffer size
- **bytes_loaded** - [out] The bytes that successfully been loaded into the TX DMA buffer

**Returns**
- ESP_OK Load data successful
- ESP_ERR_INVALID_ARG NULL pointer or not TX direction
- ESP_ERR_INVALID_STATE This channel has not stated

```c
esp_err_t i2s_channel_write(i2s_chan_handle_t handle, const void *src, size_t size, size_t *bytes_written, uint32_t timeout_ms)
```
I2S write data.

Note: Only allowed to be called when the channel state is RUNNING, (i.e., tx channel has been started and is not writing now) but the RUNNING only stands for the software state, it doesn’t mean there is no the signal transporting on line.

**Parameters**
- **handle** - [in] I2S channel handler
**Chapter 2. API Reference**

- **src** – [in] The pointer of sent data buffer
- **size** – [in] Max data buffer length
- **bytes_written** – [out] Byte number that actually be sent, can be NULL if not needed
- **timeout_ms** – [in] Max block time

**Returns**
- ESP_OK Write successfully
- ESP_ERR_INVALID_ARG NULL pointer or this handle is not tx handle
- ESP_ERR_TIMEOUT Writing timeout, no writing event received from ISR within ticks_to_wait
- ESP_ERR_INVALID_STATE I2S is not ready to write

```c
esp_err_t i2s_channel_read(i2s_chan_handle_t handle, void *dest, size_t size, size_t *bytes_read, uint32_t timeout_ms)
```

I2S read data.

**Note:** Only allowed to be called when the channel state is RUNNING but the RUNNING only stands for the software state, it doesn’t mean there is no the signal transporting on line.

**Parameters**
- **handle** – [in] I2S channel handler
- **dest** – [in] The pointer of receiving data buffer
- **size** – [in] Max data buffer length
- **bytes_read** – [out] Byte number that actually be read, can be NULL if not needed
- **timeout_ms** – [in] Max block time

**Returns**
- ESP_OK Read successfully
- ESP_ERR_INVALID_ARG NULL pointer or this handle is not rx handle
- ESP_ERR_TIMEOUT Reading timeout, no reading event received from ISR within ticks_to_wait
- ESP_ERR_INVALID_STATE I2S is not ready to read

```c
esp_err_t i2s_channel_register_event_callback(i2s_chan_handle_t handle, const i2s_event_callbacks_t *callbacks, void *user_data)
```

Set event callbacks for I2S channel.

**Note:** Only allowed to be called when the channel state is REGISTERED / READY, (i.e., before channel starts)

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the callbacks structure to NULL.

**Note:** When CONFIG_I2S_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The **user_data** should also reside in SRAM or internal RAM as well.

**Parameters**
- **handle** – [in] I2S channel handler
- **callbacks** – [in] Group of callback functions
- **user_data** – [in] User data, which will be passed to callback functions directly

**Returns**
Chapter 2. API Reference

- ESP_OK Set event callbacks successfully
- ESP_ERR_INVALID_ARG Set event callbacks failed because of invalid argument
- ESP_ERR_INVALID_STATE Set event callbacks failed because the current channel state is not REGISTERED or READY

**Structures**

```c
struct i2s_event_callbacks_t

Group of I2S callbacks.
```

**Note:** The callbacks are all running under ISR environment

**Note:** When CONFIG_I2S_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

**Public Members**

```c
i2s_isr_callback_t on_recv

Callback of data received event, only for rx channel The event data includes DMA buffer address and size that just finished receiving data
```

```c
i2s_isr_callback_t on_recv_q_ovf

Callback of receiving queue overflowed event, only for rx channel The event data includes buffer size that has been overwritten
```

```c
i2s_isr_callback_t on_sent

Callback of data sent event, only for tx channel The event data includes DMA buffer address and size that just finished sending data
```

```c
i2s_isr_callback_t on_send_q_ovf

Callback of sending queue overflowed event, only for tx channel The event data includes buffer size that has been overwritten
```

```c
struct i2s_chan_config_t

I2S controller channel configuration.
```

**Public Members**

```c
i2s_port_t id

I2S port id
```

```c
i2s_role_t role

I2S role, I2S_ROLE_MASTER or I2S_ROLE_SLAVE
```

```c
uint32_t dma_desc_num

I2S DMA buffer number, it is also the number of DMA descriptor
uint32_t dma_frame_num
   I2S frame number in one DMA buffer. One frame means one-time sample data in all slots, it should be the multiple of 3 when the data bit width is 24.

bool auto_clear
   Set to auto clear DMA TX buffer, i2s will always send zero automatically if no data to send

int intr_priority
   I2S interrupt priority, range [0, 7], if set to 0, the driver will try to allocate an interrupt with a relative low priority (1, 2, 3)

struct i2s_chan_info_t
   I2S channel information.

Public Members

i2s_port_t id
   I2S port id

i2s_role_t role
   I2S role, I2S_ROLE_MASTER or I2S_ROLE_SLAVE

i2s_dir_t dir
   I2S channel direction

i2s_comm_mode_t mode
   I2S channel communication mode

i2s_chan_handle_t pair_chan
   I2S pair channel handle in duplex mode, always NULL in simplex mode

Macros

I2S_CHANNEL_DEFAULT_CONFIG (i2s_num, i2s_role)
   get default I2S property

I2S_GPIO_UNUSED
   Used in i2s_gpio_config_t for signals which are not used

I2S Types

Header File

- components/driver/i2s/include/driver/i2s_types.h

Structures

struct i2s_event_data_t
   Event structure used in I2S event queue.
Chapter 2. API Reference

Public Members

void *data

The pointer of DMA buffer that just finished sending or receiving for on_recv and on_sent callback
NULL for on_recv_q_ovf and on_send_q_ovf callback

size_t size

The buffer size of DMA buffer when success to send or receive, also the buffer size that dropped when queue overflow. It is related to the dma_frame_num and data_bit_width, typically it is fixed when data_bit_width is not changed.

Type Definitions

typedef struct i2s_channel_obj_t *i2s_chan_handle_t

i2s channel object handle, the control unit of the i2s driver

typedef bool (*i2s_isr_callback_t)(i2s_chan_handle_t handle, i2s_event_data_t *event, void *user_ctx)

I2S event callback.

Param handle [in] I2S channel handle, created from i2s_new_channel()
Param event [in] I2S event data
Param user_ctx [in] User registered context, passed from i2s_channel_register_event_callback()
Return Whether a high priority task has been waken up by this callback function

Enumerations

enum i2s_port_t

I2S controller port number, the max port number is (SOC_I2S_NUM -1).

Values:

enumerator I2S_NUM_0
I2S controller port 0

enumerator I2S_NUM_1
I2S controller port 1

enumerator I2S_NUM_AUTO
Select whichever port is available

enum i2s_comm_mode_t

I2S controller communication mode.

Values:

enumerator I2S_COMM_MODE_STD
I2S controller using standard communication mode, support philips/MSB/PCM format

enumerator I2S_COMM_MODE_PDM
I2S controller using PDM communication mode, support PDM output or input
enumerator **I2S_COMM_MODE_NONE**
    Unspecified I2S controller mode

enum **i2s_mclk_multiple_t**
The multiple of mclk to sample rate.

    Values:

    enumerator **I2S_MCLK_MULTIPLE_128**
        mclk = sample_rate * 128

    enumerator **I2S_MCLK_MULTIPLE_256**
        mclk = sample_rate * 256

    enumerator **I2S_MCLK_MULTIPLE_384**
        mclk = sample_rate * 384

    enumerator **I2S_MCLK_MULTIPLE_512**
        mclk = sample_rate * 512

**Header File**
- components/hal/include/hal/i2s_types.h

**Type Definitions**

typedef **soc_periph_i2s_clk_src_t** **i2s_clock_src_t**
    I2S clock source

**Enumerations**

enum **i2s_slot_mode_t**
    I2S channel slot mode.

    Values:

    enumerator **I2S_SLOT_MODE_MONO**
        I2S channel slot format mono, transmit same data in all slots for tx mode, only receive the data in the first slots for rx mode.

    enumerator **I2S_SLOT_MODE_STEREO**
        I2S channel slot format stereo, transmit different data in different slots for tx mode, receive the data in all slots for rx mode.

enum **i2s_dir_t**
    I2S channel direction.

    Values:

    enumerator **I2S_DIR_RX**
        I2S channel direction RX
enumerator **I2S_DIR_TX**
   I2S channel direction TX

enum **i2s_role_t**
   I2S controller role.
   Values:
   
   enumerator **I2S_ROLE_MASTER**
      I2S controller master role, bclk and ws signal will be set to output
   
   enumerator **I2S_ROLE_SLAVE**
      I2S controller slave role, bclk and ws signal will be set to input

enum **i2s_data_bit_width_t**
   Available data bit width in one slot.
   Values:
   
   enumerator **I2S_DATA_BIT_WIDTH_8BIT**
      I2S channel data bit-width: 8
   
   enumerator **I2S_DATA_BIT_WIDTH_16BIT**
      I2S channel data bit-width: 16
   
   enumerator **I2S_DATA_BIT_WIDTH_24BIT**
      I2S channel data bit-width: 24
   
   enumerator **I2S_DATA_BIT_WIDTH_32BIT**
      I2S channel data bit-width: 32

enum **i2s_slot_bit_width_t**
   Total slot bit width in one slot.
   Values:
   
   enumerator **I2S_SLOT_BIT_WIDTH_AUTO**
      I2S channel slot bit-width equals to data bit-width
   
   enumerator **I2S_SLOT_BIT_WIDTH_8BIT**
      I2S channel slot bit-width: 8
   
   enumerator **I2S_SLOT_BIT_WIDTH_16BIT**
      I2S channel slot bit-width: 16
   
   enumerator **I2S_SLOT_BIT_WIDTH_24BIT**
      I2S channel slot bit-width: 24
   
   enumerator **I2S_SLOT_BIT_WIDTH_32BIT**
      I2S channel slot bit-width: 32
enum i2s_pdm_dsr_t
I2S PDM RX down-sampling mode.

Values:

enumerator I2S_PDM_DSR_8S
downsampling number is 8 for PDM RX mode

enumerator I2S_PDM_DSR_16S
downsampling number is 16 for PDM RX mode

enumerator I2S_PDM_DSR_MAX

enum i2s_pdm_sig_scale_t
pdm tx signal scaling mode

Values:

enumerator I2S_PDM_SIG_SCALING_DIV_2
I2S TX PDM signal scaling: /2

enumerator I2S_PDM_SIG_SCALING_MUL_1
I2S TX PDM signal scaling: x1

enumerator I2S_PDM_SIG_SCALING_MUL_2
I2S TX PDM signal scaling: x2

enumerator I2S_PDM_SIG_SCALING_MUL_4
I2S TX PDM signal scaling: x4

enum i2s_std_slot_mask_t
I2S slot select in standard mode.

Values:

enumerator I2S_STD_SLOT_LEFT
I2S transmits or receives left slot

enumerator I2S_STD_SLOT_RIGHT
I2S transmits or receives right slot

enumerator I2S_STD_SLOT_BOTH
I2S transmits or receives both left and right slot

enum i2s_pdm_slot_mask_t
I2S slot select in PDM mode.

Values:
Chapter 2. API Reference

enumerator **I2S_PDM_SLOT_RIGHT**

I2S PDM only transmits or receives the PDM device whose ‘select’ pin is pulled up

enumerator **I2S_PDM_SLOT_LEFT**

I2S PDM only transmits or receives the PDM device whose ‘select’ pin is pulled down

enumerator **I2S_PDM_SLOT_BOTH**

I2S PDM transmits or receives both two slots

2.6.10 LCD

Introduction

ESP chips can generate various kinds of timings that needed by common LCDs on the market, like SPI LCD, I80 LCD (a.k.a Intel 8080 parallel LCD), RGB/ SRGB LCD, I2C LCD, etc. The esp_lcd component is officially to support those LCDs with a group of universal APIs across chips.

Functional Overview

In esp_lcd, an LCD panel is represented by esp_lcd_panel_handle_t, which plays the role of an abstract frame buffer, regardless of the frame memory is allocated inside ESP chip or in external LCD controller. Based on the location of the frame buffer and the hardware connection interface, the LCD panel drivers are mainly grouped into the following categories:

- Controller based LCD driver involves multiple steps to get a panel handle, like bus allocation, IO device registration and controller driver install. The frame buffer is located in the controller’s internal GRAM (Graphical RAM). ESP-IDF provides only a limited number of LCD controller drivers out of the box (e.g., ST7789, SSD1306). More Controller Based LCD Drivers are maintained in the Espressif Component Registry <https://components.espressif.com/>.
- SPI Interfaced LCD describes the steps to install the SPI LCD IO driver and then get the panel handle.
- I2C Interfaced LCD describes the steps to install the I2C LCD IO driver and then get the panel handle.
- I80 Interfaced LCD describes the steps to install the I80 LCD IO driver and then get the panel handle.
- LCD Panel IO Operations - provides a set of APIs to operate the LCD panel, like turning on/off the display, setting the orientation, etc. These operations are common for either controller-based LCD panel driver or RGB LCD panel driver.

SPI Interfaced LCD

1. Create an SPI bus. Please refer to SPI Master API doc for more details.

```c
spi_bus_config_t buscfg = {
    .sclk_io_num = EXAMPLE_PIN_NUM_SCLK,
    .mosi_io_num = EXAMPLE_PIN_NUM_MOSI,
    .miso_io_num = EXAMPLE_PIN_NUM_MISO,
    .quadwp_io_num = -1, // Quad SPI LCD driver is not yet supported
    .quadhd_io_num = -1, // Quad SPI LCD driver is not yet supported
    .max_transfer_sz = EXAMPLE_LCD_H_RES * 80 * sizeof(uint16_t), // transfer 80 lines of pixels (assume pixel is RGB565) at most in one SPI transaction
};
ESP_ERROR_CHECK(spi_bus_initialize(LCD_HOST, &buscfg, SPI_DMA_CH_~AUTO)); // Enable the DMA feature
```

2. Allocate an LCD IO device handle from the SPI bus. In this step, you need to provide the following information:
- `esp_lcd_panel_io_spi_config_t::dc_gpio_num`: Sets the GPIO number for the DC signal line (some LCD calls this RS line). The LCD driver uses this GPIO to switch between sending command and sending data.
- `esp_lcd_panel_io_spi_config_t::cs_gpio_num`: Sets the GPIO number for the CS signal line. The LCD driver uses this GPIO to select the LCD chip. If the SPI bus only has one device attached (i.e., this LCD), you can set the GPIO number to -1 to occupy the bus exclusively.
- `esp_lcd_panel_io_spi_config_t::pclk_hz`: Sets the frequency of the pixel clock, in Hz. The value should not exceed the range recommended in the LCD spec.
- `esp_lcd_panel_io_spi_config_t::spi_mode`: Sets the SPI mode. The LCD driver uses this mode to communicate with the LCD. For the meaning of the SPI mode, please refer to the SPI Master API doc.
- `esp_lcd_panel_io_spi_config_t::lcd_cmd_bits` and `esp_lcd_panel_io_spi_config_t::lcd_param_bits` set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.
- `esp_lcd_panel_io_spi_config_t::trans_queue_depth`: Sets the depth of the SPI transaction queue. A bigger value means more transactions can be queued up, but it also consumes more memory.

```c
esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_spi_config_t io_config = {
  .dc_gpio_num = EXAMPLE_PIN_NUM_LCD_DC,
  .cs_gpio_num = EXAMPLE_PIN_NUM_LCD_CS,
  .pclk_hz = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
  .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
  .lcd_param_bits = EXAMPLE_LCD_PARAM_BITS,
  .spi_mode = 0,
  .trans_queue_depth = 10,
};
#endif
ESP_ERROR_CHECK(esp_lcd_new_panel_io_spi((esp_lcd_spi_bus_handle_t)LCD_ → HOST, &io_config, &io_handle));
```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the SPI IO device handle that allocated in the last step, and some panel specific configurations:
- `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the LCD’s hardware reset GPIO number. If the LCD does not have a hardware reset pin, set this to -1.
- `esp_lcd_panel_dev_config_t::rgb_ele_order` sets the R-G-B element order of each color data.
- `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bit width of the pixel color data. The LCD driver uses this value to calculate the number of bytes to send to the LCD controller chip.
- `esp_lcd_panel_dev_config_t::data_endian` specifies the data endian to be transmitted to the screen. No need to specify for color data within 1 byte, like RGB232. For drivers that do not support specifying data endian, this field would be ignored.

```c
esp_lcd_panel_handle_t panel_handle = NULL;
esp_lcd_panel_dev_config_t panel_config = {
  .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
  .rgb_ele_order = LCD_RGB_ELEMENT_ORDER_BGR,
  .bits_per_pixel = 16,
};
// Create LCD panel handle for ST7789, with the SPI IO device handle
ESP_ERROR_CHECK(esp_lcd_new_panel_st7789(io_handle, &panel_config, &panel_handle));
```
I2C Interfaced LCD

1. Create I2C bus. Please refer to I2C API doc for more details.

```c
i2c_config_t i2c_conf = {
    .mode    = I2C_MODE_MASTER, // I2C LCD is a master node
    .sda_io_num = EXAMPLE_PIN_NUM_SDA,
    .scl_io_num = EXAMPLE_PIN_NUM_SCL,
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .master.clk_speed = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
};
ESP_ERROR_CHECK(i2c_param_config(I2C_HOST, &i2c_conf));
ESP_ERROR_CHECK(i2c_driver_install(I2C_HOST, I2C_MODE_MASTER, 0, 0, 0));
```

2. Allocate an LCD IO device handle from the I2C bus. In this step, you need to provide the following information:
   - `esp_lcd_panel_io_i2c_config_t::dev_addr` sets the I2C device address of the LCD controller chip. The LCD driver uses this address to communicate with the LCD controller chip.
   - `esp_lcd_panel_io_i2c_config_t::lcd_cmd_bits` and `esp_lcd_panel_io_i2c_config_t::lcd_param_bits` set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.

```c
io_handle = NULL;
io_config = {
    .dev_addr = EXAMPLE_I2C_HW_ADDR,
    .control_phase_bytes = 1, // refer to LCD spec
    .dc_bit_offset = 6, // refer to LCD spec
    .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
    .lcd_param_bits = EXAMPLE_LCD_CMD_BITS,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_io_i2c((esp_lcd_i2c_bus_handle_t)I2C_HOST, &io_config, &io_handle));
```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the I2C IO device handle that allocated in the last step, and some panel specific configurations:
   - `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the LCD’s hardware reset GPIO number. If the LCD does not have a hardware reset pin, set this to -1.
   - `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bit width of the pixel color data. The LCD driver uses this value to calculate the number of bytes to send to the LCD controller chip.

```c
panel_handle = NULL;
panel_config = {
    .bits_per_pixel = 1,
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_ssd1306(io_handle, &panel_config, &panel_handle));
```

I80 Interfaced LCD

1. Create I80 bus by `esp_lcd_new_i80_bus()`. You need to set up the following parameters for an Intel 8080 parallel bus:
   - `esp_lcd_i80_bus_config_t::clk_src` sets the clock source of the 8080 bus. Note, the default clock source may be different between ESP targets.
   - `esp_lcd_i80_bus_config_t::wr_gpio_num` sets the GPIO number of the pixel clock (also referred as WR in some LCD spec)
• `esp_lcd_i80_bus_config_t::dc_gpio_num` sets the GPIO number of the data/command select pin (also referred as RS in some LCD spec)
• `esp_lcd_i80_bus_config_t::bus_width` sets the bit width of the data bus (only support 8 or 16)
• `esp_lcd_i80_bus_config_t::data_gpio_nums` is the array of the GPIO number of the data bus. The number of GPIOs should be equal to the `esp_lcd_i80_bus_config_t::bus_width` value.
• `esp_lcd_i80_bus_config_t::max_transfer_bytes` sets the maximum number of bytes that can be transferred in one transaction.

```c
esp_lcd_i80_bus_handle_t i80_bus = NULL;
esp_lcd_i80_bus_config_t bus_config = {
  .clk_src = LCD_CLK_SRC_DEFAULT,
  .dc_gpio_num = EXAMPLE_PIN_NUM_DC,
  .wr_gpio_num = EXAMPLE_PIN_NUM_PCLK,
  .data_gpio_nums = {
    EXAMPLE_PIN_NUM_DATA0,
    EXAMPLE_PIN_NUM_DATA1,
    EXAMPLE_PIN_NUM_DATA2,
    EXAMPLE_PIN_NUM_DATA3,
    EXAMPLE_PIN_NUM_DATA4,
    EXAMPLE_PIN_NUM_DATA5,
    EXAMPLE_PIN_NUM_DATA6,
    EXAMPLE_PIN_NUM_DATA7,
  },
  .bus_width = 8,
  .max_transfer_bytes = EXAMPLE_LCD_H_RES * 100 * sizeof(uint16_t), /
  -- transfer 100 lines of pixels (assume pixel is RGB565) at most in
  -- one transaction
  .psram_trans_align = EXAMPLE_PSRAM_DATA_ALIGNMENT,
  .sram_trans_align = 4,
};
ESP_ERROR_CHECK(esp_lcd_new_i80_bus(&bus_config, &i80_bus));
```

2. Allocate an LCD IO device handle from the I80 bus. In this step, you need to provide the following information:
• `esp_lcd_panel_io_i80_config_t::cs_gpio_num` sets the GPIO number of the chip select pin.
• `esp_lcd_panel_io_i80_config_t::pclk_hz` sets the pixel clock frequency in Hz. Higher pixel clock frequency results in higher refresh rate, but may cause flickering if the DMA bandwidth is not sufficient or the LCD controller chip does not support high pixel clock frequency.
• `esp_lcd_panel_io_i80_config_t::lcd_cmd_bits` and `esp_lcd_panel_io_i80_config_t::lcd_param_bits` set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.
• `esp_lcd_panel_io_i80_config_t::trans_queue_depth` sets the maximum number of transactions that can be queued in the LCD IO device. A bigger value means more transactions can be queued up, but it also consumes more memory.

```c
esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_i80_config_t io_config = {
  .cs_gpio_num = EXAMPLE_PIN_NUM_CS,
  .pclk_hz = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
  .trans_queue_depth = 10,
  .dc_levels = {
    .dc_idle_level = 0,
    .dc_cmd_level = 0,
    .dc_dummy_level = 0,
    .dc_data_level = 1,
  },
  .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
};
```
(continues on next page)
3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the I2C IO device handle that allocated in the last step, and some panel specific configurations:

- **esp_lcd_panel_dev_config_t::bits_per_pixel** sets the bit width of the pixel color data. The LCD driver uses this value to calculate the number of bytes to send to the LCD controller chip.
- **esp_lcd_panel_dev_config_t::reset_gpio_num** sets the GPIO number of the reset pin. If the LCD controller chip does not have a reset pin, you can set this value to -1.
- **esp_lcd_panel_dev_config_t::rgb_ele_order** sets the color order of the pixel color data.

```c
esp_lcd_panel_dev_config_t panel_config = {
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
    .rgb_ele_order = LCD_RGB_ELEMENT_ORDER_RGB,
    .bits_per_pixel = 16,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_st7789(io_handle, &panel_config, &panel_handle));
```

More Controller Based LCD Drivers

More LCD panel drivers and touch drivers are available in ESP-IDF Component Registry. The list of available and planned drivers with links is in this table.

LCD Panel IO Operations

- **esp_lcd_panel_reset()** can reset the LCD panel.
- **esp_lcd_panel_init()** performs a basic initialization of the panel. To perform more manufacture specific initialization, please go to Steps to Add Manufacture Specific Initialization.
- Through combined use of **esp_lcd_panel_swap_xy()** and **esp_lcd_panel_mirror()**, you can rotate the LCD screen.
- **esp_lcd_panel_disp_on_off()** can turn on or off the LCD screen (different from LCD backlight).
- **esp_lcd_panel_draw_bitmap()** is the most significant function, which does the magic to draw the user provided color buffer to the LCD screen, where the draw window is also configurable.

Steps to Add Manufacture Specific Initialization

The LCD controller drivers (e.g., st7789) in esp-idf only provide basic initialization in the **esp_lcd_panel_init()**, leaving the vast majority of settings to the default values. Some LCD modules needs to set a bunch of manufacture specific configurations before it can display normally. These configurations usually include gamma, power voltage and so on. If you want to add manufacture specific initialization, please follow the steps below:

```c
esp_lcd_panel_reset(panel_handle);
esp_lcd_panel_init(panel_handle);
// set extra configurations e.g., gamma control
// with the underlying IO handle
// please consult your manufacture for special commands and corresponding values
esp_lcd_panel_io_tx_param(io_handle, GAMMA_CMD, (uint8_t[]){
    GAMMA_ARRAY
}, N);
```

(continues on next page)
Application Example

Macros

LCD_RGB_ENDIAN_RGB
LCD_RGB_ENDIAN_BGR

Type Definitions

typedef soc_periph_lcd_clk_src_t lcd_clock_source_t
    LCD clock source.

typedef lcd_rgb_element_order_t lcd_color_rgb_endian_t
    for backward compatible

Enumerations

enum lcd_rgb_element_order_t
    RGB color endian.
    Values:

    enumerator LCD_RGB_ELEMENT_ORDER_RGB
        RGB element order: RGB

    enumerator LCD_RGB_ELEMENT_ORDER_BGR
        RGB element order: BGR

enum lcd_rgb_data_endian_t
    RGB data endian.
    Values:

    enumerator LCD_RGB_DATA_ENDIAN_BIG
        RGB data endian: MSB first

// turn on the display
esp_lcd_panel_disp_on_off(panel_handle, true);
enumerator **LCD_RGB_DATA_ENDIAN_LITTLE**
    RGB data endian: LSB first

defined **lcd_color_space_t**
    LCD color space.
    *Values:*
        - enumerator **LCD_COLOR_SPACE_RGB**
            Color space: RGB
        - enumerator **LCD_COLOR_SPACE_YUV**
            Color space: YUV

defined **lcd_color_range_t**
    LCD color range.
    *Values:*
        - enumerator **LCD_COLOR_RANGE_LIMIT**
            Limited color range
        - enumerator **LCD_COLOR_RANGE_FULL**
            Full color range

defined **lcd_yuv_sample_t**
    YUV sampling method.
    *Values:*
        - enumerator **LCD_YUV_SAMPLE_422**
            YUV 4:2:2 sampling
        - enumerator **LCD_YUV_SAMPLE_420**
            YUV 4:2:0 sampling
        - enumerator **LCD_YUV_SAMPLE_411**
            YUV 4:1:1 sampling

defined **lcd_yuv_conv_std_t**
    The standard used for conversion between RGB and YUV.
    *Values:*
        - enumerator **LCD_YUV_CONV_STD_BT601**
            YUV<->RGB conversion standard: BT.601
        - enumerator **LCD_YUV_CONV_STD_BT709**
            YUV<->RGB conversion standard: BT.709

**Header File**

- components/esp_lcd/include/esp_lcd_types.h
Type Definitions

typedef struct esp_lcd_panel_io_t *esp_lcd_panel_io_handle_t
     Type of LCD panel IO handle

typedef struct esp_lcd_panel_t *esp_lcd_panel_handle_t
     Type of LCD panel handle

Header File

Functions

esp_err_t esp_lcd_panel_io_rx_param (esp_lcd_panel_io_handle_t io, int lcd_cmd, void *param, size_t param_size)

Transmit LCD command and receive corresponding parameters.

Note: Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by esp_lcd_panel_io_tx_color() are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

Parameters

- io [in] LCD panel IO handle, which is created by other factory API like esp_lcd_new_panel_io_spi()
- lcd_cmd [in] The specific LCD command, set to -1 if no command needed
- param [out] Buffer for the command data
- param_size [in] Size of param buffer

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_SUPPORTED if read is not supported by transport
- ESP_OK on success

esp_err_t esp_lcd_panel_io_tx_param (esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *param, size_t param_size)

Transmit LCD command and corresponding parameters.

Note: Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by esp_lcd_panel_io_tx_color() are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

Parameters

- io [in] LCD panel IO handle, which is created by other factory API like esp_lcd_new_panel_io_spi()
- lcd_cmd [in] The specific LCD command, set to -1 if no command needed
- param [in] Buffer that holds the command specific parameters, set to NULL if no parameter is needed for the command
- param_size [in] Size of param in memory, in bytes, set to zero if no parameter is needed for the command

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success
**esp_err_t esp_lcd_panel_io_tx_color** *(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *color, size_t color_size)*

Transmit LCD RGB data.

**Note:** This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the **color** buffer. Recycling of color buffer should be done in the callback **on_color_trans_done()**.

**Parameters**
- **io** – [in] LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- **lcd_cmd** – [in] The specific LCD command, set to -1 if no command needed
- **color** – [in] Buffer that holds the RGB color data
- **color_size** – [in] Size of **color** in memory, in bytes

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**esp_err_t esp_lcd_panel_io_del** *(esp_lcd_panel_io_handle_t io)*

Destroy LCD panel IO handle (deinitialize panel and free all corresponding resource)

**Parameters**
- **io** – [in] LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**esp_err_t esp_lcd_panel_io_register_event_callbacks** *(esp_lcd_panel_io_handle_t io, const esp_lcd_panel_io_callbacks_t *cbs, void *user_ctx)*

Register LCD panel IO callbacks.

**Parameters**
- **io** – [in] LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- **cbs** – [in] Structure with all LCD panel IO callbacks
- **user_ctx** – [in] User private data, passed directly to callback’s user_ctx

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**esp_err_t esp_lcd_new_panel_io_spi** *(esp_lcd_spi_bus_handle_t bus, const esp_lcd_panel_io_spi_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)*

Create LCD panel IO handle, for SPI interface.

**Parameters**
- **bus** – [in] SPI bus handle
- **io_config** – [in] IO configuration, for SPI interface
- **ret_io** – [out] Returned IO handle

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**esp_err_t esp_lcd_new_panel_io_i2c_v1** *(uint32_t bus, const esp_lcd_panel_io_i2c_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)*

Create LCD panel IO handle, for I2C interface in legacy implementation.
Chapter 2. API Reference

Note: Please don’t call this function in your project directly. Please call esp_lcd_new_panel_to_i2c instead.

**Parameters**
- **bus** – [in] I2C bus handle, (in uint32_t)
- **io_config** – [in] IO configuration, for I2C interface
- **ret_io** – [out] Returned IO handle

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

```c
esp_err_t esp_lcd_new_panel_io_i2c_v2(i2c_master_bus_handle_t bus, const esp_lcd_panel_io_i2c_config_t *io_config,
                                    esp_lcd_panel_io_handle_t *ret_io)
```

Create LCD panel IO handle, for I2C interface in new implementation.

Note: Please don’t call this function in your project directly. Please call esp_lcd_new_panel_to_i2c instead.

**Parameters**
- **bus** – [in] I2C bus handle, (in i2c_master_dev_handle_t)
- **io_config** – [in] IO configuration, for I2C interface
- **ret_io** – [out] Returned IO handle

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

```c
esp_err_t esp_lcd_new_i80_bus(const esp_lcd_i80_bus_config_t *bus_config,
                              esp_lcd_i80_bus_handle_t *ret_bus)
```

Create Intel 8080 bus handle.

**Parameters**
- **bus_config** – [in] Bus configuration
- **ret_bus** – [out] Returned bus handle

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success
- ESP_ERR_NOT_FOUND if no free bus is available

```c
esp_err_t esp_lcd_del_i80_bus(esp_lcd_i80_bus_handle_t bus)
```

Destroy Intel 8080 bus handle.

**Parameters**
- **bus** – [in] Intel 8080 bus handle, created by esp_lcd_new_i80_bus()

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if there still be some device attached to the bus
- ESP_OK on success

```c
esp_err_t esp_lcd_new_panel_io_i80(esp_lcd_i80_bus_handle_t bus, const esp_lcd_panel_io_i80_config_t *io_config,
                                   esp_lcd_panel_io_i80_handle_t *ret_io)
```

Create LCD panel IO, for Intel 8080 interface.
Parameters

- `bus` - [in] Intel 8080 bus handle, created by `esp_lcd_new_i80_bus()`
- `io_config` - [in] IO configuration, for i80 interface
- `ret_io` - [out] Returned panel IO handle

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_SUPPORTED if some configuration can’t be satisfied, e.g. pixel clock out of the range
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Structures

- `struct esp_lcd_panel_io_event_data_t` Type of LCD panel IO event data.
- `struct esp_lcd_panel_io_callbacks_t` Type of LCD panel IO callbacks.

Public Members

- `esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done` Callback invoked when color data transfer has finished
- `struct esp_lcd_panel_io_spi_config_t` Panel IO configuration structure, for SPI interface.

Public Members

- `int cs_gpio_num` GPIO used for CS line
- `int dc_gpio_num` GPIO used to select the D/C line, set this to -1 if the D/C line is not used
- `int spi_mode` Traditional SPI mode (0~3)
- `unsigned int pclk_hz` Frequency of pixel clock
- `size_t trans_queue_depth` Size of internal transaction queue

- `esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done` Callback invoked when color data transfer has finished

- `void *user_ctx` User private data, passed directly to on_color_trans_done’s user_ctx

```c
int lcd_cmd_bits
    Bit-width of LCD command

int lcd_param_bits
    Bit-width of LCD parameter

unsigned int dc_low_on_data
    If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int octal_mode
    transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

unsigned int quad_mode
    transmit with quad mode (4 data lines), this mode is useful when transmitting LCD parameters (Only use one line for command)

unsigned int sio_mode
    Read and write through a single data line (MOSI)

unsigned int lsb_first
    transmit LSB bit first

unsigned int cs_high_active
    CS line is high active

struct esp_lcd_panel_io_spi_config_t::[anonymous] flags
    Extra flags to fine-tune the SPI device

struct esp_lcd_panel_io_i2c_config_t
    Panel IO configuration structure, for I2C interface.
```

**Public Members**

```c
uint32_t dev_addr
    I2C device address

esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done
    Callback invoked when color data transfer has finished

void *user_ctx
    User private data, passed directly to on_color_trans_done’s user_ctx

size_t control_phase_bytes
    I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes

unsigned int dc_bit_offset
    Offset of the D/C selection bit in control phase
```
int **lcd_cmd_bits**
Bit-width of LCD command

int **lcd_param_bits**
Bit-width of LCD parameter

unsigned int **dc_low_on_data**
If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int **disable_control_phase**
If this flag is enabled, the control phase isn’t used

struct **esp_lcd_panel_io_i2c_config_t::[anonymous]** flags
Extra flags to fine-tune the I2C device

uint32_t **scl_speed_hz**
I2C LCD SCL frequency (hz)

struct **esp_lcd_i80_bus_config_t**
LCD Intel 8080 bus configuration structure.

**Public Members**

int **dc_gpio_num**
GPIO used for D/C line

int **wr_gpio_num**
GPIO used for WR line

**lcd_clock_source_t** **clk_src**
Clock source for the I80 LCD peripheral

int **data_gpio_nums[](24)**
GPiOs used for data lines

size_t **bus_width**
Number of data lines, 8 or 16

size_t **max_transfer_bytes**
Maximum transfer size, this determines the length of internal DMA link

size_t **psram_trans_align**
DMA transfer alignment for data allocated from PSRAM

size_t **sram_trans_align**
DMA transfer alignment for data allocated from SRAM

struct **esp_lcd_panel_io_i80_config_t**
Panel IO configuration structure, for intel 8080 interface.
Public Members

int cs_gpio_num
    GPIO used for CS line, set to -1 will declaim exclusively use of I80 bus

uint32_t pclk_hz
    Frequency of pixel clock

size_t trans_queue_depth
    Transaction queue size, larger queue, higher throughput

esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done
    Callback invoked when color data was transferred done

void *user_ctx
    User private data, passed directly to on_color_trans_done’s user_ctx

int lcd_cmd_bits
    Bit-width of LCD command

int lcd_param_bits
    Bit-width of LCD parameter

unsigned int dc_idle_level
    Level of DC line in IDLE phase

unsigned int dc_cmd_level
    Level of DC line in CMD phase

unsigned int dc_dummy_level
    Level of DC line in DUMMY phase

unsigned int dc_data_level
    Level of DC line in DATA phase

struct esp_lcd_panel_io_i80_config_t::[anonymous] dc_levels
    Each i80 device might have its own D/C control logic

unsigned int cs_active_high
    If set, a high level of CS line will select the device, otherwise, CS line is low level active

unsigned int reverse_color_bits
    Reverse the data bits, D[N:0] -> D[0:N]

unsigned int swap_color_bytes
    Swap adjacent two color bytes

unsigned int pclk_active_neg
    The display will write data lines when there’s a falling edge on WR signal (a.k.a the PCLK)
unsigned int \texttt{pclk\_idle\_low}

The WR signal (a.k.a. the PCLK) stays at low level in IDLE phase

struct \texttt{esp\_lcd\_panel\_io\_i80\_config\_r::[anonymous]} \texttt{flags}

Panel IO config flags

**Macros**

\texttt{esp\_lcd\_new\_panel\_io\_i2c}(bus, io_config, ret_io)

Create LCD panel IO handle.

**Parameters**
- \texttt{bus} \texttt{[in]} I2C bus handle
- \texttt{io\_config} \texttt{[in]} IO configuration, for I2C interface
- \texttt{ret\_io} \texttt{[out]} Returned IO handle

**Returns**
- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

**Type Definitions**

typedef void *\texttt{esp\_lcd\_spi\_bus\_handle\_t}

Type of LCD SPI bus handle

typedef uint32_t \texttt{esp\_lcd\_i2c\_bus\_handle\_t}

Type of LCD I2C bus handle

typedef struct \texttt{esp\_lcd\_i80\_bus\_t} *\texttt{esp\_lcd\_i80\_bus\_handle\_t}

Type of LCD intel 8080 bus handle

typedef bool (*\texttt{esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t})(
    \texttt{esp\_lcd\_panel\_io\_handle\_t} panel_io,
    \texttt{esp\_lcd\_panel\_io\_event\_data\_t} *edata,
    void *user\_ctx)

Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

- \texttt{panel\_io} \texttt{[in]} LCD panel IO handle, which is created by factory API like \texttt{esp\_lcd\_new\_panel\_io\_spi()}
- \texttt{edata} \texttt{[in]} Panel IO event data, fed by driver
- \texttt{user\_ctx} \texttt{[in]} User data, passed from \texttt{esp\_lcd\_panel\_io\_xxx\_config\_t}

**Return** Whether a high priority task has been waken up by this function

**Header File**

- components/esp_lcd/include/esp_lcd_panel_ops.h

**Functions**

\texttt{esp\_err\_t \texttt{esp\_lcd\_panel\_reset}}(\texttt{esp\_lcd\_panel\_handle\_t} panel)

Reset LCD panel.

**Note:** Panel reset must be called before attempting to initialize the panel using \texttt{esp\_lcd\_panel\_init()}.
Chapter 2. API Reference

Returns

- ESP_OK on success

**esp_err_t esp_lcd_panel_init**(esp_lcd_panel_handle_t panel)
Initialize LCD panel.

**Note:** Before calling this function, make sure the LCD panel has finished the reset stage by `esp_lcd_panel_reset()`.

**Parameters**

- panel - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

Returns

- ESP_OK on success

**esp_err_t esp_lcd_panel_del**(esp_lcd_panel_handle_t panel)
Deinitialize the LCD panel.

**Parameters**

- panel - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

Returns

- ESP_OK on success

**esp_err_t esp_lcd_panel_draw_bitmap**(esp_lcd_panel_handle_t panel, int x_start, int y_start, int x_end, int y_end, const void *color_data)
Draw bitmap on LCD panel.

**Parameters**

- panel - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- x_start - [in] Start index on x-axis (x_start included)
- y_start - [in] Start index on y-axis (y_start included)
- x_end - [in] End index on x-axis (x_end not included)
- y_end - [in] End index on y-axis (y_end not included)
- color_data - [in] RGB color data that will be dumped to the specific window range

Returns

- ESP_OK on success

**esp_err_t esp_lcd_panel_mirror**(esp_lcd_panel_handle_t panel, bool mirror_x, bool mirror_y)
Mirror the LCD panel on specific axis.

**Note:** Combined with `esp_lcd_panel_swap_xy()`, one can realize screen rotation

**Parameters**

- panel - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- mirror_x - [in] Whether the panel will be mirrored about the x axis
- mirror_y - [in] Whether the panel will be mirrored about the y axis

Returns

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

**esp_err_t esp_lcd_panel_swap_xy**(esp_lcd_panel_handle_t panel, bool swap_axes)
Swap/Exchange x and y axis.

**Note:** Combined with `esp_lcd_panel_mirror()`, one can realize screen rotation
Parameters

- **panel** – [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **swap_axes** – [in] Whether to swap the x and y axis

Returns

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

```c
esp_err_t esp_lcd_panel_set_gap(esp_lcd_panel_handle_t panel, int x_gap, int y_gap)
```

Set extra gap in x and y axis.

The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively of the actual contents displayed.

**Note:** Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.

Parameters

- **panel** – [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x_gap** – [in] Extra gap on x axis, in pixels
- **y_gap** – [in] Extra gap on y axis, in pixels

Returns

- ESP_OK on success

```c
esp_err_t esp_lcd_panel_invert_color(esp_lcd_panel_handle_t panel, bool invert_color_data)
```

Invert the color (bit-wise invert the color data line)

Parameters

- **panel** – [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **invert_color_data** – [in] Whether to invert the color data

Returns

- ESP_OK on success

```c
esp_err_t esp_lcd_panel_disp_on_off(esp_lcd_panel_handle_t panel, bool on_off)
```

Turn on or off the display.

Parameters

- **panel** – [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **on_off** – [in] True to turns on display, False to turns off display

Returns

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

```c
esp_err_t esp_lcd_panel_disp_off(esp_lcd_panel_handle_t panel, bool off)
```

Turn off the display.

Parameters

- **panel** – [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **off** – [in] Whether to turn off the screen

Returns

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

**Header File**

- components/esp_lcd/include/esp_lcd_panel_rgb.h
# Chapter 2. API Reference

## Header File

- components/esp_lcd/include/esp_lcd_panel_vendor.h

## Functions

### esp_err_t esp_lcd_new_panel_st7789

```c
codef esp_err_t esp_lcd_new_panel_st7789(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model ST7789.

**Parameters**
- `io` [in] LCD panel IO handle
- `panel_dev_config` [in] general panel device configuration
- `ret_panel` [out] Returned LCD panel handle

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

### esp_err_t esp_lcd_new_panel_nt35510

```c
codef esp_err_t esp_lcd_new_panel_nt35510(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model NT35510.

**Parameters**
- `io` [in] LCD panel IO handle
- `panel_dev_config` [in] general panel device configuration
- `ret_panel` [out] Returned LCD panel handle

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

### esp_err_t esp_lcd_new_panel_ssd1306

```c
codef esp_err_t esp_lcd_new_panel_ssd1306(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model SSD1306.

**Parameters**
- `io` [in] LCD panel IO handle
- `panel_dev_config` [in] general panel device configuration
- `ret_panel` [out] Returned LCD panel handle

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

## Structures

**struct esp_lcd_panel_dev_config_t**

Configuration structure for panel device.

## Public Members

**int reset_gpio_num**

GPIO used to reset the LCD panel, set to -1 if it’s not used
Chapter 2. API Reference

```
lcd_rgb_element_order_t color_space

Deprecated:
Set RGB color space, please use rgb_ele_order instead

lcd_rgb_element_order_t rgb_endian

Deprecated:
Set RGB data endian, please use rgb_ele_order instead

lcd_rgb_element_order_t rgb_ele_order

Set RGB element order, RGB or BGR

lcd_rgb_data_endian_t data_endian

Set the data endian for color data larger than 1 byte

unsigned int bits_per_pixel

Color depth, in bpp

unsigned int reset_active_high

Setting this if the panel reset is high level active

struct esp_lcd_panel_dev_config_t::[anonymous] flags

LCD panel config flags

void *vendor_config

vendor specific configuration, optional, left as NULL if not used
```

2.6.11 LED Control (LEDC)

### Introduction

The LED control (LEDC) peripheral is primarily designed to control the intensity of LEDs, although it can also be used to generate PWM signals for other purposes. It has 8 channels which can generate independent waveforms that can be used, for example, to drive RGB LED devices.

LEDC channels are divided into two groups of 8 channels each. One group of LEDC channels operates in high speed mode. This mode is implemented in hardware and offers automatic and glitch-free changing of the PWM duty cycle. The other group of channels operate in low speed mode, the PWM duty cycle must be changed by the driver in software. Each group of channels is also able to use different clock sources.

The PWM controller can automatically increase or decrease the duty cycle gradually, allowing for fades without any processor interference.

### Functionality Overview

Setting up a channel of the LEDC in either high or low speed mode is done in three steps:

1. **Timer Configuration** by specifying the PWM signal’s frequency and duty cycle resolution.
2. **Channel Configuration** by associating it with the timer and GPIO to output the PWM signal.
3. **Change PWM Signal** that drives the output in order to change LED’s intensity. This can be done under the full control of software or with hardware fading functions.

As an optional step, it is also possible to set up an interrupt on fade end.

![Fig. 12: Key Settings of LED PWM Controller’s API](image)

**Note:** For an initial setup, it is recommended to configure for the timers first (by calling `ledc_timer_config()`), and then for the channels (by calling `ledc_channel_config()`). This ensures the PWM frequency is at the desired value since the appearance of the PWM signal from the IO pad.

**Timer Configuration** Setting the timer is done by calling the function `ledc_timer_config()` and passing the data structure `ledc_timer_config_t` that contains the following configuration settings:

- Speed mode `ledc_mode_t`
- Timer number `ledc_timer_t`
- PWM signal frequency in Hz
- Resolution of PWM duty
- Source clock `ledc_clk_cfg_t`

The frequency and the duty resolution are interdependent. The higher the PWM frequency, the lower the duty resolution which is available, and vice versa. This relationship might be important if you are planning to use this API for purposes other than changing the intensity of LEDs. For more details, see Section **Supported Range of Frequency and Duty Resolutions**.

The source clock can also limit the PWM frequency. The higher the source clock frequency, the higher the maximum PWM frequency can be configured.

### Table 5: Characteristics of ESP32 LEDC source clocks

<table>
<thead>
<tr>
<th>Clock name</th>
<th>Clock freq</th>
<th>Speed mode</th>
<th>Clock capabilities</th>
</tr>
</thead>
<tbody>
<tr>
<td>APB_CLK</td>
<td>80 MHz</td>
<td>High / Low</td>
<td>/</td>
</tr>
<tr>
<td>REF_TICK</td>
<td>1 MHz</td>
<td>High / Low</td>
<td>Dynamic Frequency Scaling compatible</td>
</tr>
<tr>
<td>RC_FAST_CLK</td>
<td>~8 MHz</td>
<td>Low</td>
<td>Dynamic Frequency Scaling compatible, Light sleep compatible</td>
</tr>
</tbody>
</table>
Note:

1. On ESP32, if RC_FAST_CLK is chosen as the LEDC clock source, an internal calibration will be performed to get the exact frequency of the clock. This ensures the accuracy of output PWM signal frequency.

When a timer is no longer needed by any channel, it can be deconfigured by calling the same function `ledc_timer_config()`. The configuration structure `ledc_timer_config_t` passes in should be:

- `ledc_timer_config_t::speed_mode` The speed mode of the timer which wants to be deconfigured (belong to `ledc_mode_t`)
- `ledc_timer_config_t::timer_num` The ID of the timers which wants to be deconfigured (`ledc_timer_t`)
- `ledc_timer_config_t::deconfigure` Set this to true so that the timer specified can be deconfigured

**Channel Configuration** When the timer is set up, configure the desired channel (one out of `ledc_channel_t`). This is done by calling the function `ledc_channel_config()`.

Similar to the timer configuration, the channel setup function should be passed a structure `ledc_channel_config_t` that contains the channel’s configuration parameters.

At this point, the channel should start operating and generating the PWM signal on the selected GPIO, as configured in `ledc_channel_config_t`, with the frequency specified in the timer settings and the given duty cycle. The channel operation (signal generation) can be suspended at any time by calling the function `ledc_stop()`.

**Change PWM Signal** Once the channel starts operating and generating the PWM signal with the constant duty cycle and frequency, there are a couple of ways to change this signal. When driving LEDs, primarily the duty cycle is changed to vary the light intensity.

The following two sections describe how to change the duty cycle using software and hardware fading. If required, the signal’s frequency can also be changed; it is covered in Section **Change PWM Frequency**.

**Change PWM Duty Cycle Using Software** To set the duty cycle, use the dedicated function `ledc_set_duty()`. After that, call `ledc_update_duty()` to activate the changes. To check the currently set value, use the corresponding _get_ function `ledc_get_duty()`.

Another way to set the duty cycle, as well as some other channel parameters, is by calling `ledc_channel_config()` covered in Section **Channel Configuration**.

The range of the duty cycle values passed to functions depends on selected `duty_resolution` and should be from 0 to \((2^{**\text{duty_resolution}})\). For example, if the selected duty resolution is 10, then the duty cycle values can range from 0 to 1024. This provides the resolution of \(\sim 0.1\%\).

**Warning:** On ESP32, when channel’s binded timer selects its maximum duty resolution, the duty cycle value cannot be set to \((2^{**\text{duty_resolution}})\). Otherwise, the internal duty counter in the hardware will overflow and be messed up.

**Change PWM Duty Cycle Using Hardware** The LEDC hardware provides the means to gradually transition from one duty cycle value to another. To use this functionality, enable fading with `ledc_fade_func_install()` and then configure it by calling one of the available fading functions:

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

Start fading with `ledc_fade_start()`. A fade can be operated in blocking or non-blocking mode, please check `ledc_fade_mode_t` for the difference between the two available fade modes. Note that with either fade mode,
the next fade or fixed-duty update will not take effect until the last fade finishes. Due to hardware limitations, there is no way to stop a fade before it reaches its target duty.

To get a notification about the completion of a fade operation, a fade end callback function can be registered for each channel by calling `ledc_cb_register()` after the fade service being installed. The fade end callback prototype is defined in `ledc_cb_t`, where you should return a boolean value from the callback function, indicating whether a high priority task is woken up by this callback function. It is worth mentioning, the callback and the function invoked by itself should be placed in IRAM, as the interrupt service routine is in IRAM. `ledc_cb_register()` will print a warning message if it finds the addresses of callback and user context are incorrect.

If not required anymore, fading and an associated interrupt can be disabled with `ledc_fade_func_uninstall()`.

**Change PWM Frequency** The LEDC API provides several ways to change the PWM frequency “on the fly”:

- Set the frequency by calling `ledc_set_freq()`. There is a corresponding function `ledc_get_freq()` to check the current frequency.
- Change the frequency and the duty resolution by calling `ledc_bind_channel_timer()` to bind some other timer to the channel.
- Change the channel’s timer by calling `ledc_channel_config()`.

**More Control Over PWM** There are several lower level timer-specific functions that can be used to change PWM settings:

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

The first two functions are called “behind the scenes” by `ledc_channel_config()` to provide a startup of a timer after it is configured.

**Use Interrupts** When configuring an LEDC channel, one of the parameters selected within `ledc_channel_config_t` is `ledc_intr_type_t` which triggers an interrupt on fade completion.

For registration of a handler to address this interrupt, call `ledc_isr_register()`.

**LEDC High and Low Speed Mode**

High speed mode enables a glitch-free changeover of timer settings. This means that if the timer settings are modified, the changes will be applied automatically on the next overflow interrupt of the timer. In contrast, when updating the low-speed timer, the change of settings should be explicitly triggered by software. The LEDC driver handles it in the background, e.g., when `ledc_timer_config()` or `ledc_timer_set()` is called.

For additional details regarding speed modes, see [ESP32 Technical Reference Manual > LED PWM Controller (LEDC)](PDF).

**Supported Range of Frequency and Duty Resolutions**

The LED PWM Controller is designed primarily to drive LEDs. It provides a large flexibility of PWM duty cycle settings. For instance, the PWM frequency of 5 kHz can have the maximum duty resolution of 13 bits. This means that the duty can be set anywhere from 0 to 100% with a resolution of ~0.012% (2 ** 13 = 8192 discrete levels of the LED intensity). Note, however, that these parameters depend on the clock signal clocking the LED PWM Controller timer which in turn clocks the channel (see timer configuration and the [ESP32 Technical Reference Manual > LED PWM Controller (LEDC)](PDF)).

The LEDC can be used for generating signals at much higher frequencies that are sufficient enough to clock other devices, e.g., a digital camera module. In this case, the maximum available frequency is 40 MHz with duty resolution of 1 bit. This means that the duty cycle is fixed at 50% and cannot be adjusted.
The LEDC API is designed to report an error when trying to set a frequency and a duty resolution that exceed the range of LEDC’s hardware. For example, an attempt to set the frequency to 20 MHz and the duty resolution to 3 bits results in the following error reported on a serial monitor:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try reducing freq_hz or duty_resolution. div_param=128
```

In such a situation, either the duty resolution or the frequency must be reduced. For example, setting the duty resolution to 2 resolves this issue and makes it possible to set the duty cycle at 25% steps, i.e., at 25%, 50% or 75%.

The LEDC driver also captures and reports attempts to configure frequency/duty resolution combinations that are below the supported minimum, e.g.:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try increasing freq_hz or duty_resolution. div_param=128000000
```

The duty resolution is normally set using `ledc_timer_bit_t`. This enumeration covers the range from 10 to 15 bits. If a smaller duty resolution is required (from 10 down to 1), enter the equivalent numeric values directly.

### Application Example

The LEDC basic example: `peripherals/ledc/ledc_basic`.

The LEDC change duty cycle and fading control example: `peripherals/ledc/ledc_fade`.

### API Reference

#### Header File

- `components/driver/ledc/include/driver/ledc.h`

#### Functions

- `esp_err_t ledc_channel_config(const ledc_channel_config_t *ledc_conf)`
  
  LEDC channel configuration Configure LEDC channel with the given channel/output gpio_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.

  **Parameters**

  - `ledc_conf` - Pointer of LEDC channel configure struct

  **Returns**

  - `ESP_OK` Success
  - `ESP_ERR_INVALID_ARG` Parameter error

- `esp_err_t ledc_timer_config(const ledc_timer_config_t *timer_conf)`
  
  LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty_resolution.

  **Parameters**

  - `timer_conf` - Pointer of LEDC timer configure struct

  **Returns**

  - `ESP_OK` Success
  - `ESP_ERR_INVALID_ARG` Parameter error
  - `ESP_FAIL` Cannot find a proper pre-divider number base on the given frequency and the current duty_resolution.
  - `ESP_ERR_INVALID_STATE` Timer cannot be de-configured because timer is not configured or is not paused

- `esp_err_t ledc_update_duty(ledc_mode_t speed_mode, ledc_channel_t channel)`

  LEDC update channel parameters.

#### Note:

Call this function to activate the LEDC updated parameters. After `ledc_set_duty`, we need to call this function to update the settings. And the new LEDC parameters don’t take effect until the next PWM cycle.
Note: ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update.

Note: If CONFIG_LEDC_CTRL_FUNC_IN_IRAM is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Cache is disabled.

Note: This function is allowed to run within ISR context.

### Parameters
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

### Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t ledc_set_duty(int gpio_num, int duty, int speed_mode, int channel)
```

Set LEDC output duty.

Note: This function only routes the LEDC signal to GPIO through matrix, other LEDC resources initialization are not involved. Please use ledc_channel_config() instead to fully configure a LEDC channel.

### Parameters
- **gpio_num** - The LEDC output gpio
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

### Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t ledc_set_pin(int gpio_num, int speed_mode, int channel)
```

Set LEDC output gpio.

Note: This function only routes the LEDC signal to GPIO through matrix, other LEDC resources initialization are not involved. Please use ledc_channel_config() instead to fully configure a LEDC channel.

### Parameters
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **idle_level** - Set output idle level after LEDC stops.

### Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t ledc_stop(int speed_mode, int channel, uint32_t idle_level)
```

LEDC stop. Disable LEDC output, and set idle level.

Note: If CONFIG_LEDC_CTRL_FUNC_IN_IRAM is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Cache is disabled.

Note: This function is allowed to run within ISR context.
Chapter 2. API Reference

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t ledc_set_freq (ledc_mode_t speed_mode, ledc_timer_t timer_num, uint32_t freq_hz)
```
LEDC set channel frequency (Hz)

Parameters
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_num** - LEDC timer index (0-3), select from ledc_timer_t
- **freq_hz** - Set the LEDC frequency

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

```c
uint32_t ledc_get_freq (ledc_mode_t speed_mode, ledc_timer_t timer_num)
```
LEDC get channel frequency (Hz)

Parameters
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_num** - LEDC timer index (0-3), select from ledc_timer_t

Returns
- 0 error
- Others Current LEDC frequency

```c
esp_err_t ledc_set_duty_with_hpoint (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)
```
LEDC set duty and hpoint value Only after calling ledc_update_duty will the duty update.

Note: ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update

```c
int ledc_get_hpoint (ledc_mode_t speed_mode, ledc_channel_t channel)
```
LEDC get hpoint value, the counter value when the output is set high level.

Parameters
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
**ledc_set_duty** (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty)

LED set duty. This function does not change the hpoint value of this channel. If needed, please call `ledc_set_duty_with_hpoint`. Only after calling `ledc_update_duty` will the duty update.

**Parameters**
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **duty** - Set the LEDC duty, the range of duty setting is \([0, (2^{duty\_resolution})]\)

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**ledc_get_duty** (ledc_mode_t speed_mode, ledc_channel_t channel)

LED get duty. This function returns the duty at the present PWM cycle. You shouldn’t expect the function to return the new duty in the same cycle of calling `ledc_update_duty`, because duty update doesn’t take effect until the next cycle.

**Parameters**
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`

**Returns**
- LEDC_ERR_DUTY if parameter error
- Others Current LEDC duty

**ledc_set_fade** (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, ledc_duty_direction_t fade_direction, uint32_t step_num, uint32_t duty_cycle_num, uint32_t duty_scale)

LED set gradient. Set LEDC gradient. After the function calls the `ledc_update_duty` function, the function can take effect.

**Parameters**
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• **channel** – LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
• **duty** – Set the start of the gradient duty, the range of duty setting is \([0, (2**duty_resolution)]\)
• **fade_direction** – Set the direction of the gradient
• **step_num** – Set the number of the gradient
• **duty_cycle_num** – Set how many LEDC tick each time the gradient lasts
• **duty_scale** – Set gradient change amplitude

**Returns**
• **ESP_OK** Success
• **ESP_ERR_INVALID_ARG** Parameter error

`esp_err_t ledc_isr_register (void (*fn)(void*), void* arg, int intr_alloc_flags, ledc_isr_handle_t *handle)`

Register LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

**Parameters**
• **fn** – Interrupt handler function.
• **arg** – User-supplied argument passed to the handler function.
• **intr_alloc_flags** – Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
• **handle** – Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Returns**
• **ESP_OK** Success
• **ESP_ERR_INVALID_ARG** Parameter error
• **ESP_ERR_NOT_FOUND** Failed to find available interrupt source

`esp_err_t ledc_timer_set (ledc_mode_t speed_mode, ledc_timer_t timer_sel, uint32_t clock_divider, uint32_t duty_resolution, ledc_clk_src_t clk_src)`

Configure LEDC settings.

**Parameters**
• **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• **timer_sel** – Timer index (0-3), there are 4 timers in LEDC module
• **clock_divider** – Timer clock divide value, the timer clock is divided from the selected clock source
• **duty_resolution** – Resolution of duty setting in number of bits. The range is \([1, SOC_LEDC_TIMER_BIT_WIDTH]\)
• **clk_src** – Select LEDC source clock.

**Returns**
• **(-1)** Parameter error
• **Other Current LEDC duty

`esp_err_t ledc_timer_rst (ledc_mode_t speed_mode, ledc_timer_t timer_sel)`

Reset LEDC timer.

**Parameters**
• **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• **timer_sel** – LEDC timer index (0-3), select from `ledc_timer_t`

**Returns**
• **ESP_ERR_INVALID_ARG** Parameter error
• **ESP_OK** Success

`esp_err_t ledc_timer_pause (ledc_mode_t speed_mode, ledc_timer_t timer_sel)`

Pause LEDC timer counter.

**Parameters**
**Chapter 2. API Reference**

- **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.

- **timer_sel** – LEDC timer index (0-3), select from `ledc_timer_t`

**Returns**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

`esp_err_t ledc_timer_resume(ledc_mode_t speed_mode, ledc_timer_t timer_sel)`

Resume LEDC timer.

**Parameters**

- **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.

- **timer_sel** – LEDC timer index (0-3), select from `ledc_timer_t`

**Returns**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

`esp_err_t ledc_bind_channel_timer(ledc_mode_t speed_mode, ledc_channel_t channel, ledc_timer_t timer_sel)`

Bind LEDC channel with the selected timer.

**Parameters**

- **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.

- **channel** – LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`

- **timer_sel** – LEDC timer index (0-3), select from `ledc_timer_t`

**Returns**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

`esp_err_t ledc_set_fade_with_step(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num)`

Set LEDC fade function.

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

**Note:** Call `ledc_fade_func_install()`, `ledc_fade_with_step`, `ledc_fade_with_time`, and `ledc_fade_start` are not thread-safe. Do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`.

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**

- **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.

- **channel** – LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`

- **target_duty** – Target duty of fading [0, (2**duty_resolution)]

- **scale** – Controls the increase or decrease step scale.

- **cycle_num** – increase or decrease the duty every `cycle_num` cycles

**Returns**
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_INVALID_STATE Channel not initialized
• ESP_FAIL Fade function init error

```c
esp_err_t ledc_set_fade_with_time(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, int max_fade_time_ms)
```

Set LEDC fade function, with a limited time.

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

**Note:** `ledc_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`.

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**

- **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** – LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **target_duty** – Target duty of fading [0, (2**duty_resolution)]
- **max_fade_time_ms** – The maximum time of the fading (ms).

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

```c
esp_err_t ledc_fade_func_install (int intr_alloc_flags)
```

Install LEDC fade function. This function will occupy interrupt of LEDC module.

**Parameters**

- **intr_alloc_flags** – Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Intr flag error
- ESP_ERR_NOT_FOUND Failed to find available interrupt source
- ESP_ERR_INVALID_STATE Fade function already installed

```c
void ledc_fade_func_uninstall (void)
```

Uninstall LEDC fade function.

```c
esp_err_t ledc_fade_start (ledc_mode_t speed_mode, ledc_channel_t channel, ledc_fade_mode_t fade_mode)
```

Start LEDC fading.

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call this API right after `ledc_set_fade_with_time` or `ledc_set_fade_with_step` before to start fading.
Note: Starting fade operation with this API is not thread-safe, use with care.

Note: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

### Parameters
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel number
- **fade_mode** - Whether to block until fading done. See `ledc_types.h` `ledc_fade_mode_t` for more info. Note that this function will not return until fading to the target duty if `LEDC_FADE_WAIT_DONE` mode is selected.

### Returns
- ESP_OK Success
- ESP_ERR_INVALID_STATE Channel not initialized or fade function not installed.
- ESP_ERR_INVALID_ARG Parameter error.

```c
esp_err_t ledc_set_duty_and_update(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)
```

A thread-safe API to set duty for LEDC channel and return when duty updated.

Note: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

### Parameters
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **duty** - Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution)]
- **hpoint** - Set the LEDC hpoint value, the range is [0, (2**duty_resolution)-1]

### Returns
- ESP_OK Success
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Fade function init error

```c
esp_err_t ledc_set_fade_time_and_start(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t max_fade_time_ms, ledc_fade_mode_t fade_mode)
```

A thread-safe API to set and start LEDC fade function, with a limited time.

Note: Call `ledc_fade_func_install()` once, before calling this function.

Note: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

### Parameters
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
Chapter 2. API Reference

- **channel** – LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **target_duty** – Target duty of fading [0, (2**duty_resolution)]
- **maxFadeTime_ms** – The maximum time of the fading (ms).
- **fade_mode** – Choose blocking or non-blocking mode

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

```c
esp_err_t ledc_set_fade_step_and_start(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num, ledc_fade_mode_t fade_mode)
```

A thread-safe API to set and start LEDC fade function.

**Note:** Call `ledc_fade_func_install()` once before calling this function.

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**
- **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** – LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **target_duty** – Target duty of fading [0, (2**duty_resolution)]
- **scale** – Controls the increase or decrease step scale.
- **cycle_num** – Increase or decrease the duty every cycle_num cycles
- **fade_mode** – Choose blocking or non-blocking mode

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

```c
esp_err_t ledc_cb_register(ledc_mode_t speed_mode, ledc_channel_t channel, ledc_cbs_t *cbs, void *user_arg)
```

LEDC callback registration function.

**Note:** The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.

**Parameters**
- **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** – LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **cbs** – Group of LEDC callback functions
- **user_arg** – User registered data for the callback function

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_INVALID_STATE Channel not initialized
• ESP_FAIL Fade function init error

Structures

struct **ledc_channel_config_t**
Configuration parameters of LEDC channel for ledc_channel_config function.

**Public Members**

int **gpio_num**
the LEDC output gpio_num, if you want to use gpio16, gpio_num = 16

**ledc_mode_t** **speed_mode**
LEDC speed speed_mode, high-speed mode (only exists on esp32) or low-speed mode

**ledc_channel_t** **channel**
LEDC channel (0 - LEDC_CHANNEL_MAX-1)

**ledc_intr_type_t** **intr_type**
configure interrupt, Fade interrupt enable or Fade interrupt disable

**ledc_timer_t** **timer_sel**
Select the timer source of channel (0 - LEDC_TIMER_MAX-1)

uint32_t **duty**
LEDC channel duty, the range of duty setting is [0, (2**duty_resolution))]

int **hpoint**
LEDC channel hpoint value, the range is [0, (2**duty_resolution)-1]

unsigned int **output_invert**
Enable (1) or disable (0) gpio output invert

struct **ledc_channel_config_t::[anonymous]** **flags**
LEDC flags

struct **ledc_timer_config_t**
Configuration parameters of LEDC timer for ledc_timer_config function.

**Public Members**

**ledc_mode_t** **speed_mode**
LEDC speed speed_mode, high-speed mode (only exists on esp32) or low-speed mode

**ledc_timer_bit_t** **duty_resolution**
LEDC channel duty resolution
**ledc_timer_t** timer_num

The timer source of channel (0 - LEDC_TIMER_MAX-1)

uint32_t **freq_hz**

LEDC timer frequency (Hz)

**ledc_clk_cfg_t** clk_cfg

Configure LEDC source clock from ledc_clk_cfg_t. Note that LEDC_USE_RC_FAST_CLK and LEDC_USE_XTAL_CLK are non-timer-specific clock sources. You can not have one LEDC timer uses RC_FAST_CLK as the clock source and have another LEDC timer uses XTAL_CLK as its clock source. All chips except esp32 and esp32s2 do not have timer-specific clock sources, which means clock source for all timers must be the same one.

bool **deconfigure**

Set this field to de-configure a LEDC timer which has been configured before. Note that it will not check whether the timer wants to be de-configure is binded to any channel. Also, the timer has to be paused first before it can be de-configure. When this field is set, duty_resolution, freq_hz, clk_cfg fields are ignored.

**struct ledc_cb_param_t**

LEDC callback parameter.

**Public Members**

**ledc_cb_event_t** event

Event name

uint32_t **speed_mode**

Speed mode of the LEDC channel group

uint32_t **channel**

LEDC channel (0 - LEDC_CHANNEL_MAX-1)

uint32_t **duty**

LEDC current duty of the channel, the range of duty is [0, (2**duty_resolution)]

**struct ledc_cbs_t**

Group of supported LEDC callbacks.

**Note:** The callbacks are all running under ISR environment

**Public Members**

**ledc_cb_t** fade_cb

LEDC fade_end callback function
Macros

**LEDC_APB_CLK_HZ**
Frequency of one of the LEDC peripheral clock sources, APB_CLK.

*Note:* This macro should have no use in your application, we keep it here only for backward compatible.

**LEDC_REF_CLK_HZ**
Frequency of one of the LEDC peripheral clock sources, REF_TICK.

*Note:* This macro should have no use in your application, we keep it here only for backward compatible.

**LEDC_ERR_DUTY**

**LEDC_ERR_VAL**

Type Definitions

```c
typedef int ledc_isr_handle_t

typedef bool (*ledc_cb_t)(const ledc_cb_param_t *param, void *user_arg)
```

Type of LEDC event callback.

- **Param param** LEDC callback parameter
- **Param user_arg** User registered data
- **Return** Whether a high priority task has been waken up by this function

Enumerations

```c
enum ledc_cb_event_t
```

LEDC callback event type.

**Values:**

```c
enumerator LEDC_FADE_END_EVT
```

LEDC fade end event

Header File

- components/hal/include/hal/ledc_types.h

Type Definitions

```c
typedef soc_periph_ledc_clk_src_legacy_t ledc_clk_cfg_t
```

LEDC clock source configuration struct.

In theory, the following enumeration shall be placed in LEDC driver’s header. However, as the next enumeration, `ledc_clk_src_t`, makes the use of some of these values and to avoid mutual inclusion of the headers, we must define it here.
Enumerations

`enum ledc_mode_t`

Values:

- Enumerator `LEDC_HIGH_SPEED_MODE`
  LEDC high speed speed_mode

- Enumerator `LEDC_LOW_SPEED_MODE`
  LEDC low speed speed_mode

- Enumerator `LEDC_SPEED_MODE_MAX`
  LEDC speed limit

`enum ledc_intr_type_t`

Values:

- Enumerator `LEDC_INTR_DISABLE`
  Disable LEDC interrupt

- Enumerator `LEDC_INTR_FADE_END`
  Enable LEDC interrupt

- Enumerator `LEDC_INTR_MAX`

`enum ledc_duty_direction_t`

Values:

- Enumerator `LEDC_DUTY_DIR_DECREASE`
  LEDC duty decrease direction

- Enumerator `LEDC_DUTY_DIR_INCREASE`
  LEDC duty increase direction

- Enumerator `LEDC_DUTY_DIR_MAX`

`enum ledc_slow_clk_sel_t`

LEDC global clock sources.

Values:

- Enumerator `LEDC_SLOW_CLK_RC_FAST`
  LEDC low speed timer clock source is RC_FAST clock

- Enumerator `LEDC_SLOW_CLK_APB`
  LEDC low speed timer clock source is 80MHz APB clock

- Enumerator `LEDC_SLOW_CLK_RTC8M`
  Alias of ‘LEDC_SLOW_CLK_RC_FAST’
enum ledc_clk_src_t

LEDC timer-specific clock sources.

Note: Setting numeric values to match ledc_clk_cfg_t values are a hack to avoid collision with
LEDC_AUTO_CLK in the driver, as these enums have very similar names and user may pass one of these by
mistake.

Values:

enumerator LEDC_REF_TICK
LEDC timer clock divided from reference tick (1Mhz)

enumerator LEDC_APB_CLK
LEDC timer clock divided from APB clock (80Mhz)

enumerator LEDC_SCLK
Selecting this value for LEDC_TICK_SEL_TIMER let the hardware take its source clock from
LEDC_APB_CLK_SEL

enum ledc_timer_t

Values:

enumerator LEDC_TIMER_0
LEDC timer 0

enumerator LEDC_TIMER_1
LEDC timer 1

enumerator LEDC_TIMER_2
LEDC timer 2

enumerator LEDC_TIMER_3
LEDC timer 3

enumerator LEDC_TIMER_MAX

enum ledc_channel_t

Values:

enumerator LEDC_CHANNEL_0
LEDC channel 0

enumerator LEDC_CHANNEL_1
LEDC channel 1

enumerator LEDC_CHANNEL_2
LEDC channel 2

enumerator LEDC_CHANNEL_3
LEDC channel 3
enumerator LEDC_CHANNEL_4
    LEDC channel 4

enumerator LEDC_CHANNEL_5
    LEDC channel 5

enumerator LEDC_CHANNEL_6
    LEDC channel 6

enumerator LEDC_CHANNEL_7
    LEDC channel 7

enumerator LEDC_CHANNEL_MAX

enum ledc_timer_bit_t
Values:

enumerator LEDC_TIMER_1_BIT
    LEDC PWM duty resolution of 1 bits

enumerator LEDC_TIMER_2_BIT
    LEDC PWM duty resolution of 2 bits

enumerator LEDC_TIMER_3_BIT
    LEDC PWM duty resolution of 3 bits

enumerator LEDC_TIMER_4_BIT
    LEDC PWM duty resolution of 4 bits

enumerator LEDC_TIMER_5_BIT
    LEDC PWM duty resolution of 5 bits

enumerator LEDC_TIMER_6_BIT
    LEDC PWM duty resolution of 6 bits

enumerator LEDC_TIMER_7_BIT
    LEDC PWM duty resolution of 7 bits

enumerator LEDC_TIMER_8_BIT
    LEDC PWM duty resolution of 8 bits

enumerator LEDC_TIMER_9_BIT
    LEDC PWM duty resolution of 9 bits

enumerator LEDC_TIMER_10_BIT
    LEDC PWM duty resolution of 10 bits

enumerator LEDC_TIMER_11_BIT
    LEDC PWM duty resolution of 11 bits
enumerator LEDC_TIMER_12_BIT
LEDC PWM duty resolution of 12 bits

enumerator LEDC_TIMER_13_BIT
LEDC PWM duty resolution of 13 bits

enumerator LEDC_TIMER_14_BIT
LEDC PWM duty resolution of 14 bits

enumerator LEDC_TIMER_15_BIT
LEDC PWM duty resolution of 15 bits

enumerator LEDC_TIMER_16_BIT
LEDC PWM duty resolution of 16 bits

enumerator LEDC_TIMER_17_BIT
LEDC PWM duty resolution of 17 bits

enumerator LEDC_TIMER_18_BIT
LEDC PWM duty resolution of 18 bits

enumerator LEDC_TIMER_19_BIT
LEDC PWM duty resolution of 19 bits

enumerator LEDC_TIMER_20_BIT
LEDC PWM duty resolution of 20 bits

enumerator LEDC_TIMER_BIT_MAX

enum ledc_fade_mode_t

Values:

enumerator LEDC_FADE_NO_WAIT
LEDC fade function will return immediately

enumerator LEDC_FADE_WAIT_DONE
LEDC fade function will block until fading to the target duty

enumerator LEDC_FADE_MAX

2.6.12 Motor Control Pulse Width Modulator (MCPWM)

The MCPWM peripheral is a versatile PWM generator, which contains various submodules to make it a key element in power electronic applications like motor control, digital power, and so on. Typically, the MCPWM peripheral can be used in the following scenarios:

- Digital motor control, e.g., brushed/brushless DC motor, RC servo motor
- Switch mode-based digital power conversion
• Power DAC, where the duty cycle is equivalent to a DAC analog value
• Calculate external pulse width, and convert it into other analog values like speed, distance
• Generate Space Vector PWM (SVPWM) signals for Field Oriented Control (FOC)

The main submodules are listed in the following diagram:

Fig. 13: MCPWM Overview

• **MCPWM Timer**: The time base of the final PWM signal. It also determines the event timing of other submodules.
• **MCPWM Operator**: The key module that is responsible for generating the PWM waveforms. It consists of other submodules, like comparator, PWM generator, dead time, and carrier modulator.
• **MCPWM Comparator**: The compare module takes the time-base count value as input, and continuously compares it to the threshold value configured. When the timer is equal to any of the threshold values, a compare event will be generated and the MCPWM generator can update its level accordingly.
• **MCPWM Generator**: One MCPWM generator can generate a pair of PWM waves, complementarily or independently, based on various events triggered by other submodules like MCPWM Timer and MCPWM Comparator.
• **MCPWM Fault**: The fault module is used to detect the fault condition from outside, mainly via the GPIO matrix. Once the fault signal is active, MCPWM Operator will force all the generators into a predefined state to protect the system from damage.
• **MCPWM Sync**: The sync module is used to synchronize the MCPWM timers, so that the final PWM signals generated by different MCPWM generators can have a fixed phase difference. The sync signal can be routed from the GPIO matrix or from an MCPWM Timer event.
• **Dead Time**: This submodule is used to insert extra delay to the existing PWM edges generated in the previous steps.
• **Carrier Modulation**: The carrier submodule can modulate a high-frequency carrier signal into PWM waveforms by the generator and dead time submodules. This capability is mandatory for controlling the power-switching elements.
• **Brake**: MCPWM operator can set how to brake the generators when a particular fault is detected. We can shut down the PWM output immediately or regulate the PWM output cycle by cycle, depending on how critical the fault is.
• **MCPWM Capture**: This is a standalone submodule that can work even without the above MCPWM operators. The capture consists one dedicated timer and several independent channels, with each channel connected to the GPIO. A pulse on the GPIO triggers the capture timer to store the time-base count value and then notify you by an interrupt. Using this feature, we can measure a pulse width precisely. What is more, the capture timer can also be synchronized by the MCPWM Sync submodule.

**Functional Overview**

Description of the MCPWM functionality is divided into the following sections:
• **Resource Allocation and Initialization** - covers how to allocate various MCPWM objects, like timers, operators, comparators, generators and so on. These objects are the basis of the following IO setting and control functions.

• **Timer Operations and Events** - describes control functions and event callbacks supported by the MCPWM timer.

• **Comparator Operations and Events** - describes control functions and event callbacks supported by the MCPWM comparator.

• **Generator Actions on Events** - describes how to set actions for MCPWM generators on particular events that are generated by the MCPWM timer and comparators.

• **Generator Configurations for Classical PWM Waveforms** - demonstrates some classical PWM waveforms that can be achieved by configuring generator actions.

• **Dead Time** - describes how to set dead time for MCPWM generators.

• **Dead Time Configurations for Classical PWM Waveforms** - demonstrates some classical PWM waveforms that can be achieved by configuring dead time.

• **Carrier Modulation** - describes how to set and modulate a high frequency onto the final PWM waveforms.

• **Faults and Brake Actions** - describes how to set brake actions for MCPWM operators on particular fault events.

• **Generator Force Actions** - describes how to control the generator output level asynchronously in a forceful way.

• **Synchronization** - describes how to synchronize the MCPWM timers and get a fixed phase difference between the generated PWM signals.

• **Capture** - describes how to use the MCPWM capture module to measure the pulse width of a signal.

• **Power Management** - describes how different source clocks affects power consumption.

• **IRAM Safe** - describes tips on how to make the RMT interrupt work better along with a disabled cache.

• **Thread Safety** - lists which APIs are guaranteed to be thread-safe by the driver.

• **Kconfig Options** - lists the supported Kconfig options that can bring different effects to the driver.

**Resource Allocation and Initialization**  As displayed in the diagram above, the MCPWM peripheral consists of several submodules. Each submodule has its own resource allocation, which is described in the following sections.

**MCPWM Timers**  You can allocate a MCPWM timer object by calling `mcpwm_new_timer()` function, with a configuration structure `mcpwm_timer_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_timer_config_t::group_id` specifies the MCPWM group ID. The ID should belong to [0, `SOC_MCPWM_GROUPS` - 1] range. Please note, timers located in different groups are totally independent.
- `mcpwm_timer_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_timer_config_t::clk_src` sets the clock source of the timer.
- `mcpwm_timer_config_t::resolution_hz` sets the expected resolution of the timer. The driver internally sets a proper divider based on the clock source and the resolution.
- `mcpwm_timer_config_t::count_mode` sets the count mode of the timer.
- `mcpwm_timer_config_t::period_ticks` sets the period of the timer, in ticks (the tick resolution is set in the `mcpwm_timer_config_t::resolution_hz`).
- `mcpwm_timer_config_t::update_period_on_empty` sets whether to update the period value when the timer counts to zero.
- `mcpwm_timer_config_t::update_period_on_sync` sets whether to update the period value when the timer takes a sync signal.

The `mcpwm_new_timer()` will return a pointer to the allocated timer object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free timers in the MCPWM group, this function will return the `ESP_ERR_NOT_FOUND` error.1

On the contrary, calling the `mcpwm_del_timer()` function will free the allocated timer object.

**MCPWM Operators**  You can allocate a MCPWM operator object by calling `mcpwm_new_operator()` function, with a configuration structure `mcpwm_operator_config_t` as the parameter. The configuration structure is defined as:

1 Different ESP chip series might have a different number of MCPWM resources (e.g., groups, timers, comparators, operators, generators, triggers and so on). Please refer to the [TRM] for details. The driver does not forbid you from applying for more MCPWM resources, but it returns an error when there are no hardware resources available. Please always check the return value when doing Resource Allocation and Initialization.
mcpwm_operator_config_t::group_id specifies the MCPWM group ID. The ID should belong to [0, SOC_MCPWM_GROUPS - 1] range. Please note, operators located in different groups are totally independent.

mcpwm_operator_config_t::intr_priority sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.

mcpwm_operator_config_t::update_gen_action_on_tez sets whether to update the generator action when the timer counts to zero. Here and below, the timer refers to the one that is connected to the operator by mcpwm_operator_connect_timer().

mcpwm_operator_config_t::update_gen_action_on_tep sets whether to update the generator action when the timer counts to peak.

mcpwm_operator_config_t::update_gen_action_on_sync sets whether to update the generator action when the timer takes a sync signal.

mcpwm_operator_config_t::update_dead_time_on_tez sets whether to update the dead time when the timer counts to zero.

mcpwm_operator_config_t::update_dead_time_on_tep sets whether to update the dead time when the timer counts to the peak.

mcpwm_operator_config_t::update_dead_time_on_sync sets whether to update the dead time when the timer takes a sync signal.

The mcpwm_new_operator() function will return a pointer to the allocated operator object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free operators in the MCPWM group, this function will return the ESP_ERR_NOT_FOUND error.

On the contrary, calling mcpwm_del_operator() function will free the allocated operator object.

MCPWM Comparators You can allocate a MCPWM comparator object by calling the mcpwm_new_comparator() function, with a MCPWM operator handle and configuration structure mcpwm_comparator_config_t as the parameter. The operator handle is created by mcpwm_new_operator(). The configuration structure is defined as:

- mcpwm_comparator_config_t::intr_priority sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- mcpwm_comparator_config_t::update_cmp_on_tez sets whether to update the compare threshold when the timer counts to zero.
- mcpwm_comparator_config_t::update_cmp_on_tep sets whether to update the compare threshold when the timer counts to the peak.
- mcpwm_comparator_config_t::update_cmp_on_sync sets whether to update the compare threshold when the timer takes a sync signal.

The mcpwm_new_comparator() function will return a pointer to the allocated comparator object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free comparators in the MCPWM operator, this function will return the ESP_ERR_NOT_FOUND error.

On the contrary, calling mcpwm_del_comparator() function will free the allocated comparator object.

MCPWM Generators You can allocate a MCPWM generator object by calling the mcpwm_new_generator() function, with a MCPWM operator handle and configuration structure mcpwm_generator_config_t as the parameter. The operator handle is created by mcpwm_new_operator(). The configuration structure is defined as:

- mcpwm_generator_config_t::gen_gpio_num sets the GPIO number used by the generator.
- mcpwm_generator_config_t::invert_pwm sets whether to invert the PWM signal.
- mcpwm_generator_config_t::io_loop_back sets whether to enable the Loop-back mode. It is for debugging purposes only. It enables both the GPIO’s input and output ability through the GPIO matrix peripheral.
- mcpwm_generator_config_t::io_od_mode configures the PWM GPIO as open-drain output.
- mcpwm_generator_config_t::pull_up and mcpwm_generator_config_t::pull_down controls whether to enable the internal pull-up and pull-down resistors accordingly.
The `mcpwm_new_generator()` function will return a pointer to the allocated generator object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free generators in the MCPWM operator, this function will return the `ESP_ERR_NOT_FOUND` error.\footnote{Page 1314.1}

On the contrary, calling the `mcpwm_del_generator()` function will free the allocated generator object.

**MCPWM Faults**  There are two types of faults: A fault signal reflected from the GPIO and a fault generated by software.

To allocate a GPIO fault object, you can call the `mcpwm_new_gpio_fault()` function, with the configuration structure `mcpwm_gpio_fault_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_gpio_fault_config_t::group_id` sets the MCPWM group ID. The ID should belong to \([0, SOC_MCPWM_GROUPS - 1]\) range. Please note, GPIO faults located in different groups are totally independent, i.e., GPIO faults in group 0 can not be detected by the operator in group 1.
- `mcpwm_gpio_fault_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_gpio_fault_config_t::gpio_num` sets the GPIO number used by the fault.
- `mcpwm_gpio_fault_config_t::active_level` sets the active level of the fault signal.
- `mcpwm_gpio_fault_config_t::pull_up` and `mcpwm_gpio_fault_config_t::pull_down` set whether to pull up and/or pull down the GPIO internally.
- `mcpwm_gpio_fault_config_t::io_loop_back` sets whether to enable the loopback mode. It is for debugging purposes only. It enables both the GPIO’s input and output ability through the GPIO matrix peripheral.

The `mcpwm_new_gpio_fault()` function will return a pointer to the allocated fault object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free GPIO faults in the MCPWM group, this function will return the `ESP_ERR_NOT_FOUND` error.\footnote{Page 1314.1}

Software fault object can be used to trigger a fault by calling the function `mcpwm_soft_fault_activate()` instead of waiting for a real fault signal on the GPIO. A software fault object can be allocated by calling the `mcpwm_new_soft_fault()` function, with configuration structure `mcpwm_soft_fault_config_t` as the parameter. Currently, this configuration structure is left for future purposes.

The `mcpwm_new_soft_fault()` function will return a pointer to the allocated fault object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there is no memory left for the fault object, this function will return the `ESP_ERR_NO_MEM` error. Although the software fault and GPIO fault are of different types, the returned fault handle is of the same type.

On the contrary, calling the `mcpwm_del_fault()` function will free the allocated fault object, this function works for both software and GPIO fault.

**MCPWM Sync Sources**  The sync source is what can be used to synchronize the MCPWM timer and MCPWM capture timer. There are three types of sync sources: a sync source reflected from the GPIO, a sync source generated by software, and a sync source generated by an MCPWM timer event.

To allocate a GPIO sync source, you can call the `mcpwm_new_gpio_sync_src()` function, with configuration structure `mcpwm_gpio_sync_src_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_gpio_sync_src_config_t::group_id` sets the MCPWM group ID. The ID should belong to \([0, SOC_MCPWM_GROUPS - 1]\) range. Please note, the GPIO sync sources located in different groups are totally independent, i.e., GPIO sync source in group 0 can not be detected by the timers in group 1.
- `mcpwm_gpio_sync_src_config_t::gpio_num` sets the GPIO number used by the sync source.
- `mcpwm_gpio_sync_src_config_t::active_neg` sets whether the sync signal is active on negative edges.
- `mcpwm_gpio_sync_src_config_t::pull_up` and `mcpwm_gpio_sync_src_config_t::pull_down` set whether to pull up and/or pull down the GPIO internally.
- `mcpwm_gpio_sync_src_config_t::io_loop_back` sets whether to enable the Loop-back mode. It is for debugging purposes only. It enables both the GPIO’s input and output ability through the GPIO matrix peripheral.
The `mcpwm_new_gpio_sync_src()` will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free GPIO sync sources in the MCPWM group, this function will return the `ESP_ERR_NOT_FOUND` error.

To allocate a timer event sync source, you can call the `mcpwm_new_timer_sync_src()` function, with configuration structure `mcpwm_timer_sync_src_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_timer_sync_src_config_t::timer_event` specifies on what timer event to generate the sync signal.
- `mcpwm_timer_sync_src_config_t::propagate_input_sync` sets whether to propagate the input sync signal (i.e., the input sync signal will be routed to its sync output).

The `mcpwm_new_timer_sync_src()` will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return an error code. Specifically, if a sync source has been allocated from the same timer before, this function will return the `ESP_ERR_INVALID_STATE` error.

Last but not least, to allocate a software sync source, you can call the `mcpwm_new_soft_sync_src()` function, with configuration structure `mcpwm_soft_sync_config_t` as the parameter. Currently, this configuration structure is left for future purposes.

`mcpwm_new_soft_sync_src()` will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there is no memory left for the sync source object, this function will return the `ESP_ERR_NO_MEM` error. Please note, to make a software sync source take effect, do not forget to call `mcpwm_soft_sync_activate()`.

On the contrary, calling the `mcpwm_del_sync_src()` function will free the allocated sync source object. This function works for all types of sync sources.

**MCPWM Capture Timer and Channels**

The MCPWM group has a dedicated timer which is used to capture the timestamp when a specific event occurred. The capture timer is connected to several independent channels, each channel is assigned a GPIO.

To allocate a capture timer, you can call the `mcpwm_new_capture_timer()` function, with configuration structure `mcpwm_capture_timer_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_capture_timer_config_t::group_id` sets the MCPWM group ID. The ID should belong to `[0, SOC_MCPWM_GROUPS - 1]` range.
- `mcpwm_capture_timer_config_t::clk_src` sets the clock source of the capture timer.
- `mcpwm_capture_timer_config_t::resolution_hz` The driver internally will set a proper divider based on the clock source and the resolution. If it is set to 0, the driver will pick an appropriate resolution on its own, and you can subsequently view the current timer resolution via `mcpwm_capture_timer_get_resolution()`.

**Note:** In ESP32, `mcpwm_capture_timer_config_t::resolution_hz` parameter is invalid, the capture timer resolution is always equal to the `MCPWM_CAPTURE_CLK_SRC_APB` parameter.

The `mcpwm_new_capture_timer()` will return a pointer to the allocated capture timer object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there is no free capture timer left in the MCPWM group, this function will return the `ESP_ERR_NOT_FOUND` error.

Next, to allocate a capture channel, you can call the `mcpwm_new_capture_channel()` function, with a capture timer handle and configuration structure `mcpwm_capture_channel_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_capture_channel_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_capture_channel_config_t::gpio_num` sets the GPIO number used by the capture channel.
- `mcpwm_capture_channel_config_t::prescale` sets the prescaler of the input signal.
• `mcpwm_capture_channel_config_t::pos_edge` and `mcpwm_capture_channel_config_t::neg_edge` set whether to capture on the positive and/or negative edge of the input signal.
• `mcpwm_capture_channel_config_t::pull_up` and `mcpwm_capture_channel_config_t::pull_down` set whether to pull up and/or pull down the GPIO internally.
• `mcpwm_capture_channel_config_t::invert_cap_signal` sets whether to invert the capture signal.
• `mcpwm_capture_channel_config_t::io_loop_back` sets whether to enable the Loop-back mode. It is for debugging purposes only. It enables both the GPIO’s input and output ability through the GPIO matrix peripheral.

The `mcpwm_new_capture_channel()` will return a pointer to the allocated capture channel object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there is no free capture channel left in the capture timer, this function will return the `ESP_ERR_NOT_FOUND` error.

On the contrary, calling `mcpwm_del_capture_channel()` and `mcpwm_del_capture_timer()` will free the allocated capture channel and timer object accordingly.

**MCPWM Interrupt Priority** MCPWM allows configuring interrupts separately for timer, operator, comparator, fault, and capture events. The interrupt priority is determined by the respective `config_t::intr_priority`. Additionally, events within the same MCPWM group share a common interrupt source. When registering multiple interrupt events, the interrupt priorities need to remain consistent.

**Note:** When registering multiple interrupt events within an MCPWM group, the driver will use the interrupt priority of the first registered event as the MCPWM group’s interrupt priority.

**Timer Operations and Events**

**Register Timer Event Callbacks** The MCPWM timer can generate different events at runtime. If you have some function that should be called when a particular event happens, you should hook your function to the interrupt service routine by calling `mcpwm_timer_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_timer_event_cb_t`. All supported event callbacks are listed in the `mcpwm_timer_event_callbacks_t`:

- `mcpwm_timer_event_callbacks_t::on_full` sets the callback function for the timer when it counts to peak value.
- `mcpwm_timer_event_callbacks_t::on_empty` sets the callback function for the timer when it counts to zero.
- `mcpwm_timer_event_callbacks_t::on_stop` sets the callback function for the timer when it is stopped.

The callback functions above are called within the ISR context, so they should not attempt to block. For example, you may make sure that only FreeRTOS APIs with the **ISR** suffix are called within the function.

The parameter `user_data` of the `mcpwm_timer_register_event_callbacks()` function is used to save your own context. It is passed to each callback function directly.

This function will lazy the install interrupt service for the MCPWM timer without enabling it. It is only allowed to be called before `mcpwm_timer_enable()`, otherwise the `ESP_ERR_INVALID_STATE` error will be returned. See also **Enable and Disable timer** for more information.

**Enable and Disable Timer** Before doing IO control to the timer, you need to enable the timer first, by calling `mcpwm_timer_enable()`. This function:

- switches the timer state from **init** to **enable**.
- enables the interrupt service if it has been lazy installed by `mcpwm_timer_register_event_callbacks()`.
- acquire a proper power management lock if a specific clock source (e.g., PLL_160M clock) is selected. See also **Power management** for more information.
On the contrary, calling `mcpwm_timer_disable()` will put the timer driver back to the **init** state, disable the interrupt service and release the power management lock.

**Start and Stop Timer**  The basic IO operation of a timer is to start and stop. Calling `mcpwm_timer_start_stop()` with different `mcpwm_timer_start_stop_cmd_t` commands can start the timer immediately or stop the timer at a specific event. What is more, you can even start the timer for only one round, which means, the timer will count to peak value or zero, and then stop itself.

**Connect Timer with Operator**  The allocated MCPWM timer should be connected with an MCPWM operator by calling `mcpwm_operator_connect_timer()`, so that the operator can take that timer as its time base, and generate the required PWM waves. Please make sure the MCPWM timer and operator are in the same group. Otherwise, this function will return the **ESP_ERR_INVALID_ARG** error.

**Comparator Operations and Events**

**Register Comparator Event Callbacks**  The MCPWM comparator can inform you when the timer counter equals the compare value. If you have some function that should be called when this event happens, you should hook your function to the interrupt service routine by calling `mcpwm_comparator_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_compare_event_cb_t`. All supported event callbacks are listed in the `mcpwm_comparator_event_callbacks_t`:

- `mcpwm_comparator_event_callbacks_t::on_reach` sets the callback function for the comparator when the timer counter equals the compare value.

The callback function provides event-specific data of type `mcpwm_compare_event_data_t` to you. The callback function is called within the ISR context, so it should not attempt to block. For example, you may make sure that only FreeRTOS APIs with the **ISR** suffix are called within the function.

The parameter `user_data` of `mcpwm_comparator_register_event_callbacks()` function is used to save your own context. It is passed to the callback function directly.

This function will lazy the installation of interrupt service for the MCPWM comparator, whereas the service can only be removed in `mcpwm_del_comparator`.

**Set Compare Value**  You can set the compare value for the MCPWM comparator at runtime by calling `mcpwm_comparator_set_compare_value()`. There are a few points to note:

- A new compare value might not take effect immediately. The update time for the compare value is set by `mcpwm_comparator_config_t::update_cmp_on_tez` or `mcpwm_comparator_config_t::update_cmp_on_tep` or `mcpwm_comparator_config_t::update_cmp_on_sync`.
- Make sure the operator has connected to one MCPWM timer already by `mcpwm_operator_connect_timer()`. Otherwise, it will return the error code **ESP_ERR_INVALID_STATE**.
- The compare value should not exceed the timer’s count peak, otherwise, the compare event will never get triggered.

**Generator Actions on Events**

**Set Generator Action on Timer Event**  One generator can set multiple actions on different timer events, by calling `mcpwm_generator_set_actions_on_timer_event()` with a variable number of action configurations. The action configuration is defined in `mcpwm_gen_timer_event_action_t`:

- `mcpwm_gen_timer_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_timer_event_action_t::event` specifies the timer event. The supported timer events are listed in `mcpwm_timer_event_t`.

Espressif Systems  1319  Release v5.2-dev-3318-g8fc8f3f479

Submit Document Feedback
* `mcpwm_gen_timer_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

There is a helper macro `MCPWM_GEN_TIMER_EVENT_ACTION` to simplify the construction of a timer event action entry.

Please note, the argument list of `mcpwm_generator_set_actions_on_timer_event()` must be terminated by `MCPWM_GEN_TIMER_EVENT_ACTION_END`.

You can also set the timer action one by one by calling `mcpwm_generator_set_action_on_timer_event()` without varargs.

**Set Generator Action on Compare Event**  One generator can set multiple actions on different compare events, by calling `mcpwm_generator_set_actions_on_compare_event()` with a variable number of action configurations. The action configuration is defined in `mcpwm_gen_compare_event_action_t`:

* `mcpwm_gen_compare_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
* `mcpwm_gen_compare_event_action_t::comparator` specifies the comparator handle. See [MCPWM Comparators](#) for how to allocate a comparator.
* `mcpwm_gen_compare_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

There is a helper macro `MCPWM_GEN_COMPARE_EVENT_ACTION` to simplify the construction of a compare event action entry.

Please note, the argument list of `mcpwm_generator_set_actions_on_compare_event()` must be terminated by `MCPWM_GEN_COMPARE_EVENT_ACTION_END`.

You can also set the compare action one by one by calling `mcpwm_generator_set_action_on_compare_event()` without varargs.

**Set Generator Action on Fault Event**  One generator can set action on fault based trigger events, by calling `mcpwm_generator_set_action_on_fault_event()` with an action configurations. The action configuration is defined in `mcpwm_gen_fault_event_action_t`:

* `mcpwm_gen_fault_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
* `mcpwm_gen_fault_event_action_t::fault` specifies the fault used for the trigger. See [MCPWM Faults](#) for how to allocate a fault.
* `mcpwm_gen_fault_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

When no free trigger slot is left in the operator to which the generator belongs, this function will return the `ESP_ERR_NOT_FOUND` error.

The trigger only support GPIO fault. when the input is not a GPIO fault, this function will return the `ESP_ERR_NOT_SUPPORTED` error.

There is a helper macro `MCPWM_GEN_FAULT_EVENT_ACTION` to simplify the construction of a trigger event action entry.

Please note, fault event does not have variadic function like `mcpwm_generator_set_actions_on_fault_event()`.

**Set Generator Action on Sync Event**  One generator can set action on sync based trigger events, by calling `mcpwm_generator_set_action_on_sync_event()` with an action configurations. The action configuration is defined in `mcpwm_gen_sync_event_action_t`:

* `mcpwm_gen_sync_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
* `mcpwm_gen_sync_event_action_t::sync` specifies the sync source used for the trigger. See [MCPWM Sync Sources](#) for how to allocate a sync source.
• `mcpwm_gen_sync_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

When no free trigger slot is left in the operator to which the generator belongs, this function will return the `ESP_ERR_NOT_FOUND` error.

The trigger only support one sync action, regardless of the kinds. When set sync actions more than once, this function will return the `ESP_ERR_INVALID_STATE` error.

There is a helper macro `MCPWM_GEN_SYNC_EVENT_ACTION` to simplify the construction of a trigger event action entry.

Please note, sync event does not have variadic function like `mcpwm_generator_set_actions_on_sync_event()`.

Generator Configurations for Classical PWM Waveforms

This section will demonstrate the classical PWM waveforms that can be generated by the pair of generators. The code snippet that is used to generate the waveforms is also provided below the diagram. Some general summary:

- The **Symmetric** or **Asymmetric** of the waveforms is determined by the count mode of the MCPWM timer.
- The **active level** of the waveform pair is determined by the level of the PWM with a smaller duty cycle.
- The period of the PWM waveform is determined by the timer’s period and count mode.
- The duty cycle of the PWM waveform is determined by the generator’s various action combinations.

**Single Edge Asymmetric Waveform - Active High**

Dead Time

In power electronics, the rectifier and inverter are commonly used. This requires the use of a rectifier bridge and an inverter bridge. Each bridge arm has two power electronic devices, such as MOSFET, IGBT, etc. The two MOSFETs on the same arm cannot conduct at the same time; otherwise, there will be a short circuit. The fact is that, although the PWM wave shows it is turning off the switch, the MOSFET still needs a small time window to make that happen. This requires an extra delay to be added to the existing PWM wave generated by setting \textit{Generator Actions on Events}.

The dead time driver works like a \textit{decorator}. This is also reflected in the function parameters of \texttt{mcpwm_generator_set_dead_time()}, where it takes the primary generator handle (\texttt{in\_generator}), and returns a new generator (\texttt{out\_generator}) after applying the dead time. Please note, if the
out_generator and in_generator are the same, it means we are adding the time delay to the PWM waveform in an “in-place” fashion. In turn, if the out_generator and in_generator are different, it means we are deriving a new PWM waveform from the existing in_generator.

Dead time specific configuration is listed in the `mcpwm_dead_time_config_t` structure:

- `mcpwm_dead_time_config_t::posedge_delay_ticks` and `mcpwm_dead_time_config_t::negedge_delay_ticks` set the number of ticks to delay the PWM waveform on the rising and falling edge. Specifically, setting both of them to zero means bypassing the dead time module. The resolution of the dead time tick is the same as the timer that is connected with the operator by `mcpwm_operator_connect_timer()`.
- `mcpwm_dead_time_config_t::invert_output` sets whether to invert the signal after applying the dead time, which can be used to control the delay edge polarity.

**Warning:** Due to the hardware limitation, one delay module (either posedge delay or negedge delay) cannot be applied to multiple MCPWM generators at the same time. e.g., the following configuration is invalid:

```c
mcpwm_dead_time_config_t dt_config = {
    .posedge_delay_ticks = 10,
};

// Set posedge delay to generator A
mcpwm_generator_set_dead_time(mcpwm_gen_a, mcpwm_gen_a, &dt_config);
// NOTE: This is invalid, you can not apply the posedge delay to another generator
mcpwm_generator_set_dead_time(mcpwm_gen_b, mcpwm_gen_b, &dt_config);
```

However, you can apply posedge delay to generator A and negedge delay to generator B. You can also set both posedge delay and negedge delay for generator A, while letting generator B bypass the dead time module.

**Note:** It is also possible to generate the required dead time by setting Generator Actions on Events, especially by controlling edge placement using different comparators. However, if the more classical edge delay-based dead time with polarity control is required, then the dead time submodule should be used.

### Dead Time Configurations for Classical PWM Waveforms

This section demonstrates the classical PWM waveforms that can be generated by the dead time submodule. The code snippet that is used to generate the waveforms is also provided below the diagram.

```c
static void gen_action_config(mcpwm_gen_handle_t gena, mcpwm_gen_handle_t genb, mcpwm_cmpr_handle_t cmpa, mcpwm_cmpr_handle_t cmpb)
{
    ESP_ERROR_CHECK(mcpwm_generator_set_action_on_timer_event(gena, MCPWM_GEN_TIMER_EVENT_ACTION(MCPWM_TIMER_DIRECTION_UP, MCPWM_TIMER_EVENT_EMPTY, MCPWM_GEN_ACTION_HIGH)));
    ESP_ERROR_CHECK(mcpwm_generator_set_action_on_compare_event(gena, MCPWM_GEN_COMPARE_EVENT_ACTION(MCPWM_TIMER_DIRECTION_UP, cmpa, MCPWM_GEN_ACTION_LOW)));
}
```

(continues on next page)
```c
static void dead_time_config(mcpwm_gen_handle_t gena, mcpwm_gen_handle_t genb)
{
    mcpwm_dead_time_config_t dead_time_config = {
        .posedge_delay_ticks = 50,
        .negedge_delay_ticks = 0
    };
    ESP_ERROR_CHECK(mcpwm_generator_set_dead_time(gena, gena, &dead_time_config));
    dead_time_config.posedge_delay_ticks = 0;
    dead_time_config.negedge_delay_ticks = 100;
    dead_time_config.flags.invert_output = true;
    ESP_ERROR_CHECK(mcpwm_generator_set_dead_time(gena, genb, &dead_time_config));
}
```

```c
static void gen_action_config(mcpwm_gen_handle_t gena, mcpwm_gen_handle_t genb, _mcpwm_cmpr_handle_t cmpa, mcpwm_cmpr_handle_t cmpb)
{
    ESP_ERROR_CHECK(mcpwm_generator_set_action_on_timer_event(gena,
        MCPWM_GEN_TIMER_EVENT_ACTION(MCPWM_TIMER_DIRECTION_UP, MCPWMGENERATOR_SET_COMPARE_ACTION(MCPWM_TIMER_DIRECTION_UP, cmpa,
            MCPWM_GEN_ACTION_LOW))));
}
```

```c
static void dead_time_config(mcpwm_gen_handle_t gena, mcpwm_gen_handle_t genb)
{
    mcpwm_dead_time_config_t dead_time_config = {
        .posedge_delay_ticks = 50,
        .negedge_delay_ticks = 0,
        .flags.invert_output = true
    };
    ESP_ERROR_CHECK(mcpwm_generator_set_dead_time(gena, gena, &dead_time_config));
    dead_time_config.posedge_delay_ticks = 0;
    dead_time_config.negedge_delay_ticks = 100;
    dead_time_config.flags.invert_output = false;
    ESP_ERROR_CHECK(mcpwm_generator_set_dead_time(gena, genb, &dead_time_config));
}
```
static void gen_action_config(mcpwm_gen_handle_t gena, mcpwm_gen_handle_t genb, mcpwm_cmpr_handle_t cmpa, mcpwm_cmpr_handle_t cmpb)
{
    ESP_ERROR_CHECK(mcpwm_generator_set_action_on_timer_event(gena, MCPWM_GEN_TIMER_EVENT_ACTION(MCPWM_TIMER_DIRECTION_UP, MCPWM_TIMEREVENTEMPTY, MCPWM_GEN_ACTIONHIGH)));
    ESP_ERROR_CHECK(mcpwm_generator_set_action_on_compare_event(gena, MCPWM_GEN_COMPARE_EVENT_ACTION(MCPWM_TIMER_DIRECTION_UP, cmpa, MCPWM_GEN_ACTIONLOW)));
}

static void dead_time_config(mcpwm_gen_handle_t gena, mcpwm_gen_handle_t genb)
{
    mcpwm_dead_time_config_t dead_time_config = {
        .posedge_delay_ticks = 50,
        .negedge_delay_ticks = 0,
    };
    ESP_ERROR_CHECK(mcpwm_generator_set_dead_time(gena, gena, &dead_time_config));
    dead_time_config.posedge_delay_ticks = 0;
    dead_time_config.negedge_delay_ticks = 100;
    ESP_ERROR_CHECK(mcpwm_generator_set_dead_time(gena, genb, &dead_time_config));
}
Rising Delay on PWMA and Bypass Dead Time for PWMB

```c
static void gen_action_config(mcpwm_gen_handle_t gena, mcpwm_gen_handle_t genb, 
   mcpwm_cmpr_handle_t cmpa, mcpwm_cmpr_handle_t cmpb)
{
    ESP_ERROR_CHECK(mcpwm_generator_set_action_on_timer_event(gena, 
                   MCPWM_TIMER_DIRECTION_UP, MCPWM_TIMER_EVENT_EMPTY, 
                   MCPWM_GEN_ACTION_HIGH));
    ESP_ERROR_CHECK(mcpwm_generator_set_action_on_compare_event(gena, 
                   MCPWM_TIMER_DIRECTION_UP, 
                   MCPWM_GEN_COMPARE_EVENT_ACTION(MCPWM TIMER_DIRECTION_UP, cmpa, 
                   MCPWM_GEN_ACTION_LOW)));
    ESP_ERROR_CHECK(mcpwm_generator_set_action_on_timer_event(gena, 
                   MCPWM_TIMER_DIRECTION_UP, MCPWM_TIMER_EVENT_EMPTY, 
                   MCPWM_GEN_ACTION_HIGH));
    ESP_ERROR_CHECK(mcpwm_generator_set_action_on_compare_event(gena, 
                   MCPWM_TIMER_DIRECTION_UP, 
                   MCPWM_GEN_COMPARE_EVENT_ACTION(MCPWM TIMER_DIRECTION_UP, cmpa, 
                   MCPWM_GEN_ACTION_LOW)));
    ESP_ERROR_CHECK(mcpwm_generator_set_action_on_timer_event(gena, 
                   MCPWM_TIMER_DIRECTION_UP, MCPWM_TIMER_EVENT_EMPTY, 
                   MCPWM_GEN_ACTION_HIGH));
    ESP_ERROR_CHECK(mcpwm_generator_set_action_on_compare_event(gena, 
                   MCPWM_TIMER_DIRECTION_UP, 
                   MCPWM_GEN_COMPARE_EVENT_ACTION(MCPWM TIMER_DIRECTION_UP, cmpa, 
                   MCPWM_GEN_ACTION_LOW)));
}
```

Falling Delay on PWMB and Bypass Dead Time for PWMA

```c

    ESP_ERROR_CHECK(mcpwm_generator_set_dead_time(genb, genb, &dead_time_config));
}
Carrier Modulation  The MCPWM operator has a carrier submodule that can be used if galvanic isolation from the motor driver is required (e.g., isolated digital power application) by passing the PWM output signals through transformers. Any of the PWM output signals may be at 100% duty and not changing whenever a motor is required to run steadily at the full load. Coupling with non-alternating signals with a transformer is problematic, so the signals are modulated by the carrier submodule to create an AC waveform, to make the coupling possible.

To configure the carrier submodule, you can call `mcpwm_operator_apply_carrier()`, and provide configuration structure `mcpwm_carrier_config_t`:

- `mcpwm_carrier_config_t::clk_src` sets the clock source of the carrier.
- `mcpwm_carrier_config_t::frequency_hz` indicates carrier frequency in Hz.
- `mcpwm_carrier_config_t::duty_cycle` indicates the duty cycle of the carrier. Note that, the supported choices of the duty cycle are discrete, the driver searches for the nearest one based on your configuration.
- `mcpwm_carrier_config_t::first_pulse_duration_us` indicates the duration of the first pulse in microseconds. The resolution of the first pulse duration is determined by the carrier frequency you set in the `mcpwm_carrier_config_t::frequency_hz`. The first pulse duration can not be zero, and it has to be at least one period of the carrier. A longer pulse width can help conduct the inductance quicker.
- `mcpwm_carrier_config_t::invert_before_modulate` and `mcpwm_carrier_config_t::invert_after_modulate` set whether to invert the carrier output before and after modulation.

Specifically, the carrier submodule can be disabled by calling `mcpwm_operator_apply_carrier()` with a NULL configuration.

Faults and Brake Actions  The MCPWM operator is able to sense external signals with information about the failure of the motor, the power driver or any other device connected. These failure signals are encapsulated into MCPWM fault objects.

You should determine possible failure modes of the motor and what action should be performed on detection of a particular fault, e.g., drive all outputs low for a brushed motor, lock current state for a stepper motor, etc. As a result of this action, the motor should be put into a safe state to reduce the likelihood of damage caused by the fault.

Set Operator Brake Mode on Fault  The way that MCPWM operator reacts to the fault is called Brake. The MCPWM operator can be configured to perform different brake modes for each fault object by calling `mcpwm_operator_set_brake_on_fault()`. Specific brake configuration is passed as a structure `mcpwm_brake_config_t`:

- `mcpwm_brake_config_t::fault` sets which fault the operator should react to.
- `mcpwm_brake_config_t::brake_mode` sets the brake mode that should be used for the fault. The supported brake modes are listed in the `mcpwm_operator_brake_mode_t`. For `MCPWM_OPER_BRAKE_MODE_CBC` mode, the operator recovers itself automatically as long as the fault disappears. You can specify the recovery time in `mcpwm_brake_config_t::cbc_recover_on_tez` and `mcpwm_brake_config_t::cbc_recover_on_tep`. For `MCPWM_OPER_BRAKE_MODE_OST` mode, the operator can not recover even though the fault disappears. You have to call `mcpwm_operator_recover_from_fault()` to manually recover it.

Set Generator Action on Brake Event  One generator can set multiple actions on different brake events, by calling `mcpwm_generator_set_actions_on_brake_event()` with a variable number of action configurations. The action configuration is defined in `mcpwm_gen_brake_event_action_t`:
• `mcpwm_gen_brake_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.

• `mcpwm_gen_brake_event_action_t::brake_mode` specifies the brake mode. The supported brake modes are listed in `mcpwm_operator_brake_mode_t`.

• `mcpwm_gen_brake_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

There is a helper macro `MCPWM_GEN_BRAKE_EVENT_ACTION` to simplify the construction of a brake event action entry.

Please note, the argument list of `mcpwm_generator_set_actions_on_brake_event()` must be terminated by `MCPWM_GEN_BRAKE_EVENT_ACTION_END`.

You can also set the brake action one by one by calling `mcpwm_generator_set_action_on_brake_event()` without varargs.

**Register Fault Event Callbacks** The MCPWM fault detector can inform you when it detects a valid fault or a fault signal disappears. If you have some function that should be called when such an event happens, you should hook your function to the interrupt service routine by calling `mcpwm_fault_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_fault_event_cb_t`. All supported event callbacks are listed in the `mcpwm_fault_event_callbacks_t`:

• `mcpwm_fault_event_callbacks_t::on_fault_enter` sets the callback function that will be called when a fault is detected.

• `mcpwm_fault_event_callbacks_t::on_fault_exit` sets the callback function that will be called when a fault is cleared.

The callback function is called within the ISR context, so it should not attempt to block. For example, you may make sure that only FreeRTOS APIs with the ISR suffix are called within the function.

The parameter `user_data` of `mcpwm_fault_register_event_callbacks()` function is used to save your own context. It is passed to the callback function directly.

This function will lazy the install interrupt service for the MCPWM fault, whereas the service can only be removed in `mcpwm_del_fault`.

**Register Brake Event Callbacks** The MCPWM operator can inform you when it is going to take a brake action. If you have some function that should be called when this event happens, you should hook your function to the interrupt service routine by calling `mcpwm_operator_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_brake_event_cb_t`. All supported event callbacks are listed in the `mcpwm_operator_event_callbacks_t`:

• `mcpwm_operator_event_callbacks_t::on_brake_cbc` sets the callback function that will be called when the operator is going to take a CBC action.

• `mcpwm_operator_event_callbacks_t::on_brake_ost` sets the callback function that will be called when the operator is going to take an OST action.

The callback function is called within the ISR context, so it should not attempt to block. For example, you may make sure that only FreeRTOS APIs with the ISR suffix are called within the function.

The parameter `user_data` of the `mcpwm_operator_register_event_callbacks()` function is used to save your own context. It will be passed to the callback function directly.

This function will lazy the install interrupt service for the MCPWM operator, whereas the service can only be removed in `mcpwm_del_operator`.

**Generator Force Actions** Software can override generator output level at runtime, by calling `mcpwm_generator_set_force_level()`. The software force level always has a higher priority than other event actions set in e.g. `mcpwm_generator_set_actions_on_timer_event()`.

• Set the level to -1 means to disable the force action, and the generator’s output level will be controlled by the event actions again.
• Set the hold_on to true, and the force output level will keep alive until it is removed by assigning level to -1.
• Set the hole_on to false, the force output level will only be active for a short time, and any upcoming event can override it.

**Synchronization**  When a sync signal is taken by the MCPWM timer, the timer will be forced into a predefined phase, where the phase is determined by count value and count direction. You can set the sync phase by calling `mcpwm_timer_set_phase_on_sync()`. The sync phase configuration is defined in `mcpwm_timer_sync_phase_config_t` structure:

- `mcpwm_timer_sync_phase_config_t::sync_src` sets the sync signal source. See MCPWM Sync Sources for how to create a sync source object. Specifically, if this is set to NULL, the driver will disable the sync feature for the MCPWM timer.
- `mcpwm_timer_sync_phase_config_t::count_value` sets the count value to load when the sync signal is taken.
- `mcpwm_timer_sync_phase_config_t::direction` sets the count direction when the sync signal is taken.

Likewise, the MCPWM Capture Timer can be synced as well. You can set the sync phase for the capture timer by calling `mcpwm_capture_timer_set_phase_on_sync()`. The sync phase configuration is defined in `mcpwm_capture_timer_sync_phase_config_t` structure:

- `mcpwm_capture_timer_sync_phase_config_t::sync_src` sets the sync signal source. See MCPWM Sync Sources for how to create a sync source object. Specifically, if this is set to NULL, the driver will disable the sync feature for the MCPWM capture timer.
- `mcpwm_capture_timer_sync_phase_config_t::count_value` sets the count value to load when the sync signal is taken.
- `mcpwm_capture_timer_sync_phase_config_t::direction` sets the count direction when the sync signal is taken. Note that, different from MCPWM Timer, the capture timer can only support one count direction: MCPWM_TIMER_DIRECTION_UP.

![GPIO Sync All MCPWM Timers](image)

**Fig. 14: GPIO Sync All MCPWM Timers**

**Sync Timers by GPIO**
```c
static void example_setup_sync_strategy(mcpwm_timer_handle_t timers[])
{
    mcpwm_sync_handle_t gpio_sync_source = NULL;
    mcpwm_gpio_sync_src_config_t gpio_sync_config = {
        .group_id = 0, // GPIO fault should be in the same group of...
        .gpio_num = EXAMPLE_SYNC_GPIO,
        .flags.pull_down = true,
        .flags.active_neg = false, // By default, a posedge pulse can trigger a...
    };
    ESP_ERROR_CHECK(mcpwm_new_gpio_sync_src(&gpio_sync_config, &gpio_sync_source));

    mcpwm_timer_sync_phase_config_t sync_phase_config = {
        .count_value = 0, // sync phase: target count value
        .direction = MCPWM_TIMER_DIRECTION_UP, // sync phase: count direction
        .sync_src = gpio_sync_source, // sync source
    };
    for (int i = 0; i < 3; i++) {
        ESP_ERROR_CHECK(mcpwm_timer_set_phase_on_sync(timers[i], &sync_phase_config));
    }
}
```

**Capture**   The basic functionality of MCPWM capture is to record the time when any pulse edge of the capture signal turns active. Then you can get the pulse width and convert it into other physical quantities like distance or speed in the capture callback function. For example, in the BLDC (Brushless DC, see figure below) scenario, we can use the capture submodule to sense the rotor position from the Hall sensor.

![Fig. 15: MCPWM BLDC with Hall Sensor](image)

The capture timer is usually connected to several capture channels. Please refer to *MCPWM Capture Timer and Channels* for more information about resource allocation.
Register Capture Event Callbacks  The MCPWM capture channel can inform you when there is a valid edge detected on the signal. You have to register a callback function to get the timer count value of the captured moment, by calling `mcpwm_capture_channel_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_capture_event_cb_t`. All supported capture callbacks are listed in the `mcpwm_capture_event_callbacks_t`:

- `mcpwm_capture_event_callbacks_t::on_cap` sets the callback function for the capture channel when a valid edge is detected.

The callback function provides event-specific data of type `mcpwm_capture_event_data_t`, so that you can get the edge of the capture signal in `mcpwm_capture_event_data_t::cap_edge` and the count value of that moment in `mcpwm_capture_event_data_t::cap_value`. To convert the capture count into a timestamp, you need to know the resolution of the capture timer by calling `mcpwm_capture_timer_get_resolution()`.

The callback function is called within the ISR context, so it should not attempt to block. For example, you may make sure that only FreeRTOS APIs with the `ISR` suffix are called within the function.

The parameter `user_data` of `mcpwm_capture_channel_register_event_callbacks()` function is used to save your context. It is passed to the callback function directly.

This function will lazy install interrupt service for the MCPWM capture channel, whereas the service can only be removed in `mcpwm_del_capture_channel`.

Enable and Disable Capture Channel  The capture channel is not enabled after allocation by `mcpwm_new_capture_channel()`. You should call `mcpwm_capture_channel_enable()` and `mcpwm_capture_channel_disable()` accordingly to enable or disable the channel. If the interrupt service is lazy installed during registering event callbacks for the channel in `mcpwm_capture_channel_register_event_callbacks()`, `mcpwm_capture_channel_enable()` will enable the interrupt service as well.

Enable and Disable Capture Timer  Before doing IO control to the capture timer, you need to enable the timer first, by calling `mcpwm_capture_timer_enable()`. Internally, this function:

- switches the capture timer state from `init` to `enable`.
- acquires a proper power management lock if a specific clock source (e.g., APB clock) is selected. See also Power management for more information.

On the contrary, calling `mcpwm_capture_timer_disable()` will put the timer driver back to `init` state, and release the power management lock.

Start and Stop Capture Timer  The basic IO operation of a capture timer is to start and stop. Calling `mcpwm_capture_timer_start()` can start the timer and calling `mcpwm_capture_timer_stop()` can stop the timer immediately.

Trigger a Software Capture Event  Sometimes, the software also wants to trigger a “fake” capture event. The `mcpwm_capture_channel_trigger_soft_catch()` is provided for that purpose. Please note that, even though it is a “fake” capture event, it can still cause an interrupt, thus your capture event callback function gets invoked as well.

Power Management  When power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will adjust the PLL and APB frequency before going into Light-sleep, thus potentially changing the period of an MCPWM timers’ counting step and leading to inaccurate time-keeping.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever the driver creates an MCPWM timer instance that has selected `MCPWM_TIMER_CLK_SRC_PLL160M` as its clock source, the driver guarantees that the power management lock is acquired when enabling the timer by `mcpwm_timer_enable()`. On the contrary, the driver releases the lock when `mcpwm_timer_disable()` is called for that timer.
Likewise, whenever the driver creates an MCPWM capture timer instance that has selected `MCPWM_CAPTURE_CLK_SRC_APB` as its clock source, the driver guarantees that the power management lock is acquired when enabling the timer by `mcpwm_capture_timer_enable()`. And releases the lock in `mcpwm_capture_timer_disable()`.

**IRAM Safe**  By default, the MCPWM interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the event callback functions will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option `CONFIG_MCPWM_ISR_IRAM_SAFE` that:

- enables the interrupt to be serviced even when the cache is disabled
- places all functions used by the ISR into IRAM
- places the driver object into DRAM (in case it is mapped to PSRAM by accident)

This allows the interrupt to run while the cache is disabled but comes at the cost of increased IRAM consumption.

There is another Kconfig option `CONFIG_MCPWM_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So, these functions can also be executable when the cache is disabled. The IO control function is as follows:

- `mcpwm_comparator_set_compare_value()`

**Thread Safety**  The factory functions like `mcpwm_new_timer()` are guaranteed to be thread-safe by the driver, which means, you can call it from different RTOS tasks without protection by extra locks.

The following function is allowed to run under the ISR context, as the driver uses a critical section to prevent them from being called concurrently in the task and ISR.

- `mcpwm_comparator_set_compare_value()`

Other functions that are not related to Resource Allocation and Initialization, are not thread-safe. Thus, you should avoid calling them in different tasks without mutex protection.

**Kconfig Options**

- `CONFIG_MCPWM_ISR_IRAM_SAFE` controls whether the default ISR handler can work when the cache is disabled, see IRAM Safe for more information.
- `CONFIG_MCPWM_CTRL_FUNC_IN_IRAM` controls where to place the MCPWM control functions (IRAM or flash), see IRAM Safe for more information.
- `CONFIG_MCPWM_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enabling this option will increase the firmware binary size.

**Application Examples**

- Brushed DC motor speed control by PID algorithm: `peripherals/mcpwm/mcpwm_bdc_speed_control`
- BLDC motor control with hall sensor feedback: `peripherals/mcpwm/mcpwm_bldc_hall_control`
- Ultrasonic sensor (HC-SR04) distance measurement: `peripherals/mcpwm/mcpwm_capture_hc_sr04`
- Servo motor angle control: `peripherals/mcpwm/mcpwm_servo_control`
- MCPWM synchronization between timers: `peripherals/mcpwm/mcpwm_sync`

---

The callback function and the sub-functions invoked by itself should also be placed in IRAM. You need to take care of this by yourself.
**Functions**

`esp_err_t mcpwm_new_timer(const mcpwm_timer_config_t *config, mcpwm_timer_handle_t *ret_timer)`  
Create MCPWM timer.

**Parameters**  
- `config` - [in] MCPWM timer configuration  
- `ret_timer` - [out] Returned MCPWM timer handle

**Returns**  
- ESP_OK: Create MCPWM timer successfully  
- ESP_ERR_INVALID_ARG: Create MCPWM timer failed because of invalid argument  
- ESP_ERR_NO_MEM: Create MCPWM timer failed because out of memory  
- ESP_ERR_NOT_FOUND: Create MCPWM timer failed because all hardware timers are used up and no more free one  
- ESP_FAIL: Create MCPWM timer failed because of other error

`esp_err_t mcpwm_del_timer(mcpwm_timer_handle_t timer)`  
Delete MCPWM timer.

**Parameters**  
- `timer` - [in] MCPWM timer handle, allocated by mcpwm_new_timer()

**Returns**  
- ESP_OK: Delete MCPWM timer successfully  
- ESP_ERR_INVALID_ARG: Delete MCPWM timer failed because of invalid argument  
- ESP_ERR_INVALID_STATE: Delete MCPWM timer failed because timer is not in init state  
- ESP_FAIL: Delete MCPWM timer failed because of other error

`esp_err_t mcpwm_timer_enable(mcpwm_timer_handle_t timer)`  
Enable MCPWM timer.

**Parameters**  
- `timer` - [in] MCPWM timer handle, allocated by mcpwm_new_timer()

**Returns**  
- ESP_OK: Enable MCPWM timer successfully  
- ESP_ERR_INVALID_ARG: Enable MCPWM timer failed because of invalid argument  
- ESP_ERR_INVALID_STATE: Enable MCPWM timer failed because timer is enabled already  
- ESP_FAIL: Enable MCPWM timer failed because of other error

`esp_err_t mcpwm_timer_disable(mcpwm_timer_handle_t timer)`  
Disable MCPWM timer.

**Parameters**  
- `timer` - [in] MCPWM timer handle, allocated by mcpwm_new_timer()

**Returns**  
- ESP_OK: Disable MCPWM timer successfully  
- ESP_ERR_INVALID_ARG: Disable MCPWM timer failed because of invalid argument  
- ESP_ERR_INVALID_STATE: Disable MCPWM timer failed because timer is disabled already  
- ESP_FAIL: Disable MCPWM timer failed because of other error

`esp_err_t mcpwm_timer_start_stop(mcpwm_timer_handle_t timer, mcpwm_timer_start_stop_cmd_t command)`  
Send specific start/stop commands to MCPWM timer.

**Parameters**  
- `timer` - [in] MCPWM timer handle, allocated by mcpwm_new_timer()  
- `command` - [in] Supported command list for MCPWM timer

**Returns**  
- ESP_OK: Start or stop MCPWM timer successfully  
- ESP_ERR_INVALID_ARG: Start or stop MCPWM timer failed because of invalid argument  
- ESP_ERR_INVALID_STATE: Start or stop MCPWM timer failed because timer is not enabled  
- ESP_FAIL: Start or stop MCPWM timer failed because of other error
**esp_err_t mcpwm_timer_register_event_callbacks**

```c
mcpwm_timer_register_event_callbacks(mcpwm_timer_handle_t timer, const
mcpwm_timer_event_callbacks_t *cbs, void
*user_data)
```

Set event callbacks for MCPWM timer.

**Note:** The first call to this function needs to be before the call to `mcpwm_timer_enable`

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

**Parameters**
- `timer` - [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- `cbs` - [in] Group of callback functions
- `user_data` - [in] User data, which will be passed to callback functions directly

**Returns**
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set event callbacks failed because timer is not in init state
- ESP_FAIL: Set event callbacks failed because of other error

**esp_err_t mcpwm_timer_set_phase_on_sync**

```c
mcpwm_timer_set_phase_on_sync(mcpwm_timer_handle_t timer, const
mcpwm_timer_sync_phase_config_t *config)
```

Set sync phase for MCPWM timer.

**Parameters**
- `timer` - [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- `config` - [in] MCPWM timer sync phase configuration

**Returns**
- ESP_OK: Set sync phase for MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Set sync phase for MCPWM timer failed because of invalid argument
- ESP_FAIL: Set sync phase for MCPWM timer failed because of other error

**Structures**

```c
struct mcpwm_timer_event_callbacks_t
```

Group of supported MCPWM timer event callbacks.

**Note:** The callbacks are all running under ISR environment

**Public Members**

```c
mcpwm_timer_event_cb_t on_full
```

Callback function when MCPWM timer counts to peak value

```c
mcpwm_timer_event_cb_t on_empty
```

Callback function when MCPWM timer counts to zero

```c
mcpwm_timer_event_cb_t on_stop
```

Callback function when MCPWM timer stops
structure `mcpwm_timer_config_t`
MCPWM timer configuration.

**Public Members**

- `int group_id`
  Specify from which group to allocate the MCPWM timer

- `mcpwm_timer_clock_source_t clk_src`
  MCPWM timer clock source

- `uint32_t resolution_hz`
  Counter resolution in Hz. The step size of each count tick equals to \((1 / \text{resolution\_hz})\) seconds

- `mcpwm_timer_count_mode_t count_mode`
  Count mode

- `uint32_t period_ticks`
  Number of count ticks within a period

- `int intr_priority`
  MCPWM timer interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1, 2, 3)

- `uint32_t update_period_on_empty`
  Whether to update period when timer counts to zero

- `uint32_t update_period_on_sync`
  Whether to update period on sync event

- `struct mcpwm_timer_config_t::[anonymous] flags`
  Extra configuration flags for timer

structure `mcpwm_timer_sync_phase_config_t`
MCPWM Timer sync phase configuration.

**Public Members**

- `mcpwm_sync_handle_t sync_src`
  The sync event source. Set to NULL will disable the timer being synced by others

- `uint32_t count_value`
  The count value that should lock to upon sync event

- `mcpwm_timer_direction_t direction`
  The count direction that should lock to upon sync event
Header File

- components/driver/mcpwm/include/driver/mcpwm_oper.h

Functions

```c
esp_err_t mcpwm_new_operator (const mcpwm_operator_config_t *config, mcpwm_oper_handle_t *ret_oper)
```
Create MCPWM operator.

**Parameters**
- `config` [in] MCPWM operator configuration
- `ret_oper` [out] Returned MCPWM operator handle

**Returns**
- ESP_OK: Create MCPWM operator successfully
- ESP_ERR_INVALID_ARG: Create MCPWM operator failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM operator failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM operator failed because can’t find free resource
- ESP_FAIL: Create MCPWM operator failed because of other error

```c
esp_err_t mcpwm_del_operator (mcpwm_oper_handle_t oper)
```
Delete MCPWM operator.

**Parameters**
- `oper` [in] MCPWM operator, allocated by mcpwm_new_operator()

**Returns**
- ESP_OK: Delete MCPWM operator successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM operator failed because of invalid argument
- ESP_FAIL: Delete MCPWM operator failed because of other error

```c
esp_err_t mcpwm_operator_connect_timer (mcpwm_oper_handle_t oper, mcpwm_timer_handle_t timer)
```
Connect MCPWM operator and timer, so that the operator can be driven by the timer.

**Parameters**
- `oper` [in] MCPWM operator handle, allocated by mcpwm_new_operator()
- `timer` [in] MCPWM timer handle, allocated by mcpwm_new_timer()

**Returns**
- ESP_OK: Connect MCPWM operator and timer successfully
- ESP_ERR_INVALID_ARG: Connect MCPWM operator and timer failed because of invalid argument
- ESP_FAIL: Connect MCPWM operator and timer failed because of other error

```c
esp_err_t mcpwm_operator_set_brake_on_fault (mcpwm_oper_handle_t oper, const mcpwm_brake_config_t *config)
```
Set brake method for MCPWM operator.

**Parameters**
- `oper` [in] MCPWM operator, allocated by mcpwm_new_operator()
- `config` [in] MCPWM brake configuration

**Returns**
- ESP_OK: Set trip for operator successfully
- ESP_ERR_INVALID_ARG: Set trip for operator failed because of invalid argument
- ESP_FAIL: Set trip for operator failed because of other error

```c
esp_err_t mcpwm_operator_recover_from_fault (mcpwm_oper_handle_t oper, mcpwm_fault_handle_t fault)
```
Try to make the operator recover from fault.

---

**Note:** To recover from fault or escape from trip, you must make sure the fault signal has dissipated already. Otherwise the recovery can’t succeed.
Chapter 2. API Reference

### Parameters
- **oper** - [in] MCPWM operator, allocated by `mcpwm_new_operator()`
- **fault** - [in] MCPWM fault handle

### Returns
- ESP_OK: Recover from fault successfully
- ESP_ERR_INVALID_ARG: Recover from fault failed because of invalid argument
- ESP_ERR_INVALID_STATE: Recover from fault failed because the fault source is still active
- ESP_FAIL: Recover from fault failed because of other error

```c
esp_err_t mcpwm_operator_register_event_callbacks(
mcpwm_oper_handle_t oper,
const mcpwm_operator_event_callbacks_t *cbs,
void *user_data)
```

Set event callbacks for MCPWM operator.

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

### Parameters
- **oper** - [in] MCPWM operator handle, allocated by `mcpwm_new_operator()`
- **cbs** - [in] Group of callback functions
- **user_data** - [in] User data, which will be passed to callback functions directly

### Returns
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

```c
esp_err_t mcpwm_operator_apply_carrier(
mcpwm_oper_handle_t oper,
const mcpwm_carrier_config_t *config)
```

Apply carrier feature for MCPWM operator.

**Parameters**
- **oper** - [in] MCPWM operator, allocated by `mcpwm_new_operator()`
- **config** - [in] MCPWM carrier specific configuration

**Returns**
- ESP_OK: Set carrier for operator successfully
- ESP_ERR_INVALID_ARG: Set carrier for operator failed because of invalid argument
- ESP_FAIL: Set carrier for operator failed because of other error

### Structures

```c
struct mcpwm_operator_config_t
```

MCPWM operator configuration.

### Public Members

\item \texttt{mcpwm\_operator\_brake\_mode\_t brake\_mode} \\
Brake mode
\item \texttt{uint32\_t cbc\_recover\_on\_tez} \\
Recovery CBC brake state on tez event
\item \texttt{uint32\_t cbc\_recover\_on\_tep} \\
Recovery CBC brake state on tep event
\end{itemize}

\textbf{Note:} The callbacks are all running under ISR environment
Public Members

`mcpwm_brake_event_cb_t on_brake_cbc`
- callback function when `mcpwm` operator brakes in CBC

`mcpwm_brake_event_cb_t on_brake_ost`
- callback function when `mcpwm` operator brakes in OST

`struct mcpwm_carrier_config_t`
- MCPWM carrier configuration structure.

Public Members

`mcpwm_carrier_clock_source_t clk_src`
- MCPWM carrier clock source

`uint32_t frequency_hz`
- Carrier frequency in Hz

`uint32_t first_pulse_duration_us`
- The duration of the first PWM pulse, in us

`float duty_cycle`
- Carrier duty cycle

`uint32_t invert_before_modulate`
- Invert the raw signal

`uint32_t invert_after_modulate`
- Invert the modulated signal

`struct mcpwm_carrier_config_t::[anonymous] flags`
- Extra flags for carrier configuration

Header File

- components/driver/mcpwm/include/driver/mcpwm_cmpr.h

Functions

`esp_err_t mcpwm_new_comparator (mcpwm_oper_handle_t oper, const mcpwm_comparator_config_t *config, mcpwm_cmpr_handle_t *ret_cmpr)`

Create MCPWM comparator.

Parameters

  - `oper` - [in] MCPWM operator, allocated by `mcpwm_new_operator()`, the new comparator will be allocated from this operator
  - `config` - [in] MCPWM comparator configuration
  - `ret_cmpr` - [out] Returned MCPWM comparator

Returns

  - ESP_OK: Create MCPWM comparator successfully
Chapter 2. API Reference

• ESP_ERR_INVALID_ARG: Create MCPWM comparator failed because of invalid argument
• ESP_ERR_NO_MEM: Create MCPWM comparator failed because out of memory
• ESP_ERR_NOT_FOUND: Create MCPWM comparator failed because can’t find free resource
• ESP_FAIL: Create MCPWM comparator failed because of other error

**esp_err_t mcpwm_del_comparator** (mcpwm_cmpr_handle_t cmpr)

Delete MCPWM comparator.

**Parameters**
- **cmpr** - [in] MCPWM comparator handle, allocated by mcpwm_new_comparator()  

**Returns**
- ESP_OK: Delete MCPWM comparator successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM comparator failed because of invalid argument
- ESP_FAIL: Delete MCPWM comparator failed because of other error

**esp_err_t mcpwm_comparator_register_event_callbacks** (mcpwm_cmpr_handle_t cmpr, const mcpwm_comparator_event_callbacks_t *cbs, void *user_data)

Set event callbacks for MCPWM comparator.

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the cbs structure to NULL.

**Parameters**
- **cmpr** - [in] MCPWM comparator handle, allocated by mcpwm_new_comparator()  
- **cbs** - [in] Group of callback functions  
- **user_data** - [in] User data, which will be passed to callback functions directly  

**Returns**
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

**esp_err_t mcpwm_comparator_set_compare_value** (mcpwm_cmpr_handle_t cmpr, uint32_t cmp_ticks)

Set MCPWM comparator’s compare value.

**Parameters**
- **cmpr** - [in] MCPWM comparator handle, allocated by mcpwm_new_comparator()  
- **cmp_ticks** - [in] The new compare value  

**Returns**
- ESP_OK: Set MCPWM compare value successfully  
- ESP_ERR_INVALID_ARG: Set MCPWM compare value failed because of invalid argument (e.g. the cmp_ticks is out of range)  
- ESP_ERR_INVALID_STATE: Set MCPWM compare value failed because the operator doesn’t have a timer connected  
- ESP_FAIL: Set MCPWM compare value failed because of other error

**Structures**

```c
struct mcpwm_comparator_config_t

MCPWM comparator configuration.
```

**Public Members**
```c
int intr_priority
MCPWM comparator interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t update_cmp_on_tez
Whether to update compare value when timer count equals to zero (tez)

uint32_t update_cmp_on_tep
Whether to update compare value when timer count equals to peak (tep)

uint32_t update_cmp_on_sync
Whether to update compare value on sync event

struct mcpwm_comparator_config_t::[anonymous] flags
Extra configuration flags for comparator

struct mcpwm_comparator_event_callbacks_t
Group of supported MCPWM compare event callbacks.

Note: The callbacks are all running under ISR environment

Public Members

mcpwm_compare_event_cb_t on_reach
ISR callback function which would be invoked when counter reaches compare value

Header File
• components/driver/mcpwm/include/driver/mcpwm_gen.h

Functions

esp_err_t mcpwm_new_generator (mcpwm_oper_handle_t oper, const mcpwm_generator_config_t *config,
mcpwm_gen_handle_t *ret_gen)
Allocate MCPWM generator from given operator.

Parameters
• oper - [in] MCPWM operator, allocated by mcpwm_new_operator()
• config - [in] MCPWM generator configuration
• ret_gen - [out] Returned MCPWM generator

Returns
• ESP_OK: Create MCPWM generator successfully
• ESP_ERR_INVALID_ARG: Create MCPWM generator failed because of invalid argument
• ESP_ERR_NO_MEM: Create MCPWM generator failed because out of memory
• ESP_ERR_NOT_FOUND: Create MCPWM generator failed because can’t find free resource
• ESP_FAIL: Create MCPWM generator failed because of other error

esp_err_t mcpwm_del_generator (mcpwm_gen_handle_t gen)
Delete MCPWM generator.

Parameters gen - [in] MCPWM generator handle, allocated by mcpwm_new_generator()
Returns

- ESP_OK: Delete MCPWM generator successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM generator failed because of invalid argument
- ESP_FAIL: Delete MCPWM generator failed because of other error

```c
esp_err_t mcpwm_generator_set_force_level (mcpwm_gen_handle_t gen, int level, bool hold_on)
```

Set force level for MCPWM generator.

**Note:** The force level will be applied to the generator immediately, regardless any other events that would change the generator’s behaviour.

**Note:** If the `hold_on` is true, the force level will retain forever, until user removes the force level by setting the force level to -1.

**Note:** If the `hold_on` is false, the force level can be overridden by the next event action.

**Note:** The force level set by this function can be inverted by GPIO matrix or dead-time module. So the level set here doesn’t equal to the final output level.

**Parameters**

- `gen` - [in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- `level` - [in] GPIO level to be applied to MCPWM generator, specially, -1 means to remove the force level
- `hold_on` - [in] Whether the forced PWM level should retain (i.e. will remain unchanged until manually remove the force level)

**Returns**

- ESP_OK: Set force level for MCPWM generator successfully
- ESP_ERR_INVALID_ARG: Set force level for MCPWM generator failed because of invalid argument
- ESP_FAIL: Set force level for MCPWM generator failed because of other error

```c
esp_err_t mcpwm_generator_set_action_on_timer_event (mcpwm_gen_handle_t gen, mcpwm_gen_timer_event_action_t ev_act)
```

Set generator action on MCPWM timer event.

**Parameters**

- `gen` - [in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- `ev_act` - [in] MCPWM timer event action, can be constructed by `MCPWM_GEN_TIMER_EVENT_ACTION` helper macro

**Returns**

- ESP_OK: Set generator action successfully
- ESP_ERR_INVALID_ARG: Set generator action failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set generator action failed because of timer is not connected to operator
- ESP_FAIL: Set generator action failed because of other error

```c
esp_err_t mcpwm_generator_set_actions_on_timer_event (mcpwm_gen_handle_t gen, mcpwm_gen_timer_event_action_t ev_act, ...)
```

Set generator actions on multiple MCPWM timer events.
Chapter 2. API Reference

Note: This is an aggregation version of `mcpwm_generator_set_action_on_timer_event`, which allows user to set multiple actions in one call.

**Parameters**

- **gen** - [in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** - [in] MCPWM timer event action list, must be terminated by `MCPWM_GEN_TIMER_EVENT_ACTION_END()`

**Returns**

- ESP_OK: Set generator actions successfully
- ESP_ERR_INVALID_ARG: Set generator actions failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set generator actions failed because of timer is not connected to operator
- ESP_FAIL: Set generator actions failed because of other error

```c
esp_err_t mcpwm_generator_set_action_on_compare_event (mcpwm_gen_handle_t generator, mcpwm_gen_compare_event_action_t ev_act)
```

Set generator action on MCPWM compare event.

**Parameters**

- **generator** - [in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** - [in] MCPWM compare event action, can be constructed by `MCPWM_GEN_COMPARE_EVENT_ACTION` helper macro

**Returns**

- ESP_OK: Set generator action successfully
- ESP_ERR_INVALID_ARG: Set generator action failed because of invalid argument
- ESP_FAIL: Set generator action failed because of other error

```c
esp_err_t mcpwm_generator_set_actions_on_compare_event (mcpwm_gen_handle_t generator, mcpwm_gen_compare_event_action_t ev_act, ...)
```

Set generator actions on multiple MCPWM compare events.

Note: This is an aggregation version of `mcpwm_generator_set_action_on_compare_event`, which allows user to set multiple actions in one call.

**Parameters**

- **generator** - [in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** - [in] MCPWM compare event action list, must be terminated by `MCPWM_GEN_COMPARE_EVENT_ACTION_END()`

**Returns**

- ESP_OK: Set generator actions successfully
- ESP_ERR_INVALID_ARG: Set generator actions failed because of invalid argument
- ESP_FAIL: Set generator actions failed because of other error

```c
esp_err_t mcpwm_generator_set_action_on_brake_event (mcpwm_gen_handle_t generator, mcpwm_gen_brake_event_action_t ev_act)
```

Set generator action on MCPWM brake event.

**Parameters**

- **generator** - [in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
• **ev_act** - [in] MCPWM brake event action, can be constructed by `MCPWM_GEN_BRAKE_EVENT_ACTION` helper macro

**Returns**
- ESP_OK: Set generator action successfully
- ESP_ERR_INVALID_ARG: Set generator action failed because of invalid argument
- ESP_FAIL: Set generator action failed because of other error

```c
esp_err_t mcpwm_generator_set_actions_on_brake_event(mcpwm_gen_handle_t generator,
                                                 mcpwm_gen_brake_event_action_t ev_act, ...)
```

Set generator actions on multiple MCPWM brake events.

**Note:** This is an aggregation version of `mcpwm_generator_set_action_on_brake_event`, which allows user to set multiple actions in one call.

**Parameters**
- **generator** - [in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** - [in] MCPWM brake event action list, must be terminated by `MCPWM_GEN_BRAKE_EVENT_ACTION_END()`

**Returns**
- ESP_OK: Set generator actions successfully
- ESP_ERR_INVALID_ARG: Set generator actions failed because of invalid argument
- ESP_FAIL: Set generator actions failed because of other error

```c
esp_err_t mcpwm_generator_set_action_on_fault_event(mcpwm_gen_handle_t generator,
                                                   mcpwm_gen_fault_event_action_t ev_act)
```

Set generator action on MCPWM Fault event.

**Parameters**
- **generator** - [in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** - [in] MCPWM trigger event action, can be constructed by `MCPWM_GEN_FAULT_EVENT_ACTION` helper macro

**Returns**
- ESP_OK: Set generator action successfully
- ESP_ERR_INVALID_ARG: Set generator action failed because of invalid argument
- ESP_FAIL: Set generator action failed because of other error

```c
esp_err_t mcpwm_generator_set_action_on_sync_event(mcpwm_gen_handle_t generator,
                                                   mcpwm_gen_sync_event_action_t ev_act)
```

Set generator action on MCPWM Sync event.

**Note:** The trigger only support one sync action, regardless of the kinds. Should not call this function more than once.

**Parameters**
- **generator** - [in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** - [in] MCPWM trigger event action, can be constructed by `MCPWM_GEN_SYNC_EVENT_ACTION` helper macro

**Returns**
- ESP_OK: Set generator action successfully
- ESP_ERR_INVALID_ARG: Set generator action failed because of invalid argument
- ESP_FAIL: Set generator action failed because of other error
`esp_err_t mcpwm_generator_set_dead_time(mcpwm_gen_handle_t in_generator, mcpwm_gen_handle_t out_generator, const mcpwm_dead_time_config_t *config)`

Set dead time for MCPWM generator.

**Note:** Due to a hardware limitation, you can’t set rising edge delay for both MCPWM generator 0 and 1 at the same time, otherwise, there will be a conflict inside the dead time module. The same goes for the falling edge setting. But you can set both the rising edge and falling edge delay for the same MCPWM generator.

**Parameters**
- `in_generator` [in] MCPWM generator, before adding the dead time
- `out_generator` [in] MCPWM generator, after adding the dead time
- `config` [in] MCPWM dead time configuration

**Returns**
- `ESP_OK`: Set dead time for MCPWM generator successfully
- `ESP_ERR_INVALID_ARG`: Set dead time for MCPWM generator failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set dead time for MCPWM generator failed because of invalid state (e.g. delay module is already in use by other generator)
- `ESP_FAIL`: Set dead time for MCPWM generator failed because of other error

**Structures**

`struct mcpwm_generator_config_t`  
MCPWM generator configuration.

**Public Members**

`int gen_gpio_num`  
The GPIO number used to output the PWM signal

`uint32_t invert_pwm`  
Whether to invert the PWM signal (done by GPIO matrix)

`uint32_t io_loop_back`  
For debug/test, the signal output from the GPIO will be fed to the input path as well

`uint32_t io_od_mode`  
Configure the GPIO as open-drain mode

`uint32_t pull_up`  
Whether to pull up internally

`uint32_t pull_down`  
Whether to pull down internally

`struct mcpwm_generator_config_t::[anonymous] flags`  
Extra configuration flags for generator

`struct mcpwm_gen_timer_event_action_t`  
Generator action on specific timer event.
Public Members

`mcpwm_timer_direction_t` `direction`
Timer direction

`mcpwm_timer_event_t` `event`
Timer event

`mcpwm_generator_action_t` `action`
Generator action should perform

```c
struct mcpwm_gen_compare_event_action_t
```
Generator action on specific comparator event.

Public Members

`mcpwm_timer_direction_t` `direction`
Timer direction

`mcpwm_cmpr_handle_t` `comparator`
Comparator handle

`mcpwm_generator_action_t` `action`
Generator action should perform

```c
struct mcpwm_gen_brake_event_action_t
```
Generator action on specific brake event.

Public Members

`mcpwm_timer_direction_t` `direction`
Timer direction

`mcpwm_operator_brake_mode_t` `brake_mode`
Brake mode

`mcpwm_generator_action_t` `action`
Generator action should perform

```c
struct mcpwm_gen_fault_event_action_t
```
Generator action on specific fault event.

Public Members

`mcpwm_timer_direction_t` `direction`
Timer direction
**mcpwm_fault_handle_t fault**
Which fault as the trigger. Only support GPIO fault

**mcpwm_generator_action_t action**
Generator action should perform

**struct mcpwm_gen_sync_event_action_t**
Generator action on specific sync event.

**Public Members**

**mcpwm_timer_direction_t direction**
Timer direction

**mcpwm_sync_handle_t sync**
Which sync as the trigger

**mcpwm_generator_action_t action**
Generator action should perform

**struct mcpwm_dead_time_config_t**
MCPWM dead time configuration structure.

**Public Members**

**uint32_t posedge_delay_ticks**
delay time applied to rising edge, 0 means no rising delay time

**uint32_t negedge_delay_ticks**
delay time applied to falling edge, 0 means no falling delay time

**uint32_t invert_output**
Invert the signal after applied the dead time

**struct mcpwm_dead_time_config_t::[anonymous] flags**
Extra flags for dead time configuration

**Macros**

**MCPWM_GEN_TIMER_EVENT_ACTION** (dir, ev, act)
Help macros to construct a mcpwm_gen_timer_event_action_t entry.

**MCPWM_GEN_TIMER_EVENT_ACTION_END** ()

**MCPWM_GENCOMPARE_EVENT_ACTION** (dir, cmp, act)
Help macros to construct a mcpwm_gen_compare_event_action_t entry.

**MCPWM_GENCOMPARE_EVENT_ACTION_END** ()

**MCPWM_GEN_BRAKE_EVENT_ACTION** (dir, mode, act)
Help macros to construct a mcpwm_gen_brake_event_action_t entry.
**MCPWM_GEN_BRAKE_EVENT_ACTION_END()**

**MCPWM_GEN_FAULT_EVENT_ACTION** (dir, flt, act)

Help macros to construct a `mcpwm_gen_fault_event_action_t` entry.

**MCPWM_GEN_SYNC_EVENT_ACTION** (dir, syn, act)

Help macros to construct a `mcpwm_gen_sync_event_action_t` entry.

**Header File**

- components/driver/mcpwm/include/driver/mcpwm_fault.h

**Functions**

**esp_err_t mcpwm_new_gpio_fault** (const `mcpwm_gpio_fault_config_t` *config, `mcpwm_fault_handle_t` *ret_fault)

Create MCPWM GPIO fault.

**Parameters**

- config [in] MCPWM GPIO fault configuration
- ret_fault [out] Returned GPIO fault handle

**Returns**

- ESP_OK: Create MCPWM GPIO fault successfully
- ESP_ERR_INVALID_ARG: Create MCPWM GPIO fault failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM GPIO fault failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM GPIO fault failed because can’t find free resource
- ESP_FAIL: Create MCPWM GPIO fault failed because of other error

**esp_err_t mcpwm_new_soft_fault** (const `mcpwm_soft_fault_config_t` *config, `mcpwm_fault_handle_t` *ret_fault)

Create MCPWM software fault.

**Parameters**

- config [in] MCPWM software fault configuration
- ret_fault [out] Returned software fault handle

**Returns**

- ESP_OK: Create MCPWM software fault successfully
- ESP_ERR_INVALID_ARG: Create MCPWM software fault failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM software fault failed because out of memory
- ESP_FAIL: Create MCPWM software fault failed because of other error

**esp_err_t mcpwm_del_fault** (`mcpwm_fault_handle_t` fault)

Delete MCPWM fault.

**Parameters**

- fault [in] MCPWM fault handle allocated by `mcpwm_new_gpio_fault()` or `mcpwm_new_soft_fault()`

**Returns**

- ESP_OK: Delete MCPWM fault successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM fault failed because of invalid argument
- ESP_FAIL: Delete MCPWM fault failed because of other error

**esp_err_t mcpwm_soft_fault_activate** (`mcpwm_fault_handle_t` fault)

Activate the software fault, trigger the fault event for once.

**Parameters**

- fault [in] MCPWM soft fault, allocated by `mcpwm_new_soft_fault()`

**Returns**

- ESP_OK: Trigger MCPWM software fault event successfully
- ESP_ERR_INVALID_ARG: Trigger MCPWM software fault event failed because of invalid argument
Chapter 2. API Reference

- ESP_FAIL: Trigger MCPWM software fault event failed because of other error

```c
esp_err_t mcpwm_fault_register_event_callbacks(mcpwm_fault_handle_t fault, const mcpwm_fault_event_callbacks_t *cbs, void *user_data)
```

Set event callbacks for MCPWM fault.

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

**Parameters**

- `fault` — [in] MCPWM GPIO fault handle, allocated by `mcpwm_new_gpio_fault()`
- `cbs` — [in] Group of callback functions
- `user_data` — [in] User data, which will be passed to callback functions directly

**Returns**

- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

**Structures**

```c
struct mcpwm_gpio_fault_config_t
```

MCPWM GPIO fault configuration structure.

**Public Members**

- `int group_id`
  In which MCPWM group that the GPIO fault belongs to

- `int intr_priority`
  MCPWM GPIO fault interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

- `int gpio_num`
  GPIO used by the fault signal

- `uint32_t active_level`
  On which level the fault signal is treated as active

- `uint32_t io_loop_back`
  For debug/test, the signal output from the GPIO will be fed to the input path as well

- `uint32_t pull_up`
  Whether to pull up internally

- `uint32_t pull_down`
  Whether to pull down internally

```c
struct mcpwm_gpio_fault_config_t::[anonymous] flags
```

Extra configuration flags for GPIO fault
struct mcpwm_soft_fault_config_t
MCPWM software fault configuration structure.

struct mcpwm_fault_event_callbacks_t
Group of supported MCPWM fault event callbacks.

Note: The callbacks are all running under ISR environment

Public Members

mcpwm_fault_event_cb_t on_fault_enter
ISR callback function that would be invoked when fault signal becomes active

mcpwm_fault_event_cb_t on_fault_exit
ISR callback function that would be invoked when fault signal becomes inactive

Header File

• components/driver/mcpwm/include/driver/mcpwm_sync.h

Functions

esp_err_t mcpwm_new_timer_sync_src (mcpwm_timer_handle_t timer, const
mcpwm_timer_sync_src_config_t *config, mcpwm_sync_handle_t
*ret_sync)
Create MCPWM timer sync source.

Parameters
• timer – [in] MCPWM timer handle, allocated by mcpwm_new_timer()
• config – [in] MCPWM timer sync source configuration
• ret_sync – [out] Returned MCPWM sync handle

Returns
• ESP_OK: Create MCPWM timer sync source successfully
• ESP_ERR_INVALID_ARG: Create MCPWM timer sync source failed because of invalid argument
• ESP_ERR_NO_MEM: Create MCPWM timer sync source failed because out of memory
• ESP_ERR_INVALID_STATE: Create MCPWM timer sync source failed because the timer has created a sync source before
• ESP_FAIL: Create MCPWM timer sync source failed because of other error

esp_err_t mcpwm_new_gpio_sync_src (const mcpwm_gpio_sync_src_config_t *config,
mcpwm_sync_handle_t *ret_sync)
Create MCPWM GPIO sync source.

Parameters
• config – [in] MCPWM GPIO sync source configuration
• ret_sync – [out] Returned MCPWM GPIO sync handle

Returns
• ESP_OK: Create MCPWM GPIO sync source successfully
• ESP_ERR_INVALID_ARG: Create MCPWM GPIO sync source failed because of invalid argument
• ESP_ERR_NO_MEM: Create MCPWM GPIO sync source failed because out of memory
• ESP_ERR_NOT_FOUND: Create MCPWM GPIO sync source failed because can’t find free resource
**Chapter 2. API Reference**

- ESP_FAIL: Create MCPWM GPIO sync source failed because of other error

```c
esp_err_t mcpwm_new_soft_sync_src(const mcpwm_soft_sync_config_t *config, mcpwm_sync_handle_t *ret_sync)
```

Create MCPWM software sync source.

**Parameters**
- `config` — [in] MCPWM software sync source configuration
- `ret_sync` — [out] Returned software sync handle

**Returns**
- ESP_OK: Create MCPWM software sync successfully
- ESP_ERR_INVALID_ARG: Create MCPWM software sync failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM software sync failed because out of memory
- ESP_FAIL: Create MCPWM software sync failed because of other error

```c
esp_err_t mcpwm_del_sync_src(mcpwm_sync_handle_t sync)
```

Delete MCPWM sync source.

**Parameters**
- `sync` — [in] MCPWM sync handle, allocated by `mcpwm_new_timer_sync_src()` or `mcpwm_new_gpio_sync_src()` or `mcpwm_new_soft_sync_src()`

**Returns**
- ESP_OK: Delete MCPWM sync source successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM sync source failed because of invalid argument
- ESP_FAIL: Delete MCPWM sync source failed because of other error

```c
esp_err_t mcpwm_soft_sync_activate(mcpwm_sync_handle_t sync)
```

Activate the software sync, trigger the sync event for once.

**Parameters**
- `sync` — [in] MCPWM soft sync handle, allocated by `mcpwm_new_soft_sync_src()`

**Returns**
- ESP_OK: Trigger MCPWM software sync event successfully
- ESP_ERR_INVALID_ARG: Trigger MCPWM software sync event failed because of invalid argument
- ESP_FAIL: Trigger MCPWM software sync event failed because of other error

**Structures**

```c
struct mcpwm_timer_sync_src_config_t
MCPWM timer sync source configuration.
```

**Public Members**

- `mcpwm_timer_event_t timer_event`
  Timer event, upon which MCPWM timer will generate the sync signal

- `uint32_t propagate_input_sync`
  The input sync signal would be routed to its sync output

- `struct mcpwm_timer_sync_src_config_t::*[anonymous] flags`
  Extra configuration flags for timer sync source

- `struct mcpwm_gpio_sync_src_config_t`
  MCPWM GPIO sync source configuration.
Chapter 2. API Reference

Public Members

int group_id
    MCPWM group ID

int gpio_num
    GPIO used by sync source

uint32_t active_neg
    Whether the sync signal is active on negedge, by default, the sync signal’s posedge is treated as active

uint32_t io_loop_back
    For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32_t pull_up
    Whether to pull up internally

uint32_t pull_down
    Whether to pull down internally

struct mcpwm_gpio_sync_src_config_t::[anonymous] flags
    Extra configuration flags for GPIO sync source

struct mcpwm_soft_sync_config_t
    MCPWM software sync configuration structure.

Header File

- components/driver/mcpwm/include/driver/mcpwm_cap.h

Functions

esp_err_t mcpwm_new_capture_timer(const mcpwm_capture_timer_config_t *config, mcpwm_cap_timer_handle_t *ret_cap_timer)
    Create MCPWM capture timer.

Parameters

- config -[in] MCPWM capture timer configuration
- ret_cap_timer -[out] Returned MCPWM capture timer handle

Returns

- ESP_OK: Create MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Create MCPWM capture timer failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM capture timer failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM capture timer failed because can’t find free resource
- ESP_FAIL: Create MCPWM capture timer failed because of other error

esp_err_t mcpwm_del_capture_timer(mcpwm_cap_timer_handle_t cap_timer)
    Delete MCPWM capture timer.

Parameters cap_timer -[in] MCPWM capture timer, allocated by mcpwm_new_capture_timer()

Returns

- ESP_OK: Delete MCPWM capture timer successfully
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG: Delete MCPWM capture timer failed because of invalid argument
- ESP_FAIL: Delete MCPWM capture timer failed because of other error

```c
esp_err_t mcpwm_capture_timer_enable (mcpwm_cap_timer_handle_t cap_timer)
```
Enable MCPWM capture timer.

**Parameters**
- `cap_timer` - [in] MCPWM capture timer handle, allocated by `mcpwm_new_capture_timer`

**Returns**
- ESP_OK: Enable MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Enable MCPWM capture timer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable MCPWM capture timer failed because timer is enabled already
- ESP_FAIL: Enable MCPWM capture timer failed because of other error

```c
esp_err_t mcpwm_capture_timer_disable (mcpwm_cap_timer_handle_t cap_timer)
```
Disable MCPWM capture timer.

**Parameters**
- `cap_timer` - [in] MCPWM capture timer handle, allocated by `mcpwm_new_capture_timer`

**Returns**
- ESP_OK: Disable MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Disable MCPWM capture timer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable MCPWM capture timer failed because timer is disabled already
- ESP_FAIL: Disable MCPWM capture timer failed because of other error

```c
esp_err_t mcpwm_capture_timer_start (mcpwm_cap_timer_handle_t cap_timer)
```
Start MCPWM capture timer.

**Parameters**
- `cap_timer` - [in] MCPWM capture timer, allocated by `mcpwm_new_capture_timer`

**Returns**
- ESP_OK: Start MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Start MCPWM capture timer failed because of invalid argument
- ESP_FAIL: Start MCPWM capture timer failed because of other error

```c
esp_err_t mcpwm_capture_timer_stop (mcpwm_cap_timer_handle_t cap_timer)
```
Start MCPWM capture timer.

**Parameters**
- `cap_timer` - [in] MCPWM capture timer, allocated by `mcpwm_new_capture_timer`

**Returns**
- ESP_OK: Stop MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Stop MCPWM capture timer failed because of invalid argument
- ESP_FAIL: Stop MCPWM capture timer failed because of other error

```c
esp_err_t mcpwm_capture_timer_get_resolution (mcpwm_cap_timer_handle_t cap_timer, uint32_t *out_resolution)
```
Get MCPWM capture timer resolution, in Hz.

**Parameters**
- `cap_timer` - [in] MCPWM capture timer, allocated by `mcpwm_new_capture_timer`
- `out_resolution` - [out] Returned capture timer resolution, in Hz

**Returns**
- ESP_OK: Get capture timer resolution successfully

Espressif Systems 1355 Release v5.2-dev-3318-g8fc8f3f479
Submit Document Feedback
• ESP_ERR_INVALID_ARG: Get capture timer resolution failed because of invalid argument
• ESP_FAIL: Get capture timer resolution failed because of other error

```
esp_err_t mcpwm_capture_timer_set_phase_on_sync
(mcpwm_cap_timer_handle_t cap_timer,
 const mcpwm_capture_timer_sync_phase_config_t *config)
```

Set sync phase for MCPWM capture timer.

**Parameters**
- `cap_timer` - [in] MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`
- `config` - [in] MCPWM capture timer sync phase configuration

**Returns**
- ESP_OK: Set sync phase for MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Set sync phase for MCPWM capture timer failed because of invalid argument
- ESP_FAIL: Set sync phase for MCPWM capture timer failed because of other error

```
esp_err_t mcpwm_new_capture_channel
(mcpwm_cap_timer_handle_t cap_timer,
 const mcpwm_capture_channel_config_t *config,
 mcpwm_cap_channel_handle_t *ret_cap_channel)
```

Create MCPWM capture channel.

**Note:** The created capture channel won’t be enabled until calling `mcpwm_capture_channel_enable`

```
esp_err_t mcpwm_del_capture_channel
(mcpwm_cap_channel_handle_t cap_channel)
```

Delete MCPWM capture channel.

**Parameters**
- `cap_channel` - [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

**Returns**
- ESP_OK: Delete MCPWM capture channel successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM capture channel failed because of invalid argument
- ESP_FAIL: Delete MCPWM capture channel failed because of other error

```
esp_err_t mcpwm_capture_channel_enable
(mcpwm_cap_channel_handle_t cap_channel)
```

Enable MCPWM capture channel.

**Note:** This function will transit the channel state from init to enable.
Chapter 2. API Reference

**Note:** This function will enable the interrupt service, if it’s lazy installed in `mcpwm_capture_channel_register_event_callbacks()`.

### Parameters `cap_channel` -[in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

### Returns
- ESP_OK: Enable MCPWM capture channel successfully
- ESP_ERR_INVALID_ARG: Enable MCPWM capture channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable MCPWM capture channel failed because the channel is already enabled
- ESP_FAIL: Enable MCPWM capture channel failed because of other error

```c
esp_err_t mcpwm_capture_channel_enable(mcpwm_cap_channel_handle_t cap_channel)
```

Disable MCPWM capture channel.

### Parameters `cap_channel` -[in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

### Returns
- ESP_OK: Disable MCPWM capture channel successfully
- ESP_ERR_INVALID_ARG: Disable MCPWM capture channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable MCPWM capture channel failed because the channel is not enabled yet
- ESP_FAIL: Disable MCPWM capture channel failed because of other error

```c
esp_err_t mcpwm_capture_channel_disable(mcpwm_cap_channel_handle_t cap_channel)
```

Set event callbacks for MCPWM capture channel.

**Note:** The first call to this function needs to be before the call to `mcpwm_capture_channel_enable`

```
esp_err_t mcpwm_capture_channel_register_event_callbacks(mcpwm_cap_channel_handle_t cap_channel, const mcpwm_capture_event_callbacks_t *cbs, void *user_data)
```

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

```
esp_err_t mcpwm_capture_channel_trigger_soft_catch(mcpwm_cap_channel_handle_t cap_channel)
```

Trigger a catch by software.
**Chapter 2. API Reference**

**Parameters**

`cap_channel` - [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

**Returns**

- ESP_OK: Trigger software catch successfully
- ESP_ERR_INVALID_ARG: Trigger software catch failed because of invalid argument
- ESP_ERR_INVALID_STATE: Trigger software catch failed because the channel is not enabled yet
- ESP_FAIL: Trigger software catch failed because of other error

**Structures**

**struct mcpwm_capture_timer_config_t**

MCPWM capture timer configuration structure.

**Public Members**

- `int group_id`
  Specify from which group to allocate the capture timer

- `mcpwm_capture_clock_source_t clk_src`
  MCPWM capture timer clock source

- `uint32_t resolution_hz`
  Resolution of capture timer

**struct mcpwm_capture_timer_sync_phase_config_t**

MCPWM Capture timer sync phase configuration.

**Public Members**

- `mcpwm_sync_handle_t sync_src`
  The sync event source

- `uint32_t count_value`
  The count value that should lock to upon sync event

- `mcpwm_timer_direction_t direction`
  The count direction that should lock to upon sync event

**struct mcpwm_capture_channel_config_t**

MCPWM capture channel configuration structure.

**Public Members**

- `int gpio_num`
  GPIO used capturing input signal
Chapter 2. API Reference

int intr_priority
MCPWM capture interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t prescale
Prescale of input signal, effective frequency = cap_input_clk/prescale

uint32_t pos_edge
Whether to capture on positive edge

uint32_t neg_edge
Whether to capture on negative edge

uint32_t pull_up
Whether to pull up internally

uint32_t pull_down
Whether to pull down internally

uint32_t invert_cap_signal
Invert the input capture signal

uint32_t io_loop_back
For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32_t keep_io_conf_at_exit
For debug/test, whether to keep the GPIO configuration when capture channel is deleted. By default, driver will reset the GPIO pin at exit.

struct mcpwm_capture_channel_config_t::[anonymous] flags
Extra configuration flags for capture channel

struct mcpwm_capture_event_callbacks_t
Group of supported MCPWM capture event callbacks.

Note: The callbacks are all running under ISR environment

Public Members

mcpwm_capture_event_cb_t on_cap
Callback function that would be invoked when capture event occurred

Header File

- components/driver/mcpwm/include/driver/mcpwm_etm.h
Functions

```c
esp_err_t mcpwm_comparator_new_etm_event(mcpwm_cmpr_handle_t cmpr, const mcpwm_cmpr_etm_event_config_t *config, esp_etm_event_handle_t*out_event)
```

Get the ETM event for MCPWM comparator.

**Note:** The created ETM event object can be deleted later by calling `esp_etm_del_event`.

**Parameters**
- `cmpr` - [in] MCPWM comparator, allocated by `mcpwm_new_comparator()` or `mcpwm_new_event_comparator()`
- `config` - [in] MCPWM ETM comparator event configuration
- `out_event` - [out] Returned ETM event handle

**Returns**
- `ESP_OK`: Get ETM event successfully
- `ESP_ERR_INVALID_ARG`: Get ETM event failed because of invalid argument
- `ESP_FAIL`: Get ETM event failed because of other error

**Structures**

```c
struct mcpwm_cmpr_etm_event_config_t
MCPWM event comparator ETM event configuration.
```

**Public Members**

- `mcpwm_comparator_etm_event_type_t event_type`
  MCPWM comparator ETM event type

**Header File**
- `components/driver/mcpwm/include/driver/mcpwm_types.h`

**Structures**

```c
struct mcpwm_timer_event_data_t
MCPWM timer event data.
```

**Public Members**

- `uint32_t count_value`
  MCPWM timer count value
- `mcpwm_timer_direction_t direction`
  MCPWM timer count direction

```c
struct mcpwm_brake_event_data_t
MCPWM brake event data.
```

```c
struct mcpwm_fault_event_data_t
MCPWM fault event data.
```
struct mcpwm_compare_event_data_t
MCPWM compare event data.

Public Members

uint32_t compare_ticks
Compare value

mcpwm_timer_direction_t direction
Count direction

struct mcpwm_capture_event_data_t
MCPWM capture event data.

Public Members

uint32_t cap_value
Captured value

mcpwm_capture_edge_t cap_edge
Capture edge

Type Definitions

typedef struct mcpwm_timer_t *mcpwm_timer_handle_t
Type of MCPWM timer handle.
typedef struct mcpwm_oper_t *mcpwm_oper_handle_t
Type of MCPWM operator handle.
typedef struct mcpwm_cmpr_t *mcpwm_cmpr_handle_t
Type of MCPWM comparator handle.
typedef struct mcpwm_gen_t *mcpwm_gen_handle_t
Type of MCPWM generator handle.
typedef struct mcpwm_fault_t *mcpwm_fault_handle_t
Type of MCPWM fault handle.
typedef struct mcpwm_sync_t *mcpwm_sync_handle_t
Type of MCPWM sync handle.
typedef struct mcpwm_cap_timer_t *mcpwm_cap_timer_handle_t
Type of MCPWM capture timer handle.
typedef struct mcpwm_cap_channel_t *mcpwm_cap_channel_handle_t
Type of MCPWM capture channel handle.
typedef bool (*mcpwm_timer_event_cb_t)(mcpwm_timer_handle_t timer, const mcpwm_timer_event_data_t *edata, void *user_ctx)

MCPWM timer event callback function.

- **Param** timer [in] MCPWM timer handle
- **Param** edata [in] MCPWM timer event data, fed by driver
- **Param** user_ctx [in] User data, set in mcpwm_timer_register_event_callbacks()
- **Return** Whether a high priority task has been waken up by this function

typedef bool (*mcpwm_brake_event_cb_t)(mcpwm_oper_handle_t oper, const mcpwm_brake_event_data_t *edata, void *user_ctx)

MCPWM operator brake event callback function.

- **Param** oper [in] MCPWM operator handle
- **Param** edata [in] MCPWM brake event data, fed by driver
- **Param** user_ctx [in] User data, set in mcpwm_operator_register_event_callbacks()
- **Return** Whether a high priority task has been waken up by this function

typedef bool (*mcpwm_fault_event_cb_t)(mcpwm_fault_handle_t fault, const mcpwm_fault_event_data_t *edata, void *user_ctx)

MCPWM fault event callback function.

- **Param** fault MCPWM fault handle
- **Param** edata MCPWM fault event data, fed by driver
- **Param** user_ctx User data, set in mcpwm_fault_register_event_callbacks()
- **Return** whether a task switch is needed after the callback returns

typedef bool (*mcpwm_compare_event_cb_t)(mcpwm_cmpr_handle_t comparator, const mcpwm_compare_event_data_t *edata, void *user_ctx)

MCPWM comparator event callback function.

- **Param** comparator MCPWM comparator handle
- **Param** edata MCPWM comparator event data, fed by driver
- **Param** user_ctx User data, set in mcpwm_comparator_register_event_callbacks()
- **Return** Whether a high priority task has been waken up by this function

typedef bool (*mcpwm_capture_event_cb_t)(mcpwm_cap_channel_handle_t cap_channel, const mcpwm_capture_event_data_t *edata, void *user_ctx)

MCPWM capture event callback function.

- **Param** cap_channel MCPWM capture channel handle
- **Param** edata MCPWM capture event data, fed by driver
- **Param** user_ctx User data, set in mcpwm_capture_channel_register_event_callbacks()
- **Return** Whether a high priority task has been waken up by this function

**Header File**

- components/hal/include/hal/mcpwm_types.h

**Type Definitions**

typedef soc_periph_mcpwm_timer_clk_src_t mcpwm_timer_clock_source_t

MCPWM timer clock source.

typedef soc_periph_mcpwm_capture_clk_src_t mcpwm_capture_clock_source_t

MCPWM capture clock source.
typedef `soc_periph_mcpwm_carrier_clk_src_t` `mcpwm_carrier_clock_source_t`

MCPWM carrier clock source.

**Enumerations**

enum `mcpwm_timer_direction_t`

MCPWM timer count direction.

*Values:*

enumerator `MCPWM_TIMER_DIRECTION_UP`

Counting direction: Increase

enumerator `MCPWM_TIMER_DIRECTION_DOWN`

Counting direction: Decrease

enum `mcpwm_timer_event_t`

MCPWM timer events.

*Values:*

enumerator `MCPWM_TIMER_EVENT_EMPTY`

MCPWM timer counts to zero (i.e. counter is empty)

enumerator `MCPWM_TIMER_EVENT_FULL`

MCPWM timer counts to peak (i.e. counter is full)

enumerator `MCPWM_TIMER_EVENT_INVALID`

MCPWM timer invalid event

enum `mcpwm_timer_count_mode_t`

MCPWM timer count modes.

*Values:*

enumerator `MCPWM_TIMER_COUNT_MODE_PAUSE`

MCPWM timer paused

enumerator `MCPWM_TIMER_COUNT_MODE_UP`

MCPWM timer counting up

enumerator `MCPWM_TIMER_COUNT_MODE_DOWN`

MCPWM timer counting down

enumerator `MCPWM_TIMER_COUNT_MODE_UP_DOWN`

MCPWM timer counting up and down

enum `mcpwm_timer_start_stop_cmd_t`  

MCPWM timer commands, specify the way to start or stop the timer.

*Values:*

Chapter 2. API Reference

enumerator **MCPWM_TIMER_STOP_EMPTY**
MCPWM timer stops when next count reaches zero

enumerator **MCPWM_TIMER_STOP_FULL**
MCPWM timer stops when next count reaches peak

enumerator **MCPWM_TIMER_START_NO_STOP**
MCPWM timer starts counting, and don’t stop until received stop command

enumerator **MCPWM_TIMER_START_STOP_EMPTY**
MCPWM timer starts counting and stops when next count reaches zero

enumerator **MCPWM_TIMER_START_STOP_FULL**
MCPWM timer starts counting and stops when next count reaches peak

enum **mcpwm_generator_action_t**
MCPWM generator actions.

*Values:*

enumerator **MCPWM_GEN_ACTION_KEEP**
Generator action: Keep the same level

enumerator **MCPWM_GEN_ACTION_LOW**
Generator action: Force to low level

enumerator **MCPWM_GEN_ACTION_HIGH**
Generator action: Force to high level

enumerator **MCPWM_GEN_ACTION_TOGGLE**
Generator action: Toggle level

enum **mcpwm_operator_brake_mode_t**
MCPWM operator brake mode.

*Values:*

enumerator **MCPWM_OPER_BRAKE_MODE_CBC**
Brake mode: CBC (cycle by cycle)

enumerator **MCPWM_OPER_BRAKE_MODE_OST**
Brake mode: OST (one shot)

enumerator **MCPWM_OPER_BRAKE_MODE_INVALID**
MCPWM operator invalid brake mode

enum **mcpwm_capture_edge_t**
MCPWM capture edge.

*Values:*

---

Espressif Systems 1364  Release v5.2-dev-3318-g8fc8f3f479
Submit Document Feedback
enumerator MCPWM_CAP_EDGE_POS
    Capture on the positive edge

denumerator MCPWM_CAP_EDGE_NEG
    Capture on the negative edge

eenum mcpwm_comparator_etm_event_type_t
    MCPWM comparator specific events that supported by the ETM module.

   Values:

   enumerator MCPWM_CMPR_ETM_EVENT_EQUAL
       The count value equals the value of comparator

   enumerator MCPWM_CMPR_ETM_EVENT_MAX
       Maximum number of comparator events

2.6.13 Pulse Counter (PCNT)

Introduction

The PCNT (Pulse Counter) module is designed to count the number of rising and/or falling edges of input signals. The ESP32 contains multiple pulse counter units in the module. Each unit is in effect an independent counter with multiple channels, where each channel can increment/decrement the counter on a rising/falling edge. Furthermore, each channel can be configured separately.

PCNT channels can react to signals of edge type and level type, however for simple applications, detecting the edge signal is usually sufficient. PCNT channels can be configured react to both pulse edges (i.e., rising and falling edge), and can be configured to increase, decrease or do nothing to the unit’s counter on each edge. The level signal is the so-called control signal, which is used to control the counting mode of the edge signals that are attached to the same channel. By combining the usage of both edge and level signals, a PCNT unit can act as a quadrature decoder.

Besides that, PCNT unit is equipped with a separate glitch filter, which is helpful to remove noise from the signal.

Typically, a PCNT module can be used in scenarios like:

- Calculate periodic signal’s frequency by counting the pulse numbers within a time slice
- Decode quadrature signals into speed and direction

Functional Overview

Description of the PCNT functionality is divided into the following sections:

- Resource Allocation - covers how to allocate PCNT units and channels with properly set of configurations. It also covers how to recycle the resources when they finished working.
- Set Up Channel Actions - covers how to configure the PCNT channel to behave on different signal edges and levels.
- Watch Points - describes how to configure PCNT watch points (i.e., tell PCNT unit to trigger an event when the count reaches a certain value).
- Register Event Callbacks - describes how to hook your specific code to the watch point event callback function.
- Set Glitch Filter - describes how to enable and set the timing parameters for the internal glitch filter.
- Enable and Disable Unit - describes how to enable and disable the PCNT unit.

1 Different ESP chip series might have different number of PCNT units and channels. Please refer to the [TRM] for details. The driver does not forbid you from applying for more PCNT units and channels, but it returns error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g., `pcnt_new_unit()`).
Chapter 2. API Reference

- **Unit IO Control** - describes IO control functions of PCNT unit, like enable glitch filter, start and stop unit, get and clear count value.
- **Power Management** - describes what functionality will prevent the chip from going into low power mode.
- **IRAM Safe** - describes tips on how to make the PCNT interrupt and IO control functions work better along with a disabled cache.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation** The PCNT unit and channel are represented by `pcnt_unit_handle_t` and `pcnt_channel_handle_t` respectively. All available units and channels are maintained by the driver in a resource pool, so you do not need to know the exact underlying instance ID.

**Install PCNT Unit** To install a PCNT unit, there is a configuration structure that needs to be given in advance: `pcnt_unit_config_t`:

- `pcnt_unit_config_t::low_limit` and `pcnt_unit_config_t::high_limit` specify the range for the internal hardware counter. The counter will reset to zero automatically when it crosses either the high or low limit.
- `pcnt_unit_config_t::accum_count` sets whether to create an internal accumulator for the counter. This is helpful when you want to extend the counter’s width, which by default is 16 bit at most, defined in the hardware. See also **Compensate Overflow Loss** for how to use this feature to compensate the overflow loss.
- `pcnt_unit_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.

**Note:** Since all PCNT units share the same interrupt source, when installing multiple PCNT units make sure that the interrupt priority `pcnt_unit_config_t::intr_priority` is the same for each unit.

Unit allocation and initialization is done by calling a function `pcnt_new_unit()` with `pcnt_unit_config_t` as an input parameter. The function will return a PCNT unit handle only when it runs correctly. Specifically, when there are no more free PCNT units in the pool (i.e., unit resources have been used up), then this function will return `ESP_ERR_NOT_FOUND` error. The total number of available PCNT units is recorded by `SOC_PCNT_UNITS_PER_GROUP` for reference.

If a previously created PCNT unit is no longer needed, it is recommended to recycle the resource by calling `pcnt_del_unit()`. Which in return allows the underlying unit hardware to be used for other purposes. Before deleting a PCNT unit, one should ensure the following prerequisites:

- The unit is in the init state, in other words, the unit is either disabled by `pcnt_unit_disable()` or not enabled yet.
- The attached PCNT channels are all removed by `pcnt_del_channel()`.

```c
#define EXAMPLE_PCNT_HIGH_LIMIT 100
#define EXAMPLE_PCNT_LOW_LIMIT -100

pcnt_unit_config_t unit_config = {
    .high_limit = EXAMPLE_PCNT_HIGH_LIMIT,
    .low_limit = EXAMPLE_PCNT_LOW_LIMIT,
};
pcnt_unit_handle_t pcnt_unit = NULL;
ESP_ERROR_CHECK(pcnt_new_unit(&unit_config, &pcnt_unit));
```

**Install PCNT Channel** To install a PCNT channel, you must initialize a `pcnt_chan_config_t` structure in advance, and then call `pcnt_new_channel()`. The configuration fields of the `pcnt_chan_config_t` structure are described below:

- `pcnt_chan_config_t::edge_gpio_num` and `pcnt_chan_config_t::level_gpio_num` specify the GPIO numbers used by `edge` type signal and `level` type signal. Please note, either of them can
be assigned to \(-1\) if it is not actually used, and thus it will become a virtual IO. For some simple pulse counting applications where one of the level/edge signals is fixed (i.e., never changes), you can reclaim a GPIO by setting the signal as a virtual IO on channel allocation. Setting the level/edge signal as a virtual IO causes that signal to be internally routed to a fixed High/Low logic level, thus allowing you to save a GPIO for other purposes.

- \texttt{pcnt\_chan\_config\_t::virt\_edge\_io\_level} and \texttt{pcnt\_chan\_config\_t::virt\_level\_io\_level} specify the virtual IO level for edge and level input signal, to ensure a deterministic state for such control signal. Please note, they are only valid when either \texttt{pcnt\_chan\_config\_t::edge\_gpio\_num} or \texttt{pcnt\_chan\_config\_t::level\_gpio\_num} is assigned to \(-1\).

- \texttt{pcnt\_chan\_config\_t::invert\_edge\_input} and \texttt{pcnt\_chan\_config\_t::invert\_level\_input} are used to decide whether to invert the input signals before they going into PCNT hardware. The invert is done by GPIO matrix instead of PCNT hardware.

- \texttt{pcnt\_chan\_config\_t::io\_loop\_back} is for debug only, which enables both the GPIO’s input and output paths. This can help to simulate the pulse signals by function \texttt{gpio\_set\_level()} on the same GPIO.

Channel allocating and initialization is done by calling a function \texttt{pcnt\_new\_channel()} with the above \texttt{pcnt\_chan\_config\_t} as an input parameter plus a PCNT unit handle returned from \texttt{pcnt\_new\_unit()}. This function will return a PCNT channel handle if it runs correctly. Specifically, when there are no more free PCNT channel within the unit (i.e., channel resources have been used up), then this function will return \texttt{ESP\_ERR\_NOT\_FOUND} error. The total number of available PCNT channels within the unit is recorded by \texttt{SOC\_PCNT\_CHANNELS\_PER\_UNIT} for reference. Note that, when install a PCNT channel for a specific unit, one should ensure the unit is in the init state, otherwise this function will return \texttt{ESP\_ERR\_INVALID\_STATE} error.

If a previously created PCNT channel is no longer needed, it is recommended to recycle the resources by calling \texttt{pcnt\_del\_channel()}. Which in return allows the underlying channel hardware to be used for other purposes.

```c
#define EXAMPLE_CHAN_GPIO_A 0
#define EXAMPLE_CHAN_GPIO_B 2

pcnt\_chan\_config\_t chan\_config = {
  .edge\_gpio\_num = EXAMPLE\_CHAN\_GPIO\_A,
  .level\_gpio\_num = EXAMPLE\_CHAN\_GPIO\_B,
};

pcnt\_channel\_handle\_t pcnt\_chan = NULL;
ESP\_ERROR\_CHECK(pcnt\_new\_channel(pcnt\_unit, \&chan\_config, \&pcnt\_chan));
```

### Set Up Channel Actions

The PCNT will increase/decrease/hold its internal count value when the input pulse signal toggles. You can set different actions for edge signal and/or level signal.

- \texttt{pcnt\_channel\_set\_edge\_action()} function is to set specific actions for rising and falling edge of the signal attached to the \texttt{pcnt\_chan\_config\_t::edge\_gpio\_num}. Supported actions are listed in \texttt{pcnt\_channel\_edge\_action\_t}.

- \texttt{pcnt\_channel\_set\_level\_action()} function is to set specific actions for high and low level of the signal attached to the \texttt{pcnt\_chan\_config\_t::level\_gpio\_num}. Supported actions are listed in \texttt{pcnt\_channel\_level\_action\_t}. This function is not mandatory if the \texttt{pcnt\_chan\_config\_t::level\_gpio\_num} is set to \(-1\) when allocating PCNT channel by \texttt{pcnt\_new\_channel()}.

```c
// decrease the counter on rising edge, increase the counter on falling edge
ESP\_ERROR\_CHECK(pcnt\_channel\_set\_edge\_action(pcnt\_chan, PCNT\_CHANNEL\_EDGE\_ACTION\_DECREASE, PCNT\_CHANNEL\_EDGE\_ACTION\_INCREASE));

// keep the counting mode when the control signal is high level, and reverse the counting mode when the control signal is low level
ESP\_ERROR\_CHECK(pcnt\_channel\_set\_level\_action(pcnt\_chan, PCNT\_CHANNEL\_LEVEL\_ACTION\_KEEP, PCNT\_CHANNEL\_LEVEL\_ACTION\_INVERSE));
```
Watch Points Each PCNT unit can be configured to watch several different values that you are interested in. The value to be watched is also called Watch Point. The watch point itself cannot exceed the range set in `pcnt_unit_config_t` by `pcnt_unit_config_t::low_limit` and `pcnt_unit_config_t::high_limit`. When the counter reaches either watch point, a watch event will be triggered and notify you by interrupt if any watch event callback has ever registered in `pcnt_unit_register_event_callbacks()`. See Register Event Callbacks for how to register event callbacks.

The watch point can be added and removed by `pcnt_unit_add_watch_point()` and `pcnt_unit_remove_watch_point()`. The commonly-used watch points are: zero cross, maximum/minimum count and other threshold values. The number of available watch point is limited, `pcnt_unit_add_watch_point()` will return error `ESP_ERR_NOT_FOUND` if it cannot find any free hardware resource to save the watch point. You cannot add the same watch point for multiple times, otherwise it will return error `ESP_ERR_INVALID_STATE`.

It is recommended to remove the unused watch point by `pcnt_unit_remove_watch_point()` to recycle the watch point resources.

```c
// add zero across watch point
ESP_ERROR_CHECK(pcnt_unit_add_watch_point(pcnt_unit, 0));
// add high limit watch point
ESP_ERROR_CHECK(pcnt_unit_add_watch_point(pcnt_unit, EXAMPLE_PCNT_HIGH_LIMIT));
```

Note: Due to the hardware limitation, after adding a watch point, you should call `pcnt_unit_clear_count()` to make it take effect.

Register Event Callbacks When PCNT unit reaches any enabled watch point, specific event will be generated and notify the CPU by interrupt. If you have some function that want to get executed when event happens, you should hook your function to the interrupt service routine by calling `pcnt_unit_register_event_callbacks()`. All supported event callbacks are listed in the `pcnt_event_callbacks_t`:

- `pcnt_event_callbacks_t::on_reach` sets a callback function for watch point event. As this function is called within the ISR context, you must ensure that the function does not attempt to block (e.g., by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The function prototype is declared in `pcnt_watch_cb_t`.

You can save your own context to `pcnt_unit_register_event_callbacks()` as well, via the parameter `user_ctx`. This user data will be directly passed to the callback functions.

In the callback function, the driver will fill in the event data of specific event. For example, the watch point event data is declared as `pcnt_watch_event_data_t`:

- `pcnt_watch_event_data_t::watch_point_value` saves the watch point value that triggers the event.
- `pcnt_watch_event_data_t::zero_cross_mode` saves how the PCNT unit crosses the zero point in the latest time. The possible zero cross modes are listed in the `pcnt_unit_zero_cross_mode_t`. Usually different zero cross mode means different counting direction and counting step size.

Registering callback function results in lazy installation of interrupt service, thus this function should only be called before the unit is enabled by `pcnt_unit_enable()`. Otherwise, it can return `ESP_ERR_INVALID_STATE` error.

```c
static bool example_pcnt_on_reach(pcnt_unit_handle_t unit, const pcnt_watch_event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_wakeup;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // send watch point to queue, from this interrupt callback
    xQueueSendFromISR(queue, &edata->watch_point_value, &high_task_wakeup);

    (continues on next page)
```
Set Glitch Filter  The PCNT unit features filters to ignore possible short glitches in the signals. The parameters that can be configured for the glitch filter are listed in `pcnt_glitch_filter_config_t`:

- `pcnt_glitch_filter_config_t::max_glitch_ns` sets the maximum glitch width, in nanoseconds. If a signal pulse’s width is smaller than this value, then it will be treated as noise and will not increase/decrease the internal counter.

You can enable the glitch filter for PCNT unit by calling `pcnt_unit_set_glitch_filter()` with the filter configuration provided above. Particularly, you can disable the glitch filter later by calling `pcnt_unit_set_glitch_filter()` with a NULL filter configuration.

This function should be called when the unit is in the init state. Otherwise, it will return `ESP_ERR_INVALID_STATE` error.

```
pcnt_glitch_filter_config_t filter_config = {
    .max_glitch_ns = 1000,
};
ESP_ERROR_CHECK(pcnt_unit_set_glitch_filter(pcnt_unit, &filter_config));
```

Enable and Disable Unit  Before doing IO control to the PCNT unit, you need to enable it first, by calling `pcnt_unit_enable()`. Internally, this function:

- switches the PCNT driver state from `init` to `enable`.
- enables the interrupt service if it has been lazy installed in `pcnt_unit_register_event_callbacks()`.
- acquires a proper power management lock if it has been lazy installed in `pcnt_unit_set_glitch_filter()`. See also `Power Management` for more information.

On the contrary, calling `pcnt_unit_disable()` will do the opposite, that is, put the PCNT driver back to the `init` state, disable the interrupts service and release the power management lock.

Unit IO Control

Start/Stop and Clear  Calling `pcnt_unit_start()` makes the PCNT unit start to work, increase or decrease counter according to pulse signals. On the contrary, calling `pcnt_unit_stop()` will stop the PCNT unit but retain current count value. Instead, clearing counter can only be done by calling `pcnt_unit_clear_count()`.

Note, `pcnt_unit_start()` and `pcnt_unit_stop()` should be called when the unit has been enabled by `pcnt_unit_enable()`. Otherwise, it will return `ESP_ERR_INVALID_STATE` error.
Get Count Value  You can read current count value at any time by calling `pcnt_unit_get_count()`. The returned count value is a signed integer, where the sign can be used to reflect the direction.

```c
int pulse_count = 0;
ESP_ERROR_CHECK(pcnt_unit_get_count(pcnt_unit, &pulse_count));
```

Compensate Overflow Loss  The internal hardware counter will be cleared to zero automatically when it reaches high or low limit. If you want to compensate for that count loss and extend the counter’s bit-width, you can:

1. Enable `pcnt_unit_config_t::accum_count` when installing the PCNT unit.
2. Add the high/low limit as the Watch Points.
3. Now, the returned count value from the `pcnt_unit_get_count()` function not only reflects the hardware’s count value, but also accumulates the high/low overflow loss to it.

**Note:**  `pcnt_unit_clear_count()` resets the accumulated count value as well.

Power Management  When power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will adjust the APB frequency before going into light sleep, thus potentially changing the behavior of PCNT glitch filter and leading to valid signal being treated as noise.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever you enable the glitch filter by `pcnt_unit_set_glitch_filter()`, the driver guarantees that the power management lock is acquired after the PCNT unit is enabled by `pcnt_unit_enable()`. Likewise, the driver releases the lock after `pcnt_unit_disable()` is called.

IRAM Safe  By default, the PCNT interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option `CONFIG_PCNT_ISR_IRAM_SAFE` that:

1. Enables the interrupt being serviced even when cache is disabled
2. Places all functions that used by the ISR into IRAM
3. Places driver object into DRAM (in case it is mapped to PSRAM by accident)

This allows the interrupt to run while the cache is disabled but comes at the cost of increased IRAM consumption.

There is another Kconfig option `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are as follows:

- `pcnt_unit_start()`
- `pcnt_unit_stop()`
- `pcnt_unit_clear_count()`
- `pcnt_unit_get_count()`

Thread Safety  The factory functions `pcnt_new_unit()` and `pcnt_new_channel()` are guaranteed to be thread safe by the driver, which means, you can call them from different RTOS tasks without protection by extra locks.

The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

- `pcnt_unit_start()`
- `pcnt_unit_stop()`

---

2 `pcnt_event_callbacks_t::on_reach` callback and the functions invoked by itself should also be placed in IRAM, you need to take care of them by themselves.
Chapter 2. API Reference

- `pcnt_unit_clear_count()`
- `pcnt_unit_get_count()`

Other functions that take the `pcnt_unit_handle_t` and `pcnt_channel_handle_t` as the first positional parameter, are not treated as thread safe. This means you should avoid calling them from multiple tasks.

Kconfig Options

- `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` controls where to place the PCNT control functions (IRAM or Flash), see [IRAM Safe](#) for more information.
- `CONFIG_PCNT_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see [IRAM Safe](#) for more information.
- `CONFIG_PCNT_ENABLE_DEBUG_LOG` is used to enabled the debug log output. Enabling this option increases the firmware binary size.

Application Examples

- Decode the quadrature signals from rotary encoder: `peripherals/pcnt/rotary_encoder`.

API Reference

Header File

- `components/driver/pcnt/include/driver/pulse_cnt.h`

Functions

```c
esp_err_t pcnt_new_unit (const pcnt_unit_config_t *config, pcnt_unit_handle_t *ret_unit)
```

Create a new PCNT unit, and return the handle.

**Note:** The newly created PCNT unit is put in the init state.

**Parameters**

- `config` [in] PCNT unit configuration
- `ret_unit` [out] Returned PCNT unit handle

**Returns**

- ESP_OK: Create PCNT unit successfully
- ESP_ERR_INVALID_ARG: Create PCNT unit failed because of invalid argument (e.g. high/low limit value out of the range)
- ESP_ERR_NO_MEM: Create PCNT unit failed because out of memory
- ESP_ERR_NOT_FOUND: Create PCNT unit failed because all PCNT units are used up and no more free one
- ESP_FAIL: Create PCNT unit failed because of other error

```c
esp_err_t pcnt_del_unit (pcnt_unit_handle_t unit)
```

Delete the PCNT unit handle.

**Note:** A PCNT unit can’t be in the enable state when this function is invoked. See also `pcnt_unit_disable()` for how to disable a unit.

**Parameters**

- `unit` [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- ESP_OK: Delete the PCNT unit successfully
- ESP_ERR_INVALID_ARG: Delete the PCNT unit failed because of invalid argument
Chapter 2. API Reference

- ESP_ERR_INVALID_STATE: Delete the PCNT unit failed because the unit is not in init state or some PCNT channel is still in working
- ESP_FAIL: Delete the PCNT unit failed because of other error

`esp_err_t pcnt_unit_set_glitch_filter (pcnt_unit_handle_t unit, const pcnt_glitch_filter_config_t *config)`

Set glitch filter for PCNT unit.

**Note:** The glitch filter module is clocked from APB, and APB frequency can be changed during DFS, which in return make the filter out of action. So this function will lazy-install a PM lock internally when the power management is enabled. With this lock, the APB frequency won’t be changed. The PM lock can be uninstalled in `pcnt_del_unit()`.

**Note:** This function should be called when the PCNT unit is in the init state (i.e. before calling `pcnt_unit_enable()`)

**Parameters**
- `unit` - [in] PCNT unit handle created by `pcnt_new_unit()`
- `config` - [in] PCNT filter configuration, set config to NULL means disabling the filter function

**Returns**
- ESP_OK: Set glitch filter successfully
- ESP_ERR_INVALID_ARG: Set glitch filter failed because of invalid argument (e.g. glitch width is too big)
- ESP_ERR_INVALID_STATE: Set glitch filter failed because the unit is not in the init state
- ESP_FAIL: Set glitch filter failed because of other error

`esp_err_t pcnt_unit_enable (pcnt_unit_handle_t unit)`

Enable the PCNT unit.

**Note:** This function will transit the unit state from init to enable.

**Note:** This function will enable the interrupt service, if it’s lazy installed in `pcnt_unit_register_event_callbacks()`.

**Note:** This function will acquire the PM lock if it’s lazy installed in `pcnt_unit_set_glitch_filter()`.

**Note:** Enable a PCNT unit doesn’t mean to start it. See also `pcnt_unit_start()` for how to start the PCNT counter.

**Parameters**
- `unit` - [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**
- ESP_OK: Enable PCNT unit successfully
- ESP_ERR_INVALID_ARG: Enable PCNT unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable PCNT unit failed because the unit is already enabled
- ESP_FAIL: Enable PCNT unit failed because of other error
### esp_err_t pcnt_unit_disable (pcnt_unit_handle_t unit)

Disable the PCNT unit.

**Note:** This function will do the opposite work to the `pcnt_unit_enable()`

**Note:** Disable a PCNT unit doesn’t mean to stop it. See also `pcnt_unit_stop()` for how to stop the PCNT counter.

**Parameters**
- `unit` – [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**
- ESP_OK: Disable PCNT unit successfully
- ESP_ERR_INVALID_ARG: Disable PCNT unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable PCNT unit failed because the unit is not enabled yet
- ESP_FAIL: Disable PCNT unit failed because of other error

### esp_err_t pcnt_unit_start (pcnt_unit_handle_t unit)

Start the PCNT unit, the counter will start to count according to the edge and/or level input signals.

**Note:** This function should be called when the unit is in the enable state (i.e. after calling `pcnt_unit_enable()`)

**Note:** This function is allowed to run within ISR context

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` is on, so that it’s allowed to be executed when Cache is disabled

**Parameters**
- `unit` – [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**
- ESP_OK: Start PCNT unit successfully
- ESP_ERR_INVALID_ARG: Start PCNT unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Start PCNT unit failed because the unit is not enabled yet
- ESP_FAIL: Start PCNT unit failed because of other error

### esp_err_t pcnt_unit_stop (pcnt_unit_handle_t unit)

Stop PCNT from counting.

**Note:** This function should be called when the unit is in the enable state (i.e. after calling `pcnt_unit_enable()`)

**Note:** The stop operation won’t clear the counter. Also see `pcnt_unit_clear_count()` for how to clear pulse count value.

**Note:** This function is allowed to run within ISR context
Note: This function will be placed into IRAM if CONFIG_PCNT_CTRL_FUNC_IN_IRAM, so that it is allowed to be executed when Cache is disabled.

**Parameters**
- `unit` - [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**
- ESP_OK: Stop PCNT unit successfully
- ESP_ERR_INVALID_ARG: Stop PCNT unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Stop PCNT unit failed because the unit is not enabled yet
- ESP_FAIL: Stop PCNT unit failed because of other error

```c
esp_err_t pcnt_unit_clear_count (pcnt_unit_handle_t unit)
```

Clear PCNT pulse count value to zero.

Note: It’s recommended to call this function after adding a watch point by `pcnt_unit_add_watch_point()`, so that the newly added watch point is effective immediately.

Note: This function is allowed to run within ISR context

Note: This function will be placed into IRAM if CONFIG_PCNT_CTRL_FUNC_IN_IRAM, so that it’s allowed to be executed when Cache is disabled.

**Parameters**
- `unit` - [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**
- ESP_OK: Clear PCNT pulse count successfully
- ESP_ERR_INVALID_ARG: Clear PCNT pulse count failed because of invalid argument
- ESP_FAIL: Clear PCNT pulse count failed because of other error

```c
esp_err_t pcnt_unit_get_count (pcnt_unit_handle_t unit, int *value)
```

Get PCNT count value.

Note: This function is allowed to run within ISR context

Note: This function will be placed into IRAM if CONFIG_PCNT_CTRL_FUNC_IN_IRAM, so that it’s allowed to be executed when Cache is disabled.

**Parameters**
- `unit` - [in] PCNT unit handle created by `pcnt_new_unit()`
- `value` - [out] Returned count value

**Returns**
- ESP_OK: Get PCNT pulse count successfully
- ESP_ERR_INVALID_ARG: Get PCNT pulse count failed because of invalid argument
- ESP_FAIL: Get PCNT pulse count failed because of other error

```c
esp_err_t pcnt_unit_register_event_callbacks (pcnt_unit_handle_t unit, const pcnt_event_callbacks_t *cbs, void *user_data)
```

Set event callbacks for PCNT unit.
Note: User registered callbacks are expected to be runnable within ISR context

Note: The first call to this function needs to be before the call to \texttt{pcnt\_unit\_enable}

Note: User can deregister a previously registered callback by calling this function and setting the callback member in the \texttt{cbs} structure to \texttt{NULL}.

**Parameters**
- \texttt{unit} - [in] PCNT unit handle created by \texttt{pcnt\_new\_unit()}
- \texttt{cbs} - [in] Group of callback functions
- \texttt{user\_data} - [in] User data, which will be passed to callback functions directly

**Returns**
- \texttt{ESP\_OK}: Set event callbacks successfully
- \texttt{ESP\_ERR\_INVALID\_ARG}: Set event callbacks failed because of invalid argument
- \texttt{ESP\_ERR\_INVALID\_STATE}: Set event callbacks failed because the unit is not in init state
- \texttt{ESP\_FAIL}: Set event callbacks failed because of other error

\texttt{esp\_err\_t pcnt\_unit\_add\_watch\_point (pcnt\_unit\_handle\_t unit, int watch\_point)}

Add a watch point for PCNT unit, PCNT will generate an event when the counter value reaches the watch point value.

**Parameters**
- \texttt{unit} - [in] PCNT unit handle created by \texttt{pcnt\_new\_unit()}
- \texttt{watch\_point} - [in] Value to be watched

**Returns**
- \texttt{ESP\_OK}: Add watch point successfully
- \texttt{ESP\_ERR\_INVALID\_ARG}: Add watch point failed because of invalid argument (e.g. the value to be watched is out of the limitation set in \texttt{pcnt\_unit\_config\_t})
- \texttt{ESP\_ERR\_INVALID\_STATE}: Add watch point failed because the same watch point has already been added
- \texttt{ESP\_ERR\_NOT\_FOUND}: Add watch point failed because no more hardware watch point can be configured
- \texttt{ESP\_FAIL}: Add watch point failed because of other error

\texttt{esp\_err\_t pcnt\_unit\_remove\_watch\_point (pcnt\_unit\_handle\_t unit, int watch\_point)}

Remove a watch point for PCNT unit.

**Parameters**
- \texttt{unit} - [in] PCNT unit handle created by \texttt{pcnt\_new\_unit()}
- \texttt{watch\_point} - [in] Watch point value

**Returns**
- \texttt{ESP\_OK}: Remove watch point successfully
- \texttt{ESP\_ERR\_INVALID\_ARG}: Remove watch point failed because of invalid argument
- \texttt{ESP\_ERR\_INVALID\_STATE}: Remove watch point failed because the watch point was not added by \texttt{pcnt\_unit\_add\_watch\_point()} yet
- \texttt{ESP\_FAIL}: Remove watch point failed because of other error

\texttt{esp\_err\_t pcnt\_new\_channel (pcnt\_unit\_handle\_t unit, const pcnt\_chan\_config\_t \*config, pcnt\_channel\_handle\_t \*ret\_chan)}

Create PCNT channel for specific unit, each PCNT has several channels associated with it.

**Note:** This function should be called when the unit is in init state (i.e. before calling
pcnt_unit_enable()

**Parameters**
- **unit** - [in] PCNT unit handle created by `pcnt_new_unit()`
- **config** - [in] PCNT channel configuration
- **ret_chan** - [out] Returned channel handle

**Returns**
- ESP_OK: Create PCNT channel successfully
- ESP_ERR_INVALID_ARG: Create PCNT channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create PCNT channel failed because of insufficient memory
- ESP_ERR_NOT_FOUND: Create PCNT channel failed because all PCNT channels are used up and no more free one
- ESP_ERR_INVALID_STATE: Create PCNT channel failed because the unit is not in the init state
- ESP_FAIL: Create PCNT channel failed because of other error

```c
esp_err_t pcnt_del_channel (pcnt_channel_handle_t chan)
```
Delete the PCNT channel.

**Parameters**
- **chan** - [in] PCNT channel handle created by `pcnt_new_channel()`

**Returns**
- ESP_OK: Delete the PCNT channel successfully
- ESP_ERR_INVALID_ARG: Delete the PCNT channel failed because of invalid argument
- ESP_FAIL: Delete the PCNT channel failed because of other error

```c
esp_err_t pcnt_channel_set_edge_action (pcnt_channel_handle_t chan, pcnt_channel_edge_action_t pos_act, pcnt_channel_edge_action_t neg_act)
```
Set channel actions when edge signal changes (e.g. falling or rising edge occurred). The edge signal is input from the `edge_gpio_num` configured in `pcnt_chan_config_t`. We use these actions to control when and how to change the counter value.

**Parameters**
- **chan** - [in] PCNT channel handle created by `pcnt_new_channel()`
- **pos_act** - [in] Action on posedge signal
- **neg_act** - [in] Action on negedge signal

**Returns**
- ESP_OK: Set edge action for PCNT channel successfully
- ESP_ERR_INVALID_ARG: Set edge action for PCNT channel failed because of invalid argument
- ESP_FAIL: Set edge action for PCNT channel failed because of other error

```c
esp_err_t pcnt_channel_set_level_action (pcnt_channel_handle_t chan, pcnt_channel_level_action_t high_act, pcnt_channel_level_action_t low_act)
```
Set channel actions when level signal changes (e.g. signal level goes from high to low). The level signal is input from the `level_gpio_num` configured in `pcnt_chan_config_t`. We use these actions to control when and how to change the counting mode.

**Parameters**
- **chan** - [in] PCNT channel handle created by `pcnt_new_channel()`
- **high_act** - [in] Action on high level signal
- **low_act** - [in] Action on low level signal

**Returns**
- ESP_OK: Set level action for PCNT channel successfully
- ESP_ERR_INVALID_ARG: Set level action for PCNT channel failed because of invalid argument
- ESP_FAIL: Set level action for PCNT channel failed because of other error
Chapter 2. API Reference

Structures

struct **pcnt_watch_event_data_t**

PCNT watch event data.

Public Members

int **watch_point_value**

Watch point value that triggered the event

```
pcnt_unit_zero_cross_mode_t **zero_cross_mode**
```

Zero cross mode

struct **pcnt_event_callbacks_t**

Group of supported PCNT callbacks.

Note: The callbacks are all running under ISR environment

Note: When CONFIG_PCNT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM.

Public Members

```
pcnt_watch_cb_t **on_reach**
```

Called when PCNT unit counter reaches any watch point

struct **pcnt_unit_config_t**

PCNT unit configuration.

Public Members

int **low_limit**

Low limitation of the count unit, should be lower than 0

int **high_limit**

High limitation of the count unit, should be higher than 0

int **intr_priority**

PCNT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

```
uint32_t **accum_count**
```

Whether to accumulate the count value when overflows at the high/low limit

struct **pcnt_unit_config_t::[anonymous]** **flags**

Extra flags
struct pcnt_chan_config_t
    PCNT channel configuration.

Public Members

int edge_gpio_num
    GPIO number used by the edge signal, input mode with pull up enabled. Set to -1 if unused

int level_gpio_num
    GPIO number used by the level signal, input mode with pull up enabled. Set to -1 if unused

uint32_t invert_edge_input
    Invert the input edge signal

uint32_t invert_level_input
    Invert the input level signal

uint32_t virt_edge_io_level
    Virtual edge IO level, 0: low, 1: high. Only valid when edge_gpio_num is set to -1

uint32_t virt_level_io_level
    Virtual level IO level, 0: low, 1: high. Only valid when level_gpio_num is set to -1

uint32_t io_loop_back
    For debug/test, the signal output from the GPIO will be fed to the input path as well

struct pcnt_chan_config_t::[anonymous] flags
    Channel config flags

struct pcnt_glitch_filter_config_t
    PCNT glitch filter configuration.

Public Members

uint32_t max_glitch_ns
    Pulse width smaller than this threshold will be treated as glitch and ignored, in the unit of ns

Type Definitions

typedef struct pcnt_unit_t *pcnt_unit_handle_t
    Type of PCNT unit handle.

typedef struct pcnt_chan_t *pcnt_channel_handle_t
    Type of PCNT channel handle.

typedef bool (*pcnt_watch_cb_t)(pcnt_unit_handle_t unit, const pcnt_watch_event_data_t *edata, void *user_ctx)
Chapter 2. API Reference

PCNT watch event callback prototype.

**Note:** The callback function is invoked from an ISR context, so it should meet the restrictions of not calling any blocking APIs when implementing the callback. e.g. must use ISR version of FreeRTOS APIs.

```c
Param unit [in] PCNT unit handle
Param edata [in] PCNT event data, fed by the driver
Param user_ctx [in] User data, passed from pcnt_unit_register_event_callbacks()
Return Whether a high priority task has been woken up by this function
```

**Header File**

- components/hal/include/hal/pcnt_types.h

**Enumerations**

enum pcnt_channel_level_action_t
    PCNT channel action on control level.
    *
Values:

- enumerator PCNT_CHANNEL_LEVEL_ACTION_KEEP
  Keep current count mode

- enumerator PCNT_CHANNEL_LEVEL_ACTION_INVERSE
  Invert current count mode (increase -> decrease, decrease -> increase)

- enumerator PCNT_CHANNEL_LEVEL_ACTION_HOLD
  Hold current count value

enum pcnt_channel_edge_action_t
    PCNT channel action on signal edge.
    *
Values:

- enumerator PCNT_CHANNEL_EDGE_ACTION_HOLD
  Hold current count value

- enumerator PCNT_CHANNEL_EDGE_ACTION_INCREASE
  Increase count value

- enumerator PCNT_CHANNEL_EDGE_ACTION_DECREASE
  Decrease count value

enum pcnt_unit_zero_cross_mode_t
    PCNT unit zero cross mode.
    *
Values:

- enumerator PCNT_UNIT_ZERO_CROSS_POS_ZERO
  start from positive value, end to zero, i.e. +N->0

2.6.14 Remote Control Transceiver (RMT)

Introduction

The RMT (Remote Control Transceiver) peripheral was designed to act as an infrared transceiver. However, due to the flexibility of its data format, RMT can be extended to a versatile and general-purpose transceiver, transmitting or receiving many other types of signals. From the perspective of network layering, the RMT hardware contains both physical and data link layers. The physical layer defines the communication media and bit signal representation. The data link layer defines the format of an RMT frame. The minimal data unit in the frame is called the RMT symbol, which is represented by `rmt_symbol_word_t` in the driver.

ESP32 contains multiple channels in the RMT peripheral\(^1\). Each channel can be independently configured as either transmitter or receiver.

Typically, the RMT peripheral can be used in the following scenarios:

- Transmit or receive infrared signals, with any IR protocols, e.g., NEC
- General-purpose sequence generator
- Transmit signals in a hardware-controlled loop, with a finite or infinite number of times
- Multi-channel simultaneous transmission
- Modulate the carrier to the output signal or demodulate the carrier from the input signal

Layout of RMT Symbols

The RMT hardware defines data in its own pattern—the RMT symbol. The diagram below illustrates the bit fields of an RMT symbol. Each symbol consists of two pairs of two values. The first value in the pair is a 15-bit value representing the signal’s duration in units of RMT ticks. The second in the pair is a 1-bit value representing the signal’s logic level, i.e., high or low.

RMT Transmitter Overview

The data path and control path of an RMT TX channel is illustrated in the figure below:

The driver encodes the user’s data into RMT data format, then the RMT transmitter can generate the waveforms according to the encoding artifacts. It is also possible to modulate a high-frequency carrier signal before being routed to a GPIO pad.

RMT Receiver Overview

The data path and control path of an RMT RX channel is illustrated in the figure below:

The RMT receiver can sample incoming signals into RMT data format, and store the data in memory. It is also possible to tell the receiver the basic characteristics of the incoming signal, so that the signal’s stop condition can be recognized, and signal glitches and noise can be filtered out. The RMT peripheral also supports demodulating the high-frequency carrier from the base signal.

---

\(^1\) Different ESP chip series might have different numbers of RMT channels. Please refer to [TRM] for details. The driver does not forbid you from applying for more RMT channels, but it returns an error when there are no hardware resources available. Please always check the return value when doing Resource Allocation.
Fig. 16: Structure of RMT symbols (L - signal level)

Fig. 17: RMT Transmitter Overview

Fig. 18: RMT Receiver Overview
Functional Overview

The description of the RMT functionality is divided into the following sections:

- **Resource Allocation** - covers how to allocate and properly configure RMT channels. It also covers how to recycle channels and other resources when they are no longer used.
- **Carrier Modulation and Demodulation** - describes how to modulate and demodulate the carrier signals for TX and RX channels respectively.
- **Register Event Callbacks** - covers how to register user-provided event callbacks in order to receive RMT channel events.
- **Enable and Disable Channel** - shows how to enable and disable the RMT channel.
- **Initiate TX Transaction** - describes the steps to initiate a transaction for a TX channel.
- **Initiate RX Transaction** - describes the steps to initiate a transaction for an RX channel.
- **Multiple Channels Simultaneous Transmission** - describes how to collect multiple channels into a sync group so that their transmissions can be started simultaneously.
- **RMT Encoder** - focuses on how to write a customized encoder by combining multiple primitive encoders that are provided by the driver.
- **Power Management** - describes how different clock sources affect power consumption.
- **IRAM Safe** - describes how disabling the cache affects the RMT driver, and tips to mitigate it.
- **Thread Safety** - lists which APIs are guaranteed to be thread-safe by the driver.
- **Kconfig Options** - describes the various Kconfig options supported by the RMT driver.

**Resource Allocation**  Both RMT TX and RX channels are represented by `rmt_channel_handle_t` in the driver. The driver internally manages which channels are available and hands out a free channel on request.

**Install RMT TX Channel**  To install an RMT TX channel, there is a configuration structure that needs to be given in advance `rmt_tx_channel_config_t`. The following list describes each member of the configuration structure.

- `rmt_tx_channel_config_t::gpio_num` sets the GPIO number used by the transmitter.
- `rmt_tx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock is also used by other channels, which means the user should ensure this configuration is the same when allocating other channels, regardless of TX or RX. For the effect on the power consumption of different clock sources, please refer to the **Power Management** section.
- `rmt_tx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of the RMT signal is calculated based on this tick.
- `rmt_tx_channel_config_t::mem_block_symbols` has a slightly different meaning based on if the DMA backend is enabled or not.
  - If the DMA is enabled via `rmt_tx_channel_config_t::with_dma`, then this field controls the size of the internal DMA buffer. To achieve a better throughput and smaller CPU overhead, we recommend you set a large value, e.g., 1024.
  - If DMA is not used, this field controls the size of the dedicated memory block owned by the channel, which should be at least 64.
- `rmt_tx_channel_config_t::trans_queue_depth` sets the depth of the internal transaction queue, the deeper the queue, the more transactions can be prepared in the backlog.
- `rmt_tx_channel_config_t::invert_out` is used to decide whether to invert the RMT signal before sending it to the GPIO pad.
- `rmt_tx_channel_config_t::with_dma` enables the DMA backend for the channel. Using the DMA allows a significant amount of the channel’s workload to be offloaded from the CPU. However, the DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter an **ESP_ERR_NOT_SUPPORTED** error.
- `rmt_tx_channel_config_t::io_loop_back` enables both input and output capabilities on the channel’s assigned GPIO. Thus, by binding a TX and RX channel to the same GPIO, loopback can be achieved.
- `rmt_tx_channel_config_t::io_od_mode` configures the channel’s assigned GPIO as open-drain. When combined with `rmt_tx_channel_config_t::io_loop_back`, a bi-directional bus (e.g., 1-wire) can be achieved.
Chapter 2. API Reference

- **rmt_tx_channel_config_t::intr_priority** Set the priority of the interrupt. If set to 0, then the driver will use an interrupt with low or medium priority (priority level may be one of 1, 2 or 3), otherwise use the priority indicated by `rmt_tx_channel_config_t::intr_priority`. Please use the number form (1, 2, 3), not the bitmask form ((1<<1), (1<<2), (1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until `rmt_del_channel()` is called.

Once the `rmt_tx_channel_config_t` structure is populated with mandatory parameters, users can call `rmt_new_tx_channel()` to allocate and initialize a TX channel. This function returns an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function returns `ESP_ERR_NOT_FOUND` error. If some feature (e.g., DMA backend) is not supported by the hardware, it returns `ESP_ERR_NOT_SUPPORTED` error.

```c
rmt_channel_handle_t tx_chan = NULL;
rmt_tx_channel_config_t tx_chan_config = {
  .clk_src = RMT_CLK_SRC_DEFAULT, // select source clock
  .gpio_num = 0, // GPIO number
  .mem_block_symbols = 64, // memory block size, 64 * 4 = 256 Bytes
  .resolution_hz = 1 * 1000 * 1000, // 1 MHz tick resolution, i.e., 1 tick = 1 µs
  .trans_queue_depth = 4, // set the number of transactions that can run in the background
  .flags.invert_out = false, // do not invert output signal
  .flags.with_dma = false, // do not need DMA backend
};
ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_chan));
```

---

**Install RMT RX Channel** To install an RMT RX channel, there is a configuration structure that needs to be given in advance `rmt_rx_channel_config_t`. The following list describes each member of the configuration structure.

- **rmt_rx_channel_config_t::gpio_num** sets the GPIO number used by the receiver.
- **rmt_rx_channel_config_t::clk_src** selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock is also used by other channels, which means the user should ensure this configuration is the same when allocating other channels, regardless of TX or RX. For the effect on the power consumption of different clock sources, please refer to the Power Management section.
- **rmt_rx_channel_config_t::resolution_hz** sets the resolution of the internal tick counter. The timing parameter of the RMT signal is calculated based on this tick.
- **rmt_rx_channel_config_t::mem_block_symbols** has a slightly different meaning based on whether the DMA backend is enabled.
  - If the DMA is enabled via `rmt_rx_channel_config_t::with_dma`, this field controls the maximum size of the DMA buffer.
  - If DMA is not used, this field controls the size of the dedicated memory block owned by the channel, which should be at least 64.
- **rmt_rx_channel_config_t::invert_in** is used to invert the input signals before it is passed to the RMT receiver. The inversion is done by the GPIO matrix instead of by the RMT peripheral.
- **rmt_rx_channel_config_t::with_dma** enables the DMA backend for the channel. Using the DMA allows a significant amount of the channel’s workload to be offloaded from the CPU. However, the DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.
- **rmt_rx_channel_config_t::io_loop_back** enables both input and output capabilities on the channel’s assigned GPIO. Thus, by binding a TX and RX channel to the same GPIO, loopback can be achieved.
- **rmt_rx_channel_config_t::intr_priority** Set the priority of the interrupt. If set to 0, then the driver will use an interrupt with low or medium priority (priority level may be one of 1, 2 or 3), otherwise use the priority indicated by `rmt_rx_channel_config_t::intr_priority`. Please use the number form (1, 2, 3), not the bitmask form ((1<<1), (1<<2), (1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until `rmt_del_channel()` is called.

Once the `rmt_rx_channel_config_t` structure is populated with mandatory parameters, users can call `rmt_new_rx_channel()` to allocate and initialize an RX channel. This function returns an RMT channel han-
If it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function returns `ESP_ERR_NOT_FOUND` error. If some feature (e.g., DMA backend) is not supported by the hardware, it returns `ESP_ERR_NOT_SUPPORTED` error.

```c
rmt_channel_handle_t rx_chan = NULL;
rmt_rx_channel_config_t rx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT, // select source clock
    .resolution_hz = 1 * 1000 * 1000, // 1 MHz tick resolution, i.e., 1 tick = 1 µs
    .mem_block_symbols = 64, // memory block size, 64 * 4 = 256 Bytes
    .gpio_num = 2, // GPIO number
    .flags.invert_in = false, // do not invert input signal
    .flags.with_dma = false, // do not need DMA backend
};
ESP_ERROR_CHECK(rmt_new_rx_channel(&rx_chan_config, &rx_chan));
```

**Note:** Due to a software limitation in the GPIO driver, when both TX and RX channels are bound to the same GPIO, ensure the RX Channel is initialized before the TX Channel. If the TX Channel was set up first, then during the RX Channel setup, the previous RMT TX Channel signal will be overridden by the GPIO control signal.

### Uninstall RMT Channel
If a previously installed RMT channel is no longer needed, it is recommended to recycle the resources by calling `rmt_del_channel()`, which in return allows the underlying software and hardware resources to be reused for other purposes.

### Carrier Modulation and Demodulation
The RMT transmitter can generate a carrier wave and modulate it onto the message signal. Compared to the message signal, the carrier signal’s frequency is significantly higher. In addition, the user can only set the frequency and duty cycle for the carrier signal. The RMT receiver can demodulate the carrier signal from the incoming signal. Note that, carrier modulation and demodulation are not supported on all ESP chips, please refer to [TRM] before configuring the carrier, or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.

Carrier-related configurations lie in `rmt_carrier_config_t`:

- `rmt_carrier_config_t::frequency_hz` sets the carrier frequency, in Hz.
- `rmt_carrier_config_t::duty_cycle` sets the carrier duty cycle.
- `rmt_carrier_config_t::polarity_active_low` sets the carrier polarity, i.e., on which level the carrier is applied.
- `rmt_carrier_config_t::always_on` sets whether to output the carrier even when the data transmission has finished. This configuration is only valid for the TX channel.

**Note:** For the RX channel, we should not set the carrier frequency exactly to the theoretical value. It is recommended to leave a tolerance for the carrier frequency. For example, in the snippet below, we set the frequency to 25 KHz, instead of the 38 KHz configured on the TX side. The reason is that reflection and refraction occur when a signal travels through the air, leading to distortion on the receiver side.

```c
rmt_carrier_config_t tx_carrier_cfg = {
    .duty_cycle = 0.33, // duty cycle 33%
    .frequency_hz = 38000, // 38 KHz
    .flags.polarity_active_low = false, // carrier should be modulated to high_level
};
// modulate carrier to TX channel
ESP_ERROR_CHECK(rmt_apply_carrier(tx_chan, &tx_carrier_cfg));
```

```c
rmt_carrier_config_t rx_carrier_cfg = {
    .duty_cycle = 0.33, // duty cycle 33%
    .frequency_hz = 25000, // 25 KHz carrier, should be smaller than...
    .the transmitter's carrier frequency
};
```

(continues on next page)
Register Event Callbacks  When an event occurs on an RMT channel (e.g., transmission or receiving is completed), the CPU is notified of this event via an interrupt. If you have some function that needs to be called when a particular events occur, you can register a callback for that event to the RMT driver’s ISR (Interrupt Service Routine) by calling `rmt_tx_register_event_callbacks()` and `rmt_rx_register_event_callbacks()` for TX and RX channel respectively. Since the registered callback functions are called in the interrupt context, the user should ensure the callback function does not block, e.g., by making sure that only FreeRTOS APIs with the `FromISR` suffix are called from within the function. The callback function has a boolean return value used to indicate whether a higher priority task has been unblocked by the callback.

The TX channel-supported event callbacks are listed in the `rmt_tx_event_callbacks_t`:

- `rmt_tx_event_callbacks_t::on_trans_done` sets a callback function for the “trans-done” event. The function prototype is declared in `rmt_tx_done_callback_t`.

The RX channel-supported event callbacks are listed in the `rmt_rx_event_callbacks_t`:

- `rmt_rx_event_callbacks_t::on_recv_done` sets a callback function for “receive-done” event. The function prototype is declared in `rmt_rx_done_callback_t`.

Users can save their own context in `rmt_tx_register_event_callbacks()` and `rmt_rx_register_event_callbacks()` as well, via the parameter `user_data`. The user data is directly passed to each callback function.

In the callback function, users can fetch the event-specific data that is filled by the driver in the `edata`. Note that the `edata` pointer is only valid for the duration of the callback.

The TX-done event data is defined in `rmt_tx_done_event_data_t`:

- `rmt_tx_done_event_data_t::num_symbols` indicates the number of transmitted RMT symbols. This also reflects the size of the encoding artifacts. Please note, this value accounts for the EOF symbol as well, which is appended by the driver to mark the end of one transaction.

The RX-complete event data is defined in `rmt_rx_done_event_data_t`:

- `rmt_rx_done_event_data_t::received_symbols` points to the received RMT symbols. These symbols are saved in the `buffer` parameter of the `rmt_receive()` function. Users should not free this receive buffer before the callback returns.
- `rmt_rx_done_event_data_t::num_symbols` indicates the number of received RMT symbols. This value is not larger than the `buffer_size` parameter of `rmt_receive()` function. If the `buffer_size` is not sufficient to accommodate all the received RMT symbols, the driver only keeps the maximum number of symbols that the buffer can hold, and excess symbols are discarded or ignored.

Enable and Disable Channel  `rmt_enable()` must be called in advance before transmitting or receiving RMT symbols. For TX channels, enabling a channel enables a specific interrupt and prepares the hardware to dispatch transactions. For RX channels, enabling a channel enables an interrupt, but the receiver is not started during this time, as the characteristics of the incoming signal have yet to be specified. The receiver is started in `rmt_receive()`. `rmt_disable()` does the opposite by disabling the interrupt and clearing any pending interrupts. The transmitter and receiver are disabled as well.

```c
ESP_ERROR_CHECK(rmt_enable(tx_chan));
ESP_ERROR_CHECK(rmt_enable(rx_chan));
```
Initiate TX Transaction  RMT is a special communication peripheral, as it is unable to transmit raw byte streams like SPI and I2C. RMT can only send data in its own format `rmt_symbol_word_t`. However, the hardware does not help to convert the user data into RMT symbols, this can only be done in software by the so-called RMT Encoder. The encoder is responsible for encoding user data into RMT symbols and then writing to the RMT memory block or the DMA buffer. For how to create an RMT encoder, please refer to RMT Encoder.

Once we got an encoder, we can initiate a TX transaction by calling `rmt_transmit()`. This function takes several positional parameters like channel handle, encoder handle, and payload buffer. Besides, we also need to provide a transmission-specific configuration in `rmt_transmit_config_t`:

- `rmt_transmit_config_t::loop_count` sets the number of transmission loops. After the transmitter has finished one round of transmission, it can restart the same transmission again if this value is not set to zero. As the loop is controlled by hardware, the RMT channel can be used to generate many periodic sequences with minimal CPU intervention.
  - Setting `rmt_transmit_config_t::loop_count` to -1 means an infinite loop transmission. In this case, the channel does not stop until `rmt_disable()` is called. The “trans-done” event is not generated as well.
  - Setting `rmt_transmit_config_t::loop_count` to a positive number means finite number of iterations. In this case, the “trans-done” event is when the specified number of iterations have completed.

  **Note:** The loop transmit feature is not supported on all ESP chips, please refer to [TRM] before you configure this option, or you might encounter `ESP_ERR_NOT_SUPPORTED` error.

- `rmt_transmit_config_t::eot_level` sets the output level when the transmitter finishes working or stops working by calling `rmt_disable()`.

  **Note:** There is a limitation in the transmission size if the `rmt_transmit_config_t::loop_count` is set to non-zero, i.e., to enable the loop feature. The encoded RMT symbols should not exceed the capacity of the RMT hardware memory block size, or you might see an error message like encoding artifacts can't exceed hw memory block for loop transmission. If you have to start a large transaction by loop, you can try either of the following methods.

  - Increase the `rmt_tx_channel_config_t::mem_block_symbols`. This approach does not work if the DMA backend is also enabled.
  - Customize an encoder and construct an infinite loop in the encoding function. See also RMT Encoder.

Internally, `rmt_transmit()` constructs a transaction descriptor and sends it to a job queue, which is dispatched in the ISR. So it is possible that the transaction is not started yet when `rmt_transmit()` returns. To ensure all pending transactions to complete, the user can use `rmt_tx_wait_all_done()`.

Multiple Channels Simultaneous Transmission  In some real-time control applications (e.g., to make two robotic arms move simultaneously), we do not want any time drift in between when startup multiple TX channels. The RMT driver can help to manage this by creating a so-called Sync Manager. The sync manager is represented by `rmt_sync_manager_handle_t` in the driver. The procedure of RMT sync transmission is shown as follows:

Install RMT Sync Manager  To create a sync manager, the user needs to tell which channels are going to be managed in the `rmt_sync_manager_config_t`:

- `rmt_sync_manager_config_t::tx_channel_array` points to the array of TX channels to be managed.
- `rmt_sync_manager_config_t::array_size` sets the number of channels to be managed.

`rmt_new_sync_manager()` can return a manager handle on success. This function could also fail due to various errors such as invalid arguments, etc. Especially, when the sync manager has been installed before, and there are no hardware resources to create another manager, this function reports `ESP_ERR_NOT_FOUND` error. In addition, if the sync manager is not supported by the hardware, it reports a `ESP_ERR_NOT_SUPPORTED` error. Please refer to [TRM] before using the sync manager feature.
For any managed TX channel, it does not start the machine until `rmt_transmit()` has been called on all channels in `rmt_sync_manager_config_t::tx_channel_array`. Before that, the channel is just put in a waiting state. TX channels will usually complete their transactions at different times due to differing transactions, thus resulting in a loss of sync. So before restarting a simultaneous transmission, the user needs to call `rmt_sync_reset()` to synchronize all channels again.

Calling `rmt_del_sync_manager()` can recycle the sync manager and enable the channels to initiate transactions independently afterward.

```c
rmt_channel_handle_t tx_channels[2] = {NULL}; // declare two channels
int tx_gpio_number[2] = {0, 2}; // install channels one by one
for (int i = 0; i < 2; i++) {
    rmt_tx_channel_config_t tx_chan_config = {
        .clk_src = RMT_CLK_SRC_DEFAULT, // select source clock
        .gpio_num = tx_gpio_number[i], // GPIO number
        .mem_block_symbols = 64, // memory block size, 64 * 4 = 256 Bytes
        .resolution_hz = 1 * 1000 * 1000, // 1 MHz resolution
        .trans_queue_depth = 1, // set the number of transactions that can pend in the background
    };
    ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_channels[i]));
}
// install sync manager
rmt_sync_manager_handle_t synchro = NULL;
rmt_sync_manager_config_t synchro_config = {
    .tx_channel_array = tx_channels,
    .array_size = sizeof(tx_channels) / sizeof(tx_channels[0]),
};
ESP_ERROR_CHECK(rmt_new_sync_manager(&synchro_config, &synchro));
...
ESP_ERROR_CHECK(rmt_transmit(tx_channels[0], led_strip_encoders[0], led_data, led_num * 3, &transmit_config));
// tx_channels[0] does not start transmission until call of `rmt_transmit()` for _tx_channels[1] returns
ESP_ERROR_CHECK(rmt_transmit(tx_channels[1], led_strip_encoders[1], led_data, led_num * 3, &transmit_config));
```
Chapter 2. API Reference

Initiate RX Transaction  As also discussed in the Enable and Disable Channel, calling rmt_enable() does not prepare an RX to receive RMT symbols. The user needs to specify the basic characteristics of the incoming signals in rmt_receive_config_t:

- rmt_receive_config_t::signal_range_min_ns specifies the minimal valid pulse duration in either high or low logic levels. A pulse width that is smaller than this value is treated as a glitch, and ignored by the hardware.
- rmt_receive_config_t::signal_range_max_ns specifies the maximum valid pulse duration in either high or low logic levels. A pulse width that is bigger than this value is treated as Stop Signal, and the receiver generates receive-complete event immediately.

The RMT receiver starts the RX machine after the user calls rmt_receive() with the provided configuration above. Note that, this configuration is transaction specific, which means, to start a new round of reception, the user needs to set the rmt_receive_config_t again. The receiver saves the incoming signals into its internal memory block or DMA buffer, in the format of rmt_symbol_word_t.

Due to the limited size of the memory block, the RMT receiver can only save short frames whose length is not longer than the memory block capacity. Long frames are truncated by the hardware, and the driver reports an error message: hw buffer too small, received symbols truncated.

The copy destination should be provided in the buffer parameter of rmt_receive() function. If this buffer overflows due to an insufficient buffer size, the receiver can continue to work, but overflowed symbols are dropped and the following error message is reported: user buffer too small, received symbols truncated. Please take care of the lifecycle of the buffer parameter, ensuring that the buffer is not recycled before the receiver is finished or stopped.

The receiver is stopped by the driver when it finishes working, i.e., receive a signal whose duration is bigger than rmt_receive_config_t::signal_range_max_ns. The user needs to call rmt_receive() again to restart the receiver, if necessary. The user can get the received data in the rmt_rx_event_callbacks_t::on_recv_done callback. See also Register Event Callbacks for more information.

```c
static bool example_rmt_rx_done_callback(rmt_channel_handle_t channel, const rmt_rx_done_event_data_t *edata, void *userdata)
{
    BaseType_t high_task_wakeup = pdFALSE;
    QueueHandle_t receive_queue = (QueueHandle_t)userdata;
    // send the received RMT symbols to the parser task
    xQueueSendFromISR(receive_queue, edata, &high_task_wakeup);
    // return whether any task is woken up
    return high_task_wakeup == pdTRUE;
}
```

QueueHandle_t receive_queue = xQueueCreate(1, sizeof(rmt_rx_done_event_data_t));
rmt_rx_event_callbacks_t cbs = {
    .on_recv_done = example_rmt_rx_done_callback,
};
ESP_ERROR_CHECK(rmt_rx_register_event_callbacks(rx_channel, &cbs, receive_queue));
```
// the following timing requirement is based on NEC protocol
rmt_receive_config_t receive_config = {
    .signal_range_min_ns = 1250, // the shortest duration for NEC signal is ~560 μs, 1250 ns < 560 μs, valid signal is not treated as noise
    .signal_range_max_ns = 12000000, // the longest duration for NEC signal is ~9000 μs, 12000000 ns > 9000 μs, the receive does not stop early
};
rmt_symbol_word_t raw_symbols[64]; // 64 symbols should be sufficient for a standard NEC frame
// ready to receive
ESP_ERROR_CHECK(rmt_receive(rx_channel, raw_symbols, sizeof(raw_symbols), &receive_config));
// wait for the RX-done signal
```

(continues on next page)
rmt_rx_done_event_data_t rx_data;
xQueueReceive(receive_queue, &rx_data, portMAX_DELAY);
// parse the received symbols
example_parse_nec_frame(rx_data.received Symbols, rx_data.num_symbols);

**RMT Encoder**  An RMT encoder is part of the RMT TX transaction, whose responsibility is to generate and write the correct RMT symbols into hardware memory or DMA buffer at a specific time. There are some special restrictions for an encoding function:

- During a single transaction, the encoding function may be called multiple times. This is necessary because the target RMT memory block cannot hold all the artifacts at once. To overcome this limitation, we utilize a ping-pong approach, where the encoding session is divided into multiple parts. This means that the encoder needs to keep track of its state in order to continue encoding from where it left off in the previous part.
- The encoding function is running in the ISR context. To speed up the encoding session, it is highly recommended to put the encoding function into IRAM. This can also avoid the cache miss during encoding.

To help get started with the RMT driver faster, some commonly-used encoders are provided out-of-the-box. They can either work alone or be chained together into a new encoder. See also Composite Pattern for the principle behind it. The driver has defined the encoder interface in `rmt_encoder_t`, it contains the following functions:

- `rmt_encoder_t::encode` is the fundamental function of an encoder. This is where the encoding session happens.
  - The function might be called multiple times within a single transaction. The encode function should return the state of the current encoding session.
  - The supported states are listed in the `rmt_encode_state_t`. If the result contains `RMT_ENCODING_COMPLETE`, it means the current encoder has finished work.
  - If the result contains `RMT_ENCODING_MEM_FULL`, we need to yield from the current session, as there is no space to save more encoding artifacts.
- `rmt_encoder_t::reset` should reset the encoder state back to the initial state (the RMT encoder is stateful).
  - If the RMT transmitter is manually stopped without resetting its corresponding encoder, subsequent encoding session can be erroneous.
  - This function is also called implicitly in `rmt_disable()`.
- `rmt_encoder_t::del` should free the resources allocated by the encoder.

**Copy Encoder**  A copy encoder is created by calling `rmt_new_copy_encoder()`. A copy encoder’s main functionality is to copy the RMT symbols from user space into the driver layer. It is usually used to encode `const` data, i.e., data does not change at runtime after initialization such as the leading code in the IR protocol.

A configuration structure `rmt_copy_encoder_config_t` should be provided in advance before calling `rmt_new_copy_encoder()`. Currently, this configuration is reserved for future expansion, and has no specific use or setting items for now.

**Bytes Encoder**  A bytes encoder is created by calling `rmt_new_bytes_encoder()`. The bytes encoder’s main functionality is to convert the user space byte stream into RMT symbols dynamically. It is usually used to encode dynamic data, e.g., the address and command fields in the IR protocol.

A configuration structure `rmt_bytes_encoder_config_t` should be provided in advance before calling `rmt_new_bytes_encoder()`:

- `rmt_bytes_encoder_config_t::bit0` and `rmt_bytes_encoder_config_t::bit1` are necessary to specify the encoder how to represent bit zero and bit one in the format of `rmt_symbol_word_t`.
- `rmt_bytes_encoder_config_t::msb_first` sets the bit endianess of each byte. If it is set to true, the encoder encodes the Most Significant Bit first. Otherwise, it encodes the Least Significant Bit first.

Besides the primitive encoders provided by the driver, the user can implement his own encoder by chaining the existing encoders together. A common encoder chain is shown as follows:
Customize RMT Encoder for NEC Protocol  In this section, we demonstrate how to write an NEC encoder. The NEC IR protocol uses pulse distance encoding of the message bits. Each pulse burst is 562.5 µs in length, logical bits are transmitted as follows. It is worth mentioning that the least significant bit of each byte is sent first.

- Logical 0: a 562.5 µs pulse burst followed by a 562.5 µs space, with a total transmit time of 1.125 ms
- Logical 1: a 562.5 µs pulse burst followed by a 1.6875 ms space, with a total transmit time of 2.25 ms

When a key is pressed on the remote controller, the transmitted message includes the following elements in the specified order:

- 9 ms leading pulse burst, also called the “AGC pulse”
- 4.5 ms space
- 8-bit address for the receiving device
- 8-bit logical inverse of the address
- 8-bit command
- 8-bit logical inverse of the command
- A final 562.5 µs pulse burst to signify the end of message transmission

Then we can construct the NEC `rmt_encoder_t::encode` function in the same order, for example:

```c
// IR NEC scan code representation
typedef struct {
    uint16_t address;
    uint16_t command;
} ir_nec_scan_code_t;

// construct an encoder by combining primitive encoders
typedef struct {
    rmt_encoder_t base; // the base "class" declares the standard
} rmt_encoder_t;
```
rmt_encoder_t *copy_encoder;  // use the copy_encoder to encode the leading...
and ending pulse
rmt_encoder_t *bytes_encoder;  // use the bytes_encoder to encode the address...
and command data
rmt_symbol_word_t nec_leading_symbol;  // NEC leading code with RMT...
representation
rmt_symbol_word_t nec_ending_symbol;  // NEC ending code with RMT...
representation
int state;  // record the current encoding state, i.e., we are in which...
encoding phase
rmt_ir_nec_encoder_t;

// The function rmt_encode_ir_nec takes care of the encoding
static size_t rmt_encode_ir_nec(rmt_encoder_t *encoder, rmt_channel_handle_t channel,
const void *primary_data, size_t data_size, rmt_encode_state_t *ret_state) {
    rmt_ir_nec_encoder_t *nec_encoder = __containerof(encoder, rmt_ir_nec_encoder_t,
base);
    rmt_encode_state_t session_state = RMT_ENCODING_RESET;
    rmt_encode_state_t state = RMT_ENCODING_RESET;
    size_t encoded_symbols = 0;
    ir_nec_scan_code_t *scan_code = (ir_nec_scan_code_t *)primary_data;
    rmt_encoder_handle_t copy_encoder = nec_encoder->copy_encoder;
    rmt_encoder_handle_t bytes_encoder = nec_encoder->bytes_encoder;
    switch (nec_encoder->state) {
        case 0:  // send leading code
            encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_encoder->nec_leading_symbol,
            sizeof(rmt_symbol_word_t), &session_state);
            if (session_state & RMT_ENCODING_COMPLETE) {
                nec_encoder->state = 1;  // we can only switch to the next state when...
                the current encoder finished
            }
            if (session_state & RMT_ENCODING_MEM_FULL) {
                state |= RMT_ENCODING_MEM_FULL;
                goto out;  // yield if there is no free space to put other encoding...
artifacts
            }
            // fall-through
            case 1:  // send address
                encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_code->address, sizeof(uint16_t), &session_state);
                if (session_state & RMT_ENCODING_COMPLETE) {
                    nec_encoder->state = 2;  // we can only switch to the next state when...
                    the current encoder finished
                }
                if (session_state & RMT_ENCODING_MEM_FULL) {
                    state |= RMT_ENCODING_MEM_FULL;
                    goto out;  // yield if there is no free space to put other encoding...
artifacts
                }
                // fall-through
                case 2:  // send command
                    encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_code->command, sizeof(uint16_t), &session_state);
                    if (session_state & RMT_ENCODING_COMPLETE) {
                        nec_encoder->state = 3;  // we can only switch to the next state when...
                        the current encoder finished
                    }
                    if (session_state & RMT_ENCODING_MEM_FULL) {
state |= RMT_ENCODING_MEM_FULL;
goto out; // yield if there is no free space to put other encoding...

Case 3: // send ending code
encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_
encoder->nec_ending_symbol), sizeof(rmt_symbol_word_t), &

session_state);
if (session_state & RMT_ENCODING_COMPLETE) {
    nec_encoder->state = RMT_ENCODING_RESET; // back to the initial...
    encoding session
    state |= RMT_ENCODING_COMPLETE; // telling the caller the NEC encoding...
    has finished
}
if (session_state & RMT_ENCODING_MEM_FULL) {
    state |= RMT_ENCODING_MEM_FULL;
goto out; // yield if there is no free space to put other encoding...
Case artifacts
}

out:
*ret_state = state;
return encoded_symbols;

A full sample code can be found in peripherals/rmt/ir_nec_transceiver. In the above snippet, we use a switch-case and several goto statements to implement a Finite-state machine. With this pattern, users can construct much more complex IR protocols.

**Power Management** When power management is enabled, i.e., CONFIG_PM_ENABLE is on, the system adjusts the APB frequency before going into Light-sleep, thus potentially changing the resolution of the RMT internal counter.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type ESP_PM_APB_FREQ_MAX. Whenever the user creates an RMT channel that has selected RMT_CLK_SRC_APB as the clock source, the driver guarantees that the power management lock is acquired after the channel enabled by rmt_enable(). Likewise, the driver releases the lock after rmt_disable() is called for the same channel. This also reveals that the rmt_enable() and rmt_disable() should appear in pairs.

If the channel clock source is selected to others like RMT_CLK_SRC_XTAL, then the driver does not install a power management lock for it, which is more suitable for a low-power application as long as the source clock can still provide sufficient resolution.

**IRAM Safe** By default, the RMT interrupt is deferred when the Cache is disabled for reasons like writing or erasing the main Flash. Thus the transaction-done interrupt does not get handled in time, which is not acceptable in a real-time application. What is worse, when the RMT transaction relies on ping-pong interrupt to successively encode or copy RMT symbols, a delayed interrupt can lead to an unpredictable result.

There is a Kconfig option CONFIG_RMT_ISR_IRAM_SAFE that has the following features:

1. Enable the interrupt being serviced even when the cache is disabled
2. Place all functions used by the ISR into IRAM
3. Place the driver object into DRAM in case it is mapped to PSRAM by accident

This Kconfig option allows the interrupt to run while the cache is disabled but comes at the cost of increased IRAM consumption.

\[ The\ callback\ function,\ e.g.,\ rmt_tx_event_callbacks_t::on\ trans\ done,\ and\ the\ functions\ invoked\ by\ itself\ should\ also\ reside\ in\ IRAM,\ users\ need\ to\ take\ care\ of\ this\ by\ themselves.\]
**Thread Safety** The factory function `rmt_new_tx_channel()`, `rmt_new_rx_channel()` and `rmt_new_sync_manager()` are guaranteed to be thread-safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks. Other functions that take the `rmt_channel_handle_t` and `rmt_sync_manager_handle_t` as the first positional parameter, are not thread-safe. which means the user should avoid calling them from multiple tasks.

**Kconfig Options**

- `CONFIG_RMT_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see also IRAM Safe for more information.
- `CONFIG_RMT_ENABLE_DEBUG_LOG` is used to enable the debug log at the cost of increased firmware binary size.

**Application Examples**

- RMT-based RGB LED strip customized encoder: `peripherals/rmt/led_strip`
- RMT IR NEC protocol encoding and decoding: `peripherals/rmt/ir_nec_transceiver`
- RMT transactions in queue: `peripherals/rmt/musical_buzzer`
- RMT-based stepper motor with S-curve algorithm: `peripherals/rmt/stepper_motor`
- RMT infinite loop for driving DShot ESC: `peripherals/rmt/dshot_esc`
- RMT simulate 1-wire protocol (take DS18B20 as example): `peripherals/rmt/onewire`

**FAQ**

- Why the RMT encoder results in more data than expected?

The RMT encoding takes place in the ISR context. If your RMT encoding session takes a long time (e.g., by logging debug information) or the encoding session is deferred somehow because of interrupt latency, then it is possible the transmitting becomes faster than the encoding. As a result, the encoder can not prepare the next data in time, leading to the transmitter sending the previous data again. There is no way to ask the transmitter to stop and wait. You can mitigate the issue by combining the following ways:

  - Increase the `rmt_tx_channel_config_t::mem_block_symbols`, in steps of 64.
  - Place the encoding function in the IRAM.
  - Enables the `rmt_tx_channel_config_t::with_dma` if it is available for your chip.

**API Reference**

**Header File**

- `components/driver/rmt/include/driver/rmt_tx.h`

**Functions**

```c
esp_err_t rmt_new_tx_channel(const rmt_tx_channel_config_t *config, rmt_channel_handle_t *ret_chan)
```

Create a RMT TX channel.

**Parameters**

- `config` [in] TX channel configurations
- `ret_chan` [out] Returned generic RMT channel handle

**Returns**

- ESP_OK: Create RMT TX channel successfully
- ESP_ERR_INVALID_ARG: Create RMT TX channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT TX channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create RMT TX channel failed because all RMT channels are used up and no more free one
- ESP_ERR_NOT_SUPPORTED: Create RMT TX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
**ESP_FAIL**: Create RMT TX channel failed because of other error

```c
esp_err_t rmt_transmit(rmt_channel_handle_t tx_channel, rmt_encoder_handle_t encoder, const void *payload, size_t payload_bytes, const rmt_transmit_config_t *config)
```

Transmit data by RMT TX channel.

**Note**: This function will construct a transaction descriptor and push to a queue. The transaction will not start immediately until it’s dispatched in the ISR. If there’re too many transactions pending in the queue, this function will block until the queue has free space.

**Note**: The data to be transmitted will be encoded into RMT symbols by the specific `encoder`.

**Parameters**
- `tx_channel` - [in] RMT TX channel that created by `rmt_new_tx_channel()`
- `encoder` - [in] RMT encoder that created by various factory APIs like `rmt_new_bytes_encoder()`
- `payload` - [in] The raw data to be encoded into RMT symbols
- `payload_bytes` - [in] Size of the `payload` in bytes
- `config` - [in] Transmission specific configuration

**Returns**
- ESP_OK: Transmit data successfully
- ESP_ERR_INVALID_ARG: Transmit data failed because of invalid argument
- ESP_ERR_INVALID_STATE: Transmit data failed because channel is not enabled
- ESP_ERR_NOT_SUPPORTED: Transmit data failed because some feature is not supported by hardware, e.g. unsupported loop count
- ESP_FAIL: Transmit data failed because of other error

```c
esp_err_t rmt_tx_wait_all_done(rmt_channel_handle_t tx_channel, int timeout_ms)
```

Wait for all pending TX transactions done.

**Note**: This function will block forever if the pending transaction can’t be finished within a limited time (e.g. an infinite loop transaction). See also `rmt_disable()` for how to terminate a working channel.

**Parameters**
- `tx_channel` - [in] RMT TX channel that created by `rmt_new_tx_channel()`

**Returns**
- ESP_OK: Flush transactions successfully
- ESP_ERR_INVALID_ARG: Flush transactions failed because of invalid argument
- ESP_ERR_TIMEOUT: Flush transactions failed because of timeout
- ESP_FAIL: Flush transactions failed because of other error

```c
esp_err_t rmt_tx_register_event_callbacks(rmt_channel_handle_t tx_channel, const rmt_tx_event_callbacks_t *cbs, void *user_data)
```

Set event callbacks for RMT TX channel.

**Note**: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

**Note**: When `CONFIG_RMT_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data`
should also reside in SRAM.

Parameters

- `tx_channel` - [in] RMT generic channel that created by `rmt_new_tx_channel()`
- `cbs` - [in] Group of callback functions
- `user_data` - [in] User data, which will be passed to callback functions directly

Returns

- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

```
esp_err_t rmt_new_sync_manager(const rmt_sync_manager_config_t *config, rmt_sync_manager_handle_t *ret_synchro)
```

Create a synchronization manager for multiple TX channels, so that the managed channel can start transmitting at the same time.

Note: All the channels to be managed should be enabled by `rmt_enable()` before put them into sync manager.

Parameters

- `config` - [in] Synchronization manager configuration
- `ret_synchro` - [out] Returned synchronization manager handle

Returns

- ESP_OK: Create sync manager successfully
- ESP_ERR_INVALID_ARG: Create sync manager failed because of invalid argument
- ESP_ERR_NOT_SUPPORTED: Create sync manager failed because it is not supported by hardware
- ESP_ERR_INVALID_STATE: Create sync manager failed because not all channels are enabled
- ESP_ERR_NO_MEM: Create sync manager failed because out of memory
- ESP_ERR_NOT_FOUND: Create sync manager failed because all sync controllers are used up and no more free one
- ESP_FAIL: Create sync manager failed because of other error

```
esp_err_t rmt_del_sync_manager(rmt_sync_manager_handle_t synchro)
```

Delete synchronization manager.

Parameters `synchro` - [in] Synchronization manager handle returned from `rmt_new_sync_manager()`

Returns

- ESP_OK: Delete the synchronization manager successfully
- ESP_ERR_INVALID_ARG: Delete the synchronization manager failed because of invalid argument
- ESP_FAIL: Delete the synchronization manager failed because of other error

```
esp_err_t rmt_sync_reset (rmt_sync_manager_handle_t synchro)
```

Reset synchronization manager.

Parameters `synchro` - [in] Synchronization manager handle returned from `rmt_new_sync_manager()`

Returns

- ESP_OK: Reset the synchronization manager successfully
- ESP_ERR_INVALID_ARG: Reset the synchronization manager failed because of invalid argument
- ESP_FAIL: Reset the synchronization manager failed because of other error
Structures

```
struct rmt_tx_event_callbacks_t

Group of RMT TX callbacks.
```

**Note:** The callbacks are all running under ISR environment.

**Note:** When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

Public Members

```
rmt_tx_done_callback_t on_trans_done

Event callback, invoked when transmission is finished
```

```
struct rmt_tx_channel_config_t

RMT TX channel specific configuration.
```

Public Members

```
gpio_num_t gpio_num

GPIO number used by RMT TX channel. Set to -1 if unused
```

```
rmt_clock_source_t clk_src

Clock source of RMT TX channel, channels in the same group must use the same clock source
```

```
uint32_t resolution_hz

Channel clock resolution, in Hz
```

```
size_t mem_block_symbols

Size of memory block, in number of rmt_symbol_word_t, must be an even. In the DMA mode, this field controls the DMA buffer size, it can be set to a large value; In the normal mode, this field controls the number of RMT memory block that will be used by the channel.
```

```
size_t trans_queue_depth

Depth of internal transfer queue, increase this value can support more transfers pending in the background
```

```
uint32_t invert_out

Whether to invert the RMT channel signal before output to GPIO pad
```

```
uint32_t with_dma

If set, the driver will allocate an RMT channel with DMA capability
```

```
uint32_t io_loop_back

The signal output from the GPIO will be fed to the input path as well
```
uint32_t io_od_mode
Configure the GPIO as open-drain mode

struct rmt_tx_channel_config_t::[anonymous] flags
TX channel config flags

int intr_priority
RMT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1, 2, 3)

struct rmt_transmit_config_t
RMT transmit specific configuration.

Public Members

int loop_count
Specify the times of transmission in a loop, -1 means transmitting in an infinite loop

uint32_t eot_level
Set the output level for the “End Of Transmission”

struct rmt_transmit_config_t::[anonymous] flags
Transmit config flags

struct rmt_sync_manager_config_t
Synchronous manager configuration.

Public Members

const rmt_channel_handle_t *tx_channel_array
Array of TX channels that are about to be managed by a synchronous controller

size_t array_size
Size of the tx_channel_array

Header File
- components/driver/rmt/include/driver/rmt_rx.h

Functions

esp_err_t rmt_new_rx_channel (const rmt_rx_channel_config_t *config, rmt_channel_handle_t *ret_chan)
Create a RMT RX channel.

Parameters
- config [in] RX channel configurations
- ret_chan [out] Returned generic RMT channel handle

Returns
- ESP_OK: Create RMT RX channel successfully
- ESP_ERR_INVALID_ARG: Create RMT RX channel failed because of invalid argument
Chapter 2. API Reference

- ESP_ERR_NO_MEM: Create RMT RX channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create RMT RX channel failed because all RMT channels are used up and no more free one
- ESP_ERR_NOT_SUPPORTED: Create RMT RX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- ESP_FAIL: Create RMT RX channel failed because of other error

```
esp_err_t rmt_receive(rmt_channel_handle_t rx_channel, void *buffer, size_t buffer_size, const rmt_receive_config_t *config)
```

Initiate a receive job for RMT RX channel.

Note: This function is non-blocking, it initiates a new receive job and then returns. User should check the received data from the on_recv_done callback that registered by `rmt_rx_register_event_callbacks()`.

### Parameters
- `rx_channel` - [in] RMT RX channel that created by `rmt_new_rx_channel()`
- `buffer` - [in] The buffer to store the received RMT symbols
- `buffer_size` - [in] size of the buffer, in bytes
- `config` - [in] Receive specific configurations

### Returns
- ESP_OK: Initiate receive job successfully
- ESP_ERR_INVALID_ARG: Initiate receive job failed because of invalid argument
- ESP_ERR_INVALID_STATE: Initiate receive job failed because channel is not enabled
- ESP_FAIL: Initiate receive job failed because of other error

```
esp_err_t rmt_rx_register_event_callbacks(rmt_channel_handle_t rx_channel, const rmt_rx_event_callbacks_t *cbs, void *user_data)
```

Set callbacks for RMT RX channel.

Note: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

Note: When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

### Parameters
- `rx_channel` - [in] RMT generic channel that created by `rmt_new_rx_channel()`
- `cbs` - [in] Group of callback functions
- `user_data` - [in] User data, which will be passed to callback functions directly

### Returns
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

### Structures

```
struct rmt_rx_event_callbacks_t
```

Group of RMT RX callbacks.

Note: The callbacks are all running under ISR environment
Note: When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

**Public Members**

```c
rmt_rx_done_callback_t on_recv_done
```
Event callback, invoked when one RMT channel receiving transaction completes

```c
struct rmt_rx_channel_config_t
```
RMT RX channel specific configuration.

**Public Members**

gpio_num_t gpio_num
GPIO number used by RMT RX channel. Set to -1 if unused

```c
rmt_clock_source_t clk_src
```
Clock source of RMT RX channel, channels in the same group must use the same clock source

```c
uint32_t resolution_hz
```
Channel clock resolution, in Hz

```c
size_t mem_block_symbols
```
Size of memory block, in number of `rmt_symbol_word_t`, must be an even. In the DMA mode, this field controls the DMA buffer size, it can be set to a large value (e.g. 1024); In the normal mode, this field controls the number of RMT memory block that will be used by the channel.

```c
uint32_t invert_in
```
Whether to invert the incoming RMT channel signal

```c
uint32_t with_dma
```
If set, the driver will allocate an RMT channel with DMA capability

```c
uint32_t io_loop_back
```
For debug/test, the signal output from the GPIO will be fed to the input path as well

```c
struct rmt_rx_channel_config_t::[anonymous] flags
```
RX channel config flags

```c
int intr_priority
```
RMT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

```c
struct rmt_receive_config_t
```
RMT receive specific configuration.
Chapter 2. API Reference

Public Members

uint32_t signal_range_min_ns
A pulse whose width is smaller than this threshold will be treated as glitch and ignored

uint32_t signal_range_max_ns
RMT will stop receiving if one symbol level has kept more than signal_range_max_ns

Header File

• components/driver/rmt/include/driver/rmt_common.h

Functions

esp_err_t rmt_del_channel (rmt_channel_handle_t channel)
Delete an RMT channel.

Parameters
  channel  [in] RMT generic channel that created by rmt_new_tx_channel() or rmt_new_rx_channel()

Returns
  • ESP_OK: Delete RMT channel successfully
  • ESP_ERR_INVALID_ARG: Delete RMT channel failed because of invalid argument
  • ESP_ERR_INVALID_STATE: Delete RMT channel failed because it is still in working
  • ESP_FAIL: Delete RMT channel failed because of other error

esp_err_t rmt_apply_carrier (rmt_channel_handle_t channel, const rmt_carrier_config_t *config)
Apply modulation feature for TX channel or demodulation feature for RX channel.

Parameters
  • channel  [in] RMT generic channel that created by rmt_new_tx_channel() or rmt_new_rx_channel()
  • config  [in] Carrier configuration. Specially, a NULL config means to disable the carrier modulation or demodulation feature

Returns
  • ESP_OK: Apply carrier configuration successfully
  • ESP_ERR_INVALID_ARG: Apply carrier configuration failed because of invalid argument
  • ESP_FAIL: Apply carrier configuration failed because of other error

esp_err_t rmt_enable (rmt_channel_handle_t channel)
Enable the RMT channel.

Note: This function will acquire a PM lock that might be installed during channel allocation

Parameters
  channel  [in] RMT generic channel that created by rmt_new_tx_channel() or rmt_new_rx_channel()

Returns
  • ESP_OK: Enable RMT channel successfully
  • ESP_ERR_INVALID_ARG: Enable RMT channel failed because of invalid argument
  • ESP_ERR_INVALID_STATE: Enable RMT channel failed because it’s enabled already
  • ESP_FAIL: Enable RMT channel failed because of other error

esp_err_t rmt_disable (rmt_channel_handle_t channel)
Disable the RMT channel.

Note: This function will release a PM lock that might be installed during channel allocation
**Parameters** `channel` - [in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`.

**Returns**
- ESP_OK: Disable RMT channel successfully
- ESP_ERR_INVALID_ARG: Disable RMT channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable RMT channel failed because it's not enabled yet
- ESP_FAIL: Disable RMT channel failed because of other error

**Structures**

```c
struct rmt_carrier_config_t
```

RMT carrier wave configuration (for either modulation or demodulation)

**Public Members**

- `uint32_t frequency_hz`
  Carrier wave frequency, in Hz, 0 means disabling the carrier

- `float duty_cycle`
  Carrier wave duty cycle (0~100%)  

- `uint32_t polarity_active_low`
  Specify the polarity of carrier, by default it's modulated to base signal's high level

- `uint32_t always_on`
  If set, the carrier can always exist even there's not transfer undergoing

```c
struct rmt_carrier_config_t::[anonymous] flags
```

Carrier config flags

**Header File**

- `components/driver/rmt/include/driver/rmt_encoder.h`

**Functions**

```c
esp_err_t rmt_new_bytes_encoder (const rmt_bytes_encoder_config_t *config, rmt_encoder_handle_t *ret_encoder)
```

Create RMT bytes encoder, which can encode byte stream into RMT symbols.

**Parameters**

- `config` - [in] Bytes encoder configuration
- `ret_encoder` - [out] Returned encoder handle

**Returns**

- ESP_OK: Create RMT bytes encoder successfully
- ESP_ERR_INVALID_ARG: Create RMT bytes encoder failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT bytes encoder failed because out of memory
- ESP_FAIL: Create RMT bytes encoder failed because of other error

```c
esp_err_t rmt_new_copy_encoder (const rmt_copy_encoder_config_t *config, rmt_encoder_handle_t *ret_encoder)
```

Create RMT copy encoder, which copies the given RMT symbols into RMT memory.

**Parameters**
---

### Chapter 2. API Reference

#### config [in] Copy encoder configuration

#### ret_encoder [out] Returned encoder handle

**Returns**

- ESP_OK: Create RMT copy encoder successfully
- ESP_ERR_INVALID_ARG: Create RMT copy encoder failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT copy encoder failed because out of memory
- ESP_FAIL: Create RMT copy encoder failed because of other error

#### esp_err_t rmt_del_encoder (rmt_encoder_handle_t encoder)

Delete RMT encoder.

**Parameters**

encoder [in] RMT encoder handle, created by e.g rmt_new_bytes_encoder()

**Returns**

- ESP_OK: Delete RMT encoder successfully
- ESP_ERR_INVALID_ARG: Delete RMT encoder failed because of invalid argument
- ESP_FAIL: Delete RMT encoder failed because of other error

#### esp_err_t rmt_encoder_reset (rmt_encoder_handle_t encoder)

Reset RMT encoder.

**Parameters**

encoder [in] RMT encoder handle, created by e.g rmt_new_bytes_encoder()

**Returns**

- ESP_OK: Reset RMT encoder successfully
- ESP_ERR_INVALID_ARG: Reset RMT encoder failed because of invalid argument
- ESP_FAIL: Reset RMT encoder failed because of other error

### Structures

#### struct rmt_encoder_t

Interface of RMT encoder.

### Public Members

**size_t(*encode)(rmt_encoder_t *encoder, rmt_channel_handle_t tx_channel, const void *primary_data, size_t data_size, rmt_encode_state_t *ret_state)**

Encode the user data into RMT symbols and write into RMT memory.

**Note:** The encoding function will also be called from an ISR context, thus the function must not call any blocking API.

**Note:** It’s recommended to put this function implementation in the IRAM, to achieve a high performance and less interrupt latency.

**Param** encoder [in] Encoder handle

**Param tx_channel [in]** RMT TX channel handle, returned from rmt_new_tx_channel()

**Param primary_data [in]** App data to be encoded into RMT symbols

**Param data_size [in]** Size of primary_data, in bytes

**Param ret_state [out]** Returned current encoder’s state

**Return** Number of RMT symbols that the primary data has been encoded into

---

Espressif Systems 1402 Release v5.2-dev-3318-g8fc8f3f479

Submit Document Feedback
Chapter 2. API Reference

```c
esp_err_t (*reset)(rmt_encoder_t *encoder)
Reset encoding state.

    Param encoder [in] Encoder handle
    Return
        • ESP_OK: reset encoder successfully
        • ESP_FAIL: reset encoder failed

esp_err_t (*del)(rmt_encoder_t *encoder)
Delete encoder object.

    Param encoder [in] Encoder handle
    Return
        • ESP_OK: delete encoder successfully
        • ESP_FAIL: delete encoder failed
```

```c
struct rmt_bytes_encoder_config_t
Bytes encoder configuration.

Public Members

```c
rmt_symbol_word_t bit0
How to represent BIT0 in RMT symbol

rmt_symbol_word_t bit1
How to represent BIT1 in RMT symbol

uint32_t msb_first
Whether to encode MSB bit first

struct rmt_bytes_encoder_config_t::{anonymous} flags
Encoder config flag

struct rmt_copy_encoder_config_t
Copy encoder configuration.
```

Enumerations

```c
enum rmt_encode_state_t
RMT encoding state.

    Values:

        enumerator RMT_ENCODING_RESET
            The encoding session is in reset state

        enumerator RMT_ENCODING_COMPLETE
            The encoding session is finished, the caller can continue with subsequent encoding

        enumerator RMT_ENCODING_MEM_FULL
            The encoding artifact memory is full, the caller should return from current encoding session
```
Chapter 2. API Reference

Header File
- components/driver/rmt/include/driver/rmt_types.h

Structures

struct rmt_tx_done_event_data_t
Type of RMT TX done event data.

Public Members

size_t num_symbols
The number of transmitted RMT symbols, including one EOF symbol, which is appended by the driver to mark the end of a transmission. For a loop transmission, this value only counts for one round.

struct rmt_rx_done_event_data_t
Type of RMT RX done event data.

Public Members

rmt_symbol_word_t *received_symbols
Point to the received RMT symbols

size_t num_symbols
The number of received RMT symbols

Type Definitions

typedef struct rmt_channel_t *rmt_channel_handle_t
Type of RMT channel handle.

typedef struct rmt_sync_manager_t *rmt_sync_manager_handle_t
Type of RMT synchronization manager handle.

typedef struct rmt_encoder_t *rmt_encoder_handle_t
Type of RMT encoder handle.

typedef bool (*rmt_tx_done_callback_t)(rmt_channel_handle_t tx_chan, const rmt_tx_done_event_data_t *edata, void *user_ctx)
Prototype of RMT event callback.

Param tx_chan [in] RMT channel handle, created from rmt_new_tx_channel()
Param edata [in] Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.
Param user_ctx [in] User registered context, passed from rmt_tx_register_event_callbacks()
Return Whether a high priority task has been waken up by this callback function

typedef bool (*rmt_rx_done_callback_t)(rmt_channel_handle_t rx_chan, const rmt_rx_done_event_data_t *edata, void *user_ctx)
Prototype of RMT event callback.

Param rx_chan [in] RMT channel handle, created from rmt_new_rx_channel()
**Param edata** [in] Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.

**Param user_ctx** [in] User registered context, passed from `rmt_rx_register_event_callbacks()`

**Return** Whether a high priority task has been waken up by this function.

**Header File**

- `components/hal/include/hal/rmt_types.h`

**Unions**

```c
union rmt_symbol_word_t
    #include <rmt_types.h> The layout of RMT symbol stored in memory, which is decided by the hardware design.
```

**Public Members**

```c
uint16_t duration0
    Duration of level0

uint16_t level0
    Level of the first part

uint16_t duration1
    Duration of level1

uint16_t level1
    Level of the second part

struct rmt_symbol_word_t::[anonymous] [anonymous]

uint32_t val
    Equivalent unsigned value for the RMT symbol
```

**Type Definitions**

```c
typedef soc_periph_rmt_clk_src_t rmt_clock_source_t
    RMT group clock source.
```

---

**Note:** User should select the clock source based on the power and resolution requirement

---

### 2.6.15 SD Pull-up Requirements

Espressif hardware products are designed for multiple use cases which may require different pull states on pins. For this reason, the pull state of particular pins on certain products needs to be adjusted to provide the pull-ups required in the SD bus.

SD pull-up requirements apply to cases where ESP32 uses the SPI or SDMMC controller to communicate with SD cards. When an SD card is operating in SPI mode or 1-bit SD mode, the CMD and DATA (DAT0 - DAT3) lines of the SD bus must be pulled up by 10 kOhm resistors. SD cards and SDIO devices should also have pull-ups on all
above-mentioned lines (regardless of whether these lines are connected to the host) in order to prevent them from entering a wrong state.

By default, the MTDI bootstrapping pin is incompatible with the DAT2 line pull-up if the flash voltage is 3.3 V. For more information, see MTDI Strapping Pin below.

This document has the following structure:

- **Overview of compatibility** between the default pull states on pins of Espressif’s products and the states required by the SD bus
- **Solutions** - ideas on how to resolve compatibility issues
- **Related information** - other relevant information

**Overview of Compatibility**

This section provides an overview of compatibility issues that might occur when using SDIO (secure digital input output). Since the SD bus needs to be connected to pull-ups, these issues should be resolved regardless of whether they are related to master (host) or slave (device). Each issue has links to its respective solution. A solution for a host and device may differ.

**Systems on a Chip (SoCs)**

- ESP32 (except for D2WD versions, see ESP32 datasheet):
  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2 for models with 3.3 V flash chip
- ESP32-D2WD:
  - No Pull-ups
  - No Pull-up on GPIO12

**Systems in Packages (SIP)**

- ESP32-PICO-D4:
  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2

**Modules**

  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2
- ESP32-WROVER Series, including ESP32-WROVER and ESP32-WROVER-I
  - No Pull-ups
- ESP32-WROVER-B Series, including ESP32-WROVER-B and ESP32-WROVER-IB
  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2

**Development Boards**

- ESP32-PICO-KIT, including PICO-KIT v4.1, v4.0, and v3
  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2
  - Download Mode Not Working (minor issue)
- ESP32-DevKitC, including ESP32-DevKitC v4 and v2
  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2
  - Download Mode Not Working (minor issue)
- ESP-WROVER-KIT
– Required pull-ups are provided
– *Pull-up Conflicts on GPIO13* (v4.1, v3, v2, and v1)
– *Conflicts Between Bootstrap and SDIO on DAT2* (v4.1, v2, and v1)
– *Download Mode Not Working (minor issue)* (v2, v1)

You can determine the version of your ESP32-WROVER-KIT by checking which module is mounted on it:
– ESP32-WROVER-B on v4.1
– ESP32-WROVER on v3
– ESP32-WROOM-32 on v1 and v2

*• ESP32-LyraTD-MSC*
  – Required pull-ups are provided
  – *Conflicts Between Bootstrap and SDIO on DAT2*

*• ESP32-LyraT*
  – Required pull-ups are provided
  – *Pull-up Conflicts on GPIO13*

**Non-Espressif Hosts**  Please make sure that your SDIO host provides necessary pull-ups for all SD bus signals.

**Solutions**

**No Pull-ups**  If you use a development board without pull-ups, you can do the following:

– If your host and slave device are on separate boards, replace one of them with a board that has pull-ups. For the list of Espressif’s development boards with pull-ups, go to [Development Boards](#).
– Attach external pull-ups by connecting each pin which requires a pull-up to VDD via a 10 kOhm resistor.

**Pull-up Conflicts on GPIO13**  If DAT3 of your device is not properly pulled up, you have the following options:

– Use 1-bit SD mode and tie the device’s DAT3 to VDD
– Use SPI mode
– **Perform one of the following actions on the GPIO13 pin:**
  – Remove the pull-down resistors
  – Attach a pull-up resistor of less than 5 kOhm (2 kOhm suggested)
  – Pull it up or drive it high either by using the host or with 3.3 V on VDD in 1-bit SD mode

**Conflicts Between Bootstrap and SDIO on DAT2**  There is a conflict between the boot strapping requirements of the ESP32 and the SDIO protocol. For details, see [MTDI Strapping Pin](#).

To resolve the conflict, you have the following options:

1. (Recommended) Burn the flash voltage selection eFuses. This permanently configures the internal regulator’s output voltage to 3.3 V, and GPIO12 will not be used as a bootstrapping pin. After that, connect a pull-up resistor to GPIO12.

**Warning:**  Burning eFuses is irreversible! The issue list above might be out of date, so please make sure that the module you are burning has a 3.3 V flash chip by checking the information on [https://www.espressif.com/](https://www.espressif.com/). If you burn the 3.3 V eFuses on a module with a 1.8 V flash chip, the module will stop functioning.

If you are sure that you need to irreversibly burn eFuses, go to your ESP-IDF directory and run the following command:

```
components/esptool_py/esptool/espefuse.py set_flash_voltage 3.3V
```

This command burns the `XPD_SDIO_TIEH`, `XPD_SDIO_FORCE`, and `XPD_SDIO_REG` eFuses. After all the three eFuses are burned to value 1, the internal VDD_SDIO flash voltage regulator is permanently set to 3.3 V. You will see the following log if the burning succeeds:
**espefuse.py v2.6**  
**Connecting....**  
Enable internal flash voltage regulator (VDD_SDIO) to 3.3 V. The following eFuses are burned: XPD_SDIO_FORCE, XPD_SDIO_REG, XPD_SDIO_TIEH. This is an irreversible operation. Type 'BURN' (all capitals) to continue.

**BURN**  
VDD_SDIO setting complete.

To check the status of the eFuses, run:

```
``components/esptool_py/esptool/espefuse.py summary``

If running from an automated flashing script, espefuse.py has an option `--do-not-confirm`.

For more details, see ESP32 Technical Reference Manual [PDF].

2. **If using 1-bit SD mode or SPI mode**, disconnect the DAT2 pin and make sure it is pulled high. For this, do the following:
   - Leave the host’s DAT2 floating and directly connect the slave’s DAT2 to VDD.
   - For a slave device, build a firmware with the option `SDIO_SLAVE_FLAG_DAT2_DISABLED` and reflash your device. This option helps avoid slave detecting on the DAT2 line. Note that 4-bit SD mode is no longer supported by the standard Card Common Control Register (CCCR); however, the host is not aware of that. The use of 4-bit SD mode has to be disabled on the host’s side.

**No Pull-up on GPIO12**  
Your module is compatible with the SDIO protocol. Just connect GPIO12 to VDD via a 10 kOhm resistor.

**Download Mode Not Working (minor issue)**  
When the GPIO2 pin is pulled high in accordance with the SD pull-up requirements, you cannot enter Download mode because GPIO2 is a bootstrapping pin which in this case must be pulled low.

There are the following solutions:

- For boards that require shorting the GPIO0 and GPIO2 pins with a jumper, put the jumper in place, and the auto-reset circuit pulls GPIO2 low along with GPIO0 before entering Download mode.
- For boards with components attached to their GPIO2 pin (such as pull-down resistors and/or LEDs), check the schematic of your development board for anything connected to GPIO2.
  - **LEDs** would not affect operation in most cases.
  - **Pull-down resistors** can interfere with DAT0 signals and must be removed.

If the above solutions do not work for you, please determine if it is the host or slave device that has pull-ups affecting their GPIO2, then locate these pull-ups and remove them.

**Related Information**

**MTDI Strapping Pin**  
MTDI (GPIO12) is used as a bootstrapping pin to select the output voltage of an internal regulator (VDD_SDIO) which powers the flash chip. This pin has an internal pull-down, so, if left unconnected, it will read low level at startup, which leads to selecting the default 3.3 V operation.

All ESP32-WROVER modules, excluding ESP32-WROVER-B, use 1.8 V flash and have internal pull-ups on GPIO12. Other modules that use 3.3 V flash have no pull-ups on the GPIO12 pin, and this pin is slightly pulled down internally.

When adding a pull-up to this pin for SD card operation, consider the following:

- For boards that do not use the internal regulator (VDD_SDIO) to power flash, GPIO12 can be pulled high.
- For boards using 1.8 V flash chips, GPIO12 needs to be pulled high at reset. This is fully compatible with the SD card operation.
On boards using the internal regulator and a 3.3 V flash chip, GPIO12 must be pulled low at reset. This is incompatible with the SD card operation. For reference information on compatibility of Espressif’s boards with the SD card operation, see Overview of Compatibility.

**Internal Pull-ups and Strapping Requirements** Using external resistors is always preferable. However, Espressif’s products have internal weak pull-up and pull-down resistors which can be enabled and used instead of external ones. Please keep in mind that this solution cannot guarantee reliable SDIO communication.

With that said, the information about these internal pull-ups and strapping requirements can still be useful. Espressif hardware products have different weak internal pull-ups/pull-downs connected to CMD and DATA pins. The table below shows the default pull-up and pull-down states of the CMD and DATA pins.

The following abbreviations are used in the table:

- **WPU**: Weak pull-up inside the SoC
- **WPD**: Weak pull-down inside the SoC
- **PU**: Pull-up inside Espressif modules but outside the SoC

### 2.6.16 SDMMC Host Driver

**Overview**

ESP32’s SDMMC host peripheral has two slots. Each slot can be used independently to connect to an SD card, SDIO device, or eMMC chip.

- **Slot 0** ([SDMMC_HOST_SLOT_0]) is an 8-bit slot. It uses HS1_* signals in the PIN MUX.
- **Slot 1** ([SDMMC_HOST_SLOT_1]) is a 4-bit slot. It uses HS2_* signals in the PIN MUX.

The slots are connected to ESP32 GPIOs using IO MUX. Pin mappings of these slots are given in the table below.

<table>
<thead>
<tr>
<th>Signal</th>
<th>Slot 0</th>
<th>Slot 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMD</td>
<td>GPIO11</td>
<td>GPIO15</td>
</tr>
<tr>

<tr>
<td>CD</td>
<td>any input via GPIO matrix</td>
<td>any input via GPIO matrix</td>
</tr>
<tr>
<td>WP</td>
<td>any input via GPIO matrix</td>
<td>any input via GPIO matrix</td>
</tr>
</tbody>
</table>
The Card Detect (CD) and Write Protect (WP) signals can be routed to arbitrary pins using the GPIO matrix. To reserve the pins, set the cd and wp members of the sdmmc_slot_config_t structure before calling sdmmc_host_init_slot(). Please note that it is not advised to specify a CD pin when working with SDIO cards, because the CD signal in ESP32 can also trigger SDIO slave interrupt.

**Warning:** Pins used by Slot 0 (HS1_*) are also used to connect the SPI flash chip in ESP32-WROOM and ESP32-WROVER modules. These pins cannot be concurrently shared between an SD card and an SPI flash. If you need to use Slot 0, establish an alternative connection for the SPI flash using different pins and configure the necessary eFuses accordingly.

### Supported Speed Modes

SDMMC Host driver supports the following speed modes:

- Default Speed (20 MHz): 1-line or 4-line with SD cards, and 1-line, 4-line, or 8-line with 3.3 V eMMC
- High Speed (40 MHz): 1-line or 4-line with SD cards, and 1-line, 4-line, or 8-line with 3.3 V eMMC
- High Speed DDR (40 MHz): 4-line with 3.3 V eMMC

Speed modes not supported at present:

- High Speed DDR mode: 8-line eMMC
- UHS-I 1.8 V modes: 4-line SD cards

### Using the SDMMC Host Driver

Of all the functions listed below, only the following ones will be used directly by most applications:

- sdmmc_host_init()
- sdmmc_host_init_slot()
- sdmmc_host_deinit()

Other functions, such as the ones given below, will be called by the SD/MMC protocol layer via function pointers in the sdmmc_host_t structure:

- sdmmc_host_set_bus_width()
- sdmmc_host_set_card_clk()
- sdmmc_host_do_transaction()

### Configuring Bus Width and Frequency

With the default initializers for sdmmc_host_t and sdmmc_slot_config_t, i.e., SDMMC_HOST_DEFAULT and SDMMC_SLOT_CONFIG_DEFAULT, SDMMC Host driver will attempt to use the widest bus supported by the card (4 lines for SD, 8 lines for eMMC) and the frequency of 20 MHz.

In the designs where communication at 40 MHz frequency can be achieved, it is possible to increase the bus frequency by changing the max_freq_khz field of sdmmc_host_t:

```c
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
```

If you need a specific frequency other than standard speeds, you are free to use any value from within an appropriate range of the SD interface given (SDMMC or SDSPI). However, the real clock frequency shall be calculated by the underlying driver and the value can be different from the one required.

For the SDMMC, max_freq_khz works as the upper limit so the final frequency value shall be always lower or equal. For the SDSPI, the nearest fitting frequency is supplied and thus the value can be greater than/equal to/lower than max_freq_khz.

To configure the bus width, set the width field of sdmmc_slot_config_t. For example, to set 1-line mode:
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.width = 1;

**SD/MMC Host Configuration**

```c
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
host.flags &= ~SDMMC_HOST_FLAG_DDR;
```

**DDR Mode for eMMC Chips**

By default, DDR mode will be used if:

- SDMMC host frequency is set to `SDMMC_FREQ_HIGHSPEED` in `sdmmc_host_t` structure, and
- eMMC chip reports DDR mode support in its CSD register

DDR mode places higher requirements for signal integrity. To disable DDR mode while keeping the `SDMMC_FREQ_HIGHSPEED` frequency, clear the `SDMMC_HOST_FLAG_DDR` bit in `sdmmc_host_t::flags` field of the `sdmmc_host_t`:

```
```

**See also**

- **SD/SDIO/MMC Driver**: introduces the higher-level driver which implements the protocol layer.
- **SD SPI Host Driver**: introduces a similar driver that uses the SPI controller and is limited to SD protocol’s SPI mode.
- **SD Pull-up Requirements**: introduces pull-up support and compatibilities of modules and development kits.

**API Reference**

**Header File**

- components/driver/sdmmc/include/driver/sdmmc_host.h

**Functions**

```c
esp_err_t sdmmc_host_init (void)
```

Initialize SDMMC host peripheral.

**Note**: This function is not thread safe

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if `sdmmc_host_init` was already called
- ESP_ERR_NO_MEM if memory cannot be allocated

```c
esp_err_t sdmmc_host_init_slot (int slot, const sdmmc_slot_config_t *slot_config)
```

Initialize given slot of SDMMC peripheral.

On the ESP32, SDMMC peripheral has two slots:

- Slot 0: 8-bit wide, maps to HS1_* signals in PIN MUX
- Slot 1: 4-bit wide, maps to HS2_* signals in PIN MUX

Card detect and write protect signals can be routed to arbitrary GPIOs using GPIO matrix.

**Note**: This function is not thread safe
## Parameters

- **slot**: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **slot_config**: additional configuration for the slot

## Returns

- **ESP_OK** on success
- **ESP_ERR_INVALID_STATE** if host has not been initialized using sdmmc_host_init

### esp_err_t sdmmc_host_set_bus_width (int slot, size_t width)

Select bus width to be used for data transfer.

SD/MMC card must be initialized prior to this command, and a command to set bus width has to be sent to the card (e.g. SD_APP_SET_BUS_WIDTH)

**Note:** This function is not thread safe

#### Parameters

- **slot**: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **width**: bus width (1, 4, or 8 for slot 0; 1 or 4 for slot 1)

#### Returns

- **ESP_OK** on success
- **ESP_ERR_INVALID_ARG** if slot number or width is not valid

### size_t sdmmc_host_get_slot_width (int slot)

Get bus width configured in sdmmc_host_init_slot to be used for data transfer.

**Parameters**

- **slot**: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

**Returns**

- **configured bus width of the specified slot.**

### esp_err_t sdmmc_host_set_card_clk (int slot, uint32_t freq_khz)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

**Note:** This function is not thread safe

#### Parameters

- **slot**: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **freq_khz**: card clock frequency, in kHz

#### Returns

- **ESP_OK** on success
- **other error codes may be returned in the future**

### esp_err_t sdmmc_host_set_bus_ddr_mode (int slot, bool ddr_enabled)

Enable or disable DDR mode of SD interface.

**Parameters**

- **slot**: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **ddr_enabled**: enable or disable DDR mode

**Returns**

- **ESP_OK** on success
- **ESP_ERR_NOT_SUPPORTED** if DDR mode is not supported on this slot

### esp_err_t sdmmc_host_set_cclk_always_on (int slot, bool cclk_always_on)

Enable or disable always-on card clock. When cclk_always_on is false, the host controller is allowed to shut down the card clock between the commands. When cclk_always_on is true, the clock is generated even if no command is in progress.
Parameters
- slot  – slot number
- cclk_always_on – enable or disable always-on clock

Returns
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the slot number is invalid

`esp_err_t sdmmc_host_do_transaction(int slot, sdmmc_command_t *cmdinfo)`

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Attention** Data buffer passed in cmdinfo->data must be in DMA capable memory

---

**Note:** This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdmmc_host_do_transaction as long as other sdmmc_host_* functions are not called.

---

Parameters
- slot  – slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- cmdinfo  – pointer to structure describing command and data to transfer

Returns
- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
- ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response
- ESP_ERR_INVALID_SIZE if the size of data transfer is not valid in SD protocol
- ESP_ERR_INVALID_ARG if the data buffer is not in DMA capable memory

`esp_err_t sdmmc_host_io_int_enable(int slot)`

Enable IO interrupts.

This function configures the host to accept SDIO interrupts.

Parameters 
- slot  – slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

Returns 
returns ESP_OK, other errors possible in the future

`esp_err_t sdmmc_host_io_int_wait(int slot, TickType_t timeout_ticks)`

Block until an SDIO interrupt is received, or timeout occurs.

Parameters
- slot  – slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- timeout_ticks  – number of RTOS ticks to wait for the interrupt

Returns
- ESP_OK on success (interrupt received)
- ESP_ERR_TIMEOUT if the interrupt did not occur within timeout_ticks

`esp_err_t sdmmc_host_deinit(void)`

Disable SDMMC host and release allocated resources.

**Note:** This function is not thread safe

Returns
- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdmmc_host_init function has not been called
### Chapter 2. API Reference

**esp_err_t sdmmc_host_get_real_freq**(int slot, int *real_freq_khz)

Provides a real frequency used for an SD card installed on specific slot of SD/MMC host controller.

This function calculates real working frequency given by current SD/MMC host controller setup for required slot: it reads associated host and card dividers from corresponding SDMMC registers, calculates respective frequency and stores the value into the ‘real_freq_khz’ parameter

**Parameters**
- *slot* - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- *real_freq_khz* - [out] output parameter for the result frequency (in kHz)

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG on real_freq_khz == NULL or invalid slot number used

**esp_err_t sdmmc_host_set_input_delay**(int slot, sdmmc_delay_phase_t delay_phase)

Set input delay

- This API sets delay when the SDMMC Host samples the signal from the SD Slave.
- This API will check if the given delay_phase is valid or not.
- This API will print out the delay time, in picosecond (ps)

**Note:** ESP32 doesn’t support this feature, you will get an ESP_ERR_NOT_SUPPORTED

**Parameters**
- *slot* - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- *delay_phase* - delay phase, this API will convert the phase into picoseconds and print it out

**Returns**
- ESP_OK: ON success.
- ESP_ERR_INVALID_ARG: Invalid argument.
- ESP_ERR_NOT_SUPPORTED: ESP32 doesn’t support this feature.

**Structures**

**struct sdmmc_slot_config_t**

Extra configuration for SDMMC peripheral slot

**Public Members**

- gpio_num_t gpio_cd
  - GPIO number of card detect signal.
- gpio_num_t cd
  - GPIO number of card detect signal; shorter name.
- gpio_num_t gpio_wp
  - GPIO number of write protect signal.
- gpio_num_t wp
  - GPIO number of write protect signal; shorter name.
Chapter 2. API Reference

```c
uint8_t width
Bus width used by the slot (might be less than the max width supported)

uint32_t flags
Features used by this slot.
```

**Macros**

**SDMMC_HOST_SLOT_0**
SDMMC slot 0.

**SDMMC_HOST_SLOT_1**
SDMMC slot 1.

**SDMMC_HOST_DEFAULT ()**
Default `sdmmc_host_t` structure initializer for SDMMC peripheral.

Uses SDMMC peripheral, with 4-bit mode enabled, and max frequency set to 20MHz

**SDMMC_SLOT_FLAG_INTERNAL_PULLUP**
Enable internal pullups on enabled pins. The internal pullups are insufficient however, please make sure external pullups are connected on the bus. This is for debug / example purpose only.

**SDMMC_SLOT_FLAG_WP_ACTIVE_HIGH**
GPIO write protect polarity. 0 means “active low”, i.e. card is protected when the GPIO is low; 1 means “active high”, i.e. card is protected when GPIO is high.

**SDMMC_SLOT_NO_CD**
indicates that card detect line is not used

**SDMMC_SLOT_NO_WP**
indicates that write protect line is not used

**SDMMC_SLOT_WIDTH_DEFAULT**
use the maximum possible width for the slot

**SDMMC_SLOT_CONFIG_DEFAULT ()**
Macro defining default configuration of SDMMC host slot

### 2.6.17 SD SPI Host Driver

**Overview**

The SD SPI host driver allows communication with one or more SD cards using the SPI Master driver, which utilizes the SPI host. Each card is accessed through an SD SPI device, represented by an SD SPI handle `sdspi_dev_handle_t`, which returns when the device is attached to an SPI bus by calling `sdspi_host_init_device()`. It is important to note that the SPI bus should be initialized beforehand by `spi_bus_initialize()`. This driver’s naming pattern was adopted from the `SDMMC Host Driver` due to their similarity. Likewise, the APIs of both drivers are also very similar.
Chapter 2. API Reference

SD SPI driver that accesses the SD card in SPI mode offers lower throughput but makes pin selection more flexible. With the help of the GPIO matrix, an SPI peripheral’s signals can be routed to any ESP32 pin. Otherwise, if an SDMMC host driver is used (see SDMMC Host Driver) to access the card in SD 1-bit/4-bit mode, higher throughput can be reached while requiring the signals through their dedicated IO_MUX pins only.

With the help of SPI Master Driver the SD SPI host driver based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks.

The SD SPI driver uses software-controlled CS signal.

How to Use

Firstly, use the macro SDSPI_DEVICE_CONFIG_DEFAULT to initialize the structure sdspi_device_config_t, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which are the same as the pin mappings of the SDMMC host driver. Modify the host and pins of the structure to desired value. Then call sdspi_host_init_device to initialize the SD SPI device and attach to its bus.

Then use the SDSPI_HOST_DEFAULT macro to initialize the sdmmc_host_t structure, which is used to store the state and configurations of the upper layer (SD/SDIO/MMC driver). Modify the slot parameter of the structure to the SD SPI device SD SPI handle just returned from sdspi_host_init_device. Call sdmmc_card_init with the sdmmc_host_t to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!

Other Details

Only the following driver’s API functions are normally used by most applications:

- sdspi_host_init()
- sdspi_host_init_device()
- sdspi_host_remove_device()
- sdspi_host_deinit()

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the sdmmc_host_t structure. For more details, see SD/SDIO/MMC Driver.

Note: SD over SPI does not support speeds above SDMMC_FREQ_DEFAULT due to the limitations of the SPI driver.

Warning: If you want to share the SPI bus among SD card and other SPI devices, there are some restrictions, see Sharing the SPI Bus Among SD Cards and Other SPI Devices.

Related Docs

Sharing the SPI Bus Among SD Cards and Other SPI Devices

The SD card has an SPI mode, enabling it to function as an SPI device, but there are some restrictions that we need to pay attention to.

Pin Loading of Other Devices  When adding more devices onto the same bus, the overall pin loading increases. The loading consists of AC loading (pin capacitor) and DC loading (pull-ups).
AC Loading

SD cards, designed for high-speed communications, have small pin capacitors (AC loading) to work until 50 MHz. However, the other attached devices will increase the pin’s AC loading.

Heavy AC loading of a pin may prevent the pin from being toggled quickly. By using an oscilloscope, you will see the edges of the pin become smoother, i.e., the gradient of the edge is smaller. The setup timing requirements of an SD card may be violated when the card is connected to a bus with a high AC load. Even worse, high AC loads may cause the SD card and other SPI devices to fail to properly resolve clock signals from the host, affecting communication stability.

This issue may be more obvious if other attached devices are not designed to work at the same frequency as the SD card, because they may have larger pin capacitors. The larger the pin capacity, the greater the pin response time, the smaller the max frequency the SD bus can work.

To see if your pin AC loading is too heavy, you can try the following tests:

Terminology:

• **launch edge**: at which clock edge the data starts to toggle;
• **latch edge**: at which clock edge the data is supposed to be sampled by the receiver. For SD card, it is the rising edge.

1. Use an oscilloscope to see the clock and compare the data line to the clock.
   • If you see the clock is not fast enough, e.g., the rising/falling edge is longer than 1/4 of the clock cycle, it means the clock is skewed too much.
   • If you see the data line unstable before the latch edge of the clock, it means the load of the data line is too large.
   
   You may also observe the corresponding phenomenon that data delayed largely from the launching edge of the clock with logic analyzers. But it is not as obvious as with an oscilloscope.

2. Try to use a slower clock frequency.
   If the lower frequency can work while the higher frequency cannot, it is an indication that the AC loading on the pins is too large.

If the AC loading of the pins is too large, you can either use other faster devices with lower pin load or slow down the clock speed.

DC Loading

The pull-ups required by SD cards are usually around 10 kOhm to 50 kOhm, which may be too strong for some other SPI devices.

Check the specification of your device about its DC output current, it should be larger than 700 μA, otherwise, the device output may not be read correctly.

Initialization Sequence

**Note**: If you see any problem in the following steps, please make sure the timing is correct first. You can try to slow down the clock speed, such as setting `SDMMC_FREQ_PROBING` to 400 kHz for SD card, to avoid the influence of pin AC loading, as discussed in the previous section.

When using an SD card with other SPI devices on the same SPI bus, due to the restrictions of the SD card startup flow, the following initialization sequence should be followed. Refer to `storage/sd_card` for further details.

1. Initialize the SPI bus properly by `spi_bus_initialize()`.
2. Tie the CS lines of all other devices than the SD card to idle state (by default it’s high). This is to avoid conflicts with the SD card in the following step.
   
   You can do this by either:
   1. Attach devices to the SPI bus by calling `spi_bus_add_device()`. This function will by default initialize the GPIO that is used as CS to the idle level: high.
   2. Initialize GPIO on the CS pin that needs to be tied up before actually adding a new device.
   3. Rely on the internal/external pull-up (**not recommended**) to pull up all the CS pins when the GPIOs of ESP are not initialized yet. You need to check carefully the pull-up is strong enough and there are no other pull-downs that will influence the pull-up. For example, internal pull-down should be enabled.
3. Mount the card to the filesystem by calling `esp_vfs_fat_sdspi_mount()`.
   This step will put the SD card into the SPI mode, which should be done before all other SPI communications on the same bus. Otherwise, the card will stay in the SD mode, in which mode it may randomly respond to any SPI communications on the bus, even when its CS line is not addressed.
   If you want to test this behavior, please also note that, once the card is put into SPI mode, it will not return to SD mode before the next power cycle, i.e., powered down and powered up again.
4. Now you can talk to other SPI devices freely!

API Reference

Header File

- components/driver/spi/include/driver/sdspi_host.h

Functions

`esp_err_t sdspi_host_init(void)`

Initialize SD SPI driver.

**Note:** This function is not thread safe

**Returns**

- ESP_OK on success
- other error codes may be returned in future versions

`esp_err_t sdspi_host_init_device(const sdspi_device_config_t *dev_config, sdspi_dev_handle_t *out_handle)`

Attach and initialize an SD SPI device on the specific SPI bus.

**Note:** This function is not thread safe

**Note:** Initialize the SPI bus by `spi_bus_initialize()` before calling this function.

**Note:** The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

**Parameters**

- `dev_config` - pointer to device configuration structure
- `out_handle` - Output of the handle to the sdspi device.

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if sdspi_host_init_device has invalid arguments
- ESP_ERR_NO_MEM if memory can not be allocated
- other errors from the underlying spi_master and gpio drivers

`esp_err_t sdspi_host_remove_device(sdspi_dev_handle_t handle)`

Remove an SD SPI device.

**Parameters** `handle` - Handle of the SD SPI device

**Returns** Always ESP_OK
**esp_err_t** sdspi_host_do_transaction**(sdspi_dev_handle_t handle, sdmmc_command_t *cmdinfo)**

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Note:** This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdspi_host_do_transaction as long as other sdspi_host_* functions are not called.

**Parameters**

- **handle** - Handle of the sdspi device
- **cmdinfo** – pointer to structure describing command and data to transfer

**Returns**

- **ESP_OK** on success
- **ESP_ERR_TIMEOUT** if response or data transfer has timed out
- **ESP_ERR_INVALID_CRC** if response or data transfer CRC check has failed
- **ESP_ERR_INVALID_RESPONSE** if the card has sent an invalid response

**esp_err_t** sdspi_host_set_card_clk**(sdspi_dev_handle_t host, uint32_t freq_khz)**

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

**Note:** This function is not thread safe

**Parameters**

- **host** - Handle of the sdspi device
- **freq_khz** – card clock frequency, in kHz

**Returns**

- **ESP_OK** on success
- other error codes may be returned in the future

**esp_err_t** sdspi_host_get_real_freq**(sdspi_dev_handle_t handle, int *real_freq_khz)**

Calculate working frequency for specific device.

**Parameters**

- **handle** - SDSPi device handle
- **real_freq_khz** – [out] output parameter to hold the calculated frequency (in kHz)

**Returns**

- **ESP_ERR_INVALID_ARG**: handle is NULL or invalid or real_freq_khz parameter is NULL
- **ESP_OK**: Success

**esp_err_t** sdspi_host_deinit**(void)**

Release resources allocated using sdspi_host_init.

**Note:** This function is not thread safe

**Returns**

- **ESP_OK** on success
- **ESP_ERR_INVALID_STATE** if sdspi_host_init function has not been called
**esp_err_t sdspi_host_io_int_enable (sdspi_dev_handle_t handle)**

Enable SDIO interrupt.

**Parameters**
- **handle** – Handle of the sdspi device

**Returns**
- ESP_OK on success

**esp_err_t sdspi_host_io_int_wait (sdspi_dev_handle_t handle, TickType_t timeout_ticks)**

Wait for SDIO interrupt until timeout.

**Parameters**
- **handle** – Handle of the sdspi device
- **timeout_ticks** – Ticks to wait before timeout.

**Returns**
- ESP_OK on success

**Structures**

```c
struct sdspi_device_config_t
```

Extra configuration for SD SPI device.

**Public Members**

```c
spi_host_device_t host_id
```

SPI host to use, SPIx_HOST (see spi_types.h).

```c
gpio_num_t gpio_cs
```

GPIO number of CS signal.

```c
gpio_num_t gpio_cd
```

GPIO number of card detect signal.

```c
gpio_num_t gpio_wp
```

GPIO number of write protect signal.

```c
gpio_num_t gpio_int
```

GPIO number of interrupt line (input) for SDIO card.

```c
bool gpio_wp_polarity
```

GPIO write protect polarity 0 means “active low”, i.e. card is protected when the GPIO is low; 1 means “active high”, i.e. card is protected when GPIO is high.

**Macros**

```c
SDSPI_DEFAULT_HOST
```

Default sdmmc_host_t structure initializer for SD over SPI driver.

Uses SPI mode and max frequency set to 20MHz

‘slot’ should be set to an sdspi device initialized by sdspi_host_init_device().
SDSPI_SLOT_NO_CS
indicates that card select line is not used

SDSPI_SLOT_NO_CD
indicates that card detect line is not used

SDSPI_SLOT_NO_WP
indicates that write protect line is not used

SDSPI_SLOT_NO_INT
indicates that interrupt line is not used

SDSPI_IO_ACTIVE_LOW

SDSPI_DEVICE_CONFIG_DEFAULT()
Macro defining default configuration of SD SPI device.

Type Definitions
typedef int sdspi_dev_handle_t
Handle representing an SD SPI device.

2.6.18 SDIO Card Slave Driver

Overview
The ESP32 SDIO Card host and slave peripherals share two sets of pins, as shown in the table below. The first set is usually occupied by the SPI0 bus, which is responsible for the SPI flash holding the code to run. This means the SDIO slave driver can only run on the second set of pins while the SDIO host is not using it.

The SDIO slave can run under three modes: SPI, 1-bit SD, and 4-bit SD modes. Based on the signals on the interface, the device can determine the current mode and configure itself to adapt to that mode. Later, the slave driver can communicate with the slave device to properly handle commands and data transfers. According to the SDIO specification, the CMD and DAT0-3 signal lines should be pulled up whether in 1-bit SD, 4-bit SD or SPI mode.

</table>

- 1-bit SD mode: Connect CLK, CMD, DAT0, DAT1 pins, and the ground.
- 4-bit SD mode: Connect all pins, and the ground.
- SPI mode: Connect SCLK, MOSI, MISO, Interrupt, #CS pins, and the ground.
**Note:** Please check if CMD and DATA lines DAT0-DAT3 of the card are properly pulled up by 10 KΩ - 90 KΩ resistors, which should be ensured even in 1-bit mode or SPI mode. Most official modules do not offer these pullups internally. If you are using official development boards, check [Overview of Compatibility](#) to see whether your development boards have such pullups.

**Note:** Most official modules have conflicts on strapping pins with the SDIO slave function. If you are using an ESP32 module with 3.3 V flash inside, when you are developing on the module for the first time, you will need to perform an eFuse burn-in prior to development. This will adjust the pin configuration of the module to make the module compatible with SDIO functionality. See [Overview of Compatibility](#) for details on how to configure this.

Here is a list of modules/kits with 3.3 V flash:

- **Modules**: All modules except ESP32-WROVER, ESP32-WROVER-I, ESP32-S3-WROOM-2, and please check [module list](#) for module list
- **Kits**: ESP32-PICO-KIT, ESP32-DevKitC (up to v4), ESP32-WROVER-KIT (v4.1 [also known as ESP32-WROVER-KIT-VB], v2, v1 [also known as DevKitJ v1])

You can tell the version of your ESP32-WROVER-KIT version from the module on it: v4.1 are with ESP32-WROVER-B modules, v3 are with ESP32-WROVER modules, while v2 and v1 are with ESP32-WROOM-32 modules.

Refer to [SD Pull-up Requirements](#) for more technical details of the pullups.

The host initializes the slave into SD mode by sending the CMD0 command with the DAT3 pin set to a high level. Alternatively, the host initializes the SPI mode by sending CMD0 with CS pin low, which is the same pin as DAT3.

After the initialization, the host can enable the 4-bit SD mode by writing CCCR register 0x07 by CMD52. All the bus detection processes are handled by the slave peripheral.

The host has to communicate with the slave by an ESP-slave-specific protocol.

The slave driver offers three services over Function 1 access by CMD52 and CMD53:

1. sending and receiving FIFO
2. 52 R/W registers (8-bit) shared by host and slave
3. 16 interrupt sources (8 from host to slave, and 8 from slave to host)

**Terminology** The SDIO slave driver uses the following terms:

- A transfer is initiated by a command token from the host and may consist of a response and multiple data blocks. The core mechanism of the ESP32 SDIO slave driver involves data exchange and communication through transfers.
- Sending: slave to host transfers.
- Receiving: host to slave transfers.

**Note:** The register names in [ESP32 Technical Reference Manual > SDIO Slave Controller](#) are organized from the host’s perspective. For instance, \(RX\) registers indicate sending, while \(TX\) registers denote receiving. In our driver implementation, we’ve chosen not to utilize the terms \(TX\) or \(RX\) to prevent any potential ambiguities.

- FIFO: A designated address within Function 1 that can be accessed using CMD53 commands for reading or writing substantial volumes of data. The address corresponds to the length intended for reading from or writing to the slave in a single transfer: \(\text{requested length} = 0x1F800 – \text{address}\).
- Ownership: When the driver assumes ownership of a buffer, it means that the driver has the capability to perform random read/write operations on the buffer (often via DMA). The application should not read/write the buffer until the ownership is returned to the application. If the application reads from a buffer owned by a receiving driver, the data read can be random; similarly, if the application writes to a buffer owned by a sending driver, the data sent may be corrupted.
- Requested length: The length requested in one transfer determined by the FIFO address.
Chapter 2. API Reference

- **Transfer length**: The length requested in one transfer determined by the CMD53 byte/block count field.

**Note**: Requested length is different from the transfer length. In the context of ESP32 SDIO slave DMA, the operation is based on the **requested length** rather than the **transfer length**. This means the DMA controller will process the data transfer according to the **requested length**, ensuring that only data within the **requested length** is transferred. The **transfer length** should be no shorter than the **requested length**, and the rest part is filled with 0 during sending or discard during receiving.

- **Receiving buffer size**: The buffer size is pre-defined between the host and the slave before communication starts. The slave application has to set the buffer size during initialization by the `recv_buffer_size` parameter in the `sdio_slave_config_t` structure.

- **Interrupts**: The ESP32 SDIO slave supports interrupts in two directions: from host to slave (referred to as slave interrupts) and from slave to host (referred to as host interrupts). For more details, refer to **Interrupts**.

- **Registers**: Specific addresses in Function 1 accessed by CMD52 or CMD53.

**Communication with ESP SDIO Slave** The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Sector 3.1.2 of **SDIO Simplified Specification**), which is described briefly in **ESP SDIO Slave Initialization**.

Furthermore, there is an ESP32-specific upper-level communication protocol built upon the foundation of CMD52/CMD53 to Function 1. Within this particular communication protocol, the master and slave engage in data exchange and communication through the utilization of CMD52/CMD53 commands. For more detailed information, please consult the **ESP SDIO Slave Protocol** section.

There is also a component **ESP Serial Slave Link** designed for ESP32 master to communicate with ESP32 SDIO slave. See example `peripherals/sdio` when programming your host.

**Interrupts** There are interrupts from host to slave, and from slave to host to help communicating conveniently.

**Slave Interrupts** The host can trigger an interruption in the slave by writing a single bit to the 0x08D register. As soon as any bit within the register is set, an interrupt is generated, prompting the SDIO slave driver to invoke the callback function specified in the `slave_intr_cb` member of the `sdio_slave_config_t` structure.

**Note**: The callback function is called in the ISR. Do not use any delay, loop or blocking function in the callback, e.g. mutex.

Similar to the previous information, there’s an alternative set of functions available. You can call `sdio_slave_wait_int` to wait for an interrupt within a certain time, or call `sdio_slave_clear_int` to clear interrupts from host. The callback function can work with the wait functions perfectly.

**Host Interrupts** The slave can interrupt the host by an interrupt line at certain time, which is level-sensitive, i.e., the interrupt signal can be triggered by detecting the level change of the interrupt line. When the host see the interrupt line pulled down, it may read the slave interrupt status register, to see the interrupt source. Host can clear interrupt bits, or choose to disable a interrupt source. The interrupt line holds active until all the sources are cleared or disabled.

There are several dedicated interrupt sources as well as general-purpose sources. see `sdio_slave_hostint_t` for more information.

**Shared Registers** There are 52 R/W shared registers (8-bit) to share information between host and slave. The slave can write or read the registers at any time by `sdio_slave_read_reg` and `sdio_slave_write_reg`. The host can access (R/W) the register by CMD52 or CMD53.
Receiving FIFO  When the host is going to send the slave some packets, it has to check whether the slave is ready to receive by reading the buffer number of slave.

To allow the host sending data to the slave, the application has to load buffers to the slave driver by the following steps:

1. Register the buffer by calling `sdio_slave_recv_register_buf`, and get the handle of the registered buffer. The driver allocates memory for the linked-list descriptor needed to link the buffer onto the hardware. The size of these buffers should equal to the Receiving buffer size.
2. Load buffers onto the driver by passing the buffer handle to `sdio_slave_recv_load_buf`.
3. Get the received data by calling `sdio_slave_recv` or `sdio_slave_recv_packet`. If a non-blocking call is needed, set `wait=0`.
   The difference between two APIs is that, `sdio_slave_recv_packet` gives more information about packet, which can consist of several buffers.
   When `ESP_ERR_NOT_FINISHED` is returned by this API, you should call this API iteratively until the return value is `ESP_OK`. All the continuous buffers returned with `ESP_ERR_NOT_FINISHED`, together with the last buffer returned with `ESP_OK`, belong to one packet from the host.
   Call `sdio_slave_recv_get_buf` to get the address of the received data, and the actual length received in each buffer. The packet length is the sum of received length of all the buffers in the packet.
   If the host never send data longer than the Receiving buffer size, or you do not care about the packet boundary (e.g., the data is only a byte stream), you can call the simpler version `sdio_slave_recv` instead.
4. Pass the handle of processed buffer back to the driver by `sdio_recv_load_buf` again.

**Note:** To minimize data copying overhead, the driver itself does not maintain any internal buffer; it is the responsibility of the application to promptly provide new buffers. The DMA system automatically stores received data into these buffers.

Sending FIFO  Each time the slave has data to send, it raises an interrupt, and the host requests the packet length. There are two sending modes:

- **Stream Mode:** When a buffer is loaded into the driver, the buffer length is included into the packet length requested by host in the incoming communications. This is irrespective of whether previous packets have been sent or not. In other words, the length of the newly loaded buffer is included into the length of the packet requested by the host, even if there are previously unsent packets. This enables the host to receive data from several buffers in a single transfer.
- **Packet Mode:** The packet length is updated packet by packet, and only when previous packet is sent. This means that the host can only get data of one buffer in one transfer.

**Note:** To avoid overhead from copying data, the driver itself does not have any buffer inside. Namely, the DMA takes data directly from the buffer provided by the application. The application should not touch the buffer until the sending is finished, so as to ensure that the data is transferred correctly.

The sending mode can be set in the `sending_mode` member of `sdio_slave_config_t`, and the buffer numbers can be set in the `send_queue_size`. All the buffers are restricted to be no larger than 4092 bytes. Though in the stream mode, several buffers can be sent in one transfer, each buffer is still counted as one in the queue.

The application can call `sdio_slave_transmit` to send packets. In this case, the function returns when the transfer is successfully done, so the queue is not fully used. When higher efficiency is required, the application can use the following functions instead:

1. Pass buffer information (address, length, as well as an `arg` indicating the buffer) to `sdio_slave_send_queue`.
   - If non-blocking call is needed, set `wait=0`.
   - If the `wait` is not `portMAX_DELAY` (wait until success), application has to check the result to know whether the data is put in to the queue or discard.
2. Call `sdio_slave_send_get_finished` to get and deal with a finished transfer. A buffer should be kept unmodified until returned from `sdio_slave_send_get_finished`. This means the buffer is actually
sent to the host, rather than just staying in the queue.

There are several ways to use the `arg` in the queue parameter:

1. Directly point `arg` to a dynamic-allocated buffer, and use the `arg` to free it when transfer finished.
2. Wrap transfer informations in a transfer structure, and point `arg` to the structure. You can use the structure to do more things like:

```c
typedef struct {
    uint8_t *buffer;
    size_t size;
    int id;
}sdio_transfer_t;

// and send as:
sdio_transfer_t trans = {
    .buffer = ADDRESS_TO_SEND,
    .size = 8,
    .id = 3, //the 3rd transfer so far
};
sdio_slave_send_queue(trans.buffer, trans.size, &trans, portMAX_DELAY);

//... maybe more transfers are sent here

// and deal with finished transfer as:
sdio_transfer_t *arg = NULL;
sdio_slave_send_get_finished((void**)arg, portMAX_DELAY);
ESP_LOGI("tag", "(%d) successfully send %d bytes of %p", arg->id, arg->size, arg->buffer);
some_post_callback(arg); //do more things

3. Work with the receiving part of this driver, and point `arg` to the receive buffer handle of this buffer, so that we can directly use the buffer to receive data when it is sent:

```c
uint8_t buffer[256]={1,2,3,4,5,6,7,8};
sdio_slave_buf_handle_t handle = sdio_slave_recv_register_buf(buffer);
sdio_slave_send_queue(buffer, 8, handle, portMAX_DELAY);

//... maybe more transfers are sent here

// and load finished buffer to receive as
sdio_slave_buf_handle_t handle = NULL;
sdio_slave_send_get_finished((void**)handle, portMAX_DELAY);
sdio_slave_recv_load_buf(handle);
```

For more about this, see peripherals/sdio.

Application Example

Slave/master communication: peripherals/sdio.

API Reference

Header File

- components/hal/include/hal/sdio_slave_types.h

Enumerations

enum sdio_slave_hostint_t

Mask of interrupts sending to the host.
**Chapter 2. API Reference**

**Values:**

enumerator `SDIO_SLAVE_HOSTINT_BIT0`
   General purpose interrupt bit 0.

enumerator `SDIO_SLAVE_HOSTINT_BIT1`

enumerator `SDIO_SLAVE_HOSTINT_BIT2`

enumerator `SDIO_SLAVE_HOSTINT_BIT3`

enumerator `SDIO_SLAVE_HOSTINT_BIT4`

enumerator `SDIO_SLAVE_HOSTINT_BIT5`

enumerator `SDIO_SLAVE_HOSTINT_BIT6`

enumerator `SDIO_SLAVE_HOSTINT_BIT7`

enumerator `SDIO_SLAVE_HOSTINT_SEND_NEW_PACKET`
   New packet available.

enum `sdio_slave_timing_t`
   Timing of SDIO slave.

**Values:**

enumerator `SDIO_SLAVE_TIMING_PSEND_PSAMPLE`
   Send at posedge, and sample at posedge. Default value for HS mode. If
   `.:macro:SDIO_SLAVE_FLAG_HIGH_SPEED` is specified in `:cpp:class:sdio_slave_config_t`,
   this should be selected. Normally there’s no problem using this to work in DS mode.

enumerator `SDIO_SLAVE_TIMING_NSEND_PSAMPLE`
   Send at negedge, and sample at posedge. Default value for DS mode and
   below. If `.:macro:SDIO_SLAVE_FLAG_DEFAULT_SPEED` is specified in
   `:cpp:class:sdio_slave_config_t`, this should be selected.

enumerator `SDIO_SLAVE_TIMING_PSEND_NSAMPLE`
   Send at posedge, and sample at negedge.

enumerator `SDIO_SLAVE_TIMING_NSEND_NSAMPLE`
   Send at negedge, and sample at negedge.

enum `sdio_slave_sending_mode_t`
   Configuration of SDIO slave mode.

**Values:**

enumerator `SDIO_SLAVE_SEND_STREAM`
   Stream mode, all packets to send will be combined as one if possible.
enumerator **SDIO_SLAVE_SEND_PACKET**

Packet mode, one packets will be sent one after another (only increase packet_len if last packet sent).

**Header File**

- components/driver/sdio_slave/include/driver/sdio_slave.h

**Functions**

```c
esp_err_t sdio_slave_initialize(sdio_slave_config_t *config)
```

Initialize the sdio slave driver

**Parameters**

- **config**: Configuration of the sdio slave driver.

**Returns**

- ESP_ERR_NOT_FOUND if no free interrupt found.
- ESP_ERR_INVALID_STATE if already initialized.
- ESP_ERR_NO_MEM if fail due to memory allocation failed.
- ESP_OK if success

```c
void sdio_slave_deinit(void)
```

De-initialize the sdio slave driver to release the resources.

```c
esp_err_t sdio_slave_start(void)
```

Start hardware for sending and receiving, as well as set the IOREADY1 to 1.

**Note**: The driver will continue sending from previous data and PKT_LEN counting, keep data received as well as start receiving from current TOKEN1 counting. See `sdio_slave_reset`.

**Returns**

- ESP_ERR_INVALID_STATE if already started.
- ESP_OK otherwise.

```c
void sdio_slave_stop(void)
```

Stop hardware from sending and receiving, also set IOREADY1 to 0.

**Note**: this will not clear the data already in the driver, and also not reset the PKT_LEN and TOKEN1 counting. Call `sdio_slave_reset` to do that.

```c
esp_err_t sdio_slave_reset(void)
```

Clear the data still in the driver, as well as reset the PKT_LEN and TOKEN1 counting.

**Returns**

- always return ESP_OK.

```c
sdio_slave_buf_handle_t sdio_slave_recv_register_buf(uint8_t *start)
```

Register buffer used for receiving. All buffers should be registered before used, and then can be used (again) in the driver by the handle returned.

**Note**: The driver will use and only use the amount of space specified in the `recv_buffer_size` member set in the `sdio_slave_config_t`. All buffers should be larger than that. The buffer is used by the DMA, so it should be DMA capable and 32-bit aligned.

**Parameters**

- **start**: The start address of the buffer.

**Returns**

- The buffer handle if success, otherwise NULL.
**esp_err_t** sdio_slave_recv_unregister_buf (sdio_slave_buf_handle_t handle)

Unregister buffer from driver, and free the space used by the descriptor pointing to the buffer.

**Parameters**
- **handle** – Handle to the buffer to release.

**Returns**
- ESP_OK if success, ESP_ERR_INVALID_ARG if the handle is NULL or the buffer is being used.

**esp_err_t** sdio_slave_recv_load_buf (sdio_slave_buf_handle_t handle)

Load buffer to the queue waiting to receive data. The driver takes ownership of the buffer until the buffer is returned by sdio_slave_send_get_finished after the transaction is finished.

**Parameters**
- **handle** – Handle to the buffer ready to receive data.

**Returns**
- ESP_ERR_INVALID_ARG if invalid handle or the buffer is already in the queue. Only after the buffer is returned by sdio_slave_recv can you load it again.
- ESP_OK if success

**esp_err_t** sdio_slave_recv_packet (sdio_slave_buf_handle_t *handle_ret, TickType_t wait)

Get buffer of received data if exist with packet information. The driver returns the ownership of the buffer to the app.

When you see return value is ESP_ERR_NOT_FINISHED, you should call this API iteratively until the return value is ESP_OK. All the continuous buffers returned with ESP_ERR_NOT_FINISHED, together with the last buffer returned with ESP_OK, belong to one packet from the host.

You can call simpler sdio_slave_recv instead, if the host never send data longer than the Receiving buffer size, or you don’t care about the packet boundary (e.g. the data is only a byte stream).

---

**Note:** Call sdio_slave_load_buf with the handle to re-load the buffer onto the link list, and receive with the same buffer again. The address and length of the buffer got here is the same as got from sdio_slave_get_buffer.

**Parameters**
- **handle_ret** – Handle of the buffer holding received data. Use this handle in sdio_slave_recv_load_buf() to receive in the same buffer again.
- **wait** – Time to wait before data received.

**Returns**
- ESP_ERR_INVALID_ARG if handle_ret is NULL
- ESP_ERR_TIMEOUT if timeout before receiving new data
- ESP_ERR_NOT_FINISHED if returned buffer is not the end of a packet from the host, should call this API again until the end of a packet
- ESP_OK if success

**esp_err_t** sdio_slave_recv (sdio_slave_buf_handle_t *handle_ret, uint8_t **out_addr, size_t *out_len, TickType_t wait)

Get received data if exist. The driver returns the ownership of the buffer to the app.

**Note:** Call sdio_slave_load_buf with the handle to re-load the buffer onto the link list, and receive with the same buffer again. The address and length of the buffer got here is the same as got from sdio_slave_get_buffer.

**Parameters**
- **handle_ret** – Handle to the buffer holding received data. Use this handle in sdio_slave_recv_load_buf to receive in the same buffer again.
- **out_addr** – [out] Output of the start address, set to NULL if not needed.
- **out_len** – [out] Actual length of the data in the buffer, set to NULL if not needed.
- **wait** – Time to wait before data received.
Chapter 2. API Reference

Returns
- ESP_ERR_INVALID_ARG if handle_ret is NULL
- ESP_ERR_TIMEOUT if timeout before receiving new data
- ESP_OK if success

uint8_t *sdio_slave_recv_get_buf(sdio_slave_buf_handle_t handle, size_t *len_o)
Retrieve the buffer corresponding to a handle.

Parameters
- handle – Handle to get the buffer.
- len_o – Output of buffer length

Returns buffer address if success, otherwise NULL.

esp_err_t sdio_slave_send_queue(uint8_t* addr, size_t len, void* arg, TickType_t wait)
Put a new sending transfer into the send queue. The driver takes ownership of the buffer until the buffer is returned by sdio_slave_send_get_finished after the transaction is finished.

Parameters
- addr – Address for data to be sent. The buffer should be DMA capable and 32-bit aligned.
- len – Length of the data, should not be longer than 4092 bytes (may support longer in the future).
- arg – Argument to returned in sdio_slave_send_get_finished. The argument can be used to indicate which transaction is done, or as a parameter for a callback. Set to NULL if not needed.
- wait – Time to wait if the buffer is full.

Returns
- ESP_ERR_INVALID_ARG if the length is not greater than 0.
- ESP_ERR_TIMEOUT if the queue is still full until timeout.
- ESP_OK if success.

esp_err_t sdio_slave_send_get_finished(void** out_arg, TickType_t wait)
Return the ownership of a finished transaction.

Parameters
- out_arg – Argument of the finished transaction. Set to NULL if unused.
- wait – Time to wait if there’s no finished sending transaction.

Returns ESP_ERR_TIMEOUT if no transaction finished, or ESP_OK if succeed.

esp_err_t sdio_slave_transmit(uint8_t* addr, size_t len)
Start a new sending transfer, and wait for it (blocked) to be finished.

Parameters
- addr – Start address of the buffer to send
- len – Length of buffer to send.

Returns
- ESP_ERR_INVALID_ARG if the length of descriptor is not greater than 0.
- ESP_ERR_TIMEOUT if the queue is full or host do not start a transfer before timeout.
- ESP_OK if success.

uint8_t sdio_slave_read_reg(int pos)
Read the spi slave register shared with host.

Note: register 28 to 31 are reserved for interrupt vector.

Parameters pos – register address, 0-27 or 32-63.
Returns value of the register.
### Chapter 2. API Reference

**esp_err_t** `sdio_slave_write_reg` (int pos, uint8_t reg)

Write the spi slave register shared with host.

**Note:** register 29 and 31 are used for interrupt vector.

**Parameters**
- **pos** – register address, 0-11, 14-15, 18-19, 24-27 and 32-63, other address are reserved.
- **reg** – the value to write.

**Returns** ESP_ERR_INVALID_ARG if address wrong, otherwise ESP_OK.

**sdio_slave_hostint_t** `sdio_slave_get_host_intena` (void)

Get the interrupt enable for host.

**Returns** the interrupt mask.

void `sdio_slave_set_host_intena` (sdio_slave_hostint_t mask)

Set the interrupt enable for host.

**Parameters** **mask** – Enable mask for host interrupt.

**esp_err_t** `sdio_slave_send_host_int` (uint8_t pos)

Interrupt the host by general purpose interrupt.

**Parameters** **pos** – Interrupt num, 0-7.

**Returns**
- ESP_ERR_INVALID_ARG if interrupt num error
- ESP_OK otherwise

void `sdio_slave_clear_host_int` (sdio_slave_hostint_t mask)

Clear general purpose interrupt to host.

**Parameters** **mask** – Interrupt bits to clear, by bit mask.

**esp_err_t** `sdio_slave_wait_int` (int pos, TickType_t wait)

Wait for general purpose interrupt from host.

**Note:** this clears the interrupt at the same time.

**Parameters**
- **pos** – Interrupt source number to wait for. is set.
- **wait** – Time to wait before interrupt triggered.

**Returns** ESP_OK if success, ESP_ERR_TIMEOUT if timeout.

**Structures**

struct `sdio_slave_config_t`  
Configuration of SDIO slave.

**Public Members**

**sdio_slave_timing_t** `timing`

timing of sdio slave. see `sdio_slave_timing_t`. 
**sdio_slave_sending_mode**

mode of *sdio_slave*. If the data needs to be sent as much as possible; *SDIO_SLAVE_MODE_PACKET* if the data should be sent in packets.

**int send_queue_size**

max buffers that can be queued before sending.

**size_t recv_buffer_size**

If buffer size is too small, it costs more CPU time to handle larger number of buffers. If buffer size is too large, the space larger than the transaction length is left blank but still counts a buffer, and the buffers are easily run out. Should be set according to length of data really transferred. All data that do not fully fill a buffer is still counted as one buffer. E.g. 10 bytes data costs 2 buffers if the size is 8 bytes per buffer. Buffer size of the slave pre-defined between host and slave before communication. All receive buffer given to the driver should be larger than this.

**sdio_event_cb**

when the host interrupts slave, this callback will be called with interrupt number (0-7).

**uint32_t flags**

Features to be enabled for the slave, combinations of *SDIO_SLAVE_FLAG_*.

**Macros**

**SDIO_SLAVE_RECV_MAX_BUFFER**

**SDIO_SLAVE_FLAG_DAT2_DISABLED**

It is required by the SD specification that all 4 data lines should be used and pulled up even in 1-bit mode or SPI mode. However, as a feature, the user can specify this flag to make use of DAT2 pin in 1-bit mode. Note that the host cannot read CCCR registers to know we don’t support 4-bit mode anymore, please do this at your own risk.

**SDIO_SLAVE_FLAG_HOST_INTR_DISABLED**

The DAT1 line is used as the interrupt line in SDIO protocol. However, as a feature, the user can specify this flag to make use of DAT1 pin of the slave in 1-bit mode. Note that the host has to do polling to the interrupt registers to know whether there are interrupts from the slave. And it cannot read CCCR registers to know we don’t support 4-bit mode anymore, please do this at your own risk.

**SDIO_SLAVE_FLAG_INTERNAL_PULLUP**

Enable internal pullups for enabled pins. It is required by the SD specification that all the 4 data lines should be pulled up even in 1-bit mode or SPI mode. Note that the internal pull-ups are not sufficient for stable communication, please do connect external pull-ups on the bus. This is only for example and debug use.

**SDIO_SLAVE_FLAG_DEFAULT_SPEED**

Disable the highspeed support of the hardware.

**SDIO_SLAVE_FLAG_HIGH_SPEED**

Enable the highspeed support of the hardware. This is the default option. The host will see highspeed capability, but the mode actually used is determined by the host.

**Type Definitions**
typedef void (*sdio_event_cb_t)(uint8_t event)

typedef void *sdio_slave_buf_handle_t

Handle of a receive buffer, register a handle by calling sdio_slave_recv_register_buf. Use the handle to load the buffer to the driver, or call sdio_slave_recv_unregister_buf if it is no longer used.

2.6.19 Sigma-Delta Modulation (SDM)

Introduction

ESP32 has a second-order sigma-delta modulator, which can generate independent PDM pulses to multiple channels. Please refer to the TRM to check how many hardware channels are available.¹

Delta-sigma modulation converts an analog voltage signal into a pulse frequency, or pulse density, which can be understood as pulse-density modulation (PDM) (refer to Delta-sigma modulation on Wikipedia).

The main differences comparing to I2S PDM mode and DAC peripheral are:

1. SDM has no clock signal, it is just like the DAC mode of PDM;
2. SDM has no DMA, and it cannot change its output density continuously. If you have to, you can update the density in a timer’s callback;
3. Based on the former two points, unlike the DAC peripheral, an external active or passive low-pass filter is required additionally to restore the analog wave (See Convert to an Analog Signal (Optional)).

Typically, a Sigma-Delta modulated channel can be used in scenarios like:

- LED dimming
- Simple DAC (8-bit), with the help of an active RC low-pass filter
- Class D amplifier, with the help of a half-bridge or full-bridge circuit plus an LC low-pass filter

Functional Overview

The following sections of this document cover the typical steps to install and operate an SDM channel:

- Resource Allocation - covers how to initialize and configure an SDM channel and how to recycle the resources when it finishes working.
- Enable and Disable Channel - covers how to enable and disable the channel.
- Set Pulse Density - describes how to set the equivalent duty cycle of the PDM pulses.
- Power Management - describes how different source clock selections can affect power consumption.
- IRAM Safe - lists which functions are supposed to work even when the cache is disabled.
- Thread Safety - lists which APIs are guaranteed to be thread-safe by the driver.
- Kconfig Options - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

Resource Allocation In ESP-IDF, the information and attributes of SDM channels are managed and accessed through specific data structures, where the data structure is called sdm_channel_handle_t. Each channel is capable to output the binary, hardware-generated signal with the sigma-delta modulation. The driver manages all available channels in a pool so that there is no need to manually assign a fixed channel to a GPIO.

To install an SDM channel, you should call sdm_new_channel() to get a channel handle. Channel-specific configurations are passed in the sdm_config_t structure:

1 Different ESP chip series might have different numbers of SDM channels. Please refer to Chapter GPIO and IOMUX in ESP32 Technical Reference Manual for more details. The driver does not forbid you from applying for more channels, but it will return an error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g., sdm_new_channel()).
Chapter 2. API Reference

- `sdm_config_t::gpio_num` sets the GPIO that the PDM pulses output from.
- `sdm_config_t::clk_src` selects the source clock for the SDM module. Note that, all channels should select the same clock source.
- `sdm_config_t::sample_rate_hz` sets the sample rate of the SDM module.
- `sdm_config_t::invert_out` sets whether to invert the output signal.
- `sdm_config_t::io_loop_back` is for debugging purposes only. It enables both the GPIO’s input and output ability through the GPIO matrix peripheral.

The function `sdm_new_channel()` can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free channels (i.e., all hardware SDM channels have been used up), `ESP_ERR_NOT_FOUND` will be returned.

If a previously created SDM channel is no longer required, you should recycle it by calling `sdm_del_channel()`. It allows the underlying HW channel to be used for other purposes. Before deleting an SDM channel handle, you should disable it by `sdm_channel_disable()` in advance or make sure it has not been enabled yet by `sdm_channel_enable()`.

Creating an SDM Channel with a Sample Rate of 1 MHz

```c
sdm_channel_handle_t chan = NULL;
sdm_config_t config = {
    .clk_src = SDM_CLK_SRC_DEFAULT,
    .sample_rate_hz = 1 * 1000 * 1000,
    .gpio_num = 0,
};
ESP_ERROR_CHECK(sdm_new_channel(&config, &chan));
```

Enable and Disable Channel  Before doing further IO control to the SDM channel, you should enable it first, by calling `sdm_channel_enable()`. Internally, this function:
- switches the channel state from `init` to `enable`
- acquires a proper power management lock if a specific clock source (e.g., APB clock) is selected. See also Power Management for more information.

On the contrary, calling `sdm_channel_disable()` does the opposite, that is, put the channel back to the `init` state and releases the power management lock.

Set Pulse Density  For the output PDM signals, the pulse density decides the output analog voltage that is restored by a low-pass filter. The restored analog voltage from the channel is calculated by \( V_{out} = \frac{VDD_{IO}}{256} \times \text{duty} + \frac{VDD_{IO}}{2} \). The range of the quantized density input parameter of `sdm_channel_set_pulse_density()` is from -128 to 127 (8-bit signed integer). Depending on the value of the density parameter, the duty cycle of the output signal will be changed accordingly. For example, if a zero value is set, then the output signal’s duty will be around 50%.

Power Management  When power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will adjust the APB frequency before going into Light-sleep, thus potentially changing the sample rate of the sigma-delta modulator.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever the driver creates an SDM channel instance that has selected `SDM_CLK_SRC_APB` as its clock source, the driver guarantees that the power management lock is acquired when enabling the channel by `sdm_channel_enable()`. Likewise, the driver releases the lock when `sdm_channel_disable()` is called for that channel.

IRAM Safe  There is a Kconfig option `CONFIG_SDM_CTRL_FUNC_IN_IRAM` that can put commonly-used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are listed as follows:

- `sdm_channel_set_pulse_density()`
Chapter 2. API Reference

Thread Safety The factory function `sdm_new_channel()` is guaranteed to be thread-safe by the driver, which means, the user can call it from different RTOS tasks without protection by extra locks.

The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

- `sdm_channel_set_pulse_density()`

Other functions that take the `sdm_channel_handle_t` as the first positional parameter, are not treated as thread-safe. This means the user should avoid calling them from multiple tasks.

Kconfig Options

- `CONFIG_SDM_CTRL_FUNC_IN_IRAM` controls where to place the SDM channel control functions (IRAM or Flash), see IRAM Safe for more information.
- `CONFIG_SDM_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enabling this option increases the firmware binary size.

Convert to an Analog Signal (Optional)

Typically, if a Sigma-Delta signal is connected to an LED to adjust the brightness, you do not have to add any filter between them, because our eyes have their own low-pass filters for changes in light intensity. However, if you want to check the real voltage or watch the analog waveform, you need to design an analog low-pass filter. Also, it is recommended to use an active filter instead of a passive filter to gain better isolation and not lose too much voltage.

For example, you can take the following Sallen-Key topology Low Pass Filter as a reference.

![Fig. 22: Sallen-Key Low Pass Filter](image)

Application Example

- 100 Hz sine wave that is modulated with Sigma-Delta: `peripherals/sigma_delta/sdm_dac`.
- LED driven by a GPIO that is modulated with Sigma-Delta: `peripherals/sigma_delta/sdm_led`. 
Chapter 2. API Reference

API Reference

Header File

- components/driver/sigma_delta/include/driver/sdm.h

Functions

`esp_err_t sdm_new_channel(const sdm_config_t *config, sdm_channel_handle_t *ret_chan)`

Create a new Sigma Delta channel.

**Parameters**
- `config` - [in] SDM configuration
- `ret_chan` - [out] Returned SDM channel handle

**Returns**
- ESP_OK: Create SDM channel successfully
- ESP_ERR_INVALID_ARG: Create SDM channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create SDM channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create SDM channel failed because all channels are used up and no more free one
- ESP_FAIL: Create SDM channel failed because of other error

`esp_err_t sdm_del_channel(sdm_channel_handle_t chan)`

Delete the Sigma Delta channel.

**Parameters**
- `chan` - [in] SDM channel created by `sdm_new_channel`

**Returns**
- ESP_OK: Delete the SDM channel successfully
- ESP_ERR_INVALID_ARG: Delete the SDM channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete the SDM channel failed because the channel is not in init state
- ESP_FAIL: Delete the SDM channel failed because of other error

`esp_err_t sdm_channel_enable(sdm_channel_handle_t chan)`

Enable the Sigma Delta channel.

**Note:** This function will transit the channel state from init to enable.

`esp_err_t sdm_channel_disable(sdm_channel_handle_t chan)`

Disable the Sigma Delta channel.

**Note:** This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the `sdm_config_t`, while `CONFIG_PM_ENABLE` is enabled.
• ESP_OK: Disable SDM channel successfully
• ESP_ERR_INVALID_ARG: Disable SDM channel failed because of invalid argument
• ESP_ERR_INVALID_STATE: Disable SDM channel failed because the channel is not enabled yet
• ESP_FAIL: Disable SDM channel failed because of other error

`esp_err_t sdm_channel_set_pulse_density (sdm_channel_handle_t chan, int8_t density)`

Set the pulse density of the PDM output signal.

**Note:** The raw output signal requires a low-pass filter to restore it into analog voltage, the restored analog output voltage could be \( V_{out} = \frac{V_{DD}}{256} \times density + \frac{V_{DD}}{2} \)

**Note:** This function is allowed to run within ISR context

**Note:** This function will be placed into IRAM if `CONFIG_SDM_CTRL_FUNC_IN_IRAM` is on, so that it's allowed to be executed when Cache is disabled

**Parameters**

- `chan` [in] SDM channel created by `sdm_new_channel`
- `density` [in] Quantized pulse density of the PDM output signal, ranges from -128 to 127. But the range of [-90, 90] can provide a better randomness.

**Returns**

- ESP_OK: Set pulse density successfully
- ESP_ERR_INVALID_ARG: Set pulse density failed because of invalid argument
- ESP_FAIL: Set pulse density failed because of other error

`esp_err_t sdm_channel_set_duty (sdm_channel_handle_t chan, int8_t duty)`

The alias function of `sdm_channel_set_pulse_density`, it decides the pulse density of the output signal.

**Note:** `sdm_channel_set_pulse_density` has a more appropriate name compare this alias function, suggest to turn to `sdm_channel_set_pulse_density` instead

**Parameters**

- `chan` [in] SDM channel created by `sdm_new_channel`
- `duty` [in] Actually it’s the quantized pulse density of the PDM output signal

**Returns**

- ESP_OK: Set duty cycle successfully
- ESP_ERR_INVALID_ARG: Set duty cycle failed because of invalid argument
- ESP_FAIL: Set duty cycle failed because of other error

**Structures**

`struct sdm_config_t`

Sigma Delta channel configuration.

**Public Members**
int gpio_num
    GPIO number

sdm_clock_source_t clk_src
    Clock source

uint32_t sample_rate_hz
    Over sample rate in Hz, it determines the frequency of the carrier pulses

uint32_t invert_out
    Whether to invert the output signal

uint32_t io_loop_back
    For debug/test, the signal output from the GPIO will be fed to the input path as well

struct sdm_config_t::[anonymous] flags
    Extra flags

Type Definitions

typedef struct sdm_channel_t *sdm_channel_handle_t
    Type of Sigma Delta channel handle.

Header File

    • components/hal/include/hal/sdm_types.h

Type Definitions

typedef soc_periph_sdm_clk_src_t sdm_clock_source_t

2.6.20 SPI Flash API

Overview

The spi_flash component contains API functions related to reading, writing, erasing, and memory mapping for data in the external flash.

For higher-level API functions which work with partitions defined in the partition table, see Partitions API

Note: esp_partition_* APIs are recommended to be used instead of the lower level esp_flash_* API functions when accessing the main SPI flash chip, since they conduct bounds checking and are guaranteed to calculate correct offsets in flash based on the information in the partition table. esp_flash_* functions can still be used directly when accessing an external (secondary) SPI flash chip.

Different from the API before ESP-IDF v4.0, the functionality of esp_flash_* APIs is not limited to the “main” SPI flash chip (the same SPI flash chip from which program runs). With different chip pointers, you can access external flash chips connected to not only SPI0/1 but also other SPI buses like SPI2.
Note: Instead of going through the cache connected to the SPI0 peripheral, most `esp_flash_*` APIs go through other SPI peripherals like SPI1, SPI2, etc. This makes them able to access not only the main flash, but also external (secondary) flash.

However, due to the limitations of the cache, operations through the cache are limited to the main flash. The address range limitation for these operations is also on the cache side. The cache is not able to access external flash chips or address range above its capabilities. These cache operations include: mmap, encrypted read/write, executing code or access to variables in the flash.

Note: Flash APIs after ESP-IDF v4.0 are no longer atomic. If a write operation occurs during another on-going read operation, and the flash addresses of both operations overlap, the data returned from the read operation may contain both old data and new data (that was updated written by the write operation).

Note: Encrypted flash operations are only supported with the main flash chip (and not with other flash chips, that is on SPI1 with different CS, or on other SPI buses). Reading through cache is only supported on the main flash, which is determined by the HW.

Support for Features of Flash Chips

**Quad/Dual Mode Chips** Features of different flashes are implemented in different ways and thus need special support. The fast/slow read and Dual mode (DOUT/DIO) of almost all flashes with 24-bit address are supported, because they do not need any vendor-specific commands.

Quad mode (QIO/QOUT) is supported on the following chip types:

1. ISSI
2. GD
3. MXIC
4. FM
5. Winbond
6. XMC
7. BOYA

Note: Only when one flash series listed above is supported by ESP32, this flash series is supported by the chip driver by default. You can use Component config > SPI Flash driver > Auto-detect flash chips in menuconfig to enable/disable a flash series.

Optional Features

**Optional Features for Flash** Some features are not supported on all ESP chips and Flash chips. You can check the list below for more information.

- Auto Suspend & Resume
- Flash unique ID
- High performance mode
- OPI flash support
- 32-bit Address Flash Chips

Note:

- The features listed above needs to be supported by both ESP chips and flash chips.
• If you are using an official Espressif modules/SiP. Some of the modules/SiPs always support the feature, in this case you can see these features listed in the datasheet. Otherwise please contact Espressif’s business team to know if we can supply such products for you.

• If you are making your own modules with your own bought flash chips, and you need features listed above. Please contact your vendor if they support the those features, and make sure that the chips can be supplied continuously.

Attention: This document only shows that ESP-IDF code has supported the features of those flash chips. It is not a list of stable flash chips certified by Espressif. If you build your own hardware from flash chips with your own bought flash chips (even with flash listed in this page), you need to validate the reliability of flash chips yourself.

Auto Suspend & Resume The support list is as follows.

ESP Chips List:
1. ESP32C3
2. ESP32C2
3. ESP32S3

Flash Chips List:
1. XM25QxxC series.
2. GD25QxxE series.

Flash Unique ID Unique ID is not flash id, which means flash has 64-Bit unique ID for each device. The instruction to read the unique ID (4Bh) accesses a factory-set read-only 64-bit number that is unique to each flash device. This ID number helps you to recognize each single device. Not all flash vendors support this feature. If you try to read the unique ID on a chip which does not have this feature, the behavior is not determined. The support list is as follows.

ESP Chips Lists:
ALL

Flash Chips List:
1. ISSI
2. GD
3. TH
4. FM
5. Winbond
6. XMC
7. BOYA

High Performance Mode

Note: This section is provided for Dual mode (DOUT/DIO) and Quad mode (QIO/QOUT) flash chips. Octal flash used on ESP-chips support High performance mode by default so far, you can refer to the octal flash support list below.

High performance mode (HPM) means that the SPI1 and flash chip works under high frequency. Usually, when the operating frequency of the flash is greater than 80 MHz, it is considered that the flash works under HPM. As far as we acknowledged, flash chips have more than two different coping strategies when flash work under HPM. For some flash chips, HPM is controlled by high performance flag (HPF) in status register and for some flash chips, HPM is controlled by dummy cycle bit.

For following conditions, ESP-IDF start code deals with HPM internally.

ESP Chips List:
1. ESP32S3

Flash Chips (name & ID) List:
1. GD25Q64C (ID: 0xC84017)
2. GD25Q32C (ID: 0xC84016)

**Attention:** It is hard to create several strategies to cover all situations, so all flash chips using HPM need to be supported explicitly. Therefore, if you try to use a flash not listed as supported under high performance mode, it might cause some error. So, when you try to use the flash chip beyond supported list, please test properly.

**OPI flash Support**  OPI flash means that the flash supports octal peripheral interface, which has octal I/O pins. Different octal flash has different configurations and different commands. Hence, it is necessary to carefully check the support list.

ESP Chips List:
1. ESP32S3

Flash Chips List:
1. MX25UM25645G

**32-bit Address Flash Chips**  Most NOR flash chips used by Espressif chips use 24-bits address, which can cover 16 MBytes memory. However, for larger memory (usually equal to or larger than 16 MBytes), flash uses a 32-bits address to address larger memory. Regretfully, 32-bits address chips have vendor-specific commands, so we need to support the chips one by one.

ESP Chips List:
ALL ESP Chips support this.

Flash Chips List:
1. W25Q256
2. GD25Q256

**Important:** Over 16 MBytes space on flash mentioned above can be only used for data saving, like file system. If your data/instructions over 16 MBytes spaces need to be mapped to MMU (so as to be accessed by the CPU), please enable the config `IDF_EXPERIMENTAL_FEATURES` and `CONFIG_SPI_FLASH_32BIT_ADDRESS` and read the limitations following:

1. This option only valid for 4-line flash. Octal flash does not need this.
2. Only MMU on ESP chip that supports mapping to a range over 16 MB memory supports this config. (Only ESP32S3 supports this up to now)
3. This option is experimental, which means it can not use on all flash chips stable, for more information, please contact Espressif Business support.

There are some features that are not supported by all flash chips, or not supported by all Espressif chips. These features include:
- 32-bit address flash - usually means that the flash has higher capacity (equal to or larger than 16 MB) that needs longer addresses.
- Flash unique ID - means that flash supports its unique 64-bit ID.

If you want to use these features, please ensure both ESP32 and ALL flash chips in your product support these features. For more details, refer to Optional Features for Flash.

You may also customise your own flash chip driver. See Overriding Default Chip Drivers for more details.
**Warning:** Customizing SPI Flash Chip Drivers is considered an “expert” feature. Users should only do so at their own risk. (See the notes below)

**Overriding Default Chip Drivers** During the SPI Flash driver’s initialization (i.e., `esp_flash_init()`), there is a chip detection step during which the driver iterates through a Default Chip Driver List and determine which chip driver can properly support the currently connected flash chip. The Default Chip Drivers are provided by the ESP-IDF, thus are updated in together with each ESP-IDF version. However ESP-IDF also allows users to customize their own chip drivers.

Users should note the following when customizing chip drivers:

1. You may need to rely on some non-public ESP-IDF functions, which have slight possibility to change between ESP-IDF versions. On the one hand, these changes may be useful bug fixes for your driver, on the other hand, they may also be breaking changes (i.e., breaks your code).
2. Some ESP-IDF bug fixes to other chip drivers are not automatically applied to your own custom chip drivers.
3. If the protection of flash is not handled properly, there may be some random reliability issues.
4. If you update to a newer ESP-IDF version that has support for more chips, you will have to manually add those new chip drivers into your custom chip driver list. Otherwise the driver will only search for the drivers in custom list you provided.

**Steps For Creating Custom Chip Drivers and Overriding the ESP-IDF Default Driver List**

1. Enable the `CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST` config option. This prevents compilation and linking of the Default Chip Driver List (default_registered_chips) provided by ESP-IDF. Instead, the linker searches for the structure of the same name (default_registered_chips) that must be provided by the user.
2. Add a new component in your project, e.g., `custom_chip_driver`.
3. Copy the necessary chip driver files from the `spi_flash` component in ESP-IDF. This may include:
   - `spi_flash_chipDrivers.c` (to provide the default_registered_chips structure)
   - Any of the `spi_flashChip_*.c` files that matches your own flash model best
   - `CMakeLists.txt` and `linker.lf` files

Modify the files above properly. Including:

- Change the `default_registered_chips` variable to non-static and remove the `#ifdef` logic around it.
- Update `linker.lf` file to rename the fragment header and the library name to match the new component.
- If reusing other drivers, some header names need prefixing with `spi_flash/` when included from outside `spi_flash` component.

**Note:**

- When writing your own flash chip driver, you can set your flash chip capabilities through `spi_flash_chip_***`(vendor)_get_caps and points the function pointer `get_chip_caps` for protection to the `spi_flash_chip_***_get_caps` function. The steps are as follows.
  1. Please check whether your flash chip have the capabilities listed in `spi_flash_caps_t` by checking the flash datasheet.
  2. Write a function named `spi_flash_chip_***`(vendor)_get_caps. Take the example below as a reference. (if the flash support suspend and read unique id).
  3. Points the pointer `get_chip_caps` (in `spi_flash_chip_t`) to the function mentioned above.

```c
spi_flash_caps_t spi_flash_chip_***`(vendor)_get_caps(esp_flash_t `_chip) {
    spi_flash_caps_t caps_flags = 0;
    // 32-bit-address flash is not supported
    flash_suspend is supported
    caps_flags |= SPI_FLASH_CHIP_CAP_SUSPEND;
    // flash read unique id.
}
```

(continues on next page)
Initializing a Flash Device

To use the esp_flash_* APIs, you need to initialise a flash chip on a certain SPI bus, as shown below:

1. Call `spi_bus_initialize()` to properly initialize an SPI bus. This function initializes the resources (I/O, DMA, interrupts) shared among devices attached to this bus.
2. Call `spi_bus_add_flash_device()` to attach the flash device to the bus. This function allocates memory and fills the members for the `esp_flash_t` structure. The CS I/O is also initialized here.
3. Call `esp_flash_init()` to actually communicate with the chip. This also detects the chip type, and influence the following operations.

Note: Multiple flash chips can be attached to the same bus now.

SPI Flash Access API

This is the set of API functions for working with data in flash:

- `esp_flash_read()` reads data from flash to RAM
- `esp_flash_write()` writes data from RAM to flash
- `esp_flash_erase_region()` erases specific region of flash
- `esp.flash_erase_chip()` erases the whole flash
- `esp.flash_get_chip_size()` returns flash chip size, in bytes, as configured in menuconfig

Generally, try to avoid using the raw SPI flash functions to the “main” SPI flash chip in favour of partition-specific functions.
**SPI Flash Size**

The SPI flash size is configured by writing a field in the software bootloader image header, flashed at offset 0x1000. By default, the SPI flash size is detected by `esptool.py` when this bootloader is written to flash, and the header is updated with the correct size. Alternatively, it is possible to generate a fixed flash size by setting `CONFIG_ESPTOOLPY_FLASHSIZE` in the project configuration.

If it is necessary to override the configured flash size at runtime, it is possible to set the `chip_size` member of the `g_rom_flashchip` structure. This size is used by `esp_flash_*` functions (in both software & ROM) to check the bounds.

**Concurrency Constraints for Flash on SPI1**

The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI Flash driver). Hence, operations to SPI1 will cause significant influence to the whole system. This kind of operations include calling SPI Flash API or other drivers on SPI1 bus, any operations like read/write/erase or other user defined SPI operations, regardless to the main flash or other SPI slave devices.

On ESP32, these caches must be disabled while reading/writing/erasing.

**When the Caches Are Disabled**

Under this condition, all CPUs should always execute code and access data from internal RAM. The APIs documented in this file will disable the caches automatically and transparently.

The way that these APIs disable the caches suspends all the other tasks. Besides, all non-IRAM-safe interrupts will be disabled. The other core will be polling in a busy loop. These will be restored until the Flash operation completes.

See also [OS Functions](#) and [SPI Bus Lock](#).

There are no such constraints and impacts for flash chips on other SPI buses than SPI0/1.

For differences between internal RAM (e.g., IRAM, DRAM) and flash cache, please refer to the [application memory layout](#) documentation.

**IRAM-Safe Interrupt Handlers**

For interrupt handlers which need to execute when the cache is disabled (e.g., for low latency operations), set the `ESP_INTR_FLAG_IRAM` flag when the interrupt handler is registered.

You must ensure that all data and functions accessed by these interrupt handlers, including the ones that handlers call, are located in IRAM or DRAM. See [How to Place Code in IRAM](#).

If a function or symbol is not correctly put into IRAM/DRAM, and the interrupt handler reads from the flash cache during a flash operation, it will cause a crash due to Illegal Instruction exception (for code which should be in IRAM) or garbage data to be read (for constant data which should be in DRAM).

**Non-IRAM-Safe Interrupt Handlers**

If the `ESP_INTR_FLAG_IRAM` flag is not set when registering, the interrupt handler will not get executed when the caches are disabled. Once the caches are restored, the non-IRAM-safe interrupts will be re-enabled. After this moment, the interrupt handler will run normally again. This means that as long as caches are disabled, users will not see the corresponding hardware event happening.
**Attention:** The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI flash driver). Hence, calling SPI Flash API on SPI1 bus (including the main flash) causes significant influence to the whole system. See *Concurrency Constraints for Flash on SPI1* for more details.

### SPI Flash Encryption

It is possible to encrypt the contents of SPI flash and have it transparently decrypted by hardware.

Refer to the *Flash Encryption documentation* for more details.

### Memory Mapping API

ESP32 features memory hardware which allows regions of flash memory to be mapped into instruction and data address spaces. This mapping works only for read operations. It is not possible to modify contents of flash memory by writing to a mapped memory region.

Mapping happens in 64 KB pages. Memory mapping hardware can map flash into the data address space and the instruction address space. See the technical reference manual for more details and limitations about memory mapping hardware.

Note that some pages are used to map the application itself into memory, so the actual number of available pages may be less than the capability of the hardware.

Reading data from flash using a memory mapped region is the only way to decrypt contents of flash when *flash encryption* is enabled. Decryption is performed at the hardware level.

Memory mapping API are declared in *spi_flash_mmap.h* and *esp_partition.h*:

- `spi_flash_mmap()` maps a region of physical flash addresses into instruction space or data space of the CPU.
- `spi_flash_munmap()` unmaps previously mapped region.
- `esp_partition_mmap()` maps part of a partition into the instruction space or data space of the CPU.

Differences between `spi_flash_mmap()` and `esp_partition_mmap()` are as follows:

- `spi_flash_mmap()` must be given a 64 KB aligned physical address.
- `esp_partition_mmap()` may be given any arbitrary offset within the partition. It adjusts the returned pointer to mapped memory as necessary.

Note that since memory mapping happens in pages, it may be possible to read data outside of the partition provided to `esp_partition_mmap`, regardless of the partition boundary.

---

**Note:** `mmap` is supported by cache, so it can only be used on main flash.

### SPI Flash Implementation

The `esp_flash_t` structure holds chip data as well as three important parts of this API:

1. The host driver, which provides the hardware support to access the chip;
2. The chip driver, which provides compatibility service to different chips;
3. The OS functions, provide support of some OS functions (e.g., lock, delay) in different stages (1st/2nd boot, or the app).
Host Driver  The host driver relies on an interface (spi_flash_host_driver_t) defined in the spi_flash_types.h (in the hal/include/hal folder). This interface provides some common functions to communicate with the chip.

In other files of the SPI HAL, some of these functions are implemented with existing ESP32 memory-spi functionalities. However, due to the speed limitations of ESP32, the HAL layer cannot provide high-speed implementations to some reading commands (so the support for it was dropped). The files (memspi_host_driver.h and .c) implement the high-speed version of these commands with the common_command function provided in the HAL, and wrap these functions as spi_flash_host_driver_t for upper layer to use.

You can also implement your own host driver, even with the GPIO. As long as all the functions in the spi_flash_host_driver_t are implemented, the esp_flash API can access the flash regardless of the low-level hardware.

Chip Driver  The chip driver, defined in spi_flash_chip_driver.h, wraps basic functions provided by the host driver for the API layer to use.

Some operations need some commands to be sent first, or read some status afterwards. Some chips need different commands or values, or need special communication ways.

There is a type of chip called generic chip which stands for common chips. Other special chip drivers can be developed on the base of the generic chip.

The chip driver relies on the host driver.

OS Functions  Currently the OS function layer provides entries of a lock and delay.

The lock (see SPI Bus Lock) is used to resolve the conflicts among the access of devices on the same SPI bus, and the SPI Flash chip access. E.g.

1. On SPI1 bus, the cache (used to fetch the data (code) in the Flash and PSRAM) should be disabled when the flash chip on the SPI0/1 is being accessed.
2. On the other buses, the flash driver needs to disable the ISR registered by SPI Master driver, to avoid conflicts.
3. Some devices of SPI Master driver may require to use the bus monopolized during a period (especially when the device does not have a CS wire, or the wire is controlled by software like SDSPi driver).

The delay is used by some long operations which requires the master to wait or polling periodically.

The top API wraps these the chip driver and OS functions into an entire component, and also provides some argument checking.

OS functions can also help to avoid a watchdog timeout when erasing large flash areas. During this time, the CPU is occupied with the flash erasing task. This stops other tasks from being executed. Among these tasks is the idle task to feed the watchdog timer (WDT). If the configuration option CONFIG_ESP_TASK_WDT_PANIC is selected and the flash operation time is longer than the watchdog timeout period, the system will reboot.

It is pretty hard to totally eliminate this risk, because the erasing time varies with different flash chips, making it hard to be compatible in flash drivers. Therefore, users need to pay attention to it. Please use the following guidelines:

1. It is recommended to enable the CONFIG_SPI_FLASH_YIELD_DURING_ERASE option to allow the scheduler to re-schedule during erasing flash memory. Besides, following parameters can also be used.
   - Increase CONFIG_SPI_FLASH_ERASE_YIELD_TICKS or decrease CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS in menuconfig.
   - You can also increase CONFIG_ESP_TASK_WDT_TIMEOUT_S in menuconfig for a larger watchdog timeout period. However, with larger watchdog timeout period, previously detected timeouts may no longer be detected.

2. Please be aware of the consequences of enabling the CONFIG_ESP_TASK_WDT_PANIC option when doing long-running SPI flash operations which triggers the panic handler when it times out. However, this option can also help dealing with unexpected exceptions in your application. Please decide whether this is needed to be enabled according to actual condition.

3. During your development, please carefully review the actual flash operation according to the specific requirements and time limits on erasing flash memory of your projects. Always allow reasonable redundancy based
Implementation Details

In order to perform some flash operations, it is necessary to make sure that both CPUs are not running any code from flash for the duration of the flash operation:

- In a single-core setup, the SDK needs to disable interrupts or scheduler before performing the flash operation.
- In a dual-core setup, the SDK needs to make sure that both CPUs are not running any code from flash.

When SPI flash API is called on CPU A (can be PRO or APP), start the `spi_flash_op_block_func` function on CPU B using the `esp_ipc_call` API. This API wakes up a high priority task on CPU B and tells it to execute a given function, in this case, `spi_flash_op_block_func`. This function disables cache on CPU B and signals that the cache is disabled by setting the `s_flash_op_can_start` flag. Then the task on CPU A disables cache as well and proceeds to execute flash operation.

While a flash operation is running, interrupts can still run on CPUs A and B. It is assumed that all interrupt code is placed into RAM. Once the interrupt allocation API is added, a flag should be added to request the interrupt to be disabled for the duration of a flash operations.

Once the flash operation is complete, the function on CPU A sets another flag, `s_flash_op_complete`, to let the task on CPU B know that it can re-enable cache and release the CPU. Then the function on CPU A re-enables the cache on CPU A as well and returns control to the calling code.

Additionally, all API functions are protected with a mutex (`s_flash_op_mutex`).

In a single core environment (`CONFIG_FREERTOS_UNICORE` enabled), you need to disable both caches, so that no inter-CPU communication can take place.

- Concurrency Constraints for Flash on SPI

**SPI Flash API ESP-IDF Version vs Chip-ROM Version** There is a set of SPI Flash drivers in Chip-ROM which you can use by enabling `CONFIG_SPI_FLASH_ROM_IMPL`. Most of the ESP-IDF SPI Flash driver code are in internal RAM, therefore enabling this option frees some internal RAM usage. Note if you enable this option, this means some SPI Flash driver features and bugfixes that are done in ESP-IDF might not be included in the Chip-ROM version.

**Feature Supported by ESP-IDF but Not in Chip-ROM**

- Octal Flash chip support. See `OPI flash Support` for details.
- 32-bit-address support for GD25Q256. Note this feature is an optional feature, please do read `32-bit Address Flash Chips` for details.
- TH Flash chip support.
- Kconfig option `CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED`.
- `CONFIG_SPI_FLASH_VERIFY_WRITE`, enabling this option helps you detect bad writing.
- `CONFIG_SPI_FLASH_LOG_FAILED_WRITE`, enabling this option prints the bad writing.
- `CONFIG_SPI_FLASH_WARN_SETTING_ZERO_TO_ONE`, enabling this option checks if you are writing zero to one.
- `CONFIG_SPI_FLASH_DANGEROUS_WRITE`, enabling this option checks for flash programming to certain protected regions like bootloader, partition table or application itself.
- `CONFIG_SPI_FLASH_ENABLE_COUNTERS`, enabling this option to collect performance data for ESP-IDF SPI Flash driver APIs.
• **CONFIG_SPI_FLASH_AUTO_SUSPEND**, enabling this option to automatically suspend / resume a long Flash operation when short Flash operation happens. Note this feature is an optional feature, please do read *Auto Suspend & Resume* for more limitations.

**Bugfixes Introduced in ESP-IDF but Not in Chip-ROM**

• Detected Flash physical size correctly, for larger than 256MBit Flash chips. (Commit ID: b4964279d44f73cce7cf5c685467fbd6fd9e)

**API Reference - SPI Flash**

**Header File**

• `components/spi_flash/include/esp_flash_spi_init.h`

**Functions**

`esp_err_t spi_bus_add_flash_device(esp_flash_t **out_chip, const esp_flash_spi_device_config_t *config)`

Add a SPI Flash device onto the SPI bus.

The bus should be already initialized by `spi_bus_initialization`.

**Parameters**

• `out_chip` - Pointer to hold the initialized chip.

• `config` - Configuration of the chips to initialize.

**Returns**

• `ESP_ERR_INVALID_ARG`: out_chip is NULL, or some field in the config is invalid.

• `ESP_ERR_NO_MEM`: failed to allocate memory for the chip structures.

• `ESP_OK`: success.

`esp_err_t spi_bus_remove_flash_device(esp_flash_t *chip)`

Remove a SPI Flash device from the SPI bus.

**Parameters**

• `chip` - The flash device to remove.

**Returns**

• `ESP_ERR_INVALID_ARG`: The chip is invalid.

• `ESP_OK`: success.

**Structures**

`struct esp_flash_spi_device_config_t`

Configurations for the SPI Flash to init.

**Public Members**

`spi_host_device_t host_id`

Bus to use.

`int cs_io_num`

GPIO pin to output the CS signal.

`esp_flash_io_mode_t io_mode`

IO mode to read from the Flash.
enum esp_flash_speed_s speed
    Speed of the Flash clock. Replaced by freq_mhz.

int input_delay_ns
    Input delay of the data pins, in ns. Set to 0 if unknown.

int cs_id
    CS line ID, ignored when not host_id is not SPI1_HOST, or CONFIG_SPI_FLASH_SHARE_SPI1_BUS is enabled. In this case, the CS line used is automatically assigned by the SPI bus lock.

int freq_mhz
    The frequency of flash chip(MHZ)

Header File
    • components/spi_flash/include/esp_flash.h

Functions
    esp_err_t esp_flash_init (esp_flash_t *chip)
    Initialise SPI flash chip interface.
    This function must be called before any other API functions are called for this chip.
    
    Note: Only the host and read_mode fields of the chip structure must be initialised before this function is called. Other fields may be auto-detected if left set to zero or NULL.
    
    Note: If the chip->drv pointer is NULL, chip chip_drv will be auto-detected based on its manufacturer & product IDs. See esp_flash_registered_flash_drivers pointer for details of this process.

    Parameters chip – Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.
    Returns ESP_OK on success, or a flash error code if initialisation fails.

bool esp_flash_chip_driver_initialized (const esp_flash_t *chip)
    Check if appropriate chip driver is set.
    
    Parameters chip – Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.
    Returns true if set, otherwise false.

    esp_err_t esp_flash_read_id (esp_flash_t *chip, uint32_t *out_id)
    Read flash ID via the common “RDID” SPI flash command.
    
    ID is a 24-bit value. Lower 16 bits of ‘id’ are the chip ID, upper 8 bits are the manufacturer ID.
    
    Parameters
        • chip – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
        • out_id – [out] Pointer to receive ID value.
    Returns ESP_OK on success, or a flash error code if operation failed.
**Chapter 2. API Reference**

---

**esp_err_t** **esp_flash_get_size**(esp_flash_t *chip, uint32_t *out_size)

Detect flash size based on flash ID.

**Note:** 1. Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn’t follow this convention, the size may be incorrectly detected.

a. The out_size returned only stands for The out_size stands for the size in the binary image header. If you want to get the real size of the chip, please call **esp_flash_get_physical_size** instead.

---

**Parameters**

- **chip** – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **out_size** [out] Detected size in bytes, standing for the size in the binary image header.

**Returns** ESP_OK on success, or a flash error code if operation failed.

---

**esp_err_t** **esp_flash_get_physical_size**(esp_flash_t *chip, uint32_t *flash_size)

Detect flash size based on flash ID.

**Note:** Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn’t follow this convention, the size may be incorrectly detected.

---

**Parameters**

- **chip** – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **flash_size** [out] Detected size in bytes.

**Returns** ESP_OK on success, or a flash error code if operation failed.

---

**esp_err_t** **esp_flash_read_unique_chip_id**(esp_flash_t *chip, uint64_t *out_id)

Read flash unique ID via the common “RDUID” SPI flash command.

ID is a 64-bit value.

**Parameters**

- **chip** – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **out_id** [out] Pointer to receive unique ID value.

**Returns**

- ESP_OK on success, or a flash error code if operation failed.
- ESP_ERR_NOT_SUPPORTED if the chip doesn’t support read id.

---

**esp_err_t** **esp_flash_erase_chip**(esp_flash_t *chip)

Erase flash chip contents.

**Parameters**

- **chip** – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()

**Returns**

- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

---

**esp_err_t** **esp_flash_erase_region**(esp_flash_t *chip, uint32_t start, uint32_t len)

Erase a region of the flash chip.
Sector size is specified in chip->drv->sector_size field (typically 4096 bytes.) ESP_ERR_INVALID_ARG will be returned if the start & length are not a multiple of this size.

Erase is performed using block (multi-sector) erases where possible (block size is specified in chip->drv->block_erase_size field, typically 65536 bytes). Remaining sectors are erased using individual sector erase commands.

**Parameters**
- **chip** – Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted.
  Must have been successfully initialised via esp_flash_init()
- **start** – Address to start erasing flash. Must be sector aligned.
- **len** – Length of region to erase. Must also be sector aligned.

**Returns**
- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

```c
esp_err_t esp_flash_get_chip_write_protect(esp_flash_t *chip, bool *write_protected)
```
Read if the entire chip is write protected.

**Note:** A correct result for this flag depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

**Parameters**
- **chip** – Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted.
  Must have been successfully initialised via esp_flash_init()
- **write_protected** – [out] Pointer to boolean, set to the value of the write protect flag.

**Returns** ESP_OK on success, or a flash error code if operation failed.

```c
esp_err_t esp_flash_set_chip_write_protect(esp_flash_t *chip, bool write_protect)
```
Set write protection for the SPI flash chip.

Some SPI flash chips may require a power cycle before write protect status can be cleared. Otherwise, write protection can be removed via a follow-up call to this function.

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

**Parameters**
- **chip** – Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted.
  Must have been successfully initialised via esp_flash_init()
- **write_protect** – Boolean value for the write protect flag

**Returns** ESP_OK on success, or a flash error code if operation failed.

```c
esp_err_t esp_flash_get_protectable_regions(const esp_flash_t *chip, const esp_flash_region_t **out_regions, uint32_t *out_num_regions)
```
Read the list of individually protectable regions of this SPI flash chip.

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

**Parameters**
• `chip` Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
• `out_regions` [out] Pointer to receive a pointer to the array of protectable regions of the chip.
• `out_num_regions` [out] Pointer to an integer receiving the count of protectable regions in the array returned in “regions”.

**Returns** ESP_OK on success, or a flash error code if operation failed.

```c
esp_err_t esp_flash_get_protected_region (esp_flash_t *chip, const esp_flash_region_t *region, bool *out_protected)
```

Detect if a region of the SPI flash chip is protected.

**Note:** It is possible for this result to be false and write operations to still fail, if protection is enabled for the entire chip.

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

**Parameters**
• `chip` Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
• `region` Pointer to a struct describing a protected region. This must match one of the regions returned from `esp_flash_get_protectable_regions(...)`.
• `out_protected` [out] Pointer to a flag which is set based on the protected status for this region.

**Returns** ESP_OK on success, or a flash error code if operation failed.

```c
esp_err_t esp_flash_set_protected_region (esp_flash_t *chip, const esp_flash_region_t *region, bool protect)
```

Update the protected status for a region of the SPI flash chip.

**Note:** It is possible for the region protection flag to be cleared and write operations to still fail, if protection is enabled for the entire chip.

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

**Parameters**
• `chip` Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
• `region` Pointer to a struct describing a protected region. This must match one of the regions returned from `esp_flash_get_protectable_regions(...)`.
• `protect` Write protection flag to set.

**Returns** ESP_OK on success, or a flash error code if operation failed.

```c
esp_err_t esp_flash_read (esp_flash_t *chip, void *buffer, uint32_t address, uint32_t length)
```

Read data from the SPI flash chip.

There are no alignment constraints on buffer, address or length.
Note: If on-chip flash encryption is used, this function returns raw (ie encrypted) data. Use the flash cache to transparently decrypt data.

**Parameters**
- `chip` - Pointer to identify flash chip. If NULL, esp.flash_default_chip is substituted. Must have been successfully initialized via esp.flash_init()
- `buffer` - Pointer to a buffer where the data will be read. To get better performance, this should be in the DRAM and word aligned.
- `address` - Address on flash to read from. Must be less than chip->size field.
- `length` - Length (in bytes) of data to read.

**Returns**
- ESP_OK: success
- ESP_ERR_NO_MEM: Buffer is in external PSRAM which cannot be concurrently accessed, and a temporary internal buffer could not be allocated.
- or a flash error code if operation failed.

```c
esp_err_t esp_flash_write(esp.flash_t *chip, const void *buffer, uint32_t address, uint32_t length)
```

Write data to the SPI flash chip.

There are no alignment constraints on buffer, address or length.

**Parameters**
- `chip` - Pointer to identify flash chip. If NULL, esp.flash_default_chip is substituted. Must have been successfully initialized via esp.flash_init()
- `address` - Address on flash to write to. Must be previously erased (SPI NOR flash can only write bits 1->0).
- `buffer` - Pointer to a buffer with the data to write. To get better performance, this should be in the DRAM and word aligned.
- `length` - Length (in bytes) of data to write.

**Returns**
- ESP_OK on success,
- ESP_FAIL, bad write, this will be detected only when CONFIG_SPI_FLASH_VERIFY_WRITE is enabled
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

```c
esp_err_t esp_flash_write_encrypted(esp.flash_t *chip, uint32_t address, const void *buffer, uint32_t length)
```

Encrypted and write data to the SPI flash chip using on-chip hardware flash encryption.

**Note:** Both address & length must be 16 byte aligned, as this is the encryption block size
• ESP_ERR_NOT_SUPPORTED: encrypted write not supported for this chip.
• ESP_ERR_INVALID_ARG: Either the address, buffer or length is invalid.

`esp_err_t esp_flash_read_encrypted(esp_flash_t *chip, uint32_t address, void *out_buffer, uint32_t length)`

Read and decrypt data from the SPI flash chip using on-chip hardware flash encryption.

**Parameters**
- `chip` - Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted read is not supported.
- `address` - Address on flash to read from.
- `out_buffer` - Pointer to a buffer for the data to read to.
- `length` - Length (in bytes) of data to read.

**Returns**
- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted read not supported for this chip.

static inline bool `esp_flash_is_quad_mode(const esp_flash_t *chip)`

Returns true if chip is configured for Quad I/O or Quad Fast Read.

**Parameters**
- `chip` - Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

**Returns**
- true if flash works in quad mode, otherwise false

**Structures**

`struct esp_flash_region_t`  
Structure for describing a region of flash.

**Public Members**

- `uint32_t offset`  
  Start address of this region.

- `uint32_t size`  
  Size of the region.

`struct esp_flash_os_functions_t`  
OS-level integration hooks for accessing flash chips inside a running OS.

It’s in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn’t be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

**Public Members**

- `esp_err_t (*start)(void *arg)`  
  Called before commencing any flash operation. Does not need to be recursive (ie is called at most once for each call to ‘end’).

- `esp_err_t (*end)(void *arg)`  
  Called after completing any flash operation.
### esp_err_t (*region_protected*) (void *arg, size_t start_addr, size_t size)
Called before any erase/write operations to check whether the region is limited by the OS

### esp_err_t (*delay_us*) (void *arg, uint32_t us)
Delay for at least ‘us’ microseconds. Called in between ‘start’ and ‘end’.

### void (*)(*get_temp_buffer*) (void *arg, size_t request_size, size_t *out_size)
Called for get temp buffer when buffer from application cannot be directly read into/write from.

### void (*)(*release_temp_buffer*) (void *arg, void *temp_buf)
Called for release temp buffer.

### esp_err_t (*check_yield*) (void *arg, uint32_t chip_status, uint32_t *out_request)
Yield to other tasks. Called during erase operations.

Return ESP_OK means yield needs to be called (got an event to handle), while ESP_ERR_TIMEOUT means skip yield.

### esp_err_t (*yield*) (void *arg, uint32_t *out_status)
Yield to other tasks. Called during erase operations.

### int64_t (*)(*get_system_time*) (void *arg)
Called for get system time.

### void (*)(*set_flash_op_status*) (uint32_t op_status)
Call to set flash operation status

---

### struct esp_flash_t
Structure to describe a SPI flash chip connected to the system.

Structure must be initialized before use (passed to esp_flash_init()). It’s in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn’t be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

#### Public Members

### spi_flash_host_inst_t *host
Pointer to hardware-specific “host_driver” structure. Must be initialized before used.

### const spi_flash_chip_t *chip_drv
Pointer to chip-model-specific “adapter” structure. If NULL, will be detected during initialisation.

### const esp_flash_os_functions_t *os_func
Pointer to os-specific hook structure. Call esp_flash_init_os_functions() to setup this field, after the host is properly initialized.

### void *os_func_data
Pointer to argument for os-specific hooks. Left NULL and will be initialized with os_func.
**esp flash io mode t read mode**

Configured SPI flash read mode. Set before esp flash init is called.

**uint32_t size**

Size of SPI flash in bytes. If 0, size will be detected during initialisation. Note: this stands for the size in the binary image header. If you want to get the flash physical size, please call esp flash get physical size.

**uint32_t chip id**

Detected chip id.

**uint32_t busy**

This flag is used to verify chip’s status.

**uint32_t hpm dummy ena**

This flag is used to verify whether flash works under HPM status.

**uint32_t reserved flags**

reserved.

**Macros**

SPI_FLASH_YIELD_REQ_YIELD

SPI_FLASH_YIELD_REQ_SUSPEND

SPI_FLASH_YIELD_STA_RESUME

SPI_FLASH_OS_IS_ERASING_STATUS_FLAG

**Type Definitions**

typedef struct spi flash chip t spi flash chip t

**Header File**

- components/spi flash/include/spi flash mmap.h

**Functions**

`esp_err_t spi flash mmap(size_t src_addr, size_t size, spi flash mmap memory t memory, const void **out_ptr, spi flash mmap handle t *out_handle)`

Map region of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configures them to map the requested region of flash memory into the address space. It may reuse MMU pages which already provide the required mapping.

As with any allocator, if mmap/munmap are heavily used then the address space may become fragmented. To troubleshoot issues with page allocation, use spi flash mmap dump() function.

**Parameters**

- **src addr** - Physical address in flash where requested region starts. This address must be aligned to 64kB boundary (SPI_FLASH MMU PAGE SIZE)
Chapter 2. API Reference

- **size** – Size of region to be mapped. This size will be rounded up to a 64kB boundary
- **memory** – Address space where the region should be mapped (data or instruction)
- **out_ptr** – [out] Output, pointer to the mapped memory region
- **out_handle** – [out] Output, handle which should be used for spi_flash_munmap call

**Returns**
- ESP_OK on success
- ESP_ERR_NO_MEM if pages cannot be allocated

```c
esp_err_t spi_flash_mmap_pages (const int *pages, size_t page_count, spi_flash_mmap_memory_t memory, const void **out_ptr, spi_flash_mmap_handle_t *out_handle)
```

Map sequences of pages of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configures them to map the indicated pages of flash memory contiguously into address space. In this respect, it works in a similar way as spi_flash_mmap() but it allows mapping a (maybe non-contiguous) set of pages into a contiguous region of memory.

**Parameters**
- **pages** – An array of numbers indicating the 64kB pages in flash to be mapped contiguously into memory. These indicate the indexes of the 64kB pages, not the byte-size addresses as used in other functions. Array must be located in internal memory.
- **page_count** – Number of entries in the pages array
- **memory** – Address space where the region should be mapped (instruction or data)
- **out_ptr** – [out] Output, pointer to the mapped memory region
- **out_handle** – [out] Output, handle which should be used for spi_flash_munmap call

**Returns**
- ESP_OK on success
- ESP_ERR_NO_MEM if pages cannot be allocated
- ESP_ERR_INVALID_ARG if pagecount is zero or pages array is not in internal memory

```c
void spi_flash_munmap (spi_flash_mmap_handle_t handle)
```

Release region previously obtained using spi_flash_mmap.

**Note:** Calling this function will not necessarily unmap memory region. Region will only be unmapped when there are no other handles which reference this region. In case of partially overlapping regions it is possible that memory will be unmapped partially.

**Parameters**
- **handle** – Handle obtained from spi_flash_mmap

```c
void spi_flash_mmap_dump (void)
```

Display information about mapped regions.

This function lists handles obtained using spi_flash_mmap, along with range of pages allocated to each handle. It also lists all non-zero entries of MMU table and corresponding reference counts.

```c
uint32_t spi_flash_mmap_get_free_pages (spi_flash_mmap_memory_t memory)
```

get free pages number which can be mmap

This function will return number of free pages available in mmu table. This could be useful before calling actual spi_flash_mmap (maps flash range to DCache or ICache memory) to check if there is sufficient space available for mapping.

**Parameters**
- **memory** – memory type of MMU table free page

**Returns**
- number of free pages which can be mmaped

```c
size_t spi_flash_cache2phys (const void *cached)
```

Given a memory address where flash is mapped, return the corresponding physical flash offset.

Cache address does not have have been assigned via spi_flash_mmap(), any address in memory mapped flash space can be looked up.

**Parameters**
- **cached** – Pointer to flashed cached memory.

**Returns**
• SPI_FLASH_CACHE2PHYS_FAIL If cache address is outside flash cache region, or the address is not mapped.
• Otherwise, returns physical offset in flash

const void *spi_flash_phys2cache (size_t phys_offs, spi_flash_mmap_memory_t memory)

Given a physical offset in flash, return the address where it is mapped in the memory space.

Physical address does not have to have been assigned via spi_flash_mmap(), any address in flash can be looked up.

Note: Only the first matching cache address is returned. If MMU flash cache table is configured so multiple entries point to the same physical address, there may be more than one cache address corresponding to that physical address. It is also possible for a single physical address to be mapped to both the IROM and DROM regions.

Note: This function doesn’t impose any alignment constraints, but if memory argument is SPI_FLASH_MMAP_INST and phys_offs is not 4-byte aligned, then reading from the returned pointer will result in a crash.

Parameters
• phys_offs – Physical offset in flash memory to look up.
• memory – Address space type to look up a flash cache address mapping for (instruction or data)

Returns
• NULL if the physical address is invalid or not mapped to flash cache of the specified memory type.
• Cached memory address (in IROM or DROM space) corresponding to phys_offs.

Macros

ESP_ERR_FLASH_OP_FAIL

This file contains spi_flash_mmap_xx APIs, mainly for doing memory mapping to an SPI0-connected external Flash, as well as some helper functions to convert between virtual and physical address

ESP_ERR_FLASH_OP_TIMEOUT

SPI_FLASH_SEC_SIZE

SPI Flash sector size

SPI_FLASH_MMU_PAGE_SIZE

Flash cache MMU mapping page size

SPI_FLASH_CACHE2PHYS_FAIL

Type Definitions
typedef uint32_t spi_flash_mmap_handle_t

Opaque handle for memory region obtained from spi_flash_mmap.

Enumerations
enum spi_flash_mmap_memory_t
   Enumeration which specifies memory space requested in an mmap call.
   Values:

   enumerator SPI_FLASH_MMAP_DATA
      map to data memory, allows byte-aligned access

   enumerator SPI_FLASH_MMAP_INST
      map to instruction memory, allows only 4-byte-aligned access

Header File
   • components/hal/include/hal/spi_flash_types.h

Structures
struct spi_flash_trans_t
   Definition of a common transaction. Also holds the return value.

   Public Members

   uint8_t reserved
      Reserved, must be 0.

   uint8_t mosi_len
      Output data length, in bytes.

   uint8_t miso_len
      Input data length, in bytes.

   uint8_t address_bitlen
      Length of address in bits, set to 0 if command does not need an address.

   uint32_t address
      Address to perform operation on.

   const uint8_t *mosi_data
      Output data to salve.

   uint8_t *miso_data
      [out] Input data from slave, little endian

   uint32_t flags
      Flags for this transaction. Set to 0 for now.

   uint16_t command
      Command to send.
uint8_t dummy_bitlen
    Basic dummy bits to use.

uint32_t io_mode
    Flash working mode when SPI_FLASH_IGNORE_BASEIO is specified.

struct spi_flash_sus_cmd_conf
    Configuration structure for the flash chip suspend feature.

    **Public Members**

    uint32_t sus_mask
        SUS/SUS1/SUS2 bit in flash register.

    uint32_t cmd_rdsr
        Read flash status register(2) command.

    uint32_t sus_cmd
        Flash suspend command.

    uint32_t res_cmd
        Flash resume command.

    uint32_t reserved
        Reserved, set to 0.

struct spi_flash_encryption_t
    Structure for flash encryption operations.

    **Public Members**

    void (*flash_encryption_enable)(void)
        Enable the flash encryption.

    void (*flash_encryption_disable)(void)
        Disable the flash encryption.

    void (*flash_encryption_data_prepare)(uint32_t address, const uint32_t* buffer, uint32_t size)
        Prepare flash encryption before operation.

    **Note:** address and buffer must be 8-word aligned.

    **Param address** The destination address in flash for the write operation.
    **Param buffer** Data for programming
    **Param size** Size to program.
void (*flash_encryption_done)(void)
flash data encryption operation is done.

void (*flash_encryption_destroy)(void)
Destroy encrypted result

bool (*flash_encryption_check)(uint32_t address, uint32_t length)
Check if is qualified to encrypt the buffer

Param address  the address of written flash partition.
Param length  Buffer size.

struct spi_flash_host_inst_t
SPI Flash Host driver instance

Public Members

const struct spi_flash_host_driver_s *driver
Pointer to the implementation function table.

struct spi_flash_host_driver_s
Host driver configuration and context structure.

Public Members

esp_err_t (*dev_config)(spi_flash_host_inst_t *host)
Configure the device-related register before transactions. This saves some time to re-configure those registers when we send continuously

esp_err_t (*common_command)(spi_flash_host_inst_t *host, spi_flash_trans_t *t)
Send an user-defined spi transaction to the device.

esp_err_t (*read_id)(spi_flash_host_inst_t *host, uint32_t *id)
Read flash ID.

void (*erase_chip)(spi_flash_host_inst_t *host)
Erase whole flash chip.

void (*erase_sector)(spi_flash_host_inst_t *host, uint32_t start_address)
Erase a specific sector by its start address.

void (*erase_block)(spi_flash_host_inst_t *host, uint32_t start_address)
Erase a specific block by its start address.

esp_err_t (*read_status)(spi_flash_host_inst_t *host, uint8_t *out_sr)
Read the status of the flash chip.
**esp_err_t** (*set_write_protect*) *(spi_flash_host_inst_t *host, bool wp)*

Disable write protection.

**void** (*program_page*) *(spi_flash_host_inst_t *host, const void *buffer, uint32_t address, uint32_t length)*

Program a page of the flash. Check `max_write_bytes` for the maximum allowed writing length.

**bool** (*supports_direct_write*) *(spi_flash_host_inst_t *host, const void *p)*

Check whether the SPI host supports direct write.

When cache is disabled, SPI1 doesn’t support directly write when buffer isn’t internal.

**int** (*write_data_slicer*) *(spi_flash_host_inst_t *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t *page_size)*

Slicer for write data. The `program_page` should be called iteratively with the return value of this function.

- **Param address**: Beginning flash address to write
- **Param len**: Length request to write
- **Param align_addr**: Output of the aligned address to write to
- **Param page_size**: Physical page size of the flash chip
- **Return**: Length that can be actually written in one `program_page` call

**esp_err_t** (*read*) *(spi_flash_host_inst_t *host, void *buffer, uint32_t address, uint32_t read_len)*

Read data from the flash. Check `max_read_bytes` for the maximum allowed reading length.

**bool** (*supports_direct_read*) *(spi_flash_host_inst_t *host, const void *p)*

Check whether the SPI host supports direct read.

When cache is disabled, SPI1 doesn’t support directly read when the given buffer isn’t internal.

**int** (*read_data_slicer*) *(spi_flash_host_inst_t *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t *page_size)*

Slicer for read data. The `read` should be called iteratively with the return value of this function.

- **Param address**: Beginning flash address to read
- **Param len**: Length request to read
- **Param align_addr**: Output of the aligned address to read
- **Param page_size**: Physical page size of the flash chip
- **Return**: Length that can be actually read in one `read` call

**uint32_t** (*host_status*) *(spi_flash_host_inst_t *host)*

Check the host status, 0: busy, 1: idle, 2: suspended.

**esp_err_t** (*configure_host_io_mode*) *(spi_flash_host_inst_t *host, uint32_t command, uint32_t addr_bitlen, int dummy_bitlen_base, esp_flash_io_mode_t io_mode)*

Configure the host to work at different read mode. Responsible to compensate the timing and set IO mode.

**void** (*poll_cmd_done*) *(spi_flash_host_inst_t *host)*

Internal use, poll the HW until the last operation is done.

**esp_err_t** (*flush_cache*) *(spi_flash_host_inst_t *host, uint32_t addr, uint32_t size)*

For some host (SPI1), they are shared with a cache. When the data is modified, the cache needs to be flushed. Left NULL if not supported.
void (*check_suspend)(spi_flash_host_inst_t *host)
    Suspend check erase/program operation, reserved for ESP32-C3 and ESP32-S3 spi flash ROM IMPL.

void (*resume)(spi_flash_host_inst_t *host)
    Resume flash from suspend manually

void (*suspend)(spi_flash_host_inst_t *host)
    Set flash in suspend status manually

esp_err_t (*sus_setup)(spi_flash_host_inst_t *host, const spi_flash_sus_cmd_conf *sus_conf)
    Suspend feature setup for setting cmd and status register mask.

Macros

SPI_FLASH_TRANS_FLAG_CMD16
    Send command of 16 bits.

SPI_FLASH_TRANS_FLAG_IGNORE_BASEIO
    Not applying the basic io mode configuration for this transaction.

SPI_FLASH_TRANS_FLAG_BYTE_SWAP
    Used for DTR mode, to swap the bytes of a pair of rising/falling edge.

SPI_FLASH_TRANS_FLAG_PE_CMD
    Indicates that this transaction is to erase/program flash chip.

SPI_FLASH_CONFIG_CONF_BITS
    OR the io_mode with this mask, to enable the dummy output feature or replace the first several dummy bits into address to meet the requirements of conf bits. (Used in DIO/QIO/OIO mode)

SPI_FLASH_OPI_FLAG
    A flag for flash work in opi mode, the io mode below are opi, above are SPI/QSPI mode. DO NOT use this value in any API.

SPI_FLASH_READ_MODE_MIN
    Slowest io mode supported by ESP32, currently SlowRd.

Type Definitions

typedef enum esp_flash_speed_s esp_flash_speed_t
    SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

    A strategy to select the maximum allowed speed is to enumerate from the ESP_FLASH_SPEED_MAX-1 or highest frequency supported by your flash, and decrease the speed until the probing success.

typedef struct spi_flash_host_driver_s spi_flash_host_driver_t

Enumerations
enum esp_flash_speed_s
SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).
A strategy to select the maximum allowed speed is to enumerate from the ESP_FLASH_SPEED_MAX-1 or highest frequency supported by your flash, and decrease the speed until the probing success.
Values:

enumerator ESP_FLASH_5MHZ
The flash runs under 5MHz.

enumerator ESP_FLASH_10MHZ
The flash runs under 10MHz.

enumerator ESP_FLASH_20MHZ
The flash runs under 20MHz.

enumerator ESP_FLASH_26MHZ
The flash runs under 26MHz.

enumerator ESP_FLASH_40MHZ
The flash runs under 40MHz.

enumerator ESP_FLASH_80MHZ
The flash runs under 80MHz.

enumerator ESP_FLASH_120MHZ
The flash runs under 120MHz, 120MHZ can only be used by main flash after timing tuning in system. Do not use this directly in any API.

enumerator ESP_FLASH_SPEED_MAX
The maximum frequency supported by the host is ESP_FLASH_SPEED_MAX-1.

enum esp_flash_io_mode_t
Mode used for reading from SPI flash.
Values:

enumerator SPI_FLASH_SLOWRD
Data read using single I/O, some limits on speed.

enumerator SPI_FLASH_FASTRD
Data read using single I/O, no limit on speed.

enumerator SPI_FLASH_DOUT
Data read using dual I/O.

enumerator SPI_FLASH_DIO
Both address & data transferred using dual I/O.
enumerator **SPI_FLASH_QOUT**
   Data read using quad I/O.

enumerator **SPI_FLASH_QIO**
   Both address & data transferred using quad I/O.

enumerator **SPI_FLASH_OPI_STR**
   Only support on OPI flash, flash read and write under STR mode.

enumerator **SPI_FLASH_OPI_DTR**
   Only support on OPI flash, flash read and write under DTR mode.

enumerator **SPI_FLASH_READ_MODE_MAX**
   The fastest io mode supported by the host is **ESP_FLASH_READ_MODE_MAX-1**.

**Header File**
- components/hal/include/hal/esp_flash_err.h

**Macros**

**ESP_ERR_FLASH_NOT_INITIALISED**
   esp_flash_chip_t structure not correctly initialised by esp_flash_init().

**ESP_ERR_FLASH_UNSUPPORTED_HOST**
   Requested operation isn’t supported via this host SPI bus (chip->spi field).

**ESP_ERR_FLASH_UNSUPPORTED_CHIP**
   Requested operation isn’t supported by this model of SPI flash chip.

**ESP_ERR_FLASH_PROTECTED**
   Write operation failed due to chip’s write protection being enabled.

**Enumerations**

enum [anonymous]
   * Values:

   enumerator **ESP_ERR_FLASH_SIZE_NOT_MATCH**
      The chip doesn’t have enough space for the current partition table.

   enumerator **ESP_ERR_FLASH_NO_RESPONSE**
      Chip did not respond to the command, or timed out.

**Header File**
- components/spi_flash/include/esp_spi_flash_counters.h
**Chapter 2. API Reference**

**Functions**

void `esp_flash_reset_counters` (void)
Reset SPI flash operation counters.

void `spi_flash_reset_counters` (void)
Reset SPI flash operation counters.

void `esp_flash_dump_counters` (FILE *stream)
Print SPI flash operation counters.

void `spi_flash_dump_counters` (void)

const `esp_flash_counters_t` *`esp_flash_get_counters` (void)
Return current SPI flash operation counters.

**Returns** pointer to the `esp_flash_counters_t` structure holding values of the operation counters

const `spi_flash_counters_t` *`spi_flash_get_counters` (void)

**Structures**

struct `esp_flash_counter_t`  
Structure holding statistics for one type of operation

**Public Members**

uint32_t `count`
number of times operation was executed

uint32_t `time`
total time taken, in microseconds

uint32_t `bytes`
total number of bytes

struct `esp_flash_counters_t`  
Structure for counters of flash actions

**Public Members**

`esp_flash_counter_t` `read`
counters for read action, like `esp_flash_read`

`esp_flash_counter_t` `write`
counters for write action, like `esp_flash_write`

`esp_flash_counter_t` `erase`
counters for erase action, like `esp_flash_erase`

**Type Definitions**

typedef `esp_flash_counter_t` `spi_flash_counter_t`

typedef `esp_flash_counters_t` `spi_flash_counters_t`
API Reference - Flash Encrypt

Header File
- components/bootloader_support/include/esp_flash_encrypt.h

Functions

bool esp_flash_encryption_enabled (void)
Is flash encryption currently enabled in hardware?
Flash encryption is enabled if the FLASH_CRYPT_CNT efuse has an odd number of bits set.

Returns true if flash encryption is enabled.

esp_err_t esp_flash_encrypt_check_and_update (void)

bool esp_flash_encrypt_state (void)
Returns the Flash Encryption state and prints it.

Returns True - Flash Encryption is enabled False - Flash Encryption is not enabled

bool esp_flash_encrypt_initialized_once (void)
Checks if the first initialization was done.
If the first initialization was done then FLASH_CRYPT_CNT != 0

Returns true - the first initialization was done false - the first initialization was NOT done

esp_err_t esp_flash_encrypt_init (void)
The first initialization of Flash Encryption key and related eFuses.

Returns ESP_OK if all operations succeeded

esp_err_t esp_flash_encrypt_contents (void)
Encrypts flash content.

Returns ESP_OK if all operations succeeded

esp_err_t esp_flash_encrypt_enable (void)
Activates Flash encryption on the chip.
It burns FLASH_CRYPT_CNT eFuse based on the CONFIG_SECURE_FLASH_ENCRYPTION_MODE_RELEASE option.

Returns ESP_OK if all operations succeeded

bool esp_flash_encrypt_is_write_protected (bool print_error)
Returns True if the write protection of FLASH_CRYPT_CNT is set.

Parameters print_error - Print error if it is write protected
Returns true - if FLASH_CRYPT_CNT is write protected

esp_err_t esp_flash_encrypt_region (uint32_t src_addr, size_t data_length)
Encrypt-in-place a block of flash sectors.

Note: This function resets RTC_WDT between operations with sectors.

Parameters
- src_addr - Source offset in flash. Should be multiple of 4096 bytes.
- data_length - Length of data to encrypt in bytes. Will be rounded up to next multiple of 4096 bytes.

Returns ESP_OK if all operations succeeded, ESP_ERR_FLASH_OP_FAIL if SPI flash fails, ESP_ERR_FLASH_OP_TIMEOUT if flash times out.
void esp_flash_write_protect_crypt_cnt (void)
Write protect FLASH_CRYPT_CNT.
Intended to be called as a part of boot process if flash encryption is enabled but secure boot is not used. This should protect against serial re-flashing of an unauthorised code in absence of secure boot.

Note: On ESP32 V3 only, write protecting FLASH_CRYPT_CNT will also prevent disabling UART Download Mode. If both are wanted, call esp_efuse_disable_rom_download_mode() before calling this function.

esp_flash_enc_mode_t esp_get_flash_encryption_mode (void)
Return the flash encryption mode.
The API is called during boot process but can also be called by application to check the current flash encryption mode of ESP32
Returns

void esp_flash_encryption_init_checks (void)
Check the flash encryption mode during startup.
Verifies the flash encryption config during startup:

• Correct any insecure flash encryption settings if hardware Secure Boot is enabled.
• Log warnings if the efuse config doesn’t match the project config in any way

Note: This function is called automatically during app startup, it doesn’t need to be called from the app.

esp_err_t esp_flash_encryption_enable_secure_features (void)
Set all secure eFuse features related to flash encryption.
Returns

• ESP_OK - Successfully

bool esp_flash_encryption_cfg_verify_release_mode (void)
Returns the verification status for all physical security features of flash encryption in release mode.
If the device has flash encryption feature configured in the release mode, then it is highly recommended to call this API in the application startup code. This API verifies the sanity of the eFuse configuration against the release (production) mode of the flash encryption feature.
Returns

• True - all eFuses are configured correctly
• False - not all eFuses are configured correctly.

void esp_flash_encryption_set_release_mode (void)
Switches Flash Encryption from “Development” to “Release”.
If already in “Release” mode, the function will do nothing. If flash encryption efuse is not enabled yet then abort. It burns:

• ” disable encrypt in dl mode”
• set FLASH_CRYPT_CNT efuse to max

Enumerations

enum esp_flash_enc_mode_t
Values:
2.6.21 SPI Master Driver

SPI Master driver is a program that controls ESP32’s General Purpose SPI (GP-SPI) peripheral(s) when it functions as a master.

Note: SPI1 is not a GP-SPI. SPI Master driver also supports SPI1 but with quite a few limitations, see Notes on Using the SPI Master Driver on SPI1 Bus.

For more hardware information about the GP-SPI peripheral(s), see ESP32 Technical Reference Manual > SPI Controller [PDF].

Terminology

The terms used in relation to the SPI Master driver are given in the table below.
<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td>The SPI controller peripheral inside ESP32 initiates SPI transmissions over the bus and acts as an SPI Master.</td>
</tr>
<tr>
<td>Device</td>
<td>SPI slave Device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO, and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.</td>
</tr>
<tr>
<td>Bus</td>
<td>A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MOSI, MOSI, SCLK, one or more CS lines, and, optionally, QUAD WP and QUAD HD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in a daisy-chain manner.</td>
</tr>
<tr>
<td>MOSI</td>
<td>Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device. Also data0 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>MISO</td>
<td>Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host. Also data1 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>SCLK</td>
<td>Serial Clock. The oscillating signal generated by a Host keeps the transmission of data bits in sync.</td>
</tr>
<tr>
<td>CS</td>
<td>Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.</td>
</tr>
<tr>
<td>QUADWP</td>
<td>Write Protect signal. Used for 4-bit (qio/qout) transactions. Also for the data2 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>QUADHD</td>
<td>Hold signal. Used for 4-bit (qio/qout) transactions. Also for the data3 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA4</td>
<td>Data4 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA5</td>
<td>Data5 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA6</td>
<td>Data6 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA7</td>
<td>Data7 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>Assertion</td>
<td>The action of activating a line.</td>
</tr>
<tr>
<td>De-assertion</td>
<td>The action of returning the line back to inactive (back to idle) status.</td>
</tr>
<tr>
<td>Transaction</td>
<td>One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.</td>
</tr>
<tr>
<td>Launch Edge</td>
<td>Edge of the clock at which the source register launches the signal onto the line.</td>
</tr>
<tr>
<td>Latch Edge</td>
<td>Edge of the clock at which the destination register latches in the signal.</td>
</tr>
</tbody>
</table>

**Driver Features**

The SPI Master driver governs the communications between Hosts and Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see *SPI Bus Lock*.

**Warning:** The SPI Master driver allows multiple Devices to be connected on a same SPI bus (sharing a single ESP32 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread-safe. However, if multiple tasks try to access the same SPI Device, the driver is **not thread-safe**. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time. You can use `spi_bus_config_t::isr_cpu_id` to register the SPI ISR to the same core as SPI peripheral-related tasks to ensure thread safety.
- Add a mutex lock around the shared Device using `xSemaphoreCreateMutex`. 
Chapter 2. API Reference

SPI Features

SPI Master

SPI Bus Lock  To realize the multiplexing of different devices from different drivers, including SPI Master, SPI Flash, etc., an SPI bus lock is applied on each SPI bus. Drivers can attach their devices to the bus with the arbitration of the lock.

Each bus lock is initialized with a BG (background) service registered. All devices that request transactions on the bus should wait until the BG is successfully disabled.

- For the SPI1 bus, the BG is the cache. The bus lock disables the cache before device operations start, and enables it again after the device releases the lock. No devices on SPI1 are allowed to use ISR, since it is meaningless for the task to yield to other tasks when the cache is disabled.
  There are quite a few limitations when using the SPI Master driver on the SPI1 bus. See Notes on Using the SPI Master Driver on SPI1 Bus.
- For other buses, the driver can register the ISR as a BG. If a device task requests exclusive bus access, the bus lock will block the task, disable the ISR, and then unblock the task. After the task releases the lock, the lock will try to re-enable the ISR if there are still pending transactions in the ISR.

SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

<table>
<thead>
<tr>
<th>Phase</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>In this phase, a command (0-16 bit) is written to the bus by the Host.</td>
</tr>
<tr>
<td>Address</td>
<td>In this phase, an address (0-64 bit) is transmitted over the bus by the Host.</td>
</tr>
<tr>
<td>Dummy</td>
<td>This phase is configurable and is used to meet the timing requirements.</td>
</tr>
<tr>
<td>Write</td>
<td>Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.</td>
</tr>
<tr>
<td>Read</td>
<td>Device sends data to its Host.</td>
</tr>
</tbody>
</table>

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, Device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the Read and Write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the Read and Write phases are not simultaneous (one direction at a time). The lengths of the Write and Read phases are determined by `spi_transaction_t::length` and `spi_transaction_t::rxlength` respectively.

The Command and Address phases are optional, as not every SPI Device requires a command and/or address. This is reflected in the Device’s configuration: if `spi_device_interface_config_t::command_bits` and/or `spi_device_interface_config_t::address_bits` are set to zero, no Command or Address phase will occur.

The Read and Write phases can also be optional, as not every transaction requires both writing and reading data. If `spi_transaction_t::rx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the Read phase
is skipped. If `spi_transaction_t::tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the Write phase is skipped.

The driver supports two types of transactions: interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see Notes on Sending Mixed Transactions to the Same Device.

**Interrupt Transactions** Interrupt transactions blocks the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver automatically handles them one by one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions are complete.

**Polling Transactions** Polling transactions do not use interrupts. The routine keeps polling the SPI Host’s status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1 µs to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see Bus Acquiring.

**Transaction Line Mode** Supported line modes for ESP32 are listed as follows, to make use of these modes, set the member flags in the struct `spi_transaction_t` as shown in the Transaction Flag column. If you want to check if corresponding IO pins are set or not, set the member flags in the `spi_bus_config_t` as shown in the Bus IO setting Flag column.

<table>

</tr>
</tbody>
</table>

**Command and Address Phases** During the Command and Address phases, the members `spi_transaction_t::cmd` and `spi_transaction_t::addr` are sent to the bus, nothing is read at this time. The default lengths of the Command and Address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the Command and Address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::flags` as usual. Then the length of each phase will be equal to `spi_transaction_ext_t::command_bits` and `spi_transaction_ext_t::address_bits` set in the struct `spi_transaction_ext_t`.

If the Command and Address phase need to have the same number of lines as the data phase, you need to set `SPI_TRANS_MULTILINE_CMD` and/or `SPI_TRANS_MULTILINE_ADDR` to the `flags` member in the struct `spi_transaction_t`. Also see *Transaction Line Mode*.

**Write and Read Phases** Normally, the data that needs to be transferred to or from a Device is read from or written to a chunk of memory indicated by the members `spi_transaction_t::rx_buffer` and `spi_transaction_t::tx_buffer`. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory (MALLOCCAP_DMA), see *DMA-Capable Memory*.
2. 32-bit aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

If using more than one data line to transmit, please set `SPI_DEVICE_HALFDUPLEX` flag for the member `flags` in the struct `spi_device_interface_config_t`. And the member `flags` in the struct `spi_transaction_t` should be set as described in *Transaction Line Mode*.

**Note:** Half-duplex transactions with both Read and Write phases are not supported when using DMA. For details and workarounds, see *Known Issues*.

**Bus Acquiring** Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other Devices until the bus is released. To acquire and release a bus, use the functions `spi_device_acquire_bus()` and `spi_device_release_bus()`.

**Driver Usage**

- Initialize an SPI bus by calling the function `spi_bus_initialize()`. Make sure to set the correct I/O pins in the struct `spi_bus_config_t`. Set the signals that are not needed to -1.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the Device might need with the parameter `dev_config`. You should now have obtained the Device’s handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
  - **Interrupt** Either queue all transactions by calling the function `spi_device_queue_trans()` and, at a later time, query the result using the function `spi_device_get_trans_result()`, or handle all requests synchronously by feeding them into `spi_device_transmit()`.  
  - **Polling** Call the function `spi_device_polling_transmit()` to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using `spi_device_polling_start()` and `spi_device_polling_end()`.
- (Optional) To perform back-to-back transactions with a Device, call the function `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()` after the transactions have been sent.
- (Optional) To remove a certain Device from the bus, call `spi_bus_remove_device()` with the Device handle as an argument.
- (Optional) To remove the driver from the bus, make sure no more devices are attached and call `spi_bus_free()`.

The example code for the SPI Master driver can be found in the `peripherals/spi_master` directory of ESP-IDF examples.

**Transactions with Data Not Exceeding 32 Bits** When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the
spi_transaction_t::tx_data member and setting the SPI_TRANS_USE_TXDATA flag on the transmission. For received data, use spi_transaction_t::rx_data and set SPI_TRANS_USE_RXDATA. In both cases, do not touch the spi_transaction_t::tx_buffer or spi_transaction_t::rx_buffer members, because they use the same memory locations as spi_transaction_t::tx_data and spi_transaction_t::rx_data.

Transactions with Integers Other than uint8_t An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB is first used in rare cases. If a value of fewer than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if \(0b00010\) needs to be sent, it should be written into a uint8_t variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional “random” bits, so the reading must be performed correctly.

On top of that, ESP32 is a little-endian chip, which means that the least significant byte of uint16_t and uint32_t variables is stored at the smallest address. Hence, if uint16_t is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has a size differing from uint8_t arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- SPI_SWAP_DATA_TX for data to be transmitted
- SPI_SWAP_DATA_RX for data received

Notes on Sending Mixed Transactions to the Same Device To reduce coding complexity, send only one type of transaction (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function spi_device_polling_end() after spi_device_polling_start() to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with spi_device_polling_transmit() so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call spi_device_polling_start(). To do that, you can keep calling spi_device_get_trans_result() until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

Notes on Using the SPI Master Driver on SPI1 Bus Note: Though the SPI Bus Lock feature makes it possible to use SPI Master driver on the SPI1 bus, it is still tricky and needs a lot of special treatment. It is a feature for advanced developers.

To use SPI Master driver on SPI1 bus, you have to take care of two problems:

1. The code and data should be in the internal memory when the driver is operating on SPI1 bus. SPI1 bus is shared among Devices and the cache for data (code) in the flash as well as the PSRAM. The cache should be disabled when other drivers are operating on the SPI1 bus. Hence the data (code) in the flash as well as the PSRAM cannot be fetched while the driver acquires the SPI1 bus by:

   - Explicit bus acquiring between spi_device_acquire_bus() and spi_device_release_bus().
   - Implicit bus acquiring between spi_device_polling_start() and spi_device_polling_end() (or inside spi_device_polling_transmit()).
During the time above, all other tasks and most ISRs will be disabled (see *IRAM-Safe Interrupt Handlers*). Application code and data used by the current task should be placed in internal memory (DRAM or IRAM), or already in the ROM. Access to external memory (flash code, const data in the flash, and static/heap data in the PSRAM) will cause a *Cache disabled but cached memory region accessed exception*. For differences between IRAM, DRAM, and flash cache, please refer to the *application memory layout* documentation.

To place functions into the IRAM, you can either:
1. Add `IRAM_ATTR` (include `esp_attr.h`) to the function like:
   ```c
   IRAM_ATTR void foo(void) {}
   ```
   Please note that when a function is inlined, it will follow its caller’s segment, and the attribute will not take effect. You may need to use `NOLINE_ATTR` to avoid this. Please also note that the compiler may transform some code into a lookup table in the const data, so `noflash_text` is not safe.
2. Use the `noflash` placement in the linker.elf. See more in *Linker Script Generation*. Please note that the compiler may transform some code into a lookup table in the const data, so `noflash_text` is not safe.

Please do take care that the optimization level may affect the compiler behavior of inline, or transform some code into a lookup table in the const data, etc.

To place data into the DRAM, you can either:
1. Add `DRAM_ATTR` (include `esp_attr.h`) to the data definition like:
   ```c
   DRAM_ATTR int g_foo = 3;
   ```
2. Use the `noflash` placement in the linker.elf. See more in *Linker Script Generation*.

Please also see the example `peripherals/spi_master/hd_eeprom`.

**GPIO Matrix and IO_MUX** Most of ESP32’s peripheral signals have a direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it.

The GPIO matrix introduces flexibility of routing but also brings the following disadvantages:

- Increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated IO_MUX pins.
- Allows signals with clock frequencies only up to 40 MHz, as opposed to 80 MHz if IO_MUX pins are used.

**Note:** For more details about the influence of the MISO input delay on the maximum clock frequency, see *Timing Considerations*.

The IO_MUX pins for SPI buses are given below.

<table>
<thead>
<tr>

</tbody>
</table>

**Transfer Speed Considerations**

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

¹ Only the first Device attached to the bus can use the CS0 pin.
The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

**Transaction Duration** Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transactions.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For **interrupt transactions**, the CPU can switch to other tasks when a transaction is in progress. This saves CPU time but increases the transaction duration. See **Interrupt Transactions**. For **polling transactions**, it does not block the task but allows to do polling when the transaction is in progress. For more information, see **Polling Transactions**.

If DMA is enabled, setting up the linked list requires about 2 µs per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2 µs, but the transaction length is limited to 64 bytes for both write and read.

The typical transaction duration for one byte of data is given below.

- Interrupt Transaction via DMA: 28 µs.
- Interrupt Transaction via CPU: 25 µs.
- Polling Transaction via DMA: 10 µs.
- Polling Transaction via CPU: 8 µs.

Note that these data are tested with **CONFIG_SPI_MASTER_ISR_IN_IRAM** enabled. SPI transaction related code are placed in the internal memory. If this option is turned off (for example, for internal memory optimization), the transaction duration may be affected.

**SPI Clock Frequency** The clock source of the GPSPI peripherals can be selected by setting `spi_device_handle_t::cfg::clock_source`. You can refer to `spi_clock_source_t` to know the supported clock sources.

By default driver sets `spi_device_handle_t::cfg::clock_source` to SPI_CLK_SRC_DEFAULT. This usually stands for the highest frequency among GPSPI clock sources. Its value is different among chips.

The actual clock frequency of a Device may not be exactly equal to the number you set, it is re-calculated by the driver to the nearest hardware-compatible number, and not larger than the clock frequency of the clock source. You can call `spi_device_get_actual_freq()` to know the actual frequency computed by the driver.

The theoretical maximum transfer speed of the Write or Read phase can be calculated according to the table below:

<table>
<thead>
<tr>
<th>Line Width of Write/Read phase</th>
<th>Speed (Bps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-Line</td>
<td><code>SPI Frequency / 8</code></td>
</tr>
<tr>
<td>2-Line</td>
<td><code>SPI Frequency / 4</code></td>
</tr>
<tr>
<td>4-Line</td>
<td><code>SPI Frequency / 2</code></td>
</tr>
</tbody>
</table>

The transfer speed calculation of other phases (Command, Address, Dummy) is similar.

If the clock frequency is too high, the use of some functions might be limited. See **Timing Considerations**.

**Cache Missing** The default config puts only the ISR into the IRAM. Other SPI-related functions, including the driver itself and the callback, might suffer from cache misses and need to wait until the code is read from flash. Select `CONFIG_SPI_MASTER_IN_IRAM` to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache missing.

**Note:** SPI driver implementation is based on FreeRTOS APIs, to use `CONFIG_SPI_MASTER_IN_IRAM`, you should not enable `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH`.

---

Submit Document Feedback
For an interrupt transaction, the overall cost is $20 + \frac{8n}{F_{spi}}\text{[MHz]}\text{[µs]}$ for $n$ bytes transferred in one transaction. Hence, the transferring speed is: $\frac{n}{20 + \frac{8n}{F_{spi}}}$. An example of transferring speed at 8 MHz clock speed is given in the following table.

<table>
<thead>
<tr>
<th>Frequency (MHz)</th>
<th>Transaction Interval (µs)</th>
<th>Transaction Length (bytes)</th>
<th>Total Time (µs)</th>
<th>Total Speed (KBps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>25</td>
<td>1</td>
<td>26</td>
<td>38.5</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>8</td>
<td>33</td>
<td>242.4</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>16</td>
<td>41</td>
<td>490.2</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>64</td>
<td>89</td>
<td>719.1</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>128</td>
<td>153</td>
<td>836.6</td>
</tr>
</tbody>
</table>

When a transaction length is short, the cost of the transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable `CONFIG_SPI_MASTER_ISR_IN_IRAM` and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations are handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache missing. For more details, see `IRAM-Safe Interrupt Handlers`.

**Timing Considerations**

As shown in the figure below, there is a delay on the MISO line after the SCLK launch edge and before the signal is latched by the internal register. As a result, the MISO pin setup time is the limiting factor for the SPI clock speed. When the delay is too long, the setup slack is < 0, which means the setup timing requirement is violated and the reading might be incorrect.

![Timing Diagram](image_url)

The maximum allowed frequency is dependent on:

- `spi_device_interface_config_t::input_delay_ns` - maximum data valid time on the MISO bus after a clock cycle on SCLK starts
- If the IO_MUX pin or the GPIO Matrix is used

When the GPIO matrix is used, the maximum allowed frequency is reduced to about 33 ~ 77% in comparison to the existing `input_delay`. To retain a higher frequency, you have to use the IO_MUX pins or the dummy bit workaround. You can obtain the maximum reading frequency of the master by using the function `spi_get_freq_limit()`.
**Dummy bit workaround:** Dummy clocks, during which the Host does not read data, can be inserted before the Read phase begins. The Device still sees the dummy clocks and sends out data, but the Host does not read until the Read phase comes. This compensates for the lack of the MISO setup time required by the Host and allows the Host to do reading at a higher frequency.

In the ideal case, if the Device is so fast that the input delay is shorter than an APB clock cycle - 12.5 ns - the maximum frequency at which the Host can read (or read and write) in different conditions is as follows:

<table>
<thead>
<tr>
<th>Frequency Limit (MHz)</th>
<th>Frequency Limit (MHz)</th>
<th>Dummy Bits Used by Driver</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPIO Matrix</td>
<td>IO_MUX Pins</td>
<td></td>
<td></td>
</tr>
<tr>
<td>26.6</td>
<td>80</td>
<td>No</td>
<td></td>
</tr>
<tr>
<td>40</td>
<td>–</td>
<td>Yes</td>
<td>Half-duplex, no DMA allowed</td>
</tr>
</tbody>
</table>

If the Host only writes data, the *dummy bit workaround* and the frequency check can be disabled by setting the bit SPI_DEVICE_NO_DUMMY in the member `spi_device_interface_config_t::flags`. When disabled, the output frequency can be 80 MHz, even if the GPIO matrix is used.

The SPI Master driver still works even if the `spi_device_interface_config_t::input_delay_ns` in the structure `spi_device_interface_config_t` is set to 0. However, setting an accurate value helps to:

- Calculate the frequency limit for full-duplex transactions
- Compensate the timing correctly with dummy bits for half-duplex transactions

You can approximate the maximum data valid time after the launch edge of SPI clocks by checking the statistics in the AC characteristics chapter of your Device’s specification or measure the time using an oscilloscope or logic analyzer.

Please note that the actual PCB layout design and excessive loads may increase the input delay. It means that non-optimal wiring and/or a load capacitor on the bus will most likely lead to input delay values exceeding the values given in the Device specification or measured while the bus is floating.

Some typical delay values are shown in the following table. These data are retrieved when the slave Device is on a different physical chip.

<table>
<thead>
<tr>
<th>Device</th>
<th>Input Delay (ns)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ideal Device</td>
<td>0</td>
</tr>
<tr>
<td>ESP32 slave using IO_MUX</td>
<td>50</td>
</tr>
<tr>
<td>ESP32 slave using GPIO_MATRIX</td>
<td>75</td>
</tr>
</tbody>
</table>

The MISO path delay (valid time) consists of a slave’s input delay plus the master’s GPIO matrix delay. The delay determines the above frequency limit for full-duplex transfers. Once exceeding, full-duplex transfers will not work as well as the half-duplex transactions that use dummy bits. The frequency limit is:

\[
\text{Freq limit [MHz]} = \frac{80}{(\text{floor(MISO delay[ns]}/12.5) + 1)}
\]

The figure below shows the relationship between frequency limit and input delay. Two extra APB clock cycle periods should be added to the MISO delay if the master uses the GPIO matrix.
Corresponding frequency limits for different Devices with different input delay times are shown in the table below.

When the master is IO_MUX (0 ns):

<table>
<thead>
<tr>
<th>Input Delay (ns)</th>
<th>MISO Path Delay (ns)</th>
<th>Freq. Limit (MHz)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>80</td>
</tr>
<tr>
<td>50</td>
<td>50</td>
<td>16</td>
</tr>
<tr>
<td>75</td>
<td>75</td>
<td>11.43</td>
</tr>
</tbody>
</table>

When the master is GPIO_MATRIX (25 ns):

<table>
<thead>
<tr>
<th>Input Delay (ns)</th>
<th>MISO Path Delay (ns)</th>
<th>Freq. Limit (MHz)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>25</td>
<td>26.67</td>
</tr>
<tr>
<td>50</td>
<td>75</td>
<td>11.43</td>
</tr>
<tr>
<td>75</td>
<td>100</td>
<td>8.89</td>
</tr>
</tbody>
</table>

**Known Issues**

1. Half-duplex transactions are not compatible with DMA when both the Write and Read phases are used. If such transactions are required, you have to use one of the alternative solutions:
   1. Use full-duplex transactions instead.
   2. Disable DMA by setting the bus initialization function’s last parameter to 0 as follows:
      ```c
      ret=spi_bus_initialize(VSPI_HOST, &buscfg, 0);
      ```
      This can prohibit you from transmitting and receiving data longer than 64 bytes. 3. Try using the command and address fields to replace the Write phase.

2. Full-duplex transactions are not compatible with the dummy bit workaround, hence the frequency is limited.

3. dummy_bits in `spi_device_interface_config_t` and `spi_transaction_ext_t` are not available when SPI Read and Write phases are both enabled (regardless of full duplex or half duplex mode).
4. `cs_ena_pretrans` is not compatible with the Command and Address phases of full-duplex transactions.

**Application Example**

The code example for using the SPI master half duplex mode to read/write an AT93C46D EEPROM (8-bit mode) can be found in the `peripherals/spi_master/hd_eeprom` directory of ESP-IDF examples.

The code example for using the SPI master full duplex mode to drive a SPI_LCD (e.g. ST7789V or ILI9341) can be found in the `peripherals/spi_master/lcd` directory of ESP-IDF examples.

**Structures**

```c
struct spi_line_mode_t
{
    Linemode of SPI transaction phases: CMD, ADDR, DOUT/DIN.
}
```

**Public Members**

```c
uint8_t cmd_lines
    The line width of command phase, e.g. 2-line-cmd-phase.

uint8_t addr_lines
    The line width of address phase, e.g. 1-line-addr-phase.

uint8_t data_lines
    The line width of data phase, e.g. 4-line-data-phase.
```

**Type Definitions**

```c
typedef soc_periph_spi_clk_src_t spi_clock_source_t
    Type of SPI clock source.
```

**Enumerations**

```c
enum spi_host_device_t
```

Enum with the three SPI peripherals that are software-accessible in it.

**Values:**

```c
enumerator SPI1_HOST
    SPI1.

enumerator SPI2_HOST
    SPI2.
```
enumerator **SPI3_HOST**
   SPI3.

enumerator **SPI_HOST_MAX**
   invalid host value

enum **spi_event_t**
   SPI Events.
   
   **Values:**
   
   enumerator **SPI_EV_BUF_TX**
   The buffer has sent data to master.

   enumerator **SPI_EV_BUF_RX**
   The buffer has received data from master.

   enumerator **SPI_EV_SEND_DMA_READY**
   Slave has loaded its TX data buffer to the hardware (DMA).

   enumerator **SPI_EV_SEND**
   Master has received certain number of the data, the number is determined by Master.

   enumerator **SPI_EV_RECV_DMA_READY**
   Slave has loaded its RX data buffer to the hardware (DMA).

   enumerator **SPI_EV_RECV**
   Slave has received certain number of data from master, the number is determined by Master.

   enumerator **SPI_EV_CMD9**
   Received CMD9 from master.

   enumerator **SPI_EV_CMDA**
   Received CMDA from master.

   enumerator **SPI_EV_TRANS**
   A transaction has done.

Functions
esp_err_t spi_bus_initialize(spi_host_device_t host_id, const spi_bus_config_t *bus_config,
                             spi_dma_chan_t dma_chan)

Initialize a SPI bus.

Warning: SPI0/1 is not supported

Warning: If a DMA channel is selected, any transmit and receive buffer used should be allocated in
DMA-capable memory.

Warning: The ISR of SPI is always executed on the core which calls this function. Never starve the ISR
on this core or the SPI transactions will not be handled.

Parameters
• host_id - SPI peripheral that controls this bus
• bus_config - Pointer to a spi_bus_config_t struct specifying how the host should be
  initialized
• dma_chan -- Selecting a DMA channel for an SPI bus allows transactions on the bus
  with size only limited by the amount of internal memory.
  – Selecting SPI_DMA_DISABLED limits the size of transactions.
  – Set to SPI_DMA.Disabled if only the SPI flash uses this bus.
  – Set to SPI_DMA.CH.AUTO to let the driver to allocate the DMA channel.

Returns
• ESP_ERR_INVALID_ARG if configuration is invalid
• ESP_ERR_INVALID_STATE if host already is in use
• ESP_ERR_NOT_FOUND if there is no available DMA channel
• ESP_ERR_NO_MEM if out of memory
• ESP_OK on success

esp_err_t spi_bus_free(spi_host_device_t host_id)
Free a SPI bus.
**Warning:** In order for this to succeed, all devices have to be removed first.

**Parameters**

- host_id - SPI peripheral to free

**Returns**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if bus hasn’t been initialized before, or not all devices on the bus are freed
- ESP_OK on success

**Structures**

struct `spi_bus_config_t`

This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO_MUX or are -1. In that case, the IO_MUX is used, allowing for >40MHz speeds.

**Note:** Be advised that the slave driver does not use the quadwp/quadhd lines and fields in `spi_bus_config_t` referring to these lines will be ignored and can thus safely be left uninitialized.

**Public Members**

- `int mosi_io_num`
  
  GPIO pin for Master Out Slave In (=spi_d) signal, or -1 if not used.

- `int data0_io_num`
  
  GPIO pin for spi data0 signal in quad/octal mode, or -1 if not used.

- `int miso_io_num`
  
  GPIO pin for Master In Slave Out (=spi_q) signal, or -1 if not used.

- `int data1_io_num`
  
  GPIO pin for spi data1 signal in quad/octal mode, or -1 if not used.

- `int sclk_io_num`
  
  GPIO pin for SPI Clock signal, or -1 if not used.

- `int quadwp_io_num`
  
  GPIO pin for WP (Write Protect) signal, or -1 if not used.

- `int data2_io_num`
  
  GPIO pin for spi data2 signal in quad/octal mode, or -1 if not used.

- `int quadhd_io_num`
  
  GPIO pin for HD (Hold) signal, or -1 if not used.

- `int data3_io_num`
  
  GPIO pin for spi data3 signal in quad/octal mode, or -1 if not used.
int data4_io_num
    GPIO pin for spi data4 signal in octal mode, or -1 if not used.

int data5_io_num
    GPIO pin for spi data5 signal in octal mode, or -1 if not used.

int data6_io_num
    GPIO pin for spi data6 signal in octal mode, or -1 if not used.

int data7_io_num
    GPIO pin for spi data7 signal in octal mode, or -1 if not used.

int max_transfer_sz
    Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to
    SOC_SPI_MAXIMUM_BUFFER_SIZE if DMA is disabled.

uint32_t flags
    Abilities of bus to be checked by the driver. Or-ed value of SPICOMMON_BUSFLAG_* flags.

esp_intr_cpu_affinity / isr_cpu_id
    Select cpu core to register SPI ISR.

int intr_flags
    Interrupt flag for the bus to set the priority, and IRAM attribute, see esp_intr_alloc.h. Note that
    the EDGE, INTRDISABLED attribute are ignored by the driver. Note that if ESP_INTR_FLAG_IRAM
    is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

Macros

SPI_MAX_DMA_LEN

SPI_SWAP_DATA_TX (DATA, LEN)
    Transform unsigned integer of length <= 32 bits to the format which can be sent by the SPI driver directly.
    E.g. to send 9 bits of data, you can:

```c
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points tx_buffer to &data.

Parameters

- **DATA** - Data to be sent, can be uint8_t, uint16_t or uint32_t.
- **LEN** - Length of data to be sent, since the SPI peripheral sends from the MSB, this helps
  to shift the data to the MSB.

SPI_SWAP_DATA_RX (DATA, LEN)
    Transform received data of length <= 32 bits to the format of an unsigned integer.
    E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```c
uint16_t data = SPI_SWAP_DATA_RX(*(uint32_t*)t->rx_data, 15);
```

Parameters

- **DATA** - Data to be rearranged, can be uint8_t, uint16_t or uint32_t.
- **LEN** - Length of data received, since the SPI peripheral writes from the MSB, this helps
  to shift the data to the LSB.
Chapter 2. API Reference

SPICOMMON_BUSFLAG_SLAVE
Initialize I/O in slave mode.

SPICOMMON_BUSFLAG_MASTER
Initialize I/O in master mode.

SPICOMMON_BUSFLAG_IOMUX_PINS
Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

SPICOMMON_BUSFLAG_GPIO_PINS
Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.

SPICOMMON_BUSFLAG_SCLK
Check existing of SCLK pin. Or indicates CLK line initialized.

SPICOMMON_BUSFLAG_MISO
Check existing of MISO pin. Or indicates MISO line initialized.

SPICOMMON_BUSFLAG_MOSI
Check existing of MOSI pin. Or indicates MOSI line initialized.

SPICOMMON_BUSFLAG_DUAL
Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

SPICOMMON_BUSFLAG_WPHD
Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

SPICOMMON_BUSFLAG_QUAD
Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

SPICOMMON_BUSFLAG_IO4_IO7
Check existing of IO4~IO7 pins. Or indicates IO4~IO7 pins initialized.

SPICOMMON_BUSFLAG_OCTAL
Check existing of MOSI/MISO/WP/HD/SPIIO4/SPIIO5/SPIIO6/SPIIO7 pins as output. Or indicates bus able to work under octal mode.

SPICOMMON_BUSFLAG_NATIVE_PINS

Type Definitions

typedef spi_common_dma_t spi_dma_chan_t

Enumerations

enum spi_common_dma_t
   SPI DMA channels.
   Values:
enumerator **SPI_DMA_DISABLED**  
Do not enable DMA for SPI.

enumerator **SPI_DMA_CH1**  
Enable DMA, select DMA Channel 1.

enumerator **SPI_DMA_CH2**  
Enable DMA, select DMA Channel 2.

enumerator **SPI_DMA_CH_AUTO**  
Enable DMA, channel is automatically selected by driver.

### API Reference - SPI Master

#### Header File

- components/driver/spi/include/driver/spi_master.h

#### Functions

**`esp_err_t spi_bus_add_device`**

```c
spi_host_device_t host_id, const spi_device_interface_config_t *dev_config,
spi_device_handle_t *handle)
```

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

**Note:** While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

**Parameters**

- **host_id** - SPI peripheral to allocate device on  
- **dev_config** - SPI interface protocol config for the device  
- **handle** - Pointer to variable to hold the device handle

**Returns**

- ESP_ERR_INVALID_ARG if parameter is invalid or configuration combination is not supported (e.g. dev_config->post_cb isn’t set while flag SPI_DEVICE_NO_RETURN_RESULT is enabled)  
- ESP_ERR_INVALID_STATE if selected clock source is unavailable or spi bus not initialized  
- ESP_ERR_NOT_FOUND if host doesn’t have any free CS slots  
- ESP_ERR_NO_MEM if out of memory  
- ESP_OK on success

**`esp_err_t spi_bus_remove_device`**

```c
spi_device_handle_t handle)
```

Remove a device from the SPI bus.

**Parameters**

- **handle** - Device handle to free

**Returns**

- ESP_ERR_INVALID_ARG if parameter is invalid  
- ESP_ERR_INVALID_STATE if device already is freed  
- ESP_OK on success
**esp_err_t** `spi_device_queue_trans` *(spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)*

Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

**Note:** Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Parameters**
- **handle** - Device handle obtained using `spi_host_add_dev`
- **trans_desc** - Description of transaction to execute
- **ticks_to_wait** - Ticks to wait until there’s room in the queue; use `portMAX_DELAY` to never time out.

**Returns**
- **ESP_ERR_INVALID_ARG** if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first) or set flag `SPI_TRANS_DMA_BUFFER_ALIGN_MANUAL` but tx or rx buffer not DMA-capable, or addr&len not align to cache line size
- **ESP_ERR_TIMEOUT** if there was no room in the queue before `ticks_to_wait` expired
- **ESP_ERR_NO_MEM** if allocating DMA-capable temporary buffer failed
- **ESP_ERR_INVALID_STATE** if previous transactions are not finished
- **ESP_OK** on success

**esp_err_t** `spi_device_get_trans_result` *(spi_device_handle_t handle, spi_transaction_t **trans_desc, TickType_t ticks_to_wait)*

Get the result of a SPI transaction queued earlier by `spi_device_queue_trans`.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

**Parameters**
- **handle** - Device handle obtained using `spi_host_add_dev`
- **trans_desc** - Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by `spi_device_get_trans_result`.
- **ticks_to_wait** - Ticks to wait until there’s a returned item; use `portMAX_DELAY` to never time out.

**Returns**
- **ESP_ERR_INVALID_ARG** if parameter is invalid
- **ESP_ERR_NOT_SUPPORTED** if flag `SPI_DEVICE_NO_RETURN_RESULT` is set
- **ESP_ERR_TIMEOUT** if there was no completed transaction before `ticks_to_wait` expired
- **ESP_OK** on success

**esp_err_t** `spi_device_transmit` *(spi_device_handle_t handle, spi_transaction_t *trans_desc)*

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_queue_trans()` followed by `spi_device_get_trans_result()`. Do not use this when there is still a transaction separately queued (started) from `spi_device_queue_trans()` or polling_start/transmit that hasn’t been finalized.

**Note:** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Parameters**
- **handle** - Device handle obtained using `spi_host_add_dev`
**trans_desc** - Description of transaction to execute

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

```c
esp_err_t spi_device_polling_start (spi_device_handle_t handle, spi_transaction_t *trans_desc,
                                TickType_t ticks_to_wait)
```

Immediately start a polling transaction.

**Note:** Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

**Parameters**
- `handle` - Device handle obtained using `spi_host_add_dev`
- `trans_desc` - Description of transaction to execute
- `ticks_to_wait` - Ticks to wait until there’s room in the queue; currently only `portMAX_DELAY` is supported.

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if SPI_TRANS_CS_KEEP_ACTIVE flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first) or set flag SPI_TRANS_DMA_BUFFER_ALIGN_MANUAL but tx or rx buffer not DMA-capable, or addr&len not align to cache line size
- ESP_ERR_TIMEOUT if the device cannot get control of the bus before `ticks_to_wait` expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
- ESP_OK on success

```c
esp_err_t spi_device_polling_end (spi_device_handle_t handle, TickType_t ticks_to_wait)
```

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

**Parameters**
- `handle` - Device handle obtained using `spi_host_add_dev`
- `ticks_to_wait` - Ticks to wait until there’s a returned item; use `portMAX_DELAY` to never time out.

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if the transaction cannot finish before `ticks_to_wait` expired
- ESP_OK on success

```c
esp_err_t spi_device_polling_transmit (spi_device_handle_t handle, spi_transaction_t *trans_desc)
```

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_polling_start()` followed by `spi_device_polling_end()`. Do not use this when there is still a transaction that hasn’t been finalized.

**Note:** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Parameters**
- `handle` - Device handle obtained using `spi_host_add_dev`
- `trans_desc` - Description of transaction to execute
Chapter 2. API Reference

Returns
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if the device cannot get control of the bus
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions of same device are not finished
- ESP_OK on success

```c
esp_err_t spi_device_acquire_bus (spi_device_handle_t device, TickType_t wait)
```

Occup the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until `spi_device_release_bus` is called.

**Note:** The function will wait until all the existing transactions have been sent.

**Parameters**
- `device` : The device to occupy the bus.
- `wait` : Time to wait before the the bus is occupied by the device. Currently MUST set to portMAX_DELAY.

**Returns**
- ESP_ERR_INVALID_ARG: `wait` is not set to portMAX_DELAY.
- ESP_OK: Success.

```c
void spi_device_release_bus (spi_device_handle_t dev)
```

Release the SPI bus occupied by the device. All other devices can start sending transactions.

**Parameters**
- `dev` : The device to release the bus.

```c
esp_err_t spi_device_get_actual_freq (spi_device_handle_t handle, int *freq_khz)
```

Calculate working frequency for specific device.

**Parameters**
- `handle` : SPI device handle
- `freq_khz` : [out] output parameter to hold calculated frequency in kHz

**Returns**
- ESP_ERR_INVALID_ARG: `handle` or `freq_khz` parameter is NULL
- ESP_OK: Success

```c
int spi_get_actual_clock (int fapb, int hz, int duty_cycle)
```

Calculate the working frequency that is most close to desired frequency.

**Parameters**
- `fapb` : The frequency of apb clock, should be APB_CLK_FREQ.
- `hz` : Desired working frequency
- `duty_cycle` : Duty cycle of the spi clock

**Returns**
Actual working frequency that most fit.

```c
void spi_get_timing (bool gpio_is_used, int input_delay_ns, int eff_clk, int *dummy_o, int *cycles_remain_o)
```

Calculate the timing settings of specified frequency and settings.

**Note:** If `**dummy_o**` is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

**Parameters**
- `gpio_is_used` : True if using GPIO matrix, or False if iomux pins are used.
- `input_delay_ns` : Input delay from SCLK launch edge to MISO data valid.
- `eff_clk` : Effective clock frequency (in Hz) from `spi_get_actual_clock()`.
Chapter 2. API Reference

- **dummy_o** – Address of dummy bits used output. Set to NULL if not needed.
- **cycles_remain_o** – Address of cycles remaining (after dummy bits are used) output.
  - -1 If too many cycles remaining, suggest to compensate half a clock.
  - 0 If no remaining cycles or dummy bits are not used.
  - positive value: cycles suggest to compensate.

```c
int spi_get_freq_limit (bool gpio_is_used, int input_delay_ns)
```

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

**Parameters**
- **gpio_is_used** – True if using GPIO matrix, or False if native pins are used.
- **input_delay_ns** – Input delay from SCLK launch edge to MISO data valid.

**Returns** Frequency limit of current configurations.

```c
esp_err_t spi_bus_get_max_transaction_len (spi_host_device_t host_id, size_t *max_bytes)
```

Get max length (in bytes) of one transaction.

**Parameters**
- **host_id** – SPI peripheral
- **max_bytes** – [out] Max length of one transaction, in bytes

**Returns**
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument

**Structures**

```c
struct spi_device_interface_config_t
```

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

**Public Members**

```c
uint8_t command_bits
```

Default amount of bits in command phase (0-16), used when SPI_TRANS_VARIABLE_CMD is not used, otherwise ignored.

```c
uint8_t address_bits
```

Default amount of bits in address phase (0-64), used when SPI_TRANS_VARIABLE_ADDR is not used, otherwise ignored.

```c
uint8_t dummy_bits
```

Amount of dummy bits to insert between address and data phase.

```c
uint8_t mode
```

SPI mode, representing a pair of (CPOL, CPHA) configuration:
- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

```c
spi_clock_source_t clock_source
```

Select SPI clock source, SPI_CLK_SRC_DEFAULT by default.
### Public Members

#### uint16_t duty_cycle_pos
Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

#### uint16_t cs_ena_pretrans
Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

#### uint8_t cs_ena_posttrans
Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

#### int clock_speed_hz
SPI clock speed in Hz. Derived from clock_source.

#### int input_delay_ns
Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it’s suggest to have the right value.

#### int spics_io_num
CS GPIO pin for this device, or -1 if not used.

#### uint32_t flags
Bitwise OR of SPI_DEVICE_* flags.

#### int queue_size
Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_device_queue_trans but not yet finished using spi_device_get_trans_result) at the same time.

#### transaction_cb_t pre_cb
Callback to be called before a transmission is started.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

#### transaction_cb_t post_cb
Callback to be called after a transmission has completed.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.
uint16_t cmd
Command data, of which the length is set in the command_bits of spi_device_interface_config_t.

NOTE: this field, used to be “command” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.
Example: write 0x0123 and command_bits=12 to send command 0x12, 0x3 (in previous version, you may have to write 0x3_12).

uint64_t addr
Address data, of which the length is set in the address_bits of spi_device_interface_config_t.

NOTE: this field, used to be “address” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.
Example: write 0x123400 and address_bits=24 to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

size_t length
Total data length, in bits.

size_t rxlength
Total data length received, should be not greater than length in full-duplex mode (0 defaults this to the value of length).

void *user
User-defined variable. Can be used to store eg transaction ID.

const void *tx_buffer
Pointer to transmit buffer, or NULL for no MOSI phase.

uint8_t tx_data[4]
If SPI_TRANS_USE_TXDATA is set, data set here is sent directly from this variable.

void *rx_buffer
Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

uint8_t rx_data[4]
If SPI_TRANS_USE_RXDATA is set, data is received directly to this variable.

struct spi_transaction_ext_t
This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to SPI_TRANS_VARIABLE_CMD_ADR to use the bit length here.

Public Members

struct spi_transaction_t base
Transaction data, so that pointer to spi_transaction_t can be converted into spi_transaction_ext_t.

uint8_t command_bits
The command length in this transaction, in bits.
uint8_t address_bits
The address length in this transaction, in bits.

uint8_t dummy_bits
The dummy length in this transaction, in bits.

Macros

SPI_MASTER_FREQ_8M
SPI common used frequency (in Hz)

Note: SPI peripheral only has an integer divider, and the default clock source can be different on other targets, so the actual frequency may be slightly different from the desired frequency. 8MHz

SPI_MASTER_FREQ_9M
8.89MHz

SPI_MASTER_FREQ_10M
10MHz

SPI_MASTER_FREQ_11M
11.43MHz

SPI_MASTER_FREQ_13M
13.33MHz

SPI_MASTER_FREQ_16M
16MHz

SPI_MASTER_FREQ_20M
20MHz

SPI_MASTER_FREQ_26M
26.67MHz

SPI_MASTER_FREQ_40M
40MHz

SPI_MASTER_FREQ_80M
80MHz

SPI_DEVICE_TXBIT_LSBFIRST
Transmit command/address/data LSB first instead of the default MSB first.

SPI_DEVICE_RXBIT_LSBFIRST
Receive data LSB first instead of the default MSB first.

SPI_DEVICE_BIT_LSBFIRST
Transmit and receive LSB first.
**SPI_DEVICE_3WIRE**

Use MOSI (=spid) for both sending and receiving data.

**SPI_DEVICE_POSITIVE_CS**

Make CS positive during a transaction instead of negative.

**SPI_DEVICE_HALFDUPLEX**

Transmit data before receiving it, instead of simultaneously.

**SPI_DEVICE_CLK_AS_CS**

Output clock on CS line if CS is active.

**SPI_DEVICE_NO_DUMMY**

There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).

- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you’re going to work with output only, or read without dummy bits at your own risk.

**SPI_DEVICE_DDRCLK**

**SPI_DEVICE_NO_RETURN_RESULT**

Don’t return the descriptor to the host on completion (use post_cb to notify instead)

**SPI_TRANS_MODE_DIO**

Transmit/receive data in 2-bit mode.

**SPI_TRANS_MODE_QIO**

Transmit/receive data in 4-bit mode.

**SPI_TRANS_USE_RXDATA**

Receive into rx_data member of spi_transaction_t instead into memory at rx_buffer.

**SPI_TRANS_USE_TXDATA**

Transmit tx_data member of spi_transaction_t instead of data at tx_buffer. Do not set tx_buffer when using this.

**SPI_TRANS_MODE_DIOQIO_ADDR**

Also transmit address in mode selected by SPI_MODE_DIO/SPI_MODE_QIO.

**SPI_TRANS_VARIABLE_CMD**

Use the command_bits in spi_transaction_ext_t rather than default value in spi_device_interface_config_t.

**SPI_TRANS_VARIABLE_ADDR**

Use the address_bits in spi_transaction_ext_t rather than default value in spi_device_interface_config_t.
SPI_TRANS_VARIABLE_DUMMY
Use the dummy_bits in spi_transaction_ext_t rather than default value in spi_device_interface_config_t.

SPI_TRANS_CS_KEEP_ACTIVE
Keep CS active after data transfer.

SPI_TRANS_MULTILINE_CMD
The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase)

SPI_TRANS_MODE_OCT
Transmit/receive data in 8-bit mode.

SPI_TRANS_MULTILINE_ADDR
The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase)

SPI_TRANS_DMA_BUFFER_ALIGN_MANUAL
By default driver will automatically re-alloc dma buffer if it doesn’t meet hardware alignment or dma_capable requirements, this flag is for you to disable this feature, you will need to take care of the alignment otherwise driver will return you error ESP_ERR_INVALID_ARG.

Type Definitions

typedef void (*transaction_cb_t)(spi_transaction_t *trans)

typedef struct spi_device_t *spi_device_handle_t
Handle for a device on a SPI bus.

2.6.22 SPI Slave Driver

SPI Slave driver is a program that controls ESP32’s General Purpose SPI (GP-SPI) peripheral(s) when it functions as a slave.

For more hardware information about the GP-SPI peripheral(s), see ESP32 Technical Reference Manual > SPI Controller [PDF].

Terminology

The terms used in relation to the SPI slave driver are given in the table below.
**Term** | **Definition**  
---|---  
**Host** | The SPI controller peripheral external to ESP32 that initiates SPI transmissions over the bus, and acts as an SPI Master.  
**Device** | SPI slave device (general purpose SPI controller). Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.  
**Bus** | A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.  
**MISO** | Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.  
**MOSI** | Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device.  
**SCLK** | Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.  
**CS** | Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.  
**QUADWP** | Write Protect signal. Only used for 4-bit (qio/qout) transactions.  
**QUADHD** | Hold signal. Only used for 4-bit (qio/qout) transactions.  
**Assertion** | The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called de-assertion.  
**Transaction** | One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.  
**Launch Edge** | Edge of the clock at which the source register launches the signal onto the line.  
**Latch Edge** | Edge of the clock at which the destination register latches in the signal.  

**Driver Features**

The SPI slave driver allows using the SPI peripherals as full-duplex Devices. The driver can send/receive transactions up to 64 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some known issues related to DMA.

The SPI slave driver supports registering the SPI ISR to a certain CPU core. If multiple tasks try to access the same SPI Device simultaneously, it is recommended that your application be refactored so that each SPI peripheral is only accessed by a single task at a time. Please also use `spi_bus_config_t::isr_cpu_id` to register the SPI ISR to the same core as SPI peripheral related tasks to ensure thread safety.

**SPI Transactions**

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.

The attributes of a transaction are determined by the configuration structure for an SPI peripheral acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`.

As not every transaction requires both writing and reading data, you can choose to configure the `spi_slave_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::tx_buffer` is set to NULL, the read phase will be skipped. Similarly, if `spi_slave_transaction_t::rx_buffer` is set to NULL, the write phase will be skipped.

**Note:** A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see *Transaction Interval*. 

---

Espressif Systems 1495 Release v5.2-dev-3318-g8fc8f3f479

Submit Document Feedback
**Driver Usage**

- Initialize an SPI peripheral as a Device by calling the function `spi_slave_initialize()`. Make sure to set the correct I/O pins in the struct `bus_config`. Set the unused signals to -1.

If transactions are expected to be longer than 32 bytes, set the parameter `dma_chan` to 1 or 2 to allow a DMA channel 1 or 2 respectively. Otherwise, set `dma_chan` to 0.

- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.

- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

**Transaction Data and Master/Slave Length Mismatches**

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `spi_slave_transaction_t::rx_buffer` and `spi_slave_transaction_t::tx_buffer`. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by `spi_slave_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction’s length is determined by the clock and CS lines driven by the Host. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `spi_slave_transaction_t::length` member will be sent and received. In this case, `spi_slave_transaction_t::trans_len` is set to `spi_slave_transaction_t::length` instead of the actual transaction length. To meet the actual transaction length requirements, set `spi_slave_transaction_t::length` to a value greater than the maximum `spi_slave_transaction_t::trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

**GPIO Matrix and IO_MUX**

Most of ESP32’s peripheral signals have direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix.

If at least one signal is routed through the GPIO matrix, then all signals will be routed through it. If the driver is configured so that all SPI signals are either routed to their dedicated IO_MUX pins or are not connected at all, the GPIO matrix will be bypassed.

The GPIO matrix introduces flexibility of routing but also increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated IO_MUX pins.

**Note:** For more details about the influence of the MISO input delay on the maximum clock frequency, see *Timing Considerations*.

The IO_MUX pins for SPI buses are given below.

### Speed and Timing Considerations

#### Transaction Interval
The ESP32 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device’s response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in `peripherals/spi_slave`.

#### SCLK Frequency Requirements
The SPI slaves are designed to operate at up to 10 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

On top of that, there are additional requirements for the data to meet the timing constraints:

- **Read (MOSI):** The Device can read data correctly only if the data is already set at the launch edge. Although it is usually the case for most masters.
- **Write (MISO):** The output delay of the MISO signal needs to be shorter than half of a clock cycle period so that the MISO line is stable before the next latch edge. Given that the clock is balanced, the output delay and frequency limitations in different cases are given below.

<table>
<thead>
<tr>
<th>/</th>
<th>Output delay of MISO (ns)</th>
<th>Freq. limit (MHz)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IO_MUX</td>
<td>43.75</td>
<td>&lt; 11.4</td>
</tr>
<tr>
<td>GPIO matrix</td>
<td>68.75</td>
<td>&lt; 7.2</td>
</tr>
</tbody>
</table>

Note: 1. If the frequency reaches the maximum limitation, random errors may occur. 2. The clock uncertainty between the Host and the Device (12.5 ns) is included. 3. The output delay is measured under ideal circumstances (no load). If the MISO pin is heavily loaded, the output delay will be longer, and the maximum allowed frequency will be lower.

Exception: The frequency is allowed to be higher if the master has more tolerance for the MISO setup time, e.g., latch data at the next edge, or configurable latching time.

#### Restrictions and Known Issues

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied.

   Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.

2. Furthermore, DMA requires SPI modes 1 and 3. For SPI modes 0 and 2, the MISO signal has to be launched half a clock cycle earlier to meet the timing. The new timing is as follows:
If DMA is enabled, a Device’s launch edge is half of an SPI clock cycle ahead of the normal time, shifting to the Master’s actual latch edge. In this case, if the GPIO matrix is bypassed, the hold time for data sampling is 68.75 ns and no longer a half of an SPI clock cycle. If the GPIO matrix is used, the hold time will increase to 93.75 ns. The Host should sample the data immediately at the latch edge or communicate in SPI modes 1 or 3. If your Host cannot meet these timing requirements, initialize your Device without DMA.

### Application Example

The code example for Device/Host communication can be found in the `peripherals/spi_slave` directory of ESP-IDF examples.

### API Reference

#### Header File

- `components/driver/spi/include/driver/spi_slave.h`

#### Functions

```c
esp_err_t spi_slave_initialize(spi_host_device_t host, const spi_bus_config_t *bus_config, const spi_slave_interface_config_t *slave_config, spi_dma_chan_t dma_chan)
```

Initialize a SPI bus as a slave interface.

**Warning:** SPI0/1 is not supported

**Warning:** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning:** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

**Parameters**

- `host` - SPI peripheral to use as a SPI slave interface
- `bus_config` - Pointer to a `spi_bus_config_t` struct specifying how the host should be initialized
- `slave_config` - Pointer to a `spi_slave_interface_config_t` struct specifying the details for the slave interface
- `dma_chan` - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting `SPI_DMA_DISABLED` limits the size of transactions.
  - Set to `SPI_DMA_DISABLED` if only the SPI flash uses this bus.
  - Set to `SPI_DMA_CH_AUTO` to let the driver to allocate the DMA channel.

**Returns**

- `ESP_ERR_INVALID_ARG` if configuration is invalid
- `ESP_ERR_INVALID_STATE` if host already is in use
esp_err_t spi_slave_free(spi_host_device_t host)
Free a SPI bus claimed as a SPI slave interface.

Parameters host – SPI peripheral to free

Returns
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_INVALID_STATE if not all devices on the bus are freed
• ESP_OK on success

esp_err_t spi_slave_queue_trans(spi_host_device_t host, const spi_slave_transaction_t *trans_desc,
TickType_t ticks_to_wait)
Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via spi_slave_initialize.) This function may block if the queue is full (depending on the ticks_to_wait parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in trans_desc to the SPI slave driver; the application is not to access this memory until spi_slave_queue_trans is called to hand ownership back to the application.

Parameters
• host – SPI peripheral that is acting as a slave
• trans_desc – Description of transaction to execute. Not const because we may want to write status back into the transaction description.
• ticks_to_wait – Ticks to wait until there’s room in the queue; use portMAX_DELAY to never time out.

Returns
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_OK on success

esp_err_t spi_slave_get_trans_result(spi_host_device_t host, spi_slave_transaction_t **trans_desc,
TickType_t ticks_to_wait)
Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with spi_slave_queue_trans) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by spi_slave_queue_trans.

Parameters
• host – SPI peripheral to that is acting as a slave
• trans_desc – [out] Pointer to variable able to contain a pointer to the description of the transaction that is executed
• ticks_to_wait – Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

Returns
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_NOT_SUPPORTED if flag SPI_SLAVE_NO_RETURN_RESULT is set
• ESP_OK on success

esp_err_t spi_slave_transmit(spi_host_device_t host, spi_slave_transaction_t *trans_desc, TickType_t ticks_to_wait)
Do a SPI transaction.

Essentially does the same as spi_slave_queue_trans followed by spi_slave_get_trans_result. Do not use this when there is still a transaction queued that hasn’t been finalized using spi_slave_get_trans_result.
Parameters

- **host** - SPI peripheral to that is acting as a slave
- **trans_desc** - Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait** - Ticks to wait until there’s a returned item; use `portMAX_DELAY` to never time out.

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

Structures

**struct spi_slave_interface_config_t**

This is a configuration for a SPI host acting as a slave device.

**Public Members**

- `int spics_io_num`
  
  CS GPIO pin for this device.

- `uint32_t flags`
  
  Bitwise OR of SPI_SLAVE_* flags.

- `int queue_size`
  
  Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using `spi_slave_queue_trans` but not yet finished using `spi_slave_get_trans_result`) at the same time.

- `uint8_t mode`
  
  SPI mode, representing a pair of (CPOL, CPHA) configuration:
  
  - 0: (0, 0)
  - 1: (0, 1)
  - 2: (1, 0)
  - 3: (1, 1)

**slave_transaction_cb_t post_setup_cb**

Callback called after the SPI registers are loaded with new data.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

**slave_transaction_cb_t post_trans_cb**

Callback called after a transaction is done.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

**struct spi_slave_transaction_t**

This structure describes one SPI transaction.
Chapter 2. API Reference

**Public Members**

```c
size_t length
   Total data length, in bits.

size_t trans_len
   Transaction data length, in bits.

const void *tx_buffer
   Pointer to transmit buffer, or NULL for no MOSI phase.

void *rx_buffer
   Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (rx_buffer%4==0), and has length of a multiple of 4 bytes.

void *user
   User-defined variable. Can be used to store eg transaction ID.
```

**Macros**

```c
SPI_SLAVE_TXBIT_LSBFIRST
   Transmit command/address/data LSB first instead of the default MSB first.

SPI_SLAVE_RXBIT_LSBFIRST
   Receive data LSB first instead of the default MSB first.

SPI_SLAVE_BIT_LSBFIRST
   Transmit and receive LSB first.

SPI_SLAVE_NO_RETURN_RESULT
   Don’t return the descriptor to the host on completion (use post_trans_cb to notify instead)
```

**Type Definitions**

typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)

2.6.23 ESP32-WROOM-32SE (Secure Element)

**Overview**

ESP32-WROOM-32SE integrates Microchip’s ATECC608A cryptoauth chip in the module. ATECC608A is a secure element, which would generate and store ECC private key in the hardware. The ECC private key can be used to enhance security to connect to IoT cloud services with the use of X.509-based mutual authentication.

The application example demonstrates ECDSA sign and verify functions using ECC private key stored in ATECC608A.
Chapter 2. API Reference

Application Example

Secure Element ECDSA Sign/Verify example: peripherals/secure_element/atecc608_ecdsa.

How to Configure and Provision ESP32-WROOM-32SE for TLS

To configure and provision ATECC608A chip on ESP32-WROOM-32SE please visit esp_cryptoauth_utility.

How to Use ATECC608A of ESP32-WROOM-32SE for TLS

ATECC608A can be used for TLS connections using ESP-TLS.

To configure ESP-TLS for using a secure element, please refer to ATECC608A (Secure Element) with ESP-TLS in ESP-TLS.

2.6.24 Touch Sensor

Introduction

A touch sensor system is built on a substrate which carries electrodes and relevant connections under a protective flat surface. When the surface is touched, the capacitance variation is used to evaluate if the touch was valid.

The sensing pads can be arranged in different combinations (e.g., matrix, slider), so that a larger area or more points can be detected. The touch pad sensing process is under the control of a hardware-implemented finite-state machine (FSM) which is initiated by software or a dedicated hardware timer.

For design, operation, and control registers of a touch sensor, see ESP32 Technical Reference Manual > On-Chip Sensors and Analog Signal Processing [PDF].

In-depth design details of touch sensors and firmware development guidelines for ESP32 are available in Touch Sensor Application Note.

For more information about testing touch sensors in various configurations, please check the Guide for ESP32-Sense-Kit.

Functionality Overview

Description of API is broken down into groups of functions to provide a quick overview of the following features:

- Initialization of touch pad driver
- Configuration of touch pad GPIO pins
- Taking measurements
- Adjusting parameters of measurements
- Filtering measurements
- Touch detection methods
- Setting up interrupts to report touch detection
- Waking up from Sleep mode on interrupt

For detailed description of a particular function, please go to Section API Reference. Practical implementation of this API is covered in Section Application Examples.

Initialization Before using a touch pad, you need to initialize the touch pad driver by calling the function touch_pad_init(). This function sets several ..._DEFAULT driver parameters listed in API Reference under Macros. It also removes the information about which pads have been touched before, if any, and disables interrupts.

If the driver is not required anymore, deinitialize it by calling touch_pad_deinit().
Configuration Enabling the touch sensor functionality for a particular GPIO is done with `touch_pad_config()`. The following 10 capacitive touch pads are supported for ESP32.

<table>
<thead>
<tr>
<th>Touch Pad</th>
<th>GPIO Pin</th>
</tr>
</thead>
<tbody>
<tr>
<td>T0</td>
<td>GPIO4</td>
</tr>
<tr>
<td>T1</td>
<td>GPIO0</td>
</tr>
<tr>

</tr>
<tr>
<td>T8</td>
<td>32K_XN</td>
</tr>
<tr>
<td>T9</td>
<td>32K_XP</td>
</tr>
</tbody>
</table>

Use the function `touch_pad_set_fsm_mode()` to select if touch pad measurement (operated by FSM) should be started automatically by a hardware timer, or by software. If software mode is selected, use `touch_pad_sw_start()` to start the FSM.

Touch State Measurements The following two functions come in handy to read raw or filtered measurements from the sensor:

- `touch_pad_read_raw_data()`
- `touch_pad_read_filtered()`

They can also be used, for example, to evaluate a particular touch pad design by checking the range of sensor readings when a pad is touched or released. This information can be then used to establish a touch threshold.

**Note:** Before using `touch_pad_read_filtered()`, you need to initialize and configure the filter by calling specific filter functions described in Section *Filtering of Measurements*.

For the demonstration of how to read the touch pad data, check the application example peripherals/touch_sensor/touch_sensor_v1/touch_pad_read.

Method of Measurements The touch sensor counts the number of charge/discharge cycles over a fixed period of time (specified by `touch_pad_set_measurement_clock_cycles()`). The count result is the raw data that read from `touch_pad_read_raw_data()`. After finishing one measurement, the touch sensor sleeps until the next measurement start, this interval between two measurements can be set by `touch_pad_set_measurement_interval()`.

**Note:** If the specified clock cycles for measurement is too small, the result may be inaccurate, but increasing clock cycles will increase the power consumption as well. Additionally, the response of the touch sensor will slow down if the total time of the interval and measurement is too long.

Optimization of Measurements A touch sensor has several configurable parameters to match the characteristics of a particular touch pad design. For instance, to sense smaller capacity changes, it is possible to narrow down the reference voltage range within which the touch pads are charged/discharged. The high and low reference voltages are set using the function `touch_pad_set_voltage()`.

Besides the ability to discern smaller capacity changes, a positive side effect is reduction of power consumption for low power applications. A likely negative effect is an increase in measurement noise. If the dynamic range of obtained readings is still satisfactory, then further reduction of power consumption might be done by reducing the measurement time with `touch_pad_set_measurement_clock_cycles()`.

The following list summarizes available measurement parameters and corresponding ‘set’ functions:
• Touch pad charge / discharge parameters:
  – voltage range: `touch_pad_set_voltage()`
  – speed (slope): `touch_pad_set_cnt_mode()`

• Clock cycles of one measurement: `touch_pad_set_measurement_clock_cycles()`

Relationship between the voltage range (high/low reference voltages), speed (slope), and measurement time is shown in the figure below.

![Diagram showing relationship between measurement parameters](image)

**Fig. 23: Touch pad - relationship between measurement parameters**

The last chart **Output** represents the touch sensor reading, i.e., the count of pulses collected within the measurement time.

All functions are provided in pairs to set a specific parameter and to get the current parameter’s value, e.g., `touch_pad_set_voltage()` and `touch_pad_get_voltage()`.

**Filtering of Measurements** If measurements are noisy, you can filter them with provided API functions. Before using the filter, please start it by calling `touch_pad_filter_start()`.

The filter type is IIR (infinite impulse response), and it has a configurable period that can be set with the function `touch_pad_set_filter_period()`. You can stop the filter with `touch_pad_filter_stop()`. If not required anymore, the filter can be deleted by invoking `touch_pad_filter_delete()`.

**Touch Detection** Touch detection is implemented in ESP32’s hardware based on the user-configured threshold and raw measurements executed by FSM. Use the functions `touch_pad_get_status()` to check which pads have been touched and `touch_pad_clear_status()` to clear the touch status information.

Hardware touch detection can also be wired to interrupts. This is described in the next section.

If measurements are noisy and capacity changes are small, hardware touch detection might be unreliable. To resolve this issue, instead of using hardware detection/provided interrupts, implement measurement filtering and perform touch detection in your own application. For sample implementation of both methods of touch detection, see `peripherals/touch_sensor/touch_sensor_v1/touch_pad_interrupt`.

**Touch Triggered Interrupts** Before enabling an interrupt on a touch detection, you should establish a touch detection threshold. Use the functions described in **Touch State Measurements** to read and display sensor measurements when a pad is touched and released. Apply a filter if measurements are noisy and relative capacity changes are small.
Depending on your application and environment conditions, test the influence of temperature and power supply voltage changes on measured values.

Once a detection threshold is established, it can be set during initialization with `touch_pad_config()` or at the runtime with `touch_pad_set_thresh()`.

In the next step, configure how interrupts are triggered. They can be triggered below or above the threshold, which is set with the function `touch_pad_set_trigger_mode()`.

Finally, configure and manage interrupt calls using the following functions:

- `touch_pad_isr_register()` / `touch_pad_isr_deregister()`
- `touch_pad_intr_enable()` / `touch_pad_intr_disable()`

When interrupts are operational, you can obtain the information from which particular pad an interrupt came by invoking `touch_pad_get_status()` and clear the pad status with `touch_pad_clear_status()`.

**Note:** Interrupts on touch detection operate on raw/unfiltered measurements checked against user established threshold and are implemented in hardware. Enabling the software filtering API (see Filtering of Measurements) does not affect this process.

---

**Wakeup from Sleep Mode** If touch pad interrupts are used to wake up the chip from a sleep mode, you can select a certain configuration of pads (SET1 or both SET1 and SET2) that should be touched to trigger the interrupt and cause the subsequent wakeup. To do so, use the function `touch_pad_set_trigger_source()`.

Configuration of required bit patterns of pads may be managed for each ‘SET’ with:

- `touch_pad_set_group_mask()` / `touch_pad_get_group_mask()`
- `touch_pad_clear_group_mask()`

---

**Application Examples**

- Touch sensor read example: `peripherals/touch_sensor/touch_sensor_v1/touch_pad_read`.
- Touch sensor interrupt example: `peripherals/touch_sensor/touch_sensor_v1/touch_pad_interrupt`.

---

**API Reference**

**Header File**

- `components/driver/touch_sensor/esp32/include/driver/touch_sensor.h`

**Functions**

```c
esp_err_t touch_pad_config(touch_pad_t touch_num, uint16_t threshold)
```

Configure touch pad interrupt threshold.

**Note:** If FSM mode is set to TOUCH_FSM_MODE_TIMER, this function will be blocked for one measurement cycle and wait for data to be valid.

---

**Parameters**

- `touch_num` - touch pad index
- `threshold` - interrupt threshold,

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG if argument wrong
- ESP_FAIL if touch pad not initialized
**esp_err_t** `touch_pad_read(touch_pad_t touch_num, uint16_t *touch_value)`

get touch sensor counter value. Each touch sensor has a counter to count the number of charge/discharge cycles. When the pad is not ‘touched’, we can get a number of the counter. When the pad is ‘touched’, the value in counter will get smaller because of the larger equivalent capacitance.

**Note:** This API requests hardware measurement once. If IIR filter mode is enabled, please use ‘touch_pad_read_raw_data’ interface instead.

### Parameters
- **touch_num** – touch pad index
- **touch_value** – pointer to accept touch sensor value

### Returns
- **ESP_OK** Success
- **ESP_ERR_INVALID_ARG** Touch pad parameter error
- **ESP_ERR_INVALID_STATE** This touch pad hardware connection is error, the value of “touch_value” is 0.
- **ESP_FAIL** Touch pad not initialized

**esp_err_t** `touch_pad_read_filtered(touch_pad_t touch_num, uint16_t *touch_value)`

get filtered touch sensor counter value by IIR filter.

**Note:** `touch_pad_filter_start` has to be called before calling `touch_pad_read_filtered`. This function can be called from ISR

### Parameters
- **touch_num** – touch pad index
- **touch_value** – pointer to accept touch sensor value

### Returns
- **ESP_OK** Success
- **ESP_ERR_INVALID_ARG** Touch pad parameter error
- **ESP_ERR_INVALID_STATE** This touch pad hardware connection is error, the value of “touch_value” is 0.
- **ESP_FAIL** Touch pad not initialized

**esp_err_t** `touch_pad_read_raw_data(touch_pad_t touch_num, uint16_t *touch_value)`

get raw data (touch sensor counter value) from IIR filter process. Need not request hardware measurements.

**Note:** `touch_pad_filter_start` has to be called before calling `touch_pad_read_raw_data`. This function can be called from ISR

### Parameters
- **touch_num** – touch pad index
- **touch_value** – pointer to accept touch sensor value

### Returns
- **ESP_OK** Success
- **ESP_ERR_INVALID_ARG** Touch pad parameter error
- **ESP_ERR_INVALID_STATE** This touch pad hardware connection is error, the value of “touch_value” is 0.
- **ESP_FAIL** Touch pad not initialized

**esp_err_t** `touch_pad_set_filter_read_cb(filter_cb_t read_cb)`

Register the callback function that is called after each IIR filter calculation.
Chapter 2. API Reference

**Note:** The ‘read_cb’ callback is called in timer task in each filtering cycle.

**Parameters**  
*read_cb* - Pointer to filtered callback function. If the argument passed in is NULL, the callback will stop.  

**Returns**  
- ESP_OK Success  
- ESP_ERR_INVALID_ARG set error

**esp_err_t touch_pad_isr_register** *(intr_handler_t fn, void *arg)*  
Register touch-pad ISR. The handler will be attached to the same CPU core that this function is running on.  

**Parameters**  
- *fn* - Pointer to ISR handler  
- *arg* - Parameter for ISR  

**Returns**  
- ESP_OK Success;  
- ESP_ERR_INVALID_ARG GPIO error  
- ESP_ERR_NO_MEM No memory

**esp_err_t touch_pad_set_measurement_clock_cycles** *(uint16_t clock_cycle)*  
Set the clock cycles of each measurement.  

**Note:** This function will specify the clock cycles of each measurement and the clock is sourced from SOC_MOD_CLK_RTC_FAST, its default frequency is SOC_CLK_RC_FAST_FREQ_APPROX. The touch sensor will record the charge and discharge times during these clock cycles as the final result (raw value)

**Note:** If clock cycles is too small, it may lead to inaccurate results.

**Parameters**  
*clock_cycle* - The clock cycles of each measurement  

**Returns**  
- ESP_OK Set the clock cycle success

**esp_err_t touch_pad_get_measurement_clock_cycles** *(uint16_t *clock_cycle)*  
Get the clock cycles of each measurement.  

**Parameters**  
*clock_cycle* - The clock cycles of each measurement  

**Returns**  
- ESP_OK Get the clock cycle success  
- ESP_ERR_INVALID_ARG The input parameter is NULL

**esp_err_t touch_pad_set_measurement_interval** *(uint16_t interval_cycle)*  
Set the interval between two measurements.  

**Note:** The touch sensor will sleep between two measurements. This function is to set the interval cycle. And the interval is clocked from SOC_MOD_CLK_RTC_SLOW, its default frequency is SOC_CLK_RC_SLOW_FREQ_APPROX.

**Parameters**  
*interval_cycle* - The interval between two measurements  

**Returns**  
- ESP_OK The input parameter is NULL  
- ESP_ERR_INVALID_ARG Frequency of RTC_SLOW_CLK can be obtained using rtc_clk_slow_freq_get_hz function.
• ESP_OK Set interval cycle success

\texttt{esp_err_t touch_pad_get_measurement_interval} (\texttt{uint16_t \*interval\_cycle})

Get the interval between two measurements.

\textbf{Parameters} \texttt{interval\_cycle} – The interval between two measurements

\textbf{Returns}
• ESP_OK Get interval cycle success
• ESP_ERR_INVALID_ARG The input parameter is NULL

\texttt{esp_err_t touch_pad_set_meas_time} (\texttt{uint16_t sleep\_cycle, uint16_t meas\_cycle})

Set touch sensor measurement and sleep time. Excessive total time will slow down the touch response. Too small measurement time will not be sampled enough, resulting in inaccurate measurements.

\textbf{Note:} The touch sensor will count the number of charge/discharge cycles over a fixed period of time (specified as the second parameter). That means the number of cycles (raw value) will decrease as the capacity of the touch pad is increasing.

\textbf{Note:} The greater the duty cycle of the measurement time, the more system power is consumed.

\textbf{Parameters}
• \texttt{sleep\_cycle} – The touch sensor will sleep after each measurement. \texttt{sleep\_cycle} decide the interval between each measurement. \( t_{\text{sleep}} = \frac{\text{sleep\_cycle}}{\text{SOC\_CLK\_RC\_SLOW\_FREQ\_APPROX}} \). The approximate frequency value of \texttt{RTC\_SLOW\_CLK} can be obtained using \texttt{rtc\_clk\_slow\_freq\_get\_hz} function.
• \texttt{meas\_cycle} – The duration of the touch sensor measurement. \( t_{\text{meas}} = \frac{\text{meas\_cycle}}{\text{SOC\_CLK\_RC\_FAST\_FREQ\_APPROX}} \), the maximum measure time is \( 0xffff / \text{SOC\_CLK\_RC\_FAST\_FREQ\_APPROX} \)

\textbf{Returns}
• ESP_OK on success

\texttt{esp_err_t touch_pad_get_meas_time} (\texttt{uint16_t \*sleep\_cycle, uint16_t \*meas\_cycle})

Get touch sensor measurement and sleep time.

\textbf{Parameters}
• \texttt{sleep\_cycle} – Pointer to accept sleep cycle number
• \texttt{meas\_cycle} – Pointer to accept measurement cycle count.

\textbf{Returns}
• ESP_OK on success
• ESP_ERR_INVALID_ARG The input parameter is NULL

\texttt{esp_err_t touch_pad_sw_start} (\texttt{void})

Trigger a touch sensor measurement, only support in SW mode of FSM.

\textbf{Returns}
• ESP_OK on success

\texttt{esp_err_t touch_pad_set_thresh} (\texttt{touch_pad_t \texttt{touch\_num}, uint16_t \texttt{threshold}})

Set touch sensor interrupt threshold.

\textbf{Parameters}
• \texttt{touch\_num} – Touch pad index
• \texttt{threshold} – Threshold of touchpad count, refer to \texttt{touch\_pad\_set\_trigger\_mode} to see how to set trigger mode.

\textbf{Returns}
• ESP_OK on success
• ESP_ERR_INVALID_ARG if argument is wrong
esp_err_t touch_pad_get_thresh (touch_pad_t touch_num, uint16_t *threshold)

Get touch sensor interrupt threshold.

Parameters
- touch_num – touch pad index
- threshold – pointer to accept threshold

Returns
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

esp_err_t touch_pad_set_trigger_mode (touch_trigger_mode_t mode)

Set touch sensor interrupt trigger mode. Interrupt can be triggered either when counter result is less than threshold or when counter result is more than threshold.

Parameters
- mode – touch sensor interrupt trigger mode

Returns
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

esp_err_t touch_pad_get_trigger_mode (touch_trigger_mode_t *mode)

Get touch sensor interrupt trigger mode.

Parameters
- mode – pointer to accept touch sensor interrupt trigger mode

Returns
- ESP_OK on success

esp_err_t touch_pad_set_trigger_source (touch_trigger_src_t src)

Set touch sensor interrupt trigger source. There are two sets of touch signals. Set1 and set2 can be mapped to several touch signals. Either set will be triggered if at least one of its touch signal is ‘touched’. The interrupt can be configured to be generated if set1 is triggered, or only if both sets are triggered.

Parameters
- src – touch sensor interrupt trigger source

Returns
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

esp_err_t touch_pad_get_trigger_source (touch_trigger_src_t *src)

Get touch sensor interrupt trigger source.

Parameters
- src – pointer to accept touch sensor interrupt trigger source

Returns
- ESP_OK on success

esp_err_t touch_pad_set_group_mask (uint16_t set1_mask, uint16_t set2_mask, uint16_t en_mask)

Set touch sensor group mask. Touch pad module has two sets of signals, ‘Touched’ signal is triggered only if at least one of touch pad in this group is “touched”. This function will set the register bits according to the given bitmask.

Parameters
- set1_mask – bitmask of touch sensor signal group1, it’s a 10-bit value
- set2_mask – bitmask of touch sensor signal group2, it’s a 10-bit value
- en_mask – bitmask of touch sensor work enable, it’s a 10-bit value

Returns
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

esp_err_t touch_pad_get_group_mask (uint16_t *set1_mask, uint16_t *set2_mask, uint16_t *en_mask)

Get touch sensor group mask.

Parameters
- set1_mask – pointer to accept bitmask of touch sensor signal group1, it’s a 10-bit value
- set2_mask – pointer to accept bitmask of touch sensor signal group2, it’s a 10-bit value
- en_mask – pointer to accept bitmask of touch sensor work enable, it’s a 10-bit value
Returns

- ESP_OK on success

```c
esp_err_t touch_pad_clear_group_mask(uint16_t set1_mask, uint16_t set2_mask, uint16_t en_mask)
```
Clear touch sensor group mask. Touch pad module has two sets of signals, Interrupt is triggered only if at least one of touch pad in this group is “touched”. This function will clear the register bits according to the given bitmask.

Parameters

- `set1_mask` – bitmask touch sensor signal group1, it’s a 10-bit value
- `set2_mask` – bitmask touch sensor signal group2, it’s a 10-bit value
- `en_mask` – bitmask of touch sensor work enable, it’s a 10-bit value

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

```c
esp_err_t touch_pad_intr_enable(void)
```
To enable touch pad interrupt.

Returns

- ESP_OK on success

```c
esp_err_t touch_pad_intr_disable(void)
```
To disable touch pad interrupt.

Returns

- ESP_OK on success

```c
esp_err_t touch_pad_intr_clear(void)
```
To clear touch pad interrupt.

Returns

- ESP_OK on success

```c
esp_err_t touch_pad_set_filter_period(uint32_t new_period_ms)
```
Set touch pad filter calibration period, in ms. Need to call `touch_pad_filter_start` before all touch filter APIs

Parameters

- `new_period_ms` – filter period, in ms

Returns

- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error
- ESP_ERR_INVALID_ARG parameter error

```c
esp_err_t touch_pad_get_filter_period(uint32_t *p_period_ms)
```
Get touch pad filter calibration period, in ms Need to call `touch_pad_filter_start` before all touch filter APIs

Parameters

- `p_period_ms` – pointer to accept period

Returns

- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error
- ESP_ERR_INVALID_ARG parameter error

```c
esp_err_t touch_pad_filter_start(uint32_t filter_period_ms)
```
Start touch pad filter function This API will start a filter to process the noise in order to prevent false triggering when detecting slight change of capacitance. Need to call `touch_pad_filter_start` before all touch filter APIs

Note: This filter uses FreeRTOS timer, which is dispatched from a task with priority 1 by default on CPU 0. So if some application task with higher priority takes a lot of CPU0 time, then the quality of data obtained from this filter will be affected. You can adjust FreeRTOS timer task priority in menuconfig.

Parameters

- `filter_period_ms` – filter calibration period, in ms
Returns

• ESP_OK Success
• ESP_ERR_INVALID_ARG parameter error
• ESP_ERR_NO_MEM No memory for driver
• ESP_ERR_INVALID_STATE driver state error

\texttt{esp_err_t touch\_pad\_filter\_stop} (void)
stop touch pad filter function Need to call touch_pad_filter_start before all touch filter APIs

Returns

• ESP_OK Success
• ESP_ERR_INVALID_STATE driver state error

\texttt{esp_err_t touch\_pad\_filter\_delete} (void)
delete touch pad filter driver and release the memory Need to call touch_pad_filter_start before all touch filter APIs

Returns

• ESP_OK Success
• ESP_ERR_INVALID_STATE driver state error

Type Definitions
typedef void (*filter\_cb\_t)(uint16_t *raw\_value, uint16_t *filtered\_value)
Callback function that is called after each IIR filter calculation.

\textbf{Note:} This callback is called in timer task in each filtering cycle.

\textbf{Note:} This callback should not be blocked.

**Param raw\_value** The latest raw data(touch sensor counter value) that points to all channels(raw_value[0..TOUCH\_PAD\_MAX-1]).

**Param filtered\_value** The latest IIR filtered data(calculated from raw data) that points to all channels(filtered_value[0..TOUCH\_PAD\_MAX-1]).

Header File

• components/driver/touch_sensor/include/driver/touch_sensor_common.h

Functions

\texttt{esp_err_t touch\_pad\_init} (void)
Initialize touch module.

\textbf{Note:} If default parameter don’t match the usage scenario, it can be changed after this function.

Returns

• ESP_OK Success
• ESP_ERR_NO_MEM Touch pad init error
• ESP_ERR_NOT_SUPPORTED Touch pad is providing current to external XTAL
**esp_err_t touch_pad_deinit (void)**

Un-install touch pad driver.

**Returns**

- ESP_OK Success
- ESP_FAIL Touch pad driver not initialized

**esp_err_t touch_pad_io_init (touch_pad_t touch_num)**

Initialize touch pad GPIO.

**Parameters**

- **touch_num** - touch pad index

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**esp_err_t touch_pad_set_voltage (touch_high_volt_t refh, touch_low_volt_t refl, touch_volt_atten_t atten)**

Set touch sensor high voltage threshold of chanrge. The touch sensor measures the channel capacitance value by charging and discharging the channel. So the high threshold should be less than the supply voltage.

**Parameters**

- **refh** - the value of DREFH
- **refl** - the value of DREFL
- **atten** - the attenuation on DREFH

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**esp_err_t touch_pad_get_voltage (touch_high_volt_t *refh, touch_low_volt_t *refl, touch_volt_atten_t *atten)**

Get touch sensor reference voltage.

**Parameters**

- **refh** - pointer to accept DREFH value
- **refl** - pointer to accept DREFL value
- **atten** - pointer to accept the attenuation on DREFH

**Returns**

- ESP_OK on success

**esp_err_t touch_pad_set_cnt_mode (touch_pad_t touch_num, touch_cnt_slope_t slope, touch_tie_opt_t opt)**

Set touch sensor charge/discharge speed for each pad. If the slope is 0, the counter would always be zero. If the slope is 1, the charging and discharging would be slow, accordingly. If the slope is set 7, which is the maximum value, the charging and discharging would be fast.

**Note:** The higher the charge and discharge current, the greater the immunity of the touch channel, but it will increase the system power consumption.
Chapter 2. API Reference

```c
esp_err_t touch_pad_get_cnt_mode (touch_pad_t touch_num, touch_cnt_slope_t *slope, touch_tie_opt_t *opt)
```

Get touch sensor charge/discharge speed for each pad.

**Parameters**
- `touch_num` – touch pad index
- `slope` – pointer to accept touch pad charge/discharge slope
- `opt` – pointer to accept the initial voltage

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

```c
esp_err_t touch_pad_isr_deregister (void (*fn)(void*), void* arg)
```

Deregister the handler previously registered using `touch_pad_isr_handler_register`.

**Parameters**
- `fn` – handler function to call (as passed to `touch_pad_isr_handler_register`)
- `arg` – argument of the handler (as passed to `touch_pad_isr_handler_register`)

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if a handler matching both `fn` and `arg` isn’t registered

```c
esp_err_t touch_pad_get_wakeup_status (touch_pad_t *pad_num)
```

Get the touch pad which caused wakeup from deep sleep.

**Parameters**
- `pad_num` – pointer to touch pad which caused wakeup

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter is NULL

```c
esp_err_t touch_pad_set_fsm_mode (touch_fsm_mode_t mode)
```

Set touch sensor FSM mode, the test action can be triggered by the timer, as well as by the software.

**Parameters**
- `mode` – FSM mode

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

```c
esp_err_t touch_pad_get_fsm_mode (touch_fsm_mode_t *mode)
```

Get touch sensor FSM mode.

**Parameters**
- `mode` – pointer to accept FSM mode

**Returns**
- ESP_OK on success

```c
esp_err_t touch_pad_clear_status (void)
```

To clear the touch sensor channel active status.

**Note:** The FSM automatically updates the touch sensor status. It is generally not necessary to call this API to clear the status.

**Returns**
- ESP_OK on success

```c
uint32_t touch_pad_get_status (void)
```

Get the touch sensor channel active status mask. The bit position represents the channel number. The 0/1 status of the bit represents the trigger status.

**Returns**
- The touch sensor status. e.g. Touch1 trigger status is `status_mask & (BIT1)`.
bool touch_pad_meas_is_done (void)
    Check touch sensor measurement status.

Returns
    • True measurement is under way
    • False measurement done

GPIO Lookup Macros Some useful macros can be used to specified the GPIO number of a touch pad channel, or vice versa. e.g.,
    1. TOUCH_PAD_NUM5_GPIO_NUM is the GPIO number of channel 5 (12);
    2. TOUCH_PAD_GPIO4_CHANNEL is the channel number of GPIO 4 (channel 0).

TOUCH_PAD_BIT_MASK_MAX

TOUCH_PAD_HIGH_VOLTAGE_THRESHOLD

TOUCH_PAD_LOW_VOLTAGE_THRESHOLD

TOUCH_PAD_ATTEN_VOLTAGE_THRESHOLD

TOUCH_PAD_IDLE_CH_CONNECT_DEFAULT

TOUCH_PAD_THRESHOLD_MAX

If set touch threshold max value, the touch sensor can’t be in touched status

TOUCH_PAD_SLEEP_CYCLE_DEFAULT

The timer frequency is RTC_SLOW_CLK (can be 150k or 32k depending on the options), max value is 0xffff

TOUCH_PAD_MEASURE_CYCLE_DEFAULT

The timer frequency is 8Mhz, the max value is 0x7fff

TOUCH_FSM_MODE_DEFAULT

The touch FSM may be started by the software or timer

TOUCH_TRIGGER_MODE_DEFAULT

Interrupts can be triggered if sensor value gets below or above threshold

TOUCH_TRIGGER_SOURCE_DEFAULT

The wakeup trigger source can be SET1 or both SET1 and SET2
Enumerations

enum touch_pad_t
Touch pad channel

Values:

enumerator TOUCH_PAD_NUM0
Touch pad channel 0 is GPIO4(ESP32)

enumerator TOUCH_PAD_NUM1
Touch pad channel 1 is GPIO0(ESP32) / GPIO1(ESP32-S2)

enumerator TOUCH_PAD_NUM2
Touch pad channel 2 is GPIO2(ESP32) / GPIO2(ESP32-S2)

enumerator TOUCH_PAD_NUM3
Touch pad channel 3 is GPIO15(ESP32) / GPIO3(ESP32-S2)

enumerator TOUCH_PAD_NUM4
Touch pad channel 4 is GPIO13(ESP32) / GPIO4(ESP32-S2)

enumerator TOUCH_PAD_NUM5
Touch pad channel 5 is GPIO12(ESP32) / GPIO5(ESP32-S2)

enumerator TOUCH_PAD_NUM6
Touch pad channel 6 is GPIO14(ESP32) / GPIO6(ESP32-S2)

enumerator TOUCH_PAD_NUM7
Touch pad channel 7 is GPIO27(ESP32) / GPIO7(ESP32-S2)

enumerator TOUCH_PAD_NUM8
Touch pad channel 8 is GPIO33(ESP32) / GPIO8(ESP32-S2)

enumerator TOUCH_PAD_NUM9
Touch pad channel 9 is GPIO32(ESP32) / GPIO9(ESP32-S2)

enumerator TOUCH_PAD_MAX

enum touch_high_volt_t
Touch sensor high reference voltage

Values:

enumerator TOUCH_HVOLT_KEEP
Touch sensor high reference voltage, no change

enumerator TOUCH_HVOLT_2V4
Touch sensor high reference voltage, 2.4V

enumerator TOUCH_HVOLT_2V5
Touch sensor high reference voltage, 2.5V
enumerator **TOUCH_HVOLT_2V6**
Touch sensor high reference voltage, 2.6V

enumerator **TOUCH_HVOLT_2V7**
Touch sensor high reference voltage, 2.7V

enumerator **TOUCH_HVOLT_MAX**

enum **touch_low_volt_t**
Touch sensor low reference voltage
**Values:**

enumerator **TOUCH_LVOLT_KEEP**
Touch sensor low reference voltage, no change

enumerator **TOUCH_LVOLT_0V5**
Touch sensor low reference voltage, 0.5V

enumerator **TOUCH_LVOLT_0V6**
Touch sensor low reference voltage, 0.6V

enumerator **TOUCH_LVOLT_0V7**
Touch sensor low reference voltage, 0.7V

enumerator **TOUCH_LVOLT_0V8**
Touch sensor low reference voltage, 0.8V

enumerator **TOUCH_LVOLT_MAX**

enum **touch_volt_atten_t**
Touch sensor high reference voltage attenuation
**Values:**

enumerator **TOUCH_HVOLT_ATTEN_KEEP**
Touch sensor high reference voltage attenuation, no change

enumerator **TOUCH_HVOLT_ATTEN_1V5**
Touch sensor high reference voltage attenuation, 1.5V attenuation

enumerator **TOUCH_HVOLT_ATTEN_1V**
Touch sensor high reference voltage attenuation, 1.0V attenuation

enumerator **TOUCH_HVOLT_ATTEN_0V5**
Touch sensor high reference voltage attenuation, 0.5V attenuation

enumerator **TOUCH_HVOLT_ATTEN_0V**
Touch sensor high reference voltage attenuation, 0V attenuation
enumerator TOUCH_HVOLT_ATTEN_MAX

enum touch_cnt_slope_t
Touch sensor charge/discharge speed

Values:

enumerator TOUCH_PAD_SLOPE_0
Touch sensor charge / discharge speed, always zero

enumerator TOUCH_PAD_SLOPE_1
Touch sensor charge / discharge speed, slowest

enumerator TOUCH_PAD_SLOPE_2
Touch sensor charge / discharge speed

enumerator TOUCH_PAD_SLOPE_3
Touch sensor charge / discharge speed

enumerator TOUCH_PAD_SLOPE_4
Touch sensor charge / discharge speed

enumerator TOUCH_PAD_SLOPE_5
Touch sensor charge / discharge speed

enumerator TOUCH_PAD_SLOPE_6
Touch sensor charge / discharge speed

enumerator TOUCH_PAD_SLOPE_7
Touch sensor charge / discharge speed, fast

enumerator TOUCH_PAD_SLOPE_MAX

enum touch_tie_opt_t
Touch sensor initial charge level

Values:

enumerator TOUCH_PAD_TIE_OPT_LOW
Initial level of charging voltage, low level

enumerator TOUCH_PAD_TIE_OPT_HIGH
Initial level of charging voltage, high level

enumerator TOUCH_PAD_TIE_OPT_MAX

enum touch fsm mode t
Touch sensor FSM mode

Values:
enumerator **TOUCH_FSM_MODE_TIMER**
To start touch FSM by timer

enumerator **TOUCH_FSM_MODE_SW**
To start touch FSM by software trigger

enumerator **TOUCH_FSM_MODE_MAX**

enum **touch_trigger_mode_t**

*Values:*

enumerator **TOUCH_TRIGGER_BELOW**
Touch interrupt will happen if counter value is less than threshold.

enumerator **TOUCH_TRIGGER_ABOVE**
Touch interrupt will happen if counter value is larger than threshold.

enumerator **TOUCH_TRIGGER_MAX**

enum **touch_trigger_src_t**

*Values:*

enumerator **TOUCH_TRIGGER_SOURCE_BOTH**
Wakeup interrupt is generated if both SET1 and SET2 are “touched”

enumerator **TOUCH_TRIGGER_SOURCE_SET1**
Wakeup interrupt is generated if SET1 is “touched”

enumerator **TOUCH_TRIGGER_SOURCE_MAX**

### 2.6.25 Two-Wire Automotive Interface (TWAI)

#### Overview

The Two-Wire Automotive Interface (TWAI) is a real-time serial communication protocol suited for automotive and industrial applications. It is compatible with ISO11898-1 Classical frames, thus can support Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID). The ESP32 contains 1 TWAI controller(s) that can be configured to communicate on a TWAI bus via an external transceiver.

**Warning:** The TWAI controller is not compatible with ISO11898-1 FD Format frames, and will interpret such frames as errors.

This programming guide is split into the following sections:

**Sections**

- Two-Wire Automotive Interface (TWAI)
  - Overview
TWAI Protocol Summary

The TWAI is a multi-master, multi-cast, asynchronous, serial communication protocol. TWAI also supports error detection and signalling, and inbuilt message prioritization.

**Multi-master:** Any node on the bus can initiate the transfer of a message.

**Multi-cast:** When a node transmits a message, all nodes on the bus will receive the message (i.e., broadcast) thus ensuring data consistency across all nodes. However, some nodes can selectively choose which messages to accept via the use of acceptance filtering (multi-cast).

**Asynchronous:** The bus does not contain a clock signal. All nodes on the bus operate at the same bit rate and synchronize using the edges of the bits transmitted on the bus.

**Error Detection and Signaling:** Every node constantly monitors the bus. When any node detects an error, it signals the detection by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This results in an error detection being propagated to all nodes on the bus.

**Message Priorities:** Messages contain an ID field. If two or more nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID value will win arbitration of the bus. All other nodes will become receivers ensuring that there is at most one transmitter at any time.

**TWAI Messages**  
TWAI Messages are split into Data Frames and Remote Frames. Data Frames are used to deliver a data payload to other nodes, whereas a Remote Frame is used to request a Data Frame from other nodes (other nodes can optionally respond with a Data Frame). Data and Remote Frames have two frame formats known as **Extended Frame** and **Standard Frame** which contain a 29-bit ID and an 11-bit ID respectively. A TWAI message consists of the following fields:

- 29-bit or 11-bit ID: Determines the priority of the message (lower value has higher priority).
- Data Length Code (DLC) between 0 to 8: Indicates the size (in bytes) of the data payload for a Data Frame, or the amount of data to request for a Remote Frame.
- Up to 8 bytes of data for a Data Frame (should match DLC).

**Error States and Counters**  
The TWAI protocol implements a feature known as “fault confinement” where a persistently erroneous node will eventually eliminate itself from the bus. This is implemented by requiring every node to maintain two internal error counters known as the **Transmit Error Counter (TEC)** and the **Receive Error Counter (REC)**. The two error counters are incremented and decremented according to a set of rules (where the counters increase on an error, and decrease on a successful message transmission/reception). The values of the counters are used to determine a node’s error state, namely **Error Active**, **Error Passive**, and **Bus-Off**.

- **Error Active:** A node is Error Active when both TEC and REC are less than 128 and indicates that the node is operating normally. Error Active nodes are allowed to participate in bus communications, and will actively signal the detection of any errors by automatically transmitting an **Active Error Flag** over the bus.

- **Error Passive:** A node is Error Passive when either the TEC or REC becomes greater than or equal to 128. Error Passive nodes are still able to take part in bus communications, but will instead transmit a **Passive Error Flag** upon detection of an error.

- **Bus-Off:** A node becomes Bus-Off when the TEC becomes greater than or equal to 256. A Bus-Off node is unable influence the bus in any manner (essentially disconnected from the bus) thus eliminating itself from the bus. A node will remain in the Bus-Off state until it undergoes bus-off recovery.
Signals Lines and Transceiver

The TWAI controller does not contain an integrated transceiver. Therefore, to connect the TWAI controller to a TWAI bus, an external transceiver is required. The type of external transceiver used should depend on the application’s physical layer specification (e.g., using SN65HVD23x transceivers for ISO 11898-2 compatibility).

The TWAI controller’s interface consists of 4 signal lines known as TX, RX, BUS-OFF, and CLKOUT. These four signal lines can be routed through the GPIO Matrix to the ESP32’s GPIO pads.

![Signal lines of the TWAI controller](image)

**TX and RX:** The TX and RX signal lines are required to interface with an external transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0 V), and a recessive bit as a high logic level (3.3 V).

**BUS-OFF:** The BUS-OFF signal line is optional and is set to a low logic level (0 V) whenever the TWAI controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3 V) otherwise.

**CLKOUT:** The CLKOUT signal line is optional and outputs a prescaled version of the controller’s source clock.

---

**Note:** An external transceiver must internally loopback the TX to RX such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the TWAI controller to interpret differences in logic levels between the two signal lines as a loss in arbitration or a bit error.

---

Driver Configuration

This section covers how to configure the TWAI driver.

**Operating Modes**  
The TWAI driver supports the following modes of operations:

**Normal Mode:** The normal operating mode allows the TWAI controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another node is required when transmitting a message.

**No Ack Mode:** The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required for a message transmission to be considered successful. This mode is useful when self testing the TWAI controller (loopback of transmissions).
Listen Only Mode: This mode prevents the TWAI controller from influencing the bus. Therefore, transmission of messages/acknowledgement/error frames will be disabled. However, the TWAI controller is still able to receive messages but will not acknowledge the message. This mode is suited for bus monitor applications.

 Alerts The TWAI driver contains an alert feature that is used to notify the application layer of certain TWAI controller or TWAI bus events. Alerts are selectively enabled when the TWAI driver is installed, but can be reconfigured during runtime by calling `twai_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `twai_read_alerts()`. The TWAI driver supports the following alerts:

<table>
<thead>
<tr>
<th>Alert Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TWAI_ALERT_TX_IDLE</td>
<td>No more messages queued for transmission</td>
</tr>
<tr>
<td>TWAI_ALERT_TX_SUCCESS</td>
<td>The previous transmission was successful</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_DATA</td>
<td>A frame has been received and added to the RX queue</td>
</tr>
<tr>
<td>TWAI_ALERTBelow_ERR_WARN</td>
<td>Both error counters have dropped below error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_ERR_ACTIVE</td>
<td>TWAI controller has become error active</td>
</tr>
<tr>
<td>TWAI_ALERT_RECOVERY_IN_PROGRESS</td>
<td>TWAI controller is undergoing bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_RECOVERED</td>
<td>TWAI controller has successfully completed bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_ARB_LOST</td>
<td>The previous transmission lost arbitration</td>
</tr>
<tr>
<td>TWAI_ALERT_ABV_Err_WARN</td>
<td>One of the error counters has exceeded the error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_ERROR</td>
<td>A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus</td>
</tr>
<tr>
<td>TWAI_ALERT_TX_FAILED</td>
<td>The previous transmission has failed</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_QUEUE_FULL</td>
<td>The RX queue is full causing a received frame to be lost</td>
</tr>
<tr>
<td>TWAI_ALERT_ERR_PASS</td>
<td>TWAI controller has become error passive</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_OFF</td>
<td>Bus-off condition occurred. TWAI controller can no longer influence bus</td>
</tr>
</tbody>
</table>

Note: The TWAI controller’s error warning limit is used to preemptively warn the application of bus errors before the error passive state is reached. By default, the TWAI driver sets the error warning limit to 96. The TWAI_ALERT_ABV_Err_WARN is raised when the TEC or REC becomes larger than or equal to the error warning limit. The TWAI_ALERT_BEL_ERR_WARN is raised when both TEC and REC return back to values below 96.

Note: When enabling alerts, the TWAI_ALERT_AND_LOG flag can be used to cause the TWAI driver to log any raised alerts to UART. However, alert logging is disabled and TWAI_ALERT_AND_LOG if the CONFIG_TWAI_ISR_IN_IRAM option is enabled (see Placing ISR into IRAM).

Note: The TWAI_ALERT_ALL and TWAI_ALERT_NONE macros can also be used to enable/disable all alerts during configuration/reconfiguration.

Bit Timing The operating bit rate of the TWAI driver is configured using the `twai_timing_config_t` structure. The period of each bit is made up of multiple time quanta, and the period of a time quantum is determined by a pre-scaled version of the TWAI controller’s source clock. A single bit contains the following segments in the following order:

1. The Synchronization Segment consists of a single time quantum
2. Timing Segment 1 consists of 1 to 16 time quanta before sample point
3. Timing Segment 2 consists of 1 to 8 time quanta after sample point

The Baudrate Prescaler is used to determine the period of each time quantum by dividing the TWAI controller’s source clock. On the ESP32, the brp can be any even number from 2 to 128. Alternatively, you can decide the resolution of each quantum, by setting `twai_timing_config_t::quanta_resolution_hz` to a non-zero...
value. In this way, the driver can calculate the underlying brp value for you. It is useful when you set different clock sources but want the bitrate to keep the same.

Supported clock source for a TWAI controller is listed in the `twai_clock_source_t` and can be specified in `twai_timing_config_t::clk_src`.

If the ESP32 is a revision 2 or later chip, the brp will also support any multiple of 4 from 132 to 256, and can be enabled by setting the `CONFIG_ESP32_REV_MIN` to revision 2 or higher.

![Fig. 25: Bit timing configuration for 500kbit/s given BRP = 8, clock source frequency is 80MHz](image)

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling **Triple Sampling** causes 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The **Synchronization Jump Width** is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. sjw can range from 1 to 4.

**Note:** Multiple combinations of brp, tseg_1, tseg_2, and sjw can achieve the same bit rate. Users should tune these values to the physical characteristics of their bus by taking into account factors such as propagation delay, node information processing time, and phase errors.

Bit timing **macro initializers** are also available for commonly used bit rates. The following macro initializers are provided by the TWAI driver.

- `TWAI_TIMING_CONFIG_1MBITS`
- `TWAI_TIMING_CONFIG_800KBITS`
- `TWAI_TIMING_CONFIG_500KBITS`
- `TWAI_TIMING_CONFIG_250KBITS`
- `TWAI_TIMING_CONFIG_125KBITS`
- `TWAI_TIMING_CONFIG_100KBITS`
- `TWAI_TIMING_CONFIG_50KBITS`
- `TWAI_TIMING_CONFIG_25KBITS`

Revision 2 or later of the ESP32 also supports the following bit rates:

- `TWAI_TIMING_CONFIG_20KBITS`
- `TWAI_TIMING_CONFIG_16KBITS`
- `TWAI_TIMING_CONFIG_12_5KBITS`

**Acceptance Filter** The TWAI controller contains a hardware acceptance filter which can be used to filter messages of a particular ID. A node that filters out a message does not receive the message, but will still acknowledge it.

Acceptance filters can make a node more efficient by filtering out messages sent over the bus that are irrelevant to the node. The acceptance filter is configured using two 32-bit values within `twai_filter_config_t` known as the **acceptance code** and the **acceptance mask**.

The **acceptance code** specifies the bit sequence which a message’s ID, RTR, and data bytes must match in order for the message to be received by the TWAI controller. The **acceptance mask** is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for a messages of different IDs to be accepted by a single acceptance code.
The acceptance filter can be used under **Single or Dual Filter Mode**. Single Filter Mode uses the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame’s 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask are interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

**Fig. 26: Bit layout of single filter mode (Right side MSBit)**

**Dual Filter Mode** uses the acceptance code and mask to define two separate filters allowing for increased flexibility of ID’s to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask are interpreted under **Dual Filter Mode** (Note: The yellow and blue fields represent standard and extended frame formats respectively).

**Fig. 27: Bit layout of dual filter mode (Right side MSBit)**

**Disabling TX Queue** The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `twai_general_config_t` to 0. This allows applications that do not require message transmission to save a small amount of memory when using the TWAI driver.

**Placing ISR into IRAM** The TWAI driver’s ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the TWAI driver’s functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR continues to:

- Read received messages from the RX buffer and place them into the driver’s RX queue.
- Load messages pending transmission from the driver’s TX queue and write them into the TX buffer.

To place the TWAI driver’s ISR, users must do the following:

- Enable the `CONFIG_TWAI_ISR_IN_IRAM` option using `idf.py menuconfig`.
- When calling `twai_driver_install()`, the `intr_flags` member of `twai_general_config_t` should set the `ESP_INTR_FLAG_IRAM` set.

**Note:** When the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled, the TWAI driver will no longer log any alerts (i.e., the `TWAI_ALERT_AND_LOG` flag will not have any effect).

**ESP32 Errata Workarounds** The ESP32’s TWAI controller contains multiple hardware errata (more details about the errata can be found in the ESP32’s ECO document). Some of these errata are critical, and under specific circumstances, can place the TWAI controller into an unrecoverable state (i.e., the controller gets stuck until it is reset by the CPU).
Chapter 2. API Reference

The TWAI driver contains software workarounds for these critical errata. With these workarounds, the ESP32 TWAI driver can operate normally, albeit with degraded performance. The degraded performance will affect users in the following ways depending on what particular errata conditions are encountered:

- The TWAI driver can occasionally drop some received messages.
- The TWAI driver can be unresponsive for a short period of time (i.e., will not transmit or ACK for 11 bit times or longer).
- If `CONFIG_TWAI_ISR_IN_IRAM` is enabled, the workarounds will increase IRAM usage by approximately 1 KB.

The software workarounds are enabled by default and it is recommended that users keep this workarounds enabled.

**Driver Operation**

The TWAI driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

![State transition diagram of the TWAI driver (see table below)](image)

<table>
<thead>
<tr>
<th>Label</th>
<th>Transition</th>
<th>Action/Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Uninstalled &gt; Stopped</td>

</tr>
<tr>
<td>H</td>
<td>Recovering &gt; Stopped</td>
<td>128 occurrences of 11 consecutive recessive bits.</td>
</tr>
</tbody>
</table>

**Driver States**

**Uninstalled:** In the uninstalled state, no memory is allocated for the driver and the TWAI controller is powered OFF.

**Stopped:** In this state, the TWAI controller is powered ON and the TWAI driver has been installed. However the TWAI controller is unable to take part in any bus activities such as transmitting, receiving, or acknowledging messages.

**Running:** In the running state, the TWAI controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore, the TWAI controller is able to transmit error frames upon detection of errors on the bus.

**Bus-Off:** The bus-off state is automatically entered when the TWAI controller’s Transmit Error Counter becomes greater than or equal to 256. The bus-off state indicates the occurrence of severe errors on the bus or in the TWAI controller. Whilst in the bus-off state, the TWAI controller is unable to take part in any bus activities. To exit the bus-off state, the TWAI controller must undergo the bus recovery process.
Chapter 2. API Reference

Recovering: The recovering state is entered when the TWAI controller undergoes bus recovery. The TWAI controller/TWAI driver remains in the recovering state until the 128 occurrences of 11 consecutive recessive bits is observed on the bus.

Message Fields and Flags    The TWAI driver distinguishes different types of messages by using the various bit field members of the `twai_message_t` structure. These bit field members determine whether a message is in standard or extended format, a remote frame, and the type of transmission to use when transmitting such a message.

These bit field members can also be toggled using the `flags` member of `twai_message_t` and the following message flags:

<table>
<thead>
<tr>
<th>Message Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TWAI_MSG_FLAG_EXTD</td>
<td>Message is in Extended Frame Format (29bit ID)</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_RTR</td>
<td>Message is a Remote Frame (Remote Transmission Request)</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_SS</td>
<td>Transmit message using Single Shot Transmission (Message will not be re-transmitted upon error or loss of arbitration). Unused for received message.</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_SELF</td>
<td>Transmit message using Self Reception Request (Transmitted message will also received by the same node). Unused for received message.</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_DLC_NON_COMP</td>
<td>Message's Data length code is larger than 8. This will break compliance with TWAI</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_NONE</td>
<td>Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.</td>
</tr>
</tbody>
</table>

Examples

Configuration & Installation The following code snippet demonstrates how to configure, install, and start the TWAI driver via the use of the various configuration structures, macro initializers, the `twai_driver_install()` function, and the `twai_start()` function.

```c
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main() {
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_NUM_22, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install TWAI driver
    if (twai_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start TWAI driver
    if (twai_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }
    ...
}
```
The usage of macro initializers is not mandatory and each of the configuration structures can be manually.

**Message Transmission** The following code snippet demonstrates how to transmit a message via the usage of the `twai_message_t` type and `twai_transmit()` function.

```c
#include "driver/twai.h"
...
//Configure message to transmit
twai_message_t message;
message.identifier = 0xAAAA;
message.extd = 1;
message.data_length_code = 4;
for (int i = 0; i < 4; i++) {
  message.data[i] = 0;
}

//Queue message for transmission
if (twai_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
  printf("Message queued for transmission\n");
} else {
  printf("Failed to queue message for transmission\n");
}
```

**Message Reception** The following code snippet demonstrates how to receive a message via the usage of the `twai_message_t` type and `twai_receive()` function.

```c
#include "driver/twai.h"
...
//Wait for message to be received
twai_message_t message;
if (twai_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
  printf("Message received\n");
} else {
  printf("Failed to receive message\n");
  return;
}

//Process received message
if (message.extd) {
  printf("Message is in Extended Format\n");
} else {
  printf("Message is in Standard Format\n");
}
printf("ID is %d\n", message.identifier);
if (!message.rtr) {
  for (int i = 0; i < message.data_length_code; i++) {
    printf("Data byte %d = %d\n", i, message.data[i]);
  }
}
```

**Reconfiguring and Reading Alerts** The following code snippet demonstrates how to reconfigure and read TWAI driver alerts via the use of the `twai_reconfigure_alerts()` and `twai_read_alerts()` functions.

```c
#include "driver/twai.h"
```

(continues on next page)
// Reconfigure alerts to detect Error Passive and Bus-Off error states
uint32_t alerts_to_enable = TWAI_ALERT_ERR_PASS | TWAI_ALERT_BUS_OFF;
if (twai_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts\n");
}

// Block indefinitely until an alert occurs
uint32_t alerts_triggered;
twai_read_alerts(&alerts_triggered, portMAX_DELAY);

Stop and Uninstall
The following code demonstrates how to stop and uninstall the TWAI driver via the use of the
twai_stop() and twai_driver_uninstall() functions.

```c
#include "driver/twai.h"
...

// Stop the TWAI driver
if (twai_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

// Uninstall the TWAI driver
if (twai_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}
```

Multiple ID Filter Configuration
The acceptance mask in twai_filter_config_t can be configured such
that two or more IDs are accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit
positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.
The following example shows how the calculate the acceptance mask given multiple IDs:

ID1 = 11'b101 1010 0000
ID2 = 11'b101 1010 0001
ID3 = 11'b101 1010 0100
ID4 = 11'b101 1010 1000
// Acceptance Mask
MASK = 11'b000 0000 1101

Application Examples
Network Example: The TWAI Network example demonstrates communication between
two ESP32s using the TWAI driver API. One TWAI node acts as a network master that initiates and ceases the transfer
of a data from another node acting as a network slave. The example can be found via peripherals/twai/twai_network.

Alert and Recovery Example: This example demonstrates how to use the TWAI driver’s alert and bus-off recovery API. The example purposely introduces errors on the bus to put the TWAI controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via peripherals/twai/twai_alert_and_recovery.
**Self Test Example:** This example uses the No Acknowledge Mode and Self Reception Request to cause the TWAI controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the TWAI controller and the external transceiver are working correctly. The example can be found via peripherals/twai/twai_self_test.

**API Reference**

**Header File**

- components/hal/include/hal/twai_types.h

**Structures**

struct **twai_message_t**

Structure to store a TWAI message.

---

**Note:** The flags member is deprecated

**Public Members**

- `uint32_t extd`
  
  Extended Frame Format (29bit ID)

- `uint32_t rtr`
  
  Message is a Remote Frame

- `uint32_t ss`
  
  Transmit as a Single Shot Transmission. Unused for received.

- `uint32_t self`
  
  Transmit as a Self Reception Request. Unused for received.

- `uint32_t dlc_non_comp`
  
  Message’s Data length code is larger than 8. This will break compliance with ISO 11898-1

- `uint32_t reserved`
  
  Reserved bits

- `uint32_t flags`
  
  Deprecated: Alternate way to set bits using message flags

- `uint32_t identifier`
  
  11 or 29 bit identifier

- `uint8_t data_length_code`
  
  Data length code

- `uint8_t data[TWAI_FRAME_MAX_DLC]`
  
  Data bytes (not relevant in RTR frame)
structure `twai_timing_config_t`  

Structure for bit timing configuration of the TWAI driver.

**Note:** Macro initializers are available for this structure

### Public Members

`twai_clock_source_t clk_src`

Clock source, set to 0 or TWAI_CLK_SRC_DEFAULT if you want a default clock source.

`uint32_t quanta_resolution_hz`

The resolution of one timing quanta, in Hz. Note: the value of `brp` will be reflected by this field if it’s non-zero, otherwise, `brp` needs to be set manually.

`uint32_t brp`

Baudrate prescale (i.e., clock divider). Any even number from 2 to 128 for ESP32, 2 to 32768 for non-ESP32 chip. Note: For ESP32 ECO 2 or later, multiples of 4 from 132 to 256 are also supported.

`uint8_t tseg_1`

Timing segment 1 (Number of time quanta, between 1 to 16)

`uint8_t tseg_2`

Timing segment 2 (Number of time quanta, 1 to 8)

`uint8_t sjw`

Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

`bool triple_sampling`

Enables triple sampling when the TWAI controller samples a bit

structure `twai_filter_config_t`  

Structure for acceptance filter configuration of the TWAI driver (see documentation)

**Note:** Macro initializers are available for this structure

### Public Members

`uint32_t acceptance_code`

32-bit acceptance code

`uint32_t acceptance_mask`

32-bit acceptance mask

`bool single_filter`

Use Single Filter Mode (see documentation)
Chapter 2. API Reference

Macros

**TWAI_EXTD_ID_MASK**
TWAI Constants.
Bit mask for 29 bit Extended Frame Format ID

**TWAI_STD_ID_MASK**
Bit mask for 11 bit Standard Frame Format ID

**TWAI_FRAME_MAX_DLC**
Max data bytes allowed in TWAI

**TWAI_FRAME_EXTD_ID_LEN_BYTES**
EFF ID requires 4 bytes (29bit)

**TWAI_FRAME_STD_ID_LEN_BYTES**
SFF ID requires 2 bytes (11bit)

**TWAI_ERR_PASS_THRESH**
Error counter threshold for error passive

Type Definitions

typedef `soc_periph_twai_clk_src_t` `twai_clock_source_t`
RMT group clock source.

---

**Note:** User should select the clock source based on the power and resolution requirement

Enumerations

enum `twai_mode_t`
TWAI Controller operating modes.

Values:

enumerator **TWAI_MODE_NORMAL**
Normal operating mode where TWAI controller can send/receive/acknowledge messages

enumerator **TWAI_MODE_NO_ACK**
Transmission does not require acknowledgment. Use this mode for self testing

enumerator **TWAI_MODE_LISTEN_ONLY**
The TWAI controller will not influence the bus (No transmissions or acknowledgments) but can receive messages

Header File

- components/driver/twai/include/driver/twai.h
Functions

`esp_err_t twai_driver_install` (const `twai_general_config_t` *g_config, const `twai_timing_config_t` *t_config, const `twai_filter_config_t` *f_config)

Install TWAI driver.

This function installs the TWAI driver using three configuration structures. The required memory is allocated and the TWAI driver is placed in the stopped state after running this function.

**Note:** Macro initializers are available for the configuration structures (see documentation)

**Note:** To reinstall the TWAI driver, call `twai_driver_uninstall()` first

**Parameters**
- `g_config` [in] General configuration structure
- `t_config` [in] Timing configuration structure
- `f_config` [in] Filter configuration structure

**Returns**
- ESP_OK: Successfully installed TWAI driver
- ESP_ERR_INVALID_ARG: Arguments are invalid, e.g. invalid clock source, invalid quanta resolution
- ESP_ERR_NO_MEM: Insufficient memory
- ESP_ERR_INVALID_STATE: Driver is already installed

`esp_err_t twai_driver_uninstall` (void)

Uninstall the TWAI driver.

This function uninstalls the TWAI driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

**Warning:** The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

**Returns**
- ESP_OK: Successfully uninstalled TWAI driver
- ESP_ERR_INVALID_STATE: Driver is not in stopped/bus-off state, or is not installed

`esp_err_t twai_start` (void)

Start the TWAI driver.

This function starts the TWAI driver, putting the TWAI driver into the running state. This allows the TWAI driver to participate in TWAI bus activities such as transmitting/receiving messages. The TX and RX queue are reset in this function, clearing any messages that are unread or pending transmission. This function can only be called when the TWAI driver is in the stopped state.

**Returns**
- ESP_OK: TWAI driver is now running
- ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed

`esp_err_t twai_stop` (void)

Stop the TWAI driver.

This function stops the TWAI driver, preventing any further message from being transmitted or received until `twai_start()` is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the TWAI driver is in the running state.
Warning: A message currently being transmitted/received on the TWAI bus will be ceased immediately. This may lead to other TWAI nodes interpreting the unfinished message as an error.

Returns
- ESP_OK: TWAI driver is now Stopped
- ESP_ERR_INVALID_STATE: Driver is not in running state, or is not installed

`esp_err_t twai_transmit` (const `twai_message_t` *message, TickType_t ticks_to_wait)

Transmit a TWAI message.

This function queues a TWAI message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the TWAI driver is in the running state and cannot be called under Listen Only Mode.

Note: This function does not guarantee that the transmission is successful. The TX_SUCCESS/TX_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

Note: The TX_IDLE alert can be used to alert the application when no other messages are awaiting transmission.

Parameters
- `message` – [in] Message to transmit
- `ticks_to_wait` – [in] Number of FreeRTOS ticks to block on the TX queue

Returns
- ESP_OK: Transmission successfully queued/initiated
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_TIMEOUT: Timed out waiting for space on TX queue
- ESP_FAIL: TX queue is disabled and another message is currently transmitting
- ESP_ERR_INVALID_STATE: TWAI driver is not in running state, or is not installed
- ESP_ERR_NOT_SUPPORTED: Listen Only Mode does not support transmissions

`esp_err_t twai_receive` (`twai_message_t` *message, TickType_t ticks_to_wait)

Receive a TWAI message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue.

Warning: The flags field of the received message should be checked to determine if the received message contains any data bytes.

Parameters
- `message` – [out] Received message
- `ticks_to_wait` – [in] Number of FreeRTOS ticks to block on RX queue

Returns
- ESP_OK: Message successfully received from RX queue
- ESP_ERR_TIMEOUT: Timed out waiting for message
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed
**esp_err_t** `twai_read_alerts` (uint32_t *alerts, TickType_t ticks_to_wait)

Read TWAI driver alerts.

This function will read the alerts raised by the TWAI driver. If no alert has been issued when this function is called, this function will block until an alert occurs or until it timeouts.

**Note:** Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

**Parameters**
- **alerts** - [out] Bit field of raised alerts (see documentation for alert flags)
- **ticks_to_wait** - [in] Number of FreeRTOS ticks to block for alert

**Returns**
- ESP_OK: Alerts read
- ESP_ERR_TIMEOUT: Timed out waiting for alerts
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**esp_err_t** `twai_reconfigure_alerts` (uint32_t alerts_enabled, uint32_t *current_alerts)

Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

**Parameters**
- **alerts_enabled** - [in] Bit field of alerts to enable (see documentation for alert flags)
- **current_alerts** - [out] Bit field of currently raised alerts. Set to NULL if unused

**Returns**
- ESP_OK: Alerts reconfigured
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**esp_err_t** `twai_initiate_recovery` (void)

Start the bus recovery process.

This function initiates the bus recovery process when the TWAI driver is in the bus-off state. Once initiated, the TWAI driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the TWAI bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

**Note:** The BUS_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

**Returns**
- ESP_OK: Bus recovery started
- ESP_ERR_INVALID_STATE: TWAI driver is not in the bus-off state, or is not installed

**esp_err_t** `twai_get_status_info` (twai_status_info_t *status_info)

Get current status information of the TWAI driver.

**Parameters**
- **status_info** - [out] Status information

**Returns**
- ESP_OK: Status information retrieved
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed
### esp_err_t twai_clear_transmit_queue (void)

Clear the transmit queue.

This function will clear the transmit queue of all messages.

**Note:** The transmit queue is automatically cleared when `twai_stop()` or `twai_initiate_recovery()` is called.

**Returns**
- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed or TX queue is disabled

### esp_err_t twai_clear_receive_queue (void)

Clear the receive queue.

This function will clear the receive queue of all messages.

**Note:** The receive queue is automatically cleared when `twai_start()` is called.

**Returns**
- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

### Structures

**struct twai_general_config_t**

Structure for general configuration of the TWAI driver.

**Note:** Macro initializers are available for this structure

### Public Members

**twai_mode_t mode**

Mode of TWAI controller

**gpio_num_t tx_io**

Transmit GPIO number

**gpio_num_t rx_io**

Receive GPIO number

**gpio_num_t clkout_io**

CLKOUT GPIO number (optional, set to -1 if unused)

**gpio_num_t bus_off_io**

Bus off indicator GPIO number (optional, set to -1 if unused)

**uint32_t tx_queue_len**

Number of messages TX queue can hold (set to 0 to disable TX Queue)
**Chapter 2. API Reference**

`uint32_t rx_queue_len`
Number of messages RX queue can hold

`uint32_t alerts_enabled`
Bit field of alerts to enable (see documentation)

`uint32_t clkout_divider`
CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

`int intr_flags`
Interrupt flags to set the priority of the driver’s ISR. Note that to use the ESP_INTR_FLAG_IRAM, the CONFIG_TWAI_ISR_IN_IRAM option should be enabled first.

**struct twai_status_info_t**
Structure to store status information of TWAI driver.

**Public Members**

`twai_state_t state`
Current state of TWAI controller (Stopped/Running/Bus-Off/Recovery)

`uint32_t msgs_to_tx`
Number of messages queued for transmission or awaiting transmission completion

`uint32_t msgs_to_rx`
Number of messages in RX queue waiting to be read

`uint32_t tx_error_counter`
Current value of Transmit Error Counter

`uint32_t rx_error_counter`
Current value of Receive Error Counter

`uint32_t tx_failed_count`
Number of messages that failed transmissions

`uint32_t rx_missed_count`
Number of messages that were lost due to a full RX queue (or errata workaround if enabled)

`uint32_t rx_overrun_count`
Number of messages that were lost due to a RX FIFO overrun

`uint32_t arb_lost_count`
Number of instances arbitration was lost

`uint32_t bus_error_count`
Number of instances a bus error has occurred
Chapter 2. API Reference

Macros

**TWAI_IO_UNUSED**
Marks GPIO as unused in TWAI configuration

Enumerations

```c
enum twai_state_t
{
    TWAI_STATE_STOPPED, // Stopped state. The TWAI controller will not participate in any TWAI bus activities
    TWAI_STATE_RUNNING,  // Running state. The TWAI controller can transmit and receive messages
    TWAI_STATE_BUS_OFF,  // Bus-off state. The TWAI controller cannot participate in bus activities until it has recovered
    TWAI_STATE_RECOVERING // Recovering state. The TWAI controller is undergoing bus recovery
};
```

2.6.26 Universal Asynchronous Receiver/Transmitter (UART)

Introduction

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e., timing requirements and data framing) using widely-adopted asynchronous serial communication interfaces, such as RS232, RS422, and RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex data exchange among different devices.

The ESP32 chip has 3 UART controllers (also referred to as port), each featuring an identical set of registers to simplify programming and for more flexibility.

Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering, number of stop bits, parity bit, etc. All the regular UART controllers are compatible with UART-enabled devices from various manufacturers and can also support Infrared Data Association (IrDA) protocols.

Functional Overview

The overview describes how to establish communication between an ESP32 and other UART devices using the functions and data types of the UART driver. A typical programming workflow is broken down into the sections provided below:

1. **Set Communication Parameters** - Setting baud rate, data bits, stop bits, etc.
2. **Set Communication Pins** - Assigning pins for connection to a device
3. **Install Drivers** - Allocating ESP32’s resources for the UART driver
4. **Run UART Communication** - Sending/receiving data
5. **Use Interrupts** - Triggering interrupts on specific communication events
6. **Deleting a Driver** - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional. The UART driver’s functions identify each of the UART controllers using `uart_port_t`. This identification is needed for all the following function calls.
Set Communication Parameters  UART communication parameters can be configured all in a single step or individually in multiple steps.

Single Step  Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```c
const uart_port_t uart_num = UART_NUM_2;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

For more information on how to configure the hardware flow control options, please refer to `peripherals/uart/uart_echo`.

Multiple Steps  Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.

<table>
<thead>
<tr>
<th>Parameter to Configure</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baudrate</td>
<td><code>uart_set_baudrate()</code></td>
</tr>
<tr>
<td>Number of transmitted bits</td>
<td><code>uart_set_word_length()</code> selected out of <code>uart_word_length_t</code></td>
</tr>
<tr>
<td>Parity control</td>
<td><code>uart_set_parity()</code> selected out of <code>uart_parity_t</code></td>
</tr>
<tr>
<td>Number of stop bits</td>
<td><code>uart_set_stop_bits()</code> selected out of <code>uart_stop_bits_t</code></td>
</tr>
<tr>
<td>Hardware flow control mode</td>
<td><code>uart_set_hw_flow_ctrl()</code> selected out of <code>uart_hw_flowcontrol_t</code></td>
</tr>
<tr>
<td>Communication mode</td>
<td><code>uart_set_mode()</code> selected out of <code>uart_mode_t</code></td>
</tr>
</tbody>
</table>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the current baud rate value, call `uart_get_baudrate()`.

Set Communication Pins  After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function `uart_set_pin()` and specify the GPIO pin numbers to which the driver should route the TX, RX, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro `UART_PIN_NO_CHANGE`.

The same macro `UART_PIN_NO_CHANGE` should be specified for pins that will not be used.

```c
// Set UART pins (TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_2, 4, 5, 18, 19));
```

Install Drivers  Once the communication pins are set, install the driver by calling `uart_driver_install()` and specify the following parameters:

- Size of TX ring buffer
- Size of RX ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function allocates the required internal resources for the UART driver.
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;

// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_2, uart_buffer_size, 
    uart_buffer_size, 10, &uart_queue, 0));

Once this step is complete, you can connect the external UART device and check the communication.

**Run UART Communication**  Serial communication is controlled by each UART controller’s finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into TX FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into RX FIFO buffer
3. Read the data from RX FIFO buffer

Therefore, an application only writes and reads data from a specific buffer using `uart_write_bytes()` and `uart_read_bytes()` respectively, and the FSM does the rest.

**Transmit Data**  After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer’s address and data length to it. The function copies the data to the TX ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the TX FIFO buffer, an interrupt service routine (ISR) moves the data from the TX ring buffer to the TX FIFO buffer in the background. The code below demonstrates the use of this function.

```c
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A ‘serial break signal’ means holding the TX line low for a period longer than one data frame.

```c
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the TX FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function does not block until space is available. Instead, it writes all data which can immediately fit into the hardware TX FIFO, and then return the number of bytes that were written.

There is a ‘companion’ function `uart_wait_tx_done()` that monitors the status of the TX FIFO buffer and returns once it is empty.

```c
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_2;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_\n
-ticks (TickType_t)
```

**Receive Data**  Once the data is received by the UART and saved in the RX FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the RX FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.
// Read data from UART.
const uart_port_t uart_num = UART_NUM_2;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);

If the data in the RX FIFO buffer is no longer needed, you can clear the buffer by calling\textit{uart\_flush}().

\textbf{Software Flow Control} If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions \textit{uart\_set\_rts}() and \textit{uart\_set\_dtr}() respectively.

\textbf{Communication Mode Selection} The UART controller supports a number of communication modes. A mode can be selected using the function \textit{uart\_set\_mode}(). Once a specific mode is selected, the UART driver handles the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));

\textbf{Use Interrupts} There are many interrupts that can be generated depending on specific UART states or detected errors. The full list of available interrupts is provided in \textit{ESP32 Technical Reference Manual > UART Controller (UART) > UART Interrupts} and \textit{UHCI Interrupts} [PDF]. You can enable or disable specific interrupts by calling \textit{uart\_enable\_intr\_mask}() or \textit{uart\_disable\_intr\_mask}() respectively.

The \textit{uart\_driver\_install}() function installs the driver’s internal interrupt handler to manage the TX and RX ring buffers and provides high-level API functions like events (see below).

The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection**: There are several events defined in \textit{uart\_event\_type\_t} that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling \textit{uart\_driver\_install}() described in Install Drivers. An example of using Event detection can be found in peripherals/uart/uart_events.

- **FIFO space threshold or transmission timeout reached**: The TX and RX FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
  - Configure respective threshold values of the buffer length and timeout by entering them in the structure \textit{uart\_intr\_config\_t} and calling \textit{uart\_intr\_config}()
  - Enable the interrupts using the functions \textit{uart\_enable\_tx\_intr}() and \textit{uart\_enable\_rx\_intr}()
  - Disable these interrupts using the corresponding functions \textit{uart\_disable\_tx\_intr}() or \textit{uart\_disable\_rx\_intr}()

- **Pattern detection**: An interrupt triggered on detecting a ‘pattern’ of the same character being received/sent repeatedly. This functionality is demonstrated in the example peripherals/uart/uart_events. It can be used, e.g., to detect a command string with a specific number of identical characters (the ‘pattern’) at the end. The following functions are available:
  - Configure and enable this interrupt using \textit{uart\_enable\_pattern\_det\_baud\_intr}()
  - Disable the interrupt using \textit{uart\_disable\_pattern\_det\_intr}()

**Macros** The API also defines several macros. For example, \textit{UART\_HW\_FIFO\_LEN} defines the length of hardware FIFO buffers; \textit{UART\_BITRATE\_MAX} gives the maximum baud rate supported by the UART controllers, etc.

**Deleting a Driver** If the communication established with \textit{uart\_driver\_install}() is no longer required, the driver can be removed to free allocated resources by calling \textit{uart\_driver\_delete}().
Overview of RS485 Specific Communication Options

Note: The following section uses [UART_REGISTER_NAME].[UART_FIELD_BIT] to refer to UART register fields/bits. For more information on a specific option bit, see ESP32 Technical Reference Manual > UART Controller (UART) > Register Summary [PDF]. Use the register name to navigate to the register description and then find the field/bit.

- UART_RS485_CONF_REG.UART_RS485_EN: setting this bit enables RS485 communication mode support.
- UART_RS485_CONF_REG.UART_RS485TX_RX_EN: if this bit is set, the transmitter’s output signal loops back to the receiver’s input signal.
- UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32’s RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt UART_RS485_CLASH_INT if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts UART_RS485_FRM_ERR_INT and UART_RS485_PARITY_ERR_INT can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is supported in the UART driver and can be used by selecting the UART_MODE_RS485_APP_CTRL mode (see the function uart_set_mode()).

The collision detection feature can work with circuit A and circuit C (see Section Interface Connection Options). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the user application. Use the function uart_get_collision_flag() to check if the collision detection flag has been raised.

The ESP32 UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the RE/DE input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the UART_MODE_RS485_HALF_DUPLEX mode when calling uart_set_mode().

Once the host starts writing data to the TX FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

Interface Connection Options This section provides example schematics to demonstrate the basic aspects of ESP32’s RS485 interface connection.

Note:
- The schematics below do not necessarily contain all required elements.
- The analog devices ADM483 & ADM2483 are examples of common RS485 transceivers and can be replaced with other similar transceivers.

Circuit A: Collision Detection Circuit

```
VCC -----------+      |
    |-----------x-------+
RXD <-----| R       |
    | B -----------< B
TXD ------| D ADM483 |
```
This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the UART peripheral when the bit UART_RS485_CONF_REG.UART_RS485TX_RX_EN is enabled.

### Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection

This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit UART_RS485_CONF_REG.UART_RS485TX_RX_EN is set. The bit UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN is not applicable in this case.

### Circuit C: Auto Switching Transmitter/Receiver

This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN to 1 and UART_RS485_CONF_REG.UART_RS485TX_RX_EN to 0. This setup can work in any RS485 UART mode or even in UART_MODE_UART.
## Application Examples

The table below describes the code examples available in the directory `peripherals/uart/`.

<table>
<thead>
<tr>
<th>Code Example</th>

## API Reference

### Header File

- `components/driver/uart/include/driver/uart.h`

### Functions

- `esp_err_t uart_driver_install (uart_port_t uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, QueueHandle_t *uart_queue, int intr_alloc_flags)`

  Install UART driver and set the UART to the default configuration.

  UART ISR handler will be attached to the same CPU core that this function is running on.

  **Note:** Rx_buffer_size should be greater than UART_HW_FIFO_LEN(uart_num). Tx_buffer_size should be either zero or greater than UART_HW_FIFO_LEN(uart_num).

  **Parameters**
  - `uart_num` – UART port number, the max port number is (UART_NUM_MAX -1).
  - `rx_buffer_size` – UART RX ring buffer size.
  - `tx_buffer_size` – UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
  - `queue_size` – UART event queue size/depth.
  - `uart_queue` – UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
  - `intr_alloc_flags` – Flags used to allocate the interrupt. One or multiple (ORed) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info. Do not set ESP_INTR_FLAG_IRAM here (the driver’s ISR handler is not located in IRAM).

  **Returns**
  - ESP_OK – Success
  - ESP_FAIL – Parameter error

- `esp_err_t uart_driver_delete (uart_port_t uart_num)`

  Uninstall UART driver.

  **Parameters**
  - `uart_num` – UART port number, the max port number is (UART_NUM_MAX -1).

  **Returns**
Chapter 2. API Reference

• ESP_OK Success
• ESP_FAIL Parameter error

bool uart_is_driver_installed(uart_port_t uart_num)
Checks whether the driver is installed or not.
Parameters uart_num – UART port number, the max port number is (UART_NUM_MAX -1).

Returns
• true driver is installed
• false driver is not installed

esp_err_t uart_set_word_length(uart_port_t uart_num, uart_word_length_t data_bit)
Set UART data bits.
Parameters
• uart_num – UART port number, the max port number is (UART_NUM_MAX -1).
• data_bit – UART data bits

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

esp_err_t uart_get_word_length(uart_port_t uart_num, uart_word_length_t *data_bit)
Get the UART data bit configuration.
Parameters
• uart_num – UART port number, the max port number is (UART_NUM_MAX -1).
• data_bit – Pointer to accept value of UART data bits.

Returns
• ESP_FAIL Parameter error
• ESP_OK Success, result will be put in (*data_bit)

esp_err_t uart_set_stop_bits(uart_port_t uart_num, uart_stop_bits_t stop_bits)
Set UART stop bits.
Parameters
• uart_num – UART port number, the max port number is (UART_NUM_MAX -1).
• stop_bits – UART stop bits

Returns
• ESP_OK Success
• ESP_FAIL Fail

esp_err_t uart_get_stop_bits(uart_port_t uart_num, uart_stop_bits_t *stop_bits)
Get the UART stop bit configuration.
Parameters
• uart_num – UART port number, the max port number is (UART_NUM_MAX -1).
• stop_bits – Pointer to accept value of UART stop bits.

Returns
• ESP_FAIL Parameter error
• ESP_OK Success, result will be put in (*stop_bit)

esp_err_t uart_set_parity(uart_port_t uart_num, uart_parity_t parity_mode)
Set UART parity mode.
Parameters
• uart_num – UART port number, the max port number is (UART_NUM_MAX -1).
• parity_mode – the enum of uart parity configuration

Returns
• ESP_FAIL Parameter error
• ESP_OK Success

esp_err_t uart_get_parity(uart_port_t uart_num, uart_parity_t *parity_mode)
Get the UART parity mode configuration.
Chapter 2  API Reference

Parameters
• **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
• **parity_mode** - Pointer to accept value of UART parity mode.

Returns
• ESP_FAIL Parameter error
• ESP_OK Success, result will be put in (*parity_mode)

```c
esp_err_t uart_get_sclk_freq(uart_sclk_t sclk, uint32_t*out_freq_hz)
```

Get the frequency of a clock source for the HP UART port.

Parameters
• **sclk** - Clock source
• **out_freq_hz** - [out] Output of frequency, in Hz

Returns
• ESP_ERR_INVALID_ARG: if the clock source is not supported
• otherwise ESP_OK

```c
esp_err_t uart_set_baudrate(uart_port_t uart_num, uint32_t baudrate)
```

Set UART baud rate.

Parameters
• **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
• **baudrate** - UART baud rate.

Returns
• ESP_FAIL Parameter error
• ESP_OK Success

```c
esp_err_t uart_get_baudrate(uart_port_t uart_num, uint32_t*baudrate)
```

Get the UART baud rate configuration.

Parameters
• **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
• **baudrate** - Pointer to accept value of UART baud rate

Returns
• ESP_FAIL Parameter error
• ESP_OK Success

```c
esp_err_t uart_set_line_inverse(uart_port_t uart_num, uint32_t inverse_mask)
```

Set UART line inverse mode.

Parameters
• **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
• **inverse_mask** - Choose the wires that need to be inverted. Using the ORred mask of
  `uart_signal_inv_t`

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

```c
esp_err_t uart_set_hw_flow_ctrl(uart_port_t uart_num, uart_hw_flowcontrol_t flow_ctrl, uint8_t rx_thresh)
```

Set hardware flow control.

Parameters
• **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
• **flow_ctrl** - Hardware flow control mode
• **rx_thresh** - Threshold of Hardware RX flow control (0 ~ UART_HW_FIFO_LEN(uart_num)). Only when UART_HW_FLOWCTRL_RTS is set, will the rx_thresh value be set.

Returns
• ESP_OK Success
• ESP_FAIL Parameter error
Chapter 2. API Reference

```c
esp_err_t uart_set_sw_flow_ctrl(uart_port_t uart_num, bool enable, uint8_t rx_thresh_xon, uint8_t rx_thresh_xoff)
```

Set software flow control.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX - 1)
- `enable` - switch on or off
- `rx_thresh_xon` - low water mark
- `rx_thresh_xoff` - high water mark

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_get_hw_flow_ctrl(uart_port_t uart_num, uart_hw_flowcontrol_t *flow_ctrl)
```

Get the UART hardware flow control configuration.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX - 1).
- `flow_ctrl` - Option for different flow control mode.

**Returns**
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*flow_ctrl)

```c
esp_err_t uart_clear_intr_status(uart_port_t uart_num, uint32_t clr_mask)
```

Clear UART interrupt status.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX - 1).
- `clr_mask` - Bit mask of the interrupt status to be cleared.

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_enable_intr_mask(uart_port_t uart_num, uint32_t enable_mask)
```

Set UART interrupt enable.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX - 1).
- `enable_mask` - Bit mask of the enable bits.

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_disable_intr_mask(uart_port_t uart_num, uint32_t disable_mask)
```

Clear UART interrupt enable bits.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX - 1).
- `disable_mask` - Bit mask of the disable bits.

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_enable_rx_intr(uart_port_t uart_num)
```

Enable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX - 1).

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error
esp_err_t uart_disable_rx_intr(uart_port_t uart_num)

Disable UART RX interrupt (RX_FULL & RX_TIMEOUT_INTERRUPT)

Parameters
uart_num – UART port number, the max port number is (UART_NUM_MAX -1).

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

esp_err_t uart_disable_tx_intr(uart_port_t uart_num)

Disable UART TX interrupt (TX_FULL & TX_TIMEOUT_INTERRUPT)

Parameters
uart_num – UART port number

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

esp_err_t uart_enable_tx_intr(uart_port_t uart_num, int enable, int thresh)

Enable UART TX interrupt (TX_FULL & TX_TIMEOUT_INTERRUPT)

Parameters
• uart_num – UART port number, the max port number is (UART_NUM_MAX -1).
• enable – 1: enable; 0: disable
• thresh – Threshold of TX interrupt, 0 ~ UART_HW_FIFO_LEN(uart_num)

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

esp_err_t uart_set_pin(uart_port_t uart_num, int tx_io_num, int rx_io_num, int rts_io_num, int cts_io_num)

Assign signals of a UART peripheral to GPIO pins.

Note: If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UART0's default TX pin and GPIO3 is UART0's default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

Note: Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

Parameters
• uart_num – UART port number, the max port number is (UART_NUM_MAX -1).
• tx_io_num – UART TX pin GPIO number.
• rx_io_num – UART RX pin GPIO number.
• rts_io_num – UART RTS pin GPIO number.
• cts_io_num – UART CTS pin GPIO number.

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

esp_err_t uart_set_rts(uart_port_t uart_num, int level)

Manually set the UART RTS pin level.

Note: UART must be configured with hardware flow control disabled.
Chapter 2. API Reference

Parameters
• **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
• **level** - 1: RTS output low (active); 0: RTS output high (block)

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

`esp_err_t uart_set_dtr(uart_port_t uart_num, int level)`
Manually set the UART DTR pin level.

Parameters
• **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
• **level** - 1: DTR output low; 0: DTR output high

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

`esp_err_t uart_set_tx_idle_num(uart_port_t uart_num, uint16_t idle_num)`
Set UART idle interval after tx FIFO is empty.

Parameters
• **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
• **idle_num** - idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

`esp_err_t uart_param_config(uart_port_t uart_num, const uart_config_t *uart_config)`
Set UART configuration parameters.

Parameters
• **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
• **uart_config** - UART parameter settings

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

`esp_err_t uart_intr_config(uart_port_t uart_num, const uart_intr_config_t *intr_conf)`
Configure UART interrupts.

Parameters
• **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
• **intr_conf** - UART interrupt settings

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

`esp_err_t uart_wait_tx_done(uart_port_t uart_num, TickType_t ticks_to_wait)`
Wait until UART TX FIFO is empty.

Parameters
• **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
• **ticks_to_wait** - Timeout, count in RTOS ticks

Returns
• ESP_OK Success
• ESP_FAIL Parameter error
• ESP_ERR_TIMEOUT Timeout

`int uart_tx_chars(uart_port_t uart_num, const char *buffer, uint32_t len)`
Send data to the UART port from a given buffer and length.
This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

**Note:** This function should only be used when UART TX buffer is not enabled.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `buffer` - data buffer address
- `len` - data length to send

**Returns**
- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

```c
int uart_write_bytes (uart_port_t uart_num, const void *src, size_t size)
```

Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `src` - data buffer address
- `size` - data length to send

**Returns**
- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

```c
int uart_write_bytes_with_break (uart_port_t uart_num, const void *src, size_t size, int brk_len)
```

Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `src` - data buffer address
- `size` - data length to send
- `brk_len` - break signal duration(unit: the time it takes to send one bit at current baudrate)

**Returns**
- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

```c
int uart_read_bytes (uart_port_t uart_num, void *buf, uint32_t length, TickType_t ticks_to_wait)
```

UART read bytes from UART buffer.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `buf` - pointer to the buffer.
- `length` - data length
- `ticks_to_wait` - sTimeout, count in RTOS ticks

**Returns**
- (-1) Error
- OTHERS (>=0) The number of bytes read from UART buffer
**esp_err_t uart_flush (uart_port_t uart_num)**

Alias of uart_flush_input. UART ring buffer flush. This will discard all data in the UART RX buffer.

**Note:** Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use uart_wait_tx_done function.

**Parameters**
- **uart_num**—UART port number, the max port number is (UART_NUM_MAX - 1).

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_flush_input (uart_port_t uart_num)**

Clear input buffer, discard all the data is in the ring-buffer.

**Note:** In order to send all the data in tx FIFO, we can use uart_wait_tx_done function.

**Parameters**
- **uart_num**—UART port number, the max port number is (UART_NUM_MAX - 1).

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_get_buffered_data_len (uart_port_t uart_num, size_t* size)**

UART get RX ring buffer cached data length.

**Parameters**
- **uart_num**—UART port number, the max port number is (UART_NUM_MAX - 1).
- **size**—Pointer of size_t to accept cached data length

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_get_tx_buffer_free_size (uart_port_t uart_num, size_t* size)**

UART get TX ring buffer free space size.

**Parameters**
- **uart_num**—UART port number, the max port number is (UART_NUM_MAX - 1).
- **size**—Pointer of size_t to accept the free space size

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t uart_disable_pattern_det_intr (uart_port_t uart_num)**

UART disable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detects a series of one same character, the interrupt will be triggered.

**Parameters**
- **uart_num**—UART port number, the max port number is (UART_NUM_MAX - 1).

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_enable_pattern_det_baud_intr (uart_port_t uart_num, char pattern_chr, uint8_t chr_num, int chr_inout, int post_idle, int pre_idle)**

UART enable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detect a series of one same character, the interrupt will be triggered.

**Parameters**
- **uart_num**—UART port number.
• **pattern_chr** - character of the pattern.
• **chr_num** - number of the character, 8bit value.
• **chr_tout** - timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at_cmd char.
• **post_idle** - idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at_cmd char.
• **pre_idle** - idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at_cmd char.

Returns

• ESP_OK Success
• ESP_FAIL Parameter error

```c
int uart_pattern_pop_pos(uart_port_t uart_num)
```

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos. It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

**Note:** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

**Parameters**

<table>
<thead>
<tr>
<th>uart_num</th>
<th>UART port number, the max port number is (UART_NUM_MAX - 1).</th>
</tr>
</thead>
</table>

**Returns**

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

```c
int uart_pattern_get_pos(uart_port_t uart_num)
```

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue. This function do nothing to the queue.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos. It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

**Note:** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

**Parameters**

<table>
<thead>
<tr>
<th>uart_num</th>
<th>UART port number, the max port number is (UART_NUM_MAX - 1).</th>
</tr>
</thead>
</table>

**Returns**

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

```c
esp_err_t uart_pattern_queue_reset(uart_port_t uart_num, int queue_length)
```

Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

**Parameters**

| uart_num | UART port number, the max port number is (UART_NUM_MAX - 1). |
• **queue_length** – Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

**Returns**
- ESP_ERR_NO_MEM No enough memory
- ESP_ERR_INVALID_STATE Driver not installed
- ESP_FAIL Parameter error
- ESP_OK Success

```c
esp_err_t uart_set_mode (uart_port_t uart_num, uart_mode_t mode)
```

UART set communication mode.

**Note:** This function must be executed after `uart_driver_install()`, when the driver object is initialized.

**Parameters**
- **uart_num** – UART number to configure, the max port number is (UART_NUM_MAX -1).
- **mode** – UART UART mode to set

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t uart_set_rx_full_threshold (uart_port_t uart_num, int threshold)
```

Set uart threshold value for RX fifo full.

**Note:** If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

**Parameters**
- **uart_num** – UART port number, the max port number is (UART_NUM_MAX -1)
- **threshold** – Threshold value above which RX fifo full interrupt is generated

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

```c
esp_err_t uart_set_tx_empty_threshold (uart_port_t uart_num, int threshold)
```

Set uart threshold values for TX fifo empty.

**Parameters**
- **uart_num** – UART port number, the max port number is (UART_NUM_MAX -1)
- **threshold** – Threshold value below which TX fifo empty interrupt is generated

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

```c
esp_err_t uart_set_rx_timeout (uart_port_t uart_num, const uint8_t tout_thresh)
```

UART set threshold timeout for TOUT feature.

**Parameters**
- **uart_num** – Uart number to configure, the max port number is (UART_NUM_MAX -1).
- **tout_thresh** – This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout_thresh = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is
expired the UART_RXFIFO_TOUT_INT interrupt is triggered. If tout_thresh == 0, the TOUT feature is disabled.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

```c
esp_err_t uart_get_collision_flag(uart_port_t uart_num, bool *collision_flag)
```

Returns collision detection flag for RS485 mode. Function returns the collision detection flag into variable pointed by collision_flag. *collision_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after uart_write_bytes()).

**Parameters**
- `uart_num` - UART number, the max port number is (UART_NUM_MAX - 1).
- `collision_flag` - Pointer to variable of type bool to return collision flag.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t uart_set_wakeup_threshold(uart_port_t uart_num, int wakeup_threshold)
```

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter ‘a’ with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when ‘a’ is sent, set wakeup_threshold=3.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To ensure that UART has correct Baud rate all the time, it is necessary to select a source clock which has a fixed frequency and remains active during sleep. For the supported clock sources of the chips, please refer to uart_sclk_t or soc_periph_uart_clk_src_legacy_t

**Note:** in ESP32, the wakeup signal can only be input via IO_MUX (i.e. GPIO3 should be configured as function_1 to wake up UART0, GPIO9 should be configured as function_5 to wake up UART1), UART2 does not support light sleep wakeup feature.

```
Parameters
- `uart_num` - UART number, the max port number is (UART_NUM_MAX - 1).
- `wakeup_threshold` - number of RX edges for light sleep wakeup, value is 3 ~ 0x3ff.

Returns
- ESP_OK on success
- ESP_ERR_INVALID_ARG if uart_num is incorrect or wakeup_threshold is outside of [3, 0x3ff] range.
```

```c
esp_err_t uart_get_wakeup_threshold(uart_port_t uart_num, int *out_wakeup_threshold)
```

Get the number of RX pin signal edges for light sleep wakeup.

See description of uart_set_wakeup_threshold for the explanation of UART wakeup feature.

```
Parameters
- `uart_num` - UART number, the max port number is (UART_NUM_MAX - 1).
- `out_wakeup_threshold` - [out] output, set to the current value of wakeup threshold for the given UART.

Returns
```
Chapter 2. API Reference

- ESP_OK on success
- ESP_ERR_INVALID_ARG if out_wakeup_threshold is NULL

```c
esp_err_t uart_wait_tx_idle_polling(uart_port_t uart_num)
```

Wait until UART tx memory empty and the last char send ok (polling mode).

* Returns
  - ESP_OK on success
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_FAIL Driver not installed

* Parameters
  - uart_num - UART number

```c
esp_err_t uart_set_loop_back(uart_port_t uart_num, bool loop_back_en)
```

Configure TX signal loop back to RX module, just for the test usage.

* Returns
  - ESP_OK on success
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_FAIL Driver not installed

* Parameters
  - uart_num - UART number
  - loop_back_en - Set true to enable the loop back function, else set it false.

```c
void uart_set_always_rx_timeout(uart_port_t uart_num, bool always_rx_timeout_en)
```

Configure behavior of UART RX timeout interrupt.

When always_rx_timeout is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

* Parameters
  - uart_num - UART number
  - always_rx_timeout_en - Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

**Structures**

```c
struct uart_config_t
```

UART configuration parameters for uart_param_config function.

**Public Members**

```c
int baud_rate
```

UART baud rate

```c
uart_word_length_t data_bits
```

UART byte size
Chapter 2. API Reference

\textit{uart\_parity\_t parity}
UART parity mode

\textit{uart\_stop\_bits\_t stop\_bits}
UART stop bits

\textit{uart\_hw\_flowcontrol\_t flow\_ctrl}
UART HW flow control mode (cts/rts)

\texttt{uint8\_t rx\_flow\_ctrl\_thresh}
UART HW RTS threshold

\textit{uart\_sclk\_t source\_clk}
UART source clock selection

\texttt{struct uart\_intr\_config\_t}
UART interrupt configuration parameters for \texttt{uart\_intr\_config} function.

**Public Members**

\texttt{uint32\_t intr\_enable\_mask}
UART interrupt enable mask, choose from UART\_XXXX\_INT\_ENA\_M under UART\_INT\_ENA\_REG(i), connect with bit-or operator

\texttt{uint8\_t rx\_timeout\_thresh}
UART timeout interrupt threshold (unit: time of sending one byte)

\texttt{uint8\_t txfifo\_empty\_intr\_thresh}
UART TX empty interrupt threshold.

\texttt{uint8\_t rxfifo\_full\_thresh}
UART RX full interrupt threshold.

\texttt{struct uart\_event\_t}
Event structure used in UART event queue.

**Public Members**

\textit{uart\_event\_type\_t type}
UART event type

\texttt{size\_t size}
UART data size for UART\_DATA event

\texttt{bool timeout\_flag}
UART data read timeout flag for UART\_DATA event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.
Chapter 2. API Reference

Macros

**UART_PIN_NO_CHANGE**

Length of the HP UART HW FIFO.

**UART_FIFO_LEN**

Length of the UART HW FIFO.

**UART_BITRATE_MAX**

Maximum configurable bitrate.

Type Definitions

typedef `intr_handle_t` **uart_isr_handle_t**

Enumerations

eenum **uart_event_type_t**

UART event types used in the ring buffer.

*Values:*

enumerator **UART_DATA**

UART data event

enumerator **UART_BREAK**

UART break event

enumerator **UART_BUFFER_FULL**

UART RX buffer full event

enumerator **UART_FIFO_OVF**

UART FIFO overflow event

enumerator **UART_FRAME_ERR**

UART RX frame error event

enumerator **UART_PARITY_ERR**

UART RX parity event

enumerator **UART_DATA_BREAK**

UART TX data and break event

enumerator **UART_PATTERN_DET**

UART pattern detected

enumerator **UART_EVENT_MAX**

UART event max index
Chapter 2. API Reference

Header File

- components/hal/include/hal/uart_types.h

Structures

struct uart_at_cmd_t
UART AT cmd char configuration parameters. Note that this function may different on different chip. Please refer to the TRM at configuration.

Public Members

uint8_t cmd_char
 UART AT cmd char

uint8_t char_num
 AT cmd char repeat number

uint32_t gap_tout
 gap time(in baud-rate) between AT cmd char

uint32_t pre_idle
 the idle time(in baud-rate) between the non AT char and first AT char

uint32_t post_idle
 the idle time(in baud-rate) between the last AT char and the none AT char

struct uart_sw_flowctrl_t
UART software flow control configuration parameters.

Public Members

uint8_t xon_char
 Xon flow control char

uint8_t xoff_char
 Xoff flow control char

uint8_t xon_thrd
 If the software flow control is enabled and the data amount in rxfifo is less than xon_thrd, an xon_char will be sent

uint8_t xoff_thrd
 If the software flow control is enabled and the data amount in rxfifo is more than xoff_thrd, an xoff_char will be sent

Type Definitions

typedef soc_periph_uart_clk_src_legacy_t uart_sclk_t
 UART source clock.
Enumerations

enum **uart_port_t**

UART port number, can be UART_NUM_0 ~ (UART_NUM_MAX -1).

*Values:*

enumerator **UART_NUM_0**

UART port 0

enumerator **UART_NUM_1**

UART port 1

enumerator **UART_NUM_2**

UART port 2

enumerator **UART_NUM_MAX**

UART port max

enum **uart_mode_t**

UART mode selection.

*Values:*

enumerator **UART_MODE_UART**

mode: regular UART mode

enumerator **UART_MODE_RS485_HALF_DUPLEX**

mode: half duplex RS485 UART mode control by RTS pin

enumerator **UART_MODE_IRDA**

mode: IRDA UART mode

enumerator **UART_MODE_RS485_COLLISION_DETECT**

mode: RS485 collision detection UART mode (used for test purposes)

enumerator **UART_MODE_RS485_APP_CTRL**

mode: application control RS485 UART mode (used for test purposes)

enum **uart_word_length_t**

UART word length constants.

*Values:*

enumerator **UART_DATA_5_BITS**

word length: 5bits

enumerator **UART_DATA_6_BITS**

word length: 6bits

enumerator **UART_DATA_7_BITS**

word length: 7bits
enumerator UART_DATA_8_BITS
    word length: 8bits

enumerator UART_DATA_BITS_MAX

enum uart_stop_bits_t
    UART stop bits number.
    Values:

enumerator UART_STOP_BITS_1
    stop bit: 1bit

enumerator UART_STOP_BITS_1_5
    stop bit: 1.5bits

enumerator UART_STOP_BITS_2
    stop bit: 2bits

enumerator UART_STOP_BITS_MAX

enum uart_parity_t
    UART parity constants.
    Values:

enumerator UART_PARITY_DISABLE
    Disable UART parity

enumerator UART_PARITY_EVEN
    Enable UART even parity

enumerator UART_PARITY_ODD
    Enable UART odd parity

enum uart_hw_flowcontrol_t
    UART hardware flow control modes.
    Values:

enumerator UART_HW_FLOWCTRL_DISABLE
    disable hardware flow control

enumerator UART_HW_FLOWCTRL_RTS
    enable RX hardware flow control (rts)

enumerator UART_HW_FLOWCTRL_CTS
    enable TX hardware flow control (cts)

enumerator UART_HW_FLOWCTRL_CTS_RTS
    enable hardware flow control
enumerator **UART_HW_FLOWCTRL_MAX**

enum **uart_signal_inv_t**

UART signal bit map.

*Values:*

enumerator **UART_SIGNAL_INV_DISABLE**

Disable UART signal inverse

driver: **UART_SIGNAL_IRDA_TX_INV**

inverse the UART irda_tx signal

driver: **UART_SIGNAL_IRDA_RX_INV**

inverse the UART irda_rx signal

driver: **UART_SIGNAL_RXD_INV**

inverse the UART rxd signal

driver: **UART_SIGNAL_CTS_INV**

inverse the UART cts signal

driver: **UART_SIGNAL_DSR_INV**

inverse the UART dsr signal

driver: **UART_SIGNAL_TXD_INV**

inverse the UART txd signal

driver: **UART_SIGNAL_RTS_INV**

inverse the UART rts signal

driver: **UART_SIGNAL_DTR_INV**

inverse the UART dtr signal

**GPIOLookupMacros**

The UART peripherals have dedicated IO_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO_MUX pin for a UART channel. GPIOLookupMacros simplify the process of finding and assigning IO_MUX pins. You choose a macro based on either the IO_MUX pin number, or a required UART channel name, and the macro returns the matching counterpart for you. See some examples below.

**Note:** These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

1. **UART_NUM_2_TXD_DIRECT_GPIO_NUM** returns the IO_MUX pin number of UART channel 2 TXD pin (pin 17)
2. **UART_GPIO19_DIRECT_CHANNEL** returns the UART number of GPIO 19 when connected to the UART peripheral via IO_MUX (this is UART_NUM_0)
3. **UART_CTS_GPIO19_DIRECT_CHANNEL** returns the UART number of GPIO 19 when used as the UART CTS pin via IO_MUX (this is UART_NUM_0). It is similar to the above macro but specifies the pin function which is also part of the IO_MUX assignment.

Code examples for this API section are provided in the peripherals directory of ESP-IDF examples.

2.7 Project Configuration

2.7.1 Introduction

The esp-idf-kconfig package that ESP-IDF uses is based on kconfiglib, which is a Python extension to the Kconfig system. Kconfig provides a compile-time project configuration mechanism and offers configuration options of several types (e.g., integers, strings, and boolens). Kconfig files specify dependencies between options, default values of options, the way options are grouped together, etc.

For the full list of available features, please see Kconfig and kconfiglib extensions.
2.7.2 Project Configuration Menu

Application developers can open a terminal-based project configuration menu with the `idf.py menuconfig` build target.

After being updated, this configuration is saved in the `sdkconfig` file under the project root directory. Based on `sdkconfig`, application build targets will generate the `sdkconfig.h` file under the build directory, and will make the `sdkconfig` options available to the project build system and source files.

2.7.3 Using `sdkconfig.defaults`

In some cases, for example, when the `sdkconfig` file is under revision control, it may be inconvenient for the build system to change the `sdkconfig` file. The build system offers a solution to prevent it from happening, which is to create the `sdkconfig.defaults` file. This file is never touched by the build system, and can be created manually or automatically. It contains all the options which matter to the given application and are different from the default ones. The format is the same as that of the `sdkconfig` file. The `sdkconfig.defaults` can be created manually when one remembers all the changed configuration, or it can be generated automatically by running the `idf.py save-defconfig` command.

Once `sdkconfig.defaults` is created, `sdkconfig` can be deleted or added to the ignore list of the revision control system (e.g., the `.gitignore` file for git). Project build targets will automatically create the `sdkconfig` file, populate it with the settings from the `sdkconfig.defaults` file, and configure the rest of the settings to their default values. Note that during the build process, settings from `sdkconfig.defaults` will not override those already in `sdkconfig`. For more information, see Custom Sdkconfig Defaults.

2.7.4 Kconfig Format Rules

Format rules for Kconfig files are as follows:

- Option names in any menus should have consistent prefixes. The prefix currently should have at least 3 characters.
- The unit of indentation should be 4 spaces. All sub-items belonging to a parent item are indented by one level deeper. For example, `menu` is indented by 0 spaces, `config menu` by 4 spaces, `help` in `config` by 8 spaces, and the text under `help` by 12 spaces.
- No trailing spaces are allowed at the end of the lines.
- The maximum length of options is 40 characters.
- The maximum length of lines is 120 characters.

Note: The `help` section of each config in the menu is treated as reStructuredText to generate the reference documentation for each option.

Format Checker

`tools/ci/check_kconfigs.py` is provided for checking Kconfig files against the above format rules. The checker checks all Kconfig and Kconfig.projbuild files in the ESP-IDF directory, and generates a new file with suffix `.new` with some suggestions about how to fix issues (if there are any). Please note that the checker cannot correct all format issues and the responsibility of the developer is to final check and make corrections in order to pass the tests. For example, indentations will be corrected if there is not any misleading formatting, but it cannot come up with a common prefix for options inside a menu.

2.7.5 Backward Compatibility of Kconfig Options

The standard Kconfig tools ignore unknown options in `sdkconfig`. So if a developer has custom settings for options which are renamed in newer ESP-IDF releases, then the given setting for the option would be silently ignored. Therefore, several features have been adopted to avoid this:
1. The tool chain uses `kconfgen` to pre-process `sdkconfig` files before anything else. For example, `menuconfig` would read them, so the settings for old options are kept and not ignored.

2. `kconfgen` recursively finds all `sdkconfig.rename` files in ESP-IDF directory which contain old and new Kconfig option names. Old options are replaced by new ones in the `sdkconfig` file. Renamesthat should only appear for a single target can be placed in a target-specific rename file `sdkconfig.rename.TARGET`, where `TARGET` is the target name, e.g., `sdkconfig.rename.esp32s2`.

3. `kconfgen` post-processes `sdkconfig` files and generates all build outputs (`sdkconfig.h`, `sdkconfig.cmake`, and `auto.conf`) by adding a list of compatibility statements, i.e., the values of old options are set for new options after modification. If users still use old options in their code, this will prevent it from breaking.

4. Deprecated options and their replacements are automatically generated by `kconfgen`.

### 2.7.6 Configuration Options Reference

Subsequent sections contain the list of available ESP-IDF options automatically generated from Kconfig files. Note that due to dependencies between options, some options listed here may not be visible by default in `menuconfig`.

By convention, all option names are upper-case letters with underscores. When Kconfig generates `sdkconfig` and `sdkconfig.h` files, option names are prefixed with `CONFIG_`. So if an option `ENABLE_FOO` is defined in a Kconfig file and selected in `menuconfig`, then the `sdkconfig` and `sdkconfig.h` files will have `CONFIG_ENABLE_FOO` defined. In the following sections, option names are also prefixed with `CONFIG_`, same as in the source code.

#### Build type

Contains:

- `CONFIG_APP_COMPATIBLE_PRE_V3_1_BOOTLOADERS`
- `CONFIG_APP_COMPATIBLE_PRE_V2_1_BOOTLOADERS`
- `CONFIG_APP_BUILD_TYPE`
- `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`
- `CONFIG_APP_REPRODUCIBLE_BUILD`
- `CONFIG_APP_NO_BLOBS`

**CONFIG_APP_BUILD_TYPE**

Application build type

*Found in: Build type*

Select the way the application is built.

By default, the application is built as a binary file in a format compatible with the ESP-IDF bootloader. In addition to this application, 2nd stage bootloader is also built. Application and bootloader binaries can be written into flash and loaded/executed from there.

Another option, useful for only very small and limited applications, is to only link the `.elf` file of the application, such that it can be loaded directly into RAM over JTAG or UART. Note that since IRAM and DRAM sizes are very limited, it is not possible to build any complex application this way. However for some kinds of testing and debugging, this option may provide faster iterations, since the application does not need to be written into flash.

Note: when `APP_BUILD_TYPE_RAM` is selected and loaded with JTAG, ESP-IDF does not contain all the startup code required to initialize the CPUs and ROM memory (data/bss). Therefore it is necessary to execute a bit of ROM code prior to executing the application. A gdbinit file may look as follows (for ESP32):

```
# Connect to a running instance of OpenOCD target remote :3333
# Reset and halt the target
mon reset halt  # Run to a specific point in ROM code, # where most of initialization is
```
Execute this gdbinit file as follows:

```
x endorse-esp32-elf-gdb build/app-name.elf -x gdbinit
```

Example gdbinit files for other targets can be found in tools/test_apps/system/gdb_loadable_elf/

When loading the BIN with UART, the ROM will jump to ram and run the app after finishing the ROM startup code, so there’s no additional startup initialization required. You can use the `load_ram` in esp_tool.py to load the generated .bin file into ram and execute.

**Example:** esptool.py -p [port] -b [baud] -no-stub load ram [app.bin]

Recommended `sdkconfig.defaults` for building loadable ELF files is as follows. CONFIG_APP_BUILD_TYPE_RAM is required, other options help reduce application memory footprint.

```
CONFIG_APP_BUILD_TYPE_RAM=y
CONFIG_VFS_SUPPORT_TERMIOS=y
CONFIG_NEWLIB_NANO_FORMAT=y
CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT=y
CONFIG_ESP_DEBUG_STUBS_ENABLE=y
CONFIG_ESP_ERR_TO_NAME_LOOKUP=y
```

**Available options:**
- Default (binary application + 2nd stage bootloader) (`APP_BUILD_TYPE_APP_2NDBOOT`)
- Build app runs entirely in RAM (EXPERIMENTAL) (`APP_BUILD_TYPE_RAM`)

**CONFIG_APP_BUILD_TYPEPURE_RAM_APP**

Build app without SPI_FLASH/PSRAM support (saves ram)

*Found in:* **Build type**

If this option is enabled, external memory and related peripherals, such as Cache, MMU, Flash and PSRAM, won’t be initialized. Corresponding drivers won’t be introduced either. Components that depend on the spi_flash component will also be unavailable, such as app_update, etc. When this option is enabled, about 26KB of RAM space can be saved.

**CONFIG_APP_REPRODUCIBLE_BUILD**

Enable reproducible build

*Found in:* **Build type**

If enabled, all date, time, and path information would be eliminated. A .gdbinit file would be create automatically. (or will be append if you have one already)

**Default value:**
- No (disabled)

**CONFIG_APP_NO_BLOBS**

No Binary Blobs

*Found in:* **Build type**

If enabled, this disables the linking of binary libraries in the application build. Note that after enabling this Wi-Fi/Bluetooth will not work.

**Default value:**
- No (disabled)
**CONFIG_APP_COMPATIBLE_PRE_V2_1_BOOTLOADERS**

App compatible with bootloaders before ESP-IDF v2.1

*Found in: Build type*

Bootloaders before ESP-IDF v2.1 did less initialisation of the system clock. This setting needs to be enabled to build an app which can be booted by these older bootloaders.

If this setting is enabled, the app can be booted by any bootloader from IDF v1.0 up to the current version.

If this setting is disabled, the app can only be booted by bootloaders from IDF v2.1 or newer.

Enabling this setting adds approximately 1KB to the app’s SRAM usage.

**Default value:**
- No (disabled)

**CONFIG_APP_COMPATIBLE_PRE_V3_1_BOOTLOADERS**

App compatible with bootloader and partition table before ESP-IDF v3.1

*Found in: Build type*

Partition tables before ESP-IDF V3.1 do not contain an MD5 checksum field, and the bootloader before ESP-IDF v3.1 cannot read a partition table that contains an MD5 checksum field.

Enable this option only if your app needs to boot on a bootloader and/or partition table that was generated from a version *before* ESP-IDF v3.1.

If this option and Flash Encryption are enabled at the same time, and any data partitions in the partition table are marked Encrypted, then the partition encrypted flag should be manually verified in the app before accessing the partition (see CVE-2021-27926).

**Default value:**
- No (disabled)

**Bootloader config**

Contains:

- `CONFIG_BOOTLOADER_LOG_LEVEL`
- `Bootloader manager`
- `CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION`
- `CONFIG_BOOTLOADER_SPI_WP_PIN`
- `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE`
- `CONFIG_BOOTLOADER_REGION_PROTECTION_ENABLE`
- `CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT`
- `CONFIG_BOOTLOADER_APP_TEST`
- `CONFIG_BOOTLOADER_FACTORY_RESET`
- `CONFIG_BOOTLOADER_HOLD_TIME_GPIO`
- `CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC`
- `CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS`
- `CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON`
- `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP`
- `CONFIG_BOOTLOADER_SPI_CUSTOM_WP_PIN`
- `CONFIG_BOOTLOADER_WDT_ENABLE`
- `CONFIG_BOOTLOADER_VDDSDIO_BOOST`
**Bootloader manager**  Contains:

- `CONFIG_BOOTLOADER_PROJECT_VER`
- `CONFIG_BOOTLOADER_COMPILE_TIME_DATE`

**CONFIG_BOOTLOADER_COMPILE_TIME_DATE**

Use time/date stamp for bootloader

*Found in:* Bootloader config > Bootloader manager

If set, then the bootloader will be built with the current time/date stamp. It is stored in the bootloader description structure. If not set, time/date stamp will be excluded from bootloader image. This can be useful for getting the same binary image files made from the same source, but at different times.

**Default value:**

- Yes (enabled) if `CONFIG_APP_REPRODUCIBLE_BUILD`

**CONFIG_BOOTLOADER_PROJECT_VER**

Project version

*Found in:* Bootloader config > Bootloader manager

Project version. It is placed in “version” field of the esp_bootloader_desc structure. The type of this field is “uint32_t”.

**Range:**

- from 0 to 4294967295

**Default value:**

- 1

**CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION**

Bootloader optimization Level

*Found in:* Bootloader config

This option sets compiler optimization level (gcc -O argument) for the bootloader.

- The default “Size” setting will add the -Os flag to CFLAGS.
- The “Debug” setting will add the -Og flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.

Note that custom optimization levels may be unsupported.

**Available options:**

- Size (-Os) (`BOOTLOADER_COMPILER_OPTIMIZATION_SIZE`)
- Debug (-Og) (`BOOTLOADER_COMPILER_OPTIMIZATION_DEBUG`)
- Optimize for performance (-O2) (`BOOTLOADER_COMPILER_OPTIMIZATION_PERF`)
- Debug without optimization (-O0) (`BOOTLOADER_COMPILER_OPTIMIZATION_NONE`)

**CONFIG_BOOTLOADER_LOG_LEVEL**

Bootloader log verbosity

*Found in:* Bootloader config

Specify how much output to see in bootloader logs.

**Available options:**

- No output (`BOOTLOADER_LOG_LEVEL_NONE`)
- Error (`BOOTLOADER_LOG_LEVEL_ERROR`)
- Warning (`BOOTLOADER_LOG_LEVEL_WARN`)
Chapter 2. API Reference

- Info (BOOTLOADER_LOG_LEVEL_INFO)
- Debug (BOOTLOADER_LOG_LEVEL_DEBUG)
- Verbose (BOOTLOADER_LOG_LEVEL_VERBOSE)

CONFIG_BOOTLOADER_SPI_CUSTOM_WP_PIN

Use custom SPI Flash WP Pin when flash pins set in eFuse (read help)

*Found in: Bootloader config*

This setting is only used if the SPI flash pins have been overridden by setting the eFuses SPI_PAD_CONFIG_xxx, and the SPI flash mode is QIO or QOUT.

When this is the case, the eFuse config only defines 3 of the 4 Quad I/O data pins. The WP pin (aka ESP32 pin “SD_DATA_3” or SPI flash pin “IO2”) is not specified in eFuse. The same pin is also used for external SPIRAM if it is enabled.

If this config item is set to N (default), the correct WP pin will be automatically used for any Espressif chip or module with integrated flash. If a custom setting is needed, set this config item to Y and specify the GPIO number connected to the WP.

*Default value:*

*• No (disabled) if ESPTOOLPY_FLASHMODE_QIO || ESP-TOOLPY_FLASHMODE_QOUT*

CONFIG_BOOTLOADER_SPI_WP_PIN

Custom SPI Flash WP Pin

*Found in: Bootloader config*

The option “Use custom SPI Flash WP Pin” must be set or this value is ignored.

If burning a customized set of SPI flash pins in eFuse and using QIO or QOUT mode for flash, set this value to the GPIO number of the SPI flash WP pin.

*Range:*

*• from 0 to 33 if ESPTOOLPY_FLASHMODE_QIO || ESP-TOOLPY_FLASHMODE_QOUT*

*Default value:*

*• 7 if ESPTOOLPY_FLASHMODE_QIO || ESPTOOLPY_FLASHMODE_QOUT*

CONFIG_BOOTLOADER_VDDSDIO_BOOST

VDDSDIO LDO voltage

*Found in: Bootloader config*

If this option is enabled, and VDDSDIO LDO is set to 1.8V (using eFuse or MTDI bootstrapping pin), bootloader will change LDO settings to output 1.9V instead. This helps prevent flash chip from browning out during flash programming operations.

This option has no effect if VDDSDIO is set to 3.3V, or if the internal VDDSDIO regulator is disabled via eFuse.

*Available options:*

*• 1.8V (BOOTLOADER_VDDSDIO(boost)1.8V)*

*• 1.9V (BOOTLOADER_VDDSDIO_BOOST_1_9V)*

CONFIG_BOOTLOADER_FACTORY_RESET
GPIO triggers factory reset

*Found in: Bootloader config*

Allows to reset the device to factory settings: - clear one or more data partitions; - boot from “factory” partition. The factory reset will occur if there is a GPIO input held at the configured level while device starts up. See settings below.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET**

Number of the GPIO input for factory reset

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

The selected GPIO will be configured as an input with internal pull-up enabled (note that on some SoCs, not all pins have an internal pull-up, consult the hardware datasheet for details.) To trigger a factory reset, this GPIO must be held high or low (as configured) on startup.

**Range:**
- from 0 to 39 if `CONFIG_BOOTLOADER_FACTORY_RESET`

**Default value:**
- 4 if `CONFIG_BOOTLOADER_FACTORY_RESET`

**CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LEVEL**

Factory reset GPIO level

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

Pin level for factory reset, can be triggered on low or high.

**Available options:**
- Reset on GPIO low (BOOTLOADER_FACTORY_RESET_PIN_LOW)
- Reset on GPIO high (BOOTLOADER_FACTORY_RESET_PIN_HIGH)

**CONFIG_BOOTLOADER OTA_DATA_ERASE**

Clear OTA data on factory reset (select factory partition)

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

The device will boot from “factory” partition (or OTA slot 0 if no factory partition is present) after a factory reset.

**CONFIG_BOOTLOADER_DATA_FACTORY_RESET**

Comma-separated names of partitions to clear on factory reset

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

Allows customers to select which data partitions will be erased while factory reset.

Specify the names of partitions as a comma-delimited with optional spaces for readability. (Like this: “nvs, phy_init, ...”) Make sure that the name specified in the partition table and here are the same. Partitions of type “app” cannot be specified here.

**Default value:**
- “nvs” if `CONFIG_BOOTLOADER_FACTORY_RESET`
CONFIG_BOOTLOADER_APP_TEST

GPIO triggers boot from test app partition

*Found in: Bootloader config*

Allows to run the test app from “TEST” partition. A boot from “test” partition will occur if there is a GPIO input pulled low while device starts up. See settings below.

**Default value:**
- No (disabled) if `CONFIG_BOOTLOADER_APP ANTI_ROLLBACK`

CONFIG_BOOTLOADER_NUM_PIN_APP_TEST

Number of the GPIO input to boot TEST partition

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_TEST*

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the old application will boot. (factory or OTA[x]). Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

**Range:**
- from 0 to 39 if `CONFIG_BOOTLOADER_APP_TEST`

**Default value:**
- 18 if `CONFIG_BOOTLOADER_APP_TEST`

CONFIG_BOOTLOADER_APP_TEST_PIN_LEVEL

App test GPIO level

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_TEST*

Pin level for app test, can be triggered on low or high.

**Available options:**
- Enter test app on GPIO low (BOOTLOADER_APP_TEST_PIN_LOW)
- Enter test app on GPIO high (BOOTLOADER_APP_TEST_PIN_HIGH)

CONFIG_BOOTLOADER_HOLD_TIME_GPIO

Hold time of GPIO for reset/test mode (seconds)

*Found in: Bootloader config*

The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

**Default value:**
- 5 if `CONFIG_BOOTLOADER_FACTORY_RESET || CONFIG_BOOTLOADER_APP_TEST`

CONFIG_BOOTLOADER_REGION_PROTECTION_ENABLE

Enable protection for unmapped memory regions

*Found in: Bootloader config*

Protects the unmapped memory regions of the entire address space from unintended accesses. This will ensure that an exception will be triggered whenever the CPU performs a memory operation on unmapped regions of the address space.

**Default value:**
- Yes (enabled)
**CONFIG_BOOTLOADER_WDT_ENABLE**

Use RTC watchdog in start code

*Found in: Bootloader config*

Tracks the execution time of startup code. If the execution time is exceeded, the RTC_WDT will restart system. It is also useful to prevent a lock up in start code caused by an unstable power source. **NOTE:** Tracks the execution time starts from the bootloader code - re-set timeout, while selecting the source for slow_clk - and ends calling app_main. Re-set timeout is needed due to WDT uses a SLOW_CLK clock source. After changing a frequency slow_clk a time of WDT needs to re-set for new frequency. slow_clk depends on RTC_CLK_SRC (INTERNAL_RC or EXTERNALCRYSTAL).

**Default value:**
- Yes (enabled)

**CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE**

Allows RTC watchdog disable in user code

*Found in: Bootloader config > CONFIG_BOOTLOADER_WDT_ENABLE*

If this option is set, the ESP-IDF app must explicitly reset, feed, or disable the rtc_wdt in the app’s own code. If this option is not set (default), then rtc_wdt will be disabled by ESP-IDF before calling the app_main() function.

Use function rtc_wdt_feed() for resetting counter of rtc_wdt. Use function rtc_wdt_disable() for disabling rtc_wdt.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_WDT_TIME_MS**

Timeout for RTC watchdog (ms)

*Found in: Bootloader config > CONFIG_BOOTLOADER_WDT_ENABLE*

Verify that this parameter is correct and more then the execution time. Pay attention to options such as reset to factory, trigger test partition and encryption on boot - these options can increase the execution time. **Note:** RTC_WDT will reset while encryption operations will be performed.

**Range:**
- from 0 to 120000

**Default value:**
- 9000

**CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE**

Enable app rollback support

*Found in: Bootloader config*

After updating the app, the bootloader runs a new app with the “ESP_OOTA_IMG_PENDING_VERIFY” state set. This state prevents the re-run of this app. After the first boot of the new app in the user code, the function should be called to confirm the operability of the app or vice versa about its non-operability. If the app is working, then it is marked as valid. Otherwise, it is marked as not valid and rolls back to the previous working app. A reboot is performed, and the app is booted before the software update. **Note:** If during the first boot a new app the power goes out or the WDT works, then roll back will happen. Rollback is possible only between the apps with the same security versions.

**Default value:**
- No (disabled)
CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK
Enable app anti-rollback support

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE*

This option prevents rollback to previous firmware/application image with lower security version.

**Default value:**
- No (disabled) if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE`

CONFIG_BOOTLOADER_APP_SECURE_VERSION
eFuse secure version of app

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

The secure version is the sequence number stored in the header of each firmware. The security version is set in the bootloader, version is recorded in the eFuse field as the number of set ones. The allocated number of bits in the eFuse field for storing the security version is limited (see `BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD` option).

Bootloader: When bootloader selects an app to boot, an app is selected that has a security version greater or equal that recorded in eFuse field. The app is booted with a higher (or equal) secure version.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.

Your partition table should have a scheme with `ota_0 + ota_1` (without factory).

**Default value:**
- 0 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD
Size of the eFuse secure version field

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

The size of the eFuse secure version field. Its length is limited to 32 bits for ESP32 and 16 bits for ESP32-S2. This determines how many times the security version can be increased.

**Range:**
- from 1 to 32 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`
- from 1 to 16 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

**Default value:**
- 32 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`
- 16 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

CONFIG_BOOTLOADER_EFUSE_SECURE_VERSION_EMULATE
Emulate operations with eFuse secure version (only test)

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

This option allows to emulate read/write operations with all eFuses and eFuse secure version. It allows to test anti-rollback implementation without permanent write eFuse bits. There should be an entry in partition table with following details: `emul_efuse, data, efuse, , 0x2000`.

This option enables: EFUSE_VIRTUAL and EFUSE_VIRTUAL_KEEP_IN_FLASH.

**Default value:**
- No (disabled) if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`
CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP

Skip image validation when exiting deep sleep

*Found in: Bootloader config*

This option disables the normal validation of an image coming out of deep sleep (checksums, SHA256, and signature). This is a trade-off between wakeup performance from deep sleep, and image integrity checks.

Only enable this if you know what you are doing. It should not be used in conjunction with using deep_sleep() entry and changing the active OTA partition as this would skip the validation upon first load of the new OTA partition.

It is possible to enable this option with Secure Boot if “allow insecure options” is enabled, however it’s strongly recommended to NOT enable it as it may allow a Secure Boot bypass.

**Default value:**
- No (disabled) if 
  
  \[
  \text{(CONFIG_SECURE_BOOT \&\& CONFIG_SECURE_BOOT_INSECURE)} \quad \text{||} \\
  \text{CONFIG_SECURE_BOOT}
  \]

CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON

Skip image validation from power on reset (READ HELP FIRST)

*Found in: Bootloader config*

Some applications need to boot very quickly from power on. By default, the entire app binary is read from flash and verified which takes up a significant portion of the boot time.

Enabling this option will skip validation of the app when the SoC boots from power on. Note that in this case it’s not possible for the bootloader to detect if an app image is corrupted in the flash, therefore it’s not possible to safely fall back to a different app partition. Flash corruption of this kind is unlikely but can happen if there is a serious firmware bug or physical damage.

Following other reset types, the bootloader will still validate the app image. This increases the chances that flash corruption resulting in a crash can be detected following soft reset, and the bootloader will fall back to a valid app image. To increase the chances of successfully recovering from a flash corruption event, keep the option BOOTLOADER_WDT_ENABLE enabled and consider also enabling BOOTLOADER_WDT_DISABLE_IN_USER_CODE - then manually disable the RTC Watchdog once the app is running. In addition, enable both the Task and Interrupt watchdog timers with reset options set.

**Default value:**
- No (disabled)

CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS

Skip image validation always (READ HELP FIRST)

*Found in: Bootloader config*

Selecting this option prevents the bootloader from ever validating the app image before booting it. Any flash corruption of the selected app partition will make the entire SoC unbootable.

Although flash corruption is a very rare case, it is not recommended to select this option. Consider selecting “Skip image validation from power on reset” instead. However, if boot time is the only important factor then it can be enabled.

**Default value:**
- No (disabled)
**CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC**

Reserve RTC FAST memory for custom purposes

*Found in: Bootloader config*

This option allows the customer to place data in the RTC FAST memory, this area remains valid when rebooted, except for power loss. This memory is located at a fixed address and is available for both the bootloader and the application. (The application and bootloader must be compiled with the same option). The RTC FAST memory has access only through PRO_CPU.

*Default value:*
- No (disabled)

**CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC_SIZE**

Size in bytes for custom purposes

*Found in: Bootloader config > CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC*

This option reserves in RTC FAST memory the area for custom purposes. If you want to create your own bootloader and save more information in this area of memory, you can increase it. It must be a multiple of 4 bytes. This area (rtc_retain_mem_t) is reserved and has access from the bootloader and an application.

*Default value:*
- 0 if **CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC**

**CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT**

Enable the support for flash chips of XMC (READ HELP FIRST)

*Found in: Bootloader config*

Perform the startup flow recommended by XMC. Please consult XMC for the details of this flow. XMC chips will be forbidden to be used, when this option is disabled.

**DON’T DISABLE THIS UNLESS YOU KNOW WHAT YOU ARE DOING.**

*Default value:*
- Yes (enabled)

**Security features**

Contains:
- **CONFIG_SECURE_BOOT_INSECURE**
- **CONFIG_SECURE_SIGNED_APPS_SCHEME**
- **CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT**
- **CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP**
- **CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_SIZE**
- **CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE**
- **CONFIG_SECURE_FLASH_ENC_ENABLED**
- **CONFIG_SECURE_BOOT**
- **CONFIG_SECURE_BOOT_FLASH_BOOTLOADER_DEFAULT**
- **CONFIG_SECURE_BOOTLOADER_KEY_ENCODING**
- Potentially insecure options
  - **CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT**
  - **CONFIG_SECURE_BOOT_VERIFICATION_KEY**
  - **CONFIG_SECURE_BOOTLOADER_MODE**
  - **CONFIG_SECURE_BOOTBUILD_SIGNED_BINARIES**
  - **CONFIG_SECURE_UART_ROM_DL_MODE**
  - **CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT**
**CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT**

Require signed app images

*Found in: Security features*

Require apps to be signed to verify their integrity.

This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement.

**CONFIG_SECURE_SIGNED_APPS_SCHEME**

App Signing Scheme

*Found in: Security features*

Select the Secure App signing scheme. Depends on the Chip Revision. There are two secure boot versions:

1. **Secure boot V1**
   - Legacy custom secure boot scheme. Supported in ESP32 SoC.

2. **Secure boot V2**
   - RSA based secure boot scheme. Supported in ESP32-ECO3 (ESP32 Chip Revision 3 onwards), ESP32-S2, ESP32-C3, ESP32-S3 SoCs.
   - ECDSA based secure boot scheme. Supported in ESP32-C2 SoC.

**Available options:**

- ECDSA (SECURE_SIGNED_APPS_ECDSA_SCHEME)
  Embeds the ECDSA public key in the bootloader and signs the application with an ECDSA key. Refer to the documentation before enabling.

- RSA (SECURE_SIGNED_APPS_RSA_SCHEME)
  Appends the RSA-3072 based Signature block to the application. Refer to <Secure Boot Version 2 documentation link> before enabling.

- ECDSA (V2) (SECURE_SIGNED_APPS_ECDSA_V2_SCHEME)
  For Secure boot V2 (e.g., ESP32-C2 SoC), appends ECDSA based signature block to the application. Refer to documentation before enabling.

**CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_SIZE**

ECDSA key size

*Found in: Security features*

Select the ECDSA key size. Two key sizes are supported

- 192 bit key using NISTP192 curve
- 256 bit key using NISTP256 curve (Recommended)

The advantage of using 256 bit key is the extra randomness which makes it difficult to be bruteforced compared to 192 bit key. At present, both key sizes are practically implausible to bruteforce.

**Available options:**

- Using ECC curve NISTP192 (SECURE_BOOT_ECDSA_KEY_LEN_192_BITS)
- Using ECC curve NISTP256 (Recommended) (SECURE_BOOT_ECDSA_KEY_LEN_256_BITS)

**CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT**

Bootloader verifies app signatures

*Found in: Security features*
Chapter 2. API Reference

If this option is set, the bootloader will be compiled with code to verify that an app is signed before booting it.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn’t add significant security by itself so most users will want to leave it disabled.

Default value:
- No (disabled) if CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT && SECURITY_SIGNED_APPS_ECDSA_SCHEME

CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT

Verify app signature on update

Found in: Security features

If this option is set, any OTA updated apps will have the signature verified before being considered valid.

When enabled, the signature is automatically checked whenever the esp_ota_ops.h APIs are used for OTA updates, or esp_image_format.h APIs are used to verify apps.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.

Default value:
- Yes (enabled) if CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT

CONFIG_SECURE_BOOT

Enable hardware Secure Boot in bootloader (READ DOCS FIRST)

Found in: Security features

Build a bootloader which enables Secure Boot on first boot.

Once enabled, Secure Boot will not boot a modified bootloader. The bootloader will only load a partition table or boot an app if the data has a verified digital signature. There are implications for reflashing updated apps once secure boot is enabled.

When enabling secure boot, JTAG and ROM BASIC Interpreter are permanently disabled by default.

Default value:
- No (disabled)

CONFIG_SECURE_BOOT_VERSION

Select secure boot version

Found in: Security features > CONFIG_SECURE_BOOT

Select the Secure Boot Version. Depends on the Chip Revision. Secure Boot V2 is the new RSA / ECDSA based secure boot scheme.

- RSA based scheme is supported in ESP32 (Revision 3 onwards), ESP32-S2, ESP32-C3 (ECO3), ESP32-S3.
- ECDSA based scheme is supported in ESP32-C2 SoC.

Please note that, RSA or ECDSA secure boot is property of specific SoC based on its HW design, supported crypto accelerators, die-size, cost and similar parameters. Please note that RSA scheme has requirement for bigger key sizes but at the same time it is comparatively faster than ECDSA verification.

Secure Boot V1 is the AES based (custom) secure boot scheme supported in ESP32 SoC.

Available options:
• Enable Secure Boot version 1 (SECURE_BOOT_V1_ENABLED)
Build a bootloader which enables secure boot version 1 on first boot. Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.

• Enable Secure Boot version 2 (SECURE_BOOT_V2_ENABLED)
Build a bootloader which enables Secure Boot version 2 on first boot. Refer to Secure Boot V2 section of the ESP-IDF Programmer’s Guide for this version before enabling.

**CONFIG_SECURE_BOOTLOADER_MODE**

Secure bootloader mode

*Found in: Security features*

**Available options:**

• One-time flash (SECURE_BOOTLOADER_ONE_TIME_FLASH)
  On first boot, the bootloader will generate a key which is not readable externally or by software. A digest is generated from the bootloader image itself. This digest will be verified on each subsequent boot. Enabling this option means that the bootloader cannot be changed after the first time it is booted.

• Reflashing (SECURE_BOOTLOADER_REFLASHABLE)
  Generate a reusable secure bootloader key, derived (via SHA-256) from the secure boot signing key.
  This allows the secure bootloader to be re-flashed by anyone with access to the secure boot signing key.
  This option is less secure than one-time flash, because a leak of the digest key from one device allows re-flashing of any device that uses it.

**CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES**

Sign binaries during build

*Found in: Security features*

Once secure boot or signed app requirement is enabled, app images are required to be signed.

If enabled (default), these binary files are signed as part of the build process. The file named in “Secure boot private signing key” will be used to sign the image.

If disabled, unsigned app/partition data will be built. They must be signed manually using espsecure.py. Version 1 to enable ECDSA Based Secure Boot and Version 2 to enable RSA based Secure Boot. (for example, on a remote signing server.)

**CONFIG_SECURE_BOOT_SIGNING_KEY**

Secure boot private signing key

*Found in: Security features > CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES*

Path to the key file used to sign app images.

Key file is an ECDSA private key (NIST256p curve) in PEM format for Secure Boot V1. Key file is an RSA private key in PEM format for Secure Boot V2.

Path is evaluated relative to the project directory.

You can generate a new signing key by running the following command: espsecure.py generate_signing_key secure_boot_signing_key.pem

See the Secure Boot section of the ESP-IDF Programmer’s Guide for this version for details.

**Default value:**

• “secure_boot_signing_key.pem” if CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES
**CONFIG_SECURE_BOOT_VERIFICATION_KEY**

Secure boot public signature verification key

*Found in: Security features*

Path to a public key file used to verify signed images. Secure Boot V1: This ECDSA public key is compiled into the bootloader and/or app, to verify app images.

Key file is in raw binary format, and can be extracted from a PEM formatted private key using the espsecure.py extract_public_key command.

Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.

**CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE**

Enable Aggressive key revoke strategy

*Found in: Security features*

If this option is set, ROM bootloader will revoke the public key digest burned in efuse block if it fails to verify the signature of software bootloader with it. Revocation of keys does not happen when enabling secure boot. Once secure boot is enabled, key revocation checks will be done on subsequent boot-up, while verifying the software bootloader

This feature provides a strong resistance against physical attacks on the device.

NOTE: Once a digest slot is revoked, it can never be used again to verify an image. This can lead to permanent bricking of the device, in case all keys are revoked because of signature verification failure.

*Default value:*

- No (disabled) if CONFIG_SECURE_BOOT && SOC_SUPPORT_SECURE_BOOT_REVOKE_KEY

**CONFIG_SECURE_BOOT_FLASH_BOOTLOADER_DEFAULT**

Flash bootloader along with other artifacts when using the default flash command

*Found in: Security features*

When Secure Boot V2 is enabled, by default the bootloader is not flashed along with other artifacts like the application and the partition table images, i.e. bootloader has to be separately flashed using the command idf.py bootloader flash, whereas, the application and partition table can be flashed using the command idf.py flash itself. Enabling this option allows flashing the bootloader along with the other artifacts by invocation of the command idf.py flash.

If this option is enabled make sure that even the bootloader is signed using the correct secure boot key, otherwise the bootloader signature verification would fail, as hash of the public key which is present in the bootloader signature would not match with the digest stored into the efuses and thus the device will not be able to boot up.

*Default value:*

- No (disabled) if SECURE_BOOT_V2_ENABLED && CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES

**CONFIG_SECURE_BOOTLOADER_KEY_ENCODING**

Hardware Key Encoding

*Found in: Security features*

In reflashable secure bootloader mode, a hardware key is derived from the signing key (with SHA-256) and can be written to eFuse with espfuse.py.

Normally this is a 256-bit key, but if 3/4 Coding Scheme is used on the device then the eFuse key is truncated to 192 bits.
This configuration item doesn’t change any firmware code, it only changes the size of key binary which is generated at build time.

**Available options:**
- No encoding (256 bit key) (SECURE_BOOTLOADER_KEY_ENCODING_256BIT)
- 3/4 encoding (192 bit key) (SECURE_BOOTLOADER_KEY_ENCODING_192BIT)

**CONFIG_SECURE_BOOT_INSECURE**

Allow potentially insecure options

*Found in: Security features*

You can disable some of the default protections offered by secure boot, in order to enable testing or a custom combination of security features.

Only enable these options if you are very sure.

Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.

**Default value:**
- No (disabled) if CONFIG_SECURE_BOOT

**CONFIG_SECURE_FLASH_ENC_ENABLED**

Enable flash encryption on boot (READ DOCS FIRST)

*Found in: Security features*

If this option is set, flash contents will be encrypted by the bootloader on first boot.

Note: After first boot, the system will be permanently encrypted. Re-flashing an encrypted system is complicated and not always possible.

Read Flash Encryption before enabling.

**Default value:**
- No (disabled)

**CONFIG_SECURE_FLASH_ENCRYPTION_KEYSIZE**

Size of generated XTS-AES key

*Found in: Security features > CONFIG_SECURE_FLASH_ENC_ENABLED*

Size of generated XTS-AES key.

- AES-128 uses a 256-bit key (32 bytes) derived from 128 bits (16 bytes) burned in half Efuse key block. Internally, it calculates SHA256(128 bits)
- AES-128 uses a 256-bit key (32 bytes) which occupies one Efuse key block.
- AES-256 uses a 512-bit key (64 bytes) which occupies two Efuse key blocks.

This setting is ignored if either type of key is already burned to Efuse before the first boot. In this case, the pre-burned key is used and no new key is generated.

**Available options:**
- AES-128 key derived from 128 bits (SHA256(128 bits)) (SECURE_FLASH_ENCRYPTION_AES128_DERIVED)
- AES-128 (256-bit key) (SECURE_FLASH_ENCRYPTION_AES128)
- AES-256 (512-bit key) (SECURE_FLASH_ENCRYPTION_AES256)
CONFIG_SECURE_FLASH_ENCRYPTION_MODE

Enable usage mode

*Found in: Security features > CONFIG_SECURE_FLASH_ENC_ENABLED*

By default Development mode is enabled which allows ROM download mode to perform flash encryption operations (plaintext sent to the device, and it encrypts it internally and writes ciphertext to flash.) This mode is not secure, it’s possible for an attacker to write their own chosen plaintext to flash.

Release mode should always be selected for production or manufacturing. Once enabled it’s no longer possible for the device in ROM Download Mode to use the flash encryption hardware.

When EFUSE_VIRTUAL is enabled, SECURE_FLASH_ENCRYPTION_MODE_RELEASE is not available. For CI tests we use IDF_CI_BUILD to bypass it ("export IDF_CI_BUILD=1"). We do not recommend bypassing it for other purposes.

Refer to the Flash Encryption section of the ESP-IDF Programmer’s Guide for details.

**Available options:**

- Development (NOT SECURE) (SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT)
- Release (SECURE_FLASH_ENCRYPTION_MODE_RELEASE)

**Potentially insecure options**

Contains:

- CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS
- CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION
- CONFIG_SECURE_BOOT_ALLOW_JTAG
- CONFIG_SECURE_BOOT_ALLOW_ROM_BASIC
- CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_DEC
- CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC
- CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE
- CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS
- CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED
- CONFIG_SECURE_FLASH_SKIP_WRITE_PROTECTION_CACHE

CONFIG_SECURE_BOOT_ALLOW_ROM_BASIC

Leave ROM BASIC Interpreter available on reset

*Found in: Security features > Potentially insecure options*

By default, the BASIC ROM Console starts on reset if no valid bootloader is read from the flash.

When either flash encryption or secure boot are enabled, the default is to disable this BASIC fallback mode permanently via eFuse.

If this option is set, this eFuse is not burned and the BASIC ROM Console may remain accessible. Only set this option in testing environments.

**Default value:**

- No (disabled) if CONFIG_SECURE_BOOT_INSECURE || SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

CONFIG_SECURE_BOOT_ALLOW_JTAG

Allow JTAG Debugging

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable JTAG (across entire chip) on first boot when either secure boot or flash encryption is enabled.

Setting this option leaves JTAG on for debugging, which negates all protections of flash encryption and some of the protections of secure boot.
Only set this option in testing environments.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE || SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

### CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION

Allow app partition length not 64KB aligned

**Found in:** Security features > Potentially insecure options

If not set (default), app partition size must be a multiple of 64KB. App images are padded to 64KB length, and the bootloader checks any trailing bytes after the signature (before the next 64KB boundary) have not been written. This is because flash cache maps entire 64KB pages into the address space. This prevents an attacker from appending unverified data after the app image in the flash, causing it to be mapped into the address space.

Setting this option allows the app partition length to be unaligned, and disables padding of the app image to this length. It is generally not recommended to set this option, unless you have a legacy partitioning scheme which doesn’t support 64KB aligned partition lengths.

### CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS

Allow additional read protecting of efuses

**Found in:** Security features > Potentially insecure options

If not set (default, recommended), on first boot the bootloader will burn the WR_DIS_RD_DIS efuse when Secure Boot is enabled. This prevents any more efuses from being read protected.

If this option is set, it will remain possible to write the EFUSE_RD_DIS efuse field after Secure Boot is enabled. This may allow an attacker to read-protect the BLK2 efuse (for ESP32) and BLOCK4-BLOCK10 (i.e. BLOCK_KEY0-BLOCK_KEY5) (for other chips) holding the public key digest, causing an immediate denial of service and possibly allowing an additional fault injection attack to bypass the signature protection.

**NOTE:** Once a BLOCK is read-protected, the application will read all zeros from that block

**NOTE:** If “UART ROM download mode (Permanently disabled (recommended))” or “UART ROM download mode (Permanently switch to Secure mode (recommended))” is set, then it is **NOT** possible to read/write efuses using espfuse.py utility. However, efuse can be read/written from the application

### CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS

Leave unused digest slots available (not revoke)

**Found in:** Security features > Potentially insecure options

If not set (default), during startup in the app all unused digest slots will be revoked. To revoke unused slot will be called esp_efuse_set_digest_revoke(num_digest) for each digest. Revoking unused digest slots makes ensures that no trusted keys can be added later by an attacker. If set, it means that you have a plan to use unused digests slots later.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE && SOC_EFUSE_REVOKE_BOOT_KEY_DIGESTS`
**CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC**
Leave UART bootloader encryption enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader encryption access on first boot. If set, the UART bootloader will still be able to access hardware encryption.

It is recommended to only set this option in testing environments.

**Default value:**
- No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

**CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_DEC**
Leave UART bootloader decryption enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader decryption access on first boot. If set, the UART bootloader will still be able to access hardware decryption.

Only set this option in testing environments. Setting this option allows complete bypass of flash encryption.

**Default value:**
- No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

**CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE**
Leave UART bootloader flash cache enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader flash cache access on first boot. If set, the UART bootloader will still be able to access the flash cache.

Only set this option in testing environments.

**Default value:**
- No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

**CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED**
Require flash encryption to be already enabled

*Found in: Security features > Potentially insecure options*

If not set (default), and flash encryption is not yet enabled in eFuses, the 2nd stage bootloader will enable flash encryption: generate the flash encryption key and program eFuses. If this option is set, and flash encryption is not yet enabled, the bootloader will error out and reboot. If flash encryption is enabled in eFuses, this option does not change the bootloader behavior.

Only use this option in testing environments, to avoid accidentally enabling flash encryption on the wrong device. The device needs to have flash encryption already enabled using espefuse.py.

**Default value:**
- No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

**CONFIG_SECURE_FLASH_SKIP_WRITE_PROTECTION_CACHE**
Skip write-protection of DIS_CACHE (DIS_ICACHE, DIS_DCACHE)

*Found in: Security features > Potentially insecure options*
If not set (default, recommended), on the first boot the bootloader will burn the write-protection of DIS_CACHE (for ESP32) or DIS_ICACHE/DIS_DCACHE (for other chips) eFuse when Flash Encryption is enabled. Write protection for cache disable eFuse prevents the chip from being blocked if it is set by accident. App and bootloader use cache so disabling it makes the chip useless for IDF. Due to other eFuses are linked with the same write protection bit (see the list below) then write-protection will not be done if these SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC, SECURE_BOOT_ALLOW_JTAG or SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE options are selected to give a chance to turn on the chip into the release model later.

List of eFuses with the same write protection bit: ESP32: MAC, MAC_CRC, DISABLE_APP_CPU, DISABLE_BT, DIS_CACHE, VOL_LEVEL_HP_INV.

ESP32-C3: DIS_ICACHE, DIS_USB_JTAG, DIS_DOWNLOAD_ICACHE, DIS_USB_SERIAL_JTAG, DIS_FORCE_DOWNLOAD, DIS_TWAI, JTAG_SEL_ENABLE, DIS_PAD_JTAG, DIS_DOWNLOAD_MANUAL_ENCRYPT.

ESP32-C6: SWAP_UART_SDIO_EN, DIS_ICACHE, DIS_USB_JTAG, DIS_DOWNLOAD_ICACHE, DIS_USB_SERIAL_JTAG, DIS_FORCE_DOWNLOAD, DIS_TWAI, JTAG_SEL_ENABLE, DIS_PAD_JTAG, DIS_DOWNLOAD_MANUAL_ENCRYPT.

ESP32-H2: DIS_ICACHE, DIS_USB_JTAG, POWERGLITCH_EN, DIS_FORCE_DOWNLOAD, SPL_DOWNLOAD_MSPI_DIS, DIS_TWAI, JTAG_SEL_ENABLE, DIS_PAD_JTAG, DIS_DOWNLOAD_MANUAL_ENCRYPT.

ESP32-S2: DIS_ICACHE, DIS_DCACHE, DIS_DOWNLOAD_ICACHE, DIS_DOWNLOAD_DCACHE, DIS_FORCE_DOWNLOAD, DIS_USB, DIS_TWAI, DIS_BOOT_REMAP, SOFT_DIS_JTAG, HARD_DIS_JTAG, DIS_DOWNLOAD_MANUAL_ENCRYPT.

ESP32-S3: DIS_ICACHE, DIS_DCACHE, DIS_DOWNLOAD_ICACHE, DIS_DOWNLOAD_DCACHE, DIS_FORCE_DOWNLOAD, DIS_USB_OTG, DIS_TWAI, DIS_APP_CPU, DIS_PAD_JTAG, DIS_DOWNLOAD_MANUAL_ENCRYPT, DIS_USB_JTAG, DIS_USB_SERIAL_JTAG, STRAP_JTAG_SEL, USB_PHY_SEL.

**CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP**

Check Flash Encryption enabled on app startup

*Found in: Security features*

If set (default), in an app during startup code, there is a check of the flash encryption eFuse bit is on (as the bootloader should already have set it). The app requires this bit is on to continue work otherwise abort.

If not set, the app does not care if the flash encryption eFuse bit is set or not.

*Default value:*

- Yes (enabled) if `CONFIG_SECURE_FLASH_ENC_ENABLED`

**CONFIG_SECURE_UART_ROM_DL_MODE**

UART ROM download mode

*Found in: Security features*

*Available options:*

- UART ROM download mode (Permanently disabled (recommended)) (SECURE_DISABLE_ROM_DL_MODE)

  If set, during startup the app will burn an eFuse bit to permanently disable the UART ROM Download Mode. This prevents any future use of esptool.py, espefuse.py and similar tools. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.

  It is recommended to enable this option in any production application where Flash Encryption and/or Secure Boot is enabled and access to Download Mode is not required.

Espressif Systems 1583 Release v5.2-dev-3318-g8fc8f3f479
Submit Document Feedback
It is also possible to permanently disable Download Mode by calling esp_efuse_disable_rom_download_mode() at runtime.

- UART ROM download mode (Permanently switch to Secure mode (recommended)) (SECURE_ENABLE_SECURE_ROM_DL_MODE)
  If set, during startup the app will burn an eFuse bit to permanently switch the UART ROM Download Mode into a separate Secure Download mode. This option can only work if Download Mode is not already disabled by eFuse.
  Secure Download mode limits the use of Download Mode functions to update SPI config, changing baud rate, basic flash write and a command to return a summary of currently enabled security features (get_security_info).
  Secure Download mode is not compatible with the esptool.py flasher stub feature, espfuse.py, read/writing memory or registers, encrypted download, or any other features that interact with unsupported Download Mode commands.
  Secure Download mode should be enabled in any application where Flash Encryption and/or Secure Boot is enabled. Disabling this option does not immediately cancel the benefits of the security features, but it increases the potential “attack surface” for an attacker to try and bypass them with a successful physical attack.
  It is also possible to enable secure download mode at runtime by calling esp_efuse_enable_rom_secure_download_mode()
  Note: Secure Download mode is not available for ESP32 (includes revisions till ECO3).

- UART ROM download mode (Enabled (not recommended)) (SECURE_INSECURE_ALLOW_DL_MODE)
  This is a potentially insecure option. Enabling this option will allow the full UART download mode to stay enabled. This option SHOULD NOT BE ENABLED for production use cases.

**Application manager**

Contains:

- CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR
- CONFIG_APP_EXCLUDE_PROJECT_VER_VAR
- CONFIG_APP_PROJECT_VER_FROM_CONFIG
- CONFIG_APP_RETRIEVE_LEN_ELF_SHA
- CONFIG_APP_COMPILE_TIME_DATE

**CONFIG_APP_COMPILE_TIME_DATE**

Use time/date stamp for app

*Found in: Application manager*

If set, then the app will be built with the current time/date stamp. It is stored in the app description structure. If not set, time/date stamp will be excluded from app image. This can be useful for getting the same binary image files made from the same source, but at different times.

*Default value:*
- Yes (enabled) if CONFIG_APP_REPRODUCIBLE_BUILD

**CONFIG_APP_EXCLUDE_PROJECT_VER_VAR**

Exclude PROJECT_VER from firmware image

*Found in: Application manager*

The PROJECT_VER variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

*Default value:*
- No (disabled)
**CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR**
Exclude PROJECT_NAME from firmware image

*Found in: Application manager*

The PROJECT_NAME variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

*Default value:*
- No (disabled)

**CONFIG_APP_PROJECT_VER_FROM_CONFIG**
Get the project version from Kconfig

*Found in: Application manager*

If this is enabled, then config item APP_PROJECT_VER will be used for the variable PROJECT_VER. Other ways to set PROJECT_VER will be ignored.

*Default value:*
- No (disabled)

**CONFIG_APP_PROJECT_VER**
Project version

*Found in: Application manager > CONFIG_APP_PROJECT_VER_FROM_CONFIG*

Project version

*Default value:*
- 1 if CONFIG_APP_PROJECT_VER_FROM_CONFIG

**CONFIG_APP_RETRIEVE_LEN_ELF_SHA**
The length of APP ELF SHA is stored in RAM(chars)

*Found in: Application manager*

At startup, the app will read the embedded APP ELF SHA-256 hash value from flash and convert it into a string and store it in a RAM buffer. This ensures the panic handler and core dump will be able to print this string even when cache is disabled. The size of the buffer is APP_RETRIEVE_LEN_ELF_SHA plus the null terminator. Changing this value will change the size of this buffer, in bytes.

*Range:*
- from 8 to 64

*Default value:*
- 9

**Serial flasher config**

Contains:
- `CONFIG_ESPTOOLPY_AFTER`
- `CONFIG_ESPTOOLPY_BEFORE`
- `CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE`
- `CONFIG_ESPTOOLPY_NO_STUB`
- `CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE`
- `CONFIG_ESPTOOLPY_FLASHSIZE`
- `CONFIG_ESPTOOLPY_FLASHMODE`
- `CONFIG_ESPTOOLPY_FLASHFREQ`
CONFIG_ESPTOOLPY_NO_STUB

Disable download stub

Found in: Serial flasher config

The flasher tool sends a precompiled download stub first by default. That stub allows things like compressed downloads and more. Usually you should not need to disable that feature

Default value:
- No (disabled) if CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

CONFIG_ESPTOOLPY_FLASHMODE

Flash SPI mode

Found in: Serial flasher config

Mode the flash chip is flashed in, as well as the default mode for the binary to run in.

Available options:
- QIO (ESPTOOLPY_FLASHMODE_QIO)
- QOUT (ESPTOOLPY_FLASHMODE_QOUT)
- DIO (ESPTOOLPY_FLASHMODE_DIO)
- DOUT (ESPTOOLPY_FLASHMODE_DOUT)
- OPI (ESPTOOLPY_FLASHMODE_OPI)

CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE

Flash Sampling Mode

Found in: Serial flasher config

Available options:
- STR Mode (ESPTOOLPY_FLASH_SAMPLE_MODE_STR)
- DTR Mode (ESPTOOLPY_FLASH_SAMPLE_MODE_DTR)

CONFIG_ESPTOOLPY_FLASHFREQ

Flash SPI speed

Found in: Serial flasher config

Available options:
- 120 MHz (ESPTOOLPY_FLASHFREQ_120M)
  - Flash 120 MHz SDR mode is stable.
  - Flash 120 MHz DDR mode is an experimental feature, it works when the temperature is stable.
  - **Risks**: If your chip powers on at a certain temperature, then after the temperature increases or decreases by approximately 20 Celsius degrees (depending on the chip), the program will crash randomly.
- 80 MHz (ESPTOOLPY_FLASHFREQ_80M)
- 64 MHz (ESPTOOLPY_FLASHFREQ_64M)
- 60 MHz (ESPTOOLPY_FLASHFREQ_60M)
- 48 MHz (ESPTOOLPY_FLASHFREQ_48M)
- 40 MHz (ESPTOOLPY_FLASHFREQ_40M)
- 32 MHz (ESPTOOLPY_FLASHFREQ_32M)
- 30 MHz (ESPTOOLPY_FLASHFREQ_30M)
- 26 MHz (ESPTOOLPY_FLASHFREQ_26M)
- 24 MHz (ESPTOOLPY_FLASHFREQ_24M)
- 20 MHz (ESPTOOLPY_FLASHFREQ_20M)
- 16 MHz (ESPTOOLPY_FLASHFREQ_16M)
- 15 MHz (ESPTOOLPY_FLASHFREQ_15M)
**CONFIG_ESPTOOLPY_FLASHSIZE**

Flash size

*Found in: Serial flasher config*

SPI flash size, in megabytes

**Available options:**

- 1 MB (ESPTOOLPY_FLASHSIZE_1MB)
- 2 MB (ESPTOOLPY_FLASHSIZE_2MB)
- 4 MB (ESPTOOLPY_FLASHSIZE_4MB)
- 8 MB (ESPTOOLPY_FLASHSIZE_8MB)
- 16 MB (ESPTOOLPY_FLASHSIZE_16MB)
- 32 MB (ESPTOOLPY_FLASHSIZE_32MB)
- 64 MB (ESPTOOLPY_FLASHSIZE_64MB)
- 128 MB (ESPTOOLPY_FLASHSIZE_128MB)

**CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE**

Detect flash size when flashing bootloader

*Found in: Serial flasher config*

If this option is set, flashing the project will automatically detect the flash size of the target chip and update the bootloader image before it is flashed.

Enabling this option turns off the image protection against corruption by a SHA256 digest. Updating the bootloader image before flashing would invalidate the digest.

**Default value:**

- No (disabled) if `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`

**CONFIG_ESPTOOLPY_BEFORE**

Before flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 before flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

**Available options:**

- Reset to bootloader (ESPTOOLPY_BEFORE_RESET)
- No reset (ESPTOOLPY_BEFORE_NORESET)

**CONFIG_ESPTOOLPY_AFTER**

After flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 after flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

**Available options:**

- Reset after flashing (ESPTOOLPY_AFTER_RESET)
- Stay in bootloader (ESPTOOLPY_AFTER_NORESET)
Chapter 2. API Reference

Partition Table

Contains:

- `CONFIG_PARTITION_TABLE_CUSTOM_FILENAME`
- `CONFIG_PARTITION_TABLE_MD5`
- `CONFIG_PARTITION_TABLE_OFFSET`
- `CONFIG_PARTITION_TABLE_TYPE`

**CONFIG_PARTITION_TABLE_TYPE**

Partition Table

*Found in: Partition Table*

The partition table to flash to the ESP32. The partition table determines where apps, data and other resources are expected to be found.

The predefined partition table CSV descriptions can be found in the components/partition_table directory. These are mostly intended for example and development use, it’s expect that for production use you will copy one of these CSV files and create a custom partition CSV for your application.

**Available options:**

- **Single factory app, no OTA** (PARTITION_TABLE_SINGLE_APP)
  This is the default partition table, designed to fit into a 2MB or larger flash with a single 1MB app partition.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp.csv
  This partition table is not suitable for an app that needs OTA (over the air update) capability.
- **Single factory app (large), no OTA** (PARTITION_TABLE_SINGLE_APP_LARGE)
  This is a variation of the default partition table, that expands the 1MB app partition size to 1.5MB to fit more code.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_large.csv
  This partition table is not suitable for an app that needs OTA (over the air update) capability.
- **Factory app, two OTA definitions** (PARTITION_TABLE_TWO_OTA)
  This is a basic OTA-enabled partition table with a factory app partition plus two OTA app partitions. All are 1MB, so this partition table requires 4MB or larger flash size.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_two_ota.csv
- **Custom partition table CSV** (PARTITION_TABLE_CUSTOM)
  Specify the path to the partition table CSV to use for your project.
  Consult the Partition Table section in the ESP-IDF Programmers Guide for more information.
- **Single factory app, no OTA, encrypted NVS** (PARTITION_TABLE_SINGLE_APP_ENCRYPTED_NVS)
  This is a variation of the default “Single factory app, no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_encr_nvs.csv
- **Single factory app (large), no OTA, encrypted NVS** (PARTITION_TABLE_SINGLE_APP_LARGE_ENC_NVS)
  This is a variation of the “Single factory app (large), no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_large_encr_nvs.csv
- **Factory app, two OTA definitions, encrypted NVS** (PARTITION_TABLE_TWO_OTA_ENCRYPTED_NVS)
Chapter 2. API Reference

This is a variation of the “Factory app, two OTA definitions” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.

The corresponding CSV file in the IDF directory is components/partition_table/partitions_two OTA_encr_nvs.csv

**CONFIG_PARTITION_TABLE_CUSTOM_FILENAME**

Custom partition CSV file

*Found in: Partition Table*

Name of the custom partition CSV filename. This path is evaluated relative to the project root directory.

*Default value:*

- “partitions.csv”

**CONFIG_PARTITION_TABLE_OFFSET**

Offset of partition table

*Found in: Partition Table*

The address of partition table (by default 0x8000). Allows you to move the partition table, it gives more space for the bootloader. Note that the bootloader and app will both need to be compiled with the same PARTITION_TABLE_OFFSET value.

This number should be a multiple of 0x1000.

Note that partition offsets in the partition table CSV file may need to be changed if this value is set to a higher value. To have each partition offset adapt to the configured partition table offset, leave all partition offsets blank in the CSV file.

*Default value:*

- “0x8000”

**CONFIG_PARTITION_TABLE_MD5**

Generate an MD5 checksum for the partition table

*Found in: Partition Table*

Generate an MD5 checksum for the partition table for protecting the integrity of the table. The generation should be turned off for legacy bootloaders which cannot recognize the MD5 checksum in the partition table.

*Default value:*

- Yes (enabled) if CONFIG_APP_COMPATIBLE_PRE_V3_1_BOOTLOADERS

**Compiler options**

Contains:

- CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL
- CONFIG_COMPILER_FLOAT_LIB_FROM
- CONFIG_COMPILER_RT_LIB
- CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT
- CONFIG_COMPILER_DISABLE_GCC12_WARNINGS
- CONFIG_COMPILER_DUMP_RTL_FILES
- CONFIG_COMPILER_WARN_WRITE_STRINGS
- CONFIG_COMPILER_CXX_EXCEPTIONS
- CONFIG_COMPILER_CXX_RTTI
- CONFIG_COMPILER_OPTIMIZATION
• CONFIG_COMPILER_HIDE_PATHS_MACROS
• CONFIG_COMPILER_STACK_CHECK_MODE

CONFIG_COMPILER_OPTIMIZATION

Optimization Level

*Found in: Compiler options*

This option sets compiler optimization level (gcc -O argument) for the app.

- The “Debug” setting will add the -Og flag to CFLAGS.
- The “Size” setting will add the -Os flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.

The “Size” setting causes the compiled code to be smaller and faster, but may lead to difficulties of correlating code addresses to source file lines when debugging.

The “Performance” setting causes the compiled code to be larger and faster, but will be easier to correlated code addresses to source file lines.

“None” with -O0 produces compiled code without optimization.

Note that custom optimization levels may be unsupported.

Compiler optimization for the IDF bootloader is set separately, see the BOOT-LOADER_COMPILER_OPTIMIZATION setting.

*Available options:*

- Debug (-Og) (COMPILER_OPTIMIZATION_DEBUG)
- Optimize for size (-Os) (COMPILER_OPTIMIZATION_SIZE)
- Optimize for performance (-O2) (COMPILER_OPTIMIZATION_PERF)
- Debug without optimization (-O0) (COMPILER_OPTIMIZATION_NONE)

CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL

Assertion level

*Found in: Compiler options*

Assertions can be:

- Enabled. Failure will print verbose assertion details. This is the default.
- Set to “silent” to save code size (failed assertions will abort() but user needs to use the aborting address to find the line number with the failed assertion.)
- Disabled entirely (not recommended for most configurations.) -DNDEBUG is added to CPPFLAGS in this case.

*Available options:*

- Enabled (COMPILER_OPTIMIZATION_ASSERTIONS_ENABLE)
  Enable assertions. Assertion content and line number will be printed on failure.
- Silent (saves code size) (COMPILER_OPTIMIZATION_ASSERTIONS_SILENT)
  Enable silent assertions. Failed assertions will abort(), user needs to use the aborting address to find the line number with the failed assertion.
- Disabled (sets -DNDEBUG) (COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE)
  If assertions are disabled, -DNDEBUG is added to CPPFLAGS.

CONFIG_COMPILER_FLOAT_LIB_FROM

Compiler float lib source

*Found in: Compiler options*
In the soft-fp part of libgcc, riscv version is written in C, and handles all edge cases in IEEE754, which makes it larger and performance is slow.

RVfplib is an optimized RISC-V library for FP arithmetic on 32-bit integer processors, for single and double-precision FP. RVfplib is “fast”, but it has a few exceptions from IEEE 754 compliance.

Available options:
- libgcc (COMPILER_FLOAT_LIB_FROM_GCCLIB)
- librvfp (COMPILER_FLOAT_LIB_FROM_RVFPLIB)

**CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT**

Disable messages in ESP_RETURN_ON_ * and ESP_EXIT_ON_ * macros

*Found in: Compiler options*

If enabled, the error messages will be discarded in following check macros: - ESP_RETURN_ON_ERROR - ESP_EXIT_ON_ERROR - ESP_RETURN_ON_FALSE - ESP_EXIT_ON_FALSE

*Default value:*
- No (disabled)

**CONFIG_COMPILER_HIDE_PATHS_MACROS**

Replace ESP-IDF and project paths in binaries

*Found in: Compiler options*

When expanding the __FILE__ and __BASE_FILE__ macros, replace paths inside ESP-IDF with paths relative to the placeholder string “IDF” , and convert paths inside the project directory to relative paths.

This allows building the project with assertions or other code that embeds file paths, without the binary containing the exact path to the IDF or project directories.

This option passes -fmacro-prefix-map options to the GCC command line. To replace additional paths in your binaries, modify the project CMakeLists.txt file to pass custom -fmacro-prefix-map or -ffile-prefix-map arguments.

*Default value:*
- Yes (enabled)

**CONFIG_COMPILER_CXX_EXCEPTIONS**

Enable C++ exceptions

*Found in: Compiler options*

Enabling this option compiles all IDF C++ files with exception support enabled.

Disabling this option disables C++ exception support in all compiled files, and any libstdc++ code which throws an exception will abort instead.

Enabling this option currently adds an additional ~500 bytes of heap overhead when an exception is thrown in user code for the first time.

*Default value:*
- No (disabled)

Contains:
- **CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE**
CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE

Emergency Pool Size

*Found in: Compiler options > CONFIG_COMPILER_CXX_EXCEPTIONS*

Size (in bytes) of the emergency memory pool for C++ exceptions. This pool will be used to allocate memory for thrown exceptions when there is not enough memory on the heap.

*Default value:*

- 0 if CONFIG_COMPILER_CXX_EXCEPTIONS

CONFIG_COMPILER_CXX_RTTI

Enable C++ run-time type info (RTTI)

*Found in: Compiler options*

Enabling this option compiles all C++ files with RTTI support enabled. This increases binary size (typically by tens of kB) but allows using dynamic_cast conversion and typeid operator.

*Default value:*

- No (disabled)

CONFIG_COMPILER_STACK_CHECK_MODE

Stack smashing protection mode

*Found in: Compiler options*

Stack smashing protection mode. Emit extra code to check for buffer overflows, such as stack smashing attacks. This is done by adding a guard variable to functions with vulnerable objects. The guards are initialized when a function is entered and then checked when the function exits. If a guard check fails, program is halted. Protection has the following modes:

- In NORMAL mode (GCC flag: -fstack-protector) only functions that call alloca, and functions with buffers larger than 8 bytes are protected.
- STRONG mode (GCC flag: -fstack-protector-strong) is like NORMAL, but includes additional functions to be protected – those that have local array definitions, or have references to local frame addresses.
- In OVERALL mode (GCC flag: -fstack-protector-all) all functions are protected.

Modes have the following impact on code performance and coverage:

- performance: NORMAL > STRONG > OVERALL
- coverage: NORMAL < STRONG < OVERALL

The performance impact includes increasing the amount of stack memory required for each task.

*Available options:*

- None (COMPILER_STACK_CHECK_MODE_NONE)
- Normal (COMPILER_STACK_CHECK_MODE_NORM)
- Strong (COMPILER_STACK_CHECK_MODE_STRONG)
- Overall (COMPILER_STACK_CHECK_MODE_ALL)

CONFIG_COMPILER_WARN_WRITE_STRINGS

Enable -Wwrite-strings warning flag

*Found in: Compiler options*

Adds -Wwrite-strings flag for the C/C++ compilers.

For C, this gives string constants the type `const char[]` so that copying the address of one into a non-const `char *` pointer produces a warning. This warning helps to find at compile time code that tries to write into a string constant.
For C++, this warns about the deprecated conversion from string literals to `char`.*.

**Default value:**
- No (disabled)

**CONFIG_COMPILER_DISABLE_GCC12_WARNINGS**

Disable new warnings introduced in GCC 12

*Found in:* Compiler options

Enable this option if use GCC 12 or newer, and want to disable warnings which don’t appear with GCC 11.

*Default value:*
- No (disabled)

**CONFIG_COMPILER_DUMP_RTL_FILES**

Dump RTL files during compilation

*Found in:* Compiler options

If enabled, RTL files will be produced during compilation. These files can be used by other tools, for example to calculate call graphs.

**CONFIG_COMPILER_RT_LIB**

Compiler runtime library

*Found in:* Compiler options

Select runtime library to be used by compiler. - GCC toolchain supports libgcc only. - Clang allows to choose between libgcc or libclang_rt. - For host builds ( “linux” target), uses the default library.

*Available options:*
- libgcc (COMPILER_RT_LIB_GCCLIB)
- libclang_rt (COMPILER_RT_LIB_CLANGRT)
- Host (COMPILER_RT_LIB_HOST)

**Component config**

Contains:

- ADC and ADC Calibration
- Application Level Tracing
- Bluetooth
- Common ESP-related
- Core dump
- Driver Configurations
- eFuse Bit Manager
- CONFIG_BLE_MESH
- ESP HTTP client
- ESP HTTPS OTA
- ESP HTTPS server
- ESP NETIF Adapter
- ESP PSRAM
- ESP Ringbuf
- ESP System Settings
- ESP-MQTT Configurations
- ESP-TLS
Chapter 2. API Reference

- Event Loop Library
- FAT Filesystem support
- FreeRTOS
- GDB Stub
- Hardware Abstraction Layer (HAL) and Low Level (LL)
- Hardware Settings
- Heap memory debugging
- High resolution timer (esp_timer)
- HTTP Server
- IEEE 802.15.4
- IPC (Inter-Processor Call)
- LCD and Touch Panel
- Log output
- LWIP
- mbedtls
- Newlib
- NVS
- NVS Security Provider
- OpenThread
- Partition API Configuration
- PHY
- Power Management
- Protocomm
- PThreads
- SoC Settings
- SPI Flash driver
- SPIFFS Configuration
- TCP Transport
- Ultra Low Power (ULP) Co-processor
- Unity unit testing library
- Virtual file system
- Wear Levelling
- Wi-Fi
- Wi-Fi Provisioning Manager
- Wireless Coexistence

Application Level Tracing Contains:

- CONFIG_APPTRACE_DESTINATION1
- CONFIG_APPTRACE_DESTINATION2
- FreeRTOS SystemView Tracing
- CONFIG_APPTRACE_GCOV_ENABLE
- CONFIG_APPTRACE_BUF_SIZE
- CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX
- CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH
- CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_THRESH
- CONFIG_APPTRACE_UART_BAUDRATE
- CONFIG_APPTRACE_UART_RX_GPIO
- CONFIG_APPTRACE_UART_RX_BUFF_SIZE
- CONFIG_APPTRACE_UART_TASK_PRIO
- CONFIG_APPTRACE_UART_TX_MSG_SIZE
- CONFIG_APPTRACE_UART_TX_GPIO
- CONFIG_APPTRACE_UART_TX_BUFF_SIZE

CONFIG_APPTRACE_DESTINATION1
Data Destination 1
Chapter 2. API Reference

Found in: Component config > Application Level Tracing

Select destination for application trace: JTAG or none (to disable).

**Available options:**

- JTAG (APPRTRACE_DEST_JTAG)
- None (APPRTRACE_DEST_NONE)

**CONFIG_APPTRACE_DESTINATION2**

Data Destination 2

Found in: Component config > Application Level Tracing

Select destination for application trace: UART(XX) or none (to disable).

**Available options:**

- UART0 (APPRTRACE_DEST_UART0)
- UART1 (APPRTRACE_DEST_UART1)
- UART2 (APPRTRACE_DEST_UART2)
- USB_CDC (APPRTRACE_DEST_USB_CDC)
- None (APPRTRACE_DEST_UART_NONE)

**CONFIG_APPTRACE_UART_TX_GPIO**

UART TX on GPIO#

Found in: Component config > Application Level Tracing

This GPIO is used for UART TX pin.

**CONFIG_APPTRACE_UART_RX_GPIO**

UART RX on GPIO#

Found in: Component config > Application Level Tracing

This GPIO is used for UART RX pin.

**CONFIG_APPTRACE_UART_BAUDRATE**

UART baud rate

Found in: Component config > Application Level Tracing

This baud rate is used for UART.

The app’s maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

**CONFIG_APPTRACE_UART_RX_BUFF_SIZE**

UART RX ring buffer size

Found in: Component config > Application Level Tracing

Size of the UART input ring buffer. This size related to the baud rate, system tick frequency and amount of data to transfer. The data placed to this buffer before sent out to the interface.
Chapter 2. API Reference

**CONFIG_APPTRACE_UART_TX_BUFF_SIZE**

UART TX ring buffer size

*Found in: Component config > Application Level Tracing*

Size of the UART output ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer.

**CONFIG_APPTRACE_UART_TX_MSG_SIZE**

UART TX message size

*Found in: Component config > Application Level Tracing*

Maximum size of the single message to transfer.

**CONFIG_APPTRACE_UART_TASK_PRIO**

UART Task Priority

*Found in: Component config > Application Level Tracing*

UART task priority. In case of high events rate, this parameter could be changed up to (config-MAX_PRIORITIES-1).

Range:
- from 1 to 32

Default value:
- 1

**CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO**

Timeout for flushing last trace data to host on panic

*Found in: Component config > Application Level Tracing*

Timeout for flushing last trace data to host in case of panic. In ms. Use -1 to disable timeout and wait forever.

**CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH**

Threshold for flushing last trace data to host on panic in post-mortem mode. This is minimal amount of data needed to perform flush. In bytes.

**CONFIG_APPTRACE_BUF_SIZE**

Size of the apptrace buffer

*Found in: Component config > Application Level Tracing*

Size of the memory buffer for trace data in bytes.

**CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX**

Size of the pending data buffer

*Found in: Component config > Application Level Tracing*

Size of the buffer for events in bytes. It is useful for buffering events from the time critical code (scheduler, ISRs etc). If this parameter is 0 then events will be discarded when main HW buffer is full.
FreeRTOS SystemView Tracing  Contains:

- CONFIG_APPTRACE_SV_CPU
- CONFIG_APPTRACE_SV_EVT_ISR_ENTER_ENABLE
- CONFIG_APPTRACE_SV_EVT_ISR_EXIT_ENABLE
- CONFIG_APPTRACE_SV_EVT_ISR_TO_SCHED_ENABLE
- CONFIG_APPTRACE_SV_MAX_TASKS
- CONFIG_APPTRACE_SV_EVT_IDLE_ENABLE
- CONFIG_APPTRACE_SV_ENABLE
- CONFIG_APPTRACE_SV_EVT_TASK_CREATE_ENABLE
- CONFIG_APPTRACE_SV_EVT_TASK_START_EXEC_ENABLE
- CONFIG_APPTRACE_SV_EVT_TASK_START_READY_ENABLE
- CONFIG_APPTRACE_SV_EVT_TASK_STOP_EXEC_ENABLE
- CONFIG_APPTRACE_SV_EVT_TASK_STOP_READY_ENABLE
- CONFIG_APPTRACE_SV_EVT_TASK_TERMINATE_ENABLE
- CONFIG_APPTRACE_SV_EVT_TIMER_ENTER_ENABLE
- CONFIG_APPTRACE_SV_EVT_TIMER_EXIT_ENABLE
- CONFIG_APPTRACE_SV_TS_SOURCE
- CONFIG_APPTRACE_SV_EVT_OVERFLOW_ENABLE
- CONFIG_APPTRACE_SV_BUF_WAIT_TMO

CONFIG_APPTRACE_SV_ENABLE

SystemView Tracing Enable

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables support for SEGGER SystemView tracing functionality.

CONFIG_APPTRACE_SV_DEST

SystemView destination

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

SystemView will transfer data through defined interface.

**Available options:**
- Data destination JTAG (APPTRACE_SV_DEST_JTAG)
  Send SEGGER SystemView events through JTAG interface.
- Data destination UART (APPTRACE_SV_DEST_UART)
  Send SEGGER SystemView events through UART interface.

CONFIG_APPTRACE_SV_CPU

CPU to trace

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Define the CPU to trace by SystemView.

**Available options:**
- CPU0 (APPTRACE_SV_DEST_CPU_0)
  Send SEGGER SystemView events for Pro CPU.
- CPU1 (APPTRACE_SV_DEST_CPU_1)
  Send SEGGER SystemView events for App CPU.

CONFIG_APPTRACE_SV_TS_SOURCE
Timer to use as timestamp source

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing

SystemView needs to use a hardware timer as the source of timestamps when tracing. This option selects the timer for it.

**Available options:**
- CPU cycle counter (CCOUNT) (APPTRACE_SV_TS_SOURCE_CCOUNT)
- General Purpose Timer (Timer Group) (APPTRACE_SV_TS_SOURCE_GPTIMER)
- esp_timer high resolution timer (APPTRACE_SV_TS_SOURCE_ESP_TIMER)

**CONFIG_APPTRACE_SV_MAX_TASKS**

Maximum supported tasks

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Configures maximum supported tasks in sysview debug

**CONFIG_APPTRACE_SV_BUF_WAIT_TMO**

Trace buffer wait timeout

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Configures timeout (in us) to wait for free space in trace buffer. Set to -1 to wait forever and avoid lost events.

**CONFIG_APPTRACE_SV_EVT_OVERFLOW_ENABLE**

Trace Buffer Overflow Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “Trace Buffer Overflow” event.

**CONFIG_APPTRACE_SV_EVT_ISR_ENTER_ENABLE**

ISR Enter Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “ISR Enter” event.

**CONFIG_APPTRACE_SV_EVT_ISR_EXIT_ENABLE**

ISR Exit Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “ISR Exit” event.

**CONFIG_APPTRACE_SV_EVT_ISR_TO_SCHED_ENABLE**

ISR Exit to Scheduler Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “ISR to Scheduler” event.
CONFIG_APPTRACE_SV_EVT_TASK_START_EXEC_ENABLE

Task Start Execution Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “Task Start Execution” event.

CONFIG_APPTRACE_SV_EVT_TASK_STOP_EXEC_ENABLE

Task Stop Execution Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “Task Stop Execution” event.

CONFIG_APPTRACE_SV_EVT_TASK_START_READY_ENABLE

Task Start Ready State Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “Task Start Ready State” event.

CONFIG_APPTRACE_SV_EVT_TASK_STOP_READY_ENABLE

Task Stop Ready State Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “Task Stop Ready State” event.

CONFIG_APPTRACE_SV_EVT_TASK_CREATE_ENABLE

Task Create Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “Task Create” event.

CONFIG_APPTRACE_SV_EVT_TASK_TERMINATE_ENABLE

Task Terminate Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “Task Terminate” event.

CONFIG_APPTRACE_SV_EVT_IDLE_ENABLE

System Idle Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “System Idle” event.

CONFIG_APPTRACE_SV_EVT_TIMER_ENTER_ENABLE

Timer Enter Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “Timer Enter” event.
**CONFIG_APPTRACE_SV_EVT_TIMER_EXIT_ENABLE**

Timer Exit Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Timer Exit” event.

**CONFIG_APPTRACE_GCOV_ENABLE**

GCOV to Host Enable

*Found in: Component config > Application Level Tracing*

Enables support for GCOV data transfer to host.

**CONFIG_APPTRACE_GCOV_DUMP_TASK_STACK_SIZE**

Gcov dump task stack size

*Found in: Component config > Application Level Tracing > CONFIG_APPTRACE_GCOV_ENABLE*

Configures stack size of Gcov dump task

**Default value:**

- 2048 if `CONFIG_APPTRACE_GCOV_ENABLE`

**Bluetooth**

Contains:

- Bluedroid Options
- `CONFIG_BT_ENABLED`
- Controller Options
- NimBLE Options

**CONFIG_BT_ENABLED**

Bluetooth

*Found in: Component config > Bluetooth*

Select this option to enable Bluetooth and show the submenu with Bluetooth configuration choices.

**CONFIG_BT_HOST**

Host

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED*

This helps to choose Bluetooth host stack

**Available options:**

- Bluedroid - Dual-mode (`BT_BLUEDROID_ENABLED`)
  This option is recommended for classic Bluetooth or for dual-mode usecases
- NimBLE - BLE only (`BT_NIMBLE_ENABLED`)
  This option is recommended for BLE only usecases to save on memory
- Disabled (`BT_CONTROLLER_ONLY`)
  This option is recommended when you want to communicate directly with the controller (without any host) or when you are using any other host stack not supported by Espressif (not mentioned here).
Chapter 2. API Reference

CONFIG_BT_CONTROLLER

Controller

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED*

This helps to choose Bluetooth controller stack

**Available options:**

- Enabled (BT_CONTROLLER_ENABLED)
  
  This option is recommended for Bluetooth controller use cases
- Disabled (BT_CONTROLLER_DISABLED)
  
  This option is recommended for Bluetooth Host only use cases

**Bluedroid Options**

Contains:

- CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK
- CONFIG_BT_BLUEPORTION_MEM_DEBUG
- CONFIG_BT_BTU_TASK_STACK_SIZE
- CONFIG_BT_BTU_TASK_STACK_SIZE
- CONFIG_BT_BLE_ENABLED
- BT_DEBUG LOG LEVEL
- CONFIG_BT_ACL_CONNECTIONS
- CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST
- CONFIG_BT_CLASSIC_ENABLED
- CONFIG_BT_HID_ENABLED
- CONFIG_BT_STACK_NO_LOG
- CONFIG_BT_BLE_42_FEATURES_SUPPORTED
- CONFIG_BT_BLE_50_FEATURES_SUPPORTED
- CONFIG_BT_BLE_HIGH_DUTY_ADV_INTERVAL
- CONFIG_BT_MULTI_CONNECTION_ENBALE
- CONFIG_BT_BLE_FEAT_PERIODIC_ADV_SYNC_TRANSFER
- CONFIG_BT_BLUEPORTION ESP COEX VSC
- CONFIG_BT_BLE_FEAT_PERIODIC_ADV_ENH
- CONFIG_BT_MAX DEVICE_NAME_LEN
- CONFIG_BT_BLE_ACT_SCAN_REP ADV SCAN
- CONFIG_BT_BLUEPORTION_PINNED TO CORE CHOICE
- CONFIG_BT_BLE_ESTAB LINK_CONN TOUT
- CONFIG_BT_BLE_RPA_TIMEOUT
- CONFIG_BT_BLE_RPA_SUPPORTED
- CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY
- CONFIG_BT_HFP WBS_ENABLE

CONFIG_BT_BTU_TASK_STACK_SIZE

Bluetooth event (callback to application) task stack size

*Found in: Component config > Bluetooth > Bluedroid Options*

This select btu task stack size

**Default value:**

- 3072 if BT_BLUEPORTION_ENABLED && BT_BLUEPORTION_ENABLED

CONFIG_BT_BLUEPORTION_PINNED TO CORE CHOICE

The cpu core which Bluedroid run

*Found in: Component config > Bluetooth > Bluedroid Options*

Which the cpu core to run Bluedroid. Can choose core0 and core1. Can not specify no-affinity.
Available options:

- Core 0 (PRO CPU) (BT_BLUEDROID_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BT_BLUEDROID_PINNED_TO_CORE_1)

**CONFIG_BT_BTU_TASK_STACK_SIZE**

Bluetooth Bluedroid Host Stack task stack size

*Found in: Component config > Bluetooth > Bluedroid Options*

This select btu task stack size

**Default value:**

- 4096 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_BLUEDROID_MEM_DEBUG**

Bluedroid memory debug

*Found in: Component config > Bluetooth > Bluedroid Options*

Bluedroid memory debug

**Default value:**

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_BLUEDROID_ESP_COEX_VSC**

Enable Espressif Vendor-specific HCI commands for coexist status configuration

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable Espressif Vendor-specific HCI commands for coexist status configuration

**Default value:**

- Yes (enabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_CLASSIC_ENABLED**

Classic Bluetooth

*Found in: Component config > Bluetooth > Bluedroid Options*

For now this option needs “SMP_ENABLE” to be set to yes

**Default value:**

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_CLASSIC_BQB_ENABLED**

Host Qualification support for Classic Bluetooth

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

This enables functionalities of Host qualification for Classic Bluetooth.

**Default value:**

- No (disabled) if CONFIG_BT_CLASSIC_ENABLED && BT_BLUEDROID_ENABLED
Chapter 2. API Reference

**CONFIG_BT_A2DP_ENABLE**

A2DP

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

Advanced Audio Distribution Profile

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_SPP_ENABLED**

SPP

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

This enables the Serial Port Profile

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_L2CAP_ENABLED**

BT L2CAP

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

This enables the Logical Link Control and Adaptation Layer Protocol. Only supported classic bluetooth.

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_HFP_ENABLE**

Hands Free/Handset Profile

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_HFP_ROLE**

Hands-free Profile Role configuration

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE*

**Available options:**

- Hands Free Unit (BT_HFP_CLIENT_ENABLE)
- Audio Gateway (BT_HFP_AG_ENABLE)

**CONFIG_BT_HFP_AUDIO_DATA_PATH**

audio(SCO) data path

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE*

SCO data path, i.e. HCI or PCM. This option is set using API “esp_bredr_sco_datapath_set” in Bluetooth host. Default SCO data path can also be set in Bluetooth Controller.

**Available options:**

- PCM (BT_HFP_AUDIO_DATA_PATH_PCM)
- HCI (BT_HFP_AUDIO_DATA_PATH_HCI)
CONFIG_BT_HFP_WBS_ENABLE
Wide Band Speech

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Wide Band Speech. Should disable it when SCO data path is PCM. Otherwise there will be no data transmitted via GPIOs.

**Default value:**
- Yes (enabled) if BT_HFP_AUDIO_DATA_PATH_HCI && BT_BLUEDROID_ENABLED

CONFIG_BT_HID_ENABLED
Classic BT HID

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables the BT HID Host

**Default value:**
- No (disabled) if CONFIG_BT_CLASSIC_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_HID_ROLE
Profile Role configuration

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_HID_ENABLED*

**Available options:**
- Classic BT HID Host (BT_HID_HOST_ENABLED)
  This enables the BT HID Host
- Classic BT HID Device (BT_HID_DEVICE_ENABLED)
  This enables the BT HID Device

CONFIG_BT_BLE_ENABLED
Bluetooth Low Energy

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Bluetooth Low Energy

**Default value:**
- Yes (enabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTS_ENABLE
Include GATT server module(GATTs)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED*

This option can be disabled when the app work only on gatt client mode

**Default value:**
- Yes (enabled) if CONFIG_BT_BLE_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTS_PPCP_CHAR_GAP
Enable Peripheral Preferred Connection Parameters characteristic in GAP service

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*
This enables “Peripheral Preferred Connection Parameters” characteristic (UUID: 0x2A04) in GAP service that has connection parameters like min/max connection interval, slave latency and supervision timeout multiplier.

**Default value:**
- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_BLE_BLUFI_ENABLE**

Include blufi function

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

This option can be close when the app does not require blufi function.

**Default value:**
- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_GATT_MAX_SR_PROFILES**

Max GATT Server Profiles

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

Maximum GATT Server Profiles Count

**Range:**
- from 1 to 32 if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

**Default value:**
- 8 if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_GATT_MAX_SR_ATTRIBUTES**

Max GATT Service Attributes

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

Maximum GATT Service Attributes Count

**Range:**
- from 1 to 500 if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

**Default value:**
- 100 if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_MODE**

GATT Server Service Change Mode

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

Service change indication mode for GATT Server.

**Available options:**
- GATTs manually send service change indication (BT_GATTS_SEND_SERVICE_CHANGE_MANUAL)
  - Manually send service change indication through API
  - `esp_ble_gatts_send_service_change_indication()`
GATTs automatically send service change indication
(BTGattS_Send_Service_Change_Auto)
Let Bluedroid handle the service change indication internally

**CONFIG_BT_GATTS_ROBUST_CACHING_ENABLED**

Enable Robust Caching on Server Side

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

This option enable gatt robust caching feature on server

**Default value:**

- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_GATTS_DEVICE_NAME_WRITABLE**

Allow to write device name by GATT clients

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

Enabling this option allows remote GATT clients to write device name

**Default value:**

- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_GATTS_APPEARANCE_WRITABLE**

Allow to write appearance by GATT clients

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

Enabling this option allows remote GATT clients to write appearance

**Default value:**

- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_GATTC_ENABLE**

Include GATT client module(GATTC)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED*

This option can be close when the app work only on gatt server mode

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_GATTC_MAX_CACHE_CHAR**

Max gattc cache characteristic for discover

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE*

Maximum GATTC cache characteristic count

**Range:**

- from 1 to 500 if `CONFIG_BT_GATTC_ENABLE` && `BT_BLUEDROID_ENABLED`

**Default value:**

- 40 if `CONFIG_BT_GATTC_ENABLE` && `BT_BLUEDROID_ENABLED`
CONFIG_BT_GATTC_CACHE_NVS_FLASH

Save gattc cache data to nvs flash

*Found in: Component config > Bluetooth > Bluez > Bluez Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE*

This select can save gattc cache data to nvs flash

**Default value:**
- No (disabled) if `CONFIG_BT_GATTC_ENABLE` && `BT_BLUEDROID_ENABLED`

CONFIG_BT_GATTC_CONNECT_RETRY_COUNT

The number of attempts to reconnect if the connection establishment failed

*Found in: Component config > Bluetooth > Bluez > Bluez Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE*

The number of attempts to reconnect if the connection establishment failed

**Range:**
- from 0 to 7 if `CONFIG_BT_GATTC_ENABLE` && `BT_BLUEDROID_ENABLED`

**Default value:**
- 3 if `CONFIG_BT_GATTC_ENABLE` && `BT_BLUEDROID_ENABLED`

CONFIG_BT_BLE_SMP_ENABLE

Include BLE security module(SMP)

*Found in: Component config > Bluetooth > Bluez > Bluez Options > CONFIG_BT_BLE_ENABLED*

This option can be close when the app not used the ble security connect.

**Default value:**
- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `BT_BLUEDROID_ENABLED`

CONFIG_BT_SMP_SLAVE_CON_PARAMS_UPD_ENABLE

Slave enable connection parameters update during pairing

*Found in: Component config > Bluetooth > Bluez > Bluez Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_BLE_SMP_ENABLE*

In order to reduce the pairing time, slave actively initiates connection parameters update during pairing.

**Default value:**
- No (disabled) if `CONFIG_BT_BLE_SMP_ENABLE` && `BT_BLUEDROID_ENABLED`

CONFIG_BT_STACK_NO_LOG

Disable BT debug logs (minimize bin size)

*Found in: Component config > Bluetooth > Bluez > Bluez Options*

This select can save the rodata code size

**Default value:**
- No (disabled) if `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`
**BT DEBUG LOG LEVEL**  Contains:

- `CONFIG_BT_LOG_A2D_TRACE_LEVEL`
- `CONFIG_BT_LOG_APLL_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVCT_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVDT_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVRC_TRACE_LEVEL`
- `CONFIG_BT_LOG_BLUFI_TRACE_LEVEL`
- `CONFIG_BT_LOG_BNEP_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTIF_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTMC_TRACE_LEVEL`
- `CONFIG_BT_LOG_GAP_TRACE_LEVEL`
- `CONFIG_BT_LOG_GATT_TRACE_LEVEL`
- `CONFIG_BT_LOG_HCI_TRACE_LEVEL`
- `CONFIG_BT_LOG_HID_TRACE_LEVEL`
- `CONFIG_BT_LOG_L2CAP_TRACE_LEVEL`
- `CONFIG_BT_LOG_MCA_TRACE_LEVEL`
- `CONFIG_BT_LOG_OSI_TRACE_LEVEL`
- `CONFIG_BT_LOG_PAN_TRACE_LEVEL`
- `CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL`
- `CONFIG_BT_LOG_SDP_TRACE_LEVEL`
- `CONFIG_BT_LOG_SMP_TRACE_LEVEL`

**CONFIG_BT_LOG_HCI_TRACE_LEVEL**

HCl layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for HCl layer

**Available options:**

- NONE (BT_LOG_HCI_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_HCI_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_HCI_TRACE_LEVEL_WARNING)
- API (BT_LOG_HCI_TRACE_LEVEL_API)
- EVENT (BT_LOG_HCI_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_HCI_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_HCI_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_BTM_TRACE_LEVEL**

BTM layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BTM layer

**Available options:**

- NONE (BT_LOG_BTM_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BTM_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BTM_TRACE_LEVEL_WARNING)
- API (BT_LOG_BTM_TRACE_LEVEL_API)
- EVENT (BT_LOG_BTM_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BTM_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BTM_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_L2CAP_TRACE_LEVEL**
L2CAP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for L2CAP layer

**Available options:**
- NONE (BT_LOG_L2CAP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_L2CAP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_L2CAP_TRACE_LEVEL_WARNING)
- API (BT_LOG_L2CAP_TRACE_LEVEL_API)
- EVENT (BT_LOG_L2CAP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_L2CAP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_L2CAP_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL**

RFCOMM layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for RFCOMM layer

**Available options:**
- NONE (BT_LOG_RFCOMM_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_RFCOMM_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_RFCOMM_TRACE_LEVEL_WARNING)
- API (BT_LOG_RFCOMM_TRACE_LEVEL_API)
- EVENT (BT_LOG_RFCOMM_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_RFCOMM_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_RFCOMM_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_SDP_TRACE_LEVEL**

SDP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for SDP layer

**Available options:**
- NONE (BT_LOG_SDP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_SDP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_SDP_TRACE_LEVEL_WARNING)
- API (BT_LOG_SDP_TRACE_LEVEL_API)
- EVENT (BT_LOG_SDP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_SDP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_SDP_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_GAP_TRACE_LEVEL**

GAP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for GAP layer

**Available options:**
- NONE (BT_LOG_GAP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_GAP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_GAP_TRACE_LEVEL_WARNING)
- API (BT_LOG_GAP_TRACE_LEVEL_API)
- EVENT (BT_LOG_GAP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_GAP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_GAP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BNEP_TRACE_LEVEL

BNEP layer

*Found in:* Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BNEP layer

**Available options:**
• NONE (BT_LOG_BNEP_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_BNEP_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_BNEP_TRACE_LEVEL_WARNING)
• API (BT_LOG_BNEP_TRACE_LEVEL_API)
• EVENT (BT_LOG_BNEP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BNEP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BNEP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_PAN_TRACE_LEVEL

PAN layer

*Found in:* Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for PAN layer

**Available options:**
• NONE (BT_LOG_PAN_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_PAN_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_PAN_TRACE_LEVEL_WARNING)
• API (BT_LOG_PAN_TRACE_LEVEL_API)
• EVENT (BT_LOG_PAN_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_PAN_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_PAN_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_A2D_TRACE_LEVEL

A2D layer

*Found in:* Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for A2D layer

**Available options:**
• NONE (BT_LOG_A2D_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_A2D_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_A2D_TRACE_LEVEL_WARNING)
• API (BT_LOG_A2D_TRACE_LEVEL_API)
• EVENT (BT_LOG_A2D_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_A2D_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_A2D_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVDT_TRACE_LEVEL

AVDT layer

*Found in:* Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for AVDT layer

**Available options:**
• NONE (BT_LOG_AVDT_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_AVDT_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_AVDT_TRACE_LEVEL_WARNING)
• API (BT_LOG_AVDT_TRACE_LEVEL_API)
• EVENT (BT_LOG_AVDT_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_AVDT_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_AVDT_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_AVCT_TRACE_LEVEL**

AVCT layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for AVCT layer

**Available options:**

• NONE (BT_LOG_AVCT_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_AVCT_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_AVCT_TRACE_LEVEL_WARNING)
• API (BT_LOG_AVCT_TRACE_LEVEL_API)
• EVENT (BT_LOG_AVCT_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_AVCT_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_AVCT_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_AVRC_TRACE_LEVEL**

AVRC layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for AVRC layer

**Available options:**

• NONE (BT_LOG_AVRC_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_AVRC_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_AVRC_TRACE_LEVEL_WARNING)
• API (BT_LOG_AVRC_TRACE_LEVEL_API)
• EVENT (BT_LOG_AVRC_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_AVRC_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_AVRC_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_MCA_TRACE_LEVEL**

MCA layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for MCA layer

**Available options:**

• NONE (BT_LOG_MCA_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_MCA_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_MCA_TRACE_LEVEL_WARNING)
• API (BT_LOG_MCA_TRACE_LEVEL_API)
• EVENT (BT_LOG_MCA_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_MCA_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_MCA_TRACE_LEVEL_VERBOSE)
CONFIG_BT_LOG_HID_TRACE_LEVEL

HID layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for HID layer

**Available options:**
- NONE (BT_LOG_HID_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_HID_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_HID_TRACE_LEVEL_WARNING)
- API (BT_LOG_HID_TRACE_LEVEL_API)
- EVENT (BT_LOG_HID_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_HID_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_HID_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_APPL_TRACE_LEVEL

APPL layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for APPL layer

**Available options:**
- NONE (BT_LOG_APPL_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_APPL_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_APPL_TRACE_LEVEL_WARNING)
- API (BT_LOG_APPL_TRACE_LEVEL_API)
- EVENT (BT_LOG_APPL_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_APPL_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_APPL_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_GATT_TRACE_LEVEL

GATT layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for GATT layer

**Available options:**
- NONE (BT_LOG_GATT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_GATT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_GATT_TRACE_LEVEL_WARNING)
- API (BT_LOG_GATT_TRACE_LEVEL_API)
- EVENT (BT_LOG_GATT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_GATT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_GATT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_SMP_TRACE_LEVEL

SMP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for SMP layer

**Available options:**
- NONE (BT_LOG_SMP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_SMP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_SMP_TRACE_LEVEL_WARNING)
- API (BT_LOG_SMP_TRACE_LEVEL_API)
• EVENT (BT_LOG_SMP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_SMP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_SMP_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_BTIF_TRACE_LEVEL**

BTIF layer

*Found in: Component config > Bluetooth > Bluez Options > BT DEBUG LOG LEVEL*

Define BT trace level for BTIF layer

**Available options:**

- NONE (BT_LOG_BTIF_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BTIF_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BTIF_TRACE_LEVEL_WARNING)
- API (BT_LOG_BTIF_TRACE_LEVEL_API)
- EVENT (BT_LOG_BTIF_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BTIF_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BTIF_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_BTC_TRACE_LEVEL**

BTC layer

*Found in: Component config > Bluetooth > Bluez Options > BT DEBUG LOG LEVEL*

Define BT trace level for BTC layer

**Available options:**

- NONE (BT_LOG_BTC_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BTC_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BTC_TRACE_LEVEL_WARNING)
- API (BT_LOG_BTC_TRACE_LEVEL_API)
- EVENT (BT_LOG_BTC_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BTC_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BTC_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_OSI_TRACE_LEVEL**

OSI layer

*Found in: Component config > Bluetooth > Bluez Options > BT DEBUG LOG LEVEL*

Define BT trace level for OSI layer

**Available options:**

- NONE (BT_LOG_OSI_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_OSI_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_OSI_TRACE_LEVEL_WARNING)
- API (BT_LOG_OSI_TRACE_LEVEL_API)
- EVENT (BT_LOG_OSI_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_OSI_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_OSI_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_BLUFI_TRACE_LEVEL**

BLUFI layer

*Found in: Component config > Bluetooth > Bluez Options > BT DEBUG LOG LEVEL*

Define BT trace level for BLUFI layer
Available options:

- NONE (BT_LOG_BLUFI_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BLUFI_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BLUFI_TRACE_LEVEL_WARNING)
- API (BT_LOG_BLUFI_TRACE_LEVEL_API)
- EVENT (BT_LOG_BLUFI_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BLUFI_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BLUFI_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_ACL_CONNECTIONS**

BT/BLE MAX ACL CONNECTIONS (1~9)

*Found in: Component config > Bluetooth > Bluedroid Options*

Maximum BT/BLE connection count. The ESP32-C3/S3 chip supports a maximum of 10 instances, including ADV, SCAN and connections. The ESP32-C3/S3 chip can connect up to 9 devices if ADV or SCAN uses only one. If ADV and SCAN are both used, The ESP32-C3/S3 chip is connected to a maximum of 8 devices. Because Bluetooth cannot reclaim used instances once ADV or SCAN is used.

*Range:*

- from 1 to 9 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

*Default value:*

- 4 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_MULTI_CONNECTION_ENABLE**

Enable BLE multi-conections

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable this option if there are multiple connections

*Default value:*

- Yes (enabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST**

BT/BLE will first malloc the memory from the PSRAM

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can save the internal RAM if there have the PSRAM

*Default value:*

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY**

Use dynamic memory allocation in BT/BLE stack

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can make the allocation of memory will become more flexible

*Default value:*

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED
CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK

BLE queue congestion check

*Found in: Component config > Bluetooth > Bluedroid Options*

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. If enabled, adv packets will be lost when host queue is congested.

**Default value:**
- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN

Report adv data and scan response individually when BLE active scan

*Found in: Component config > Bluetooth > Bluedroid Options*

Originally, when doing BLE active scan, Bluedroid will not report adv to application layer until receive scan response. This option is used to disable the behavior. When enable this option, Bluedroid will report adv data or scan response to application layer immediately.

# Memory reserved at start of DRAM for Bluetooth stack

**Default value:**
- No (disabled) if BT_BLUEDROID_ENABLED && CONFIG_BT_BLE_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT

Timeout of BLE connection establishment

*Found in: Component config > Bluetooth > Bluedroid Options*

Bluetooth Connection establishment maximum time, if connection time exceeds this value, the connection establishment fails, ESP_GATTC_OPEN_EVT or ESP_GATTS_OPEN_EVT is triggered.

**Range:**
- from 1 to 60 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**Default value:**
- 30 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_MAX_DEVICE_NAME_LEN

length of bluetooth device name

*Found in: Component config > Bluetooth > Bluedroid Options*

Bluetooth Device name length shall be no larger than 248 octets, If the broadcast data cannot contain the complete device name, then only the shortname will be displayed, the rest parts that can’t fit in will be truncated.

**Range:**
- from 32 to 248 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**Default value:**
- 32 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_RPA_SUPPORTED

Update RPA to Controller

*Found in: Component config > Bluetooth > Bluedroid Options*
This enables controller RPA list function. For ESP32, ESP32 only support network privacy mode. If this option is enabled, ESP32 will only accept advertising packets from peer devices that contain private address, HW will not receive the advertising packets contain identity address after IRK changed. If this option is disabled, address resolution will be performed in the host, so the functions that require controller to resolve address in the white list cannot be used. This option is disabled by default on ESP32, please enable or disable this option according to your own needs.

For other BLE chips, devices support network privacy mode and device privacy mode, users can switch the two modes according to their own needs. So this option is enabled by default.

Default value:
- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_RPA_TIMEOUT

Timeout of resolvable private address

*Found in: Component config > Bluetooth > Bluedroid Options*

This set RPA timeout of Controller and Host. Default is 900 s (15 minutes). Range is 1 s to 1 hour (3600 s).

*Range:*
- from 1 to 3600 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

Default value:
- 900 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_50_FEATURES_SUPPORTED

Enable BLE 5.0 features

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE 5.0 features, this option only support esp32c3/esp32s3 chip

Default value:
- Yes (enabled) if BT_BLUEDROID_ENABLED && SOC_ESP_NIMBLE_CONTROLLER && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_42_FEATURES_SUPPORTED

Enable BLE 4.2 features

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE 4.2 features.

Default value:
- No (disabled) if BT_BLUEDROID_ENABLED && SOC_ESP_NIMBLE_CONTROLLER && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_FEAT_PERIODIC_ADV_SYNC_TRANSFER

Enable BLE periodic advertising sync transfer feature

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE periodic advertising sync transfer feature

Default value:
- No (disabled) if BT_BLUEDROID_ENABLED && CONFIG_BT_BLE_50_FEATURES_SUPPORTED && SOC_ESP_NIMBLE_CONTROLLER && BT_BLUEDROID_ENABLED
**CONFIG_BT_BLE_FEAT_PERIODIC_ADV_ENH**

Enable periodic adv enhancements (adi support)

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable the periodic advertising enhancements

**Default value:**

- No (disabled) if BT_BLUEDROID_ENABLED &
  CONFIG_BT_BLE_50_FEATURES_SUPPORTED &
  SOC_ESP_NIMBLE_CONTROLLER &
  BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_HIGH_DUTY_ADV_INTERVAL**

Enable BLE high duty advertising interval feature

*Found in: Component config > Bluetooth > Bluedroid Options*

This enable BLE high duty advertising interval feature

**Default value:**

- No (disabled) if BT_BLUEDROID_ENABLED &
  BT_BLUEDROID_ENABLED

**NimBLE Options**

Contains:

- `CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME`
- `CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS`

• CONFIG_BT_NIMBLE_RPA_TIMEOUT
• CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE
• CONFIG_BT_NIMBLE_TEST_throughput_TEST

CONFIG_BT_NIMBLE_MEMALLOC_MODE

Memory allocation strategy

Found in: Component config > Bluetooth > NimBLE Options

Allocation strategy for NimBLE host stack, essentially provides ability to allocate all required dynamic allocations from,

• Internal DRAM memory only
• External SPIRAM memory only
• Either internal or external memory based on default malloc() behavior in ESP-IDF
• Internal IRAM memory wherever applicable else internal DRAM

Available options:

• Internal memory (BT_NIMBLE_MEM_ALLOC_MODE_INTERNAL)
• External SPIRAM (BT_NIMBLE_MEM_ALLOC_MODE_EXTERNAL)
• Default alloc mode (BT_NIMBLE_MEM_ALLOC_MODE_DEFAULT)
• Internal IRAM (BT_NIMBLE_MEM_ALLOC_MODE_IRAM_8BIT)

Allows to use IRAM memory region as 8bit accessible region.
Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

CONFIG_BT_NIMBLE_LOG_LEVEL

NimBLE Host log verbosity

Found in: Component config > Bluetooth > NimBLE Options

Select NimBLE log level. Please make a note that the selected NimBLE log verbosity can not exceed the level set in “Component config -> Log output -> Default log verbosity” .

Available options:

• No logs (BT_NIMBLE_LOG_LEVEL_NONE)
• Error logs (BT_NIMBLE_LOG_LEVEL_ERROR)
• Warning logs (BT_NIMBLE_LOG_LEVEL_WARNING)
• Info logs (BT_NIMBLE_LOG_LEVEL_INFO)
• Debug logs (BT_NIMBLE_LOG_LEVEL_DEBUG)

CONFIG_BT_NIMBLE_MAX_CONNECTIONS

Maximum number of concurrent connections

Found in: Component config > Bluetooth > NimBLE Options

Defines maximum number of concurrent BLE connections. For ESP32, user is expected to configure BTDM_CTRL_BLE_MAX_CONN from controller menu along with this option. Similarly for ESP32-C3 or ESP32-S3, user is expected to configure BT_CTRL_BLE_MAX_ACT from controller menu. For ESP32C2, ESP32C6 and ESP32H2, each connection will take about 1k DRAM.

Range:

• from 1 to 9 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Default value:

• 3 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
**CONFIG_BT_NIMBLE_MAX_BONDS**

Maximum number of bonds to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of bonds to save for peer security and our security

**Default value:**

- 3 if BT_NIMBLEENABLED & BT_NIMBLEENABLED

---

**CONFIG_BT_NIMBLE_MAX_CCCDS**

Maximum number of CCC descriptors to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of CCC descriptors to save

**Default value:**

- 8 if BT_NIMBLEENABLED & BT_NIMBLEENABLED

---

**CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM**

Maximum number of connection oriented channels

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of BLE Connection Oriented Channels. When set to (0), BLE COC is not compiled in

**Range:**

- from 0 to 9 if BT_NIMBLEENABLED & BT_NIMBLEENABLED

**Default value:**

- 0 if BT_NIMBLEENABLED & BT_NIMBLEENABLED

---

**CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE**

The CPU core on which NimBLE host will run

*Found in: Component config > Bluetooth > NimBLE Options*

The CPU core on which NimBLE host will run. You can choose Core 0 or Core 1. Cannot specify no-affinity

**Available options:**

- Core 0 (PRO CPU) (BT_NIMBLE_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BT_NIMBLE_PINNED_TO_CORE_1)

---

**CONFIG_BT_NIMBLE_HOST_TASK_STACK_SIZE**

NimBLE Host task stack size

*Found in: Component config > Bluetooth > NimBLE Options*

This configures stack size of NimBLE host task

**Default value:**

- 5120 if CONFIG_BLE_MESH & BT_NIMBLE_ENABLEDB &
  BT_NIMBLE_ENABLEDB
- 4096 if BT_NIMBLE_ENABLEDB & BT_NIMBLE_ENABLEDB
CONFIG_BT_NIMBLE_ROLE_CENTRAL
Enable BLE Central role

Found in: Component config > Bluetooth > NimBLE Options

Enables central role

Default value:
• Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ROLE_PERIPHERAL
Enable BLE Peripheral role

Found in: Component config > Bluetooth > NimBLE Options

Enable peripheral role

Default value:
• Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ROLE_BROADCASTER
Enable BLE Broadcaster role

Found in: Component config > Bluetooth > NimBLE Options

Enables broadcaster role

Default value:
• Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ROLE_OBSERVER
Enable BLE Observer role

Found in: Component config > Bluetooth > NimBLE Options

Enables observer role

Default value:
• Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_NVS_PERSIST
Persist the BLE Bonding keys in NVS

Found in: Component config > Bluetooth > NimBLE Options

Enable this flag to make bonding persistent across device reboots

Default value:
• No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SECURITY_ENABLE
Enable BLE SM feature

Found in: Component config > Bluetooth > NimBLE Options

Enable BLE sm feature

Default value:
• Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Contains:
• CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_ENCRYPTION
• CONFIG_BT_NIMBLE_SM_LEGACY
• CONFIG_BT_NIMBLE_SM_SC

CONFIG_BT_NIMBLE_SM_LEGACY

Security manager legacy pairing

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE

Enable security manager legacy pairing

Default value:
• Yes (enabled) if CONFIG_BT_NIMBLE_SECURITY_ENABLE && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SM_SC

Security manager secure connections (4.2)

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE

Enable security manager secure connections

Default value:
• Yes (enabled) if CONFIG_BT_NIMBLE_SECURITY_ENABLE && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SM_SC_DEBUG_KEYS

Use predefined public-private key pair

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE > CONFIG_BT_NIMBLE_SM_SC

If this option is enabled, SM uses predefined DH key pair as described in Core Specification, Vol. 3, Part H, 2.3.5.6.1. This allows to decrypt air traffic easily and thus should only be used for debugging.

Default value:
• No (disabled) if CONFIG_BT_NIMBLE_SECURITY_ENABLE && CONFIG_BT_NIMBLE_SM_SC && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_ENCRYPTION

Enable LE encryption

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE

Enable encryption connection

Default value:
• Yes (enabled) if CONFIG_BT_NIMBLE_SECURITY_ENABLE && BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_DEBUG

Enable extra runtime asserts and host debugging

Found in: Component config > Bluetooth > NimBLE Options

This enables extra runtime asserts and host debugging
Default value:
  • No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_DYNAMIC_SERVICE**

Enable dynamic services

*Found in: Component config > Bluetooth > NimBLE Options*

This enables user to add/remove Gatt services at runtime

**CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME**

BLE GAP default device name

*Found in: Component config > Bluetooth > NimBLE Options*

The Device Name characteristic shall contain the name of the device as an UTF-8 string. This name can be changed by using API ble_svc_gap_device_name_set()

Default value:
  • “nimble” if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN**

Maximum length of BLE device name in octets

*Found in: Component config > Bluetooth > NimBLE Options*

Device Name characteristic value shall be 0 to 248 octets in length

Default value:
  • 31 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU**

Preferred MTU size in octets

*Found in: Component config > Bluetooth > NimBLE Options*

This is the default value of ATT MTU indicated by the device during an ATT MTU exchange. This value can be changed using API ble_att_set_preferred_mtu()

Default value:
  • 256 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE**

External appearance of the device

*Found in: Component config > Bluetooth > NimBLE Options*

Standard BLE GAP Appearance value in HEX format e.g. 0x02C0

Default value:
  • 0 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**Memory Settings**

Contains:

  • CONFIG_BT_NIMBLE_TRANSPORT_ACL_FROM_LL_COUNT
  • CONFIG_BT_NIMBLE_TRANSPORT_EVT_DISCARD_COUNT
  • CONFIG_BT_NIMBLE_MSYS_1_BLOCK_COUNT
  • CONFIG_BT_NIMBLE_MSYS_1_BLOCK_SIZE
  • CONFIG_BT_NIMBLE_MSYS_2_BLOCK_COUNT
Chapter 2. API Reference

- CONFIG_BT_NIMBLE_MSYS_2_BLOCK_SIZE
- CONFIG_BT_NIMBLE_TRANSPORT_ACL_SIZE
- CONFIG_BT_NIMBLE_TRANSPORT_EVT_COUNT
- CONFIG_BT_NIMBLE_TRANSPORT_EVT_SIZE

**CONFIG_BT_NIMBLE_MSYS_1_BLOCK_COUNT**

MSYS_1 Block Count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

MSYS is a system level mbuf registry. For prepare write & prepare responses MBUFs are allocated out of msys_1 pool. For NIMBLE_MESH enabled cases, this block count is increased by 8 than user defined count.

**Default value:**

- 24 if SOC_ESP_NIMBLE_CONTROLLER && BT_NIMBLE_ENABLED
- 12 if SOC_ESP_NIMBLE_CONTROLLER && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MSYS_1_BLOCK_SIZE**

MSYS_1 Block Size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

Dynamic memory size of block 1

**Default value:**

- 128 if SOC_ESP_NIMBLE_CONTROLLER && BT_NIMBLE_ENABLED
- 256 if SOC_ESP_NIMBLE_CONTROLLER && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MSYS_2_BLOCK_COUNT**

MSYS_2 Block Count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

Dynamic memory count

**Default value:**

- 24 if BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MSYS_2_BLOCK_SIZE**

MSYS_2 Block Size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

Dynamic memory size of block 2

**Default value:**

- 320 if BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_TRANSPORT_ACL_FROM_LL_COUNT**

ACL Buffer count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

The number of ACL data buffers allocated for host.

**Default value:**

- 24 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_TRANSPORT_ACL_SIZE

Transport ACL Buffer size

*Found in:* Component config > Bluetooth > NimBLE Options > Memory Settings

This is the maximum size of the data portion of HCI ACL data packets. It does not include the HCI data header (of 4 bytes)

**Default value:**
- 255 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_TRANSPORT_EVT_SIZE

Transport Event Buffer size

*Found in:* Component config > Bluetooth > NimBLE Options > Memory Settings

This is the size of each HCI event buffer in bytes. In case of extended advertising, packets can be fragmented. 257 bytes is the maximum size of a packet.

**Default value:**
- 257 if CONFIG_BT_NIMBLE_EXT_ADV && BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
- 70 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_TRANSPORT_EVT_COUNT

Transport Event Buffer count

*Found in:* Component config > Bluetooth > NimBLE Options > Memory Settings

This is the high priority HCI events’ buffer size. High-priority event buffers are for everything except advertising reports. If there are no free high-priority event buffers then host will try to allocate a low-priority buffer instead

**Default value:**
- 30 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_TRANSPORT_EVT_DISCARD_COUNT

Discardable Transport Event Buffer count

*Found in:* Component config > Bluetooth > NimBLE Options > Memory Settings

This is the low priority HCI events’ buffer size. Low-priority event buffers are only used for advertising reports. If there are no free low-priority event buffers, then an incoming advertising report will get dropped

**Default value:**
- 8 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_GATT_MAX_PROCS

Maximum number of GATT client procedures

*Found in:* Component config > Bluetooth > NimBLE Options

Maximum number of GATT client procedures that can be executed.

**Default value:**
- 4 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_HS_FLOW_CTRL
Enable Host Flow control

*Found in: Component config > Bluetooth > NimBLE Options*
Enable Host Flow control

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_ITVL
Host Flow control interval

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*
Host flow control interval in msecs

**Default value:**
- 1000 if CONFIG_BT_NIMBLE_HS_FLOW_CTRL && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_THRESH
Host Flow control threshold

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*
Host flow control threshold, if the number of free buffers are at or below this threshold, send an immediate number-of-completed-packets event

**Default value:**
- 2 if CONFIG_BT_NIMBLE_HS_FLOW_CTRL && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_TX_ON_DISCONNECT
Host Flow control on disconnect

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*
Enable this option to send number-of-completed-packets event to controller after disconnection

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_HS_FLOW_CTRL && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_RPA_TIMEOUT
RPA timeout in seconds

*Found in: Component config > Bluetooth > NimBLE Options*
Time interval between RPA address change. This is applicable in case of Host based RPA

**Range:**
- from 1 to 41400 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**Default value:**
- 900 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
**CONFIG_BT_NIMBLE_MESH**

Enable BLE mesh functionality

*Found in: Component config > Bluetooth > NimBLE Options*

Enable BLE Mesh example present in upstream mynewt-nimble and not maintained by Espressif.

IDF maintains ESP-BLE-MESH as the official Mesh solution. Please refer to ESP-BLE-MESH guide at: `doc:/esp32/api-guides/esp-ble-mesh/ble-mesh-index`

**Default value:**
- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Contains:
- `CONFIG_BT_NIMBLE_MESH_PROVISIONER`
- `CONFIG_BT_NIMBLE_MESH_PROV`
- `CONFIG_BT_NIMBLE_MESH_GATT_PROXY`
- `CONFIG_BT_NIMBLE_MESH_FRIEND`
- `CONFIG_BT_NIMBLE_MESH_LOW_POWER`
- `CONFIG_BT_NIMBLE_MESH_PROXY`
- `CONFIG_BT_NIMBLE_MESH_RELAY`
- `CONFIG_BT_NIMBLE_MESH_DEVICE_NAME`
- `CONFIG_BT_NIMBLE_MESH_NODE_COUNT`

**CONFIG_BT_NIMBLE_MESH_PROXY**

Enable mesh proxy functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable proxy. This is automatically set whenever NIMBLE_MESH_PB_GATT or NIMBLE_MESH_GATT_PROXY is set

**Default value:**
- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MESH_PROV**

Enable BLE mesh provisioning

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable mesh provisioning

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH` && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MESH_PB_ADV**

Enable mesh provisioning over advertising bearer

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV*

Enable this option to allow the device to be provisioned over the advertising bearer

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH_PROV` && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_MESH_PB_GATT
Enable mesh provisioning over GATT bearer

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV*

Enable this option to allow the device to be provisioned over the GATT bearer

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_MESH_PROV && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_GATT_PROXY
Enable GATT Proxy functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

This option enables support for the Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_RELAY
Enable mesh relay functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Support for acting as a Mesh Relay Node

**Default value:**
- No (disabled) if CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_LOW_POWER
Enable mesh low power mode

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable this option to be able to act as a Low Power Node

**Default value:**
- No (disabled) if CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_FRIEND
Enable mesh friend functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable this option to be able to act as a Friend Node

**Default value:**
- No (disabled) if CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_DEVICE_NAME
Set mesh device name

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

This value defines Bluetooth Mesh device/node name

**Default value:**
- “nimble-node” if CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_MESH_NODE_COUNT
Set mesh node count

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Defines mesh node count.

**Default value:**
- 1 if `CONFIG_BT_NIMBLE_MESH` & `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH_PROVISIONER
Enable BLE mesh provisioner

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable mesh provisioner.

**Default value:**
- 0 if `CONFIG_BT_NIMBLE_MESH` & `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS
Override TinyCrypt with mbedTLS for crypto computations

*Found in: Component config > Bluetooth > NimBLE Options*

Enable this option to choose mbedTLS instead of TinyCrypt for crypto computations.

**Default value:**
- Yes (enabled) if `BT_NIMBLE_ENABLED` & `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS
BLE host stop timeout in msec

*Found in: Component config > Bluetooth > NimBLE Options*

BLE Host stop procedure timeout in milliseconds.

**Default value:**
- 2000 if `BT_NIMBLE_ENABLED` & `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_HOST_BASED_PRIVACY
Enable host based privacy for random address.

*Found in: Component config > Bluetooth > NimBLE Options*

Use this option to do host based Random Private Address resolution. If this option is disabled then controller based privacy is used.

**Default value:**
- No (disabled) if `BT_NIMBLE_ENABLED` & `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT
Enable connection reattempts on connection establishment error

*Found in: Component config > Bluetooth > NimBLE Options*

Enable to make the NimBLE host to reattempt GAP connection on connection establishment failure.

**Default value:**
- Yes (enabled) if `SOC_ESP_NIMBLE_CONTROLLER` & `BT_NIMBLE_ENABLED`
- No (disabled) if `BT_NIMBLE_ENABLED`
Chapter 2.  API Reference

CONFIG_BT_NIMBLE_MAX_CONN_REATTEMPT

Maximum number connection reattempts

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT

Defines maximum number of connection reattempts.

*Range:*
- from 1 to 7 if BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT

*Default value:*
- 3 if BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT

CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Enable BLE 5 feature

*Found in:* Component config > Bluetooth > NimBLE Options

Enable BLE 5 feature

*Default value:*
- Yes (enabled) if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

*Contains:*
- CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_2M_PHY
- CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_CODED_PHY
- CONFIG_BT_NIMBLE_EXT_ADV
- CONFIG_BT_NIMBLE_BLE_POWER_CONTROL
- CONFIG_BT_NIMBLE_MAX_PERIODIC_ADVERTISER_LIST
- CONFIG_BT_NIMBLE_MAX_PERIODIC_SYNCS
- CONFIG_BT_NIMBLE_PERIODIC_ADV_ENH

CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_2M_PHY

Enable 2M Phy

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Enable 2M-PHY

*Default value:*
- Yes (enabled) if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_CODED_PHY

Enable coded Phy

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Enable coded-PHY

*Default value:*
- Yes (enabled) if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT
**CONFIG_BT_NIMBLE_EXT_ADV**

Enable extended advertising.

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Enable this option to do extended advertising. Extended advertising will be supported from BLE 5.0 onwards.

**Default value:**
- No (disabled) if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MAX_EXT_ADV_INSTANCES**

Maximum number of extended advertising instances.

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV

Change this option to set maximum number of extended advertising instances. Minimum there is always one instance of advertising. Enter how many more advertising instances you want. For ESP32C2, ESP32C6 and ESP32H2, each extended advertising instance will take about 0.5k DRAM.

**Range:**
- from 0 to 4 if CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && BT_NIMBLE_ENABLED

**Default value:**
- 1 if CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV &&& BT_NIMBLE_ENABLED
- 0 if CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV &&& BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_EXT_ADV_MAX_SIZE**

Maximum length of the advertising data.

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV

Defines the length of the extended adv data. The value should not exceed 1650.

**Range:**
- from 0 to 1650 if CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV &&& BT_NIMBLE_ENABLED

**Default value:**
- 1650 if CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV &&& CONFIG_BT_NIMBLE_EXT_ADV &&& BT_NIMBLE_ENABLED
- 0 if CONFIG_BT_NIMBLE_EXT_ADV &&& CONFIG_BT_NIMBLE_EXT_ADV &&& BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV**

Enable periodic advertisement.

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV

Enable this option to start periodic advertisement.

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_EXT_ADV &&& CONFIG_BT_NIMBLE_EXT_ADV &&& BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_PERIODIC_ADV_SYNC_TRANSFER

Enable Transfer Sync Events

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV > CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV

This enables controller transfer periodic sync events to host

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV && CONFIG_BT_NIMBLE_EXT_ADV && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_PERIODIC_SYNCS

Maximum number of periodic advertising syncs

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Set this option to set the upper limit for number of periodic sync connections. This should be less than maximum connections allowed by controller.

**Range:**
- from 0 to 8 if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && BT_NIMBLE_ENABLED

**Default value:**
- 1 if CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV && CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && BT_NIMBLE_ENABLED
- 0 if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_PERIODIC_ADVERTISER_LIST

Maximum number of periodic advertiser list

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Set this option to set the upper limit for number of periodic advertiser list.

**Range:**
- from 1 to 5 if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && SOC_ESP_NIMBLE_CONTROLLER && BT_NIMBLE_ENABLED

**Default value:**
- 5 if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && SOC_ESP_NIMBLE_CONTROLLER && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_BLE_POWER_CONTROL

Enable support for BLE Power Control

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Set this option to enable the Power Control feature

**Default value:**
- No (disabled) if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && SOC_BLE_POWER_CONTROL_SUPPORTED && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_PERIODIC_ADV_ENH

Periodic adv enhancements (adi support)

*Found in:* Component config > Bluetooth > NimBLE Options

- Enable the periodic advertising enhancements

CONFIG_BT_NIMBLE_COEX_PHY_CODED_TX_RX_TLIM

Coexistence: limit on MAX Tx/Rx time for coded-PHY connection

*Found in:* Component config > Bluetooth > NimBLE Options

- When using PHY-Coded in BLE connection, limitation on max tx/rx time can be applied to better avoid dramatic performance deterioration of Wi-Fi.

**Available options:**
- Force Enable (BT_NIMBLE_COEX_PHY_CODED_TX_RX_TLIM_EN)
  - Always enable the limitation on max tx/rx time for Coded-PHY connection
- Force Disable (BT_NIMBLE_COEX_PHY_CODED_TX_RX_TLIM_DIS)
  - Disable the limitation on max tx/rx time for Coded-PHY connection

CONFIG_BT_NIMBLE_WHITELIST_SIZE

BLE white list size

*Found in:* Component config > Bluetooth > NimBLE Options

- BLE list size

**Range:**
- from 1 to 15 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**Default value:**
- 12 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_TEST_THROUGHPUT_TEST

Throughput Test Mode enable

*Found in:* Component config > Bluetooth > NimBLE Options

- Enable the throughput test mode

**Default value:**
- No (disabled) if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_BLUFI_ENABLE

Enable blufi functionality

*Found in:* Component config > Bluetooth > NimBLE Options

- Set this option to enable blufi functionality.

**Default value:**
- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_USE_ESP_TIMER

Enable Esp Timer for Nimble

*Found in: Component config > Bluetooth > NimBLE Options*

Set this option to use Esp Timer which has higher priority timer instead of FreeRTOS timer

**Default value:**

- Yes (enabled) if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_BLE_GATT_BLOB_TRANSFER

Blob transfer

*Found in: Component config > Bluetooth > NimBLE Options*

This option is used when data to be sent is more than 512 bytes. For peripheral role, BT_NIMBLE_MSYS_1_BLOCK_COUNT needs to be increased according to the need.

GAP Service  Contains:

- GAP Appearance write permissions
- CONFIG_BT_NIMBLE_SVC_GAP_CENT_ADDR_RESOLUTION
- GAP device name write permissions
- CONFIG_BT_NIMBLE_SVC_GAP_PPCP_MAX_CONN_INTERVAL
- CONFIG_BT_NIMBLE_SVC_GAP_PPCP_MIN_CONN_INTERVAL
- CONFIG_BT_NIMBLE_SVC_GAP_PPCP_SLAVE_LATENCY
- CONFIG_BT_NIMBLE_SVC_GAP_PPCP_SUPERVISION_TMO

GAP Appearance write permissions  Contains:

- CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE

CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE

Write

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions*

Enable write permission (BLE_GATT_CHR_F_WRITE)

**Default value:**

- No (disabled) if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE_ENC

Write with encryption

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions > CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE*

Enable write with encryption permission (BLE_GATT_CHR_F_WRITE_ENC)

**Default value:**

- No (disabled) if CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE && BT_NIMBLE_ENABLED
**CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE_AUTHEN**

Write with authentication

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions > CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE*

Enable write with authentication permission (BLE_GATT_CHR_F_WRITE_AUTHEN)

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE` & `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE_AUTHOR**

Write with authorisation

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions > CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE*

Enable write with authorisation permission (BLE_GATT_CHR_F_WRITE_AUTHOR)

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE` & `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_SVC_GAP_CENT_ADDR_RESOLUTION**

GAP Characteristic - Central Address Resolution

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Weather or not Central Address Resolution characteristic is supported on the device, and if supported, weather or not Central Address Resolution is supported.

- Central Address Resolution characteristic not supported
- Central Address Resolution not supported
- Central Address Resolution supported

**Available options:**

- Characteristic not supported (BT_NIMBLE_SVC_GAP_CAR_CHAR_NOT_SUPP)
- Central Address Resolution not supported (BT_NIMBLE_SVC_GAP_CAR_NOT_SUPP)
- Central Address Resolution supported (BT_NIMBLE_SVC_GAP_CAR_SUPP)

**GAP device name write permissions**

Contains:

- `CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE`

**CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE**

Write

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions*

Enable write permission (BLE_GATT_CHR_F_WRITE)

**Default value:**

- No (disabled) if `BT_NIMBLE_ENABLED`
CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE_ENC

Write with encryption

Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions > CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE

Enable write with encryption permission (BLE_GATT_CHR_F_WRITE_ENC)

Default value:
- No (disabled) if CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE_AUTHEN

Write with authentication

Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions > CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE

Enable write with authentication permission (BLE_GATT_CHR_F_WRITE_AUTHEN)

Default value:
- No (disabled) if CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE_AUTHOR

Write with authorisation

Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions > CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE

Enable write with authorisation permission (BLE_GATT_CHR_F_WRITE_AUTHOR)

Default value:
- No (disabled) if CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SVC_GAP_PPPCP_MAX_CONN_INTERVAL

PPCP Connection Interval Max (Unit: 1.25 ms)

Found in: Component config > Bluetooth > NimBLE Options > GAP Service

Peripheral Preferred Connection Parameter: Connection Interval maximum value Interval Max = value * 1.25 ms

Default value:
- 0 if CONFIG_BT_NIMBLE_ROLE_PERIPHERAL && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SVC_GAP_PPPCP_MIN_CONN_INTERVAL

PPCP Connection Interval Min (Unit: 1.25 ms)

Found in: Component config > Bluetooth > NimBLE Options > GAP Service

Peripheral Preferred Connection Parameter: Connection Interval minimum value Interval Min = value * 1.25 ms

Default value:
- 0 if CONFIG_BT_NIMBLE_ROLE_PERIPHERAL && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_SVC_GAP_PPCP_SLAVE_LATENCY
PPCP Slave Latency

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Peripheral Preferred Connection Parameter: Slave Latency

**Default value:**
- 0 if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SVC_GAP_PPCP_SUPERVISION_TMO
PPCP Supervision Timeout (Uint: 10 ms)

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Peripheral Preferred Connection Parameter: Supervision Timeout Timeout = Value * 10 ms

**Default value:**
- 0 if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_VS_SUPPORT
Enable support for VSC and VSE

*Found in: Component config > Bluetooth > NimBLE Options*

This option is used to enable support for sending Vendor Specific HCI commands and handling Vendor Specific HCI Events.

CONFIG_BT_NIMBLE_OPTIMIZE_MULTI_CONN
Enable the optimization of multi-connection

*Found in: Component config > Bluetooth > NimBLE Options*

This option enables the use of vendor-specific APIs for multi-connections, which can greatly enhance the stability of coexistence between numerous central and peripheral devices. It will prohibit the usage of standard APIs.

**Default value:**
- No (disabled) if SOC_BLE_MULTI_CONN_OPTIMIZATION && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ENC_ADV_DATA
Encrypted Advertising Data

*Found in: Component config > Bluetooth > NimBLE Options*

This option is used to enable encrypted advertising data.

CONFIG_BT_NIMBLE_MAX_EADS
Maximum number of EAD devices to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_ENC_ADV_DATA*

Defines maximum number of encrypted advertising data key material to save

**Default value:**
- 10 if BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENC_ADV_DATA && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_HIGH_DUTY_ADV_ITVL
Enable BLE high duty advertising interval feature

*Found in: Component config > Bluetooth > NimBLE Options*

This enable BLE high duty advertising interval feature

CONFIG_BT_NIMBLE_HOST_QUEUE_CONG_CHECK
BLE queue congestion check

*Found in: Component config > Bluetooth > NimBLE Options*

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.

**Default value:**
- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**Controller Options**
Contains:
- CONFIG_BTDM_CTRL_AUTO_LATENCY
- CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP
- CONFIG_BTDM_CTRL_FULL_SCAN_SUPPORTED
- CONFIG_BTDM_CTRL_BLE_MAX_CONN
- CONFIG_BTDM_BLE_SCAN_DUPL
- CONFIG_BTDM_BLE_SLEEP_CLOCK_ACCURACY
- CONFIG_BTDM_CTRL_MODE
- CONFIG_BTDM_CTRL_BR_EDR_MAX_ACL_CONN
- CONFIG_BTDM_CTRL_BR_EDR_SOC_DATA_PATH
- CONFIG_BTDM_CTRL_BR_EDR_MAX_SYNC_CONN
- CONFIG_BTDM_CTRL_HCI_MODE_CHOICE
- HCI UART(H4) Options
- CONFIG_BTDM_CTRL_HLI
- CONFIG_BTDM_CTRL_LEGACY_AUTH_VENDOR_EVT
- MODEM SLEEP Options
- CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG
- CONFIG_BTDM_CTRL_PINNED_TO_CORE_CHOICE

CONFIG_BTDM_CTRL_MODE
Bluetooth controller mode (BR/EDR/BLE/DUALMODE)

*Found in: Component config > Bluetooth > Controller Options*

Specify the bluetooth controller mode (BR/EDR, BLE or dual mode).

**Available options:**
- BLE Only (BTDM_CTRL_MODE_BLE_ONLY)
- BR/EDR Only (BTDM_CTRL_MODE_BR_EDR_ONLY)
- Bluetooth Dual Mode (BTDM_CTRL_MODE_BTDM)

CONFIG_BTDM_CTRL_BLE_MAX_CONN
BLE Max Connections

*Found in: Component config > Bluetooth > Controller Options*

BLE maximum connections of bluetooth controller. Each connection uses 1KB static DRAM whenever the BT controller is enabled.
Range:
  • from 1 to 9 if (BTDM_CTRL_MODE_BLE_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

Default value:
  • 3 if (BTDM_CTRL_MODE_BLE_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

CONFIG_BTDM_CTRL_BR_EDR_MAX_ACL_CONN

BR/EDR ACL Max Connections

Found in: Component config > Bluetooth > Controller Options

BR/EDR ACL maximum connections of bluetooth controller. Each connection uses 1.2 KB DRAM whenever the BT controller is enabled.

Range:
  • from 1 to 7 if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

Default value:
  • 2 if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

CONFIG_BTDM_CTRL_BR_EDR_MAX_SYNC_CONN

BR/EDR Sync(SCO/eSCO) Max Connections

Found in: Component config > Bluetooth > Controller Options

BR/EDR Synchronize maximum connections of bluetooth controller. Each connection uses 2 KB DRAM whenever the BT controller is enabled.

Range:
  • from 0 to 3 if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

Default value:
  • 0 if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

CONFIG_BTDM_CTRL_BR_EDR_SCO_DATA_PATH

BR/EDR Sync(SCO/eSCO) default datapath

Found in: Component config > Bluetooth > Controller Options

SCO datapath, i.e. HCI or PCM. SCO data can be sent/received through HCI synchronous packets, or the data can be routed to on-chip PCM module on ESP32. PCM input/output signals can be “matrixed” to GPIOs. The default data path can also be set using API “esp_bredr_sco_datapath_set”

Available options:
  • HCI (BTDM_CTRL_BR_EDR_SCO_DATA_PATH_HCI)
  • PCM (BTDM_CTRL_BR_EDR_SCO_DATA_PATH_PCM)

CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG

PCM Signal Config (Role and Polar)

Found in: Component config > Bluetooth > Controller Options

Default value:
  • Yes (enabled) if BTDM_CTRL_BR_EDR_SCO_DATA_PATH_PCM && BT_CONTROLLER_ENABLED
Contains:

- `CONFIG_BTDM_CTRL_PCM_POLAR`
- `CONFIG_BTDM_CTRL_PCM_ROLE`

**CONFIG_BTDM_CTRL_PCM_ROLE**

PCM Role

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG*

PCM role can be configured as PCM master or PCM slave

**Available options:**

- PCM Master (BTDM_CTRL_PCM_ROLE_MASTER)
- PCM Slave (BTDM_CTRL_PCM_ROLE_SLAVE)

**CONFIG_BTDM_CTRL_PCM_POLAR**

PCM Polar

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG*

PCM polarity can be configured as Falling Edge or Rising Edge

**Available options:**

- Falling Edge (BTDM_CTRL_PCM_POLAR_FALLING_EDGE)
- Rising Edge (BTDM_CTRL_PCM_POLAR_RISING_EDGE)

**CONFIG_BTDM_CTRL_AUTO_LATENCY**

Auto latency

*Found in: Component config > Bluetooth > Controller Options*

BLE auto latency, used to enhance classic BT performance while classic BT and BLE are enabled at the same time.

**Default value:**

- No (disabled) if BTDM_CTRL_MODE_BTDM && BT_CONTROLLER_ENABLED

**CONFIG_BTDM_CTRL_LEGACY_AUTH_VENDOR_EVT**

Legacy Authentication Vendor Specific Event Enable

*Found in: Component config > Bluetooth > Controller Options*

To protect from BIAS attack during Legacy authentication, Legacy authentication Vendor specific event should be enabled

**Default value:**

- Yes (enabled) if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

**CONFIG_BTDM_CTRL_PINNED_TO_CORE_CHOICE**

The cpu core which bluetooth controller run

*Found in: Component config > Bluetooth > Controller Options*

Specify the cpu core to run bluetooth controller. Can not specify no-affinity.

**Available options:**

Submit Document Feedback
Chapter 2. API Reference

- Core 0 (PRO CPU) (BTDM_CTRL_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BTDM_CTRL_PINNED_TO_CORE_1)

**CONFIG_BTDM_CTRL_HCI_MODE_CHOICE**

HCI mode

*Found in: Component config > Bluetooth > Controller Options*

Specify HCI mode as VHCI or UART(H4)

**Available options:**

- VHCI (BTDM_CTRL_HCI_MODE_VHCI)
  
  Normal option. Mostly, choose this VHCI when bluetooth host run on ESP32, too.

- UART(H4) (BTDM_CTRL_HCI_MODE_UART_H4)
  
  If use external bluetooth host which run on other hardware and use UART as the HCI interface, choose this option.

**HCI UART(H4) Options**  Contains:

- `CONFIG_BTDM_CTRL_HCI_UART_FLOW_CTRL_EN`
- `CONFIG_BTDM_CTRL_HCI_UART_BAUDRATE`
- `CONFIG_BTDM_CTRL_HCI_UART_NO`

**CONFIG_BTDM_CTRL_HCI_UART_NO**

UART Number for HCI

*Found in: Component config > Bluetooth > Controller Options > HCI UART(H4) Options*

Uart number for HCI. The available uart is UART1 and UART2.

**Range:**

- from 1 to 2 if BTDM_CTRL_HCI_MODE_UART_H4 && BT_CONTROLLER_ENABLED

**Default value:**

- 1 if BTDM_CTRL_HCI_MODE_UART_H4 && BT_CONTROLLER_ENABLED

**CONFIG_BTDM_CTRL_HCI_UART_BAUDRATE**

UART Baudrate for HCI

*Found in: Component config > Bluetooth > Controller Options > HCI UART(H4) Options*

UART Baudrate for HCI. Please use standard baudrate.

**Range:**

- from 115200 to 921600 if BTDM_CTRL_HCI_MODE_UART_H4 && BT_CONTROLLER_ENABLED

**Default value:**

- 921600 if BTDM_CTRL_HCI_MODE_UART_H4 && BT_CONTROLLER_ENABLED

**CONFIG_BTDM_CTRL_HCI_UART_FLOW_CTRL_EN**

Enable UART flow control

*Found in: Component config > Bluetooth > Controller Options > HCI UART(H4) Options*

**Default value:**

- Yes (enabled) if BTDM_CTRL_HCI_MODE_UART_H4 && BT_CONTROLLER_ENABLED
MODEM SLEEP Options  Contains:
  • CONFIG_BTDM_CTRL_LOW_POWER_CLOCK
  • CONFIG_BTDM_CTRL_MODEM_SLEEP

CONFIG_BTDM_CTRL_MODEM_SLEEP
Bluetooth modem sleep

*Found in: Component config > Bluetooth > Controller Options > MODEM SLEEP Options*

Enable/disable bluetooth controller low power mode.

**Default value:**
  • Yes (enabled) if BT_CONTROLLER_ENABLED

CONFIG_BTDM_CTRL_MODEM_SLEEP_MODE
Bluetooth Modemsleep mode

*Found in: Component config > Bluetooth > Controller Options > MODEM SLEEP Options > CONFIG_BTDM_CTRL_MODEM_SLEEP*

To select which strategy to use for modem sleep

**Available options:**
  • ORIG Mode(sleep with low power clock) (BTDM_CTRL_MODEM_SLEEP_MODE_ORIG)
    ORIG mode is a bluetooth sleep mode that can be used for dual mode controller. In this mode, bluetooth controller sleeps between BR/EDR frames and BLE events. A low power clock is used to maintain bluetooth reference clock.
  • EVED Mode(For internal test only) (BTDM_CTRL_MODEM_SLEEP_MODE_EVED)
    EVED mode is for BLE only and is only for internal test. Do not use it for production. this mode is not compatible with DFS nor light sleep

CONFIG_BTDM_CTRL_LOW_POWER_CLOCK
Bluetooth low power clock

*Found in: Component config > Bluetooth > Controller Options > MODEM SLEEP Options*

Select the low power clock source for bluetooth controller. Bluetooth low power clock is the clock source to maintain time in sleep mode.

- “Main crystal” option provides good accuracy and can support Dynamic Frequency Scaling to be used with Bluetooth modem sleep. Light sleep is not supported.
- “External 32kHz crystal” option allows user to use a 32.768kHz crystal as Bluetooth low power clock. This option is allowed as long as External 32kHz crystal is configured as the system RTC clock source. This option provides good accuracy and supports Bluetooth modem sleep to be used alongside Dynamic Frequency Scaling or light sleep.

**Available options:**
  • Main crystal (BTDM_CTRL_LPCLK_SEL_MAIN_XTAL)
    Main crystal can be used as low power clock for bluetooth modem sleep. If this option is selected, bluetooth modem sleep can work under Dynamic Frequency Scaling(DFS) enabled, but cannot work when light sleep is enabled. Main crystal has a good performance in accuracy as the bluetooth low power clock source.
  • External 32kHz crystal (BTDM_CTRL_LPCLK_SEL_EXT_32K_XTAL)
    External 32kHz crystal has a nominal frequency of 32.768kHz and provides good frequency stability. If used as Bluetooth low power clock, External 32kHz can support Bluetooth modem sleep to be used with both DFS and light sleep.
CONFIG_BTDM_BLE_SLEEP_CLOCK_ACCURACY

BLE Sleep Clock Accuracy

*Found in: Component config > Bluetooth > Controller Options*

BLE Sleep Clock Accuracy (SCA) for the local device is used to estimate window widening in BLE connection events. With a lower level of clock accuracy (e.g., 500ppm over 250ppm), the slave needs a larger RX window to synchronize with master in each anchor point, thus resulting in an increase of power consumption but a higher level of robustness in keeping connected. According to the requirements of Bluetooth Core specification 4.2, the worst-case accuracy of Classic Bluetooth low power oscillator (LPO) is +/-250ppm in STANDBY and in low power modes such as sniff. For BLE the worst-case SCA is +/-500ppm.

- “151ppm to 250ppm” option is the default value for Bluetooth Dual mode
- “251ppm to 500ppm” option can be used in BLE only mode when using external 32kHz crystal as low power clock. This option is provided in case that BLE sleep clock has a lower level of accuracy, or other error sources contribute to the inaccurate timing during sleep.

Available options:

- 251ppm to 500ppm (BTDM_BLE_DEFAULT_SCA_500PPM)
- 151ppm to 250ppm (BTDM_BLE_DEFAULT_SCA_250PPM)

CONFIG_BTDM_BLE_SCAN_DUPL

BLE Scan Duplicate Options

*Found in: Component config > Bluetooth > Controller Options*

This select enables parameters setting of BLE scan duplicate.

Default value:

- Yes (enabled) if (BTDM_CTRL_MODE_BTDM || BTDM_CTRL_MODE_BLE_ONLY) && BT_CONTROLLER_ENABLED

CONFIG_BTDM_SCAN_DUPL_TYPE

Scan Duplicate Type

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_BLE_SCAN_DUPL*

Scan duplicate have three ways. one is “Scan Duplicate By Device Address”, This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once. Another way is “Scan Duplicate By Device Address And Advertising Data”. This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported. The last way is “Scan Duplicate By Advertising Data”. This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.

Available options:

- Scan Duplicate By Device Address (BTDM_SCAN_DUPL_TYPE_DEVICE) This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once
- Scan Duplicate By Advertising Data (BTDM_SCAN_DUPL_TYPE_DATA) This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.
- Scan Duplicate By Device Address And Advertising Data (BTDM_SCAN_DUPL_TYPE_DATA_DEVICE) This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported.
**CONFIG_BTDM_SCAN_DUPL_CACHE_SIZE**

Maximum number of devices in scan duplicate filter

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_BLE_SCAN_DUPL*

Maximum number of devices which can be recorded in scan duplicate filter. When the maximum amount of device in the filter is reached, the cache will be refreshed.

*Range:*

- from 10 to 1000 if `CONFIG_BTDM_BLE_SCAN_DUPL` && `BT_CONTROLLER_ENABLED`

*Default value:*

- 100 if `CONFIG_BTDM_BLE_SCAN_DUPL` && `BT_CONTROLLER_ENABLED`

**CONFIG_BTDM_SCAN_DUPL_CACHE_REFRESH_PERIOD**

Duplicate scan list refresh period (seconds)

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_BLE_SCAN_DUPL*

If the period value is non-zero, the controller will periodically clear the device information stored in the scan duplicate filter. If it is 0, the scan duplicate filter will not be cleared until the scanning is disabled. Duplicate advertisements for this period should not be sent to the Host in advertising report events. There are two scenarios where the ADV packet will be repeatedly reported: 1. The duplicate scan cache is full, the controller will delete the oldest device information and add new device information. 2. When the refresh period is up, the controller will clear all device information and start filtering again.

*Range:*

- from 0 to 1000 if `CONFIG_BTDM_BLE_SCAN_DUPL` && `BT_CONTROLLER_ENABLED`

*Default value:*

- 0 if `CONFIG_BTDM_BLE_SCAN_DUPL` && `BT_CONTROLLER_ENABLED`

**CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN**

Special duplicate scan mechanism for BLE Mesh scan

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_BLE_SCAN_DUPL*

This enables the BLE scan duplicate for special BLE Mesh scan.

*Default value:*

- No (disabled) if `CONFIG_BTDM_BLE_SCAN_DUPL` && `BT_CONTROLLER_ENABLED`

**CONFIG_BTDM_MESH_DUPL_SCAN_CACHE_SIZE**

Maximum number of Mesh adv packets in scan duplicate filter

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_BLE_SCAN_DUPL > CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN*

Maximum number of adv packets which can be recorded in duplicate scan cache for BLE Mesh. When the maximum amount of device in the filter is reached, the cache will be refreshed.

*Range:*

- from 10 to 1000 if `CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN` && `BT_CONTROLLER_ENABLED`

*Default value:*

- 100 if `CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN` && `BT_CONTROLLER_ENABLED`
CONFIG_BTDM_CTRL_FULL_SCAN_SUPPORTED

BLE full scan feature supported

*Found in: Component config > Bluetooth > Controller Options*

The full scan function is mainly used to provide BLE scan performance. This is required for scenes with high scan performance requirements, such as BLE Mesh scenes.

**Default value:**
- Yes (enabled) if (BTDM_CTRL_MODE_BLE_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP

BLE adv report flow control supported

*Found in: Component config > Bluetooth > Controller Options*

The function is mainly used to enable flow control for advertising reports. When it is enabled, advertising reports will be discarded by the controller if the number of unprocessed advertising reports exceeds the size of BLE adv report flow control.

**Default value:**
- Yes (enabled) if (BTDM_CTRL_MODE_BTDM || BTDM_CTRL_MODE_BLE_ONLY) && BT_CONTROLLER_ENABLED

CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM

BLE adv report flow control number

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP*

The number of unprocessed advertising report that Bluedroid can save. If you set BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM to a small value, this may cause adv packets lost. If you set BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM to a large value, Bluedroid may cache a lot of adv packets and this may cause system memory run out. For example, if you set it to 50, the maximum memory consumed by host is 35 * 50 bytes. Please set BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM according to your system free memory and handle adv packets as fast as possible, otherwise it will cause adv packets lost.

**Range:**
- from 50 to 1000 if CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP && BT_CONTROLLER_ENABLED

**Default value:**
- 100 if CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP && BT_CONTROLLER_ENABLED

CONFIG_BTDM_BLE_ADV_REPORT_DISCARD_THRESHOLD

BLE adv lost event threshold value

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP*

When adv report flow control is enabled, The ADV lost event will be generated when the number of ADV packets lost in the controller reaches this threshold. It is better to set a larger value. If you set BTDM_BLE_ADV_REPORT_DISCARD_THRESHOLD to a small value or printf every adv lost event, it may cause adv packets lost more.

**Range:**
- from 1 to 1000 if CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP && BT_CONTROLLER_ENABLED
Default value:

- 20 if `CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP` && `BT_CONTROLLER_ENABLED`

**CONFIG_BTDM_CTRL_HLI**

High level interrupt

*Found in: Component config > Bluetooth > Controller Options*

Using Level 4 interrupt for Bluetooth.

**Default value:**

- Yes (enabled) if `CONFIG_BT_ENABLED` && `BT_CONTROLLER_ENABLED`

**CONFIG_BLE_MESH**

ESP BLE Mesh Support

*Found in: Component config*

This option enables ESP BLE Mesh support. The specific features that are available may depend on other features that have been enabled in the stack, such as Bluetooth Support, Bluedroid Support & GATT support.

*Contains:*

- BLE Mesh and BLE coexistence support
- `CONFIG_BLE_MESH_GATT_PROXY_CLIENT`
- `CONFIG_BLE_MESH_GATT_PROXY_SERVER`
- BLE Mesh NET BUF DEBUG LOG LEVEL
- `CONFIG_BLE_MESH_PROV`
- `CONFIG_BLE_MESH_PROXY`
- BLE Mesh specific test option
- BLE Mesh STACK DEBUG LOG LEVEL
- `CONFIG_BLE_MESH_NO_LOG`
- `CONFIG_BLE_MESH_IVU_DIVIDER`
- `CONFIG_BLE_MESH_FAST_PROV`
- `CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC`
- `CONFIG_BLE_MESH_CRL`
- `CONFIG_BLE_MESH_RX_SDU_MAX`
- `CONFIG_BLE_MESH_MODEL_KEY_COUNT`
- `CONFIG_BLE_MESH_APP_KEY_COUNT`
- `CONFIG_BLE_MESH_MODEL_GROUP_COUNT`
- `CONFIG_BLE_MESH_LABEL_COUNT`
- `CONFIG_BLE_MESH_SUBNET_COUNT`
- `CONFIG_BLE_MESH_TX_SEG_MAX`
- `CONFIG_BLE_MESH_RX_SEG_MSG_COUNT`
- `CONFIG_BLE_MESH_TX_SEG_MSG_COUNT`
- `CONFIG_BLE_MESH_MEM_ALLOC_MODE`
- `CONFIG_BLE_MESH_MSG_CACHE_SIZE`
- `CONFIG_BLE_MESH_PB_GATT`
- `CONFIG_BLE_MESH_PB_ADV`
- `CONFIG_BLE_MESH_IVU_RECOVERY_IVI`
- `CONFIG_BLE_MESH_RELAY`
- `CONFIG_BLE_MESH_SETTINGS`
- `CONFIG_BLE_MESH_ACTIVE_SCAN`
- `CONFIG_BLE_MESH_DEINIT`
- `CONFIG_BLE_MESH_USE_DUPLICATE_SCAN`
- Support for BLE Mesh Client/Server models
Chapter 2. API Reference

- **Support for BLE Mesh Foundation models**
- `CONFIG_BLE_MESH_NODE`
- `CONFIG_BLE_MESH_PROVISIONER`
- `CONFIG_BLE_MESH_FRIEND`
- `CONFIG_BLE_MESH_LOW_POWER`
- `CONFIG_BLE_MESH_HCI_5_0`
- `CONFIG_BLE_MESH_IV_UPDATE_TEST`
- `CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT`

**CONFIG_BLE_MESH_HCI_5_0**

Support sending 20ms non-connectable adv packets

*Found in: Component config > CONFIG_BLE_MESH*

It is a temporary solution and needs further modifications.

*Default value:*
  - Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_USE_DUPLICATE_SCAN**

Support Duplicate Scan in BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow using specific duplicate scan filter in BLE Mesh, and Scan Duplicate Type must be set by choosing the option in the Bluetooth Controller section in menuconfig, which is “Scan Duplicate By Device Address and Advertising Data”.

*Default value:*
  - Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_ACTIVE_SCAN**

Support Active Scan in BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow using BLE Active Scan for BLE Mesh.

**CONFIG_BLE_MESH_MEM_ALLOC_MODE**

Memory allocation strategy

*Found in: Component config > CONFIG_BLE_MESH*

Allocation strategy for BLE Mesh stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

*Available options:*
Chapter 2. API Reference

- Internal DRAM (BLE_MESH_MEM_ALLOC_MODE_INTERNAL)
- External SPIRAM (BLE_MESH_MEM_ALLOC_MODE_EXTERNAL)
- Default alloc mode (BLE_MESH_MEM_ALLOC_MODE_DEFAULT)
  
  Enable this option to use the default memory allocation strategy when external SPIRAM is enabled. See the SPIRAM options for more details.

- Internal IRAM (BLE_MESH_MEM_ALLOC_MODE_IRAM_8BIT)
  
  Allows to use IRAM memory region as 8bit accessible region. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

**CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC**

Enable FreeRTOS static allocation

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to use FreeRTOS static allocation APIs for BLE Mesh, which provides the ability to use different dynamic memory (i.e. SPIRAM or IRAM) for FreeRTOS objects. If this option is disabled, the FreeRTOS static allocation APIs will not be used, and internal DRAM will be allocated for FreeRTOS objects.

**Default value:**

- No (disabled) if (CONFIG_SPIRAM || CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY) && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC_MODE**

Memory allocation for FreeRTOS objects

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC*

Choose the memory to be used for FreeRTOS objects.

**Available options:**

- External SPIRAM (BLE_MESH_FREERTOS_STATIC_ALLOC_EXTERNAL)
  
  If enabled, BLE Mesh allocates dynamic memory from external SPIRAM for FreeRTOS objects, i.e. mutex, queue, and task stack. External SPIRAM can only be used for task stack when SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY is enabled. See the SPIRAM options for more details.

- Internal IRAM (BLE_MESH_FREERTOS_STATIC_ALLOC_IRAM_8BIT)
  
  If enabled, BLE Mesh allocates dynamic memory from internal IRAM for FreeRTOS objects, i.e. mutex, queue. Note: IRAM region cannot be used as task stack.

**CONFIG_BLE_MESH_DEINIT**

Support de-initialize BLE Mesh stack

*Found in: Component config > CONFIG_BLE_MESH*

If enabled, users can use the function esp_ble_mesh_deinit() to de-initialize the whole BLE Mesh stack.

**Default value:**

- Yes (enabled) if CONFIG_BLE_MESH

**BLE Mesh and BLE coexistence support** Contains:

- CONFIG_BLE_MESH_SUPPORT_BLE_SCAN
- CONFIG_BLE_MESH_SUPPORT_BLE_ADV
CONFIG BLE_MESH_SUPPORT_BLE_ADV

Support sending normal BLE advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support*

When selected, users can send normal BLE advertising packets with specific API.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_BLE_ADV_BUF_COUNT

Number of advertising buffers for BLE advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support > CONFIG_BLE_MESH_SUPPORT_BLE_ADV*

Number of advertising buffers for BLE packets available.

**Range:**
- from 1 to 255 if CONFIG_BLE_MESH_SUPPORT_BLE_ADV && CONFIG_BLE_MESH

**Default value:**
- 3 if CONFIG_BLE_MESH_SUPPORT_BLE_ADV && CONFIG_BLE_MESH

CONFIG_BLE_MESH_SUPPORT_BLE_SCAN

Support scanning normal BLE advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support*

When selected, users can register a callback and receive normal BLE advertising packets in the application layer.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_FAST_PROV

Enable BLE Mesh Fast Provisioning

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow BLE Mesh fast provisioning solution to be used. When there are multiple unprovisioned devices around, fast provisioning can greatly reduce the time consumption of the whole provisioning process. When this option is enabled, and after an unprovisioned device is provisioned into a node successfully, it can be changed to a temporary Provisioner.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_NODE

Support for BLE Mesh Node

*Found in: Component config > CONFIG_BLE_MESH*

Enable the device to be provisioned into a node. This option should be enabled when an unprovisioned device is going to be provisioned into a node and communicate with other nodes in the BLE Mesh network.
CONFIG_BLE_MESH_PROVISIONER

Support for BLE Mesh Provisioner

Found in: Component config > CONFIG_BLE_MESH

Enable the device to be a Provisioner. The option should be enabled when a device is going to act as a Provisioner and provision unprovisioned devices into the BLE Mesh network.

CONFIG_BLE_MESH_WAIT_FOR_PROV_MAX_DEV_NUM

Maximum number of unprovisioned devices that can be added to device queue

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER

This option specifies how many unprovisioned devices can be added to device queue for provisioning. Users can use this option to define the size of the queue in the bottom layer which is used to store unprovisioned device information (e.g. Device UUID, address).

Range:
• from 1 to 100 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

Default value:
• 10 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_MAX_PROV_NODES

Maximum number of devices that can be provisioned by Provisioner

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER

This option specifies how many devices can be provisioned by a Provisioner. This value indicates the maximum number of unprovisioned devices which can be provisioned by a Provisioner. For instance, if the value is 6, it means the Provisioner can provision up to 6 unprovisioned devices. Theoretically a Provisioner without the limitation of its memory can provision up to 32766 unprovisioned devices, here we limit the maximum number to 100 just to limit the memory used by a Provisioner. The bigger the value is, the more memory it will cost by a Provisioner to store the information of nodes.

Range:
• from 1 to 1000 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

Default value:
• 10 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_PBA_SAME_TIME

Maximum number of PB-ADV running at the same time by Provisioner

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER

This option specifies how many devices can be provisioned at the same time using PB-ADV. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-ADV at the same time.

Range:
• from 1 to 10 if CONFIG_BLE_MESH_PB_ADV && CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

Default value:
• 2 if CONFIG_BLE_MESH_PB_ADV && CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH
**CONFIG_BLE_MESH_PBG_SAME_TIME**

Maximum number of PB-GATT running at the same time by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-GATT. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-GATT at the same time.

*Range:*
- from 1 to 5 if `CONFIG_BLE_MESH_PB_GATT` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

*Default value:*
- 1 if `CONFIG_BLE_MESH_PB_GATT` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROVISIONER_SUBNET_COUNT**

Maximum number of mesh subnets that can be created by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many subnets per network a Provisioner can create. Indeed, this value decides the number of network keys which can be added by a Provisioner.

*Range:*
- from 1 to 4096 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

*Default value:*
- 3 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROVISIONER_APP_KEY_COUNT**

Maximum number of application keys that can be owned by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many application keys the Provisioner can have. Indeed, this value decides the number of the application keys which can be added by a Provisioner.

*Range:*
- from 1 to 4096 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

*Default value:*
- 3 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROVISIONER_RECV_HB**

Support receiving Heartbeat messages

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

When this option is enabled, Provisioner can call specific functions to enable or disable receiving Heartbeat messages and notify them to the application layer.

*Default value:*
- No (disabled) if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROVISIONER_RECV_HB_FILTER_SIZE**

Maximum number of filter entries for receiving Heartbeat messages

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER > CONFIG_BLE_MESH_PROVISIONER_RECV_HB*
This option specifies how many heartbeat filter entries Provisioner supports. The heartbeat filter (acceptlist or rejectlist) entries are used to store a list of SRC and DST which can be used to decide if a heartbeat message will be processed and notified to the application layer by Provisioner. Note: The filter is an empty rejectlist by default.

**Range:**
- from 1 to 1000 if `CONFIG_BLE_MESH_PROVISIONER_RECV_HB` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH_PROVISIONER_RECV_HB` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

---

**CONFIG_BLE_MESH_PROV**

BLE Mesh Provisioning support

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to support BLE Mesh Provisioning functionality. For BLE Mesh, this option should be always enabled.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

---

**CONFIG_BLE_MESH_PROV_EPA**

BLE Mesh enhanced provisioning authentication

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROV*

Enable this option to support BLE Mesh enhanced provisioning authentication functionality. This option can increase the security level of provisioning. It is recommended to enable this option.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH_PROV` && `CONFIG_BLE_MESH`

---

**CONFIG_BLE_MESH_CERT_BASED_PROV**

Support Certificate-based provisioning

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROV*

Enable this option to support BLE Mesh Certificate-Based Provisioning.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_PROV` && `CONFIG_BLE_MESH`

---

**CONFIG_BLE_MESH_RECORD_FRAG_MAX_SIZE**

Maximum size of the provisioning record fragment that Provisioner can receive

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROV > CONFIG_BLE_MESH_CERT_BASED_PROV*

This option sets the maximum size of the provisioning record fragment that the Provisioner can receive. The range depends on provisioning bearer.

**Range:**
- from 1 to 57 if `CONFIG_BLE_MESH_CERT_BASED_PROV` && `CONFIG_BLE_MESH`

**Default value:**
- 56 if `CONFIG_BLE_MESH_CERT_BASED_PROV` && `CONFIG_BLE_MESH`
CONFIG_BLE_MESH_PB_ADV

Provisioning support using the advertising bearer (PB-ADV)

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow the device to be provisioned over the advertising bearer. This option should be enabled if PB-ADV is going to be used during provisioning procedure.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_UNPROVISIONED_BEACON_INTERVAL

Interval between two consecutive Unprovisioned Device Beacon

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PB_ADV*

This option specifies the interval of sending two consecutive unprovisioned device beacon, users can use this option to change the frequency of sending unprovisioned device beacon. For example, if the value is 5, it means the unprovisioned device beacon will send every 5 seconds. When the option of BLE_MESH_FAST_PROV is selected, the value is better to be 3 seconds, or less.

**Range:**
- from 1 to 100 if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`

**Default value:**
- 5 if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`
- 3 if `CONFIG_BLE_MESH_FAST_PROV` && `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_PB_GATT

Provisioning support using GATT (PB-GATT)

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow the device to be provisioned over GATT. This option should be enabled if PB-GATT is going to be used during provisioning procedure.

# Virtual option enabled whenever any Proxy protocol is needed

CONFIG_BLE_MESH_PROXY

BLE Mesh Proxy protocol support

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to support BLE Mesh Proxy protocol used by PB-GATT and other proxy pdu transmission.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_GATT_PROXY_SERVER

BLE Mesh GATT Proxy Server

*Found in: Component config > CONFIG_BLE_MESH*

This option enables support for Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network. This option should be enabled if a node is going to be a Proxy Server.
Chapter 2. API Reference

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH_NODE` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_NODE_ID_TIMEOUT**

Node Identity advertising timeout

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER*

This option determines for how long the local node advertises using Node Identity. The given value is in seconds. The specification limits this to 60 seconds and lists it as the recommended value as well. So leaving the default value is the safest option. When an unprovisioned device is provisioned successfully and becomes a node, it will start to advertise using Node Identity during the time set by this option. And after that, Network ID will be advertised.

*Range:*
  - from 1 to 60 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` & `CONFIG_BLE_MESH`

*Default value:*
  - 60 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROXY_FILTER_SIZE**

Maximum number of filter entries per Proxy Client

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER*

This option specifies how many Proxy Filter entries the local node supports. The entries of Proxy filter (whitelist or blacklist) are used to store a list of addresses which can be used to decide which messages will be forwarded to the Proxy Client by the Proxy Server.

*Range:*
  - from 1 to 32767 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` & `CONFIG_BLE_MESH`

*Default value:*
  - 4 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROXY_PRIVACY**

Support Proxy Privacy

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER*

The Proxy Privacy parameter controls the privacy of the Proxy Server over the connection. The value of the Proxy Privacy parameter is controlled by the type of proxy connection, which is dependent on the bearer used by the proxy connection.

*Default value:*
  - Yes (enabled) if `CONFIG_BLE_MESH_PRB_SRV` & `CONFIG_BLE_MESH_GATT_PROXY_SERVER` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROXY_SOLIC_PDU_RX**

Support receiving Proxy Solicitation PDU

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER*

Enable this option to support receiving Proxy Solicitation PDU.
CONFIG_BLE_MESH_PROXY_SOLIC_RX_CRPL

Maximum capacity of solicitation replay protection list

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER > CONFIG_BLE_MESH_PROXY_SOLIC_PDU_RX

This option specifies the maximum capacity of the solicitation replay protection list. The solicitation replay protection list is used to reject Solicitation PDUs that were already processed by a node, which will store the solicitation src and solicitation sequence number of the received Solicitation PDU message.

**Range:**
- from 1 to 255 if CONFIG_BLE_MESH_PROXY_SOLIC_PDU_RX && CONFIG_BLE_MESH

**Default value:**
- 2 if CONFIG_BLE_MESH_PROXY_SOLIC_PDU_RX && CONFIG_BLE_MESH

CONFIG_BLE_MESH_GATT_PROXY_CLIENT

BLE Mesh GATT Proxy Client

*Found in:* Component config > CONFIG_BLE_MESH

This option enables support for Mesh GATT Proxy Client. The Proxy Client can use the GATT bearer to send mesh messages to a node that supports the advertising bearer.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_PROXY_SOLIC_PDU_TX

Support sending Proxy Solicitation PDU

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_CLIENT

Enable this option to support sending Proxy Solicitation PDU.

CONFIG_BLE_MESH_PROXY_SOLIC_TX_SRC_COUNT

Maximum number of SSRC that can be used by Proxy Client

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_CLIENT > CONFIG_BLE_MESH_PROXY_SOLIC_PDU_TX

This option specifies the maximum number of Solicitation Source (SSRC) that can be used by Proxy Client for sending a Solicitation PDU. A Proxy Client may use the primary address or any of the secondary addresses as the SSRC for a Solicitation PDU. So for a Proxy Client, it’s better to choose the value based on its own element count.

**Range:**
- from 1 to 16 if CONFIG_BLE_MESH_PROXY_SOLIC_PDU_TX && CONFIG_BLE_MESH

**Default value:**
- 2 if CONFIG_BLE_MESH_PROXY_SOLIC_PDU_TX && CONFIG_BLE_MESH

CONFIG_BLE_MESH_SETTINGS

Store BLE Mesh configuration persistently

*Found in:* Component config > CONFIG_BLE_MESH

When selected, the BLE Mesh stack will take care of storing/restoring the BLE Mesh configuration persistently in flash. If the device is a BLE Mesh node, when this option is enabled, the configuration of the device will be stored persistently, including unicast address, NetKey, AppKey, etc. And if the device is a BLE Mesh Provisioner, the information of the device will be stored persistently, including the information of provisioned nodes, NetKey, AppKey, etc.
**Chapter 2. API Reference**

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_STORE_TIMEOUT**

Delay (in seconds) before storing anything persistently

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines in seconds how soon any pending changes are actually written into persistent storage (flash) after a change occurs. The option allows nodes to delay a certain period of time to save proper information to flash. The default value is 0, which means information will be stored immediately once there are updates.

**Range:**
- from 0 to 1000000 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**Default value:**
- 0 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SEQ_STORE_RATE**

How often the sequence number gets updated in storage

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines how often the local sequence number gets updated in persistent storage (i.e. flash). e.g. a value of 100 means that the sequence number will be stored to flash on every 100th increment. If the node sends messages very frequently a higher value makes more sense, whereas if the node sends infrequently a value as low as 0 (update storage for every increment) can make sense. When the stack gets initialized it will add sequence number to the last stored one, so that it starts off with a value that’s guaranteed to be larger than the last one used before power off.

**Range:**
- from 0 to 1000000 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**Default value:**
- 0 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_RPL_STORE_TIMEOUT**

Minimum frequency that the RPL gets updated in storage

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines in seconds how soon the RPL (Replay Protection List) gets written to persistent storage after a change occurs. If the node receives messages frequently, then a large value is recommended. If the node receives messages rarely, then the value can be as low as 0 (which means the RPL is written into the storage immediately). Note that if the node operates in a security-sensitive case, and there is a risk of sudden power-off, then a value of 0 is strongly recommended. Otherwise, a power loss before RPL being written into the storage may introduce message replay attacks and system security will be in a vulnerable state.

**Range:**
- from 0 to 1000000 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**Default value:**
- 0 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SETTINGS_BACKWARD_COMPATIBILITY**

A specific option for settings backward compatibility

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*
This option is created to solve the issue of failure in recovering node information after mesh stack updates. In the old version mesh stack, there is no key of “mesh/role” in nvs. In the new version mesh stack, key of “mesh/role” is added in nvs, recovering node information needs to check “mesh/role” key in nvs and implements selective recovery of mesh node information. Therefore, there may be failure in recovering node information during node restarting after OTA.

The new version mesh stack adds the option of “mesh/role” because we have added the support of storing Provisioner information, while the old version only supports storing node information.

If users are updating their nodes from old version to new version, we recommend enabling this option, so that system could set the flag in advance before recovering node information and make sure the node information recovering could work as expected.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SPECIFIC_PARTITION**

Use a specific NVS partition for BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

When selected, the mesh stack will use a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using `nvs_flash_init_partition()` API, and the partition must exists in the csv file. When Provisioner needs to store a large amount of nodes' information in the flash (e.g. more than 20), this option is recommended to be enabled.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PARTITION_NAME**

Name of the NVS partition for BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_SPECIFIC_PARTITION*

This value defines the name of the specified NVS partition used by the mesh stack.

**Default value:**
- “ble_mesh” if `CONFIG_BLE_MESH_SPECIFIC_PARTITION && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE**

Support using multiple NVS namespaces by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

When selected, Provisioner can use different NVS namespaces to store different instances of mesh information. For example, if in the first room, Provisioner uses NetKey A, AppKey A and provisions three devices, these information will be treated as mesh information instance A. When the Provisioner moves to the second room, it uses NetKey B, AppKey B and provisions two devices, then the information will be treated as mesh information instance B. Here instance A and instance B will be stored in different namespaces. With this option enabled, Provisioner needs to use specific functions to open the corresponding NVS namespace, restore the mesh information, release the mesh information or erase the mesh information.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH`
CONFIG_BLE_MESH_MAX_NVS_NAMESPACE

Maximum number of NVS namespaces

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE

This option specifies the maximum NVS namespaces supported by Provisioner.

**Range:**
- from 1 to 255 if CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

**Default value:**
- 2 if CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

CONFIG_BLE_MESH_SUBNET_COUNT

Maximum number of mesh subnets per network

*Found in:* Component config > CONFIG_BLE_MESH

This option specifies how many subnets a Mesh network can have at the same time. Indeed, this value decides the number of the network keys which can be owned by a node.

**Range:**
- from 1 to 4096 if CONFIG_BLE_MESH

**Default value:**
- 3 if CONFIG_BLE_MESH

CONFIG_BLE_MESH_APP_KEY_COUNT

Maximum number of application keys per network

*Found in:* Component config > CONFIG_BLE_MESH

This option specifies how many application keys the device can store per network. Indeed, this value decides the number of the application keys which can be owned by a node.

**Range:**
- from 1 to 4096 if CONFIG_BLE_MESH

**Default value:**
- 3 if CONFIG_BLE_MESH

CONFIG_BLE_MESH_MODEL_KEY_COUNT

Maximum number of application keys per model

*Found in:* Component config > CONFIG_BLE_MESH

This option specifies the maximum number of application keys to which each model can be bound.

**Range:**
- from 1 to 4096 if CONFIG_BLE_MESH

**Default value:**
- 3 if CONFIG_BLE_MESH

CONFIG_BLE_MESH_MODEL_GROUP_COUNT

Maximum number of group address subscriptions per model

*Found in:* Component config > CONFIG_BLE_MESH

This option specifies the maximum number of addresses to which each model can be subscribed.
Chapter 2. API Reference

**CONFIG_BLE_MESH_LABEL_COUNT**

Maximum number of Label UUIDs used for Virtual Addresses

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies how many Label UUIDs can be stored. Indeed, this value decides the number of the Virtual Addresses can be supported by a node.

*Range:*
- from 0 to 4096 if `CONFIG_BLE_MESH`

*Default value:*
- 3 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_CRPL**

Maximum capacity of the replay protection list

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum capacity of the replay protection list. It is similar to Network message cache size, but has a different purpose. The replay protection list is used to prevent a node from replay attack, which will store the source address and sequence number of the received mesh messages. For Provisioner, the replay protection list size should not be smaller than the maximum number of nodes whose information can be stored. And the element number of each node should also be taken into consideration. For example, if Provisioner can provision up to 20 nodes and each node contains two elements, then the replay protection list size of Provisioner should be at least 40.

*Range:*
- from 2 to 65535 if `CONFIG_BLE_MESH`

*Default value:*
- 10 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_MSG_CACHE_SIZE**

Network message cache size

*Found in: Component config > CONFIG_BLE_MESH*

Number of messages that are cached for the network. This helps prevent unnecessary decryption operations and unnecessary relays. This option is similar to Replay protection list, but has a different purpose. A node is not required to cache the entire Network PDU and may cache only part of it for tracking, such as values for SRC/SEQ or others.

*Range:*
- from 2 to 65535 if `CONFIG_BLE_MESH`

*Default value:*
- 10 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_ADV_BUF_COUNT**

Number of advertising buffers

*Found in: Component config > CONFIG_BLE_MESH*

Number of advertising buffers available. The transport layer reserves ADV_BUF_COUNT - 3 buffers for outgoing segments. The maximum outgoing SDU size is 12 times this value (out of which 4 or 8 bytes are used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size
is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC, or 52 bytes using an 8-byte MIC.

**Range:**
- from 6 to 256 if `CONFIG_BLE_MESH`

**Default value:**
- 60 if `CONFIG_BLE_MESH`

### CONFIG_BLE_MESH_IVU_DIVIDER

Divider for IV Update state refresh timer

*Found in: Component config > CONFIG_BLE_MESH*

When the IV Update state enters Normal operation or IV Update in Progress, we need to keep track of how many hours has passed in the state, since the specification requires us to remain in the state at least for 96 hours (Update in Progress has an additional upper limit of 144 hours).

In order to fulfill the above requirement, even if the node might be powered off once in a while, we need to store persistently how many hours the node has been in the state. This doesn’t necessarily need to happen every hour (thanks to the flexible duration range). The exact cadence will depend a lot on the ways that the node will be used and what kind of power source it has.

Since there is no single optimal answer, this configuration option allows specifying a divider, i.e. how many intervals the 96 hour minimum gets split into. After each interval the duration that the node has been in the current state gets stored to flash. E.g. the default value of 4 means that the state is saved every 24 hours (96 / 4).

**Range:**
- from 2 to 96 if `CONFIG_BLE_MESH`

**Default value:**
- 4 if `CONFIG_BLE_MESH`

### CONFIG_BLE_MESH_IVU_RECOVERY_IVI

Recovery the IV index when the latest whole IV update procedure is missed

*Found in: Component config > CONFIG_BLE_MESH*

According to Section 3.10.5 of Mesh Specification v1.0.1. If a node in Normal Operation receives a Secure Network beacon with an IV index equal to the last known IV index+1 and the IV Update Flag set to 0, the node may update its IV without going to the IV Update in Progress state, or it may initiate an IV Index Recovery procedure (Section 3.10.6), or it may ignore the Secure Network beacon. The node makes the choice depending on the time since last IV update and the likelihood that the node has missed the Secure Network beacons with the IV update Flag. When the above situation is encountered, this option can be used to decide whether to perform the IV index recovery procedure.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

### CONFIG_BLE_MESH_TX_SEG_MSG_COUNT

Maximum number of simultaneous outgoing segmented messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of simultaneous outgoing multi-segment and/or reliable messages. The default value is 1, which means the device can only send one segmented message at a time. And if another segmented message is going to be sent, it should wait for the completion of the previous one. If users are going to send multiple segmented messages at the same time, this value should be configured properly.

**Range:**
- from 1 to if `CONFIG_BLE_MESH`
Default value:
  • 1 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_RX_SEG_MSG_COUNT**

Maximum number of simultaneous incoming segmented messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of simultaneous incoming multi-segment and/or reliable messages. The default value is 1, which means the device can only receive one segmented message at a time. And if another segmented message is going to be received, it should wait for the completion of the previous one. If users are going to receive multiple segmented messages at the same time, this value should be configured properly.

*Range:*
  • from 1 to 255 if `CONFIG_BLE_MESH`

*Default value:*
  • 1 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_RX_SDU_MAX**

Maximum incoming Upper Transport Access PDU length

*Found in: Component config > CONFIG_BLE_MESH*

Maximum incoming Upper Transport Access PDU length. Leave this to the default value, unless you really need to optimize memory usage.

*Range:*
  • from 36 to 384 if `CONFIG_BLE_MESH`

*Default value:*
  • 384 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_TX_SEG_MAX**

Maximum number of segments in outgoing messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of segments supported for outgoing messages. This value should typically be fine-tuned based on what models the local node supports, i.e. what’s the largest message payload that the node needs to be able to send. This value affects memory and call stack consumption, which is why the default is lower than the maximum that the specification would allow (32 segments).

The maximum outgoing SDU size is 12 times this number (out of which 4 or 8 bytes is used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC and 52 bytes using an 8-byte MIC.

Be sure to specify a sufficient number of advertising buffers when setting this option to a higher value. There must be at least three more advertising buffers (BLE_MESH_ADV_BUF_COUNT) as there are outgoing segments.

*Range:*
  • from 2 to 32 if `CONFIG_BLE_MESH`

*Default value:*
  • 32 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_RELAY**

Relay support

*Found in: Component config > CONFIG_BLE_MESH*
Support for acting as a Mesh Relay Node. Enabling this option will allow a node to support the Relay feature, and the Relay feature can still be enabled or disabled by proper configuration messages. Disabling this option will let a node not support the Relay feature.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH_NODE` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_RELAY_ADV_BUF**

Use separate advertising buffers for relay packets

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY*

When selected, self-send packets will be put in a high-priority queue and relay packets will be put in a low-priority queue.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_RELAY` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_RELAY_ADV_BUF_COUNT**

Number of advertising buffers for relay packets

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY > CONFIG_BLE_MESH_RELAY_ADV_BUF*

Number of advertising buffers for relay packets available.

**Range:**
- from 6 to 256 if `CONFIG_BLE_MESH_RELAY_ADV_BUF` & `CONFIG_BLE_MESH_RELAY` & `CONFIG_BLE_MESH`

**Default value:**
- 60 if `CONFIG_BLE_MESH_RELAY_ADV_BUF` & `CONFIG_BLE_MESH_RELAY` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LOW_POWER**

Support for Low Power features

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to operate as a Low Power Node. If low power consumption is required by a node, this option should be enabled. And once the node enters the mesh network, it will try to find a Friend node and establish a friendship.

**CONFIG_BLE_MESH_LPN_ESTABLISHMENT**

Perform Friendship establishment using low power

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Perform the Friendship establishment using low power with the help of a reduced scan duty cycle. The downside of this is that the node may miss out on messages intended for it until it has successfully set up Friendship with a Friend node. When this option is enabled, the node will stop scanning for a period of time after a Friend Request or Friend Poll is sent, so as to reduce more power consumption.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_LOW_POWER` & `CONFIG_BLE_MESH`
CONFIG_BLE_MESH_LPN_AUTO

Automatically start looking for Friend nodes once provisioned

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Once provisioned, automatically enable LPN functionality and start looking for Friend nodes. If this option is disabled LPN mode needs to be manually enabled by calling `bt_mesh_lpn_set(true)`. When an unprovisioned device is provisioned successfully and becomes a node, enabling this option will trigger the node to send Friend Request at a certain period until it finds a proper Friend node.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

CONFIG_BLE_MESH_LPN_AUTO_TIMEOUT

Time from last received message before going to LPN mode

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER > CONFIG_BLE_MESH_LPN_AUTO*

Time in seconds from the last received message, that the node waits out before starting to look for Friend nodes.

**Range:**
- from 0 to 3600 if `CONFIG_BLE_MESH_LPN_AUTO && CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**Default value:**
- 15 if `CONFIG_BLE_MESH_LPN_AUTO && CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

CONFIG_BLE_MESH_LPN_RETRY_TIMEOUT

Retry timeout for Friend requests

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Time in seconds between Friend Requests, if a previous Friend Request did not yield any acceptable Friend Offers.

**Range:**
- from 1 to 3600 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**Default value:**
- 6 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

CONFIG_BLE_MESH_LPN_RSSI_FACTOR

RSSI Factor, used in Friend Offer Delay calculation

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The contribution of the RSSI, measured by the Friend node, used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. RSSI Factor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**
- from 0 to 3 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**Default value:**
- 0 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`
**CONFIG_BLE_MESH_LPN_RECV_WIN_FACTOR**

ReceiveWindowFactor, used in Friend Offer Delay calculation

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The contribution of the supported Receive Window used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. ReceiveWindowFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**
- from 0 to 3 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**Default value:**
- 0 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_MIN_QUEUE_SIZE**

Minimum size of the acceptable friend queue (MinQueueSizeLog)

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The MinQueueSizeLog field is defined as $\log_2(N)$, where $N$ is the minimum number of maximum size Lower Transport PDUs that the Friend node can store in its Friend Queue. As an example, MinQueueSizeLog value 1 gives $N = 2$, and value 7 gives $N = 128$.

**Range:**
- from 1 to 7 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**Default value:**
- 1 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_RECV_DELAY**

Receive delay requested by the local node

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The ReceiveDelay is the time between the Low Power node sending a request and listening for a response. This delay allows the Friend node time to prepare the response. The value is in units of milliseconds.

**Range:**
- from 10 to 255 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**Default value:**
- 100 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_POLL_TIMEOUT**

The value of the PollTimeout timer

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOWPOWER*

PollTimeout timer is used to measure time between two consecutive requests sent by a Low Power node. If no requests are received the Friend node before the PollTimeout timer expires, then the friendship is considered terminated. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds. The smaller the value, the faster the Low Power node tries to get messages from corresponding Friend node and vice versa.

**Range:**
- from 10 to 244735 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**Default value:**
- 300 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`
CONFIG_BLE_MESH_LPN_INIT_POLL_TIMEOUT
The starting value of the PollTimeout timer

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The initial value of the PollTimeout timer when Friendship is to be established for the first time. After this, the timeout gradually grows toward the actual PollTimeout, doubling in value for each iteration. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds.

**Range:**
- from 10 to if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**Default value:**
- if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPN_SCAN_LATENCY
Latency for enabling scanning

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Latency (in milliseconds) is the time it takes to enable scanning. In practice, it means how much time in advance of the Receive Window, the request to enable scanning is made.

**Range:**
- from 0 to 50 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**Default value:**
- 10 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPN_GROUPS
Number of groups the LPN can subscribe to

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Maximum number of groups to which the LPN can subscribe.

**Range:**
- from 0 to 16384 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**Default value:**
- 8 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPN_SUB_ALL_NODES_ADDR
Automatically subscribe all nodes address

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Automatically subscribe all nodes address when friendship established.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_FRIEND
Support for Friend feature

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to be able to act as a Friend Node.
**CONFIG_BLE_MESH_FRIEND_RECV_WIN**

Friend Receive Window

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Receive Window in milliseconds supported by the Friend node.

**Range:**
- from 1 to 255 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**
- 255 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FRIEND_QUEUE_SIZE**

Minimum number of buffers supported per Friend Queue

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Minimum number of buffers available to be stored for each local Friend Queue. This option decides the size of each buffer which can be used by a Friend node to store messages for each Low Power node.

**Range:**
- from 2 to 65536 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**
- 16 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FRIEND_SUB_LIST_SIZE**

Friend Subscription List Size

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Size of the Subscription List that can be supported by a Friend node for a Low Power node. And Low Power node can send Friend Subscription List Add or Friend Subscription List Remove messages to the Friend node to add or remove subscription addresses.

**Range:**
- from 0 to 1023 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FRIEND_LPN_COUNT**

Number of supported LPN nodes

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Number of Low Power Nodes with which a Friend can have Friendship simultaneously. A Friend node can have friendship with multiple Low Power nodes at the same time, while a Low Power node can only establish friendship with only one Friend node at the same time.

**Range:**
- from 1 to 1000 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**
- 2 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FRIEND_SEG_RX**

Number of incomplete segment lists per LPN

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Number of incomplete segment lists tracked for each Friends’ LPN. In other words, this determines from how many elements can segmented messages destined for the Friend queue be received simultaneously.
Range:
- from 1 to 1000 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

Default value:
- 1 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_NO_LOG**

Disable BLE Mesh debug logs (minimize bin size)

*Found in: Component config > CONFIG_BLE_MESH*

Select this to save the BLE Mesh related rodata code size. Enabling this option will disable the output of BLE Mesh debug log.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH` && `CONFIG_BLE_MESH`

**BLE Mesh STACK DEBUG LOG LEVEL**  
Contains:
- `CONFIG_BLE_MESH_STACK_TRACE_LEVEL`

**CONFIG_BLE_MESH_STACK_TRACE_LEVEL**

`BLE_MESH_STACK`

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh STACK DEBUG LOG LEVEL*

Define BLE Mesh trace level for BLE Mesh stack.

**Available options:**
- NONE (BLE_MESH_TRACE_LEVEL_NONE)
- ERROR (BLE_MESH_TRACE_LEVEL_ERROR)
- WARNING (BLE_MESH_TRACE_LEVEL_WARNING)
- INFO (BLE_MESH_TRACE_LEVEL_INFO)
- DEBUG (BLE_MESH_TRACE_LEVEL_DEBUG)
- VERBOSE (BLE_MESH_TRACE_LEVEL_VERBOSE)

**BLE Mesh NET BUF DEBUG LOG LEVEL**  
Contains:
- `CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL`

**CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL**

`BLE_MESH_NET_BUF`

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh NET BUF DEBUG LOG LEVEL*

Define BLE Mesh trace level for BLE Mesh net buffer.

**Available options:**
- NONE (BLE_MESH_NET_BUF_TRACE_LEVEL_NONE)
- ERROR (BLE_MESH_NET_BUF_TRACE_LEVEL_ERROR)
- WARNING (BLE_MESH_NET_BUF_TRACE_LEVEL_WARNING)
- INFO (BLE_MESH_NET_BUF_TRACE_LEVEL_INFO)
- DEBUG (BLE_MESH_NET_BUF_TRACE_LEVEL_DEBUG)
- VERBOSE (BLE_MESH_NET_BUF_TRACE_LEVELVERBOSE)
**CONFIG BLE_MESH_CLIENT_MSG_TIMEOUT**

Timeout(ms) for client message response

*Found in: Component config > CONFIG_BLE_MESH*

Timeout value used by the node to get response of the acknowledged message which is sent by the client model. This value indicates the maximum time that a client model waits for the response of the sent acknowledged messages. If a client model uses 0 as the timeout value when sending acknowledged messages, then the default value will be used which is four seconds.

**Range:**
- from 100 to 1200000 if `CONFIG_BLE_MESH`

**Default value:**
- 4000 if `CONFIG_BLE_MESH`

**Support for BLE Mesh Foundation models**

- `CONFIG_BLE_MESH_BRC_CLI`
- `CONFIG_BLE_MESH_BRC_SRV`
- `CONFIG_BLE_MESH_CFG_CLI`
- `CONFIG_BLE_MESH_DF_CLI`
- `CONFIG_BLE_MESH_DF_SRV`
- `CONFIG_BLE_MESH_HEALTH_CLI`
- `CONFIG_BLE_MESH_HEALTH_SRV`
- `CONFIG_BLE_MESH_LCD_CLI`
- `CONFIG_BLE_MESH_LCD_SRV`
- `CONFIG_BLE_MESH_PRB_CLI`
- `CONFIG_BLE_MESH_PRB_SRV`
- `CONFIG_BLE_MESH_ODP_CLI`
- `CONFIG_BLE_MESH_ODP_SRV`
- `CONFIG_BLE_MESH_AGG_CLI`
- `CONFIG_BLE_MESH_AGG_SRV`
- `CONFIG_BLE_MESH_RPR_CLI`
- `CONFIG_BLE_MESH_RPR_SRV`
- `CONFIG_BLE_MESH_SAR_CLI`
- `CONFIG_BLE_MESH_SAR_SRV`
- `CONFIG_BLE_MESH_SRPL_CLI`
- `CONFIG_BLE_MESH_SRPL_SRV`
- `CONFIG_BLE_MESH_COMP_DATA_1`
- `CONFIG_BLE_MESH_COMP_DATA_128`
- `CONFIG_BLE_MESH_MODELS_METADATA_0`

**CONFIG BLE_MESH_CFG_CLI**

Configuration Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Configuration Client model.

**CONFIG BLE_MESH_HEALTH_CLI**

Health Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Client model.
CONFIG_BLE_MESH_HEALTH_SRV

Health Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Server model.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_BRC_CLI

Bridge Configuration Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Bridge Configuration Client model.

CONFIG_BLE_MESH_BRC_SRV

Bridge Configuration Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Bridge Configuration Server model.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_MAX_BRIDGING_TABLE_ENTRY_COUNT

Maximum number of Bridging Table entries

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_BRC_SRV*

Maximum number of Bridging Table entries that the Bridge Configuration Server can support.

**Range:**
- from 16 to 65535 if `CONFIG_BLE_MESH_BRC_SRV` && `CONFIG_BLE_MESH`

**Default value:**
- 16 if `CONFIG_BLE_MESH_BRC_SRV` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_PRB_CLI

Mesh Private Beacon Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Mesh Private Beacon Client model.

CONFIG_BLE_MESH_PRB_SRV

Mesh Private Beacon Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Mesh Private Beacon Server model.
CONFIG_BLE_MESH_ODP_CLI
On-Demand Private Proxy Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*
Enable support for On-Demand Private Proxy Client model.

CONFIG_BLE_MESH_ODP_SRV
On-Demand Private Proxy Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*
Enable support for On-Demand Private Proxy Server model.

CONFIG_BLE_MESH_SRPL_CLI
Solicitation PDU RPL Configuration Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*
Enable support for Solicitation PDU RPL Configuration Client model.

CONFIG_BLE_MESH_SRPL_SRV
Solicitation PDU RPL Configuration Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*
Enable support for Solicitation PDU RPL Configuration Server model. Note: This option depends on the functionality of receiving Solicitation PDU. If the device doesn’t support receiving Solicitation PDU, then there is no need to enable this server model.

CONFIG_BLE_MESH_AGG_CLI
Opcodes Aggregator Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*
Enable support for Opcodes Aggregator Client model.

CONFIG_BLE_MESH_AGG_SRV
Opcodes Aggregator Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*
Enable support for Opcodes Aggregator Server model.

CONFIG_BLE_MESH_SAR_CLI
SAR Configuration Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*
Enable support for SAR Configuration Client model.

CONFIG_BLE_MESH_SAR_SRV
SAR Configuration Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*
Enable support for SAR Configuration Server model.
CONFIG_BLE_MESH_COMP_DATA_1

Support Composition Data Page 1

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Composition Data Page 1 contains information about the relationships among models. Each model either can be a root model or can extend other models.

CONFIG_BLE_MESH_COMP_DATA_128

Support Composition Data Page 128

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Composition Data Page 128 is used to indicate the structure of elements, features, and models of a node after the successful execution of the Node Address Refresh procedure or the Node Composition Refresh procedure, or after the execution of the Node Removal procedure followed by the provisioning process. Composition Data Page 128 shall be present if the node supports the Remote Provisioning Server model; otherwise it is optional.

CONFIG_BLE_MESH_MODELS_METADATA_0

Support Models Metadata Page 0

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

The Models Metadata state contains metadata of a node’s models. The Models Metadata state is composed of a number of pages of information. Models Metadata Page 0 shall be present if the node supports the Large Composition Data Server model.

CONFIG_BLE_MESH_MODELS_METADATA_128

Support Models Metadata Page 128

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_MODELS_METADATA_0*

The Models Metadata state contains metadata of a node’s models. The Models Metadata state is composed of a number of pages of information. Models Metadata Page 128 contains metadata for the node’s models after the successful execution of the Node Address Refresh procedure or the Node Composition Refresh procedure, or after the execution of the Node Removal procedure followed by the provisioning process. Models Metadata Page 128 shall be present if the node supports the Remote Provisioning Server model and the node supports the Large Composition Data Server model.

CONFIG_BLE_MESH_LCD_CLI

Large Composition Data Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Large Composition Data Client model.

CONFIG_BLE_MESH_LCD_SRV

Large Composition Data Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Large Composition Data Server model.
CONFIG_BLE_MESH_RPR_CLI
Remote Provisioning Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models
Enable support for Remote Provisioning Client model

CONFIG_BLE_MESH_RPR_CLI_PROV_SAME_TIME
Maximum number of PB-Remote running at the same time by Provisioner

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_RPR_CLI
This option specifies how many devices can be provisioned at the same time using PB-REMOTE. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-REMOTE at the same time.

Range:
- from 1 to 5 if CONFIG_BLE_MESH_RPR_CLI && CONFIG_BLE_MESH
Default value:
- 2 if CONFIG_BLE_MESH_RPR_CLI && CONFIG_BLE_MESH

CONFIG_BLE_MESH_RPR_SRV
Remote Provisioning Server model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models
Enable support for Remote Provisioning Server model

CONFIG_BLE_MESH_RPR_SRV_MAX_SCANNED_ITEMS
Maximum number of device information can be scanned

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_RPR_SRV
This option specifies how many device information can a Remote Provisioning Server store each time while scanning.

Range:
- from 4 to 255 if CONFIG_BLE_MESH_RPR_SRV && CONFIG_BLE_MESH
Default value:
- 10 if CONFIG_BLE_MESH_RPR_SRV && CONFIG_BLE_MESH

CONFIG_BLE_MESH_RPR_SRV_ACTIVE_SCAN
Support Active Scan for remote provisioning

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_RPR_SRV
Enable this option to support Active Scan for remote provisioning.

CONFIG_BLE_MESH_RPR_SRV_MAX_EXT_SCAN
Maximum number of extended scan procedures

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_RPR_SRV
This option specifies how many extended scan procedures can be started by the Remote Provisioning Server.
Chapter 2. API Reference

Range:

• from 1 to 10 if CONFIG_BLE_MESH_RPR_SRV && CONFIG_BLE_MESH

Default value:

• 1 if CONFIG_BLE_MESH_RPR_SRV && CONFIG_BLE_MESH

CONFIG_BLE_MESH_DF_CLI

Directed Forwarding Configuration Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Enable support for Directed Forwarding Configuration Client model.

CONFIG_BLE_MESH_DF_SRV

Directed Forwarding Configuration Server model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Enable support for Directed Forwarding Configuration Server model.

CONFIG_BLE_MESH_MAX_DISC_TABLE_ENTRY_COUNT

Maximum number of discovery table entries in a given subnet

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_DF_SRV

Maximum number of Discovery Table entries supported by the node in a given subnet.

Range:

• from 2 to 255 if CONFIG_BLE_MESH_DF_SRV && CONFIG_BLE_MESH

Default value:

• 2 if CONFIG_BLE_MESH_DF_SRV && CONFIG_BLE_MESH

CONFIG_BLE_MESH_MAX_FORWARD_TABLE_ENTRY_COUNT

Maximum number of forward table entries in a given subnet

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_DF_SRV

Maximum number of Forward Table entries supported by the node in a given subnet.

Range:

• from 2 to 64 if CONFIG_BLE_MESH_DF_SRV && CONFIG_BLE_MESH

Default value:

• 2 if CONFIG_BLE_MESH_DF_SRV && CONFIG_BLE_MESH

CONFIG_BLE_MESH_MAX_DEPS_NODES_PER_PATH

Maximum number of dependent nodes per path

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_DF_SRV

Maximum size of dependent nodes list supported by each forward table entry.

Range:

• from 2 to 64 if CONFIG_BLE_MESH_DF_SRV && CONFIG_BLE_MESH

Default value:

• 2 if CONFIG_BLE_MESH_DF_SRV && CONFIG_BLE_MESH
CONFIG_BLE_MESH_PATH_MONITOR_TEST

Enable Path Monitoring test mode

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_DF_SRV*

The option only removes the Path Use timer; all other behavior of the device is not changed. If Path Monitoring test mode is going to be used, this option should be enabled.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH_DF_SRV && CONFIG_BLE_MESH

CONFIG_BLE_MESH_SUPPORT_DIRECTED_PROXY

Enable Directed Proxy functionality

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_DF_SRV*

Support Directed Proxy functionality.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH_DF_SRV && CONFIG_BLE_MESH

Support for BLE Mesh Client/Server models

Contains:

- CONFIG_BLE_MESH_MBT_CLI
- CONFIG_BLE_MESH_MBT_SRV
- CONFIG_BLE_MESH_GENERIC_BATTERY_CLI
- CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI

CONFIG_BLE_MESH_GENERIC_ONOFF_CLI

Generic OnOff Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic OnOff Client model.
CONFIG_BLE_MESH_GENERIC_LEVEL_CLI
Generic Level Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic Level Client model.

CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI
Generic Default Transition Time Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic Default Transition Time Client model.

CONFIG_BLE_MESH_GENERIC_POWER_ONOFF_CLI
Generic Power OnOff Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic Power OnOff Client model.

CONFIG_BLE_MESH_GENERIC_POWER_LEVEL_CLI
Generic Power Level Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic Power Level Client model.

CONFIG_BLE_MESH_GENERIC_BATTERY_CLI
Generic Battery Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic Battery Client model.

CONFIG_BLE_MESH_GENERIC_LOCATION_CLI
Generic Location Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic Location Client model.

CONFIG_BLE_MESH_GENERIC_PROPERTY_CLI
Generic Property Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic Property Client model.

CONFIG_BLE_MESH_SENSOR_CLI
Sensor Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Sensor Client model.
CONFIG_BLE_MESH_TIME_CLI
Time Client model
Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Time Client model.

CONFIG_BLE_MESH_SCENE_CLI
Scene Client model
Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Scene Client model.

CONFIG_BLE_MESH_SCHEDULER_CLI
Scheduler Client model
Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Scheduler Client model.

CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI
Light Lightness Client model
Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Light Lightness Client model.

CONFIG_BLE_MESH_LIGHT_CTL_CLI
Light CTL Client model
Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Light CTL Client model.

CONFIG_BLE_MESH_LIGHT_HSL_CLI
Light HSL Client model
Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Light HSL Client model.

CONFIG_BLE_MESH_LIGHT_XYL_CLI
Light XYL Client model
Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Light XYL Client model.

CONFIG_BLE_MESH_LIGHT_LC_CLI
Light LC Client model
Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Light LC Client model.
**CONFIG_BLE_MESH_GENERIC_SERVER**

Generic server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic server models.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SENSOR_SERVER**

Sensor server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Sensor server models.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_TIME_SCENE_SERVER**

Time and Scenes server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Time and Scenes server models.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LIGHTING_SERVER**

Lighting server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Lighting server models.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_MBT_CLI**

BLOB Transfer Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for BLOB Transfer Client model.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_MAX_BLOB_RECEIVERS**

Maximum number of simultaneous blob receivers

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models > CONFIG_BLE_MESH_MBT_CLI*

Maximum number of BLOB Transfer Server models that can participating in the BLOB transfer with a BLOB Transfer Client model.

**Range:**
- from 1 to 255 if `CONFIG_BLE_MESH_MBT_CLI` & `CONFIG_BLE_MESH`
**CONFIG_BLE_MESH_MBT_SRV**

BLOB Transfer Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for BLOB Transfer Server model.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_IV_UPDATE_TEST**

Test the IV Update Procedure

*Found in: Component config > CONFIG_BLE_MESH*

This option removes the 96 hour limit of the IV Update Procedure and lets the state to be changed at any time. If IV Update test mode is going to be used, this option should be enabled.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

**BLE Mesh specific test option**

Contains:

- `CONFIG_BLE_MESH_DEBUG`
- `CONFIG_BLE_MESH_SHELL`
- `CONFIG_BLE_MESH_BQB_TEST`
- `CONFIG_BLE_MESH_SELF_TEST`
- `CONFIG_BLE_MESH_TEST_AUTO_ENTER_NETWORK`
- `CONFIG_BLE_MESH_TEST_USE_WHITE_LIST`

**CONFIG_BLE_MESH_SELF_TEST**

Perform BLE Mesh self-tests

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

This option adds extra self-tests which are run every time BLE Mesh networking is initialized.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_BQB_TEST**

Enable BLE Mesh specific internal test

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

This option is used to enable some internal functions for auto-pts test.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`
CONFIG_BLE_MESH_TEST_AUTO_ENTER_NETWORK
Unprovisioned device enters mesh network automatically

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

With this option enabled, an unprovisioned device can automatically enter the mesh network using a specific test function without the provisioning procedure. On the Provisioner side, a test function needs to be invoked to add the node information into the mesh stack.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH_SELF_TEST` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_TEST_USE_WHITE_LIST
Use white list to filter mesh advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

With this option enabled, users can use white list to filter mesh advertising packets while scanning.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_SELF_TEST` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_SHELL
Enable BLE Mesh shell

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

Activate shell module that provides BLE Mesh commands to the console.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_DEBUG
Enable BLE Mesh debug logs

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

Enable debug logs for the BLE Mesh functionality.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_DEBUG_NET
Network layer debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Network layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_TRANS
Transport layer debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Transport layer debug logs for the BLE Mesh functionality.
CONFIG_BLE_MESH_DEBUG_BEACON
Beacon debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Beacon-related debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_CRYPTO
Crypto debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable cryptographic debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_PROV
Provisioning debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Provisioning debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_ACCESS
Access layer debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Access layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_MODEL
Foundation model debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Foundation Models debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_ADV
Advertising debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable advertising debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_LOW_POWER
Low Power debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Low Power debug logs for the BLE Mesh functionality.
CONFIG_BLE_MESH_DEBUG_FRIEND

Friend debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Friend debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_PROXY

Proxy debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Proxy protocol debug logs for the BLE Mesh functionality.

Driver Configurations Contains:

- Analog Comparator Configuration
- DAC Configuration
- GPIO Configuration
- GPTimer Configuration
- I2C Configuration
- I2S Configuration
- LEDC Configuration
- Legacy ADC Configuration
- MCPWM Configuration
- Parallel IO Configuration
- PCNT Configuration
- RMT Configuration
- Sigma Delta Modulator Configuration
- SPI Configuration
- Temperature sensor Configuration
- TWAI Configuration
- UART Configuration
- USB Serial/JTAG Configuration

Legacy ADC Configuration Contains:

- CONFIG_ADC_DISABLE_DAC
- Legacy ADC Calibration Configuration
- CONFIG_ADC_SUPPRESS_DEPRECATE_WARN

CONFIG_ADC_DISABLE_DAC

Disable DAC when ADC2 is used on GPIO 25 and 26

*Found in:* Component config > Driver Configurations > Legacy ADC Configuration

If this is set, the ADC2 driver will disable the output of the DAC corresponding to the specified channel. This is the default value.

For testing, disable this option so that we can measure the output of DAC by internal ADC.

**Default value:**
- Yes (enabled)
CONFIG_ADC_SUPPRESS_DEPRECATE_WARN

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > Legacy ADC Configuration*

Whether to suppress the deprecation warnings when using legacy adc driver (driver/adc.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

Legacy ADC Calibration Configuration  Contains:

- CONFIG_ADC_CALI_SUPPRESS_DEPRECATE_WARN
- CONFIG_ADC_CAL_EFUSE_VREF_ENABLE
- CONFIG_ADC_CAL_LUT_ENABLE
- CONFIG_ADC_CAL_EFUSE_TP_ENABLE

CONFIG_ADC_CAL_EFUSE_TP_ENABLE

Use Two Point Values

*Found in: Component config > Driver Configurations > Legacy ADC Configuration > Legacy ADC Calibration Configuration*

Some ESP32s have Two Point calibration values burned into eFuse BLOCK3. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using Two Point values if they are available.

**Default value:**
- Yes (enabled)

CONFIG_ADC_CAL_EFUSE_VREF_ENABLE

Use eFuse Vref

*Found in: Component config > Driver Configurations > Legacy ADC Configuration > Legacy ADC Calibration Configuration*

Some ESP32s have Vref burned into eFuse BLOCK0. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using eFuse Vref if it is available.

**Default value:**
- Yes (enabled)

CONFIG_ADC_CAL_LUT_ENABLE

Use Lookup Tables

*Found in: Component config > Driver Configurations > Legacy ADC Configuration > Legacy ADC Calibration Configuration*

This option will allow the ADC calibration component to use Lookup Tables to correct for non-linear behavior in 11db attenuation. Other attenuations do not exhibit non-linear behavior hence will not be affected by this option.

**Default value:**
- Yes (enabled)
**CONFIG_ADC_CALI_SUPPRESS_DEPRECATE_WARN**

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > Legacy ADC Configuration > Legacy ADC Calibration Configuration*

Whether to suppress the deprecation warnings when using legacy adc calibration driver (esp_adc_cal.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

**SPI Configuration**

Contains:
- `CONFIG_SPI_MASTER_ISR_IN_IRAM`
- `CONFIG_SPI_SLAVE_ISR_IN_IRAM`
- `CONFIG_SPI_MASTER_IN_IRAM`
- `CONFIG_SPI_SLAVE_IN_IRAM`

**CONFIG_SPI_MASTER_IN_IRAM**

Place transmitting functions of SPI master into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*

Normally only the ISR of SPI master is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there’s some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue_trans, get_trans_result` and `transmit` functions into the IRAM to avoid possible cache miss.

This configuration won’t be available if `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH` is enabled.

During unit test, this is enabled to measure the ideal case of api.

**Default value:**
- No (disabled) if `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH`

**CONFIG_SPI_MASTER_ISR_IN_IRAM**

Place SPI master ISR function into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*

Place the SPI master ISR in to IRAM to avoid possible cache miss.

Enabling this configuration is possible only when `HEAP_PLACE_FUNCTION_INTO_FLASH` is disabled since the spi master uses can allocate transactions buffers into DMA memory section using the heap component API that ipso facto has to be placed in IRAM.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

**Default value:**
- Yes (enabled) if `CONFIG_HEAP_PLACE_FUNCTION_INTO_FLASH`

**CONFIG_SPI_SLAVE_IN_IRAM**

Place transmitting functions of SPI slave into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*
Normally only the ISR of SPI slave is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there’s some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put queue_trans, get__trans__result and transmit functions into the IRAM to avoid possible cache miss.

**Default value:**
- No (disabled)

**CONFIG_SPI_SLAVE_ISR_IN_IRAM**

Place SPI slave ISR function into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*

Place the SPI slave ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add ESP_INTR_FLAG_IRAM when initializing the driver.

**Default value:**
- Yes (enabled)

**TWAI Configuration**

Contains:
  - **CONFIG_TWAI_ERRATA_FIX_RX_FRAME_INVALID**
  - **CONFIG_TWAI_ERRATA_FIX_LISTEN_ONLY_DOM**
  - **CONFIG_TWAI_ERRATA_FIX_BUS_OFF_REC**
  - **CONFIG_TWAI_ERRATA_FIX_RX_FIFO_CORRUPT**
  - **CONFIG_TWAI_ERRATA_FIX_TX_INTR_LOST**
  - **CONFIG_TWAI_ISR_IN_IRAM**

**CONFIG_TWAI_ISR_IN_IRAM**

Place TWAI ISR function into IRAM

*Found in: Component config > Driver Configurations > TWAI Configuration*

Place the TWAI ISR in to IRAM. This will allow the ISR to avoid cache misses, and also be able to run whilst the cache is disabled (such as when writing to SPI Flash). Note that if this option is enabled:
- Users should also set the ESP_INTR_FLAG_IRAM in the driver configuration structure when installing the driver (see docs for specifics). - Alert logging (i.e., setting of the TWAI_ALERT_AND_LOG flag) will have no effect.

**Default value:**
- No (disabled)

**CONFIG_TWAI_ERRATA_FIX_BUS_OFF_REC**

Add SW workaround for REC change during bus-off

*Found in: Component config > Driver Configurations > TWAI Configuration*

When the bus-off condition is reached, the REC should be reset to 0 and frozen (via LOM) by the driver’s ISR. However on the ESP32, there is an edge case where the REC will increase before the driver’s ISR can respond in time (e.g., due to the rapid occurrence of bus errors), thus causing the REC to be non-zero after bus-off. A non-zero REC can prevent bus-off recovery as the bus-off recovery condition is that both TEC and REC become 0. Enabling this option will add a workaround in the driver to forcibly reset REC to zero on reaching bus-off.

**Default value:**
- Yes (enabled)
CONFIG_TWAI_ERRATA_FIX_TX_INTR_LOST
Add SW workaround for TX interrupt lost errata

Found in: Component config > Driver Configurations > TWAI Configuration

On the ESP32, when a transmit interrupt occurs, and interrupt register is read on the same APB clock cycle, the transmit interrupt could be lost. Enabling this option will add a workaround that checks the transmit buffer status bit to recover any lost transmit interrupt.

Default value:
• Yes (enabled)

CONFIG_TWAI_ERRATA_FIX_RX_FRAME_INVALID
Add SW workaround for invalid RX frame errata

Found in: Component config > Driver Configurations > TWAI Configuration

On the ESP32, when receiving a data or remote frame, if a bus error occurs in the data or CRC field, the data of the next received frame could be invalid. Enabling this option will add a workaround that will reset the peripheral on detection of this errata condition. Note that if a frame is transmitted on the bus whilst the reset is ongoing, the message will not be receive by the peripheral sent on the bus during the reset, the message will be lost.

Default value:
• Yes (enabled)

CONFIG_TWAI_ERRATA_FIX_RX_FIFO_CORRUPT
Add SW workaround for RX FIFO corruption errata

Found in: Component config > Driver Configurations > TWAI Configuration

On the ESP32, when the RX FIFO overruns and the RX message counter maxes out at 64 messages, the entire RX FIFO is no longer recoverable. Enabling this option will add a workaround that resets the peripheral on detection of this errata condition. Note that if a frame is being sent on the bus during the reset bus during the reset, the message will be lost.

Default value:
• Yes (enabled)

CONFIG_TWAI_ERRATA_FIX_LISTEN_ONLY_DOM
Add SW workaround for listen only transmits dominant bit errata

Found in: Component config > Driver Configurations > TWAI Configuration

When in the listen only mode, the TWAI controller must not influence the TWAI bus (i.e., must not send any dominant bits). However, while in listen only mode on the ESP32/ESP32-S2/ESP32-S3/ESP32-C3, the TWAI controller will still transmit dominant bits when it detects an error (i.e., as part of an active error frame). Enabling this option will add a workaround that forces the TWAI controller into an error passive state on initialization, thus preventing any dominant bits from being sent.

Default value:
• Yes (enabled)

Temperature sensor Configuration  Contains:
• CONFIG_TEMP_SENSOR_ENABLE_DEBUG_LOG
• CONFIG_TEMP_SENSOR_SUPPRESS_DEPRECATE_WARN
• CONFIG_TEMP_SENSOR_ISR_IRAM_SAFE
**CONFIG_TEMPSENSOR_SUPPRESS_DEPRECATED_WARN**

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > Temperature sensor Configuration*

Whether to suppress the deprecation warnings when using legacy temperature sensor driver (driver/temp_sensor.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled) if SOC_TEMP_SENSOR_SUPPORTED

**CONFIG_TEMPSENSOR_ENABLE_DEBUG_LOG**

Enable debug log

*Found in: Component config > Driver Configurations > Temperature sensor Configuration*

Whether to enable the debug log message for temperature sensor driver. Note that, this option only controls the temperature sensor driver log, won’t affect other drivers.

**Default value:**
- No (disabled) if SOC_TEMP_SENSOR_SUPPORTED

**CONFIG_TEMPSENSOR_ISR_IRAM_SAFE**

Temperature sensor ISR IRAM-Safe

*Found in: Component config > Driver Configurations > Temperature sensor Configuration*

Ensure the Temperature Sensor interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
- No (disabled) if SOC_TEMPERATURE_SENSOR_INTR_SUPPORT && SOC_TEMP_SENSOR_SUPPORTED

UART Configuration Contains:

- **CONFIG_UART_ISR_IN_IRAM**

**CONFIG_UART_ISR_IN_IRAM**

Place UART ISR function into IRAM

*Found in: Component config > Driver Configurations > UART Configuration*

If this option is not selected, UART interrupt will be disabled for a long time and may cause data lost when doing spi flash operation.

**Default value:**
- No (disabled) if CONFIG_RINGBUF_PLACE_ISR_FUNCTIONS_INTO_FLASH

GPIO Configuration Contains:

- **CONFIG_GPIO_CTRL_FUNC_IN_IRAM**
- **CONFIG_GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL**
CONFIG_GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL
Support light sleep GPIO pullup/pulldown configuration for ESP32

Found in: Component config > Driver Configurations > GPIO Configuration

This option is intended to fix the bug that ESP32 is not able to switch to configured pullup/pulldown mode in sleep. If this option is selected, chip will automatically emulate the behaviour of switching, and about 450B of source codes would be placed into IRAM.

CONFIG_GPIO_CTRL_FUNC_IN_IRAM
Place GPIO control functions into IRAM

Found in: Component config > Driver Configurations > GPIO Configuration

Place GPIO control functions (like intr_disable/set_level) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.

Default value:
- No (disabled)

Sigma Delta Modulator Configuration Contains:

- CONFIG_SDM_ENABLE_DEBUG_LOG
- CONFIG_SDM_CTRL_FUNC_IN_IRAM
- CONFIG_SDM_SUPPRESS_DEPRECATE_WARN

CONFIG_SDM_CTRL_FUNC_IN_IRAM
Place SDM control functions into IRAM

Found in: Component config > Driver Configurations > Sigma Delta Modulator Configuration

Place SDM control functions (like set_duty) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

Default value:
- No (disabled)

CONFIG_SDM_SUPPRESS_DEPRECATE_WARN
Suppress legacy driver deprecated warning

Found in: Component config > Driver Configurations > Sigma Delta Modulator Configuration

Wether to suppress the deprecation warnings when using legacy sigma delta driver. If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

Default value:
- No (disabled)

CONFIG_SDM_ENABLE_DEBUG_LOG
Enable debug log

Found in: Component config > Driver Configurations > Sigma Delta Modulator Configuration

Wether to enable the debug log message for SDM driver. Note that, this option only controls the SDM driver log, won’t affect other drivers.

Default value:
- No (disabled)
Analog Comparator Configuration  Contains:

- `CONFIG_ANA_CMPR_ISR_IRAM_SAFE`
- `CONFIG_ANA_CMPR_ENABLE_DEBUG_LOG`
- `CONFIG_ANA_CMPR_CTRL_FUNC_IN_IRAM`

**CONFIG_ANA_CMPR_ISR_IRAM_SAFE**

Analog comparator ISR IRAM-Safe

*Found in: Component config > Driver Configurations > Analog Comparator Configuration*

Ensure the Analog Comparator interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
- No (disabled) if SOC_ANA_CMPR_SUPPORTED

**CONFIG_ANA_CMPR_CTRL_FUNC_IN_IRAM**

Place Analog Comparator control functions into IRAM

*Found in: Component config > Driver Configurations > Analog Comparator Configuration*

Place Analog Comparator control functions (like ana_cmpr_set_internal_reference) into IRAM, so that these functions can be IRAM-safe and able to be called in an IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled) if SOC_ANA_CMPR_SUPPORTED

**CONFIG_ANA_CMPR_ENABLE_DEBUG_LOG**

Enable debug log

*Found in: Component config > Driver Configurations > Analog Comparator Configuration*

Whether to enable the debug log message for Analog Comparator driver. Note that, this option only controls the Analog Comparator driver log, won’t affect other drivers.

**Default value:**
- No (disabled) if SOC_ANA_CMPR_SUPPORTED

GPTimer Configuration  Contains:

- `CONFIG_GPTIMER_ENABLE_DEBUG_LOG`
- `CONFIG_GPTIMER_ISR_IRAM_SAFE`
- `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM`
- `CONFIG_GPTIMER_ISR_HANDLER_IN_IRAM`
- `CONFIG_GPTIMER_SUPPRESS_DEPRECATE_WARN`

**CONFIG_GPTIMER_ISR_HANDLER_IN_IRAM**

Place GPTimer ISR handler into IRAM

*Found in: Component config > Driver Configurations > GPTimer Configuration*

Place GPTimer ISR handler into IRAM for better performance and fewer cache misses.

**Default value:**
- Yes (enabled)
CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM

Place GPTimer control functions into IRAM

*Found in: Component config > Driver Configurations > GPTimer Configuration*

Place GPTimer control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled)

CONFIG_GPTIMER_ISR_IRAM_SAFE

GPTimer ISR IRAM-Safe

*Found in: Component config > Driver Configurations > GPTimer Configuration*

Ensure the GPTimer interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
- No (disabled)

CONFIG_GPTIMER_SUPPRESS_DEPRECATE_WARN

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > GPTimer Configuration*

Whether to suppress the deprecation warnings when using legacy timer group driver (driver/timer.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

CONFIG_GPTIMER_ENABLE_DEBUG_LOG

Enable debug log

*Found in: Component config > Driver Configurations > GPTimer Configuration*

Whether to enable the debug log message for GPTimer driver. Note that, this option only controls the GPTimer driver log, won’t affect other drivers.

**Default value:**
- No (disabled)

PCNT Configuration  
Contains:
- CONFIG_PCNT_ENABLE_DEBUG_LOG
- CONFIG_PCNT_ISR_IRAM_SAFE
- CONFIG_PCNT_CTRL_FUNC_IN_IRAM
- CONFIG_PCNT_SUPPRESS_DEPRECATE_WARN

CONFIG_PCNT_CTRL_FUNC_IN_IRAM

Place PCNT control functions into IRAM

*Found in: Component config > Driver Configurations > PCNT Configuration*
Chapter 2. API Reference

Place PCNT control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

Default value:
- No (disabled)

**CONFIG_PCNT_ISR_IRAM_SAFE**

PCNT ISR IRAM-Safe

*Found in: Component config > Driver Configurations > PCNT Configuration*

Ensure the PCNT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

Default value:
- No (disabled)

**CONFIG_PCNT_SUPPRESS_DEPRECATE_WARN**

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > PCNT Configuration*

Whether to suppress the deprecation warnings when using legacy PCNT driver (driver/pcnt.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

Default value:
- No (disabled)

**CONFIG_PCNT_ENABLE_DEBUG_LOG**

Enable debug log

*Found in: Component config > Driver Configurations > PCNT Configuration*

Whether to enable the debug log message for PCNT driver. Note that, this option only controls the PCNT driver log, won’t affect other drivers.

Default value:
- No (disabled)

**RMT Configuration**

Contains:

- **CONFIG_RMT_ENABLE_DEBUG_LOG**
- **CONFIG_RMT_ISR_IRAM_SAFE**
- **CONFIG_RMT_SUPPRESS_DEPRECATE_WARN**

**CONFIG_RMT_ISR_IRAM_SAFE**

RMT ISR IRAM-Safe

*Found in: Component config > Driver Configurations > RMT Configuration*

Ensure the RMT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

Default value:
- No (disabled)
**CONFIG_RMT_SUPPRESS_DEPRECATE_WARN**

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > RMT Configuration*

Wether to suppress the deprecation warnings when using legacy rmt driver (driver/rmt.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

**CONFIG_RMT_ENABLE_DEBUG_LOG**

Enable debug log

*Found in: Component config > Driver Configurations > RMT Configuration*

Wether to enable the debug log message for RMT driver. Note that, this option only controls the RMT driver log, won’t affect other drivers.

**Default value:**
- No (disabled)

**MCPWM Configuration**

Contains:
- **CONFIG_MCPWM_ENABLE_DEBUG_LOG**
- **CONFIG_MCPWM_CTRL_FUNC_IN_IRAM**
- **CONFIG_MCPWM_ISR_IRAM_SAFE**
- **CONFIG_MCPWM_SUPPRESS_DEPRECATE_WARN**

**CONFIG_MCPWM_ISR_IRAM_SAFE**

Place MCPWM ISR function into IRAM

*Found in: Component config > Driver Configurations > MCPWM Configuration*

This will ensure the MCPWM interrupt handle is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write)

**Default value:**
- No (disabled)

**CONFIG_MCPWM_CTRL_FUNC_IN_IRAM**

Place MCPWM control functions into IRAM

*Found in: Component config > Driver Configurations > MCPWM Configuration*

Place MCPWM control functions (like set_compare_value) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled)

**CONFIG_MCPWM_SUPPRESS_DEPRECATE_WARN**

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > MCPWM Configuration*
Wether to suppress the deprecation warnings when using legacy MCPWM driver (driver/mcpwm.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

**CONFIG_MCPWM_ENABLE_DEBUG_LOG**

Enable debug log

*Found in: Component config > Driver Configurations > MCPWM Configuration*

Wether to enable the debug log message for MCPWM driver. Note that, this option only controls the MCPWM driver log, won’t affect other drivers.

**Default value:**
- No (disabled)

**I2S Configuration**

Contains:

- **CONFIG_I2S_ENABLE_DEBUG_LOG**
- **CONFIG_I2S_ISR_IRAM_SAFE**
- **CONFIG_I2S_SUPPRESS_DEPRECATE_WARN**

**CONFIG_I2S_ISR_IRAM_SAFE**

I2S ISR IRAM-Safe

*Found in: Component config > Driver Configurations > I2S Configuration*

Ensure the I2S interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
- No (disabled)

**CONFIG_I2S_SUPPRESS_DEPRECATE_WARN**

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > I2S Configuration*

Enable this option will suppress the deprecation warnings of using APIs in legacy I2S driver.

**Default value:**
- No (disabled)

**CONFIG_I2S_ENABLE_DEBUG_LOG**

Enable I2S debug log

*Found in: Component config > Driver Configurations > I2S Configuration*

Wether to enable the debug log message for I2S driver. Note that, this option only controls the I2S driver log, will not affect other drivers.

**Default value:**
- No (disabled)
### DAC Configuration

Contains:

- `CONFIG_DAC_DMA_AUTO_16BIT_ALIGN`
- `CONFIG_DAC_ISR_IRAM_SAFE`
- `CONFIG_DAC_ENABLE_DEBUG_LOG`
- `CONFIG_DAC_CTRL_FUNC_IN_IRAM`
- `CONFIG_DAC_SUPPRESS_DEPRECATE_WARN`

#### CONFIG_DAC_CTRL_FUNC_IN_IRAM

Place DAC control functions into IRAM

*Found in: Component config > Driver Configurations > DAC Configuration*

Place DAC control functions (e.g. `dac_oneshot_output_voltage`) into IRAM, so that this function can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled)

#### CONFIG_DAC_ISR_IRAM_SAFE

DAC ISR IRAM-Safe

*Found in: Component config > Driver Configurations > DAC Configuration*

Ensure the DAC interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
- No (disabled)

#### CONFIG_DAC_SUPPRESS_DEPRECATE_WARN

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > DAC Configuration*

Whether to suppress the deprecation warnings when using legacy DAC driver (driver/dac.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

#### CONFIG_DAC_ENABLE_DEBUG_LOG

Enable debug log

*Found in: Component config > Driver Configurations > DAC Configuration*

Whether to enable the debug log message for DAC driver. Note that, this option only controls the DAC driver log, won’t affect other drivers.

**Default value:**
- No (disabled)
**CONFIG_DAC_DMA_AUTO_16BIT_ALIGN**

Align the continuous data to 16 bit automatically

*Found in: Component config > Driver Configurations > DAC Configuration*

Whether to left shift the continuous data to align every byte to 16 bits in the driver. On ESP32, although the DAC resolution is only 8 bits, the hardware requires 16 bits data in continuous mode. By enabling this option, the driver will left shift 8 bits for the input data automatically. Only disable this option when you decide to do this step by yourself. Note that the driver will allocate a new piece of memory to save the converted data.

**Default value:**
- Yes (enabled)

**USB Serial/JTAG Configuration**  
Contains:
- `CONFIG_USJ_NO_AUTO_LS_ON_CONNECTION`

**CONFIG_USJ_NO_AUTO_LS_ON_CONNECTION**

Don’t enter the automatic light sleep when USB Serial/JTAG port is connected

*Found in: Component config > Driver Configurations > USB Serial/JTAG Configuration*

If enabled, the chip will constantly monitor the connection status of the USB Serial/JTAG port. As long as the USB Serial/JTAG is connected, a ESP_PM_NO_LIGHT_SLEEP power management lock will be acquired to prevent the system from entering light sleep. This option can be useful if serial monitoring is needed via USB Serial/JTAG while power management is enabled, as the USB Serial/JTAG cannot work under light sleep and after waking up from light sleep. Note. This option can only control the automatic Light-Sleep behavior. If esp_light_sleep_start() is called manually from the program, enabling this option will not prevent light sleep entry even if the USB Serial/JTAG is in use.

**Parallel IO Configuration**  
Contains:
- `CONFIG_PARLIO_ENABLE_DEBUG_LOG`
- `CONFIG_PARLIO_ISR_IRAM_SAFE`

**CONFIG_PARLIO_ENABLE_DEBUG_LOG**

Enable debug log

*Found in: Component config > Driver Configurations > Parallel IO Configuration*

Whether to enable the debug log message for parallel IO driver. Note that, this option only controls the parallel IO driver log, won’t affect other drivers.

**Default value:**
- No (disabled) if SOC_PARLIO_SUPPORTED

**CONFIG_PARLIO_ISR_IRAM_SAFE**

Parallel IO ISR IRAM-Safe

*Found in: Component config > Driver Configurations > Parallel IO Configuration*

Ensure the Parallel IO interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
- No (disabled) if SOC_PARLIO_SUPPORTED
LEDCConfigurationContains:

• CONFIG_LEDC_CTRL_FUNC_IN_IRAM

CONFIG_LEDC_CTRL_FUNC_IN_IRAM
Place LEDC control functions into IRAM

*Found in: Component config > Driver Configurations > LEDC Configuration*

Place LEDC control functions (ledc_update_duty and ledc_stop) into IRAM, so that these functions can be IRAM-safe and able to be called in an IRAM context. Enabling this option can improve driver performance as well.

**Default value:**
• No (disabled)

I2CConfigurationContains:

• CONFIG_I2C_ENABLE_DEBUG_LOG
• CONFIG_I2C_ISR_IRAM_SAFE

CONFIG_I2C_ISR_IRAM_SAFE
I2C ISR IRAM-Safe

*Found in: Component config > Driver Configurations > I2C Configuration*

Ensure the I2C interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write). note: This cannot be used in the I2C legacy driver.

**Default value:**
• No (disabled)

CONFIG_I2C_ENABLE_DEBUG_LOG
Enable I2C debug log

*Found in: Component config > Driver Configurations > I2C Configuration*

Whether to enable the debug log message for I2C driver. Note that this option only controls the I2C driver log, will not affect other drivers.

Note: This cannot be used in the I2C legacy driver.

**Default value:**
• No (disabled)

eFuseBitManagerContains:

• CONFIG_EFUSE_CODE_SCHEME_SELECTOR
• CONFIG_EFUSE_VIRTUAL
• CONFIG_EFUSE_CUSTOM_TABLE

CONFIG_EFUSE_CUSTOM_TABLE
Use custom eFuse table

*Found in: Component config > eFuse Bit Manager*

Allows to generate a structure for eFuse from the CSV file.

**Default value:**
• No (disabled)
CONFIG_EFUSE_CUSTOM_TABLE_FILENAME

Custom eFuse CSV file

Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_CUSTOM_TABLE

Name of the custom eFuse CSV filename. This path is evaluated relative to the project root directory.

Default value:
- “main/esp_efuse_custom_table.csv” if CONFIG_EFUSE_CUSTOM_TABLE

CONFIG_EFUSE_VIRTUAL

Simulate eFuse operations in RAM

Found in: Component config > eFuse Bit Manager

If “n” - No virtual mode. All eFuse operations are real and use eFuse registers. If “y” - The virtual mode is enabled and all eFuse operations (read and write) are redirected to RAM instead of eFuse registers, all permanent changes (via eFuse) are disabled. Log output will state changes that would be applied, but they will not be.

If it is “y”, then SECURE_FLASH_ENCRYPTION_MODE_RELEASE cannot be used. Because the EFUSE VIRT mode is for testing only.

During startup, the eFuses are copied into RAM. This mode is useful for fast tests.

Default value:
- No (disabled)

CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH

Keep eFuses in flash

Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_VIRTUAL

In addition to the “Simulate eFuse operations in RAM” option, this option just adds a feature to keep eFuses after reboots in flash memory. To use this mode the partition_table should have the efuse partition.

partition.csv: “efuse_em, data, efuse, , 0x2000,”

During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This mode is useful when need to keep changes after reboot (testing secure_boot and flash_encryption).

CONFIG_EFUSE_VIRTUAL_LOG_ALL_WRITES

Log all virtual writes

Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_VIRTUAL

If enabled, log efuse burns. This shows changes that would be made.

CONFIG_EFUSE_CODE_SCHEME_SELECTOR

Coding Scheme Compatibility

Found in: Component config > eFuse Bit Manager

Selector eFuse code scheme.

Available options:
- None Only (EFUSE_CODE_SCHEME_COMPAT_NONE)
- 3/4 and None (EFUSE_CODE_SCHEME_COMPAT_3_4)
- Repeat, 3/4 and None (common table does not support it) (EFUSE_CODE_SCHEME_COMPAT_REPEAT)
ESP-TLS  Contains:

- CONFIG_ESP_TLS_INSECURE
- CONFIG_ESP_TLS_LIBRARY_CHOOSE
- CONFIG_ESP_TLS_CLIENT_SESSION_TICKETS
- CONFIG_ESP_DEBUG_WOLFSSL
- CONFIG_ESP_TLS_SERVER
- CONFIG_ESP_TLS_PSK_VERIFICATION
- CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY
- CONFIG_ESP_TLS_USE_DS_PERIPHERAL
- CONFIG_ESP_TLS_USE_SECURE_ELEMENT

CONFIG_ESP_TLS_LIBRARY_CHOOSE

Choose SSL/TLS library for ESP-TLS (See help for more Info)

*Found in: Component config > ESP-TLS*

The ESP-TLS APIs support multiple backend TLS libraries. Currently mbedTLS and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

*Available options:*  
- mbedTLS (ESP_TLS_USING_MBEDTLS)
- wolfSSL (License info in wolfSSL directory README) (ESP_TLS_USING_WOLFSSL)

CONFIG_ESP_TLS_USE_SECURE_ELEMENT

Use Secure Element (ATECC608A) with ESP-TLS

*Found in: Component config > ESP-TLS*

Enable use of Secure Element for ESP-TLS, this enables internal support for ATECC608A peripheral on ESPWROOM32SE, which can be used for TLS connection.

CONFIG_ESP_TLS_USE_DS_PERIPHERAL

Use Digital Signature (DS) Peripheral with ESP-TLS

*Found in: Component config > ESP-TLS*

Enable use of the Digital Signature Peripheral for ESP-TLS. The DS peripheral can only be used when it is appropriately configured for TLS. Consult the ESP-TLS documentation in ESP-IDF Programming Guide for more details.

*Default value:*  
- Yes (enabled) if ESP_TLS_USING_MBEDTLS && SOC_DIG_SIGN_SUPPORTED

CONFIG_ESP_TLS_CLIENT_SESSION_TICKETS

Enable client session tickets

*Found in: Component config > ESP-TLS*

Enable session ticket support as specified in RFC5077.

CONFIG_ESP_TLS_SERVER

Enable ESP-TLS Server

*Found in: Component config > ESP-TLS*

Enable support for creating server side SSL/TLS session, available for mbedTLS as well as wolfSSL TLS library.
**CONFIG_ESP_TLS_SERVER_SESSION_TICKETS**

Enable server session tickets

*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_SERVER*

Enable session ticket support as specified in RFC5077

**CONFIG_ESP_TLS_SERVER_SESSION_TICKET_TIMEOUT**

Server session ticket timeout in seconds

*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_SERVER > CONFIG_ESP_TLS_SERVER_SESSION_TICKETS*

Sets the session ticket timeout used in the tls server.

**Default value:**
- 86400 if CONFIG_ESP_TLS_SERVER_SESSION_TICKETS

**CONFIG_ESP_TLS_SERVER_CERT_SELECT_HOOK**

Certificate selection hook

*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_SERVER*

Ability to configure and use a certificate selection callback during server handshake, to select a certificate to present to the client based on the TLS extensions supplied in the client hello (alpn, sni, etc).

**CONFIG_ESP_TLS_SERVER_MIN_AUTH_MODE_OPTIONAL**

ESP-TLS Server: Set minimum Certificate Verification mode to Optional

*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_SERVER*

When this option is enabled, the peer (here, the client) certificate is checked by the server, however the handshake continues even if verification failed. By default, the peer certificate is not checked and ignored by the server.

`mbedtls_ssl_get_verify_result()` can be called after the handshake is complete to retrieve status of verification.

**CONFIG_ESP_TLS_PSK_VERIFICATION**

Enable PSK verification

*Found in: Component config > ESP-TLS*

Enable support for pre shared key ciphers, supported for both mbedTLS as well as wolfSSL TLS library.

**CONFIG_ESP_TLS_INSECURE**

Allow potentially insecure options

*Found in: Component config > ESP-TLS*

You can enable some potentially insecure options. These options should only be used for testing purposes. Only enable these options if you are very sure.
Chapter 2. API Reference

**CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY**

Skip server certificate verification by default (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_INSECURE*

After enabling this option the esp-tls client will skip the server certificate verification by default. Note that this option will only modify the default behaviour of esp-tls client regarding server cert verification. The default behaviour should only be applicable when no other option regarding the server cert verification is opted in the esp-tls config (e.g. crt_bundle_attach, use_global_ca_store etc.). WARNING: Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca_store etc.

**CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY**

Enable SMALL_CERT_VERIFY

*Found in: Component config > ESP-TLS*

Enables server verification with Intermediate CA cert, does not authenticate full chain of trust upto the root CA cert (After Enabling this option client only needs to have Intermediate CA certificate of the server to authenticate server, root CA cert is not necessary).

*Default value:*

- Yes (enabled) if ESP_TLS_USING_WOLFSSL

**CONFIG_ESP_DEBUG_WOLFSSL**

Enable debug logs for wolfSSL

*Found in: Component config > ESP-TLS*

Enable detailed debug prints for wolfSSL SSL library.

**ADC and ADC Calibration** Contains:

- **ADC Calibration Configurations**
- **CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE**
- **CONFIG_ADC_DISABLE_DAC_OUTPUT**
- **CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM**

**CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM**

Place ISR version ADC oneshot mode read function into IRAM

*Found in: Component config > ADC and ADC Calibration*

Place ISR version ADC oneshot mode read function into IRAM.

*Default value:*

- No (disabled)

**CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE**

ADC continuous mode driver ISR IRAM-Safe

*Found in: Component config > ADC and ADC Calibration*

Ensure the ADC continuous mode ISR is IRAM-Safe. When enabled, the ISR handler will be available when the cache is disabled.

*Default value:*
Chapter 2. API Reference

ADC Calibration Configurations

Contains:

- **CONFIG_ADC_CALI_EFUSE_VREF_ENABLE**
- **CONFIG_ADC_CALI_LUT_ENABLE**
- **CONFIG_ADC_CALI_EFUSE_TP_ENABLE**

**CONFIG_ADC_CALI_EFUSE_TP_ENABLE**

Use Two Point Values

*Found in: Component config > ADC and ADC Calibration > ADC Calibration Configurations*

Some ESP32s have Two Point calibration values burned into eFuse BLOCK3. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using Two Point values if they are available.

**Default value:**

- Yes (enabled)

**CONFIG_ADC_CALI_EFUSE_VREF_ENABLE**

Use eFuse Vref

*Found in: Component config > ADC and ADC Calibration > ADC Calibration Configurations*

Some ESP32s have Vref burned into eFuse BLOCK0. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using eFuse Vref if it is available.

**Default value:**

- Yes (enabled)

**CONFIG_ADC_CALI_LUT_ENABLE**

Use Lookup Tables

*Found in: Component config > ADC and ADC Calibration > ADC Calibration Configurations*

This option will allow the ADC calibration component to use Lookup Tables to correct for non-linear behavior in 11db attenuation. Other attenuations do not exhibit non-linear behavior hence will not be affected by this option.

**Default value:**

- Yes (enabled)

**CONFIG_ADC_DISABLE_DAC_OUTPUT**

Disable DAC when ADC2 is in use

*Found in: Component config > ADC and ADC Calibration*

By default, this is set. The ADC oneshot driver will disable the output of the corresponding DAC channels: ESP32: IO25 and IO26 ESP32S2: IO17 and IO18

Disable this option so as to measure the output of DAC by internal ADC, for test usage.

**Default value:**

- Yes (enabled)

Wireless Coexistence

Contains:

- **CONFIG_ESP_COEX_SW_COEXIST_ENABLE**
**CONFIG_ESP_COEX_SW_COEXIST_ENABLE**

Software controls WiFi/Bluetooth coexistence

*Found in: Component config > Wireless Coexistence*

If enabled, WiFi & Bluetooth coexistence is controlled by software rather than hardware. Recommended for heavy traffic scenarios. Both coexistence configuration options are automatically managed, no user intervention is required. If only Bluetooth is used, it is recommended to disable this option to reduce binary file size.

**Default value:**
- Yes (enabled) if `CONFIG_BT_ENABLED`

**Common ESP-related**

Contains:
- `CONFIG_ESP_ERR_TO_NAME_LOOKUP`

**CONFIG_ESP_ERR_TO_NAME_LOOKUP**

Enable lookup of error code strings

*Found in: Component config > Common ESP-related*

Functions `esp_err_to_name()` and `esp_err_to_name_r()` return string representations of error codes from a pre-generated lookup table. This option can be used to turn off the use of the look-up table in order to save memory but this comes at the price of sacrificing distinguishable (meaningful) output string representations.

**Default value:**
- Yes (enabled)

**Ethernet**

Contains:
- `CONFIG_ETH_TRANSMIT_MUTEX`
- `CONFIG_ETH_USE_ESP32_EMAC`
- `CONFIG_ETH_USE_OPENETH`
- `CONFIG_ETH_USE_SPI_ETHERNET`

**CONFIG_ETH_USE_ESP32_EMAC**

Support ESP32 internal EMAC controller

*Found in: Component config > Ethernet*

ESP32 integrates a 10/100M Ethernet MAC controller.

**Default value:**
- Yes (enabled)
CONFIG_ETH_PHY_INTERFACE

PHY interface

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Select the communication interface between MAC and PHY chip.

*Available options:*

- Reduced Media Independent Interface (RMII) (ETH_PHY_INTERFACE_RMII)

CONFIG_ETH_RMII_CLK_MODE

RMII clock mode

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Select external or internal RMII clock.

*Available options:*

- Input RMII clock from external (ETH_RMII_CLK_INPUT)
  MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.  
- Output RMII clock from internal (ETH_RMII_CLK_OUTPUT)
  ESP32 can generate RMII clock by internal APLL. This clock can be routed to the external PHY device. ESP32 supports to route the RMII clock to GPIO0/16/17.

CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0

Output RMII clock from GPIO0 (Experimental!)

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn’t have directly relationship with EMAC peripheral. Sometimes this clock won’t work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don’t select GPIO0 output mode for stability.

*Default value:*

- No (disabled) if ETH_RMII_CLK_OUTPUT && CONFIG_ETH_USE_ESP32_EMAC

CONFIG_ETH_RMII_CLK_OUT_GPIO

RMII clock GPIO number

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Set the GPIO number to output RMII Clock.

*Range:*

- from 16 to 17 if CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0 && ETH_RMII_CLK_OUTPUT && CONFIG_ETH_USE_ESP32_EMAC

*Default value:*

- 17 if CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0 && ETH_RMII_CLK_OUTPUT && CONFIG_ETH_USE_ESP32_EMAC

CONFIG_ETH_DMA_BUFFER_SIZE

Ethernet DMA buffer size (Byte)

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Set the size of each buffer used by Ethernet MAC DMA.
CONFIG_ETH_DMA_RX_BUFFER_NUM

Amount of Ethernet DMA Rx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Number of DMA receive buffers. Each buffer’s size is ETH_DMA_BUFFER_SIZE. Larger number of buffers could increase throughput somehow.

**Range:**
- from 3 to 30

**Default value:**
- 10

CONFIG_ETH_DMA_TX_BUFFER_NUM

Amount of Ethernet DMA Tx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Number of DMA transmit buffers. Each buffer’s size is ETH_DMA_BUFFER_SIZE. Larger number of buffers could increase throughput somehow.

**Range:**
- from 3 to 30

**Default value:**
- 10

CONFIG_ETH_SOFT_FLOW_CONTROL

Enable software flow control

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Ethernet MAC engine on ESP32 doesn’t feature a flow control logic. The MAC driver can perform a software flow control if you enable this option. Note that, if the RX buffer number is small, enabling software flow control will cause obvious performance loss.

**Default value:**
- No (disabled) if `CONFIG_ETH_DMA_RX_BUFFER_NUM > 15` && `CONFIG_ETH_USE_ESP32_EMAC`

CONFIG_ETH_IRAM_OPTIMIZATION

Enable IRAM optimization

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

If enabled, functions related to RX/TX are placed into IRAM. It can improve Ethernet throughput. If disabled, all functions are placed into FLASH.

**Default value:**
- No (disabled)
CONFIG_ETH_USE_SPI_ETHERNET

Support SPI to Ethernet Module

*Found in: Component config > Ethernet*

ESP-IDF can also support some SPI-Ethernet modules.

**Default value:**
- Yes (enabled)

Contains:

- `CONFIG_ETH_SPI_ETHERNET_DM9051`
- `CONFIG_ETH_SPI_ETHERNET_KSZ8851SNL`
- `CONFIG_ETH_SPI_ETHERNET_W5500`

CONFIG_ETH_SPI_ETHERNET_DM9051

Use DM9051

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*

DM9051 is a fast Ethernet controller with an SPI interface. It’s also integrated with a 10/100M PHY and MAC. Select this to enable DM9051 driver.

CONFIG_ETH_SPI_ETHERNET_W5500

Use W5500 (MAC RAW)

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*

W5500 is a HW TCP/IP embedded Ethernet controller. TCP/IP stack, 10/100 Ethernet MAC and PHY are embedded in a single chip. However the driver in ESP-IDF only enables the RAW MAC mode, making it compatible with the software TCP/IP stack. Say yes to enable W5500 driver.

CONFIG_ETH_SPI_ETHERNET_KSZ8851SNL

Use KSZ8851SNL

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*

The KSZ8851SNL is a single-chip Fast Ethernet controller consisting of a 10/100 physical layer transceiver (PHY), a MAC, and a Serial Peripheral Interface (SPI). Select this to enable KSZ8851SNL driver.

CONFIG_ETH_USE_OPENETH

Support OpenCores Ethernet MAC (for use with QEMU)

*Found in: Component config > Ethernet*

OpenCores Ethernet MAC driver can be used when an ESP-IDF application is executed in QEMU. This driver is not supported when running on a real chip.

**Default value:**
- No (disabled)

Contains:

- `CONFIG_ETH_OPENETH_DMA_RX_BUFFER_NUM`
- `CONFIG_ETH_OPENETH_DMA_TX_BUFFER_NUM`
CONFIG_ETH_OPENETH_DMA_RX_BUFFER_NUM
Number of Ethernet DMA Rx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_OPENETH*

Number of DMA receive buffers, each buffer is 1600 bytes.

*Range:*
  - from 1 to 64 if CONFIG_ETH_USE_OPENETH
*Default value:*
  - 4 if CONFIG_ETH_USE_OPENETH

CONFIG_ETH_OPENETH_DMA_TX_BUFFER_NUM
Number of Ethernet DMA Tx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_OPENETH*

Number of DMA transmit buffers, each buffer is 1600 bytes.

*Range:*
  - from 1 to 64 if CONFIG_ETH_USE_OPENETH
*Default value:*
  - 1 if CONFIG_ETH_USE_OPENETH

CONFIG_ETH_TRANSMIT_MUTEX
Enable Transmit Mutex

*Found in: Component config > Ethernet*

Prevents multiple accesses when Ethernet interface is used as shared resource and multiple functionalities might try to access it at a time.

*Default value:*
  - No (disabled)

Event Loop Library Contains:

- CONFIG_ESP_EVENT_LOOP_PROFILING
- CONFIG_ESP_EVENT_POST_FROM_ISR

CONFIG_ESP_EVENT_LOOP_PROFILING
Enable event loop profiling

*Found in: Component config > Event Loop Library*

Enables collections of statistics in the event loop library such as the number of events posted to/received by an event loop, number of callbacks involved, number of events dropped to a full event loop queue, run time of event handlers, and number of times/run time of each event handler.

*Default value:*
  - No (disabled)

CONFIG_ESP_EVENT_POST_FROM_ISR
Support posting events from ISRs

*Found in: Component config > Event Loop Library*

Enable posting events from interrupt handlers.

*Default value:*
**CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR**

Support posting events from ISRs placed in IRAM

*Found in: Component config > Event Loop Library > CONFIG_ESP_EVENT_POST_FROM_ISR*

Enable posting events from interrupt handlers placed in IRAM. Enabling this option places API functions `esp_event_post` and `esp_event_post_to` in IRAM.

*Default value:*
- Yes (enabled)

---

**GDB Stub**

Contains:

- `CONFIG_ESP_GDBSTUB_SUPPORT_TASKS`
- `CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME`

---

**CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME**

GDBStub at runtime

*Found in: Component config > GDB Stub*

Enable builtin GDBStub. This allows to debug the target device using serial port:  - Run `idf.py monitor` .  - Wait for the device to initialize.  - Press Ctrl+C to interrupt the execution and enter GDB attached to your device for debugging. **NOTE:** all UART input will be handled by GDBStub.

---

**CONFIG_ESP_GDBSTUB_SUPPORT_TASKS**

Enable listing FreeRTOS tasks through GDB Stub

*Found in: Component config > GDB Stub*

If enabled, GDBStub can supply the list of FreeRTOS tasks to GDB. Thread list can be queried from GDB using `info threads` command. Note that if GDB task lists were corrupted, this feature may not work. If GDBStub fails, try disabling this feature.

---

**CONFIG_ESP_GDBSTUB_MAX_TASKS**

Maximum number of tasks supported by GDB Stub

*Found in: Component config > GDB Stub > CONFIG_ESP_GDBSTUB_SUPPORT_TASKS*

Set the number of tasks which GDB Stub will support.

*Default value:*
- 32 if `CONFIG_ESP_GDBSTUB_SUPPORT_TASKS`

---

**ESP HTTP client**

Contains:

- `CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH`
- `CONFIG_ESP_HTTP_CLIENT_ENABLE_DIGEST_AUTH`
- `CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS`
CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS

Enable https

*Found in: Component config > ESP HTTP client*

This option will enable https protocol by linking esp-tls library and initializing SSL transport

**Default value:**
- Yes (enabled)

CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH

Enable HTTP Basic Authentication

*Found in: Component config > ESP HTTP client*

This option will enable HTTP Basic Authentication. It is disabled by default as Basic auth uses unencrypted encoding, so it introduces a vulnerability when not using TLS

**Default value:**
- No (disabled)

CONFIG_ESP_HTTP_CLIENT_ENABLE_DIGEST_AUTH

Enable HTTP Digest Authentication

*Found in: Component config > ESP HTTP client*

This option will enable HTTP Digest Authentication. It is enabled by default, but use of this configuration is not recommended as the password can be derived from the exchange, so it introduces a vulnerability when not using TLS

**Default value:**
- No (disabled)

HTTP Server

Contains:

- CONFIG_HTTPD_QUEUE_WORK_BLOCKING
- CONFIG_HTTPD_PURGE_BUF_LEN
- CONFIG_HTTPD_LOG_PURGE_DATA
- CONFIG_HTTPD_MAX_REQ_HDR_LEN
- CONFIG_HTTPD_MAX_URI_LEN
- CONFIG_HTTPD_ERR_RESP_NO_DELAY
- CONFIG_HTTPD_WS_SUPPORT

CONFIG_HTTPD_MAX_REQ_HDR_LEN

Max HTTP Request Header Length

*Found in: Component config > HTTP Server*

This sets the maximum supported size of headers section in HTTP request packet to be processed by the server

**Default value:**
- 512

CONFIG_HTTPD_MAX_URI_LEN

Max HTTP URI Length

*Found in: Component config > HTTP Server*

This sets the maximum supported size of HTTP request URI to be processed by the server
CONFIG_HTTPD_ERR_RESP_NO_DELAY

Use TCP_NODELAY socket option when sending HTTP error responses

* Default value:
  - Yes (enabled)

Found in: Component config > HTTP Server

Using TCP_NODEALY socket option ensures that HTTP error response reaches the client before the underlying socket is closed. Please note that turning this off may cause multiple test failures.

CONFIG_HTTPD_PURGE_BUF_LEN

Length of temporary buffer for purging data

* Default value:
  - 32

Found in: Component config > HTTP Server

This sets the size of the temporary buffer used to receive and discard any remaining data that is received from the HTTP client in the request, but not processed as part of the server HTTP request handler.

If the remaining data is larger than the available buffer size, the buffer will be filled in multiple iterations. The buffer should be small enough to fit on the stack, but large enough to avoid excessive iterations.

CONFIG_HTTPD_LOG_PURGE_DATA

Log purged content data at Debug level

* Default value:
  - No (disabled)

Found in: Component config > HTTP Server

Enabling this will log discarded binary HTTP request data at Debug level. For large content data this may not be desirable as it will clutter the log.

CONFIG_HTTPD_WS_SUPPORT

WebSocket server support

* Default value:
  - No (disabled)

Found in: Component config > HTTP Server

This sets the WebSocket server support.

CONFIG_HTTPD_QUEUE_WORK_BLOCKING

httpd_queue_work as blocking API

* Default value:

Found in: Component config > HTTP Server

This makes httpd_queue_work() API to wait until a message space is available on UDP control socket. It internally uses a counting semaphore with count set to LWIP_UDP_RECVMBOX_SIZE to achieve this. This config will slightly change API behavior to block until message gets delivered on control socket.
ESP HTTPS OTA  Contains:

- `CONFIG_ESP_HTTPS_OTA_ALLOW_HTTP`
- `CONFIG_ESP_HTTPS_OTA_DECRYPT_CB`

### CONFIG_ESP_HTTPS_OTA_DECRYPT_CB

Provide decryption callback

*Found in: Component config > ESP HTTPS OTA*

Exposes an additional callback whereby firmware data could be decrypted before being processed by OTA update component. This can help to integrate external encryption related format and removal of such encapsulation layer from firmware image.

**Default value:**

- No (disabled)

### CONFIG_ESP_HTTPS_OTA_ALLOW_HTTP

Allow HTTP for OTA (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

*Found in: Component config > ESP HTTPS OTA*

It is highly recommended to keep HTTPS (along with server certificate validation) enabled. Enabling this option comes with potential risk of:
- Non-encrypted communication channel with server
- Accepting firmware upgrade image from server with fake identity

**Default value:**

- No (disabled)

ESP HTTPS server  Contains:

- `CONFIG_ESP_HTTPS_SERVER_ENABLE`

### CONFIG_ESP_HTTPS_SERVER_ENABLE

Enable ESP_HTTPS_SERVER component

*Found in: Component config > ESP HTTPS server*

Enable ESP HTTPS server component

#### Hardware Settings

Contains:

- Chip revision
- Crypto DPA Protection
- ESP_SLEEP_WORKAROUND
- ETM Configuration
- GDMA Configuration
- MAC Config
- Main XTAL Config
- Peripheral Control
- RTC Clock Config
- Sleep Config

#### Chip revision

Contains:

- `CONFIG_ESP_REV_NEW_CHIP_TEST`
- `CONFIG_ESP32_REV_MIN`
CONFIG_ESP32_REV_MIN

Minimum Supported ESP32 Revision

*Found in: Component config > Hardware Settings > Chip revision*

Required minimum chip revision. ESP-IDF will check for it and reject to boot if the chip revision fails the check. This ensures the chip used will have some modifications (features, or bugfixes).

The compiled binary will only support chips above this revision, this will also help to reduce binary size.

**Available options:**

- Rev v0.0 (ECO0) (ESP32_REV_MIN_0)
- Rev v1.0 (ECO1) (ESP32_REV_MIN_1)
- Rev v1.1 (ECO1.1) (ESP32_REV_MIN_1.1)
- Rev v2.0 (ECO2) (ESP32_REV_MIN_2)
- Rev v3.0 (ECO3) (ESP32_REV_MIN_3)
- Rev v3.1 (ECO4) (ESP32_REV_MIN_3.1)

CONFIG_ESP_REV_NEW_CHIP_TEST

Internal test mode

*Found in: Component config > Hardware Settings > Chip revision*

For internal chip testing, a small number of new versions chips didn’t update the version field in eFuse, you can enable this option to force the software recognize the chip version based on the rev selected in menuconfig.

**Default value:**

- No (disabled)

MAC Config

Contains:

- CONFIG_ESP_MAC_IGNORE_MAC_CRC_ERROR
- CONFIG_ESP32_UNIVERSAL_MAC_ADDRESSES

CONFIG_ESP32_UNIVERSAL_MAC_ADDRESSES

Number of universally administered (by IEEE) MAC address

*Found in: Component config > Hardware Settings > MAC Config*

Configure the number of universally administered (by IEEE) MAC addresses. During initialization, MAC addresses for each network interface are generated or derived from a single base MAC address. If the number of universal MAC addresses is four, all four interfaces (WiFi station, WiFi softap, Bluetooth and Ethernet) receive a universally administered MAC address. These are generated sequentially by adding 0, 1, 2 and 3 (respectively) to the final octet of the base MAC address. If the number of universal MAC addresses is two, only two interfaces (WiFi station and Bluetooth) receive a universally administered MAC address. These are generated sequentially by adding 0 and 1 (respectively) to the base MAC address. The remaining two interfaces (WiFi softap and Ethernet) receive local MAC addresses. These are derived from the universal WiFi station and Bluetooth MAC addresses, respectively. When using the default (Espressif-assigned) base MAC address, either setting can be used. When using a custom universal MAC address range, the correct setting will depend on the allocation of MAC addresses in this range (either 2 or 4 per device.)

**Available options:**

- Two (ESP32_UNIVERSAL_MAC_ADDRESSES_TWO)
- Four (ESP32_UNIVERSAL_MAC_ADDRESSES_FOUR)
**CONFIG_ESP_MAC_IGNORE_MAC_CRC_ERROR**

Ignore MAC CRC error (not recommended)

*Found in:* Component config > Hardware Settings > MAC Config

If you have an invalid MAC CRC (ESP_ERR_INVALID_CRC) problem and you still want to use this chip, you can enable this option to bypass such an error. This applies to both MAC_FACTORY and CUSTOM_MAC fuses.

**Default value:**
- No (disabled)

**Sleep Config**

Contains:
- CONFIG_ESP_SLEEP_GPIO_ENABLE_INTERNAL_RESISTORS
- CONFIG_ESP_SLEEP_CACHE_SAFE_ASSERTION
- CONFIG_ESP_SLEEP_EVENT_CALLBACKS
- CONFIG_ESP_SLEEP_DEBUG
- CONFIG_ESP_SLEEP_DEEP_SLEEP_WAKEUP_DELAY
- CONFIG_ESP_SLEEP_GPIO_RESET_WORKAROUND
- CONFIG_ESP_SLEEP_POWER_DOWN_FLASH
- CONFIG_ESP_SLEEP_MSPI_NEED_ALL_IO_PU
- CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND
- CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND

**CONFIG_ESP_SLEEP_POWER_DOWN_FLASH**

Power down flash in light sleep when there is no SPIRAM

*Found in:* Component config > Hardware Settings > Sleep Config

If enabled, chip will try to power down flash as part of esp_light_sleep_start(), which costs more time when chip wakes up. Can only be enabled if there is no SPIRAM configured.

This option will power down flash under a strict but relatively safe condition. Also, it is possible to power down flash under a relaxed condition by using esp_sleep_pd_config() to set ESP_PD_DOMAIN_VDDSDIO to ESP_PD_OPTION_OFF. It should be noted that there is a risk in powering down flash, you can refer ESP-IDF Programming Guide/API Reference/System API/Sleep Modes/Power-down of Flash for more details.

**Default value:**
- No (disabled) if CONFIG_SPIRAM

**CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND**

Pull-up Flash CS pin in light sleep

*Found in:* Component config > Hardware Settings > Sleep Config

All IOs will be set to isolate(floating) state by default during sleep. Since the power supply of SPI Flash is not lost during lightsleep, if its CS pin is recognized as low level(selected state) in the floating state, there will be a large current leakage, and the data in Flash may be corrupted by random signals on other SPI pins. Select this option will set the CS pin of Flash to PULL-UP state during sleep, but this will increase the sleep current about 10 uA. If you are developing with esp32xx modules, you must select this option, but if you are developing with chips, you can also pull up the CS pin of SPI Flash in the external circuit to save power consumption caused by internal pull-up during sleep. (!!! Don’t deselect this option if you don’t have external SPI Flash CS pin pullups.)

**Default value:**
- Yes (enabled) if CONFIG_APP_BUILD_TYPE_PURE_RAM_APP && CONFIG_ESP_SLEEP_POWER_DOWN_FLASH
**CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND**

Pull-up PSRAM CS pin in light sleep

*Found in: Component config > Hardware Settings > Sleep Config*

All IOs will be set to isolate(floating) state by default during sleep. Since the power supply of PSRAM is not lost during lightsleep, if its CS pin is recognized as low level(selected state) in the floating state, there will be a large current leakage, and the data in PSRAM may be corrupted by random signals on other SPI pins. Select this option will set the CS pin of PSRAM to PULL-UP state during sleep, but this will increase the sleep current about 10 uA. If you are developing with esp32xx modules, you must select this option, but if you are developing with chips, you can also pull up the CS pin of PSRAM in the external circuit to save power consumption caused by internal pull-up during sleep. (!!! Don’t deselect this option if you don’t have external PSRAM CS pin pullups.)

**Default value:**
- Yes (enabled) if `CONFIG_SPIRAM`

**CONFIG_ESP_SLEEP_MSPI_NEED_ALL_IO_PU**

Pull-up all SPI pins in light sleep

*Found in: Component config > Hardware Settings > Sleep Config*

To reduce leakage current, some types of SPI Flash/RAM only need to pull up the CS pin during light sleep. But there are also some kinds of SPI Flash/RAM that need to pull up all pins. It depends on the SPI Flash/RAM chip used.

**CONFIG_ESP_SLEEP_GPIO_RESET_WORKAROUND**

light sleep GPIO reset workaround

*Found in: Component config > Hardware Settings > Sleep Config*

`esp32c2`, `esp32c3`, `esp32s3`, `esp32c6` and `esp32h2` will reset at wake-up if GPIO is received a small electrostatic pulse during light sleep, with specific condition

- GPIO needs to be configured as input-mode only
- The pin receives a small electrostatic pulse, and reset occurs when the pulse voltage is higher than 6 V

For GPIO set to input mode only, it is not a good practice to leave it open/floating. The hardware design needs to controlled it with determined supply or ground voltage is necessary.

This option provides a software workaround for this issue. Configure to isolate all GPIO pins in sleep state.

**CONFIG_ESP_SLEEP_DEEP_SLEEP_WAKEUP_DELAY**

Extra delay in deep sleep wake stub (in us)

*Found in: Component config > Hardware Settings > Sleep Config*

When the chip exits deep sleep, the CPU and the flash chip are powered on at the same time. CPU will run deep sleep stub first, and then proceed to load code from flash. Some flash chips need sufficient time to pass between power on and first read operation. By default, without any extra delay, this time is approximately 900us, although some flash chip types need more than that.

By default extra delay is set to 2000us. When optimizing startup time for applications which require it, this value may be reduced.

If you are seeing “flash read err, 1000” message printed to the console after deep sleep reset, try increasing this value.

**Range:**

---

Espressif Systems 1711 Release v5.2-dev-3318-g8fc8f3f479

Submit Document Feedback
• from 0 to 5000

**Default value:**

• 2000

**CONFIG_ESP_SLEEP_CACHE_SAFE_ASSERTION**

Check the cache safety of the sleep wakeup code in sleep process

*Found in: Component config > Hardware Settings > Sleep Config*

Enabling it will check the cache safety of the code before the flash power is ready after light sleep wakeup, and check PM_SLP_IRAM_OPT related code cache safety. This option is only for code quality inspection. Enabling it will increase the time overhead of entering and exiting sleep. It is not recommended to enable it in the release version.

**Default value:**

• No (disabled)

**CONFIG_ESP_SLEEP_DEBUG**

esp sleep debug

*Found in: Component config > Hardware Settings > Sleep Config*

Enable esp sleep debug.

**Default value:**

• No (disabled)

**CONFIG_ESP_SLEEP_GPIO_ENABLE_INTERNAL_RESISTORS**

Allow to enable internal pull-up/downs for the Deep-Sleep wakeup IOs

*Found in: Component config > Hardware Settings > Sleep Config*

When using rtc gpio wakeup source during deepsleep without external pull-up/downs, you may want to make use of the internal ones.

**Default value:**

• Yes (enabled)

**CONFIG_ESP_SLEEP_EVENT_CALLBACKS**

Enable registration of sleep event callbacks

*Found in: Component config > Hardware Settings > Sleep Config*

If enabled, it allows user to register sleep event callbacks. It is primarily designed for internal developers and customers can use PM_LIGHT_SLEEP_CALLBACKS as an alternative.

NOTE: These callbacks are executed from the IDLE task context hence you cannot have any blocking calls in your callbacks.

NOTE: Enabling these callbacks may change sleep duration calculations based on time spent in callback and hence it is highly recommended to keep them as short as possible.

**Default value:**

• No (disabled) if CONFIG_FREERTOS_USE_TICKLESS_IDLE

**ESP_SLEEP_WORKAROUND**
RTC Clock Config Contains:

- CONFIG_RTC_EXT_CRYST_ADDIT_CURRENT_METHOD
- CONFIG_RTC_XTAL_CAL_RETRY
- CONFIG_RTC_CLK_CAL_CYCLES
- CONFIG_RTC_CLK_SRC

**RTC_CLK_SRC**

RTC clock source

*Found in: Component config > Hardware Settings > RTC Clock Config*

Choose which clock is used as RTC clock source.

- **“Internal 150kHz oscillator”** option provides lowest deep sleep current consumption, and does not require extra external components. However frequency stability with respect to temperature is poor, so time may drift in deep/light sleep modes.
- **“External 32kHz crystal”** provides better frequency stability, at the expense of slightly higher (1uA) deep sleep current consumption.
- **“External 32kHz oscillator”** allows using 32kHz clock generated by an external circuit. In this case, external clock signal must be connected to 32K_XN pin. Amplitude should be <1.2V in case of sine wave signal, and <1V in case of square wave signal. Common mode voltage should be 0.1 < Vcm < 0.5Vamp, where Vamp is the signal amplitude. Additionally, 1nF capacitor must be connected between 32K_XP pin and ground. 32K_XP pin cannot be used as a GPIO in this case.
- **“Internal 8.5MHz oscillator divided by 256”** option results in higher deep sleep current (by 5uA) but has better frequency stability than the internal 150kHz oscillator. It does not require external components.

*Available options:*

- Internal 150kHz RC oscillator (RTC_CLK_SRC_INT_RC)
- External 32kHz crystal (RTC_CLK_SRC_EXT_CRYST)
- External 32kHz oscillator at 32K_XN pin (RTC_CLK_SRC_EXT_OSC)
- Internal 8.5MHz oscillator, divided by 256 (~33kHz) (RTC_CLK_SRC_INT_8MD256)

**CONFIG_RTC_EXT_CRYST_ADDIT_CURRENT_METHOD**

Additional current for external 32kHz crystal

*Found in: Component config > Hardware Settings > RTC Clock Config*

With some 32kHz crystal configurations, the X32N and X32P pins may not have enough drive strength to keep the crystal oscillating. Choose the method to provide additional current from touchpad 9 to the external 32kHz crystal. Note that the deep sleep current is slightly high (4-5uA) and the touchpad and the wakeup sources of both touchpad and ULP are not available in method 1 and method 2.

This problem is fixed in ESP32 ECO 3, so this workaround is not needed. Setting the project configuration to minimum revision ECO3 will disable this option, allow all wakeup sources, and save some code size.

- **“None”** option will not provide additional current to external crystal
- **“Method 1”** option can’t ensure 100% to solve the external 32k crystal start failed issue, but the touchpad can work in this method.
- **“Method 2”** option can solve the external 32k issue, but the touchpad can’t work in this method.

*Available options:*

- None (RTC_EXT_CRYST_ADDIT_CURRENT_NONE)
- Method 1 (RTC_EXT_CRYST_ADDIT_CURRENT)
- Method 2 (RTC_EXT_CRYST_ADDIT_CURRENT_V2)
**CONFIG_RTC_CLK_CAL_CYCLES**

Number of cycles for RTC_SLOW_CLK calibration

*Found in: Component config > Hardware Settings > RTC Clock Config*

When the startup code initializes RTC_SLOW_CLK, it can perform calibration by comparing the RTC_SLOW_CLK frequency with main XTAL frequency. This option sets the number of RTC_SLOW_CLK cycles measured by the calibration routine. Higher numbers increase calibration precision, which may be important for applications which spend a lot of time in deep sleep. Lower numbers reduce startup time.

When this option is set to 0, clock calibration will not be performed at startup, and approximate clock frequencies will be assumed:

- 150000 Hz if internal RC oscillator is used as clock source. For this use value 1024.
- 32768 Hz if the 32k crystal oscillator is used. For this use value 3000 or more. In case more value will help improve the definition of the launch of the crystal. If the crystal could not start, it will be switched to internal RC.

*Range:*
- from 0 to 27000 if RTC_CLK_SRC_EXT_CRYS || RTC_CLK_SRC_EXT_OSC || RTC_CLK_SRC_INT_8MD256
- from 0 to 32766

*Default value:*
- 3000 if RTC_CLK_SRC_EXT_CRYS || RTC_CLK_SRC_EXT_OSC || RTC_CLK_SRC_INT_8MD256
- 1024

**CONFIG_RTC_XTAL_CAL_RETRY**

Number of attempts to repeat 32k XTAL calibration

*Found in: Component config > Hardware Settings > RTC Clock Config*

Number of attempts to repeat 32k XTAL calibration before giving up and switching to the internal RC. Increase this option if the 32k crystal oscillator does not start and switches to internal RC.

*Default value:*
- 1 if RTC_CLK_SRC_EXT_CRYS

**Peripheral Control** Contains:

- **CONFIG_PERIPH_CTRL_FUNC_IN_IRAM**

**CONFIG_PERIPH_CTRL_FUNC_IN_IRAM**

Place peripheral control functions into IRAM

*Found in: Component config > Hardware Settings > Peripheral Control*

Place peripheral control functions (e.g. periph_module_reset) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.

*Default value:*
- No (disabled)

**ETM Configuration** Contains:

- **CONFIG_ETM_ENABLE_DEBUG_LOG**
CONFIG_ETM_ENABLE_DEBUG_LOG
Enable debug log

*Found in: Component config > Hardware Settings > ETM Configuration*

Whether to enable the debug log message for ETM core driver. Note that, this option only controls the ETM related driver log, won’t affect other drivers.

**Default value:**
- No (disabled) if SOC_ETM_SUPPORTED

GDMA Configuration  Contains:
- CONFIG_GDMA_ENABLE_DEBUG_LOG
- CONFIG_GDMA_ISR_IRAM_SAFE
- CONFIG_GDMA_CTRL_FUNC_IN_IRAM

CONFIG_GDMA_CTRL_FUNC_IN_IRAM
Place GDMA control functions into IRAM

*Found in: Component config > Hardware Settings > GDMA Configuration*

Place GDMA control functions (like start/stop/append/reset) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled) if SOC_GDMA_SUPPORTED

CONFIG_GDMA_ISR_IRAM_SAFE
GDMA ISR IRAM-Safe

*Found in: Component config > Hardware Settings > GDMA Configuration*

This will ensure the GDMA interrupt handler is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write).

**Default value:**
- No (disabled) if SOC_GDMA_SUPPORTED

CONFIG_GDMA_ENABLE_DEBUG_LOG
Enable debug log

*Found in: Component config > Hardware Settings > GDMA Configuration*

Whether to enable the debug log message for GDMA driver. Note that, this option only controls the GDMA driver log, won’t affect other drivers.

**Default value:**
- No (disabled) if SOC_GDMA_SUPPORTED

Main XTAL Config  Contains:
- CONFIG_XTAL_FREQ_SEL
CONFIG_XTAL_FREQ_SEL

Main XTAL frequency

*Found in: Component config > Hardware Settings > Main XTAL Config*

This option selects the operating frequency of the XTAL (crystal) clock used to drive the ESP target. The selected value **MUST** reflect the frequency of the given hardware.

Note: The XTAL_FREQ_AUTO option allows the ESP target to automatically estimating XTAL clock’s operating frequency. However, this feature is only supported on the ESP32. The ESP32 uses the internal 8MHz as a reference when estimating. Due to the internal oscillator’s frequency being temperature dependent, usage of the XTAL_FREQ_AUTO is not recommended in applications that operate in high ambient temperatures or use high-temperature qualified chips and modules.

**Available options:**
- 24 MHz (XTAL_FREQ_24)
- 26 MHz (XTAL_FREQ_26)
- 32 MHz (XTAL_FREQ_32)
- 40 MHz (XTAL_FREQ_40)
- Autodetect (XTAL_FREQ_AUTO)

Crypto DPA Protection  Contains:

- CONFIG_ESP_CRYPTO_DPA_PROTECTION_AT_STARTUP

CONFIG_ESP_CRYPTO_DPA_PROTECTION_AT_STARTUP

Enable crypto DPA protection at startup

*Found in: Component config > Hardware Settings > Crypto DPA Protection*

This config controls the DPA (Differential Power Analysis) protection knob for the crypto peripherals. DPA protection dynamically adjusts the clock frequency of the crypto peripheral. DPA protection helps to make it difficult to perform SCA attacks on the crypto peripherals. However, there is also associated performance impact based on the security level set. Please refer to the TRM for more details.

**Default value:**
- Yes (enabled) if SOC_CRYPTO_DPA_PROTECTION_SUPPORTED

CONFIG_ESP_CRYPTO_DPA_PROTECTION_LEVEL

DPA protection level

*Found in: Component config > Hardware Settings > Crypto DPA Protection > CONFIG_ESP_CRYPTO_DPA_PROTECTION_AT_STARTUP*

Configure the DPA protection security level

**Available options:**
- Security level low (ESP_CRYPTO_DPA_PROTECTION_LEVEL_LOW)
- Security level medium (ESP_CRYPTO_DPA_PROTECTION_LEVEL_MEDIUM)
- Security level high (ESP_CRYPTO_DPA_PROTECTION_LEVEL_HIGH)

LCD and Touch Panel  Contains:

- LCD Peripheral Configuration
Chapter 2. API Reference

**LCD Peripheral Configuration**  Contains:

- `CONFIG_LCD_ENABLE_DEBUG_LOG`
- `CONFIG_LCD_PANEL_IO_FORMAT_BUF_SIZE`
- `CONFIG_LCD_RGB_RESTART_IN_VSYNC`
- `CONFIG_LCD_RGB_ISR_IRAM_SAFE`

**CONFIG_LCD_PANEL_IO_FORMAT_BUF_SIZE**

LCD panel io format buffer size

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

LCD driver allocate an internal buffer to transform the data into a proper format, because of the endian order mismatch. This option is to set the size of the buffer, in bytes.

**Default value:**
- 32

**CONFIG_LCD_ENABLE_DEBUG_LOG**

Enable debug log

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

Wether to enable the debug log message for LCD driver. Note that, this option only controls the LCD driver log, won’t affect other drivers.

**Default value:**
- No (disabled)

**CONFIG_LCD_RGB_ISR_IRAM_SAFE**

RGB LCD ISR IRAM-Safe

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

Ensure the LCD interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write). If you want the LCD driver to keep flushing the screen even when cache ops disabled, you can enable this option. Note, this will also increase the IRAM usage.

**Default value:**
- No (disabled) if SOC_LCD_RGB_SUPPORTED

**CONFIG_LCD_RGB_RESTART_IN_VSYNC**

Restart transmission in VSYNC

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

Reset the GDMA channel every VBlank to stop permanent desyncs from happening. Only need to enable it when in your application, the DMA can’t deliver data as fast as the LCD consumes it.

**Default value:**
- No (disabled) if SOC_LCD_RGB_SUPPORTED

**ESP NETIF Adapter**  Contains:

- `CONFIG_ESP_NETIF_BRIDGE_EN`
- `CONFIG_ESP_NETIF_L2_TAP`
- `CONFIG_ESP_NETIF_IP_LOST_TIMER_INTERVAL`
- `CONFIG_ESP_NETIF_USE_TCP_IP_STACK_LIB`
- `CONFIG_ESP_NETIF_RECEIVE_REPORT_ERRORS`
CONFIG_ESP_NETIF_IP_LOST_TIMER_INTERVAL

IP Address lost timer interval (seconds)

*Found in: Component config > ESP NETIF Adapter*

The value of 0 indicates the IP lost timer is disabled, otherwise the timer is enabled.

The IP address may be lost because of some reasons, e.g. when the station disconnects from soft-AP, or when DHCP IP renew fails etc. If the IP lost timer is enabled, it will be started everytime the IP is lost. Event SYSTEM_EVENT_STA_LOST_IP will be raised if the timer expires. The IP lost timer is stopped if the station get the IP again before the timer expires.

**Range:**
- from 0 to 65535

**Default value:**
- 120

CONFIG_ESP_NETIF_USE_TCPIP_STACK_LIB

TCP/IP Stack Library

*Found in: Component config > ESP NETIF Adapter*

Choose the TCP/IP Stack to work, for example, LwIP, uIP, etc.

**Available options:**
- LwIP (ESP_NETIF_TCPIP_LWIP)
  lwIP is a small independent implementation of the TCP/IP protocol suite.
- Loopback (ESP_NETIF_LOOPBACK)
  Dummy implementation of esp-netif functionality which connects driver transmit to receive function. This option is for testing purpose only

CONFIG_ESP_NETIF_RECEIVE_REPORT_ERRORS

Use esp_err_t to report errors from esp_netif_receive

*Found in: Component config > ESP NETIF Adapter*

Enable if esp_netif_receive() should return error code. This is useful to inform upper layers that packet input to TCP/IP stack failed, so the upper layers could implement flow control. This option is disabled by default due to backward compatibility and will be enabled in v6.0 (IDF-7194)

**Default value:**
- No (disabled)

CONFIG_ESP_NETIF_L2_TAP

Enable netif L2 TAP support

*Found in: Component config > ESP NETIF Adapter*

A user program can read/write link layer (L2) frames from/to ESP TAP device. The ESP TAP device can be currently associated only with Ethernet physical interfaces.

CONFIG_ESP_NETIF_L2_TAP_MAX_fds

Maximum number of opened L2 TAP File descriptors

*Found in: Component config > ESP NETIF Adapter > CONFIG_ESP_NETIF_L2_TAP*

Maximum number of opened File descriptors (FD’s) associated with ESP TAP device. ESP TAP FD’s take up a certain amount of memory, and allowing fewer FD’s to be opened at the same time conserves memory.
CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE

Size of L2 TAP Rx queue

*Found in: Component config > ESP NETIF Adapter > CONFIG_ESP_NETIF_L2_TAP*

Maximum number of frames queued in opened File descriptor. Once the queue is full, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

**Range:**
- from 1 to 100 if `CONFIG_ESP_NETIF_L2_TAP`

**Default value:**
- 20 if `CONFIG_ESP_NETIF_L2_TAP`

CONFIG_ESP_NETIF_BRIDGE_EN

Enable LwIP IEEE 802.1D bridge

*Found in: Component config > ESP NETIF Adapter*

Enable LwIP IEEE 802.1D bridge support in ESP-NETIF. Note that “Number of clients store data in netif” (`LWIP_NUM_NETIF_CLIENT_DATA`) option needs to be properly configured to be LwIP bridge available!

**Default value:**
- No (disabled)

Partition API Configuration

**PHY** Contains:
- `CONFIG_ESP_PHY_CALIBRATION_MODE`
- `CONFIG_ESP_PHY_ENABLE_USB`
- `CONFIG_ESP_PHY_IMPROVE_RX_11B`
- `CONFIG_ESP_PHY_MAX_WIFI_TX_POWER`
- `CONFIG_ESP_PHY_MAC_BB_PD`
- `CONFIG_ESP_PHY_REDUCE_TX_POWER`
- `CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE`
- `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`

**CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE**

Store phy calibration data in NVS

*Found in: Component config > PHY*

If this option is enabled, NVS will be initialized and calibration data will be loaded from there. PHY calibration will be skipped on deep sleep wakeup. If calibration data is not found, full calibration will be performed and stored in NVS. Normally, only partial calibration will be performed. If this option is disabled, full calibration will be performed.

If it’s easy that your board calibrate bad data, choose ‘n’. Two cases for example, you should choose ‘n’: 1. If your board is easy to be boot up with antenna disconnected. 2. Because of your board design, each time when you do calibration, the result are too unstable. If unsure, choose ‘y’.

**Default value:**
Chapter 2. API Reference

- Yes (enabled)

**CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION**

Use a partition to store PHY init data

*Found in: Component config > PHY*

If enabled, PHY init data will be loaded from a partition. When using a custom partition table, make sure that PHY data partition is included (type: ‘data’, subtype: ‘phy’). With default partition tables, this is done automatically. If PHY init data is stored in a partition, it has to be flashed there, otherwise runtime error will occur.

If this option is not enabled, PHY init data will be embedded into the application binary.

*Default value:*

- No (disabled)

Contains:

- **CONFIG_ESP_PHY_DEFAULT_INIT_IF_INVALID**
- **CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN**

**CONFIG_ESP_PHY_DEFAULT_INIT_IF_INVALID**

Reset default PHY init data if invalid

*Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION*

If enabled, PHY init data will be restored to default if it cannot be verified successfully to avoid endless bootloops.

*Default value:*

- No (disabled)

**CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN**

Support multiple PHY init data bin

*Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION*

If enabled, the corresponding PHY init data type can be automatically switched according to the country code. China’s PHY init data bin is used by default. Can be modified by country information in API esp_wifi_set_country(). The priority of switching the PHY init data type is: 1. Country configured by API esp_wifi_set_country() and the parameter policy is WIFI_COUNTRY_POLICY_MANUAL. 2. Country notified by the connected AP. 3. Country configured by API esp_wifi_set_country() and the parameter policy is WIFI_COUNTRY_POLICY_AUTO.

*Default value:*

- No (disabled) if **CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION**

**CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN_EMBED**

Support embedded multiple phy init data bin to app bin

*Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION > CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN*

If enabled, multiple phy init data bin will be embedded into app bin If not enabled, multiple phy init data bin will still leave alone, and need to be flashed by users.
**Default value:**
- No (disabled) if `CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN` && `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`

**CONFIG_ESP_PHY_INIT_DATA_ERROR**

Terminate operation when PHY init data error

*Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION > CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN*

If enabled, when an error occurs while the PHY init data is updated, the program will terminate and restart. If not enabled, the PHY init data will not be updated when an error occurs.

**Default value:**
- No (disabled) if `CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN` && `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`

**CONFIG_ESP_PHY_MAX_WIFI_TX_POWER**

Max WiFi TX power (dBm)

*Found in: Component config > PHY*

Set maximum transmit power for WiFi radio. Actual transmit power for high data rates may be lower than this setting.

**Range:**
- from 10 to 20

**Default value:**
- 20

**CONFIG_ESP_PHY_MAC_BB_PD**

Power down MAC and baseband of Wi-Fi and Bluetooth when PHY is disabled

*Found in: Component config > PHY*

If enabled, the MAC and baseband of Wi-Fi and Bluetooth will be powered down when PHY is disabled. Enabling this setting reduces power consumption by a small amount but increases RAM use by approximately 4 KB (Wi-Fi only), 2 KB (Bluetooth only) or 5.3 KB (Wi-Fi + Bluetooth).

**Default value:**
- No (disabled) if SOC_PM_SUPPORT_MAC_BB_PD && `CONFIG_FREERTOS_USE_TICKLESS_IDLE`

**CONFIG_ESP_PHY_REDUCE_TX_POWER**

Reduce PHY TX power when brownout reset

*Found in: Component config > PHY*

When brownout reset occurs, reduce PHY TX power to keep the code running.

**Default value:**
- No (disabled)

**CONFIG_ESP_PHY_ENABLE_USB**

Enable USB when phy init

*Found in: Component config > PHY*
When using USB Serial/JTAG/OTG/CDC, PHY should enable USB, otherwise USB module can not work properly. Notice: Enabling this configuration option will slightly impact Wi-Fi performance.

**Default value:**
- No (disabled) if `ESP_CONSOLE_USB_SERIAL_JTAG || ESP_CONSOLE_SECONDARY_USB_SERIAL_JTAG`

**CONFIG_ESP_PHY_CALIBRATION_MODE**

Calibration mode

*Found in: Component config > PHY*

Select PHY calibration mode. During RF initialization, the partial calibration method is used by default for RF calibration. Full calibration takes about 100ms more than partial calibration. If boot duration is not critical, it is suggested to use the full calibration method. No calibration method is only used when the device wakes up from deep sleep.

**Available options:**
- Calibration partial (ESP_PHY_RF_CAL_PARTIAL)
- Calibration none (ESP_PHY_RF_CAL_NONE)
- Calibration full (ESP_PHY_RF_CAL_FULL)

**CONFIG_ESP_PHY_IMPROVE_RX_11B**

Improve Wi-Fi receive 11b pkts

*Found in: Component config > PHY*

This is a workaround to improve Wi-Fi receive 11b pkts for some modules using AC-DC power supply with high interference, enable this option will sacrifice Wi-Fi OFDM receive performance. But to guarantee 11b receive performance serves as a bottom line in this case.

**Default value:**
- No (disabled) if `SOC_PHY_IMPROVE_RX_11B`

**Power Management**  
Contains:

- `CONFIG_PM_LIGHTSLEEP_RTC_OSC_CAL_INTERVAL`
- `CONFIG_PM_SLP_DISABLE_GPIO`
- `CONFIG_PM_LIGHT_SLEEP_CALLBACKS`
- `CONFIG_PM_POWER_DOWN_CPU_IN_LIGHT_SLEEP`
- `CONFIG_PM_POWER_DOWN_PERIPHERAL_IN_LIGHT_SLEEP`
- `CONFIG_PM_SLP_IRAM_OPT`
- `CONFIG_PMRTOS_IDLE_OPT`
- `CONFIG_PM_ENABLE`

**CONFIG_PM_ENABLE**

Support for power management

*Found in: Component config > Power Management*

If enabled, application is compiled with support for power management. This option has run-time overhead (increased interrupt latency, longer time to enter idle state), and it also reduces accuracy of RTOS ticks and timers used for timekeeping. Enable this option if application uses power management APIs.

**Default value:**
- No (disabled) if `CONFIG_FREERTOS_SMP || __DOXYGEN__`
CONFIG_PM_DFS_INIT_AUTO

Enable dynamic frequency scaling (DFS) at startup

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, startup code configures dynamic frequency scaling. Max CPU frequency is set to DEFAULT_CPU_FREQ_MHZ setting, min frequency is set to XTAL frequency. If disabled, DFS will not be active until the application configures it using esp_pm_configure function.

Default value:
- No (disabled) if CONFIG_PM_ENABLE

CONFIG_PM_PROFILING

Enable profiling counters for PM locks

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, esp_pm_* functions will keep track of the amount of time each of the power management locks has been held, and esp_pm_dump_locks function will print this information. This feature can be used to analyze which locks are preventing the chip from going into a lower power state, and see what time the chip spends in each power saving mode. This feature does incur some run-time overhead, so should typically be disabled in production builds.

Default value:
- No (disabled) if CONFIG_PM_ENABLE

CONFIG_PM_TRACE

Enable debug tracing of PM using GPIOs

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, some GPIOs will be used to signal events such as RTOS ticks, frequency switching, entry/exit from idle state. Refer to pm_trace.c file for the list of GPIOs. This feature is intended to be used when analyzing/debugging behavior of power management implementation, and should be kept disabled in applications.

Default value:
- No (disabled) if CONFIG_PM_ENABLE

CONFIG_PM_SLP_IRAM_OPT

Put lightsleep related codes in internal RAM

*Found in: Component config > Power Management*

If enabled, about 2.1KB of lightsleep related source code would be in IRAM and chip would sleep longer for 310us at 160MHz CPU frequency most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

CONFIG_PM_RTOS_IDLE_OPT

Put RTOS IDLE related codes in internal RAM

*Found in: Component config > Power Management*

If enabled, about 180Bytes of RTOS_IDLE related source code would be in IRAM and chip would sleep longer for 20us at 160MHz CPU frequency most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.
**CONFIG_PM_SLP_DISABLE_GPIO**

Disable all GPIO when chip at sleep

*Found in: Component config > Power Management*

This feature is intended to disable all GPIO pins at automatic sleep to get a lower power mode. If enabled, chips will disable all GPIO pins at automatic sleep to reduce about 200–300 uA current. If you want to specifically use some pins normally as chip wakes when chip sleeps, you can call `gpio_sleep_sel_dis` to disable this feature on those pins. You can also keep this feature on and call `gpio_sleep_set_direction` and `gpio_sleep_set_pull_mode` to have a different GPIO configuration at sleep. Warning: If you want to enable this option on ESP32, you should enable `GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL` at first, otherwise you will not be able to switch pullup/pulldown mode.

**CONFIG_PM_LIGHTSLEEP_RTC_OSC_CAL_INTERVAL**

Calibrate the RTC_FAST/SLOW clock every N times of light sleep

*Found in: Component config > Power Management*

The value of this option determines the calibration interval of the RTC_FAST/SLOW clock during sleep when power management is enabled. When it is configured as N, the RTC_FAST/SLOW clock will be calibrated every N times of lightsleep. Decreasing this value will increase the time the chip is in the active state, thereby increasing the average power consumption of the chip. Increasing this value can reduce the average power consumption, but when the external environment changes drastically and the chip RTC_FAST/SLOW oscillator frequency drifts, it may cause system instability.

**Range:**
- from 1 to 128 if `CONFIG_PM_ENABLE`

**Default value:**
- 1 if `CONFIG_PM_ENABLE`

**CONFIG_PM_POWER_DOWN_CPU_IN_LIGHT_SLEEP**

Power down CPU in light sleep

*Found in: Component config > Power Management*

If enabled, the CPU will be powered down in light sleep. On esp32c3 soc, enabling this option will consume 1.68 KB of internal RAM and will reduce sleep current consumption by about 100 uA. On esp32s3 soc, enabling this option will consume 8.58 KB of internal RAM and will reduce sleep current consumption by about 650 uA.

**Default value:**
- Yes (enabled) if `SOC_PM_SUPPORT_CPU_PD`

**CONFIG_PM_POWER_DOWN_PERIPHERAL_IN_LIGHT_SLEEP**

Power down Digital Peripheral in light sleep (EXPERIMENTAL)

*Found in: Component config > Power Management*

If enabled, digital peripherals will be powered down in light sleep, it will reduce sleep current consumption by about 100 uA. Chip will save/restore register context at sleep/wake time to keep the system running. Enabling this option will increase static RAM and heap usage, the actual cost depends on the peripherals you have initialized. In order to save/restore the context of the necessary hardware for FreeRTOS to run, it will need at least 4.55 KB free heap at sleep time. Otherwise sleep will not power down the peripherals.

**Note1:** Please use this option with caution, the current IDF does not support the retention of all peripherals. When the digital peripherals are powered off and a sleep and wake-up is completed, the peripherals that have not saved the running context are equivalent to performing a reset. !!! Please confirm the
peripherals used in your application and their sleep retention support status before enabling this option, peripherals sleep retention driver support status is tracked in power_management.rst

Note2: When this option is enabled simultaneously with FREERTOS_USE_TICKLESS_IDLE, since the UART will be powered down, the uart FIFO will be flushed before sleep to avoid data loss, however, this has the potential to block the sleep process and cause the wakeup time to be skipped, which will cause the tick of freertos to not be compensated correctly when returning from sleep and cause the system to crash. To avoid this, you can increase FREERTOS_IDLE_TIME_BEFORE_SLEEP threshold in menuconfig.

Default value:
- No (disabled) if SOC_PAU_SUPPORTED

**CONFIG_PM_LIGHT_SLEEP_CALLBACKS**

Enable registration of pm light sleep callbacks

*Found in: Component config > Power Management*

If enabled, it allows user to register entry and exit callbacks which are called before and after entering auto light sleep.

NOTE: These callbacks are executed from the IDLE task context hence you cannot have any blocking calls in your callbacks.

NOTE: Enabling these callbacks may change sleep duration calculations based on time spent in callback and hence it is highly recommended to keep them as short as possible

Default value:
- No (disabled) if CONFIG_FREERTOS_USE_TICKLESS_IDLE

**ESP PSRAM** Contains:
- **CONFIG_SPIRAM**

**CONFIG_SPIRAM**

Support for external, SPI-connected RAM

*Found in: Component config > ESP PSRAM*

This enables support for an external SPI RAM chip, connected in parallel with the main SPI flash chip.

Default value:
- No (disabled) if CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

**SPI RAM config** Contains:
- **CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY**
- **CONFIG_SPIRAM_ALLOW_NOINIT_SEG_EXTERNAL_MEMORY**
- **CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY**
- **CONFIG_SPIRAM_SPIWP_SD3_PIN**
- **CONFIG_SPIRAM_BANKSWITCH_ENABLE**
- **CONFIG_SPIRAM_2T_MODE**
- **CONFIG_SPIRAM_CACHE_WORKAROUND**
- **CONFIG_SPIRAM_BOOT_INIT**
- **CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL**
- **PSRAM clock and cs IO for ESP32-D2WD**
- **PSRAM clock and cs IO for ESP32-DOWD**
- **PSRAM clock and cs IO for ESP32-PICO-D4**
- **CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL**
- **CONFIG_SPIRAM_MEMTEST**
Chapter 2. API Reference

- `CONFIG_SPIRAM_SPEED`
- `CONFIG_SPIRAM_OCCUPY_SPI_HOST`
- `CONFIG_SPIRAM_USE`
- SPIRAM cache workaround debugging
- SPIRAM workaround libraries placement
- `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`
- `CONFIG_SPIRAM_TYPE`
- `CONFIG_SPIRAM_CUSTOM_SPIWP_SD3_PIN`

**CONFIG_SPIRAM_TYPE**

Type of SPI RAM chip in use

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

**Available options:**

- Auto-detect (SPIRAM_TYPE.AUTO)
- ESP-PSRAM16 or APS1604 (SPIRAM_TYPE_ESPPSRAM16)
- ESP-PSRAM32 (SPIRAM_TYPE_ESPPSRAM32)
- ESP-PSRAM64 or LY68L6400 (SPIRAM_TYPE_ESPPSRAM64)

**CONFIG_SPIRAM_SPEED**

Set RAM clock speed

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

Select the speed for the SPI RAM chip. If SPI RAM is enabled, we only support three combinations of SPI speed mode we supported now:

1. Flash SPI running at 40Mhz and RAM SPI running at 40Mhz
2. Flash SPI running at 80Mhz and RAM SPI running at 40Mhz
3. Flash SPI running at 80Mhz and RAM SPI running at 80Mhz

Note: If the third mode (80Mhz+80Mhz) is enabled for SPI RAM of type 32MBit, one of the HSPI/VSPI host will be occupied by the system. Which SPI host to use can be selected by the config item SPIRAM_OCCUPY_SPI_HOST. Application code should never touch HSPI/VSPI hardware in this case. The option to select 80MHz will only be visible if the flash SPI speed is also 80MHz. (ESP_TOOLPY_FLASHFREQ_80M is true)

**Available options:**

- 40MHz clock speed (SPIRAM_SPEED_40M)
- 80MHz clock speed (SPIRAM_SPEED_80M)

**CONFIG_SPIRAM_BOOT_INIT**

Initialize SPI RAM during startup

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

If this is enabled, the SPI RAM will be enabled during initial boot. Unless you have specific requirements, you’ll want to leave this enabled so memory allocated during boot-up can also be placed in SPI RAM.

**Default value:**

- Yes (enabled) if `CONFIG_SPIRAM` && `CONFIG_APP_BUILD_TYPEPURE_RAM_APP`

**CONFIG_SPIRAM_IGNORE_NOTFOUND**

Ignore PSRAM when not found

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > CONFIG_SPIRAM_BOOT_INIT*
Normally, if psram initialization is enabled during compile time but not found at runtime, it is seen as an error making the CPU panic. If this is enabled, booting will complete but no PSRAM will be available.

Default value:
- No (disabled) if CONFIG_SPIRAM_BOOT_INIT && CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

**CONFIG_SPIRAM_USE**

SPI RAM access method

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

The SPI RAM can be accessed in multiple methods: by just having it available as an unmanaged memory region in the CPU’s memory map, by integrating it in the heap as ‘special’ memory needing heap_caps_malloc to allocate, or by fully integrating it making malloc() also able to return SPI RAM pointers.

Available options:
- Integrate RAM into memory map (SPIRAM_USE_MEMMAP)
- Make RAM allocatable using heap_caps_malloc(...) (SPIRAM_USE_CAPS_ALLOC)
- Make RAM allocatable using malloc() as well (SPIRAM_USE_MALLOC)

**CONFIG_SPIRAM_MEMTEST**

Run memory test on SPI RAM initialization

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

Runs a rudimentary memory test on initialization. Aborts when memory test fails. Disable this for slightly faster startup.

Default value:
- Yes (enabled) if CONFIG_SPIRAM_BOOT_INIT && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

**CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL**

Maximum malloc() size, in bytes, to always put in internal memory

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

If malloc() is capable of also allocating SPI-connected ram, its allocation strategy will prefer to allocate chunks less than this size in internal memory, while allocations larger than this will be done from external RAM. If allocation from the preferred region fails, an attempt is made to allocate from the non-preferred region instead, so malloc() will not suddenly fail when either internal or external memory is full.

Range:
- from 0 to 131072 if SPIRAM_USE_MALLOC && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

Default value:
- 16384 if SPIRAM_USE_MALLOC && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

**CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP**

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, allocate internal memory

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*
Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, try to allocate internal memory then.

**Default value:**
- No (disabled) if (SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC) && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

**CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL**

Reserve this amount of bytes for data that specifically needs to be in DMA or internal memory

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

Because the external/internal RAM allocation strategy is not always perfect, it sometimes may happen that the internal memory is entirely filled up. This causes allocations that are specifically done in internal memory, for example the stack for new tasks or memory to service DMA or have memory that’s also available when SPI cache is down, to fail. This option reserves a pool specifically for requests like that; the memory in this pool is not given out when a normal malloc() is called.

Set this to 0 to disable this feature.

Note that because FreeRTOS stacks are forced to internal memory, they will also use this memory pool; be sure to keep this in mind when adjusting this value.

Note also that the DMA reserved pool may not be one single contiguous memory region, depending on the configured size and the static memory usage of the app.

**Range:**
- from 0 to 262144 if SPIRAM_USE_MALLOC && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

**Default value:**
- 32768 if SPIRAM_USE_MALLOC && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

**CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY**

Allow .bss segment placed in external memory

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

If enabled, variables with EXT_RAM_BSS_ATTR attribute will be placed in SPIRAM instead of internal DRAM. BSS section of lwip, net80211, pp, bt libraries will be automatically placed in SPIRAM. BSS sections from other object files and libraries can also be placed in SPIRAM through linker fragment scheme extram_bss.

Note that the variables placed in SPIRAM using EXT_RAM_BSS_ATTR will be zero initialized.

**Default value:**
- No (disabled) if CONFIG_SPIRAM && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

**CONFIG_SPIRAM_ALLOW_NOINIT_SEG_EXTERNAL_MEMORY**

Allow .noinit segment placed in external memory

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

If enabled, noinit variables can be placed in PSRAM using EXT_RAM_NOINIT_ATTR.

Note the values placed into this section will not be initialized at startup and should keep its value after software restart.

**Default value:**
- No (disabled) if CONFIG_SPIRAM && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP
**CONFIG_SPIRAM_CACHE_WORKAROUND**

Enable workaround for bug in SPI RAM cache for Rev1 ESP32s

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

Revision 1 of the ESP32 has a bug that can cause a write to PSRAM not to take place in some situations when the cache line needs to be fetched from external RAM and an interrupt occurs. This enables a fix in the compiler (-mfix-esp32-psram-cache-issue) that makes sure the specific code that is vulnerable to this will not be emitted.

This will also not use any bits of newlib that are located in ROM, opting for a version that is compiled with the workaround and located in flash instead.

The workaround is not required for ESP32 revision 3 and above.

**Default value:**

- Yes (enabled) if (SPIRAM_USE_MEMMAP || SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC) && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

**SPIRAM cache workaround debugging** Contains:

- CONFIG_SPIRAM_CACHE_WORKAROUND_STRATEGY

**CONFIG_SPIRAM_CACHE_WORKAROUND_STRATEGY**

Workaround strategy

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM cache workaround debugging*

Select the workaround strategy. Note that the strategy for precompiled libraries (libgcc, newlib, bt, wifi) is not affected by this selection.

Unless you know you need a different strategy, it’s suggested you stay with the default MEMW strategy. Note that DUPLDST can interfere with hardware encryption and this will be automatically disabled if this workaround is selected. ‘Insert nops’ is the workaround that was used in older esp-idf versions. This workaround still can cause faulty data transfers from/to SPI RAM in some situation.

**Available options:**

- Insert memw after vulnerable instructions (default) (SPIRAM_CACHE_WORKAROUND_STRATEGY_MEMW)
- Duplicate LD/ST for 32-bit, memw for 8/16 bit (SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST)
- Insert nops between vulnerable loads/stores (old strategy, obsolete) (SPIRAM_CACHE_WORKAROUND_STRATEGY_NOPS)

**SPIRAM workaround libraries placement** Contains:

- CONFIG_SPIRAM_CACHE_LIBCHAR_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBENV_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBFILE_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBIO_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBJMP_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBMATH_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBMEM_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBMISC_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBNUMPARSER_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBRAND_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBSTR_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBTIME_IN_IRAM
CONFIG_SPIRAM_CACHE_LIBJMP_IN_IRAM

Put libc’s jump related functions in IRAM

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: longjmp and setjmp. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*
  - Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

CONFIG_SPIRAM_CACHE_LIBMATH_IN_IRAM

Put libc’s math related functions in IRAM

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: abs, div, labs, ldiv, quorem, fpclassify, and nan. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*
  - Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

CONFIG_SPIRAM_CACHE_LIBNUMPARSER_IN_IRAM

Put libc’s number parsing related functions in IRAM

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: utoa, itoa, atoi, atol, strtol, and strtoul. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*
  - Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

CONFIG_SPIRAM_CACHE_LIBIO_IN_IRAM

Put libc’s I/O related functions in IRAM

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: wcrtomb, fwrite, wbuf, wsetup, fputwc, wctomb_r, ungetc, makebuf, fflush, refill, and sccl. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*
  - Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP
**CONFIG_SPIRAM_CACHE_LIBTIME_IN_IRAM**

Put libc’s time related functions in IRAM

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: asctime, asctime_r,ctime,ctime_r,lcftime,lcftime_r, gmtime, gmtime_r,strftime, mktime, tzset_r, tzset, time, gettzinfo, systimes, month_lengths, timelocal, tzvars, tzlock, tzscale_limits, and strptime. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*  
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`

**CONFIG_SPIRAM_CACHE_LIBCHAR_IN_IRAM**

Put libc’s characters related functions in IRAM

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: ctype, toupper, tolower, toascii,strupr,bzero, isalnum, isalpha, isascii, isblank, iscntrl, isdigit, isgraph, islower, isprint, ispunct, isspace, and isupper. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*  
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`

**CONFIG_SPIRAM_CACHE_LIBMEM_IN_IRAM**

Put libc’s memory related functions in IRAM

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: memccpy, memchr, memmove, and memrchr. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*  
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`

**CONFIG_SPIRAM_CACHE_LIBSTR_IN_IRAM**

Put libc’s string related functions in IRAM

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: strcasecmp, strcasestr, strchr, strcoll, strcpy, strcspn, strdup, strdup_r,strlcat, strlcpy, strlen, strlwr, strcasecmpp, strncat, strnchr, strnchrp, strnatcmp, strndup, strndup_r, strnchr, strsep, strspn, strstr, strtok_r, and strupr. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*  
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`
CONFIG_SPIRAM_CACHE_LIBRAND_IN_IRAM

Put libc’s random related functions in IRAM

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: srand, rand, and rand_r. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*

- Yes (enabled) if \texttt{CONFIG_SPIRAM_CACHE_WORKAROUND} && \texttt{CONFIG_SPIRAM} && \texttt{CONFIG_APP_BUILD_TYPE_PURE_RAM_APP}

CONFIG_SPIRAM_CACHE_LIBENV_IN_IRAM

Put libc’s environment related functions in IRAM

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: environ, envlock, and getenv_r. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*

- Yes (enabled) if \texttt{CONFIG_SPIRAM_CACHE_WORKAROUND} && \texttt{CONFIG_SPIRAM} && \texttt{CONFIG_APP_BUILD_TYPE_PURE_RAM_APP}

CONFIG_SPIRAM_CACHE_LIBFILE_IN_IRAM

Put libc’s file related functions in IRAM

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: lock, isatty, fclose, open, close,creat,read, rshift, sbrk, stdio, syssbrk, syslog, syslog, creat, sysread, syswrite, impure, fwalk, and findfp. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*

- Yes (enabled) if \texttt{CONFIG_SPIRAM_CACHE_WORKAROUND} && \texttt{CONFIG_SPIRAM} && \texttt{CONFIG_APP_BUILD_TYPE_PURE_RAM_APP}

CONFIG_SPIRAM_CACHE_LIBMISC_IN_IRAM

Put libc’s miscellaneous functions in IRAM, see help

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: raise and system Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*

- Yes (enabled) if \texttt{CONFIG_SPIRAM_CACHE_WORKAROUND} && \texttt{CONFIG_SPIRAM} && \texttt{CONFIG_APP_BUILD_TYPE_PURE_RAM_APP}
CONFIG_SPIRAM_BANKSWITCH_ENABLE

Enable bank switching for >4MiB external RAM

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

The ESP32 only supports 4MiB of external RAM in its address space. The hardware does support larger memories, but these have to be bank-switched in and out of this address space. Enabling this allows you to reserve some MMU pages for this, which allows the use of the esp_himem api to manage these banks.

#Note that this is limited to 62 banks, as esp_psram_extram_writeback_cache needs some kind of mapping of #some banks below that mark to work. We cannot at this moment guarantee this to exist when himem is #enabled.

If spiram 2T mode is enabled, the size of 64Mbit psram will be changed as 32Mbit, so himem will be unusable.

*Default value:*
  * Yes (enabled) if (SPIRAM_USE_MEMMAP || SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC) && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

CONFIG_SPIRAM_BANKSWITCH_RESERVE

Amount of 32K pages to reserve for bank switching

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > CONFIG_SPIRAM_BANKSWITCH_ENABLE*

Select the amount of banks reserved for bank switching. Note that the amount of RAM allocatable with malloc/esp_heap_alloc_caps will decrease by 32K for each page reserved here.

Note that this reservation is only actually done if your program actually uses the himem API. Without any himem calls, the reservation is not done and the original amount of memory will be available to malloc/esp_heap_alloc_caps.

*Range:*
  * from 1 to 62 if CONFIG_SPIRAM_BANKSWITCH_ENABLE && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

*Default value:*
  * 8 if CONFIG_SPIRAM_BANKSWITCH_ENABLE && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

CONFIG_SPIRAMALLOW_STACK_EXTERNAL_MEMORY

Allow external memory as an argument to xTaskCreateStatic

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

Because some bits of the ESP32 code environment cannot be recompiled with the cache workaround, normally tasks cannot be safely run with their stack residing in external memory; for this reason xTaskCreate (and related task creaton functions) always allocate stack in internal memory and xTaskCreateStatic will check if the memory passed to it is in internal memory. If you have a task that needs a large amount of stack and does not call on ROM code in any way (no direct calls, but also no Bluetooth/WiFi), you can try enable this to cause xTaskCreateStatic to allow tasks stack in external memory.

*Default value:*
  * No (disabled) if SPIRAM_USE_MALLOC && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

CONFIG_SPIRAM_OCCUPY_SPI_HOST
SPI host to use for 32MBit PSRAM

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

When both flash and PSRAM is working under 80MHz, and the PSRAM is of type 32MBit, one of the HSPI/VSPI host will be used to output the clock. Select which one to use here.

**Available options:**
- HSPI host (SPI2) (SPI_RAM_OCCUPY_HSPI_HOST)
- VSPI host (SPI3) (SPI_RAM_OCCUPY_VSPI_HOST)
- Will not try to use any host, will abort if not able to use the PSRAM (SPI_RAM_OCCUPY_NO_HOST)

**PSRAM clock and cs IO for ESP32-DOWD** Contains:
- `CONFIG_D0WD_PSRAM_CLK_IO`
- `CONFIG_D0WD_PSRAM_CS_IO`

**CONFIG_D0WD_PSRAM_CLK_IO**

PSRAM CLK IO number

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > PSRAM clock and cs IO for ESP32-DOWD*

The PSRAM CLOCK IO can be any unused GPIO, user can config it based on hardware design. If user use 1.8V flash and 1.8V psram, this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

If configured to the same pin as Flash, PSRAM shouldn’t be rev0. Contact Espressif for more information.

**Range:**
- from 0 to 33 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM` && `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`

**Default value:**
- 17 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM` && `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`

**CONFIG_D0WD_PSRAM_CS_IO**

PSRAM CS IO number

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > PSRAM clock and cs IO for ESP32-DOWD*

The PSRAM CS IO can be any unused GPIO, user can config it based on hardware design. If user use 1.8V flash and 1.8V psram, this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

**Range:**
- from 0 to 33 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM` && `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`

**Default value:**
- 16 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM` && `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`

**PSRAM clock and cs IO for ESP32-D2WD** Contains:
- `CONFIG_D2WD_PSRAM_CLK_IO`
- `CONFIG_D2WD_PSRAM_CS_IO`
**CONFIG_D2WD_PSRAM_CLK_IO**

PSRAM CLK IO number

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > PSRAM clock and cs IO for ESP32-D2WD*

User can config it based on hardware design. For ESP32-D2WD chip, the psram can only be 1.8V psram, so this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

If configured to the same pin (GPIO6) as Flash, PSRAM shouldn’t be rev0. Contact Espressif for more information.

*Range:*  
- from 0 to 33 if CONFIG_SPIRAM && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

*Default value:*  
- 9 if CONFIG_SPIRAM && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

**CONFIG_D2WD_PSRAM_CS_IO**

PSRAM CS IO number

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > PSRAM clock and cs IO for ESP32-D2WD*

User can config it based on hardware design. For ESP32-D2WD chip, the psram can only be 1.8V psram, so this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

*Range:*  
- from 0 to 33 if CONFIG_SPIRAM && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

*Default value:*  
- 10 if CONFIG_SPIRAM && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

**PSRAM clock and cs IO for ESP32-PICO-D4**  
Contains:

- **CONFIG_PICO_PSRAM_CS_IO**

**CONFIG_PICO_PSRAM_CS_IO**

PSRAM CS IO number

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > PSRAM clock and cs IO for ESP32-PICO-D4*

The PSRAM CS IO can be any unused GPIO, user can config it based on hardware design.

For ESP32-PICO chip, the psram share clock with flash, so user do not need to configure the clock IO. For the reference hardware design, please refer to [https://www.espressif.com/sites/default/files/documentation/esp32-pico-d4_datasheet_en.pdf](https://www.espressif.com/sites/default/files/documentation/esp32-pico-d4_datasheet_en.pdf)

*Range:*  
- from 0 to 33 if CONFIG_SPIRAM && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

*Default value:*  
- 10 if CONFIG_SPIRAM && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP
**CONFIG_SPIRAM_CUSTOM_SPIWP_SD3_PIN**

Use custom SPI PSRAM WP(SD3) Pin when flash pins set in eFuse (read help)

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

This setting is only used if the SPI flash pins have been overridden by setting the eFuses SPI_PAD_CONFIG_xxx, and the SPI flash mode is DIO or DOUT.

When this is the case, the eFuse config only defines 3 of the 4 Quad I/O data pins. The WP pin (aka ESP32 pin “SD_DATA_3” or SPI flash pin “IO2”) is not specified in eFuse. The psram only has QPi mode, so a WP pin setting is necessary.

If this config item is set to N (default), the correct WP pin will be automatically used for any Espressif chip or module with integrated flash. If a custom setting is needed, set this config item to Y and specify the GPIO number connected to the WP pin.

When flash mode is set to QIO or QOUT, the PSRAM WP pin will be set the same as the SPI Flash WP pin configured in the bootloader.

*Default value:*

- No (disabled) if (ESPTOOLPY_FLASHMODE_DIO || ESPTOOLPY_FLASHMODE_DOUT) && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

**CONFIG_SPIRAM_SPIWP_SD3_PIN**

Custom SPI PSRAM WP(SD3) Pin

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

The option “Use custom SPI PSRAM WP(SD3) pin” must be set or this value is ignored

If burning a customized set of SPI flash pins in eFuse and using DIO or DOUT mode for flash, set this value to the GPIO number of the SPIRAM WP pin.

*Range:*

- from 0 to 33 if (ESPTOOLPY_FLASHMODE_DIO || ESPTOOLPY_FLASHMODE_DOUT) && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

*Default value:*

- 7 if (ESPTOOLPY_FLASHMODE_DIO || ESPTOOLPY_FLASHMODE_DOUT) && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

**CONFIG_SPIRAM_2T_MODE**

Enable SPI PSRAM 2T mode

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

Enable this option to fix single bit errors inside 64Mbit PSRAM.

Some 64Mbit PSRAM chips have a hardware issue in the RAM which causes bit errors at multiple fixed bit positions.

Note: If this option is enabled, the 64Mbit PSRAM chip will appear to be 32Mbit in size. Applications will not be affected unless the use the esp_himem APIs, which are not supported in 2T mode.

*Default value:*

- No (disabled) if CONFIG_SPIRAM && CONFIG_SPIRAM && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

**ESP Ringbuf** Contains:

- CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH
**CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH**

Place non-ISR ringbuf functions into flash

*Found in:* Component config > ESP Ringbuf

Place non-ISR ringbuf functions (like `xRingbufferCreate/xRingbufferSend`) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled.

**Default value:**

- No (disabled)

**CONFIG_RINGBUF_PLACE_ISR_FUNCTIONS_INTO_FLASH**

Place ISR ringbuf functions into flash

*Found in:* Component config > ESP Ringbuf > CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH

Place ISR ringbuf functions (like `xRingbufferSendFromISR/xRingbufferReceiveFromISR`) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled or from an IRAM interrupt context.

This option is not compatible with ESP-IDF drivers which are configured to run the ISR from an IRAM context, e.g. `CONFIG_UART_ISR_IN_IRAM`.

**Default value:**

- No (disabled) if `CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH`

---

**ESP System Settings**

- `CONFIG_ESP_CONSOLE_UART_RX_GPIO`
- `CONFIG_ESP_CONSOLE_UART_TX_GPIO`

**CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ**
CPU frequency

*Found in: Component config > ESP System Settings*

CPU frequency to be set on application startup.

**Available options:**
- 40 MHz (ESP_DEFAULT_CPU_FREQ_MHZ_40)
- 80 MHz (ESP_DEFAULT_CPU_FREQ_MHZ_80)
- 160 MHz (ESP_DEFAULT_CPU_FREQ_MHZ_160)
- 240 MHz (ESP_DEFAULT_CPU_FREQ_MHZ_240)

**Memory**

Contains:
- CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY
- Non-backward compatible options
  - CONFIG_ESP32_RTCDATA_IN_FAST_MEM
  - CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE

**CONFIG_ESP32_RTCDATA_IN_FAST_MEM**

PlaceRTC_DATA_ATTRandRTC_RODATA_ATTRvariables into RTC fast memory segment

*Found in: Component config > ESP System Settings > Memory*

This option allows to place .rtc_data and .rtc_rodata sections into RTC fast memory segment to free the slow memory region for ULP programs. This option depends on the CONFIG_FREERTOS_UNICORE option because RTC fast memory can be accessed only by PRO_CPU core.

**Default value:**
- No (disabled) if CONFIG_FREERTOS_UNICORE

**CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE**

Use fixed static RAM size

*Found in: Component config > ESP System Settings > Memory*

If this option is disabled, the DRAM part of the heap starts right after the .bss section, within the dram0_0 region. As a result, adding or removing some static variables will change the available heap size.

If this option is enabled, the DRAM part of the heap starts right after the dram0_0 region, where its length is set with ESP32_FIXED_STATIC_RAM_SIZE

**Default value:**
- No (disabled)

**CONFIG_ESP32_FIXED_STATIC_RAM_SIZE**

Fixed Static RAM size

*Found in: Component config > ESP System Settings > Memory > CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE*

RAM size dedicated for static variables (.data & .bss sections). Please note that the actual length will be reduced by BTDM_reserve_dram if Bluetooth controller is enabled.

**Range:**
- from 0 to 0x2c200 if CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE

**Default value:**
- “0x1E000” if CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE
CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY

Enable IRAM as 8 bit accessible memory

*Found in: Component config > ESP System Settings > Memory*

If enabled, application can use IRAM as byte accessible region for storing data (Note: IRAM region cannot be used as task stack)

This is possible due to handling of exceptions LoadStoreError (3) and LoadStoreAlignmentError (9) Each unaligned read/write access will incur a penalty of maximum of 167 CPU cycles.

Non-backward compatible options Contains:
- CONFIG_ESP_SYSTEM_ESP32_SRAM1_REGION_AS_IRAM

CONFIG_ESP_SYSTEM_ESP32_SRAM1_REGION_AS_IRAM

Reserve parts of SRAM1 for app IRAM (WARNING, read help before enabling)

*Found in: Component config > ESP System Settings > Memory > Non-backward compatible options*

Reserve parts of SRAM1 for app IRAM which was previously reserved for bootloader DRAM. If booting an app on an older bootloader from before this option was introduced, the app will fail to boot due to not recognizing the new IRAM memory area.

If this is the case please test carefully before pushing out any OTA updates.

Trace memory Contains:
- CONFIG_ESP32_TRAX

CONFIG_ESP32_TRAX

Use TRAX tracing feature

*Found in: Component config > ESP System Settings > Trace memory*

The ESP32 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that can’t be used for general purposes anymore. Disable this if you do not know what this is.

**Default value:**
- No (disabled)

CONFIG_ESP32_TRAX_TWOBANKS

Reserve memory for tracing both pro as well as app cpu execution

*Found in: Component config > ESP System Settings > Trace memory > CONFIG_ESP32_TRAX*

The ESP32 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that can’t be used for general purposes anymore. Disable this if you do not know what this is.

# Memory to reverse for trace, used in linker script

**Default value:**
- No (disabled) if CONFIG_ESP32_TRAX && CONFIG_FREERTOS_UNICORE
CONFIG_ESP_SYSTEM_PANIC

Panic handler behaviour

*Found in:* Component config > ESP System Settings

If FreeRTOS detects unexpected behaviour or an unhandled exception, the panic handler is invoked. Configure the panic handler’s action here.

**Available options:**

- Print registers and halt (ESP_SYSTEM_PANIC_PRINT_HALT)
  - Outputs the relevant registers over the serial port and halt the processor. Needs a manual reset to restart.
- Print registers and reboot (ESP_SYSTEM_PANIC_PRINT_REBOOT)
  - Outputs the relevant registers over the serial port and immediately reset the processor.
- Silent reboot (ESP_SYSTEM_PANIC_SILENT_REBOOT)
  - Just resets the processor without outputting anything
- GDBStub on panic (ESP_SYSTEM_PANIC_GDBSTUB)
  - Invokes gdbstub on the serial port, allowing for gdb to attach to it to do a postmortem of the crash.

CONFIG_ESP_SYSTEM_PANIC_REBOOT_DELAY_SECONDS

Panic reboot delay (Seconds)

*Found in:* Component config > ESP System Settings

After the panic handler executes, you can specify a number of seconds to wait before the device reboots.

**Range:**

- from 0 to 99

**Default value:**

- 0

CONFIG_ESP_SYSTEM_RTC_EXT_XTAL_BOOTSTRAP_CYCLES

Bootstrap cycles for external 32kHz crystal

*Found in:* Component config > ESP System Settings

To reduce the startup time of an external RTC crystal, we bootstrap it with a 32kHz square wave for a fixed number of cycles. Setting 0 will disable bootstrapping (if disabled, the crystal may take longer to start up or fail to oscillate under some conditions).

If this value is too high, a faulty crystal may initially start and then fail. If this value is too low, an otherwise good crystal may not start.

To accurately determine if the crystal has started, set a larger “Number of cycles for RTC_SLOW_CLK calibration” (about 3000).

CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP

Enable RTC fast memory for dynamic allocations

*Found in:* Component config > ESP System Settings

This config option allows to add RTC fast memory region to system heap with capability similar to that of DRAM region but without DMA. This memory will be consumed first per heap initialization order by early startup services and scheduler related code. Speed wise RTC fast memory operates on APB clock and hence does not have much performance impact.
Memory protection  Contains:

- `CONFIG_ESP_SYSTEM_PMP_IDRAM_SPLIT`
- `CONFIG_ESP_SYSTEM_MEMPROT_FEATURE`

### `CONFIG_ESP_SYSTEM_PMP_IDRAM_SPLIT`
Enable IRAM/DRAM split protection

*Found in: Component config > ESP System Settings > Memory protection*

If enabled, the CPU watches all the memory access and raises an exception in case of any memory violation. This feature automatically splits the SRAM memory, using PMP, into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

**Default value:**
- Yes (enabled) if SOC_CPU_IDRAM_SPLIT_USING_PMP

### `CONFIG_ESP_SYSTEM_MEMPROT_FEATURE`
Enable memory protection

*Found in: Component config > ESP System Settings > Memory protection*

If enabled, the permission control module watches all the memory access and fires the panic handler if a permission violation is detected. This feature automatically splits the SRAM memory into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

**Default value:**
- Yes (enabled) if SOC_MEMPROT_SUPPORTED

### `CONFIG_ESP_SYSTEM_MEMPROT_FEATURE_LOCK`
Lock memory protection settings

*Found in: Component config > ESP System Settings > Memory protection > `CONFIG_ESP_SYSTEM_MEMPROT_FEATURE`*

Once locked, memory protection settings cannot be changed anymore. The lock is reset only on the chip startup.

**Default value:**
- Yes (enabled) if `CONFIG_ESP_SYSTEM_MEMPROT_FEATURE`

### `CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE`
System event queue size

*Found in: Component config > ESP System Settings*

Config system event queue size in different application.

**Default value:**
- 32
Chapter 2. API Reference

CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE
Event loop task stack size

*Found in: Component config > ESP System Settings*

Config system event task stack size in different application.

**Default value:**
- 2304

CONFIG_ESP_MAIN_TASK_STACK_SIZE
Main task stack size

*Found in: Component config > ESP System Settings*

Configure the “main task” stack size. This is the stack of the task which calls app_main(). If app_main() returns then this task is deleted and its stack memory is freed.

**Default value:**
- 3584

CONFIG_ESP_MAIN_TASK_AFFINITY
Main task core affinity

*Found in: Component config > ESP System Settings*

Configure the “main task” core affinity. This is the used core of the task which calls app_main(). If app_main() returns then this task is deleted.

**Available options:**
- CPU0 (ESP_MAIN_TASK_AFFINITY_CPU0)
- CPU1 (ESP_MAIN_TASK_AFFINITY_CPU1)
- No affinity (ESP_MAIN_TASK_AFFINITY_NO_AFFINITY)

CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE
Minimal allowed size for shared stack

*Found in: Component config > ESP System Settings*

Minimal value of size, in bytes, accepted to execute an expression with shared stack.

**Default value:**
- 2048

CONFIG_ESP_CONSOLE_UART
Channel for console output

*Found in: Component config > ESP System Settings*

Select where to send console output (through stdout and stderr).

- Default is to use UART0 on pre-defined GPIOs.
- If “Custom” is selected, UART0 or UART1 can be chosen, and any pins can be selected.
- If “None” is selected, there will be no console output on any UART, except for initial output from ROM bootloader. This ROM output can be suppressed by GPIO strapping or EFUSE, refer to chip datasheet for details.
- On chips with USB OTG peripheral, “USB CDC” option redirects output to the CDC port. This option uses the CDC driver in the chip ROM. This option is incompatible with TinyUSB stack.
- On chips with an USB serial/JTAG debug controller, selecting the option for that redirects output to the CDC/ACM (serial port emulation) component of that device.
Available options:
- Default: UART0 (ESP_CONSOLE_UART_DEFAULT)
- USB CDC (ESP_CONSOLE_USB_CDC)
- USB Serial/JTAG Controller (ESP_CONSOLE_USB_SERIAL_JTAG)
- Custom UART (ESP_CONSOLE_UART_CUSTOM)
- None (ESP_CONSOLE_NONE)

**CONFIG_ESP_CONSOLE_SECONDARY**

Channel for console secondary output

*Found in: Component config > ESP System Settings*

This secondary option supports output through other specific port like USB_SERIAL_JTAG when UART0 port as a primary is selected but not connected. This secondary output currently only supports non-blocking mode without using REPL. If you want to output in blocking mode with REPL or input through this secondary port, please change the primary config to this port in *Channel for console output* menu.

Available options:
- No secondary console (ESP_CONSOLE_SECONDARY_NONE)
- USB_SERIAL_JTAG PORT (ESP_CONSOLE_SECONDARY_USB_SERIAL_JTAG)

This option supports output through USB_SERIAL_JTAG port when the UART0 port is not connected. The output currently only supports non-blocking mode without using the console. If you want to output in blocking mode with REPL or input through USB_SERIAL_JTAG port, please change the primary config to ESP_CONSOLE_USB_SERIAL_JTAG above.

**CONFIG_ESP_CONSOLE_UART_NUM**

UART peripheral to use for console output (0-1)

*Found in: Component config > ESP System Settings*

This UART peripheral is used for console output from the ESP-IDF Bootloader and the app.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

Due to an ESP32 ROM bug, UART2 is not supported for console output via esp_rom_printf.

Available options:
- UART0 (ESP_CONSOLE_UART_CUSTOM_NUM_0)
- UART1 (ESP_CONSOLE_UART_CUSTOM_NUM_1)

**CONFIG_ESP_CONSOLE_UART_TX_GPIO**

UART TX on GPIO#

*Found in: Component config > ESP System Settings*

This GPIO is used for console UART TX output in the ESP-IDF Bootloader and the app (including boot log output and default standard output and standard error of the app).

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**
- from 0 to 46 if ESP_CONSOLE_UART_CUSTOM

**Default value:**
- 1 if ESP_CONSOLE_UART_CUSTOM
- 43 if ESP_CONSOLE_UART_CUSTOM
**CONFIG_ESP_CONSOLE_UART_RX_GPIO**

UART RX on GPIO#

*Found in: Component config > ESP System Settings*

This GPIO is used for UART RX input in the ESP-IDF Bootloader and the app (including default default standard input of the app).

Note: The default ESP-IDF Bootloader configures this pin but doesn’t read anything from the UART.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**
- from 0 to 46 if ESP_CONSOLE_UART_CUSTOM

**Default value:**
- 3 if ESP_CONSOLE_UART_CUSTOM
- 44 if ESP_CONSOLE_UART_CUSTOM

**CONFIG_ESP_CONSOLE_UART_BAUDRATE**

UART console baud rate

*Found in: Component config > ESP System Settings*

This baud rate is used by both the ESP-IDF Bootloader and the app (including boot log output and default standard input/output/error of the app).

The app’s maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**
- from 1200 to 4000000 if CONFIG_PM_ENABLE
- from 1200 to 1000000 if CONFIG_PM_ENABLE

**Default value:**
- 115200

**CONFIG_ESP_INT_WDT**

Interrupt watchdog

*Found in: Component config > ESP System Settings*

This watchdog timer can detect if the FreeRTOS tick interrupt has not been called for a certain time, either because a task turned off interrupts and did not turn them on for a long time, or because an interrupt handler did not return. It will try to invoke the panic handler first and failing that reset the SoC.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_INT_WDT_TIMEOUT_MS**

Interrupt watchdog timeout (ms)

*Found in: Component config > ESP System Settings > CONFIG_ESP_INT_WDT*

The timeout of the watchdog, in milliseconds. Make this higher than the FreeRTOS tick rate.

**Range:**
Chapter 2. API Reference

- from 10 to 10000

Default value:
- 300 if `CONFIG_SPIRAM & & CONFIG_ESP_INT_WDT`
- 800 if `CONFIG_SPIRAM & & CONFIG_ESP_INT_WDT`

`CONFIG_ESP_INT_WDT_CHECK_CPU1`

Also watch CPU1 tick interrupt

*Found in: Component config > ESP System Settings > CONFIG_ESP_INT_WDT*

Also detect if interrupts on CPU 1 are disabled for too long.

Default value:
- Yes (enabled) if `CONFIG_ESP_INT_WDT & & CONFIG_FREERTOS_UNICORE`

`CONFIG_ESP_TASK_WDT_EN`

Enable Task Watchdog Timer

*Found in: Component config > ESP System Settings*

The Task Watchdog Timer can be used to make sure individual tasks are still running. Enabling this option will enable the Task Watchdog Timer. It can be either initialized automatically at startup or initialized after startup (see Task Watchdog Timer API Reference)

Default value:
- Yes (enabled)

`CONFIG_ESP_TASK_WDT_INIT`

Initialize Task Watchdog Timer on startup

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT_EN*

Enabling this option will cause the Task Watchdog Timer to be initialized automatically at startup.

Default value:
- Yes (enabled)

`CONFIG_ESP_TASK_WDT_PANIC`

Invoke panic handler on Task Watchdog timeout

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT_EN > CONFIG_ESP_TASK_WDT_INIT*

If this option is enabled, the Task Watchdog Timer will be configured to trigger the panic handler when it times out. This can also be configured at run time (see Task Watchdog Timer API Reference)

Default value:
- No (disabled)

`CONFIG_ESP_TASK_WDT_TIMEOUT_S`

Task Watchdog timeout period (seconds)

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT_EN > CONFIG_ESP_TASK_WDT_INIT*

Timeout period configuration for the Task Watchdog Timer in seconds. This is also configurable at run time (see Task Watchdog Timer API Reference)

Range:
- from 1 to 60
**Default value:**
- 5

**CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0**

Watch CPU0 Idle Task

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT_EN > CONFIG_ESP_TASK_WDT_INIT*

If this option is enabled, the Task Watchdog Timer will watch the CPU0 Idle Task. Having the Task Watchdog watch the Idle Task allows for detection of CPU starvation as the Idle Task not being called is usually a symptom of CPU starvation. Starvation of the Idle Task is detrimental as FreeRTOS household tasks depend on the Idle Task getting some runtime every now and then.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU1**

Watch CPU1 Idle Task

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT_EN > CONFIG_ESP_TASK_WDT_INIT*

If this option is enabled, the Task Watchdog Timer will watch the CPU1 Idle Task.

**Default value:**
- Yes (enabled) if CONFIG_ESP_TASK_WDT_INIT && CONFIG_FREERTOS_UNICORE

**CONFIG_ESP_PANIC_HANDLER_IRAM**

Place panic handler code in IRAM

*Found in: Component config > ESP System Settings*

If this option is disabled (default), the panic handler code is placed in flash not IRAM. This means that if ESP-IDF crashes while flash cache is disabled, the panic handler will automatically re-enable flash cache before running GDB Stub or Core Dump. This adds some minor risk, if the flash cache status is also corrupted during the crash.

If this option is enabled, the panic handler code (including required UART functions) is placed in IRAM. This may be necessary to debug some complex issues with crashes while flash cache is disabled (for example, when writing to SPI flash) or when flash cache is corrupted when an exception is triggered.

**Default value:**
- No (disabled)

**CONFIG_ESP_DEBUG_STUBS_ENABLE**

OpenOCD debug stubs

*Found in: Component config > ESP System Settings*

Debug stubs are used by OpenOCD to execute pre-compiled onboard code which does some useful debugging stuff, e.g. GCOV data dump.

**Default value:**
- “COMPILER_OPTIMIZATION_LEVEL_DEBUG” if CONFIG_ESP32_TRAX && ESP32S2_TRAX && ESP32S3_TRAX
### CONFIG_ESP_DEBUG_OCDAWARE

Make exception and panic handlers JTAG/OCD aware

*Found in:* Component config > ESP System Settings

The FreeRTOS panic and unhandled exception handlers can detect a JTAG OCD debugger and instead of panicking, have the debugger stop on the offending instruction.

**Default value:**
- Yes (enabled)

### CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL

Interrupt level to use for Interrupt Watchdog and other system checks

*Found in:* Component config > ESP System Settings

Interrupt level to use for Interrupt Watchdog, IPC_ISR and other system checks.

**Available options:**
- Level 5 interrupt (ESP_SYSTEM_CHECK_INT_LEVEL_5)
  Using level 5 interrupt for Interrupt Watchdog, IPC_ISR and other system checks.
- Level 4 interrupt (ESP_SYSTEM_CHECK_INT_LEVEL_4)
  Using level 4 interrupt for Interrupt Watchdog, IPC_ISR and other system checks.

### Brownout Detector

Contains:
- `CONFIG_ESP_BROWNOUT_DET`

### CONFIG_ESP_BROWNOUT_DET

Hardware brownout detect & reset

*Found in:* Component config > ESP System Settings > Brownout Detector

The ESP has a built-in brownout detector which can detect if the voltage is lower than a specific value. If this happens, it will reset the chip in order to prevent unintended behaviour.

**Default value:**
- Yes (enabled)

### CONFIG_ESP_BROWNOUT_DET_LVL_SEL

Brownout voltage level

*Found in:* Component config > ESP System Settings > Brownout Detector > CONFIG_ESP_BROWNOUT_DET

The brownout detector will reset the chip when the supply voltage is approximately below this level. Note that there may be some variation of brownout voltage level between each ESP chip.

#The voltage levels here are estimates, more work needs to be done to figure out the exact voltages #of the brownout threshold levels.

**Available options:**
- 2.43V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_0)
- 2.48V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_1)
- 2.58V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_2)
- 2.62V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_3)
- 2.67V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_4)
- 2.70V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_5)
- 2.77V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_6)
- 2.80V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_7)
CONFIG_ESP32_DISABLE_BASIC_ROM_CONSOLE

Permanently disable BASIC ROM Console

*Found in: Component config > ESP System Settings*

If set, the first time the app boots it will disable the BASIC ROM Console permanently (by burning an eFuse).

Otherwise, the BASIC ROM Console starts on reset if no valid bootloader is read from the flash.

(Enabling secure boot also disables the BASIC ROM Console by default.)

**Default value:**
- No (disabled)

CONFIG_ESP_SYSTEM_HW_STACK_GUARD

Hardware stack guard

*Found in: Component config > ESP System Settings*

This config allows to trigger a panic interrupt when Stack Pointer register goes out of allocated stack memory bounds.

**Default value:**
- Yes (enabled) if SOC_ASSIST_DEBUG_SUPPORTED

IPC (Inter-Processor Call)  Contains:

- CONFIG_ESP_IPC_TASK_STACK_SIZE
- CONFIG_ESP_IPC_USES_CALLERS_PRIORITY

CONFIG_ESP_IPC_TASK_STACK_SIZE

Inter-Processor Call (IPC) task stack size

*Found in: Component config > IPC (Inter-Processor Call)*

Configure the IPC tasks stack size. An IPC task runs on each core (in dual core mode), and allows for cross-core function calls. See IPC documentation for more details. The default IPC stack size should be enough for most common simple use cases. However, users can increase/decrease the stack size to their needs.

**Range:**
- from 512 to 65536

**Default value:**
- 1024

CONFIG_ESP_IPC_USES_CALLERS_PRIORITY

IPC runs at caller’s priority

*Found in: Component config > IPC (Inter-Processor Call)*

If this option is not enabled then the IPC task will keep behavior same as prior to that of ESP-IDF v4.0, hence IPC task will run at (configMAX_PRIORITIES - 1) priority.

**Default value:**
- Yes (enabled) if CONFIG_FREERTOS_UNICORE
High resolution timer (esp_timer) Contains:

- CONFIG_ESP_TIMER_PROFILING
- CONFIG_ESP_TIMER_TASK_AFFINITY
- CONFIG_ESP_TIMER_TASK_STACK_SIZE
- CONFIG_ESP_TIMER_INTERRUPT_LEVEL
- CONFIG_ESP_TIMER_SHOW_EXPERIMENTAL
- CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD
- CONFIG_ESP_TIMER_ISR_AFFINITY

**CONFIG_ESP_TIMER_PROFILING**

Enable esp_timer profiling features

*Found in: Component config > High resolution timer (esp_timer)*

If enabled, esp_timer_dump will dump information such as number of times the timer was started, number of times the timer has triggered, and the total time it took for the callback to run. This option has some effect on timer performance and the amount of memory used for timer storage, and should only be used for debugging/testing purposes.

**Default value:**

- No (disabled)

**CONFIG_ESP_TIMER_TASK_STACK_SIZE**

High-resolution timer task stack size

*Found in: Component config > High resolution timer (esp_timer)*

Configure the stack size of “timer_task” task. This task is used to dispatch callbacks of timers created using ets_timer and esp_timer APIs. If you are seeing stack overflow errors in timer task, increase this value.

Note that this is not the same as FreeRTOS timer task. To configure FreeRTOS timer task size, see “FreeRTOS timer task stack size” option in “FreeRTOS”.

**Range:**

- from 2048 to 65536

**Default value:**

- 3584

**CONFIG_ESP_TIMER_INTERRUPT_LEVEL**

Interrupt level

*Found in: Component config > High resolution timer (esp_timer)*

It sets the interrupt level for esp_timer ISR in range 1..3. A higher level (3) helps to decrease the ISR esp_timer latency.

**Range:**

- from 1 to 3
- from 1 to 1

**Default value:**

- 1

**CONFIG_ESP_TIMER_SHOW_EXPERIMENTAL**

show esp_timer’s experimental features

*Found in: Component config > High resolution timer (esp_timer)*
This shows some hidden features of esp_timer. Note that they may break other features, use them with care.

**CONFIG_ESP_TIMER_TASK_AFFINITY**

`esp_timer` task core affinity

*Found in: Component config > High resolution timer (esp_timer)*

The default settings: timer TASK on CPU0 and timer ISR on CPU0. Other settings may help in certain cases, but note that they may break other features, use them with care.

- “CPU0”: (default) esp_timer task is processed by CPU0.
- “CPU1”: esp_timer task is processed by CPU1.
- “No affinity”: esp_timer task can be processed by any CPU.

**Available options:**

- CPU0 (ESP_TIMER_TASK_AFFINITY_CPU0)
- CPU1 (ESP_TIMER_TASK_AFFINITY_CPU1)
- No affinity (ESP_TIMER_TASK_AFFINITY_NO_AFFINITY)

**CONFIG_ESP_TIMER_ISR_AFFINITY**

timer interrupt core affinity

*Found in: Component config > High resolution timer (esp_timer)*

The default settings: timer TASK on CPU0 and timer ISR on CPU0. Other settings may help in certain cases, but note that they may break other features, use them with care.

- “CPU0”: (default) timer interrupt is processed by CPU0.
- “CPU1”: timer interrupt is processed by CPU1.
- “No affinity”: timer interrupt can be processed by any CPU. It helps to reduce latency but there is a disadvantage it leads to the timer ISR running on every core. It increases the CPU time usage for timer ISRs by N on an N-core system.

**Available options:**

- CPU0 (ESP_TIMER_ISR_AFFINITY_CPU0)
- CPU1 (ESP_TIMER_ISR_AFFINITY_CPU1)
- No affinity (ESP_TIMER_ISR_AFFINITY_NO_AFFINITY)

**CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD**

Support ISR dispatch method

*Found in: Component config > High resolution timer (esp_timer)*

Allows using ESP_TIMER_ISR dispatch method (ESP_TIMER_TASK dispatch method is also available).

- ESP_TIMER_TASK - Timer callbacks are dispatched from a high-priority esp_timer task.
- ESP_TIMER_ISR - Timer callbacks are dispatched directly from the timer interrupt handler. The ISR dispatch can be used, in some cases, when a callback is very simple or need a lower-latency.

**Default value:**

- No (disabled)

**Wi-Fi**

Contains:

- CONFIG_ESP_WIFI_TESTING_OPTIONS
- CONFIG_ESP_WIFI_WPS_SOFTAP_REGISTRAR

• CONFIG_ESP_WIFI_TASK_CORE_ID

WPS Configuration Options

CONFIG_ESP_WIFI_STATIC_RX_BUFFER_NUM

Max number of WiFi static RX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi static RX buffers. Each buffer takes approximately 1.6KB of RAM. The static
rx buffers are allocated when esp_wifi_init is called, they are not freed until esp_wifi_deinit is called.

WiFi hardware use these buffers to receive all 802.11 frames. A higher number may allow higher
throughput but increases memory use. If ESP_WIFI_AMPDU_RX_ENABLED is enabled, this value is
recommended to set equal or bigger than ESP_WIFI_RX_BA_WIN in order to achieve better through-
put and compatibility with both stations and APs.

*Range:*
  • from 2 to 25 if SOC_WIFI_HE_SUPPORT
  • from 2 to 128 if SOC_WIFI_HE_SUPPORT

*Default value:*
  • 10 if CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP
  • 16 if CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP

CONFIG_ESP_WIFI_DYNAMIC_RX_BUFFER_NUM
Max number of WiFi dynamic RX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi dynamic RX buffers, 0 means unlimited RX buffers will be allocated (provided sufficient free RAM). The size of each dynamic RX buffer depends on the size of the received data frame.

For each received data frame, the WiFi driver makes a copy to an RX buffer and then delivers it to the high layer TCP/IP stack. The dynamic RX buffer is freed after the higher layer has successfully received the data frame.

For some applications, WiFi data frames may be received faster than the application can process them. In these cases we may run out of memory if RX buffer number is unlimited (0).

If a dynamic RX buffer limit is set, it should be at least the number of static RX buffers.

**Range:**
- from 0 to 128 if `CONFIG_LWIP_WND_SCALE`
- from 0 to 1024 if `CONFIG_LWIP_WND_SCALE`

**Default value:**
- 32

**CONFIG_ESP_WIFI_TX_BUFFER**

Type of WiFi TX buffers

*Found in: Component config > Wi-Fi*

Select type of WiFi TX buffers:

If “Static” is selected, WiFi TX buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static TX buffer is fixed to about 1.6KB.

If “Dynamic” is selected, each WiFi TX buffer is allocated as needed when a data frame is delivered to the WiFi driver from the TCP/IP stack. The buffer is freed after the data frame has been sent by the WiFi driver. The size of each dynamic TX buffer depends on the length of each data frame sent by the TCP/IP layer.

If PSRAM is enabled, “Static” should be selected to guarantee enough WiFi TX buffers. If PSRAM is disabled, “Dynamic” should be selected to improve the utilization of RAM.

**Available options:**
- Static (ESP_WIFI_STATIC_TX_BUFFER)
- Dynamic (ESP_WIFI_DYNAMIC_TX_BUFFER)

**CONFIG_ESP_WIFI_STATIC_TX_BUFFER_NUM**

Max number of WiFi static TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi static TX buffers. Each buffer takes approximately 1.6KB of RAM. The static RX buffers are allocated when esp_wifi_init() is called, they are not released until esp_wifi_deinit() is called.

For each transmitted data frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

**Range:**
- from 1 to 64 if ESP_WIFI_STATIC_TX_BUFFER

**Default value:**
- 16 if ESP_WIFI_STATIC_TX_BUFFER
**CONFIG_ESP_WIFI_CACHE_TX_BUFFER_NUM**

Max number of WiFi cache TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi cache TX buffer number.

For each TX packet from uplayer, such as LWIP etc, WiFi driver needs to allocate a static TX buffer and makes a copy of uplayer packet. If WiFi driver fails to allocate the static TX buffer, it caches the uplayer packets to a dedicated buffer queue, this option is used to configure the size of the cached TX queue.

**Range:**
- from 16 to 128 if `CONFIG_SPIRAM`

**Default value:**
- 32 if `CONFIG_SPIRAM`

**CONFIG_ESP_WIFI_DYNAMIC_TX_BUFFER_NUM**

Max number of WiFi dynamic TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi dynamic TX buffers. The size of each dynamic TX buffer is not fixed, it depends on the size of each transmitted data frame.

For each transmitted frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications, especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

**Range:**
- from 1 to 128

**Default value:**
- 32

**CONFIG_ESP_WIFI_MGMT_RX_BUFFER**

Type of WiFi RX MGMT buffers

*Found in: Component config > Wi-Fi*

Select type of WiFi RX MGMT buffers:

If “Static” is selected, WiFi RX MGMT buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static RX MGMT buffer is fixed to about 500 Bytes.

If “Dynamic” is selected, each WiFi RX MGMT buffer is allocated as needed when a MGMT data frame is received. The MGMT buffer is freed after the MGMT data frame has been processed by the WiFi driver.

**Available options:**
- Static (ESP_WIFI_STATIC_RX_MGMT_BUFFER)
- Dynamic (ESP_WIFI_DYNAMIC_RX_MGMT_BUFFER)

**CONFIG_ESP_WIFI_RX_MGMT_BUF_NUM_DEF**

Max number of WiFi RX MGMT buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi RX MGMT buffers.

For Management buffers, the number of dynamic and static management buffers is the same. In order to prevent memory fragmentation, the management buffer type should be set to static first.
Chapter 2. API Reference

**CONFIG_ESP_WIFI_CSI_ENABLED**

WiFi CSI(Channel State Information)

*Found in: Component config > Wi-Fi*

Select this option to enable CSI(Channel State Information) feature. CSI takes about CONFIG_ESP_WIFI_STATIC_RX_BUFFER_NUM KB of RAM. If CSI is not used, it is better to disable this feature in order to save memory.

**Default value:**

- No (disabled)

**CONFIG_ESP_WIFI_AMPDU_TX_ENABLED**

WiFi AMPDU TX

*Found in: Component config > Wi-Fi*

Select this option to enable AMPDU TX feature

**Default value:**

- Yes (enabled)

**CONFIG_ESP_WIFI_TX_BA_WIN**

WiFi AMPDU TX BA window size

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_AMPDU_TX_ENABLED*

Set the size of WiFi Block Ack TX window. Generally a bigger value means higher throughput but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP TX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12.

**Range:**

- from 2 to 32 if SOC_WIFI_HE_SUPPORT && CONFIG_ESP_WIFI_AMPDU_TX_ENABLED
- from 2 to 64 if SOC_WIFI_HE_SUPPORT && CONFIG_ESP_WIFI_AMPDU_TX_ENABLED

**Default value:**

- 6

**CONFIG_ESP_WIFI_AMPDU_RX_ENABLED**

WiFi AMPDU RX

*Found in: Component config > Wi-Fi*

Select this option to enable AMPDU RX feature

**Default value:**

- Yes (enabled)
CONFIG_ESP_WIFI_RX_BA_WIN

WiFi AMPDU RX BA window size

*Found in:* [Component config] > Wi-Fi > CONFIG_ESP_WIFI_AMPDU_RX_ENABLED

Set the size of WiFi Block Ack RX window. Generally a bigger value means higher throughput and better compatibility but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP RX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9-12. If PSRAM is used and WiFi memory is prefered to allocat in PSRAM first, the default and minimum value should be 16 to achieve better throughput and compatibility with both stations and APs.

*Range:*
- from 2 to 32 if SOC_WIFI_HE_SUPPORT && CONFIG_ESP_WIFI_AMPDU_RX_ENABLED
- from 2 to 64 if SOC_WIFI_HE_SUPPORT && CONFIG_ESP_WIFI_AMPDU_RX_ENABLED

*Default value:*
- 6 if CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP && CONFIG_ESP_WIFI_AMPDU_RX_ENABLED
- 16 if CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP && CONFIG_ESP_WIFI_AMPDU_RX_ENABLED

CONFIG_ESP_WIFI_AMSDU_TX_ENABLED

WiFi AMSDU TX

*Found in:* [Component config] > Wi-Fi

Select this option to enable AMSDU TX feature

*Default value:*
- No (disabled) if CONFIG_SPIRAM

CONFIG_ESP_WIFI_NVS_ENABLED

WiFi NVS flash

*Found in:* [Component config] > Wi-Fi

Select this option to enable WiFi NVS flash

*Default value:*
- Yes (enabled)

CONFIG_ESP_WIFI_TASK_CORE_ID

WiFi Task Core ID

*Found in:* [Component config] > Wi-Fi

Pinned WiFi task to core 0 or core 1.

*Available options:*
- Core 0 (ESP_WIFI_TASK_PINNED_TO_CORE_0)
- Core 1 (ESP_WIFI_TASK_PINNED_TO_CORE_1)

CONFIG_ESP_WIFI_SOFTAP_BEACON_MAX_LEN

Max length of WiFi SoftAP Beacon

*Found in:* [Component config] > Wi-Fi
Chapter 2. API Reference

ESP-MESH utilizes beacon frames to detect and resolve root node conflicts (see documentation). However, the default length of a beacon frame can simultaneously hold only five root node identifier structures, meaning that a root node conflict of up to five nodes can be detected at one time. In the occurrence of more root nodes conflict involving more than five root nodes, the conflict resolution process will detect five of the root nodes, resolve the conflict, and re-detect more root nodes. This process will repeat until all root node conflicts are resolved. However, this process can generally take a very long time.

To counter this situation, the beacon frame length can be increased such that more root nodes can be detected simultaneously. Each additional root node will require 36 bytes and should be added on top of the default beacon frame length of 752 bytes. For example, if you want to detect 10 root nodes simultaneously, you need to set the beacon frame length as 932 (752+36*5).

Setting a longer beacon length also assists with debugging as the conflicting root nodes can be identified more quickly.

Range:
- from 752 to 1256

Default value:
- 752

**CONFIG_ESP_WIFI_MGMT_SBUF_NUM**
WiFi mgmt short buffer number

*Found in: Component config > Wi-Fi*

Set the number of WiFi management short buffer.

Range:
- from 6 to 32

Default value:
- 32

**CONFIG_ESP_WIFI_IRAM_OPT**
WiFi IRAM speed optimization

*Found in: Component config > Wi-Fi*

Select this option to place frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 10Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

Default value:
- No (disabled) if `CONFIG_BT_ENABLED` && `CONFIG_SPIRAM`
- Yes (enabled)

**CONFIG_ESP_WIFI_EXTRA_IRAM_OPT**
WiFi EXTRA IRAM speed optimization

*Found in: Component config > Wi-Fi*

Select this option to place additional frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 5Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

Default value:
- No (disabled)
CHAPTER 2. API REFERENCE

CONFIG_ESP_WIFI_RX_IRAM_OPT
WiFi RX IRAM speed optimization

*Found in: Component config > Wi-Fi*

Select this option to place frequently called Wi-Fi library RX functions in IRAM. When this option is disabled, more than 17Kbytes of IRAM memory will be saved but Wi-Fi performance will be reduced.

**Default value:**
- No (disabled) if `CONFIG_BT_ENABLED` && `CONFIG_SPIRAM`
- Yes (enabled)

CONFIG_ESP_WIFI_ENABLE_WPA3_SAE
Enable WPA3-Personal

*Found in: Component config > Wi-Fi*

Select this option to allow the device to establish a WPA3-Personal connection with eligible AP’s. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

**Default value:**
- Yes (enabled)

CONFIG_ESP_WIFI_ENABLE_SAE_PK
Enable SAE-PK

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_WPA3_SAE*

Select this option to enable SAE-PK

**Default value:**
- Yes (enabled)

CONFIG_ESP_WIFI_SOFTAP_SAE_SUPPORT
Enable WPA3 Personal(SAE) SoftAP

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_WPA3_SAE*

Select this option to enable SAE support in softAP mode.

**Default value:**
- Yes (enabled)

CONFIG_ESP_WIFI_ENABLE_WPA3_OWE_STA
Enable OWE STA

*Found in: Component config > Wi-Fi*

Select this option to allow the device to establish OWE connection with eligible AP’s. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

**Default value:**
- Yes (enabled)
CONFIG_ESP_WIFI_SLP_IRAM_OPT

WiFi SLP IRAM speed optimization

*Found in: Component config > Wi-Fi*

Select this option to place called Wi-Fi library TBTT process and receive beacon functions in IRAM. Some functions can be put in IRAM either by ESP_WIFI_IRAM_OPT and ESP_WIFI_RX_IRAM_OPT, or this one. If already enabled ESP_WIFI_IRAM_OPT, the other 7.3KB IRAM memory would be taken by this option. If already enabled ESP_WIFI_RX_IRAM_OPT, the other 1.3KB IRAM memory would be taken by this option. If neither of them are enabled, the other 7.4KB IRAM memory would be taken by this option. Wi-Fi power-save mode average current would be reduced if this option is enabled.

CONFIG_ESP_WIFI_SLP_DEFAULT_MIN_ACTIVE_TIME

Minimum active time

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_IRAM_OPT*

The minimum timeout for waiting to receive data, unit: milliseconds.

**Range:**
- from 8 to 60 if CONFIG_ESP_WIFI_SLP_IRAM_OPT

**Default value:**
- 50 if CONFIG_ESP_WIFI_SLP_IRAM_OPT

CONFIG_ESP_WIFI_SLP_DEFAULT_MAX_ACTIVE_TIME

Maximum keep alive time

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_IRAM_OPT*

The maximum time that wifi keep alive, unit: seconds.

**Range:**
- from 10 to 60 if CONFIG_ESP_WIFI_SLP_IRAM_OPT

**Default value:**
- 10 if CONFIG_ESP_WIFI_SLP_IRAM_OPT

CONFIG_ESP_WIFI_FTM_ENABLE

WiFi FTM

*Found in: Component config > Wi-Fi*

Enable feature Fine Timing Measurement for calculating WiFi Round-Trip-Time (RTT).

**Default value:**
- No (disabled) if SOC_WIFI_FTM_SUPPORT

CONFIG_ESP_WIFI_FTM_INITIATOR_SUPPORT

FTM Initiator support

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_FTM_ENABLE*

**Default value:**
- Yes (enabled) if CONFIG_ESP_WIFI_FTM_ENABLE
**CONFIG_ESP_WIFI_FTM_RESPONDER_SUPPORT**

FTM Responder support

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_FTM_ENABLE*

**Default value:**
- Yes (enabled) if `CONFIG_ESP_WIFI_FTM_ENABLE`

**CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE**

Power Management for station at disconnected

*Found in: Component config > Wi-Fi*

Select this option to enable power_management for station when disconnected. Chip will do modem-sleep when rf module is not in use any more.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_WIFI_GCMP_SUPPORT**

WiFi GCMP Support(GCMP128 and GCMP256)

*Found in: Component config > Wi-Fi*

Select this option to enable GCMP support. GCMP support is compulsory for WiFi Suite-B support.

**Default value:**
- No (disabled) if SOC_WIFI_GCMP_SUPPORT

**CONFIG_ESP_WIFI_GMAC_SUPPORT**

WiFi GMAC Support(GMAC128 and GMAC256)

*Found in: Component config > Wi-Fi*

Select this option to enable GMAC support. GMAC support is compulsory for WiFi 192 bit certification.

**Default value:**
- No (disabled)

**CONFIG_ESP_WIFI_SOFTAP_SUPPORT**

WiFi SoftAP Support

*Found in: Component config > Wi-Fi*

WiFi module can be compiled without SoftAP to save code size.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_WIFI_ENHANCED_LIGHT_SLEEP**

WiFi modem automatically receives the beacon

*Found in: Component config > Wi-Fi*

The wifi modem automatically receives the beacon frame during light sleep.

**Default value:**
- No (disabled) if `CONFIG_ESP_PHY_MAC_BB_PD` && `SOC_PM_SUPPORT_BEACON_WAKEUP`
**CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT**

WiFi sleep optimize when beacon lost

*Found in: Component config > Wi-Fi*

Enable wifi sleep optimization when beacon loss occurs and immediately enter sleep mode when the WiFi module detects beacon loss.

**CONFIG_ESP_WIFI_SLP_BEACON_LOST_TIMEOUT**

Beacon loss timeout

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT*

Timeout time for close rf phy when beacon loss occurs, Unit: 1024 microsecond.

*Range:*
- from 5 to 100 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

*Default value:*
- 10 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

**CONFIG_ESP_WIFI_SLP_BEACON_LOST_THRESHOLD**

Maximum number of consecutive lost beacons allowed

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT*

Maximum number of consecutive lost beacons allowed, WiFi keeps Rx state when the number of consecutive beacons lost is greater than the given threshold.

*Range:*
- from 0 to 8 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

*Default value:*
- 3 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

**CONFIG_ESP_WIFI_SLP_PHY_ON_DELTA_EARLY_TIME**

Delta early time for RF PHY on

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT*

Delta early time for rf phy on, When the beacon is lost, the next rf phy on will be earlier the time specified by the configuration item, Unit: 32 microsecond.

*Range:*
- from 0 to 100 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

*Default value:*
- 2 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

**CONFIG_ESP_WIFI_SLP_PHY_OFF_DELTA_TIMEOUT_TIME**

Delta timeout time for RF PHY off

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT*

Delta timeout time for rf phy off, When the beacon is lost, the next rf phy off will be delayed for the time specified by the configuration item. Unit: 1024 microsecond.

*Range:*
- from 0 to 8 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

*Default value:*
- 2 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`
**CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM**

Maximum espnow encrypt peers number

*Found in: Component config > Wi-Fi*

Maximum number of encrypted peers supported by espnow. The number of hardware keys for encryption is fixed. And the espnow and SoftAP share the same hardware keys. So this configuration will affect the maximum connection number of SoftAP. Maximum espnow encrypted peers number + maximum number of connections of SoftAP = Max hardware keys number. When using ESP mesh, this value should be set to a maximum of 6.

**Range:**
- from 0 to 17

**Default value:**
- 7

**CONFIG_ESP_WIFI_NAN_ENABLE**

WiFi Aware

*Found in: Component config > Wi-Fi*

Enable WiFi Aware (NAN) feature.

**Default value:**
- No (disabled)

**CONFIG_ESP_WIFI_ENABLE_WIFI_TX_STATS**

Enable Wi-Fi transmission statistics

*Found in: Component config > Wi-Fi*

Enable Wi-Fi transmission statistics. Total support 4 access category. Each access category will use 346 bytes memory.

**Default value:**
- Yes (enabled) if SOC_WIFI_HE_SUPPORT

**CONFIG_ESP_WIFI_MBEDTLS_CRYPTO**

Use MbedTLS crypto APIs

*Found in: Component config > Wi-Fi*

Select this option to enable the use of MbedTLS crypto APIs. The internal crypto support within the supplicant is limited and may not suffice for all new security features, including WPA3.

It is recommended to always keep this option enabled. Additionally, note that MbedTLS can leverage hardware acceleration if available, resulting in significantly faster cryptographic operations.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_WIFI_MBEDTLS_TLS_CLIENT**

Use MbedTLS TLS client for WiFi Enterprise connection

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_MBEDTLS_CRYPTO*

Select this option to use MbedTLS TLS client for WPA2 enterprise connection. Please note that from MbedTLS-3.0 onwards, MbedTLS does not support SSL-3.0, TLS-v1.0, TLS-v1.1 versions. Incase your server is using one of these version, it is advisable to update your server. Please disable this option for compatibility with older TLS versions.
Default value:
• Yes (enabled)

CONFIG_ESP_WIFI_WAPI_PSK
Enable WAPI PSK support
*Found in: Component config > Wi-Fi*
Select this option to enable WAPI-PSK which is a Chinese National Standard Encryption for Wireless LANs (GB 15629.11-2003).
Default value:
• No (disabled)

CONFIG_ESP_WIFI_SUITE_B_192
Enable NSA suite B support with 192 bit key
*Found in: Component config > Wi-Fi*
Select this option to enable 192 bit NSA suite-B. This is necessary to support WPA3 192 bit security.
Default value:
• No (disabled) if SOC_WIFI_GCMP_SUPPORT

CONFIG_ESP_WIFI_11KV_SUPPORT
Enable 802.11k, 802.11v APIs Support
*Found in: Component config > Wi-Fi*
Select this option to enable 802.11k 802.11v APIs(RRM and BTM support). Only APIs which are helpful for network assisted roaming are supported for now. Enable this option with BTM and RRM enabled in sta config to make device ready for network assisted roaming. BTM: BSS transition management enables an AP to request a station to transition to a specific AP, or to indicate to a station a set of preferred APs. RRM: Radio measurements enable STAs to understand the radio environment, it enables STAs to observe and gather data on radio link performance and on the radio environment. Current implementation adds beacon report, link measurement, neighbor report.
Default value:
• No (disabled)

CONFIG_ESP_WIFI_SCAN_CACHE
Keep scan results in cache
*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_11KV_SUPPORT*
Keep scan results in cache, if not enabled, those will be flushed immediately.
Default value:
• No (disabled) if CONFIG_ESP_WIFI_11KV_SUPPORT

CONFIG_ESP_WIFI_MBO_SUPPORT
Enable Multi Band Operation Certification Support
*Found in: Component config > Wi-Fi*
Select this option to enable WiFi Multiband operation certification support.
Default value:
• No (disabled)
CONFIG_ESP_WIFI_DPP_SUPPORT

Enable DPP support

*Found in:* `Component config > Wi-Fi`

Select this option to enable WiFi Easy Connect Support.

**Default value:**
- No (disabled)

CONFIG_ESP_WIFI_11R_SUPPORT

Enable 802.11R (Fast Transition) Support

*Found in:* `Component config > Wi-Fi`

Select this option to enable WiFi Fast Transition Support.

**Default value:**
- No (disabled)

CONFIG_ESP_WIFI_WPS_SOFTAP_REGISTRAR

Add WPS Registrar support in SoftAP mode

*Found in:* `Component config > Wi-Fi`

Select this option to enable WPS registrar support in softAP mode.

**Default value:**
- No (disabled)

CONFIG_ESP_WIFI_ENABLE_WIFI_RX_STATS

Enable Wi-Fi reception statistics

*Found in:* `Component config > Wi-Fi`

Enable Wi-Fi reception statistics. Total support 2 access category. Each access category will use 190 bytes memory.

**Default value:**
- Yes (enabled) if SOC_WIFI_HE_SUPPORT

CONFIG_ESP_WIFI_ENABLE_WIFI_RX_MU_STATS

Enable Wi-Fi DL MU-MIMO and DL OFDMA reception statistics

*Found in:* `Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_WIFI_RX_STATS`

Enable Wi-Fi DL MU-MIMO and DL OFDMA reception statistics. Will use 10932 bytes memory.

**Default value:**
- Yes (enabled) if `CONFIG_ESP_WIFI_ENABLE_WIFI_RX_STATS`

WPS Configuration Options

Contains:

- `CONFIG_ESP_WIFI_WPS_PASSPHRASE`
- `CONFIG_ESP_WIFI_WPS_STRICT`
**CONFIG_ESP_WIFI_WPS STRICT**

Strictly validate all WPS attributes

*Found in: Component config > Wi-Fi > WPS Configuration Options*

Select this option to enable validate each WPS attribute rigorously. Disabling this add the workarounds with various APs. Enabling this may cause interoperability issues with some APs.

**Default value:**
- No (disabled)

**CONFIG_ESP_WIFI_WPS_PASSPHRASE**

Get WPA2 passphrase in WPS config

*Found in: Component config > Wi-Fi > WPS Configuration Options*

Select this option to get passphrase during WPS configuration. This option fakes the virtual display capabilities to get the configuration in passphrase mode. Not recommended to be used since WPS credentials should not be shared to other devices, making it in readable format increases that risk, also passphrase requires pbkdf2 to convert in psk.

**Default value:**
- No (disabled)

**CONFIG_ESP_WIFI_DEBUG_PRINT**

Print debug messages from WPA Supplicant

*Found in: Component config > Wi-Fi*

Select this option to print logging information from WPA supplicant, this includes handshake information and key hex dumps depending on the project logging level.

Enabling this could increase the build size ~60kb depending on the project logging level.

**Default value:**
- No (disabled)

**CONFIG_ESP_WIFI_TESTING_OPTIONS**

Add DPP testing code

*Found in: Component config > Wi-Fi*

Select this to enable unity test for DPP.

**Default value:**
- No (disabled)

**CONFIG_ESP_WIFI_ENTERPRISE_SUPPORT**

Enable enterprise option

*Found in: Component config > Wi-Fi*

Select this to enable/disable enterprise connection support.

disabling this will reduce binary size. disabling this will disable the use of any esp_wifi_sta_wpa2_ent_* (as APIs will be meaningless)

**Default value:**
- Yes (enabled)
Core dump  Contains:

- `CONFIG_ESP_COREDUMP_CHECK_BOOT`
- `CONFIG_ESP_COREDUMP_DATA_FORMAT`
- `CONFIG_ESP_COREDUMP_CHECKSUM`
- `CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART`
- `CONFIG_ESP_COREDUMP_UART_DELAY`
- `CONFIG_ESP_COREDUMP_LOGS`
- `CONFIG_ESP_COREDUMP_DECODE`
- `CONFIG_ESP_COREDUMP_MAX_TASKS_NUM`
- `CONFIG_ESP_COREDUMP_STACK_SIZE`

**CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART**

Data destination

*Found in: Component config > Core dump*

Select place to store core dump: flash, uart or none (to disable core dumps generation).

Core dumps to Flash are not available if PSRAM is used for task stacks.

If core dump is configured to be stored in flash and custom partition table is used add corresponding entry to your CSV. For examples, please see predefined partition table CSV descriptions in the components/partition_table directory.

**Available options:**

- Flash (`ESP_COREDUMP_ENABLE_TO_FLASH`)
- UART (`ESP_COREDUMP_ENABLE_TO_UART`)
- None (`ESP_COREDUMP_ENABLE_TO_NONE`)

**CONFIG_ESP_COREDUMP_DATA_FORMAT**

Core dump data format

*Found in: Component config > Core dump*

Select the data format for core dump.

**Available options:**

- Binary format (`ESP_COREDUMP_DATA_FORMAT_BIN`)
- ELF format (`ESP_COREDUMP_DATA_FORMAT_ELF`)

**CONFIG_ESP_COREDUMP_CHECKSUM**

Core dump data integrity check

*Found in: Component config > Core dump*

Select the integrity check for the core dump.

**Available options:**

- Use CRC32 for integrity verification (`ESP_COREDUMP_CHECKSUM_CRC32`)
- Use SHA256 for integrity verification (`ESP_COREDUMP_CHECKSUM_SHA256`)

**CONFIG_ESP_COREDUMP_CHECK_BOOT**

Check core dump data integrity on boot

*Found in: Component config > Core dump*

When enabled, if any data are found on the flash core dump partition, they will be checked by calculating their checksum.

**Default value:**
• Yes (enabled) if ESP_COREDUMP_ENABLE_TO_FLASH

**CONFIG_ESP_COREDUMP_LOGS**
Enable coredump logs for debugging

*Found in: Component config > Core dump*
Enable/disable coredump logs. Logs strings from espcoredump component are placed in DRAM. Disabling these helps to save ~5KB of internal memory.

**CONFIG_ESP_COREDUMP_MAX_TASKS_NUM**
Maximum number of tasks

*Found in: Component config > Core dump*
Maximum number of tasks snapshots in core dump.

**CONFIG_ESP_COREDUMP_UART_DELAY**
Delay before print to UART

*Found in: Component config > Core dump*
Config delay (in ms) before printing core dump to UART. Delay can be interrupted by pressing Enter key.

*Default value:*
• 0 if ESP_COREDUMP_ENABLE_TO_UART

**CONFIG_ESP_COREDUMP_STACK_SIZE**
Reserved stack size

*Found in: Component config > Core dump*
Size of the memory to be reserved for core dump stack. If 0 core dump process will run on the stack of crashed task/ISR, otherwise special stack will be allocated. To ensure that core dump itself will not overflow task/ISR stack set this to the value above 800. NOTE: It eats DRAM.

**CONFIG_ESP_COREDUMP_DECODE**
Handling of UART core dumps in IDF Monitor

*Found in: Component config > Core dump*

*Available options:*
• Decode and show summary (info_corefile) (ESP_COREDUMP_DECODE_INFO)
• Don’t decode (ESP_COREDUMP_DECODE_DISABLE)

**FAT Filesystem support**
Contains:

• `CONFIG_FATFS_API_ENCODING`
• `CONFIG_FATFS_VFS_FSTAT_BLKSIZE`
• `CONFIG_FATFS_USE_FASTSEEK`
• `CONFIG_FATFS_LONG_FILENAMES`
• `CONFIG_FATFS_MAX_LFN`
• `CONFIG_FATFS_FS_LOCK`
• `CONFIG_FATFS_VOLUME_COUNT`
• `CONFIG_FATFS_CHOOSE_CODEPAGE`
• `CONFIG_FATFS_ALLOC_PREFER_EXTRAM`
Chapter 2. API Reference

- **CONFIG_FATFS_SECTOR_SIZE**
- **CONFIG_FATFS_TIMEOUT_MS**
- **CONFIG_FATFS_PER_FILE_CACHE**

**CONFIG_FATFS_VOLUME_COUNT**

Number of volumes

*Found in: Component config > FAT Filesystem support*

Number of volumes (logical drives) to use.

**Range:**

- from 1 to 10

**Default value:**

- 2

**CONFIG_FATFS_LONG_FILENAMES**

Long filename support

*Found in: Component config > FAT Filesystem support*

Support long filenames in FAT. Long filename data increases memory usage. FATFS can be configured to store the buffer for long filename data in stack or heap.

**Available options:**

- No long filenames (FATFS_LFN_NONE)
- Long filename buffer in heap (FATFS_LFN_HEAP)
- Long filename buffer on stack (FATFS_LFN_STACK)

**CONFIG_FATFS_SECTOR_SIZE**

Sector size

*Found in: Component config > FAT Filesystem support*

Specify the size of the sector in bytes for FATFS partition generator.

**Available options:**

- 512 (FATFS_SECTOR_512)
- 4096 (FATFS_SECTOR_4096)

**CONFIG_FATFS_CHOOSE_CODEPAGE**

OEM Code Page

*Found in: Component config > FAT Filesystem support*

OEM code page used for file name encodings.

If “Dynamic” is selected, code page can be chosen at runtime using f_setcp function. Note that choosing this option will increase application size by ~480kB.

**Available options:**

- Dynamic (all code pages supported) (FATFS_CODEPAGE_DYNAMIC)
- US (CP437) (FATFS_CODEPAGE_437)
- Arabic (CP720) (FATFS_CODEPAGE_720)
- Greek (CP737) (FATFS_CODEPAGE_737)
- KBL (CP771) (FATFS_CODEPAGE_771)
- Baltic (CP775) (FATFS_CODEPAGE_775)
- Latin 1 (CP850) (FATFS_CODEPAGE_850)
- Latin 2 (CP852) (FATFS_CODEPAGE_852)
- Cyrillic (CP855) (FATFS_CODEPAGE_855)
• Turkish (CP857) (FATFS_CODEPAGE_857)
• Portuguese (CP860) (FATFS_CODEPAGE_860)
• Icelandic (CP861) (FATFS_CODEPAGE_861)
• Hebrew (CP862) (FATFS_CODEPAGE_862)
• Canadian French (CP863) (FATFS_CODEPAGE_863)
• Arabic (CP864) (FATFS_CODEPAGE_864)
• Nordic (CP865) (FATFS_CODEPAGE_865)
• Russian (CP866) (FATFS_CODEPAGE_866)
• Greek 2 (CP869) (FATFS_CODEPAGE_869)
• Japanese (DBCS) (CP932) (FATFS_CODEPAGE_932)
• Simplified Chinese (DBCS) (CP936) (FATFS_CODEPAGE_936)
• Korean (DBCS) (CP949) (FATFS_CODEPAGE_949)
• Traditional Chinese (DBCS) (CP950) (FATFS_CODEPAGE_950)

CONFIG_FATFS_MAX_LFN

Max long filename length

Found in: Component config > FAT Filesystem support

Maximum long filename length. Can be reduced to save RAM.

Range:
• from 12 to 255

Default value:
• 255

CONFIG_FATFS_API_ENCODING

API character encoding

Found in: Component config > FAT Filesystem support

Choose encoding for character and string arguments/returns when using FATFS APIs. The encoding of arguments will usually depend on text editor settings.

Available options:
• API uses ANSI/OEM encoding (FATFS_API_ENCODING_ANSI_OEM)
• API uses UTF-8 encoding (FATFS_API_ENCODING_UTF_8)

CONFIG_FATFS_FS_LOCK

Number of simultaneously open files protected by lock function

Found in: Component config > FAT Filesystem support

This option sets the FATFS configuration value _FS_LOCK. The option _FS_LOCK switches file lock function to control duplicated file open and illegal operation to open objects.

* 0: Disable file lock function. To avoid volume corruption, application should avoid illegal open, remove and rename to the open objects.

* >0: Enable file lock function. The value defines how many files/sub-directories can be opened simultaneously under file lock control.

Note that the file lock control is independent of re-entrancy.

Range:
• from 0 to 65535

Default value:
• 0
**CONFIG_FATFS_TIMEOUT_MS**

Timeout for acquiring a file lock, ms

*Found in: Component config > FAT Filesystem support*

This option sets FATFS configuration value _FS_TIMEOUT, scaled to milliseconds. Sets the number of milliseconds FATFS will wait to acquire a mutex when operating on an open file. For example, if one task is performing a lengthy operation, another task will wait for the first task to release the lock, and time out after amount of time set by this option.

**Default value:**
- 10000

**CONFIG_FATFS_PER_FILE_CACHE**

Use separate cache for each file

*Found in: Component config > FAT Filesystem support*

This option affects FATFS configuration value _FS_TINY.

If this option is set, _FS_TINY is 0, and each open file has its own cache, size of the cache is equal to the _MAX_SS variable (512 or 4096 bytes). This option uses more RAM if more than 1 file is open, but needs less reads and writes to the storage for some operations.

If this option is not set, _FS_TINY is 1, and single cache is used for all open files, size is also equal to _MAX_SS variable. This reduces the amount of heap used when multiple files are open, but increases the number of read and write operations which FATFS needs to make.

**Default value:**
- Yes (enabled)

**CONFIG_FATFS_ALLOC_PREFER_EXTRAM**

Prefer external RAM when allocating FATFS buffers

*Found in: Component config > FAT Filesystem support*

When the option is enabled, internal buffers used by FATFS will be allocated from external RAM. If the allocation from external RAM fails, the buffer will be allocated from the internal RAM. Disable this option if optimizing for performance. Enable this option if optimizing for internal memory size.

**Default value:**
- Yes (enabled) if SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC

**CONFIG_FATFS_USE_FASTSEEK**

Enable fast seek algorithm when using lseek function through VFS FAT

*Found in: Component config > FAT Filesystem support*

The fast seek feature enables fast backward/long seek operations without FAT access by using an in-memory CLMT (cluster link map table). Please note, fast-seek is only allowed for read-mode files, if a file is opened in write-mode, the seek mechanism will automatically fallback to the default implementation.

**Default value:**
- No (disabled)
### CONFIG_FATFS_FASTSEEK_BUFFER_SIZE

Fast seek CLMT buffer size

*Found in: Component config > FAT Filesystem support > CONFIG_FATFS_USE_FASTSEEK*

If fast seek algorithm is enabled, this defines the size of CLMT buffer used by this algorithm in 32-bit word units. This value should be chosen based on prior knowledge of maximum elements of each file entry would store.

**Default value:**
- 64 if `CONFIG_FATFS_USE_FASTSEEK`

### CONFIG_FATFS_VFS_FSTAT_BLKSIZE

Default block size

*Found in: Component config > FAT Filesystem support*

If set to 0, the ‘newlib’ library’s default size (BLKSIZ) is used (128 B). If set to a non-zero value, the value is used as the block size. Default file buffer size is set to this value and the buffer is allocated when first attempt of reading/writing to a file is made. Increasing this value improves fread() speed, however the heap usage is increased as well.

**NOTE:** The block size value is shared by all the filesystem functions accessing target media for given file descriptor! See ‘Improving I/O performance’ section of ‘Maximizing Execution Speed’ documentation page for more details.

**Default value:**
- 0

### FreeRTOS

Contains:
- **Kernel**
- **Port**

### Kernel

Contains:
- `CONFIG_FREERTOS_CHECK_STACKOVERFLOW`
- `CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY`
- `CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS`
- `CONFIG_FREERTOS_MAX_TASK_NAME_LEN`
- `CONFIG_FREERTOS_IDLE_TASK_STACKSIZE`
- `CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS`
- `CONFIG_FREERTOS_QUEUE_REGISTRY_SIZE`
- `CONFIG_FREERTOS_TASK_NOTIFICATION_ARRAY_ENTRIES`
- `CONFIG_FREERTOS_HZ`
- `CONFIG_FREERTOS_TIMER_QUEUE_LENGTH`
- `CONFIG_FREERTOS_TIMER_SERVICE_TASK_NAME`
- `CONFIG_FREERTOS_TIMER_TASK_PRIORITY`
- `CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH`
- `CONFIG_FREERTOS_USE_IDLE_HOOK`
- `CONFIG_FREERTOS_OPTIMIZED_SCHEDULER`
- `CONFIG_FREERTOS_USE_TICK_HOOK`
- `CONFIG_FREERTOS_USE_TICKLESS_IDLE`
- `CONFIG_FREERTOS_USE_TRACE_FACILITY`
- `CONFIG_FREERTOS_UNICORE`
- `CONFIG_FREERTOS_SMP`
- `CONFIG_FREERTOS_USE_MINIMAL_IDLE_HOOK`
- `CONFIG_FREERTOS_USE_KERNEL_10_5_1`
CONFIG_FREERTOS_USE_KERNEL_10_5_1

Use v10.5.1 Kernel (BETA)

*Found in: Component config > FreeRTOS > Kernel*

This option enables building for FreeRTOS v10.5.1 kernel.

Note: The v10.5.1 kernel is still in BETA, thus is not production ready.

**Default value:**
- No (disabled)

CONFIG_FREERTOS_SMP

Run the Amazon SMP FreeRTOS kernel instead (FEATURE UNDER DEVELOPMENT)

*Found in: Component config > FreeRTOS > Kernel*

Amazon has released an SMP version of the FreeRTOS Kernel which can be found via the following link: https://github.com/FreeRTOS/FreeRTOS-Kernel/tree/smp

IDF has added an experimental port of this SMP kernel located in components/freertos/FreeRTOS-Kernel-SMP. Enabling this option will cause IDF to use the Amazon SMP kernel. Note that THIS FEATURE IS UNDER ACTIVE DEVELOPMENT, users use this at their own risk.

Leaving this option disabled will mean the IDF FreeRTOS kernel is used instead, which is located in: components/freertos/FreeRTOS-Kernel. Both kernel versions are SMP capable, but differ in their implementation and features.

**Default value:**
- No (disabled) if CONFIG_FREERTOS_USE_KERNEL_10_5_1

CONFIG_FREERTOS_UNICORE

Run FreeRTOS only on first core

*Found in: Component config > FreeRTOS > Kernel*

This version of FreeRTOS normally takes control of all cores of the CPU. Select this if you only want to start it on the first core. This is needed when e.g. another process needs complete control over the second core.

CONFIG_FREERTOS_HZ

configTICK_RATE_HZ

*Found in: Component config > FreeRTOS > Kernel*

Sets the FreeRTOS tick interrupt frequency in Hz (see configTICK_RATE_HZ documentation for more details).

**Range:**
- from 1 to 1000

**Default value:**
- 100

CONFIG_FREERTOS_OPTIMIZED_SCHEDULER

configUSE_PORT_OPTIMISED_TASK_SELECTION

*Found in: Component config > FreeRTOS > Kernel*

Enables port specific task selection method. This option can speed up the search of ready tasks when scheduling (see configUSE_PORT_OPTIMISED_TASK_SELECTION documentation for more details).
Default value:
  • Yes (enabled) if \texttt{CONFIG_FREERTOS_UNICORE} \& \texttt{CONFIG_FREERTOS_SMP}

\textbf{CONFIG_FREERTOS_CHECK_STACKOVERFLOW}

cfg\texttt{CHECK\_FOR\_STACK\_OVERFLOW}

\textit{Found in: Component config > FreeRTOS > Kernel}

Enables FreeRTOS to check for stack overflows (see \texttt{configCHECK\_FOR\_STACK\_OVERFLOW} documentation for more details).

Note: If users do not provide their own \texttt{vApplicationStackOverflowHook()} function, a default function will be provided by ESP-IDF.

\textbf{Available options:}
  • No checking (\texttt{FREERTOS\_CHECK\_STACKOVERFLOW\_NONE})
    Do not check for stack overflows (\texttt{configCHECK\_FOR\_STACK\_OVERFLOW} = 0)
  • Check by stack pointer value (Method 1) (\texttt{FREERTOS\_CHECK\_STACKOVERFLOW\_PTRVAL})
    Check for stack overflows on each context switch by checking if the stack pointer is in a valid range. Quick but does not detect stack overflows that happened between context switches (\texttt{configCHECK\_FOR\_STACK\_OVERFLOW} = 1)
  • Check using canary bytes (Method 2) (\texttt{FREERTOS\_CHECK\_STACKOVERFLOW\_CANARY})
    Places some magic bytes at the end of the stack area and on each context switch, check if these bytes are still intact. More thorough than just checking the pointer, but also slightly slower. (\texttt{configCHECK\_FOR\_STACK\_OVERFLOW} = 2)

\textbf{CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS}

cfg\texttt{NUM\_THREAD\_LOCAL\_STORAGE\_POINTERS}

\textit{Found in: Component config > FreeRTOS > Kernel}

Set the number of thread local storage pointers in each task (see \texttt{configNUM\_THREAD\_LOCAL\_STORAGE\_POINTERS} documentation for more details).

Note: In ESP-IDF, this value must be at least 1. Index 0 is reserved for use by the pthreads API thread-local-storage. Other indexes can be used for any desired purpose.

\textbf{Range:}
  • from 1 to 256

\textbf{Default value:}
  • 1

\textbf{CONFIG_FREERTOS_IDLE_TASK_STACKSIZE}

cfg\texttt{MINIMAL\_STACK\_SIZE} (Idle task stack size)

\textit{Found in: Component config > FreeRTOS > Kernel}

Sets the idle task stack size in bytes (see \texttt{configMINIMAL\_STACK\_SIZE} documentation for more details).

Note:
  • ESP-IDF specifies stack sizes in bytes instead of words.
  • The default size is enough for most use cases.
  • The stack size may need to be increased above the default if the app installs idle or thread local storage cleanup hooks that use a lot of stack memory.
  • Conversely, the stack size can be reduced to the minimum if non of the idle features are used.

\textbf{Range:}
  • from 768 to 32768
Default value:
  • 1536

**CONFIG_FREERTOS_USE_IDLE_HOOK**

```
configUSE_IDLE_HOOK
```

*Found in: Component config > FreeRTOS > Kernel*

Enables the idle task application hook (see `configUSE_IDLE_HOOK` documentation for more details).

**Note:**

  • The application must provide the hook function `void vApplicationIdleHook(void);`
  • `vApplicationIdleHook()` is called from FreeRTOS idle task(s)
  • The FreeRTOS idle hook is NOT the same as the ESP-IDF Idle Hook, but both can be enabled simultaneously.

Default value:
  • No (disabled)

**CONFIG_FREERTOS_USE_MINIMAL_IDLE_HOOK**

Use `FreeRTOS` minimal idle hook

*Found in: Component config > FreeRTOS > Kernel*

Enables the minimal idle task application hook (see `configUSE_IDLE_HOOK` documentation for more details).

**Note:**

  • The application must provide the hook function `void vApplicationMinimalIdleHook(void);`
  • `vApplicationMinimalIdleHook()` is called from FreeRTOS minimal idle task(s)

Default value:
  • No (disabled) if `CONFIG_FREERTOS_SMP`

**CONFIG_FREERTOS_USE_TICK_HOOK**

```
configUSE_TICK_HOOK
```

*Found in: Component config > FreeRTOS > Kernel*

Enables the tick hook (see `configUSE_TICK_HOOK` documentation for more details).

**Note:**

  • The application must provide the hook function `void vApplicationTickHook(void);`
  • `vApplicationTickHook()` is called from FreeRTOS’s tick handling function `xTaskIncrementTick()`
  • The FreeRTOS tick hook is NOT the same as the ESP-IDF Tick Interrupt Hook, but both can be enabled simultaneously.

Default value:
  • No (disabled)
CONFIG_FREERTOS_MAX_TASK_NAME_LEN

configMAX_TASK_NAME_LEN

*Found in: Component config > FreeRTOS > Kernel*

Sets the maximum number of characters for task names (see configMAX_TASK_NAME_LEN documentation for more details).

*Note: For most uses, the default of 16 characters is sufficient.*

*Range:*
  - from 1 to 256

*Default value:*
  - 16

CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY

configENABLE_BACKWARD_COMPATIBILITY

*Found in: Component config > FreeRTOS > Kernel*

Enable backward compatibility with APIs prior to FreeRTOS v8.0.0. (see configENABLE_BACKWARD_COMPATIBILITY documentation for more details).

*Default value:*
  - No (disabled)

CONFIG_FREERTOS_TIMER_SERVICE_TASK_NAME

configTIMER_SERVICE_TASK_NAME

*Found in: Component config > FreeRTOS > Kernel*

Sets the timer task’s name (see configTIMER_SERVICE_TASK_NAME documentation for more details).

*Default value:*
  - “Tmr Svc”

CONFIG_FREERTOS_TIMER_TASK_PRIORITY

configTIMER_TASK_PRIORITY

*Found in: Component config > FreeRTOS > Kernel*

Sets the timer task’s priority (see configTIMER_TASK_PRIORITY documentation for more details).

*Range:*
  - from 1 to 25

*Default value:*
  - 1

CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH

configTIMER_TASK_STACK_DEPTH

*Found in: Component config > FreeRTOS > Kernel*

Set the timer task’s stack size (see configTIMER_TASK_STACK_DEPTH documentation for more details).

*Range:*
  - from 1536 to 32768

*Default value:*
  - 2048
CONFIG_FREERTOS_TIMER_QUEUE_LENGTH

```c
configTIMER_QUEUE_LENGTH
```

*Found in: Component config > FreeRTOS > Kernel*

Set the timer task’s command queue length (see configTIMER_QUEUE_LENGTH documentation for more details).

**Range:**
- from 5 to 20

**Default value:**
- 10

CONFIG_FREERTOS_QUEUE_REGISTRY_SIZE

```c
configQUEUE_REGISTRY_SIZE
```

*Found in: Component config > FreeRTOS > Kernel*

Set the size of the queue registry (see configQUEUE_REGISTRY_SIZE documentation for more details).

Note: A value of 0 will disable queue registry functionality

**Range:**
- from 0 to 20

**Default value:**
- 0

CONFIG_FREERTOS_TASK_NOTIFICATION_ARRAY_ENTRIES

```c
configTASK_NOTIFICATION_ARRAY_ENTRIES
```

*Found in: Component config > FreeRTOS > Kernel*

Set the size of the task notification array of each task. When increasing this value, keep in mind that this means additional memory for each and every task on the system. However, task notifications in general are more lightweight compared to alternatives such as semaphores.

**Range:**
- from 1 to 32

**Default value:**
- 1

CONFIG_FREERTOS_USE_TRACE_FACILITY

```c
configUSE_TRACE_FACILITY
```

*Found in: Component config > FreeRTOS > Kernel*

Enables additional structure members and functions to assist with execution visualization and tracing (see configUSE_TRACE_FACILITY documentation for more details).

**Default value:**
- No (disabled)

CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS

```c
configUSE_STATS_FORMATTING_FUNCTIONS
```

*Found in: Component config > FreeRTOS > Kernel > CONFIG_FREERTOS_USE_TRACE_FACILITY*
Set configUSE_TRACE_FACILITY and configUSE_STATS_FORMATTING_FUNCTIONS to 1 to include the vTaskList() and vTaskGetRunTimeStats() functions in the build (see configUSE_STATS_FORMATTING_FUNCTIONS documentation for more details).

**Default value:**
- No (disabled) if `CONFIG_FREERTOS_USE_TRACE_FACILITY`.

**CONFIG_FREERTOS_VTASKLIST_INCLUDE_COREID**

Enable display of xCoreID in vTaskList.

*Found in: Component config > FreeRTOS > Kernel > CONFIG_FREERTOS_USE_TRACE_FACILITY > CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS*

If enabled, this will include an extra column when vTaskList is called to display the CoreID the task is pinned to (0,1) or -1 if not pinned.

**Default value:**
- No (disabled) if `CONFIG_FREERTOS_SMP` && `CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS`.

**CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS**

configGENERATE_RUN_TIME_STATS

*Found in: Component config > FreeRTOS > Kernel*

Enables collection of run time statistics for each task (see configGENERATE_RUN_TIME_STATS documentation for more details).

Note: The clock used for run time statistics can be configured in FREERTOS_RUN_TIME_STATS_CLK.

**Default value:**
- No (disabled)

**CONFIG_FREERTOS_USE_TICKLESS_IDLE**

configUSE_TICKLESS_IDLE

*Found in: Component config > FreeRTOS > Kernel*

If power management support is enabled, FreeRTOS will be able to put the system into light sleep mode when no tasks need to run for a number of ticks. This number can be set using FREERTOS_IDLE_TIME_BEFORE_SLEEP option. This feature is also known as “automatic light sleep”.

Note that timers created using esp_timer APIs may prevent the system from entering sleep mode, even when no tasks need to run. To skip unnecessary wake-up initialize a timer with the “skip_unhandled_events” option as true.

If disabled, automatic light sleep support will be disabled.

**Default value:**
- No (disabled) if `CONFIG_PM_ENABLE`.

**CONFIG_FREERTOS_IDLE_TIME_BEFORE_SLEEP**

configEXPECTED_IDLE_TIME_BEFORE_SLEEP

*Found in: Component config > FreeRTOS > Kernel > CONFIG_FREERTOS_USE_TICKLESS_IDLE*

FreeRTOS will enter light sleep mode if no tasks need to run for this number of ticks. You can enable PM_PROFILING feature in esp_pm components and dump the sleep status with esp_pm_dump_locks, if the proportion of rejected sleeps is too high, please increase this value to improve scheduling efficiency.
Range:
- from 2 to 4294967295 if `CONFIG_FREERTOS_USE_TICKLESS_IDLE`

Default value:
- 3 if `CONFIG_FREERTOS_USE_TICKLESS_IDLE`

Port
Contains:
- `CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER`
- `CONFIG_FREERTOS_RUN_TIME_STATS_CLK`
- `CONFIG_FREERTOS_INTERRUPT_BACKTRACE`
- `CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK`
- `CONFIG_FREERTOS_ENABLE_STATIC_TASK_CLEAN_UP`
- `CONFIG_FREERTOS_TASK_PRE_DELETION_HOOK`
- `CONFIG_FREERTOS_TLSP_DELETION_CALLBACKS`
- `CONFIG_FREERTOS_ISR_STACKSIZE`
- `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH`
- `CONFIG_FREERTOS_CHECK_PORT_CRITICAL_COMPLIANCE`
- `CONFIG_FREERTOS_CORETIMER`
- `CONFIG_FREERTOS_FPU_IN_ISR`
- `CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER`

CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER
Wrap task functions

*Found in: Component config > FreeRTOS > Port*

If enabled, all FreeRTOS task functions will be enclosed in a wrapper function. If a task function mistakenly returns (i.e. does not delete), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application. This option is also required for GDB backtraces and C++ exceptions to work correctly inside top-level task functions.

Default value:
- Yes (enabled)

CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK
Enable stack overflow debug watchpoint

*Found in: Component config > FreeRTOS > Port*

FreeRTOS can check if a stack has overflown its bounds by checking either the value of the stack pointer or by checking the integrity of canary bytes. (See `FREERTOS_CHECK_STACKOVERFLOW` for more information.) These checks only happen on a context switch, and the situation that caused the stack overflow may already be long gone by then. This option will use the last debug memory watchpoint to allow breaking into the debugger (or panic`ing`) as soon as any of the last 32 bytes on the stack of a task are overwritten. The side effect is that using `gdb`, you effectively have one hardware watchpoint less because the last one is overwritten as soon as a task switch happens.

Another consequence is that due to alignment requirements of the watchpoint, the usable stack size decreases by up to 60 bytes. This is because the watchpoint region has to be aligned to its size and the size for the stack watchpoint in IDF is 32 bytes.

This check only triggers if the stack overflow writes within 32 bytes near the end of the stack, rather than overshooting further, so it is worth combining this approach with one of the other stack overflow check methods.

When this watchpoint is hit, `gdb` will stop with a SIGTRAP message. When no JTAG OCD is attached, `esp-idf` will panic on an unhandled debug exception.

Default value:
- No (disabled)
CONFIG_FREERTOS_TLSP_DELETION_CALLBACKS

Enable thread local storage pointers deletion callbacks

*Found in: Component config > FreeRTOS > Port*

ESP-IDF provides users with the ability to free TLSP memory by registering TLSP deletion callbacks. These callbacks are automatically called by FreeRTOS when a task is deleted. When this option is turned on, the memory reserved for TLSPs in the TCB is doubled to make space for storing the deletion callbacks. If the user does not wish to use TLSP deletion callbacks then this option could be turned off to save space in the TCB memory.

**Default value:**
- Yes (enabled)

CONFIG_FREERTOS_TASK_PRE_DELETION_HOOK

Enable task pre-deletion hook

*Found in: Component config > FreeRTOS > Port*

Enable this option to make FreeRTOS call a user provided hook function right before it deletes a task (i.e., frees/releases a dynamically/statically allocated task’s memory). This is useful if users want to know when a task is actually deleted (in case the task’s deletion is delegated to the IDLE task).

If this config option is enabled, users must define a `void vTaskPreDeletionHook( void *pxTCB )` hook function in their application.

**Default value:**
- No (disabled) if `CONFIG_FREERTOS_ENABLE_STATIC_TASK_CLEAN_UP`

CONFIG_FREERTOS_ENABLE_STATIC_TASK_CLEAN_UP

Enable static task clean up hook (DEPRECATED)

*Found in: Component config > FreeRTOS > Port*

THIS OPTION IS DEPRECATED. Use `CONFIG_FREERTOS_TASK_PRE_DELETION_HOOK` instead.

Enable this option to make FreeRTOS call the static task clean up hook when a task is deleted.

Note: Users will need to provide a `void vPortCleanUpTCB ( void *pxTCB )` callback

**Default value:**
- No (disabled)

CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER

Check that mutex semaphore is given by owner task

*Found in: Component config > FreeRTOS > Port*

If enabled, assert that when a mutex semaphore is given, the task giving the semaphore is the task which is currently holding the mutex.

**Default value:**
- Yes (enabled) if `CONFIG_FREERTOS_SMP`

CONFIG_FREERTOS_ISR_STACKSIZE

ISR stack size

*Found in: Component config > FreeRTOS > Port*

The interrupt handlers have their own stack. The size of the stack can be defined here. Each processor has its own stack, so the total size occupied will be twice this.
**Range:**
- from 2096 to 32768 if ESP_COREDUMP_DATA_FORMAT_ELF
- from 1536 to 32768

**Default value:**
- 2096 if ESP_COREDUMP_DATA_FORMAT_ELF
- 1536

---

**CONFIG_FREERTOS_INTERRUPT_BACKTRACE**

Enable backtrace from interrupt to task context

*Found in: Component config > FreeRTOS > Port*

If this option is enabled, interrupt stack frame will be modified to point to the code of the interrupted task as its return address. This helps the debugger (or the panic handler) show a backtrace from the interrupt to the task which was interrupted. This also works for nested interrupts: higher level interrupt stack can be traced back to the lower level interrupt. This option adds 4 instructions to the interrupt dispatching code.

*Default value:*
- Yes (enabled)

---

**CONFIG_FREERTOS_FPU_IN_ISR**

Use float in Level 1 ISR

*Found in: Component config > FreeRTOS > Port*

When enabled, the usage of float type is allowed inside Level 1 ISRs. Note that usage of float types in higher level interrupts is still not permitted.

*Default value:*
- No (disabled)

---

**CONFIG_FREERTOS_CORETIMER**

Tick timer source (Xtensa Only)

*Found in: Component config > FreeRTOS > Port*

FreeRTOS needs a timer with an associated interrupt to use as the main tick source to increase counters, run timers and do pre-emptive multitasking with. There are multiple timers available to do this, with different interrupt priorities.

*Available options:*
- Timer 0 (int 6, level 1) (FREERTOS_CORETIMER_0)
  - Select this to use timer 0
- Timer 1 (int 15, level 3) (FREERTOS_CORETIMER_1)
  - Select this to use timer 1
- SYSTIMER 0 (level 1) (FREERTOS_CORETIMER_SYSTIMER_LVL1)
  - Select this to use systimer with the 1 interrupt priority.
- SYSTIMER 0 (level 3) (FREERTOS_CORETIMER_SYSTIMER_LVL3)
  - Select this to use systimer with the 3 interrupt priority.

---

**CONFIG_FREERTOS_RUN_TIME_STATS_CLK**

Choose the clock source for run time stats

*Found in: Component config > FreeRTOS > Port*

Choose the clock source for FreeRTOS run time stats. Options are CPU0’s CPU Clock or the ESP Timer. Both clock sources are 32 bits. The CPU Clock can run at a higher frequency hence provide a
finer resolution but will overflow much quicker. Note that run time stats are only valid until the clock source overflows.

Available options:

- Use ESP TIMER for run time stats (FREERTOS_RUN_TIME_STATS_USING_ESP_TIMER)
  ESP Timer will be used as the clock source for FreeRTOS run time stats. The ESP Timer runs at a frequency of 1MHz regardless of Dynamic Frequency Scaling. Therefore the ESP Timer will overflow in approximately 4290 seconds.
- Use CPU Clock for run time stats (FREERTOS_RUN_TIME_STATS_USING_CPU_CLK)
  CPU Clock will be used as the clock source for the generation of run time stats. The CPU Clock has a frequency dependent on ESP_DEFAULT_CPU_FREQ_MHZ and Dynamic Frequency Scaling (DFS). Therefore the CPU Clock frequency can fluctuate between 80 to 240MHz. Run time stats generated using the CPU Clock represents the number of CPU cycles each task is allocated and DOES NOT reflect the amount of time each task runs for (as CPU clock frequency can change). If the CPU clock consistently runs at the maximum frequency of 240MHz, it will overflow in approximately 17 seconds.

CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH

Place FreeRTOS functions into Flash

Found in: Component config > FreeRTOS > Port

When enabled the selected Non-ISR FreeRTOS functions will be placed into Flash memory instead of IRAM. This saves up to 8KB of IRAM depending on which functions are used.

Default value:

- No (disabled)

CONFIG_FREERTOS_CHECK_PORT_CRITICAL_COMPLIANCE

Tests compliance with Vanilla FreeRTOS port*_CRITICAL calls

Found in: Component config > FreeRTOS > Port

If enabled, context of port*_CRITICAL calls (ISR or Non-ISR) would be checked to be in compliance with Vanilla FreeRTOS. e.g Calling port*_CRITICAL from ISR context would cause assert failure

Default value:

- No (disabled)

Hardware Abstraction Layer (HAL) and Low Level (LL) Contains:

- CONFIG_HAL_DEFAULT_ASSERTION_LEVEL
- CONFIG_HAL_LOG_LEVEL
- CONFIG_HAL_SYSTIMER_USE_ROM_IMPL
- CONFIG_HAL_WDT_USE_ROM_IMPL

CONFIG_HAL_DEFAULT_ASSERTION_LEVEL

Default HAL assertion level

Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)

Set the assert behavior / level for HAL component. HAL component assert level can be set separately, but the level can’t exceed the system assertion level. e.g. If the system assertion is disabled, then the HAL assertion can’t be enabled either. If the system assertion is enable, then the HAL assertion can still be disabled by this Kconfig option.

Available options:

- Same as system assertion level (HAL_ASSERTION_EQUALS_SYSTEM)
- Disabled (HAL_ASSERTION_DISABLE)
Chapter 2. API Reference

- Silent (HAL_ASSERTION_SILENT)
- Enabled (HAL_ASSERTION_ENABLE)

**CONFIG_HAL_LOG_LEVEL**

HAL layer log verbosity

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Specify how much output to see in HAL logs.

**Available options:**
- No output (HAL_LOG_LEVEL_NONE)
- Error (HAL_LOG_LEVEL_ERROR)
- Warning (HAL_LOG_LEVEL_WARN)
- Info (HAL_LOG_LEVEL_INFO)
- Debug (HAL_LOG_LEVEL_DEBUG)
- Verbose (HAL_LOG_LEVEL_VERBOSE)

**CONFIG_HAL_SYSTIMER_USE_ROM_IMPL**

Use ROM implementation of SysTimer HAL driver

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Enable this flag to use HAL functions from ROM instead of ESP-IDF.

If keeping this as “n” in your project, you will have less free IRAM. If making this as “y” in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**
- Yes (enabled) if ESP_ROM_HAS_HAL_SYSTIMER

**CONFIG_HAL_WDT_USE_ROM_IMPL**

Use ROM implementation of WDT HAL driver

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Enable this flag to use HAL functions from ROM instead of ESP-IDF.

If keeping this as “n” in your project, you will have less free IRAM. If making this as “y” in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**
- Yes (enabled) if ESP_ROM_HAS_HAL_WDT

**Heap memory debugging**

Contains:

- CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS
- CONFIG_HEAP_TASK_TRACKING
- CONFIG_HEAP_PLACE_FUNCTION_INTO_FLASH
- CONFIG_HEAP_CORRUPTION_DETECTION
- CONFIG_HEAP_TRACING_DEST
- CONFIG_HEAP_TRACING_STACK_DEPTH
- CONFIG_HEAP_USE_HOOKS
- CONFIG_HEAP_TRACE_HASH_MAP
- CONFIG_HEAP_TLSF_USE_ROM_IMPL
CONFIG_HEAP_CORRUPTION_DETECTION

Heap corruption detection

*Found in: Component config > Heap memory debugging*

Enable heap poisoning features to detect heap corruption caused by out-of-bounds access to heap memory.

See the “Heap Memory Debugging” page of the IDF documentation for a description of each level of heap corruption detection.

**Available options:**
- Basic (no poisoning) (HEAP_POISONING_DISABLED)
- Light impact (HEAP_POISONING_LIGHT)
- Comprehensive (HEAP_POISONING_COMPREHENSIVE)

CONFIG_HEAP_TRACING_DEST

Heap tracing

*Found in: Component config > Heap memory debugging*

Enables the heap tracing API defined in esp_heap_trace.h.

This function causes a moderate increase in IRAM code size and a minor increase in heap function (malloc/free/realloc) CPU overhead, even when the tracing feature is not used. So it’s best to keep it disabled unless tracing is being used.

**Available options:**
- Disabled (HEAP_TRACING_OFF)
- Standalone (HEAP_TRACING_STANDALONE)
- Host-based (HEAP_TRACING_TOHOST)

CONFIG_HEAP_TRACING_STACK_DEPTH

Heap tracing stack depth

*Found in: Component config > Heap memory debugging*

Number of stack frames to save when tracing heap operation callers.

More stack frames use more memory in the heap trace buffer (and slows down allocation), but can provide useful information.

CONFIG_HEAP_USE_HOOKS

Use allocation and free hooks

*Found in: Component config > Heap memory debugging*

Enable the user to implement function hooks triggered for each successful allocation and free.

CONFIG_HEAP_TASK_TRACKING

Enable heap task tracking

*Found in: Component config > Heap memory debugging*

Enables tracking the task responsible for each heap allocation.

This function depends on heap poisoning being enabled and adds four more bytes of overhead for each block allocated.
CONFIG_HEAP_TRACE_HASH_MAP

Use hash map mechanism to access heap trace records

*Found in: Component config > Heap memory debugging*

Enable this flag to use a hash map to increase performance in handling heap trace records.

Heap trace standalone supports storing records as a list, or a list + hash map.

Using only a list takes less memory, but calls to ‘free’ will get slower as the list grows. This is particularly affected when using HEAP_TRACE_ALL mode.

By using a list + hash map, calls to ‘free’ remain fast, at the cost of additional memory to store the hash map.

**Default value:**
- No (disabled) if HEAP_TRACING_STANDALONE

CONFIG_HEAP_TRACE_HASH_MAP_IN_EXT_RAM

Place hash map in external RAM

*Found in: Component config > Heap memory debugging > CONFIG_HEAP_TRACE_HASH_MAP*

When enabled this configuration forces the hash map to be placed in external RAM.

**Default value:**
- No (disabled) if CONFIG_HEAP_TRACE_HASH_MAP

CONFIG_HEAP_TRACE_HASH_MAP_SIZE

The number of entries in the hash map

*Found in: Component config > Heap memory debugging > CONFIG_HEAP_TRACE_HASH_MAP*

Defines the number of entries in the heap trace hashmap. Each entry takes 8 bytes. The bigger this number is, the better the performance. Recommended range: 200 - 2000.

**Default value:**
- 512 if CONFIG_HEAP_TRACE_HASH_MAP

CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS

Abort if memory allocation fails

*Found in: Component config > Heap memory debugging*

When enabled, if a memory allocation operation fails it will cause a system abort.

**Default value:**
- No (disabled)

CONFIG_HEAP_TLSF_USE_ROM_IMPL

Use ROM implementation of heap tlsf library

*Found in: Component config > Heap memory debugging*

Enable this flag to use heap functions from ROM instead of ESP-IDF.

If keeping this as “n” in your project, you will have less free IRAM. If making this as “y” in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**
- Yes (enabled) if ESP_ROM_HAS_HEAP_TLSF
**CONFIG_HEAP_PLACE_FUNCTION_INTO_FLASH**

Force the entire heap component to be placed in flash memory

*Found in: Component config > Heap memory debugging*

Enable this flag to save up RAM space by placing the heap component in the flash memory

Note that it is only safe to enable this configuration if no functions from esp_heap_caps.h or esp_heap_trace.h are called from ISR.

**Default value:**
- No (disabled) if `CONFIG_HEAP_TLSF_USE_ROM_IMPL`

**IEEE 802.15.4** Contains:
- `CONFIG_IEEE802154_CCA_THRESHOLD`
- `CONFIG_IEEE802154_CCA_MODE`
- `CONFIG_IEEE802154_DEBUG`
- `CONFIG_IEEE802154_SLEEP_ENABLE`
- `CONFIG_IEEE802154_MULTI_PAN_ENABLE`
- `CONFIG_IEEE802154_TIMING_OPTIMIZATION`
- `CONFIG_IEEE802154_PENDING_TABLE_SIZE`
- `CONFIG_IEEE802154_RX_BUFFER_SIZE`

**CONFIG_IEEE802154_RX_BUFFER_SIZE**

The number of 802.15.4 receive buffers

*Found in: Component config > IEEE 802.15.4*

The number of 802.15.4 receive buffers

**CONFIG_IEEE802154_CCA_MODE**

Clear Channel Assessment (CCA) mode

*Found in: Component config > IEEE 802.15.4*

configure the CCA mode

**Available options:**
- Carrier sense only (IEEE802154_CCA_CARRIER)
  configure the CCA mode to Energy above threshold
- Energy above threshold (IEEE802154_CCA_ED)
  configure the CCA mode to Energy above threshold
- Carrier sense OR energy above threshold (IEEE802154_CCA_CARRIER_OR_ED)
  configure the CCA mode to Carrier sense OR energy above threshold
- Carrier sense AND energy above threshold (IEEE802154_CCA_CARRIER_AND_ED)
  configure the CCA mode to Carrier sense AND energy above threshold

**CONFIG_IEEE802154_CCA_THRESHOLD**

CCA detection threshold

*Found in: Component config > IEEE 802.15.4*

set the CCA threshold, in dB

**Range:**
- from -120 to 0

**Default value:**
- “-60”
CONFIG_IEEE802154_PENDING_TABLE_SIZE

Pending table size

*Found in: Component config > IEEE 802.15.4*

set the pending table size

*Range:*
  - from 1 to 100

*Default value:*
  - 20

CONFIG_IEEE802154_MULTI_PAN_ENABLE

Enable multi-pan feature for frame filter

*Found in: Component config > IEEE 802.15.4*

Enable IEEE802154 multi-pan

*Default value:*
  - No (disabled)

CONFIG_IEEE802154_TIMING_OPTIMIZATION

Enable throughput optimization

*Found in: Component config > IEEE 802.15.4*

Enabling this option increases throughput by ~5% at the expense of ~2.1k IRAM code size increase.

*Default value:*
  - No (disabled)

CONFIG_IEEE802154_SLEEP_ENABLE

Enable IEEE802154 light sleep

*Found in: Component config > IEEE 802.15.4*

Enabling this option allows the IEEE802154 module to be powered down during automatic light sleep, which reduces current consumption.

*Default value:*
  - No (disabled) if CONFIG_PM_ENABLE && CONFIG_PM_POWER_DOWN_PERIPHERAL_IN_LIGHT_SLEEP

CONFIG_IEEE802154_DEBUG

Enable IEEE802154 Debug

*Found in: Component config > IEEE 802.15.4*

Enabling this option allows different kinds of IEEE802154 debug output. All IEEE802154 debug features increase the size of the final binary.

*Default value:*
  - No (disabled)

Contains:

- CONFIG_IEEE802154_RECORD_ABORT
- CONFIG_IEEE802154_RECORD_CMD
- CONFIG_IEEE802154_RECORD_EVENT
- CONFIG_IEEE802154_RECORD_STATE
- CONFIG_IEEE802154_ASSERT
**CONFIG_IEEE802154_ASSERT**

Enrich the assert information with IEEE802154 state and event

*Found in: Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG*

Enabling this option to add some probe codes in the driver, and these informations will be printed when assert.

*Default value:*

  - No (disabled) if `CONFIG_IEEE802154_DEBUG`

**CONFIG_IEEE802154_RECORD_EVENT**

Enable record event information for debugging

*Found in: Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG*

Enabling this option to record event, when assert, the recorded event will be printed.

*Default value:*

  - No (disabled) if `CONFIG_IEEE802154_DEBUG`

**CONFIG_IEEE802154_RECORD_EVENT_SIZE**

Record event table size

*Found in: Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD_EVENT*

set the record event table size

*Range:*

  - from 1 to 50 if `CONFIG_IEEE802154_RECORD_EVENT`

*Default value:*

  - 30 if `CONFIG_IEEE802154_RECORD_EVENT`

**CONFIG_IEEE802154_RECORD_STATE**

Enable record state information for debugging

*Found in: Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG*

Enabling this option to record state, when assert, the recorded state will be printed.

*Default value:*

  - No (disabled) if `CONFIG_IEEE802154_DEBUG`

**CONFIG_IEEE802154_RECORD_STATE_SIZE**

Record state table size

*Found in: Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD_STATE*

set the record state table size

*Range:*

  - from 1 to 50 if `CONFIG_IEEE802154_RECORD_STATE`

*Default value:*

  - 10 if `CONFIG_IEEE802154_RECORD_STATE`
CONFIG_IEEE802154_RECORD_CMD

Enable record command information for debugging

*Found in: Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG*

Enabling this option to record the command, when assert, the recorded command will be printed.

**Default value:**
- No (disabled) if `CONFIG_IEEE802154_DEBUG`

CONFIG_IEEE802154_RECORD_CMD_SIZE

Record command table size

*Found in: Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD_CMD*

set the record command table size

**Range:**
- from 1 to 50 if `CONFIG_IEEE802154_RECORD_CMD`

**Default value:**
- 10 if `CONFIG_IEEE802154_RECORD_CMD`

CONFIG_IEEE802154_RECORD_ABORT

Enable record abort information for debugging

*Found in: Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG*

Enabling this option to record the abort, when assert, the recorded abort will be printed.

**Default value:**
- No (disabled) if `CONFIG_IEEE802154_DEBUG`

CONFIG_IEEE802154_RECORD_ABORT_SIZE

Record abort table size

*Found in: Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD_ABORT*

set the record abort table size

**Range:**
- from 1 to 50 if `CONFIG_IEEE802154_RECORD_ABORT`

**Default value:**
- 10 if `CONFIG_IEEE802154_RECORD_ABORT`

Log output

Contains:
- `CONFIG_LOG_DEFAULT_LEVEL`
- `CONFIG_LOG_MASTER_LEVEL`
- `CONFIG_LOG_TIMESTAMP_SOURCE`
- `CONFIG_LOG_MAXIMUM_LEVEL`
- `CONFIG_LOG_COLORS`
**CONFIG_LOG_DEFAULT_LEVEL**

Default log verbosity

*Found in: Component config > Log output*

Specify how much output to see in logs by default. You can set lower verbosity level at runtime using esp_log_level_set function.

By default, this setting limits which log statements are compiled into the program. For example, selecting “Warning” would mean that changing log level to “Debug” at runtime will not be possible. To allow increasing log level above the default at runtime, see the next option.

**Available options:**
- No output (LOG_DEFAULT_LEVEL_NONE)
- Error (LOG_DEFAULT_LEVEL_ERROR)
- Warning (LOG_DEFAULT_LEVEL_WARN)
- Info (LOG_DEFAULT_LEVEL_INFO)
- Debug (LOG_DEFAULT_LEVEL_DEBUG)
- Verbose (LOG_DEFAULT_LEVEL_VERBOSE)

**CONFIG_LOG_MAXIMUM_LEVEL**

Maximum log verbosity

*Found in: Component config > Log output*

This config option sets the highest log verbosity that it’s possible to select at runtime by calling esp_log_level_set(). This level may be higher than the default verbosity level which is set when the app starts up.

This can be used enable debugging output only at a critical point, for a particular tag, or to minimize startup time but then enable more logs once the firmware has loaded.

Note that increasing the maximum available log level will increase the firmware binary size.

This option only applies to logging from the app, the bootloader log level is fixed at compile time to the separate “Bootloader log verbosity” setting.

**Available options:**
- Same as default (LOG_MAXIMUM_EQUALS_DEFAULT)
- Error (LOG_MAXIMUM_LEVEL_ERROR)
- Warning (LOG_MAXIMUM_LEVEL_WARN)
- Info (LOG_MAXIMUM_LEVEL_INFO)
- Debug (LOG_MAXIMUM_LEVEL_DEBUG)
- Verbose (LOG_MAXIMUM_LEVEL_VERBOSE)

**CONFIG_LOG_MASTER_LEVEL**

Enable global master log level

*Found in: Component config > Log output*

Enables an additional global “master” log level check that occurs before a log tag cache lookup. This is useful if you want to compile in a lot of logs that are selectable at runtime, but avoid the performance hit during periods where you don’t want log output. Examples include remote log forwarding, or disabling logs during a time-critical or CPU-intensive section and re-enabling them later. Results in larger program size depending on number of logs compiled in.

If enabled, defaults to LOG_DEFAULT_LEVEL and can be set using esp_log_set_level_master(). This check takes precedence over ESP_LOG_LEVEL_LOCAL.

**Default value:**
- No (disabled)
**CONFIG_LOG_COLORS**

Use ANSI terminal colors in log output

*Found in: Component config > Log output*

Enable ANSI terminal color codes in bootloader output.

In order to view these, your terminal program must support ANSI color codes.

**Default value:**
- Yes (enabled)

**CONFIG_LOG_TIMESTAMP_SOURCE**

Log Timestamps

*Found in: Component config > Log output*

Choose what sort of timestamp is displayed in the log output:

- Milliseconds since boot is calculated from the RTOS tick count multiplied by the tick period. This time will reset after a software reboot. e.g. (90000)
- System time is taken from POSIX time functions which use the chip’s RTC and high resolution timers to maintain an accurate time. The system time is initialized to 0 on startup, it can be set with an SNTP sync, or with POSIX time functions. This time will not reset after a software reboot. e.g. (00:01:30.000)

**NOTE:** Currently this will not get used in logging from binary blobs (i.e WiFi & Bluetooth libraries), these will always print milliseconds since boot.

**Available options:**
- Milliseconds Since Boot (LOG_TIMESTAMP_SOURCE_RTOS)
- System Time (LOG_TIMESTAMP_SOURCE_SYSTEM)

**LWIP** Contains:

- `CONFIG_LWIP_CHECK_THREAD_SAFETY`
- `Checksums`
- `CONFIG_LWIP_DHCP_COARSE_TIMER_SECS`
- `DHCP server`
- `CONFIG_LWIP_DHCP_OPTIONS_LEN`
- `CONFIG_LWIP_DHCP_DISABLE_CLIENT_ID`
- `CONFIG_LWIP_DHCP_DISABLE_VENDOR_CLASS_ID`
- `CONFIG_LWIP_DHCP DOES ARP CHECK`
- `CONFIG_LWIP_DHCP_RESTORE_LAST_IP`
- `CONFIG_LWIP_PPP CHAP_SUPPORT`
- `CONFIG_LWIP_L2_TO_L3_COPY`
- `CONFIG_LWIP_IPV6_DHCP6`
- `CONFIG_LWIP_IP4_FRAG`
- `CONFIG_LWIP_IP6_FRAG`
- `CONFIG_LWIP_IP FORWARD`
- `CONFIG_LWIP_NETBUF_RECVINFO`

- `CONFIG_LWIP_IP_REASS MAX PBUFS`
- `UDP`
- `CONFIG_LWIP_IPV6_RDNSS_MAX DNS SERVERS`

**CONFIG_LWIP_ENABLE**

Enable LwIP stack

*Found in: Component config > LWIP*

Builds normally if selected. Excludes LwIP from build if unselected, even if it is a dependency of a component or application. Some applications can switch their IP stacks, e.g., when switching between chip and Linux targets (LwIP stack vs. Linux IP stack). Since the LwIP dependency cannot easily be excluded based on a Kconfig option, it has to be a dependency in all cases. This switch allows the LwIP stack to be built selectively, even if it is a dependency.

*Default value:*
- Yes (enabled)

**CONFIG_LWIP_LOCAL_HOSTNAME**

Local netif hostname
**Found in: Component config > LWIP**

The default name this device will report to other devices on the network. Could be updated at runtime with esp_netif_set_hostname()

**Default value:**
- “espressif”

**CONFIG_LWIP_NETIF_API**

Enable usage of standard POSIX APIs in LWIP

**Found in: Component config > LWIP**

If this feature is enabled, standard POSIX APIs: if_indextoname(), if_nametoindex() could be used to convert network interface index to name instead of IDF specific esp-netif APIs (such as esp_netif_get_netif_impl_name())

**Default value:**
- No (disabled)

**CONFIG_LWIP_TCPIP_TASK_PRIO**

LWIP TCP/IP Task Priority

**Found in: Component config > LWIP**

LWIP tcpip task priority. In case of high throughput, this parameter could be changed up to (config-MAX_PRIORITIES-1).

**Range:**
- from 1 to 24

**Default value:**
- 18

**CONFIG_LWIP_TCPIP_CORE_LOCKING**

Enable tcpip core locking

**Found in: Component config > LWIP**

If Enable tcpip core locking, creates a global mutex that is held during TCPIP thread operations. Can be locked by client code to perform lwIP operations without changing into TCPIP thread using callbacks. See LOCK_TCPIP_CORE() and UNLOCK_TCPIP_CORE().

If disable tcpip core locking, TCP IP will perform tasks through context switching

**Default value:**
- No (disabled)

**CONFIG_LWIP_TCPIP_CORE_LOCKING_INPUT**

Enable tcpip core locking input

**Found in: Component config > LWIP > CONFIG_LWIP_TCPIP_CORE_LOCKING**

when LWIP_TCPIP_CORE_LOCKING is enabled, this lets tcpip_input() grab the mutex for input packets as well, instead of allocating a message and passing it to tcpip_thread.

**Default value:**
- No (disabled) if CONFIG_LWIP_TCPIP_CORE_LOCKING
CONFIG_LWIP_CHECK_THREAD_SAFETY

Checks that lwip API runs in expected context

*Found in: Component config > LWIP*

Enable to check that the project does not violate lwip thread safety. If enabled, all lwip functions that require thread awareness run an assertion to verify that the TCP/IP core functionality is either locked or accessed from the correct thread.

**Default value:**
- No (disabled)

CONFIG_LWIP_DNS_SUPPORT_MDNS_QUERIES

Enable mDNS queries in resolving host name

*Found in: Component config > LWIP*

If this feature is enabled, standard API such as gethostbyname support .local addresses by sending one shot multicast mDNS query

**Default value:**
- Yes (enabled)

CONFIG_LWIP_L2_TO_L3_COPY

Enable copy between Layer2 and Layer3 packets

*Found in: Component config > LWIP*

If this feature is enabled, all traffic from layer2(WIFI Driver) will be copied to a new buffer before sending it to layer3(LWIP stack), freeing the layer2 buffer. Please be notified that the total layer2 receiving buffer is fixed and ESP32 currently supports 25 layer2 receiving buffer, when layer2 buffer runs out of memory, then the incoming packets will be dropped in hardware. The layer3 buffer is allocated from the heap, so the total layer3 receiving buffer depends on the available heap size, when heap runs out of memory, no copy will be sent to layer3 and packet will be dropped in layer2. Please make sure you fully understand the impact of this feature before enabling it.

**Default value:**
- No (disabled)

CONFIG_LWIP_IRAM_OPTIMIZATION

Enable LWIP IRAM optimization

*Found in: Component config > LWIP*

If this feature is enabled, some functions relating to RX/TX in LWIP will be put into IRAM, it can improve UDP/TCP throughput by >10% for single core mode, it doesn’t help too much for dual core mode. On the other hand, it needs about 10KB IRAM for these optimizations.

If this feature is disabled, all lwip functions will be put into FLASH.

**Default value:**
- No (disabled)

CONFIG_LWIP_EXTRA_IRAM_OPTIMIZATION

Enable LWIP IRAM optimization for TCP part

*Found in: Component config > LWIP*

If this feature is enabled, some tcp part functions relating to RX/TX in LWIP will be put into IRAM, it can improve TCP throughput. On the other hand, it needs about 17KB IRAM for these optimizations.
Default value:
• No (disabled)

CONFIG_LWIP_TIMERS_ONDEMAND
Enable LWIP Timers on demand
 FOUND in: Component config > LWIP
If this feature is enabled, IGMP and MLD6 timers will be activated only when joining groups or receiving QUERY packets.
This feature will reduce the power consumption for applications which do not use IGMP and MLD6.

Default value:
• Yes (enabled)

CONFIG_LWIP_ND6
LWIP NDP6 Enable/Disable
 FOUND in: Component config > LWIP
This option is used to disable the Network Discovery Protocol (NDP) if it is not required. Please use this option with caution, as the NDP is essential for IPv6 functionality within a local network.

Default value:
• Yes (enabled)

CONFIG_LWIP_MAX_SOCKETS
Max number of open sockets
 FOUND in: Component config > LWIP
Sockets take up a certain amount of memory, and allowing fewer sockets to be open at the same time conserves memory. Specify the maximum amount of sockets here. The valid value is from 1 to 16.

Range:
• from 1 to 16

Default value:
• 10

CONFIG_LWIP_USE_ONLY_LWIP_SELECT
Support LWIP socket select() only (DEPRECATED)
 FOUND in: Component config > LWIP
This option is deprecated. Do not use this option, use VFS_SUPPORT_SELECT instead.

Default value:
• No (disabled)

CONFIG_LWIP_SO_LINGER
Enable SO_LINGER processing
 FOUND in: Component config > LWIP
Enabling this option allows SO_LINGER processing. l_onoff = 1, l_linger can set the timeout.
If l_linger = 0, When a connection is closed, TCP will terminate the connection. This means that TCP will discard any data packets stored in the socket send buffer and send an RST to the peer.
If l linger!=0, Then closesocket() calls to block the process until the remaining data packets has been sent or timed out.

**Default value:**
- No (disabled)

**CONFIG_LWIP_SO_REUSE**
Enable SO_REUSEADDR option

*Found in: Component config > LWIP*

Enabling this option allows binding to a port which remains in TIME_WAIT.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_SO_REUSE_RXTOALL**
SO_REUSEADDR copies broadcast/multicast to all matches

*Found in: Component config > LWIP > CONFIG_LWIP_SO_REUSE*

Enabling this option means that any incoming broadcast or multicast packet will be copied to all of the local sockets that it matches (may be more than one if SO_REUSEADDR is set on the socket.)

This increases memory overhead as the packets need to be copied, however they are only copied per matching socket. You can safely disable it if you don’t plan to receive broadcast or multicast traffic on more than one socket at a time.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_SO_RCVBUF**
Enable SO_RCVBUF option

*Found in: Component config > LWIP*

Enabling this option allows checking for available data on a netconn.

**Default value:**
- No (disabled)

**CONFIG_LWIP_NETBUF_RECVINFO**
Enable IP_PKTINFO option

*Found in: Component config > LWIP*

Enabling this option allows checking for the destination address of a received IPv4 Packet.

**Default value:**
- No (disabled)

**CONFIG_LWIP_IP4_FRAG**
Enable fragment outgoing IP4 packets

*Found in: Component config > LWIP*

Enabling this option allows fragmenting outgoing IP4 packets if their size exceeds MTU.

**Default value:**
- Yes (enabled)
CONFIG_LWIP_IP6_FRAG

Enable fragment outgoing IP6 packets

*Found in: Component config > LWIP*

Enabling this option allows fragmenting outgoing IP6 packets if their size exceeds MTU.

**Default value:**
- Yes (enabled)

CONFIG_LWIP_IP4_REASSEMBLY

Enable reassembly incoming fragmented IP4 packets

*Found in: Component config > LWIP*

Enabling this option allows reassembling incoming fragmented IP4 packets.

**Default value:**
- No (disabled)

CONFIG_LWIP_IP6_REASSEMBLY

Enable reassembly incoming fragmented IP6 packets

*Found in: Component config > LWIP*

Enabling this option allows reassembling incoming fragmented IP6 packets.

**Default value:**
- No (disabled)

CONFIG_LWIP_IP_REASS_MAX_PBUFS

The maximum amount of pbufs waiting to be reassembled

*Found in: Component config > LWIP*

Set the maximum amount of pbufs waiting to be reassembled.

**Range:**
- from 10 to 100

**Default value:**
- 10

CONFIG_LWIP_IP_FORWARD

Enable IP forwarding

*Found in: Component config > LWIP*

Enabling this option allows packets forwarding across multiple interfaces.

**Default value:**
- No (disabled)

CONFIG_LWIP_IPV4_NAPT

Enable NAT (new/experimental)

*Found in: Component config > LWIP > CONFIG_LWIP_IP_FORWARD*

Enabling this option allows Network Address and Port Translation.

**Default value:**
- No (disabled) if CONFIG_LWIP_IP_FORWARD
**CONFIG_LWIP_IPV4_NAPT_PORTMAP**

Enable NAT Port Mapping (new/experimental)

*Found in: Component config > LWIP > CONFIG_LWIP_IP_FORWARD > CONFIG_LWIP_IPV4_NAPT*

Enabling this option allows Port Forwarding or Port mapping.

**Default value:**
- Yes (enabled) if `CONFIG_LWIP_IPV4_NAPT`

**CONFIG_LWIP_STATS**

Enable LWIP statistics

*Found in: Component config > LWIP*

Enabling this option allows LWIP statistics

**Default value:**
- No (disabled)

**CONFIG_LWIP_ESP_GRATUITOUS_ARP**

Send gratuitous ARP periodically

*Found in: Component config > LWIP*

Enable this option allows to send gratuitous ARP periodically.

This option solve the compatibility issues. If the ARP table of the AP is old, and the AP doesn’t send ARP request to update it’s ARP table, this will lead to the STA sending IP packet fail. Thus we send gratuitous ARP periodically to let AP update it’s ARP table.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_GARP_TMR_INTERVAL**

GARP timer interval(seconds)

*Found in: Component config > LWIP > CONFIG_LWIP_ESP_GRATUITOUS_ARP*

Set the timer interval for gratuitous ARP. The default value is 60s

**Default value:**
- 60

**CONFIG_LWIP_ESP_MLDV6_REPORT**

Send mldv6 report periodically

*Found in: Component config > LWIP*

Enable this option allows to send mldv6 report periodically.

This option solve the issue that failed to receive multicast data. Some routers fail to forward multicast packets. To solve this problem, send multicast mldv6 report to routers regularly.

**Default value:**
- Yes (enabled)
CONFIG_LWIP_MLDV6_TMR_INTERVAL

mldv6 report timer interval (seconds)

*Found in: Component config > LWIP > CONFIG_LWIP_ESP_MLDV6_REPORT*

Set the timer interval for mldv6 report. The default value is 30s

**Default value:**
- 40

CONFIG_LWIP_TCPIP_RECVMBOX_SIZE

TCPIP task receive mailbox size

*Found in: Component config > LWIP*

Set TCPIP task receive mailbox size. Generally bigger value means higher throughput but more memory. The value should be bigger than UDP/TCP mailbox size.

**Range:**
- from 6 to 64 if CONFIG_LWIP_WND_SCALE
- from 6 to 1024 if CONFIG_LWIP_WND_SCALE

**Default value:**
- 32

CONFIG_LWIP_DHCP_DOES_ARP_CHECK

DHCP: Perform ARP check on any offered address

*Found in: Component config > LWIP*

Enabling this option performs a check (via ARP request) if the offered IP address is not already in use by another host on the network.

**Default value:**
- Yes (enabled)

CONFIG_LWIP_DHCP_DISABLE_CLIENT_ID

DHCP: Disable Use of HW address as client identification

*Found in: Component config > LWIP*

This option could be used to disable DHCP client identification with its MAC address. (Client id is used by DHCP servers to uniquely identify clients and are included in the DHCP packets as an option 61) Set this option to “y” in order to exclude option 61 from DHCP packets.

**Default value:**
- No (disabled)

CONFIG_LWIP_DHCP_DISABLE_VENDOR_CLASS_ID

DHCP: Disable Use of vendor class identification

*Found in: Component config > LWIP*

This option could be used to disable DHCP client vendor class identification. Set this option to “y” in order to exclude option 60 from DHCP packets.

**Default value:**
- Yes (enabled)
**CONFIG_LWIP_DHCP_RESTORE_LAST_IP**

DHCP: Restore last IP obtained from DHCP server

*Found in: Component config > LWIP*

When this option is enabled, DHCP client tries to re-obtain last valid IP address obtained from DHCP server. Last valid DHCP configuration is stored in nvs and restored after reset/power-up. If IP is still available, there is no need for sending discovery message to DHCP server and save some time.

*Default value:*
  - No (disabled)

**CONFIG_LWIP_DHCP_OPTIONS_LEN**

DHCP total option length

*Found in: Component config > LWIP*

Set total length of outgoing DHCP option msg. Generally bigger value means it can carry more options and values. If your code meets LWIP_ASSERT due to option value is too long. Please increase the LWIP_DHCP_OPTIONS_LEN value.

*Range:*
  - from 68 to 255

*Default value:*
  - 68
  - 108

**CONFIG_LWIP_NUM_NETIF_CLIENT_DATA**

Number of clients store data in netif

*Found in: Component config > LWIP*

Number of clients that may store data in client_data member array of struct netif.

*Range:*
  - from 0 to 256

*Default value:*
  - 0

**CONFIG_LWIP_DHCP_COARSE_TIMER_SECS**

DHCP coarse timer interval(s)

*Found in: Component config > LWIP*

Set DHCP coarse interval in seconds. A higher value will be less precise but cost less power consumption.

*Range:*
  - from 1 to 10

*Default value:*
  - 1

**DHCP server**

Contains:
  - CONFIG_LWIP_DHCPS
CONFIG_LWIP_DHCPS

DHCPs: Enable IPv4 Dynamic Host Configuration Protocol Server (DHCPs)

Found in: Component config > LWIP > DHCP server

Enabling this option allows the device to run the DHCP server (to dynamically assign IPv4 addresses to clients).

Default value:
- Yes (enabled)

CONFIG_LWIP_DHCPSLEASE_UNIT

Multiplier for lease time, in seconds

Found in: Component config > LWIP > DHCP server > CONFIG_LWIP_DHCPS

The DHCP server is calculating lease time multiplying the sent and received times by this number of seconds per unit. The default is 60, that equals one minute.

Range:
- from 1 to 3600

Default value:
- 60

CONFIG_LWIP_DHCPS_MAX_STATION_NUM

Maximum number of stations

Found in: Component config > LWIP > DHCP server > CONFIG_LWIP_DHCPS

The maximum number of DHCP clients that are connected to the server. After this number is exceeded, DHCP server removes of the oldest device from it’s address pool, without notification.

Range:
- from 1 to 64

Default value:
- 8

CONFIG_LWIP_AUTOIP

Enable IPV4 Link-Local Addressing (AUTOIP)

Found in: Component config > LWIP

Enabling this option allows the device to self-assign an address in the 169.256/16 range if none is assigned statically or via DHCP.

See RFC 3927.

Default value:
- No (disabled)

Contains:
- CONFIG_LWIP_AUTOIP_TRIES
- CONFIG_LWIP_AUTOIP_MAX_CONFLICTS
- CONFIG_LWIP_AUTOIP_RATE_LIMIT_INTERVAL
**CONFIG_LWIP_AUTOIP_TRIES**

DHCP Probes before self-assigning IPv4 LL address

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

DHCP client will send this many probes before self-assigning a link local address.

From LWIP help: “This can be set as low as 1 to get an AutoIP address very quickly, but you should be prepared to handle a changing IP address when DHCP overrides AutoIP.” (In the case of ESP-IDF, this means multiple SYSTEM_EVENT_STA_GOT_IP events.)

**Range:**
- from 1 to 100 if `CONFIG_LWIP_AUTOIP`

**Default value:**
- 2 if `CONFIG_LWIP_AUTOIP`

**CONFIG_LWIP_AUTOIP_MAX_CONFLICTS**

Max IP conflicts before rate limiting

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

If the AUTOIP functionality detects this many IP conflicts while self-assigning an address, it will go into a rate limited mode.

**Range:**
- from 1 to 100 if `CONFIG_LWIP_AUTOIP`

**Default value:**
- 9 if `CONFIG_LWIP_AUTOIP`

**CONFIG_LWIP_AUTOIP_RATE_LIMIT_INTERVAL**

Rate limited interval (seconds)

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

If rate limiting self-assignment requests, wait this long between each request.

**Range:**
- from 5 to 120 if `CONFIG_LWIP_AUTOIP`

**Default value:**
- 20 if `CONFIG_LWIP_AUTOIP`

**CONFIG_LWIP_IPV4**

Enable IPv4

*Found in: Component config > LWIP*

Enable IPv4 stack. If you want to use IPv6 only TCP/IP stack, disable this.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_IPV6**

Enable IPv6

*Found in: Component config > LWIP*

Enable IPv6 function. If not use IPv6 function, set this option to n. If disabling LWIP_IPV6 then some other components (coap and asio) will no longer be available.

**Default value:**
- Yes (enabled)
CONFIG_LWIP_IPV6_AUTOCONFIG

Enable IPv6 stateless address autoconfiguration (SLAAC)

*Found in:* Component config > LWIP > CONFIG_LWIP_IPV6

Enabling this option allows the devices to IPv6 stateless address autoconfiguration (SLAAC).

See RFC 4862.

**Default value:**
- No (disabled)

CONFIG_LWIP_IPV6_NUM_ADDRESSES

Number of IPv6 addresses on each network interface

*Found in:* Component config > LWIP > CONFIG_LWIP_IPV6

The maximum number of IPv6 addresses on each interface. Any additional addresses will be discarded.

**Default value:**
- 3

CONFIG_LWIP_IPV6_FORWARD

Enable IPv6 forwarding between interfaces

*Found in:* Component config > LWIP > CONFIG_LWIP_IPV6

Forwarding IPv6 packets between interfaces is only required when acting as a router.

**Default value:**
- No (disabled)

CONFIG_LWIP_IPV6_RDNSS_MAX_DNS_SERVERS

Use IPv6 Router Advertisement Recursive DNS Server Option

*Found in:* Component config > LWIP

Use IPv6 Router Advertisement Recursive DNS Server Option (as per RFC 6106) to copy a defined maximum number of DNS servers to the DNS module. Set this option to a number of desired DNS servers advertised in the RA protocol. This feature is disabled when set to 0.

**Default value:**
- 0 if CONFIG_LWIP_IPV6_AUTOCONFIG

CONFIG_LWIP_IPV6_DHCP6

Enable DHCPv6 stateless address autoconfiguration

*Found in:* Component config > LWIP

Enable DHCPv6 for IPv6 stateless address autoconfiguration. Note that the dhcpv6 client has to be started using dhcpv6_enable_stateless(netif); Note that the stateful address autoconfiguration is not supported.

**Default value:**
- No (disabled) if CONFIG_LWIP_IPV6_AUTOCONFIG
CONFIG_LWIP_NETIF_STATUS_CALLBACK

Enable status callback for network interfaces

*Found in: Component config > LWIP*

Enable callbacks when the network interface is up/down and addresses are changed.

**Default value:**
- No (disabled)

CONFIG_LWIP_NETIF_LOOPBACK

Support per-interface loopback

*Found in: Component config > LWIP*

Enabling this option means that if a packet is sent with a destination address equal to the interface’s own IP address, it will “loop back” and be received by this interface. Disabling this option disables support of loopback interface in lwIP.

**Default value:**
- Yes (enabled)

Contains:

- CONFIG_LWIP_LOOPBACK_MAX_PBUFS

CONFIG_LWIP_LOOPBACK_MAX_PBUFS

Max queued loopback packets per interface

*Found in: Component config > LWIP > CONFIG_LWIP_NETIF_LOOPBACK*

Configure the maximum number of packets which can be queued for loopback on a given interface. Reducing this number may cause packets to be dropped, but will avoid filling memory with queued packet data.

**Range:**
- from 0 to 16

**Default value:**
- 8

TCP

Contains:

- CONFIG_LWIP_TCP_WND_DEFAULT
- CONFIG_LWIP_TCP_SND_BUF_DEFAULT
- CONFIG_LWIP_TCP_RECVMBOX_SIZE
- CONFIG_LWIP_TCP_RTO_TIME
- CONFIG_LWIP_MAX_ACTIVE_TCP
- CONFIG_LWIP_TCP_FIN_WAIT_TIMEOUT
- CONFIG_LWIP_MAX_LISTENING_TCP
- CONFIG_LWIP_TCP_MAXRTX
- CONFIG_LWIP_TCP_SYNMAXRTX
- CONFIG_LWIP_TCP_MSL
- CONFIG_LWIP_TCP_MSS
- CONFIG_LWIP_TCP_OVERSIZE
- CONFIG_LWIP_TCP_QUEUE_OOSEQ
- CONFIG_LWIP_WND_SCALE
- CONFIG_LWIP_TCP_HIGH_SPEED_RETRANSMISSION
- CONFIG_LWIP_TCP_TMR_INTERVAL
CONFIG_LWIP_MAX_ACTIVE_TCP

Maximum active TCP Connections

*Found in: Component config > LWIP > TCP*

The maximum number of simultaneously active TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new TCP connections after the limit is reached.

**Range:**
- from 1 to 1024

**Default value:**
- 16

CONFIG_LWIP_MAX_LISTENING_TCP

Maximum listening TCP Connections

*Found in: Component config > LWIP > TCP*

The maximum number of simultaneously listening TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new listening TCP connections after the limit is reached.

**Range:**
- from 1 to 1024

**Default value:**
- 16

CONFIG_LWIP_TCP_HIGH_SPEED_RETRANSMISSION

TCP high speed retransmissions

*Found in: Component config > LWIP > TCP*

Speed up the TCP retransmission interval. If disabled, it is recommended to change the number of SYN retransmissions to 6, and TCP initial rto time to 3000.

**Default value:**
- Yes (enabled)

CONFIG_LWIP_TCP_MAXRTX

Maximum number of retransmissions of data segments

*Found in: Component config > LWIP > TCP*

Set maximum number of retransmissions of data segments.

**Range:**
- from 3 to 12

**Default value:**
- 12

CONFIG_LWIP_TCP_SYNMAXRTX

Maximum number of retransmissions of SYN segments

*Found in: Component config > LWIP > TCP*

Set maximum number of retransmissions of SYN segments.
Chapter 2. API Reference

**CONFIG_LWIP_TCP_MSS**

Maximum Segment Size (MSS)

*Found in: Component config > LWIP > TCP*

Set maximum segment size for TCP transmission.

Can be set lower to save RAM, the default value 1460 (ipv4)/1440 (ipv6) will give best throughput. IPv4 TCP_MSS Range: 576 <= TCP_MSS <= 1460 IPv6 TCP_MSS Range: 1220 <= TCP_mSS <= 1440

**Range:**
- from 536 to 1460

**Default value:**
- 1440

**CONFIG_LWIP_TCP_TMR_INTERVAL**

TCP timer interval (ms)

*Found in: Component config > LWIP > TCP*

Set TCP timer interval in milliseconds.

Can be used to speed connections on bad networks. A lower value will redeliver unacked packets faster.

**Default value:**
- 250

**CONFIG_LWIP_TCP_MSL**

Maximum segment lifetime (MSL)

*Found in: Component config > LWIP > TCP*

Set maximum segment lifetime in milliseconds.

**Default value:**
- 60000

**CONFIG_LWIP_TCP_FIN_WAIT_TIMEOUT**

Maximum FIN segment lifetime

*Found in: Component config > LWIP > TCP*

Set maximum segment lifetime in milliseconds.

**Default value:**
- 20000

**CONFIG_LWIP_TCP_SND_BUF_DEFAULT**

Default send buffer size

*Found in: Component config > LWIP > TCP*

Set default send buffer size for new TCP sockets.

Per-socket send buffer size can be changed at runtime with lwip_setsockopt(s, TCP_SNDBUF, ...).
This value must be at least 2x the MSS size, and the default is 4x the default MSS size. Setting a smaller default SNDBUF size can save some RAM, but will decrease performance.

**Range:**
- from 2440 to 65535 if `CONFIG_LWIP_WND_SCALE`
- from 2440 to 1024000 if `CONFIG_LWIP_WND_SCALE`

**Default value:**
- 5744

**CONFIG_LWIP_TCPWndDefault**
Default receive window size

*Found in: Component config > LWIP > TCP*

Set default TCP receive window size for new TCP sockets.

Per-socket receive window size can be changed at runtime with `lwip_setsockopt(s, TCP_WINDOW, ... )`.

Setting a smaller default receive window size can save some RAM, but will significantly decrease performance.

**Range:**
- from 2440 to 65535 if `CONFIG_LWIP_WND_SCALE`
- from 2440 to 1024000 if `CONFIG_LWIP_WND_SCALE`

**Default value:**
- 5744

**CONFIG_LWIP_TCPRecvmboxSize**
Default TCP receive mailbox size

*Found in: Component config > LWIP > TCP*

Set TCP receive mailbox size. Generally bigger value means higher throughput but more memory. The recommended value is: `LWIP_TCPWndDefault/TCP_MSS + 2`. e.g. if `LWIP_TCPWndDefault`=14360, `TCP_MSS`=1436, then the recommended receive mailbox size is `(14360/1436 + 2) = 12`.

TCP receive mailbox is a per socket mailbox, when the application receives packets from TCP socket, LWIP core firstly posts the packets to TCP receive mailbox and the application then fetches the packets from mailbox. It means LWIP can caches maximum `LWIP_TCPRecvmboxSize` packets for each TCP socket, so the maximum possible cached TCP packets for all TCP sockets is `LWIP_TCPRecvmboxSize * LIP_TCPWndDefault` multiples the maximum TCP socket number. In other words, the bigger `LWIP_TCPRecvmboxSize` means more memory. On the other hand, if the receive mailbox is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the TCP receive mailbox is big enough to avoid packet drop between LWIP core and application.

**Range:**
- from 6 to 64 if `CONFIG_LWIP_WND_SCALE`
- from 6 to 1024 if `CONFIG_LWIP_WND_SCALE`

**Default value:**
- 6

**CONFIG_LWIP_TCPQueueOoSeq**
Queue incoming out-of-order segments

*Found in: Component config > LWIP > TCP*

Queue incoming out-of-order segments for later use.
Disable this option to save some RAM during TCP sessions, at the expense of increased retransmissions if segments arrive out of order.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_TCP_SACK_OUT**
Support sending selective acknowledgements

*Found in: Component config > LWIP > TCP > CONFIG_LWIP_TCP_QUEUE_OOSEQ*

TCP will support sending selective acknowledgements (SACKs).

**Default value:**
- No (disabled)

**CONFIG_LWIP_TCP_OVERSIZE**
Pre-allocate transmit PBUF size

*Found in: Component config > LWIP > TCP*

Allows enabling “oversize” allocation of TCP transmission pbufs ahead of time, which can reduce the length of pbuf chains used for transmission.

This will not make a difference to sockets where Nagle’s algorithm is disabled.

Default value of MSS is fine for most applications, 25% MSS may save some RAM when only transmitting small amounts of data. Disabled will have worst performance and fragmentation characteristics, but uses least RAM overall.

**Available options:**
- MSS (LWIP_TCP_OVERSIZE_MSS)
- 25% MSS (LWIP_TCP_OVERSIZE_QUARTER_MSS)
- Disabled (LWIP_TCP_OVERSIZE_DISABLE)

**CONFIG_LWIP_WND_SCALE**
Support TCP window scale

*Found in: Component config > LWIP > TCP*

Enable this feature to support TCP window scaling.

**Default value:**
- No (disabled) if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`

**CONFIG_LWIP_TCP_RCV_SCALE**
Set TCP receiving window scaling factor

*Found in: Component config > LWIP > TCP > CONFIG_LWIP_WND_SCALE*

Enable this feature to support TCP window scaling.

**Range:**
- from 0 to 14 if `CONFIG_LWIP_WND_SCALE`

**Default value:**
- 0 if `CONFIG_LWIP_WND_SCALE`
**CONFIG_LWIP_TCP_RTO_TIME**

Default TCP rto time

*Found in: Component config > LWIP > TCP*

Set default TCP rto time for a reasonable initial rto. In bad network environment, recommend set value of rto time to 1500.

**Default value:**
- 3000
- 1500

**UDP**  Contains:

- **CONFIG_LWIP_UDP_RECVMBOX_SIZE**
- **CONFIG_LWIP_MAX_UDP_PCBS**

**CONFIG_LWIP_MAX_UDP_PCBS**

Maximum active UDP control blocks

*Found in: Component config > LWIP > UDP*

The maximum number of active UDP “connections” (ie UDP sockets sending/receiving data). The practical maximum limit is determined by available heap memory at runtime.

**Range:**
- from 1 to 1024

**Default value:**
- 16

**CONFIG_LWIP_UDP_RECVMBOX_SIZE**

Default UDP receive mail box size

*Found in: Component config > LWIP > UDP*

Set UDP receive mail box size. The recommended value is 6.

UDP receive mail box is a per socket mail box, when the application receives packets from UDP socket, LWIP core firstly posts the packets to UDP receive mail box and the application then fetches the packets from mail box. It means LWIP can caches maximum UDP_RECCVMBOX_SIZE packets for each UDP socket, so the maximum possible cached UDP packets for all UDP sockets is UDP_RECCVMBOX_SIZE multiples the maximum UDP socket number. In other words, the bigger UDP_RECCVMBOX_SIZE means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the UDP receive mail box is big enough to avoid packet drop between LWIP core and application.

**Range:**
- from 6 to 64

**Default value:**
- 6

**Checksums**  Contains:

- **CONFIG_LWIP_CHECKSUM_CHECK_ICMP**
- **CONFIG_LWIP_CHECKSUM_CHECK_IP**
- **CONFIG_LWIP_CHECKSUM_CHECK_UDP**
CONFIG_LWIP_CHECKSUM_CHECK_IP

Enable LWIP IP checksums

*Found in: Component config > LWIP > Checksums*

Enable checksum checking for received IP messages

**Default value:**
- No (disabled)

CONFIG_LWIP_CHECKSUM_CHECK_UDP

Enable LWIP UDP checksums

*Found in: Component config > LWIP > Checksums*

Enable checksum checking for received UDP messages

**Default value:**
- No (disabled)

CONFIG_LWIP_CHECKSUM_CHECK_ICMP

Enable LWIP ICMP checksums

*Found in: Component config > LWIP > Checksums*

Enable checksum checking for received ICMP messages

**Default value:**
- Yes (enabled)

CONFIG_LWIP_TCPIP_TASK_STACK_SIZE

TCP/IP Task Stack Size

*Found in: Component config > LWIP*

Configure TCP/IP task stack size, used by LWIP to process multi-threaded TCP/IP operations. Setting this stack too small will result in stack overflow crashes.

**Range:**
- from 2048 to 65536

**Default value:**
- 3072

CONFIG_LWIP_TCPIP_TASK_AFFINITY

TCP/IP task affinity

*Found in: Component config > LWIP*

Allows setting LwIP tasks affinity, i.e. whether the task is pinned to CPU0, pinned to CPU1, or allowed to run on any CPU. Currently this applies to “TCP/IP” task and “Ping” task.

**Available options:**
- No affinity (LWIP_TCPIP_TASK_AFFINITY_NO_AFFINITY)
- CPU0 (LWIP_TCPIP_TASK_AFFINITY_CPU0)
- CPU1 (LWIP_TCPIP_TASK_AFFINITY_CPU1)
Chapter 2. API Reference

**CONFIG_LWIP_PPP_SUPPORT**

Enable PPP support

*Found in: Component config > LWIP*

Enable PPP stack. Now only PPP over serial is possible.

**Default value:**

- No (disabled)

Contains:

- **CONFIG_LWIP_PPP_ENABLE_IPV6**

**CONFIG_LWIP_PPP_ENABLE_IPV6**

Enable IPv6 support for PPP connections (IPV6CP)

*Found in: Component config > LWIP > CONFIG_LWIP_PPP_SUPPORT*

Enable IPv6 support in PPP for the local link between the DTE (processor) and DCE (modem). There are some modems which do not support the IPv6 addressing in the local link. If they are requested for IPv6CP negotiation, they may time out. This would in turn fail the configuration for the whole link. If your modem is not responding correctly to PPP Phase Network, try to disable IPv6 support.

**Default value:**

- Yes (enabled) if `CONFIG_LWIP_PPP_SUPPORT` && `CONFIG_LWIP_IPV6`

**CONFIG_LWIP_IPV6_MEMP_NUM_ND6_QUEUE**

Max number of IPv6 packets to queue during MAC resolution

*Found in: Component config > LWIP*

Config max number of IPv6 packets to queue during MAC resolution.

**Range:**

- from 3 to 20

**Default value:**

- 3

**CONFIG_LWIP_IPV6_ND6_NUM_NEIGHBORS**

Max number of entries in IPv6 neighbor cache

*Found in: Component config > LWIP*

Config max number of entries in IPv6 neighbor cache

**Range:**

- from 3 to 10

**Default value:**

- 5

**CONFIG_LWIP_PPP_NOTIFY_PHASE_SUPPORT**

Enable Notify Phase Callback

*Found in: Component config > LWIP*

Enable to set a callback which is called on change of the internal PPP state machine.

**Default value:**

- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`
CONFIG_LWIP_PPP_PAP_SUPPORT

Enable PAP support

*Found in: Component config > LWIP*

Enable Password Authentication Protocol (PAP) support

**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

CONFIG_LWIP_PPP_CHAP_SUPPORT

Enable CHAP support

*Found in: Component config > LWIP*

Enable Challenge Handshake Authentication Protocol (CHAP) support

**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

CONFIG_LWIP_PPP_MSCHAP_SUPPORT

Enable MSCHAP support

*Found in: Component config > LWIP*

Enable Microsoft version of the Challenge-Handshake Authentication Protocol (MSCHAP) support

**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

CONFIG_LWIP_PPP_MPPE_SUPPORT

Enable MPPE support

*Found in: Component config > LWIP*

Enable Microsoft Point-to-Point Encryption (MPPE) support

**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

CONFIG_LWIP_ENABLE_LCP_ECHO

Enable LCP ECHO

*Found in: Component config > LWIP*

Enable LCP echo keepalive requests

**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

CONFIG_LWIP_LCP_ECHOINTERVAL

Echo interval (s)

*Found in: Component config > LWIP > CONFIG_LWIP_ENABLE_LCP_ECHO*

Interval in seconds between keepalive LCP echo requests, 0 to disable.

**Range:**
- from 0 to 1000000 if `CONFIG_LWIP_ENABLE_LCP_ECHO`

**Default value:**
- 3 if `CONFIG_LWIP_ENABLE_LCP_ECHO`
**CONFIG_LWIP_LCP_MAXECHOFAILS**

Maximum echo failures

*Found in: Component config > LWIP > CONFIG_LWIP_ENABLE_LCP_ECHO*

Number of consecutive unanswered echo requests before failure is indicated.

**Range:**
- from 0 to 100000 if `CONFIG_LWIP_ENABLE_LCP_ECHO`

**Default value:**
- 3 if `CONFIG_LWIP_ENABLE_LCP_ECHO`

**CONFIG_LWIP_PPP_DEBUG_ON**

Enable PPP debug log output

*Found in: Component config > LWIP*

Enable PPP debug log output

**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

**CONFIG_LWIP_SLIP_SUPPORT**

Enable SLIP support (new/experimental)

*Found in: Component config > LWIP*

Enable SLIP stack. Now only SLIP over serial is possible.

SLIP over serial support is experimental and unsupported.

**Default value:**
- No (disabled)

Contains:
- `CONFIG_LWIP_SLIP_DEBUG_ON`

**CONFIG_LWIP_SLIP_DEBUG_ON**

Enable SLIP debug log output

*Found in: Component config > LWIP > CONFIG_LWIP_SLIP_SUPPORT*

Enable SLIP debug log output

**Default value:**
- No (disabled) if `CONFIG_LWIP_SLIP_SUPPORT`

**ICMP**

Contains:
- `CONFIG_LWIP_ICMP`
- `CONFIG_LWIP_BROADCAST_PING`
- `CONFIG_LWIP_MULTICAST_PING`

**CONFIG_LWIP_ICMP**

ICMP: Enable ICMP

*Found in: Component config > LWIP > ICMP*

Enable ICMP module for check network stability

**Default value:**
• Yes (enabled)

**CONFIG_LWIP_MULTICAST_PING**

Respond to multicast pings

*Found in: Component config > LWIP > ICMP*

**Default value:**

• No (disabled)

**CONFIG_LWIP_BROADCAST_PING**

Respond to broadcast pings

*Found in: Component config > LWIP > ICMP*

**Default value:**

• No (disabled)

**LWIP RAW API**  Contains:

• **CONFIG_LWIP_MAX_RAW_PCBS**

**CONFIG_LWIP_MAX_RAW_PCBS**

Maximum LWIP RAW PCBs

*Found in: Component config > LWIP > LWIP RAW API*

The maximum number of simultaneously active LWIP RAW protocol control blocks. The practical maximum limit is determined by available heap memory at runtime.

**Range:**

• from 1 to 1024

**Default value:**

• 16

**SNTP**  Contains:

• **CONFIG_LWIP_SNTP_MAX_SERVERS**
• **CONFIG_LWIP_SNTP_UPDATE_DELAY**
• **CONFIG_LWIP_DHCP_GET_NTP_SRV**

**CONFIG_LWIP_SNTP_MAX_SERVERS**

Maximum number of NTP servers

*Found in: Component config > LWIP > SNTP*

Set maximum number of NTP servers used by LwIP SNTP module. First argument of sntp_setserver/sntp_setservername functions is limited to this value.

**Range:**

• from 1 to 16

**Default value:**

• 1
CONFIG_LWIP_DHCP_GET_NTP_SRV

Request NTP servers from DHCP

*Found in: Component config > LWIP > SNTP*

If enabled, LWIP will add ‘NTP’ to Parameter-Request Option sent via DHCP-request. DHCP server might reply with an NTP server address in option 42. SNTP callback for such replies should be set accordingly (see snntp_servermode_dhcp() func.)

**Default value:**
- No (disabled)

CONFIG_LWIP_DHCP_MAX_NTP_SERVERS

Maximum number of NTP servers acquired via DHCP

*Found in: Component config > LWIP > SNTP > CONFIG_LWIP_DHCP_GET_NTP_SRV*

Set maximum number of NTP servers acquired via DHCP-offer. Should be less or equal to “Maximum number of NTP servers”, any extra servers would be just ignored.

**Range:**
- from 1 to 16 if CONFIG_LWIP_DHCP_GET_NTP_SRV

**Default value:**
- 1 if CONFIG_LWIP_DHCP_GET_NTP_SRV

CONFIG_LWIP_SNTP_UPDATE_DELAY

Request interval to update time (ms)

*Found in: Component config > LWIP > SNTP*

This option allows you to set the time update period via SNTP. Default is 1 hour. Must not be below 15 seconds by specification. (SNTPv4 RFC 4330 enforces a minimum update time of 15 seconds).

**Range:**
- from 15000 to 4294967295

**Default value:**
- 3600000

CONFIG_LWIP_BRIDGEIF_MAX_PORTS

Maximum number of bridge ports

*Found in: Component config > LWIP*

Set maximum number of ports a bridge can consist of.

**Range:**
- from 1 to 63

**Default value:**
- 7

CONFIG_LWIP_ESP_LWIP_ASSERT

Enable LWIP ASSERT checks

*Found in: Component config > LWIP*

Enable this option keeps LWIP assertion checks enabled. It is recommended to keep this option enabled. If asserts are disabled for the entire project, they are also disabled for LWIP and this option is ignored.

**Default value:**
- Yes (enabled) if COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE
Hooks  Contains:

- `CONFIG_LWIP_HOOK_ND6_GET_GW`
- `CONFIG_LWIP_HOOK_IP6_INPUT`
- `CONFIG_LWIP_HOOK_IP6_ROUTE`
- `CONFIG_LWIP_HOOK_IP6_SELECT_SRC_ADDR`
- `CONFIG_LWIP_HOOK_NETCONN_EXTERNAL_RESOLVE`
- `CONFIG_LWIP_HOOK_TCP_ISN`

**CONFIG_LWIP_HOOK_TCP_ISN**

TCP ISN Hook

*Found in: Component config > LWIP > Hooks*

Enables to define a TCP ISN hook to randomize initial sequence number in TCP connection. The default TCP ISN algorithm used in IDF (standardized in RFC 6528) produces ISN by combining an MD5 of the new TCP id and a stable secret with the current time. This is because the lwIP implementation (`tcp_next_iss`) is not very strong, as it does not take into consideration any platform specific entropy source.

Set to `LWIP_HOOK_TCP_ISN_CUSTOM` to provide custom implementation. Set to `LWIP_HOOK_TCP_ISN_NONE` to use lwIP implementation.

**Available options:**

- No hook declared (`LWIP_HOOK_TCP_ISN_NONE`)
- Default implementation (`LWIP_HOOK_TCP_ISN_DEFAULT`)
- Custom implementation (`LWIP_HOOK_TCP_ISN_CUSTOM`)

**CONFIG_LWIP_HOOK_IP6_ROUTE**

IPv6 route Hook

*Found in: Component config > LWIP > Hooks*

Enables custom IPv6 route hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**

- No hook declared (`LWIP_HOOK_IP6_ROUTE_NONE`)
- Default (weak) implementation (`LWIP_HOOK_IP6_ROUTE_DEFAULT`)
- Custom implementation (`LWIP_HOOK_IP6_ROUTE_CUSTOM`)

**CONFIG_LWIP_HOOK_ND6_GET_GW**

IPv6 get gateway Hook

*Found in: Component config > LWIP > Hooks*

Enables custom IPv6 route hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**

- No hook declared (`LWIP_HOOK_ND6_GET_GW_NONE`)
- Default (weak) implementation (`LWIP_HOOK_ND6_GET_GW_DEFAULT`)
- Custom implementation (`LWIP_HOOK_ND6_GET_GW_CUSTOM`)**
CONFIG_LWIP_HOOK_IP6_SELECT_SRC_ADDR
IPv6 source address selection Hook

*Found in: Component config > LWIP > Hooks*

Enables custom IPv6 source address selection. Setting this to “default” provides weak implementation stub that could be overwitten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**
- No hook declared (LWIP_HOOK_IP6_SELECT_SRC_ADDR_NONE)
- Default (weak) implementation (LWIP_HOOK_IP6_SELECT_SRC_ADDR_DEFAULT)
- Custom implementation (LWIP_HOOK_IP6_SELECT_SRC_ADDR_CUSTOM)

CONFIG_LWIP_HOOK_NETCONN_EXTERNAL_RESOLVE
Netconn external resolve Hook

*Found in: Component config > LWIP > Hooks*

Enables custom DNS resolve hook. Setting this to “default” provides weak implementation stub that could be overwitten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**
- No hook declared (LWIP_HOOK_NETCONN_EXT_RESOLVE_NONE)
- Default (weak) implementation (LWIP_HOOK_NETCONN_EXT_RESOLVE_DEFAULT)
- Custom implementation (LWIP_HOOK_NETCONN_EXT_RESOLVE_CUSTOM)

CONFIG_LWIP_HOOK_IP6_INPUT
IPv6 packet input

*Found in: Component config > LWIP > Hooks*

Enables custom IPv6 packet input. Setting this to “default” provides weak implementation stub that could be overwitten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**
- No hook declared (LWIP_HOOK_IP6_INPUT_NONE)
- Default (weak) implementation (LWIP_HOOK_IP6_INPUT_DEFAULT)
- Custom implementation (LWIP_HOOK_IP6_INPUT_CUSTOM)

CONFIG_LWIP_DEBUG
Enable LWIP Debug

*Found in: Component config > LWIP*

Enabling this option allows different kinds of lwIP debug output.

All lwIP debug features increase the size of the final binary.

**Default value:**
- No (disabled)

Contains:
- `CONFIG_LWIP_API_LIB_DEBUG`
- `CONFIG_LWIP_BRIDGEIF_FDB_DEBUG`
- `CONFIG_LWIP_BRIDGEIF_FW_DEBUG`
- `CONFIG_LWIP_BRIDGEIF_DEBUG`
- `CONFIG_LWIP_DHCP_DEBUG`
• `CONFIG_LWIP_DHCP_STATE_DEBUG`
• `CONFIG_LWIP_DNS_DEBUG`
• `CONFIG_LWIP_ETHARP_DEBUG`
• `CONFIG_LWIP_ICMP_DEBUG`
• `CONFIG_LWIP_ICMP6_DEBUG`
• `CONFIG_LWIP_IP_DEBUG`
• `CONFIG_LWIP_IP6_DEBUG`
• `CONFIG_LWIP_NAPT_DEBUG`
• `CONFIG_LWIP_NETIF_DEBUG`
• `CONFIG_LWIP_PBUF_DEBUG`
• `CONFIG_LWIP_SNTP_DEBUG`
• `CONFIG_LWIP_SOCKETS_DEBUG`
• `CONFIG_LWIP_TCP_DEBUG`
• `CONFIG_LWIP_UDP_DEBUG`
• `CONFIG_LWIP_DEBUG_ESP_LOG`

**CONFIG_LWIP_DEBUG_ESP_LOG**

Route LWIP debugs through ESP_LOG interface

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

Enabling this option routes all enabled LWIP debugs through ESP_LOGD.

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_NETIF_DEBUG**

Enable netif debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_PBUF_DEBUG**

Enable pbuf debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_ETHARP_DEBUG**

Enable etharp debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_API_LIB_DEBUG**

Enable api lib debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`
CONFIG_LWIP_SOCKETS_DEBUG

Enable socket debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

CONFIG_LWIP_IP_DEBUG

Enable IP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

CONFIG_LWIP_ICMP_DEBUG

Enable ICMP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG` & `CONFIG_LWIP_ICMP`

CONFIG_LWIP_DHCP_STATE_DEBUG

Enable DHCP state tracking

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

CONFIG_LWIP_DHCP_DEBUG

Enable DHCP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

CONFIG_LWIP_IP6_DEBUG

Enable IP6 debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

CONFIG_LWIP_ICMP6_DEBUG

Enable ICMP6 debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`
CONFIG_LWIP_TCP_DEBUG
Enable TCP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
  - No (disabled) if *CONFIG_LWIP_DEBUG*

CONFIG_LWIP_UDP_DEBUG
Enable UDP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
  - No (disabled) if *CONFIG_LWIP_DEBUG*

CONFIG_LWIP_SNTP_DEBUG
Enable SNTP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
  - No (disabled) if *CONFIG_LWIP_DEBUG*

CONFIG_LWIP_DNS_DEBUG
Enable DNS debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
  - No (disabled) if *CONFIG_LWIP_DEBUG*

CONFIG_LWIP_NAPT_DEBUG
Enable NAPT debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
  - No (disabled) if *CONFIG_LWIP_DEBUG* & & *CONFIG_LWIP_IPV4_NAPT*

CONFIG_LWIP_BRIDGEIF_DEBUG
Enable bridge generic debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
  - No (disabled) if *CONFIG_LWIP_DEBUG*

CONFIG_LWIP_BRIDGEIF_FDB_DEBUG
Enable bridge FDB debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
  - No (disabled) if *CONFIG_LWIP_DEBUG*
CONFIG_LWIP_BRIDGEIF_FW_DEBUG

Enable bridge forwarding debug messages

_found in:_ Component config > LWIP > CONFIG_LWIP_DEBUG

_default value:_

- No (disabled) if CONFIG_LWIP_DEBUG

_mbedTLS_ Contains:

Chapter 2. API Reference

- `CONFIG_MBEDTLS_SSL_RENEGOTIATION`
- `Symmetric Ciphers`
- `TLS Key Exchange Methods`
- `CONFIG_MBEDTLS_SSL_MAX_CONTENT_LEN`
- `CONFIG_MBEDTLS_TLS_MODE`
- `CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS`
- `CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS`
- `CONFIG_MBEDTLS_ROM_MD5`
- `CONFIG_MBEDTLS_DYNAMIC_BUFFER`

**CONFIG_MBEDTLS_MEM_ALLOC_MODE**

Memory allocation strategy

*Found in: Component config > mbedTLS*

Allocation strategy for mbedTLS, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Custom allocation mode, by overwriting calloc()/free() using mbedtls_platform_set_calloc_free() function
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

**Available options:**

- Internal memory (MBEDTLS_INTERNAL_MEM_ALLOC)
- External SPIRAM (MBEDTLS_EXTERNAL_MEMALLOC)
- Default alloc mode (MBEDTLS_DEFAULT_MEM_ALLOC)
- Custom alloc mode (MBEDTLS_CUSTOM_MEM_ALLOC)
- Internal IRAM (MBEDTLS_IRAM_8BIT_MEM_ALLOC)

Allows to use IRAM memory region as 8bit accessible region. TLS input and output buffers will be allocated in IRAM section which is 32bit aligned memory. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

**CONFIG_MBEDTLS_SSL_MAX_CONTENT_LEN**

TLS maximum message content length

*Found in: Component config > mbedTLS*

Maximum TLS message length (in bytes) supported by mbedTLS. 16384 is the default and this value is required to comply fully with TLS standards.

However you can set a lower value in order to save RAM. This is safe if the other end of the connection supports Maximum Fragment Length Negotiation Extension (max_fragment_length, see RFC6066) or you know for certain that it will never send a message longer than a certain number of bytes.

If the value is set too low, symptoms are a failed TLS handshake or a return value of MBEDTLS_ERR_SSL_INVALID_RECORD (-0x7200).

**Range:**

- from 512 to 16384
Default value:
  • 16384

`CONFIG_MBEDTLSASYMMETRIC_CONTENT_LEN`

Asymmetric in/out fragment length

*Found in: Component config > mbedTLS*

If enabled, this option allows customizing TLS in/out fragment length in asymmetric way. Please note that enabling this with default values saves 12KB of dynamic memory per TLS connection.

Default value:
  • Yes (enabled)

`CONFIG_MBEDTLS_SSL_IN_CONTENT_LEN`

TLS maximum incoming fragment length

*Found in: Component config > mbedTLS > CONFIG_MBEDTLSASYMMETRIC_CONTENT_LEN*

This defines maximum incoming fragment length, overriding default maximum content length (MBEDTLS_SSL_MAX_CONTENT_LEN).

Range:
  • from 512 to 16384

Default value:
  • 16384

`CONFIG_MBEDTLS_SSL_OUT_CONTENT_LEN`

TLS maximum outgoing fragment length

*Found in: Component config > mbedTLS > CONFIG_MBEDTLSASYMMETRIC_CONTENT_LEN*

This defines maximum outgoing fragment length, overriding default maximum content length (MBEDTLS_SSL_MAX_CONTENT_LEN).

Range:
  • from 512 to 16384

Default value:
  • 4096

`CONFIG_MBEDTLS_DYNAMIC_BUFFER`

Using dynamic TX/RX buffer

*Found in: Component config > mbedTLS*

Using dynamic TX/RX buffer. After enabling this option, mbedTLS will allocate TX buffer when need to send data and then free it if all data is sent, allocate RX buffer when need to receive data and then free it when all data is used or read by upper layer.

By default, when SSL is initialized, mbedTLS also allocate TX and RX buffer with the default value of “MBEDTLS_SSL_OUT_CONTENT_LEN” or “MBEDTLS_SSL_IN_CONTENT_LEN”, so to save more heap, users can set the options to be an appropriate value.

Default value:
  • No (disabled) if CONFIG_MBEDTLS_SSL_PROTO_DTLS && CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH
CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA

Free private key and DHM data after its usage

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER

Free private key and DHM data after its usage in handshake process.
The option will decrease heap cost when handshake, but also lead to problem:
Because all certificate, private key and DHM data are freed so users should register certificate and private key to ssl config object again.

Default value:
• No (disabled) if CONFIG_MBEDTLS_DYNAMIC_BUFFER

CONFIG_MBEDTLS_DYNAMIC_FREE_CA_CERT

Free SSL CA certificate after its usage

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER > CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA

Free CA certificate after its usage in the handshake process. This option will decrease the heap footprint for the TLS handshake, but may lead to a problem: If the respective ssl object needs to perform the TLS handshake again, the CA certificate should once again be registered to the ssl object.

Default value:
• Yes (enabled) if CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA

CONFIG_MBEDTLS_DEBUG

Enable mbedTLS debugging

Found in: Component config > mbedTLS

Enable mbedTLS debugging functions at compile time.
If this option is enabled, you can include “mbedtls/esp_debug.h” and call mbedtls_esp_enable_debug_log() at runtime in order to enable mbedTLS debug output via the ESP log mechanism.

Default value:
• No (disabled)

CONFIG_MBEDTLS_DEBUG_LEVEL

Set mbedTLS debugging level

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DEBUG

Set mbedTLS debugging level

Available options:
• Warning (MBEDTLS_DEBUG_LEVEL_WARN)
• Info (MBEDTLS_DEBUG_LEVEL_INFO)
• Debug (MBEDTLS_DEBUG_LEVEL_DEBUG)
• Verbose (MBEDTLS_DEBUG_LEVEL_VERBOSE)

mbedTLS v3.x related Contains:
• DTLS-based configurations
• CONFIG_MBEDTLS_PKCS7_C
• CONFIG_MBEDTLS_SSL_CONTEXT_SERIALIZATION
• CONFIG_MBEDTLS_X509_TRUSTED_CERT_CALLBACK
Chapter 2. API Reference

- CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE
- CONFIG_MBEDTLS_SSL_CID_PADDING_GRANULARITY
- CONFIG_MBEDTLS_SSL_PROTO_TLS1_3
- CONFIG_MBEDTLS_ECDH_LEGACY_CONTEXT
- CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH

CONFIG_MBEDTLS_SSL_PROTO_TLS1_3

Support TLS 1.3 protocol

Found in: Component config > mbedTLS > mbedTLS v3.x related

Default value:
- No (disabled) if CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE && CONFIG_MBEDTLS_DYNAMIC_BUFFER

TLS 1.3 related configurations Contains:

- CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_EPHEMERAL
- CONFIG_MBEDTLS_SSL_TLS1_3_COMPATIBILITY_MODE
- CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_PSK_EPHEMERAL
- CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_PSK

CONFIG_MBEDTLS_SSL_TLS1_3_COMPATIBILITY_MODE

TLS 1.3 middlebox compatibility mode

Found in: Component config > mbedTLS > mbedTLS v3.x related > CONFIG_MBEDTLS_SSL_PROTO_TLS1_3 > TLS 1.3 related configurations

Default value:
- Yes (enabled) if CONFIG_MBEDTLS_SSL_PROTO_TLS1_3

CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_PSK

TLS 1.3 PSK key exchange mode

Found in: Component config > mbedTLS > mbedTLS v3.x related > CONFIG_MBEDTLS_SSL_PROTO_TLS1_3 > TLS 1.3 related configurations

Default value:
- Yes (enabled) if CONFIG_MBEDTLS_SSL_PROTO_TLS1_3

CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_EPHEMERAL

TLS 1.3 ephemeral key exchange mode

Found in: Component config > mbedTLS > mbedTLS v3.x related > CONFIG_MBEDTLS_SSL_PROTO_TLS1_3 > TLS 1.3 related configurations

Default value:
- Yes (enabled) if CONFIG_MBEDTLS_SSL_PROTO_TLS1_3

CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_PSK_EPHEMERAL

TLS 1.3 PSK ephemeral key exchange mode

Found in: Component config > mbedTLS > mbedTLS v3.x related > CONFIG_MBEDTLS_SSL_PROTO_TLS1_3 > TLS 1.3 related configurations

Default value:
- Yes (enabled) if CONFIG_MBEDTLS_SSL_PROTO_TLS1_3
**CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH**

Variable SSL buffer length

*Found in: Component config > mbedtls > mbedtls v3.x related*

This enables the SSL buffer to be resized automatically based on the negotiated maximum fragment length in each direction.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_ECDH_LEGACY_CONTEXT**

Use a backward compatible ECDH context (Experimental)

*Found in: Component config > mbedtls > mbedtls v3.x related*

Use the legacy ECDH context format. Define this option only if you enable MBEDTLS_ECP_RESTARTABLE or if you want to access ECDH context fields directly.

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_ECDH_C && CONFIG_MBEDTLS_ECP_RESTARTABLE

**CONFIG_MBEDTLS_X509_TRUSTED_CERT_CALLBACK**

Enable trusted certificate callbacks

*Found in: Component config > mbedtls > mbedtls v3.x related*

Enables users to configure the set of trusted certificates through a callback instead of a linked list.

See mbedtls documentation for required API and more details.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_SSL_CONTEXT_SERIALIZATION**

Enable serialization of the TLS context structures

*Found in: Component config > mbedtls > mbedtls v3.x related*

Enable serialization of the TLS context structures. This is a local optimization in handling a single, potentially long-lived connection.

See mbedtls documentation for required API and more details. Disabling this option will save some code size.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE**

Keep peer certificate after handshake completion

*Found in: Component config > mbedtls > mbedtls v3.x related*

Keep the peer’s certificate after completion of the handshake. Disabling this option will save about 4kB of heap and some code size.

See mbedtls documentation for required API and more details.

**Default value:**
- Yes (enabled) if MBEDTLS_DYNAMIC_FREE_PEER_CERT
CONFIG_MBEDTLS_PKCS7_C

Enable PKCS #7

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

Enable PKCS #7 core for using PKCS #7-formatted signatures.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_SSL_CID_PADDING_GRANULARITY

Record plaintext padding

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

Controls the use of record plaintext padding in TLS 1.3 and when using the Connection ID extension in DTLS 1.2.

The padding will always be chosen so that the length of the padded plaintext is a multiple of the value of this option.

**Notes:** A value of 1 means that no padding will be used for outgoing records. On systems lacking division instructions, a power of two should be preferred.

**Range:**
- from 0 to 32 if CONFIG_MBEDTLS_SSL_PROTO_TLS1_3 || CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

**Default value:**
- 16 if CONFIG_MBEDTLS_SSL_PROTO_TLS1_3 || CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

DTLS-based configurations

Contains:
- CONFIG_MBEDTLS_SSL_DTLS_SRTP
- CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

Support for the DTLS Connection ID extension

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations*

Enable support for the DTLS Connection ID extension which allows to identify DTLS connections across changes in the underlying transport.

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_SSL_PROTO_DTLS

CONFIG_MBEDTLS_SSL_CID_IN_LEN_MAX

Maximum length of CIDs used for incoming DTLS messages

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID*

Maximum length of CIDs used for incoming DTLS messages

**Range:**
- from 0 to 32 if CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID && CONFIG_MBEDTLS_SSL_PROTO_DTLS

**Default value:**
- 32 if CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID && CONFIG_MBEDTLS_SSL_PROTO_DTLS
CONFIG_MBEDTLS_SSL_CID_OUT_LEN_MAX

Maximum length of CIDs used for outgoing DTLS messages

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID*

Maximum length of CIDs used for outgoing DTLS messages

**Range:**
- from 0 to 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**Default value:**
- 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

CONFIG_MBEDTLS_SSL_DTLS_SRTP

Enable support for negotiation of DTLS-SRTP (RFC 5764)

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations*

Enable support for negotiation of DTLS-SRTP (RFC 5764) through the use_srtp extension.

See mbedTLS documentation for required API and more details. Disabling this option will save some code size.

**Default value:**
- No (disabled) if `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

Certificate Bundle

Contains:

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`

CONFIG_MBEDTLS_CERTIFICATE_BUNDLE

Enable trusted root certificate bundle

*Found in: Component config > mbedTLS > Certificate Bundle*

Enable support for large number of default root certificates

When enabled this option allows user to store default as well as customer specific root certificates in compressed format rather than storing full certificate. For the root certificates the public key and the subject name will be stored.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE

Default certificate bundle options

*Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE*

**Available options:**
- Use the full default certificate bundle (`MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_FULL`)
- Use only the most common certificates from the default bundles (`MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_CMN`)
  Use only the most common certificates from the default bundles, reducing the size with 50%, while still having around 99% coverage.
- Do not use the default certificate bundle (`MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_NONE`)
CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE
Add custom certificates to the default bundle

Default value:
• No (disabled)

CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH
Custom certificate bundle path

Name of the custom certificate directory or file. This path is evaluated relative to the project root directory.

CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_MAX_CERTS
Maximum no of certificates allowed in certificate bundle

Default value:
• 200

CONFIG_MBEDTLS_ECP_RESTARTABLE
Enable mbedtls ecp restartable

Default value:
• No (disabled)

CONFIG_MBEDTLS_CMAC_C
Enable CMAC mode for block ciphers

Default value:
• No (disabled)

CONFIG_MBEDTLS_HARDWARE_AES
Enable hardware AES acceleration

Default value:
• Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST
CONFIG_MBEDTLS_HARDWARE_GCM
Enable partially hardware accelerated GCM

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HARDWARE_AES*

Enable partially hardware accelerated GCM. GHASH calculation is still done in software.
If MBEDTLS_HARDWARE_GCM is disabled and MBEDTLS_HARDWARE_AES is enabled then
mbedTLS will still use the hardware accelerated AES block operation, but on a single block at a time.

**Default value:**
- Yes (enabled) if SOC_AES_SUPPORT_GCM && CONFIG_MBEDTLS_HARDWARE_AES

CONFIG_MBEDTLS_HARDWARE_MPI
Enable hardware MPI (bignum) acceleration

*Found in: Component config > mbedTLS*

Enable hardware accelerated multiple precision integer operations.
Hardware accelerated multiplication, modulo multiplication, and modular exponentiation for up to
SOC_RSA_MAX_BIT_LEN bit results.
These operations are used by RSA.

**Default value:**
- Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST

CONFIG_MBEDTLS_HARDWARE_SHA
Enable hardware SHA acceleration

*Found in: Component config > mbedTLS*

Enable hardware accelerated SHA1, SHA256, SHA384 & SHA512 in mbedTLS.
Due to a hardware limitation, on the ESP32 hardware acceleration is only guaranteed if SHA digests
are calculated one at a time. If more than one SHA digest is calculated at the same time, one will be
calculated fully in hardware and the rest will be calculated (at least partially calculated) in software. This
happens automatically.
SHA hardware acceleration is faster than software in some situations but slower in others. You should
benchmark to find the best setting for you.

**Default value:**
- Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST

CONFIG_MBEDTLS_HARDWARE_ECC
Enable hardware ECC acceleration

*Found in: Component config > mbedTLS*

Enable hardware accelerated ECC point multiplication and point verification for points on curve
SECP192R1 and SECP256R1 in mbedTLS

**Default value:**
- Yes (enabled) if SOC_ECC_SUPPORTED
CONFIG_MBEDTLS_ECC_OTHER_CURVES_SOFT_FALLBACK

Fallback to software implementation for curves not supported in hardware

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HARDWARE_ECC

Fallback to software implementation of ECC point multiplication and point verification for curves not supported in hardware.

Default value:
- Yes (enabled) if CONFIG_MBEDTLS_HARDWARE_ECC

CONFIG_MBEDTLS_ROM_MD5

Use MD5 implementation in ROM

Found in: Component config > mbedTLS

Use ROM MD5 in mbedTLS.

Default value:
- Yes (enabled)

CONFIG_MBEDTLS_HARDWARE_ECDSA_SIGN

Enable ECDSA signing using on-chip ECDSA peripheral

Found in: Component config > mbedTLS

Enable hardware accelerated ECDSA peripheral to sign data on curve SECP192R1 and SECP256R1 in mbedTLS.

Note that for signing, the private key has to be burnt in an efuse key block with key purpose set to ECDSA_KEY. If no key is burnt, it will report an error

The key should be burnt in little endian format. espfuse.py utility handles it internally but care needs to be taken while burning using esp_efuse APIs

Default value:
- No (disabled) if SOC_ECDSA_SUPPORTED

CONFIG_MBEDTLS_HARDWARE_ECDSA_VERIFY

Enable ECDSA signature verification using on-chip ECDSA peripheral

Found in: Component config > mbedTLS

Enable hardware accelerated ECDSA peripheral to verify signature on curve SECP192R1 and SECP256R1 in mbedTLS.

Default value:
- Yes (enabled) if SOC_ECDSA_SUPPORTED

CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN

Enable hardware ECDSA sign acceleration when using ATECC608A

Found in: Component config > mbedTLS

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

Default value:
- No (disabled)
CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY
Enable hardware ECDSA verify acceleration when using ATECC608A

Found in: Component config > mbedTLS
This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

Default value:
• No (disabled)

CONFIG_MBEDTLS_HAVE_TIME
Enable mbedtls time support

Found in: Component config > mbedTLS
Enable use of time.h functions (time() and gmtime()) by mbedTLS.
This option doesn’t require the system time to be correct, but enables functionality that requires relative timekeeping - for example periodic expiry of TLS session tickets or session cache entries.
Disabling this option will save some firmware size, particularly if the rest of the firmware doesn’t call any standard timekeeping functions.

Default value:
• Yes (enabled)

CONFIG_MBEDTLS_PLATFORM_TIME_ALT
Enable mbedtls time support: platform-specific

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HAVE_TIME
Enabling this config will provide users with a function “mbedtls_platform_set_time()” that allows to set an alternative time function pointer.

Default value:
• No (disabled)

CONFIG_MBEDTLS_HAVE_TIME_DATE
Enable mbedtls certificate expiry check

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HAVE_TIME
Enables X.509 certificate expiry checks in mbedTLS.
If this option is disabled (default) then X.509 certificate “valid from” and “valid to” timestamp fields are ignored.
If this option is enabled, these fields are compared with the current system date and time. The time is retrieved using the standard time() and gmtime() functions. If the certificate is not valid for the current system time then verification will fail with code MBEDTLS_X509_BADCERT_FUTURE or MBEDTLS_X509_BADCERT_EXPIRED.
Enabling this option requires adding functionality in the firmware to set the system clock to a valid timestamp before using TLS. The recommended way to do this is via ESP-IDF’s SNTP functionality, but any method can be used.
In the case where only a small number of certificates are trusted by the device, please carefully consider the tradeoffs of enabling this option. There may be undesired consequences, for example if all trusted certificates expire while the device is offline and a TLS connection is required to update. Or if an issue with the SNTP server means that the system time is invalid for an extended period after a reset.

Default value:
Chapter 2. API Reference

- No (disabled)

**CONFIG_MBEDTLS_ECDSA_DETERMINISTIC**

Enable deterministic ECDSA

*Found in: Component config > mbedTLS*

Standard ECDSA is “fragile” in the sense that lack of entropy when signing may result in a compromise of the long-term signing key.

*Default value:*
  - Yes (enabled)

**CONFIG_MBEDTLS_SHA512_C**

Enable the SHA-384 and SHA-512 cryptographic hash algorithms

*Found in: Component config > mbedTLS*

Enable MBEDTLS_SHA512_C adds support for SHA-384 and SHA-512.

*Default value:*
  - Yes (enabled)

**CONFIG_MBEDTLS_TLS_MODE**

TLS Protocol Role

*Found in: Component config > mbedTLS*

mbedTLS can be compiled with protocol support for the TLS server, TLS client, or both server and client.

Reducing the number of TLS roles supported saves code size.

*Available options:*
  - Server & Client (MBEDTLS_TLS_SERVER_AND_CLIENT)
  - Server (MBEDTLS_TLS_SERVER_ONLY)
  - Client (MBEDTLS_TLS_CLIENT_ONLY)
  - None (MBEDTLS_TLS_DISABLED)

**TLS Key Exchange Methods** Contains:

- **CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA**
- **CONFIG_MBEDTLS_KEY_EXCHANGE_ECJPAKE**
- **CONFIG_MBEDTLS_PSK_MODES**
- **CONFIG_MBEDTLS_KEY_EXCHANGE_RSA**
- **CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE**

**CONFIG_MBEDTLS_PSK_MODES**

Enable pre-shared-key ciphersuites

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*

Enable to show configuration for different types of pre-shared-key TLS authentication methods.

Leaving this options disabled will save code size if they are not used.

*Default value:*
  - No (disabled)
CONFIG_MBEDTLS_KEY_EXCHANGE_PSK
Enable PSK based ciphersuite modes

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES
Enable to support symmetric key PSK (pre-shared-key) TLS key exchange modes.

*Default value:* • No (disabled) if CONFIG_MBEDTLS_PSK_MODES

CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_PSK
Enable DHE-PSK based ciphersuite modes

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES
Enable to support Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

*Default value:* • Yes (enabled) if CONFIG_MBEDTLS_PSK_MODES && CONFIG_MBEDTLS_DHM_C

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_PSK
Enable ECDHE-PSK based ciphersuite modes

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES
Enable to support Elliptic-Curve-Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

*Default value:* • Yes (enabled) if CONFIG_MBEDTLS_PSK_MODES && CONFIG_MBEDTLS_ECDH_C

CONFIG_MBEDTLS_KEY_EXCHANGE_RSA_PSK
Enable RSA-PSK based ciphersuite modes

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES
Enable to support RSA PSK (pre-shared-key) TLS authentication modes.

*Default value:* • Yes (enabled) if CONFIG_MBEDTLS_PSK_MODES

CONFIG_MBEDTLS_KEY_EXCHANGE_RSA
Enable RSA-only based ciphersuite modes

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods
Enable to support ciphersuites with prefix TLS-RSA-WITH-

*Default value:* • Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA
Enable DHE-RSA based ciphersuite modes

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods
Enable to support ciphersuites with prefix TLS-DHE-RSA-WITH-
Default value:
  • Yes (enabled) if CONFIG_MBEDTLS_DH_C

CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE

Support Elliptic Curve based ciphersuites

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*

Enable to show Elliptic Curve based ciphersuite mode options.
Disabling all Elliptic Curve ciphersuites saves code size and can give slightly faster TLS handshakes, provided the server supports RSA-only ciphersuite modes.

Default value:
  • Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_RSA

Enable ECDHE-RSA based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE*

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

Default value:
  • Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_ECDSA

Enable ECDHE-ECDSA based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE*

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

Default value:
  • Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_ECDSA

Enable ECDH-ECDSA based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE*

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

Default value:
  • Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_RSA

Enable ECDH-RSA based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE*

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

Default value:
  • Yes (enabled)
CONFIG_MBEDTLS_KEY_EXCHANGE_ECJPAKE
Enable ECJPAKE based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*

Enable to support ciphersuites with prefix TLS-ECJPAKE-WITH-

**Default value:**
- No (disabled) if `CONFIG_MBEDTLS_ECJPAKE_C` && `CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED`

CONFIG_MBEDTLS_SSL_RENEGOTIATION
Support TLS renegotiation

*Found in: Component config > mbedTLS*

The two main uses of renegotiation are (1) refresh keys on long-lived connections and (2) client authentication after the initial handshake. If you don’t need renegotiation, disabling it will save code size and reduce the possibility of abuse/vulnerability.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_SSL_PROTO_TLS1_2
Support TLS 1.2 protocol

*Found in: Component config > mbedTLS*

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_SSL_PROTO_GMTSSL1_1
Support GM/T SSL 1.1 protocol

*Found in: Component config > mbedTLS*

Provisions for GM/T SSL 1.1 support

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_SSL_PROTO_DTLS
Support DTLS protocol (all versions)

*Found in: Component config > mbedTLS*

Requires TLS 1.2 to be enabled for DTLS 1.2

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_SSL_ALPN
Support ALPN (Application Layer Protocol Negotiation)

*Found in: Component config > mbedTLS*

Disabling this option will save some code size if it is not needed.

**Default value:**
- Yes (enabled)
Chapter 2. API Reference

**CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS**
TLS: Client Support for RFC 5077 SSL session tickets

*Found in: Component config > mbedTLS*

Client support for RFC 5077 session tickets. See mbedTLS documentation for more details. Disabling this option will save some code size.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS**
TLS: Server Support for RFC 5077 SSL session tickets

*Found in: Component config > mbedTLS*

Server support for RFC 5077 session tickets. See mbedTLS documentation for more details. Disabling this option will save some code size.

**Default value:**
- Yes (enabled)

**Symmetric Ciphers**
Contains:

- **CONFIG_MBEDTLS_AES_C**
- **CONFIG_MBEDTLS_BLOWFISH_C**
- **CONFIG_MBEDTLS_CAMELLIA_C**
- **CONFIG_MBEDTLS_CCM_C**
- **CONFIG_MBEDTLS_DES_C**
- **CONFIG_MBEDTLS_GCM_C**
- **CONFIG_MBEDTLS_NIST_KW_C**
- **CONFIG_MBEDTLS_XTEA_C**

**CONFIG_MBEDTLS_AES_C**
AES block cipher

*Found in: Component config > mbedTLS > Symmetric Ciphers*

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_CAMELLIA_C**
Camellia block cipher

*Found in: Component config > mbedTLS > Symmetric Ciphers*

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_DES_C**
DES block cipher (legacy, insecure)

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enables the DES block cipher to support 3DES-based TLS ciphersuites.

3DES is vulnerable to the Sweet32 attack and should only be enabled if absolutely necessary.

**Default value:**
- No (disabled)
**CONFIG_MBEDTLS_BLOWFISH_C**

Blowfish block cipher (read help)

*Found in: Component config > mbedtls > Symmetric Ciphers*

Enables the Blowfish block cipher (not used for TLS sessions.)

The Blowfish cipher is not used for mbedtls TLS sessions but can be used for other purposes. Read up on the limitations of Blowfish (including Sweet32) before enabling.

**Default value:**

- No (disabled)

**CONFIG_MBEDTLS_XTEA_C**

XTEA block cipher

*Found in: Component config > mbedtls > Symmetric Ciphers*

Enables the XTEA block cipher.

**Default value:**

- No (disabled)

**CONFIG_MBEDTLS_CCM_C**

CCM (Counter with CBC-MAC) block cipher modes

*Found in: Component config > mbedtls > Symmetric Ciphers*

Enable Counter with CBC-MAC (CCM) modes for AES and/or Camellia ciphers.

Disabling this option saves some code size.

**Default value:**

- Yes (enabled)

**CONFIG_MBEDTLS_GCM_C**

GCM (Galois/Counter) block cipher modes

*Found in: Component config > mbedtls > Symmetric Ciphers*

Enable Galois/Counter Mode for AES and/or Camellia ciphers.

This option is generally faster than CCM.

**Default value:**

- Yes (enabled)

**CONFIG_MBEDTLS_NIST_KW_C**

NIST key wrapping (KW) and KW padding (KWP)

*Found in: Component config > mbedtls > Symmetric Ciphers*

Enable NIST key wrapping and key wrapping padding.

**Default value:**

- No (disabled)
CONFIG_MBEDTLS_RIPEMD160_C
Enable RIPEMD-160 hash algorithm

Found in: Component config > mbedTLS
Enable the RIPEMD-160 hash algorithm.

Default value:
- No (disabled)

Certificates Contains:
- CONFIG_MBEDTLS_PEM_PARSE_C
- CONFIG_MBEDTLS_PEM_WRITE_C
- CONFIG_MBEDTLS_X509_CRL_PARSE_C
- CONFIG_MBEDTLS_X509_CSR_PARSE_C

CONFIG_MBEDTLS_PEMPARSE_C
Read & Parse PEM formatted certificates

Found in: Component config > mbedTLS > Certificates
Enable decoding/parsing of PEM formatted certificates.
If your certificates are all in the simpler DER format, disabling this option will save some code size.

Default value:
- Yes (enabled)

CONFIG_MBEDTLS_PEMWRITE_C
Write PEM formatted certificates

Found in: Component config > mbedTLS > Certificates
Enable writing of PEM formatted certificates.
If writing certificate data only in DER format, disabling this option will save some code size.

Default value:
- Yes (enabled)

CONFIG_MBEDTLSX509CRLPARSE_C
X.509 CRL parsing

Found in: Component config > mbedTLS > Certificates

Default value:
- Yes (enabled)

CONFIG_MBEDTLSX509CSRPARSE_C
X.509 CSR parsing

Found in: Component config > mbedTLS > Certificates
Support for parsing X.509 Certificate Signing Requests

Default value:
- Yes (enabled)
Chapter 2. API Reference

CONFIG_MBEDTLS_ECP_C
Elliptic Curve Ciphers

Found in: Component config > mbedTLS

Default value:
• Yes (enabled)

CONFIG_MBEDTLS_DHM_C
Diffie-Hellman-Merkle key exchange (DHM)

Found in: Component config > mbedTLS
Enable DHM. Needed to use DHE-xxx TLS ciphersuites.
Note that the security of Diffie-Hellman key exchanges depends on a suitable prime being used for the exchange. Please see detailed warning text about this in file mbedtls/dhm.h file.

Default value:
• No (disabled)

CONFIG_MBEDTLS_ECDH_C
Elliptic Curve Diffie-Hellman (ECDH)

Found in: Component config > mbedTLS
Enable ECDH. Needed to use ECDHE-xxx TLS ciphersuites.

Default value:
• Yes (enabled)

CONFIG_MBEDTLS_ECDSA_C
Elliptic Curve DSA

Found in: Component config > mbedTLS
Enable ECDSA. Needed to use ECDSA-xxx TLS ciphersuites.

Default value:
• Yes (enabled)

CONFIG_MBEDTLS_ECJPAKE_C
Elliptic curve J-PAKE

Found in: Component config > mbedTLS
Enable ECJPAKE. Needed to use ECJPAKE-xxx TLS ciphersuites.

Default value:
• No (disabled)

CONFIG_MBEDTLS_ECP_DP_SECP192R1_ENABLED
Enable SECP192R1 curve

Found in: Component config > mbedTLS
Enable support for SECP192R1 Elliptic Curve.

Default value:
• Yes (enabled) if (CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C
CONFIG_MBEDTLS_ECP_DP_SECP224R1_ENABLED
Enable SECP224R1 curve

*Found in:* Component config > mbedTLS
Enable support for SECP224R1 Elliptic Curve.

**Default value:**
- Yes (enabled) if \( (CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN \lor CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) \land CONFIG_MBEDTLS_ECP_C \)

CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED
Enable SECP256R1 curve

*Found in:* Component config > mbedTLS
Enable support for SECP256R1 Elliptic Curve.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_ECP_DP_SECP384R1_ENABLED
Enable SECP384R1 curve

*Found in:* Component config > mbedTLS
Enable support for SECP384R1 Elliptic Curve.

**Default value:**
- Yes (enabled) if \( (CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN \lor CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) \land CONFIG_MBEDTLS_ECP_C \)

CONFIG_MBEDTLS_ECP_DP_SECP521R1_ENABLED
Enable SECP521R1 curve

*Found in:* Component config > mbedTLS
Enable support for SECP521R1 Elliptic Curve.

**Default value:**
- Yes (enabled) if \( (CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN \lor CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) \land CONFIG_MBEDTLS_ECP_C \)

CONFIG_MBEDTLS_ECP_DP_SECP192K1_ENABLED
Enable SECP192K1 curve

*Found in:* Component config > mbedTLS
Enable support for SECP192K1 Elliptic Curve.

**Default value:**
- Yes (enabled) if \( (CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN \lor CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) \land CONFIG_MBEDTLS_ECP_C \)

CONFIG_MBEDTLS_ECP_DP_SECP224K1_ENABLED
Enable SECP224K1 curve

*Found in:* Component config > mbedTLS
Enable support for SECP224K1 Elliptic Curve.
Chapter 2. API Reference

Default value:
• Yes (enabled) if (CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C

CONFIG_MBEDTLS_ECP_DP_SECP256K1_ENABLED
Enable SECP256K1 curve

*Found in: Component config > mbedTLS*
Enable support for SECP256K1 Elliptic Curve.

Default value:
• Yes (enabled) if (CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C

CONFIG_MBEDTLS_ECP_DP_BP256R1_ENABLED
Enable BP256R1 curve

*Found in: Component config > mbedTLS*
support for DP Elliptic Curve.

Default value:
• Yes (enabled) if (CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C

CONFIG_MBEDTLS_ECP_DP_BP384R1_ENABLED
Enable BP384R1 curve

*Found in: Component config > mbedTLS*
support for DP Elliptic Curve.

Default value:
• Yes (enabled) if (CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C

CONFIG_MBEDTLS_ECP_DP_BP512R1_ENABLED
Enable BP512R1 curve

*Found in: Component config > mbedTLS*
support for DP Elliptic Curve.

Default value:
• Yes (enabled) if (CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C

CONFIG_MBEDTLS_ECP_DP_CURVE25519_ENABLED
Enable CURVE25519 curve

*Found in: Component config > mbedTLS*
Enable support for CURVE25519 Elliptic Curve.

Default value:
• Yes (enabled) if (CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C
CONFIG_MBEDTLS_ECP_NIST_OPTIM
NIST ‘modulo p’ optimisations

*Found in: Component config > mbedTLS*

NIST ‘modulo p’ optimisations increase Elliptic Curve operation performance.
Disabling this option saves some code size.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_ECP_FIXED_POINT_OPTIM
Enable fixed-point multiplication optimisations

*Found in: Component config > mbedTLS*

This configuration option enables optimizations to speedup (about 3 ~ 4 times) the ECP fixed point multiplication using pre-computed tables in the flash memory. Disabling this configuration option saves flash footprint (about 29KB if all Elliptic Curves selected) in the application binary.

# end of Elliptic Curve options

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_POLY1305_C
Poly1305 MAC algorithm

*Found in: Component config > mbedTLS*

Enable support for Poly1305 MAC algorithm.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_CHACHA20_C
Chacha20 stream cipher

*Found in: Component config > mbedTLS*

Enable support for Chacha20 stream cipher.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_CHACHAPOLY_C
Chacha20-Poly1305 AEAD algorithm

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_CHACHA20_C*

Enable support for ChaCha20-Poly1305 AEAD algorithm.

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_CHACHA20_C && CONFIG_MBEDTLS_POLY1305_C
CONFIG_MBEDTLS_HKDF_C
HKDF algorithm (RFC 5869)
*Found in: Component config > mbedTLS*
Enable support for the Hashed Message Authentication Code (HMAC)-based key derivation function (HKDF).
**Default value:**
- No (disabled)

CONFIG_MBEDTLS_THREADING_C
Enable the threading abstraction layer
*Found in: Component config > mbedTLS*
If you do intend to use contexts between threads, you will need to enable this layer to prevent race conditions.
**Default value:**
- No (disabled)

CONFIG_MBEDTLS_THREADING_ALT
Enable threading alternate implementation
*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_THREADING_C*
Enable threading alt to allow your own alternate threading implementation.
**Default value:**
- Yes (enabled) if CONFIG_MBEDTLS_THREADING_C

CONFIG_MBEDTLS_THREADING_PTHREAD
Enable threading pthread implementation
*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_THREADING_C*
Enable the pthread wrapper layer for the threading layer.
**Default value:**
- No (disabled) if CONFIG_MBEDTLS_THREADING_C

CONFIG_MBEDTLS_LARGE_KEYSOFTWARE_MPI
Fallback to software implementation for larger MPI values
*Found in: Component config > mbedTLS*
Fallback to software implementation for RSA key lengths larger than SOC_RSA_MAX_BIT_LEN. If this is not active then the ESP will be unable to process keys greater than SOC_RSA_MAX_BIT_LEN.
**Default value:**
- No (disabled)

CONFIG_MBEDTLS_SECURITY_RISKS
Show configurations with potential security risks
*Found in: Component config > mbedTLS*
**Default value:**
- No (disabled)
Contains:

- `CONFIG_MBEDTLS_ALLOW_UNSUPPORTED_CRITICAL_EXT`

**CONFIG_MBEDTLS_ALLOW_UNSUPPORTED_CRITICAL_EXT**

X.509 CRT parsing with unsupported critical extensions

*Found in: Component config > mbedtls > CONFIG_MBEDTLS_SECURITY_RISKS*

Allow the X.509 certificate parser to load certificates with unsupported critical extensions

**Default value:**

- No (disabled) if `CONFIG_MBEDTLS_SECURITY_RISKS`

**ESP-MQTT Configurations**

Contains:

- `CONFIG_MQTT_CUSTOM_OUTBOX`
- `CONFIG_MQTT_TRANSPORT_SSL`
- `CONFIG_MQTT_TRANSPORT_WEBSOCKET`
- `CONFIG_MQTT_PROTOCOL_311`
- `CONFIG_MQTT_PROTOCOL_5`
- `CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED`
- `CONFIG_MQTT_USE_CUSTOM_CONFIG`
- `CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS`
- `CONFIG_MQTT_REPORT_DELETED_MESSAGES`
- `CONFIG_MQTT_SKIP_PUBLISH_IF_DISCONNECTED`
- `CONFIG_MQTT_OUTBOX_DATA_ON_EXTERNAL_MEMORY`
- `CONFIG_MQTT_MSG_ID_INCREMENTAL`

**CONFIG_MQTT_PROTOCOL_311**

Enable MQTT protocol 3.1.1

*Found in: Component config > ESP-MQTT Configurations*

If not, this library will use MQTT protocol 3.1

**Default value:**

- Yes (enabled)

**CONFIG_MQTT_PROTOCOL_5**

Enable MQTT protocol 5.0

*Found in: Component config > ESP-MQTT Configurations*

If not, this library will not support MQTT 5.0

**Default value:**

- No (disabled)

**CONFIG_MQTT_TRANSPORT_SSL**

Enable MQTT over SSL

*Found in: Component config > ESP-MQTT Configurations*

Enable MQTT transport over SSL with mbedtls

**Default value:**

- Yes (enabled)
Chapter 2. API Reference

**CONFIG_MQTT_TRANSPORT_WEBSOCKET**
Enable MQTT over Websocket

*Found in: Component config > ESP-MQTT Configurations*
Enable MQTT transport over Websocket.

**Default value:**
- Yes (enabled)

**CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE**
Enable MQTT over Websocket Secure

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_TRANSPORT_WEBSOCKET*
Enable MQTT transport over Websocket Secure.

**Default value:**
- Yes (enabled)

**CONFIG_MQTT_MSG_ID_INCREMENTAL**
Use Incremental Message Id

*Found in: Component config > ESP-MQTT Configurations*
Set this to true for the message id (2.3.1 Packet Identifier) to be generated as an incremental number rather than a random value (used by default).

**Default value:**
- No (disabled)

**CONFIG_MQTT_SKIP_PUBLISH_IF_DISCONNECTED**
Skip publish if disconnected

*Found in: Component config > ESP-MQTT Configurations*
Set this to true to avoid publishing (enqueueing messages) if the client is disconnected. The MQTT client tries to publish all messages by default, even in the disconnected state (where the qos1 and qos2 packets are stored in the internal outbox to be published later) The MQTT_SKIP_PUBLISH_IF_DISCONNECTED option allows applications to override this behaviour and not enqueue publish packets in the disconnected state.

**Default value:**
- No (disabled)

**CONFIG_MQTT_REPORT_DELETED_MESSAGES**
Report deleted messages

*Found in: Component config > ESP-MQTT Configurations*
Set this to true to post events for all messages which were deleted from the outbox before being correctly sent and confirmed.

**Default value:**
- No (disabled)
CONFIG_MQTT_USE_CUSTOM_CONFIG
MQTT Using custom configurations

*Found in:* Component config > ESP-MQTT Configurations

Custom MQTT configurations.

**Default value:**
- No (disabled)

CONFIG_MQTT_TCP_DEFAULT_PORT
Default MQTT over TCP port

*Found in:* Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

Default MQTT over TCP port

**Default value:**
- 1883 if CONFIG_MQTT_USE_CUSTOM_CONFIG

CONFIG_MQTT_SSL_DEFAULT_PORT
Default MQTT over SSL port

*Found in:* Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

Default MQTT over SSL port

**Default value:**
- 8883 if CONFIG_MQTT_USE_CUSTOM_CONFIG && CONFIG_MQTT_TRANSPORT_SSL

CONFIG_MQTT_WS_DEFAULT_PORT
Default MQTT over Websocket port

*Found in:* Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

Default MQTT over Websocket port

**Default value:**
- 80 if CONFIG_MQTT_USE_CUSTOM_CONFIG && CONFIG_MQTT_TRANSPORT_WEBSOCKET

CONFIG_MQTT_WSS_DEFAULT_PORT
Default MQTT over Websocket Secure port

*Found in:* Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

Default MQTT over Websocket Secure port

**Default value:**
- 443 if CONFIG_MQTT_USE_CUSTOM_CONFIG && CONFIG_MQTT_TRANSPORT_WEBSOCKET && CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE

CONFIG_MQTT_BUFFER_SIZE
Default MQTT Buffer Size

*Found in:* Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

This buffer size using for both transmit and receive

**Default value:**
- 1024 if CONFIG_MQTT_USE_CUSTOM_CONFIG
CONFIG_MQTT_TASK_STACK_SIZE
MQTT task stack size
*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*
MQTT task stack size
*Default value:*
- 6144 if CONFIG_MQTT_USE_CUSTOM_CONFIG

CONFIG_MQTT_DISABLE_API_LOCKS
Disable API locks
*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*
Default config employs API locks to protect internal structures. It is possible to disable these locks if the user code doesn’t access MQTT API from multiple concurrent tasks
*Default value:*
- No (disabled) if CONFIG_MQTT_USE_CUSTOM_CONFIG

CONFIG_MQTT_TASK_PRIORITY
MQTT task priority
*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*
MQTT task priority. Higher number denotes higher priority.
*Default value:*
- 5 if CONFIG_MQTT_USE_CUSTOM_CONFIG

CONFIG_MQTT_POLL_READ_TIMEOUT_MS
MQTT transport poll read timeout
*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*
Timeout when polling underlying transport for read.
*Default value:*
- 1000 if CONFIG_MQTT_USE_CUSTOM_CONFIG

CONFIG_MQTT_EVENT_QUEUE_SIZE
Number of queued events.
*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*
A value higher than 1 enables multiple queued events.
*Default value:*
- 1 if CONFIG_MQTT_USE_CUSTOM_CONFIG

CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED
Enable MQTT task core selection
*Found in: Component config > ESP-MQTT Configurations*
This will enable core selection
CONFIG_MQTT_TASK_CORE_SELECTION

Core to use?

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED*

*Available options:*
  * Core 0 (MQTT_USE_CORE_0)
  * Core 1 (MQTT_USE_CORE_1)

CONFIG_MQTT_OUTBOX_DATA_ON_EXTERNAL_MEMORY

Use external memory for outbox data

*Found in: Component config > ESP-MQTT Configurations*

Set to true to use external memory for outbox data.

*Default value:*
  * No (disabled) if CONFIG_MQTT_USE_CUSTOM_CONFIG

CONFIG_MQTT_CUSTOM_OUTBOX

Enable custom outbox implementation

*Found in: Component config > ESP-MQTT Configurations*

Set to true if a specific implementation of message outbox is needed (e.g. persistent outbox in NVM or similar). Note: Implementation of the custom outbox must be added to the mqtt component.

These CMake commands could be used to append the custom implementation to lib-mqtt sources:

```
idf_component_get_property(mqttmqttCOMPONENT_LIB)set_property(TARGET${mqtt}PROPERTY SOURCES ${PROJECT_DIR}/custom_outbox.c APPEND)
```

*Default value:*
  * No (disabled)

CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS

Outbox message expired timeout [ms]

*Found in: Component config > ESP-MQTT Configurations*

Messages which stays in the outbox longer than this value before being published will be discarded.

*Default value:*
  * 30000 if CONFIG_MQTT_USE_CUSTOM_CONFIG

Newlib contains:

- CONFIG_NEWLIB_NANO_FORMAT
- CONFIG_NEWLIB_STDIN_LINE_ENDING
- CONFIG_NEWLIB_STDOUT_LINE_ENDING
- CONFIG_NEWLIB_TIME_SYSCALL

CONFIG_NEWLIB_STDOUT_LINE_ENDING

Line ending for UART output

*Found in: Component config > Newlib*

This option allows configuring the desired line endings sent to UART when a newline ( \n , LF) appears on stdout. Three options are possible:

CRLF: whenever LF is encountered, prepend it with CR
Chapter 2. API Reference

LF: no modification is applied, stdout is sent as is
CR: each occurrence of LF is replaced with CR
This option doesn’t affect behavior of the UART driver (drivers/uart.h).

**Available options:**
- CRLF (NEWLIB_STDOUT_LINE_ENDING_CRLF)
- LF (NEWLIB_STDOUT_LINE_ENDING_LF)
- CR (NEWLIB_STDOUT_LINE_ENDING_CR)

**CONFIG_NEWLIB_STDIN_LINE_ENDING**

Line ending for UART input

*Found in: Component config > Newlib*

This option allows configuring which input sequence on UART produces a newline (’n’, LF) on stdin.
Three options are possible:
CRLF: CRLF is converted to LF
LF: no modification is applied, input is sent to stdin as is
CR: each occurrence of CR is replaced with LF
This option doesn’t affect behavior of the UART driver (drivers/uart.h).

**Available options:**
- CRLF (NEWLIB_STDIN_LINE_ENDING_CRLF)
- LF (NEWLIB_STDIN_LINE_ENDING_LF)
- CR (NEWLIB_STDIN_LINE_ENDING_CR)

**CONFIG_NEWLIB_NANO_FORMAT**

Enable ‘nano’ formatting options for printf/scanf family

*Found in: Component config > Newlib*

In most chips the ROM contains parts of newlib C library, including printf/scanf family of functions.
These functions have been compiled with so-called “nano” formatting option. This option doesn’t support 64-bit integer formats and C99 features, such as positional arguments.

For more details about “nano” formatting option, please see newlib readme file, search for ‘–enable-newlib-nano-formatted-io’ : https://sourceware.org/newlib/README

If this option is enabled and the ROM contains functions from newlib-nano, the build system will use functions available in ROM, reducing the application binary size. Functions available in ROM run faster than functions which run from flash. Functions available in ROM can also run when flash instruction cache is disabled.

Some chips (e.g. ESP32-C6) has the full formatting versions of printf/scanf in ROM instead of the nano versions and in this building with newlib nano might actually increase the size of the binary. Which functions are present in ROM can be seen from ROM caps: ESP_ROM_HAS_NEWLIB_NANO_FORMAT and ESP_ROM_HAS_NEWLIB_NORMAL_FORMAT.

If you need 64-bit integer formatting support or C99 features, keep this option disabled.

**CONFIG_NEWLIB_TIME_SYSCALL**

Timers used for gettimeofday function

*Found in: Component config > Newlib*

This setting defines which hardware timers are used to implement ‘gettimeofday’ and ‘time’ functions in C library.
• If both high-resolution (systimer for all targets except ESP32) and RTC timers are used, timekeeping will continue in deep sleep. Time will be reported at 1 microsecond resolution. This is the default, and the recommended option.

• If only high-resolution timer (systimer) is used, gettimeofday will provide time at microsecond resolution. Time will not be preserved when going into deep sleep mode.

• If only RTC timer is used, timekeeping will continue in deep sleep, but time will be measured at 6.6 microsecond resolution. Also the gettimeofday function itself may take longer to run.

• If no timers are used, gettimeofday and time functions return -1 and set errno to ENOSYS.

• When RTC is used for timekeeping, two RTC_STORE registers are used to keep time in deep sleep mode.

Available options:

• RTC and high-resolution timer (NEWLIB_TIME_SYSCALL_USE_RTC_HRT)
• RTC (NEWLIB_TIME_SYSCALL_USE_RTC)
• High-resolution timer (NEWLIB_TIME_SYSCALL_USE_HRT)
• None (NEWLIB_TIME_SYSCALL_USE_NONE)

NVS Contains:

• CONFIG_NVS_LEGACY_DUP_KEYS_COMPATIBILITY
• CONFIG_NVS_ENCRYPTION
• CONFIG_NVS_COMPATIBLE_PRE_V4_3_ENCRYPTION_FLAG
• CONFIG_NVS_ASSERT_ERROR_CHECK

CONFIG_NVS_ENCRYPTION
Enable NVS encryption

Found in: Component config > NVS

This option enables encryption for NVS. When enabled, XTS-AES is used to encrypt the complete NVS data, except the page headers. It requires XTS encryption keys to be stored in an encrypted partition (enabling flash encryption is mandatory here) or to be derived from an HMAC key burnt in eFuse.

Default value:

• Yes (enabled) if CONFIG_SECURE_FLASH_ENC_ENABLED && (CONFIG_SECURE_FLASH_ENC_ENABLED || SOC_HMAC_SUPPORTED)

CONFIG_NVS_COMPATIBLE_PRE_V4_3_ENCRYPTION_FLAG
NVS partition encrypted flag compatible with ESP-IDF before v4.3

Found in: Component config > NVS

Enabling this will ignore “encrypted” flag for NVS partitions. NVS encryption scheme is different than hardware flash encryption and hence it is not recommended to have “encrypted” flag for NVS partitions. This was not being checked in pre v4.3 IDF. Hence, if you have any devices where this flag is kept enabled in partition table then enabling this config will allow to have same behavior as pre v4.3 IDF.

CONFIG_NVS_ASSERT_ERROR_CHECK
Use assertions for error checking

Found in: Component config > NVS

This option switches error checking type between assertions (y) or return codes (n).

Default value:

• No (disabled)
CONFIG_NVS_LEGACY_DUP_KEYS_COMPATIBILITY

Enable legacy nvs_set function behavior when same key is reused with different data types

*Found in: Component config > NVS*

Enabling this option will switch the nvs_set() family of functions to the legacy mode: when called repeatedly with the same key but different data type, the existing value in the NVS remains active and the new value is just stored, actually not accessible through corresponding nvs_get() call for the key given. Use this option only when your application relies on such NVS API behaviour.

**Default value:**
- No (disabled)

NVS Security Provider Contains:

- CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID
- CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME

CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME

NVS Encryption: Key Protection Scheme

*Found in: Component config > NVS Security Provider*

This choice defines the default NVS encryption keys protection scheme; which will be used for the default NVS partition. Users can use the corresponding scheme registration APIs to register other schemes for the default as well as other NVS partitions.

**Available options:**
- Using Flash Encryption (NVS_SEC_KEY_PROTECT_USING_FLASH_ENC)
  Protect the NVS Encryption Keys using Flash Encryption Requires a separate ‘nvs_keys’ partition (which will be encrypted by flash encryption) for storing the NVS encryption keys
- Using HMAC peripheral (NVS_SEC_KEY_PROTECT_USING_HMAC)
  Derive and protect the NVS Encryption Keys using the HMAC peripheral Requires the specified eFuse block (NVS_SEC_HMAC_EFUSE_KEY_ID or the v2 API argument) to be empty or pre-written with a key with the purpose ESP_EFUSE_KEY_PURPOSE_HMAC_UP

CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID

eFuse key ID storing the HMAC key

*Found in: Component config > NVS Security Provider*

eFuse block key ID storing the HMAC key for deriving the NVS encryption keys

**Note:** The eFuse block key ID required by the HMAC scheme (CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC) is set using this config when the default NVS partition is initialized with nvs_flash_init(). The eFuse block key ID can also be set at runtime by passing the appropriate value to the NVS security scheme registration APIs.

**Range:**
- from 0 to 6 if NVS_SEC_KEY_PROTECT_USING_HMAC

**Default value:**
- 6 if NVS_SEC_KEY_PROTECT_USING_HMAC

OpenThread Contains:

- CONFIG_OPENTHREAD_PLATFORM_MSGPOOL_MANAGEMENT
- CONFIG_OPENTHREAD_DEVICE_TYPE
- CONFIG_OPENTHREAD_RADIO_TYPE
- CONFIG_OPENTHREAD_BORDER_ROUTER
Chapter 2. API Reference

- CONFIG_OPENTHREAD_COMMISSIONER
- CONFIG_OPENTHREAD_CSL_DEBUG_ENABLE
- CONFIG_OPENTHREAD_CSL_ENABLE
- CONFIG_OPENTHREAD_DIAG
- CONFIG_OPENTHREAD_DNS_CLIENT
- CONFIG_OPENTHREAD_DUA_ENABLE
- CONFIG_OPENTHREAD_JOINER
- CONFIG_OPENTHREAD_LINK_METRICS
- CONFIG_OPENTHREAD_MACFILTER_ENABLE
- CONFIG_OPENTHREAD_CLI
- CONFIG_OPENTHREAD_SRP_CLIENT
- CONFIG_OPENTHREAD_TIME_SYNC
- CONFIG_OPENTHREAD_ENABLED
- CONFIG_OPENTHREAD_XTAL_ACCURACY
- CONFIG_OPENTHREAD_CSL_UNCERTAIN
- CONFIG_OPENTHREAD_CSL_ACCURACY
- CONFIG_OPENTHREAD_NUM_MESSAGE_BUFFERS
- CONFIG_OPENTHREAD_RCP_TRANSPORT
- CONFIG_OPENTHREAD_MLE_MAX_CHILDREN
- CONFIG_OPENTHREAD_TMF_ADDR_CACHE_ENTRIES
- CONFIG_OPENTHREAD_SPINEL_RX_FRAME_BUFFER_SIZE
- CONFIG_OPENTHREAD_UART_BUFFER_SIZE
- Thread Operational Dataset
- CONFIG_OPENTHREAD_DNS64_CLIENT

CONFIG_OPENTHREAD_ENABLED

OpenThread

*Found in: Component config > OpenThread*

Select this option to enable OpenThread and show the submenu with OpenThread configuration choices.

**Default value:**
- No (disabled)

CONFIG_OPENTHREAD_LOG_LEVEL_DYNAMIC

Enable dynamic log level control

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable dynamic log level control for OpenThread

**Default value:**
- Yes (enabled) if CONFIG_OPENTHREAD_ENABLED

CONFIG_OPENTHREAD_LOG_LEVEL

OpenThread log verbosity

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select OpenThread log level.

**Available options:**
- No logs (OPENTHREAD_LOG_LEVEL_NONE)
- Error logs (OPENTHREAD_LOG_LEVEL_CRIT)
- Warning logs (OPENTHREAD_LOG_LEVEL_WARN)
- Notice logs (OPENTHREAD_LOG_LEVEL_NOTE)
- Info logs (OPENTHREAD_LOG_LEVEL_INFO)
- Debug logs (OPENTHREAD_LOG_LEVEL_DEBG)
Thread Operational Dataset

Contains:

- `CONFIG_OPENTHREAD_NETWORK_EXTPANID`
- `CONFIG_OPENTHREAD_MESH_LOCAL_PREFIX`
- `CONFIG_OPENTHREAD_NETWORK_CHANNEL`
- `CONFIG_OPENTHREAD_NETWORK_MASTERKEY`
- `CONFIG_OPENTHREAD_NETWORK_NAME`
- `CONFIG_OPENTHREAD_NETWORK_PANID`
- `CONFIG_OPENTHREAD_NETWORK_PSKC`

**CONFIG_OPENTHREAD_NETWORK_NAME**

OpenThread network name

*Found in: Component config > OpenThread > Thread Operational Dataset*

**Default value:**

- “OpenThread-ESP”

**CONFIG_OPENTHREAD_MESH_LOCAL_PREFIX**

OpenThread mesh local prefix, format `<address>/<plen>`

*Found in: Component config > OpenThread > Thread Operational Dataset*

A string in the format “`<address>/<plen>`”, where `<address>` is an IPv6 address and `<plen>` is a prefix length. For example “`fd00:db8:a0:0::/64`”

**Default value:**

- “`fd00:db8:a0:0::/64`”

**CONFIG_OPENTHREAD_NETWORK_CHANNEL**

OpenThread network channel

*Found in: Component config > OpenThread > Thread Operational Dataset*

**Range:**

- from 11 to 26

**Default value:**

- 15

**CONFIG_OPENTHREAD_NETWORK_PANID**

OpenThread network pan id

*Found in: Component config > OpenThread > Thread Operational Dataset*

**Range:**

- from 0 to `0xFFFF`

**Default value:**

- “`0x1234`”

**CONFIG_OPENTHREAD_NETWORK_EXTPANID**

OpenThread extended pan id

*Found in: Component config > OpenThread > Thread Operational Dataset*

The OpenThread network extended pan id in hex string format

**Default value:**

- `dead00beef00cafe`
**CONFIG_OPENTHREAD_NETWORK_MASTERKEY**

OpenThread network key

*Found in: Component config > OpenThread > Thread Operational Dataset*

The OpenThread network network key in hex string format

**Default value:**
- 00112233445566778899aabbccddeeff

**CONFIG_OPENTHREAD_NETWORK_PSKC**

OpenThread pre-shared commissioner key

*Found in: Component config > OpenThread > Thread Operational Dataset*

The OpenThread pre-shared commissioner key in hex string format

**Default value:**
- 104810e2315100afd6bc9215a6bfac53

**CONFIG_OPENTHREAD_RADIO_TYPE**

Configure how OpenThread connects to the 15.4 radio

*Found in: Component config > OpenThread*

**Available options:**
- Native 15.4 radio (OPENTHREAD_RADIO_NATIVE)
  Select this to use the native 15.4 radio.
- Connect via UART (OPENTHREAD_RADIO_SPINEL_UART)
  Select this to connect to a Radio Co-Processor via UART.
- Connect via SPI (OPENTHREAD_RADIO_SPINEL_SPI)
  Select this to connect to a Radio Co-Processor via SPI.

**CONFIG_OPENTHREAD_DEVICE_TYPE**

Configure the Thread device type

*Found in: Component config > OpenThread*

OpenThread can be configured to different device types (FTD, MTD, Radio)

**Available options:**
- Full Thread Device (OPENTHREAD_FTD)
  Select this to enable Full Thread Device which can act as router and leader in a Thread network.
- Minimal Thread Device (OPENTHREAD_MTD)
  Select this to enable Minimal Thread Device which can only act as end device in a Thread network. This will reduce the code size of the OpenThread stack.
- Radio Only Device (OPENTHREAD_RADIO)
  Select this to enable Radio Only Device which can only forward 15.4 packets to the host. The OpenThread stack will be run on the host and OpenThread will have minimal footprint on the radio only device.

**CONFIG_OPENTHREAD_RCP_TRANSPORT**

The RCP transport type

*Found in: Component config > OpenThread*

**Available options:**

---

Espressif Systems 1853 Release v5.2-dev-3318-g8fc8f3f479

Submit Document Feedback
UART RCP (OPENTHREAD_RCP_UART)
Select this to enable UART connection to host.

SPI RCP (OPENTHREAD_RCP_SPI)
Select this to enable SPI connection to host.

CONFIG_OPENTHREAD_CLI
Enable OpenThread Command-Line Interface

Found in: Component config > OpenThread

Select this option to enable Command-Line Interface in OpenThread.

Default value:
• Yes (enabled) if CONFIG_OPENTHREAD_ENABLED

CONFIG_OPENTHREAD_DIAG
Enable diag

Found in: Component config > OpenThread

Select this option to enable Diag in OpenThread. This will enable diag mode and a series of diag commands in the OpenThread command line. These commands allow users to manipulate low-level features of the storage and 15.4 radio.

Default value:
• Yes (enabled) if CONFIG_OPENTHREAD_ENABLED

CONFIG_OPENTHREAD_COMM_MAX_JOINER_ENTRIES
The size of max commissioning joiner entries

Found in: Component config > OpenThread > CONFIG_OPENTHREAD_COMMISSIONER

Range:
• from 2 to 50 if CONFIG_OPENTHREAD_COMMISSIONER

Default value:
• 2 if CONFIG_OPENTHREAD_COMMISSIONER

CONFIG_OPENTHREAD_JOINER
Enable Joiner

Found in: Component config > OpenThread

Select this option to enable Joiner in OpenThread. This allows a device to join the Thread network with a pre-shared key using the Thread commissioning protocol.

Default value:
• No (disabled) if \texttt{CONFIG\_OPENTHREAD\_ENABLED}

\textbf{CONFIG\_OPENTHREAD\_SRP\_CLIENT}

Enable SRP Client

\textit{Found in: Component config > OpenThread}

Select this option to enable SRP Client in OpenThread. This allows a device to register SRP services to SRP Server.

\textbf{Default value:}

• Yes (enabled) if \texttt{CONFIG\_OPENTHREAD\_ENABLED}

\textbf{CONFIG\_OPENTHREAD\_SRP\_CLIENT\_MAX\_SERVICES}

Specifies number of service entries in the SRP client service pool

\textit{Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_SRP\_CLIENT}

Set the max buffer size of service entries in the SRP client service pool.

\textbf{Range:}

• from 2 to 20 if \texttt{CONFIG\_OPENTHREAD\_SRP\_CLIENT}

\textbf{Default value:}

• 5 if \texttt{CONFIG\_OPENTHREAD\_SRP\_CLIENT}

\textbf{CONFIG\_OPENTHREAD\_DNS\_CLIENT}

Enable DNS Client

\textit{Found in: Component config > OpenThread}

Select this option to enable DNS Client in OpenThread.

\textbf{Default value:}

• Yes (enabled) if \texttt{CONFIG\_OPENTHREAD\_ENABLED}

\textbf{CONFIG\_OPENTHREAD\_BORDER\_ROUTER}

Enable Border Router

\textit{Found in: Component config > OpenThread}

Select this option to enable border router features in OpenThread.

\textbf{Default value:}

• No (disabled) if \texttt{CONFIG\_OPENTHREAD\_ENABLED}

\textbf{CONFIG\_OPENTHREAD\_PLATFORM\_MSGPOOL\_MANAGEMENT}

Allocate message pool buffer from PSRAM

\textit{Found in: Component config > OpenThread}

If enabled, the message pool is managed by platform defined logic.

\textbf{Default value:}

• No (disabled) if \texttt{CONFIG\_OPENTHREAD\_ENABLED} \&\& (\texttt{SPIRAM\_USE\_CAPS\_ALLOC} \&\& \texttt{SPIRAM\_USE\__MALLOC})
CONFIG_OPENTHREAD_NUM_MESSAGE_BUFFERS

The number of openthread message buffers

*Found in: Component config > OpenThread*

*Range:*
  - from 10 to 100 if `CONFIG_OPENTHREAD_PLATFORM_MSGPOOL_MANAGEMENT` && `CONFIG_OPENTHREAD_ENABLED`
  - from 10 to 8191 if `CONFIG_OPENTHREAD_PLATFORM_MSGPOOL_MANAGEMENT` && `CONFIG_OPENTHREAD_ENABLED`

*Default value:*
  - 65 if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_SPINEL_RX_FRAME_BUFFER_SIZE

The size of openthread spinel rx frame buffer

*Found in: Component config > OpenThread*

*Range:*
  - from 512 to 8192 if `CONFIG_OPENTHREAD_ENABLED`

*Default value:*
  - 1024 if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_MLE_MAX_CHILDREN

The size of max MLE children entries

*Found in: Component config > OpenThread*

*Range:*
  - from 5 to 50 if `CONFIG_OPENTHREAD_ENABLED`

*Default value:*
  - 10 if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_TMF_ADDR_CACHE_ENTRIES

The size of max TMF address cache entries

*Found in: Component config > OpenThread*

*Range:*
  - from 5 to 50 if `CONFIG_OPENTHREAD_ENABLED`

*Default value:*
  - 20 if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_DNS64_CLIENT

Use dns64 client

*Found in: Component config > OpenThread*

Select this option to acquire NAT64 address from dns servers.

*Default value:*
  - No (disabled) if `CONFIG_OPENTHREAD_ENABLED` && `CONFIG_LWIP_IPV4`
CONFIG_OPENTHREAD_DNS_SERVER_ADDR
DNS server address (IPv4)

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_DNS64_CLIENT*

Set the DNS server IPv4 address.

**Default value:**
- "8.8.8.8" if CONFIG_OPENTHREAD_DNS64_CLIENT

CONFIG_OPENTHREAD_UART_BUFFER_SIZE
The uart received buffer size of openthread

*Found in: Component config > OpenThread*

Set the OpenThread UART buffer size.

**Range:**
- from 128 to 1024 if CONFIG_OPENTHREAD_ENABLED

**Default value:**
- 256 if CONFIG_OPENTHREAD_ENABLED

CONFIG_OPENTHREAD_LINK_METRICS
Enable link metrics feature

*Found in: Component config > OpenThread*

Select this option to enable link metrics feature

**Default value:**
- No (disabled) if CONFIG_OPENTHREAD_ENABLED

CONFIG_OPENTHREAD_MACFILTER_ENABLE
Enable mac filter feature

*Found in: Component config > OpenThread*

Select this option to enable mac filter feature

**Default value:**
- No (disabled) if CONFIG_OPENTHREAD_ENABLED

CONFIG_OPENTHREAD_CSL_ENABLE
Enable CSL feature

*Found in: Component config > OpenThread*

Select this option to enable CSL feature

**Default value:**
- No (disabled) if CONFIG_OPENTHREAD_ENABLED

CONFIG_OPENTHREAD_XTAL_ACCURACY
The accuracy of the XTAL

*Found in: Component config > OpenThread*

The device’s XTAL accuracy, in ppm.

**Default value:**
- 130
CONFIG_OPENTHREAD_CSL_ACCURACY

The current CSL rx/tx scheduling drift, in units of ± ppm

*Found in: Component config > OpenThread*

The current accuracy of the clock used for scheduling CSL operations

**Default value:**

- 1 if `CONFIG_OPENTHREAD_CSL_ENABLE`

CONFIG_OPENTHREAD_CSL_UNCERTAIN

The CSL Uncertainty in units of 10 us.

*Found in: Component config > OpenThread*

The fixed uncertainty of the Device for scheduling CSL Transmissions in units of 10 microseconds.

**Default value:**

- 1 if `CONFIG_OPENTHREAD_CSL_ENABLE`

CONFIG_OPENTHREAD_CSL_DEBUG_ENABLE

Enable CSL debug

*Found in: Component config > OpenThread*

Select this option to set rx on when sleep in CSL feature, only for debug

**Default value:**

- No (disabled) if `CONFIG_OPENTHREAD_CSL_ENABLE`

CONFIG_OPENTHREAD_DUA_ENABLE

Enable Domain Unicast Address feature

*Found in: Component config > OpenThread*

Only used for Thread1.2 certification

**Default value:**

- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_TIME_SYNC

Enable the time synchronization service feature

*Found in: Component config > OpenThread*

Select this option to enable time synchronization feature, the devices in the same Thread network could sync to the same network time.

**Default value:**

- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

Protocomm Contains:

- `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0`
- `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1`
- `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2`
CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0
Support protocomm security version 0 (no security)

Found in: Component config > Protocomm

Enable support of security version 0. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

Default value:
• Yes (enabled)

CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1
Support protocomm security version 1 (Curve25519 key exchange + AES-CTR encryption/decryption)

Found in: Component config > Protocomm

Enable support of security version 1. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

Default value:
• Yes (enabled)

CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2
Support protocomm security version 2 (SRP6a-based key exchange + AES-GCM encryption/decryption)

Found in: Component config > Protocomm

Enable support of security version 2. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

Default value:
• Yes (enabled)

PThreads  Contains:
• CONFIG_PTHREAD_TASK_NAME_DEFAULT
• CONFIG_PTHREAD_TASK_CORE_DEFAULT
• CONFIG_PTHREAD_TASK_PRIO_DEFAULT
• CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT
• CONFIG_PTHREAD_STACK_MIN

CONFIG_PTHREAD_TASK_PRIO_DEFAULT
Default task priority

Found in: Component config > PThreads

Priority used to create new tasks with default pthread parameters.

Range:
• from 0 to 255

Default value:
• 5
CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT

Default task stack size

*Found in: Component config > PThreads*

Stack size used to create new tasks with default pthread parameters.

**Default value:**

- 3072

CONFIG_PTHREAD_STACK_MIN

Minimum allowed pthread stack size

*Found in: Component config > PThreads*

Minimum allowed pthread stack size set in attributes passed to pthread_create

**Default value:**

- 768

CONFIG_PTHREAD_TASK_CORE_DEFAULT

Default pthread core affinity

*Found in: Component config > PThreads*

The default core to which pthreads are pinned.

**Available options:**

- No affinity (PTHREAD_DEFAULT_CORE_NO_AFFINITY)
- Core 0 (PTHREAD_DEFAULT_CORE_0)
- Core 1 (PTHREAD_DEFAULT_CORE_1)

CONFIG_PTHREAD_TASK_NAME_DEFAULT

Default name of pthreads

*Found in: Component config > PThreads*

The default name of pthreads.

**Default value:**

- “pthread”

SoC Settings  Contains:

- MMU Config

MMU Config

SPI Flash driver  Contains:

- CONFIG_SPI_FLASH_AUTO_SUSPEND
- Auto-detect flash chips
- CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE
- CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE
- CONFIG_SPI_FLASH_ENABLE_COUNTERS
- CONFIG_SPI_FLASH_ROM_DRIVER_PATCH
- CONFIG_SPI_FLASH_YIELD_DURING_ERASE
- CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED
- CONFIG_SPI_FLASH_WRITE_CHUNK_SIZE
• CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST
• CONFIG_SPI_FLASH_SIZE_OVERRIDE
• SPI Flash behavior when brownout
• CONFIG_SPI_FLASH_SHARE_SPI1_BUS
• CONFIG_SPI_FLASH_ROM_IMPL
• CONFIG_SPI_FLASH_VERIFY_WRITE
• CONFIG_SPI_FLASH_DANGEROUS_WRITE

CONFIG_SPI_FLASH_VERIFY_WRITE

Verify SPI flash writes

Found in: Component config > SPI Flash driver

If this option is enabled, any time SPI flash is written then the data will be read back and verified. This can catch hardware problems with SPI flash, or flash which was not erased before verification.

Default value:
• No (disabled) if CONFIG_SPI_FLASH_ROM_IMPL && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

CONFIG_SPI_FLASH_LOG_FAILED_WRITE

Log errors if verification fails

Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_VERIFY_WRITE

If this option is enabled, if SPI flash write verification fails then a log error line will be written with the address, expected & actual values. This can be useful when debugging hardware SPI flash problems.

Default value:
• No (disabled) if CONFIG_SPI_FLASH_VERIFY_WRITE && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

CONFIG_SPI_FLASH_WARN_SETTING_ZERO_TO_ONE

Log warning if writing zero bits to ones

Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_VERIFY_WRITE

If this option is enabled, any SPI flash write which tries to set zero bits in the flash to ones will log a warning. Such writes will not result in the requested data appearing identically in flash once written, as SPI NOR flash can only set bits to one when an entire sector is erased. After erasing, individual bits can only be written from one to zero.

Note that some software (such as SPIFFS) which is aware of SPI NOR flash may write one bits as an optimisation, relying on the data in flash becoming a bitwise AND of the new data and any existing data. Such software will log spurious warnings if this option is enabled.

Default value:
• No (disabled) if CONFIG_SPI_FLASH_VERIFY_WRITE && CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

CONFIG_SPI_FLASH_ENABLE_COUNTERS

Enable operation counters

Found in: Component config > SPI Flash driver

This option enables the following APIs:
• esp_flash_reset_counters
• esp_flash_dump_counters
• esp_flash_get_counters
These APIs may be used to collect performance data for spi_flash APIs and to help understand behaviour of libraries which use SPI flash.

Default value:
- No (disabled) if `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`

**CONFIG_SPI_FLASH_ROM_DRIVER_PATCH**

Enable SPI flash ROM driver patched functions

*Found in: Component config > SPI Flash driver*

Enable this flag to use patched versions of SPI flash ROM driver functions. This option should be enabled, if any one of the following is true: (1) need to write to flash on ESP32-D2WD; (2) main SPI flash is connected to non-default pins; (3) main SPI flash chip is manufactured by ISSI.

Default value:
- Yes (enabled) if `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`

**CONFIG_SPI_FLASH_ROM_IMPL**

Use esp_flash implementation in ROM

*Found in: Component config > SPI Flash driver*

Enable this flag to use new SPI flash driver functions from ROM instead of ESP-IDF.

If keeping this as “n” in your project, you will have less free IRAM. But you can use all of our flash features.

If making this as “y” in your project, you will increase free IRAM. But you may miss out on some flash features and support for new flash chips.

Currently the ROM cannot support the following features:
- SPI_FLASH_AUTO_SUSPEND (C3, S3)

Default value:
- No (disabled) if `ESP_ROM_HAS_SPI_FLASH` && `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`

**CONFIG_SPI_FLASH_DANGEROUS_WRITE**

Writing to dangerous flash regions

*Found in: Component config > SPI Flash driver*

SPI flash APIs can optionally abort or return a failure code if erasing or writing addresses that fall at the beginning of flash (covering the bootloader and partition table) or that overlap the app partition that contains the running app.

It is not recommended to ever write to these regions from an IDF app, and this check prevents logic errors or corrupted firmware memory from damaging these regions.

Note that this feature *does not* check calls to the esp_rom_xxx SPI flash ROM functions. These functions should not be called directly from IDF applications.

Available options:
- Aborts (SPI_FLASH_DANGEROUS_WRITE_ABORTS)
- Fails (SPI_FLASH_DANGEROUS_WRITE_FAILS)
- Allowed (SPI_FLASH_DANGEROUS_WRITE_ALLOWED)
CONFIG_SPI_FLASH_SHARE_SPI1_BUS
Support other devices attached to SPI1 bus

*Found in: Component config > SPI Flash driver*

Each SPI bus needs a lock for arbitration among devices. This allows multiple devices on a same bus, but may reduce the speed of esp_flash driver access to the main flash chip.

If you only need to use esp_flash driver to access the main flash chip, disable this option, and the lock will be bypassed on SPI1 bus. Otherwise if extra devices are needed to attach to SPI1 bus, enable this option.

**Default value:**
- No (disabled) if `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`

CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE
Bypass a block erase and always do sector erase

*Found in: Component config > SPI Flash driver*

Some flash chips can have very high “max” erase times, especially for block erase (32KB or 64KB). This option allows to bypass “block erase” and always do sector erase commands. This will be much slower overall in most cases, but improves latency for other code to run.

**Default value:**
- No (disabled) if `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`

CONFIG_SPI_FLASH_YIELD_DURING_ERASE
Enables yield operation during flash erase

*Found in: Component config > SPI Flash driver*

This allows to yield the CPUs between erase commands. Prevents starvation of other tasks. Please use this configuration together with `SPI_FLASHERASE_YIELD DURATION_MS` and `SPI_FLASH_ERASE_YIELD TICKS` after carefully checking flash datasheet to avoid a watchdog timeout. For more information, please check SPI Flash API reference documentation under section OS Function.

**Default value:**
- Yes (enabled) if `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`

CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS
Duration of erasing to yield CPUs (ms)

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_YIELD_DURING_ERASE*

If a duration of one erase command is large then it will yield CPUs after finishing a current command.

**Default value:**
- 20 if `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`

CONFIG_SPI_FLASH_ERASE_YIELD_TICKS
CPU release time (tick) for an erase operation

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_YIELD_DURING_ERASE*

Defines how many ticks will be before returning to continue a erasing.

**Default value:**
Chapter 2. API Reference

- 1  if  CONFIG_SPI_FLASH_YIELD_DURING_ERASE  &&  CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

**CONFIG_SPI_FLASH_AUTO_SUSPEND**

Auto suspend long erase/write operations (READ DOCS FIRST)

*Found in: Component config > SPI Flash driver*

This option is disabled by default because it is supported only for specific flash chips and for specific Espressif chips. To evaluate if you can use this feature refer to *Optional Features for Flash > Auto Suspend & Resume* of the ESP-IDF Programming Guide.

**CAUTION:** If you want to OTA to an app with this feature turned on, please make sure the bootloader has the support for it. (later than IDF v4.3)

If you are using an official Espressif module, please contact Espressif Business support to check if the module has the flash that support this feature installed. Also refer to *Concurrency Constraints for Flash on SPI > Flash Auto Suspend Feature* before enabling this option.

**CONFIG_SPI_FLASH_WRITE_CHUNK_SIZE**

Flash write chunk size

*Found in: Component config > SPI Flash driver*

Flash write is broken down in terms of multiple (smaller) write operations. This configuration options helps to set individual write chunk size, smaller value here ensures that cache (and non-IRAM resident interrupts) remains disabled for shorter duration.

**Range:**
- from 256 to 8192 if  CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

**Default value:**
- 8192 if  CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

**CONFIG_SPI_FLASH_SIZE_OVERRIDE**

Override flash size in bootloader header by ESPTOOLPY_FLASHSIZE

*Found in: Component config > SPI Flash driver*

SPI Flash driver uses the flash size configured in bootloader header by default. Enable this option to override flash size with latest ESPTOOLPY_FLASHSIZE value from the app header if the size in the bootloader header is incorrect.

**Default value:**
- No (disabled) if  CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

**CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED**

Flash timeout checkout disabled

*Found in: Component config > SPI Flash driver*

This option is helpful if you are using a flash chip whose timeout is quite large or unpredictable.

**Default value:**
- No (disabled) if  CONFIG_APP_BUILD_TYPE_PURE_RAM_APP
CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST

Override default chip driver list

*Found in: Component config > SPI Flash driver*

This option allows the chip driver list to be customized, instead of using the default list provided by ESP-IDF.

When this option is enabled, the default list is no longer compiled or linked. Instead, the default_registered_chips structure must be provided by the user.

See example: custom_chip_driver under examples/storage for more details.

*Default value:*
  * No (disabled) if CONFIG_APP_BUILD_TYPEPURE_RAM_APP

SPI Flash behavior when brownout

Contains:

- CONFIG_SPI_FLASH_BROWNOUT_RESET_XMC

CONFIG_SPI_FLASH_BROWNOUT_RESET_XMC

Enable sending reset when brownout for XMC flash chips

*Found in: Component config > SPI Flash driver > SPI Flash behavior when brownout*

When this option is selected, the patch will be enabled for XMC. Follow the recommended flow by XMC for better stability.

**DO NOT DISABLE UNLESS YOU KNOW WHAT YOU ARE DOING.**

*Default value:*
  * Yes (enabled) if CONFIG_APP_BUILD_TYPEPURE_RAM_APP

Auto-detect flash chips

Contains:

- CONFIG_SPI_FLASH_SUPPORT_BOYA_CHIP
- CONFIG_SPI_FLASH_SUPPORT_GD_CHIP
- CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP
- CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP
- CONFIG_SPI_FLASH_SUPPORT_TH_CHIP
- CONFIG_SPI_FLASH_SUPPORT_WINBOND_CHIP

CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP

ISSI

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of ISSI chips if chip vendor not directly given by chip_drv member of the chip struct. This adds support for variant chips, however will extend detecting time.

*Default value:*
  * Yes (enabled) if CONFIG_APP_BUILD_TYPEPURE_RAM_APP
  * No (disabled) if CONFIG_APP_BUILD_TYPEPURE_RAM_APP

CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP

MXIC

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of MXIC chips if chip vendor not directly given by chip_drv member of the chip struct. This adds support for variant chips, however will extend detecting time.
Chapter 2. API Reference

**CONFIG_SPI_FLASH_SUPPORT_GD_CHIP**

GigaDevice

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of GD (GigaDevice) chips if chip vendor not directly given by `chip_drv` member of the chip struct. If you are using Wrover modules, please don’t disable this, otherwise your flash may not work in 4-bit mode.

This adds support for variant chips, however will extend detecting time and image size. Note that the default chip driver supports the GD chips with product ID 60H.

**Default value:**

- Yes (enabled) if `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`
- No (disabled) if `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`

**CONFIG_SPI_FLASH_SUPPORT_WINBOND_CHIP**

Winbond

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of Winbond chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**

- Yes (enabled) if `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`
- No (disabled) if `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`

**CONFIG_SPI_FLASH_SUPPORT_BOYA_CHIP**

BOYA

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of BOYA chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**

- Yes (enabled) if `SPI_FLASH_VENDOR_BOYA_SUPPORTED` && `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`
- No (disabled) if `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`

**CONFIG_SPI_FLASH_SUPPORT_TH_CHIP**

TH

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of TH chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**

- Yes (enabled) if `SPI_FLASH_VENDOR_TH_SUPPORTED` && `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`
- No (disabled) if `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`
CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE

Enable encrypted partition read/write operations

*Found in: Component config > SPI Flash driver*

This option enables flash read/write operations to encrypted partition/s. This option is kept enabled irrespective of state of flash encryption feature. However, in case application is not using flash encryption feature and is in need of some additional memory from IRAM region (~1KB) then this config can be disabled.

**Default value:**
- Yes (enabled) if `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`

SPIFFS Configuration

Contains:
- *Debug Configuration*
- `CONFIG_SPIFFS_USE_MAGIC`
- `CONFIG_SPIFFS_GC_STATS`
- `CONFIG_SPIFFS_PAGE_CHECK`
- `CONFIG_SPIFFS_FOLLOW_SYMLINKS`
- `CONFIG_SPIFFS_MAX_PARTITIONS`
- `CONFIG_SPIFFS_USE_MTIME`
- `CONFIG_SPIFFS_GC_MAX_RUNS`
- `CONFIG_SPIFFS_OBJ_NAME_LEN`
- `CONFIG_SPIFFS_META_LENGTH`
- SPIFFS Cache Configuration
- `CONFIG_SPIFFS_PAGE_SIZE`
- `CONFIG_SPIFFS_MTIME_WIDE_64_BITS`

CONFIG_SPIFFS_MAX_PARTITIONS

Maximum Number of Partitions

*Found in: Component config > SPIFFS Configuration*

Define maximum number of partitions that can be mounted.

**Range:**
- from 1 to 10

**Default value:**
- 3

SPIFFS Cache Configuration

Contains:
- `CONFIG_SPIFFS_CACHE`

CONFIG_SPIFFS_CACHE

Enable SPIFFS Cache

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration*

Enables/disable memory read caching of nucleus file system operations.

**Default value:**
- Yes (enabled)
CONFIG_SPIFFS_CACHE_WR
Enable SPIFFS Write Caching

Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration > CONFIG_SPIFFS_CACHE

Enables memory write caching for file descriptors in hydrogen.

Default value:
• Yes (enabled)

CONFIG_SPIFFS_CACHE_STATS
Enable SPIFFS Cache Statistics

Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration > CONFIG_SPIFFS_CACHE

Enable/disable statistics on caching. Debug/test purpose only.

Default value:
• No (disabled)

CONFIG_SPIFFS_PAGE_CHECK
Enable SPIFFS Page Check

Found in: Component config > SPIFFS Configuration

Always check header of each accessed page to ensure consistent state. If enabled it will increase number of reads from flash, especially if cache is disabled.

Default value:
• Yes (enabled)

CONFIG_SPIFFS_GC_MAX_RUNS
Set Maximum GC Runs

Found in: Component config > SPIFFS Configuration

Define maximum number of GC runs to perform to reach desired free pages.

Range:
• from 1 to 10000

Default value:
• 10

CONFIG_SPIFFS_GC_STATS
Enable SPIFFS GC Statistics

Found in: Component config > SPIFFS Configuration

Enable/disable statistics on gc. Debug/test purpose only.

Default value:
• No (disabled)
Chapter 2. API Reference

CONFIG_SPIFFS_PAGE_SIZE

SPIFFS logical page size

*Found in: Component config > SPIFFS Configuration*

Logical page size of SPIFFS partition, in bytes. Must be multiple of flash page size (which is usually 256 bytes). Larger page sizes reduce overhead when storing large files, and improve filesystem performance when reading large files. Smaller page sizes reduce overhead when storing small (< page size) files.

**Range:**
- from 256 to 1024

**Default value:**
- 256

CONFIG_SPIFFS_OBJ_NAME_LEN

Set SPIFFS Maximum Name Length

*Found in: Component config > SPIFFS Configuration*

Object name maximum length. Note that this length include the zero-termination character, meaning maximum string of characters can at most be SPIFFS_OBJ_NAME_LEN - 1.

SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.

**Range:**
- from 1 to 256

**Default value:**
- 32

CONFIG_SPIFFS_FOLLOW_SYMLINKS

Enable symbolic links for image creation

*Found in: Component config > SPIFFS Configuration*

If this option is enabled, symbolic links are taken into account during partition image creation.

**Default value:**
- No (disabled)

CONFIG_SPIFFS_USE_MAGIC

Enable SPIFFS Filesystem Magic

*Found in: Component config > SPIFFS Configuration*

Enable this to have an identifiable spiffs filesystem. This will look for a magic in all sectors to determine if this is a valid spiffs system or not at mount time.

**Default value:**
- Yes (enabled)

CONFIG_SPIFFS_USE_MAGIC_LENGTH

Enable SPIFFS Filesystem Length Magic

*Found in: Component config > SPIFFS Configuration > CONFIG_SPIFFS_USE_MAGIC*

If this option is enabled, the magic will also be dependent on the length of the filesystem. For example, a filesystem configured and formatted for 4 megabytes will not be accepted for mounting with a configuration defining the filesystem as 2 megabytes.

**Default value:**
Chapter 2. API Reference

- Yes (enabled)

**CONFIG_SPIFFS_META_LENGTH**

Size of per-file metadata field

*Found in: Component config > SPIFFS Configuration*

This option sets the number of extra bytes stored in the file header. These bytes can be used in an application-specific manner. Set this to at least 4 bytes to enable support for saving file modification time.

SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.

**Default value:**

- 4

**CONFIG_SPIFFS_USE_MTIME**

Save file modification time

*Found in: Component config > SPIFFS Configuration*

If enabled, then the first 4 bytes of per-file metadata will be used to store file modification time (mtime), accessible through stat/fstat functions. Modification time is updated when the file is opened.

**Default value:**

- Yes (enabled)

**CONFIG_SPIFFS_MTIME_WIDE_64_BITS**

The time field occupies 64 bits in the image instead of 32 bits

*Found in: Component config > SPIFFS Configuration*

If this option is not set, the time field is 32 bits (up to 2106 year), otherwise it is 64 bits and make sure it matches SPIFFS_META_LENGTH. If the chip already has the spiffs image with the time field = 32 bits then this option cannot be applied in this case. Erase it first before using this option. To resolve the Y2K38 problem for the spiffs, use a toolchain with 64-bit time_t support.

**Default value:**

- No (disabled) if CONFIG_SPIFFS_META_LENGTH >= 8

**Debug Configuration**

Contains:

- CONFIG_SPIFFS_DBG
- CONFIG_SPIFFS_API_DBG
- CONFIG_SPIFFS_CACHE_DBG
- CONFIG_SPIFFS_CHECK_DBG
- CONFIG_SPIFFS_TEST_VISUALISATION
- CONFIG_SPIFFS_GC_DBG

**CONFIG_SPIFFS_DBG**

Enable general SPIFFS debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print general debug messages to the console.

**Default value:**

- No (disabled)
**CONFIG_SPIFFS_API_DBG**

Enable SPIFFS API debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print API debug messages to the console.

**Default value:**
- No (disabled)

**CONFIG_SPIFFS_GC_DBG**

Enable SPIFFS Garbage Cleaner debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print GC debug messages to the console.

**Default value:**
- No (disabled)

**CONFIG_SPIFFS_CACHE_DBG**

Enable SPIFFS Cache debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print cache debug messages to the console.

**Default value:**
- No (disabled)

**CONFIG_SPIFFS_CHECK_DBG**

Enable SPIFFS Filesystem Check debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print Filesystem Check debug messages to the console.

**Default value:**
- No (disabled)

**CONFIG_SPIFFS_TEST_VISUALISATION**

Enable SPIFFS Filesystem Visualization

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enable this option to enable SPIFFS_vis function in the API.

**Default value:**
- No (disabled)

**TCP Transport**

Contains:
- **Websocket**

**Websocket**

Contains:
- **CONFIG_WS_TRANSPORT**
CONFIG_WS_TRANSPORT
Enable Websocket Transport

*Found in: Component config > TCP Transport > Websocket*
Enable support for creating websocket transport.

**Default value:**
- Yes (enabled)

CONFIG_WS_BUFFER_SIZE
Websocket transport buffer size

*Found in: Component config > TCP Transport > Websocket > CONFIG_WS_TRANSPORT*
Size of the buffer used for constructing the HTTP Upgrade request during connect

**Default value:**
- 1024

CONFIG_WS_DYNAMIC_BUFFER
Using dynamic websocket transport buffer

*Found in: Component config > TCP Transport > Websocket > CONFIG_WS_TRANSPORT*
If enable this option, websocket transport buffer will be freed after connection succeed to save more heap.

**Default value:**
- No (disabled)

Ultra Low Power (ULP) Co-processor Contains:
- CONFIG_ULP_COPROC_ENABLED
- ULP RISC-V Settings

CONFIG_ULP_COPROC_ENABLED
Enable Ultra Low Power (ULP) Co-processor

*Found in: Component config > Ultra Low Power (ULP) Co-processor*
Enable this feature if you plan to use the ULP Co-processor. Once this option is enabled, further ULP co-processor configuration will appear in the menu.

**Default value:**
- No (disabled)

CONFIG_ULP_COPROC_TYPE
ULP Co-processor type

*Found in: Component config > Ultra Low Power (ULP) Co-processor > CONFIG_ULP_COPROC_ENABLED*
Choose the ULP Coprocessor type: ULP FSM (Finite State Machine) or ULP RISC-V.

**Available options:**
- ULP FSM (Finite State Machine) (ULP_COPROC_TYPE_FSM)
- ULP RISC-V (ULP_COPROC_TYPE_RISCV)
- LP core RISC-V (ULP_COPROC_TYPE_LP_CORE)
**CONFIG_ULP_COPROC_RESERVE_MEM**

RTC slow memory reserved for coprocessor

*Found in*: Component config > Ultra Low Power (ULP) Co-processor > CONFIG_ULP_COPROC_ENABLED

Bytes of memory to reserve for ULP Co-processor firmware & data. Data is reserved at the beginning of RTC slow memory.

**Range:**
- from 32 to 8176 if CONFIG_ULP_COPROC_ENABLED

**Default value:**
- 512 if CONFIG_ULP_COPROC_ENABLED
- 4096 if CONFIG_ULP_COPROC_ENABLED

**ULP RISC-V Settings**

Contains:
- CONFIG_ULP_RISCV_UART_BAUDRATE
- CONFIG_ULP_RISCV_I2C_RW_TIMEOUT

**CONFIG_ULP_RISCV_UART_BAUDRATE**

Baudrate used by the bitbanged ULP RISC-V UART driver

*Found in*: Component config > Ultra Low Power (ULP) Co-processor > ULP RISC-V Settings

The accuracy of the bitbanged UART driver is limited, it is not recommend to increase the value above 19200.

**Default value:**
- 9600 if ULP_COPROC_TYPE_RISCV

**CONFIG_ULP_RISCV_I2C_RW_TIMEOUT**

Set timeout for ULP RISC-V I2C transaction timeout in ticks.

*Found in*: Component config > Ultra Low Power (ULP) Co-processor > ULP RISC-V Settings

Set the ULP RISC-V I2C read/write timeout. Set this value to -1 if the ULP RISC-V I2C read and write APIs should wait forever. Please note that the tick rate of the ULP co-processor would be different than the OS tick rate of the main core and therefore can have different timeout value depending on which core the API is invoked on.

**Range:**
- from -1 to 4294967295 if ULP_COPROC_TYPE_RISCV

**Default value:**
- 500 if ULP_COPROC_TYPE_RISCV

**Unity unit testing library**

Contains:
- CONFIG.Unity_ENABLE_COLOR
- CONFIG.Unity_ENABLE_IDF_TEST_RUNNER
- CONFIG.Unity_ENABLE_FIXTURE
- CONFIG.Unity_ENABLE_BACKTRACE_ON_FAIL
- CONFIG.Unity_ENABLE_64BIT
- CONFIG.Unity_ENABLE_DOUBLE
- CONFIG.Unity_ENABLE_FLOAT
Chapter 2. API Reference

CONFIG_UNITY_ENABLE_FLOAT
Support for float type

Found in: Component config > Unity unit testing library

If not set, assertions on float arguments will not be available.

Default value:
• Yes (enabled)

CONFIG_UNITY_ENABLE_DOUBLE
Support for double type

Found in: Component config > Unity unit testing library

If not set, assertions on double arguments will not be available.

Default value:
• Yes (enabled)

CONFIG_UNITY_ENABLE_64BIT
Support for 64-bit integer types

Found in: Component config > Unity unit testing library

If not set, assertions on 64-bit integer types will always fail. If this feature is enabled, take care not to pass pointers (which are 32 bit) to UNITY_ASSERT_EQUAL, as that will cause pointer-to-int-cast warnings.

Default value:
• No (disabled)

CONFIG_UNITY_ENABLE_COLOR
Colorize test output

Found in: Component config > Unity unit testing library

If set, Unity will colorize test results using console escape sequences.

Default value:
• No (disabled)

CONFIG_UNITY_ENABLE_IDF_TEST_RUNNER
Include ESP-IDF test registration/running helpers

Found in: Component config > Unity unit testing library

If set, then the following features will be available:

• TEST_CASE macro which performs automatic registration of test functions
• Functions to run registered test functions: unity_run_all_tests, unity_run_tests_with_filter, unity_run_single_test_by_name.
• Interactive menu which lists test cases and allows choosing the tests to be run, available via unity_run_menu function.

Disable if a different test registration mechanism is used.

Default value:
• Yes (enabled)
**CONFIGUNITY_ENABLE_FIXTURE**

Include Unity test fixture

*Found in: Component config > Unity unit testing library*

If set, unity_fixture.h header file and associated source files are part of the build. These provide an optional set of macros and functions to implement test groups.

**Default value:**
- No (disabled)

**CONFIGUNITY_ENABLE_BACKTRACE_ON_FAIL**

Print a backtrace when a unit test fails

*Found in: Component config > Unity unit testing library*

If set, the unity framework will print the backtrace information before jumping back to the test menu. The jumping is usually occurs in assert functions such as TEST_ASSERT, TEST_FAIL etc.

**Default value:**
- No (disabled)

**Virtual file system** Contains:

- **CONFIG vfs support io**

**CONFIG VFS SUPPORT IO**

Provide basic I/O functions

*Found in: Component config > Virtual file system*

If enabled, the following functions are provided by the VFS component.

- open, close, read, write, pread, pwrite, lseek, fstat, fsync, ioctl, fcntl

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

Note that the following functions can still be used with socket file descriptors when this option is disabled:

- close, read, write, ioctl, fcntl.

**Default value:**
- Yes (enabled)

**CONFIG VFS SUPPORT DIR**

Provide directory related functions

*Found in: Component config > Virtual file system > CONFIG VFS SUPPORT IO*

If enabled, the following functions are provided by the VFS component.

- stat, link, unlink, rename, utime, access, truncate, rmdir, mkdir, opendir, closedir, readdir, readdir_r, seekdir, telldir, rewinddir

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

**Default value:**
- Yes (enabled)
CONFIG_VFS_SUPPORT_SELECT

Provide select function

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO*

If enabled, select function is provided by the VFS component, and can be used on peripheral file descriptors (such as UART) and sockets at the same time.

If disabled, the default select implementation will be provided by LWIP for sockets only.

Disabling this option can reduce code size if support for “select” on UART file descriptors is not required.

**Default value:**
- Yes (enabled) if CONFIG_VFS_SUPPORT_IO && CONFIG_LWIP_USE_ONLY_LWIP_SELECT

CONFIG_VFS_SUPPRESS_SELECT_DEBUG_OUTPUT

Suppress select() related debug outputs

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > CONFIG_VFS_SUPPORT_SELECT*

Select() related functions might produce an unconveniently lot of debug outputs when one sets the default log level to DEBUG or higher. It is possible to suppress these debug outputs by enabling this option.

**Default value:**
- Yes (enabled)

CONFIG_VFS_SUPPORT_TERMIOS

Provide termios.h functions

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO*

Disabling this option can save memory when the support for termios.h is not required.

**Default value:**
- Yes (enabled)

CONFIG_VFS_MAX_COUNT

Maximum Number of Virtual Filesystems

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO*

Define maximum number of virtual filesystems that can be registered.

**Range:**
- from 1 to 20

**Default value:**
- 8

Host File System I/O (Semihosting) Contains:

- CONFIG_VFS_SEMIHOSTFS_MAX_MOUNT_POINTS
## CONFIG_VFS_SEMIHOSTFS_MAX_MOUNT_POINTS

Host FS: Maximum number of the host filesystem mount points

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > Host File System I/O (Semihosting)*

Define maximum number of host filesystem mount points.

**Default value:**

- 1

### Wear Levelling

Contains:

- `CONFIG_WL_SECTOR_MODE`
- `CONFIG_WL_SECTOR_SIZE`

## CONFIG_WL_SECTOR_SIZE

Wear Levelling library sector size

*Found in: Component config > Wear Levelling*

Sector size used by wear levelling library. You can set default sector size or size that will fit to the flash device size.

With sector size set to 4096 bytes, wear levelling library is more efficient. However if FAT filesystem is used on top of wear levelling library, it will need more temporary storage: 4096 bytes for each mounted filesystem and 4096 bytes for each opened file.

With sector size set to 512 bytes, wear levelling library will perform more operations with flash memory, but less RAM will be used by FAT filesystem library (512 bytes for the filesystem and 512 bytes for each file opened).

**Available options:**

- 512 (`WL_SECTOR_SIZE_512`)
- 4096 (`WL_SECTOR_SIZE_4096`)

## CONFIG_WL_SECTOR_MODE

Sector store mode

*Found in: Component config > Wear Levelling*

Specify the mode to store data into flash:

- In Performance mode a data will be stored to the RAM and then stored back to the flash. Compared to the Safety mode, this operation is faster, but if power will be lost when erase sector operation is in progress, then the data from complete flash device sector will be lost.
- In Safety mode data from complete flash device sector will be read from flash, modified, and then stored back to flash. Compared to the Performance mode, this operation is slower, but if power is lost during erase sector operation, then the data from full flash device sector will not be lost.

**Available options:**

- Performance (`WL_SECTOR_MODE_PERF`)
- Safety (`WL_SECTOR_MODE_SAFE`)

### Wi-Fi Provisioning Manager

Contains:

- `CONFIG_WIFI_PROV_BLE_BONDING`
- `CONFIG_WIFI_PROV_BLE_SEC_CONN`
- `CONFIG_WIFI_PROV_BLE_FORCE_ENCRYPTION`
- `CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV`
- `CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES`
Chapter 2. API Reference

- `CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT`
- `CONFIG_WIFI_PROV_STA_SCAN_METHOD`

**CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES**

Max Wi-Fi Scan Result Entries

*Found in: Component config > Wi-Fi Provisioning Manager*

This sets the maximum number of entries of Wi-Fi scan results that will be kept by the provisioning manager.

**Range:**
- from 1 to 255

**Default value:**
- 16

**CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT**

Provisioning auto-stop timeout

*Found in: Component config > Wi-Fi Provisioning Manager*

Time (in seconds) after which the Wi-Fi provisioning manager will auto-stop after connecting to a Wi-Fi network successfully.

**Range:**
- from 5 to 600

**Default value:**
- 30

**CONFIG_WIFI_PROV_BLE_BONDING**

Enable BLE bonding

*Found in: Component config > Wi-Fi Provisioning Manager*

This option is applicable only when provisioning transport is BLE.

**CONFIG_WIFI_PROV_BLE_SEC_CONN**

Enable BLE Secure connection flag

*Found in: Component config > Wi-Fi Provisioning Manager*

Used to enable Secure connection support when provisioning transport is BLE.

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED

**CONFIG_WIFI_PROV_BLE_FORCE_ENCRYPTION**

Force Link Encryption during characteristic Read / Write

*Found in: Component config > Wi-Fi Provisioning Manager*

Used to enforce link encryption when attempting to read / write characteristic

**CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV**

Keep BT on after provisioning is done

*Found in: Component config > Wi-Fi Provisioning Manager*
CONFIG_WIFI_PROV_DISCONNECT_AFTER_PROV

Terminate connection after provisioning is done

Found in: Component config > Wi-Fi Provisioning Manager > CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV

Default value:
- Yes (enabled) if CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV

CONFIG_WIFI_PROV_STA_SCAN_METHOD

Wifi Provisioning Scan Method

Found in: Component config > Wi-Fi Provisioning Manager

Available options:
- All Channel Scan (WIFI_PROV_STA_ALL_CHANNEL_SCAN) Scan will end after scanning the entire channel. This option is useful in Mesh WiFi Systems.
- Fast Scan (WIFI_PROV_STA_FAST_SCAN) Scan will end after an AP matching with the SSID has been detected.

CONFIG_IDF_EXPERIMENTAL_FEATURES

Make experimental features visible

Found in:

By enabling this option, ESP-IDF experimental feature options will be visible.

Note you should still enable a certain experimental feature option to use it, and you should read the corresponding risk warning and known issue list carefully.

Current experimental feature list:
- CONFIG_ESPTOOLPY_FLASHFREQ_120M
- CONFIG_SPIRAM_SPEED_120M
- CONFIG_SPI_FLASH_32BIT_ADDR_ENABLE
- CONFIG_FREERTOS_USE_KERNEL_10_5_1

Default value:
- No (disabled)

Deprecated options and their replacements

- CONFIG_A2DP_ENABLE (CONFIG_BT_A2DP_ENABLE)

2.8 Provisioning API

2.8.1 Protocol Communication

Overview

The Protocol Communication (protocomm) component manages secure sessions and provides the framework for multiple transports. The application can also use the protocomm layer directly to have application-specific extensions for the provisioning or non-provisioning use cases.

Following features are available for provisioning:

• Communication security at the application level
  – protocomm_security0 (no security)
  – protocomm_security1 (Curve25519 key exchange + AES-CTR encryption/decryption)
  – protocomm_security2 (SRP6a-based key exchange + AES-GCM encryption/decryption)
• Proof-of-possession (support with protocomm_security1 only)
• Salt and Verifier (support with protocomm_security2 only)

Protocomm internally uses protobuf (protocol buffers) for secure session establishment. Users can choose to implement their own security (even without using protobuf). Protocomm can also be used without any security layer.

Protocomm provides the framework for various transports:

• Bluetooth LE
• Wi-Fi (SoftAP + HTTPD)
• Console, in which case the handler invocation is automatically taken care of on the device side. See Transport Examples below for code snippets.

Note that for protocomm_security1 and protocomm_security2, the client still needs to establish sessions by performing the two-way handshake. See Unified Provisioning for more details about the secure handshake logic.

Enabling Protocomm Security Version

The protocomm component provides a project configuration menu to enable/disable support of respective security versions. The respective configuration options are as follows:
• Support `protocomm_security0` with no security: `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0`, this option is enabled by default.
• Support `protocomm_security1` with Curve25519 key exchange + AES-CTR encryption/decryption: `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1`, this option is enabled by default.
• Support `protocomm_security2` with SRP6a-based key exchange + AES-GCM encryption/decryption: `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2`.

**Note:** Enabling multiple security versions at once offers the ability to control them dynamically but also increases the firmware size.

**SoftAP + HTTP Transport Example with Security 2**

For sample usage, see `wifi_provisioning/src/schema_softap.c`.

```c
/* The endpoint handler to be registered with protocomm. This simply echoes back the received data. */

esp_err_t echo_req_handler (uint32_t session_id,
    const uint8_t *inbuf, ssize_t inlen,
    uint8_t **outbuf, ssize_t *outlen,
    void *priv_data)
{
    /* Session ID may be used for persistence. */
    printf("Session ID : \%d", session_id);

    /* Echo back the received data. */
    *outlen = inlen; /* Output the data length updated. */
    *outbuf = malloc(inlen); /* This is to be deallocated outside. */
    memcpy(*outbuf, inbuf, inlen);

    /* Private data that was passed at the time of endpoint creation. */
    uint32_t *priv = (uint32_t *) priv_data;
    if (priv) {
        printf("Private data : \%d", *priv);
    }

    return ESP_OK;
}

    protocomm_ble_stop(pc);

    protocomm_delete(pc);
}

API Reference

Header File

- components/protocomm/include/common/protocomm.h

Functions

protocomm_t *protocomm_new (void)
Create a new protocomm instance.

This API will return a new dynamically allocated protocomm instance with all elements of the protocomm_t structure initialized to NULL.

Returns

- protocomm_t*: On success
- NULL: No memory for allocating new instance

void protocomm_delete (protocomm_t *pc)
Delete a protocomm instance.

This API will deallocate a protocomm instance that was created using protocomm_new().
**Parameters**

- **pc** - [in] Pointer to the protocomm instance to be deleted

**esp_err_t protocomm_add_endpoint** (*protocomm_t* *pc*, const char *ep_name, *protocomm_req_handler_t* h,void *priv_data)

Add endpoint request handler for a protocomm instance.

This API will bind an endpoint handler function to the specified endpoint name, along with any private data that needs to be pass to the handler at the time of call.

**Note:**

- An endpoint must be bound to a valid protocomm instance, created using *protocomm_new()*.
- This function internally calls the registered *add_endpoint()* function of the selected transport which is a member of the protocomm_t instance structure.

**Parameters**

- **pc** - [in] Pointer to the protocomm instance
- **ep_name** - [in] Endpoint identifier(name) string
- **h** - [in] Endpoint handler function
- **priv_data** - [in] Pointer to private data to be passed as a parameter to the handler function on call. Pass NULL if not needed.

**Returns**

- ESP_OK : Success
- ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_NO_MEM : Error allocating endpoint resource
- ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

**esp_err_t protocomm_remove_endpoint** (*protocomm_t* *pc*, const char *ep_name)

Remove endpoint request handler for a protocomm instance.

This API will remove a registered endpoint handler identified by an endpoint name.

**Note:**

- This function internally calls the registered *remove_endpoint()* function which is a member of the protocomm_t instance structure.

**Parameters**

- **pc** - [in] Pointer to the protocomm instance
- **session_id** - [in] Unique ID for a communication session

**Returns**

- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

**esp_err_t protocomm_open_session** (*protocomm_t* *pc*, uint32_t session_id)

Allocates internal resources for new transport session.

**Note:**

- An endpoint must be bound to a valid protocomm instance, created using *protocomm_new()*.
Chapter 2. API Reference

- ESP_OK: Request handled successfully
- ESP_ERR_NO_MEM: Error allocating internal resource
- ESP_ERR_INVALID_ARG: Null instance/name arguments

`esp_err_t protocomm_close_session(protocomm_t *pc, uint32_t session_id)`

Frees internal resources used by a transport session.

**Note:**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

**Parameters**
- `pc` - [in] Pointer to the protocomm instance
- `session_id` - [in] Unique ID for a communication session

**Returns**
- ESP_OK: Request handled successfully
- ESP_ERR_INVALID_ARG: Null instance/name arguments

`esp_err_t protocomm_req_handle(protocomm_t *pc, const char* ep_name, uint32_t session_id, const uint8_t* inbuf, ssize_t inlen, uint8_t** outbuf, ssize_t*outlen)`

Calls the registered handler of an endpoint session for processing incoming data and generating the response.

**Note:**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- Resulting output buffer must be deallocated by the caller.

**Parameters**
- `pc` - [in] Pointer to the protocomm instance
- `ep_name` - [in] Endpoint identifier(name) string
- `session_id` - [in] Unique ID for a communication session
- `inbuf` - [in] Input buffer contains input request data which is to be processed by the registered handler
- `inlen` - [in] Length of the input buffer
- `outbuf` - [out] Pointer to internally allocated output buffer, where the resulting response data output from the registered handler is to be stored
- `outlen` - [out] Buffer length of the allocated output buffer

**Returns**
- ESP_OK: Request handled successfully
- ESP_FAIL: Internal error in execution of registered handler
- ESP_ERR_NO_MEM: Error allocating internal resource
- ESP_ERR_NOT_FOUND: Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG: Null instance/name arguments

`esp_err_t protocomm_set_security(protocomm_t *pc, const char* ep_name, const protocomm_security_t *sec, const void *sec_params)`

Add endpoint security for a protocomm instance.

This API will bind a security session establisher to the specified endpoint name, along with any proof of possession that may be required for authenticating a session client.

**Note:**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
• The choice of security can be any protocomm_security_t instance. Choices protocomm_security0 and protocomm_security1 and protocomm_security2 are readily available.

Parameters

• pc - [in] Pointer to the protocomm instance
• ep_name - [in] Endpoint identifier(name) string
• sec - [in] Pointer to endpoint security instance
• sec_params - [in] Pointer to security params (NULL if not needed) The pointer should contain the security params struct of appropriate security version. For protocomm security version 1 and 2 sec_params should contain pointer to struct of type protocomm_security1_params_t and protocmm_security2_params_t respectively. The contents of this pointer must be valid till the security session has been running and is not closed.

Returns

• ESP_OK : Success
• ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
• ESP_ERR_INVALID_STATE : Security endpoint already set
• ESP_ERR_NO_MEM : Error allocating endpoint resource
• ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

```
esp_err_t protocomm_unset_security ( protocomm_t *pc, const char *ep_name )
```

Remove endpoint security for a protocomm instance.

This API will remove a registered security endpoint identified by an endpoint name.

Parameters

• pc - [in] Pointer to the protocomm instance
• ep_name - [in] Endpoint identifier(name) string

Returns

• ESP_OK : Success
• ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
• ESP_ERR_INVALID_STATE : Security endpoint already set
• ESP_ERR_NO_MEM : Error allocating endpoint resource
• ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

```
esp_err_t protocomm_set_version ( protocomm_t *pc, const char *ep_name, const char *version )
```

Set endpoint for version verification.

This API can be used for setting an application specific protocol version which can be verified by clients through the endpoint.

Note:

• An endpoint must be bound to a valid protocomm instance, created using protocomm_new().

Parameters

• pc - [in] Pointer to the protocomm instance
• ep_name - [in] Endpoint identifier(name) string
• version - [in] Version identifier(name) string

Returns

• ESP_OK : Success
• ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
• ESP_ERR_INVALID_STATE : Version endpoint already set
• ESP_ERR_NO_MEM : Error allocating endpoint resource
• ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

```
esp_err_t protocomm_unset_version ( protocomm_t *pc, const char *ep_name )
```

Remove version verification endpoint from a protocomm instance.
This API will remove a registered version endpoint identified by an endpoint name.

**Parameters**

- pc - [in] Pointer to the protocomm instance
- ep_name - [in] Endpoint identifier(name) string

**Returns**

- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

**Type Definitions**

typedef *protocomm_req_handler_t* (*protocomm_req_handler_t)(uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)

Function prototype for protocomm endpoint handler.

typedef struct protocomm

This structure corresponds to a unique instance of protocomm returned when the API `protocomm_new()` is called. The remaining Protocomm APIs require this object as the first parameter.

**Note:** Structure of the protocomm object is kept private

**Header File**

- components/protocomm/include/security/protocomm_security.h

**Structures**

struct protocomm_security1_params

Protocomm Security 1 parameters: Proof Of Possession.

**Public Members**

- const uint8_t *data
  
  Pointer to buffer containing the proof of possession data

- uint16_t len
  
  Length (in bytes) of the proof of possession data

struct protocomm_security2_params

Protocomm Security 2 parameters: Salt and Verifier.

**Public Members**

- const char *salt
  
  Pointer to the buffer containing the salt

- uint16_t salt_len
  
  Length (in bytes) of the salt
const char *verifier
    Pointer to the buffer containing the verifier

uint16_t verifier_len
    Length (in bytes) of the verifier

struct protocomm_security
    Protocomm security object structure.
    The member functions are used for implementing secure protocomm sessions.

Note: This structure should not have any dynamic members to allow re-entrancy

Public Members

int ver
    Unique version number of security implementation

esp_err_t (*init)(protocomm_security_handle_t *handle)
    Function for initializing/allocating security infrastructure

esp_err_t (*cleanup)(protocomm_security_handle_t handle)
    Function for deallocating security infrastructure

esp_err_t (*new_transport_session)(protocomm_security_handle_t handle, uint32_t session_id)
    Starts new secure transport session with specified ID

esp_err_t (*close_transport_session)(protocomm_security_handle_t handle, uint32_t session_id)
    Closes a secure transport session with specified ID

esp_err_t (*security_req_handler)(protocomm_security_handle_t handle, const void *sec_params, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)
    Handler function for authenticating connection request and establishing secure session

esp_err_t (*encrypt)(protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)
    Function which implements the encryption algorithm

esp_err_t (*decrypt)(protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)
    Function which implements the decryption algorithm

Type Definitions

typedef struct protocomm_security1_params protocomm_security1_params_t
    Protocomm Security 1 parameters: Proof Of Possession.

typedef protocomm_security1_params_t protocomm_security_pop_t
typedef struct protocomm_security2_params protocomm_security2_params_t
    Protocomm Security 2 parameters: Salt and Verifier.

typedef void *protocomm_security_handle_t

typedef struct protocomm_security protocomm_security_t
    Protocomm security object structure.
    The member functions are used for implementing secure protocomm sessions.

    Note: This structure should not have any dynamic members to allow re-entrancy

Enumerations

enum protocomm_security_session_event_t
    Events generated by the protocomm security layer.
    These events are generated while establishing secured session.
    Values:

enumerator PROTOCOMM_SECURITY_SESSION_SETUP_OK
        Secured session established successfully

enumerator PROTOCOMM_SECURITY_SESSION_INVALID_SECURITY_PARAMS
        Received invalid (NULL) security parameters (username / client public-key)

enumerator PROTOCOMM_SECURITY_SESSION_CREDENTIALS_MISMATCH
        Received incorrect credentials (username / PoP)

Header File

    • components/protocomm/include/security/protocomm_security0.h

Header File

    • components/protocomm/include/security/protocomm_security1.h

Header File

    • components/protocomm/include/transports/protocomm_httpd.h

Functions

esp_err_t protocomm_httpd_start (protocomm_t *pc, const protocomm_httpd_config_t *config)
    Start HTTPD protocomm transport.
    This API internally creates a framework to allow endpoint registration and security configuration for the protocomm.

    Note: This is a singleton. ie. Protocomm can have multiple instances, but only one instance can be bound to an HTTP transport layer.
Chapter 2. API Reference

Parameters
- \( pc \) – [in] Protocomm instance pointer obtained from protocomm_new()
- \( config \) – [in] Pointer to config structure for initializing HTTP server

Returns
- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_NOT_SUPPORTED : Transport layer bound to another protocomm instance
- ESP_ERR_INVALID_STATE : Transport layer already bound to this protocomm instance
- ESP_ERR_NO_MEM : Memory allocation for server resource failed
- ESP_ERR_HTTPD_* : HTTP server error on start

```c
esp_err_t protocomm_httpd_stop (protocomm_t *pc)
```

Stop HTTPD protocomm transport.

This API cleans up the HTTPD transport protocomm and frees all the handlers registered with the protocomm.

Parameters \( pc \) – [in] Same protocomm instance that was passed to protocomm_httpd_start()

Returns
- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null / incorrect protocomm instance pointer

Unions

```c
union protocomm_httpd_config_data_t
```

```c
#include <protocomm_httpd.h> Protocomm HTTPD Configuration Data
```

Public Members

```c
void *handle
```

HTTP Server Handle, if ext_handle_provided is set to true

```c
protocomm_http_server_config_t config
```

HTTP Server Configuration, if a server is not already active

Structures

```c
struct protocomm_http_server_config_t
```

Config parameters for protocomm HTTP server.

Public Members

```c
uint16_t port
```

Port on which the HTTP server will listen

```c
size_t stack_size
```

Stack size of server task, adjusted depending upon stack usage of endpoint handler

```c
unsigned task_priority
```

Priority of server task

```c
struct protocomm_httpd_config_t
```

Config parameters for protocomm HTTP server.
Chapter 2. API Reference

Public Members

```cpp
bool ext_handle_provided
```

Flag to indicate of an external HTTP Server Handle has been provided. In such case, protocomm will use the same HTTP Server and not start a new one internally.

```cpp
protocomm_httpd_config_data_t data
```

Protocomm HTTPD Configuration Data

Macros

```cpp
PROTOCOMM_HTTPD_DEFAULT_CONFIG()
```

Header File

- components/protocomm/include/transports/protocomm_ble.h

Functions

```cpp
esp_err_t protocomm_ble_start(protocomm_t *pc, const protocomm_ble_config_t *config)
```

Start Bluetooth Low Energy based transport layer for provisioning.

Initialize and start required BLE service for provisioning. This includes the initialization for characteristics/service for BLE.

Parameters

- `pc` [in] Protocomm instance pointer obtained from protocomm_new()
- `config` [in] Pointer to config structure for initializing BLE

Returns

- ESP_OK: Success
- ESP_FAIL: Simple BLE start error
- ESP_ERR_NO_MEM: Error allocating memory for internal resources
- ESP_ERR_INVALID_STATE: Error in ble config
- ESP_ERR_INVALID_ARG: Null arguments

```cpp
esp_err_t protocomm_ble_stop(protocomm_t *pc)
```

Stop Bluetooth Low Energy based transport layer for provisioning.

Stops service/task responsible for BLE based interactions for provisioning

**Note:** You might want to optionally reclaim memory from Bluetooth. Refer to the documentation of esp_bt_mem_release in that case.

```cpp
Parameters pc [in] Same protocomm instance that was passed to protocomm_ble_start()
```

Returns

- ESP_OK : Success
- ESP_FAIL : Simple BLE stop error
- ESP_ERR_INVALID_ARG : Null / incorrect protocomm instance

Structures

```cpp
struct name_uuid
```

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.
Public Members

const char *name
    Name of the handler, which is passed to protocomm layer

uint16_t uuid
    UUID to be assigned to the BLE characteristic which is mapped to the handler

struct protocomm_ble_config
    Config parameters for protocomm BLE service.

Public Members

char device_name[MAX_BLE_DEVNAME_LEN + 1]
    BLE device name being broadcast at the time of provisioning

uint8_t *service_uuid[BLE_UUID128_VAL_LENGTH]
    128 bit UUID of the provisioning service

uint8_t *manufacturer_data
    BLE device manufacturer data pointer in advertisement

ssize_t manufacturer_data_len
    BLE device manufacturer data length in advertisement

ssize_t nu_lookup_count
    Number of entries in the Name-UUID lookup table

struct protocomm_ble_name_uuid_t *nu_lookup
    Pointer to the Name-UUID lookup table

unsigned ble_bonding
    BLE bonding

unsigned ble_sm_sc
    BLE security flag

unsigned ble_link_encryption
    BLE security flag

Macros

MAX_BLE_DEVNAME_LEN
    BLE device name cannot be larger than this value 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes

BLE_UUID128_VAL_LENGTH
**MAX_BLE_MANUFACTURER_DATA_LEN**

Theoretically, the limit for max manufacturer length remains same as BLE device name i.e. 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes However, manufacturer data goes along with BLE device name in scan response. So, it is important to understand the actual length should be smaller than (29 - (BLE device name length) - 2).

**Type Definitions**

```c
typedef struct name_uuid protocomm_ble_name_uuid_t
This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

typedef struct protocomm_ble_config protocomm_ble_config_t
Config parameters for protocomm BLE service.
```

**Enumerations**

```c
enum protocomm_transport_ble_event_t
Events generated by BLE transport.

These events are generated when the BLE transport is paired and disconnected.

Values:

enumerator PROTOCOMM_TRANSPORT_BLE_CONNECTED
	enumerator PROTOCOMM_TRANSPORT_BLE_DISCONNECTED
```

## 2.8.2 Unified Provisioning

**Overview**

The unified provisioning support in the ESP-IDF provides an extensible mechanism to the developers to configure the device with the Wi-Fi credentials and/or other custom configuration using various transports and different security schemes. Depending on the use case, it provides a complete and ready solution for Wi-Fi network provisioning along with example iOS and Android applications. The developers can choose to extend the device-side and phone-app side implementations to accommodate their requirements for sending additional configuration data. The followings are the important features of this implementation:

1. **Extensible Protocol**

   The protocol is completely flexible and it offers the ability for the developers to send custom configuration in the provisioning process. The data representation is also left to the application to decide.

2. **Transport Flexibility**

   The protocol can work on Wi-Fi (SoftAP + HTTP server) or on Bluetooth LE as a transport protocol. The framework provides an ability to add support for any other transport easily as long as command-response behavior can be supported on the transport.

3. **Security Scheme Flexibility**
It is understood that each use case may require different security scheme to secure the data that is exchanged in the provisioning process. Some applications may work with SoftAP that is WPA2 protected or Bluetooth LE with the “just-works” security. Or the applications may consider the transport to be insecure and may want application-level security. The unified provisioning framework allows the application to choose the security as deemed suitable.

4. Compact Data Representation

The protocol uses Google Protobuf as a data representation for session setup and Wi-Fi provisioning. They provide a compact data representation and ability to parse the data in multiple programming languages in native format. Please note that this data representation is not forced on application-specific data and the developers may choose the representation of their choice.

Typical Provisioning Process

Deciding on Transport

The unified provisioning subsystem supports Wi-Fi (SoftAP+HTTP server) and Bluetooth LE (GATT based) transport schemes. The following points need to be considered while selecting the best possible transport for provisioning:

1. The Bluetooth LE-based transport has the advantage of maintaining an intact communication channel between the device and the client during the provisioning, which ensures reliable provisioning feedback.
2. The Bluetooth LE-based provisioning implementation makes the user experience better from the phone apps as on Android and iOS both, the phone app can discover and connect to the device without requiring the user to go out of the phone app.
3. However, the Bluetooth LE transport consumes about 110 KB memory at runtime. If the product does not use the Bluetooth LE or Bluetooth functionality after provisioning is done, almost all the memory can be reclaimed and added into the heap.
4. The SoftAP-based transport is highly interoperable. However, there are a few considerations:
   • The device uses the same radio to host the SoftAP and also to connect to the configured AP. Since these could potentially be on different channels, it may cause connection status updates not to be reliably received by the phone
   • The phone (client) has to disconnect from its current AP in order to connect to the SoftAP. The original network will get restored only when the provisioning process is complete, and the softAP is taken down.
5. The SoftAP transport does not require much additional memory for the Wi-Fi use cases.
6. The SoftAP-based provisioning requires the phone-app user to go to System Settings to connect to the Wi-Fi network hosted by the device in the iOS system. The discovery (scanning) as well as connection APIs are not available for the iOS applications.

Deciding on Security

Depending on the transport and other constraints, the security scheme needs to be selected by the application developers. The following considerations need to be given from the provisioning-security perspective:

1. The configuration data sent from the client to the device and the response have to be secured.
2. The client should authenticate the device that it is connected to.
3. The device manufacturer may choose proof-of-possession (PoP), a unique per-device secret to be entered on the provisioning client as a security measure to make sure that only the user can provision the device in their possession.

There are two levels of security schemes, of which the developer may select one or a combination, depending on requirements.

1. Transport Security

For SoftAP provisioning, developers may choose WPA2-protected security with unique per-device passphrase. Unique per-device passphrase can also act as a proof-of-possession. For Bluetooth LE, the “just-works” security can be used as a transport-level security after assessing its provided level of security.

2. Application Security
Chapter 2. API Reference

Fig. 29: Typical Provisioning Process

1. Transport-specific discovery and connection

   Some form of beaconing
   Client connects

2. Session Establishment

   Get Version Request
   Get Version Response
   Session Setup Request
   Session Setup Response

   One or multiple steps as per protocol

3. Configuration

   App-specific Set Config (optional)
   Set Config Response (optional)
   Wi-Fi SetConfig(SSID, Passphrase...)
   Wi-Fi SetConfig response
   Wi-Fi ApplyConfig cmd
   Wi-Fi ApplyConfig resp
   Wi-Fi GetStatus cmd (repeated)
   Wi-Fi GetStatus resp (repeated)

4. Close connection

   Close Connection
Chapter 2. API Reference

The unified provisioning subsystem provides the application-level security (Security 1 Scheme) that provides data protection and authentication through PoP, if the application does not use the transport-level security, or if the transport-level security is not sufficient for the use case.

**Device Discovery**

The advertisement and device discovery is left to the application and depending on the protocol chosen, the phone apps and device-firmware application can choose appropriate method for advertisement and discovery.

For the SoftAP+HTTP transport, typically the SSID (network name) of the AP hosted by the device can be used for discovery.

For the Bluetooth LE transport, device name or primary service included in the advertisement or a combination of both can be used for discovery.

**Architecture**

The below diagram shows the architecture of unified provisioning:

![Unified Provisioning Architecture](image)

It relies on the base layer called *Protocol Communication* (protocomm) which provides a framework for security schemes and transport mechanisms. The Wi-Fi Provisioning layer uses protocomm to provide simple callbacks to the application for setting the configuration and getting the Wi-Fi status. The application has control over implementation of these callbacks. In addition, the application can directly use protocomm to register custom handlers.

The application creates a protocomm instance which is mapped to a specific transport and specific security scheme. Each transport in the protocomm has a concept of an “end-point” which corresponds to the logical channel for communication for specific type of information. For example, security handshake happens on a different endpoint from the Wi-Fi configuration endpoint. Each end-point is identified using a string and depending on the transport internal representation of the end-point changes. In case of the SoftAP+HTTP transport, the end-point corresponds to URI, whereas in case of Bluetooth LE, the end-point corresponds to the GATT characteristic with specific UUID.
Developers can create custom end-points and implement handler for the data that is received or sent over the same end-point.

**Security Schemes**

At present, the unified provisioning supports the following security schemes:

1. Security 0
   - No security (No encryption).
2. Security 1
   - Curve25519-based key exchange, shared key derivation and AES256-CTR mode encryption of the data. It supports two modes:
     a. Authorized - Proof of Possession (PoP) string used to authorize session and derive shared key.
     b. No Auth (Null PoP) - Shared key derived through key exchange only.
3. Security 2
   - SRP6a-based shared key derivation and AES256-GCM mode encryption of the data.

**Note:** The respective security schemes need to be enabled through the project configuration menu. Please refer to [Enabling Protocomm Security Version](#) for more details.

### Security 1 Scheme

The Security 1 scheme details are shown in the below sequence diagram:

### Security 2 Scheme

The Security 2 scheme is based on the Secure Remote Password (SRP6a) protocol, see [RFC 5054](#). The protocol requires the Salt and Verifier to be generated beforehand with the help of the identifying username $I$ and the plaintext password $p$. The Salt and Verifier are then stored on ESP32.

- The password $p$ and the username $I$ are to be provided to the Phone App (Provisioning entity) by suitable means, e.g., QR code sticker.

Details about the Security 2 scheme are shown in the below sequence diagram:

### Sample Code

Please refer to [Protocol Communication](#) and [Wi-Fi Provisioning](#) for API guides and code snippets on example usage. Application implementation can be found as an example under [provisioning](#).

### Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - Bluetooth LE Provisioning app on Play Store.
  - SoftAP Provisioning app on Play Store.
  - Source code on GitHub: esp-idf-provisioning-android.
- **iOS:**
  - Bluetooth LE Provisioning app on App Store.
  - SoftAP Provisioning app on App Store.

– Source code on GitHub: esp-idf-provisioning-ios.
  • Linux/macOS/Windows: tools/esp_prov, a Python-based command line tool for provisioning.

The phone applications offer simple UI and are thus more user centric, while the command-line application is useful as a debugging tool for developers.

### 2.8.3 Wi-Fi Provisioning

#### Overview

This component provides APIs that control the Wi-Fi provisioning service for receiving and configuring Wi-Fi credentials over SoftAP or Bluetooth LE transport via secure Protocol Communication sessions. The set of wifi_prov_mgr_ APIs help quickly implement a provisioning service that has necessary features with minimal amount of code and sufficient flexibility.

#### Initialization

**wifi_prov_mgr_init()** is called to configure and initialize the provisioning manager, and thus must be called prior to invoking any other wifi_prov_mgr_ APIs. Note that the manager relies on other components of ESP-IDF, namely NVS, TCP/IP, Event Loop and Wi-Fi, and optionally mDNS, hence these components must be initialized beforehand. The manager can be de-initialized at any moment by making a call to **wifi_prov_mgr_deinit()**.

```c
wifi_prov_mgr_config_t config = {
  .scheme = wifi_prov_scheme_ble,
  .scheme_event_handler = WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
};
ESP_ERROR_CHECK( wifi_prov_mgr_init(config) );
```

The configuration structure **wifi_prov_mgr_config_t** has a few fields to specify the desired behavior of the manager:

- **wifi_prov_mgr_config_t::scheme**: This is used to specify the provisioning scheme. Each scheme corresponds to one of the modes of transport supported by protocomm. Hence, support the following options:
  - **wifi_prov_scheme_ble**: Bluetooth LE transport and GATT Server for handling the provisioning commands.
  - **wifi_prov_scheme_softap**: Wi-Fi SoftAP transport and HTTP Server for handling the provisioning commands.
  - **wifi_prov_scheme_console**: Serial transport and console for handling the provisioning commands.
- **wifi_prov_mgr_config_t::scheme_event_handler**: An event handler defined along with the scheme. Choosing the appropriate scheme-specific event handler allows the manager to take care of certain matters automatically. Presently, this option is not used for either the SoftAP or Console-based provisioning, but is very convenient for Bluetooth LE. To understand how, we must recall that Bluetooth requires a substantial amount of memory to function, and once the provisioning is finished, the main application may want to reclaim back this memory (or part of it) if it needs to use either Bluetooth LE or classic Bluetooth. Also, upon every future reboot of a provisioned device, this reclamation of memory needs to be performed again. To reduce this complication in using wifi_prov_scheme_ble, the scheme-specific handlers have been defined, and depending upon the chosen handler, the Bluetooth LE/classic Bluetooth/BTDM memory is freed automatically when the provisioning manager is de-initialized. The available options are:
  - WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM - Free both classic Bluetooth and Bluetooth LE/BTDM memory. Used when the main application does not require Bluetooth at all.
– WiFi_Prov_Scheme_BLE_Event_Handler_Free_BLE - Free only Bluetooth LE memory. Used when main application requires classic Bluetooth.
– WiFi_Prov_Scheme_BLE_Event_Handler_Free_BT - Free only classic Bluetooth. Used when main application requires Bluetooth LE. In this case freeing happens right when the manager is initialized.
– WiFi_Prov_Event_Handler_None - Do not use any scheme specific handler. Used when the provisioning scheme is not Bluetooth LE, i.e., using SoftAP or Console, or when main application wants to handle the memory reclaiming on its own, or needs both Bluetooth LE and classic Bluetooth to function.

• wifi_prov_mgr_config_t::app_event_handler (Deprecated) - It is now recommended to catch WiFi_PROV_EVENT that is emitted to the default event loop handler. See definition of wifi_prov_cb_event_t for the list of events that are generated by the provisioning service. Here is an excerpt showing some of the provisioning events:

```c
static void event_handler(void* arg, esp_event_base_t event_base, int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT) {
        switch (event_id) {
            case WIFI_PROV_START:  
                ESP_LOGI(TAG, "Provisioning started");
                break;
            case WIFI_PROV_CRED_RECV: {
                wifi_sta_config_t* wifi_sta_cfg = (wifi_sta_config_t*)event_data;
                ESP_LOGI(TAG, "Received Wi-Fi credentials"
                "\nSSID : %s
                Password : %s",
                        (const char*)wifi_sta_cfg->ssid,
                        (const char*)wifi_sta_cfg->password);
                break;
            } case WIFI_PROV_CRED_FAIL: {
                wifi_prov_sta_fail_reason_t* reason = (wifi_prov_sta_fail_reason_t*)event_data;
                ESP_LOGE(TAG, "Provisioning failed!\nReason : %s"
                "\nP lease reset to factory and retry\nprovisioning",
                        (*reason == WIFI_PROV_STA_AUTH_ERROR) ? "Wi-Fi station authentication failed" : "Wi-Fi access-point not found");
                break;
            } case WIFI_PROV_CRED_SUCCESS:
                ESP_LOGI(TAG, "Provisioning successful");
                break;
            case WIFI_PROV_END:
                // De-initialize manager once provisioning is finished */
                wifi_prov_mgr_deinit();
                break;
        default:
            break;
        }
    }
}
```

The manager can be de-initialized at any moment by making a call to wifi_prov_mgr_deinit().

Check the Provisioning State  Whether the device is provisioned or not can be checked at runtime by calling wifi_prov_mgr_is_provisioned(). This internally checks if the Wi-Fi credentials are stored in NVS.

Note that presently the manager does not have its own NVS namespace for storage of Wi-Fi credentials, instead it
relies on the esp_wifi_ APIs to set and get the credentials stored in NVS from the default location.

If the provisioning state needs to be reset, any of the following approaches may be taken:

- The associated part of NVS partition has to be erased manually
- The main application must implement some logic to call esp_wifi_ APIs for erasing the credentials at runtime
- The main application must implement some logic to force start the provisioning irrespective of the provisioning state

```c
bool provisioned = false;
ESP_ERROR_CHECK( wifi_prov_mgr_is_provisioned(&provisioned) );
```

### Start the Provisioning Service

At the time of starting provisioning we need to specify a service name and the corresponding key, that is to say:

- A Wi-Fi SoftAP SSID and a passphrase, respectively, when the scheme is wifi_prov_scheme_softap.
- Bluetooth LE device name with the service key ignored when the scheme is wifi_prov_scheme_ble.

Also, since internally the manager uses protocomm, we have the option of choosing one of the security features provided by it:

- Security 1 is secure communication which consists of a prior handshake involving X25519 key exchange along with authentication using a proof of possession pop, followed by AES-CTR for encryption or decryption of subsequent messages.
- Security 0 is simply plaintext communication. In this case the pop is simply ignored.

See [Unified Provisioning](#) for details about the security features.

```c
const char *service_name = "my_device";
const char *service_key = "password";

wifi_prov_security_t security = WIFI_PROV_SECURITY_1;
const char *pop = "abcd1234";

ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_--name, service_key) );
```

The provisioning service automatically finishes only if it receives valid Wi-Fi AP credentials followed by successful connection of device to the AP with IP obtained. Regardless of that, the provisioning service can be stopped at any moment by making a call to wifi_prov_mgr_stop_provisioning().

**Note:** If the device fails to connect with the provided credentials, it does not accept new credentials anymore, but the provisioning service keeps on running, only to convey failure to the client, until the device is restarted. Upon restart, the provisioning state turns out to be true this time, as credentials are found in NVS, but the device does fail again to connect with those same credentials, unless an AP with the matching credentials somehow does become available. This situation can be fixed by resetting the credentials in NVS or force starting the provisioning service. This has been explained above in [Check the Provisioning State](#).

### Waiting for Completion

Typically, the main application waits for the provisioning to finish, then de-initializes the manager to free up resources, and finally starts executing its own logic.

There are two ways for making this possible. The simpler way is to use a blocking call to wifi_prov_mgr_wait().

```c
// Start provisioning service
ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_--name, service_key) );
```

(continues on next page)
The other way is to use the default event loop handler to catch WIFI_PROV_EVENT and call wifi_prov_mgr_deinit() when event ID is WIFI_PROV_END:

```c
static void event_handler(void * arg, esp_event_base_t event_base, int event_id, void * event_data)
{
    if (event_base == WIFI_PROV_EVENT && event_id == WIFI_PROV_END) {
        /* De-initialize the manager once the provisioning is finished */
        wifi_prov_mgr_deinit();
    }
}
```

User Side Implementation  When the service is started, the device to be provisioned is identified by the advertised service name, which, depending upon the selected transport, is either the Bluetooth LE device name or the SoftAP SSID.

When using SoftAP transport, for allowing service discovery, mDNS must be initialized before starting provisioning. In this case, the host name set by the main application is used, and the service type is internally set to _esp_wifi_prov.

When using Bluetooth LE transport, a custom 128-bit UUID should be set using wifi_prov_scheme_ble_set_service_uuid(). This UUID is to be included in the Bluetooth LE advertisement and corresponds to the primary GATT service that provides provisioning endpoints as GATT characteristics. Each GATT characteristic is formed using the primary service UUID as the base, with different auto-assigned 12th and 13th bytes, presumably counting from the 0th byte. Since an endpoint characteristic UUID is auto-assigned, it should not be used to identify the endpoint. Instead, client-side applications should identify the endpoints by reading the User Characteristic Description (0x2901) descriptor for each characteristic, which contains the endpoint name of the characteristic. For example, if the service UUID is set to 55cc035e-fb27-4f80-be02-3c60828b7451, each endpoint characteristic is assigned a UUID like 55cc____-fb27-4f80-be02-3c60828b7451, with unique values at the 12th and 13th bytes.

Once connected to the device, the provisioning-related protocomm endpoints can be identified as follows:

<table>
<thead>
<tr>
<th>Endpoint Name</th>
<th>URL, i.e., Bluetooth LE GATT Server + mDNS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prov-session</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-session</td>
<td>Security endpoint used for session establishment</td>
</tr>
<tr>
<td>prov-scan</td>
<td><a href="http://wifi-prov.local/prov-scan">http://wifi-prov.local/prov-scan</a></td>
<td>the endpoint used for starting Wi-Fi scan and receiving scan results</td>
</tr>
<tr>
<td>prov-ctrl</td>
<td><a href="http://wifi-prov.local/prov-ctrl">http://wifi-prov.local/prov-ctrl</a></td>
<td>the endpoint used for controlling Wi-Fi provisioning state</td>
</tr>
<tr>
<td>prov-config</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-config</td>
<td>the endpoint used for configuring Wi-Fi credentials on device</td>
</tr>
<tr>
<td>proto-ver</td>
<td>http://&lt;mdns-hostname&gt;.local/proto-ver</td>
<td>the endpoint for retrieving version info</td>
</tr>
</tbody>
</table>

Immediately after connecting, the client application may fetch the version/capabilities information from the proto-ver endpoint. All communications to this endpoint are unencrypted, hence necessary information, which may be relevant for deciding compatibility, can be retrieved before establishing a secure session. The response is in
JSON format and looks like:

```
prov: { ver: v1.1, cap: [no_pop] },
my_app: { ver: 1.345, cap: [cloud, local_ctrl] },
```

Here label `prov` provides provisioning service version `ver` and capabilities `cap`. For now, only the `no_pop` capability is supported, which indicates that the service does not require proof of possession for authentication. Any application-related version or capabilities are given by other labels, e.g., `my_app` in this example. These additional fields are set using `wifi_prov_mgr_set_app_info()`.

User side applications need to implement the signature handshaking required for establishing and authenticating secure protocomm sessions as per the security scheme configured for use, which is not needed when the manager is configured to use protocomm security 0.

See *Unified Provisioning* for more details about the secure handshake and encryption used. Applications must use the `.proto` files found under `protocomm/proto`, which define the Protobuf message structures supported by `prov-session` endpoint.

Once a session is established, Wi-Fi credentials are configured using the following set of `wifi_config` commands, serialized as Protobuf messages with the corresponding `.proto` files that can be found under `wifi_provisioning/proto`:

- **get_status** - For querying the Wi-Fi connection status. The device responds with a status which is one of connecting, connected or disconnected. If the status is disconnected, a disconnection reason is also to be included in the status response.
- **set_config** - For setting the Wi-Fi connection credentials.
- **apply_config** - For applying the credentials saved during `set_config` and starting the Wi-Fi station.

After session establishment, the client can also request Wi-Fi scan results from the device. The results returned is a list of AP SSIDs, sorted in descending order of signal strength. This allows client applications to display APs nearby to the device at the time of provisioning, and users can select one of the SSIDs and provide the password which is then sent using the `wifi_config` commands described above. The `wifi_scan` endpoint supports the following protobuf commands:

- **scan_start** - For starting Wi-Fi scan with various options:
  - `blocking` (input) - If true, the command returns only when the scanning is finished.
  - `passive` (input) - If true, the scan is started in passive mode, which may be slower, instead of active mode.
  - `group_channels` (input) - This specifies whether to scan all channels in one go when zero, or perform scanning of channels in groups, with 120 ms delay between scanning of consecutive groups, and the value of this parameter sets the number of channels in each group. This is useful when transport mode is SoftAP, where scanning all channels in one go may not give the Wi-Fi driver enough time to send out beacons, and hence may cause disconnection with any connected stations. When scanning in groups, the manager waits for at least 120 ms after completing the scan on a group of channels, and thus allows the driver to send out the beacons. For example, given that the total number of Wi-Fi channels is 14, then setting `group_channels` to 3 creates 5 groups, with each group having 3 channels, except the last one which has 14 % 3 = 2 channels. So, when the scan is started, the first 3 channels will be scanned, followed by a 120 ms delay, and then the next 3 channels, and so on, until all the 14 channels have been scanned. One may need to adjust this parameter as having only a few channels in a group may increase the overall scan time, while having too many may again cause disconnection. Usually, a value of 4 should work for most cases. Note that for any other mode of transport, e.g., Bluetooth LE, this can be safely set to 0, and hence achieve the shortest overall scanning time.
  - `period_ms` (input) - The scan parameter specifying how long to wait on each channel.
- **scan_status** - It gives the status of scanning process:
  - `scan_finished` (output) - When the scan has finished, this returns true.
  - `result_count` (output) - This gives the total number of results obtained till now. If the scan is yet happening, this number keeps on updating.
- **scan_result** - For fetching the scan results. This can be called even if the scan is still on going:
  - `start_index` (input) - Where the index starts from to fetch the entries from the results list.
  - `count` (input) - The number of entries to fetch from the starting index.
  - `entries` (output) - The list of entries returned. Each entry consists of `ssid`, `channel` and `rssi` information.

The client can also control the provisioning state of the device using `wifi_ctrl` endpoint. The `wifi_ctrl` endpoint supports the following protobuf commands:
• **ctrl_reset** - Resets internal state machine of the device and clears provisioned credentials only in case of provisioning failures.
• **ctrl_reprov** - Resets internal state machine of the device and clears provisioned credentials only in case the device is to be provisioned again for new credentials after a previous successful provisioning.

**Additional Endpoints** In case users want to have some additional protocomm endpoints customized to their requirements, this is done in two steps. First is creation of an endpoint with a specific name, and the second step is the registration of a handler for this endpoint. See [Protocol Communication](#) for the function signature of an endpoint handler. A custom endpoint must be created after initialization and before starting the provisioning service. Whereas, the protocomm handler is registered for this endpoint only after starting the provisioning service.

```c
wifi_prov_mgr_init(config);
wifi_prov_mgr_endpoint_create("custom-endpoint");
wifi_prov_mgr_start_provisioning(security, pop, service_name, service_→key);
wifi_prov_mgr_endpoint_register("custom-endpoint", custom_ep_handler,␣
→custom_ep_data);
```

When the provisioning service stops, the endpoint is unregistered automatically.

One can also choose to call `wifiProvMgrEndpointUnregister()` to manually deactivate an endpoint at runtime. This can also be used to deactivate the internal endpoints used by the provisioning service.

**When/How to Stop the Provisioning Service?** The default behavior is that once the device successfully connects using the Wi-Fi credentials set by the `apply_config` command, the provisioning service stops, and Bluetooth LE or SoftAP turns off, automatically after responding to the next `get_status` command. If `get_status` command is not received by the device, the service stops after a 30 s timeout.

On the other hand, if device is not able to connect using the provided Wi-Fi credentials, due to incorrect SSID or passphrase, the service keeps running, and `get_status` keeps responding with disconnected status and reason for disconnection. Any further attempts to provide another set of Wi-Fi credentials, are to be rejected. These credentials are preserved, unless the provisioning service is force started, or NVS erased.

If this default behavior is not desired, it can be disabled by calling `wifi_prov_mgr_disable_auto_stop()`. Now the provisioning service stops only after an explicit call to `wifi_prov_mgr_stop_provisioning()`, which returns immediately after scheduling a task for stopping the service. The service stops after a certain delay and WIFI_PROV_END event gets emitted. This delay is specified by the argument to `wifi_prov_mgr_disable_auto_stop()`.

The customized behavior is useful for applications which want the provisioning service to be stopped some time after the Wi-Fi connection is successfully established. For example, if the application requires the device to connect to some cloud service and obtain another set of credentials, and exchange these credentials over a custom protocomm endpoint, then after successfully doing so, stop the provisioning service by calling `wifi_prov_mgr_stop_provisioning()` inside the protocomm handler itself. The right amount of delay ensures that the transport resources are freed only after the response from the protocomm handler reaches the client side application.

**Application Examples**

For complete example implementation see provision/wifi_prov_mgr.

**Provisioning Tools**

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - Bluetooth LE Provisioning app on Play Store.
  - SoftAP Provisioning app on Play Store.
– Source code on GitHub: esp-idf-provisioning-android.

• iOS:
  – Bluetooth LE Provisioning app on App Store.
  – SoftAP Provisioning app on App Store.
  – Source code on GitHub: esp-idf-provisioning-ios.

• Linux/MacOS/Windows: tools/esp_prov, a Python-based command-line tool for provisioning.

The phone applications offer simple UI and are thus more user centric, while the command-line application is useful as a debugging tool for developers.

API Reference

Header File

- components/wifi_provisioning/include/wifi_provisioning/manager.h

Functions

`esp_err_t wifi_prov_mgr_init (wifi_prov_mgr_config_t config)`

- Initialize provisioning manager instance.
  - Configures the manager and allocates internal resources
  - Configuration specifies the provisioning scheme (transport) and event handlers
  - Event WIFI_PROV_INIT is emitted right after initialization is complete

- Parameters config [in] Configuration structure
- Returns
  - ESP_OK : Success
  - ESP_FAIL : Fail

`void wifi_prov_mgr_deinit (void)`

- Stop provisioning (if running) and release resource used by the manager.

- Event WIFI_PROV_DEINIT is emitted right after de-initialization is finished

- If provisioning service is still active when this API is called, it first stops the service, hence emitting WIFI_PROV_END, and then performs the de-initialization

`esp_err_t wifi_prov_mgr_is_provisioned (bool *provisioned)`

- Checks if device is provisioned.

- This checks if Wi-Fi credentials are present on the NVS

- The Wi-Fi credentials are assumed to be kept in the same NVS namespace as used by esp_wifi component

- If one were to call esp_wifi_set_config() directly instead of going through the provisioning process, this function will still yield true (i.e. device will be found to be provisioned)

- Note: Calling wifi_prov_mgr_start_provisioning() automatically resets the provision state, irrespective of what the state was prior to making the call.

- Parameters provisioned [out] True if provisioned, else false

- Returns
  - ESP_OK : Retrieved provision state successfully
  - ESP_FAIL : Wi-Fi not initialized
  - ESP_ERR_INVALID_ARG : Null argument supplied

`esp_err_t wifi_prov_mgr_start_provisioning (wifi_prov_security_t security, const void *wifi_prov_sec_params, const char *service_name, const char *service_key)`
Start provisioning service.

This starts the provisioning service according to the scheme configured at the time of initialization. For scheme:

- wifi_prov_scheme_ble: This starts protocomm_ble, which internally initializes BLE transport and starts GATT server for handling provisioning requests
- wifi_prov_scheme_softap: This activates SoftAP mode of Wi-Fi and starts protocomm_httpd, which internally starts an HTTP server for handling provisioning requests (If mDNS is active it also starts advertising service with type _esp_wifi_prov._tcp)

Event WIFI_PROV_START is emitted right after provisioning starts without failure

Note: This API will start provisioning service even if device is found to be already provisioned, i.e. wifi_prov_mgr_is_provisioned() yields true

Parameters

- **security** [in] Specify which protocomm security scheme to use:
  - WIFI_PROV_SECURITY_0: For no security
  - WIFI_PROV_SECURITY_1: x25519 secure handshake for session establishment followed by AES-CTR encryption of provisioning messages
  - WIFI_PROV_SECURITY_2: SRP6a based authentication and key exchange followed by AES-GCM encryption/decryption of provisioning messages
- **wifi_prov_sec_params** [in] Pointer to security params (NULL if not needed). This is not needed for protocomm security 0. This pointer should hold the struct of type wifi_prov_security1_params_t for protocomm security 1 and wifi_prov_security2_params_t for protocomm security 2 respectively. This pointer and its contents should be valid till the provisioning service is running and has not been stopped or de-inited.
- **service_name** [in] Unique name of the service. This translates to:
  - Wi-Fi SSID when provisioning mode is softAP
  - Device name when provisioning mode is BLE
- **service_key** [in] Key required by client to access the service (NULL if not needed). This translates to:
  - Wi-Fi password when provisioning mode is softAP
  - ignored when provisioning mode is BLE

Returns

- ESP_OK: Provisioning started successfully
- ESP_FAIL: Failed to start provisioning service
- ESP_ERR_INVALID_STATE: Provisioning manager not initialized or already started

void wifi_prov_mgr_stop_provisioning (void)

Stop provisioning service.

If provisioning service is active, this API will initiate a process to stop the service and return. Once the service actually stops, the event WIFI_PROV_END will be emitted.

If wifi_prov_mgr_deinit() is called without calling this API first, it will automatically stop the provisioning service and emit the WIFI_PROV_END, followed by WIFI_PROV_DEINIT, before returning.

This API will generally be used along with wifi_prov_mgr_disable_auto_stop() in the scenario when the main application has registered its own endpoints, and wishes that the provisioning service is stopped only when some protocomm command from the client side application is received.

Calling this API inside an endpoint handler, with sufficient cleanup_delay, will allow the response / acknowledgment to be sent successfully before the underlying protocomm service is stopped.

Cleanup_delay is set when calling wifi_prov_mgr_disable_auto_stop(). If not specified, it defaults to 1000ms.
For straightforward cases, using this API is usually not necessary as provisioning is stopped automatically once WIFI_PROV_CRED_SUCCESS is emitted. Stopping is delayed (maximum 30 seconds) thus allowing the client side application to query for Wi-Fi state, i.e. after receiving the first query and sending Wi-Fi state connected response the service is stopped immediately.

```c
void wifi_prov_mgr_wait (void)
```

Wait for provisioning service to finish.

Calling this API will block until provisioning service is stopped i.e. till event WIFI_PROV_END is emitted. This will not block if provisioning is not started or not initialized.

```c
esp_err_t wifi_prov_mgr_disable_auto_stop (uint32_t cleanup_delay)
```

Disable auto stopping of provisioning service upon completion.

By default, once provisioning is complete, the provisioning service is automatically stopped, and all endpoints (along with those registered by main application) are deactivated.

This API is useful in the case when main application wishes to close provisioning service only after it receives some protocomm command from the client side app. For example, after connecting to Wi-Fi, the device may want to connect to the cloud, and only once that is successfully, the device is said to be fully configured. But, then it is up to the main application to explicitly call wifi_prov_mgr_stop_provisioning() later when the device is fully configured and the provisioning service is no longer required.

**Note:** This must be called before executing wifi_prov_mgr_start_provisioning()

**Parameters**
- `cleanup_delay` - [in] Sets the delay after which the actual cleanup of transport related resources is done after a call to wifi_prov_mgr_stop_provisioning() returns. Minimum allowed value is 100ms. If not specified, this will default to 1000ms.

**Returns**
- ESP_OK : Success
- ESP_ERR_INVALID_STATE : Manager not initialized or provisioning service already started

```c
esp_err_t wifi_prov_mgr_set_app_info (const char* label, const char* version, const char** capabilities, size_t total_capabilities)
```

Set application version and capabilities in the JSON data returned by proto-ver endpoint.

This function can be called multiple times, to specify information about the various application specific services running on the device, identified by unique labels.

The provisioning service itself registers an entry in the JSON data, by the label “prov”, containing only provisioning service version and capabilities. Application services should use a label other than “prov” so as not to overwrite this.

**Note:** This must be called before executing wifi_prov_mgr_start_provisioning()

**Parameters**
- `label` - [in] String indicating the application name.
- `version` - [in] String indicating the application version. There is no constraint on format.
- `capabilities` - [in] Array of strings with capabilities. These could be used by the client side app to know the application registered endpoint capabilities.
- `total_capabilities` - [in] Size of capabilities array

**Returns**
- ESP_OK : Success
- ESP_ERR_INVALID_STATE : Manager not initialized or provisioning service already started
- ESP_ERR_NO_MEM : Failed to allocate memory for version string
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG: Null argument

`esp_err_t wifi_prov_mgr_endpoint_create(const char* ep_name)`
Create an additional endpoint and allocate internal resources for it.

This API is to be called by the application if it wants to create an additional endpoint. All additional endpoints
will be assigned UUIDs starting from 0xFF54 and so on in the order of execution.

The protocol handler for the created endpoint is to be registered later using `wifi_prov_mgr_endpoint_register()`
after provisioning has started.

**Note:** This API can only be called BEFORE provisioning is started

**Note:** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials,
those are necessary for the main application and hence must be set prior to starting the application

**Note:** After session establishment, the additional endpoints must be targeted first by the client side application
before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is
stopped and hence all endpoints are unregistered

**Parameters**  
ep_name - [in] unique name of the endpoint

**Returns**
- ESP_OK : Success
- ESP_FAIL : Failure

`esp_err_t wifi_prov_mgr_endpoint_register(const char* ep_name, protocomm_req_handler_t handler, void* user_ctx)`

Register a handler for the previously created endpoint.

This API can be called by the application to register a protocol handler to any endpoint that was created
using `wifi_prov_mgr_endpoint_create()`.

**Note:** This API can only be called AFTER provisioning has started

**Note:** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials,
those are necessary for the main application and hence must be set prior to starting the application

**Note:** After session establishment, the additional endpoints must be targeted first by the client side application
before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is
stopped and hence all endpoints are unregistered

**Parameters**
- **ep_name** - [in] Name of the endpoint
- **handler** - [in] Endpoint handler function
- **user_ctx** - [in] User data

**Returns**
- ESP_OK : Success
- ESP_FAIL : Failure
void wifi_prov_mgr_endpoint_unregister (const char *ep_name)

Unregister the handler for an endpoint.

This API can be called if the application wants to selectively unregister the handler of an endpoint while the provisioning is still in progress.

All the endpoint handlers are unregistered automatically when the provisioning stops.

Parameters ep_name - [in] Name of the endpoint

esp_err_t wifi_prov_mgr_get_wifi_state (wifi_prov_sta_state_t *state)

Get state of Wi-Fi Station during provisioning.

Parameters state - [out] Pointer to wifi_prov_sta_state_t variable to be filled

Returns

• ESP_OK : Successfully retrieved Wi-Fi state
• ESP_FAIL : Provisioning app not running

esp_err_t wifiProv_mgr_get_wifi_disconnect_reason (wifi_prov_sta_fail_reason_t *reason)

Get reason code in case of Wi-Fi station disconnection during provisioning.

Parameters reason - [out] Pointer to wifi_prov_sta_fail_reason_t variable to be filled

Returns

• ESP_OK : Successfully retrieved Wi-Fi disconnect reason
• ESP_FAIL : Provisioning app not running

esp_err_t wifi_prov_mgr_configure_sta (wifi_config_t *wifi_cfg)

Runs Wi-Fi as Station with the supplied configuration.

Configures the Wi-Fi station mode to connect to the AP with SSID and password specified in config structure and sets Wi-Fi to run as station.

This is automatically called by provisioning service upon receiving new credentials.

If credentials are to be supplied to the manager via a different mode other than through protocomm, then this API needs to be called.

Event WIFI_PROV_CRED_RECV is emitted after credentials have been applied and Wi-Fi station started

Parameters wifi_cfg - [in] Pointer to Wi-Fi configuration structure

Returns

• ESP_OK : Wi-Fi configured and started successfully
• ESP_FAIL : Failed to set configuration

esp_err_t wifi_prov_mgr_reset_provisioning (void)

Reset Wi-Fi provisioning config.

Calling this API will restore WiFi stack persistent settings to default values.

Returns

• ESP_OK : Reset provisioning config successfully
• ESP_FAIL : Failed to reset provisioning config

esp_err_t wifi_prov_mgr_reset_sm_state_on_failure (void)

Reset internal state machine and clear provisioned credentials.

This API should be used to restart provisioning ONLY in the case of provisioning failures without rebooting the device.

Returns

• ESP_OK : Reset provisioning state machine successfully
• ESP_FAIL : Failed to reset provisioning state machine
• ESP_ERR_INVALID_STATE : Manager not initialized
**Chapter 2. API Reference**

**esp_err_t wifi_prov_mgr_reset_sm_state_for_reprovision (void)**

Reset internal state machine and clear provisioned credentials.

This API can be used to restart provisioning ONLY in case the device is to be provisioned again for new credentials after a previous successful provisioning without rebooting the device.

**Note:** This API can be used only if provisioning auto-stop has been disabled using `wifi_prov_mgr_disable_auto_stop()`

**Returns**

- ESP_OK : Reset provisioning state machine successfully
- ESP_FAIL : Failed to reset provisioning state machine
- ESP_ERR_INVALID_STATE : Manager not initialized

**Structures**

struct **wifi_prov_event_handler_t**

Event handler that is used by the manager while provisioning service is active.

**Public Members**

`wifi_prov_cb_func_t event_cb`

Callback function to be executed on provisioning events

`void *user_data`

User context data to pass as parameter to callback function

struct **wifi_prov_scheme**

Structure for specifying the provisioning scheme to be followed by the manager.

**Note:** Ready to use schemes are available:

- `wifi_prov_scheme_ble` : for provisioning over BLE transport + GATT server
- `wifi_prov_scheme_softap` : for provisioning over SoftAP transport + HTTP server
- `wifi_prov_scheme_console` : for provisioning over Serial UART transport + Console (for debugging)

**Public Members**

`esp_err_t (*prov_start)(protocomm_t *pc, void *config)`

Function which is to be called by the manager when it is to start the provisioning service associated with a protocomm instance and a scheme specific configuration

`esp_err_t (*prov_stop)(protocomm_t *pc)`

Function which is to be called by the manager to stop the provisioning service previously associated with a protocomm instance

`void *(*new_config)(void)`

Function which is to be called by the manager to generate a new configuration for the provisioning service, that is to be passed to `prov_start()`
void (*delete_config)(void *config)
Function which is to be called by the manager to delete a configuration generated using new_config()

esp_err_t (*set_config_service)(void *config, const char *service_name, const char *service_key)
Function which is to be called by the manager to set the service name and key values in the configuration structure

esp_err_t (*set_config_endpoint)(void *config, const char *endpoint_name, uint16_t uuid)
Function which is to be called by the manager to set a protocol comm endpoint with an identifying name and UUID in the configuration structure

wifi_mode_t wifi_mode
Sets mode of operation of Wi-Fi during provisioning. This is set to:
- WIFI_MODE_APSTA for SoftAP transport
- WIFI_MODE_STA for BLE transport

struct wifi_prov_mgr_config_t
Structure for specifying the manager configuration.

Public Members

wifi_prov_scheme_t scheme
Provisioning scheme to use. Following schemes are already available:
- wifi_prov_scheme_ble: for provisioning over BLE transport + GATT server
- wifi_prov_scheme_softap: for provisioning over SoftAP transport + HTTP server + mDNS (optional)
- wifi_prov_scheme_console: for provisioning over Serial UART transport + Console (for debugging)

wifi_prov_event_handler_t scheme_event_handler
Event handler required by the scheme for incorporating scheme specific behavior while provisioning manager is running. Various options may be provided by the scheme for setting this field. Use WIFI_PROV_EVENT_HANDLER_NONE when not used. When using scheme wifi_prov_scheme_ble, the following options are available:
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT

wifi_prov_event_handler_t app_event_handler
Event handler that can be set for the purpose of incorporating application specific behavior. Use WIFI_PROV_EVENT_HANDLER_NONE when not used.

Macros

WIFI_PROV_EVENT_HANDLER_NONE
Event handler can be set to none if not used.

Type Definitions

typedef void (*wifi_prov_cb_func_t)(void *user_data, wifi_prov_cb_event_t event, void *event_data)
typedef struct wifi_prov_scheme wifi_prov_scheme_t
    Structure for specifying the provisioning scheme to be followed by the manager.

Note: Ready to use schemes are available:

• wifi_prov_scheme_ble: for provisioning over BLE transport + GATT server
• wifi_prov_scheme_softap: for provisioning over SoftAP transport + HTTP server
• wifi_prov_scheme_console: for provisioning over Serial UART transport + Console (for debugging)

typedef enum wifi_prov_security wifi_prov_security_t
    Security modes supported by the Provisioning Manager.
    These are same as the security modes provided by protocomm

typedef protocomm_security2_params_t wifi_prov_security2_params_t
    Security 2 params structure This needs to be passed when using WIFI_PROV_SECURITY_2.

Enumerations

enum wifi_prov_cb_event_t
    Events generated by manager.
    These events are generated in order of declaration and, for the stretch of time between initialization and de-
    initialization of the manager, each event is signaled only once
    Values:

enumerator WIFI_PROV_INIT
    Emitted when the manager is initialized

enumerator WIFI_PROV_START
    Indicates that provisioning has started

enumerator WIFI_PROV_CRED_RECV
    Emitted when Wi-Fi AP credentials are received via protocomm endpoint wifi_config. The event
    data in this case is a pointer to the corresponding wifi_sta_config_t structure

enumerator WIFI_PROV_CRED_FAIL
    Emitted when device fails to connect to the AP of which the credentials were received earlier on event
    WIFI_PROV_CRED_RECV. The event data in this case is a pointer to the disconnection reason code
    with type wifi_prov_sta_fail_reason_t

enumerator WIFI_PROV_CRED_SUCCESS
    Emitted when device successfully connects to the AP of which the credentials were received earlier on
    event WIFI_PROV_CRED_RECV

enumerator WIFI_PROV_END
    Signals that provisioning service has stopped

enumerator WIFI_PROV_DEINIT
    Signals that manager has been de-initialized
enum wifi_prov_security

Security modes supported by the Provisioning Manager. These are same as the security modes provided by protocomm

Values:

enumerator WIFI_PROV_SECURITY_0
No security (plain-text communication)

enumerator WIFI_PROV_SECURITY_1
This secure communication mode consists of X25519 key exchange
  • proof of possession (pop) based authentication
  • AES-CTR encryption

enumerator WIFI_PROV_SECURITY_2
This secure communication mode consists of SRP6a based authentication and key exchange
  • AES-GCM encryption/decryption

Header File

- components/wifi_provisioning/include/wifi_provisioning/scheme_ble.h

Functions

void wifi_prov_scheme_ble_event_cb_free_btdm (void *user_data, wifi_prov_cb_event_t event, void *event_data)

void wifi_prov_scheme_ble_event_cb_free_BLE (void *user_data, wifiProv_cb_event_t event, void *event_data)

void wifi_prov_scheme_ble_event_cb_free_BT (void *user_data, wifiProv_cb_event_t event, void *event_data)

esp_err_t wifi_prov_scheme_ble_set_service_UUID (uint8_t *uuid128)
Set the 128 bit GATT service UUID used for provisioning.
This API is used to override the default 128 bit provisioning service UUID, which is 0000fff-0000-1000-8000-00805f9b34fb.
This must be called before starting provisioning, i.e. before making a call to wifi_prov_mgr_start_provisioning(), otherwise the default UUID will be used.

Note: The data being pointed to by the argument must be valid at least till provisioning is started. Upon start, the manager will store an internal copy of this UUID, and this data can be freed or invalidated afterwords.

Parameters uuid128 [in] A custom 128 bit UUID

Returns
  • ESP_OK : Success
  • ESP_ERR_INVALID_ARG : Null argument

esp_err_t wifi_prov_scheme_ble_set_mfg_data (uint8_t *mfg_data, ssize_t mfg_data_len)
Set manufacturer specific data in scan response.
This must be called before starting provisioning, i.e. before making a call to wifi_prov_mgr_start_provisioning().
Note: It is important to understand that length of custom manufacturer data should be within limits. The manufacturer data goes into scan response along with BLE device name. By default, BLE device name length is of 11 Bytes, however it can vary as per application use case. So, one has to honour the scan response data size limits i.e. \((\text{mfg\_data\_len} + 2) < 31 - (\text{device\_name\_length} + 2)\). If the \text{mfg\_data\_length} exceeds this limit, the length will be truncated.

**Parameters**
- \text{mfg\_data} - [in] Custom manufacturer data
- \text{mfg\_data\_len} - [in] Manufacturer data length

**Returns**
- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null argument

**Macros**
- WiFi_prov_scheme_BLE_event_handler_free_BTDM
- WiFi_prov_scheme_BLE_event_handler_free_BLE
- WiFi_prov_scheme_BLE_event_handler_free_BT

**Header File**
- components/wifi_provisioning/include/wifi_provisioning/scheme_softap.h

**Functions**
- void wifi_prov_scheme_softap_set_httpd_handle (void *handle)
  
  Provide HTTPD server handle externally.
  
  Useful in cases wherein applications need the webserver for some different operations, and do not want the wifi provisioning component to start/stop a new instance.
  
  Note: This API should be called before wifi_prov_mgr_start_provisioning()
**Structures**

*struct wifi_prov_sta_conn_info_t*

WiFi STA connected status information.

**Public Members**

char \texttt{ip_addr}[IP4ADDR_STRLEN_MAX]

IP Address received by station

char \texttt{bssid}[6]

BSSID of the AP to which connection was established

char \texttt{ssid}[33]

SSID of the to which connection was established

uint8_t \texttt{channel}

Channel of the AP

uint8_t \texttt{auth_mode}

Authorization mode of the AP

*struct wifi_prov_config_get_data_t*

WiFi status data to be sent in response to \texttt{get_status} request from master.

**Public Members**

*\texttt{wifi_prov_sta_state_t} wifi_state*

WiFi state of the station

*\texttt{wifi_prov_sta_fail_reason_t} fail_reason*

Reason for disconnection (valid only when \texttt{wifi_state} is WIFI_STATION_DISCONNECTED)

*\texttt{wifi_prov_sta_conn_info_t} conn_info*

Connection information (valid only when \texttt{wifi_state} is WIFI_STATION_CONNECTED)

*struct wifiProv_config_set_data_t*

WiFi config data received by slave during \texttt{set_config} request from master.

**Public Members**

char \texttt{ssid}[33]

SSID of the AP to which the slave is to be connected

char \texttt{password}[64]

Password of the AP
char bssid[6]
  // BSSID of the AP

uint8_t channel
  // Channel of the AP

struct wifi_prov_config_handlers
  // Internal handlers for receiving and responding to protocomm requests from master.
  // This is to be passed as priv_data for protocomm request handler (refer to
  // wifi_prov_config_data_handler()) when calling protocomm_add_endpoint().

Public Members

esp_err_t (*get_status_handler)(wifi_prov_config_get_data_t *resp_data, wifi_prov_ctx_t **ctx)
  // Handler function called when connection status of the slave (in WiFi station mode) is requested

esp_err_t (*set_config_handler)(const wifi_prov_config_set_data_t *req_data, wifi_prov_ctx_t **ctx)
  // Handler function called when WiFi connection configuration (eg. AP SSID, password, etc.) of the slave
  // (in WiFi station mode) is to be set to user provided values

esp_err_t (*apply_config_handler)(wifi_prov_ctx_t **ctx)
  // Handler function for applying the configuration that was set in set_config_handler. After applying
  // the station may get connected to the AP or may fail to connect. The slave must be ready to convey the
  // updated connection status information when get_status_handler is invoked again by the master.

wifi_prov_ctx_t *ctx
  // Context pointer to be passed to above handler functions upon invocation

Type Definitions

typedef struct wifi_prov_ctx wifi_prov_ctx_t
  // Type of context data passed to each get/set/apply handler function set in wifi_prov_config_handlers
  // structure.
  // This is passed as an opaque pointer, thereby allowing it be defined later in application code as per requirements.

typedef struct wifi_prov_config_handlers wifi_prov_config_handlers_t
  // Internal handlers for receiving and responding to protocomm requests from master.
  // This is to be passed as priv_data for protocomm request handler (refer to
  // wifi_prov_config_data_handler()) when calling protocomm_add_endpoint().

Enumerations

enum wifi_prov_sta_state_t
  // WiFi STA status for conveying back to the provisioning master.
  // Values:

  enumerator WIFI_PROV_STA_CONNECTING
enumerator WIFI_PROV_STA_CONNECTED

enumerator WIFI_PROV_STA_DISCONNECTED

defined

WIFI_PROV_STA_FAIL_REASON_T

WIFI_STA_connection_fail_reason.

Values:

enumerator WIFI_PROV_STA_AUTH_ERROR

enumerator WIFI_PROV_STA_AP_NOT_FOUND

Code examples for above API are provided in the provisioning directory of ESP-IDF examples.

Code example for above API is provided in wifi/smart_config.

Code example for above API is provided in wifi/wifi_easy_connect/dpp-enrollee.

2.9 Storage API

This section contains reference of the high-level storage APIs. They are based on low-level drivers such as SPI Flash, SD/MMC.

• Partitions API allow block based access to SPI Flash according to the Partition Table.
• Non-Volatile Storage library (NVS) implements a fault-tolerant wear-levelled key-value storage in SPI NOR Flash.
• Virtual File System (VFS) library provides an interface for registration of file system drivers. SPIFFS, FAT and various other file system libraries are based on the VFS.
• SPIFFS is a wear-levelled file system optimized for SPI NOR Flash, well suited for small partition sizes and low throughput
• FAT is a standard file system which can be used in SPI Flash or on SD/MMC cards
• Wear Levelling library implements a flash translation layer (FTL) suitable for SPI NOR Flash. It is used as a container for FAT partitions in Flash.

Note: It is suggested to use high-level APIs (esp_partition or file system) instead of low-level driver APIs to access the SPI NOR Flash.

Due to the restriction of NOR Flash and ESP hardware, accessing the main flash will affect the performance of the whole system. See SPI Flash Documents to learn more about the limitations.

2.9.1 FAT Filesystem Support

ESP-IDF uses the FatFs library to work with FAT filesystems. FatFs resides in the fatfs component. Although the library can be used directly, many of its features can be accessed via VFS using the C standard library and POSIX API functions.

Additionally, FatFs has been modified to support the runtime pluggable disk I/O layer. This allows mapping of FatFs drives to physical disks at runtime.
Using FatFs with VFS

The header file `fatfs/vfs/esp_vfs_fat.h` defines the functions for connecting FatFs and VFS.

The function `esp_vfs_fat_register()` allocates a FATFS structure and registers a given path prefix in VFS. Subsequent operations on files starting with this prefix are forwarded to FatFs APIs.

The function `esp_vfs_fat_unregister_path()` deletes the registration with VFS, and frees the FATFS structure.

Most applications use the following workflow when working with `esp_vfs_fat_` functions:

1. **Call `esp_vfs_fat_register()` to specify:**
   - Path prefix where to mount the filesystem (e.g., "/sdcard", "/spiflash")
   - FatFs drive number
   - A variable which receives the pointer to the FATFS structure
2. Call `ff_diskio_register()` to register the disk I/O driver for the drive number used in Step 1.
3. Call the FatFs function `f_mount`, and optionally `f_fdisk`, `f_mkfs`, to mount the filesystem using the same drive number which was passed to `esp_vfs_fat_register()`. For more information, see FatFs documentation.
4. Call the C standard library and POSIX API functions to perform such actions on files as open, read, write, erase, copy, etc. Use paths starting with the path prefix passed to `esp_vfs_register()` (for example, "/sdcard/hello.txt"). The filesystem uses 8.3 filenames format (SFN) by default. If you need to use long filenames (LFN), enable the `CONFIG_FATFS_LONG_FILENAMES` option. More details on the FatFs filenames are available here.
5. Optionally, by enabling the option `CONFIG_FATFS_USE_FASTSEEK`, you can use the POSIX lseek function to perform it faster. The fast seek does not work for files in write mode, so to take advantage of fast seek, you should open (or close and then reopen) the file in read-only mode.
6. Optionally, call the FatFs library functions directly. In this case, use paths without a VFS prefix (for example, "/hello.txt").
7. Close all open files.
8. Call the FatFs function `f_mount` for the same drive number with NULL FATFS* argument to unmount the filesystem.
9. Call the FatFs function `ff_diskio_register()` with NULL ff_diskio_impl_t* argument and the same drive number to unregister the disk I/O driver.
10. Call `esp_vfs_fat_unregister_path()` with the path where the file system is mounted to remove FatFs from VFS, and free the FATFS structure allocated in Step 1.

The convenience functions `esp_vfs_fat_sdmmc_mount()`, `esp_vfs_fat_sdspi_mount()`, and `esp_vfs_fat_sdcard_unmount()` wrap the steps described above and also handle SD card initialization. These functions are described in the next section.

Using FatFs with VFS and SD Cards

The header file `fatfs/vfs/esp_vfs_fat.h` also defines convenience functions `esp_vfs_fat_sdmmc_mount()`, `esp_vfs_fat_sdspi_mount()`, and `esp_vfs_fat_sdcard_unmount()`. These functions perform Steps 1–3 and 7–9 respectively and handle SD card initialization, but provide only limited error handling. Developers are encouraged to check its source code and incorporate more advanced features into production applications.

The convenience function `esp_vfs_fat_sdmmc_unmount()` unmounts the filesystem and releases the resources acquired by `esp_vfs_fat_sdmmc_mount()`. These functions perform Steps 1–3 and 7–9 respectively and handle SD card initialization, but provide only limited error handling. Developers are encouraged to check its source code and incorporate more advanced features into production applications.

Using FatFs with VFS in Read-Only Mode

The header file `fatfs/vfs/esp_vfs_fat.h` also defines the convenience functions `esp_vfs_fat_spiflash_mount_ro()` and `esp_vfs_fat_spiflash_unmount_ro()`. These functions perform Steps 1-3 and 7-9 respectively for read-only FAT partitions. These are particularly helpful for data partitions written only once during factory provisioning, which will not be changed by production application throughout the lifetime of the hardware.
FatFS Disk IO Layer

FatFs has been extended with API functions that register the disk I/O driver at runtime. These APIs provide implementation of disk I/O functions for SD/MMC cards and can be registered for the given FatFs drive number using the function `ff_diskio_register_sdmmc()`.

```c
void ff_diskio_register (BYTE pdrv, const ff_diskio_impl_t *discio_impl)
```

Register or unregister diskio driver for given drive number. When FATFS library calls one of disk_xxx functions for driver number pdrv, corresponding function in discio_impl for given pdrv will be called.

**Parameters**
- `pdrv` - drive number
- `discio_impl` - pointer to `ff_diskio_impl_t` structure with diskio functions or NULL to unregister and free previously registered drive

```c
struct ff_diskio_impl_t
```

Structure of pointers to disk IO driver functions.

See FatFs documentation for details about these functions

**Public Members**

```c
DSTATUS (*init)(unsigned char pdrv)
```

disk initialization function

```c
DSTATUS (*status)(unsigned char pdrv)
```

disk status check function

```c
DRESULT (*read)(unsigned char pdrv, unsigned char *buff, uint32_t sector, unsigned count)
```

sector read function

```c
DRESULT (*write)(unsigned char pdrv, const unsigned char *buff, uint32_t sector, unsigned count)
```

sector write function

```c
DRESULT (*ioctl)(unsigned char pdrv, unsigned char cmd, void *buff)
```

function to get info about disk and do some misc operations

```c
void ff_diskio_register_sdmmc (unsigned char pdrv, sdmmc_card_t *card)
```

Register SD/MMC diskio driver

**Parameters**
- `pdrv` - drive number
- `card` - pointer to `sdmmc_card_t` structure describing a card; card should be initialized before calling `f_mount`.

```c
esp_err_t ff_diskio_register_wl_partition (unsigned char pdrv, wl_handle_t flash_handle)
```

Register spi flash partition

**Parameters**
- `pdrv` - drive number
- `flash_handle` - handle of the wear levelling partition.
**Chapter 2. API Reference**

```c
esp_err_t esp_diskio_register_raw_partition(unsigned char pdrv, const esp_partition_t *part_handle)
```

Register spi flash partition

**Parameters**
- `pdrv` - drive number
- `part_handle` - pointer to raw flash partition.

**FatFs Partition Generator**

We provide a partition generator for FatFs (`wl_fatfsgen.py`) which is integrated into the build system and could be easily used in the user project.

The tool is used to create filesystem images on a host and populat e it with content of the specified host folder.

The script is based on the partition generator (`fatfsgen.py`). Apart from generating partition, it can also initialize wear levelling.

The latest version supports both short and long file names, FAT12 and FAT16. The long file names are limited to 255 characters and can contain multiple periods (.) characters within the filename and additional characters `+`, `,`, `;`, `=`, `[`, and `]`.

An in-depth description of the FatFs partition generator and analyzer can be found at Generating and parsing FAT partition on host.

**Build System Integration with FatFs Partition Generator** It is possible to invoke FatFs generator directly from the CMake build system by calling `fatfs_create_spiflash_image`:

```bash
fatfs_create_spiflash_image(<partition> <base_dir> [FLASH_IN_PROJECT])
```

If you prefer generating partition without wear levelling support, you can use `fatfs_create_rawflash_image`:

```bash
fatfs_create_rawflash_image(<partition> <base_dir> [FLASH_IN_PROJECT])
```

`fatfs_create_spiflash_image` respectively `fatfs_create_rawflash_image` must be called from project’s CMakeLists.txt.

If you decide for any reason to use `fatfs_create_rawflash_image` (without wear levelling support), beware that it supports mounting only in read-only mode in the device.

The arguments of the function are as follows:

1. `partition` - the name of the partition as defined in the partition table (e.g., `storage/fatfsgen/partitions_example.csv`).
2. `base_dir` - the directory that will be encoded to FatFs partition and optionally flashed into the device. Beware that you have to specify the suitable size of the partition in the partition table.
3. `flag FLASH_IN_PROJECT` - optionally, users can have the image automatically flashed together with the app binaries, partition tables, etc. on `idf.py flash -p <PORT>` by specifying `FLASH_IN_PROJECT`.
4. `flag PRESERVE_TIME` - optionally, users can force preserving the timestamps from the source folder to the target image. Without preserving the time, every timestamp will be set to the FATFS default initial time (1st January 1980).

For example:

```bash
fatfs_create_spiflash_image(my_fatfs_partition my_folder FLASH_IN_PROJECT)
```

If `FLASH_IN_PROJECT` is not specified, the image will still be generated, but you will have to flash it manually using `esptool.py` or a custom build system target.

For an example, see `storage/fatfsgen`. 
FatFs Partition Analyzer

(fatfsparse.py) is a partition analyzing tool for FatFs. It is a reverse tool of (fatfsgen.py), i.e., it can generate the folder structure on the host based on the FatFs image.

Usage:

./fatfsparse.py [-h] [--wl-layer (detect,enabled,disabled)] fatfs_image.img

High-level API Reference

Header File

• components/fatfs/vfs/esp_vfs_fat.h

Functions

esp_err_t esp_vfs_fat_register (const char *base_path, const char *fat_drive, size_t max_files, FATFS **out_fs)

Register FATFS with VFS component.

This function registers given FAT drive in VFS, at the specified base path. If only one drive is used, fat_drive argument can be an empty string. Refer to FATFS library documentation on how to specify FAT drive. This function also allocates FATFS structure which should be used for f_mount call.

Parameters

• base_path – path prefix where FATFS should be registered
• fat_drive – FATFS drive specification; if only one drive is used, can be an empty string
• max_files – maximum number of files which can be open at the same time
• out_fs – [out] pointer to FATFS structure which can be used for FATFS f_mount call is returned via this argument.

Returns

• ESP_OK on success
• ESP_ERR_INVALID_STATE if esp_vfs_fat_register was already called
• ESP_ERR_NO_MEM if not enough memory or too many VFSes already registered

esp_err_t esp_vfs_fat_unregister_path (const char *base_path)

Un-register FATFS from VFS.

Note: FATFS structure returned by esp_vfs_fat_register is destroyed after this call. Make sure to call f_mount function to unmount it before calling esp_vfs_fat_unregister_ctx. Difference between this function and the one above is that this one will release the correct drive, while the one above will release the last registered one

Parameters base_path – path prefix where FATFS is registered. This is the same used when esp_vfs_fat_register was called

Returns

• ESP_OK on success
• ESP_ERR_INVALID_STATE if FATFS is not registered in VFS

esp_err_t esp_vfs_fat_sdmmc_mount (const char *base_path, const sdmmc_host_t *host_config, const void *slot_config, const esp_vfs_fat_mount_config_t *mount_config, sdmmc_card_t **out_card)
Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes SDMMC driver or SPI driver with configuration in host_config
- initializes SD card with configuration in slot_config
- mounts FAT partition on SD card using FATFS library, with configuration in mount_config
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

Note: Use this API to mount a card through SDSPI is deprecated. Please call esp_vfs_fat_sdspi_mount() instead for that case.

**Parameters**

- **base_path** — path where partition should be registered (e.g. “/sdcard”)
- **host_config** — Pointer to structure describing SDMMC host. When using SD-MMC peripheral, this structure can be initialized using SDMMC_HOST_DEFAULT() macro. When using SPI peripheral, this structure can be initialized using SD-SPI_HOST_DEFAULT() macro.
- **slot_config** — Pointer to structure with slot configuration. For SDMMC peripheral, pass a pointer to sdmmc_slot_config_t structure initialized using SDMMC_SLOT_CONFIG_DEFAULT.
- **mount_config** — Pointer to structure with extra parameters for mounting FATFS
- **out_card** — [out] if not NULL, pointer to the card information structure will be returned via this argument

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount was already called
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

```
esp_err_t esp_vfs_fat_sdspi_mount(const char*base_path,const sdmmc_host_t*host_config_input,
                                  const sdspi_device_config_t*slot_config,const
                                  esp_vfs_fat_mount_config_t*mount_config, sdmmc_card_t
                                  **out_card)
```

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes an SPI Master device based on the SPI Master driver with configuration in slot_config, and attach it to an initialized SPI bus.
- initializes SD card with configuration in host_config_input
- mounts FAT partition on SD card using FATFS library, with configuration in mount_config
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

Note: This function try to attach the new SD SPI device to the bus specified in host_config. Make sure the SPI bus specified in host_config->slot have been initialized by spi_bus_initialize() before.

**Parameters**
• **base_path** – path where partition should be registered (e.g. “/sdcard”)
• **host_config_input** – Pointer to structure describing SDMMC host. This structure can be initialized using SD_SPI_HOST_DEFAULT() macro.
• **slot_config** – Pointer to structure with slot configuration. For SPI peripheral, pass a pointer to sdspi_device_config_t structure initialized using SD_SPI_DEVICE_CONFIG_DEFAULT().
• **mount_config** – pointer to structure with extra parameters for mounting FATFS
• **out_card** – [out] If not NULL, pointer to the card information structure will be returned via this argument. It is suggested to hold this handle and use it to unmount the card later if needed. Otherwise it’s not suggested to use more than one card at the same time and unmount one of them in your application.

**Returns**
• ESP_OK on success
• ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount was already called
• ESP_ERR_NO_MEM if memory cannot be allocated
• ESP_FAIL if partition cannot be mounted
• other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

```c
esp_err_t esp_vfs_fat_sdmmc_unmount (void)
```

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_sdmmc_mount.

**Deprecated:**
Use esp_vfs_fat_sdcard_unmount() instead.

**Returns**
• ESP_OK on success
• ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount hasn’t been called

```c
esp_err_t esp_vfs_fat_sdcard_unmount (const char*base_path, sdmmc_card_t *card)
```

Unmount an SD card from the FAT filesystem and release resources acquired using esp_vfs_fat_sdmmc_mount() or esp_vfs_fat_sdspi_mount().

**Returns**
• ESP_OK on success
• ESP_ERR_INVALID_ARG if the card argument is unregistered
• ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount hasn’t been called

```c
esp_err_t esp_vfs_fat_sdcard_format (const char*base_path, sdmmc_card_t *card)
```

Format FAT filesystem.

**Note:** This API should be only called when the FAT is already mounted.

**Parameters**
• **base_path** – Path where partition should be registered (e.g. “/sdcard”)
• **card** – Pointer to the card handle, which should be initialised by calling esp_vfs_fat_sdspi_mount first

**Returns**
• ESP_OK
• ESP_ERR_INVALID_STATE: FAT partition isn’t mounted, call esp_vfs_fat_sdmmc_mount or esp_vfs_fat_sdspi_mount first
• ESP_ERR_NO_MEM: if memory can not be allocated
• ESP_FAIL: fail to format it, or fail to mount back

```c
esp_err_t esp_vfs_fat_spiflash_mount_rw_wl (const char *base_path, const char *partition_label, const esp_vfs_fat_mount_config_t *mount_config, wl_handle_t *wl_handle)
```
Convenience function to initialize FAT filesystem in SPI flash and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition_label. Partition label should be configured in the partition table.
- initializes flash wear levelling library on top of the given partition
- mounts FAT partition using FATFS library on top of flash wear levelling library
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact.

**Parameters**

- **base_path** – path where FATFS partition should be mounted (e.g. “/spiflash”)
- **partition_label** – label of the partition which should be used
- **mount_config** – pointer to structure with extra parameters for mounting FATFS
- **wl_handle** – [out] wear levelling driver handle

**Returns**

- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_rw_wl was already called
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition cannot be mounted
- other error codes from wear levelling library, SPI flash driver, or FATFS drivers

**esp_err_t esp_vfs_fat_spiflash_unmount_rw_wl (const char *base_path, wl_handle_t *wl_handle)**

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_spiflash_mount_rw_wl.

**Parameters**

- **base_path** – path where partition should be registered (e.g. “/spiflash”)
- **wl_handle** – wear levelling driver handle returned by esp_vfs_fat_spiflash_mount_rw_wl

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_rw_wl hasn’t been called

**esp_err_t esp_vfs_fat_spiflash_format_rw_wl (const char *base_path, const char *partition_label)**

Format FAT filesystem.

**Note:** This API can be called when the FAT is mounted / not mounted. If this API is called when the FAT isn’t mounted (by calling esp_vfs_fat_spiflash_mount_rw_wl), this API will first mount the FAT then format it, then restore back to the original state.

**Parameters**

- **base_path** – Path where partition should be registered (e.g. “/spiflash”)
- **partition_label** – Label of the partition which should be used

**Returns**

- ESP_OK
- ESP_ERR_NO_MEM: if memory cannot be allocated
- Other errors from esp_vfs_fat_spiflash_mount_rw_wl

**esp_err_t esp_vfs_fat_spiflash_mount_ro (const char *base_path, const char *partition_label, const esp_vfs_fat_mount_config_t *mount_config)**

Convenience function to initialize read-only FAT filesystem and register it in VFS.

This is an all-in-one function which does the following:
finds the partition with defined partition_label. Partition label should be configured in the partition table.
- mounts FAT partition using FATFS library
- registers FATFS library with VFS, with prefix given by base_prefix variable

**Note:** Wear levelling is not used when FAT is mounted in read-only mode using this function.

### Parameters
- **base_path** – path where FATFS partition should be mounted (e.g. “/spiflash”)
- **partition_label** – label of the partition which should be used
- **mount_config** – pointer to structure with extra parameters for mounting FATFS

### Returns
- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_ro was already called for the same partition
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition cannot be mounted
- other error codes from SPI flash driver, or FATFS drivers

`esp_err_t esp_vfs_fat_spiflash_unmount_ro(const char*base_path, const char*partition_label)`

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_spiflash_mount_ro.

### Parameters
- **base_path** – path where partition should be registered (e.g. “/spiflash”)
- **partition_label** – label of partition to be unmounted

### Returns
- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_ro has not been called

`esp_err_t esp_vfs_fat_info(const char *base_path, uint64_t *out_total_bytes, uint64_t *out_free_bytes)`

Get information for FATFS partition.

### Parameters
- **base_path** – Base path of the partition examined (e.g. “/spiflash”)
- **out_total_bytes** – [out] Size of the file system
- **out_free_bytes** – [out] Free bytes available in the file system

### Returns
- ESP_OK on success
- ESP_ERR_INVALID_STATE if partition not found
- ESP_FAIL if another FRESULT error (saved in errno)

### Structures

**struct esp_vfs_fat_mount_config_t**

Configuration arguments for esp_vfs_fat_sdmmc_mount and esp_vfs_fat_spiflash_mount_rw_wl functions.

### Public Members

**bool format_if_mount_failed**

If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

**int max_files**

Max number of open files.
size_t allocation_unit_size

If format_if_mount_failed is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and 128 * sector size. For SD cards, sector size is always 512 bytes. For wear_levelling, sector size is determined by CONFIG_WL_SECTOR_SIZE option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

bool disk_status_check_enable

Enables real ff_disk_status function implementation for SD cards (ff_sdmmc_status). Possibly slows down IO performance.

Try to enable if you need to handle situations when SD cards are not unmounted properly before physical removal or you are experiencing issues with SD cards.

Doesn’t do anything for other memory storage media.

Type Definitions

typedef esp_vfs_fat_mount_config_t esp_vfs_fat_sdmmc_mount_config_t

2.9.2 Manufacturing Utility

Introduction

This utility is designed to create instances of factory NVS partition images on a per-device basis for mass manufacturing purposes. The NVS partition images are created from CSV files containing user-provided configurations and values.

Please note that this utility only creates manufacturing binary images which then need to be flashed onto your devices using:

- esptool.py
- Flash Download tool (available on Windows only)
  - Download and unzip it, and follow the instructions inside the doc folder.
- Direct flash programming using custom production tools.

Prerequisites

This utility is dependent on ESP-IDF’s NVS Partition Generator Utility.

- Operating System requirements:
  - Linux / MacOS / Windows (standard distributions)
- The following packages are needed to use this utility:
  - Python

Note:

Before using this utility, please make sure that:

- The path to Python is added to the PATH environment variable.
- You have installed the packages from requirement.txt, the file in the root of the ESP-IDF directory.
Chapter 2. API Reference

Workflow

CSV Configuration File

This file contains the configuration of the device to be flashed.

The data in the configuration file has the following format (the REPEAT tag is optional):

```
name1,namespace,  <!-- First entry should be of type "namespace"
key1,type1,encoding1
key2,type2,encoding2,REPEAT
name2,namespace,
key3,type3,encoding3
key4,type4,encoding4
```

**Note:** The first line in this file should always be the namespace entry.

Each line should have three parameters: key, type, encoding, separated by a comma. If the REPEAT tag is present, the value corresponding to this key in the master value CSV file will be the same for all devices.

*Please refer to README of the NVS Partition Generator Utility for detailed description of each parameter.*

Below is a sample example of such a configuration file:

```
app,namespace,
firmware_key,data,hex2bin
serial_no,data,string,REPEAT
device_no,data,i32
```

**Note:**

- Make sure there are no spaces:
  - before and after `,`.
  - at the end of each line in a CSV file

Master Value CSV File

This file contains details of the devices to be flashed. Each line in this file corresponds to a device instance.

The data in the master value CSV file has the following format:

```
key1,key2,key3,.....
value1,value2,value3,.....
```

**Note:** The first line in the file should always contain the key names. All the keys from the configuration file should be present here in the same order. This file can have additional columns (keys). The additional keys will be treated as metadata and would not be part of the final binary files.
Each line should contain the value of the corresponding keys, separated by a comma. If the key has the REPEAT tag, its corresponding value must be entered in the second line only. Keep the entry empty for this value in the following lines.

The description of this parameter is as follows:

**value** Data value

Data value is the value of data corresponding to the key.

Below is a sample example of a master value CSV file:

```
id,firmware_key,serial_no,device_no
1,1a2b3c4d5e6faabb,A1,101
2,1a2b3c4d5e6fccdd,,102
3,1a2b3c4d5e6feeff,,103
```

**Note:** If the ‘REPEAT’ tag is present, a new master value CSV file will be created in the same folder as the input Master CSV File with the values inserted at each line for the key with the ‘REPEAT’ tag.

This utility creates intermediate CSV files which are used as input for the NVS partition utility to generate the binary files.

The format of this intermediate CSV file is as follows:

```
key,type,encoding,value
key,namespace, ,
key1,type1,encoding1,value1
key2,type2,encoding2,value2
```

An instance of an intermediate CSV file will be created for each device on an individual basis.

**Running the utility**

**Usage:**

```
python mfg_gen.py [-h] {generate,generate_key} ...
```

**Optional Arguments:**

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>-h/--help</td>
<td>Show the help message and exit</td>
</tr>
</tbody>
</table>

**Commands:**

Run mfg_gen.py {command} -h for additional help

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>generate</td>
<td>Generate NVS partition</td>
</tr>
<tr>
<td>2</td>
<td>generate-key</td>
<td>Generate keys for encryption</td>
</tr>
</tbody>
</table>

**To generate factory images for each device (Default):**

**Usage:**

```
python mfg_gen.py generate [-h] [--fileid FILEID] [--version {1,2}] [--keygen] [--inputkey INPUTKEY] [--outdir OUTDIR] [--key_protect_hmac] [--kp_hmac_keygen]
```

(continues on next page)
Positional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conf</td>
<td>Path to configuration csv file to parse</td>
</tr>
<tr>
<td>values</td>
<td>Path to values csv file to parse</td>
</tr>
<tr>
<td>prefix</td>
<td>Unique name for each output filename prefix</td>
</tr>
<tr>
<td>size</td>
<td>Size of NVS partition in bytes (must be multiple of 4096)</td>
</tr>
</tbody>
</table>

Optional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h/--help</td>
<td>Show the help message and exit</td>
</tr>
<tr>
<td>--fileid FILEID</td>
<td>Unique file identifier (any key in values file) for each filename suffix</td>
</tr>
<tr>
<td>--version {1,2}</td>
<td>Set multipage blob version. (Default: Version 2)</td>
</tr>
<tr>
<td></td>
<td>Version 1 - Multipage blob support disabled.</td>
</tr>
<tr>
<td></td>
<td>Version 2 - Multipage blob support enabled.</td>
</tr>
<tr>
<td>--keygen</td>
<td>Generates key for encrypting NVS partition</td>
</tr>
<tr>
<td>--inputkey INPUTKEY</td>
<td>File having key for encrypting NVS partition</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>Output directory to store files created (Default: current directory)</td>
</tr>
<tr>
<td>--key_protect_hmac</td>
<td>If set, the NVS encryption key protection scheme based on HMAC peripheral is</td>
</tr>
<tr>
<td></td>
<td>used; else the default scheme based on Flash Encryption is used</td>
</tr>
<tr>
<td>--kp_hmac_keygen</td>
<td>Generate the HMAC key for HMAC-based encryption scheme</td>
</tr>
<tr>
<td>--kp_hmac_keyfile KP_HMAC_KEYFILE</td>
<td>Path to output HMAC key file</td>
</tr>
<tr>
<td>--kp_hmac_inputkey KP_HMAC_INPUTKEY</td>
<td>File having the HMAC key for generating the NVS encryption keys</td>
</tr>
</tbody>
</table>

You can run the utility to generate factory images for each device using the command below. A sample CSV file is provided with the utility:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_/singlepage_blob.csv Sample 0x3000
```

The master value CSV file should have the path in the file type relative to the directory from which you are running the utility.

To generate encrypted factory images for each device:

You can run the utility to encrypt factory images for each device using the command below. A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

  ```
  python mfg_gen.py generate samples/sample_config.csv samples/sample_values_/singlepage_blob.csv Sample 0x3000 --keygen
  ```

  **Note:** Encryption key of the following format `<outdir>/keys/keys-<prefix>-<fileid>.bin` is created. This newly created file having encryption keys in keys/ directory is compatible with NVS key-partition structure. Refer to **NVS Key Partition** for more details.
To generate an encrypted image using the HMAC-based scheme, the above command can be used along with some additional parameters.

- Encrypt by allowing the utility to generate encryption keys and the HMAC-key:

```python
python mfg_gen.py generate samples/sample_config.csv samples/... sample_values_singlepage_blob.csv Sample 0x3000 --keygen --key_protect_hmac --kp_hmac_keygen
```

**Note:** Encryption key of the format `<outdir>/keys/keys-<timestamp>.bin` and HMAC key of the format `<outdir>/keys/hmac-keys-<timestamp>.bin` are created.

- Encrypt by allowing the utility to generate encryption keys with user-provided HMAC-key:

```python
python mfg_gen.py generate samples/sample_config.csv samples/... sample_values_singlepage_blob.csv Sample 0x3000 --keygen --key_protect_hmac --kp_hmac_keygen --kp_hmac_keyfile KP_HMAC_KEYFILE
```

**Note:** You can provide the custom filename for the HMAC key as well as the encryption key as a parameter.

- Encrypt by providing the encryption keys as input binary file:

```python
python mfg_gen.py generate samples/sample_config.csv samples/... sample_values_singlepage_blob.csv Sample 0x3000 --inputkey keys/sample_keys.bin
```

To generate only encryption keys:

**Usage:** `python mfg_gen.py generate-key [-h] [-keyfile KEYFILE] [-outdir OUTDIR]`

**Optional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-h/--help</code></td>
<td>Show the help message and exit</td>
</tr>
<tr>
<td><code>--keyfile KEYFILE</code></td>
<td>Path to output encryption keys file</td>
</tr>
<tr>
<td><code>--outdir OUTDIR</code></td>
<td>Output directory to store files created. (Default: current directory)</td>
</tr>
<tr>
<td><code>--key_protect_hmac</code></td>
<td>If set, the NVS encryption key protection scheme based on HMAC peripheral is used; else the default scheme based on Flash Encryption is used</td>
</tr>
<tr>
<td><code>--kp_hmac_keygen</code></td>
<td>Generate the HMAC key for HMAC-based encryption scheme</td>
</tr>
<tr>
<td><code>--kp_hmac_keyfile</code></td>
<td>Path to output HMAC key file</td>
</tr>
<tr>
<td><code>--kp_hmac_inputkey</code></td>
<td>File having the HMAC key for generating the NVS encryption keys</td>
</tr>
</tbody>
</table>

You can run the utility to generate only encryption keys using the command below:

```python
python mfg_gen.py generate-key
```

**Note:** Encryption key of the following format `<outdir>/keys/keys-<timestamp>.bin` is created. Timestamp format is: `%m-%d_%H-%M`. To provide custom target filename use the `--keyfile` argument.

For generating encryption key for the HMAC-based scheme, the following commands can be used:

- Generate the HMAC key and the NVS encryption keys:

```python
python mfg_gen.py generate-key --key_protect_hmac --kp_hmac_keygen
```

**Note:** Encryption key of the format `<outdir>/keys/keys-<timestamp>.bin` and HMAC key of the format `<outdir>/keys/hmac-keys-<timestamp>.bin` are created.
• Generate the NVS encryption keys, given the HMAC-key:

```python
python mfg_gen.py generate-key --key_protect_hmac --kp_hmac_inputkey testdata/
--sample_hmac_key.bin
```

**Note:** You can provide the custom filename for the HMAC key as well as the encryption key as a parameter.

Generated encryption key binary file can further be used to encrypt factory images created on the per device basis.

The default numeric value: 1,2,3... of the `fileid` argument corresponds to each line bearing device instance values in the master value CSV file.

While running the manufacturing utility, the following folders will be created in the specified `outdir` directory:

- `bin/` for storing the generated binary files
- `csv/` for storing the generated intermediate CSV files
- `keys/` for storing encryption keys (when generating encrypted factory images)

## 2.9.3 Non-Volatile Storage Library

**Introduction**

Non-volatile storage (NVS) library is designed to store key-value pairs in flash. This section introduces some concepts used by NVS.

**Underlying Storage** Currently, NVS uses a portion of main flash memory through the `esp_partition` API. The library uses all the partitions with data type and nvs subtype. The application can choose to use the partition with the label `nvs` through the `nvs_open()` API function or any other partition by specifying its name using the `nvs_open_from_partition()` API function.

Future versions of this library may have other storage backends to keep data in another flash chip (SPI or I2C), RTC, FRAM, etc.

**Note:** if an NVS partition is truncated (for example, when the partition table layout is changed), its contents should be erased. ESP-IDF build system provides a `idf.py erase-flash` target to erase all contents of the flash chip.

**Note:** NVS works best for storing many small values, rather than a few large values of the type ‘string’ and ‘blob’. If you need to store large blobs or strings, consider using the facilities provided by the FAT filesystem on top of the wear levelling library.

**Keys and Values** NVS operates on key-value pairs. Keys are ASCII strings; the maximum key length is currently 15 characters. Values can have one of the following types:

- integer types: `uint8_t`, `int8_t`, `uint16_t`, `int16_t`, `uint32_t`, `int32_t`, `uint64_t`, `int64_t`
- zero-terminated string
- variable length binary data (blob)

**Note:** String values are currently limited to 4000 bytes. This includes the null terminator. Blob values are limited to 508,000 bytes or 97.6% of the partition size - 4000 bytes, whichever is lower.
Additional types, such as `float` and `double` might be added later.

Keys are required to be unique. Assigning a new value to an existing key replaces the old value and data type specified by a write operation.

A data type check is performed when reading a value. An error is returned if the data type expected by read operation does not match the data type of entry found for the key provided.

**Namespaces** To mitigate potential conflicts in key names between different components, NVS assigns each key-value pair to one of namespaces. Namespace names follow the same rules as key names, i.e., the maximum length is 15 characters. Furthermore, there can be no more than 254 different namespaces in one NVS partition. Namespace name is specified in the `nvs_open()` or `nvs_open_from_partition` call. This call returns an opaque handle, which is used in subsequent calls to the `nvs_get_*`, `nvs_set_*`, and `nvs_commit()` functions. This way, a handle is associated with a namespace, and key names will not collide with same names in other namespaces. Please note that the namespaces with the same name in different NVS partitions are considered as separate namespaces.

**NVS Iterators** Iterators allow to list key-value pairs stored in NVS, based on specified partition name, namespace, and data type.

There are the following functions available:

- `nvs_entry_find()` creates an opaque handle, which is used in subsequent calls to the `nvs_entry_next()` and `nvs_entry_info()` functions.
- `nvs_entry_next()` advances an iterator to the next key-value pair.
- `nvs_entry_info()` returns information about each key-value pair

In general, all iterators obtained via `nvs_entry_find()` have to be released using `nvs_release_iterator()`, which also tolerates NULL iterators.

`nvs_entry_find()` and `nvs_entry_next()` set the given iterator to NULL or a valid iterator in all cases except a parameter error occurred (i.e., return `ESP_ERR_NVS_NOT_FOUND`). In case of a parameter error, the given iterator will not be modified. Hence, it is best practice to initialize the iterator to NULL before calling `nvs_entry_find()` to avoid complicated error checking before releasing the iterator.

**Security, Tampering, and Robustness** NVS is not directly compatible with the ESP32 flash encryption system. However, data can still be stored in encrypted form if NVS encryption is used together with ESP32 flash encryption. Please refer to [NVS Encryption](#) for more details.

If NVS encryption is not used, it is possible for anyone with physical access to the flash chip to alter, erase, or add key-value pairs. With NVS encryption enabled, it is not possible to alter or add a key-value pair and get recognized as a valid pair without knowing corresponding NVS encryption keys. However, there is no tamper-resistance against the erase operation.

The library does try to recover from conditions when flash memory is in an inconsistent state. In particular, one should be able to power off the device at any point and time and then power it back on. This should not result in loss of data, except for the new key-value pair if it was being written at the moment of powering off. The library should also be able to initialize properly with any random data present in flash memory.

**NVS Encryption**

Please refer to the [NVS Encryption](#) guide for more details.

**NVS Partition Generator Utility**

This utility helps generate NVS partition binary files which can be flashed separately on a dedicated partition via a flashing utility. Key-value pairs to be flashed onto the partition can be provided via a CSV file. For more details, please refer to [NVS Partition Generator Utility](#).
Instead of calling the nvs_partition_gen.py tool manually, the creation of the partition binary files can also be done directly from CMake using the function nvs_create_partition_image:

```
nvs_create_partition_image(<partition> <csv> [FLASH_IN_PROJECT] [DEPENDS dep dep...
       ...

Positional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>partition</td>
<td>Name of the NVS partition</td>
</tr>
<tr>
<td>csv</td>
<td>Path to CSV file to parse</td>
</tr>
</tbody>
</table>

Optional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FLASH_IN_PROJECT</td>
<td>Name of the NVS partition</td>
</tr>
<tr>
<td>DEPENDS</td>
<td>Specify files on which the command depends</td>
</tr>
</tbody>
</table>

If FLASH_IN_PROJECT is not specified, the image will still be generated, but you will have to flash it manually using idf.py <partition>-flash (e.g., if your partition name is nvs, then use idf.py nvs-flash). nvs_create_partition_image must be called from one of the component CMakeLists.txt files. Currently, only non-encrypted partitions are supported.

Application Example

You can find code examples in the storage directory of ESP-IDF examples:

`storage/nvs_rw_value`

Demonstrates how to read a single integer value from, and write it to NVS.

The value checked in this example holds the number of the ESP32 module restarts. The value’s function as a counter is only possible due to its storing in NVS.

The example also shows how to check if a read/write operation was successful, or if a certain value has not been initialized in NVS. The diagnostic procedure is provided in plain text to help you track the program flow and capture any issues on the way.

`storage/nvs_rw_blob`

Demonstrates how to read a single integer value and a blob (binary large object), and write them to NVS to preserve this value between ESP32 module restarts.

  - value - tracks the number of the ESP32 module soft and hard restarts.
  - blob - contains a table with module run times. The table is read from NVS to dynamically allocated RAM. A new run time is added to the table on each manually triggered soft restart, and then the added run time is written to NVS. Triggering is done by pulling down GPIO0.

The example also shows how to implement the diagnostic procedure to check if the read/write operation was successful.

`storage/nvs_rw_value_cxx`

This example does exactly the same as `storage/nvs_rw_value`, except that it uses the C++ NVS handle class.

Internals

**Log of Key-Value Pairs** NVS stores key-value pairs sequentially, with new key-value pairs being added at the end. When a value of any given key has to be updated, a new key-value pair is added at the end of the log and the old key-value pair is marked as erased.
**Pages and Entries** NVS library uses two main entities in its operation: pages and entries. Page is a logical structure which stores a portion of the overall log. Logical page corresponds to one physical sector of flash memory. Pages which are in use have a sequence number associated with them. Sequence numbers impose an ordering on pages. Higher sequence numbers correspond to pages which were created later. Each page can be in one of the following states:

- **Empty/uninitialized** Flash storage for the page is empty (all bytes are 0xff). Page is not used to store any data at this point and does not have a sequence number.
- **Active** Flash storage is initialized, page header has been written to flash, page has a valid sequence number. Page has some empty entries and data can be written there. No more than one page can be in this state at any given moment.
- **Full** Flash storage is in a consistent state and is filled with key-value pairs. Writing new key-value pairs into this page is not possible. It is still possible to mark some key-value pairs as erased.
- **Erasing** Non-erased key-value pairs are being moved into another page so that the current page can be erased. This is a transient state, i.e., page should never stay in this state at the time when any API call returns. In case of a sudden power off, the move-and-erase process will be completed upon the next power-on.
- **Corrupted** Page header contains invalid data, and further parsing of page data was canceled. Any items previously written into this page will not be accessible. The corresponding flash sector will not be erased immediately and will be kept along with sectors in uninitialized state for later use. This may be useful for debugging.

Mapping from flash sectors to logical pages does not have any particular order. The library will inspect sequence numbers of pages found in each flash sector and organize pages in a list based on these numbers.

```
+---------+ +---------+ +---------+ +---------+
| Page 1  | | Page 2  | | Page 3  | | Page 4  |
| Full    | | Full    | | Active  | | Empty   | | Empty   |
| #11     | | #12     | | #14     | | /       | | /       |
+---------+ +---------+ +---------+ +---------+ <- states
+---------+ +---------+ +---------+ +---------+ <- sequence numbers
|          | |          | |          | |          |

|          | |          | |          | |          |
|          | |          | |          | |          |
+---------+ +---------+ +---------+ +---------+ <- physical sectors
```

**Structure of a Page** For now, we assume that flash sector size is 4096 bytes and that ESP32 flash encryption hardware operates on 32-byte blocks. It is possible to introduce some settings configurable at compile-time (e.g., via menuconfig) to accommodate flash chips with different sector sizes (although it is not clear if other components in the system, e.g., SPI flash driver and SPI flash cache can support these other sizes).

Page consists of three parts: header, entry state bitmap, and entries themselves. To be compatible with ESP32 flash encryption, the entry size is 32 bytes. For integer types, an entry holds one key-value pair. For strings and blobs, an entry holds part of key-value pair (more on that in the entry structure description).

The following diagram illustrates the page structure. Numbers in parentheses indicate the size of each part in bytes.

```
+-----------+-----------+-----------+-----------+-----------+-----------+-----------+-----------+-----------+-----------+
| State (4) | Seq. no. (4) | version (1) | Unused (19) | CRC32 (4) | Header (32) |
+-----------+-----------+-----------+-----------+-----------+-----------+-----------+-----------+-----------+-----------+
|           | Entry state bitmap (32) |
+-----------+-------------------------+
| Entry 0 (32) |
+-----------+-------------------------+
| Entry 1 (32) |
+-----------+-------------------------+
| Entry 125 (32) |
+-----------+-------------------------+
```
Page header and entry state bitmap are always written to flash unencrypted. Entries are encrypted if flash encryption feature of ESP32 is used.

Page state values are defined in such a way that changing state is possible by writing 0 into some of the bits. Therefore it is not necessary to erase the page to change its state unless that is a change to the erased state.

The version field in the header reflects the NVS format version used. For backward compatibility reasons, it is decremented for every version upgrade starting at 0xff (i.e., 0xff for version-1, 0xfe for version-2 and so on).

CRC32 value in the header is calculated over the part which does not include a state value (bytes 4 to 28). The unused part is currently filled with 0xff bytes.

The following sections describe the structure of entry state bitmap and entry itself.

**Entry and Entry State Bitmap** Each entry can be in one of the following three states represented with two bits in the entry state bitmap. The final four bits in the bitmap (256 - 2 * 126) are not used.

**Empty (2’ b11)** Nothing is written into the specific entry yet. It is in an uninitialized state (all bytes are 0xff).

**Written (2’ b10)** A key-value pair (or part of key-value pair which spans multiple entries) has been written into the entry.

**Erased (2’ b00)** A key-value pair in this entry has been discarded. Contents of this entry will not be parsed anymore.

**Structure of Entry** For values of primitive types (currently integers from 1 to 8 bytes long), entry holds one key-value pair. For string and blob types, entry holds part of the whole key-value pair. For strings, in case when a key-value pair spans multiple entries, all entries are stored in the same page. Blobs are allowed to span over multiple pages by dividing them into smaller chunks. For tracking these chunks, an additional fixed length metadata entry is stored called “blob index”. Earlier formats of blobs are still supported (can be read and modified). However, once the blobs are modified, they are stored using the new format.

```
+---------+--------------------------------------------------+-
| NS (1)  | Type (1) | Span (1) | ChunkIndex (1) | CRC32 (4) | Key (16) | Data...
+---------+--------------------------------------------------+-
|         |         |         |              |          |         |         
+---------+--------------------------------------------------+-
|         |         |         |               |          |         |         
|         |         |         |               |          |         |         
+---------+--------------------------------------------------+-
| Primitive | +---------------------------------+----------------|
|         |         | Data (8) |                 |
+---------+--------------------------------------------------+-
|         | +---------------------------------+----------------|
|         | Types | +---------------------------------+----------------|
|         |         |         | Size(4) | ChunkCount(1)|
+---------+---------------------------------+----------------|
|         | Data format | Blob Index | +---------------------------------+----------------|
|         |         |         |         |          |         |         |
|         |         |         |         |          |         |         |
|         |         |         |         |          |         |         |
+---------+---------------------------------+----------------|
```

Individual fields in entry structure have the following meanings:

**NS** Namespace index for this entry. For more information on this value, see the section on namespaces implementation.

**Type** One byte indicating the value data type. See the `ItemType` enumeration in `nvs_flash/include/nvs_handle.hpp` for possible values.
Span  Number of entries used by this key-value pair. For integer types, this is equal to 1. For strings and blobs, this
depends on value length.
ChunkIndex Used to store the index of a blob-data chunk for blob types. For other types, this should be 0xff.
CRC32 Checksum calculated over all the bytes in this entry, except for the CRC32 field itself.
Key Zero-terminated ASCII string containing a key name. Maximum string length is 15 bytes, excluding a zero
terminator.
Data For integer types, this field contains the value itself. If the value itself is shorter than 8 bytes, it is padded to
the right, with unused bytes filled with 0xff.
For “blob index” entry, these 8 bytes hold the following information about data-chunks:
  • Size (Only for blob index.) Size, in bytes, of complete blob data.
  • ChunkCount (Only for blob index.) Total number of blob-data chunks into which the blob was divided
during storage.
  • ChunkStart (Only for blob index.) ChunkIndex of the first blob-data chunk into which the blob was divided
during storage.
For string and blob data chunks, these 8 bytes hold additional data about the value, which are described below:
  • Size (Only for strings and blobs.) Size, in bytes, of actual data. For strings, this includes zero terminators.
  • CRC32 (Only for strings and blobs.) Checksum calculated over all bytes of data.

Variable length values (strings and blobs) are written into subsequent entries, 32 bytes per entry. The Span field of
the first entry indicates how many entries are used.

Namespaces  As mentioned above, each key-value pair belongs to one of the namespaces. Namespace identifiers
(strings) are stored as keys of key-value pairs in namespace with index 0. Values corresponding to these keys are
indexes of these namespaces.

```
+-----------------+-----------------+-----------------+     Entry describing namespace "wifi"
| NS-0 Type=uint8_t Key="wifi" Value=1 | NS-1 Type=uint32_t Key="channel" Value=6 | NS-0 Type=uint8_t Key="channel" Value=20 | NS-2 Type=uint16_t Key="channel" Value=20 |
```

Item Hash List  To reduce the number of reads from flash memory, each member of the Page class maintains a list
of pairs: item index; item hash. This list makes searches much quicker. Instead of iterating over all entries, reading
them from flash one at a time, Page::findItem first performs a search for the item hash in the hash list. This gives the
item index within the page if such an item exists. Due to a hash collision, it is possible that a different item is found.
This is handled by falling back to iteration over items in flash.

Each node in the hash list contains a 24-bit hash and 8-bit item index. Hash is calculated based on item namespace,
key name, and ChunkIndex. CRC32 is used for calculation; the result is truncated to 24 bits. To reduce the overhead
for storing 32-bit entries in a linked list, the list is implemented as a double-linked list of arrays. Each array holds
29 entries, for the total size of 128 bytes, together with linked list pointers and a 32-bit count field. The minimum
amount of extra RAM usage per page is therefore 128 bytes; maximum is 640 bytes.

API Reference

Header File

- components/nvs_flash/include/nvs_flash.h

Functions

```
esp_err_t nvs_flash_init(void)
```

Initialize the default NVS partition.
This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

When “NVS_ENCRYPTION” is enabled in the menuconfig, this API enables the NVS encryption for the default NVS partition as follows

a. Read security configurations from the first NVS key partition listed in the partition table. (NVS key partition is any “data” type partition which has the subtype value set to “nvs_keys”)
b. If the NVS key partition obtained in the previous step is empty, generate and store new keys in that NVS key partition.
c. Internally call “nvs_flash_secure_init()” with the security configurations obtained/generated in the previous steps.

Post initialization NVS read/write APIs remain the same irrespective of NVS encryption.

Returns

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver
- error codes from nvs_flash_read_security_cfg API (when “NVS_ENCRYPTION” is enabled).
- error codes from nvs_flash_generate_keys API (when “NVS_ENCRYPTION” is enabled).
- error codes from nvs_flash_secure_init_partition API (when “NVS_ENCRYPTION” is enabled).

`esp_err_t nvs_flash_init_partition (const char *partition_label)`

Initialize NVS flash storage for the specified partition.

Parameters

- `partition_label` - [in] Label of the partition. Must be no longer than 16 characters.

Returns

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

`esp_err_t nvs_flash_init_partition_ptr (const esp_partition_t *partition)`

Initialize NVS flash storage for the partition specified by partition pointer.

Parameters

- `partition` - [in] pointer to a partition obtained by the ESP partition API.

Returns

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_INVALID_ARG in case partition is NULL
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

`esp_err_t nvs_flash_deinit (void)`

Deinitialize NVS storage for the default NVS partition.

Default NVS partition is the partition with “nvs” label in the partition table.

Returns

- ESP_OK on success (storage was deinitialized)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage was not initialized prior to this call
esp_err_t nvs_flash_deinit_partition (const char *partition_label)
Deinitialize NVS storage for the given NVS partition.

Parameters partition_label — [in] Label of the partition

Returns
• ESP_OK on success
• ESP_ERR_NVS_NOT_INITIALIZED if the storage for given partition was not initialized prior to this call

esp_err_t nvs_flash_erase (void)
Erase the default NVS partition.
Erases all contents of the default NVS partition (one with label “nvs”).

Note: If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

Returns
• ESP_OK on success
• ESP_ERR_NOT_FOUND if there is no NVS partition labeled “nvs” in the partition table
• different error in case de-initialization fails (shouldn’t happen)

esp_err_t nvs_flash_erase_partition (const char *part_name)
Erase specified NVS partition.
Erase all content of a specified NVS partition

Note: If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

Parameters part_name — [in] Name (label) of the partition which should be erased

Returns
• ESP_OK on success
• ESP_ERR_NOT_FOUND if there is no NVS partition with the specified name in the partition table
• different error in case de-initialization fails (shouldn’t happen)

esp_err_t nvs_flash_erase_partition_ptr (const esp_partition_t *partition)
Erase custom partition.
Erase all content of specified custom partition.

Note: If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

Parameters partition — [in] pointer to a partition obtained by the ESP partition API.

Returns
• ESP_OK on success
• ESP_ERR_NOT_FOUND if there is no partition with the specified parameters in the partition table
• ESP_ERR_INVALID_ARG in case partition is NULL
• one of the error codes from the underlying flash storage driver
Chapter 2. API Reference

`esp_err_t nvs_flash_secure_init(nvs_sec_cfg_t *cfg)`

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

**Parameters**

- `cfg` – [in] Security configuration (keys) to be used for NVS encryption/decryption. If `cfg` is NULL, no encryption is used.

**Returns**

- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

`esp_err_t nvs_flash_secure_init_partition(const char* partition_label, nvs_sec_cfg_t *cfg)`

Initialize NVS flash storage for the specified partition.

**Parameters**

- `partition_label` – [in] Label of the partition. Note that internally, a reference to passed value is kept and it should be accessible for future operations
- `cfg` – [in] Security configuration (keys) to be used for NVS encryption/decryption. If `cfg` is null, no encryption/decryption is used.

**Returns**

- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

`esp_err_t nvs_flash_generate_keys(const esp_partition_t *partition, nvs_sec_cfg_t *cfg)`

Generate and store NVS keys in the provided esp partition.

**Parameters**

- `partition` – [in] Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- `cfg` – [out] Pointer to nvs security configuration structure. Pointer must be non-NULL. Generated keys will be populated in this structure.

**Returns**

- ESP_OK, if `cfg` was read successfully;
- ESP_ERR_INVALID_ARG, if `partition` or `cfg` is NULL;
- or error codes from esp_partition_write/erase APIs.

`esp_err_t nvs_flash_read_security_cfg(const esp_partition_t *partition, nvs_sec_cfg_t *cfg)`

Read NVS security configuration from a partition.

**Note:** Provided partition is assumed to be marked ‘encrypted’.

**Parameters**

- `partition` – [in] Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- `cfg` – [out] Pointer to nvs security configuration structure. Pointer must be non-NULL.

**Returns**

- ESP_OK, if `cfg` was read successfully;
- ESP_ERR_INVALID_ARG, if `partition` or `cfg` is NULL
- ESP_ERR_NVS_KEYS_NOT_INITIALIZED, if the partition is not yet written with keys.
• ESP_ERR_NVS_CORRUPT_KEY_PART, if the partition containing keys is found to be corrupt.
• or error codes from esp_partition_read API.

_esp_err_t nvs_flash_register_security_scheme (nvs_sec_scheme_t *scheme_cfg)_

Registers the given security scheme for NVS encryption. The scheme registered with sec_scheme_id by this API be used as the default security scheme for the “nvs” partition. Users will have to call this API explicitly in their application.

**Parameters**

scheme_cfg – [in] Pointer to the security scheme configuration structure that the user (or the nvs_key_provider) wants to register.

**Returns**

• ESP_OK, if security scheme registration succeeds;
• ESP_ERR_INVALID_ARG, if scheme_cfg is NULL;
• ESP_FAIL, if security scheme registration fails

_nvs_sec_scheme_t *nvs_flash_get_default_security_scheme (void)_

Fetch the configuration structure for the default active security scheme for NVS encryption.

**Returns**

Pointer to the default active security scheme configuration (NULL if no scheme is registered yet i.e. active)

_esp_err_t nvs_flash_generate_keys_v2 (nvs_sec_scheme_t *scheme_cfg, nvs_sec_cfg_t *cfg)_

Generate (and store) the NVS keys using the specified key-protection scheme.

**Parameters**

• scheme_cfg – [in] Security scheme specific configuration
• cfg – [out] Security configuration (encryption keys)

**Returns**

• ESP_OK, if cfg was populated successfully with generated encryption keys;
• ESP_ERR_INVALID_ARG, if scheme_cfg or cfg is NULL;
• ESP_FAIL, if the key generation process fails

_esp_err_t nvs_flash_read_security_cfg_v2 (nvs_sec_scheme_t *scheme_cfg, nvs_sec_cfg_t *cfg)_

Read NVS security configuration set by the specified security scheme.

**Parameters**

• scheme_cfg – [in] Security scheme specific configuration
• cfg – [out] Security configuration (encryption keys)

**Returns**

• ESP_OK, if cfg was read successfully;
• ESP_ERR_INVALID_ARG, if scheme_cfg or cfg is NULL;
• ESP_FAIL, if the key reading process fails

**Structures**

**struct nvs_sec_cfg_t**

Key for encryption and decryption.

**Public Members**

uint8_t eky[NVS_KEY_SIZE]

XTS encryption and decryption key

uint8_t tky[NVS_KEY_SIZE]

XTS tweak key
struct nvs_sec_scheme_t

NVS encryption: Security scheme configuration structure.

**Public Members**

int scheme_id

Security Scheme ID (E.g. HMAC)

void *scheme_data

Scheme-specific data (E.g. eFuse block for HMAC-based key generation)

nvs_flash_generate_keys_t nvs_flash_key_gen

Callback for the nvs_flash_key_gen implementation

nvs_flash_read_cfg_t nvs_flash_read_cfg

Callback for the nvs_flash_read_keys implementation

**Macros**

NVS_KEY_SIZE

**Type Definitions**

typedef esp_err_t (*nvs_flash_generate_keys_t)(const void *scheme_data, nvs_sec_cfg_t *cfg)

Callback function prototype for generating the NVS encryption keys.

typedef esp_err_t (*nvs_flash_read_cfg_t)(const void *scheme_data, nvs_sec_cfg_t *cfg)

Callback function prototype for reading the NVS encryption keys.

**Header File**

components/nvs_flash/include/nvs.h

**Functions**

esp_err_t nvs_set_i8 (nvs_handle_t handle, const char *key, int8_t value)

set int8_t value for given key

Set value for the key, given its name. Note that the actual storage will not be updated until nvs_commit is called. Regardless whether key-value pair is created or updated, function always requires at least one nvs available entry. See nvs_get_stats. After create type of operation, the number of available entries is decreased by one. After update type of operation, the number of available entries remains the same.

**Parameters**

- handle – [in] Handle obtained from nvs_open function. Handles that were opened read only cannot be used.
- key – [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.

**Returns**

- ESP_OK if value was set successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
• ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
• ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
• ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
• ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
• ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

```c
esp_err_t nvs_set_u8 (nvs_handle_t handle, const char *key, uint8_t value)
```
set uint8_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

```c
esp_err_t nvs_set_i16 (nvs_handle_t handle, const char *key, int16_t value)
```
set int16_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

```c
esp_err_t nvs_set_u16 (nvs_handle_t handle, const char *key, uint16_t value)
```
set uint16_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

```c
esp_err_t nvs_set_i32 (nvs_handle_t handle, const char *key, int32_t value)
```
set int32_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

```c
esp_err_t nvs_set_u32 (nvs_handle_t handle, const char *key, uint32_t value)
```
set uint32_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

```c
esp_err_t nvs_set_i64 (nvs_handle_t handle, const char *key, int64_t value)
```
set int64_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

```c
esp_err_t nvs_set_u64 (nvs_handle_t handle, const char *key, uint64_t value)
```
set uint64_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

```c
esp_err_t nvs_set_str (nvs_handle_t handle, const char *key, const char *value)
```
set string for given key

Sets string value for the key. Function requires whole space for new data to be available as contiguous entries in same nvs page. Operation consumes 1 overhead entry and 1 entry per each 32 characters of new string including zero character to be set. In case of value update for existing key, entries occupied by the previous value and overhead entry are returned to the pool of available entries. Note that storage of long string values can fail due to fragmentation of nvs pages even if `available_entries` returned by `nvs_get_stats` suggests enough overall space available. Note that the underlying storage will not be updated until `nvs_commit` is called.

**Parameters**

- **handle** – [in] Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- **key** – [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- **value** – [in] The value to set. For strings, the maximum length (including null character) is 4000 bytes, if there is one complete page free for writing. This decreases, however, if the free space is fragmented.

**Returns**

- ESP_OK if value was set successfully
• ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
• ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
• ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
• ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
• ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.
• ESP_ERR_NVS_VALUE_TOO_LONG if the string value is too long

```c
esp_err_t nvs_get_i8 (nvs_handle_t handle, const char* key, int8_t*out_value)
```

get int8_t value for given key

These functions retrieve value for the key, given its name. If key does not exist, or the requested variable type doesn’t match the type which was used when setting a value, an error is returned.

In case of any error, out_value is not modified.

out_value has to be a pointer to an already allocated variable of the given type.

```
// Example of using nvs_get_i32:
int32_t max_buffer_size = 4096; // default value
esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
// if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
// have its default value.
```

**Parameters**

- **handle** – [in] Handle obtained from nvs_open function.
- **key** – [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- **out_value** – Pointer to the output value. May be NULL for nvs_get_str and nvs_get_blob, in this case required length will be returned in length argument.

**Returns**

- ESP_OK if the value was retrieved successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data

```c
esp_err_t nvs_get_u8 (nvs_handle_t handle, const char* key, uint8_t*out_value)
```

get uint8_t value for given key

This function is the same as nvs_get_i8 except for the data type.

```c
esp_err_t nvs_get_i16 (nvs_handle_t handle, const char* key, int16_t*out_value)
```

get int16_t value for given key

This function is the same as nvs_get_i8 except for the data type.

```c
esp_err_t nvs_get_u16 (nvs_handle_t handle, const char* key, uint16_t*out_value)
```

get uint16_t value for given key

This function is the same as nvs_get_i8 except for the data type.

```c
esp_err_t nvs_get_i32 (nvs_handle_t handle, const char* key, int32_t*out_value)
```

get int32_t value for given key

This function is the same as nvs_get_i8 except for the data type.
Chapter 2. API Reference

```c
Esp_err_t nvs_get_u32(nvs_handle_t handle, const char *key, uint32_t *out_value)
get uint32_t value for given key
This function is the same as nvs_get_i8 except for the data type.

Esp_err_t nvs_get_i64(nvs_handle_t handle, const char *key, int64_t *out_value)
get int64_t value for given key
This function is the same as nvs_get_i8 except for the data type.

Esp_err_t nvs_get_u64(nvs_handle_t handle, const char *key, uint64_t *out_value)
get uint64_t value for given key
This function is the same as nvs_get_i8 except for the data type.

Esp_err_t nvs_get_str(nvs_handle_t handle, const char *key, char *out_value, size_t *length)
get string value for given key
These functions retrieve the data of an entry, given its key. If key does not exist, or the requested variable type
doesn’t match the type which was used when setting a value, an error is returned.
In case of any error, out_value is not modified.
All functions expect out_value to be a pointer to an already allocated variable of the given type.

nvs_get_str and nvs_get_blob functions support WinAPI-style length queries. To get the size necessary to
store the value, call nvs_get_str or nvs_get_blob with zero out_value and non-zero pointer to length. Variable
pointed to by length argument will be set to the required length. For nvs_get_str, this length includes the zero
terminator. When calling nvs_get_str and nvs_get_blob with non-zero out_value, length has to be non-zero and
has to point to the length available in out_value. It is suggested that nvs_get/set_str is used for zero-terminated
C strings, and nvs_get/set_blob used for arbitrary data structures.
```

```c
// Example (without error checking) of using nvs_get_str to get a string into
// a dynamic array:
size_t required_size;
nvs_get_str(my_handle, "server_name", NULL, &required_size);
char* server_name = malloc(required_size);
nvs_get_str(my_handle, "server_name", server_name, &required_size);

// Example (without error checking) of using nvs_get_blob to get a binary data
// into a static array:
uint8_t mac_addr[6];
size_t size = sizeof(mac_addr);
nvs_get_blob(my_handle, "dst_mac_addr", mac_addr, &size);
```

### Parameters
- **handle [in]** Handle obtained from nvs_open function.
- **key [in]** Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- **out_value [out]** Pointer to the output value. May be NULL for nvs_get_str and
  nvs_get_blob, in this case required length will be returned in length argument.
- **length [inout]** A non-zero pointer to the variable holding the length of out_value. In
case out_value a zero, will be set to the length required to hold the value. In case out_value
is not zero, will be set to the actual length of the value written. For nvs_get_str this includes
zero terminator.

### Returns
- ESP_OK if the value was retrieved successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only
if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
**Chapter 2. API Reference**

- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data

```c
esp_err_t nvs_get_blob(nvs_handle_t handle, const char* key, void*out_value, size_t *length)
```

get blob value for given key

This function behaves the same as `nvs_get_str`, except for the data type.

```c
esp_err_t nvs_open(const char* namespace_name, nvs_open_mode_t open_mode, nvs_handle_t *out_handle)
```

Open non-volatile storage with a given namespace from the default NVS partition.

Multiple internal ESP-IDF and third party application modules can store their key-value pairs in the NVS module. In order to reduce possible conflicts on key names, each module can use its own namespace. The default NVS partition is the one that is labelled “nvs” in the partition table.

**Parameters**

- `namespace_name` -in- Namespace name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- `open_mode` -in- NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- `out_handle` -out- If successful (return code is zero), handle will be returned in this argument.

**Returns**

- ESP_OK if storage handle was opened successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with label “nvs” is not found
- ESP_ERR_NVS_NOT_FOUND if namespace doesn’t exist yet and mode is NVS_READONLY
- ESP_ERR_NVS_INVALID_NAME if namespace name doesn’t satisfy constraints
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is no space for a new entry or there are too many different namespaces (maximum allowed different namespaces: 254)
- other error codes from the underlying storage driver

```c
esp_err_t nvs_open_from_partition(const char* part_name, const char* namespace_name, nvs_open_mode_t open_mode, nvs_handle_t *out_handle)
```

Open non-volatile storage with a given namespace from specified partition.

The behaviour is same as `nvs_open()` API. However this API can operate on a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using `nvs_flash_init_partition()` API.

**Parameters**

- `part_name` -[in] Label (name) of the partition of interest for object read/write/erase
- `namespace_name` -[in] Namespace name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- `open_mode` -[in] NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- `out_handle` -[out] If successful (return code is zero), handle will be returned in this argument.

**Returns**

- ESP_OK if storage handle was opened successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with specified name is not found
- ESP_ERR_NVS_NOT_FOUND if namespace doesn’t exist yet and mode is NVS_READONLY
- ESP_ERR_NVS_INVALID_NAME if namespace name doesn’t satisfy constraints
• ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
• ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is no space for a new entry or there are too many different namespaces (maximum allowed different namespaces: 254)
• other error codes from the underlying storage driver

`esp_err_t nvs_set_blob(nvs_handle_t handle, const char* key, const void* value, size_t length)`

Sets variable length binary value for given key

Sets variable length binary value for the key. Function uses 2 overhead and 1 entry per each 32 bytes of new data from the pool of available entries. See `nvs_get_stats`. In case of value update for existing key, space occupied by the existing value and 2 overhead entries are returned to the pool of available entries. Note that the underlying storage will not be updated until `nvs_commit` is called.

Parameters

- `handle` - [in] Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- `key` - [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- `value` - [in] The value to set.
- `length` - [in] length of binary value to set, in bytes; Maximum length is 508000 bytes or (97.6% of the partition size - 4000) bytes whichever is lower.

Returns

- ESP_OK if value was set successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.
- ESP_ERR_NVS_VALUE_TOO_LONG if the value is too long

`esp_err_t nvs_erase_key(nvs_handle_t handle, const char *key)`

Erase key-value pair with given key name.

Note that actual storage may not be updated until `nvs_commit` function is called.

Parameters

- `handle` - [in] Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.
- `key` - [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.

Returns

- ESP_OK if erase operation was successful
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if handle was opened as read only
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
- other error codes from the underlying storage driver

`esp_err_t nvs_erase_all(nvs_handle_t handle)`

Erase all key-value pairs in a namespace.

Note that actual storage may not be updated until `nvs_commit` function is called.

Parameters

- `handle` - [in] Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

Returns
• ESP_OK if erase operation was successful
• ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
• ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
• ESP_ERR_NVS_READ_ONLY if handle was opened as read only
• other error codes from the underlying storage driver

```
esp_err_t nvs_commit (nvs_handle_t handle)
```

Write any pending changes to non-volatile storage.

After setting any values, nvs_commit() must be called to ensure changes are written to non-volatile storage. Individual implementations may write to storage at other times, but this is not guaranteed.

**Parameters**

`handle` **[in]** Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.

**Returns**

• ESP_OK if the changes have been written successfully
• ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
• other error codes from the underlying storage driver

```
void nvs_close (nvs_handle_t handle)
```

Close the storage handle and free any allocated resources.

This function should be called for each handle opened with nvs_open once the handle is not in use any more. Closing the handle may not automatically write the changes to nonvolatile storage. This has to be done explicitly using nvs_commit function. Once this function is called on a handle, the handle should no longer be used.

**Parameters**

`handle` **[in]** Storage handle to close

```
esp_err_t nvs_get_stats (const char *part_name, nvs_stats_t *nvs_stats)
```

Fill structure `nvs_stats_t`. It provides info about memory used by NVS.

This function calculates the number of used entries, free entries, available entries, total entries and number of namespaces in partition.

```
// Example of nvs_get_stats() to get overview of actual statistics of data...
    entries :
    nvs_stats_t nvs_stats;
    nvs_get_stats(NULL, &nvs_stats);
    printf("Count: UsedEntries = (%lu), FreeEntries = (%lu), AvailableEntries = (%lu), AllEntries = (%lu)\n",
               nvs_stats.used_entries, nvs_stats.free_entries, nvs_stats.available_entries, nvs_stats.total_entries);
```

**Parameters**

• `part_name` **[in]** Partition name NVS in the partition table. If pass a NULL than will use NVS_DEFAULT_PART_NAME ( "nvs" ).
• `nvs_stats` **[out]** Returns filled structure nvs_states_t. It provides info about used memory the partition.

**Returns**

• ESP_OK if the changes have been written successfully. Return param nvs_stats will be filled.
• ESP_ERR_NVS_PART_NOT_FOUND if the partition with label “name” is not found. Return param nvs_stats will be filled 0.
• ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return param nvs_stats will be filled 0.
• ESP_ERR_INVALID_ARG if nvs_stats equal to NULL.
• ESP_ERR_INVALID_STATE if there is page with the status of INVALID. Return param nvs_stats will be filled not with correct values because not all pages will be counted. Counting will be interrupted at the first INVALID page.
**esp_err_t nvs_get_used_entry_count (nvs_handle_t handle, size_t* used_entries)**

Calculate all entries in a namespace.

An entry represents the smallest storage unit in NVS. Strings and blobs may occupy more than one entry. Note that to find out the total number of entries occupied by the namespace, add one to the returned value used_entries (if err is equal to ESP_OK). Because the name space entry takes one entry.

```c
// Example of nvs_get_used_entry_count() to get amount of all key-value pairs... in one namespace:

nvs_handle_t handle;
nvs_open("namespace1", NVS_READWRITE, &handle);
...

size_t used_entries;
size_t total_entries_namespace;

if(nvs_get_used_entry_count(handle, &used_entries) == ESP_OK){
    // the total number of entries occupied by the namespace
    total_entries_namespace = used_entries + 1;
}
```

**Parameters**

- **handle** [in] Handle obtained from nvs_open function.
- **used_entries** [out] Returns amount of used entries from a namespace.

**Returns**

- ESP_OK if the changes have been written successfully. Return param used_entries will be filled valid value.
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return param used_entries will be filled 0.
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL. Return param used_entries will be filled 0.
- ESP_ERR_NVS_INVALID_ARG if used_entriest equal to NULL.
- Other error codes from the underlying storage driver. Return param used_entries will be filled 0.

**esp_err_t nvs_entry_find (const char* part_name, const char* namespace_name, nvs_type_t type, nvs_iterator_t *output_iterator)**

Create an iterator to enumerate NVS entries based on one or more parameters.

```c
// Example of listing all the key-value pairs of any type under specified... partition and namespace

nvs_iterator_t it = NULL;
esp_err_t res = nvs_entry_find(<nvs_partition_name>, <namespace>, NVS_TYPE_...ANY, &it);

while(res == ESP_OK) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info); // Can omit error check if parameters are guaranteed to be non-NULL
    printf("key '%s', type '%d' \n", info.key, info.type);
    res = nvs_entry_next(&it);
}

nvs_release_iterator(it);
```

**Parameters**

- **part_name** [in] Partition name
- **namespace_name** [in] Set this value if looking for entries with a specific namespace. Pass NULL otherwise.
- **type** [in] One of nvs_type_t values.
• **output_iterator** - [out] Set to a valid iterator to enumerate all the entries found. Set to NULL if no entry for specified criteria was found. If any other error except ESP_ERR_INVALID_ARG occurs, `output_iterator` is NULL, too. If ESP_ERR_INVALID_ARG occurs, `output_iterator` is not changed. If a valid iterator is obtained through this function, it has to be released using `nvs_release_iterator` when not used any more, unless ESP_ERR_INVALID_ARG is returned.

**Returns**

- ESP_OK if no internal error or programming error occurred.
- ESP_ERR_NVS_NOT_FOUND if no element of specified criteria has been found.
- ESP_ERR_NO_MEM if memory has been exhausted during allocation of internal structures.
- ESP_ERR_INVALID_ARG if any of the parameters is NULL. Note: don’t release `output_iterator` in case ESP_ERR_INVALID_ARG has been returned.

```c
esp_err_t nvs_entry_find_in_handle(nvs_handle_t handle, nvs_type_t type, nvs_iterator_t *output_iterator)
```

Create an iterator to enumerate NVS entries based on a handle and type.

```c
// Example of listing all the key-value pairs of any type under specified handle (which defines a partition and namespace)

nvs_iterator_t it = NULL;
esp_err_t res = nvs_entry_find_in_handle(<nvs_handle>, NVS_TYPE_ANY, &it);
while(res == ESP_OK) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info); // Can omit error check if parameters are guaranteed to be non-NULL
    printf("key '%s', type '%d' \n", info.key, info.type);
    res = nvs_entry_next(&it);
}

nvs_release_iterator(it);
```

**Parameters**

- **handle** - [in] Handle obtained from `nvs_open` function.
- **type** - [in] One of `nvs_type_t` values.
- **output_iterator** - [out] Set to a valid iterator to enumerate all the entries found. Set to NULL if no entry for specified criteria was found. If any other error except ESP_ERR_INVALID_ARG occurs, `output_iterator` is NULL, too. If ESP_ERR_INVALID_ARG occurs, `output_iterator` is not changed. If a valid iterator is obtained through this function, it has to be released using `nvs_release_iterator` when not used any more, unless ESP_ERR_INVALID_ARG is returned.

**Returns**

- ESP_OK if no internal error or programming error occurred.
- ESP_ERR_NVS_NOT_FOUND if no element of specified criteria has been found.
- ESP_ERR_NO_MEM if memory has been exhausted during allocation of internal structures.
- ESP_ERR_NVS_INVALID_HANDLE if unknown handle was specified.
- ESP_ERR_INVALID_ARG if output_iterator parameter is NULL. Note: don’t release `output_iterator` in case ESP_ERR_INVALID_ARG has been returned.

```c
esp_err_t nvs_entry_next(nvs_iterator_t *iterator)
```

Advances the iterator to next item matching the iterator criteria.

Note that any copies of the iterator will be invalid after this call.

**Parameters**

- **iterator** - [in/out] Iterator obtained from `nvs_entry_find` or `nvs_entry_find_in_handle` function. Must be non-NULL. If any error ex-
except ESP_ERR_INVALID_ARG occurs, iterator is set to NULL. If ESP_ERR_INVALID_ARG occurs, iterator is not changed.

**Returns**
- ESP_OK if no internal error or programming error occurred.
- ESP_ERR_NVS_NOT_FOUND if no next element matching the iterator criteria.
- ESP_ERR_INVALID_ARG if iterator is NULL.
- Possibly other errors in the future for internal programming or flash errors.

```c
esp_err_t nvs_entry_info(const nvs_iterator_t iterator, nvs_entry_info_t *out_info)
```

Fills *nvs_entry_info_t* structure with information about entry pointed to by the iterator.

**Parameters**
- **iterator** - [in] Iterator obtained from *nvs_entry_find* or *nvs_entry_find_in_handle* function. Must be non-NULL.
- **out_info** - [out] Structure to which entry information is copied.

**Returns**
- ESP_OK if all parameters are valid; current iterator data has been written to out_info
- ESP_ERR_INVALID_ARG if one of the parameters is NULL.

```c
void nvs_release_iterator(nvs_iterator_t iterator)
```

Release iterator.

**Parameters**
- **iterator** - [in] Release iterator obtained from *nvs_entry_find* or *nvs_entry_find_in_handle* or *nvs_entry_next* function. NULL argument is allowed.

**Structures**

```c
struct nvs_entry_info_t
```

Information about entry obtained from *nvs_entry_info* function

**Public Members**

```c
char namespace_name[NVS_NS_NAME_MAX_SIZE]
```

Namespace to which key-value belong

```c
char key[NVS_KEY_NAME_MAX_SIZE]
```

Key of stored key-value pair

```c
nvs_type_t type
```

Type of stored key-value pair

```c
struct nvs_stats_t
```

**Note:** Info about storage space NVS.

**Public Members**

```c
size_t used_entries
```

Number of used entries.

```c
size_t free_entries
```

Number of free entries. It includes also reserved entries.
size_t available_entries
   Number of entries available for data storage.

size_t total_entries
   Number of all entries.

size_t namespace_count
   Number of namespaces.

Macros

ESP_ERR_NVS_BASE
   Starting number of error codes

ESP_ERR_NVS_NOT_INITIALIZED
   The storage driver is not initialized

ESP_ERR_NVS_NOT_FOUND
   A requested entry couldn’t be found or namespace doesn’t exist yet and mode is NVS_READONLY

ESP_ERR_NVS_TYPE_MISMATCH
   The type of set or get operation doesn’t match the type of value stored in NVS

ESP_ERR_NVS_READ_ONLY
   Storage handle was opened as read only

ESP_ERR_NVS_NOT_ENOUGH_SPACE
   There is not enough space in the underlying storage to save the value

ESP_ERR_NVS_INVALID_NAME
   Namespace name doesn’t satisfy constraints

ESP_ERR_NVS_INVALID_HANDLE
   Handle has been closed or is NULL

ESP_ERR_NVS_REMOVE_FAILED
   The value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

ESP_ERR_NVS_KEY_TOO_LONG
   Key name is too long

ESP_ERR_NVS_PAGE_FULL
   Internal error; never returned by nvs API functions

ESP_ERR_NVS_INVALID_STATE
   NVS is in an inconsistent state due to a previous error. Call nvs_flash_init and nvs_open again, then retry.

ESP_ERR_NVS_INVALID_LENGTH
   String or blob length is not sufficient to store data
Chapter 2. API Reference

**ESP_ERR_NVS_NO_FREE_PAGES**
NVS partition doesn’t contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs_flash_init again.

**ESP_ERR_NVS_VALUE_TOO_LONG**
Value doesn’t fit into the entry or string or blob length is longer than supported by the implementation

**ESP_ERR_NVS_PART_NOT_FOUND**
Partition with specified name is not found in the partition table

**ESP_ERR_NVS_NEW_VERSION_FOUND**
NVS partition contains data in new format and cannot be recognized by this version of code

**ESP_ERR_NVS_XTS_ENCR_FAILED**
XTS encryption failed while writing NVS entry

**ESP_ERR_NVS_XTS_DECR_FAILED**
XTS decryption failed while reading NVS entry

**ESP_ERR_NVS_XTS_CFG_FAILED**
XTS configuration setting failed

**ESP_ERR_NVS_XTS_CFG_NOT_FOUND**
XTS configuration not found

**ESP_ERR_NVS_ENCR_NOT_SUPPORTED**
NVS encryption is not supported in this version

**ESP_ERR_NVS_KEYS_NOT_INITIALIZED**
NVS key partition is uninitialized

**ESP_ERR_NVS_CORRUPT_KEY_PART**
NVS key partition is corrupt

**ESP_ERR_NVS_WRONG_ENCRYPTION**
NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

**ESP_ERR_NVS_CONTENT_DIFFERS**
Internal error; never returned by nvs API functions. NVS key is different in comparison

**NVS_DEFAULT_PART_NAME**
Default partition name of the NVS partition in the partition table

**NVS_PART_NAME_MAX_SIZE**
maximum length of partition name (excluding null terminator)

**NVS_KEY_NAME_MAX_SIZE**
Maximum length of NVS key name (including null terminator)
NVS_NS_NAME_MAX_SIZE

Maximum length of NVS namespace name (including null terminator)

Type Definitions

typedef uint32_t nvs_handle_t
  Opaque pointer type representing non-volatile storage handle

typedef nvs_handle_t nvs_handle

typedef nvs_open_mode_t nvs_open_mode

typedef struct nvs_opaque_iterator_t *nvs_iterator_t
  Opaque pointer type representing iterator to nvs entries

Enumerations

enum nvs_open_mode_t
  Mode of opening the non-volatile storage.
  Values:

  enumerator NVS_READONLY
    Read only

  enumerator NVS_READWRITE
    Read and write

enum nvs_type_t
  Types of variables.
  Values:

  enumerator NVS_TYPE_U8
    Type uint8_t

  enumerator NVS_TYPE_I8
    Type int8_t

  enumerator NVS_TYPE_U16
    Type uint16_t

  enumerator NVS_TYPE_I16
    Type int16_t

  enumerator NVS_TYPE_U32
    Type uint32_t

  enumerator NVS_TYPE_I32
    Type int32_t
Chapter 2. API Reference

enumerator **NVS_TYPE_U64**
Type uint64_t

enumerator **NVS_TYPE_I64**
Type int64_t

enumerator **NVS_TYPE_STR**
Type string

enumerator **NVS_TYPE_BLOB**
Type blob

enumerator **NVS_TYPE_ANY**
Must be last

### 2.9.4 NVS Encryption

#### Overview

This guide provides an overview of the NVS encryption feature. NVS encryption helps to achieve secure storage on the device flash memory.

Data stored in NVS partitions can be encrypted using XTS-AES in the manner similar to the one mentioned in disk encryption standard IEEE P1619. For the purpose of encryption, each entry is treated as one sector and relative address of the entry (w.r.t., partition-start) is fed to the encryption algorithm as sector-number.

#### NVS Encryption: Flash Encryption-Based Scheme

In this scheme, the keys required for NVS encryption are stored in yet another partition, which is protected using Flash Encryption. Therefore, enabling Flash Encryption becomes a prerequisite for NVS encryption here.

NVS encryption is enabled by default when Flash Encryption is enabled. This is done because Wi-Fi driver stores credentials (like SSID and passphrase) in the default NVS partition. It is important to encrypt them as default choice if platform level encryption is already enabled.

For using NVS encryption using this scheme, the partition table must contain the **NVS Key Partition**. Two partition tables containing the NVS Key Partition are provided for NVS encryption under the partition table option (menuconfig>Partition Table). They can be selected with the project configuration menu (idf.py menuconfig). Please refer to the example security/flash_encryption for how to configure and use the NVS encryption feature.

**NVS Key Partition**  An application requiring NVS encryption support (using the Flash Encryption-based scheme) needs to be compiled with a key-partition of the type data and subtype key. This partition should be marked as encrypted and its size should be the minimum partition size (4 KB). Refer to Partition Tables for more details. Two additional partition tables which contain the NVS Key Partition are provided under the partition table option (menuconfig>Partition Table). They can be directly used for NVS encryption. The structure of these partitions is depicted below:

```
+-------------------------------+----------------------+
| XTS encryption key (32)      |                     |
+-------------------------------+----------------------+
| XTS tweak key (32)           |                     |
```

(continues on next page)
The XTS encryption keys in the **NVS Key Partition** can be generated in one of the following two ways.

**Generate the keys on ESP32 chip itself**

- When NVS encryption is enabled, the `nvs_flash_init()` API function can be used to initialize the encrypted default NVS partition. The API function internally generates the XTS encryption keys on the ESP chip. The API function finds the first **NVS Key Partition**.
- Then the API function automatically generates and stores the NVS keys in that partition by making use of the `nvs_flash_generate_keys()` API function provided by `nvs_flash/include/nvs_flash.h`. New keys are generated and stored only when the respective key partition is empty. The same key partition can then be used to read the security configurations for initializing a custom encrypted NVS partition with help of `nvs_flash_secure_init_partition()`.
- The API functions `nvs_flash_secure_init()` and `nvs_flash_secure_init_partition()` do not generate the keys internally. When these API functions are used for initializing encrypted NVS partitions, the keys can be generated after startup using the `nvs_flash_generate_keys()` API function provided by `nvs_flash.h`. The API function then writes those keys onto the key-partition in encrypted form.

**Note:** Please note that `nvs_keys` partition must be completely erased before you start the application in this approach. Otherwise the application may generate the `ESP_ERR_NVS_CORRUPT_KEY_PART` error code assuming that `nvs_keys` partition is not empty and contains malformatted data. You can use the following command for this:

```
parttool.py --port PORT --partition-table-file=PARTITION_TABLE_FILE --partition-table-offset PARTITION_TABLE_OFFSET erase_partition --partition-type=data --partition-subtype=nvs_keys
```

**Use a pre-generated NVS key partition**

This option will be required by the user when keys in the **NVS Key Partition** are not generated by the application. The **NVS Key Partition** containing the XTS encryption keys can be generated with the help of **NVS Partition Generator Utility**. Then the user can store the pre-generated key partition on the flash with help of the following two commands:

1. Build and flash the partition table

   ```
idf.py partition-table partition-table-flash
   ```

2. Store the keys in the **NVS Key Partition** (on the flash) with the help of `parttool.py` (see Partition Tool section in `partition-tables` for more details)

   ```
parttool.py --port PORT --partition-table-offset PARTITION_TABLE_OFFSET write_partition --partition-name="name of nvs_key partition" --input NVS_KEY_PARTITION_FILE
   ```

**Note:** If the device is encrypted in flash encryption development mode and you want to renew the NVS key partition, you need to tell `parttool.py` to encrypt the NVS key partition and you also need to give it a pointer to the unencrypted partition table in your build directory (build/partition_table) since the partition table on the device is encrypted, too. You can use the following command:

```
parttool.py --esptool-write-args encrypt --port PORT --partition-table-file=PARTITION_TABLE_FILE --partition-table-offset PARTITION_TABLE_OFFSET write_partition --partition-name="name of nvs_key partition" --input NVS_KEY_PARTITION_FILE
```
Since the key partition is marked as encrypted and Flash Encryption is enabled, the bootloader will encrypt this partition using flash encryption key on the first boot.

It is possible for an application to use different keys for different NVS partitions and thereby have multiple key-partitions. However, it is a responsibility of the application to provide the correct key-partition and keys for encryption or decryption.

**NVS Encryption: HMAC Peripheral-Based Scheme**

In this scheme, the XTS keys required for NVS encryption are derived from an HMAC key programmed in eFuse with the purpose esp_efuse_purpose_t::ESP_EFUSE_KEY_PURPOSE_HMAC_UP. Since the encryption keys are derived at runtime, they are not stored anywhere in the flash. Thus, this feature does not require a separate NVS Key Partition.

**Note:** This scheme enables us to achieve secure storage on ESP32 without enabling flash encryption.

**Important:** Please take note that this scheme uses one eFuse block for storing the HMAC key required for deriving the encryption keys.

• When NVS encryption is enabled, the nvs_flash_init() API function can be used to initialize the encrypted default NVS partition. The API function first checks whether an HMAC key is present at CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID.

**Note:** The valid range for the config CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID is from 0 (hmac_key_id_t::HMAC_KEY0) to 5 (hmac_key_id_t::HMAC_KEY5). By default, the config is set to 6 (hmac_key_id_t::HMAC_KEY_MAX), which have to be configured before building the user application.

• If no key is found, a key is generated internally and stored at the eFuse block specified at CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID.

• If a key is found with the purpose esp_efuse_purpose_t::ESP_EFUSE_KEY_PURPOSE_HMAC_UP, the same is used for the derivation of the XTS encryption keys.

• If the specified eFuse block is found to be occupied with a key with a purpose other than esp_efuse_purpose_t::ESP_EFUSE_KEY_PURPOSE_HMAC_UP, an error is thrown.

• The API nvs_flash_init() then automatically generates the NVS keys on demand by using the nvs_flash_generate_keys_v2() API function provided by the nvs_flash/include/nvs_flash.h. The same keys can also be used to read the security configurations (see nvs_flash_read_security_cfg_v2()) for initializing a custom encrypted NVS partition with help of nvs_flash_secure_init_partition().

• The API functions nvs_flash_secure_init() and nvs_flash_secure_init_partition() do not generate the keys internally. When these API functions are used for initializing encrypted NVS partitions, the keys can be generated after startup using the nvs_flash_generate_keys_v2() API function or take and populate the NVS security configuration structure nvs_sec_cfg_t with nvs_flash_read_security_cfg_v2() and feed them into the above APIs.

**Note:** Users can program their own HMAC key in eFuse block beforehand by using the following command:

```bash
espefuse.py -p PORT burn_key <BLOCK_KEYN> <hmac_key_file.bin> HMAC_UP
```
Chapter 2. API Reference

Encrypted Read/Write

The same NVS API functions nvs_get_* or nvs_set_* can be used for reading of, and writing to an encrypted NVS partition as well.

Encrypt the default NVS partition

• To enable encryption for the default NVS partition, no additional step is necessary. When CONFIG_NVS_ENCRYPTION is enabled, the nvs_flash_init() API function internally performs some additional steps to enable encryption for the default NVS partition depending on the scheme being used (set by CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME).

• For the flash encryption-based scheme, the first NVS Key Partition found is used to generate the encryption keys while for the HMAC one, keys are generated using the HMAC key burnt in eFuse at CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID (refer to the API documentation for more details).

Alternatively, nvs_flash_secure_init() API function can also be used to enable encryption for the default NVS partition.

Encrypt a custom NVS partition

• To enable encryption for a custom NVS partition, nvs_flash_secure_init_partition() API function is used instead of nvs_flash_init_partition().

• When nvs_flash_secure_init() and nvs_flash_secure_init_partition() API functions are used, the applications are expected to follow the steps below in order to perform NVS read/write operations with encryption enabled:

  1. Populate the NVS security configuration structure nvs_sec_cfg_t

     - For the Flash Encryption-based scheme
       * Find key partition and NVS data partition using esp_partition_find* API functions.
       * Populate the nvs_sec_cfg_t struct using the nvs_flash_read_security_cfg() or nvs_flash_generate_keys() API functions.

     - For the HMAC-based scheme
       * Set the scheme-specific config data with nvs_sec_config_hmac_t and register the HMAC-based scheme with the API nvs_sec_provider_register_hmac() which will also populate the scheme-specific handle (see nvs_sec_scheme_t).
       * Populate the nvs_sec_cfg_t struct using the nvs_flash_read_security_cfg_v2() or nvs_flash_generate_keys_v2() API functions.

```c
nvs_sec_cfg_t cfg = {};
nvs_sec_scheme_t *sec_scheme_handle = NULL;
nvs_sec_config_hmac_t sec_scheme_cfg = {};
hmac_key_id_t hmac_key = HMAC_KEY0;
sec_scheme_cfg.hmac_key_id = hmac_key;
ret = nvs_sec_provider_register_hmac(&sec_scheme_cfg, &sec_scheme_handle);
if (ret != ESP_OK) {
    return ret;
}
ret = nvs_flash_read_security_cfg_v2(sec_scheme_handle, &cfg);
if (ret != ESP_OK) {
    if (ret == ESP_ERR_NVS_SEC_HMAC_KEY_NOT_FOUND) {
        ret = nvs_flash_generate_keys_v2(sec_scheme_handle, &cfg);
    } else if (ret != ESP_OK) {
        ESP_LOGE(TAG, "Failed to generate NVS encr-keys!");
    }
    return ret;
}
```

(continues on next page)
Chapter 2. API Reference

(continued from previous page)

ESP_LOGE(TAG, "Failed to read NVS security cfg!");
return ret;
}

2. Initialise NVS flash partition using the `nvs_flash_secure_init()` or
   `nvs_flash_secure_init_partition()` API functions.
3. Open a namespace using the `nvs_open()` or `nvs_open_from_partition()` API functions.
4. Perform NVS read/write operations using `nvs_get_*` or `nvs_set_*`.
5. Deinitialise an NVS partition using `nvs_flash_deinit()`.

Note: While using the HMAC-based scheme, the above workflow can be used without enabling any of the config options for NVS encryption - `CONFIG_NVSEC_ENCRYPTION`, `CONFIG_NVSEC_KEY_PROTECTION_SCHEME` -> `CONFIG_NVSEC_SEC_KEY_PROTECT_USING_HMAC` and `CONFIG_NVSEC_HMAC_EFUSE_KEY_ID` to encrypt the default as well as custom NVS partitions with `nvs_flash_secure_init()` API.

NVS Security Provider

The component `nvs_sec_provider` stores all the implementation-specific code for the NVS encryption schemes and would also accommodate any future schemes. This component acts as an interface to the `nvs_flash` component for the handling of encryption keys. `nvs_sec_provider` has a configuration menu of its own, based on which the selected security scheme and the corresponding settings are registered for the `nvs_flash` component.

API Reference

Header File

- components/nvs_sec_provider/include/nvs_sec_provider.h

Functions

```c
esp_err_t nvs_sec_provider_register_flash_enc(const nvs_sec_config_flash_enc_t *sec_scheme_cfg, nvs_sec_scheme_t **sec_scheme_handle_out)
```

Register the Flash-Encryption based scheme for NVS Encryption.

Parameters

- `sec_scheme_cfg` - [in] Security scheme specific configuration data
- `sec_scheme_handle_out` - [out] Security scheme specific configuration handle

Returns

- ESP_OK, if `sec_scheme_handle_out` was populated successfully with the scheme configuration;
- ESP_ERR_INVALID_ARG, if `sec_scheme_cfg_hmac` is NULL;
- ESP_ERR_NO_MEM, No memory for the scheme-specific handle
- ESP_ERR_NOT_FOUND, if no `nvs_keys` partition is found

```c
esp_err_t nvs_sec_provider_deregister(nvs_sec_scheme_t *sec_scheme_handle)
```

Deregister the NVS encryption scheme registered with the given handle.

Parameters `sec_scheme_handle` - [in] Security scheme specific configuration handle

Returns

- ESP_OK, if the scheme registered with `sec_scheme_handle` was deregistered successfully
- ESP_ERR_INVALID_ARG, if `sec_scheme_handle` is NULL;
Structures

struct nvs_sec_config_flash_enc_t

Flash encryption-based scheme specific configuration data.

Public Members

const esp_partition_t *nvs_keys_part

Partition of subtype nvs_keys holding the NVS encryption keys

Macros

ESP_ERR_NVS_SEC_BASE

Starting number of error codes

ESP_ERR_NVS_SEC_HMAC_KEY_NOT_FOUND

HMAC Key required to generate the NVS encryption keys not found

ESP_ERR_NVS_SEC_HMAC_KEY_BLK_ALREADY_USED

Provided eFuse block for HMAC key generation is already in use

ESP_ERR_NVS_SEC_HMAC_KEY_GENERATION_FAILED

Failed to generate/write the HMAC key to eFuse

ESP_ERR_NVS_SEC_HMAC_XTS_KEYS_DERIV_FAILED

Failed to derive the NVS encryption keys based on the HMAC-based scheme

NVS_SEC_PROVIDER_CFG_FLASH_ENC_DEFAULT()

Helper for populating the Flash encryption-based scheme specific configuration data.

Enumerations

denum nvs_sec_scheme_id_t

NVS Encryption Keys Protection Scheme.

Values:

enumerator NVS_SEC_SCHEME_FLASH_ENC

Protect NVS encryption keys using Flash Encryption

enumerator NVS_SEC_SCHEME_HMAC

Protect NVS encryption keys using HMAC peripheral

enumerator NVS_SEC_SCHEME_MAX

2.9.5 NVS Partition Generator Utility
Introduction

The utility `nvs_flash/nvs_partition_generator/nvs_partition_gen.py` creates a binary file, compatible with the NVS architecture defined in *Non-Volatile Storage*, based on the key-value pairs provided in a CSV file.

This utility is ideally suited for generating a binary blob, containing data specific to ODM/OEM, which can be flashed externally at the time of device manufacturing. This allows manufacturers to generate many instances of the same application firmware with customized parameters for each device, such as a serial number.

Prerequisites

To use this utility in encryption mode, install the following packages:

- cryptography

All the required packages are included in `requirements.txt` in the root of the ESP-IDF directory.

CSV File Format  Each line of a CSV file should contain 4 parameters, separated by a comma. The table below describes each of these parameters.

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Key</td>
<td>Key of the data. The data can be accessed later from an application using this key.</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>Type</td>
<td>Supported values are <code>file</code>, <code>data</code>, and <code>namespace</code>.</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Encoding</td>
<td>Supported values are: <code>u8</code>, <code>i8</code>, <code>u16</code>, <code>i16</code>, <code>u32</code>, <code>i32</code>, <code>u64</code>, <code>i64</code>, <code>string</code>, <code>hex2bin</code>, <code>base64</code>, and <code>binary</code>. This specifies how actual data values are encoded in the resulting binary file. The difference between the <code>string</code> and <code>binary</code> encoding is that <code>string</code> data is terminated with a NULL character, whereas <code>binary</code> data is not. As of now, for the <code>file</code> type, only <code>hex2bin</code>, <code>base64</code>, <code>string</code>, and <code>binary</code> encoding is supported.</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>Value</td>
<td>Data value</td>
<td>Encoding and Value cells for the namespace field type should be empty. Encoding and Value of namespace are fixed and are not configurable. Any values in these cells are ignored.</td>
</tr>
</tbody>
</table>

Note:  The first line of the CSV file should always be the column header and it is not configurable.

Below is an example dump of such a CSV file:

```
key,type,encoding,value     <<< column header
namespace_name,namespace,,   <<< First entry should be of type "namespace"
key1,data,u8,1
key2,file,string,/path/to/file
```

Note:  Make sure there are no spaces:

- before and after ','
Chapter 2. API Reference

• at the end of each line in a CSV file

NVS Entry and Namespace Association

When a namespace entry is encountered in a CSV file, each following entry will be treated as part of that namespace until the next namespace entry is found. At this point, all the following entries will be treated as part of the new namespace.

Note: First entry in a CSV file should always be a namespace entry.

Multipage Blob Support

By default, binary blobs are allowed to span over multiple pages and are written in the format mentioned in Section Structure of Entry. If you intend to use the older format, the utility provides an option to disable this feature.

Encryption-Decryption Support

The NVS Partition Generator utility also allows you to create an encrypted binary file and decrypt an encrypted one. The utility uses the XTS-AES encryption. Please refer to NVS Encryption for more details.

Running the Utility

Usage:

```
python nvs_partition_gen.py [-h] {generate,generate-key,encrypt,decrypt} ...
```

Optional Arguments:

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>-h --help</td>
<td>Show the help message and exit</td>
</tr>
</tbody>
</table>

Commands:

Run nvs_partition_gen.py {command} -h for additional help

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>generate</td>
<td>Generate NVS partition</td>
</tr>
<tr>
<td>2</td>
<td>generate-key</td>
<td>Generate keys for encryption</td>
</tr>
<tr>
<td>3</td>
<td>encrypt</td>
<td>Generate NVS encrypted partition</td>
</tr>
<tr>
<td>4</td>
<td>decrypt</td>
<td>Decrypt NVS encrypted partition</td>
</tr>
</tbody>
</table>

Generate NVS Partition (Default) Usage:

```
python nvs_partition_gen.py generate [-h] [--version {1,2}] [--outdir OUTDIR]--input output size
```

Positional Arguments:
Chapter 2. API Reference

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Path to CSV file to parse</td>
</tr>
<tr>
<td>output</td>
<td>Path to output NVS binary file</td>
</tr>
<tr>
<td>size</td>
<td>Size of NVS partition in bytes (must be multiple of 4096)</td>
</tr>
</tbody>
</table>

Optional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h --help</td>
<td>Show the help message and exit</td>
</tr>
<tr>
<td>--version {1,2}</td>
<td>Set multipage blob version (Default: Version 2)&lt;br&gt;Version 1 - Multipage blob support disabled&lt;br&gt;Version 2 - Multipage blob support enabled</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>Output directory to store file created (Default: current directory)</td>
</tr>
</tbody>
</table>

You can run the utility to generate NVS partition using the command below. A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000
```

**Generate Encryption Keys Partition**

Usage:

```
python nvs_partition_gen.py generate-key [-h] [--key_protect_hmac] [--kp_hmac_keygen]

```

Optional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h --help</td>
<td>Show the help message and exit</td>
</tr>
<tr>
<td>--key_protect_hmac</td>
<td>If set, the NVS encryption key protection scheme based on HMAC peripheral is used; else the default scheme based on Flash Encryption is used</td>
</tr>
<tr>
<td>--kp_hmac_keygen</td>
<td>Generate the HMAC key for HMAC-based encryption scheme</td>
</tr>
<tr>
<td>--kp_hmac_keyfile KP_HMAC_KEYFILE</td>
<td>Path to output HMAC key file</td>
</tr>
<tr>
<td>--kp_hmac_inputkey KP_HMAC_INPUTKEY</td>
<td>File having the HMAC key for generating the NVS encryption keys</td>
</tr>
<tr>
<td>--keyfile KEYFILE</td>
<td>Path to output encryption keys file</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>Output directory to store files created. (Default: current directory)</td>
</tr>
</tbody>
</table>

You can run the utility to generate only the encryption key partition using the command below:

```
python nvs_partition_gen.py generate-key
```

For generating encryption key for the HMAC-based scheme, the following commands can be used:

- Generate the HMAC key and the NVS encryption keys:
  ```
  python nvs_partition_gen.py generate-key --key_protect_hmac --kp_hmac_keygen
  ```

**Note:** Encryption key of the format `<outdir>/keys/keys-<timestamp>.bin` and HMAC key of the format `<outdir>/keys/hmac-keys-<timestamp>.bin` are created.
• Generate the NVS encryption keys, given the HMAC-key:

```
python nvs_partition_gen.py generate-key --key_protect_hmac --kp_hmac_inputkey --testdata/sample_hmac_key.bin
```

**Note:** You can provide the custom filename for the HMAC key as well as the encryption key as a parameter.

---

### Generate Encrypted NVS Partition  Usage:

```
python nvs_partition_gen.py encrypt [-h] [--version {1,2}] [--keygen]
--keyfile KEYFILE [--inputkey INPUTKEY] [--outdir OUTDIR]
--key_protect_hmac [--kp_hmac_keygen]
--kp_hmac_keyfile KP_HMAC_KEYFILE [--kp_hmac_inputkey KP_HMAC_INPUTKEY]
```

**Positional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Path to CSV file to parse</td>
</tr>
<tr>
<td>output</td>
<td>Path to output NVS binary file</td>
</tr>
<tr>
<td>size</td>
<td>Size of NVS partition in bytes (must be multiple of 4096)</td>
</tr>
</tbody>
</table>

**Optional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h --help</td>
<td>Show the help message and exit</td>
</tr>
<tr>
<td>--version {1,2}</td>
<td>Set multipage blob version (Default: Version 2)</td>
</tr>
<tr>
<td></td>
<td>Version 1 - Multipage blob support disabled</td>
</tr>
<tr>
<td></td>
<td>Version 2 - Multipage blob support enabled</td>
</tr>
<tr>
<td>--keygen</td>
<td>Generates key for encrypting NVS partition</td>
</tr>
<tr>
<td>--keyfile KEYFILE</td>
<td>Path to output encryption keys file</td>
</tr>
<tr>
<td>--inputkey INPUTKEY</td>
<td>File having key for encrypting NVS partition</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>Output directory to store file created (Default: current directory)</td>
</tr>
<tr>
<td>--key_protect_hmac</td>
<td>If set, the NVS encryption key protection scheme based on HMAC peripheral is used; else the default scheme based on Flash Encryption is used</td>
</tr>
<tr>
<td>--kp_hmac_keygen</td>
<td>Generate the HMAC key for HMAC-based encryption scheme</td>
</tr>
<tr>
<td>--kp_hmac_keyfile KP_HMAC_KEYFILE</td>
<td>Path to output HMAC key file</td>
</tr>
<tr>
<td>--kp_hmac_inputkey KP_HMAC_INPUTKEY</td>
<td>File having the HMAC key for generating the NVS encryption keys</td>
</tr>
</tbody>
</table>

You can run the utility to encrypt NVS partition using the command below. A sample CSV file is provided with the utility:

• Encrypt by allowing the utility to generate encryption keys:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin --0x3000 --keygen
```

**Note:** Encryption key of the format `<outdir>/keys/keys-<timestamp>.bin` is created.

- To generate an encrypted partition using the HMAC-based scheme, the above command can be used along with some additional parameters.
  • Encrypt by allowing the utility to generate encryption keys and the HMAC-key:
Python nvs_partition_gen encrypt sample_singlepage_blob.csv sample_encr.bin 0x3000 --keygen --key_protect_hmac --kp_hmac_keygen

Note: Encryption key of the format `<outdir>/keys/keys-<timestamp>.bin` and HMAC key of the format `<outdir>/keys/hmac-keys-<timestamp>.bin` are created.

* Encrypt by allowing the utility to generate encryption keys with user-provided HMAC-key:

Python nvs_partition_gen encrypt sample_singlepage_blob.csv sample_encr.bin 0x3000 --keygen --key_protect_hmac --kp_hmac_inputkey --testdata/sample_hmac_key.bin

Note: You can provide the custom filename for the HMAC key as well as the encryption key as a parameter.

* Encrypt by allowing the utility to generate encryption keys and store it in provided custom filename:

Python nvs_partition_gen encrypt sample_singlepage_blob.csv sample_encr.bin 0x3000 --keygen --keyfile sample_keys.bin

Note:
* Encryption key of the format `<outdir>/keys/sample_keys.bin` is created.
* This newly created file having encryption keys in `keys/` directory is compatible with NVS key-partition structure. Refer to NVS Key Partition for more details.

* Encrypt by providing the encryption keys as input binary file:

Python nvs_partition_gen encrypt sample_singlepage_blob.csv sample_encr.bin 0x3000 --inputkey sample_keys.bin

Decrypt Encrypted NVS Partition Usage:

Python nvs_partition_gen decrypt [-h] [--outdir OUTDIR] input key output

Positional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Path to encrypted NVS partition file to parse</td>
</tr>
<tr>
<td>key</td>
<td>Path to file having keys for decryption</td>
</tr>
<tr>
<td>output</td>
<td>Path to output decrypted binary file</td>
</tr>
</tbody>
</table>

Optional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h/--help</td>
<td>Show the help message and exit</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>Output directory to store file created (Default: current directory)</td>
</tr>
</tbody>
</table>

You can run the utility to decrypt encrypted NVS partition using the command below:

Python nvs_partition_gen decrypt sample_encr.bin sample_keys.bin sample_decr.bin

You can also provide the format version number:
* Multipage Blob Support Disabled (Version 1)
* Multipage Blob Support Enabled (Version 2)
Chapter 2. API Reference

**Multipage Blob Support Disabled (Version 1)** You can run the utility in this format by setting the version parameter to 1, as shown below. A sample CSV file for the same is provided with the utility:

```bash
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000 --version 1
```

**Multipage Blob Support Enabled (Version 2)** You can run the utility in this format by setting the version parameter to 2, as shown below. A sample CSV file for the same is provided with the utility:

```bash
python nvs_partition_gen.py generate sample_multipage_blob.csv sample.bin 0x4000 --version 2
```

**Note:**
- Minimum NVS Partition Size needed is 0x3000 bytes.
- When flashing the binary onto the device, make sure it is consistent with the application’s sdkconfig.

**Caveats**

- Utility does not check for duplicate keys and will write data pertaining to both keys. You need to make sure that the keys are distinct.
- Once a new page is created, no data will be written in the space left on the previous page. Fields in the CSV file need to be ordered in such a way as to optimize memory.
- 64-bit datatype is not yet supported.

### 2.9.6 NVS Partition Parser Utility

**Introduction**

The utility `nvs_flash/nvs_partition_tool/nvs_tool.py` loads and parses an NVS storage partition for easier debugging and data extraction. The utility also features integrity check which scans the partition for potential errors. Data blobs are encoded in `base64` format.

**Encrypted Partitions**

This utility does not support decryption. To decrypt the NVS partition, please use the *NVS Partition Generator Utility* which does support NVS partition encryption and decryption.

**Usage**

There are two output format styles available with the `-f` or `--format` option:

- `json` - All of the output is printed as a JSON.
- `text` - The output is printed as a human-readable text with different selectable output styles mentioned below.

For the `text` output format, the utility provides six different output styles with the `-d` or `--dump` option:

- `all` (default) - Prints all entries with metadata.
- `written` - Prints only written entries with metadata.
- `minimal` - Prints written `namespace: key = value` pairs.
- `namespaces` - Prints all written namespaces.
- `blobs` - Prints all blobs and strings (reconstructs them if they are chunked).
• **storage_info** - Prints entry states count for every page.

**Note:** There is also a *none* option which will not print anything. This can be used with the integrity check option if the NVS partition contents are irrelevant.

The utility also provides an integrity check feature via the `-i` or `--integrity-check` option (available only with the text format as it would invalidate the *json* output). This feature scans through the entire partition and prints potential errors. It can be used with the `-d none` option which will print only the potential errors.

### 2.9.7 SD/SDIO/MMC Driver

#### Overview

The SD/SDIO/MMC driver currently supports SD memory, SDIO cards, and eMMC chips. This is a protocol level driver built on top of SDMMC and SD SPI host drivers.

SDMMC and SD SPI host drivers ([driver/sdmmc/include/driver/sdmmc_host.h](driver/sdmmc/include/driver/sdmmc_host.h) and [driver/spi/include/driver/sdspi_host.h](driver/spi/include/driver/sdspi_host.h)) provide API functions for:

- Sending commands to slave devices
- Sending and receiving data
- Handling error conditions within the bus

For functions used to initialize and configure:

- SDMMC host, see [SDMMC Host API](#)
- SD SPI host, see [SD SPI Host API](#)

The SDMMC protocol layer described in this document handles the specifics of the SD protocol, such as the card initialization and data transfer commands.

The protocol layer works with the host via the *sdmmc_host_t* structure. This structure contains pointers to various functions of the host.

#### Application Example

An example which combines the SDMMC driver with the FATFS library is provided in the `storage/sd_card` directory of ESP-IDF examples. This example initializes the card, then writes and reads data from it using POSIX and C library APIs. See README.md file in the example directory for more information.

**Combo (Memory + IO) Cards**  
The driver does not support SD combo cards. Combo cards are treated as IO cards.

**Thread Safety**  
Most applications need to use the protocol layer only in one task. For this reason, the protocol layer does not implement any kind of locking on the *sdmmc_card_t* structure, or when accessing SDMMC or SD SPI host drivers. Such locking is usually implemented on a higher layer, e.g., in the filesystem driver.
Chapter 2. API Reference

Protocol Layer API

The protocol layer is given the `sdmmc_host_t` structure. This structure describes the SD/MMC host driver, lists its capabilities, and provides pointers to functions of the driver. The protocol layer stores card-specific information in the `sdmmc_card_t` structure. When sending commands to the SD/MMC host driver, the protocol layer uses the `sdmmc_command_t` structure to describe the command, arguments, expected return values, and data to transfer if there is any.

Using API with SD Memory Cards

1. To initialize the host, call the host driver functions, e.g., `sdmmc_host_init()`, `sdmmc_host_init_slot()`.
2. To initialize the card, call `sdmmc_card_init()` and pass to it the parameters `host` - the host driver information, and `card` - a pointer to the structure `sdmmc_card_t` which will be filled with information about the card when the function completes.
3. To read and write sectors of the card, use `sdmmc_read_sectors()` and `sdmmc_write_sectors()` respectively and pass to it the parameter `card` - a pointer to the card information structure.
4. If the card is not used anymore, call the host driver function - e.g., `sdmmc_host_deinit()` - to disable the host peripheral and free the resources allocated by the driver.

Using API with eMMC Chips

From the protocol layer’s perspective, eMMC memory chips behave exactly like SD memory cards. Even though eMMCs are chips and do not have a card form factor, the terminology for SD cards can still be applied to eMMC due to the similarity of the protocol (`sdmmc_card_t`, `sdmmc_card_init`). Note that eMMC chips cannot be used over SPI, which makes them incompatible with the SD SPI host driver.

To initialize eMMC memory and perform read/write operations, follow the steps listed for SD cards in the previous section.

Using API with SDIO Cards

Initialization and the probing process are the same as with SD memory cards. The only difference is in data transfer commands in SDIO mode.

During the card initialization and probing, performed with `sdmmc_card_init()`, the driver only configures the following registers of the IO card:

1. The IO portion of the card is reset by setting RES bit in the I/O Abort (0x06) register.
2. If 4-line mode is enabled in host and slot configuration, the driver attempts to set the Bus width field in the Bus Interface Control (0x07) register. If setting the filed is successful, which means that the slave supports 4-line mode, the host is also switched to 4-line mode.
3. If high-speed mode is enabled in the host configuration, the SHS bit is set in the High Speed (0x13) register.

In particular, the driver does not set any bits in (1) I/O Enable and Int Enable registers, (2) I/O block sizes, etc. Applications can set them by calling `sdmmc_io_write_byte()`.

For card configuration and data transfer, choose the pair of functions relevant to your case from the table below.

<table>
<thead>
<tr>
<th>Action</th>
<th>Read Function</th>
<th>Write Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read and write a single byte using IO_RW_DIRECT (CMD52)</td>
<td><code>sdmmc_io_read_byte()</code></td>
<td><code>sdmmc_io_write_byte()</code></td>
</tr>
<tr>
<td>Read and write multiple bytes using IO_RW_EXTENDED (CMD53) in byte mode</td>
<td><code>sdmmc_io_read_bytes()</code></td>
<td><code>sdmmc_io_write_bytes()</code></td>
</tr>
<tr>
<td>Read and write blocks of data using IO_RW_EXTENDED (CMD53) in block mode</td>
<td><code>sdmmc_io_read_blocks()</code></td>
<td><code>sdmmc_io_write_blocks()</code></td>
</tr>
</tbody>
</table>

SDIO interrupts can be enabled by the application using the function `sdmmc_io_enable_int()`. When using SDIO in 1-line mode, the D1 line also needs to be connected to use SDIO interrupts.

If you want the application to wait until the SDIO interrupt occurs, use `sdmmc_io_wait_int()`.

There is a component ESSL (ESP Serial Slave Link) to use if you are communicating with an ESP32 SDIO slave. See ESP Serial Slave Link and example peripherals/sdio/host.
API Reference

Header File

- components/sdmmc/include/sdmmc_cmd.h

Functions

```c
esp_err_t sdmmc_card_init (const sdmmc_host_t *host, sdmmc_card_t *out_card)
```

Probe and initialize SD/MMC card using given host

**Note:** Only SD cards (SDSC and SDHC/SDXC) are supported now. Support for MMC/eMMC cards will be added later.

**Parameters**

- `host` - pointer to structure defining host controller
- `out_card` - pointer to structure which will receive information about the card when the function completes

**Returns**

- ESP_OK on success
- One of the error codes from SDMMC host controller

```c
void sdmmc_card_print_info (FILE *stream, const sdmmc_card_t *card)
```

Print information about the card to a stream.

**Parameters**

- `stream` - stream obtained using fopen or fdopen
- `card` - card information structure initialized using sdmmc_card_init

```c
esp_err_t sdmmc_get_status (sdmmc_card_t *card)
```

Get status of SD/MMC card

**Parameters**

- `card` - pointer to card information structure previously initialized using sdmmc_card_init

**Returns**

- ESP_OK on success
- One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_write_sectors (sdmmc_card_t *card, const void *src, size_t start_sector, size_t sector_count)
```

Write given number of sectors to SD/MMC card

**Parameters**

- `card` - pointer to card information structure previously initialized using sdmmc_card_init
- `src` - pointer to data buffer to read data from; data size must be equal to sector_count * card->csd.sector_size
- `start_sector` - sector where to start writing
- `sector_count` - number of sectors to write

**Returns**

- ESP_OK on success or sector_count equal to 0
- One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_read_sectors (sdmmc_card_t *card, void *dst, size_t start_sector, size_t sector_count)
```

Read given number of sectors from the SD/MMC card

**Parameters**

- `card` - pointer to card information structure previously initialized using sdmmc_card_init
- `dst` - pointer to data buffer to write into; buffer size must be at least sector_count * card->csd.sector_size
- `start_sector` - sector where to start reading
**sector_count** - number of sectors to read

**Returns**
- ESP_OK on success or sector_count equal to 0
- One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_erase_sectors (sdmmc_card_t *card, size_t start_sector, size_t sector_count, sdmmc_erase_arg_t arg)
```

Erase given number of sectors from the SD/MMC card

**Note:** When sdmmc_erase_sectors used with cards in SDSPi mode, it was observed that card requires re-init after erase operation.

**Parameters**
- **card** - pointer to card information structure previously initialized using sdmmc_card_init
- **start_sector** - sector where to start erase
- **sector_count** - number of sectors to erase
- **arg** - erase command (CMD38) argument

**Returns**
- ESP_OK on success or sector_count equal to 0
- One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_can_discard (sdmmc_card_t *card)
```

Check if SD/MMC card supports discard

**Parameters**
- **card** - pointer to card information structure previously initialized using sdmmc_card_init

**Returns**
- ESP_OK if supported by the card/device
- ESP_FAIL if not supported by the card/device

```c
esp_err_t sdmmc_can_trim (sdmmc_card_t *card)
```

Check if SD/MMC card supports trim

**Parameters**
- **card** - pointer to card information structure previously initialized using sdmmc_card_init

**Returns**
- ESP_OK if supported by the card/device
- ESP_FAIL if not supported by the card/device

```c
esp_err_t sdmmc_mmc_can_sanitize (sdmmc_card_t *card)
```

Check if SD/MMC card supports sanitize

**Parameters**
- **card** - pointer to card information structure previously initialized using sdmmc_card_init

**Returns**
- ESP_OK if supported by the card/device
- ESP_FAIL if not supported by the card/device

```c
esp_err_t sdmmc_mmc_sanitize (sdmmc_card_t *card, uint32_t timeout_ms)
```

Sanitize the data that was unmapped by a Discard command

**Note:** Discard command has to precede sanitize operation. To discard, use MMC_DICARD_ARG with sdmmc_erase_sectors argument

**Parameters**
- **card** - pointer to card information structure previously initialized using sdmmc_card_init
• `timeout_ms` - timeout value in milliseconds required to sanitize the selected range of sectors.

**Returns**
- ESP_OK on success
- One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_full_erase(sdmmc_card_t *card)
```

Erase complete SD/MMC card

**Parameters**
- `card` - pointer to card information structure previously initialized using `sdmmc_card_init`

**Returns**
- ESP_OK on success
- One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_io_read_byte(sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t *out_byte)
```

Read one byte from an SDIO card using IO_RW_DIRECT (CMD52)

**Parameters**
- `card` - pointer to card information structure previously initialized using `sdmmc_card_init`
- `function` - IO function number
- `reg` - byte address within IO function
- `out_byte` - [out] output, receives the value read from the card

**Returns**
- ESP_OK on success
- One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_io_write_byte(sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t in_byte, uint8_t *out_byte)
```

Write one byte to an SDIO card using IO_RW_DIRECT (CMD52)

**Parameters**
- `card` - pointer to card information structure previously initialized using `sdmmc_card_init`
- `function` - IO function number
- `reg` - byte address within IO function
- `in_byte` - value to be written
- `out_byte` - [out] if not NULL, receives new byte value read from the card (read-after-write).

**Returns**
- ESP_OK on success
- One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_io_read_bytes(sdmmc_card_t *card, uint32_t function, uint32_t addr, void *dst, size_t size)
```

Read multiple bytes from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in byte mode. For block mode, see `sdmmc_io_read_blocks`.

**Parameters**
- `card` - pointer to card information structure previously initialized using `sdmmc_card_init`
- `function` - IO function number
- `addr` - byte address within IO function where reading starts
- `dst` - buffer which receives the data read from card
- `size` - number of bytes to read

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_io_write_bytes(sdmmc_card_t *card, uint32_t function, uint32_t addr, const void *src, size_t size)
```

Submit Document Feedback
Write multiple bytes to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in byte mode. For block mode, see sdmmc_io_write_blocks.

**Parameters**
- `card` - pointer to card information structure previously initialized using sdmmc_card_init
- `function` - IO function number
- `addr` - byte address within IO function where writing starts
- `src` - data to be written
- `size` - number of bytes to write

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

`esp_err_t sdmmc_io_read_blocks (sdmmc_card_t *card, uint32_t function, uint32_t addr, void *dst, size_t size)`

Read blocks of data from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in block mode. For byte mode, see sdmmc_io_read_bytes.

**Parameters**
- `card` - pointer to card information structure previously initialized using sdmmc_card_init
- `function` - IO function number
- `addr` - byte address within IO function where writing starts
- `dst` - buffer which receives the data read from card
- `size` - number of bytes to read, must be divisible by the card block size.

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

`esp_err_t sdmmc_io_write_blocks (sdmmc_card_t *card, uint32_t function, uint32_t addr, const void *src, size_t size)`

Write blocks of data to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in block mode. For byte mode, see sdmmc_io_write_bytes.

**Parameters**
- `card` - pointer to card information structure previously initialized using sdmmc_card_init
- `function` - IO function number
- `addr` - byte address within IO function where writing starts
- `src` - data to be written
- `size` - number of bytes to read, must be divisible by the card block size.

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

`esp_err_t sdmmc_io_enable_int (sdmmc_card_t *card)`

Enable SDIO interrupt in the SDMMC host

**Parameters**
- `card` - pointer to card information structure previously initialized using sdmmc_card_init

**Returns**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts
**esp_err_t sdmmc io_wait_int (sdmmc_card_t *card, TickType_t timeout_ticks)**

Block until an SDIO interrupt is received

Slave uses D1 line to signal interrupt condition to the host. This function can be used to wait for the interrupt.

**Parameters**
- **card**: pointer to card information structure previously initialized using sdmmc_card_init
- **timeout_ticks**: time to wait for the interrupt, in RTOS ticks

**Returns**
- ESP_OK if the interrupt is received
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts
- ESP_ERR_TIMEOUT if the interrupt does not happen in timeout_ticks

**esp_err_t sdmmc io_get_cis_data (sdmmc_card_t *card, uint8_t *out_buffer, size_t buffer_size, size_t *inout_cis_size)**

Get the data of CIS region of an SDIO card.

You may provide a buffer not sufficient to store all the CIS data. In this case, this function stores as much data into your buffer as possible. Also, this function will try to get and return the size required for you.

**Parameters**
- **card**: pointer to card information structure previously initialized using sdmmc_card_init
- **out_buffer**: Output buffer of the CIS data
- **buffer_size**: Size of the buffer.
- **inout_cis_size**: Mandatory, pointer to a size, input and output.
  - **input**: Limitation of maximum searching range, should be 0 or larger than buffer_size. The function searches for CIS_CODE_END until this range. Set to 0 to search infinitely.
  - **output**: The size required to store all the CIS data, if CIS_CODE_END is found.

**Returns**
- ESP_OK: on success
- ESP_ERR_INVALID_RESPONSE: if the card does not (correctly) support CIS.
- ESP_ERR_INVALID_SIZE: CIS_CODE_END found, but buffer_size is less than required size, which is stored in the inout_cis_size then.
- ESP_ERR_NOT_FOUND: if the CIS_CODE_END not found. Increase input value of inout_cis_size or set it to 0, if you still want to search for the end; output value of inout_cis_size is invalid in this case.
- and other error code return from sdmmc io_read_bytes

**esp_err_t sdmmc io_print_cis_info (uint8_t *buffer, size_t buffer_size, FILE *fp)**

Parse and print the CIS information of an SDIO card.

**Parameters**
- **buffer**: Buffer to parse
- **buffer_size**: Size of the buffer.
- **fp**: File pointer to print to, set to NULL to print to stdout.

**Returns**
- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: if the value from the card is not supported to be parsed.
- ESP_ERR_INVALID_SIZE: if the CIS size fields are not correct.

---

**Note:** Not all the CIS codes and all kinds of tuples are supported. If you see some unresolved code, you can add the parsing of these code in sdmmc io.c and contribute to the IDF through the Github repository.

```c
esp_err_t (*set_bus_ddr_mode)(int slot, bool ddr_enable)

host function to set DDR mode

esp_err_t (*set_card_clk)(int slot, uint32_t freq_khz)

host function to set card clock frequency

esp_err_t (*set_cclk_always_on)(int slot, bool cclk_always_on)

host function to set whether the clock is always enabled

esp_err_t (*do_transaction)(int slot, sdmmc_command_t *cmdinfo)

host function to do a transaction

esp_err_t (*deinit)(void)

host function to deinitialize the driver

esp_err_t (*deinit_p)(int slot)

host function to deinitialize the driver, called with the slot

esp_err_t (*io_int_enable)(int slot)

Host function to enable SDIO interrupt line

esp_err_t (*io_int_wait)(int slot, TickType_t timeout_ticks)

Host function to wait for SDIO interrupt line to be active

int command_timeout_ms

timeout, in milliseconds, of a single command. Set to 0 to use the default value.

esp_err_t (*get_real_freq)(int slot, int *real_freq)

Host function to provide real working freq, based on SDMMC controller setup

sdmmc_delay_phase_t input_delay_phase

input delay phase, this will only take into effect when the host works in SDMMC_FREQ_HIGHSPEED
or SDMMC_FREQ_52M. Driver will print out how long the delay is

esp_err_t (*set_input_delay)(int slot, sdmmc_delay_phase_t delay_phase)

set input delay phase

struct sdmmc_card_t

SD/MMC card information structure

Public Members

sdmmc_host_t host

Host with which the card is associated

uint32_t ocr

OCR (Operation Conditions Register) value
**sdmmc_cid_t cid**

decoded CID (Card IDentification) register value

**sdmmc_response_t raw_cid**

raw CID of MMC card to be decoded after the CSD is fetched in the data transfer mode

**sdmmc_csd_t csd**

decoded CSD (Card-Specific Data) register value

**sdmmc_scr_t scr**

decoded SCR (SD card Configuration Register) value

**sdmmc_ssr_t ssr**

decoded SSR (SD Status Register) value

**sdmmc_ext_csd_t ext_csd**

decoded EXT_CSD (Extended Card Specific Data) register value

uint16_t rca

RCA (Relative Card Address)

uint16_t max_freq_khz

Maximum frequency, in kHz, supported by the card

int real_freq_khz

Real working frequency, in kHz, configured on the host controller

uint32_t is_mem

Bit indicates if the card is a memory card

uint32_t is_sdio

Bit indicates if the card is an IO card

uint32_t is_mmc

Bit indicates if the card is MMC

uint32_t num_io_functions

If is_sdio is 1, contains the number of IO functions on the card

uint32_t log_bus_width

log2(bus width supported by card)

uint32_t is_ddr

Card supports DDR mode

uint32_t reserved

Reserved for future expansion

Macros

```c
#define SDMMC_HOST_FLAG_1BIT host supports 1-line SD and MMC protocol
#define SDMMC_HOST_FLAG_4BIT host supports 4-line SD and MMC protocol
#define SDMMC_HOST_FLAG_8BIT host supports 8-line MMC protocol
#define SDMMC_HOST_FLAG_SPI host supports SPI protocol
#define SDMMC_HOST_FLAG_DDR host supports DDR mode for SD/MMC
#define SDMMC_HOST_FLAG_DEINIT_ARG host `deinit` function called with the slot argument
```

```c
#define SDMMC_FREQ_DEFAULT SD/MMC Default speed (limited by clock divider)
#define SDMMC_FREQ_HIGHSPEED SD High speed (limited by clock divider)
#define SDMMC_FREQ_PROBING SD/MMC probing speed
#define SDMMC_FREQ_52M MMC 52MHz speed
#define SDMMC_FREQ_26M MMC 26MHz speed
```

Type Definitions

typedef uint32_t `sdmmc_response_t[4]`
SD/MMC command response buffer

Enumerations

```c
enum `sdmmc_delay_phase_t`
SD/MMC Host clock timing delay phases
This will only take effect when the host works in SDMMC_FREQ_HIGHSPEED or SDMMC_FREQ_52M.
Driver will print out how long the delay is, in picosecond (ps).
Values:

enumerator `SDMMC_DELAY_PHASE_0`
Delay phase 0
```
Chapter 2. API Reference

enumerator **SDMMC_DELAY_PHASE_1**
    Delay phase 1

enumerator **SDMMC_DELAY_PHASE_2**
    Delay phase 2

enumerator **SDMMC_DELAY_PHASE_3**
    Delay phase 3

enum **sdmmc_erase_arg_t**

SD/MMC erase command(38) arguments

SD: ERASE: Erase the write blocks, physical/hard erase.

DISCARD: Card may deallocate the discarded blocks partially or completely. After discard operation the previously written data may be partially or fully read by the host depending on card implementation.

MMC: ERASE: Does TRIM, applies erase operation to write blocks instead of Erase Group.

DISCARD: The Discard function allows the host to identify data that is no longer required so that the device can erase the data if necessary during background erase events. Applies to write blocks instead of Erase Group. After discard operation, the original data may be remained partially or fully accessible to the host dependent on device.

Values:

enumerator **SDMMC_ERASE_ARG**
    Erase operation on SD, Trim operation on MMC

enumerator **SDMMC_DISCARD_ARG**
    Discard operation for SD/MMC

2.9.8 Partitions API

Overview

The **esp_partition** component has higher-level API functions which work with partitions defined in the **partition table**. These APIs are based on lower level API provided by **SPI Flash driver**.

Partition Table API

ESP-IDF projects use a partition table to maintain information about various regions of SPI flash memory (bootloader, various application binaries, data, filesystems). More information can be found in **Partition Tables**.

This component provides API functions to enumerate partitions found in the partition table and perform operations on them. These functions are declared in **esp_partition.h**:

- **esp_partition_find()** checks a partition table for entries with specific type, returns an opaque iterator.
- **esp_partition_get()** returns a structure describing the partition for a given iterator.
- **esp_partition_next()** shifts the iterator to the next found partition.
- **esp_partition_iterator_release()** releases iterator returned by **esp_partition_find()**.
- **esp_partition_find_first()** is a convenience function which returns the structure describing the first partition found by **esp_partition_find()**.
- **esp_partition_read(), esp_partition_write(), esp_partition_erase_range()** are equivalent to **esp_flash_read(), esp_flash_write(), esp_flash_erase_region()**, but operate within partition boundaries.

API Reference - Partition Table

Header File

- components/esp_partition/include/esp_partition.h

Functions

```c
esp_partition_iterator_t esp_partition_find(esp_partition_type_t type, esp_partition_subtype_t subtype, const char *label)
```

Find partition based on one or more parameters.

**Parameters**

- `type` - Partition type, one of esp_partition_type_t values or an 8-bit unsigned integer. To find all partitions, no matter the type, use ESP_PARTITION_TYPE_ANY, and set subtype argument to ESP_PARTITION_SUBTYPE_ANY.
- `subtype` - Partition subtype, one of esp_partition_subtype_t values or an 8-bit unsigned integer. To find all partitions of given type, use ESP_PARTITION_SUBTYPE_ANY.
- `label` - (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

**Returns** iterator which can be used to enumerate all the partitions found, or NULL if no partitions were found. Iterator obtained through this function has to be released using esp_partition_iterator_release when not used any more.

```c
const esp_partition_t *esp_partition_find_first(esp_partition_type_t type, esp_partition_subtype_t subtype, const char *label)
```

Find first partition based on one or more parameters.

**Parameters**

- `type` - Partition type, one of esp_partition_type_t values or an 8-bit unsigned integer. To find all partitions, no matter the type, use ESP_PARTITION_TYPE_ANY, and set subtype argument to ESP_PARTITION_SUBTYPE_ANY.
- `subtype` - Partition subtype, one of esp_partition_subtype_t values or an 8-bit unsigned integer. To find all partitions of given type, use ESP_PARTITION_SUBTYPE_ANY.
- `label` - (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

**Returns** pointer to esp_partition_t structure, or NULL if no partition is found. This pointer is valid for the lifetime of the application.

```c
const esp_partition_t *esp_partition_get(esp_partition_iterator_t iterator)
```

Get esp_partition_t structure for given partition.

**Parameters** `iterator` - Iterator obtained using esp_partition_find. Must be non-NULL.

**Returns** pointer to esp_partition_t structure. This pointer is valid for the lifetime of the application.

```c
esp_partition_iterator_t esp_partition_next(esp_partition_iterator_t iterator)
```

Move partition iterator to the next partition found.

Any copies of the iterator will be invalid after this call.

**Parameters** `iterator` - Iterator obtained using esp_partition_find. Must be non-NULL.

**Returns** NULL if no partition was found, valid esp_partition_iterator_t otherwise.

```c
void esp_partition_iterator_release(esp_partition_iterator_t iterator)
```

Release partition iterator.
Parameters **iterator** – Iterator obtained using esp_partition_find. The iterator is allowed to be NULL, so it is not necessary to check its value before calling this function.

```c
const esp_partition_t *esp_partition_verify(const esp_partition_t *partition)
```

Verify partition data.

Given a pointer to partition data, verify this partition exists in the partition table (all fields match.)

This function is also useful to take partition data which may be in a RAM buffer and convert it to a pointer to the permanent partition data stored in flash.

Pointers returned from this function can be compared directly to the address of any pointer returned from esp_partition_get(), as a test for equality.

Parameters **partition** – Pointer to partition data to verify. Must be non-NULL. All fields of this structure must match the partition table entry in flash for this function to return a successful match.

Returns
- If partition not found, returns NULL.
- If found, returns a pointer to the esp_partition_t structure in flash. This pointer is always valid for the lifetime of the application.

```c
esp_err_t esp_partition_read(const esp_partition_t *partition, size_t src_offset, void *dst, size_t size)
```

Read data from the partition.

Partitions marked with an encryption flag will automatically be be read and decrypted via a cache mapping.

Parameters
- **partition** – Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- **dst** – Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- **src_offset** – Address of the data to be read, relative to the beginning of the partition.
- **size** – Size of data to be read, in bytes.

Returns ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if src_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

```c
esp_err_t esp_partition_write(const esp_partition_t *partition, size_t dst_offset, const void *src, size_t size)
```

Write data to the partition.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using esp_partition_erase_range function.

Partitions marked with an encryption flag will automatically be written via the esp_flash_write_encrypted() function. If writing to an encrypted partition, all write offsets and lengths must be multiples of 16 bytes. See the esp_flash_write_encrypted() function for more details. Unencrypted partitions do not have this restriction.

Note: Prior to writing to flash memory, make sure it has been erased with esp_partition_erase_range call.

Parameters
- **partition** – Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- **dst_offset** – Address where the data should be written, relative to the beginning of the partition.
- **src** – Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- **size** – Size of data to be written, in bytes.
Returns ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; or one of error codes from lower-level flash driver.

```c
esp_err_t esp_partition_read_raw(const esp_partition_t *partition, size_t src_offset, void *dst, size_t size)
```

Read data from the partition without any transformation/decryption.

**Note:** This function is essentially the same as `esp_partition_read()` above. It just never decrypts data but returns it as is.

**Parameters**
- `partition` – Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- `dst` – Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least `size` bytes long.
- `src_offset` – Address of the data to be read, relative to the beginning of the partition.
- `size` – Size of data to be read, in bytes.

**Returns** ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if src_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

```c
esp_err_t esp_partition_write_raw(const esp_partition_t *partition, size_t dst_offset, const void *src, size_t size)
```

Write data to the partition without any transformation/encryption.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `esp_partition_erase_range` function.

**Note:** This function is essentially the same as `esp_partition_write()` above. It just never encrypts data but writes it as is.

**Note:** Prior to writing to flash memory, make sure it has been erased with `esp_partition_erase_range` call.

**Parameters**
- `partition` – Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- `dst_offset` – Address where the data should be written, relative to the beginning of the partition.
- `src` – Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least `size` bytes long.
- `size` – Size of data to be written, in bytes.

**Returns** ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; or one of the error codes from lower-level flash driver.

```c
esp_err_t esp_partition_erase_range(const esp_partition_t *partition, size_t offset, size_t size)
```

Erase part of the partition.

**Parameters**
- `partition` – Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
• offset - Offset from the beginning of partition where erase operation should start. Must be aligned to partition->erase_size.
• size - Size of the range which should be erased, in bytes. Must be divisible by partition->erase_size.

Returns ESP_OK, if the range was erased successfully; ESP_ERR_INVALID_ARG, if iterator or dst are NULL; ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition; or one of error codes from lower-level flash driver.

```c
esp_err_t esp_partition_mmap( const esp_partition_t *partition, size_t offset, size_t size,
                           esp_partition_mmap_memory_t memory, const void **out_ptr,
                           esp_partition_mmap_handle_t *out_handle)
```

Configure MMU to map partition into data memory.

Unlike spi_flash_mmap function, which requires a 64kB aligned base address, this function doesn’t impose such a requirement. If offset results in a flash address which is not aligned to 64kB boundary, address will be rounded to the lower 64kB boundary, so that mapped region includes requested range. Pointer returned via out_ptr argument will be adjusted to point to the requested offset (not necessarily to the beginning of mmap-ed region).

To release mapped memory, pass handle returned via out_handle argument to esp_partition_munmap function.

Parameters
• partition - Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
• offset - Offset from the beginning of partition where mapping should start.
• size - Size of the area to be mapped.
• memory - Memory space where the region should be mapped
• out_ptr - Output, pointer to the mapped memory region
• out_handle - Output, handle which should be used for esp_partition_munmap call

Returns ESP_OK, if successful

```c
void esp_partition_munmap( esp_partition_mmap_handle_t handle)
```

Release region previously obtained using esp_partition_mmap.

Note: Calling this function will not necessarily unmap memory region. Region will only be unmapped when there are no other handles which reference this region. In case of partially overlapping regions it is possible that memory will be unmapped partially.

Parameters handle - Handle obtained from spi_flash_mmap

```c
esp_err_t esp_partition_get_sha256( const esp_partition_t *partition, uint8_t *sha_256)
```

Get SHA-256 digest for required partition.

For apps with SHA-256 appended to the app image, the result is the appended SHA-256 value for the app image content. The hash is verified before returning, if app content is invalid then the function returns ESP_ERR_IMAGE_INVALID. For apps without SHA-256 appended to the image, the result is the SHA-256 of all bytes in the app image. For other partition types, the result is the SHA-256 of the entire partition.

Parameters
• partition - [in] Pointer to info for partition containing app or data. (fields: address, size and type, are required to be filled).
• sha_256 - [out] Returned SHA-256 digest for a given partition.

Returns
• ESP_OK: In case of successful operation.
• ESP_ERR_INVALID_ARG: The size was 0 or the sha_256 was NULL.
• ESP_ERR_NO_MEM: Cannot allocate memory for sha256 operation.
• ESP_ERR_IMAGE_INVALID: App partition doesn’t contain a valid app image.
• ESP_FAIL: An allocation error occurred.
bool esp_partition_check_identity (const esp_partition_t *partition_1, const esp_partition_t *partition_2)

Check for the identity of two partitions by SHA-256 digest.

Parameters
- **partition_1** – [in] Pointer to info for partition 1 containing app or data. (fields: address, size, and type, are required to be filled).
- **partition_2** – [in] Pointer to info for partition 2 containing app or data. (fields: address, size, and type, are required to be filled).

Returns
- True: In case of the two firmware is equal.
- False: Otherwise

```c
esp_err_t esp_partition_register_external (esp_flash_t *flash_chip, size_t offset, size_t size, const char *label, esp_partition_type_t type, esp_partition_subtype_t subtype, const esp_partition_t **out_partition)
```

Register a partition on an external flash chip.

This API allows designating certain areas of external flash chips (identified by the esp_flash_t structure) as partitions. This allows using them with components which access SPI flash through the esp_partition API.

Parameters
- **flash_chip** – Pointer to the structure identifying the flash chip
- **offset** – Address in bytes, where the partition starts
- **size** – Size of the partition in bytes
- **label** – Partition name
- **type** – One of the partition types (ESP_PARTITION_TYPE_*), or an integer. Note that applications can not be booted from external flash chips, so using ESP_PARTITION_TYPE_APP is not supported.
- **subtype** – One of the partition subtypes (ESP_PARTITION_SUBTYPE_*), or an integer.
- **out_partition** – [out] Output, if non-NULL, receives the pointer to the resulting esp_partition_t structure

Returns
- ESP_OK on success
- ESP_ERR_NO_MEM if memory allocation has failed
- ESP_ERR_INVALID_ARG if the new partition overlaps another partition on the same flash chip
- ESP_ERR_INVALID_SIZE if the partition doesn’t fit into the flash chip size

```c
esp_err_t esp_partition_deregister_external (const esp_partition_t *partition)
```

Deregister the partition previously registered using esp_partition_register_external.

Parameters **partition** – pointer to the partition structure obtained from esp_partition_register_external,

Returns
- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition pointer is not found
- ESP_ERR_INVALID_ARG if the partition comes from the partition table
- ESP_ERR_INVALID_ARG if the partition was not registered using esp_partition_register_external function.

**Structures**

```c
struct esp_partition_t
```

partition information structure

This is not the format in flash, that format is esp_partition_info_t.

However, this is the format used by this API.
Public Members

`esp_flash_t *flash_chip`
SPI flash chip on which the partition resides

`esp_partition_type_t type`
partition type (app/data)

`esp_partition_subtype_t subtype`
partition subtype

`uint32_t address`
starting address of the partition in flash

`uint32_t size`
size of the partition, in bytes

`uint32_t erase_size`
size the erase operation should be aligned to

`char label[17]`
partition label, zero-terminated ASCII string

`bool encrypted`
flag is set to true if partition is encrypted

Macros

`ESP_PARTITION_SUBTYPE OTA (i)`
Convenience macro to get esp_partition_subtype_t value for the i-th OTA partition.

Type Definitions

typedef `uint32_t esp_partition_mmap_handle_t`
Opaque handle for memory region obtained from esp_partition_mmap.

typedef struct esp_partition_iterator_opaque_ * `esp_partition_iterator_t`
Opaque partition iterator type.

Enumerations

enum `esp_partition_mmap_memory_t`
Enumeration which specifies memory space requested in an mmap call.

Values:

enumerator `ESP_PARTITION_MMAP_DATA`
map to data memory (Vaddr0), allows byte-aligned access, 4 MB total

enumerator `ESP_PARTITION_MMAP_INST`
map to instruction memory (Vaddr1-3), allows only 4-byte-aligned access, 11 MB total
Chapter 2. API Reference

enum **esp_partition_type_t**
Partition type.

**Note:** Partition types with integer value 0x00-0x3F are reserved for partition types defined by ESP-IDF. Any other integer value 0x40-0xFE can be used by individual applications, without restriction.

**Values:**

enumerator **ESP_PARTITION_TYPE_APP**
Application partition type.

enumerator **ESP_PARTITION_TYPE_DATA**
Data partition type.

enumerator **ESP_PARTITION_TYPE_ANY**
Used to search for partitions with any type.

enum **esp_partition_subtype_t**
Partition subtype.

Application-defined partition types (0x40-0xFE) can set any numeric subtype value.

**Note:** These ESP-IDF-defined partition subtypes apply to partitions of type ESP_PARTITION_TYPE_APP and ESP_PARTITION_TYPE_DATA.

**Values:**

enumerator **ESP_PARTITION_SUBTYPE_APP_FACTORY**
Factory application partition.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_MIN**
Base for OTA partition subtypes.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_0**
OTA partition 0.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_1**
OTA partition 1.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_2**
OTA partition 2.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_3**
OTA partition 3.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_4**
OTA partition 4.
enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_5**
OTA partition 5.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_6**
OTA partition 6.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_7**
OTA partition 7.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_8**
OTA partition 8.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_9**
OTA partition 9.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_10**
OTA partition 10.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_11**
OTA partition 11.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_12**
OTA partition 12.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_13**
OTA partition 13.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_14**
OTA partition 14.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_15**
OTA partition 15.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_MAX**
Max subtype of OTA partition.

enumerator **ESP_PARTITION_SUBTYPE_APP_TEST**
Test application partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_OTA**
OTA selection partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_PHY**
PHY init data partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_NVS**
NVS partition.
enumerator **ESP_PARTITION_SUBTYPE_DATA_COREDUMP**
COREDUMP partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_NVS_KEYS**
Partition for NVS keys.

enumerator **ESP_PARTITION_SUBTYPE_DATA_EFUSE_EM**
Partition for emulate eFuse bits.

enumerator **ESP_PARTITION_SUBTYPE_DATA_UNDEFINED**
Undefined (or unspecified) data partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_ESPHTTPD**
ESPHTTPD partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_FAT**
FAT partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_SPIFFS**
SPIFFS partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_LITTLEFS**
LITTLEFS partition.

enumerator **ESP_PARTITION_SUBTYPE_ANY**
Used to search for partitions with any subtype.

### 2.9.9 SPIFFS Filesystem

**Overview**

SPIFFS is a file system intended for SPI NOR flash devices on embedded targets. It supports wear levelling, file system consistency checks, and more.

**Notes**

- Currently, SPIFFS does not support directories, it produces a flat structure. If SPIFFS is mounted under /spiffs, then creating a file with the path /spiffs/tmp/myfile.txt will create a file called /tmp/myfile.txt in SPIFFS, instead of myfile.txt in the directory /spiffs/tmp.
- It is not a real-time stack. One write operation might take much longer than another.
- For now, it does not detect or handle bad blocks.
- SPIFFS is able to reliably utilize only around 75% of assigned partition space.
- When the filesystem is running out of space, the garbage collector is trying to find free space by scanning the filesystem multiple times, which can take up to several seconds per write function call, depending on required space. This is caused by the SPIFFS design and the issue has been reported multiple times (e.g., [here](https://github.com/espressif/spiffs)) and in the official SPIFFS github repository. The issue can be partially mitigated by the SPIFFS configuration.
- Deleting a file does not always remove the whole file, which leaves unusable sections throughout the filesystem.
When the chip experiences a power loss during a file system operation it could result in SPIFFS corruption. However the file system still might be recovered via `esp_spiffs_check` function. More details in the official SPIFFS FAQ.

### Tools

**spiffsgen.py**  
`spiffsgen.py` is a write-only Python SPIFFS implementation used to create filesystem images from the contents of a host folder. To use `spiffsgen.py`, open Terminal and run:

```bash
python spiffsgen.py <image_size> <base_dir> <output_file>
```

The required arguments are as follows:

- **image_size**: size of the partition onto which the created SPIFFS image will be flashed.
- **base_dir**: directory for which the SPIFFS image needs to be created.
- **output_file**: SPIFFS image output file.

There are also other arguments that control image generation. Documentation on these arguments can be found in the tool’s help:

```bash
python spiffsgen.py --help
```

These optional arguments correspond to a possible SPIFFS build configuration. To generate the right image, please make sure that you use the same arguments/configuration as were used to build SPIFFS. As a guide, the help output indicates the SPIFFS build configuration to which the argument corresponds. In cases when these arguments are not specified, the default values shown in the help output will be used.

When the image is created, it can be flashed using `esptool.py` or `parttool.py`.

Aside from invoking the `spiffsgen.py` standalone by manually running it from the command line or a script, it is also possible to invoke `spiffsgen.py` directly from the build system by calling `spiffs_create_partition_image`:

```bash
spiffs_create_partition_image(<partition> <base_dir> [FLASH_IN_PROJECT] [DEPENDS...
  <-dep dep dep...])
```

This is more convenient as the build configuration is automatically passed to the tool, ensuring that the generated image is valid for that build. An example of this is while the **image_size** is required for the standalone invocation, only the **partition** name is required when using `spiffs_create_partition_image` - the image size is automatically obtained from the project’s partition table.

`spiffs_create_partition_image` must be called from one of the component CMakeLists.txt files. Optionally, users can opt to have the image automatically flashed together with the app binaries, partition tables, etc. on `idf.py flash` by specifying `FLASH_IN_PROJECT`. For example:

```bash
spiffs_create_partition_image(my_spiffs_partition my_folder FLASH_IN_PROJECT)
```

If `FLASH_IN_PROJECT/SPIFFS_IMAGE_FLASH_IN_PROJECT` is not specified, the image will still be generated, but you will have to flash it manually using `esptool.py`, `parttool.py`, or a custom build system target.

There are cases where the contents of the base directory itself is generated at build time. Users can use `DEPENDS/SPIFFS_IMAGE_DEPENDS` to specify targets that should be executed before generating the image:

```bash
add_custom_target(dep COMMAND ...)
spiffs_create_partition_image(my_spiffs_partition my_folder DEPENDS dep)
```

For an example, see `storage/spiffsgen`.

---

**Chapter 2. API Reference**
Markspiffs  Another tool for creating SPIFFS partition images is markspiffs. Similar to spiffsgen.py, it can be used to create an image from a given folder and then flash that image using esptool.py.

For that, you need to obtain the following parameters:

- **Block Size**: 4096 (standard for SPI Flash)
- **Page Size**: 256 (standard for SPI Flash)
- **Image Size**: Size of the partition in bytes (can be obtained from a partition table)
- **Partition Offset**: Starting address of the partition (can be obtained from a partition table)

To pack a folder into a 1-Megabyte image, run:

```bash
markspiffs -c [src_folder] -b 4096 -p 256 -s 0x100000 spiffs.bin
```

To flash the image onto ESP32 at offset 0x110000, run:

```bash
python esptool.py --chip esp32 --port [port] --baud [baud] write_flash -z 0x110000- spiffs.bin
```

Notes on Which SPIFFS Tool to Use  The two tools presented above offer very similar functionality. However, there are reasons to prefer one over the other, depending on the use case.

Use spiffsgen.py in the following cases:

1. If you want to simply generate a SPIFFS image during the build. spiffsgen.py makes it very convenient by providing functions/commands from the build system itself.
2. If the host has no C/C++ compiler available, because spiffsgen.py does not require compilation.

Use markspiffs in the following cases:

1. If you need to unpack SPIFFS images in addition to image generation. For now, it is not possible with spiffsgen.py.
2. If you have an environment where a Python interpreter is not available, but a host compiler is available. Otherwise, a pre-compiled markspiffs binary can do the job. However, there is no build system integration for markspiffs and the user has to do the corresponding work: compiling markspiffs during build (if a pre-compiled binary is not used), creating build rules/targets for the output files, passing proper parameters to the tool, etc.

- **Partition Table documentation**

Application Example

An example of using SPIFFS is provided in the storage/spiffs directory. This example initializes and mounts a SPIFFS partition, then writes and reads data from it using POSIX and C library APIs. See the README.md file in the example directory for more information.

High-level API Reference

**Header File**

- components/spiffs/include/spiffs.h

**Functions**
**esp_err_t** esp_vfs_spiffs_register(const esp_vfs_spiffs_conf_t *conf)

Register and mount SPIFFS to VFS with given path prefix.

**Parameters**
conf – Pointer to esp_vfs_spiffs_conf_t configuration structure

**Returns**
- ESP_OK if success
- ESP_ERR_NO_MEM if objects could not be allocated
- ESP_ERR_INVALID_STATE if already mounted or partition is encrypted
- ESP_ERR_NOT_FOUND if partition for SPIFFS was not found
- ESP_FAIL if mount or format fails

**esp_err_t** esp_vfs_spiffs_unregister(const char* partition_label)

Unregister and unmount SPIFFS from VFS

**Parameters**
partition_label – Same label as passed to esp_vfs_spiffs_register.

**Returns**
- ESP_OK if successful
- ESP_ERR_INVALID_STATE already unregistered

**bool** esp_spiffs_mounted(const char* partition_label)

Check if SPIFFS is mounted

**Parameters**
partition_label – Optional, label of the partition to check. If not specified, first partition with subtype=spiffs is used.

**Returns**
- true if mounted
- false if not mounted

**esp_err_t** esp_vfs_spiffs_format(const char* partition_label)

Format the SPIFFS partition

**Parameters**
partition_label – Same label as passed to esp_vfs_spiffs_register.

**Returns**
- ESP_OK if successful
- ESP_FAIL on error

**esp_err_t** esp_vfs_spiffs_info(const char* partition_label, size_t* total_bytes, size_t* used_bytes)

Get information for SPIFFS

**Parameters**
- partition_label – Same label as passed to esp_vfs_spiffs_register
- total_bytes – [out] Size of the file system
- used_bytes – [out] Current used bytes in the file system

**Returns**
- ESP_OK if success
- ESP_ERR_INVALID_STATE if not mounted

**esp_err_t** esp_vfs_spiffs_check(const char* partition_label)

Check integrity of SPIFFS

**Parameters**
partition_label – Same label as passed to esp_vfs_spiffs_register

**Returns**
- ESP_OK if successful
- ESP_ERR_INVALID_STATE if not mounted
- ESP_FAIL on error

**esp_err_t** esp_vfs_spiffs_gc(const char* partition_label, size_t size_to_gc)

Perform garbage collection in SPIFFS partition.

Call this function to run GC and ensure that at least the given amount of space is available in the partition. This function will fail with ESP_ERR_NOT_FINISHED if it is not possible to reclaim the requested space (that is, not enough free or deleted pages in the filesystem). This function will also fail if it fails to reclaim the requested space after CONFIG_SPIFFS_GC_MAX_RUNS number of GC iterations. On one GC iteration, SPIFFS will
erase one logical block (4kB). Therefore the value of CONFIG_SPIFFS_GC_MAX_RUNS should be set at least to the maximum expected size_to_gc, divided by 4096. For example, if the application expects to make room for a 1MB file and calls esp_spiffs_gc(label, 1024 * 1024), CONFIG_SPIFFS_GC_MAX_RUNS should be set to at least 256. On the other hand, increasing CONFIG_SPIFFS_GC_MAX_RUNS value increases the maximum amount of time for which any SPIFFS GC or write operation may potentially block.

Parameters
- **partition_label** – Label of the partition to be garbage-collected. The partition must be already mounted.
- **size_to_gc** – The number of bytes that the GC process should attempt to make available.

Returns
- ESP_OK on success
- ESP_ERR_NOT_FINISHED if GC fails to reclaim the size given by size_to_gc
- ESP_ERR_INVALID_STATE if the partition is not mounted
- ESP_FAIL on all other errors

Structures

```c
struct esp_vfs_spiffs_conf_t
```

Configuration structure for esp_vfs_spiffs_register.

Public Members

- const char *`base_path`
  File path prefix associated with the filesystem.
- const char *`partition_label`
  Optional, label of SPIFFS partition to use. If set to NULL, first partition with subtype=spiffs will be used.
- size_t `max_files`
  Maximum files that could be open at the same time.
- bool `format_if_mount_failed`
  If true, it will format the file system if it fails to mount.

2.9.10 Virtual Filesystem Component

Overview

Virtual filesystem (VFS) component provides a unified interface for drivers which can perform operations on file-like objects. These can be real filesystems (FAT, SPIFFS, etc.) or device drivers which provide a file-like interface.

This component allows C library functions, such as fopen and fprintf, to work with FS drivers. At a high level, each FS driver is associated with some path prefix. When one of C library functions needs to open a file, the VFS component searches for the FS driver associated with the file path and forwards the call to that driver. VFS also forwards read, write, and other calls for the given file to the same FS driver.

For example, one can register a FAT filesystem driver with the `/fat` prefix and call fopen("/fat/file.txt", "w"). Then the VFS component calls the function open of the FAT driver and pass the argument `/file.txt` to
it together with appropriate mode flags. All subsequent calls to C library functions for the returned FILE* stream will also be forwarded to the FAT driver.

**FS Registration**

To register an FS driver, an application needs to define an instance of the \texttt{esp vfs t} structure and populate it with function pointers to FS APIs:

```c
esp vfs t myfs = {
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
    .open = &myfs_open,
    .fstat = &myfs_fstat,
    .close = &myfs_close,
    .read = &myfs_read,
};
ESP_ERROR_CHECK(esp vfs_register("/data", &myfs, NULL));
```

Depending on the way the FS driver declares its API functions, either \texttt{read}, \texttt{write}, etc., or \texttt{read p}, \texttt{write p}, etc., should be used.

**Case 1:** API functions are declared without an extra context pointer (the FS driver is a singleton):

```c
ssize_t myfs_write(int fd, const void * data, size_t size);
// In definition of esp vfs t:
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
// ... other members initialized
// When registering FS, context pointer (third argument) is NULL:
ESP_ERROR_CHECK(esp vfs_register("/data", &myfs, NULL));
```

**Case 2:** API functions are declared with an extra context pointer (the FS driver supports multiple instances):

```c
ssize_t myfs_write(myfs t * fs, int fd, const void * data, size_t size);
// In definition of esp vfs t:
    .flags = ESP_VFS_FLAG_CONTEXT_PTR,
    .write p = &myfs_write,
// ... other members initialized
// When registering FS, pass the FS context pointer into the third argument
// (hypothetical myfs_mount function is used for illustrative purposes)
myfs t * myfs inst1 = myfs mount(partition1->offset, partition1->size);     
ESP_ERROR_CHECK(esp vfs_register("/data1", &myfs, myfs inst1));
// Can register another instance:
myfs t * myfs inst2 = myfs mount(partition2->offset, partition2->size);     
ESP_ERROR_CHECK(esp vfs_register("/data2", &myfs, myfs inst2));
```

**Synchronous Input/Output Multiplexing** Synchronous input/output multiplexing by \texttt{select()} is supported in the VFS component. The implementation works in the following way.

1. \texttt{select()} is called with file descriptors which could belong to various VFS drivers.
2. The file descriptors are divided into groups each belonging to one VFS driver.
3. The file descriptors belonging to non-socket VFS drivers are handed over to the given VFS drivers by \texttt{start_select()}, described later on this page. This function represents the driver-specific implementation of \texttt{select()} for the given driver. This should be a non-blocking call which means the function should immediately return after setting up the environment for checking events related to the given file descriptors.
4. The file descriptors belonging to the socket VFS driver are handed over to the socket driver by `socket_select()` described later on this page. This is a blocking call which means that it will return only if there is an event related to socket file descriptors or a non-socket driver signals `socket_select()` to exit.

5. Results are collected from each VFS driver and all drivers are stopped by de-initialization of the environment for checking events.

6. The `select()` call ends and returns the appropriate results.

Non-Socket VFS Drivers  If you want to use `select()` with a file descriptor belonging to a non-socket VFS driver, then you need to register the driver with functions `start_select()` and `end_select()` similarly to the following example:

```c
// In definition of esp_vfs_t:
    .start_select = &uart_start_select,
    .end_select = &uart_end_select,
// ... other members initialized
```

`start_select()` is called for setting up the environment for detection of read/write/error conditions on file descriptors belonging to the given VFS driver.

`end_select()` is called to stop/deinitialize/free the environment which was setup by `start_select()`.

**Note:** `end_select()` might be called without a previous `start_select()` call in some rare circumstances. `end_select()` should fail gracefully if this is the case (i.e., should not crash but return an error instead).

Please refer to the reference implementation for the UART peripheral in `vfs/vfs_uart.c` and most particularly to the functions `esp_vfs_dev_uart_register()`, `uart_start_select()`, and `uart_end_select()` for more information.

Please check the following examples that demonstrate the use of `select()` with VFS file descriptors:

- `peripherals/uart/uart_select`
- `system/select`

Socket VFS Drivers  A socket VFS driver is using its own internal implementation of `select()` and non-socket VFS drivers notify it upon read/write/error conditions.

A socket VFS driver needs to be registered with the following functions defined:

```c
// In definition of esp_vfs_t:
    .socket_select = &lwip_select,
    .get_socket_select_semaphore = &lwip_get_socket_select_semaphore,
    .stop_socket_select = &lwip_stop_socket_select,
    .stop_socket_select_isr = &lwip_stop_socket_select_isr,
// ... other members initialized
```

`socket_select()` is the internal implementation of `select()` for the socket driver. It works only with file descriptors belonging to the socket VFS.

`get_socket_select_semaphore()` returns the signalization object (semaphore) which is used in non-socket drivers to stop the waiting in `socket_select()`.

`stop_socket_select()` call is used to stop the waiting in `socket_select()` by passing the object returned by `get_socket_select_semaphore()`.

`stop_socket_select_isr()` has the same functionality as `stop_socket_select()` but it can be used from ISR.

Please see `lwip/port/esp32xx/vfs_lwip.c` for a reference socket driver implementation using LWIP.
Chapter 2. API Reference

Note: If you use `select()` for socket file descriptors only then you can disable the `CONFIG_VFS_SUPPORT_SELECT` option to reduce the code size and improve performance. You should not change the socket driver during an active `select()` call or you might experience some undefined behavior.

Paths

Each registered FS has a path prefix associated with it. This prefix can be considered as a “mount point” of this partition.

In case when mount points are nested, the mount point with the longest matching path prefix is used when opening the file. For instance, suppose that the following filesystems are registered in VFS:

- FS 1 on /data
- FS 2 on /data/static

Then:

- FS 1 will be used when opening a file called `/data/log.txt`
- FS 2 will be used when opening a file called `/data/static/index.html`
- Even if `/index.html" does not exist in FS 2, FS 1 will not be searched for `/static/index.html`.

As a general rule, mount point names must start with the path separator (/) and must contain at least one character after path separator. However, an empty mount point name is also supported and might be used in cases when an application needs to provide a “fallback” filesystem or to override VFS functionality altogether. Such filesystem will be used if no prefix matches the path given.

VFS does not handle dots (.) in path names in any special way. VFS does not treat `..` as a reference to the parent directory. In the above example, using a path `/data/static/../../log.txt` will not result in a call to FS 1 to open `/log.txt`. Specific FS drivers (such as FATFS) might handle dots in file names differently.

When opening files, the FS driver receives only relative paths to files. For example:

1. The `myfs` driver is registered with `/data` as a path prefix.
2. The application calls `fopen("/data/config.json", ...)`.
3. The VFS component calls `myfs_open("/config.json", ...)`.
4. The `myfs` driver opens the `/config.json` file.

VFS does not impose any limit on total file path length, but it does limit the FS path prefix to `ESP_VFS_PATH_MAX` characters. Individual FS drivers may have their own filename length limitations.

File Descriptors

File descriptors are small positive integers from 0 to `FD_SETSIZE - 1`, where `FD_SETSIZE` is defined in `newlib’ $sys/types.h`. The largest file descriptors (configured by `CONFIG_LWIP_MAX_SOCKETS`) are reserved for sockets. The VFS component contains a lookup-table called `s_fd_table` for mapping global file descriptors to VFS driver indexes registered in the `s_vfs` array.

Standard IO Streams (`stdin`, `stdout`, `stderr`)

If the menuconfig option UART for console output is not set to `None`, then `stdin`, `stdout`, and `stderr` are configured to read from, and write to, a UART. It is possible to use UART0 or UART1 for standard IO. By default, UART0 is used with 115200 baud rate; TX pin is GPIO1; RX pin is GPIO3. These parameters can be changed in menuconfig.

Writing to `stdout` or `stderr` sends characters to the UART transmit FIFO. Reading from `stdin` retrieves characters from the UART receive FIFO.
By default, VFS uses simple functions for reading from and writing to UART. Writes busy-wait until all data is put into UART FIFO, and reads are non-blocking, returning only the data present in the FIFO. Due to this non-blocking read behavior, higher level C library calls, such as fscanf("%d\n", &var);, might not have desired results.

Applications which use the UART driver can instruct VFS to use the driver's interrupt driven, blocking read and write functions instead. This can be done using a call to the esp_vfs_dev_uart_use_driver function. It is also possible to revert to the basic non-blocking functions using a call to esp_vfs_dev_uart_use_nonblocking.

VFS also provides an optional newline conversion feature for input and output. Internally, most applications send and receive lines terminated by the LF (‘n’) character. Different terminal programs may require different line terminations, such as CR or CRLF. Applications can configure this separately for input and output either via menuconfig, or by calls to the functions esp_vfs_dev_uart_port_set_rx_line_endings and esp_vfs_dev_uart_port_set_tx_line_endings.

**Standard Streams and FreeRTOS Tasks**  
FILE objects for stdin, stdout, and stderr are shared between all FreeRTOS tasks, but the pointers to these objects are stored in per-task struct _reent.

The following code is transferred to fprintf(__getreent()->_stderr, "42\n"); by the preprocessor:

```c
fprintf(stderr, "42\n");
```

The __getreent() function returns a per-task pointer to struct _reent in newlib libc. This structure is allocated on the TCB of each task. When a task is initialized, _stdin, _stdout, and _stderr members of struct _reent are set to the values of stdin, stdout, and stderr of _GLOBAL_REENT (i.e., the structure which is used before FreeRTOS is started).

Such a design has the following consequences:

- It is possible to set stdin, stdout, and stderr for any given task without affecting other tasks, e.g., by doing stdin = fopen("/dev/uart/1", "r").
- Closing default stdin, stdout, or stderr using fclose closes the FILE stream object, which will affect all other tasks.
- To change the default stdin, stdout, stderr streams for new tasks, modify _GLOBAL_REENT->_stdin(_stdout, _stderr) before creating the task.

**eventfd()**

The eventfd() call is a powerful tool to notify a select() based loop of custom events. The eventfd() implementation in ESP-IDF is generally the same as described in man(2) eventfd except for:

- esp_vfs_eventfd_register() has to be called before calling eventfd()
- Options EFD_CLOEXEC, EFD_NONBLOCK and EFD_SEMAPHORE are not supported in flags.
- Option EFD_SUPPORT_ISR has been added in flags. This flag is required to read and write the eventfd in an interrupt handler.

Note that creating an eventfd with EFD_SUPPORT_ISR will cause interrupts to be temporarily disabled when reading, writing the file and during the beginning and the ending of the select() when this file is set.

**Functions**

ssize_t esp_vfs_write (struct _reent *r, int fd, const void *data, size_t size)

These functions are to be used in newline syscall table. They will be called by newline when it needs to use any of the syscalls.
off_t esp_vfs_lseek (struct_reent *r, int fd, off_t size, int mode)

ssize_t esp_vfs_read (struct_reent *r, int fd, void *dst, size_t size)

int esp_vfs_open (struct_reent *r, const char *path, int flags, int mode)

int esp_vfs_close (struct_reent *r, int fd)

int esp_vfs_fstat (struct_reent *r, int fd, struct stat *st)

int esp_vfs_stat (struct_reent *r, const char *path, struct stat *st)

int esp_vfs_link (struct_reent *r, const char *n1, const char *n2)

int esp_vfs_unlink (struct_reent *r, const char *path)

int esp_vfs_rename (struct_reent *r, const char *src, const char *dst)

int esp_vfs.utime (const char *path, const struct utimbuf *times)

esp_err_t esp_vfs_register (const char *base_path, const esp_vfs_t *vfs, void *ctx)

Register a virtual filesystem for given path prefix.

Parameters

• base_path – file path prefix associated with the filesystem. Must be a zero-terminated C string, may be empty. If not empty, must be up to ESP_VFS_PATH_MAX characters long, and at least 2 characters long. Name must start with a ‘/’ and must not end with ‘/’. For example, “/data” or “/dev/spi” are valid. These VFSes would then be called to handle file paths such as “/data/myfile.txt” or “/dev/spi/0”. In the special case of an empty base_path, a “fallback” VFS is registered. Such VFS will handle paths which are not matched by any other registered VFS.

• vfs – Pointer to esp_vfs_t, a structure which maps syscalls to the filesystem driver functions. VFS component doesn’t assume ownership of this pointer.

• ctx – If vfs->flags has ESP_VFS_FLAG_CONTEXT_PTR set, a pointer which should be passed to VFS functions. Otherwise, NULL.

Returns ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered.

esp_err_t esp_vfs_register_fd_range (const esp_vfs_t *vfs, void *ctx, int min_fd, int max_fd)

Special case function for registering a VFS that uses a method other than open() to open new file descriptors from the interval <min_fd; max_fd).

This is a special-purpose function intended for registering LWIP sockets to VFS.

Parameters

• vfs – Pointer to esp_vfs_t. Meaning is the same as for esp_vfs_register().

• ctx – Pointer to context structure. Meaning is the same as for esp_vfs_register().

• min_fd – The smallest file descriptor this VFS will use.

• max_fd – Upper boundary for file descriptors this VFS will use (the biggest file descriptor plus one).

Returns ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

esp_err_t esp_vfs_register_with_id (const esp_vfs_t *vfs, void *ctx, esp_vfs_id_t *vfs_id)

Special case function for registering a VFS that uses a method other than open() to open new file descriptors. In comparison with esp_vfs_register_fd_range, this function doesn’t pre-registers an interval of file descriptors. File descriptors can be registered later, by using esp_vfs_register_fd.

Parameters

• vfs – Pointer to esp_vfs_t. Meaning is the same as for esp_vfs_register().

• ctx – Pointer to context structure. Meaning is the same as for esp_vfs_register().

• vfs_id – Here will be written the VFS ID which can be passed to esp_vfs_register_fd for registering file descriptors.
Returns ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

**esp_err_t esp_vfs_unregister (const char *base_path)**

Unregister a virtual filesystem for given path prefix

Parameters **base_path** - file prefix previously used in esp_vfs_register call

Returns ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn’t been registered

**esp_err_t esp_vfs_unregister_with_id (esp_vfs_id_t vfs_id)**

Unregister a virtual filesystem with the given index

Parameters **vfs_id** - The VFS ID returned by esp_vfs_unregister_with_id

Returns ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for the given index hasn’t been registered

**esp_err_t esp_vfs_register_fd (esp_vfs_id_t vfs_id, int *fd)**

Special function for registering another file descriptor for a VFS registered by esp_vfs_register_with_id.

Parameters

- **vfs_id** - VFS identifier returned by esp_vfs_register_with_id.
- **fd** - The registered file descriptor will be written to this address.

Returns ESP_OK if the registration is successful, ESP_ERR_NO_MEM if too many file descriptors are registered, ESP_ERR_INVALID_ARG if the arguments are incorrect.

**esp_err_t esp_vfs_register_fd_with_local_fd (esp_vfs_id_t vfs_id, int local_fd, bool permanent, int *fd)**

Special function for registering another file descriptor with given local_fd for a VFS registered by esp_vfs_register_with_id.

Parameters

- **vfs_id** - VFS identifier returned by esp_vfs_register_with_id.
- **local_fd** - The fd in the local vfs. Passing -1 will set the local fd as the (*fd) value.
- **permanent** - Whether the fd should be treated as persistent (not removed after close())
- **fd** - The registered file descriptor will be written to this address.

Returns ESP_OK if the registration is successful, ESP_ERR_NO_MEM if too many file descriptors are registered, ESP_ERR_INVALID_ARG if the arguments are incorrect.

**esp_err_t esp_vfs_unregister_fd (esp_vfs_id_t vfs_id, int fd)**

Special function for unregistering a file descriptor belonging to a VFS registered by esp_vfs_register_with_id.

Parameters

- **vfs_id** - VFS identifier returned by esp_vfs_register_with_id.
- **fd** - File descriptor which should be unregistered.

Returns ESP_OK if the registration is successful, ESP_ERR_INVALID_ARG if the arguments are incorrect.

**int esp_vfs_select (int nfds, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval *timeout)**

Synchronous I/O multiplexing which implements the functionality of POSIX select() for VFS.

Parameters

- **nfds** - Specifies the range of descriptors which should be checked. The first nfds descriptors will be checked in each set.
- **readfds** - If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to read, and on output indicates which descriptors are ready to read.
- **writefds** - If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to write, and on output indicates which descriptors are ready to write.
- **errorfds** - If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for error conditions, and on output indicates which descriptors have error conditions.
• **timeout** – If not NULL, then points to timeval structure which specifies the time period after which the functions should time-out and return. If it is NULL, then the function will not time-out. Note that the timeout period is rounded up to the system tick and incremented by one.

**Returns** The number of descriptors set in the descriptor sets, or -1 when an error (specified by errno) have occurred.

```c
void esp_vfs_select_triggered (esp_vfs_select_sem_t sem)
```

Notification from a VFS driver about a read/write/error condition.

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to start_select.

**Parameters**
- `sem` – semaphore structure which was passed to the driver by the start_select call

```c
void esp_vfs_select_triggered_isr (esp_vfs_select_sem_t sem, BaseType_t *woken)
```

Notification from a VFS driver about a read/write/error condition (ISR version)

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to start_select.

**Parameters**
- `sem` – semaphore structure which was passed to the driver by the start_select call
- `woken` – is set to pdTRUE if the function wakes up a task with higher priority

```c
ssize_t esp_vfs_pread (int fd, void *dst, size_t size, off_t offset)
```

Implements the VFS layer of POSIX `pread()`

**Parameters**
- `fd` – File descriptor used for read
- `dst` – Pointer to the buffer where the output will be written
- `size` – Number of bytes to be read
- `offset` – Starting offset of the read

**Returns** A positive return value indicates the number of bytes read. -1 is return on failure and errno is set accordingly.

```c
ssize_t esp_vfs_pwrite (int fd, const void *src, size_t size, off_t offset)
```

Implements the VFS layer of POSIX `pwrite()`

**Parameters**
- `fd` – File descriptor used for write
- `src` – Pointer to the buffer from where the output will be read
- `size` – Number of bytes to write
- `offset` – Starting offset of the write

**Returns** A positive return value indicates the number of bytes written. -1 is return on failure and errno is set accordingly.

**Structures**

```c
struct esp_vfs_select_sem_t
```

VFS semaphore type for select()

**Public Members**

```c
bool is_sem_local
```

type of “sem” is SemaphoreHandle_t when true, defined by socket driver otherwise

```c
void *sem
```

semaphore instance
Chapter 2. API Reference

struct esp_vfs_t

  VFS definition structure.

  This structure should be filled with pointers to corresponding FS driver functions.

  VFS component will translate all FDs so that the filesystem implementation sees them starting at zero. The
caller sees a global FD which is prefixed with an pre-filesystem-implementation.

  Some FS implementations expect some state (e.g. pointer to some structure) to be passed in as a first argument.
For these implementations, populate the members of this structure which have _p suffix, set flags member
to ESP_VFS_FLAG_CONTEXT_PTR and provide the context pointer to esp_vfs_register function. If the
implementation doesn’t use this extra argument, populate the members without _p suffix and set flags member
to ESP_VFS_FLAG_DEFAULT.

  If the FS driver doesn’t provide some of the functions, set corresponding members to NULL.

Public Members

int flags

  ESP_VFS_FLAG_CONTEXT_PTR or ESP_VFS_FLAG_DEFAULT

ssize_t (*write_p)(void *p, int fd, const void *data, size_t size)

  Write with context pointer

ssize_t (*write)(int fd, const void *data, size_t size)

  Write without context pointer

off_t (*lseek_p)(void *p, int fd, off_t size, int mode)

  Seek with context pointer

off_t (*lseek)(int fd, off_t size, int mode)

  Seek without context pointer

ssize_t (*read_p)(void *ctx, int fd, void *dst, size_t size)

  Read with context pointer

ssize_t (*read)(int fd, void *dst, size_t size)

  Read without context pointer

ssize_t (*pread_p)(void *ctx, int fd, void *dst, size_t size, off_t offset)

  pread with context pointer

ssize_t (*pread)(int fd, void *dst, size_t size, off_t offset)

  pread without context pointer

ssize_t (*pwrite_p)(void *ctx, int fd, const void *src, size_t size, off_t offset)

  pwrite with context pointer

ssize_t (*pwrite)(int fd, const void *src, size_t size, off_t offset)

  pwrite without context pointer
int (*open_p)(void *ctx, const char *path, int flags, int mode)
open with context pointer

int (*open)(const char *path, int flags, int mode)
open without context pointer

int (*close_p)(void *ctx, int fd)
close with context pointer

int (*close)(int fd)
close without context pointer

int (*fstat_p)(void *ctx, int fd, struct stat *st)
fstat with context pointer

int (*fstat)(int fd, struct stat *st)
fstat without context pointer

int (*stat_p)(void *ctx, const char *path, struct stat *st)
stat with context pointer

int (*stat)(const char *path, struct stat *st)
stat without context pointer

int (*link_p)(void *ctx, const char *n1, const char *n2)
link with context pointer

int (*link)(const char *n1, const char *n2)
link without context pointer

int (*unlink_p)(void *ctx, const char *path)
unlink with context pointer

int (*unlink)(const char *path)
unlink without context pointer

int (*rename_p)(void *ctx, const char *src, const char *dst)
rename with context pointer

int (*rename)(const char *src, const char *dst)
rename without context pointer

DIR *(*opendir_p)(void *ctx, const char *name)
opendir with context pointer

DIR *(*opendir)(const char *name)
opendir without context pointer
struct dirent *(*readdir_p)(void *ctx, DIR *pdir)
    readdir with context pointer

struct dirent *(*readdir)(DIR *pdir)
    readdir without context pointer

int (*readdir_r_p)(void *ctx, DIR *pdir, struct dirent *entry, struct dirent **out_dirent)
    readdir_r with context pointer

int (*readdir_r)(DIR *pdir, struct dirent *entry, struct dirent **out_dirent)
    readdir_r without context pointer

long (*telldir_p)(void *ctx, DIR *pdir)
    telldir with context pointer

long (*telldir)(DIR *pdir)
    telldir without context pointer

void (*seekdir_p)(void *ctx, DIR *pdir, long offset)
    seekdir with context pointer

void (*seekdir)(DIR *pdir, long offset)
    seekdir without context pointer

int (*closedir_p)(void *ctx, DIR *pdir)
    closedir with context pointer

int (*closedir)(DIR *pdir)
    closedir without context pointer

int (*mkdir_p)(void *ctx, const char *name, mode_t mode)
    mkdir with context pointer

int (*mkdir)(const char *name, mode_t mode)
    mkdir without context pointer

int (*rmdir_p)(void *ctx, const char *name)
    rmdir with context pointer

int (*rmdir)(const char *name)
    rmdir without context pointer

int (*fcntl_p)(void *ctx, int fd, int cmd, int arg)
    fcntl with context pointer

int (*fcntl)(int fd, int cmd, int arg)
    fcntl without context pointer
int (*ioctl_p)(void *ctx, int fd, int cmd, va_list args)
  ioctl with context pointer

int (*ioctl)(int fd, int cmd, va_list args)
  ioctl without context pointer

int (*fsync_p)(void *ctx, int fd)
  fsync with context pointer

int (*fsync)(int fd)
  fsync without context pointer

int (*access_p)(void *ctx, const char *path, int amode)
  access with context pointer

int (*access)(const char *path, int amode)
  access without context pointer

int (*truncate_p)(void *ctx, const char *path, off_t length)
  truncate with context pointer

int (*truncate)(const char *path, off_t length)
  truncate without context pointer

int (*ftruncate_p)(void *ctx, int fd, off_t length)

int (*tcsendbreak)(int fd, int duration)
tcsendbreak without context pointer

esp_err_t (*start_select)(int nfds, fd_set *readfds, fd_set *writefds, fd_set *exceptfds, esp_vfs_select_sem_t sem, void **end_select_args)
start_select is called for setting up synchronous I/O multiplexing of the desired file descriptors in the given VFS

int (*socket_select)(int nfds, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval *timeout)
socket select function for socket FDs with the functionality of POSIX select(); this should be set only for the socket VFS

void (*stop_socket_select)(void *sem)
called by VFS to interrupt the socket_select call when select is activated from a non-socket VFS driver; set only for the socket driver

void (*stop_socket_select_isr)(void *sem, BaseType_t *woken)
stop_socket_select which can be called from ISR; set only for the socket driver

void *(*get_socket_select_semaphore)(void)
end_select is called to stop the I/O multiplexing and deinitialize the environment created by start_select for the given VFS
**esp_err_t** (*end_select*)(void *end_select_args)

get_socket_select_semaphore returns semaphore allocated in the socket driver; set only for the socket driver

**Macros**

**MAX_FDS**

Maximum number of (global) file descriptors.

**ESP_VFS_PATH_MAX**

Maximum length of path prefix (not including zero terminator)

**ESP_VFS_FLAG_DEFAULT**

Default value of flags member in esp_vfs_t structure.

**ESP_VFS_FLAG_CONTEXT_PTR**

Flag which indicates that FS needs extra context pointer in syscalls.

**Type Definitions**

typedef int esp_vfs_id_t

**Header File**

- components/vfs/include/esp_vfs_dev.h

**Functions**

void esp_vfs_dev_uart_register (void)

add /dev/uart virtual filesystem driver

This function is called from startup code to enable serial output

void esp_vfs_dev_uart_set_rx_line_endings (esp_line_endings_t mode)

Set the line endings expected to be received on UART.

This specifies the conversion between line endings received on UART and newlines (‘\n’, LF) passed into stdin:

- ESP_LINE_ENDINGS_CRLF: convert CRLF to LF
- ESP_LINE_ENDINGS_CR: convert CR to LF
- ESP_LINE_ENDINGS_LF: no modification

**Note:** this function is not thread safe w.r.t. reading from UART

**Parameters** **mode** – line endings expected on UART
void esp_vfs_dev_uart_set_tx_line_endings (esp_line_endings_t mode)
Set the line endings to sent to UART.

This specifies the conversion between newlines (’
’ , LF) on stdout and line endings sent over UART:

• ESP_LINE_ENDINGS_CRLF: convert LF to CRLF
• ESP_LINE_ENDINGS_CR: convert LF to CR
• ESP_LINE_ENDINGS_LF: no modification

Note: this function is not thread safe w.r.t. writing to UART

Parameters
  mode – line endings to send to UART

Parameters
  • uart_num – the UART number
  • mode – line endings to send to UART

Returns 0 if successed, or -1 when an error (specified by errno) have occurred.

int esp_vfs_dev_uart_port_set_rx_line_endings (int uart_num, esp_line_endings_t mode)
Set the line endings expected to be received on specified UART.

This specifies the conversion between line endings received on UART and newlines (’
’ , LF) passed into stdin:

• ESP_LINE_ENDINGS_CRLF: convert CRLF to LF
• ESP_LINE_ENDINGS_CR: convert CR to LF
• ESP_LINE_ENDINGS_LF: no modification

Note: this function is not thread safe w.r.t. reading from UART

Parameters
  • uart_num – the UART number
  • mode – line endings to send to UART

Returns 0 if successed, or -1 when an error (specified by errno) have occurred.

int esp_vfs_dev_uart_port_set_tx_line_endings (int uart_num, esp_line_endings_t mode)
Set the line endings to sent to specified UART.

This specifies the conversion between newlines (’
’ , LF) on stdout and line endings sent over UART:

• ESP_LINE_ENDINGS_CRLF: convert LF to CRLF
• ESP_LINE_ENDINGS_CR: convert LF to CR
• ESP_LINE_ENDINGS_LF: no modification

Note: this function is not thread safe w.r.t. writing to UART

Parameters
  • uart_num – the UART number
• **mode** - line endings to send to UART

**Returns** 0 if successful, or -1 when an error (specified by errno) have occurred.

```c
void esp_vfs_dev_uart_use_nonblocking (int uart_num)
```

set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

**Parameters** `uart_num` – UART peripheral number

```c
void esp_vfs_dev_uart_use_driver (int uart_num)
```

set VFS to use UART driver for reading and writing

**Note:** application must configure UART driver before calling these functions. With these functions, read and write are blocking and interrupt-driven.

```c
void esp_vfs_usb_serial_jtag_use_driver (void)
```

set VFS to use USB-SERIAL-JTAG driver for reading and writing

**Note:** application must configure USB-SERIAL-JTAG driver before calling these functions. With these functions, read and write are blocking and interrupt-driven.

```c
void esp_vfs_usb_serial_jtag_use_nonblocking (void)
```

set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

**Header File**

- `components/vfs/include/esp_vfs_eventfd.h`

**Functions**

- `esp_err_t esp_vfs_eventfd_register (const esp_vfs_eventfd_config_t *config)`

  Registers the event vfs.

  **Returns** ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered.

- `esp_err_t esp_vfs_eventfd_unregister (void)`

  Unregisters the event vfs.

  **Returns** ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn’t been registered

```c
int eventfd (unsigned int initval, int flags)
```

**Structures**

- `struct esp_vfs_eventfd_config_t`

  Eventfd vfs initialization settings.

**Public Members**

- `size_t max_fds`

  The maximum number of eventfds supported

2.9.11 Wear Levelling API

Overview

Most of flash memory and especially SPI flash that is used in ESP32 has a sector-based organization and also has a limited number of erase/modification cycles per memory sector. The wear levelling component helps to distribute wear and tear among sectors more evenly without requiring any attention from the user.

The wear levelling component provides API functions related to reading, writing, erasing, and memory mapping of data in external SPI flash through the partition component. The component also has higher-level API functions which work with the FAT filesystem defined in FAT filesystem.

The wear levelling component, together with the FAT FS component, uses FAT FS sectors of 4096 bytes, which is a standard size for flash memory. With this size, the component shows the best performance but needs additional memory in RAM.

To save internal memory, the component has two additional modes which both use sectors of 512 bytes:

• **Performance mode.** Erase sector operation data is stored in RAM, the sector is erased, and then data is copied back to flash memory. However, if a device is powered off for any reason, all 4096 bytes of data is lost.

• **Safety mode.** The data is first saved to flash memory, and after the sector is erased, the data is saved back. If a device is powered off, the data can be recovered as soon as the device boots up.

The default settings are as follows:

• Sector size is 512 bytes
• Performance mode

You can change the settings through the configuration menu.

The wear levelling component does not cache data in RAM. The write and erase functions modify flash directly, and flash contents are consistent when the function returns.

Wear Levelling access API functions

This is the set of API functions for working with data in flash:

• `wl_mount` - initializes the wear levelling module and mounts the specified partition
• `wlUnmount` - unmounts the partition and deinitializes the wear levelling module
• `wl_erase_range` - erases a range of addresses in flash
• `wl_write` - writes data to a partition
• `wl_read` - reads data from a partition
• `wl_size` - returns the size of available memory in bytes
• `wl_sector_size` - returns the size of one sector

As a rule, try to avoid using raw wear levelling functions and use filesystem-specific functions instead.

Memory Size

The memory size is calculated in the wear levelling module based on partition parameters. The module uses some sectors of flash for internal data.
See Also

- FAT Filesystem Support
- Partition Tables

Application Example

An example that combines the wear levelling driver with the FATFS library is provided in the storage/wear_levelling directory. This example initializes the wear levelling driver, mounts FatFs partition, as well as writes and reads data from it using POSIX and C library APIs. See storage/wear_levelling/README.md for more information.

High-level API Reference

Header Files

- fatfs/vfs/esp_vfs_fat.h

High-level wear levelling functions esp_vfs_fat_spiflash_mount_rw_wl(), esp_vfs_fat_spiflash_unmount_rw_wl() and struct esp_vfs_fat_mount_config_t are described in FAT Filesystem Support.

Mid-level API Reference

Header File

- components/wear_levelling/include/wear_levelling.h

Functions

esp_err_t wl_mount(const esp_partition_t *partition, wl_handle_t *out_handle)

Mount WL for defined partition.

Parameters

- partition – that will be used for access
- out_handle – handle of the WL instance

Returns

- ESP_OK, if the WL allocation is successful;
- ESP_ERR_INVALID_ARG, if the arguments for WL configuration are not valid;
- ESP_ERR_NO_MEM, if the WL allocation fails because of insufficient memory;

esp_err_t wl_unmount(wl_handle_t handle)

Unmount WL for defined partition.

Parameters handle – WL partition handle

Returns

- ESP_OK, if the operation is successful;
- or one of error codes from lower-level flash driver.

esp_err_t wl_erase_range(wl_handle_t handle, size_t start_addr, size_t size)

Erase part of the WL storage.

Parameters

- handle – WL handle that are related to the partition
- start_addr – Address from where erase operation should start. Must be aligned to the result of function wl_sector_size(⋯).
- size – Size of the range which should be erased, in bytes. Must be divisible by the result of function wl_sector_size(⋯).

Returns

- ESP_OK, if the given range was erased successfully;
- ESP_ERR_INVALID_ARG, if iterator or dst are NULL;
• ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition;
• or one of error codes from lower-level flash driver.

```
void esp_err_t wl_write(wl_handle_t handle, size_t dest_addr, const void* src, size_t size)
```

Write data to the WL storage.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `wl_erase_range` function.

**Note:** Prior to writing to WL storage, make sure it has been erased with `wl_erase_range` call.

**Parameters**
- **handle** - WL handle corresponding to the WL partition
- **dest_addr** - Address where the data should be written, relative to the beginning of the partition.
- **src** - Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least `size` bytes long.
- **size** - Size of data to be written, in bytes.

**Returns**
- ESP_OK, if data was written successfully;
- ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size;
- ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

```
void esp_err_t wl_read(wl_handle_t handle, size_t src_addr, void* dest, size_t size)
```

Read data from the WL storage.

**Parameters**
- **handle** - WL module instance that was initialized before
- **dest** - Pointer to the buffer where data should be stored. The Pointer must be non-NULL and the buffer must be at least `size` bytes long.
- **src_addr** - Address of the data to be read, relative to the beginning of the partition.
- **size** - Size of data to be read, in bytes.

**Returns**
- ESP_OK, if data was read successfully;
- ESP_ERR_INVALID_ARG, if src_offset exceeds partition size;
- ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

```
size_t wl_size(wl_handle_t handle)
```

Get the actual flash size in use for the WL storage partition.

**Parameters**
- **handle** - WL module handle that was initialized before

**Returns**
- usable size, in bytes

```
size_t wl_sector_size(wl_handle_t handle)
```

Get sector size of the WL instance.

**Parameters**
- **handle** - WL module handle that was initialized before

**Returns**
- sector size, in bytes

---

**Macros**

`WL_INVALID_HANDLE`

---

**Type Definitions**
typedef int32_t wl_handle_t

wear levelling handle

Code examples for this API section are provided in the storage directory of ESP-IDF examples.

# 2.10 System API

## 2.10.1 App Image Format

### Application Image Structures

An application image consists of the following structures:

1. The `esp_image_header_t` structure describes the mode of SPI flash and the count of memory segments.
2. The `esp_image_segment_header_t` structure describes each segment, its length, and its location in ESP32's memory, followed by the data with a length of `data_len`. The data offset for each segment in the image is calculated in the following way:
   - offset for 0 Segment = `sizeof(esp_image_header_t)` + `sizeof(esp_image_segment_header_t)`.
   - offset for 1 Segment = offset for 0 Segment + length of 0 Segment + `sizeof(esp_image_segment_header_t)`.
   - offset for 2 Segment = offset for 1 Segment + length of 1 Segment + `sizeof(esp_image_segment_header_t)`.
   - ...

The count of each segment is defined in the `segment_count` field that is stored in `esp_image_header_t`. The count cannot be more than `ESP_IMAGE_MAX_SEGMENTS`.

To get the list of your image segments, please run the following command:

```bash
esptool.py --chip esp32 image_info build/app.bin
```

```
esptool.py v2.3.1
Image version: 1
Entry point: 40080ea4
13 segments
Segment 1: len 0x13ce0 load 0x3f400020 file_offs 0x00000018 SOC_DROM
Segment 2: len 0x00000 load 0x3fff8000 file_offs 0x00013d00 SOC_RTC_DRAM
Segment 3: len 0x00000 load 0x3fff8000 file_offs 0x00013d08 SOC_RTC_DRAM
Segment 4: len 0x00000 load 0x3fff8000 file_offs 0x00013d10 DRAM
Segment 5: len 0x00000 load 0x3fff8000 file_offs 0x000165f8 DRAM
Segment 6: len 0x00000 load 0x40080000 file_offs 0x00016600 SOC_IRAM
Segment 7: len 0x09600 load 0x40080000 file_offs 0x00016a08 SOC_IRAM
Segment 8: len 0x028e0 load 0x40080000 file_offs 0x00016d10 SOC_IRAM
Segment 9: len 0x00000 load 0x40080000 file_offs 0x00016d18 SOC_IRAM
Segment 10: len 0x00000 load 0x40080000 file_offs 0x00016d20 SOC_IRAM
Segment 11: len 0x00000 load 0x50000000 file_offs 0x00089b58 SOC_RTC_IRAM
Segment 12: len 0x00000 load 0x50000000 file_offs 0x00089c60 SOC_RTC_IRAM
Segment 13: len 0x00000 load 0x50000000 file_offs 0x00089c74 SOC_RTC_IRAM
Checksum: e8 (valid)
Validation Hash: 407089ca0eae2bbf83b4120979d335ab1938a49cb7a0c997f240474ef2ec76b… (valid)
```

You can also see the information on segments in the ESP-IDF logs while your application is booting:
3. The image has a single checksum byte after the last segment. This byte is written on a sixteen byte padded boundary, so the application image might need padding.

4. If the hash_appended field from esp_image_header_t is set then a SHA256 checksum will be appended. The value of the SHA256 hash is calculated on the range from the first byte and up to this field. The length of this field is 32 bytes.

5. If the option CONFIG_SECURE_SIGNED_APPS_SCHEME is set to ECDSA then the application image will have an additional 68 bytes for an ECDSA signature, which includes:
   - version word (4 bytes),
   - signature data (64 bytes).

6. If the option CONFIG_SECURE_SIGNED_APPS_SCHEME is set to RSA or ECDSA (V2) then the application image will have an additional signature sector of 4K size. For more details on the format of this signature sector, please refer to Signature Block Format.

Application Description

The DROM segment of the application binary starts with the esp_app_desc_t structure which carries specific fields describing the application:

- magic_word - the magic word for the esp_app_desc structure.
- secure_version - see Anti-rollback.
- version - see App version. *
- project_name is filled from PROJECT_NAME. *
- time and date - compile time and date.
- idf_ver - version of ESP-IDF. *
- app_elf_sha256 - contains sha256 hash for the application ELF file.

* - The maximum length is 32 characters, including null-termination character. For example, if the length of PROJECT_NAME exceeds 31 characters, the excess characters will be disregarded.
This structure is useful for identification of images uploaded via Over-the-Air (OTA) updates because it has a fixed offset = sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t). As soon as a device receives the first fragment containing this structure, it has all the information to determine whether the update should be continued with or not.

To obtain the esp_app_desc_t structure for the currently running application, use esp_app_get_description().

To obtain the esp_app_desc_t structure for another OTA partition, use esp_ota_get_partition_description().

Adding a Custom Structure to an Application

Users also have the opportunity to have similar structure with a fixed offset relative to the beginning of the image.

The following pattern can be used to add a custom structure to your image:

```c
const __attribute__((section(".rodata_custom_desc"))) esp_custom_app_desc_t custom_app_desc = { ... }
```

Offset for custom structure is sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t) + sizeof(esp_app_desc_t).

To guarantee that the custom structure is located in the image even if it is not used, you need to add target_link_libraries(${COMPONENT_TARGET} "-u custom_app_desc") into CMakeLists.txt.

API Reference

Header File

- components/bootloader_support/include/esp_app_format.h

Structures

struct esp_image_header_t

Main header of binary image.

Public Members

uint8_t\_\_magic

Magic word ESP\_IMAGE\_HEADER\_MAGIC

uint8_t\_segment\_count

Count of memory segments

uint8_t\_spi\_mode

flash read mode (esp_image_spi_mode_t as uint8_t)

uint8_t\_spi\_speed

flash frequency (esp_image_spi_freq_t as uint8_t)

uint8_t\_spi\_size

flash chip size (esp_image_flash_size_t as uint8_t)
uint32_t entry_addr
  Entry address

uint8_t wp_pin
  WP pin when SPI pins set via efuse (read by ROM bootloader, the IDF bootloader uses software to configure the WP pin and sets this field to 0xEE=disabled)

uint8_t spi_pin_drv[3]
  Drive settings for the SPI flash pins (read by ROM bootloader)

esp_chip_id_t chip_id
  Chip identification number

uint8_t min_chip_rev
  Minimal chip revision supported by image. After the Major and Minor revision eFuses were introduced into the chips, this field is no longer used. But for compatibility reasons, we keep this field and the data in it. Use min_chip_rev_full instead. The software interprets this as a Major version for most of the chips and as a Minor version for the ESP32-C3.

uint16_t min_chip_rev_full
  Minimal chip revision supported by image, in format: major * 100 + minor

uint16_t max_chip_rev_full
  Maximal chip revision supported by image, in format: major * 100 + minor

uint8_t reserved[4]
  Reserved bytes in additional header space, currently unused

uint8_t hash_appended
  If 1, a SHA256 digest “simple hash” (of the entire image) is appended after the checksum. Included in image length. This digest is separate to secure boot and only used for detecting corruption. For secure boot signed images, the signature is appended after this (and the simple hash is included in the signed data).

struct esp_image_segment_header_t
  Header of binary image segment.

Public Members

uint32_t load_addr
  Address of segment

uint32_t data_len
  Length of data

Macros

ESP_IMAGE_HEADER_MAGIC
  The magic word for the esp_image_header_t structure.
**ESP_IMAGE_MAX_SEGMENTS**

Max count of segments in the image.

**Enumerations**

eenum esp_chip_id_t

ESP chip ID.

*Values:*

- **enumerator ESP_CHIP_ID_ESP32**
  - chip ID: ESP32
- **enumerator ESP_CHIP_ID_ESP32S2**
  - chip ID: ESP32-S2
- **enumerator ESP_CHIP_ID_ESP32C3**
  - chip ID: ESP32-C3
- **enumerator ESP_CHIP_ID_ESP32S3**
  - chip ID: ESP32-S3
- **enumerator ESP_CHIP_ID_ESP32C2**
  - chip ID: ESP32-C2
- **enumerator ESP_CHIP_ID_ESP32C6**
  - chip ID: ESP32-C6
- **enumerator ESP_CHIP_ID_ESP32H2**
  - chip ID: ESP32-H2
- **enumerator ESP_CHIP_ID_ESP32P4**
  - chip ID: ESP32-P4
- **enumerator ESP_CHIP_ID_INVALID**
  - Invalid chip ID (we defined it to make sure the esp_chip_id_t is 2 bytes size)

eenum esp_image_spi_mode_t

SPI flash mode, used in esp_image_header_t.

*Values:*

- **enumerator ESP_IMAGE_SPI_MODE_QIO**
  - SPI mode QIO
- **enumerator ESP_IMAGE_SPI_MODE_QOUT**
  - SPI mode QOUT
- **enumerator ESP_IMAGE_SPI_MODE_DIO**
  - SPI mode DIO
enumerator ESP_IMAGE_SPI_MODE_DOUT
    SPI mode DOUT

enumerator ESP_IMAGE_SPI_MODE_FAST_READ
    SPI mode FAST_READ

enumerator ESP_IMAGE_SPI_MODE_SLOW_READ
    SPI mode SLOW_READ

define esp_image_spi_freq_t
    SPI flash clock division factor.
    Values:

enumerator ESP_IMAGE_SPI_SPEED_DIV_2
    The SPI flash clock frequency is divided by 2 of the clock source

enumerator ESP_IMAGE_SPI_SPEED_DIV_3
    The SPI flash clock frequency is divided by 3 of the clock source

enumerator ESP_IMAGE_SPI_SPEED_DIV_4
    The SPI flash clock frequency is divided by 4 of the clock source

enumerator ESP_IMAGE_SPI_SPEED_DIV_1
    The SPI flash clock frequency equals to the clock source

define esp_image_flash_size_t
    Supported SPI flash sizes.
    Values:

enumerator ESP_IMAGE_FLASH_SIZE_1MB
    SPI flash size 1 MB

enumerator ESP_IMAGE_FLASH_SIZE_2MB
    SPI flash size 2 MB

enumerator ESP_IMAGE_FLASH_SIZE_4MB
    SPI flash size 4 MB

enumerator ESP_IMAGE_FLASH_SIZE_8MB
    SPI flash size 8 MB

enumerator ESP_IMAGE_FLASH_SIZE_16MB
    SPI flash size 16 MB

enumerator ESP_IMAGE_FLASH_SIZE_32MB
    SPI flash size 32 MB
Chapter 2. API Reference

enumerator ESP_IMAGE_FLASH_SIZE_64MB
SPI flash size 64 MB

enumerator ESP_IMAGE_FLASH_SIZE_128MB
SPI flash size 128 MB

enumerator ESP_IMAGE_FLASH_SIZE_MAX
SPI flash size MAX

2.10.2 Bootloader Image Format

The bootloader image consists of the same structures as the application image, see Application Image Structures. The only difference is in the Bootloader Description structure.

To get information about the bootloader image, please run the following command:

```bash
esptool.py --chip esp32 image_info build/bootloader/bootloader.bin --version 2
```

Bootloader information

Bootloader version: 1
ESP-IDF: v5.1-dev-4304-gcb51a3b-dirty
Compile time: Mar 30 2023 19:14:17
Bootloader Description

The DRAM0 segment of the bootloader binary starts with the `esp_bootloader_desc_t` structure which carries specific fields describing the bootloader. This structure is located at a fixed offset = sizeof(`esp_image_header_t`) + sizeof(`esp_image_segment_header_t`).

- `magic_byte` - the magic byte for the `esp_bootloader_desc` structure.
- `reserved` - reserved for the future IDF use.
- `version` - bootloader version, see `CONFIG_BOOTLOADER_PROJECT_VER`
- `idf_ver` - ESP-IDF version. *
- `date` and `time` - compile date and time.
- `reserved2` - reserved for the future IDF use.

* - The maximum length is 32 characters, including null-termination character.

To get the `esp_bootloader_desc_t` structure from the running bootloader, use `esp_bootloader_get_description()`.

To get the `esp_bootloader_desc_t` structure from a running application, use `esp_ota_get_bootloader_description()`.

API Reference

Header File

- `components/esp_bootloader_format/include/esp_bootloader_desc.h`

Functions

```c
const esp_bootloader_desc_t*esp_bootloader_get_description (void)
```

Return esp_bootloader_desc structure.

Intended for use by the bootloader.

**Returns** Pointer to `esp_bootloader_desc` structure.

Structures

```c
struct esp_bootloader_desc_t
```

Bootloader description structure.

Public Members

```c
uint8_t magic_byte
```

Magic byte ESP_BOOTLOADER_DESC_MAGIC_BYTE

```c
uint8_t reserved[3]
```

reserved for IDF

```c
uint32_t version
```

Bootloader version

```c
char idf_ver[32]
```

2.10.3 Application Level Tracing

Overview

ESP-IDF provides a useful feature for program behavior analysis called Application Level Tracing. The feature can be enabled in menuconfig and allows transfer of arbitrary data between the host and ESP32 via JTAG interface with minimal overhead on program execution.

Developers can use this library to send application specific state of execution to the host and receive commands or other type of information in the opposite direction at runtime. The main use cases of this library are:

1. Collecting application specific data, see Application Specific Tracing
2. Lightweight logging to the host, see Logging to Host
3. System behaviour analysis, see System Behavior Analysis with SEGGER SystemView

API Reference

Header File

- components/app_trace/include/esp_app_trace.h

Functions

- esp_err_t esp_apptrace_init (void)

  Initializes application tracing module.

  **Note:** Should be called before any esp_apptrace_xxx call.

  **Returns** ESP_OK on success, otherwise see esp_err_t

- void esp_apptrace_down_buffer_config (uint8_t *buf, uint32_t size)

  Configures down buffer.

  **Note:** Needs to be called before attempting to receive any data using esp_apptrace_down_buffer_get and esp_apptrace_read. This function does not protect internal data by lock.

  **Parameters**

  - *buf* – Address of buffer to use for down channel (host to target) data.
  - *size* – Size of the buffer.
uint8_t *esp_apptrace_buffer_get (esp_apptrace_dest_t dest, uint32_t size, uint32_t tmo)

Allocates buffer for trace data. Once the data in the buffer is ready to be sent, esp_apptrace_buffer_put must be called to indicate it.

Parameters
• dest – Indicates HW interface to send data.
• size – Size of data to write to trace buffer.
• tmo – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

Returns non-NULL on success, otherwise NULL.

esp_err_t esp_apptrace_buffer_put (esp_apptrace_dest_t dest, uint8_t *ptr, uint32_t tmo)

Indicates that the data in the buffer is ready to be sent. This function is a counterpart of and must be preceded by esp_apptrace_buffer_get.

Parameters
• dest – Indicates HW interface to send data. Should be identical to the same parameter in call to esp_apptrace_buffer_get.
• ptr – Address of trace buffer to release. Should be the value returned by call to esp_apptrace_buffer_get.
• tmo – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

Returns ESP_OK on success, otherwise see esp_err_t

esp_err_t esp_apptrace_write (esp_apptrace_dest_t dest, const void *data, uint32_t size, uint32_t tmo)

Writes data to trace buffer.

Parameters
• dest – Indicates HW interface to send data.
• data – Address of data to write to trace buffer.
• size – Size of data to write to trace buffer.
• tmo – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

Returns ESP_OK on success, otherwise see esp_err_t

int esp_apptrace_vprintf_to (esp_apptrace_dest_t dest, uint32_t tmo, const char *fmt, va_list ap)

vprintf-like function to send log messages to host via specified HW interface.

Parameters
• dest – Indicates HW interface to send data.
• tmo – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.
• fmt – Address of format string.
• ap – List of arguments.

Returns Number of bytes written.

int esp_apptrace_vprintf (const char *fmt, va_list ap)

vprintf-like function to send log messages to host.

Parameters
• fmt – Address of format string.
• ap – List of arguments.

Returns Number of bytes written.

esp_err_t esp_apptrace_flush (esp_apptrace_dest_t dest, uint32_t tmo)

Flushes remaining data in trace buffer to host.

Parameters
• dest – Indicates HW interface to flush data on.
• tmo – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

Returns ESP_OK on success, otherwise see esp_err_t
**esp_err_t** esp_apptraceFlushNoLock(esp_apptrace_dest_t dest, uint32_t min_sz, uint32_t tmo)

Flushes remaining data in trace buffer to host without locking internal data. This is a special version of esp_apptrace_flush which should be called from panic handler.

**Parameters**
- **dest** - Indicates HW interface to flush data on.
- **min_sz** - Threshold for flushing data. If current filling level is above this value, data will be flushed. TRAX destinations only.
- **tmo** - Timeout for operation (in us). Use ESP_APTRACE_TMO_INFINITE to wait indefinitely.

**Returns** ESP_OK on success, otherwise see esp_err_t

**esp_err_t** esp_apptraceRead(esp_apptrace_dest_t dest, void *data, uint32_t *size, uint32_t tmo)

Reads host data from trace buffer.

**Parameters**
- **dest** - Indicates HW interface to read the data on.
- **data** - Address of buffer to put data from trace buffer.
- **size** - Pointer to store size of read data. Before call to this function pointed memory must hold requested size of data
- **tmo** - Timeout for operation (in us). Use ESP_APTRACE_TMO_INFINITE to wait indefinitely.

**Returns** ESP_OK on success, otherwise see esp_err_t

**uint8_t** *esp_apptraceDownBufferGet(esp_apptrace_dest_t dest, uint32_t *size, uint32_t tmo)

Retrieves incoming data buffer if any. Once data in the buffer is processed, esp_apptrace_down_buffer_put must be called to indicate it.

**Parameters**
- **dest** - Indicates HW interface to receive data.
- **size** - Address to store size of available data in down buffer. Must be initialized with requested value.
- **tmo** - Timeout for operation (in us). Use ESP_APTRACE_TMO_INFINITE to wait indefinitely.

**Returns** non-NULL on success, otherwise NULL.

**esp_err_t** esp_apptraceDownBufferPut(esp_apptrace_dest_t dest, uint8_t *ptr, uint32_t tmo)

Indicates that the data in the down buffer is processed. This function is a counterpart of and must be preceded by esp_apptrace_down_buffer_get.

**Parameters**
- **dest** - Indicates HW interface to receive data. Should be identical to the same parameter in call to esp_apptrace_down_buffer_get.
- **ptr** - Address of trace buffer to release. Should be the value returned by call to esp_apptrace_down_buffer_get.
- **tmo** - Timeout for operation (in us). Use ESP_APTRACE_TMO_INFINITE to wait indefinitely.

**Returns** ESP_OK on success, otherwise see esp_err_t

**bool** esp_apptraceHostIsConnected(esp_apptrace_dest_t dest)

Checks whether host is connected.

**Parameters** **dest** - Indicates HW interface to use.

**Returns** true if host is connected, otherwise false

**void** *esp_apptraceFopen(esp_apptrace_dest_t dest, const char *path, const char *mode)

Opens file on host. This function has the same semantic as ‘fopen’ except for the first argument.

**Parameters**
- **dest** - Indicates HW interface to use.
- **path** - Path to file.
- **mode** - Mode string. See fopen for details.
Returns non zero file handle on success, otherwise 0

```c
int esp_apptrace_fclose (esp_apptrace_dest_t dest, void *stream)
```

Closes file on host. This function has the same semantic as ‘fclose’ except for the first argument.

**Parameters**
- **dest** – Indicates HW interface to use.
- **stream** – File handle returned by esp_apptrace_fopen.

**Returns** Zero on success, otherwise non-zero. See fclose for details.

```c
size_t esp_apptrace_fwrite (esp_apptrace_dest_t dest, const void *ptr, size_t size, size_t nmemb, void *stream)
```

Writes to file on host. This function has the same semantic as ‘fwrite’ except for the first argument.

**Parameters**
- **dest** – Indicates HW interface to use.
- **ptr** – Address of data to write.
- **size** – Size of an item.
- **nmemb** – Number of items to write.
- **stream** – File handle returned by esp_apptrace_fopen.

**Returns** Number of written items. See fwrite for details.

```c
size_t esp_apptrace_fread (esp_apptrace_dest_t dest, void *ptr, size_t size, size_t nmemb, void *stream)
```

Read file on host. This function has the same semantic as ‘fread’ except for the first argument.

**Parameters**
- **dest** – Indicates HW interface to use.
- **ptr** – Address to store read data.
- **size** – Size of an item.
- **nmemb** – Number of items to read.
- **stream** – File handle returned by esp_apptrace_fopen.

**Returns** Number of read items. See fread for details.

```c
int esp_apptrace_fseek (esp_apptrace_dest_t dest, void *stream, long offset, int whence)
```

Set position indicator in file on host. This function has the same semantic as ‘fseek’ except for the first argument.

**Parameters**
- **dest** – Indicates HW interface to use.
- **stream** – File handle returned by esp_apptrace_fopen.
- **offset** – Offset. See fseek for details.
- **whence** – Position in file. See fseek for details.

**Returns** Zero on success, otherwise non-zero. See fseek for details.

```c
int esp_apptrace_ftell (esp_apptrace_dest_t dest, void *stream)
```

Get current position indicator for file on host. This function has the same semantic as ‘ftell’ except for the first argument.

**Parameters**
- **dest** – Indicates HW interface to use.
- **stream** – File handle returned by esp_apptrace_fopen.

**Returns** Current position in file. See ftell for details.

```c
int esp_apptrace_fstop (esp_apptrace_dest_t dest)
```

Indicates to the host that all file operations are complete. This function should be called after all file operations are finished and indicate to the host that it can perform cleanup operations (close open files etc.).

**Parameters**
- **dest** – Indicates HW interface to use.

**Returns** ESP_OK on success, otherwise see esp_err_t

```c
void esp_gcov_dump (void)
```

Triggers gcov info dump. This function waits for the host to connect to target before dumping data.
Enumerations

enum esp_apptrace_dest_t

   Application trace data destinations bits.

   Values:

   enumerator ESP_APPTRACE_DEST_JTAG
      JTAG destination.

   enumerator ESP_APPTRACE_DEST_TRAX
      xxx_TRAX name is obsolete, use more common xxx_JTAG

   enumerator ESP_APPTRACE_DEST_UART
      UART destination.

   enumerator ESP_APPTRACE_DEST_MAX

   enumerator ESP_APPTRACE_DEST_NUM

Header File

- components/app_trace/include/esp_sysview_trace.h

Functions

static inline esp_err_t esp_sysview_flush(uint32_t tmo)

   Flushes remaining data in SystemView trace buffer to host.

      Parameters tmo - Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.
      Returns ESP_OK.

int esp_sysview_vprintf(const char *format, va_list args)

   vprintf-like function to sent log messages to the host.

      Parameters
         - format - Address of format string.
         - args - List of arguments.
      Returns Number of bytes written.

esp_err_t esp_sysview_heap_trace_start(uint32_t tmo)

   Starts SystemView heap tracing.

      Parameters tmo - Timeout (in us) to wait for the host to be connected. Use -1 to wait forever.
      Returns ESP_OK on success, ESP_ERR_TIMEOUT if operation has been timed out.

esp_err_t esp_sysview_heap_trace_stop(void)

   Stops SystemView heap tracing.

      Returns ESP_OK.

void esp_sysview_heap_trace_alloc(void *addr, uint32_t size, const void *callers)

   Sends heap allocation event to the host.

      Parameters
         - addr - Address of allocated block.
         - size - Size of allocated block.
         - callers - Pointer to array with callstack addresses. Array size must be CONFIG_HEAP_TRACING_STACK_DEPTH.
void esp_sysview_heap_trace_free (void *addr, const void *callers)
Sends heap de-allocation event to the host.

Parameters
• addr - Address of de-allocated block.
• callers - Pointer to array with callstack addresses. Array size must be CONFIG_HEAP_TRACING_STACK_DEPTH.

2.10.4 Call Function with External Stack

Overview
A given function can be executed with a user-allocated stack space which is independent of current task stack, this mechanism can be used to save stack space wasted by tasks which call a common function with intensive stack usage such as printf. The given function can be called inside the shared stack space which is a callback function deferred by calling esp_execute_shared_stack_function(), passing that function as a parameter.

Usage
esp_execute_shared_stack_function() takes four arguments:
• a mutex object allocated by the caller, which is used to protect if the same function shares its allocated stack
• a pointer to the top of stack used for that function
• the size of stack in bytes
• a pointer to the shared stack function

The user-defined function is deferred as a callback and can be called using the user-allocated space without taking space from current task stack.

The usage may look like the code below:

```c
void external_stack_function(void)
{
    printf("Executing this printf from external stack! \n");
}

//Let us suppose we want to call printf using a separated stack space
//allowing the app to reduce its stack size.
void app_main()
{
    //Allocate a stack buffer, from heap or as a static form:
    StackType_t *shared_stack = malloc(8192 * sizeof(StackType_t));
    assert(shared_stack != NULL);

    //Allocate a mutex to protect its usage:
    SemaphoreHandle_t printf_lock = xSemaphoreCreateMutex();
    assert(printf_lock != NULL);

    //Call the desired function using the macro helper:
    esp_execute_shared_stack_function(printf_lock, shared_stack, 8192, external_stack_function);

    vSemaphoreDelete(printf_lock);
    free(shared_stack);
}
```
Chapter 2. API Reference

API Reference

Header File

- components/esp_system/include/esp_expression_with_stack.h

Functions

void esp_execute_shared_stack_function(SemaphoreHandle_t lock, void *stack, size_t stack_size, shared_stack_function function)

Calls user defined shared stack space function.

Note: if either lock, stack or stack size is invalid, the expression will be called using the current stack.

Parameters

- lock - Mutex object to protect in case of shared stack
- stack - Pointer to user allocated stack
- stack_size - Size of current stack in bytes
- function - Pointer to the shared stack function to be executed

Macros

ESP_EXECUTE_EXPRESSION_WITH_STACK(lock, stack, stack_size, expression)

Type Definitions

typedef void (*shared_stack_function)(void)

2.10.5 Chip Revision

Overview

ESP32 may have different revisions. These revisions mainly fix some issues, sometimes also bring new features to
the chip. Versioning Scheme describes the versioning of these chip revisions, and the APIs to read the versions at
runtime.

There are some considerations of compatibility among application, ESP-IDF version, and chip revisions.

- Application may depends on some fixes/features provided by a chip revision.
- When using updated version of hardware, sometimes it’s not compatible with earlier version of ESP-IDF.

Compatibility Checks of ESP-IDF describes how the application can specify its requirement and the way ESP-IDF
checks the compatibility. After that, there is troubleshooting information for this mechanism.

Versioning Scheme

A new chip versioning logic was introduced in new chips. Chip Revision vX.Y, where:

- X means Major wafer version. If it is changed, it means that the current software version is not compatible
  with this released chip and the software must be updated to use this chip.
- Y means Minor wafer version. If it is changed that means the current software version is compatible with
  the released chip, and there is no need to update the software.

The vX.Y chip version format is used further instead of the ECO number.

If the newly released chip does not have breaking changes, that means it can run the same software as the previous
chip, then in that chip we keep the same major version and increment the minor version by 1. Otherwise, if there is
a breaking change in the newly released chip, meaning it can not run the same software as the previous chip, then in that chip we increase the major version and set the minor version to 0.

The new versioning logic is being introduced to indicate the derivation relationship of chip revisions, and distinguish changes in chips as breaking changes and non-breaking changes.

Software is supposed to execute on a future chip revision with the same logic as the chip’s nearest previous revision. This way user can directly port their compiled binaries to newer MINOR chip revisions without upgrading their ESP-IDF version and re-compile the whole project.

When a binary is executed on a chip revision of unexpected MAJOR revision, the software is also able to report issues according to the MAJOR revision.

The major and minor versioning scheme also allows hardware changes to be branchable.

**EFuse Bits for Chip Revisions** Chips have several eFuse version fields:

- Major wafer version (`WAFER_VERSION_MAJOR` eFuse)
- Minor wafer version (`WAFER_VERSION_MINOR` eFuse)
- Ignore maximum revision (`DISABLE_WAFER_VERSION_MAJOR` eFuse). See *Compatibility Checks of ESP-IDF* on how this is used.

**Note:** The previous versioning logic was based on a single eFuse version field (`WAFER_VERSION`). This approach makes it impossible to mark chips as breaking or non-breaking changes, and the versioning logic becomes linear.

**Chip Revision APIs** These APIs helps to get chip revision from eFuses:

- `efuse_hal_chip_revision()`. It returns revision in the `major * 100 + minor` format.
- `efuse_hal_get_major_chip_version()`. It returns Major revision.
- `efuse_hal_get_minor_chip_version()`. It returns Minor revision.

The following Kconfig definitions (in `major * 100 + minor` format) that can help add the chip revision dependency to the code:

- `CONFIG_ESP32_REV_MIN_FULL`
- `CONFIG_ESP_REV_MIN_FULL`
- `CONFIG_ESP32_REV_MAX_FULL`
- `CONFIG_ESP_REV_MAX_FULL`

**Compatibility Checks of ESP-IDF**

The application supports a number of chip revisions, from the minimum to the maximum (the min/max configs are defined in Kconfig).

Minimum version, selected by Kconfig option `CONFIG_ESP32_REV_MIN`, limits the software to only run on a chip revision that is high enough to support some features or include some bugfixes.

Maximum version, determined by the version of ESP-IDF used, is the maximum chip revision that is well-supported by current ESP-IDF. It’s usually `maximum supported MAJOR version + 99`. When chip revision is above the maximum version, it means that ESP-IDF is unaware of the new chip revision. In this case, software will reject to boot, unless the Ignore maximum revision restrictions bit is set (which bypasses the maximum revision limitation). However, the software may not work on, or work with risk on the chip.

Below is the information about troubleshooting when the chip revision fails the compatibility check. Then there are technical details of the checking and software behavior on earlier version of ESP-IDF.

**Troubleshooting**

1. If the 2nd stage bootloader is run on the chip revision < minimum revision shown in the image, a reboot occurs. The following message will be printed:
Chapter 2. API Reference

Image requires chip rev >= v3.0, but chip is v1.0

To resolve this issue:

• make sure the chip you are using is suitable for the software, or use a chip with the required minimum revision or higher.
• update the software with `CONFIG_ESP32_REV_MIN` to get it <= the revision of chip being used

2. If application does not match minimum and maximum chip revisions, a reboot occurs. The following message will be printed:

Image requires chip rev <= v2.99, but chip is v3.0

To resolve this issue, update the ESP-IDF to a newer version that supports the used chip (`CONFIG_ESP32_REV_MAX_FULL`). Another way to fix this is to set the Ignore maximal revision bit in eFuse or use a chip that is suitable for the software.

Representing Revision Requirement of a Binary Image  The 2nd stage bootloader and the application binary images have the `esp_image_header_t` header, which stores the revision numbers of the chip on which the software can be run. This header has 3 fields related to revisions:

• `min_chip_rev` - Minimum chip MAJOR revision required by image (but for ESP32-C3 it is MINOR revision). Its value is determined by `CONFIG_ESP32_REV_MIN`.
• `min_chip_rev_full` - Minimum chip MINOR revision required by image in format: major * 100 + minor. Its value is determined by `CONFIG_ESP32_REV_MIN`.
• `max_chip_rev_full` - Maximum chip revision required by image in format: major * 100 + minor. Its value is determined by `CONFIG_ESP32_REV_MAX_FULL`. It can not be changed by user. Only Espressif can change it when a new version will be supported in ESP-IDF.

Maximum And Minumum Revision Restrictions The order for checking the minimum and maximum revisions:

1. The 1st stage bootloader (ROM bootloader) does not check minimum and maximum revision fields from `esp_image_header_t` before running the 2nd stage bootloader.
2. The 2nd stage bootloader checks at the initialization phase that bootloader itself can be launched on the chip of this revision. It extracts the minimum revision from the header of the bootloader image and checks against the chip revision from eFuses. If the chip revision is less than the minimum revision, the bootloader refuses to boot up and aborts. The maximum revision is not checked at this phase.
3. Then the 2nd stage bootloader checks the revision requirements of the application. It extracts the minimum and maximum revisions from the header of the application image and checks against the chip revision from eFuses. If the chip revision is less than the minimum revision or higher than the maximum revision, the bootloader refuses to boot up and aborts. However, if the Ignore maximum revision bit is set, the maximum revision constraint can be ignored. The ignore bit is set by the customer themself when there is confirmation that the software is able to work with this chip revision.
4. Further, at the OTA update stage, the running application checks if the new software matches the chip revision. It extracts the minimum and maximum revisions from the header of the new application image and checks against the chip revision from eFuses. It checks for revision matching in the same way that the bootloader does, so that the chip revision is between the min and max revisions (logic of ignoring max revision also applies).

Backward Compatible With Bootloaders Built By Older ESP-IDF Versions The old bootloaders (ESP-IDF < v5.0) do not know about Major and Minor wafer version eFuses. They use one single eFuse for this - wafer version. The old bootloaders did not read the minor wafer version eFuse, the major version can be only <= v3. So it means that the old bootloader can detect correctly only chip version in range v0.0 - v3.0, where the minor version is always set to 0.

Please check the chip version using `esptool chip_id` command.

Functions

```c
void efuse_hal_get_mac (uint8_t* mac)
get factory mac address
uint32_t efuse_hal_chip_revision (void)
Returns chip version.
    Returns Chip version in format: Major * 100 + Minor
uint32_t efuse_hal_blk_version (void)
Return block version.
    Returns Block version in format: Major * 100 + Minor
bool efuse_hal_flash_encryption_enabled (void)
Is flash encryption currently enabled in hardware?
Flash encryption is enabled if the FLASHCRYPT_CNT efuse has an odd number of bits set.
    Returns true if flash encryption is enabled.
bool efuse_hal_get_disable_wafer_version_major (void)
Returns the status of whether the bootloader (and OTA) will check the maximum chip version or not.
    Returns true - Skip the maximum chip version check.
uint32_t efuse_hal_get_major_chip_version (void)
Returns major chip version.
uint32_t efuse_hal_get_minor_chip_version (void)
Returns minor chip version.
```

2.10.6 Console

ESP-IDF provides console component, which includes building blocks needed to develop an interactive console over serial port. This component includes the following features:

- Line editing, provided by linenoise library. This includes handling of backspace and arrow keys, scrolling through command history, command auto-completion, and argument hints.
- Splitting of command line into arguments.
- Argument parsing, provided by argtable3 library. This library includes APIs used for parsing GNU style command line arguments.
- Functions for registration and dispatching of commands.
- Functions to establish a basic REPL (Read-Evaluate-Print-Loop) environment.
Note: These features can be used together or independently. For example, it is possible to use line editing and command registration features, but use `getopt` or custom code for argument parsing, instead of `argtable3`. Likewise, it is possible to use simpler means of command input (such as `fgets`) together with the rest of the means for command splitting and argument parsing.

Note: When using a console application on a chip that supports a hardware USB serial interface, we suggest to disable the secondary serial console output. The secondary output will be output-only and consequently does not make sense in an interactive application.

Line Editing

Line editing feature lets users compose commands by typing them, erasing symbols using the backspace key, navigating within the command using the left/right keys, navigating to previously typed commands using the up/down keys, and performing autocompletion using the tab key.

Note: This feature relies on ANSI escape sequence support in the terminal application. As such, serial monitors which display raw UART data cannot be used together with the line editing library. If you see `\[6n` or similar escape sequence when running `system/console` example instead of a command prompt (e.g., `esp>`), it means that the serial monitor does not support escape sequences. Programs which are known to work are GNU screen, minicom, and esp-idf-monitor (which can be invoked using `idf.py monitor` from project directory).

Here is an overview of functions provided by `linenoise` library.

Configuration

Linenoise library does not need explicit initialization. However, some configuration defaults may need to be changed before invoking the main line editing function.

- `linenoiseClearScreen()`: Clear terminal screen using an escape sequence and position the cursor at the top left corner.
- `linenoiseSetMultiLine()`: Switch between single line and multi line editing modes. In single line mode, if the length of the command exceeds the width of the terminal, the command text is scrolled within the line to show the end of the text. In this case the beginning of the text is hidden. Single line mode needs less data to be sent to refresh screen on each key press, so exhibits less glitching compared to the multi line mode. On the flip side, editing commands and copying command text from terminal in single line mode is harder. Default is single line mode.
- `linenoiseAllowEmpty()`: Set whether linenoise library returns a zero-length string (if `true`) or NULL (if `false`) for empty lines. By default, zero-length strings are returned.
- `linenoiseSetMaxLineLen()`: Set maximum length of the line for linenoise library. Default length is 4096 bytes. The default value can be updated to optimize RAM memory usage.

Main Loop

- `linenoise()`: In most cases, console applications have some form of read/eval loop. `linenoise()` is the single function which handles user’s key presses and returns the completed line once the `enter` key is pressed. As such, it handles the read part of the loop.
- `linenoiseFree()`: This function must be called to release the command line buffer obtained from `linenoise()` function.

Hints and Completions
• `linenoiseSetCompletionCallback()`
  When the user presses the tab key, linenoise library invokes the completion callback. The callback should inspect the contents of the command typed so far and provide a list of possible completions using calls to `linenoiseAddCompletion()` function. `linenoiseSetCompletionCallback()` function should be called to register this completion callback, if completion feature is desired.
  
  console component provides a ready made function to provide completions for registered commands, `esp_console_get_completion()` (see below).

• `linenoiseAddCompletion()`
  Function to be called by completion callback to inform the library about possible completions of the currently typed command.

• `linenoiseSetHintsCallback()`
  Whenever user input changes, linenoise invokes the hints callback. This callback can inspect the command line typed so far, and provide a string with hints (which can include list of command arguments, for example). The library then displays the hint text on the same line where editing happens, possibly with a different color.
  
  • `linenoiseSetFreeHintsCallback()`
    If the hint string returned by hints callback is dynamically allocated or needs to be otherwise recycled, the function which performs such cleanup should be registered via `linenoiseSetFreeHintsCallback()`.

**History**

• `linenoiseHistorySetMaxLen()`
  This function sets the number of most recently typed commands to be kept in memory. Users can navigate the history using the up/down arrows keys.

• `linenoiseHistoryAdd()`
  Linenoise does not automatically add commands to history. Instead, applications need to call this function to add command strings to the history.

• `linenoiseHistorySave()`
  Function saves command history from RAM to a text file, for example on an SD card or on a filesystem in flash memory.

• `linenoiseHistoryLoad()`
  Counterpart to `linenoiseHistorySave()`, loads history from a file.

• `linenoiseHistoryFree()`
  Releases memory used to store command history. Call this function when done working with linenoise library.

**Splitting of Command Line into Arguments**

console component provides `esp_console_split_argv()` function to split command line string into arguments. The function returns the number of arguments found (`argc`) and fills an array of pointers which can be passed as `argv` argument to any function which accepts arguments in `argc, argv` format.

The command line is split into arguments according to the following rules:

• Arguments are separated by spaces
• If spaces within arguments are required, they can be escaped using `\` (backslash) character.
• Other escape sequences which are recognized are `\` (which produces literal backslash) and `\"`, which produces a double quote.
• Arguments can be quoted using double quotes. Quotes may appear only in the beginning and at the end of the argument. Quotes within the argument must be escaped as mentioned above. Quotes surrounding the argument are stripped by `esp_console_split_argv` function.

Examples:

• `abc  def  1 20 .3` -> `[abc, def, 1, 20, .3]`
• `abc 123 456  def` -> `[abc, 123, 456, def ]`
• `a \b\c"` -> `[a b\c" ]`
Chapter 2. API Reference

Argument Parsing

For argument parsing, console component includes argtable3 library. Please see tutorial for an introduction to argtable3. Github repository also includes examples.

Command Registration and Dispatching

console component includes utility functions which handle registration of commands, matching commands typed by the user to registered ones, and calling these commands with the arguments given on the command line.

Application first initializes command registration module using a call to esp_console_init(), and calls esp_console_cmd_register() function to register command handlers.

For each command, application provides the following information (in the form of esp_console_cmd_t structure):

• Command name (string without spaces)
• Help text explaining what the command does
• Optional hint text listing the arguments of the command. If application uses Argtable3 for argument parsing, hint text can be generated automatically by providing a pointer to argtable argument definitions structure instead.
• The command handler function.

A few other functions are provided by the command registration module:

• esp_console_run()
  This function takes the command line string, splits it into argc/argv argument list using esp_console_split_argv(), looks up the command in the list of registered components, and if it is found, executes its handler.
• esp_console_register_help_command()
  Adds help command to the list of registered commands. This command prints the list of all the registered commands, along with their arguments and help texts.
• esp_console_get_completion()
  Callback function to be used with linenoiseSetCompletionCallback() from linenoise library. Provides completions to linenoise based on the list of registered commands.
• esp_console_get_hint()
  Callback function to be used with linenoiseSetHintsCallback() from linenoise library. Provides argument hints for registered commands to linenoise.

Initialize Console REPL Environment

To establish a basic REPL environment, console component provides several useful APIs, combining those functions described above.

In a typical application, you only need to call esp_console_new_repl_uart() to initialize the REPL environment based on UART device, including driver install, basic console configuration, spawning a thread to do REPL task and register several useful commands (e.g., help).

After that, you can register your own commands with esp_console_cmd_register(). The REPL environment keeps in init state until you call esp_console_start_repl().

Application Example

Example application illustrating usage of the console component is available in system/console directory. This example shows how to initialize UART and VFS functions, set up linenoise library, read and handle commands from UART, and store command history in Flash. See README.md in the example directory for more details.

Besides that, ESP-IDF contains several useful examples which are based on the console component and can be treated as “tools” when developing applications. For example, peripherals/i2c/i2c_tools, wifi/iperf.
API Reference

Header File

- components/console/esp_console.h

Functions

**esp_err_t esp_console_init**(const esp_console_config_t *config)

initialize console module

**Note:** Call this once before using other console module features

**Parameters**

config – console configuration

**Returns**

- ESP_OK on success
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_STATE if already initialized
- ESP_ERR_INVALID_ARG if the configuration is invalid

**esp_err_t esp_console_deinit**(void)

de-initialize console module

**Note:** Call this once when done using console module functions

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized yet

**esp_err_t esp_console_cmd_register**(const esp_console_cmd_t *cmd)

Register console command.

**Parameters**

cmd – pointer to the command description; can point to a temporary value

**Returns**

- ESP_OK on success
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_ARG if command description includes invalid arguments

**esp_err_t esp_console_run**(const char *cmdline, int *cmd_ret)

Run command line.

**Parameters**

cmdline – command line (command name followed by a number of arguments)

**Returns**

- ESP_OK, if command was run
- ESP_ERR_INVALID_ARG, if the command line is empty, or only contained whitespace
- ESP_ERR_NOT_FOUND, if command with given name wasn’t registered
- ESP_ERR_INVALID_STATE, if esp_console_init wasn’t called

**size_t esp_console_split_argv**(char *line, char **argv, size_t argv_size)

Split command line into arguments in place.
This function finds whitespace-separated arguments in the given input line.

'abc def 1 20 .3' -> [ 'abc', 'def', '1', '20', '.3' ]

Argument which include spaces may be surrounded with quotes. In this case spaces are preserved and quotes are stripped.

'abc "123 456" def' -> [ 'abc', '123 456', 'def' ]

Escape sequences may be used to produce backslash, double quote, and space:

'a\ b\c"' -> [ 'a b\c' ]

Note: Pointers to at most argv_size - 1 arguments are returned in argv array. The pointer after the last one (i.e. argv[argc]) is set to NULL.

Parameters

- **line** - pointer to buffer to parse; it is modified in place
- **argv** - array where the pointers to arguments are written
- **argv_size** - number of elements in argv_array (max. number of arguments)

Returns number of arguments found (argc)

```c
void esp_console_get_completion(const char* buf, linenoiseCompletions *lc)
```

Callback which provides command completion for linenoise library.

When using linenoise for line editing, command completion support can be enabled like this:

```
linenoiseSetCompletionCallback(&esp_console_get_completion);
```

Parameters

- **buf** - the string typed by the user
- **lc** - linenoiseCompletions to be filled in

```c
const char* esp_console_get_hint(const char* buf, int*color, int*bold)
```

Callback which provides command hints for linenoise library.

When using linenoise for line editing, hints support can be enabled as follows:

```
linenoiseSetHintsCallback((linenoiseHintsCallback*) &esp_console_get_hint);
```

The extra cast is needed because linenoiseHintsCallback is defined as returning a char* instead of const char*.

Parameters

- **buf** - line typed by the user
- **color** - [out] ANSI color code to be used when displaying the hint
- **bold** - [out] set to 1 if hint has to be displayed in bold

Returns string containing the hint text. This string is persistent and should not be freed (i.e. linenoiseSetFreeHintsCallback should not be used).

```c
esp_err_t esp_console_register_help_command(void)
```

Register a ‘help’ command.

Default ‘help’ command prints the list of registered commands along with hints and help strings if no additional argument is given. If an additional argument is given, the help command will look for a command with the same name and only print the hints and help strings of that command.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE, if esp_console_init wasn’t called
Esp_err_t esp_console_new_repl_uart(const esp_console_dev_uart_config_t *dev_config, const esp_console_repl_config_t *repl_config, esp_console_repl_t **ret_repl)

Establish a console REPL environment over UART driver.

Attention This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying linenoise and esp_console functions.

Note: This is an all-in-one function to establish the environment needed for REPL, includes:

- Install the UART driver on the console UART (8n1, 115200, REF_TICK clock source)
- Configures the stdin/stdout to go through the UART driver
- Initializes linenoise
- Spawn new thread to run REPL in the background

Parameters

- dev_config [in] UART device configuration
- repl_config [in] REPL configuration
- ret_repl [out] return REPL handle after initialization succeed, return NULL otherwise

Returns

- ESP_OK on success
- ESP_FAIL Parameter error

Esp_err_t esp_console_start_repl(esp_console_repl_t *repl)

Start REPL environment.

Note: Once the REPL gets started, it won’t be stopped until the user calls repl->del(repl) to destroy the REPL environment.

Parameters repl [in] REPL handle returned from esp_console_new_repl_xxx

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE, if repl has started already

Structures

struct esp_console_config_t

Parameters for console initialization.

Public Members

size_t max_cmdline_length

length of command line buffer, in bytes

size_t max_cmdline_args

maximum number of command line arguments to parse

uint32_t heap_alloc_caps

where to (e.g. MALLOC_CAP_SPIRAM) allocate heap objects such as cmds used by esp_console

Submit Document Feedback
int hint_color
    ASCII color code of hint text.

int hint_bold
    Set to 1 to print hint text in bold.

struct esp_console_repl_config_t
    Parameters for console REPL (Read Eval Print Loop)

    Public Members

    uint32_t max_history_len
        maximum length for the history

    const char *history_save_path
        file path used to save history commands, set to NULL won’t save to file system

    uint32_t task_stack_size
        repl task stack size

    uint32_t task_priority
        repl task priority

    const char *prompt
        prompt (NULL represents default: “esp> “)

    size_t max_cmdline_length
        maximum length of a command line. If 0, default value will be used

struct esp_console_dev_uart_config_t
    Parameters for console device: UART.

    Public Members

    int channel
        UART channel number (count from zero)

    int baud_rate
        Communication baud rate.

    int tx_gpio_num
        GPIO number for TX path, -1 means using default one.

    int rx_gpio_num
        GPIO number for RX path, -1 means using default one.

struct esp_console_cmd_t
    Console command description.
Public Members

const char *command
Command name. Must not be NULL, must not contain spaces. The pointer must be valid until the call to esp_console_deinit.

const char *help
Help text for the command, shown by help command. If set, the pointer must be valid until the call to esp_console_deinit. If not set, the command will not be listed in ‘help’ output.

const char *hint
Hint text, usually lists possible arguments. If set to NULL, and ‘argtable’ field is non-NULL, hint will be generated automatically.

esp_console_cmd_func_t func
Pointer to a function which implements the command.

void *argtable
Array or structure of pointers to arg_xxx structures, may be NULL. Used to generate hint text if ‘hint’ is set to NULL. Array/structure which this field points to must end with an arg_end. Only used for the duration of esp_console_cmd_register call.

struct esp_console_repl_s
Console REPL base structure.

Public Members

esp_err_t (*del)(esp_console_repl_t *repl)
Delete console REPL environment.

Param repl [in] REPL handle returned from esp_console_new_repl_xxx
Return
• ESP_OK on success
• ESP_FAIL on errors

Macros
ESP_CONSOLE_CONFIG_DEFAULT()
Default console configuration value.

ESP_CONSOLE_REPL_CONFIG_DEFAULT()
Default console repl configuration value.

ESP_CONSOLE_DEV_UART_CONFIG_DEFAULT()

Type Definitions
typedef struct linenoiseCompletions linenoiseCompletions
typedef int (*esp_console_cmd_func_t)(int argc, char **argv)
Console command main function.

Param argc number of arguments
Param argv array with argc entries, each pointing to a zero-terminated string argument
Return  console command return code, 0 indicates “success”

typedef struct esp_console_repl_s esp_console_repl_t
     Type defined for console REPL.

2.10.7  eFuse Manager

Introduction

The eFuse Manager library is designed to structure access to eFuse bits and make using these easy. This library operates eFuse bits by a structure name which is assigned in eFuse table. This section introduces some concepts used by eFuse Manager.

Hardware Description

The ESP32 has a number of eFuses which can store system and user parameters. Each eFuse is a one-bit field which can be programmed to 1 after which it cannot be reverted back to 0. Some of system parameters are using these eFuse bits directly by hardware modules and have special place (for example EFUSE_BLK0).

For more details, see ESP32 Technical Reference Manual > eFuse Controller (eFuse) [PDF]. Some eFuse bits are available for user applications.

ESP32 has 4 eFuse blocks each of the size of 256 bits (not all bits are available):

- EFUSE_BLK0 is used entirely for system purposes;
- EFUSE_BLK1 is used for flash encrypt key. If not using that Flash Encryption feature, they can be used for another purpose;
- EFUSE_BLK2 is used for security boot key. If not using that Secure Boot feature, they can be used for another purpose;
- EFUSE_BLK3 can be partially reserved for the custom MAC address, or used entirely for user application. Note that some bits are already used in ESP-IDF.

Each block is divided into 8 32-bits registers.

eFuse Manager Component

The component has API functions for reading and writing fields. Access to the fields is carried out through the structures that describe the location of the eFuse bits in the blocks. The component provides the ability to form fields of any length and from any number of individual bits. The description of the fields is made in a CSV file in a table form. To generate from a tabular form (CSV file) in the C-source uses the tool efuse_table_gen.py. The tool checks the CSV file for uniqueness of field names and bit intersection, in case of using a custom file from the user’s project directory, the utility checks with the common CSV file.

CSV files:

- common (esp_efuse_table.csv) - contains eFuse fields which are used inside the ESP-IDF. C-source generation should be done manually when changing this file (run command idf.py efuse-common-table). Note that changes in this file can lead to incorrect operation.
- custom - (optional and can be enabled by CONFIG_EFUSE_CUSTOM_TABLE) contains eFuse fields that are used by the user in their application. C-source generation should be done manually when changing this file and running idf.py efuse-custom-table.

Description CSV File

The CSV file contains a description of the eFuse fields. In the simple case, one field has one line of description. Table header:
Individual params in CSV file the following meanings:

field_name

Name of field. The prefix ESP_EFUSE_ is added to the name, and this field name is available in the code. This name is used to access the fields. The name must be unique for all fields. If the line has an empty name, then this line is combined with the previous field. This allows you to set an arbitrary order of bits in the field, and expand the field as well (see MAC_FACTORY field in the common table). The field_name supports structured format using . to show that the field belongs to another field (see WR_DIS and RD_DIS in the common table).

efuse_block

Block number. It determines where the eFuse bits are placed for this field. Available EFUSE_BLK0..EFUSE_BLK3.

bit_start

Start bit number (0..255). The bit_start field can be omitted. In this case, it is set to bit_start + bit_count from the previous record, if it has the same efuse_block. Otherwise (if efuse_block is different, or this is the first entry), an error will be generated.

bit_count

The number of bits to use in this field (1..-). This parameter cannot be omitted. This field also may be MAX_BLK_LEN in this case, the field length has the maximum block length, taking into account the coding scheme (applicable for ESP_EFUSE_SECURE_BOOT_KEY and ESP_EFUSE_ENCRYPT_FLASH_KEY fields). The value MAX_BLK_LEN depends on CONFIG_EFUSE_CODE_SCHEME_SELECTOR, which will be replaced with “None” - 256, “3/4” - 192, “REPEAT” - 128.

comment

This param is using for comment field, it also move to C-header file. The comment field can be omitted.

If a non-sequential bit order is required to describe a field, then the field description in the following lines should be continued without specifying a name, indicating that it belongs to one field. For example two fields MAC_FACTORY and MAC_FACTORY_CRC:

```plaintext
# Factory MAC address #
#########################
MAC_FACTORY, EFUSE_BLK0, 72, 8, Factory MAC addr [0]
, EFUSE_BLK0, 64, 8, Factory MAC addr [1]
, EFUSE_BLK0, 56, 8, Factory MAC addr [2]
, EFUSE_BLK0, 48, 8, Factory MAC addr [3]
, EFUSE_BLK0, 40, 8, Factory MAC addr [4]
, EFUSE_BLK0, 32, 8, Factory MAC addr [5]
MAC_FACTORY_CRC, EFUSE_BLK0, 80, 8, CRC8 for factory MAC address
```

This field is available in code as ESP_EFUSE_MAC_FACTORY and ESP_EFUSE_MAC_FACTORY_CRC.

**Structured eFuse Fields**

```plaintext
WR_DIS, EFUSE_BLK0, 0, 32, Write protection
WR_DIS.RD_DIS, EFUSE_BLK0, 0, 1, Write protection for...
- RD_DIS
WR_DIS.FIELD_1, EFUSE_BLK0, 1, 1, Write protection for...
- FIELD_1
WR_DIS.FIELD_2, EFUSE_BLK0, 2, 4, Write protection for...
- FIELD_2 (includes B1 and B2)
```
The structured eFuse field looks like `WR_DIS.RD_DIS` where the dot points that this field belongs to the parent field `WR_DIS` and cannot be out of the parent’s range.

It is possible to use some levels of structured fields as `WR_DIS.FIELD_2.B1` and `B2`. These fields should not be crossed each other and should be in the range of two fields: `WR_DIS` and `WR_DIS.FIELD_2`.

It is possible to create aliases for fields with the same range, see `WR_DIS.FIELD_3` and `WR_DIS.FIELD_3.ALIAS`.

The ESP-IDF names for structured eFuse fields should be unique. The `efuse_table_gen` tool generates the final names where the dot is replaced by `_`. The names for using in ESP-IDF are `ESP_EFUSE_WR_DIS`, `ESP_EFUSE_WR_DIS_RD_DIS`, `ESP_EFUSE_WR_DIS_FIELD_2_B1`, etc.

The `efuse_table_gen` tool checks that the fields do not overlap each other and must be within the range of a field if there is a violation, then throws the following error:

```
Field at USER_DATA, EFUSE_BLK3, 0, 256 intersected with SERIAL_NUMBER, EFUSE_BLK3, 0, 32
```

**Solution:** Describe `SERIAL_NUMBER` to be included in USER_DATA. (USER_DATA.SERIAL_NUMBER).

```
Field at FEILD, EFUSE_BLK3, 0, 50 out of range FEILD.MAJOR_NUMBER, EFUSE_BLK3, 0, 60, 32
```

**Solution:** Change bit_start for `FIELD.MAJOR_NUMBER` from 60 to 0, so `MAJOR_NUMBER` is in the `FEILD` range.

**efuse_table_gen.py Tool**

The tool is designed to generate C-source files from CSV file and validate fields. First of all, the check is carried out on the uniqueness of the names and overlaps of the field bits. If an additional custom file is used, it will be checked with the existing common file (esp_efuse_table.csv). In case of errors, a message will be displayed and the string that caused the error. C-source files contain structures of type `esp_efuse_desc_t`.

To generate a common files, use the following command `idf.py efuse-common-table` or:

```
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py --idf_target esp32 esp32/esp_efuse_table.csv
```

After generation in the folder `$IDF_PATH/components/efuse/esp32` create:

- `esp_efuse_table.c` file.
- In `include` folder `esp_efuse_table.c` file.

To generate a custom files, use the following command `idf.py efuse-custom-table` or:

```
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py --idf_target esp32 esp32/esp_efuse_table.csv PROJECT_PATH/
--main/esp_efuse_custom_table.csv
```

After generation in the folder `PROJECT_PATH/main` create:
• esp_efuse_custom_table.c file.
• In include folder esp_efuse_custom_table.c file.

To use the generated fields, you need to include two files:

```c
#include "esp_efuse.h"
#include "esp_efuse_table.h" // or "esp_efuse_custom_table.h"
```

**Supported Coding Scheme**

eFuse have three coding schemes:

- None (value 0).
- 3/4 (value 1).
- Repeat (value 2).

The coding scheme affects only EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3 blocks. EUSE_BLK0 block always has a coding scheme None. Coding changes the number of bits that can be written into a block, the block length is constant 256, some of these bits are used for encoding and not available for the user.

When using a coding scheme, the length of the payload that can be written is limited (for more details 20.3.1.3 System Parameter coding_scheme):

- None 256 bits.
- 3/4 192 bits.
- Repeat 128 bits.

You can find out the coding scheme of your chip:

- run a espefuse.py -p PORT summary command.
- from esptool utility logs (during flashing).
- calling the function in the code esp_efuse_get_coding_scheme() for the EFUSE_BLK3 block.

eFuse tables must always comply with the coding scheme in the chip. There is an CONFIG_EFUSE_CODE_SCHEME_SELECTOR option to select the coding type for tables in a Kconfig. When generating source files, if your tables do not follow the coding scheme, an error message will be displayed. Adjust the length or offset fields. If your program was compiled with None encoding and 3/4 is used in the chip, then the ESP_ERR_CODING error may occur when calling the eFuse API (the field is outside the block boundaries). If the field matches the new block boundaries, then the API will work without errors.

Also, 3/4 coding scheme imposes restrictions on writing bits belonging to one coding unit. The whole block with a length of 256 bits is divided into 4 coding units, and in each coding unit there are 6 bytes of useful data and 2 service bytes. These 2 service bytes contain the checksum of the previous 6 data bytes.

It turns out that only one field can be written into one coding unit. Repeated rewriting in one coding unit is prohibited. But if the record was made in advance or through a esp_efuse_write_block() function, then reading the fields belonging to one coding unit is possible.

In case 3/4 coding scheme, the writing process is divided into the coding units and we cannot use the usual mode of writing some fields. We can prepare all the data for writing and burn it in one time. You can also use this mode for None coding scheme but it is not necessary. It is important for 3/4 coding scheme. The batch writing mode blocks esp_efuse_read... operations.

After changing the coding scheme, run efuse_common_table and efuse_custom_table commands to check the tables of the new coding scheme.

To write some fields into one block, or different blocks in one time, you need to use the batch writing mode. Firstly set this mode through esp_efuse_batch_write_begin() function then write some fields as usual using the esp_efuse_write... functions. At the end to burn them, call the esp_efuse_batch_write_commit() function. It burns prepared data to the eFuse blocks and disables the batch recording mode.
**Note:** If there is already pre-written data in the eFuse block using the 3/4 or Repeat encoding scheme, then it is not possible to write anything extra (even if the required bits are empty) without breaking the previous encoding data. This encoding data will be overwritten with new encoding data and completely destroyed (however, the payload eFuses are not damaged). It can be related to: CUSTOM_MAC, SPI_PAD_CONFIG HD, SPI_PAD_CONFIG_CS, etc. Please contact Espressif to order the required pre-burnt eFuses.

FOR TESTING ONLY (NOT RECOMMENDED): You can ignore or suppress errors that violate encoding scheme data in order to burn the necessary bits in the eFuse block.

---

### eFuse API

Access to the fields is via a pointer to the description structure. API functions have some basic operation:

- `esp_efuse_read_field_blob()` - returns an array of read eFuse bits.
- `esp_efuse_read_field_cnt()` - returns the number of bits programmed as “1”.
- `esp_efuse_write_field_blob()` - writes an array.
- `esp_efuse_write_field_cnt()` - writes a required count of bits as “1”.
- `esp_efuse_get_field_size()` - returns the number of bits by the field name.
- `esp_efuse_read_reg()` - returns value of eFuse register.
- `esp_efuse_write_reg()` - writes a required count of bits as “1”.
- `esp_efuse_get_coding_scheme()` - returns eFuse coding scheme for blocks.
- `esp_efuse_read_block()` - reads key to eFuse block starting at the offset and the required size.
- `esp_efuse_write_block()` - writes key to eFuse block starting at the offset and the required size.
- `esp_efuse_batch_write_begin()` - set the batch mode of writing fields.
- `esp_efuse_batch_write_commit()` - writes all prepared data for batch writing mode and reset the batch writing mode.
- `esp_efuse_batch_write_cancel()` - reset the batch writing mode and prepared data.
- `esp_efuse_get_key_dis_read()` - Returns a read protection for the key block.
- `esp_efuse_set_key_dis_read()` - Sets a read protection for the key block.
- `esp_efuse_get_key_dis_write()` - Returns a write protection for the key block.
- `esp_efuse_set_key_dis_write()` - Sets a write protection for the key block.
- `esp_efuse_get_key_purpose()` - Returns the current purpose set for an eFuse key block.
- `esp_efuse_write_key()` - Programs a block of key data to an eFuse block.
- `esp_efuse_write_keys()` - Programs keys to unused eFuse blocks.
- `esp_efuse_find_purpose()` - Finds a key block with the particular purpose set.
- `esp_efuse_get_keypurpose_dis_write()` - Returns a write protection of the key purpose field for an eFuse key block (for esp32 always true).
- `esp_efuse_key_block_unused()` - Returns true if the key block is unused, false otherwise.

For frequently used fields, special functions are made, like this `esp_efuse_get_pkg_ver()`.

### How to Add a New Field

1. Find a free bits for field. Show `esp_efuse_table.csv` file or run `idf.py show-efuse-table` or the next command:

```bash
$./efuse_table_gen.py esp32/esp_efuse_table.csv --info
```

Parsing eFuse CSV input file $IDF_PATH/components/efuse/esp32/esp_efuse_table.csv .

Verifying eFuse table...
Max number of bits in BLK 192

</table>

Used bits in efuse table:

```
EFUSE_BLK0:
[0 15] [0 2] [2 3] ... [19 19] [19 27] [32 87] [96 111] [128 140] [142 144] [160-180] [182 185] [188 202]
EFUSE_BLK1:
[0 191]
EFUSE_BLK2:
[0 191]
EFUSE_BLK3:
[0 55] [96 159] [184 191]
```

Note: Not printed ranges are free for using. (bits in EFUSE_BLK0 are reserved for Espressif).

The number of bits not included in square brackets is free (some bits are reserved for Espressif). All fields are checked.
for overlapping.

To add fields to an existing field, use the `Structured efuse fields` technique. For example, adding the fields: `SERIAL_NUMBER`, `MODEL_NUMBER` and `HARDWARE_REV` to an existing `USER_DATA` field. Use . (dot) to show an attachment in a field.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Block</th>
<th>Bit Start</th>
<th>Bit Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>USER_DATA.SERIAL_NUMBER</td>
<td>EFUSE.BLK3</td>
<td>0</td>
<td>32</td>
</tr>
<tr>
<td>USER_DATA.MODEL_NUMBER</td>
<td>EFUSE.BLK3</td>
<td>32</td>
<td>10</td>
</tr>
<tr>
<td>USER_DATA.HARDWARE_REV</td>
<td>EFUSE.BLK3</td>
<td>42</td>
<td>10</td>
</tr>
</tbody>
</table>

2. Fill a line for field: `field_name, efuse_block, bit_start, bit_count, comment`. 
3. Run a `show_efuse_table` command to check eFuse table. To generate source files run `efuse_common_table` or `efuse_custom_table` command.

You may get errors such as `intersects with` or `out of range`. Please see how to solve them in the `Structured efuse fields` article.

**Bit Order**

The eFuses bit order is little endian (see the example below), it means that eFuse bits are read and written from LSB to MSB:

```bash
$ espefuse.py dump

USER_DATA (BLOCK3) [3] read_regs: 03020100 07060504 0B0A0908...
  0F0E0D0C 13121111 17161514 1B1A1918 1F1E1D1C

BLOCK4 (BLOCK4) [4] read_regs: 03020100 07060504 0B0A0908...
  0F0E0D0C 13121111 17161514 1B1A1918 1F1E1D1C

where is the register representation:

- `EFUSE_RD_USR_DATA0_REG` = 0x03020100
- `EFUSE_RD_USR_DATA1_REG` = 0x07060504
- `EFUSE_RD_USR_DATA2_REG` = 0x0B0A0908
- `EFUSE_RD_USR_DATA3_REG` = 0x0F0E0D0C
- `EFUSE_RD_USR_DATA4_REG` = 0x13121111
- `EFUSE_RD_USR_DATA5_REG` = 0x17161514
- `EFUSE_RD_USR_DATA6_REG` = 0x1B1A1918
- `EFUSE_RD_USR_DATA7_REG` = 0x1F1E1D1C

where is the byte representation:

- `byte[0] = 0x00`, `byte[1] = 0x01`, ... `byte[3] = 0x03`, `byte[4] = 0x04`, ..., `byte[31]`...
- `= 0x1F`

For example, csv file describes the `USER_DATA` field, which occupies all 256 bits (a whole block).

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Block</th>
<th>Bit Start</th>
<th>Bit Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>USER_DATA</td>
<td>EFUSE.BLK3</td>
<td>0</td>
<td>256</td>
</tr>
<tr>
<td>USER_DATA.FIELD1</td>
<td>EFUSE.BLK3</td>
<td>16</td>
<td>16</td>
</tr>
<tr>
<td>ID</td>
<td>EFUSE.BLK4</td>
<td>8</td>
<td>3</td>
</tr>
<tr>
<td>,</td>
<td>EFUSE.BLK4</td>
<td>16</td>
<td>2</td>
</tr>
<tr>
<td>,</td>
<td>EFUSE.BLK4</td>
<td>32</td>
<td>3</td>
</tr>
</tbody>
</table>

Thus, reading the eFuse `USER_DATA` block written as above gives the following results:

```c
uint8_t buf[32] = { 0 };
esp_efuse_read_field_blob(ESP_EFUSE_USER_DATA, &buf, sizeof(buf) * 8);
// buf[0] = 0x00, buf[1] = 0x01, ... buf[31] = 0xF

uint32_t field1 = 0;
```

(continues on next page)
size_t field1_size = ESP_EFUSE_USER_DATA[0]->bit_count; // can be used for this case because it only consists of one entry
esp_efuse_read_field_blob(ESP_EFUSE_USER_DATA, &field1, field1_size);
// field1 = 0x0302

uint32_t field1_1 = 0;
esp_efuse_read_field_blob(ESP_EFUSE_USER_DATA, &field1_1, 2); // reads only first 2 bits
// field1 = 0x0002

uint8_t id = 0;
size_t id_size = esp_efuse_get_field_size(ESP_EFUSE_ID); // returns 6
// size_t id_size = ESP_EFUSE_USER_DATA[0]->bit_count; // cannot be used because it consists of 3 entries. It returns 3 not 6.
esp_efuse_read_field_blob(ESP_EFUSE_ID, &id, id_size);
// id = 0x91
// b'100 10 001
// [3] [2] [3]

uint8_t id_1 = 0;
esp_efuse_read_field_blob(ESP_EFUSE_ID, &id_1, 3);
// id = 0x01
// b'001

Get eFuses During Build

There is a way to get the state of eFuses at the build stage of the project. There are two cmake functions for this:

- espefuse_get_json_summary() - It calls the espefuse.py summary --format json command and returns a json string (it is not stored in a file).
- espefuse_get_efuse() - It finds a given eFuse name in the json string and returns its property.

The json string has the following properties:

```json
{
    "MAC": {
        "bit_len": 48,
        "block": 0,
        "category": "identity",
        "description": "Factory MAC Address",
        "efuse_type": "bytes:6",
        "name": "MAC",
        "pos": 0,
        "readable": true,
        "value": "94:b9:7e:5a:6e:58 (CRC 0xe2 OK)",
        "word": 1,
        "writeable": true
    },
}
```

These functions can be used from a top-level project CMakeLists.txt (get-started/hello_world/CMakeLists.txt):

```cmake
# ...
project(hello_world)
espefuse_get_json_summary(efuse_json)
espefuse_get_efuse(ret_data ${efuse_json} "MAC" "value")
message("MAC: " ${ret_data})
```

The format of the value property is the same as shown in espefuse.py summary.
There is an example test system/efuse/CMakeLists.txt which adds a custom target efuse-summary. This allows you to run the idf.py efuse-summary command to read the required eFuses (specified in the efuse_names list) at any time, not just at project build time.

Debug eFuse & Unit Tests

Virtual eFuses  The Kconfig option CONFIG_EFUSE_VIRTUAL virtualizes eFuse values inside the eFuse Manager, so writes are emulated and no eFuse values are permanently changed. This can be useful for debugging app and unit tests. During startup, the eFuses are copied to RAM. All eFuse operations (read and write) are performed with RAM instead of the real eFuse registers.

In addition to the CONFIG_EFUSE_VIRTUAL option there is CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH option that adds a feature to keep eFuses in flash memory. To use this mode the partition_table should have the efuse partition. partition.csv: "efuse_em, data, efuse, , 0x2000,". During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This option allows keeping eFuses after reboots (possible to test secure_boot and flash_encryption features with this option).

Flash Encryption Testing  Flash Encryption (FE) is a hardware feature that requires the physical burning of eFuses: key and FLASH_CRYPT_CNT. If FE is not actually enabled then enabling the CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH option just gives testing possibilities and does not encrypt anything in the flash, even though the logs say encryption happens. The bootloader_flash_write() is adapted for this purpose. But if FE is already enabled on the chip and you run an application or bootloader created with the CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH option then the flash encryption/decryption operations will work properly (data are encrypted as it is written into an encrypted flash partition and decrypted when they are read from an encrypted partition).

espefuse.py  esptool includes a useful tool for reading/writing ESP32 eFuse bits - espefuse.py.
CHIP_CPU_FREQ_LOW (BLOCK0)  
<table>
<thead>
<tr>
<th>Requires</th>
<th>Effect</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>FALSE</code></td>
<td>FS_UP</td>
<td>For CPU run at 80 MHz.0</td>
</tr>
</tbody>
</table>

CHIP_CPU_FREQ_RATED (BLOCK0)  
If set, the ESP32's maximum CPU frequency is rated.

BLK3_PART_RESERVE (BLOCK0)  
If set; BLOCK3 partially served for ADC calibration data.

CLK8M_FREQ (BLOCK0)  
8MHz clock freq override.

VOL_LEVEL_HP_INV (BLOCK0)  
This field stores the voltage to CPU to run at 240 MHz; or for flash/PSRAM.

Coding Scheme (BLOCK0)  
Efuse variable block length.

Flash Fuses:  
FLASH_CRYPT_CNT (BLOCK0)  
This field has an odd number of bits set.

Identity Fuses:  
CHIP_PACKAGE_4BIT (BLOCK0)  
Chip package identifier #4bit.

JTAG Fuses:  
JTAG_DISABLE (BLOCK0)  
Disable JTAG.

Mac Fuses:  
MAC (BLOCK0)  
MAC address.
### Chapter 2. API Reference (continued from previous page)

**Header File**

- components/efuse/esp32/include/esp_efuse_chip.h

**Enumerations**

```c
enum esp_efuse_block_t
{
    EFUSE_BLK0,  
    EFUSE_BLK1,  
    EFUSE_BLK_KEY0,  
    EFUSE_BLK_ENCRYPT_FLASH,  
    EFUSE_BLK2,  
    EFUSE_BLK_KEY1,  
    EFUSE_BLK_SECURE_BOOT,  
}
```

Type of eFuse blocks for ESP32.

**Values:**

- **EFUSE_BLK0**  
  Number of eFuse block. Reserved.

- **EFUSE_BLK1**  
  Number of eFuse block. Used for Flash Encryption. If not using that Flash Encryption feature, they can be used for another purpose.

- **EFUSE_BLK_KEY0**  
  Number of eFuse block. Used for Flash Encryption. If not using that Flash Encryption feature, they can be used for another purpose.

- **EFUSE_BLK_ENCRYPT_FLASH**  
  Number of eFuse block. Used for Flash Encryption. If not using that Flash Encryption feature, they can be used for another purpose.

- **EFUSE_BLK2**  
  Number of eFuse block. Used for Secure Boot. If not using that Secure Boot feature, they can be used for another purpose.

- **EFUSE_BLK_KEY1**  
  Number of eFuse block. Used for Secure Boot. If not using that Secure Boot feature, they can be used for another purpose.

- **EFUSE_BLK_SECURE_BOOT**  
  Number of eFuse block. Used for Secure Boot. If not using that Secure Boot feature, they can be used for another purpose.
enumerator **EFUSE_BLK3**
   Number of eFuse block. Uses for the purpose of the user.

enumerator **EFUSE_BLK_KEY2**
   Number of eFuse block. Uses for the purpose of the user.

enumerator **EFUSE_BLK_KEY_MAX**

enumerator **EFUSE_BLK_MAX**

enum **esp_efuse_coding_scheme_t**
   Type of coding scheme.
   
   Values:

   enumerator **EFUSE_CODING_SCHEME_NONE**
       None

   enumerator **EFUSE_CODING_SCHEME_3_4**
       3/4 coding

   enumerator **EFUSE_CODING_SCHEME_REPEAT**
       Repeat coding

enum **esp_efuse_purpose_t**
   Type of key purpose (virtual because ESP32 has only fixed purposes for blocks)
   
   Values:

   enumerator **ESP_efuse_key_purpose_user**
       BLOCK3

   enumerator **ESP_efuse_key_purpose_system**
       BLOCK0

   enumerator **ESP_efuse_key_purpose_flash_encryption**
       BLOCK1

   enumerator **ESP_efuse_key_purpose_secure_boot_v2**
       BLOCK2

   enumerator **ESP_efuse_key_purpose_max**
       MAX PURPOSE

**Header File**

- components/efuse/include/esp_efuse.h
Functions

`esp_err_t esp_efuse_read_field_blob (const esp_efuse_desc_t *field[], void *dst, size_t dst_size_bits)`

Reads bits from EFUSE field and writes it into an array.

The number of read bits will be limited to the minimum value from the description of the bits in the field structure or the `dst_size_bits` required size. Use `esp_efuse_get_field_size()` function to determine the length of the field.

**Note:** Please note that reading in the batch mode does not show uncommitted changes.

**Parameters**

- `field` [in] A pointer to the structure describing the fields of efuse.
- `dst` [out] A pointer to array that will contain the result of reading.
- `dst_size_bits` [in] The number of bits required to read. If the requested number of bits is greater than the field, the number will be limited to the field size.

**Returns**

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

`bool esp_efuse_read_field_bit (const esp_efuse_desc_t *field[])`

Read a single bit eFuse field as a boolean value.

**Note:** The value must exist and must be a single bit wide. If there is any possibility of an error in the provided arguments, call `esp_efuse_read_field_blob()` and check the returned value instead.

**Note:** If assertions are enabled and the parameter is invalid, execution will abort

**Note:** Please note that reading in the batch mode does not show uncommitted changes.

**Parameters**

- `field` [in] A pointer to the structure describing the fields of efuse.

**Returns**

- true: The field parameter is valid and the bit is set.
- false: The bit is not set, or the parameter is invalid and assertions are disabled.

`esp_err_t esp_efuse_read_field_cnt (const esp_efuse_desc_t *field[], size_t *out_cnt)`

Reads bits from EFUSE field and returns number of bits programmed as “1”.

If the bits are set not sequentially, they will still be counted.

**Note:** Please note that reading in the batch mode does not show uncommitted changes.

**Parameters**

- `field` [in] A pointer to the structure describing the fields of efuse.
- `out_cnt` [out] A pointer that will contain the number of programmed as “1” bits.

**Returns**

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

`esp_err_t esp_efuse_write_field_blob (const esp_efuse_desc_t *field[], const void *src, size_t src_size_bits)`
Writes array to EFUSE field.

The number of write bits will be limited to the minimum value from the description of the bits in “field” structure or “src_size_bits” required size. Use “esp_efuse_get_field_size()” function to determine the length of the field. After the function is completed, the writing registers are cleared.

Parameters
- **field** [in] A pointer to the structure describing the fields of efuse.
- **src** [in] A pointer to array that contains the data for writing.
- **src_size_bits** [in] The number of bits required to write.

Returns
- ESP_OK: The operation was successfully completed.
- ESP_ERRINVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

```c
esp_err_t esp_efuse_write_field_cnt (const esp_efuse_desc_t *field[], size_t cnt)
```

Writes a required count of bits as “1” to EFUSE field.

If there are no free bits in the field to set the required number of bits to “1”, ESP_ERR_EFUSE_CNT_IS_FULL error is returned, the field will not be partially recorded. After the function is completed, the writing registers are cleared.

Parameters
- **field** [in] A pointer to the structure describing the fields of efuse.
- **cnt** [in] Required number of programmed as “1” bits.

Returns
- ESP_OK: The operation was successfully completed.
- ESP_ERRINVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.

```c
esp_err_t esp_efuse_write_field_bit (const esp_efuse_desc_t *field[])
```

Write a single bit eFuse field to 1.

For use with eFuse fields that are a single bit. This function will write the bit to value 1 if it is not already set, or does nothing if the bit is already set.

This is equivalent to calling esp_efuse_write_field_cnt() with the cnt parameter equal to 1, except that it will return ESP_OK if the field is already set to 1.

Parameters **field** [in] Pointer to the structure describing the efuse field.

Returns
- ESP_OK: The operation was successfully completed, or the bit was already set to value 1.
- ESP_ERRINVALID_ARG: Error in the passed arguments, including if the efuse field is not 1 bit wide.

```c
esp_err_t esp_efuse_set_write_protect (esp_efuse_block_t blk)
```

Sets a write protection for the whole block.

After that, it is impossible to write to this block. The write protection does not apply to block 0.

Parameters **blk** [in] Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)

Returns
- ESP_OK: The operation was successfully completed.
- ESP_ERRINVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.
- ESP_ERR_NOT_SUPPORTED: The block does not support this command.

```c
esp_err_t esp_efuse_set_read_protect (esp_efuse_block_t blk)
```

Sets a read protection for the whole block.
After that, it is impossible to read from this block. The read protection does not apply to block 0.

**Parameters**

- **blk**  
  Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)

**Returns**

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.
- ESP_ERR_NOT_SUPPORTED: The block does not support this command.

```c
int esp_efuse_get_field_size (const esp_efuse_desc_t *field[])
```

Returns the number of bits used by field.

**Parameters**

- **field**  
  A pointer to the structure describing the fields of efuse.

**Returns**

Returns the number of bits used by field.

```c
uint32_t esp_efuse_read_reg (esp_efuse_block_t blk, unsigned int num_reg)
```

Returns value of efuse register.

This is a thread-safe implementation. Example: EFUSE_BLK2_RDATA3_REG where (blk=2, num_reg=3)

**Note:** Please note that reading in the batch mode does not show uncommitted changes.

```c
esp_err_t esp_efuse_write_reg (esp_efuse_block_t blk, unsigned int num_reg, uint32_t val)
```

Write value to efuse register.

Apply a coding scheme if necessary. This is a thread-safe implementation. Example: EFUSE_BLK3_WDATA0_REG where (blk=3, num_reg=0)

**Parameters**

- **blk**  
  Block number of eFuse.
- **num_reg**  
  The register number in the block.

**Returns**

- ESP_OK: The operation was successfully completed.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.

```c
esp_efuse_coding_scheme_t esp_efuse_get_coding_scheme (esp_efuse_block_t blk)
```

Return efuse coding scheme for blocks.

**Note:** The coding scheme is applicable only to 1, 2 and 3 blocks. For 0 block, the coding scheme is always NONE.

**Parameters**

- **blk**  
  Block number of eFuse.

**Returns**

Return efuse coding scheme for blocks

```c
esp_err_t esp_efuse_read_block (esp_efuse_block_t blk, void *dst_key, size_t offset_in_bits, size_t size_bits)
```

Read key to efuse block starting at the offset and the required size.

**Note:** Please note that reading in the batch mode does not show uncommitted changes.
Chapter 2. API Reference

- **blk** – [in] Block number of eFuse.
- **dst_key** – [in] A pointer to array that will contain the result of reading.
- **size_bits** – [in] The number of bits required to read.

**Returns**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

```c
esp_err_t esp_efuse_write_block (esp_efuse_block_t blk, const void *src_key, size_t offset_in_bits, size_t size_bits)
```

Write key to eFuse block starting at the offset and the required size.

**Parameters**
- **blk** – [in] Block number of eFuse.
- **src_key** – [in] A pointer to array that contains the key for writing.
- **size_bits** – [in] The number of bits required to write.

**Returns**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits

```c
uint32_t esp_efuse_get_pkg_ver (void)
```

Returns chip package from eFuse.

**Returns**
- chip package

```c
void esp_efuse_reset (void)
```

Reset eFuse write registers.

Efuse write registers are written to zero, to negate any changes that have been staged here.

**Note:** This function is not threadsafe, if calling code updates efuse values from multiple tasks then this is caller’s responsibility to serialise.

```c
void esp_efuse_disable_basic_rom_console (void)
```

Disable BASIC ROM Console via eFuse.

By default, if booting from flash fails the ESP32 will boot a BASIC console in ROM.

Call this function (from bootloader or app) to permanently disable the console on this chip.

```c
esp_err_t esp_efuse_disable_rom_download_mode (void)
```

Disable ROM Download Mode via eFuse.

Permanently disables the ROM Download Mode feature. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.

**Note:** Not all SoCs support this option. An error will be returned if called on an ESP32 with a silicon revision lower than 3, as these revisions do not support this option.

**Note:** If ROM Download Mode is already disabled, this function does nothing and returns success.

**Returns**
• ESP_OK If the eFuse was successfully burned, or had already been burned.
• ESP_ERR_NOT_SUPPORTED (ESP32 only) This SoC is not capable of disabling UART download mode
• ESP_ERR_INVALID_STATE (ESP32 only) This eFuse is write protected and cannot be written

```
esp_err_t esp_efuse_set_rom_log_scheme (esp_efuse_log_scheme_t log_scheme)
```

Set boot ROM log scheme via eFuse.

**Note:** By default, the boot ROM will always print to console. This API can be called to set the log scheme only once per chip, once the value is changed from the default it can’t be changed again.

Parameters

log_scheme - Supported ROM log scheme

Returns

• ESP_OK If the eFuse was successfully burned, or had already been burned.
• ESP_ERR_NOT_SUPPORTED (ESP32 only) This SoC is not capable of setting ROM log scheme
• ESP_ERR_INVALID_STATE This eFuse is write protected or has been burned already

```
uint32_t esp_efuse_read_secure_version (void)
```

Return secure_version from eFuse field.

Returns

Secure version from eFuse field

```
bool esp_efuse_check_secure_version (uint32_t secure_version)
```

Check secure_version from app and secure_version and from eFuse field.

Parameters

secure_version - Secure version from app.

Returns

• True: If version of app is equal or more then secure_version from eFuse.

```
esp_err_t esp_efuse_update_secure_version (uint32_t secure_version)
```

Write eFuse field by secure_version value.

Update the secure_version value is available if the coding scheme is None. Note: Do not use this function in your applications. This function is called as part of the other API.

Parameters

secure_version - [in] Secure version from app.

Returns

• ESP_OK: Successful.
• ESP_FAIL: secure version of app cannot be set to eFuse field.
• ESP_ERR_NOT_SUPPORTED: Anti rollback is not supported with the 3/4 and Repeat coding scheme.

```
esp_err_t esp_efuse_batch_write_begin (void)
```

Set the batch mode of writing fields.

This mode allows you to write the fields in the batch mode when need to burn several efuses at one time. To enable batch mode call begin() then perform as usually the necessary operations read and write and at the end call commit() to actually burn all written efuses. The batch mode can be used nested. The commit will be done by the last commit() function. The number of begin() functions should be equal to the number of commit() functions.

**Note:** If batch mode is enabled by the first task, at this time the second task cannot write/read efuses. The second task will wait for the first task to complete the batch operation.
// Example of using the batch writing mode.

// set the batch writing mode
esp_efuse_batch_write_begin();

// use any writing functions as usual
esp_efuse_write_field_blob(ESP_EFUSE_...);
esp_efuse_write_field_cnt(ESP_EFUSE_...);
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_write_reg(EFUSE_BLKx, ...);
esp_efuse_write_block(EFUSE_BLKx, ...);
esp_efuse_write(ESP_EFUSE_1, 3);  // ESP_EFUSE_1 == 1, here we write a new...

...value = 3. The changes will be burn by the commit() function.

esp_efuse_read...(ESP_EFUSE_1);  // this function returns ESP_EFUSE_1 == 1...
...because uncommitted changes are not readable, it will be available only...
...after commit.
...

// esp_efuse_batch_write APIs can be called recursively.
esp_efuse_batch_write_begin();
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_batch_write_commit();  // the burn will be skipped here, it will be...
...done in the last commit().
...

// Write all of these fields to the efuse registers
esp_efuse_batch_write_commit();
esp_efuse_read...(ESP_EFUSE_1);  // this function returns ESP_EFUSE_1 == 3.

Note: Please note that reading in the batch mode does not show uncommitted changes.

Returns
- ESP_OK: Successful.

esp_err_t esp_efuse_batch_write_cancel (void)
Reset the batch mode of writing fields.

It will reset the batch writing mode and any written changes.

Returns
- ESP_OK: Successful.
- ESP_ERR_INVALID_STATE: Tha batch mode was not set.

esp_err_t esp_efuse_batch_write_commit (void)
Writes all prepared data for the batch mode.

Must be called to ensure changes are written to the efuse registers. After this the batch writing mode will be reset.

Returns
- ESP_OK: Successful.
- ESP_ERR_INVALID_STATE: The deferred writing mode was not set.

bool esp_efuse_block_is_empty (esp_efuse_block_t block)
Checks that the given block is empty.

Returns
- True: The block is empty.
- False: The block is not empty or was an error.
bool esp_efuse_get_key_dis_read (esp_efuse_block_t *block)
Returns a read protection for the key block.

Parameters block [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
Returns True: The key block is read protected False: The key block is readable.

esp_err_t esp_efuse_set_key_dis_read (esp_efuse_block_t block)
Sets a read protection for the key block.

Parameters block [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
Returns
• ESP_OK: Successful.
• ESP_ERR_INVALID_ARG: Error in the passed arguments.
• ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed
  bits is strictly forbidden.
• ESP_ERR_CODING: Error range of data does not match the coding scheme.

bool esp_efuse_get_key_dis_write (esp_efuse_block_t *block)
Returns a write protection for the key block.

Parameters block [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
Returns True: The key block is write protected False: The key block is writeable.

esp_err_t esp Efuse_set_key_dis_write (esp_efuse_block_t block)
Sets a write protection for the key block.

Parameters block [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
Returns
• ESP_OK: Successful.
• ESP_ERR_INVALID_ARG: Error in the passed arguments.
• ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed
  bits is strictly forbidden.
• ESP_ERR_CODING: Error range of data does not match the coding scheme.

bool esp_efuse_key_block_unused (esp_efuse_block_t block)
Returns true if the key block is unused, false otherwise.

An unused key block is all zero content, not read or write protected, and has purpose 0
(ESP_EFUSE_KEY_PURPOSE_USER)

Parameters block [in] Key block to check.
Returns
• True if key block is unused,
• False if key block is used or the specified block index is not a key block.

bool esp_efuse_find_purpose (esp_efuse_purpose_t purpose, esp_efuse_block_t *block)
Find a key block with the particular purpose set.

Parameters
• purpose [in] Purpose to search for.
• block [out] Pointer in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
  which will be set to the key block if found. Can be NULL, if only need to test the key
  block exists.
Returns
• True: If found,
• False: If not found (value at block pointer is unchanged).

bool esp_efuse_get_keypurpose_dis_write (esp_efuse_block_t block)
Returns a write protection of the key purpose field for an efuse key block.

Note: For ESP32: no keypurpose, it returns always True.
Chapter 2. API Reference

Parameters `block` [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

Returns True: The key purpose is write protected. False: The key purpose is writeable.

`esp_efuse_get_key_purpose` (esp_efuse_block_t block)

Returns the current purpose set for an efuse key block.

Parameters `block` [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

Returns

- Value: If Successful, it returns the value of the purpose related to the given key block.
- ESP_EFUSE_KEY_PURPOSE_MAX: Otherwise.

`esp_efuse_write_key` (esp_efuse_block_t block, esp_efuse_purpose_t purpose, const void*key, size_t key_size_bytes)

Program a block of key data to an efuse block.

The burn of a key, protection bits, and a purpose happens in batch mode.

Parameters

- `block` [in] Block to read purpose for. Must be in range EFUSE_BLK_KEY0 to EFUSE_BLK_KEY_MAX. Key block must be unused (esp_efuse_key_block_unused).
- `purpose` [in] Purpose to set for this key. Purpose must be already unset.
- `key` [in] Pointer to data to write.
- `key_size_bytes` [in] Bytes length of data to write.

Returns

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_INVALID_STATE: Error in efuses state, unused block not found.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

`esp_efuse_write_keys` (const esp_efuse_purpose_t purposes[], uint8_t keys[][32], unsigned number_of_keys)

Program keys to unused efuse blocks.

The burn of keys, protection bits, and purposes happens in batch mode.

Parameters

- `purposes` [in] Array of purposes (purpose[number_of_keys]).
- `keys` [in] Array of keys (uint8_t keys[number_of_keys][32]). Each key is 32 bytes long.
- `number_of_keys` [in] The number of keys to write (up to 6 keys).

Returns

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_INVALID_STATE: Error in efuses state, unused block not found.
- ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS: Error not enough unused key blocks available
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

`esp_efuse_check_errors` (void)

Checks efuse errors in BLOCK0.

It does a BLOCK0 check if eFuse EFUSE_ERR_RST_ENABLE is set. If BLOCK0 has an error, it prints the error and returns ESP_FAIL, which should be treated as esp_restart.

Note: Refers to ESP32-C3 only.
Returns

- ESP_OK: No errors in BLOCK0.
- ESP_FAIL: Error in BLOCK0 requiring reboot.

Structures

struct esp_efuse_desc_t
    Type definition for an eFuse field.

Public Members

    esp_efuse_block_t efuse_block
        Block of eFuse

    uint8_t bit_start
        Start bit [0..255]

    uint16_t bit_count
        Length of bit field [1..-]

Macros

ESP_ERR_EFUSE
    Base error code for efuse api.

ESP_OK_EFUSE_CNT
    OK the required number of bits is set.

ESP_ERR_EFUSE_CNT_IS_FULL
    Error field is full.

ESP_ERR_EFUSE_REPEATED_PROG
    Error repeated programming of programmed bits is strictly forbidden.

ESP_ERR_CODING
    Error while a encoding operation.

ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS
    Error not enough unused key blocks available

ESP_ERR_DAMAGED_READING
    Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to
    the efuse component and not returned by any public API.

Enumerations

enum esp_efuse_rom_log_scheme_t
    Type definition for ROM log scheme.
    Values:
Chapter 2. API Reference

enumerator **ESP_EFUSE_ROM_LOG_ALWAYS_ON**
   Always enable ROM logging

enumerator **ESP_EFUSE_ROM_LOG_ON_GPIO_LOW**
   ROM logging is enabled when specific GPIO level is low during start up

enumerator **ESP_EFUSE_ROM_LOG_ON_GPIO_HIGH**
   ROM logging is enabled when specific GPIO level is high during start up

enumerator **ESP_EFUSE_ROM_LOG_ALWAYS_OFF**
   Disable ROM logging permanently

### 2.10.8 Error Code and Helper Functions

This section lists definitions of common ESP-IDF error codes and several helper functions related to error handling. For general information about error codes in ESP-IDF, see *Error Handling*. For the full list of error codes defined in ESP-IDF, see *Error Codes Reference*.

#### API Reference

**Header File**

- `components/esp_common/include/esp_check.h`

**Macros**

**ESP_RETURN_ON_ERROR** *(x, log_tag, format, ...)*

Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message and returns. In the future, we want to switch to C++20. We also want to become compatible with clang. Hence, we provide two versions of the following macros. The first one is using the GNU extension `#__VA_ARGS__`. The second one is using the C++20 feature `VA_OPT()`. This allows users to compile their code with standard C++20 enabled instead of the GNU extension. Below C++20, we haven’t found any good alternative to using `#__VA_ARGS__`. Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message and returns.

**ESP_RETURN_ON_ERROR_ISR** *(x, log_tag, format, ...)*

A version of ESP_RETURN_ON_ERROR() macro that can be called from ISR.

**ESP_GOTO_ON_ERROR** *(x, goto_tag, log_tag, format, ...)*

Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message, sets the local variable ‘ret’ to the code, and then exits by jumping to ‘goto_tag’.

**ESP_GOTO_ON_ERROR_ISR** *(x, goto_tag, log_tag, format, ...)*

A version of ESP_GOTO_ON_ERROR() macro that can be called from ISR.

**ESP_RETURN_ON_FALSE** *(a, err_code, log_tag, format, ...)*

Macro which can be used to check the condition. If the condition is not ‘true’, it prints the message and returns with the supplied ‘err_code’.

**ESP_RETURN_ON_FALSE_ISR** *(a, err_code, log_tag, format, ...)*

A version of ESP_RETURN_ON_FALSE() macro that can be called from ISR.
Chapter 2. API Reference

ESP_GOTO_ON_FALSE (a, err_code, goto_tag, log_tag, format, ...)
Macro which can be used to check the condition. If the condition is not ‘true’, it prints the message, sets the local variable ‘ret’ to the supplied ‘err_code’, and then exits by jumping to ‘goto_tag’.

ESP_GOTO_ON_FALSE_ISR (a, err_code, goto_tag, log_tag, format, ...)
A version of ESP_GOTO_ON_FALSE() macro that can be called from ISR.

Header File
- components/esp_common/include/esp_err.h

Functions
const char *esp_err_to_name (esp_err_t code)
Returns string for esp_err_t error codes.
This function finds the error code in a pre-generated lookup-table and returns its string representation.
The function is generated by the Python script tools/gen_esp_err_to_name.py which should be run each time an esp_err_t error is modified, created or removed from the IDF project.

Parameters
code - esp_err_t error code

Returns string error message

const char *esp_err_to_name_r (esp_err_t code, char *buf, size_t buflen)
Returns string for esp_err_t and system error codes.
This function finds the error code in a pre-generated lookup-table of esp_err_t errors and returns its string representation. If the error code is not found then it is attempted to be found among system errors.
The function is generated by the Python script tools/gen_esp_err_to_name.py which should be run each time an esp_err_t error is modified, created or removed from the IDF project.

Parameters
- code - esp_err_t error code
- buf - [out] buffer where the error message should be written
- buflen - Size of buffer buf. At most buflen bytes are written into the buf buffer (including the terminating null byte).

Returns buf containing the string error message

Macros
ESP_OK
esp_err_t value indicating success (no error)

ESP_FAIL
Generic esp_err_t code indicating failure

ESP_ERR_NO_MEM
Out of memory

ESP_ERR_INVALID_ARG
Invalid argument

ESP_ERR_INVALID_STATE
Invalid state

ESP_ERR_INVALID_SIZE
Invalid size
Chapter 2. API Reference

ESP_ERR_NOT_FOUND
Requested resource not found

ESP_ERR_NOT_SUPPORTED
Operation or feature not supported

ESP_ERR_TIMEOUT
Operation timed out

ESP_ERR_INVALID_RESPONSE
Received response was invalid

ESP_ERR_INVALID_CRC
CRC or checksum was invalid

ESP_ERR_INVALID_VERSION
Version was invalid

ESP_ERR_INVALID_MAC
MAC address was invalid

ESP_ERR_NOT_FINISHED
Operation has not fully completed

ESP_ERR_WIFI_BASE
Starting number of WiFi error codes

ESP_ERR_MESH_BASE
Starting number of MESH error codes

ESP_ERR_FLASH_BASE
Starting number of flash error codes

ESP_ERR_HW_CRYPTO_BASE
Starting number of HW cryptography module error codes

ESP_ERR_MEMPROT_BASE
Starting number of Memory Protection API error codes

ESP_ERROR_CHECK
Macro which can be used to check the error code, and terminate the program in case the code is not ESP_OK. Prints the error code, error location, and the failed statement to serial output.
Disabled if assertions are disabled.

ESP_ERROR_CHECK_WITHOUT_ABORT
Macro which can be used to check the error code. Prints the error code, error location, and the failed statement to serial output. In comparison with ESP_ERROR_CHECK(), this prints the same error message but isn’t terminating the program.
Chapter 2. API Reference

Type Definitions

typedef int esp_err_t

2.10.9 ESP HTTPS OTA

Overview

`esp_https_ota` provides simplified APIs to perform firmware upgrades over HTTPS. It is an abstraction layer over existing OTA APIs.

Application Example

```c
esp_err_t do_firmware_upgrade()
{
    esp_http_client_config_t config = {
        .url = CONFIG_FIRMWARE_UPGRADE_URL,
        .cert_pem = (char *)server_cert_pem_start,
    };
    esp_https_ota_config_t ota_config = {
        .http_config = &config,
    };
    esp_err_t ret = esp_https_ota(&ota_config);
    if (ret == ESP_OK) {
        esp_restart();
    } else {
        return ESP_FAIL;
    }
    return ESP_OK;
}
```

Server Verification

Please refer to [ESP-TLS: TLS Server Verification](#) for more information on server verification. The root certificate (in PEM format) needs to be provided to the `esp_http_client_config_t::cert_pem` member.

**Note:** The server-endpoint root certificate should be used for verification instead of any intermediate ones from the certificate chain. The reason is that the root certificate has the maximum validity and usually remains the same for a long period of time. Users can also use the ESP x509 Certificate Bundle feature for verification, which covers most of the trusted root certificates (using the `esp_http_client_config_t::crt_bundle_attach` member).

Partial Image Download over HTTPS

To use partial image download feature, enable `partial_http_download` configuration in `esp_https_ota_config_t`. When this configuration is enabled, firmware image will be downloaded in multiple HTTP requests of specified size. Maximum content length of each request can be specified by setting `max_http_request_size` to required value.

This option is useful while fetching image from a service like AWS S3, where mbedtls Rx buffer size (`CONFIGMBEDTLS_SSL_IN_CONTENT_LEN`) can be set to lower value which is not possible without enabling this configuration.
Default value of mbedTLS Rx buffer size is set to 16K. By using partial_http_download with max_http_request_size of 4K, size of mbedTLS Rx buffer can be reduced to 4K. With this configuration, memory saving of around 12K is expected.

Signature Verification

For additional security, signature of OTA firmware images can be verified. For that, refer Secure OTA Updates Without Secure Boot

Advanced APIs

esp_https_ota also provides advanced APIs which can be used if more information and control is needed during the OTA process.

Example that uses advanced ESP_HTTPS OTA APIs: system/ota/advanced_https_ota.

OTA Upgrades with Pre-Encrypted Firmware

To perform OTA upgrades with Pre-Encrypted Firmware, please enable CONFIG_ESP_HTTPS_OTA_DECRYPT_CB in component menuconfig.

Example that performs OTA upgrade with Pre-Encrypted Firmware: system/ota/pre_encrypted_ota.

OTA System Events

ESP HTTPS OTA has various events for which a handler can be triggered by the Event Loop library when the particular event occurs. The handler has to be registered using esp_event_handler_register(). This helps in event handling for ESP HTTPS OTA. esp_https_ota_event_t has all the events which can happen when performing OTA upgrade using ESP HTTPS OTA.

Event Handler Example

```c
/* Event handler for catching system events */
static void event_handler(void* arg, esp_event_base_t event_base, int32_t event_id, void* event_data)
{
    if (event_base == ESP_HTTPS_OTA_EVENT) {
        switch (event_id) {
            case ESP_HTTPS_OTA_START:
                ESP_LOGI(TAG, "OTA started");
                break;
            case ESP_HTTPS_OTA_CONNECTED:
                ESP_LOGI(TAG, "Connected to server");
                break;
            case ESP_HTTPS_OTA_GET_IMG_DESC:
                ESP_LOGI(TAG, "Reading Image Description");
                break;
            case ESP_HTTPS_OTA_VERIFY_CHIP_ID:
                ESP_LOGI(TAG, "Verifying chip id of new image: %d", *(esp_chip_id_t*)event_data);
                break;
            case ESP_HTTPS_OTA_DECRYPT_CB:
                ESP_LOGI(TAG, "Callback to decrypt function");
                break;
            default:
                break;
        }
    }
}
```
case ESP_HTTPS_OTA_WRITE_FLASH:
    ESP_LOGD(TAG, "Writing to flash: \$d written", *(int_ -> event_data));
    break;

case ESP_HTTPS_OTA_UPDATE_BOOT_PARTITION:
    ESP_LOGI(TAG, "Boot partition updated. Next Partition: \$d -> ", *(esp_partition_subtype_t *)event_data);
    break;

case ESP_HTTPS_OTA_FINISH:
    ESP_LOGI(TAG, "OTA finish");
    break;

case ESP_HTTPS_OTA_ABORT:
    ESP_LOGI(TAG, "OTA abort");
    break;
}
}

Expected data type for different ESP HTTPS OTA events in the system event loop:

- ESP_HTTPS_OTA_START: NULL
- ESP_HTTPS_OTA_CONNECTED: NULL
- ESP_HTTPS_OTA_GET_IMG_DESC: NULL
- ESP_HTTPS_OTA_VERIFY_CHIP_ID: esp_chip_id_t
- ESP_HTTPS_OTA_DECRYPT_CB: NULL
- ESP_HTTPS_OTA_WRITE_FLASH: int
- ESP_HTTPS_OTA_UPDATE_BOOT_PARTITION: esp_partition_subtype_t
- ESP_HTTPS_OTA_FINISH: NULL
- ESP_HTTPS_OTA_ABORT: NULL

API Reference

Header File

- components/esp_https_ota/include/esp_https_ota.h

Functions

```c
esp_err_t esp_https_ota (const esp_https_ota_config_t *ota_config)
```

HTTPS OTA Firmware upgrade.

This function allocates HTTPS OTA Firmware upgrade context, establishes HTTPS connection, reads image data from HTTP stream and writes it to OTA partition and finishes HTTPS OTA Firmware upgrade operation. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to cert_pem member of ota_config->http_config.

Note: This API handles the entire OTA operation, so if this API is being used then no other APIs from esp_https_ota component should be called. If more information and control is needed during the HTTPS OTA process, then one can use esp_https_ota_begin and subsequent APIs. If this API returns successfully, esp_restart() must be called to boot from the new firmware image.

Parameters

- `ota_config` [in] pointer to `esp_https_ota_config_t` structure.

Returns

- ESP_OK: OTA data updated, next reboot will use specified partition.
- ESP_FAIL: For generic failure.
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_OTA_VALIDATE_FAILED: Invalid app image
- ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
Chapter 2. API Reference

- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf’s app_update component.

`esp_err_t esp_https_ota_begin(const esp_https_ota_config_t *ota_config, esp_https_ota_handle_t *handle)`

Start HTTPS OTA Firmware upgrade.

This function initializes ESP HTTPS OTA context and establishes HTTPS connection. This function must be invoked first. If this function returns successfully, then `esp_https_ota_perform` should be called to continue with the OTA process and there should be a call to `esp_https_ota_finish` on completion of OTA operation or on failure in subsequent operations. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to `cert_pem` member of `http_config`, which is a part of `ota_config`. In case of error, this API explicitly sets `handle` to NULL.

**Note:** This API is blocking, so setting `is_async` member of `http_config` structure will result in an error.

### Parameters

- `ota_config` [in] pointer to `esp_https_ota_config_t` structure
- `handle` [out] pointer to an allocated data of type `esp_https_ota_handle_t` which will be initialised in this function

### Returns

- ESP_OK: HTTPS OTA Firmware upgrade context initialised and HTTPS connection established
- ESP_FAIL: For generic failure.
- ESP_ERR_INVALID_ARG: Invalid argument (missing/incorrect config, certificate, etc.)
- For other return codes, refer documentation in app_update component and esp_http_client component in esp-idf.

`esp_err_t esp_https_ota_perform(esp_https_ota_handle_t https_ota_handle)`

Read imagedata from HTTP stream and write it to OTA partition.

This function reads image data from HTTP stream and writes it to OTA partition. This function must be called only if `esp_https_ota_begin()` returns successfully. This function must be called in a loop since it returns after every HTTP read operation thus giving you the flexibility to stop OTA operation midway.

### Parameters

- `https_ota_handle` [in] pointer to `esp_https_ota_handle_t` structure

### Returns

- ESP_ERR_HTTPS_OTA_IN_PROGRESS: OTA update is in progress, call this API again to continue.
- ESP_OK: OTA update was successful
- ESP_FAIL: OTA update failed
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_INVALID_VERSION: Invalid chip revision in image header
- ESP_ERR_OTA_VALIDATE_FAILED: Invalid app image
- ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf’s app_update component.

`bool esp_https_ota_is_complete_data_received(esp_https_ota_handle_t https_ota_handle)`

Checks if complete data was received or not.

**Note:** This API can be called just before `esp_https_ota_finish()` to validate if the complete image was indeed received.

### Parameters

- `https_ota_handle` [in] pointer to `esp_https_ota_handle_t` structure
Returns

• false
• true

`esp_err_t esp_https_ota_finish(esp_https_ota_handle_t https_ota_handle)`

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context. This function switches the boot partition to the OTA partition containing the new firmware image.

**Note:** If this API returns successfully, esp_restart() must be called to boot from the new firmware image esp_https_ota_finish should not be called after calling esp_https_ota_abort

Parameters

- `https_ota_handle` - [in] pointer to esp_https_ota_handle_t structure

Returns

- ESP_OK: Clean-up successful
- ESP_ERR_INVALID_STATE
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_OTA_VALIDATE_FAILED: Invalid app image

`esp_err_t esp_https_ota_abort(esp_https_ota_handle_t https_ota_handle)`

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context.

**Note:** esp_https_ota_abort should not be called after calling esp_https_ota_finish

Parameters

- `https_ota_handle` - [in] pointer to esp_https_ota_handle_t structure

Returns

- ESP_OK: Clean-up successful
- ESP_ERR_INVALID_STATE: Invalid ESP HTTPS OTA state
- ESP_FAIL: OTA not started
- ESP_ERR_NOT_FOUND: OTA handle not found
- ESP_ERR_INVALID_ARG: Invalid argument

`esp_err_t esp_https_ota_get_img_desc(esp_https_ota_handle_t https_ota_handle, esp_app_desc_t *new_app_info)`

Reads app description from image header. The app description provides information like the “Firmware version” of the image.

**Note:** This API can be called only after esp_https_ota_begin() and before esp_https_ota_perform(). Calling this API is not mandatory.

Parameters

- `https_ota_handle` - [in] pointer to esp_https_ota_handle_t structure
- `new_app_info` - [out] pointer to an allocated esp_app_desc_t structure

Returns

- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_INVALID_STATE: Invalid state to call this API. esp_https_ota_begin() not called yet.
- ESP_FAIL: Failed to read image descriptor
- ESP_OK: Successfully read image descriptor
### Chapter 2. API Reference

**int esp_https_ota_get_image_len_read (esp_https_ota_handle_t https_ota_handle)**

This function returns OTA image data read so far.

**Note:** This API should be called only if `esp_https_ota_perform()` has been called at least once or if `esp_https_ota_get_img_desc` has been called before.

**Parameters**
- `https_ota_handle` - [in] pointer to esp_https_ota_handle_t structure

**Returns**
- `-1` On failure
- `total bytes read so far`

**int esp_https_ota_get_image_size (esp_https_ota_handle_t https_ota_handle)**

This function returns OTA image total size.

**Note:** This API should be called after `esp_https_ota_begin()` has been already called. This can be used to create some sort of progress indication (in combination with `esp_https_ota_get_image_len_read()`)

**Parameters**
- `https_ota_handle` - [in] pointer to esp_https_ota_handle_t structure

**Returns**
- `-1` On failure or chunked encoding
- `total bytes of image`

### Structures

**struct esp_https_ota_config_t**

ESP HTTPS OTA configuration.

### Public Members

- **const esp_http_client_config_t *http_config**
  ESP HTTP client configuration

- **http_client_init_cb_t http_client_init_cb**
  Callback after ESP HTTP client is initialised

- **bool bulk_flash_erase**
  Erase entire flash partition during initialization. By default flash partition is erased during write operation and in chunk of 4K sector size

- **bool partial_http_download**
  Enable Firmware image to be downloaded over multiple HTTP requests

- **int max_http_request_size**
  Maximum request size for partial HTTP download

### Macros

- **ESP_ERR_HTTPS_OTA_BASE**

- **ESP_ERR_HTTPS_OTA_IN_PROGRESS**
Type Definitions

typedef void *esp_https_ota_handle_t

typedef esp_err_t (*http_client_init_cb_t)(esp_http_client_handle_t)

Enumerations

enum esp_https_ota_event_t
    Events generated by OTA process.
    Values:

enumerator ESP_HTTPS_OTA_START
    OTA started

enumerator ESP_HTTPS_OTA_CONNECTED
    Connected to server

enumerator ESP_HTTPS_OTA_GET_IMG_DESC
    Read app description from image header

enumerator ESP_HTTPS_OTA_VERIFY_CHIP_ID
    Verify chip id of new image

enumerator ESP_HTTPS_OTA_DECRYPT_CB
    Callback to decrypt function

enumerator ESP_HTTPS_OTA_WRITE_FLASH
    Flash write operation

enumerator ESP_HTTPS_OTA_UPDATE_BOOT_PARTITION
    Boot partition update after successful ota update

enumerator ESP_HTTPS_OTA_FINISH
    OTA finished

enumerator ESP_HTTPS_OTA_ABORT
    OTA aborted

2.10.10 Event Loop Library

Overview

The event loop library allows components to declare events so that other components can register handlers –codes that executes when those events occur. This allows loosely-coupled components to attach desired behavior to state changes of other components without application involvement. This also simplifies event processing by serializing and deferring code execution to another context.
Chapter 2. API Reference

One common case is, if a high-level library is using the Wi-Fi library: it may subscribe to ESP32 Wi-Fi Programming Model directly and act on those events.

Note: Various modules of the Bluetooth stack deliver events to applications via dedicated callback functions instead of via the Event Loop Library.

Using esp_event APIs

There are two objects of concern for users of this library: events and event loops.

An event indicates an important occurrence, such as a successful Wi-Fi connection to an access point. A two-part identifier should be used when referencing events, see declaring and defining events for details. The event loop is the bridge between events and event handlers. The event source publishes events to the event loop using the APIs provided by the event loop library, and event handlers registered to the event loop respond to specific types of events.

Using this library roughly entails the following flow:

1. The user defines a function that should run when an event is posted to a loop. This function is referred to as the event handler, and should have the same signature as esp_event_handler_t.
2. An event loop is created using esp_event_loop_create(), which outputs a handle to the loop of type esp_event_loop_handle_t. Event loops created using this API are referred to as user event loops. There is, however, a special type of event loop called the default event loop which is discussed in default event loop.
3. Components register event handlers to the loop using esp_event_handler_register_with(). Handlers can be registered with multiple loops, see notes on handler registration.
4. Event sources post an event to the loop using esp_event_post_to().
5. Components wanting to remove their handlers from being called can do so by unregistering from the loop using esp_event_handler_unregister_with().
6. Event loops that are no longer needed can be deleted using esp_event_loop_delete().

In code, the flow above may look like as follows:

```c
// 1. Define the event handler
void run_on_event(void *handler_arg, esp_event_base_t base, int32_t id, void *event_data) {
    // Event handler logic
}

void app_main() {
    // 2. A configuration structure of type esp_event_loop_args_t is needed to specify the properties of the loop to be created. A handle of type esp_event_loop_handle_t is obtained, which is needed by the other APIs to reference the loop to perform their operations.
    esp_event_loop_args_t loop_args = {
        .queue_size = ...,
        .task_name = ...,
        .task_priority = ...,
        .task_stack_size = ...,
        .task_core_id = ...
    };

    esp_event_loop_handle_t loop_handle;
    esp_event_loop_create(&loop_args, &loop_handle);

    // 3. Register event handler defined in (1). MY_EVENT_BASE and MY_EVENT_ID specify a hypothetical event that handler run_on_event should execute when it gets posted to the loop.
    esp_event_handler_register_with(MY_EVENT_BASE, MY_EVENT_ID, run_on_event, esp_event_handler_t);
}
```

(continues on next page)
Declaring and Defining Events

As mentioned previously, events consist of two-part identifiers: the event base and the event ID. The event base identifies an independent group of events; the event ID identifies the event within that group. Think of the event base and event ID as a person’s last name and first name, respectively. A last name identifies a family, and the first name identifies a person within that family.

The event loop library provides macros to declare and define the event base easily.

Event base declaration:

```
ESP_EVENT_DECLARE_BASE(EVENT_BASE)
```

Event base definition:

```
ESP_EVENT_DEFINE_BASE(EVENT_BASE)
```

**Note:** In ESP-IDF, the base identifiers for system events are uppercase and are postfixed with _EVENT. For example, the base for Wi-Fi events is declared and defined as WIFI_EVENT, the Ethernet event base ETHERNET_EVENT, and so on. The purpose is to have event bases look like constants (although they are global variables considering the definitions of macros ESP_EVENT_DECLARE_BASE and ESP_EVENT_DEFINE_BASE).

For event IDs, declaring them as enumerations is recommended. Once again, for visibility, these are typically placed in public header files.

Event ID:

```
enum {
    EVENT_ID_1,
    EVENT_ID_2,
    EVENT_ID_3,
    ...
}
```
Default Event Loop

The default event loop is a special type of loop used for system events (Wi-Fi events, for example). The handle for this loop is hidden from the user, and the creation, deletion, handler registration/deregistration, and posting of events are done through a variant of the APIs for user event loops. The table below enumerates those variants, and the user event loops equivalent.

<table>
<thead>
<tr>
<th>User Event Loops</th>
<th>Default Event Loops</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_event_loop_create()</td>
<td>esp_event_loop_create_default()</td>
</tr>
<tr>
<td>esp_event_loop_delete()</td>
<td>esp_event_loop_delete_default()</td>
</tr>
<tr>
<td>esp_event_handler_register_with()</td>
<td>esp_event_handler_register()</td>
</tr>
<tr>
<td>esp_event_handler_unregister_with()</td>
<td>esp_event_handler_unregister()</td>
</tr>
<tr>
<td>esp_event_post_to()</td>
<td>esp_event_post()</td>
</tr>
</tbody>
</table>

If you compare the signatures for both, they are mostly similar except for the lack of loop handle specification for the default event loop APIs.

Other than the API difference and the special designation to which system events are posted, there is no difference in how default event loops and user event loops behave. It is even possible for users to post their own events to the default event loop, should the user opt to not create their own loops to save memory.

Notes on Handler Registration

It is possible to register a single handler to multiple events individually by using multiple calls to esp_event_handler_register_with(). For those multiple calls, the specific event base and event ID can be specified with which the handler should execute.

However, in some cases, it is desirable for a handler to execute on the following situations:

1. all events that get posted to a loop
2. all events of a particular base identifier

This is possible using the special event base identifier ESP_EVENT_ANY_BASE and special event ID ESP_EVENT_ANY_ID. These special identifiers may be passed as the event base and event ID arguments for esp_event_handler_register_with().

Therefore, the valid arguments to esp_event_handler_register_with() are:

1. <event base>, <event ID> - handler executes when the event with base <event base> and event ID <event ID> gets posted to the loop
2. <event base>, ESP_EVENT_ANY_ID - handler executes when any event with base <event base> gets posted to the loop
3. ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID - handler executes when any event gets posted to the loop

As an example, suppose the following handler registrations were performed:

```c
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event_1, ...);
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, ESP_EVENT_ANY_ID, run_on_event_2, ...);
esp_event_handler_register_with(loop_handle, ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID, run_on_event_3, ...);
```

If the hypothetical event MY_EVENT_BASE, MY_EVENT_ID is posted, all three handlers run_on_event_1, run_on_event_2, and run_on_event_3 would execute.

If the hypothetical event MY_EVENT_BASE, MY_OTHER_EVENT_ID is posted, only run_on_event_2 and run_on_event_3 would execute.

If the hypothetical event MY_OTHER_EVENT_BASE, MY_OTHER_EVENT_ID is posted, only run_on_event_3 would execute.
Handler Un-Registering Itself  In general, an event handler run by an event loop is not allowed to do any (un)registering activity on that event loop. There is one exception, though: un-registering itself is allowed for the handler. E.g., it is possible to do the following:

```c
void run_on_event(void* handler_arg, esp_event_base_t base, int32_t id, void* __event_data)
{
    esp_event_loop_handle_t *loop_handle = (esp_event_loop_handle_t*) handler_arg;
    esp_event_handler_unregister_with(*loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event);
}
```

```c
void app_main(void)
{
    esp_event_loop_handle_t loop_handle;
    esp_event_loop_create(&loop_args, &loop_handle);
    esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event, &loop_handle);
    // ... post-event MY_EVENT_BASE, MY_EVENT_ID and run loop at some point
}
```

Handler Registration and Handler Dispatch Order  The general rule is that, for handlers that match a certain posted event during dispatch, those which are registered first also get executed first. The user can then control which handlers get executed first by registering them before other handlers, provided that all registrations are performed using a single task. If the user plans to take advantage of this behavior, caution must be exercised if there are multiple tasks registering handlers. While the ‘first registered, first executed’ behavior still holds true, the task which gets executed first also gets its handlers registered first. Handlers registered one after the other by a single task are still dispatched in the order relative to each other, but if that task gets pre-empted in between registration by another task that also registers handlers; then during dispatch those handlers also get executed in between.

Event Loop Profiling

A configuration option `CONFIG_ESP_EVENT_LOOP_PROFILING` can be enabled in order to activate statistics collection for all event loops created. The function `esp_event_dump()` can be used to output the collected statistics to a file stream. More details on the information included in the dump can be found in the `esp_event_dump()` API Reference.

Application Example

Examples of using the `esp_event` library can be found in `system/esp_event`. The examples cover event declaration, loop creation, handler registration and deregistration, and event posting.

Other examples which also adopt `esp_event` library:

- NMEA Parser, which decodes the statements received from GPS.

API Reference

Header File

- `components/esp_event/include/esp_event.h`

Functions

`esp_err_t esp_event_loop_create` (const `esp_event_loop_args_t *event_loop_args,` `esp_event_loop_handle_t *event_loop`)

Create a new event loop.
Parameters
• `event_loop_args` [in] configuration structure for the event loop to create
• `event_loop` [out] handle to the created event loop

Returns
• ESP_OK: Success
• ESP_ERR_INVALID_ARG: event_loop_args or event_loop was NULL
• ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
• ESP_FAIL: Failed to create task loop
• Others: Fail

`esp_err_t esp_event_loop_delete` (esp_event_loop_handle_t event_loop)
Delete an existing event loop.

Parameters `event_loop` [in] event loop to delete, must not be NULL

Returns
• ESP_OK: Success
• Others: Fail

`esp_err_t esp_event_loop_create_default` (void)
Create default event loop.

Returns
• ESP_OK: Success
• ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
• ESP_ERR_INVALID_STATE: Default event loop has already been created
• ESP_FAIL: Failed to create task loop
• Others: Fail

`esp_err_t esp_event_loop_delete_default` (void)
Delete the default event loop.

Returns
• ESP_OK: Success
• Others: Fail

`esp_err_t esp_event_loop_run` (esp_event_loop_handle_t event_loop, TickType_t ticks_to_run)
Dispatch events posted to an event loop.

This function is used to dispatch events posted to a loop with no dedicated task, i.e. task name was set to NULL in event_loop_args argument during loop creation. This function includes an argument to limit the amount of time it runs, returning control to the caller when that time expires (or some time afterwards). There is no guarantee that a call to this function will exit at exactly the time of expiry. There is also no guarantee that events have been dispatched during the call, as the function might have spent all the allotted time waiting on the event queue. Once an event has been dequeued, however, it is guaranteed to be dispatched. This guarantee contributes to not being able to exit exactly at time of expiry as (1) blocking on internal mutexes is necessary for dispatching the dequeued event, and (2) during dispatch of the dequeued event there is no way to control the time occupied by handler code execution. The guaranteed time of exit is therefore the allotted time + amount of time required to dispatch the last dequeued event.

In cases where waiting on the queue times out, ESP_OK is returned and not ESP_ERR_TIMEOUT, since it is normal behavior.

**Note:** encountering an unknown event that has been posted to the loop will only generate a warning, not an error.

Parameters
• `event_loop` [in] event loop to dispatch posted events from, must not be NULL
• `ticks_to_run` [in] number of ticks to run the loop

Returns
• ESP_OK: Success
• Others: Fail
```c
esp_err_t esp_event_handler_register(esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler, void *event_handler_arg)
```

Register an event handler to the system event loop (legacy).

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

- specific events: specify exact `event_base` and `event_id`
- all events of a certain base: specify exact `event_base` and use `ESP_EVENT_ANY_ID` as the `event_id`
- all events known by the loop: use `ESP_EVENT_ANY_BASE` for `event_base` and `ESP_EVENT_ANY_ID` as the `event_id`

Registering multiple handlers to events is possible. Registering a single handler to multiple events is also possible. However, registering the same handler to the same event multiple times would cause the previous registrations to be overwritten.

**Note:** the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called.

**Parameters**
- `event_base` - [in] the base ID of the event to register the handler for
- `event_id` - [in] the ID of the event to register the handler for
- `event_handler` - [in] the handler function which gets called when the event is dispatched
- `event_handler_arg` - [in] data, aside from event data, that is passed to the handler when it is called

**Returns**
- `ESP_OK`: Success
- `ESP_ERR_NO_MEM`: Cannot allocate memory for the handler
- `ESP_ERR_INVALID_ARG`: Invalid combination of event base and event ID
- Others: Fail

```c
esp_err_t esp_event_handler_register_with(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler, void *event_handler_arg)
```

Register an event handler to a specific loop (legacy).

This function behaves in the same manner as `esp_event_handler_register`, except the additional specification of the event loop to register the handler to.

**Note:** the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called.

**Parameters**
- `event_loop` - [in] the event loop to register this handler function to, must not be NULL
- `event_base` - [in] the base ID of the event to register the handler for
- `event_id` - [in] the ID of the event to register the handler for
- `event_handler` - [in] the handler function which gets called when the event is dispatched
- `event_handler_arg` - [in] data, aside from event data, that is passed to the handler when it is called

**Returns**
- `ESP_OK`: Success
- `ESP_ERR_NO_MEM`: Cannot allocate memory for the handler
- `ESP_ERR_INVALID_ARG`: Invalid combination of event base and event ID
**Chapter 2. API Reference**

- Others: Fail

**esp_err_t esp_event_handler_instance_register_with**

- (esp_event_loop_handle_t event_loop,
  - esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler, void *event_handler_arg,
  - esp_event_handler_instance_t *instance)

Register an instance of event handler to a specific loop.

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

- specific events: specify exact event_base and event_id
- all events of a certain base: specify exact event_base and use ESP_EVENT_ANY_ID as the event_id
- all events known by the loop: use ESP_EVENT_ANY_BASE for event_base and ESP_EVENT_ANY_ID as the event_id

Besides the error, the function returns an instance object as output parameter to identify each registration. This is necessary to remove (unregister) the registration before the event loop is deleted.

Registering multiple handlers to events, registering a single handler to multiple events as well as registering the same handler to the same event multiple times is possible. Each registration yields a distinct instance object which identifies it over the registration lifetime.

**Note:** the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

**Parameters**

- event_loop - [in] the event loop to register this handler function to, must not be NULL
- event_base - [in] the base ID of the event to register the handler for
- event_id - [in] the ID of the event to register the handler for
- event_handler - [in] the handler function which gets called when the event is dispatched
- event_handler_arg - [in] data, aside from event data, that is passed to the handler when it is called
- instance - [out] An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed, but the handler should be deleted when the event loop is deleted, instance can be NULL.

**Returns**

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID or instance is NULL
- Others: Fail

**esp_err_t esp_event_handler_instance_register**

- (esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler, void *event_handler_arg,
  - esp_event_handler_instance_t *instance)

Register an instance of event handler to the default loop.

This function does the same as esp_event_handler_instance_register_with, except that it registers the handler to the default event loop.
parameters

- `event_base` - [in] the base ID of the event to register the handler for
- `event_id` - [in] the ID of the event to register the handler for
- `event_handler` - [in] the handler function which gets called when the event is dispatched
- `event_handler_arg` - [in] data, aside from event data, that is passed to the handler when it is called
- `instance` - [out] An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed, but the handler should be deleted when the event loop is deleted, instance can be NULL.

returns

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID or instance is NULL
- Others: Fail

`esp_err_t esp_event_handler_unregister(esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler)`

unregister a handler with the system event loop (legacy).

unregisters a handler, so it will no longer be called during dispatch. Handlers can be unregistered for any combination of event_base and event_id which were previously registered. To unregister a handler, the event_base and event_id arguments must match exactly the arguments passed to `esp_event_handler_register()` when that handler was registered. Passing ESPEVENT_ANY_BASE and/or ESPEVENT_ANY_ID will only unregister handlers that were registered with the same wildcard arguments.

*note:* When using ESPEVENT_ANY_ID, handlers registered to specific event IDs using the same base will not be unregistered. When using ESPEVENT_ANY_BASE, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

**parameters**

- `event_base` - [in] the base of the event with which to unregister the handler
- `event_id` - [in] the ID of the event with which to unregister the handler
- `event_handler` - [in] the handler to unregister

**returns**

- ESP_OK success
- ESP_ERR_INVALID_ARG invalid combination of event base and event ID
- Others fail

`esp_err_t esp_event_handler_unregister_with(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler)`

unregister a handler from a specific event loop (legacy).

this function behaves in the same manner as `esp_event_handler_unregister`, except the additional specification of the event loop to unregister the handler with.

**parameters**

- `event_loop` - [in] the event loop with which to unregister this handler function, must not be NULL
Chapter 2. API Reference

- **event_base** - [in] the base of the event with which to unregister the handler
- **event_id** - [in] the ID of the event with which to unregister the handler
- **event_handler** - [in] the handler to unregister

**Returns**

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```
esp_err_t esp_event_handler_instance_unregister_with(esp_event_loop_handle_t event_loop,
        esp_event_base_t event_base, int32_t event_id,
        esp_event_handler_instance_t instance)
```

Unregister a handler instance from a specific event loop.

Unregisters a handler instance, so it will no longer be called during dispatch. Handler instances can be unregistered for any combination of event_base and event_id which were previously registered. To unregister a handler instance, the event_base and event_id arguments must match exactly the arguments passed to `esp_event_handler_instance_register()` when that handler instance was registered. Passing ESP_EVENT_ANY_BASE and/or ESP_EVENT_ANY_ID will only unregister handler instances that were registered with the same wildcard arguments.

**Note:** When using ESP_EVENT_ANY_ID, handlers registered to specific event IDs using the same base will not be unregistered. When using ESP_EVENT_ANY_BASE, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

**Parameters**

- **event_loop** - [in] the event loop with which to unregister this handler function, must not be NULL
- **event_base** - [in] the base of the event with which to unregister the handler
- **event_id** - [in] the ID of the event with which to unregister the handler
- **instance** - [in] the instance object of the registration to be unregistered

**Returns**

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```
esp_err_t esp_event_handler_instance_unregister(esp_event_base_t event_base, int32_t event_id,
        esp_event_handler_instance_t instance)
```

Unregister a handler from the system event loop.

This function does the same as `esp_event_handler_instance_unregister_with()`, except that it unregisters the handler instance from the default event loop.

**Parameters**

- **event_base** - [in] the base of the event with which to unregister the handler
- **event_id** - [in] the ID of the event with which to unregister the handler
- **instance** - [in] the instance object of the registration to be unregistered

**Returns**

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```
esp_err_t esp_event_post(esp_event_base_t event_base, int32_t event_id, const void *event_data, size_t event_data_size, TickType_t ticks_to_wait)
```

Posts an event to the system default event loop. The event loop library keeps a copy of `event_data` and manages the copy’s lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

**Parameters**
• **event_base** - [in] the event base that identifies the event
• **event_id** - [in] the event ID that identifies the event
• **event_data** - [in] the data, specific to the event occurrence, that gets passed to the handler
• **event_data_size** - [in] the size of the event data
• **ticks_to_wait** - [in] number of ticks to block on a full event queue

**Returns**
- ESP_OK: Success
- ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```c
esp_err_t esp_event_post_to(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, const void* event_data, size_t event_data_size, TickType_t ticks_to_wait)
```

Posts an event to the specified event loop. The event loop library keeps a copy of event_data and manages the copy’s lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

This function behaves in the same manner as esp_event_post_to, except the additional specification of the event loop to post the event to.

**Parameters**
- **event_loop** - [in] the event loop to post to, must not be NULL
- **event_base** - [in] the event base that identifies the event
- **event_id** - [in] the event ID that identifies the event
- **event_data** - [in] the data, specific to the event occurrence, that gets passed to the handler
- **event_data_size** - [in] the size of the event data
- **ticks_to_wait** - [in] number of ticks to block on a full event queue

**Returns**
- ESP_OK: Success
- ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```c
esp_err_t esp_event_isr_post(esp_event_base_t event_base, int32_t event_id, const void* event_data, size_t event_data_size, BaseType_t* task_unblocked)
```

Special variant of esp_event_post for posting events from interrupt handlers.

**Note:** this function is only available when CONFIG_ESP_EVENT_POST_FROM_ISR is enabled

**Note:** when this function is called from an interrupt handler placed in IRAM, this function should be placed in IRAM as well by enabling CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR

**Parameters**
- **event_base** - [in] the event base that identifies the event
- **event_id** - [in] the event ID that identifies the event
- **event_data** - [in] the data, specific to the event occurrence, that gets passed to the handler
- **event_data_size** - [in] the size of the event data; max is 4 bytes
- **task_unblocked** - [out] an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.
Returns

- ESP_OK: Success
- ESP_FAIL: Event queue for the default event loop full
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID, data size of more than 4 bytes
- Others: Fail

```c
esp_err_t esp_event_isr_post_to(esp_event_loop_handle_t event_loop, esp_event_base_t event_base,
                               int32_t event_id, const void* event_data, size_t event_data_size,
                               BaseType_t* task_unblocked)
```

Special variant of esp_event_post_to for posting events from interrupt handlers.

**Note:** this function is only available when CONFIG_ESP_EVENT_POST_FROM_ISR is enabled

**Note:** when this function is called from an interrupt handler placed in IRAM, this function should be placed in IRAM as well by enabling CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR

### Parameters

- `event_loop` - [in] the event loop to post to, must not be NULL
- `event_base` - [in] the event base that identifies the event
- `event_id` - [in] the event ID that identifies the event
- `event_data` - [in] the data, specific to the event occurrence, that gets passed to the handler
- `event_data_size` - [in] the size of the event data
- `task_unblocked` - [out] an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

### Returns

- ESP_OK: Success
- ESP_FAIL: Event queue for the loop full
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID, data size of more than 4 bytes
- Others: Fail

```c
esp_err_t esp_event_dump(FILE *file)
```

Dumps statistics of all event loops.

Dumps event loop info in the format:

```
  event loop
  handler
  handler
  ...
  event loop
  handler
  handler
  ...

where:

```
  event loop
  format: address, name rx:total_received dr:total_dropped
  where:
      address - memory address of the event loop
```

(continues on next page)
name - name of the event loop, 'none' if no dedicated task
total_received - number of successfully posted events
total_dropped - number of events unsuccessfully posted due to queue... being full

handler

format: address ev:base, id inv:total_invoked run:total_runtime

where:
address - address of the handler function
base, id - the event specified by event base and ID this handler...

executes
total_invoked - number of times this handler has been invoked
total_runtime - total amount of time used for invoking this handler

Note: this function is a noop when CONFIG_ESP_EVENT_LOOP_PROFILING is disabled

Parameters

file - [in] the file stream to output to

Returns

• ESP_OK: Success
• ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
• Others: Fail

Structures

struct esp_event_loop_args_t
Configuration for creating event loops.

Public Members

int32_t queue_size
size of the event loop queue

const char *task_name
name of the event loop task; if NULL, a dedicated task is not created for event loop

UBaseType_t task_priority
priority of the event priority task, ignored if task name is NULL

uint32_t task_stack_size
stack size of the event loop task, ignored if task name is NULL

BaseType_t task_core_id
core to which the event loop task is pinned to, ignored if task name is NULL

Header File

• components/esp_event/include/esp_event_base.h
Chapter 2. API Reference

Macros

ESP_EVENT_DECLARE_BASE (id)

ESP_EVENT_DEFINE_BASE (id)

ESP_EVENT_ANY_BASE
   register handler for any event base

ESP_EVENT_ANY_ID
   register handler for any event id

Type Definitions

typedef void *esp_event_loop_handle_t
   a number that identifies an event with respect to a base

typedef void (*esp_event_handler_t)(void *event_handler_arg, esp_event_base_t event_base, int32_t event_id, void *event_data)
   function called when an event is posted to the queue

typedef void *esp_event_handler_instance_t
   context identifying an instance of a registered event handler

2.10.11 FreeRTOS Overview

Overview

FreeRTOS is an open source RTOS (real-time operating system) kernel that is integrated into ESP-IDF as a component. Thus, all ESP-IDF applications and many ESP-IDF components are written based on FreeRTOS. The FreeRTOS kernel is ported to all architectures (i.e., Xtensa and RISC-V) available of ESP chips.

Furthermore, ESP-IDF provides different implementations of FreeRTOS in order to support SMP (Symmetric Multiprocessing) on multi-core ESP chips. This document provides an overview of the FreeRTOS component, the different FreeRTOS implementations offered by ESP-IDF, and the common aspects across all implementations.

Implementations

The official FreeRTOS (henceforth referred to as Vanilla FreeRTOS) is a single-core RTOS. In order to support the various multi-core ESP targets, ESP-IDF supports different FreeRTOS implementations as listed below:

ESP-IDF FreeRTOS ESP-IDF FreeRTOS is a FreeRTOS implementation based on Vanilla FreeRTOS v10.4.3, but contains significant modifications to support SMP. ESP-IDF FreeRTOS only supports two cores at most (i.e., dual core SMP), but is more optimized for this scenario by design. For more details regarding ESP-IDF FreeRTOS and its modifications, please refer to the FreeRTOS (ESP-IDF) document.

Note: ESP-IDF FreeRTOS is currently the default FreeRTOS implementation for ESP-IDF.
Amazon SMP FreeRTOS  Amazon SMP FreeRTOS is an SMP implementation of FreeRTOS that is officially supported by Amazon. Amazon SMP FreeRTOS is able to support N-cores (i.e., more than two cores). Amazon SMP FreeRTOS can be enabled via the `CONFIG_PREERTOS_SMP` option. For more details regarding Amazon SMP FreeRTOS, please refer to the official Amazon SMP FreeRTOS documentation.

Warning: The Amazon SMP FreeRTOS implementation (and its port in ESP-IDF) are currently in experimental/beta state. Therefore, significant behavioral changes and breaking API changes can occur.

Configuration

Kernel Configuration  Vanilla FreeRTOS requires that ports and applications configure the kernel by adding various `#define config...` macro definitions to the `FreeRTOSConfig.h` header file. Vanilla FreeRTOS supports a list of kernel configuration options which allow various kernel behaviors and features to be enabled or disabled.

However, for all FreeRTOS ports in ESP-IDF, the `FreeRTOSConfig.h` header file is considered private and must not be modified by users. A large number of kernel configuration options in `FreeRTOSConfig.h` are hard-coded as they are either required/not supported by ESP-IDF. All kernel configuration options that are configurable by the user are exposed via menuconfig under Component Config/FreeRTOS/Kernel.

For the full list of user configurable kernel options, see Project Configuration. The list below highlights some commonly used kernel configuration options:

- `CONFIG_FREERTOS_UNICORE` runs FreeRTOS only on CPU0. Note that this is not equivalent to running Vanilla FreeRTOS. Furthermore, this option may affect behavior of components other than freertos. For more details regarding the effects of running FreeRTOS on a single core, refer to ESP-IDF FreeRTOS Single Core (if using ESP-IDF FreeRTOS) or the official Amazon SMP FreeRTOS documentation. Alternatively, users can also search for occurrences of `CONFIG_FREERTOS_UNICORE` in the ESP-IDF components.
- `CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY` enables backward compatibility with some FreeRTOS macros/types/functions that were deprecated from v8.0 onwards.

Port Configuration  All other FreeRTOS related configuration options that are not part of the kernel configuration are exposed via menuconfig under Component Config/FreeRTOS/Port. These options configure aspects such as:

- The FreeRTOS ports themselves (e.g., tick timer selection, ISR stack size)
- Additional features added to the FreeRTOS implementation or ports

Using FreeRTOS

Application Entry Point  Unlike Vanilla FreeRTOS, users of FreeRTOS in ESP-IDF must never call `vTaskStartScheduler()` and `vTaskEndScheduler()`. Instead, ESP-IDF starts FreeRTOS automatically. Users must define a `void app_main(void)` function which acts as the entry point for user’s application and is automatically invoked on ESP-IDF startup.

- Typically, users would spawn the rest of their application’s task from `app_main`.
- The `app_main` function is allowed to return at any point (i.e., before the application terminates).
- The `app_main` function is called from the `main` task.

Background Tasks  During startup, ESP-IDF and the FreeRTOS kernel automatically create multiple tasks that run in the background (listed in the table below).
Table 10: List of Tasks Created During Startup

<table>
<thead>
<tr>
<th>Task Name</th>
<th>Description</th>
<th>Stack Size</th>
<th>Priority</th>
</tr>
</thead>
<tbody>
<tr>
<td>Idle Tasks (IDLEx)</td>
<td>An idle task (IDLEx) is created for (and pinned to) each CPU core, where x is the CPU core’s number. The x is dropped when single-core configuration is enabled.</td>
<td>Core 0</td>
<td></td>
</tr>
<tr>
<td>FreeRTOS Timer Task (Tmr Svc)</td>
<td>FreeRTOS will create the Timer Service/Daemon Task if any FreeRTOS Timer APIs are called by the application</td>
<td>Core 0</td>
<td></td>
</tr>
<tr>
<td>Main Task (main)</td>
<td>Task that simply calls app_main. This task will self delete when app_main returns</td>
<td>Core 1</td>
<td></td>
</tr>
<tr>
<td>IPC Tasks (ipcx)</td>
<td>When CONFIG_FREERTOS_UNICORE is false, an IPC task (ipcx) is created for (and pinned to) each CPU core. IPC tasks are used to implement the Inter-processor Call (IPC) feature.</td>
<td>Core 24</td>
<td></td>
</tr>
<tr>
<td>ESP Timer Task (esp_timer)</td>
<td>ESP-IDF creates the ESP Timer Task used to process ESP Timer callbacks</td>
<td>Core 22</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** Note that if an application uses other ESP-IDF features (e.g., Wi-Fi or Bluetooth), those features may create their own background tasks in addition to the tasks listed in the table above.

**FreeRTOS Additions**

ESP-IDF provides some supplemental features to FreeRTOS such as Ring Buffers, ESP-IDF style Tick and Idle Hooks, and TLSP deletion callbacks. See *FreeRTOS (Supplemental Features)* for more details.

**FreeRTOS Heap**

Vanilla FreeRTOS provides its own selection of heap implementations. However, ESP-IDF already implements its own heap (see *Heap Memory Allocation*), thus ESP-IDF does not make use of the heap implementations provided by Vanilla FreeRTOS. All FreeRTOS ports in ESP-IDF map FreeRTOS memory allocation or free calls (e.g., pvPortMalloc() and pvPortFree()) to ESP-IDF heap API (i.e., heap_caps_malloc() and heap_caps_free()). However, the FreeRTOS ports ensure that all dynamic memory allocated by FreeRTOS is placed in internal memory.

**Note:** If users wish to place FreeRTOS tasks/objects in external memory, users can use the following methods:

- Allocate the task or object using one of the ...CreateWithCaps() API, such as xTaskCreateWithCaps() and xQueueCreateWithCaps() (see *IDF Additional API* for more details).
- Manually allocate external memory for those objects using heap_caps_malloc(), then create the objects from the allocated memory using on of the ...CreateStatic() FreeRTOS functions.

2.10.12 FreeRTOS (ESP-IDF)
Overview

The original FreeRTOS (hereinafter referred to as Vanilla FreeRTOS) is a small and efficient Real Time Operating System supported on many single-core MCUs and SoCs. However, to support numerous dual core ESP targets (such as the ESP32, ESP32-S3 and ESP32-P4), ESP-IDF provides a dual core SMP (Symmetric Multiprocessing) capable implementation of FreeRTOS, (hereinafter referred to as ESP-IDF FreeRTOS).

ESP-IDF FreeRTOS is based on Vanilla FreeRTOS v10.4.3, but contains significant modifications to both API and kernel behavior in order to support dual core SMP. This document describes the API and behavioral differences between Vanilla FreeRTOS and ESP-IDF FreeRTOS.

Note: This document assumes that the reader has a requisite understanding of Vanilla FreeRTOS (its features, behavior, and API usage). Refer to the Vanilla FreeRTOS documentation for more details.

Note: ESP-IDF FreeRTOS can be built for a single core by enabling the CONFIG_FREERTOS_UNICORE configuration option. ESP targets that are single core always have the CONFIG_FREERTOS_UNICORE option enabled. However, note that building with CONFIG_FREERTOS_UNICORE enabled does not equate to building with Vanilla FreeRTOS (i.e., some of the behavioral and API changes of ESP-IDF are still present). For more details, see ESP-IDF FreeRTOS Single Core.

This document is split into the following parts.

Symmetric Multiprocessing

Basic Concepts  SMP (Symmetric Multiprocessing) is a computing architecture where two or more identical CPUs (cores) are connected to a single shared main memory and controlled by a single operating system. In general, an SMP system --

- has multiple cores running independently. Each core has its own register file, interrupts, and interrupt handling.
- presents an identical view of memory to each core. Thus a piece of code that accesses a particular memory address has the same effect regardless of which core it runs on.

The main advantages of an SMP system compared to single core or Asymmetric Multiprocessing systems are that --

- the presence of multiple CPUs allows for multiple hardware threads, thus increases overall processing throughput.
- having symmetric memory means that threads can switch cores during execution. This in general can lead to better CPU utilization.

Although an SMP system allows threads to switch cores, there are scenarios where a thread must/should only run on a particular core. Therefore, threads in an SMP system also have a core affinity that specifies which particular core the thread is allowed to run on.

- A thread that is pinned to a particular core is only be able to run on that core
A thread that is unpinned will be allowed to switch between cores during execution instead of being pinned to a particular core.

**SMP on an ESP Target**  ESP targets (such as the ESP32, ESP32-S3 and ESP32-P4) are dual core SMP SoCs. These targets have the following hardware features that make them SMP capable:

- Two identical cores known as CPU0 and CPU1. This means that the execution of a piece of code is identical regardless of which core it runs on.
- Symmetric memory (with some small exceptions).
  - If multiple cores access the same memory address, their access will be serialized at the memory bus level.
  - True atomic access to the same memory address is achieved via an atomic compare-and-swap instruction provided by the ISA.
- Cross-core interrupts that allow one CPU to trigger and interrupt on another CPU. This allows cores to signal each other.

**Note:** CPU0 is also known as Protocol CPU or PRO_CPU and CPU1 is also known as Application CPU or APP_CPU. The PRO_CPU and APP_CPU aliases for CPU0 and CPU1 exist in ESP-IDF as they reflect how typical ESP-IDF applications utilize the two CPUs. Typically, the tasks responsible for handling wireless networking (e.g., Wi-Fi or Bluetooth) are pinned to CPU0 (thus the name PRO_CPU), whereas the tasks handling the remainder of the application are pinned to CPU1 (thus the name APP_CPU).

**Tasks**

**Creation**  Vanilla FreeRTOS provides the following functions to create a task:

- `xTaskCreate()` creates a task. The task’s memory is dynamically allocated
- `xTaskCreateStatic()` creates a task. The task’s memory is statically allocated (i.e., provided by the user)

However, in an SMP system, tasks need to be assigned a particular affinity. Therefore, ESP-IDF provides a Pinned-ToCore version of Vanilla FreeRTOS’s task creation functions:

- `xTaskCreatePinnedToCore()` creates a task with a particular core affinity. The task’s memory is dynamically allocated.
- `xTaskCreateStaticPinnedToCore()` creates a task with a particular core affinity. The task’s memory is statically allocated (i.e., provided by the user)

The PinnedToCore versions of the task creation functions API differ from their vanilla counterparts by having an extra `xCoreID` parameter that is used to specify the created task’s core affinity. The valid values for core affinity are:

- 0 which pins the created task to CPU0
- 1 which pins the created task to CPU1
- `tskNO_AFFINITY` which allows the task to be run on both CPUs

Note that ESP-IDF FreeRTOS still supports the vanilla versions of the task creation functions. However, they have been modified to simply call their PinnedToCore counterparts with `tskNO_AFFINITY`.

**Note:**  ESP-IDF FreeRTOS also changes the units of `ulStackDepth` in the task creation functions. Task stack sizes in Vanilla FreeRTOS are specified in number of words, whereas in ESP-IDF FreeRTOS, the task stack sizes are specified in bytes.

**Execution**  The anatomy of a task in ESP-IDF FreeRTOS is the same as Vanilla FreeRTOS. More specifically, ESP-IDF FreeRTOS tasks:

- Can only be in one of following states: Running, Ready, Blocked, or Suspended.
- Task functions are typically implemented as an infinite loop
Task functions should never return

**Deletion**  Task deletion in Vanilla FreeRTOS is called via `vTaskDelete()`. The function allows deletion of another task or the currently running task (if the provided task handle is NULL). The actual freeing of the task’s memory is sometimes delegated to the idle task (if the task being deleted is the currently running task).

ESP-IDF FreeRTOS provides the same `vTaskDelete()` function. However, due to the dual core nature, there are some behavioral differences when calling `vTaskDelete()` in ESP-IDF FreeRTOS:

- When deleting a task that is pinned to the other core, that task’s memory is always freed by the idle task of the other core (due to the need to clear FPU registers).
- When deleting a task that is currently running on the other core, an yield is triggered on the other core and the task’s memory is freed by one of the idle tasks (depending on the task’s core affinity)
- A deleted task’s memory is freed immediately if:
  - The tasks is currently running on this core and is also pinned to this core
  - The task is not currently running and is not pinned to any core

Users should avoid calling `vTaskDelete()` on a task that is currently running on the other core. This is due to the fact that it is difficult to know what the task currently running on the other core is executing, thus can lead to unpredictable behavior such as:

- Deleting a task that is holding a mutex
- Deleting a task that has yet to free memory it previously allocated

Where possible, users should design their application such that `vTaskDelete()` is only ever called on tasks in a known state. For example:

- Tasks self deleting (via `vTaskDelete(NULL)`) when their execution is complete and have also cleaned up all resources used within the task.
- Tasks placing themselves in the suspend state (via `vTaskSuspend()`) before being deleted by another task.

**SMP Scheduler**

The Vanilla FreeRTOS scheduler is best described as a **Fixed Priority Preemptive scheduler with Time Slicing** meaning that:

- Each tasks is given a constant priority upon creation. The scheduler executes highest priority ready state task
- The scheduler can switch execution to another task without the cooperation of the currently running task
- The scheduler periodically switches execution between ready state tasks of the same priority (in a round robin fashion). Time slicing is governed by a tick interrupt.

The ESP-IDF FreeRTOS scheduler supports the same scheduling features (i.e., Fixed Priority, Preemption, and Time Slicing) albeit with some small behavioral differences.

**Fixed Priority**  In Vanilla FreeRTOS, when scheduler selects a new task to run, it always selects the current highest priority ready state task. In ESP-IDF FreeRTOS, each core independently schedules tasks to run. When a particular core selects a task, the core will select the highest priority ready state task that can be run by the core. A task can be run by the core if:

- The task has a compatible affinity (i.e., is either pinned to that core or is unpinned)
- The task is not currently being run by another core

However, users should not assume that the two highest priority ready state tasks are always run by the scheduler as a task’s core affinity must also be accounted for. For example, given the following tasks:

- Task A of priority 10 pinned to CPU0
- Task B of priority 9 pinned to CPU0
- Task C of priority 8 pinned to CPU1

The resulting schedule will have Task A running on CPU0 and Task C running on CPU1. Task B is not run even though it is the second highest priority task.
Preemption  In Vanilla FreeRTOS, the scheduler can preempt the currently running task if a higher priority task becomes ready to execute. Likewise in ESP-IDF FreeRTOS, each core can be individually preempted by the scheduler if the scheduler determines that a higher priority task can run on that core.

However, there are some instances where a higher priority task that becomes ready can be run on multiple cores. In this case, the scheduler only preempts one core. The scheduler always gives preference to the current core when multiple cores can be preempted. In other words, if the higher priority ready task is unpinned and has a higher priority than the current priority of both cores, the scheduler will always choose to preempt the current core. For example, given the following tasks:

- Task A of priority 8 currently running on CPU0
- Task B of priority 9 currently running on CPU1
- Task C of priority 10 that is unpinned and was unblocked by Task B

The resulting schedule will have Task A running on CPU0 and Task C preempting Task B given that the scheduler always gives preference to the current core.

Time Slicing  The Vanilla FreeRTOS scheduler implements time slicing meaning that if current highest priority contains multiple ready tasks, the scheduler will switch between those tasks periodically in a round robin fashion.

However, in ESP-IDF FreeRTOS, it is not possible to implement perfect Round Robin time slicing due to the fact that a particular task may not be able to run on a particular core due to the following reasons:

- The task is pinned to the another core.
- For unpinned tasks, the task is already being run by another core.

Therefore, when a core searches the ready state task list for a task to run, the core may need to skip over a few tasks in the same priority list or drop to a lower priority in order to find a ready state task that the core can run.

The ESP-IDF FreeRTOS scheduler implements a Best Effort Round Robin time slicing for ready state tasks of the same priority by ensuring that tasks that have been selected to run are placed at the back of the list, thus giving unselected tasks a higher priority on the next scheduling iteration (i.e., the next tick interrupt or yield).

The following example demonstrates the Best Effort Round Robin time slicing in action. Assume that:

- There are four ready state tasks of the same priority AX, B0, C1, D1 where: - The priority is the current highest priority with ready state tasks - The first character represents the task’s names (i.e., A, B, C, D) - And the second character represents the tasks core pinning (and X means unpinned)
- The task list is always searched from the head

<table>
<thead>
<tr>
<th>1. Starting state. None of the ready state tasks have been selected to run</th>
</tr>
</thead>
<tbody>
<tr>
<td>Head [ AX , B0 , C1 , D0 ] Tail</td>
</tr>
<tr>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>1. Core 0 has tick interrupt and searches for a task to run.</td>
</tr>
<tr>
<td>Task A is selected and is moved to the back of the list</td>
</tr>
<tr>
<td>Core0--</td>
</tr>
<tr>
<td>Head [ AX , B0 , C1 , D0 ] Tail</td>
</tr>
<tr>
<td>0</td>
</tr>
<tr>
<td>Head [ B0 , C1 , D0 , AX ] Tail</td>
</tr>
<tr>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>1. Core 1 has a tick interrupt and searches for a task to run.</td>
</tr>
<tr>
<td>Task B cannot be run due to incompatible affinity, so core 1 skips to Task C.</td>
</tr>
<tr>
<td>Task C is selected and is moved to the back of the list</td>
</tr>
</tbody>
</table>

(continues on next page)
Core1------| 0
Head [ B0 , C1 , D0 , AX ] Tail

0 1
Head [ B0 , D0 , AX , C1 ] Tail

--------------------------------------------------------------------------------

1. Core 0 has another tick interrupt and searches for a task to run.
   Task B is selected and moved to the back of the list

Core0--| 1
Head [ B0 , D0 , AX , C1 ] Tail

1 0
Head [ D0 , AX , C1 , B0 ] Tail

--------------------------------------------------------------------------------

1. Core 1 has another tick and searches for a task to run.
   Task D cannot be run due to incompatible affinity, so core 1 skips to Task A
   Task A is selected and moved to the back of the list

Core1------| 0
Head [ D0 , AX , C1 , B0 ] Tail

0 1
Head [ D0 , C1 , B0 , AX ] Tail

The implications to users regarding the Best Effort Round Robin time slicing:

- Users cannot expect multiple ready state tasks of the same priority to run sequentially (as is the case in Vanilla FreeRTOS). As demonstrated in the example above, a core may need to skip over tasks.
- However, given enough ticks, a task will eventually be given some processing time.
- If a core cannot find a task runnable task at the highest ready state priority, it will drop to a lower priority to search for tasks.
- To achieve ideal round robin time slicing, users should ensure that all tasks of a particular priority are pinned to the same core.

Tick Interrupts  Vanilla FreeRTOS requires that a periodic tick interrupt occurs. The tick interrupt is responsible for:

- Incrementing the scheduler’s tick count
- Unblocking any blocked tasks that have timed out
- Checking if time slicing is required (i.e., triggering a context switch)
- Executing the application tick hook

In ESP-IDF FreeRTOS, each core receives a periodic interrupt and independently run the tick interrupt. The tick interrupts on each core are of the same period but can be out of phase. However, the tick responsibilities listed above are not run by all cores:

- CPU0 executes all of the tick interrupt responsibilities listed above
- CPU1 only checks for time slicing and execute the application tick hook

Note:  CPU0 is solely responsible for keeping time in ESP-IDF FreeRTOS. Therefore anything that prevents CPU0 from incrementing the tick count (such as suspending the scheduler on CPU0) causes the entire schedulers time keeping to lag behind.
Idle Tasks   Vanilla FreeRTOS will implicitly create an idle task of priority 0 when the scheduler is started. The idle task runs when no other task is ready to run, and it has the following responsibilities:
   • Freeing the memory of deleted tasks
   • Executing the application idle hook

In ESP-IDF FreeRTOS, a separate pinned idle task is created for each core. The idle tasks on each core have the same responsibilities as their vanilla counterparts.

Scheduler Suspension   Vanilla FreeRTOS allows the scheduler to be suspended/resumed by calling `vTaskSuspendAll()` and `xTaskResumeAll()` respectively. While the scheduler is suspended:
   • Task switching is disabled but interrupts are left enabled.
   • Calling any blocking/yielding function is forbidden, and time slicing is disabled.
   • The tick count is frozen (but the tick interrupt still occurs to execute the application tick hook)

On scheduler resumption, `xTaskResumeAll()` catches up all of the lost ticks and unblock any timed out tasks.

In ESP-IDF FreeRTOS, suspending the scheduler across multiple cores is not possible. Therefore when `vTaskSuspendAll()` is called on a particular core (e.g., core A):
   • Task switching is disabled only on core A but interrupts for core A are left enabled
   • Calling any blocking/yielding function on core A is forbidden. Time slicing is disabled on core A.
   • If an interrupt on core A unblocks any tasks, tasks with affinity to core A will go into core A’s own pending ready task list. Unpinned tasks or tasks with affinity to other cores can be scheduled on cores with the scheduler running.
   • In case the scheduler is suspended on all cores, tasks unblocked by an interrupt will go to the pending ready task lists of their pinned cores or to the pending ready list of the core on which the interrupt is called if the tasks are unpinned.
   • If core A is CPU0, the tick count is frozen and a pended tick count is incremented instead. However, the tick interrupt will still occur in order to execute the application tick hook.

When `xTaskResumeAll()` is called on a particular core (e.g., core A):
   • Any tasks added to core A’s pending ready task list will be resumed
   • If core A is CPU0, the pended tick count is unwound to catch up the lost ticks.

Warning:   Given that scheduler suspension on ESP-IDF FreeRTOS only suspends scheduling on a particular core, scheduler suspension is **NOT** a valid method ensuring mutual exclusion between tasks when accessing shared data. Users should use proper locking primitives such as mutexes or spinlocks if they require mutual exclusion.

Disabling Interrupts   Vanilla FreeRTOS allows interrupts to be disabled and enabled by calling `taskDISABLE_INTERRUPTS` and `taskENABLE_INTERRUPTS` respectively.

ESP-IDF FreeRTOS provides the same API, however interrupts are only disabled or enabled on the current core.

Warning:   Disabling interrupts is a valid method of achieve mutual exclusion in Vanilla FreeRTOS (and single core systems in general). However, in an SMP system, disabling interrupts is **NOT** a valid method ensuring mutual exclusion. Refer to Critical Sections for more details.

Critical Sections

API Changes   Vanilla FreeRTOS implements critical sections by disabling interrupts. This prevents preemptive context switches and the servicing of ISRs during a critical section. Thus a task/ISR that enters a critical section is guaranteed to be the sole entity to access a shared resource. Critical sections in Vanilla FreeRTOS have the following API:
   • `taskENTER_CRITICAL()` enters a critical section by disabling interrupts
Chapter 2. API Reference

- `taskEXIT_CRITICAL()` exits a critical section by reenabling interrupts
- `taskENTER_CRITICAL_FROM_ISR()` enters a critical section from an ISR by disabling interrupt nesting
- `taskEXIT_CRITICAL_FROM_ISR()` exits a critical section from an ISR by reenabling interrupt nesting

However, in an SMP system, merely disabling interrupts does not constitute a critical section as the presence of other cores means that a shared resource can still be concurrently accessed. Therefore, critical sections in ESP-IDF FreeRTOS are implemented using spinlocks. To accommodate the spinlocks, the ESP-IDF FreeRTOS critical section APIs contain an additional spinlock parameter as shown below:

- Spinlocks are of `portMUX_TYPE` (not to be confused to FreeRTOS mutexes)
- `taskENTER_CRITICAL(&spinlock)` enters a critical section from a task context
- `taskEXIT_CRITICAL(&spinlock)` exits a critical section from a task context
- `taskENTER_CRITICAL_ISR(&spinlock)` enters a critical section from an interrupt context
- `taskEXIT_CRITICAL_ISR(&spinlock)` exits a critical section from an interrupt context

**Note:** The critical section API can be called recursively (i.e., nested critical sections). Entering a critical section multiple times recursively is valid so long as the critical section is exited the same number of times it was entered. However, given that critical sections can target different spinlocks, users should take care to avoid deadlocking when entering critical sections recursively.

Spinlocks can be allocated statically or dynamically. As such, macros are provided for both static and dynamic initialization of spinlocks, as demonstrated by the following code snippets.

- Allocating a static spinlock and initializing it using `portMUX_INITIALIZER_UNLOCKED`

```c
// Statically allocate and initialize the spinlock
static portMUX_TYPE my_spinlock = portMUX_INITIALIZER_UNLOCKED;

void some_function(void)
{
    taskENTER_CRITICAL(&my_spinlock);
    // We are now in a critical section
    taskEXIT_CRITICAL(&my_spinlock);
}
```

- Allocating a dynamic spinlock and initializing it using `portMUX_INITIALIZER()`

```c
// Allocate the spinlock dynamically
portMUX_TYPE *mySpinlock = malloc(sizeof(portMUX_TYPE));
// Initialize the spinlock dynamically
portMUX_INITIALIZER(mySpinlock);
...

// Access the resource

// Critical section

taskENTER_CRITICAL(mySpinlock);
// Access the resource

taskEXIT_CRITICAL(mySpinlock);
```

**Implementation** In ESP-IDF FreeRTOS, the process of a particular core entering and exiting a critical section is as follows:

- **For taskENTER_CRITICAL(&spinlock) (or taskENTER_CRITICAL_ISR(&spinlock))**
  1. The core disables its interrupts (or interrupt nesting) up to `configMAX_SYSCALL_INTERRUPT_PRIORITY`
  2. The core then spins on the spinlock using an atomic compare-and-set instruction until it acquires the lock.
  3. Once the spinlock is acquired, the function returns. The remainder of the critical section runs with interrupts (or interrupt nesting) disabled.
- **For taskEXIT_CRITICAL(&spinlock) (or taskEXIT_CRITICAL_ISR(&spinlock))**
  1. The core releases the spinlock by clearing the spinlock’s owner value
2. The core re-enables interrupts (or interrupt nesting)

**Restrictions and Considerations**  Given that interrupts (or interrupt nesting) are disabled during a critical section, there are multiple restrictions regarding what can be done within a critical section. During a critical section, users should keep the following restrictions and considerations in mind:

- Critical sections should be as kept as short as possible
  - The longer the critical section lasts, the longer a pending interrupt can be delayed.
  - A typical critical section should only access a few data structures and/or hardware registers
  - If possible, defer as much processing and/or event handling to the outside of critical sections.
- FreeRTOS API should not be called from within a critical section
- Users should never call any blocking or yielding functions within a critical section

**Misc**

**Floating Point Usage**  Usually, when a context switch occurs:

- the current state of a CPU’s registers are saved to the stack of task being switch out
- the previously saved state of the CPU’s registers are loaded from the stack of the task being switched in

However, ESP-IDF FreeRTOS implements Lazy Context Switching for the FPU (Floating Point Unit) registers of a CPU. In other words, when a context switch occurs on a particular core (e.g., CPU0), the state of the core’s FPU registers are not immediately saved to the stack of the task getting switched out (e.g., Task A). The FPU’s registers are left untouched until:

- A different task (e.g., Task B) runs on the same core and uses the FPU. This will trigger an exception that saves the FPU registers to Task A’s stack.
- Task A gets scheduled to the same core and continues execution. Saving and restoring the FPU’s registers is not necessary in this case.

However, given that tasks can be unpinned thus can be scheduled on different cores (e.g., Task A switches to CPU1), it is unfeasible to copy and restore the FPU’s registers across cores. Therefore, when a task utilizes the FPU (by using a `float` type in its call flow), ESP-IDF FreeRTOS will automatically pin the task to the current core it is running on. This ensures that all tasks that uses the FPU are always pinned to a particular core.

Furthermore, ESP-IDF FreeRTOS by default does not support the usage of the FPU within an interrupt context given that the FPU’s register state is tied to a particular task.

**Note:**  ESP targets that contain an FPU do not support hardware acceleration for double precision floating point arithmetic (`double`). Instead `double` is implemented via software hence the behavioral restrictions regarding the `float` type do not apply to `double`. Note that due to the lack of hardware acceleration, `double` operations may consume significantly more CPU time in comparison to `float`.

**ESP-IDF FreeRTOS Single Core**  Although ESP-IDF FreeRTOS is an SMP scheduler, some ESP targets are single core (such as the ESP32-S2 and ESP32-C3). When building ESP-IDF applications for these targets, ESP-IDF FreeRTOS is still used but the number of cores will be set to 1 (i.e., the `CONFIG_FREERTOS_UNICORE` will always be enabled for single core targets).

For multicore targets (such as the ESP32 and ESP32-S3), `CONFIG_FREERTOS_UNICORE` can also be set. This results in ESP-IDF FreeRTOS only running on CPU0, and all other cores will be inactive.

**Note:**  Users should bear in mind that enabling `CONFIG_FREERTOS_UNICORE` is NOT equivalent to running Vanilla FreeRTOS. The additional API of ESP-IDF FreeRTOS can still be called, and the behavior changes of ESP-IDF FreeRTOS incurs a small amount of overhead even when compiled for only a single core.
API Reference

This section contains documentation of FreeRTOS types, functions, and macros. It is automatically generated from FreeRTOS header files.

Task API

**Header File**

- components/freertos/FreeRTOS-Kernel/include/freertos/task.h

**Functions**

```c
static inline BaseType_t xTaskCreate(TaskFunction_t pxTaskCode, const char *const pcName, const configSTACK_DEPTH_TYPE usStackDepth, void *const pvParameters, UBaseType_t uxPriority, TaskHandle_t *const pxCreatedTask)
```

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task’s data structures. The second block is used by the task as its stack. If a task is created using xTaskCreate() then both blocks of memory are automatically dynamically allocated inside the xTaskCreate() function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a task is created using xTaskCreateStatic() then the application writer must provide the required memory. xTaskCreateStatic() therefore allows a task to be created without using any dynamic memory allocation.

See xTaskCreateStatic() for a version that does not use any dynamic memory allocation.

xTaskCreate() can only be used to create a task that has unrestricted access to the entire microcontroller memory map. Systems that include MPU support can alternatively create an MPU constrained task using xTaskCreateRestricted().

**Example usage:**

```c
// Task to be created.
void vTaskCode( void * pvParameters )
{

}

// Task code goes here.

// Function that creates a task.
void vOtherFunction( void )
{

static uint8_t ucParameterToPass;
TaskHandle_t xHandle = NULL;

// Create the task, storing the handle. Note that the passed parameter...
ucParameterToPass
// must exist for the lifetime of the task, so in this case is declared...
static. If it was just an...
// an automatic stack variable it might no longer exist, or at least have...
been corrupted, by the time...
// the new task attempts to access it.
xCtxTaskCreate( vTaskCode, "NAME", STACK_SIZE, &ucParameterToPass, tskIDLE_
--PRIORITY, &xHandle );
configASSERT( xHandle );
```

(continues on next page)
// Use the handle to delete the task.
if ( xHandle != NULL )
{
    vTaskDelete( xHandle );
}

Note: If program uses thread local variables (ones specified with “__thread” keyword) then storage for them will be allocated on the task’s stack.

Parameters

- **pxTaskCode** - Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- **pcName** - A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by configMAX_TASK_NAME_LEN - default is 16.
- **usStackDepth** - The size of the task stack specified as the NUMBER OF BYTES. Note that this differs from vanilla FreeRTOS.
- **pvParameters** - Pointer that will be used as the parameter for the task being created.
- **uxPriority** - The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit portPRIVILEGE_BIT of the priority parameter. For example, to create a privileged task at priority 2 the uxPriority parameter should be set to (2 | portPRIVILEGE_BIT).
- **pxCreatedTask** - Used to pass back a handle by which the created task can be referenced.

Returns pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

static inline TaskHandle_t xTaskCreateStatic(TaskFunction_t pxTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, StackType_t *const puxStackBuffer, StaticTask_t *const pxTaskBuffer)

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task’s data structures. The second block is used by the task as its stack. If a task is created using xTaskCreate() then both blocks of memory are automatically dynamically allocated inside the xTaskCreate() function. (see https://www.FreeRTOS.org/a00111.html). If a task is created using xTaskCreateStatic() then the application writer must provide the required memory. xTaskCreateStatic() therefore allows a task to be created without using any dynamic memory allocation.

Example usage:

```c
#define STACK_SIZE 200
StaticTask_t xTaskBuffer;

// Structure that will hold the TCB of the task being created.
static TaskHandle_t xTaskHandle;

// Buffer that the task being created will use as its stack. Note this is // an array of StackType_t variables. The size of StackType_t is dependent on // the RTOS port.
StaticTask_t xStack[ STACK_SIZE ];
```
// Function that implements the task being created.
void vTaskCode( void * pvParameters )
{
    // The parameter value is expected to be 1 as 1 is passed in the
    // pvParameters value in the call to xTaskCreateStatic().
    configASSERT( ( uint32_t ) pvParameters == 1UL );

    for( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    TaskHandle_t xHandle = NULL;

    // Create the task without using any dynamic memory allocation.
    xHandle = xTaskCreateStatic(
        vTaskCode,        // Function that implements the task.
        "NAME",          // Text name for the task.
        STACK_SIZE,      // Stack size in bytes, not words.
        ( void * ) 1,    // Parameter passed into the task.
        tskIDLE_PRIORITY, // Priority at which the task is created.
        xStack,          // Array to use as the task's stack.
        &xTaskBuffer );  // Variable to hold the task's data...

    // puxStackBuffer and pxTaskBuffer were not NULL, so the task will have
    // been created, and xHandle will be the task's handle. Use the handle
    // to suspend the task.
    vTaskSuspend( xHandle );
}

Note: If program uses thread local variables (ones specified with “__thread” keyword) then storage for them
will be allocated on the task’s stack.

Parameters
- pxTaskCode - Pointer to the task entry function. Tasks must be implemented to never
  return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- pcName - A descriptive name for the task. This is mainly used to facilitate debugging.
  The maximum length of the string is defined by configMAX_TASK_NAME_LEN in
  FreeRTOSConfig.h.
- ulStackDepth - The size of the task stack specified as the NUMBER OF BYTES.
  Note that this differs from vanilla FreeRTOS.
- pvParameters - Pointer that will be used as the parameter for the task being created.
- uxPriority - The priority at which the task will run.
- puxStackBuffer - Must point to a StackType_t array that has at least ulStackDepth
  indexes - the array will then be used as the task’s stack, removing the need for the stack
  to be allocated dynamically.
- pxTaskBuffer - Must point to a variable of type StaticTask_t, which will then be used
  to hold the task’s data structures, removing the need for the memory to be allocated
dynamically.

Returns If neither pxStackBuffer or pxTaskBuffer are NULL, then the task will be created
and pdPASS is returned. If either pxStackBuffer or pxTaskBuffer are NULL then the task will not
be created and errCOULD_NOT_ALLOCATE_REQUIRED_MEMORY is returned.
void vTaskAllocateMPURegions (TaskHandle_t xTask, const MemoryRegion_t *const pxRegions)

Only available when configSUPPORT_DYNAMIC_ALLOCATION is set to 1.

xTaskCreateRestricted() should only be used in systems that include an MPU implementation.

Create a new task and add it to the list of tasks that are ready to run. The function parameters define the memory regions and associated access permissions allocated to the task.

See xTaskCreateRestrictedStatic() for a version that does not use any dynamic memory allocation.

Example usage:

```c
// Create an TaskParameters_t structure that defines the task to be created.
static const TaskParameters_t xCheckTaskParameters = {
    vATask,       // pvTaskCode - the function that implements the task.
    "ATask",      // pcName - just a text name for the task to assist debugging.
    100,          // usStackDepth - the stack size DEFINED IN WORDS.
    NULL,         // pvParameters - passed into the task function as the function...
    parameters,   // parameters.
    1UL | portPRIVILEGE_BIT,  // uxPriority - task priority, set the...
    cStackBuffer,  // pxStackBuffer - the buffer to be used as the task stack.

    // xRegions - Allocate up to three separate memory regions for access by
    // the task, with appropriate access permissions. Different processors have
    // different memory alignment requirements - refer to the FreeRTOS...
    // documentation
    // for full information.
    {
        // Base address Length Parameters
        { cReadWriteArray, 32, portMPU_REGION_READ_WRITE },
        { cReadOnlyArray, 32, portMPU_REGION_READ_ONLY },
        { cPrivilegedOnlyAccessArray, 128, portMPU_REGION_PRIVILEGED_READ_
          WRITE }
    }
};

int main( void )
{
    TaskHandle_t xHandle;

    // Create a task from the const structure defined above. The task handle
    // is requested (the second parameter is not NULL) but in this case just for
    // demonstration purposes as its not actually used.
    xTaskCreateRestricted( &xRegTest1Parameters, &xHandle );

    // Start the scheduler.
    vTaskStartScheduler();

    // Will only get here if there was insufficient memory to create the idle
    // and/or timer task.
    for(;;);
}
```

Only available when configSUPPORT_STATIC_ALLOCATION is set to 1.

xTaskCreateRestrictedStatic() should only be used in systems that include an MPU implementation.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task’s data structures. The second block is used by the task as its stack. If a task is created using xTaskCreateRestricted() then the stack is provided by the application writer, and the memory used to hold the task’s data structure is automatically dynamically allocated inside the xTaskCreateRestricted() function. If a
A task is created using `xTaskCreateRestrictedStatic()` then the application writer must provide the memory used to hold the task’s data structures too. `xTaskCreateRestrictedStatic()` therefore allows a memory protected task to be created without using any dynamic memory allocation.

Example usage:

```c
// Create an TaskParameters_t structure that defines the task to be created.
// The StaticTask_t variable is only included in the structure when
// configSUPPORT_STATIC_ALLOCATION is set to 1. The PRIVILEGED_DATA macro can
// be used to force the variable into the RTOS kernel's privileged data area.
static PRIVILEGED_DATA StaticTask_t xTaskBuffer;
static const TaskParameters_t xCheckTaskParameters =
{
    vATask,   // pvTaskCode - the function that implements the task.
    "ATask", // pcName - just a text name for the task to assist debugging.
    100,     // usStackDepth - the stack size DEFINED IN BYTES.
    NULL,    // pvParameters - passed into the task function as the function_-
              --parameters.
    1UL | portPRIVILEGE_BIT, // uxPriority - task priority, set the_-
              --portPRIVILEGE_BIT if the task should run in a privileged state.
    cStackBuffer, // puxStackBuffer - the buffer to be used as the task stack.
    // xRegions - Allocate up to three separate memory regions for access by
    // the task, with appropriate access permissions. Different processors have
    // different memory alignment requirements - refer to the FreeRTOS_-
    // documentation 
    // for full information.
    { cReadWriteArray, 32, portMPU_REGION_READ_WRITE },
    { cReadOnlyArray, 32, portMPU_REGION_READ_ONLY },
    { cPrivilegedOnlyAccessArray, 128, portMPU_REGION_PRIVILEGED_READ_-
      WRITE }
};

int main( void )
{
    TaskHandle_t xHandle;

    // Create a task from the const structure defined above. The task handle
    // is requested (the second parameter is not NULL) but in this case just for
    // demonstration purposes as its not actually used.
    xTaskCreateRestricted( &xRegTest1Parameters, &xHandle );

    // Start the scheduler.
    vTaskStartScheduler();

    // Will only get here if there was insufficient memory to create the idle
    // and/or timer task.
    for( ;; );
}
```

Memory regions are assigned to a restricted task when the task is created by a call to `xTaskCreateRestricted()`. These regions can be redefined using `vTaskAllocateMPURegions()`.

Example usage:
// Define an array of MemoryRegion_t structures that configures an MPU region
// allowing read/write access for 1024 bytes starting at the beginning of the
// ucOneKByte array. The other two of the maximum 3 definable regions are
// unused so set to zero.
static const MemoryRegion_t xAltRegions[portNUM_CONFIGURABLE_REGIONS] = {
    // Base address Length Parameters
    { ucOneKByte, 1024, portMPU_REGION_READ_WRITE },
    { 0, 0, 0 },
    { 0, 0, 0 }
};

void vATask(void *pvParameters)
{
    // This task was created such that it has access to certain regions of
    // memory as defined by the MPU configuration. At some point it is
    // desired that these MPU regions are replaced with that defined in the
    // xAltRegions const struct above. Use a call to vTaskAllocateMPURegions()
    // for this purpose. NULL is used as the task handle to indicate that this
    // function should modify the MPU regions of the calling task.
    vTaskAllocateMPURegions(NULL, xAltRegions);

    // Now the task can continue its function, but from this point on can only
    // access its stack and the ucOneKByte array (unless any other statically
    // defined or shared regions have been declared elsewhere).
}

Parameters

- **pxTaskDefinition** – Pointer to a structure that contains a member for each of the normal xTaskCreate() parameters (see the xTaskCreate() API documentation) plus an optional stack buffer and the memory region definitions.
- **pxCreatedTask** – Used to pass back a handle by which the created task can be referenced.
- **pxTaskDefinition** – Pointer to a structure that contains a member for each of the normal xTaskCreate() parameters (see the xTaskCreate() API documentation) plus an optional stack buffer and the memory region definitions. If configSUPPORT_STATIC_ALLOCATION is set to 1 the structure contains an additional member, which is used to point to a variable of type StaticTask_t - which is then used to hold the task’s data structure.
- **pxCreatedTask** – Used to pass back a handle by which the created task can be referenced.
- **xTask** – The handle of the task being updated.
- **pxRegions** – A pointer to an MemoryRegion_t structure that contains the new memory region definitions.

Returns

- **pdPASS** if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h
- **Returns** pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

void vTaskDelete(TaskHandle_t xTaskToDelete)

INCLUDE_vTaskDelete must be defined as 1 for this function to be available. See the configuration section for more information.

Remove a task from the RTOS real time kernel’s management. The task being deleted will be removed from all ready, blocked, suspended and event lists.

NOTE: The idle task is responsible for freeing the kernel allocated memory from tasks that have been deleted. It is therefore important that the idle task is not starved of microcontroller processing time if your application makes any calls to vTaskDelete(). Memory allocated by the task code is not automatically freed, and should be freed before the task is deleted.
See the demo application file death.c for sample code that utilises vTaskDelete().

Example usage:

```c
void vOtherFunction( void )
{
    TaskHandle_t xHandle;

    // Create the task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle );

    // Use the handle to delete the task.
    vTaskDelete( xHandle );
}
```

**Parameters**

- **xTaskToDelete** – The handle of the task to be deleted. Passing NULL will cause the calling task to be deleted.

void vTaskDelay (const TickType_t xTicksToDelay)

Delay a task for a given number of ticks. The actual time that the task remains blocked depends on the tick rate. The constant portTICK_PERIOD_MS can be used to calculate real time from the tick rate - with the resolution of one tick period.

INCLUDE_vTaskDelay must be defined as 1 for this function to be available. See the configuration section for more information.

vTaskDelay() specifies a time at which the task wishes to unblock relative to the time at which vTaskDelay() is called. For example, specifying a block period of 100 ticks will cause the task to unblock 100 ticks after vTaskDelay() is called. vTaskDelay() does not therefore provide a good method of controlling the frequency of a periodic task as the path taken through the code, as well as other task and interrupt activity, will effect the frequency at which vTaskDelay() gets called and therefore the time at which the task next executes. See xTaskDelayUntil() for an alternative API function designed to facilitate fixed frequency execution. It does this by specifying an absolute time (rather than a relative time) at which the calling task should unblock.

Example usage:

```c
void vTaskFunction( void * pvParameters )
{
    // Block for 500ms.
    const TickType_t xDelay = 500 / portTICK_PERIOD_MS;

    for( ;; )
    {
        // Simply toggle the LED every 500ms, blocking between each toggle.
        vToggleLED();
        vTaskDelay( xDelay );
    }
}
```

**Parameters**

- **xTicksToDelay** – The amount of time, in tick periods, that the calling task should block.

BaseType_t xTaskDelayUntil (TickType_t *const pxPreviousWakeTime, const TickType_t xTimeIncrement)

INCLUDE_xTaskDelayUntil must be defined as 1 for this function to be available. See the configuration section for more information.
Delay a task until a specified time. This function can be used by periodic tasks to ensure a constant execution frequency.

This function differs from vTaskDelay() in one important aspect: vTaskDelay() will cause a task to block for the specified number of ticks from the time vTaskDelay() is called. It is therefore difficult to use vTaskDelay() by itself to generate a fixed execution frequency as the time between a task starting to execute and that task calling vTaskDelay() may not be fixed [the task may take a different path though the code between calls, or may get interrupted or preempted a different number of times each time it executes].

Whereas vTaskDelay() specifies a wake time relative to the time at which the function is called, xTaskDelayUntil() specifies the absolute (exact) time at which it wishes to unblock.

The macro pdMS_TO_TICKS() can be used to calculate the number of ticks from a time specified in milliseconds with a resolution of one tick period.

Example usage:

```c
// Perform an action every 10 ticks.
void vTaskFunction( void * pvParameters ) {
    TickType_t xLastWakeTime;
    const TickType_t xFrequency = 10;
    BaseType_t xWasDelayed;

    // Initialise the xLastWakeTime variable with the current time.
    xLastWakeTime = xTaskGetTickCount();
    for (;;) {
        // Wait for the next cycle.
        xWasDelayed = xTaskDelayUntil( &xLastWakeTime, xFrequency );

        // Perform action here. xWasDelayed value can be used to determine
        // whether a deadline was missed if the code here took too long.
    }
}
```

Parameters
- **pxPreviousWakeTime** – Pointer to a variable that holds the time at which the task was last unblocked. The variable must be initialised with the current time prior to its first use (see the example below). Following this the variable is automatically updated within xTaskDelayUntil().
- **xTimeIncrement** – The cycle time period. The task will be unblocked at time *pxPreviousWakeTime + xTimeIncrement*. Calling xTaskDelayUntil with the same xTimeIncrement parameter value will cause the task to execute with a fixed interface period.

Returns Value which can be used to check whether the task was actually delayed. Will be pdTRUE if the task was delayed and pdFALSE otherwise. A task will not be delayed if the next expected wake time is in the past.

BaseType_t xTaskAbortDelay( TaskHandle_t xTask)

INCLUDE_xTaskAbortDelay must be defined as 1 in FreeRTOSConfig.h for this function to be available.

A task will enter the Blocked state when it is waiting for an event. The event it is waiting for can be a temporal event (waiting for a time), such as when vTaskDelay() is called, or an event on an object, such as when xQueueReceive() or ulTaskNotifyTake() is called. If the handle of a task that is in the Blocked state is used in a call to xTaskAbortDelay() then the task will leave the Blocked state, and return from whichever function call placed the task into the Blocked state.

There is no ‘FromISR’ version of this function as an interrupt would need to know which object a task was blocked on in order to know which actions to take. For example, if the task was blocked on a queue the interrupt handler would then need to know if the queue was locked.
**Parameters** `xTask` - The handle of the task to remove from the Blocked state.

**Returns** If the task referenced by xTask was not in the Blocked state then **pdFAIL** is returned. Otherwise **pdPASS** is returned.

```c
UBaseType_t uxTaskPriorityGet (const TaskHandle_t xTask)
```

INCLUDE_uxTaskPriorityGet must be defined as 1 for this function to be available. See the configuration section for more information.

Obtain the priority of any task.

Example usage:

```c
define void vAFunction(void)
define {
TaskHandle_t xHandle;

// Create a task, storing the handle.
xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_--);

// ...

// Use the handle to obtain the priority of the created task.
// It was created with tskIDLE_PRIORITY, but may have changed // it itself.
if( uxTaskPriorityGet( xHandle ) != tskIDLE_PRIORITY )
{
    // The task has changed it's priority.
}

// ...

// Is our priority higher than the created task?
if( uxTaskPriorityGet( xHandle ) < uxTaskPriorityGet( NULL ) )
{
    // Our priority (obtained using NULL handle) is higher.
}
}
```

**Parameters** `xTask` - Handle of the task to be queried. Passing a NULL handle results in the priority of the calling task being returned.

**Returns** The priority of xTask.

```c
UBaseType_t uxTaskPriorityGetFromISR (const TaskHandle_t xTask)
```

A version of uxTaskPriorityGet() that can be used from an ISR.

**eTaskState eTaskGetState (TaskHandle_t xTask)**

INCLUDE_eTaskGetState must be defined as 1 for this function to be available. See the configuration section for more information.

Obtain the state of any task. States are encoded by the eTaskState enumerated type.

**Parameters** `xTask` - Handle of the task to be queried.

**Returns** The state of xTask at the time the function was called. Note the state of the task might change between the function being called, and the functions return value being tested by the calling task.

```c
void vTaskGetInfo (TaskHandle_t xTask, TaskStatus_t *pxTaskStatus, BaseType_t xGetFreeStackSpace, eTaskState eState)
```

configUSE_TRACE_FACILITY must be defined as 1 for this function to be available. See the configuration section for more information.
Populates a TaskStatus_t structure with information about a task.

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;
    TaskStatus_t xTaskDetails;

    // Obtain the handle of a task from its name.
    xHandle = xTaskGetHandle("Task_Name");

    // Check the handle is not NULL.
    configASSERT( xHandle );

    // Use the handle to obtain further information about the task.
    vTaskGetInfo( xHandle,
                  &xTaskDetails,
                  pdTRUE, // Include the high water mark in xTaskDetails.
                  eInvalid ); // Include the task state in xTaskDetails.
}
```

**Parameters**

- **xTask** – Handle of the task being queried. If xTask is NULL then information will be returned about the calling task.
- **pxTaskStatus** – A pointer to the TaskStatus_t structure that will be filled with information about the task referenced by the handle passed using the xTask parameter.
- **xGetFreeStackSpace** – The TaskStatus_t structure contains a member to report the stack high water mark of the task being queried. Calculating the stack high water mark takes a relatively long time, and can make the system temporarily unresponsive - so the xGetFreeStackSpace parameter is provided to allow the high water mark checking to be skipped. The high watermark value will only be written to the TaskStatus_t structure if xGetFreeStackSpace is not set to pdFALSE;
- **eState** – The TaskStatus_t structure contains a member to report the state of the task being queried. Obtaining the task state is not as fast as a simple assignment - so the eState parameter is provided to allow the state information to be omitted from the TaskStatus_t structure. To obtain state information then set eState to eInvalid - otherwise the value passed in eState will be reported as the task state in the TaskStatus_t structure.

```c
void vTaskPrioritySet( TaskHandle_t xTask, UBaseType_t uxNewPriority )
```

INCLUDE_vTaskPrioritySet must be defined as 1 for this function to be available. See the configuration section for more information.

Set the priority of any task.

A context switch will occur before the function returns if the priority being set is higher than the currently executing task.

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle...);  
```

(continues on next page)
// ...  
// Use the handle to raise the priority of the created task.  
vTaskPrioritySet( xHandle, tskIDLE_PRIORITY + 1 );  
// ...  

// Use a NULL handle to raise our priority to the same value.  
vTaskPrioritySet( NULL, tskIDLE_PRIORITY + 1 );  

Parameters  
• xTask – Handle to the task for which the priority is being set. Passing a NULL handle  
  results in the priority of the calling task being set.  
• uxNewPriority – The priority to which the task will be set.  

void vTaskSuspend( TaskHandle_t xTaskToSuspend )  

INCLUDE_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section  
for more information.  

Suspend any task. When suspended a task will never get any microcontroller processing time, no matter what  
its priority.  

Calls to vTaskSuspend are not accumulative - i.e. calling vTaskSuspend () twice on the same task still only  
requires one call to vTaskResume () to ready the suspended task.  

Example usage:  

void vAFunction( void )  
{  
    TaskHandle_t xHandle;  

    // Create a task, storing the handle.  
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle);  

    // ...  

    // Use the handle to suspend the created task.  
    vTaskSuspend( xHandle );  

    // ...  

    // The created task will not run during this period, unless  
    // another task calls vTaskResume( xHandle ).  
    //...  

    // Suspend ourselves.  
    vTaskSuspend( NULL );  

    // We cannot get here unless another task calls vTaskResume  
    // with our handle as the parameter.  
}

Parameters xTaskToSuspend – Handle to the task being suspended. Passing a NULL handle  
will cause the calling task to be suspended.
void **TaskResume**( TaskHandle_t xTaskToResume )

INCLUDE_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.

Resumes a suspended task.

A task that has been suspended by one or more calls to vTaskSuspend () will be made available for running again by a single call to vTaskResume ().

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle );

    // ...

    // Use the handle to suspend the created task.
    vTaskSuspend( xHandle );

    // ...

    // The created task will not run during this period, unless
    // another task calls vTaskResume( xHandle ).

    // ...

    // Resume the suspended task ourselves.
    vTaskResume( xHandle );

    // The created task will once again get microcontroller processing
    // time in accordance with its priority within the system.
}
```

**Parameters** **xTaskToResume** – Handle to the task being readied.

**Returns**

pdTRUE if resuming the task should result in a context switch, otherwise pdFALSE. This is used by the ISR to determine if a context switch may be required following the ISR.

---

void **vTaskStartScheduler**( void )

Starts the real time kernel tick processing. After calling the kernel has control over which tasks are executed and when.

**Parameters**

---
See the demo application file main.c for an example of creating tasks and starting the kernel.

Example usage:

```c
void vAFunction( void )
{
    // Create at least one task before starting the kernel.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, NULL );

    // Start the real time kernel with preemption.
    vTaskStartScheduler();

    // Will not get here unless a task calls vTaskEndScheduler()
}
```

**Note:** In ESP-IDF the scheduler is started automatically during application startup, vTaskStartScheduler() should not be called from ESP-IDF applications.

```c
void vTaskEndScheduler( void )
{
    // Stops the real time kernel tick. All created tasks will be automatically deleted and multitasking (either preemptive or cooperative) will stop. Execution then resumes from the point where vTaskStartScheduler() was called, as if vTaskStartScheduler() had just returned.

    See the demo application file main. c in the demo/PC directory for an example that uses vTaskEndScheduler().

    vTaskEndScheduler() requires an exit function to be defined within the portable layer (see vPortEndScheduler() in port. c for the PC port). This performs hardware specific operations such as stopping the kernel tick.

    vTaskEndScheduler() will cause all of the resources allocated by the kernel to be freed - but will not free resources allocated by application tasks.

    Example usage:

```c
void vTaskCode( void * pvParameters )
{
    for( ; ; )
    {
        // Task code goes here.
        // At some point we want to end the real time kernel processing
        // so call ...
        vTaskEndScheduler();
    }
}
```
void \texttt{vTaskSuspendAll} (void)

Suspends the scheduler without disabling interrupts. Context switches will not occur while the scheduler is suspended.

After calling \texttt{vTaskSuspendAll()} the calling task will continue to execute without risk of being swapped out until a call to \texttt{xTaskResumeAll()} has been made.

API functions that have the potential to cause a context switch (for example, \texttt{vTaskDelayUntil()}, \texttt{xQueueSend()}, etc.) must not be called while the scheduler is suspended.

Example usage:

```c
void vTask1( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.
        // ...
        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // \texttt{taskENTER_CRITICAL()}/\texttt{taskEXIT_CRITICAL()} as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.
        // Prevent the real time kernel swapping out the task.
        vTaskSuspendAll();
        // Perform the operation here. There is no need to use critical
        // sections as we have all the microcontroller processing time.
        // During this time interrupts will still operate and the kernel
        // tick count will be maintained.
        // ...
        // The operation is complete. Restart the kernel.
        xTaskResumeAll();
    }
}
```

\texttt{BaseType_t xTaskResumeAll} (void)

Resumes scheduler activity after it was suspended by a call to \texttt{vTaskSuspendAll()}. \texttt{xTaskResumeAll()} only resumes the scheduler. It does not unsuspend tasks that were previously suspended by a call to \texttt{vTaskSuspend()}. 

Example usage:

```c
void vTask1( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.
        // ...
        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // \texttt{taskENTER_CRITICAL()}/\texttt{taskEXIT_CRITICAL()} as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.
    }
}
```
// Prevent the real time kernel swapping out the task.
// Prevent the real time kernel swapping out the task.
// vTaskSuspendAll ();

// Perform the operation here. There is no need to use critical
// Perform the operation here. There is no need to use critical
// sections as we have all the microcontroller processing time.
// During this time interrupts will still operate and the real
// During this time interrupts will still operate and the real
// time kernel tick count will be maintained.
// ... ...

// The operation is complete. Restart the kernel. We want to force
// The operation is complete. Restart the kernel. We want to force
// a context switch - but there is no point if resuming the scheduler
// a context switch - but there is no point if resuming the scheduler
// caused a context switch already.
if( !xTaskResumeAll () )
{
    taskYIELD ();
}

Returns
If resuming the scheduler caused a context switch then pdTRUE is returned, otherwise
If resuming the scheduler caused a context switch then pdTRUE is returned, otherwise
pdFALSE is returned.

TickType_t xTaskGetTickCount ( void )

Returns
The count of ticks since vTaskStartScheduler was called.
The count of ticks since vTaskStartScheduler was called.

TickType_t xTaskGetTickCountFromISR ( void )

This is a version of xTaskGetTickCount() that is safe to be called from an ISR - provided that TickType_t is
This is a version of xTaskGetTickCount() that is safe to be called from an ISR - provided that TickType_t is
the natural word size of the microcontroller being used or interrupt nesting is either not supported or not being
the natural word size of the microcontroller being used or interrupt nesting is either not supported or not being
used.

Returns
The count of ticks since vTaskStartScheduler was called.
The count of ticks since vTaskStartScheduler was called.

UBaseType_t uxTaskGetNumberOfTasks ( void )

Returns
The number of tasks that the real time kernel is currently managing. This includes all
The number of tasks that the real time kernel is currently managing. This includes all
ready, blocked and suspended tasks. A task that has been deleted but not yet freed by the idle
task will also be included in the count.
task will also be included in the count.

char *pcTaskGetName ( TaskHandle_t xTaskToQuery )

Returns
The text (human readable) name of the task referenced by the handle xTaskToQuery. A task that has been deleted but not yet freed by the idle
task can query its own name by either passing in its own handle, or by setting xTaskToQuery
task can query its own name by either passing in its own handle, or by setting xTaskToQuery
to NULL.
to NULL.

TaskHandle_t xTaskGetHandle ( const char *pcNameToQuery )

NOTE: This function takes a relatively long time to complete and should be used sparingly.
NOTE: This function takes a relatively long time to complete and should be used sparingly.

Returns
The handle of the task that has the human readable name pcNameToQuery. NULL
The handle of the task that has the human readable name pcNameToQuery. NULL
is returned if no matching name is found. INCLUDE_xTaskGetHandle must be set to 1 in
is returned if no matching name is found. INCLUDE_xTaskGetHandle must be set to 1 in
FreeRTOSConfig.h for pcTaskGetHandle() to be available.
FreeRTOSConfig.h for pcTaskGetHandle() to be available.

BaseType_t xTaskGetStaticBuffers ( TaskHandle_t xTask, StackType_t **ppuxStackBuffer, StaticTask_t **ppxTaskBuffer )

UBaseType_t uxTaskGetStackHighWaterMark ( TaskHandle_t xTask )

Returns the high water mark of the stack associated with xTask.
Returns the high water mark of the stack associated with xTask.

INCLUDE_uxTaskGetStackHighWaterMark must be set to 1 in FreeRTOSConfig.h for this function to be
INCLUDE_uxTaskGetStackHighWaterMark must be set to 1 in FreeRTOSConfig.h for this function to be
available.
Returns the high water mark of the stack associated with \texttt{xTask}. That is, the minimum free stack space there has been (in bytes not words, unlike vanilla FreeRTOS) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

\texttt{uxTaskGetStackHighWaterMark()} and \texttt{uxTaskGetStackHighWaterMark2()} are the same except for their return type. Using \texttt{configSTACK_DEPTH_TYPE} allows the user to determine the return type. It gets around the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications that expect an 8-bit return type.

**Parameters** \texttt{xTask} – Handle of the task associated with the stack to be checked. Set \texttt{xTask} to \texttt{NULL} to check the stack of the calling task.

**Returns** The smallest amount of free stack space there has been (in bytes not words, unlike vanilla FreeRTOS) since the task referenced by \texttt{xTask} was created.

\texttt{configSTACK_DEPTH_TYPE \texttt{uxTaskGetStackHighWaterMark2(\texttt{TaskHandle_t xTask})}}

Returns the start of the stack associated with \texttt{xTask}.

\texttt{INCLUDE\_uxTaskGetStackHighWaterMark2} must be set to 1 in \texttt{FreeRTOSConfig.h} for this function to be available.

Returns the high water mark of the stack associated with \texttt{xTask}. That is, the minimum free stack space there has been (in bytes not words, unlike vanilla FreeRTOS) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

\texttt{uxTaskGetStackHighWaterMark()} and \texttt{uxTaskGetStackHighWaterMark2()} are the same except for their return type. Using \texttt{configSTACK_DEPTH_TYPE} allows the user to determine the return type. It gets around the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications that expect an 8-bit return type.

**Parameters** \texttt{xTask} – Handle of the task associated with the stack to be checked. Set \texttt{xTask} to \texttt{NULL} to check the stack of the calling task.

**Returns** The smallest amount of free stack space there has been (in bytes not words, unlike vanilla FreeRTOS) since the task referenced by \texttt{xTask} was created.

\texttt{void vTaskSetApplicationTaskTag(\texttt{TaskHandle_t xTask}, \texttt{TaskHookFunction_t pxHookFunction})}

Sets \texttt{pxHookFunction} to be the task hook function used by the task \texttt{xTask}.

**Parameters**
- \texttt{xTask} – Handle of the task to set the hook function for. Passing \texttt{xTask} as \texttt{NULL} has the effect of setting the calling tasks hook function.
- \texttt{pxHookFunction} – Pointer to the hook function.

\texttt{TaskHookFunction_t xTaskGetApplicationTaskTag(\texttt{TaskHandle_t xTask})}

Returns the \texttt{pxHookFunction} value assigned to the task \texttt{xTask}. Do not call from an interrupt service routine - call \texttt{xTaskGetApplicationTaskTagFromISR()} instead.

\texttt{TaskHookFunction_t xTaskGetApplicationTaskTagFromISR(\texttt{TaskHandle_t xTask})}

Returns the \texttt{pxHookFunction} value assigned to the task \texttt{xTask}. Can be called from an interrupt service routine.

\texttt{void vTaskSetThreadLocalStoragePointer(\texttt{TaskHandle_t xTaskToSet}, \texttt{BaseType_t xIndex}, \texttt{void *pvValue})}

Set local storage pointer specific to the given task.

Each task contains an array of pointers that is dimensioned by the \texttt{configNUM\_THREAD\_LOCAL\_STORAGE\_POINTERS} setting in \texttt{FreeRTOSConfig.h}. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

**Parameters**
- \texttt{xTaskToSet} – Task to set thread local storage pointer for
- \texttt{xIndex} – The index of the pointer to set, from 0 to \texttt{configNUM\_THREAD\_LOCAL\_STORAGE\_POINTERS} - 1.
- \texttt{pvValue} – Pointer value to set.
void *pvTaskGetThreadLocalStoragePointer (TaskHandle_t xTaskToQuery, BaseType_t xIndex)

Get local storage pointer specific to the given task.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Parameters
- xTaskToQuery -- Task to get thread local storage pointer for
- xIndex -- The index of the pointer to get, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.

Returns Pointer value

void vApplicationGetIdleTaskMemory (StaticTask_t **ppxIdleTaskTCBuffer, StackType_t **ppxIdleTaskStackBuffer, uint32_t *pulIdleTaskStackSize)

This function is used to provide a statically allocated block of memory to FreeRTOS to hold the Idle Task TCB. This function is required when configSUPPORT_STATIC_ALLOCATION is set. For more information see this URI: https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION

Parameters
- ppxIdleTaskTCBuffer -- A handle to a statically allocated TCB buffer
- ppxIdleTaskStackBuffer -- A handle to a statically allocated Stack buffer for the idle task
- pulIdleTaskStackSize -- A pointer to the number of elements that will fit in the allocated stack buffer

BaseType_t xTaskCallApplicationTaskHook (TaskHandle_t xTask, void *pvParameter)

Calls the hook function associated with xTask. Passing xTask as NULL has the effect of calling the Running tasks (the calling task) hook function.

Parameters
- xTask -- Handle of the task to call the hook for.
- pvParameter -- Parameter passed to the hook function for the task to interpret as it wants. The return value is the value returned by the task hook function registered by the user.

TaskHandle_t xTaskGetIdleTaskHandle (void)

xTaskGetIdleTaskHandle() is only available if INCLUDE_xTaskGetIdleTaskHandle is set to 1 in FreeRTOSConfig.h.

Simply returns the handle of the idle task. It is not valid to call xTaskGetIdleTaskHandle() before the scheduler has been started.

UBaseType_t uxTaskGetSystemState (TaskStatus_t *const pxTaskStatusArray, const UBaseType_t uxArraySize, uint32_t *const pulTotalRunTime)

configUSE_TRACE_FACILITY must be defined as 1 in FreeRTOSConfig.h for uxTaskGetSystemState() to be available.

uxTaskGetSystemState() populates an TaskStatus_t structure for each task in the system. TaskStatus_t structures contain, among other things, members for the task handle, task name, task priority, task state, and total amount of run time consumed by the task. See the TaskStatus_t structure definition in this file for the full member list.

Example usage:

```c
void vTaskGetRunTimeStats (char *pcWriteBuffer )
{
    TaskStatus_t *pxTaskStatusArray;

    // This example demonstrates how a human readable table of run time stats
    // information is generated from raw data provided by uxTaskGetSystemState().
    // The human readable table is written to pcWriteBuffer

    // (continues on next page)
```
volatile UBaseType_t uxArraySize, x;
uint32_t ulTotalRunTime, ulStatsAsPercentage;

// Make sure the write buffer does not contain a string.
*pWriteBuffer = 0x00;

// Take a snapshot of the number of tasks in case it changes while this
// function is executing.
uxArraySize = uxTaskGetNumberOfTasks();

// Allocate a TaskStatus_t structure for each task. An array could be
// allocated statically at compile time.
pxTaskStatusArray = pvPortMalloc( uxArraySize * sizeof( TaskStatus_t ) );

if( pxTaskStatusArray != NULL )
{
   // Generate raw status information about each task.
   uxArraySize = uxTaskGetSystemState( pxTaskStatusArray, uxArraySize, &ulTotalRunTime );

   // For percentage calculations.
   ulTotalRunTime /= 100UL;

   // Avoid divide by zero errors.
   if( ulTotalRunTime > 0 )
   {
      // For each populated position in the pxTaskStatusArray array,
      // format the raw data as human readable ASCII data
      for( x = 0; x < uxArraySize; x++ )
      {
         // What percentage of the total run time has the task used?
         // This will always be rounded down to the nearest integer.
         // ulTotalRunTimeDiv100 has already been divided by 100.
         ulStatsAsPercentage = pxTaskStatusArray[ x ].ulRunTimeCounter ~
         ~ulTotalRunTime;

         if( ulStatsAsPercentage > 0UL )
         {
            sprintf( pcWriteBuffer, "%s\t%lu\t%lu%%\r\n", ~
            ~pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter, ~
            ~ulStatsAsPercentage );
         }
         else
         {
            // If the percentage is zero here then the task has
            // consumed less than 1% of the total run time.
            sprintf( pcWriteBuffer, "%s\t%lu\t<1%%\r\n", ~
            ~pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter );
         }

         pcWriteBuffer += strlen( (char *) pcWriteBuffer );
      }
   }

   // The array is no longer needed, free the memory it consumes.
   vPortFree( pxTaskStatusArray );
}

Note: This function is intended for debugging use only as its use results in the scheduler remaining suspended
for an extended period.

Parameters

- **pxTaskStatusArray** – A pointer to an array of TaskStatus_t structures. The array must contain at least one TaskStatus_t structure for each task that is under the control of the RTOS. The number of tasks under the control of the RTOS can be determined using the uxTaskGetNumberOfTasks() API function.

- **uxArraySize** – The size of the array pointed to by the pxTaskStatusArray parameter. The size is specified as the number of indexes in the array, or the number of TaskStatus_t structures contained in the array, not by the number of bytes in the array.

- **pulTotalRunTime** – If configGENERATE_RUN_TIME_STATS is set to 1 in FreeRTOSConfig.h then *pulTotalRunTime is set by uxTaskGetSystemState() to the total run time (as defined by the run time stats clock, see [https://www.FreeRTOS.org/rtos-run-time-stats.html](https://www.FreeRTOS.org/rtos-run-time-stats.html)) since the target booted. pulTotalRunTime can be set to NULL to omit the total run time information.

Returns

The number of TaskStatus_t structures that were populated by uxTaskGetSystemState(). This should equal the number returned by the uxTaskGetNumberOfTasks() API function, but will be zero if the value passed in the uxArraySize parameter was too small.

```c
void vTaskList (char *pcWriteBuffer)
List all the current tasks.

configUSE_TRACE_FACILITY and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. See the configuration section of the FreeRTOS.org website for more information.

NOTE 1: This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Lists all the current tasks, along with their current state and stack usage high water mark.

Tasks are reported as blocked (‘B’), ready (‘R’), deleted (‘D’) or suspended (‘S’).

PLEASE NOTE:

This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

vTaskList() calls uxTaskGetSystemState(), then formats part of the uxTaskGetSystemState() output into a human readable table that displays task names, states and stack usage.

vTaskList() has a dependency on the sprintf() C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of sprintf() is provided in many of the FreeRTOS/Demo sub-directories in a file called printf-stdarg.c (note printf-stdarg.c does not provide a full snprintf() implementation!).

It is recommended that production systems call uxTaskGetSystemState() directly to get access to raw stats data, rather than indirectly through a call to vTaskList().

**Parameters pcWriteBuffer** – A buffer into which the above mentioned details will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

```c
void vTaskGetRunTimeStats (char *pcWriteBuffer)
Get the state of running tasks as a string

configGENERATE_RUN_TIME_STATS and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. The application must also then provide definitions for portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() to configure a peripheral timer/counter and return the timers current count value respectively. The counter should be at least 10 times the frequency of the tick count.
NOTE 1: This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Setting configGENERATE_RUN_TIME_STATS to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() macro. Calling vTaskGetRunTimeStats() writes the total execution time of each task into a buffer, both as an absolute count value and as a percentage of the total system execution time.

NOTE 2:
This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

vTaskGetRunTimeStats() calls uTaskGetSystemState(), then formats part of the uTaskGetSystemState() output into a human readable table that displays the amount of time each task has spent in the Running state in both absolute and percentage terms.

vTaskGetRunTimeStats() has a dependency on the sprintf() C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of sprintf() is provided in many of the FreeRTOS/Demo sub-directories in a file called printf-stdarg.c (note printf-stdarg.c does not provide a full sprintf() implementation!).

It is recommended that production systems call uTaskGetSystemState() directly to get access to raw stats data, rather than indirectly through a call to vTaskGetRunTimeStats().

Parameters

- pcWriteBuffer – A buffer into which the execution times will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.
- uint32_t ulTaskGetIdleRunTimeCounter (void)

configGENERATE_RUN_TIME_STATS and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. The application must also then provide definitions for portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() to configure a peripheral timer/counter and return the timers current count value respectively. The counter should be at least 10 times the frequency of the tick count.

Setting configGENERATE_RUN_TIME_STATS to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() macro. While uTaskGetSystemState() and vTaskGetRunTimeStats() writes the total execution time of each task into a buffer, ulTaskGetIdleRunTimeCounter() returns the total execution time of just the idle task.

Returns

The total run time of the idle task. This is the amount of time the idle task has actually been executing. The unit of time is dependent on the frequency configured using the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() macros.

BaseType_t xTaskGenericNotify (TaskHandle_t xTaskToNotify, UBaseType_t uxIndexToNotify, uint32_t ulValue, eNotifyAction eAction, uint32_t *pulPreviousNotificationValue)

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

Sends a direct to task notification to a task, with an optional value and action.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.
A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value” , and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotify() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling xTaskNotify() is equivalent to calling xTaskNotifyIndexed() with the uxIndexToNotify parameter set to 0.

**eSetBits** - The target notification value is bitwise ORed with ulValue. xTaskNotifyIndexed() always returns pdPASS in this case.

**eIncrement** - The target notification value is incremented. ulValue is not used and xTaskNotifyIndexed() always returns pdPASS in this case.

**eSetValueWithOverwrite** - The target notification value is set to the value of ulValue, even if the task being notified had not yet processed the previous notification at the same array index (the task already had a notification pending at that index). xTaskNotifyIndexed() always returns pdPASS in this case.

**eSetValueWithoutOverwrite** - If the task being notified did not already have a notification pending at the same array index then the target notification value is set to ulValue and xTaskNotifyIndexed() will return pdPASS. If the task being notified already had a notification pending at the same array index then no action is performed and pdFAIL is returned.

**eNoAction** - The task receives a notification at the specified array index without the notification value at that index being updated. ulValue is not used and xTaskNotifyIndexed() always returns pdPASS in this case.

**Parameters**

- **xTaskToNotify** – The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().

- **uxIndexToNotify** – The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than config-TASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotify() does not have this parameter and always sends notifications to index 0.

- **ulValue** – Data that can be sent with the notification. How the data is used depends on the value of the eAction parameter.

- **eAction** – Specifies how the notification updates the task’s notification value, if at all. Valid values for eAction are as follows:

  - **pulPreviousNotificationValue** – Can be used to pass out the subject task’s notification value before any bits are modified by the notify function.

**Returns**

Dependent on the value of eAction. See the description of the eAction parameter.

```
BaseType_t xTaskGenericNotifyFromISR( TaskHandle_t xTaskToNotify, UBaseType_t uxIndexToNotify, uint32_t ulValue, eNotifyAction eAction, uint32_t *pulPreviousNotificationValue, BaseType_t *pxHigherPriorityTaskWoken )
```

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

A version of xTaskNotifyIndexed() that can be used from an interrupt service routine (ISR).

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyFromISR() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling xTaskNotifyFromISR() is equivalent to calling xTaskNotifyIndexedFromISR() with the uxIndexToNotify parameter set to 0.

eSetBits - The task’s notification value is bitwise ORed with ulValue. xTaskNotify() always returns pdPASS in this case.

eIncrement - The task’s notification value is incremented. ulValue is not used and xTaskNotify() always returns pdPASS in this case.

eSetValueWithOverwrite - The task’s notification value is set to the value of ulValue, even if the task being notified had not yet processed the previous notification (the task already had a notification pending). xTaskNotify() always returns pdPASS in this case.

eSetValueWithoutOverwrite - If the task being notified did not already have a notification pending then the task’s notification value is set to ulValue and xTaskNotify() will return pdPASS. If the task being notified already had a notification pending then no action is performed and pdFAIL is returned.

eNoAction - The task receives a notification without its notification value being updated. ulValue is not used and xTaskNotify() always returns pdPASS in this case.

Parameters

- **uxIndexToNotify** - The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyFromISR() does not have this parameter and always sends notifications to index 0.
- **xTaskToNotify** - The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- **ulValue** - Data that can be sent with the notification. How the data is used depends on the value of the eAction parameter.
Chapter 2. API Reference

- **eAction** – Specifies how the notification updates the task’s notification value, if at all. Valid values for eAction are as follows:
- **pulPreviousNotificationValue** – Can be used to pass out the subject task’s notification value before any bits are modified by the notify function.
- **pxHigherPriorityTaskWoken** – xTaskNotifyFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If xTaskNotifyFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited. A context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

**Returns** Dependent on the value of eAction. See the description of the eAction parameter.

BaseType_t xTaskGenericNotifyWait (UBaseType_t uxIndexToWaitOn, uint32_t ulBitsToClearOnEntry, uint32_t ulBitsToClearOnExit, uint32_t *pulNotificationValue, TickType_t xTicksToWait)

Waits for a direct to task notification to be pending at a given index within an array of direct to task notifications. See [https://www.FreeRTOS.org/RTOS-task-notifications.html](https://www.FreeRTOS.org/RTOS-task-notifications.html) for details.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this function to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyWait() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling xTaskNotifyWait() is equivalent to calling xTaskNotifyWaitIndexed() with the uxIndexToWaitOn parameter set to 0.

**Parameters**

- **uxIndexToWaitOn** – The index within the calling task’s array of notification values on which the calling task will wait for a notification to be received. uxIndexToWaitOn must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyWait() does not have this parameter and always waits for notifications on index 0.
- **ulBitsToClearOnEntry** – Bits that are set in ulBitsToClearOnEntry value will be cleared in the calling task’s notification value before the task is marked as waiting for a new notification (provided a notification is not already pending). Optionally blocks if no notifications are pending. Setting ulBitsToClearOnEntry to ULONG_MAX (if limits.h is
Chapter 2. API Reference

included) or 0xffffffffUL (if limits.h is not included) will have the effect of resetting the
task’s notification value to 0. Setting ulBitsToClearOnEntry to 0 will leave the task’s
notification value unchanged.

• **ulBitsToClearOnExit** - If a notification is pending or received before the calling
task exits the xTaskNotifyWait() function then the task’s notification value (see the xTask-
Notify() API function) is passed out using the pulNotificationValue parameter. Then any
bits that are set in ulBitsToClearOnExit will be cleared in the task’s notification value (note
*pulNotificationValue is set before any bits are cleared). Setting ulBitsToClearOnExit to
ULONG_MAX (if limits.h is included) or 0xffffffffUL (if limits.h is not included) will
have the effect of resetting the task’s notification value to 0 before the function exits.
Setting ulBitsToClearOnExit to 0 will leave the task’s notification value unchanged when
the function exits (in which case the value passed out in pulNotificationValue will match
the task’s notification value).

• **pulNotificationValue** - Used to pass the task’s notification value out of the func-
tion. Note the value passed out will not be affected by the clearing of any bits caused by
ulBitsToClearOnExit being non-zero.

• **xTicksToWait** - The maximum amount of time that the task should wait in the Blocked
state for a notification to be received, should a notification not already be pending when
xTaskNotifyWait() was called. The task will not consume any processing time while it is
in the Blocked state. This is specified in kernel ticks, the macro pdMS_TO_TICKS(
value_in_ms ) can be used to convert a time specified in milliseconds to a time specified
in ticks.

**Returns** If a notification was received (including notifications that were already pending when
xTaskNotifyWait was called) then pdPASS is returned. Otherwise pdFAIL is returned.

```c
void vTaskGenericNotifyGiveFromISR( TaskHandle_t xTaskToNotify, UBaseType_t uxIndexToNotify,
                                    BaseType_t *pxHigherPriorityTaskWoken )
```

A version of xTaskNotifyGiveIndexed() that can be called from an interrupt service routine (ISR).

**configUSE_TASK_NOTIFICATIONS** must be undefined or defined as 1 for this macro to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit un-
signed integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number
of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS
V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores,
mutexes and event groups. Task notifications are a method of sending an event directly to a task without the
need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of
the task’s notification values. In that way task notifications can be used to send data to a task, or be used as
light weight and fast binary or counting semaphores.

vTaskNotifyGiveIndexedFromISR() is intended for use when task notifications are used as light weight and
faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given from an ISR using
the xSemaphoreGiveFromISR() API function, the equivalent action that instead uses a task notification is
vTaskNotifyGiveIndexedFromISR().

When task notifications are being used as a binary or counting semaphore equivalent then the task being no-
tified should wait for the notification using the ulTaskNotificationTakeIndexed() API function rather than the
xTaskNotifyWaitIndexed() API function.

**NOTE** Each notification within the array operates independently - a task can only block on one notification
within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”
, and all task notification API functions operated on that value. Replacing the single notification value with
an array of notification values necessitated a new set of API functions that could address specific notifications
within the array. xTaskNotifyFromISR() is the original API function, and remains backward compatible by
always operating on the notification value at index 0 within the array. Calling xTaskNotifyGiveFromISR() is equivalent to calling xTaskNotifyGiveIndexedFromISR() with the uxIndexToNotify parameter set to 0.

**Parameters**

- **xTaskToNotify** - The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().

- **uxIndexToNotify** - The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyGiveFromISR() does not have this parameter and always sends notifications to index 0.

- **pxHigherPriorityTaskWoken** - vTaskNotifyGiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If vTaskNotifyGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

```c
uint32_t ulTaskGenericNotifyTake ( UBaseType_t uxIndexToWaitOn, BaseType_t xClearCountOnExit, TickType_t xTicksToWait)
```

Waits for a direct to task notification on a particular index in the calling task’s notification array in a manner similar to taking a counting semaphore.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this function to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

ulTaskNotifyTakeIndexed() is intended for use when a task notification is used as a faster and lighter weight binary or counting semaphore alternative. Actual FreeRTOS semaphores are taken using the xSemaphoreTake() API function, the equivalent action that instead uses a task notification is ulTaskNotifyTakeIndexed().

When a task is using its notification value as a binary or counting semaphore other tasks should send notifications to it using the xTaskNotifyGiveIndexed() macro, or xTaskNotifyIndex() function with the eAction parameter set to eIncrement.

ulTaskNotifyTakeIndexed() can either clear the task’s notification value at the array index specified by the uxIndexToWaitOn parameter to zero on exit, in which case the notification value acts like a binary semaphore, or decrement the notification value on exit, in which case the notification value acts like a counting semaphore.

A task can use ulTaskNotifyTakeIndexed() to [optionally] block to wait for the task’s notification value to be non-zero. The task does not consume any CPU time while it is in the Blocked state.

Where as xTaskNotifyWaitIndexed() will return when a notification is pending, ulTaskNotifyTakeIndexed() will return when the task’s notification value is not zero.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications.
within the array. ulTaskNotifyTake() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling ulTaskNotifyTake() is equivalent to calling ulTaskNotifyTakeIndexed() with the uxIndexToWaitOn parameter set to 0.

**Parameters**

- **uxIndexToWaitOn** – The index within the calling task’s array of notification values on which the calling task will wait for a notification to be non-zero. uxIndexToWaitOn must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. ulTaskNotifyTake() does not have this parameter and always waits for notifications on index 0.
- **xClearCountOnExit** – If xClearCountOnExit is pdFALSE then the task’s notification value is decremented when the function exits. In this way the notification value acts like a counting semaphore. If xClearCountOnExit is not pdFALSE then the task’s notification value is cleared to zero when the function exits. In this way the notification value acts like a binary semaphore.
- **xTicksToWait** – The maximum amount of time that the task should wait in the Blocked state for the task’s notification value to be greater than zero, should the count not already be greater than zero when ulTaskNotifyTake() was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro pdMS_TO_TICKS(value_in_ms) can be used to convert a time specified in milliseconds to a time specified in ticks.

**Returns**
The task’s notification count before it is either cleared to zero or decremented (see the xClearCountOnExit parameter).

```c
BaseType_t xTaskGenericNotifyStateClear(TaskHandle_t xTask, UBaseType_t uxIndexToClear)
```

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

If a notification is sent to an index within the array of notifications then the notification at that index is said to be ‘pending’ until it is read or explicitly cleared by the receiving task. xTaskNotifyStateClearIndexed() is the function that clears a pending notification without reading the notification value. The notification value at the same array index is not altered. Set xTask to NULL to clear the notification state of the calling task.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value” , and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyStateClear() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling xTaskNotifyStateClear() is equivalent to calling xTaskNotifyStateClearIndexed() with the uxIndexToNotify parameter set to 0.

**Parameters**

- **xTask** – The handle of the RTOS task that will have a notification state cleared. Set xTask to NULL to clear a notification state in the calling task. To obtain a task’s handle create the task using xTaskCreate() and make use of the pxCreatedTask parameter, or create the task using xTaskCreateStatic() and store the returned value, or use the task’s name in a call to xTaskGetHandle().
- **uxIndexToClear** – The index within the target task’s array of notification values to act upon. For example, setting uxIndexToClear to 1 will clear the state of the notification at index 1 within the array. uxIndexToClear must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. ulTaskNotifyStateClear() does not have this parameter and always acts on the notification at index 0.

**Returns**
pdTRUE if the task’s notification state was set to eNotWaitingNotification, otherwise pdFALSE.

```c
uint32_t ulTaskGenericNotifyValueClear(TaskHandle_t xTask, UBaseType_t uxIndexToClear, uint32_t ulBitsToClear)
```
configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

Each task has a private array of “notification values” (or “notifications”), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

ulTaskNotifyValueClearIndexed() clears the bits specified by the ulBitsToClear bit mask in the notification value at array index uxIndexToClear of the task referenced by xTask.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. ulTaskNotifyValueClear() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling ulTaskNotifyValueClear() is equivalent to calling ulTaskNotifyValueClearIndexed() with the uxIndexToClear parameter set to 0.

Parameters

• xTask – The handle of the RTOS task that will have bits in one of its notification values cleared. Set xTask to NULL to clear bits in a notification value of the calling task. To obtain a task’s handle create the task using xTaskCreate() and make use of the pxCreatedTask parameter, or create the task using xTaskCreateStatic() and store the returned value, or use the task’s name in a call to xTaskGetHandle().

• uxIndexToClear – The index within the target task’s array of notification values in which to clear the bits. uxIndexToClear must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. ulTaskNotifyValueClear() does not have this parameter and always clears bits in the notification value at index 0.

• ulBitsToClear – Bit mask of the bits to clear in the notification value of xTask. Set a bit to 1 to clear the corresponding bits in the task’s notification value. Set ulBitsToClear to 0xffffffff (UINT_MAX on 32-bit architectures) to clear the notification value to 0. Set ulBitsToClear to 0 to query the task’s notification value without clearing any bits.

Returns

The value of the target task’s notification value before the bits specified by ulBitsToClear were cleared.

Example Usage:

```c
size_t xUART_Receive( uint8_t *pucBuffer, size_t uxWantedBytes )
{
    size_t uxReceived = 0;
    TickType_t xTicksToWait = MAX_TIME_TO_WAIT;
    (continues on next page)
```
TimeOut_t xTimeOut;

// Initialize xTimeOut. This records the time at which this function
// was entered.
void xTaskSetTimeOutState( &xTimeOut );

// Loop until the buffer contains the wanted number of bytes, or a
// timeout occurs.
while( UART_bytes_in_rx_buffer( pxUARTInstance ) < uxWantedBytes )
{
    // The buffer didn't contain enough data so this task is going to
    // enter the Blocked state. Adjusting xTicksToWait to account for
    // any time that has been spent in the Blocked state within this
    // function so far to ensure the total amount of time spent in the
    // Blocked state does not exceed MAX_TIME_TO_WAIT.
    if( xTaskCheckForTimeOut( &xTimeOut, &xTicksToWait ) != pdFALSE )
    {
        //Timed out before the wanted number of bytes were available,
        // exit the loop.
        break;
    }

    // Wait for a maximum of xTicksToWait ticks to be notified that the
    // receive interrupt has placed more data into the buffer.
    ulTaskNotifyTake( pdTRUE, xTicksToWait );
}

// Attempt to read uxWantedBytes from the receive buffer into pucBuffer.
// The actual number of bytes read (which might be less than
// uxWantedBytes) is returned.
uxReceived = UART_read_from_receive_buffer( pxUARTInstance,
                                          pucBuffer,
                                          uxWantedBytes );

return uxReceived;

See also:
https://www.FreeRTOS.org/xTaskCheckForTimeOut.html

Parameters

- **pxTimeOut** -The time status as captured previously using vTaskSetTimeOutState. If
  the timeout has not yet occurred, it is updated to reflect the current time status.
- **pxTicksToWait** -The number of ticks to check for timeout i.e. if pxTicksToWait
  ticks have passed since pxTimeOut was last updated (either by vTaskSetTimeOutState() or
  xTaskCheckForTimeOut()), the timeout has occurred. If the timeout has not occurred,
  pxTicksToWait is updated to reflect the number of remaining ticks.

Returns If timeout has occurred, pdTRUE is returned. Otherwise pdFALSE is returned and
pxTicksToWait is updated to reflect the number of remaining ticks.

`xTaskNotifyWaitIndexed (uxIndexToWorld, ulBitsToClearOnEntry, ulBitsToClearOnExit, pulNotificationValue, xTicksToWait)`  

`xTaskNotifyGiveIndexed (xTaskToNotify, uxIndexToNotify)`  

Sends a direct to task notification to a particular index in the target task’s notification array in a manner similar to giving a counting semaphore.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for these macros to be available.

Each task has a private array of “notification values” (or “notifications”), each of which is a 32-bit unsigned integer (uint32_t). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.
Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as lightweight and fast binary or counting semaphores.

\texttt{xTaskNotifyGiveIndexed()} is a helper macro intended for use when task notifications are used as lightweight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given using the \texttt{xSemaphoreGive()} API function, the equivalent action that instead uses a task notification is \texttt{xTaskNotifyGiveIndexed().}

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the \texttt{ulTaskNotificationTakeIndexed()} API function rather than the \texttt{xTaskNotifyWaitIndexed()} API function.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. \texttt{xTaskNotifyGive()} is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling \texttt{xTaskNotifyGive()} is equivalent to calling \texttt{xTaskNotifyGiveIndexed()} with the \texttt{uxIndexToNotify} parameter set to 0.

**Parameters**
- \texttt{xTaskToNotify} - The handle of the task being notified. The handle to a task can be returned from the \texttt{xtaskCreate()} API function used to create the task, and the handle of the currently running task can be obtained by calling \texttt{xtaskGetCurrentTaskHandle().}
- \texttt{uxIndexToNotify} - The index within the target task’s array of notification values to which the notification is to be sent. \texttt{uxIndexToNotify} must be less than \texttt{configTASK_NOTIFICATION_ARRAY_ENTRIES}. \texttt{xTaskNotifyGive()} does not have this parameter and always sends notifications to index 0.

**Returns** \texttt{xTaskNotifyGive()} is a macro that calls \texttt{xTaskNotify()} with the \texttt{eAction} parameter set to \texttt{eIncrement} - so \texttt{pdPASS} is always returned.

\texttt{xTaskNotifyGive \ (xTaskToNotify)}
\texttt{vTaskNotifyGiveFromISR \ (xTaskToNotify, pxHigherPriorityTaskWoken)}

enum `eTaskState`
   Task states returned by `eTaskGetState`.
   Values:
   
   enumerator `eRunning`
   
   enumerator `eReady`
   
   enumerator `eBlocked`
   
   enumerator `eSuspended`
   
   enumerator `eDeleted`
   
   enumerator `eInvalid`

enum `eNotifyAction`
   Values:
   
   enumerator `eNoAction`
   
   enumerator `eSetBits`
   
   enumerator `eIncrement`
   
   enumerator `eSetValueWithOverwrite`
   
   enumerator `eSetValueWithoutOverwrite`

enum `eSleepModeStatus`
   Possible return values for `cTaskConfirmSleepModeStatus()`.
   Values:
   
   enumerator `eAbortSleep`
   
   enumerator `eStandardSleep`
   
   enumerator `eNoTasksWaitingTimeout`

Queue API

Header File

Functions

BaseType_t **QueueGenericSend** ([QueueHandle_t xQueue, const void *const pvItemToQueue, TickType_t xTicksToWait, const BaseType_t xCopyPosition])

It is preferred that the macros xQueueSend(), xQueueSendToFront() and xQueueSendToBack() are used in place of calling this function directly.

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ));

    // ...
    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become
        // available if necessary.
        if( xQueueGenericSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10,...
            queueSEND_TO_BACK ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the
        // queue is already full.
        pxMessage = &xMessage;
        xQueueGenericSend( xQueue2, ( void * ) pxMessage, ( TickType_t ) 0,...
            queueSEND_TO_BACK );
    }

    // ... Rest of task code.
}
```

Parameters

- **xQueue** – The handle to the queue on which the item is to be posted.
- **pvItemToQueue** – A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
• **xTicksToWait** – The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant `portTICK_PERIOD_MS` should be used to convert to real time if this is required.

• **xCopyPosition** – Can take the value `queueSEND_TO_BACK` to place the item at the back of the queue, or `queueSEND_TO_FRONT` to place the item at the front of the queue (for high priority messages).

**Returns** `pdTRUE` if the item was successfully posted, otherwise `errQUEUE_FULL`.

**BaseType_t xQueuePeek** *(QueueHandle_t xQueue, void *const pvBuffer, TickType_t xTicksToWait)*

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to `xQueueReceive()`.

This macro must not be used in an interrupt service routine. See `xQueuePeekFromISR()` for an alternative that can be called from an interrupt service routine.

**Example usage:**

```c
// Create a queue capable of containing 10 pointers to AMessage structures. These should be passed by pointer as they contain a lot of data.
QueueHandle_t xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
if( xQueue == 0 )
{
    // Failed to create the queue.
}

// Send a pointer to a struct AMessage object. Don't block if the queue is already full.
pxMessage = & xMessage;
xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );

// ... Rest of task code.

// Task to peek the data from the queue.
void vADifferentTask( void *pvParameters )
{
    struct AMessage *pxRxedMessage;
    if( xQueue != 0 )
    {
        // Peek a message on the created queue. Block for 10 ticks if a
    }
}
```

(continues on next page)
// message is not immediately available.
if ( xQueuePeek( xQueue, & pxRxedMessage, ( TickType_t ) 10 ) )
{
    // pcRxedMessage now points to the struct AMessage variable posted
    // by vATask, but the item still remains on the queue.
}

// ... Rest of task code.

Parameters
• xQueue – The handle to the queue from which the item is to be received.
• pvBuffer – Pointer to the buffer into which the received item will be copied.
• xTicksToWait – The maximum amount of time the task should block waiting for an
  item to receive should the queue be empty at the time of the call. The time is defined
  in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real
  time if this is required. xQueuePeek() will return immediately if xTicksToWait is 0 and
  the queue is empty.

Returns pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

BaseType_t xQueuePeekFromISR ( QueueHandle_t xQueue, void*const pvBuffer )
A version of xQueuePeek() that can be called from an interrupt service routine (ISR).

Receive an item from a queue without removing the item from the queue. The item is received by copy so a
buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the
queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to
xQueueReceive().

Parameters
• xQueue – The handle to the queue from which the item is to be received.
• pvBuffer – Pointer to the buffer into which the received item will be copied.

Returns pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.
