# Table of contents

## 1 Get Started

1.1 Introduction ................................................. 3
1.2 What You Need ............................................... 3
   1.2.1 Hardware .............................................. 3
   1.2.2 Software .............................................. 13
1.3 Installation ................................................. 13
   1.3.1 IDE ................................................... 13
   1.3.2 Manual Installation .................................... 14
1.4 Build Your First Project ................................. 43

## 2 API Reference

2.1 API Conventions ............................................. 45
   2.1.1 Error handling ......................................... 45
   2.1.2 Configuration structures ............................... 45
   2.1.3 Private APIs ........................................... 46
   2.1.4 Components in example projects ....................... 46
   2.1.5 API Stability .......................................... 47
2.2 Application Protocols ....................................... 48
   2.2.1 ASIO port .............................................. 48
   2.2.2 ESP-Modbus ............................................. 48
   2.2.3 ESP-MQTT .............................................. 70
   2.2.4 ESP-TLS ............................................... 81
   2.2.5 ESP HTTP Client ........................................ 92
   2.2.6 ESP Local Control ...................................... 104
   2.2.7 ESP Serial Slave Link ................................. 113
   2.2.8 ESP WebSocket Client .................................. 125
   2.2.9 ESP x509 Certificate Bundle .......................... 132
   2.2.10 HTTP Server .......................................... 134
   2.2.11 HTTPS server ......................................... 156
   2.2.12 ICMP Echo ............................................ 159
   2.2.13 mDNS Service ......................................... 163
   2.2.14 IP Network Layer ..................................... 177
2.3 Bluetooth API ............................................... 177
   2.3.1 BT COMMON ............................................. 177
   2.3.2 BT LE .................................................. 182
   2.3.3 Controller & VHCI ....................................... 274
   2.3.4 ESP-BLE-MESH ......................................... 282
   2.3.5 NimBLE-based host APIs ............................... 493
2.4 Error Codes Reference ...................................... 496
2.5 Networking APIs ............................................. 502
   2.5.1 Wi-Fi .................................................. 502
   2.5.2 Ethernet ............................................... 585
   2.5.3 Thread ................................................. 608
   2.5.4 ESP-NETIF .............................................. 613
   2.5.5 IP Network Layer ...................................... 630
## 2.6 Peripherals API

2.6.1 Analog to Digital Converter (ADC) ................................................................. 633
2.6.2 GPIO & RTC GPIO ......................................................................................... 653
2.6.3 General Purpose Timer (GPTimer) ................................................................. 666
2.6.4 Dedicated GPIO ............................................................................................ 675
2.6.5 Hash-based Message Authentication Code (HMAC) ................................. 678
2.6.6 Digital Signature (DS) ................................................................................... 682
2.6.7 Inter-Integrated Circuit (I2C) ......................................................................... 687
2.6.8 Inter-IC Sound (I2S) .................................................................................... 702
2.6.9 LCD .............................................................................................................. 717
2.6.10 LED Control (LEDC) .................................................................................. 724
2.6.11 Remote Control (RMT) ................................................................................ 738
2.6.12 SD SPI Host Driver ..................................................................................... 758
2.6.13 Sigma-delta Modulation ............................................................................. 763
2.6.14 SPI Master Driver ....................................................................................... 766
2.6.15 SPI Slave Driver ......................................................................................... 784
2.6.16 Temperature Sensor ................................................................................... 790
2.6.17 Two-Wire Automotive Interface (TWAI) .................................................... 792
2.6.18 Universal Asynchronous Receiver/Transmitter (UART) ............................ 807

## 2.7 Project Configuration

2.7.1 Introduction ................................................................................................... 829
2.7.2 Project Configuration Menu ......................................................................... 830
2.7.3 Using sdkconfig.defaults .......................................................................... 830
2.7.4 Kconfig Formatting Rules ............................................................................ 830
2.7.5 Backward Compatibility of Kconfig Options ............................................. 830
2.7.6 Configuration Options Reference ............................................................... 831

## 2.8 Provisioning API

2.8.1 Protocol Communication ............................................................................. 1063
2.8.2 Unified Provisioning .................................................................................... 1073
2.8.3 Wi-Fi Provisioning ...................................................................................... 1077

## 2.9 Storage API

2.9.1 FAT Filesystem Support ............................................................................... 1094
2.9.2 Manufacturing Utility .................................................................................. 1100
2.9.3 Non-volatile storage library ....................................................................... 1104
2.9.4 NVS Partition Generator Utility ................................................................. 1124
2.9.5 SD/SDIO/MMC Driver ............................................................................... 1130
2.9.6 SPI Flash API ............................................................................................... 1138
2.9.7 SPIFFS Filesystem ...................................................................................... 1165
2.9.8 Virtual filesystem component ..................................................................... 1168
2.9.9 Wear Levelling API ..................................................................................... 1181

## 2.10 System API

2.10.1 App Image Format ...................................................................................... 1184
2.10.2 Application Level Tracing ......................................................................... 1190
2.10.3 Call function with external stack ............................................................... 1194
2.10.4 Console ...................................................................................................... 1195
2.10.5 eFuse Manager ......................................................................................... 1203
2.10.6 Error Codes and Helper Functions ............................................................. 1223
2.10.7 ESP HTTPS OTA ......................................................................................... 1225
2.10.8 Event Loop Library .................................................................................... 1229
2.10.9 FreeRTOS .................................................................................................. 1245
2.10.10 FreeRTOS Supplemental Features ............................................................ 1349
2.10.11 Heap Memory Allocation ......................................................................... 1366
2.10.12 Heap Memory Debugging ....................................................................... 1377
2.10.13 High Resolution Timer ........................................................................... 1387
2.10.14 Internal and Unstable APIs ..................................................................... 1393
2.10.15 Interrupt allocation .................................................................................. 1394
2.10.16 Logging library ........................................................................................ 1399
3 ESP32-C3 Hardware Reference
3.1 Chip Series Comparison ........................................ 1453
3.1.1 Related Documents ........................................ 1455

4 API Guides ......................................................... 1457
4.1 Application Level Tracing library .............................. 1457
  4.1.1 Overview ................................................. 1457
  4.1.2 Modes of Operation ...................................... 1457
  4.1.3 Configuration Options and Dependencies .............. 1458
  4.1.4 How to use this library ................................ 1459
4.2 Application Startup Flow ..................................... 1467
  4.2.1 First stage bootloader .................................. 1467
  4.2.2 Second stage bootloader ................................. 1467
  4.2.3 Application startup .................................... 1468
4.3 BluFi .......................................................... 1469
  4.3.1 Overview .................................................. 1469
  4.3.2 The BluFi Flow .......................................... 1469
  4.3.3 The Flow Chart of BluFi ............................... 1470
  4.3.4 The Frame Formats Defined in BluFi ................. 1471
  4.3.5 The Security Implementation of ESP32-C3 ............ 1475
  4.3.6 GATT Related Instructions ............................ 1476
4.4 Bootloader .................................................... 1476
  4.4.1 Bootloader compatibility ................................ 1477
  4.4.2 Log Level ................................................. 1477
  4.4.3 Factory reset ............................................ 1477
  4.4.4 Boot from Test Firmware ................................ 1478
  4.4.5 Rollback .................................................. 1478
  4.4.6 Watchdog ............................................... 1478
  4.4.7 Bootloader Size ........................................ 1479
  4.4.8 Fast boot from Deep Sleep .............................. 1479
  4.4.9 Custom bootloader ...................................... 1479
4.5 Build System .................................................. 1479
  4.5.1 Overview .................................................. 1479
  4.5.2 Using the Build System ................................. 1480
  4.5.3 Example Project ........................................ 1484
  4.5.4 Project CMakeLists File ............................... 1485
  4.5.5 Component CMakeLists Files ............................ 1486
  4.5.6 Component Configuration ............................... 1488
  4.5.7 Preprocessor Definitions ............................... 1488
  4.5.8 Component Requirements ............................... 1489
  4.5.9 Overriding Parts of the Project ....................... 1492
  4.5.10 Configuration-Only Components ....................... 1493
  4.5.11 Debugging CMake ...................................... 1493
  4.5.12 Example Component CMakeLists ....................... 1494
  4.5.13 Custom sdkconfig defaults ............................ 1498
  4.5.14 Flash arguments ....................................... 1498
  4.5.15 Building the Bootloader ............................... 1498
  4.5.16 Selecting the Target .................................. 1499

This is the documentation for Espressif IoT Development Framework (esp-idf). ESP-IDF is the official development framework for the ESP32, ESP32-S and ESP32-C Series SoCs.

This document describes using ESP-IDF with the ESP32-C3 SoC.
Chapter 1

Get Started

This document is intended to help you set up the software development environment for the hardware based on the ESP32-C3 chip by Espressif. After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then for building and flashing firmware onto an ESP32-C3 board.

Note: This is documentation for the master branch (latest version) of ESP-IDF. This version is under continual development. Stable version documentation is available, as well as other ESP-IDF Versions.

1.1 Introduction

ESP32-C3 is a system on a chip that integrates the following features:

- Wi-Fi (2.4 GHz band)
- Bluetooth Low Energy
- High performance 32-bit RISC-V single-core processor
- Multiple peripherals
- Built-in security hardware

Powered by 40 nm technology, ESP32-C3 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32-C3 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.

1.2 What You Need

1.2.1 Hardware

- An ESP32-C3 board.
- USB cable - USB A / micro USB B.
- Computer running Windows, Linux, or macOS.

Note: Currently, some of the development boards are using USB Type C connectors. Be sure you have the correct cable to connect your board!

If you have one of ESP32-C3 official development boards listed below, you can click on the link to learn more about the hardware.
Chapter 1. Get Started

ESP32-C3-DevKitM-1

This user guide will help you get started with ESP32-C3-DevKitM-1 and will also provide more in-depth information. ESP32-C3-DevKitM-1 is an entry-level development board based on ESP32-C3-MINI-1, a module named for its small size. This board integrates complete Wi-Fi and Bluetooth LE functions.

Most of the I/O pins on the ESP32-C3-MINI-1 module are broken out to the pin headers on both sides of this board for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-C3-DevKitM-1 on a breadboard.

Fig. 1: ESP32-C3-DevKitM-1

The document consists of the following major sections:

- **Getting Started**: Overview of ESP32-C3-DevKitM-1 and hardware/software setup instructions to get started.
- **Hardware Reference**: More detailed information about the ESP32-C3-DevKitM-1’s hardware.
- **Hardware Revision Details**: Revision history, known issues, and links to user guides for previous versions (if any) of ESP32-C3-DevKitM-1.
- **Related Documents**: Links to related documentation.

**Getting Started** This section provides a brief introduction of ESP32-C3-DevKitM-1, instructions on how to do the initial hardware setup and how to flash firmware onto it.

**Description of Components** The key components of the board are described in a counter-clockwise direction.
Chapter 1. Get Started

### Key Component

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP32-C3-MINI-1</td>
<td>ESP32-C3-MINI-1 is a general-purpose Wi-Fi and Bluetooth LE combo module that comes with a PCB antenna. At the core of this module is ESP32-C3FN4, a chip that has an embedded flash of 4 MB. Since flash is packaged in the ESP32-C3FN4 chip, rather than integrated into the module, ESP32-C3-MINI-1 has a smaller package size.</td>
</tr>
<tr>
<td>5 V to 3.3 V LDO</td>
<td>Power regulator that converts a 5 V supply into a 3.3 V output.</td>
</tr>
<tr>
<td>5 V Power On LED</td>
<td>Turns on when the USB power is connected to the board.</td>
</tr>
<tr>
<td>Pin Headers</td>
<td>All available GPIO pins (except for the SPI bus for flash) are broken out to the pin headers on the board. For details, please see Header Block.</td>
</tr>
<tr>
<td>Boot Button</td>
<td>Download button. Holding down Boot and then pressing Reset initiates Firmware Download mode for downloading firmware through the serial port.</td>
</tr>
<tr>
<td>Micro-USB Port</td>
<td>USB interface. Power supply for the board as well as the communication interface between a computer and the ESP32-C3FN4 chip.</td>
</tr>
<tr>
<td>Reset Button</td>
<td>Press this button to restart the system.</td>
</tr>
<tr>
<td>USB-to-UART Bridge</td>
<td>Single USB-UART bridge chip provides transfer rates up to 3 Mbps.</td>
</tr>
<tr>
<td>RGB LED</td>
<td>Addressable RGB LED, driven by GPIO8.</td>
</tr>
</tbody>
</table>

### Start Application Development

Before powering up your ESP32-C3-DevKitM-1, please make sure that it is in good condition with no obvious signs of damage.

### Required Hardware

- ESP32-C3-DevKitM-1
- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS

**Note:** Be sure to use an appropriate USB cable. Some cables are for charging only and do not provide the needed data lines nor work for programming the boards.
**Software Setup** Please proceed to *Get Started*, where Section *Installation* will quickly help you set up the development environment and then flash an application example onto your ESP32-C3-DevKitM-1.

**Contents and Packaging**

**Retail Orders** If you order one or several samples, each ESP32-C3-DevKitM-1 comes in an individual package in either antistatic bag or any packaging depending on your retailer.

**Wholesale Orders** If you order in bulk, the boards come in large cardboard boxes.

**Hardware Reference**

**Block Diagram** The block diagram below shows the components of ESP32-C3-DevKitM-1 and their interconnections.

![Block Diagram](Fig.3: ESP32-C3-DevKitM-1 (click to enlarge))

**Power Supply Options** There are three mutually exclusive ways to provide power to the board:

- Micro-USB Port, default power supply
- 5V and GND pin headers
- 3V3 and GND pin headers

It is recommended to use the first option: Micro-USB Port.

**Header Block** The two tables below provide the **Name** and **Function** of the pin headers on both sides of the board (J1 and J3). The pin header names are shown in *ESP32-C3-DevKitM-1 - front*. The numbering is the same as in the *ESP32-C3-DevKitM-1 Schematic* (PDF).
## Pin Layout

### Hardware Revision Details
No previous versions available.

For further design documentation for the board, please contact us at sales@espressif.com.

P: Power supply; I: Input; O: Output; T: High impedance.
GPIO2, GPIO8, and GPIO9 are strapping pins of the ESP32-C3FN4 chip. These pins are used to control several chip functions depending on binary voltage values applied to the pins during chip power-up or system reset. For description and application of the strapping pins, please refer to Section Strapping Pins in ESP32-C3 Datasheet.
This user guide will help you get started with ESP32-C3-DevKitC-02 and will also provide more in-depth information. ESP32-C3-DevKitC-02 is an entry-level development board based on ESP32-C3-WROOM-02, a general-purpose module with 4 MB SPI flash. This board integrates complete Wi-Fi and Bluetooth LE functions.

Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-C3-DevKitC-02 on a breadboard.

The document consists of the following major sections:

- **Getting Started**: Overview of ESP32-C3-DevKitC-02 and hardware/software setup instructions to get started.
- **Hardware Reference**: More detailed information about the ESP32-C3-DevKitC-02’s hardware.
- **Hardware Revision Details**: Revision history, known issues, and links to user guides for previous versions (if any) of ESP32-C3-DevKitC-02.
- **Related Documents**: Links to related documentation.

**Getting Started**  This section provides a brief introduction of ESP32-C3-DevKitC-02, instructions on how to do the initial hardware setup and how to flash firmware onto it.

**Description of Components**  The key components of the board are described in a counter-clockwise direction.

1.2.2 Software

To start using ESP-IDF on ESP32-C3 you’ll need the following software installed:

• Toolchain to compile code for ESP32-C3
• Build tools - CMake and Ninja to build a full Application for ESP32-C3
• ESP-IDF that essentially contains API (software libraries and source code) for ESP32-C3 and scripts to operate the Toolchain

1.3 Installation

To install all the required software, we offer some different ways to facilitate this task. Choose from one of the available options.

1.3.1 IDE

Note: We highly recommend installing the ESP-IDF through your favorite IDE.
Build and Flash with Eclipse IDE

ESP-IDF V4.0 has a new CMake-based build system as the default build system.

There is a new ESP-IDF Eclipse Plugin that works with the CMake-based build system. Please refer to Espressif IDF Eclipse Plugins IDF for further instructions.

Note: In Espressif IDF Eclipse Plugins, though screenshots are captured from macOS, installation instructions are applicable for Windows, Linux and macOS.

Getting Started with VS Code IDE

We have official support for VS Code and we aim to provide complete end to end support for all actions related to ESP-IDF namely build, flash, monitor, debug, tracing, core-dump, System Trace Viewer, etc.

Quick Install Guide Recommended way to install ESP-IDF Visual Studio Code Extension is by downloading it from VS Code Marketplace or following Quick Installation Guide.

Supported Features

- **Setup**, will help you to quickly install ESP-IDF and its relevant toolchain with just few clicks.
- **Build**, with one click build and multi target build, you can easily build and deploy your applications.
- **Flash**, with both UART and JTAG flash out of the box.
- **Monitoring** comes with built-in terminal where you can trigger IDF Monitor Commands from within VS Code as you are used to in traditional terminals.
- **Debugging** <https://github.com/espressif/vscode-esp-idf-extension/blob/master/docs/tutorial/debugging.md>, with out of box hardware debugging and also support for postmortem debugging like core-dump, you can analyze the bugs with convenience.
- **GUI Menu Config**, provides with simplified UI for configuring your chip.
- **App & Heap Tracing**, provides support for collecting traces from your application and simplified UI for analyzing them.
- **System View Tracing Viewer**, aims to read and display the .svdat files into trace UI, we also support multiple core tracing views.
- **IDF Size Analysis Overview** presents an UI for binary size analysis.
- **Rainmaker Cloud**, we have inbuilt Rainmaker Cloud support where you can edit/read state of your connected IoT devices easily.
- **Code Coverage**, we have inbuilt code coverage support which shall highlight in color which line have been covered. We also render the existing HTML report directly inside the IDE.

Bugs & Feature Requests If you face an issue with certain feature of VS Code or VS Code in general we recommend to ask your question in the forum, or open a github issue for our dev teams to review.

We also welcome new feature request, most of the features we have today is result of people asking it to implement, or improve certain aspect of the extension, raise your feature request on github.

1.3.2 Manual Installation

For the manual procedure, please select according to your operating system.
Standard Setup of Toolchain for Windows

Introduction  ESP-IDF requires some prerequisite tools to be installed so you can build firmware for supported chips. The prerequisite tools include Python, Git, cross-compilers, CMake and Ninja build tools.

For this Getting Started we’re going to use the Command Prompt, but after ESP-IDF is installed you can use Eclipse or another graphical IDE with CMake support instead.

Note: Limitations: - The installation path of ESP-IDF and ESP-IDF Tools must not be longer than 90 characters. Too long installation paths might result in a failed build. - The installation path of Python or ESP-IDF must not contain white spaces or parentheses. - The installation path of Python or ESP-IDF should not contain special characters (non-ASCII) unless the operating system is configured with “Unicode UTF-8” support.

System Administrator can enable the support via Control Panel - Change date, time, or number formats - Administrative tab - Change system locale - check the option “Beta: Use Unicode UTF-8 for worldwide language support” - Ok and reboot the computer.

ESP-IDF Tools Installer  The easiest way to install ESP-IDF’s prerequisites is to download one of ESP-IDF Tools Installers.

What is the use case for Online and Offline Installer  Online Installer is very small and allows the installation of all available releases of ESP-IDF. The installer will download only necessary dependencies including Git For Windows during the installation process. The installer stores downloaded files in the cache directory %userprofile%\espressif

Offline Installer does not require any network connection. The installer contains all required dependencies including Git For Windows.

Components of the installation  The installer deploys the following components:

- Embedded Python
- Cross-compilers
- OpenOCD
- CMake and Ninja build tools
- ESP-IDF

The installer also allows reusing the existing directory with ESP-IDF. The recommended directory is %userprofile%\Desktop\esp-idf where %userprofile% is your home directory.

Launching ESP-IDF Environment  At the end of the installation process you can check out option Run ESP-IDF PowerShell Environment or Run ESP-IDF Command Prompt (cmd.exe). The installer will launch ESP-IDF environment in selected prompt.

Run ESP-IDF PowerShell Environment:
Fig. 9: Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF PowerShell Environment

Fig. 10: ESP-IDF PowerShell
Chapter 1. Get Started

Run ESP-IDF Command Prompt (cmd.exe):

![Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF Command Prompt (cmd.exe)](image)

Fig. 11: Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF Command Prompt (cmd.exe)

**Using the Command Prompt**  For the remaining Getting Started steps, we’re going to use the Windows Command Prompt.

ESP-IDF Tools Installer also creates a shortcut in the Start menu to launch the ESP-IDF Command Prompt. This shortcut launches the Command Prompt (cmd.exe) and runs `export.bat` script to set up the environment variables (PATH, IDF_PATH and others). Inside this command prompt, all the installed tools are available.

Note that this shortcut is specific to the ESP-IDF directory selected in the ESP-IDF Tools Installer. If you have multiple ESP-IDF directories on the computer (for example, to work with different versions of ESP-IDF), you have two options to use them:

1. Create a copy of the shortcut created by the ESP-IDF Tools Installer, and change the working directory of the new shortcut to the ESP-IDF directory you wish to use.
2. Alternatively, run cmd.exe, then change to the ESP-IDF directory you wish to use, and run `export.bat`. Note that unlike the previous option, this way requires Python and Git to be present in PATH. If you get errors related to Python or Git not being found, use the first option.

**First Steps on ESP-IDF**  Now you have all requirements met, the next topic will guide you on how to start your first project.

This guide will help you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32-C3 and build, flash, and monitor the device output.

**Note:** If you haven’t yet installed the ESP-IDF, please go to Installation and follow the instruction in order to get

Checking if Python packages are up to date...
Python requirements from C:\Users\test\esp\idf\requirements.txt are satisfied.

Done! You can now compile ESP-IDF projects.
Go to the project directory and run:

idf.py build

C:\Users\test\esp\idf

Fig. 12: ESP-IDF Command Prompt
all the software needed to use this guide.

**Start a Project**  Now you are ready to prepare your application for ESP32-C3. You can start with `get-started/hello_world` project from `examples` directory in IDF.

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

Copy the project `get-started/hello_world` to `~/esp` directory:

**Windows**

```bash
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

**Linux/macOS**

```bash
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

**Note:** There is a range of example projects in the `examples` directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place, without copying them first.

**Connect Your Device**  Now connect your ESP32-C3 board to the computer and check under what serial port the board is visible.

Serial ports have the following patterns in their names:

- **Windows:** names like `COM1`
- **Linux:** starting with `/dev/tty`
- **macOS:** starting with `/dev/cu.`

If you are not sure how to check the serial port name, please refer to *Establish Serial Connection with ESP32-C3* for full details.

**Note:** Keep the port name handy as you will need it in the next steps.

**Configure your Project**  Navigate to your `hello_world` directory, set ESP32-C3 chip as the target and run the project configuration utility `menuconfig`.

**Windows**

```bash
cd %userprofile%\esp\hello_world
idf.py set-target esp32c3
idf.py menuconfig
```

**Linux/macOS**

```bash
cd ~/esp/hello_world
idf.py set-target esp32c3
idf.py menuconfig
```
Setting the target with `idf.py set-target esp32c3` should be done once after opening a new project. If
the project contains some existing builds and configurations, they will be cleared and
initialized. The target may be saved in the environment variable to skip this step at all. See Selecting the Target for additional information.

If the previous steps have been done correctly, the following menu appears:

![Project configuration - Home window](image)

You are using this menu to set up project specific variables, e.g. Wi-Fi network name and
password, the processor speed, etc. Setting up the project with menuconfig may be skipped for
`hello_world`. This example will run with default configuration.

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option
`--style`. Please run `idf.py menuconfig --help` for further information.

**Build the Project** Build the project by running:

```
$ idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader,
partition table, and application binaries.

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration

-- Component paths: ...
... (more lines of build system output)
[527/527] Generating hello_world.bin
esptool.py v2.3.1
Project build complete. To flash, run this command:
```

(continues on next page)
Chapter 1. Get Started

(continued from previous page)

```bash
..//../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash
  --flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
  --bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
  --partition-table.bin
or run 'idf.py -p PORT flash'
```

If there are no errors, the build will finish by generating the firmware binary .bin files.

**Flash onto the Device**  Flash the binaries that you just built (bootloader.bin, partition-table.bin and hello_world.bin) onto your ESP32-C3 board by running:

```
idf.py -p PORT [-b BAUD] flash
```

Replace PORT with your ESP32-C3 board’s serial port name.

You can also change the flasher baud rate by replacing BAUD with the baud rate you need. The default baud rate is 460800.

For more information on idf.py arguments, see `idf.py`.

**Note:** The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

**Encountered Issues While Flashing?**  If you run the given command and see errors such as “Failed to connect”, there might be several reasons for this. One of the reasons might be issues encountered by `esptool.py`, the utility that is called by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple solution to try is manual reset described below, and if it does not help you can find more details about possible issues in Troubleshooting.

`esptool.py` resets ESP32-C3 automatically by asserting DTR and RTS control lines of the USB to serial converter chip, i.e., FTDI or CP210x (for more information, see `Establish Serial Connection with ESP32-C3`). The DTR and RTS control lines are in turn connected to GPIO9 and CHIP_PU (EN) pins of ESP32-C3, thus changes in the voltage levels of DTR and RTS will boot ESP32-C3 into Firmware Download mode. As an example, check the schematic for the ESP32 DevKitC development board.

In general, you should have no problems with the official esp-idf development boards. However, `esptool.py` is not able to reset your hardware automatically in the following cases:

- Your hardware does not have the DTR and RTS lines connected to GPIO9 and CHIP_PU
- The DTR and RTS lines are configured differently
- There are no such serial control lines at all

Depending on the kind of hardware you have, it may also be possible to manually put your ESP32-C3 board into Firmware Download mode (reset).

- For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an ESP-IDF development board, hold down the **Boot** button (GPIO9) and press the **EN** button (CHIP_PU).
- For other types of hardware, try pulling GPIO9 down.

**Normal Operation**  When flashing, you will see the output log similar to the following:

```bash
...
esptool.py --chip esp32c3 -p /dev/ttyUSB0 -b 460800 --before=default_reset --
  --after-hard_reset write_flash --flash_mode dio --flash_freq 80m --flash_size 2MB-
  --0x8000 partition_table/partition-table.bin 0x0 bootloader/bootloader.bin 0x10000-
  --hello_world.bin
esptool.py v3.0
```

(continues on next page)

Done

If there are no issues by the end of the flash process, the board will reboot and start up the “hello_world” application.

If you’d like to use the Eclipse or VS Code IDE instead of running idf.py, check out the Eclipse guide, VS Code guide.

Monitor the Output To check if “hello_world” is indeed running, type idf.py -p PORT monitor (Do not forget to replace PORT with your serial port name).

This command launches the IDF Monitor application:

```
$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_world/build/hello_world.elf"
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+I | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun 8 2016 00:22:57
rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
...
```

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.
...Hello world!
Restarting in 10 seconds...
This is esp32c3 chip with 1 CPU core(s), WiFi/BLE, silicon revision 0, 2MB...
--external flash
Minimum free heap size: 337332 bytes
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...

To exit IDF monitor use the shortcut Ctrl+].

Note: You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:

- **IDF Monitor** for handy shortcuts and more details on using IDF monitor.
- **idf.py** for a full reference of idf.py commands and options.

That’s all that you need to get started with ESP32-C3!

Now you are ready to try some other examples, or go straight to developing your own applications.

Important: Some of examples do not support ESP32-C3 because required hardware is not included in ESP32-C3 so it cannot be supported.

If building an example, please check the README file for the Supported Targets table. If this is present including ESP32-C3 target, or the table does not exist at all, the example will work on ESP32-C3.

Additional Tips

Permission issues /dev/ttyUSB0 With some Linux distributions, you may get the Failed to open port /dev/ttyUSB0 error message when flashing the ESP32-C3. *This can be solved by adding the current user to the dialout group.*

Python compatibility ESP-IDF supports Python 3.6 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from sources or the use of a Python version management system such as pyenv.

Related Documents For advanced users who want to customize the install process:

Updating ESP-IDF tools on Windows

Install ESP-IDF tools using a script From the Windows Command Prompt, change to the directory where ESP-IDF is installed. Then run:

```
install.bat
```

For Powershell, change to the directory where ESP-IDF is installed. Then run:

```
install.ps1
```
This will download and install the tools necessary to use ESP-IDF. If the specific version of the tool is already installed, no action will be taken. The tools are downloaded and installed into a directory specified during ESP-IDF Tools Installer process. By default, this is `C:\Users\username\.espressif`.

**Add ESP-IDF tools to PATH using an export script**

ESP-IDF tools installer creates a Start menu shortcut for “ESP-IDF Command Prompt”. This shortcut opens a Command Prompt window where all the tools are already available.

In some cases, you may want to work with ESP-IDF in a Command Prompt window which wasn’t started using that shortcut. If this is the case, follow the instructions below to add ESP-IDF tools to PATH.

In the command prompt where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.bat`:

```
cd %UserProfile%\esp\esp-idf
export.bat
```

Alternatively in the Powershell where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.ps1`:

```
cd ~/esp/esp-idf
export.ps1
```

When this is done, the tools will be available in this command prompt.

**Establish Serial Connection with ESP32-C3**

This section provides guidance how to establish serial connection between ESP32-C3 and PC.

**Connect ESP32-C3 to PC**

Connect the ESP32-C3 board to the PC using the USB cable. If device driver does not install automatically, identify USB to serial converter chip on your ESP32-C3 board (or external converter dongle), search for drivers in internet and install them.

Below is the list of USB to serial converter chips installed on most of the ESP32-C3 boards produced by Espressif together with links to the drivers:

- CP210x: [CP210x USB to UART Bridge VCP Drivers](#)
- FTDI: [FTDI Virtual COM Port Drivers](#)

Please check the board user guide for specific USB to serial converter chip used. The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with an operating system and automatically installed upon connecting the board to the PC.

**Check port on Windows**

Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32-C3 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT

**Check port on Linux and macOS**

To check the device name for the serial port of your ESP32-C3 board (or external converter dongle), run this command two times, first with the board / dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

Linux

```
ls /dev/tty*
```

macOS

```
ls /dev/cu.*
```
Fig. 14: USB to UART bridge of ESP32-DevKitC in Windows Device Manager
Fig. 15: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager
Chapter 1. Get Started

Note: macOS users: if you don’t see the serial port then check you have the USB/serial drivers installed as shown in the Getting Started guide for your particular development board. For macOS High Sierra (10.13), you may also have to explicitly allow the drivers to load. Open System Preferences -> Security & Privacy -> General and check if there is a message shown here about “System Software from developer …” where the developer name is Silicon Labs or FTDI.

Adding user to dialout on Linux The currently logged user should have read and write access the serial port over USB. On most Linux distributions, this is done by adding the user to dialout group with the following command:

```
sudo usermod -a -G dialout $USER
```

on Arch Linux this is done by adding the user to uucp group with the following command:

```
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.

Verify serial connection Now verify that the serial connection is operational. You can do this using a serial terminal program by checking if you get any output on the terminal after resetting ESP32-C3.

Windows and Linux In this example we will use PuTTY SSH Client that is available for both Windows and Linux. You can use other serial program and set communication parameters like below.

Run terminal, set identified serial port, baud rate = 115200, data bits = 8, stop bits = 1, and parity = N. Below are example screen shots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

Then open serial port in terminal and check, if you see any log printed out by ESP32-C3. The log contents will depend on application loaded to ESP32-C3, see Example Output.

Note: Close the serial terminal after verification that communication is working. If you keep the terminal session open, the serial port will be inaccessible for uploading firmware later.

macOS To spare you the trouble of installing a serial terminal program, macOS offers the **screen** command.

- As discussed in Check port on Linux and macOS, run:

  ```
  ls /dev/cu.*
  ```

- You should see similar output:

  ```
  /dev/cu.Bluetooth-Incoming-Port /dev/cu.SLAB_USBtoUART /dev/cu.SLAB_USBtoUART
  ```

- The output will vary depending on the type and the number of boards connected to your PC. Then pick the device name of your board and run:

  ```
  screen /dev/cu.device_name 115200
  ```

  Replace device_name with the name found running `ls /dev/cu.*`.  
- What you are looking for is some log displayed by the **screen**. The log contents will depend on application loaded to ESP32-C3, see Example Output. To exit the **screen** session type Ctrl-A +\.

Espressif Systems

Submit Document Feedback
Fig. 16: Setting Serial Communication in PuTTY on Windows
Fig. 17: Setting Serial Communication in PuTTY on Linux
Chapter 1. Get Started

**Note:** Do not forget to **exit the screen session** after verifying that the communication is working. If you fail to do it and just close the terminal window, the serial port will be inaccessible for uploading firmware later.

---

**Example Output**  An example log by ESP32-C3 is shown below. Reset the board if you do not see anything.

```console
ets Jun 8 2016 00:22:57
rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configsip: 0, SPIWP:0x00
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0008,len:8
load:0x3fff0010,len:3464
load:0x40078000,len:7828
load:0x40080000,len:252
entry 0x40080034
I (44) boot: ESP- IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10
...
```

If you can see readable log output, it means serial connection is working and you are ready to proceed with installation and finally upload of application to ESP32-C3.

---

**Note:** For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32-C3 will boot and produce serial output. This depends on the hardware itself, most development boards (including all Espressif boards) do not have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the **esptool documentation** for more details.

If you got here from **Step 5. First Steps on ESP-IDF** when installing s/w for ESP32-C3 development, then you can continue with **Step 5. First Steps on ESP-IDF**.

**IDF Monitor**  The IDF monitor tool is mainly a serial terminal program which relays serial data to and from the target device’s serial port. It also provides some IDF-specific features.

This tool can be launched from an IDF project by running `idf.py monitor`.

**Keyboard Shortcuts**  For easy interaction with IDF Monitor, use the keyboard shortcuts given in the table.
<table>
<thead>
<tr>
<th>Keyboard Shortcut</th>

</tbody>
</table>

Any keys pressed, other than Ctrl-] and Ctrl-T, will be sent through the serial port.

**IDF-specific features**

**Automatic Address Decoding** Whenever ESP-IDF outputs a hexadecimal code address of the form 0x4_______, IDF Monitor uses addr2line to look up the location in the source code and find the function name.

If an ESP-IDF app crashes and panics, a register dump and backtrace is produced, such as the following:

```
abort() was called at PC 0x42067cd5 on core 0
```

(continues on next page)

To decode each address, IDF Monitor runs the following command in the background:

riscv32-esp-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS

**Note:** Set environment variable ESP_MONITOR_DECODE to 0 or call idf_monitor.py with specific command line option: idf_monitor.py --disable-address-decoding to disable address decoding.

**Launching GDB with GDBStub**

By default, if esp-idf crashes, the panic handler prints relevant registers and the stack dump (similar to the ones above) over the serial port. Then it resets the board.

Furthermore, the application can be configured to run GDBStub in the background and handle the Ctrl+C event from the monitor.

Optionally, the panic handler can be configured to run GDBStub, the tool which can communicate with GDB project debugger. GDBStub allows to read memory, examine call stack frames and variables, etc. It is not as versatile as JTAG debugging, but this method does not require any special hardware.

To enable GDBStub on panic, open the project configuration menu (idf.py menuconfig) and set CONFIG_ESP_SYSTEM_PANIC to GDBStub on panic or set CONFIG_ESP_SYSTEM_PANIC to GDBStub on runtime.

In this case, if the panic handler or Ctrl+C command is triggered, as soon as IDF Monitor sees that GDBStub has loaded, it automatically pauses serial monitoring and runs GDB with necessary arguments. After GDB exits, the

Espressif Systems 33  Release v5.0-dev-1712-g4a553510b7

Submit Document Feedback
board is reset via the RTS serial line. If this line is not connected, please reset the board manually by pressing its Reset button.

In the background, IDF Monitor runs the following command:

```
riscv32-esp-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex...
```

Output Filtering  IDFMonitor can be invoked as idf.py monitor --print-filter="xyz", where --print-filter is the parameter for output filtering. The default value is an empty string, which means that everything is printed.

Restrictions on what to print can be specified as a series of <tag>:<log_level> items where <tag> is the tag string and <log_level> is a character from the set {N, E, W, I, D, V, *} referring to a level for logging.

For example, PRINT_FILTER="tag1:W" matches and prints only the outputs written with ESP_LOGW("tag1", ...) or at lower verbosity level, i.e. ESP_LOGE("tag1", ...). Not specifying a <log_level> or using * defaults to Verbose level.

Note: Use primary logging to disable at compilation the outputs you do not need through the logging library. Output filtering with IDF monitor is a secondary solution which can be useful for adjusting the filtering options without recompiling the application.

Your app tags must not contain spaces, asterisks *, or colons : to be compatible with the output filtering feature.

If the last line of the output in your app is not followed by a carriage return, the output filtering might get confused, i.e., the monitor starts to print the line and later finds out that the line should not have been written. This is a known issue and can be avoided by always adding a carriage return (especially when no output follows immediately afterwards).

Examples Of Filtering Rules:

- * can be used to match any tags. However, the string PRINT_FILTER="*:I tag1:E" with regards to tag1 prints errors only, because the rule for tag1 has a higher priority over the rule for *.
- The default (empty) rule is equivalent to *:V because matching every tag at the Verbose level or lower means matching everything.
- "*:N" suppresses not only the outputs from logging functions, but also the prints made by printf, etc. To avoid this, use *:E or a higher verbosity level.
- Rules "tag1:V", "tag1:v", "tag1:", "tag1:*", and "tag1" are equivalent.
- Rule "tag1:W tag1:E" is equivalent to "tag1:E" because any consequent occurrence of the same tag name overwrites the previous one.
- Rule "tag1:I tag2:W" only prints tag1 at the Info verbosity level or lower and tag2 at the Warning verbosity level or lower.
- Rule "tag1:I tag2:W tag3:N" is essentially equivalent to the previous one because tag3:N specifies that tag3 should not be printed.
- "tag3:N in the rule "tag1:I tag2:W tag3:N *:V" is more meaningful because without tag3:N the tag3 messages could have been printed; the errors for tag1 and tag2 will be printed at the specified (or lower) verbosity level and everything else will be printed by default.

A More Complex Filtering Example  The following log snippet was acquired without any filtering options:

```
load:0x40078000,len:13564
tag: 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
```

(continues on next page)
The captured output for the filtering options PRINT_FILTER="wifi esp_image:E light_driver:I"

The options `PRINT_FILTER="light_driver:D esp_image:N boot:N cpu_start:N vfs:N wifi:N *:V"` show the following output:

Known Issues with IDF Monitor

**Issues Observed on Windows**

- Arrow keys, as well as some other keys, do not work in GDB due to Windows Console limitations.
- Occasionally, when `idf.py` exits, it might stall for up to 30 seconds before IDF Monitor resumes.
- When `gdb` is run, it might stall for a short time before it begins communicating with the GDBStub.

**Standard Toolchain Setup for Linux and macOS**

**Installation Step by Step**  This is a detailed roadmap to walk you through the installation process.

**Setting up Development Environment**  These are the steps for setting up the ESP-IDF for your ESP32-C3.

- **Step 1. Install Prerequisites**
- **Step 2. Get ESP-IDF**
- **Step 3. Set up the tools**
- **Step 4. Set up the environment variables**
- **Step 5. First Steps on ESP-IDF**

**Step 1. Install Prerequisites**  In order to use ESP-IDF with the ESP32-C3, you need to install some software packages based on your Operating System. This setup guide will help you on getting everything installed on Linux and macOS based systems.

**For Linux Users**  To compile using ESP-IDF you will need to get the following packages. The command to run depends on which distribution of Linux you are using:

- Ubuntu and Debian:
  ```sh
sudo apt-get install git wget flex bison gperf python3 python3-pip python3--setuptools cmake ninja-build ccache libffi-dev libssl-dev dfu-util libusb-1.0-0
  ```

- CentOS 7 & 8:
Chapter 1. Get Started

CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

- Arch:

```
sudo yum -y update && sudo yum install git wget flex bison gperf python3-
--python3-pip python3-setuptools cmake ninja-build ccache dfu-util libusbx
```

Note:

- CMake version 3.5 or newer is required for use with ESP-IDF. Older Linux distributions may require updating, enabling of a “backports” repository, or installing of a “cmake3” package rather than “cmake”.
- If you do not see your Linux distribution in the above list then please check its documentation to find out which command to use for package installation.

For macOS Users  ESP-IDF will use the version of Python installed by default on macOS.

- Install pip:

```
sudo easy_install pip
```

- Install CMake & Ninja build:
  - If you have HomeBrew, you can run:

```
brew install cmake ninja dfu-util
```

  - If you have MacPorts, you can run:

```
sudo port install cmake ninja dfu-util
```

  - Otherwise, consult the CMake and Ninja home pages for macOS installation downloads.
- It is strongly recommended to also install ccache for faster builds. If you have HomeBrew, this can be done via brew install ccache or sudo port install ccache on MacPorts.

Note: If an error like this is shown during any step:

```
```

Then you will need to install the XCode command line tools to continue. You can install these by running xcode-select --install.

Installing Python 3  Based on macOS Catalina 10.15 release notes, use of Python 2.7 is not recommended and Python 2.7 will not be included by default in future versions of macOS. Check what Python you currently have:

```
python --version
```

If the output is like Python 2.7.17, your default interpreter is Python 2.7. If so, also check if Python 3 isn’t already installed on your computer:

```
python3 --version
```

If the above command returns an error, it means Python 3 is not installed.

Below is an overview of the steps to install Python 3.

  - Installing with HomeBrew can be done as follows:
Chapter 1. Get Started

```bash
brew install python3

• If you have MacPorts, you can run:
  sudo port install python38
```

**Step 2. Get ESP-IDF** To build applications for the ESP32-C3, you need the software libraries provided by Espressif in ESP-IDF repository.

To get ESP-IDF, navigate to your installation directory and clone the repository with `git clone`, following instructions below specific to your operating system.

Open Terminal, and run the following commands:

```bash
mkdir -p ~/esp
cd ~/esp
git clone --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into `~/esp/esp-idf`.

Consult *ESP-IDF Versions* for information about which ESP-IDF version to use in a given situation.

**Step 3. Set up the tools** Aside from the ESP-IDF, you also need to install the tools used by ESP-IDF, such as the compiler, debugger, Python packages, etc.

```bash
cd ~/esp/esp-idf
./install.sh esp32c3
```

or with Fish shell

```bash
cd ~/esp/esp-idf
./install.fish esp32c3
```

**Note:** To install tools for multiple targets you can specify those targets at once. For example: `./install.sh esp32,esp32c3,esp32s3`. To install tools for all supported targets, run the script without specifying targets `./install.sh` or use `./install.sh all`.

**Alternative File Downloads** The tools installer downloads a number of files attached to GitHub Releases. If accessing GitHub is slow then it is possible to set an environment variable to prefer Espressif’s download server for GitHub asset downloads.

**Note:** This setting only controls individual tools downloaded from GitHub releases, it doesn’t change the URLs used to access any Git repositories.

To prefer the Espressif download server when installing tools, use the following sequence of commands when running `install.sh`:

```bash
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

**Customizing the tools installation path** The scripts introduced in this step install compilation tools required by ESP-IDF inside the user home directory: `$HOME/.espressif` on Linux. If you wish to install the tools into a different directory, set the environment variable `IDF_TOOLS_PATH` before running the installation scripts. Make sure that your user account has sufficient permissions to read and write this path.
Chapter 1. Get Started

If changing the IDF_TOOLS_PATH, make sure it is set to the same value every time the Install script (install.bat, install.psl or install.sh) and an Export script (export.bat, export.psl or export.sh) are executed.

**Step 4. Set up the environment variables**  
The installed tools are not yet added to the PATH environment variable. To make the tools usable from the command line, some environment variables must be set. ESP-IDF provides another script which does that.

In the terminal where you are going to use ESP-IDF, run:

```
. $HOME/esp/esp-idf/export.sh
```

or for fish (supported only since fish version 3.0.0):

```
. $HOME/esp/esp-idf/export.fish
```

Note the space between the leading dot and the path!

If you plan to use esp-idf frequently, you can create an alias for executing export.sh:

1. Copy and paste the following command to your shell’s profile (.profile, .bashrc, .zprofile, etc.):

   ```
   alias get_idf=' . $HOME/esp/esp-idf/export.sh'
   ```

2. Refresh the configuration by restarting the terminal session or by running `source [path to profile]`, for example, `source ~/.bashrc`.

Now you can run `get_idf` to set up or refresh the esp-idf environment in any terminal session.

Technically, you can add `export.sh` to your shell’s profile directly; however, it is not recommended. Doing so activates IDF virtual environment in every terminal session (including those where IDF is not needed), defeating the purpose of the virtual environment and likely affecting other software.

**Step 5. First Steps on ESP-IDF**  
Now you have all requirements met, the next topic will guide you on how to start your first project.

This guide will help you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32-C3 and build, flash, and monitor the device output.

**Note:**  If you haven’t yet installed the ESP-IDF, please go to Installation and follow the instruction in order to get all the software needed to use this guide.

**Start a Project**  Now you are ready to prepare your application for ESP32-C3. You can start with `get-started/hello_world` project from `examples` directory in IDF.

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

Copy the project `get-started/hello_world` to `~/esp` directory:

**Windows**

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

**Linux/macOS**
Chapter 1. Get Started

```
{cd} ~/esp
(cp -r {IDF_PATH} /examples/get-started/hello_world .
```

**Note:** There is a range of example projects in the examples directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place, without copying them first.

---

**Connect Your Device** Now connect your ESP32-C3 board to the computer and check under what serial port the board is visible.

Serial ports have the following patterns in their names:

- **Windows:** names like COM1
- **Linux:** starting with /dev/tty
- **macOS:** starting with /dev/cu.

If you are not sure how to check the serial port name, please refer to *Establish Serial Connection with ESP32-C3* for full details.

**Note:** Keep the port name handy as you will need it in the next steps.

---

**Configure your Project** Navigate to your hello_world directory, set ESP32-C3 chip as the target and run the project configuration utility menuconfig.

**Windows**

```
{cd} %userprofile%\esp\hello_world
{idf.py} set-target esp32c3
{idf.py} menuconfig
```

**Linux/macOS**

```
{cd} ~/esp/hello_world
{idf.py} set-target esp32c3
{idf.py} menuconfig
```

Setting the target with `idf.py set-target esp32c3` should be done once after opening a new project. If the project contains some existing builds and configurations, they will be cleared and initialized. The target may be saved in the environment variable to skip this step at all. See *Selecting the Target* for additional information.

If the previous steps have been done correctly, the following menu appears:

You are using this menu to set up project specific variables, e.g. Wi-Fi network name and password, the processor speed, etc. Setting up the project with menuconfig may be skipped for “hello_world”. This example will run with default configuration.

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

---

**Build the Project** Build the project by running:

```
idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...
... (more lines of build system output)
[527/527] Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:

```
./components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash

--flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
--bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
--partition-table.bin
```

or run 'idf.py -p PORT flash'

If there are no errors, the build will finish by generating the firmware binary .bin files.

**Flash onto the Device**  Flash the binaries that you just built (bootloader.bin, partition-table.bin and hello_world.bin) onto your ESP32-C3 board by running:

```
idf.py -p PORT [-b BAUD] flash
```

Replace PORT with your ESP32-C3 board’s serial port name.

You can also change the flasher baud rate by replacing BAUD with the baud rate you need. The default baud rate is 460800.

For more information on idf.py arguments, see *idf.py*.

**Note:** The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.
Encountered Issues While Flashing?  If you run the given command and see errors such as “Failed to connect”, there might be several reasons for this. One of the reasons might be issues encountered by `esptool.py`, the utility that is called by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple solution to try is manual reset described below, and if it does not help you can find more details about possible issues in Troubleshooting.

`esptool.py` resets ESP32-C3 automatically by asserting DTR and RTS control lines of the USB to serial converter chip, i.e., FTDI or CP210x (for more information, see Establish Serial Connection with ESP32-C3). The DTR and RTS control lines are in turn connected to GPIO9 and CHIP_PU (EN) pins of ESP32-C3, thus changes in the voltage levels of DTR and RTS will boot ESP32-C3 into Firmware Download mode. As an example, check the schematic for the ESP32 DevKitC development board.

In general, you should have no problems with the official esp-idf development boards. However, `esptool.py` is not able to reset your hardware automatically in the following cases:

- Your hardware does not have the DTR and RTS lines connected to GPIO9 and CHIP_PU
- The DTR and RTS lines are configured differently
- There are no such serial control lines at all

Depending on the kind of hardware you have, it may also be possible to manually put your ESP32-C3 board into Firmware Download mode (reset).

- For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an ESP-IDF development board, hold down the Boot button (GPIO9) and press the EN button (CHIP_PU).
- For other types of hardware, try pulling GPIO9 down.

Normal Operation  When flashing, you will see the output log similar to the following:

```
... esptool.py --chip esp32c3 -p /dev/ttyUSB0 -b 460800 --before=default_reset --
--after=hard_reset write_flash --flash_mode dio --flash_freq 80m --flash_size 2MB --
--0x8000 partition_table/partition-table.bin 0x0 bootloader/bootloader.bin 0x10000 --
--hello_world.bin

If there are no issues by the end of the flash process, the board will reboot and start up the “hello_world” application. If you’d like to use the Eclipse or VS Code IDE instead of running idf.py, check out the Eclipse guide, VS Code guide.

**Monitor the Output**  To check if “hello_world” is indeed running, type idf.py -p PORT monitor (Do not forget to replace PORT with your serial port name).

This command launches the **IDF Monitor** application:

```
$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_→world/build/hello_world.elf"
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---

Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut Ctrl+].

**Note:** You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:

- **IDF Monitor** for handy shortcuts and more details on using IDF monitor.
- **idf.py** for a full reference of idf.py commands and options.

That’s all that you need to get started with ESP32-C3!

Now you are ready to try some other examples, or go straight to developing your own applications.

**Important:** Some of examples do not support ESP32-C3 because required hardware is not included in ESP32-C3 so it cannot be supported.
Chapter 1. Get Started

If building an example, please check the README file for the Supported Targets table. If this is present including ESP32-C3 target, or the table does not exist at all, the example will work on ESP32-C3.

Additional Tips

Permission issues /dev/ttyUSB0  With some Linux distributions, you may get the Failed to open port /dev/ttyUSB0 error message when flashing the ESP32-C3. This can be solved by adding the current user to the dialout group.

Python compatibility  ESP-IDF supports Python 3.6 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from sources or the use of a Python version management system such as pyenv.

Tip: Updating ESP-IDF  It is recommended to update ESP-IDF from time to time, as newer versions fix bugs and/or provide new features. Please note that each ESP-IDF major and minor release version has an associated support period, and when one release branch is approaching end of life (EOL), all users are encouraged to upgrade their projects to more recent ESP-IDF releases, to find out more about support periods, see ESP-IDF Versions.

The simplest way to do the update is to delete the existing esp-idf folder and clone it again, as if performing the initial installation described in Step 2. Get ESP-IDF.

Another solution is to update only what has changed. The update procedure depends on the version of ESP-IDF you are using.

After updating ESP-IDF, execute the Install script again, in case the new ESP-IDF version requires different versions of tools. See instructions at Step 3. Set up the tools.

Once the new tools are installed, update the environment using the Export script. See instructions at Step 4. Set up the environment variables.

1.4 Build Your First Project

If you already have the ESP-IDF installed and not using IDE, you can build your first project from the command line following Step 5. First Steps on ESP-IDF.
Chapter 2

API Reference

2.1 API Conventions

This document describes conventions and assumptions common to ESP-IDF Application Programming Interfaces (APIs).

ESP-IDF provides several kinds of programming interfaces:

- C functions, structures, enums, type definitions and preprocessor macros declared in public header files of ESP-IDF components. Various pages in the API Reference section of the programming guide contain descriptions of these functions, structures and types.
- Build system functions, predefined variables and options. These are documented in the *build system guide*.
- *Kconfig* options can be used in code and in the build system (CMakeLists.txt) files.
- *Host tools* and their command line parameters are also part of ESP-IDF interface.

ESP-IDF consists of components written specifically for ESP-IDF as well as third-party libraries. In some cases, an ESP-IDF-specific wrapper is added to the third-party library, providing an interface that is either simpler or better integrated with the rest of ESP-IDF facilities. In other cases, the original API of the third-party library is presented to the application developers.

Following sections explain some of the aspects of ESP-IDF APIs and their usage.

2.1.1 Error handling

Most ESP-IDF APIs return error codes defined with `esp_err_t` type. See *Error Handling* section for more information about error handling approaches. *Error Code Reference* contains the list of error codes returned by ESP-IDF components.

2.1.2 Configuration structures

---

**Important:** Correct initialization of configuration structures is an important part in making the application compatible with future versions of ESP-IDF.

Most initialization or configuration functions in ESP-IDF take as an argument a pointer to a configuration structure. For example:

```
const esp_timer_create_args_t my_timer_args = {
    .callback = my_timer_callback,
    .arg = callback_arg,
    .name = "my_timer"
```

(continues on next page)
Initialization functions never store the pointer to the configuration structure, so it is safe to allocate the structure on the stack.

The application must initialize all fields of the structure. The following is incorrect:

```c
esp_timer_create_args_t my_timer_args;
my_timer_args.callback = &my_timer_callback;
/* Incorrect! Fields .arg and .name are not initialized */
esp_timer_create(&my_timer_args, &my_timer);
```

Most ESP-IDF examples use C99 designated initializers for structure initialization, since they provide a concise way of setting a subset of fields, and zero-initializing the remaining fields:

```c
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    /* Correct, fields .arg and .name are zero-initialized */
};
```

C++ language doesn’t support the designated initializers syntax until C++20, however GCC compiler partially supports it as an extension. When using ESP-IDF APIs in C++ code, you may consider using the following pattern:

```c
esp_timer_create_args_t my_timer_args = {};
/* All the fields are zero-initialized */
my_timer_args.callback = &my_timer_callback;
```

**Default initializers**

For some configuration structures, ESP-IDF provides macros for setting default values of fields:

```c
httpd_config_t config = HTTPD_DEFAULT_CONFIG();
/* HTTPD_DEFAULT_CONFIG expands to a designated initializer.
   Now all fields are set to the default values.
   Any field can still be modified: */
config.server_port = 8081;
httpd_handle_t server;
esp_err_t err = httpd_start(&server, &config);
```

It is recommended to use default initializer macros whenever they are provided for a particular configuration structure.

### 2.1.3 Private APIs

Certain header files in ESP-IDF contain APIs intended to be used only in ESP-IDF source code, and not by the applications. Such header files often contain `private` or `esp_private` in their name or path. Certain components, such as `hal` only contain private APIs.

Private APIs may be removed or changed in an incompatible way between minor or patch releases.

### 2.1.4 Components in example projects

ESP-IDF examples contain a variety of projects demonstrating usage of ESP-IDF APIs. In order to reduce code duplication in the examples, a few common helpers are defined inside components that are used by multiple examples. This includes components located in `common_components` directory, as well as some of the components located in the examples themselves. These components are not considered to be part of the ESP-IDF API.
It is not recommended to reference these components directly in custom projects (via EXTRA_COMPONENT_DIRS build system variable), as they may change significantly between ESP-IDF versions. When starting a new project based on an ESP-IDF example, copy both the project and the common components it depends on out of ESP-IDF, and treat the common components as part of the project. Note that the common components are written with examples in mind, and might not include all the error handling required for production applications. Take time to read the code and understand if it applicable to your use case.

### 2.1.5 API Stability

ESP-IDF uses **Semantic Versioning** as explained in the versions page.

Minor and bugfix releases of ESP-IDF guarantee compatibility with previous releases. The sections below explain different aspects and limitations to compatibility.

#### Source level compatibility

ESP-IDF guarantees source level compatibility of C functions, structures, enums, type definitions and preprocessor macros declared in public header files of ESP-IDF components. Source level compatibility implies that the application can be recompiled with the newer version of ESP-IDF without changes.

The following changes are allowed between minor versions and do not break source level compatibility:

- Deprecating functions (using the `deprecated` attribute) and header files (using a preprocessor `#warning`). Deprecations are listed in ESP-IDF release notes. It is recommended to update the source code to use the newer functions or files that replace the deprecated ones, however this is not mandatory. Deprecated functions and files can be removed in major versions of ESP-IDF.
- Renaming components, moving source and header files between components — provided that the build system ensures that correct files are still found.
- Renaming Kconfig options. Kconfig system renaming mechanism ensures that the original Kconfig option names can still be used by the application in `sdkconfig` file, CMake files and source code.

#### Lack of binary compatibility

ESP-IDF does not guarantee binary compatibility between releases. This means that if a precompiled library is built with one ESP-IDF version, it is not guaranteed to work the same way with the next minor or bugfix release. The following are the possible changes that keep source level compatibility but not binary compatibility:

- Changing numerical values for C enum members.
- Adding new structure members or changing the order of members. See Configuration structures for tips that help ensure compatibility.
- Replacing an `extern` function with a `static inline` one with the same signature, or vice versa.
- Replacing a function-like macro with a compatible C function.

#### Other exceptions from compatibility

While we try to make upgrading to a new ESP-IDF version easy, there are parts of ESP-IDF that may change between minor versions in an incompatible way. We appreciate issue reports about any unintended breaking changes that don’t fall into the categories below.

- **Private APIs.**
- **Components in example projects.**
- Features clearly marked as “beta”, “preview”, or “experimental”.
- Changes made to mitigate security issues or to replace insecure default behaviors with a secure ones.
- Features which were never functional. For example, if it was never possible to use a certain function or an enumeration value, it may get renamed (as part of fixing it) or removed. This includes software features which depend on non-functional chip hardware features.
• Unexpected or undefined behavior (for example, due to missing validation of argument ranges) that is not documented explicitly may be fixed/changed.
• Location of Kconfig options in menuconfig.
• Location and names of example projects.

2.2 Application Protocols

2.2.1 ASIO port

Overview

Asio is a cross-platform C++ library, see https://think-async.com. It provides a consistent asynchronous model using a modern C++ approach.

ASIO documentation Please refer to the original asio documentation at https://think-async.com/Asio/Documentation. Asio also comes with a number of examples which could be found under Documentation/Examples on that website.

Supported features ESP platform port currently supports only network asynchronous socket operations; does not support serial port. SSL/TLS support is disabled by default and could be enabled in component configuration menu by choosing TLS library from
• mbedTLS with OpenSSL translation layer (default option)
• wolfSSL

SSL support is very basic at this stage and it does include following features:
• Verification callbacks
• DH property files
• Certificates/private keys file APIs

Internal asio settings for ESP include
• EXCEPTIONS are enabled in ASIO if enabled in menuconfig
• TYPEID is enabled in ASIO if enabled in menuconfig

Application Example

ESP examples are based on standard asio protocols/asio:
• protocols/asio/udp_echo_server
• protocols/asio/tcp_echo_server
• protocols/asio/asio_chat
• protocols/asio/ssl_client_server

Please refer to the specific example README.md for details

2.2.2 ESP-Modbus

Overview

The Modbus serial communication protocol is de facto standard protocol widely used to connect industrial electronic devices. Modbus allows communication among many devices connected to the same network, for example, a system that measures temperature and humidity and communicates the results to a computer. The Modbus protocol uses several types of data: Holding Registers, Input Registers, Coils (single bit output), Discrete Inputs. Versions of the Modbus protocol exist for serial port and for Ethernet and other protocols that support the Internet protocol suite. There are many variants of Modbus protocols, some of them are:
• **Modbus RTU** — This is used in serial communication and makes use of a compact, binary representation of the data for protocol communication. The RTU format follows the commands/data with a cyclic redundancy check checksum as an error check mechanism to ensure the reliability of data. Modbus RTU is the most common implementation available for Modbus. A Modbus RTU message must be transmitted continuously without inter-character hesitations. Modbus messages are framed (separated) by idle (silent) periods. The RS-485 interface communication is usually used for this type.

• **Modbus ASCII** — This is used in serial communication and makes use of ASCII characters for protocol communication. The ASCII format uses a longitudinal redundancy check checksum. Modbus ASCII messages are framed by leading colon (":" ) and trailing newline (CR/LF).

• **Modbus TCP/IP or Modbus TCP** — This is a Modbus variant used for communications over TCP/IP networks, connecting over port 502. It does not require a checksum calculation, as lower layers already provide checksum protection.

The following document (and included code snippets) requires some familiarity with the Modbus protocol. Refer to the Modbus Organization’s with protocol specifications for specifics.

**Messaging Model And Data Mapping**

Modbus is an application protocol that defines rules for messaging structure and data organization that are independent of the data transmission medium. Traditional serial Modbus is a register-based protocol that defines message transactions that occur between master(s) and slave devices (multiple masters are allowed on using Modbus TCP/IP). The slave devices listen for communication from the master and simply respond as instructed. The master(s) always controls communication and may communicate directly to one slave, or all connected slaves, but the slaves cannot communicate directly with each other.

**Note:** It is assumed that the number of slaves and their register maps are known by the Modbus master before the start of stack.

The register map of each slave device is usually part of its device manual. A Slave device usually permits configuration of its short slave address and communication options that are used within the device’s network segment.

The Modbus protocol allows devices to map data to four types of registers (Holding, Input, Discrete, Coil). The figure below illustrates an example mapping of a device’s data to the four types of registers.

The following sections give an overview of how to use the ESP_Modbus component found under components/freemodbus. The sections cover initialization of a Modbus port, and the setup a master or slave device accordingly:

- **Modbus Port Initialization**
- **Modbus Slave API Overview**
- **Modbus Master API Overview**

**Modbus Port Initialization** The ESP_Modbus supports Modbus SERIAL and TCP ports and a port must be initialized before calling any other Modbus API. The functions below are used to create and then initialize Modbus controller interface (either master or slave) over a particular transmission medium (either Serial or TCP/IP):

- `mbc_slave_init()`
- `mbc_master_init()`
- `mbc_slave_init_tcp()`
- `mbc_master_init_tcp()`

The API call uses the first parameter to recognize the type of port being initialized. Supported enumeration for different ports: `MB_PORT_SERIAL_MASTER, MB_PORT_SERIAL_SLAVE` accordingly. The parameters `MB_PORT_TCP_MASTER, MB_PORT_TCP_SLAVE` are reserved for internal usage.
Chapter 2. API Reference

UID-1 (UNIT ID = slave address)  N - number of slaves in the network segment usually <= 32

Modbus Slave 1

Modbus master device initiates transactions to read/write slave registers

Modbus Slave 2

Modbus Master

... Network (RS485 for Modbus RTU and ASCII, Ethernet or WiFi connection for Modbus TCP)

UID-N

Modbus Slave N

Slave devices listen for communication from the master and simply respond as instructed

    ESP_LOGE(TAG, "mb controller initialization fail.");
}

This example code to initialize slave port:

```c
void* slave_handler = NULL; // Pointer to allocate interface structure
// Initialization of Modbus slave for TCP
esp_err_t err = mbc_slave_init_tcp(&slave_handler);
if (slave_handler == NULL || err != ESP_OK) {
    // Error handling is performed here
    ESP_LOGE(TAG, "mb controller initialization fail.");
}
```

Modbus Master API Overview

The following overview describes how to setup Modbus master communication. The overview reflects a typical programming workflow and is broken down into the sections provided below:

1. **Modbus Port Initialization** - Initialization of Modbus controller interface for the selected port.
2. **Configuring Master Data Access** - Configure data descriptors to access slave parameters.
3. **Master Communication Options** - Allows to setup communication options for selected port.
4. **Master Communication** - Start stack and sending / receiving data.
5. **Modbus Master Teardown** - Destroy Modbus controller and its resources.

**Configuring Master Data Access**  The architectural approach of ESP_Modbus includes one level above standard Modbus IO driver. The additional layer is called Modbus controller and its goal is to add an abstraction such as CID - characteristic identifier. The CID is linked to a corresponding Modbus registers through the table called Data Dictionary and represents device physical parameter (such as temperature, humidity, etc.) in specific Modbus slave device. This approach allows the upper layer (e.g., MESH or MQTT) to be isolated from Modbus specifics thus simplify Modbus integration with other protocols/networks.

The Data Dictionary is the list in the Modbus master which shall be defined by user to link each CID to its corresponding Modbus registers representation using Register Mapping table of the Modbus slave being used. Each element in this data dictionary is of type `mb_parameter_descriptor_t` and represents the description of one physical characteristic:
### Table 1: Table 1 Modbus master Data Dictionary description

// Enumeration of modbus slave addresses accessed by master device
enum {
    MBDEVICE_ADDR1 = 1,
    MBDEVICE_ADDR2,
    MB_SLAVE_COUNT
} (continues on next page)
// Enumeration of all supported CIDs for device
enum
{
    CID_SER_NUM1 = 0,
    CID_SW_VER1,
    CID_TEMP_DATA_1,
    CID_SER_NUM2,
    CID_SW_VER2,
    CID_TEMP_DATA_2
};

// Example Data Dictionary for Modbus parameters in 2 slaves in the segment
mb_parameter_descriptor_t device_parameters[] = {
    // CID, Name, Units, Modbus addr, register type, Modbus Reg Start Addr, Modbus
    // Reg read length,
    // Instance offset (NA), Instance type, Instance length (bytes), Options (NA),
    // Permissions
    { CID_SER_NUM1, STR("Serial_number_1"), STR("--"), MB_DEVICE_ADDR1, MB_PARAM_→INPUT, 0, 2, 0, PARAM_TYPE_U32, 4, OPTS( 0, 0, 0 ), PAR_PERMS_READ_WRITE_→TRIGGER },
    { CID_SW_VER1, STR("Software_version_1"), STR("--"), MB_DEVICE_ADDR1, MB_PARAM_→INPUT, 2, 1, 0, PARAM_TYPE_U16, 2, OPTS( 0, 0, 0 ), PAR_PERMS_READ_WRITE_→TRIGGER },
    { CID_TEMP_DATA_1, STR("Temperature_1"), STR("C"), MB_DEVICE_ADDR1, MB_PARAM_→HOLDING, 0, 2, 0, PARAM_TYPE_FLOAT, 4, OPTS( 16, 30, 1 ), PAR_PERMS_READ_→WRITE_TRIGGER },
    { CID_SER_NUM2, STR("Serial_number_2"), STR("--"), MB_DEVICE_ADDR2, MB_PARAM_→INPUT, 0, 2, 0, PARAM_TYPE_U32, 4, OPTS( 0, 0, 0 ), PAR_PERMS_READ_WRITE_→TRIGGER },
    { CID_SW_VER2, STR("Software_version_2"), STR("--"), MB_DEVICE_ADDR2, MB_PARAM_→INPUT, 2, 1, 0, PARAM_TYPE_U16, 2, OPTS( 0, 0, 0 ), PAR_PERMS_READ_WRITE_→TRIGGER },
    { CID_TEMP_DATA_2, STR("Temperature_2"), STR("C"), MB_DEVICE_ADDR2, MB_PARAM_→HOLDING, 0, 2, 0, PARAM_TYPE_FLOAT, 4, OPTS( 20, 30, 1 ), PAR_PERMS_READ_→WRITE_TRIGGER },
};

// Calculate number of parameters in the table
uint16_t num_device_parameters = (sizeof(device_parameters) / sizeof(device_→parameters[0]));

During initialization of the Modbus stack, a pointer to the Data Dictionary (called descriptor) must be provided as
the parameter of the function below.

mbc_master_set_descriptor(): Initialization of master descriptor.

ESP_ERROR_CHECK(mbc_master_set_descriptor(&device_parameters[0], num_device_→parameters));

The Data Dictionary can be initialized from SD card, MQTT or other source before start of stack. Once the initial-
ization and setup is done, the Modbus controller allows the reading of complex parameters from any slave included
in descriptor table using its CID.

Master Communication Options
Calling the setup function allows for specific communication options to be defined for port.
mbc_master_setup()

The communication structure provided as a parameter is different for serial and TCP communication mode.

Example setup for serial port:

```c
mb_communication_info_t comm_info = {
    .port = MB_PORT_NUM, // Serial port number
    .mode = MB_MODE_RTU, // Modbus mode of communication (MB_MODE_RTU or MB_MODE_ASCII)
    .baudrate = 9600, // Modbus communication baud rate
    .parity = MB_PARITY_NONE // parity option for serial port
};
ESP_ERROR_CHECK(mbc_master_setup((void*)&comm_info));
```

Modbus master TCP port requires additional definition of IP address table where number of addresses should be equal to number of unique slave addresses in master Modbus Data Dictionary:

```
#define MB_SLAVE_COUNT 2 // Number of slaves in the segment being accessed (as defined in Data Dictionary)
char* slave_ip_address_table[MB_SLAVE_COUNT] = {
    "192.168.1.2", // Address corresponds to UID1 and set to predefined value by user
    "192.168.1.3", // corresponds to UID2 in the segment
    NULL // end of table
};
mb_communication_info_t comm_info = {
    .ip_port = MB_TCP_PORT, // Modbus TCP port number (default = 502)
    .ip_addr_type = MB_IPV4, // version of IP protocol
    .ip_mode = MB_MODE_TCP, // Port communication mode
    .ip_addr = (void*)slave_ip_address_table, // assign table of IP addresses
    .ip_netif_ptr = esp_netif_ptr // esp_netif_ptr pointer to the corresponding network interface
};
ESP_ERROR_CHECK(mbc_master_setup((void*)&comm_info));
```

**Note:** Refer to `esp_netif component` for more information about network interface initialization.

The slave IP addresses in the table can be assigned automatically using mDNS service as described in the example. Refer to `protocols/modbus/tcp/mb_tcp_master` for more information.

**Note:** RS485 communication requires call to UART specific APIs to setup communication mode and pins. Refer to `Running UART Communication` section of UART documentation.

**Master Communication** The starting of the Modbus controller is the final step in enabling communication. This is performed using function below:

```c
mbc_master_start()
```

```c
esp_err_t err = mbc_master_start();
if (err != ESP_OK) {
    // Error handling
} (continues on next page)
```
The list of functions below are used by the Modbus master stack from a user’s application:

**mbc_master_send_request()**: This function executes a blocking Modbus request. The master sends a data request (as defined in parameter request structure `mb_param_request_t`) and then blocks until a response from the corresponding slave and returns the status of command execution. This function provides a standard way for read/write access to Modbus devices in the network.

**mbc_master_get_cid_info()**: The function gets information about each characteristic supported in the data dictionary and returns the characteristic’s description in the form of the `mb_parameter_descriptor_t` structure. Each characteristic is accessed using its CID.

**mbc_master_get_parameter()**: The function reads the data of a characteristic defined in the parameters of a Modbus slave device. The additional data for request is taken from parameter description table.

Example:

```c
const mb_parameter_descriptor_t* param_descriptor = NULL;
uint8_t temp_data[4] = {0}; // temporary buffer to hold maximum CID size
uint8_t type = 0;

// Get the information for characteristic cid from data dictionary
esp_err_t err = mbc_master_get_cid_info(cid, &param_descriptor);
if ((err != ESP_ERR_NOT_FOUND) && (param_descriptor != NULL)) {
    err = mbc_master_get_parameter(param_descriptor->cid, (char*)param_descriptor->param_key, (uint8_t*)temp_data, &type);
    if (err == ESP_OK) {
        ESP_LOGI(TAG, "Characteristic #%d %s (%s) value = (0x%08x) read successful.",
                param_descriptor->cid,
                (char*)param_descriptor->param_key,
                (char*)param_descriptor->param_units,
                (uint32_t*)temp_data);
    } else {
        ESP_LOGE(TAG, "Characteristic #%d (%s) read fail, err = 0x%x (%s).",
                param_descriptor->cid,
                (char*)param_descriptor->param_key,
                (int)err,
                (char*)esp_err_to_name(err));
    }
} else {
    ESP_LOGE(TAG, "Could not get information for characteristic %d.", cid);
}
```

**mbc_master_set_parameter()**

The function writes characteristics’ value defined as a name and cid parameter in the corresponding slave device. The additional data for parameter request is taken from master parameter description table.

```c
uint8_t type = 0; // Type of parameter
uint8_t temp_data[4] = {0}; // temporary buffer

esp_err_t err = mbc_master_set_parameter(CID_TEMP_DATA_2, "Temperature_2", (uint8_t*)temp_data, &type);
if (err == ESP_OK) {
    ESP_LOGI(TAG, "Set parameter data successfully.");
} else {
    ESP_LOGE(TAG, "Set data fail, err = 0x%x (%s).", (int)err, (char*)esp_err_to_name(err));
}
```
**Modbus Master Teardown**  This function stops Modbus communication stack and destroys controller interface and free all used active objects.

```c
mbc_master_destroy();
```

**Modbus Slave API Overview**

The sections below represent typical programming workflow for the slave API which should be called in following order:

1. **Modbus Port Initialization** - Initialization of Modbus controller interface for the selected port.
2. **Configuring Slave Data Access** - Configure data descriptors to access slave parameters.
3. **Slave Communication Options** - Allows to setup communication options for selected port.
4. **Slave Communication** - Start stack and sending / receiving data. Filter events when master accesses the register areas.
5. **Modbus Slave Teardown** - Destroy Modbus controller and its resources.

**Configuring Slave Data Access**  The following functions must be called when the Modbus controller slave port is already initialized. Refer to **Modbus Port Initialization**.

The slave stack requires the user to define structures (memory storage areas) that store the Modbus parameters accessed by stack. These structures should be prepared by the user and be assigned to the Modbus controller interface using `mbc_slave_set_descriptor()` API call before the start of communication. The slave task can call the `mbc_slave_check_event()` function which will block until the Modbus master access the slave. The slave task can then get information about the data being accessed.

**Note:** One slave can define several area descriptors per each type of Modbus register area with different start_offset.

Register area is defined by using the `mb_register_area_descriptor_t` structure.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start</td>
<td>Zero-based register relative offset for defined register area. Example: register address = 40002 (4x register area - Function 3 - holding register), start_offset = 2</td>
</tr>
<tr>
<td>type</td>
<td>Type of the Modbus register area. Refer to <code>mb_param_type_t</code> for more information.</td>
</tr>
<tr>
<td>address</td>
<td>A pointer to the memory area which is used to store the register data for this area descriptor.</td>
</tr>
<tr>
<td>size</td>
<td>The size of the memory area in bytes which is used to store register data.</td>
</tr>
</tbody>
</table>

`mbc_slave_set_descriptor()`

The function initializes Modbus communication descriptors for each type of Modbus register area (Holding Registers, Input Registers, Coils (single bit output), Discrete Inputs). Once areas are initialized and the `mbc_slave_start()` API is called the Modbus stack can access the data in user data structures by request from master.

```c
# define MB_REG_INPUT_START_AREA0 (0)
# define MB_REG_HOLDING_START_AREA0 (0)
# define MB_REG_HOLD_CNT (100)
# define MB_REG_INPUT_CNT (100)

mb_register_area_descriptor_t reg_area; // Modbus register area descriptor...

unit16_t holding_reg_area[MB_REG_HOLD_CNT] = {0}; // storage area for holding...
unit16_t input_reg_area[MB_REG_INPUT_CNT] = {0}; // storage area for input...
```

(continues on next page)
At least one area descriptor per each Modbus register type must be set in order to provide register access to its area. If the master tries to access an undefined area, the stack will generate a Modbus exception.

Direct access to register area from user application must be protected by critical section:

```c
portENTER_CRITICAL(&param_lock);
holding_reg_area[2] += 10;
portEXIT_CRITICAL(&param_lock);
```

**Slave Communication Options** The function initializes the Modbus controller interface and its active context (tasks, RTOS objects and other resources).

```c
mbc_slave_setup()
```

The function is used to setup communication parameters of the Modbus stack.

Example initialization of Modbus TCP communication:

```c
esp_netif_init();
...
mb_communication_info_t comm_info = {
  .ip_port = MB_TCP_PORT, // Modbus TCP port number (default = 502)
  .ip_addr_type = MB_IPV4, // version of IP protocol
  .ip_mode = MB_MODE_TCP, // Port communication mode
  .ip_addr = NULL, // This field keeps the client IP...
  .address_to_bind, NULL - bind to any client
  .ip_netif_ptr = esp_netif_ptr // esp_netif_ptr = pointer to the...
  .corresponding_network_interface
};
// Setup communication parameters and start stack
ESP_ERROR_CHECK(mbc_slave_setup((void*)&comm_info));
```

Example initialization of Modbus serial communication:

```c
#define MB_SLAVE_DEV_SPEED 9600
#define MB_SLAVE_ADDR 1
#define MB_SLAVE_PORT_NUM 2
...
// Setup communication parameters and start stack
mb_communication_info_t comm_info = {
```
### Slave Communication

The function below is used to start Modbus controller interface and allows communication.

```c
mbc_slave_start()
ESP_ERROR_CHECK(mbc_slave_start());
```

```c
mbc_slave_check_event()
```

The blocking call to function waits for a event specified (represented as an event mask parameter). Once the master accesses the parameter and the event mask matches the parameter type, the application task will be unblocked and function will return the corresponding event `mb_event_group_t` which describes the type of register access being done.

```c
mbc_slave_get_param_info()
```

The function gets information about accessed parameters from the Modbus controller event queue. The KConfig `CONFIG_FMB_CONTROLLER_NOTIFY_QUEUE_SIZE` key can be used to configure the notification queue size. The timeout parameter allows a timeout to be specified when waiting for a notification. The `mb_param_info_t` structure contains information about accessed parameter.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>time_stamp</td>
<td>the time stamp of the event when defined parameter is accessed</td>
</tr>
<tr>
<td>mb_offset</td>
<td>start Modbus register accessed by master</td>
</tr>
<tr>
<td>type</td>
<td>type of the Modbus register area being accessed (See the <code>mb_event_group_t</code> for more information)</td>
</tr>
<tr>
<td>address</td>
<td>memory address that corresponds to accessed register in defined area descriptor</td>
</tr>
<tr>
<td>size</td>
<td>number of registers being accessed by master</td>
</tr>
</tbody>
</table>

**Example to get event when holding or input registers accessed in the slave:**

```c
#define MB_READ_MASK    (MB_EVENT_INPUT_REG_RD | MB_EVENT_HOLDING_REG_RD)
#define MB_WRITE_MASK    (MB_EVENT_HOLDING_REG_WR)
#define MB_READ_WRITE_MASK (MB_READ_MASK | MB_WRITE_MASK)
#define MB_PAR_INFO_GET_TOUT (10 / portTICK_PERIOD_MS)

// The function blocks while waiting for register access
mb_event_group_t event = mbc_slave_check_event(MB_READ_WRITE_MASK);

// Get information about data accessed from master
ESP_ERROR_CHECK(mbc_slave_get_param_info(&reg_info, MB_PAR_INFO_GET_TOUT));
const char* rw_str = (event & MB_READ_MASK) ? "READ" : "WRITE";

// Filter events and process them accordingly
if (event & (MB_EVENT_HOLDING_REG_WR | MB_EVENT_HOLDING_REG_RD)) {
    ESP_LOGI(TAG, "HOLDING %s (%u us), ADDR:%u, TYPE:%u, INST_ADDR:0x%.4x, SIZE:%u");
    rw_str,
    // ...
}
```

(continues on next page)
(continued from previous page)

```c
(uint32_t)reg_info.time_stamp,
(uint32_t)reg_info.mb_offset,
(uint32_t)reg_info.type,
(uint32_t)reg_info.address,
(uint32_t)reg_info.size);
```

```c
} else if (event & (MB_EVENT_INPUT_REG_RD)) {
    ESP_LOGI(TAG, "INPUT %s (%u us), ADDR:%u, TYPE:%u, INST_ADDR:0x%.4x, SIZE:%u",
            rw_str,
            (uint32_t)reg_info.time_stamp,
            (uint32_t)reg_info.mb_offset,
            (uint32_t)reg_info.type,
            (uint32_t)reg_info.address,
            (uint32_t)reg_info.size);
}
```

**Modbus Slave Teardown**  
This function stops the Modbus communication stack, destroys the controller interface, and frees all used active objects allocated for the slave.

```c
mbc_slave_destroy()
ESP_ERROR_CHECK(mbc_slave_destroy());
```

**Possible Communication Issues And Solutions**

If the examples do not work as expected and slave and master boards are not able to communicate correctly, it is possible to find the reason for errors. The most important errors are described in master example output and formatted as below:

```c
E (1692332) MB_CONTROLLER_MASTER: mbc_master_get_parameter(111): SERIAL master get...
    parameter failure error=(0x107) (ESP_ERR_TIMEOUT).
```
Table 5: Table 5 Modbus error codes and troubleshooting

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
<th>Possible solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x10</td>
<td>ESP_ERR_NOT_SUPPORTED - Invalid register request - slave returned an exception because the requested register is not supported.</td>
<td>Refer to slave register map. Check the master data dictionary for correctness.</td>
</tr>
<tr>
<td>0x10</td>
<td>ESP_ERR_TIMEOUT - Slave response timeout - Modbus slave did not send response during configured slave response timeout.</td>
<td>Measure and increase the maximum slave response timeout idf.py menu-config, option CONFIG_FMB_MASTER_TIMEOUT_MS_RESPOND. Check physical connection or network configuration and make sure that the slave response can reach the master side. If the application has some high performance tasks with higher priority than CONFIG_FMB_PORT_TASK_Prio it is recommended to place Modbus tasks on the other core using an option CONFIG_FMB_PORT_TASK_AFFINITY. Configure the Modbus task’s priority CONFIG_FMB_PORT_TASK_Prio to ensure that the task gets sufficient processing time to handle Modbus stack events.</td>
</tr>
<tr>
<td>0x10</td>
<td>ESP_ERR_INVALID_RESPONSE - Received unsupported response from slave or frame check failure. Master can not execute command handler because the command is either not supported or is incorrect.</td>
<td>Check the physical connection then refer to register map of your slave to configure the master data dictionary properly.</td>
</tr>
<tr>
<td>0x10</td>
<td>ESP_ERR_INVALID_STATE - Critical failure or FSM sequence failure or master FSM is busy processing previous request.</td>
<td>Make sure your physical connection is working properly. Increase task stack size and check Modbus initialization sequence.</td>
</tr>
</tbody>
</table>

Application Example

The examples below use the FreeModbus library port for serial TCP slave and master implementations accordingly. The selection of stack is performed through KConfig menu option “Enable Modbus stack support …” for appropriate communication mode and related configuration keys.

- protocols/modbus/serial/mb_slave
- protocols/modbus/serial/mb_master
- protocols/modbus/tcp/mb_tcp_slave
- protocols/modbus/tcp/mb_tcp_master

Please refer to the specific example README.md for details.

Enumerations

```c
enum mb_port_type_t
    Types of actual Modbus implementation.

    Values:

    MB_PORT_SERIAL_MASTER = 0x00
        Modbus port type serial master.

    MB_PORT_SERIAL_SLAVE
        Modbus port type serial slave.

    MB_PORT_TCP_MASTER
        Modbus port type TCP master.

    MB_PORT_TCP_SLAVE
        Modbus port type TCP slave.

    MB_PORT_COUNT
        Modbus port count.

    MB_PORT_INACTIVE = 0xFF
```

```c
enum mb_event_group_t
    Event group for parameters notification.

    Values:

    MB_EVENT_NO_EVENTS = 0x00

    MB_EVENT_HOLDING_REG_WR = BIT0
        Modbus Event Write Holding registers.

    MB_EVENT_HOLDING_REG_RD = BIT1
        Modbus Event Read Holding registers.

    MB_EVENT_INPUT_REG_RD = BIT3
        Modbus Event Read Input registers.

    MB_EVENT_COILS_WR = BIT4
        Modbus Event Write Coils.

    MB_EVENT_COILS_RD = BIT5
        Modbus Event Read Coils.

    MB_EVENT_DISCRETE_RD = BIT6
        Modbus Event Read Discrete bits.

    MB_EVENT_STACK_STARTED = BIT7
        Modbus Event Stack started
```

```c
enum mb_param_type_t
    Type of Modbus parameter.

    Values:
```
MB_PARAM_HOLDING = 0x00
Modbus Holding register.

MB_PARAM_INPUT
Modbus Input register.

MB_PARAM_COIL
Modbus Coils.

MB_PARAM_DISCRETE
Modbus Discrete bits.

MB_PARAM_COUNT
MB_PARAM_UNKNOWN = 0xFF

enum mb_mode_type_t
Modbus serial transmission modes (RTU/ASCII).
Values:

MB_MODE_RTU
RTU transmission mode.

MB_MODE_ASCII
ASCII transmission mode.

MB_MODE_TCP
TCP communication mode.

MB_MODE_UDP
UDP communication mode.

enum mb_tcp_addr_type_t
Modbus TCP type of address.
Values:

MB_IPV4 = 0
TCP IPV4 addressing

MB_IPV6 = 1
TCP IPV6 addressing

Header File
- components/freemodbus/common/include/esp_modbus_master.h

Functions

 esp_err_t mbc_master_init_tcp( void **handler )
Initialize Modbus controller and stack for TCP port.

Return
- ESP_OK Success
- ESP_ERR_NO_MEM Parameter error
- ESP_ERR_NOT_SUPPORTED Port type not supported
- ESP_ERR_INVALID_STATE Initialization failure

Parameters
- [out] handler: handler(pointer) to master data structure

 esp_err_t mbc_master_init ( mb_port_type_t port_type, void **handler )
Initialize Modbus Master controller and stack for Serial port.

Return
- ESP_OK Success
- ESP_ERR_NO_MEM Parameter error
- ESP_ERR_NOT_SUPPORTED Port type not supported
• ESP_ERR_INVALID_STATE Initialization failure

Parameters
• [out] handler: handler(pointer) to master data structure
• [in] port_type: type of stack

void mbc_master_init_iface (void *handler)
Initialize Modbus Master controller interface handle.

Parameters
• [in] handler: - pointer to master data structure

esp_err_t mbc_master_destroy (void)
Destroy Modbus controller and stack.

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE Parameter error

esp_err_t mbc_master_start (void)
Start Modbus communication stack.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Modbus stack start error

esp_err_t mbc_master_setup (void *comm_info)
Set Modbus communication parameters for the controller.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Incorrect parameter data

Parameters
• comm_info: Communication parameters structure.

esp_err_t mbc_master_set_descriptor (const mb_parameter_descriptor_t *descriptor, const uint16_t num_elements)
Assign parameter description table for Modbus controller interface.

Return
• esp_err_t ESP_OK - set descriptor successfully
• esp_err_t ESP_ERR_INVALID_ARG - invalid argument in function call

Parameters
• [in] descriptor: pointer to parameter description table
• num_elements: number of elements in the table

esp_err_t mbc_master_send_request (mb_param_request_t *request, void *data_ptr)
Send data request as defined in parameter request, waits response from slave and returns status of command execution. This function provides standard way for read/write access to Modbus devices in the network.

Return
• esp_err_t ESP_OK - request was successful
• esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function
• esp_err_t ESP_ERR_INVALID_RESPONSE - an invalid response from slave
• esp_err_t ESP_ERR_TIMEOUT - operation timeout or no response from slave
• esp_err_t ESP_ERR_NOT_SUPPORTED - the request command is not supported by slave
• esp_err_t ESP_FAIL - slave returned an exception or other failure

Parameters
• [in] request: pointer to request structure of type mb_param_request_t
• [in] data_ptr: pointer to data buffer to send or received data (dependent of command field in request)

esp_err_t mbc_master_get_cid_info (uint16_t cid, const mb_parameter_descriptor_t **param_info)
Get information about supported characteristic defined as cid. Uses parameter description table to get this
information. The function will check if characteristic defined as a cid parameter is supported and returns its
description in param_info. Returns ESP_ERR_NOT_FOUND if characteristic is not supported.

Return
• esp_err_t ESP_OK - request was successful and buffer contains the supported characteristic name
• esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function
• esp_err_t ESP_ERR_NOT_FOUND - the characteristic (cid) not found
• esp_err_t ESP_FAIL - unknown error during lookup table processing

Parameters
• [in] cid: characteristic id
• param_info: pointer to pointer of characteristic data.

esp_err_t mbc_master_get_parameter (uint16_t cid, char *name, uint8_t *value, uint8_t *type)
Read parameter from modbus slave device whose name is defined by name and has cid. The additional data
for request is taken from parameter description (lookup) table.

Return
• esp_err_t ESP_OK - request was successful and value buffer contains representation of actual pa-
parameter data from slave
• esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function or parameter descriptor
• esp_err_t ESP_ERR_INVALID_RESPONSE - an invalid response from slave
• esp_err_t ESP_ERR_INVALID_STATE - invalid state during data processing or allocation failure
• esp_err_t ESP_ERR_TIMEOUT - operation timed out and no response from slave
• esp_err_t ESP_ERR_NOT_SUPPORTED - the request command is not supported by slave
• esp_err_t ESP_ERR_NOT_FOUND - the parameter is not found in the parameter description table
• esp_err_t ESP_FAIL - slave returned an exception or other failure

Parameters
• [in] cid: id of the characteristic for parameter
• [in] name: pointer into string name (key) of parameter (null terminated)
• [out] value: pointer to data buffer of parameter
• [out] type: parameter type associated with the name returned from parameter description table.

esp_err_t mbc_master_set_parameter (uint16_t cid, char *name, uint8_t *value, uint8_t *type)
Set characteristic’s value defined as a name and cid parameter. The additional data for cid parameter request
is taken from master parameter lookup table.

Return
• esp_err_t ESP_OK - request was successful and value was saved in the slave device registers
• esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function or parameter descriptor
• esp_err_t ESP_ERR_INVALID_RESPONSE - an invalid response from slave during processing of
parameter
• esp_err_t ESP_ERR_INVALID_STATE - invalid state during data processing or allocation failure
• esp_err_t ESP_ERR_TIMEOUT - operation timed out and no response from slave
• esp_err_t ESP_ERR_NOT_SUPPORTED - the request command is not supported by slave
• esp_err_t ESP_FAIL - slave returned an exception or other failure

Parameters
• [in] cid: id of the characteristic for parameter
• [in] name: pointer into string name (key) of parameter (null terminated)
• [out] value: pointer to data buffer of parameter (actual representation of json value field in
binary form)
• [out] type: pointer to parameter type associated with the name returned from parameter lookup
table.

Unions
union mb_parameter_opt_t

#include <esp_modbus_master.h> Modbus parameter options for description table.
Public Members

int opt1
Parameter option1

int opt2
Parameter option2

int opt3
Parameter option3

struct mb_parameter_opt_t:

int min
Parameter minimum value

int max
Parameter maximum value

int step
Step of parameter change tracking

struct mb_parameter_opt_t:

Structures

struct mb_parameter_descriptor_t
Characteristics descriptor type is used to describe characteristic and link it with Modbus parameters that reflect its data.

Public Members

uint16_t cid
Characteristic cid

const char *param_key
The key (name) of the parameter

const char *param_units
The physical units of the parameter

uint8_t mb_slave_addr
Slave address of device in the Modbus segment

mb_param_type_t mb_param_type
Type of modbus parameter

uint16_t mb_reg_start
This is the Modbus register address. This is the 0 based value.

uint16_t mb_size
Size of mb parameter in registers

uint16_t param_offset
Parameter name (OFFSET in the parameter structure)

mb_descr_type_t param_type
Float, U8, U16, U32, ASCII, etc.

mb_descr_size_t param_size
Number of bytes in the parameter.

mb_parameter_opt_t param_opts
Parameter options used to check limits and etc.

mb_param_perms_t access
Access permissions based on mode
struct mb_param_request_t
    Modbus register request type structure.

Public Members

uint8_t slave_addr
    Modbus slave address

uint8_t command
    Modbus command to send

uint16_t reg_start
    Modbus start register

uint16_t reg_size
    Modbus number of registers

Macros

MB_MASTER_CHECK (a, err_code, format, ...)
MB_MASTER_ASSERT (con)

Enumerations

enum mb_descr_type_t
    Modbus descriptor table parameter type defines.
    Values:
    PARAM_TYPE_U8 = 0x00
        Unsigned 8
    PARAM_TYPE_U16 = 0x01
        Unsigned 16
    PARAM_TYPE_U32 = 0x02
        Unsigned 32
    PARAM_TYPE_FLOAT = 0x03
        Float type
    PARAM_TYPE_ASCII = 0x04
        ASCII type

enum mb_descr_size_t
    Modbus descriptor table parameter size in bytes.
    Values:
    PARAM_SIZE_U8 = 0x01
        Unsigned 8
    PARAM_SIZE_U16 = 0x02
        Unsigned 16
    PARAM_SIZE_U32 = 0x04
        Unsigned 32
    PARAM_SIZE_FLOAT = 0x04
        Float size
    PARAM_SIZE_ASCII = 0x08
        ASCII size
    PARAM_SIZE_ASCII24 = 0x18
        ASCII24 size
PARAM_MAX_SIZE

enum mb_param_perms_t
Permissions for the characteristics.
Values:

PAR_PERMS_READ = 1 << BIT0
the characteristic of the device are readable

PAR_PERMS_WRITE = 1 << BIT1
the characteristic of the device are writable

PAR_PERMS_TRIGGER = 1 << BIT2
the characteristic of the device are triggerable

PAR_PERMS_READ_WRITE = PAR_PERMS_READ | PAR_PERMS_WRITE
the characteristic of the device are readable & writable

PAR_PERMS_READ_TRIGGER = PAR_PERMS_READ | PAR_PERMS_TRIGGER
the characteristic of the device are readable & triggerable

PAR_PERMS_WRITE_TRIGGER = PAR_PERMS_WRITE | PAR_PERMS_TRIGGER
the characteristic of the device are writable & triggerable

PAR_PERMS_READ_WRITE_TRIGGER = PAR_PERMS_READ_WRITE | PAR_PERMS_TRIGGER
the characteristic of the device are readable & writable & triggerable

Header File
- components/freemodbus/common/include/esp_modbus_slave.h

Functions

esp_err_t mbc_slave_init_tcp (void **handler)
Initialize Modbus Slave controller and stack for TCP port.

Return
- ESP_OK Success
- ESP_ERR_NO_MEM Parameter error
- ESP_ERR_NOT_SUPPORTED Port type not supported
- ESP_ERR_INVALID_STATE Initialization failure

Parameters
- [out] handler: handler(pointer) to master data structure

esp_err_t mbc_slave_init (mb_port_type_t port_type, void **handler)
Initialize Modbus Slave controller and stack for Serial port.

Return
- ESP_OK Success
- ESP_ERR_NO_MEM Parameter error
- ESP_ERR_NOT_SUPPORTED Port type not supported
- ESP_ERR_INVALID_STATE Initialization failure

Parameters
- [out] handler: handler(pointer) to master data structure
- [in] port_type: the type of port

void mbc_slave_init_iface (void *handler)
Initialize Modbus Slave controller interface handle.

Parameters
- [in] handler: - pointer to slave interface data structure

esp_err_t mbc_slave_destroy (void)
Destroy Modbus controller and stack.

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE Parameter error

```c
esp_err_t mbc_slave_start (void)
Start Modbus communication stack.
```

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Modbus stack start error

```c
esp_err_t mbc_slave_setup (void *comm_info)
Set Modbus communication parameters for the controller.
```

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Incorrect parameter data

Parameters
• comm_info: Communication parameters structure.

```c
mb_event_group_t mbc_slave_check_event (mb_event_group_t group)
Wait for specific event on parameter change.
```

Return
• mb_event_group_t event bits triggered

Parameters
• group: Group event bit mask to wait for change

```c
esp_err_t mbc_slave_get_param_info (mb_param_info_t *reg_info, uint32_t timeout)
Get parameter information.
```

Return
• ESP_OK Success
• ESP_ERR_TIMEOUT Cannot get data from parameter queue or queue overflow

Parameters
• [out] reg_info: Parameter info structure
• timeout: Timeout in milliseconds to read information from parameter queue

```c
esp_err_t mbc_slave_set_descriptor (mb_register_area_descriptor_t descr_data)
Set Modbus area descriptor.
```

Return
• ESP_OK: The appropriate descriptor is set
• ESP_ERR_INVALID_ARG: The argument is incorrect

Parameters
• descr_data: Modbus registers area descriptor structure

Structures

```c
struct mb_param_info_t
Parameter access event information type.
```

Public Members

```c
uint32_t time_stamp
Timestamp of Modbus Event (uS)
```

```c
uint16_t mb_offset
Modbus register offset
```

```c
mb_event_group_t type
Modbus event type
```

```c
uint8_t *address
Modbus data storage address
```
Chapter 2. API Reference

```c
size_t size
    Modbus event register size (number of registers)
```

```c
struct mb_register_area_descriptor_t
    Parameter storage area descriptor.
```

**Public Members**

```c
uint16_t start_offset
    Modbus start address for area descriptor
```

```c
mb_param_type_t type
    Type of storage area descriptor
```

```c
void *address
    Instance address for storage area descriptor
```

```c
size_t size
    Instance size for area descriptor (bytes)
```

**Macros**

```c
MB_SLAVE_CHECK(a, err_code, format, ...)
```

```c
MB_SLAVE_ASSERT(con)
```

### 2.2.3 ESP-MQTT

**Overview**

ESP-MQTT is an implementation of MQTT protocol client (MQTT is a lightweight publish/subscribe messaging protocol).

**Features**

- Supports MQTT over TCP, SSL with mbedtls, MQTT over Websocket, MQTT over Websocket Secure.
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)
- Support subscribing, publishing, authentication, last will messages, keep alive pings and all 3 QoS levels (it should be a fully functional client).

**Application Example**

- `protocols/mqtt/tcp`: MQTT over tcp, default port 1883
- `protocols/mqtt/ssl`: MQTT over tcp, default port 8883
- `protocols/mqtt/ssl_psk`: MQTT over tcp using pre-shared keys for authentication, default port 8883
- `protocols/mqtt/ws`: MQTT over Websocket, default port 80
- `protocols/mqtt/wss`: MQTT over Websocket Secure, default port 443

**Configuration**

**URI**

- Currently support `mqtt`, `mqtts`, `ws`, `wss` schemes
- MQTT over TCP samples:
  - `mqtt://mqtt.eclipseprojects.io`: MQTT over TCP, default port 1883:
  - `mqtt://mqtt.eclipseprojects.io:1884` MQTT over TCP, port 1884:
Chapter 2. API Reference

- mqtt://username:password@mqtt.eclipseprojects.io:1884 MQTT over TCP, port 1884, with username and password

- MQTT over SSL samples:
  - mqtts://mqtt.eclipseprojects.io:MQTT over SSL, port 8883
  - mqtts://mqtt.eclipseprojects.io:8884: MQTT over SSL, port 8884

- MQTT over Websocket samples:
  - ws://mqtt.eclipseprojects.io:80/mqtt

- MQTT over Websocket Secure samples:
  - wss://mqtt.eclipseprojects.io:443/mqtt

- Minimal configurations:

```c
const esp_mqtt_client_config_t mqtt_cfg = {
    .uri = "mqtt://mqtt.eclipseprojects.io",
    // .user_context = (void *)your_context
};
```

```c
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler,
                               client);
esp_mqtt_client_start(client);
```

- Note: By default mqtt client uses event loop library to post related mqtt events (connected, subscribed, published, etc.)

SSL

- Get certificate from server, example: mqtt.eclipseprojects.io openssl s_client -showcerts -connect mqtt.eclipseprojects.io:8883 </dev/null 2>/dev/null openssl x509 -outform PEM >mqtt_eclipse_org.pem

- Check the sample application: examples/mqtt_ssl

- Configuration:

```c
const esp_mqtt_client_config_t mqtt_cfg = {
    .uri = "mqtts://mqtt.eclipseprojects.io:8883",
    .event_handle = mqtt_event_handler,
    .cert_pem = (const char *)mqtt_eclipse_org_pem_start,
};
```

If the certificate is not null-terminated then cert_len should also be set. Other SSL related configuration parameters are:

- use_global_ca_store: use the global certificate store to verify server certificate, see esp-tls.h for more information
- client_cert_pem: pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.
- client_cert_len: length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem.
- client_key_pem: pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.
- client_key_len: length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem.
- psk_hint_key: pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled
- alpn_protos: NULL-terminated list of protocols to be used for ALPN.

**Last Will and Testament** MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the esp_mqtt_client_config_t struct.

- lwt_topic: pointer to the LWT message topic
- lwt_msg: pointer to the LWT message
- lwt_msg_len: length of the LWT message, required if lwt_msg is not null-terminated
- lwt_qos: quality of service for the LWT message
• lwt_retain: specifies the retain flag of the LWT message

Other Configuration Parameters

• disable_clean_session: determines the clean session flag for the connect message, defaults to a clean session
• keepalive: determines how many seconds the client will wait for a ping response before disconnecting, default is 120 seconds.
• disable_auto_reconnect: enable to stop the client from reconnecting to server after errors or disconnects
• user_context: custom context that will be passed to the event handler
• task_prio: MQTT task priority, defaults to 5
• task_stack: MQTT task stack size, defaults to 6144 bytes, setting this will override setting from menu-config
• buffer_size: size of MQTT send/receive buffer, default is 1024 bytes
• username: pointer to the username used for connecting to the broker
• password: pointer to the password used for connecting to the broker
• client_id: pointer to the client id, defaults to ESP32_%CHIPID% where %CHIPID% are the last 3 bytes of MAC address in hex format
• host: MQTT broker domain (ipv4 as string), setting the uri will override this
• port: MQTT broker port, specifying the port in the uri will override this
• transport: sets the transport protocol, setting the uri will override this
• refresh_connection_after_ms: refresh connection after this value (in milliseconds)
• event_handle: handle for MQTT events as a callback in legacy mode
• event_loop_handle: handle for MQTT event loop library

For more options on esp_mqtt_client_config_t, please refer to API reference below

Change settings in Project Configuration Menu  The settings for MQTT can be found using idf.py menu-config, under Component config -> ESP-MQTT Configuration

The following settings are available:

• CONFIG_MQTT_PROTOCOL_311: Enables 3.1.1 version of MQTT protocol
• CONFIG_MQTT_TRANSPORT_SSL, CONFIG_MQTT_TRANSPORT_WEBSOCKET: Enables specific MQTT transport layer, such as SSL, WEBSOCKET, WEBSOCKET_SECURE
• CONFIG_MQTT_CUSTOM_OUTBOX: Disables default implementation of mqtt_outbox, so a specific implementation can be supplied

Events

The following events may be posted by the MQTT client:

• MQTT_EVENT_BEFORE_CONNECT: The client is initialized and about to start connecting to the broker.
• MQTT_EVENT_CONNECTED: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
• MQTT_EVENT_DISCONNECTED: The client has aborted the connection due to being unable to read or write data, e.g. because the server is unavailable.
• MQTT_EVENT_SUBSCRIBED: The broker has acknowledged the client’s subscribe request. The event data will contain the message ID of the subscribe message.
• MQTT_EVENT_UNSUBSCRIBED: The broker has acknowledged the client’s unsubscribe request. The event data will contain the message ID of the unsubscribe message.
• MQTT_EVENT_PUBLISHED: The broker has acknowledged the client’s publish message. This will only be posted for Quality of Service level 1 and 2, as level 0 does not use acknowledgements. The event data will contain the message ID of the publish message.
• MQTT_EVENT_DATA: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer multiple MQTT_EVENT_DATA will be posted and current_data_offset and total_data_len from event data updated to keep track of the fragmented message.
Chapter 2. API Reference

• MQTT_EVENT_ERROR: The client has encountered an error. esp_mqtt_error_type_t from error_handle in the event data can be used to further determine the type of the error. The type of error will determine which parts of the error_handle struct is filled.

API Reference

Header File

• components/mqtt/esp-mqtt/include/mqtt_client.h

Functions

esp_mqtt_client_handle_t esp_mqtt_client_init(const esp_mqtt_client_config_t *config)
Creates mqtt client handle based on the configuration.

Return mqtt_client_handle if successfully created, NULL on error

Parameters

• config: mqtt configuration structure

esp_err_t esp_mqtt_client_set_uri(esp_mqtt_client_handle_t client, const char *uri)
Sets mqtt connection URI. This API is usually used to overrides the URI configured in esp_mqtt_client_init.

Return ESP_FAIL if URI parse error, ESP_OK on success

Parameters

• client: mqtt client handle
• uri:

esp_err_t esp_mqtt_client_start(esp_mqtt_client_handle_t client)
Starts mqtt client with already created client handle.

Return ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL on other error

Parameters

• client: mqtt client handle

esp_err_t esp_mqtt_client_reconnect(esp_mqtt_client_handle_t client)
This api is typically used to force reconnection upon a specific event.

Return ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state

Parameters

• client: mqtt client handle

esp_err_t esp_mqtt_client_disconnect(esp_mqtt_client_handle_t client)
This api is typically used to force disconnection from the broker.

Return ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization

Parameters

• client: mqtt client handle

esp_err_t esp_mqtt_client_stop(esp_mqtt_client_handle_t client)

This api is typically used to force disconnection from the broker.

Return ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization

Parameters

• client: mqtt client handle

int esp_mqtt_client_subscribe(esp_mqtt_client_handle_t client, const char *topic, int qos)
Subscribe the client to defined topic with defined qos.

Notes:

• Client must be connected to send subscribe message
• This API can be executed from a user task or from a mqtt event callback i.e. internal mqtt task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.

Return message_id of the subscribe message on success -1 on failure

Parameters
- client: mqtt client handle
- topic:
- qos:

int esp_mqtt_client_unsubscribe (esp_mqtt_client_handle_t client, const char *topic)

Unsubscribe the client from defined topic.

Notes:
- Client must be connected to send unsubscribe message
- It is thread safe, please refer to esp_mqtt_client_subscribe for details

Return message_id of the subscribe message on success -1 on failure

Parameters
- client: mqtt client handle
- topic:

int esp_mqtt_client_publish (esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain)

Client to send a publish message to the broker.

Notes:
- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
- Client doesn’t have to be connected for this API to work, enqueueing the messages with qos>1 (returning -1 for all the qos=0 messages if disconnected). If MQTT_SKIP_PUBLISH_IF_DISCONNECTED is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
- It is thread safe, please refer to esp_mqtt_client_subscribe for details

Return message_id of the publish message (for QoS 0 message_id will always be zero) on success. -1 on failure.

Parameters
- client: mqtt client handle
- topic: topic string
- data: payload string (set to NULL, sending empty payload message)
- len: data length, if set to 0, length is calculated from payload string
- qos: qos of publish message
- retain: retain flag

int esp_mqtt_client_enqueue (esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain, bool store)

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also used for qos=0 messages if store=true.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the esp_mqtt_client_publish() which sends the publish message immediately in the user task’s context). Thus, it could be used as a non blocking version of esp_mqtt_client_publish().

Return message_id if queued successfully, -1 otherwise

Parameters
- client: mqtt client handle
- topic: topic string
- data: payload string (set to NULL, sending empty payload message)
- len: data length, if set to 0, length is calculated from payload string
- qos: qos of publish message
- retain: retain flag
- store: if true, all messages are enqueued; otherwise only qos1 and qos 2 are enqueued
**esp_err_t esp_mqtt_client_destroy (esp_mqtt_client_handle_t client)**

Destroys the client handle.

**Notes:**
• Cannot be called from the mqtt event handler

**Return** ESP_OK ESP_ERR_INVALID_ARG on wrong initialization

**Parameters**
• client: mqtt client handle

**esp_err_t esp_mqtt_set_config (esp_mqtt_client_handle_t client, const esp_mqtt_client_config_t *config)**

Set configuration structure, typically used when updating the config (i.e. on “before_connect” event).

**Return** ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG if conflicts on transport configuration. ESP_OK on success

**Parameters**
• client: mqtt client handle
• config: mqtt configuration structure

**esp_err_t esp_mqtt_client_register_event (esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler, void *event_handler_arg)**

Registers mqtt event.

**Return** ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG on wrong initialization ESP_OK on success

**Parameters**
• client: mqtt client handle
• event: event type
• event_handler: handler callback
• event_handler_arg: handlers context

**int esp_mqtt_client_get_outbox_size (esp_mqtt_client_handle_t client)**

Get outbox size.

**Return** outbox size 0 on wrong initialization

**Parameters**
• client: mqtt client handle

**Structures**

**struct esp_mqtt_error_codes**

MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends esp_tls_last_error error structure and is backward compatible with it (so might be down-casted and treated as esp_tls_last_error error, but recommended to update applications if used this way previously)

Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

<table>
<thead>
<tr>
<th>error_type</th>
<th>related member variables</th>
<th>note</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERROR_TYPE_TCP_TRANSPORT</td>
<td>esp_tls_last esp.err, esp_tls stack err, esp_tls cert verify flags, sock errno</td>
<td>Error reported from tcp_transport/esp-tls</td>
</tr>
<tr>
<td>MQTT_ERROR_TYPE_CONNECTION_REFUSED</td>
<td>connect_return_code</td>
<td>Internal error reported from MQTT broker on connection</td>
</tr>
</tbody>
</table>

**Public Members**

**esp_err_t esp_tls_last esp_err**

last esp_err code reported from esp-tls component
**int esp_tls_stack_err**

ts specific error code reported from underlying tls stack

**int esp_tls_cert_verify_flags**

ts flags reported from underlying tls stack during certificate verification

**esp_mqtt_error_type_t** error_type

error type referring to the source of the error

**esp_mqtt_connect_return_code_t** connect_return_code

connection refused error code reported from MQTT broker on connection

**int esp_transport_sock_errno**

errno from the underlying socket

**struct esp_mqtt_event_t**

MQTT event configuration structure

### Public Members

**esp_mqtt_event_id_t** event_id

MQTT event type

**esp_mqtt_client_handle_t** client

MQTT client handle for this event

**void** *user_context*

User context passed from MQTT client config

**char** *data*

Data associated with this event

**int data_len**

Length of the data for this event

**int total_data_len**

Total length of the data (longer data are supplied with multiple events)

**int current_data_offset**

Actual offset for the data associated with this event

**char** *topic*

Topic associated with this event

**int topic_len**

Length of the topic for this event associated with this event

**int msg_id**

MQTT messaged id of message

**int session_present**

MQTT session_present flag for connection event

**esp_mqtt_error_codes_t** *error_handle*

esp-mqtt error handle including esp-tls errors as well as internal mqtt errors

**bool retain**

Retained flag of the message associated with this event

**int qos**

qos of the messages associated with this event

**bool dup**

dup flag of the message associated with this event

**struct esp_mqtt_client_config_t**

MQTT client configuration structure
Public Members

mqtt_event_callback_t event_handle
handle for MQTT events as a callback in legacy mode

esp_event_loop_handle_t event_loop_handle
handle for MQTT event loop library

const char *host
MQTT server domain (ipv4 as string)

const char *uri
Complete MQTT broker URI

uint32_t port
MQTT server port

bool set_null_client_id
Selects a NULL client id

const char *client_id
Set client id. Ignored if set_null_client_id == true If NULL set the default client id. Default client id is ESP32_CHIPID% where CHIPID% are last 3 bytes of MAC address in hex format

const char *username
MQTT username

const char *password
MQTT password

const char *lwt_topic
LWT (Last Will and Testament) message topic (NULL by default)

const char *lwt_msg
LWT message (NULL by default)

int lwt_qos
LWT message qos

int lwt_retain
LWT retained message flag

int lwt_msg_len
LWT message length

int disable_clean_session
mqtt clean session, default clean_session is true

int keepalive
mqtt keepalive, default is 120 seconds

bool disable_auto_reconnect
this mqtt client will reconnect to server (when errors/disconnect). Set disable_auto_reconnect=true to disable

void *user_context
pass user context to this option, then can receive that context in event->user_context

int task_prio
MQTT task priority, default is 5, can be changed in make menuconfig

int task_stack
MQTT task stack size, default is 6144 bytes, can be changed in make menuconfig

int buffer_size
size of MQTT send/receive buffer, default is 1024 (only receive buffer size if out_buffer_size defined)
const char *cert_pem
  Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in cert_len.

size_t cert_len
  Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert_pem
  Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_key_pem has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_cert_len.

size_t client_cert_len
  Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

const char *client_key_pem
  Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_cert_pem has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_key_len.

size_t client_key_len
  Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

esp_mqtt_transport_t transport
  overrides URI transport

int refresh_connection_after_ms
  Refresh connection after this value (in milliseconds)

const struct psk_key_hint *psk_hint_key
  Pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled

bool use_global_ca_store
  Use a global ca_store for all the connections in which this bool is set.

esp_err_t (*crt_bundle_attach)(void *conf)
  Pointer to ESP x509 Certificate Bundle attach function for the usage of certification bundles in mqtts

int reconnect_timeout_ms
  Reconnect to the broker after this value in miliseconds if auto reconnect is not disabled (defaults to 10s)

const char **alpn_protos
  NULL-terminated list of supported application protocols to be used for ALPN

const char *clientkey_password
  Client key decryption password string

int clientkey_password_len
  String length of the password pointed to by clientkey_password

esp_mqtt_protocol_ver_t protocol_ver
  MQTT protocol version used for connection, defaults to value from menuconfig

int out_buffer_size
  size of MQTT output buffer. If not defined, both output and input buffers have the same size defined as buffer_size

bool skip_cert_common_name_check
  Skip any validation of server certificate CN field, this reduces the security of TLS and makes the mqtt client susceptible to MITM attacks

bool use_secure_element
  enable secure element for enabling SSL connection
### Chapter 2. API Reference

```c
void *ds_data
    carrier of handle for digital signature parameters
```

```c
int network_timeout_ms
    Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s)
```

```c
bool disable_keepalive
    Set disable_keepalive=true to turn off keep-alive mechanism, false by default (keepalive is active by default). Note: setting the config value keepalive to 0 doesn’t disable keepalive feature, but uses a default keepalive period
```

```c
const char *path
    Path in the URI
```

```c
int message_retransmit_timeout
    timeout for retransmit of failed packet
```

### Macros

**MQTT_ERROR_TYPE_ESP_TLS**

MQTT_ERROR_TYPE_TCP_TRANSPORT error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from MQTT_ERROR_TYPE_ESP_TLS layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility

### Type Definitions

**typedef struct esp_mqtt_client**

`typedef struct esp_mqtt_client *esp_mqtt_client_handle_t`

MQTT error code structure to be passed as a contextual information into ERROR event.

**typedef struct esp_mqtt_error_codes**

`typedef struct esp_mqtt_error_codes esp_mqtt_error_codes_t`  

MQTT error code structure to be passed as a contextual information into ERROR event.

**typedef esp_mqtt_event_t *esp_mqtt_event_handle_t**

**typedef esp_err_t (**esp_mqtt_event_callback_t**) (esp_mqtt_event_handle_t event)**

### Enumerations

**enum esp_mqtt_event_id_t**

MQTT event types.

User event handler receives context data in `esp_mqtt_event_t` structure with

- `user_context` - user data from `esp_mqtt_client_config_t`
- `client` - mqtt client handle
- various other data depending on event type

**Values:**

- **MQTT_EVENT_ANY** = -1
- **MQTT_EVENT_ERROR** = 0

on error event, additional context: connection return code, error handle from `esp_tls` (if supported)

- **MQTT_EVENT_CONNECTED**

connected event, additional context: session_present flag

---

Espressif Systems 79 Release v5.0-dev-1712-g4a553510b7 Submit Document Feedback
MQTT_EVENT_DISCONNECTED
Disconnected event

MQTT_EVENT_SUBSCRIBED
subscribed event, additional context:
  • msg_id message id
  • data pointer to the received data
  • data_len length of the data for this event

MQTT_EVENT_UNSUBSCRIBED
unsubscribed event

MQTT_EVENT_PUBLISHED
published event, additional context: msg_id

MQTT_EVENT_DATA
data event, additional context:
  • msg_id message id
  • topic pointer to the received topic
  • topic_len length of the topic
  • data pointer to the received data
  • data_len length of the data for this event
  • current_data_offset offset of the current data for this event
  • total_data_len total length of the data received
  • retain retain flag of the message
  • qos qos level of the message
  • dup dup flag of the message Note: Multiple MQTT_EVENT_DATA could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

MQTT_EVENT_BEFORE_CONNECT
The event occurs before connecting

MQTT_EVENT_DELETED
Notification on delete of one message from the internal outbox, if the message couldn’t have been sent and acknowledged before expiring defined in OUTBOX_EXPIRED_TIMEOUT_MS. (events are not posted upon deletion of successfully acknowledged messages)
  • This event id is posted only if MQTT_REPORT_DELETED_MESSAGES==1
  • Additional context: msg_id (id of the deleted message).

enum esp_mqtt_connect_return_code_t
MQTT connection error codes propagated via ERROR event

Values:

MQTT_CONNECTION_ACCEPTED = 0
Connection accepted

MQTT_CONNECTION_REFUSE_PROTOCOL
MQTT connection refused reason: Wrong protocol

MQTT_CONNECTION_REFUSE_ID_REJECTED
MQTT connection refused reason: ID rejected

MQTT_CONNECTION_REFUSE_SERVER_UNAVAILABLE
MQTT connection refused reason: Server unavailable

MQTT_CONNECTION_REFUSE_BAD_USERNAME
MQTT connection refused reason: Wrong user

MQTT_CONNECTION_REFUSE_NOT_AUTHORIZED
MQTT connection refused reason: Wrong username or password

enum esp_mqtt_error_type_t
MQTT connection error codes propagated via ERROR event
Chapter 2. API Reference

Values:

```
MQTT_ERROR_TYPE_NONE = 0
MQTT_ERROR_TYPE_TCP_TRANSPORT
MQTT_ERROR_TYPE_CONNECTION_REFUSED
```

```
enum esp_mqtt_transport_t
Values:

MQTT_TRANSPORT_UNKNOWN = 0x0
MQTT_TRANSPORT_OVER_TCP
MQTT over TCP, using scheme: mqtt
MQTT_TRANSPORT_OVER_SSL
MQTT over SSL, using scheme: mqtts
MQTT_TRANSPORT_OVER_WS
MQTT over Websocket, using scheme: ws
MQTT_TRANSPORT_OVER_WSS
MQTT over Websocket Secure, using scheme: wss
```

```
enum esp_mqtt_protocol_ver_t
Values:

MQTT_PROTOCOL_UNDEFINED = 0
MQTT_PROTOCOL_V_3_1
MQTT_PROTOCOL_V_3_1_1
```

2.2.4 ESP-TLS

Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection among others. All the configuration can be specified in the `esp_tls_cfg_t` data structure. Once done, TLS communication can be conducted using the following APIs:

- `esp_tls_conn_new()`: for opening a new TLS connection.
- `esp_tls_conn_read()`: for reading from the connection.
- `esp_tls_conn_write()`: for writing into the connection.
- `esp_tls_conn_destroy()`: for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: `protocols/https_request`.

Tree structure for ESP-TLS component

```
├── esp_tls.c
├── esp_tls.h
├── esp_tls_mbedtls.c
├── esp_tls_wolfssl.c
└── private_include
```

(continues on next page)
The ESP-TLS component has a file `esp-tls/esp_tls.h` which contain the public API headers for the component. Internally ESP-TLS component uses one of the two SSL/TLS Libraries between mbedtls and wolfssl for its operation. API specific to mbedtls are present in `esp-tls/private_include/esp_tls_mbedtls.h` and API specific to wolfssl are present in `esp-tls/private_include/esp_tls_wolfssl.h`.

**TLS Server verification**

The ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer’s server certificate or with the help of pre-shared keys. The user should select only one of the following options in the `esp_tls_cfg_t` structure for TLS server verification. If no option is selected then client will return a fatal error by default at the time of the TLS connection setup.

- **cacert_buf and cacert_bytes**: The CA certificate can be provided in a buffer to the `esp_tls_cfg_t` structure. The ESP-TLS will use the CA certificate present in the buffer to verify the server. The following variables in `esp_tls_cfg_t` structure must be set.
  - `cacert_buf`: pointer to the buffer which contains the CA cert.
  - `cacert_bytes`: size of the CA certificate in bytes.
- **use_global_ca_store**: The `global_ca_store` can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set `use_global_ca_store = true` in their respective `esp_tls_cfg_t` structure. See API Reference section below on information regarding different API used for initializing and setting up the `global_ca_store`.
- **crt_bundle_attach**: The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at ESP x509 Certificate Bundle.
- **psk_hint_key**: To use pre-shared keys for server verification, `CONFIG_ESP_TLS_PSK_VERIFICATION` should be enabled in the ESP-TLS menuconfig. Then the pointer to PSK hint and key should be provided to the `esp_tls_cfg_t` structure. The ESP-TLS will use the PSK for server verification only when no other option regarding the server verification is selected.
- **skip server verification**: This is an insecure option provided in the ESP-TLS for testing purpose. The option can be set by enabling `CONFIG_ESP_TLS_INSECURE` and `CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY` in the ESP-TLS menuconfig. When this option is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the `esp_tls_cfg_t` structure. WARNING: Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like `ca_store` etc.

**Underlying SSL/TLS Library Options**

The ESP-TLS component has an option to use mbedtls or wolfssl as their underlying SSL/TLS library. By default only mbedtls is available and is used, wolfssl SSL/TLS library is available publicly at https://github.com/espressif/esp-wolfssl. The repository provides wolfssl component in binary format, it also provides few examples which are useful for understanding the API. Please refer the repository README.md for information on licensing and other options. Please see below option for using wolfssl in your project.

**Note:** As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.

**How to use wolfssl with ESP-IDF**

There are two ways to use wolfssl in your project

1) Directly add wolfssl as a component in your project with following three commands.:
Chapter 2. API Reference

(First change directory (cd) to your project directory)

mkdir components
cd components
git clone https://github.com/espressif/esp-wolfssl.git

2) Add wolfssl as an extra component in your project.

- Download wolfssl with:

  git clone https://github.com/espressif/esp-wolfssl.git

- Include esp-wolfssl in ESP-IDF with setting EXTRA_COMPONENT_DIRS in CMakeLists.txt of your project as done in wolfssl/examples. For reference see Optional Project variables in build-system.

After above steps, you will have option to choose wolfssl as underlying SSL/TLS library in configuration menu of your project as follows:

```
idf.py menuconfig -> ESP-TLS -> choose SSL/TLS Library -> mbedtls/wolfssl
```

Comparison between mbedtls and wolfssl

The following table shows a typical comparison between wolfssl and mbedtls when protocols/https_request example (which has server authentication) was run with both SSL/TLS libraries and with all respective configurations set to default. (mbedtls IN_CONTENT length and OUT_CONTENT length were set to 16384 bytes and 4096 bytes respectively)

<table>
<thead>
<tr>
<th>Property</th>
<th>Wolfssl</th>
<th>Mbedtls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Heap Consumed</td>
<td>~19 Kb</td>
<td>~37 Kb</td>
</tr>
<tr>
<td>Task Stack Used</td>
<td>~2.2 Kb</td>
<td>~3.6 Kb</td>
</tr>
<tr>
<td>Bin size</td>
<td>~858 Kb</td>
<td>~736 Kb</td>
</tr>
</tbody>
</table>

Note: These values are subject to change with change in configuration options and version of respective libraries.

Digital Signature with ESP-TLS

ESP-TLS provides support for using the Digital Signature (DS) with ESP32-C3. Use of the DS for TLS is supported only when ESP-TLS is used with mbedTLS (default stack) as its underlying SSL/TLS stack. For more details on Digital Signature, please refer to the Digital Signature Documentation. The technical details of Digital Signature such as how to calculate private key parameters can be found in ESP32-C3 Technical Reference Manual > Digital Signature (DS) [PDF]. The DS peripheral must be configured before it can be used to perform Digital Signature, see Configure the DS Peripheral in Digital Signature.

The DS peripheral must be initialized with the required encrypted private key parameters (obtained when the DS peripheral is configured). ESP-TLS internally initializes the DS peripheral when provided with the required DS context (DS parameters). Please see the below code snippet for passing the DS context to esp-tls context. The DS context passed to the esp-tls context should not be freed till the TLS connection is deleted.

```
#include "esp_tls.h"

esp_ds_data_ctx_t *ds_ctx;
/* initialize ds_ctx with encrypted private key parameters, which can be read from
 the nvs or
 provided through the application code */

esp_tls_cfg_t cfg = {
 .clientcert_buf = /* the client cert */,
 .clientcert_bytes = /* length of the client cert */,
 /* other configurations options */
```

(continues on next page)
.ds_data = (void *)ds_ctx,
};

Note: When using Digital Signature for the TLS connection, along with the other required params, only the client cert (clientcert_buf) and the DS params (ds_data) are required and the client key (clientkey_buf) can be set to NULL.

• An example of mutual authentication with the DS peripheral can be found at ssl mutual auth which internally uses (ESP-TLS) for the TLS connection.

API Reference

Header File
• components/esp-tls/esp_tls.h

Functions

esp_tls_t *esp_tls_init (void)
Create TLS connection.
This function allocates and initializes esp-tls structure handle.

Return tls Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

esp_tls_t *esp_tls_conn_new (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg)
Create a new blocking TLS/SSL connection.
This function establishes a TLS/SSL connection with the specified host in blocking manner.

Note: This API is present for backward compatibility reasons. Alternative function with the same functionality is esp_tls_conn_new_sync (and its asynchronous version esp_tls_conn_new_async)

Return pointer to esp_tls_t, or NULL if connection couldn’t be opened.

Parameters
• [in] hostname: Hostname of the host.
• [in] hostlen: Length of hostname.
• [in] port: Port number of the host.
• [in] cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.

int esp_tls_conn_new_sync (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg,
                                   esp_tls_t *tls)
Create a new blocking TLS/SSL connection.
This function establishes a TLS/SSL connection with the specified host in blocking manner.

Return
• -1 If connection establishment fails.
• 1 If connection establishment is successful.
• 0 If connection state is in progress.

Parameters
• [in] hostname: Hostname of the host.
• [in] hostlen: Length of hostname.
• [in] port:: Port number of the host.
• [in] cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.
• [in] tls: Pointer to esp-tls as esp-tls handle.
**esp_tls_t** *esp_tls_conn_http_new(const char *url, const esp_tls_cfg_t *cfg)*  
Create a new blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as esp_tls_conn_new() API. However this API accepts host’s url.

Return pointer to esp_tls_t, or NULL if connection couldn’t be opened.

Parameters

- [in] url: url of host.
- [in] cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to ‘esp_tls_cfg_t’ . At a minimum, this structure should be zero-initialized.

int esp_tls_conn_new_async(const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)  
Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn’t wait for the connection to get established.

Return

-1 If connection establishment fails.
0 If connection establishment is in progress.
1 If connection establishment is successful.

Parameters

- [in] hostname: Hostname of the host.
- [in] port: Port number of the host.
- [in] cfg: TLS configuration as esp_tls_cfg_t. non_block member of this structure should be set to be true.
- [in] tls: pointer to esp-tls as esp-tls handle.

int esp_tls_conn_http_new_async(const char *url, const esp_tls_cfg_t *cfg, esp_tls_t *tls)  
Create a new non-blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as esp_tls_conn_new() API. However this API accepts host’s url.

Return

-1 If connection establishment fails.
0 If connection establishment is in progress.
1 If connection establishment is successful.

Parameters

- [in] url: url of host.
- [in] cfg: TLS configuration as esp_tls_cfg_t.
- [in] tls: pointer to esp-tls as esp-tls handle.

static ssize_t esp_tls_conn_write(esp_tls_t *tls, const void *data, size_t datalen)  
Write from buffer ‘data’ into specified tls connection.

Return

>=0 if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
<0 if write operation was not successful, because either an error occured or an action must be taken by the calling process.
ESP_TLS_ERR_SSL_WANT_READ/ ESP_TLS_ERR_SSL_WANT_WRITE. if the handshake is incomplete and waiting for data to be available for reading. In this case this functions needs to be called again when the underlying transport is ready for operation.

Parameters

- [in] tls: pointer to esp-tls as esp-tls handle.
- [in] data: Buffer from which data will be written.
- [in] datalen: Length of data buffer.

static ssize_t esp_tls_conn_read(esp_tls_t *tls, void *data, size_t datalen)  
Read from specified tls connection into the buffer ‘data’.
Return

- >0 if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
- 0 if read operation was not successful. The underlying connection was closed.
- <0 if read operation was not successful, because either an error occurred or an action must be taken by the calling process.

Parameters

- [in] tls: pointer to esp-tls as esp-tls handle.
- [in] data: Buffer to hold read data.
- [in] datalen: Length of data buffer.

void esp_tls_conn_delete (esp_tls_t *tls)

Compatible version of esp_tls_conn_destroy() to close the TLS/SSL connection.

Parameters

- [in] tls: pointer to esp-tls as esp-tls handle.

int esp_tls_conn_destroy (esp_tls_t *tls)

Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with esp_tls_conn_new() or esp_tls_conn_http_new() APIs.

Return

- 0 on success

Parameters

- [in] tls: pointer to esp-tls as esp-tls handle.

ssize_t esp_tls_get_bytes_avail (esp_tls_t *tls)

Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over mbedTLS’s mbedtls_ssl_get_bytes_avail() API.

Return

- -1 in case of invalid arg
- bytes available in the application data record read buffer

Parameters

- [in] tls: pointer to esp-tls as esp-tls handle.

esp_err_t esp_tls_get_conn_sockfd (esp_tls_t *tls, int *sockfd)

Returns the connection socket file descriptor from esp_tls session.

Return

- ESP_OK on success and value of sockfd will be updated with socket file descriptor for connection
- ESP_ERR_INVALID_ARG if (tls == NULL || sockfd == NULL)

Parameters

- [in] tls: handle to esp_tls context
- [out] sockfd: int pointer to sockfd value.

esp_err_t esp_tls_init_global_ca_store (void)

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling esp_tls_set_global_ca_store(). To be effective, this function must be called before any call to esp_tls_set_global_ca_store().

Return

- ESP_OK if creating global CA store was successful.
- ESP_ERR_NO_MEM if an error occurred when allocating the mbedTLS resources.

esp_err_t esp_tls_set_global_ca_store (const unsigned char *cacert_pem_buf, const unsigned int cacert_pem_bytes)

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls
esp_tls_init_global_ca_store() if it has not already been called. The application must call this function before calling esp_tls_conn_new().

Return
- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

Parameters
- [in] cacert_pem_buf: Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.

void esp_tls_free_global_ca_store(void)
Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

esp_err_t esp_tls_get_and_clear_last_error (esp_tls_error_handle_t h, int *esp_tls_code, int *esp_tls_flags)
Returns last error in esp_tls with detailed mbedtls related error codes. The error information is cleared internally upon return.

Return
- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK (0) if no error occurred
- specific error code (based on ESP_ERR_ESP_TLS_BASE) otherwise

Parameters
- [in] h: esp-tls error handle.
- [out] esp_tls_code: last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code
- [out] esp_tls_flags: last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

esp_err_t esp_tls_get_and_clear_error_type (esp_tls_error_handle_t h, esp_tls_error_type_t err_type, int *error_code)
Returns the last error captured in esp_tls of a specific type. The error information is cleared internally upon return.

Return
- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK if a valid error returned and was cleared

Parameters
- [in] h: esp-tls error handle.
- [in] err_type: specific error type
- [out] error_code: last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

mbedtls_x509_crt *esp_tls_get_global_ca_store (void)
Get the pointer to the global CA store currently being used.

The application must first call esp_tls_set_global_ca_store(). Then the same CA store could be used by the application for APIs other than esp_tls.

Note: Modifying the pointer might cause a failure in verifying the certificates.

Return
- Pointer to the global CA store currently being used if successful.
- NULL if there is no global CA store set.

esp_err_t esp_tls_plain_tcp_connect (const char *host, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_error_handle_t error_handle, int *sockfd)
Creates a plain TCP connection, returning a valid socket fd on success or an error handle.

Return ESP_OK on success ESP_ERR_INVALID_ARG if invalid output parameters ESP-TLS based error codes on failure

Parameters
• [in] host: Hostname of the host.
• [in] hostlen: Length of hostname.
• [in] port: Port number of the host.
• [in] cfg: ESP-TLS configuration as esp_tls_cfg_t.
• [out] error_handle: ESP-TLS error handle holding potential errors occurred during connection
• [out] sockfd: Socket descriptor if successfully connected on TCP layer

Structures

struct psk_key_hint
ESP-TLS preshared key and hint structure.

Public Members

const uint8_t *key
key in PSK authentication mode in binary format

const size_t key_size
length of the key

const char *hint
hint in PSK authentication mode in string format

struct tls_keep_alive_cfg
esp-tls client session ticket ctx
Keep alive parameters structure

Public Members

bool keep_alive_enable
Enable keep-alive timeout

int keep_alive_idle
Keep-alive idle time (second)

int keep_alive_interval
Keep-alive interval time (second)

int keep_alive_count
Keep-alive packet retry send count

struct esp_tls_cfg
ESP-TLS configuration parameters.

Note
Note about format of certificates:
- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
- Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format.
- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

Public Members

const char **alpn_protos
Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that
should be negotiated. The format is length followed by protocol name. For the most common cases the
following is ok: const char **alpn_protos = [ “h2”, NULL ];

• where ‘h2’ is the protocol name

const unsigned char *cacert_buf
Certificate Authority’s certificate in a buffer. Format may be PEM or DER, depending on mbedtls-
support This buffer should be NULL terminated in case of PEM

const unsigned char *cacert_pem_buf
CA certificate buffer legacy name

unsigned int cacert_bytes
Size of Certificate Authority certificate pointed to by cacert_buf (including NULL-terminator in case of
PEM format)

unsigned int cacert_pem_bytes
Size of Certificate Authority certificate legacy name

const unsigned char *clientcert_buf
Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer
should be NULL terminated in case of PEM

const unsigned char *clientcert_pem_buf
Client certificate legacy name

unsigned int clientcert_bytes
Size of client certificate pointed to by clientcert_pem_buf (including NULL-terminator in case of PEM
format)

unsigned int clientcert_pem_bytes
Size of client certificate legacy name

const unsigned char *clientkey_buf
Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be
NULL terminated in case of PEM

const unsigned char *clientkey_pem_buf
Client key legacy name

unsigned int clientkey_bytes
Size of client key pointed to by clientkey_pem_buf (including NULL-terminator in case of PEM format)

unsigned int clientkey_pem_bytes
Size of client key legacy name

const unsigned char *clientkey_password
Client key decryption password string

unsigned int clientkey_password_len
String length of the password pointed to by clientkey_password

bool non_block
Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking
mode after tls session is established

bool use_secure_element
Enable this option to use secure element or atecc608a chip (Integrated with ESP32-WROOM-32SE)

int timeout_ms
Network timeout in milliseconds

bool use_global_ca_store
Use a global ca_store for all the connections in which this bool is set.

const char *common_name
If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match
hostname.
bool skip_common_name
Skip any validation of server certificate CN field

tls_keep_alive_cfg *keep_alive_cfg
Enable TCP keep-alive timeout for SSL connection

const psk_hint_key_t *psk_hint_key
Pointer to PSK hint and key. if not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

esp_err_t (*crt_bundle_attach) (void *conf)
Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

void *ds_data
Pointer for digital signature peripheral context

bool is_plain_tcp
Use non-TLS connection: When set to true, the esp-tls uses plain TCP transport rather than TLS/SSL connection. Note, that it is possible to connect using a plain tcp transport directly with esp_tls_plain_tcp_connect() API

struct ifreq *if_name
The name of interface for data to go through. Use the default interface without setting

struct esp_tls
ESP-TLS Connection Handle.

Public Members

mbedtls_ssl_context ssl
TLS/SSL context

mbedtls_entropy_context entropy
mbedTLS entropy context structure

mbedtls_ctr_drbg_context ctr_drbg
mbedTLS ctr drbg context structure. CTR_DRBG is deterministic random bit generation based on AES-256

mbedtls_ssl_config conf
TLS/SSL configuration to be shared between mbedtls_ssl_context structures

mbedtls_net_context server_fd
mbedTLS wrapper type for sockets

mbedtls_x509_crt cacert
Container for the X.509 CA certificate

mbedtls_x509_crt *cacert_ptr
Pointer to the cacert being used.

mbedtls_x509_crt clientcert
Container for the X.509 client certificate

mbedtls_pk_context clientkey
Container for the private key of the client certificate

int sockfd
Underlying socket file descriptor.

ssize_t (*read)(struct esp_tls *tls, char *data, size_t datalen)
Callback function for reading data from TLS/SSL connection.

ssize_t (*write)(struct esp_tls *tls, const char *data, size_t datalen)
Callback function for writing data to TLS/SSL connection.
**esp_tls_conn_state_t** `conn_state`
ESP-TLS Connection state

```c
fd_set rset
    read file descriptors
fd_set wset
    write file descriptors
bool is_tls
    indicates connection type (TLS or NON-TLS)
```

**esp_tls_role_t** `role`
esp-tls role
- ESP_TLS_CLIENT
- ESP_TLS_SERVER

**esp_tls_error_handle_t** `error_handle`
handle to error descriptor

### Type Definitions

```c
typedef enum esp_tls_conn_state esp_tls_conn_state_t
    ESP-TLS Connection State.
typedef enum esp_tls_role esp_tls_role_t
    ESP-TLS Preshared Key and Hint Structure.
typedef struct psk_key_hint psk_hint_key_t
    ESP-TLS session ticket context.
typedef struct tls_keep_alive_cfg tls_keep_alive_cfg_t
    ESP-TLS Keep Alive Parameters Structure.
typedef struct esp_tls_cfg esp_tls_cfg_t
    ESP-TLS Configuration Parameters.
```

**Note**
Note about format of certificates:
- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
- Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format.
- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf* and *_pem_bytes* names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

```c
typedef struct esp_tls esp_tls_t
    ESP-TLS Connection Handle.
```

### Enumerations

```c
enum esp_tls_conn_state
    ESP-TLS Connection State.
```

**Values**
- **ESP_TLS_INIT** = 0
- **ESP_TLS_CONNECTING**
- **ESP_TLS_HANDSHAKE**
- **ESP_TLS_FAIL**
- **ESP_TLS_DONE**
Chapter 2. API Reference

```c
enum esp_tls_role
{   
    ESP_TLS_CLIENT = 0,
    ESP_TLS_SERVER
}
```

2.2.5 ESP HTTP Client

**Overview**

`esp_http_client` provides an API for making HTTP/S requests from ESP-IDF applications. The steps to use this API are as follows:

- `esp_http_client_init()`: Creates an `esp_http_client_config_t` instance i.e. a HTTP client handle based on the given `esp_http_client_config_t` configuration. This function must be the first to be called; default values will be assumed for the configuration values that are not explicitly defined by the user.
- `esp_http_client_perform()`: Performs all operations of the `esp_http_client` - opening the connection, exchanging data and closing the connection (as required), while blocking the current task until its completion. All related events will be invoked through the event handler (as specified in `esp_http_client_config_t`).
- `esp_http_client_cleanup()`: Closes the connection (if any) and frees up all the memory allocated to the HTTP client instance. This must be the last function to be called after the completion of operations.

**Application Example**

Simple example that uses ESP HTTP Client to make HTTP/S requests at protocols/esp_http_client.

**Basic HTTP request**

Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example for implementation details.

**Persistent Connections**

Persistent connection means that the HTTP client can re-use the same connection for several exchanges. If the server does not request to close the connection with the `Connection: close` header, the connection is not dropped but is instead kept open and used for further requests.

To allow ESP HTTP client to take full advantage of persistent connections, one should make as many requests as possible using the same handle instance.

Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example. Here, once the connection is created, multiple requests (GET, POST, PUT, etc.) are made before the connection is closed.

**HTTPS Request**

ESP HTTP client supports SSL connections using `mbedtls`, with the `url` configuration starting with `https` scheme or `transport_type` set to `HTTP_TRANSPORT_OVER_SSL`. HTTPS support can be configured via `CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS` (enabled by default).

**Note:** While making HTTPS requests, if server verification is needed, additional root certificate (in PEM format) needs to be provided to the `cert_pem` member in `esp_http_client_config_t` configuration. Users can...
also use the ESP x509 Certificate Bundle for server verification using the \texttt{crt_bundle_attach} member of the \texttt{esp_http_client_config_t} configuration.

Check out the example functions \texttt{https_with_url} and \texttt{https_with_hostname_path} in the application example. (Implementation details of the above note are found here)

**HTTP Stream**

Some applications need to open the connection and control the exchange of data actively (data streaming). In such cases, the application flow is different from regular requests. Example flow is given below:

- \texttt{esp_http_client_init()}: Create a HTTP client handle
- \texttt{esp_http_client_set_*} or \texttt{esp_http_client_delete_*}: Modify the HTTP connection parameters (optional)
- \texttt{esp_http_client_open()}: Open the HTTP connection with \texttt{write_len} parameter (content length that needs to be written to server); set \texttt{write_len=0} for read-only connection
- \texttt{esp_http_client_write()}: Write data to server with a maximum length equal to \texttt{write_len} of \texttt{esp_http_client_open()}; function; no need to call this function for \texttt{write_len=0}
- \texttt{esp_http_client_fetch_headers()}: Read the HTTP Server response headers, after sending the request headers and server data (if any). Returns the \texttt{content-length} from the server and can be succeeded by \texttt{esp_http_client_get_status_code()} for getting the HTTP status of the connection.
- \texttt{esp_http_client_read()}: Read the HTTP stream
- \texttt{esp_http_client_close()}: Close the connection
- \texttt{esp_http_client_cleanup()}: Release allocated resources

Check out the example function \texttt{http_perform_as_stream_reader} in the application example for implementation details.

**HTTP Authentication**

ESP HTTP client supports both Basic and Digest Authentication.

- Users can provide the username and password in the \texttt{url} or the \texttt{username} and \texttt{password} members of the \texttt{esp_http_client_config_t} configuration. For \texttt{auth_type = HTTP_AUTH_TYPE_BASIC}, the HTTP client takes only 1 perform operation to pass the authentication process.
- If \texttt{auth_type = HTTP_AUTH_TYPE_NONE}, but the \texttt{username} and \texttt{password} fields are present in the configuration, the HTTP client takes 2 perform operations. The client will receive the 401 Unauthorized header in its first attempt to connect to the server. Based on this information, it decides which authentication method to choose and performs it in the second operation.
- Check out the example functions \texttt{http_auth_basic}, \texttt{http_auth_basic_redirect} (for Basic authentication) and \texttt{http_auth_digest} (for Digest authentication) in the application example for implementation details.

**Examples of Authentication Configuration**

- Authentication with URI

```c
esp_http_client_config_t config = {
    .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

- Authentication with username and password entry

```c
esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",
    .password = "passwd",
};
```

(continues on next page)
Chapter 2. API Reference

(continued from previous page)

```c
.auth_type = HTTP_AUTH_TYPE_BASIC,
```

### API Reference

**Header File**

- components/esp_http_client/include/esp_http_client.h

**Functions**

- `esp_http_client_handle_t esp_http_client_init(const esp_http_client_config_t *config)`
  
  Start a HTTP session. This function must be the first function to call, and it returns a `esp_http_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_http_client_cleanup` when the operation is complete.

  **Return**
  - `esp_http_client_handle_t`
  - `NULL` if any errors

  **Parameters**
  - `[in] config`: The configurations, see `http_client_config_t`

- `esp_err_t esp_http_client_perform(esp_http_client_handle_t client)`

  Invoke this function after `esp_http_client_init` and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same `esp_http_client_handle_t` as input as the `esp_http_client_init` call returned. `esp_http_client_perform` performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking `esp_http_client_perform()`, `is_async` member of `esp_http_client_config_t` must be set while making a call to `esp_http_client_init()` API. You can do any amount of calls to `esp_http_client_perform` while using the same `esp_http_client_handle_t`. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are encouraged to do so. `esp_http_client` will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use `esp_http_client_set_**` between the invoke to set options for the following `esp_http_client_perform`.

  **Note** You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several `esp_http_client_handle_t`. This function include `esp_http_client_open` => `esp_http_client_write` => `esp_http_client_fetch_headers` => `esp_http_client_read` (and option) `esp_http_client_close`.

  **Return**
  - `ESP_OK` on successful
  - `ESP_FAIL` on error

  **Parameters**
  - `client`: The `esp_http_client` handle

- `esp_err_t esp_http_client_set_url(esp_http_client_handle_t client, const char *url)`

  Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

  **Return**
  - `ESP_OK`
  - `ESP_FAIL`

  **Parameters**
  - `[in] client`: The `esp_http_client` handle
  - `[in] url`: The url
```c
esp_err_t esp_http_client_set_post_field (esp_http_client_handle_t client, const char *data, int len)
```

Set post data, this function must be called before esp_http_client_perform. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

Return
- ESP_OK
- ESP_FAIL

Parameters
- [in] client: The esp_http_client handle
- [in] data: post data pointer
- [in] len: post length

```c
int esp_http_client_get_post_field (esp_http_client_handle_t client, char **data)
```

Get current post field information.

Return  Size of post data
Parameters
- [in] client: The client
- [out] data: Point to post data pointer

```c
esp_err_t esp_http_client_set_header (esp_http_client_handle_t client, const char *key, const char *value)
```

Set http request header, this function must be called after esp_http_client_init and before any perform function.

Return
- ESP_OK
- ESP_FAIL

Parameters
- [in] client: The esp_http_client handle
- [in] key: The header key
- [in] value: The header value

```c
esp_err_t esp_http_client_get_header (esp_http_client_handle_t client, const char *key, char **value)
```

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after esp_http_client_init.

Return
- ESP_OK
- ESP_FAIL

Parameters
- [in] client: The esp_http_client handle
- [in] key: The header key
- [out] value: The header value

```c
esp_err_t esp_http_client_get_username (esp_http_client_handle_t client, char **value)
```

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after esp_http_client_init.

Return
- ESP_OK
- ESP_ERR_INVALID_ARG

Parameters
- [in] client: The esp_http_client handle
- [out] value: The username value

```c
esp_err_t esp_http_client_set_username (esp_http_client_handle_t client, const char *username)
```

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

Return
- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] client: The esp_http_client handle
- [in] username: The username value

`esp_err_t esp_http_client_get_password(esp_http_client_handle_t client, char **value)`

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Return**
- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] client: The esp_http_client handle
- [out] value: The password value

`esp_err_t esp_http_client_set_password(esp_http_client_handle_t client, const char *password)`

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

**Return**
- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] client: The esp_http_client handle
- [in] password: The password value

`esp_err_t esp_http_client_set_authtype(esp_http_client_handle_t client, esp_http_client_auth_type_t auth_type)`

Set http request auth_type.

**Return**
- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] client: The esp_http_client handle
- [in] auth_type: The esp_http_client auth type

`int esp_http_client_get_errno(esp_http_client_handle_t client)`

Get HTTP client session errno.

**Return**
- (-1) if invalid argument
- errno

**Parameters**
- [in] client: The esp_http_client handle

`esp_err_t esp_http_client_set_method(esp_http_client_handle_t client, esp_http_client_method_t method)`

Set http request method.

**Return**
- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] client: The esp_http_client handle
- [in] method: The method

`esp_err_t esp_http_client_set_timeout_ms(esp_http_client_handle_t client, int timeout_ms)`

Set http request timeout.

**Return**
- ESP_OK
- ESP_ERR_INVALID_ARG
Parameters
- [in] client: The esp_http_client handle
- [in] timeout_ms: The timeout value

```
esp_err_t esp_http_client_delete_header (esp_http_client_handle_t client, const char *key)
```
Delete http request header.
Return
- ESP_OK
- ESP_FAIL
Parameters
- [in] client: The esp_http_client handle
- [in] key: The key

```
esp_err_t esp_http_client_open (esp_http_client_handle_t client, int write_len)
```
This function will be open the connection, write all header strings and return.
Return
- ESP_OK
- ESP_FAIL
Parameters
- [in] client: The esp_http_client handle
- [in] write_len: HTTP Content length need to write to the server

```
int esp_http_client_write (esp_http_client_handle_t client, const char *buffer, int len)
```
This function will write data to the HTTP connection previously opened by esp_http_client_open()
Return
- (-1) if any errors
- Length of data written
Parameters
- [in] client: The esp_http_client handle
- buffer: The buffer
- [in] len: This value must not be larger than the write_len parameter provided to esp_http_client_open()

```
int64_t esp_http_client_fetch_headers (esp_http_client_handle_t client)
```
This function need to call after esp_http_client_open, it will read from http stream, process all receive headers.
Return
- (0) if stream doesn’ t contain content-length header, or chunked encoding (checked by esp_http_client_is_chunked_response)
- (-1: ESP_FAIL) if any errors
- Download data length defined by content-length header
Parameters
- [in] client: The esp_http_client handle

```
bool esp_http_client_is_chunked_response (esp_http_client_handle_t client)
```
Check response data is chunked.
Return true or false
Parameters
- [in] client: The esp_http_client handle

```
int esp_http_client_read (esp_http_client_handle_t client, char *buffer, int len)
```
Read data from http stream.
Return
- (-1) if any errors
- Length of data was read
Parameters
- [in] client: The esp_http_client handle
- buffer: The buffer
- [in] len: The length
int esp_http_client_get_status_code(esp_http_client_handle_t client)

Get http response status code, the valid value if this function invoke after esp_http_client_perform

Return Status code

Parameters
• [in] client: The esp_http_client handle

int64_t esp_http_client_get_content_length(esp_http_client_handle_t client)

Get http response content length (from header Content-Length) the valid value if this function invoke after esp_http_client_perform

Return
• (-1) Chunked transfer
• Content-Length value as bytes

Parameters
• [in] client: The esp_http_client handle

esp_err_t esp_http_client_close(esp_http_client_handle_t client)

Close http connection, still kept all http request resources.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] client: The esp_http_client handle

esp_err_t esp_http_client_cleanup(esp_http_client_handle_t client)

This function must be the last function to call for an session. It is the opposite of the esp_http_client_init function and must be called with the same handle as input that a esp_http_client_init call returned. This might close all connections this handle has used and possibly has kept open until now. Don’t call this function if you intend to transfer more files, re-using handles is a key to good performance with esp_http_client.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] client: The esp_http_client handle

esp_http_client_transport_t esp_http_client_get_transport_type(esp_http_client_handle_t client)

Get transport type.

Return
• HTTP_TRANSPORT_UNKNOWN
• HTTP_TRANSPORT_OVER_TCP
• HTTP_TRANSPORT_OVER_SSL

Parameters
• [in] client: The esp_http_client handle

esp_err_t esp_http_client_set_redirection(esp_http_client_handle_t client)

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] client: The esp_http_client handle

void esp_http_client_add_auth(esp_http_client_handle_t client)

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

Note There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.
Parameters
• [in] client: The esp_http_client handle

bool esp_http_client_is_complete_data_received(esp_http_client_handle_t client)
Checks if entire data in the response has been read without any error.

Return
• true
• false

Parameters
• [in] client: The esp_http_client handle

int esp_http_client_read_response(esp_http_client_handle_t client, char *buffer, int len)
Helper API to read larger data chunks This is a helper API which internally calls esp_http_client_read multiple times till the end of data is reached or till the buffer gets full.

Return
• Length of data was read

Parameters
• [in] client: The esp_http_client handle
• buffer: The buffer
• [in] len: The buffer length

esp_err_t esp_http_client_flush_response(esp_http_client_handle_t client, int *len)
Process all remaining response data This uses an internal buffer to repeatedly receive, parse, and discard response data until complete data is processed. As no additional user-supplied buffer is required, this may be preferrable to esp_http_client_read_response in situations where the content of the response may be ignored.

Return
• ESP_OK If successful, len will have discarded length
• ESP_FAIL If failed to read response
• ESP_ERR_INVALID_ARG If the client is NULL

Parameters
• [in] client: The esp_http_client handle
• len: Length of data discarded

esp_err_t esp_http_client_get_url(esp_http_client_handle_t client, char *url, const int len)
Get URL from client.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] client: The esp_http_client handle
• [inout] url: The buffer to store URL
• [in] len: The buffer length

esp_err_t esp_http_client_get_chunk_length(esp_http_client_handle_t client, int *len)
Get Chunk-Length from client.

Return
• ESP_OK If successful, len will have length of current chunk
• ESP_FAIL If the server is not a chunked server
• ESP_ERR_INVALID_ARG If the client or len are NULL

Parameters
• [in] client: The esp_http_client handle
• [out] len: Variable to store length

Structures
struct esp_http_client_event
HTTP Client events data.
Public Members

`esp_http_client_event_id_t event_id`
- event_id, to know the cause of the event

`esp_http_client_handle_t client`
- esp_http_client_handle_t context

void *data
- data of the event

int data_len
- data length of data

void *user_data
- user_data context, from `esp_http_client_config_t user_data`

char *header_key
- For HTTP_EVENT_ON_HEADER event_id, it’s store current http header key

char *header_value
- For HTTP_EVENT_ON_HEADER event_id, it’s store current http header value

`struct esp_http_client_config_t`
- HTTP configuration.

Public Members

const char *url
- HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

const char *host
- Domain or IP as string

int port
- Port to connect, default depend on esp_http_client_transport_t (80 or 443)

const char *username
- Using for Http authentication

const char *password
- Using for Http authentication

`esp_http_client_auth_type_t auth_type`
- Http authentication type, see `esp_http_client_auth_type_t`

const char *path
- HTTP Path, if not set, default is /

const char *query
- HTTP query

const char *cert_pem
- SSL server certification, PEM format as string, if the client requires to verify server

size_t cert_len
- Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert_pem
- SSL client certification, PEM format as string, if the server requires to verify client

size_t client_cert_len
- Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

const char *client_key_pem
- SSL client key, PEM format as string, if the server requires to verify client
size_t client_key_len
Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

const char *client_key_password
Client key decryption password string

size_t client_key_password_len
String length of the password pointed to by client_key_password

const char *user_agent
The User Agent string to send with HTTP requests

esp_http_client_method_t method
HTTP Method

int timeout_ms
Network timeout in milliseconds

bool disable_auto_redirect
Disable HTTP automatic redirects

int max_redirection_count
Max number of redirections on receiving HTTP redirect status code, using default value if zero

int max_authorization_retries
Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables authorization retry if -1

http_event_handle_cb event_handler
HTTP Event Handle

esp_http_client_transport_t transport_type
HTTP transport type, see esp_http_client_transport_t

int buffer_size
HTTP receive buffer size

int buffer_size_tx
HTTP transmit buffer size

void *user_data
HTTP user_data context

bool is_async
Set asynchronous mode, only supported with HTTPS for now

bool use_global_ca_store
Use a global ca_store for all the connections in which this bool is set.

bool skip_cert_common_name_check
Skip any validation of server certificate CN field

esp_err_t (*crt_bundle_attach)(void *conf)
Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

bool keep_alive_enable
Enable keep-alive timeout

int keep_alive_idle
Keep-alive idle time. Default is 5 (second)

int keep_alive_interval
Keep-alive interval time. Default is 5 (second)

int keep_alive_count
Keep-alive packet retry send count. Default is 3 counts
**Chapter 2. API Reference**

```c
struct ifreq *if_name
```

The name of interface for data to go through. Use the default interface without setting

**Macros**

- `DEFAULT_HTTP_BUF_SIZE`
  - Starting number of HTTP error codes
- `ESP_ERR_HTTP_BASE`
  - The error exceeds the number of HTTP redirects
- `ESP_ERR_HTTP_MAX_REDIRECT`
  - Error open the HTTP connection
- `ESP_ERR_HTTP_WRITE_DATA`
  - Error write HTTP data
- `ESP_ERR_HTTP_FETCH_HEADER`
  - Error read HTTP header from server
- `ESP_ERR_HTTP_INVALID_TRANSPORT`
  - There are no transport support for the input scheme
- `ESP_ERR_HTTP_CONNECTING`
  - HTTP connection hasn’t been established yet
- `ESP_ERR_HTTP_EAGAIN`
  - Mapping of errno EAGAIN to esp_err_t
- `ESP_ERR_HTTP_CONNECTION_CLOSED`
  - Read FIN from peer and the connection closed

**Type Definitions**

```c
typedef struct esp_http_client *esp_http_client_handle_t

typedef struct esp_http_client_event *esp_http_client_event_handle_t

typedef struct esp_http_client_event esp_http_client_event_t
```

HTTP Client events data.

```c
typedef esp_err_t (*http_event_handle_cb)(esp_http_client_event_t *evt)
```

**Enumerations**

```c
enum esp_http_client_event_id_t
```

HTTP Client events id.

*Values:*

- `HTTP_EVENT_ERROR = 0`
  - This event occurs when there are any errors during execution
- `HTTP_EVENT_ON_CONNECTED`
  - Once the HTTP has been connected to the server, no data exchange has been performed
- `HTTP_EVENT_HEADERS_SENT`
  - After sending all the headers to the server
- `HTTP_EVENT_HEADER_SENT = HTTP_EVENT_HEADERS_SENT`
  - This header has been kept for backward compatibility and will be deprecated in future versions esp-idf
- `HTTP_EVENT_ON_HEADER`
  - Occurs when receiving each header sent from the server
- `HTTP_EVENT_ON_DATA`
  - Occurs when receiving data from the server, possibly multiple portions of the packet
HTTP_EVENT_ON_FINISH
Occurs when finish a HTTP session

HTTP_EVENT_DISCONNECTED
The connection has been disconnected

HTTP_EVENT_REDIRECT
Intercepting HTTP redirects to handle them manually

enum esp_http_client_transport_t
HTTP Client transport.

Values:

HTTP_TRANSPORT_UNKNOWN = 0x0
Unknown

HTTP_TRANSPORT_OVER_TCP
Transport over tcp

HTTP_TRANSPORT_OVER_SSL
Transport over ssl

enum esp_http_client_method_t
HTTP method.

Values:

HTTP_METHOD_GET = 0
HTTP GET Method

HTTP_METHOD_POST
HTTP POST Method

HTTP_METHOD_PUT
HTTP PUT Method

HTTP_METHOD_PATCH
HTTP PATCH Method

HTTP_METHOD_DELETE
HTTP DELETE Method

HTTP_METHOD_HEAD
HTTP HEAD Method

HTTP_METHOD_NOTIFY
HTTP NOTIFY Method

HTTP_METHOD_SUBSCRIBE
HTTP SUBSCRIBE Method

HTTP_METHOD_UNSUBSCRIBE
HTTP UNSUBSCRIBE Method

HTTP_METHOD_OPTIONS
HTTP OPTIONS Method

HTTP_METHOD_COPY
HTTP COPY Method

HTTP_METHOD_MOVE
HTTP MOVE Method

HTTP_METHOD_LOCK
HTTP LOCK Method

HTTP_METHOD_UNLOCK
HTTP UNLOCK Method
HTTP_METHOD_PROPFIND
HTTP PROPFIND Method

HTTP_METHOD_PROPPATCH
HTTP PROPPATCH Method

HTTP_METHOD_MKCOL
HTTP MKCOL Method

HTTP_METHOD_MAX

enum esp_http_client_auth_type_t
HTTP Authentication type.
Values:

HTTP_AUTH_TYPE_NONE = 0
No authentication

HTTP_AUTH_TYPE_BASIC
HTTP Basic authentication

HTTP_AUTH_TYPE_DIGEST
HTTP Digest authentication

enum HttpStatus_Code
Enum for the HTTP status codes.
Values:

HttpStatus_Ok = 200
HttpStatus_MultipleChoices = 300
HttpStatus_MovedPermanently = 301
HttpStatus_Found = 302
HttpStatus_TemporaryRedirect = 307
HttpStatus_BadRequest = 400
HttpStatus_Unauthorized = 401
HttpStatus_Forbidden = 403
HttpStatus_NotFound = 404
HttpStatus_InternalError = 500

2.2.6 ESP Local Control

Overview

ESP Local Control (esp_local_ctrl) component in ESP-IDF provides capability to control an ESP device over Wi-Fi + HTTPS or BLE. It provides access to application defined properties that are available for reading / writing via a set of configurable handlers.

Initialization of the esp_local_ctrl service over BLE transport is performed as follows:

```c
esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = & (protocomm_ble_config_t) {
            .device_name = SERVICE_NAME,
            .service_uuid = {
                /* LSB <---------------------------------------
                * ---------------------------------------> MSB */
```

(continues on next page)
Similarly for HTTPS transport:

```c
/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char cacert_pem_start[] asm("_binary_cacert_pem__start");
extern const unsigned char cacert_pem_end[] asm("_binary_cacert_pem_end");
https_conf.cacert_pem = cacert_pem_start;
https_conf.cacert_len = cacert_pem_end - cacert_pem_start;

/* Load server private key */
extern const unsigned char prvtkey_pem_start[] asm("_binary_prvtkey_pem__start");
extern const unsigned char prvtkey_pem_end[] asm("_binary_prvtkey_pem__end");
https_conf.prvtkey_pem = prvtkey_pem_start;
https_conf.prvtkey_len = prvtkey_pem_end - prvtkey_pem_start;

esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_HTTPD,
    .transport_config = {
        .httpd = &https_conf
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .pop = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};
/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));
```

(continues on next page)
You may set security for transport in ESP local control using following options:

1.  **PROTOCOM_SEC1**: specifies that end to end encryption is used.
2.  **PROTOCOM_SEC0**: specifies that data will be exchanged as a plain text.
3.  **PROTOCOM_SEC_CUSTOM**: you can define your own security requirement. Please note that you will also have to provide `custom_handle` of type `protocomm_security_t *` in this context.

### Creating a property

Now that we know how to start the `esp_local_ctrl` service, let’s add a property to it. Each property must have a unique `name` (string), a `type` (e.g. enum), `flags` (bit fields) and `size`.

The `size` is to be kept 0, if we want our property value to be of variable length (e.g. if it’s a string or bytestream). For fixed length property value data-types, like int, float, etc., setting the `size` field to the right value, helps `esp_local_ctrl` to perform internal checks on arguments received with write requests.

The interpretation of `type` and `flags` fields is totally up to the application, hence they may be used as enumerations, bit-fields, or even simple integers. One way is to use `type` values to classify properties, while `flags` to specify characteristics of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines `TYPE_TIMESTAMP` and `READONLY`, which are used for setting the `type` and `flags` fields here.

```c
/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name = "timestamp",
    .type = TYPE_TIMESTAMP,
    .size = sizeof(int32_t),
    .flags = READONLY,
    .ctx = func_get_time,
    .ctx_free_fn = NULL
};
/* Now register the property */
esp_local_ctrl_add_property(&timestamp);
```

Also notice that there is a `ctx` field, which is set to point to some custom `func_get_time()`. This can be used inside the property `get / set` handlers to retrieve timestamp.

Here is an example of `get_prop_values()` handler, which is used for retrieving the timestamp.

```c
static esp_err_t get_property_values(size_t props_count, const esp_local_ctrl_prop_t *props, esp_local_ctrl_prop_val_t *prop_values, void *usr_ctx) {
    for (uint32_t i = 0; i < props_count; i++) {
        ESP_LOGI(TAG, "Reading %s", props[i].name);
        if (props[i].type == TYPE_TIMESTAMP) {
            /* Obtain the timer function from ctx */
            int32_t (*func_get_time)(void) = props[i].ctx;
```

(continues on next page)
/* Use static variable for saving the value. 
* This is essential because the value has to be 
* valid even after this function returns. 
* Alternative is to use dynamic allocation 
* and set the free_fn field */
static int32_t ts = func_get_time();
prop_values[i].data = &ts;
}
}
return ESP_OK;
}

Here is an example of `set_prop_values()` handler. Notice how we restrict from writing to read-only properties.

```c
static esp_err_t set_property_values(size_t props_count, const esp_local_ctrl_prop_t *props,
                                    const esp_local_ctrl_prop_val_t *prop_values,
                                    void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s", props[i].name);
            return ESP_ERR_INVALID_ARG;
        } else {
            ESP_LOGI(TAG, "Setting %s", props[i].name);
            /* For keeping it simple, lets only log the incoming data */
            ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data, prop_values[i].size, ESP_LOG_INFO);
        }
    }
    return ESP_OK;
}
```

For complete example see `protocols/esp_local_ctrl`

Client Side Implementation

The client side implementation will have establish a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the `esp_local_ctrl` service. The service will translate these messages into requests and then call the appropriate handlers (set / get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the `esp_local_ctrl` service:

1. `get_prop_count` : This should simply return the total number of properties supported by the service
2. `get_prop_values` : This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices
3. `set_prop_values` : This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call `get_prop_count` and then `get_prop_values`, hence form an index to name mapping for all properties. Now when calling `set_prop_values` for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index to name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by `esp_local_ctrl` are listed below:
Table 6: Endpoints provided by ESP Local Control

<table>
<thead>
<tr>
<th>Endpoint Name (BLE + GATT Server)</th>

</table>

API Reference

Header File

- components/esp_local_ctrl/include/esp_local_ctrl.h

Functions

(/^
 const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_ble (void)
  Function for obtaining BLE transport mode.
,const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_httpd (void)
  Function for obtaining HTTPD transport mode.
/

esp_err_t esp_local_ctrl_start (const esp_local_ctrl_config_t *config)
  Start local control service.

  Return
  * ESP_OK : Success
  * ESP_FAIL : Failure

  Parameters
  * [in] config : Pointer to configuration structure

esp_err_t esp_local_ctrl_stop (void)
  Stop local control service.

esp_err_t esp_local_ctrl_add_property (const esp_local_ctrl_prop_t *prop)
  Add a new property.

  This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option max_properties

  Return
  * ESP_OK : Success
  * ESP_FAIL : Failure

  Parameters
  * [in] prop : Property description structure

esp_err_t esp_local_ctrl_remove_property (const char *name)
  Remove a property.

  This finds a property by name, and releases the internal resources which are associated with it.

  Return
  * ESP_OK : Success
  * ESP_ERR_NOT_FOUND : Failure

  Parameters
  * [in] name : Name of the property to remove

const esp_local_ctrl_prop_t *esp_local_ctrl_get_property (const char *name)
  Get property description structure by name.
This API may be used to get a property’s context structure `esp_local_ctrl_prop_t` when its name is known.

**Return**
- Pointer to property
- NULL if not found

**Parameters**
- [in] name: Name of the property to find

```c
esp_err_t esp_local_ctrl_set_handler(const char *ep_name, protocomm_req_handler_t handler, void *user_ctx)
```

Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

**Note** In case of BLE transport the names and uuids of all custom endpoints must be provided beforehand as a part of the `protocomm_ble_config_t` structure set in `esp_local_ctrl_config_t`, and passed to `esp_local_ctrl_start()`.

**Return**
- ESP_OK : Success
- ESP_FAIL : Failure

**Parameters**
- [in] ep_name: Name of the endpoint
- [in] handler: Endpoint handler function
- [in] user_ctx: User data

**Unions**

```c
union esp_local_ctrl_transport_config_t
```

#include <esp_local_ctrl.h> Transport mode (BLE / HTTPD) configuration.

**Public Members**

```c
esp_local_ctrl_transport_config_ble_t *ble
```

This is same as `protocomm_ble_config_t`. See `protocomm_ble.h` for available configuration parameters.

```c
esp_local_ctrl_transport_config_httpd_t *httpd
```

This is same as `httpd_ssl_config_t`. See `esp_https_server.h` for available configuration parameters.

**Structures**

```c
struct esp_local_ctrl_prop
```

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

**Public Members**

```c
cchar *name
```

Unique name of property

```c
uint32_t type
```

Type of property. This may be set to application defined enums

```c
size_t size
```

Size of the property value, which:
Chapter 2. API Reference

- if zero, the property can have values of variable size
- if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by esp_local_ctrl when setting the value of such a property

**uint32_t flags**
Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

**void **
Pointer to some context data relevant for this property. This will be available for use inside the get_prop_values and set_prop_values handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the esp_local_ctrl service is stopped.

**void (*ctx_free_fn)(void *ctx)**
Function used by esp_local_ctrl to internally free the property context when esp_local_ctrl_remove_property() or esp_local_ctrl_stop() is called.

**struct esp_local_ctrl_prop_val**
Property value data structure. This gets passed to the get_prop_values() and set_prop_values() handlers for the purpose of retrieving or setting the present value of a property.

**Public Members**

**void *data**
Pointer to memory holding property value

**size_t size**
Size of property value

**void (*free_fn)(void *data)**
This may be set by the application in get_prop_values() handler to tell esp_local_ctrl to call this function on the data pointer above, for freeing its resources after sending the get_prop_values response.

**struct esp_local_ctrl_handlers**
Handlers for receiving and responding to local control commands for getting and setting properties.

**Public Members**

**esp_err_t (**get_prop_values**)(size_t props_count, const esp_local_ctrl_prop_t props[], esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)**
Handler function to be implemented for retrieving current values of properties.

**Note** If any of the properties have fixed sizes, the size field of corresponding element in prop_values need to be set

**Return** Returning different error codes will convey the corresponding protocol level errors to the client

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : InvalidArgument
- ESP_ERR_INVALID_STATE : InvalidProto
- All other error codes : InternalError

**Parameters**
- [in] props_count: Total elements in the props array
- [in] props: Array of properties, the current values for which have been requested by the client
- [out] prop_values: Array of empty property values, the elements of which need to be populated with the current values of those properties specified by props argument
- [in] usr_ctx: This provides value of the usr_ctx field of esp_local_ctrl_handlers_t structure
esp_err_t (*set_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[], const esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)

Handler function to be implemented for changing values of properties.

**Note** If any of the properties have variable sizes, the size field of the corresponding element in prop_values must be checked explicitly before making any assumptions on the size.

**Return** Returning different error codes will convey the corresponding protocol level errors to the client:
- ESP_OK : Success
- ESP_ERR_INVALID_ARG : InvalidArgument
- ESP_ERR_INVALID_STATE : InvalidProto
- All other error codes : InternalError

**Parameters**
- [in] props_count: Total elements in the props array
- [in] props: Array of properties, the values for which the client requests to change
- [in] prop_values: Array of property values, the elements of which need to be used for updating those properties specified by props argument
- [in] usr_ctx: This provides value of the usr_ctx field of esp_local_ctrl_handlers_t structure

void *usr_ctx
Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the esp_local_ctrl service, and freed only when the service is stopped.

void (*usr_ctx_free_fn)(void *usr_ctx)
Pointer to function which will be internally invoked on usr_ctx for freeing the context resources when esp_local_ctrl_stop() is called.

**struct esp_local_ctrl_proto_sec_cfg**
Protocom security configs

**Public Members**

*esp_local_ctrl_proto_sec_t* version
This sets protocom security version, sec0/sec1 or custom If custom, user must provide handle via proto_sec_custom_handle below

void *custom_handle
Custom security handle if security is set custom via proto_sec above This handle must follow protocomm_security_t signature

void *pop
Proof of possession to be used for local control. Could be NULL.

**struct esp_local_ctrl_config**
Configuration structure to pass to esp_local_ctrl_start()

**Public Members**

*const esp_local_ctrl_transport_t* transport
Transport layer over which service will be provided

del* esp_local_ctrl_transport_config_t transport_config
Transport layer over which service will be provided

*esp_local_ctrl_proto_sec_cfg_t* proto_sec
Security version and POP

*esp_local_ctrl_handlers_t* handlers
Register handlers for responding to get/set requests on properties
size_t max_properties
This limits the number of properties that are available at a time

Macros
ESP_LOCAL_CTRL_TRANSPORT_BLE
ESP_LOCAL_CTRL_TRANSPORT_HTTPD

Type Definitions
typedef struct esp_local_ctrl_prop esp_local_ctrl_prop_t
Property description data structure, which is to be populated and passed to the
esp_local_ctrl_add_property() function.
Once a property is added, its structure is available for read-only access inside get_prop_values() and
set_prop_values() handlers.
typedef struct esp_local_ctrl_prop_val esp_local_ctrl_prop_val_t
Property value data structure. This gets passed to the get_prop_values() and set_prop_values() handlers for the purpose of retrieving or setting the present value of a property.
typedef struct esp_local_ctrl_handlers esp_local_ctrl_handlers_t
Handlers for receiving and responding to local control commands for getting and setting properties.
typedef struct esp_local_ctrl_transport esp_local_ctrl_transport_t
Transport mode (BLE / HTTPD) over which the service will be provided.
This is forward declaration of a private structure, implemented internally by esp_local_ctrl.
typedef struct protocomm_ble_config esp_local_ctrl_transport_config_ble_t
Configuration for transport mode BLE.
This is a forward declaration for protocomm_ble_config_t. To use this, application must set CON-
FIG_BT_BLUEDROID_ENABLED and include protocomm_ble.h.
typedef struct httpd_ssl_config esp_local_ctrl_transport_config_httpd_t
Configuration for transport mode HTTPD.
This is a forward declaration for httpd_ssl_config_t. To use this, application must set CON-
FIG_ESP_HTTPS_SERVER_ENABLE and include esp_https_server.h

typedef enum esp_local_ctrl_proto_sec esp_local_ctrl_proto_sec_t
Security types for esp_local_control.
typedef struct esp_local_ctrl_proto_sec_cfg esp_local_ctrl_proto_sec_cfg_t
Protocom security configs
typedef struct esp_local_ctrl_config esp_local_ctrl_config_t
Configuration structure to pass to esp_local_ctrl_start()

### 2.2.7 ESP Serial Slave Link

#### Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The `esp_serial_slave_link` component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an `esp_serial_slave_link` device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

#### Espressif Device protocols

For more details about Espressif device protocols, see the following documents.

#### ESP SPI Slave HD (Half Duplex) Mode Protocol

#### Introduction

In the half duplex mode, the master has to use the protocol defined by the slave to communicate with the slave. Each transaction may consist of the following phases (list by the order they should exist):

- **Command**: 8-bit, master to slave
  This phase determines the rest phases of the transactions. See Supported Commands.

- **Address**: 8-bit, master to slave, optional
  For some commands (WRBUF, RDBUF), this phase specifies the address of the shared buffer to write to/read from. For other commands with this phase, they are meaningless but still have to exist in the transaction.

- **Dummy**: 8-bit, floating, optional
  This phase is the turnaround time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to the master.

- **Data**: variable length, the direction is also determined by the command.
  This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The direction means which side (master or slave) controls the MOSI, MISO, WP, and HD pins.

#### Data IO Modes

In some IO modes, more data wires can be used to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in the 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here are the modes supported by the ESP32-S2 SPI slave and the wire number used in corresponding modes.

<table>
<thead>
<tr>
<th>Mode</th>
<th>command WN</th>
<th>address WN</th>
<th>dummy cycles</th>
<th>data WN</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-bit</td>
<td>1</td>
<td>1</td>

<td>4</td>
<td>4</td>
<td>4</td>
</tr>
<tr>
<td>QPI</td>
<td>4</td>
<td>4</td>
<td>4</td>
<td>4</td>
</tr>
</tbody>
</table>
Normally, which mode is used is determined by the command sent by the master (See Supported Commands), except the QPI mode.

**QPI Mode**  The QPI mode is a special state of the SPI Slave. The master can send the ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it’s not compatible with the normal modes. The master should only send QPI commands when the slave is in QPI mode. To exit from the QPI mode, master can send the EXQPI command.

**Supported Commands**  
*Note:* The command name is in a master-oriented direction. For example, WRBUF means master writes the buffer of slave.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Command</th>
<th>Address</th>
<th>Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>WRBUF</td>
<td>Write buffer</td>
<td>0x01</td>
<td>Buf addr</td>
<td>master to slave, no longer than buffer size</td>
</tr>
<tr>
<td>RDBUF</td>
<td>Read buffer</td>
<td>0x02</td>
<td>Buf addr</td>
<td>slave to master, no longer than buffer size</td>
</tr>
<tr>
<td>WRDMA</td>
<td>Write DMA</td>
<td>0x03</td>
<td>8 bits</td>
<td>master to slave, no longer than length provided by slave</td>
</tr>
<tr>
<td>RDDMA</td>
<td>Read DMA</td>
<td>0x04</td>
<td>8 bits</td>
<td>slave to master, no longer than length provided by slave</td>
</tr>
<tr>
<td>SEG_DONE</td>
<td>Segments done</td>
<td>0x05</td>
<td>•</td>
<td>•</td>
</tr>
<tr>
<td>ENQPI</td>
<td>Enter QPI mode</td>
<td>0x06</td>
<td>•</td>
<td>•</td>
</tr>
<tr>
<td>WR_DONE</td>
<td>Write segments done</td>
<td>0x07</td>
<td>•</td>
<td>•</td>
</tr>
<tr>
<td>CMD8</td>
<td>Interrupt</td>
<td>0x08</td>
<td>•</td>
<td>•</td>
</tr>
<tr>
<td>CMD9</td>
<td>Interrupt</td>
<td>0x09</td>
<td>•</td>
<td>•</td>
</tr>
<tr>
<td>CMDA</td>
<td>Interrupt</td>
<td>0x0A</td>
<td>•</td>
<td>•</td>
</tr>
<tr>
<td>EXQPI</td>
<td>Exit QPI mode</td>
<td>0xDD</td>
<td>•</td>
<td>•</td>
</tr>
</tbody>
</table>

Moreover, WRBUF, RDBUF, WRDMA, RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0xA1 means WRBUF in QIO mode.

<table>
<thead>
<tr>
<th>Mode</th>
<th>Mask</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-bit</td>
<td>0x00</td>
</tr>
<tr>
<td>DOUT</td>
<td>0x10</td>
</tr>
<tr>
<td>DIO</td>
<td>0x50</td>
</tr>
<tr>
<td>QOUT</td>
<td>0x20</td>
</tr>
<tr>
<td>QIO</td>
<td>0xA0</td>
</tr>
<tr>
<td>QPI</td>
<td>0xA0</td>
</tr>
</tbody>
</table>
Segment Transaction Mode  Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave load onto the DMA, the master is allowed to read or write in segments. This way the master doesn’t have to prepare a large buffer as the size of data provided by the slave. After the master finishes reading/writing a buffer, it has to send the corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is WRDONE (0x07) for the WRDMA and CMD8 (0x08) for the RDDMA.

Here’s an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA
2. The master do seven RDDMA transactions, each of them is 512 bytes long, and reads the first 3584 bytes from the slave
3. The master do the last RDDMA transaction of 512 bytes (equal, longer, or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.
4. The master sends CMD8 to the slave
5. The slave loads another 4092 bytes of data onto the RDDMA
6. The master can start new reading transactions after it sends the CMD8

Terminology

- ESSL: Abbreviation for ESP Serial Slave Link, the component described by this document.
- Master: The device running the esp_serial_slave_link component.
- ESSL device: a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- ESSL device handle: a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.
  The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- ESP slave: the slave device connected to the bus, which ESSL component is designed to communicate with.
- Bus: The bus over which the master and the slave communicate with each other.
- Slave protocol: The special communication protocol specified by Espressif HW/SW over the bus.
- TX buffer num: a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- RX data size: a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

Services provided by ESP slave

There are some common services provided by the Espressif slaves:

1. Tohost Interrupts: The slave can inform the master about certain events by the interrupt line. (optional)
2. Frhost Interrupts: The master can inform the slave about certain events.
3. Tx FIFO (master to slave): the slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.
   The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.
4. Rx FIFO (slave to master): the slave can receive data from the master in units of receiving buffers.
   The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. Shared registers: the master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave’s model. See SPI Slave Capabilities of Espressif chips for more details.
Initialization of ESP Serial Slave Link

**ESP SDIO Slave**  The ESP SDIO slave link (ESSL SDIO) devices relies on the sdmmc component. It includes the usage of communicating with ESP SDIO Slave device via SDSPI feature. The ESSL device should be initialized as below:

1. Initialize a sdmmc card (see `Document of SDMMC driver` structure.
2. Call `sdmmc_card_init()` to initialize the card.
3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.
4. Call `essl_init()` to do initialization of the SDIO part.
5. Call `essl_wait_for_ready()` to wait for the slave to be ready.

**ESP SPI Slave**  

*Note:* If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the *SDIO interface* instead. Hasn’t been supported yet.

**APIs**

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

**Tohost Interrupts (optional)**

1. Call `essl_get_intr_ena()` to know which events will trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that will trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.

**Frhost Interrupts**

1. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.

**TX FIFO**

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it try to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essl_send_packet()` to send data to the slave.

**RX FIFO**

1. Call `essl_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it will update the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_data_size` keeps 0, until timeout.
2. Call `essl_get_packet()` to receive data from the slave.

**Reset counters (Optional)**  Call `essl_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.
Chapter 2. API Reference

Application Example

The example below shows how ESP32-C3 SDIO host and slave communicate with each other. The host use the ESSL SDIO.

peripherals/sdio.
Please refer to the specific example README.md for details.

API Reference

Header File

• components/esp_serial_slave_link/include/esp_serial_slave_link/essl.h

Functions

esp_err_t essl_init (essl_handle_t handle, uint32_t wait_ms)
Initialize the slave.

Return
• ESP_OK: If success
• ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
• Other value returned from lower layer init.

Parameters
• handle: Handle of an ESSL device.
• wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

esp_err_t essl_wait_for_ready (essl_handle_t handle, uint32_t wait_ms)
Wait for interrupt of an ESSL slave device.

Return
• ESP_OK: If success
• ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
• One of the error codes from SDMMC host controller

Parameters
• handle: Handle of an ESSL device.
• wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

esp_err_t essl_get_tx_buffer_num (essl_handle_t handle, uint32_t *out_tx_num, uint32_t wait_ms)
Get buffer num for the host to send data to the slave. The buffers are size of buffer_size.

Return
• ESP_OK: Success
• ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
• One of the error codes from SDMMC/SPI host controller

Parameters
• handle: Handle of an ESSL device.
• out_tx_num: Output of buffer num that host can send data to ESSL slave.
• wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

esp_err_t essl_get_rx_data_size (essl_handle_t handle, uint32_t *out_rx_size, uint32_t wait_ms)
Get the size, in bytes, of the data that the ESSL slave is ready to send

Return
• ESP_OK: Success
• ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
• One of the error codes from SDMMC/SPI host controller

Parameters
• handle: Handle of an ESSL device.
• out_rx_size: Output of data size to read from slave, in bytes
• wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.
**Chapter 2. API Reference**

**esp_err_t essl_reset_cnt (essl_handle_t handle)**
Reset the counters of this component. Usually you don’t need to do this unless you know the slave is reset.

**Return**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init.

**Parameters**
- handle: Handle of an ESSL device.

**esp_err_t essl_send_packet (essl_handle_t handle, const void *start, size_t length, uint32_t wait_ms)**
Send a packet to the ESSL Slave. The Slave receives the packet into buffers whose size is buffer_size (configured during initialization).

**Return**
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init or other argument is not valid.
- ESP_ERR_TIMEOUT: No buffer to use, or error from SDMMC host controller.
- ESP_ERR_NOT_FOUND: Slave is not ready for receiving.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

**Parameters**
- handle: Handle of an ESSL device.
- start: Start address of the packet to send
- length: Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**esp_err_t essl_get_packet (essl_handle_t handle, void *out_data, size_t size, size_t *out_length, uint32_t wait_ms)**
Get a packet from ESSL slave.

**Return**
- ESP_OK: Success: All the data has been read from the slave.
- ESP_ERR_INVALID_ARG: Invalid argument, The handle is not initialized or the other arguments are invalid.
- ESP_ERR_NOT_FINISHED: Read was successful, but there is still data remaining.
- ESP_ERR_NOT_FOUND: Slave is not ready to send data.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

**Parameters**
- handle: Handle of an ESSL device.
- [out] out_data: Data output address
- size: The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns ESP_ERR_NOT_FINISHED
- [out] out_length: Output of length the data actually received from slave.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**esp_err_t essl_write_reg (essl_handle_t handle, uint8_t addr, uint8_t value, uint8_t* value_o, uint32_t wait_ms)**
Write general purpose R/W registers (8-bit) of ESSL slave.

**Note**
sdio 28-31 are reserved, the lower API helps to skip.

**Return**
- ESP_OK: Success
- One of the error codes from SDMMC/SPI host controller

**Parameters**
- handle: Handle of an ESSL device.
- addr: Address of register to write. For SDIO, valid address: 0-59. For SPI, see essl_spi.h
- value: Value to write to the register.
- value_o: Output of the returned written value.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.
### `esp_err_t essl_read_reg(essl_handle_t handle, uint8_t add, uint8_t* value_o, uint32_t wait_ms)`

Read general purpose R/W registers (8-bit) of ESSL slave.

**Return**
- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

**Parameters**
- **handle**: Handle of a ESSL device.
- **add**: Address of register to read. For SDIO, Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read). For SPI, see `essl_spi.h`
- **value_o**: Output value read from the register.
- **wait_ms**: Millisecond to wait before timeout, will not wait at all if set to 0-9.

### `esp_err_t essl_wait_int (essl_handle_t handle, uint32_t wait_ms)`

wait for an interrupt of the slave

**Return**
- ESP_OK: If interrupt is triggered.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- ESP_ERR_TIMEOUT: No interrupts before timeout.

**Parameters**
- **handle**: Handle of an ESSL device.
- **wait_ms**: Millisecond to wait before timeout, will not wait at all if set to 0-9.

### `esp_err_t essl_clear_intr (essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)`

Clear interrupt bits of ESSL slave. All the bits set in the mask will be cleared, while other bits will stay the same.

**Return**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Parameters**
- **handle**: Handle of an ESSL device.
- **intr_mask**: Mask of interrupt bits to clear.
- **wait_ms**: Millisecond to wait before timeout, will not wait at all if set to 0-9.

### `esp_err_t essl_get_intr (essl_handle_t handle, uint32_t* intr_raw, uint32_t* intr_st, uint32_t wait_ms)`

Get interrupt bits of ESSL slave.

**Return**
- ESP_OK: Success
- ESP_INVALID_ARG: If both `intr_raw` and `intr_st` are NULL.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Parameters**
- **handle**: Handle of an ESSL device.
- **intr_raw**: Output of the raw interrupt bits. Set to NULL if only masked bits are read.
- **intr_st**: Output of the masked interrupt bits. set to NULL if only raw bits are read.
- **wait_ms**: Millisecond to wait before timeout, will not wait at all if set to 0-9.

### `esp_err_t essl_set_intr_ena (essl_handle_t handle, uint32_t ena_mask, uint32_t wait_ms)`

Set interrupt enable bits of ESSL slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

**Return**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Parameters**
- **handle**: Handle of an ESSL device.
- **ena_mask**: Mask of the interrupt bits to enable.
- **wait_ms**: Millisecond to wait before timeout, will not wait at all if set to 0-9.
**Chapter 2. API Reference**

**esp_err_t essl_get_intr_ena(essl_handle_t handle, uint32_t* ena_mask_o, uint32_t wait_ms)**

Get interrupt enable bits of ESSL slave.

**Return**
- ESP_OK: Success
- One of the error codes from SDMMC host controller

**Parameters**
- handle: Handle of an ESSL device.
- ena_mask_o: Output of interrupt bit enable mask.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**esp_err_t essl_send_slave_intr(essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)**

Send interrupts to slave. Each bit of the interrupt will be triggered.

**Return**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Parameters**
- handle: Handle of an ESSL device.
- intr_mask: Mask of interrupt bits to send to slave.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Type Definitions**

```c
typedef struct essl_dev_t *essl_handle_t
Handle of an ESSL device.
```

**Header File**

- components/esp_serial_slave_link/include/esp_serial_slave_link/essl_sdio.h

**Functions**

**esp_err_t essl_sdio_init_dev(essl_handle_t *out_handle, const essl_sdio_config_t *config)**

Initialize the ESSL SDIO device and get its handle.

**Return**
- ESP_OK: on success
- ESP_ERR_NO_MEM: memory exhausted.

**Parameters**
- out_handle: Output of the handle.
- config: Configuration for the ESSL SDIO device.

**esp_err_t essl_sdio_deinit_dev(essl_handle_t handle)**

Deinitialize and free the space used by the ESSL SDIO device.

**Return**
- ESP_OK: on success
- ESP_ERR_INVALID_ARG: wrong handle passed

**Parameters**
- handle: Handle of the ESSL SDIO device to deinit.

**Structures**

**struct essl_sdio_config_t**
Configuration for the ESSL SDIO device.

**Public Members**

```c
sdmmc_card_t *card
The initialized sdmmc card pointer of the slave.
```
int recv_buffer_size
The pre-negotiated recv buffer size used by both the host and the slave.

Header File

- components/esp_serial_slave_link/include/esp_serial_slave_link/essl_spi.h

Functions

esp_err_t essl_spi_init_dev(essl_handle_t *out_handle, const essl_spi_config_t *init_config)
Initialize the ESSL SPI device function list and get its handle.

Return
- ESP_OK: On success
- ESP_ERR_NO_MEM: Memory exhausted
- ESP_ERR_INVALID_STATE: SPI driver is not initialized
- ESP_ERR_INVALID_ARG: Wrong register ID

Parameters
- [out] out_handle: Output of the handle
- init_config: Configuration for the ESSL SPI device

esp_err_t essl_spi_deinit_dev(essl_handle_t handle)
Deinitialize the ESSL SPI device and free the memory used by the device.

Return
- ESP_OK: On success
- ESP_ERR_INVALID_STATE: ESSL SPI is not in use

Parameters
- handle: Handle of the ESSL SPI device

esp_err_t essl_spi_read_reg(void *arg, uint8_t addr, uint8_t *out_value, uint32_t wait_ms)
Read from the shared registers.

Note: The registers for Master/Slave synchronization are reserved. Do not use them. (see rx_sync_reg in essl_spi_config_t)

Return
- ESP_OK: success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The address argument is not valid. See note 1.
- or other return value from :cpp:func:spi_device_transmit.

Parameters
- arg: Context of the component. (Member arg from essl_handle_t)
- addr: Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1).
- [out] out_value: Read buffer for the shared registers.
- wait_ms: Time to wait before timeout (reserved for future use, user should set this to 0).

esp_err_t essl_spi_get_packet(void *arg, void *out_data, size_t size, uint32_t wait_ms)
Get a packet from Slave.

Return
- ESP_OK: On Success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The output data address is neither DMA capable nor 4 byte-aligned
- ESP_ERR_INVALID_SIZE: Master requires size bytes of data but Slave did not load enough bytes.

Parameters
- arg: Context of the component. (Member arg from essl_handle_t)
- [out] out_data: Output data address
- size: The size of the output data.
- wait_ms: Time to wait before timeout (reserved for future use, user should set this to 0).
**esp_err_t essl_spi_write_reg**(void *arg, uint8_t addr, uint8_t value, uint8_t *out_value, uint32_t wait_ms)

Write to the shared registers.

**Note** The registers for Master/Slave synchronization are reserved. Do not use them. (see `tx_sync_reg` in `essl_spi_config_t`)

**Note** Feature of checking the actual written value (`out_value`) is not supported.

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The address argument is not valid. See note 1.
- ESP_ERR_NOT_SUPPORTED: Should set `out_value` to NULL. See note 2.
- or other return value from `cpp:func:spi_device_transmit`.

**Parameters**
- `arg`: Context of the component. (Member `arg` from `essl_handle_t`)
- `addr`: Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note 1)
- `value`: Buffer for data to send, should be align to 4.
- `[out] out_value`: Not supported, should be set to NULL.
- `wait_ms`: Time to wait before timeout (reserved for future use, user should set this to 0).

**esp_err_t essl_spi_send_packet**(void *arg, const void *data, size_t size, uint32_t wait_ms)

Send a packet to Slave.

**Return**
- ESP_OK: On success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The data address is not DMA capable
- ESP_ERR_INVALID_SIZE: Master will send `size` bytes of data but Slave did not load enough RX buffer

**Parameters**
- `arg`: Context of the component. (Member `arg` from `essl_handle_t`)
- `data`: Address of the data to send
- `size`: Size of the data to send.
- `wait_ms`: Time to wait before timeout (reserved for future use, user should set this to 0).

**void essl_spi_reset_cnt**(void *arg)

Reset the counter in Master context.

**Note** Shall only be called if the slave has reset its counter. Else, Slave and Master would be desynchronized

**Parameters**
- `arg`: Context of the component. (Member `arg` from `essl_handle_t`)

**esp_err_t essl_spi_rdbuf**(spi_device_handle_t spi, uint8_t *out_data, int addr, int len, uint32_t flags)

Read the shared buffer from the slave in ISR way.

**Note** The slave’s HW doesn’t guarantee the data in one SPI transaction is consistent. It sends data in unit of byte. In other words, if the slave SW attempts to update the shared register when a rdbuf SPI transaction is in-flight, the data got by the master will be the combination of bytes of different writes of slave SW.

**Note** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

**Return**
- ESP_OK: on success
- or other return value from `cpp:func:spi_device_transmit`.

**Parameters**
- `spi`: SPI device handle representing the slave
- `[out] out_data`: Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- `addr`: Address of the slave shared buffer
- `len`: Length to read
- `flags`: SPI_TRANS_* flags to control the transaction mode of the transaction to send.
**esp_err_t** **essl_spi_rdbuf_polling** *(spi_device_handle_t spi, uint8_t *out_data, int addr, int len, uint32_t flags)*

Read the shared buffer from the slave in polling way.

**Note** out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

**Return**
- ESP_OK: on success
- or other return value from :cpp:func:`spi_device_transmit`.

**Parameters**
- spi: SPI device handle representing the slave
- [out] out_data: Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- addr: Address of the slave shared buffer
- len: Length to read
- flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**esp_err_t** **essl_spi_wrbuf** *(spi_device_handle_t spi, const uint8_t *data, int addr, int len, uint32_t flags)*

Write the shared buffer of the slave in ISR way.

**Note** out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

**Return**
- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`.

**Parameters**
- spi: SPI device handle representing the slave
- data: Buffer for data to send, strongly suggested to be in the DRAM
- addr: Address of the slave shared buffer,
- len: Length to write
- flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**esp_err_t** **essl_spi_wrbuf_polling** *(spi_device_handle_t spi, const uint8_t *data, int addr, int len, uint32_t flags)*

Write the shared buffer of the slave in polling way.

**Note** out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

**Return**
- ESP_OK: success
- or other return value from :cpp:func:`spi_device_polling_transmit`.

**Parameters**
- spi: SPI device handle representing the slave
- data: Buffer for data to send, strongly suggested to be in the DRAM
- addr: Address of the slave shared buffer,
- len: Length to write
- flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**esp_err_t** **essl_spi_rddma** *(spi_device_handle_t spi, uint8_t *out_data, int len, int seg_len, uint32_t flags)*

Receive long buffer in segments from the slave through its DMA.

**Note** This function combines several :cpp:func:`essl_spi_rddma_seg` and one :cpp:func:`essl_spi_rddma_done` at the end. Used when the slave is working in segment mode.

**Return**
- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`.

**Parameters**
Chapter 2. API Reference

- spi: SPI device handle representing the slave
- [out] out_data: Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- len: Total length of data to receive.
- seg_len: Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the rddma_done will still be sent.)
- flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_rddma_seg(spi_device_handle_t spi, uint8_t* out_data, int seg_len, uint32_t flags)
```

Read one data segment from the slave through its DMA.

Note To read long buffer, call :cpp:func:essl_spi_rddma instead.

Return
- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.

Parameters
- spi: SPI device handle representing the slave
- [out] out_data: Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- seg_len: Length of this segment
- flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_rddma_done(spi_device_handle_t spi, uint32_t flags)
```

Send the rddma_done command to the slave. Upon receiving this command, the slave will stop sending the current buffer even there are data unsent, and maybe prepare the next buffer to send.

Note This is required only when the slave is working in segment mode.

Return
- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.

Parameters
- spi: SPI device handle representing the slave
- flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_wrdma(spi_device_handle_t spi, const uint8_t *data, int len, int seg_len, uint32_t flags)
```

Send long buffer in segments to the slave through its DMA.

Note This function combines several :cpp:func:essl_spi_wrdma_seg and one :cpp:func:essl_spi_wrdma_done at the end. Used when the slave is working in segment mode.

Return
- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.

Parameters
- spi: SPI device handle representing the slave
- data: Buffer for data to send, strongly suggested to be in the DRAM
- len: Total length of data to send.
- seg_len: Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the wrdma_done will still be sent.)
- flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_wrdma_seg(spi_device_handle_t spi, const uint8_t *data, int seg_len, uint32_t flags)
```

Send one data segment to the slave through its DMA.

Note To send long buffer, call :cpp:func:essl_spi_wrdma instead.

Return
- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.
**Parameters**

- **spi**: SPI device handle representing the slave
- **data**: Buffer for data to send, strongly suggested to be in the DRAM
- **seg_len**: Length of this segment
- **flags**: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```
esp_err_t essl_spi_wrdma_done(spi_device_handle_t spi, uint32_t flags)
```

Send the wrdma_done command to the slave. Upon receiving this command, the slave will stop receiving, process the received data, and maybe prepare the next buffer to receive.

**Note** This is required only when the slave is working in segment mode.

**Return**

- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`

**Parameters**

- **spi**: SPI device handle representing the slave
- **flags**: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Structures**

```
struct essl_spi_config_t
```

Configuration of ESSL SPI device.

**Public Members**

```
spi_device_handle_t *spi
```

Pointer to SPI device handle.

```
uint32_t tx_buf_size
```

The pre-negotiated Master TX buffer size used by both the host and the slave.

```
uint8_t tx_sync_reg
```

The pre-negotiated register ID for Master-TX-SLAVE-RX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

```
uint8_t rx_sync_reg
```

The pre-negotiated register ID for Master-RX-Slave-TX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

### 2.2.8 ESP WebSocket Client

**Overview**

The ESP WebSocket client is an implementation of WebSocket protocol client for ESP32-C3

**Features**

- Supports WebSocket over TCP, TLS with mbedTLS
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)

**Configuration**

**URI**

- Supports *ws*, *wss* schemes
- WebSocket samples:
  - `ws://echo.websocket.org`: WebSocket over TCP, default port 80
Minimal configurations:

```c
const esp_websocket_client_config_t ws_cfg = {
  .uri = "ws://echo.websocket.org",
};
```

The WebSocket client supports the use of both path and query in the URI. Sample:

```c
const esp_websocket_client_config_t ws_cfg = {
  .uri = "ws://echo.websocket.org/connectionhandler?id=104",
};
```

If there are any options related to the URI in `esp_websocket_client_config_t`, the option defined by the URI will be overridden. Sample:

```c
const esp_websocket_client_config_t ws_cfg = {
  .uri = "ws://echo.websocket.org:123",
  .port = 4567,
};
```

//WebSocket client will connect to websocket.org using port 4567

**TLS** Configuration:

```c
const esp_websocket_client_config_t ws_cfg = {
  .uri = "wss://echo.websocket.org",
  .cert_pem = (const char *)websocket_org_pem_start,
};
```

Note: If you want to verify the server, then you need to provide a certificate in PEM format, and provide to `cert_pem` in `websocket_client_config_t`. If no certificate is provided then the TLS connection will default to not requiring verification.

PEM certificate for this example could be extracted from an openssl `s_client` command connecting to websocket.org. In case a host operating system has `openssl` and `sed` packages installed, one could execute the following command to download and save the root or intermediate root certificate to a file (Note for Windows users: Both Linux like environment or Windows native packages may be used). `echo "" | openssl s_client -showcerts -connect websocket.org:443 | sed -n "1,/Root/d; /BEGIN/,/END/p" | openssl x509 -outform PEM >websocket_org.pem`

This command will extract the second certificate in the chain and save it as a pem-file.

**Subprotocol** The subprotocol field in the config struct can be used to request a subprotocol

```c
const esp_websocket_client_config_t ws_cfg = {
  .uri = "ws://websocket.org",
  .subprotocol = "soap",
};
```

Note: The client is indifferent to the subprotocol field in the server response and will accept the connection no matter what the server replies.

For more options on `esp_websocket_client_config_t`, please refer to API reference below
Chapter 2. API Reference

Events

- **WEBSOCKET_EVENT_CONNECTED**: The client has successfully established a connection to the server. The client is now ready to send and receive data. Contains no event data.
- **WEBSOCKET_EVENT_DISCONNECTED**: The client has aborted the connection due to the transport layer failing to read data, e.g. because the server is unavailable. Contains no event data.
- **WEBSOCKET_EVENT_DATA**: The client has successfully received and parsed a WebSocket frame. The event data contains a pointer to the payload data, the length of the payload data as well as the opcode of the received frame. A message may be fragmented into multiple events if the length exceeds the buffer size. This event will also be posted for non-payload frames, e.g. pong or connection close frames.
- **WEBSOCKET_EVENT_ERROR**: Not used in the current implementation of the client.

If the client handle is needed in the event handler it can be accessed through the pointer passed to the event handler:

```c
esp_websocket_client_handle_t client = (esp_websocket_client_handle_t)handler_args;
```

Limitations and Known Issues

- The client is able to request the use of a subprotocol from the server during the handshake, but does not do any subprotocol related checks on the response from the server.

Application Example

A simple WebSocket example that uses `esp_websocket_client` to establish a websocket connection and send/receive data with the `websocket.org` server can be found here: `protocols/websocket`.

Sending Text Data

The WebSocket client supports sending data as a text data frame, which informs the application layer that the payload data is text data encoded as UTF-8. Example:

```c
esp_websocket_client_send_text(client, data, len, portMAX_DELAY);
```

API Reference

Header File

- `components/esp_websocket_client/include/esp_websocket_client.h`

Functions

```c
esp_websocket_client_handle_t esp_websocket_client_init(const esp_websocket_client_config_t *config)
```

Start a Websocket session This function must be the first function to call, and it returns a `esp_websocket_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_websocket_client_destroy` when the operation is complete.

**Return**

- `esp_websocket_client_handle_t`
- `NULL` if any errors

**Parameters**

- `[in] config`: The configuration

```c
esp_err_t esp_websocket_client_set_uri(esp_websocket_client_handle_t client, const char *uri)
```

Set URL for client, when performing this behavior, the options in the URL will replace the old ones Must stop the WebSocket client before set URI if the client has been connected.

**Return** `esp_err_t`

**Parameters**

Submit Document Feedback
Chapter 2. API Reference

- [in] client: The client
- [in] uri: The uri

`esp_err_t esp_websocket_client_start(esp_websocket_client_handle_t client)`

Open the WebSocket connection.

Return esp_err_t
Parameters
- [in] client: The client

`esp_err_t esp_websocket_client_stop(esp_websocket_client_handle_t client)`

Stops the WebSocket connection without websocket closing handshake.

This API stops ws client and closes TCP connection directly without sending close frames. It is a good practice to close the connection in a clean way using esp_websocket_client_close().

Notes:
- Cannot be called from the websocket event handler

Return esp_err_t
Parameters
- [in] client: The client

`esp_err_t esp_websocket_client_destroy(esp_websocket_client_handle_t client)`

Destroy the WebSocket connection and free all resources. This function must be the last function to call for a session. It is the opposite of the esp_websocket_client_init function and must be called with the same handle as input that a esp_websocket_client_init call returned. This might close all connections this handle has used.

Notes:
- Cannot be called from the websocket event handler

Return esp_err_t
Parameters
- [in] client: The client

`int esp_websocket_client_send_bin(esp_websocket_client_handle_t client, const char *data, int len, TickType_t timeout)`

Write binary data to the WebSocket connection (data send with WS OPCODE=02, i.e. binary)

Return
- Number of data was sent
- (-1) if any errors
Parameters
- [in] client: The client
- [in] data: The data
- [in] len: The length
- [in] timeout: Write data timeout in RTOS ticks

`int esp_websocket_client_send_text(esp_websocket_client_handle_t client, const char *data, int len, TickType_t timeout)`

Write textual data to the WebSocket connection (data send with WS OPCODE=01, i.e. text)

Return
- Number of data was sent
- (-1) if any errors
Parameters
- [in] client: The client
- [in] data: The data
- [in] len: The length
- [in] timeout: Write data timeout in RTOS ticks

`esp_err_t esp_websocket_client_close(esp_websocket_client_handle_t client, TickType_t timeout)`

Close the WebSocket connection in a clean way.
Sequence of clean close initiated by client:

- Client sends CLOSE frame
- Client waits until server echos the CLOSE frame
- Client waits until server closes the connection
- Client is stopped the same way as by the `esp_websocket_client_stop()`

Notes:
- Cannot be called from the websocket event handler

Return: `esp_err_t`

Parameters:
- `[in] client`: The client
- `[in] timeout`: Timeout in RTOS ticks for waiting

`esp_err_t` `esp_websocket_client_close_with_code` (esp_websocket_client_handle_t `client`, int `code`, const char *`data`, int `len`, TickType_t `timeout`)

Close the WebSocket connection in a clean way with custom code/data Closing sequence is the same as for `esp_websocket_client_close()`

Notes:
- Cannot be called from the websocket event handler

Return: `esp_err_t`

Parameters:
- `[in] client`: The client
- `[in] code`: Close status code as defined in RFC6455 section-7.4
- `[in] data`: Additional data to closing message
- `[in] len`: The length of the additional data
- `[in] timeout`: Timeout in RTOS ticks for waiting

`bool` `esp_websocket_client_is_connected` (esp_websocket_client_handle_t `client`)

Check the WebSocket client connection state.

Return:
- `true`
- `false`

Parameters:
- `[in] client`: The client handle

`esp_err_t` `esp_websocket_register_events` (esp_websocket_client_handle_t `client`, esp_websocket_event_id_t `event`, esp_websocket_event_handler_t `event_handler`, void *`event_handler_arg`)

Register the WebSocket Events.

Return: `esp_err_t`

Parameters:
- `client`: The client handle
- `event`: The event id
- `event_handler`: The callback function
- `event_handler_arg`: User context

**Structures**

`struct esp_websocket_event_data_t`

Websocket event data.

**Public Members**

```c
const char *data_ptr
```

Data pointer
int data_len
    Data length

uint8_t op_code
    Received opcode

*esp_websocket_client_handle_t* client
    *esp_websocket_client_handle_t* context

void *user_context
    user_data context, from *esp_websocket_client_config_t* user_data

int payload_len
    Total payload length, payloads exceeding buffer will be posted through multiple events

int payload_offset
    Actual offset for the data associated with this event

struct esp_websocket_client_config_t
    Websocket client setup configuration.

Public Members

const char *uri
    Websocket URI, the information on the URI can be overrides the other fields below, if any

const char *host
    Domain or IP as string

int port
    Port to connect, default depend on esp_websocket_transport_t (80 or 443)

const char *username
    Using for Http authentication - Not supported for now

const char *password
    Using for Http authentication - Not supported for now

const char *path
    HTTP Path, if not set, default is /

bool disable_auto_reconnect
    Disable the automatic reconnect function when disconnected

void *user_context
    HTTP user data context

int task_prio
    Websocket task priority

int task_stack
    Websocket task stack

int buffer_size
    Websocket buffer size

const char *cert_pem
    Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in cert_len.

size_t cert_len
    Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert
    Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_key has to be provided.
Chapter 2. API Reference

PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_cert_len.

size_t client_cert_len
Length of the buffer pointed to by client_cert. May be 0 for null-terminated pem

const char *client_key
Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_cert has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_key_len

size_t client_key_len
Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

esp_websocket_transport_t transport
Websocket transport type, see `esp_websocket_transport_t

const char *subprotocol
Websocket subprotocol

const char *user_agent
Websocket user-agent

const char *headers
Websocket additional headers

int pingpong_timeout_sec
Period before connection is aborted due to no PONGs received

bool disable_pingpong_discon
Disable auto-disconnect due to no PONG received within pingpong_timeout_sec

bool use_global_ca_store
Use a global ca_store for all the connections in which this bool is set.

bool skip_cert_common_name_check
Skip any validation of server certificate CN field

bool keep_alive_enable
Enable keep-alive timeout

int keep_alive_idle
Keep-alive idle time. Default is 5 (second)

int keep_alive_interval
Keep-alive interval time. Default is 5 (second)

int keep_alive_count
Keep-alive packet retry send count. Default is 3 counts

int reconnect_timeout_ms
Reconnect after this value in milliseconds if disable_auto_reconnect is not enabled (defaults to 10s)

int network_timeout_ms
Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s)

size_t ping_interval_sec
Websocket ping interval, defaults to 10 seconds if not set

struct ifreq *if_name
The name of interface for data to go through. Use the default interface without setting

Type Definitions
typedef struct esp_websocket_client *esp_websocket_client_handle_t
### Enumerations

**enum esp_websocket_event_id_t**

Websocket Client events id.

*Values:*

- `WEBSOCKET_EVENT_ANY = -1`
- `WEBSOCKET_EVENT_ERROR = 0`
  - This event occurs when there are any errors during execution
- `WEBSOCKET_EVENT_CONNECTED`
  - Once the Websocket has been connected to the server, no data exchange has been performed
- `WEBSOCKET_EVENT_DISCONNECTED`
  - The connection has been disconnected
- `WEBSOCKET_EVENT_DATA`
  - When receiving data from the server, possibly multiple portions of the packet
- `WEBSOCKET_EVENT_CLOSED`
  - The connection has been closed cleanly

**enum esp_websocket_transport_t**

Websocket Client transport.

*Values:*

- `WEBSOCKET_TRANSPORT_UNKNOWN = 0x0`
  - Transport unknown
- `WEBSOCKET_TRANSPORT_OVER_TCP`
  - Transport over tcp
- `WEBSOCKET_TRANSPORT_OVER_SSL`
  - Transport over ssl

### 2.2.9 ESP x509 Certificate Bundle

#### Overview

The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification.

**Note:** The bundle is currently not available when using WolfSSL.

The bundle comes with the complete list of root certificates from Mozilla’s NSS root certificate store. Using the `gen_crt_bundle.py` python utility the certificates’ subject name and public key are stored in a file and embedded in the ESP32-C3 binary.

When generating the bundle you may choose between:

- The full root certificate bundle from Mozilla, containing more than 130 certificates. The current bundle was updated Tue Oct 5 09:35:35 2021 GMT.
- A pre-selected filter list of the name of the most commonly used root certificates, reducing the amount of certificates to around 35 while still having around 90% coverage according to market share statistics.

In addition it is possible to specify a path to a certificate file or a directory containing certificates which then will be added to the generated bundle.
Chapter 2. API Reference

**Note:** Trusting all root certificates means the list will have to be updated if any of the certificates are retracted. This includes removing them from `cacert_all.pem`.

### Configuration

Most configuration is done through menuconfig. CMake will generate the bundle according to the configuration and embed it.

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: automatically build and attach the bundle.
- `CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE`: decide which certificates to include from the complete root list.
- `CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH`: specify the path of any additional certificates to embed in the bundle.

To enable the bundle when using ESP-TLS simply pass the function pointer to the bundle attach function:

```c
esp_tls_cfg_t cfg = {
    .crt_bundle_attach = esp_crt_bundle_attach,
};
```

This is done to avoid embedding the certificate bundle unless activated by the user.

If using mbedTLS directly then the bundle may be activated by directly calling the attach function during the setup process:

```c
mbedtls_ssl_config conf;
mbedtls_ssl_config_init(&conf);
esp_crt_bundle_attach(&conf);
```

### Generating the List of Root Certificates

The list of root certificates comes from Mozilla’s NSS root certificate store, which can be found [here](#) The list can be downloaded and created by running the script `mk-ca-bundle.pl` that is distributed as a part of curl. Another alternative would be to download the finished list directly from the curl website: CA certificates extracted from Mozilla

The common certificates bundle were made by selecting the authorities with a market share of more than 1% from w3tech’s SSL Survey. These authorities were then used to pick the names of the certificates for the filter list, `cmn_crtAuthorities.csv`, from this list provided by Mozilla.

### Updating the Certificate Bundle

The bundle is embedded into the app and can be updated along with the app by an OTA update. If you want to include a more up-to-date bundle than the bundle currently included in IDF, then the certificate list can be downloaded from Mozilla as described in *Updating the Certificate Bundle*.

### Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection using the certificate bundle with two custom certificates added for verification: `protocols/https_x509_bundle`.

HTTPS example that uses ESP-TLS and the default bundle: `protocols/https_request`.

HTTPS example that uses mbedTLS and the default bundle: `protocols/https_mbedtls`.
API Reference

Header File

- components/mbedtls/esp_crt_bundle/include/esp_crt_bundle.h

Functions

**esp_err_t esp_crt_bundle_attach (void *conf)**

Attach and enable use of a bundle for certificate verification.

Attach and enable use of a bundle for certificate verification through a verification callback. If no specific bundle has been set through `esp_crt_bundle_set()` it will default to the bundle defined in menuconfig and embedded in the binary.

**Return**

- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

**Parameters**

- [in] conf: The config struct for the SSL connection.

**void esp_crt_bundle_detach (mbedtls_ssl_config *conf)**

Disable and dealloc the certification bundle.

Removes the certificate verification callback and deallocates used resources

**Parameters**

- [in] conf: The config struct for the SSL connection.

**void esp_crt_bundle_set (const uint8_t *x509_bundle)**

Set the default certificate bundle used for verification.

Overrides the default certificate bundle. In most use cases the bundle should be set through menuconfig. The bundle needs to be sorted by subject name since binary search is used to find certificates.

**Parameters**

- [in] x509_bundle: A pointer to the certificate bundle.

### 2.2.10 HTTP Server

**Overview**

The HTTP Server component provides an ability for running a lightweight web server on ESP32-C3. Following are detailed steps to use the API exposed by HTTP Server:

- **httpd_start():** Creates an instance of HTTP server, allocate memory/resources for it depending upon the specified configuration and outputs a handle to the server instance. The server has both, a listening socket (TCP) for HTTP traffic, and a control socket (UDP) for control signals, which are selected in a round robin fashion in the server task loop. The task priority and stack size are configurable during server instance creation by passing `httpd_config_t` structure to `httpd_start()`. TCP traffic is parsed as HTTP requests and, depending on the requested URI, user registered handlers are invoked which are supposed to send back HTTP response packets.

- **httpd_stop():** This stops the server with the provided handle and frees up any associated memory/resources. This is a blocking function that first signals a halt to the server task and then waits for the task to terminate. While stopping, the task will close all open connections, remove registered URI handlers and reset all session context data to empty.

- **httpd_register_uri_handler():** A URI handler is registered by passing object of type `httpd_uri_t` structure which has members including `uri`, `method` type (eg. HTTPD_GET/HTTPD_POST/HTTPD_PUT etc.), function pointer of type `esp_err_t *handler (httpd_req_t *req)` and `user_ctx` pointer to user context data.
### Application Example

```c
/* Our URI handler function to be called during GET /uri request */
esp_err_t get_handler(httpd_req_t *req)
{
    /* Send a simple response */
    const char resp[] = "URI GET Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* Our URI handler function to be called during POST /uri request */
esp_err_t post_handler(httpd_req_t *req)
{
    /* Destination buffer for content of HTTP POST request. * httpd_req_recv() accepts char* only, but content could * as well be any binary data (needs type casting). * In case of string data, null termination will be absent, and * content length would give length of string */
    char content[100];
    /* Truncate if content length larger than the buffer */
    size_t recv_size = MIN(req->content_len, sizeof(content));
    int ret = httpd_req_recv(req, content, recv_size);
    if (ret <= 0) { /* 0 return value indicates connection closed */
        /* Check if timeout occurred */
        if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
            /* In case of timeout one can choose to retry calling * httpd_req_recv(), but to keep it simple, here we * respond with an HTTP 408 (Request Timeout) error */
            httpd_resp_send_408(req);
        }
        /* In case of error, returning ESP_FAIL will * ensure that the underlying socket is closed */
        return ESP_FAIL;
    }
    /* Send a simple response */
    const char resp[] = "URI POST Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* URI handler structure for GET /uri */
httpd_uri_t uri_get = {
    .uri = "/uri",
    .method = HTTP_GET,
    .handler = get_handler,
    .user_ctx = NULL
};

/* URI handler structure for POST /uri */
httpd_uri_t uri_post = {
    .uri = "/uri",
    .method = HTTP_POST,
    .handler = post_handler,
    .user_ctx = NULL
};

/* Function for starting the webserver */
httpd_handle_t start_webserver(void)
{
    (continues on next page)
}
```
Simple HTTP server example  Check HTTP server example under protocols/http_server/simple where handling of arbitrary content lengths, reading request headers and URL query parameters, and setting response headers is demonstrated.

Persistent Connections

HTTP server features persistent connections, allowing for the re-use of the same connection (session) for several transfers, all the while maintaining context specific data for the session. Context data may be allocated dynamically by the handler in which case a custom function may need to be specified for freeing this data when the connection/session is closed.

Persistent Connections Example

```c
/* Custom function to free context */
void free_ctx_func(void *ctx)
{
    /* Could be something other than free */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* Create session's context if not already available */
    if (!req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE));  /* Pointer to context */
        req->free_ctx = free_ctx_func;  /* Function to free context */
    }

    /* Access context data */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *)req->sess_ctx;
}

(continues on next page)```
/* Respond */
............
............
return ESP_OK;
}

Check the example under protocols/http_server/persistent_sockets.

**Websocket server**

HTTP server provides a simple websocket support if the feature is enabled in menuconfig, please see CONFIG_HTTPD_WS_SUPPORT. Please check the example under protocols/http_server/ws_echo_server

**API Reference**

**Header File**

- components/esp_http_server/include/esp_http_server.h

**Functions**

`httpd_register_uri_handler(httpd_handle_t handle, const httpd_uri_t *uri_handler)`

Registers a URI handler.

Example usage:

```c
esp_err_t my_uri_handler(httpd_req_t* req)
{
    // Recv, Process and Send
    ....
    ....
    ....

    // Fail condition
    if (....) {
        // Return fail to close session
        return ESP_FAIL;
    }

    // On success
    return ESP_OK;
}

// URI handler structure
httpd_uri_t my_uri {
    .uri = "/my_uri/path/xyz",
    .method = HTTPD_GET,
    .handler = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
    // If failed to register handler
    ....
}
```
Note URI handlers can be registered in real time as long as the server handle is valid.

Return
- ESP_OK: On successfully registering the handler
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_HANDLERS_FULL: If no slots left for new handler
- ESP_ERR_HTTPD_HANDLER_EXISTS: If handler with same URI and method is already registered

Parameters
- [in] handle: handle to HTTPD server instance
- [in] uri_handler: pointer to handler that needs to be registered

esp_err_t httpd_unregister_uri_handler(handle_t handle, const char *uri, httpd_method_t method)

Unregister a URI handler.

Return
- ESP_OK: On successfully deregistering the handler
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_HANDLER_EXISTS: Handler with same URI and method not found

Parameters
- [in] handle: handle to HTTPD server instance
- [in] uri: URI string
- [in] method: HTTP method

esp_err_t httpd_unregister_uri(handle_t handle, const char *uri)

Unregister all URI handlers with the specified uri string.

Return
- ESP_OK: On successfully deregistering all such handlers
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_NOT_FOUND: No handler registered with specified uri string

Parameters
- [in] handle: handle to HTTPD server instance
- [in] uri: string specifying all handlers that need to be deregistered

esp_err_t httpd_sess_set_recv_override(handle_t hd, int sockfd, httpd_recv_func_t recv_func)

Override web server’s receive function (by session FD)

This function overrides the web server’s receive function. This same function is used to read HTTP request packets.

Note This API is supposed to be called either from the context of
- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()

Return
- ESP_OK: On successfully registering override
- ESP_ERR_INVALID_ARG: Null arguments

Parameters
- [in] hd: HTTPD instance handle
- [in] sockfd: Session socket FD
- [in] recv_func: The receive function to be set for this session

esp_err_t httpd_sess_set_send_override(handle_t hd, int sockfd, httpd_send_func_t send_func)

Override web server’s send function (by session FD)

This function overrides the web server’s send function. This same function is used to send out any response to any HTTP request.

Note This API is supposed to be called either from the context of
- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()
Chapter 2. API Reference

- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

**Parameters**
- **[in]** hd: HTTPD instance handle
- **[in]** sockfd: Session socket FD
- **[in]** send_func: The send function to be set for this session

```c
esp_err_t httpd_sess_set_pending_override(httpd_handle_t hd, int sockfd, httpd_pending_func_t pending_func)
```

Override web server’s pending function (by session FD)

This function overrides the web server’s pending function. This function is used to test for pending bytes in a socket.

**Note** This API is supposed to be called either from the context of
- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()

**Return**
- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

**Parameters**
- **[in]** hd: HTTPD instance handle
- **[in]** sockfd: Session socket FD
- **[in]** pending_func: The receive function to be set for this session

```c
int httpd_req_to_sockfd(httpd_req_t *r)
```

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, i.e.: httpd_sess_get_ctx(), httpd_sess_trigger_close(), httpd_sess_update_lru_counter().

**Note** This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.

**Return**
- Socket descriptor : The socket descriptor for this request
- -1 : Invalid/NULL request pointer

**Parameters**
- **[in]** r: The request whose socket descriptor should be found

```c
int httpd_req_recv(httpd_req_t *r, char *buf, size_t buf_len)
```

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use content_len provided in httpd_req_t structure to know the length of data to be fetched. If content_len is too large for the buffer then user may have to make multiple calls to this function, each time fetching ‘buf_len’ number of bytes, while the pointer to content data is incremented internally by the same number.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
- Presently Chunked Encoding is not supported

**Return**
- Bytes : Number of bytes read into the buffer successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

**Parameters**
- **[in]** r: The request being responded to
- **[in]** buf: Pointer to a buffer that the data will be read into
Chapter 2. API Reference

• [in] buf_len: Length of the buffer

size_t httpd_req_get_hdr_value_len (httpd_req_t *r, const char *field)
Search for a field in request headers and return the string length of it’s value.

Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return
• Length : If field is found in the request URL
• Zero : Field not found / Invalid request / Null arguments

Parameters
• [in] r: The request being responded to
• [in] field: The header field to be searched in the request

esp_err_t httpd_req_get_hdr_value_str (httpd_req_t *r, const char *field, char *val, size_t val_size)
Get the value string of a field from the request headers.

Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
• If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
• Use httpd_req_get_hdr_value_len() to know the right buffer length

Return
• ESP_OK : Field found in the request header and value string copied
• ESP_ERR_NOT_FOUND : Key not found
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_INVALID_REQ : Invalid HTTP request pointer
• ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

Parameters
• [in] r: The request being responded to
• [in] field: The field to be searched in the header
• [out] val: Pointer to the buffer into which the value will be copied if the field is found
• [in] val_size: Size of the user buffer “val”

size_t httpd_req_get_url_query_len (httpd_req_t *r)
Get Query string length from the request URL.

Note
This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid

Return
• Length : Query is found in the request URL
• Zero : Query not found / Null arguments / Invalid request

Parameters
• [in] r: The request being responded to

esp_err_t httpd_req_get_url_query_str (httpd_req_t *r, char *buf, size_t buf_len)
Get Query string from the request URL.

Note
• Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using httpd_req_get_hdr_value_str() to know the ‘Content-Type’ (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid
• If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
• Prior to calling this function, one can use httpd_req_get_url_query_len() to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string.

Return
• ESP_OK : Query is found in the request URL and copied to buffer
• ESP_ERR_NOT_FOUND : Query not found
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_INVALID_REQ : Invalid HTTP request pointer
• ESP_ERR_HTTPD_RESULT_TRUNC : Query string truncated

Parameters
• [in] r : The request being responded to
• [out] buf : Pointer to the buffer into which the query string will be copied (if found)
• [in] buf_len : Length of output buffer

```c
esp_err_t httpd_query_key_value(const char *qry, const char *key, char *val, size_t val_size)
```
Helper function to get a URL query tag from a query string of the type param1=val1&param2=val2.

Note
• The components of URL query string (keys and values) are not URL decoded. The user must check for ‘Content-Type’ field in the request headers and then depending upon the specified encoding (URL encoded or otherwise) apply the appropriate decoding algorithm.
• If actual value size is greater than val_size, then the value is truncated, accompanied by truncation error as return value.

Return
• ESP_OK : Key is found in the URL query string and copied to buffer
• ESP_ERR_NOT_FOUND : Key not found
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

Parameters
• [in] qry : Pointer to query string
• [in] key : The key to be searched in the query string
• [out] val : Pointer to the buffer into which the value will be copied if the key is found
• [in] val_size : Size of the user buffer “val”

```c
esp_err_t httpd_req_get_cookie_val(httpd_req_t *req, const char *cookie_name, char *val, size_t *val_size)
```
Get the value string of a cookie value from the “Cookie” request headers by cookie name.

Return
• ESP_OK : Key is found in the cookie string and copied to buffer
• ESP_ERR_NOT_FOUND : Key not found
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated
• ESP_ERR_NO_MEM : Memory allocation failure

Parameters
• [in] req : Pointer to the HTTP request
• [in] cookie_name : The cookie name to be searched in the request
• [out] val : Pointer to the buffer into which the value of cookie will be copied if the cookie is found
• [inout] val_size : Pointer to size of the user buffer “val”. This variable will contain cookie length if ESP_OK is returned and required buffer length incase ESP_ERR_HTTPD_RESULT_TRUNC is returned.

```c
bool httpd_uri_match_wildcard(const char *uri_template, const char *uri_to_match, size_t match_upto)
```
Test if a URI matches the given wildcard template.

Template may end with “?” to make the previous character optional (typically a slash), “*” for a wildcard match, and “?*” to make the previous character optional, and if present, allow anything to follow.
Example:

- * matches everything
- /foo/? matches /foo and /foo/
- /foo/* (sans the backslash) matches /foo/ and /foo/bar, but not /foo or /fo
- /foo/?* or /foo/*/ (sans the backslash) matches /foo/, /foo/bar, and also /foo, but not /foox or /fo

The special characters “?” and “*” anywhere else in the template will be taken literally.

Return  true if a match was found

Parameters

- [in] uri_template: URI template (pattern)
- [in] uri_to_match: URI to be matched
- [in] match_upto: how many characters of the URI buffer to test (there may be trailing query string etc.)

```
esp_err_t httpd_resp_send(httpd_req_t *r, const char *buf, ssize_t buf_len)
```

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use httpd_resp_send_chunk() instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers:

- httpd_resp_set_status() - for setting the HTTP status string
- httpd_resp_set_type() - for setting the Content Type
- httpd_resp_set_hdr() - for appending any additional field value entries in the response header

Note

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, the request has been responded to.
- No additional data can then be sent for the request.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return

- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null request pointer
- ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request

Parameters

- [in] r: The request being responded to
- [in] buf: Buffer from where the content is to be fetched
- [in] buf_len: Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

```
esp_err_t httpd_resp_send_chunk(httpd_req_t *r, const char *buf, ssize_t buf_len)
```

API to send one HTTP chunk.

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use httpd_resp_send() instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers:

- httpd_resp_set_status() - for setting the HTTP status string
- httpd_resp_set_type() - for setting the Content Type
- httpd_resp_set_hdr() - for appending any additional field value entries in the response header

Note

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- When you are finished sending all your chunks, you must call this function with buf_len as 0.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
Chapter 2. API Reference

Return
- ESP_OK: On successfully sending the response packet chunk
- ESP_ERR_INVALID_ARG: Null request pointer
- ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

Parameters
- [in] r: The request being responded to
- [in] buf: Pointer to a buffer that stores the data
- [in] buf_len: Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

static esp_err_t httpd_resp_sendstr(httpd_req_t *r, const char *str)

API to send a complete string as HTTP response.

This API simply calls http_resp_send with buffer length set to string length assuming the buffer contains a null terminated string

Return
- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null request pointer
- ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request

Parameters
- [in] r: The request being responded to
- [in] str: String to be sent as response body

static esp_err_t httpd_resp_sendstr_chunk(httpd_req_t *r, const char *str)

API to send a string as an HTTP response chunk.

This API simply calls http_resp_send_chunk with buffer length set to string length assuming the buffer contains a null terminated string

Return
- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null request pointer
- ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request

Parameters
- [in] r: The request being responded to
- [in] str: String to be sent as response body (NULL to finish response packet)

esp_err_t httpd_resp_set_status(httpd_req_t *r, const char *status)

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the ‘200 OK’ response is sent as the response.

Note
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- This API only sets the status to this value. The status isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the status string is valid till send function is called.

Return
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

Parameters
- [in] r: The request being responded to
- [in] status: The HTTP status code of this response
**esp_err_t** `httpd_resp_set_type(httpd_req_t *r, const char *type)`

API to set the HTTP content type.

This API sets the ‘Content Type’ field of the response. The default content type is ‘text/html’.

**Note**
- This API is supposed to be called only from the context of a URI handler where `httpd_req_t` request pointer is valid.
- This API only sets the content type to this value. The type isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the type string is valid till send function is called.

**Return**
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

**Parameters**
- **[in]** `r`: The request being responded to
- **[in]** `type`: The Content Type of the response

**esp_err_t** `httpd_resp_set_hdr(httpd_req_t *r, const char *field, const char *value)`

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

**Note**
- This API is supposed to be called only from the context of a URI handler where `httpd_req_t` request pointer is valid.
- The header isn’t sent out until any of the send APIs is executed.
- The maximum allowed number of additional headers is limited to value of max_resp_headers in config structure.
- Make sure that the lifetime of the field value strings are valid till send function is called.

**Return**
- ESP_OK: On successfully appending new header
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESP_HDR: Total additional headers exceed max allowed
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

**Parameters**
- **[in]** `r`: The request being responded to
- **[in]** `field`: The field name of the HTTP header
- **[in]** `value`: The value of this HTTP header

**esp_err_t** `httpd_resp_send_err(httpd_req_t *req, httpd_err_code_t error, const char *msg)`

For sending out error code in response to HTTP request.

**Note**
- This API is supposed to be called only from the context of a URI handler where `httpd_req_t` request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Return**
- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

**Parameters**
- **[in]** `req`: Pointer to the HTTP request for which the response needs to be sent
- **[in]** `error`: Error type to send
- **[in]** `msg`: Error message string (pass NULL for default message)

**static esp_err_t** `httpd_resp_send_404(httpd_req_t *r)`
Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**
- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

**Parameters**
- [in] r: The request being responded to

```c
static esp_err_t httpd_resp_send_404 (httpd_req_t *r)
```

Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**
- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

**Parameters**
- [in] r: The request being responded to

```c
static esp_err_t httpd_resp_send_408 (httpd_req_t *r)
```

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**
- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

**Parameters**
- [in] r: The request being responded to

```c
static esp_err_t httpd_resp_send_500 (httpd_req_t *r)
```

**int httpd_send (httpd_req_t *r, const char *buf, size_t buf_len)**

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually, and HTTP delimeters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.
If the send override function is set, this API will end up calling that function eventually to send data out.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn’t have to call this API, but you would rather use either of: httpd_res_send(), httpd_res_send_chunk()

**Return**
- Bytes : Number of bytes that were sent successfully
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()

**Parameters**
- [in] r: The request being responded to
- [in] buf: Buffer from where the fully constructed packet is to be read
- [in] buf_len: Length of the buffer

```c
int httpd_socket_send (httpd_handle_t hd, int sockfd, const char* buf, size_t buf_len, int flags)
```

A low level API to send data on a given socket

This internally calls the default send function, or the function registered by httpd_sess_set_send_override().

**Note** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous data is to be sent over a socket.

**Return**
- Bytes : The number of bytes sent successfully
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()

**Parameters**
- [in] hd: server instance
- [in] sockfd: session socket file descriptor
- [in] buf: buffer with bytes to send
- [in] buf_len: data size
- [in] flags: flags for the send() function

```c
int httpd_socket_recv (httpd_handle_t hd, int sockfd, char* buf, size_t buf_len, int flags)
```

A low level API to receive data from a given socket

This internally calls the default recv function, or the function registered by httpd_sess_set_recv_override().

**Note** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.

**Return**
- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

**Parameters**
- [in] hd: server instance
- [in] sockfd: session socket file descriptor
- [in] buf: buffer with bytes to send
- [in] buf_len: data size
- [in] flags: flags for the send() function

```c
esp_err_t httpd_register_err_handler (httpd_handle_t handle, httpd_err_code_t error, httpd_err_handler_func_t handler_fn)
```

Function for registering HTTP error handlers.
This function maps a handler function to any supported error code given by \texttt{httpd_err_code_t}. See prototype \texttt{httpd_err_handler_func_t} above for details.

\textbf{Return}

- ESP\_OK: handler registered successfully
- ESP\_ERR\_INVALID\_ARG: invalid error code or server handle

\textbf{Parameters}

- [in] handle: HTTP server handle
- [in] error: Error type
- [in] handler\_fn: User implemented handler function (Pass NULL to unset any previously set handler)

\begin{verbatim}
esp_err_t httpd_start(httpd_handle_t *handle, const httpd_config_t *config)
\end{verbatim}

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

Example usage:

\begin{verbatim}
// Function for starting the webserver
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
    httpd_handle_t server = NULL;

    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    // If server failed to start, handle will be NULL
    return server;
}
\end{verbatim}

\textbf{Return}

- ESP\_OK: Instance created successfully
- ESP\_ERR\_INVALID\_ARG: Null argument(s)
- ESP\_ERR\_HTTPD\_ALLOC\_MEM: Failed to allocate memory for instance
- ESP\_ERR\_HTTPD\_TASK: Failed to launch server task

\textbf{Parameters}

- [in] config: Configuration for new instance of the server
- [out] handle: Handle to newly created instance of the server. NULL on error

\begin{verbatim}
esp_err_t httpd_stop(httpd_handle_t handle)
\end{verbatim}

Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

\begin{verbatim}
// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
    // Ensure handle is non NULL
    if (server != NULL) {
        // Stop the httpd server
        httpd_stop(server);
    }
}
\end{verbatim}
Return

- ESP_OK: Server stopped successfully
- ESP_ERR_INVALID_ARG: Handle argument is NULL

Parameters

- [in] handle: Handle to server returned by httpd_start

`esp_err_t httpd_queue_work(httpd_handle_t handle, httpd_work_fn_t work, void *arg)`

Queue execution of a function in HTTPD’s context.

This API queues a work function for asynchronous execution.

Note Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

Return

- ESP_OK: On successfully queueing the work
- ESP_FAIL: Failure in ctrl socket
- ESP_ERR_INVALID_ARG: Null arguments

Parameters

- [in] handle: Handle to server returned by httpd_start
- [in] work: Pointer to the function to be executed in the HTTPD’s context
- [in] arg: Pointer to the arguments that should be passed to this function

`void *httpd_sess_get_ctx(httpd_handle_t handle, int sockfd)`

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the httpd_req_t structure. But, there are cases where the web server’s send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

Return

- void*: Pointer to the context associated with this session
- NULL: Empty context / Invalid handle / Invalid socket fd

Parameters

- [in] handle: Handle to server returned by httpd_start
- [in] sockfd: The socket descriptor for which the context should be extracted.

`void httpd_sess_set_ctx(httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)`

Set session context by socket descriptor.

Parameters

- [in] handle: Handle to server returned by httpd_start
- [in] sockfd: The socket descriptor for which the context should be extracted.
- [in] ctx: Context object to assign to the session
- [in] free_fn: Function that should be called to free the context

`void *httpd_sess_get_transport_ctx(httpd_handle_t handle, int sockfd)`

Get session ‘transport’ context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

See `httpd_sess_get_ctx()`

Return

- void*: Pointer to the transport context associated with this session
- NULL: Empty context / Invalid handle / Invalid socket fd

Parameters

- [in] handle: Handle to server returned by httpd_start
- [in] sockfd: The socket descriptor for which the context should be extracted.
void httpd_sess_set_transport_ctx(httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)

Set session ‘transport’ context by socket descriptor.

See httpd_sess_set_ctx()

Parameters

• [in] handle: Handle to server returned by httpd_start
• [in] sockfd: The socket descriptor for which the context should be extracted.
• [in] ctx: Transport context object to assign to the session
• [in] free_fn: Function that should be called to free the transport context

void *httpd_get_global_user_ctx(httpd_handle_t handle)

Get HTTPD global user context (it was set in the server config struct)

Return global user context

Parameters

• [in] handle: Handle to server returned by httpd_start

void *httpd_get_global_transport_ctx(httpd_handle_t handle)

Get HTTPD global transport context (it was set in the server config struct)

Return global transport context

Parameters

• [in] handle: Handle to server returned by httpd_start

esp_err_t httpd_sess_trigger_close(httpd_handle_t handle, int sockfd)

Trigger an httpd session close externally.

Note Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

Return

• ESP_OK: On successfully initiating closure
• ESP_FAIL: Failure to queue work
• ESP_ERR_NOT_FOUND: Socket fd not found
• ESP_ERR_INVALID_ARG: Null arguments

Parameters

• [in] handle: Handle to server returned by httpd_start
• [in] sockfd: Thesocket descriptor of the session to be closed

esp_err_t httpd_sess_update_lru_counter(httpd_handle_t handle, int sockfd)

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

Note Calling this API is only necessary if the LRU Purge Enable option is enabled.

Return

• ESP_OK: Socket found and LRU counter updated
• ESP_ERR_NOT_FOUND: Socket not found
• ESP_ERR_INVALID_ARG: Null arguments

Parameters

• [in] handle: Handle to server returned by httpd_start
• [in] sockfd: The socket descriptor of the session for which LRU counter is to be updated

esp_err_t httpd_get_client_list(httpd_handle_t handle, size_t* fds, int* client_fds)

Returns list of current socket descriptors of active sessions.

Note Size of provided array has to be equal or greater then maximum number of opened sockets, configured upon initialization with max_open_sockets field in httpd_config_t structure.
Return
- ESP_OK: Successfully retrieved session list
- ESP_ERR_INVALID_ARG: Wrong arguments or list is longer than provided array

Parameters
- [in] handle: Handle to server returned by httpd_start
- [inout] fds: In: Size of provided client_fds array Out: Number of valid client fds returned in client_fds,
- [out] client_fds: Array of client fds

Structures
struct httpd_config
HTTP Server Configuration Structure.

Note  Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

Public Members

unsigned task_priority
Priority of FreeRTOS task which runs the server

size_t stack_size
The maximum stack size allowed for the server task

BaseType_t core_id
The core the HTTP server task will run on

uint16_t server_port
TCP Port number for receiving and transmitting HTTP traffic

uint16_t ctrl_port
UDP Port number for asynchronously exchanging control signals between various components of the server

uint16_t max_open_sockets
Max number of sockets/clients connected at any time

uint16_t max_uri_handlers
Maximum allowed uri handlers

uint16_t max_resp_headers
Maximum allowed additional headers in HTTP response

uint16_t backlog_conn
Number of backlog connections

bool lru_purge_enable
Purge “Least Recently Used” connection

uint16_t recv_wait_timeout
Timeout for recv function (in seconds)

uint16_t send_wait_timeout
Timeout for send function (in seconds)

void* global_user_ctx
Global user context.

This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the httpd_req_t struct.

When shutting down, the server frees up the user context by calling free() on the global_user_ctx field. If you wish to use a custom function for freeing the global user context, please specify that here.
httpd_free_ctx_fn_t `global_user_ctx_free_fn`
Free function for global user context

void * `global_transport_ctx`
Global transport context.

Similar to global_user_ctx, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using free(), unless global_transport_ctx_free_fn is specified.

httpd_free_ctx_fn_t `global_transport_ctx_free_fn`
Free function for global transport context

httpd_open_func_t `open_fn`
Custom session opening callback.

Called on a new session socket just after accept(), but before reading any data.

This is an opportunity to set up e.g. SSL encryption using global_transport_ctx and the send/recv/pending session overrides.

If a context needs to be maintained between these functions, store it in the session using httpd_sess_set_transport_ctx() and retrieve it later with httpd_sess_get_transport_ctx()

Returning a value other than ESP_OK will immediately close the new socket.

httpd_close_func_t `close_fn`
Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket.

This is a place for custom de-init code common to all sockets.

The server will only close the socket if no custom session closing callback is set. If a custom callback is used, close(sockfd) should be called in here for most cases.

Set the user or transport context to NULL if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

httpd_uri_match_func_t `uri_match_fn`
URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using httpd_register_uri_handler()

Available options are: 1) NULL : Internally do basic matching using strncmp() 2) httpd_uri_matchWildcard() : URI wildcard matcher

Users can implement their own matching functions (See description of the httpd_uri_match_func_t function prototype)

struct httpd_req
HTTP Request Data Structure.

Public Members

httpd_handle_t `handle`
Handle to server instance

int `method`
The type of HTTP request, -1 if unsupported method

const char uri[HTTPD_MAX_URI_LEN + 1]
The URI of this request (1 byte extra for null termination)

size_t `content_len`
Length of the request body
void *aux
    Internally used members

void *user_ctx
    User context pointer passed during URI registration.

void *sess_ctx
    Session Context Pointer

    A session context. Contexts are maintained across ‘sessions’ for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

    By default, this is NULL. URI Handlers can set this to any meaningful value.

    If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling free(), unless free_ctx function is set.

httpd_free_ctx_fn_t free_ctx
    Pointer to free context hook

    Function to free session context

    If the web server’s socket closes, it frees up the session context by calling free() on the sess_ctx member.

    If you wish to use a custom function for freeing the session context, please specify that here.

bool ignore_sess_ctx_changes
    Flag indicating if Session Context changes should be ignored

    By default, if you change the sess_ctx in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of sess_ctx yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling free_ctx or free()) only if the socket gets closed.

struct httpd_uri
    Structure for URI handler.

Public Members

const char *uri
    The URI to handle

httpd_method_t method
    Method supported by the URI

esp_err_t (*handler)(httpd_req_t *r)
    Handler to call for supported request method. This must return ESP_OK, or else the underlying socket will be closed.

void *user_ctx
    Pointer to user context data which will be available to handler

Macros
HTTPD_MAX_REQ_HDR_LEN
HTTPD_MAX_URI_LEN
HTTPD_SOCK_ERR_FAIL
HTTPD_SOCK_ERR_INVALID
HTTPD_SOCK_ERR_TIMEOUT
HTTPD_200
    HTTP Response 200
HTTPD_204
HTTP Response 204

HTTPD_207
HTTP Response 207

HTTPD_400
HTTP Response 400

HTTPD_404
HTTP Response 404

HTTPD_408
HTTP Response 408

HTTPD_500
HTTP Response 500

HTTPD_TYPE_JSON
HTTP Content type JSON

HTTPD_TYPE_TEXT
HTTP Content type text/HTML

HTTPD_TYPE_OCTET
HTTP Content type octet-stream

HTTPD_DEFAULT_CONFIG

ESP_ERR_HTTPD_BASE
Starting number of HTTPD error codes

ESP_ERR_HTTPD_HANDLERS_FULL
All slots for registering URI handlers have been consumed

ESP_ERR_HTTPD_HANDLER_EXISTS
URI handler with same method and target URI already registered

ESP_ERR_HTTPD_INVALID_REQ
Invalid request pointer

ESP_ERR_HTTPD_RESULT_TRUNC
Result string truncated

ESP_ERR_HTTPD_RESP_HDR
Response header field larger than supported

ESP_ERR_HTTPD_RESP_SEND
Error occurred while sending response packet

ESP_ERR_HTTPD_ALLOC_MEM
Failed to dynamically allocate memory for resource

ESP_ERR_HTTPD_TASK
Failed to launch server task/thread

HTTPD_RESP_USE_STRLEN

Type Definitions
typedef struct httpd_req httpd_req_t
HTTPRequest Data Structure.

typedef struct httpd_uri httpd_uri_t
Structure for URI handler.

typedef int (*httpd_send_func_t) (httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)
Prototype for HTTPD low-level send function.
Note User specified send function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_send() function

Return
- Bytes: The number of bytes sent successfully
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket send()

Parameters
- [in] hd: server instance
- [in] sockfd: session socket file descriptor
- [in] buf: buffer with bytes to send
- [in] buf_len: data size
- [in] flags: flags for the send() function

typedef int (*httpd_recv_func_t)(httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)
Prototype for HTTPDs low-level recv function.

Note User specified recv function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_req_recv() function

Return
- Bytes: The number of bytes received successfully
- 0: Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket recv()

Parameters
- [in] hd: server instance
- [in] sockfd: session socket file descriptor
- [in] buf: buffer with bytes to send
- [in] buf_len: data size
- [in] flags: flags for the send() function

typedef int (*httpd_pending_func_t)(httpd_handle_t hd, int sockfd)
Prototype for HTTPDs low-level “get pending bytes” function.

Note User specified pending function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will be handled accordingly in the server task.

Return
- Bytes: The number of bytes waiting to be received
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket pending()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket pending()

Parameters
- [in] hd: server instance
- [in] sockfd: session socket file descriptor

typedef esp_err_t (*httpd_err_handler_func_t)(httpd_req_t *req, httpd_err_code_t error)
Function prototype for HTTP error handling.

This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

Note
- If implemented, the server will not automatically send out HTTP error response codes, therefore, httpd_resp_send_err() must be invoked inside this function if user wishes to generate HTTP error responses.
- When invoked, the validity of uri, method, content_len and user_ctx fields of the httpd_req_t parameter is not guaranteed as the HTTP request may be partially received/parsed.
The function must return ESP_OK if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type HTTPD_500_INTERNAL_SERVER_ERROR and the socket closed anyway.

**Return**

- ESP_OK : error handled successful
- ESP_FAIL : failure indicates that the underlying socket needs to be closed

**Parameters**

- [in] `req` : HTTP request for which the error needs to be handled
- [in] `error` : Error type

```c
typedef void *httpd_handle_t
HTTP Server Instance Handle.
```

Every instance of the server will have a unique handle.

```c
typedef enum http_method httpd_method_t
HTTP Method Type wrapper over "enum http_method" available in "http_parser" library.
```

```c
typedef void (*httpd_free_ctx_fn_t)(void *ctx)
Prototype for freeing context data (if any)
```

**Parameters**

- [in] `ctx` : object to free

```c
typedef esp_err_t (*httpd_open_func_t)(httpd_handle_t hd, int sockfd)
Function prototype for opening a session.
```

Called immediately after the socket was opened to set up the send/recv functions and other parameters of the socket.

**Return**

- ESP_OK : On success
- Any value other than ESP_OK will signal the server to close the socket immediately

**Parameters**

- [in] `hd` : server instance
- [in] `sockfd` : session socket file descriptor

```c
typedef void (*httpd_close_func_t)(httpd_handle_t hd, int sockfd)
Function prototype for closing a session.
```

**Note** It’s possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

**Parameters**

- [in] `hd` : server instance
- [in] `sockfd` : session socket file descriptor

```c
typedef bool (*httpd_uri_match_func_t)(const char *reference_uri, const char *uri_to_match, size_t match_upto)
Function prototype for URI matching.
```

**Return** true on match

**Parameters**

- [in] `reference_uri` : URI/template with respect to which the other URI is matched
- [in] `uri_to_match` : URI/template being matched to the reference URI/template
- [in] `match_upto` : For specifying the actual length of `uri_to_match` up to which the matching algorithm is to be applied (The maximum value is strlen(`uri_to_match`), independent of the length of `reference_uri`)

```c
typedef struct httpd_config httpd_config_t
HTTP Server Configuration Structure.
```

**Note** Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

```c
typedef void (*httpd_work_fn_t)(void *arg)
Prototype of the HTTPD work function Please refer to httpd_queue_work() for more details.
Parameters

- [in] arg: The arguments for this work function

Enumerations

```c
enum httpd_err_code_t
```
Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.

Values:

- `HTTPD_500_INTERNAL_SERVER_ERROR` = 0
- `HTTPD_501_METHOD_NOT_IMPLEMENTED`
- `HTTPD_505_VERSION_NOT_SUPPORTED`
- `HTTPD_400_BAD_REQUEST`
- `HTTPD_401_UNAUTHORIZED`
- `HTTPD_403_FORBIDDEN`
- `HTTPD_404_NOT_FOUND`
- `HTTPD_405_METHOD_NOT_ALLOWED`
- `HTTPD_408_REQ_TIMEOUT`
- `HTTPD_411_LENGTH_REQUIRED`
- `HTTPD_414_URI_TOO_LONG`
- `HTTPD_431_REQ_HDR_FIELDS_TOO_LARGE`
- `HTTPD_ERR_CODE_MAX`

2.2.11 HTTPS server

Overview

This component is built on top of `esp_http_server`. The HTTPS server takes advantage of hooks and function overrides in the regular HTTP server to provide encryption using OpenSSL.

All documentation for `esp_http_server` applies also to a server you create this way.

Used APIs

The following API of `esp_http_server` should not be used with `esp_https_server`, as they are used internally to handle secure sessions and to maintain internal state:

- “send” , “receive” and “pending” function overrides - secure socket handling
  - `httpd_sess_set_send_override()`
  - `httpd_sess_set_recv_override()`
  - `httpd_sess_set_pending_override()`
- “transport context” - both global and session
  - `httpd_sess_get_transport_ctx()` - returns SSL used for the session
  - `httpd_sess_set_transport_ctx()`
  - `httpd_get_global_transport_ctx()` - returns the shared SSL context
  - `httpd_config_t.global_transport_ctx`
  - `httpd_config_t.global_transport_ctx_free_fn`
  - `httpd_config_t.open_fn` - used to set up secure sockets

Everything else can be used without limitations.
Usage

Please see the example protocols/https_server to learn how to set up a secure server.

Basically all you need is to generate a certificate, embed it in the firmware, and provide its pointers and lengths to the start function via the init struct.

The server can be started with or without SSL by changing a flag in the init struct - httpd_ssl_config.transport_mode. This could be used e.g. for testing or in trusted environments where you prefer speed over security.

Performance

The initial session setup can take about two seconds, or more with slower clock speeds or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

API Reference

Header File

- components/esp_https_server/include/esp_https_server.h

Functions

esp_err_t httpd_ssl_start (httpd_handle_t *handle, httpd_ssl_config_t *config)

Create a SSL capable HTTP server (secure mode may be disabled in config)

Return success

Parameters

- [inout] config: - server config, must not be const. Does not have to stay valid after calling this function.
- [out] handle: - storage for the server handle, must be a valid pointer

void httpd_ssl_stop (httpd_handle_t handle)

Stop the server. Blocks until the server is shut down.

Parameters

- [in] handle:

Structures

struct esp_https_server_user_cb_arg

Callback data struct, contains the ESP-TLS connection handle.

struct httpd_ssl_config

HTTPS server config struct

Please use HTTPD_SSL_CONFIG_DEFAULT() to initialize it.

Public Members

httpd_config_t httpd

Underlying HTTPD server config

Parameters like task stack size and priority can be adjusted here.

const uint8_t *servercert

Server certificate

size_t servercert_len

Server certificate byte length
const uint8_t *cacert_pem
CA certificate ((CA used to sign clients, or client cert itself)

size_t cacert_len
CA certificate byte length

const uint8_t *prvtkey_pem
Private key

size_t prvtkey_len
Private key byte length

httpd_ssl_transport_mode_t transport_mode
Transport Mode (default secure)

uint16_t port_secure
Port used when transport mode is secure (default 443)

uint16_t port_insecure
Port used when transport mode is insecure (default 80)

bool session_tickets
Enable tls session tickets

esp_https_server_user_cb *user_cb
User callback for esp_https_server

Macros
HTTPD_SSL_CONFIG_DEFAULT()
Default config struct init

(http_server default config had to be copied for customization)

Notes:
• port is set when starting the server, according to `transport_mode`
• one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
• SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
• Stack size may need adjustments depending on the user application

Type Definitions
typedef struct esp_https_server_user_cb_arg esp_https_server_user_cb_arg_t
Callback data struct, containsthe ESP-TLS connection handle.

typedef void esp_https_server_user_cb (esp_https_server_user_cb_arg_t *user_cb)
Callback function prototype Can be used to get connection or client information (SSL context) E.g. Client
certificate, Socket FD, Connection state, etc.

Parameters
• user_cb: Callback data struct

typedef struct httpd_ssl_config httpd_ssl_config_t

Enumerations
enum httpd_ssl_transport_mode_t
Values:

HTTPD_SSL_TRANSPORT_SECURE
HTTPD_SSL_TRANSPORT_INSECURE
2.2.12 ICMP Echo

Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network utility ping is implemented based on the ICMP packets with the type field value of 0, also called Echo Reply.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g. packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending/parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

Create a new ping session To create a ping session, you need to fill in the `esp_ping_config_t` configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the `esp_ping_callbacks_t` structure.

Example method to create a new ping session and register callbacks:

```c
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char * str = (const char *) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_time));
    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\n",
           recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
    printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4), seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;
    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted, sizeof(transmitted));
    (continues on next page)
```
esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_time_ms));
printf("%d packets transmitted, %d received, time %dms\n", transmitted, received, total_time_ms);
}

void initialize_ping()
{
    /* convert URL to IP address */
    ip_addr_t target_addr;
    struct addrinfo hint;
    struct addrinfo *res = NULL;
    memset(&hint, 0, sizeof(hint));
    memset(&target_addr, 0, sizeof(target_addr));
    getaddrinfo("www.espressif.com", NULL, &hint, &res);
    struct in_addr addr4 = ((struct sockaddr_in*) (res->ai_addr))->sin_addr;
    inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
    freeaddrinfo(res);
    esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
    ping_config.target_addr = target_addr;  // target IP address
    ping_config.count = ESP_PING_COUNT_INFINITE;  // ping in infinite mode, esp_ping_stop can stop it

    /* set callback functions */
    esp_ping_callbacks_t cbs;
    cbs.on_ping_success = test_on_ping_success;
    cbs.on_ping_timeout = test_on_ping_timeout;
    cbs.on_ping_end = test_on_ping_end;
    cbs.cb_args = "foo";  // arguments that will feed to all callback functions, can be NULL
    cbs.cb_args = eth_event_group;
    esp_ping_handle_t ping;
    esp_ping_new_session(&ping_config, &cbs, &ping);
}

Start and Stop ping session You can start and stop ping session with the handle returned by esp_ping_new_session. Note that, the ping session won’t start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

Delete a ping session If a ping session won’t be used any more, you can delete it with esp_ping_delete_session. Please make sure the ping session is in stop state (i.e. you have called esp_ping_stop before or the ping session has finished all the procedures) when you call this function.

Get runtime statistics As the example code above, you can call esp_ping_get_profile to get different runtime statistics of ping session in the callback function.

Application Example

ICMP echo example: protocols/icmp_echo

API Reference

Header File
**Components**

- components/lwip/include/apps/ping/ping_sock.h

**Functions**

`esp_err_t esp_ping_new_session(const esp_ping_config_t *config, const esp_ping_callbacks_t *cbs, esp_ping_handle_t *hdl_out)`

Create a ping session.

**Return**

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. configuration is null, etc)
- ESP_ERR_NO_MEM: out of memory
- ESP_FAIL: other internal error (e.g. socket error)
- ESP_OK: create ping session successfully, user can take the ping handle to do follow-on jobs

**Parameters**

- `config`: ping configuration
- `cbs`: a bunch of callback functions invoked by internal ping task
- `hdl_out`: handle of ping session

`esp_err_t esp_ping_delete_session(esp_ping_handle_t hdl)`

Delete a ping session.

**Return**

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: delete ping session successfully

**Parameters**

- `hdl`: handle of ping session

`esp_err_t esp_ping_start(esp_ping_handle_t hdl)`

Start the ping session.

**Return**

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: start ping session successfully

**Parameters**

- `hdl`: handle of ping session

`esp_err_t esp_ping_stop(esp_ping_handle_t hdl)`

Stop the ping session.

**Return**

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: stop ping session successfully

**Parameters**

- `hdl`: handle of ping session

`esp_err_t esp_ping_get_profile(esp_ping_handle_t hdl, esp_ping_profile_t profile, void *data, uint32_t size)`

Get runtime profile of ping session.

**Return**

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_ERR_INVALID_SIZE: the actual profile data size doesn’t match the “size” parameter
- ESP_OK: get profile successfully

**Parameters**

- `hdl`: handle of ping session
- `profile`: type of profile
- `data`: profile data
- `size`: profile data size

**Structures**

`struct esp_ping_callbacks_t`

Type of “ping” callback functions.
Public Members

void *cb_args
arguments for callback functions

void (*on_ping_success)(esp_ping_handle_t hdl, void *args)
Invoked by internal ping thread when received ICMP echo reply packet.

void (*on_ping_timeout)(esp_ping_handle_t hdl, void *args)
Invoked by internal ping thread when receive ICMP echo reply packet timeout.

void (*on_ping_end)(esp_ping_handle_t hdl, void *args)
Invoked by internal ping thread when a ping session is finished.

struct esp_ping_config_t
Type of “ping” configuration.

Public Members

uint32_t count
A “ping” session contains count procedures

uint32_t interval_ms
Milliseconds between each ping procedure

uint32_t timeout_ms
Timeout value (in milliseconds) of each ping procedure

uint32_t data_size
Size of the data next to ICMP packet header

uint8_t tos
Type of Service, a field specified in the IP header

ip_addr_t target_addr
Target IP address, either IPv4 or IPv6

uint32_t task_stack_size
Stack size of internal ping task

uint32_t task_prio
Priority of internal ping task

uint32_t interface
Netif index, interface=0 means NETIF_NO_INDEX

Macros

ESP_PING_DEFAULT_CONFIG()
Default ping configuration.

ESP_PING_COUNT_INFINITE
Set ping count to zero will ping target infinitely

Type Definitions

typedef void *esp_ping_handle_t
Type of “ping” session handle.

Enumerations

enum esp_ping_profile_t
Profile of ping session.

Values:
ESP_PING_PROF_SEQNO
   Sequence number of a ping procedure

ESP_PING_PROF_TTL
   Time to live of a ping procedure

ESP_PING_PROF_REQUEST
   Number of request packets sent out

ESP_PING_PROF_REPLY
   Number of reply packets received

ESP_PING_PROF_IPADDR
   IP address of replied target

ESP_PING_PROF_SIZE
   Size of received packet

ESP_PING_PROF_TIMEGAP
   Elapsed time between request and reply packet

ESP_PING_PROF_DURATION
   Elapsed time of the whole ping session

2.2.13 mDNS Service

Overview

mDNS is a multicast UDP service that is used to provide local network service and host discovery.
mDNS is installed by default on most operating systems or is available as separate package. On Mac OS it is installed by default and is called Bonjour. Apple releases an installer for Windows that can be found on Apple’s support page. On Linux, mDNS is provided by avahi and is usually installed by default.

mDNS Properties

- hostname: the hostname that the device will respond to. If not set, the hostname will be read from the interface. Example: my-esp32c3 will resolve to my-esp32c3.local
- default_instance: friendly name for your device, like Jhon's ESP32-C3 Thing. If not set, hostname will be used.

Example method to start mDNS for the STA interface and set hostname and default_instance:

```c
void start_mdns_service()
{
   //initialize mDNS service
   esp_err_t err = mdns_init();
   if (err) {
      printf("MDNS Init failed: %d\n", err);
      return;
   }

   //set hostname
   mdns_hostname_set("my-esp32c3");
   //set default instance
   mdns_instance_name_set("Jhon's ESP32-C3 Thing");
}
```

mDNS Services mDNS can advertise information about network services that your device offers. Each service is defined by a few properties.
• instance_name: friendly name for your service, like Jhon's ESP32-C3 Web Server. If not defined, default_instance will be used.
• service_type: (required) service type, prepended with underscore. Some common types can be found here.
• proto: (required) protocol that the service runs on, prepended with underscore. Example: _tcp or _udp
• port: (required) network port that the service runs on
• txt: {var, val} array of strings, used to define properties for your service

Example method to add a few services and different properties:

```c
void add_mdns_services()
{
    //add our services
    mdns_service_add(NULL, "_http", "_tcp", 80, NULL, 0);
    mdns_service_add(NULL, "_arduino", "_tcp", 3232, NULL, 0);
    mdns_service_add(NULL, "_myservice", "_udp", 1234, NULL, 0);

    //NOTE: services must be added before their properties can be set
    //use custom instance for the web server
    mdns_service_instance_name_set("_http", "_tcp", "Jhon's ESP32-C3 Web Server");

    mdns_txt_item_t serviceTxtData[3] = {
        {"board","esp32c3"},
        {"u","user"},
        {"p","password"}
    };
    //set txt data for service (will free and replace current data)
    mdns_service_txt_set("_http", "_tcp", serviceTxtData, 3);

    //change service port
    mdns_service_port_set("_myservice", "_udp", 4321);
}
```

**mDNS Query**  mDNS provides methods for browsing for services and resolving host’s IP/IPv6 addresses.

Results for services are returned as a linked list of mdns_result_t objects.

Example method to resolve host IPs:

```c
void resolve_mdns_host(const char * host_name)
{
    printf("Query A: %s.local", host_name);

    struct ip4_addr addr;
    addr.addr = 0;

    esp_err_t err = mdns_query_a(host_name, 2000, &addr);
    if(err){
        if(err == ESP_ERR_NOT_FOUND){
            printf("Host was not found!");
            return;
        }
        printf("Query Failed");
        return;
    }

    printf(IPSTR, IP2STR(&addr));
}
```

Example method to resolve local services:
static const char * if_str[] = {"STA", "AP", "ETH", "MAX"};
static const char * ip_protocol_str[] = {"V4", "V6", "MAX"};

void mdns_print_results(mdns_result_t * results){
    mdns_result_t * r = results;
    mdns_ip_addr_t * a = NULL;
    int i = 1, t;
    while(r){
        printf("%d: Interface: %s, Type: %s\n", i++, if_str[r->tcpip_if], ip_protocol_str[r->ip_protocol]);
        if(r->instance_name){
            printf("PTR : %s\n", r->instance_name);
        }
        if(r->hostname){
            printf("SRV : %s.local:%u\n", r->hostname, r->port);
        }
        if(r->txt_count){
            printf("TXT : [%u] \n", r->txt_count);
            for(t=0; t<r->txt_count; t++){
                printf("%s=%s\n", r->txt[t].key, r->txt[t].value);
            }
            printf("\n");
        }
        a = r->addr;
        while(a){
            if(a->addr.type == IPADDR_TYPE_V6){
                printf("AAAAA: " IPV6STR "\n", IPV62STR(a->addr.u_addr.ip6));
            } else {
                printf(" A : " IPSTR "\n", IP2STR(%(a->addr.u_addr.ip4)));
            }
            a = a->next;
        }
        r = r->next;
    }
}

void find_mdns_service(const char * service_name, const char * proto){
    ESP_LOGI(TAG, "Query PTR: %s.%s.local\n", service_name, proto);
    mdns_result_t * results = NULL;
    esp_err_t err = mdns_query_ptr(service_name, proto, 3000, 20, &results);
    if(err){
        ESP_LOGE(TAG, "Query Failed");
        return;
    }
    if(!results){
        ESP_LOGW(TAG, "No results found!" );
        return;
    }
    mdns_print_results(results);
    mdns_query_results_free(results);
}

Example of using the methods above:

void my_app_some_method(){
    //search for esp32c3-mdns.local
    resolve_mdns_host("esp32c3-mdns");
}
Chapter 2. API Reference

(continued from previous page)

```c
//search for HTTP servers
find_mdns_service("_http", "_tcp");

//or file servers
find_mdns_service("_smb", "_tcp"); //windows sharing
find_mdns_service("_afpovertcp", "_tcp"); //apple sharing
find_mdns_service("_nfs", "_tcp"); //NFS server
find_mdns_service("_ftp", "_tcp"); //FTP server

//or networked printer
find_mdns_service("_printer", "_tcp");
find_mdns_service("_ipp", "_tcp");
```

Application Example

mDNS server/scanner example: protocols/mdns.

API Reference

Header File

- components/mdns/include/mdns.h

Functions

```c
esp_err_t mdns_init (void)
    Initialize mDNS on given interface.

    Return
    • ESP_OK on success
    • ESP_ERR_INVALID_STATE when failed to register event handler
    • ESP_ERR_NO_MEM on memory error
    • ESP_FAIL when failed to start mdns task

void mdns_free (void)
    Stop and free mDNS server.

esp_err_t mdns_hostname_set (const char *hostname)
    Set the hostname for mDNS server required if you want to advertise services.

    Return
    • ESP_OK success
    • ESP_ERR_INVALID_ARG Parameter error
    • ESP_ERR_NO_MEM memory error

Parameters
    • hostname: Hostname to set

esp_err_t mdns_delegate_hostname_add (const char *hostname, const mdns_ip_addr_t *address_list)
    Adds a hostname and address to be delegated A/AAAA queries will be replied for the hostname and services can be added to this host.

    Return
    • ESP_OK success
    • ESP_ERR_INVALID_STATE mDNS is not running
    • ESP_ERR_INVALID_ARG Parameter error
    • ESP_ERR_NO_MEM memory error

Parameters
    • hostname: Hostname to add
    • address_list: The IP address list of the host
```
`esp_err_t mdns_delegate_hostname_remove(const char *hostname)`
Remove a delegated hostname. All the services added to this host will also be removed.

Return
- ESP_OK success
- ESP_ERR_INVALID_STATE MDNS is not running
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

Parameters
- hostname: Hostname to remove

`bool mdns_hostname_exists(const char *hostname)`
Query whether a hostname has been added.

Return
- true The hostname has been added.
- false The hostname has not been added.

Parameters
- hostname: Hostname to query

`esp_err_t mdns_instance_name_set(const char *instance_name)`
Set the default instance name for mDNS server.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

Parameters
- instance_name: Instance name to set

`esp_err_t mdns_service_add(const char *instance_name, const char *service_type, const char *proto, uint16_t port, mdns_txt_item_t txt[], size_t num_items)`
Add service to mDNS server.

Note The value length of txt items will be automatically decided by strlen

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error
- ESP_FAIL failed to add service

Parameters
- instance_name: instance name to set. If NULL, global instance name or hostname will be used. Note that MDNS_MULTIPLE_INSTANCE config option needs to be enabled for adding multiple instances with the same instance type.
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- port: service port
- txt: string array of TXT data (eg. {{"var","val"},{"other","2"}})
- num_items: number of items in TXT data

`esp_err_t mdns_service_add_for_host(const char *instance_name, const char *service_type, const char *proto, const char *hostname, uint16_t port, mdns_txt_item_t txt[], size_t num_items)`
Add service to mDNS server with a delegated hostname.

Note The value length of txt items will be automatically decided by strlen

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error
- ESP_FAIL failed to add service

Parameters
• **instance_name**: instance name to set. If NULL, global instance name or hostname will be used. Note that MDNS_MULTIPLE_INSTANCE config option needs to be enabled for adding multiple instances with the same instance type.

• **service_type**: service type (_http, _ftp, etc)

• **proto**: service protocol (_tcp, _udp)

• **hostname**: service hostname. If NULL, local hostname will be used.

• **port**: service port

• **txt**: string array of TXT data (eg. `{{ "var", "val" },{ "other", "2" }}`)

• **num_items**: number of items in TXT data

```c
bool mdns_service_exists (const char *service_type, const char *proto, const char *hostname)
```

Check whether a service has been added.

**Return**

• true Corresponding service has been added.

• false Service not found.

**Parameters**

• **service_type**: service type (_http, _ftp, etc)

• **proto**: service protocol (_tcp, _udp)

• **hostname**: service hostname. If NULL, checks for the local hostname.

```c
bool mdns_service_exists_with_instance (const char *instance, const char *service_type,
                                        const char *proto, const char *hostname)
```

Check whether a service has been added.

**Return**

• true Corresponding service has been added.

• false Service not found.

**Parameters**

• **instance**: instance name

• **service_type**: service type (_http, _ftp, etc)

• **proto**: service protocol (_tcp, _udp)

• **hostname**: service hostname. If NULL, checks for the local hostname.

```c
esp_err_t mdns_service_remove (const char *service_type, const char *proto)
```

Remove service from mDNS server.

**Return**

• ESP_OK success

• ESP_ERR_INVALID_ARG Parameter error

• ESP_ERR_NOT_FOUND Service not found

• ESP_ERR_NO_MEM memory error

**Parameters**

• **service_type**: service type (_http, _ftp, etc)

• **proto**: service protocol (_tcp, _udp)

```c
esp_err_t mdns_service_remove_for_host (const char *instance, const char *service_type,
                                        const char *proto, const char *hostname)
```

Remove service from mDNS server with hostname.

**Return**

• ESP_OK success

• ESP_ERR_INVALID_ARG Parameter error

• ESP_ERR_NOT_FOUND Service not found

• ESP_ERR_NO_MEM memory error

**Parameters**

• **instance**: instance name

• **service_type**: service type (_http, _ftp, etc)

• **proto**: service protocol (_tcp, _udp)

• **hostname**: service hostname. If NULL, local hostname will be used.

```c
esp_err_t mdns_service_instance_name_set (const char *service_type, const char *proto,
                                          const char *instance_name)
```

Submit Document Feedback
Set instance name for service.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- instance_name: instance name to set

```c
esp_err_t mdns_service_instance_name_set_for_host(const char *instance_old, const char *service_type, const char *proto, const char *hostname, const char *instance_name)
```

Set instance name for service with hostname.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters
- instance_old: original instance name
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- hostname: service hostname. If NULL, local hostname will be used.
- instance_name: instance name to set

```c
esp_err_t mdns_service_port_set(const char *service_type, const char *proto, uint16_t port)
```

Set service port.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- port: service port

```c
esp_err_t mdns_service_port_set_for_host(const char *instance, const char *service_type, const char *proto, const char *hostname, uint16_t port)
```

Set service port with hostname.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters
- instance: instance name
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- hostname: service hostname. If NULL, local hostname will be used.
- port: service port

```c
esp_err_t mdns_service_txt_set(const char *service_type, const char *proto, mdns_txt_item_t txt[], uint8_t num_items)
```

Replace all TXT items for service.
Note The value length of txt items will be automatically decided by strlen

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- txt: array of TXT data (eg. {{ “var” , ” val” },{ “other”, ” 2” }})
- num_items: number of items in TXT data

```c
esp_err_t mdns_service_txt_set_for_host (const char *instance, const char *service_type,
                                      const char *proto, const char *hostname,
                                      mdns_txt_item_t txt[], uint8_t num_items)
```

Replace all TXT items for service with hostname.

Note The value length of txt items will be automatically decided by strlen

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters
- instance: instance name
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- hostname: service hostname. If NULL, localhost name will be used.
- txt: array of TXT data (eg. {{ “var” , ” val” },{ “other”, ” 2” }})
- num_items: number of items in TXT data

```c
esp_err_t mdns_service_txt_item_set (const char *service_type, const char *proto,
                                     const char *key, const char *value)
```

Set/Add TXT item for service TXT record.

Note The value length will be automatically decided by strlen

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- key: the key that you want to add/update
- value: the new value of the key

```c
esp_err_t mdns_service_txt_item_set_with_explicit_value_len (const char *service_type, const char *proto,
                                                            const char *key, const char *value,
                                                            uint8_t value_len)
```

Set/Add TXT item for service TXT record.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters
- service_type: service type (_http, _ftp, etc)
Chapter 2. API Reference

- **proto**: service protocol (_tcp, _udp)
- **key**: the key that you want to add/update
- **value**: the new value of the key
- **value_len**: the length of the value

```
esp_err_t mdns_service_txt_item_set_for_host(const char *instance, const char *service_type, const char *proto, const char *hostname, const char *key, const char *value)
```

Set/Add TXT item for service TXT record with hostname.

**Note**  The value length will be automatically decided by strlen

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- **instance**: instance name
- **service_type**: service type (_http, _ftp, etc)
- **proto**: service protocol (_tcp, _udp)
- **hostname**: service hostname. If NULL, local hostname will be used.
- **key**: the key that you want to add/update
- **value**: the new value of the key

```
esp_err_t mdns_service_txt_item_set_for_host_with_explicit_value_len(const char *instance, const char *service_type, const char *proto, const char *hostname, const char *key, const char *value, uint8_t value_len)
```

Set/Add TXT item for service TXT record with hostname and txt value length.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- **instance**: instance name
- **service_type**: service type (_http, _ftp, etc)
- **proto**: service protocol (_tcp, _udp)
- **hostname**: service hostname. If NULL, local hostname will be used.
- **key**: the key that you want to add/update
- **value**: the new value of the key
- **value_len**: the length of the value
```c
esp_err_t mdns_service_txt_item_remove(const char *service_type, const char *proto, const char *key)

Remove TXT item for service TXT record.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- key: the key that you want to remove

esp_err_t mdns_service_txt_item_remove_for_host(const char *instance, const char *service_type, const char *proto, const char *hostname, const char *key)

Remove TXT item for service TXT record with hostname.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters
- instance: instance name
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- hostname: service hostname. If NULL, local hostname will be used.
- key: the key that you want to remove

esp_err_t mdns_service_subtype_add_for_host(const char *instance_name, const char *service_type, const char *proto, const char *hostname, const char *subtype)

Add subtype for service.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters
- instance_name: instance name. If NULL, will find the first service with the same service type and protocol.
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- hostname: service hostname. If NULL, local hostname will be used.
- subtype: The subtype to add.

esp_err_t mdns_service_remove_all(void)

Remove and free all services from mDNS server.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t mdns_query_async_delete(mdns_search_once_t *search)

Deletes the finished query. Call this only after the search has ended!

Return
- ESP_OK success
- ESP_ERR_INVALID_STATE search has not finished
```
**mdns_query_async_get_results**

```c
bool mdns_query_async_get_results(mdns_search_once_t *search, uint32_t timeout, mdns_result_t **results, uint8_t *num_results)
```

Get results from search pointer. Results available as a pointer to the output parameter. Pointer to search object has to be deleted via `mdns_query_async_delete` once the query has finished. The results although have to be freed manually.

**Parameters**
- `search`: pointer to search object
- `timeout`: time in milliseconds to wait for answers
- `results`: pointer to the results of the query
- `num_results`: pointer to the number of the actual result items (set to NULL to ignore this return value)

**Return** True if search has finished before or at timeout False if search timeout is over

**mdns_search_once_t**

```c
mdns_search_once_t *mdns_query_async_new(const char *name, const char *service_type, const char *proto, uint16_t type, uint32_t timeout, size_t max_results, mdns_query_notify_t notifier)
```

Query mDNS for host or service asynchronously. Search has to be tested for progress and deleted manually!

**Parameters**
- `name`: service instance or host name (NULL for PTR queries)
- `service_type`: service type (_http, _arduino, _ftp etc.) (NULL for host queries)
- `proto`: service protocol (_tcp, _udp, etc.) (NULL for host queries)
- `type`: type of query (MDNS_TYPE_*)
- `timeout`: time in milliseconds during which mDNS query is active
- `max_results`: maximum results to be collected
- `notifier`: Notification function to be called when the result is ready, can be NULL

**Return** `mdns_search_once_s` pointer to new search object if query initiated successfully. NULL otherwise.

**esp_err_t**

```c
esp_err_t mdns_query_generic(const char *name, const char *service_type, const char *proto, uint16_t type, mdns_query_transmission_type_t transmission_type, uint32_t timeout, size_t max_results, mdns_result_t **results)
```

Generic mDNS query All following query methods are derived from this one.

**Parameters**
- `name`: service instance or host name (NULL for PTR queries)
- `service_type`: service type (_http, _arduino, _ftp etc.) (NULL for host queries)
- `proto`: service protocol (_tcp, _udp, etc.) (NULL for host queries)
- `type`: type of query (MDNS_TYPE_*)
- `transmission_type`: either Unicast query, or Multicast query
- `timeout`: time in milliseconds to wait for answers.
- `max_results`: maximum results to be collected
- `results`: pointer to the results of the query results must be freed using `mdns_query_results_free` below

**Return**
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG timeout was not given

**Parameters**
- `name`: service instance or host name (NULL for PTR queries)
- `service_type`: service type (_http, _arduino, _ftp etc.) (NULL for host queries)
- `proto`: service protocol (_tcp, _udp, etc.) (NULL for host queries)
- `type`: type of query (MDNS_TYPE_*)
- `transmission_type`: either Unicast query, or Multicast query
- `timeout`: time in milliseconds to wait for answers.
- `max_results`: maximum results to be collected
- `results`: pointer to the results of the query results must be freed using `mdns_query_results_free` below

**Return**
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
ESP_ERR_NO_MEM memory error
ESP_ERR_INVALID_ARG timeout was not given

Parameters
- **name**: service instance or host name (NULL for PTR queries)
- **service_type**: service type (_http, _arduino, _ftp etc.) (NULL for host queries)
- **proto**: service protocol (_tcp, _udp, etc.) (NULL for host queries)
- **type**: type of query (MDNS_TYPE_*)
- **timeout**: time in milliseconds to wait for answers.
- **max_results**: maximum results to be collected
- **results**: pointer to the results of the query results must be freed using mdns_query_results_free below

```c
void mdns_query_results_free (mdns_result_t *results)
```
Free query results.

Parameters
- **results**: linked list of results to be freed

```c
esp_err_t mdns_query_ptr (const char *service_type, const char *proto, uint32_t timeout, size_t max_results, mdns_result_t **results)
```
Query mDNS for service.

Return
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

Parameters
- **service_type**: service type (_http, _arduino, _ftp etc.)
- **proto**: service protocol (_tcp, _udp, etc.)
- **timeout**: time in milliseconds to wait for answer.
- **max_results**: maximum results to be collected
- **results**: pointer to the results of the query

```c
esp_err_t mdns_query_srv (const char *instance_name, const char *service_type, const char *proto, uint32_t timeout, mdns_result_t **result)
```
Query mDNS for SRV record.

Return
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

Parameters
- **instance_name**: service instance name
- **service_type**: service type (_http, _arduino, _ftp etc.)
- **proto**: service protocol (_tcp, _udp, etc.)
- **timeout**: time in milliseconds to wait for answer.
- **result**: pointer to the result of the query

```c
esp_err_t mdns_query_txt (const char *instance_name, const char *service_type, const char *proto, uint32_t timeout, mdns_result_t **result)
```
Query mDNS for TXT record.

Return
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

Parameters
- **instance_name**: service instance name
- **service_type**: service type (_http, _arduino, _ftp etc.)
- **proto**: service protocol (_tcp, _udp, etc.)
• `timeout`: time in milliseconds to wait for answer.
• `result`: pointer to the result of the query

```c
esp_err_t mdns_query_a(const char *host_name, uint32_t timeout, esp_ip4_addr_t *addr)
```
Query mDNS for A record.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

**Parameters**
- `host_name`: host name to look for
- `timeout`: time in milliseconds to wait for answer.
- `addr`: pointer to the resulting IP4 address

```c
esp_err_t mdns_query_aaaa(const char *host_name, uint32_t timeout, esp_ip6_addr_t *addr)
```
Query mDNS for A record.

Please note that hostname must not contain domain name, as mDNS uses `.local` domain.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

**Parameters**
- `host_name`: host name to look for
- `timeout`: time in milliseconds to wait for answer. If 0, max_results needs to be defined
- `addr`: pointer to the resulting IP6 address

**Structures**

```c
struct mdns_txt_item_t
```
mDNS basic text item structure Used in mdns_service_add()

**Public Members**

```c
const char *key
```
item key name

```c
const char *value
```
item value string

```c
struct mdns_ip_addr_s
```
mDNS query linked list IP item

**Public Members**

```c
esp_ip_addr_t addr
```
IP address

```c
struct mdns_ip_addr_s *next
```
next IP, or NULL for the last IP in the list

```c
struct mdns_result_s
```
mDNS query result structure
Public Members

```c
struct mdns_result_s *next
    next result, or NULL for the last result in the list

mdns_if_t tcpip_if
    interface index

uint32_t ttl
    time to live

mdns_ip_protocol_t ip_protocol
    ip_protocol type of the interface (v4/v6)

char *instance_name
    instance name

char *service_type
    service type

char *proto
    service protocol

char *hostname
    hostname

uint16_t port
    service port

mdns_txt_item_t *txt
    txt record

uint8_t *txt_value_len
    array of txt value len of each record

size_t txt_count
    number of txt items

mdns_ip_addr_t *addr
    linked list of IP addresses found
```

Macros

```c
MDNS_TYPE_A
MDNS_TYPE_PTR
MDNS_TYPE_TXT
MDNS_TYPE_AAAA
MDNS_TYPE_SRV
MDNS_TYPE_OPT
MDNS_TYPE_NSEC
MDNS_TYPE_ANY
```

Type Definitions

```c
typedef struct mdns_search_once_s mdns_search_once_t
    Asynchronous query handle.
typedef struct mdns_ip_addr_s mdns_ip_addr_t
    mDNS query linked list IP item
typedef enum mdns_if_internal mdns_if_t

typedef struct mdns_result_s mdns_result_t
    mDNS query result structure
```
typedef void (*mdns_query_notify_t) (mdns_search_once_t *search)

Enumerations

defined

enum mdns_ip_protocol_t
    mDNS enum to specify the ip_protocol type

Values:

    MDNS_IP_PROTOCOL_V4
    MDNS_IP_PROTOCOL_V6
    MDNS_IP_PROTOCOL_MAX

enum mdns_if_internal
    Values:

    MDNS_IF_STA = 0
    MDNS_IF_AP = 1
    MDNS_IF_ETH = 2
    MDNS_IF_MAX

enum mdns_query_transmission_type_t
    mDNS query type to be explicitly set to either Unicast or Multicast

Values:

    MDNS_QUERY_UNICAST
    MDNS_QUERY_MULTICAST

Code examples for this API section are provided in the protocols directory of ESP-IDF examples.

2.2.14 IP Network Layer

Documentation for IP Network Layer protocols (below the Application Protocol layer) are provided in Networking APIs.

2.3 Bluetooth API

2.3.1 BT COMMON

BT GENERIC DEFINES

Overview  Instructions

Application Example  Instructions

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_bt_defs.h

Structures

struct esp_bt_uuid_t
    UUID type.
Public Members

```c
uint16_t len
   UUID length, 16bit, 32bit or 128bit

uint16_t uuid16
   16bit UUID

uint32_t uuid32
   32bit UUID

uint8_t uuid128[ESP_UUID_LEN_128]
   128bit UUID

union esp_bt_uuid_t::[anonymous] uuid
   UUID
```

Macros

```c
ESP_BLUEDROID_STATUS_CHECK(status)
ESP_BT_OCTET16_LEN
ESP_BT_OCTET8_LEN
ESP_DEFAULT_GATT_IF
   Default GATT interface id.

ESP_BLE_CONN_INT_MIN
   relate to BTM_BLE_CONN_INT_MIN in stack/btm_ble_api.h

ESP_BLE_CONN_INT_MAX
   relate to BTM_BLE_CONN_INT_MAX in stack/btm_ble_api.h

ESP_BLE_CONN_LATENCY_MAX
   relate to ESP_BLE_CONN_LATENCY_MAX in stack/btm_ble_api.h

ESP_BLE_CONN_SUP_TOUT_MIN
   relate to BTM_BLE_CONN_SUP_TOUT_MIN in stack/btm_ble_api.h

ESP_BLE_CONN_SUP_TOUT_MAX
   relate to ESP_BLE_CONN_SUP_TOUT_MAX in stack/btm_ble_api.h

ESP_BLE_CONN_PARAM_UNDEF

ESP_BLE_SCAN_PARAM_UNDEF

ESP_BLE_IS_VALID_PARAM(x, min, max)
   Check the param is valid or not.

ESP_UUID_LEN_16

ESP_UUID_LEN_32

ESP_UUID_LEN_128

ESP_BD_ADDR_LEN
   Bluetooth address length.

ESP_BLE_ENC_KEY_MASK
   Used to exchange the encryption key in the init key & response key.

ESP_BLE_ID_KEY_MASK
   Used to exchange the IRK key in the init key & response key.

ESP_BLE_CSR_KEY_MASK
   Used to exchange the CSRK key in the init key & response key.
```
ESP_BLE_LINK_KEY_MASK
Used to exchange the link key (this key just used in the BLE & BR/EDR coexist mode) in the init key & response key.

ESP_APP_ID_MIN
Minimum of the application id.

ESP_APP_ID_MAX
Maximum of the application id.

ESP_BD_ADDR_STR
ESP_BD_ADDR_HEX (addr)

Type Definitions
typedef uint8_t esp_bt_octet16_t [ESP_BT_OCTET16_LEN]
typedef uint8_t esp_bt_octet8_t [ESP_BT_OCTET8_LEN]
typedef uint8_t esp_link_key [ESP_BT_OCTET16_LEN]
typedef uint8_t esp_bd_addr_t [ESP_BD_ADDR_LEN]
Bluetooth device address.
typedef uint8_t esp_ble_key_mask_t

Enumerations
enum esp_bt_status_t
SensitiveReturn Value.

Values:
ESP_BT_STATUS_SUCCESS = 0
ESP_BT_STATUS_FAIL
ESP_BT_STATUS_NOT_READY
ESP_BT_STATUS_NOMEM
ESP_BT_STATUS_BUSY
ESP_BT_STATUS_DONE = 5
ESP_BT_STATUS_UNSUPPORTED
ESP_BT_STATUS_PARM_INVALID
ESP_BT_STATUS_UNHANDLED
ESP_BT_STATUS_AUTH_FAILURE
ESP_BT_STATUS_RMT_DEV_DOWN = 10
ESP_BT_STATUS_AUTH_REJECTED
ESP_BT_STATUS_INVALID_STATIC_RAND_ADDR
ESP_BT_STATUS_PENDING
ESP_BT_STATUS_UNACCEPT_CONN_INTERVAL
ESP_BT_STATUS_PARAM_OUT_OF_RANGE
ESP_BT_STATUS_TIMEOUT
ESP_BT_STATUS_PEER_LE_DATA_LEN_UNSUPPORTED
ESP_BT_STATUS_CONTROL_LE_DATA_LEN_UNSUPPORTED
ESP_BT_STATUS_ERR_ILLEGAL_PARAMETER_FMT
ESP_BT_STATUS_MEMORY_FULL = 20
ESP_BT_STATUS_EIR_TOO_LARGE

enum esp_bt_dev_type_t
   Bluetooth device type.
   Values:
   ESP_BT_DEVICE_TYPE_BREDR = 0x01
   ESP_BT_DEVICE_TYPE_BLE = 0x02
   ESP_BT_DEVICE_TYPE_DUMO = 0x03

enum esp_ble_addr_type_t
   BLE device address type.
   Values:
   BLE_ADDR_TYPE_PUBLIC = 0x00
   BLE_ADDR_TYPE_RANDOM = 0x01
   BLE_ADDR_TYPE_RPA_PUBLIC = 0x02
   BLE_ADDR_TYPE_RPA_RANDOM = 0x03

enum esp_ble wl_addr_type_t
   BLE white list address type
   Values:
   BLE_WL_ADDR_TYPE_PUBLIC = 0x00
   BLE_WL_ADDR_TYPE_RANDOM = 0x01

BT MAIN API

Overview  Instructions

Application Example  Instructions

API Reference

Header File
   • components/bt/host/bluedroid/api/include/api/esp_bt_main.h

Functions
esp_bluedroid_status_t esp_bluedroid_get_status (void)
   Get bluetooth stack status.
   Return  Bluetooth stack status

esp_err_t esp_bluedroid_enable (void)
   Enable bluetooth, must after esp_bluedroid_init().
   Return
      • ESP_OK : Succeed
      • Other : Failed

esp_err_t esp_bluedroid_disable (void)
   Disable bluetooth, must prior to esp_bluedroid_deinit().
   Return
Chapter 2. API Reference

- ESP_OK : Succeed
- Other : Failed

```c
esp_err_t esp_bluedroid_init (void)
```
Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

**Return**
- ESP_OK : Succeed
- Other : Failed

```c
esp_err_t esp_bluedroid_deinit (void)
```
Deinit and free the resource for bluetooth, must be after every bluetooth stuff.

**Return**
- ESP_OK : Succeed
- Other : Failed

### Enumerations

**enum esp_bluedroid_status_t**
Bluetooth stack status type, to indicate whether the bluetooth stack is ready.

**Values:**
- `ESP_BLUEDROID_STATUS_UNINITIALIZED` = 0
  Bluetooth not initialized
- `ESP_BLUEDROID_STATUS_INITIALIZED`
  Bluetooth initialized but not enabled
- `ESP_BLUEDROID_STATUS_ENABLED`
  Bluetooth initialized and enabled

### BT DEVICE APIs

**Overview** Bluetooth device reference APIs.

**Instructions**

**Application Example** Instructions

**API Reference**

**Header File**
- components/bt/host/bluedroid/api/include/api/esp_bt_device.h

**Functions**

```c
const uint8_t *esp_bt_dev_get_address (void)
```
Get bluetooth device address. Must use after "esp_bluedroid_enable()".

**Return**
- Bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled

```c
esp_err_t esp_bt_dev_set_device_name (const char *name)
```
Set bluetooth device name. This function should be called after esp_bluedroid_enable() completes successfully.

A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

**Return**
- ESP_OK : Succeed
- ESP_ERR_INVALID_ARG : if name is NULL pointer or empty, or string length out of limit
Chapter 2. API Reference

- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] name: device name to be set

### 2.3.2 BT LE

**GAP API**

**Overview**

**Application Example** Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a SMP security client demo and its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.
  - bluetooth/bluedroid/ble/gatt_security_client
  - GATT Security Client Example Walkthrough
- This is a SMP security server demo and its tutorial. This demo initiates its security parameters and acts as a GATT server, which can send a pair request to the peer device and then complete the encryption procedure.
  - bluetooth/bluedroid/ble/gatt_security_server
  - GATT Security Server Example Walkthrough

**API Reference**

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_gap_ble_api.h

**Functions**

```c
esp_err_t esp_ble_gap_register_callback(esp_gap_ble_cb_t callback)
```

This function is called to occur gap event, such as scan result.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- [in] callback: callback function

```c
esp_err_t esp_ble_gap_config_adv_data(esp_ble_adv_data_t *adv_data)
```

This function is called to override the BTA default ADV parameters.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- [in] adv_data: Pointer to User defined ADV data structure. This memory space can not be freed until callback of config_adv_data is received.

```c
esp_err_t esp_ble_gap_set_scan_params(esp_ble_scan_params_t *scan_params)
```

This function is called to set scan parameters.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- [in] scan_params: Pointer to User defined scan_params data structure. This memory space can not be freed until callback of set_scan_params
**esp_err_t esp_ble_gap_start_scanning**(uint32_t duration)

This procedure keep the device scanning the peer device which advertising on the air.

**Return**

- ESP_OK : success
- other : failed

**Parameters**

- [in] duration: Keeping the scanning time, the unit is second.

**esp_err_t esp_ble_gap_stop_scanning**(void)

This function call to stop the device scanning the peer device which advertising on the air.

**Return**

- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_start_advertising**(esp_ble_adv_params_t *adv_params)

This function is called to start advertising.

**Return**

- ESP_OK : success
- other : failed

**Parameters**

- [in] adv_params: pointer to User defined adv_params data structure.

**esp_err_t esp_ble_gap_stop_advertising**(void)

This function is called to stop advertising.

**Return**

- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_update_conn_params**(esp_ble_conn_update_params_t *params)

Update connection parameters, can only be used when connection is up.

**Return**

- ESP_OK : success
- other : failed

**Parameters**

- [in] params: - connection update parameters

**esp_err_t esp_ble_gap_set_pkt_data_len**(esp_bd_addr_t remote_device, uint16_t tx_data_length)

This function is to set maximum LE data packet size.

**Return**

- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_set_rand_addr**(esp_bd_addr_t rand_addr)

This function sets the static Random Address and Non-Resolvable Private Address for the application.

**Return**

- ESP_OK : success
- other : failed

**Parameters**

- [in] rand_addr: the random address which should be setting

**esp_err_t esp_ble_gap_clear_rand_addr**(void)

This function clears the random address for the application.

**Return**

- ESP_OK : success
- other : failed
**esp_err_t esp_ble_gap_config_local_privacy** (bool privacy_enable)

Enable/disable privacy on the local device.

Return
- ESP_OK : success
- other : failed

Parameters
- [in] privacy_enable: - enable/disable privacy on remote device.

**esp_err_t esp_ble_gap_config_local_icon** (uint16_t icon)

set local gap appearance icon

Return
- ESP_OK : success
- other : failed

Parameters
- [in] icon: - External appearance value, these values are defined by the Bluetooth SIG, please refer to https://www.bluetooth.com/specifications/gatt/viewer?attributeXmlFile=org.bluetooth.characteristic.gap.appearance.xml

**esp_err_t esp_ble_gap_update_whitelist** (bool add_remove, esp_bd_addr_t remote_bda, esp_ble_wl_addr_type_t wl_addr_type)

Add or remove device from white list.

Return
- ESP_OK : success
- other : failed

Parameters
- [in] add_remove: the value is true if added the ble device to the white list, and false remove to the white list.
- [in] remote_bda: the remote device address add/remove from the white list.
- [in] wl_addr_type: whitelist address type

**esp_err_t esp_ble_gap_clear_whitelist** (void)

Clear all white list.

Return
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_get_whitelist_size** (uint16_t *length)

Get the whitelist size in the controller.

Return
- ESP_OK : success
- other : failed

Parameters
- [out] length: the white list length.

**esp_err_t esp_ble_gap_set_prefer_conn_params** (esp_bd_addr_t bd_addr, uint16_t min_conn_int, uint16_t max_conn_int, uint16_t slave_latency, uint16_t supervision_tout)

This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

Return
- ESP_OK : success
- other : failed

Parameters
- [in] bd_addr: BD address of the peripheral
- [in] min_conn_int: minimum preferred connection interval
- [in] max_conn_int: maximum preferred connection interval
- [in] slave_latency: preferred slave latency
• [in] supervision_tout: preferred supervision timeout

esp_err_t esp_ble_gap_set_device_name(const char *name)
Set device name to the local device.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] name: device name.

esp_err_t esp_ble_gap_get_local_used_addr(esp_bd_addr_t local_used_addr, uint8_t *addr_type)
This function is called to get local used address and address type. uint8_t *esp_bluetooth_device_address(void) get the public address.

Return - ESP_OK : success
• other : failed

Parameters
• [in] local_used_addr: current local used ble address (six bytes)
• [in] addr_type: ble address type

uint8_t *esp_ble_resolve_adv_data(uint8_t *adv_data, uint8_t type, uint8_t *length)
This function is called to get ADV data for a specific type.

Return pointer of ADV data

Parameters
• [in] adv_data: pointer of ADV data which to be resolved
• [in] type: finding ADV data type
• [out] length: return the length of ADV data not including type

esp_err_t esp_ble_gap_config_adv_data_raw(uint8_t *raw_data, uint32_t raw_data_len)
This function is called to set raw advertising data. User need to fill ADV data by self.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] raw_data: raw advertising data
• [in] raw_data_len: raw advertising data length, less than 31 bytes

esp_err_t esp_ble_gap_config_scan_rsp_data_raw(uint8_t *raw_data, uint32_t raw_data_len)
This function is called to set raw scan response data. User need to fill scan response data by self.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] raw_data: raw scan response data
• [in] raw_data_len: raw scan response data length, less than 31 bytes

esp_err_t esp_ble_gap_read_rssi(esp_bd_addr_t remote_addr)
This function is called to read the RSSI of remote device. The address of link policy results are returned in the gap callback function with ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT event.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] remote_addr: The remote connection device address.
**esp_err_t esp_ble_gap_add_duplicate_scan_exceptional_device**

```
(esp_ble_duplicate_exceptional_info_type_t type,
 esp_duplicate_info_t device_info)
```

This function is called to add a device info into the duplicate scan exceptional list.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] type: device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV, device_info is invalid.

**esp_err_t esp_ble_gap_remove_duplicate_scan_exceptional_device**

```
(esp_ble_duplicate_exceptional_info_type_t type,
 esp_duplicate_info_t device_info)
```

This function is called to remove a device info from the duplicate scan exceptional list.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] type: device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV, device_info is invalid.

**esp_err_t esp_ble_gap_clean_duplicate_scan_exceptional_list**

```
(esp_duplicate_scan_exceptional_list_type_t list_type)
```

This function is called to clean the duplicate scan exceptional list. This API will delete all device information in the duplicate scan exceptional list.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] list_type: duplicate scan exceptional list type, the value can be one or more of esp_duplicate_scan_exceptional_list_type_t.

**esp_err_t esp_ble_gap_set_security_param**

```
(esp_ble_sm_param_t param_type, void *value, uint8_t len)
```

Set a GAP security parameter value. Overrides the default value.

Secure connection is highly recommended to avoid some major vulnerabilities like 'Impersonation in the Pin Pairing Protocol' (CVE-2020-26555) and 'Authentication of the LE Legacy Pairing Protocol'.

To accept only 'secure connection mode', it is necessary do as following:

1. Set bit `ESP_LE_AUTH_REQ_SC_ONLY` (`param_type` is `ESP_BLE_SM_AUTHEN_REQ_MODE`), bit `ESP_LE_AUTH_BOND` and bit `ESP_LE_AUTH_REQ_MITM` is optional as required.
2. Set to `ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE` (`param_type` is `ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH`).

**Return** - ESP_OK : success
• other : failed

**Parameters**
- [in] param_type: the type of the param which to be set
- [in] value: the param value
- [in] len: the length of the param value

*esp_err_t* esp_ble_gap_security_rsp(*esp_bd_addr_t* bd_addr, bool accept)*

Grant security request access.

**Return** - ESP_OK : success
- other : failed

**Parameters**
- [in] bd_addr: BD address of the peer
- [in] accept: accept the security request or not

*esp_err_t* esp_ble_set_encryption(*esp_bd_addr_t* bd_addr, *esp_ble_sec_act_t* sec_act)*

Set a gap parameter value. Use this function to change the default GAP parameter values.

**Return** - ESP_OK : success
- other : failed

**Parameters**
- [in] bd_addr: the address of the peer device need to encryption
- [in] sec_act: This is the security action to indicate what kind of BLE security level is required for the BLE link if the BLE is supported

*esp_err_t* esp_ble_passkey_reply(*esp_bd_addr_t* bd_addr, bool accept, uint32_t passkey)*

Reply the key value to the peer device in the legacy connection stage.

**Return** - ESP_OK : success
- other : failed

**Parameters**
- [in] bd_addr: BD address of the peer
- [in] accept: passkey entry successful or declined.
- [in] passkey: passkey value, must be a 6 digit number, can be lead by 0.

*esp_err_t* esp_ble_confirm_reply(*esp_bd_addr_t* bd_addr, bool accept)*

Reply the confirm value to the peer device in the secure connection stage.

**Return** - ESP_OK : success
- other : failed

**Parameters**
- [in] bd_addr: BD address of the peer device
- [in] accept: numbers to compare are the same or different.

*esp_err_t* esp_ble_remove_bond_device(*esp_bd_addr_t* bd_addr)*

Removes a device from the security database list of peer device. It manages unpairing event while connected.

**Return** - ESP_OK : success
- other : failed

**Parameters**
- [in] bd_addr: BD address of the peer device

*int* esp_ble_get_bond_device_num(void)*

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

**Return** - >= 0: bonded devices number.
- ESP_FAIL: failed

*esp_err_t* esp_ble_get_bond_device_list(*int* dev_num, *esp_ble_bond_dev_t* dev_list)*

Get the device from the security database list of peer device. It will return the device bonded information immediately.

**Return** - ESP_OK : success
- other : failed
Parameters
  • [inout] dev_num: Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
  • [out] dev_list: an array(buffer) of esp_ble_bond_dev_t type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

esp_err_t esp_ble_oob_req_reply(esp_bd_addr_t bd_addr, uint8_t* TK, uint8_t len)
This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_OOB_REQ_EVT.

Return - ESP_OK : success
          • other : failed

Parameters
  • [in] bd_addr: BD address of the peer device.
  • [in] TK: TK value, the TK value shall be a 128-bit random number
  • [in] len: length of tk, should always be 128-bit

esp_err_t esp_ble_gap_disconnect(esp_bd_addr_t remote_device)
This function is to disconnect the physical connection of the peer device. gattc may have multiple virtual GATT server connections when multiple app_id registered. esp_ble_gattc_close (esp_gatt_if_t gattc_if, uint16_t conn_id) only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. esp_ble_gap_disconnect(esp_bd_addr_t remote_device) disconnect the physical connection directly.

Return - ESP_OK : success
          • other : failed

Parameters
  • [in] remote_device:: BD address of the peer device

esp_err_t esp_ble_get_current_conn_params(esp_bd_addr_t bd_addr, esp_gap_conn_params_t *conn_params)
This function is called to read the connection parameters information of the device.

Return - ESP_OK : success
          • other : failed

Parameters
  • [in] bd_addr: BD address of the peer device.
  • [out] conn_params: the connection parameters information

esp_err_t esp_gap_ble_set_channels(esp_gap_ble_channels channels)
BLE set channels.

Return - ESP_OK : success
          • ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
          • other : failed

Parameters
  • [in] channels:: The n th such field (in the range 0 to 36) contains the value for the link layer channel index n. 0 means channel n is bad. 1 means channel n is unknown. The most significant bits are reserved and shall be set to 0. At least one channel shall be marked as unknown.

esp_err_t esp_gap_ble_set_authorization(esp_bd_addr_t bd_addr, bool authorize)
This function is called to authorized a link after Authentication(MITM protection)

Return - ESP_OK : success
          • other : failed

Parameters
  • [in] bd_addr: BD address of the peer device.
  • [out] authorize: Authorized the link or not.

esp_err_t esp_ble_gap_read_phy(esp_bd_addr_t bd_addr)
This function is used to read the current transmitter PHY and receiver PHY on the connection identified by remote address.

Return - ESP_OK : success
parameters

- other : failed

**Parameters**

- [in] bd_addr : BD address of the peer device

```c
esp_err_t esp_ble_gap_set_preferred_default_phy(esp_ble_gap_phy_mask_t tx_phy_mask,
                                              esp_ble_gap_phy_mask_t rx_phy_mask)
```

This function is used to allow the Host to specify its preferred values for the transmitter PHY and receiver PHY to be used for all subsequent connections over the LE transport.

**Return** - ESP_OK : success

- other : failed

**Parameters**

- [in] tx_phy_mask : indicates the transmitter PHYs that the Host prefers the Controller to use
- [in] rx_phy_mask : indicates the receiver PHYs that the Host prefers the Controller to use

```c
esp_err_t esp_ble_gap_set_preferred_phy(esp_bd_addr_t bd_addr,
                                       esp_ble_gap_phy_mask_t tx_phy_mask,
                                       esp_ble_gap_phy_mask_t rx_phy_mask,
                                       esp_ble_gap_prefer_phy_options_t phy_options)
```

This function is used to set the PHY preferences for the connection identified by the remote address. The Controller might not be able to make the change (e.g. because the peer does not support the requested PHY) or may decide that the current PHY is preferable.

**Return** - ESP_OK : success

- other : failed

**Parameters**

- [in] bd_addr : remote address
- [in] all_phys_mask : a bit field that allows the Host to specify
- [in] tx_phy_mask : a bit field that indicates the transmitter PHYs that the Host prefers the Controller to use
- [in] rx_phy_mask : a bit field that indicates the receiver PHYs that the Host prefers the Controller to use
- [in] phy_options : a bit field that allows the Host to specify options for PHYs

```c
esp_err_t esp_ble_gap_ext_adv_set_rand_addr(uint8_t instance, esp_bd_addr_t rand_addr)
```

This function is used by the Host to set the random device address specified by the Random_Address parameter.

**Return** - ESP_OK : success

- other : failed

**Parameters**

- [in] instance : Used to identify an advertising set
- [in] rand_addr : Random Device Address

```c
esp_err_t esp_ble_gap_ext_adv_set_params(uint8_t instance,
                                         const esp_ble_gap_ext_adv_params_t *params)
```

This function is used by the Host to set the advertising parameters.

**Return** - ESP_OK : success

- other : failed

**Parameters**

- [in] instance : identifies the advertising set whose parameters are being configured.
- [in] params : advertising parameters

```c
esp_err_t esp_ble_gap_config_ext_adv_data_raw(uint8_t instance, uint16_t length,
                                             const uint8_t *data)
```

This function is used to set the data used in advertising PDUs that have a data field.

**Return** - ESP_OK : success

- other : failed

**Parameters**

- [in] instance : identifies the advertising set whose data are being configured
- [in] length : data length
- [in] data : data information
**esp_err_t esp_ble_gap_config_ext_scan_rsp_data_raw** (uint8_t instance, uint16_t length, const uint8_t *scan_rsp_data)

This function is used to provide scan response data used in scanning response PDUs.

- **Return**
  - ESP_OK : success
  - other : failed

- **Parameters**
  - [in] instance: identifies the advertising set whose response data are being configured.
  - [in] length: response data length
  - [in] scan_rsp_data: response data information

**esp_err_t esp_ble_gap_ext_adv_start** (uint8_t num_adv, const esp_ble_gap_ext_adv_t *ext_adv)

This function is used to request the Controller to enable one or more advertising sets using the advertising sets identified by the instance parameter.

- **Return**
  - ESP_OK : success
  - other : failed

- **Parameters**
  - [in] num_adv: Number of advertising sets to enable or disable
  - [in] ext_adv: adv parameters

**esp_err_t esp_ble_gap_ext_adv_stop** (uint8_t num_adv, const uint8_t *ext_adv_inst)

This function is used to request the Controller to disable one or more advertising sets using the advertising sets identified by the instance parameter.

- **Return**
  - ESP_OK : success
  - other : failed

- **Parameters**
  - [in] num_adv: Number of advertising sets to enable or disable
  - [in] ext_adv_inst: ext adv instance

**esp_err_t esp_ble_gap_ext_adv_set_remove** (uint8_t instance)

This function is used to remove an advertising set from the Controller.

- **Return**
  - ESP_OK : success
  - other : failed

- **Parameters**
  - [in] instance: Used to identify an advertising set

**esp_err_t esp_ble_gap_ext_adv_set_clear** (void)

This function is used to remove all existing advertising sets from the Controller.

- **Return**
  - ESP_OK : success
  - other : failed

**esp_err_t esp_ble_gap_periodic_adv_set_params** (uint8_t instance, const esp_ble_gap_periodic_adv_params_t *params)

This function is used by the Host to set the parameters for periodic advertising.

- **Return**
  - ESP_OK : success
  - other : failed

- **Parameters**
  - [in] instance: identifies the advertising set whose periodic advertising parameters are being configured.
  - [in] params: periodic adv parameters

**esp_err_t esp_ble_gap_config_periodic_adv_data_raw** (uint8_t instance, uint16_t length, const uint8_t *data)

This function is used to set the data used in periodic advertising PDUs.

- **Return**
  - ESP_OK : success
  - other : failed

- **Parameters**
• [in] instance: identifies the advertising set whose periodic advertising parameters are being configured.
• [in] length: the length of periodic data
• [in] data: periodic data information

`esp_err_t esp_ble_gap_periodic_adv_start(uint8_t instance)`
This function is used to request the Controller to enable the periodic advertising for the advertising set specified.

Return  
- ESP_OK: success
- other: failed

Parameters
• [in] instance: Used to identify an advertising set

`esp_err_t esp_ble_gap_periodic_adv_stop(uint8_t instance)`
This function is used to request the Controller to disable the periodic advertising for the advertising set specified.

Return  
- ESP_OK: success
- other: failed

Parameters
• [in] instance: Used to identify an advertising set

`esp_err_t esp_ble_gap_set_ext_scan_params(const esp_ble_ext_scan_params_t *params)`
This function is used to set the extended scan parameters to be used on the advertising channels.

Return  
- ESP_OK: success
- other: failed

Parameters
• [in] params: scan parameters

`esp_err_t esp_ble_gap_start_ext_scan(uint32_t duration, uint16_t period)`
This function is used to enable scanning.

Return  
- ESP_OK: success
- other: failed

Parameters
• [in] duration: Scan duration
• [in] period: Time interval from when the Controller started its last Scan Duration until it begins the subsequent Scan Duration.

`esp_err_t esp_ble_gap_stop_ext_scan(void)`
This function is used to disable scanning.

Return  
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gap_periodic_adv_create_sync(const esp_ble_gap_periodic_adv_sync_params_t *params)`
This function is used to synchronize with periodic advertising from an advertiser and begin receiving periodic advertising packets.

Return  
- ESP_OK: success
- other: failed

Parameters
• [in] params: sync parameters

`esp_err_t esp_ble_gap_periodic_adv_sync_cancel(void)`
This function is used to cancel the LE_Periodic_Advertising_Create_Sync command while it is pending.

Return  
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gap_periodic_adv_sync_terminate(uint16_t sync_handle)`
This function is used to stop reception of the periodic advertising identified by the Sync Handle parameter.

Return  
- ESP_OK: success
- other: failed
# API Reference

## Parameters

- **[in]** `sync_handle`: identifies the periodic advertiser

```c
esp_err_t esp_ble_gap_periodic_adv_add_dev_to_list(esp_ble_addr_type_t addr_type, esp_bd_addr_t addr, uint8_t sid)
```

This function is used to add a single device to the Periodic Advertiser list stored in the Controller.

**Return**  
- ESP_OK : success
- other : failed

**Parameters**

- [in] `addr_type`: address type
- [in] `addr`: Device Address
- [in] `sid`: Advertising SID subfield in the ADI field used to identify the Periodic Advertising

```c
esp_err_t esp_ble_gap_periodic_adv_remove_dev_from_list(esp_ble_addr_type_t addr_type, esp_bd_addr_t addr, uint8_t sid)
```

This function is used to remove one device from the list of Periodic Advertisers stored in the Controller. Removals from the Periodic Advertisers List take effect immediately.

**Return**  
- ESP_OK : success
- other : failed

**Parameters**

- [in] `addr_type`: address type
- [in] `addr`: Device Address
- [in] `sid`: Advertising SID subfield in the ADI field used to identify the Periodic Advertising

```c
esp_err_t esp_ble_gap_periodic_adv_clear_dev(void)
```

This function is used to remove all devices from the list of Periodic Advertisers in the Controller.

**Return**  
- ESP_OK : success
- other : failed

**Parameters**

- [in] `addr`: device address
- [in] `phy_mask`: indicates the PHY(s) on which the advertising packets should be received on the primary advertising channel and the PHYs for which connection parameters have been specified.
- [in] `phy_1m_conn_params`: Scan connectable advertisements on the LE 1M PHY. Connection parameters for the LE 1M PHY are provided.
- [in] `phy_2m_conn_params`: Connection parameters for the LE 2M PHY are provided.
- [in] `phy_coded_conn_params`: Scan connectable advertisements on the LE Coded PHY. Connection parameters for the LE Coded PHY are provided.

```
The length of device_info
Chapter 2. API Reference

Public Members

\textit{esp_bt_status_t status}
Indicate the add or remove whitelist operation success status

\textit{esp_ble_wl_opration_t wl_opration}
The value is ESP_BLE_WHITELIST_ADD if add address to whitelist operation success, ESP_BLE_WHITELIST_REMOVE if remove address from the whitelist operation success

Structures

\texttt{struct esp_ble_adv_params_t}
Advertising parameters.

\textbf{Public Members}

\texttt{uint16_t adv_int_min}
Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

\texttt{uint16_t adv_int_max}
Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

\texttt{esp_ble_adv_type_t adv_type}
Advertising type

\texttt{esp_ble_addr_type_t own_addr_type}
Owner bluetooth device address type

\texttt{esp_bd_addr_t peer_addr}
Peer device bluetooth device address

\texttt{esp_ble_addr_type_t peer_addr_type}
Peer device bluetooth device address type, only support public address type and random address type

\texttt{esp_ble_adv_channel_t channel_map}
Advertising channel map

\texttt{esp_ble_adv_filter_t adv_filter_policy}
Advertising filter policy

\texttt{struct esp_ble_adv_data_t}
Advertising data content, according to “Supplement to the Bluetooth Core Specification”.

Public Members

\texttt{bool set_scan_rsp}
Set this advertising data as scan response or not

\texttt{bool include_name}
Advertising data include device name or not

\texttt{bool include_txpower}
Advertising data include TX power

\texttt{int min_interval}
Advertising data show slave preferred connection min interval. The connection interval in the following manner: \texttt{connIntervalMin = Conn\_Interval\_Min * 1.25 ms} Conn\_Interval\_Min range: 0x0006 to 0x0C80 Value of 0xFFFFFFFF indicates no specific minimum. Values not defined above are reserved for future use.
**int max_interval**

Advertising data show slave preferred connection max interval. The connection interval in the following manner: \( \text{connIntervalmax} = \text{Conn}_{-}\text{Interval}_{-}\text{Max} \times 1.25 \text{ ms} \) \( \text{Conn}_{-}\text{Interval}_{-}\text{Max} \) range: \( 0x0006 \) to \( 0x0C80 \) \( \text{Conn}_{-}\text{Interval}_{-}\text{Max} \) shall be equal to or greater than the \( \text{Conn}_{-}\text{Interval}_{-}\text{Min} \). Value of \( 0xFFFF \) indicates no specific maximum. Values not defined above are reserved for future use.

**int appearance**

External appearance of device

**uint16_t manufacturer_len**

Manufacturer data length

**uint8_t* p_manufacturer_data**

Manufacturer data point

**uint16_t service_data_len**

Service data length

**uint8_t* p_service_data**

Service data point

**uint16_t service_uuid_len**

Service uuid length

**uint8_t* p_service_uuid**

Service uuid array point

**uint8_t flag**

Advertising flag of discovery mode, see BLE_ADV_DATA_FLAG detail

**struct esp_ble_scan_params_t**

Ble scan parameters.

**Public Members**

**exp_ble_scan_type_t scan_type**

Scan type

**exp_ble_addr_type_t own_addr_type**

Owner address type

**exp_ble_scan_filter_t scan_filter_policy**

Scan filter policy

**uint16_t scan_interval**

Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: \( 0x0004 \) to \( 0x4000 \) Default: \( 0x0010 \) (10 ms) Time = \( N \times 0.625 \) msec Time Range: 2.5 msec to 10.24 seconds

**uint16_t scan_window**

Scan window. The duration of the LE scan. \( \text{LE}_{-}\text{Scan}_{-}\text{Window} \) shall be less than or equal to \( \text{LE}_{-}\text{Scan}_{-}\text{Interval} \) Range: \( 0x0004 \) to \( 0x4000 \) Default: \( 0x0010 \) (10 ms) Time = \( N \times 0.625 \) msec Time Range: 2.5 msec to 10240 msec

**exp_ble_scan_duplicate_t scan_duplicate**

The Scan_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (BLE_SCAN_DUPLICATE_ENABLE) to the Host, or if the Link Layer should generate advertising reports for each packet received

**struct esp_gap_conn_params_t**

connection parameters information
**Public Members**

`uint16_t interval`
- connection interval

`uint16_t latency`
- Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

`uint16_t timeout`
- Supervision timeout for the LE Link. Range: 0x0000A to 0x0C80. Mandatory Range: 0x0000A to 0x0C80
  - Time = N * 10 msec
  - Time Range: 100 msec to 32 seconds

**struct esp_ble_conn_update_params_t**
- Connection update parameters.

**Public Members**

`esp_bd_addr_t bda`
- Bluetooth device address

`uint16_t min_int`
- Min connection interval

`uint16_t max_int`
- Max connection interval

`uint16_t latency`
- Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

`uint16_t timeout`
- Supervision timeout for the LE Link. Range: 0x0000A to 0x0C80. Mandatory Range: 0x0000A to 0x0C80
  - Time = N * 10 msec
  - Time Range: 100 msec to 32 seconds

**struct esp_ble_pkt_data_length_params_t**
- BLE pkt date length keys.

**Public Members**

`uint16_t rx_len`
- pkt rx data length value

`uint16_t tx_len`
- pkt tx data length value

**struct esp_ble_penc_keys_t**
- BLE encryption keys.

**Public Members**

`esp_bt_octet16_t ltk`
- The long term key

`esp_bt_octet8_t rand`
- The random number

`uint16_t ediv`
- The ediv value

`uint8_t sec_level`
- The security level of the security link

`uint8_t key_size`
- The key size(7~16) of the security link
struct esp_ble_pcsrk_keys_t
  BLE CSRK keys.

  **Public Members**

  uint32_t **counter**
  The counter

  *esp_bt_octet16_t* **csrk**
  The csrk key

  uint8_t **sec_level**
  The security level

struct esp_ble_pid_keys_t
  BLE pid keys.

  **Public Members**

  *esp_bt_octet16_t* **irk**
  The irk value

  *esp_ble_addr_type_t* **addr_type**
  The address type

  *esp_bd_addr_t* **static_addr**
  The static address

struct esp_ble_lenc_keys_t
  BLE Encryption reproduction keys.

  **Public Members**

  *esp_bt_octet16_t* **ltk**
  The long term key

  uint16_t **div**
  The div value

  uint8_t **key_size**
  The key size of the security link

  uint8_t **sec_level**
  The security level of the security link

struct esp_ble_lcsrk_keys
  BLE SRK keys.

  **Public Members**

  uint32_t **counter**
  The counter value

  uint16_t **div**
  The div value

  uint8_t **sec_level**
  The security level of the security link

  *esp_bt_octet16_t* **csrk**
  The csrk key value
struct esp_ble_sec_key_notif_t
    Structure associated with ESP_KEY_NOTIF_EVT.

Public Members

  esp_bd_addr_t bd_addr
      peer address

  uint32_t passkey
      the numeric value for comparison. If just_works, do not show this number to UI

struct esp_ble_sec_req_t
    Structure of the security request.

Public Members

  esp_bd_addr_t bd_addr
      peer address

struct esp_ble_bond_key_info_t
    struct type of the bond key information value

Public Members

  esp_ble_key_mask_t key_mask
      the key mask to indicate witch key is present

  esp_ble_penc_keys_t penc_key
      received peer encryption key

  esp_ble_pcsrk_keys_t pcsrk_key
      received peer device SRK

  esp_ble_pid_keys_t pid_key
      peer device ID key

struct esp_ble_bond_dev_t
    struct type of the bond device value

Public Members

  esp_bd_addr_t bd_addr
      peer address

  esp_ble_bond_key_info_t bond_key
      the bond key information

struct esp_ble_key_t
    union type of the security key value

Public Members

  esp_bd_addr_t bd_addr
      peer address

  esp_ble_key_type_t key_type
      key type of the security link

  esp_ble_key_value_t p_key_value
      the pointer to the key value
struct esp_ble_local_id_keys_t
  structure type of the ble local id keys value

Public Members

esp_bt_octet16_t ir
  the 16 bits of the ir value

esp_bt_octet16_t irk
  the 16 bits of the ir key value

esp_bt_octet16_t dhk
  the 16 bits of the dh key value

struct esp_ble_auth_cmpl_t
  Structure associated with ESP_AUTH_CMPL_EVT.

Public Members

esp_bd_addr_t bd_addr
  BD address peer device.

bool key_present
  Valid link key value in key element

esp_link_key key
  Link key associated with peer device.

uint8_t key_type
  The type of Link Key

bool success
  TRUE of authentication succeeded, FALSE if failed.

uint8_t fail_reason
  The HCI reason/error code for when success=FALSE

esp_ble_addr_type_t addr_type
  Peer device address type

esp_bt_dev_type_t dev_type
  Device type

esp_ble_auth_req_t auth_mode
  authentication mode

struct esp_ble_gap_ext_adv_params_t
  ext adv parameters

Public Members

esp_ble_ext_adv_type_mask_t type
  ext adv type

typedef uint8_t esp_ble_gap_adv_type_t
typedef void (*esp_gap_ble_cb_t)(esp_gap_ble_cb_event_t event, esp_gap_ble_cb_param_t *param)
GAP callback function type.
Parameters

- `event`: Event type
- `param`: Point to callback parameter, currently is union type

Enumerations

```cpp
enum esp_gap_ble_cb_event_t
{
  ESP_GAP_BLE_ADV_DATA_SET_COMPLETE_EVT = 0,
  ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT,
  ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT,
  ESP_GAP_BLE_SCAN_RESULT_EVT,
  ESP_GAP_BLE_ADV_DATA_RAW_SET_COMPLETE_EVT,
  ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT,
  ESP_GAP_BLE_ADV_START_COMPLETE_EVT,
  ESP_GAP_BLE_SCAN_START_COMPLETE_EVT,
  ESP_GAP_BLE_AUTH_CMPL_EVT = 8,
  ESP_GAP_BLE_KEY_EVT,

  ESP_GAP_BLE_LOCAL_ER_EVT,
  ESP_GAP_BLE_NC_REQ_EVT,
  ESP_GAP_BLE_ADV_STOP_COMPLETE_EVT,
  ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT,
  ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT = 19,
  ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT,
  ESP_GAP_BLE_SET_PKT_LENGTH_COMPLETE_EVT,
  ESP_GAP_BLE_SET_LOCAL_PRIVACY_COMPLETE_EVT,
};
```

- `ESP_GAP_BLE_ADV_DATA_SET_COMPLETE_EVT`: When advertising data set complete, the event comes
- `ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT`: When scan response data set complete, the event comes
- `ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT`: When scan parameters set complete, the event comes
- `ESP_GAP_BLE_SCAN_RESULT_EVT`: When one scan result ready, the event comes each time
- `ESP_GAP_BLE_ADV_DATA_RAW_SET_COMPLETE_EVT`: When raw advertising data set complete, the event comes
- `ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT`: When raw advertising data set complete, the event comes
- `ESP_GAP_BLE_ADV_START_COMPLETE_EVT`: When start advertising complete, the event comes
- `ESP_GAP_BLE_SCAN_START_COMPLETE_EVT`: When start scan complete, the event comes
- `ESP_GAP_BLE_AUTH_CMPL_EVT`: When start advertising complete, the event comes
- `ESP_GAP_BLE_KEY_EVT`: When start scan complete, the event comes
- `ESP_GAP_BLE_SEC_REQ_EVT`: When set the static rand address complete, the event comes
- `ESP_GAP_BLE_PASSKEY_NOTIF_EVT`: When update connection parameters complete, the event comes
- `ESP_GAP_BLE_PASSKEY_REQ_EVT`: When set pkt length complete, the event comes
- `ESP_GAP_BLE_OOB_REQ_EVT`: When Enable/disable privacy on the local device complete, the event comes
Chapter 2. API Reference

ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT
When remove the bond device complete, the event comes

ESP_GAP_BLE_CLEAR_BOND_DEV_COMPLETE_EVT
When clear the bond device clear complete, the event comes

ESP_GAP_BLE_GET_BOND_DEV_COMPLETE_EVT
When get the bond device list complete, the event comes

ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT
When read the rssi complete, the event comes

ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT
When add or remove whitelist complete, the event comes

ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT
When update duplicate exceptional list complete, the event comes

ESP_GAP_BLE_SET_CHANNELS_EVT = 29
When setting BLE channels complete, the event comes

enum esp_ble_scan_type_t
Ble scan type.
Values:
BLE_SCAN_TYPE_PASSIVE = 0x0
Passive scan
BLE_SCAN_TYPE_ACTIVE = 0x1
Active scan

enum esp_ble_scan_filter_t
Ble scan filter type.
Values:
BLE_SCAN_FILTER_ALLOW_ALL = 0x0
Accept all :
1. advertisement packets except directed advertising packets not addressed to this device (default).
BLE_SCAN_FILTER_ALLOW_ONLY_WLST = 0x1
Accept only :
1. advertisement packets from devices where the advertiser’s address is in the White list.
2. Directed advertising packets which are not addressed for this device shall be ignored.
BLE_SCAN_FILTER_ALLOW_UND_RPA_DIR = 0x2
Accept all :
1. undirected advertisement packets, and
2. directed advertising packets where the initiator address is a resolvable private address, and
3. directed advertising packets addressed to this device.
BLE_SCAN_FILTER_ALLOW_WLIST_RPA_DIR = 0x3
Accept all :
1. advertisement packets from devices where the advertiser’s address is in the White list, and
2. directed advertising packets where the initiator address is a resolvable private address, and
3. directed advertising packets addressed to this device.

enum esp_ble_scan_duplicate_t
Ble scan duplicate type.
Values:
BLE_SCAN_DUPLICATE_DISABLE = 0x0
the Link Layer should generate advertising reports to the host for each packet received
BLE_SCAN_DUPLICATE_ENABLE = 0x1
the Link Layer should filter out duplicate advertising reports to the Host
\textbf{BLE\_SCAN\_DUPLICATE\_MAX} = 0x2

0x02-0xFF, Reserved for future use

\textbf{enum esp\_gap\_search\_evt\_t}

Sub Event of ESP\_GAP\_BLE\_SCAN\_RESULT\_EVT.

\textit{Values:}

\texttt{ESP\_GAP\_SEARCH\_INQ\_RES\_EVT} = 0

Inquiry result for a peer device.

\texttt{ESP\_GAP\_SEARCH\_INQ\_CMPL\_EVT} = 1

Inquiry complete.

\texttt{ESP\_GAP\_SEARCH\_DISC\_RES\_EVT} = 2

Discovery result for a peer device.

\texttt{ESP\_GAP\_SEARCH\_DISC\_BLE\_RES\_EVT} = 3

Discovery result for BLE GATT based service on a peer device.

\texttt{ESP\_GAP\_SEARCH\_DISC\_CMPL\_EVT} = 4

Discovery complete.

\texttt{ESP\_GAP\_SEARCH\_DI\_DISC\_CMPL\_EVT} = 5

Discovery complete.

\texttt{ESP\_GAP\_SEARCH\_SEARCH\_CANCEL\_CMPL\_EVT} = 6

Search cancelled

\texttt{ESP\_GAP\_SEARCH\_INQ\_DISCARD\_NUM\_EVT} = 7

The number of pkt discarded by flow control

\textbf{enum esp\_ble\_evt\_type\_t}

Ble scan result event type, to indicate the result is scan response or advertising data or other.

\textit{Values:}

\texttt{ESP\_BLE\_EVT\_CONN\_ADV} = 0x00

Connectable undirected advertising (ADV\_IND)

\texttt{ESP\_BLE\_EVT\_CONN\_DIR\_ADV} = 0x01

Connectable directed advertising (ADV\_DIRECT\_IND)

\texttt{ESP\_BLE\_EVT\_DISC\_ADV} = 0x02

Scannable undirected advertising (ADV\_SCAN\_IND)

\texttt{ESP\_BLE\_EVT\_NON\_CONN\_ADV} = 0x03

Non connectable undirected advertising (ADV\_NONCONN\_IND)

\texttt{ESP\_BLE\_EVT\_SCAN\_RSP} = 0x04

Scan Response (SCAN\_RSP)

\textbf{enum esp\_ble\_wl\_opration\_t}

Values:

\texttt{ESP\_BLE\_WHITELIST\_REMOVE} = 0X00

remove mac from whitelist

\texttt{ESP\_BLE\_WHITELIST\_ADD} = 0X01

add address to whitelist

\textbf{enum esp\_bt\_duplicate\_exceptional\_subcode\_type\_t}

Values:

\texttt{ESP\_BLE\_DUPLICATE\_EXCEPTIONAL\_LIST\_ADD} = 0

Add device info into duplicate scan exceptional list

\texttt{ESP\_BLE\_DUPLICATE\_EXCEPTIONAL\_LIST\_REMOVE}

Remove device info from duplicate scan exceptional list
**ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN**
Clean duplicate scan exceptional list

**enum esp_ble_duplicate_exceptional_info_type_t**
*Values:*

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_ADV_ADDR** = 0
  BLE advertising address, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_LINK_ID**
  BLE mesh link ID, it is for BLE mesh, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_BEACON_TYPE**
  BLE mesh beacon AD type, the format is | Len | 0x2B | Beacon Type | Beacon Data |

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROV_SRV_ADV**
  BLE mesh provisioning service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1827 | ...

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROXY_SRV_ADV**
  BLE mesh adv with proxy service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1828 | ...

**enum esp_duplicate_scan_exceptional_list_type_t**
*Values:*

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST** = BLE_BIT(0)
  duplicate scan exceptional addr list

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST** = BLE_BIT(1)
  duplicate scan exceptional mesh link ID list

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_BEACON_TYPE_LIST** = BLE_BIT(2)
  duplicate scan exceptional mesh beacon type list

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROV_SRV_ADV_LIST** = BLE_BIT(3)
  duplicate scan exceptional mesh adv with provisioning service uuid

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROXY_SRV_ADV_LIST** = BLE_BIT(4)
  duplicate scan exceptional mesh adv with provisioning service uuid

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ALL_LIST** = 0xFFFF
  duplicate scan exceptional all list

**GATT DEFINES**

**Overview**

**Application Example**

**API Reference**

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_gatt_defs.h

**Unions**

**union esp_gatt_rsp_t**

```
#include <esp_gatt_defs.h>
```

GATT remote read request response type.
Public Members

*esp_gatt_value_t* attr_value
Gatt attribute structure

uint16_t handle
Gatt attribute handle

Structures

*struct esp_gatt_id_t*
Gatt id, include uuid and instance id.

Public Members

*esp_bt_uuid_t* uuid
UUID

uint8_t inst_id
Instance id

*struct esp_gatt_svc_id_t*
Gatt service id, include id (uuid and instance id) and primary flag.

Public Members

*esp_gatt_id_t* id
Gatt id, include uuid and instance

bool is_primary
This service is primary or not

*struct esp_attr_desc_t*
Attribute description (used to create database)

Public Members

uint16_t uuid_length
UUID length

uint8_t *uuid_p
UUID value

uint16_t perm
Attribute permission

uint16_t max_length
Maximum length of the element

uint16_t length
Current length of the element

uint8_t *value
Element value array

*struct esp_attr_control_t*
attribute auto response flag
Public Members

uint8_t auto_rsp
if auto_rsp set to ESP_GATT_RSP_BY_APP, means the response of Write/Read operation will by replied by application. if auto_rsp set to ESP_GATT_AUTO_RSP, means the response of Write/Read operation will be replied by GATT stack automatically.

struct esp_gatts_attr_db_t
attribute type added to the gatt server database

Public Members

esp_attr_control_t attr_control
The attribute control type

esp_attr_desc_t att_desc
The attribute type

struct esp_attr_value_t
set the attribute value type

Public Members

uint16_t attr_max_len
attribute max value length

uint16_t attr_len
attribute current value length

uint8_t *attr_value
the pointer to attribute value

struct esp_gatts_incl_svc_desc_t
Gatt includeservice entry element.

Public Members

uint16_t start_hdl
Gatt start handle value of included service

uint16_t end_hdl
Gatt end handle value of included service

uint16_t uuid
Gatt attribute value UUID of included service

struct esp_gatts_incl128_svc_desc_t
Gatt include 128 bit service entry element.

Public Members

uint16_t start_hdl
Gatt start handle value of included 128 bit service

uint16_t end_hdl
Gatt end handle value of included 128 bit service

struct esp_gatt_value_t
Gatt attribute value.
**Public Members**

- `uint8_t value[ESP_GATT_MAX_ATTR_LEN]`
  
  Gatt attribute value

- `uint16_t handle`
  
  Gatt attribute handle

- `uint16_t offset`
  
  Gatt attribute value offset

- `uint16_t len`
  
  Gatt attribute value length

- `uint8_t auth_req`
  
  Gatt authentication request

```c
struct esp_gatt_attribute_t
```

Connection attribute.

**Public Members**

- `uint16_t interval`
  
  Connection interval

- `uint16_t latency`
  
  Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

- `uint16_t timeout`
  
  Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
  
  Time = N * 10 msec Time Range: 100 msec to 32 seconds

```c
struct esp_gattc_multi_t
```

Read multiple attribute

**Public Members**

- `uint8_t num_attr`
  
  The number of the attribute

- `uint16_t handles[ESP_GATT_MAX_READ_MULTI_HANDLES]`
  
  The handles list

```c
struct esp_gattc_db_elem_t
```

Database attribute element

**Public Members**

- `esp_gatt_db_attr_type_t type`
  
  The attribute type

- `uint16_t attribute_handle`
  
  The attribute handle, it’s valid for all of the type

- `uint16_t start_handle`
  
  The service start handle, it’s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

- `uint16_t end_handle`
  
  The service end handle, it’s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE
**esp_gatt_char_prop_t** properties
The characteristic properties, it’s valid only when the type = ESP_GATT_DB_CHARACTERISTIC

**esp_bt_uuid_t** uuid
The attribute uuid, it’s valid for all of the type

**struct esp_gattc_service_elem_t**
service element

**Public Members**

bool **is_primary**
The service flag, true if the service is primary service, else is secondary service

uint16_t **start_handle**
The start handle of the service

uint16_t **end_handle**
The end handle of the service

**esp_bt_uuid_t** uuid
The uuid of the service

**struct esp_gattc_char_elem_t**
characteristic element

**Public Members**

uint16_t **char_handle**
The characteristic handle

**esp_gatt_char_prop_t** properties
The characteristic properties

**esp_bt_uuid_t** uuid
The characteristic uuid

**struct esp_gattc_descr_elem_t**
descriptor element

**Public Members**

uint16_t **handle**
The characteristic descriptor handle

**esp_bt_uuid_t** uuid
The characteristic descriptor uuid

**struct esp_gattc_incl_svc_elem_t**
include service element

**Public Members**

uint16_t **handle**
The include service current attribute handle

uint16_t **incl_srvc_s_handle**
The start handle of the service which has been included

uint16_t **incl_srvc_e_handle**
The end handle of the service which has been included
**esp_bt_uuid_t**

The include service uuid

**Macros**

- `ESP_GATT_UUID_IMMEDIATE_ALERT_SVC`
- `ESP_GATT_UUID_LINK_LOSS_SVC`
- `ESP_GATT_UUID_TX_POWER_SVC`

ESP_GATT_AUTO_RSP
ESP_GATT_IF_NONE
    If callback report gatte_if/gatts_if as this macro, means this event is not correspond to any app

Type Definitions
typedef uint16_t esp_gatt_perm_t
typedef uint8_t esp_gatt_char_prop_t
    Gatt interface type, different application on GATT client use different gatt_if

Enumerations
enum esp_gatt_prep_write_type
    Attribute write data type from the client.
    Values:
    ESP_GATT_PREP_WRITE_CANCEL = 0x00
        Prepare write cancel
    ESP_GATT_PREP_WRITE_EXEC = 0x01
        Prepare write execute
enum esp_gatt_status_t
    GATT success code and error codes.
    Values:
    ESP_GATT_OK = 0x0
    ESP_GATT_INVALID_HANDLE = 0x01
    ESP_GATT_READ_NOT_PERMIT = 0x02
    ESP_GATT_WRITE_NOT_PERMIT = 0x03

ESP_GATT_UNKNOWN_ERROR = 0xef
ESP_GATT_CCC_CFG_ERR = 0xfd
ESP_GATT_PRC_IN_PROGRESS = 0xfe
ESP_GATT_OUT_OF_RANGE = 0xff

define enum esp_gatt_conn_reason_t
    Gatt Connection reason enum.
    Values:
    ESP_GATT_CONN_UNKNOWN = 0
        Gatt connection unknown
    ESP_GATT_CONN_L2C_FAILURE = 1
        General L2cap failure
Chapter 2. API Reference

**ESP_GATT_CONN_TIMEOUT** = 0x08  
Connection timeout

**ESP_GATT_CONN_TERMINATE_PEER_USER** = 0x13  
Connection terminate by peer user

**ESP_GATT_CONN_TERMINATE_LOCAL_HOST** = 0x16  
Connection terminated by local host

**ESP_GATT_CONN_FAIL_ESTABLISH** = 0x3e  
Connection fail to establish

**ESP_GATT_CONN_LMP_TIMEOUT** = 0x22  
Connection fail for LMP response tout

**ESP_GATT_CONN_CONN_CANCEL** = 0x0100  
L2CAP connection cancelled

**ESP_GATT_CONN_NONE** = 0x0101  
No connection to cancel

**enum esp_gatt_auth_req_t**  
Gatt authentication request type.

*Values:*

**ESP_GATT_AUTH_REQ_NONE** = 0  
**ESP_GATT_AUTH_REQ_NO_MITM** = 1  
**ESP_GATT_AUTH_REQ_MITM** = 2  
**ESP_GATT_AUTH_REQ_SIGNED_NO_MITM** = 3  
**ESP_GATT_AUTH_REQ_SIGNED_MITM** = 4

**enum esp_service_source_t**  
Values:

**ESP_GATT_SERVICE_FROM_REMOTE_DEVICE** = 0  
**ESP_GATT_SERVICE_FROM_NVS_FLASH** = 1  
**ESP_GATT_SERVICE_FROM_UNKNOWN** = 2

**enum esp_gatt_write_type_t**  
Gatt write type.

*Values:*

**ESP_GATT_WRITE_TYPE_NO_RSP** = 1  
Gatt write attribute need no response

**ESP_GATT_WRITE_TYPE_RSP**  
Gatt write attribute need remote response

**enum esp_gatt_db_attr_type_t**  
the type of attribute element

*Values:*

**ESP_GATT_DB_PRIMARY_SERVICE**  
Gattte primary service attribute type in the cache

**ESP_GATT_DB_SECONDARY_SERVICE**  
Gattte secondary service attribute type in the cache

**ESP_GATT_DB_CHARACTERISTIC**  
Gattte characteristic attribute type in the cache

**ESP_GATT_DB_DESCRIPTOR**  
Gattte characteristic descriptor attribute type in the cache
ESP_GATT_DB_INCLUDED_SERVICE
Gattc includes service attribute type in the cache

ESP_GATT_DB_ALL
Gattc all the attribute (primary service & secondary service & include service & char & descriptor) type in the cache

GATT SERVER API

Overview

Application Example
Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

• This is a GATT sever demo and its tutorial. This demo creates a GATT service with an attribute table, which releases the user from adding attributes one by one. This is the recommended method of adding attributes.
  – bluetooth/bluedroid/ble/gatt_server_service_table
  – GATT Server Service Table Example Walkthrough

• This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by one as defined by Bluedroid. The recommended method of adding attributes is presented in example above.
  – bluetooth/bluedroid/ble/gatt_server
  – GATT Server Example Walkthrough

• This is a BLE SPP-Like demo. This demo, which acts as a GATT server, can receive data from UART and then send the data to the peer device automatically.
  – bluetooth/bluedroid/ble/ble_spp_server

API Reference

Header File

• components/bt/host/bluedroid/api/include/api/esp_gatts_api.h

Functions

esp_err_t esp_ble_gatts_register_callback (esp_gatts_cb_t callback)
This function is called to register application callbacks with BTA GATTS module.

Return
• ESP_OK : success
• other : failed

esp_err_t esp_ble_gatts_app_register (uint16_t app_id)
This function is called to register application identifier.

Return
• ESP_OK : success
• other : failed

esp_err_t esp_ble_gatts_app_unregister (esp_gatt_if_t gatts_if)
unregister with GATT Server.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] gatts_if: GATT server access interface

esp_err_t esp_ble_gatts_create_service (esp_gatt_if_t gatts_if, esp_gatt_srvc_id_t *service_id,
uint16_t num_handle)
Create a service. When service creation is done, a callback event ESP_GATTS_CREATE_EVT is called to
report status and service ID to the profile. The service ID obtained in the callback function needs to be used when adding included service and characteristics descriptors into the service.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gatts_if: GATT server access interface
• [in] service_id: service ID
• [in] num_handle: number of handle requested for this service.

\[
\text{esp_err_t esp_ble_gatts_create_attr_tab} \left( \text{const esp_gatts_attr_db_t *gatts_attr_db, esp_gatt_if_t gatts_if, uint8_t max_nb_attr, uint8_t srvc_inst_id} \right)
\]

Create a service attribute tab.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gatts_attr_db: the pointer to the service attr tab
• [in] gatts_if: GATT server access interface
• [in] max_nb_attr: the number of attribute to be added to the service database.
• [in] srvc_inst_id: the instance id of the service

\[
\text{esp_err_t esp_ble_gatts_add_included_service} \left( \text{uint16_t service_handle, included_service_handle} \right)
\]

This function is called to add an included service. This function have to be called between `esp_ble_gatts_create_service` and `esp_ble_gatts_add_char`. After included service is included, a callback event ESP_GATTS_ADD_INCL_SRVC_EVT is reported the included service ID.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] service_handle: service handle to which this included service is to be added.
• [in] included_service_handle: the service ID to be included.

\[
\text{esp_err_t esp_ble_gatts_add_char} \left( \text{uint16_t service_handle, esp_bt_uuid_t *char_uuid, esp_gatt_perm_t perm, esp_gatt_char_prop_t property, esp_attr_value_t *char_val, esp_attr_control_t *control} \right)
\]

This function is called to add a characteristic into a service.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] service_handle: service handle to which this included service is to be added.
• [in] char_uuid: Characteristic UUID.
• [in] perm: Characteristic value declaration attribute permission.
• [in] property: Characteristic Properties
• [in] char_val: Characteristic value
• [in] control: attribute response control byte

\[
\text{esp_err_t esp_ble_gatts_add_chardescr} \left( \text{uint16_t service_handle, esp_bt_uuid_t *descr_uuid, esp_gatt_perm_t perm, esp_attr_value_t *char_descr_val, esp_attr_control_t *control} \right)
\]

This function is called to add characteristic descriptor. When it’s done, a callback event ESP_GATTS_ADD_DESCR_EVT is called to report the status and an ID number for this descriptor.

Return
• ESP_OK: success
• other: failed
Parameters
• [in] service_handle: service handle to which this characteristic descriptor is to be added.
• [in] perm: descriptor access permission.
• [in] descr_uuid: descriptor UUID.
• [in] char_descr_val: Characteristic descriptor value
• [in] control:: attribute response control byte

esp_err_t esp_ble_gatts_delete_service (uint16_t service_handle)
This function is called to delete a service. When this is done, a callback event ESP_GATTS_DELETE_EVT
is report with the status.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] service_handle: service_handle to be deleted.

esp_err_t esp_ble_gatts_start_service (uint16_t service_handle)
This function is called to start a service.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] service_handle: the service handle to be started.

esp_err_t esp_ble_gatts_stop_service (uint16_t service_handle)
This function is called to stop a service.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] service_handle: - service to be stopped.

esp_err_t esp_ble_gatts_send_indicate (esp_gatt_if_t gatts_if, uint16_t conn_id, uint16_t attr_handle, uint16_t value_len, uint8_t *value, bool need_confirm)
Send indicate or notify to GATT client. Set param need_confirm as false will send notification, otherwise
indication.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] gatts_if: GATT server access interface
• [in] conn_id: - connection id to indicate.
• [in] attr_handle: - attribute handle to indicate.
• [in] value_len: - indicate value length.
• [in] value: value to indicate.
• [in] need_confirm: - Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

esp_err_t esp_ble_gatts_send_response (esp_gatt_if_t gatts_if, uint16_t conn_id, uint32_t trans_id, esp_gatt_status_t status, esp_gatt_rsp_t *rsp)
This function is called to send a response to a request.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] gatts_if: GATT server access interface
Chapter 2. API Reference

- [in] trans_id: - transfer id
- [in] status: - response status

`esp_err_t esp_ble_gatts_set_attr_value(uint16_t attr_handle, uint16_t length, const uint8_t *value)`

This function is called to set the attribute value by the application.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] attr_handle: the attribute handle which to be set
- [in] length: the value length
- [in] value: the pointer to the attribute value

`esp_gatt_status_t esp_ble_gatts_get_attr_value(uint16_t attr_handle, uint16_t *length, const uint8_t **value)`

Retrieve attribute value.

**Return**
- ESP_GATT_OK : success
- other : failed

**Parameters**
- [in] attr_handle: Attribute handle.
- [out] length: pointer to the attribute value length
- [out] value: Pointer to attribute value payload, the value cannot be modified by user

`esp_err_t esp_ble_gatts_open(esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda, bool is_direct)`

Open a direct open connection or add a background auto connection.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] gatts_if: GATT server access interface
- [in] remote_bda: remote device bluetooth device address.
- [in] is_direct: direct connection or background auto connection

`esp_err_t esp_ble_gatts_close(esp_gatt_if_t gatts_if, uint16_t conn_id)`

Close a connection a remote device.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] gatts_if: GATT server access interface
- [in] conn_id: connection ID to be closed.

`esp_err_t esp_ble_gatts_send_service_change_indication(esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda)`

Send service change indication.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] gatts_if: GATT server access interface
- [in] remote_bda: remote device bluetooth device address. If remote_bda is NULL then it will send service change indication to all the connected devices and if not then to a specific device

Unions
union esp_ble_gatts_cb_param_t
#include <esp_gatts_api.h> Gatt server callback parameters union.

Public Members

struct esp_ble_gatts_cb_param_t::gatts_reg_evt_param reg
Gatt server callback param of ESP_GATTS_REG_EVT

struct esp_ble_gatts_cb_param_t::gatts_read_evt_param read
Gatt server callback param of ESP_GATTS_READ_EVT

struct esp_ble_gatts_cb_param_t::gatts_write_evt_param write
Gatt server callback param of ESP_GATTS_WRITE_EVT

struct esp_ble_gatts_cb_param_t::gatts_exec_write_evt_param exec_write
Gatt server callback param of ESP_GATTS_EXEC_WRITE_EVT

struct esp_ble_gatts_cb_param_t::gatts_mtu_evt_param mtu
Gatt server callback param of ESP_GATTS_MBU_EVT

struct esp_ble_gatts_cb_param_t::gatts_conf_evt_param conf
Gatt server callback param of ESP_GATTS_CONF_EVT (confirm)

struct esp_ble_gatts_cb_param_t::gatts_create_evt_param create
Gatt server callback param of ESP_GATTS_CREATE_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_incl_srvc_evt_param add_incl_srvc
Gatt server callback param of ESP_GATTS_ADD_INCL_SRVC_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_char_evt_param add_char
Gatt server callback param of ESP_GATTS_ADD_CHAR_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_char_descr_evt_param add_char_descr
Gatt server callback param of ESP_GATTS_ADD_CHAR_DESCR_EVT

struct esp_ble_gatts_cb_param_t::gatts_delete_evt_param del
Gatt server callback param of ESP_GATTS_DELETE_EVT

struct esp_ble_gatts_cb_param_t::gatts_start_evt_param start
Gatt server callback param of ESP_GATTS_START_EVT

struct esp_ble_gatts_cb_param_t::gatts_stop_evt_param stop
Gatt server callback param of ESP_GATTS_STOP_EVT

struct esp_ble_gatts_cb_param_t::gatts_connect_evt_param connect
Gatt server callback param of ESP_GATTS_CONNECT_EVT

struct esp_ble_gatts_cb_param_t::gatts_disconnect_evt_param disconnect
Gatt server callback param of ESP_GATTS_DISCONNECT_EVT

struct esp_ble_gatts_cb_param_t::gatts_open_evt_param open
Gatt server callback param of ESP_GATTS_OPEN_EVT

struct esp_ble_gatts_cb_param_t::gatts_cancel_open_evt_param cancel_open
Gatt server callback param of ESP_GATTS_CANCEL_OPEN_EVT

struct esp_ble_gatts_cb_param_t::gatts_close_evt_param close
Gatt server callback param of ESP_GATTS_CLOSE_EVT

struct esp_ble_gatts_cb_param_t::gatts_congest_evt_param congest
Gatt server callback param of ESP_GATTS_CONGEST_EVT

struct esp_ble_gatts_cb_param_t::gatts_rsp_evt_param rsp
Gatt server callback param of ESP_GATTS_RESPONSE_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_attr_tab_evt_param add_attr_tab
Gatt server callback param of ESP_GATTS_CREAT_ATTR_TAB_EVT
struct esp_ble_gatts_cb_param_t::gatts_set_attr_val_evt_param set_attr_val
Gatt server callback param of ESP_GATTS_SET_ATTR_VAL_EVT

struct esp_ble_gatts_cb_param_t::gatts_send_service_change_evt_param service_change
Gatt server callback param of ESP_GATTS_SEND_SERVICE_CHANGE_EVT

struct gatts_add_attr_tab_evt_param
#include <esp_gatts_api.h> ESP_GATTS_CREAT_ATTR_TAB_EVT.

Public Members

esp_gatt_status_t status
Operation status

esp_bt_uuid_t svc_uuid
Service uuid type

uint8_t svc_inst_id
Service id

uint16_t num_handle
The number of the attribute handle to be added to the gatts database

uint16_t *handles
The number to the handles

struct gatts_add_char_descr_evt_param
#include <esp_gatts_api.h> ESP_GATTS_ADD_CHAR_DESCR_EVT.

Public Members

esp_gatt_status_t status
Operation status

uint16_t attr_handle
Descriptor attribute handle

uint16_t service_handle
Service attribute handle

esp_bt_uuid_t descr_uuid
Characteristic descriptor uuid

struct gatts_add_char_evt_param
#include <esp_gatts_api.h> ESP_GATTS_ADD_CHAR_EVT.

Public Members

esp_gatt_status_t status
Operation status

uint16_t attr_handle
Characteristic attribute handle

uint16_t service_handle
Service attribute handle

esp_bt_uuid_t char_uuid
Characteristic uuid

ESP_GATTS_WRITE_EVT.
```

Public Members

```c
uint16_t conn_id
Connection id
```

```c
uint32_t trans_id
Transfer id
```

```c
esp_bd_addr_t bda
The bluetooth device address which been written
```

```c
uint16_t handle
The attribute handle
```

```c
uint16_t offset
Offset of the value, if the value is too long
```

```c
bool need_rsp
The write operation need to do response
```

```c
bool is_prep
This write operation is prepare write
```

```c
uint16_t len
The write attribute value length
```

```c
uint8_t* value
The write attribute value
```

Macros

```c
ESP_GATT_PREP_WRITE_CANCEL
Prepare write flag to indicate cancel prepare write
```

```c
ESP_GATT_PREP_WRITE_EXEC
Prepare write flag to indicate execute prepare write
```

Type Definitions

```c
typedef void (*esp_gatts_cb_t)(esp_gatts_cb_event_t event, esp_gatt_if_t gatts_if, esp_ble_gatts_cb_param_t *param)
GATT Server callback function type.
```

Parameters

- **event**: Event type
- **gatts_if**: GATT server access interface, normally different gatts_if correspond to different profile
- **param**: Point to callback parameter, currently is union type

Enumerations
enum esp_gatts_cb_event_t
GATT Server callback function events.

Values:

ESP_GATTS_REG_EVT = 0
  When register application id, the event comes

ESP_GATTS_READ_EVT = 1
  When gatt client request read operation, the event comes

ESP_GATTS_WRITE_EVT = 2
  When gatt client request write operation, the event comes

ESP_GATTS_EXEC_WRITE_EVT = 3
  When gatt client request execute write, the event comes

ESP_GATTS_MTU_EVT = 4
  When set mtu complete, the event comes

ESP_GATTS_CONF_EVT = 5
  When receive confirm, the event comes

ESP_GATTS_UNREG_EVT = 6
  When unregister application id, the event comes

ESP_GATTS_CREATE_EVT = 7
  When create service complete, the event comes

ESP_GATTS_ADD_INCL_SRVC_EVT = 8
  When add included service complete, the event comes

ESP_GATTS_ADD_CHAR_EVT = 9
  When add characteristic complete, the event comes

ESP_GATTS_ADD_CHAR_DESCR_EVT = 10
  When add descriptor complete, the event comes

ESP_GATTS_DELETE_EVT = 11
  When delete service complete, the event comes

ESP_GATTS_START_EVT = 12
  When start service complete, the event comes

ESP_GATTS_STOP_EVT = 13
  When stop service complete, the event comes

ESP_GATTS_CONNECT_EVT = 14
  When gatt client connect, the event comes

ESP_GATTS_DISCONNECT_EVT = 15
  When gatt client disconnect, the event comes

ESP_GATTS_OPEN_EVT = 16
  When connect to peer, the event comes

ESP_GATTS_CANCEL_OPEN_EVT = 17
  When disconnect from peer, the event comes

ESP_GATTS_CLOSE_EVT = 18
  When gatt server close, the event comes

ESP_GATTS_LISTEN_EVT = 19
  When gatt listen to be connected the event comes

ESP_GATTS_CONGEST_EVT = 20
  When congest happen, the event comes

ESP_GATTS_RESPONSE_EVT = 21
  When gatt send response complete, the event comes
ESP_GATTS_CREAT_ATTR_TAB_EVT = 22
When gatt create table complete, the event comes

ESP_GATTS_SET_ATTR_VAL_EVT = 23
When gatt set attr value complete, the event comes

ESP_GATTS_SEND_SERVICE_CHANGE_EVT = 24
When gatt send service change indication complete, the event comes

**GATT CLIENT API**

**Overview**

**Application Example**  
Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
  - bluetooth/bluedroid/ble/gatt_client
  - GATT Client Example Walkthrough
- This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
  - bluetooth/bluedroid/ble/gattc_multi_connect
  - GATT Client Multi-connection Example Walkthrough
- This is a BLE SPP-Like demo. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.
  - bluetooth/bluedroid/ble/ble_spp_client

**API Reference**

**Header File**
- components/bt/host/bluedroid/api/include/api/esp_gatte_api.h

**Functions**

`esp_err_t esp_ble_gattc_register_callback (esp_gattc_cb_t callback)`  
This function is called to register application callbacks with GATTC module.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] callback:: pointer to the application callback function.

`esp_err_t esp_ble_gattc_app_register (uint16_t app_id)`  
This function is called to register application callbacks with GATTC module.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] app_id:: Application Identify (UUID), for different application

`esp_err_t esp_ble_gattc_app_unregister (esp_gatt_if_t gattc_if)`  
This function is called to unregister an application from GATTC module.

Return
- ESP_OK: success
- other: failed
Chapter 2. API Reference

Parameters

- **in** `gattc_if`: Gatt client access interface.

```c
esp_err_t esp_ble_gattc_open(esp_gatt_if_t gattc_if, esp_bd_addr_t remote_bda, esp_ble_addr_type_t remote_addr_type, bool is_direct)
```

Open a direct connection or add a background auto connection.

Return

- ESP_OK: success
- other: failed

Parameters

- **in** `gattc_if`: Gatt client access interface.
- **in** `remote_bda`: remote device bluetooth device address.
- **in** `remote_addr_type`: remote device bluetooth device the address type.
- **in** `is_direct`: direct connection or background auto connection(by now, background auto connection is not supported).

```c
esp_err_t esp_ble_gattc_aux_open(esp_gatt_if_t gattc_if, esp_bd_addr_t remote_bda, esp_ble_addr_type_t remote_addr_type, bool is_direct)
```

```c
esp_err_t esp_ble_gattc_close(esp_gatt_if_t gattc_if, uint16_t conn_id)
```

Close the virtual connection to the GATT server. gattc may have multiple virtual GATT server connections when multiple app_id registered, this API only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. if you want to disconnect the physical connection directly, you can use esp_ble_gap_disconnect(esp_bd_addr_t remote_device).

Return

- ESP_OK: success
- other: failed

Parameters

- **in** `gattc_if`: Gatt client access interface.
- **in** `conn_id`: connection ID.

```c
esp_err_t esp_ble_gattc_send_mtu_req(esp_gatt_if_t gattc_if, uint16_t conn_id)
```

Configure the MTU size in the GATT channel. This can be done only once per connection. Before using, use esp_ble_gatt_set_local_mtu() to configure the local MTU size.

Return

- ESP_OK: success
- other: failed

Parameters

- **in** `gattc_if`: Gatt client access interface.
- **in** `conn_id`: connection ID.

```c
esp_err_t esp_ble_gattc_search_service(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_bt_uuid_t *filter_uuid)
```

This function is called to get service from local cache. This function report service search result by a callback event, and followed by a service search complete event.

Return

- ESP_OK: success
- other: failed

Parameters

- **in** `gattc_if`: Gatt client access interface.
- **in** `conn_id`: connection ID.
- **in** `filter_uuid`: a UUID of the service application is interested in. If Null, discover for all services.

```c
esp_gatt_status_t esp_ble_gattc_get_service(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_bt_uuid_t *svc_uuid, esp_gatt_service_elem_t *result, uint16_t *count, uint16_t *offset)
```

Find all the service with the given service uuid in the gattc cache, if the svc_uuid is NULL, find all the service. Note: It just get service from local cache, won’t get from remote devices. If want to get it from remote device, need to used the esp_ble_gattc_cache_refresh, then call esp_ble_gattc_get_service again.

Espressif Systems 250 Release v5.0-dev-1712-g4a553510b7

Submit Document Feedback
Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] svc_uuid: the pointer to the service uuid.
- [out] result: The pointer to the service which has been found in the gattc cache.
- [inout] count: input the number of service want to find, it will output the number of service has been found in the gattc cache with the given service uuid.
- [in] offset: Offset of the service position to get.

\[\text{esp_gatt_status_t espl_ble_gattc_get_all_char (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_gattc_char_elem_t *result, uint16_t *count, uint16_t offset)}\]

Find all the characteristic with the given service in the gattc cache Note: It just get characteristic from local cache, won’t get from remote devices.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] start_handle: the attribute start handle.
- [in] end_handle: the attribute end handle
- [out] result: The pointer to the characteristic in the service.
- [inout] count: input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.
- [in] offset: Offset of the characteristic position to get.

\[\text{esp_gatt_status_t espl_ble_gattc_get_all_descr (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_gattc_descr_elem_t *result, uint16_t *count, uint16_t offset)}\]

Find all the descriptor with the given characteristic in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] char_handle: the given characteristic handle
- [out] result: The pointer to the descriptor in the characteristic.
- [inout] count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
- [in] offset: Offset of the descriptor position to get.

\[\text{esp_gatt_status_t espl_ble_gattc_get_char_by_uuid (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_gattc_char_elem_t *result, uint16_t *count)}\]

Find the characteristic with the given characteristic uuid in the gattc cache Note: It just get characteristic from local cache, won’t get from remote devices.

Return
- ESP_OK: success
- other: failed

Parameters
Chapter 2. API Reference

- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] start_handle: the attribute start handle
- [in] end_handle: the attribute end handle
- [in] char_uuid: the characteristic uuid
- [out] result: The pointer to the characteristic in the service.
- [inout] count: input the number of characteristic want to find, it will output the number of characteristic has been found in the gatt cache with the given service.

```
esp_gatt_status_t esp_ble_gattc_get_descr_by_uuid(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic uuid in the gatt cache Note: It just get descriptor from local cache, won’t get from remote devices.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] start_handle: the attribute start handle
- [in] end_handle: the attribute end handle
- [in] char_uuid: the characteristic uuid.
- [out] result: The pointer to the descriptor in the given characteristic.
- [inout] count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gatt cache with the given characteristic.

```
esp_gatt_status_t esp_ble_gattc_get_descr_by_char_handle(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic handle in the gatt cache Note: It just get descriptor from local cache, won’t get from remote devices.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] char_handle: the characteristic handle.
- [out] result: The pointer to the descriptor in the given characteristic.
- [inout] count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gatt cache with the given characteristic.

```
esp_gatt_status_t esp_ble_gattc_get_include_service(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t *incl_uuid, esp_gattc_incl_svc_elem_t *result, uint16_t *count)
```

Find the include service with the given service handle in the gatt cache Note: It just get include service from local cache, won’t get from remote devices.

Return
- ESP_OK: success

• other: failed

**Parameters**

- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] start_handle: the attribute start handle
- [in] end_handle: the attribute end handle
- [in] incl_uuid: the include service uuid
- [out] result: The pointer to the include service in the given service.
- [inout] count: input the number of include service want to find, it will output the number of include service has been found in the gatt cache with the given service.

```c
esp_gatt_status_t esp_ble_gattc_get_attr_count (esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gatt_db_attr_type_t type, uint16_t start_handle, uint16_t end_handle, uint16_t incl_uuid, uint16_t *count)
```

Find the attribute count with the given service or characteristic in the gatt cache.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] type: the attribute type.
- [in] start_handle: the attribute start handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- [in] end_handle: the attribute end handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- [in] char_handle: the characteristic handle, this parameter valid when the type is ESP_GATT_DB_DESCRIPTOR. If the type isn’t ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore.
- [out] count: output the number of attribute has been found in the gatt cache with the given attribute type.

```c
esp_gatt_status_t esp_ble_gattc_get_db (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_gattc_db_elem_t *db, uint16_t *count)
```

This function is called to get the GATT database. Note: It just get attribute data base from local cache, won’t get from remote devices.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- [in] gattc_if: Gatt client access interface.
- [in] start_handle: the attribute start handle
- [in] end_handle: the attribute end handle
- [in] conn_id: connection ID which identify the server.
- [in] db: output parameter which will contain the GATT database copy. Caller is responsible for freeing it.
- [in] count: number of elements in database.

```c
esp_err_t esp_ble_gattc_read_char (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, esp_gatt_auth_req_t auth_req)
```

This function is called to read a service’s characteristics of the given characteristic handle.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
Chapter 2. API Reference

- **[in] handle**: characteristic handle to read.
- **[in] auth_req**: authenticate request type

```c
esp_err_t esp_ble_gattc_read_by_type(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t
  start_handle, uint16_t end_handle, esp_bt_uuid_t *uuid,
  esp_gatt_auth_req_t auth_req)
```

This function is called to read a service’s characteristics of the given characteristic UUID.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- **[in] gattc_if**: Gatt client access interface.
- **[in] conn_id**: connection ID.
- **[in] start_handle**: the attribute start handle.
- **[in] end_handle**: the attribute end handle
- **[in] uuid**: The UUID of attribute which will be read.
- **[in] auth_req**: authenticate request type

```c
esp_err_t esp_ble_gattc_read_multiple(esp_gatt_if_t gattc_if, uint16_t conn_id,
    esp_gattc_multi_t *read_multi, esp_gatt_auth_req_t auth_req)
```

This function is called to read multiple characteristic or characteristic descriptors.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- **[in] gattc_if**: Gatt client access interface.
- **[in] conn_id**: connection ID.
- **[in] read_multi**: pointer to the read multiple parameter.
- **[in] auth_req**: authenticate request type

```c
esp_err_t esp_ble_gattc_read_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t han-
    dle, esp_gatt_auth_req_t auth_req)
```

This function is called to read a characteristics descriptor.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- **[in] gattc_if**: Gatt client access interface.
- **[in] conn_id**: connection ID.
- **[in] handle**: descriptor handle to read.
- **[in] auth_req**: authenticate request type

```c
esp_err_t esp_ble_gattc_write_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle,
  uint16_t value_len, uint8_t *value, esp_gatt_write_type_t write_type, esp_gatt_auth_req_t auth_req)
```

This function is called to write characteristic value.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- **[in] gattc_if**: Gatt client access interface.
- **[in] conn_id**: connection ID.
- **[in] handle**: characteristic handle to write.
- **[in] value_len**: length of the value to be written.
- **[in] value**: the value to be written.
- **[in] write_type**: the type of attribute write operation.
- **[in] auth_req**: authentication request.
**esp_err_t esp_ble_gattc_write_char_descr**

```c
esp_err_t esp_ble_gattc_write_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value,
                                       esp_gatt_write_type_t write_type, esp_gatt_auth_req_t auth_req)
```

This function is called to write characteristic descriptor value.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] handle: descriptor handle to write.
- [in] value_len: length of the value to be written.
- [in] value: the value to be written.
- [in] write_type: the type of attribute write operation.
- [in] auth_req: authentication request.

**esp_err_t esp_ble_gattc_prepare_write**

```c
esp_err_t esp_ble_gattc_prepare_write(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value,
                                      esp_gatt_auth_req_t auth_req)
```

This function is called to prepare write a characteristic value.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] handle: characteristic handle to prepare write.
- [in] offset: offset of the write value.
- [in] value_len: length of the value to be written.
- [in] value: the value to be written.
- [in] auth_req: authentication request.

**esp_err_t esp_ble_gattc_prepare_write_char_descr**

```c
esp_err_t esp_ble_gattc_prepare_write_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value,
                                                esp_gatt_auth_req_t auth_req)
```

This function is called to prepare write a characteristic descriptor value.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] handle: characteristic descriptor handle to prepare write.
- [in] offset: offset of the write value.
- [in] value_len: length of the value to be written.
- [in] value: the value to be written.
- [in] auth_req: authentication request.

**esp_err_t esp_ble_gattc_execute_write**

```c
esp_err_t esp_ble_gattc_execute_write(esp_gatt_if_t gattc_if, uint16_t conn_id, bool is_execute)
```

This function is called to execute write a prepare write sequence.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
• [in] is_execute: execute or cancel.

```c
esp_err_t esp_ble_gattc_register_for_notify(esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda, uint16_t handle)
```

This function is called to register for notification of a service.

**Return**
- ESP_OK: registration succeeds
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] handle: GATT characteristic handle.

```c
esp_err_t esp_ble_gattc_unregister_for_notify(esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda, uint16_t handle)
```

This function is called to de-register for notification of a service.

**Return**
- ESP_OK: unregister succeeds
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] handle: GATT characteristic handle.

```c
esp_err_t esp_ble_gattc_cache_refresh(esp_bd_addr_t remote_bda)
```

Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] remote_bda: remote device BD address.

```c
esp_err_t esp_ble_gattc_cache_assoc(esp_gatt_if_t gattc_if, esp_bd_addr_t src_addr, esp_bd_addr_t assoc_addr, bool is_assoc)
```

Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device’s attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address mains that device want to used the database has stored in the local cache. The source address mains that device want to share the database to the associated address device.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] src_addr: the source address which provide the attribute table.
- [in] assoc_addr: the associated device address which went to share the attribute table with the source address.
- [in] is_assoc: true add the associated device address, false remove the associated device address.

```c
esp_err_t esp_ble_gattc_cache_get_addr_list(esp_gatt_if_t gattc_if)
```

Get the address list which has store the attribute table in the gattc cache. There will callback ESP_GATTC_GET_ADDR_LIST_EVT event when get address list complete.

**Return**
- ESP_OK: success
- other: failed
Parameters

- `[in] gattc_if`: Gatt client access interface.

```c
esp_err_t esp_ble_gattc_cache_clean(esp_bd_addr_t remote_bda)
```
Clean the service cache of this device in the gattc stack.

Return

- ESP_OK: success
- other: failed

Parameters

- `[in] remote_bda`: remote device BD address.

Unions

```c
union esp_ble_gattc_cb_param_t
```
#include `<esp_gattc_api.h>` Gatt client callback parameters union.

Public Members

```c
struct esp_ble_gattc_cb_param_t::gattc_reg_evt_param_reg
```

Chapter 2. API Reference

uint16_t offset
The prepare write offset, this value is valid only when prepare write

Type Definitions

typedef void (*esp_gattc_cb_t) (esp_gattc_cb_event_t event, esp_gatt_if_t gattc_if, esp_ble_gattc_cb_param_t *param)
GATT Client callback function type.

Parameters
- event:: Event type
- gattc_if: GATT client access interface, normally different gattc_if correspond to different profile
- param: Point to callback parameter, currently is union type

Enumerations

enum esp_gattc_cb_event_t
GATT Client callback function events.

Values:

ESP_GATTC_REG_EVT = 0
When GATT client is registered, the event comes

ESP_GATTC_UNREG_EVT = 1
When GATT client is unregistered, the event comes

ESP_GATTC_OPEN_EVT = 2
When GATT virtual connection is set up, the event comes

ESP_GATTC_READ_CHAR_EVT = 3
When GATT characteristic is read, the event comes

ESP_GATTC_WRITE_CHAR_EVT = 4
When GATT characteristic write operation completes, the event comes

ESP_GATTC_CLOSE_EVT = 5
When GATT virtual connection is closed, the event comes

ESP_GATTC_SEARCH_CMPL_EVT = 6
When GATT service discovery is completed, the event comes

ESP_GATTC_SEARCH_RES_EVT = 7
When GATT service discovery result is got, the event comes

ESP_GATTC_READ_DESCR_EVT = 8
When GATT characteristic descriptor read completes, the event comes

ESP_GATTC_WRITE_DESCR_EVT = 9
When GATT characteristic descriptor write completes, the event comes

ESP_GATTC_NOTIFY_EVT = 10
When GATT notification or indication arrives, the event comes

ESP_GATTC_PREP_WRITE_EVT = 11
When GATT prepare-write operation completes, the event comes

ESP_GATTC_EXEC_EVT = 12
When write execution completes, the event comes

ESP_GATTC_ACL_EVT = 13
When ACL connection is up, the event comes

ESP_GATTC_CANCEL_OPEN_EVT = 14
When GATT client ongoing connection is cancelled, the event comes
ESP_GATTC_SRVC_CHG_EVT = 15
When "service changed" occurs, the event comes

ESP_GATTC_ENC_CMPL_CB_EVT = 17
When encryption procedure completes, the event comes

ESP_GATTC_CFG_MTU_EVT = 18
When configuration of MTU completes, the event comes

ESP_GATTC_ADV_DATA_EVT = 19
When advertising of data, the event comes

ESP_GATTC_MULT_ADV_ENB_EVT = 20
When multi-advertising is enabled, the event comes

ESP_GATTC_MULT_ADV_UPD_EVT = 21
When multi-advertising parameters are updated, the event comes

ESP_GATTC_MULT_ADV_DATA_EVT = 22
When multi-advertising data arrives, the event comes

ESP_GATTC_MULT_ADV_DIS_EVT = 23
When multi-advertising is disabled, the event comes

ESP_GATTC_CONGEST_EVT = 24
When GATT connection congestion comes, the event comes

ESP_GATTC_BTH_SCAN_ENB_EVT = 25
When batch scan is enabled, the event comes

ESP_GATTC_BTH_SCAN_CFG_EVT = 26
When batch scan storage is configured, the event comes

ESP_GATTC_BTH_SCAN_RD_EVT = 27
When Batch scan read event is reported, the event comes

ESP_GATTC_BTH_SCAN_THR_EVT = 28
When Batch scan threshold is set, the event comes

ESP_GATTC_BTH_SCAN_PARAM_EVT = 29
When Batch scan parameters are set, the event comes

ESP_GATTC_BTH_SCAN_DIS_EVT = 30
When Batch scan is disabled, the event comes

ESP_GATTC_SCAN_FLT_CFG_EVT = 31
When Scan filter configuration completes, the event comes

ESP_GATTC_SCAN_FLT_PARAM_EVT = 32
When Scan filter parameters are set, the event comes

ESP_GATTC_SCAN_FLT_STATUS_EVT = 33
When Scan filter status is reported, the event comes

ESP_GATTC_ADV_VSC_EVT = 34
When advertising vendor spec content event is reported, the event comes

ESP_GATTC_REG_FOR_NOTIFY_EVT = 38
When register for notification of a service completes, the event comes

ESP_GATTC_UNREG_FOR_NOTIFY_EVT = 39
When unregister for notification of a service completes, the event comes

ESP_GATTC_CONNECT_EVT = 40
When the ble physical connection is set up, the event comes

ESP_GATTC_DISCONNECT_EVT = 41
When the ble physical connection disconnected, the event comes
**Chapter 2. API Reference**

### ESP_GATTC_READ_MULTIPLE_EVT = 42
When the ble characteristic or descriptor multiple complete, the event comes

### ESP_GATTC_QUEUE_FULL_EVT = 43
When the gattc command queue full, the event comes

### ESP_GATTC_SET_ASSOC_EVT = 44
When the ble gattc set the associated address complete, the event comes

### ESP_GATTC_GET_ADDR_LIST_EVT = 45
When the ble get gattc address list in cache finish, the event comes

### ESP_GATTC_DIS_SRVC_CMPL_EVT = 46
When the ble discover service complete, the event comes

---

**BLUFI API**

**Overview**
BLUFI is a profile based GATT to config ESP32 WIFI to connect/disconnect AP or setup a softap and etc. Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.
2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the “Key Exchange/Negotiation” procedure.

**Application Example**
Check `bluetooth` folder in ESP-IDF examples, which contains the following application:

- This is the BLUFI demo. This demo can set ESP32’s wifi to softap/station/softap&station mode and config wifi connections - `bluetooth/blufi`

**API Reference**

**Header File**

- `components/bt/common/api/include/api/esp_blufi_api.h`

**Functions**

```c
esp_err_t esp_blufi_register_callbacks (esp_blufi_callbacks_t *callbacks)
```
This function is called to receive blufi callback event.

**Return**
ESP_OK - success, other - failed

**Parameters**
- [in] callbacks: callback functions

```c
esp_err_t esp_blufi_profile_init (void)
```
This function is called to initialize blufi_profile.

**Return**
ESP_OK - success, other - failed

```c
esp_err_t esp_blufi_profile_deinit (void)
```
This function is called to de-initialize blufi_profile.

**Return**
ESP_OK - success, other - failed

```c
esp_err_t esp_blufi_send_wifi_conn_report (wifi_mode_t opmode, esp_blufi_sta_conn_state_t sta_conn_state, uint8_t softap_conn_num, esp_blufi_extra_info_t *extra_info)
```
This function is called to send wifi connection report.

**Return**
ESP_OK - success, other - failed

**Parameters**
- opmode: wifi opmode
- sta_conn_state: station is already in connection or not
Chapter 2. API Reference

• `softap_conn_num`: softap connection number
• `extra_info`: extra information, such as sta_ssid, softap_ssid and etc.

```c
esp_err_t esp_blufi_send_wifi_list (uint16_t apCount, esp_blufi_ap_record_t *list)
```
This function is called to send wifi list.

- **Return**: ESP_OK - success, other - failed
- **Parameters**
  - `apCount`: wifi list count
  - `list`: wifi list

```c
uint16_t esp_blufi_get_version (void)
```
Get BLUFI profile version.

- **Return**: Most 8bit significant is Great version, Least 8bit is Sub version

```c
esp_err_t esp_blufi_send_error_info (esp_blufi_error_state_t state)
```
This function is called to send blufi error information.

- **Return**: ESP_OK - success, other - failed
- **Parameters**
  - `state`: error state

```c
esp_err_t esp_blufi_send_custom_data (uint8_t *data, uint32_t data_len)
```
This function is called to send custom data.

- **Return**: ESP_OK - success, other - failed
- **Parameters**
  - `data`: custom data value
  - `data_len`: the length of custom data

**Unions**

```c
union esp_blufi_cb_param_t
#include <esp_blufi_api.h> BLUFI callback parameters union.
```

**Public Members**

```c
struct esp_blufi_cb_param_t::blufi_init_finish_evt_param init_finish
```
Blufi callback param of ESP_BLUFI_EVENT_INIT_FINISH

```c
struct esp_blufi_cb_param_t::blufi_deinit_finish_evt_param deinit_finish
```
Blufi callback param of ESP_BLUFI_EVENT_DEINIT_FINISH

```c
struct esp_blufi_cb_param_t::blufi_set_wifi_mode_evt_param wifi_mode
```
Blufi callback param of ESP_BLUFI_EVENT_INIT_FINISH

```c
struct esp_blufi_cb_param_t::blufi_connect_evt_param connect
```
Blufi callback param of ESP_BLUFI_EVENT_CONNECT

```c
struct esp_blufi_cb_param_t::blufi_disconnect_evt_param disconnect
```
Blufi callback param of ESP_BLUFI_EVENT_DISCONNECT

```c
struct esp_blufi_cb_param_t::blufi_recv_sta_bssid_evt_param sta_bssid
```
Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_BSSID

```c
struct esp_blufi_cb_param_t::blufi_recv_sta_ssid_evt_param sta_ssid
```
Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_SSID

```c
struct esp_blufi_cb_param_t::blufi_recv_sta_passwd_evt_param sta_passwd
```
Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_PASSWD

```c
struct esp_blufi_cb_param_t::blufi_recv_softap_ssid_evt_param softap_ssid
```
Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_SSID

```c
struct esp_blufi_cb_param_t::blufi_recv_softap_passwd_evt_param softap_passwd
   Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_PASSWD

struct esp_blufi_cb_param_t::blufi_recv_softap_max_conn_num_evt_param softap_max_conn_num
   Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_MAX_CONN_NUM

struct esp_blufi_cb_param_t::blufi_recv_softap_auth_mode_evt_param softap_auth_mode
   Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_AUTH_MODE

struct esp_blufi_cb_param_t::blufi_recv_softap_channel_evt_param softap_channel
   Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_CHANNEL

struct esp_blufi_cb_param_t::blufi_recv_username_evt_param username
   Blufi callback param of ESP_BLUFI_EVENT_RECV_USERNAME

struct esp_blufi_ap_record_t
Description of an WiFi AP.

Public Members

uint8_t ssid[33]
SSID of AP

int8_t rssi
signal strength of AP

struct esp_blufi_callbacks_t
BLUFI callback functions type.

Public Members

esp_blufi_event_cb_t event_cb
BLUFI event callback

esp_blufi_negotiate_data_handler_t negotiate_data_handler
BLUFI negotiate data function for negotiate share key

esp_blufi_encrypt_func_t encrypt_func
BLUFI encrypt data function with share key generated by negotiate_data_handler

esp_blufi_decrypt_func_t decrypt_func
BLUFI decrypt data function with share key generated by negotiate_data_handler

esp_blufi_checksum_func_t checksum_func
BLUFI check sum function (FCS)

Macros

ESP_BD_ADDR_LEN
Bluetooth address length.

Type Definitions

typedef uint8_t esp_bd_addr_t[ESP_BD_ADDR_LEN]
Bluetooth device address.

typedef void (*esp_blufi_event_cb_t)(esp_blufi_cb_event_t event, esp_blufi_cb_param_t *param)
BLUFI event callback function type.

Parameters

• event:: Event type
• param:: Point to callback parameter, currently is union type

typedef void (*esp_blufi_negotiate_data_handler_t)(uint8_t *data, int len, uint8_t **output_data, int *output_len, bool *need_free)
BLUFI negotiate data handler.

Parameters

• data:: data from phone
• len:: length of data from phone
• output_data:: data want to send to phone
• output_len:: length of data want to send to phone
• need_free:: output reporting if memory needs to be freed or not *

typedef int (*esp_blufi_encrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)
BLUFI encrypt the data after negotiate a share key.
Chapter 2. API Reference

**Return** Nonnegative number is encrypted length, if error, return negative number;

**Parameters**
- `iv8`: initial vector(8bit), normally, blufi core will input packet sequence number
- `crypt_data`: plain text and encrypted data, the encrypt function must support autochthonous encrypt
- `crypt_len`: length of plain text

```c
typedef int (*esp_blufi_decrypt_func_t)(uint8_t* iv8, uint8_t* crypt_data, int crypt_len)
```
BLUFI decrypt the data after negotiate a share key.

**Return** Nonnegative number is decrypted length, if error, return negative number;

**Parameters**
- `iv8`: initial vector(8bit), normally, blufi core will input packet sequence number
- `crypt_data`: encrypted data and plain text, the encrypt function must support autochthonous decrypt
- `crypt_len`: length of encrypted text

```c
typedef uint16_t (*esp_blufi_checksum_func_t)(uint8_t* iv8, uint8_t* data, int len)
```
BLUFI checksum.

**Parameters**
- `iv8`: initial vector(8bit), normally, blufi core will input packet sequence number
- `data`: data need to checksum
- `len`: length of data

**Enumerations**

```c
enum esp_blufi_cb_event_t
```
Values:

- `ESP_BLUFI_EVENT_INIT_FINISH` = 0
- `ESP_BLUFI_EVENT_DEINIT_FINISH`
- `ESP_BLUFI_EVENT_SET_WIFI_OPMODE`
- `ESP_BLUFI_EVENT_BLE_CONNECT`

2.3.3 Controller && VHCI

Overview

Instructions
Chapter 2. API Reference

Application Example

Check `bluetooth/hci` folder in ESP-IDF examples, which contains the following application:

- This is a BLE advertising demo with virtual HCI interface. Send `reset/ADV_PARAM/ADV_DATA/ADV_ENABLE` HCI command for BLE advertising - `bluetooth/hci/controller_vhci_ble_adv`.

API Reference

Header File

- `components/bt/include/esp32/include/esp_bt.h`

Functions

- `esp_err_t esp_ble_tx_power_set (esp_ble_power_type_t power_type, esp_power_level_t power_level)`
  Set BLE TX power Connection Tx power should only be set after connection created.
  
  **Return** ESP_OK - success, other - failed
  
  **Parameters**
  - `power_type`: The type of which tx power, could set Advertising/Connection/Default and etc
  - `power_level`: Power level(index) corresponding to absolute value(dbm)

- `esp_err_t esp_ble_tx_power_get (esp_ble_power_type_t power_type)`
  Get BLE TX power Connection Tx power should only be get after connection created.
  
  **Return** >=0 - Power level, <0 - Invalid
  
  **Parameters**
  - `power_type`: The type of which tx power, could set Advertising/Connection/Default and etc

- `esp_err_t esp_bredr_tx_power_set (esp_power_level_t min_power_level, esp_power_level_t max_power_level)`
  Set BR/EDR TX power BR/EDR power control will use the power in range of minimum value and maximum value. The power level will effect the global BR/EDR TX power, such inquire, page, connection and so on. Please call the function after `esp_bt_controller_enable` and before any function which cause RF do TX. So you can call the function before doing discovery, profile init and so on. For example, if you want BR/EDR use the new TX power to do inquire, you should call this function before inquire. Another word, If call this function when BR/EDR is in inquire(ING), please do inquire again after call this function. Default minimum power level is ESP_PWR_LVL_N0, and maximum power level is ESP_PWR_LVL_P3.
  
  **Return** ESP_OK - success, other - failed
  
  **Parameters**
  - `min_power_level`: The minimum power level
  - `max_power_level`: The maximum power level

- `esp_err_t esp_bredr_tx_power_get (esp_power_level_t *min_power_level, esp_power_level_t *max_power_level)`
  Get BR/EDR TX power If the argument is not NULL, then store the corresponding value.
  
  **Return** ESP_OK - success, other - failed
  
  **Parameters**
  - `min_power_level`: The minimum power level
  - `max_power_level`: The maximum power level

- `esp_err_t esp_bredr_sco_datapath_set (esp_sco_data_path_t data_path)`
  Set default SCO data path Should be called after controller is enabled, and before (e)SCO link is established.
  
  **Return** ESP_OK - success, other - failed
  
  **Parameters**
  - `data_path`: SCO data path
**esp_err_t esp_bt_controller_init (esp_bt_controller_config_t *cfg)**

Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.

**Return** ESP_OK - success, other - failed

**Parameters**

- `cfg`: Initial configuration of BT controller. Different from previous version, there’s a mode and some connection configuration in “cfg” to configure controller work mode and allocate the resource which is needed.

**esp_err_t esp_bt_controller_deinit (void)**

De-initialize BT controller to free resource and delete task.

This function should be called only once, after any other BT functions are called.

**Return** ESP_OK - success, other - failed

**esp_err_t esp_bt_controller_enable (esp_bt_mode_t mode)**

Enable BT controller. Due to a known issue, you cannot call esp_bt_controller_enable() a second time to change the controller mode dynamically. To change controller mode, call esp_bt_controller_disable() and then call esp_bt_controller_enable() with the new mode.

**Return** ESP_OK - success, other - failed

**Parameters**

- `mode`: the mode (BLE/BT/BTDM) to enable. For compatible of API, retain this argument. This mode must be equal as the mode in “cfg” of esp_bt_controller_init().

**esp_err_t esp_bt_controller_disable (void)**

Disable BT controller.

**Return** ESP_OK - success, other - failed

**esp_bt_controller_status_t esp_bt_controller_get_status (void)**

Get BT controller is initialised/de-initialised/enabled/disabled.

**Return** status value

**bool esp_vhci_host_check_send_available (void)**

esp_vhci_host_check_send_available used for check actively if the host can send packet to controller or not.

**Return** true for ready to send, false means cannot send packet

**void esp_vhci_host_send_packet (uint8_t *data, uint16_t len)**

esp_vhci_host_send_packet host send packet to controller

Should not call this function from within a critical section or when the scheduler is suspended.

**Parameters**

- `data`: the packet point
- `len`: the packet length

**esp_err_t esp_vhci_host_register_callback (const esp_vhci_host_callback_t *callback)**

esp_vhci_host_register_callback register the vhci reference callback struct defined by vhci_host_callback structure.

**Return** ESP_OK - success, ESP_FAIL - failed

**Parameters**

- `callback`: esp_vhci_host_callback type variable

**esp_err_t esp_bt_controller_mem_release (esp_bt_mode_t mode)**

esp_bt_controller_mem_release release the controller memory as per the mode

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k bytes.

esp_bt_controller_mem_release(mode) should be called only before esp_bt_controller_init() or after esp_bt_controller_deinit().
Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the Bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If the app calls esp_bt_controller_enable(ESP_BT_MODE_BLE) to use BLE only then it is safe to call esp_bt_controller_mem_release(ESP_BT_MODE_CLASSIC_BT) at initialization time to free unused BT Classic memory.

If the mode is ESP_BT_MODE_BTDM, then it may be useful to call API esp_bt_mem_release(ESP_BT_MODE_BTDM) instead, which internally calls esp_bt_controller_mem_release(ESP_BT_MODE_BTDM) and additionally releases the BSS and data consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation of esp_bt_mem_release() function

Return ESP_OK - success, other - failed

Parameters
• mode: : the mode want to release memory

disp_err_t esp_bt_mem_release (esp_bt_mode_t mode)

esp_bt_mem_release release controller memory and BSS and data section of the BT/BLE host stack as per the mode

This function first releases controller memory by internally calling esp_bt_controller_mem_release(). Additionally, if the mode is set to ESP_BT_MODE_BTDM, it also releases the BSS and data consumed by the BT/BLE host stack to heap

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call esp_bt_mem_release(ESP_BT_MODE_BTDM) before esp_bt_controller_init or after esp_bt_controller_deinit.

For example, if a user only uses bluetooth for setting the WiFi configuration, and does not use bluetooth in the rest of the product operation . In such cases, after receiving the WiFi configuration, you can disable/deinit bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:

```c
esp_bluedroid_disable();
esp_bluedroid_deinit();
esp_bt_controller_disable();
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);
```

Note In case of NimBLE host, to release BSS and data memory to heap, the mode needs to be set to ESP_BT_MODE_BTDM as controller is dual mode.

Return ESP_OK - success, other - failed

Parameters
• mode: : the mode whose memory is to be released

disp_err_t esp_bt_sleep_enable (void)

enable bluetooth to enter modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

There are currently two options for bluetooth modem sleep, one is ORIG mode, and another is EVED Mode. EVED Mode is intended for BLE only.

For ORIG mode: Bluetooth modem sleep is enabled in controller start up by default if CONFIG_CTRL_BTDM_MODEM_SLEEP is set and “ORIG mode” is selected. In ORIG modem sleep mode, bluetooth controller will switch off some components and pause to work every now and then, if there is no
event to process; and wake up according to the scheduled interval and resume the work. It can also wake up earlier upon external request using function “esp_bt_controller_wakeup_request”.

Return
- ESP_OK: success
- other: failed

*esp_err_t* esp_bt_sleep_disable (void)

disable bluetooth modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

If esp_bt_sleep_disable() is called, bluetooth controller will not be allowed to enter modem sleep;

If ORIG modem sleep mode is in use, if this function is called, bluetooth controller may not immediately wake up if it is dormant then. In this case, esp_bt_controller_wakeup_request() can be used to shorten the time for wakeup.

Return
- ESP_OK: success
- other: failed

*esp_err_t* esp_ble_scan_duplicate_list_flush (void)

Manually clear scan duplicate list.

Note that scan duplicate list will be automatically cleared when the maximum amount of device in the filter is reached the amount of device in the filter can be configured in menuconfig.

Note This function name is incorrectly spelled, it will be fixed in release 5.x version.

Return
- ESP_OK: success
- other: failed

void esp_wifi_bt_power_domain_on (void)

bt Wi-Fi power domain power on

void esp_wifi_bt_power_domain_off (void)

bt Wi-Fi power domain power off

Structures

*struct esp_bt_controller_config_t*

Controller config options, depend on config mask. Config mask indicate which functions enabled, this means some options or parameters of some functions enabled by config mask.

Public Members

uint16_t controller_task_stack_size

Bluetooth controller task stack size

uint8_t controller_task_prio

Bluetooth controller task priority

uint8_t hci_uart_no

If use UART1/2 as HCI IO interface, indicate UART number

uint32_t hci_uart_baudrate

If use UART1/2 as HCI IO interface, indicate UART baudrate

uint8_t scan_duplicate_mode

scan duplicate mode

uint8_t scan_duplicate_type

scan duplicate type
uint16_t normal_adv_size
   Normal adv size for scan duplicate

uint16_t mesh_adv_size
   Mesh adv size for scan duplicate

uint16_t send_adv_reserved_size
   Controller minimum memory value

uint32_t controller_debug_flag
   Controller debug log flag

uint8_t mode
   Controller mode: BR/EDR, BLE or Dual Mode

uint8_t ble_max_conn
   BLE maximum connection numbers

uint8_t bt_max_acl_conn
   BR/EDR maximum ACL connection numbers

uint8_t bt_sco_datapath
   SCO data path, i.e. HCI or PCM module

bool auto_latency
   BLE auto latency, used to enhance classic BT performance

bool bt_legacy_auth_vs_evt
   BR/EDR Legacy auth complete event required to protect from BIAS attack

uint8_t bt_max_sync_conn
   BR/EDR maximum ACL connection numbers. Effective in menuconfig

uint8_t ble_sca
   BLE low power crystal accuracy index

uint8_t pcm_role
   PCM role (master & slave)

uint8_t pcm_polar
   PCM polar trig (falling clk edge & rising clk edge)

bool hli
   Using high level interrupt or not

uint32_t magic
   Magic number

struct esp_vhci_host_callback
   esp_vhci_host_callback used for vhci call host function to notify what host need to do

Public Members

void (*notify_host_send_available)(void)
   callback used to notify that the host can send packet to controller

int (*notify_host_recv)(uint8_t *data, uint16_t len)
   callback used to notify that the controller has a packet to send to the host

Macros
ESP_BT_CONTROLLER_CONFIG_MAGIC_VAL
BT_CONTROLLER_INIT_CONFIG_DEFAULT()
Type Definitions

typedef struct esp_vhci_host_callback esp_vhci_host_callback_t
  esp_vhci_host_callback used for vhci call host function to notify what host need to do

Enumerations

enum esp_bt_mode_t
  Bluetooth mode for controller enable/disable.
  Values:
  ESP_BT_MODE_IDLE = 0x00
    Bluetooth is not running
  ESP_BT_MODE_BLE = 0x01
    Run BLE mode
  ESP_BT_MODE_CLASSIC_BT = 0x02
    Run Classic BT mode
  ESP_BT_MODE_BTDM = 0x03
    Run dual mode

enum [anonymous]
  BLE sleep clock accuracy(SCA), values for ble_sca field in esp_bt_controller_config_t, currently only
  ESP_BLE_SCA_500PPM and ESP_BLE_SCA_250PPM are supported.
  Values:
  ESP_BLE_SCA_500PPM = 0
    BLE SCA at 500ppm
  ESP_BLE_SCA_250PPM
    BLE SCA at 250ppm
  ESP_BLE_SCA_150PPM
    BLE SCA at 150ppm
  ESP_BLE_SCA_100PPM
    BLE SCA at 100ppm
  ESP_BLE_SCA_75PPM
    BLE SCA at 75ppm
  ESP_BLE_SCA_50PPM
    BLE SCA at 50ppm
  ESP_BLE_SCA_30PPM
    BLE SCA at 30ppm
  ESP_BLE_SCA_20PPM
    BLE SCA at 20ppm

enum esp_bt_controller_status_t
  Bluetooth controller enable/disable/initialised/de-initialised status.
  Values:
  ESP_BT_CONTROLLER_STATUS_IDLE = 0
  ESP_BT_CONTROLLER_STATUS_INITED
  ESP_BT_CONTROLLER_STATUS_ENABLED
  ESP_BT_CONTROLLER_STATUS_NUM

enum esp_ble_power_type_t
  BLE tx power type ESP_BLE_PWR_TYPE_CONN_HDL0-8: for each connection, and only be
  set after connection completed. when disconnect, the correspond TX power is not effected.
ESP_BLE_PWR_TYPE_DEFAULT : if each connection’s TX power is not set, it will use this default value. If neither in scan mode nor in adv mode, it will use this default value. If none of power type is set, system will use ESP_PWR_LVL_P3 as default for ADV/SCAN/CONN0-9.

Values:

ESP_BLE_PWR_TYPE_CONN_hdl0 = 0
  For connection handle 0
ESP_BLE_PWR_TYPE_CONN_hdl1 = 1
  For connection handle 1
ESP_BLE_PWR_TYPE_CONN_hdl2 = 2
  For connection handle 2
ESP_BLE_PWR_TYPE_CONN_hdl3 = 3
  For connection handle 3
ESP_BLE_PWR_TYPE_CONN_hdl4 = 4
  For connection handle 4
ESP_BLE_PWR_TYPE_CONN_hdl5 = 5
  For connection handle 5
ESP_BLE_PWR_TYPE_CONN_hdl6 = 6
  For connection handle 6
ESP_BLE_PWR_TYPE_CONN_hdl7 = 7
  For connection handle 7
ESP_BLE_PWR_TYPE_CONN_hdl8 = 8
  For connection handle 8
ESP_BLE_PWR_TYPE_ADV = 9
  For advertising
ESP_BLE_PWR_TYPE_SCAN = 10
  For scan
ESP_BLE_PWR_TYPE_DEFAULT = 11
  For default, if not set other, it will use default value
ESP_BLE_PWR_TYPE_NUM = 12
  TYPE numbers

enum esp_power_level_t
  Bluetooth TX power level(index), it’s just a index corresponding to power(dbm).
  Values:

ESP_PWR_LVL_N12 = 0
  Corresponding to -12dbm
ESP_PWR_LVL_N9 = 1
  Corresponding to -9dbm
ESP_PWR_LVL_N6 = 2
  Corresponding to -6dbm
ESP_PWR_LVL_N3 = 3
  Corresponding to -3dbm
ESP_PWR_LVL_N0 = 4
  Corresponding to 0dbm
ESP_PWR_LVL_P3 = 5
  Corresponding to +3dbm
ESP_PWR_LVL_P6 = 6
  Corresponding to +6dbm
ESP_PWR_LVL_P9 = 7
Corresponding to +9dbm

ESP_PWR_LVL_N14 = ESP_PWR_LVL_N12
Backward compatibility! Setting to -14dbm will actually result to -12dbm

ESP_PWR_LVL_N11 = ESP_PWR_LVL_N9
Backward compatibility! Setting to -11dbm will actually result to -9dbm

ESP_PWR_LVL_N8 = ESP_PWR_LVL_N6
Backward compatibility! Setting to -8dbm will actually result to -6dbm

ESP_PWR_LVL_N5 = ESP_PWR_LVL_N3
Backward compatibility! Setting to -5dbm will actually result to -3dbm

ESP_PWR_LVL_N2 = ESP_PWR_LVL_N0
Backward compatibility! Setting to -2dbm will actually result to 0dbm

ESP_PWR_LVL_P1 = ESP_PWR_LVL_P3
Backward compatibility! Setting to +1dbm will actually result to +3dbm

ESP_PWR_LVL_P4 = ESP_PWR_LVL_P6
Backward compatibility! Setting to +4dbm will actually result to +6dbm

ESP_PWR_LVL_P7 = ESP_PWR_LVL_P9
Backward compatibility! Setting to +7dbm will actually result to +9dbm

enum esp_sco_data_path_t

Bluetooth audio data transport path.

Values:

ESP_SCO_DATA_PATH_HCI = 0
data over HCI transport

ESP_SCO_DATA_PATH_PCM = 1
data over PCM interface

2.3.4  ESP-BLE-MESH

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.

For an ESP32 to join and work on a ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an unprovisioned device, will join the ESP-BLE-MESH network and become a ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.

Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH Provisioner, which could provision unprovisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section Getting Started with ESP-BLE-MESH. If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section ESP-BLE-MESH Architecture.

Application Examples and Demos

Please refer to Sections ESP-BLE-MESH Examples and ESP-BLE-MESH Demo Videos.

API Reference

ESP-BLE-MESH APIs are divided into the following parts:

• ESP-BLE-MESH Definitions
Chapter 2. API Reference

- ESP-BLE-MESH Core API Reference
- ESP-BLE-MESH Models API Reference

ESP-BLE-MESH Definitions

This section contains only one header file, which lists the following items of ESP-BLE-MESH.

- ID of all the models and related message opcodes
- Structs of model, element and Composition Data
- Structs of used by ESP-BLE-MESH Node/Provisioner for provisioning
- Structs used to transmit/receive messages
- Event types and related event parameters

Header File

- components/bt/esp_ble_mesh/api/esp_ble_mesh_defs.h

Unions

union esp_ble_mesh_prov_cb_param_t

#include <esp_ble_mesh_defs.h> BLE Mesh Node/Provisioner callback parameters union.

Public Members

```c
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_prov_register_comp_param
    prov_register_comp

int err_code
Indicate the result of enabling/disabling to receive heartbeat messages by the Provisioner
Indicate the result of setting the heartbeat filter type by the Provisioner
Indicate the result of setting the heartbeat filter address by the Provisioner
Indicate the result of directly erasing settings by the Provisioner
Indicate the result of opening settings with index by the Provisioner
Indicate the result of opening settings with user id by the Provisioner
Indicate the result of closing settings with index by the Provisioner
Indicate the result of closing settings with user id by the Provisioner
Indicate the result of deleting settings with index by the Provisioner
Indicate the result of deleting settings with user id by the Provisioner

bool enable
Indicate enabling or disabling receiving heartbeat messages

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_enable_heartbeat_recv_comp
provisioner_enable_heartbeat_recv
ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT

uint8_t type
Type of the filter used for receiving heartbeat messages

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_set_heartbeat_filter_type_comp
provisioner_set_heartbeat_filter_type
ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT
uint8_t `op`  
Operation (add, remove, clean)

uint16_t `hb_src`  
Heartbeat source address

uint16_t `hb_dst`  
Heartbeat destination address

```c
struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_set_heartbeat_filter_info_comp
ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT.
```

Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT

uint8_t `init_ttl`  
Heartbeat InitTTL

uint8_t `rx_ttl`  
Heartbeat RxTTL

uint8_t `hops`  
Heartbeat hops (InitTTL - RxTTL + 1)

uint16_t `feature`  
Bit field of currently active features of the node

int8_t `rssi`  
RSSI of the heartbeat message

```c
struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_recv_heartbeat
ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT.
```

Event parameters of ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT

```c

Public Types

enum [anonymous]
This enum value is the reason of friendship termination on the friend node side

Values:

ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_ESTABLISH_FAIL
Friend Offer has been sent, but Friend Offer is not received within 1 second, friendship fails to be established

ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_POLL_TIMEOUT
Friendship is established, PollTimeout timer expires and no Friend Poll/Sub Add/Sub Remove is received

ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_REQ
Receive Friend Request from existing Low Power Node

ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_CLEAR
Receive Friend Clear from other friend node

ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_DISABLE
Friend feature disabled or corresponding NetKey is deleted

Public Members

uint16_t lpn_addr
Low Power Node unicast address

esp_ble_mesh_prov_ch_param_:::ble_mesh_friend_friendship_terminate_param:::[anonymous] reason
This enum value is the reason of friendship termination on the friend node side Friendship terminated reason

struct ble_mesh_heartbeat_msg_recv_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT.
Chapter 2. API Reference

Public Members

```c
uint8_t hops
    Heartbeat hops (InitTTL - RxTTL + 1)
```

```c
uint16_t feature
    Bit field of currently active features of the node
```

Event parameter of ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT
struct ble_mesh_client_model_send_timeout_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT.
Public Members

uint32_t opcode
    Opcode of the previously sent message

esp_ble_mesh_model_t *model
    Pointer to the model which sends the previous message

esp_ble_mesh_msg_ctx_t *ctx
    Pointer to the context of the previous message

struct ble_mesh_mod_recv_publish_msg_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT.

Public Members

uint32_t opcode
    Opcode of the unsolicited received message

esp_ble_mesh_model_t *model
    Pointer to the model which receives the message

esp_ble_mesh_msg_ctx_t *ctx
    Pointer to the context of the previous message

uint16_t length
    Length of the received message

uint8_t *msg
    Value of the received message

struct ble_mesh_model_operation_evt_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_OPERATION_EVT.

Public Members

uint32_t opcode
    Opcode of the received message

esp_ble_mesh_model_t *model
    Pointer to the model which receives the message

esp_ble_mesh_msg_ctx_t *ctx
    Pointer to the context of the received message

uint16_t length
    Length of the received message

uint8_t *msg
    Value of the received message

struct ble_mesh_model_publish_comp_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT.

Public Members

int err_code
    Indicate the result of publishing a message

esp_ble_mesh_model_t *model
    Pointer to the model which publishes the message
struct ble_mesh_model_publish_update_evt_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT.

Public Members

esp_ble_mesh_model_t *model
Pointer to the model which is going to update its publish message

struct ble_mesh_model_send_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_SEND_COMP_EVT.

Public Members

int err_code
Indicate the result of sending a message
uint32_t opcode
Opcode of the message

esp_ble_mesh_model_t *model
Pointer to the model which sends the message

esp_ble_mesh_msg_ctx_t *ctx
Context of the message

struct ble_mesh_server_model_update_state_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT.

Public Members

int err_code
Indicate the result of updating server model state

esp_ble_mesh_model_t *model
Pointer to the server model which state value is updated

esp_ble_mesh_server_state_type_t type
Type of the updated server state

Structures

struct esp_ble_mesh_deinit_param_t
BLE Mesh deinit parameters

Public Members

bool erase_flash
Indicate if erasing flash when deinit mesh stack

struct esp_ble_mesh_elem_t
Abstraction that describes a BLE Mesh Element. This structure is associated with struct bt_mesh_elem in mesh_access.h

Public Members

uint16_t element_addr
Element Address, assigned during provisioning.

```c
const uint16_t location
   Location Descriptor (GATT Bluetooth Namespace Descriptors)

const uint8_t sig_model_count
   SIG Model count

const uint8_t vnd_model_count
   Vendor Model count

esp_ble_mesh_model_t *sig_models
   SIG Models

esp_ble_mesh_model_t *vnd_models
   Vendor Models

struct esp_ble_mesh_model_pub_t
   Abstraction that describes a model publication context. This structure is associated with struct bt_mesh_model_pub in mesh_access.h

Public Members

esp_ble_mesh_model_t *model
   Pointer to the model to which the context belongs. Initialized by the stack.

uint16_t publish_addr
   Publish Address.

uint16_t app_idx : 12
   Publish AppKey Index.

uint16_t cred : 1
   Friendship Credentials Flag.

uint16_t send_rel : 1
   Force reliable sending (segment acks)

uint8_t ttl
   Publish Time to Live.

uint8_t retransmit
   Retransmit Count & Interval Steps.

uint8_t period
   Publish Period.

uint8_t period_div : 4
   Divisor for the Period.

uint8_t fast_period : 1
   Use FastPeriodDivisor

uint8_t count : 3
   Retransmissions left.

uint32_t period_start
   Start of the current period.

struct net_buf_simple *msg
   Publication buffer, containing the publication message.
   This will get correctly created when the publication context has been defined using the
   ESP_BLE_MESH_MODEL_PUB_DEFINE macro.

   ESP_BLE_MESH_MODEL_PUB_DEFINE(name, size);

esp_ble_mesh_cb_t update
   Callback used to update publish message. Initialized by the stack.
```
struct k_delayed_work timer
    Publish Period Timer. Initialized by the stack.

    uint8_t dev_role
    Role of the device that is going to publish messages

struct esp_ble_mesh_model_op_t
    Abstraction that describes a model operation context. This structure is associated with struct
    bt_mesh_model_op in mesh_access.h

Public Members

const uint32_t opcode
    Message opcode

const size_t min_len
    Message minimum length

esp_ble_mesh_cb_t param_cb
    Callback used to handle message. Initialized by the stack.

struct esp_ble_mesh_model_cbs_t
    Abstraction that describes a model callback structure. This structure is associated with struct
    bt_mesh_model_cb in mesh_access.h.

Public Members

esp_ble_mesh_cb_t init_cb
    Callback used during model initialization. Initialized by the stack.

struct esp_ble_mesh_model
    Abstraction that describes a Mesh Model instance. This structure is associated with struct bt_mesh_model in
    mesh_access.h

Public Members

const uint16_t model_id
    16-bit model identifier

uint16_t company_id
    16-bit company identifier

uint16_t model_id
    16-bit model identifier

struct esp_ble_mesh_model::[anonymous]::[anonymous] vnd
    Structure encapsulating a model ID with a company ID

union esp_ble_mesh_model::[anonymous] [anonymous]
    Model ID

uint8_t element_idx
    Internal information, mainly for persistent storage Belongs to Nth element

uint8_t model_idx
    Is the Nth model in the element

uint16_t flags
    Information about what has changed

esp_ble_mesh_elem_t *element
    The Element to which this Model belongs
**Chapter 2. API Reference**

```c
esp_ble_mesh_model_pub_t *const pub
    Model Publication

uint16_t keys[CONFIG_BLE_MESH_MODEL_KEY_COUNT]
    AppKey List

uint16_t groups[CONFIG_BLE_MESH_MODEL_GROUP_COUNT]
    Subscription List (group or virtual addresses)
```

```c
esp_ble_mesh_model_op_t *op
    Model operation context
```

```c
esp_ble_mesh_model_cbs_t *cb
    Model callback structure
```

```c
void *user_data
    Model-specific user data
```

**struct esp_ble_mesh_msg_ctx_t**

Message sending context. This structure is associated with struct bt_mesh_msg_ctx in mesh_access.h

### Public Members

```c
uint16_t net_idx
    NetKey Index of the subnet through which to send the message.
```

```c
uint16_t app_idx
    AppKey Index for message encryption.
```

```c
uint16_t addr
    Remote address.
```

```c
uint16_t recv_dst
    Destination address of a received message. Not used for sending.
```

```c
int8_t recv_rssi
    RSSI of received packet. Not used for sending.
```

```c
uint8_t recv_ttl : 7
    Received TTL value. Not used for sending.
```

```c
uint8_t send_rel : 1
    Force sending reliably by using segment acknowledgement
```

```c
uint8_t send_ttl
    TTL, or ESP_BLE_MESH_TTL_DEFAULT for default TTL.
```

```c
uint32_t recv_op
    Opcode of a received message. Not used for sending message.
```

```c
esp_ble_mesh_model_t *model
    Model corresponding to the message, no need to be initialized before sending message
```

```c
bool srv_send
    Indicate if the message is sent by a node server model, no need to be initialized before sending message
```

**struct esp_ble_mesh_prov_t**

Provisioning properties & capabilities. This structure is associated with struct bt_mesh_prov in mesh_access.h

**struct esp_ble_mesh_comp_t**

Node Composition data context. This structure is associated with struct bt_mesh_comp in mesh_access.h

### Public Members

```c
uint16_t cid
    16-bit SIG-assigned company identifier
```
Chapter 2. API Reference

```c
uint16_t pid  
16-bit vendor-assigned product identifier

uint16_t vid  
16-bit vendor-assigned product version identifier

size_t element_count  
Element count

esp_ble_mesh_elem_t *elements  
A sequence of elements
```

```c
struct esp_ble_mesh_unprov_dev_add_t
Information of the device which is going to be added for provisioning.

Public Members

esp_ble_mesh_bd_addr_t addr  
Device address

esp_ble_mesh_addr_type_t addr_type  
Device address type

uint8_t uuid[16]  
Device UUID

uint16_t oob_info  
Device OOB Info ADD_DEV_START_PROV_NOW_FLAG shall not be set if the bearer has both PB-ADV and PB-GATT enabled

esp_ble_mesh_prov_bearer_t bearer  
Provisioning Bearer
```

```c
struct esp_ble_mesh_device_delete_t
Information of the device which is going to be deleted.

Public Members

esp_ble_mesh_bd_addr_t addr  
Device address

esp_ble_mesh_addr_type_t addr_type  
Device address type

uint8_t uuid[16]  
Device UUID

uint8_t flag  
BIT0: device address; BIT1: device UUID
```

```c
struct esp_ble_mesh_prov_data_info_t
Information of the provisioner which is going to be updated.

Public Members

uint16_t net_idx  
NetKey Index

uint8_t flags  
Flags

uint32_t iv_index  
IV Index
```
uint8_t flag
    BIT0: net_idx; BIT1: flags; BIT2: iv_index

struct esp_ble_mesh_node_t
    Information of the provisioned node

Public Members

esp_ble_mesh_bd_addr_t addr
    Node device address

esp_ble_mesh_addr_type_t addr_type
    Node device address type

uint8_t dev_uid[16]
    Device UUID

uint16_t oob_info
    Node OOB information

uint16_t unicast_addr
    Node unicast address

uint8_t element_num
    Node element number

uint16_t net_idx
    Node NetKey Index

uint8_t flags
    Node key refresh flag and iv update flag

uint32_t iv_index
    Node IV Index

uint8_t dev_key[16]
    Node device key

c char name[ESP_BLE_MESH_NODE_NAME_MAX_LEN + 1]
    Node name

uint16_t comp_length
    Length of Composition Data

uint8_t* comp_data
    Value of Composition Data

struct esp_ble_mesh_fast_prov_info_t
    Context of fast provisioning which need to be set.

Public Members

uint16_t unicast_min
    Minimum unicast address used for fast provisioning

uint16_t unicast_max
    Maximum unicast address used for fast provisioning

uint16_t net_idx
    Netkey index used for fast provisioning

uint8_t flags
    Flags used for fast provisioning

uint32_t iv_index
    IV Index used for fast provisioning
uint8_t offset
    Offset of the UUID to be compared

uint8_t match_len
    Length of the UUID to be compared

uint8_t match_val[16]
    Value of UUID to be compared

struct esp_ble_mesh_heartbeat_filter_info_t
    Context of Provisioner heartbeat filter information to be set

Public Members

uint16_t hb_src
    Heartbeat source address (unicast address)

uint16_t hb_dst
    Heartbeat destination address (unicast address or group address)

struct esp_ble_mesh_client_op_pair_t
    BLE Mesh client models related definitions.
    Client model Get/Set message opcode and corresponding Status message opcode

Public Members

uint32_t cli_op
    The client message opcode

uint32_t status_op
    The server status opcode corresponding to the client message opcode

struct esp_ble_mesh_client_t
    Client Model user data context.

Public Members

esp_ble_mesh_model_t *model
    Pointer to the client model. Initialized by the stack.

int op_pair_size
    Size of the op_pair

const esp_ble_mesh_client_op_pair_t *op_pair
    Table containing get/set message opcode and corresponding status message opcode

uint32_t publish_status
    Callback used to handle the received unsolicited message. Initialized by the stack.

void *internal_data
    Pointer to the internal data of client model

uint8_t msg_role
    Role of the device (Node/Provisioner) that is going to send messages

struct esp_ble_mesh_client_common_param_t
    Common parameters of the messages sent by Client Model.
Public Members

```c
esp_ble_mesh_opcode_t opcode
    Message opcode

esp_ble_mesh_model_t *model
    Pointer to the client model structure

esp_ble_mesh_msg_ctx_t ctx
    The context used to send message

int32_t msg_timeout
    Timeout value (ms) to get response to the sent message Note: if using default timeout value in menuconfig, make sure to set this value to 0

uint8_t msg_role
    Role of the device - Node/Provisioner
```

```c
struct esp_ble_mesh_state_transition_t
    Parameters of the server model state transition
```

Public Functions

```c
BLE_MESH_ATOMIC_DEFINE (flag, ESP_BLE_MESH_SERVER_FLAG_MAX)
    Flag used to indicate if the transition timer has been started internally.

    If the model which contains `esp_ble_mesh_state_transition_t` sets “set_auto_rsp” to ESP_BLE_MESH_SERVER_RSP_BY_APP, the handler of the timer shall be initialized by the users.

    And users can use this flag to indicate whether the timer is started or not.
```

Public Members

```c
bool just_started
    Indicate if the state transition has just started

uint8_t trans_time
    State transition time

uint8_t remain_time
    Remaining time of state transition

uint8_t delay
    Delay before starting state transition

uint32_t quo_tt
    Duration of each divided transition step

uint32_t counter
    Number of steps which the transition duration is divided

uint32_t total_duration
    State transition total duration

int64_t start_timestamp
    Time when the state transition is started
```

```c
struct k_delayed_work timer
    Timer used for state transition
```

```c
struct esp_ble_mesh_last_msg_info_t
    Parameters of the server model received last same set message.
```
Chapter 2. API Reference

Public Members

uint8_t _tid
Transaction number of the last message

uint16_t _src
Source address of the last message

uint16_t _dst
Destination address of the last message

int64_t _timestamp
Time when the last message is received

struct esp_ble_mesh_server_rsp_ctrl_t
Parameters of the Server Model response control

Public Members

uint8_t get_auto_rsp : 1
BLE Mesh Server Response Option.
1. If get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client
   Get messages need to be replied by the application;
2. If get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Get
   messages will be replied by the server models;
3. If set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client
   Set messages need to be replied by the application;
4. If set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Set
   messages will be replied by the server models;
5. If status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Server
   Status messages need to be replied by the application;
6. If status_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Server
   Status messages will be replied by the server models; Response control for Client Get messages

uint8_t set_auto_rsp : 1
Response control for Client Set messages

uint8_t status_auto_rsp : 1
Response control for Server Status messages

Macros

ESP_BLE_MESH_SDU_MAX_LEN
< The maximum length of a BLE Mesh message, including Opcode, Payload and TransMIC Length of a short
Mesh MIC.

ESP_BLE_MESH_MIC_SHORT
Length of a long Mesh MIC.

ESP_BLE_MESH_MIC_LONG
The maximum length of a BLE Mesh provisioned node name

ESP_BLE_MESH_NODE_NAME_MAX_LEN
The maximum length of a BLE Mesh unprovisioned device name

ESP_BLE_MESH_DEVICE_NAME_MAX_LEN
The maximum length of settings user id

ESP_BLE_MESH_SETTINGS_UID_SIZE
Invalid settings index

ESP_BLE_MESH_INVALID_SETTINGS_IDX
Define the BLE Mesh octet 16 bytes size
ESP_BLE_MESH_OCTET16_LEN
ESP_BLE_MESH_OCTET8_LEN

ESP_BLE_MESH_CID_NVAL
Special TTL value to request using configured default TTL

ESP_BLE_MESH_TTL_DEFAULT
Maximum allowed TTL value

ESP_BLE_MESH_TTL_MAX
ESP_BLE_MESH_ADDR_UNASSIGNED
ESP_BLE_MESH_ADDR_ALL_NODES
ESP_BLE_MESH_ADDR_PROXIES
ESP_BLE_MESH_ADDR_FRIENDS
ESP_BLE_MESH_ADDR_RELAYS
ESP_BLE_MESH_KEY_UNUSED
ESP_BLE_MESH_KEY_DEV
ESP_BLE_MESH_KEY_PRIMARY
ESP_BLE_MESH_KEY_ANY
Primary Network Key index

ESP_BLE_MESH_NET_PRIMARY
Relay state value

ESP_BLE_MESH_RELAY_DISABLED
ESP_BLE_MESH_RELAY_ENABLED
ESP_BLE_MESH_RELAY_NOT_SUPPORTED
Beacon state value

ESP_BLE_MESH_BEACON_DISABLED
ESP_BLE_MESH_BEACON_ENABLED
GATT Proxy state value

ESP_BLE_MESH_GATT_PROXY_DISABLED
ESP_BLE_MESH_GATT_PROXY_ENABLED
ESP_BLE_MESH_GATT_PROXY_NOT_SUPPORTED
Friend state value

ESP_BLE_MESH_FRIEND_DISABLED
ESP_BLE_MESH_FRIEND_ENABLED
ESP_BLE_MESH_FRIEND_NOT_SUPPORTED
Node identity state value

ESP_BLE_MESH_NODE_IDENTITY_STOPPED
ESP_BLE_MESH_NODE_IDENTITY_RUNNING
ESP_BLE_MESH_NODE_IDENTITY_NOT_SUPPORTED
Supported features

ESP_BLE_MESH_FEATURE_RELAY
ESP_BLE_MESH_FEATURE_PROXY
ESP_BLE_MESH_FEATURE_FRIEND
ESP_BLE_MESH_FEATURE_LOW_POWER
ESP_BLE_MESH_FEATURE_ALL_SUPPORTED
ESP_BLE_MESH_ADDR_IS_UNICAST(addr)
ESP_BLE_MESH_ADDR_IS_GROUP(addr)
ESP_BLE_MESH_ADDR_IS_VIRTUAL(addr)
ESP_BLE_MESH_ADDR_IS_RFU(addr)
ESP_BLE_MESH_INVALID_NODE_INDEX
ESP_BLE_MESH_TRANSMIT(count, int_ms)
    Encode transmission count & interval steps.
    Note For example, ESP_BLE_MESH_TRANSMIT(2, 20) means that the message will be sent about 90ms (count is 3, step is 1, interval is 30 ms which includes 10ms of advertising interval random delay).
    Return BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.
    Parameters
    • count: Number of retransmissions (first transmission is excluded).
    • int_ms: Interval steps in milliseconds. Must be greater than 0 and a multiple of 10.
ESP_BLE_MESH_GET_TRANSMIT_COUNT(transmit)
    Decode transmit count from a transmit value.
    Return Transmission count (actual transmissions equal to N + 1).
    Parameters
    • transmit: Encoded transmit count & interval value.
ESP_BLE_MESH_GET_TRANSMIT_INTERVAL(transmit)
    Decode transmit interval from a transmit value.
    Return Transmission interval in milliseconds.
    Parameters
    • transmit: Encoded transmit count & interval value.
ESP_BLE_MESH_PUBLISH_TRANSMIT(count, int_ms)
    Encode Publish Retransmit count & interval steps.
    Return BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.
    Parameters
    • count: Number of retransmissions (first transmission is excluded).
    • int_ms: Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.
ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_COUNT(transmit)
    Decode Publish Retransmit count from a given value.
    Return Retransmission count (actual transmissions equal to N + 1).
    Parameters
    • transmit: Encoded Publish Retransmit count & interval value.
ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_INTERVAL(transmit)
    Decode Publish Retransmit interval from a given value.
    Callbacks which are not needed to be initialized by users (set with 0 and will be initialized internally)
    Return Transmission interval in milliseconds.
    Parameters
    • transmit: Encoded Publish Retransmit count & interval value.
ESP_BLE_MESH_PROV_STATIC_OOB_MAX_LEN
    Maximum length of string used by Output OOB authentication
ESP_BLE_MESH_PROV_OUTPUT_OOB_MAX_LEN
    Maximum length of string used by Output OOB authentication
ESP_BLE_MESH_PROV_INPUT_OOB_MAX_LEN
    Macros used to define message opcode
ESP_BLE_MESH_MODEL_OP_1 (b0)
ESP_BLE_MESH_MODEL_OP_2 (b0, b1)
ESP_BLE_MESH_MODEL_OP_3 (b0, cid)

This macro is associated with BLE_MESH_MODEL_CB in mesh_access.h

ESP_BLE_MESH_MODEL_SIG_MODEL (_id, _op, _pub, _user_data)

This macro is associated with BLE_MESH_MODEL_VND_CB in mesh_access.h

ESP_BLE_MESH_VENDOR_MODEL (_company, _id, _op, _pub, _user_data)

ESP_BLE_MESH_ELEMENT (_loc, _mods, _vnd_mods)

Helper to define a BLE Mesh element within an array.

In case the element has no SIG or Vendor models, the helper macro ESP_BLE_MESH_MODEL_NONE can be given instead.

Note This macro is associated with BLE_MESH_ELEM in mesh_access.h

Parameters
  • _loc: Location Descriptor.
  • _mods: Array of SIG models.
  • _vnd_mods: Array of vendor models.

ESP_BLE_MESH_MODEL_PUB_DEFINE (_name, _msg_len, _role)

Define a model publication context.

Parameters
  • _name: Variable name given to the context.
  • _msg_len: Length of the publication message.
  • _role: Role of the device which contains the model.

ESP_BLE_MESH_MODEL_OP (_opcode, _min_len)

Define a model operation context.

Parameters
  • _opcode: Message opcode.
  • _min_len: Message minimum length.

ESP_BLE_MESH_MODEL_OP_END

Define the terminator for the model operation table. Each model operation struct array must use this terminator as the end tag of the operation unit.

ESP_BLE_MESH_MODEL_NONE

Helper to define an empty model array. This structure is associated with BLE_MESH_MODEL_NONE in mesh_access.h

ADD_DEV_RM_AFTER_PROV_FLAG

Device will be removed from queue after provisioned successfully

ADD_DEV_START_PROV_NOW_FLAG

Start provisioning device immediately

ADD_DEV_FLUSHABLE_DEV_FLAG

Device can be remove when queue is full and new device is going to added
DEL_DEV_ADDR_FLAG

Type Definitions
typedef uint8_t esp_ble_mesh_octet16_t [ESP_BLE_MESH_OCTET16_LEN]
  Define the BLE Mesh octet 8 bytes size
typedef uint8_t esp_ble_mesh_octet8_t [ESP_BLE_MESH_OCTET8_LEN]
  Invalid Company ID
typedef uint32_t esp_ble_mesh_dev_add_flag_t
typedef uint8_t esp_ble_mesh_model_t
typedef struct esp_ble_mesh_model
typedef uint8_t esp_ble_mesh_dev_add_flag_t
typedef uint32_t esp_ble_mesh_health_model_status_t
  BLE device address type.
typedef struct esp_ble_mesh_model esp_ble_mesh_model_t
typedef uint8_t esp_ble_mesh_dev_add_flag_t
typedef uint32_t esp_ble_mesh_opcode_config_client_get_t
  esp_ble_mesh_opcode_config_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to
  locate the opcodes used by esp_ble_mesh_config_client_get_state. The following opcodes will only be used in
  the esp_ble_mesh_config_client_get_state function.
typedef uint32_t esp_ble_mesh_opcode_config_client_set_t
  esp_ble_mesh_opcode_config_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to
  locate the opcodes used by esp_ble_mesh_config_client_set_state. The following opcodes will only be used in
  the esp_ble_mesh_config_client_set_state function.
typedef uint32_t esp_ble_mesh_opcode_config_status_t
  esp_ble_mesh_opcode_config_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate
  the opcodes used by the Config Model messages. The following opcodes are used by the BLE Mesh Config
  Server Model internally to respond to the Config Client Model’s request messages.
typedef uint8_t esp_ble_mesh_cfg_status_t
  This typedef is only used to indicate the status code contained in some of the Configuration Server Model status
  message.
typedef uint32_t esp_ble_mesh_opcode_health_client_get_t
  esp_ble_mesh_opcode_health_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to
  locate the opcodes used by esp_ble_mesh_health_client_get_state. The following opcodes will only be used in
  the esp_ble_mesh_health_client_get_state function.
typedef uint32_t esp_ble_mesh_opcode_health_client_set_t
  esp_ble_mesh_opcode_health_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to
  locate the opcodes used by esp_ble_mesh_health_client_set_state. The following opcodes will only be used in
  the esp_ble_mesh_health_client_set_state function.
typedef uint32_t esp_ble_mesh_health_model_status_t
  esp_ble_mesh_health_model_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate
the opcodes used by the Health Model messages. The following opcodes are used by the BLE Mesh Health Server Model internally to respond to the Health Client Model’s request messages.

```c
typedef uint32_t esp_ble_mesh_generic_message_opcode_t
esp_ble_mesh_generic_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_generic_client_get_state & esp_ble_mesh_generic_client_set_state. Generic OnOff Message Opcode
```

```c
typedef uint32_t esp_ble_mesh_sensor_message_opcode_t
esp_ble_mesh_sensor_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_sensor_client_get_state & esp_ble_mesh_sensor_client_set_state. Sensor Message Opcode
```

```c
typedef uint32_t esp_ble_mesh_time_scene_message_opcode_t
esp_ble_mesh_time_scene_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_time_scene_client_get_state & esp_ble_mesh_time_scene_client_set_state. Time Message Opcode
```

```c
typedef uint32_t esp_ble_mesh_light_message_opcode_t
esp_ble_mesh_light_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_light_client_get_state & esp_ble_mesh_light_client_set_state. Light Lightness Message Opcode
```

```c
typedef uint32_t esp_ble_mesh_opcode_t
End of defines of esp_ble_mesh_opcode_t
```

```c
typedef uint8_t esp_ble_mesh_model_status_t
This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.
```

### Enumerations

```c
enum esp_ble_mesh_cb_type_t
Values:

- ESP_BLE_MESH_TYPE_PROV_CB
- ESP_BLE_MESH_TYPE_OUTPUT_NUM_CB
- ESP_BLE_MESH_TYPE_OUTPUT_STR_CB
- ESP_BLE_MESH_TYPE_INPUT_CB
- ESP_BLE_MESH_TYPE_LINK_OPEN_CB
- ESP_BLE_MESH_TYPE_LINK_CLOSE_CB
- ESP_BLE_MESH_TYPE_COMPLETE_CB
- ESP_BLE_MESH_TYPE_RESET_CB
```

```c
enum esp_ble_mesh_oob_method_t
Values:

- ESP_BLE_MESH_NO_OOB
- ESP_BLE_MESH_STATIC_OOB
- ESP_BLE_MESH_OUTPUT_OOB
- ESP_BLE_MESH_INPUT_OOB
```

```c
enum esp_ble_mesh_output_action_t
Values:

- ESP_BLE_MESH_NO_OUTPUT = 0
- ESP_BLE_MESH_BLINK = BIT(0)
- ESP_BLE_MESH_BEEP = BIT(1)
```
ESP_BLE_MESH_VIBRATE = BIT(2)
ESP_BLE_MESH_DISPLAY_NUMBER = BIT(3)
ESP_BLE_MESH_DISPLAY_STRING = BIT(4)

enum esp_ble_mesh_input_action_t
Values:
ESP_BLE_MESH_NO_INPUT = 0
ESP_BLE_MESH_PUSH = BIT(0)
ESP_BLE_MESH_TWIST = BIT(1)
ESP_BLE_MESH_ENTER_NUMBER = BIT(2)
ESP_BLE_MESH_ENTER_STRING = BIT(3)

enum esp_ble_mesh_prov_bearer_t
Values:
ESP_BLE_MESH_PROV_ADV = BIT(0)
ESP_BLE_MESH_PROV_GATT = BIT(1)

enum esp_ble_mesh_prov_oob_info_t
Values:
ESP_BLE_MESH_PROV_OOB_OTHER = BIT(0)
ESP_BLE_MESH_PROV_OOB_URI = BIT(1)
ESP_BLE_MESH_PROV_OOB_2D_CODE = BIT(2)
ESP_BLE_MESH_PROV_OOB_BAR_CODE = BIT(3)
ESP_BLE_MESH_PROV_OOB_NFC = BIT(4)
ESP_BLE_MESH_PROV_OOB_NUMBER = BIT(5)
ESP_BLE_MESH_PROV_OOB_STRING = BIT(6)
ESP_BLE_MESH_PROV_OOB_ON_BOX = BIT(11)
ESP_BLE_MESH_PROV_OOB_IN_BOX = BIT(12)
ESP_BLE_MESH_PROV_OOB_ON_PAPER = BIT(13)
ESP_BLE_MESH_PROV_OOB_IN_MANUAL = BIT(14)
ESP_BLE_MESH_PROV_OOB_ON_DEV = BIT(15)

enum esp_ble_mesh_dev_role_t
Values:
ROLE_NODE = 0
ROLE_PROVISIONER
ROLE_FAST_PROV

enum esp_ble_mesh_fast_prov_action_t
Values:
FAST_PROV_ACT_NONE
FAST_PROV_ACT_ENTER
FAST_PROV_ACT_SUSPEND
FAST_PROV_ACT_EXIT
FAST_PROV_ACT_MAX
enum esp_ble_mesh_proxy_filter_type_t
    Values:
    PROXY_FILTER_WHITELIST
    PROXY_FILTER_BLACKLIST

enum esp_ble_mesh_prov_cb_event_t
    Values:
    ESP_BLE_MESH_PROV_REGISTER_COMP_EVT
        Initialize BLE Mesh provisioning capabilities and internal data information completion event
    ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT
        Set the unprovisioned device name completion event
    ESP_BLE_MESH_NODE_PROV_ENABLE_COMP_EVT
        Enable node provisioning functionality completion event
    ESP_BLE_MESH_NODE_PROV_DISABLE_COMP_EVT
        Disable node provisioning functionality completion event
    ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT
        Establish a BLE Mesh link event
    ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT
        Close a BLE Mesh link event
    ESP_BLE_MESH_NODE_PROV_OOB_PUB_KEY_EVT
        Generate Node input OOB public key event
    ESP_BLE_MESH_NODE_PROV_OUTPUT_NUMBER_EVT
        Generate Node Output Number event
    ESP_BLE_MESH_NODE_PROV_OUTPUT_STRING_EVT
        Generate Node Output String event
    ESP_BLE_MESH_NODE_PROV_INPUT_EVT
        Event requiring the user to input a number or string
    ESP_BLE_MESH_NODE_PROV_COMPLETE_EVT
        Provisioning done event
    ESP_BLE_MESH_NODE_PROV_RESET_EVT
        Provisioning reset event
    ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT
        Node set oob public key completion event
    ESP_BLE_MESH_NODE_PROV_INPUT_NUMBER_COMP_EVT
        Node input number completion event
    ESP_BLE_MESH_NODE_PROV_INPUT_STRING_COMP_EVT
        Node input string completion event
    ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT
        Enable BLE Mesh Proxy Identity advertising completion event
    ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT
        Enable BLE Mesh GATT Proxy Service completion event
    ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT
        Disable BLE Mesh GATT Proxy Service completion event
    ESP_BLE_MESH_NODE_ADD_LOCAL_NET_KEY_COMP_EVT
        Node add NetKey locally completion event
    ESP_BLE_MESH_NODE_ADD_LOCAL_APP_KEY_COMP_EVT
        Node add AppKey locally completion event
Chapter 2. API Reference

ESP_BLE_MESH_NODE_BIND_APP_KEY_TO_MODEL_COMP_EVT
   Node bind AppKey to model locally completion event

ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT
   Provisioner enable provisioning functionality completion event

ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT
   Provisioner disable provisioning functionality completion event

ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT
   Provisioner receives unprovisioned device beacon event

ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT
   Provisioner read unprovisioned device OOB public key event

ESP_BLE_MESH_PROVISIONER_PROV_INPUT_EVT
   Provisioner input value for provisioning procedure event

ESP_BLE_MESH_PROVISIONER_PROV_OUTPUT_EVT
   Provisioner output value for provisioning procedure event

ESP_BLE_MESH_PROVISIONER_PROV_LINK_OPEN_EVT
   Provisioner establish a BLE Mesh link event

ESP_BLE_MESH_PROVISIONER_PROV_LINK_CLOSE_EVT
   Provisioner close a BLE Mesh link event

ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT
   Provisioner provisioning done event

ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT
   Provisioner add a device to the list which contains devices that are waiting/going to be provisioned completion event

ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT
   Provisioner start to provision an unprovisioned device completion event

ESP_BLE_MESH_PROVISIONER_DELETE_DEV_COMP_EVT
   Provisioner delete a device from the list, close provisioning link with the device completion event

ESP_BLE_MESH_PROVISIONER_SET_DEV_UUID_ADDR_COMP_EVT
   Provisioner set the value to be compared with part of the unprovisioned device UUID completion event

ESP_BLE_MESH_PROVISIONER_SET_PROV_DATA_INFO_COMP_EVT
   Provisioner set net_idx/flags/iv_index used for provisioning completion event

ESP_BLE_MESH_PROVISIONER_SET_STATIC_OOB_VALUE_COMP_EVT
   Provisioner set static oob value used for provisioning completion event

ESP_BLE_MESH_PROVISIONER_SET_PRIMARY_ELEM_ADDR_COMP_EVT
   Provisioner set unicast address of primary element completion event

ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT
   Provisioner read unprovisioned device OOB public key completion event

ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT
   Provisioner input number completion event

ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT
   Provisioner input string completion event

ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT
   Provisioner set node name completion event

ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT
   Provisioner add local app key completion event

ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT
   Provisioner update local app key completion event
Chapter 2. API Reference

ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT
Provisioner bind local model with local app key completion event

ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT
Provisioner add local network key completion event

ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT
Provisioner update local network key completion event

ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT
Provisioner store node composition data completion event

ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT
Provisioner delete node with uuid completion event

ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT
Provisioner delete node with unicast address completion event

ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT
Provisioner start to receive heartbeat message completion event

ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT
Provisioner set the heartbeat filter type completion event

ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT
Provisioner set the heartbeat filter information completion event

ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT
Provisioner receive heartbeat message event

ESP_BLE_MESH_PROVISIONER_DIRECT_ERASE_SETTINGS_COMP_EVT
Provisioner directly erase settings completion event

ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT
Provisioner open settings with index completion event

ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT
Provisioner open settings with user id completion event

ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT
Provisioner close settings with index completion event

ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT
Provisioner close settings with user id completion event

ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT
Provisioner delete settings with index completion event

ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT
Provisioner delete settings with user id completion event

ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT
Set fast provisioning information (e.g. unicast address range, net_idx, etc.) completion event

ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT
Set fast provisioning action completion event

ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT
Receive Heartbeat message event

ESP_BLE_MESH_LPN_ENABLE_COMP_EVT
Enable Low Power Node completion event

ESP_BLE_MESH_LPN_DISABLE_COMP_EVT
Disable Low Power Node completion event

ESP_BLE_MESH_LPN_POLL_COMP_EVT
Low Power Node send Friend Poll completion event
Chapter 2. API Reference

ESP_BLE_MESH_LPN_FRIENDSHIP_ESTABLISH_EVT
Low Power Node establishes friendship event

ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT
Low Power Node terminates friendship event

ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT
Friend Node establishes friendship event

ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT
Friend Node terminates friendship event

ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT
Proxy Client receives Network ID advertising packet event

ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT
Proxy Client establishes connection successfully event

ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT
Proxy Client terminates connection successfully event

ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT
Proxy Client receives Proxy Filter Status event

ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT
Proxy Client connect completion event

ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT
Proxy Client disconnect completion event

ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT
Proxy Client set filter type completion event

ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT
Proxy Client add filter address completion event

ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT
Proxy Client remove filter address completion event

ESP_BLE_MESH_MODEL_SUBSCRIBE_GROUP_ADDR_COMP_EVT
Local model subscribes group address completion event

ESP_BLE_MESH_MODEL_UNSUBSCRIBE_GROUP_ADDR_COMP_EVT
Local model unsubscribes group address completion event

ESP_BLE_MESH_DEINIT_MESH_COMP_EVT
De-initialize BLE Mesh stack completion event

ESP_BLE_MESH_PROV_EVT_MAX

enum [anonymous]
BLE Mesh server models related definitions.
This enum value is the flag of transition timer operation

Values:

ESP_BLE_MESH_SERVER_TRANS_TIMER_START

ESP_BLE_MESH_SERVER_FLAG_MAX

enum esp_ble_mesh_server_state_type_t
This enum value is the type of server model states

Values:

ESP_BLE_MESH_GENERIC_ONOFF_STATE
ESP_BLE_MESH GENERIC LEVEL STATE
ESP_BLE_MESH GENERIC ONPOWERUP_STATE
ESP_BLE_MESH_GENERIC_POWER_ACTUAL_STATE
ESP_BLE_MESH_LIGHT_LIGHTNESS_ACTUAL_STATE
ESP_BLE_MESH_LIGHT_LIGHTNESS_LINEAR_STATE
ESP_BLE_MESH_LIGHT_CTL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_CTL_TEMP_DELTA_UV_STATE
ESP_BLE_MESH_LIGHT_HSL_STATE
ESP_BLE_MESH_LIGHT_HSL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_HSL_HUE_STATE
ESP_BLE_MESH_LIGHT_HSL_SATURATION_STATE
ESP_BLE_MESH_LIGHT_XYL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_XYL_XY_STATE
ESP_BLE_MESH_LIGHT_XYL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_XYL_XY_STATE
ESP_BLE_MESH_SERVER_MODEL_STATE_MAX

enum esp_ble_mesh_model_cb_event_t

Values:

ESP_BLE_MESH_MODEL_OPERATION_EVT
  User-defined models receive messages from peer devices (e.g. get, set, status, etc) event

ESP_BLE_MESH_MODEL_SEND_COMP_EVT
  User-defined models send messages completion event

ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT
  User-defined models publish messages completion event

ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT
  User-defined client models receive publish messages event

ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT
  Timeout event for the user-defined client models that failed to receive response from peer server models

ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT
  When a model is configured to publish messages periodically, this event will occur during every publish period

ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT
  Server models update state value completion event

ESP_BLE_MESH_MODEL_EVT_MAX

ESP-BLE-MESH Core API Reference

This section contains ESP-BLE-MESH Core related APIs, which can be used to initialize ESP-BLE-MESH stack, provision, send/publish messages, etc.

This API reference covers six components:

- ESP-BLE-MESH Stack Initialization
- Reading of Local Data Information
- Low Power Operation (Updating)
- Send/Publish Messages, add Local AppKey, etc.
- ESP-BLE-MESH Node/Provisioner Provisioning
- ESP-BLE-MESH GATT Proxy Server

ESP-BLE-MESH Stack Initialization
Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_common_api.h

Functions

`esp_err_t esp_ble_mesh_init(esp_ble_mesh_prov_t *prov, esp_ble_mesh_comp_t *comp)`
Initialize BLE Mesh module. This API initializes provisioning capabilities and composition data information.

**Note** After calling this API, the device needs to call `esp_ble_mesh_prov_enable()` to enable provisioning functionality again.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] `prov`: Pointer to the device provisioning capabilities. This pointer must remain valid during the lifetime of the BLE Mesh device.
- [in] `comp`: Pointer to the device composition data information. This pointer must remain valid during the lifetime of the BLE Mesh device.

`esp_err_t esp_ble_mesh_deinit(esp_ble_mesh_deinit_param_t *param)`
De-initialize BLE Mesh module.

**Note** This function shall be invoked after `esp_ble_mesh_client_model_deinit()`.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

Reading of Local Data Information

Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_local_data_operation_api.h

Functions

`int32_t esp_ble_mesh_get_model_publish_period(esp_mesh_model_t *model)`
Get the model publish period, the unit is ms.

**Return** Publish period value on success, 0 or (negative) error code from `errno.h` on failure.

**Parameters**

`uint16_t esp_ble_mesh_get_primary_element_address(void)`
Get the address of the primary element.

**Return** Address of the primary element on success, or ESP_BLE_MESH_ADDR_UNASSIGNED on failure which means the device has not been provisioned.

`uint16_t *esp_ble_mesh_is_model_subscribed_to_group(esp_mesh_model_t *model, uint16_t group_addr)`
Check if the model has subscribed to the given group address. Note: E.g., once a status message is received and the destination address is a group address, the model uses this API to check if it is successfully subscribed to the given group address.

**Return** Pointer to the group address within the Subscription List of the model on success, or NULL on failure which means the model has not subscribed to the given group address. Note: With the pointer to the group address returned, you can reset the group address to 0x0000 in order to unsubscribe the model from the group.

**Parameters**

- [in] `model`: Pointer to the model.
- [in] `group_addr`: Group address.

`esp_ble_mesh_elem_t *esp_ble_mesh_find_element(uint16_t element_addr)`
Find the BLE Mesh element pointer via the element address.
**Return** Pointer to the element on success, or NULL on failure.

**Parameters**
- `[in]` `element_addr`: Element address.

uint8_t `esp_ble_mesh_get_element_count` (void)
Get the number of elements that have been registered.

**Return** Number of elements.

```c
esp_ble_mesh_model_t *esp_ble_mesh_find_vendor_model(const esp_ble_mesh_elem_t *element, uint16_t company_id, uint16_t model_id);
```
Find the Vendor specific model with the given element, the company ID and the Vendor Model ID.

**Return** Pointer to the Vendor Model on success, or NULL on failure which means the Vendor Model is not found.

**Parameters**
- `[in]` `element`: Element to which the model belongs.
- `[in]` `company_id`: A 16-bit company identifier assigned by the Bluetooth SIG.

```c
esp_ble_mesh_model_t *esp_ble_mesh_find_sig_model(const esp_ble_mesh_elem_t *element, uint16_t model_id);
```
Find the SIG model with the given element and Model id.

**Return** Pointer to the SIG Model on success, or NULL on failure which means the SIG Model is not found.

**Parameters**
- `[in]` `element`: Element to which the model belongs.

```c
const esp_ble_mesh_comp_t *esp_ble_mesh_get_composition_data(void)
```
Get the Composition data which has been registered.

**Return** Pointer to the Composition data on success, or NULL on failure which means the Composition data is not initialized.

```c
esp_err_t esp_ble_mesh_model_subscribe_group_addr(uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr);
```
A local model of node or Provisioner subscribes a group address.

**Note** This function shall not be invoked before node is provisioned or Provisioner is enabled.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `[in]` `element_addr`: Unicast address of the element to which the model belongs.
- `[in]` `group_addr`: The group address to be subscribed.

```c
esp_err_t esp_ble_mesh_model_unsubscribe_group_addr(uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr);
```
A local model of node or Provisioner unsubscribes a group address.

**Note** This function shall not be invoked before node is provisioned or Provisioner is enabled.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `[in]` `element_addr`: Unicast address of the element to which the model belongs.
- `[in]` `group_addr`: The subscribed group address.

```c
const uint8_t *esp_ble_mesh_node_get_local_net_key(uint16_t net_idx);
```
This function is called by Node to get the local NetKey.

**Return** NetKey on success, or NULL on failure.
Parameters

• [in] net_idx: NetKey index.

const uint8_t *esp_ble_mesh_node_get_local_app_key (uint16_t app_idx)

This function is called by Node to get the local AppKey.

Return  AppKey on success, or NULL on failure.

Parameters

• [in] app_idx: AppKey index.

esp_err_t esp_ble_mesh_node_add_local_net_key (const uint8_t net_key[16], uint16_t net_idx)

This function is called by Node to add a local NetKey.

Note  This function can only be called after the device is provisioned.

Return  ESP_OK on success or error code otherwise.

Parameters

• [in] net_key: NetKey to be added.
• [in] net_idx: NetKey Index.

esp_err_t esp_ble_mesh_node_add_local_app_key (const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)

This function is called by Node to add a local AppKey.

Note  The net_idx must be an existing one. This function can only be called after the device is provisioned.

Return  ESP_OK on success or error code otherwise.

Parameters

• [in] app_key: AppKey to be added.
• [in] net_idx: NetKey Index.
• [in] app_idx: AppKey Index.

esp_err_t esp_ble_mesh_node_bind_app_key_to_local_model (uint16_t element_addr,
                                                  uint16_t company_id,
                                                  uint16_t model_id,
                                                  uint16_t app_idx)

This function is called by Node to bind AppKey to model locally.

Note  If going to bind app_key with local vendor model, the company_id shall be set to 0xFFFF. This function can only be called after the device is provisioned.

Return  ESP_OK on success or error code otherwise.

Parameters

• [in] element_addr: Node local element address
• [in] company_id: Node local company id
• [in] model_id: Node local model id
• [in] app_idx: Node local appkey index

Low Power Operation (Updating)

Header File

• components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_low_power_api.h

Functions

esp_err_t esp_ble_mesh_lpn_enable (void)

Enable BLE Mesh device LPN functionality.

Note  This API enables LPN functionality. Once called, the proper Friend Request will be sent.

Return  ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_lpn_disable (bool force)

Disable BLE Mesh device LPN functionality.

Return  ESP_OK on success or error code otherwise.
Chapter 2. API Reference

Parameters

- **[in]** *force*: when disabling LPN functionality, use this flag to indicate whether directly clear corresponding information or just send friend clear to disable it if friendship has already been established.

```c
esp_err_t esp_ble_mesh_lpn_poll (void)
```
LPN tries to poll messages from the Friend Node.

**Note** The Friend Poll message is sent by a Low Power node to ask the Friend node to send a message that it has stored for the Low Power node. Users can call this API to send Friend Poll message manually. If this API is not invoked, the bottom layer of the Low Power node will send Friend Poll before the PollTimeout timer expires. If the corresponding Friend Update is received and MD is set to 0, which means there are no messages for the Low Power node, then the Low Power node will stop scanning.

**Return** ESP_OK on success or error code otherwise.

Send/Publish Messages, add Local AppKey, etc.

Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_networking_api.h

Functions

```c
esp_err_t esp_ble_mesh_register_custom_model_callback (esp_ble_mesh_model_cb_t *callback)
```
Register BLE Mesh callback for user-defined models’ operations. This callback can report the following events generated for the user-defined models:

- Call back the messages received by user-defined client and server models to the application layer;
- If users call esp_ble_mesh_server/client_model_send, this callback notifies the application layer of the send_complete event;
- If user-defined client model sends a message that requires response, and the response message is received after the timer expires, the response message will be reported to the application layer as published by a peer device;
- If the user-defined client model fails to receive the response message during a specified period of time, a timeout event will be reported to the application layer.

**Note** The client models (i.e. Config Client model, Health Client model, Generic Client models, Sensor Client model, Scene Client model and Lighting Client models) that have been realized internally have their specific register functions. For example, esp_ble_mesh_register_config_client_callback is the register function for Config Client Model.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** *callback*: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_model_msg_opcode_init (uint8_t *data, uint32_t opcode)
```
Add the message opcode to the beginning of the model message before sending or publishing the model message.

**Note** This API is only used to set the opcode of the message.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** *data*: Pointer to the message data.
- **[in]** *opcode*: The message opcode.

```c
esp_err_t esp_ble_mesh_client_model_init (esp_ble_mesh_model_t *model)
```
Initialize the user-defined client model. All user-defined client models shall call this function to initialize the client model internal data. Node: Before calling this API, the op_pair_size and op_pair variabled within the user_data(defined using esp_ble_mesh_client_t) of the client model need to be initialized.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

---

Submit Document Feedback
• [in] model: BLE Mesh Client model to which the message belongs.

```
esp_err_t esp_ble_mesh_client_model_deinit(esp_ble_mesh_model_t *model)
```
De-initialize the user-defined client model.

**Note** This function shall be invoked before esp_ble_mesh_deinit() is called.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

```
esp_err_t esp_ble_mesh_server_model_send_msg(esp_ble_mesh_model_t *model,
                                          esp_ble_mesh_msg_ctx_t *ctx,
                                          uint32_t opcode, uint16_t length, uint8_t *data)
```
Send server model messages (such as server model status messages).

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] model: BLE Mesh Server Model to which the message belongs.
- [in] ctx: Message context, includes keys, TTL, etc.
- [in] length: Message length (exclude the message opcode).
- [in] data: Parameters of Access Payload (exclude the message opcode) to be sent.

```
esp_err_t esp_ble_mesh_client_model_send_msg(esp_ble_mesh_model_t *model,
                                          esp_ble_mesh_msg_ctx_t *ctx,
                                          uint32_t opcode, uint16_t length, uint8_t *data,
                                          int32_t msg_timeout, bool need_rsp,
                                          esp_ble_mesh_dev_role_t device_role)
```
Send client model message (such as model get, set, etc).

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] model: BLE Mesh Client Model to which the message belongs.
- [in] ctx: Message context, includes keys, TTL, etc.
- [in] length: Message length (exclude the message opcode).
- [in] data: Parameters of the Access Payload (exclude the message opcode) to be sent.
- [in] msg_timeout: Time to get response to the message (in milliseconds).
- [in] need_rsp: TRUE if the opcode requires the peer device to reply, FALSE otherwise.
- [in] device_role: Role of the device (Node/Provisioner) that sends the message.

```
esp_err_t esp_ble_mesh_model_publish(esp_ble_mesh_model_t *model, uint32_t opcode, uint16_t length, uint8_t *data,
                                     esp_ble_mesh_dev_role_t device_role)
```
Send a model publication message.

**Note** Before calling this function, the user needs to ensure that the model publication message (esp_ble_mesh_model_pub_t::msg) contains a valid message to be sent. And if users want to update the publishing message, this API should be called in ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT with the message updated.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] length: Message length (exclude the message opcode).
- [in] data: Parameters of the Access Payload (exclude the message opcode) to be sent.
- [in] device_role: Role of the device (node/provisioner) publishing the message of the type esp_ble_mesh_dev_role_t.

```
esp_err_t esp_ble_mesh_server_model_update_state(esp_ble_mesh_model_t *model,
                                               esp_ble_mesh_server_state_type_t type,
                                               esp_ble_mesh_server_state_value_t *value)
```

Chapter 2. API Reference

Update a server model state value. If the model publication state is set properly (e.g. publish address is set to a valid address), it will publish corresponding status message.

Note Currently this API is used to update bound state value, not for all server model states.

Return ESP_OK on success or error code otherwise.

Parameters

- **[in] model**: Server model which is going to update the state.
- **[in] type**: Server model state type.
- **[in] value**: Server model state value.

```c
esp_err_t esp_ble_mesh_node_local_reset (void)
```

Reset the provisioning procedure of the local BLE Mesh node.

Note All provisioning information in this node will be deleted and the node needs to be reprovisioned. The API function esp_ble_mesh_node_prov_enable() needs to be called to start a new provisioning procedure.

Return ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_set_node_name (uint16_t index, const char *name)
```

This function is called to set the node (provisioned device) name.

Note index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

Return ESP_OK on success or error code otherwise.

Parameters

- **[in] index**: Index of the node in the node queue.
- **[in] name**: Name (end by ‘\0’) to be set for the node.

```c
const char *esp_ble_mesh_provisioner_get_node_name (uint16_t index)
```

This function is called to get the node (provisioned device) name.

Note index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

Return Node name on success, or NULL on failure.

Parameters

- **[in] index**: Index of the node in the node queue.

```c
uint16_t esp_ble_mesh_provisioner_get_node_index (const char *name)
```

This function is called to get the node (provisioned device) index.

Return Node index on success, or an invalid value (0xFFFF) on failure.

Parameters

- **[in] name**: Name of the node (end by ‘\0’).

```c
esp_err_t esp_ble_mesh_provisioner_store_node_comp_data (uint16_t unicast_addr, uint8_t *data, uint16_t length)
```

This function is called to store the Composition Data of the node.

Return ESP_OK on success or error code otherwise.

Parameters

- **[in] unicast_addr**: Element address of the node
- **[in] data**: Pointer of Composition Data
- **[in] length**: Length of Composition Data

```c
esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_uuid (const uint8_t uuid[16])
```

This function is called to get the provisioned node information with the node device uuid.

Return Pointer of the node info struct or NULL on failure.

Parameters

- **[in] uuid**: Device UUID of the node

```c
esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_addr (uint16_t unicast_addr)
```

This function is called to get the provisioned node information with the node unicast address.

Return Pointer of the node info struct or NULL on failure.

Parameters
Chapter 2. API Reference

• [in] unicast_addr: Unicast address of the node

```c
const esp_ble.mesh_node_t *esp_ble.mesh.provisioner.get_node_with_name(const char *name)
```

This function is called to get the provisioned node information with the node name.

**Parameters**

• [in] name: Name of the node (end by ‘\0’).

```c
uint16_t esp_ble.mesh.provisioner.get_prov_node_count()
```

This function is called by Provisioner to get provisioned node count.

**Return**

Number of the provisioned nodes.

```c
const esp_ble.mesh_node_t **esp_ble.mesh.provisioner.get_node_table_entry()
```

This function is called by Provisioner to get the entry of the node table.

**Note**

After invoking the function to get the entry of nodes, users can use the “for” loop combined with the macro CONFIG_BLE_MESH_MAX_prov_NODES to get each node’s information. Before trying to read the node’s information, users need to check if the node exists, i.e. if the *(esp_ble.mesh.node_t **node) is NULL. For example:

```c
const esp_ble.mesh.node_t **entry = esp_ble.mesh.provisioner.get_node_table_entry(); for (int i = 0; i < CONFIG_BLE_MESH_MAX_PROV_NODES; i++) { const esp_ble.mesh.node_t *node = entry[i]; if (node) { …… } }
```

**Return**

Pointer to the start of the node table.

```c
esp_err_t esp_ble.mesh.provisioner.delete_node_with_uuid(const uint8_t uuid[16])
```

This function is called to delete the provisioned node information with the node device uuid.

**Parameters**

• [in] uuid: Device UUID of the node

```c
esp_err_t esp_ble.mesh.provisioner.delete_node_with_addr(uint16_t unicast_addr)
```

This function is called to delete the provisioned node information with the node unicast address.

**Return**

ESP_OK on success or error code otherwise.

**Parameters**

• [in] unicast_addr: Unicast address of the node

```c
esp_err_t esp_ble.mesh.provisioner.add_local_app_key(const uint8_t app_key[16],
                                                  uint16_t net_idx, uint16_t app_idx)
```

This function is called to add a local AppKey for Provisioner.

**Note**

app_key: If set to NULL, app_key will be generated internally.

net_idx: Should be an existing one.

app_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new app_idx will be reported via an event.

**Return**

ESP_OK on success or error code otherwise.

**Parameters**

• [in] app_key: The app key to be set for the local BLE Mesh stack.

• [in] net_idx: The network key index.

• [in] app_idx: The key index.

```c
esp_err_t esp_ble.mesh.provisioner.update_local_app_key(const uint8_t app_key[16],
                                                       uint16_t net_idx, uint16_t app_idx)
```

This function is used to update a local AppKey for Provisioner.

**Return**

ESP_OK on success or error code otherwise.

**Parameters**

• [in] app_key: Value of the AppKey.

• [in] net_idx: Corresponding NetKey Index.

• [in] app_idx: The AppKey Index
const uint8_t* esp_ble_mesh_provisioner_get_local_app_key (uint16_t net_idx, uint16_t app_idx)

This function is called by Provisioner to get the local app key value.

Return App key on success, or NULL on failure.

Parameters
  • [in] app_idx: Application key index.

esp_err_t esp_ble_mesh_provisioner_bind_app_key_to_local_model (uint16_t element_addr, uint16_t app_idx, uint16_t model_id, uint16_t company_id)

This function is called by Provisioner to bind own model with proper app key.

Note company_id: If going to bind app_key with local vendor model, company_id should be set to 0xFFFF.

Return ESP_OK on success or error code otherwise.

Parameters
  • [in] element_addr: Provisioner local element address
  • [in] app_idx: Provisioner local app key index
  • [in] model_id: Provisioner local model id
  • [in] company_id: Provisioner local company id

esp_err_t esp_ble_mesh_provisioner_add_local_net_key (const uint8_t net_key[16], uint16_t net_idx)

This function is called by Provisioner to add local network key.

Note net_key: If set to NULL, net_key will be generated internally. net_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new net_idx will be reported via an event.

Return ESP_OK on success or error code otherwise.

Parameters
  • [in] net_key: The network key to be added to the Provisioner local BLE Mesh stack.
  • [in] net_idx: The network key index.

esp_err_t esp_ble_mesh_provisioner_update_local_net_key (const uint8_t net_key[16], uint16_t net_idx)

This function is called by Provisioner to update a local network key.

Return ESP_OK on success or error code otherwise.

Parameters
  • [in] net_key: Value of the NetKey.
  • [in] net_idx: The NetKey Index.

const uint8_t* esp_ble_mesh_provisioner_get_local_net_key (uint16_t net_idx)

This function is called by Provisioner to get the local network key value.

Return Network key on success, or NULL on failure.

Parameters

esp_err_t esp_ble_mesh_provisioner_recv_heartbeat (bool enable)

This function is called by Provisioner to enable or disable receiving heartbeat messages.

Note If enabling receiving heartbeat message successfully, the filter will be an empty reject list by default, which means all heartbeat messages received by the Provisioner will be reported to the application layer.

Return ESP_OK on success or error code otherwise.

Parameters
  • [in] enable: Enable or disable receiving heartbeat messages.

esp_err_t esp_ble_mesh_provisioner_set_heartbeat_filter_type (uint8_t type)

This function is called by Provisioner to set the heartbeat filter type.
Note 1. If the filter type is not the same with the current value, then all the filter entries will be cleaned.

1. If the previous type is rejectlist, and changed to acceptlist, then the filter will be an empty acceptlist, which means no heartbeat messages will be reported. Users need to add SRC or DST into the filter entry, then heartbeat messages from the SRC or to the DST will be reported.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] type: Heartbeat filter type (acceptlist or rejectlist).

```c
esp_err_t esp_ble_mesh_provisioner_set_heartbeat_filter_info (uint8_t op,
                          esp_ble_mesh_heartbeat_filter_info_t *info)
```

This function is called by Provisioner to add or remove a heartbeat filter entry.

1. If the operation is “REMOVE”, the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.
   - The filter entry with the same SRC or DST will be removed.

Note 1. If the operation is “ADD”, the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.
   - If only one of them is set, the filter entry will only use the configured SRC or DST to filter heartbeat messages.
   - If both of them are set, the SRC and DST will both be used to decide if a heartbeat message will be handled.
   - If SRC or DST already exists in some filter entry, then the corresponding entry will be cleaned firstly, then a new entry will be allocated to store the information.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] op: Add or REMOVE
- [in] info: Heartbeat filter entry information, including: hb_src - Heartbeat source address; hb_dst - Heartbeat destination address;

```c
esp_err_t esp_ble_mesh_provisioner_direct_erase_settings (void)
```

This function is called by Provisioner to directly erase the mesh information from nvs namespace.

Note This function can be invoked when the mesh stack is not initialized or has been de-initialized.

Return ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_open_settings_with_index (uint8_t index)
```

This function is called by Provisioner to open a nvs namespace for storing mesh information.

Note Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] index: Settings index.

```c
esp_err_t esp_ble_mesh_provisioner_open_settings_with_uid (const char *uid)
```

This function is called by Provisioner to open a nvs namespace for storing mesh information.

Note Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] uid: Settings user id.

```c
esp_err_t esp_ble_mesh_provisioner_close_settings_with_index (uint8_t index, bool erase)
```

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

Note 1. Before closing the nvs namespace, it must be open.

1. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey,
nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.

2. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.

3. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) ……

Return ESP_OK on success or error code otherwise.

Parameters

• [in] index: Settings index.
• [in] erase: Indicate if erasing mesh information.

**esp_err_t esp_ble_mesh_provisioner_close_settings_with_uid(const char *uid, bool erase)**

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

Note 1. Before closing the nvs namespace, it must be open.
1. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.
2. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
3. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) ……

Return ESP_OK on success or error code otherwise.

Parameters

• [in] uid: Settings user id.
• [in] erase: Indicate if erasing mesh information.

**esp_err_t esp_ble_mesh_provisioner_delete_settings_with_index(uint8_t index)**

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

Note When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] index: Settings index.

**esp_err_t esp_ble_mesh_provisioner_delete_settings_with_uid(const char *uid)**

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

Note When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] uid: Settings user id.

**const char *esp_ble_mesh_provisioner_get_settings_uid(uint8_t index)**

This function is called by Provisioner to get settings user id.

Return Setting user id on success or NULL on failure.

Parameters

• [in] index: Settings index.

**uint8_t esp_ble_mesh_provisioner_get_settings_index(const char *uid)**

This function is called by Provisioner to get settings index.

Return Settings index.

Parameters

• [in] uid: Settings user id.
uint8_t esp_ble_mesh_provisioner_get_free_settings_count (void)

This function is called by Provisioner to get the number of free settings user id.

Return Number of free settings user id.

const uint8_t *esp_ble_mesh_get_fast_prov_app_key (uint16_t net_idx, uint16_t app_idx)

This function is called to get fast provisioning application key.

Return Application key on success, or NULL on failure.

Parameters
• [in] app_idx: Application key index.

Type Definitions
typedef void (*esp_ble_mesh_model_cb_t) (esp_ble_mesh_model_cb_event_t event, esp_ble_mesh_model_cb_param_t *param)

: event, event code of user-defined model events; param, parameters of user-defined model events

ESP-BLE-MESH Node/Provisioner Provisioning

Header File
• components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_provisioning_api.h

Functions
esp_err_t esp_ble_mesh_node_prov_enable (esp_ble_mesh_prov_bearer_t bearers)

Enable specific provisioning bearers to get the device ready for provisioning.

Note PB-ADV: send unprovisioned device beacon. PB-GATT: send connectable advertising packets.

Return ESP_OK on success or error code otherwise.

Parameters
• bearers: Bit-wise OR of provisioning bearers.

esp_err_t esp_ble_mesh_node_prov_disable (esp_ble_mesh_prov_bearer_t bearers)

Disable specific provisioning bearers to make a device inaccessible for provisioning.

Return ESP_OK on success or error code otherwise.

Parameters
• bearers: Bit-wise OR of provisioning bearers.

esp_err_t esp_ble_mesh_node_set_oob_pub_key (uint8_t pub_key_x[32], uint8_t pub_key_y[32], uint8_t private_key[32])

Unprovisioned device set own oob public key & private key pair.

Note In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys. So as an unprovisioned device, it should use this function to input the Public Key exchanged through the out-of-band mechanism.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] pub_key_x: Unprovisioned device’s Public Key X
Chapter 2. API Reference

- [in] pub_key_y: Unprovisioned device’s Public Key Y
- [in] private_key: Unprovisioned device’s Private Key

esp_err_t esp_ble_mesh_node_input_number(uint32_t number)

Provide provisioning input OOB number.

Note This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_NUMBER as the action.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] number: Number input by device.

esp_err_t esp_ble_mesh_node_input_string(const char *string)

Provide provisioning input OOB string.

Note This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_STRING as the action.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] string: String input by device.

esp_err_t esp_ble_mesh_set_unprovisioned_device_name(const char *name)

Using this function, an unprovisioned device can set its own device name, which will be broadcasted in its advertising data.

Note This API applicable to PB-GATT mode only by setting the name to the scan response data, it doesn’t apply to PB-ADV mode.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] name: Unprovisioned device name

esp_err_t esp_ble_mesh_provisioner_read_oob_pub_key(uint8_t link_idx, uint8_t pub_key_x[32], uint8_t pub_key_y[32])

Provisioner inputs unprovisioned device’s oob public key.

Note In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] link_idx: The provisioning link index
- [in] pub_key_x: Unprovisioned device’s Public Key X
- [in] pub_key_y: Unprovisioned device’s Public Key Y

esp_err_t esp_ble_mesh_provisioner_input_string(const char *string, uint8_t link_idx)

Provide provisioning input OOB string.

This is intended to be called after the esp_ble_mesh_prov_t prov__input_num callback has been called with ESP_BLE_MESH_ENTER_STRING as the action.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] string: String input by Provisioner.
- [in] link_idx: The provisioning link index.

esp_err_t esp_ble_mesh_provisioner_input_number(uint32_t number, uint8_t link_idx)

Provide provisioning input OOB number.

This is intended to be called after the esp_ble_mesh_prov_t prov__input_num callback has been called with ESP_BLE_MESH_ENTER_NUMBER as the action.
Return ESP_OK on success or error code otherwise.

Parameters
- [in] number: Number input by Provisioner.
- [in] link_idx: The provisioning link index.

esp_err_t esp_ble_mesh_provisioner_prov_enable(esp_ble_mesh_prov_bearer_t bearers)
Enable one or more provisioning bearers.

Note PB-ADV: Enable BLE scan. PB-GATT: Initialize corresponding BLE Mesh Proxy info.
Return ESP_OK on success or error code otherwise.

Parameters

esp_err_t esp_ble_mesh_provisioner_prov_disable(esp_ble_mesh_prov_bearer_t bearers)
Disable one or more provisioning bearers.

Note PB-ADV: Disable BLE scan. PB-GATT: Break any existing BLE Mesh Provisioning connections.
Return ESP_OK on success or error code otherwise.

Parameters

esp_err_t esp_ble_mesh_provisioner_add_unprov_dev(esp_ble_mesh_unprov_dev_add_t *add_dev,
                                                       esp_ble_mesh_add_flag_t flags)
Add unprovisioned device info to the unprov_dev queue.

Return ESP_OK on success or error code otherwise.

Note: 1. Currently address type only supports public address and static random address.
   1. If device UUID and/or device address as well as address type already exist in the device queue, but
the bearer is different from the existing one, add operation will also be successful and it will update
the provision bearer supported by the device.
   2. For example, if the Provisioner wants to add an unprovisioned device info before receiving its un-
provisioned device beacon or Mesh Provisioning advertising packets, the Provisioner can use this
API to add the device info with each one or both of device UUID and device address added. When
the Provisioner gets the device’ s advertising packets, it will start provisioning the device internally.
   • In this situation, the Provisioner can set bearers with each one or both of
     ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled, and
cannot set flags with ADD_DEV_START_PROV_NOW_FLAG enabled.
   3. Another example is when the Provisioner receives the unprovisioned device’ s beacon or Mesh
Provisioning advertising packets, the advertising packets will be reported on to the application layer
using the callback registered by the function esp_ble_mesh_register_prov_callback. And in the call-
back, the Provisioner can call this API to start provisioning the device.
   • If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device
address can be added, bearers shall be set with ESP_BLE_MESH_PROV_ADV enabled and
the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
   • If the Provisioner uses PB-GATT to provision, both the device UUID and device address need
to be added, bearers shall be set with ESP_BLE_MESH_PROV_GATT enabled, and the flags
shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
   • If the Provisioner just wants to store the unprovisioned device info when receiving its
advertising packets and start to provision it the next time (e.g. after receiving its advertising packets again),
than it can add the device info with either one or both of device UUID and device address included. Bearers can be set with either one or both of
ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled (recommend
to enable the bearer which will receive its advertising packets, because if the other bearer is
enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set
with ADD_DEV_START_PROV_NOW_FLAG enabled.
   • Note: ESP_BLE_MESH_PROV_ADV, ESP_BLE_MESH_PROV_GATT and
ADD_DEV_START_PROV_NOW_FLAG can not be enabled at the same time.

Parameters
- [in] add_dev: Pointer to a struct containing the device information
- [in] flags: Flags indicate several operations on the device information
– Remove device information from queue after device has been provisioned (BIT0)
– Start provisioning immediately after device is added to queue (BIT1)
– Device can be removed if device queue is full (BIT2)

```c
esp_err_t esp_ble_mesh_provisioner_prov_device_with_addr(const uint8_t uuid[16],
                                                         esp_ble_mesh_bd_addr_t addr,
                                                         esp_ble_mesh_addr_type_t addr_type,
                                                         esp_ble_mesh_prov_bearer_t bearer, uint16_t oob_info,
                                                         uint16_t unicast_addr)
```

Provision an unprovisioned device and assign a fixed unicast address for it in advance.

**Return** Zero on success or (negative) error code otherwise.

**Note**:
1. Currently address type only supports public address and static random address.
2. Bearer must be equal to ESP_BLE_MESH_PROV_ADV or ESP_BLE_MESH_PROV_GATT, since Provisioner will start to provision a device immediately once this function is invoked. And the input bearer must be identical with the one within the parameters of the ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT event.
3. If this function is used by a Provisioner to provision devices, the application should take care of the assigned unicast address and avoid overlap of the unicast addresses of different nodes.
4. Recommend to use only one of the functions “esp_ble_mesh_provisioner_add_unprov_dev” and “esp_ble_mesh_provisioner_prov_device_with_addr” by a Provisioner.

**Parameters**
- `[in] uuid`: Device UUID of the unprovisioned device
- `[in] addr`: Device address of the unprovisioned device
- `[in] addr_type`: Device address type of the unprovisioned device
- `[in] bearer`: Provisioning bearer going to be used by Provisioner
- `[in] oob_info`: OOB info of the unprovisioned device
- `[in] unicast_addr`: Unicast address going to be allocated for the unprovisioned device

```c
esp_err_t esp_ble_mesh_provisioner_delete_dev(esp_ble_mesh_device_delete_t *del_dev)
```

Delete device from queue, and reset current provisioning link with the device.

**Note** If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate the provisioning procedure. Either one of the device address or device UUID can be used as input.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `[in] del_dev`: Pointer to a struct containing the device information.

```c
esp_err_t esp_ble_mesh_provisioner_set_dev_uuid_match(const uint8_t *match_val,
                                                      uint8_t match_len, uint8_t offset,
                                                      bool prov_after_match)
```

This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `[in] match_val`: Value to be compared with the part of the device UUID.
- `[in] match_len`: Length of the compared match value.
- `[in] offset`: Offset of the device UUID to be compared (based on zero).
- `[in] prov_after_match`: Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.

```c
esp_err_t esp_ble_mesh_provisioner_set_prov_data_info(esp_ble_mesh_prov_data_info_t *prov_data_info)
```

This function is called by Provisioner to set provisioning data information before starting to provision.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `[in] prov_data_info`: Pointer to a struct containing net_idx or flags or iv_index.
**esp_err_t esp_ble_mesh_provisioner_set_static_oob_value(const uint8_t *value, uint8_t length)**

This function is called by Provisioner to set static oob value used for provisioning.

AuthValues selected using a cryptographically secure random or pseudorandom number generator and having the maximum permitted entropy (128-bits) will be most difficult to brute-force. AuthValues with reduced entropy or generated in a predictable manner will not grant the same level of protection against this vulnerability. Selecting a new AuthValue with each provisioning attempt can also make it more difficult to launch a brute-force attack by requiring the attacker to restart the search with each provisioning attempt (CVE-2020-26556).

**Note** The Bluetooth SIG recommends that mesh implementations enforce a randomly selected AuthValue using all of the available bits, where permitted by the implementation. A large entropy helps ensure that a brute-force of the AuthValue, even a static AuthValue, cannot normally be completed in a reasonable time (CVE-2020-26557).

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] value: Pointer to the static oob value.
- [in] length: Length of the static oob value.

**esp_err_t esp_ble_mesh_provisioner_set_primary_elem_addr(uint16_t addr)**

This function is called by Provisioner to set own Primary element address.

**Note** This API must be invoked when BLE Mesh initialization is completed successfully, and can be invoked before Provisioner functionality is enabled. Once this API is invoked successfully, the prov_unicast_addr value in the struct esp_ble_mesh_prov_t will be ignored, and Provisioner will use this address as its own primary element address. And if the unicast address going to assigned for the next unprovisioned device is smaller than the input address + element number of Provisioner, then the address for the next unprovisioned device will be recalculated internally.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] addr: Unicast address of the Primary element of Provisioner.

**esp_err_t esp_ble_mesh_set_fast_prov_info(esp_ble_mesh_fast_prov_info_t *fast_prov_info)**

This function is called to set provisioning data information before starting fast provisioning.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] fast_prov_info: Pointer to a struct containing unicast address range, net_idx, etc.

**esp_err_t esp_ble_mesh_set_fast_prov_action(esp_ble_mesh_fast_prov_action_t action)**

This function is called to start/suspend/exit fast provisioning.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] action: fast provisioning action (i.e. enter, suspend, exit).

**Type Definitions**

```c
typedef void(*esp_ble_mesh_prov_cb_t)(esp_ble_mesh_prov_cb_event_t event, esp_ble_mesh_prov_cb_param_t *param)
```

: event, event code of provisioning events; param, parameters of provisioning events

```c
typedef void(*esp_ble_mesh_prov_adv_cb_t)(const esp_ble_mesh_bd_addr_t addr, const esp_ble_mesh_addr_type_t addr_type,
                                          const uint8_t adv_type, const esp_ble_mesh_adv_pattern_t *dev_uuid,
                                          uint16_t oob_info, esp_ble_mesh_prov_bearer_t bearer)
```

Callback for Provisioner that received advertising packets from unprovisioned devices which are not in the unprovisioned device queue.

Report on the unprovisioned device beacon and mesh provisioning service adv data to application.

**Parameters**
- [in] addr: Pointer to the unprovisioned device address.
Chapter 2. API Reference

• [in] addr_type: Unprovisioned device address type.
• [in] adv_type: Adv packet type(ADV_IND or ADV_NONCONN_IND).
• [in] oob_info: OOB information of the unprovisioned device.
• [in] bearer: Adv packet received from PB-GATT or PB-ADV bearer.

ESP-BLE-MESH GATT Proxy Server

Header File

• components.bt.esp_ble_mesh.api.core.include.esp_ble_mesh_proxy_api.h

Functions

esp_err_t esp_ble_mesh_proxy_identity_enable (void)

Enable advertising with Node Identity.

Note This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising
using Node Identity for the next 60 seconds, and after 60s Network ID will be advertised. Under normal
conditions, the BLE Mesh Proxy Node Identity and Network ID advertising will be enabled automatically
by BLE Mesh stack after the device is provisioned.

Return ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_proxy_gatt_enable (void)

Enable BLE Mesh GATT Proxy Service.

Return ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_proxy_gatt_disable (void)

Disconnect the BLE Mesh GATT Proxy connection if there is any, and disable the BLE Mesh GATT Proxy
Service.

Return ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_proxy_client_connect (esp_ble_mesh_bd_addr_t addr,
                                             esp_ble_mesh_addr_type_t addr_type,
                                             uint16_t net_idx)

Proxy Client creates a connection with the Proxy Server.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] addr: Device address of the Proxy Server.
• [in] addr_type: Device address type(public or static random).
• [in] net_idx: NetKey Index related with Network ID in the Mesh Proxy advertising packet.

esp_err_t esp_ble_mesh_proxy_client_disconnect (uint8_t conn_handle)

Proxy Client terminates a connection with the Proxy Server.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] conn_handle: Proxy connection handle.

esp_err_t esp_ble_mesh_proxy_client_set_filter_type (uint8_t conn_handle,
                                                   uint16_t net_idx,
                                                   esp_ble_mesh_proxy_filter_type_t filter_type)

Proxy Client sets the filter type of the Proxy Server.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] conn_handle: Proxy connection handle.
• [in] net_idx: Corresponding NetKey Index.
• [in] filter_type: whitelist or blacklist.
**esp_err_t esp_ble_mesh_proxy_client_add_filter_addr**

```c
uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num
```

Proxy Client adds address to the Proxy Server filter list.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `[in] conn_handle`: Proxy connection handle.
- `[in] net_idx`: Corresponding NetKey Index.
- `[in] addr`: Pointer to the filter address.
- `[in] addr_num`: Number of the filter address.

**esp_err_t esp_ble_mesh_proxy_client_remove_filter_addr**

```c
uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num
```

Proxy Client removes address from the Proxy Server filter list.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `[in] conn_handle`: Proxy connection handle.
- `[in] net_idx`: Corresponding NetKey Index.
- `[in] addr`: Pointer to the filter address.
- `[in] addr_num`: Number of the filter address.

**ESP-BLE-MESH Models API Reference**

This section contains ESP-BLE-MESH Model related APIs, event types, event parameters, etc.

There are six categories of models:
- **Configuration Client/Server Models**
- **Health Client/Server Models**
- **Generic Client/Server Models**
- **Sensor Client/Server Models**
- **Time and Scenes Client/Server Models**
- **Lighting Client/Server Models**

**Note:** Definitions related to Server Models are being updated, and will be released soon.

**Configuration Client/Server Models**

**Header File**

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_config_model_api.h

**Functions**

**esp_err_t esp_ble_mesh_register_config_client_callback**

```c
(esp_ble_mesh_cfg_client_cb_t callback)
```

Register BLE Mesh Config Client Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `[in] callback`: Pointer to the callback function.

**esp_err_t esp_ble_mesh_register_config_server_callback**

```c
(esp_ble_mesh_cfg_server_cb_t callback)
```

Register BLE Mesh Config Server Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
• [in] callback: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_config_client_get_state(esp_ble_mesh_client_common_param_t *params,
                                           esp_ble_mesh_cfg_client_get_state_t *get_state)
```

Get the value of Config Server Model states using the Config Client Model get messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_config_client_get_t` in `esp_ble_mesh_defs.h`.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] `get_state`: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_config_client_set_state(esp_ble_mesh_client_common_param_t *params,
                                              esp_ble_mesh_cfg_client_set_state_t *set_state)
```

Set the value of the Configuration Server Model states using the Config Client Model set messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_config_client_set_t` in `esp_ble_mesh_defs.h`.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] `set_state`: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

**Unions**

```c
union esp_ble_mesh_cfg_client_get_state_t
#include <esp_ble_mesh_config_model_api.h> For ESP_BLE_MESH_MODEL_OP_BEACON_GET
ESP_BLE_MESH_MODEL_OP_COMPOSITION_DATA_GET ESP_BLE_MESH_MODEL_OP_DEFAULT_TTL_GET
ESP_BLE_MESH_MODEL_OP_GATT_PROXY_GET ESP_BLE_MESH_MODEL_OP_RELAY_GET
ESP_BLE_MESH_MODEL_OP_MODEL_PUB_GET ESP_BLE_MESH_MODEL_OP_FRIEND_GET
ESP_BLE_MESH_MODEL_OP_HEARTBEAT_PUB_GET ESP_BLE_MESH_MODEL_OP_HEARTBEAT_SUB_GET
```

the `get_state` parameter in the `esp_ble_mesh_config_client_get_state` function should not be set to NULL.

The key refresh phase status value

esp_ble_mesh_cfg_lpn_pollto_status_cb_t lpn_timeout_status
The low power node poll timeout status value

union esp_ble_mesh_cfg_server_state_change_t
#include <esp_ble_mesh_config_model_api.h> Configuration Server model state change value union.

Public Members

esp_ble_mesh_state_change_cfg_mod_pub_set_t mod_pub_set
The recv_op in ctx can be used to decide which state is changed. Config Model Publication Set

esp_ble_mesh_state_change_cfg_model_sub_add_t mod_sub_add
Config Model Subscription Add

esp_ble_mesh_state_change_cfg_model_sub_delete_t mod_sub_delete
Config Model Subscription Delete

esp_ble_mesh_state_change_cfg_netkey_add_t netkey_add
Config NetKey Add

esp_ble_mesh_state_change_cfg_netkey_update_t netkey_update
Config NetKey Update

esp_ble_mesh_state_change_cfg_netkey_delete_t netkey_delete
Config NetKey Delete

esp_ble_mesh_state_change_cfg_appkey_add_t appkey_add
Config AppKey Add

esp_ble_mesh_state_change_cfg_appkey_update_t appkey_update
Config AppKey Update

esp_ble_mesh_state_change_cfg_appkey_delete_t appkey_delete
Config AppKey Delete

```c
union esp_ble_mesh_cfg_server_cb_value_t
#include <esp_ble_mesh_config_model_api.h> Configuration Server model callback value union.

Public Members

esp_ble_mesh_cfg_server_state_change_t state_change
ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT

Structures
struct esp_ble_mesh_cfg_srv
Configuration Server Model context

Public Members

esp_ble_mesh_model_t *model
Pointer to Configuration Server Model

uint8_t net_transmit
Network Transmit state

uint8_t relay
Relay Mode state

uint8_t relay_retransmit
Relay Retransmit state

uint8_t beacon
Secure Network Beacon state

uint8_t gatt_proxy
GATT Proxy state

uint8_t friend_state
Friend state

uint8_t default_ttl
Default TTL

struct k_delayed_work timer
Heartbeat Publication timer

uint16_t dst
Destination address for Heartbeat messages

uint16_t count
Number of Heartbeat messages to be sent
Number of Heartbeat messages received

uint8_t period
Period for sending Heartbeat messages

uint8_t ttl
TTL to be used when sending Heartbeat messages
```
uint16_t feature
   Bit field indicating features that trigger Heartbeat messages when changed

uint16_t net_idx
   NetKey Index used by Heartbeat Publication

struct esp_ble_mesh_cfg_srv::<anonymous> heartbeat_pub
   Heartbeat Publication

int64_t expiry
   Timestamp when Heartbeat subscription period is expired

uint16_t src
   Source address for Heartbeat messages

uint8_t min_hops
   Minimum hops when receiving Heartbeat messages

uint8_t max_hops
   Maximum hops when receiving Heartbeat messages

esp_ble_mesh_cb_t heartbeat_recv_cb
   Optional heartbeat subscription tracking function

struct esp_ble_mesh_cfg_srv::<anonymous> heartbeat_sub
   Heartbeat Subscription

struct esp_ble_mesh_cfg_composition_data_get_t
   Parameters of Config Composition Data Get.

Public Members

uint8_t page
   Page number of the Composition Data.

struct esp_ble_mesh_cfg_model_pub_get_t
   Parameters of Config Model Publication Get.

Public Members

uint16_t element_addr
   The element address

uint16_t model_id
   The model id

uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_sig_model_sub_get_t
   Parameters of Config SIG Model Subscription Get.

Public Members

uint16_t element_addr
   The element address

uint16_t model_id
   The model id

struct esp_ble_mesh_cfg_vnd_model_sub_get_t
   Parameters of Config Vendor Model Subscription Get.
Public Members

```c
uint16_t element_addr
The element address
```

```c
uint16_t model_id
The model id
```

```c
uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF
```

**struct esp_ble_mesh_cfg_app_key_get_t**
Parameters of Config AppKey Get.

Public Members

```c
uint16_t net_idx
The network key index
```

**struct esp_ble_mesh_cfg_node_identity_get_t**
Parameters of Config Node Identity Get.

Public Members

```c
uint16_t net_idx
The network key index
```

**struct esp_ble_mesh_cfg_sig_model_app_get_t**
Parameters of Config SIG Model App Get.

Public Members

```c
uint16_t element_addr
The element address
```

```c
uint16_t model_id
The model id
```

**struct esp_ble_mesh_cfg_vnd_model_app_get_t**
Parameters of Config Vendor Model App Get.

Public Members

```c
uint16_t element_addr
The element address
```

```c
uint16_t model_id
The model id
```

```c
uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF
```

**struct esp_ble_mesh_cfg_kr_phase_get_t**
Parameters of Config Key Refresh Phase Get.
Chapter 2. API Reference

Public Members

uint16_t net_idx
The network key index

struct esp_ble_mesh_cfg_lpn_polltimeout_get_t
Parameters of Config Low Power Node PollTimeout Get.

Public Members

uint16_t lpn_addr
The unicast address of the Low Power node

struct esp_ble_mesh_cfg_beacon_set_t
Parameters of Config Beacon Set.

Public Members

uint8_t beacon
New Secure Network Beacon state

struct esp_ble_mesh_cfg_default_ttl_set_t
Parameters of Config Default TTL Set.

Public Members

uint8_t friend_state
The friend state value

struct esp_ble_mesh_cfg_gatt_proxy_set_t
Parameters of Config GATT Proxy Set.

Public Members

uint8_t gatt_proxy
The GATT Proxy state value

struct esp_ble_mesh_cfg_relay_set_t
Parameters of Config Relay Set.

Public Members

uint8_t relay
The relay value
uint8_t relay_retransmit
The relay retransmit value

struct esp_ble_mesh_cfg_net_key_add_t
Parameters of Config NetKey Add.
Public Members

uint16_t net_idx
   The network key index

uint8_t net_key[16]
   The network key value

struct esp_ble_mesh_cfg_app_key_add_t
   Parameters of Config AppKey Add.

Public Members

uint16_t net_idx
   The network key index

uint16_t app_idx
   The app key index

uint8_t app_key[16]
   The app key value

struct esp_ble_mesh_cfg_model_app_bind_t
   Parameters of Config Model App Bind.

Public Members

uint16_t element_addr
   The element address

uint16_t model_app_idx
   Index of the app key to bind with the model

uint16_t model_id
   The model id

uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_pub_set_t
   Parameters of Config Model Publication Set.

Public Members

uint16_t element_addr
   The element address

uint16_t publish_addr
   Value of the publish address

uint16_t publish_app_idx
   Index of the application key

bool cred_flag
   Value of the Friendship Credential Flag

uint8_t publish_ttl
   Default TTL value for the publishing messages

uint8_t publish_period
   Period for periodic status publishing
Chapter 2. API Reference

uint8_t **\texttt{\texttt{publish\_retransmit}}**  
\hspace{1em} Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t **\texttt{\texttt{model\_id}}**  
\hspace{1em} The model id

uint16_t **\texttt{\texttt{company\_id}}**  
\hspace{1em} The company id, if not a vendor model, shall set to 0xFFFF

\texttt{\texttt{struct esp\_ble\_mesh\_cfg\_model\_sub\_add\_t}}  
\hspace{1em} Parameters of Config Model Subscription Add.

\textbf{Public Members}

uint16_t **\texttt{\texttt{element\_addr}}**  
\hspace{1em} The element address

uint16_t **\texttt{\texttt{sub\_addr}}**  
\hspace{1em} The address to be added to the Subscription List

uint16_t **\texttt{\texttt{model\_id}}**  
\hspace{1em} The model id

uint16_t **\texttt{\texttt{company\_id}}**  
\hspace{1em} The company id, if not a vendor model, shall set to 0xFFFF

\texttt{\texttt{struct esp\_ble\_mesh\_cfg\_model\_sub\_delete\_t}}  
\hspace{1em} Parameters of Config Model Subscription Delete.

\textbf{Public Members}

uint16_t **\texttt{\texttt{element\_addr}}**  
\hspace{1em} The element address

uint16_t **\texttt{\texttt{sub\_addr}}**  
\hspace{1em} The address to be removed from the Subscription List

uint16_t **\texttt{\texttt{model\_id}}**  
\hspace{1em} The model id

uint16_t **\texttt{\texttt{company\_id}}**  
\hspace{1em} The company id, if not a vendor model, shall set to 0xFFFF

\texttt{\texttt{struct esp\_ble\_mesh\_cfg\_model\_sub\_overwrite\_t}}  
\hspace{1em} Parameters of Config Model Subscription Overwrite.

\textbf{Public Members}

uint16_t **\texttt{\texttt{element\_addr}}**  
\hspace{1em} The element address

uint16_t **\texttt{\texttt{sub\_addr}}**  
\hspace{1em} The address to be added to the Subscription List

uint16_t **\texttt{\texttt{model\_id}}**  
\hspace{1em} The model id

uint16_t **\texttt{\texttt{company\_id}}**  
\hspace{1em} The company id, if not a vendor model, shall set to 0xFFFF

\texttt{\texttt{struct esp\_ble\_mesh\_cfg\_model\_sub\_va\_add\_t}}  
\hspace{1em} Parameters of Config Model Subscription Virtual Address Add.

\textbf{Public Members}

uint16_t **\texttt{\texttt{element\_addr}}**  
\hspace{1em} The element address

uint16_t **\texttt{\texttt{sub\_addr}}**  
\hspace{1em} The address to be added to the Subscription List

uint16_t **\texttt{\texttt{model\_id}}**  
\hspace{1em} The model id

uint16_t **\texttt{\texttt{company\_id}}**  
\hspace{1em} The company id, if not a vendor model, shall set to 0xFFFF
Public Members

uint16_t element_addr
The element address

uint8_t label_uuid[16]
The Label UUID of the virtual address to be added to the Subscription List

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_va_delete_t
Parameters of Config Model Subscription Virtual Address Delete.

Public Members

uint16_t element_addr
The element address

uint8_t label_uuid[16]
The Label UUID of the virtual address to be removed from the Subscription List

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_va_overwrite_t
Parameters of Config Model Subscription Virtual Address Overwrite.

Public Members

uint16_t element_addr
The element address

uint8_t label_uuid[16]
The Label UUID of the virtual address to be added to the Subscription List

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_pub_va_set_t
Parameters of Config Model Publication Virtual Address Set.

Public Members

uint16_t element_addr
The element address

uint8_t label_uuid[16]
Value of the Label UUID publish address

uint16_t publish_app_idx
Index of the application key
Chapter 2. API Reference

bool cred_flag
   Value of the Friendship Credential Flag

uint8_t publish_ttl
   Default TTL value for the publishing messages

uint8_t publish_period
   Period for periodic status publishing

uint8_t publish_retransmit
   Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t model_id
   The model id

uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_delete_all_t
   Parameters of Config Model Subscription Delete All.

   Public Members

   uint16_t element_addr
      The element address

   uint16_t model_id
      The model id

   uint16_t company_id
      The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_net_key_update_t
   Parameters of Config NetKey Update.

   Public Members

   uint16_t net_idx
      The network key index

   uint8_t net_key[16]
      The network key value

struct esp_ble_mesh_cfg_net_key_delete_t
   Parameters of Config NetKey Delete.

   Public Members

   uint16_t net_idx
      The network key index

struct esp_ble_mesh_cfg_app_key_update_t
   Parameters of Config AppKey Update.

   Public Members

   uint16_t net_idx
      The network key index

   uint16_t app_idx
      The app key index
uint8_t app_key[16]
The app key value

**struct esp_ble_mesh_cfg_app_key_delete_t**
Parameters of Config AppKey Delete.

**Public Members**

uint16_t net_idx
The network key index
uint16_t app_idx
The app key index

**struct esp_ble_mesh_cfg_node_identity_set_t**
Parameters of Config Node Identity Set.

**Public Members**

uint16_t net_idx
The network key index
uint8_t identity
New Node Identity state

**struct esp_ble_mesh_cfg_model_app_unbind_t**
Parameters of Config Model App Unbind.

**Public Members**

uint16_t element_addr
The element address
uint16_t model_app_idx
Index of the app key to bind with the model
uint16_t model_id
The model id
uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_kr_phase_set_t**
Parameters of Config Key Refresh Phase Set.

**Public Members**

uint16_t net_idx
The network key index
uint8_t transition
New Key Refresh Phase Transition

**struct esp_ble_mesh_cfg_net_transmit_set_t**
Parameters of Config Network Transmit Set.

**Public Members**

uint16_t net_idx
The network key index
uint8_t transition
New Key Refresh Phase Transition
Chapter 2. API Reference

Public Members

uint8_t net_transmit
Network Transmit State

struct esp_ble_mesh_cfg_heartbeat_pub_set_t
Parameters of Config Model Heartbeat Publication Set.

Public Members

uint16_t dst
Destination address for Heartbeat messages

uint8_t count
Number of Heartbeat messages to be sent

uint8_t period
Period for sending Heartbeat messages

uint8_t ttl
TTL to be used when sending Heartbeat messages

uint16_t feature
Bit field indicating features that trigger Heartbeat messages when changed

uint16_t net_idx
NetKey Index

struct esp_ble_mesh_cfg_heartbeat_sub_set_t
Parameters of Config Model Heartbeat Subscription Set.

Public Members

uint16_t src
Source address for Heartbeat messages

uint16_t dst
Destination address for Heartbeat messages

uint8_t period
Period for receiving Heartbeat messages

struct esp_ble_mesh_cfg_beacon_status_cb_t
Parameter of Config Beacon Status

Public Members

uint8_t beacon
Secure Network Beacon state value

struct esp_ble_mesh_cfg_comp_data_status_cb_t
Parameters of Config Composition Data Status

Public Members

uint8_t page
Page number of the Composition Data

struct net_buf_simple *composition_data
Pointer to Composition Data for the identified page
struct esp_ble_mesh_cfg_default_ttl_status_cb_t
Parameter of Config Default TTL Status

Public Members

uint8_t default_ttl
Default TTL state value

struct esp_ble_mesh_cfg_gatt_proxy_status_cb_t
Parameter of Config GATT Proxy Status

Public Members

uint8_t gatt_proxy
GATT Proxy state value

struct esp_ble_mesh_cfg_relay_status_cb_t
Parameters of Config Relay Status

Public Members

uint8_t relay
Relay state value

uint8_t retransmit
Relay retransmit value (number of retransmissions and number of 10-millisecond steps between retransmissions)

struct esp_ble_mesh_cfg_model_pub_status_cb_t
Parameters of Config Model Publication Status

Public Members

uint8_t status
StatusCode for the request message

uint16_t element_addr
Address of the element

uint16_t publish_addr
Value of the publish address

uint16_t app_idx
Index of the application key

bool cred_flag
Value of the Friendship Credential Flag

uint8_t ttl
Default TTL value for the outgoing messages

uint8_t period
Period for periodic status publishing

uint8_t transmit
Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t company_id
Company ID

uint16_t model_id
Model ID
struct esp_ble_mesh_cfg_model_sub_status_cb_t
Parameters of Config Model Subscription Status

Public Members

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element

uint16_t sub_addr
Value of the address

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct esp_ble_mesh_cfg_net_key_status_cb_t
Parameters of Config NetKey Status

Public Members

uint8_t status
Status Code for the request message

uint16_t net_idx
Index of the NetKey

struct esp_ble_mesh_cfg_app_key_status_cb_t
Parameters of Config AppKey Status

Public Members

uint8_t status
Status Code for the request message

uint16_t net_idx
Index of the NetKey

uint16_t app_idx
Index of the application key

struct esp_ble_mesh_cfg_mod_app_status_cb_t
Parameters of Config Model App Status

Public Members

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element

uint16_t app_idx
Index of the application key

uint16_t company_id
Company ID
## Chapter 2. API Reference

### Public Members

#### uint16_t `model_id`
Model ID

#### `struct esp_ble_mesh_cfg_friend_status_cb_t`
Parameter of Config Friend Status

- `uint8_t friend_state`
  Friend state value

#### `struct esp_ble_mesh_cfg_hb_pub_status_cb_t`
Parameters of Config Heartbeat Publication Status

- `uint8_t status`
  Status Code for the request message

- `uint16_t dst`
  Destination address for Heartbeat messages

- `uint8_t count`
  Number of Heartbeat messages remaining to be sent

- `uint8_t period`
  Period for sending Heartbeat messages

- `uint8_t ttl`
  TTL to be used when sending Heartbeat messages

- `uint16_t features`
  Features that trigger Heartbeat messages when changed

- `uint16_t net_idx`
  Index of the NetKey

#### `struct esp_ble_mesh_cfg_hb_sub_status_cb_t`
Parameters of Config Heartbeat Subscription Status

- `uint8_t status`
  Status Code for the request message

- `uint16_t src`
  Source address for Heartbeat messages

- `uint16_t dst`
  Destination address for Heartbeat messages

- `uint8_t period`
  Remaining Period for processing Heartbeat messages

- `uint8_t count`
  Number of Heartbeat messages received

- `uint8_t min_hops`
  Minimum hops when receiving Heartbeat messages

- `uint8_t max_hops`
  Maximum hops when receiving Heartbeat messages
**struct esp_ble_mesh_cfg_net_trans_status_cb_t**
Parameters of Config Network Transmit Status

**Public Members**

uint8_t **net_trans_count** : 3
Number of transmissions for each Network PDU originating from the node

uint8_t **net_trans_step** : 5
Maximum hops when receiving Heartbeat messages

**struct esp_ble_mesh_cfg_model_sub_list_cb_t**
Parameters of Config SIG/Vendor Subscription List

**Public Members**

uint8_t **status**
Status Code for the request message

uint16_t **element_addr**
Address of the element

uint16_t **company_id**
Company ID

uint16_t **model_id**
Model ID

**struct net_buf_simple *sub_addr**
A block of all addresses from the Subscription List

**struct esp_ble_mesh_cfg_net_key_list_cb_t**
Parameter of Config NetKey List

**Public Members**

**struct net_buf_simple *net_idx**
A list of NetKey Indexes known to the node

**struct esp_ble_mesh_cfg_app_key_list_cb_t**
Parameters of Config AppKey List

**Public Members**

uint8_t **status**
Status Code for the request message

uint16_t **net_idx**
NetKey Index of the NetKey that the AppKeys are bound to

**struct net_buf_simple *app_idx**
A list of AppKey indexes that are bound to the NetKey identified by NetKeyIndex

**struct esp_ble_mesh_cfg_node_id_status_cb_t**
Parameters of Config Node Identity Status
Public Members

uint8_t status
  Status Code for the request message

uint16_t net_idx
  Index of the NetKey

uint8_t identity
  Node Identity state

struct esp_ble_mesh_cfg_model_app_list_cb_t
  Parameters of Config SIG/Vendor Model App List

Public Members

uint8_t status
  Status Code for the request message

uint16_t element_addr
  Address of the element

uint16_t company_id
  Company ID

uint16_t model_id
  Model ID

struct net_buf_simple *app_idx
  All AppKey indexes bound to the Model

struct esp_ble_mesh_cfg_kr_phase_status_cb_t
  Parameters of Config Key Refresh Phase Status

Public Members

uint8_t status
  Status Code for the request message

uint16_t net_idx
  Index of the NetKey

uint8_t phase
  Key Refresh Phase state

struct esp_ble_mesh_cfg_lpn_pollto_status_cb_t
  Parameters of Config Low Power Node PollTimeout Status

Public Members

uint16_t lpn_addr
  The unicast address of the Low Power node

int32_t poll_timeout
  The current value of the PollTimeout timer of the Low Power node

struct esp_ble_mesh_cfg_client_cb_param_t
  Configuration Client Model callback parameters
Chapter 2. API Reference

Public Members

int error_code
Appropriate error code

*params
The client common parameters

status_cb
The config status message callback values

struct esp_ble_mesh_state_change_cfg_mod_pub_set_t
Configuration Server model related context.

Public Members

uint16_t element_addr
Element Address

uint16_t pub_addr
Publish Address

uint16_t app_idx
AppKey Index

bool cred_flag
Friendship Credential Flag

uint8_t pub_ttl
Publish TTL

uint8_t pub_period
Publish Period

uint8_t pub_retransmit
Publish Retransmit

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct esp_ble_mesh_state_change_cfg_model_sub_set_t
Parameters of Config Model Subscription Add

Public Members

uint16_t element_addr
Element Address

uint16_t sub_addr
Subscription Address

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct esp_ble_mesh_state_change_cfg_model_sub_delete_t
Parameters of Config Model Subscription Delete
Public Members

```c
uint16_t element_addr
Element Address
```

```c
uint16_t sub_addr
Subscription Address
```

```c
uint16_t company_id
Company ID
```

```c
uint16_t model_id
Model ID
```

Model ID
```

```c
struct esp_ble_mesh_state_change_cfg_kr_phase_set_t
Parameters of Config Key Refresh Phase Set
```
Chapter 2. API Reference

Public Members

uint16_t net_idx
Net Key Index

uint8_t kr_phase
New Key Refresh Phase Transition

struct esp_ble_mesh_cfg_server_cb_param_t
Configuration Server model callback parameters

Public Members

esp_ble_mesh_model_t *model
Pointer to the server model structure

esp_ble_mesh_msg_ctx_t ctx
Context of the received message

esp_ble_mesh_cfg_server_cb_value_t value
Value of the received configuration messages

Macros

ESP_BLE_MESH_MODEL_CFG_SRV (srv_data)
Define a new Config Server Model.

Note The Config Server Model can only be included by a Primary Element.

Return New Config Server Model instance.

Parameters
• srv_data: Pointer to a unique Config Server Model user_data.

ESP_BLE_MESH_MODEL_CFG_CLI (cli_data)
Define a new Config Client Model.

Note The Config Client Model can only be included by a Primary Element.

Return New Config Client Model instance.

Parameters
• cli_data: Pointer to a unique struct esp_ble_mesh_client_t.

Type Definitions

typedef struct esp_ble_mesh_cfg_srv esp_ble_mesh_cfg_srv_t
Configuration Server Model context

typedef void (*esp_ble_mesh_cfg_client_cb_t) (esp_ble_mesh_cfg_client_cb_event_t event,
                                          esp_ble_mesh_cfg_client_cb_param_t *param)

Bluetooth Mesh Config Client and Server Model functions.

Configuration Client Model callback function type

Parameters
• event: Event type
• param: Pointer to callback parameter

typedef void (*esp_ble_mesh_cfg_server_cb_t) (esp_ble_mesh_cfg_server_cb_event_t event,
                                          esp_ble_mesh_cfg_server_cb_param_t *param)

Configuration Server Model callback function type.

Parameters
• event: Event type
• param: Pointer to callback parameter
Enumerations

define esp_ble_mesh_cfg_client_cb_event_t

This enum value is the event of Configuration Client Model

Values:

<table>
<thead>
<tr>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP_BLE_MESH_CFG_CLIENT_GET_STATE_EVT</td>
</tr>
<tr>
<td>ESP_BLE_MESH_CFG_CLIENT_SET_STATE_EVT</td>
</tr>
<tr>
<td>ESP_BLE_MESH_CFG_CLIENT_PUBLISH_EVT</td>
</tr>
<tr>
<td>ESP_BLE_MESH_CFG_CLIENT_TIMEOUT_EVT</td>
</tr>
<tr>
<td>ESP_BLE_MESH_CFG_CLIENT_EVT_MAX</td>
</tr>
</tbody>
</table>

define esp_ble_mesh_cfg_server_cb_event_t

This enum value is the event of Configuration Server model

Values:

<table>
<thead>
<tr>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT</td>
</tr>
<tr>
<td>ESP_BLE_MESH_CFG_SERVER_EVT_MAX</td>
</tr>
</tbody>
</table>

Health Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_health_model_api.h

Functions

```
esp_err_t esp_ble_mesh_register_health_client_callback(esp_ble_mesh_health_client_cb_t callback)
```

Register BLE Mesh Health Model callback, the callback will report Health Client & Server Model events.

Return: ESP_OK on success or error code otherwise.

Parameters

- [in] callback: Pointer to the callback function.

```
esp_err_t esp_ble_mesh_register_health_server_callback(esp_ble_mesh_health_server_cb_t callback)
```

Register BLE Mesh Health Server Model callback.

Return: ESP_OK on success or error code otherwise.

Parameters

- [in] callback: Pointer to the callback function.

```
esp_err_t esp_ble_mesh_health_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_health_client_get_state_t *get_state)
```

This function is called to get the Health Server states using the Health Client Model get messages.

Note: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to
esp_ble_mesh_opcode_health_client_get_t in esp_ble_mesh_defs.h

Return: ESP_OK on success or error code otherwise.

Parameters

- [in] get_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

```
esp_err_t esp_ble_mesh_health_client_set_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_health_client_set_state_t *set_state)
```

This function is called to set the Health Server states using the Health Client Model set messages.
Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_health_client_set_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters
- [in] set_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

esp_err_t esp_ble_mesh_health_server_fault_update (esp_ble_mesh_elem_t *element)

This function is called by the Health Server Model to update the context of its Health Current status.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] element: The element to which the Health Server Model belongs.

Unions

union esp_ble_mesh_health_client_get_state_t

#include <esp_ble_mesh_health_model_api.h>

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET
ESP_BLE_MESH_MODEL_OP_ATTENTION_GET ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_GET
the get_state parameter in the esp_ble_mesh_health_client_get_state function should not be set to NULL.

Public Members

esp_ble_mesh_health_fault_get_t fault_get

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET.

union esp_ble_mesh_health_client_set_state_t

#include <esp_ble_mesh_health_model_api.h>

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR
ESP_BLE_MESH_MODEL_OP_ATTENTION_CLEAR_UNACK ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD
ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK ESP_BLE_MESH_MODEL_OP_ATTENTION_SET
ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK the set_state parameter in the
esp_ble_mesh_health_client_set_state function should not be set to NULL.

Public Members

esp_ble_mesh_health_attention_set_t attention_set

For ESP_BLE_MESH_MODEL_OP_ATTENTION_SET or ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK.

esp_ble_mesh_health_period_set_t period_set

For ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET
or
ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK.

esp_ble_mesh_health_fault_test_t fault_test

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST
or
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK.

esp_ble_mesh_health_fault_clear_t fault_clear

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR
or
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK.

union esp_ble_mesh_health_client_common_cb_param_t

#include <esp_ble_mesh_health_model_api.h> Health Client Model received message union.

Public Members

esp_ble_mesh_health_current_status_cb_t current_status

The health current status value
**Chapter 2. API Reference**

```c
#include <esp_ble_mesh_health_model_api.h>
```

Public Members

- `esp_ble_mesh_health_fault_update_comp_t fault_update_comp`

  ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT

Structures

- `struct esp_ble_mesh_health_srv_cb_t`
  ESP BLE Mesh Health Server callback

Public Members

- `esp_ble_mesh_cb_t fault_clear`
  Clear health registered faults. Initialized by the stack.

- `esp_ble_mesh_cb_t fault_test`
  Run a specific health test. Initialized by the stack.

- `esp_ble_mesh_cb_t attention_on`
  Health attention on callback. Initialized by the stack.

- `esp_ble_mesh_cb_t attention_off`
  Health attention off callback. Initialized by the stack.

- `struct esp_ble_mesh_health_test_t`
  ESP BLE Mesh Health Server test Context

Public Members

- `uint8_t id_count`
  Number of Health self-test ID

- `const uint8_t *test_ids`
  Array of Health self-test IDs

- `uint16_t company_id`
  Company ID used to identify the Health Fault state

- `uint8_t prev_test_id`
  Current test ID of the health fault test
uint8_t current_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]
    Array of current faults
uint8_t registered_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]
    Array of registered faults

struct esp_ble_mesh_health_srv_t
    ESP BLE Mesh Health Server Model Context

Public Members

esp_ble_mesh_model_t *model
    Pointer to Health Server Model

esp_ble_mesh_health_srv_cb_t health_cb
    Health callback struct

struct k_delayed_work attention_timer
    Attention Timer state

bool attention_timer_start
    Attention Timer start flag

esp_ble_mesh_health_test_t health_test
    Health Server fault test

struct esp_ble_mesh_health_fault_get_t
    Parameter of Health Fault Get

Public Members

uint16_t company_id
    Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_attention_set_t
    Parameter of Health Attention Set

Public Members

uint8_t attention
    Value of the Attention Timer state

struct esp_ble_mesh_health_period_set_t
    Parameter of Health Period Set

Public Members

uint8_t fast_period_divisor
    Divider for the Publish Period

struct esp_ble_mesh_health_fault_test_t
    Parameter of Health Fault Test

Public Members

uint16_t company_id
    Bluetooth assigned 16-bit Company ID
uint8_t test_id
    ID of a specific test to be performed
struct esp_ble_mesh_health_fault_clear_t
Parameter of Health Fault Clear

Public Members

uint16_t company_id
Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_current_status_cb_t
Parameters of Health Current Status

Public Members

uint8_t test_id
ID of a most recently performed test
uint16_t company_id
Bluetooth assigned 16-bit Company ID
struct net_buf_simple *fault_array
FaultArray field contains a sequence of 1-octet fault values

struct esp_ble_mesh_health_fault_status_cb_t
Parameters of Health Fault Status

Public Members

uint8_t test_id
ID of a most recently performed test
uint16_t company_id
Bluetooth assigned 16-bit Company ID
struct net_buf_simple *fault_array
FaultArray field contains a sequence of 1-octet fault values

struct esp_ble_mesh_health_period_status_cb_t
Parameter of Health Period Status

Public Members

uint8_t fast_period_divisor
Divider for the Publish Period

struct esp_ble_mesh_health_attention_status_cb_t
Parameter of Health Attention Status

Public Members

uint8_t attention
Value of the Attention Timer state

struct esp_ble_mesh_health_client_cb_param_t
Health Client Model callback parameters
Chapter 2. API Reference

**Public Members**

- `int error_code`
  Appropriate error code

- `esp_ble_mesh_client_common_param_t *params`
  The client common parameters.

- `esp_ble_mesh_health_client_common_cb_param_t status_cb`
  The health message status callback values

  ```
  struct esp_ble_mesh_health_fault_update_comp_cb_t
  Parameter of publishing Health Current Status completion event
  ```

**Public Members**

- `int error_code`
  The result of publishing Health Current Status

- `esp_ble_mesh_elem_t *element`
  Pointer to the element which contains the Health Server Model

  ```
  struct esp_ble_mesh_health_fault_clear_cb_t
  Parameters of Health Fault Clear event
  ```

**Public Members**

- `esp_ble_mesh_model_t *model`
  Pointer to the Health Server Model

- `uint16_t company_id`
  Bluetooth assigned 16-bit Company ID

  ```
  struct esp_ble_mesh_health_fault_test_cb_t
  Parameters of Health Fault Test event
  ```

**Public Members**

- `esp_ble_mesh_model_t *model`
  Pointer to the Health Server Model

- `uint8_t test_id`
  ID of a specific test to be performed

- `uint16_t company_id`
  Bluetooth assigned 16-bit Company ID

  ```
  struct esp_ble_mesh_health_attention_on_cb_t
  Parameter of Health Attention On event
  ```

**Public Members**

- `esp_ble_mesh_model_t *model`
  Pointer to the Health Server Model

- `uint8_t time`
  Duration of attention timer on (in seconds)

  ```
  struct esp_ble_mesh_health_attention_off_cb_t
  Parameter of Health Attention Off event
  ```
Public Members

```c
esp_ble_mesh_model_t *model
```

Pointer to the Health Server Model

Macros

```c
ESP_BLE_MESH_MODEL_HEALTH_SRV(srv, pub)
```

Define a new Health Server Model.

**Note** The Health Server Model can only be included by a Primary Element.

**Return** New Health Server Model instance.

**Parameters**

- `srv`: Pointer to the unique struct `esp_ble_mesh_health_srv_t`.
- `pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.

```c
ESP_BLE_MESH_MODEL_HEALTH_CLI(cli_data)
```

Define a new Health Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Health Client Model.

**Return** New Health Client Model instance.

**Parameters**

- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

```c
ESP_BLE_MESH_HEALTH_PUB_DEFINE(_name, _max, _role)
```

A helper to define a health publication context

**Parameters**

- `_name`: Name given to the publication context variable.
- `_max`: Maximum number of faults the element can have.
- `_role`: Role of the device which contains the model.

```c
ESP_BLE_MESH_HEALTH_STANDARD_TEST
```

SIG identifier of Health Fault Test. 0x01 ~ 0xFF: Vendor Specific Test.

```c
ESP_BLE_MESH_NO_FAULT
```

Fault values of Health Fault Test. 0x33 ~ 0x7F: Reserved for Future Use. 0x80 ~ 0xFF: Vendor Specific Warning/Error.

Type Definitions

typedef void (*esp_ble_mesh_health_client_cb_t)(esp_ble_mesh_health_client_cb_event_t event, esp_ble_mesh_health_client_cb_param_t *param)

Bluetooth Mesh Health Client and Server Model function. Health Client Model callback function type

Parameters
• event: Event type
• param: Pointer to callback parameter

typedef void (*esp_ble_mesh_health_server_cb_t)(esp_ble_mesh_health_server_cb_event_t event, esp_ble_mesh_health_server_cb_param_t *param)

Health Server Model callback function type.

Parameters
• event: Event type
• param: Pointer to callback parameter

Enumerations

enum esp_ble_mesh_health_client_cb_event_t
This enum value is the event of Health Client Model

Values:
ESP_BLE_MESH_HEALTH_CLIENT_GET_STATE_EVT
ESP_BLE_MESH_HEALTH_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_HEALTH_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_HEALTH_CLIENT_TIMEOUT_EVT

enum esp_ble_mesh_health_server_cb_event_t
This enum value is the event of Health Server Model

Values:
ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT
ESP_BLE_MESH_HEALTH_SERVER_FAULT_CLEAR_EVT
ESP_BLE_MESH_HEALTH_SERVER_FAULT_TEST_EVT
ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_ON_EVT
ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT
ESP_BLE_MESH_HEALTH_SERVER_EVT_MAX

Generic Client/Server Models

Header File
• components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_generic_model_api.h

Functions
esp_err_t esp_ble_mesh_register_generic_client_callback(esp_ble_mesh_generic_client_cb_t callback)

Register BLE Mesh Generic Client Model callback.

Return ESP_OK on success or error code otherwise.

Parameters
Chapter 2. API Reference

- [in] callback: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_generic_client_get_state
  (esp_ble_mesh_client_common_param_t *params,
   esp_ble_mesh_generic_client_get_state_t *get_state)
```

Get the value of Generic Server Model states using the Generic Client Model get messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_message_opcode_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] get_state: Pointer to generic get message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_generic_client_set_state
  (esp_ble_mesh_client_common_param_t *params,
   esp_ble_mesh_generic_client_set_state_t *set_state)
```

Set the value of Generic Server Model states using the Generic Client Model set messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_message_opcode_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] set_state: Pointer to generic set message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_register_generic_server_callback
  (esp_ble_mesh_generic_server_cb_t callback)
```

Register BLE Mesh Generic Server Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] callback: Pointer to the callback function.

**Unions**
```
union esp_ble_mesh_generic_client_get_state_t
  #include <esp_ble_mesh_generic_model_api.h> Generic Client Model get message union.

**Structures**

```c
struct esp_ble_mesh_gen_onoff_set_t
Bluetooth Mesh Generic Client Model Get and Set parameters structure.
Parameters of Generic OnOff Set.

Public Members

bool op_en
Indicate if optional parameters are included

uint8_t onoff
Target value of Generic OnOff state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)
```

```c
struct esp_ble_mesh_gen_level_set_t
Parameters of Generic Level Set.

Public Members

bool op_en
Indicate if optional parameters are included
```
**Chapter 2. API Reference**

- **int16_t** `level`
  Target value of Generic Level state

- **uint8_t** `tid`
  Transaction ID

- **uint8_t** `trans_time`
  Time to complete state transition (optional)

- **uint8_t** `delay`
  Indicate message execution delay (C.1)

**struct esp_ble_mesh_gen_delta_set_t**
Parameters of Generic Delta Set.

**Public Members**

- **bool** `op_en`
  Indicate if optional parameters are included

- **int32_t** `level`
  Delta change of Generic Level state

- **uint8_t** `tid`
  Transaction ID

- **uint8_t** `trans_time`
  Time to complete state transition (optional)

- **uint8_t** `delay`
  Indicate message execution delay (C.1)

**struct esp_ble_mesh_gen_move_set_t**
Parameters of Generic Move Set.

**Public Members**

- **bool** `op_en`
  Indicate if optional parameters are included

- **int16_t** `delta_level`
  Delta Level step to calculate Move speed for Generic Level state

- **uint8_t** `tid`
  Transaction ID

- **uint8_t** `trans_time`
  Time to complete state transition (optional)

- **uint8_t** `delay`
  Indicate message execution delay (C.1)

**struct esp_ble_mesh_gen_def_trans_time_set_t**
Parameter of Generic Default Transition Time Set.

**Public Members**

- **uint8_t** `trans_time`
  The value of the Generic Default Transition Time state

**struct esp_ble_mesh_gen_onpowerup_set_t**
Parameter of Generic OnPowerUp Set.
Public Members

```c
uint8_t onpowerup
```
The value of the Generic OnPowerUp state

```c
struct esp_ble_mesh_gen_power_level_set_t
```
Parameters of Generic Power Level Set.

Public Members

```c
bool op_en
```
Indicate if optional parameters are included

```c
uint16_t power
```
Target value of Generic Power Actual state

```c
uint8_t tid
```
Transaction ID

```c
uint8_t trans_time
```
Time to complete state transition (optional)

```c
uint8_t delay
```
Indicate message execution delay (C.1)

```c
struct esp_ble_mesh_gen_power_default_set_t
```
Parameter of Generic Power Default Set.

Public Members

```c
uint16_t power
```
The value of the Generic Power Default state

```c
struct esp_ble_mesh_gen_power_range_set_t
```
Parameters of Generic Power Range Set.

Public Members

```c
uint16_t range_min
```
Value of Range Min field of Generic Power Range state

```c
uint16_t range_max
```
Value of Range Max field of Generic Power Range state

```c
struct esp_ble_mesh_gen_loc_global_set_t
```
Parameters of Generic Location Global Set.

Public Members

```c
int32_t global_latitude
```
Global Coordinates (Latitude)

```c
int32_t global_longitude
```
Global Coordinates (Longitude)

```c
int16_t global_altitude
```
Global Altitude

```c
struct esp_ble_mesh_gen_loc_local_set_t
```
Parameters of Generic Location Local Set.
Public Members

int16_t local_north
Local Coordinates (North)

int16_t local_east
Local Coordinates (East)

int16_t local_altitude
Local Altitude

uint8_t floor_number
Floor Number

uint16_t uncertainty
Uncertainty

struct esp_ble_mesh_gen_user_property_get_t
Parameter of Generic User Property Get.

Public Members

uint16_t property_id
Property ID identifying a Generic User Property

struct esp_ble_mesh_gen_user_property_set_t
Parameters of Generic User Property Set.

Public Members

uint16_t property_id
Property ID identifying a Generic User Property

struct net_buf_simple *property_value
Raw value for the User Property

struct esp_ble_mesh_gen_admin_property_get_t
Parameter of Generic Admin Property Get.

Public Members

uint16_t property_id
Property ID identifying a Generic Admin Property

uint8_t user_access
Enumeration indicating user access

struct net_buf_simple *property_value
Raw value for the Admin Property

struct esp_ble_mesh_gen_manufacturer_property_get_t
Parameter of Generic Manufacturer Property Get.
Public Members

uint16_t *property_id
Property ID identifying a Generic Manufacturer Property

struct esp_ble_mesh_gen_manufacturer_property_set_t
Parameters of Generic Manufacturer Property Set.

Public Members

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

uint8_t user_access
Enumeration indicating user access

struct esp_ble_mesh_gen_client_properties_get_t
Parameter of Generic Client Properties Get.

Public Members

uint16_t property_id
A starting Client Property ID present within an element

struct esp_ble_mesh_gen_onoff_status_cb_t
Bluetooth Mesh Generic Client Model Get and Set callback parameters structure.
Parameters of Generic OnOff Status.

Public Members

bool op_en
Indicate if optional parameters are included

uint8_t present_onoff
Current value of Generic OnOff state

uint8_t target_onoff
Target value of Generic OnOff state (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_gen_level_status_cb_t
Parameters of Generic Level Status.

Public Members

bool op_en
Indicate if optional parameters are included

int16_t present_level
Current value of Generic Level state

int16_t target_level
Target value of the Generic Level state (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_gen_def_trans_time_status_cb_t
Parameter of Generic Default Transition Time Status.
Public Members

`uint8_t trans_time`

The value of the Generic Default Transition Time state

`struct esp_ble_mesh_gen_onpowerup_status_cb_t`

Public Members

`uint8_t onpowerup`

The value of the Generic OnPowerUp state

`struct esp_ble_mesh_gen_power_level_status_cb_t`

Parameters of Generic Power Level Status.

Public Members

`bool op_en`

Indicate if optional parameters are included

`uint16_t present_power`

Current value of Generic Power Actual state

`uint16_t target_power`

Target value of Generic Power Actual state (optional)

`uint8_t remain_time`

Time to complete state transition (C.1)

`struct esp_ble_mesh_gen_power_last_status_cb_t`

Parameter of Generic Power Last Status.

Public Members

`uint16_t power`

The value of the Generic Power Last state

`struct esp_ble_mesh_gen_power_default_status_cb_t`

Parameter of Generic Power Default Status.

Public Members

`uint16_t power`

The value of the Generic Default Last state

`struct esp_ble_mesh_gen_power_range_status_cb_t`

Parameters of Generic Power Range Status.

Public Members

`uint8_t status_code`

StatusCode for the request message

`uint16_t range_min`

Value of Range Min field of Generic Power Range state

`uint16_t range_max`

Value of Range Max field of Generic Power Range state
struct esp_ble_mesh_gen_battery_status_cb_t
Parameters of Generic Battery Status.

Public Members

uint32_t battery_level : 8
Value of Generic Battery Level state

uint32_t time_to_discharge : 24
Value of Generic Battery Time to Discharge state

uint32_t time_to_charge : 24
Value of Generic Battery Time to Charge state

uint32_t flags : 8
Value of Generic Battery Flags state

struct esp_ble_mesh_gen_loc_global_status_cb_t
Parameters of Generic Location Global Status.

Public Members

int32_t global_latitude
Global Coordinates (Latitude)

int32_t global_longitude
Global Coordinates (Longitude)

int16_t global_altitude
Global Altitude

struct esp_ble_mesh_gen_loc_local_status_cb_t
Parameters of Generic Location Local Status.

Public Members

int16_t local_north
Local Coordinates (North)

int16_t local_east
Local Coordinates (East)

int16_t local_altitude
Local Altitude

uint8_t floor_number
Floor Number

uint16_t uncertainty
Uncertainty

struct esp_ble_mesh_gen_user_properties_status_cb_t
Parameter of Generic User Properties Status.

Public Members

struct net_buf_simple *property_ids
Buffer contains a sequence of N User Property IDs

struct esp_ble_mesh_gen_user_property_status_cb_t
Parameters of Generic User Property Status.
Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID identifying a Generic User Property

uint8_t user_access
Enumeration indicating user access (optional)

struct net_buf_simple *property_value
Raw value for the User Property (C.1)

struct esp_ble_mesh_gen_admin_properties_status_cb_t
Parameter of Generic Admin Properties Status.

Public Members

struct net_buf_simple *property_ids
Buffer contains a sequence of N Admin Property IDs

struct esp_ble_mesh_gen_admin_property_status_cb_t
Parameters of Generic Admin Property Status.

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID identifying a Generic Admin Property

uint8_t user_access
Enumeration indicating user access (optional)

struct net_buf_simple *property_value
Raw value for the Admin Property (C.1)

struct esp_ble_mesh_gen_admin_manufacturer_properties_status_cb_t
Parameter of Generic Manufacturer Properties Status.

Public Members

struct net_buf_simple *property_ids
Buffer contains a sequence of N Manufacturer Property IDs

struct esp_ble_mesh_gen_manufacturer_property_status_cb_t
Parameters of Generic Manufacturer Property Status.

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

uint8_t user_access
Enumeration indicating user access (optional)
```c
struct net_buf_simple *property_value
    Raw value for the Manufacturer Property (C.1)

struct esp_ble_mesh_gen_client_properties_status_cb_t
    Parameter of Generic Client Properties Status.

Public Members

struct net_buf_simple *property_ids
    Buffer contains a sequence of N Client Property IDs

struct esp_ble_mesh_generic_client_cb_param_t
    Generic Client Model callback parameters

Public Members

int error_code
    Appropriate error code

esp_ble_mesh_client_common_param_t *params
    The client common parameters.

esp_ble_mesh_gen_client_status_cb_t status_cb
    The generic status message callback values

struct esp_ble_mesh_gen_onoff_state_t
    Parameters of Generic OnOff state

Public Members

uint8_t onoff
    The present value of the Generic OnOff state

uint8_t target_onoff
    The target value of the Generic OnOff state

struct esp_ble_mesh_gen_onoff_srv_t
    User data of Generic OnOff Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Generic OnOff Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_gen_onoff_state_t *state
    Parameters of the Generic OnOff state

esp_ble_mesh_last_msg_info_t *last
    Parameters of the last received set message

esp_ble_mesh_state_transition_t *transition
    Parameters of state transition

struct esp_ble_mesh_gen_level_state_t
    Parameters of Generic Level state
```
Chapter 2. API Reference

Public Members

int16_t level
The present value of the Generic Level state

int16_t target_level
The target value of the Generic Level state

int16_t last_level
When a new transaction starts, level should be set to last_last, and use “level + incoming delta” to calculate the target level. In another word, “last_level” is used to record “level” of the last transaction, and “last_delta” is used to record the previously received delta_level value. The last value of the Generic Level state

int32_t last_delta
The last delta change of the Generic Level state

bool move_start
Indicate if the transition of the Generic Level state has been started

bool positive
Indicate if the transition is positive or negative

struct esp_ble_mesh_gen_level_srv_t
User data of Generic Level Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Level Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_gen_level_state_t *state
Parameters of the Generic Level state

esp_ble_mesh_last_msg_info_t *last
Parameters of the last received set message

esp_ble_mesh_state_transition_t *transition
Parameters of state transition

int32_t tt_delta_level
Delta change value of level state transition

struct esp_ble_mesh_gen_def_trans_time_state_t
Parameter of Generic Default Transition Time state

Public Members

uint8_t trans_time
The value of the Generic Default Transition Time state

struct esp_ble_mesh_gen_def_trans_time_srv_t
User data of Generic Default Transition Time Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Default Transition Time Server Model. Initialized internally.
**Chapter 2. API Reference**

*esp_ble_mesh_server_rsp_ctrl_t* `rsp_ctrl`
Response control of the server model received messages

*esp_ble_mesh_gen_def_trans_time_state_t* `state`
Parameters of the Generic Default Transition Time state

**struct esp_ble_mesh_gen_onpowerup_state_t**
Parameter of Generic OnPowerUp state

**Public Members**

`uint8_t onpowerup`
The value of the Generic OnPowerUp state

**struct esp_ble_mesh_gen_power_onoff_srv_t**
User data of Generic Power OnOff Server Model

**Public Members**

*esp_ble_mesh_model_t* `model`
Pointer to the Generic Power OnOff Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* `rsp_ctrl`
Response control of the server model received messages

*esp_ble_mesh_gen_onpowerup_state_t* `state`
Parameters of the Generic OnPowerUp state

**struct esp_ble_mesh_gen_power_onoff_setup_srv_t**
User data of Generic Power OnOff Setup Server Model

**Public Members**

*esp_ble_mesh_model_t* `model`
Pointer to the Generic Power OnOff Setup Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* `rsp_ctrl`
Response control of the server model received messages

*esp_ble_mesh_gen_onpowerup_state_t* `state`
Parameters of the Generic OnPowerUp state

**struct esp_ble_mesh_gen_power_level_state_t**
Parameters of Generic Power Level state

**Public Members**

`uint16_t power_actual`
The present value of the Generic Power Actual state

`uint16_t target_power_actual`
The target value of the Generic Power Actual state

`uint16_t power_last`
The value of the Generic Power Last state

`uint16_t power_default`
The value of the Generic Power Default state

`uint8_t status_code`
The status code of setting Generic Power Range state
Chapter 2. API Reference

```c
uint16_t power_range_min
The minimum value of the Generic Power Range state

uint16_t power_range_max
The maximum value of the Generic Power Range state

struct esp_ble_mesh_gen_power_level_srv_t
User data of Generic Power Level Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Power Level Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_gen_power_level_state_t *state
Parameters of the Generic Power Level state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t *transition
Parameters of state transition

int32_t tt_delta_level
Delta change value of level state transition

struct esp_ble_mesh_gen_power_level_setup_srv_t
User data of Generic Power Level Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Power Level Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_gen_power_level_state_t *state
Parameters of the Generic Power Level state

struct esp_ble_mesh_gen_battery_srv_t
User data of Generic Battery Server Model

Public Members

uint32_t battery_level : 8
The value of the Generic Battery Level state

uint32_t time_to_discharge : 24
The value of the Generic Battery Time to Discharge state

uint32_t time_to_charge : 24
The value of the Generic Battery Time to Charge state

uint32_t battery_flags : 8
The value of the Generic Battery Flags state

struct esp_ble_mesh_gen_battery_srv_t
User data of Generic Battery Server Model
```
Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Generic Battery Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_gen_battery_state_t *state`
Parameters of the Generic Battery state

`struct esp_ble_mesh_gen_location_state_t`
Parameters of Generic Location state

Public Members

`int32_t global_latitude`
The value of the Global Latitude field

`int32_t global_longitude`
The value of the Global Longitude field

`int16_t global_altitude`
The value of the Global Altitude field

`int16_t local_north`
The value of the Local North field

`int16_t local_east`
The value of the Local East field

`int16_t local_altitude`
The value of the Local Altitude field

`uint8_t floor_number`
The value of the Floor Number field

`uint16_t uncertainty`
The value of the Uncertainty field

`struct esp_ble_mesh_gen_location_srv_t`
User data of Generic Location Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Generic Location Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_gen_location_state_t *state`
Parameters of the Generic Location state

`struct esp_ble_mesh_gen_location_setup_srv_t`
User data of Generic Location Setup Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Generic Location Setup Server Model. Initialized internally.
**Chapter 2. API Reference**

*esp_ble_mesh_server_rsp_ctrl_t* **rsp_ctrl**
Response control of the server model received messages

*esp_ble_mesh_gen_location_state_t* **state**
Parameters of the Generic Location state

**struct esp_ble_mesh_generic_property_t**
Parameters of Generic Property states

### Public Members

- **uint16_t id**
  The value of User/Admin/Manufacturer Property ID

- **uint8_t user_access**
  The value of User Access field

- **uint8_t admin_access**
  The value of Admin Access field

- **uint8_t manu_access**
  The value of Manufacturer Access field

- **struct net_buf_simple *val**
  The value of User/Admin/Manufacturer Property

**struct esp_ble_mesh_gen_user_prop_srv_t**
User data of Generic User Property Server Model

### Public Members

- **esp_ble_mesh_model_t *model**
  Pointer to the Generic User Property Server Model. Initialized internally.

- **esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl**
  Response control of the server model received messages

- **uint8_t property_count**
  Generic User Property count

- **esp_ble_mesh_generic_property_t *properties**
  Parameters of the Generic User Property state

**struct esp_ble_mesh_gen_admin_prop_srv_t**
User data of Generic Admin Property Server Model

### Public Members

- **esp_ble_mesh_model_t *model**
  Pointer to the Generic Admin Property Server Model. Initialized internally.

- **esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl**
  Response control of the server model received messages

- **uint8_t property_count**
  Generic Admin Property count

- **esp_ble_mesh_generic_property_t *properties**
  Parameters of the Generic Admin Property state

**struct esp_ble_mesh_gen_manu_prop_srv_t**
User data of Generic Manufacturer Property Server Model

uint16_t power
The value of Generic Power Default state

struct esp_ble_mesh_state_change_gen_power_range_set_t
Parameters of Generic Power Range Set state change event

Public Members

uint16_t range_min
The minimum value of Generic Power Range state

uint16_t range_max
The maximum value of Generic Power Range state

struct esp_ble_mesh_state_change_gen_loc_global_set_t
Parameters of Generic Location Global Set state change event

Public Members

int32_t latitude
The Global Latitude value of Generic Location state
Chapter 2. API Reference

int32_t longitude
The Global Longitude value of Generic Location state

int16_t altitude
The Global Altitude value of Generic Location state

struct esp_ble_mesh_state_change_gen_loc_local_set_t
Parameters of Generic Location Local Set state change event

Public Members

int16_t north
The Local North value of Generic Location state

int16_t east
The Local East value of Generic Location state

int16_t altitude
The Local Altitude value of Generic Location state

uint8_t floor_number
The Floor Number value of Generic Location state

uint16_t uncertainty
The Uncertainty value of Generic Location state

struct esp_ble_mesh_state_change_gen_user_property_set_t
Parameters of Generic User Property Set state change event

Public Members

uint16_t id
The property id of Generic User Property state

struct net_buf_simple *value
The property value of Generic User Property state

struct esp_ble_mesh_state_change_gen_admin_property_set_t
Parameters of Generic Admin Property Set state change event

Public Members

uint16_t id
The property id of Generic Admin Property state

uint8_t access
The property access of Generic Admin Property state

struct net_buf_simple *value
The property value of Generic Admin Property state

struct esp_ble_mesh_state_change_gen_manu_property_set_t
Parameters of Generic Manufacturer Property Set state change event

Public Members

uint16_t id
The property id of Generic Manufacturer Property state

uint8_t access
The property value of Generic Manufacturer Property state
struct esp_ble_mesh_server_recv_gen_user_property_get_t
   Context of the received Generic User Property Get message

Public Members

uint16_t property_id
   Property ID identifying a Generic User Property

struct esp_ble_mesh_server_recv_gen_admin_property_get_t
   Context of the received Generic Admin Property Get message

Public Members

uint16_t property_id
   Property ID identifying a Generic Admin Property

struct esp_ble_mesh_server_recv_gen_manufacturer_property_get_t
   Context of the received Generic Manufacturer Property message

Public Members

uint16_t property_id
   Property ID identifying a Generic Manufacturer Property

struct esp_ble_mesh_server_recv_gen_client_properties_get_t
   Context of the received Generic Client Properties Get message

Public Members

uint16_t property_id
   A starting Client Property ID present within an element

struct esp_ble_mesh_server_recv_gen_onoff_set_t
   Context of the received Generic OnOff Set message

Public Members

bool op_en
   Indicate if optional parameters are included

uint8_t onoff
   Target value of Generic OnOff state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_level_set_t
   Context of the received Generic Level Set message

Public Members

...
Public Members

bool op_en
   Indicate if optional parameters are included

int16_t level
   Target value of Generic Level state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_delta_set_t
   Context of the received Generic Delta Set message

Public Members

bool op_en
   Indicate if optional parameters are included

int32_t delta_level
   Delta change of Generic Level state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_move_set_t
   Context of the received Generic Move Set message

Public Members

bool op_en
   Indicate if optional parameters are included

int16_t delta_level
   Delta Level step to calculate Move speed for Generic Level state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_def_trans_time_set_t
   Context of the received Generic Default Transition Time Set message
Chapter 2. API Reference

Public Members

**uint8_t trans_time**
The value of the Generic Default Transition Time state

**struct esp_ble_mesh_server_recv_gen_onpowerup_set_t**
Context of the received Generic OnPowerUp Set message

Public Members

**uint8_t onpowerup**
The value of the Generic OnPowerUp state

**struct esp_ble_mesh_server_recv_gen_power_level_set_t**
Context of the received Generic Power Level Set message

Public Members

**bool op_en**
Indicate if optional parameters are included

**uint16_t power**
Target value of Generic Power Actual state

**uint8_t tid**
Transaction ID

**uint8_t trans_time**
Time to complete state transition (optional)

**uint8_t delay**
Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_gen_power_default_set_t**
Context of the received Generic Power Default Set message

Public Members

**uint16_t power**
The value of the Generic Power Default state

**struct esp_ble_mesh_server_recv_gen_power_range_set_t**
Context of the received Generic Power Range Set message

Public Members

**uint16_t range_min**
Value of Range Min field of Generic Power Range state

**uint16_t range_max**
Value of Range Max field of Generic Power Range state

**struct esp_ble_mesh_server_recv_gen_loc_global_set_t**
Context of the received Generic Location Global Set message
Chapter 2. API Reference

Public Members

int32_t \texttt{global_latitude}  
Global Coordinates (Latitude)

int32_t \texttt{global_longitude}  
Global Coordinates (Longitude)

int16_t \texttt{global_altitude}  
Global Altitude

\begin{verbatim}
struct esp_ble_mesh_server_recv_gen_loc_local_set_t  
Context of the received Generic Location Local Set message
\end{verbatim}

Public Members

int16_t \texttt{local_north}  
Local Coordinates (North)

int16_t \texttt{local_east}  
Local Coordinates (East)

int16_t \texttt{local_altitude}  
Local Altitude

uint8_t \texttt{floor_number}  
Floor Number

uint16_t \texttt{uncertainty}  
Uncertainty

\begin{verbatim}
struct esp_ble_mesh_server_recv_gen_user_property_set_t  
Context of the received Generic User Property Set message
\end{verbatim}

Public Members

uint16_t \texttt{property_id}  
Property ID identifying a Generic User Property

\begin{verbatim}
struct net_buf_simple *\texttt{property_value}  
Raw value for the User Property
\end{verbatim}

\begin{verbatim}
struct esp_ble_mesh_server_recv_gen_admin_property_set_t  
Context of the received Generic Admin Property Set message
\end{verbatim}

Public Members

uint16_t \texttt{property_id}  
Property ID identifying a Generic Admin Property

uint8_t \texttt{user_access}  
Enumeration indicating user access

\begin{verbatim}
struct net_buf_simple *\texttt{property_value}  
Raw value for the Admin Property
\end{verbatim}

\begin{verbatim}
struct esp_ble_mesh_server_recv_gen_manufacturer_property_set_t  
Context of the received Generic Manufacturer Property Set message
\end{verbatim}
Public Members

uint16_t property_id
  Property ID identifying a Generic Manufacturer Property

uint8_t user_access
  Enumeration indicating user access

struct esp_ble_mesh_generic_server_cb_param_t
  Generic Server Model callback parameters

Public Members

esp_ble_mesh_model_t *model
  Pointer to Generic Server Models

esp_ble_mesh_msg_ctx_t ctx
  Context of the received messages

esp_ble_mesh_generic_server_cb_value_t value
  Value of the received Generic Messages

Macros

ESP_BLE_MESH_MODEL_GEN_ONOFF_CLI (cli_pub, cli_data)
  Define a new Generic OnOff Client Model.
  Note This API needs to be called for each element on which the application needs to have a Generic OnOff
  Client Model.
  Return New Generic OnOff Client Model instance.
  Parameters
  • cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
  • cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_GEN_LEVEL_CLI (cli_pub, cli_data)
  Define a new Generic Level Client Model.
  Note This API needs to be called for each element on which the application needs to have a Generic Level
  Client Model.
  Return New Generic Level Client Model instance.
  Parameters
  • cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
  • cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_CLI (cli_pub, cli_data)
  Define a new Generic Default Transition Time Client Model.
  Note This API needs to be called for each element on which the application needs to have a Generic Default
  Transition Time Client Model.
  Return New Generic Default Transition Time Client Model instance.
  Parameters
  • cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
  • cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_CLI (cli_pub, cli_data)
  Define a new Generic Power OnOff Client Model.
  Note This API needs to be called for each element on which the application needs to have a Generic Power
  OnOff Client Model.
  Return New Generic Power OnOff Client Model instance.
  Parameters
  • cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
  • cli_data: Pointer to the unique struct esp_ble_mesh_client_t.
**ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_CLI** (cli_pub, cli_data)

Define a new Generic Power Level Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Power Level Client Model.

**Return** New Generic Power Level Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_BATTERY_CLI** (cli_pub, cli_data)

Define a new Generic Battery Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Battery Client Model.

**Return** New Generic Battery Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_LOCATION_CLI** (cli_pub, cli_data)

Define a new Generic Location Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Location Client Model.

**Return** New Generic Location Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_PROPERTY_CLI** (cli_pub, cli_data)

Define a new Generic Property Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Property Client Model.

**Return** New Generic Location Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_ONOFF_SRV** (srv_pub, srv_data)

Generic Server Models related context.

Define a new Generic OnOff Server Model.

**Note** 1. The Generic OnOff Server Model is a root model.
   1. This model shall support model publication and model subscription.

**Return** New Generic OnOff Server Model instance.

**Parameters**
- srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- srv_data: Pointer to the unique struct `esp_ble_mesh_gen_onoff_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_LEVEL_SRV** (srv_pub, srv_data)

Define a new Generic Level Server Model.

**Note** 1. The Generic Level Server Model is a root model.
   1. This model shall support model publication and model subscription.

**Return** New Generic Level Server Model instance.

**Parameters**
- srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- srv_data: Pointer to the unique struct `esp_ble_mesh_gen_level_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_SRV** (srv_pub, srv_data)

Define a new Generic Default Transition Time Server Model.
Note 1. The Generic Default Transition Time Server Model is a root model.
1. This model shall support model publication and model subscription.

Return New Generic Default Transition Time Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_def_trans_time_srv_t`.

```c
ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SRV (srv_pub, srv_data)
```

Define a new Generic Power OnOff Server Model.

Note 1. The Generic Power OnOff Server model extends the Generic OnOff Server model. When this model is present on an element, the corresponding Generic Power OnOff Setup Server model shall also be present.
1. This model may be used to represent a variety of devices that do not fit any of the model descriptions that have been defined but support the generic properties of On/Off.
2. This model shall support model publication and model subscription.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_power_onoff_srv_t`.

```c
ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SETUP_SRV (srv_pub, srv_data)
```

Define a new Generic Power OnOff Setup Server Model.

1. This model shall support model subscription.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_power_onoff_setup_srv_t`.

```c
ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SRV (srv_pub, srv_data)
```

Define a new Generic Power Level Server Model.

Note 1. The Generic Power Level Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Generic Power Level Setup Server model shall also be present.
1. This model shall support model publication and model subscription.

Return New Generic Power Level Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_power_level_srv_t`.

```c
ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SETUP_SRV (srv_pub, srv_data)
```

Define a new Generic Power Level Setup Server Model.

1. This model shall support model subscription.

Return New Generic Power Level Setup Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_power_level_setup_srv_t`.

```c
ESP_BLE_MESH_MODEL_GEN_BATTERY_SRV (srv_pub, srv_data)
```

Define a new Generic Battery Server Model.

Note 1. The Generic Battery Server Model is a root model.
1. This model shall support model publication and model subscription.
2. The model may be used to represent an element that is powered by a battery.

Return New Generic Battery Server Model instance.

Parameters
• srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• srv_data: Pointer to the unique struct `esp_ble_mesh_gen_battery_srv_t`.

`ESP_BLE_MESH_MODEL_GEN_LOCATION_SRV` (srv_pub, srv_data)

Define a new Generic Location Server Model.

**Note**
1. The Generic Location Server model is a root model. When this model is present on an Element, the corresponding Generic Location Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.
   2. The model may be used to represent an element that knows its location (global or local).

**Return** New Generic Location Server Model instance.

**Parameters**
• srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• srv_data: Pointer to the unique struct `esp_ble_mesh_gen_location_srv_t`.

`ESP_BLE_MESH_MODEL_GEN_LOCATION_SETUP_SRV` (srv_pub, srv_data)

Define a new Generic Location Setup Server Model.

**Note**
1. The Generic Location Setup Server model extends the Generic Location Server model.
   1. This model shall support model subscription.

**Return** New Generic Location Setup Server Model instance.

**Parameters**
• srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• srv_data: Pointer to the unique struct `esp_ble_mesh_gen_location_setup_srv_t`.

`ESP_BLE_MESH_MODEL_GEN_USER_PROP_SRV` (srv_pub, srv_data)

Define a new Generic User Property Server Model.

**Note**
1. The Generic User Property Server model is a root model.
   1. This model shall support model publication and model subscription.

**Return** New Generic User Property Server Model instance.

**Parameters**
• srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• srv_data: Pointer to the unique struct `esp_ble_mesh_gen_user_prop_srv_t`.

`ESP_BLE_MESH_MODEL_GEN_ADMIN_PROP_SRV` (srv_pub, srv_data)

Define a new Generic Admin Property Server Model.

**Note**
1. The Generic Admin Property Server model extends the Generic User Property Server model.
   1. This model shall support model publication and model subscription.

**Return** New Generic Admin Property Server Model instance.

**Parameters**
• srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• srv_data: Pointer to the unique struct `esp_ble_mesh_gen_admin_prop_srv_t`.

`ESP_BLE_MESH_MODEL_GEN_MANUFACTURER_PROP_SRV` (srv_pub, srv_data)

Define a new Generic Manufacturer Property Server Model.

**Note**
1. The Generic Manufacturer Property Server model extends the Generic User Property Server model.
   1. This model shall support model publication and model subscription.

**Return** New Generic Manufacturer Property Server Model instance.

**Parameters**
• srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• srv_data: Pointer to the unique struct `esp_ble_mesh_gen_manu_prop_srv_t`.

`ESP_BLE_MESH_MODEL_GEN_CLIENT_PROP_SRV` (srv_pub, srv_data)

Define a new Generic Client Property Server Model.

**Note**
1. The Generic Client Property Server model is a root model.
   1. This model shall support model publication and model subscription.

**Return** New Generic Client Property Server Model instance.

**Parameters**
• srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• srv_data: Pointer to the unique struct `esp_ble_mesh_gen_client_prop_srv_t`.
Type Definitions

typedef void (*esp_ble_mesh_generic_client_cb_t)(
estp_ble_mesh_generic_client_cb_event_t event,
estp_ble_mesh_generic_client_cb_param_t *param)

Bluetooth Mesh Generic Client Model function.

Generic Client Model callback function type

Parameters
• event: Event type
• param: Pointer to callback parameter

typedef void (*esp_ble_mesh_generic_server_cb_t)(
estp_ble_mesh_generic_server_cb_event_t event,
estp_ble_mesh_generic_server_cb_param_t *param)

Bluetooth Mesh Generic Server Model function.

Generic Server Model callback function type

Parameters
• event: Event type
• param: Pointer to callback parameter

Enumerations

enum esp_ble_mesh_generic_client_cb_event_t
This enum value is the event of Generic Client Model

Values:
ESP_BLE_MESH_GENERIC_CLIENT_GET_STATE_EVT
ESP_BLE_MESH_GENERIC_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_GENERIC_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_GENERIC_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_GENERIC_CLIENT_EVT_MAX

enum esp_ble_mesh_gen_user_prop_access_t
This enum value is the access value of Generic User Property

Values:
ESP_BLE_MESH_GEN_USER_ACCESS_PROHIBIT
ESP_BLE_MESH_GEN_USER_ACCESS_READ
ESP_BLE_MESH_GEN_USER_ACCESS_WRITE
ESP_BLE_MESH_GEN_USER_ACCESS_READ_WRITE

enum esp_ble_mesh_gen_admin_prop_access_t
This enum value is the access value of Generic Admin Property

Values:
ESP_BLE_MESH_GEN_ADMIN_NOT_USER_PROP
ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ
ESP_BLE_MESH_GEN_ADMIN_ACCESS_WRITE
ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ_WRITE

enum esp_ble_mesh_gen_manu_prop_access_t
This enum value is the access value of Generic Manufacturer Property

Values:
Chapter 2. API Reference

ESP_BLE_MESH_GEN_MANU_NOT_USER_PROP
ESP_BLE_MESH_GEN_MANU_ACCESS_READ

enum esp_ble_mesh_generic_server_cb_event_t

This enum value is the event of Generic Server Model

Values:

ESP_BLE_MESH_GENERIC_SERVER_STATE_CHANGE_EVT

1. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback
to the application layer when Generic Get messages are received.
2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback
to the application layer when Generic Set/Set Unack messages are received.

ESP_BLE_MESH_GENERIC_SERVER_RECV_GET_MSG_EVT

When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback
to the application layer when Generic Get messages are received.

ESP_BLE_MESH_GENERIC_SERVER_RECV_SET_MSG_EVT

When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback
to the application layer when Generic Set/Set Unack messages are received.

ESP_BLE_MESH_GENERIC_SERVER_EVT_MAX

Sensor Client/Server Models

Header File

• components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_sensor_model_api.h

Functions

esp_err_t esp_ble_mesh_register_sensor_client_callback (esp_ble_mesh_sensor_client_cb_t callback)

Register BLE Mesh Sensor Client Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] callback: Pointer to the callback function.

esp_err_t esp_ble_mesh_sensor_client_get_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_sensor_client_get_state_t *get_state)

Get the value of Sensor Server Model states using the Sensor Client Model get messages.

Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to
esp_ble_mesh_sensor_message_opcode_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters

• [in] params: Pointer to BLE Mesh common client parameters.
• [in] get_state: Pointer to sensor get message value. Shall not be set to NULL.

esp_err_t esp_ble_mesh_sensor_client_set_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_sensor_client_set_state_t *set_state)

Set the value of Sensor Server Model states using the Sensor Client Model set messages.

Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to
esp_ble_mesh_sensor_message_opcode_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters

• [in] params: Pointer to BLE Mesh common client parameters.
• [in] set_state: Pointer to sensor set message value. Shall not be set to NULL.
Chapter 2. API Reference

```c
esp_err_t esp_ble_mesh_register_sensor_server_callback(esp_ble_mesh_sensor_server_cb_t callback)
```

Register BLE Mesh Sensor Server Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

• [in] callback: Pointer to the callback function.

**Unions**

```c
union esp_ble_mesh_sensor_client_get_state_t

#include <esp_ble_mesh_sensor_model_api.h> Sensor Client Model get message union.

    ESP_BLE_MESH_SENSOR_SERVER_RECV_GET_MSG_EVT
\end{verbatim}

\texttt{esp\_ble\_mesh\_sensor\_server\_recv\_msg\_t set}
\begin{verbatim}
    ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT
\end{verbatim}

Structures

\texttt{struct esp\_ble\_mesh\_sensor\_descriptor\_get\_t}

\hspace{1cm} Bluetooth Mesh Sensor Client Model Get and Set parameters structure.

Parameters of Sensor Descriptor Get

Public Members

bool \texttt{op\_en}

Indicate if optional parameters are included

uint16_t \texttt{property\_id}

Property ID of a sensor (optional)

\texttt{struct esp\_ble\_mesh\_sensor\_cadence\_get\_t}

Parameter of Sensor Cadence Get

Public Members

uint16_t \texttt{property\_id}

Property ID of a sensor

\texttt{struct esp\_ble\_mesh\_sensor\_cadence\_set\_t}

Parameters of Sensor Cadence Set

Public Members

uint16_t \texttt{property\_id}

Property ID for the sensor

uint8_t \texttt{fast\_cadence\_period\_divisor} \begin{small}7\end{small}

Divisor for the publish period

uint8_t \texttt{status\_trigger\_type} \begin{small}1\end{small}

The unit and format of the Status Trigger Delta fields

\texttt{struct net\_buf\_simple *} \texttt{status\_trigger\_delta\_down}

Delta down value that triggers a status message

\texttt{struct net\_buf\_simple *} \texttt{status\_trigger\_delta\_up}

Delta up value that triggers a status message

uint8_t \texttt{status\_min\_interval}

Minimum interval between two consecutive Status messages

\texttt{struct net\_buf\_simple *} \texttt{fast\_cadence\_low}

Low value for the fast cadence range

\texttt{struct net\_buf\_simple *} \texttt{fast\_cadence\_high}

Fast value for the fast cadence range
struct esp_ble_mesh_sensor_settings_get_t  
Parameter of Sensor Settings Get

**Public Members**

uint16_t sensor_property_id  
Property ID of a sensor

struct esp_ble_mesh_sensor_setting_get_t  
Parameters of Sensor Setting Get

**Public Members**

uint16_t sensor_property_id  
Property ID of a sensor

uint16_t sensor_setting_property_id  
Setting ID identifying a setting within a sensor

struct esp_ble_mesh_sensor_setting_set_t  
Parameters of Sensor Setting Set

**Public Members**

uint16_t sensor_property_id  
Property ID identifying a sensor

uint16_t sensor_setting_property_id  
Setting ID identifying a setting within a sensor

struct net_buf_simple *sensor_setting_raw  
Raw value for the setting

struct esp_ble_mesh_sensor_get_t  
Parameters of Sensor Get

**Public Members**

bool op_en  
Indicate if optional parameters are included

uint16_t property_id  
Property ID for the sensor (optional)

struct esp_ble_mesh_sensor_column_get_t  
Parameters of Sensor Column Get

**Public Members**

uint16_t property_id  
Property identifying a sensor

struct net_buf_simple *raw_value_x  
Raw value identifying a column

struct esp_ble_mesh_sensor_series_get_t  
Parameters of Sensor Series Get
Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t property_id
   Property identifying a sensor

struct net_buf_simple *raw_value_x1
   Raw value identifying a starting column (optional)

struct net_buf_simple *raw_value_x2
   Raw value identifying an ending column (C.1)

struct esp_ble_mesh_sensor_descriptor_status_cb_t
   Bluetooth Mesh Sensor Client Model Get and Set callback parameters structure.
   Parameter of Sensor Descriptor Status

Public Members

struct net_buf_simple *descriptor
   Sequence of 8-octet sensor descriptors (optional)

struct esp_ble_mesh_sensor_cadence_status_cb_t
   Parameters of Sensor Cadence Status

Public Members

uint16_t property_id
   Property for the sensor

struct net_buf_simple *sensor_cadence_value
   Value of sensor cadence state

struct esp_ble_mesh_sensor_settings_status_cb_t
   Parameters of Sensor Settings Status

Public Members

uint16_t sensor_property_id
   Property ID identifying a sensor

struct net_buf_simple *sensor_setting_property_ids
   A sequence of N sensor setting property IDs (optional)

struct esp_ble_mesh_sensor_setting_status_cb_t
   Parameters of Sensor Setting Status

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t sensor_property_id
   Property ID identifying a sensor

uint16_t sensor_setting_property_id
   Setting ID identifying a setting within a sensor
uint8_t sensor_setting_access
    Read/Write access rights for the setting (optional)

struct net_buf_simple *sensor_setting_raw
    Raw value for the setting

struct esp_ble_mesh_sensor_status_cb_t
    Parameter of Sensor Status

Public Members

struct net_buf_simple *marshalled_sensor_data
    Value of sensor data state (optional)

struct esp_ble_mesh_sensor_column_status_cb_t
    Parameters of Sensor Column Status

Public Members

uint16_t property_id
    Property identifying a sensor and the Y axis

struct net_buf_simple *sensor_column_value
    Left values of sensor column status

struct esp_ble_mesh_sensor_series_status_cb_t
    Parameters of Sensor Series Status

Public Members

uint16_t property_id
    Property identifying a sensor and the Y axis

struct net_buf_simple *sensor_series_value
    Left values of sensor series status

struct esp_ble_mesh_sensor_client_cb_param_t
    Sensor Client Model callback parameters

Public Members

int error_code
    0: success, otherwise failure. For the error code values please refer to errno.h file. A negative sign is added to the standard error codes in errno.h.

esp_ble_mesh_client_common_param_t *params
    The client common parameters.

esp_ble_mesh_sensor_client_status_cb_t *status_cb
    The sensor status message callback values

struct esp_ble_mesh_sensor_descriptor_t
    Parameters of Sensor Descriptor state

Public Members

uint32_t positive_tolerance
    The value of Sensor Positive Tolerance field
uint32_t negative_tolerance : 12
    The value of Sensor Negative Tolerance field

uint32_t sampling_function : 8
    The value of Sensor Sampling Function field

uint8_t measure_period
    The value of Sensor Measurement Period field

uint8_t update_interval
    The value of Sensor Update Interval field

struct esp_ble_mesh_sensor_setting_t
    Parameters of Sensor Setting state

**Public Members**

uint16_t property_id
    The value of Sensor Setting Property ID field

uint8_t access
    The value of Sensor Setting Access field

struct net_buf_simple *raw
    The value of Sensor Setting Raw field

struct esp_ble_mesh_sensor_cadence_t
    Parameters of Sensor Cadence state

**Public Members**

uint8_t period_divisor : 7
    The value of Fast Cadence Period Divisor field

uint8_t trigger_type : 1
    The value of Status Trigger Type field

struct net_buf_simple *trigger_delta_down
    Note: The parameter “size” in trigger_delta_down, trigger_delta_up, fast_cadence_low & fast_cadence_high indicates the exact length of these four parameters, and they are associated with the Sensor Property ID. Users need to initialize the “size” precisely. The value of Status Trigger Delta Down field

struct net_buf_simple *trigger_delta_up
    The value of Status Trigger Delta Up field

uint8_t min_interval
    The value of Status Min Interval field

struct net_buf_simple *fast_cadence_low
    The value of Fast Cadence Low field

struct net_buf_simple *fast_cadence_high
    The value of Fast Cadence High field

struct esp_ble_mesh_sensor_data_t
    Parameters of Sensor Data state

**Public Members**

uint8_t format : 1
    Format A: The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
Format B: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1 – 127). The value 0x7F represents a length of zero. The value of the Sensor Data format

```c
uint8_t length : 7
    The value of the Sensor Data length

struct net_buf_simple *raw_value
    The value of Sensor Data raw value
```

**struct esp_ble_mesh_sensor_series_column_t**

Parameters of Sensor Series Column state

**Public Members**

```c
struct net_buf_simple *raw_value_x
    The value of Sensor Raw Value X field

struct net_buf_simple *column_width
    The value of Sensor Column Width field

struct net_buf_simple *raw_value_y
    The value of Sensor Raw Value Y field
```

**struct esp_ble_mesh_sensor_state_t**

Parameters of Sensor states

**Public Members**

```c
uint16_t sensor_property_id
    The value of Sensor Property ID field

esp_ble_mesh_sensor_descriptor_t descriptor
    Parameters of the Sensor Descriptor state

const uint8_t setting_count
    Multiple Sensor Setting states may be present for each sensor. The Sensor Setting Property ID values shall be unique for each Sensor Property ID that identifies a sensor within an element.

esp_ble_mesh_sensor_setting_t *settings
    Parameters of the Sensor Setting state

esp_ble_mesh_sensor_cadence_t *cadence
    The Sensor Cadence state may be not supported by sensors based on device properties referencing “non-scalar characteristics” such as “histograms” or “composite characteristics”. Parameters of the Sensor Cadence state

esp_ble_mesh_sensor_data_t sensor_data
    Parameters of the Sensor Data state

esp_ble_mesh_sensor_series_column_t *series_column
    Parameters of the Sensor Series Column state
```

**struct esp_ble_mesh_sensor_srv_t**

User data of Sensor Server Model

**Public Members**

```c
esp_ble_mesh_model_t *model
    Pointer to the Sensor Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages
```
**Chapter 2. API Reference**

```c
const uint8_t state_count
Sensor state count

esp_ble_mesh_sensor_state_t *states
Parameters of the Sensor states
```

**Public Members**

```c
esp_ble_mesh_model_t *model
Pointer to the Sensor Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages
```

```c
const uint8_t state_count
Sensor state count

esp_ble_mesh_sensor_state_t *states
Parameters of the Sensor states
```

**struct esp_ble_mesh_sensor_setup_srv_t**
User data of Sensor Setup Server Model

**Public Members**

```c
uint16_t property_id
The value of Sensor Property ID state

uint8_t period_divisor : 7
The value of Fast Cadence Period Divisor state

uint8_t trigger_type : 1
The value of Status Trigger Type state
```

```c
struct net_buf_simple *trigger_delta_down
The value of Status Trigger Delta Down state

struct net_buf_simple *trigger_delta_up
The value of Status Trigger Delta Up state
```

```c
uint8_t min_interval
The value of Status Min Interval state
```

```c
struct net_buf_simple *fast_cadence_low
The value of Fast Cadence Low state

struct net_buf_simple *fast_cadence_high
The value of Fast Cadence High state
```

**struct esp_ble_mesh_state_change_sensor_cadence_set_t**
Parameters of Sensor Cadence Set state change event

**Public Members**

```c
uint16_t property_id
The value of Sensor Property ID state

uint16_t setting_property_id
The value of Sensor Setting Property ID state
```

**struct esp_ble_mesh_state_change_sensor_setting_set_t**
Parameters of Sensor Setting Set state change event

**Public Members**

```c
uint16_t property_id
The value of Sensor Property ID state

uint16_t setting_property_id
The value of Sensor Setting Property ID state
```
struct net_buf_simple *setting_value
    The value of Sensor Property Value state

struct esp_ble_mesh_server_recv_sensor_descriptor_get_t
    Context of the received Sensor Descriptor Get message

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t property_id
    Property ID of a sensor (optional)

struct esp_ble_mesh_server_recv_sensor_cadence_get_t
    Context of the received Sensor Cadence Get message

Public Members

uint16_t property_id
    Property ID of a sensor

struct esp_ble_mesh_server_recv_sensor_settings_get_t
    Context of the received Sensor Settings Get message

Public Members

uint16_t property_id
    Property ID of a sensor

uint16_t setting_property_id
    Setting ID identifying a setting within a sensor

struct esp_ble_mesh_server_recv_sensor_setting_get_t
    Context of the received Sensor Setting Get message

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t property_id
    Property ID for the sensor (optional)

struct esp_ble_mesh_server_recv_sensor_column_get_t
    Context of the received Sensor Column Get message

Public Members

Public Members

**Public Members**

```c
uint16_t property_id
```
Property identifying a sensor

```c
struct net_buf_simple *raw_value_x
```
Raw value identifying a column

**struct esp_ble_mesh_server_recv_sensor_series_get_t**
Context of the received Sensor Series Get message

**Public Members**

```c
bool op_en
```
Indicate if optional parameters are included

```c
uint16_t property_id
```
Property identifying a sensor

```c
struct net_buf_simple *raw_value
```
Raw value containing X1 and X2 (optional)

**struct esp_ble_mesh_server_recv_sensor_cadence_set_t**
Context of the received Sensor Cadence Set message

**Public Members**

```c
uint16_t property_id
```
Property ID for the sensor

```c
struct net_buf_simple *cadence
```
Value of Sensor Cadence state

**struct esp_ble_mesh_server_recv_sensor_setting_set_t**
Context of the received Sensor Setting Set message

**Public Members**

```c
uint16_t property_id
```
Property ID identifying a sensor

```c
uint16_t setting_property_id
```
Setting ID identifying a setting within a sensor

```c
struct net_buf_simple *setting_raw
```
Raw value for the setting

**struct esp_ble_mesh_sensor_server_cb_param_t**
Sensor Server Model callback parameters

**Public Members**

```c
esp_ble_mesh_model_t *model
```
Pointer to Sensor Server Models

```c
esp_ble_mesh_msg_ctx_t *ctx
```
Context of the received messages

```c
esp_ble_mesh_sensor_server_cb_value_t *value
```
Value of the received Sensor Messages
Macros

ESP_BLE_MESH_MODEL_SENSOR_CLI (cli_pub, cli_data)

Define a new Sensor Client Model.

Note  This API needs to be called for each element on which the application needs to have a Sensor Client Model.

Return  New Sensor Client Model instance.

Parameters

- cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_SENSOR_SRV (srv_pub, srv_data)

Sensor Server Models related context.

Define a new Sensor Server Model.

Note  1. The Sensor Server model is a root model. When this model is present on an element, the corresponding Sensor Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.

Return  New Sensor Server Model instance.

Parameters

- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_sensor_srv_t.

ESP_BLE_MESH_MODEL_SENSOR_SETUP_SRV (srv_pub, srv_data)

Define a new Sensor Setup Server Model.

Note  1. The Sensor Setup Server model extends the Sensor Server model.
   1. This model shall support model publication and model subscription.

Return  New Sensor Setup Server Model instance.

Parameters

- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_sensor_setup_srv_t.

ESP_BLE_MESH_INVALID_SENSOR_PROPERTY_ID

Invalid Sensor Property ID

ESP_BLE_MESH_SENSOR_PROPERTY_ID_LEN

Length of Sensor Property ID

ESP_BLE_MESH_SENSOR_DESCRIPTOR_LEN

Length of Sensor Descriptor state

ESP_BLE_MESH_SENSOR_UNSPECIFIED_POS_TOLERANCE

Unspecified Sensor Positive Tolerance

ESP_BLE_MESH_SENSOR_UNSPECIFIED_NEG_TOLERANCE

Unspecified Sensor Negative Tolerance

ESP_BLE_MESH_SENSOR_NOT_APPL_MEASURE_PERIOD

Not applicable Sensor Measurement Period

ESP_BLE_MESH_SENSOR_NOT_APPL_UPDATE_INTERVAL

Not applicable Sensor Update Interval

ESP_BLE_MESH_INVALID_SENSOR_SETTING_PROPERTY_ID

Invalid Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_PROPERTY_ID_LEN

Length of Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_LEN

Length of Sensor Setting Access

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ

Sensor Setting Access - Read
ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ_WRITE
Sensor Setting Access - Read & Write

ESP_BLE_MESH_SENSOR_DIVISOR_TRIGGER_TYPE_LEN
Length of Sensor Divisor Trigger Type

ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_LEN
Length of Sensor Status Min Interval

ESP_BLE_MESH_SENSOR_PERIOD_DIVISOR_MAX_VALUE
Maximum value of Sensor Period Divisor

ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_MAX
Maximum value of Sensor Status Min Interval

ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_CHAR
Sensor Status Trigger Type - Format Type of the characteristic that the Sensor Property ID state references

ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_UINT16
Sensor Status Trigger Type - Format Type “uint16”

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A
Sensor Data Format A

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B
Sensor Data Format B

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID_LEN
MPID length of Sensor Data Format A

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID_LEN
MPID length of Sensor Data Format B

ESP_BLE_MESH_SENSOR_DATA_ZERO_LEN
Zero length of Sensor Data.

Note: The Length field is a 1-based uint7 value (valid range 0x0-0x7F, representing range of 1-127). The value 0x7F represents a length of zero.

ESP_BLE_MESH_GET_SENSOR_DATA_FORMAT (_data)
Get format of the sensor data.

Note Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the format of the corresponding sensor data.

Return Format of the sensor data.

Parameters
• _data: Pointer to the start of the sensor data.

ESP_BLE_MESH_GET_SENSOR_DATA_LENGTH (_data, _fmt)
Get length of the sensor data.

Note Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the length of the corresponding sensor data.

Return Length (zero-based) of the sensor data.

Parameters
• _data: Pointer to the start of the sensor data.
• _fmt: Format of the sensor data.

ESP_BLE_MESH_GET_SENSOR_DATA_PROPERTY_ID (_data, _fmt)
Get Sensor Property ID of the sensor data.

Note Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting Sensor Property ID of the corresponding sensor data.

Return Sensor Property ID of the sensor data.

Parameters
• _data: Pointer to the start of the sensor data.
• _fmt: Format of the sensor data.
ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID (_len, _id)

Generate a MPID value for sensor data with Format A.

**Note**

1. The Format field is 0b0 and indicates that Format A is used.
2. The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
3. The Property ID is an 11-bit bit field representing 11 LSb of a Property ID.
4. This format may be used for Property Values that are not longer than 16 octets and for Property IDs less than 0x0800.

**Return**

2-octet MPID value for sensor data with Format A.

**Parameters**

- **_len**: Length of Sensor Raw value.
- **_id**: Sensor Property ID.

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID (_len, _id)

Generate a MPID value for sensor data with Format B.

**Note**

1. The Format field is 0b1 and indicates Format B is used.
2. The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
3. The Property ID is a 16-bit bit field representing a Property ID.
4. This format may be used for Property Values not longer than 128 octets and for any Property IDs.
   Property values longer than 128 octets are not supported by the Sensor Status message.
5. Exclude the generated 1-octet value, the 2-octet Sensor Property ID

**Return**

3-octet MPID value for sensor data with Format B.

**Parameters**

- **_len**: Length of Sensor Raw value.
- **_id**: Sensor Property ID.

**Type Definitions**

typedef void (*esp_ble_mesh_sensor_client_cb_t)(esp_ble_mesh_sensor_client_cb_event_t event, esp_ble_mesh_sensor_client_cb_param_t *param)

Bluetooth Mesh Sensor Client Model function.

Sensor Client Model callback function type

**Parameters**

- **event**: Event type
- **param**: Pointer to callback parameter

typedef void (*esp_ble_mesh_sensor_server_cb_t)(esp_ble_mesh_sensor_server_cb_event_t event, esp_ble_mesh_sensor_server_cb_param_t *param)

Bluetooth Mesh Sensor Server Model function.

Sensor Server Model callback function type

**Parameters**

- **event**: Event type
- **param**: Pointer to callback parameter

**Enumerations**

type enum esp_ble_mesh_sensor_client_cb_event_t

This enum value is the event of Sensor Client Model

**Values**

- ESP_BLE_MESH_SENSOR_CLIENT_GET_STATE_EVT
- ESP_BLE_MESH_SENSOR_CLIENT_SET_STATE_EVT
- ESP_BLE_MESH_SENSOR_CLIENT_PUBLISH_EVT
- ESP_BLE_MESH_SENSOR_CLIENT_TIMEOUT_EVT

Submit Document Feedback
Chapter 2. API Reference

ESP_BLE_MESH_SENSOR_CLIENT_EVT_MAX

enum esp_ble_mesh_sensor_sample_func

This enum value is value of Sensor Sampling Function

Values:

ESP_BLE_MESH_SAMPLE_FUNC_UNSPECIFIED
ESP_BLE_MESH_SAMPLE_FUNC_INSTANTANEOUS
ESP_BLE_MESH_SAMPLE_FUNC_ARITHMETIC_MEAN
ESP_BLE_MESH_SAMPLE_FUNC_RMS
ESP_BLE_MESH_SAMPLE_FUNC_MAXIMUM
ESP_BLE_MESH_SAMPLE_FUNC_MINIMUM
ESP_BLE_MESH_SAMPLE_FUNC_ACCUMULATED
ESP_BLE_MESH_SAMPLE_FUNC_COUNT

enum esp_ble_mesh_sensor_server_cb_event_t

This enum value is the event of Sensor Server Model

Values:

ESP_BLE_MESH_SENSOR_SERVER_STATE_CHANGE_EVT
1. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Sensor Get messages are received.
2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

ESP_BLE_MESH_SENSOR_SERVER_RECV_GET_MSG_EVT
When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Get messages are received.

ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT
When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

ESP_BLE_MESH_SENSOR_SERVER_EVT_MAX

Time and Scenes Client/Server Models

Header File

• components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_time_scene_model_api.h

Functions

esp_err_t esp_ble_mesh_register_time_scene_client_callback(esp_ble_mesh_time_scene_client_cb_t callback)

Register BLE Mesh Time Scene Client Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] callback: Pointer to the callback function.

esp_err_t esp_ble_mesh_time_scene_client_get_state(esp_ble_mesh_client_common_param_t *params,
esp_ble_mesh_time_scene_client_get_state_t *get_state)

Get the value of Time Scene Server Model states using the Time Scene Client Model get messages.

Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_time_scene_message_opcode_t in esp_ble_mesh_defs.h
Return  ESP_OK on success or error code otherwise.

Parameters
- [in] get_state: Pointer to time scene get message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_time_scene_client_set_state(esp_ble_mesh_client_common_param_t *params,
                                                esp_ble_mesh_time_scene_client_set_state_t *set_state)
```

Set the value of Time Scene Server Model states using the Time Scene Client Model set messages.

Note  If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_time_scene_message_opcode_t in esp_ble_mesh_defs.h

Return  ESP_OK on success or error code otherwise.

Parameters
- [in] set_state: Pointer to time scene set message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_register_time_scene_server_callback(esp_ble_mesh_time_scene_server_cb_t callback)
```

Register BLE Mesh Time and Scenes Server Model callback.

Return  ESP_OK on success or error code otherwise.

Parameters
- [in] callback: Pointer to the callback function.

Unions

```c
union esp_ble_mesh_time_scene_client_get_state_t

Structures

struct esp_ble_mesh_time_set_t
Bluetooth Mesh Time Scene Client Model Get and Set parameters structure.
Parameters of Time Set

Public Members

uint8_t tai_seconds[5]
The current TAI time in seconds

uint8_t sub_second
The sub-second time in units of 1/256 second

uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t time_authority : 1
0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta : 15
Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
The local time zone offset in 15-minute increments

struct esp_ble_mesh_time_zone_set_t
Parameters of Time Zone Set

Public Members

uint8_t time_zone_offset_new
Upcoming local time zone offset

uint8_t tai_zone_change[5]
TAI Seconds time of the upcoming Time Zone Offset change

struct esp_ble_mesh_tai_utc_delta_set_t
Parameters of TAI-UTC Delta Set

Public Members

uint16_t tai_utc_delta_new : 15
Upcoming difference between TAI and UTC in seconds

uint16_t padding : 1
Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]
TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_time_role_set_t
Parameter of Time Role Set

Public Members

uint8_t time_role
The Time Role for the element

struct esp_ble_mesh_scene_store_t
Parameter of Scene Store
Public Members

uint16_t scene_number
The number of scenes to be stored

struct esp_ble_mesh_scene_recall_t
Parameters of Scene Recall

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t scene_number
The number of scenes to be recalled

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_scene_delete_t
Parameter of Scene Delete

Public Members

uint16_t scene_number
The number of scenes to be deleted

struct esp_ble_mesh_scheduler_act_get_t
Parameter of Scheduler Action Get

Public Members

uint8_t index
Index of the Schedule Register entry to get

struct esp_ble_mesh_scheduler_act_set_t
Parameters of Scheduler Action Set

Public Members

uint64_t index: 4
Index of the Schedule Register entry to set

uint64_t year: 7
Scheduled year for the action

uint64_t month: 12
Scheduled month for the action

uint64_t day: 5
Scheduled day of the month for the action

uint64_t hour: 5
Scheduled hour for the action
uint64_t minute: 6  
Scheduled minute for the action

uint64_t second: 6  
Scheduled second for the action

day_of_week: 7  
Schedule days of the week for the action

uint64_t action: 4  
Action to be performed at the scheduled time

uint64_t trans_time: 8  
Transition time for this action

uint16_t scene_number  
Transition time for this action

struct esp_ble_mesh_time_status_cb_t  
Bluetooth Mesh Time Scene Client Model Get and Set callback parameters structure.

Parameters of Time Status

Public Members

uint8_t tai_seconds[5]  
The current TAI time in seconds

uint8_t sub_second  
The sub-second time in units of 1/256 second

uint8_t uncertainty  
The estimated uncertainty in 10-millisecond steps

uint16_t time_authority: 1  
0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta: 15  
Current difference between TAI and UTC in seconds

uint8_t time_zone_offset  
The local time zone offset in 15-minute increments

struct esp_ble_mesh_time_zone_status_cb_t  
Parameters of Time Zone Status

Public Members

uint8_t time_zone_offset_curr  
Current local time zone offset

uint8_t time_zone_offset_new  
Upcoming local time zone offset

uint8_t tai_zone_change[5]  
TAI Seconds time of the upcoming Time Zone Offset change

struct esp_ble_mesh_tai_utc_delta_status_cb_t  
Parameters of TAI-UTC Delta Status

Public Members

uint16_t tai_utc_delta_curr: 15  
Current difference between TAI and UTC in seconds
uint16_t padding_1: 1
    Always 0b0. Other values are Prohibited.

uint16_t tai_utc_delta_new: 15
    Upcoming difference between TAI and UTC in seconds

uint16_t padding_2: 1
    Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]
    TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_time_role_status_cb_t
    Parameter of Time Role Status

Public Members

uint8_t time_role
    The Time Role for the element

struct esp_ble_mesh_scene_status_cb_t
    Parameters of Scene Status

Public Members

bool op_en
    Indicate if optional parameters are included

uint8_t status_code
    Status code of the last operation

uint16_t current_scene
    Scene Number of the current scene

uint16_t target_scene
    Scene Number of the target scene (optional)

uint8_t remain_time
    Time to complete state transition (C.1)

struct esp_ble_mesh_scene_register_status_cb_t
    Parameters of Scene Register Status

Public Members

uint8_t status_code
    Status code for the previous operation

uint16_t current_scene
    Scene Number of the current scene

struct net_buf_simple *scenes
    A list of scenes stored within an element

struct esp_ble_mesh_scheduler_status_cb_t
    Parameter of Scheduler Status

Public Members

uint16_t schedules
    Bit field indicating defined Actions in the Schedule Register
struct esp_ble_mesh_scheduler_act_status_cb_t
Parameters of Scheduler Action Status

Public Members

uint64_t index: 4
Enumerates (selects) a Schedule Register entry

uint64_t year: 7
Scheduled year for the action

uint64_t month: 12
Scheduled month for the action

uint64_t day: 5
Scheduled day of the month for the action

uint64_t hour: 5
Scheduled hour for the action

uint64_t minute: 6
Scheduled minute for the action

uint64_t second: 6
Scheduled second for the action

uint64_t day_of_week: 7
Scheduled days of the week for the action

uint64_t action: 4
Action to be performed at the scheduled time

uint64_t trans_time: 8
Transition time for this action

uint16_t scene_number
Transition time for this action

struct esp_ble_mesh_time_scene_client_cb_param_t
Time Scene Client Model callback parameters

Public Members

int error_code
Appropriate error code

esp_ble_mesh_client_common_param_t *params
The client common parameters.

esp_ble_mesh_time_scene_client_status_cb_t status_cb
The scene status message callback values

struct esp_ble_mesh_time_state_t
Parameters of Time state

Public Members

uint8_t tai_seconds[5]
The value of the TAI Seconds state

uint8_t subsecond
The value of the Subsecond field
Chapter 2. API Reference

uint8_t uncertainty
  The value of the Uncertainty field

uint8_t time_zone_offset_curr
  The value of the Time Zone Offset Current field

uint8_t time_zone_offset_new
  The value of the Time Zone Offset New state

uint8_t tai_zone_change[5]
  The value of the TAI of Zone Change field

uint16_t time_authority : 1
  The value of the Time Authority bit

uint16_t tai_utc_delta_curr : 15
  The value of the TAI-UTC Delta Current state

uint16_t tai_utc_delta_new : 15
  The value of the TAI-UTC Delta New state

uint8_t tai_delta_change[5]
  The value of the TAI of Delta Change field

struct esp_ble_mesh_time_state_t::[anonymous] time
  Parameters of the Time state

uint8_t time_role
  The value of the Time Role state

struct esp_ble_mesh_time_srv_t
  User data of Time Server Model

Public Members

esp_ble_mesh_model_t *model
  Pointer to the Time Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
  Response control of the server model received messages

esp_ble_mesh_time_state_t *state
  Parameters of the Time state

struct esp_ble_mesh_time_setup_srv_t
  User data of Time Setup Server Model

Public Members

esp_ble_mesh_model_t *model
  Pointer to the Time Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
  Response control of the server model received messages

esp_ble_mesh_time_state_t *state
  Parameters of the Time state

struct esp_ble_mesh_scene_register_t
  1. Scene Store is an operation of storing values of a present state of an element.
  2. The structure and meaning of the stored state is determined by a model. States to be stored are specified by each model.
  3. The Scene Store operation shall persistently store all values of all states marked as Stored with Scene for all models present on all elements of a node.
4. If a model is extending another model, the extending model shall determine the Stored with Scene behavior of that model. Parameters of Scene Register state

**Public Members**

```c
uint16_t scene_number
The value of the Scene Number
```

```c
uint8_t scene_type
The value of the Scene Type
```

```c
struct net_buf_simple *scene_value
Scene value may use a union to represent later, the union contains structures of all the model states which can be stored in a scene. The value of the Scene Value
```

```c
struct esp_ble_mesh_scenes_state_t
Parameters of Scenes state.
```

Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states of an element can be stored as a scene and can be recalled later from the scene memory.

A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container associated with it, are determined by a model.

The Scenes state change may start numerous parallel model transitions. In that case, each individual model handles the transition internally.

The scene transition is defined as a group of individual model transitions started by a Scene Recall operation. The scene transition is in progress when at least one transition from the group of individual model transitions is in progress.

**Public Members**

```c
const uint16_t scene_count
The Scenes state’s scene count
```

```c
esp_ble_mesh_scene_register_t *scenes
Parameters of the Scenes state
```

```c
uint16_t current_scene
The Current Scene state is a 16-bit value that contains either the Scene Number of the currently active scene or a value of 0x0000 when no scene is active.

When a Scene Store operation or a Scene Recall operation completes with success, the Current Scene state value shall be to the Scene Number used during that operation.

When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Current Scene state shall be set to 0x0000.

When any of the element’s state that is marked as “Stored with Scene” has changed not as a result of a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.

When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The value of the Current Scene state

```c
uint16_t target_scene
The Target Scene state is a 16-bit value that contains the target Scene Number when a scene transition is in progress.

When the scene transition is in progress and the target Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Target Scene state shall be set to 0x0000.

When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.
When the scene transition is not in progress, the value of the Target Scene state shall be set to 0x0000.
The value of the Target Scene state

`uint8_t status_code`
The status code of the last scene operation

`bool in_progress`
Indicate if the scene transition is in progress

**struct esp_ble_mesh_scene_srv_t**
User data of Scene Server Model

**Public Members**

`esp_ble_mesh_model_t *model`
Pointer to the Scene Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_scenes_state_t *state`
Parameters of the Scenes state

`esp_ble_mesh_last_msg_info_t last`
Parameters of the last received set message

`esp_ble_mesh_state_transition_t *transition`
Parameters of state transition

**struct esp_ble_mesh_scene_setup_srv_t**
User data of Scene Setup Server Model

**Public Members**

`esp_ble_mesh_model_t *model`
Pointer to the Scene Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_scenes_state_t *state`
Parameters of the Scenes state

**struct esp_ble_mesh_schedule_register_t**
Parameters of Scheduler Register state

**Public Members**

`bool in_use`
Indicate if the registered schedule is in use

`uint64_t year : 7`
The value of Scheduled year for the action

`uint64_t month : 12`
The value of Scheduled month for the action

`uint64_t day : 5`
The value of Scheduled day of the month for the action

`uint64_t hour : 5`
The value of Scheduled hour for the action
The value of Scheduled minute for the action

The value of Scheduled second for the action

The value of Schedule days of the week for the action

The value of Action to be performed at the scheduled time

The value of Transition time for this action

The value of Scene Number to be used for some actions

```
struct esp_ble_mesh_scheduler_state_t
Parameters of Scheduler state
```

**Public Members**

```
const uint8_t schedule_count
Scheduler count
```

```
esp_ble_mesh_schedule_register_t *schedules
Up to 16 scheduled entries
```

```
struct esp_ble_mesh_scheduler_srv_t
User data of Scheduler Server Model
```

**Public Members**

```
esp_ble_mesh_model_t *model
Pointer to the Scheduler Server Model. Initialized internally.
```

```
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages
```

```
esp_ble_mesh_scheduler_state_t *state
Parameters of the Scheduler state
```

```
struct esp_ble_mesh_scheduler_setup_srv_t
User data of Scheduler Setup Server Model
```

**Public Members**

```
esp_ble_mesh_model_t *model
Pointer to the Scheduler Setup Server Model. Initialized internally.
```

```
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages
```

```
esp_ble_mesh_scheduler_state_t *state
Parameters of the Scheduler state
```

```
struct esp_ble_mesh_state_change_time_set_t
Parameters of Time Set state change event
```
Public Members

uint8_t tai_seconds[5]
The current TAI time in seconds

uint8_t subsecond
The sub-second time in units of 1/256 second

uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t time_authority : 1
0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta_curr : 15
Current difference between TAI and UTC in seconds

uint8_t time_zone_offset_curr
The local time zone offset in 15-minute increments

struct esp_ble_mesh_state_change_time_status_t
Parameters of Time Status state change event

Public Members

uint8_t tai_seconds[5]
The current TAI time in seconds

uint8_t subsecond
The sub-second time in units of 1/256 second

uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t time_authority : 1
0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta_curr : 15
Current difference between TAI and UTC in seconds

uint8_t time_zone_offset_curr
The local time zone offset in 15-minute increments

struct esp_ble_mesh_state_change_time_zone_set_t
Parameters of Time Zone Set state change event

Public Members

uint8_t time_zone_offset_new
Upcoming local time zone offset

uint8_t tai_zone_change[5]
TAI Seconds time of the upcoming Time Zone Offset change

struct esp_ble_mesh_state_change_tai_utc_delta_set_t
Parameters of TAI UTC Delta Set state change event

Public Members

uint16_t tai_utc_delta_new : 15
Upcoming difference between TAI and UTC in seconds
uint8_t tai_delta_change[5]
  TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_state_change_time_role_set_t
  Parameter of Time Role Set state change event

  Public Members

  uint8_t time_role
    The Time Role for the element

struct esp_ble_mesh_state_change_scene_store_t
  Parameter of Scene Store state change event

  Public Members

  uint16_t scene_number
    The number of scenes to be stored

struct esp_ble_mesh_state_change_scene_recall_t
  Parameter of Scene Recall state change event

  Public Members

  uint16_t scene_number
    The number of scenes to be recalled

struct esp_ble_mesh_state_change_scene_delete_t
  Parameter of Scene Delete state change event

  Public Members

  uint16_t scene_number
    The number of scenes to be deleted

struct esp_ble_mesh_state_change_scheduler_act_set_t
  Parameter of Scheduler Action Set state change event

  Public Members

  uint64_t index : 4
    Index of the Schedule Register entry to set

  uint64_t year : 7
    Scheduled year for the action

  uint64_t month : 12
    Scheduled month for the action

  uint64_t day : 5
    Scheduled day of the month for the action

  uint64_t hour : 5
    Scheduled hour for the action

  uint64_t minute : 6
    Scheduled minute for the action

  uint64_t second : 6
    Scheduled second for the action
Chapter 2. API Reference

```c
uint64_t day_of_week : 7
    Schedule days of the week for the action

uint64_t action : 4
    Action to be performed at the scheduled time

uint64_t trans_time : 8
    Transition time for this action

uint16_t scene_number
    Scene number to be used for some actions
```

**struct esp_ble_mesh_server_recv_scheduler_act_get_t**
Context of the received Scheduler Action Get message

**Public Members**

```c
uint8_t index
    Index of the Schedule Register entry to get
```

**struct esp_ble_mesh_server_recv_time_set_t**
Context of the received Time Set message

**Public Members**

```c
uint8_t tai_seconds[5]
    The current TAI time in seconds

uint8_t subsecond
    The sub-second time in units of 1/256 second

uint8_t uncertainty
    The estimated uncertainty in 10-millisecond steps

uint16_t time_authority : 1
    0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta : 15
    Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
    The local timezone offset in 15-minute increments
```

**struct esp_ble_mesh_server_recv_time_zone_set_t**
Context of the received Time Zone Set message

**Public Members**

```c
uint8_t time_zone_offset_new
    Upcoming local time zone offset

uint8_t tai_zone_change[5]
    TAI Seconds time of the upcoming Time Zone Offset change
```

**struct esp_ble_mesh_server_recv_tai_utc_delta_set_t**
Context of the received TAI UTC Delta Set message

**Public Members**

```c
uint16_t tai_utc_delta_new : 15
    Upcoming difference between TAI and UTC in seconds
```
uint16_t padding : 1  
Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]  
TAI Secondstime of the upcoming TAI-UTC Delta change

**struct esp_ble_mesh_server_recv_time_role_set_t**  
Context of the received Time Role Set message

**Public Members**

uint8_t time_role  
The Time Role for the element

**struct esp_ble_mesh_server_recv_scene_store_t**  
Context of the received Scene Store message

**Public Members**

uint16_t scene_number  
The number of scenes to be stored

**struct esp_ble_mesh_server_recv_scene_recall_t**  
Context of the received Scene Recall message

**Public Members**

bool op_en  
Indicate if optional parameters are included

uint16_t scene_number  
The number of scenes to be recalled

uint8_t tid  
Transaction ID

uint8_t trans_time  
Time to complete state transition (optional)

uint8_t delay  
Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_scene_delete_t**  
Context of the received Scene Delete message

**Public Members**

uint16_t scene_number  
The number of scenes to be deleted

**struct esp_ble_mesh_server_recv_scheduler_act_set_t**  
Context of the received Scheduler Action Set message

**Public Members**

uint64_t index : 4  
Index of the Schedule Register entry to set

uint64_t year : 7  
Scheduled year for the action
Chapter 2. API Reference

```c
uint64_t month: 12
    Scheduled month for the action
uint64_t day: 5
    Scheduled day of the month for the action
uint64_t hour: 5
    Scheduled hour for the action
uint64_t minute: 6
    Scheduled minute for the action
uint64_t second: 6
    Scheduled second for the action
uint64_t day_of_week: 7
    Schedule days of the week for the action
uint64_t action: 4
    Action to be performed at the scheduled time
uint64_t trans_time: 8
    Transition time for this action
uint16_t scene_number
    Scene number to be used for some actions
```

```c
struct esp_ble_mesh_server_recv_time_status_t
    Context of the received Time Status message
```

**Public Members**

```c
uint8_t tai_seconds[5]
    The current TAI time in seconds
uint8_t subsecond
    The sub-second time in units of 1/256 second

    The estimated uncertainty in 10-millisecond steps
uint16_t time_authority: 1
    0 = No Time Authority, 1 = Time Authority
uint16_t tai_utc_delta: 15
    Current difference between TAI and UTC in seconds
uint8_t time_zone_offset
    The local time zone offset in 15-minute increments
```

```c
struct esp_ble_mesh_time_scene_server_cb_param_t
    Time Scene Server Model callback parameters
```

**Public Members**

```c
esp_ble_mesh_model_t *model
    Pointer to Time and Scenes Server Models
esp_ble_mesh_msg_ctx_t ctx
    Context of the received messages
esp_ble_mesh_time_scene_server_cb_value_t value
    Value of the received Time and Scenes Messages
```
Chapter 2. API Reference

Macros

ESP_BLE_MESH_MODEL_TIME_CLI(cli_pub, cli_data)

Define a new Time Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Time Client Model.

**Return** New Time Client Model instance.

**Parameters**

- cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_SCENE_CLI(cli_pub, cli_data)

Define a new Scene Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Scene Client Model.

**Return** New Scene Client Model instance.

**Parameters**

- cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_SCHEDULER_CLI(cli_pub, cli_data)

Define a new Scheduler Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Scheduler Client Model.

**Return** New Scheduler Client Model instance.

**Parameters**

- cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_TIME_SRV(srv_pub, srv_data)

Time Scene Server Models related context.

Define a new Time Server Model.

**Note** 1. The Time Server model is a root model. When this model is present on an Element, the corresponding Time Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

**Return** New Time Server Model instance.

**Parameters**

- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_time_srv_t.

ESP_BLE_MESH_MODEL_TIME_SETUP_SRV(srv_data)

Define a new Time Setup Server Model.

**Note** 1. The Time Setup Server model extends the Time Server model. Time is sensitive information that is propagated across a mesh network.

1. Only an authorized Time Client should be allowed to change the Time and Time Role states. A dedicated application key Bluetooth SIG Proprietary should be used on the Time Setup Server to restrict access to the server to only authorized Time Clients.

2. This model does not support subscribing nor publishing.

**Return** New Time Setup Server Model instance.

**Parameters**

- srv_data: Pointer to the unique struct esp_ble_mesh_time_setup_srv_t.

ESP_BLE_MESH_MODEL_SCENE_SRV(srv_pub, srv_data)

Define a new Scene Server Model.

**Note** 1. The Scene Server model is a root model. When this model is present on an Element, the corresponding Scene Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

2. The model may be present only on the Primary element of a node.

**Return** New Scene Server Model instance.
Chapter 2. API Reference

Parameters
- srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- srv_data: Pointer to the unique struct `esp_ble_mesh_scene_srv_t`.

ESP_BLE_MESH_MODEL_SCENE_SETUP_SRV (srv_pub, srv_data)
Define a new Scene Setup Server Model.

**Note** 1. The Scene Setup Server model extends the Scene Server model and the Generic Default Transition Time Server model.
2. This model shall support model subscription.
3. The model may be present only on the Primary element of a node.

**Return** New Scene Setup Server Model instance.

Parameters
- srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- srv_data: Pointer to the unique struct `esp_ble_mesh_scene_setup_srv_t`.

ESP_BLE_MESH_MODEL_SCHEDULER_SRV (srv_pub, srv_data)
Define a new Scheduler Server Model.

**Note** 1. The Scheduler Server model extends the Scene Server model. When this model is present on an Element, the corresponding Scheduler Setup Server model shall also be present.
2. This model shall support model publication and model subscription.
3. The model may be present only on the Primary element of a node.
4. The model requires the Time Server model shall be present on the element.

**Return** New Scheduler Server Model instance.

Parameters
- srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- srv_data: Pointer to the unique struct `esp_ble_mesh_scheduler_srv_t`.

ESP_BLE_MESH_MODEL_SCHEDULER_SETUP_SRV (srv_pub, srv_data)
Define a new Scheduler Setup Server Model.

**Note** 1. The Scheduler Setup Server model extends the Scheduler Server and the Scene Setup Server models.
2. This model shall support model subscription.
3. The model may be present only on the Primary element of a node.

**Return** New Scheduler Setup Server Model instance.

Parameters
- srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- srv_data: Pointer to the unique struct `esp_ble_mesh_scheduler_setup_srv_t`.

ESP_BLE_MESH_UNKNOWN_TAI_SECONDS
Unknown TAI Seconds

ESP_BLE_MESH_UNKNOWN_TAI_ZONE_CHANGE
Unknown TAI of Zone Change

ESP_BLE_MESH_UNKNOWN_TAI_DELTA_CHANGE
Unknown TAI of Delta Change

ESP_BLE_MESH_TAI_UTC_DELTA_MAX_VALUE
Maximum TAI-UTC Delta value

ESP_BLE_MESH_TAI_SECONDS_LEN
Length of TAI Seconds

ESP_BLE_MESH_TAI_OF_ZONE_CHANGE_LEN
Length of TAI of Zone Change

ESP_BLE_MESH_TAI_OF_DELTA_CHANGE_LEN
Length of TAI of Delta Change

ESP_BLE_MESH_INVALID_SCENE_NUMBER
Invalid Scene Number

ESP_BLE_MESH_SCENE_NUMBER_LEN
Length of the Scene Number
ESP_BLE_MESH_SCHEDULE_YEAR_ANY_YEAR
Any year of the Scheduled year

ESP_BLE_MESH_SCHEDULE_DAY_ANY_DAY
Any day of the Scheduled day

ESP_BLE_MESH_SCHEDULE_HOUR_ANY_HOUR
Any hour of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_HOUR_ONCE_A_DAY
Any hour of the Scheduled Day

ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_HOUR
Any minute of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_MIN
Every 15 minutes of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_MIN
Every 20 minutes of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_HOUR
Once of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_MIN
Any second of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_SEC
Every 15 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_SEC
Every 20 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_MIN
Once of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_ACT_TURN_OFF
Scheduled Action - Turn Off

ESP_BLE_MESH_SCHEDULE_ACT_TURN_ON
Scheduled Action - Turn On

ESP_BLE_MESH_SCHEDULE_ACT_SCENE_RECALL
Scheduled Action - Scene Recall

ESP_BLE_MESH_SCHEDULE_ACT_NO_ACTION
Scheduled Action - No Action

ESP_BLE_MESH_SCHEDULE_SCENE_NO_SCENE
Scheduled Scene - No Scene

ESP_BLE_MESH_SCHEDULE_ENTRY_MAX_INDEX
Maximum number of Scheduled entries

ESP_BLE_MESH_TIME_NONE
Time Role - None

ESP_BLE_MESH_TIME_AUTHORITY
Time Role - Mesh Time Authority

ESP_BLE_MESH_TIME_RELAY
Time Role - Mesh Time Relay

ESP_BLE_MESH_TIME_CLIENT
Time Role - Mesh Time Client

ESP_BLE_MESH_SCENE_SUCCESS
Scene operation - Success
**Type Definitions**

```c
typedef void (*esp_ble_mesh_time_scene_client_cb_t)(
    esp_ble_mesh_time_scene_client_cb_event_t event,
    esp_ble_mesh_time_scene_client_cb_param_t *param)
```

Bluetooth Mesh Time Scene Client Model function.

Time Scene Client Model callback function type

**Parameters**
- `event`: Event type
- `param`: Pointer to callback parameter

```c
typedef void (*esp_ble_mesh_time_scene_server_cb_t)(
    esp_ble_mesh_time_scene_server_cb_event_t event,
    esp_ble_mesh_time_scene_server_cb_param_t *param)
```

Bluetooth Mesh Time and Scenes Server Model function.

Time Scene Server Model callback function type

**Parameters**
- `event`: Event type
- `param`: Pointer to callback parameter

**Enumerations**

```c
enum esp_ble_mesh_time_scene_client_cb_event_t
{
    ESP_BLE_MESH_TIME_SCENE_CLIENT_GET_STATE_EVT,
    ESP_BLE_MESH_TIME_SCENE_CLIENT_SET_STATE_EVT,
    ESP_BLE_MESH_TIME_SCENE_CLIENT_PUBLISH_EVT,
    ESP_BLE_MESH_TIME_SCENE_CLIENT_TIMEOUT_EVT,
    ESP_BLE_MESH_TIME_SCENE_CLIENT_EVT_MAX
}
```

This enum value is the event of Time Scene Client Model

**Values:**
- `ESP_BLE_MESH_TIME_SCENE_CLIENT_GET_STATE_EVT`
- `ESP_BLE_MESH_TIME_SCENE_CLIENT_SET_STATE_EVT`
- `ESP_BLE_MESH_TIME_SCENE_CLIENT_PUBLISH_EVT`
- `ESP_BLE_MESH_TIME_SCENE_CLIENT_TIMEOUT_EVT`

```c
enum esp_ble_mesh_time_scene_server_cb_event_t
{
    ESP_BLE_MESH_TIME_SCENE_SERVER_STATE_CHANGE_EVT,
    ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_GET_MSG_EVT,
    ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_SET_MSG_EVT,
    ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_UNSPECIFIED_EVT,
    ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_UNACK_EVT,
    ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_GET_MSG_EVT_MAX
}
```

This enum value is the event of Time Scene Server Model

**Values:**
- `ESP_BLE_MESH_TIME_SCENE_SERVER_STATE_CHANGE_EVT`
- `ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_GET_MSG_EVT`
- `ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_SET_MSG_EVT`

1. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Time Scene Get messages are received.
2. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

**ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_GET_MSG_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Scene Get messages are received.

**ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_SET_MSG_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.
Chapter 2. API Reference

**ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_STATUS_MSG_EVT**
When status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Time Status message is received.

**ESP_BLE_MESH_TIME_SCENE_SERVER_EVT_MAX**

Lighting Client/Server Models

**Header File**
- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_lighting_model_api.h

**Functions**

- `esp_err_t esp_ble_mesh_register_light_client_callback (esp_ble_mesh_light_client_cb_t callback)`
  Register BLE Mesh Light Client Model callback.
  **Return** ESP_OK on success or error code otherwise.
  **Parameters**
  - [in] callback: pointer to the callback function.

- `esp_err_t esp_ble_mesh_light_client_get_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_light_client_get_state_t *get_state)`
  Get the value of Light Server Model states using the Light Client Model get messages.
  **Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h
  **Return** ESP_OK on success or error code otherwise.
  **Parameters**
  - [in] get_state: Pointer of light get message value. Shall not be set to NULL.

- `esp_err_t esp_ble_mesh_light_client_set_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_light_client_set_state_t *set_state)`
  Set the value of Light Server Model states using the Light Client Model set messages.
  **Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h
  **Return** ESP_OK on success or error code otherwise.
  **Parameters**
  - [in] set_state: Pointer of light set message value. Shall not be set to NULL.

- `esp_err_t esp_ble_mesh_register_lighting_server_callback (esp_ble_mesh_lighting_server_cb_t callback)`
  Register BLE Mesh Lighting Server Model callback.
  **Return** ESP_OK on success or error code otherwise.
  **Parameters**
  - [in] callback: Pointer to the callback function.

**Unions**

- `union esp_ble_mesh_light_client_get_state_t`

**Structures**

**struct esp_ble_mesh_light_lightness_set_t**
- Bluetooth Mesh Light Lightness Client Model Get and Set parameters structure.

  Parameters of Light Lightness Set

**Public Members**

**bool op_en**
- Indicate if optional parameters are included
uint16_t lightness
Target value of light lightness actual state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_light_lightness_linear_set_t
Parameters of Light Lightness Linear Set

**Public Members**

bool op_en
Indicate if optional parameters are included

uint16_t lightness
Target value of light lightness linear state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_light_lightness_default_set_t
Parameter of Light Lightness Default Set

**Public Members**

uint16_t lightness
The value of the Light Lightness Default state

struct esp_ble_mesh_light_lightness_range_set_t
Parameters of Light Lightness Range Set

**Public Members**

uint16_t range_min
Value of range min field of light lightness range state

uint16_t range_max
Value of range max field of light lightness range state

struct esp_ble_mesh_light_ctl_set_t
Parameters of Light CTL Set

**Public Members**

bool op_en
Indicate if optional parameters are included

uint16_t ctl_lightness
Target value of light ctl lightness state
Chapter 2. API Reference

```c
uint16_t ctl_temperature
    Target value of light ctl temperature state
int16_t ctl_delta_uv
    Target value of light ctl delta UV state
uint8_t tid
    Transaction ID
uint8_t trans_time
    Time to complete state transition (optional)
uint8_t delay
    Indicate message execution delay (C.1)
```

```c
struct esp_ble_mesh_light_ctl_temperature_set_t
Parameters of Light CTL Temperature Set
```

**Public Members**

```c
bool op_en
    Indicate if optional parameters are included
uint16_t ctl_temperature
    Target value of light ctl temperature state
int16_t ctl_delta_uv
    Target value of light ctl delta UV state
uint8_t tid
    Transaction ID
uint8_t trans_time
    Time to complete state transition (optional)
uint8_t delay
    Indicate message execution delay (C.1)
```

```c
struct esp_ble_mesh_light_ctl_temperature_range_set_t
Parameters of Light CTL Temperature Range Set
```

**Public Members**

```c
uint16_t range_min
    Value of temperature range min field of light ctl temperature range state
uint16_t range_max
    Value of temperature range max field of light ctl temperature range state
```

```c
struct esp_ble_mesh_light_ctl_default_set_t
Parameters of Light CTL Default Set
```

**Public Members**

```c
uint16_t lightness
    Value of light lightness default state
uint16_t temperature
    Value of light temperature default state
int16_t delta_uv
    Value of light delta UV default state
```
struct esp_ble_mesh_light_hsl_set_t
Parameters of Light HSL Set

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t hsl_lightness
Target value of light hsl lightness state

uint16_t hsl_hue
Target value of light hsl hue state

uint16_t hsl_saturation
Target value of light hsl saturation state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_light_hsl_hue_set_t
Parameters of Light HSL Hue Set

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t hue
Target value of light hsl hue state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_light_hsl_saturation_set_t
Parameters of Light HSL Saturation Set

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t saturation
Target value of light hsl hue state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)
Chapter 2. API Reference

```c
uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_light_hsl_default_set_t
Parameters of Light HSL Default Set

    Public Members

    uint16_t lightness
        Value of light lightness default state

    uint16_t hue
        Value of light hue default state

    uint16_t saturation
        Value of light saturation default state

struct esp_ble_mesh_light_hsl_range_set_t
Parameters of Light HSL Range Set

    Public Members

    uint16_t hue_range_min
        Value of hue range min field of light hsl hue range state

    uint16_t hue_range_max
        Value of hue range max field of light hsl hue range state

    uint16_t saturation_range_min
        Value of saturation range min field of light hsl saturation range state

    uint16_t saturation_range_max
        Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_light_xyl_set_t
Parameters of Light xyL Set

    Public Members

    bool op_en
        Indicate whether optional parameters included

    uint16_t xyl_lightness
        The target value of the Light xyL Lightness state

    uint16_t xyl_x
        The target value of the Light xyL x state

    uint16_t xyl_y
        The target value of the Light xyL y state

    uint8_t tid
        Transaction Identifier

    uint8_t trans_time
        Time to complete state transition (optional)

    uint8_t delay
        Indicate message execution delay (C.1)

struct esp_ble_mesh_light_xyl_default_set_t
Parameters of Light xyL Default Set
```
Public Members

uint16_t lightness
The value of the Light Lightness Default state

uint16_t xyl_x
The value of the Light xyL x Default state

uint16_t xyl_y
The value of the Light xyL y Default state

struct esp_ble_mesh_light_xyl_range_set_t
Parameters of Light xyL Range Set

Public Members

uint16_t xyl_x_range_min
The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t xyl_x_range_max
The value of the xyL x Range Max field of the Light xyL x Range state

uint16_t xyl_y_range_min
The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t xyl_y_range_max
The value of the xyL y Range Max field of the Light xyL y Range state

struct esp_ble_mesh_light_lc_mode_set_t
Parameter of Light LC Mode Set

Public Members

uint8_t mode
The target value of the Light LC Mode state

struct esp_ble_mesh_light_lc_om_set_t
Parameter of Light LC OM Set

Public Members

uint8_t mode
The target value of the Light LC Occupancy Mode state

struct esp_ble_mesh_light_lc_light_onoff_set_t
Parameters of Light LC Light OnOff Set

Public Members

bool op_en
Indicate whether optional parameters included

uint8_t light_onoff
The target value of the Light LC Light OnOff state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)
```c
uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_light_lc_property_get_t
    Parameter of Light LC Property Get

Public Members

uint16_t property_id
    Property ID identifying a Light LC Property

struct esp_ble_mesh_light_lc_property_set_t
    Parameters of Light LC Property Set

Public Members

uint16_t property_id
    Property ID identifying a Light LC Property

struct net_buf_simple *property_value
    Raw value for the Light LC Property

struct esp_ble_mesh_light_lightness_status_cb_t
    Bluetooth Mesh Light Lightness Client Model Get and Set callback parameters structure.

Parameters of Light Lightness Status

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t present_lightness
    Current value of light lightness actual state

uint16_t target_lightness
    Target value of light lightness actual state (optional)

uint8_t remain_time
    Time to complete state transition (C.1)

struct esp_ble_mesh_light_lightness_linear_status_cb_t
    Parameters of Light Lightness Linear Status

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t present_lightness
    Current value of light lightness linear state

uint16_t target_lightness
    Target value of light lightness linear state (optional)

uint8_t remain_time
    Time to complete state transition (C.1)

struct esp_ble_mesh_light_lightness_last_status_cb_t
    Parameter of Light Lightness Last Status
```
Public Members

```c
uint16_t lightness
```
The value of the Light Lightness Last state

```c
struct esp_ble_mesh_light_lightness_default_status_cb_t
```
Parameter of Light Lightness Default Status

Public Members

```c
uint16_t lightness
```
The value of the Light Lightness default State

```c
struct esp_ble_mesh_light_lightness_range_status_cb_t
```
Parameters of Light Lightness Range Status

Public Members

```c
uint8_t status_code
```
Status Code for the request message

```c
uint16_t range_min
```
Value of range min field of light lightness range state

```c
uint16_t range_max
```
Value of range max field of light lightness range state

```c
struct esp_ble_mesh_light_ctl_status_cb_t
```
Parameters of Light CTL Status

Public Members

```c
bool op_en
```
Indicate if optional parameters are included

```c
uint16_t present_ctl_lightness
```
Current value of light ctl lightness state

```c
uint16_t present_ctl_temperature
```
Current value of light ctl temperature state

```c
uint16_t target_ctl_lightness
```
Target value of light ctl lightness state (optional)

```c
uint16_t target_ctl_temperature
```
Target value of light ctl temperature state (C.1)

```c
uint8_t remain_time
```
Time to complete state transition (C.1)

```c
struct esp_ble_mesh_light_ctl_temperature_status_cb_t
```
Parameters of Light CTL Temperature Status

Public Members

```c
bool op_en
```
Indicate if optional parameters are included

```c
uint16_t present_ctl_temperature
```
Current value of light ctl temperature state
uint16_t present_ctl_delta_uv
Current value of light ctl delta UV state

uint16_t target_ctl_temperature
Target value of light ctl temperature state (optional)

uint16_t target_ctl_delta_uv
Target value of light ctl delta UV state (C.1)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_ctl_temperature_range_status_cb_t
Parameters of Light CTL Temperature Range Status

Public Members

uint8_t status_code
Status code for the request message

uint16_t range_min
Value of temperature range min field of light ctl temperature range state

uint16_t range_max
Value of temperature range max field of light ctl temperature range state

struct esp_ble_mesh_light_ctl_default_status_cb_t
Parameters of Light CTL Default Status

Public Members

uint16_t lightness
Value of light lightness default state

uint16_t temperature
Value of light temperature default state

int16_t delta_uv
Value of light delta UV default state

struct esp_ble_mesh_light_hsl_status_cb_t
Parameters of Light HSL Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t hsl_lightness
Current value of light hsl lightness state

uint16_t hsl_hue
Current value of light hsl hue state

uint16_t hsl_saturation
Current value of light hsl saturation state

uint8_t remain_time
Time to complete state transition (optional)

struct esp_ble_mesh_light_hsl_target_status_cb_t
Parameters of Light HSL Target Status
Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t hsl_lightness_target
   Target value of light hsl lightness state

uint16_t hsl_hue_target
   Target value of light hsl hue state

uint16_t hsl_saturation_target
   Target value of light hsl saturation state

uint8_t remain_time
   Time to complete state transition (optional)

struct esp_ble_mesh_light_hsl_hue_status_cb_t
   Parameters of Light HSL Hue Status

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t present_hue
   Current value of light hsl hue state

uint16_t target_hue
   Target value of light hsl hue state (optional)

uint8_t remain_time
   Time to complete state transition (C.1)

struct esp_ble_mesh_light_hsl_saturation_status_cb_t
   Parameters of Light HSL Saturation Status

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t present_saturation
   Current value of light hsl saturation state

uint16_t target_saturation
   Target value of light hsl saturation state (optional)

uint8_t remain_time
   Time to complete state transition (C.1)

struct esp_ble_mesh_light_hsl_default_status_cb_t
   Parameters of Light HSL Default Status

Public Members

uint16_t lightness
   Value of light lightness default state

uint16_t hue
   Value of light hue default state
uint16_t \texttt{saturation} \\
Value of light saturation default state

\textbf{struct esp_ble_mesh_light_hsl_range_status_cb_t} \\
Parameters of Light HSL Range Status

\textbf{Public Members}

uint8_t \texttt{status\_code} \\
Status code for the request message

uint16_t \texttt{hue\_range\_min} \\
Value of hue range min field of light hsl hue range state

uint16_t \texttt{hue\_range\_max} \\
Value of hue range max field of light hsl hue range state

uint16_t \texttt{saturation\_range\_min} \\
Value of saturation range min field of light hsl saturation range state

uint16_t \texttt{saturation\_range\_max} \\
Value of saturation range max field of light hsl saturation range state

\textbf{struct esp_ble_mesh_light_xyl_status_cb_t} \\
Parameters of Light xyL Status

\textbf{Public Members}

bool \texttt{op\_en} \\
Indicate whether optional parameters included

uint16_t \texttt{xyl\_lightness} \\
The present value of the Light xyL Lightness state

uint16_t \texttt{xyl\_x} \\
The present value of the Light xyL x state

uint16_t \texttt{xyl\_y} \\
The present value of the Light xyL y state

uint8_t \texttt{remain\_time} \\
Time to complete state transition (optional)

\textbf{struct esp_ble_mesh_light_xyl_target_status_cb_t} \\
Parameters of Light xyL Target Status

\textbf{Public Members}

bool \texttt{op\_en} \\
Indicate whether optional parameters included

uint16_t \texttt{target\_xyl\_lightness} \\
The target value of the Light xyL Lightness state

uint16_t \texttt{target\_xyl\_x} \\
The target value of the Light xyL x state

uint16_t \texttt{target\_xyl\_y} \\
The target value of the Light xyL y state

uint8_t \texttt{remain\_time} \\
Time to complete state transition (optional)
```c
struct esp_ble_mesh_light_xyl_default_status_cb_t
Parameters of Light xYL Default Status

Public Members

uint16_t lightness
The value of the Light Lightness Default state

uint16_t xyl_x
The value of the Light xYL x Default state

uint16_t xyl_y
The value of the Light xYL y Default state
```

```c
struct esp_ble_mesh_light_xyl_range_status_cb_t
Parameters of Light xYL Range Status

Public Members

uint8_t status_code
StatusCode for the requesting message

uint16_t xyl_x_range_min
The value of the xYL x Range Min field of the Light xYL x Range state

uint16_t xyl_x_range_max
The value of the xYL x Range Max field of the Light xYL x Range state

uint16_t xyl_y_range_min
The value of the xYL y Range Min field of the Light xYL y Range state

uint16_t xyl_y_range_max
The value of the xYL y Range Max field of the Light xYL y Range state
```

```c
struct esp_ble_mesh_light_lc_mode_status_cb_t
Parameter of Light LC Mode Status

Public Members

uint8_t mode
The present value of the Light LC Mode state
```

```c
struct esp_ble_mesh_light_lc_om_status_cb_t
Parameter of Light LC OM Status

Public Members

uint8_t mode
The present value of the Light LC Occupancy Mode state
```

```c
struct esp_ble_mesh_light_lc_light_onoff_status_cb_t
Parameters of Light LC Light OnOff Status

Public Members

bool op_en
Indicate whether optional parameters included

uint8_t present_light_onoff
The present value of the Light LC Light OnOff state
```
Chapter 2. API Reference

uint8_t `target_light_onoff`
   The target value of the Light LC Light OnOff state (Optional)

uint8_t `remain_time`
   Time to complete state transition (C.1)

`struct esp_ble_mesh_light_lc_property_status_cb_t`
Parameters of Light LC Property Status

**Public Members**

uint16_t `property_id`
   Property ID identifying a Light LC Property

`struct net_buf_simple *property_value`
   Raw value for the Light LC Property

`struct esp_ble_mesh_light_client_cb_param_t`
Lighting Client Model callback parameters

**Public Members**

int `error_code`
   Appropriate error code

`esp_ble_mesh_client_common_param_t *params`
   The client common parameters.

`esp_ble_mesh_light_client_status_cb_t status_cb`
   The light status message callback values

`struct esp_ble_mesh_light_lightness_state_t`
Parameters of Light Lightness state

**Public Members**

uint16_t `lightness_linear`
   The present value of Light Lightness Linear state

uint16_t `target_lightness_linear`
   The target value of Light Lightness Linear state

uint16_t `lightness_actual`
   The present value of Light Lightness Actual state

uint16_t `target_lightness_actual`
   The target value of Light Lightness Actual state

uint16_t `lightness_last`
   The value of Light Lightness Last state

uint16_t `lightness_default`
   The value of Light Lightness Default state

uint8_t `status_code`
   The status code of setting Light Lightness Range state

uint16_t `lightness_range_min`
   The minimum value of Light Lightness Range state

uint16_t `lightness_range_max`
   The maximum value of Light Lightness Range state
struct esp_ble_mesh_light_lightness_srv_t
User data of Light Lightness Server Model

Public Members

esp_ble_mesh_model_t *model
  Pointer to the Lighting Lightness Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
  Response control of the server model received messages

esp_ble_mesh_light_lightness_state_t *state
  Parameters of the Light Lightness state

esp_ble_mesh_last_msg_info_t last
  Parameters of the last received set message

esp_ble_mesh_state_transition_t *actual_transition
  Parameters of state transition

esp_ble_mesh_state_transition_t *linear_transition
  Parameters of state transition

int32_t tt_delta_lightness_actual
  Delta change value of lightness actual state transition

int32_t tt_delta_lightness_linear
  Delta change value of lightness linear state transition

struct esp_ble_mesh_light_lightness_setup_srv_t
User data of Light Lightness Setup Server Model

Public Members

esp_ble_mesh_model_t *model
  Pointer to the Lighting Lightness Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
  Response control of the server model received messages

esp_ble_mesh_light_lightness_state_t *state
  Parameters of the Light Lightness state

struct esp_ble_mesh_light_ctl_state_t
  Parameters of Light CTL state

Public Members

uint16_t lightness
  The present value of Light CTL Lightness state

uint16_t target_lightness
  The target value of Light CTL Lightness state

uint16_t temperature
  The present value of Light CTL Temperature state

uint16_t target_temperature
  The target value of Light CTL Temperature state

int16_t delta_uv
  The present value of Light CTL Delta UV state
int16_t target_delta_uv
    The target value of Light CTL Delta UV state

uint8_t status_code
    The status code of setting Light CTL Temperature Range state

uint16_t temperature_range_min
    The minimum value of Light CTL Temperature Range state

uint16_t temperature_range_max
    The maximum value of Light CTL Temperature Range state

uint16_t lightness_default
    The value of Light Lightness Default state

uint16_t temperature_default
    The value of Light CTL Temperature Default state

int16_t delta_uv_default
    The value of Light CTL Delta UV Default state

struct esp_ble_mesh_light_ctl_srv_t
    User data of Light CTL Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Lighting CTL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t *state
    Parameters of the Light CTL state

esp_ble_mesh_last_msg_info_t last
    Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
    Parameters of state transition

int32_t tt_delta_lightness
    Delta change value of lightness state transition

int32_t tt_delta_temperature
    Delta change value of temperature state transition

int32_t tt_delta_delta_uv
    Delta change value of delta uv state transition

struct esp_ble_mesh_light_ctl_setup_srv_t
    User data of Light CTL Setup Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Lighting CTL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t *state
    Parameters of the Light CTL state

struct esp_ble_mesh_light_ctl_temp_srv_t
    User data of Light CTL Temperature Server Model

Submit Document Feedback
Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting CTL Temperature Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_ctl_state_t *state`
Parameters of the Light CTL state

`esp_ble_mesh_last_msg_info_t last`
Parameters of the last received set message

`esp_ble_mesh_state_transition_t *transition`
Parameters of state transition

`int32_t tt_delta_temperature`
Delta change value of temperature state transition

`int32_t tt_delta_delta_uv`
Delta change value of delta uv state transition

`struct esp_ble_mesh_light_hsl_state_t`
Parameters of Light HSL state

Public Members

`uint16_t lightness`
The present value of Light HSL Lightness state

`uint16_t target_lightness`
The target value of Light HSL Lightness state

`uint16_t hue`
The present value of Light HSL Hue state

`uint16_t target_hue`
The target value of Light HSL Hue state

`uint16_t saturation`
The present value of Light HSL Saturation state

`uint16_t target_saturation`
The target value of Light HSL Saturation state

`uint16_t lightness_default`
The value of Light Lightness Default state

`uint16_t hue_default`
The value of Light HSL Hue Default state

`uint16_t saturation_default`
The value of Light HSL Saturation Default state

`uint8_t status_code`
The status code of setting Light HSL Hue & Saturation Range state

`uint16_t hue_range_min`
The minimum value of Light HSL Hue Range state

`uint16_t hue_range_max`
The maximum value of Light HSL Hue Range state

`uint16_t saturation_range_min`
The minimum value of Light HSL Saturation state
chapter 2. API Reference

uint16_t saturation_range_max
   The maximum value of Light HSL Saturation state

struct esp_ble_mesh_light_hsl_srv_t
   User data of Light HSL Server Model

Public Members

esp_ble_mesh_model_t *model
   Pointer to the Lighting HSL Server Model. Initialized internally.

   Parameters of the Light HSL state

struct esp_ble_mesh_light_hsl_hue_srv_t
   User data of Light HSL Hue Server Model

Public Members

esp_ble_mesh_model_t *model
   Pointer to the Lighting HSL Hue Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
   Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t *state
   Parameters of the Light HSL state

esp_ble_mesh_last_msg_info_t last
   Parameters of the last received set message
**Chapter 2. API Reference**

```c
esp_ble_mesh_state_transition_t transition
   Parameters of state transition
int32_t tt_delta_hue
   Delta change value of hue state transition
```

```c
struct esp_ble_mesh_light_hsl_sat_srv_t
   User data of Light HSL Saturation Server Model
```

### Public Members

```c
esp_ble_mesh_model_t *model
   Pointer to the Lighting HSL Saturation Server Model. Initialized internally.
```

```c
esp_ble_mesh_server_rsp_ctrl_t /rsp_ctrl
   Response control of the server model received messages
```

```c
esp_ble_mesh_light_hsl_state_t *state
   Parameters of the Light HSL state
```

```c
esp_ble_mesh_last_msg_info_t last
   Parameters of the last received set message
```

```c
esp_ble_mesh_state_transition_t transition
   Parameters of state transition
int32_t tt_delta_saturation
   Delta change value of saturation state transition
```

```c
struct esp_ble_mesh_light_xyl_state_t
   Parameters of Light xyL state
```

### Public Members

```c
uint16_t lightness
   The present value of Light xyL Lightness state
```

```c
uint16_t target_lightness
   The target value of Light xyL Lightness state
```

```c
uint16_t x
   The present value of Light xyL x state
```

```c
uint16_t target_x
   The target value of Light xyL x state
```

```c
uint16_t y
   The present value of Light xyL y state
```

```c
uint16_t target_y
   The target value of Light xyL y state
```

```c
uint16_t lightness_default
   The value of Light Lightness Default state
```

```c
uint16_t x_default
   The value of Light xyL x Default state
```

```c
uint16_t y_default
   The value of Light xyL y Default state
```

```c
uint8_t status_code
   The status code of setting Light xyL x & y Range state
```

```c
uint16_t x_range_min
   The minimum value of Light xyL x Range state
```
Chapter 2. API Reference

```c
typedef uint16_t x_range_max
The maximum value of Light xyL x Range state

typedef uint16_t y_range_min
The minimum value of Light xyL y Range state

typedef uint16_t y_range_max
The maximum value of Light xyL y Range state
```

```c
struct esp_ble_mesh_light_xyl_srv_t
User data of Light xyL Server Model

Public Members
```
```
struct esp_ble_mesh_light_xyl_setup_srv_t
User data of Light xyL Setup Server Model

Public Members
```
```
struct esp_ble_mesh_light_lc_state_t
Parameters of Light LC states
```
```
Public Members
```
```
uint32_t mode = 1
0b0 The controller is turned off.
0b1 The controller is turned on.
```
```
• The binding with the Light Lightness state is disabled.
  • The binding with the Light Lightness state is enabled. The value of Light LC Mode state
```
Chapter 2. API Reference

uint32_t occupancy_mode : 1
The value of Light LC Occupancy Mode state

uint32_t light_onoff : 1
The present value of Light LC Light OnOff state

uint32_t target_light_onoff : 1
The target value of Light LC Light OnOff state

uint32_t occupancy : 1
The value of Light LC Occupancy state

uint32_t ambient_luxlevel : 24
The value of Light LC Ambient LuxLevel state

uint16_t linear_output
1. Light LC Linear Output = max((Lightness Out)^2/65535, Regulator Output)
2. If the Light LC Mode state is set to 0b1, the binding is enabled and upon a change of the Light LC Linear Output state, the following operation shall be performed: Light Lightness Linear = Light LC Linear Output
3. If the Light LC Mode state is set to 0b0, the binding is disabled (i.e., upon a change of the Light LC Linear Output state, no operation on the Light Lightness Linear state is performed). The value of Light LC Linear Output state

struct esp_ble_mesh_light_lc_property_state_t
Parameters of Light Property states. The Light LC Property states are read / write states that determine the configuration of a Light Lightness Controller. Each state is represented by a device property and is controlled by Light LC Property messages.

Public Members

uint32_t time_occupancy_delay
A timing state that determines the delay for changing the Light LC Occupancy state upon receiving a Sensor Status message from an occupancy sensor. The value of Light LC Time Occupancy Delay state

uint32_t time_fade_on
A timing state that determines the time the controlled lights fade to the level determined by the Light LC Lightness On state. The value of Light LC Time Fade On state

uint32_t time_run_on
A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness On state. The value of Light LC Time Run On state

uint32_t time_fade
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness On state to the level determined by the Light Lightness Prolong state. The value of Light LC Time Fade state

uint32_t time_prolong
A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness Prolong state. The value of Light LC Time Prolong state

uint32_t time_fade_standby_auto
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is automatic. The value of Light LC Time Fade Standby Auto state

uint32_t time_fade_standby_manual
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is triggered by a change in the Light LC Light OnOff state. The value of Light LC Time Fade Standby Manual state
Chapter 2. API Reference

```
uint16_t lightness_on
A lightness state that determines the perceptive light lightness at the Occupancy and Run internal controller states. The value of Light LC Lightness On state

uint16_t lightness_prolong
A lightness state that determines the light lightness at the Prolong internal controller state. The value of Light LC Lightness Prolong state

uint16_t lightness_standby
A lightness state that determines the light lightness at the Standby internal controller state. The value of Light LC Lightness Standby state

uint16_t ambient_luxlevel_on
A uint16 state representing the Ambient LuxLevel level that determines if the controller transitions from the Light Control Standby state. The value of Light LC Ambient LuxLevel On state

uint16_t ambient_luxlevel_prolong
A uint16 state representing the required Ambient LuxLevel level in the Prolong state. The value of Light LC Ambient LuxLevel Prolong state

uint16_t ambient_luxlevel_standby
A uint16 state representing the required Ambient LuxLevel level in the Standby state. The value of Light LC Ambient LuxLevel Standby state

float regulator_kiu
A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than LuxLevel Out. Valid range: 0.0 ~ 1000.0. The default value is 250.0. The value of Light LC Regulator Kiu state

float regulator_kid
A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 25.0. The value of Light LC Regulator Kid state

float regulator_kpu
A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpu state

float regulator_kpd
A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpd state

int8_t regulator_accuracy
A int8 state representing the percentage accuracy of the Light LC PI Feedback Regulator. Valid range: 0.0 ~ 100.0. The default value is 2.0. The value of Light LC Regulator Accuracy state

uint32_t set_occupancy_to_1_delay
If the message Raw field contains a Raw Value for the Time Since Motion Sensed device property, which represents a value less than or equal to the value of the Light LC Occupancy Delay state, it shall delay setting the Light LC Occupancy state to 0b1 by the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value. The value of the difference between value of the Light LC Occupancy Delay state and the received Time Since Motion value

struct esp_ble_mesh_light_lc_state_machine_t
Parameters of Light LC state machine
```
Public Members

uint8_t **_fade_on**
The value of transition time of Light LC Time Fade On

uint8_t **_fade**
The value of transition time of Light LC Time Fade

uint8_t **_fade_standby_auto**
The value of transition time of Light LC Time Fade Standby Auto

uint8_t **_fade_standby_manual**
The value of transition time of Light LC Time Fade Standby Manual

`struct esp_ble_mesh_light_lc_state_machine_t {[anonymous]} trans_time`
The Fade On, Fade, Fade Standby Auto, and Fade Standby Manual states are transition states that define the transition of the Lightness Out and Lux Level Out states. This transition can be started as a result of the Light LC State Machine change or as a result of receiving the Light LC Light On Off Set or Light LC Light Set Unacknowledged message. The value of transition time

`esp_ble_mesh_lc_state_t state`
The value of Light LC state machine state

`struct k_delayed_work timer`
Timer of Light LC state machine

`struct esp_ble_mesh_light_control_t`
Parameters of Light Lightness controller

Public Members

`esp_ble_mesh_light_lc_state_t state`
Parameters of Light LC state

`esp_ble_mesh_light_lc_property_state_t prop_state`
Parameters of Light LC Property state

`esp_ble_mesh_light_lc_state_machine_t state_machine`
Parameters of Light LC state machine

`struct esp_ble_mesh_light_lc_srv_t`
User data of Light LC Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting LC Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_control_t *lc`
Parameters of the Light controller

`esp_ble_mesh_last_msg_info_t last`
Parameters of the last received set message

`esp_ble_mesh_state_transition_t transition`
Parameters of state transition

`struct esp_ble_mesh_light_lc_setup_srv_t`
User data of Light LC Setup Server Model
**Public Members**

```c
esp_ble_mesh_model_t *model
```
Pointer to the Lighting LC Setup Server Model. Initialized internally.

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
```
Response control of the server model received messages

```c
esp_ble_mesh_light_control_t *lc
```
Parameters of the Light controller

```c
struct esp_ble_mesh_state_change_light_lightness_set_t
```
Parameter of Light Lightness Actual state change event

**Public Members**

```c
uint16_t lightness
```
The value of Light Lightness Actual state

```c
struct esp_ble_mesh_state_change_light_lightness_linear_set_t
```
Parameter of Light Lightness Linear state change event

**Public Members**

```c
uint16_t lightness
```
The value of Light Lightness Linear state

```c
struct esp_ble_mesh_state_change_light_lightness_default_set_t
```
Parameter of Light Lightness Default state change event

**Public Members**

```c
uint16_t lightness
```
The value of Light Lightness Default state

```c
struct esp_ble_mesh_state_change_light_lightness_range_set_t
```
Parameters of Light Lightness Range state change event

**Public Members**

```c
uint16_t range_min
```
The minimum value of Light Lightness Range state

```c
uint16_t range_max
```
The maximum value of Light Lightness Range state

```c
struct esp_ble_mesh_state_change_light_ctl_set_t
```
Parameters of Light CTL state change event

**Public Members**

```c
uint16_t lightness
```
The value of Light CTL Lightness state

```c
uint16_t temperature
```
The value of Light CTL Temperature state

```c
int16_t delta_uv
```
The value of Light CTL Delta UV state

```c
struct esp_ble_mesh_state_change_light_ctl_temperature_set_t
Parameters of Light CTL Temperature state change event

Public Members

uint16_t temperature
The value of Light CTL Temperature state

int16_t delta_uv
The value of Light CTL Delta UV state
```

```c
struct esp_ble_mesh_state_change_light_ctl_temperature_range_set_t
Parameters of Light CTL Temperature Range state change event

Public Members

uint16_t range_min
The minimum value of Light CTL Temperature Range state

uint16_t range_max
The maximum value of Light CTL Temperature Range state
```

```c
struct esp_ble_mesh_state_change_light_ctl_default_set_t
Parameters of Light CTL Default state change event

Public Members

uint16_t lightness
The value of Light Lightness Default state

uint16_t temperature
The value of Light CTL Temperature Default state

int16_t delta_uv
The value of Light CTL Delta UV Default state
```

```c
struct esp_ble_mesh_state_change_light_hsl_set_t
Parameters of Light HSL state change event

Public Members

uint16_t lightness
The value of Light HSL Lightness state

uint16_t hue
The value of Light HSL Hue state

uint16_t saturation
The value of Light HSL Saturation state
```

```c
struct esp_ble_mesh_state_change_light_hsl_hue_set_t
Parameter of Light HSL Hue state change event

Public Members

uint16_t hue
The value of Light HSL Hue state
```

```c
struct esp_ble_mesh_state_change_light_hsl_saturation_set_t
Parameter of Light HSL Saturation state change event

Public Members

uint16_t hue
The value of Light HSL Hue state
```
Chapter 2. API Reference

Public Members

```c
uint16_t saturation
```
The value of Light HSL Saturation state

```c
struct esp_ble_mesh_state_change_light_hsl_default_set_t
```
Parameters of Light HSL Default state change event

Public Members

```c
uint16_t lightness
```
The value of Light HSL Lightness Default state

```c
uint16_t hue
```
The value of Light HSL Hue Default state

```c
uint16_t saturation
```
The value of Light HSL Saturation Default state

```c
struct esp_ble_mesh_state_change_light_hsl_range_set_t
```
Parameters of Light HSL Range state change event

Public Members

```c
uint16_t hue_range_min
```
The minimum hue value of Light HSL Range state

```c
uint16_t hue_range_max
```
The maximum hue value of Light HSL Range state

```c
uint16_t saturation_range_min
```
The minimum saturation value of Light HSL Range state

```c
uint16_t saturation_range_max
```
The maximum saturation value of Light HSL Range state

```c
struct esp_ble_mesh_state_change_light_xyl_set_t
```
Parameters of Light xyL state change event

Public Members

```c
uint16_t lightness
```
The value of Light xyL Lightness state

```c
uint16_t x
```
The value of Light xyL x state

```c
uint16_t y
```
The value of Light xyL y state

```c
struct esp_ble_mesh_state_change_light_xyl_default_set_t
```
Parameters of Light xyL Default state change event

Public Members

```c
uint16_t lightness
```
The value of Light Lightness Default state

```c
uint16_t x
```
The value of Light xyL x Default state
uint16_t y
   The value of Light xyL y Default state

struct esp_ble_mesh_state_change_light_xyl_range_set_t
Parameters of Light xyL Range state change event

Public Members

uint16_t x_range_min
   The minimum value of Light xyL x Range state
uint16_t x_range_max
   The maximum value of Light xyL x Range state
uint16_t y_range_min
   The minimum value of Light xyL y Range state
uint16_t y_range_max
   The maximum value of Light xyL y Range state

struct esp_ble_mesh_state_change_light_lc_mode_set_t
Parameter of Light LC Mode state change event

Public Members

uint8_t mode
   The value of Light LC Mode state

struct esp_ble_mesh_state_change_light_lc_om_set_t
Parameter of Light LC Occupancy Mode state change event

Public Members

uint8_t mode
   The value of Light LC Occupancy Mode state

struct esp_ble_mesh_state_change_light_lc_light_onoff_set_t
Parameter of Light LC Light OnOff state change event

Public Members

uint8_t onoff
   The value of Light LC Light OnOff state

struct esp_ble_mesh_state_change_light_lc_property_set_t
Parameters of Light LC Property state change event

Public Members

uint16_t property_id
   The property id of Light LC Property state

struct net_buf_simple *property_value
   The property value of Light LC Property state

struct esp_ble_mesh_state_change_sensor_status_t
Parameters of Sensor Status state change event
Public Members

uint16_t property_id
   The value of Sensor Property ID

uint8_t occupancy
   The value of Light LC Occupancy state

uint32_t set_occupancy_to_1_delay
   The value of Light LC Set Occupancy to 1 Delay state

uint32_t ambient_luxlevel
   The value of Light LC Ambient Luxlevel state

union esp_ble_mesh_state_change_sensor_status_t::[anonymous] state
   Parameters of Sensor Status related state

struct esp_ble_mesh_server_recv_light_lc_property_get_t
   Context of the received Light LC Property Get message

Public Members

uint16_t property_id
   Property ID identifying a Light LC Property

struct esp_ble_mesh_server_recv_light_lightness_set_t
   Context of the received Light Lightness Set message

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t lightness
   Target value of light lightness actual state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lightness_linear_set_t
   Context of the received Light Lightness Linear Set message

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t lightness
   Target value of light lightness linear state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

```c
uint8_t delay
   Indicate message execution delay (C.1)
```

```c
struct esp_ble_mesh_server_recv_light_lightness_defau lt_set_t
   Context of the received Light Lightness Default Set message
```

Public Members

```c
uint16_t lightness
   The value of the Light Lightness Default state
```

```c
struct esp_ble_mesh_server_recv_light_lightness_range_set_t
   Context of the received Light Lightness Range Set message
```

Public Members

```c
uint16_t range_min
   Value of range min field of light lightness range state
```

```c
uint16_t range_max
   Value of range max field of light lightness range state
```

```c
struct esp_ble_mesh_server_recv_light_ctl_set_t
   Context of the received Light CTL Set message
```

Public Members

```c
bool op_en
   Indicate if optional parameters are included
```

```c
uint16_t lightness
   Target value of light ctl lightness state
```

```c
uint16_t temperature
   Target value of light ctl temperature state
```

```c
int16_t delta_uv
   Target value of light ctl delta UV state
```

```c
uint8_t tid
   Transaction ID
```

```c
uint8_t trans_time
   Time to complete state transition (optional)
```

```c
uint8_t delay
   Indicate message execution delay (C.1)
```

```c
struct esp_ble_mesh_server_recv_light_ctl_temperature_set_t
   Context of the received Light CTL Temperature Set message
```

Public Members

```c
bool op_en
   Indicate if optional parameters are included
```

```c
uint16_t temperature
   Target value of light ctl temperature state
```

```c
int16_t delta_uv
   Target value of light ctl delta UV state
```
**Chapter 2. API Reference**

```c
uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)
```

**struct esp_ble_mesh_server_recv_light_ctl_temperature_range_set_t**
Context of the received Light CTL Temperature Range Set message

**Public Members**

```c
uint16_t range_min
   Value of temperature range min field of light ctl temperature range state

uint16_t range_max
   Value of temperature range max field of light ctl temperature range state
```

**struct esp_ble_mesh_server_recv_light_ctl_default_set_t**
Context of the received Light CTL Default Set message

**Public Members**

```c
uint16_t lightness
   Value of light lightness default state

uint16_t temperature
   Value of light temperature default state

int16_t delta_uv
   Value of light delta UV default state
```

**struct esp_ble_mesh_server_recv_light_hsl_set_t**
Context of the received Light HSL Set message

**Public Members**

```c
bool op_en
   Indicate if optional parameters are included

uint16_t lightness
   Target value of light hsl lightness state

uint16_t hue
   Target value of light hsl hue state

uint16_t saturation
   Target value of light hsl saturation state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)
```

**struct esp_ble_mesh_server_recv_light_hsl_hue_set_t**
Context of the received Light HSL Hue Set message
Chapter 2. API Reference

**Public Members**

bool `op_en`
Indicate if optional parameters are included

`uint16_t hue`
Target value of light hsl hue state

`uint8_t tid`
Transaction ID

`uint8_t trans_time`
Time to complete state transition (optional)

`uint8_t delay`
Indicate message execution delay (C.1)

*struct esp_ble_mesh_server_recv_light_hsl_saturation_set_t*
Context of the received Light HSL Saturation Set message

**Public Members**

bool `op_en`
Indicate if optional parameters are included

`uint16_t saturation`
Target value of light hsl hue state

`uint8_t tid`
Transaction ID

`uint8_t trans_time`
Time to complete state transition (optional)

`uint8_t delay`
Indicate message execution delay (C.1)

*struct esp_ble_mesh_server_recv_light_hsl_default_set_t*
Context of the received Light HSL Default Set message

**Public Members**

`uint16_t lightness`
Value of light lightness default state

`uint16_t hue`
Value of light hue default state

`uint16_t saturation`
Value of light saturation default state

*struct esp_ble_mesh_server_recv_light_hsl_range_set_t*
Context of the received Light HSL Range Set message

**Public Members**

`uint16_t hue_range_min`
Value of hue range min field of light hsl hue range state

`uint16_t hue_range_max`
Value of hue range max field of light hsl hue range state
uint16_t saturation_range_min
Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_server_recv_light_xyl_set_t
Context of the received Light xYL Set message

Public Members

bool op_en
Indicate whether optional parameters included

uint16_t lightness
The target value of the Light xYL Lightness state

uint16_t x
The target value of the Light xYL x state

uint16_t y
The target value of the Light xYL y state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_xyl_default_set_t
Context of the received Light xYL Default Set message

Public Members

uint16_t lightness
The value of the Light Lightness Default state

uint16_t x
The value of the Light xYL x Default state

uint16_t y
The value of the Light xYL y Default state

struct esp_ble_mesh_server_recv_light_xyl_range_set_t
Context of the received Light xyl Range Set message

Public Members

uint16_t x_range_min
The value of the xyl x Range Min field of the Light xyl x Range state

uint16_t x_range_max
The value of the xyl x Range Max field of the Light xyl x Range state

uint16_t y_range_min
The value of the xyl y Range Min field of the Light xyl y Range state

uint16_t y_range_max
The value of the xyl y Range Max field of the Light xyl y Range state
**struct esp_ble_mesh_server_recv_light_lc_mode_set_t**
Context of the received Light LC Mode Set message

**Public Members**

```c
uint8_t mode
```
The target value of the Light LC Mode state

**struct esp_ble_mesh_server_recv_light_lc_om_set_t**
Context of the received Light OM Set message

**Public Members**

```c
uint8_t mode
```
The target value of the Light LC Occupancy Mode state

**struct esp_ble_mesh_server_recv_light_lc_light_onoff_set_t**
Context of the received Light LC Light OnOff Set message

**Public Members**

```c
bool op_en
```
Indicate whether optional parameters included

```c
uint8_t light_onoff
```
The target value of the Light LC Light OnOff state

```c
uint8_t tid
```
Transaction Identifier

```c
uint8_t trans_time
```
Time to complete state transition (optional)

```c
uint8_t delay
```
Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_light_lc_property_set_t**
Context of the received Light LC Property Set message

**Public Members**

```c
uint16_t property_id
```
Property ID identifying a Light LC Property

```c
struct net_buf_simple *property_value
```
Raw value for the Light LC Property

**struct esp_ble_mesh_server_recv_sensor_status_t**
Context of the received Sensor Status message

**Public Members**

```c
struct net_buf_simple *data
```
Value of sensor data state (optional)

**struct esp_ble_mesh_lighting_server_cb_param_t**
Lighting Server Model callback parameters
Public Members

*esp_ble_mesh_model_t* `model`

Pointer to Lighting Server Models

*esp_ble_mesh_msg_ctx_t* `ctx`

Context of the received messages

*esp_ble_mesh_lighting_server_cb_value_t* `value`

Value of the received Lighting Messages

Macros

**ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_CLI** (cli_pub, cli_data)

Define a new Light Lightness Client Model.

*Note* This API needs to be called for each element on which the application needs to have a Light Lightness Client Model.

*Return* New Light Lightness Client Model instance.

*Parameters*

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_LIGHT_CTL_CLI** (cli_pub, cli_data)

Define a new Light CTL Client Model.

*Note* This API needs to be called for each element on which the application needs to have a Light CTL Client Model.

*Return* New Light CTL Client Model instance.

*Parameters*

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_CLI** (cli_pub, cli_data)

Define a new Light HSL Client Model.

*Note* This API needs to be called for each element on which the application needs to have a Light HSL Client Model.

*Return* New Light HSL Client Model instance.

*Parameters*

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_LIGHT_XYL_CLI** (cli_pub, cli_data)

Define a new Light xyl Client Model.

*Note* This API needs to be called for each element on which the application needs to have a Light xyl Client Model.

*Return* New Light xyl Client Model instance.

*Parameters*

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_LIGHT_LC_CLI** (cli_pub, cli_data)

Define a new Light LC Client Model.

*Note* This API needs to be called for each element on which the application needs to have a Light LC Client Model.

*Return* New Light LC Client Model instance.

*Parameters*

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SRV** (srv_pub, srv_data)

Lighting Server Models related context.
Define a new Light Lightness Server Model.

Note 1. The Light Lightness Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Light Lightness Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

Return New Light Lightness Server Model instance.

Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_light_lightness_srv_t.

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SETUP_SRV (srv_pub, srv_data)

Define a new Light Lightness Setup Server Model.

Note 1. The Light Lightness Setup Server model extends the Light Lightness Server model and the Generic Power OnOff Setup Server model.

1. This model shall support model subscription.

Return New Light Lightness Setup Server Model instance.

Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_light_lightness_setup_srv_t.

ESP_BLE_MESH_MODEL_LIGHT_CTL_SRV (srv_pub, srv_data)

Define a new Light CTL Server Model.

Note 1. The Light CTL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light CTL Temperature Server model and the corresponding Light CTL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding Light CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.

Return New Light CTL Server Model instance.

Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_light_ctl_srv_t.

ESP_BLE_MESH_MODEL_LIGHT_CTL_SETUP_SRV (srv_pub, srv_data)

Define a new Light CTL Setup Server Model.

Note 1. The Light CTL Setup Server model extends the Light CTL Server and the Light Lightness Setup Server.

1. This model shall support model subscription.

Return New Light CTL Setup Server Model instance.

Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_light_ctl_setup_srv_t.

ESP_BLE_MESH_MODEL_LIGHT_CTL_TEMP_SRV (srv_pub, srv_data)

Define a new Light CTL Temperature Server Model.

Note 1. The Light CTL Temperature Server model extends the Generic Level Server model.

1. This model shall support model publication and model subscription.

Return New Light CTL Temperature Server Model instance.

Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_light_ctl_temp_srv_t.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SRV (srv_pub, srv_data)

Define a new Light HSL Server Model.
Note 1. The Light HSL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light HSL Hue Server model and the corresponding Light HSL Saturation Server model and the corresponding Light HSL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. The model requires three elements: the main element and the Hue element and the Saturation element. The Hue element contains the corresponding Light HSL Hue Server model and an instance of a Generic Level state bound to the Light HSL Hue state on the Hue element. The Saturation element contains the corresponding Light HSL Saturation Server model and an instance of a Generic Level state bound to the Light HSL Saturation state on the Saturation element. The Light HSL Hue state on the Hue element is bound to the Light HSL state on the main element and the Light HSL Saturation state on the Saturation element is bound to the Light HSL state on the main element.

Return New Light HSL Server Model instance.
Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_light_hsl_srv_t.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SETUP_SRV (srv_pub, srv_data)
Define a new Light HSL Setup Server Model.

Note 1. The Light HSL Setup Server model extends the Light HSL Server and the Light Lightness Setup Server.

Return New Light HSL Setup Server Model instance.
Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_light_hsl_setup_srv_t.

ESP_BLE_MESH_MODEL_LIGHT_HSL_HUE_SRV (srv_pub, srv_data)
Define a new Light HSL Hue Server Model.

Note 1. The Light HSL Hue Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

Return New Light HSL Hue Server Model instance.
Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_light_hsl_hue_srv_t.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SAT_SRV (srv_pub, srv_data)
Define a new Light HSL Saturation Server Model.

Note 1. The Light HSL Saturation Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

Return New Light HSL Saturation Server Model instance.
Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_light_hsl_sat_srv_t.

ESP_BLE_MESH_MODEL_LIGHT_XYL_SRV (srv_pub, srv_data)
Define a new Light xyL Server Model.

Note 1. The Light xyL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light xyL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

Return New Light xyL Server Model instance.
Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_light_xyl_srv_t.

ESP_BLE_MESH_MODEL_LIGHT_XYL_SETUP_SRV (srv_pub, srv_data)
Define a new Light xyL Setup Server Model.
Note 1. The Light xyL Setup Server model extends the Light xyL Server and the Light Lightness Setup Server.
1. This model shall support model subscription.

Return New Light xyL Setup Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_xy_l_setup_srv_t`.

`ESP_BLE_MESH_MODEL_LIGHT_XY_L_SRVT (srv_pub, srv_data)`
Define a new Light xyL Server Model.

Note 1. The Light LC (Lightness Control) Server model extends the Light Lightness Server model and the Generic OnOff Server model. When this model is present on an Element, the corresponding Light LC Setup Server model shall be present.
1. This model shall support model publication and model subscription.
2. This model may be used to represent an element that is a client to a Sensor Server model and controls the Light Lightness Actual state via defined state bindings.

Return New Light LC Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_lc_srv_t`.

`ESP_BLE_MESH_MODEL_LIGHT_LC_SRV (srv_pub, srv_data)`
Define a new Light LC Server Model.

Note 1. The Light LC (Lightness Control) Server model extends the Light LC Server model.
1. This model shall support model publication and model subscription.
2. This model may be used to configure setup parameters for the Light LC Server model.

Return New Light LC Setup Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_lc_setup_srv_t`.

`ESP_BLE_MESH_MODEL_LIGHT_LC_SETUP_SRV (srv_pub, srv_data)`
Define a new Light LC Setup Server Model.

Note 1. The Light LC (Lightness Control) Setup model extends the Light LC Server model.
1. This model shall support model publication and model subscription.
2. This model may be used to configure setup parameters for the Light LC Server model.

Return New Light LC Setup Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_lc_setup_srv_t`.

Type Definitions

```c
typedef void (*esp_ble_mesh_light_client_cb_t)(esp_ble_mesh_light_client_cb_event_t event, esp_ble_mesh_light_client_cb_param_t *param)
```

Bluetooth Mesh Light Client Model function.
Lighting Client Model callback function type

Parameters
- `event`: Event type
- `param`: Pointer to callback parameter

```c
typedef void (*esp_ble_mesh_lighting_server_cb_t)(esp_ble_mesh_lighting_server_cb_event_t event, esp_ble_mesh_lighting_server_cb_param_t *param)
```

Bluetooth Mesh Lighting Server Model function.
Lighting Server Model callback function type

Parameters
- `event`: Event type
- `param`: Pointer to callback parameter

Enumerations

```c
enum esp_ble_mesh_light_client_cb_event_t
```

This enum value is the event of Lighting Client Model

Values:

- `ESP_BLE_MESH_LIGHT_CLIENT_GET_STATE_EVT`
Chapter 2. API Reference

ESP_BLE_MESH_LIGHT_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_LIGHT_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_LIGHT_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_LIGHT_CLIENT_EVT_MAX

enum esp_ble_mesh_lc_state_t
This enum value is the Light LC State Machine states

Values:
ESP_BLE_MESH_LC_OFF
ESP_BLE_MESH_LC_STANDBY
ESP_BLE_MESH_LC_FADE_ON
ESP_BLE_MESH_LC_RUN
ESP_BLE_MESH_LC_FADE
ESP_BLE_MESH_LC_PROLONG
ESP_BLE_MESH_LC_FADE_STANDBY_AUTO
ESP_BLE_MESH_LC_FADE_STANDBY_MANUAL

enum esp_ble_mesh_lighting_server_cb_event_t
This enum value is the event of Lighting Server Model

Values:
ESP_BLE_MESH_LIGHTING_SERVER_STATE_CHANGE_EVT
1. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Lighting Get messages are received.
2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

ESP_BLE_MESH_LIGHTING_SERVER_RECV_GET_MSG_EVT
When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Lighting Get messages are received.

ESP_BLE_MESH_LIGHTING_SERVER_RECV_SET_MSG_EVT
When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

ESP_BLE_MESH_LIGHTING_SERVER_RECV_STATUS_MSG_EVT
When status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Status message is received.

ESP_BLE_MESH_LIGHTING_SERVER_EVT_MAX

2.3.5 NimBLE-based host APIs

Overview

Apache MyNewt NimBLE is a highly configurable and BT SIG qualifiable BLE stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and FreeRTOS. The underlying controller is still the same (as in case of Bluedroid) providing VHCI interface. Refer to NimBLE user guide for a complete list of features and additional information on NimBLE stack. Most features of NimBLE including BLE Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.
Architecture

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.

Threading Model

The NimBLE host can run inside the application thread or can have its own independent thread. This flexibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function nimble_port_freertos_init. This behavior can be changed by overriding the same function. For BLE Mesh, additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.

Programming Sequence

To begin with, make sure that the NimBLE stack is enabled from menuconfig choose NimBLE for the Bluetooth host.

Typical programming sequence with NimBLE stack consists of the following steps:

- Initialize NVS flash using nvs_flash_init() API. This is because ESP controller uses NVS during initialization.
- Call esp_nimble_hci_and_controller_init() to initialize ESP controller as well as transport layer. This will also link the host and controller modules together. Alternatively, if ESP controller is already initialized, then esp_nimble_hci_init() can be called for the remaining initialization.
- Initialize the host stack using nimble_port_init.
- Initialize the required NimBLE host configuration parameters and callbacks
- Perform application specific tasks/initialization
- Run the thread for host stack using nimble_port_freertos_init

This documentation does not cover NimBLE APIs. Refer to NimBLE tutorial for more details on the programming sequence/NimBLE APIs for different scenarios.

API Reference

Header File

- components/bt/host/nimble/esp-hci/include/esp_nimble_hci.h

Functions

esp_err_t esp_nimble_hci_init(void)
Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.
Return

• ESP_OK if the initialization is successful
• Appropriate error code from esp_err_t in case of an error

```
esp_err_t esp_nimble_hci_and_controller_init (void)
```

Initialize ESP Bluetooth controller (link layer) and VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes ESP controller in BLE only mode and the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

Below is the sequence of APIs to be called to init/enable NimBLE host and ESP controller:

```c
void ble_host_task(void *param)
{
    nimble_port_run(); // This function will return only when nimble_port_stop() is executed.
    nimble_port_freertos_deinit();
}

int ret = esp_nimble_hci_and_controller_init();
if (ret != ESP_OK) {
    ESP_LOGE(TAG, "esp_nimble_hci_and_controller_init() failed with error: %d", ret);
    return;
}

nimble_port_init();
// Initialize the NimBLE Host configuration
nimble_port_freertos_init(ble_host_task);
```

nimble_port_freertos_init() is an optional call that creates a new task in which the NimBLE host will run. The task function should have a call to nimble_port_run(). If a separate task is not required, calling nimble_port_run() will run the NimBLE host in the current task.

Return

• ESP_OK if the initialization is successful
• Appropriate error code from esp_err_t in case of an error

```
esp_err_t esp_nimble_hci_deinit (void)
```

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

Note This function should be called after the NimBLE host is deinitialized.

Return

• ESP_OK if the deinitialization is successful
• Appropriate error codes from esp_err_t in case of an error

```
esp_err_t esp_nimble_hci_and_controller_deinit (void)
```

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller and disable the controller.

Below is the sequence of APIs to be called to disable/deinit NimBLE host and ESP controller:

Note This function should not be executed in the context of Bluetooth host task.
Note This function should be called after the NimBLE host is deinitialized.

```c
int ret = nimble_port_stop();
if (ret == 0) {
    nimble_port_deinit();
    ret = esp_nimble_hci_and_controller_deinit();
    if (ret != ESP_OK) {
        ESP_LOGE(TAG, "esp_nimble_hci_and_controller_deinit() failed with...
        error: %s", ret);
    }
}
```

(continues on next page)
If nimble_port_freertos_init() is used during initialization, then nimble_port_freertos_deinit() should be called in the host task after nimble_port_run().

Return

- ESP_OK if the deinitialization is successful
- Appropriate error codes from esp_err_t in case of an error

Macros

BLE_HCI_UART_H4_NONE
BLE_HCI_UART_H4_CMD
BLE_HCI_UART_H4_ACL
BLE_HCI_UART_H4_SCO
BLE_HCI_UART_H4_EVT

ESP-IDF currently supports two host stacks. The Bluedroid based stack (default) supports classic Bluetooth as well as BLE. On the other hand, Apache NimBLE based stack is BLE only. For users to make a choice:

- For use cases involving classic Bluetooth as well as BLE, Bluedroid should be used.
- For BLE-only use cases, using NimBLE is recommended. It is less demanding in terms of code footprint and runtime memory, making it suitable for such scenarios.

Code examples for this API section are provided in the bluetooth/bluedroid directory of ESP-IDF examples.

The following examples contain detailed walkthroughs:

- GATT Client Example Walkthrough
- GATT Server Service Table Example Walkthrough
- GATT Server Example Walkthrough
- GATT Security Client Example Walkthrough
- GATT Security Server Example Walkthrough
- GATT Client Multi-connection Example Walkthrough

### 2.4 Error Codes Reference

This section lists various error code constants defined in ESP-IDF.

For general information about error codes in ESP-IDF, see Error Handling.

ESP_FAIL (-1): Generic esp_err_t code indicating failure

ESP_OK (0): esp_err_t value indicating success (no error)

ESP_ERR_NO_MEM (0x101): Out of memory

ESP_ERR_INVALID_ARG (0x102): Invalid argument

ESP_ERR_INVALID_STATE (0x103): Invalid state

ESP_ERR_INVALID_SIZE (0x104): Invalid size

ESP_ERR_NOT_FOUND (0x105): Requested resource not found

ESP_ERR_NOT_SUPPORTED (0x106): Operation or feature not supported

ESP_ERR_TIMEOUT (0x107): Operation timed out

ESP_ERR_INVALID_RESPONSE (0x108): Received response was invalid

ESP_ERR_INVALID_CRC (0x109): CRC or checksum was invalid
**ESP_ERR_INVALID_VERSION** (0x10a): Version was invalid

**ESP_ERR_INVALID_MAC** (0x10b): MAC address was invalid

**ESP_ERR_NOT_FINISHED** (0x10c): There are items remained to retrieve

**ESP_ERR_NVS_BASE** (0x1100): Starting number of error codes

**ESP_ERR_NVS_NOT_INITIALIZED** (0x1101): The storage driver is not initialized

**ESP_ERR_NVS_NOT_FOUND** (0x1102): Id namespace doesn’t exist yet and mode is NVS_READONLY

**ESP_ERR_NVS_TYPE_MISMATCH** (0x1103): The type of set or get operation doesn’t match the type of value stored in NVS

**ESP_ERR_NVS_READ_ONLY** (0x1104): Storage handle was opened as read only

**ESP_ERR_NVS_NOT_ENOUGH_SPACE** (0x1105): There is not enough space in the underlying storage to save the value

**ESP_ERR_NVS_INVALID_NAME** (0x1106): Namespace name doesn’t satisfy constraints

**ESP_ERR_NVS_INVALID_HANDLE** (0x1107): Handle has been closed or is NULL

**ESP_ERR_NVS_REMOVE_FAILED** (0x1108): The value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

**ESP_ERR_NVS_KEY_TOO_LONG** (0x1109): Key name is too long

**ESP_ERR_NVS_PAGE_FULL** (0x110a): Internal error; never returned by nvs API functions

**ESP_ERR_NVS_INVALID_STATE** (0x110b): NVS is in an inconsistent state due to a previous error. Call nvs_flash_init and nvs_open again, then retry.

**ESP_ERR_NVS_INVALID_LENGTH** (0x110c): String or blob length is not sufficient to store data

**ESP_ERR_NVS_NO_FREE_PAGES** (0x110d): NVS partition doesn’t contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs_flash_init again.

**ESP_ERR_NVS_VALUE_TOO_LONG** (0x110e): String or blob length is longer than supported by the implementation

**ESP_ERR_NVS_PART_NOT_FOUND** (0x110f): Partition with specified name is not found in the partition table

**ESP_ERR_NVS_NEW_VERSION_FOUND** (0x1110): NVS partition contains data in new format and cannot be recognized by this version of code

**ESP_ERR_NVS_XTS_ENCR_FAILED** (0x1111): XTS encryption failed while writing NVS entry

**ESP_ERR_NVS_XTS_DECR_FAILED** (0x1112): XTS decryption failed while reading NVS entry

**ESP_ERR_NVS_XTS_CFG_FAILED** (0x1113): XTS configuration setting failed

**ESP_ERR_NVS_XTS_CFG_NOT_FOUND** (0x1114): XTS configuration not found

**ESP_ERR_NVS_ENCR_NOT_SUPPORTED** (0x1115): NVS encryption is not supported in this version

**ESP_ERR_NVS_KEYS_NOT_INITIALIZED** (0x1116): NVS key partition is uninitialized

**ESP_ERR_NVS_CORRUPT_KEY_PART** (0x1117): NVS key partition is corrupt

**ESP_ERR_NVS_CONTENT_DIFFERS** (0x1118): Internal error; never returned by nvs API functions. NVS key is different in comparison

**ESP_ERR_NVS_WRONG_ENCRYPTION** (0x1119): NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

**ESP_ERR_ULP_BASE** (0x1200): Offset for ULP-related error codes

**ESP_ERR_ULP_SIZE_TOO_BIG** (0x1201): Program doesn’t fit into RTC memory reserved for the ULP

**ESP_ERR_ULP_INVALID_LOAD_ADDR** (0x1202): Load address is outside of RTC memory reserved for the ULP
ESP_ERR_ULP_DUPLICATE_LABEL (0x1203): More than one label with the same number was defined
ESP_ERR_ULP_UNDEFINED_LABEL (0x1204): Branch instructions references an undefined label
ESP_ERR_ULP_BRANCH_OUT_OF_RANGE (0x1205): Branch target is out of range of B instruction (try replacing with BX)

ESP_ERR_OTA_BASE (0x1500): Base error code for ota_ops api
ESP_ERR_OTA_PARTITION_CONFLICT (0x1501): Error if request was to write or erase the current running partition
ESP_ERR_OTA_SELECT_INFO_INVALID (0x1502): Error if OTA data partition contains invalid content
ESP_ERR_OTA_VALIDATE_FAILED (0x1503): Error if OTA app image is invalid
ESP_ERR_OTA_SMALL_SEC_VER (0x1504): Error if the firmware has a secure version less than the running firmware.
ESP_ERR_OTA_ROLLBACK_FAILED (0x1505): Error if flash does not have valid firmware in passive partition and hence rollback is not possible
ESP_ERR_OTA_ROLLBACK_INVALID_STATE (0x1506): Error if current active firmware is still marked in pending validation state (ESP_OTA_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible
ESP_ERR_EFUSE (0x1600): Base error code for efuse api.
ESP_OK_EFUSE_CNT (0x1601): OK the required number of bits is set.
ESP_ERR_EFUSE_CNT_IS_FULL (0x1602): Error field is full.
ESP_ERR_EFUSE_REPEATED_PROG (0x1603): Error repeated programming of programmed bits is strictly forbidden.
ESP_ERR_CODING (0x1604): Error while a encoding operation.
ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS (0x1605): Error not enough unused key blocks available
ESP_ERR_DAMAGED_READING (0x1606): Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.
ESP_ERR_IMAGE_BASE (0x2000)
ESP_ERR_IMAGE_FLASH_FAIL (0x2001)
ESP_ERR_IMAGE_INVALID (0x2002)
ESP_ERR_WI FI_BASE (0x3000): Starting number of WiFi error codes
ESP_ERR_WI FI NOT INIT (0x3001): WiFi driver was not installed by esp_wifi_init
ESP_ERR_WI FI NOT STARTED (0x3002): WiFi driver was not started by esp_wifi_start
ESP_ERR_WI FI NOT STOPPED (0x3003): WiFi driver was not stopped by esp_wifi_stop
ESP_ERR_WI FI IF (0x3004): WiFi interface error
ESP_ERR_WI FI MODE (0x3005): WiFi mode error
ESP_ERR_WI FI STATE (0x3006): WiFi internal state error
ESP_ERR_WI FI_CONN (0x3007): WiFi internal control block of station or soft-AP error
ESP_GATE_WI FI_NV S (0x3008): WiFi internal NVS module error
ESP_ERR_WI FI_MAC (0x3009): MAC address is invalid
ESP_ERR_WI FI_SSID (0x300a): SSID is invalid
ESP_ERR_WI FI_PASSWORD (0x300b): Password is invalid
ESP_ERR_WI FI_TIMEOUT (0x300c): Timeout error
ESP_ERR_WI FI_WAKE_FAIL (0x300d): WiFi is in sleep state(RF closed) and wakeup fail
ESP_ERR_WIFI_WOULD_BLOCK (0x300e): The caller would block
ESP_ERR_WIFI_NOT_CONNECT (0x300f): Station still in disconnect status
ESP_ERR_WIFI_POST (0x3012): Failed to post the event to WiFi task
ESP_ERR_WIFI_INIT_STATE (0x3013): Invalid WiFi state when init/deinit is called
ESP_ERR_WIFI_STOP_STATE (0x3014): Returned when WiFi is stopping
ESP_ERR_WIFI_NOT_ASSOC (0x3015): The WiFi connection is not associated
ESP_ERR_WIFI_TX_DISALLOW (0x3016): The WiFi TX is disallowed
ESP_ERR_WIFI_REGISTRAR (0x3033): WPS registrar is not supported

ESP_ERR_MEMPROT_AREA_INVALID (0xd007)

2.5 Networking APIs

2.5.1 Wi-Fi

ESP-NOW

Overview  ESP-NOW is a kind of connectionless Wi-Fi communication protocol that is defined by Espressif. In ESP-NOW, application data is encapsulated in a vendor-specific action frame and then transmitted from one Wi-Fi device to another without connection. CTR with CBC-MAC Protocol (CCMP) is used to protect the action frame for security. ESP-NOW is widely used in smart light, remote controlling, sensor, etc.

Frame Format  ESP-NOW uses a vendor-specific action frame to transmit ESP-NOW data. The default ESP-NOW bit rate is 1 Mbps. The format of the vendor-specific action frame is as follows:

```
| MAC Header | Category Code | Organization Identifier | Random Values | VendorSpecific Content | FCS |
```

| 24 bytes | 1 byte | 3 bytes | 4 bytes | 7~ | 255 bytes | 4 bytes |

- Category Code: The Category Code field is set to the value(127) indicating the vendor-specific category.
• Organization Identifier: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
• Random Value: The Random Value filed is used to prevents relay attacks.
• Vendor Specific Content: The Vendor Specific Content contains vendor-specific fields as follows:

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Organization Identifier</th>
<th>Type</th>
<th>Version</th>
<th>Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 byte</td>
<td>1 byte</td>
<td>3 bytes</td>
<td>1 byte</td>
<td>1 byte</td>
<td>0~250 bytes</td>
</tr>
</tbody>
</table>

• Element ID: The Element ID field is set to the value (221), indicating the vendor-specific element.
• Length: The length is the total length of Organization Identifier, Type, Version and Body.
• Organization Identifier: The Organization Identifier contains a unique identifier(0x18fe34), which is the first three bytes of MAC address applied by Espressif.
• Type: The Type field is set to the value (4) indicating ESP-NOW.
• Version: The Version field is set to the version of ESP-NOW.
• Body: The Body contains the ESP-NOW data.

As ESP-NOW is connectionless, the MAC header is a little different from that of standard frames. The FromDS and ToDS bits of FrameControl field are both 0. The first address field is set to the destination address. The second address field is set to the source address. The third address field is set to broadcast address (0xff:0xff:0xff:0xff:0xff:0xff).

Security

ESP-NOW uses the CCMP method, which is described in IEEE Std. 802.11-2012, to protect the vendor-specific action frame.

• PMK is used to encrypt LMK with the AES-128 algorithm. Call esp_now_set_pmk() to set PMK. If PMK is not set, a default PMK will be used.
• LMK of the paired device is used to encrypt the vendor-specific action frame with the CCMP method. The maximum number of different LMKs is six. If the LMK of the paired device is not set, the vendor-specific action frame will not be encrypted.

Encrypting multicast vendor-specific action frame is not supported.

Initialization and De-initialization Call esp_now_init() to initialize ESP-NOW and esp_now_deinit() to de-initialize ESP-NOW. ESP-NOW data must be transmitted after Wi-Fi is started, so it is recommended to start Wi-Fi before initializing ESP-NOW and stop Wi-Fi after de-initializing ESP-NOW. When esp_now_deinit() is called, all of the information of paired devices will be deleted.

Add Paired Device Call esp_now_add_peer() to add the device to the paired device list before you send data to this device. The maximum number of paired devices is twenty. If security is enabled, the LMK must be set. You can send ESP-NOW data via both the Station and the SoftAP interface. Make sure that the interface is enabled before sending ESP-NOW data. A device with a broadcast MAC address must be added before sending broadcast data. The range of the channel of paired devices is from 0 to 14. If the channel is set to 0, data will be sent on the current channel. Otherwise, the channel must be set as the channel that the local device is on.

Send ESP-NOW Data Call esp_now_send() to send ESP-NOW data and esp_now_register_send_cb to register sending callback function. It will return ESP_NOW_SEND_SUCCESS in sending callback function if the data is received successfully on the MAC layer. Otherwise, it will return ESP_NOW_SEND_FAIL. Several reasons can lead to ESP-NOW fails to send data. For example, the destination device doesn’t exist; the channels of the devices are not the same; the action frame is lost when transmitting on the air, etc. It is not guaranteed that application layer can receive the data. If necessary, send back ack data when receiving ESP-NOW data. If receiving ack data timeouts, retransmit the ESP-NOW data. A sequence number can also be assigned to ESP-NOW data to drop the duplicate data.

If there is a lot of ESP-NOW data to send, call esp_now_send() to send less than or equal to 250 bytes of data once a time. Note that too short interval between sending two ESP-NOW data may lead to disorder of sending callback function. So, it is recommended that sending the next ESP-NOW data after the sending callback function
of the previous sending has returned. The sending callback function runs from a high-priority Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

Receiving ESP-NOW Data  Call `esp_now_register_recv_cb` to register receiving callback function. Call the receiving callback function when receiving ESP-NOW. The receiving callback function also runs from the Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

Application Examples

- Example of sending and receiving ESP-NOW data between two devices: `wifi/espnow`.
- For more application examples of how to use ESP-NOW, please visit ESP-NOW repository.

API Reference

Header File

- `components/esp_wifi/include/esp_now.h`

Functions

```c
esp_err_t esp_now_init (void)
Initialize ESPNOW function.

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_INTERNAL : Internal error
```

```c
esp_err_t esp_now_deinit (void)
De-initialize ESPNOW function.

Return
• ESP_OK : succeed
```

```c
esp_err_t esp_now_get_version (uint32_t *version)
Get the version of ESPNOW.

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_ARG : invalid argument

Parameters
• version: ESPNOW version
```

```c
esp_err_t esp_now_register_recv_cb (esp_now_recv_cb_t cb)
Register callback function of receiving ESPNOW data.

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_INTERNAL : internal error

Parameters
• cb: callback function of receiving ESPNOW data
```

```c
esp_err_t esp_now_unregister_recv_cb (void)
Unregister callback function of receiving ESPNOW data.

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
```
**esp_err_t esp_now_register_send_cb** *(esp_now_send_cb_t cb)*  
Register callback function of sending ESPNOW data.

**Return**  
- ESP_OK: succeed  
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized  
- ESP_ERR_ESPNOW_INTERNAL: internal error

**Parameters**  
- cb: callback function of sending ESPNOW data

**esp_err_t esp_now_unregister_send_cb** *(void)*  
Unregister callback function of sending ESPNOW data.

**Return**  
- ESP_OK: succeed  
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized

**esp_err_t esp_now_send** *(const uint8_t *peer_addr, const uint8_t *data, size_t len)*  
Send ESPNOW data.

**Attention**  
1. If peer_addr is not NULL, send data to the peer whose MAC address matches peer_addr  
2. If peer_addr is NULL, send data to all of the peers that are added to the peer list  
3. The maximum length of data must be less than ESP_NOW_MAX_DATA_LEN  
4. The buffer pointed to by data argument does not need to be valid after esp_now_send returns

**Return**  
- ESP_OK: succeed  
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized  
- ESP_ERR_ESPNOW_ARG: invalid argument  
- ESP_ERR_ESPNOW_INTERNAL: internal error  
- ESP_ERR_ESPNOW_NO_MEM: out of memory  
- ESP_ERR_ESPNOW_NOT_FOUND: peer is not found  
- ESP_ERR_ESPNOW_IF: current WiFi interface doesn’t match that of peer

**Parameters**  
- peer_addr: peer MAC address  
- data: data to send  
- len: length of data

**esp_err_t esp_now_add_peer** *(const esp_now_peer_info_t *peer)*  
Add a peer to peer list.

**Return**  
- ESP_OK: succeed  
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized  
- ESP_ERR_ESPNOW_ARG: invalid argument  
- ESP_ERR_ESPNOW_FULL: peer list is full  
- ESP_ERR_ESPNOW_NO_MEM: out of memory  
- ESP_ERR_ESPNOW_EXIST: peer has existed

**Parameters**  
- peer: peer information

**esp_err_t esp_now_del_peer** *(const uint8_t *peer_addr)*  
Delete a peer from peer list.

**Return**  
- ESP_OK: succeed  
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized  
- ESP_ERR_ESPNOW_ARG: invalid argument  
- ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

**Parameters**  
- peer_addr: peer MAC address

**esp_err_t esp_now_mod_peer** *(const esp_now_peer_info_t *peer)*  
Modify a peer.
Return
• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG: invalid argument
• ESP_ERR_ESPNOW_FULL: peer list is full

Parameters
• peer: peer information

```
void esp_err_t esp_now_get_peer (const uint8_t *peer_addr, esp_now_peer_info_t *peer)
```

Get a peer whose MAC address matches peer_addr from peer list.

Return
• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG: invalid argument
• ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

Parameters
• peer_addr: peer MAC address
• peer: peer information

```
void esp_err_t esp_now_fetch_peer (bool from_head, esp_now_peer_info_t *peer)
```

Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

Return
• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG: invalid argument
• ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

Parameters
• from_head: fetch from head of list or not
• peer: peer information

```
bool esp_now_is_peer_exist (const uint8_t *peer_addr)
```

Peer exists or not.

Return
• true: peer exists
• false: peer not exists

Parameters
• peer_addr: peer MAC address

```
void esp_err_t esp_now_get_peer_num (esp_now_peer_num_t *num)
```

Get the number of peers.

Return
• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG: invalid argument

Parameters
• num: number of peers

```
void esp_err_t esp_now_set_pmk (const uint8_t *pmk)
```

Set the primary master key.

**Attention**
1. primary master key is used to encrypt local master key

Return
• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG: invalid argument

Parameters
• pmk: primary master key
esp_err_t esp_now_set_wake_window(uint16_t window)
Set esp_now wake window for sta disconnected power management.

**Attention** 1. Only when ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work
**Attention** 2. This configuration only work for station mode and disconnected status
**Attention** 3. If more than one module has configured its wake_window, chip would choose the largest one to stay waked
**Attention** 4. If the gap between interval and window is smaller than 5ms, the chip would keep waked all the time
**Attention** 5. If never configured wake_window, the chip would keep waked at disconnected once it uses esp_now

**Return**
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

**Parameters**
- window: how much microsecond would the chip keep waked each interval, vary from 0 to 65535

**Structures**

**struct esp_now_peer_info**
ESPNOW peer information parameters.

**Public Members**

uint8_t **peer_addr**[ESP_NOW_ETH_ALEN]
ESPNOW peer MAC address that is also the MAC address of station or softap

uint8_t **lmk**[ESP_NOW_KEY_LEN]
ESPNOW peer local master key that is used to encrypt data

uint8_t **channel**
Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

**wifi_interface_t ifidx**
Wi-Fi interface that peer uses to send/receive ESPNOW data

bool **encrypt**
ESPNOW data that this peer sends/receives is encrypted or not

void * **priv**
ESPNOW peer private data

**struct esp_now_peer_num**
Number of ESPNOW peers which exist currently.

**Public Members**

int **total_num**
Total number of ESPNOW peers, maximum value is ESP_NOW_MAX_TOTAL_PEER_NUM

int **encrypt_num**
Number of encrypted ESPNOW peers, maximum value is ESP_NOW_MAX_ENCRYPT_PEER_NUM

**Macros**

**ESP_ERR_ESPNOW_BASE**
ESPNOW error number base.

**ESP_ERR_ESPNOW_NOT_INIT**
ESPNOW is not initialized.
### Chapter 2. API Reference

**ESP_ERR_ESPNOW_ARG**
Invalid argument

**ESP_ERR_ESPNOW_NO_MEM**
Out of memory

**ESP_ERR_ESPNOW_FULL**
ESPNOW peer list is full

**ESP_ERR_ESPNOW_NOT_FOUND**
ESPNOW peer is not found

**ESP_ERR_ESPNOW_INTERNAL**
Internal error

**ESP_ERR_ESPNOW_EXIST**
ESPNOW peer has existed

**ESP_ERR_ESPNOW_IF**
Interface error

**ESP_NOW_ETH_ALEN**
Length of ESPNOW peer MAC address

**ESP_NOW_KEY_LEN**
Length of ESPNOW peer local master key

**ESP_NOW_MAX_TOTAL_PEER_NUM**
Maximum number of ESPNOW total peers

**ESP_NOW_MAX_ENCRYPT_PEER_NUM**
Maximum number of ESPNOW encrypted peers

**ESP_NOW_MAX_DATA_LEN**
Maximum length of ESPNOW data which is sent very time

### Type Definitions

```c
typedef struct esp_now_peer_info esp_now_peer_info_t
ESPNOW peer information parameters.
typedef struct esp_now_peer_num esp_now_peer_num_t
Number of ESPNOW peers which exist currently.
typedef void (*esp_now_recv_cb_t)(const uint8_t *mac_addr, const uint8_t *data, int data_len)
Callback function of receiving ESPNOW data.
```

**Parameters**

- `mac_addr`: peer MAC address
- `data`: received data
- `data_len`: length of received data

```c
typedef void (*esp_now_send_cb_t)(const uint8_t *mac_addr, esp_now_send_status_t status)
Callback function of sending ESPNOW data.
```

**Parameters**

- `mac_addr`: peer MAC address
- `status`: status of sending ESPNOW data (succeed or fail)

### Enumerations

```c
typedef enum esp_now_send_status_t
Status of sending ESPNOW data .
```

**Values:**
ESP_NOW_SEND_SUCCESS = 0
Send ESPNOW data successfully

ESP_NOW_SEND_FAIL
Send ESPNOW data fail

**ESP-WIFI-MESH** Programming Guide

This is a programming guide for ESP-WIFI-MESH, including the API reference and coding examples. This guide is split into the following parts:

1. *ESP-WIFI-MESH Programming Model*
2. *Writing an ESP-WIFI-MESH Application*
3. *Self Organized Networking*
4. *Application Examples*
5. *API Reference*

For documentation regarding the ESP-WIFI-MESH protocol, please see the *ESP-WIFI-MESH API Guide*. For more information about ESP-WIFI-MESH Development Framework, please see ESP-WIFI-MESH Development Framework.

**ESP-WIFI-MESH Programming Model**

**Software Stack**  The ESP-WIFI-MESH software stack is built atop the Wi-Fi Driver/FreeRTOS and may use the LwIP Stack in some instances (i.e. the root node). The following diagram illustrates the ESP-WIFI-MESH software stack.

![Fig. 4: ESP-WIFI-MESH Software Stack](image)

**System Events**  An application interfaces with ESP-WIFI-MESH via *ESP-WIFI-MESH Events*. Since ESP-WIFI-MESH is built atop the Wi-Fi stack, it is also possible for the application to interface with the Wi-Fi driver via the *Wi-Fi Event Task*. The following diagram illustrates the interfaces for the various System Events in an ESP-WIFI-MESH application.

The mesh_event_id_t defines all possible ESP-WIFI-MESH events and can indicate events such as the connection/disconnection of parent/child. Before ESP-WIFI-MESH events can be used, the application must register a Mesh Events handler via esp_event_handler_register() to the default event task. The Mesh Events handler that is registered contain handlers for each ESP-WIFI-MESH event relevant to the application.

Typical use cases of mesh events include using events such as MESH_EVENT_PARENT_CONNECTED and MESH_EVENT_CHILD_CONNECTED to indicate when a node can begin transmitting data upstream and downstream respectively. Likewise, IP_EVENT_STA_GOT_IP and IP_EVENT_STA_LOST_IP can be used to indicate when the root node can and cannot transmit data to the external IP network.
Warning: When using ESP-WIFI-MESH under self-organized mode, users must ensure that no calls to Wi-Fi API are made. This is due to the fact that the self-organizing mode will internally make Wi-Fi API calls to connect/disconnect/scan etc. Any Wi-Fi calls from the application (including calls from callbacks and handlers of Wi-Fi events) may interfere with ESP-WIFI-MESH’s self-organizing behavior. Therefore, users should not call Wi-Fi APIs after `esp_mesh_start()` is called, and before `esp_mesh_stop()` is called.

LwIP & ESP-WIFI-MESH  The application can access the ESP-WIFI-MESH stack directly without having to go through the LwIP stack. The LwIP stack is only required by the root node to transmit/receive data to/from an external IP network. However, since every node can potentially become the root node (due to automatic root node selection), each node must still initialize the LwIP stack.

Each node is required to initialize LwIP by calling `tcpip_adapter_init()`. In order to prevent non-root node access to LwIP, the application should stop the following services after LwIP initialization:

- DHCP server service on the softAP interface.
- DHCP client service on the station interface.

The following code snippet demonstrates how to initialize LwIP for ESP-WIFI-MESH applications.

```c
/* tcpip initialization */
tcpip_adapter_init();
/*
 * for mesh
 * stop DHCP server on softAP interface by default
 * stop DHCP client on station interface by default
 */
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhcpc_stop(TCPIP_ADAPTER_IF_STA));
```

Note: ESP-WIFI-MESH requires a root node to be connected with a router. Therefore, in the event that a node becomes the root, the corresponding handler must start the DHCP client service and immediately obtain an IP address. Doing so will allow other nodes to begin transmitting/receiving packets to/from the external IP network. However, this step is unnecessary if static IP settings are used.

Writing an ESP-WIFI-MESH Application  The prerequisites for starting ESP-WIFI-MESH is to initialize LwIP and Wi-Fi. The following code snippet demonstrates the necessary prerequisite steps before ESP-WIFI-MESH itself can be initialized.

```c
tcpip_adapter_init();
/*
(continues on next page)
```
After initializing LwIP and Wi-Fi, the process of getting an ESP-WIFI-MESH network up and running can be summarized into the following three steps:

1. Initialize Mesh
2. Configuring an ESP-WIFI-MESH Network
3. Start Mesh

### Initialize Mesh
The following code snippet demonstrates how to initialize ESP-WIFI-MESH:

```c
/* mesh initialization */
ESP_ERROR_CHECK(esp_mesh_init());
/* register mesh events handler */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_, event_handler, NULL));
```

### Configuring an ESP-WIFI-MESH Network
ESP-WIFI-MESH is configured via `esp_mesh_set_config()` which receives its arguments using the `mesh_cfg_t` structure. The structure contains the following parameters used to configure ESP-WIFI-MESH:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel</td>
<td>Range from 1 to 14</td>
</tr>
<tr>
<td>Mesh ID</td>
<td>ID of ESP-WIFI-MESH Network, see <code>mesh_addr_t</code></td>
</tr>
<tr>
<td>Router</td>
<td>Router Configuration, see <code>mesh_router_t</code></td>
</tr>
<tr>
<td>Mesh AP</td>
<td>Mesh AP Configuration, see <code>mesh_ap_cfg_t</code></td>
</tr>
<tr>
<td>Crypto Functions</td>
<td>Crypto Functions for Mesh IE, see <code>mesh_crypto_funcs_t</code></td>
</tr>
</tbody>
</table>

The following code snippet demonstrates how to configure ESP-WIFI-MESH:

```c
/* Enable the Mesh IE encryption by default */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
/* mesh ID */
memcpy((uint8_t *) &cfg.mesh_id, MESH_ID, 6);
/* channel (must match the router’s channel) */
cfg.channel = CONFIG_MESH_CHANNEL;
/* router */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *) &cfg.router.ssid, CONFIG_MESH_ROUTER_SSID, cfg.router.ssid_len);
memcpy((uint8_t *) &cfg.router.password, CONFIG_MESH_ROUTER_PASSWD,
```
```c
strlen(CONFIG_MESH_ROUTER_PASSWD));
/* mesh softAP */
cfg.mesh_ap.max_connection = CONFIG_MESH_AP_CONNECTIONS;
memcpy((uint8_t *)&cfg.mesh_ap.password, CONFIG_MESH_AP_PASSWD,
strlen(CONFIG_MESH_AP_PASSWD));
ESP_ERROR_CHECK(esp_mesh_set_config(&cfg));
```

### Start Mesh

The following code snippet demonstrates how to start ESP-WIFI-MESH.

```c
/* mesh start */
ESP_ERROR_CHECK(esp_mesh_start());
```

After starting ESP-WIFI-MESH, the application should check for ESP-WIFI-MESH events to determine when it has connected to the network. After connecting, the application can start transmitting and receiving packets over the ESP-WIFI-MESH network using `esp_mesh_send()` and `esp_mesh_recv()`.

### Self Organized Networking

Self organized networking is a feature of ESP-WIFI-MESH where nodes can autonomously scan/select/connect/reconnect to other nodes and routers. This feature allows an ESP-WIFI-MESH network to operate with high degree of autonomy by making the network robust to dynamic network topologies and conditions. With self organized networking enabled, nodes in an ESP-WIFI-MESH network are able to carry out the following actions without autonomously:

- Selection or election of the root node (see [Automatic Root Node Selection](#) in Building a Network)
- Selection of a preferred parent node (see [Parent Node Selection](#) in Building a Network)
- Automatic reconnection upon detecting a disconnection (see [Intermediate Parent Node Failure](#) in Managing a Network)

When self organized networking is enabled, the ESP-WIFI-MESH stack will internally make calls to Wi-Fi APIs. Therefore, the application layer should not make any calls to Wi-Fi APIs whilst self organized networking is enabled as doing so would risk interfering with ESP-WIFI-MESH.

### Toggling Self Organized Networking

Self organized networking can be enabled or disabled by the application at runtime by calling the `esp_mesh_set_self_organized()` function. The function has the two following parameters:

- `bool enable` specifies whether to enable or disable self organized networking.
- `bool select_parent` specifies whether a new parent node should be selected when enabling self organized networking. Selecting a new parent has different effects depending the node type and the node’s current state. This parameter is unused when disabling self organized networking.

### Disabling Self Organized Networking

The following code snippet demonstrates how to disable self organized networking.

```c
//Disable self organized networking
esp_mesh_set_self_organized(false, false);
```

ESP-WIFI-MESH will attempt to maintain the node’s current Wi-Fi state when disabling self organized networking.

- If the node was previously connected to other nodes, it will remain connected.
- If the node was previously disconnected and was scanning for a parent node or router, it will stop scanning.
- If the node was previously attempting to reconnect to a parent node or router, it will stop reconnecting.

### Enabling Self Organized Networking

ESP-WIFI-MESH will attempt to maintain the node’s current Wi-Fi state when enabling self organized networking. However, depending on the node type and whether a new parent is selected, the Wi-Fi state of the node can change. The following table shows effects of enabling self organized networking.
<table>
<thead>
<tr>
<th>Select Parent</th>
<th>Is Root Node</th>
<th>Effects</th>
</tr>
</thead>
</table>
| N             | N           | • Nodes already connected to a parent node will remain connected.  
• Nodes previously scanning for a parent nodes will stop scanning. Call `esp_mesh_connect()` to restart. |
| Y             |             | • A root node already connected to router will stay connected.  
• A root node disconnected from router will need to call `esp_mesh_connect()` to reconnect. |
| Y             | N           | • Nodes without a parent node will automatically select a preferred parent and connect.  
• Nodes already connected to a parent node will disconnect, reselect a preferred parent node, and connect. |
| Y             |             | • For a root node to connect to a parent node, it must give up it’s role as root. Therefore, a root node will disconnect from the router and all child nodes, select a preferred parent node, and connect. |

The following code snippet demonstrates how to enable self organized networking.

```c
//Enable self organized networking and select a new parent  
esp_mesh_set_self_organized(true, true);
...
//Enable self organized networking and manually reconnect  
esp_mesh_set_self_organized(true, false);  
esp_mesh_connect();
```

**Calling Wi-Fi API** There can be instances in which an application may want to directly call Wi-Fi API whilst using ESP-WIFI-MESH. For example, an application may want to manually scan for neighboring APs. However, self organized networking must be disabled before the application calls any Wi-Fi APIs. This will prevent the ESP-WIFI-MESH stack from attempting to call any Wi-Fi APIs and potentially interfering with the application’s calls.

Therefore, application calls to Wi-Fi APIs should be placed in between calls of `esp_mesh_set_self_organized()` which disable and enable self organized networking. The following code snippet demonstrates how an application can safely call `esp_wifi_scan_start()` whilst using...
ESP-WIFI-MESH.

```c
//Disable self organized networking
esp_mesh_set_self_organized(0, 0);

//Stop any scans already in progress
esp_wifi_scan_stop();

//Manually start scan. Will automatically stop when run to completion
esp_wifi_scan_start();

//Process scan results
...

//Re-enable self organized networking if still connected
esp_mesh_set_self_organized(1, 0);
...

//Re-enable self organized networking if non-root and disconnected
esp_mesh_set_self_organized(1, 1);
...

//Re-enable self organized networking if root and disconnected
esp_mesh_set_self_organized(1, 0); //Don't select new parent
esp_mesh_connect(); //Manually reconnect to router
```

**Application Examples** ESP-IDF contains these ESP-WIFI-MESH example projects:

The **Internal Communication Example** demonstrates how to set up a ESP-WIFI-MESH network and have the root node send a data packet to every node within the network.

The **Manual Networking Example** demonstrates how to use ESP-WIFI-MESH without the self-organizing features. This example shows how to program a node to manually scan for a list of potential parent nodes and select a parent node based on custom criteria.

**API Reference**

**Header File**

- components/esp_wifi/include/esp_mesh.h

**Functions**

```c
def esp_err_t esp_mesh_init (void)
Mesh initialization.

- Check whether Wi-Fi is started.
- Initialize mesh global variables with default values.

Attention This API shall be called after Wi-Fi is started.

Return
- ESP_OK
- ESP_FAIL

def esp_err_t esp_mesh_deinit (void)
Mesh de-initialization.

Return
- Release resources and stop the mesh
```
Chapter 2. API Reference

- ESP_OK
- ESP_FAIL

**esp_err_t esp_mesh_start (void)**

Start mesh.

- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

**Attention** This API shall be called after mesh initialization and configuration.

**Return**

- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_NOT_INIT
- ESP_ERR_MESH_NOT_CONFIG
- ESP_ERR_MESH_NO_MEMORY

**esp_err_t esp_mesh_stop (void)**

Stop mesh.

- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.
- Stop mesh network management service.
- Unregister mesh packets receive callback.
- Delete TX and RX queues.
- Release resources.
- Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.
- Set Wi-Fi Power Save type to WIFI_PS_NONE.

**Return**

- ESP_OK
- ESP_FAIL

**esp_err_t esp_mesh_send (const mesh_addr_t *to, const mesh_data_t *data, int flag, const mesh_opt_t opt[], int opt_count)**

Send a packet over the mesh network.

- Send a packet to any device in the mesh network.
- Send a packet to external IP network.

**Attention** This API is not reentrant.

**Return**

- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_DISCONNECTED
- ESP_ERR_MESH_OPT_UNKNOWN
- ESP_ERR_MESH_EXCEED_MTU
- ESP_ERR_MESH_NO_MEMORY
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_NO_ROUTE_FOUND
- ESP_ERR_MESH_DISCARD

**Parameters**

- [in] to: the address of the final destination of the packet
  - If the packet is to the root, set this parameter to NULL.
  - If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.
• [in] data: pointer to a sending mesh packet
  – Field size should not exceed MESH_MPS. Note that the size of one mesh packet should not
    exceed MESH_MTU.
  – Field proto should be set to data protocol in use (default is MESH_PROTO_BIN for binary).
  – Field tos should be set to transmission tos (type of service) in use (default is MESH_TOS_P2P
    for point-to-point reliable).
• [in] flag: bitmap for data sent
  – Speed up the route search
    * If the packet is to the root and “to” parameter is NULL, set this parameter to 0.
    * If the packet is to an internal device, MESH_DATA_P2P should be set.
    * If the packet is to the root (“to” parameter isn’t NULL) or to external IP network,
      MESH_DATA_TODS should be set.
    * If the packet is from the root to an internal device, MESH_DATA_FROMDS should be set.
  – Specify whether this API is block or non-block, block by default
    * If needs non-blocking, MESH_DATA_NONBLOCK should be set. Otherwise, may use
      esp_mesh_send_block_time() to specify a blocking time.
  – In the situation of the root change. MESH_DATA_DROP identifies this packet can be dropped
    by the new root for upstream data to external IP network, we try our best to avoid data loss caused
    by the root change, but there is a risk that the new root is running out of memory because most of
    memory is occupied by the pending data which isn’t read out in time by esp_mesh_recv_toDS().
    Generally, we suggest esp_mesh_recv_toDS() is called after a connection with IP network
    is created. Thus data outgoing to external IP network via socket is just from reading
    esp_mesh_recv_toDS() which avoids unnecessary memory copy.
• [in] opt: options
  – In case of sending a packet to a certain group, MESH_OPT_SEND_GROUP is a good choice.
    In this option, the value field should be set to the target receiver addresses in this group.
  – Root sends a packet to an internal device, this packet is from external IP network in case the
    receiver device responds this packet, MESH_OPT_RECV_DS_ADDR is required to attach the
    target DS address.
• [in] opt_count: option count
  – Currently, this API only takes one option, so opt_count is only supported to be 1.

```
esp_err_t esp_mesh_send_block_time(uint32_t time_ms)
Set blocking time of esp_mesh_send()
```

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK

**Parameters**
- [in] time_ms: blocking time of esp_mesh_send(), unit: ms

```
esp_err_t esp_mesh_recv(mesh_addr_t *from, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)
Receive a packet targeted to self over the mesh network.
```

**flag** could be MESH_DATA_FROMDS or MESH_DATA_TODS.

**Attention** Mesh RX queue should be checked regularly to avoid running out of memory.
  - Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to
    be received by applications.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD

**Parameters**
- [out] from: the address of the original source of the packet
- [out] data: pointer to the received mesh packet
  – Field proto is the data protocol in use. Should follow it to parse the received data.
  – Field tos is the transmission tos (type of service) in use.
• [in] timeout_ms: wait time if a packet isn’t immediately available (0: no wait, port-MAX_DELAY: wait forever)

• [out] flag: bitmap for data received
  – MESH_DATA_FROMDS represents data from external IP network
  – MESH_DATA_TODS represents data directed upward within the mesh network

Parameters
• [out] opt: options desired to receive
  – MESH_OPT_RECV_DS_ADDR attaches the DS address

• [in] opt_count: option count desired to receive
  – Currently, this API only takes one option, so opt_count is only supported to be 1.

\[
\text{esp_err_t esp_mesh_recv_toDS (mesh_addr_t *from, mesh_addr_t *to, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)}
\]

Receive a packet targeted to external IP network.

• Root uses this API to receive packets destined to external IP network
• Root forwards the received packets to the final destination via socket.
• If no socket connection is ready to send out the received packets and this esp_mesh_recv_toDS() hasn’t been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using esp_mesh_set_xon_qsize() users may configure the RX queue size, default:32. If this size is too large, and esp_mesh_recv_toDS() hasn’t called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.

flag could be MESH_DATA_TODS.

Attention This API is only called by the root.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_START
• ESP_ERR_MESH_TIMEOUT
• ESP_ERR_MESH_DISCARD
• ESP_ERR_MESH_RECV_RELEASE

Parameters
• [out] from: the address of the original source of the packet
• [out] to: the address contains remote IP address and port (IPv4:PORT)
• [out] data: pointer to the received packet
  – Contain the protocol and applications should follow it to parse the data.
• [in] timeout_ms: wait time if a packet isn’t immediately available (0: no wait, port-MAX_DELAY: wait forever)
• [out] flag: bitmap for data received
  – MESH_DATA_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.

Parameters
• [out] opt: options desired to receive
• [in] opt_count: option count desired to receive

\[
\text{esp_err_t esp_mesh_set_config (const mesh_cfg_t *config)}
\]

Set mesh stack configuration.

• Use MESH_INIT_CONFIG_DEFAULT() to initialize the default values, mesh IE is encrypted by default.
• Mesh network is established on a fixed channel (1-14).
• Mesh event callback is mandatory.
• Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
• Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn’t set and there exists more than one router with same SSID, there is a risk that more roots
than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn’t handle roots connected with different BSSID. Because users might have such requirements of setting up routers with same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. max_connection of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

**Attention** This API shall be called before mesh is started after mesh is initialized.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**Parameters**
- [in] config: pointer to mesh stack configuration

```c
esp_err_t esp_mesh_get_config(mesh_cfg_t *config)
```
Get mesh stack configuration.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- [out] config: pointer to mesh stack configuration

```c
esp_err_t esp_mesh_set_router(const mesh_router_t *router)
```
Get router configuration.

**Attention** This API is used to dynamically modify the router configuration after mesh is configured.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- [in] router: pointer to router configuration

```c
esp_err_t esp_mesh_get_router(mesh_router_t *router)
```
Get router configuration.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- [out] router: pointer to router configuration

```c
esp_err_t esp_mesh_set_id(const mesh_addr_t *id)
```
Set mesh network ID.

**Attention** This API is used to dynamically modify the mesh network ID.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT: invalid argument

**Parameters**
- [in] id: pointer to mesh network ID

```c
esp_err_t esp_mesh_get_id(mesh_addr_t *id)
```
Get mesh network ID.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- [out] id: pointer to mesh network ID
**esp_err_t esp_mesh_set_type(mesh_type_t type)**

Designate device type over the mesh network.

- **MESH_IDLE**: designates a device as a self-organized node for a mesh network
- **MESH_ROOT**: designates the root node for a mesh network
- **MESH_LEAF**: designates a device as a standalone Wi-Fi station that connects to a parent
- **MESH_STA**: designates a device as a standalone Wi-Fi station that connects to a router

**Return**

- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED

**Parameters**

- **[in]** type: device type

**mesh_type_t esp_mesh_get_type(void)**

Get device type over mesh network.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Return** mesh type

**esp_err_t esp_mesh_set_max_layer(int max_layer)**

Set network max layer value.

- for tree topology, the max is 25.
- for chain topology, the max is 1000.
- Network max layer limits the max hop count.

**Attention** This API shall be called before mesh is started.

**Return**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**Parameters**

- **[in]** max_layer: max layer value

**int esp_mesh_get_max_layer(void)**

Get max layer value.

**Return** max layer value

**esp_err_t esp_mesh_set_ap_password(const uint8_t *pwd, int len)**

Set mesh softAP password.

**Attention** This API shall be called before mesh is started.

**Return**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**Parameters**

- **[in]** pwd: pointer to the password
- **[in]** len: password length

**esp_err_t esp_mesh_set_ap_authmode(wifi_auth_mode_t authmode)**

Set mesh softAP authentication mode.

**Attention** This API shall be called before mesh is started.

**Return**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**Parameters**

- **[in]** authmode: authentication mode
### Chapter 2. API Reference

**wifi_auth_mode_t esp_mesh_get_ap_authmode (void)**

Get mesh softAP authentication mode.

**Return**

authentication mode

**esp_err_t esp_mesh_set_ap_connections (int connections)**

Set mesh max connection value.

- Set mesh softAP max connection = mesh max connection + non-mesh max connection

**Attention** This API shall be called before mesh is started.

**Return**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**

- [in] connections: the number of max connections

**int esp_mesh_get_ap_connections (void)**

Get mesh max connection configuration.

**Return**

the number of mesh max connections

**int esp_mesh_get_non_mesh_connections (void)**

Get non-mesh max connection configuration.

**Return**

the number of non-mesh max connections

**int esp_mesh_get_layer (void)**

Get current layer value over the mesh network.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Return**

layer value

**esp_err_t esp_mesh_get_parent_bssid (mesh_addr_t *bssid)**

Get the parent BSSID.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Return**

- ESP_OK
- ESP_FAIL

**Parameters**

- [out] bssid: pointer to parent BSSID

**bool esp_mesh_is_root (void)**

Return whether the device is the root node of the network.

**Return**

true/false

**esp_err_t esp_mesh_set_self_organized (bool enable, bool select_parent)**

Enable/disable self-organized networking.

- Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
- Self-organized networking is enabled by default.
- If self-organized is disabled, users should set a parent for the device via esp_mesh_set_parent().

**Attention** This API is used to dynamically modify whether to enable the self organizing.

**Return**

- ESP_OK
- ESP_FAIL

**Parameters**

- [in] enable: enable or disable self-organized networking
- [in] select_parent: Only valid when self-organized networking is enabled.
  - if select_parent is set to true, the root will give up its mesh root status and search for a new parent like other non-root devices.
bool esp_mesh_get_self_organized(void)
Return whether enable self-organized networking or not.

Return true/false

esp_err_t esp_mesh_waive_root(const mesh_vote_t *vote, int reason)
Cause the root device to give up (waive) its mesh root status.

• A device is elected root primarily based on RSSI from the external router.
• If external router conditions change, users can call this API to perform a root switch.
• In this API, users could specify a desired root address to replace itself or specify an attempts value to ask current root to initiate a new round of voting. During the voting, a better root candidate would be expected to find to replace the current one.
• If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better root candidate is found, keep the current one. If a better candidate is found, the new better one will send a root switch request to the current root, current root will respond with a root switch acknowledgment.
• After that, the new candidate will connect to the router to be a new root, the previous root will disconnect with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

Attention This API is only called by the root.

Return
• ESP_OK
• ESP_ERR_MESH_QUEUE_FULL
• ESP_ERR_MESH_DISCARD
• ESP_FAIL

Parameters
• [in] vote: vote configuration
  – If this parameter is set NULL, the vote will perform the default 15 times.
  – Field percentage threshold is 0.9 by default.
  – Field is_rc_specified shall be false.
  – Field attempts shall be at least 15 times.
• [in] reason: only accept MESH_VOTE_REASON_ROOT_INITIATED for now

esp_err_t esp_mesh_set_vote_percentage (float percentage)
Set vote percentage threshold for approval of being a root (default:0.9)

• During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

Attention This API shall be called before mesh is started.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] percentage: vote percentage threshold

float esp_mesh_get_vote_percentage (void)
Get vote percentage threshold for approval of being a root.

Return percentage threshold

esp_err_t esp_mesh_set_ap_assoc_expire (int seconds)
Set mesh softAP associate expired time (default:10 seconds)

• If mesh softAP hasn’t received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
• If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] seconds: the expired time
int esp_mesh_get_ap_assoc_expire (void)
    Get mesh softAP associate expired time.

Return  seconds

int esp_mesh_get_total_node_num (void)
    Get total number of devices in current network (including the root)

Attention  The returned value might be incorrect when the network is changing.

Return  total number of devices (including the root)

int esp_mesh_get_routing_table_size (void)
    Get the number of devices in this device’s sub-network (including self)

Return  the number of devices over this device’s sub-network (including self)

esp_err_t esp_mesh_get_routing_table (mesh_addr_t *mac, int len, int *size)
    Get routing table of this device’s sub-network (including itself)

Return
    • ESP_OK
    • ESP_ERR_MESH_ARGUMENT

Parameters
    • [out] mac: pointer to routing table
    • [in] len: routing table size (in bytes)
    • [out] size: pointer to the number of devices in routing table (including itself)

esp_err_t esp_mesh_post_toDS_state (bool reachable)
    Post the toDS state to the mesh stack.

Attention  This API is only for the root.

Return
    • ESP_OK
    • ESP_FAIL

Parameters
    • [in] reachable: this state represents whether the root is able to access external IP network

esp_err_t esp_mesh_get_tx_pending (mesh_tx_pending_t *pending)
    Return the number of packets pending in the queue waiting to be sent by the mesh stack.

Return
    • ESP_OK
    • ESP_FAIL

Parameters
    • [out] pending: pointer to the TX pending

esp_err_t esp_mesh_get_rx_pending (mesh_rx_pending_t *pending)
    Return the number of packets available in the queue waiting to be received by applications.

Return
    • ESP_OK
    • ESP_FAIL

Parameters
    • [out] pending: pointer to the RX pending

int esp_mesh_available_txupQ_num (const mesh_addr_t *addr, uint32_t *xseqno_in)
    Return the number of packets could be accepted from the specified address.

Return  the number of upQ for a certain address

Parameters
    • [in] addr: self address or an associate children address
    • [out] xseqno_in: sequence number of the last received packet from the specified address

esp_err_t esp_mesh_set_xon_qsize (int qsize)
    Set the number of queue.

Attention  This API shall be called before mesh is started.
Chapter 2. API Reference

Return

- ESP_OK
- ESP_FAIL

Parameters

- [in] qsize: default:32 (min:16)

int esp_mesh_get_xon_qsize (void)
Get queue size.

Return the number of queue

**esp_err_t** esp_mesh_allow_root_conflicts (bool allowed)
Set whether allow more than one root existing in one network.

Return

- ESP_OK
- ESP_WIFI_ERR_NOT_INIT
- ESP_WIFI_ERR_NOT_START

Parameters

- [in] allowed: allow or not

bool esp_mesh_is_root_conflicts_allowed (void)
Check whether allow more than one root to exist in one network.

Return true/false

**esp_err_t** esp_mesh_set_group_id (const mesh_addr_t *addr, int num)
Set group ID addresses.

Return

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

Parameters

- [in] addr: pointer to new group ID addresses
- [in] num: the number of group ID addresses

**esp_err_t** esp_mesh_delete_group_id (const mesh_addr_t *addr, int num)
Delete group ID addresses.

Return

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

Parameters

- [in] addr: pointer to deleted group ID address
- [in] num: the number of group ID addresses

int esp_mesh_get_group_num (void)
Get the number of group ID addresses.

Return the number of group ID addresses

**esp_err_t** esp_mesh_get_group_list (mesh_addr_t *addr, int num)
Get group ID addresses.

Return

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

Parameters

- [out] addr: pointer to group ID addresses
- [in] num: the number of group ID addresses

bool esp_mesh_is_my_group (const mesh_addr_t *addr)
Check whether the specified group address is my group.

Return true/false
Chapter 2. API Reference

**esp_err_t esp_mesh_set_capacity_num (int num)**
Set mesh network capacity (max:1000, default:300)

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED
- ESP_MESH_ERR_ARGUMENT

**Parameters**
- [in] num: mesh network capacity

int esp_mesh_get_capacity_num (void)
Get mesh network capacity.

**esp_err_t esp_mesh_set_ie_crypto_funcs (const mesh_crypto_funcs_t *crypto_funcs)**
Set mesh IE crypto functions.

**Attention** This API can be called at any time after mesh is initialized.

**Return**
- ESP_OK

**Parameters**
- [in] crypto_funcs: crypto functions for mesh IE
  - If crypto_funcs is set to NULL, mesh IE is no longer encrypted.

**esp_err_t esp_mesh_set_ie_crypto_key (const char *key, int len)**
Set mesh IE crypto key.

**Attention** This API can be called at any time after mesh is initialized.

**Return**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

**Parameters**
- [in] key: ASCII crypto key
- [in] len: length in bytes, range:8~64

**esp_err_t esp_mesh_get_ie_crypto_key (char *key, int len)**
Get mesh IE crypto key.

**Return**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

**Parameters**
- [out] key: ASCII crypto key
- [in] len: length in bytes, range:8~64

**esp_err_t esp_mesh_set_root_healing_delay (int delay_ms)**
Set delay time before starting root healing.

**Return**
- ESP_OK

**Parameters**
- [in] delay_ms: delay time in milliseconds

int esp_mesh_get_root_healing_delay (void)
Get delay time before network starts root healing.

**Return** delay time in milliseconds

**esp_err_t esp_mesh_fix_root (bool enable)**
Enable network Fixed Root Setting.

- Enabling fixed root disables automatic election of the root node via voting.
- All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
- If Fixed Root is enabled, users should make sure a root node is designated for the network.
### Return
- ESP_OK

### Parameters
- [in] enable: enable or not

---

#### bool esp_mesh_is_root_fixed (void)
Check whether network Fixed Root Setting is enabled.

- Enable/disable network Fixed Root Setting by API esp_mesh_fix_root().
- Network Fixed Root Setting also changes with the “flag” value in parent networking IE.

**Return** true/false

---

#### esp_err_t esp_mesh_set_parent (const wifi_config_t *parent, const mesh_addr_t *parent_mesh_id, mesh_type_t my_type, int my_layer)
Set a specified parent for the device.

**Attention** This API can be called at any time after mesh is configured.

**Return**
- ESP_OK
- ESP_ERR_ARGUMENT
- ESP_ERR_MESH_NOT_CONFIG

**Parameters**
- [in] parent: parent configuration, the SSID and the channel of the parent are mandatory.
  - If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise the device will never find this specified parent.
- [in] parent_mesh_id: parent mesh ID.
  - If this value is not set, the original mesh ID is used.
- [in] my_type: mesh type
  - MESH_STA is not supported.
  - If the parent set for the device is the same as the router in the network configuration, then my_type shall set MESH_ROOT and my_layer shall set MESH_ROOT_LAYER.
- [in] my_layer: mesh layer
  - my_layer of the device may change after joining the network.
  - If my_type is set MESH_NODE, my_layer shall be greater than MESH_ROOT_LAYER.
  - If my_type is set MESH_LEAF, the device becomes a standalone Wi-Fi station and no longer has the ability to extend the network.

---

#### esp_err_t esp_mesh_scan_get_ap_ie_len (int *len)
Get mesh networking IE length of one AP.

**Return**
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG
- ESP_ERR_WIFI_FAIL

**Parameters**
- [out] len: mesh networking IE length

---

#### esp_err_t esp_mesh_scan_get_ap_record (wifi_ap_record_t *ap_record, void *buffer)
Get AP record.

**Attention** Different from esp_wifi_scan_get_ap_records(), this API only gets one of APs scanned each time. See “manual_networking” example.

**Return**
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG
- ESP_ERR_WIFI_FAIL

**Parameters**
- [out] ap_record: pointer to one AP record
- [out] buffer: pointer to the mesh networking IE of this AP
**esp_err_t esp_mesh_flush_upstream_packets** (void)
Flush upstream packets pending in to_parent queue and to_parent_p2p queue.

**Return**
- ESP_OK

**esp_err_t esp_mesh_get_subnet_nodes_num** (const mesh_addr_t *child_mac, int *nodes_num)
Get the number of nodes in the subnet of a specific child.

**Return**
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- [in] child_mac: an associated child address of this device
- [out] nodes_num: pointer to the number of nodes in the subnet of a specific child

**esp_err_t esp_mesh_get_subnet_nodes_list** (const mesh_addr_t *child_mac, mesh_addr_t *nodes, int nodes_num)
Get nodes in the subnet of a specific child.

**Return**
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- [in] child_mac: an associated child address of this device
- [out] nodes: pointer to nodes in the subnet of a specific child
- [in] nodes_num: the number of nodes in the subnet of a specific child

**esp_err_t esp_mesh_disconnect** (void)
Disconnect from current parent.

**Return**
- ESP_OK

**esp_err_t esp_mesh_connect** (void)
Connect to current parent.

**Return**
- ESP_OK

**esp_err_t esp_mesh_flush_scan_result** (void)
Flush scan result.

**Return**
- ESP_OK

**esp_err_t esp_mesh_switch_channel** (const uint8_t *new_bssid, int csa_newchan, int csa_count)
Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
- Set how many beacons with CSA IE will be sent before changing a new channel
- Enable the channel switch function

**Attention** This API is only called by the root.

**Return**
- ESP_OK

**Parameters**
- [in] new_bssid: the new router BSSID if the router changes
- [in] csa_newchan: the new channel number to which the whole network is moving
- [in] csa_count: channel switch period(beacon count), unit is based on beacon interval of its softAP, the default value is 15.

**esp_err_t esp_mesh_get_router_bssid** (uint8_t *router_bssid)
Get the router BSSID.
Return

• ESP_OK
• ESP_ERR_WIFI_NOT_INIT
• ESP_ERR_WIFI_ARG

Parameters

• [out] router_bssid: pointer to the router BSSID

int64_t esp_mesh_get_tsf_time (void)
Get the TSF time.

Return the TSF time

esp_err_t esp_mesh_set_topology (esp_mesh_topology_t topo) Set mesh topology. The default value is MESH_TOPO_TREE.

• MESH_TOPO_CHAIN supports up to 1000 layers

Attention This API shall be called before mesh is started.

Return

• ESP_OK
• ESP_MESH_ERR_ARGUMENT
• ESP_ERR_MESH_NOT_ALLOWED

Parameters

• [in] topo: MESH_TOPO_TREE or MESH_TOPO_CHAIN

esp_mesh_topology_t esp_mesh_get_topology (void)
Get mesh topology.

Return MESH_TOPO_TREE or MESH_TOPO_CHAIN

esp_err_t esp_mesh_enable_ps (void) Enable mesh Power Save function.

Attention This API shall be called before mesh is started.

Return

• ESP_OK
• ESP_ERR_WIFI_NOT_INIT
• ESP_ERR_MESH_NOT_ALLOWED

esp_err_t esp_mesh_disable_ps (void) Disable mesh Power Save function.

Attention This API shall be called before mesh is started.

Return

• ESP_OK
• ESP_ERR_WIFI_NOT_INIT
• ESP_ERR_MESH_NOT_ALLOWED

bool esp_mesh_is_ps_enabled (void) Check whether the mesh Power Save function is enabled.

Return true/false

bool esp_mesh_is_device_active (void)
Check whether the device is in active state.

• If the device is not in active state, it will neither transmit nor receive frames.

Return true/false

esp_err_t esp_mesh_set_active_duty_cycle (int dev_duty, int dev_duty_type) Set the device duty cycle and type.

• The range of dev_duty values is 1 to 100. The default value is 10.
• dev_duty = 100, the PS will be stopped.
• dev_duty is better to not less than 5.
• dev_duty_type could be MESH_PS_DEVICE_DUTY_REQUEST or MESH_PS_DEVICE_DUTY_DEMAND.
• If dev_duty_type is set to MESH_PS_DEVICE_DUTY_REQUEST, the device will use a nwk_duty provided by the network.
• If dev_duty_type is set to MESH_PS_DEVICE_DUTY_DEMAND, the device will use the specified dev_duty.

Attention This API can be called at any time after mesh is started.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] dev_duty: device duty cycle
• [in] dev_duty_type: device PS duty cycle type, not accept MESH_PS_NETWORK_DUTY_MASTER

esp_err_t esp_mesh_get_active_duty_cycle (int *dev_duty, int *dev_duty_type)
Get device duty cycle and type.

Return
• ESP_OK

Parameters
• [out] dev_duty: device duty cycle
• [out] dev_duty_type: device PS duty cycle type

esp_err_t esp_mesh_set_network_duty_cycle (int nwk_duty, int duration_mins, int applied_rule)
Set the network duty cycle, duration and rule.

• The range of nwk_duty values is 1 to 100. The default value is 10.
• nwk_duty is the network duty cycle the entire network or the up-link path will use. A device that successfully sets the nwk_duty is known as a NWK-DUTY-MASTER.
• duration_mins specifies how long the specified nwk_duty will be used. Once duration_mins expires, the root will take over as the NWK-DUTY-MASTER. If an existing NWK-DUTY-MASTER leaves the network, the root will take over as the NWK-DUTY-MASTER again.
• duration_mins = (-1) represents nwk_duty will be used until a new NWK-DUTY-MASTER with a different nwk_duty appears.
• Only the root can set duration_mins to (-1).
• If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE, the nwk_duty will be used by the entire network.
• If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_UPLINK, the nwk_duty will only be used by the up-link path nodes.
• The root does not accept MESH_PS_NETWORK_DUTY_APPLIED_UPLINK.
• A nwk_duty with duration_mins(-1) set by the root is the default network duty cycle used by the entire network.

Attention This API can be called at any time after mesh is started.
• In self-organized network, if this API is called before mesh is started in all devices, (1)nwk_duty shall be set to the same value for all devices; (2)duration_mins shall be set to (-1); (3)applied_rule shall be set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE, after the voted root appears, the root will become the NWK-DUTY-MASTER and broadcast the nwk_duty and its identity of NWK-DUTY-MASTER.
• If the root is specified (FIXED-ROOT), call this API in the root to provide a default nwk_duty for the entire network.
• After joins the network, any device can call this API to change the nwk_duty, duration_mins or applied_rule.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] nwk_duty: network duty cycle
• [in] duration_mins: duration (unit: minutes)
Chapter 2. API Reference

- [in] applied_rule: only support MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

```c
esp_err_t esp_mesh_get_network_duty_cycle(int *nwk_duty, int *duration_mins, int *dev_duty_type, int *applied_rule)
```

Get the network duty cycle, duration, type and rule.

**Return**
- ESP_OK

**Parameters**
- [out] nwk_duty: current network duty cycle
- [out] duration_mins: the duration of current nwk_duty
- [out] dev_duty_type: if it includes MESH_PS_DEVICE_DUTY_MASTER, this device is the current NWK-DUTY-MASTER.
- [out] applied_rule: MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

```c
int esp_mesh_get_running_active_duty_cycle(void)
```

Get the running active duty cycle.

- The running active duty cycle of the root is 100.
- If duty type is set to MESH_PSDEVICE_DUTY_REQUEST, the running active duty cycle is nwk_duty provided by the network.
- If duty type is set to MESH_PSDEVICE_DUTY_DEMAND, the running active duty cycle is dev_duty specified by the users.
- In a mesh network, devices are typically working with a certain duty-cycle (transmitting, receiving and sleep) to reduce the power consumption. The running active duty cycle decides the amount of awake time within a beacon interval. At each start of beacon interval, all devices wake up, broadcast beacons, and transmit packets if they do have pending packets for their parents or for their children. Note that Low-duty-cycle means devices may not be active in most of the time, the latency of data transmission might be greater.

**Return** the running active duty cycle

```c
esp_err_t esp_mesh_ps_duty_signaling(int fwd_times)
```

Duty signaling.

**Return**
- ESP_OK

**Parameters**
- [in] fwd_times: the times of forwarding duty signaling packets

**Unions**

```c
union mesh_addr_t
#include <esp_mesh.h> Mesh address.
```

**Public Members**

```c
uint8_t addr[6]
mac address
```

```c
mip_t mip
mip address
```

```c
union mesh_event_info_t
#include <esp_mesh.h> Mesh event information.
```

**Public Members**

```c
mesh_event_channel_switch_t channel_switch
channel switch
```

```c
mesh_event_child_connected_t child_connected
child connected
```
mesh_event_child_disconnected_t child_disconnected
    child disconnected
mesh_event_routing_table_change_t routing_table
    routing table change
mesh_event_connected_t connected
    parent connected
mesh_event_disconnected_t disconnected
    parent disconnected
mesh_event_no_parent_found_t no_parent
    no parent found
mesh_event_layer_change_t layer_change
    layer change
mesh_event_toDS_state_t toDS_state
    toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to BE MESH_TODS_REACHABLE.
mesh_event_vote_started_t vote_started
    vote started
mesh_event_root_address_t root_addr
    root address
mesh_event_root_switch_req_t switch_req
    root switch request
mesh_event_root_conflict_t root_conflict
    other powerful root
mesh_event_root_fixed_t root_fixed
    fixed root
mesh_event_scan_done_t scan_done
    scan done
mesh_event_network_state_t network_state
    network state, such as whether current mesh network has a root.
mesh_event_find_network_t find_network
    network found that can join
mesh_event_router_switch_t router_switch
    new router information
mesh_event_ps_duty_t ps_duty
    PS duty information

union mesh_rc_config_t
    #include <esp_mesh.h> Vote address configuration.

Public Members

int attempts
    max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)

mesh_addr_t rc_addr
    a new root address specified by users for API esp_mesh_waive_root()
Chapter 2. API Reference

**Structures**

**struct mip_t**
- IP address and port.

**Public Members**
- `ip4_addr_t ip4`
  - IP address
- `uint16_t port`
  - Port

**struct mesh_event_channel_switch_t**
- Channel switch information.

**Public Members**
- `uint8_t channel`
  - New channel

**struct mesh_event_connected_t**
- Parent connected information.

**Public Members**
- `wifi_event_sta_connected_t connected`
  - Parent information, same as Wi-Fi event SYSTEM_EVENT_STA_CONNECTED does
- `uint16_t self_layer`
  - Layer
- `uint8_t duty`
  - Parent duty

**struct mesh_event_no_parent_found_t**
- No parent found information.

**Public Members**
- `int scan_times`
  - Scan times being through

**struct mesh_event_layer_change_t**
- Layer change information.

**Public Members**
- `uint16_t new_layer`
  - New layer

**struct mesh_event_vote_started_t**
- Vote started information

**Public Members**
- `int reason`
  - Vote reason, vote could be initiated by children or by the root itself
Chapter 2. API Reference

```c
int attempts
max vote attempts before stopped

mesh_addr_t rc_addr
root address specified by users via API esp_mesh_waive_root()

struct mesh_event_find_network_t
find a mesh network that this device can join

Public Members

uint8_t channel
channel number of the new found network

uint8_t router_bssid[6]
router BSSID

struct mesh_event_root_switch_req_t
Root switch request information.

Public Members

int reason
root switch reason, generally root switch is initialized by users via API esp_mesh_waive_root()

mesh_addr_t rc_addr
the address of root switch requester

struct mesh_event_root_conflict_t
Other powerful root address.

Public Members

int8_t rssi
rssi with router

uint16_t capacity
the number of devices in current network

uint8_t addr[6]
other powerful root address

struct mesh_event_routing_table_change_t
Routing table change.

Public Members

uint16_t rt_size_new
the new value

uint16_t rt_size_change
the changed value

struct mesh_event_root_fixed_t
Root fixed.
```
Public Members

bool is_fixed
status

struct mesh_event_scan_done_t
Scan done event information.

Public Members

uint8_t number
the number of APs scanned

struct mesh_event_network_state_t
Network state information.

Public Members

bool is_rootless
whether current mesh network has a root

struct mesh_event_ps_duty_t
PS duty information.

Public Members

uint8_t duty
parent or child duty

mesh_event_child_connected_t child_connected
child info

struct mesh_opt_t
Mesh option.

Public Members

uint8_t type
option type

uint16_t len
option length

uint8_t* val
option value

struct mesh_data_t
Mesh data for esp_mesh_send() and esp_mesh_recv()

Public Members

uint8_t* data
data

uint16_t size
data size

mesh_proto_t proto
data protocol
**mesh_tos_t**

data type of service

**struct mesh_router_t**

Router configuration.

**Public Members**

uint8_t  **ssid[32]**

SSID

uint8_t  **ssid_len**

length of SSID

uint8_t  **bssid[6]**

BSSID, if this value is specified, users should also specify “allow_router_switch”.

uint8_t  **password[64]**

password

bool  **allow_router_switch**

if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after “fail” (mesh_attempts_t) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

**struct mesh_ap_cfg_t**

Mesh softAP configuration.

**Public Members**

uint8_t  **password[64]**

mesh softAP password

uint8_t  **max_connection**

max number of stations allowed to connect in, default 6, max 10 = max_connection + non-mesh_max_connection max mesh connections

uint8_t  **nonmesh_max_connection**

max non-mesh connections

**struct mesh_cfg_t**

Mesh initialization configuration.

**Public Members**

uint8_t  **channel**

channel, the mesh network on

bool  **allow_channel_switch**

if this value is set, when “fail” (mesh_attempts_t) times is reached, device will change to a full channel scan for a network that could join. The default value is false.

mesh_addr_t  **mesh_id**

mesh network identification

mesh_router_t  **router**

router configuration

mesh_ap_cfg_t  **mesh_ap**

mesh softAP configuration

```c
const mesh_crypto_funcs_t *crypto_funcs
```

crypto functions

```c
struct mesh_vote_t
```

Vote.

**Public Members**

- `float percentage` vote percentage threshold for approval of being a root
- `bool is_rc_specified` if true, rc_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make network start root election.
- `mesh_rc_config_t config` vote address configuration

```c
struct mesh_tx_pending_t
```

The number of packets pending in the queue waiting to be sent by the mesh stack.

**Public Members**

- `int to_parent` to parent queue
- `int to_parent_p2p` to parent (P2P) queue
- `int to_child` to child queue
- `int to_child_p2p` to child (P2P) queue
- `int mgmt` management queue
- `int broadcast` broadcast and multicast queue

```c
struct mesh_rx_pending_t
```

The number of packets available in the queue waiting to be received by applications.

**Public Members**

- `int toDS` to external DS
- `int toSelf` to self

**Macros**

- `MESH_ROOT_LAYER` root layer value
- `MESH_MTU` max transmit unit (in bytes)
- `MESH_MPS` max payload size (in bytes)
ESP_ERR_MESH_WIFI_NOT_START
   Mesh error code definition.
   Wi-Fi isn’t started

ESP_ERR_MESH_NOT_INIT
   mesh isn’t initialized

ESP_ERR_MESH_NOT_CONFIG
   mesh isn’t configured

ESP_ERR_MESH_NOT_START
   mesh isn’t started

ESP_ERR_MESH_NOT_SUPPORT
   not supported yet

ESP_ERR_MESH_NOT_ALLOWED
   operation is not allowed

ESP_ERR_MESH_NO_MEMORY
   out of memory

ESP_ERR_MESH_ARGUMENT
   illegal argument

ESP_ERR_MESH_EXCEED_MTU
   packet size exceeds MTU

ESP_ERR_MESH_TIMEOUT
   timeout

ESP_ERR_MESH_DISCONNECTED
   disconnected with parent on station interface

ESP_ERR_MESH_QUEUE_FAIL
   queue fail

ESP_ERR_MESH_QUEUE_FULL
   queue full

ESP_ERR_MESH_NO_PARENT_FOUND
   no parent found to join the mesh network

ESP_ERR_MESH_NO_ROUTE_FOUND
   no route found to forward the packet

ESP_ERR_MESH_OPTION_NULL
   no option found

ESP_ERR_MESH_OPTION_UNKNOWN
   unknown option

ESP_ERR_MESH_XON_NO_WINDOW
   no window for software flow control on upstream

ESP_ERR_MESH_INTERFACE
   low-level Wi-Fi interface error

ESP_ERR_MESH_DISCARD_DUPLICATE
   discard the packet due to the duplicate sequence number

ESP_ERR_MESH_DISCARD
   discard the packet

ESP_ERR_MESH_VOTING
   vote in progress

ESP_ERR_MESH_XMIT
   XMIT
Chapter 2. API Reference

ESP_ERR_MESH_QUEUE_READ
    error in reading queue

ESP_ERR_MESH_PS
    mesh PS is not specified as enable or disable

ESP_ERR_MESH_RECV_RELEASE
    release esp_mesh_recv_toDS

MESH_DATA_ENC
    Flags bitmap for esp_mesh_send() and esp_mesh_recv()
    data encrypted (Unimplemented)

MESH_DATA_P2P
    point-to-point delivery over the mesh network

MESH_DATA_FROMDS
    receive from external IP network

MESH_DATA_TODS
    identify this packet is target to external IP network

MESH_DATA_NONBLOCK
    esp_mesh_send() non-block

MESH_DATA_DROP
    in the situation of the root having been changed, identify this packet can be dropped by new root

MESH_DATA_GROUP
    identify this packet is target to a group address

MESH_OPT_SEND_GROUP
    Option definitions for esp_mesh_send() and esp_mesh_recv()
    data transmission by group; used with esp_mesh_send() and shall have payload

MESH_OPT_RECV_DS_ADDR
    return a remote IP address; used with esp_mesh_send() and esp_mesh_recv()

MESH_ASSOC_FLAG_VOTE_IN_PROGRESS
    Flag of mesh networking IE.
    vote in progress

MESH_ASSOC_FLAG_NETWORK_FREE
    no root in current network

MESH_ASSOC_FLAG_ROOTS_FOUND
    root conflict is found

MESH_ASSOC_FLAG_ROOT_FIXED
    fixed root

MESH_PSDEVICE_DUTY_REQUEST
    Mesh PS (Power Save) duty cycle type.
    requests to join a network PS without specifying a device duty cycle. After the device joins the network, a
    network duty cycle will be provided by the network

MESH_PSDEVICE_DUTY_DEMAND
    requests to join a network PS and specifies a demanded device duty cycle

MESH_PSNETWORK_DUTY_MASTER
    indicates the device is the NWK-DUTY-MASTER (network duty cycle master)

MESH_PSNETWORK_DUTY.Applied.Entire
    Mesh PS (Power Save) duty cycle applied rule.

MESH_PSNETWORK_DUTY_APPLIED_UPDOWN
**Type Definitions**

typedef `mesh_addr_t` mesh_event_root_address_t  
Root address.

typedef `wifi_event_sta_disconnected_t` mesh_event_disconnected_t  
Parent disconnected information.

typedef `wifi_event_ap_staconnected_t` mesh_event_child_connected_t  
Child connected information.

typedef `wifi_event_ap_stadisconnected_t` mesh_event_child_disconnected_t  
Child disconnected information.

typedef `wifi_event_sta_connected_t` mesh_event_router_switch_t  
New router information.

**Enumerations**

typedef enum mesh_event_id_t  
Enumerated list of mesh event id.

Values:

- **MESH_EVENT_STARTED**  
  mesh is started
- **MESH_EVENT_STOPPED**  
  mesh is stopped
- **MESH_EVENT_CHANNEL_SWITCH**  
  channel switch
- **MESH_EVENT_CHILD_CONNECTED**  
  a child is connected on softAP interface
- **MESH_EVENT_CHILD_DISCONNECTED**  
  a child is disconnected on softAP interface
- **MESH_EVENT_ROUTING_TABLE_ADD**  
  routing table is changed by adding newly joined children
- **MESH_EVENT_ROUTING_TABLE_REMOVE**  
  routing table is changed by removing leave children
- **MESH_EVENT_PARENT_CONNECTED**  
  parent is connected on station interface
- **MESH_EVENT_PARENT_DISCONNECTED**  
  parent is disconnected on station interface
- **MESH_EVENT_NO_PARENT_FOUND**  
  no parent found
- **MESH_EVENT_LAYER_CHANGE**  
  layer changes over the mesh network
- **MESH_EVENT_TODS_STATE**  
  state represents whether the root is able to access external IP network
- **MESH_EVENT_VOTE_STARTED**  
  the process of voting a new root is started either by children or by the root
- **MESH_EVENT_VOTE_STOPPED**  
  the process of voting a new root is stopped
**MESH_EVENT_ROOT_ADDRESS**
the root address is obtained. It is posted by mesh stack automatically.

**MESH_EVENT_ROOT_SWITCH_REQ**
root switch request sent from a new voted root candidate

**MESH_EVENT_ROOT_SWITCH_ACK**
root switch acknowledgment responds the above request sent from current root

**MESH_EVENT_ROOT_ASKED_YIELD**
the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a new parent for this device. If self organized is enabled, this device will find a new parent by itself, users could ignore this event.

**MESH_EVENT_ROOT_FIXED**
when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent’s. Fixed Root Setting of each device is variable as that setting changes of the root.

**MESH_EVENT_SCAN_DONE**
if self-organized networking is disabled, user can call esp_wifi_scan_start() to trigger this event, and add the corresponding scan done handler in this event.

**MESH_EVENT_NETWORK_STATE**
network state, such as whether current mesh network has a root.

**MESH_EVENT_STOP_RECONNECTION**
the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

**MESH_EVENT_FIND_NETWORK**
when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

**MESH_EVENT_ROUTER_SWITCH**
if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.

**MESH_EVENT_PS_PARENT_DUTY**
parent duty

**MESH_EVENT_PS_CHILD_DUTY**
child duty

**MESH_EVENT_PS_DEVICE_DUTY**
device duty

**MESH_EVENT_MAX**
enum mesh_type_t
Device type.

**Values:**

**MESH_IDLE**
hasn’t joined the mesh network yet

**MESH_ROOT**
the only sink of the mesh network. Has the ability to access external IP network

**MESH_NODE**
intermediate device. Has the ability to forward packets over the mesh network

**MESH_LEAF**
has no forwarding ability

**MESH_STA**
connect to router with a standalone Wi-Fi station mode, no network expansion capability
enum mesh_proto_t
   Protocol of transmitted application data.
   Values:
   MESH_PROTO_BIN
       binary
   MESH_PROTO_HTTP
       HTTP protocol
   MESH_PROTO_JSON
       JSON format
   MESH_PROTO_MQTT
       MQTT protocol
   MESH_PROTO_AP
       IP network mesh communication of node’s AP interface
   MESH_PROTO_STA
       IP network mesh communication of node’s STA interface

enum mesh_tos_t
   For reliable transmission, mesh stack provides three type of services.
   Values:
   MESH_TOS_P2P
       provide P2P (point-to-point) retransmission on mesh stack by default
   MESH_TOS_E2E
       provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)
   MESH_TOS_DEF
       no retransmission on mesh stack

enum mesh_vote_reason_t
   Vote reason.
   Values:
   MESH_VOTE_REASON_ROOT_INITIATED = 1
       vote is initiated by the root
   MESH_VOTE_REASON_CHILD_INITIATED
       vote is initiated by children

enum mesh_disconnect_reason_t
   Mesh disconnect reason code.
   Values:
   MESH_REASON_CYCLIC = 100
       cyclic is detected
   MESH_REASON_PARENT_IDLE
       parent is idle
   MESH_REASON_LEAF
       the connected device is changed to a leaf
   MESH_REASON_DIFF_ID
       in different mesh ID
   MESH_REASON_ROOTS
       root conflict is detected
   MESH_REASON_PARENT_STOPPED
       parent has stopped the mesh
MESH_REASON_SCAN_FAIL
scan fail
MESH_REASON_IE_UNKNOWN
unknown IE
MESH_REASON_WAIVE_ROOT
waive root
MESH_REASON_PARENT_WORSE
parent with very poor RSSI
MESH_REASON_EMPTY_PASSWORD
use an empty password to connect to an encrypted parent
MESH_REASON_PARENT_UNENCRYPTED
connect to an unencrypted parent/router

defined

enum esp_mesh_topology_t
Mesh topology.

Values:

MESH_TOPO_TREE
tree topology
MESH_TOPO_CHAIN
chain topology

enum mesh_event_toDS_state_t
The reachability of the root to a DS (distribute system)

Values:

MESH_TODS_UNREACHABLE
the root isn’t able to access external IP network
MESH_TODS_REACHABLE
the root is able to access external IP network

SmartConfig

The SmartConfig™ is a provisioning technology developed by TI to connect a new Wi-Fi device to a Wi-Fi network. It uses a mobile app to broadcast the network credentials from a smartphone, or a tablet, to an un-provisioned Wi-Fi device. The advantage of this technology is that the device does not need to directly know SSID or password of an Access Point (AP). This information is provided using the smartphone. This is particularly important to headless device and systems, due to their lack of a user interface.

If you are looking for other options to provision your ESP32-C3 devices, check Provisioning API.

Application Example Connect ESP32-C3 to target AP using SmartConfig: wifi/smart_config.

API Reference

Header File

• components/esp_wifi/include/esp_smartconfig.h
Functions

const char *esp_smartconfig_get_version (void)
Get the version of SmartConfig.

Return
  • SmartConfig version const char.

esp_err_t esp_smartconfig_start (const smartconfig_start_config_t *config)
Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniffer special packets from the air that containing SSID and password of target AP.

Attention 1. This API can be called in station or softAP-station mode.
Attention 2. Can not call esp_smartconfig_start twice before it finish, please call esp_smartconfig_stop first.

Return
  • ESP_OK: succeed
  • others: fail

Parameters
  • config: pointer to smartconfig start configure structure

esp_err_t esp_smartconfig_stop (void)
Stop SmartConfig, free the buffer taken by esp_smartconfig_start.

Attention Whether connect to AP succeed or not, this API should be called to free memory taken by smartconfig_start.

Return
  • ESP_OK: succeed
  • others: fail

esp_err_t esp_esptouch_set_timeout (uint8_t time_s)
Set timeout of SmartConfig process.

Attention Timing starts from SC_STATUS_FIND_CHANNEL status. SmartConfig will restart if timeout.

Return
  • ESP_OK: succeed
  • others: fail

Parameters
  • time_s: range 15s~255s, offset: 45s.

esp_err_t esp_smartconfig_set_type (smartconfig_type_t type)
Set protocol type of SmartConfig.

Attention If users need to set the SmartConfig type, please set it before calling esp_smartconfig_start.

Return
  • ESP_OK: succeed
  • others: fail

Parameters
  • type: Choose from the smartconfig_type_t.

esp_err_t esp_smartconfig_fast_mode (bool enable)
Set mode of SmartConfig. default normal mode.

Attention 1. Please call it before API esp_smartconfig_start.
Attention 2. Fast mode have corresponding APP(phone).
Attention 3. Two mode is compatible.

Return
  • ESP_OK: succeed
  • others: fail

Parameters
  • enable: false-disable(default); true-enable;

esp_err_t esp_smartconfig_get_rvd_data (uint8_t *rvd_data, uint8_t len)
Get reserved data of ESPTouch v2.

Return
  • ESP_OK: succeed
Chapter 2. API Reference

- others: fail

Parameters
- rvd_data: reserved data
- len: length of reserved data

Structures
struct smartconfig_event_got_ssid_pswd_t
  Argument structure for SC_EVENT_GOT_SSID_PSWD event

Public Members

uint8_t ssid[32]
  SSID of the AP. Null terminated string.

uint8_t password[64]
  Password of the AP. Null terminated string.

bool bssid_set
  whether set MAC address of target AP or not.

uint8_t bssid[6]
  MAC address of target AP.

smartconfig_type_t type
  Type of smartconfig(ESPTouch or AirKiss).

uint8_t token
  Token from cellphone which is used to send ACK to cellphone.

uint8_t cellphone_ip[4]
  IP address of cellphone.

struct smartconfig_start_config_t
  Configure structure for esp_smartconfig_start

Public Members

bool enable_log
  Enable smartconfig logs.

bool esp_touch_v2_enable_crypt
  Enable ESPTouch v2 crypt.

char *esp_touch_v2_key
  ESPTouch v2 crypt key, len should be 16.

Macros
SMARTCONFIG_START_CONFIG_DEFAULT ()

Enumerations
enum smartconfig_type_t
  Values:
  
  SC_TYPE_ESPTOUCH = 0
  protocol: ESPTouch

  SC_TYPE_AIRKISS
  protocol: AirKiss

  SC_TYPE_ESPTOUCH_AIRKISS
  protocol: ESPTouch and AirKiss
Chapter 2. API Reference

SC_TYPE_ESPTOUCH_V2
protocol: ESPTouch v2

enum smartconfig_event_t
Smartconfig event declarations

Values:

SC_EVENT_SCAN_DONE
ESP32 station smartconfig has finished to scan for APs

SC_EVENT_FOUND_CHANNEL
ESP32 station smartconfig has found the channel of the target AP

SC_EVENT_GOT_SSID_PSWD
ESP32 station smartconfig got the SSID and password

SC_EVENT_SEND_ACK_DONE
ESP32 station smartconfig has sent ACK to cellphone

Wi-Fi

Introduction The Wi-Fi libraries provide support for configuring and monitoring the ESP32-C3 Wi-Fi networking functionality. This includes configuration for:

• Station mode (aka STA mode or Wi-Fi client mode). ESP32-C3 connects to an access point.
• AP mode (aka Soft-AP mode or Access Point mode). Stations connect to the ESP32-C3.
• Station/AP-coexistence mode (ESP32-C3 is concurrently an access point and a station connected to another access point).
• Various security modes for the above (WPA, WPA2, WEP, etc.)
• Scanning for access points (active & passive scanning).
• Promiscuous mode for monitoring of IEEE802.11 Wi-Fi packets.

Application Examples The wifi directory of ESP-IDF examples contains the following applications:

• Code examples for Wi-Fi.
• A simple esp-idf-template application to demonstrate a minimal IDF project structure.

API Reference

Header File

• components/esp_wifi/include/esp_wifi.h

Functions

esp_err_t esp_wifi_init (const wifi_init_config_t *config)
Initialize WiFi Allocate resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc. This WiFi also starts WiFi task.

Attention 1. This API must be called before all other WiFi API can be called
Attention 2. Always use WIFI_INIT_CONFIG_DEFAULT macro to initialize the configuration to default values, this can guarantee all the fields get correct value when more fields are added into wifi_init_config_t in future release. If you want to set your own initial values, overwrite the default values which are set by WIFI_INIT_CONFIG_DEFAULT. Please be notified that the field ‘magic’ of wifi_init_config_t should always be WIFI_INIT_CONFIG_MAGIC!

Return

• ESP_OK: succeed
• ESP_ERR_NO_MEM: out of memory
• others: refer to error code esp_err.h

Parameters
• **config**: pointer to WiFi initialized configuration structure; can point to a temporary variable.

```c
esp_err_t esp_wifi_deinit(void)
```

Deinit WiFi Free all resource allocated in esp_wifi_init and stop WiFi task.

**Attention** 1. This API should be called if you want to remove WiFi driver from the system

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```c
esp_err_t esp_wifi_set_mode(wifi_mode_t mode)
```

Set the WiFi operating mode.

| Set the WiFi operating mode as station, soft-AP or station+soft-AP, The default mode is station mode. |

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error code in esp_err.h

**Parameters**
- `mode`: WiFi operating mode

```c
esp_err_t esp_wifi_get_mode(wifi_mode_t *mode)
```

Get current operating mode of WiFi.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- `[out] mode`: store current WiFi mode

```c
esp_err_t esp_wifi_start(void)
```

Start WiFi according to current configuration If mode is WIFI_MODE_STA, it create station control block and start station If mode is WIFI_MODE_AP, it create soft-AP control block and start soft-AP If mode is WIFI_MODE_APSTA, it create soft-AP and station control block and start soft-AP and station.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_FAIL: other WiFi internal errors

```c
esp_err_t esp_wifi_stop(void)
```

Stop WiFi If mode is WIFI_MODE_STA, it stop station and free station control block If mode is WIFI_MODE_AP, it stop soft-AP and free soft-AP control block If mode is WIFI_MODE_APSTA, it stop station/soft-AP and free station/soft-AP control block.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```c
esp_err_t esp_wifi_restore(void)
```

Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:
- esp_wifi_set_bandwidth,
- esp_wifi_set_protocol,
- esp_wifi_set_config related
- esp_wifi_set_mode
Chapter 2. API Reference

 esp_err_t esp_wifi_connect (void)
Connect the ESP32 WiFi station to the AP.

 Attention 1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTAmode
 Attention 2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to disconnect.
 Attention 3. The scanning triggered by esp_wifi_start_scan() will not be effective until connection between
 ESP32 and the AP is established. If ESP32 is scanning and connecting at the same time, ESP32 will abort
 scanning and return a warning message and error number ESP_ERR_WIFI_STATE. If you want to do re-
 connection after ESP32 received disconnect event, remember to add the maximum retry time, otherwise
 the called scan will not work. This is especially true when the AP doesn’t exist, and you still try reconnec-
 tion after ESP32 received disconnect event with the reason code WIFI_REASON_NO_AP_FOUND.

 Return
 • ESP_OK: succeed
 • ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
 • ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
 • ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
 • ESP_ERR_WIFI_SSID: SSID of AP which station connects is invalid

 esp_err_t esp_wifi_disconnect (void)
Disconnect the ESP32 WiFi station from the AP.

 Return
 • ESP_OK: succeed
 • ESP_ERR_WIFI_NOT_INIT: WiFi was not initialized by esp_wifi_init
 • ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
 • ESP_FAIL: other WiFi internal errors

 esp_err_t esp_wifi_clear_fast_connect (void)
Currently this API is just an stub API.

 Return
 • ESP_OK: succeed
 • others: fail

 esp_err_t esp_wifi_deauth_sta (uint16_t aid)
deauthenticate all stations or associated id equals to aid

 Return
 • ESP_OK: succeed
 • ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
 • ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
 • ESP_ERR_INVALID_ARG: invalid argument
 • ESP_ERR_WIFI_MODE: WiFi mode is wrong

 Parameters
 • aid: when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id
 is aid

 esp_err_t esp_wifi_scan_start (const wifi_scan_config_t *config, bool block)
Scan all available APs.

 Attention If this API is called, the found APs are stored in WiFi driver dynamic allocated memory and the
 will be freed in esp_wifi_scan_get_ap_records, so generally, call esp_wifi_scan_get_ap_records to cause
 the memory to be freed once the scan is done
 Attention The values of maximum active scan time and passive scan time per channel are limited to 1500
 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

 Return
 • ESP_OK: succeed
 • ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
 • ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
**Chapter 2. API Reference**

- **ESP_ERR_WIFI_TIMEOUT**: blocking scan is timeout
- **ESP_ERR_WIFI_STATE**: wifi still connecting when invoke esp_wifi_scan_start
- Others: refer to error code in esp_err.h

**Parameters**
- **config**: configuration of scanning
- **block**: if block is true, this API will block the caller until the scan is done, otherwise it will return immediately

```c
esp_err_t esp_wifi_scan_stop (void)
```

Stop the scan in process.

**Return**
- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_WIFI_NOT_STARTED**: WiFi is not started by esp_wifi_start

```c
esp_err_t esp_wifi_scan_get_ap_num (uint16_t *number)
```

Get number of APs found in last scan.

**Attention** This API can only be called when the scan is completed, otherwise it may get wrong value.

**Return**
- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_WIFI_NOT_STARTED**: WiFi is not started by esp_wifi_start
- **ESP_ERR_INVALID_ARG**: invalid argument

**Parameters**
- **[out]** number: store number of APIs found in last scan

```c
esp_err_t esp_wifi_scan_get_ap_records (uint16_t *number, wifi_ap_record_t *ap_records)
```

Get AP list found in last scan.

**Return**
- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_WIFI_NOT_STARTED**: WiFi is not started by esp_wifi_start
- **ESP_ERR_INVALID_ARG**: invalid argument
- **ESP_ERR_NO_MEM**: out of memory

**Parameters**
- **[inout]** number: As input param, it stores max AP number ap_records can hold. As output param, it receives the actual AP number this API returns.
- **ap_records**: wifi_ap_record_t array to hold the found APs

```c
esp_err_t esp_wifi_sta_get_ap_info (wifi_ap_record_t *ap_info)
```

Get information of AP which the ESP32 station is associated with.

**Attention** When the obtained country information is empty, it means that the AP does not carry country information

**Return**
- **ESP_OK**: succeed
- **ESP_ERR_WIFI_CONN**: The station interface don’t initialized
- **ESP_ERR_WIFI_NOT_CONNECT**: The station is in disconnect status

**Parameters**
- **ap_info**: the wifi_ap_record_t to hold AP information sta can get the connected ap’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_1r in the wifi_ap_record_t struct. For example, phy_11b = 1 imply that ap support 802.11b mode

```c
esp_err_t esp_wifi_set_ps (wifi_ps_type_t type)
```

Set current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

**Return** **ESP_OK**: succeed

**Parameters**
- **type**: power save type
**esp_err_t esp_wifi_get_ps(wifi_type_t **type)**

Get current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

**Return** ESP_OK: succeed

**Parameters**
- [out] type: store current power save type

**esp_err_t esp_wifi_set_protocol(wifi_interface_t ifx, uint8_t protocol_bitmap)**

Set protocol type of specified interface. The default protocol is (WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROTOCOL_11N).

**Attention** Currently we only support 802.11b or 802.11bg or 802.11bgn mode.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- others: refer to error codes in esp_err.h

**Parameters**
- ifx: interfaces
- protocol_bitmap: WiFi protocol bitmap

**esp_err_t esp_wifi_get_protocol(wifi_interface_t ifx, uint8_t *protocol_bitmap)**

Get the current protocol bitmap of the specified interface.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

**Parameters**
- ifx: interface
- [out] protocol_bitmap: store current WiFi protocol bitmap of interface ifx

**esp_err_t esp_wifi_set_bandwidth(wifi_interface_t ifx, wifi_bandwidth_t bw)**

Set the bandwidth of ESP32 specified interface.

**Attention** 1. API return false if try to configure an interface that is not enabled
   2. WIFI_BW_HT40 is supported only when the interface support 11N

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

**Parameters**
- ifx: interface to be configured
- bw: bandwidth

**esp_err_t esp_wifi_get_bandwidth(wifi_interface_t ifx, wifi_bandwidth_t *bw)**

Get the bandwidth of ESP32 specified interface.

**Attention** 1. API return false if try to get a interface that is not enable

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- ifx: interface to be configured
- [out] bw: store bandwidth of interface ifx
**esp_err_t esp_wifi_set_channel** (uint8_t primary, wifi_second_chan_t second)
Set primary/secondary channel of ESP32.

**Attention** 1. This API should be called after esp_wifi_start()
**Attention** 2. When ESP32 is in STA mode, this API should not be called when STA is scanning or connecting to an external AP
**Attention** 3. When ESP32 is in softAP mode, this API should not be called when softAP has connected to external STAs
**Attention** 4. When ESP32 is in STA+softAP mode, this API should not be called when in the scenarios described above

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- primary: for HT20, primary is the channel number, for HT40, primary is the primary channel
- second: for HT20, second is ignored, for HT40, second is the second channel

**esp_err_t esp_wifi_get_channel** (uint8_t* primary, wifi_second_chan_t* second)
Get the primary/secondary channel of ESP32.

**Attention** 1. API return false if try to get a interface that is not enable

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- primary: store current primary channel
- [out] second: store current second channel

**esp_err_t esp_wifi_set_country** (const wifi_country_t* country)
configure country info

**Attention** 1. It is discouraged to call this API since this doesn’t validate the per-country rules, it’s up to the user to fill in all fields according to local regulations. Please use esp_wifi_set_country_code instead.

**Attention** 2. The default country is CHINA {.cc="CN", .schan=1, .nchan=13, policy=WIFI_COUNTRY_POLICY_AUTO}

**Attention** 3. When the country policy is WIFI_COUNTRY_POLICY_AUTO, the country info of the AP to which the station is connected is used. E.g. if the configured country info is {.cc="USA", .schan=1, .nchan=11} and the country info of the AP to which the station is connected is {.cc="JP", .schan=1, .nchan=14} then the country info that will be used is {.cc="JP", .schan=1, .nchan=14}. If the station disconnected from the AP the country info is set back to the country info of the station automatically, {.cc="US", .schan=1, .nchan=11} in the example.

**Attention** 4. When the country policy is WIFI_COUNTRY_POLICY_MANUAL, then the configured country info is used always.

**Attention** 5. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

**Attention** 6. The country configuration is stored into flash.

**Attention** 7. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- country: the configured country info

**esp_err_t esp_wifi_get_country** (wifi_country_t* country)
get the current country info

**Return**
Chapter 2. API Reference

- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_INVALID_ARG**: invalid argument

### Parameters

- `country`: country info

```c
esp_err_t esp_wifi_set_mac(wifi_interface_t ifx, const uint8_t mac[6])
```

Set MAC address of the ESP32 WiFi station or the soft-AP interface.

**Attention** 1. This API can only be called when the interface is disabled
2. ESP32 soft-AP and station have different MAC addresses, do not set them to be the same.
3. The bit 0 of the first byte of ESP32 MAC address can not be 1. For example, the MAC address can set to be “1a:XX:XX:XX:XX:XX”, but can not be “15:XX:XX:XX:XX:XX”.

### Return

- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_INVALID_ARG**: invalid argument
- **ESP_ERR_WIFI_IF**: invalid interface
- **ESP_ERR_WIFI_MAC**: invalid mac address
- **ESP_ERR_WIFI_MODE**: WiFi mode is wrong
- **others**: refer to error codes in esp_err.h

### Parameters

- `ifx`: interface
- `mac`: the MAC address

```c
esp_err_t esp_wifi_get_mac(wifi_interface_t ifx, uint8_t mac[6])
```

Get mac of specified interface.

### Return

- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_INVALID_ARG**: invalid argument
- **ESP_ERR_WIFI_IF**: invalid interface

### Parameters

- `ifx`: interface
- `[out] mac`: store mac of the interface ifx

```c
esp_err_t esp_wifi_set_promiscuous_rx_cb(wifi_promiscuous_cb_t cb)
```

Register the RX callback function in the promiscuous mode.

Each time a packet is received, the registered callback function will be called.

### Return

- **ESP_OK**: succeed

### Parameters

- `cb`: callback

```c
esp_err_t esp_wifi_set_promiscuous(bool en)
```

Enable the promiscuous mode.

### Return

- **ESP_OK**: succeed

### Parameters

- `en`: false - disable, true - enable

```c
esp_err_t esp_wifi_get_promiscuous(bool *en)
```

Get the promiscuous mode.

### Return

- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_INVALID_ARG**: invalid argument
### Parameters
- **[out] en**: store the current status of promiscuous mode

```c
esp_err_t esp_wifi_set_promiscuous_filter(const wifi_promiscuous_filter_t *filter)
```

Enable the promiscuous mode packet type filter.

**Note** The default filter is to filter all packets except WIFI_PKT_MISC

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
- **filter**: the packet type filtered in promiscuous mode.

```c
esp_err_t esp_wifi_get_promiscuous_filter(wifi_promiscuous_filter_t *filter)
```

Get the promiscuous filter.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- **[out] filter**: store the current status of promiscuous filter

```c
esp_err_t esp_wifi_set_promiscuous_ctrl_filter(const wifi_promiscuous_filter_t *filter)
```

Enable subtype filter of the control packet in promiscuous mode.

**Note** The default filter is to filter none control packet.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
- **filter**: the subtype of the control packet filtered in promiscuous mode.

```c
esp_err_t esp_wifi_get_promiscuous_ctrl_filter(wifi_promiscuous_filter_t *filter)
```

Get the subtype filter of the control packet in promiscuous mode.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- **[out] filter**: store the current status of subtype filter of the control packet in promiscuous mode

```c
esp_err_t esp_wifi_set_config(wifi_interface_t interface, wifi_config_t *conf)
```

Set the configuration of the ESP32 STA or AP.

**Attention**
1. This API can be called only when specified interface is enabled, otherwise, API fail
2. For station configuration, bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.
3. ESP32 is limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the ESP32 station.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MODE: invalid mode
- ESP_ERR_WIFI_PASSWORD: invalid password
- ESP_ERR_WIFI_NVS: WiFi internal NVS error
- others: refer to the erro code in esp_err.h

**Parameters**
- **interface**: interface
Chapter 2. API Reference

• conf: station or soft-AP configuration

`esp_err_t esp_wifi_get_config(wifi_interface_t interface, wifi_config_t *conf)`
Get configuration of specified interface.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

Parameters
- interface: interface
- [out] conf: station or soft-AP configuration

`esp_err_t esp_wifi_ap_get_sta_list(wifi_sta_list_t *sta)`
Get STAs associated with soft-AP.

Attention  SSC only API

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFimodeis wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

Parameters
- [out] sta: station list ap can get the connected sta’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the wifi_sta_info_t struct. For example, phy_11b = 1 imply that sta support 802.11b mode

`esp_err_t esp_wifi_ap_get_sta_aid(const uint8_t mac[6], uint16_t *aid)`
Get AID of STA connected with soft-AP.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NOT_FOUND: Requested resource not found
- ESP_ERR_WIFI_MODE: WiFimode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

Parameters
- mac: STA’s mac address
- [out] aid: Store the AID corresponding to STA mac

`esp_err_t esp_wifi_set_storage(wifi_storage_t storage)`
Set the WiFi API configuration storage type.

Attention 1. The default value is WIFI_STORAGE_FLASH

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

Parameters
- storage: : storage type

`esp_err_t esp_wifi_set_vendor_ie(bool enable, wifi_vendor_ie_type_t type, wifi_vendor_ie_id_t idx, const void *vnd_ie)`
Set 802.11 Vendor-Specific Information Element.

`esp_err_t esp_wifi_set_vendor_ie(bool enable, wifi_vendor_ie_type_t type, wifi_vendor_ie_id_t idx, const void *vnd_ie)`

Set 802.11 Vendor-Specific Information Element.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init()
- ESP_ERR_INVALID_ARG: Invalid argument, including if first byte of vnd_ie is not WIFI_VENDOR_IE_ELEMENT_ID (0xDD) or second byte is an invalid length.
Chapter 2. API Reference

- ESP_ERR_NO_MEM: Out of memory

Parameters
- enable: If true, specified IE is enabled. If false, specified IE is removed.
- type: Information Element type. Determines the frame type to associate with the IE.
- idx: Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
- vnd_ie: Pointer to vendor specific element data. First 6 bytes should be a header with fields matching vendor_ie_data_t. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

```c
esp_err_t esp_wifi_set_vendor_ie_cb(esp_vendor_ie_cb_t cb, void *ctx)
```
Register Vendor-Specific Information Element monitoring callback.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters
- cb: Callback function
- ctx: Context argument, passed to callback function.

```c
esp_err_t esp_wifi_set_max_tx_power(int8_t power)
```
Set maximum transmitting power after WiFi start.

Attention 1. Maximum power before wifi startup is limited by PHY init data bin.
Attention 2. The value set by this API will be mapped to the max_tx_power of the structure wifi_country_t variable.
Attention 3. Mapping Table {Power, max_tx_power} = {{8, 2}, {20, 5}, {28, 7}, {34, 8}, {44, 11}, {52, 13}, {60, 15}, {66, 16}, {72, 18}, {80, 20}}.
Attention 4. Param power unit is 0.25dBm, range is [8, 84] corresponding to 2dBm - 20dBm.
Attention 5. Relationship between set value and actual value. As follows: {set value range, actual value} = {{[8, 19],8}, {[20, 27],20}, {[28, 33],28}, {[34, 43],34}, {[44, 51],44}, {[52, 55],52}, {[56, 59],56}, {[60, 65],60}, {[66, 71],66}, {[72, 79],72}, {[80, 84],80}}.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is out of range

Parameters
- power: Maximum WiFi transmitting power.

```c
esp_err_t esp_wifi_set_event_mask(uint32_t mask)
```
Set mask to enable or disable some WiFi events.

Attention 1. Mask can be created by logical OR of various WIFI_EVENT_MASK_ constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.
Attention 2. Default WiFi event mask is WIFI_EVENT_MASK_AP_PROBEREQRECVED.
Attention 3. There may be lots of stations sending probe request data around. Don’t unmask this event unless you need to receive probe request data.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

Parameters
- mask: Maximum WiFi transmitting power, unit is 0.25dBm.
**mask:** WiFi event mask.

```c
esp_err_t esp_wifi_get_event_mask (uint32_t *mask)
```

Get mask of WiFi events.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

**Parameters**
- *mask:* WiFi event mask.

```c
esp_err_t esp_wifi_80211_tx (wifi_interface_t ifx, const void* buffer, int len, bool en_sys_seq)
```

Send raw ieee80211 data.

**Attention** Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

**Return**
- ESP_OK: success
- ESP_ERR_WIFI_IF: Invalid interface
- ESP_ERR_INVALID_ARG: Invalid parameter
- ESP_ERR_WIFI_NO_MEM: out of memory

**Parameters**
- *ifx:* interface if the Wi-Fi mode is Station, the ifx should be WIFI_IF_STA. If the Wi-Fi mode is SoftAP, the ifx should be WIFI_IF_AP. If the Wi-Fi mode is Station+SoftAP, the ifx should be WIFI_IF_STA or WIFI_IF_AP. If the ifx is wrong, the API returns ESP_ERR_WIFI_IF.
- *buffer:* raw ieee80211 buffer
- *len:* the length of raw buffer, the len must be <= 1500 Bytes and >= 24 Bytes
- *en_sys_seq:* indicate whether use the internal sequence number. If en_sys_seq is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if esp_wifi_80211_tx is called before the Wi-Fi connection has been set up, both en_sys_seq==true and en_sys_seq==false are fine. However, if the API is called after the Wi-Fi connection has been set up, en_sys_seq must be true, otherwise ESP_ERR_WIFI_ARG is returned.

```c
esp_err_t esp_wifi_set_csi_rx_cb (wifi_csi_cb_t cb, void* ctx)
```

Register the RX callback function of CSI data.

Each time a CSI data **is** received, the callback function will be called.

**Return**
- ESP_OK: succeed

**Parameters**
- *cb:* callback
- *ctx:* context argument, passed to callback function

```c
esp_err_t esp_wifi_set_csi_config (const wifi_csi_config_t *config)
```

Set CSI data configuration.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- *config:* configuration

```c
esp_err_t esp_wifi_set_csi (bool en)
```

Enable or disable CSI.
Chapter 2. API Reference

return

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
• ESP_ERR_INVALID_ARG: invalid argument

Parameters
• en: true - enable, false - disable

`esp_err_t esp_wifi_set_ant_gpio(const wifi_ant_gpio_config_t *config)`

Set antenna GPIO configuration.

Return

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_ARG: Invalid argument, e.g. parameter is NULL, invalid GPIO number etc

Parameters
• config: Antenna GPIO configuration.

`esp_err_t esp_wifi_get_ant_gpio(wifi_ant_gpio_config_t *config)`

Get current antenna GPIO configuration.

Return

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL

Parameters
• config: Antenna GPIO configuration.

`esp_err_t esp_wifi_set_ant(const wifi_ant_config_t *config)`

Set antenna configuration.

Return

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_ARG: Invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

Parameters
• config: Antenna configuration.

`esp_err_t esp_wifi_get_ant(wifi_ant_config_t *config)`

Get current antenna configuration.

Return

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL

Parameters
• config: Antenna configuration.

`int64_t esp_wifi_get_tsf_time(wifi_interface_t interface)`

Get the TSF time In Station mode or SoftAP+Station mode if station is not connected or station doesn’t receive at least one beacon after connected, will return 0.

Attention: Enabling power save may cause the return value inaccurate, except WiFi modem sleep

Return 0 or the TSF time

Parameters
• interface: The interface whose tsf_time is to be retrieved.

`esp_err_t esp_wifi_set_inactive_time(wifi_interface_t ifs, uint16_t sec)`

Set the inactive time of the ESP32 STA or AP.
Attention 1. For Station, if the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.

Attention 2. For SoftAP, if the softAP doesn’t receive any data from the connected STA during inactive time, the softAP will force deauth the STA. Default is 300s.

Attention 3. The inactive time configuration is not stored into flash

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument, For Station, if sec is less than 3. For SoftAP, if sec is less than 10.

Parameters
- ifx: interface to be configured.
- sec: Inactive time. Unit seconds.

\[ \text{esp_err_t esp_wifi_get_inactive_time (wifi_interface_t ifx, uint16_t* sec)} \]
Get inactive time of specified interface.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

Parameters
- ifx: Interface to be configured.
- sec: Inactive time. Unit seconds.

\[ \text{esp_err_t esp_wifi_statis_dump (uint32_t modules)} \]
Dump WiFi statistics.

Return
- ESP_OK: succeed
- others: failed

Parameters
- modules: statistic modules to be dumped

\[ \text{esp_err_t esp_wifi_set_rssi_threshold (int32_t rssi)} \]
Set RSSI threshold below which APP will get an event.

Attention This API needs to be called every time after WIFI_EVENT_STA_BSS_RSSI_LOW event is received.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

Parameters
- rssi: threshold value in dbm between -100 to 0

\[ \text{esp_err_t esp_wifi_ftm_initiate_session (wifi_ftm_initiator_cfg_t *cfg)} \]
Start an FTM Initiator session by sending FTM request If successful, event WIFI_EVENT_FTM_REPORT is generated with the result of the FTM procedure.

Attention Use this API only in Station mode

Return
- ESP_OK: succeed
- others: failed

Parameters
- cfg: FTM Initiator session configuration

\[ \text{esp_err_t esp_wifi_ftm_end_session (void)} \]
End the ongoing FTM Initiator session.

Attention This API works only on FTM Initiator

Return
**esp_err_t esp_wifi_ftm_resp_set_offset** (int16_t offset_cm)
Set offset in cm for FTM Responder. An equivalent offset is calculated in picoseconds and added in TOD of FTM Measurement frame (T1).

**Attention**  Use this API only in AP mode before performing FTM as responder

**Return**  
- ESP_OK: succeed
- others: failed

**Parameters**  
- offset_cm: T1 Offset to be added in centimeters

**esp_err_t esp_wifi_config_11b_rate** (wifi_interface_t ifx, bool disable)
Enable or disable 11b rate of specified interface.

**Attention**  
1. This API should be called after esp_wifi_init() and before esp_wifi_start().
2. Only when really need to disable 11b rate call this API otherwise don’t call this.

**Return**  
- ESP_OK: succeed
- others: failed

**Parameters**  
- ifx: Interface to be configured.
- disable: true means disable 11b rate while false means enable 11b rate.

**esp_err_t esp_wifi_config_espnow_rate** (wifi_interface_t ifx, wifi_phy_rate_t rate)
Config ESPNOW rate of specified interface.

**Attention**  
1. This API should be called after esp_wifi_init() and before esp_wifi_start().

**Return**  
- ESP_OK: succeed
- others: failed

**Parameters**  
- ifx: Interface to be configured.
- rate: Phy rate to be configured.

**esp_err_t esp_wifi_set_connectionless_wake_interval** (uint16_t interval)
Set interval for station to wake up periodically at disconnected.

**Attention**  
1. Only when ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work
2. This configuration only work for station mode and disconnected status
3. This configuration would influence nothing until some module configure wake_window
4. A sensible interval which is not too small is recommended (e.g. 100ms)

**Parameters**  
- interval: how much microsecond would the chip wake up, from 1 to 65535.

**esp_err_t esp_wifi_set_country_code** (const char* country, bool ieee80211d_enabled)
configure country

**Attention**  
1. When ieee80211d_enabled, the country info of the AP to which the station is connected is used.
   E.g. if the configured country is US and the country info of the AP to which the station is connected is JP then the country info that will be used is JP. If the station disconnected from the AP the country info is set back to the country info of the station automatically, US in the example.
2. When ieee80211d_enabled is disabled, then the configured country info is used always.
3. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.
4. The country configuration is stored into flash.
5. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.
Attention 7. When country code “01” (world safe mode) is set, SoftAP mode won’t contain country IE.
Attention 8. The default country is “CN” and iee80211d_enabled is TRUE.

Return

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument

Parameters

• country: the configured country ISO code
• iee80211d_enabled: 802.11d is enabled or not

\(\text{esp_err_t esp_wifi_get_country_code(char *country)}\)

going the current country code

Return

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument

Parameters

• country: country code

\(\text{esp_err_t esp_wifi_config_80211_tx_rate(wifi_interface_t ifx, wifi_phy_rate_t rate)}\)

Config 80211 tx rate of specified interface.

Attention 1. This API should be called after esp_wifi_init() and before esp_wifi_start().

Return

• ESP_OK: succeed
• others: failed

Parameters

• ifx: Interface to be configured.
• rate: Phy rate to be configured.

Structures

\(\text{struct wifi_init_config_t}\)

WiFi stack configuration parameters passed to esp_wifi_init call.

Public Members

\(\text{system_event_handler_t event_handler}\)

WiFi event handler

\(\text{wifi_osi_funcs_t *osi_funcs}\)

WiFi OS functions

\(\text{wpa_crypto_funcs_t wpa_crypto_funcs}\)

WiFi station crypto functions when connect

\(\text{int static_rx_buf_num}\)

WiFi static RX buffer number

\(\text{int dynamic_rx_buf_num}\)

WiFi dynamic RX buffer number

\(\text{int tx_buf_type}\)

WiFi TX buffer type

\(\text{int static_tx_buf_num}\)

WiFi static TX buffer number
int `dynamic_tx_buf_num`
   WiFi dynamic TX buffer number

int `cache_tx_buf_num`
   WiFi TX cache buffer number

int `csi_enable`
   WiFi channel state information enable flag

int `ampdu_rx_enable`
   WiFi AMPDU RX feature enable flag

int `ampdu_tx_enable`
   WiFi AMPDU TX feature enable flag

int `amsdu_tx_enable`
   WiFi AMSDU TX feature enable flag

int `nvs_enable`
   WiFi NVS flash enable flag

int `nano_enable`
   Nano option for printf.scan family enable flag

int `rx_ba_win`
   WiFi Block Ack RX window size

int `wifi_task_core_id`
   WiFi Task Core ID

int `beacon_max_len`
   WiFi softAP maximum length of the beacon

int `mgmt_sbuf_num`
   WiFi management short buffer number, the minimum value is 6, the maximum value is 32

uint64_t `feature_caps`
   Enables additional WiFi features and capabilities

bool `sta_disconnected_pm`
   WiFi Power Management for station at disconnected status

int `magic`
   WiFi init magic number, it should be the last field

**Macros**

ESP_ERR_WIFI_NOT_INIT
   WiFi driver was not installed by esp_wifi_init

ESP_ERR_WIFI_NOT_STARTED
   WiFi driver was not started by esp_wifi_start

ESP_ERR_WIFI_NOT_STOPPED
   WiFi driver was not stopped by esp_wifi_stop

ESP_ERR_WIFI_IF
   WiFi interface error

ESP_ERR_WIFI_MODE
   WiFi mode error

ESP_ERR_WIFI_STATE
   WiFi internal state error

ESP_ERR_WIFI_CONN
   WiFi internal control block of station or soft-AP error
Chapter 2. API Reference

ESP_ERR_WIFI_NVS
WiFi internal NVS module error

ESP_ERR_WIFI_MAC
MAC address is invalid

ESP_ERR_WIFI_SSID
SSID is invalid

ESP_ERR_WIFI_PASSWORD
Password is invalid

ESP_ERR_WIFI_TIMEOUT
Timeout error

ESP_ERR_WIFI_WAKE_FAIL
WiFi is in sleep state (RF closed) and wakeup fail

ESP_ERR_WIFI_WOULD_BLOCK
The caller would block

ESP_ERR_WIFI_NOT_CONNECT
Station still in disconnect status

ESP_ERR_WIFI_POST
Failed to post the event to WiFi task

ESP_ERR_WIFI_INIT_STATE
Invalid WiFi state when init/deinit is called

ESP_ERR_WIFI_STOP_STATE
Returned when WiFi is stopping

ESP_ERR_WIFI_NOT_ASSOC
The WiFi connection is not associated

ESP_ERR_WIFI_TX_DISALLOW
The WiFi TX is disallowed

WIFI_STATIC_TX_BUFFER_NUM

WIFI_CACHE_TX_BUFFER_NUM

WIFI_DYNAMIC_TX_BUFFER_NUM

WIFI_CSI_ENABLED

WIFI_AMPDU_RX_ENABLED

WIFI_AMPDU_TX_ENABLED

WIFI_AMSDU_TX_ENABLED

WIFI_NVS_ENABLED

WIFI_NANO_FORMAT_ENABLED

WIFI_INIT_CONFIG_MAGIC

WIFI_DEFAULT_RX_BA_WIN

WIFI_TASK_CORE_ID

WIFI_SOFTAP_BEACON_MAX_LEN

WIFI_MGMT_SBUF_NUM

WIFI_STA_DISCONNECTED_PM_ENABLED

CONFIG_FEATURE_WPA3_SAE_BIT

CONFIG_FEATURE_CACHE_TX_BUF_BIT
Chapter 2. API Reference

CONFIG_FEATURE_FTM_INITIATOR_BIT
CONFIG_FEATURE_FTM_RESPONDER_BIT
WIFI_INIT_CONFIG_DEFAULT()

Type Definitions
typedef void (*wifi_promiscuous_cb_t)(void *buf, wifi_promiscuous_pkt_type_t type)
The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

Parameters
  • buf: Data received. Type of data in buffer (wifi_promiscuous_pkt_t or wifi_pkt_rx_ctrl_t) indicated by ‘type’ parameter.
  • type: promiscuous packet type.
typedef void (*esp_vendor_ie_cb_t)(void *ctx, wifi_vendor_ie_type_t type, const uint8_t sa[6], const vendor_ie_data_t *vnd_ie, int rssi)
Function signature for received Vendor-Specific Information Element callback.

Parameters
  • ctx: Context argument, as passed to esp_wifi_set_vendor_ie_cb() when registering callback.
  • type: Information element type, based on frame type received.
  • sa: Source 802.11 address.
  • vnd_ie: Pointer to the vendor specific element data received.
  • rssi: Received signal strength indication.
typedef void (*wifi_csi_cb_t)(void *ctx, wifi_csi_info_t *data)
The RX callback function of Channel State Information(CSI) data.

Parameters
  • ctx: context argument, passed to esp_wifi_set_csi_rx_cb() when registering callback function.
  • data: CSI data received. The memory that it points to will be deallocated after callback function returns.

Header File
  • components/esp_wifi/include/esp_wifi_types.h

Unions
union wifi_config_t
#include <esp_wifi_types.h> Configuration data for ESP32 AP or STA.
The usage of this union (for ap or sta configuration) is determined by the accompanying interface argument passed to esp_wifi_set_config() or esp_wifi_get_config()

Public Members

wifi_ap_config_t ap
configuration of AP

wifi_sta_config_t sta
configuration of STA

Structures
struct wifi_country_t
Structure describing WiFi country-based regional restrictions.
Chapter 2.  API Reference

Public Members

char cc[3]
country code string

uint8_t schan
start channel

uint8_t nchan
total channel number

int8_t max_tx_power
This field is used for getting WiFi maximum transmitting power, call esp_wifi_set_max_tx_power to set the maximum transmitting power.

wifi_country_policy_t policy
country policy

struct wifi_active_scan_time_t
Range of active scan times per channel.

Public Members

uint32_t min
minimum active scan time per channel, units: millisecond

uint32_t max
maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct wifi_scan_time_t
Aggregate of active & passive scan time per channel.

Public Members

wifi_active_scan_time_t active
active scan time per channel, units: millisecond.

uint32_t passive
passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct wifi_scan_config_t
Parameters for an SSID scan.

Public Members

uint8_t *ssid
SSID of AP

uint8_t *bssid
MAC address of AP

uint8_t channel
channel, scan the specific channel

bool show_hidden
enable to scan AP whose SSID is hidden

wifi_scan_type_t scan_type
scan type, active or passive

**wifi_scan_time_t**: scan time per channel

**struct wifi_ap_record_t**
Description of a WiFi AP.

**Public Members**

- `uint8_t bssid[6]`
  MAC address of AP
- `uint8_t ssid[33]`
  SSID of AP
- `uint8_t primary`
  channel of AP
- `wifi_second_chan_t second`
  secondary channel of AP
- `int8_t rssi`
  signal strength of AP
- `wifi_auth_mode_t authmode`
  authmode of AP
- `wifi_cipher_type_t pairwise_cipher`
  pairwise cipher of AP
- `wifi_cipher_type_t group_cipher`
  group cipher of AP
- `wifi_ant_t ant`
  antenna used to receive beacon from AP
- `uint32_t phy_11b : 1`
  bit: 0 flag to identify if 11b mode is enabled or not
- `uint32_t phy_11g : 1`
  bit: 1 flag to identify if 11g mode is enabled or not
- `uint32_t phy_11n : 1`
  bit: 2 flag to identify if 11n mode is enabled or not
- `uint32_t phy_lr : 1`
  bit: 3 flag to identify if low rate is enabled or not
- `uint32_t wps : 1`
  bit: 4 flag to identify if WPS is supported or not
- `uint32_t ftm_responder : 1`
  bit: 5 flag to identify if FTM is supported in responder mode
- `uint32_t ftm_initiator : 1`
  bit: 6 flag to identify if FTM is supported in initiator mode
- `uint32_t reserved : 25`
  bit: 7..31 reserved
- `wifi_country_t country`
  country information of AP

**struct wifi_scan_threshold_t**
Structure describing parameters for a WiFi fast scan.
Chapter 2. API Reference

**Public Members**

```c
int8_t rssi
```

The minimum rssi to accept in the fast scan mode

```c
wifi_auth_mode_t authmode
```

The weakest authmode to accept in the fast scan mode

**struct wifi_pmf_config_t**

Configuration structure for Protected Management Frame

**Public Members**

```c
bool capable
```

Device will always connect in PMF mode if other device also advertizes PMF capability.

```c
bool required
```

Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable devices.

**struct wifi_ap_config_t**

Soft-AP configuration settings for the ESP32.

**Public Members**

```c
uint8_t ssid[32]
```

SSID of ESP32 soft-AP. If ssid_len field is 0, this must be a Null terminated string. Otherwise, length is set according to ssid_len.

```c
uint8_t password[64]
```

Password of ESP32 soft-AP.

```c
uint8_t ssid_len
```

Optional length of SSID field.

```c
uint8_t channel
```

Channel of ESP32 soft-AP

```c
wifi_auth_mode_t authmode
```

Auth mode of ESP32 soft-AP. Do not support AUTH_WEP in soft-AP mode

```c
uint8_t ssid_hidden
```

Broadcast SSID or not, default 0, broadcast the SSID

```c
uint8_t max_connection
```

Max number of stations allowed to connect in, default 4, max 10

```c
uint16_t beacon_interval
```

Beacon interval which should be multiples of 100. Unit: TU(time unit, 1 TU = 1024 us). Range: 100 ~ 60000. Default value: 100

```c
wifi_cipher_type_t pairwise_cipher
```

pairwise cipher of SoftAP, group cipher will be derived using this. cipher values are valid starting from WIFI_CIPHER_TYPE_TKIP, enum values before that will be considered as invalid and default cipher suites(TKIP+CCMP) will be used. Valid cipher suites in softAP mode are WIFI_CIPHER_TYPE_TKIP, WIFI_CIPHER_TYPE_CCMP and WIFI_CIPHER_TYPE_TKIP_CCMP.

```c
bool ftm_responder
```

Enable FTM Responder mode

**struct wifi_pmf_config_t**

Configuration for Protected Management Frame
struct wifi_sta_config_t
    STA configuration settings for the ESP32.

Public Members

uint8_t ssid[32]
    SSID of target AP.

uint8_t password[64]
    Password of target AP.

wifi_scan_method_t scan_method
    do all channel scan or fast scan

bool bssid_set
    whether set MAC address of target AP or not. Generally, station_config.bssid_set needs to be 0; and it
    needs to be 1 only when users need to check the MAC address of the AP.

uint8_t bssid[6]
    MAC address of target AP

uint8_t channel
    channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If
    the channel of AP is unknown, set it to 0.

uint16_t listen_interval
    Listen interval for ESP32 station to receive beacon when WIFI_PS_MAX_MODEM is set. Units: AP
    beacon intervals. Defaults to 3 if set to 0.

wifi_sort_method_t sort_method
    sort the connect AP in the list by rssi or security mode

wifi_scan_threshold_t threshold
    When sort_method is set, only APs which have an auth mode that is more secure than the selected auth
    mode and a signal stronger than the minimum RSSI will be used.

ewifi_pmf_config_t pmf_cfg
    Configuration for Protected Management Frame. Will be advertised in RSN Capabilities in RSN IE.

uint32_t rm_enabled : 1
    Whether Radio Measurements are enabled for the connection

uint32_t btm_enabled : 1
    Whether BSS Transition Management is enabled for the connection

uint32_t mbo_enabled : 1
    Whether MBO is enabled for the connection

uint32_t reserved : 29
    Reserved for future feature set

struct wifi_sta_info_t
    Description of STA associated with AP.

Public Members

uint8_t mac[6]
    mac address

int8_t rssi
    current average rssi of sta connected

uint32_t phy_11b : 1
    bit: 0 flag to identify if 11b mode is enabled or not
Chapter 2. API Reference

```c
uint32_t phy_11g : 1
    bit: 1 flag to identify if 11g mode is enabled or not

uint32_t phy_11n : 1
    bit: 2 flag to identify if 11n mode is enabled or not

uint32_t phy_lr : 1
    bit: 3 flag to identify if low rate is enabled or not

uint32_t is_mesh_child : 1
    bit: 4 flag to identify mesh child

uint32_t reserved : 27
    bit: 5..31 reserved
```

```c
struct wifi_sta_list_t
    List of stations associated with the ESP32 Soft-AP.
```

**Public Members**

```c
wifi_sta_info_t sta[ESP_WIFI_MAX_CONN_NUM]
    station list

int num
    number of stations in the list (other entries are invalid)
```

```c
struct vendor_ie_data_t
    Vendor Information Element header.
    The first bytes of the Information Element will match this header. Payload follows.
```

**Public Members**

```c
uint8_t element_id
    Should be set to WIFI_VENDOR_IE_ELEMENT_ID (0xDD)

uint8_t length
    Length of all bytes in the element data following this field. Minimum 4.

uint8_t vendor_oui[3]
    Vendor identifier (OUI).

uint8_t vendor_oui_type
    Vendor-specific OUI type.

uint8_t payload[0]
    Payload. Length is equal to value in ‘length’ field, minus 4.
```

```c
struct wifi_pkt_rx_ctrl_t
    Received packet radio metadata header, this is the common header at the beginning of all promiscuous mode RX callback buffers.
```

**Public Members**

```c
signed rssi : 8
    Received Signal Strength Indicator (RSSI) of packet. unit: dBm

unsigned rate : 5
    PHY rate encoding of the packet. Only valid for non HT(11bg) packet

unsigned __pad0__ : 1
    reserved
```
Chapter 2. API Reference

unsigned sig_mode : 2
0: non HT(11bg) packet; 1: HT(11n) packet; 3: VHT(11ac) packet

unsigned __pad1__ : 16
reserved

unsigned mcs : 7
Modulation Coding Scheme. If is HT(11n) packet, shows the modulation, range from 0 to 76(MSC0 ~ MCS76)

unsigned cwb : 1
Channel Bandwidth of the packet. 0: 20MHz; 1: 40MHz

unsigned __pad2__ : 16
reserved

unsigned smoothing : 1
reserved

unsigned not_sounding : 1
reserved

unsigned __pad3__ : 1
reserved

unsigned aggregation : 1
Aggregation. 0: MPDU packet; 1: AMPDU packet

unsigned stbc : 2
Space Time Block Code(STBC). 0: non STBC packet; 1: STBC packet

unsigned fec_coding : 1
Flag is set for 11n packets which are LDPC

unsigned sgi : 1
Short Guide Interval(SGI). 0: Long GI; 1: Short GI

unsigned __pad4__ : 8
reserved

unsigned ampdu_cnt : 8
ampdu cnt

unsigned channel : 4
primary channel on which this packet is received

unsigned secondary_channel : 4
secondary channel on which this packet is received. 0: none; 1: above; 2: below

unsigned __pad5__ : 8
reserved

unsigned timestamp : 32
timestamp. The local time when this packet is received. It is precise only if modem sleep or light sleep is not enabled. unit: microsecond

unsigned __pad6__ : 32
reserved

signed noise_floor : 8
noise floor of Radio Frequency Module(RF). unit: 0.25dBm

unsigned __pad7__ : 24
reserved

unsigned __pad8__ : 32
reserved
unsigned __pad9__: 31
    reserved
unsigned ant: 1
    antenna number from which this packet is received. 0: WiFi antenna 0; 1: WiFi antenna 1
unsigned __pad10__: 32
    reserved
unsigned __pad11__: 32
    reserved
unsigned __pad12__: 32
    reserved
unsigned sig_len: 12
    length of packet including Frame Check Sequence(FCS)
unsigned __pad13__: 12
    reserved
unsigned rx_state: 8
    state of the packet. 0: no error; others: error numbers which are not public

struct wifi_promiscuous_pkt_t
    Payload passed to ‘buf’ parameter of promiscuous mode RX callback.

Public Members

wifi_pkt_rx_ctrl_t rx_ctl
    metadata header
uint8_t payload[0]
    Data or management payload. Length of payload is described by rx_ctl.sig_len. Type of content determined by packet type argument of callback.

struct wifi_promiscuous_filter_t
    Mask for filtering different packet types in promiscuous mode.

Public Members

uint32_t filter_mask
    OR of one or more filter values WIFI_PROMIS_FILTER_*

struct wifi_csi_config_t
    Channel state information(CSI) configuration type.

Public Members

bool lltf_en
    enable to receive legacy long training field(lltf) data. Default enabled
bool hltf_en
    enable to receive HT long training field(htltf) data. Default enabled
bool stbc_hltf2_en
    enable to receive space time block code HT long training field(stbc-hltf2) data. Default enabled
bool ltf_merge_en
    enable to generate htlf data by averaging lltf and ht_ltf data when receiving HT packet. Otherwise, use ht_ltf data directly. Default enabled
bool channel_filter_en
    enable to turn on channel filter to smooth adjacent sub-carrier. Disable it to keep independence of adjacent sub-carrier. Default enabled

bool manu_scale
    manually scale the CSI data by left shifting or automatically scale the CSI data. If set true, please set the shift bits. false: automatically. true: manually. Default false

uint8_t shift
    manually left shift bits of the scale of the CSI data. The range of the left shift bits is 0~15

struct wifi_csi_info_t
    CSI data type.

Public Members

wifi_pkt_rx_ctrl_t rx_ctrl
    received packet radio metadata header of the CSI data

uint8_t mac[6]
    source MAC address of the CSI data

bool first_word_invalid
    first four bytes of the CSI data is invalid or not

int8_t *buf
    buffer of CSI data

uint16_t len
    length of CSI data

struct wifi_ant_gpio_t
    WiFi GPIO configuration for antenna selection.

Public Members

uint8_t gpio_select : 1
    Whether this GPIO is connected to external antenna switch

uint8_t gpio_num : 7
    The GPIO number that connects to external antenna switch

struct wifi_ant_gpio_config_t
    WiFi GPiOs configuration for antenna selection.

Public Members

struct wifi_ant_mode_t rx_ant_mode
    WiFi antenna mode for receiving

wifi_ant_t rx_ant_default
    Default antenna mode for receiving, it’s ignored if rx_ant_mode is not WIFI_ANT_MODE_AUTO
### Chapter 2. API Reference

#### wifi_ant_mode_t

Wi-Fi antenna mode for transmission, it can be set to WIFI_ANT_MODE_AUTO only if rx_ant_mode is set to WIFI_ANT_MODE_AUTO

- `uint8_t enabled_ant0 : 4`
  - Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT0

- `uint8_t enabled_ant1 : 4`
  - Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT1

#### struct wifi_action_tx_req_t

Action Frame Tx Request.

**Public Members**

- `wifi_interface_t ifx`
  - WiFi interface to send request to

- `uint8_t dest_mac[6]`
  - Destination MAC address

- `bool no_ack`
  - Indicates no ack required

- `wifi_action_rx_cb_t rx_cb`
  - Rx Callback to receive any response

- `uint32_t data_len`
  - Length of the appended Data

- `uint8_t data[0]`
  - Appended Data payload

#### struct wifi_ftm_initiator_cfg_t

FTM Initiator configuration.

**Public Members**

- `uint8_t resp_mac[6]`
  - MAC address of the FTM Responder

- `uint8_t channel`
  - Primary channel of the FTM Responder

- `uint8_t frm_count`
  - No. of FTM frames requested in terms of 4 or 8 bursts (allowed values - 0 (No pref), 16, 24, 32, 64)

- `uint16_t burst_period`
  - Requested time period between consecutive FTM bursts in 100s of milliseconds (0 - No pref)

#### struct wifi_event_sta_scan_done_t

Argument structure for WIFI_EVENT_SCAN_DONE event

**Public Members**

- `uint32_t status`
  - status of scanning APs: 0 — success, 1 - failure

- `uint8_t number`
  - number of scan results

- `uint8_t scan_id`
  - scan sequence number, used for block scan
struct wifi_event_sta_connected_t
Argument structure for WIFI_EVENT_STA_CONNECTED event

Public Members

uint8_t ssid[32]
SSID of connected AP

uint8_t ssid_len
SSID length of connected AP

uint8_t bssid[6]
BSSID of connected AP

uint8_t channel
channel of connected AP

wifi_auth_mode_t authmode
authentication mode used by AP

struct wifi_event_sta_disconnected_t
Argument structure for WIFI_EVENT_STA_DISCONNECTED event

Public Members

uint8_t ssid[32]
SSID of disconnected AP

uint8_t ssid_len
SSID length of disconnected AP

uint8_t bssid[6]
BSSID of disconnected AP

uint8_t reason
reason of disconnection

struct wifi_event_sta_authmode_change_t
Argument structure for WIFI_EVENT_STA_AUTHMODE_CHANGE event

Public Members

wifi_auth_mode_t old_mode
the old auth mode of AP

wifi_auth_mode_t new_mode
the new auth mode of AP

struct wifi_event_sta_wps_er_pin_t
Argument structure for WIFI_EVENT_STA_WPS_ER_PIN event

Public Members

uint8_t pin_code[8]
PIN code of station in enrollee mode

struct wifi_event_sta_wps_er_success_t
Argument structure for WIFI_EVENT_STA_WPS_ER_SUCCESS event
Chapter 2. API Reference

**Public Members**

```c
uint8_t ap_cred_cnt
// Number of AP credentials received
```

```c
uint8_t ssid[MAX SSID_LEN]
// SSID of AP
```

```c
uint8_t passphrase[MAX PASSPHRASE_LEN]
// Passphrase for the AP
```

```c
struct wifi_event_sta_wps_or_success_t::[anonymous] ap_cred[MAX WPS_AP_CRED]
// All AP credentials received from WPS handshake
```

```c
struct wifi_event_ap_staconnected_t
// Argument structure for WIFI_EVENT_AP_STACONNECTED event
```

**Public Members**

```c
uint8_t mac[6]
// MAC address of the station connected to ESP32 soft-AP
```

```c
uint8_t aid
// the aid that ESP32 soft-AP gives to the station connected to
```

```c
bool is_mesh_child
// flag to identify mesh child
```

```c
struct wifi_event_ap_stadisconnected_t
// Argument structure for WIFI_EVENT_AP_STADISCONNECTED event
```

**Public Members**

```c
uint8_t mac[6]
// MAC address of the station disconnects to ESP32 soft-AP
```

```c
uint8_t aid
// the aid that ESP32 soft-AP gave to the station disconnects to
```

```c
bool is_mesh_child
// flag to identify mesh child
```

```c
struct wifi_event_ap_probe_req_rx_t
// Argument structure for WIFI_EVENT_AP_PROBEREQRECVD event
```

**Public Members**

```c
int rssi
// Received probe request signal strength
```

```c
uint8_t mac[6]
// MAC address of the station which send probe request
```

```c
struct wifi_event_bss_rssi_low_t
// Argument structure for WIFI_EVENT_STA_BSS_RSSI_LOW event
```

**Public Members**

```c
int32_t rssi
// RSSI value of bss
```
**struct wifi_ftm_report_entry_t**

Argument structure for

**Public Members**

uint8_t `dlog_token`
Dialog Token of the FTM frame

int8_t `rssi`
RSSI of the FTM frame received

uint32_t `rtt`
Round Trip Time in pSec with a peer

uint64_t `t1`
Time of departure of FTM frame from FTM Responder in pSec

uint64_t `t2`
Time of arrival of FTM frame at FTM Initiator in pSec

uint64_t `t3`
Time of departure of ACK from FTM Initiator in pSec

uint64_t `t4`
Time of arrival of ACK at FTM Responder in pSec

**struct wifi_event_ftm_report_t**

Argument structure for WIFI_EVENT_FTM_REPORT event

**Public Members**

uint8_t `peer_mac[6]`
MAC address of the FTM Peer

`wifi_ftm_status_t status`
Status of the FTM operation

uint32_t `rtt_raw`
Raw average Round-Trip-Time with peer in Nano-Seconds

uint32_t `rtt_est`
Estimated Round-Trip-Time with peer in Nano-Seconds

uint32_t `dist_est`
Estimated one-way distance in Centi-Meters

`wifi_ftm_report_entry_t *ftm_report_data`
Pointer to FTM Report with multiple entries, should be freed after use

uint8_t `ftm_report_num_entries`
Number of entries in the FTM Report data

**struct wifi_event_action_tx_status_t**

Argument structure for WIFI_EVENT_ACTION_TX_STATUS event

**Public Members**

`wifi_interface_t ifx`
WiFi interface to send request to

uint32_t `context`
Context to identify the request
uint8_t da[6]
    Destination MAC address

uint8_t status
    Status of the operation

struct wifi_event_roc_done_t
    Argument structure for WIFI_EVENT_ROC_DONE event

Public Members

uint32_t context
    Context to identify the request

Macros

WIFI_OFFCHAN_TX_REQ
    WIFI OFFCHAN TX_REQ

WIFI_OFFCHAN_TX_CANCEL
    WIFI OFFCHAN TX_CANCEL

WIFI_ROC_REQ
    WIFI ROC_REQ

WIFI_ROC_CANCEL
    WIFI ROC_CANCEL

WIFI_PROTOCOL_11B
    WIFI PROTOCOL 11B

WIFI_PROTOCOL_11G
    WIFI PROTOCOL 11G

WIFI_PROTOCOL_11N
    WIFI PROTOCOL 11N

WIFI_PROTOCOL_LR
    WIFI PROTOCOL LR

ESP_WIFI_MAX_CONN_NUM
    max number of stations which can connect to ESP32 soft-AP

WIFI_VENDOR_IE_ELEMENT_ID

WIFI_PROMIS_FILTER_MASK_ALL
    filter all packets

WIFI_PROMIS_FILTER_MASK_MGMT
    filter the packets with type of WIFI_PKT_MGMT

WIFI_PROMIS_FILTER_MASK_CTRL
    filter the packets with type of WIFI_PKT_CTRL

WIFI_PROMIS_FILTER_MASK_DATA
    filter the packets with type of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_MISC
    filter the packets with type of WIFI_PKT_MISC

WIFI_PROMIS_FILTER_MASK_DATA_MPDU
    filter the MPDU which is a kind of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_DATA_AMPDU
    filter the AMPDU which is a kind of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_FCSFAIL
    filter the FCS failed packets, do not open it in general

WIFI_PROMIS_CTRL_FILTER_MASK_ALL
    filter all control packets

WIFI_PROMIS_CTRL_FILTER_MASK_WRAPPER
    filter the control packets with subtype of Control Wrapper

WIFI_PROMIS_CTRL_FILTER_MASK_BAR
    filter the control packets with subtype of Block Ack Request
WIFI_PROMIS_CTRL_FILTER_MASK_BA
filter the control packets with subtype of Block Ack

WIFI_PROMIS_CTRL_FILTER_MASK_PSPOLL
filter the control packets with subtype of PS-Poll

WIFI_PROMIS_CTRL_FILTER_MASK_RTS
filter the control packets with subtype of RTS

WIFI_PROMIS_CTRL_FILTER_MASK_CTS
filter the control packets with subtype of CTS

WIFI_PROMIS_CTRL_FILTER_MASK_ACK
filter the control packets with subtype of ACK

WIFI_PROMIS_CTRL_FILTER_MASK_CFEND
filter the control packets with subtype of CF-END

WIFI_PROMIS_CTRL_FILTER_MASK_CFENDACK
filter the control packets with subtype of CF-END+CF-ACK

WIFI_EVENT_MASK_ALL
mask all WiFi events

WIFI_EVENT_MASK_NONE
mask none of the WiFi events

WIFI_EVENT_MASK_AP_PROBEREQRECVED
mask SYSTEM_EVENT_AP_PROBEREQRECVED event

MAX_SSID_LEN
MAX_PASSPHRASE_LEN
MAX_WPS_AP_CRED
WIFI_STATIS_BUFFER
WIFI_STATIS_RXTX
WIFI_STATIS_HW
WIFI_STATIS_DIAG
WIFI_STATIS_PS
WIFI_STATIS_ALL

Type Definitions
typedef int (*wifi_action_rx_cb_t) (uint8_t *hdr, uint8_t *payload, size_t len, uint8_t *channel)
The Rx callback function of Action Tx operations.

Parameters
• hdr: pointer to the IEEE 802.11 Header structure
• payload: pointer to the Payload following 802.11 Header
• len: length of the Payload
• channel: channel number the frame is received on

Enumerations
defi n wifi_mode_t
Values:

WIFI_MODE_NULL = 0
null mode

WIFI_MODE_STA
WiFi station mode
WIFI_MODE_AP
   WiFi soft-AP mode

WIFI_MODE_APSTA
   WiFi station + soft-AP mode

WIFI_MODE_MAX

enum wifi_interface_t
   Values:
   WiFi_EQUAL = Esp_IF_WIFI_STA
   WiFi_EQUAL = Esp_IF_WIFI_AP

enum wifi_country_policy_t
   Values:
   WIFI_COUNTRY_POLICY_AUTO
      Country policy is auto, use the country info of AP to which the station is connected
   WIFI_COUNTRY_POLICY_MANUAL
      Country policy is manual, always use the configured country info

enum wifi_auth_mode_t
   Values:
   WIFI_AUTH_OPEN = 0
      authenticate mode : open
   WIFI_AUTH_WEP
      authenticate mode : WEP
   WIFI_AUTH_WPA_PSK
      authenticate mode : WPA_PSK
   WIFI_AUTH_WPA2_PSK
      authenticate mode : WPA2_PSK
   WIFI_AUTH_WPA_WPA2_PSK
      authenticate mode : WPA_WPA2_PSK
   WIFI_AUTH_WPA2_ENTERPRISE
      authenticate mode : WPA2_ENTERPRISE
   WIFI_AUTH_WPA3_PSK
      authenticate mode : WPA3_PSK
   WIFI_AUTH_WPA2_WPA3_PSK
      authenticate mode : WPA2_WPA3_PSK
   WIFI_AUTH_WAPI_PSK
      authenticate mode : WAPI_PSK
   WIFI_AUTH_MAX

enum wifi_err_reason_t
   Values:
   WIFI_REASON_UNSPECIFIED = 1
   WIFI_REASON_AUTH_EXPIRE = 2
   WIFI_REASON_AUTH_LEAVE = 3
   WIFI_REASON_ASSOC_EXPIRE = 4
   WIFI_REASON_ASSOC_TOOMANY = 5

WIFI_REASON_ASSOC_FAIL = 203
WIFI_REASON_HANDSHAKE_TIMEOUT = 204
WIFI_REASON_CONNECTION_FAIL = 205
WIFI_REASON_AP_TSF_RESET = 206
WIFI_REASON_ROAMING = 207

enum wifi_second_chan_t
Values:

WIFI_SECOND_CHAN_NONE = 0
the channel width is HT20

WIFI_SECOND_CHAN_ABOVE
the channel width is HT40 and the secondary channel is above the primary channel

WIFI_SECOND_CHAN_BELOW
the channel width is HT40 and the secondary channel is below the primary channel

enum wifi_scan_type_t
Values:

WIFI_SCAN_TYPE_ACTIVE = 0
active scan

WIFI_SCAN_TYPE_PASSIVE
passive scan

enum wifi_cipher_type_t
Values:
WIFI_CIPHER_TYPE_NONE = 0
    the cipher type is none
WIFI_CIPHER_TYPE_WEP40
    the cipher type is WEP40
WIFI_CIPHER_TYPE_WEP104
    the cipher type is WEP104
WIFI_CIPHER_TYPE_TKIP
    the cipher type is TKIP
WIFI_CIPHER_TYPE_CCMP
    the cipher type is CCMP
WIFI_CIPHER_TYPE_TKIP_CCMP
    the cipher type is TKIP and CCMP
WIFI_CIPHER_TYPE_AES_CMAC128
    the cipher type is AES-CMAC-128
WIFI_CIPHER_TYPE_SMS4
    the cipher type is SMS4
WIFI_CIPHER_TYPE_GCMP
    the cipher type is GCMP
WIFI_CIPHER_TYPE_GCMP256
    the cipher type is GCMP-256
WIFI_CIPHER_TYPE_AES_GMAC128
    the cipher type is AES-GMAC-128
WIFI_CIPHER_TYPE_AES_GMAC256
    the cipher type is AES-GMAC-256
WIFI_CIPHER_TYPE_UNKNOWN
    the cipher type is unknown

enum wifi_ant_t
    WiFi antenna.
    Values:
    WIFI_ANT_ANT0
        WiFi antenna 0
    WIFI_ANT_ANT1
        WiFi antenna 1
    WIFI_ANT_MAX
        Invalid WiFi antenna

def wifi_scan_method_t
    Values:
    WIFI_FAST_SCAN = 0
        Do fast scan, scan will end after find SSID match AP
    WIFI_ALL_CHANNEL_SCAN
        All channel scan, scan will end after scan all the channel

def wifi_sort_method_t
    Values:
    WIFI_CONNECT_AP_BY_SIGNAL = 0
        Sort match AP in scan list by RSSI
    WIFI_CONNECT_AP_BY_SECURITY
        Sort match AP in scan list by security mode
enum wifi_ps_type_t
Values:

WIFI_PS_NONE
No power save

WIFI_PS_MIN_MODEM
Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period

WIFI_PS_MAX_MODEM
Maximum modem power saving. In this mode, interval to receive beacons is determined by the listen_interval parameter in `wifi_sta_config_t`

enum wifi_bandwidth_t
Values:

WIFI_BW_HT20 = 1
WIFI_BW_HT40

enum wifi_storage_t
Values:

WIFI_STORAGE_FLASH
all configuration will store in both memory and flash

WIFI_STORAGE_RAM
all configuration will only store in the memory

enum wifi_vendor_ie_type_t
Vendor Information Element type.
Determines the frame type that the IE will be associated with.
Values:

WIFI_VND_IE_TYPE_BEACON
WIFI_VND_IE_TYPE_PROBE_REQ
WIFI_VND_IE_TYPE_PROBE_RESP
WIFI_VND_IE_TYPE_ASSOC_REQ
WIFI_VND_IE_TYPE_ASSOC_RESP

enum wifi_vendor_ie_id_t
Vendor Information Element index.
Each IE type can have up to two associated vendor ID elements.
Values:

WIFI_VND_IE_ID_0
WIFI_VND_IE_ID_1

enum wifi_promiscuous_pkt_type_t
Promiscuous frame type.
Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.
Values:

WIFI_PKT_MGMT
Management frame, indicates ‘buf’ argument is `wifi_promiscuous_pkt_t`

WIFI_PKT_CTRL
Control frame, indicates ‘buf’ argument is `wifi_promiscuous_pkt_t`

WIFI_PKT_DATA
Data frame, indicates ‘buf’ argument is `wifi_promiscuous_pkt_t`
Chapter 2. API Reference

WIFI_PKT_MISC
Other type, such as MIMO etc. ‘buf’ argument is *wifi_promiscuous_pkt_t* but the payload is zero length.

```c
enum wifi_ant_mode_t
    WiFi antenna mode.

    WIFI_ANT_MODE_ANT0
    Enable WiFi antenna 0 only

    WIFI_ANT_MODE_ANT1
    Enable WiFi antenna 1 only

    WIFI_ANT_MODE_AUTO
    Enable WiFi antenna 0 and 1, automatically select an antenna

    WIFI_ANT_MODE_MAX
    Invalid WiFi enabled antenna
```

```c
enum wifi_phy_rate_t
    WiFi PHY rate encodings.

    WIFI_PHY_RATE_1M_L = 0x00
    1 Mbps with long preamble

    WIFI_PHY_RATE_2M_L = 0x01
    2 Mbps with long preamble

    WIFI_PHY_RATE_5M_L = 0x02
    5.5 Mbps with long preamble

    WIFI_PHY_RATE_11M_L = 0x03
    11 Mbps with long preamble

    WIFI_PHY_RATE_2M_S = 0x05
    2 Mbps with short preamble

    WIFI_PHY_RATE_5M_S = 0x06
    5.5 Mbps with short preamble

    WIFI_PHY_RATE_11M_S = 0x07
    11 Mbps with short preamble

    WIFI_PHY_RATE_48M = 0x08
    48 Mbps

    WIFI_PHY_RATE_24M = 0x09
    24 Mbps

    WIFI_PHY_RATE_12M = 0x0A
    12 Mbps

    WIFI_PHY_RATE_6M = 0x0B
    6 Mbps

    WIFI_PHY_RATE_54M = 0x0C
    54 Mbps

WiFi event declarations

Values:

WIFI_EVENT_WIFI_READY = 0
ESP32 WiFi ready

WIFI_EVENT_SCAN_DONE
ESP32 finish scanning AP

WIFI_EVENT_STA_START
ESP32 station start
WIFI_EVENT_STA_STOP
ESP32 station stop

WIFI_EVENT_STA_CONNECTED
ESP32 station connected to AP

WIFI_EVENT_STA_DISCONNECTED
ESP32 station disconnected from AP

WIFI_EVENT_STA_AUTHMODE_CHANGE
the auth mode of AP connected by ESP32 station changed

WIFI_EVENT_STA_WPS_ER_SUCCESS
ESP32 station wps succeeds in enrollee mode

WIFI_EVENT_STA_WPS_ER_FAILED
ESP32 station wps fails in enrollee mode

WIFI_EVENT_STA_WPS_ER_TIMEOUT
ESP32 station wps timeout in enrollee mode

WIFI_EVENT_STA_WPS_ER_PIN
ESP32 station wps pin code in enrollee mode

WIFI_EVENT_STA_WPS_ER_PBC_OVERLAP
ESP32 station wps overlap in enrollee mode

WIFI_EVENT_AP_START
ESP32 soft-AP start

WIFI_EVENT_AP_STOP
ESP32 soft-AP stop

WIFI_EVENT_AP_STACONNECTED
a station connected to ESP32 soft-AP

WIFI_EVENT_AP_STADISCONNECTED
a station disconnected from ESP32 soft-AP

WIFI_EVENT_AP_PROBEREQRECVED
Receive probe request packet in soft-AP interface

WIFI_EVENT_FTM_REPORT
Receive report of FTM procedure

WIFI_EVENT_STA_BSS_RSSI_LOW
AP’s RSSI crossed configured threshold

WIFI_EVENT_ACTION_TX_STATUS
Status indication of Action Tx operation

WIFI_EVENT_ROC_DONE
Remain-on-Channel operation complete

WIFI_EVENT_STA_BEACON_TIMEOUT
ESP32 station beacon timeout

WIFI_EVENT_MAX
Invalid WiFi event ID

enum wifi_event_sta_wps_fail_reason_t
Argument structure for WIFI_EVENT_STA_WPS_ER_FAILED event

Values:

WPS_FAIL_REASON_NORMAL = 0
ESP32 WPS normal fail reason

WPS_FAIL_REASON_RECV_M2D
ESP32 WPS receive M2D frame
WPS_FAIL_REASON_MAX

c enum wifi_ftm_status_t
   FTM operation status types.

Values:

FTM_STATUS_SUCCESS = 0
   FTM exchange is successful

FTM_STATUS_UNSUPPORTED
   Peer does not support FTM

FTM_STATUS_CONF_REJECTED
   Peer rejected FTM configuration in FTM Request

FTM_STATUS_NO_RESPONSE
   Peer did not respond to FTM Requests

FTM_STATUS_FAIL
   Unknown error during FTM exchange

Wi-Fi Easy Connect™ (DPP)

Wi-Fi Easy Connect™, also known as Device Provisioning Protocol (DPP) or Easy Connect, is a provisioning protocol certified by Wi-Fi Alliance. It is a secure and standardized provisioning protocol for configuration of Wi-Fi Devices. With Easy Connect adding a new device to a network is as simple as scanning a QR Code. This reduces complexity and enhances user experience while onboarding devices without UI like Smart Home and IoT products. Unlike old protocols like WiFi Protected Setup (WPS), Wi-Fi Easy Connect incorporates strong encryption through public key cryptography to ensure networks remain secure as new devices are added. Easy Connect brings many benefits in the User Experience:

• Simple and intuitive to use; no lengthy instructions to follow for new device setup
• No need to remember and enter passwords into the device being provisioned
• Works with electronic or printed QR codes, or human-readable strings
• Supports both WPA2 and WPA3 networks

Please refer to Wi-Fi Alliance’s official page on Easy Connect for more information.

ESP32-C3 supports Enrollee mode of Easy Connect with QR Code as the provisioning method. A display is required to display this QR Code. Users can scan this QR Code using their capable device and provision the ESP32-C3 to their Wi-Fi network. The provisioning device needs to be connected to the AP which need not support Wi-Fi Easy Connect™. Easy Connect is still an evolving protocol. Of known platforms that support the QR Code method are some Android smartphones with Android 10 or higher. To use Easy Connect no additional App needs to be installed on the supported smartphone.

Application Example Example on how to provision ESP32-C3 using a supported smartphone: wifi/wifi_easy_connect/dpp-enrollee.

API Reference

Header File

• components/wpa_supplicant/esp_supplicant/include/esp_dpp.h

Functions

esp_err_t esp_supp_dpp_init (esp_supp_dpp_event_cb_t evt_cb)
   Initialize DPP Supplicant.
Chapter 2. API Reference

Starts DPP Supplicant and initializes related Data Structures.

return

- ESP_OK: Success
- ESP_FAIL: Failure

Parameters
- evt_cb: Callback function to receive DPP related events

void esp_supp_dpp_deinit (void)
De-initialize DPP Supplicant.

Frees memory from DPP Supplicant Data Structures.

esp_err_t esp_supp_dpp_bootstrap_gen (const char *chan_list, esp_supp_dpp_bootstrap_t type, const char *key, const char *info)
Generates Bootstrap Information as an Enrollee.

Generates Out Of Band Bootstrap information as an Enrollee which can be used by a DPP Configurator to provision the Enrollee.

Return
- ESP_OK: Success
- ESP_FAIL: Failure

Parameters
- chan_list: List of channels device will be available on for listening
- type: Bootstrap method type, only QR Code method is supported for now.
- key: (Optional) Private Key used to generate a Bootstrapping Public Key
- info: (Optional) Ancillary Device Information like Serial Number

esp_err_t esp_supp_dpp_start_listen (void)
Start listening on Channels provided during esp_supp_dpp_bootstrap_gen.

Listens on every Channel from Channel List for a pre-defined wait time.

Return
- ESP_OK: Success
- ESP_FAIL: Generic Failure
- ESP_ERR_INVALID_STATE: ROC attempted before WiFi is started
- ESP_ERR_NO_MEM: Memory allocation failed while posting ROC request

void esp_supp_dpp_stop_listen (void)
Stop listening on Channels.

Stops listening on Channels and cancels ongoing listen operation.

Macros

ESP_ERR_DPP_FAILURE
Generic failure during DPP Operation

ESP_ERR_DPP_TX_FAILURE
DPP Frame Tx failed OR not Acked

ESP_ERR_DPP_INVALID_ATTR
Encountered invalid DPP Attribute

Type Definitions

typedef enum dpp_bootstrap_type esp_supp_dpp_bootstrap_t
Types of Bootstrap Methods for DPP.

typedef void (*esp_supp_dpp_event_cb_t)(esp_supp_dpp_event_t evt, void *data)
Callback function for receiving DPP Events from Supplicant.
Callback function will be called with DPP related information.

Parameters

- **evt**: DPP event ID
- **data**: Event data payload

Enumerations

```c
enum dpp_bootstrap_type

Types of Bootstrap Methods for DPP.

Values:

DPP_BOOTSTRAP_QR_CODE
QR Code Method

DPP_BOOTSTRAP_PKEX
Proof of Knowledge Method

DPP_BOOTSTRAP_NFC_URI
NFC URI record Method
```

```c
enum esp_supp_dpp_event_t

Types of Callback Events received from DPP Supplicant.

Values:

ESP_SUPP_DPP_URI_READY
URI is ready through Bootstrapping

ESP_SUPP_DPP_CFG_RECVD
Config received via DPP Authentication

ESP_SUPP_DPP_FAIL
DPP Authentication failure
```

Code examples for the Wi-Fi API are provided in the `wifi` directory of ESP-IDF examples.

Code examples for ESP-WIFI-MESH are provided in the `mesh` directory of ESP-IDF examples.

### 2.5.2 Ethernet

**Overview**

ESP-IDF provides a set of consistent and flexible APIs to support both internal Ethernet MAC (EMAC) controller and external SPI-Ethernet modules.

This programming guide is split into the following sections:

1. *Basic Ethernet Concepts*
2. *Configure MAC and PHY*
3. *Connect Driver to TCP/IP Stack*
4. *Misc control of Ethernet driver*

**Basic Ethernet Concepts**

Ethernet is an asynchronous Carrier Sense Multiple Access with Collision Detect (CSMA/CD) protocol/interface. It is generally not well suited for low power applications. However, with ubiquitous deployment, internet connectivity, high data rates and limitless range expandability, Ethernet can accommodate nearly all wired communications.

Normal IEEE 802.3 compliant Ethernet frames are between 64 and 1518 bytes in length. They are made up of five or six different fields: a destination MAC address (DA), a source MAC address (SA), a type/length field, data payload, an optional padding field and a Cyclic Redundancy Check (CRC). Additionally, when transmitted on the Ethernet medium, a 7-byte preamble field and Start-of-Frame (SOF) delimiter byte are appended to the beginning of the Ethernet packet.
Thus the traffic on the twist-pair cabling will appear as shown below:

![Ethernet Data Frame Format](image)

<table>
<thead>
<tr>
<th>Process</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Preamble (7 Bytes)</td>
</tr>
<tr>
<td>2</td>
<td>Start-of-Frame Delimiter (1 Byte)</td>
</tr>
<tr>
<td>3</td>
<td>Destination Address (6 Bytes)</td>
</tr>
<tr>
<td>4</td>
<td>Source Address (6 Bytes)</td>
</tr>
<tr>
<td>5</td>
<td>Type / Length (2 Bytes)</td>
</tr>
<tr>
<td>6</td>
<td>Payload (0 ~ 1500 Bytes) [2U]</td>
</tr>
<tr>
<td>7</td>
<td>Pad (if necessary) [2U]</td>
</tr>
<tr>
<td>8</td>
<td>Frame Check Sequence (4 Bytes)</td>
</tr>
</tbody>
</table>

**Preamble and Start-of-Frame Delimiter**  The preamble contains seven bytes of 55H, it allows the receiver to lock onto the stream of data before the actual frame arrives. The Start-of-Frame Delimiter (SFD) is a binary sequence 10101011 (as seen on the physical medium). It is sometimes considered to be part of the preamble.

When transmitting and receiving data, the preamble and SFD bytes will automatically be generated or stripped from the packets.

**Destination Address**  The destination address field contains a 6-byte length MAC address of the device that the packet is directed to. If the Least Significant bit in the first byte of the MAC address is set, the address is a multi-cast destination. For example, 01-00-00-00-F0-00 and 33-45-67-89-AB-CD are multi-cast addresses, while 00-00-00-00-F0-00 and 32-45-67-89-AB-CD are not. Packets with multi-cast destination addresses are designed to arrive and be important to a selected group of Ethernet nodes. If the destination address field is the reserved multi-cast address, i.e. FF-FF-FF-FF-FF, the packet is a broadcast packet and it will be directed to everyone sharing the network. If the Least Significant bit in the first byte of the MAC address is clear, the address is a uni-cast address and will be designed for usage by only the addressed node.

Normally the EMAC controller incorporates receive filters which can be used to discard or accept packets with multi-cast, broadcast and/or uni-cast destination addresses. When transmitting packets, the host controller is responsible for writing the desired destination address into the transmit buffer.

**Source Address**  The source address field contains a 6-byte length MAC address of the node which created the Ethernet packet. Users of Ethernet must generate a unique MAC address for each controller used. MAC addresses consist of two portions. The first three bytes are known as the Organizationally Unique Identifier (OUI). OUIs are distributed by the IEEE. The last three bytes are address bytes at the discretion of the company that purchased the OUI. More information about MAC Address used in ESP-IDF, please see **MAC Address Allocation**.
When transmitting packets, the assigned source MAC address must be written into the transmit buffer by the host controller.

**Type / Length** The type/length field is a 2-byte field, if the value in this field is \( \leq 1500 \) (decimal), it is considered a length field and it specifies the amount of non-padding data which follows in the data field. If the value is \( \geq 1536 \), it represents the protocol the following packet data belongs to. The following are the most common type values:

- IPv4 = 0800H
- IPv6 = 86DDH
- ARP = 0806H

Users implementing proprietary networks may choose to treat this field as a length field, while applications implementing protocols such as the Internet Protocol (IP) or Address Resolution Protocol (ARP), should program this field with the appropriate type defined by the protocol’s specification when transmitting packets.

**Payload** The payload field is a variable length field, anywhere from 0 to 1500 bytes. Larger data packets will violate Ethernet standards and will be dropped by most Ethernet nodes. This field contains the client data, such as an IP datagram.

**Padding and FCS** The padding field is a variable length field added to meet IEEE 802.3 specification requirements when small data payloads are used. The DA, SA, type, payload and padding of an Ethernet packet must be no smaller than 60 bytes. Adding the required 4-byte FCS field, packets must be no smaller than 64 bytes. If the data field is less than 46 bytes long, a padding field is required.

The FCS field is a 4-byte field which contains an industry standard 32-bit CRC calculated with the data from the DA, SA, type, payload and padding fields. Given the complexity of calculating a CRC, the hardware normally will automatically generate a valid CRC and transmit it. Otherwise, the host controller must generate the CRC and place it in the transmit buffer.

Normally, the host controller does not need to concern itself with padding and the CRC which the hardware EMAC will also be able to automatically generate when transmitting and verify when receiving. However, the padding and CRC fields will be written into the receive buffer when packets arrive, so they may be evaluated by the host controller if needed.

---

**Note:** Besides the basic data frame described above, there are two other common frame types in 10/100 Mbps Ethernet: control frames and VLAN tagged frames. They’re not supported in ESP-IDF.

---

**Configure MAC and PHY** Ethernet driver is composed of two parts: MAC and PHY.

We need to setup necessary parameters for MAC and PHY respectively based on your Ethernet board design and then combine the two together, completing the driver installation.

Configuration for MAC is described in `eth_mac_config_t`, including:

- `sw_reset_timeout_ms`: software reset timeout value, in milliseconds, typically MAC reset should be finished within 100ms.
- `rx_task_stack_size` and `rx_task_prio`: the MAC driver creates a dedicated task to process incoming packets, these two parameters are used to set the stack size and priority of the task.
- `flags`: specifying extra features that the MAC driver should have, it could be useful in some special situations. The value of this field can be OR’d with macros prefixed with `ETH_MAC_FLAG_`. For example, if the MAC driver should work when cache is disabled, then you should configure this field with `ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE`.

Configuration for PHY is described in `eth_phy_config_t`, including:

- `phy_addr`: multiple PHY device can share the same SMI bus, so each PHY needs a unique address. Usually this address is configured during hardware design by pulling up/down some PHY strapping pins. You can set
Chapter 2. API Reference

the value from 0 to 15 based on your Ethernet board. Especially, if the SMI bus is shared by only one PHY
device, setting this value to -1 can enable the driver to detect the PHY address automatically.
• reset_timeout_ms: reset timeout value, in milliseconds, typically PHY reset should be finished within
100ms.
• autonego_timeout_ms: auto-negotiation timeout value, in milliseconds. Ethernet driver will start nego-
tiation with the peer Ethernet node automatically, to determine to duplex and speed mode. This value usually
depends on the ability of the PHY device on your board.
• reset_gpio_num: if your board also connect the PHY reset pin to one of the GPIO, then set it here.
Otherwise, set this field to -1.

ESP-IDF provides a default configuration for MAC and PHY in macro ETH_MAC_DEFAULT_CONFIG and
ETH_PHY_DEFAULT_CONFIG.

Create MAC and PHY Instance Ethernet driver is implemented in an Object-Oriented style. Any operation on
MAC and PHY should be based on the instance of them two.

**SPI-Ethernet Module**

```c
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG();  // apply default MAC configuration
eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG();  // apply default PHY configuration
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR;  // alter the PHY address according to your board design
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO;  // alter the GPIO used for PHY reset

// Install GPIO interrupt service (as the SPI-Ethernet module is interrupt driven)
gpio_install_isr_service();

// SPI bus configuration
spi_device_handle_t spi_handle = NULL;
spi_bus_config_t buscfg = {
    .miso_io_num = CONFIG_EXAMPLE_ETH_SPI_MISO_GPIO,
    .mosi_io_num = CONFIG_EXAMPLE_ETH_SPI_MOSI_GPIO,
    .sclk_io_num = CONFIG_EXAMPLE_ETH_SPI_SCLK_GPIO,
    .quadwp_io_num = -1,
    .quadhd_io_num = -1,
};
ESP_ERROR_CHECK(spi_bus_initialize(CONFIG_EXAMPLE_ETH_SPI_HOST, &buscfg, 1));

// Allocate SPI device from the bus
spi_device_interface_config_t devcfg = {
    .command_bits = 1,
    .address_bits = 7,
    .mode = 0,
    .clock_speed_hz = CONFIG_EXAMPLE_ETH_SPI_CLOCK_MHZ * 1000 * 1000,
    .spics_io_num = CONFIG_EXAMPLE_ETH_SPI_CS_GPIO,
    .queue_size = 20,
};
ESP_ERROR_CHECK(spi_bus_add_device(CONFIG_EXAMPLE_ETH_SPI_HOST, &devcfg, &spi_handle));

/* dm9051 ethernet driver is based on spi driver */
eth_dm9051_config_t dm9051_config = ETH_DM9051_DEFAULT_CONFIG(spi_handle);
dm9051_config.int_gpio_num = CONFIG_EXAMPLE_ETH_SPI_INT_GPIO;
esp_eth_mac_t *mac = esp_eth_mac_new_dm9051(&dm9051_config, &mac_config);
esp_eth_phy_t *phy = esp_eth_phy_new_dm9051(&phy_config);
```

**Note:**

• When creating MAC and PHY instance for SPI-Ethernet modules (e.g. DM9051), the constructor function
must have the same suffix (e.g. esp_eth_mac_new_dm9051 and esp_eth_phy_new_dm9051). This is because we
don’t have other choices but the integrated PHY.
• We have to create an SPI device handle firstly and then pass it to the MAC constructor function. More instructions on creating SPI device handle, please refer to SPI Master.
• The SPI device configuration (i.e. spi_device_interface_config_t) can be different for other Ethernet modules. Please check out your module’s spec and the examples in esp-idf.

**Install Driver**  To install the Ethernet driver, we need to combine the instance of MAC and PHY and set some additional high-level configurations (i.e. not specific to either MAC or PHY) in esp_eth_config_t:

- **mac**: instance that created from MAC generator (e.g. esp_eth_mac_new_esp32()).
- **phy**: instance that created from PHY generator (e.g. esp_eth_phy_new_ip101()).
- **check_link_period_ms**: Ethernet driver starts an OS timer to check the link status periodically, this field is used to set the interval, in milliseconds.
- **stack_input**: In most of Ethernet IoT applications, any Ethernet frame that received by driver should be passed to upper layer (e.g. TCP/IP stack). This field is set to a function which is responsible to deal with the incoming frames. You can even update this field at runtime via function esp_eth_update_input_path() after driver installation.
- **on_lowlevel_init_done** and **on_lowlevel_deinit_done**: These two fields are used to specify the hooks which get invoked when low level hardware has been initialized or de-initialized.

ESP-IDF provides a default configuration for driver installation in macro **ETH_DEFAULT_CONFIG**.

```c
esp_eth_config_t config = ETH_DEFAULT_CONFIG(mac, phy); // apply default driver configuration
esp_eth_handle_t eth_handle = NULL; // after driver installed, we will get the handle of the driver
esp_eth_driver_install(&config, &eth_handle); // install driver
```

Ethernet driver also includes event-driven model, which will send useful and important event to user space. We need to initialize the event loop before installing the Ethernet driver. For more information about event-driven programming, please refer to ESP Event.

```c
/** Event handler for Ethernet events */
static void eth_event_handler(void *arg, esp_event_base_t event_base, int32_t event_id, void *event_data)
{
    uint8_t mac_addr[6] = {0};
    /* we can get the ethernet driver handle from event data */
    esp_eth_handle_t eth_handle = *(esp_eth_handle_t *)event_data;

    switch (event_id) {
    case ETHERNET_EVENT_CONNECTED:
        esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
        ESP_LOGI(TAG, "Ethernet Link Up");
        ESP_LOGI(TAG, "Ethernet HW Addr %02x:%02x:%02x:%02x:%02x:%02x",
                mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_addr[5]);
        break;
    case ETHERNET_EVENT_DISCONNECTED:
        ESP_LOGI(TAG, "Ethernet Link Down");
        break;
    case ETHERNET_EVENT_START:
        ESP_LOGI(TAG, "Ethernet Started");
        break;
    case ETHERNET_EVENT_STOP:
        ESP_LOGI(TAG, "Ethernet Stopped");
        break;
    default:
        break;
    }
}
```

(continues on next page)
esphandle = esp_event_loop_create_default(); // create a default event loop that running in background
esp_event_handler_register(ETH_EVENT, ESP_EVENT_ANY_ID, &eth_event_handler, NULL);  
// register Ethernet event handler (to deal with user specific stuffs when event like link up/down happened)

**Start Ethernet Driver**  After driver installation, we can start Ethernet immediately.

```c
esp_eth_start(eth_handle); // start Ethernet driver state machine
```

**Connect Driver to TCP/IP Stack**  Up until now, we have installed the Ethernet driver. From the view of OSI (Open System Interconnection), we’re still on level 2 (i.e. Data Link Layer). We can detect link up and down event, we can gain MAC address in user space, but we can’t obtain IP address, let alone send HTTP request. The TCP/IP stack used in ESP-IDF is called LwIP, for more information about it, please refer to LwIP.

To connect Ethernet driver to TCP/IP stack, these three steps need to follow:

1. Create network interface for Ethernet driver
2. Attach the network interface to Ethernet driver
3. Register IP event handlers

More information about network interface, please refer to Network Interface.

```c
/** Event handler for IP_EVENT_ETH_GOT_IP */
static void got_ip_event_handler(void *arg, esp_event_base_t event_base, int32_t event_id, void *event_data)
{
    ip_event_got_ip_t *event = (ip_event_got_ip_t *) event_data;
    const esp_netif_ip_info_t *ip_info = &event->ip_info;

    ESP_LOGI(TAG, "Ethernet Got IP Address");
    ESP_LOGI(TAG, "~~~~~~~~~~~");
    ESP_LOGI(TAG, "ETHIP: IPSTR, IP2STR(ip_info->ip));
    ESP_LOGI(TAG, "ETHMASK: IPSTR, IP2STR(ip_info->netmask));
    ESP_LOGI(TAG, "ETHGW: IPSTR, IP2STR(ip_info->gw));
    ESP_LOGI(TAG, "~~~~~~~~~~~");
}
```

```c
esp_netif_init(); // Initialize TCP/IP network interface (should be called only once in application)
esp_netif_config_t cfg = ESP_NETIF_DEFAULT_ETH(); // apply default network interface configuration for Ethernet
esp_netif_t *eth_netif = esp_netif_new(&cfg); // create network interface for Ethernet driver

esp_netif_attach(eth_netif, esp_eth_new_netif_glue(eth_handle)); // attach Ethernet driver to TCP/IP stack
esp_event_handler_register(IP_EVENT, IP_EVENT_ETH_GOT_IP, &got_ip_event_handler, NULL); // register user defined IP event handlers
esp_eth_start(eth_handle); // start Ethernet driver state machine
```

**Warning**: It is recommended to fully initialize the Ethernet driver and network interface prior registering user’s Ethernet/IP event handlers, i.e. register the event handlers as the last thing prior starting the Ethernet driver. Such approach ensures that Ethernet/IP events get executed first by the Ethernet driver or network interface and so the system is in expected state when executing user’s handlers.
Chapter 2. API Reference

Misc control of Ethernet driver The following functions should only be invoked after the Ethernet driver has been installed.

- Stop Ethernet driver: `esp_eth_stop()`
- Update Ethernet data input path: `esp_eth_update_input_path()`
- Misc get/set of Ethernet driver attributes: `esp_eth_ioctl()`

```c
/* get MAC address */
uint8_t mac_addr[6];
memset(mac_addr, 0, sizeof(mac_addr));
esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
ESP_LOGI(TAG, "Ethernet MAC Address: %02x:%02x:%02x:%02x:%02x:%02x",
         mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_addr[5]);

/* get PHY address */
int phy_addr = -1;
esp_eth_ioctl(eth_handle, ETH_CMD_G_PHY_ADDR, &phy_addr);
ESP_LOGI(TAG, "Ethernet PHY Address: %d", phy_addr);
```

Flow control Ethernet on MCU usually has a limitation in the number of frames it can handle during network congestion, because of the limitation in RAM size. A sending station might be transmitting data faster than the peer end can accept it. Ethernet flow control mechanism allows the receiving node to signal the sender requesting suspension of transmissions until the receiver catches up. The magic behind that is the pause frame, which was defined in IEEE 802.3x.

Pause frame is a special Ethernet frame used to carry the pause command, whose EtherType field is 0x8808, with the Control opcode set to 0x0001. Only stations configured for full-duplex operation may send pause frames. When a station wishes to pause the other end of a link, it sends a pause frame to the 48-bit reserved multicast address of 01-80-C2-00-00-01. The pause frame also includes the period of pause time being requested, in the form of a two-byte integer, ranging from 0 to 65535.

After Ethernet driver installation, the flow control feature is disabled by default. You can enable it by:

```c
bool flow_ctrl_enable = true;
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, &flow_ctrl_enable);
```

One thing should be kept in mind, is that the pause frame ability will be advertised to peer end by PHY during auto negotiation. Ethernet driver sends pause frame only when both sides of the link support it.

Application Example

- Ethernet basic example: `ethernet/basic`.
- Ethernet iperf example: `ethernet/iperf`.
- Ethernet to Wi-Fi AP “router” : `ethernet/eth2ap`.
- Most of protocol examples should also work for Ethernet: `protocols`.

API Reference

Header File

- `components/esp_eth/include/esp_eth.h`

Functions

```c
esp_err_t esp_eth_driver_install(const esp_eth_config_t *config, esp_eth_handle_t *out_hdl)
Install Ethernet driver.
```

Return

- ESP_OK: install esp_eth driver successfully
Chapter 2. API Reference

- **ESP_ERR_INVALID_ARG**: install esp_eth driver failed because of some invalid argument
- **ESP_ERR_NO_MEM**: install esp_eth driver failed because there’s no memory for driver
- **ESP_FAIL**: install esp_eth driver failed because some other error occurred

**Parameters**
- **in** config: configuration of the Ethernet driver
- **out** out_hdl: handle of Ethernet driver

```c
esp_err_t esp_eth_driver_uninstall(esp_eth_handle_t hdl)
```

Uninstall Ethernet driver.

**Note**
It’s not recommended to uninstall Ethernet driver unless it won’t get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

**Return**
- **ESP_OK**: uninstall esp_eth driver successfully
- **ESP_ERR_INVALID_ARG**: uninstall esp_eth driver failed because of some invalid argument
- **ESP_ERR_INVALID_STATE**: uninstall esp_eth driver failed because it has more than one reference
- **ESP_FAIL**: uninstall esp_eth driver failed because some other error occurred

**Parameters**
- **in** hdl: handle of Ethernet driver

```c
esp_err_t esp_eth_start(esp_eth_handle_t hdl)
```

Start Ethernet driver ONLY in standalone mode (i.e. without TCP/IP stack)

**Note**
This API will start driver state machine and internal software timer (for checking link status).

**Return**
- **ESP_OK**: start esp_eth driver successfully
- **ESP_ERR_INVALID_ARG**: start esp_eth driver failed because of some invalid argument
- **ESP_ERR_INVALID_STATE**: start esp_eth driver failed because driver has started already
- **ESP_FAIL**: start esp_eth driver failed because some other error occurred

**Parameters**
- **in** hdl: handle of Ethernet driver

```c
esp_err_t esp_eth_stop(esp_eth_handle_t hdl)
```

Stop Ethernet driver.

**Note**
This function does the opposite operation of `esp_eth_start`.

**Return**
- **ESP_OK**: stop esp_eth driver successfully
- **ESP_ERR_INVALID_ARG**: stop esp_eth driver failed because of some invalid argument
- **ESP_ERR_INVALID_STATE**: stop esp_eth driver failed because driver has not started yet
- **ESP_FAIL**: stop esp_eth driver failed because some other error occurred

**Parameters**
- **in** hdl: handle of Ethernet driver

```c
esp_err_t esp_eth_update_input_path(esp_eth_handle_t hdl, esp_err_t (*stack_input)(esp_eth_handle_t hdl, uint8_t *buffer, uint32_t length, void *priv), void *priv)
```

Update Ethernet data input path (i.e. specify where to pass the input buffer)

**Note**
After install driver, Ethernet still don’t know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

**Return**
- **ESP_OK**: update input path successfully
- **ESP_ERR_INVALID_ARG**: update input path failed because of some invalid argument
- **ESP_FAIL**: update input path failed because some other error occurred

**Parameters**
- **in** hdl: handle of Ethernet driver
- **in** stack_input: function pointer, which does the actual process on incoming packets
- **in** priv: private resource, which gets passed to `stack_input` callback without any modification
**esp_err_t esp_eth_transmit** *(esp_eth_handle_t hdl, void *buf, size_t length)*

**General Transmit.**

**Return**
- ESP_OK: transmit frame buffer successfully
- ESP_ERR_INVALID_ARG: transmit frame buffer failed because of some invalid argument
- ESP_FAIL: transmit frame buffer failed because some other error occurred

**Parameters**
- [in] hdl: handle of Ethernet driver
- [in] buf: buffer of the packet to transfer
- [in] length: length of the buffer to transfer

**esp_err_t esp_eth_receive** *(esp_eth_handle_t hdl, uint8_t *buf, uint32_t *length)*

**General Receive is deprecated and shall not be accessed from app code, as polling is not supported by Ethernet.**

**Note**  
Before this function got invoked, the value of “length” should set by user, equals the size of buffer.  
After the function returned, the value of “length” means the real length of received data.

**Note**  
This API was exposed by accident, users should not use this API in their applications. Ethernet driver is interrupt driven, and doesn’t support polling mode. Instead, users should register input callback with esp_eth_update_input_path.

**Return**
- ESP_OK: receive frame buffer successfully
- ESP_ERR_INVALID_ARG: receive frame buffer failed because of some invalid argument
- ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- ESP_FAIL: receive frame buffer failed because some other error occurred

**Parameters**
- [in] hdl: handle of Ethernet driver
- [out] buf: buffer to preserve the received packet
- [out] length: length of the received packet

**esp_err_t esp_eth_ioctl** *(esp_eth_handle_t hdl, esp_eth_io_cmd_t cmd, void *data)*

**Misc IO function of Ethernet driver.**

The following IO control commands are supported:

- [ETH_CMD_S_MAC_ADDR] sets Ethernet interface MAC address. data argument is pointer to MAC address buffer with expected size of 6 bytes.
- [ETH_CMD_G_MAC_ADDR] gets Ethernet interface MAC address. data argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.
- [ETH_CMD_S_PHY_ADDR] sets PHY address in range of <0-31>. data argument is pointer to memory of uint32_t datatype from where the configuration option is read.
- [ETH_CMD_G_PHY_ADDR] gets PHY address. data argument is pointer to memory of uint32_t datatype to which the PHY address is to be stored.
- [ETH_CMD_S_AUTONEGO] enables or disables Ethernet link speed and duplex mode autonegotiation. data argument is pointer to memory of bool datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped.
- [ETH_CMD_G_AUTONEGO] gets current configuration of the Ethernet link speed and duplex mode autonegotiation. data argument is pointer to memory of bool datatype to which the current configuration is to be stored.
- [ETH_CMD_S_SPEED] sets the Ethernet link speed. data argument is pointer to memory of eth_speed_t datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- [ETH_CMD_G_SPEED] gets current Ethernet link speed. data argument is pointer to memory of eth_speed_t datatype to which the speed is to be stored.
- [ETH_CMD_S_PROMISCUOUS] sets/resets Ethernet interface promiscuous mode. data argument is pointer to memory of bool datatype from which the configuration option is read.
- [ETH_CMD_S_FLOW_CTRL] sets/resets Ethernet interface flow control. data argument is pointer to memory of bool datatype from which the configuration option is read.
- [ETH_CMD_S_DUPLEX_MODE] sets the Ethernet duplex mode. data argument is pointer to memory of eth_duplex_t datatype from which the configuration option is read. Preconditions: Ethernet driver needs
to be stopped and auto-negotiation disabled.

- **ETH_CMD_G_DUPLEX_MODE** gets current Ethernet link duplex mode. The `data` argument is a pointer to memory of `eth_duplex_t` datatype to which the duplex mode is to be stored.
- **ETH_CMD_S_PHY_LOOPBACK** sets/resets PHY to/from loopback mode. The `data` argument is a pointer to memory of `bool` datatype from which the configuration option is read.

**Return**

- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred
- ESP_ERR_NOT_SUPPORTED: requested feature is not supported

**Parameters**

- `[in] hdl`: handle of Ethernet driver
- `[in] cmd`: IO control command
- `[inout] data`: address of data for set command or address where to store the data when used with get command

```c
esp_err_t esp_eth_increase_reference(esp_eth_handle_t hdl)
```

Increase Ethernet driver reference.

**Note**

Ethernet driver handle can be obtained by os timer, netif, etc. It’s dangerous when thread A is using Ethernet but thread B uninstalls the driver. Using reference counter can prevent such risk, but care should be taken when you obtain Ethernet driver, this API must be invoked so that the driver won’t be uninstalled during your using time.

**Return**

- ESP_OK: increase reference successfully
- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

**Parameters**

- `[in] hdl`: handle of Ethernet driver

```c
esp_err_t esp_eth_decrease_reference(esp_eth_handle_t hdl)
```

Decrease Ethernet driver reference.

**Return**

- ESP_OK: increase reference successfully
- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

**Parameters**

- `[in] hdl`: handle of Ethernet driver

**Structures**

```c
define struct esp_eth_config_t
```

Configuration of Ethernet driver.

**Public Members**

```c
esp_eth_mac_t *mac
```

Ethernet MAC object.

```c
esp_eth_phy_t *phy
```

Ethernet PHY object.

```c
uint32_t check_link_period_ms
```

Period time of checking Ethernet link status.

```c
define esp_err_t (*stack_input)(esp_eth_handle_t eth_handle, uint8_t *buffer, uint32_t length, void *priv)
```

Input frame buffer to user’s stack.

**Return**

- ESP_OK: input frame buffer to upper stack successfully
- ESP_FAIL: error occurred when inputting buffer to upper stack
Parameters
- [in] eth_handle: handle of Ethernet driver
- [in] buffer: frame buffer that will get input to upper stack
- [in] length: length of the frame buffer

```
esp_err_t(*on_lowlevel_init_done)(esp_eth_handle_t eth_handle)
```
Callback function invoked when lowlevel initialization is finished.

Return
- ESP_OK: process extra lowlevel initialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel initialization

Parameters
- [in] eth_handle: handle of Ethernet driver

```
esp_err_t(*on_lowlevel_deinit_done)(esp_eth_handle_t eth_handle)
```
Callback function invoked when lowlevel deinitialization is finished.

Return
- ESP_OK: process extra lowlevel deinitialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel deinitialization

Parameters
- [in] eth_handle: handle of Ethernet driver

```
esp_err_t(*read_phy_reg)(esp_eth_handle_t eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t*reg_value)
```
Read PHY register.

Note Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC’s SMI interface.

Return
- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

Parameters
- [in] eth_handle: handle of Ethernet driver
- [in] phy_addr: PHY chip address (0~31)
- [in] phy_reg: PHY register index code
- [out] reg_value: PHY register value

```
esp_err_t(*write_phy_reg)(esp_eth_handle_t eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)
```
Write PHY register.

Note Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC’s SMI interface.

Return
- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_ARG: write PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

Parameters
- [in] eth_handle: handle of Ethernet driver
- [in] phy_addr: PHY chip address (0~31)
- [in] phy_reg: PHY register index code
- [in] reg_value: PHY register value

Macros

```
ETH_DEFAULT_CONFIG(emac, ephy)
```
Default configuration for Ethernet driver.
Type Definitions

```c
typedef void *esp_eth_handle_t
Handle of Ethernet driver.
```

Enumerations

```c
enum esp_eth_io_cmd_t
Command list for ioctl API.

Values:

- ETH_CMD_G_MAC_ADDR
  Get MAC address
- ETH_CMD_S_MAC_ADDR
  Set MAC address
- ETH_CMD_G_PHY_ADDR
  Get PHY address
- ETH_CMD_S_PHY_ADDR
  Set PHY address
- ETH_CMD_G_AUTONEGO
  Get PHY Auto Negotiation
- ETH_CMD_S_AUTONEGO
  Set PHY Auto Negotiation
- ETH_CMD_G_SPEED
  Get Speed
- ETH_CMD_S_SPEED
  Set Speed
- ETH_CMD_S_PROMISCUOUS
  Set promiscuous mode
- ETH_CMD_S_FLOW_CTRL
  Set flow control
- ETH_CMD_G_DUPLEX_MODE
  Get Duplex mode
- ETH_CMD_S_DUPLEX_MODE
  Set Duplex mode
- ETH_CMD_S_PHY_LOOPBACK
  Set PHY loopback
```

Header File

- components/esp_eth/include/esp_eth_com.h

Functions

```c
esp_err_t esp_eth_detect_phy_addr(esp_eth_mediator_t *eth, int *detected_addr)
Detect PHY address.

Return

- ESP_OK: detect phy address successfully
- ESP_ERR_INVALID_ARG: invalid parameter
- ESP_ERR_NOT_FOUND: can’t detect any PHY device
- ESP_FAIL: detect phy address failed because some error occurred

Parameters

- [in] eth: mediator of Ethernet driver
```
Structures

```c
struct esp_eth_mediator_s
Ethemet mediator.
```

Public Members

```c
esp_err_t (*phy_reg_read)(esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg,
                         uint32_t *reg_value)
```

Read PHY register.

Return
- ESP_OK: read PHY register successfully
- ESP_FAIL: read PHY register failed because some error occurred

Parameters
- [in] eth: mediator of Ethernet driver
- [in] phy_addr: PHY Chip address (0-31)
- [in] phy_reg: PHY register index code
- [out] reg_value: PHY register value

```c
esp_err_t (*phy_reg_write)(esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg,
                          uint32_t reg_value)
```

Write PHY register.

Return
- ESP_OK: write PHY register successfully
- ESP_FAIL: write PHY register failed because some error occurred

Parameters
- [in] eth: mediator of Ethernet driver
- [in] phy_addr: PHY Chip address (0-31)
- [in] phy_reg: PHY register index code
- [in] reg_value: PHY register value

```c
esp_err_t (*stack_input)(esp_eth_mediator_t *eth, uint8_t *buffer, uint32_t length)
```

Deliver packet to upper stack.

Return
- ESP_OK: deliver packet to upper stack successfully
- ESP_FAIL: deliver packet failed because some error occurred

Parameters
- [in] eth: mediator of Ethernet driver
- [in] buffer: packet buffer
- [in] length: length of the packet

```c
esp_err_t (*on_state_changed)(esp_eth_mediator_t *eth, esp_eth_state_t state, void *args)
```

Callback on Ethernet state changed.

Return
- ESP_OK: process the new state successfully
- ESP_FAIL: process the new state failed because some error occurred

Parameters
- [in] eth: mediator of Ethernet driver
- [in] state: new state
- [in] args: optional argument for the new state

Type Definitions

```c
typedef struct esp_eth_mediator_s esp_eth_mediator_t
Ethenet mediator.
```
Enumerations

enum esp_eth_state_t

Ethernet driver state.

Values:

- ETH_STATE_LLINIT: Low level init done
- ETH_STATE_DEINIT: Deinit done
- ETH_STATE_LINK: Link status changed
- ETH_STATE_SPEED: Speed updated
- ETH_STATE_DUPLEX: Duplex updated
- ETH_STATE_PAUSE: Pause ability updated

enum eth_event_t

Ethernet event declarations.

Values:

- ETHERNET_EVENT_START: Ethernet driver start
- ETHERNET_EVENT_STOP: Ethernet driver stop
- ETHERNET_EVENT_CONNECTED: Ethernet got a valid link
- ETHERNET_EVENT_DISCONNECTED: Ethernet lost a valid link

Header File

- components/esp_eth/include/esp_eth_mac.h

Unions

union eth_mac_clock_config_t

#include <esp_eth_mac.h> Ethernet MAC Clock Configuration.

EMAC RMII Clock Configuration
Structures

struct esp_eth_mac_s
    Ethernet MAC.

Public Members

\texttt{esp_err_t\ (*set_mediator)(esp_eth_mac_t \*mac, esp_eth_mediator_t \*eth)}

Set mediator for Ethernet MAC.

Return
- ESP_OK: set mediator for Ethernet MAC successfully
- ESP_ERR_INVALID_ARG: set mediator for Ethernet MAC failed because of invalid argument

Parameters
- [in] \texttt{mac}: Ethernet MAC instance
- [in] \texttt{eth}: Ethernet mediator

\texttt{esp_err_t\ (*init)(esp_eth_mac_t \*mac)}

Initialize Ethernet MAC.

Return
- ESP_OK: initialize Ethernet MAC successfully
- ESP_ERR_TIMEOUT: initialize Ethernet MAC failed because of timeout
- ESP_FAIL: initialize Ethernet MAC failed because some other error occurred

Parameters
- [in] \texttt{mac}: Ethernet MAC instance

\texttt{esp_err_t\ (*deinit)(esp_eth_mac_t \*mac)}

Deinitialize Ethernet MAC.

Return
- ESP_OK: deinitialize Ethernet MAC successfully
- ESP_FAIL: deinitialize Ethernet MAC failed because some error occurred

Parameters
- [in] \texttt{mac}: Ethernet MAC instance

\texttt{esp_err_t\ (*start)(esp_eth_mac_t \*mac)}

Start Ethernet MAC.

Return
- ESP_OK: start Ethernet MAC successfully
- ESP_FAIL: start Ethernet MAC failed because some other error occurred

Parameters
- [in] \texttt{mac}: Ethernet MAC instance

\texttt{esp_err_t\ (*stop)(esp_eth_mac_t \*mac)}

Stop Ethernet MAC.

Return
- ESP_OK: stop Ethernet MAC successfully
- ESP_FAIL: stop Ethernet MAC failed because some error occurred

Parameters
- [in] \texttt{mac}: Ethernet MAC instance

\texttt{esp_err_t\ (*transmit)(esp_eth_mac_t \*mac, uint8_t \*buf, uint32_t length)}

Transmit packet from Ethernet MAC.

Return
- ESP_OK: transmit packet successfully
- ESP_ERR_INVALID_ARG: transmit packet failed because of invalid argument
- ESP_ERR_INVALID_STATE: transmit packet failed because of wrong state of MAC
- ESP_FAIL: transmit packet failed because some other error occurred

Parameters
- [in] \texttt{mac}: Ethernet MAC instance
- [in] \texttt{buf}: Buffer for transmit packet
- [in] \texttt{length}: Length of transmit packet
### Chapter 2. API Reference

- **in** `mac`: Ethernet MAC instance
- **in** `buf`: packet buffer to transmit
- **in** `length`: length of packet

```c
def esp_err_t (*receive)(esp_eth_mac_t *mac, uint8_t *buf, uint32_t *length)
```

Receive packet from Ethernet MAC.

**Note** Memory of `buf` is allocated in the Layer2, make sure it get free after process.

**Note** Before this function got invoked, the value of “length” should set by user, equals the size of buffer.

After the function returned, the value of “length” means the real length of received data.

**Return**
- ESP_OK: receive packet successfully
- ESP_ERR_INVALID_ARG: receive packet failed because of invalid argument
- ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- ESP_FAIL: receive packet failed because some other error occurred

**Parameters**
- **in** `mac`: Ethernet MAC instance
- **out** `buf`: packet buffer which will preserve the received frame
- **out** `length`: length of the received packet

```c
def esp_err_t (*read_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)
```

Read PHY register.

**Return**
- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_INVALID_STATE: read PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

**Parameters**
- **in** `mac`: Ethernet MAC instance
- **in** `phy_addr`: PHY chip address (0~31)
- **in** `phy_reg`: PHY register index code
- **out** `reg_value`: PHY register value

```c
def esp_err_t (*write_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)
```

Write PHY register.

**Return**
- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_STATE: write PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

**Parameters**
- **in** `mac`: Ethernet MAC instance
- **in** `phy_addr`: PHY chip address (0~31)
- **in** `phy_reg`: PHY register index code
- **in** `reg_value`: PHY register value

```c
def esp_err_t (*set_addr)(esp_eth_mac_t *mac, uint8_t *addr)
```

Set MAC address.

**Return**
- ESP_OK: set MAC address successfully
- ESP_ERR_INVALID_ARG: set MAC address failed because of invalid argument
- ESP_FAIL: set MAC address failed because some other error occurred

**Parameters**
- **in** `mac`: Ethernet MAC instance
- **in** `addr`: MAC address
Chapter 2. API Reference

\[ \text{esp_err_t (*get_addr)(esp_eth_mac_t *mac, uint8_t *addr)} \]
Get MAC address.

**Return**
- ESP_OK: get MAC address successfully
- ESP_ERR_INVALID_ARG: get MAC address failed because of invalid argument
- ESP_FAIL: get MAC address failed because some other error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [out] addr: MAC address

\[ \text{esp_err_t (*set_speed)(esp_eth_mac_t *mac, eth_speed_t speed)} \]
Set speed of MAC.

**Return**
- ESP_OK: set MAC speed successfully
- ESP_ERR_INVALID_ARG: set MAC speed failed because of invalid argument
- ESP_FAIL: set MAC speed failed because some other error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [in] speed: MAC speed

\[ \text{esp_err_t (*set_duplex)(esp_eth_mac_t *mac, eth_duplex_t duplex)} \]
Set duplex mode of MAC.

**Return**
- ESP_OK: set MAC duplex mode successfully
- ESP_ERR_INVALID_ARG: set MAC duplex failed because of invalid argument
- ESP_FAIL: set MAC duplex failed because some other error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [in] duplex: MAC duplex

\[ \text{esp_err_t (*set_link)(esp_eth_mac_t *mac, eth_link_t link)} \]
Set link status of MAC.

**Return**
- ESP_OK: set link status successfully
- ESP_ERR_INVALID_ARG: set link status failed because of invalid argument
- ESP_FAIL: set link status failed because some other error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [in] link: Link status

\[ \text{esp_err_t (*set_promiscuous)(esp_eth_mac_t *mac, bool enable)} \]
Set promiscuous of MAC.

**Return**
- ESP_OK: set promiscuous mode successfully
- ESP_FAIL: set promiscuous mode failed because some error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [in] enable: set true to enable promiscuous mode; set false to disable promiscuous mode

\[ \text{esp_err_t (*enable_flow_ctrl)(esp_eth_mac_t *mac, bool enable)} \]
Enable flow control on MAC layer or not.

**Return**
- ESP_OK: set flow control successfully
- ESP_FAIL: set flow control failed because some error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [in] enable: set true to enable flow control; set false to disable flow control
esp_err_t (*set_peer_pause_ability)(esp_eth_mac_t *mac, uint32_t ability)
Set the PAUSE ability of peer node.

Return
• ESP_OK: set peer pause ability successfully
• ESP_FAIL: set peer pause ability failed because some error occurred

Parameters
• [in] mac: Ethernet MAC instance
• [in] ability: zero indicates that pause function is supported by link partner; non-zero indicates that pause function is not supported by link partner

esp_err_t (*del)(esp_eth_mac_t *mac)
Free memory of Ethernet MAC.

Return
• ESP_OK: free Ethernet MAC instance successfully
• ESP_FAIL: free Ethernet MAC instance failed because some error occurred

Parameters
• [in] mac: Ethernet MAC instance

struct eth_mac_config_t
Configuration of Ethernet MAC object.

Public Members

uint32_t sw_reset_timeout_ms
Software reset timeout value (Unit: ms)

uint32_t rx_task_stack_size
Stack size of the receive task

uint32_t rx_task_prio
Priority of the receive task

uint32_t flags
Flags that specify extra capability for mac driver

Macros

ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE
MAC driver can work when cache is disabled

ETH_MAC_FLAG_PIN_TO_CORE
Pin MAC task to the CPU core where driver installation happened

ETH_MAC_DEFAULT_CONFIG()
Default configuration for Ethernet MAC object.

Type Definitions
typedef struct esp_eth_mac_s esp_eth_mac_t
Ethernet MAC.

Enumerations
denum emac_rmii_clock_mode_t
RMII Clock Mode Options.

Values:

EMAC_CLK_DEFAULT
Default values configured using Kconfig are going to be used when “Default” selected.
Chapter 2. API Reference

EMAC_CLK_EXT_IN
Input RMII Clock from external. EMAC Clock GPIO number needs to be configured when this option is selected.

Note MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.

EMAC_CLK_OUT
Output RMII Clock from internal APLL Clock. EMAC Clock GPIO number needs to be configured when this option is selected.

enum emac_rmii_clock_gpio_t
RMII Clock GPIO number Options.

Values:

EMAC_CLK_IN_GPIO = 0
MAC will get RMII clock from outside at this GPIO.

Note ESP32 only supports GPIO0 to input the RMII clock.

EMAC_APPL_CLK_OUT_GPIO = 0
Output RMII Clock from internal APLL Clock available at GPIO0.

Note GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn’t have directly relationship with EMAC peripheral. Sometimes this clock won’t work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don’t select GPIO0 output mode for stability.

EMAC_CLK_OUT_GPIO = 16
Output RMII Clock from internal APLL Clock available at GPIO16.

EMAC_CLK_OUT_180_GPIO = 17
Inverted Output RMII Clock from internal APLL Clock available at GPIO17.

Header File

• components/esp_eth/include/esp_eth_phy.h

Functions

esp_eth_phy_t *esp_eth_phy_new_ip101(const eth_phy_config_t *config)
Create a PHY instance of IP101.

Return
• instance: create PHY instance successfully
• NULL: create PHY instance failed because some error occurred

Parameters
• [in] config: configuration of PHY

esp_eth_phy_t *esp_eth_phy_new_rtl8201(const eth_phy_config_t *config)
Create a PHY instance of RTL8201.

Return
• instance: create PHY instance successfully
• NULL: create PHY instance failed because some error occurred

Parameters
• [in] config: configuration of PHY

esp_eth_phy_t *esp_eth_phy_new_lan87xx(const eth_phy_config_t *config)
Create a PHY instance of LAN87xx.

Return
• instance: create PHY instance successfully
• NULL: create PHY instance failed because some error occurred
Parameters

- [in] config: configuration of PHY

```c
esp_eth_phy_t *esp_eth_phy_new_dp83848(const eth_phy_config_t *config)
```
Create a PHY instance of DP83848.

Return

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Parameters

- [in] config: configuration of PHY

```c
esp_eth_phy_t *esp_eth_phy_new_ksz80xx(const eth_phy_config_t *config)
```
Create a PHY instance of KSZ80xx.

The phy model from the KSZ80xx series is detected automatically. If the driver is unable to detect a supported model, NULL is returned.

Currently, the following models are supported: KSZ8001, KSZ8021, KSZ8031, KSZ8041, KSZ8051, KSZ8061, KSZ8081, KSZ8091

Return

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Parameters

- [in] config: configuration of PHY

Structures

```c
struct esp_eth_phy_s
```
Ethernet PHY.

Public Members

```c
esp_err_t (*set_mediator)(esp_eth_phy_t *phy, esp_eth_mediator_t *mediator)
```
Set mediator for PHY.

Return

- ESP_OK: set mediator for Ethernet PHY instance successfully
- ESP_ERR_INVALID_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments

Parameters

- [in] phy: Ethernet PHY instance
- [in] mediator: mediator of Ethernet driver

```c
esp_err_t (*reset)(esp_eth_phy_t *phy)
```
Software Reset Ethernet PHY.

Return

- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

Parameters

- [in] phy: Ethernet PHY instance

```c
esp_err_t (*reset_hw)(esp_eth_phy_t *phy)
```
Hardware Reset Ethernet PHY.

Note

Hardware reset is mostly done by pull down and up PHY’s nRST pin

Return

- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

Parameters

- [in] phy: Ethernet PHY instance
**esp_err_t** (*init*) (*esp_eth_phy_t* *phy*)

Initialize Ethernet PHY.

### Return
- ESP_OK: initialize Ethernet PHY successfully
- ESP_FAIL: initialize Ethernet PHY failed because some error occurred

### Parameters
- [in] phy: Ethernet PHY instance

**esp_err_t** (*deinit*) (*esp_eth_phy_t* *phy*)

Deinitialize Ethernet PHY.

### Return
- ESP_OK: deinitialize Ethernet PHY successfully
- ESP_FAIL: deinitialize Ethernet PHY failed because some error occurred

### Parameters
- [in] phy: Ethernet PHY instance

**esp_err_t** (*autonego_ctrl*) (*esp_eth_phy_t* *phy*, *eth_phy_autoneg_cmd_t* cmd, bool *autonego_en_stat*)

Configure auto negotiation.

### Return
- ESP_OK: restart auto negotiation successfully
- ESP_FAIL: restart auto negotiation failed because some error occurred
- ESP_ERR_INVALID_ARG: invalid command

### Parameters
- [in] phy: Ethernet PHY instance
- [in] cmd: Configuration command, it is possible to Enable (restart), Disable or get current status of PHY auto negotiation
- [out] autonego_en_stat: Address where to store current status of auto negotiation configuration

**esp_err_t** (*get_link*) (*esp_eth_phy_t* *phy*)

Get Ethernet PHY link status.

### Return
- ESP_OK: get Ethernet PHY link status successfully
- ESP_FAIL: get Ethernet PHY link status failed because some error occurred

### Parameters
- [in] phy: Ethernet PHY instance

**esp_err_t** (*pwrctl*) (*esp_eth_phy_t* *phy*, bool enable)

Power control of Ethernet PHY.

### Return
- ESP_OK: control Ethernet PHY power successfully
- ESP_FAIL: control Ethernet PHY power failed because some error occurred

### Parameters
- [in] phy: Ethernet PHY instance
- [in] enable: set true to power on Ethernet PHY; set false to power off Ethernet PHY

**esp_err_t** (*set_addr*) (*esp_eth_phy_t* *phy*, uint32_t addr)

Set PHY chip address.

### Return
- ESP_OK: set Ethernet PHY address successfully
- ESP_FAIL: set Ethernet PHY address failed because some error occurred

### Parameters
- [in] phy: Ethernet PHY instance
- [in] addr: PHY chip address

**esp_err_t** (*get_addr*) (*esp_eth_phy_t* *phy*, uint32_t *addr)

Get PHY chip address.
Return
• ESP_OK: get Ethernet PHY address successfully
• ESP_ERR_INVALID_ARG: get Ethernet PHY address failed because of invalid argument

Parameters
• [in] phy: Ethernet PHY instance
• [out] addr: PHY chip address

`esp_err_t (*advertise_pause_ability)(esp_eth_phy_t *phy, uint32_t ability)` Advertise pause function supported by MAC layer.

Return
• ESP_OK: Advertise pause ability successfully
• ESP_ERR_INVALID_ARG: Advertise pause ability failed because of invalid argument

Parameters
• [in] phy: Ethernet PHY instance
• [out] addr: Pause ability

`esp_err_t (*loopback)(esp_eth_phy_t *phy, bool enable)` Sets the PHY to loopback mode.

Return
• ESP_OK: PHY instance loopback mode has been configured successfully
• ESP_FAIL: PHY instance loopback configuration failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance
• [in] enable: enables or disables PHY loopback

`esp_err_t (*set_speed)(esp_eth_phy_t *phy, eth_speed_t speed)` Sets PHY speed mode.

Note Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

Return
• ESP_OK: PHY instance speed mode has been configured successfully
• ESP_FAIL: PHY instance speed mode configuration failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance
• [in] speed: Speed mode to be set

`esp_err_t (*set_duplex)(esp_eth_phy_t *phy, eth_duplex_t duplex)` Sets PHY duplex mode.

Note Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

Return
• ESP_OK: PHY instance duplex mode has been configured successfully
• ESP_FAIL: PHY instance duplex mode configuration failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance
• [in] duplex: Duplex mode to be set

`esp_err_t (*del)(esp_eth_phy_t *phy)` Free memory of Ethernet PHY instance.

Return
• ESP_OK: free PHY instance successfully
• ESP_FAIL: free PHY instance failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance

`struct eth_phy_config_t` Ethernet PHY configuration.
Public Members

int32_t phy_addr
PHY address, set -1 to enable PHY address detection at initialization stage

uint32_t reset_timeout_ms
Reset timeout value (Unit: ms)

uint32_t autonego_timeout_ms
Auto-negotiation timeout value (Unit: ms)

int reset_gpio_num
Reset GPIO number, -1 means no hardware reset

Macros
ESP_ETH_PHY_ADDR_AUTO
ETH_PHY_DEFAULT_CONFIG()
Default configuration for Ethernet PHY object.

Type Definitions
typedef struct esp_eth_phy_s esp_eth_phy_t
Ethernet PHY.

Enumerations
enum eth_phy_autoneg_cmd_t
Auto-negotiation control commands.

Values:
ESP_ETH_PHY_AUTONEGO_RESTART
ESP_ETH_PHY_AUTONEGO_EN
ESP_ETH_PHY_AUTONEGO_DIS
ESP_ETH_PHY_AUTONEGO_G_STAT

Header File
• components/esp_eth/include/esp_eth_netif_glue.h

Functions
esp_eth_netif glue_handle_t esp_eth_new_netif glue (esp_eth_handle_t eth_hdl)
Create a netif glue for Ethernet driver.

Note netif glue is used to attach io driver to TCP/IP netif
Return glue object, which inherits esp_netif_driver_base_t

Parameters
• eth_hdl: Ethernet driver handle

esp_err_t esp_eth_del_netif glue (esp_eth_netif glue_handle_t eth_netif glue)
Delete netif glue of Ethernet driver.

Return -ESP_OK: delete netif glue successfully

Parameters
• eth_netif glue: netif glue

Type Definitions
typedef struct esp_eth_netif glue_t *esp_eth_netif glue_handle_t
Handle of netif glue - an intermediate layer between netif and Ethernet driver.

Code examples for the Ethernet API are provided in the ethernet directory of ESP-IDF examples.
### 2.5.3 Thread

#### Introduction

Thread is a IP-based mesh networking protocol. It’s based on the 802.15.4 physical and MAC layer.

#### Application Examples

The openthread directory of ESP-IDF examples contains the following applications:

- The OpenThread interactive shell openthread/ot_cli.
- The Thread border router openthread/ot_br.
- The Thread radio co-processor openthread/ot_rcp.

#### API Reference

For manipulating the Thread network, the OpenThread api shall be used. The OpenThread api docs can be found at the [OpenThread official website](https://www.openthread.io).

ESP-IDF provides extra apis for launching and managing the OpenThread stack, binding to network interfaces and border routing features.

#### Header File

- components/openthread/include/esp_openthread.h

#### Functions

- **esp_err_t esp_openthread_init (const esp_openthread_platform_config_t *init_config)**

  Initializes the full OpenThread stack.

  **Note** The OpenThread instance will also be initialized in this function.

  **Return**

  - ESP_OK on success
  - ESP_ERR_NO_MEM if allocation has failed
  - ESP_ERR_INVALID_ARG if radio or host connection mode not supported
  - ESP_ERR_INVALID_STATE if already initialized

  **Parameters**

  - [in] init_config: The initialization configuration.

- **esp_err_t esp_openthread_launch_mainloop (void)**

  Launches the OpenThread main loop.

  **Note** This function will not return unless error happens when running the OpenThread stack.

  **Return**

  - ESP_OK on success
  - ESP_ERR_NO_MEM if allocation has failed
  - ESP_FAIL on other failures

- **esp_err_t esp_openthread_deinit (void)**

  This function performs OpenThread stack and platform driver deinitialization.

  **Return**

  - ESP_OK on success
  - ESP_ERR_INVALID_STATE if not initialized

- **otInstance *esp_openthread_get_instance (void)**

  This function acquires the underlying OpenThread instance.

  **Note** This function can be called on other tasks without lock.

  **Return** The OpenThread instance pointer
Chapter 2. API Reference

Header File

- components/openthread/include.esp_openthread_types.h

Structures

struct esp_openthread_mainloop_context_t
This structure represents a context for a select() based mainloop.

Public Members

fd_set read_fds
The read file descriptors

fd_set write_fds
The write file descriptors

fd_set error_fds
The error file descriptors

int max_fd
The max file descriptor

struct timeval timeout
The timeout

struct esp_openthread_uart_config_t
The uart port config for OpenThread.

Public Members

uart_port_t port
UART port number

uart_config_t uart_config
UART configuration, see uart_config_t docs

int rx_pin
UART RX pin

int tx_pin
UART TX pin

struct esp_openthread_radio_config_t
The OpenThread radio configuration.

Public Members

esp_openthread_radio_mode_t radio_mode
The radio mode

esp_openthread_uart_config_t radio_uart_config
The uart configuration to RCP

struct esp_openthread_host_connection_config_t
The OpenThread host connection configuration.

Public Members

esp_openthread_host_connection_mode_t host_connection_mode
The host connection mode
**esp_openthread_uart_config_t host_uart_config**

The uart configuration to host

**struct esp_openthread_port_config_t**

The OpenThread port specific configuration.

**Public Members**

```c
const char *storage_partition_name
```

The partition for storing OpenThread dataset

```c
uint8_t netif_queue_size
```

The packet queue size for the network interface

```c
uint8_t task_queue_size
```

The task queue size

**struct esp_openthread_platform_config_t**

The OpenThread platform configuration.

**Public Members**

```c
esp_openthread_radio_config_t radio_config
```

The radio configuration

```c
esp_openthread_host_connection_config_t host_config
```

The host connection configuration

```c
esp_openthread_port_config_t port_config
```

The port configuration

**Enumerations**

**enum esp_openthread_event_t**

OpenThread event declarations.

*Values:*

```c
OPENTHREAD_EVENT_START
```

OpenThread stack start

```c
OPENTHREAD_EVENT_STOP
```

OpenThread stack stop

```c
OPENTHREAD_EVENT_IF_UP
```

OpenThread network interface up

```c
OPENTHREAD_EVENT_IF_DOWN
```

OpenThread network interface down

```c
OPENTHREAD_EVENT_GOT_IP6
```

OpenThread stack added IPv6 address

```c
OPENTHREAD_EVENT_LOST_IP6
```

OpenThread stack removed IPv6 address

```c
OPENTHREAD_EVENT_MULTICAST_GROUP_JOIN
```

OpenThread stack joined IPv6 multicast group

```c
OPENTHREAD_EVENT_MULTICAST_GROUP_LEAVE
```

OpenThread stack left IPv6 multicast group

```c
OPENTHREAD_EVENT_TREL_ADD_IP6
```

OpenThread stack added TREL IPv6 address
Chapter 2. API Reference

**OPENTHREAD_EVENT_TREL_REMOVE_IP6**  
OpenThread stack removed TREL IPv6 address

**OPENTHREAD_EVENT_TREL_MULTICAST_GROUP_JOIN**  
OpenThread stack joined TREL IPv6 multicast group

**enum esp_openthread_radio_mode_t**  
The radio mode of OpenThread.

*Values:*

- **RADIO_MODE_NATIVE** = 0x0  
  Use the native 15.4 radio

- **RADIO_MODE_UART_RCP** = 0x1  
  UART connection to a 15.4 capable radio co-processor (RCP)

- **RADIO_MODE_SPI_RCP** = 0x2  
  SPI connection to a 15.4 capable radio co-processor (RCP)

**enum esp_openthread_host_connection_mode_t**  
How OpenThread connects to the host.

*Values:*

- **HOST_CONNECTION_MODE_NONE** = 0x0  
  Disable host connection

- **HOST_CONNECTION_MODE_CLI_UART** = 0x1  
  CLI UART connection to the host

- **HOST_CONNECTION_MODE_RCP_UART** = 0x2  
  RCP UART connection to the host

**Header File**

- components/openthread/include/esp_openthread_lock.h

**Functions**

```c
esp_err_t esp_openthread_lock_init (void)  
This function initializes the OpenThread API lock.

**Return**

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_STATE if already initialized

void esp_openthread_lock_deinit (void)  
This function deinitializes the OpenThread API lock.

bool esp_openthread_lock_acquire (TickType_t block_ticks)  
This function acquires the OpenThread API lock.

**Note**  
Every OT APIs that takes an otInstance argument MUST be protected with this API lock except that  
the call site is in OT callbacks.

**Return**

- True on lock acquired
- False on failing to acquire the lock with the timeout.

**Parameters**

- [in] block_ticks: The maximum number of RTOS ticks to wait for the lock.

void esp_openthread_lock_release (void)  
This function releases the OpenThread API lock.
```
Header File

- components/openthread/include/esp_openthread_netif_glue.h

Functions

void *esp_openthread_netif_glue_init (const esp_openthread_platform_config_t *config)
This function initializes the OpenThread network interface glue.

Return
• glue pointer on success
• NULL on failure

Parameters
• [in] config: The platform configuration.

void esp_openthread_netif_glue_deinit (void)
This function deinitializes the OpenThread network interface glue.

esp_netif_t *esp_openthread_get_netif (void)
This function acquires the OpenThread netif.

Return The OpenThread netif or NULL if not initialized.

Header File

- components/openthread/include/esp_openthread_border_router.h

Functions

void esp_openthread_set_backbone_netif (esp_netif_t *backbone_netif)
Sets the backbone interface used for border routing.

Note This function must be called before esp_openthread_init

Parameters
• [in] backbone_netif: The backbone network interface (WiFi or ethernet)

esp_err_t esp_openthread_border_router_init (void)
Initializes the border router features of OpenThread.

Note Calling this function will make the device behave as an OpenThread border router. Kconfig option CONFIG_OPENTHREAD_BORDER_ROUTER is required.

Return
• ESP_OK on success
• ESP_ERR_NOT_SUPPORTED if feature not supported
• ESP_ERR_INVALID_STATE if already initialized
• ESP_FIAL on other failures

esp_err_t esp_openthread_border_router_deinit (void)
Deinitializes the border router features of OpenThread.

Return
• ESP_OK on success
• ESP_ERR_INVALID_STATE if not initialized
• ESP_FIAL on other failures

esp_netif_t *esp_openthread_get_backbone_netif (void)
Gets the backbone interface of OpenThread border router.

Return The backbone interface or NULL if border router not initialized.

Thread is an IPv6-based mesh networking technology for IoT. Code examples for the Thread API are provided in the openthread directory of ESP-IDF examples.
2.5.4 ESP-NETIF

ESP-NETIF

The purpose of ESP-NETIF library is twofold:

- It provides an abstraction layer for the application on top of the TCP/IP stack. This will allow applications to choose between IP stacks in the future.
- The APIs it provides are thread safe, even if the underlying TCP/IP stack APIs are not.

ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation agnostic and different implementations are possible.

Some ESP-NETIF API functions are intended to be called by application code, for example to get/set interface IP addresses, configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called from the default network event handlers.

ESP-NETIF component is a successor of the tcpip_adapter, former network interface abstraction, which has become deprecated since IDF v4.1. Please refer to the TCP/IP Adapter Migration Guide section in case existing applications to be ported to use the esp-netif API instead.

ESP-NETIF architecture
Data and event flow in the diagram

- Initialization line from user code to ESP-NETIF and communication driver
- Data packets going from communication media to TCP/IP stack and back
- Events aggregated in ESP-NETIF propagates to driver, user code and network stack
- User settings and runtime configuration

ESP-NETIF interaction

A) User code, boiler plate Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and outlined as below:

A) Initialization code

1) Initializes IO driver
2) Creates a new instance of ESP-NETIF and configure with
   - ESP-NETIF specific options (flags, behaviour, name)
   - Network stack options (netif’ init and input functions, not publicly available)
   - IO driver specific options (transmit, free rx buffer functions, IO driver handle)
3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
4) Configures event handlers
   - use default handlers for common interfaces defined in IO drivers; or define a specific handlers for customised behaviour/new interfaces
   - register handlers for app related events (such as IP lost/acquired)

B) Interaction with network interfaces using ESP-NETIF API

- Getting and setting TCP/IP related parameters (DHCP, IP, etc)
- Receiving IP events (connect/disconnect)
- Controlling application lifecycle (set interface up/down)

B) Communication driver, IO driver, media driver Communication driver plays these two important roles in relation with ESP-NETIF:

1) Event handlers: Define behaviour patterns of interaction with ESP-NETIF (for example: ethernet link-up -> turn netif on)
2) Glue IO layer: Adapts the input/output functions to use ESP-NETIF transmit, receive and free receive buffer
   - Installs driver_transmit to appropriate ESP-NETIF object, so that outgoing packets from network stack are passed to the IO driver
   - Calls esp_netif_receive() to pass incoming data to network stack

C) ESP-NETIF, former tcpip_adapter ESP-NETIF is an intermediary between an IO driver and a network stack, connecting packet data path between these two. As that it provides a set of interfaces for attaching a driver to ESP-NETIF object (runtime) and configuring a network stack (compile time). In addition to that a set of API is provided to control network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface could be divided into these 6 groups:

1) Initialization APIs (to create and configure ESP-NETIF instance)
2) Input/Output API (for passing data between IO driver and network stack)
3) Event or Action API
   - Used for network interface lifecycle management
   - ESP-NETIF provides building blocks for designing event handlers
4) Setters and Getters for basic network interface properties
5) Network stack abstraction: enabling user interaction with TCP/IP stack
   - Set interface up or down
• DHCP server and client API
• DNS API

6) Driver conversion utilities

D) Network stack  Network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

E) ESP-NETIF L2 TAP Interface  The ESP-NETIF L2 TAP interface is ESP-IDF mechanism utilized to access Data Link Layer (L2 per OSI/ISO) for frame reception and transmission from user application. Its typical usage in embedded world might be implementation of non-IP related protocols such as PTP, Wake on LAN and others. Note that only Ethernet (IEEE 802.3) is currently supported.

From user perspective, the ESP-NETIF L2 TAP interface is accessed using file descriptors of VFS which provides a file-like interfacing (using functions like open(), read(), write(), etc). Refer to Virtual filesystem component to learn more.

There is only one ESP-NETIF L2 TAP interface device (path name) available. However multiple file descriptors with different configuration can be opened at a time since the ESP-NETIF L2 TAP interface can be understood as generic entry point to the NETIF internal structure. Important is then specific configuration of particular file descriptor. It can be configured to give an access to specific Network Interface identified by if_key (e.g. ETH_DEF) and to filter only specific frames based on their type (e.g. Ethernet type in case of IEEE 802.3). Filtering only specific frames is crucial since the ESP-NETIF L2 TAP needs to work along with IP stack and so the IP related traffic (IP, ARP, etc.) should not be passed directly to the user application. Even though such option is still configurable, it is not recommended in standard use cases. Filtering is also advantageous from a perspective the user’s application gets access only to frame types it is interested in and the remaining traffic is either passed to other L2 TAP file descriptors or to IP stack.

ESP-NETIF L2 TAP Interface Usage Manual

Initialization  To be able to use the ESP-NETIF L2 TAP interface, it needs to be enabled in Kconfig by CONFIG_ESP_NETIF_L2_TAP first and then registered by esp_vfs_l2tap_intf_register() prior usage of any VFS function.

open()  Once the ESP-NETIF L2 TAP is registered, it can be opened at path name “/dev/net/tap”. The same path path name can be opened multiple times up to CONFIG_ESP_NETIF_L2_TAP_MAX_FDS and multiple file descriptors with with different configuration may access the Data Link Layer in the NETIF.

The ESP-NETIF L2 TAP can be opened with O_NONBLOCK file status flag to the read() does not block. Note that the write() may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed. The file status flag can be retrieved and modified using fcntl().

On success, open() returns the new file descriptor (a nonnegative integer). On error, -1 is returned and errno is set to indicate the error.

ioctl()  The newly opened ESP-NETIF L2 TAP file descriptor needs to be configured prior its usage since it is not bounded to any specific Network Interface and no frame type filter is configured. The following configuration options are available to do so:

• L2TAP_S_INTF_DEVICE - bounds the file descriptor to specific Network Interface which is identified by its if_key. Network Interface if_key is passed to ioctl() as the third parameter. Note that default Network Interfaces if_key’s used in ESP-IDF can be found in esp_netif/include/esp_netif_defaults.h.
• L2TAP_S_RCV_FILTER - sets the filter to frames with this type to be passed to the file descriptor. In case of Ethernet frames, the frames are to be filtered based on Length/Ethernet type field. In case the filter value is set less than or equal to 0x05DC, the Ethernet type field is considered to represent IEEE802.3 Length Field and all frames with values in interval <0, 0x05DC> at that field are to be passed to the file descriptor. The IEEE802.2
logical link control (LLC) resolution is then expected to be performed by user’s application. In case the filter value is set greater than 0x05DC, the Ethernet type field is considered to represent protocol identification and only frames which are equal to the set value are to be passed to the file descriptor.

All set configuration options have getter counterpart option to read the current settings.

**Note:** VLAN tagged frames are currently not recognized. If user needs to process VLAN tagged frames, they need set filter to be equal to VLAN tag (i.e. 0x8100 or 0x88A8) and process the VLAN tagged frames in user application.

On success, `ioctl()` returns 0. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**EINVAL** - invalid configuration argument. Ethernet type filter is already used by other file descriptor.

**ENODEV** - no such Network Interface which is tried to be assigned to the file descriptor exists.

**ENOSPC** - NETIF L2 receive hook is already taken by other function when trying to assign Network Interface to the file descriptor.

**ENOSYS** - unsupported operation, passed configuration option does not exists.

**read()** Opened and configured ESP-NETIF L2 TAP file descriptor can be accessed by `read()` to get inbound frames. The read operation can be either blocking or non-blocking based on actual state of `O_NONBLOCK` file status flag. When the file status flag is set blocking, the read operation waits until a frame is received and context is switched to other task. When the file status flag is set non-blocking, the read operation returns immediately. In such case, either a frame is returned if it was already queued or the function indicates the queue is empty. The number of queued frames associated with one file descriptor is limited by `CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE` Kconfig option. Once the number of queued frames reach configured threshold, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

On success, `read()` returns the number of bytes read. Zero is returned when size of the destination buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**EAGAIN** - the file descriptor has been marked non-blocking (`O_NONBLOCK`), and the read would block.

**write()** A raw Data Link Layer frame can be sent to Network Interface via opened and configured ESP-NETIF L2 TAP file descriptor. User’s application is responsible to construct the whole frame except for fields which are added automatically by the physical interface device. The following fields need to be constructed by the user’s application in case of Ethernet link: source/destination MAC addresses, Ethernet type, actual protocol header and user data. See below for more information about Ethernet frame structure.

```
+-------------------+-------------------+-------------+----------------------------
| Destination MAC   | Source MAC        | Type/Length | Payload (protocol header/
data) ... |
+-------------------+-------------------+-------------+----------------------------
 | 6B                 | 6B                | 2B          | 0-1486B                     |
```

In other words, there is no additional frame processing performed by the ESP-NETIF L2 TAP interface. It only checks the Ethernet type of the frame is the same as the filter configured in the file descriptor. If the Ethernet type is different, an error is returned and the frame is not sent. Note that the `write()` may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed.

On success, `write()` returns the number of bytes written. Zero is returned when size of the input buffer is 0. On
error, -1 is returned, and errno is set to indicate the error.

**EBADF** - not a valid file descriptor.

**EBADMSG** - Ethernet type of the frame is different then file descriptor configured filter.

**EIO** - Network interface not available or busy.

**close()**  
Opened ESP-NETIF L2 TAP file descriptor can be closed by the close() to free its allocated resources. The ESP-NETIF L2 TAP implementation of close() may block. On the other hand, it is thread safe and can be called from different task than the file descriptor is actually used. If such situation occurs and one task is blocked in I/O operation and another task tries to close the file descriptor, the first task is unblocked. The first’s task read operation then ends with error.

On success, close() returns zero. On error, -1 is returned, and errno is set to indicate the error.

**EBADF** - not a valid file descriptor.

**select()**  
Select is used in a standard way, just CONFIG_VFS_SUPPORT_SELECT needs to be enabled to be the select() function available.

**ESP-NETIF programmer’s manual**  
Please refer to the example section for basic initialization of default interfaces:

- WiFi Station: wifi/getting_started/station/main/station_example_main.c
- Ethernet: ethernet/basic/main/ethernet_example_main.c
- WiFi Access Point: wifi/getting_started/softAP/main/softap_example_main.c

For more specific cases please consult this guide: ESP-NETIF Custom I/O Driver.

**WiFi default initialization**  
The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in separate APIs to facilitate simple startup code for most applications:

- esp_netif_create_default_wifi_sta()
- esp_netif_create_default_wifi_ap()

Please note that these functions return the esp_netif handle, i.e. a pointer to a network interface object allocated and configured with default settings, which as a consequence, means that:

- The created object has to be destroyed if a network de-initialization is provided by an application using esp_netif_destroy_default_wifi().
- These default interfaces must not be created multiple times, unless the created handle is deleted using esp_netif_destroy().
- When using Wifi in AP+STA mode, both these interfaces has to be created.

**API Reference**

**Header File**

- components/esp_netif/include/esp_netif.h

**Functions**

- esp_err_t esp_netif_init (void)
  
  Initialize the underlying TCP/IP stack.

  **Return**
  - ESP_OK on success
• ESP_FAIL if initializing failed

**Note** This function should be called exactly once from application code, when the application starts up.

```c
esp_err_t esp_netif_deinit(void)
```

Deinitialize the esp-netif component (and the underlying TCP/IP stack)

```sql
Note: Deinitialization is not supported yet
```

**Return**

- ESP_ERR_INVALID_STATE if esp_netif not initialized
- ESP_ERR_NOT_SUPPORTED otherwise

```c
esp_netif_t *esp_netif_new(const esp_netif_config_t *esp_netif_config)
```

Creates an instance of new esp-netif object based on provided config.

**Return**

- pointer to esp-netif object on success
- NULL otherwise

**Parameters**

- [in] esp_netif_config: pointer esp-netif configuration

```c
void esp_netif_destroy(esp_netif_t *esp_netif)
```

Destroys the esp_netif object.

**Parameters**

- [in] esp_netif: pointer to the object to be deleted

```c
esp_err_t esp_netif_set_driver_config(esp_netif_t *esp_netif, const esp_netif_driver_ifconfig_t *driver_config)
```

Configures driver related options of esp_netif object.

**Return**

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS if invalid parameters provided

**Parameters**

- [inout] esp_netif: pointer to the object to be configured
- [in] driver_config: pointer esp-netif io driver related configuration

```c
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle driver_handle)
```

Attaches esp_netif instance to the io driver handle.

Calling this function enables connecting specific esp_netif object with already initialized io driver to update esp_netif object with driver specific configuration (i.e. calls post_attach callback, which typically sets io driver callbacks to esp_netif instance and starts the driver)

**Return**

- ESP_OK on success
- ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED if driver’s post_attach callback failed

**Parameters**

- [inout] esp_netif: pointer to esp_netif object to be attached
- [in] driver_handle: pointer to the driver handle

```c
esp_err_t esp_netif_receive(esp_netif_t *esp_netif, void *buffer, size_t len, void *eb)
```

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

**Return**

- ESP_OK

**Parameters**

- [in] esp_netif: Handle to esp-netif instance
- [in] buffer: Received data
- [in] len: Length of the data frame
- [in] eb: Pointer to internal buffer (used in Wi-Fi driver)
Chapter 2. API Reference

**esp_err_t esp_netif_transmit_hook_attach (esp_netif_t *esp_netif, void *hook_fn)**

Add transmit hook callback function reference into ESP-NETIF. This callback function is then called just prior the ESP-NETIF passes data to network driver.

**Return**

- ESP_OK - success
- ESP_ERR_INVALID_ARG

**Parameters**

- [in] esp_netif: Handle to esp-netif instance
- [in] hook_fn: reference to transmit hook callback function

**esp_err_t esp_netif_post_transmit_hook_attach (esp_netif_t *esp_netif, void *hook_fn)**

Add post transmit hook callback function reference into ESP-NETIF. This callback function is then called just after the ESP-NETIF passes data to network driver.

**Note** Intention of this function is either to release resources allocated by transmit hook function or for other use cases such as time stamping, etc.

**Return**

- ESP_OK - success
- ESP_ERR_INVALID_ARG

**Parameters**

- [in] esp_netif: Handle to esp-netif instance
- [in] hook_fn: reference to post transmit hook callback function

**esp_err_t esp_netif_recv_hook_attach (esp_netif_t *esp_netif, void *hook_fn)**

Add receive hook callback function reference into ESP-NETIF. This callback function is then called when network driver receives data.

**Return**

- ESP_OK - success
- ESP_ERR_INVALID_ARG

**Parameters**

- [in] esp_netif: Handle to esp-netif instance
- [in] hook_fn: reference to receive hook callback function

**esp_err_t esp_netif_transmit_hook_detach (esp_netif_t *esp_netif)**

Removes reference to previously attached transmit hook callback function.

**Return**

- ESP_OK - success
- ESP_ERR_INVALID_ARG

**Parameters**

- [in] esp_netif: Handle to esp-netif instance

**esp_err_t esp_netif_post_transmit_hook_detach (esp_netif_t *esp_netif)**

Removes reference to previously attached post transmit hook callback function.

**Return**

- ESP_OK - success
- ESP_ERR_INVALID_ARG

**Parameters**

- [in] esp_netif: Handle to esp-netif instance

**esp_err_t esp_netif_recv_hook_detach (esp_netif_t *esp_netif)**

Removes reference to previously attached receive hook callback function.

**Return**

- ESP_OK - success
- ESP_ERR_INVALID_ARG

**Parameters**

- [in] esp_netif: Handle to esp-netif instance

**void esp_netif_action_start (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)**

Default building block for network interface action upon IO driver start event Creates network interface, if
AUTOUP enabled turns the interface on, if DHCP enabled starts dhcp server.

**Note** This API can be directly used as event handler

**Parameters**
- `[in]` esp_netif: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

```c
void esp_netif_action_stop (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```

Default building block for network interface action upon IO driver stop event.

**Note** This API can be directly used as event handler

**Parameters**
- `[in]` esp_netif: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

```c
void esp_netif_action_connected (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```

Default building block for network interface action upon IO driver connected event.

**Note** This API can be directly used as event handler

**Parameters**
- `[in]` esp_netif: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

```c
void esp_netif_action_disconnected (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```

Default building block for network interface action upon IO driver disconnected event.

**Note** This API can be directly used as event handler

**Parameters**
- `[in]` esp_netif: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

```c
void esp_netif_action_got_ip (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```

Default building block for network interface action upon network got IP event.

**Note** This API can be directly used as event handler

**Parameters**
- `[in]` esp_netif: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

```c
void esp_netif_action_join_ip6_multicast_group (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```

Default building block for network interface action upon IPv6 multicast group join.

**Note** This API can be directly used as event handler

**Parameters**
- `[in]` esp_netif: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

```c
void esp_netif_action_leave_ip6_multicast_group (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```
Default building block for network interface action upon IPv6 multicast group leave.

**Note** This API can be directly used as event handler

**Parameters**
- `[in] esp_netif`: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

```c
void esp_netif_action_add_ip6_address (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```

Default building block for network interface action upon IPv6 address added by the underlying stack.

**Note** This API can be directly used as event handler

**Parameters**
- `[in] esp_netif`: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

```c
void esp_netif_action_remove_ip6_address (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```

Default building block for network interface action upon IPv6 address removed by the underlying stack.

**Note** This API can be directly used as event handler

**Parameters**
- `[in] esp_netif`: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

```c
esp_err_t esp_netif_set_mac (esp_netif_t *esp_netif, uint8_t mac[])
```

Set the mac address for the interface instance.

**Return**
- `ESP_OK` - success
- `ESP_ERR_ESP_NETIF_IF_NOT_READY` - interface status error
- `ESP_ERR_NOT_SUPPORTED` - mac not supported on this interface

**Parameters**
- `[in] esp_netif`: Handle to esp-netif instance
- `[in] mac`: Desired mac address for the related network interface

```c
esp_err_t esp_netif_get_mac (esp_netif_t *esp_netif, uint8_t mac[])
```

Get the mac address for the interface instance.

**Return**
- `ESP_OK` - success
- `ESP_ERR_ESP_NETIF_IF_NOT_READY` - interface status error
- `ESP_ERR_NOT_SUPPORTED` - mac not supported on this interface

**Parameters**
- `[in] esp_netif`: Handle to esp-netif instance
- `[out] mac`: Resultant mac address for the related network interface

```c
esp_err_t esp_netif_set_hostname (esp_netif_t *esp_netif, const char *hostname)
```

Set the hostname of an interface.

The configured hostname overrides the default configuration value `CONFIG_LWIP_LOCAL_HOSTNAME`. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects

**Return**
- `ESP_OK` - success
- `ESP_ERR_ESP_NETIF_IF_NOT_READY` - interface status error
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS` - parameter error

**Parameters**
Chapter 2. API Reference

- [in] esp_netif: Handle to esp-netif instance

**esp_err_t** esp_netif_get_hostname(esp_netif_t *esp_netif, const char **hostname)

Get interface hostname.

**Return**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] hostname: Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

**bool** esp_netif_is_netif_up(esp_netif_t *esp_netif)

Test if supplied interface is up or down.

**Return**
- true - Interface is up
- false - Interface is down

**Parameters**
- [in] esp_netif: Handle to esp-netif instance

**esp_err_t** esp_netif_get_ip_info(esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)

Get interface’s IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] ip_info: If successful, IP information will be returned in this argument.

**esp_err_t** esp_netif_get_old_ip_info(esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)

Get interface’s old IP information.

Returns an “old” IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] ip_info: If successful, IP information will be returned in this argument.

**esp_err_t** esp_netif_set_ip_info(esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)

Set interface’s IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

**Note** DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

**Note** Calling this interface for may generate a SYSTEM_EVENT_STA_GOT_IP or SYSTEM_EVENT_ETH_GOT_IP event.

**Return**
Chapter 2. API Reference

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED If DHCP server or client is still running

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] ip_info: IP information to set on the specified interface

```c
esp_err_t esp_netif_set_old_ip_info(esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)
```

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the `SYSTEM_EVENT_STA_CONNECTED` and `SYSTEM_EVENT_ETH_CONNECTED` events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the “IP lost timer” will expire (after the configured interval) and set the old IP information to zero.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] ip_info: Store the old IP information for the specified interface

```c
int esp_netif_get_netif_impl_index(esp_netif_t *esp_netif)
```

Get net interface index from network stack implementation.

**Note** This index could be used in `setsockopt()` to bind socket with multicast interface

**Return** implementation specific index of interface represented with supplied esp_netif

**Parameters**
- [in] esp_netif: Handle to esp-netif instance

```c
esp_err_t esp_netif_get_netif_impl_name(esp_netif_t *esp_netif, char *name)
```

Get net interface name from network stack implementation.

**Note** This name could be used in `setsockopt()` to bind socket with appropriate interface

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] name: Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)

```c
esp_err_t esp_netif_dhcps_option(esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)
```

Set or Get DHCP server option.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] opt_op: `ESP_NETIF_OP_SET` to set an option, `ESP_NETIF_OP_GET` to get an option.
- [in] opt_id: Option index to get or set, must be one of the supported enum values.
- [inout] opt_val: Pointer to the option parameter.
**Chapter 2. API Reference**

- **[in] opt_len**: Length of the option parameter.

  ```c
  esp_err_t esp_netif_dhcpc_option(esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op,
                                  esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)
  ```

  Set or Get DHCP client option.

  **Return**
  - ESP_OK
  - ESP_ERR_ESP_NETIF_INVALID_PARAMS
  - ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
  - ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

  **Parameters**
  - **[in] esp_netif**: Handle to esp-netif instance
  - **[in] opt_op**: ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
  - **[in] opt_id**: Option index to get or set, must be one of the supported enum values.
  - **[inout] opt_val**: Pointer to the option parameter.
  - **[in] opt_len**: Length of the option parameter.

- **esp_err_t esp_netif_dhcpc_start(esp_netif_t *esp_netif)**

  Start DHCP client (only if enabled in interface object)

  **Note** The default event handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEMEVENT_ETH_CONNECTED events call this function.

  **Return**
  - ESP_OK
  - ESP_ERR_ESP_NETIF_INVALID_PARAMS
  - ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED
  - ESP_ERR_ESP_NETIF_DHCPC_START_FAILED

  **Parameters**
  - **[in] esp_netif**: Handle to esp-netif instance

- **esp_err_t esp_netif_dhcpc_stop(esp_netif_t *esp_netif)**

  Stop DHCP client (only if enabled in interface object)

  **Note** Calling action_netif_stop() will also stop the DHCP Client if it is running.

  **Return**
  - ESP_OK
  - ESP_ERR_ESP_NETIF_INVALID_PARAMS
  - ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
  - ESP_ERR_ESP_NETIF_IF_NOT_READY

  **Parameters**
  - **[in] esp_netif**: Handle to esp-netif instance

- **esp_err_t esp_netif_dhcpc_get_status(esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)**

  Get DHCP client status.

  **Return**
  - ESP_OK

  **Parameters**
  - **[in] esp_netif**: Handle to esp-netif instance
  - **[out] status**: If successful, the status of DHCP client will be returned in this argument.

- **esp_err_t esp_netif_dhcps_get_status(esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)**

  Get DHCP Server status.

  **Return**
  - ESP_OK

  **Parameters**
  - **[in] esp_netif**: Handle to esp-netif instance
  - **[out] status**: If successful, the status of the DHCP server will be returned in this argument.

- **esp_err_t esp_netif_dhcps_start(esp_netif_t *esp_netif)**

  Start DHCP server (only if enabled in interface object)
Return

• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS
• ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

Parameters

• [in] esp_netif: Handle to esp-netif instance

.esp_err_t esp_netif_dhcps_stop (esp_netif_t *esp_netif)
Stop DHCP server (only if enabled in interface object)

Return

• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS
• ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
• ESP_ERR_ESP_NETIF_IF_NOT_READY

Parameters

• [in] esp_netif: Handle to esp-netif instance

.esp_err_t esp_netif_set_dns_info (esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)
Set DNS Server information.

This function behaves differently if DHCP server or client is enabled

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

• The default Main DNS server is typically the IP of the Wi-Fi AP interface itself.
• This function can override it by setting server type ESP_NETIF_DNS_MAIN.
• Other DNS Server types are not supported for the Wi-Fi AP interface.

Return

• ESP_OK on success
• ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

Parameters

• [in] esp_netif: Handle to esp-netif instance
• [in] type: Type of DNS Server to set: ESP_NETIF_DNS_MAIN,
ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
• [in] dns: DNS Server address to set

.esp_err_t esp_netif_get_dns_info (esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)
Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.

This may be result of a previous call to esp_netif_set_dns_info(). If the interface’s DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

Return

• ESP_OK on success
• ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

Parameters

• [in] esp_netif: Handle to esp-netif instance
• [in] type: Type of DNS Server to get: ESP_NETIF_DNS_MAIN,
ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
• [out] dns: DNS Server result is written here on success

.esp_err_t esp_netif_create_ip6_linklocal (esp_netif_t *esp_netif)
Create interface link-local IPv6 address.
Chapter 2. API Reference

Causethe TCP/IP stack to create a link-local IPv6 address for the specified interface.

This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a SYSTEM_EVENT_GOT_IP6 event will be sent.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**Parameters**
- [in] esp_netif: Handle to esp-netif instance

```c
esp_err_t esp_netif_get_ip6_linklocal (esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)
```

Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

**Return**
- ESP_OK
- ESP_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] if_ip6: IPv6 information will be returned in this argument if successful.

```c
esp_err_t esp_netif_get_ip6_global (esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)
```

Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

**Return**
- ESP_OK
- ESP_FAIL If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] if_ip6: IPv6 information will be returned in this argument if successful.

```c
int esp_netif_get_all_ip6 (esp_netif_t *esp_netif, esp_ip6_addr_t if_ip6[])
```

Get all IPv6 addresses of the specified interface.

**Return** number of returned IPv6 addresses

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] if_ip6: Array of IPv6 addresses will be copied to the argument

```c
void esp_netif_set_ip4_addr (esp_ip4_addr_t *addr, uint8_t a, uint8_t b, uint8_t c, uint8_t d)
```

Sets IPv4 address to the specified octets.

**Parameters**
- [out] addr: IP address to be set
- a: the first octet (127 for IP 127.0.0.1)
- b:
- c:
- d:

```c
char *esp_ip4addr_ntoa (const esp_ip4_addr_t *addr, char *buf, int buflen)
```

Converts numeric IP address into decimal dotted ASCII representation.

**Return** either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small

**Parameters**
- addr: ip address in network order to convert
- buf: target buffer where the string is stored
- buflen: length of buf

```c
uint32_t esp_ip4addr_aton(const char *addr)

Ascii internet address interpretation routine. The value returned is in network order.

Return  ip address in network order

Parameters
•  addr: IP address in ascii representation (e.g. “127.0.0.1”)

esp_err_t esp_netif_str_to_ip4(const char *src, esp_ip4_addr_t *dst)

Converts Ascii internet IPv4 address into esp_ip4_addr_t.

Return
•  ESP_OK on success
•  ESP_FAIL if conversion failed
•  ESP_ERR_INVALID_ARG if invalid parameter is passed into

Parameters
•  [in] src: IPv4 address in ascii representation (e.g. “127.0.0.1”)
•  [out] dst: Address of the target esp_ip4_addr_t structure to receive converted address

esp_err_t esp_netif_str_to_ip6(const char *src, esp_ip6_addr_t *dst)

Converts Ascii internet IPv6 address into esp_ip4_addr_t. Zeros in the IP address can be stripped or completely omitted: “2001:db8:85a3::0:0:2:1” or “2001::2:1”

Return
•  ESP_OK on success
•  ESP_FAIL if conversion failed
•  ESP_ERR_INVALID_ARG if invalid parameter is passed into

Parameters
•  [in] src: IPv6 address in ascii representation (e.g. “2001:db8:85a3::0:0:2:1”)
•  [out] dst: Address of the target esp_ip6_addr_t structure to receive converted address

esp_netif_iomdriver_handle esp_netif_get_io_driver(esp_netif_t *esp_netif)

Gets media driver handle for this esp-netif instance.

Return  opaque pointer of related IO driver

Parameters
•  [in] esp_netif: Handle to esp-netif instance

esp_netif_t *esp_netif_get_handle_from_ifkey(const char *if_key)

Searches over a list of created objects to find an instance with supplied if key.

Return  Handle to esp-netif instance

Parameters
•  if_key: Textual description of network interface

esp_netif_flags_t esp_netif_get_flags(esp_netif_t *esp_netif)

Returns configured flags for this interface.

Return  Configuration flags

Parameters
•  [in] esp_netif: Handle to esp-netif instance

const char *esp_netif_get_ifkey(esp_netif_t *esp_netif)

Returns configured interface key for this esp-netif instance.

Return  Textual description of related interface

Parameters
•  [in] esp_netif: Handle to esp-netif instance

const char *esp_netif_get_desc(esp_netif_t *esp_netif)

Returns configured interface type for this esp-netif instance.

Return  Enumerated type of this interface, such as station, AP, ethernet

Parameters
•  [in] esp_netif: Handle to esp-netif instance
```
int esp_netif_get_route_prio (esp_netif_t *esp_netif)
Returns configured routing priority number.

Return Integer representing the instance’s route-prio, or -1 if invalid parameters
Parameters
  • [in] esp_netif: Handle to esp-netif instance

int32_t esp_netif_get_event_id (esp_netif_t *esp_netif, esp_netif_ip_event_type_t event_type)
Returns configured event for this esp-netif instance and supplied event type.

Return Specific event id which is configured to be raised if the interface lost or acquired IP address -1 if supplied event_type is not known
Parameters
  • [in] esp_netif: Handle to esp-netif instance
  • event_type: (either get or lost IP)

esp_netif_t *esp_netif_next (esp_netif_t *esp_netif)
Iterates over list of interfaces. Returns first netif if NULL given as parameter.

Return First netif from the list if supplied parameter is NULL, next one otherwise
Parameters
  • [in] esp_netif: Handle to esp-netif instance

size_t esp_netif_get_nr_of_ifs (void)
Returns number of registered esp_netif objects.

Return Number of esp_netifs

void esp_netif_netstack_buf_ref (void *netstack_buf)
increase the reference counter of net stack buffer

Parameters
  • [in] netstack_buf: the net stack buffer

void esp_netif_netstack_buf_free (void *netstack_buf)
free the netstack buffer

Parameters
  • [in] netstack_buf: the net stack buffer

Macros
_ESP_NETIF_SUPPRESS_LEGACY_WARNING_

WiFi default API reference

Header File
  • components/esp_wifi/include/esp_wifi_default.h

Functions
esp_err_t esp_netif_attach_wifi_station (esp_netif_t *esp_netif)
Attaches wifi station interface to supplied netif.

Return
  • ESP_OK on success
  • ESP_FAIL if attach failed
Parameters
  • esp_netif: instance to attach the wifi station to

esp_err_t esp_netif_attach_wifi_ap (esp_netif_t *esp_netif)
Attaches wifi soft AP interface to supplied netif.

Return
- ESP_OK on success
- ESP_FAIL if attach failed

**Parameters**
- esp_netif: instance to attach the wifi AP to

```c
esp_err_t esp_wifi_set_default_wifi_sta_handlers(void)
```
Sets default wifi event handlers for STA interface.

**Return**
- ESP_OK on success, error returned from esp_event_handler_register if failed

```c
esp_err_t esp_wifi_set_default_wifi_ap_handlers(void)
```
Sets default wifi event handlers for AP interface.

**Return**
- ESP_OK on success, error returned from esp_event_handler_register if failed

```c
esp_err_t esp_wifi_clear_default_wifi_driver_and_handlers(void*)
```
Clears default wifi event handlers for supplied network interface.

**Return**
- ESP_OK on success, error returned from esp_event_handler_register if failed

**Parameters**
- esp_netif: instance of corresponding if object

```c
esp_netif_t* esp_netif_create_default_wifi_ap(void)
```
Creates default WiFi AP. In case of any init error this API aborts.

**Note** The API creates esp_netif object with default WiFi access point config, attaches the netif to wifi and registers default wifi handlers.

**Return**
- pointer to esp-netif instance

```c
esp_netif_t* esp_netif_create_default_wifi_sta(void)
```
Creates default WiFi STA. In case of any init error this API aborts.

**Note** The API creates esp_netif object with default WiFi station config, attaches the netif to wifi and registers default wifi handlers.

**Return**
- pointer to esp-netif instance

```c
void esp_netif_destroy_default_wifi(void*)
```
Destroys default WiFi netif created with esp_netif_create_default_wifi_A() API.

**Note** This API unregisters wifi handlers and detaches the created object from the wifi. (this function is a no-operation if esp_netif is NULL)

**Parameters**
- [in] esp_netif: object to detach from WiFi and destroy

```c
esp_netif_t* esp_netif_create_wifi(wifi_interface_t wifi_if, esp_netif_inherent_config_t *esp_netif_config)
```
Creates esp_netif WiFi object based on the custom configuration.

**Attention** This API DOES NOT register default handlers!

**Return**
- pointer to esp-netif instance

**Parameters**
- [in] wifi_if: type of wifi interface
- [in] esp_netif_config: inherent esp-netif configuration pointer

```c
esp_err_t esp_netif_create_default_wifi_mesh_netifs(esp_netif_t* p_netif_sta, esp_netif_t* p_netif_ap)
```
Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled. Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.
Return ESP_OK on success

Parameters
• [out] p_netif_sta: pointer where the resultant STA interface is saved (if non NULL)
• [out] p_netif_ap: pointer where the resultant AP interface is saved (if non NULL)

2.5.5 IP Network Layer

TCP/IP Adapter Migration Guide

TCP/IP Adapter is a network interface abstraction component used in IDF prior to v4.1. This page outlines migration from tcpip_adapter API to its successor ESP-NETIF.

Updating network connection code

Network stack initialization Simply replace tcpip_adapter_init() with esp_netif_init(). Please note that the ESP-NETIF initialization API returns standard error code and the esp_netif_deinit() for un-initialization is available.

Also replace #include "tcpip_adapter.h" with #include "esp_netif.h".

Network interface creation TCP/IP Adapter defined these three interfaces statically:
• WiFi Station
• WiFi Access Point
• Ethernet

Network interface instance shall be explicitly constructed for the ESP-NETIF to enable its connection to the TCP/IP stack. For example initialization code for WiFi has to explicitly call esp_netif_create_default_wifi_sta(); or esp_netif_create_default_wifi_ap(); after the TCP/IP stack and the event loop have been initialized. Please consult an example initialization code for these three interfaces:
• WiFi Station: wifi/getting_started/station/main/station_example_main.c
• WiFi Access Point: wifi/getting_started/softAP/main/softap_example_main.c
• Ethernet: ethernet/basic/main/ethernet_example_main.c

Replacing other tcpip_adapter API All the tcpip_adapter functions have their esp-netif counter-part. Please refer to the esp_netif.h grouped into these sections:
• Setters/Getters
• DHCP
• DNS
• IP address

Default event handlers Event handlers are moved from tcpip_adapter to appropriate driver code. There is no change from application code perspective, all events shall be handled in the same way. Please note that within IP related event handlers, application code usually receives IP addresses in a form of esp-netif specific struct (not the LwIP structs, but binary compatible). This is the preferred way of printing the address:

```
ESP_LOGI(TAG, "got ip:酊 IPSTR \n", IP2STR(&event->ip_info.ip));
```

Instead of

```
ESP_LOGI(TAG, "got ip:%s\n", ip4addr_ntoa(&event->ip_info.ip));
```

Since ip4addr_ntoa() is a LwIP API, the esp-netif provides esp_ip4addr_ntoa() as a replacement, but the above method is generally preferred.
IP addresses  It is preferred to use esp-netif defined IP structures. Please note that the LwIP structs will still work when default compatibility enabled. * esp-netif IP address definitions

Next steps  Additional step in porting an application to fully benefit from the ESP-NETIF is to disable the tcpip_adapter compatibility layer in the component configuration: ESP NETIF Adapter -> Enable backward compatible tcpip_adapter interface and check if the project compiles. TCP/IP adapter brings many include dependencies and this step might help in decoupling the application from using specific TCP/IP stack API directly.

ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with esp-netif connection capabilities. By convention the I/O driver has to register itself as an esp-netif driver and thus holds a dependency on esp-netif component and is responsible for providing data path functions, post-attach callback and in most cases also default event handlers to define network interface actions based on driver’s lifecycle transitions.

Packet input/output  As shown in the diagram, the following three API functions for the packet data path must be defined for connecting with esp-netif:

- esp_netif_transmit()
- esp_netif_free_rx_buffer()
- esp_netif_receive()

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e. they get called from esp-netif (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver’s code simply calls esp_netif_receive() on a new data received event.

Post attach callback  A final part of the network interface initialization consists of attaching the esp-netif instance to the I/O driver, by means of calling the following API:

```c
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle... DRIVER_HANDLE);
```

It is assumed that the esp_netif_iodriver_handle is a pointer to driver’s object, a struct derived from struct esp_netif_driver_base_s, so that the first member of I/O driver structure must be this base structure with pointers to

- post-attach function callback
- related esp-netif instance

As a consequence the I/O driver has to create an instance of the struct per below:

```c
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base;  /* ! base structure reserved as... DRIVER_BASE */
    esp_netif_driver_impl *impl;  /* handle of driver... IMPLEMENTATION */
    esp_netif_iodriver_handle handle;
} my_netif_driver_t;
```

with actual values of my_netif_driver_t::base.post_attach and the actual drivers handle my_netif_driver_t::h. So when the esp_netif_attach() gets called from the initialization code, the post-attach callback from I/O driver’s code gets executed to mutually register callbacks between esp-netif and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:
```c
static esp_err_t my_post_attach_start(esp_netif_t * esp_netif, void * args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
    my_driver_start(driver->driver_impl);
    return ESP_OK;
}
```

**Default handlers** I/O drivers also typically provide default definitions of lifecycle behaviour of related network interfaces based on state transitions of I/O drivers. For example `driver start` -> `network start`, etc. An example of such a default handler is provided below:

```c
esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_netif_t * esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_---EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_---EVENT_STOP, esp_netif);
    return ESP_OK;
}
```

**Network stack connection** The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the esp-netif, specifically from its TCP/IP stack connecting layer. The following API reference outlines these network stack interaction with the esp-netif.

**Header File**

- components/esp_netif/include/esp_netif_net_stack.h

**Functions**

- `esp_netif_t *esp_netif_get_handle_from_netif_impl(void *dev)`
  Returns esp-netif handle.

  **Return** handle to related esp-netif instance

  **Parameters**

  * [in] dev: opaque ptr to network interface of specific TCP/IP stack

- `void *esp_netif_get_netif_impl(esp_netif_t *esp_netif)`
  Returns network stack specific implementation handle (if supported)

  Note that it is not supported to acquire PPP netif impl pointer and this function will return NULL for esp_netif instances configured to PPP mode

  **Return** handle to related network stack netif handle

  **Parameters**

  * [in] esp_netif: Handle to esp-netif instance

- `esp_err_t esp_netif_transmit(esp_netif_t *esp_netif, void *data, size_t len)`
  Outputs packets from the TCP/IP stack to the media to be transmitted.

  This function gets called from network stack to output packets to IO driver.

  **Return** ESP_OK on success, an error passed from the I/O driver otherwise
### Parameters

- **[in]** `esp_netif`: Handle to esp-netif instance
- **[in]** `data`: Data to be transmitted
- **[in]** `len`: Length of the data frame

```c
esp_err_t esp_netif_transmit_wrap(esp_netif_t *esp_netif, void *data, size_t len, void *netstack_buf)
```

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

#### Return

- **ESP_OK** on success, an error passed from the I/O driver otherwise

### Parameters

- **[in]** `esp_netif`: Handle to esp-netif instance
- **[in]** `data`: Data to be transmitted
- **[in]** `len`: Length of the data frame
- **[in]** `netstack_buf`: net stack buffer

```c
void esp_netif_free_rx_buffer(esp_netif_t *esp_netif, void *buffer)
```

Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

#### Parameters

- **[in]** `esp_netif`: Handle to esp-netif instance
- **[in]** `buffer`: Rx buffer pointer

Code examples for TCP/IP socket APIs are provided in the `protocols/sockets` directory of ESP-IDF examples.

The TCP/IP Adapter (legacy network interface library) has been deprecated, please consult the [TCP/IP Adapter Migration Guide](#) to update existing IDF applications.

### 2.5.6 Application Layer

Documentation for Application layer network protocols (above the IP Network layer) are provided in [Application Protocols](#).

### 2.6 Peripherals API

#### 2.6.1 Analog to Digital Converter (ADC)

**ADC Channels**

The ESP32-C3 integrates 2 SAR (Successive Approximation Register) ADCs, supporting a total of 6 measurement channels (analog enabled pins).

These channels are supported:

**ADC1:**
- 5 channels: GPIO0 - GPIO4

**ADC2:**
- 1 channel: GPIO5

**ADC Attenuation**

Vref is the reference voltage used internally by ESP32-C3 ADCs for measuring the input voltage. The ESP32-C3 ADCs can measure analog voltages from 0 V to Vref. Among different chips, the Vref varies, the median is 1.1 V. In order to convert voltages larger than Vref, input voltages can be attenuated before being input to the ADCs. There are 4 available attenuation options, the higher the attenuation is, the higher the measurable input voltage could be.
### ADC Conversion

An ADC conversion is to convert the input analog voltage to a digital value. The ADC conversion results provided by the ADC driver APIs are raw data. Resolution of ESP32-C3 ADC raw results under Single Read mode is 12-bit.

- `adc1_get_raw()`
- `adc2_get_raw()`
- `adc_digi_read_bytes()

To calculate the voltage based on the ADC raw results, this formula can be used:

\[
V_{\text{out}} = \frac{D_{\text{out}} \times V_{\text{max}}}{D_{\text{max}}} \quad (1)
\]

where:

<table>
<thead>
<tr>
<th>Vout</th>
<th>Digital output result, standing for the voltage.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dout</td>
<td>ADC raw digital reading result.</td>
</tr>
<tr>
<td>Vmax</td>
<td>Maximum measurable input analog voltage, see <code>ADC Attenuation</code>.</td>
</tr>
<tr>
<td>Dmax</td>
<td>Maximum of the output ADC raw digital reading result, which is 4095 under Single Read mode, 4095 under Continuous Read mode.</td>
</tr>
</tbody>
</table>

For boards with eFuse ADC calibration bits, `esp_adc_cal_raw_to_voltage()` can be used to get the calibrated conversion results. These results stand for the actual voltage (in mV). No need to transform these data via the formula (1). If ADC calibration APIs are used on boards without eFuse ADC calibration bits, warnings will be generated. See `ADC Calibration`.

### ADC Limitations

**Note:**

- Since the ADC2 module is also used by the Wi-Fi, reading operation of `adc2_get_raw()` may fail between `esp_wifi_start()` and `esp_wifi_stop()`. Use the return code to see whether the reading is successful.
- A specific ADC module can only work under one operating mode at any one time, either Continuous Read Mode or Single Read Mode.
- ADC1 and ADC2 cannot work under Single Read Mode simultaneously. One of them will get blocked until another one finishes.
- For continuous (DMA) read mode, the ADC sampling frequency (the `sample_freq_hz` member of `adc_digi_config_t`) should be within `SOC_ADC_SAMPLE_FREQ_THRES_LOW` and `SOC_ADC_SAMPLE_FREQ_THRES_HIGH`.

### Driver Usage

Each ADC unit supports two work modes, ADC single read mode and ADC continuous (DMA) mode. ADC single read mode is suitable for low-frequency sampling operations. ADC continuous (DMA) read mode is suitable for high-frequency continuous sampling actions.
### ADC Continuous (DMA) Read mode

To use the ADC continuous read mode driver, execute the following steps:

1. Initialize the ADC driver by calling the function `adc_digi_initialize()`.
2. Initialize the ADC controller by calling the function `adc_digi_controller_config()`.
3. Start the ADC continuous reading by calling the function `adc_digi_start()`.
4. After starting the ADC, you can get the ADC reading result by calling the function `adc_digi_read_bytes()`. Before stopping the ADC (by calling `adc_digi_stop()`), the driver will keep converting the analog data to digital data.
5. Stop the ADC reading by calling the function `adc_digi_stop()`.
6. Deinitialize the ADC driver by calling the function `adc_digi_deinitialize()`.

The code example for using ADC continuous (DMA) read mode can be found in the `peripherals/adc/dma_read` directory of ESP-IDF examples. See [ADC Limitations](#) for the limitation of using ADC continuous (DMA) read mode.

### ADC Single Read mode

The ADC should be configured before reading is taken.

- For ADC1, configure desired precision and attenuation by calling functions `adc1_config_width()` and `adc1_config_channel_atten()`.
- For ADC2, configure the attenuation by `adc2_config_channel_atten()`. The reading width of ADC2 is configured every time you take the reading.

Attenuation configuration is done per channel, see `adc1_channel_t` and `adc2_channel_t`, set as a parameter of above functions.

Then it is possible to read ADC conversion result with `adc1_get_raw()` and `adc2_get_raw()`. Reading width of ADC2 should be set as a parameter of `adc2_get_raw()` instead of in the configuration functions.

Single Read mode ADC example can be found in `peripherals/adc/single_read` directory of ESP-IDF examples. See [ADC Limitations](#) for the limitation of using ADC single read mode.

### Minimizing Noise

The ESP32-C3 ADC can be sensitive to noise leading to large discrepancies in ADC readings. Depending on the usage scenario, users may connect a bypass capacitor (e.g. a 100 nF ceramic capacitor) to the ADC input pad in use, to minimize noise. Besides, multisampling may also be used to further mitigate the effects of noise.

### ADC Calibration

ESP32-C3 ADC Calibration contains 2 steps: Hardware Calibration and Software Calibration.

#### Hardware Calibration

Based on series of comparisons with the reference voltage, ESP32-C3 ADC determines each bit of the output digital result. Per design the ESP32-C3 ADC reference voltage is 1100 mV, however the true reference voltage can range from 1000 mV to 1200 mV among different chips. To minimize this difference, hardware calibration is introduced.

Hardware calibration contains 2 steps:

1. Set an auto-calibration parameter of bandgap voltage reference. In this way, the difference mentioned above can be minimized.
2. Correct the offset of the ADC Vin-Dout characteristics. ADC characteristics is generally a function: f(x) = A * x + B, where B is the offset.

An uncalibrated ADC characteristics is as follows:

The offset in the uncalibrated characteristics is significant. Step 2 is to correct the offset to 0.

After hardware calibration, the ADC characteristics would be like:

Hardware calibration is done internally by the ADC driver. The consequent results are raw data. A transformation is needed to get the final result, see ADC Conversion.

**Software Calibration**  To convert ADC raw data to calibrated digital data, following steps should be followed:

1. Check the eFuse to know if the software calibration is supported via `esp_adc_cal_check_efuse()`.
2. Calculate the ADC calibration characteristics via `esp_adc_cal_characterize()`. The ADC software calibration characteristics are per ADC module and per attenuation. For example, characteristics of ADC1 channel 0 under 11 dB attenuation are the same as characteristics of ADC1 channel 2 under 11 dB attenuation. But characteristics of ADC1 channel 0 under 11 dB attenuation are different with characteristics of ADC2 channel 0 under 11 dB attenuation. Also characteristics of ADC1 channel 0 under 11 dB attenuation are different with characteristics of ADC1 channel 0 under 6 dB attenuation.
3. Get the actual voltage value via `esp_adc_cal_raw_to_voltage()`.

After software calibration, the ADC characteristics would be like:

The results provided by the ADC calibration APIs indicate the actual voltage values. ADC software calibration example can be found in `peripherals/adc/single_read` directory of ESP-IDF examples.

**GPIO Lookup Macros**

There are macros available to specify the GPIO number of a ADC channel, or vice versa. e.g.

1. `ADC1_CHANNEL_0_GPIO_NUM` is the GPIO number of ADC1 channel 0.
2. `ADC1_GPIO0_CHANNEL` is the ADC1 channel number of GPIO n.
API Reference

This reference covers three components:

- ADC driver
- ADC Calibration
- GPIO Lookup Macros

ADC driver

Header File

- components/driver/include/driver/adc.h

Functions

void **adc_power_on**(void)

Enable ADC power.

void **adc_power_off**(void)

Power off SAR ADC.

void **adc_power_acquire**(void)

Increment the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0. Call **adc_power_release** when done using the ADC.

void **adc_power_release**(void)

Decrement the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0. Call this function when done using the ADC.

**esp_err_t adc1_pad_get_io_num(adc1_channel_t channel, gpio_num_t *gpio_num)**

Get the GPIO number of a specific ADC1 channel.

Return

- ESP_OK if success
- ESP_ERR_INVALID_ARG if channel not valid

Parameters

- channel: Channel to get the GPIO number
- gpio_num: output buffer to hold the GPIO number

**esp_err_t adc1_config_channel_atten(adc1_channel_t channel, adc_atten_t atten)**

Set the attenuation of a particular channel on ADC1, and configure its associated GPIO pin mux.

The default ADC voltage is for attenuation 0 dB and listed in the table below. By setting higher attenuation it is possible to read higher voltages.

Due to ADC characteristics, most accurate results are obtained within the “suggested range” shown in the following table.

<table>
<thead>
<tr>
<th>SoC</th>
<th>attenuation (dB)</th>
<th>suggested range (mV)</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP32</td>
<td>0</td>
<td>100 ~ 950</td>
</tr>
<tr>
<td></td>
<td>2.5</td>
<td>100 ~ 1250</td>
</tr>
<tr>
<td></td>
<td>6</td>
<td>150 ~ 1750</td>
</tr>
<tr>
<td></td>
<td>11</td>
<td>150 ~ 2450</td>
</tr>
<tr>
<td></td>
<td>0</td>
<td>0 ~ 750</td>
</tr>
</tbody>
</table>

(continues on next page)
For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

**Note** For any given channel, this function must be called before the first time `adc1_get_raw()` is called for that channel.

**Note** This function can be called multiple times to configure multiple ADC channels simultaneously. You may call `adc1_get_raw()` only after configuring a channel.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `channel`: ADC1 channel to configure
- `atten`: Attenuation level

```c
def esp_err_t adc1_config_width(adc_bits_width_t width_bit)
{
    // Configure ADC1 capture width, meanwhile enable output invert for ADC1. The configuration is for all channels of ADC1.
    // Return
    // ESP_OK success
    // ESP_ERR_INVALID_ARG Parameter error

    // Parameters
    // width_bit: Bit capture width for ADC1
```

```c
int adc1_get_raw(adc1_channel_t channel)
{
    // Take an ADC1 reading from a single channel.
    // Return
    // -1: Parameter error
    // Other: ADC1 channel reading.

    // Parameters
    // channel: ADC1 channel to read
```

```c
esp_err_t adc2_pad_get_io_num(adc2_channel_t channel, gpio_num_t *gpio_num)
{
    // Get the GPIO number of a specific ADC2 channel.
    // Return
    // ESP_OK if success
    // ESP_ERR_INVALID_ARG if channel not valid

    // Parameters
    // channel: Channel to get the GPIO number
    // gpio_num: output buffer to hold the GPIO number
```

```c
esp_err_t adc2_config_channel_atten(adc2_channel_t channel, adc_atten_t atten)
```
Configure the ADC2 channel, including setting attenuation.

The default ADC voltage is for attenuation 0 dB and listed in the table below. By setting higher attenuation it is possible to read higher voltages.

Due to ADC characteristics, most accurate results are obtained within the “suggested range” shown in the following table.

```
<table>
<thead>
<tr>
<th>SoC</th>
<th>attenuation (dB)</th>
<th>suggested range (mV)</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP32</td>
<td>0</td>
<td>100 ~ 950</td>
</tr>
<tr>
<td></td>
<td>2.5</td>
<td>100 ~ 1250</td>
</tr>
<tr>
<td></td>
<td>6</td>
<td>150 ~ 1750</td>
</tr>
<tr>
<td></td>
<td>11</td>
<td>150 ~ 2450</td>
</tr>
<tr>
<td>ESP32-S2</td>
<td>0</td>
<td>0 ~ 750</td>
</tr>
<tr>
<td></td>
<td>2.5</td>
<td>0 ~ 1050</td>
</tr>
<tr>
<td></td>
<td>6</td>
<td>0 ~ 1300</td>
</tr>
<tr>
<td></td>
<td>11</td>
<td>0 ~ 2500</td>
</tr>
</tbody>
</table>
```

For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

**Note** This function also configures the input GPIO pin mux to connect it to the ADC2 channel. It must be called before calling `adc2_get_raw()` for this channel.

**Note** For any given channel, this function must be called before the first time `adc2_get_raw()` is called for that channel.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- channel: ADC2 channel to configure
- atten: Attenuation level

```c
esp_err_t adc2_get_raw(adc2_channel_t channel, adc_bits_width_t width_bit, int *raw_out)
```

Take an ADC2 reading on a single channel.

**Note** ESP32: When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of 'ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

**Note** ESP32: For a given channel, `adc2_config_channel_atten()` must be called before the first time this function is called. If Wi-Fi is started via `esp_wifi_start()`, this function will always fail with ESP_ERR_TIMEOUT.

**Note** ESP32-S2: ADC2 support hardware arbiter. The arbiter is to improve the use efficiency of ADC2. After the control right is robbed by the high priority, the low priority controller will read the invalid ADC2 data. Default priority: Wi-Fi > RTC > Digital;

**Return**
- ESP_OK if success
- ESP_ERR_TIMEOUT ADC2 is being used by other controller and the request timed out.
- ESP_ERR_INVALID_STATE The controller status is invalid. Please try again.
Parameters

- **channel**: ADC2 channel to read
- **width_bit**: Bit capture width for ADC2
- **raw_out**: the variable to hold the output data.

**esp_err_t adc_vref_to_gpio(adc_unit_t adc_unit, gpio_num_t gpio)**

Output ADC1 or ADC2’s reference voltage to adc2_channe_t’s IO.

This function routes the internal reference voltage of ADCn to one of ADC2’s channels. This reference voltage can then be manually measured for calibration purposes.

**Note** ESP32 only supports output of ADC2’s internal reference voltage.

**Return**

- ESP_OK: v_ref successfully routed to selected GPIO
- ESP_ERR_INVALID_ARG: Unsupported GPIO

**Parameters**

- **[in]** adc_unit: ADC unit index
- **[in]** gpio: GPIO number (Only ADC2’s channels IO are supported)

**esp_err_t adc2_vref_to_gpio(gpio_num_t gpio)**

Output ADC2 reference voltage to adc2_channe_t’s IO.

This function routes the internal reference voltage of ADCn to one of ADC2’s channels. This reference voltage can then be manually measured for calibration purposes.

**Return**

- ESP_OK: v_ref successfully routed to selected GPIO
- ESP_ERR_INVALID_ARG: Unsupported GPIO

**Parameters**

- **[in]** gpio: GPIO number (ADC2’s channels are supported)

**esp_err_t adc_digi_initialize(const adc_digi_init_config_t *init_config)**

Initialize the Digital ADC.

**Return**

- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_NO_MEM If out of memory
- ESP_OK On success

**Parameters**

- **init_config**: Pointer to Digital ADC initialization config. Refer to adc_digi_init_config_t.

**esp_err_t adc_digi_read_bytes(uint8_t *buf, uint32_t length_max, uint32_t *out_length, uint32_t timeout_ms)**

Read bytes from Digital ADC through DMA.

**Return**

- ESP_ERR_INVALID_STATE Driver state is invalid. Usually it means the ADC sampling rate is faster than the task processing rate.
- ESP_ERR_TIMEOUT Operation timed out
- ESP_OK On success

**Parameters**

- **[out]** buf: Buffer to read from ADC.
- **[in]** length_max: Expected length of data read from the ADC.
- **[out]** out_length: Real length of data read from the ADC via this API.
- **[in]** timeout_ms: Time to wait for data via this API, in millisecond.

**esp_err_t adc_digi_start(void)**

Start the Digital ADC and DMA peripherals. After this, the hardware starts working.

**Return**

- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success
**esp_err_t adc_digi_stop (void)**

Stop the Digital ADC and DMA peripherals. After this, the hardware stops working.

**Return**
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

**esp_err_t adc_digi_deinit (void)**

Deinitialize the Digital ADC.

**Return**
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

**esp_err_t adc_digi_controller_config (const adc_digi_configuration_t *config)**

Setting the digital controller.

**Return**
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_OK On success

**Parameters**
- `config`: Pointer to digital controller parameter. Refer to `adc_digi_config_t`.

**esp_err_t adc_digi_filter_reset (adc_digi_filter_idx_t idx)**

Reset adc digital controller filter.

**Return**
- ESP_OK Success

**Parameters**
- `idx`: Filter index.

**esp_err_t adc_digi_filter_set_config (adc_digi_filter_idx_t idx, adc_digi_filter_t *config)**

Set adc digital controller filter configuration.

**Note** For ESP32S2, Filter IDX0/IDX1 can only be used to filter all enabled channels of ADC1/ADC2 unit at the same time.

**Return**
- ESP_OK Success

**Parameters**
- `idx`: Filter index.
- `config`: See `adc_digi_filter_t`.

**esp_err_t adc_digi_filter_get_config (adc_digi_filter_idx_t idx, adc_digi_filter_t *config)**

Get adc digital controller filter configuration.

**Note** For ESP32S2, Filter IDX0/IDX1 can only be used to filter all enabled channels of ADC1/ADC2 unit at the same time.

**Return**
- ESP_OK Success

**Parameters**
- `idx`: Filter index.
- `config`: See `adc_digi_filter_t`.

**esp_err_t adc_digi_filter_enable (adc_digi_filter_idx_t idx, bool enable)**

Enable/disable adc digital controller filter. Filtering the ADC data to obtain smooth data at higher sampling rates.

**Note** For ESP32S2, Filter IDX0/IDX1 can only be used to filter all enabled channels of ADC1/ADC2 unit at the same time.

**Return**
- ESP_OK Success

**Parameters**
- `idx`: Filter index.
- `enable`: Enable/Disable filter.
Chapter 2. API Reference

esp_err_t adc_digi_monitor_set_config(adc_digi_monitor_idx_t idx, adc_digi_monitor_t *config)

Config monitor of adc digital controller.

Note For ESP32S2, The monitor will monitor all the enabled channel data of the each ADC unit at the same time.

Return
• ESP_OK Success

Parameters
• idx: Monitor index.
• config: See adc_digi_monitor_t.

esp_err_t adc_digi_monitor_enable(adc_digi_monitor_idx_t idx, bool enable)

Enable/disable monitor of adc digital controller.

Note For ESP32S2, The monitor will monitor all the enabled channel data of the each ADC unit at the same time.

Return
• ESP_OK Success

Parameters
• idx: Monitor index.
• enable: True or false enable monitor.

Structures
struct adc_digi_init_config_s
ADC DMA driver configuration.

Public Members

uint32_t max_store_buf_size
Max length of the converted data that driver can store before they are processed.

uint32_t conv_num_each_intr
Bytes of data that can be converted in 1 interrupt.

uint32_t adc1_chan_mask
Channel list of ADC1 to be initialized.

uint32_t adc2_chan_mask
Channel list of ADC2 to be initialized.

struct adc_digi_configuration_t
ADC digital controller settings.

Public Members

bool conv_limit_en
To limit ADC conversion times. Conversion stops after finishing conv_limit_num times conversion.

uint32_t conv_limit_num
Set the upper limit of the number of ADC conversion triggers. Range: 1 ~ 255.

uint32_t pattern_num
Number of ADC channels that will be used.

adc_digi_pattern_config_t *adc_pattern
List of configs for each ADC channel that will be used.

uint32_t sample_freq_hz
The expected ADC sampling frequency in Hz. Range: 611Hz ~ 83333Hz Fs = Fd / interval / 2 Fs: sampling frequency; Fd: digital controller frequency, no larger than 5M for better performance interval:
interval between 2 measurement trigger signal, the smallest interval should not be smaller than the ADC measurement period, the largest interval should not be larger than 4095

```plaintext
adc_digi_convert_mode_t conv_mode
ADC DMA conversion mode, see adc_digi_convert_mode_t.

adc_digi_output_format_t format
ADC DMA conversion output format, see adc_digi_output_format_t.
```

### Macros

```plaintext
ADC_ATTEN_0db
ADC rtc controller attenuation option.

Note: This definitions are only for being back-compatible

ADC_ATTEN_2_5db
ADC_ATTEN_6db
ADC_ATTEN_11db

ADC_WIDTH_BIT_DEFAULT
The default (max) bit width of the ADC of current version. You can also get the maximum bitwidth by SOC_ADC_MAX_BITWIDTH defined in soc_caps.h.

ADC_WIDTH_9Bit
ADC_WIDTH_10Bit
ADC_WIDTH_11Bit
ADC_WIDTH_12Bit

ADC_MAX_DELAY
Digital ADC DMA read max timeout value, it may make the adc_digi_read_bytes block forever if the OS supports.
```

### Type Definitions

```plaintext
typedef struct adc_digi_init_config_s adc_digi_init_config_t
ADC DMA driver configuration.
```

### Enumerations

```plaintext
enum adc1_channel_t
Values:

ADC1_CHANNEL_0 = 0
ADC1 channel 0 is GPIO0

ADC1_CHANNEL_1
ADC1 channel 1 is GPIO1

ADC1_CHANNEL_2
ADC1 channel 2 is GPIO2

ADC1_CHANNEL_3
ADC1 channel 3 is GPIO3

ADC1_CHANNEL_4
ADC1 channel 4 is GPIO4

ADC1_CHANNEL_MAX
```

```plaintext
enum adc2_channel_t
Values:

ADC2_CHANNEL_0 = 0
ADC2 channel 0 is GPIO5
```
ADC2_CHANNEL_MAX

enum adc_i2s_encode_t
ADC digital controller encode option.
Values:

ADC_ENCODE_12BIT
ADC to DMA data format, [15:12]-channel [11:0]-12 bits ADC data

ADC_ENCODE_11BIT
ADC to DMA data format, [15]-unit, [14:11]-channel [10:0]-11 bits ADC data

ADC_ENCODE_MAX

Header File
- components/hal/include/hal/adc_types.h

Structures
struct adc_digi_pattern_config_t
ADC digital controller pattern configuration.

Public Members
uint8_t atten
Attenuation of this ADC channel.

uint8_t channel
ADC channel.

uint8_t unit
ADC unit.

uint8_t bit_width
ADC output bit width.

struct adc_digi_output_data_t
ADC digital controller (DMA mode) output data format. Used to analyze the acquired ADC (DMA) data.

Public Members
uint32_t data : 12
ADC real output data info. Resolution: 12 bit.

uint32_t reserved12 : 1
Reserved12.

uint32_t channel : 3
ADC channel index info. If (channel < ADC_CHANNEL_MAX), The data is valid. If (channel >
ADC_CHANNEL_MAX), The data is invalid.

uint32_t unit : 1
ADC unit index info. 0: ADC1; 1: ADC2.

uint32_t reserved17_31 : 15
Reserved17.

struct adc_digi_output_data_t::[anonymous]::[anonymous] type2
When the configured output format is 12bit. ADC_DIGI_FORMAT_11BIT

uint32_t val
Raw data value
**struct adc_arbiter_t**

ADC arbiter work mode and priority setting.

*Note* ESP32-S2: Only ADC2 support arbiter.

**Public Members**

```c
adc_arbiter_mode_t mode
```

Refer to `adc_arbiter_mode_t`. Note: only support ADC2.

```c
uint8_t rtc_pri
```

RTC controller priority. Range: 0 ~ 2.

```c
uint8_t dig_pri
```

Digital controller priority. Range: 0 ~ 2.

```c
uint8_t pwdet_pri
```

Wi-Fi controller priority. Range: 0 ~ 2.

**struct adc_digi_filter_t**

ADC digital controller (DMA mode) filter configuration.

*Note* For ESP32-S2, the filter object of the ADC is fixed.

*Note* For ESP32-S2, the filter object is always all enabled channels.

**Public Members**

```c
adc_unit_t adc_unit
```

Set adc unit number for filter. For ESP32-S2, Filter IDX0/IDX1 can only be used to filter all enabled channels of ADC1/ADC2 unit at the same time.

```c
adc_channel_t channel
```

Set adc channel number for filter. For ESP32-S2, it’s always ADC_CHANNEL_MAX

```c
adc_digi_filter_mode_t mode
```

Set adc filter mode for filter. See `adc_digi_filter_mode_t`.

**struct adc_digi_monitor_t**

ADC digital controller (DMA mode) monitor configuration.

*Note* For ESP32-S2, the monitor object of the ADC is fixed.

*Note* For ESP32-S2, the monitor object is always all enabled channels.

**Public Members**

```c
adc_unit_t adc_unit
```

Set adc unit number for monitor. For ESP32-S2, monitor IDX0/IDX1 can only be used to monitor all enabled channels of ADC1/ADC2 unit at the same time.

```c
adc_channel_t channel
```

Set adc channel number for monitor. For ESP32-S2, it’s always ADC_CHANNEL_MAX

```c
adc_digi_monitor_mode_t mode
```

Set adc monitor mode. See `adc_digi_monitor_mode_t`.

```c
uint32_t h_threshold
```

Set monitor threshold of adc digital controller.

```c
uint32_t l_threshold
```

Set monitor threshold of adc digital controller.
Chapter 2. API Reference

Macros

ADC_ARBITER_CONFIG_DEFAULT()
ADC arbiter default configuration.

Note ESP32S2: Only ADC2 supports (needs) an arbiter.

Enumerations

enum adc_unit_t
ADC unit enumeration.

Note For ADC digital controller (DMA mode), ESP32 doesn’t support ADC_UNIT_2, ADC_UNIT_BOTH, ADC_UNIT_ALTER.

Values:

ADC_UNIT_1 = 1
SAR ADC 1.

ADC_UNIT_2 = 2
SAR ADC 2.

ADC_UNIT_BOTH = 3
SAR ADC 1 and 2.

ADC_UNIT_ALTER = 7
SAR ADC 1 and 2 alternative mode.

ADC_UNIT_MAX

enum adc_channel_t
ADC channels handle. See adc1_channel_t, adc2_channel_t.

Note For ESP32 ADC1, don’t use ADC_CHANNEL_8, ADC_CHANNEL_9. See adc1_channel_t.

Values:

ADC_CHANNEL_0 = 0
ADC channel

ADC_CHANNEL_1
ADC channel

ADC_CHANNEL_2
ADC channel

ADC_CHANNEL_3
ADC channel

ADC_CHANNEL_4
ADC channel

ADC_CHANNEL_5
ADC channel

ADC_CHANNEL_6
ADC channel

ADC_CHANNEL_7
ADC channel

ADC_CHANNEL_8
ADC channel

ADC_CHANNEL_9
ADC channel

ADC_CHANNEL_MAX
enum adc_atten_t
ADC attenuation parameter. Different parameters determine the range of the ADC. See adc1_config_channel_atten.

Values:

ADC_ATTEN_DB_0 = 0
No input attenuation, ADC can measure up to approx. 800 mV.

ADC_ATTEN_DB_2_5 = 1
The input voltage of ADC will be attenuated extending the range of measurement by about 2.5 dB (1.33 x)

ADC_ATTEN_DB_6 = 2
The input voltage of ADC will be attenuated extending the range of measurement by about 6 dB (2 x)

ADC_ATTEN_DB_11 = 3
The input voltage of ADC will be attenuated extending the range of measurement by about 11 dB (3.55 x)

ADC_ATTEN_MAX

enum adc_bits_width_t
ADC resolution setting option.

Note Only used in single read mode

Values:

ADC_WIDTH_BIT_12 = 3
ADC capture width is 12Bit.

ADC_WIDTH_MAX

enum adc_digi_convert_mode_t
ADC digital controller (DMA mode) work mode.

Values:

ADC_CONV_SINGLE_UNIT_1 = 1
Only use ADC1 for conversion.

ADC_CONV_SINGLE_UNIT_2 = 2
Only use ADC2 for conversion.

ADC_CONV_BOTH_UNIT = 3
Use Both ADC1 and ADC2 for conversion simultaneously.

ADC_CONV_ALTER_UNIT = 7
Use both ADC1 and ADC2 for conversion by turn. e.g. ADC1 -> ADC2 -> ADC1 -> ADC2 ... .

ADC_CONV_UNIT_MAX

enum adc_digi_output_format_t
ADC digital controller (DMA mode) output data format option.

Values:

ADC_DIGI_FORMAT_12BIT
ADC to DMA data format, [15:12]-channel, [11: 0]-12 bits ADC data (adc_digi_output_data_t). Note: For single convert mode.

ADC_DIGI_FORMAT_11BIT
ADC to DMA data format, [15]-adc unit, [14:11]-channel, [10: 0]-11 bits ADC data (adc_digi_output_data_t). Note: For multi or alter convert mode.

ADC_DIGI_FORMAT_MAX

ADC_DIGI_OUTPUT_FORMAT_TYPE1
See adc_digi_output_data_t.type1
ADC_DIGI_OUTPUT_FORMAT_TYPE2
See `adc_digi_output_data_t.type2`

enum adc_arbiter_mode_t
ADC arbiter work mode option.

Note ESP32-S2: Only ADC2 support arbiter.

Values:

ADC_ARB_MODE_SHIELD
Force shield arbiter, Select the highest priority controller to work.

ADC_ARB_MODE_FIX
Fixed priority switch controller mode.

ADC_ARB_MODE_LOOP
Loop priority switch controller mode. Each controller has the same priority, and the arbiter will switch to the next controller after the measurement is completed.

enum adc_digi_filter_idx_t
ADC digital controller (DMA mode) filter index options.

Note For ESP32-S2, The filter object of the ADC is fixed.

Values:

ADC_DIGI_FILTER_IDX0 = 0
The filter index 0. For ESP32-S2, It can only be used to filter all enabled channels of ADC1 unit at the same time.

ADC_DIGI_FILTER_IDX1
The filter index 1. For ESP32-S2, It can only be used to filter all enabled channels of ADC2 unit at the same time.

ADC_DIGI_FILTER_IDX_MAX

enum adc_digi_filter_mode_t
ADC digital controller (DMA mode) filter type options. Expression: filter_data = (k-1)/k * last_data + new_data / k.

Values:

ADC_DIGI_FILTER_DIS = -1
Disable filter

ADC_DIGI_FILTER_IIR_2 = 0
The filter mode is first-order IIR filter. The coefficient is 2.

ADC_DIGI_FILTER_IIR_4
The filter mode is first-order IIR filter. The coefficient is 4.

ADC_DIGI_FILTER_IIR_8
The filter mode is first-order IIR filter. The coefficient is 8.

ADC_DIGI_FILTER_IIR_16
The filter mode is first-order IIR filter. The coefficient is 16.

ADC_DIGI_FILTER_IIR_64
The filter mode is first-order IIR filter. The coefficient is 64.

ADC_DIGI_FILTER_IIR_MAX

enum adc_digi_monitor_idx_t
ADC digital controller (DMA mode) monitor index options.

Note For ESP32-S2, The monitor object of the ADC is fixed.

Values:
ADC_DIGI_MONITOR_IDX0 = 0
The monitor index 0. For ESP32-S2, it can only be used to monitor all enabled channels of ADC1 unit at the same time.

ADC_DIGI_MONITOR_IDX1
The monitor index 1. For ESP32-S2, it can only be used to monitor all enabled channels of ADC2 unit at the same time.

ADC_DIGI_MONITOR_IDX_MAX

e num adc_digi_monitor_mode_t
Set monitor mode of adc digital controller. MONITOR_HIGH: If ADC_OUT > threshold, Generates monitor interrupt. MONITOR_LOW: If ADC_OUT < threshold, Generates monitor interrupt.

Values:

ADC_DIGI_MONITOR_DIS = 0
Disable monitor.

ADC_DIGI_MONITOR_EN
If ADC_OUT < threshold, Generates monitor interrupt. If ADC_OUT > threshold, Generates monitor interrupt.

ADC_DIGI_MONITOR_MAX

e num adc_i2s_source_t
ESP32 ADC DMA source selection.

Values:

ADC_I2S_DATA_SRC_IO_SIG = 0
I2S data from GPIO matrix signal

ADC_I2S_DATA_SRC_ADC = 1
I2S data from ADC

ADC_I2S_DATA_SRC_MAX

ADC Calibration

Header File
• components/esp_adc_cal/include/esp_adc_cal.h

Functions

esp_err_t esp_adc_cal_check_efuse (esp_adc_cal_value_t value_type)
Checks if ADC calibration values are burned into eFuse.

This function checks if ADC reference voltage or Two Point values have been burned to the eFuse of the current ESP32

Note in ESP32S2, only ESP_ADC_CAL_VAL_EFUSE_TP is supported. Some old ESP32S2s do not support this, either. In which case you have to calibrate it manually, possibly by performing your own two-point calibration on the chip.

Return
• ESP_OK: The calibration mode is supported in eFuse
• ESP_ERR_NOT_SUPPORTED: Error, eFuse values are not burned
• ESP_ERR_INVALID_ARG: Error, invalid argument (ESP_ADC_CAL_VAL_DEFAULT_VREF)

Parameters
• value_type: Type of calibration value (ESP_ADC_CAL_VAL_EFUSE_VREF or ESP_ADC_CAL_VAL_EFUSE_TP)
**esp_adc_cal_value_t**

`esp_adc_cal_characterize(adc_unit_t adc_num, adc_atten_t atten, adc_bits_width_t bit_width, uint32_t default_vref, esp_adc_cal_characteristics_t *chars)`

Characterize an ADC at a particular attenuation.

This function will characterize the ADC at a particular attenuation and generate the ADC-Voltage curve in the form of \[ y = \text{coeff}_a \times x + \text{coeff}_b \]. Characterization can be based on Two Point values, eFuse Vref, or default Vref and the calibration values will be prioritized in that order.

**Note** For ESP32, Two Point values and eFuse Vref calibration can be enabled/disabled using menuconfig. For ESP32s2, only Two Point values calibration and only ADC_WIDTH_BIT_13 is supported. The parameter default_vref is unused.

**Return**
- ESP_ADC_CAL_VAL_EFUSE_VREF: eFuse Vref used for characterization
- ESP_ADC_CAL_VAL_EFUSE_TP: Two Point value used for characterization (only in Linear Mode)
- ESP_ADC_CAL_VAL_DEFAULT_VREF: Default Vref used for characterization

**Parameters**
- **[in]** `adc_num`: ADC to characterize (ADC_UNIT_1 or ADC_UNIT_2)
- **[in]** `atten`: Attenuation to characterize
- **[in]** `bit_width`: Bit width configuration of ADC
- **[in]** `default_vref`: Default ADC reference voltage in mV (Only in ESP32, used if eFuse values is not available)
- **[out]** `chars`: Pointer to empty structure used to store ADC characteristics

**uint32_t**

`esp_adc_cal_raw_to_voltage(uint32_t adc_reading, const esp_adc_cal_characteristics_t *chars)`

Convert an ADC reading to voltage in mV.

This function converts an ADC reading to a voltage in mV based on the ADC’s characteristics.

**Note** Characteristics structure must be initialized before this function is called (call esp_adc_cal_characterize())

**Return** Voltage in mV

**Parameters**
- **[in]** `adc_reading`: ADC reading
- **[in]** `chars`: Pointer to initialized structure containing ADC characteristics

**esp_err_t**

`esp_adc_cal_get_voltage(adc_channel_t channel, const esp_adc_cal_characteristics_t *chars, uint32_t *voltage)`

Reads an ADC and converts the reading to a voltage in mV.

This function reads an ADC then converts the raw reading to a voltage in mV based on the characteristics provided. The ADC that is read is also determined by the characteristics.

**Note** The Characteristics structure must be initialized before this function is called (call esp_adc_cal_characterize())

**Return**
- ESP_OK: ADC read and converted to mV
- ESP_ERR_INVALID_ARG: Error due to invalid arguments
- ESP_ERR_INVALID_STATE: Reading result is invalid. Try to read again.

**Parameters**
- **[in]** `channel`: ADC Channel to read
- **[in]** `chars`: Pointer to initialized ADC characteristics structure
- **[out]** `voltage`: Pointer to store converted voltage

---

**Structures**

**struct esp_adc_cal_characteristics_t**

Structure storing characteristics of an ADC.

**Note** Call esp_adc_cal_characterize() to initialize the structure
Public Members

```c
adc_unit_t adc_num
    ADC number

adc_atten_t atten
    ADC attenuation

adc_bits_width_t bit_width
    ADC bit width

uint32_t coeff_a
    Gradient of ADC-Voltage curve

uint32_t coeff_b
    Offset of ADC-Voltage curve

uint32_t vref
    Vref used by lookup table

const uint32_t* low_curve
    Pointer to low Vref curve of lookup table (NULL if unused)

const uint32_t* high_curve
    Pointer to high Vref curve of lookup table (NULL if unused)

uint8_t version
    ADC Calibration
```

Enumerations

```
enum esp_adc_cal_value_t
    Type of calibration value used in characterization.
    Values:

    ESP_ADC_CAL_VAL_EFUSE_VREF = 0
        Characterization based on reference voltage stored in eFuse

    ESP_ADC_CAL_VAL_EFUSE_TP = 1
        Characterization based on Two Point values stored in eFuse

    ESP_ADC_CAL_VAL_DEFAULT_VREF = 2
        Characterization based on default reference voltage

    ESP_ADC_CAL_VAL_EFUSE_TP_FIT = 3
        Characterization based on Two Point values and fitting curve coefficients stored in eFuse

    ESP_ADC_CAL_VAL_MAX

    ESP_ADC_CAL_VAL_NOT_SUPPORTED = ESP_ADC_CAL_VAL_MAX

2.6.2 GPIO & RTC GPIO

Overview

The ESP32-C3 chip features 22 physical GPIO pads (GPIO0 ~ GPIO21). Some GPIO pads cannot be used or do not have the corresponding pin on the chip package. For more details, see ESP32-C3 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX) [PDF]. Each pad can be used as a general purpose I/O or can be connected to an internal peripheral signal.

The table below provides more information on pin usage, and please note the comments in the table for GPIOs with restrictions.

Note:

- Strapping pin: GPIO2, GPIO8 and GPIO9 are strapping pins. For more information, please refer to ESP32-C3 datasheet.
- SPI0/1: GPIO12-17 are usually used for SPI flash and PSRAM and not recommended for other uses.
- USB-JTAG: GPIO 18 and 19 are used by USB-JTAG by default. In order to use them as GPIOs, USB-JTAG will be disabled by the drivers.
Chapter 2. API Reference

- RTC: GPIO0-5 can be used when in deep sleep.

Application Example

GPIO output and input interrupt example: peripherals/gpio/generic_gpio.

API Reference - Normal GPIO

Header File
- components/driver/include/driver/gpio.h

Functions

`esp_err_t gpio_config(const gpio_config_t *pGPIOConfig)`

GPIO common configuration.

- Configure GPIO's Mode, pull-up, PullDown, IntrType

`Return`
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

`Parameters`
- pGPIOConfig: Pointer to GPIO configure struct

`esp_err_t gpio_reset_pin(gpio_num_t gpio_num)`

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

- Note This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

- Return Always return ESP_OK.

- Parameters
  - gpio_num: GPIO number.

`esp_err_t gpio_set_intr_type(gpio_num_t gpio_num, gpio_int_type_t intr_type)`

GPIO set interrupt trigger type.

- Return
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error

- Parameters
  - gpio_num: GPIO number. If you want to set the trigger type of e.g. of GPIO16, gpio_num should be GPIO_NUM_16 (16);
  - intr_type: Interrupt type, select from gpio_int_type_t

`esp_err_t gpio_intr_enable(gpio_num_t gpio_num)`

Enable GPIO module interrupt signal.

- Note Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi with sleep mode enabled. Please refer to the comments of adc1_get_raw. Please refer to section 3.11 of 'ECO and Workarounds for Bugs in ESP32' for the description of this issue. As a workaround, call adc_power_acquire() in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

- Return
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error

- Parameters
  - gpio_num: GPIO number. If you want to enable an interrupt on e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
**esp_err_t gpio_intr_disable (gpio_num_t gpio_num)**

Disable GPIO module interrupt signal.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- gpio_num: GPIO number. If you want to disable the interrupt of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);

**esp_err_t gpio_set_level (gpio_num_t gpio_num, uint32_t level)**

GPIO set output level.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO number error

**Parameters**
- gpio_num: GPIO number. If you want to set the output level of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
  - level: Output level. 0: low; 1: high

**int gpio_get_level (gpio_num_t gpio_num)**

GPIO get input level.

**Warning** If the pad is not configured for input (or input and output) the returned value is always 0.

**Return**
- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

**Parameters**
- gpio_num: GPIO number. If you want to get the logic level of e.g. pin GPIO16, gpio_num should be GPIO_NUM_16 (16);

**esp_err_t gpio_set_direction (gpio_num_t gpio_num, gpio_mode_t mode)**

GPIO set direction.

Configure GPIO direction, such as output_only, input_only, output_and_input

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

**Parameters**
- gpio_num: Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
  - mode: GPIO direction

**esp_err_t gpio_set_pull_mode (gpio_num_t gpio_num, gpio_pull_mode_t pull)**

Configure GPIO pull-up/pull-down resistors.

Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

**Parameters**
- gpio_num: GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
  - pull: GPIO pull up/down mode.

**esp_err_t gpio_wakeup_enable (gpio_num_t gpio_num, gpio_int_type_t intr_type)**

Enable GPIO wake-up function.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
Chapter 2. API Reference

Parameters
• gpio_num: GPIO number.
• intr_type: GPIO wake-up type. Only GPIO_INTR_LOW_LEVEL or GPIO_INTR_HIGH_LEVEL can be used.

`esp_err_t gpio_wakeup_disable(gpio_num_t gpio_num)`
Disable GPIO wake-up function.

Return
• ESP_OK Success
• ESP.ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number

`esp_err_t gpio_isr_register(void (*fn)(void*) void *, void *arg, int intr_alloc_flags, gpio_isr_handle_t *handle)`
Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative gpio_install_isr_service() and gpio_isr_handler_add() API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the interrupt allocation functions.

Parameters
• fn: Interrupt handler function.
• arg: Parameter for handler function
• intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
• handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

Return
• ESP_OK Success;
• ESP.ERR_INVALID_ARG GPIO error
• ESP.ERR.NOT_FOUND No free interrupt found with the specified flags

`esp_err_t gpio_pullup_en(gpio_num_t gpio_num)`
Enable pull-up on GPIO.

Return
• ESP_OK Success
• ESP.ERR.INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number

`esp_err_t gpio_pullup_dis(gpio_num_t gpio_num)`
Disable pull-up on GPIO.

Return
• ESP_OK Success
• ESP.ERR.INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number

`esp_err_t gpio_pulldown_en(gpio_num_t gpio_num)`
Enable pull-down on GPIO.

Return
• ESP_OK Success
• ESP.ERR.INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number

`esp_err_t gpio_pulldown_dis(gpio_num_t gpio_num)`
Disable pull-down on GPIO.

Return
Chapter 2. API Reference

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `gpio_num`: GPIO number

*esp_err_t* `gpio_install_isr_service`(*int intr_alloc_flags*)

Install the driver’s GPIO ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with `gpio_isr_register()` - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the `gpio_isr_handler_add()` function.

**Return**
- ESP_OK Success
- ESP_ERR_NO_MEM No memory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_INVALID_ARG GPIO error

**Parameters**
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORed) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

*void* `gpio_uninstall_isr_service`(*void*)

Uninstall the driver’s GPIO ISR service, freeing related resources.

*esp_err_t* `gpio_isr_handler_add`(*gpio_num_t gpio_num, gpio_isr_t isr_handler, void *args*)

Add ISR handler for the corresponding GPIO pin.

Call this function after using `gpio_install_isr_service()` to install the driver’s GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with IRAM_ATTR, unless you pass the ESP_INTR_FLAG_IRAM flag when allocating the ISR in `gpio_install_isr_service()`.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `gpio_num`: GPIO number
- `isr_handler`: ISR handler function for the corresponding GPIO number.
- `args`: parameter for ISR handler.

*esp_err_t* `gpio_isr_handler_remove`(*gpio_num_t gpio_num*)

Remove ISR handler for the corresponding GPIO pin.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `gpio_num`: GPIO number

*esp_err_t* `gpio_set_drive_capability`(*gpio_num_t gpio_num, gpio_drive_cap_t strength*)

Set GPIO pad drive capability.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `gpio_num`: GPIO number, only support output GPIOs
- `strength`: Drive capability of the pad
**esp_err_t gpio_get_drive_capability** (gpio_num_t gpio_num, gpio_drive_cap_t *strength)
Get GPIO pad drive capability.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- gpio_num: GPIO number, only support output GPIOs
- strength: Pointer to accept drive capability of the pad

**esp_err_t gpio_hold_en** (gpio_num_t gpio_num)
Enable gpio pad hold function.

The gpio pad hold function works in both input and output modes, but must be output-capable gpios. If pad hold enabled: in output mode: the output level of the pad will be force locked and can not be changed. in input mode: the input value read will not change, regardless the changes of input signal.

The state of digital gpio cannot be held during Deep-sleep, and it will resume the hold function when the chip wakes up from Deep-sleep. If the digital gpio also needs to be held during Deep-sleep, gpio_deep_sleep_hold_en should also be called.

Power down or call gpio_hold_dis will disable this function.

**Return**
- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

**Parameters**
- gpio_num: GPIO number, only support output-capable GPIOs

**esp_err_t gpio_hold_dis** (gpio_num_t gpio_num)
Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don’t want the level changes, the gpio should be configured to a known state before this function is called. E.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and gpio_hold_dis is called, gpio18 will output low level (because gpio18 is input mode by default). If you don’t want this behavior, you should configure gpio18 as output mode and set it to high level before calling gpio_hold_dis.

**Return**
- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

**Parameters**
- gpio_num: GPIO number, only support output-capable GPIOs

void gpio_deep_sleep_hold_en (void)
Enable all digital gpio pad hold function during Deep-sleep.

When the chip is in Deep-sleep mode, all digital gpio will hold the state before sleep, and when the chip is woken up, the status of digital gpio will not be held. Note that the pad hold feature only works when the chip is in Deep-sleep mode, when not in sleep mode, the digital gpio state can be changed even you have called this function.

Power down or call gpio_hold_dis will disable this function, otherwise, the digital gpio hold feature works as long as the chip enter Deep-sleep.

void gpio_deep_sleep_hold_dis (void)
Disable all digital gpio pad hold function during Deep-sleep.

void gpio_iomux_in (uint32_t gpio_num, uint32_t signal_idx)
Set pad input to a peripheral signal through the IOMUX.

**Parameters**
- gpio_num: GPIO number of the pad.
- signal_idx: Peripheral signal id to input. One of the *_INIDX signals in soc/gpio_sig_map.h.
void gpio_iomux_out (uint8_t gpio_num, int func, bool oen_inv)
    Set peripheral output to an GPIO pad through the IOMUX.

Parameters
    • gpio_num: gpio_num GPIO number of the pad.
    • func: The function number of the peripheral pin to output pin. One of the FUNC_X_* of specified
      pin (X) in soc/io_mux_reg.h.
    • oen_inv: True if the output enable needs to be inverted, otherwise False.

esp_err_t gpio_force_hold_all (void)
    Force hold digital and rtc gpio pad.

Note  GPIO force hold, whether the chip in sleep mode or wakeup mode.

esp_err_t gpio_force_unhold_all (void)
    Force unhold digital and rtc gpio pad.

Note  GPIO force unhold, whether the chip in sleep mode or wakeup mode.

esp_err_t gpio_sleep_sel_en (gpio_num_t gpio_num)
    Enable SLP_SEL to change GPIO status automatically in lightsleep.

Return
    • ESP_OK Success

Parameters
    • gpio_num: GPIO number of the pad.

esp_err_t gpio_sleep_sel_dis (gpio_num_t gpio_num)
    Disable SLP_SEL to change GPIO status automatically in lightsleep.

Return
    • ESP_OK Success

Parameters
    • gpio_num: GPIO number of the pad.

esp_err_t gpio_sleep_set_direction (gpio_num_t gpio_num, gpio_mode_t mode)
    GPIO set direction at sleep.

Configure GPIO direction, such as output_only,input_only,output_and_input

Return
    • ESP_OK Success

Parameters
    • gpio_num: Configure GPIO pins number, it should be GPIO number. If you want to set direction
      of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
    • mode: GPIO direction

esp_err_t gpio_sleep_set_pull_mode (gpio_num_t gpio_num, gpio_pull_mode_t pull)
    Configure GPIO pull-up/pull-down resistors at sleep.

Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs
34-39 do not.

Return
    • ESP_OK Success

Parameters
    • gpio_num: GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio_num
      should be GPIO_NUM_16 (16);
    • pull: GPIO pull up/down mode.

esp_err_t gpio_deep_sleep_wakeup_enable (gpio_num_t gpio_num, gpio_int_type_t intr_type)
    Enable GPIO deep-sleep wake-up function.

Note  Called by the SDK. User shouldn’t call this directly in the APP.

Return
Chapter 2. API Reference

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `gpio_num`: GPIO number.
- `intr_type`: GPIO wake-up type. Only GPIO_INTR_LOW_LEVEL or GPIO_INTR_HIGH_LEVEL can be used.

```c
esp_err_t gpio_deep_sleep_wakeup_disable(gpio_num_t gpio_num)
```
 Disable GPIO deep-sleep wake-up function.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `gpio_num`: GPIO number

Macros
- GPIO_PIN_COUNT
- GPIO_IS_VALID_GPIO(gpio_num)
  Check whether it is a valid GPIO number.
- GPIO_IS_VALID_OUTPUT_GPIO(gpio_num)
  Check whether it can be a valid GPIO number of output mode.
- GPIO_IS_DEEP_SLEEP_WAKEUP_VALID_GPIO(gpio_num)

Type Definitions
- `typedef intr_handle_t gpio_isr_handle_t`

Header File
- `components/hal/include/hal/gpio_types.h`

Structures
- `struct gpio_config_t`
  Configuration parameters of GPIO pad for gpio_config function.

Public Members
- `uint64_t pin_bit_mask`
  GPIO pin: set with bit mask, each bit maps to a GPIO
- `gpio_mode_t mode`
  GPIO mode: set input/output mode
- `gpio_pullup_t pull_up_en`
  GPIO pull-up

```

2.6.3 General Purpose Timer (GPTimer)

Introduction

A general purpose timer is a hardware timer with high resolution and flexible alarm action. The behavior when the internal counter of a timer reaches a specific target value is called timer alarm. When a timer alarms, a user registered per-timer callback would be called.

Typically, a general purpose timer can be used in scenarios like:

- Free running as a wall clock, fetching a high-resolution time stamp at any time and any places
- Generate period alarms, trigger events periodically
- Generate one-shot alarm, respond in target time

Functional Overview

The following sections of this document cover the typical steps to install and operate a timer:

- **Resource Allocation** - covers which parameters should be set up to get a timer handle and how to recycle the resources when GPTimer finishes working.
- **Set and Get count value** - covers how to force the timer counting from a start point and how to get the count value at anytime.
- **Set Up Alarm Action** - covers the parameters that should be set up to enable the alarm event.
- **Register Event Callbacks** - covers how to hook user specific code to the alarm event callback function.
- **Start and Stop timer** - shows some typical use cases that start the timer with different alarm behavior.
- **Power Management** - describes how different source clock selections can affect power consumption.
- **IRAM Safe** - describes tips on how to make the timer interrupt and IO control functions work better along with a disabled cache.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.

**Resource Allocation** Different ESP chip might have different number of independent timer groups, and within each group, there could also be several independent timers. Refer to the datasheet to find out how many hardware timers exist (usually described in the “General Purpose Timer” chapter).
Chapter 2. API Reference

From driver’s point of view, a GPTimer instance is represented by `gptimer_handle_t`. The driver behind will manage all available hardware resources in a pool, so that users don’t need to care about which timer and which group it belongs to.

To install a timer instance, there’s a configuration structure that needs to be given in advance: `gptimer_config_t`:

- `clk_src` selects the source clock for the timer. The available clocks are listed in `gptimer_clock_source_t`, you can only pick one of them. For the effect on power consumption of different clock source, please refer to Power management section.
- `direction` sets the counting direction of the timer, supported directions are listed in `gptimer_count_direction_t`, you can only pick one of them.
- `resolution_hz` sets the resolution of the internal counter. Each count step is equivalent to $1 / \text{resolution}_\text{hz}$ seconds.
- Optional `intr_shared` sets whether or not mark the timer interrupt source as a shared one. For the pros/cons of a shared interrupt, you can refer to Interrupt Handling.

With all the above configurations set in the structure, the structure can be passed to `gptimer_new_timer()` which will instantiate the timer instance and return a handle of the timer.

The function can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free timers (i.e. all hardware resources have been used up), then ESP_ERR_NOT_FOUND will be returned. The total number of available timers is represented by the SOC_TIMER_GROUP_TOTAL_TIMERS and its value will depend on the ESP chip.

If a previously created GPTimer instance is no longer required, you should recycle the timer by calling `gptimer_del_timer()`. This will allow the underlying HW timer to be used for other purposes. Before deleting a GPTimer handle, you should stop it by `gptimer_stop()` in advance or make sure it has not started yet by `gptimer_start()`.

Creating a GPTimer Handle with Resolution of 1MHz

```c

gptimer_handle_t gptimer = NULL;
gptimer_config_t timer_config = {
    .clk_src = GPTIMER_CLK_SRC_APB,
    .direction = GPTIMER_COUNT_UP,
    .resolution_hz = 1 * 1000 * 1000, // 1MHz, 1 tick = 1us
};
ESP_ERROR_CHECK(gptimer_new_timer(&timer_config, &gptimer));
```

Set and Get Count Value When the GPTimer is created, the internal counter will be reset to zero by default. The counter value can be updated asynchronously by `gptimer_set_raw_count()`. The maximum count value is dependent on the hardware timer’s bit-width, which is also reflected by the SOC macro SOC_TIMER_GROUP_COUNTER_BIT_WIDTH. When updating the raw count of an active timer, the timer will immediately start counting from the new value.

Count value can be retrieved by `gptimer_get_raw_count()`, at anytime.

Set Up Alarm Action Most of the use cases of GPTimer should set up the alarm action before starting the timer, except for the simple wall-clock scenario, where a free running timer is enough. To set up the alarm action, one should configure several members of `gptimer_alarm_config_t` based on how he takes use of the alarm event:

- `alarm_count` sets the target count value that will trigger the alarm event. You should also take the counting direction into consideration when setting the alarm value. Specially, `alarm_count` and `reload_count` can’t be set to the same value when `auto_reload_on_alarm` is true, as keeping reload with a target alarm count is meaningless.
- `reload_count` sets the count value to be reloaded when the alarm event happens. This configuration only takes effect when `auto_reload_on_alarm` is set to true.

Some ESP chip might only support a sub-set of the clocks, if an unsupported clock source is specified, you will get a runtime error during timer installation.
• auto_reload_on_alarm flag sets whether to enable the auto-reload feature. If enabled, the hardware timer will reload the value of reload_count into counter immediately when alarm event happens.

To make the alarm configurations take effect, one should call gptimer_set_alarm_action(). Especially, if gptimer_alarm_config_t is set to NULL, the alarm function will be disabled.

Note:
• If an alarm value is set and the timer has already crossed this value, the alarm will be triggered immediately.

Register Event Callbacks  After the timer starts up, it can generate specific event (e.g. the “Alarm Event”) dynamically. If you have some function that should be called when event happens, you should hook your function to the interrupt service routine by calling gptimer_register_event_callbacks(). All supported event callbacks are listed in the gptimer_event_callbacks_t:

• on_alarm sets callback function for alarm event. As this function is called within the ISR context, user must ensure that the function doesn’t attempt to block (e.g., by making sure that only FreeRTOS APIs with ISR suffix are called from within the function). The function prototype is declared in gptimer_alarm_cb_t.

One can save his own context to gptimer_register_event_callbacks() as well, via the parameter user_data. The user data will be directly passed to the callback functions.

Start and Stop Timer  To start a timer means to enable its internal counter, it can only be achieved by calling gptimer_start(). The timer can be stopped at any time (even in the interrupt context) by gptimer_stop(). One thing should be kept in mind, calling of gptimer_start() should have the same times of calling gptimer_stop() before you delete the timer, otherwise the driver might be put in an undetermined state. For example, the timer might keep a Power Management lock, which in return increase the power consumption. Also see Power management section.

Start Timer As a Wall Clock

```
ESP_ERROR_CHECK(gptimer_start(gptimer));
// Retrieve timestamp at anytime
uint64_t count;
ESP_ERROR_CHECK(gptimer_get_raw_count(gptimer, &count));
```

Trigger Period Events

```
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Retrieve count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    // Don't introduce complex logics in callbacks.
    // Suggest dealing with event data in the main loop, instead of in this callback.
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
```

(continues on next page)
gptimer_alarm_config_t alarm_config = {
    .reload_count = 0, // counter will reload with 0 on alarm event
    .alarm_count = 1000000, // period = 1s @resolution 1MHz
    .flags.auto_reload_on_alarm = true, // enable auto-reload
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_start(gptimer));

Trigger One-Shot Event

```c
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Stop timer the sooner the better
    gptimer_stop(timer);
    // Retrieve count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}
```

```c
gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1 * 1000 * 1000, // alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_start(gptimer));
```

Dynamic Alarm Update Alarm value can be updated dynamically inside the ISR handler callback, by changing the `alarm_value` of `gptimer_alarm_event_data_t`. Then the alarm value will be updated after the callback function returns.

```c
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Stop timer the sooner the better
    gptimer_stop(timer);
    // Retrieve count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}
```

```c
gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1 * 1000 * 1000, // alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_start(gptimer));
```
(continued from previous page)

```c
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_data;
    // Retrieve count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // reconfigure alarm value
    gptimer_alarm_config_t alarm_config = {
        .alarm_count = edata->alarm_value + 1000000, // alarm in next 1s
    };
    gptimer_set_alarm_action(timer, &alarm_config);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

Power Management  When power management is enabled (i.e. CONFIG_PM_ENABLE is on), the system will adjust the APB frequency before going into light sleep, thus potentially changing the period of a GPTimer’s counting step and leading to inaccurate time keeping.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type ESP_PM_APB_FREQ_MAX. Whenever the driver creates a GPTimer instance that has selected GPTIMER_CLK_SRC_APB as its clock source, the driver will guarantee that the power management lock is acquired when the timer is started by `gptimer_start()`. Likewise, the driver releases the lock when `gptimer_stop()` is called for that timer. This requires that the `gptimer_start()` and `gptimer_stop()` should appear in pairs.

IRAM Safe  By default, the GPTimer interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There’s a Kconfig option `CONFIG_GPTIMER_ISR_IRAM_SAFE` that will:

1. Enable the interrupt being serviced even when cache is disabled
2. Place all functions that used by the ISR into IRAM
3. Place driver object into DRAM (in case it’s linked to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

There’s another Kconfig option `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are as follows:

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`

on_alarm callback and the functions invoked by itself should also be placed in IRAM, users need to take care of them by themselves.
Chapter 2. API Reference

- `gptimer_set_raw_count()`
- `gptimer_set_alarm_action()`

**Thread Safety** The factory function `gptimer_new_timer()` is guaranteed to be thread safe by the driver, which means, user can call it from different RTOS tasks without protection by extra locks. Other functions that take the `gptimer_handle_t` as the first positional parameter, are not thread safe. The lifecycle of the gptimer handle is maintained by the user. So user should avoid calling them concurrently. If it has to, then one should introduce another mutex to prevent the gptimer handle being accessed concurrently.

**Application Examples**

Typical use cases of GPTimer are listed in the example: `peripherals/timer_group/gptimer`.

**API Reference**

**Header File**

- `components/driver/include/driver/gptimer.h`

**Functions**

- `esp_err_t gptimer_new_timer(const gptimer_config_t *config, gptimer_handle_t *ret_timer)`

Create a new General Purpose Timer, and return the handle.

**Note** Once a timer is created, it is placed in the stopped state and will not start until `gptimer_start()` is called.

**Return**

- ESP_OK: Create GPTimer successfully
- ESP_ERR_INVALID_ARG: Create GPTimer failed because of invalid argument
- ESP_ERR_NO_MEM: Create GPTimer failed because out of memory
- ESP_ERR_NOT_FOUND: Create GPTimer failed because all hardware timers are used up and no more free one
- ESP_FAIL: Create GPTimer failed because of other error

**Parameters**

- `[in] config: GPTimer configuration`
- `[out] ret_timer: Returned timer handle`

- `esp_err_t gptimer_del_timer(gptimer_handle_t timer)`

Delete the GPTimer handle.

**Note** A timer must be in a stop state before it can be deleted.

**Return**

- ESP_OK: Delete GPTimer successfully
- ESP_ERR_INVALID_ARG: Delete GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete GPTimer failed because the timer has not stopped
- ESP_FAIL: Delete GPTimer failed because of other error

**Parameters**

- `[in] timer: Timer handle created by gptimer_new_timer()`

- `esp_err_t gptimer_set_raw_count(gptimer_handle_t timer, uint64_t value)`

Set GPTimer raw count value.

**Note** When updating the raw count of an active timer, the timer will immediately start counting from the new value.

**Note** This function is allowed to run within ISR context

**Note** This function is allowed to be executed when Cache is disabled, by enabling CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM

**Return**

- ESP_OK: Set GPTimer raw count value successfully
- ESP_ERR_INVALID_ARG: Set GPTimer raw count value failed because of invalid argument
• ESP_FAIL: Set GPTimer raw count value failed because of other error

**Parameters**
- [in] `timer`: Timer handle created by `gptimer_new_timer()`
- [in] `value`: Count value to be set

```c
esp_err_t gptimer_get_raw_count(gptimer_handle_t timer, uint64_t* value)
```

Get GPTimer raw count value.

**Note** With the raw count value and the resolution set in the `gptimer_config_t`, you can convert the count value into seconds.

**Note** This function is allowed to run within ISR context

**Note** This function is allowed to be executed when Cache is disabled, by enabling `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM`

**Return**
- ESP_OK: Get GPTimer raw count value successfully
- ESP_ERR_INVALID_ARG: Get GPTimer raw count value failed because of invalid argument
- ESP_FAIL: Get GPTimer raw count value failed because of other error

**Parameters**
- [in] `timer`: Timer handle created by `gptimer_new_timer()`
- [out] `value`: Returned GPTimer count value

```c
esp_err_t gptimer_register_event_callbacks(gptimer_handle_t timer, const gptimer_event_callbacks_t* cbs, void* user_data)
```

Set callbacks for GPTimer.

**Note** The user registered callbacks are expected to be runnable within ISR context

**Return**
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

**Parameters**
- [in] `timer`: Timer handle created by `gptimer_new_timer()`
- [in] `cbs`: Group of callback functions
- [in] `user_data`: User data, which will be passed to callback functions directly

```c
esp_err_t gptimer_set_alarm_action(gptimer_handle_t timer, const gptimer_alarm_config_t* config)
```

Set alarm event actions for GPTimer.

**Note** This function is allowed to run within ISR context

**Note** This function is allowed to be executed when Cache is disabled, by enabling `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM`

**Return**
- ESP_OK: Set alarm action for GPTimer successfully
- ESP_ERR_INVALID_ARG: Set alarm action for GPTimer failed because of invalid argument
- ESP_FAIL: Set alarm action for GPTimer failed because of other error

**Parameters**
- [in] `timer`: Timer handle created by `gptimer_new_timer()`
- [in] `config`: Alarm configuration, especially, set `config` to NULL means disabling the alarm function

```c
esp_err_t gptimer_start(gptimer_handle_t timer)
```

Start GPTimer.

**Note** This function is allowed to run within ISR context

**Note** This function is allowed to be executed when Cache is disabled, by enabling `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM`

**Return**
- ESP_OK: Start GPTimer successfully
- ESP_ERR_INVALID_ARG: Start GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Start GPTimer failed because the timer is not in stop state
- ESP_FAIL: Start GPTimer failed because of other error
Parameters
• [in] timer: Timer handle created by gptimer_new_timer()

esp_err_t gptimer_stop (gptimer_handle_t timer)
Stop GPTimer.

Note This function is allowed to run within ISR context
Note This function is allowed to be executed when Cache is disabled, by enabling CON-
FIG_GPTIMER_CTRL_FUNC_IN_IRAM

Return
• ESP_OK: Stop GPTimer successfully
• ESP_ERR_INVALID_ARG: Stop GPTimer failed because of invalid argument
• ESP_ERR_INVALID_STATE: Stop GPTimer failed because the timer is not in start state
• ESP_FAIL: Stop GPTimer failed because of other error

Parameters
• [in] timer: Timer handle created by gptimer_new_timer()

Structures
struct gptimer_alarm_event_data_t
GPTimer alarm event data.

Public Members

uint64_t count_value
Current count value

uint64_t alarm_value
Current alarm value

struct gptimer_event_callbacks_t
Group of supported GPTimer callbacks.

Note The callbacks are all running under ISR environment

Public Members

gptimer_alarm_cb_t on_alarm
Timer alarm callback

struct gptimer_config_t
General Purpose Timer configuration.

Public Members

struct gptimer_clock_source_t clk_src
GPTimer clock source

struct gptimer_count_direction_t direction
Count direction

uint32_t resolution_hz
Counter resolution (working frequency) in Hz, hence, the step size of each count tick equals to (1 / resolution_hz) seconds

uint32_t intr_shared : 1
Set true, the timer interrupt number can be shared with other peripherals

struct gptimer_alarm_config_t
General Purpose Timer alarm configuration.
Chapter 2. API Reference

Public Members

uint64_t alarm_count
  Alarm target count value

uint64_t reload_count
  Alarm reload count value, effect only when auto_reload_on_alarm is set to true

uint32_t auto_reload_on_alarm : 1
  Reload the count value by hardware, immediately at the alarm event

Type Definitions

typedef struct gptimer_t *gptimer_handle_t
  Type of General Purpose Timer handle.

typedef bool (*gptimer_alarm_cb_t) (gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
  Timer alarm callback prototype.

  Return Whether a high priority task has been waken up by this function

Parameters

  • [in] timer: Timer handle created by gptimer_new_timer()
  • [in] edata: Alarm event data, fed by driver
  • [in] user_ctx: User data, passed from gptimer_register_event_callbacks()

Header File

  • components/hal/include/hal/timer_types.h

Enumerations

typedef enum gptimer_clock_source_t
  GPTimer clock source.

  Note The clock source listed here is not supported on all targets

  Note User should select the clock source based on real requirements:

<table>
<thead>
<tr>
<th>GPTimer clock source</th>
<th>Features</th>
<th>Power Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPTIMER_CLK_SRC_APB</td>
<td>High resolution</td>
<td>ESP_PM_APB_FREQ_MAX lock</td>
</tr>
<tr>
<td>GPTIMER_CLK_SRC_XTAL</td>
<td>Medium resolution, high accuracy</td>
<td>No PM lock</td>
</tr>
</tbody>
</table>

Values:

GPTIMER_CLK_SRC_APB
  Select APB as the source clock

GPTIMER_CLK_SRC_XTAL
  Select XTAL as the source clock

typedef enum gptimer_count_direction_t
  GPTimer count direction.

Values:

GPTIMER_COUNT_DOWN
  Decrease count value

GPTIMER_COUNT_UP
  Increase count value
Chapter 2. API Reference

2.6.4 Dedicated GPIO

Overview

The dedicated GPIO is designed for CPU interaction with GPIO matrix and IO MUX. Any GPIO that is configured as “dedicated” can be access by CPU instructions directly, which makes it easy to achieve a high GPIO flip speed, and simulate serial/parallel interface in a bit-banging way. As toggling a GPIO in this “CPU Dedicated” way costs few overhead, it would be great for cases like performance measurement using an oscilloscope.

Create/Destroy GPIO Bundle

A GPIO bundle is a group of GPIOs, which can be manipulated at the same time in one CPU cycle. The maximal number of GPIOs that a bundle can contain is limited by each CPU. What’s more, the GPIO bundle has a strong relevance to the CPU which it derives from. Any operations on the GPIO bundle should be put inside a task which is running on the same CPU core to the GPIO bundle belongs to. Likewise, only those ISRs who are installed on the same CPU core are allowed to do operations on that GPIO bundle.

Note: Dedicated GPIO is more of a CPU peripheral, so it has a strong relationship with CPU core. It’s highly recommended to install and operate GPIO bundle in a pin-to-core task. For example, if GPIOA is connected to CPU0, and the dedicated GPIO instruction is issued from CPU1, then it’s impossible to control GPIOA.

To install a GPIO bundle, one needs to call dedic_gpio_new_bundle() to allocate the software resources and connect the dedicated channels to user selected GPIOs. Configurations for a GPIO bundle are covered in dedic_gpio_bundle_config_t structure:

- gpio_array: An array that contains GPIO number.
- array_size: Element number of gpio_array.
- flags: Extra flags to control the behavior of GPIO Bundle.
  - in_en and out_en are used to select whether to enable the input and output function (note, they can be enabled together).
  - in_invert and out_invert are used to select whether to invert the GPIO signal.

The following code shows how to install an output only GPIO bundle:

```c
// configure GPIO
const int bundleA_gpios[] = {0, 1};
gpio_config_t io_conf = {
    .mode = GPIO_MODE_OUTPUT,
};
for (int i = 0; i < sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]); i++) {
    io_conf.pin_bit_mask = 1ULL << bundleA_gpios[i];
gpio_config(&io_conf);
}
// Create bundleA, output only
dedic_gpio_bundle_handle_t bundleA = NULL;
dedic_gpio_bundle_config_t bundleA_config = {
    .gpio_array = bundleA_gpios,
    .array_size = sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]),
    .flags = {
        .out_en = 1,
    },
};
ESP_ERROR_CHECK(dedic_gpio_new_bundle(&bundleA_config, &bundleA));
```

To uninstall the GPIO bundle, one needs to call dedic_gpio_del_bundle().

Note: dedic_gpio_new_bundle() doesn’t cover any GPIO pad configuration (e.g. pull up/down, drive ability, output/input enable), so before installing a dedicated GPIO bundle, you have to configure the GPIO separately.
using GPIO driver API (e.g. `gpio_config()`). For more information about GPIO driver, please refer to [GPIO API Reference](#).

### GPIO Bundle Operations

<table>
<thead>
<tr>
<th>Operations</th>
<th>Functions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Write to GPIOs in the bundle by mask</td>
<td><code>dedic_gpio_bundle_write()</code></td>
</tr>
<tr>
<td>Read the value that input to bundle</td>
<td><code>dedic_gpio_bundle_read_out()</code></td>
</tr>
<tr>
<td>Read the value that output from bundle</td>
<td><code>dedic_gpio_bundle_read_in()</code></td>
</tr>
</tbody>
</table>

**Note:** The functions above just wrap the customized instructions defined for ESP32-C3, for the details of those instructions, please refer to [ESP32-C3 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX)](#).

### Manipulate GPIOs by Writing Assembly Code

For advanced users, they can always manipulate the GPIOs by writing assembly code or invoking CPU Low Level APIs. The usual procedure could be:

1. Allocate a GPIO bundle: `dedic_gpio_new_bundle()`
2. Query the mask occupied by that bundle: `dedic_gpio_get_out_mask()` or `dedic_gpio_get_in_mask()`
3. Call CPU LL apis (e.g. `cpu_ll_write_dedic_gpio_mask`) or write assembly code with that mask
4. The fastest way of toggling IO is to use the dedicated “set/clear” instructions:

<table>
<thead>
<tr>
<th>CPU Arch</th>
<th>Set bits of GPIO</th>
<th>Clear bits of GPIO</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Xtensa</td>
<td><code>set_bit_gpio_out imm[7:0]</code></td>
<td><code>clr_bit_gpio_out imm[7:0]</code></td>
<td>immediate value width depends on the number of dedicated GPIO channels</td>
</tr>
<tr>
<td>RISC-V</td>
<td><code>csrri rd, csr, imm[4:0]</code></td>
<td><code>csrrci rd, csr, imm[4:0]</code></td>
<td>can only control the lowest 4 GPIO channels</td>
</tr>
</tbody>
</table>

For details of supported dedicated GPIO instructions, please refer to [ESP32-C3 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX)](#). The supported dedicated CPU instructions are also wrapped inside `soc/cpu_ll.h` as helper inline functions.

**Note:** Writing assembly code in application could make your code hard to port between targets, because those customized instructions are not guaranteed to remain the same format on different targets.

### Application Example

Matrix keyboard example based on dedicated GPIO: `peripherals/gpio/matrix_keyboard`.

### API Reference

#### Header File

- `components/driver/include/driver/dedic_gpio.h`
Functions

```c
esp_err_t dedic_gpio_get_out_mask(dedic_gpio_bundle_handle_t bundle, uint32_t *mask)
```
Get allocated channel mask.

**Return**
- ESP_OK: Get channel mask successfully
- ESP_ERR_INVALID_ARG: Get channel mask failed because of invalid argument
- ESP_FAIL: Get channel mask failed because of other error

**Note**
Each bundle should have at least one mask (in or/and out), based on bundle configuration.

**Note**
With the returned mask, user can directly invoke LL function like “cpu_ll_write_dedic_gpio_mask” or write assembly code with dedicated GPIO instructions, to get better performance on GPIO manipulation.

**Parameters**
- `[in]` bundle: Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”
- `[out]` mask: Returned mask value for on specific direction (in or out)

```c
esp_err_t dedic_gpio_get_in_mask(dedic_gpio_bundle_handle_t bundle, uint32_t *mask)
```

```c
esp_err_t dedic_gpio_new_bundle(const dedic_gpio_bundle_config_t *config, dedic_gpio_bundle_handle_t *ret_bundle)
```
Create GPIO bundle and return the handle.

**Return**
- ESP_OK: Create GPIO bundle successfully
- ESP_ERR_INVALID_ARG: Create GPIO bundle failed because of invalid argument
- ESP_ERR_NO_MEM: Create GPIO bundle failed because of no capable memory
- ESP_ERR_NOT_FOUND: Create GPIO bundle failed because of no enough continuous dedicated channels
- ESP_FAIL: Create GPIO bundle failed because of other error

**Note**
One has to enable at least input or output mode in “config” parameter.

**Parameters**
- `[in]` config: Configuration of GPIO bundle
- `[out]` ret_bundle: Returned handle of the new created GPIO bundle

```c
esp_err_t dedic_gpio_del_bundle(dedic_gpio_bundle_handle_t bundle)
```
Destory GPIO bundle.

**Return**
- ESP_OK: Destory GPIO bundle successfully
- ESP_ERR_INVALID_ARG: Destory GPIO bundle failed because of invalid argument
- ESP_FAIL: Destory GPIO bundle failed because of other error

**Parameters**
- `[in]` bundle: Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”

```c
void dedic_gpio_bundle_write(dedic_gpio_bundle_handle_t bundle, uint32_t mask, uint32_t value)
```
Write value to GPIO bundle.

**Note**
The mask is seen from the view of GPIO bundle. For example, bundleA contains [GPIO10, GPIO12, GPIO17], to set GPIO17 individually, the mask should be 0x04.

**Note**
For performance reasons, this function doesn’t check the validity of any parameters, and is placed in IRAM.

**Parameters**
- `[in]` bundle: Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”
- `[in]` mask: Mask of the GPIOs to be written in the given bundle
- `[in]` value: Value to write to given GPIO bundle, low bit represents low member in the bundle

```c
uint32_t dedic_gpio_bundle_read_out(dedic_gpio_bundle_handle_t bundle)
```
Read the value that output from the given GPIO bundle.

**Return**
Value that output from the GPIO bundle, low bit represents low member in the bundle

**Note**
For performance reasons, this function doesn’t check the validity of any parameters, and is placed in IRAM.

**Parameters**
- `[in]` bundle: Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”
uint32_t \texttt{dedic\_gpio\_bundle\_read\_in}(\texttt{dedic\_gpio\_bundle\_handle\_t} \texttt{bundle})

Read the value that input to the given GPIO bundle.

\textbf{Return} Value that input to the GPIO bundle, low bit represents low member in the bundle

\textbf{Note} For performance reasons, this function doesn’t check the validity of any parameters, and is placed in IRAM.

\textbf{Parameters}
- \texttt{[in]} \texttt{bundle}: Handle of GPIO bundle that returned from “\texttt{dedic\_gpio\_new\_bundle}”

\textbf{Structures}
\texttt{struct dedic\_gpio\_bundle\_config\_t}
Type of Dedicated GPIO bundle configuration.

\textbf{Public Members}

\begin{verbatim}
const int *gpio_array
\end{verbatim}
Array of GPIO numbers, gpio_array[0] \textasciitilde gpio_array[size-1] \leftrightarrow low_dedic_channel_num \textasciitilde high_dedic_channel_num

\begin{verbatim}
size_t array_size
\end{verbatim}
Number of GPIOs in gpio_array

\begin{verbatim}
unsigned int in_en : 1
\end{verbatim}
Enable input

\begin{verbatim}
unsigned int in_invert : 1
\end{verbatim}
Invert input signal

\begin{verbatim}
unsigned int out_en : 1
\end{verbatim}
Enable output

\begin{verbatim}
unsigned int out_invert : 1
\end{verbatim}
Invert output signal

\begin{verbatim}
struct dedic\_gpio\_bundle\_config\_t::[anonymous] flags
\end{verbatim}
Flags to control specific behaviour of GPIO bundle

\textbf{Type Definitions}

\begin{verbatim}
typedef struct dedic\_gpio\_bundle\_t \*dedic\_gpio\_bundle\_handle\_t
\end{verbatim}
Type of Dedicated GPIO bundle.

2.6.5 \textbf{Hash-based Message Authentication Code (HMAC)}

The HMAC (Hash-based Message Authentication Code) module provides hardware acceleration for SHA256-HMAC generation using a key burned into an eFuse block. HMACs work with pre-shared secret keys and provide authenticity and integrity to a message.

For more detailed information on the application workflow and the HMAC calculation process, see \textit{ESP32-C3 Technical Reference Manual > HMAC Accelerator (HMAC) [PDF]}.

\textbf{Generalized Application Scheme}

Let there be two parties, A and B. They want to verify the authenticity and integrity of messages sent between each other. Before they can start sending messages, they need to exchange the secret key via a secure channel. To verify A’s messages, B can do the following:

- A calculates the HMAC of the message it wants to send.
- A sends the message and the HMAC to B.
- B calculates HMAC of the received message itself.
Chapter 2. API Reference

- B checks whether the received and calculated HMACs match. If they do match, the message is authentic.

However, the HMAC itself isn’t bound to this use case. It can also be used for challenge-response protocols supporting HMAC or as a key input for further security modules (see below), etc.

**HMAC on the ESP32-C3**

On the ESP32-C3, the HMAC module works with a secret key burnt into the eFuses. This eFuse key can be made completely inaccessible for any resources outside the cryptographic modules, thus avoiding key leakage.

Furthermore, the ESP32-C3 has three different application scenarios for its HMAC module:

1. HMAC is generated for software use
2. HMAC is used as a key for the Digital Signature (DS) module
3. HMAC is used for enabling the soft-disabled JTAG interface

The first mode is also called *Upstream* mode, while the last two modes are also called *Downstream* modes.

**eFuse Keys for HMAC**

Six physical eFuse blocks can be used as keys for the HMAC module: block 4 up to block 9. The enum `hmac_key_id_t` in the API maps them to `HMAC_KEY0` to `HMAC_KEY5`. Each key has a corresponding eFuse parameter *key purpose* determining for which of the three HMAC application scenarios (see below) the key may be used:

<table>
<thead>
<tr>
<th>Key Purpose</th>
<th>Application Scenario</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>HMAC generated for software use</td>
</tr>
<tr>
<td>7</td>
<td>HMAC used as a key for the Digital Signature (DS) module</td>
</tr>
<tr>
<td>6</td>
<td>HMAC used for enabling the soft-disabled JTAG interface</td>
</tr>
<tr>
<td>5</td>
<td>HMAC both as a key for the DS module and for enabling JTAG</td>
</tr>
</tbody>
</table>

This is to prevent the usage of a key for a different function than originally intended.

To calculate an HMAC, the software has to provide the ID of the key block containing the secret key as well as the *key purpose* (see *ESP32-C3 Technical Reference Manual > eFuse Controller (eFuse)* [PDF]). Before the HMAC key calculation, the HMAC module looks up the purpose of the provided key block. The calculation only proceeds if the provided key purpose matches the purpose stored in the eFuses of the key block provided by the ID.

**HMAC Generation for Software**

Key Purpose value: 8

In this case, the HMAC is given out to the software (e.g. to authenticate a message).

The API to calculate the HMAC is `esp_hmac_calculate()`. Only the message, message length and the eFuse key block ID have to be provided to that function. The rest, like setting the key purpose, is done automatically.

**HMAC for Digital Signature**

Key Purpose values: 7, 5

The HMAC can be used as a key derivation function to decrypt private key parameters which are used by the Digital Signature module. A standard message is used by the hardware in that case. The user only needs to provide the eFuse key block and purpose on the HMAC side (additional parameters are required for the Digital Signature component in that case). Neither the key nor the actual HMAC are ever exposed to outside the HMAC module and DS component. The calculation of the HMAC and its hand-over to the DS component happen internally.

For more details, see *ESP32-C3 Technical Reference Manual > Digital Signature (DS)* [PDF].

**HMAC for Enabling JTAG**

Key Purpose values: 6, 5

The third application is using the HMAC as a key to enable JTAG if it was soft-disabled before. Following is the procedure to re-enable the JTAG

Setup
1. Generate a 256-bit HMAC secret key to use for JTAG re-enable.
2. Write the key to an eFuse block with key purpose HMAC_DOWN_ALL (5) or HMAC_DOWN_JTAG (6).
   This can be done using the ets_efuse_write_key() function in the firmware or using espfuse.py from the host.
3. Configure the eFuse key block to be read protected using the esp_efuse_set_read_protect(), so that software
cannot read back the value.
4. Burn the “soft JTAG disable” bit by esp_efuse_write_field_bit(ESP_EFUSE_SOFT_DIS_JTAG). This will
   permanently disable JTAG unless the correct key value is provided by software.

JTAG enable
1. The key to re-enable JTAG is the output of the HMAC-SHA256 function using the secret key in eFuse and
   32 0x00 bytes as the message.
2. Pass this key value when calling the esp_hmac_jtag_enable() function from the firmware.
3. To re-disable JTAG in the firmware, reset the system or call esp_hmac_jtag_disable().

For more details, see ESP32-C3 Technical Reference Manual > HMAC Accelerator (HMAC) [PDF].

Application Outline

Following code is an outline of how to set an eFuse key and then use it to calculate an HMAC for software usage.
We use ets_efuse_write_key to set physical key block 4 in the eFuse for the HMAC module together with its purpose.
ETS_EFUSE_KEY_PURPOSE_HMAC_UP (8) means that this key can only be used for HMAC generation for software
usage:

```c
#include "esp32c3/rom/efuse.h"

const uint8_t key_data[32] = { ... };

int ets_status = ets_efuse_write_key(ETS_EFUSE_BLOCK_KEY4,
                                         ETS_EFUSE_KEY_PURPOSE_HMAC_UP,
                                         key_data, sizeof(key_data));

if (ets_status == ESP_OK) {
    // written key
} else {
    // writing key failed, maybe written already
}
```

Now we can use the saved key to calculate an HMAC for software usage.

```c
#include "esp_hmac.h"

uint8_t hmac[32];

const char *message = "Hello, HMAC!";
const size_t msg_len = 12;

esp_err_t result = esp_hmac_calculate(HMAC_KEY4, message, msg_len, hmac);

if (result == ESP_OK) {
    // HMAC written to hmac now
} else {
    // failure calculating HMAC
}
```

API Reference

Header File
- components/esp_hw_support/include/soc/esp32c3/esp_hmac.h
Functions

```c
esp_err_t esp_hmac_calculate(hmac_key_id_t key_id, const void *message, size_t message_len,
                               uint8_t *hmac)
```

Calculate the HMAC of a given message.

Calculates the HMAC `hmac` of a given message `message` with length `message_len`. SHA256 is used for the calculation (fixed on ESP32S2).

**Note** Uses the HMAC peripheral in “upstream” mode.

**Return**
- ESP_OK, if the calculation was successful,
- ESP_FAIL, if the hmac calculation failed

**Parameters**
- `key_id`: Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to the HMAC upstream purpose value.
- `message`: the message for which to calculate the HMAC
- `message_len`: message length return ESP_ERR_INVALID_STATE if unsuccessful
- `[out] hmac`: the hmac result; the buffer behind the provided pointer must be 32 bytes long

```c
esp_err_t esp_hmac_jtag_enable(hmac_key_id_t key_id, const uint8_t *token)
```

Use HMAC peripheral in Downstream mode to re-enable the JTAG, if it is not permanently disabled by HW. In downstream mode, HMAC calculations performed by peripheral are used internally and not provided back to user.

**Return**
- ESP_OK, if the calculation was successful, if the calculated HMAC value matches with provided token, JTAG will be re-enable otherwise JTAG will remain disabled. Return value does not indicate the JTAG status.
- ESP_FAIL, if the hmac calculation failed or JTAG is permanently disabled by EFUSE_HARD_DIS_JTAG eFuse parameter.
- ESP_ERR_INVALID_ARG, invalid input arguments

**Parameters**
- `key_id`: Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to HMAC downstream purpose.
- `token`: Pre calculated HMAC value of the 32-byte 0x00 using SHA-256 and the known private HMAC key. The key is already programmed to aFuse key block. The key block number is provided as the first parameter to this function.

```c
esp_err_t esp_hmac_jtag_disable(void)
```

Disable the JTAG which might be enabled using the HMAC downstream mode. This function just clears the result generated by calling `esp_hmac_jtag_enable()` API.

**Return**
- ESP_OK return ESP_OK after writing the HMAC_SET_INVALIDATE_JTAG_REG with value 1.

Enumerations

```c
eenum hmac_key_id_t
```

The possible efuse keys for the HMAC peripheral

**Values:**
- HMAC_KEY0 = 0
- HMAC_KEY1
- HMAC_KEY2
- HMAC_KEY3
- HMAC_KEY4
- HMAC_KEY5
2.6.6 Digital Signature (DS)

The Digital Signature (DS) module provides hardware acceleration of signing messages based on RSA. It uses pre-encrypted parameters to calculate a signature. The parameters are encrypted using HMAC as a key-derivation function. In turn, the HMAC uses eFuses as input key. The whole process happens in hardware so that neither the decryption key for the RSA parameters nor the input key for the HMAC key derivation function can be seen by the software while calculating the signature.

For more detailed information on the hardware involved in signature calculation and the registers used, see ESP32-C3 Technical Reference Manual > Digital Signature (DS) [PDF].

Private Key Parameters

The private key parameters for the RSA signature are stored in flash. To prevent unauthorized access, they are AES-encrypted. The HMAC module is used as a key-derivation function to calculate the AES encryption key for the private key parameters. In turn, the HMAC module uses a key from the eFuses key block which can be read-protected to prevent unauthorized access as well.

Upon signature calculation invocation, the software only specifies which eFuse key to use, the corresponding eFuse key purpose, the location of the encrypted RSA parameters and the message.

Key Generation

Both the HMAC key and the RSA private key have to be created and stored before the DS peripheral can be used. This needs to be done in software on the ESP32-C3 or alternatively on a host. For this context, the IDF provides `esp_efuse_write_block()` to set the HMAC key and `esp_hmac_calculate()` to encrypt the private RSA key parameters.

You can find instructions on how to calculate and assemble the private key parameters in ESP32-C3 Technical Reference Manual > Digital Signature (DS) [PDF].

Signature Calculation with IDF

For more detailed information on the workflow and the registers used, see ESP32-C3 Technical Reference Manual > Digital Signature (DS) [PDF].

Three parameters need to be prepared to calculate the digital signature:

1. the eFuse key block ID which is used as key for the HMAC,
2. the location of the encrypted private key parameters,
3. and the message to be signed.

Since the signature calculation takes some time, there are two possible API versions to use in IDF. The first one is `esp_ds_sign()` and simply blocks until the calculation is finished. If software needs to do something else during the calculation, `esp_ds_start_sign()` can be called, followed by periodic calls to `esp_ds_is_busy()` to check when the calculation has finished. Once the calculation has finished, `esp_ds_finish_sign()` can be called to get the resulting signature.

The APIs `esp_ds_sign()` and `esp_ds_start_sign()` calculate a plain RSA signature with help of the DS peripheral. This signature needs to be converted to appropriate format for further use. For example, MbedTLS SSL stack supports PKCS#1 format. The API `esp_ds_rsa_sign()` can be used to obtain the signature directly in the PKCS#1 v1.5 format. It internally uses `esp_ds_start_sign()` and converts the signature into PKCS#1 v1.5 format.
Chapter 2. API Reference

**Note:** Note that this is only the basic DS building block, the message length is fixed. To create signatures of arbitrary messages, the input is normally a hash of the actual message, padded up to the required length. An API to do this is planned in the future.

**Configure the DS peripheral for a TLS connection**

The DS peripheral on ESP32-C3 chip must be configured before it can be used for a TLS connection. The configuration involves the following steps -

1) Randomly generate a 256 bit value called the *Initialization Vector* (IV).
2) Randomly generate a 256 bit value called the *HMAC_KEY*.
3) Calculate the encrypted private key parameters from the client private key (RSA) and the parameters generated in the above steps.
4) Then burn the 256 bit *HMAC_KEY* on the eFuse, which can only be read by the DS peripheral.

To configure the DS peripheral for development purposes, you can use the python script `configure_ds.py`. More details about the `configure_ds.py` script can be found at [mqtt example README](https://github.com/espressif/mqtt_testing/blob/master/examples/mqtt_example.md).

The encrypted private key parameters obtained after the DS peripheral configuration are then to be kept in flash. Furthermore, they are to be passed to the DS peripheral which makes use of those parameters for the Digital Signature operation. *Non Volatile Storage* can be used to store the encrypted private key parameters in flash. The script `configure_ds.py` creates an NVS partition for the encrypted private key parameters. Then the script flashes this partition onto the ESP32-C3. The application then needs to read the DS data from NVS, which can be done with the function `esp_read_ds_data_from_nvs()` in file `ssl_ds/main/app_main.c`

The process of initializing the DS peripheral and then performing the Digital Signature operation is done internally with help of ESP-TLS. Please refer to *Digital Signature with ESP-TLS* in [ESP-TLS](https://www.espressif.com/sites/default/files/documentation/ESP-TLS_V5.pdf) for more details. As mentioned in the ESP-TLS documentation, the application only needs to provide the encrypted private key parameters to the esp_tls context (as *ds_data*), which internally performs all necessary operations for initializing the DS peripheral and then performing the DS operation.

**Example for SSL Mutual Authentication using DS**

The example `ssl_ds` shows how to use the DS peripheral for mutual authentication. The example uses `mqtt_client` (Implemented through ESP-MQTT) to connect to broker test.mosquitto.org using ssl transport with mutual authentication. The ssl part is internally performed with ESP-TLS. See [example README](https://github.com/espressif/mqtt_testing/blob/master/examples/mqtt_example.md) for more details.

**API Reference**

**Header File**

- components/esp_hw_support/include/soc/esp32c3/esp_ds.h

**Functions**

- `esp_err_t esp_ds_sign (const void *message, const esp_ds_data_t *data, hmac_key_id_t key_id, void *signature)`

  Sign the message with a hardware key from specific key slot. The function calculates a plain RSA signature with help of the DS peripheral. The RSA encryption operation is as follows: \( Z = XY \mod M \) where, \( Z \) is the signature, \( X \) is the input message, \( Y \) and \( M \) are the RSA private key parameters.

  This function is a wrapper around `esp_ds_finish_sign()` and `esp_ds_start_sign()`, so do not use them in parallel. It blocks until the signing is finished and then returns the signature.

  **Note** This function locks the HMAC, SHA, AES and RSA components during its entire execution time.
Chapter 2. API Reference

- ESP_OK if successful, the signature was written to the parameter `signature`.
- ESP_ERR_INVALID_ARG if one of the parameters is NULL or `data->rsa_length` is too long or 0.
- ESP_ERR_HW_CRYPTO_DS_HMAC_FAIL if there was an HMAC failure during retrieval of the decryption key.
- ESP_ERR_NO_MEM if there hasn’t been enough memory to allocate the context object.
- ESP_ERR_HW_CRYPTO_DS_INVALID_KEY if there’s a problem with passing the HMAC key to the DS component.
- ESP_ERR_HW_CRYPTO_DS_INVALID_DIGEST if the message digest didn’t match; the signature is invalid.
- ESP_ERR_HW_CRYPTO_DS_INVALID_PADDING if the message padding is incorrect, the signature can be read though since the message digest matches.

**Parameters**

- `message`: the message to be signed; its length should be `(data->rsa_length + 1)*4` bytes.
- `data`: the encrypted signing key data (AES encrypted RSA key + IV).
- `key_id`: the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data.
- `signature`: the destination of the signature, should be `(data->rsa_length + 1)*4` bytes long.

```c
esp_err_t esp_ds_start_sign(const void *message, const esp_ds_data_t *data, hmac_key_id_t key_id, esp_ds_context_t **esp_ds_ctx)
```

Start the signing process.

This function yields a context object which needs to be passed to `esp_ds_finish_sign()` to finish the signing process. The function calculates a plain RSA signature with help of the DS peripheral. The RSA encryption operation is as follows: \( Z = XY \mod M \) where, \( Z \) is the signature, \( X \) is the input message, \( Y \) and \( M \) are the RSA private key parameters.

**Note**  This function locks the HMAC, SHA, AES and RSA components, so the user has to ensure to call `esp_ds_finish_sign()` in a timely manner.

**Return**

- ESP_OK if successful, the ds operation was started now and has to be finished with `esp_ds_finish_sign()`.
- ESP_ERR_INVALID_ARG if one of the parameters is NULL or `data->rsa_length` is too long or 0.
- ESP_ERR_HW_CRYPTO_DS_HMAC_FAIL if there was an HMAC failure during retrieval of the decryption key.
- ESP_ERR_NO_MEM if there hasn’t been enough memory to allocate the context object.
- ESP_ERR_HW_CRYPTO_DS_INVALID_KEY if there’s a problem with passing the HMAC key to the DS component.

```c
bool esp_ds_is_busy (void)
```

Return true if the DS peripheral is busy, otherwise false.

**Note**  Only valid if `esp_ds_start_sign()` was called before.

```c
esp_err_t esp_ds_finish_sign(void *signature, esp_ds_context_t *esp_ds_ctx)
```

Finish the signing process.

**Return**

- ESP_OK if successful, the ds operation has been finished and the result is written to signature.
- ESP_ERR_INVALID_ARG if one of the parameters is NULL.
- ESP_ERR_HW_CRYPTO_DS_INVALID_DIGEST if the message digest didn’t match; the signature is invalid. This means that the encrypted RSA key parameters are invalid, indicating that they may have been tampered with or indicating a flash error, etc.
- ESP_ERR_HW_CRYPTO_DS_INVALID_PADDING if the message padding is incorrect, the signature can be read though since the message digest matches (see TRM for more details).

**Parameters**

- `message`: the message to be signed; its length should be `(data->rsa_length + 1)*4` bytes.
- `data`: the encrypted signing key data (AES encrypted RSA key + IV).
- `key_id`: the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data.
- `esp_ds_ctx`: the context object which is needed for finishing the signing process later.
Chapter 2. API Reference

- **signature**: the destination of the signature, should be (data->rsa_length + 1)*4 bytes long
- **esp_ds_ctx**: the context object retrieved by `esp_ds_start_sign()

```c
esp_err_t esp_ds_encrypt_params(esp_ds_data_t *data, const void *iv, const esp_ds_p_data_t *p_data, const void *key)
```

Encrypt the private key parameters.

The encryption is a prerequisite step before any signature operation can be done. It is not strictly necessary to use this encryption function, the encryption could also happen on an external device.

**Return**

- **ESP_OK** if successful, the ds operation has been finished and the result is written to signature.
- **ESP_ERR_INVALID_ARG** if one of the parameters is NULL or p_data->rsa_length is too long

**Parameters**

- **data**: Output buffer to store encrypted data, suitable for later use generating signatures. The allocated memory must be in internal memory and word aligned since it’s filled by DMA. Both is asserted at run time.
- **iv**: Pointer to 16 byte IV buffer, will be copied into ‘data’. Should be randomly generated bytes each time.
- **p_data**: Pointer to input plaintext key data. The expectation is this data will be deleted after this process is done and ‘data’ is stored.
- **key**: Pointer to 32 bytes of key data. Type determined by key_type parameter. The expectation is the corresponding HMAC key will be stored to efuse and then permanently erased.

**Structures**

`struct esp_digital_signature_data`

Encrypted private key data. Recommended to store in flash in this format.

**Note** This struct has to match to one from the ROM code! This documentation is mostly taken from there.

**Public Members**

```c
esp_digital_signature_length_t rsa_length
```

RSA LENGTH register parameters (number of words in RSA key & operands, minus one).

Max value 127 (for RSA 3072).

This value must match the length field encrypted and stored in ‘c’, or invalid results will be returned. (The DS peripheral will always use the value in ‘c’, not this value, so an attacker can’t alter the DS peripheral results this way, it will just truncate or extend the message and the resulting signature in software.)

**Note** In IDF, the enum type length is the same as of type unsigned, so they can be used interchangeably.

See the IDF code for the original declaration of struct ets_ds_data_t.

```c
uint32_t iv[ESP_DS_IV_BIT_LEN / 32]
```

IV value used to encrypt ‘c’

```c
uint8_t c[ESP_DS_C_LEN]
```

Encrypted Digital Signature parameters. Result of AES-CBC encryption of plaintext values. Includes an encrypted message digest.

`struct esp_ds_p_data_t`

Plaintext parameters used by Digital Signature.

This is only used for encrypting the RSA parameters by calling `esp_ds_encrypt_params()`. Afterwards, the result can be stored in flash or in other persistent memory. The encryption is a prerequisite step before any signature operation can be done.
Public Members

```c
uint32_t Y[ESP_DS_SIGNATURE_MAX_BIT_LEN / 32]
    RSA exponent.

uint32_t M[ESP_DS_SIGNATURE_MAX_BIT_LEN / 32]
    RSA modulus.

uint32_t Rb[ESP_DS_SIGNATURE_MAX_BIT_LEN / 32]
    RSA r inverse operand.

uint32_t M_prime
    RSA M prime operand.

uint32_t length
    RSA length in words (32 bit)
```

Macros

```c
ESP32C3_ERR_HW_CRYPTO_DS_HMAC_FAIL
    HMAC peripheral problem

ESP32C3_ERR_HW_CRYPTO_DS_INVALID_KEY
    given HMAC key isn’t correct, HMAC peripheral problem

ESP32C3_ERR_HW_CRYPTO_DS_INVALID_DIGEST
    message digest check failed, result is invalid

ESP32C3_ERR_HW_CRYPTO_DS_INVALID_PADDING
    padding check failed, but result is produced anyway and can be read
```

Type Definitions

```c
typedef struct esp_ds_context esp_ds_context_t
 typedef struct esp_digital_signature_data esp_ds_data_t
```

Encrypted private key data. Recommended to store in flash in this format.

**Note** This struct has to match to one from the ROM code! This documentation is mostly taken from there.

Enumerations

```c
enum esp_digital_signature_length_t
```

**Values:**

```c
ESP_DS_RSA_1024 = (1024 / 32) - 1
ESP_DS_RSA_2048 = (2048 / 32) - 1
ESP_DS_RSA_3072 = (3072 / 32) - 1
```
2.6.7 Inter-Integrated Circuit (I2C)

Overview

I2C is a serial, synchronous, half-duplex communication protocol that allows co-existence of multiple masters and slaves on the same bus. The I2C bus consists of two lines: serial data line (SDA) and serial clock (SCL). Both lines require pull-up resistors.

With such advantages as simplicity and low manufacturing cost, I2C is mostly used for communication of low-speed peripheral devices over short distances (within one foot).

ESP32-C3 has 1 I2C controller (also referred to as port), responsible for handling communications on the I2C bus. A single I2C controller can operate as master or slave.

Driver Features

I2C driver governs communications of devices over the I2C bus. The driver supports the following features:

- Reading and writing bytes in Master mode
- Slave mode
- Reading and writing to registers which are in turn read/written by the master

Driver Usage

The following sections describe typical steps of configuring and operating the I2C driver:

1. Configuration - set the initialization parameters (master or slave mode, GPIO pins for SDA and SCL, clock speed, etc.)
2. Install Driver - activate the driver on one of the two I2C controllers as a master or slave
3. Depending on whether you configure the driver for a master or slave, choose the appropriate item
   a) Communication as Master - handle communications (master)
   b) Communication as Slave - respond to messages from the master (slave)
4. Interrupt Handling - configure and service I2C interrupts
5. Customized Configuration - adjust default I2C communication parameters (timings, bit order, etc.)
6. Error Handling - how to recognize and handle driver configuration and communication errors
7. Delete Driver - release resources used by the I2C driver when communication ends

Configuration

To establish I2C communication, start by configuring the driver. This is done by setting the parameters of the structure `i2c_config_t`:

- Set I2C mode of operation - slave or master from `i2c_mode_t`
- Configure communication pins
  - Assign GPIO pins for SDA and SCL signals
  - Set whether to enable ESP32-C3’s internal pull-ups
- (Master only) Set I2C clock speed
- (Slave only) Configure the following
  - Whether to enable 10 bit address mode
  - Define slave address

After that, initialize the configuration for a given I2C port. For this, call the function `i2c_param_config()` and pass to it the port number and the structure `i2c_config_t`.

Configuration example (master):

```c
int i2c_master_port = 0;
i2c_config_t conf = {
    .mode = I2C_MODE_MASTER,
    .sda_io_num = I2C_MASTER_SDA_IO, // select GPIO specific to your_
    .scl_io_num = I2C_MASTER_SCL_IO, // project

    .sda_pullup_en = 0,
    .scl_pullup_en = 0,
    .general_call_address = 0,
};
```
Chapter 2. API Reference

(continued from previous page)

```c
.sda_pullup_en = GPIO_PULLUP_ENABLE,
.scl_io_num = I2C_MASTER_SCL_IO,     // select GPIO specific to your
.project
.scl_pullup_en = GPIO_PULLUP_ENABLE,
.master.clk_speed = I2C_MASTER_FREQ_HZ, // select frequency specific to your
.project
// .clk_flags = 0,    /*'Optional, you can use I2C_SCLK_SRC_FLAG_*
--flags to choose 12c source clock here. */
```

Configuration example (slave):

```c
int i2c_slave_port = I2C_SLAVE_NUM;
i2c_config_t conf_slave = { 
    .sda_io_num = I2C_SLAVE_SDA_IO,     // select GPIO specific to your
.project
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_SLAVE_SCL_IO,     // select GPIO specific to your
.project
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .mode = I2C_MODE_SLAVE,
    .slave.addr_10bit_en = 0,
    .slave.slave_addr = ESP_SLAVE_ADDR, // address of your project
};
```

At this stage, `i2c_param_config()` also sets a few other I2C configuration parameters to default values that are defined by the I2C specification. For more details on the values and how to modify them, see Customized Configuration.

**Source Clock Configuration** Clock sources allocator is added for supporting different clock sources. The clock allocator will choose one clock source that meets all the requirements of frequency and capability (as requested in `i2c_config_t::clk_flags`).

When `i2c_config_t::clk_flags` is 0, the clock allocator will select only according to the desired frequency. If no special capabilities are needed, such as APB, you can configure the clock allocator to select the source clock only according to the desired frequency. For this, set `i2c_config_t::clk_flags` to 0. For clock characteristics, see the table below.

**Note:** A clock is not a valid option, if it doesn’t meet the requested capabilities, i.e. any bit of requested capabilities (clk_flags) is 0 in the clock’s capabilities.

<table>
<thead>
<tr>
<th>Clock name</th>
<th>Clock freq for SCL</th>
<th>Clock capabilities</th>
</tr>
</thead>
<tbody>
<tr>
<td>XTAL 40 MHz</td>
<td>2 MHz</td>
<td>/</td>
</tr>
<tr>
<td>RTC 20 MHz</td>
<td>1 MHz</td>
<td>I2C_SCLK_SRC_FLAG_AWARE_DFS, I2C_SCLK_SRC_FLAG_LIGHT_SLEEP</td>
</tr>
</tbody>
</table>

Explanations for `i2c_config_t::clk_flags` are as follows:

1. `I2C_SCLK_SRC_FLAG_AWARE_DFS`: Clock’s baud rate will not change while APB clock is changing.
2. `I2C_SCLK_SRC_FLAG_LIGHT_SLEEP`: It supports Light-sleep mode, which APB clock cannot do.
3. Some flags may not be supported on ESP32-C3, reading technical reference manual before using it.
**Note:** The clock frequency of SCL in master mode should not be larger than max frequency for SCL mentioned in the table above.

**Install Driver**  After the I2C driver is configured, install it by calling the function `i2c_driver_install()` with the following parameters:

- Port number, one of the two port numbers from `i2c_port_t`
- Master or slave, selected from `i2c_mode_t`
- (Slave only) Size of buffers to allocate for sending and receiving data. As I2C is a master-centric bus, data can only go from the slave to the master at the master’s request. Therefore, the slave will usually have a send buffer where the slave application writes data. The data remains in the send buffer to be read by the master at the master’s own discretion.
- Flags for allocating the interrupt (see `ESP_INTR_FLAG_*` values in `esp_hw_support/include/esp_intr_alloc.h`)

**Communication as Master**  After installing the I2C driver, ESP32-C3 is ready to communicate with other I2C devices.

ESP32-C3’s I2C controller operating as master is responsible for establishing communication with I2C slave devices and sending commands to trigger a slave to action, for example, to take a measurement and send the readings back to the master.

For better process organization, the driver provides a container, called a “command link”, that should be populated with a sequence of commands and then passed to the I2C controller for execution.

**Master Write**  The example below shows how to build a command link for an I2C master to send $n$ bytes to a slave.

![I2C command link - master write example](image)

The following describes how a command link for a “master write” is set up and what comes inside:

1. Create a command link with `i2c_cmd_link_create()`.
   Then, populate it with the series of data to be sent to the slave:
   a) **Start bit** - `i2c_master_start()`
   b) **Slave address** - `i2c_master_write_byte()`. The single byte address is provided as an argument of this function call.
   c) **Data** - One or more bytes as an argument of `i2c_master_write()`
   d) **Stop bit** - `i2c_master_stop()`
Both functions `i2c_master_write_byte()` and `i2c_master_write()` have an additional argument specifying whether the master should ensure that it has received the ACK bit.

2. Trigger the execution of the command link by I2C controller by calling `i2c_master_cmd_begin()`. Once the execution is triggered, the command link cannot be modified.

3. After the commands are transmitted, release the resources used by the command link by calling `i2c_cmd_link_delete()`.

### Master Read

The example below shows how to build a command link for an I2C master to read $n$ bytes from a slave.

**Fig. 8: I2C command link - master read example**

Compared to writing data, the command link is populated in Step 4 not with `i2c_master_write...` functions but with `i2c_master_read_byte()` and/or `i2c_master_read()`. Also, the last read in Step 5 is configured so that the master does not provide the ACK bit.

### Indicating Write or Read

After sending a slave address (see Step 3 on both diagrams above), the master either writes or reads from the slave.

The information on what the master will actually do is hidden in the least significant bit of the slave’s address.

For this reason, the command link sent by the master to write data to the slave contains the address `(ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE` and looks as follows:

```c
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

Likewise, the command link to read from the slave looks as follows:

```c
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);
```

### Communication as Slave

After installing the I2C driver, ESP32-C3 is ready to communicate with other I2C devices.

The API provides the following functions for slaves

- `i2c_slave_read_buffer()`
  Whenever the master writes data to the slave, the slave will automatically store it in the receive buffer. This allows the slave application to call the function `i2c_slave_read_buffer()` at its own discretion. This function also has a parameter to specify block time if no data is in the receive buffer. This will allow the slave application to wait with a specified timeout for data to arrive to the buffer.

- `i2c_slave_write_buffer()`
The send buffer is used to store all the data that the slave wants to send to the master in FIFO order. The data stays there until the master requests for it. The function `i2c_slave_write_buffer()` has a parameter to specify block time if the send buffer is full. This will allow the slave application to wait with a specified timeout for the adequate amount of space to become available in the send buffer.

A code example showing how to use these functions can be found in `peripherals/i2c`.

**Interrupt Handling**  
During driver installation, an interrupt handler is installed by default.

**Customized Configuration**  
As mentioned at the end of Section `Configuration`, when the function `i2c_param_config()` initializes the driver configuration for an I2C port, it also sets several I2C communication parameters to default values defined in the I2C specification. Some other related parameters are pre-configured in registers of the I2C controller.

All these parameters can be changed to user-defined values by calling dedicated functions given in the table below. Please note that the timing values are defined in APB clock cycles. The frequency of APB is specified in `I2C_APB_CLK_FREQ`.

```
<table>
<thead>
<tr>
<th>Parameters to Change</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>High time and low time for SCL pulses</td>
<td><code>i2c_set_period()</code></td>
</tr>
<tr>
<td>SCL and SDA signal timing used during generation of <strong>start</strong> signals</td>
<td><code>i2c_set_start_timing()</code></td>
</tr>
<tr>
<td>SCL and SDA signal timing used during generation of <strong>stop</strong> signals</td>
<td><code>i2c_set_stop_timing()</code></td>
</tr>
<tr>
<td>Timing relationship between SCL and SDA signals when slave samples, as well as when master toggles</td>
<td><code>i2c_set_data_timing()</code></td>
</tr>
<tr>
<td><strong>I2C timeout</strong></td>
<td><code>i2c_set_timeout()</code></td>
</tr>
<tr>
<td>Choice between transmitting / receiving the LSB or MSB first, choose one of the modes defined in <code>i2c_trans_mode_t</code></td>
<td><code>i2c_set_data_mode()</code></td>
</tr>
</tbody>
</table>
```

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the I2C timeout value, call `i2c_get_timeout()`.

To check the default parameter values which are set during the driver configuration process, please refer to the file `driver/i2c.c` and look for defines with the suffix `_DEFAULT`.

You can also select different pins for SDA and SCL signals and alter the configuration of pull-ups with the function `i2c_set_pin()`. If you want to modify already entered values, use the function `i2c_param_config()`.

**Note:**  
ESP32-C3’s internal pull-ups are in the range of tens of kOhm, which is, in most cases, insufficient for use as I2C pull-ups. Users are advised to use external pull-ups with values described in the I2C specification.

**Error Handling**  
The majority of I2C driver functions either return `ESP_OK` on successful completion or a specific error code on failure. It is a good practice to always check the returned values and implement error handling. The driver also prints out log messages that contain error details, e.g., when checking the validity of entered configuration. For details please refer to the file `driver/i2c.c` and look for defines with the suffix `_ERR_STR`.

Use dedicated interrupts to capture communication failures. For instance, if a slave stretches the clock for too long while preparing the data to send back to master, the interrupt `I2C_TIME_OUT_INT` will be triggered. For detailed information, see `Interrupt Handling`.

In case of a communication failure, you can reset the internal hardware buffers by calling the functions `i2c_reset_tx_fifo()` and `i2c_reset_rx_fifo()` for the send and receive buffers respectively.
Delete Driver  When the I2C communication is established with the function `i2c_driver_install()` and is not required for some substantial amount of time, the driver may be deinitialized to release allocated resources by calling `i2c_driver_delete()`.

Before calling `i2c_driver_delete()` to remove i2c driver, please make sure that all threads have stopped using the driver in any way, because this function does not guarantee thread safety.

Application Example

I2C master and slave example: `peripherals/i2c`.

API Reference

Header File

- `components/driver/include/driver/i2c.h`

Functions

```c
esp_err_t i2c_driver_install(i2c_port_t i2c_num, i2c_mode_t mode, size_t slv_rx_buf_len, size_t slv_tx_buf_len, int intr_alloc_flags)
```

Install an I2C driver.

**Note** In master mode, if the cache is likely to be disabled (such as write flash) and the slave is time-sensitive, `ESP_INTR_FLAG_IRAM` is suggested to be used. In this case, please use the memory allocated from internal RAM in i2c read and write function, because we can not access the pswram (if pswram is enabled) in interrupt handle function when cache is disabled.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver installation error

**Parameters**

- `i2c_num`: I2C port number
- `mode`: I2C mode (either master or slave)
- `slv_rx_buf_len`: Receiving buffer size. Only slave mode will use this value, it is ignored in master mode.
- `slv_tx_buf_len`: Sending buffer size. Only slave mode will use this value, it is ignored in master mode.
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORed) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

```c
esp_err_t i2c_driver_delete(i2c_port_t i2c_num)
```

Delete I2C driver.

**Note** This function does not guarantee thread safety. Please make sure that no thread will continuously hold semaphores before calling the delete function.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `i2c_num`: I2C port to delete

```c
esp_err_t i2c_param_config(i2c_port_t i2c_num, const i2c_config_t *i2c_conf)
```

Configure an I2C bus with the given configuration.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `i2c_num`: I2C port to configure
- `i2c_conf`: Pointer to the I2C configuration
`esp_err_t i2c_reset_tx_fifo(i2c_port_t i2c_num)`
reset I2C tx hardware fifo

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number

`esp_err_t i2c_reset_rx_fifo(i2c_port_t i2c_num)`
reset I2C rx fifo

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number

`esp_err_t i2c_set_pin(i2c_port_t i2c_num, int sda_io_num, int scl_io_num, bool sda_pullup_en, bool scl_pullup_en, i2c_mode_t mode)`
Configure GPIO pins for I2C SCK and SDA signals.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- sda_io_num: GPIO number for I2C SDA signal
- scl_io_num: GPIO number for I2C SCL signal
- sda_pullup_en: Enable the internal pullup for SDA pin
- scl_pullup_en: Enable the internal pullup for SCL pin
- mode: I2C mode

`esp_err_t i2c_master_write_to_device(i2c_port_t i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, TickType_t ticks_to_wait)`
Perform a write to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc… It shall only be called in I2C master mode.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

Parameters
- i2c_num: I2C port number to perform the transfer on
- device_address: I2C device’s 7-bit address
- write_buffer: Bytes to send on the bus
- write_size: Size, in bytes, of the write buffer
- ticks_to_wait: Maximum ticks to wait before issuing a timeout.

`esp_err_t i2c_master_read_from_device(i2c_port_t i2c_num, uint8_t device_address, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)`
Perform a read to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc… It shall only be called in I2C master mode.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
• ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
• ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
• ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

Parameters
• i2c_num: I2C port number to perform the transfer on
• device_address: I2C device’s 7-bit address
• read_buffer: Buffer to store the bytes received on the bus
• read_size: Size, in bytes, of the read buffer
• ticks_to_wait: Maximum ticks to wait before issuing a timeout.

\[ \text{esp_err_t } \text{i2c_master_write_read_device} \left( \text{i2c_port_t } i2c_num, \text{ uint8_t } \text{device_address}, \right. \]
\[ \left. \text{const } \text{uint8_t * } \text{write_buffer}, \text{ size_t } \text{write_size}, \right. \]
\[ \left. \text{uint8_t * } \text{read_buffer}, \text{ size_t read_size, TickType_t } \text{ticks_to_wait} \right) \]

Perform a write followed by a read to a device on the I2C bus. A repeated start signal is used between the write and read, thus, the bus is not released until the two transactions are finished. This function is a wrapper to \text{i2c_master_start()}, \text{i2c_master_write()}, \text{i2c_master_read()}, etc... It shall only be called in I2C master mode.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
• ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

Parameters
• i2c_num: I2C port number to perform the transfer on
• device_address: I2C device’s 7-bit address
• write_buffer: Bytes to send on the bus
• write_size: Size, in bytes, of the write buffer
• read_buffer: Buffer to store the bytes received on the bus
• read_size: Size, in bytes, of the read buffer
• ticks_to_wait: Maximum ticks to wait before issuing a timeout.

\[ \text{i2c_cmd_handle_t } \text{i2c_cmd_link_create_static} \left( \text{uint8_t * } \text{buffer}, \text{uint32_t } \text{size} \right) \]

Create and initialize an I2C commands list with a given buffer. All the allocations for data or signals (START, STOP, ACK, ...) will be performed within this buffer. This buffer must be valid during the whole transaction. After finishing the I2C transactions, it is required to call \text{i2c_cmd_link_delete_static}().

Note It is highly advised to not allocate this buffer on the stack. The size of the data used underneath may increase in the future, resulting in a possible stack overflow as the macro \text{I2C_LINK_RECOMMENDED_SIZE} would also return a bigger value. A better option is to use a buffer allocated statically or dynamically (with malloc).

Return Handle to the I2C command link or NULL if the buffer provided is too small, please use \text{I2C_LINK_RECOMMENDED_SIZE} macro to get the recommended size for the buffer.

Parameters
• buffer: Buffer to use for commands allocations
• size: Size in bytes of the buffer

\[ \text{i2c_cmd_handle_t } \text{i2c_cmd_link_create} \left( \text{void} \right) \]

Create and initialize an I2C commands list with a given buffer. After finishing the I2C transactions, it is required to call \text{i2c_cmd_link_delete()} to release and return the resources. The required bytes will be dynamically allocated.

Return Handle to the I2C command link or NULL in case of insufficient dynamic memory.

\[ \text{void } \text{i2c_cmd_link_delete_static} \left( \text{i2c_cmd_handle_t } \text{cmd_handle} \right) \]

Free the I2C commands list allocated statically with \text{i2c_cmd_link_create_static}().

Parameters
• cmd_handle: I2C commands list allocated statically. This handle should be created thanks to \text{i2c_cmd_link_create_static()} function
void i2c_cmd_link_delete (i2c_cmd_handle_t cmd_handle)

Free the I2C commands list.

Parameters
• cmd_handle: I2C commands list. This handle should be created thanks to i2c_cmd_link_create() function

esp_err_t i2c_master_start (i2c_cmd_handle_t cmd_handle)

Queue a “START signal” to the given commands list. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all the queued commands.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
• ESP_FAIL No more memory left on the heap

Parameters
• cmd_handle: I2C commands list

esp_err_t i2c_master_write_byte (i2c_cmd_handle_t cmd_handle, uint8_t data, bool ack_en)

Queue a “write byte” command to the commands list. A single byte will be sent on the I2C port. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all queued commands.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
• ESP_FAIL No more memory left on the heap

Parameters
• cmd_handle: I2C commands list
• data: Byte to send on the port
• ack_en: Enable ACK signal

esp_err_t i2c_master_write (i2c_cmd_handle_t cmd_handle, const uint8_t *data, size_t data_len, bool ack_en)

Queue a “write (multiple) bytes” command to the commands list. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all queued commands.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
• ESP_FAIL No more memory left on the heap

Parameters
• cmd_handle: I2C commands list
• data: Bytes to send. This buffer shall remain valid until the transaction is finished. If the PSRAM is enabled and intr_flag is set to ESP_INTR_FLAG_IRAM, data should be allocated from internal RAM.
• data_len: Length, in bytes, of the data buffer
• ack_en: Enable ACK signal

esp_err_t i2c_master_read_byte (i2c_cmd_handle_t cmd_handle, uint8_t *data, i2c_ack_type_t ack)

Queue a “read byte” command to the commands list. A single byte will be read on the I2C bus. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all queued commands.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
• ESP_FAIL No more memory left on the heap

Parameters
• cmd_handle: I2C commands list
• **data**: Pointer where the received byte will be stored. This buffer shall remain **valid** until the transaction is finished.
• **ack**: ACK signal

```c
esp_err_t i2c_master_read(i2c_cmd_handle_t cmd_handle, uint8_t *data, size_t data_len, i2c_ack_type_t ack)
```

Queue a “read (multiple) bytes” command to the commands list. Multiple bytes will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

**Parameters**
- `cmd_handle`: I2C commands list
- `data`: Pointer where the received bytes will be stored. This buffer shall remain **valid** until the transaction is finished.
- `data_len`: Size, in bytes, of the `data` buffer
- `ack`: ACK signal

```c
esp_err_t i2c_master_stop(i2c_cmd_handle_t cmd_handle)
```

Queue a “STOP signal” to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

**Parameters**
- `cmd_handle`: I2C commands list

```c
esp_err_t i2c_master_cmd_begin(i2c_port_t i2c_num, i2c_cmd_handle_t cmd_handle, TickType_t ticks_to_wait)
```

Send all the queued commands on the I2C bus, in master mode. The task will be blocked until all the commands have been sent out. The I2C APIs are not thread-safe, if you want to use one I2C port in different tasks, you need to take care of the multi-thread issue. This function shall only be called in I2C master mode.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

**Parameters**
- `i2c_num`: I2C port number
- `cmd_handle`: I2C commands list
- `ticks_to_wait`: Maximum ticks to wait before issuing a timeout.

```c
int i2c_slave_write_buffer(i2c_port_t i2c_num, const uint8_t *data, int size, TickType_t ticks_to_wait)
```

Write bytes to internal ringbuffer of the I2C slave data. When the TX fifo empty, the ISR will fill the hardware FIFO with the internal ringbuffer’s data.

**Note** This function shall only be called in I2C slave mode.

**Return**
- ESP_FAIL (-1) Parameter error
- Other (>=0) The number of data bytes pushed to the I2C slave buffer.

**Parameters**
- `i2c_num`: I2C port number
- `data`: Bytes to write into internal buffer
Chapter 2. API Reference

- **size**: Size, in bytes, of data buffer
- **ticks_to_wait**: Maximum ticks to wait.

```c
int i2c_slave_read_buffer(i2c_port_t i2c_num, uint8_t *data, size_t max_size, TickType_t ticks_to_wait)
```

Read bytes from I2C internal buffer. When the I2C bus receives data, the ISR will copy them from the hardware RX FIFO to the internal ringbuffer. Calling this function will then copy bytes from the internal ringbuffer to the data user buffer.

**Note** This function shall only be called in I2C slave mode.

**Return**
- ESP_FAIL(-1) Parameter error
- Others(>=0) The number of data bytes read from I2C slave buffer.

**Parameters**
- **i2c_num**: I2C port number
- **data**: Buffer to fill with ringbuffer’s bytes
- **max_size**: Maximum bytes to read
- **ticks_to_wait**: Maximum waiting ticks

```c
esp_err_t i2c_set_period(i2c_port_t i2c_num, int high_period, int low_period)
```

Set I2C master clock period.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **i2c_num**: I2C port number
- **high_period**: Clock cycle number during SCL is high level, high_period is a 14 bit value
- **low_period**: Clock cycle number during SCL is low level, low_period is a 14 bit value

```c
esp_err_t i2c_get_period(i2c_port_t i2c_num, int* high_period, int* low_period)
```

Get I2C master clock period.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **i2c_num**: I2C port number
- **high_period**: pointer to get clock cycle number during SCL is high level, will get a 14 bit value
- **low_period**: pointer to get clock cycle number during SCL is low level, will get a 14 bit value

```c
esp_err_t i2c_filter_enable(i2c_port_t i2c_num, uint8_t cyc_num)
```

Enable hardware filter on I2C bus. Sometimes the I2C bus is disturbed by high frequency noise (about 20ns), or the rising edge of the SCL clock is very slow, these may cause the master state machine to break. Enable hardware filter can filter out high frequency interference and make the master more stable.

**Note** Enable filter will slow down the SCL clock.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **i2c_num**: I2C port number to filter
- **cyc_num**: the APB cycles need to be filtered (0<=cyc_num <=7). When the period of a pulse is less than cyc_num * APB_cycle, the I2C controller will ignore this pulse.

```c
esp_err_t i2c_filter_disable(i2c_port_t i2c_num)
```

Disable filter on I2C bus.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **i2c_num**: I2C port number

```c
esp_err_t i2c_set_start_timing(i2c_port_t i2c_num, int setup_time, int hold_time)
set I2C master start signal timing

Return
• ESP_OK Success
• ESP_ERR_INVAL ARG Parameter error

Parameters
• i2c_num: I2C port number
• setup_time: clock number between the falling-edge of SDA and rising-edge of SCL for start mark, it’s a 10-bit value.
• hold_time: clock number between the falling-edge of SDA and falling-edge of SCL for start mark, it’s a 10-bit value.

esp_err_t i2c_get_start_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)
get I2C master start signal timing

Return
• ESP_OK Success
• ESP_ERR_INVAL ARG Parameter error

Parameters
• i2c_num: I2C port number
• setup_time: pointer to get setup time
• hold_time: pointer to get hold time

esp_err_t i2c_set_stop_timing(i2c_port_t i2c_num, int setup_time, int hold_time)
set I2C master stop signal timing

Return
• ESP_OK Success
• ESP_ERR_INVAL ARG Parameter error

Parameters
• i2c_num: I2C port number
• setup_time: clock number between the rising-edge of SCL and the rising-edge of SDA, it’s a 10-bit value.
• hold_time: clock number after the STOP bit’s rising-edge, it’s a 14-bit value.

esp_err_t i2c_get_stop_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)
gen I2C master stop signal timing

Return
• ESP_OK Success
• ESP_ERR_INVAL ARG Parameter error

Parameters
• i2c_num: I2C port number
• setup_time: pointer to get setup time.
• hold_time: pointer to get hold time.

esp_err_t i2c_set_data_timing(i2c_port_t i2c_num, int sample_time, int hold_time)
set I2C data signal timing

Return
• ESP_OK Success
• ESP_ERR_INVAL ARG Parameter error

Parameters
• i2c_num: I2C port number
• sample_time: clock number I2C used to sample data on SDA after the rising-edge of SCL, it’s a 10-bit value
• hold_time: clock number I2C used to hold the data after the falling-edge of SCL, it’s a 10-bit value

esp_err_t i2c_get_data_timing(i2c_port_t i2c_num, int *sample_time, int *hold_time)
get I2C data signal timing

Return
```
Chapter 2. API Reference

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- i2c_num: I2C port number
- sample_time: pointer to get sample time
- hold_time: pointer to get hold time

```c
esp_err_t i2c_set_timeout (i2c_port_t i2c_num, int timeout)
```

Set I2C timeout value

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- i2c_num: I2C port number
- timeout: timeout value for I2C bus (unit: APB 80Mhz clock cycle)

```c
esp_err_t i2c_get_timeout (i2c_port_t i2c_num, int *timeout)
```

Get I2C timeout value

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- i2c_num: I2C port number
- timeout: pointer to get timeout value

```c
esp_err_t i2c_set_data_mode (i2c_port_t i2c_num, i2c_trans_mode_t tx_trans_mode, i2c_trans_mode_t rx_trans_mode)
```

Set I2C data transfer mode

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- i2c_num: I2C port number
- tx_trans_mode: I2C sending data mode
- rx_trans_mode: I2C receiving data mode

```c
esp_err_t i2c_get_data_mode (i2c_port_t i2c_num, i2c_trans_mode_t *tx_trans_mode, i2c_trans_mode_t *rx_trans_mode)
```

Get I2C data transfer mode

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- i2c_num: I2C port number
- tx_trans_mode: pointer to get I2C sending data mode
- rx_trans_mode: pointer to get I2C receiving data mode

**Structures**

```c
struct i2c_config_t
```

I2C initialization parameters.

**Public Members**

```c
i2c_mode_t mode
```

I2C mode

```c
int sda_io_num
```

GPIO number for I2C sda signal
int scl_io_num
    GPIO number for I2C scl signal

bool sda_pullup_en
    Internal GPIO pull mode for I2C sda signal

bool scl_pullup_en
    Internal GPIO pull mode for I2C scl signal

uint32_t clk_speed
    I2C clock frequency for master mode, (no higher than 1MHz for now)

struct i2c_config_t::[anonymous]::[anonymous]::master
    I2C master config

uint8_t addr_10bit_en
    I2C 10bit address mode enable for slave mode

uint16_t slave_addr
    I2C address for slave mode

uint32_t maximum_speed
    I2C expected clock speed from SCL.

struct i2c_config_t::[anonymous]::[anonymous]::slave
    I2C slave config

uint32_t clk_flags
    Bitwise of I2C_SCLK_SRC_FLAG_**FOR_DFS** for clk source choice

Macros

I2C_APB_CLK_FREQ
    I2C source clock is APB clock, 80MHz

I2C_NUM_MAX
    I2C port max

I2C_NUM_0
    I2C port 0

I2C_SCLK_SRC_FLAG_FOR_NORMAL
    Any one clock source that is available for the specified frequency may be choosen

I2C_SCLK_SRC_FLAG_AWARE_FOR_DFS
    For REF tick clock, it won’t change with APB.

I2C_SCLK_SRC_FLAG_LIGHT_SLEEP
    For light sleep mode.

I2C_INTERNAL_STRUCT_SIZE
    Minimum size, in bytes, of the internal private structure used to describe I2C commands link.

I2C_LINK_RECOMMENDED_SIZE (TRANSACTIONS)
    The following macro is used to determine the recommended size of the buffer to pass to
    i2c_cmd_link_create_static() function. It requires one parameter, TRANSACTIONS, de-
    scribing the number of transactions intended to be performed on the I2C port. For example, if one wants
    to perform a read on an I2C device register, TRANSACTIONS must be at least 2, because the commands
    required are the following:
    • write device register
    • read register content
    Signals such as “(repeated) start”, “stop”, “nack”, “ack” shall not be counted.
Type Definitions

typedef void *i2c.cmd_handle_t
I2C command handle

Header File

- components/hal/include/hal/i2c_types.h

Macros

I2C_CLK_FREQ_MAX
Use the highest speed that is available for the clock source picked by clk_flags.

Type Definitions

typedef int i2c_port_t
I2C port number, can be I2C_NUM_0 ~ (I2C_NUM_MAX-1).

Enumerations

enum i2c_mode_t
Values:
  I2C_MODE_SLAVE = 0
  I2C slave mode
  I2C_MODE_MASTER
  I2C master mode
  I2C_MODE_MAX

enum i2c_rw_t
Values:
  I2C_MASTER_WRITE = 0
  I2C write data
  I2C_MASTER_READ
  I2C read data

enum i2c_trans_mode_t
Values:
  I2C_DATA_MODE_MSB_FIRST = 0
  I2C data msb first
  I2C_DATA_MODE_LSB_FIRST = 1
  I2C data lsb first
  I2C_DATA_MODE_MAX

enum i2c_addr_mode_t
Values:
  I2C_ADDR_BIT_7 = 0
  I2C 7bit address for slave mode
  I2C_ADDR_BIT_10
  I2C 10bit address for slave mode
  I2C_ADDR_BIT_MAX

enum i2c_ack_type_t
Values:
  I2C_MASTER_ACK = 0x0
  I2C ack for each byte read
2.6.8 Inter-IC Sound (I2S)

Overview

I2S (Inter-IC Sound) is a serial, synchronous communication protocol that is usually used for transmitting audio data between two digital audio devices.

ESP32-C3 contains one I2S peripheral(s). These peripherals can be configured to input and output sample data via the I2S driver.

An I2S bus consists of the following lines:

- Master clock line (operational)
- Bit clock line
- Channel select line
- Serial data line

Each I2S controller has the following features that can be configured using the I2S driver:

- Operation as system master or slave
- Capable of acting as transmitter or receiver
- DMA controller that allows for streaming sample data without requiring the CPU to copy each data sample

Each controller can operate in half-duplex communication mode. Thus, the two controllers can be combined to establish full-duplex communication.

Functional Overview

Installing the Driver

Install the I2S driver by calling the function `i2s_driver_install` and passing the following arguments:

- Port number
- The structure `i2s_config_t` with defined communication parameters
- Event queue size and handle

Once `i2s_driver_install` returns `ESP_OK`, it means I2S has started.

Configuration example:
static const int i2s_num = 0; // i2s port number

i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S,
    .tx_desc_auto_clear = false,
    .dma_desc_num = 8,
    .dma_frame_num = 64,
    .bits_per_chan = I2S_BITS_PER_SAMPLE_16BIT
};
i2s_driver_install(I2S_NUM, &i2s_config, 0, NULL);

Setting Communication Pins  Once the driver is installed, configure physical GPIO pins to which signals will be routed. For this, call the function `i2s_set_pin` and pass the following arguments to it:

- Port number
- The structure `i2s_pin_config_t` defining the GPIO pin numbers to which the driver should route the MCK, BCK, WS, DATA out, and DATA in signals. If you want to keep a currently allocated pin number for a specific signal, or if this signal is unused, then pass the macro `I2S_PIN_NO_CHANGE`. See the example below.

Note: MCK only takes effect in `I2S_MODE_MASTER` mode.

static const i2s_pin_config_t pin_config = {
    .mck_io_num = 0,
    .bck_io_num = 4,
    .ws_io_num = 5,
    .data_out_num = 18,
    .data_in_num = I2S_PIN_NO_CHANGE
};
i2s_set_pin(i2s_num, &pin_config);

Running I2S Communication  To perform a transmission:

- Prepare the data for sending
- Call the function `i2s_write()` and pass the data buffer address and data length to it

The function will write the data to the DMA Tx buffer, and then the data will be transmitted automatically.

i2s_write(I2S_NUM, samples_data, ((bits+8)/16)*SAMPLE_PER_CYCLE*4, &i2s_bytes_write, 100);

To retrieve received data, use the function `i2s_read()`. It will retrieve the data from the DMA Rx buffer, once the data is received by the I2S controller.

i2s_read(I2S_NUM, data_recv, ((bits+8)/16)*SAMPLE_PER_CYCLE*4, &i2s_bytes_read, 100);

You can temporarily stop the I2S driver by calling the function `i2s_stop()`, which will disable the I2S Tx/Rx units until the function `i2s_start()` is called. If the function `i2s_driver_install` is used, the driver will start up automatically eliminating the need to call `i2s_start()`.
### Deleting the Driver

If the established communication is no longer required, the driver can be removed to free allocated resources by calling `i2s_driver_uninstall()`.

### Application Example

A code example for the I2S driver can be found in the directory `peripherals/i2s`.

In addition, there is a short configuration example for the I2S driver.

#### I2S configuration

Example for general usage.

```c
#include "driver/i2s.h"

static const int i2s_num = 0; // i2s port number

i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S
    .tx_desc_auto_clear = false,
    .dma_desc_num = 8,
    .dma_frame_num = 64
};

static const i2s_pin_config_t pin_config = {
    .bck_io_num = 4,
    .ws_io_num = 5,
    .data_out_num = 18,
    .data_in_num = I2S_PIN_NO_CHANGE
};

i2s_driver_install(i2s_num, &i2s_config, 0, NULL); // install and start i2s driver
i2s_set_pin(i2s_num, &pin_config);

/* You can reset parameters by calling 'i2s_set_clk'
   */
   * The low 16 bits are the valid data bits in one chan and the high 16 bits are
   * the total bits in one chan. If high 16 bits is smaller than low 16 bits, it will
   * be set to a same value as low 16 bits.
   */

uint32_t bits_cfg = (I2S_BITS_PER_CHAN_32BIT << 16) | I2S_BITS_PER_SAMPLE_16BIT;
i2s_set_clk(i2s_num, 22050, bits_cfg, I2S_CHANNEL_STEREO);

i2s_driver_uninstall(i2s_num); // stop & destroy i2s driver
```

I2S on ESP32-C3 support TDM mode, up to 16 channels are available in TDM mode. If you want to use TDM mode, set field `channel_format` of `i2s_config_t` to `I2S_CHANNEL_FMT_MULTIPLE`. Then enable the channels by setting `chan_mask` using masks in `i2s_channel_t`, the number of active channels and total channels will be calculate automatically. Also you can set a particular total channel number for it, but it shouldn’t be smaller than the largest channel you use.

If active channels are discrete, the inactive channels within total channels will be filled by a constant automatically. But if `skip_msk` is enabled, these inactive channels will be skipped.

```c
#include "driver/i2s.h"

static const int i2s_num = 0; // i2s port number

(continues on next page)
```
```c
i2s_config_t i2s_config = {
  .mode = I2S_MODE_MASTER | I2S_MODE_TX,
  .sample_rate = 44100,
  .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
  .channel_format = I2S_CHANNEL_FMT_MULTIPLE,
  .communication_format = I2S_COMM_FORMAT_STAND_I2S,
  .tx_desc_auto_clear = false,
  .dma_desc_num = 8,
  .dma_frame_num = 64,
  .chan_mask = I2S_TDM_ACTIVE_CH0 | I2S_TDM_ACTIVE_CH2
};

static const i2s_pin_config_t pin_config = {
  .bck_io_num = 4,
  .ws_io_num = 5,
  .data_out_num = 18,
  .data_in_num = I2S_PIN_NO_CHANGE
};

i2s_driver_install(i2s_num, &i2s_config, 0, NULL); // install and start i2s driver
i2s_set_pin(i2s_num, &pin_config);
...

// You can reset parameters by calling 'i2s_set_clk'
*
* The low 16 bits are the valid data bits in one chan and the high 16 bits are
* the total bits in one chan. If high 16 bits is smaller than low 16 bits, it will
* be set to a same value as low 16 bits.
*
uint32_t bits_cfg = (I2S_BITS_PER_CHAN_32BIT << 16) | I2S_BITS_PER_SAMPLE_16BIT;

i2s_set_clk(i2s_port_t i2s_num, 22050, bits_cfg, I2S_TDM_ACTIVE_CH0 | I2S_TDM_ACTIVE_CH1); // set clock
...

i2s_driver_uninstall(i2s_num); // stop & destroy i2s driver
```

**Application Notes** If you are using a high sample rate like more than 48 kHz or see the data being lost, the following information might help.

Considering different applications have different requirements, `dma_desc_num` and `dma_frame_num` are made public. Here is the detailed explanation to these two fields:

- **dma_desc_num**: The total number of descriptors used by I2S DMA to receive/transmit data. A descriptor includes some information such as buffer address, the address of the next descriptor, and the buffer length. Since one descriptor points to one buffer, therefore, `dma_desc_num` can be interpreted as the total number of DMA buffers used to store data from DMA interrupt. Notice that these buffers are internal to `i2s_read()` and descriptors are created automatically inside of the I2S driver. Users only need to set the buffer number while the length is derived from the parameter described below.

- **dma_frame_num**: The number of frames for one-time sampling. The frame here means the total data from all the channels in one WS cycle. For example, if two channels in stereo mode (i.e., `channel_format` is set to `I2S_CHANNEL_FMT_RIGHT_LEFT`) are active, and each channel transfers 32 bits (i.e., `bits_per_sample` is set to `I2S_BITS_PER_CHAN_32BIT`), then the total number of bytes of a frame is `channel_format * bits_per_sample = 2 * 32 / 8 = 8` bytes. For example, we assume that the current `dma_frame_num` is 100, then the length of the DMA buffer is `8 * 100 = 800` bytes. Note that the length of an internal DMA buffer shouldn’t be greater than 4092.

When the data received by DMA reach the size of internal DMA buffer, a receive interrupt is triggered, and an internal message queue will transport this buffer to `i2s_read()`. The main task of `i2s_read()` is to copy the data in the internal DMA buffer into the user given buffer. Since the internal DMA buffer is usually not equal to the
user given buffer size, there are two cases:

- If the size of internal DMA buffers is smaller than the user given buffer size, \texttt{i2s\_read()} will consume several internal DMA buffers to fill up the user given buffer. If the message queue of DMA buffer is not long enough, \texttt{i2s\_read()} will be blocked on receive message queue until getting enough data. You can estimate the time \texttt{i2s\_read()} function is blocked by the formula block\_time (sec) = (given\_bufer\_size) / (sample\_rate \times channel\_num \times channel\_bytes). If we place \texttt{i2s\_read()} in a while together with other functions we should also consider the time the loop execution is blocked by the other functions before \texttt{i2s\_read()} is executed again. It is not allowed to exceed the max\_wait\_time (sec) = ((dma\_desc\_num - 1) \times dma\_buffer\_size) / (sample\_rate), otherwise the internal message queue will overflow and in consequence some data will be lost.

- If the DMA buffer size is greater than the user given buffer size, it means \texttt{i2s\_read()} would need to be called in a loop several times to take all the data, the max\_wait\_time may be exceeded, and the message queue overflow is likely to happen. Therefore it is quite risky to use a small user buffer for data receiving.

Here are a couple of tips when the sample rate is high:

1. Increasing \texttt{dma\_frame\_num} can help to reduce the I2S DMA interrupt frequency;
2. Increasing \texttt{dma\_desc\_num} can help to allow a longer max\_wait\_time to be spent by the other functions in the loop containing \texttt{i2s\_read();}

```c
while (1) {
    ... // Other operations (e.g. Waiting on a semaphore)
    i2s_read(I2S_NUM, user\_given\_buffer, user\_given\_buffer\_size, &i2s_bytes\_read, 100);
    ... // Other operations (e.g. Sending the data to another thread...
    ... // Avoid any data processing here.)
}
```

3. Increasing the size of the buffer internal to \texttt{i2s\_read()} can help to increase the max\_wait\_time. When you process I2S data (like storing the data to an SD card) in another thread, the time spent in processing thread for one loop should not exceed the max\_wait\_time otherwise some data will be lost. So if the processing of the received data is rather slow, please allow \texttt{i2s\_read()} a big internal buffer for storing the read data;

4. Allocating at least two user given buffers can improve the data receipt efficiency. One buffer can continue to receive data while the other one is under processing. But we have to guarantee the buffer that is going to read data is not under processing in the other thread. We can use a semaphore or another lock to avoid overwriting the data in the buffer while it is still under processing:

```c
uint8_t **user\_given\_buffers = (uint8_t **)calloc(buffer\_num, sizeof(uint8_t *));
// Don't forget to check if user\_given\_buffers is NULL here
for (int i = 0; i < buffer\_num; i++) {
    user\_given\_buffers[i] = (uint8_t *)calloc(user\_given\_buffer\_size, sizeof(uint8_t *));
    // Don't forget to check if user\_given\_buffers[i] is NULL here
}
int cnt = 0;
while (1) {
    ... // Other operations (e.g. Waiting on a semaphore)
    i2s_read(I2S_NUM, user\_given\_buffer[cnt], user\_given\_buffer\_size, &i2s\_bytes\_read, 100);
    ... // Other operations (e.g. Sending the data to another thread...
    ... // Avoid any data processing here.)
    cnt++;
    cnt %= buffer\_num;
}
```

5. Increasing the priority of the thread that contains \texttt{i2s\_read()} can help the data in the message queue to be taken more timely.

To check whether there are data lost, you can offer an event queue handler to the driver during installation:
QueueHandle_t evt_que;
i2s_driver_install(i2s_num, &i2s_config, 10, &evt_que);

You will receive I2S_EVENT_RX_Q_OVF event when there are data lost.

API Reference

Header File

- components/driver/include/driver/i2s.h

Functions

esp_err_t i2s_set_pin(i2s_port_t i2s_num, const i2s_pin_config_t *pin)
Set I2S pin number.

Inside the pin configuration structure, set I2S_PIN_NO_CHANGE for any pin where the current configuration should not be changed.

Note The I2S peripheral output signals can be connected to multiple GPIO pads. However, the I2S peripheral input signal can only be connected to one GPIO pad.

Parameters

- i2s_num: I2S port number
- pin: I2S Pin structure, or NULL to set 2-channel 8-bit internal DAC pin configuration (GPIO25 & GPIO26)

Note if *pin is set as NULL, this function will initialize both of the built-in DAC channels by default. if you don’t want this to happen and you want to initialize only one of the DAC channels, you can call i2s_set_dac_mode instead.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL IO error

esp_err_t i2s_set_pdm_tx_up_sample(i2s_port_t i2s_num, const i2s_pdm_tx_upsample_cfg_t *upsample_cfg)
Set TX PDM mode up-sample rate.

Note If you have set PDM mode while calling ‘i2s_driver_install’, default PDM TX upsample parameters have already been set, no need to call this function again if you don’t have to change the default configuration.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

Parameters

- i2s_num: I2S port number
- upsample_cfg: Set I2S PDM up-sample rate configuration

esp_err_t i2s_driver_install(i2s_port_t i2s_num, const i2s_config_t *i2s_config, int queue_size, void *i2s_queue)
Install and start I2S driver.

This function must be called before any I2S driver read/write operations.

Parameters

- i2s_num: I2S port number
- i2s_config: I2S configurations - see i2s_config_t struct
- queue_size: I2S event queue size/depth.
- i2s_queue: I2S event queue handle, if set NULL, driver will not use an event queue.

Return

- ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NO_MEM Out of memory
• ESP_ERR_INVALID_STATE Current I2S port is in use

`esp_err_t i2s_driver_uninstall(i2s_port_t i2s_num)`

Uninstall I2S driver.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_INVALID_STATE I2S port has been uninstalled by others (e.g. LCD i80)

Parameters

• `i2s_num`: I2S port number

`esp_err_t i2s_write(i2s_port_t i2s_num, const void *src, size_t size, size_t *bytes_written, TickType_t ticks_to_wait)`

Write data to I2S DMA transmit buffer.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• `i2s_num`: I2S port number
• `src`: Source address to write from
• `size`: Size of data in bytes
• `bytes_written`: Number of bytes written, if timeout, the result will be less than the size passed in.
• `ticks_to_wait`: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

`esp_err_t i2s_write_expand(i2s_port_t i2s_num, const void *src, size_t size, size_t src_bits, size_t aim_bits, size_t *bytes_written, TickType_t ticks_to_wait)`

Write data to I2S DMA transmit buffer while expanding the number of bits per sample. For example, expanding 16-bit PCM to 32-bit PCM.

Format of the data in source buffer is determined by the I2S configuration (see `i2s_config_t`).

Parameters

• `i2s_num`: I2S port number
• `src`: Source address to write from
• `size`: Size of data in bytes
• `src_bits`: Source audio bit
• `aim_bits`: Bit wanted, no more than 32, and must be greater than src_bits
• `bytes_written`: Number of bytes written, if timeout, the result will be less than the size passed in.
• `ticks_to_wait`: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

`esp_err_t i2s_read(i2s_port_t i2s_num, void *dest, size_t size, size_t *bytes_read, TickType_t ticks_to_wait)`

Read data from I2S DMA receive buffer.

Note If the built-in ADC mode is enabled, we should call i2s_adc_enable and i2s_adc_disable around the whole reading process, to prevent the data getting corrupted.

Return

• ESP_OK Success
Chapter 2. API Reference

• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2s_num: I2S port number
• dest: Destination address to read into
• size: Size of data in bytes
• [out] bytes_read: Number of bytes read, if timeout, bytes read will be less than the size passed in.
• ticks_to_wait: RX buffer wait timeout in RTOS ticks. If this many ticks pass without bytes becoming available in the DMA receive buffer, then the function will return (note that if data is read from the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

esp_err_t i2s_set_sample_rates (i2s_port_t i2s_num, uint32_t rate)
Set sample rate used for I2S RX and TX.

The bit clock rate is determined by the sample rate and i2s_config_t configuration parameters (number of channels, bits_per_sample).

bit_clock = rate * (number of channels) * bits_per_sample

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NO_MEM Out of memory

Parameters
• i2s_num: I2S port number
• rate: I2S sample rate (ex: 8000, 44100…)

esp_err_t i2s_stop (i2s_port_t i2s_num)
Stop I2S driver.

There is no need to call i2s_stop() before calling i2s_driver_uninstall().

Disables I2S TX/RX, until i2s_start() is called.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2s_num: I2S port number

esp_err_t i2s_start (i2s_port_t i2s_num)
Start I2S driver.

It is not necessary to call this function after i2s_driver_install() (it is started automatically), however it is necessary to call it after i2s_stop().

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2s_num: I2S port number

esp_err_t i2s_zero_dma_buffer (i2s_port_t i2s_num)
Zero the contents of the TX DMA buffer.

Pushes zero-byte samples into the TX DMA buffer, until it is full.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2s_num: I2S port number

esp_err_t i2s_pcm_config (i2s_port_t i2s_num, const i2s_pcm_cfg_t *pcm_cfg)
Configure I2S a/u-law decompress or compress.
Chapter 2. API Reference

Note This function should be called after i2s driver installed Only take effective when the i2s ‘communication_format’ is set to ‘I2S_COMM_FORMAT_STAND_PCM_SHORT’ or ‘I2S_COMM_FORMAT_STAND_PCM_LONG’

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2s_num: I2S port number
- pcm_cfg: including mode selection and a/u-law decompress or compress configuration paramater

```c
esp_err_t i2s_set_clk (i2s_port_t i2s_num, uint32_t rate, uint32_t bits_cfg, i2s_channel_t ch)
```

Set clock & bit width used for I2S RX and TX.

Similar to i2s_set_sample_rates(), but also sets bit width.

1. stop i2s;
2. calculate melk, bck, bck_factor
3. malloc dma buffer;
4. start i2s

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

Parameters
- i2s_num: I2S port number
- rate: I2S sample rate (ex: 8000, 44100…)
- bits_cfg: I2S bits configuration the low 16 bits is for data bits per sample in one channel (see ‘i2s_bits_per_sample_t’ ) the high 16 bits is for total bits in one channel (see ‘i2s_bits_per_chan_t’ ) high 16bits =0 means same as the bits per sample.
- ch: I2S channel, (I2S_CHANNEL_MONO, I2S_CHANNEL_STEREO or specific channel in TDM mode)

```c
float i2s_get_clk (i2s_port_t i2s_num)
```

get clock set on particular port number.

Return
- actual clock set by i2s driver

Parameters
- i2s_num: I2S port number

Structures

```c
struct i2s_pcm_cfg_t
I2S PCM configuration.
```

Public Members

```c
i2s_pcm_compress_t pcm_type
I2S PCM a/u-law decompress or compress type
```

```c
struct i2s_pdm_tx_upsample_cfg_t
I2S PDM up-sample rate configuration.
```

Note TX PDM can only be set to the following two upsampling rate configurations: 1: fp = 960, fs = sample_rate / 100, in this case, Fpdm = 128*48000 2: fp = 960, fs = 480, in this case, Fpdm = 128*Fpcm = 128*sample_rate If the pdm receiver do not care the pdm serial clock, it’s recommended set Fpdm = 128*48000. Otherwise, the second configuration should be applied.
Public Members

int sample_rate
   I2S PDM sample rate
int fp
   I2S PDM TX upsampling parameter. Normally it should be set to 960
int fs
   I2S PDM TX upsampling parameter. When it is set to 480, the pdm clock frequency Fpdm = 128 * sample_rate, when it is set to sample_rate / 100, Fpdm will be fixed to 128*48000

struct i2s_pin_config_t
   I2S pin number for i2s_set_pin.

Public Members

int mck_io_num
   MCK in out pin. Note that ESP32 supports setting MCK on GPIO0/GPIO1/GPIO3 only
int bck_io_num
   BCK in out pin
int ws_io_num
   WS in out pin
int data_out_num
   DATA out pin
int data_in_num
   DATA in pin

struct i2s_driver_config_t
   I2S driver configuration parameters.

Public Members

i2s_mode_t mode
   I2S work mode
uint32_t sample_rate
   I2S sample rate
i2s_bits_per_sample_t bits_per_sample
   I2S sample bits in one channel
i2s_channel_fmt_t channel_format
   I2S channel format.
i2s_comm_format_t communication_format
   I2S communication format
int intr_alloc_flags
   Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info
int dma_desc_num
   The total number of descriptors used by I2S DMA to receive/transmit data
int dma_buf_count
   This is an alias to ‘dma_desc_num’ for backward compatibility
int dma_frame_num
   Number of frames for one-time sampling. The frame here means the total data from all the channels in a WS cycle
int dma_buf_len
    This is an alias to ‘dma_frame_num’ for backward compatibility

bool use_apll
    I2S using APLL as main I2S clock, enable it to get accurate clock

bool tx_desc_auto_clear
    I2S auto clear tx descriptor if there is underflow condition (helps in avoiding noise in case of data unavailability)

int fixed_mclk
    I2S using fixed MCLK output. If use_apll = true and fixed_mclk > 0, then the clock output for i2s is fixed and equal to the fixed_mclk value. If fixed_mclk set, mclk_multiple won’t take effect

i2s_mclk_multiple_t mclk_multiple
    The multiple of I2S master clock(MCLK) to sample rate

i2s_bits_per_chan_t bits_per_chan
    I2S total bits in one channel, only take effect when larger than ‘bits_per_sample’, default ‘0’ means equal to ‘bits_per_sample’

i2s_channel_t chan_mask
    I2S active channel bit mask, set value in i2s_channel_t to enable specific channel, the bit map of active channel can not exceed (0x1<<total_chan).

uint32_t total_chan
    I2S Total number of channels. If it is smaller than the biggest active channel number, it will be set to this number automatically.

bool left_align
    Set to enable left alignment

bool big_edin
    Set to enable big edin

bool bit_order_msb
    Set to enable msb order

bool skip_msk
    Set to enable skip mask. If it is enabled, only the data of the enabled channels will be sent, otherwise all data stored in DMA TX buffer will be sent

struct i2s_event_t
    Event structure used in I2S event queue.

Public Members

i2s_event_type_t type
    I2S event type

size_t size
    I2S data size for I2S_DATA event

Macros

I2S_PIN_NO_CHANGE
    Use in i2s_pin_config_t for pins which should not be changed

I2S_PDM_DEFAULT_UPSAMPLE_CONFIG(rate)
    Default I2S PDM Up-Sampling Rate configuration.

Type Definitions

typedef i2s_driver_config_t i2s_config_t

typedef intr_handler_t i2s_isr_handle_t
Enumerations

```c
enum i2s_port_t
{
    I2S_NUM_0 = 0,
    I2S_NUM_MAX
}
```

* I2S port number, the max port number is (I2S_NUM_MAX -1).

Values:

- I2S_NUM_0 = 0
- I2S_NUM_MAX

```c
enum i2s_event_type_t
{
    I2S_EVENT_DMA_ERROR,
    I2S_EVENT_TX_DONE,
    I2S_EVENT_RX_DONE,
    I2S_EVENT_TX_Q_OVF,
    I2S_EVENT_RX_Q_OVF,
    I2S_EVENT_MAX
}
```

* I2S event queue types.

Values:

- I2S_EVENT_DMA_ERROR
- I2S_EVENT_TX_DONE
- I2S_EVENT_RX_DONE
- I2S_EVENT_TX_Q_OVF
- I2S_EVENT_RX_Q_OVF
- I2S_EVENT_MAX

Header File

- components/hal/include/hal/i2s_types.h

Enumerations

```c
enum i2s_bits_per_sample_t
{
    I2S_BITS_PER_SAMPLE_8BIT = 8,
    I2S_BITS_PER_SAMPLE_16BIT = 16,
    I2S_BITS_PER_SAMPLE_24BIT = 24,
    I2S_BITS_PER_SAMPLE_32BIT = 32
}
```

* I2S bit width per sample.

Values:

- I2S_BITS_PER_SAMPLE_8BIT = 8
- I2S_BITS_PER_SAMPLE_16BIT = 16
- I2S_BITS_PER_SAMPLE_24BIT = 24
- I2S_BITS_PER_SAMPLE_32BIT = 32

```c
enum i2s_bits_per_chan_t
{
    I2S_BITS_PER_CHAN_DEFAULT = 0,
    I2S_BITS_PER_CHAN_8BIT = 8,
    I2S_BITS_PER_CHAN_16BIT = 16
}
```

* I2S bit width per chan.

Values:

- I2S_BITS_PER_CHAN_DEFAULT = 0
- I2S_BITS_PER_CHAN_8BIT = 8
- I2S_BITS_PER_CHAN_16BIT = 16
I2S_BITS_PER_CHAN_24BIT = (24)
channel bit-width: 24

I2S_BITS_PER_CHAN_32BIT = (32)
channel bit-width: 32

enum i2s_channel_t
I2S channel.

Values:

I2S_CHANNEL_MONO = (0x01 << 31) | 0x03
I2S channel (mono), two channel enabled. In this mode, you only need to send one channel data but the fifo will copy same data for another channel automatically, then both channels will transmit same data. The highest bit is for differentiating I2S_CHANNEL_STEREO since they both use two channels

I2S_CHANNEL_STEREO = 0x03
I2S channel (stereo), two channel enabled. In this mode, two channels will transmit different data.

I2S_TDM_ACTIVE_CH0 = (0x1 << 0)
I2S channel 0 enabled

I2S_TDM_ACTIVE_CH1 = (0x1 << 1)
I2S channel 1 enabled

I2S_TDM_ACTIVE_CH2 = (0x1 << 2)
I2S channel 2 enabled

I2S_TDM_ACTIVE_CH3 = (0x1 << 3)
I2S channel 3 enabled

I2S_TDM_ACTIVE_CH4 = (0x1 << 4)
I2S channel 4 enabled

I2S_TDM_ACTIVE_CH5 = (0x1 << 5)
I2S channel 5 enabled

I2S_TDM_ACTIVE_CH6 = (0x1 << 6)
I2S channel 6 enabled

I2S_TDM_ACTIVE_CH7 = (0x1 << 7)
I2S channel 7 enabled

I2S_TDM_ACTIVE_CH8 = (0x1 << 8)
I2S channel 8 enabled

I2S_TDM_ACTIVE_CH9 = (0x1 << 9)
I2S channel 9 enabled

I2S_TDM_ACTIVE_CH10 = (0x1 << 10)
I2S channel 10 enabled

I2S_TDM_ACTIVE_CH11 = (0x1 << 11)
I2S channel 11 enabled

I2S_TDM_ACTIVE_CH12 = (0x1 << 12)
I2S channel 12 enabled

I2S_TDM_ACTIVE_CH13 = (0x1 << 13)
I2S channel 13 enabled

I2S_TDM_ACTIVE_CH14 = (0x1 << 14)
I2S channel 14 enabled

I2S_TDM_ACTIVE_CH15 = (0x1 << 15)
I2S channel 15 enabled

enum i2s_comm_format_t
I2S communication standard format.
Values:

\texttt{I2S\_COMM\_FORMAT\_STAND\_I2S} = 0X01
I2S communication I2S Philips standard, data launch at second BCK

\texttt{I2S\_COMM\_FORMAT\_STAND\_MSB} = 0X02
I2S communication MSB alignment standard, data launch at first BCK

\texttt{I2S\_COMM\_FORMAT\_STAND\_PCM\_SHORT} = 0x04
PCM Short standard, also known as DSP mode. The period of synchronization signal (WS) is 1 bck cycle.

\texttt{I2S\_COMM\_FORMAT\_STAND\_PCM\_LONG} = 0x0C
PCM Long standard. The period of synchronization signal (WS) is channel_bit*bck cycles.

\texttt{I2S\_COMM\_FORMAT\_STAND\_MAX}
standard max

\texttt{I2S\_COMM\_FORMAT\_I2S} = 0x01
I2S communication format I2S, correspond to \texttt{I2S\_COMM\_FORMAT\_STAND\_I2S}

\texttt{I2S\_COMM\_FORMAT\_I2S\_MSB} = 0x01
I2S format MSB, \texttt{(I2S\_COMM\_FORMAT\_I2S \| I2S\_COMM\_FORMAT\_I2S\_MSB)} correspond to \texttt{I2S\_COMM\_FORMAT\_STAND\_I2S}

\texttt{I2S\_COMM\_FORMAT\_I2S\_LSB} = 0x02
I2S format LSB, \texttt{(I2S\_COMM\_FORMAT\_I2S \| I2S\_COMM\_FORMAT\_I2S\_LSB)} correspond to \texttt{I2S\_COMM\_FORMAT\_STAND\_MSB}

\texttt{I2S\_COMM\_FORMAT\_PCM} = 0x04
I2S communication format PCM, correspond to \texttt{I2S\_COMM\_FORMAT\_STAND\_PCM\_SHORT}

\texttt{I2S\_COMM\_FORMAT\_PCM\_SHORT} = 0x04
PCM Short, \texttt{(I2S\_COMM\_FORMAT\_PCM \| I2S\_COMM\_FORMAT\_PCM\_SHORT)} correspond to \texttt{I2S\_COMM\_FORMAT\_STAND\_PCM\_SHORT}

\texttt{I2S\_COMM\_FORMAT\_PCM\_LONG} = 0x08
PCM Long, \texttt{(I2S\_COMM\_FORMAT\_PCM \| I2S\_COMM\_FORMAT\_PCM\_LONG)} correspond to \texttt{I2S\_COMM\_FORMAT\_STAND\_PCM\_LONG}

\texttt{enum \_i2s\_channel\_fmt\_t}
I2S channel format type.

Values:

\texttt{I2S\_CHANNEL\_FMT\_RIGHT\_LEFT}
Separated left and right channel

\texttt{I2S\_CHANNEL\_FMT\_ALL\_RIGHT}
Load right channel data in both two channels

\texttt{I2S\_CHANNEL\_FMT\_ALL\_LEFT}
Load left channel data in both two channels

\texttt{I2S\_CHANNEL\_FMT\_ONLY\_RIGHT}
Only load data in right channel (mono mode)

\texttt{I2S\_CHANNEL\_FMT\_ONLY\_LEFT}
Only load data in left channel (mono mode)

\texttt{I2S\_CHANNEL\_FMT\_MULTIPLE}
More than two channels are used

\texttt{enum \_i2s\_mode\_t}
I2S Mode.

Values:
I2S_MODE_MASTER = (0x1 << 0)
  Master mode
I2S_MODE_SLAVE = (0x1 << 1)
  Slave mode
I2S_MODE_TX = (0x1 << 2)
  TX mode
I2S_MODE_RX = (0x1 << 3)
  RX mode
I2S_MODE_PDM = (0x1 << 6)
  I2S PDM mode

enum i2s_clock_src_t
  I2S source clock.
  
  Values:
  I2S_CLK_D2CLK = 0
    Clock from PLL_D2_CLK(160M)

enum i2s_mclk_multiple_t
  The multiple of mclk to sample rate.
  
  Values:
  I2S_MCLK_MULTIPLE_DEFAULT = 0
    Default value. mclk = sample_rate * 256
  I2S_MCLK_MULTIPLE_128 = 128
    mclk = sample_rate * 128
  I2S_MCLK_MULTIPLE_256 = 256
    mclk = sample_rate * 256
  I2S_MCLK_MULTIPLE_384 = 384
    mclk = sample_rate * 384

enum i2s_pcm_compress_t
  A/U-law decompressor compress configuration.
  
  Values:
  I2S_PCM_DISABLE = 0
    Disable A/U law decompressor or compress
  I2S_PCM_A_DECOMPRESS
    A-law decompress
  I2S_PCM_A_COMPRESS
    A-law compress
  I2S_PCM_U_DECOMPRESS
    U-law decompress
  I2S_PCM_U_COMPRESS
    U-law compress

enum i2s_pdm_sig_scale_t
  Values:
  I2S_PDM_SIG_SCALING_DIV_2 = 0
    I2S TX PDM sigmadelta signal scaling: /2
  I2S_PDM_SIG_SCALING_MUL_1 = 1
    I2S TX PDM sigmadelta signal scaling: x1
2.6.9 LCD

Introduction

ESP chips can generate various kinds of timings that needed by common LCDs on the market, like SPI LCD, I80 LCD (a.k.a Intel 8080 parallel LCD), RGB LCD, I2C LCD, etc. The esp_lcd component is officially to support those LCDs with a group of universal APIs across chips.

Functional Overview

In esp_lcd, an LCD panel is represented by esp_lcd_panel_handle_t, which plays the role of an abstract frame buffer, regardless of the frame memory is allocated inside ESP chip or in external LCD controller. Based on the location of the frame buffer, the LCD panel allocation functions are mainly grouped into the following categories:

- RGB LCD panel - is simply based on a group of specific synchronous signals indicating where to start and stop a frame.
- Controller based LCD panel involves multiple steps to get a panel handle, like bus allocation, IO device registration and controller driver install.

After we get the LCD handle, the remaining LCD operations are the same for different LCD interfaces and vendors.

Application Example

LCD examples are located under: peripherals/lcd:

- Jpeg decoding and LCD display - peripherals/lcd/tjpgd
- I80 controller based LCD and LVGL animation UI - peripherals/lcd/i80_controller
- GC9A01 user customized driver and dash board UI - peripherals/lcd/gc9a01
- RGB panel example with scatter chart UI - peripherals/lcd/rgb_panel
- I2C interfaced OLED display scrolling text - peripherals/lcd/i2c_oled

</tr>
</tbody>
</table>

Values:
LCD_CLK_SRC_PLL160M
Select PLL160M as the source clock

LCD_CLK_SRC_PLL240M
Select PLL240M as the source clock

LCD_CLK_SRC_APPL
Select APPL as the source clock

LCD_CLK_SRC_XTAL
Select XTAL as the source clock

Header File

* components/esp_lcd/include/esp_lcd_types.h

Type Definitions
typedef struct esp_lcd_panel_io_t *esp_lcd_panel_io_handle_t
Type of LCD panel IO handle
typedef struct esp_lcd_panel_t *esp_lcd_panel_handle_t
Type of LCD panel handle

Enumerations
define esp_lcd_color_space_t
LCD color space type definition.

Values:

ESP_LCD_COLOR_SPACE_RGB
Color space: RGB

ESP_LCD_COLOR_SPACE_BGR
Color space: BGR

ESP_LCD_COLOR_SPACE_MONOCHROME
Color space: monochrome

Header File

* components/esp_lcd/include/esp_lcd_panel_io.h

Functions
esp_err_t esp_lcd_panel_io_tx_param (esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *param, size_t param_size)
Transmit LCD command and corresponding parameters.

Note Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by esp_lcd_panel_io_tx_color() are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

Return

* ESP_ERR_INVALID_ARG if parameter is invalid
* ESP_OK on success

Parameters

* [in] io: LCD panel IO handle, which is created by other factory API like esp_lcd_new_panel_io_spi()
* [in] lcd_cmd: The specific LCD command
* [in] param: Buffer that holds the command specific parameters, set to NULL if no parameter is needed for the command
• [in] param_size: Size of param in memory, in bytes, set to zero if no parameter is needed for the command

```c
esp_err_t esp_lcd_panel_io_tx_color(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *color, size_t color_size)
```

Transmit LCD RGB data.

**Note** This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the `color` buffer. Recycling of color buffer should be done in the callback `on_color_trans_done()`.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**
- [in] io: LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- [in] lcd_cmd: The specific LCD command
- [in] color: Buffer that holds the RGB color data
- [in] color_size: Size of color in memory, in bytes

```c
esp_err_t esp_lcd_panel_io_del(esp_lcd_panel_io_handle_t io)
```

Destroy LCD panel IO handle (deinitialize panel and free all corresponding resource)

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**
- [in] io: LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

```c
esp_err_t esp_lcd_new_panel_io_spi(esp_lcd_spi_bus_handle_t bus, const esp_lcd_panel_io_spi_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)
```

Create LCD panel IO handle, for SPI interface.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**
- [in] bus: SPI bus handle
- [in] io_config: IO configuration, for SPI interface
- [out] ret_io: Returned IO handle

```c
esp_err_t esp_lcd_new_panel_io_i2c(esp_lcd_i2c_bus_handle_t bus, const esp_lcd_panel_io_i2c_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)
```

Create LCD panel IO handle, for I2C interface.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**
- [in] bus: I2C bus handle
- [in] io_config: IO configuration, for I2C interface
- [out] ret_io: Returned IO handle

**Structures**

```c
struct esp_lcd_panel_io_event_data_t
```

Type of LCD panel IO event data.
struct esp_lcd_panel_io_spi_config_t
   Panel IO configuration structure, for SPI interface.

**Public Members**

- `int cs_gpio_num`
  - GPIO used for CS line

- `int dc_gpio_num`
  - GPIO used to select the D/C line, set this to -1 if the D/C line not controlled by manually pulling high/low GPIO

- `int spi_mode`
  - Traditional SPI mode (0~3)

- `unsigned int pclk_hz`
  - Frequency of pixel clock

- `size_t trans_queue_depth`
  - Size of internal transaction queue

- `esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done`
  - Callback invoked when color data transfer has finished

- `void *user_ctx`
  - User private data, passed directly to on_color_trans_done’s user_ctx

- `int lcd_cmd_bits`
  - Bit-width of LCD command

- `int lcd_param_bits`
  - Bit-width of LCD parameter

- `unsigned int dc_as_cmd_phase : 1`
  - D/C line value is encoded into SPI transaction command phase

- `unsigned int dc_low_on_data : 1`
  - If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

- `unsigned int octal_mode : 1`
  - Transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

---

struct esp_lcd_panel_io_i2c_config_t

**Public Members**

- `uint32_t dev_addr`
  - I2C device address

- `esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done`
  - Callback invoked when color data transfer has finished

- `void *user_ctx`
  - User private data, passed directly to on_color_trans_done’s user_ctx

- `size_t control_phase_bytes`
  - I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes

- `unsigned int dc_bit_offset`
  - Offset of the D/C selection bit in control phase

- `int lcd_cmd_bits`
  - Bit-width of LCD command

- `int lcd_param_bits`
  - Bit-width of LCD parameter
unsigned int dc_low_on_data : 1
If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

**Type Definitions**

```c
typedef void *esp_lcd_spi_bus_handle_t
Type of LCD SPI bus handle
```

```c
typedef void *esp_lcd_i2c_bus_handle_t
Type of LCD I2C bus handle
```

```c
typedef struct esp_lcd_i80_bus_t *esp_lcd_i80_bus_handle_t
Type of LCD intel 8080 bus handle
```

```c
typedef bool (*esp_lcd_panel_io_color_trans_done_cb_t)(esp_lcd_panel_io_handle_t panel_io,
esp_lcd_panel_io_event_data_t *edata, void *user_ctx)
```

Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

**Return** Whether a high priority task has been waken up by this function.

**Parameters**

- [in] panel_io: LCD panel IO handle, which is created by factory API like esp_lcd_new_panel_io_spi()
- [in] edata: Panel IO event data, fed by driver
- [in] user_ctx: User data, passed from esp_lcd_panel_io_xxx_config_t

**Header File**

- components/esp_lcd/include/esp_lcd_panel_ops.h

**Functions**

```c
esp_err_t esp_lcd_panel_reset(esp_lcd_panel_handle_t panel)
Reset LCD panel.
```

**Note** Panel reset must be called before attempting to initialize the panel using esp_lcd_panel_init().

**Return**

- ESP_OK on success

**Parameters**

- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()

```c
esp_err_t esp_lcd_panel_init(esp_lcd_panel_handle_t panel)
Initialize LCD panel.
```

**Note** Before calling this function, make sure the LCD panel has finished the reset stage by esp_lcd_panel_reset().

**Return**

- ESP_OK on success

**Parameters**

- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()

```c
esp_err_t esp_lcd_panel_del(esp_lcd_panel_handle_t panel)
Deinitialize the LCD panel.
```

**Return**

- ESP_OK on success

**Parameters**

- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
**esp_err_t esp_lcd_panel_draw_bitmap** (esp_lcd_panel_handle_t panel, int x_start, int y_start, int x_end, int y_end, const void *color_data)

Draw bitmap on LCD panel.

**Return**

- ESP_OK on success

**Parameters**

- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
- [in] x_start: Start index on x-axis (x_start included)
- [in] y_start: Start index on y-axis (y_start included)
- [in] x_end: End index on x-axis (x_end not included)
- [in] y_end: End index on y-axis (y_end not included)
- [in] color_data: RGB color data that will be dumped to the specific window range

**esp_err_t esp_lcd_panel_mirror** (esp_lcd_panel_handle_t panel, bool mirror_x, bool mirror_y)

Mirror the LCD panel on specific axis.

**Note** Combined with esp_lcd_panel_swap_xy(), one can realize screen rotation

**Return**

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

**Parameters**

- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
- [in] mirror_x: Whether the panel will be mirrored about the x axis
- [in] mirror_y: Whether the panel will be mirrored about the y axis

**esp_err_t esp_lcd_panel_swap_xy** (esp_lcd_panel_handle_t panel, bool swap_axes)

Swap/Exchange x and y axis.

**Note** Combined with esp_lcd_panel_mirror(), one can realize screen rotation

**Return**

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

**Parameters**

- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
- [in] swap_axes: Whether to swap the x and y axis

**esp_err_t esp_lcd_panel_set_gap** (esp_lcd_panel_handle_t panel, int x_gap, int y_gap)

Set extra gap in x and y axis.

The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively of the actual contents displayed.

**Note** Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.

**Return**

- ESP_OK on success

**Parameters**

- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
- [in] x_gap: Extra gap on x axis, in pixels
- [in] y_gap: Extra gap on y axis, in pixels

**esp_err_t esp_lcd_panel_invert_color** (esp_lcd_panel_handle_t panel, bool invert_color_data)

Invert the color (bit-wise invert the color data line)

**Return**

- ESP_OK on success

**Parameters**

- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
• [in] invert_color_data: Whether to invert the color data

`esp_err_t esp_lcd_panel_disp_off(esp_lcd_panel_handle_t panel, bool off)`

Turn off the display.

Return
• ESP_OK on success
• ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

Parameters
• [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
• [in] off: Whether to turn off the screen

Header File
• components/esp_lcd/include/esp_lcd_panel_rgb.h

Header File
• components/esp_lcd/include/esp_lcd_panel_vendor.h

Functions

`esp_err_t esp_lcd_new_panel_st7789(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)`

Create LCD panel for model ST7789.

Return
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_NO_MEM if out of memory
• ESP_OK on success

Parameters
• [in] io: LCD panel IO handle
• [in] panel_dev_config: general panel device configuration
• [out] ret_panel: Returned LCD panel handle

`esp_err_t esp_lcd_new_panel_nt35510(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)`

Create LCD panel for model NT35510.

Return
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_NO_MEM if out of memory
• ESP_OK on success

Parameters
• [in] io: LCD panel IO handle
• [in] panel_dev_config: general panel device configuration
• [out] ret_panel: Returned LCD panel handle

`esp_err_t esp_lcd_new_panel_ssd1306(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)`

Create LCD panel for model SSD1306.

Return
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_NO_MEM if out of memory
• ESP_OK on success

Parameters
• [in] io: LCD panel IO handle
• [in] panel_dev_config: general panel device configuration
• [out] ret_panel: Returned LCD panel handle

Structures
struct esp_lcd_panel_dev_config_t
  Configuration structure for panel device.

Public Members

  int reset_gpio_num
    GPIO used to reset the LCD panel, set to -1 if it’s not used

  esp_lcd_color_space_t color_space
    Set the color space used by the LCD panel

  unsigned int bits_per_pixel
    Color depth, in bpp

  unsigned int reset_active_high : 1
    Setting this if the panel reset is high level active

2.6.10 LED Control (LEDC)

Introduction

The LED control (LEDC) peripheral is primarily designed to control the intensity of LEDs, although it can also be used to generate PWM signals for other purposes. It has 6 channels which can generate independent waveforms that can be used, for example, to drive RGB LED devices.

The PWM controller can automatically increase or decrease the duty cycle gradually, allowing for fades without any processor interference.

Functionality Overview

Setting up a channel of the LEDC is done in three steps. Note that unlike ESP32, ESP32-C3 only supports configuring channels in “low speed” mode.

1. Timer Configuration by specifying the PWM signal’s frequency and duty cycle resolution.
2. Channel Configuration by associating it with the timer and GPIO to output the PWM signal.
3. Change PWM Signal that drives the output in order to change LED’s intensity. This can be done under the full control of software or with hardware fading functions.

As an optional step, it is also possible to set up an interrupt on fade end.

Timer Configuration Setting the timer is done by calling the function ledc_timer_config() and passing the data structure ledc_timer_config_t that contains the following configuration settings:

• Speed mode (value must be LEDC_LOW_SPEED_MODE)
• Timer number ledc_timer_t
• PWM signal frequency
• Resolution of PWM duty
• Source clock ledc_clk_cfg_t

The frequency and the duty resolution are interdependent. The higher the PWM frequency, the lower the duty resolution which is available, and vice versa. This relationship might be important if you are planning to use this API for purposes other than changing the intensity of LEDs. For more details, see Section Supported Range of Frequency and Duty Resolutions.
The source clock can also limit the PWM frequency. The higher the source clock frequency, the higher the maximum PWM frequency can be configured.

Table 9: Characteristics of ESP32-C3 LEDC source clocks

<table>
<thead>
<tr>
<th>Clock name</th>
<th>Clock freq</th>
<th>Clock capabilities</th>
</tr>
</thead>
<tbody>
<tr>
<td>APB_CLK</td>
<td>80 MHz</td>
<td>/</td>
</tr>
<tr>
<td>RTC20M_CLK</td>
<td>~20 MHz</td>
<td>Dynamic Frequency Scaling compatible, Light sleep compatible</td>
</tr>
<tr>
<td>XTAL_CLK</td>
<td>40 MHz</td>
<td>Dynamic Frequency Scaling compatible</td>
</tr>
</tbody>
</table>

Note: For ESP32-C3, all timers share one clock source. In other words, it is impossible to use different clock sources for different timers.

Channel Configuration When the timer is set up, configure the desired channel (one out of `ledc_channel_t`). This is done by calling the function `ledc_channel_config()`. Similar to the timer configuration, the channel setup function should be passed a structure `ledc_channel_config_t` that contains the channel’s configuration parameters. At this point, the channel should start operating and generating the PWM signal on the selected GPIO, as configured in `ledc_channel_config_t`, with the frequency specified in the timer settings and the given duty cycle. The channel operation (signal generation) can be suspended at any time by calling the function `ledc_stop()`.

Change PWM Signal Once the channel starts operating and generating the PWM signal with the constant duty cycle and frequency, there are a couple of ways to change this signal. When driving LEDs, primarily the duty cycle is changed to vary the light intensity. The following two sections describe how to change the duty cycle using software and hardware fading. If required, the signal’s frequency can also be changed; it is covered in Section Change PWM Frequency.

Note: All the timers and channels in the ESP32-C3’s LED PWM Controller only support low speed mode. Any change of PWM settings must be explicitly triggered by software (see below).
**Change PWM Duty Cycle Using Software** To set the duty cycle, use the dedicated function `ledc_set_duty()`. After that, call `ledc_update_duty()` to activate the changes. To check the currently set value, use the corresponding `_get_` function `ledc_get_duty()`.

Another way to set the duty cycle, as well as some other channel parameters, is by calling `ledc_channel_config()` covered in Section *Channel Configuration*.

The range of the duty cycle values passed to functions depends on selected *duty_resolution* and should be from 0 to $(2^{\text{duty_resolution}}) - 1$. For example, if the selected duty resolution is 10, then the duty cycle values can range from 0 to 1023. This provides the resolution of ~0.1%.

**Change PWM Duty Cycle using Hardware** The LEDC hardware provides the means to gradually transition from one duty cycle value to another. To use this functionality, enable fading with `ledc_fade_func_install()` and then configure it by calling one of the available fading functions:

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

Start fading with `ledc_fade_start()`. A fade can be operated in blocking or non-blocking mode, please check `ledc_fade_mode_t` for the difference between the two available fade modes. Note that with either fade mode, the next fade or fixed-duty update will not take effect until the last fade finishes or is stopped. `ledc_fade_stop()` has to be called to stop a fade that is in progress.

To get a notification about the completion of a fade operation, a fade end callback function can be registered for each channel by calling `ledc_cb_register()` after the fade service being installed.

If not required anymore, fading and an associated interrupt can be disabled with `ledc_fade_func_uninstall()`.

**Change PWM Frequency** The LEDC API provides several ways to change the PWM frequency “on the fly”:

- Set the frequency by calling `ledc_set_freq()`. There is a corresponding function `ledc_get_freq()` to check the current frequency.
- Change the frequency and the duty resolution by calling `ledc_bind_channel_timer()` to bind some other timer to the channel.
- Change the channel’s timer by calling `ledc_channel_config()`.

**More Control Over PWM** There are several lower level timer-specific functions that can be used to change PWM settings:

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

The first two functions are called “behind the scenes” by `ledc_channel_config()` to provide a startup of a timer after it is configured.

**Use Interrupts** When configuring an LEDC channel, one of the parameters selected within `ledc_channel_config_t` is `ledc_intr_type_t` which triggers an interrupt on fade completion.

For registration of a handler to address this interrupt, call `ledc_isr_register()`.

**Supported Range of Frequency and Duty Resolutions**

The LED PWM Controller is designed primarily to drive LEDs. It provides a large flexibility of PWM duty cycle settings. For instance, the PWM frequency of 5 kHz can have the maximum duty resolution of 13 bits. This means that the duty can be set anywhere from 0 to 100% with a resolution of ~0.012% $(2^{13} = 8192)$ discrete levels of the...
LED intensity). Note, however, that these parameters depend on the clock signal clocking the LED PWM Controller timer which in turn clocks the channel (see timer configuration and the ESP32-C3 Technical Reference Manual > LED PWM Controller (LEDC) [PDF]).

The LEDC can be used for generating signals at much higher frequencies that are sufficient enough to clock other devices, e.g., a digital camera module. In this case, the maximum available frequency is 40 MHz with duty resolution of 1 bit. This means that the duty cycle is fixed at 50% and cannot be adjusted.

The LEDC API is designed to report an error when trying to set a frequency and a duty resolution that exceed the range of LEDC’s hardware. For example, an attempt to set the frequency to 20 MHz and the duty resolution to 3 bits will result in the following error reported on a serial monitor:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try reducing freq_hz or duty_resolution. div_param=128
```

In such a situation, either the duty resolution or the frequency must be reduced. For example, setting the duty resolution to 2 will resolve this issue and will make it possible to set the duty cycle at 25% steps, i.e., at 25%, 50% or 75%.

The LEDC driver will also capture and report attempts to configure frequency / duty resolution combinations that are below the supported minimum, e.g.:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try increasing freq_hz or duty_resolution. div_param=128000000
```

The duty resolution is normally set using `ledc_timer_bit_t`. This enumeration covers the range from 10 to 15 bits. If a smaller duty resolution is required (from 10 down to 1), enter the equivalent numeric values directly.

### Application Example

The LEDC change duty cycle and fading control example: `peripherals/ledc/ledc_fade`.

The LEDC basic example: `peripherals/ledc/ledc_basic`.

### API Reference

#### Header File

- `components/driver/include/driver/ledc.h`

#### Functions

- `esp_err_t ledc_channel_config(const ledc_channel_config_t *ledc_conf)`
  
  LEDC channel configuration Configure LEDC channel with the given channel/output gpio_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.

  **Return**
  
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error

  **Parameters**
  
  - `ledc_conf`: Pointer of LEDC channel configure struct

- `esp_err_t ledc_timer_config(const ledc_timer_config_t *timer_conf)`
  
  LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty_resolution.

  **Return**
  
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

  **Parameters**
  
  - `timer_conf`: Pointer of LEDC timer configure struct
**esp_err_t** `ledc_update_duty`(ledc_mode_t speed_mode, ledc_channel_t channel)

LEDC update channel parameters.

**Note** Call this function to activate the LEDC updated parameters. After `ledc_set_duty`, we need to call this function to update the settings. And the new LEDC parameters don’t take effect until the next PWM cycle.

**Note** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

**esp_err_t** `ledc_set_pin`(int gpio_num, ledc_mode_t speed_mode, ledc_channel_t ledc_channel)

Set LEDC output gpio.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- gpio_num: The LEDC output gpio
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- ledc_channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

**esp_err_t** `ledc_stop`(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t idle_level)

LEDC stop. Disable LEDC output, and set idle level.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- idle_level: Set output idle level after LEDC stops.

**esp_err_t** `ledc_set_freq`(ledc_mode_t speed_mode, ledc_timer_t timer_num, uint32_t freq_hz)

LEDC set channel frequency (Hz)

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- timer_num: LEDC timer index (0-3), select from ledc_timer_t
- freq_hz: Set the LEDC frequency

**uint32_t** `ledc_get_freq`(ledc_mode_t speed_mode, ledc_timer_t timer_num)

LEDC get channel frequency (Hz)

**Return**
- 0 error
- Others Current LEDC frequency

**Parameters**
Chapter 2. API Reference

- **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_num**: LEDC timer index (0-3), select from ledc_timer_t

```c
esp_err_t ledc_set_duty_with_hpoint (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)
```

LEDC set duty and hpoint value. Only after calling `ledc_update_duty` will the duty update.

**Note** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`.

**Note** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel**: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **duty**: Set the LEDC duty, the range of duty setting is \([0, (2^{**duty_resolution}) - 1]\)
- **hpoint**: Set the LEDC hpoint value (max: 0xfffff)

```c
int ledc_get_hpoint (ledc_mode_t speed_mode, ledc_channel_t channel)
```

LEDC get hpoint value, the counter value when the output is set high level.

**Return**
- LEDC_ERR_VAL if parameter error
- Others Current hpoint value of LEDC channel

**Parameters**
- **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel**: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

```c
esp_err_t ledc_set_duty (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty)
```

LEDC set duty. This function do not change the hpoint value of this channel. If needed, please call `ledc_set_duty_with_hpoint` only after calling `ledc_update_duty` will the duty update.

**Note** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`.

**Note** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel**: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **duty**: Set the LEDC duty, the range of duty setting is \([0, (2^{**duty_resolution}) - 1]\)

```c
uint32_t ledc_get_duty (ledc_mode_t speed_mode, ledc_channel_t channel)
```

LEDC get duty. This function returns the duty at the present PWM cycle. You shouldn’t expect the function to return the new duty in the same cycle of calling `ledc_update_duty`, because duty update doesn’t take effect until the next cycle.

**Return**
- LEDC_ERR_DUTY if parameter error
- Others Current LEDC duty

**Parameters**
Chapter 2. API Reference

• **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.

• **channel**: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

```c
esp_err_t ledc_set_fade(  
    ledc_mode_t speed_mode,  
    ledc_channel_t channel,  
    uint32_t duty,  
    ledc_duty_direction_t fade_direction,  
    uint32_t step_num,  
    uint32_t duty_cycle_num,  
    uint32_t duty_scale)
```

LEDC set gradient Set LEDC gradient. After the function calls the ledc_update_duty function, the function can take effect.

**Note** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Return**

• ESP_OK Success

• ESP_ERR_INVALID_ARG Parameter error

**Parameters**

• **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.

• **channel**: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

• **duty**: Set the start of the gradient duty, the range of duty setting is [0, (2**duty_resolution) - 1]

• **fade_direction**: Set the direction of the gradient

• **step_num**: Set the number of the gradient

• **duty_cycle_num**: Set how many LEDC tick each time the gradient lasts

• **duty_scale**: Set gradient change amplitude

```c
esp_err_t ledc_isr_register(void (*fn)(void *), void *arg, int intr_alloc_flags, ledc_isr_handle_t *handle)
```

Register LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

**Return**

• ESP_OK Success

• ESP_ERR_INVALID_ARG Function pointer error

**Parameters**

• **fn**: Interrupt handler function.

• **arg**: User-supplied argument passed to the handler function.

• **intr_alloc_flags**: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_*. See esp_intr_alloc.h for more info.

• **handle**: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

```c
esp_err_t ledc_timer_set(  
    ledc_mode_t speed_mode,  
    ledc_timer_t timer_sel,  
    uint32_t clock_divider,  
    uint32_t duty_resolution,  
    ledc_clk_src_t clk_src)
```

Configure LEDC settings.

**Return**

• (-1) Parameter error

• Other Current LEDC duty

**Parameters**

• **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.

• **timer_sel**: Timer index (0-3), there are 4 timers in LEDC module

• **clock_divider**: Timer clock divide value, the timer clock is divided from the selected clock source

• **duty_resolution**: Resolution of duty setting in number of bits. The range of duty values is [0, (2**duty_resolution)]

• **clk_src**: Select LEDC source clock.

```c
esp_err_t ledc_timer_rst(ledc_mode_t speed_mode, ledc_timer_t timer_sel)
```

Reset LEDC timer.

**Return**

• ESP_ERR_INVALID_ARG Parameter error

• ESP_OK Success
Chapter 2. API Reference

Parameters
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `timer_sel`: LEDC timer index (0-3), select from `ledc_timer_t`

```c
esp_err_t ledc_timer_pause(ledc_mode_t speed_mode, ledc_timer_t timer_sel)
```
Pause LEDC timer counter.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `timer_sel`: LEDC timer index (0-3), select from `ledc_timer_t`

```c
esp_err_t ledc_timer_resume(ledc_mode_t speed_mode, ledc_timer_t timer_sel)
```
Resume LEDC timer.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `timer_sel`: LEDC timer index (0-3), select from `ledc_timer_t`

```c
esp_err_t ledc_bind_channel_timer(ledc_mode_t speed_mode, ledc_channel_t channel, ledc_timer_t timer_sel)
```
Bind LEDC channel with the selected timer.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `timer_sel`: LEDC timer index (0-3), select from `ledc_timer_t`

```c
esp_err_t ledc_set fade_with_step(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target duty, uint32_t scale, uint32_t cycle num)
```
Set LEDC fade function.

Note Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

Note `ledc_set fade with_step, ledc_set fade with_time and ledc fade start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set fade_step_and_start`

Note For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

Parameters
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `target_duty`: Target duty of fading [0, (2**duty_resolution) - 1]
- `scale`: Controls the increase or decrease step scale.
• cycle_num: increase or decrease the duty every cycle_num cycles

```c
esp_err_t ledc_set_fade_with_time(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, int max Fade_time_ms)
```

Set LEDC fade function, with a limited time.

**Note** Call ledc_fade_func_install() once before calling this function. Call ledc_fade_start() after this to start fading.

**Note** ledc_set_fade_with_step, ledc_set_fade_with_time and ledc_fade_start are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_fade_step_and_start

**Note** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- target_duty: Target duty of fading [0, (2*duty_resolution) - 1]
- max_fade_time_ms: The maximum time of the fading (ms).

```c
esp_err_t ledc_fade_func_install (int intr_alloc_flags)
```

Install LEDC fade function. This function will occupy interrupt of LEDC module.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function already installed.

**Parameters**
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_@ values. See esp_intr_alloc.h for more info.

```c
void ledc_fade_func_uninstall (void)
```

Uninstall LEDC fade function.

```c
esp_err_t ledc_fade_start (ledc_mode_t speed_mode, ledc_channel_t channel, ledc_fade_mode_t fade_mode)
```

Start LEDC fading.

**Note** Call ledc_fade_func_install() once before calling this function. Call this API right after ledc_set_fade_with_time or ledc_set_fade_with_step before to start fading.

**Note** Starting fade operation with this API is not thread-safe, use with care.

**Note** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_ERR_INVALID_ARG Parameter error.

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel number
- fade_mode: Whether to block until fading done. See ledc_types.h ledc_fade_mode_t for more info. Note that this function will not return until fading to the target duty if LEDC_FADE_WAIT_DONE mode is selected.

```c
esp_err_t ledc_fade_stop (ledc_mode_t speed_mode, ledc_channel_t channel)
```

Stop LEDC fading. Duty of the channel will stay at its present value.
Note This API can be called if a new fixed duty or a new fade want to be set while the last fade operation is still running in progress.

Note Call this API will abort the fading operation only if it was started by calling ledc_fade_start with LEDC_FADE_NO_WAIT mode.

Note If a fade was started with LEDC_FADE_WAIT_DONE mode, calling this API afterwards is no use in stopping the fade. Fade will continue until it reaches the target duty.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_ERR_INVALID_ARG Parameter error.

Parameters

- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel number

`esp_err_t ledc_set_duty_and_update (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)`

A thread-safe API to set duty for LEDC channel and return when duty updated.

Note For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Parameters

- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- duty: Set the LEDC duty, the range of duty setting is [0, (2^duty_resolution) - 1]
- hpoint: Set the LEDC hpoint value(max: 0xffff)

`esp_err_t ledc_set_fade_time_and_start (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t max_fade_time_ms, ledc_fade_mode_t fade_mode)`

A thread-safe API to set and start LEDC fade function, with a limited time.

Note Call ledc_fade_func_install() once, before calling this function.

Note For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

Parameters

- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- target_duty: Target duty of fading [0, (2^duty_resolution) - 1]
- max_fade_time_ms: The maximum time of the fading ( ms ).
- fade_mode: choose blocking or non-blocking mode

`esp_err_t ledc_set_fade_step_and_start (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num, ledc_fade_mode_t fade_mode)`

A thread-safe API to set and start LEDC fade function.

Note Call ledc_fade_func_install() once before calling this function.

Note For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error
Parameters

- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- target_duty: Target duty of fading [0, (2**duty_resolution) - 1]
- scale: Controls the increase or decrease step scale.
- cycle_num: increase or decrease the duty every cycle_num cycles
- fade_mode: choose blocking or non-blocking mode

```c
esp_err_t ledc_cb_register(ledc_mode_t speed_mode, ledc_channel_t channel, ledc_cbs_t *cbs, void *user_arg)
```

LEDC callback registration function.

Note: The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

Parameters

- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- cbs: Group of LEDC callback functions
- user_arg: user registered data for the callback function

Structures

**struct ledc_channel_config_t**
Configuration parameters of LEDC channel for ledc_channel_config function.

Public Members

```c
int gpio_num
```

the LEDC output gpio_num, if you want to use gpio16, gpio_num = 16

```c
ledc_mode_t speed_mode
```
LEDC speed speed_mode, high-speed mode or low-speed mode

```c
ledc_channel_t channel
```
LEDC channel (0 - 7)

```c
ledc_intr_type_t intr_type
```
configure interrupt, Fade interrupt enable or Fade interrupt disable

```c
ledc_timer_t timer_sel
```
Select the timer source of channel (0 - 3)

```c
uint32_t duty
```
LEDC channel duty, the range of duty setting is [0, (2**duty_resolution)]

```c
int hpoint
```
LEDC channel hpoint value, the max value is 0xffffffff

```c
unsigned int output_invert : 1
```
Enable (1) or disable (0) gpio output invert

```c
struct ledc_channel_config_t::[anonymous] flags
```
LEDC flags

```c
struct ledc_timer_config_t:
```
Configuration parameters of LEDC Timer timer for ledc_timer_config function.
Public Members

`ledc_mode_t speed_mode`
   LEDC speed speed_mode, high-speed mode or low-speed mode

`ledc_timer_bit_t duty_resolution`
   LEDC channel duty resolution

`ledc_timer_bit_t bit_num`
   Deprecated in ESP-IDF 3.0. This is an alias to `duty_resolution` for backward compatibility with ESP-IDF 2.1

`ledc_timer_t timer_num`
   The timer source of channel (0 - 3)

`uint32_t freq_hz`
   LEDC timer frequency (Hz)

`ledc_clk_cfg_t clk_cfg`
   Configure LEDC source clock. For low speed channels and high speed channels, you can specify the source clock using LEDC_USE_REF_TICK, LEDC_USE_APB_CLK or LEDC_AUTO_CLK. For low speed channels, you can also specify the source clock using LEDC_USE_RTC8M_CLK, in this case, all low speed channel’s source clock must be RTC8M_CLK

`struct ledc_cb_param_t`
   LEDC callback parameter.

Public Members

`ledc_cb_event_t event`
   Event name

`uint32_t speed_mode`
   Speed mode of the LEDC channel group

`uint32_t channel`
   LEDC channel (0 - LEDC_CHANNEL_MAX-1)

`uint32_t duty`
   LEDC current duty of the channel, the range of duty is [0, (2**duty_resolution) - 1]

`struct ledc_cbs_t`
   Group of supported LEDC callbacks.

Note The callbacks are all running under ISR environment

Public Members

`ledc_cb_t fade_cb`
   LEDC fade_end callback function

Macros

`LEDC_APB_CLK_HZ`
`LEDC_REF_CLK_HZ`
`LEDC_ERR_DUTY`
`LEDC_ERR_VAL`
Type Definitions

```c
typedef intr_handle_t ledc_isr_handle_t
typedef bool (*ledc_cb_t)(const ledc_cb_param_t *param, void *user_arg)
```

Type of LEDC event callback.

**Parameters**
- `param`: LEDC callback parameter
- `user_arg`: User registered data

Enumerations

```c
enum ledc_cb_event_t
{
    LEDC_FADE_END_EVT
}
```

LEDC callback event type.

**Values:**
- `LEDC_FADE_END_EVT`: LEDC fade end event

Header File

- `components/hal/include/hal/ledc_types.h`

Enumerations

```c
enum ledc_mode_t
{
    LEDC_LOW_SPEED_MODE,
    LEDC_SPEED_MODE_MAX
}
```

LEDC speed limit

```c
enum ledc_intr_type_t
{
    LEDC_INTR_DISABLE = 0,
    LEDC_INTR_FADE_END
}
```

Enable LEDC interrupt

```c
enum ledc_duty_direction_t
{
    LEDC_DUTY_DIR_DECREASE = 0,
    LEDC_DUTY_DIR_INCREASE = 1
}
```

LEDC duty direction

```c
enum ledc_slow_clk_sel_t
{
    LEDC_SLOW_CLK_RTC8M = 0,
    LEDC_SLOW_CLK_APB,
    LEDC_SLOW_CLK_XTAL
}
```

LEDC low speed timer clock source

enum ledc_clk_cfg_t
In theory, the following enumeration shall be placed in LEDC driver’s header. However, as the next enumeration, ledc_clk_src_t, makes the use of some of these values and to avoid mutual inclusion of the headers, we must define it here.

Values:

LEDC_AUTO_CLK = 0
The driver will automatically select the source clock (REF_TICK or APB) based on the giving resolution and duty parameter when init the timer

LEDC_USE_APB_CLK
LEDC timer select APB clock as source clock

LEDC_USE_RTC8M_CLK
LEDC timer select RTC8M_CLK as source clock. Only for low speed channels and this parameter must be the same for all low speed channels

LEDC_USE_XTAL_CLK
LEDC timer select XTAL clock as source clock

class ledc_clk_src_t

Values:

LEDC_APB_CLK = LEDC_USE_APB_CLK
LEDC timer clock divided from APB clock (80Mhz)

LEDC_SCLK = LEDC_USE_APB_CLK
Selecting this value for LEDC_TICK_SEL_TIMER let the hardware take its source clock from LEDC_APB_CLK_SEL

class ledc_timer_t

Values:

LEDC_TIMER_0 = 0
LEDC timer 0

LEDC_TIMER_1
LEDC timer 1

LEDC_TIMER_2
LEDC timer 2

LEDC_TIMER_3
LEDC timer 3

LEDC_TIMER_MAX

class ledc_channel_t

Values:

LEDC_CHANNEL_0 = 0
LEDC channel 0

LEDC_CHANNEL_1
LEDC channel 1

LEDC_CHANNEL_2
LEDC channel 2

LEDC_CHANNEL_3
LEDC channel 3

LEDC_CHANNEL_4
LEDC channel 4

LEDC_CHANNEL_5
LEDC channel 5
Chapter 2. API Reference

LEDC_CHANNEL_MAX

enum ledc_timer_bit_t

Values:

LEDC_TIMER_1_BIT = 1
  LEDC PWM duty resolution of 1 bits

LEDC_TIMER_2_BIT
  LEDC PWM duty resolution of 2 bits

LEDC_TIMER_3_BIT
  LEDC PWM duty resolution of 3 bits

LEDC_TIMER_4_BIT
  LEDC PWM duty resolution of 4 bits

LEDC_TIMER_5_BIT
  LEDC PWM duty resolution of 5 bits

LEDC_TIMER_6_BIT
  LEDC PWM duty resolution of 6 bits

LEDC_TIMER_7_BIT
  LEDC PWM duty resolution of 7 bits

LEDC_TIMER_8_BIT
  LEDC PWM duty resolution of 8 bits

LEDC_TIMER_9_BIT
  LEDC PWM duty resolution of 9 bits

LEDC_TIMER_10_BIT
  LEDC PWM duty resolution of 10 bits

LEDC_TIMER_11_BIT
  LEDC PWM duty resolution of 11 bits

LEDC_TIMER_12_BIT
  LEDC PWM duty resolution of 12 bits

LEDC_TIMER_13_BIT
  LEDC PWM duty resolution of 13 bits

LEDC_TIMER_14_BIT
  LEDC PWM duty resolution of 14 bits

LEDC_TIMER_BIT_MAX

enum ledc_fade_mode_t

Values:

LEDC_FADE_NO_WAIT = 0
  LEDC fade function will return immediately

LEDC_FADE_WAIT_DONE
  LEDC fade function will block until fading to the target duty

LEDC_FADE_MAX

2.6.11 Remote Control (RMT)

The RMT (Remote Control) module driver can be used to send and receive infrared remote control signals. Due to flexibility of RMT module, the driver can also be used to generate or receive many other types of signals.

The signal, which consists of a series of pulses, is generated by RMT’s transmitter based on a list of values. The values define the pulse duration and a binary level, see below. The transmitter can also provide a carrier and modulate it with provided pulses.
Chapter 2. API Reference

Fig. 10: RMT Transmitter Overview

The reverse operation is performed by the receiver, where a series of pulses is decoded into a list of values containing the pulse duration and binary level. A filter may be applied to remove high frequency noise from the input signal.

Fig. 11: RMT Receiver Overview

There couple of typical steps to setup and operate the RMT and they are discussed in the following sections:

1. **Configure Driver**
2. **Transmit Data or Receive Data**
3. **Change Operation Parameters**
4. **Use Interrupts**

The RMT has four channels numbered from zero to three. The first half (i.e. Channel 0 ~ 1) channels can only be configured for transmitting, and the other half (i.e. Channel 2 ~ 3) channels can only be configured for receiving. They are referred to using indexes defined in structure `rmt_channel_t`.

**Configure Driver**

There are several parameters that define how particular channel operates. Most of these parameters are configured by setting specific members of `rmt_config_t` structure. Some of the parameters are common to both transmit or receive mode, and some are mode specific. They are all discussed below.

**Common Parameters**

- The channel to be configured, select one from the `rmt_channel_t` enumerator.
- The RMT operation mode - whether this channel is used to transmit or receive data, selected by setting a `rmt_mode` members to one of the values from `rmt_mode_t`.
- What is the pin number to transmit or receive RMT signals, selected by setting `gpio_num`.
- How many memory blocks will be used by the channel, set with `mem_block_num`. 
Extra miscellaneous parameters for the channel can be set in the flags.

- When `RMT_CHANNEL_FLAGS_AWARE_DFS` is set, RMT channel will take REF_TICK or XTAL as source clock. The benefit is, RMT channel can continue work even when APB clock is changing. See power_management for more information.
- When `RMT_CHANNEL_FLAGS_INVERT_SIG` is set, the driver will invert the RMT signal sending to or receiving from the channel. It just works like an external inverter connected to the GPIO of certain RMT channel.

A clock divider, that will determine the range of pulse length generated by the RMT transmitter or discriminated by the receiver. Selected by setting `clk_div` to a value within [1..255] range. The RMT source clock is typically APB CLK, 80Mhz by default. But when `RMT_CHANNEL_FLAGS_AWARE_DFS` is set in flags, RMT source clock is changed to REF_TICK or XTAL.

**Note:** The period of a square wave after the clock divider is called a ‘tick’. The length of the pulses generated by the RMT transmitter or discriminated by the receiver is configured in number of ‘ticks’.

There are also couple of specific parameters that should be set up depending if selected channel is configured in Transmit Mode or Receive Mode:

**Transmit Mode** When configuring channel in transmit mode, set `tx_config` and the following members of `rmt_tx_config_t`:

- Transmit the currently configured data items in a loop - `loop_en`
- Enable the RMT carrier signal - `carrier_en`
- Frequency of the carrier in Hz - `carrier_freq_hz`
- Duty cycle of the carrier signal in percent (%) - `carrier_duty_percent`
- Level of the RMT output, when the carrier is applied - `carrier_level`
- Enable the RMT output if idle - `idle_output_en`
- Set the signal level on the RMT output if idle - `idle_level`
- Specify maximum number of transmissions in a loop - `loop_count`

**Receive Mode** In receive mode, set `rx_config` and the following members of `rmt_rx_config_t`:

- Enable a filter on the input of the RMT receiver - `filter_en`
- A threshold of the filter, set in the number of ticks - `filter_ticks_thresh`. Pulses shorter than this setting will be filtered out. Note, that the range of entered tick values is [0..255].
- A pulse length threshold that will turn the RMT receiver idle, set in number of ticks - `idle_threshold`. The receiver will ignore pulses longer than this setting.
- Enable the RMT carrier demodulation - `carrier_rm`
- Frequency of the carrier in Hz - `carrier_freq_hz`
- Duty cycle of the carrier signal in percent (%) - `carrier_duty_percent`
- Level of the RMT input, where the carrier is modulated to - `carrier_level`

**Finalize Configuration** Once the `rmt_config_t` structure is populated with parameters, it should be then invoked with `rmt_config()` to make the configuration effective.

The last configuration step is installation of the driver in memory by calling `rmt_driver_install()`. If `rx_buf_size` parameter of this function is > 0, then a ring buffer for incoming data will be allocated. A default ISR handler will be installed, see a note in Use Interrupts.

Now, depending on how the channel is configured, we are ready to either Transmit Data or Receive Data. This is described in next two sections.

**Transmit Data**

Before being able to transmit some RMT pulses, we need to define the pulse pattern. The minimum pattern recognized by the RMT controller, later called an ‘item’, is provided in a structure `rmt_item32_t`. Each item consists of
two pairs of two values. The first value in a pair describes the signal duration in ticks and is 15 bits long, the second provides the signal level (high or low) and is contained in a single bit. A block of couple of items and the structure of an item is presented below.

![Diagram of RMT items structure](image)

Fig. 12: Structure of RMT items (L - signal level)

For a simple example how to define a block of items see peripherals/rmt/morse_code.

The items are provided to the RMT controller by calling function \texttt{rmt_write_items()}. This function also automatically triggers start of transmission. It may be called to wait for transmission completion or exit just after transmission start. In such case you can wait for the transmission end by calling \texttt{rmt_wait_tx_done()}. This function does not limit the number of data items to transmit. It is using an interrupt to successively copy the new data chunks to RMT’s internal memory as previously provided data are sent out.

Another way to provide data for transmission is by calling \texttt{rmt_fill_tx_items()}. In this case transmission is not started automatically. To control the transmission process use \texttt{rmt_tx_start()} and \texttt{rmt_tx_stop()}. The number of items to sent is restricted by the size of memory blocks allocated in the RMT controller’s internal memory, see \texttt{rmt_set_mem_block_num()}. 

**Receive Data**

Before starting the receiver we need some storage for incoming items. The RMT controller has 192 x 32-bits of internal RAM shared between all four channels.

In typical scenarios it is not enough as an ultimate storage for all incoming (and outgoing) items. Therefore this API supports retrieval of incoming items on the fly to save them in a ring buffer of a size defined by the user. The size is provided when calling \texttt{rmt_driver_install()} discussed above. To get a handle to this buffer call \texttt{rmt_get_ringbuf_handle()}. 

With the above steps complete we can start the receiver by calling \texttt{rmt_rx_start()} and then move to checking what’s inside the buffer. To do so, you can use common FreeRTOS functions that interact with the ring buffer. Please see an example how to do it in peripherals/rmt/ir_protocols.

To stop the receiver, call \texttt{rmt_rx_stop()}. 

**Change Operation Parameters**

Previously described function \texttt{rmt_config()} provides a convenient way to set several configuration parameters in one shot. This is usually done on application start. Then, when the application is running, the API provides an alternate way to update individual parameters by calling dedicated functions. Each function refers to the specific...
RMT channel provided as the first input parameter. Most of the functions have _get_ counterpart to read back the currently configured value.

**Parameters Common to Transmit and Receive Mode**

- Selection of a GPIO pin number on the input or output of the RMT - `rmt_set_gpio()`
- Number of memory blocks allocated for the incoming or outgoing data - `rmt_set_mem_pd()`
- Setting of the clock divider - `rmt_set_clk_div()`
- Selection of the clock source, note that currently one clock source is supported, the APB clock which is 80Mhz - `rmt_set_source_clk()`

**Transmit Mode Parameters**

- Enable or disable the loop back mode for the transmitter - `rmt_set_tx_loop_mode()`
- Binary level on the output to apply the carrier - `rmt_set_tx_carrier()`, selected from `rmt_carrier_level_t`
- Determines the binary level on the output when transmitter is idle - `rmt_set_idle_level()`, selected from `rmt_idle_level_t`
- Enable or disable loop count feature to automatically transmit items for N iterations, then trigger an ISR callback - `rmt_set_tx_loop_count()`
- Enable automatically stopping when the number of iterations matches the set loop count. Note this is not reliable for target that doesn’ t support `SOC_RMT_SUPPORT_TX_LOOP_AUTOSTOP`. - `rmt_enable_tx_loop_autostop()`

**Receive Mode Parameters**

- The filter setting - `rmt_set_rx_filter()`
- The receiver threshold setting - `rmt_set_rx_idle_thresh()`
- Whether the transmitter or receiver is entitled to access RMT’s memory - `rmt_set_memory_owner()`, selection is from `rmt_mem_owner_t`.

**Use Interrupts**

Registering of an interrupt handler for the RMT controller is done be calling `rmt_isr_register()`.

**Note:** When calling `rmt_driver_install()` to use the system RMT driver, a default ISR is being installed. In such a case you cannot register a generic ISR handler with `rmt_isr_register()`.

The RMT controller triggers interrupts on four specific events describes below. To enable interrupts on these events, the following functions are provided:

- The RMT receiver has finished receiving a signal - `rmt_set_rx_intr_en()`
- The RMT transmitter has finished transmitting the signal - `rmt_set_tx_intr_en()`
- The number of events the transmitter has sent matches a threshold value - `rmt_set_tx_thr_intr_en()`
- Ownership to the RMT memory block has been violated - `rmt_set_err_intr_en()`

Setting or clearing an interrupt enable mask for specific channels and events may be also done by calling `rmt_set_intr_enable_mask()` or `rmt_clr_intr_enable_mask()`.

When servicing an interrupt within an ISR, the interrupt need to explicitly cleared. To do so, set specific bits described as RMT.int_clr.val.chN_event_name and defined as a volatile struct in `soc/esp32c3/include/soc/rmt_struct.h`, where N is the RMT channel number [0, n] and the event_name is one of four events described above.

If you do not need an ISR anymore, you can deregister it by calling a function `rmt_isr_deregister()`.
Warning: It’s not recommended for users to register an interrupt handler in their applications. RMT driver is highly dependent on interrupt, especially when doing transaction in a ping-pong way, so the driver itself has registered a default handler called `rmt_driver_isr_default`. Instead, if what you want is to get a notification when transaction is done, go ahead with `rmt_register_tx_end_callback()`.

Uninstall Driver

If the RMT driver has been installed with `rmt_driver_install()` for some specific period of time and then not required, the driver may be removed to free allocated resources by calling `rmt_driver_uninstall()`.

Application Examples

• Using RMT to send morse code: `peripherals/rmt/morse_code`.
• Using RMT to drive RGB LED strip: `peripherals/rmt/led_strip`.
• NEC remote control TX and RX example: `peripherals/rmt/ir_protocols`.
• Musical buzzer example: `peripherals/rmt/musical_buzzer`.

API Reference

Header File

• `components/driver/include/driver/rmt.h`

Functions

```c
esp_err_t rmt_set_clk_div(rmt_channel_t channel, uint8_t div_cnt)
Set RMT clock divider, channel clock is divided from source clock.
```

Return

• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters

• `channel`: RMT channel
• `div_cnt`: RMT counter clock divider

```c
esp_err_t rmt_get_clk_div(rmt_channel_t channel, uint8_t* div_cnt)
Get RMT clock divider, channel clock is divided from source clock.
```

Return

• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters

• `channel`: RMT channel
• `div_cnt`: pointer to accept RMT counter divider

```c
esp_err_t rmt_set_rx_idle_thresh(rmt_channel_t channel, uint16_t thresh)
Set RMT RX idle threshold value.
```

In receive mode, when no edge is detected on the input signal for longer than idle_thres channel clock cycles, the receive process is finished.

Return

• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters

• `channel`: RMT channel
• `thresh`: RMT RX idle threshold
**esp_err_t rmt_get_rx_idle_thresh(rmt_channel_t channel, uint16_t* thresh)**

Get RMT idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than idle_thres channel clock cycles, the receive process is finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- thresh: pointer to accept RMT RX idle threshold value

**esp_err_t rmt_set_mem_block_num(rmt_channel_t channel, uint8_t rmt_mem_num)**

Set RMT memory block number for RMT channel.

This function is used to configure the amount of memory blocks allocated to channel n. The 8 channels share a 512x32-bit RAM block which can be read and written by the processor cores over the APB bus, as well as read by the transmitters and written by the receivers.

The RAM address range for channel n is start_addr_CHn to end_addr_CHn, which are defined by:

- Memory block start address is RMT_CHANNEL_MEM(n) (in soc/rmt_reg.h), that is, start_addr_chn = RMT base address + 0x800 + 64 * 4 * n, and end_addr_chn = RMT base address + 0x800 + 64 * 4 * n + 64 * 4 * RMT_MEM_SIZE_CHn mod 512 * 4

@note
- If memory block number of one channel is set to a value greater than 1, this channel will occupy the memory block of the next channel.
- Channel 0 can use at most 8 blocks of memory, accordingly channel 7 can only use one memory block.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- rmt_mem_num: RMT RX memory block number, one block has 64 * 32 bits.

**esp_err_t rmt_get_mem_block_num(rmt_channel_t channel, uint8_t*rmt_mem_num)**

Get RMT memory block number.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- rmt_mem_num: Pointer to accept RMT RX memory block number

**esp_err_t rmt_set_tx_carrier(rmt_channel_t channel, bool carrier_en, uint16_t high_level, uint16_t low_level, rmt_carrier_level_t carrier_level)**

Configure RMT carrier for TX signal.

Set different values for carrier_high and carrier_low to set different frequency of carrier. The unit of carrier_high/low is the source clock tick, not the divided channel counter clock.
Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- carrier_en: Whether to enable output carrier.
- high_level: High level duration of carrier
- low_level: Low level duration of carrier
- carrier_level: Configure the way carrier wave is modulated for channel.
  - 1'b1: transmit on low output level
  - 1'b0: transmit on high output level

```c
esp_err_t rmt_set_mem_pd(rmt_channel_t channel, bool carrier_en)
```
Set RMT memory in low power mode.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- carrier_en: RMT memory low power enable.

```c
esp_err_t rmt_get_mem_pd(rmt_channel_t channel, bool *carrier_en)
```
Get RMT memory low power mode.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- carrier_en: Pointer to accept RMT memory low power mode.

```c
esp_err_t rmt_tx_start(rmt_channel_t channel, bool tx_idx_rst)
```
Set RMT start sending data from memory.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- tx_idx_rst: Set true to reset memory index for TX. Otherwise, transmitter will continue sending from the last index in memory.

```c
esp_err_t rmt_tx_stop(rmt_channel_t channel)
```
Set RMT stop sending.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel

```c
esp_err_t rmt_rx_start(rmt_channel_t channel, bool rx_idx_rst)
```
Set RMT start receiving data.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
• **rx_idx_rst**: Set true to reset memory index for receiver. Otherwise, receiver will continue receiving data to the last index in memory.

```c
esp_err_t rmt rx stop (rmt_channel_t channel)
Set RMT stop receiving data.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
```

```c
esp_err_t rmt tx memory reset (rmt_channel_t channel)
Reset RMT TX memory.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
```

```c
esp_err_t rmt rx memory reset (rmt_channel_t channel)
Reset RMT RX memory.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
```

```c
esp_err_t rmt set memory owner (rmt_channel_t channel, rmt_mem_owner_t owner)
Set RMT memory owner.

Note Setting memroy is only valid for RX channel.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• owner: To set when the transmitter or receiver can process the memory of channel.
```

```c
esp_err_t rmt get memory owner (rmt_channel_t channel, rmt_mem_owner_t *owner)
Get RMT memory owner.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• owner: Pointer to get memory owner.
```

```c
esp_err_t rmt set tx loop mode (rmt_channel_t channel, bool loop_en)
Set RMT tx loop mode.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• loop_en: Enable RMT transmitter loop sending mode. If set true, transmitter will continue sending from the first data to the last data in channel over and over again in a loop.
```

```c
esp_err_t rmt get tx loop mode (rmt_channel_t channel, bool *loop_en)
Get RMT tx loop mode.
```

```c
```
Chapter 2. API Reference

**Return**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**

- `channel`: RMT channel
- `loop_en`: Pointer to accept RMT transmitter loop sending mode.

```c
esp_err_t rmt_set_rx_filter(rmt_channel_t channel, bool rx_filter_en, uint8_t thresh)
```

Set RMT RX filter.

In receive mode, channel will ignore input pulse when the pulse width is smaller than threshold.

- Counted in source clock, **not** divided counter clock.

**Return**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**

- `channel`: RMT channel
- `rx_filter_en`: To enable RMT receiver filter.
- `thresh`: Threshold of pulse width for receiver.

```c
esp_err_t rmt_set_source_clk(rmt_channel_t channel, rmt_source_clk_t base_clk)
```

Set RMT source clock.

RMT module has two clock sources:
1. APB clock which **is 80Mhz**
2. REF tick clock, which would be !Mhz (not supported in this version).

**Return**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**

- `channel`: RMT channel
- `base_clk`: To choose source clock for RMT module.

```c
esp_err_t rmt_get_source_clk(rmt_channel_t channel, rmt_source_clk_t *src_clk)
```

Get RMT source clock.

RMT module has two clock sources:
1. APB clock which **is 80Mhz**
2. REF tick clock, which would be !Mhz (not supported in this version).

**Return**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**

- `channel`: RMT channel
- `src_clk`: Pointer to accept source clock for RMT module.

```c
esp_err_t rmt_set_idle_level(rmt_channel_t channel, bool idle_out_en, rmt_idle_level_t level)
```

Set RMT idle output level for transmitter.

**Return**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**

- `channel`: RMT channel
- `idle_out_en`: To enable idle level output.
- `level`: To set the output signal’s level for channel in idle state.

```c
esp_err_t rmt_get_idle_level(rmt_channel_t channel, bool *idle_out_en, rmt_idle_level_t *level)
```

Get RMT idle output level for transmitter.
Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- idle_out_en: Pointer to accept value of enable idle.
- level: Pointer to accept value of output signal’s level in idle state for specified channel.

\[
\text{esp_err_t rmt_get_status}(\text{rmt_channel_t channel}, \text{uint32_t}* \text{status})
\]
Get RMT status.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- status: Pointer to accept channel status. Please refer to RMT_CHnSTATUS_REG(n=0~7) in rmt_reg.h for more details of each field.

\[
\text{esp_err_t rmt_set_rx_intr_en}(\text{rmt_channel_t channel}, \text{bool} \text{ en})
\]
Set RMT RX interrupt enable.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- en: enable or disable RX interrupt.

\[
\text{esp_err_t rmt_set_err_intr_en}(\text{rmt_channel_t channel}, \text{bool} \text{ en})
\]
Set RMT RX error interrupt enable.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- en: enable or disable RX err interrupt.

\[
\text{esp_err_t rmt_set_tx_intr_en}(\text{rmt_channel_t channel}, \text{bool} \text{ en})
\]
Set RMT TX interrupt enable.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- en: enable or disable TX interrupt.

\[
\text{esp_err_t rmt_set_tx_thr_intr_en}(\text{rmt_channel_t channel}, \text{bool} \text{ en}, \text{uint16_t} \text{ evt_thresh})
\]
Set RMT TX threshold event interrupt enable.

An interrupt will be triggered when the number of transmitted items reaches the threshold value.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- en: enable or disable TX event interrupt.
- evt_thresh: RMT event interrupt threshold value

\[
\text{esp_err_t rmt_set_gpio}(\text{rmt_channel_t channel}, \text{rmt_mode_t mode}, \text{gpio_num_t gpio_num}, \text{bool} \text{ invert_signal})
\]
Configure the GPIO used by RMT channel.

**Return**
- ESP_ERR_INVALID_ARG Configure RMT GPIO failed because of wrong parameter
- ESP_OK Configure RMT GPIO successfully

**Parameters**
- channel: RMT channel
- mode: RMT mode, either RMT_MODE_TX or RMT_MODE_RX
- gpio_num: GPIO number, which is connected with certain RMT signal
- invert_signal: Invert RMT signal physically by GPIO matrix

```c
esp_err_t rmt_config(const rmt_config_t*rmt_param)
```
Configure RMT parameters.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- rmt_param: RMT parameter struct

```c
esp_err_t rmt_isr_register(void (*fn) void * arg, void *intr_alloc_flags, rmt_isr_handle_t *handle)
```
Register RMT interrupt handler, the handler is an ISR.

The handler will be attached to the same CPU core that this function is running on.

**Note** If you already called rmt_driver_install to use system RMT driver, please do not register ISR handler again.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.
- ESP_FAIL System driver installed, cannot register ISR handler for RMT

**Parameters**
- fn: Interrupt handler function.
- arg: Parameter for the handler function
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- handle: If non-zero, a handle to later clean up the ISR gets stored here.

```c
esp_err_t rmt_isr_deregister(rmt_isr_handle_t handle)
```
Deregister previously registered RMT interrupt handler.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Handle invalid

**Parameters**
- handle: Handle obtained from rmt_isr_register

```c
esp_err_t rmt_fill_tx_items(rmt_channel_t channel, const rmt_item32_t*item, uint16_t item_num, uint16_t mem_offset)
```
Fill memory data of channel with given RMT items.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- item: Pointer of items.
- item_num: RMT sending items number.
- mem_offset: Index offset of memory.
Esp_err_t rmt_driver_install (rmt_channel_t channel, size_t rx_buf_size, int intr_alloc_flags)

Initialize RMT driver.

Return
• ESP_ERR_INVALID_STATE Driver is already installed, call rmt_driver_uninstall first.
• ESP_ERR_NO_MEM Memory allocation failure
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• rx_buf_size: Size of RMT RX ringbuffer. Can be 0 if the RX ringbuffer is not used.
• intr_alloc_flags: Flags for the RMT driver interrupt handler. Pass 0 for default flags. See esp_intr_alloc.h for details. If ESP_INTR_FLAG_IRAM is used, please do not use the memory allocated from psram when calling rmt_write_items.

Esp_err_t rmt_driver_uninstall (rmt_channel_t channel)

Uninstall RMT driver.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel

Esp_err_t rmt_get_channel_status (rmt_channel_status_result_t *channel_status)

Get the current status of eight channels.

Note: Do not call this function if it is possible that rmt_driver_uninstall will be called at the same time.

Return
• ESP_ERR_INVALID_ARG Parameter is NULL
• ESP_OK Success

Parameters
• [out] channel_status: store the current status of each channel

Esp_err_t rmt_get_counter_clock (rmt_channel_t channel, uint32_t *clock_hz)

Get speed of channel’s internal counter clock.

Return
• ESP_ERR_INVALID_ARG Parameter is NULL
• ESP_OK Success

Parameters
• channel: RMT channel
• [out] clock_hz: counter clock speed, in hz

Esp_err_t rmt_write_items (rmt_channel_t channel, const rmt_item32_t *rmt_item, int item_num, bool wait_tx_done)

RMT send waveform from rmt_item array.

This API allows user to send waveform with any length.

Note: This function will not copy data, instead, it will point to the original items, and send the waveform items. If wait_tx_done is set to true, this function will block and will not return until all items have been sent out. If wait_tx_done is set to false, this function will return immediately, and the driver interrupt will continue sending the items. We must make sure the item data will not be damaged when the driver is still sending items in driver interrupt.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• rmt_item: head point of RMT items array. If ESP_INTR_FLAG_IRAM is used, please do not use the memory allocated from psram when calling rmt_write_items.
- `item_num`: RMT data item number.
- `wait_tx_done`:
  - If set 1, it will block the task and wait for sending done.
  - If set 0, it will not wait and return immediately.

**`esp_err_t rmt_wait_tx_done(rmt_channel_t channel, TickType_t wait_time)`**
Wait RMT TX finished.

**Return**
- ESP_OK RMT Tx done successfully
- ESP_ERR_TIMEOUT Exceeded the ‘wait_time’ given
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

**Parameters**
- `channel`: RMT channel
- `wait_time`: Maximum time in ticks to wait for transmission to be complete. If set 0, return immediately with ESP_ERR_TIMEOUT if TX is busy (polling).

**`esp_err_t rmt_get_ringbuf_handle(rmt_channel_t channel, RingbufHandle_t *buf_handle)`**
Get ringbuffer from RMT.

> Users can get the RMT RX ringbuffer handle, and process the RX data.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- `channel`: RMT channel
- `buf_handle`: Pointer to buffer handle to accept RX ringbuffer handle.

**`esp_err_t rmt_translator_init(rmt_channel_t channel, sample_to_rmt_t fn)`**
Init rmt translator and register user callback. The callback will convert the raw data that needs to be sent to rmt format. If a channel is initialized more than once, the user callback will be replaced by the later.

**Return**
- ESP_FAIL Init fail.
- ESP_OK Init success.

**Parameters**
- `channel`: RMT channel.
- `fn`: Point to the data conversion function.

**`esp_err_t rmt_translator_set_context(rmt_channel_t channel, void *context)`**
Set user context for the translator of specific channel.

**Return**
- ESP_FAIL Set context fail
- ESP_OK Set context success

**Parameters**
- `channel`: RMT channel number
- `context`: User context

**`esp_err_t rmt_translator_get_context(const size_t *item_num, void **context)`**
Get the user context set by ‘rmt_translator_set_context’.

**Note**
This API must be invoked in the RMT translator callback function, and the first argument must be the actual parameter ‘item_num’ you got in that callback function.

**Return**
- ESP_FAIL Get context fail
- ESP_OK Get context success

**Parameters**
- `item_num`: Address of the memory which contains the number of translated items (It’s from driver’s internal memroy)
- `context`: Returned User context
### Chapter 2. API Reference

#### esp_err_t rmt_write_sample(rmt_channel_t channel, const uint8_t *src, size_t src_size, bool wait_tx_done)

Translate uint8_t type of data into rmt format and send it out. Requires `rmt_translator_init` to init the translator first.

**Return**
- ESP_FAIL Send fail
- ESP_OK Send success

**Parameters**
- channel: RMT channel.
- src: Pointer to the raw data.
- src_size: The size of the raw data.
- wait_tx_done: Set true to wait all data send done.

#### rmt_tx_end_callback_t rmt_register_tx_end_callback(rmt_tx_end_fn_t function, void *arg)

Registers a callback that will be called when transmission ends.

Called by `rmt_driver_isr_default` in interrupt context.

**Note** Requires `rmt_driver_install` to install the default ISR handler.

**Return** the previous callback settings (members will be set to NULL if there was none)

**Parameters**
- function: Function to be called from the default interrupt handler or NULL.
- arg: Argument which will be provided to the callback when it is called.

#### esp_err_t rmt_set_rx_thr_intr_en(rmt_channel_t channel, bool en, uint16_t evt_thresh)

Set RMT RX threshold event interrupt enable.

An interrupt will be triggered when the number of received items reaches the threshold value

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- en: enable or disable RX event interrupt.
- evt_thresh: RMT event interrupt threshold value

#### esp_err_t rmt_add_channel_to_group(rmt_channel_t channel)

Add channel into a synchronous group (channels in the same group can start transactions simultaneously)

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel

#### esp_err_t rmt_remove_channel_from_group(rmt_channel_t channel)

Remove channel out of a group.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel

#### esp_err_t rmt_set_tx_loop_count(rmt_channel_t channel, uint32_t count)

Set loop count threshold value for RMT TX channel.

When tx loop count reaches this value, an ISR callback will notify user

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
• channel: RMT channel
• count: loop count, 1 ~ 1023

esp_err_t rmt_enable_tx_loop_autostop(rmt_channel_t channel, bool en)
Enable or disable the feature that when loop count reaches the threshold, RMT will stop transmitting.

• When the loop auto-stop feature is enabled will halt RMT transmission after the loop count reaches a certain threshold
• When disabled, the RMT transmission continue indefinitely until halted by the users

Note The auto-stop feature is implemented in hardware on particular targets (i.e. those with SOC_RMT_SUPPORT_TX_LOOP_AUTOSTOP defined). Otherwise, the auto-stop feature is implemented in software via the interrupt.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• en: enable bit

esp_err_t rmt_memory_rw_rst(rmt_channel_t channel)
Reset RMT TX/RX memory index.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel

void rmt_set_intr_enable_mask(uint32_t mask)
Set mask value to RMT interrupt enable register.

Parameters
• mask: Bitmask to set to the register

void rmt_clr_intr_enable_mask(uint32_t mask)
Clear mask value to RMT interrupt enable register.

Parameters
• mask: Bitmask to clear the register

esp_err_t rmt_set_pin(rmt_channel_t channel, rmt_mode_t mode, gpio_num_t gpio_num)
Set RMT pin.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• mode: TX or RX mode for RMT
• gpio_num: GPIO number to transmit or receive the signal.

Structures
struct rmt_item32_t
Definition of RMT item.

Public Members

uint32_t duration0 : 15
Duration of level0

uint32_t level0 : 1
Level of the first part
Chapter 2. API Reference

uint32_t duration1 : 15
   Duration of level 1

uint32_t level1 : 1
   Level of the second part

tval
   Equivalent unsigned value for the RMT item

struct rmt_tx_config_t
   Data struct of RMT TX configure parameters.

Public Members

uint32_t carrier_freq_hz
   RMT carrier frequency

rmt_carrier_level_t carrier_level
   Level of the RMT output, when the carrier is applied

rmt_idle_level_t idle_level
   RMT idle level

uint8_t carrier_duty_percent
   RMT carrier duty (%)

uint32_t loop_count
   Maximum loop count

bool carrier_en
   RMT carrier enable

bool loop_en
   Enable sending RMT items in a loop

bool idle_output_en
   RMT idle level output enable

struct rmt_rx_config_t
   Data struct of RMT RX configure parameters.

Public Members

uint16_t idle_threshold
   RMT RX idle threshold

uint8_t filter_ticks_thresh
   RMT filter tick number

bool filter_en
   RMT receiver filter enable

bool rm_carrier
   RMT receiver remove carrier enable

uint32_t carrier_freq_hz
   RMT carrier frequency

uint8_t carrier_duty_percent
   RMT carrier duty (%)

rmt_carrier_level_t carrier_level
   The level to remove the carrier

struct rmt_config_t
   Data struct of RMT configure parameters.
Public Members

\texttt{rmt\_mode\_t rmt\_mode}
  RMT mode: transmitter or receiver

\texttt{rmt\_channel\_t channel}
  RMT channel

\texttt{gpio\_num\_t gpio\_num}
  RMT GPIO number

uint8\_t \texttt{clk\_div}
  RMT channel counter divider

uint8\_t \texttt{mem\_block\_num}
  RMT memory block number

uint32\_t \texttt{flags}
  RMT channel extra configurations, OR’d with RMT\_CHANNEL\_FLAGS\_[*]

\texttt{rmt\_tx\_config\_t tx\_config}
  RMT TX parameter

\texttt{rmt\_rx\_config\_t rx\_config}
  RMT RX parameter

\texttt{struct rmt\_tx\_end\_callback\_t}
  Structure encapsulating a RMT TX end callback.

Public Members

\texttt{rmt\_tx\_end\_fn\_t function}
  Function which is called on RMT TX end

void *\texttt{arg}
  Optional argument passed to function

Macros

\texttt{RMT\_CHANNEL\_FLAGS\_AWARE\_DFS}
  Channel can work during APB clock scaling

\texttt{RMT\_CHANNEL\_FLAGS\_INVERT\_SIG}
  Invert RMT signal

\texttt{RMT\_MEM\_ITEM\_NUM}
  Define memory space of each RMT channel (in words = 4 bytes)

\texttt{RMT\_DEFAULT\_CONFIG\_TX (gpio, channel\_id)}
  Default configuration for Tx channel.

\texttt{RMT\_DEFAULT\_CONFIG\_RX (gpio, channel\_id)}
  Default configuration for RX channel.

Type Definitions

\texttt{typedef intr\_handle\_t rmt\_isr\_handle\_t}
  RMT interrupt handle.

\texttt{typedef void (*rmt\_tx\_end\_fn\_t) (rmt\_channel\_t channel, void *arg)}
  Type of RMT Tx End callback function.

\texttt{typedef void (*sample\_to\_rmt\_t) (const void *src, rmt\_item32\_t *dest, size\_t src\_size, size\_t wanted\_num, size\_t *translated\_size, size\_t *item\_num)}
  User callback function to convert uint8\_t type data to rmt format(rmt\_item32\_t).
This function may be called from an ISR, so, the code should be short and efficient.

Note In fact, item_num should be a multiple of translated_size, e.g.: When we convert each byte of uint8_t type data to rmt format data, the relation between item_num and translated_size should be item_num = translated_size*8.

Parameters

• src: Pointer to the buffer storing the raw data that needs to be converted to rmt format.
• [out] dest: Pointer to the buffer storing the rmt format data.
• src_size: The raw data size.
• wanted_num: The number of rmt format data that wanted to get.
• [out] translated_size: The size of the raw data that has been converted to rmt format, it should return 0 if no data is converted in user callback.
• [out] item_num: The number of the rmt format data that actually converted to, it can be less than wanted_num if there is not enough raw data, but cannot exceed wanted_num. It should return 0 if no data was converted.

Header File

• components/hal/include/hal/rmt_types.h

Structures

struct rmt_channel_status_result_t
Data struct of RMT channel status.

Public Members

rmt_channel_status_t status[RMT_CHANNEL_MAX]
Store the current status of each channel

Enumerations

denum rmt_channel_t
RMT channel ID.

Values:

RMT_CHANNEL_0
RMT channel number 0

RMT_CHANNEL_1
RMT channel number 1

RMT_CHANNEL_2
RMT channel number 2

RMT_CHANNEL_3
RMT channel number 3

RMT_CHANNEL_MAX
Number of RMT channels

denum rmt_mem_owner_t
RMT Internal Memory Owner.

Values:

RMT_MEM_OWNER_TX
RMT RX mode, RMT transmitter owns the memory block

RMT_MEM_OWNER_RX
RMT RX mode, RMT receiver owns the memory block
Chapter 2. API Reference

enum rmt_source_clk_t
Clock Source of RMT Channel.

Values:
- RMT_BASECLK_APB = 1
  RMT source clock is APB CLK, 80Mhz by default
- RMT_BASECLK_XTAL = 3
  RMT source clock is XTAL clock, 40Mhz by default

enum rmt_data_mode_t
RMT Data Mode.

Note We highly recommended to use MEM mode not FIFO mode since there will be some gotcha in FIFO mode.

Values:
- RMT_DATA_MODE_FIFO
- RMT_DATA_MODE_MEM
- RMT_DATA_MODE_MAX

enum rmt_mode_t
RMT Channel Working Mode (TX or RX)

Values:
- RMT_MODE_TX
  RMT TX mode
- RMT_MODE_RX
  RMT RX mode
- RMT_MODE_MAX

enum rmt_idle_level_t
RMT Idle Level.

Values:
- RMT_IDLE_LEVEL_LOW
  RMT TX idle level: low Level
- RMT_IDLE_LEVEL_HIGH
  RMT TX idle level: high Level
- RMT_IDLE_LEVEL_MAX

enum rmt_carrier_level_t
RMT Carrier Level.

Values:
- RMT_CARRIER_LEVEL_LOW
  RMT carrier wave is modulated for low Level output
- RMT_CARRIER_LEVEL_HIGH
  RMT carrier wave is modulated for high Level output
- RMT_CARRIER_LEVEL_MAX

enum rmt_channel_status_t
RMT Channel Status.

Values:
2.6.12 SD SPI Host Driver

Overview

The SD SPI host driver allows communicating with one or more SD cards by the SPI Master driver which makes use of the SPI host. Each card is accessed through an SD SPI device represented by an `sdspi_dev_handle_t` returned when attaching the device to an SPI bus by calling `sdspi_host_init_device`. The bus should be already initialized before (by `spi_bus_initialize`).

With the help of SPI Master driver based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks. The SD SPI driver uses software-controlled CS signal.

How to Use

Firstly, use the macro `SDSPI_DEVICE_CONFIG_DEFAULT` to initialize a structure `sdmmc_slot_config_t`, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which is same as the pin mappings of SDMMC host driver. Modify the host and pins of the structure to desired value. Then call `sdspi_host_init_device` to initialize the SD SPI device and attach to its bus.

Then use `SDSPI_HOST_DEFAULT` macro to initialize a `sdmmc_host_t` structure, which is used to store the state and configurations of upper layer (SD/SDIO/MMC driver). Modify the `slot` parameter of the structure to the SD SPI device `spi_handle` just returned from `sdspi_host_init_device`. Call `sdmmc_card_init` with the `sdmmc_host_t` to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!

Other Details

Only the following driver’s API functions are normally used by most applications:

- `sdspi_host_init()`
- `sdspi_host_init_device()`
- `sdspi_host_remove_device()`
- `sdspi_host_deinit()`

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the `sdmmc_host_t` structure. For more details, see the SD/SDIO/MMC Driver.

Note: SD over SPI does not support speeds above `SDMMC_FREQ_DEFAULT` due to the limitations of the SPI driver.

Warning: If you want to share the SPI bus among SD card and other SPI devices, there are some restrictions, see Sharing the SPI bus among SD card and other SPI devices.
Chapter 2. API Reference

Related Docs

Sharing the SPI bus among SD card and other SPI devices  The SD card has a SPI mode, which allows it to be communicated to as a SPI device. But there are some restrictions that we need to pay attention to.

Pin loading of other devices  When adding more devices onto the same bus, the overall pin loading increases. The loading consists of AC loading (pin capacitor) and DC loading (pull-ups).

AC loading  SD cards, which are designed for high-speed communications, have small pin capacitors (AC loading) to work until 50MHz. However, the other attached devices will increase the pin’ s AC loading.

Heavy AC loading of a pin may prevent the pin from being toggled quickly. By using an oscilloscope, you will see the edges of the pin become smoother and not ideal any more (the gradient of the edge is smaller). The setup timing requirements of an SD card may be violoated when the card is connected to such bus. Even worse, the clock from the host may not be recognized by the SD card and other SPI devices on the same bus.

This issue may be more obvious if other attached devices are not designed to work at the same frequency as the SD card, because they may have larger pin capacitors.

To see if your pin AC loading is too heavy, you can try the following tests:

(Terminology: launch edge: at which clock edge the data start to toggle; latch edge: at which clock edge the data is supposed to be sampled by the receiver, for SD cad, it’ s the rising edge.)

1. Use an oscilloscope to see the clock and compare the data line to the clock. - If you see the clock is not fast enough (for example, the rising/falling edge is longer than 1/4 of the clock cycle), it means the clock is skewed too much. - If you see the data line unstable before the latch edge of the clock, it means the load of the data line is too large.
   You may also observed the corresponding phenomenon (data delayed largely from launching edge of clock) with logic analyzers. But it’ s not as obvious as with an oscilloscope.
2. Try to use slower clock frequency.
   If the lower frequency can work while the higher frequency can’ t, it’ s an indication of the AC loading on the pins is too large.

If the AC loading of the pins is too large, you can either use other faster devices (with lower pin load) or slow down the clock speed.

DC loading  The pull-ups required by SD cards are usually around 10 kOhm to 50 kOhm, which may be too strong for some other SPI devices.

Check the specification of your device about its DC output current, it should be larger than 700uA, otherwise the device output may not be read correctly.

Initialization sequence

Note:  If you see any problem in the following steps, please make sure the timing is correct first. You can try to slow down the clock speed (SDMMC_FREQ_PROBING = 400 KHz for SD card) to avoid the influence of pin AC loading (see above section).

When using ab SD card with other SPI devices on the same SPI bus, due to the restrictions of the SD card startup flow, the following initialization sequence should be followed: (See also storage/sd_card)

1. Initialize the SPI bus properly by spi_bus_initialize.
2. Tie the CS lines of all other devices than the SD card to high. This is to avoid conflicts to the SD card in the following step.
   You can do this by either:
   1. Attach devices to the SPI bus by calling spi_bus_add_device. This function will initialize the GPIO that is used as CS to the idle level: high.
   2. Initialize GPIO on the CS pin that needs to be tied up before actually adding a new device.
3. Rely on the internal/external pull-up (not recommended) to pull-up all the CS pins when the GPIOs of ESP are not initialized yet. You need to check carefully the pull-up is strong enough and there are no other pull-downs that will influence the pull-up (For example, internal pull-down should be enabled).

3. Mount the card to the filesystem by calling `esp_vfs_fat_sdspi_mount`. This step will put the SD card into the SPI mode, which SHOULD be done before all other SPI communications on the same bus. Otherwise the card will stay in the SD mode, in which mode it may randomly respond to any SPI communications on the bus, even when its CS line is not addressed.

   If you want to test this behavior, please also note that, once the card is put into SPI mode, it will not return to SD mode before next power cycle, i.e. powered down and powered up again.

4. Now you can talk to other SPI devices freely!

### API Reference

**Header File**

- components/driver/include/driver/sdspi_host.h

**Functions**

#### `esp_err_t sdspi_host_init (void)`

Initialize SD SPI driver.

**Note** This function is not thread safe

**Return**

- ESP_OK on success
- other error codes may be returned in future versions

#### `esp_err_t sdspi_host_init_device (const sdspi_device_config_t *dev_config, sdspi_dev_handle_t *out_handle)`

Attach and initialize an SD SPI device on the specific SPI bus.

**Note** This function is not thread safe

**Note** Initialize the SPI bus by `spi_bus_initialize()` before calling this function.

**Note** The SDIO over sdspl needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if sdspi_host_init_device has invalid arguments
- ESP_ERR_NO_MEM if memory can not be allocated
- other errors from the underlying spi_master and gpio drivers

**Parameters**

- `dev_config`: pointer to device configuration structure
- `out_handle`: Output of the handle to the sdspi device.

#### `esp_err_t sdspi_host_remove_device (sdspi_dev_handle_t handle)`

Remove an SD SPI device.

**Return** Always ESP_OK

**Parameters**

- `handle`: Handle of the SD SPI device

#### `esp_err_t sdspi_host_do_transaction (sdspi_dev_handle_t handle, sdmmc_command_t *cmdinfo)`

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Note** This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdspi_host_do_transaction as long as other sdspi_host_ * functions are not called.

**Return**

- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
• ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response

**Parameters**
- handle: Handle of the sdspi device
- cmdinfo: pointer to structure describing command and data to transfer

```c
esp_err_t sdspi_host_set_card_clk (sdspi_dev_handle_t host, uint32_t freq_khz)
```

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- other error codes may be returned in the future

**Parameters**
- host: Handle of the sdspi device
- freq_khz: card clock frequency, in kHz

```c
esp_err_t sdspi_host_deinit (void)
```

Release resources allocated using sdspi_host_init.

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdspi_host_init function has not been called

```c
esp_err_t sdspi_host_io_int_enable (sdspi_dev_handle_t handle)
```

Enable SDIO interrupt.

**Return**
- ESP_OK on success

**Parameters**
- handle: Handle of the sdspi device

```c
esp_err_t sdspi_host_io_int_wait (sdspi_dev_handle_t handle, TickType_t timeout_ticks)
```

Wait for SDIO interrupt until timeout.

**Return**
- ESP_OK on success

**Parameters**
- handle: Handle of the sdspi device
- timeout_ticks: Ticks to wait before timeout.

```c
esp_err_t sdspi_host_init_slot (int slot, const sdspi_slot_config_t *slot_config)
```

Initialize SD SPI driver for the specific SPI controller.

**Note** This function is not thread safe

**Note** The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

**Parameters**
- slot: SPI controller to use (SPI2_HOST or SPI3_HOST)
- slot_config: pointer to slot configuration structure

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if sdspi_init_slot has invalid arguments
- ESP_ERR_NO_MEM if memory can not be allocated
- other errors from the underlying spi_master and gpio drivers

**Structures**

SDSPI_SLOT_CONFIG_DEFAULT()
Macro defining default configuration of SPI host

Type Definitions
typedef int sdspi_dev_handle_t
Handle representing an SD SPI device.

2.6.13 Sigma-delta Modulation

Introduction
ESP32-C3 has a second-order sigma-delta modulation module. This driver configures the channels of the sigma-delta module.

Functionality Overview
There are 4 independent sigma-delta modulation channels identified with sigmadelta_channel_t. Each channel is capable to output the binary, hardware generated signal with the sigma-delta modulation.

Selected channel should be set up by providing configuration parameters in sigmadelta_config_t and then applying this configuration with sigmadelta_config().

Another option is to call individual functions, that will configure all required parameters one by one:

- **Prescaler** of the sigma-delta generator - sigmadelta_set_prescale()
- **Duty** of the output signal - sigmadelta_set_duty()
- **GPIO pin** to output modulated signal - sigmadelta_set_pin()

The range of the ‘duty’ input parameter of sigmadelta_set_duty() is from -128 to 127 (eight bit signed integer). If zero value is set, then the output signal’s duty will be about 50%, see description of sigmadelta_set_duty().

Convert to analog signal (Optional)

Typically, if the sigma-delta signal is connected to an LED, you don’t have to add any filter between them (because our eyes are a low pass filter naturally). However, if you want to check the real voltage or watch the analog waveform, you need to design an analog low pass filter. Also, it is recommended to use an active filter instead of a passive filter to gain better isolation and not lose too much voltage.

For example, you can take the following Sallen-Key topology Low Pass Filter as a reference.

Application Example

Sigma-delta Modulation example: peripherals/sigmadelta.

API Reference

Header File

- components/driver/include/driver/sigmadelta.h
Chapter 2. API Reference

Fig. 13: Sallen-Key Low Pass Filter

**Functions**

```c
esp_err_t sigmadelta_config(const sigmadelta_config_t *config)
```

Configure Sigma-delta channel.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadeltadriver already initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- **config**: Pointer of Sigma-delta channel configuration struct

```c
esp_err_t sigmadelta_set_duty(sigmadelta_channel_t channel, int8_t duty)
```

Set Sigma-delta channel duty.

This function is used to set Sigma-delta channel duty, if you add a capacitor between the output pin and ground, the average output voltage will be \( V_{dc} = \frac{V_{DDIO}}{256} \times \text{duty} + \frac{V_{DDIO}}{2} \), where \( V_{DDIO} \) is the power supply voltage.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadeltadriver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- **channel**: Sigma-delta channel number
- **duty**: Sigma-delta duty of one channel, the value ranges from -128 to 127, recommended range is -90 ~ 90. The waveform is more like a random one in this range.

```c
esp_err_t sigmadelta_set_prescale(sigmadelta_channel_t channel, uint8_t prescale)
```

Set Sigma-delta channel’s clock pre-scale value. The source clock is APP_CLK, 80MHz. The clock frequency of the sigma-delta channel is APP_CLK / pre_scale.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadeltadriver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error
Chapter 2. API Reference

Parameters

- **channel**: Sigma-delta channel number
- **prescale**: The divider of source clock, ranges from 0 to 255

```c
esp_err_t sigmadelta_set_pin(sigmadelta_channel_t channel, gpio_num_t gpio_num)
```

Set Sigma-delta signal output pin.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadeltadriver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- **channel**: Sigma-delta channel number
- **gpio_num**: GPIO number of output pin.

Structures

```c
struct sigmadelta_config_t
```

Sigma-delta configure struct.

Public Members

```c
sigmadelta_channel_t channel
```

Sigma-delta channel number

```c
int8_t sigmadelta_duty
```

Sigma-delta duty, duty ranges from -128 to 127.

```c
uint8_t sigmadelta_prescale
```

Sigma-delta prescale, prescaler ranges from 0 to 255.

```c
uint8_t sigmadelta_gpio
```

Sigma-delta output pin number, refer to gpio.h for more details.

Header File

- components/hal/include/hal/sigmadelta_types.h

Enumerations

```c
enum sigmadelta_port_t
```

SIGMADELTA port number, the max port number is (SIGMADELTA_NUM_MAX - 1).

Values:

```c
SIGMADELTA_PORT_0
SIGMADELTA_PORT_MAX
```

SIGMADELTA port 0

```c
SIGMADELTA_CHANNEL_0
SIGMADELTA_CHANNEL_1
SIGMADELTA_CHANNEL_2
```

SIGMADELTA port max

Sigma-delta channel list.

Values:

```c
SIGMADELTA_CHANNEL_0
SIGMADELTA_CHANNEL_1
SIGMADELTA_CHANNEL_2
```
2.6.14 SPI Master Driver

SPI Master driver is a program that controls ESP32-C3’s SPI peripherals while they function as masters.

Overview of ESP32-C3’s SPI peripherals

ESP32-C3 integrates 3 SPI peripherals.

- SPI0 and SPI1 are used internally to access the ESP32-C3’s attached flash memory. Both controllers share the same SPI bus signals, and there is an arbiter to determine which can access the bus. Currently, SPI Master driver does not support SPI1 bus.
- SPI2 is a general purpose SPI controller. It has an independent signal bus with the same name. The bus has 6 CS lines to drive up to 6 SPI slaves.

Terminology

The terms used in relation to the SPI master driver are given in the table below.
**Term** | **Definition**  
--- | ---  
**Host** | The SPI controller peripheral inside ESP32-C3 that initiates SPI transmissions over the bus, and acts as an SPI Master.  
**Device** | SPI slave device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.  
**Bus** | A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.  
**MOSI** | Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device. Also data0 signal in Octal/OPI mode.  
**MISO** | Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host. Also data1 signal in Octal/OPI mode.  
**SCLK** | Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.  
**CS** | Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.  
**QUADWP** | Protect signal. Used for 4-bit (qio/qout) transactions. Also for data2 signal in Octal/OPI mode.  
**QUADHD** | Hold signal. Used for 4-bit (qio/qout) transactions. Also for data3 signal in Octal/OPI mode.  
**DATA4** | Data4 signal in Octal/OPI mode.  
**DATA5** | Data5 signal in Octal/OPI mode.  
**DATA6** | Data6 signal in Octal/OPI mode.  
**DATA7** | Data7 signal in Octal/OPI mode.  
**Assertion** | The action of activating a line.  
**De-assertion** | The action of returning the line back to inactive (back to idle) status.  
**Transaction** | One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.  
**Launch edge** | Edge of the clock at which the source register launches the signal onto the line.  
**Latch edge** | Edge of the clock at which the destination register latches in the signal.  

**Driver Features**

The SPI master driver governs communications of Hosts with Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see *SPI Bus Lock*.

**Warning:** The SPI master driver has the concept of multiple Devices connected to a single bus (sharing a single ESP32-C3 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread safe. However, if multiple tasks try to access the same SPI Device, the driver is *not thread-safe*. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time.
- Add a mutex lock around the shared Device using *xSemaphoreCreateMutex*.

**SPI Features**
Chapter 2. API Reference

SPI Master

SPI Bus Lock  To realize the multiplexing of different devices from different drivers (SPI Master, SPI Flash, etc.), an SPI bus lock is applied on each SPI bus. Drivers can attach their devices onto the bus with the arbitration of the lock.

Each bus lock are initialized with a BG (background) service registered, all devices request to do transactions on the bus should wait until the BG to be successfully disabled.

- For SPI1 bus, the BG is the cache, the bus lock will help to disable the cache before device operations starts, and enable it again after device releasing the lock. No devices on SPI1 is allowed using ISR (it’s meaningless for the task to yield to other tasks when the cache is disabled).
- For other buses, the driver may register its ISR as the BG. The bus lock will block a device task when it requests for exclusive use of the bus, try to disable the ISR, and unblock the device task allowed to exclusively use the bus when the ISR is successfully disabled. When the task releases the lock, the lock will also try to resume the ISR if there are pending transactions to be done in the ISR.

SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

<table>
<thead>
<tr>
<th>Phase</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>In this phase, a command (0-16 bit) is written to the bus by the Host.</td>
</tr>
<tr>
<td>Address</td>
<td>In this phase, an address (0-32 bit) is transmitted over the bus by the Host.</td>
</tr>
<tr>
<td>Write</td>
<td>Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.</td>
</tr>
<tr>
<td>Dummy</td>
<td>This phase is configurable and is used to meet the timing requirements.</td>
</tr>
<tr>
<td>Read</td>
<td>Device sends data to its Host.</td>
</tr>
</tbody>
</table>

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the read and write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the read and write phases are not simultaneous (one direction at a time). The lengths of the write and read phases are determined by `length` and `rxlength` members of the struct `spi_transaction_t` respectively.

The command and address phases are optional, as not every SPI device requires a command and/or address. This is reflected in the Device’s configuration: if `command_bits` and/or `address_bits` are set to zero, no command or address phase will occur.

The read and write phases can also be optional, as not every transaction requires both writing and reading data. If `rx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the read phase is skipped. If `tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the write phase is skipped.

The driver supports two types of transactions: the interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see Notes on Sending Mixed Transactions to the Same Device.
Chapter 2. API Reference

Interrupt Transactions  Interrupt transactions will block the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver will automatically handle them one-by-one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions complete.

Polling Transactions  Polling transactions do not use interrupts. The routine keeps polling the SPI Host’s status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they will need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1 us to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see Bus Acquiring.

Transaction Line Mode  Supported line modes for ESP32-C3 are listed as follows, to make use of these modes, set the member `flags` in the struct `spi_transaction_t` as shown in the Transaction Flag column. If you want to check if corresponding IO pins are set or not, set the member `flags` in the `spi_bus_config_t` as shown in the Bus IO setting Flag column.

<table>
<thead>
<tr>
<th>Mode name</th>

</tr>
</tbody>
</table>

Command and Address Phases  During the command and address phases, the members `cmd` and `addr` in the struct `spi_transaction_t` are sent to the bus, nothing is read at this time. The default lengths of the command and address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the command and address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::base` and configure the rest of base as usual. Then the length of each phase will be equal to `command_bits` and `address_bits` set in the struct `spi_transaction_ext_t`.

If the command and address phase need to be as the same number of lines as data phase, you need to set `SPI_TRANS_MULTILINE_CMD` and/or `SPI_TRANS_MULTILINE_ADDR` to the `flags` member in the struct `spi_transaction_t`. Also see Transaction Line Mode.
Write and Read Phases Normally, the data that needs to be transferred to or from a Device will be read from or written to a chunk of memory indicated by the members rx_buffer and tx_buffer of the structure spi_transaction_t. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory. If external PSRAM is enabled, this means using pvPortMallocCaps(size, MALLOC_CAP_DMA).
2. 32-bit aligned (staring from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

If using more than one data lines to transmit, please set SPI_DEVICE_HALFDUPLEX flag for the member flags in the struct spi_device_interface_config_t. And the member flags in the struct spi_transaction_t should be set as described in Transaction Line Mode.

Note: Half-duplex transactions with both read and write phases are not supported. Please use full duplex mode.

Bus Acquiring Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other devices until the bus is released. To acquire and release a bus, use the functions spi_device_acquire_bus() and spi_device_release_bus().

Driver Usage

- Initialize an SPI bus by calling the function spi_bus_initialize(). Make sure to set the correct I/O pins in the struct spi_bus_config_t. Set the signals that are not needed to -1.
- Register a Device connected to the bus with the driver by calling the function spi_bus_add_device(). Make sure to configure any timing requirements the device might need with the parameter dev_config. You should now have obtained the Device’s handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more spi_transaction_t structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
  - **Interrupt** Either queue all transactions by calling the function spi_device_queue_trans() and, at a later time, query the result using the function spi_device_get_trans_result(), or handle all requests synchronously by feeding them into spi_device_transmit().
  - **Polling** Call the function spi_device_polling_transmit() to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using spi_device_polling_start() and spi_device_polling_end().
- (Optional) To perform back-to-back transactions with a Device, call the function spi_device_acquire_bus() before sending transactions and spi_device_release_bus() after the transactions have been sent.
- (Optional) To unload the driver for a certain Device, call spi_bus_remove_device() with the Device handle as an argument.
- (Optional) To remove the driver for a bus, make sure no more drivers are attached and call spi_bus_free().

The example code for the SPI master driver can be found in the peripherals/spi_master directory of ESP-IDF examples.

Transactions with Data Not Exceeding 32 Bits When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the tx_data member and setting the SPI_TRANS_USE_TXDATA flag on the transmission. For received data, use rx_data and set SPI_TRANS_USE_RXDATA. In both cases, do not touch the tx_buffer or rx_buffer members, because they use the same memory locations as tx_data and rx_data.
Transactions with Integers Other Than uint8_t  
An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB first used in rare cases. If a value less than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner. For example, if 0b00010 needs to be sent, it should be written into a uint8_t variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional “random” bits, so the reading must be performed correctly.

On top of that, ESP32-C3 is a little-endian chip, which means that the least significant byte of uint16_t and uint32_t variables is stored at the smallest address. Hence, if uint16_t is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has the size differing from uint8_t arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- \texttt{SPI_SWAP_DATA_TX} for data to be transmitted
- \texttt{SPI_SWAP_DATA_RX} for data received

Notes on Sending Mixed Transactions to the Same Device  
To reduce coding complexity, send only one type of transactions (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function \texttt{spi_device_polling_end()} after \texttt{spi_device_polling_start()} to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with \texttt{spi_device_polling_transmit()} so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call \texttt{spi_device_polling_start()}. To do that, you can keep calling \texttt{spi_device_get_trans_result()} until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

Transfer Speed Considerations

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

Transaction Duration  
Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transaction.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For interrupt transactions, the CPU can switch to other tasks when a transaction is in progress. This saves the CPU time but increases the transaction duration. See Interrupt Transactions. For polling transactions, it does not block the task but allows to do polling when the transaction is in progress. For more information, see Polling Transactions.

If DMA is enabled, setting up the linked list requires about 2 us per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte
from the FIFO by itself. Usually, this is faster than 2 us, but the transaction length is limited to 64 bytes for both write and read.

Typical transaction duration for one byte of data are given below.

- Interrupt Transaction via DMA: 28 µs.
- Interrupt Transaction via CPU: 27 µs.
- Polling Transaction via DMA: 10 µs.
- Polling Transaction via CPU: 9 µs.

**SPI Clock Frequency** Transferring each byte takes eight times the clock period $\frac{8}{f_{spi}}$.

**Cache Miss** The default config puts only the ISR into the IRAM. Other SPI related functions, including the driver itself and the callback, might suffer from cache misses and will need to wait until the code is read from flash. Select `CONFIG_SPI_MASTER_IN_IRAM` to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache misses.

For an interrupt transaction, the overall cost is $20 + \frac{8n}{f_{spi}}$ [us] for $n$ bytes transferred in one transaction. Hence, the transferring speed is: $\frac{n}{20 + 8n/f_{spi}}$. An example of transferring speed at 8 MHz clock speed is given in the following table.

<table>
<thead>
<tr>
<th>Frequency (MHz)</th>
<th>Transaction Interval (us)</th>
<th>Transaction Length (bytes)</th>
<th>Total Time (us)</th>
<th>Total Speed (KBps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>25</td>
<td>1</td>
<td>26</td>
<td>38.5</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>8</td>
<td>33</td>
<td>242.4</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>16</td>
<td>41</td>
<td>490.2</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>64</td>
<td>89</td>
<td>719.1</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>128</td>
<td>153</td>
<td>836.6</td>
</tr>
</tbody>
</table>

When a transaction length is short, the cost of transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable `CONFIG_SPI_MASTER_ISR_IN_IRAM` and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations will be handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache miss. For more details, see [IRAM-Safe Interrupt Handlers](#).

**Application Example**

The code example for using the SPI master half duplex mode to read/write a AT93C46D EEPROM (8-bit mode) can be found in the `peripherals/spi_master/hd_eeprom` directory of ESP-IDF examples.

**API Reference - SPI Common**

**Header File**

- `components/hal/include/hal/spi_types.h`

**Structures**

```c
struct spi_line_mode_t
```

Line mode of SPI transaction phases: CMD, ADDR, DOUT/DIN.
Public Members

uint8_t cmd_lines
The line width of command phase, e.g. 2-line-cmd-phase.

uint8_t addr_lines
The line width of address phase, e.g. 1-line-addr-phase.

uint8_t data_lines
The line width of data phase, e.g. 4-line-data-phase.

Enumerations

enum spi_host_device_t
Enum with the three SPI peripherals that are software-accessible in it.

Values:

SPI1_HOST = 0
SPI1.

SPI2_HOST = 1
SPI2.

SPI3_HOST = 2
SPI3.

SPI_HOST_MAX
invalid host value

enum spi_clock_source_t
Values:

SPI_CLK_APB
Select APB as the source clock.

SPI_CLK_XTAL
Select XTAL as the source clock.

enum spi_event_t
SPI Events.

Values:

SPI_EV_BUF_TX = BIT(0)
The buffer has sent data to master.

SPI_EV_BUF_RX = BIT(1)
The buffer has received data from master.

SPI_EV_SEND_DMA_READY = BIT(2)
Slave has loaded its TX data buffer to the hardware (DMA).

SPI_EV_SEND = BIT(3)
Master has received certain number of the data, the number is determined by Master.

SPI_EV_RECV_DMA_READY = BIT(4)
Slave has loaded its RX data buffer to the hardware (DMA).

SPI_EV_RECV = BIT(5)
Slave has received certain number of data from master, the number is determined by Master.

SPI_EV_CMD9 = BIT(6)
Received CMD9 from master.

SPI_EV_CMDA = BIT(7)
Received CMDA from master.
Chapter 2. API Reference

SPI_EVE_TRANS = BIT(8)
A transaction has done.

Header File
- components/driver/include/driver/spi_common.h

Functions

```c
esp_err_t spi_bus_initialize(spi_host_device_t host_id, const spi_bus_config_t *bus_config, spi_dma_chan_t dma_chan)
```
Initialize a SPI bus.

**Warning** SPI0/1 is not supported
**Warning** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.
**Warning** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

**Return**
- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**
- host_id: SPI peripheral that controls this bus
- bus_config: Pointer to a spi_bus_config_t struct specifying how the host should be initialized
- dma_chan: - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting SPI_DMA_DISABLED limits the size of transactions.
  - Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.
  - Set to SPI_DMA_CH_AUTO to let the driver to allocate the DMA channel.

```c
esp_err_t spi_bus_free(spi_host_device_t host_id)
```
Free a SPI bus.

**Warning** In order for this to succeed, all devices have to be removed first.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if not all devices on the bus are freed
- ESP_OK on success

**Parameters**
- host_id: SPI peripheral to free

Structures

```
struct spi_bus_config_t
```
This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO_MUX or are -1. In that case, the IO_MUX is used, allowing for >40MHz speeds.

**Note** Be advised that the slave driver does not use the quadwp/quadhd lines and fields in spi_bus_config_t refering to these lines will be ignored and can thus safely be left uninitialized.

Public Members

```c
int mosi_io_num
```
GPIO pin for Master Out Slave In (=spi_d) signal, or -1 if not used.
int data0_io_num
    GPIO pin for spi data0 signal in quad/octal mode, or -1 if not used.

int miso_io_num
    GPIO pin for Master In Slave Out (=spi_q) signal, or -1 if not used.

int data1_io_num
    GPIO pin for spi data1 signal in quad/octal mode, or -1 if not used.

int sclk_io_num
    GPIO pin for SPI Clock signal, or -1 if not used.

int quadwp_io_num
    GPIO pin for WP (Write Protect) signal, or -1 if not used.

int data2_io_num
    GPIO pin for spi data2 signal in quad/octal mode, or -1 if not used.

int quadhd_io_num
    GPIO pin for HD (Hold) signal, or -1 if not used.

int data3_io_num
    GPIO pin for spi data3 signal in quad/octal mode, or -1 if not used.

int data4_io_num
    GPIO pin for spi data4 signal in octal mode, or -1 if not used.

int data5_io_num
    GPIO pin for spi data5 signal in octal mode, or -1 if not used.

int data6_io_num
    GPIO pin for spi data6 signal in octal mode, or -1 if not used.

int data7_io_num
    GPIO pin for spi data7 signal in octal mode, or -1 if not used.

int max_transfer_sz
    Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to
    SOC_SPI_MAXIMUM_BUFFER_SIZE if DMA is disabled.

uint32_t flags
    Abilities of bus to be checked by the driver. Or-ed value of SPICOMMON_BUSFLAG_* flags.

int intr_flags
    Interrupt flag for the bus to set the priority, and IRAM attribute, see esp_intr_alloc.h. Note that
    the EDGE, INTRDISABLED attribute are ignored by the driver. Note that if ESP_INTR_FLAG_IRAM
    is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

Macros

SPI_MAX_DMA_LEN

SPI_SWAP_DATA_TX (DATA, LEN)
    Transform unsigned integer of length <= 32 bits to the format which can be sent by the SPI driver directly.
    E.g. to send 9 bits of data, you can:

    uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);

    Then points tx_buff to &data.

Parameters

    • DATA: Data to be sent, can be uint8_t, uint16_t or uint32_t.
    • LEN: Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the
data to the MSB.

SPI_SWAP_DATA_RX (DATA, LEN)
    Transform received data of length <= 32 bits to the format of an unsigned integer.
E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```c
uint16_t data = SPI_SWAP_DATA_RX((uint32_t*)t->rx_data, 15);
```

**Parameters**
- **DATA**: Data to be rearranged, can be uint8_t, uint16_t or uint32_t.
- **LEN**: Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.

**SPICOMMON_BUSFLAG_SLAVE**
Initializes I/O in slave mode.

**SPICOMMON_BUSFLAG_MASTER**
Initializes I/O in master mode.

**SPICOMMON_BUSFLAG_IOMUX_PINS**
Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

**SPICOMMON_BUSFLAG_GPIO_PINS**
Forces the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.

**SPICOMMON_BUSFLAG_SCLK**
Check existing of SCLK pin. Or indicates CLK line initialized.

**SPICOMMON_BUSFLAG_MISO**
Check existing of MISO pin. Or indicates MISO line initialized.

**SPICOMMON_BUSFLAG_MOSI**
Check existing of MOSI pin. Or indicates MOSI line initialized.

**SPICOMMON_BUSFLAG_DUAL**
Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

**SPICOMMON_BUSFLAG_WPHD**
Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

**SPICOMMON_BUSFLAG_QUAD**
Check existing of MOSI/MISO/HP/HD pins as output. Or indicates bus able to work under QIO mode.

**SPICOMMON_BUSFLAG_IO4_IO7**
Check existing of IO4–IO7 pins. Or indicates IO4–IO7 pins initialized.

**SPICOMMON_BUSFLAG_OCTAL**
Check existing of MOSI/MISO/HP/HD/SPIIO4/SPIIO5/SPIIO6/SPIIO7 pins as output. Or indicates bus able to work under octal mode.

**Type Definitions**
```c
typedef spi_common_dma_t spi_dma_chan_t
```

**Enumerations**
```c
enum spi_common_dma_t
```
- SPI DMA channels.

**Values**
- **SPI_DMA_DISABLED** = 0
  - Do not enable DMA for SPI.
- **SPI_DMA_CH_AUTO** = 3
  - Enable DMA, channel is automatically selected by driver.
API Reference - SPI Master

Header File

- components/driver/include/driver/spi_master.h

Functions

**esp_err_t spi_bus_add_device** (spi_host_device_t host_id, const spi_device_interface_config_t *dev_config, spi_device_handle_t *handle)

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

**Note** While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_FOUND if host doesn’t have any free CS slots
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**

- host_id: SPI peripheral to allocate device on
- dev_config: SPI interface protocol config for the device
- handle: Pointer to variable to hold the device handle

**esp_err_t spi_bus_remove_device** (spi_device_handle_t handle)

Remove a device from the SPI bus.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if device already is freed
- ESP_OK on success

**Parameters**

- handle: Device handle to free

**esp_err_t spi_device_queue_trans** (spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)

Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

**Note** Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if SPI_TRANS_CS_KEEP_ACTIVE flag is specified while the bus was not acquired (spi_device_acquire_bus() should be called first)
- ESP_ERR_TIMEOUT if there was no room in the queue before ticks_to_wait expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
- ESP_OK on success

**Parameters**

- handle: Device handle obtained using spi_host_add_dev
- trans_desc: Description of transaction to execute
- ticks_to_wait: Ticks to wait until there’s room in the queue; use portMAX_DELAY to never time out.

**esp_err_t spi_device_get_trans_result** (spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)

Get the result of a SPI transaction queued earlier by `spi_device_queue_trans`.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use...
the buffers.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if there was no completed transaction before ticks_to_wait expired
- ESP_OK on success

**Parameters**
- handle: Device handle obtained using spi_host_add_dev
- trans_desc: Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by spi_device_get_trans_result.
- ticks_to_wait: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

```c
esp_err_t spi_device_transmit (spi_device_handle_t handle, spi_transaction_t *trans_desc)
```

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling spi_device_queue_trans() followed by spi_device_get_trans_result(). Do not use this when there is still a transaction separately queued (started) from spi_device_queue_trans() or polling_start/transmit that hasn’t been finalized.

**Note** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**
- handle: Device handle obtained using spi_host_add_dev
- trans_desc: Pointer to variable able to contain a pointer to the description of the transaction that is executed
- ticks_to_wait: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

```c
esp_err_t spi_device_polling_start (spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)
```

Immediately start a polling transaction.

**Note** Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**
- handle: Device handle obtained using spi_host_add_dev
- trans_desc: Description of transaction to execute
- ticks_to_wait: Ticks to wait until there’s room in the queue; currently only portMAX_DELAY is supported.

```c
esp_err_t spi_device_polling_end (spi_device_handle_t handle, TickType_t ticks_to_wait)
```

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if the transaction cannot finish before ticks_to_wait expired
- ESP_OK on success

**Parameters**
- handle: Device handle obtained using spi_host_add_dev
**ticks_to_wait**: Ticks to wait until there’s a returned item; use `portMAX_DELAY` to never time out.

```c
esp_err_t spi_device_polling_transmit(spi_device_handle_t handle, spi_transaction_t *trans_desc)
```

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_polling_start()` followed by `spi_device_polling_end()`. Do not use this when there is still a transaction that hasn’t been finalized.

**Note** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**
- `handle`: Device handle obtained using `spi_host_add_dev`
- `trans_desc`: Description of transaction to execute

```c
esp_err_t spi_device_acquire_bus(spi_device_handle_t device, TickType_t wait)
```

Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until `spi_device_release_bus` is called.

**Note** The function will wait until all the existing transactions have been sent.

**Return**
- ESP_ERR_INVALID_ARG: `wait` is not set to `portMAX_DELAY`.
- ESP_OK : Success.

**Parameters**
- `device`: The device to occupy the bus.
- `wait`: Time to wait before the the bus is occupied by the device. Currently MUST set to `portMAX_DELAY`.

```c
void spi_device_release_bus(spi_device_handle_t dev)
```

Release the SPI bus occupied by the device. All other devices can start sending transactions.

**Parameters**
- `dev`: The device to release the bus.

```c
int spi_cal_clock(int fapb, int hz, int duty_cycle, uint32_t *reg_o)
```

Calculate the working frequency that is most close to desired frequency, and also the register value.

**Parameters**
- `fapb`: The frequency of apb clock, should be `APB_CLK_FREQ`.
- `hz`: Desired working frequency
- `duty_cycle`: Duty cycle of the spi clock
- `reg_o`: Output of value to be set in clock register, or NULL if not needed.

**Return** Actual working frequency that most fit.

```c
int spi_get_actual_clock(int fapb, int hz, int duty_cycle)
```

Calculate the working frequency that is most close to desired frequency.

**Return** Actual working frequency that most fit.

**Parameters**
- `fapb`: The frequency of apb clock, should be `APB_CLK_FREQ`.
- `hz`: Desired working frequency
- `duty_cycle`: Duty cycle of the spi clock

```c
void spi_get_timing(bool gpio_is_used, int input_delay_ns, int eff_clk, int *dummy_o, int *cycles_remain_o)
```

Calculate the timing settings of specified frequency and settings.

**Note** If `*dummy_o` is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

**Parameters**
• **gpio_is_used**: True if using GPIO matrix, or False if iOMUX pins are used.
• **input_delay_ns**: Input delay from SCLK launch edge to MISO data valid.
• **eff_clk**: Effective clock frequency (in Hz) from spi_cal_clock.
• **dummy_o**: Address of dummy bits used output. Set to NULL if not needed.
• **cycles_remain_o**: Address of cycles remaining (after dummy bits are used) output.
  - -1 If too many cycles remaining, suggest to compensate half a clock.
  - 0 If no remaining cycles or dummy bits are not used.
  - positive value: cycles suggest to compensate.

```c
int spi_get_freq_limit (bool gpio_is_used, int input_delay_ns)
```

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

**Return** Frequency limit of current configurations.

**Parameters**

- **gpio_is_used**: True if using GPIO matrix, or False if native pins are used.
- **input_delay_ns**: Input delay from SCLK launch edge to MISO data valid.

**Structures**

```c
struct spi_device_interface_config_t
```

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

**Public Members**

- **command_bits**: Default amount of bits in command phase (0-16), used when SPI_TRANS_VARIABLE_CMD is not used, otherwise ignored.
- **address_bits**: Default amount of bits in address phase (0-64), used when SPI_TRANS_VARIABLE_ADDR is not used, otherwise ignored.
- **dummy_bits**: Amount of dummy bits to insert between address and data phase.
- **mode**: SPI mode, representing a pair of (CPOL, CPHA) configuration:
  - 0: (0, 0)
  - 1: (0, 1)
  - 2: (1, 0)
  - 3: (1, 1)
- **duty_cycle_pos**: Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.
- **cs_ena_pretrans**: Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.
- **cs_ena_posttrans**: Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)
- **clock_speed_hz**: Clock speed, divisors of 80MHz, in Hz. See SPI_MASTER_FREQ_*. 
- **input_delay_ns**: Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it’s suggest to have the right value.
int spics_io_num
    CS GPIO pin for this device, or -1 if not used.

uint32_t flags
    Bitwise OR of SPI_DEVICE_* flags.

int queue_size
    Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_device_queue_trans but not yet finished using spi_device_get_trans_result) at the same time.

transaction_ch_f pre_cb
    Callback to be called before a transmission is started.

    This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

transaction_ch_f post_cb
    Callback to be called after a transmission has completed.

    This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

struct spi_transaction_t
    This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

Public Members

uint32_t flags
    Bitwise OR of SPI_TRANS_* flags.

uint16_t cmd
    Command data, of which the length is set in the command_bits of spi_device_interface_config_t.

    NOTE: this field, used to be "command" in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

    Example: write 0x0123 and command_bits=12 to send command 0x12, 0x3_ (in previous version, you may have to write 0x3_12).

uint64_t addr
    Address data, of which the length is set in the address_bits of spi_device_interface_config_t.

    NOTE: this field, used to be "address" in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

    Example: write 0x123400 and address_bits=24 to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

size_t length
    Total data length, in bits.

size_t rxlength
    Total data length received, should be not greater than length in full-duplex mode (0 defaults this to the value of length).

void *user
    User-defined variable. Can be used to store eg transaction ID.

const void *tx_buffer
    Pointer to transmit buffer, or NULL for no MOSI phase.

uint8_t tx_data[4]
    If SPI_TRANS_USE_TXDATA is set, data set here is sent directly from this variable.
Chapter 2. API Reference

void *rx_buffer
   Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

uint8_t rx_data[4]
   If SPI_TRANS_USE_RXDATA is set, data is received directly to this variable.

struct spi_transaction_ext_t
   This struct is for SPI transactions which may change their address and command length. Please do set the flags
   in base to SPI_TRANS_VARIABLE_CMD_ADR to use the bit length here.

Public Members

struct spi_transaction_t base
   Transaction data, so that pointer to spi_transaction_t can be converted into spi_transaction_ext_t.

uint8_t command_bits
   The command length in this transaction, in bits.

uint8_t address_bits
   The address length in this transaction, in bits.

uint8_t dummy_bits
   The dummy length in this transaction, in bits.

Macros

SPI_MASTER_FREQ_8M
   SPI master clock is divided by 80MHz apb clock. Below defines are example frequencies, and are accurate. Be free
to specify a random frequency, it will be rounded to closest frequency (to macros below if above 8MHz).
   8MHz
SPI_MASTER_FREQ_9M
   8.89MHz
SPI_MASTER_FREQ_10M
   10MHz
SPI_MASTER_FREQ_11M
   11.43MHz
SPI_MASTER_FREQ_13M
   13.33MHz
SPI_MASTER_FREQ_16M
   16MHz
SPI_MASTER_FREQ_20M
   20MHz
SPI_MASTER_FREQ_26M
   26.67MHz
SPI_MASTER_FREQ_40M
   40MHz
SPI_MASTER_FREQ_80M
   80MHz

SPI_DEVICE_TXBIT_LSBFIRST
   Transmit command/address/data LSB first instead of the default MSB first.

SPI_DEVICE_RXBIT_LSBFIRST
   Receive data LSB first instead of the default MSB first.

SPI_DEVICE_BIT_LSBFIRST
   Transmit and receive LSB first.
Chapter 2. API Reference

**SPI_DEVICE_3WIRE**
Use MOSI (=spid) for both sending and receiving data.

**SPI_DEVICE_POSITIVE_CS**
Make CS positive during a transaction instead of negative.

**SPI_DEVICE_HALFDUPLEX**
Transmit data before receiving it, instead of simultaneously.

**SPI_DEVICE_CLK_AS_CS**
Output clock on CS line if CS is active.

**SPI_DEVICE_NO_DUMMY**
There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).
- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you’re going to work with output only, or read without dummy bits at your own risk.

**SPI_DEVICE_DDRCLK**

**SPI_TRANS_MODE_DIO**
Transmit/receive data in 2-bit mode.

**SPI_TRANS_MODE_QIO**
Transmit/receive data in 4-bit mode.

**SPI_TRANS_USE_RXDATA**
Receive into rx_data member of `spi_transaction_t` instead into memory at rx_buffer.

**SPI_TRANS_USE_TXDATA**
Transmit tx_data member of `spi_transaction_t` instead of data at tx_buffer. Do not set tx_buffer when using this.

**SPI_TRANS_MODE_DIOQIO_ADDR**
Also transmit address in mode selected by SPI_MODE_DIO/SPI_MODE_QIO.

**SPI_TRANS_VARIABLE_CMD**
Use the `command_bits` in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

**SPI_TRANS_VARIABLE_ADDR**
Use the `address_bits` in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

**SPI_TRANS_VARIABLE_DUMMY**
Use the `dummy_bits` in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

**SPI_TRANS_CS_KEEP_ACTIVE**
Keep CS active after data transfer.

**SPI_TRANS.MULTILINE_CMD**
The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase)

**SPI_TRANS_MODE_OCT**
Transmit/receive data in 8-bit mode.

**SPI_TRANS.MULTILINE_ADDR**
The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase)
Chapter 2. API Reference

Type Definitions

```c
typedef struct spi_transaction_t spi_transaction_t
typedef void (*transaction_cb_t)(spi_transaction_t *trans)
typedef struct spi_device_t *spi_device_handle_t
```

Handle for a device on a SPI bus.

2.6.15 SPI Slave Driver

SPI Slave driver is a program that controls ESP32-C3’s SPI peripherals while they function as slaves.

Overview of ESP32-C3’s SPI peripherals

ESP32-C3 integrates one general purpose SPI controller which can be used as slave node driven by an off-chip SPI master. The controller is called SPI2 and has an independent signal bus with the same name.

Terminology

The terms used in relation to the SPI slave driver are given in the table below.
<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td>The SPI controller peripheral external to ESP32-C3 that initiates SPI transmissions over the bus, and acts as an SPI Master.</td>
</tr>
<tr>
<td>Device</td>
<td>SPI slave device (general purpose SPI controller). Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.</td>
</tr>
<tr>
<td>Bus</td>
<td>A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.</td>
</tr>
<tr>
<td>• MISO</td>
<td>Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.</td>
</tr>
<tr>
<td>• MOSI</td>
<td>Master Out, Slave in, a.k.a. D. Data transmission from a Host to Device.</td>
</tr>
<tr>
<td>• SCLK</td>
<td>Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.</td>
</tr>
<tr>
<td>• CS</td>
<td>Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.</td>
</tr>
<tr>
<td>• QUADWP</td>
<td>Write Protect signal. Only used for 4-bit (qio/qout) transactions.</td>
</tr>
<tr>
<td>• QUADHD</td>
<td>Hold signal. Only used for 4-bit (qio/qout) transactions.</td>
</tr>
<tr>
<td>• Assertion</td>
<td>The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called de-assertion.</td>
</tr>
<tr>
<td>Transaction</td>
<td>One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.</td>
</tr>
<tr>
<td>Launch edge</td>

**Driver Features**

The SPI slave driver allows using the SPI peripherals as full-duplex Devices. The driver can send/receive transactions up to 64 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some known issues related to DMA.

**SPI Transactions**

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.
Chapter 2. API Reference

The attributes of a transaction are determined by the configuration structure for an SPI host acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`.

As not every transaction requires both writing and reading data, you have a choice to configure the `spi_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::rx_buffer` is set to NULL, the read phase will be skipped. If `spi_slave_transaction_t::tx_buffer` is set to NULL, the write phase will be skipped.

**Note:** A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see Transaction Interval.

**Driver Usage**

- Initialize an SPI peripheral as a Device by calling the function `spi_slave_initialize`. Make sure to set the correct I/O pins in the `bus_config`. Set the unused signals to -1.
- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.
- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

**Transaction Data and Master/Slave Length Mismatches**

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `rx_buffer` and `tx_buffer` members of the `spi_transaction_t` structure. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by the member `spi_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction’s length is determined by a Host which drives the clock and CS lines. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `length` member will be sent and received. In this case, `trans_len` is set to `length` instead of the actual transaction length. To meet the actual transaction length requirements, set `length` to a value greater than the maximum `trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

**Speed and Timing Considerations**

The ESP32-C3 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device’s response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in `peripherals/spi_slave`.
**SCLK Frequency Requirements**  The SPI slaves are designed to operate at up to 60 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

**Restrictions and Known Issues**

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied.
   Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.

**Application Example**

The code example for Device/Host communication can be found in the peripherals/spi_slave directory of ESP-IDF examples.

**API Reference**

**Header File**

- components/driver/include/driver/spi_slave.h

**Functions**

1. `esp_err_t spi_slave_initialize(spi_host_device_t host, const spi_bus_config_t *bus_config, const spi_slave_interface_config_t *slave_config, spi_dma_chan_t dma_chan)`

   Initialize a SPI bus as a slave interface.

   **Warning**  SPI0/1 is not supported

   **Warning**  If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

   **Warning**  The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

   **Return**
   - ESP_ERR_INVALID_ARG if configuration is invalid
   - ESP_ERR_INVALID_STATE if host already is in use
   - ESP_ERR_NOT_FOUND if there is no available DMA channel
   - ESP_ERR_NO_MEM if out of memory
   - ESP_OK on success

   **Parameters**
   - host: SPI peripheral to use as a SPI slave interface
   - bus_config: Pointer to a spi_bus_config_t struct specifying how the host should be initialized
   - slave_config: Pointer to a spi_slave_interface_config_t struct specifying the details for the slave interface
   - dma_chan: - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
     - Selecting SPI_DMA_DISABLED limits the size of transactions.
     - Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.
     - Set to SPI_DMA_CH_AUTO to let the driver to allocate the DMA channel.

2. `esp_err_t spi_slave_free(spi_host_device_t host)`

   Free a SPI bus claimed as a SPI slave interface.

   **Return**
   - ESP_ERR_INVALID_ARG if parameter is invalid
   - ESP_ERR_INVALID_STATE if not all devices on the bus are freed
   - ESP_OK on success

   **Parameters**
Chapter 2. API Reference

- host: SPI peripheral to free

```c
esp_err_t spi_slave_queue_trans(spi_host_device_t host, const spi_slave_transaction_t *trans_desc, TickType_t ticks_to_wait)
```

Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via `spi_slave_initialize`.) This function may block if the queue is full (depending on the `ticks_to_wait` parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in `trans_desc` to the SPI slave driver; the application is not to access this memory until `spi_slave_queue_trans` is called to hand ownership back to the application.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**
- host: SPI peripheral that is acting as a slave
- `trans_desc`: Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- `ticks_to_wait`: Ticks to wait until there’s room in the queue; use portMAX_DELAY to never time out.

```c
esp_err_t spi_slave_get_trans_result(spi_host_device_t host, spi_slave_transaction_t **trans_desc, TickType_t ticks_to_wait)
```

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with `spi_slave_queue_trans`) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by `spi_slave_queue_trans`.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**
- host: SPI peripheral to that is acting as a slave
- [out] `trans_desc`: Pointer to variable able to contain a pointer to the description of the transaction that is executed
- `ticks_to_wait`: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

```c
esp_err_t spi_slave_transmit(spi_host_device_t host, spi_slave_transaction_t *trans_desc, TickType_t ticks_to_wait)
```

Do a SPI transaction.

Essentially does the same as `spi_slave_queue_trans` followed by `spi_slave_get_trans_result`. Do not use this when there is still a transaction queued that hasn’t been finalized using `spi_slave_get_trans_result`.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**
- host: SPI peripheral to that is acting as a slave
- `trans_desc`: Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- `ticks_to_wait`: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

**Structures**
The `struct spi_slave_interface_config_t` is a configuration for a SPI host acting as a slave device.

### Public Members

- **int spics_io_num**
  
  CS GPIO pin for this device.

- **uint32_t flags**

  Bitwise OR of SPI_SLAVE_* flags.

- **int queue_size**

  Transaction queue size. This sets how many transactions can be in the air (queued using `spi_slave_queue_trans` but not yet finished using `spi_slave_get_trans_result`) at the same time.

- **uint8_t mode**

  SPI mode, representing a pair of (CPOL, CPHA) configuration:

  - 0: (0, 0)
  - 1: (0, 1)
  - 2: (1, 0)
  - 3: (1, 1)

### slave_transaction_cb / post_setup_cb

Callback called after the SPI registers are loaded with new data.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

### slave_transaction_cb / post_trans_cb

Callback called after a transaction is done.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

The `struct spi_slave_transaction_t` this structure describes one SPI transaction.

### Public Members

- **size_t length**

  Total data length, in bits.

- **size_t trans_len**

  Transaction data length, in bits.

- **const void *tx_buffer**

  Pointer to transmit buffer, or NULL for no MOSI phase.

- **void *rx_buffer**

  Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (`rx_buffer % 4 == 0`), and has length of a multiple of 4 bytes.

- **void *user**

  User-defined variable. Can be used to store e.g. transaction ID.

### Macros

- **SPI_SLAVE_TXBIT_LSBFIRST**

  Transmit command/address/data LSB first instead of the default MSB first.

- **SPI_SLAVE_RXBIT_LSBFIRST**

  Receive data LSB first instead of the default MSB first.
SPI_SLAVE_BIT_LSBFIRST
Transmit and receive LSB first.

Type Definitions

typedef struct spi_slave_transaction_t spi_slave_transaction_t
typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)

2.6.16 Temperature Sensor

Overview

The ESP32-C3 has a built-in temperature sensor used to measure the chip’s internal temperature, and hard to
measure the environmental temperature accurately. Being built-in means that the temperature sensor should work on
any ESP32-C3 regardless of what board the chip is embedded in. The temperature sensor module contains an 8-bit
Sigma-Delta ADC and a temperature offset DAC.

The conversion relationship is the first column of the table below. Among them, offset = 0 is the main measurement
option, and other values are extended measurement options.

<table>
<thead>
<tr>
<th>offset</th>
<th>measure range(Celsius)</th>
<th>measure error(Celsius)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-2</td>
<td>50 ~ 125</td>
<td>&lt; 3</td>
</tr>
<tr>
<td>-1</td>
<td>20 ~ 100</td>
<td>&lt; 2</td>
</tr>
<tr>
<td>0</td>
<td>-10 ~ 80</td>
<td>&lt; 1</td>
</tr>
<tr>
<td>1</td>
<td>-30 ~ 50</td>
<td>&lt; 2</td>
</tr>
<tr>
<td>2</td>
<td>-40 ~ 20</td>
<td>&lt; 3</td>
</tr>
</tbody>
</table>

Driver Usage

1. Initialize the temperature sensor by calling the function temp_sensor_set_config() and pass to it a
temp_sensor_config_t structure. The temp_sensor_config_t structure should contain all the
required parameters. See the example below.

```c
temp_sensor_config_t temp_sensor = {
    .dac_offset = TSENS_DAC_L2,
    .clk_div = 6,
};
temp_sensor_set_config(temp_sensor);
```

2. Start the temp_sensor by calling temp_sensor_start. The temperature sensor will now measure
the temperature.

3. To get the current temperature, take the example below as a reference, the value you get is in Celsius.

```c
float tsens_out;
temp_sensor_read_celsius(&tsens_out);
```

4. To stop the temperature sensor, please call temp_sensor_stop.

Note: If you want dynamic reconfiguration, you need to stop the sensor first (temp_sensor_stop), set the new
configuration (temp_sensor_set_config), then start the sensor again (temp_sensor_start).

Application Example

Temperature sensor reading example: peripherals/temp_sensor.
API Reference - Normal Temp Sensor

Header File
- components/driver/esp32c3/include/driver/temp_sensor.h

Functions

`esp_err_t temp_sensor_set_config(temp_sensor_config_t tsens)`
Set parameter of temperature sensor.

Return
- ESP_OK Success

Parameters
- tsens:

`esp_err_t temp_sensor_get_config(temp_sensor_config_t *tsens)`
Get parameter of temperature sensor.

Return
- ESP_OK Success

Parameters
- tsens:

`esp_err_t temp_sensor_start(void)`
Start temperature sensor measure.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE if temperature sensor is started already.

`esp_err_t temp_sensor_stop(void)`
Stop temperature sensor measure.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE if temperature sensor is stopped already.

`esp_err_t temp_sensor_read_raw(uint32_t *tsens_out)`
Read temperature sensor raw data.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG tsens_out is NULL
- ESP_ERR_INVALID_STATE temperature sensor don't start

Parameters
- tsens_out: Pointer to raw data, Range: 0 ~ 255

`esp_err_t temp_sensor_read_celsius(float *celsius)`
Read temperature sensor data that is converted to degrees Celsius.

Note Should not be called from interrupt.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG ARG is NULL.
- ESP_ERR_INVALID_STATE The ambient temperature is out of range.

Parameters
- celsius: The measure output value.

Structures

`struct temp_sensor_config_t`
Configuration for temperature sensor reading.
Chapter 2. API Reference

Public Members

temp_sensor_dac_offset_t dac_offset
The temperature measurement range is configured with a built-in temperature offset DAC.

uint8_t clk_div
Default: 6

Macros
TSENS_CONFIG_DEFAULT()

Enumerations
enum temp_sensor_dac_offset_t

Values:

TSENS_DAC_L0 = 0
offset = -2, measure range: 50℃ ~ 125℃, error < 3℃.

TSENS_DAC_L1
offset = -1, measure range: 20℃ ~ 100℃, error < 2℃.

TSENS_DAC_L2
offset = 0, measure range: -10℃ ~ 80℃, error < 1℃.

TSENS_DAC_L3
offset = 1, measure range: -30℃ ~ 50℃, error < 2℃.

TSENS_DAC_L4
offset = 2, measure range: -40℃ ~ 20℃, error < 3℃.

TSENS_DAC_MAX
TSENS_DAC_DEFAULT = TSENS_DAC_L2

2.6.17 Two-Wire Automotive Interface (TWAI)

Overview

The Two-Wire Automotive Interface (TWAI) is a real-time serial communication protocol suited for automotive and industrial applications. It is compatible with ISO11898-1 Classical frames, thus can support Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID). The ESP32-C3’s peripherals contains a TWAI controller that can be configured to communicate on a TWAI bus via an external transceiver.

Warning: The TWAI controller is not compatible with ISO11898-1 FD Format frames, and will interpret such frames as errors.

This programming guide is split into the following sections:

Sections

- Two-Wire Automotive Interface (TWAI)
  - Overview
  - TWAI Protocol Summary
  - Signals Lines and Transceiver
  - Driver Configuration
  - Driver Operation
  - Examples
TWAI Protocol Summary

The TWAI is a multi-master, multi-cast, asynchronous, serial communication protocol. TWAI also supports error detection and signalling, and inbuilt message prioritization.

**Multi-master:** Any node on the bus can initiate the transfer of a message.

**Multi-cast:** When a node transmits a message, all nodes on the bus will receive the message (i.e., broadcast) thus ensuring data consistency across all nodes. However, some nodes can selectively choose which messages to accept via the use of acceptance filtering (multi-cast).

**Asynchronous:** The bus does not contain a clock signal. All nodes on the bus operate at the same bit rate and synchronize using the edges of the bits transmitted on the bus.

**Error Detection and Signalling:** Every node will constantly monitor the bus. When any node detects an error, it will signal the detection by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This will result in an error detection being propagated to all nodes on the bus.

**Message Priorities:** Messages contain an ID field. If two or more nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID value will win arbitration of the bus. All other nodes will become receivers ensuring that there is at most one transmitter at any time.

**TWAI Messages**

TWAI Messages are split into Data Frames and Remote Frames. Data Frames are used to deliver a data payload to other nodes, whereas a Remote Frame is used to request a Data Frame from other nodes (other nodes can optionally respond with a Data Frame). Data and Remote Frames have two frame formats known as Extended Frame and Standard Frame which contain a 29-bit ID and an 11-bit ID respectively. A TWAI message consists of the following fields:

- 29-bit or 11-bit ID: Determines the priority of the message (lower value has higher priority).
- Data Length Code (DLC) between 0 to 8: Indicates the size (in bytes) of the data payload for a Data Frame, or the amount of data to request for a Remote Frame.
- Up to 8 bytes of data for a Data Frame (should match DLC).

**Error States and Counters**

The TWAI protocol implements a feature known as “fault confinement” where a persistently erroneous node will eventually eliminate itself form the bus. This is implemented by requiring every node to maintain two internal error counters known as the Transmit Error Counter (TEC) and the Receive Error Counter (REC). The two error counters are incremented and decremented according to a set of rules (where the counters increase on an error, and decrease on a successful message transmission/reception). The values of the counters are used to determine a node’s error state, namely **Error Active**, **Error Passive**, and **Bus-Off**.

**Error Active:** A node is Error Active when both TEC and REC are less than 128 and indicates that the node is operating normally. Error Active nodes are allowed to participate in bus communications, and will actively signal the detection of any errors by automatically transmitting an Active Error Flag over the bus.

**Error Passive:** A node is Error Passive when either the TEC or REC becomes greater than or equal to 128. Error Passive nodes are still able to take part in bus communications, but will instead transmit a Passive Error Flag upon detection of an error.

**Bus-Off:** A node becomes Bus-Off when the TEC becomes greater than or equal to 256. A Bus-Off node is unable influence the bus in any manner (essentially disconnected from the bus) thus eliminating itself from the bus. A node will remain in the Bus-Off state until it undergoes bus-off recovery.

**Signals Lines and Transceiver**

The TWAI controller does not contain an integrated transceiver. Therefore, to connect the TWAI controller to a TWAI bus, an external transceiver is required. The type of external transceiver used should depend on the application’s physical layer specification (e.g. using SN65HVD23x transceivers for ISO 11898-2 compatibility).
The TWAI controller’s interface consists of 4 signal lines known as TX, RX, BUS-OFF, and CLKOUT. These four signal lines can be routed through the GPIO Matrix to the ESP32-C3’s GPIO pads.

**TX and RX:** The TX and RX signal lines are required to interface with an external transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0V), and a recessive bit as a high logic level (3.3V).

**BUS-OFF:** The BUS-OFF signal line is optional and is set to a low logic level (0V) whenever the TWAI controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3V) otherwise.

**CLKOUT:** The CLKOUT signal line is optional and outputs a prescaled version of the controller’s source clock (APB Clock).

---

**Note:** An external transceiver must internally loopback the TX to RX such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the TWAI controller to interpret differences in logic levels between the two signal lines as a loss in arbitration or a bit error.

---

**Driver Configuration**

This section covers how to configure the TWAI driver.

**Operating Modes** The TWAI driver supports the following modes of operations:

**Normal Mode:** The normal operating mode allows the TWAI controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another node is required when transmitting a message.

**No Ack Mode:** The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required for a message transmission to be considered successful. This mode is useful when self testing the TWAI controller (loopback of transmissions).

**Listen Only Mode:** This mode will prevent the TWAI controller from influencing the bus. Therefore, transmission of messages/acknowledgement/error frames will be disabled. However the TWAI controller will still be able to receive messages but will not acknowledge the message. This mode is suited for bus monitor applications.
Alerts   The TWAI driver contains an alert feature that is used to notify the application layer of certain TWAI controller or TWAI bus events. Alerts are selectively enabled when the TWAI driver is installed, but can be reconfigured during runtime by calling `twai_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `twai_read_alerts()`. The TWAI driver supports the following alerts:

<table>
<thead>
<tr>
<th>Alert Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TWAI_ALERT_TX_IDLE</td>
<td>No more messages queued for transmission</td>
</tr>
<tr>
<td>TWAI_ALERT_TX_SUCCESS</td>
<td>The previous transmission was successful</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_DATA</td>
<td>A frame has been received and added to the RX queue</td>
</tr>
<tr>
<td>TWAI_ALERT BELOW_ERR_WARN</td>
<td>Both error counters have dropped below error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_ERR_ACTIVE</td>
<td>TWAI controller has become error active</td>
</tr>
<tr>
<td>TWAI_ALERT_RECOVERY_IN_PROGRESS</td>
<td>TWAI controller is undergoing bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_RECOVERED</td>
<td>TWAI controller has successfully completed bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_ARB_LOST</td>
<td>The previous transmission lost arbitration</td>
</tr>
<tr>
<td>TWAI_ALERT ABOVE_ERR_WARN</td>
<td>One of the error counters have exceeded the error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_ERROR</td>
<td>A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus</td>
</tr>
<tr>
<td>TWAI_ALERT TX FAILED</td>
<td>The previous transmission has failed</td>
</tr>
<tr>
<td>TWAI_ALERT RX QUEUE_FULL</td>
<td>The RX queue is full causing a received frame to be lost</td>
</tr>
<tr>
<td>TWAI_ALERT_ERROR_PASS</td>
<td>TWAI controller has become error passive</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_OFF</td>
<td>Bus-off condition occurred. TWAI controller can no longer influence bus</td>
</tr>
</tbody>
</table>

**Note:** The TWAI controller’s error warning limit is used to preemptively warn the application of bus errors before the error passive state is reached. By default, the TWAI driver sets the error warning limit to 96. The `TWAI_ALERT ABOVE_ERR_WARN` is raised when the TEC or REC becomes larger then or equal to the error warning limit. The `TWAI_ALERT BELOW ERR_WARN` is raised when both TEC and REC return back to values below 96.

**Note:** When enabling alerts, the `TWAI_ALERT AND LOG` flag can be used to cause the TWAI driver to log any raised alerts to UART. However, alert logging is disabled and `TWAI_ALERT AND LOG` if the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled (see Placing ISR into IRAM).

**Note:** The `TWAI ALERT ALL` and `TWAI ALERT NONE` macros can also be used to enable/disable all alerts during configuration/reconfiguration.

Bit Timing   The operating bit rate of the TWAI driver is configured using the `twai_timing_config_t` structure. The period of each bit is made up of multiple time quanta, and the period of a time quantum is determined by a prescaled version of the TWAI controller’s source clock. A single bit contains the following segments in the following order:

1. The **Synchronization Segment** consists of a single time quantum
2. **Timing Segment 1** consists of 1 to 16 time quanta before sample point
3. **Timing Segment 2** consists of 1 to 8 time quanta after sample point

The **Baudrate Prescaler** is used to determine the period of each time quantum by dividing the TWAI controller’s source clock (80 MHz APB clock). On the ESP32-C3, the brp can be any even number from 2 to 16384.

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling **Triple Sampling** will cause 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).
The **Synchronization Jump Width** is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. \( sjw \) can range from 1 to 4.

*Note:* Multiple combinations of \( brp, tseg_1, tseg_2, \) and \( sjw \) can achieve the same bit rate. Users should tune these values to the physical characteristics of their bus by taking into account factors such as propagation delay, node information processing time, and phase errors.

Bit timing *macro initializers* are also available for commonly used bit rates. The following macro initializers are provided by the TWAI driver:

- TWAI_TIMING_CONFIG_1MBITS()
- TWAI_TIMING_CONFIG_800KBITS()
- TWAI_TIMING_CONFIG_500KBITS()
- TWAI_TIMING_CONFIG_250KBITS()
- TWAI_TIMING_CONFIG_125KBITS()
- TWAI_TIMING_CONFIG_100KBITS()
- TWAI_TIMING_CONFIG_50KBITS()
- TWAI_TIMING_CONFIG_25KBITS()
- TWAI_TIMING_CONFIG_20KBITS()
- TWAI_TIMING_CONFIG_16KBITS()
- TWAI_TIMING_CONFIG_12_5KBITS()
- TWAI_TIMING_CONFIG_10KBITS()
- TWAI_TIMING_CONFIG_5KBITS()
- TWAI_TIMING_CONFIG_1KBITS()

**Acceptance Filter** The TWAI controller contains a hardware acceptance filter which can be used to filter messages of a particular ID. A node that filters out a message will not receive the message, but will still acknowledge it. Acceptance filters can make a node more efficient by filtering out messages sent over the bus that are irrelevant to the node. The acceptance filter is configured using two 32-bit values within `twai_filter_config_t` known as the **acceptance code** and the **acceptance mask**.

The **acceptance code** specifies the bit sequence which a message’s ID, RTR, and data bytes must match in order for the message to be received by the TWAI controller. The **acceptance mask** is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for a messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under **Single or Dual Filter Mode**. Single Filter Mode will use the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame’s 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

**Dual Filter Mode** will use the acceptance code and mask to define two separate filters allowing for increased flexibility of ID’s to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under **Dual Filter Mode** (Note: The yellow and blue fields represent standard and extended frame formats respectively).
Disabling TX Queue  The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `twai_general_config_t` to 0. This will allow applications that do not require message transmission to save a small amount of memory when using the TWAI driver.

Placing ISR into IRAM  The TWAI driver’s ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the TWAI driver’s functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR will continue to:

- Read received messages from the RX buffer and place them into the driver’s RX queue.
- Load messages pending transmission from the driver’s TX queue and write them into the TX buffer.

To place the TWAI driver’s ISR, users must do the following:

- Enable the `CONFIG_TWAI_ISR_IN_IRAM` option using `idf.py menuconfig`.
- When calling `twai_driver_install()`, the `intr_flags` member of `twai_general_config_t` should set the `ESP_INTR_FLAG_IRAM` set.

Note: When the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled, the TWAI driver will no longer log any alerts (i.e., the TWAI_ALERT_AND_LOG flag will not have any effect).

Driver Operation

The TWAI driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

<table>
<thead>
<tr>
<th>Label</th>
<th>Transition</th>
<th>Action/Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Uninstalled -&gt; Stopped</td>
<td><code>twai_driver_install()</code></td>
</tr>
<tr>
<td>B</td>
<td>Stopped -&gt; Uninstalled</td>
<td><code>twai_driver_uninstall()</code></td>
</tr>
<tr>
<td>C</td>
<td>Stopped -&gt; Running</td>
<td><code>twai_start()</code></td>
</tr>
<tr>
<td>D</td>
<td>Running -&gt; Stopped</td>
<td><code>twai_stop()</code></td>
</tr>
<tr>
<td>E</td>
<td>Running -&gt; Bus-Off</td>
<td>Transmit Error Counter &gt;= 256</td>
</tr>
<tr>

</tr>
<tr>
<td>H</td>
<td>Recovering -&gt; Stopped</td>
<td>128 occurrences of 11 consecutive recessive bits.</td>
</tr>
</tbody>
</table>
**Driver States**  
**Uninstalled:** In the uninstalled state, no memory is allocated for the driver and the TWAI controller is powered OFF.

**Stopped:** In this state, the TWAI controller is powered ON and the TWAI driver has been installed. However the TWAI controller will be unable to take part in any bus activities such as transmitting, receiving, or acknowledging messages.

**Running:** In the running state, the TWAI controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore the TWAI controller will be able to transmit error frames upon detection of errors on the bus.

**Bus-Off:** The bus-off state is automatically entered when the TWAI controller’s Transmit Error Counter becomes greater than or equal to 256. The bus-off state indicates the occurrence of severe errors on the bus or in the TWAI controller. Whilst in the bus-off state, the TWAI controller will be unable to take part in any bus activities. To exit the bus-off state, the TWAI controller must undergo the bus recovery process.

**Recovering:** The recovering state is entered when the TWAI controller undergoes bus recovery. The TWAI controller/TWAI driver will remain in the recovering state until the 128 occurrences of 11 consecutive recessive bits is observed on the bus.

**Message Fields and Flags**  
The TWAI driver distinguishes different types of messages by using the various bit field members of the `twai_message_t` structure. These bit field members determine whether a message is in standard or extended format, a remote frame, and the type of transmission to use when transmitting such a message.

These bit field members can also be toggled using the the `flags` member of `twai_message_t` and the following message flags:

<table>
<thead>
<tr>
<th>Message Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>TWAI_MSG_FLAG_EXTD</code></td>
<td>Message is in Extended Frame Format (29bit ID)</td>
</tr>
<tr>
<td><code>TWAI_MSG_FLAG_RTR</code></td>
<td>Message is a Remote Frame (Remote Transmission Request)</td>
</tr>
<tr>
<td><code>TWAI_MSG_FLAG_SS</code></td>
<td>Transmit message using Single Shot Transmission (Message will not be retransmitted upon error or loss of arbitration). Unused for received message.</td>
</tr>
<tr>
<td><code>TWAI_MSG_FLAG_SELF</code></td>
<td>Transmit message using Self Reception Request (Transmitted message will also received by the same node). Unused for received message.</td>
</tr>
<tr>
<td><code>TWAI_MSG_FLAG_DLC_NON_COMP</code></td>
<td>Message’s Data length code is larger than 8. This will break compliance with TWAI</td>
</tr>
<tr>
<td><code>TWAI_MSG_FLAG_NONE</code></td>
<td>Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.</td>
</tr>
</tbody>
</table>

**Examples**

**Configuration & Installation**  
The following code snippet demonstrates how to configure, install, and start the TWAI driver via the use of the various configuration structures, macro initializers, the `twai_driver_install()` function, and the `twai_start()` function.
```c
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main()
{
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_NUM_22, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install TWAI driver
    if (twai_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start TWAI driver
    if (twai_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }

    ...
}
```

The usage of macro initializers is not mandatory and each of the configuration structures can be manually.

**Message Transmission** The following code snippet demonstrates how to transmit a message via the usage of the `twai_message_t` type and `twai_transmit()` function.

```c
#include "driver/twai.h"
...

//Configure message to transmit
twai_message_t message;
message.identifier = 0xAAAA;
message.extd = 1;
message.data_length_code = 4;
for (int i = 0; i < 4; i++) {
    message.data[i] = 0;
}

//Queue message for transmission
if (twai_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}
```

**Message Reception** The following code snippet demonstrates how to receive a message via the usage of the `twai_message_t` type and `twai_receive()` function.
// Wait for message to be received
twai_message_t message;
if (twai_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}

// Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}
printf("ID is %d\n", message.identifier);
if (!message.rtr) {
    for (int i = 0; i < message.data_length_code; i++) {
        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}

Reconfiguring and Reading Alerts  The following code snippet demonstrates how to reconfigure and read TWAI driver alerts via the use of the twai_reconfigure_alerts() and twai_read_alerts() functions.

#include "driver/twai.h"
...

// Reconfigure alerts to detect Error Passive and Bus-Off error states
uint32_t alerts_to_enable = TWAI_ALERT_ERR_PASS | TWAI_ALERT_BUS_OFF;
if (twai_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts\n");
}

// Block indefinitely until an alert occurs
uint32_t alerts_triggered;
twai_read_alerts(&alerts_triggered, portMAX_DELAY);

Stop and Uninstall  The following code demonstrates how to stop and uninstall the TWAI driver via the use of the twai_stop() and twai_driver_uninstall() functions.

#include "driver/twai.h"
...

// Stop the TWAI driver
if (twai_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

(continues on next page)
//Uninstall the TWAI driver
if (twai_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}

Multiple ID Filter Configuration  The acceptance mask in twai_filter_config_t can be configured such
that two or more IDs will be accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting
bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the
IDs.

The following example shows how the calculate the acceptance mask given multiple IDs:

<table>
<thead>
<tr>
<th>ID1</th>
<th>ID2</th>
<th>ID3</th>
<th>ID4</th>
</tr>
</thead>
<tbody>
<tr>
<td>11'b101 1010 0000</td>
<td>11'b101 1010 0001</td>
<td>11'b101 1010 0100</td>
<td>11'b101 1010 1000</td>
</tr>
</tbody>
</table>

//Acceptance Mask
MASK = 11'b000 0000 1101

Application Examples  Network Example: The TWAINetwork example demonstrates communication between
two ESP32-C3s using the TWAI driver API. One TWAI node acts as a network master that initiates and ceases
the transfer of a data from another node acting as a network slave. The example can be found via peripherals/twai/twai_network.

Alert and Recovery Example: This example demonstrates how to use the TWAI driver’s alert and bus-off recovery API. The example purposely introduces errors on the bus to put the TWAI controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via peripherals/twai/twai_alert_and_recovery.

Self Test Example: This example uses the No Acknowledge Mode and Self Reception Request to cause the TWAI controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the TWAI controller and the external transceiver are working correctly. The example can be found via peripherals/twai/twai_self_test.

API Reference

Header File

- components/hal/include/hal/twai_types.h

Structures

struct twai_message_t
    Structure to store a TWAI message.
    
    Note  The flags member is deprecated

Public Members

uint32_t extd : 1
    Extended Frame Format (29bit ID)

uint32_t rtr : 1
    Message is a Remote Frame
Chapter 2. API Reference

```c
uint32_t ss : 1
    Transmit as a Single Shot Transmission. Unused for received.

uint32_t self : 1
    Transmit as a Self Reception Request. Unused for received.

uint32_t dlc_non_comp : 1
    Message’s Data length code is larger than 8. This will break compliance with ISO 11898-1

uint32_t reserved : 27
    Reserved bits

uint32_t flags
    Deprecated: Alternate way to set bits using message flags

uint32_t identifier
    11 or 29 bit identifier

uint8_t data_length_code
    Data length code

uint8_t data[TWAI_FRAME_MAX_DLC]
    Data bytes (not relevant in RTR frame)
```

### struct twai_timing_config_t
Structure for bit timing configuration of the TWAI driver.

#### Note
Macro initializers are available for this structure

### Public Members

```c
uint32_t brp
    Baudrate prescaler (i.e., APB clock divider). Any even number from 2 to 128 for ESP32, 2 to 32768 for ESP32S2. For ESP32 Rev 2 or later, multiples of 4 from 132 to 256 are also supported

uint8_t tseg_1
    Timing segment 1 (Number of time quanta, between 1 to 16)

uint8_t tseg_2
    Timing segment 2 (Number of time quanta, 1 to 8)

uint8_t sjw
    Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

bool triple_sampling
    Enables triple sampling when the TWAI controller samples a bit
```

### struct twai_filter_config_t
Structure for acceptance filter configuration of the TWAI driver (see documentation)

#### Note
Macro initializers are available for this structure

### Public Members

```c
uint32_t acceptance_code
    32-bit acceptance code

uint32_t acceptance_mask
    32-bit acceptance mask

bool single_filter
    Use Single Filter Mode (see documentation)
```
Chapter 2. API Reference

Functions

esp_err_t twai_driver_install(const twai_general_config_t *g_config, const twai_timing_config_t *t_config, const twai_filter_config_t *f_config)

Install TWAI driver.

This function installs the TWAI driver using three configuration structures. The required memory is allocated and the TWAI driver is placed in the stopped state after running this function.

Note Macro initializers are available for the configuration structures (see documentation)

Note To reinstall the TWAI driver, call twai_driver_uninstall() first

Return

- ESP_OK: Successfully installed TWAI driver
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_NO_MEM: Insufficient memory
- ESP_ERR_INVALID_STATE: Driver is already installed

Parameters

- [in] g_config: General configuration structure
- [in] t_config: Timing configuration structure
- [in] f_config: Filter configuration structure
`esp_err_t twai_driver_uninstall (void)`
Uninstall the TWAI driver.

This function uninstalls the TWAI driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

**Warning** The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

**Return**
- ESP_OK: Successfully uninstalled TWAI driver
- ESP_ERR_INVALID_STATE: Driver is not in stopped/bus-off state, or is not installed

`esp_err_t twai_start (void)`
Start the TWAI driver.

This function starts the TWAI driver, putting the TWAI driver into the running state. This allows the TWAI driver to participate in TWAI bus activities such as transmitting/receiving messages. The TX and RX queue are reset in this function, clearing any messages that are unread or pending transmission. This function can only be called when the TWAI driver is in the stopped state.

**Return**
- ESP_OK: TWAI driver is now running
- ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed

`esp_err_t twai_stop (void)`
Stop the TWAI driver.

This function stops the TWAI driver, preventing any further message from being transmitted or received until `twai_start()` is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the TWAI driver is in the running state.

**Warning** A message currently being transmitted/received on the TWAI bus will be ceased immediately. This may lead to other TWAI nodes interpreting the unfinished message as an error.

**Return**
- ESP_OK: TWAI driver is now Stopped
- ESP_ERR_INVALID_STATE: Driver is not in running state, or is not installed

`esp_err_t twai_transmit (const twai_message_t *message, TickType_t ticks_to_wait)`
Transmit a TWAI message.

This function queues a TWAI message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the TWAI driver is in the running state and cannot be called under Listen Only Mode.

**Note** This function does not guarantee that the transmission is successful. The TX_SUCCESS/TX_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

**Note** The TX_IDLE alert can be used to alert the application when no other messages are awaiting transmission.

**Return**
- ESP_OK: Transmission successfully queued/initiated
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_TIMEOUT: Timed out waiting for space on TX queue
- ESP_FAIL: TX queue is disabled and another message is currently transmitting
- ESP_ERR_INVALID_STATE: TWAI driver is not in running state, or is not installed
- ESP_ERR_NOT_SUPPORTED: Listen Only Mode does not support transmissions

**Parameters**
- `[in] message: Message to transmit`
- `[in] ticks_to_wait: Number of FreeRTOS ticks to block on the TX queue`

`esp_err_t twai_receive (twai_message_t *message, TickType_t ticks_to_wait)`
Receive a TWAI message.
This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue.

**Warning** The flags field of the received message should be checked to determine if the received message contains any data bytes.

**Return**
- ESP_OK: Message successfully received from RX queue
- ESP_ERR_TIMEOUT: Timed out waiting for message
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Parameters**
- [out] message: Received message
- [in] ticks_to_wait: Number of FreeRTOS ticks to block on RX queue

```c
esp_err_t twai_read_alerts (uint32_t *alerts, TickType_t ticks_to_wait)
```

Read TWAI driver alerts.

This function will read the alerts raised by the TWAI driver. If no alert has been issued when this function is called, this function will block until an alert occurs or until it timeouts.

**Note** Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

**Return**
- ESP_OK: Alerts read
- ESP_ERR_TIMEOUT: Timed out waiting for alerts
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Parameters**
- [out] alerts: Bit field of raised alerts (see documentation for alert flags)
- [in] ticks_to_wait: Number of FreeRTOS ticks to block for alert

```c
esp_err_t twai_reconfigure_alerts (uint32_t alerts_enabled, uint32_t *current_alerts)
```

Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

**Return**
- ESP_OK: Alerts reconfigured
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Parameters**
- [in] alerts_enabled: Bit field of alerts to enable (see documentation for alert flags)
- [out] current_alerts: Bit field of currently raised alerts. Set to NULL if unused

```c
esp_err_t twai_initiate_recovery (void)
```

Start the bus recovery process.

This function initiates the bus recovery process when the TWAI driver is in the bus-off state. Once initiated, the TWAI driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the TWAI bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

**Note** The BUS_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

**Return**
- ESP_OK: Bus recovery started
- ESP_ERR_INVALID_STATE: TWAI driver is not in the bus-off state, or is not installed

```c
esp_err_t twai_get_status_info (twai_status_info_t *status_info)
```

Get current status information of the TWAI driver.

**Return**
- ESP_OK: Status information retrieved
- ESP_ERR_INVALID_ARG: Arguments are invalid
Chapter 2. API Reference

- ESP_ERR_INVALID_STATE: TWAI driver is not installed

Parameters
- [out] status_info: Status information

```c
esp_err_t twai_clear_transmit_queue(void)
```

Clear the transmit queue.

This function will clear the transmit queue of all messages.

**Note** The transmit queue is automatically cleared when `twai_stop()` or `twai_initiate_recovery()` is called.

**Return**
- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed or TX queue is disabled

```c
esp_err_t twai_clear_receive_queue(void)
```

Clear the receive queue.

This function will clear the receive queue of all messages.

**Note** The receive queue is automatically cleared when `twai_start()` is called.

**Return**
- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Structures**

**struct twai_general_config_t**
Structure for general configuration of the TWAI driver.

**Note** Macro initializers are available for this structure

**Public Members**

```c
twai_mode_t mode
```
Mode of TWAI controller

```c
gpio_num_t tx_io
```
Transmit GPIO number

```c
gpio_num_t rx_io
```
Receive GPIO number

```c
gpio_num_t clkout_io
```
CLKOUT GPIO number (optional, set to -1 if unused)

```c
gpio_num_t bus_off_io
```
Bus off indicator GPIO number (optional, set to -1 if unused)

```c
uint32_t tx_queue_len
```
Number of messages TX queue can hold (set to 0 to disable TX Queue)

```c
uint32_t rx_queue_len
```
Number of messages RX queue can hold

```c
uint32_t alerts_enabled
```
Bit field of alerts to enable (see documentation)

```c
uint32_t clkout_divider
```
CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

```c
int intr_flags
```
Interrupt flags to set the priority of the driver’s ISR. Note that to use the ESP_INTR_FLAG_IRAM, the CONFIG_TWAI_ISR_IN_IRAM option should be enabled first.

**struct twai_status_info_t**
Structure to store status information of TWAI driver.
Public Members

\texttt{twai\_state\_t state}

Current state of TWAI controller (Stopped/Running/Bus-Off/Recovery)

uint32\_t msgs\_to\_tx

Number of messages queued for transmission or awaiting transmission completion

uint32\_t msgs\_to\_rx

Number of messages in RX queue waiting to be read

uint32\_t tx\_error\_counter

Current value of Transmit Error Counter

uint32\_t rx\_error\_counter

Current value of Receive Error Counter

uint32\_t tx\_failed\_count

Number of messages that failed transmissions

uint32\_t rx\_missed\_count

Number of messages that were lost due to a full RX queue (or errata workaround if enabled)

uint32\_t rx\_overrun\_count

Number of messages that were lost due to a RX FIFO overrun

uint32\_t arb\_lost\_count

Number of instances arbitration was lost

uint32\_t bus\_error\_count

Number of instances a bus error has occurred

Macros

\texttt{TWAI\_IO\_UNUSED}

Marks GPIO as unused in TWAI configuration

Enumerations

\texttt{enum twai\_state\_t}

TWAI driver states.

Values:

\texttt{TWAI\_STATE\_STOPPED}

Stopped state. The TWAI controller will not participate in any TWAI bus activities

\texttt{TWAI\_STATE\_RUNNING}

Running state. The TWAI controller can transmit and receive messages

\texttt{TWAI\_STATE\_BUS\_OFF}

Bus-off state. The TWAI controller cannot participate in bus activities until it has recovered

\texttt{TWAI\_STATE\_RECOVERING}

Recovering state. The TWAI controller is undergoing bus recovery

2.6.18 Universal Asynchronous Receiver/Transmitter (UART)

Overview

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e., timing requirements and data framing) using widely-adopted asynchronous serial communication interfaces, such as RS232, RS422, RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex data exchange among different devices.
The ESP32-C3 chip has two UART controllers (UART0 and UART1), each featuring an identical set of registers to simplify programming and for more flexibility.

Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering, number of stop bits, parity bit etc. All the controllers are compatible with UART-enabled devices from various manufacturers and can also support Infrared Data Association protocols (IrDA).

Functional Overview

The following overview describes how to establish communication between an ESP32-C3 and other UART devices using the functions and data types of the UART driver. The overview reflects a typical programming workflow and is broken down into the sections provided below:

1. **Setting Communication Parameters** - Setting baud rate, data bits, stop bits, etc.
2. **Setting Communication Pins** - Assigning pins for connection to a device.
3. **Driver Installation** - Allocating ESP32-C3’s resources for the UART driver.
4. **Running UART Communication** - Sending / receiving data
5. **Using Interrupts** - Triggering interrupts on specific communication events
6. **Deleting a Driver** - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional.

The UART driver’s functions identify each of the UART controllers using `uart_port_t`. This identification is needed for all the following function calls.

**Setting Communication Parameters**

UART communication parameters can be configured all in a single step or individually in multiple steps.

**Single Step**

Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```c
const uart_port_t uart_num = UART_NUM_1;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

For more information on how to configure the hardware flow control options, please refer to peripherals/uart/uart_echo.

**Multiple Steps**

Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.

Table 11: Functions for Configuring specific parameters individually

<table>
<thead>
<tr>
<th>Parameter to Configure</th>
<th>Function</th>

</table>
Each of the above functions has a \_get\_ counterpart to check the currently set value. For example, to check the current baud rate value, call \texttt{uart\_get\_baudrate()}.

**Setting Communication Pins** After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function \texttt{uart\_set\_pin()} and specify the GPIO pin numbers to which the driver should route the Tx, Rx, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro \texttt{UART\_PIN\_NO\_CHANGE}.

The same macro should be specified for pins that will not be used.

```c
// Set UART pins(TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_1, 4, 5, 18, 19));
```

**Driver Installation** Once the communication pins are set, install the driver by calling \texttt{uart\_driver\_install()} and specify the following parameters:

- Size of Tx ring buffer
- Size of Rx ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function will allocate the required internal resources for the UART driver.

```c
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_1, uart_buffer_size, \    uart_buffer_size, 10, &uart_queue, 0));
```

Once this step is complete, you can connect the external UART device and check the communication.

**Running UART Communication** Serial communication is controlled by each UART controller’s finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into Tx FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into Rx FIFO buffer
3. Read the data from Rx FIFO buffer

Therefore, an application will be limited to writing and reading data from a respective buffer using \texttt{uart\_write\_bytes()} and \texttt{uart\_read\_bytes()} respectively, and the FSM will do the rest.

**Transmitting** After preparing the data for transmission, call the function \texttt{uart\_write\_bytes()} and pass the data buffer’s address and data length to it. The function will copy the data to the Tx ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the Tx FIFO buffer, an interrupt service routine (ISR) moves the data from the Tx ring buffer to the Tx FIFO buffer in the background. The code below demonstrates the use of this function.

```c
// Write data to UART.
char\* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```
The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A ‘serial break signal’ means holding the Tx line low for a period longer than one data frame.

```
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the Tx FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function will not block until space is available. Instead, it will write all data which can immediately fit into the hardware Tx FIFO, and then return the number of bytes that were written.

There is a ‘companion’ function `uart_wait_tx_done()` that monitors the status of the Tx FIFO buffer and returns once it is empty.

```
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_1;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_ticks (TickType_t)
```

### Receiving

Once the data is received by the UART and saved in the Rx FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the Rx FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```
// Read data from UART.
const uart_port_t uart_num = UART_NUM_1;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, &length));
length = uart_read_bytes(uart_num, data, length, 100);
```

If the data in the Rx FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

### Software Flow Control

If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

### Communication Mode Selection

The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver will handle the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

### Using Interrupts

There are many interrupts that can be generated following specific UART states or detected errors. The full list of available interrupts is provided in ESP32-C3 Technical Reference Manual > UART Controller (UART) > UART Interrupts and UHCI Interrupts [PDF]. You can enable or disable specific interrupts by calling `uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively. The mask of all interrupts is available as `UART_INTR_MASK`.

The `uart_driver_install()` function installs the driver’s internal interrupt handler to manage the Tx and Rx ring buffers and provides high-level API functions like events (see below).

The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection**: There are several events defined in `uart_event_type_t` that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling...
uart_driver_install() described in Driver Installation. An example of using Event detection can be found in peripherals/uart/uart_events.

- **FIFO space threshold or transmission timeout reached**: The Tx and Rx FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
  - Configure respective threshold values of the buffer length and timeout by entering them in the structure uart_intr_config_t and calling uart_intr_config()
  - Enable the interrupts using the functions uart_enable_tx_intr() and uart_enable_rx_intr()
  - Disable these interrupts using the corresponding functions uart_disable_tx_intr() or uart_disable_rx_intr()

- **Pattern detection**: An interrupt triggered on detecting a ‘pattern’ of the same character being received/sent repeatedly for a number of times. This functionality is demonstrated in the example peripherals/uart/uart_events. It can be used, e.g., to detect a command string followed by a specific number of identical characters (the ‘pattern’) added at the end of the command string. The following functions are available:
  - Configure and enable this interrupt using uart_enable_pattern_det_intr()
  - Disable the interrupt using uart_disable_pattern_det_intr()

**Macros**: The API also defines several macros. For example, UART_FIFO_LEN defines the length of hardware FIFO buffers; UART_BITRATE_MAX gives the maximum baud rate supported by the UART controllers, etc.

**Deleting a Driver**: If the communication established with uart_driver_install() is no longer required, the driver can be removed to free allocated resources by calling uart_driver_delete().

**Overview of RS485 specific communication options**

**Note**: The following section will use [UART_REGISTER_NAME].[UART_FIELD_BIT] to refer to UART register fields/bits. For more information on a specific option bit, see ESP32-C3 Technical Reference Manual > UART Controller (UART) > Register Summary [PDF]. Use the register name to navigate to the register description and then find the field/bit.

- UART_RS485_CONF_REG.UART_RS485_EN: setting this bit enables RS485 communication mode support.
- UART_RS485_CONF_REG.UART_RS485TX_RX_EN: if this bit is set, the transmitter’s output signal loops back to the receiver’s input signal.
- UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32-C3’s RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt UART_RS485_CLASH_INT if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts UART_RS485_FRM_ERR_INT and UART_RS485_PARITY_ERR_INT can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is supported in the UART driver and can be used by selecting the UART_MODE_RS485_APP_CTRL mode (see the function uart_set_mode()).

The collision detection feature can work with circuit A and circuit C (see Section Interface Connection Options). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the user application. Use the function uart_get_collision_flag() to check if the collision detection flag has been raised.

The ESP32-C3 UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the ~RE/DE input of RS485 bus driver. However, half-duplex com-
Circuit A: Collision Detection Circuit

This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the UART peripheral when the bit UART_RS485_CONF_REG.UART_RS485TX_RX_EN is enabled.

Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection

This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit UART_RS485_CONF_REG.UART_RS485TX_RX_EN is set. The bit UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN is not applicable in this case.

Circuit C: Auto Switching Transmitter/Receiver
This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` to 1 and `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` to 0. This setup can work in any RS485 UART mode or even in `UART_MODE_UART`.

### Application Examples

The table below describes the code examples available in the directory `peripherals/uart/`.

### API Reference

#### Header File

- components/driver/include/driver/uart.h

#### Functions

`esp_err_t uart_driver_install(uart_port_t uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, QueueHandle_t *uart_queue, int intr_alloc_flags)`

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.
Note Rx_buffer_size should be greater than UART_FIFO_LEN. Tx_buffer_size should be either zero or greater than UART_FIFO_LEN.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- rx_buffer_size: UART RX ring buffer size.
- tx_buffer_size: UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- queue_size: UART event queue size/depth.
- uart_queue: UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info. Do not set ESP_INTR_FLAG_IRAM here (the driver’s ISR handler is not located in IRAM).

```c
espr_err_t uart_driver_delete (uart_port_t uart_num)
```
Uninstall UART driver.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

```c
bool uart_is_driver_installed (uart_port_t uart_num)
```
Checks whether the driver is installed or not.

Return
- true driver is installed
- false driver is not installed

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

```c
espr_err_t uart_set_word_length (uart_port_t uart_num, uart_word_length_t data_bit)
```
Set UART data bits.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- data_bit: UART data bits

```c
espr_err_t uart_get_word_length (uart_port_t uart_num, uart_word_length_t *data_bit)
```
Get the UART data bit configuration.

Return
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*data_bit)

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- data_bit: Pointer to accept value of UART data bits.

```c
espr_err_t uart_set_stop_bits (uart_port_t uart_num, uart_stop_bits_t stop_bits)
```
Set UART stop bits.

Return
- ESP_OK Success
- ESP_FAIL Fail

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- stop_bits: UART stop bits
**esp_err_t uart_get_stop_bits** *(uart_port_t uart_num, uart_stop_bits_t *stop_bits)*

Get the UART stop bit configuration.

**Return**
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*stop_bit)

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- stop_bits: Pointer to accept value of UART stop bits.

**esp_err_t uart_set_parity** *(uart_port_t uart_num, uart_parity_t parity_mode)*

Set UART parity mode.

**Return**
- ESP_FAIL Parameter error
- ESP_OK Success

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- parity_mode: the enum of uart parity configuration

**esp_err_t uart_get_parity** *(uart_port_t uart_num, uart_parity_t *parity_mode)*

Get the UART parity mode configuration.

**Return**
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*parity_mode)

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- parity_mode: Pointer to accept value of UART parity mode.

**esp_err_t uart_set_baudrate** *(uart_port_t uart_num, uint32_t baudrate)*

Set UART baud rate.

**Return**
- ESP_FAIL Parameter error
- ESP_OK Success

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- baudrate: UART baud rate.

**esp_err_t uart_get_baudrate** *(uart_port_t uart_num, uint32_t *baudrate)*

Get the UART baud rate configuration.

**Return**
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*baudrate)

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- baudrate: Pointer to accept value of UART baud rate

**esp_err_t uart_set_line_inverse** *(uart_port_t uart_num, uint32_t inverse_mask)*

Set UART line inverse mode.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- inverse_mask: Choose the wires that need to be inverted. Using the ORred mask of uart_signal_inv_t

**esp_err_t uart_set_hw_flow_ctrl** *(uart_port_t uart_num, uart_hw_flowcontrol_t flow_ctrl, uint8_t rx_thresh)*

Set hardware flow control.
Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- flow_ctrl: Hardware flow control mode
- rx_thresh: Threshold of Hardware RX flow control (0 ~ UART_FIFO_LEN). Only when UART_HW_FLOWCTRL_RTS is set, will the rx_thresh value be set.

```c
esp_err_t uart_set_sw_flow_ctrl (uart_port_t uart_num, bool enable, uint8_t rx_thresh_xon, uint8_t rx_thresh_xoff)
```
Set software flow control.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- enable: switch on or off
- rx_thresh_xon: low water mark
- rx_thresh_xoff: high water mark

```c
esp_err_t uart_get_hw_flow_ctrl (uart_port_t uart_num, uart_hw_flowcontrol_t *flow_ctrl)
```
Get the UART hardware flow control configuration.

Return
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*flow_ctrl)

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- flow_ctrl: Option for different flow control mode.

```c
esp_err_t uart_clear_intr_status (uart_port_t uart_num, uint32_t clr_mask)
```
Clear UART interrupt status.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- clr_mask: Bit mask of the interrupt status to be cleared.

```c
esp_err_t uart_enable_intr_mask (uart_port_t uart_num, uint32_t enable_mask)
```
Set UART interrupt enable.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- enable_mask: Bit mask of the enable bits.

```c
esp_err_t uart_disable_intr_mask (uart_port_t uart_num, uint32_t disable_mask)
```
Clear UART interrupt enable bits.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- disable_mask: Bit mask of the disable bits.

```c
esp_err_t uart_enable_rx_intr (uart_port_t uart_num)
```
Enable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)
Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

`esp_err_t uart_disable_rx_intr(uart_port_t uart_num)`
Disable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

`esp_err_t uart_disable_tx_intr(uart_port_t uart_num)`
Disable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number

`esp_err_t uart_enable_tx_intr(uart_port_t uart_num, int enable, int thresh)`
Enable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• enable: 1: enable; 0: disable
• thresh: Threshold of TX interrupt, 0 ~ UART_FIFO_LEN

`esp_err_t uart_set_pin(uart_port_t uart_num, int tx_io_num, int rx_io_num, int rts_io_num, int cts_io_num)`
Assign signals of a UART peripheral to GPIO pins.

Note If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UART0’s default TX pin and GPIO3 is UART0’s default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

Note Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• tx_io_num: UART TX pin GPIO number.
• rx_io_num: UART RX pin GPIO number.
• rts_io_num: UART RTS pin GPIO number.
• cts_io_num: UART CTS pin GPIO number.

`esp_err_t uart_set_rts(uart_port_t uart_num, int level)`
Manually set the UART RTS pin level.

Note UART must be configured with hardware flow control disabled.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• level: 1: RTS output low (active); 0: RTS output high (block)

\[
\text{esp_err_t uart_set_dtr (uart_port_t uart_num, int level)}
\]
Manually set the UART DTR pin level.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• level: 1: DTR output low; 0: DTR output high

\[
\text{esp_err_t uart_set_tx_idle_num (uart_port_t uart_num, uint16_t idle_num)}
\]
Set UART idle interval after tx FIFO is empty.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• idle_num: idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

\[
\text{esp_err_t uart_param_config (uart_port_t uart_num, const uart_config_t *uart_config)}
\]
Set UART configuration parameters.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• uart_config: UART parameter settings

\[
\text{esp_err_t uart_intr_config (uart_port_t uart_num, const uart_intr_config_t *intr_conf)}
\]
Configure UART interrupts.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• intr_conf: UART interrupt settings

\[
\text{esp_err_t uart_wait_tx_done (uart_port_t uart_num, TickType_t ticks_to_wait)}
\]
Wait until UART TX FIFO is empty.

Return
• ESP_OK Success
• ESP_FAIL Parameter error
• ESP_ERR_TIMEOUT Timeout

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• ticks_to_wait: Timeout, count in RTOS ticks

\[
\text{int uart_tx_chars (uart_port_t uart_num, const char *buffer, uint32_t len)}
\]
Send data to the UART port from a given buffer and length.
This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

Note This function should only be used when UART TX buffer is not enabled.

Return
• (-1) Parameter error
• OTHERS (>=0) The number of bytes pushed to the TX FIFO

Parameters
  • `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
  • `buffer`: data buffer address
  • `len`: data length to send

`int uart_write_bytes (uart_port_t uart_num, const void *src, size_t size)`

Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

Return
  • (-1) Parameter error
  • OTHERS (>=0) The number of bytes pushed to the TX FIFO

Parameters
  • `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
  • `src`: data buffer address
  • `size`: data length to send

`int uart_write_bytes_with_break (uart_port_t uart_num, const void *src, size_t size, int brk_len)`

Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

Return
  • (-1) Parameter error
  • OTHERS (>=0) The number of bytes pushed to the TX FIFO

Parameters
  • `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
  • `src`: data buffer address
  • `size`: data length to send
  • `brk_len`: break signal duration(unit: the time it takes to send one bit at current baudrate)

`int uart_read_bytes (uart_port_t uart_num, void *buf, uint32_t length, TickType_t ticks_to_wait)`

UART read bytes from UART buffer.

Return
  • (-1) Error
  • OTHERS (>=0) The number of bytes read from UART FIFO

Parameters
  • `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
  • `buf`: pointer to the buffer.
  • `length`: data length
  • `ticks_to_wait`: sTimeout, count in RTOS ticks

`esp_err_t uart_flush (uart_port_t uart_num)`

Alias of uart_flush_input. UART ring buffer flush. This will discard all data in the UART RX buffer.

Note Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use uart_wait_tx_done function.

Return
  • ESP_OK Success
  • ESP_FAIL Parameter error
Chapter 2: API Reference

Parameters
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).

```c
esp_err_t uart_flush_input(uart_port_t uart_num)
```
Clear input buffer, discard all the data is in the ring-buffer.

**Note** In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).

```c
esp_err_t uart_get_buffered_data_len(uart_port_t uart_num, size_t *size)
```
UART get RX ring buffer cached data length.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).
- `size`: Pointer of `size_t` to accept cached data length

```c
esp_err_t uart_disable_pattern_det_intr(uart_port_t uart_num)
```
UART disable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detects a series of one same character, the interrupt will be triggered.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).

```c
esp_err_t uart_enable_pattern_det_baud_intr(uart_port_t uart_num, char pattern_chr,
                                          uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)
```
UART enable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detects a series of one same character, the interrupt will be triggered.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- `uart_num`: UART port number.
- `pattern_chr`: character of the pattern.
- `chr_num`: number of the character, 8bit value.
- `chr_tout`: timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at_cmd char.
- `post_idle`: idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at_cmd char.
- `pre_idle`: idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at_cmd char.

```c
int uart_pattern_pop_pos(uart_port_t uart_num)
```
Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.
Chapter 2. API Reference

**Note**  If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

**Return**
- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX-1).

```c
int uart_pattern_get_pos (uart_port_t uart_num)
```

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue. This function do nothing to the queue.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

**Note**  If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

**Return**
- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX-1).

```c
esp_err_t uart_pattern_queue_reset (uart_port_t uart_num, int queue_length)
```

Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

**Return**
- ESP_ERR_NO_MEM No enough memory
- ESP_ERR_INVALID_STATE Driver not installed
- ESP_FAIL Parameter error
- ESP_OK Success

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX-1).
- `queue_length`: Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

```c
esp_err_t uart_set_mode (uart_port_t uart_num, uart_mode_t mode)
```

UART set communication mode.

**Note**  This function must be executed after `uart_driver_install()`, when the driver object is initialized.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `uart_num`: Uart number to configure, the max port number is (UART_NUM_MAX-1).
- `mode`: UART MODE to set

```c
esp_err_t uart_set_rx_full_threshold (uart_port_t uart_num, int threshold)
```

Set uart threshold value for RX fifo full.

**Note**  If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

**Parameters**
- `uart_num`: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- `threshold`: Threshold value above which RX fifo full interrupt is generated
esp_err_t uart_set_tx_empty_threshold(uart_port_t uart_num, int threshold)

Set uart threshold values for TX fifo empty.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

Parameters

- uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- threshold: Threshold value below which TX fifo empty interrupt is generated

esp_err_t uart_set_rx_timeout(uart_port_t uart_num, const uint8_t tout_thresh)

UART set threshold timeout for TOUT feature.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

Parameters

- uart_num: Uart number to configure, the max port number is (UART_NUM_MAX -1).
- tout_thresh: This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout_thresh = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART_RXFIFO_TOUT_INT interrupt is triggered. If tout_thresh == 0, the TOUT feature is disabled.

esp_err_t uart_get_collision_flag(uart_port_t uart_num, bool *collision_flag)

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by collision_flag. *collision_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after uart_write_bytes()).

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- uart_num: Uart number to configure the max port number is (UART_NUM_MAX -1).
- collision_flag: Pointer to variable of type bool to return collision flag.

esp_err_t uart_set_wakeup_threshold(uart_port_t uart_num, int wakeup_threshold)

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter ‘a’ with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when ‘a’ is sent, set wakeup_threshold=3.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To make sure that UART has correct baud rate all the time, select REF_TICK as UART clock source, by setting use_ref_tick field in uart_config_t to true.

Note in ESP32, the wakeup signal can only be input via IO_MUX (i.e. GPIO3 should be configured as function_1 to wake up UART0, GPIO9 should be configured as function_5 to wake up UART1), UART2 does not support light sleep wakeup feature.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if uart_num is incorrect or wakeup_threshold is outside of [3, 0x3ff] range.

Parameters

- uart_num: UART number, the max port number is (UART_NUM_MAX -1).
• **wakeup_threshold**: number of RX edges for light sleep wakeup, value is 3..0x3ff.

```c
esp_err_t uart_get_wakeup_threshold(uart_port_t uart_num, int *out_wakeup_threshold)
```

Get the number of RX pin signal edges for light sleep wakeup.

See description of `uart_set_wakeup_threshold` for the explanation of UART wakeup feature.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if `out_wakeup_threshold` is NULL

**Parameters**
- ` uart_num`: UART number, the max port number is (UART_NUM_MAX-1).
- `[out] out_wakeup_threshold`: output, set to the current value of wakeup threshold for the given UART.

```c
esp_err_t uart_wait_tx_idle_polling(uart_port_t uart_num)
```

Wait until UART tx memory empty and the last char send ok (polling mode).

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

**Parameters**
- ` uart_num`: UART number

```c
esp_err_t uart_set_loop_back(uart_port_t uart_num, bool loop_back_en)
```

Configure TX signal loop back to RX module, just for the test usage.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

**Parameters**
- ` uart_num`: UART number
- `loop_back_en`: Set to enable the loop back function, else set it false.

```c
void uart_set_always_rx_timeout(uart_port_t uart_num, bool always_rx_timeout_en)
```

Configure behavior of UART RX timeout interrupt.

When `always_rx_timeout` is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

**Parameters**
- ` uart_num`: UART number
- `always_rx_timeout_en`: Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

**Structures**

```c
struct uart_intr_config_t
```

UART interrupt configuration parameters for `uart_intr_config` function.

**Public Members**

```c
uint32_t intr_enable_mask
```

UART interrupt enable mask, choose from UART_XXXX_INT_ENA_M under UART_INT_ENA_REG(i), connect with bit-or operator

```c
uint8_t rx_timeout_thresh
```

UART timeout interrupt threshold (unit: time of sending one byte)
uint8_t txfifo_empty_intr_thresh
UART TX empty interrupt threshold.

uint8_t rxfifo_full_thresh
UART RX full interrupt threshold.

struct uart_event_t
Event structure used in UART event queue.

Public Members

\texttt{uart_event_type_t type}
UART event type

size_t size
UART data size for UART_DATA event

bool timeout_flag
UART data read timeout flag for UART_DATA event (no new data received during configured RX
timeout) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag
before the next byte coming.

Macros

\texttt{UART_NUM_0}
UART port 0

\texttt{UART_NUM_1}
UART port 1

\texttt{UART_NUM_MAX}
UART port max

\texttt{UART_PIN_NO_CHANGE}

\texttt{UART_FIFO_LEN}
Length of the UART HW FIFO.

\texttt{UART_BITRATE_MAX}
Maximum configurable bitrate.

Type Definitions

typedef \texttt{intr_handle_t} uart_isr_handle_t

Enumerations

\texttt{enum uart_event_type_t}
UART event types used in the ring buffer.

Values:

\texttt{UART_DATA}
UART data event

\texttt{UART_BREAK}
UART break event

\texttt{UART_BUFFER_FULL}
UART RX buffer full event

\texttt{UART_FIFO_OVF}
UART FIFO overflow event

\texttt{UART_FRAME_ERR}
UART RX frame error event

**Chapter 2. API Reference**

**UART_PARITY_ERR**
UART RX parity event

**UART_DATA_BREAK**
UART TX data and break event

**UART_PATTERN_DET**
UART pattern detected

**UART_WAKEUP**
UART wakeup event

**UART_EVENT_MAX**
UART event max index

**Header File**

- components/hal/include/hal/uart_types.h

**Structures**

**struct uart_at_cmd_t**
UART AT cmd char configuration parameters. Note that this function may differ on different chip. Please refer to the TRM at configuration.

**Public Members**

- uint8_t **cmd_char**
  UART AT cmd char
- uint8_t **char_num**
  AT cmd char repeat number
- uint32_t **gap_tout**
  gap time (in baud-rate) between AT cmd char
- uint32_t **pre_idle**
  the idle time (in baud-rate) between the non AT char and first AT char
- uint32_t **post_idle**
  the idle time (in baud-rate) between the last AT char and the none AT char

**struct uart_sw_flowctrl_t**
UART software flow control configuration parameters.

**Public Members**

- uint8_t **xon_char**
  Xon flow control char
- uint8_t **xoff_char**
  Xoff flow control char
- uint8_t **xon_thrd**
  If the software flow control is enabled and the data amount in rxfifo is less than xon_thrd, an xon_char will be sent
- uint8_t **xoff_thrd**
  If the software flow control is enabled and the data amount in rxfifo is more than xoff_thrd, an xoff_char will be sent

**struct uart_config_t**
UART configuration parameters for uart_param_config function.
Public Members

```c
int baud_rate
   UART baud rate

uint8_t data_bits
   UART byte size

uint8_t parity
   UART parity mode

uint8_t stop_bits
   UART stop bits

uint8_t flow_ctrl
   UART HW flow control mode (cts/rts)

uint8_t rx_flow_ctrl_thresh
   UART HW RTS threshold

uint8_t source_clk
   UART source clock selection

bool use_ref_tick
   Deprecated method to select ref tick clock source, set source_clk field instead
```

Type Definitions

typedef int uart_port_t
   UART port number, can be UART_NUM_0 ~ (UART_NUM_MAX -1).

Enumerations

enum uart_mode_t
   UART mode selection.

Values:

```
UART_MODE_UART = 0x00
   mode: regular UART mode

UART_MODE_RS485_HALF_DUPLEX = 0x01
   mode: half duplex RS485 UART mode control by RTS pin

UART_MODE_IRDA = 0x02
   mode: IRDA UART mode

UART_MODE_RS485_COLLISION_DETECT = 0x03
   mode: RS485 collision detection UART mode (used for test purposes)

UART_MODE_RS485_APP_CTRL = 0x04
   mode: application control RS485 UART mode (used for test purposes)
```

enum uart_word_length_t
   UART word length constants.

Values:

```
UART_DATA_5_BITS = 0x0
   word length: 5bits

UART_DATA_6_BITS = 0x1
   word length: 6bits

UART_DATA_7_BITS = 0x2
   word length: 7bits

UART_DATA_8_BITS = 0x3
   word length: 8bits
```
Chapter 2. API Reference

UART_DATA_BITS_MAX = 0x4

enum uart_stop_bits_t
UART stop bits number.
Values:

UART_STOP_BITS_1 = 0x1
  stop bit: 1bit
UART_STOP_BITS_1_5 = 0x2
  stop bit: 1.5bits
UART_STOP_BITS_2 = 0x3
  stop bit: 2bits
UART_STOP_BITS_MAX = 0x4

enum uart_parity_t
UART parity constants.
Values:

UART_PARITY_DISABLE = 0x0
  Disable UART parity
UART_PARITY_EVEN = 0x2
  Enable UART even parity
UART_PARITY_ODD = 0x3
  Enable UART odd parity

enum uart_hw_flowcontrol_t
UART hardware flow control modes.
Values:

UART_HW_FLOWCTRL_DISABLE = 0x0
  disable hardware flow control
UART_HW_FLOWCTRL_RTS = 0x1
  enable RX hardware flow control (rts)
UART_HW_FLOWCTRL_CTS = 0x2
  enable TX hardware flow control (cts)
UART_HW_FLOWCTRL_CTS_RTS = 0x3
  enable hardware flow control
UART_HW_FLOWCTRL_MAX = 0x4

enum uart_signal_inv_t
UART signal bit map.
Values:

UART_SIGNAL_INV_DISABLE = 0
  Disable UART signal inverse
UART_SIGNAL_IRDA_TX_INV = (0x1 << 0)
  inverse the UART irda_tx signal
UART_SIGNAL_IRDA_RX_INV = (0x1 << 1)
  inverse the UART irda_rx signal
UART_SIGNAL_RXD_INV = (0x1 << 2)
  inverse the UART rxd signal
UART_SIGNAL_CTS_INV = (0x1 << 3)
  inverse the UART cts signal
UART_SIGNAL_DSR_INV = (0x1 << 4)
inverse the UART dsr signal

UART_SIGNAL_TXD_INV = (0x1 << 5)
inverse the UART txd signal

UART_SIGNAL_RTS_INV = (0x1 << 6)
inverse the UART rts signal

UART_SIGNAL_DTR_INV = (0x1 << 7)
inverse the UART dtr signal

enum uart_sclk_t
UART source clock.

Values:

UART_SCLK_APB = 0x0
UART source clock from APB

UART_SCLK_RTC = 0x1
UART source clock from RTC

UART_SCLK_XTAL = 0x2
UART source clock from XTAL

**GPIO Lookup Macros**  The UART peripherals have dedicated IO_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of finding and assigning IO_MUX pins. You choose a macro based on either the IO_MUX pin number, or a required UART channel name, and the macro will return the matching counterpart for you. See some examples below.

**Note:** These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

1. UART_NUM_2_TXD_DIRECT_GPIO_NUM returns the IO_MUX pin number of UART channel 2 TXD pin (pin 17)
2. UART_GPIO19_DIRECT_CHANNEL returns the UART number of GPIO 19 when connected to the UART peripheral via IO_MUX (this is UART_NUM_0)
3. UART_CTS_GPIO19_DIRECT_CHANNEL returns the UART number of GPIO 19 when used as the UART CTS pin via IO_MUX (this is UART_NUM_0). Similar to the above macro but specifies the pin function which is also part of the IO_MUX assignment.

**Header File**

- components/soc/esp32c3/include/soc/uart_channel.h

**Macros**

- UART_GPIO1_DIRECT_CHANNEL
- UART_NUM_0_TXD_DIRECT_GPIO_NUM
- UART_GPIO3_DIRECT_CHANNEL
- UART_NUM_0_RXD_DIRECT_GPIO_NUM
- UART_GPIO19_DIRECT_CHANNEL
- UART_NUM_0_CTS_DIRECT_GPIO_NUM
- UART_GPIO22_DIRECT_CHANNEL
UART_NUM_0_RTS_DIRECT_GPIO_NUM
UART_TXD_GPIO1_DIRECT_CHANNEL
UART_RXD_GPIO3_DIRECT_CHANNEL
UART_CTS_GPIO19_DIRECT_CHANNEL
UART_RTS_GPIO22_DIRECT_CHANNEL
UART_GPIO10_DIRECT_CHANNEL
UART_NUM_1_TXD_DIRECT_GPIO_NUM
UART_GPIO9_DIRECT_CHANNEL
UART_NUM_1_RXD_DIRECT_GPIO_NUM
UART_GPIO6_DIRECT_CHANNEL
UART_NUM_1_CTS_DIRECT_GPIO_NUM
UART_GPIO11_DIRECT_CHANNEL
UART_NUM_1_RTS_DIRECT_GPIO_NUM
UART_TXD_GPIO10_DIRECT_CHANNEL
UART_RXD_GPIO9_DIRECT_CHANNEL
UART_CTS_GPIO6_DIRECT_CHANNEL
UART_RTS_GPIO11_DIRECT_CHANNEL
UART_GPIO17_DIRECT_CHANNEL
UART_NUM_2_TXD_DIRECT_GPIO_NUM
UART_GPIO16_DIRECT_CHANNEL
UART_NUM_2_RXD_DIRECT_GPIO_NUM
UART_GPIO8_DIRECT_CHANNEL
UART_NUM_2_CTS_DIRECT_GPIO_NUM
UART_GPIO7_DIRECT_CHANNEL
UART_NUM_2_RTS_DIRECT_GPIO_NUM
UART_TXD_GPIO17_DIRECT_CHANNEL
UART_RXD_GPIO16_DIRECT_CHANNEL
UART_CTS_GPIO8_DIRECT_CHANNEL
UART_RTS_GPIO17_DIRECT_CHANNEL

Code examples for this API section are provided in the peripherals directory of ESP-IDF examples.

2.7 Project Configuration

2.7.1 Introduction

ESP-IDF uses kconfiglib which is a Python-based extension to the Kconfig system which provides a compile-time project configuration mechanism. Kconfig is based around options of several types: integer, string, boolean. Kconfig files specify dependencies between options, default values of the options, the way the options are grouped together, etc.

For the complete list of available features please see Kconfig and kconfiglib extensions.
Chapter 2. API Reference

2.7.2 Project Configuration Menu

Application developers can open a terminal-based project configuration menu with the `idf.py menuconfig` build target.

After being updated, this configuration is saved inside `sdkconfig` file in the project root directory. Based on `sdkconfig`, application build targets will generate `sdkconfig.h` file in the build directory, and will make `sdkconfig` options available to the project build system and source files.

2.7.3 Using `sdkconfig.defaults`

In some cases, such as when `sdkconfig` file is under revision control, the fact that `sdkconfig` file gets changed by the build system may be inconvenient. The build system offers a way to avoid this, in the form of `sdkconfig.defaults` file. This file is never touched by the build system, and can be created manually or automatically. It can contain all the options which matter for the given application and are different from the default ones. The format is the same as that of the `sdkconfig` file. `sdkconfig.defaults` can be created manually when one remembers all the changed configurations. Otherwise, the file can be generated automatically by running the `idf.py save-defconfig` command.

Once `sdkconfig.defaults` is created, `sdkconfig` can be deleted and added to the ignore list of the revision control system (e.g. `.gitignore` file for git). Project build targets will automatically create `sdkconfig` file, populated with the settings from `sdkconfig.defaults` file, and the rest of the settings will be set to their default values. Note that the build process will not override settings that are already in `sdkconfig` by ones from `sdkconfig.defaults`. For more information, see Custom `sdkconfig defaults`.

2.7.4 Kconfig Formatting Rules

The following attributes of `Kconfig` files are standardized:

- Within any menu, option names should have a consistent prefix. The prefix length is currently set to at least 3 characters.
- The indentation style is 4 characters created by spaces. All sub-items belonging to a parent item are indented by one level deeper. For example, `menu` is indented by 0 characters, the `config` inside of the menu by 4 characters, the `help` of the `config` by 8 characters and the text of the `help` by 12 characters.
- No trailing spaces are allowed at the end of the lines.
- The maximum length of options is set to 40 characters.
- The maximum length of lines is set to 120 characters.

Format checker

`tools/check_kconfigs.py` is provided for checking the `Kconfig` formatting rules. The checker checks all `Kconfig` and `Kconfig.projbuild` files in the ESP-IDF directory and generates a new file with suffix `.new` with some recommendations how to fix issues (if there are any). Please note that the checker cannot correct all rules and the responsibility of the developer is to check and make final corrections in order to pass the tests. For example, indentations will be corrected if there isn’t some misleading previous formatting but it cannot come up with a common prefix for options inside a menu.

2.7.5 Backward Compatibility of Kconfig Options

The standard `Kconfig` tools ignore unknown options in `sdkconfig`. So if a developer has custom settings for options which are renamed in newer ESP-IDF releases then the given setting for the option would be silently ignored. Therefore, several features have been adopted to avoid this:

1. `configen.py` is used by the tool chain to pre-process `sdkconfig` files before anything else, for example `menuconfig` would read them. As the consequence, the settings for old options will be kept and not ignored.
2. `confgen.py` recursively finds all `sdkconfig.rename` files in ESP-IDF directory which contain old and new `Kconfig` option names. Old options are replaced by new ones in the `sdkconfig` file. Renames that should only appear for a single target can be placed in a target specific rename file: `sdkconfig.rename.TARGET`, where `TARGET` is the target name, e.g. `sdkconfig.rename.esp32s2`.

3. `confgen.py` post-processes `sdkconfig` files and generates all build outputs (`sdkconfig.h`, `sdkconfig.cmake`, `auto.conf`) by adding a list of compatibility statements, i.e. value of the old option is set the value of the new option (after modification). This is done in order to not break customer codes where old option might still be used.

4. Deprecated options and their replacements are automatically generated by `confgen.py`.

## 2.7.6 Configuration Options Reference

Subsequent sections contain the list of available ESP-IDF options, automatically generated from Kconfig files. Note that depending on the options selected, some options listed here may not be visible by default in the interface of menuconfig.

By convention, all option names are upper case with underscores. When Kconfig generates `sdkconfig` and `sdkconfig.h` files, option names are prefixed with `CONFIG_`. So if an option `ENABLE_FOO` is defined in a Kconfig file and selected in menuconfig, then `sdkconfig` and `sdkconfig.h` files will have `CONFIG_ENABLE_FOO` defined. In this reference, option names are also prefixed with `CONFIG_`, same as in the source code.

### Build type

Contains:

- `CONFIG_APP_BUILD_TYPE`
- `CONFIG_APP_REPRODUCIBLE_BUILD`

**CONFIG_APP_BUILD_TYPE**

Application build type

*Found in: Build type*

Select the way the application is built.

By default, the application is built as a binary file in a format compatible with the ESP-IDF bootloader. In addition to this application, 2nd stage bootloader is also built. Application and bootloader binaries can be written into flash and loaded/executed from there.

Another option, useful for only very small and limited applications, is to only link the `.elf` file of the application, such that it can be loaded directly into RAM over JTAG. Note that since IRAM and DRAM sizes are very limited, it is not possible to build any complex application this way. However for kinds of testing and debugging, this option may provide faster iterations, since the application does not need to be written into flash. Note that at the moment, ESP-IDF does not contain all the startup code required to initialize the CPUs and ROM memory (data/bss). Therefore it is necessary to execute a bit of ROM code prior to executing the application. A gdbinit file may look as follows (for ESP32):

```
# Connect to a running instance of OpenOCD target remote:3333 # Reset and halt the target
# Run to a specific point in ROM code, # where most of initialization is complete. thb *0x40007d54 c # Load the application into RAM load # Run till app_main tb
app_main c
```

Execute this gdbinit file as follows:

```
xtena-esp32-elf-gdb build/app-name.elf -x gdbinit
```

Example gdbinit files for other targets can be found in `tools/test_apps/system/gdb_loadable_elf/`

Recommended `sdkconfig.defaults` for building loadable ELF files is as follows. `CONFIG_APP_BUILD_TYPE_ELF_RAM` is required, other options help reduce application memory footprint.
CONFIG_APP_BUILD_TYPE_ELF_RAM=y CONFIG_VFS_SUPPORT_TERMIOS=y CONFIG_NEWLIB_NANO_FORMAT=y CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT=y CONFIG_ESP_DEBUG_STUBS_ENABLE=y CONFIG_ESP_ERR_TO_NAME_LOOKUP=y

Available options:
- Default (binary application + 2nd stage bootloader) (APP_BUILD_TYPE_APP_2NDBOOT)
- ELF file, loadable into RAM (EXPERIMENTAL) (APP_BUILD_TYPE_ELF_RAM)

CONFIG_APP_REPRODUCIBLE_BUILD

Enable reproducible build

Found in: Build type

If enabled, all date, time, and path information would be eliminated. A .gdbinit file would be created automatically. (or will be append if you have one already)

Default value:
- No (disabled)

Application manager

Contains:
- CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR
- CONFIG_APP_EXCLUDE_PROJECT_VER_VAR
- CONFIG_APP_PROJECT_VER_FROM_CONFIG
- CONFIG_APP_RETRIEVE_LEN_ELF_SHA
- CONFIG_APP_COMPILE_TIME_DATE

CONFIG_APP_COMPILE_TIME_DATE

Use time/date stamp for app

Found in: Application manager

If set, then the app will be built with the current time/date stamp. It is stored in the app description structure. If not set, time/date stamp will be excluded from app image. This can be useful for getting the same binary image files made from the same source, but at different times.

Default value:
- Yes (enabled)

CONFIG_APP_EXCLUDE_PROJECT_VER_VAR

Exclude PROJECT_VER from firmware image

Found in: Application manager

The PROJECT_VER variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

Default value:
- No (disabled)

CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR

Exclude PROJECT_NAME from firmware image

Found in: Application manager
The PROJECT_NAME variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

**Default value:**
- No (disabled)

**CONFIG_APP_PROJECT_VER_FROM_CONFIG**

Get the project version from Kconfig

*Found in: Application manager*

If this is enabled, then config item APP_PROJECT_VER will be used for the variable PROJECT_VER. Other ways to set PROJECT_VER will be ignored.

**Default value:**
- No (disabled)

**CONFIG_APP_PROJECT_VER**

Project version

*Found in: Application manager > CONFIG_APP_PROJECT_VER_FROM_CONFIG*

Project version

**Default value:**
- 1 if CONFIG_APP_PROJECT_VER_FROM_CONFIG

**CONFIG_APP_RETRIEVE_LEN_ELF_SHA**

The length of APP ELF SHA is stored in RAM(chars)

*Found in: Application manager*

At startup, the app will read this many hex characters from the embedded APP ELF SHA-256 hash value and store it in static RAM. This ensures the app ELF SHA-256 value is always available if it needs to be printed by the panic handler code. Changing this value will change the size of a static buffer, in bytes.

**Range:**
- from 8 to 64

**Default value:**
- 16

**Bootloader config**

Contains:

- `CONFIG_BOOTLOADER_LOG_LEVEL`
- `CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION`
- `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE`
- `CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT`
- `CONFIG_BOOTLOADER_APP_TEST`
- `CONFIG_BOOTLOADER_FACTORY_RESET`
- `CONFIG_BOOTLOADER_HOLD_TIME_GPIO`
- `CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC`
- `CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS`
- `CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON`
- `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN.Deep_SLEEP`
- `CONFIG_BOOTLOADER_WDT_ENABLE`
- `CONFIG_BOOTLOADER_VDDSDIO_BOOST`
**CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION**

Bootloader optimization Level

*Found in: Bootloader config*

This option sets compiler optimization level (gcc -O argument) for the bootloader.

- The default “Size” setting will add the -Os flag to CFLAGS.
- The “Debug” setting will add the -Og flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.

Note that custom optimization levels may be unsupported.

*Available options:*

- Size (-Os) (BOOTLOADER_COMPILER_OPTIMIZATION_SIZE)
- Debug (-Og) (BOOTLOADER_COMPILER_OPTIMIZATION_DEBUG)
- Optimize for performance (-O2) (BOOTLOADER_COMPILER_OPTIMIZATION_PERF)
- Debug without optimization (-O0) (BOOTLOADER_COMPILER_OPTIMIZATION_NONE)

**CONFIG_BOOTLOADER_LOG_LEVEL**

Bootloader log verbosity

*Found in: Bootloader config*

Specify how much output to see in bootloader logs.

*Available options:*

- No output (BOOTLOADER_LOG_LEVEL_NONE)
- Error (BOOTLOADER_LOG_LEVEL_ERROR)
- Warning (BOOTLOADER_LOG_LEVEL_WARN)
- Info (BOOTLOADER_LOG_LEVEL_INFO)
- Debug (BOOTLOADER_LOG_LEVEL_DEBUG)
- Verbose (BOOTLOADER_LOG_LEVEL_VERBOSE)

**CONFIG_BOOTLOADER_VDDSDIO_BOOST**

VDDSDIO LDO voltage

*Found in: Bootloader config*

If this option is enabled, and VDDSDIO LDO is set to 1.8V (using eFuse or MTDI bootstrapping pin), bootloader will change LDO settings to output 1.9V instead. This helps prevent flash chip from browning out during flash programming operations.

This option has no effect if VDDSDIO is set to 3.3V, or if the internal VDDSDIO regulator is disabled via eFuse.

*Available options:*

- 1.8V (BOOTLOADER_VDDSDIO_BOOST_1_8V)
- 1.9V (BOOTLOADER_VDDSDIO_BOOST_1_9V)

**CONFIG_BOOTLOADER_FACTORY_RESET**

GPIO triggers factory reset

*Found in: Bootloader config*

Allows to reset the device to factory settings: - clear one or more data partitions; - boot from “factory” partition. The factory reset will occur if there is a GPIO input held at the configured level while device starts up. See settings below.

*Default value:*
Chapter 2. API Reference

- No (disabled)

**CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET**

Number of the GPIO input for factory reset

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

The selected GPIO will be configured as an input with internal pull-up enabled (note that on some SoCs, not all pins have an internal pull-up, consult the hardware datasheet for details.) To trigger a factory reset, this GPIO must be held high or low (as configured) on startup.

**Default value:**
- 4 if `CONFIG_BOOTLOADER_FACTORY_RESET`

**CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LEVEL**

Factory reset GPIO level

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

Pin level for factory reset, can be triggered on low or high.

**Available options:**
- Reset on GPIO low (BOOTLOADER_FACTORY_RESET_PIN_LOW)
- Reset on GPIO high (BOOTLOADER_FACTORY_RESET_PIN_HIGH)

**CONFIG_BOOTLOADER_OTA_DATA_ERASE**

Clear OTA data on factory reset (select factory partition)

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

The device will boot from “factory” partition (or OTA slot 0 if no factory partition is present) after a factory reset.

**CONFIG_BOOTLOADER_DATA_FACTORY_RESET**

Comma-separated names of partitions to clear on factory reset

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

Allows customers to select which data partitions will be erased while factory reset.

Specify the names of partitions as a comma-delimited with optional spaces for readability. (Like this: “nvs, phy_init, …” ) Make sure that the name specified in the partition table and here are the same. Partitions of type “app” cannot be specified here.

**Default value:**
- “nvs” if `CONFIG_BOOTLOADER_FACTORY_RESET`

**CONFIG_BOOTLOADER_APP_TEST**

GPIO triggers boot from test app partition

*Found in: Bootloader config*

Allows to run the test app from “TEST” partition. A boot from “test” partition will occur if there is a GPIO input pulled low while device starts up. See settings below.

**Default value:**
- No (disabled) if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`
**CONFIG_BOOTLOADER_NUM_PIN_APP_TEST**

Number of the GPIO input to boot TEST partition

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_TEST*

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the old application will boot. (factory or OTA[x]). Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

**Range:**
- from 0 to 39 if **CONFIG_BOOTLOADER_APP_TEST**

**Default value:**
- 18 if **CONFIG_BOOTLOADER_APP_TEST**

**CONFIG_BOOTLOADER_HOLD_TIME_GPIO**

Hold time of GPIO for reset/test mode (seconds)

*Found in: Bootloader config*

The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

**Default value:**
- 5 if **CONFIG_BOOTLOADER_FACTORY_RESET** || **CONFIG_BOOTLOADER_APP_TEST**

**CONFIG_BOOTLOADER_WDT_ENABLE**

Use RTC watchdog in start code

*Found in: Bootloader config*

Tracks the execution time of startup code. If the execution time is exceeded, the RTC_WDT will restart system. It is also useful to prevent a lock up in start code caused by an unstable power source. NOTE: Tracks the execution time starts from the bootloader code - re-set timeout, while selecting the source for slow_clk - and ends calling app_main. Re-set timeout is needed due to WDT uses a SLOW_CLK clock source. After changing a frequency slow_clk a time of WDT needs to re-set for new frequency. slow_clk depends on ESP32_RTC_CLK_SRC (INTERNAL_RC or EXTERNALCRYSTAL).

**Default value:**
- Yes (enabled)

**CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE**

Allows RTC watchdog disable in user code

*Found in: Bootloader config > CONFIG_BOOTLOADER_WDT_ENABLE*

If this option is set, the ESP-IDF app must explicitly reset, feed, or disable the rtc_wdt in the app’s own code. If this option is not set (default), then rtc_wdt will be disabled by ESP-IDF before calling the app_main() function.

Use function rtc_wdt_feed() for resetting counter of rtc_wdt. Use function rtc_wdt_disable() for disabling rtc_wdt.

**Default value:**
- No (disabled)
Chapter 2. API Reference

**CONFIG_BOOTLOADER_WDT_TIME_MS**
Timeout for RTC watchdog (ms)

*Found in: Bootloader config > CONFIG_BOOTLOADER_WDT_ENABLE*

Verify that this parameter is correct and more then the execution time. Pay attention to options such as reset to factory, trigger test partition and encryption on boot - these options can increase the execution time. Note: RTC_WDT will reset while encryption operations will be performed.

**Range:**
- from 0 to 120000

**Default value:**
- 9000

**CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE**
Enable app rollback support

*Found in: Bootloader config*

After updating the app, the bootloader runs a new app with the “ESP_OTA_IMG_PENDING_VERIFY” state set. This state prevents the re-run of this app. After the first boot of the new app in the user code, the function should be called to confirm the operability of the app or vice versa about its non-operability. If the app is working, then it is marked as valid. Otherwise, it is marked as not valid and rolls back to the previous working app. A reboot is performed, and the app is booted before the software update. Note: If during the first boot a new app the power goes out or the WDT works, then roll back will happen. Rollback is possible only between the apps with the same security versions.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK**
Enable app anti-rollback support

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE*

This option prevents rollback to previous firmware/application image with lower security version.

**Default value:**
- No (disabled) if **CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE**

**CONFIG_BOOTLOADER_APP_SECURE_VERSION**
eFuse secure version of app

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

The secure version is the sequence number stored in the header of each firmware. The security version is set in the bootloader, version is recorded in the eFuse field as the number of set ones. The allocated number of bits in the efuse field for storing the security version is limited (see **BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD** option).

Bootloader: When bootloader selects an app to boot, an app is selected that has a security version greater or equal that recorded in eFuse field. The app is booted with a higher (or equal) secure version.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.

Your partition table should has a scheme with ota_0 + ota_1 (without factory).

**Default value:**
- 0 if **CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK**
CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD

Size of the efuse secure version field

*Found in:* Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

The size of the efuse secure version field. Its length is limited to 32 bits for ESP32 and 16 bits for ESP32-S2. This determines how many times the security version can be increased.

*Range:*
  - from 1 to 16 if CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

*Default value:*
  - 16 if CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

CONFIG_BOOTLOADER_EFUSE_SECURE_VERSION_EMULATE

Emulate operations with efuse secure version (only test)

*Found in:* Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

This option allows to emulate read/write operations with all eFuses and efuse secure version. It allows to test anti-rollback implementation without permanent write eFuse bits. There should be an entry in partition table with following details: `emul_efuse, data, efuse, , 0x2000`.

This option enables EFUSE_VIRTUAL and EFUSE_VIRTUAL_KEEP_IN_FLASH.

*Default value:*
  - No (disabled) if CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP

Skip image validation when exiting deep sleep

*Found in:* Bootloader config

This option disables the normal validation of an image coming out of deep sleep (checksums, SHA256, and signature). This is a trade-off between wakeup performance from deep sleep, and image integrity checks.

Only enable this if you know what you are doing. It should not be used in conjunction with using `deep_sleep()` entry and changing the active OTA partition as this would skip the validation upon first load of the new OTA partition.

It is possible to enable this option with Secure Boot if “allow insecure options” is enabled, however it’s strongly recommended to NOT enable it as it may allow a Secure Boot bypass.

*Default value:*
  - No (disabled) if (CONFIG_SECURE_BOOT & & CONFIG_SECURE_BOOT_INSECURE) || CONFIG_SECURE_BOOT

CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON

Skip image validation from power on reset (READ HELP FIRST)

*Found in:* Bootloader config

Some applications need to boot very quickly from power on. By default, the entire app binary is read from flash and verified which takes up a significant portion of the boot time.

Enabling this option will skip validation of the app when the SoC boots from power on. Note that in this case it’s not possible for the bootloader to detect if an app image is corrupted in the flash, therefore it’s not possible to safely fall back to a different app partition. Flash corruption of this kind is unlikely but can happen if there is a serious firmware bug or physical damage.
Following other reset types, the bootloader will still validate the app image. This increases the chances that flash corruption resulting in a crash can be detected following soft reset, and the bootloader will fall back to a valid app image. To increase the chances of successfully recovering from a flash corruption event, keep the option BOOTLOADER_WDT_ENABLE enabled and consider also enabling BOOTLOADER_WDT_DISABLE_IN_USER_CODE - then manually disable the RTC Watchdog once the app is running. In addition, enable both the Task and Interrupt watchdog timers with reset options set.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS**

Skip image validation always (READ HELP FIRST)

*Found in: Bootloader config*

Selecting this option prevents the bootloader from ever validating the app image before booting it. Any flash corruption of the selected app partition will make the entire SoC unbootable.

Although flash corruption is a very rare case, it is not recommended to select this option. Consider selecting “Skip image validation from power on reset” instead. However, if boot time is the only important factor then it can be enabled.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC**

Reserve RTC FAST memory for custom purposes

*Found in: Bootloader config*

This option allows the customer to place data in the RTC FAST memory, this area remains valid when rebooted, except for power loss. This memory is located at a fixed address and is available for both the bootloader and the application. (The application and bootloader must be compiled with the same option). The RTC FAST memory has access only through PRO_CPU.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC_SIZE**

Size in bytes for custom purposes

*Found in: Bootloader config > CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC*

This option reserves in RTC FAST memory the area for custom purposes. If you want to create your own bootloader and save more information in this area of memory, you can increase it. It must be a multiple of 4 bytes. This area (rtc_retain_mem_t) is reserved and has access from the bootloader and an application.

**Range:**
- from 0 to 0x10 if CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC

**Default value:**
- 0 if CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC

**CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT**

Enable the support for flash chips of XMC (READ HELP FIRST)

*Found in: Bootloader config*

Perform the startup flow recommended by XMC. Please consult XMC for the details of this flow. XMC chips will be forbidden to be used, when this option is disabled.
DON’T DISABLE THIS UNLESS YOU KNOW WHAT YOU ARE DOING.

Default value:
- Yes (enabled)

Security features

Contains:
- CONFIG_SECURE_BOOT_INSECURE
- CONFIG_SECURE_SIGNED_APPS_SCHEME
- CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP
- CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE
- CONFIG_SECURE_FLASH_ENC_ENABLED
- CONFIG_SECURE_BOOT
- Potentially insecure options
  - CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT
  - CONFIG_SECURE_BOOT_VERIFICATION_KEY
  - CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES
  - CONFIG_SECURE_UART_ROM_DL_MODE
  - CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT

CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT

Require signed app images

Found in: Security features

Require apps to be signed to verify their integrity.

This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement.

CONFIG_SECURE_SIGNED_APPS_SCHEME

App Signing Scheme

Found in: Security features

Available options:
- ECDSA (SECURE_SIGNED_APPS_ECDSA_SCHEME)
  Embeds the ECDSA public key in the bootloader and signs the application with an ECDSA key.
  Refer to the documentation before enabling.
- RSA (SECURE_SIGNED_APPS_RSA_SCHEME)
  Appends the RSA-3072 based Signature block to the application. Refer to <Secure Boot Version 2 documentation link> before enabling.

CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT

Verify app signature on update

Found in: Security features

If this option is set, any OTA updated apps will have the signature verified before being considered valid.
When enabled, the signature is automatically checked whenever the esp_ota_ops.h APIs are used for OTA updates, or esp_image_format.h APIs are used to verify apps.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.

Default value:
- Yes (enabled) if CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT

**CONFIG_SECURE_BOOT**

Enable hardware Secure Boot in bootloader (READ DOCS FIRST)

*Found in: Security features*

Build a bootloader which enables Secure Boot on first boot.

Once enabled, Secure Boot will not boot a modified bootloader. The bootloader will only load a partition table or boot an app if the data has a verified digital signature. There are implications for reflashing updated apps once secure boot is enabled.

When enabling secure boot, JTAG and ROM BASIC Interpreter are permanently disabled by default.

Default value:
- No (disabled)

**CONFIG_SECURE_BOOT_VERSION**

Select secure boot version

*Found in: Security features > CONFIG_SECURE_BOOT*

Available options:
- Enable Secure Boot version 1 (SECURE_BOOT_V1_ENABLED)
  Build a bootloader which enables secure boot version 1 on first boot. Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.
- Enable Secure Boot version 2 (SECURE_BOOT_V2_ENABLED)
  Build a bootloader which enables Secure Boot version 2 on first boot. Refer to Secure Boot V2 section of the ESP-IDF Programmer’s Guide for this version before enabling.

**CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES**

Sign binaries during build

*Found in: Security features*

Once secure boot or signed app requirement is enabled, app images are required to be signed.

If enabled (default), these binary files are signed as part of the build process. The file named in “Secure boot private signing key” will be used to sign the image.

If disabled, unsigned app/partition data will be built. They must be signed manually using espsecure.py. Version 1 to enable ECDSA Based Secure Boot and Version 2 to enable RSA based Secure Boot. (for example, on a remote signing server.)
**CONFIG_SECURE_BOOT_SIGNING_KEY**

Secure boot private signing key

*Found in: Security features ➔ CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES*

Path to the key file used to sign app images.

Key file is an ECDSA private key (NIST256p curve) in PEM format for Secure Boot V1. Key file is an RSA private key in PEM format for Secure Boot V2.

Path is evaluated relative to the project directory.

You can generate a new signing key by running the following command: `espsecure.py generate_signing_key secure_boot_signing_key.pem`

See the Secure Boot section of the ESP-IDF Programmer’s Guide for this version for details.

**Default value:**

- “secure_boot_signing_key.pem” if `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`

**CONFIG_SECURE_BOOT_VERIFICATION_KEY**

Secure boot public signature verification key

*Found in: Security features*

Path to a public key file used to verify signed images. Secure Boot V1: This ECDSA public key is compiled into the bootloader and/or app, to verify app images. Secure Boot V2: This RSA public key is compiled into the signature block at the end of the bootloader/app.

Key file is in raw binary format, and can be extracted from a PEM formatted private key using the `espsecure.py extract_public_key` command.

Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.

**CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE**

Enable Aggressive key revoke strategy

*Found in: Security features*

If this option is set, ROM bootloader will revoke the public key digest burned in efuse block if it fails to verify the signature of software bootloader with it. Revocation of keys does not happen when enabling secure boot. Once secure boot is enabled, key revocation checks will be done on subsequent boot-up, while verifying the software bootloader.

This feature provides a strong resistance against physical attacks on the device.

**NOTE:** Once a digest slot is revoked, it can never be used again to verify an image. This can lead to permanent bricking of the device, in case all keys are revoked because of signature verification failure.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT`

**CONFIG_SECURE_BOOT_INSECURE**

Allow potentially insecure options

*Found in: Security features*

You can disable some of the default protections offered by secure boot, in order to enable testing or a custom combination of security features.

Only enable these options if you are very sure.

Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.
**Default value:**
- No (disabled) if `CONFIG_SECURE_BOOT`

**CONFIG_SECURE_FLASH_ENC_ENABLED**

Enable flash encryption on boot (READ DOCS FIRST)

*Found in:* Security features

If this option is set, flash contents will be encrypted by the bootloader on first boot.

Note: After first boot, the system will be permanently encrypted. Re-flashing an encrypted system is complicated and not always possible.

Read *Flash Encryption* before enabling.

**Default value:**
- No (disabled)

**CONFIG_SECURE_FLASH_ENCRYPTION_MODE**

Enable usage mode

*Found in:* Security features > `CONFIG_SECURE_FLASH_ENC_ENABLED`

By default Development mode is enabled which allows ROM download mode to perform flash encryption operations (plaintext is sent to the device, and it encrypts it internally and writes ciphertext to flash.) This mode is not secure, it’s possible for an attacker to write their own chosen plaintext to flash.

Release mode should always be selected for production or manufacturing. Once enabled it’s no longer possible for the device in ROM Download Mode to use the flash encryption hardware.

Refer to the Flash Encryption section of the ESP-IDF Programmer’s Guide for details.

**Available options:**
- Development (NOT SECURE) (`SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`)
- Release (`SECURE_FLASH_ENCRYPTION_MODE_RELEASE`)

**Potentially insecure options**

Contains:
- `CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS`
- `CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION`
- `CONFIG_SECURE_BOOT_ALLOW_JTAG`
- `CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC`
- `CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE`
- `CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS`
- `CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED`

**CONFIG_SECURE_BOOT_ALLOW_JTAG**

Allow JTAG Debugging

*Found in:* Security features > Potentially insecure options

If not set (default), the bootloader will permanently disable JTAG (across entire chip) on first boot when either secure boot or flash encryption is enabled.

Setting this option leaves JTAG on for debugging, which negates all protections of flash encryption and some of the protections of secure boot.

Only set this option in testing environments.

**Default value:**
- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE` || `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`
**CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION**

Allow app partition length not 64KB aligned

*Found in: Security features > Potentially insecure options*

If not set (default), app partition size must be a multiple of 64KB. App images are padded to 64KB length, and the bootloader checks any trailing bytes after the signature (before the next 64KB boundary) have not been written. This is because flash cache maps entire 64KB pages into the address space. This prevents an attacker from appending unverified data after the app image in the flash, causing it to be mapped into the address space.

Setting this option allows the app partition length to be unaligned, and disables padding of the app image to this length. It is generally not recommended to set this option, unless you have a legacy partitioning scheme which doesn’t support 64KB aligned partition lengths.

**CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS**

Allow additional read protecting of efuses

*Found in: Security features > Potentially insecure options*

If not set (default, recommended), on first boot the bootloader will burn the WR_DIS_RD_DIS efuse when Secure Boot is enabled. This prevents any more efuses from being read protected.

If this option is set, it will remain possible to write the EFUSE_RD_DIS efuse field after Secure Boot is enabled. This may allow an attacker to read-protect the BLK2 efuse (for ESP32) and BLOCK4-BLOCK10 (i.e., BLOCK_KEY0-BLOCK_KEY5) (for other chips) holding the public key digest, causing an immediate denial of service and possibly allowing an additional fault injection attack to bypass the signature protection.

**NOTE:** Once a BLOCK is read-protected, the application will read all zeros from that block

**NOTE:** If “UART ROM download mode (Permanently disabled (recommended))” or “UART ROM download mode (Permanently switch to Secure mode (recommended))” is set, then it is __NOT__ possible to read/write efuses using espfuse.py utility. However, efuse can be read/written from the application

**CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS**

Leave unused digest slots available (not revoke)

*Found in: Security features > Potentially insecure options*

If not set (default), during startup in the app all unused digest slots will be revoked. To revoke unused slot will be called esp_efuse_set_digest_revoke(num_digest) for each digest. Revoking unused digest slots makes ensures that no trusted keys can be added later by an attacker. If set, it means that you have a plan to use unused digests slots later.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE`

**CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC**

Leave UART bootloader encryption enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader encryption access on first boot. If set, the UART bootloader will still be able to access hardware encryption.

It is recommended to only set this option in testing environments.

**Default value:**

- No (disabled) if `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`
CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE

Leave UART bootloader flash cache enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader flash cache access on first boot. If set, the UART bootloader will still be able to access the flash cache.

Only set this option in testing environments.

**Default value:**
- No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED

Require flash encryption to be already enabled

*Found in: Security features > Potentially insecure options*

If not set (default), and flash encryption is not yet enabled in eFuses, the 2nd stage bootloader will enable flash encryption: generate the flash encryption key and program eFuses. If this option is set, and flash encryption is not yet enabled, the bootloader will error out and reboot. If flash encryption is enabled in eFuses, this option does not change the bootloader behavior.

Only use this option in testing environments, to avoid accidentally enabling flash encryption on the wrong device. The device needs to have flash encryption already enabled using espefuse.py.

**Default value:**
- No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP

Check Flash Encryption enabled on app startup

*Found in: Security features*

If set (default), in an app during startup code, there is a check of the flash encryption eFuse bit is on (as the bootloader should already have set it). The app requires this bit is on to continue work otherwise abort.

If not set, the app does not care if the flash encryption eFuse bit is set or not.

**Default value:**
- Yes (enabled) if CONFIG_SECURE_FLASH_ENC_ENABLED

CONFIG_SECURE_UART_ROM_DL_MODE

UART ROM download mode

*Found in: Security features*

**Available options:**
- UART ROM download mode (Permanently disabled (recommended)) (SECURE_DISABLE_ROM_DL_MODE)
  
  If set, during startup the app will burn an eFuse bit to permanently disable the UART ROM Download Mode. This prevents any future use of esptool.py, espfuse.py and similar tools. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.

  It is recommended to enable this option in any production application where Flash Encryption and/or Secure Boot is enabled and access to Download Mode is not required.

  It is also possible to permanently disable Download Mode by calling esp_efuse_disable_rom_download_mode() at runtime.
• UART ROM download mode (Permanently switch to Secure mode (recommended)) (SECURE_ENABLE_SECURE_ROM_DL_MODE)
  If set, during startup the app will burn an eFuse bit to permanently switch the UART ROM Download Mode into a separate Secure Download mode. This option can only work if Download Mode is not already disabled by eFuse.
  Secure Download mode limits the use of Download Mode functions to simple flash read, write and erase operations, plus a command to return a summary of currently enabled security features.
  Secure Download mode is not compatible with the esptool.py flasher stub feature, espfuse.py, read/writing memory or registers, encrypted download, or any other features that interact with unsupported Download Mode commands.
  Secure Download mode should be enabled in any application where Flash Encryption and/or Secure Boot is enabled. Disabling this option does not immediately cancel the benefits of the security features, but it increases the potential “attack surface” for an attacker to try and bypass them with a successful physical attack.
  It is also possible to enable secure download mode at runtime by calling esp_efuse_enable_rom_secure_download_mode().
  Note: Secure Download mode is not available for ESP32 (includes revisions till ECO3).

• UART ROM download mode (Enabled (not recommended)) (SECURE_INSECURE_ALLOW_DL_MODE)
  This is a potentially insecure option. Enabling this option will allow the full UART download mode to stay enabled. This option SHOULD NOT BE ENABLED for production use cases.

Boot ROM Behavior

Contains:

  * CONFIG_BOOT_ROM_LOG_SCHEME

CONFIG_BOOT_ROM_LOG_SCHEME

Permanently change Boot ROM output

*Found in: Boot ROM Behavior*

Controls the Boot ROM log behavior. The rom log behavior can only be changed for once, specific eFuse bit(s) will be burned at app boot stage.

*Available options:*

  * Always Log (BOOT_ROM_LOG_ALWAYS_ON)  
    Always print ROM logs, this is the default behavior.
  * Permanently disable logging (BOOT_ROM_LOG_ALWAYS_OFF)  
    Don’t print ROM logs.
  * Log on GPIO High (BOOT_ROM_LOG_ON_GPIO_HIGH)  
    Print ROM logs when GPIO level is high during start up. The GPIO number is chip dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.
  * Log on GPIO Low (BOOT_ROM_LOG_ON_GPIO_LOW)  
    Print ROM logs when GPIO level is low during start up. The GPIO number is chip dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.

Serial flasher config

Contains:

  * CONFIG_ESPTOOLPY_AFTER
  * CONFIG_ESPTOOLPY_BEFORE
  * CONFIG_ESPTOOLPY_FLASHSIZE_DETECT
  * CONFIG_ESPTOOLPY_NO_STUB
  * CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE
Chapter 2. API Reference

- **CONFIG_ESPTOOLPY_FLASHSIZE**
- **CONFIG_ESPTOOLPY_FLASHMODE**
- **CONFIG_ESPTOOLPY_FLASHFREQ**

**CONFIG_ESPTOOLPY_NO_STUB**
Disable download stub

*Found in: Serial flasher config*

The flasher tool sends a precompiled download stub first by default. That stub allows things like compressed downloads and more. Usually you should not need to disable that feature

*Default value:*
- No (disabled)

**CONFIG_ESPTOOLPY_FLASHMODE**
Flash SPI mode

*Found in: Serial flasher config*

Mode the flash chip is flashed in, as well as the default mode for the binary to run in.

*Available options:*
- QIO (ESPTOOLPY_FLASHMODE_QIO)
- QOUT (ESPTOOLPY_FLASHMODE_QOUT)
- DIO (ESPTOOLPY_FLASHMODE_DIO)
- DOUT (ESPTOOLPY_FLASHMODE_DOUT)
- OPI (ESPTOOLPY_FLASHMODE_OPI)

**CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE**
Flash Sampling Mode

*Found in: Serial flasher config*

*Available options:*
- STR Mode (ESPTOOLPY_FLASH_SAMPLE_MODE_STR)
- DTR Mode (ESPTOOLPY_FLASH_SAMPLE_MODE_DTR)

**CONFIG_ESPTOOLPY_FLASHFREQ**
Flash SPI speed

*Found in: Serial flasher config*

The SPI flash frequency to be used.

*Available options:*
- 120 MHz (ESPTOOLPY_FLASHFREQ_120M)
- 80 MHz (ESPTOOLPY_FLASHFREQ_80M)
- 40 MHz (ESPTOOLPY_FLASHFREQ_40M)
- 26 MHz (ESPTOOLPY_FLASHFREQ_26M)
- 20 MHz (ESPTOOLPY_FLASHFREQ_20M)

**CONFIG_ESPTOOLPY_FLASHSIZE**
Flash size

*Found in: Serial flasher config*

SPI flash size, in megabytes
Available options:

- 1 MB (ESPTOOLPY_FLASHSIZE_1MB)
- 2 MB (ESPTOOLPY_FLASHSIZE_2MB)
- 4 MB (ESPTOOLPY_FLASHSIZE_4MB)
- 8 MB (ESPTOOLPY_FLASHSIZE_8MB)
- 16 MB (ESPTOOLPY_FLASHSIZE_16MB)
- 32 MB (ESPTOOLPY_FLASHSIZE_32MB)
- 64 MB (ESPTOOLPY_FLASHSIZE_64MB)
- 128 MB (ESPTOOLPY_FLASHSIZE_128MB)

CONFIG_ESPTOOLPY_FLASHSIZE_DETECT

Detect flash size when flashing bootloader

*Found in: Serial flasher config*

If this option is set, flashing the project will automatically detect the flash size of the target chip and update the bootloader image before it is flashed.

*Default value:*

- Yes (enabled)

CONFIG_ESPTOOLPY_BEFORE

Before flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 before flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

*Available options:*

- Reset to bootloader (ESPTOOLPY_BEFORE_RESET)
- No reset (ESPTOOLPY_BEFORE_NORESET)

CONFIG_ESPTOOLPY_AFTER

After flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 after flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

*Available options:*

- Reset after flashing (ESPTOOLPY_AFTER_RESET)
- Stay in bootloader (ESPTOOLPY_AFTER_NORESET)

Partition Table

Contains:

- CONFIG_PARTITION_TABLE_CUSTOM_FILENAME
- CONFIG_PARTITION_TABLE_MD5
- CONFIG_PARTITION_TABLE_OFFSET
- CONFIG_PARTITION_TABLE_TYPE
CONFIG_PARTITION_TABLE_TYPE

Partition Table

*Found in: Partition Table*

The partition table to flash to the ESP32. The partition table determines where apps, data and other resources are expected to be found.

The predefined partition table CSV descriptions can be found in the components/partition_table directory. These are mostly intended for example and development use, it’s expect that for production use you will copy one of these CSV files and create a custom partition CSV for your application.

**Available options:**

- Single factory app, no OTA (PARTITION_TABLE_SINGLE_APP)
  This is the default partition table, designed to fit into a 2MB or larger flash with a single 1MB app partition.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp.csv
  This partition table is not suitable for an app that needs OTA (over the air update) capability.

- Single factory app (large), no OTA (PARTITION_TABLE_SINGLE_APP_LARGE)
  This is a variation of the default partition table, that expands the 1MB app partition size to 1.5MB to fit more code.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_large.csv
  This partition table is not suitable for an app that needs OTA (over the air update) capability.

- Factory app, two OTA definitions (PARTITION_TABLE_TWO_OTA)
  This is a basic OTA-enabled partition table with a factory app partition plus two OTA app partitions. All are 1MB, so this partition table requires 4MB or larger flash size.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_two_ota.csv

- Custom partition table CSV (PARTITION_TABLE_CUSTOM)
  Specify the path to the partition table CSV to use for your project.
  Consult the Partition Table section in the ESP-IDF Programmers Guide for more information.

- Single factory app, no OTA, encrypted NVS (PARTITION_TABLE_SINGLE_APP_ENCRYPTED_NVS)
  This is a variation of the default “Single factory app, no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_encr_nvs.csv

- Single factory app (large), no OTA, encrypted NVS (PARTITION_TABLE_SINGLE_APP_LARGE_ENC_NVS)
  This is a variation of the “Single factory app (large), no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_large_encr_nvs.csv

- Factory app, two OTA definitions, encrypted NVS (PARTITION_TABLE_TWO_OTA_ENCRYPTED_NVS)
  This is a variation of the “Factory app, two OTA definitions” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_two_ota_encr_nvs.csv

CONFIG_PARTITION_TABLE_CUSTOM_FILENAME

Custom partition CSV file

*Found in: Partition Table*
Name of the custom partition CSV filename. This path is evaluated relative to the project root directory.

**Default value:**
- “partitions.csv”

**CONFIG_PARTITION_TABLE_OFFSET**

Offset of partition table

*Found in: Partition Table*

The address of partition table (by default 0x8000). Allows you to move the partition table, it gives more space for the bootloader. Note that the bootloader and app will both need to be compiled with the same PARTITION_TABLE_OFFSET value.

This number should be a multiple of 0x1000.

Note that partition offsets in the partition table CSV file may need to be changed if this value is set to a higher value. To have each partition offset adapt to the configured partition table offset, leave all partition offsets blank in the CSV file.

**Default value:**
- “0x8000”

**CONFIG_PARTITION_TABLE_MD5**

Generate an MD5 checksum for the partition table

*Found in: Partition Table*

Generate an MD5 checksum for the partition table for protecting the integrity of the table. The generation should be turned off for legacy bootloaders which cannot recognize the MD5 checksum in the partition table.

**Default value:**
- Yes (enabled) if ESP32_COMPATIBLE_PRE_V3_1_BOOTLOADERS

**Compiler options**

Contains:

- `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`
- `CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT`
- `CONFIG_COMPILER_DISABLE_GCC8_WARNINGS`
- `CONFIG_COMPILER_DUMPRTL_FILES`
- `CONFIG_COMPILER_SAVESTORE_LIBCALLS`
- `CONFIG_COMPILER_WARN_WRITE_STRINGS`
- `CONFIG_COMPILER_CXX_EXCEPTIONS`
- `CONFIG_COMPILER_CXX_RTTI`
- `CONFIG_COMPILER_OPTIMIZATION`
- `CONFIG_COMPILER_HIDE_PATHS_MACROS`
- `CONFIG_COMPILER_STACK_CHECK_MODE`

**CONFIG_COMPILER_OPTIMIZATION**

Optimization Level

*Found in: Compiler options*

This option sets compiler optimization level (gcc -O argument) for the app.

- The “Default” setting will add the -Og flag to CFLAGS.
- The “Size” setting will add the -Os flag to CFLAGS.
• The “Performance” setting will add the -O2 flag to CFLAGS.
• The “None” setting will add the -O0 flag to CFLAGS.

The “Size” setting cause the compiled code to be smaller and faster, but may lead to difficulties of correlating code addresses to source file lines when debugging.

The “Performance” setting causes the compiled code to be larger and faster, but will be easier to correlated code addresses to source file lines.

“None” with -O0 produces compiled code without optimization.

Note that custom optimization levels may be unsupported.

Compiler optimization for the IDF bootloader is set separately, see the BOOTLOADER_COMPILER_OPTIMIZATION setting.

Available options:
• Debug (-Og) (COMPILER_OPTIMIZATION_DEFAULT)
• Optimize for size (-Os) (COMPILER_OPTIMIZATION_SIZE)
• Optimize for performance (-O2) (COMPILER_OPTIMIZATION_PERF)
• Debug without optimization (-O0) (COMPILER_OPTIMIZATION_NONE)

CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL

Assertion level

Found in: Compiler options

Assertions can be:
• Enabled. Failure will print verbose assertion details. This is the default.
• Set to “silent” to save code size (failed assertions will abort() but user needs to use the aborting address to find the line number with the failed assertion.)
• Disabled entirely (not recommended for most configurations.) -DNDEBUG is added to CPPFLAGS in this case.

Available options:
• Enabled (COMPILER_OPTIMIZATION_ASSERTIONS_ENABLE)
  Enable assertions. Assertion content and line number will be printed on failure.
• Silent (saves code size) (COMPILER_OPTIMIZATION_ASSERTIONS_SILENT)
  Enable silent assertions. Failed assertions will abort(), user needs to use the aborting address to find the line number with the failed assertion.
• Disabled (sets -DNDEBUG) (COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE)
  If assertions are disabled, -DNDEBUG is added to CPPFLAGS.

CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT

Disable messages in ESP_RETURN_ON_* and ESP_EXIT_ON_* macros

Found in: Compiler options

If enabled, the error messages will be discarded in following check macros: -ESP_RETURN_ON_ERROR -ESP_EXIT_ON_ERROR -ESP_RETURN_ON_FALSE -ESP_EXIT_ON_FALSE

Default value:
• No (disabled)

CONFIG_COMPILER_HIDE_PATHS_MACROS

Replace ESP-IDF and project paths in binaries

Found in: Compiler options
When expanding the `__FILE__` and `__BASE_FILE__` macros, replace paths inside ESP-IDF with paths relative to the placeholder string “IDF”, and convert paths inside the project directory to relative paths. This allows building the project with assertions or other code that embeds file paths, without the binary containing the exact path to the IDF or project directories.

This option passes `-fmacro-prefix-map` options to the GCC command line. To replace additional paths in your binaries, modify the project `CMakeLists.txt` file to pass custom `-fmacro-prefix-map` or `-ffile-prefix-map` arguments.

**Default value:**
- Yes (enabled)

### CONFIG_COMPILER_CXX_EXCEPTIONS

Enable C++ exceptions

*Found in: Compiler options*

Enabling this option compiles all IDF C++ files with exception support enabled.

Disabling this option disables C++ exception support in all compiled files, and any libstdc++ code which throws an exception will abort instead.

Enabling this option currently adds an additional ~500 bytes of heap overhead when an exception is thrown in user code for the first time.

**Default value:**
- No (disabled)

**Contains:**
- `CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE`

### CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE

Emergency Pool Size

*Found in: Compiler options > CONFIG_COMPILER_CXX_EXCEPTIONS*

Size (in bytes) of the emergency memory pool for C++ exceptions. This pool will be used to allocate memory for thrown exceptions when there is not enough memory on the heap.

**Default value:**
- 0 if `CONFIG_COMPILER_CXX_EXCEPTIONS`

### CONFIG_COMPILER_CXX RTTI

Enable C++ run-time type info (RTTI)

*Found in: Compiler options*

Enabling this option compiles all C++ files with RTTI support enabled. This increases binary size (typically by tens of kB) but allows using `dynamic_cast` conversion and `typeid` operator.

**Default value:**
- No (disabled)

### CONFIG_COMPILER_STACK_CHECK_MODE

Stack smashing protection mode

*Found in: Compiler options*

Stack smashing protection mode. Emit extra code to check for buffer overflows, such as stack smashing attacks. This is done by adding a guard variable to functions with vulnerable objects. The guards are
initialized when a function is entered and then checked when the function exits. If a guard check fails, program is halted. Protection has the following modes:

- In NORMAL mode (GCC flag: -fstack-protector) only functions that call alloca, and functions with buffers larger than 8 bytes are protected.
- STRONG mode (GCC flag: -fstack-protector-strong) is like NORMAL, but includes additional functions to be protected – those that have local array definitions, or have references to local frame addresses.
- In OVERALL mode (GCC flag: -fstack-protector-all) all functions are protected.

Modes have the following impact on code performance and coverage:

- performance: NORMAL > STRONG > OVERALL
- coverage: NORMAL < STRONG < OVERALL

The performance impact includes increasing the amount of stack memory required for each task.

### Available options:

- None (COMPILER_STACK_CHECK_MODE_NONE)
- Normal (COMPILER_STACK_CHECK_MODE_NORM)
- Strong (COMPILER_STACK_CHECK_MODE_STRONG)
- Overall (COMPILER_STACK_CHECK_MODE_ALL)

### CONFIG_COMPILER_WARN_WRITE_STRINGS

Enable -Wwrite-strings warning flag

*Found in: Compiler options*

Adds -Wwrite-strings flag for the C/C++ compilers.

For C, this gives string constants the type const char[] so that copying the address of one into a non-const char * pointer produces a warning. This warning helps to find at compile time code that tries to write into a string constant.

For C++, this warns about the deprecated conversion from string literals to char *.

*Default value:*

- No (disabled)

### CONFIG_COMPILER_SAVE_RESTORE_LIBCALLS

Enable -msave-restore flag to reduce code size

*Found in: Compiler options*

Adds -msave-restore to C/C++ compilation flags.

When this flag is enabled, compiler will call library functions to save/restore registers in function prologues/epilogues. This results in lower overall code size, at the expense of slightly reduced performance.

This option can be enabled for RISC-V targets only.

### CONFIG_COMPILER_DISABLE_GCC8_WARNINGS

Disable new warnings introduced in GCC 6 - 8

*Found in: Compiler options*

Enable this option if using GCC 6 or newer, and wanting to disable warnings which don’t appear with GCC 5.

*Default value:*

- No (disabled)
CONFIG_COMPILER_DUMP_RTL_FILES

Dump RTL files during compilation

Found in: Compiler options

If enabled, RTL files will be produced during compilation. These files can be used by other tools, for example to calculate call graphs.

Component config

Contains:

- ADC-Calibration
- Application Level Tracing

**Application Level Tracing**

Contains:

- `CONFIG_APPTRACE_DESTINATION`
- FreeRTOS SystemView Tracing
- `CONFIG_APPTRACE_GCOV_ENABLE`
- `CONFIG_APPTRACE_BUF_SIZE`
- `CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX`
- `CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH`
- `CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO`

**CONFIG_APPTRACE_DESTINATION**

Data Destination

*Found in: Component config > Application Level Tracing*

Select destination for application trace: JTAG or none (to disable).

*Available options:*

- JTAG (`APPRACE_DEST_JTAG`)
- None (`APPRACE_DEST_NONE`)

**CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO**

Timeout for flushing last trace data to host on panic

*Found in: Component config > Application Level Tracing*

Timeout for flushing last trace data to host in case of panic. In ms. Use -1 to disable timeout and wait forever.

**CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH**

Threshold for flushing last trace data to host on panic

*Found in: Component config > Application Level Tracing*

Threshold for flushing last trace data to host on panic in post-mortem mode. This is minimal amount of data needed to perform flush. In bytes.

**CONFIG_APPTRACE_BUF_SIZE**

Size of the apptrace buffer

*Found in: Component config > Application Level Tracing*

Size of the memory buffer for trace data in bytes.

**CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX**

Size of the pending data buffer

*Found in: Component config > Application Level Tracing*

Size of the buffer for events in bytes. It is useful for buffering events from the time critical code (scheduler, ISRs etc). If this parameter is 0 then events will be discarded when main HW buffer is full.
FreeRTOS SystemView Tracing  Contains:

- CONFIG_APPTRACE_SV_ENABLE

CONFIG_APPTRACE_SV_ENABLE
SystemView Tracing Enable

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables support for SEGGER SystemView tracing functionality.

CONFIG_APPTRACE_SV_TS_SOURCE
Timer to use as timestamp source

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

SystemView needs to use a hardware timer as the source of timestamps when tracing. This option selects the timer for it.

Available options:
- CPU cycle counter (CCOUNT) (APPTTRACE_SV_TS_SOURCE_CCOUNT)
- General Purpose Timer (Timer Group) (APPTTRACE_SV_TS_SOURCE_GPTIMER)
- esp_timer high resolution timer (APPTTRACE_SV_TS_SOURCE_ESP_TIMER)

CONFIG_APPTRACE_SV_MAX_TASKS
Maximum supported tasks

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

Configures maximum supported tasks in/sysview debug

CONFIG_APPTRACE_SV_BUF_WAIT_TMO
Trace buffer wait timeout

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

Configures timeout (in us) to wait for free space in trace buffer. Set to -1 to wait forever and avoid lost events.

CONFIG_APPTRACE_SV_EVT_OVERFLOW_ENABLE
Trace Buffer Overflow Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

Enables “Trace Buffer Overflow” event.

CONFIG_APPTRACE_SV_EVT_ISR_ENTER_ENABLE
ISR Enter Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

Enables “ISR Enter” event.
CONFIG_APPTRACE_SV_EVT_ISR_EXIT_ENABLE
ISR Exit Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

Enables “ISR Exit” event.

CONFIG_APPTRACE_SV_EVT_ISR_TO_SCHED_ENABLE
ISR Exit to Scheduler Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

Enables “ISR to Scheduler” event.

CONFIG_APPTRACE_SV_EVT_TASK_START_EXEC_ENABLE
Task Start Execution Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

Enables “Task Start Execution” event.

CONFIG_APPTRACE_SV_EVT_TASK_STOP_EXEC_ENABLE
Task Stop Execution Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

Enables “Task Stop Execution” event.

CONFIG_APPTRACE_SV_EVT_TASK_START_READY_ENABLE
Task Start Ready State Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

Enables “Task Start Ready State” event.

CONFIG_APPTRACE_SV_EVT_TASK_STOP_READY_ENABLE
Task Stop Ready State Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

Enables “Task Stop Ready State” event.

CONFIG_APPTRACE_SV_EVT_TASK_CREATE_ENABLE
Task Create Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

Enables “Task Create” event.
CONFIG_APPTRACE_SV_EVT_TASK_TERMINATE_ENABLE

Task Terminate Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

Enables “Task Terminate” event.

CONFIG_APPTRACE_SV_EVT_IDLE_ENABLE

System Idle Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

Enables “System Idle” event.

CONFIG_APPTRACE_SV_EVT_TIMER_ENTER_ENABLE

Timer Enter Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

Enables “Timer Enter” event.

CONFIG_APPTRACE_SV_EVT_TIMER_EXIT_ENABLE

Timer Exit Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

Enables “Timer Exit” event.

CONFIG_APPTRACE_GCOV_ENABLE

GCOV to Host Enable

*Found in: Component config > Application Level Tracing*

Enables support for GCOV data transfer to host.

ESP-ASIO Contains:

- CONFIG_ASIO_SSL_SUPPORT

CONFIG_ASIO_SSL_SUPPORT

Enable SSL/TLS support of ASIO

*Found in: Component config > ESP-ASIO*

Enable support for basic SSL/TLS features, available for mbedTLS/OpenSSL as well as wolfSSL TLS library.

**Default value:**

- No (disabled)
CONFIG_ASIO_SSL_LIBRARY_CHOICE

Choose SSL/TLS library for ESP-TLS (See help for more Info)

*Found in: Component config > ESP-ASIO > CONFIG_ASIO_SSL_SUPPORT*

The ASIO support multiple backend TLS libraries. Currently the mbedtlsTLS with a thin ESP-OpenSSL port layer (default choice) and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

**Available options:**
- esp-openssl (ASIO_USE_ESP_OPENSSSL)
- wolfSSL (License info in wolfSSL directory README) (ASIO_USE_ESP_WOLFSSL)

CONFIG_ASIO_SSL_BIO_SIZE

Size of BIO object

*Found in: Component config > ESP-ASIO > CONFIG_ASIO_SSL_SUPPORT*

Size in bytes of SSL-BIO implementation. Reducing the BIO size saves more RAM, but may slow down input output operations due to fragmentation.

**Default value:**
- 1024 if CONFIG_ASIO_SSL_SUPPORT

Bluetooth Contains:

- Bluedroid Options
- CONFIG_BT_ENABLED
- NimBLE Options

CONFIG_BT_ENABLED

Bluetooth

*Found in: Component config > Bluetooth*

Select this option to enable Bluetooth and show the submenu with Bluetooth configuration choices.

Bluetooth controller Contains:

- CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP
- CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL
- CONFIG_BT_CTRL_BLE_MAX_ACT
- CONFIG_BT_CTRL_BLE_SCAN_DUPL
- CONFIG_BT_CTRL_BLE_STATIC_ACL_TX_BUF_NB
- CONFIG_BT_CTRL_HW_CCA_VAL
- CONFIG_BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM
- CONFIG_BT_CTRL_CE_LENGTH_TYPE
- CONFIG_BT_CTRL_RX_ANTENNA_INDEX
- CONFIG_BT_CTRL_TX_ANTENNA_INDEX
- CONFIG_BT_CTRL_AGC_RECOVER_EN
- CONFIG_BT_CTRL_HCI_MODE_CHOICE
- CONFIG_BT_CTRL_HW_CCA
- MODEM SLEEP Options
- CONFIG_BT_CTRL_ADV_DUP_FILT_MAX
**CONFIG_BT_CTRL_BLE_MAX_ACT**

BLE Max Instances

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

BLE maximum activities of bluetooth controller, both of connections, scan, sync and adv (periodic adv, multi-adv).

**Range:**
- from 1 to 10 if `CONFIG_BT_ENABLED`

**Default value:**
- 10 if `CONFIG_BT_ENABLED`

**CONFIG_BT_CTRL_BLE_STATIC_ACL_TX_BUF_NB**

BLE static ACL TX buffer numbers

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

BLE ACL buffer have two methods to be allocated. One is persistent allocating (allocate when controller initialise, never free until controller de-initialise) another is dynamically allocating (allocate before TX and free after TX).

**Range:**
- from 0 to 12 if `CONFIG_BT_ENABLED`

**Default value:**
- 0 if `CONFIG_BT_ENABLED`

**CONFIG_BT_CTRL_HCI_MODE_CHOICE**

HCI mode

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

Specify HCI mode as VHCI or UART(H4)

**Available options:**
- VHCI (BT_CTRL_HCI_MODE_VHCI)
  - Normal option. Mostly, choose this VHCI when bluetooth host run on ESP32C3, too.
- UART(H4) (BT_CTRL_HCI_MODE_UART_H4)
  - If use external bluetooth host which run on other hardware and use UART as the HCI interface, choose this option.

**CONFIG_BT_CTRL_ADV_DUP_FILT_MAX**

The maximum number of 5.0 extend duplicate scan filter

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

The maximum number of suplicate scan filter

**Range:**
- from 1 to 500 if `CONFIG_BT_ENABLED`

**Default value:**
- 30 if `CONFIG_BT_ENABLED`

**CONFIG_BT_CTRL_HW_CCA**

HW CCA check enable

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

It enables HW CCA feature in controller
Default value:
  • No (disabled) if CONFIG_BT_ENABLED

CONFIG_BT_CTRL_HW_CCA_VAL

CCA threshold value

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

It is the threshold value of HW CCA, if the value is 30, it means CCA threshold is -30 dBm.

*Range:*
  • from 20 to 60 if CONFIG_BT_ENABLED

*Default value:*
  • 20 if CONFIG_BT_ENABLED

CONFIG_BT_CTRL_CE_LENGTH_TYPE

Connection event length determination method

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

Specify connection event length determination

*Available options:*
  • ORIGINAL (BT_CTRL_CE_LENGTH_TYPE_ORIG)
  • Use CE parameter for HCI command (BT_CTRL_CE_LENGTH_TYPE_CE)
  • Use Espressif self-defined method (BT_CTRL_CE_LENGTH_TYPE_SD)

CONFIG_BT_CTRL_TX_ANTENNA_INDEX

default Tx antenna used

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

Specify default Tx antenna used for bluetooth

*Available options:*
  • Antenna 0 (BT_CTRL_TX_ANTENNA_INDEX_0)
  • Antenna 1 (BT_CTRL_TX_ANTENNA_INDEX_1)

CONFIG_BT_CTRL_RX_ANTENNA_INDEX

default Rx antenna used

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

Specify default Rx antenna used for bluetooth

*Available options:*
  • Antenna 0 (BT_CTRL_RX_ANTENNA_INDEX_0)
  • Antenna 1 (BT_CTRL_RX_ANTENNA_INDEX_1)

CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL

BLE default Tx power level

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

Specify default Tx power level

*Available options:*
  • -27dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N27)
  • -24dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N24)
  • -21dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N21)
Chapter 2. API Reference

-18dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N18)
-15dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N15)
-12dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N12)
-9dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N9)
-6dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N6)
-3dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N3)
0dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N0)
+3dBm (BT_CTRL_DFT_TX_POWER_LEVEL_P3)
+6dBm (BT_CTRL_DFT_TX_POWER_LEVEL_P6)
+9dBm (BT_CTRL_DFT_TX_POWER_LEVEL_P9)
+12dBm (BT_CTRL_DFT_TX_POWER_LEVEL_P12)
+15dBm (BT_CTRL_DFT_TX_POWER_LEVEL_P15)
+18dBm (BT_CTRL_DFT_TX_POWER_LEVEL_P18)

**CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP**

BLE adv report flow control supported

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

The function is mainly used to enable flow control for advertising reports. When it is enabled, advertising reports will be discarded by the controller if the number of unprocessed advertising reports exceeds the size of BLE adv report flow control.

**Default value:**
- Yes (enabled) if `CONFIG_BT_ENABLED`

**CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM**

BLE adv report flow control number

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP*

The number of unprocessed advertising report that bluetooth host can save. If you set `BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM` to a small value, this may cause adv packets lost. If you set `BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM` to a large value, bluetooth host may cache a lot of adv packets and this may cause system memory run out. For example, if you set it to 50, the maximum memory consumed by host is 35 * 50 bytes. Please set `BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM` according to your system free memory and handle adv packets as fast as possible, otherwise it will cause adv packets lost.

**Range:**
- from 50 to 1000 if `CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP` & `CONFIG_BT_ENABLED`

**Default value:**
- 100 if `CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP` & `CONFIG_BT_ENABLED`

**CONFIG_BT_CTRL_BLE_ADV_REPORT_DISCARD_THRESHOLD**

BLE adv lost event threshold value

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP*

When adv report flow control is enabled, The ADV lost event will be generated when the number of ADV packets lost in the controller reaches this threshold. It is better to set a larger value. If you set `BT_CTRL_BLE_ADV_REPORT_DISCARD_THRESHOLD` to a small value or printf every adv lost event, it may cause adv packets lost more.

**Range:**
Chapter 2. API Reference

- from 1 to 1000 if `CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP && CONFIG_BT_ENABLED`

**Default value:**
- 20 if `CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP && CONFIG_BT_ENABLED`

**CONFIG_BT_CTRL_BLE_SCAN_DUPL**

BLE Scan Duplicate Options

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

This select enables parameters setting of BLE scan duplicate.

**Default value:**
- Yes (enabled) if `CONFIG_BT_ENABLED`

**CONFIG_BT_CTRL_SCAN_DUPL_TYPE**

Scan Duplicate Type

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CONFIG_BT_CTRL_BLE_SCAN_DUPL*

Scan duplicate have three ways. one is “Scan Duplicate By Device Address”, This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once. Another way is “Scan Duplicate By Device Address And Advertising Data”. This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported. The last way is “Scan Duplicate By Advertising Data”. This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.

**Available options:**
- Scan Duplicate By Device Address (BT_CTRL_SCAN_DUPL_TYPE_DEVICE)
  This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once
- Scan Duplicate By Advertising Data (BT_CTRL_SCAN_DUPL_TYPE_DATA)
  This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.
- Scan Duplicate By Device Address And Advertising Data (BT_CTRL_SCAN_DUPL_TYPE_DATA_DEVICE)
  This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported.

**CONFIG_BT_CTRL_SCAN_DUPL_CACHE_SIZE**

Maximum number of devices in scan duplicate filter

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CONFIG_BT_CTRL_BLE_SCAN_DUPL*

Maximum number of devices which can be recorded in scan duplicate filter. When the maximum amount of device in the filter is reached, the cache will be refreshed.

**Range:**
- from 10 to 1000 if `CONFIG_BT_CTRL_BLE_SCAN_DUPL && CONFIG_BT_ENABLED`

**Default value:**
- 100 if `CONFIG_BT_CTRL_BLE_SCAN_DUPL && CONFIG_BT_ENABLED`

**CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN**
Special duplicate scan mechanism for BLE Mesh scan

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CONFIG_BT_CTRL_BLE_SCAN_DUPL*

This enables the BLE scan duplicate for special BLE Mesh scan.

**Default value:**
- No (disabled) if `CONFIG_BT_CTRL_BLE_SCAN_DUPL` && `CONFIG_BT_ENABLED`

**CONFIG_BT_CTRL_MESH_DUPL_SCAN_CACHE_SIZE**

Maximum number of Mesh adv packets in scan duplicate filter

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CONFIG_BT_CTRL_BLE_SCAN_DUPL > CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN*

Maximum number of adv packets which can be recorded in duplicate scan cache for BLE Mesh. When the maximum amount of device in the filter is reached, the cache will be refreshed.

**Range:**
- from 10 to 1000 if `CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN` && `CONFIG_BT_ENABLED`

**Default value:**
- 100 if `CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN` && `CONFIG_BT_ENABLED`

**CONFIG_BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM**

Coexistence: limit on MAX Tx/Rx time for coded-PHY connection

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

When using PHY-Coded in BLE connection, limitation on max tx/rx time can be applied to better avoid dramatic performance deterioration of Wi-Fi.

**Available options:**
- Force Enable (BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM_EN)
  - Always enable the limitation on max tx/rx time for Coded-PHY connection
- Force Disable (BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM_DIS)
  - Disable the limitation on max tx/rx time for Coded-PHY connection

**MODEM SLEEP Options**

Contains:

- `CONFIG_BT_CTRL_MODEM_SLEEP`

**CONFIG_BT_CTRL_MODEM_SLEEP**

Bluetooth modem sleep

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > MODEM SLEEP Options*

Enable/disable bluetooth controller low power mode. Modem sleep is not supported to be used with UART HCI.

**Default value:**
- No (disabled) if `BT_CTRL_HCI_MODE_UART_H4` && `CONFIG_BT_ENABLED`
CONFIG_BT_CTRL_MODEM_SLEEP_MODE_1

Bluetooth Modem sleep Mode 1

*Found in:* Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > MODEM SLEEP Options > CONFIG_BT_CTRL_MODEM_SLEEP

Mode 1 is the currently supported sleep mode. In this mode, bluetooth controller sleeps between and BLE events. A low power clock is used to maintain bluetooth reference clock.

**Default value:**
- Yes (enabled) if CONFIG_BT_CTRL_MODEM_SLEEP && CONFIG_BT_ENABLED

CONFIG_BT_CTRL_LOW_POWER_CLOCK

Bluetooth low power clock

*Found in:* Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > MODEM SLEEP Options > CONFIG_BT_CTRL_MODEM_SLEEP > CONFIG_BT_CTRL_MODEM_SLEEP_MODE_1

Select the low power clock source for bluetooth controller

**Available options:**
- Main crystal (BT_CTRL_LPCLK_SEL_MAIN_XTAL)
  Main crystal can be used as low power clock for bluetooth modem sleep. If this option is selected, bluetooth modem sleep can work under Dynamic Frequency Scaling (DFS) enabled, but cannot work when light sleep is enabled. Main crystal has a relatively better performance than other bluetooth low power clock sources.
- External 32kHz crystal (BT_CTRL_LPCLK_SEL_EXT_32K_XTAL)
  External 32kHz crystal has a nominal frequency of 32.768kHz and provides good frequency stability. If used as Bluetooth low power clock, External 32kHz can support Bluetooth modem sleep to be used with both DFS and light sleep.
- Internal 150kHz RC oscillator (BT_CTRL_LPCLK_SEL_RTC_SLOW)
  Internal 150kHz RC oscillator. The accuracy of this clock is a lot larger than 500ppm which is required in Bluetooth communication, so don’t select this option in scenarios such as BLE connection state.

CONFIG_BT_CTRL_AGC_RECORRECT_EN

Enable HW AGC recorrect

*Found in:* Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller

Enable uncoded phy AGC recorrect

**Default value:**
- No (disabled) if CONFIG_BT_ENABLED

CONFIG_BT_CTRL_CODED_AGC_RECORRECT_EN

Enable coded phy AGC recorrect

*Found in:* Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CONFIG_BT_CTRL_AGC_RECORRECT_EN

Enable coded phy AGC recorrect

**Default value:**
- No (disabled) if CONFIG_BT_CTRL_AGC_RECORRECT_EN && CONFIG_BT_ENABLED
CONFIG_BT_HOST

Bluetooth Host

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED*

This helps to choose Bluetooth host stack

**Available options:**
- Bluedroid - Dual-mode (BT_BLUEDROID_ENABLED)
  This option is recommended for classic Bluetooth or for dual-mode usecases
- NimBLE - BLE only (BT_NIMBLE_ENABLED)
  This option is recommended for BLE only usecases to save on memory
- Controller Only (BT_CONTROLLER_ONLY)
  This option is recommended when you want to communicate directly with the controller (without any host) or when you are using any other host stack not supported by Espressif (not mentioned here).

**Bluedroid Options**

Contains:

- `CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK`
- `CONFIG_BT_BLUEDROID_MEM_DEBUG`
- `CONFIG_BT_BTU_TASK_STACK_SIZE`
- `CONFIG_BT_BTC_TASK_STACK_SIZE`
- `CONFIG_BT_BLE_ENABLED`
- `BT DEBUG LOG LEVEL`
- `CONFIG_BT_ACL_CONNECTIONS`
- `CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST`
- `CONFIG_BT_STACK_NO_LOG`
- `CONFIG_BT_BLE_42_FEATURES_SUPPORTED`
- `CONFIG_BT_BLE_50_FEATURES_SUPPORTED`
- `CONFIG_BT_MULTI_CONNECTION_ENBALE`
- `CONFIG_BT_MAX_DEVICE_NAME_LEN`
- `CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN`
- `CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE`
- `CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT`
- `CONFIG_BT_BLE_RPA_SUPPORTED`
- `CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY`

CONFIG_BT_BTC_TASK_STACK_SIZE

Bluetooth event (callback to application) task size

*Found in: Component config > Bluetooth > Bluedroid Options*

This select btc task stack size

**Default value:**
- 3072 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE

The cpu core which Bluedroid run

*Found in: Component config > Bluetooth > Bluedroid Options*

Which the cpu core to run Bluedroid. Can choose core0 and core1. Can not specify no-affinity.

**Available options:**
- Core 0 (PRO CPU) (BT_BLUEDROID_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BT_BLUEDROID_PINNED_TO_CORE_1)
CONFIG_BT_BTU_TASK_STACK_SIZE

Bluetooth Bluedroid Host Stack task stack size

*Found in:* Component config > Bluetooth > Bluedroid Options

This select btu task stack size

**Default value:**
- 4096 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLUEDROID_MEM_DEBUG

Bluedroid memory debug

*Found in:* Component config > Bluetooth > Bluedroid Options

Bluedroid memory debug

**Default value:**
- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_ENABLED

Bluetooth Low Energy

*Found in:* Component config > Bluetooth > Bluedroid Options

This enables Bluetooth Low Energy

**Default value:**
- Yes (enabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTS_ENABLE

Include GATT server module(GATTS)

*Found in:* Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED

This option can be disabled when the app work only on gatt client mode

**Default value:**
- Yes (enabled) if CONFIG_BT_BLE_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTS_PPCP_CHAR_GAP

Enable Peripheral Preferred Connection Parameters characteristic in GAP service

*Found in:* Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

This enables “Peripheral Preferred Connection Parameters” characteristic (UUID: 0x2A04) in GAP service that has connection parameters like min/max connection interval, slave latency and supervision timeout multiplier

**Default value:**
- No (disabled) if CONFIG_BT_GATTS_ENABLE && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_BLUFI_ENABLE

Include blufi function

*Found in:* Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

This option can be close when the app does not require blufi function.
**Default value:**
- No (disabled) if `CONFIG_BT_GATTS_ENABLE` & BT_BLUE DROID ENABLED

### `CONFIG_BT_GATT_MAX_SR_PROFILES`

Max GATT Server Profiles

*Found in: Component config > Bluetooth > Blue droid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATT_MAX_SR_PROFILES*

Maximum GATT Server Profiles Count

**Range:**
- from 1 to 32 if `CONFIG_BT_GATTS_ENABLE` & BT_BLUE DROID ENABLED &
  & BT_BLUE DROID ENABLED

**Default value:**
- 8 if `CONFIG_BT_GATTS_ENABLE` & BT_BLUE DROID ENABLED &
  & BT_BLUE DROID ENABLED

### `CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_MODE`

GATTS Service Change Mode

*Found in: Component config > Bluetooth > Blue droid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_MODE*

Service change indication mode for GATT Server.

**Available options:**
- GATTS manually send service change indication (BT_GATTS_SEND_SERVICE_CHANGE_MANUAL)
  Manually send service change indication through API
  esp_ble_gatts_send_service_change_indication()
- GATTS automatically send service change indication
  (BT_GATTS_SEND_SERVICE_CHANGE_AUTO)
  Let Blue droid handle the service change indication internally

### `CONFIG_BT_GATTC_ENABLE`

Include GATT client module(GATTC)

*Found in: Component config > Bluetooth > Blue droid Options > CONFIG_BT_BLE_ENABLED*

This option can be close when the app work only on gatt server mode

**Default value:**
- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` & BT_BLUE DROID ENABLED

### `CONFIG_BT_GATTC_CACHE_NVS_FLASH`

Save gattc cache data to nvs flash

*Found in: Component config > Bluetooth > Blue droid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE*

This select can save gattc cache data to nvs flash

**Default value:**
- No (disabled) if `CONFIG_BT_GATTC_ENABLE` & BT_BLUE DROID ENABLED
CONFIG_BT_GATTC_CONNECT_RETRY_COUNT

The number of attempts to reconnect if the connection establishment failed

*Found in:* Component config > Bluetooth > Bluez > Bluez Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE

The number of attempts to reconnect if the connection establishment failed

**Range:**
- from 0 to 7 if CONFIG_BT_GATTC_ENABLE && BT_BLUEDROID_ENABLED

**Default value:**
- 3 if CONFIG_BT_GATTC_ENABLE && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_SMP_ENABLE

Include BLE security module(SMP)

*Found in:* Component config > Bluetooth > Bluez > Bluez Options > CONFIG_BT_BLE_ENABLED

This option can be close when the app not used the ble security connect.

**Default value:**
- Yes (enabled) if CONFIG_BT_BLE_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_SMP_SLAVE_CON_PARAMS_UPD_ENABLE

Slave enable connection parameters update during pairing

*Found in:* Component config > Bluetooth > Bluez > Bluez Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_BLE_SMP_ENABLE

In order to reduce the pairing time, slave actively initiates connection parameters update during pairing.

**Default value:**
- No (disabled) if CONFIG_BT_BLE_SMP_ENABLE && BT_BLUEDROID_ENABLED

CONFIG_BT_STACK_NO_LOG

Disable BT debug logs (minimize bin size)

*Found in:* Component config > Bluetooth > Bluez Options

This select can save the rodata code size

**Default value:**
- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

BT DEBUG LOG LEVEL

Contains:

- CONFIG_BT_LOG_A2D_TRACE_LEVEL
- CONFIG_BT_LOG_APB1_TRACE_LEVEL
- CONFIG_BT_LOG_AVCT_TRACE_LEVEL
- CONFIG_BT_LOG_AVDT_TRACE_LEVEL
- CONFIG_BT_LOG_AVRC_TRACE_LEVEL
- CONFIG_BT_LOG_BLUFI_TRACE_LEVEL
- CONFIG_BT_LOG_BNEP_TRACE_LEVEL
- CONFIG_BT_LOG_BTIF_TRACE_LEVEL
- CONFIG_BT_LOG_BTM_TRACE_LEVEL
- CONFIG_BT_LOG_GAP_TRACE_LEVEL
- CONFIG_BT_LOG_GATT_TRACE_LEVEL
- CONFIG_BT_LOG_HCI_TRACE_LEVEL
- CONFIG_BT_LOG_HID_TRACE_LEVEL
• CONFIG_BT_LOG_L2CAP_TRACE_LEVEL
• CONFIG_BT_LOG_MCA_TRACE_LEVEL
• CONFIG_BT_LOG_OSI_TRACE_LEVEL
• CONFIG_BT_LOG_PAN_TRACE_LEVEL
• CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL
• CONFIG_BT_LOG_SDP_TRACE_LEVEL
• CONFIG_BT_LOG_SMP_TRACE_LEVEL

CONFIG_BT_LOG_HCI_TRACE_LEVEL

HCI layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for HCI layer

**Available options:**
- NONE (BT_LOG_HCI_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_HCI_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_HCI_TRACE_LEVEL_WARNING)
- API (BT_LOG_HCI_TRACE_LEVEL_API)
- EVENT (BT_LOG_HCI_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_HCI_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_HCI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTM_TRACE_LEVEL

BTM layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BTM layer

**Available options:**
- NONE (BT_LOG_BTM_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BTM_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BTM_TRACE_LEVEL_WARNING)
- API (BT_LOG_BTM_TRACE_LEVEL_API)
- EVENT (BT_LOG_BTM_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BTM_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BTM_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_L2CAP_TRACE_LEVEL

L2CAP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for L2CAP layer

**Available options:**
- NONE (BT_LOG_L2CAP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_L2CAP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_L2CAP_TRACE_LEVEL_WARNING)
- API (BT_LOG_L2CAP_TRACE_LEVEL_API)
- EVENT (BT_LOG_L2CAP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_L2CAP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_L2CAP_TRACE_LEVEL_VERBOSE)
CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL

RFCOMM layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for RFCOMM layer

**Available options:**
- NONE (BT_LOG_RFCOMM_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_RFCOMM_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_RFCOMM_TRACE_LEVEL_WARNING)
- API (BT_LOG_RFCOMM_TRACE_LEVEL_API)
- EVENT (BT_LOG_RFCOMM_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_RFCOMM_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_RFCOMM_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_SDP_TRACE_LEVEL

SDP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for SDP layer

**Available options:**
- NONE (BT_LOG_SDP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_SDP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_SDP_TRACE_LEVEL_WARNING)
- API (BT_LOG_SDP_TRACE_LEVEL_API)
- EVENT (BT_LOG_SDP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_SDP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_SDP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_GAP_TRACE_LEVEL

GAP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for GAP layer

**Available options:**
- NONE (BT_LOG_GAP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_GAP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_GAP_TRACE_LEVEL_WARNING)
- API (BT_LOG_GAP_TRACE_LEVEL_API)
- EVENT (BT_LOG_GAP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_GAP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_GAP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BNEP_TRACE_LEVEL

BNEP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BNEP layer

**Available options:**
- NONE (BT_LOG_BNEP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BNEP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BNEP_TRACE_LEVEL_WARNING)
- API (BT_LOG_BNEP_TRACE_LEVEL_API)
• EVENT (BT_LOG_BNEP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BNEP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BNEP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_PAN_TRACE_LEVEL

PAN layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for PAN layer

*Available options:*
• NONE (BT_LOG_PAN_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_PAN_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_PAN_TRACE_LEVEL_WARNING)
• API (BT_LOG_PAN_TRACE_LEVEL_API)
• EVENT (BT_LOG_PAN_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_PAN_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_PAN_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_A2D_TRACE_LEVEL

A2D layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for A2D layer

*Available options:*
• NONE (BT_LOG_A2D_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_A2D_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_A2D_TRACE_LEVEL_WARNING)
• API (BT_LOG_A2D_TRACE_LEVEL_API)
• EVENT (BT_LOG_A2D_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_A2D_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_A2D_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVDT_TRACE_LEVEL

AVDT layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for AVDT layer

*Available options:*
• NONE (BT_LOG_AVDT_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_AVDT_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_AVDT_TRACE_LEVEL_WARNING)
• API (BT_LOG_AVDT_TRACE_LEVEL_API)
• EVENT (BT_LOG_AVDT_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_AVDT_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_AVDT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVCT_TRACE_LEVEL

AVCT layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for AVCT layer
Available options:

- NONE (BT_LOG_AVCT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVCT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVCT_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVCT_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVCT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVCT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVCT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVRC_TRACE_LEVEL

AVRC layer

*Found in: Component config > Bluetooth > Bluez* *Options* *> BT DEBUG LOG LEVEL*

Define BT trace level for AVRC layer

Available options:

- NONE (BT_LOG_AVRC_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVRC_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVRC_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVRC_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVRC_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVRC_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVRC_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_MCA_TRACE_LEVEL

MCA layer

*Found in: Component config > Bluetooth > Bluez* *Options* *> BT DEBUG LOG LEVEL*

Define BT trace level for MCA layer

Available options:

- NONE (BT_LOG_MCA_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_MCA_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_MCA_TRACE_LEVEL_WARNING)
- API (BT_LOG_MCA_TRACE_LEVEL_API)
- EVENT (BT_LOG_MCA_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_MCA_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_MCA_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_HID_TRACE_LEVEL

HID layer

*Found in: Component config > Bluetooth > Bluez* *Options* *> BT DEBUG LOG LEVEL*

Define BT trace level for HID layer

Available options:

- NONE (BT_LOG_HID_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_HID_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_HID_TRACE_LEVEL_WARNING)
- API (BT_LOG_HID_TRACE_LEVEL_API)
- EVENT (BT_LOG_HID_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_HID_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_HID_TRACE_LEVEL_VERBOSE)
### CONFIG_BT_LOG_APPL_TRACE_LEVEL

APL layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for APPL layer

**Available options:**

- NONE (BT_LOG_APPL_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_APPL_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_APPL_TRACE_LEVEL_WARNING)
- API (BT_LOG_APPL_TRACE_LEVEL_API)
- EVENT (BT_LOG_APPL_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_APPL_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_APPL_TRACE_LEVEL_VERBOSE)

### CONFIG_BT_LOG_GATT_TRACE_LEVEL

GATT layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for GATT layer

**Available options:**

- NONE (BT_LOG_GATT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_GATT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_GATT_TRACE_LEVEL_WARNING)
- API (BT_LOG_GATT_TRACE_LEVEL_API)
- EVENT (BT_LOG_GATT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_GATT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_GATT_TRACE_LEVEL_VERBOSE)

### CONFIG_BT_LOG_SMP_TRACE_LEVEL

SMP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for SMP layer

**Available options:**

- NONE (BT_LOG_SMP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_SMP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_SMP_TRACE_LEVEL_WARNING)
- API (BT_LOG_SMP_TRACE_LEVEL_API)
- EVENT (BT_LOG_SMP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_SMP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_SMP_TRACE_LEVEL_VERBOSE)

### CONFIG_BT_LOG_BTIF_TRACE_LEVEL

BTIF layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BTIF layer

**Available options:**

- NONE (BT_LOG_BTIF_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BTIF_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BTIF_TRACE_LEVEL_WARNING)
- API (BT_LOG_BTIF_TRACE_LEVEL_API)
Chapter 2. API Reference

• EVENT (BT_LOG_BTIF_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BTIF_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BTIF_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTC_TRACE_LEVEL

BTC layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BTC layer

*Available options:*
  • NONE (BT_LOG_BTC_TRACE_LEVEL_NONE)
  • ERROR (BT_LOG_BTC_TRACE_LEVEL_ERROR)
  • WARNING (BT_LOG_BTC_TRACE_LEVEL_WARNING)
  • API (BT_LOG_BTC_TRACE_LEVEL_API)
  • EVENT (BT_LOG_BTC_TRACE_LEVEL_EVENT)
  • DEBUG (BT_LOG_BTC_TRACE_LEVEL_DEBUG)
  • VERBOSE (BT_LOG_BTC_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_OSI_TRACE_LEVEL

OSI layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for OSI layer

*Available options:*
  • NONE (BT_LOG_OSI_TRACE_LEVEL_NONE)
  • ERROR (BT_LOG_OSI_TRACE_LEVEL_ERROR)
  • WARNING (BT_LOG_OSI_TRACE_LEVEL_WARNING)
  • API (BT_LOG_OSI_TRACE_LEVEL_API)
  • EVENT (BT_LOG_OSI_TRACE_LEVEL_EVENT)
  • DEBUG (BT_LOG_OSI_TRACE_LEVEL_DEBUG)
  • VERBOSE (BT_LOG_OSI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BLUFI_TRACE_LEVEL

BLUFI layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BLUFI layer

*Available options:*
  • NONE (BT_LOG_BLUFI_TRACE_LEVEL_NONE)
  • ERROR (BT_LOG_BLUFI_TRACE_LEVEL_ERROR)
  • WARNING (BT_LOG_BLUFI_TRACE_LEVEL_WARNING)
  • API (BT_LOG_BLUFI_TRACE_LEVEL_API)
  • EVENT (BT_LOG_BLUFI_TRACE_LEVEL_EVENT)
  • DEBUG (BT_LOG_BLUFI_TRACE_LEVEL_DEBUG)
  • VERBOSE (BT_LOG_BLUFI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_ACL_CONNECTIONS

BT/BLE MAX ACL CONNECTIONS(1~7)

*Found in: Component config > Bluetooth > Bluedroid Options*

Maximum BT/BLE connection count
Range:
  • from 1 to 7 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

Default value:
  • 4 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_MULTI_CONNECTION_ENBALE

Enable BLE multi-connections

Found in: Component config > Bluetooth > Bluedroid Options

Enable this option if there are multiple connections

Default value:
  • Yes (enabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST

BT/BLE will first malloc the memory from the PSRAM

Found in: Component config > Bluetooth > Bluedroid Options

This select can save the internal RAM if there have the PSRAM

Default value:
  • No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY

Use dynamic memory allocation in BT/BLE stack

Found in: Component config > Bluetooth > Bluedroid Options

This select can make the allocation of memory will become more flexible

Default value:
  • No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK

BLE queue congestion check

Found in: Component config > Bluetooth > Bluedroid Options

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.

Default value:
  • No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN

Report adv data and scan response individually when BLE active scan

Found in: Component config > Bluetooth > Bluedroid Options

Originally, when doing BLE active scan, Bluedroid will not report adv to application layer until receive scan response. This option is used to disable the behavior. When enable this option, Bluedroid will report adv data or scan response to application layer immediately.

# Memory reserved at start of DRAM for Bluetooth stack

Default value:
• No (disabled) if BT_BLUEDROID_ENABLED && (BTDM_CTRL_MODE_BTDM || BTDM_CTRL_MODE_BLE_ONLY) && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT

Timeout of BLE connection establishment

*Found in: Component config > Bluetooth > Bluedroid Options*

Bluetooth Connection establishment maximum time, if connection time exceeds this value, the connection establishment fails, ESP_GATTC_OPEN_EVT or ESP_GATTS_OPEN_EVT is triggered.

**Range:**
- from 1 to 60 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**Default value:**
- 30 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_MAX_DEVICE_NAME_LEN

Length of bluetooth device name

*Found in: Component config > Bluetooth > Bluedroid Options*

Bluetooth Device name length shall be no larger than 248 octets. If the broadcast data cannot contain the complete device name, then only the shortname will be displayed, the rest parts that can’t fit in will be truncated.

**Range:**
- from 32 to 248 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**Default value:**
- 32 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_RPA_SUPPORTED

Update RPA to Controller

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables controller RPA list function. For ESP32, ESP32 only support network privacy mode. If this option is enabled, ESP32 will only accept advertising packets from peer devices that contain private address, HW will not receive the advertising packets contain identity address after IRK changed. If this option is disabled, address resolution will be performed in the host, so the functions that require controller to resolve address in the white list cannot be used. This option is disabled by default on ESP32, please enable or disable this option according to your own needs.

For ESP32C3 and esp32s3, devices support network privacy mode and device privacy mode, users can switch the two modes according to their own needs. So this option is enabled by default.

**Default value:**
- Yes (enabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_50_FEATURES_SUPPORTED

Enable BLE 5.0 features

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE 5.0 features, this option only support esp32c3/esp32s3 chip

**Default value:**
- Yes (enabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED
CONFIG_BT_BLE_42_FEATURES_SUPPORTED

Enable BLE 4.2 features

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE 4.2 features.

**Default value:**
- No (disabled) if BT_BLUELEDROID_ENABLED && BT_BLUELEDROID_ENABLED

**NimBLE Options** Contains:

- CONFIG_BT_NIMBLE_ACL_BUF_COUNT
- CONFIG_BT_NIMBLE_ACL_BUF_SIZE
- CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME
- CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS
- CONFIG_BT_NIMBLE_ROLE_BROADCASTER
- CONFIG_BT_NIMBLE_ROLE_CENTRAL
- CONFIG_BT_NIMBLE_MESH
- CONFIG_BT_NIMBLE_ROLE_OBSERVER
- CONFIG_BT_NIMBLE_ROLE_PERIPHERAL
- CONFIG_BT_NIMBLE_BLUFI_ENABLE
- CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT
- CONFIG_BT_NIMBLE_USE_ESP_TIMER
- CONFIG_BT_NIMBLE_EXT_ADV
- CONFIG_BT_NIMBLE_DEBUG
- CONFIG_BT_NIMBLE_HOST_BASED_PRIVACY
- CONFIG_BT_NIMBLE_HS_FLOW_CTRL
- CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE
- CONFIG_BT_NIMBLE_HCI_EVT_BUF_SIZE
- CONFIG_BT_NIMBLE_HCI_EVT_HI_BUF_COUNT
- CONFIG_BT_NIMBLE_HCI_EVT_LO_BUF_COUNT
- CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN
- CONFIG_BT_NIMBLE_MAX_BONDS
- CONFIG_BT_NIMBLE_MAX_CCCDS
- CONFIG_BT_NIMBLE_MAX_CONNECTIONS
- CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM
- CONFIG_BT_NIMBLE_MEM_ALLOC_MODE
- CONFIG_BT_NIMBLE_MSYS1_BLOCK_COUNT
- CONFIG_BT_NIMBLE_LOG_LEVEL
- CONFIG_BT_NIMBLE_TASK_STACK_SIZE
- CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS
- CONFIG_BT_NIMBLE_NVS_PERSIST
- CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU
- CONFIG_BT_NIMBLE_RPA_TIMEOUT
- CONFIG_BT_NIMBLE_SM_LEGACY
- CONFIG_BT_NIMBLE_SM_SC
- CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE
- CONFIG_BT_NIMBLE_SM_SC_DEBUG_KEYS

**CONFIG_BT_NIMBLE_MEM_ALLOC_MODE**

Memory allocation strategy

*Found in: Component config > Bluetooth > NimBLE Options*

Allocation strategy for NimBLE host stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
• External SPI RAM memory only
• Either internal or external memory based on default malloc() behavior in ESP-IDF
• Internal IRAM memory wherever applicable else internal DRAM

Available options:
• Internal memory (BT_NIMBLE_MEM_ALLOC_MODE_INTERNAL)
• External SPI RAM (BT_NIMBLE_MEM_ALLOC_MODE_EXTERNAL)
• Default alloc mode (BT_NIMBLE_MEM_ALLOC_MODE_DEFAULT)
• Internal IRAM (BT_NIMBLE_MEM_ALLOC_MODE_IRAM_8BIT)
  Allows to use IRAM memory region as 8bit accessible region.
  Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain
clock cycles per unaligned read/write.

CONFIG_BT_NIMBLE_LOG_LEVEL

NimBLE Host log verbosity

Found in: Component config > Bluetooth > NimBLE Options

Select NimBLE log level. Please make a note that the selected NimBLE log verbosity can not exceed
the level set in “Component config -> Log output -> Default log verbosity” .

Available options:
• No logs (BT_NIMBLE_LOG_LEVEL_NONE)
• Error logs (BT_NIMBLE_LOG_LEVEL_ERROR)
• Warning logs (BT_NIMBLE_LOG_LEVEL_WARNING)
• Info logs (BT_NIMBLE_LOG_LEVEL_INFO)
• Debug logs (BT_NIMBLE_LOG_LEVEL_DEBUG)

CONFIG_BT_NIMBLE_MAX_CONNECTIONS

Maximum number of concurrent connections

Found in: Component config > Bluetooth > NimBLE Options

Defines maximum number of concurrent BLE connections. For ESP32, user is expected to configure
BTDM_CTRL_BLE_MAX_CONN from controller menu along with this option. Similarly for ESP32-
C3 or ESP32-S3, user is expected to configure BT_CTRL_BLE_MAX_ACT from controller menu.

Range:
• from 1 to 8 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Default value:
• 3 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_BONDS

Maximum number of bonds to save across reboots

Found in: Component config > Bluetooth > NimBLE Options

Defines maximum number of bonds to save for peer security and our security

Default value:
• 3 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_CCCDS

Maximum number of CCC descriptors to save across reboots

Found in: Component config > Bluetooth > NimBLE Options

Defines maximum number of CCC descriptors to save

Default value:
Chapter 2. API Reference

- 8 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM**

Maximum number of connection oriented channels

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of BLE Connection Oriented Channels. When set to (0), BLE COC is not compiled in

*Range:*
  - from 0 to 9 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

*Default value:*
  - 0 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE**

The CPU core on which NimBLE host will run

*Found in: Component config > Bluetooth > NimBLE Options*

The CPU core on which NimBLE host will run. You can choose Core 0 or Core 1. Cannot specify no-affinity

*Available options:*
  - Core 0 (PRO CPU) (BT_NIMBLE_PINNED_TO_CORE_0)
  - Core 1 (APP CPU) (BT_NIMBLE_PINNED_TO_CORE_1)

**CONFIG_BT_NIMBLE_TASK_STACK_SIZE**

NimBLE Host task stack size

*Found in: Component config > Bluetooth > NimBLE Options*

This configures stack size of NimBLE host task

*Default value:*
  - 5120 if CONFIG_BLE_MESH && BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
  - 4096 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_ROLE_CENTRAL**

Enable BLE Central role

*Found in: Component config > Bluetooth > NimBLE Options*

*Default value:*
  - Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_ROLE_PERIPHERAL**

Enable BLE Peripheral role

*Found in: Component config > Bluetooth > NimBLE Options*

*Default value:*
  - Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_ROLE_BROADCASTER
Enable BLE Broadcaster role

*Found in: Component config > Bluetooth > NimBLE Options*

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ROLE_OBSERVER
Enable BLE Observer role

*Found in: Component config > Bluetooth > NimBLE Options*

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_NVS_PERSIST
Persist the BLE Bonding keys in NVS

*Found in: Component config > Bluetooth > NimBLE Options*
Enable this flag to make bonding persistent across device reboots

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SM_LEGACY
Security manager legacy pairing

*Found in: Component config > Bluetooth > NimBLE Options*
Enable security manager legacy pairing

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SM_SC
Security manager secure connections (4.2)

*Found in: Component config > Bluetooth > NimBLE Options*
Enable security manager secure connections

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_DEBUG
Enable extra runtime asserts and host debugging

*Found in: Component config > Bluetooth > NimBLE Options*
This enables extra runtime asserts and host debugging

**Default value:**
- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_SM_SC_DEBUG_KEYS

Use predefined public-private key pair

*Found in: Component config > Bluetooth > NimBLE Options*

If this option is enabled, SM uses predefined DH key pair as described in Core Specification, Vol. 3, Part H, 2.3.5.6.1. This allows to decrypt air traffic easily and thus should only be used for debugging.

**Default value:**
- No (disabled) if `CONFIG_BT_NIMBLE_SM_SC && BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME

BLE GAP default device name

*Found in: Component config > Bluetooth > NimBLE Options*

The Device Name characteristic shall contain the name of the device as an UTF-8 string. This name can be changed by using API `ble_svc_gap_device_name_set()`

**Default value:**
- “nimble” if `BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN

Maximum length of BLE device name in octets

*Found in: Component config > Bluetooth > NimBLE Options*

Device Name characteristic value shall be 0 to 248 octets in length

**Default value:**
- 31 if `BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU

Preferred MTU size in octets

*Found in: Component config > Bluetooth > NimBLE Options*

This is the default value of ATT MTU indicated by the device during an ATT MTU exchange. This value can be changed using API `ble_att_set_preferred_mtu()`

**Default value:**
- 256 if `BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE

External appearance of the device

*Found in: Component config > Bluetooth > NimBLE Options*

Standard BLE GAP Appearance value in HEX format e.g. 0x02C0

**Default value:**
- 0 if `BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ACL_BUF_COUNT

ACL Buffer count

*Found in: Component config > Bluetooth > NimBLE Options*

The number of ACL data buffers.

**Default value:**
• 20 if `BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`

`CONFIG_BT_NIMBLE_ACL_BUF_SIZE`

ACL Buffer size

*Found in: Component config > Bluetooth > NimBLE Options*

This is the maximum size of the data portion of HCI ACL data packets. It does not include the HCI data header (of 4 bytes)

**Default value:**

• 255 if `BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`

`CONFIG_BT_NIMBLE_HCI_EVT_BUF_SIZE`

HCI Event Buffer size

*Found in: Component config > Bluetooth > NimBLE Options*

This is the size of each HCI event buffer in bytes. In case of extended advertising, packets can be fragmented. 257 bytes is the maximum size of a packet.

**Default value:**

• 257 if `CONFIG_BT_NIMBLE_EXT_ADV && BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`
  
• 70 if `BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`

`CONFIG_BT_NIMBLE_HCI_EVT_HI_BUF_COUNT`

High Priority HCI Event Buffer count

*Found in: Component config > Bluetooth > NimBLE Options*

This is the high priority HCI events’ buffer size. High-priority event buffers are for everything except advertising reports. If there are no free high-priority event buffers then host will try to allocate a low-priority buffer instead.

**Default value:**

• 30 if `BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`

`CONFIG_BT_NIMBLE_HCI_EVT_LO_BUF_COUNT`

Low Priority HCI Event Buffer count

*Found in: Component config > Bluetooth > NimBLE Options*

This is the low priority HCI events’ buffer size. Low-priority event buffers are only used for advertising reports. If there are no free low-priority event buffers, then an incoming advertising report will get dropped.

**Default value:**

• 8 if `BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`

`CONFIG_BT_NIMBLE_MSYS1_BLOCK_COUNT`

MSYS_1 Block Count

*Found in: Component config > Bluetooth > NimBLE Options*

MSYS is a system level mbuf registry. For prepare write & prepare responses MBUFs are allocated out of msys_1 pool. For NIMBLE_MESH enabled cases, this block count is increased by 8 than user defined count.

**Default value:**
Chapter 2. API Reference

- 12 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HS_FLOW_CTRL**

Enable Host Flow control

*Found in: Component config > Bluetooth > NimBLE Options*

Enable Host Flow control

*Default value:*

- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HS_FLOW_CTRL_ITVL**

Host Flow control interval

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Host flow control interval in msecs

*Default value:*

- 1000 if CONFIG_BT_NIMBLE_HS_FLOW_CTRL && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HS_FLOW_CTRL_THRESH**

Host Flow control threshold

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Host flow control threshold, if the number of free buffers are at or below this threshold, send an immediate number-of-completed-packets event

*Default value:*

- 2 if CONFIG_BT_NIMBLE_HS_FLOW_CTRL && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HS_FLOW_CTRL_TX_ON_DISCONNECT**

Host Flow control on disconnect

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Enable this option to send number-of-completed-packets event to controller after disconnection

*Default value:*

- Yes (enabled) if CONFIG_BT_NIMBLE_HS_FLOW_CTRL && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_RPA_TIMEOUT**

RPA timeout in seconds

*Found in: Component config > Bluetooth > NimBLE Options*

Time interval between RPA address change. This is applicable in case of Host based RPA

*Range:*

- from 1 to 41400 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

*Default value:*

- 900 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_MESH

Enable BLE mesh functionality

*Found in: Component config > Bluetooth > NimBLE Options*

Enable BLE Mesh functionality

**Default value:**
- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Contains:
- CONFIG_BT_NIMBLE_MESH_PROVISIONER
- CONFIG_BT_NIMBLE_MESH_PROV
- CONFIG_BT_NIMBLE_MESH_GATT_PROXY
- CONFIG_BT_NIMBLE_MESH_FRIEND
- CONFIG_BT_NIMBLE_MESH_LOW_POWER
- CONFIG_BT_NIMBLE_MESH_PROXY
- CONFIG_BT_NIMBLE_MESH_RELAY
- CONFIG_BT_NIMBLE_MESH_DEVICE_NAME
- CONFIG_BT_NIMBLE_MESH_NODE_COUNT

CONFIG_BT_NIMBLE_MESH_PROXY

Enable mesh proxy functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable proxy. This is automatically set whenever NIMBLE_MESH_PB_GATT or NIMBLE_MESH_GATT_PROXY is set

**Default value:**
- No (disabled) if CONFIG_BT_NIMBLE_MESH & & BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_PROV

Enable BLE mesh provisioning

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable mesh provisioning

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_MESH & & BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_PB_ADV

Enable mesh provisioning over advertising bearer

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV*

Enable this option to allow the device to be provisioned over the advertising bearer

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_MESH_PROV & & BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_PB_GATT

Enable mesh provisioning over GATT bearer

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV*

Enable this option to allow the device to be provisioned over the GATT bearer
Chapter 2.  API Reference

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH_PROV` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MESH_GATT_PROXY**
Enable GATT Proxy functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

This option enables support for the Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MESH_RELAY**
Enable mesh relay functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Support for acting as a Mesh Relay Node

**Default value:**
- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MESH_LOW_POWER**
Enable mesh low power mode

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable this option to be able to act as a Low Power Node

**Default value:**
- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MESH_FRIEND**
Enable mesh friend functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable this option to be able to act as a Friend Node

**Default value:**
- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MESH_DEVICE_NAME**
Set mesh device name

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

This value defines Bluetooth Mesh device/node name

**Default value:**
- “nimble-mesh-node” if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`
CONFIG_BT_NIMBLE_MESH_NODE_COUNT

Set mesh node count

Default value:
• 1 if CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_PROVISIONER

Enable BLE mesh provisioner

Default value:
• 0 if CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS

Override TinyCrypt with mbedtls for crypto computations

Default value:
• Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS

BLE host stop timeout in msec

Default value:
• 2000 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HOST_BASED_PRIVACY

Enable host based privacy for random address.

Default value:
• No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT

Enable connection reattempts on connection establishment error

Default value:
• Yes (enabled) if BT_NIMBLE_ENABLED
**CONFIG_BT_NIMBLE_MAX_CONN_REATTEMPT**

Maximum number connection reattempts

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT*

Defines maximum number of connection reattempts.

**Range:**
- from 1 to 7 if BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT && BT_NIMBLE_ENABLED

**Default value:**
- 3 if BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_EXT_ADV**

Enable extended advertising.

*Found in: Component config > Bluetooth > NimBLE Options*

Enable this option to do extended advertising. Extended advertising will be supported from BLE 5.0 onwards.

**CONFIG_BT_NIMBLE_MAX_EXT_ADV_INSTANCES**

Maximum number of extended advertising instances.

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_EXT_ADV*

Change this option to set maximum number of extended advertising instances. Minimum there is always one instance of advertising. Enter how many more advertising instances you want.

**Range:**
- from 0 to 4 if CONFIG_BT_NIMBLE_EXT_ADV && BT_NIMBLE_ENABLED

**Default value:**
- 1 if CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && BT_NIMBLE_ENABLED
- 0 if CONFIG_BT_NIMBLE_EXT_ADV && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MAX_EXT_ADV_DATA_LEN**

Maximum length of the advertising data.

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_EXT_ADV*

Defines size of extended advertising data. Size should not increase 1650.

**Range:**
- from 0 to 1650 if CONFIG_BT_NIMBLE_EXT_ADV && BT_NIMBLE_ENABLED

**Default value:**
- 1650 if CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && BT_NIMBLE_ENABLED
- 0 if CONFIG_BT_NIMBLE_EXT_ADV && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV**

Enable periodic advertisement.

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_EXT_ADV*

Enable this option to start periodic advertisement.

**Default value:**
• Yes (enabled) if \texttt{CONFIG_BT_NIMBLE_EXT_ADV} \&\& BT_NIMBLE_ENABLED

\textbf{CONFIG_BT_NIMBLE_MAX_PERIODIC_SYNCS}

Maximum number of periodic advertising syncs.

\textit{Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_EXT_ADV > CONFIG_BT_NIMBLE_MAX_PERIODIC_SYNCS}

Set this option to set the upper limit for number of periodic sync connections. This should be less than maximum connections allowed by controller.

\textbf{Range:}

• from 1 to 8 if \texttt{CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV} \&\& BT_NIMBLE_ENABLED

\textbf{Default value:}

• 1 if \texttt{CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV} \&\& \texttt{CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV} \&\& BT_NIMBLE_ENABLED

• 0 if \texttt{CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV} \&\& BT_NIMBLE_ENABLED

\textbf{CONFIG_BT_NIMBLE_BLUFI_ENABLE}

Enable blufi functionality

\textit{Found in: Component config > Bluetooth > NimBLE Options}

Set this option to enable blufi functionality.

\textbf{Default value:}

• No (disabled) if BT_NIMBLE_ENABLED \&\& BT_NIMBLE_ENABLED

\textbf{CONFIG_BT_NIMBLE_USE_ESP_TIMER}

Enable Esp Timer for Nimble

\textit{Found in: Component config > Bluetooth > NimBLE Options}

Set this option to use Esp Timer which has higher priority timer instead of FreeRTOS timer

\textbf{Default value:}

• Yes (enabled) if BT_NIMBLE_ENABLED

\textbf{CONFIG_BLE_MESH}

ESP BLE Mesh Support

\textit{Found in: Component config}

This option enables ESP BLE Mesh support. The specific features that are available may depend on other features that have been enabled in the stack, such as Bluetooth Support, Bluedroid Support & GATT support.

\textbf{Contains:}

• \texttt{BLE Mesh and BLE coexistence support}

• \texttt{CONFIG_BLE_MESH_GATT_PROXY_CLIENT}

• \texttt{CONFIG_BLE_MESH_GATT_PROXY_SERVER}

• \texttt{BLE Mesh NET BUF DEBUG LOG LEVEL}

• \texttt{CONFIG_BLE_MESH_PROXY}

• \texttt{CONFIG_BLE_MESH_PROV}

• \texttt{BLE Mesh specific test option}

• \texttt{BLE Mesh STACK DEBUG LOG LEVEL}

• \texttt{CONFIG_BLE_MESH_NO_LOG}

• \texttt{CONFIG_BLE_MESH_IVU_DIVIDER}
• CONFIG_BLE_MESH_FAST_PROV
• CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC
• CONFIG_BLE_MESH_CRPL
• CONFIG_BLE_MESH_RX_SDU_MAX
• CONFIG_BLE_MESH_MODEL_KEY_COUNT
• CONFIG_BLE_MESH_APP_KEY_COUNT
• CONFIG_BLE_MESH_MODEL_GROUP_COUNT
• CONFIG_BLE_MESH_LABEL_COUNT
• CONFIG_BLE_MESH_SUBNET_COUNT
• CONFIG_BLE_MESH_TX_SEG_MAX
• CONFIG_BLE_MESH_TX_SEG_MSG_COUNT
• CONFIG_BLE_MESH_RX_SEG_MSG_COUNT
• CONFIG_BLE_MESH_MEM_ALLOC_MODE
• CONFIG_BLE_MESH_MSG_CACHE_SIZE
• CONFIG_BLE_MESH_ADV_BUF_COUNT
• CONFIG_BLE_MESH_PB_GATT
• CONFIG_BLE_MESH_PB_ADV
• CONFIG_BLE_MESH_RELAY
• CONFIG_BLE_MESH_SETTINGS
• CONFIG_BLE_MESH_DEINIT
• CONFIG_BLE_MESH_USE_DUPLICATE_SCAN
• Support for BLE Mesh Client/Server models
• Support for BLE Mesh Foundation models
• CONFIG_BLE_MESH_NODE
• CONFIG_BLE_MESH_PROVISIONER
• CONFIG_BLE_MESH_FRIEND
• CONFIG_BLE_MESH_LOW_POWER
• CONFIG_BLE_MESH_HCI_5_0
• CONFIG_BLE_MESH_IV_UPDATE_TEST
• CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT

CONFIG_BLE_MESH_HCI_5_0
Support sending 20ms non-connectable adv packets

Found in: Component config > CONFIG_BLE_MESH

It is a temporary solution and needs further modifications.

Default value:
• Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_USE_DUPLICATE_SCAN
Support Duplicate Scan in BLE Mesh

Found in: Component config > CONFIG_BLE_MESH

Enable this option to allow using specific duplicate scan filter in BLE Mesh, and Scan Duplicate Type must be set by choosing the option in the Bluetooth Controller section in menuconfig, which is “Scan Duplicate By Device Address and Advertising Data”.

Default value:
• Yes (enabled) if BT_BLUEDROID_ENABLED && CONFIG_BLE_MESH

CONFIG_BLE_MESH_MEM_ALLOC_MODE
Memory allocation strategy

Found in: Component config > CONFIG_BLE_MESH
Allocation strategy for BLE Mesh stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

Available options:

- Internal DRAM (BLE_MESH_MEM_ALLOC_MODE_INTERNAL)
- External SPIRAM (BLE_MESH_MEM_ALLOC_MODE_EXTERNAL)
- Default alloc mode (BLE_MESH_MEM_ALLOC_MODE_DEFAULT)

Enable this option to use the default memory allocation strategy when external SPIRAM is enabled. See the SPIRAM options for more details.

- Internal IRAM (BLE_MESH_MEM_ALLOC_MODE_IRAM_8BIT)

Allows to use IRAM memory region as 8bit accessible region. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC

Enable FreeRTOS static allocation

Found in: Component config > CONFIG_BLE_MESH

Enable this option to use FreeRTOS static allocation APIs for BLE Mesh, which provides the ability to use different dynamic memory (i.e. SPIRAM or IRAM) for FreeRTOS objects. If this option is disabled, the FreeRTOS static allocation APIs will not be used, and internal DRAM will be allocated for FreeRTOS objects.

Default value:

- No (disabled) if (ESP32_SPIRAM_SUPPORT || ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY) && CONFIG_BLE_MESH

CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC_MODE

Memory allocation for FreeRTOS objects

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC

Choose the memory to be used for FreeRTOS objects.

Available options:

- External SPIRAM (BLE_MESH_FREERTOS_STATIC_ALLOC_EXTERNAL)
  
  If enabled, BLE Mesh allocates dynamic memory from external SPIRAM for FreeRTOS objects, i.e. mutex, queue, and task stack. External SPIRAM can only be used for task stack when SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY is enabled. See the SPIRAM options for more details.

- Internal IRAM (BLE_MESH_FREERTOS_STATICALLOC_IRAM_8BIT)
  
  If enabled, BLE Mesh allocates dynamic memory from internal IRAM for FreeRTOS objects, i.e. mutex, queue. Note: IRAM region cannot be used as task stack.
CONFIG_BLE_MESH_DEINIT
Support de-initialize BLE Mesh stack

*Found in: Component config > CONFIG_BLE_MESH*

If enabled, users can use the function esp_ble_mesh_deinit() to de-initialize the whole BLE Mesh stack.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH

BLE Mesh and BLE coexistence support
Contains:
- `CONFIG_BLE_MESH_SUPPORT_BLE_SCAN`
- `CONFIG_BLE_MESH_SUPPORT_BLE_ADV`

CONFIG_BLE_MESH_SUPPORT_BLE_ADV
Support sending normal BLE advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support*

When selected, users can send normal BLE advertising packets with specific API.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_BLE_ADV_BUF_COUNT
Number of advertising buffers for BLE advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support > CONFIG_BLE_MESH_SUPPORT_BLE_ADV*

Number of advertising buffers for BLE packets available.

**Range:**
- from 1 to 255 if CONFIG_BLE_MESH_SUPPORT_BLE_ADV && CONFIG_BLE_MESH

**Default value:**
- 3 if CONFIG_BLE_MESH_SUPPORT_BLE_ADV && CONFIG_BLE_MESH

CONFIG_BLE_MESH_SUPPORT_BLE_SCAN
Support scanning normal BLE advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support*

When selected, users can register a callback and receive normal BLE advertising packets in the application layer.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_FAST_PROV
Enable BLE Mesh Fast Provisioning

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow BLE Mesh fast provisioning solution to be used. When there are multiple unprovisioned devices around, fast provisioning can greatly reduce the time consumption of the whole provisioning process. When this option is enabled, and after an unprovisioned device is provisioned into a node successfully, it can be changed to a temporary Provisioner.

**Default value:**
• No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_NODE
Support for BLE Mesh Node

*Found in: Component config > CONFIG_BLE_MESH*

Enable the device to be provisioned into a node. This option should be enabled when an unprovisioned device is going to be provisioned into a node and communicate with other nodes in the BLE Mesh network.

CONFIG_BLE_MESH_PROVISIONER
Support for BLE Mesh Provisioner

*Found in: Component config > CONFIG_BLE_MESH*

Enable the device to be a Provisioner. The option should be enabled when a device is going to act as a Provisioner and provision unprovisioned devices into the BLE Mesh network.

CONFIG_BLE_MESH_WAIT_FOR_PROV_MAX_DEV_NUM
Maximum number of unprovisioned devices that can be added to device queue

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many unprovisioned devices can be added to device queue for provisioning. Users can use this option to define the size of the queue in the bottom layer which is used to store unprovisioned device information (e.g. Device UUID, address).

*Range:*
  • from 1 to 100 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

*Default value:*
  • 10 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_MAX_PROV_NODES
Maximum number of devices that can be provisioned by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned by a Provisioner. This value indicates the maximum number of unprovisioned devices which can be provisioned by a Provisioner. For instance, if the value is 6, it means the Provisioner can provision up to 6 unprovisioned devices. Theoretically a Provisioner without the limitation of its memory can provision up to 32766 unprovisioned devices, here we limit the maximum number to 100 just to limit the memory used by a Provisioner. The bigger the value is, the more memory it will cost by a Provisioner to store the information of nodes.

*Range:*
  • from 1 to 1000 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

*Default value:*
  • 10 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_PBASAME_TIME
Maximum number of PB-ADV running at the same time by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-ADV. For examples, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-ADV at the same time.
Range:
- from 1 to 10 if `CONFIG_BLE_MESH_PB_ADV` & `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

Default value:
- 2 if `CONFIG_BLE_MESH_PB_ADV` & `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PBG_SAME_TIME**

Maximum number of PB-GATT running at the same time by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-GATT. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-GATT at the same time.

Range:
- from 1 to 5 if `CONFIG_BLE_MESH_PB_GATT` & `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

Default value:
- 1 if `CONFIG_BLE_MESH_PB_GATT` & `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROVISIONER_SUBNET_COUNT**

Maximum number of mesh subnets that can be created by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many subnets per network a Provisioner can create. Indeed, this value decides the number of network keys which can be added by a Provisioner.

Range:
- from 1 to 4096 if `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

Default value:
- 3 if `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROVISIONER_APP_KEY_COUNT**

Maximum number of application keys that can be owned by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many application keys the Provisioner can have. Indeed, this value decides the number of the application keys which can be added by a Provisioner.

Range:
- from 1 to 4096 if `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

Default value:
- 3 if `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROVISIONER_RECV_HB**

Support receiving Heartbeat messages

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

When this option is enabled, Provisioner can call specific functions to enable or disable receiving Heartbeat messages and notify them to the application layer.

Default value:
- No (disabled) if `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`
**CONFIG_BLE_MESH_PROVISIONER_RECV_HB_FILTER_SIZE**

Maximum number of filter entries for receiving Heartbeat messages

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER > CONFIG_BLE_MESH_PROVISIONER_RECV_HB*

This option specifies how many heartbeat filter entries Provisioner supports. The heartbeat filter (acceptlist or rejectlist) entries are used to store a list of SRC and DST which can be used to decide if a heartbeat message will be processed and notified to the application layer by Provisioner. Note: The filter is an empty rejectlist by default.

*Range:*
- from 1 to 1000 if `CONFIG_BLE_MESH_PROVISIONER_RECV_HB` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

*Default value:*
- 3 if `CONFIG_BLE_MESH_PROVISIONER_RECV_HB` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROV**

BLE Mesh Provisioning support

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to support BLE Mesh Provisioning functionality. For BLE Mesh, this option should be always enabled.

*Default value:*
- Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PB_ADV**

Provisioning support using the advertising bearer (PB-ADV)

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow the device to be provisioned over the advertising bearer. This option should be enabled if PB-ADV is going to be used during provisioning procedure.

*Default value:*
- Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_UNPROVISIONED_BEACON_INTERVAL**

Interval between two consecutive Unprovisioned Device Beacon

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PB_ADV*

This option specifies the interval of sending two consecutive unprovisioned device beacon, users can use this option to change the frequency of sending unprovisioned device beacon. For example, if the value is 5, it means the unprovisioned device beacon will send every 5 seconds. When the option of BLE_MESH_FAST_PROV is selected, the value is better to be 3 seconds, or less.

*Range:*
- from 1 to 100 if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`

*Default value:*
- 5 if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`
- 3 if `CONFIG_BLE_MESH_FAST_PROV` && `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`
**CONFIG_BLE_MESH_PB_GATT**

Provisioning support using GATT (PB-GATT)

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow the device to be provisioned over GATT. This option should be enabled if PB-GATT is going to be used during provisioning procedure.

# Virtual option enabled whenever any Proxy protocol is needed

**CONFIG_BLE_MESH_PROXY**

BLE Mesh Proxy protocol support

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to support BLE Mesh Proxy protocol used by PB-GATT and other proxy pdu transmission.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_GATT_PROXY_SERVER**

BLE Mesh GATT Proxy Server

*Found in: Component config > CONFIG_BLE_MESH*

This option enables support for Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network. This option should be enabled if a node is going to be a Proxy Server.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_NODE_ID_TIMEOUT**

Node Identity advertising timeout

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER*

This option determines for how long the local node advertises using Node Identity. The given value is in seconds. The specification limits this to 60 seconds and lists it as the recommended value as well. So leaving the default value is the safest option. When an unprovisioned device is provisioned successfully and becomes a node, it will start to advertise using Node Identity during the time set by this option. And after that, Network ID will be advertised.

**Range:**

- from 1 to 60 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH`

**Default value:**

- 60 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROXY_FILTER_SIZE**

Maximum number of filter entries per Proxy Client

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER*

This option specifies how many Proxy Filter entries the local node supports. The entries of Proxy filter (whitelist or blacklist) are used to store a list of addresses which can be used to decide which messages will be forwarded to the Proxy Client by the Proxy Server.

**Range:**
**Chapter 2. API Reference**

- from 1 to 32767 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`

**Default value:**
- 4 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_GATT_PROXY_CLIENT**

BLE Mesh GATT Proxy Client

*Found in: Component config > CONFIG_BLE_MESH*

This option enables support for Mesh GATT Proxy Client. The Proxy Client can use the GATT bearer to send mesh messages to a node that supports the advertising bearer.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SETTINGS**

Store BLE Mesh configuration persistently

*Found in: Component config > CONFIG_BLE_MESH*

When selected, the BLE Mesh stack will take care of storing/restoring the BLE Mesh configuration persistently in flash. If the device is a BLE Mesh node, when this option is enabled, the configuration of the device will be stored persistently, including unicast address, NetKey, AppKey, etc. And if the device is a BLE Mesh Provisioner, the information of the device will be stored persistently, including the information of provisioned nodes, NetKey, AppKey, etc.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_STORE_TIMEOUT**

Delay (in seconds) before storing anything persistently

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines in seconds how soon any pending changes are actually written into persistent storage (flash) after a change occurs. The option allows nodes to delay a certain period of time to save proper information to flash. The default value is 0, which means information will be stored immediately once there are updates.

**Range:**
- from 0 to 1000000 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**Default value:**
- 0 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SEQ_STORE_RATE**

How often the sequence number gets updated in storage

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines how often the local sequence number gets updated in persistent storage (i.e. flash), e.g. a value of 100 means that the sequence number will be stored to flash on every 100th increment. If the node sends messages very frequently a higher value makes more sense, whereas if the node sends infrequently a value as low as 0 (update storage for every increment) can make sense. When the stack gets initialized it will add sequence number to the last stored one, so that it starts off with a value that’s guaranteed to be larger than the last one used before power off.

**Range:**
- from 0 to 1000000 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`
**Default value:**
- 0 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_RPL_STORE_TIMEOUT**

Minimum frequency that the RPL gets updated in storage

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines in seconds how soon the RPL (Replay Protection List) gets written to persistent storage after a change occurs. If the node receives messages frequently, then a large value is recommended. If the node receives messages rarely, then the value can be as low as 0 (which means the RPL is written into the storage immediately). Note that if the node operates in a security-sensitive case, and there is a risk of sudden power-off, then a value of 0 is strongly recommended. Otherwise, a power loss before RPL being written into the storage may introduce message replay attacks and system security will be in a vulnerable state.

**Range:**
- from 0 to 1000000 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**Default value:**
- 0 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SETTINGS_BACKWARD_COMPATIBILITY**

A specific option for settings backward compatibility

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This option is created to solve the issue of failure in recovering node information after mesh stack updates. In the old version mesh stack, there is no key of “mesh/role” in nvs. In the new version mesh stack, key of “mesh/role” is added in nvs, recovering node information needs to check “mesh/role” key in nvs and implements selective recovery of mesh node information. Therefore, there may be failure in recovering node information during node restarting after OTA.

The new version mesh stack adds the option of “mesh/role” because we have added the support of storing Provisioner information, while the old version only supports storing node information.

If users are updating their nodes from old version to new version, we recommend enabling this option, so that system could set the flag in advance before recovering node information and make sure the node information recovering could work as expected.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SPECIFIC_PARTITION**

Use a specific NVS partition for BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

When selected, the mesh stack will use a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using nvs_flash_init_partition() API, and the partition must exists in the csv file. When Provisioner needs to store a large amount of nodes’ information in the flash (e.g. more than 20), this option is recommended to be enabled.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`
**CONFIG_BLE_MESH_PARTITION_NAME**

Name of the NVS partition for BLE Mesh

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_SPECIFIC_PARTITION

This value defines the name of the specified NVS partition used by the mesh stack.

**Default value:**

- “ble_mesh” if CONFIG_BLE_MESH_SPECIFIC_PARTITION && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE**

Support using multiple NVS namespaces by Provisioner

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS

When selected, Provisioner can use different NVS namespaces to store different instances of mesh information. For example, if in the first room, Provisioner uses NetKey A, AppKey A and provisions three devices, these information will be treated as mesh information instance A. When the Provisioner moves to the second room, it uses NetKey B, AppKey B and provisions two devices, then the information will be treated as mesh information instance B. Here instance A and instance B will be stored in different namespaces. With this option enabled, Provisioner needs to use specific functions to open the corresponding NVS namespace, restore the mesh information, release the mesh information or erase the mesh information.

**Default value:**

- No (disabled) if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_MAX_NVNS_NAMESPACE**

Maximum number of NVS namespaces

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE

This option specifies the maximum NVS namespaces supported by Provisioner.

**Range:**

- from 1 to 255 if CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

**Default value:**

- 2 if CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_SUBNET_COUNT**

Maximum number of mesh subnets per network

*Found in:* Component config > CONFIG_BLE_MESH

This option specifies how many subnets a Mesh network can have at the same time. Indeed, this value decides the number of the network keys which can be owned by a node.

**Range:**

- from 1 to 4096 if CONFIG_BLE_MESH

**Default value:**

- 3 if CONFIG_BLE_MESH
CONFIG_BLE_MESH_APP_KEY_COUNT

Maximum number of application keys per network

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies how many application keys the device can store per network. Indeed, this value
decides the number of the application keys which can be owned by a node.

*Range:*
  - from 1 to 4096 if CONFIG_BLE_MESH

*Default value:*
  - 3 if CONFIG_BLE_MESH

CONFIG_BLE_MESH_MODEL_KEY_COUNT

Maximum number of application keys per model

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum number of application keys to which each model can be bound.

*Range:*
  - from 1 to 4096 if CONFIG_BLE_MESH

*Default value:*
  - 3 if CONFIG_BLE_MESH

CONFIG_BLE_MESH_MODEL_GROUP_COUNT

Maximum number of group address subscriptions per model

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum number of addresses to which each model can be subscribed.

*Range:*
  - from 1 to 4096 if CONFIG_BLE_MESH

*Default value:*
  - 3 if CONFIG_BLE_MESH

CONFIG_BLE_MESH_LABEL_COUNT

Maximum number of Label UUIDs used for Virtual Addresses

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies how many Label UUIDs can be stored. Indeed, this value decides the number of
the Virtual Addresses can be supported by a node.

*Range:*
  - from 0 to 4096 if CONFIG_BLE_MESH

*Default value:*
  - 3 if CONFIG_BLE_MESH

CONFIG_BLE_MESH_CRPL

Maximum capacity of the replay protection list

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum capacity of the replay protection list. It is similar to Network message
cache size, but has a different purpose. The replay protection list is used to prevent a node from replay
attack, which will store the source address and sequence number of the received mesh messages. For
Provisioner, the replay protection list size should not be smaller than the maximum number of nodes
whose information can be stored. And the element number of each node should also be taken into
consideration. For example, if Provisioner can provision up to 20 nodes and each node contains two elements, then the replay protection list size of Provisioner should be at least 40.

**Range:**
- from 2 to 65535 if `CONFIG_BLE_MESH`

**Default value:**
- 10 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_MSG_CACHE_SIZE**

Network message cache size

*Found in: Component config > CONFIG_BLE_MESH*

Number of messages that are cached for the network. This helps prevent unnecessary decryption operations and unnecessary relays. This option is similar to Replay protection list, but has a different purpose. A node is not required to cache the entire Network PDU and may cache only part of it for tracking, such as values for SRC/SEQ or others.

**Range:**
- from 2 to 65535 if `CONFIG_BLE_MESH`

**Default value:**
- 10 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_ADV_BUF_COUNT**

Number of advertising buffers

*Found in: Component config > CONFIG_BLE_MESH*

Number of advertising buffers available. The transport layer reserves ADV_BUF_COUNT - 3 buffers for outgoing segments. The maximum outgoing SDU size is 12 times this value (out of which 4 or 8 bytes are used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC, or 52 bytes using an 8-byte MIC.

**Range:**
- from 6 to 256 if `CONFIG_BLE_MESH`

**Default value:**
- 60 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_IVU_DIVIDER**

Divider for IV Update state refresh timer

*Found in: Component config > CONFIG_BLE_MESH*

When the IV Update state enters Normal operation or IV Update in Progress, we need to keep track of how many hours has passed in the state, since the specification requires us to remain in the state at least for 96 hours (Update in Progress has an additional upper limit of 144 hours).

In order to fulfill the above requirement, even if the node might be powered off once in a while, we need to store persistently how many hours the node has been in the state. This doesn’t necessarily need to happen every hour (thanks to the flexible duration range). The exact cadence will depend a lot on the ways that the node will be used and what kind of power source it has.

Since there is no single optimal answer, this configuration option allows specifying a divider, i.e. how many intervals the 96 hour minimum gets split into. After each interval the duration that the node has been in the current state gets stored to flash. E.g. the default value of 4 means that the state is saved every 24 hours (96 / 4).

**Range:**
- from 2 to 96 if `CONFIG_BLE_MESH`
**Default value:**
- 4 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_TX_SEG_MSG_COUNT**

Maximum number of simultaneous outgoing segmented messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of simultaneous outgoing multi-segment and/or reliable messages. The default value is 1, which means the device can only send one segmented message at a time. And if another segmented message is going to be sent, it should wait for the completion of the previous one. If users are going to send multiple segmented messages at the same time, this value should be configured properly.

*Range:*
- from 1 to if `CONFIG_BLE_MESH`

*Default value:*
- 1 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_RX_SEG_MSG_COUNT**

Maximum number of simultaneous incoming segmented messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of simultaneous incoming multi-segment and/or reliable messages. The default value is 1, which means the device can only receive one segmented message at a time. And if another segmented message is going to be received, it should wait for the completion of the previous one. If users are going to receive multiple segmented messages at the same time, this value should be configured properly.

*Range:*
- from 1 to 255 if `CONFIG_BLE_MESH`

*Default value:*
- 1 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_RX_SDU_MAX**

Maximum incoming Upper Transport Access PDU length

*Found in: Component config > CONFIG_BLE_MESH*

Maximum incoming Upper Transport Access PDU length. Leave this to the default value, unless you really need to optimize memory usage.

*Range:*
- from 36 to 384 if `CONFIG_BLE_MESH`

*Default value:*
- 384 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_TX_SEG_MAX**

Maximum number of segments in outgoing messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of segments supported for outgoing messages. This value should typically be fine-tuned based on what models the local node supports, i.e. what’s the largest message payload that the node needs to be able to send. This value affects memory and call stack consumption, which is why the default is lower than the maximum that the specification would allow (32 segments).
The maximum outgoing SDU size is 12 times this number (out of which 4 or 8 bytes is used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC and 52 bytes using an 8-byte MIC.

Be sure to specify a sufficient number of advertising buffers when setting this option to a higher value. There must be at least three more advertising buffers (BLE_MESH_ADV_BUF_COUNT) as there are outgoing segments.

**Range:**
- from 2 to 32 if `CONFIG_BLE_MESH`

**Default value:**
- 32 if `CONFIG_BLE_MESH`

---

**CONFIG_BLE_MESH_RELAY**

Relay support

*Found in:* `Component config > CONFIG_BLE_MESH`

Support for acting as a Mesh Relay Node. Enabling this option will allow a node to support the Relay feature, and the Relay feature can still be enabled or disabled by proper configuration messages. Disabling this option will let a node not support the Relay feature.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH`

---

**CONFIG_BLE_MESH_RELAY_ADV_BUF**

Use separate advertising buffers for relay packets

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY`

When selected, self-send packets will be put in a high-priority queue and relay packets will be put in a low-priority queue.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_RELAY && CONFIG_BLE_MESH`

---

**CONFIG_BLE_MESH_RELAY_ADV_BUF_COUNT**

Number of advertising buffers for relay packets

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY > CONFIG_BLE_MESH_RELAY_ADV_BUF`

Number of advertising buffers for relay packets available.

**Range:**
- from 6 to 256 if `CONFIG_BLE_MESH_RELAY_ADV_BUF && CONFIG_BLE_MESH_RELAY && CONFIG_BLE_MESH`

**Default value:**
- 60 if `CONFIG_BLE_MESH_RELAY_ADV_BUF && CONFIG_BLE_MESH_RELAY && CONFIG_BLE_MESH`

---

**CONFIG_BLE_MESH_LOWPOWER**

Support for Low Power features

*Found in:* `Component config > CONFIG_BLE_MESH`

Enable this option to operate as a Low Power Node. If low power consumption is required by a node, this option should be enabled. And once the node enters the mesh network, it will try to find a Friend node and establish a friendship.
**CONFIG_BLE_MESH_LPN_ESTABLISHMENT**

Perform Friendship establishment using low power

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Perform the Friendship establishment using low power with the help of a reduced scan duty cycle. The downside of this is that the node may miss out on messages intended for it until it has successfully set up Friendship with a Friend node. When this option is enabled, the node will stop scanning for a period of time after a Friend Request or Friend Poll is sent, so as to reduce more power consumption.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_AUTO**

Automatically start looking for Friend nodes once provisioned

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Once provisioned, automatically enable LPN functionality and start looking for Friend nodes. If this option is disabled LPN mode needs to be manually enabled by calling `bt_mesh_lpn_set(true)`. When an unprovisioned device is provisioned successfully and becomes a node, enabling this option will trigger the node starts to send Friend Request at a certain period until it finds a proper Friend node.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_AUTO_TIMEOUT**

Time from last received message before going to LPN mode

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER > CONFIG_BLE_MESH_LPN_AUTO*

Time in seconds from the last received message, that the node waits out before starting to look for Friend nodes.

**Range:**
- from 0 to 3600 if `CONFIG_BLE_MESH_LPN_AUTO` && `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**
- 15 if `CONFIG_BLE_MESH_LPN_AUTO` && `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_RETRY_TIMEOUT**

Retry timeout for Friend requests

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Time in seconds between Friend Requests, if a previous Friend Request did not yield any acceptable Friend Offers.

**Range:**
- from 1 to 3600 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**
- 6 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_RSSI_FACTOR**
Chapter 2. API Reference

**RSSIFactor**, used in Friend Offer Delay calculation

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The contribution of the RSSI, measured by the Friend node, used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. RSSIFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**
- from 0 to 3 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**Default value:**
- 0 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_LPN_RECV_WIN_FACTOR**

ReceiveWindowFactor, used in Friend Offer Delay calculation

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The contribution of the supported Receive Window used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. ReceiveWindowFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**
- from 0 to 3 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**Default value:**
- 0 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_LPN_MIN_QUEUE_SIZE**

Minimum size of the acceptable friend queue (MinQueueSizeLog)

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The MinQueueSizeLog field is defined as log_2(N), where N is the minimum number of maximum size Lower Transport PDUs that the Friend node can store in its Friend Queue. As an example, MinQueueSizeLog value 1 gives N = 2, and value 7 gives N = 128.

**Range:**
- from 1 to 7 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**Default value:**
- 1 if CONFIG_BLE_MESH_LOWPOWER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_LPN_RECV_DELAY**

Receive delay requested by the local node

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The ReceiveDelay is the time between the Low Power node sending a request and listening for a response. This delay allows the Friend node time to prepare the response. The value is in units of milliseconds.

**Range:**
- from 10 to 255 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**Default value:**
- 100 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_LPN_POLL_TIMEOUT**

The value of the PollTimeout timer

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*
PollTimeout timer is used to measure time between two consecutive requests sent by a Low Power node. If no requests are received the Friend node before the PollTimeout timer expires, then the friendship is considered terminated. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds. The smaller the value, the faster the Low Power node tries to get messages from corresponding Friend node and vice versa.

**Range:**
- from 10 to 244735 if `CONFIG_BLE_MESH_LOW_POWER` & `CONFIG_BLE_MESH_LOW_POWER` & `CONFIG_BLE_MESH_LOW_POWER` & `CONFIG_BLE_MESH_LOW_POWER`

**Default value:**
- 300 if `CONFIG_BLE_MESH_LOW_POWER` & `CONFIG_BLE_MESH_LOW_POWER` & `CONFIG_BLE_MESH_LOW_POWER` & `CONFIG_BLE_MESH_LOW_POWER`

**CONFIG_BLE_MESH_LPN_INIT_POLL_TIMEOUT**

The starting value of the PollTimeout timer

*Found in:* Component config > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_LOW_POWER`

The initial value of the PollTimeout timer when Friendship is to be established for the first time. After this, the timeout gradually grows toward the actual PollTimeout, doubling in value for each iteration. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds.

**Range:**
- from 10 to if `CONFIG_BLE_MESH_LOW_POWER` & `CONFIG_BLE_MESH_LOW_POWER` & `CONFIG_BLE_MESH_LOW_POWER` & `CONFIG_BLE_MESH_LOW_POWER`

**Default value:**
- if `CONFIG_BLE_MESH_LOW_POWER` & `CONFIG_BLE_MESH_LOW_POWER` & `CONFIG_BLE_MESH_LOW_POWER` & `CONFIG_BLE_MESH_LOW_POWER`

**CONFIG_BLE_MESH_LPN_SCAN_LATENCY**

Latency for enabling scanning

*Found in:* Component config > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_LOW_POWER`

Latency (in milliseconds) is the time it takes to enable scanning. In practice, it means how much time in advance of the Receive Window, the request to enable scanning is made.

**Range:**
- from 0 to 50 if `CONFIG_BLE_MESH_LOW_POWER` & `CONFIG_BLE_MESH_LOW_POWER` & `CONFIG_BLE_MESH_LOW_POWER`

**Default value:**
- 10 if `CONFIG_BLE_MESH_LOW_POWER` & `CONFIG_BLE_MESH_LOW_POWER` & `CONFIG_BLE_MESH_LOW_POWER`

**CONFIG_BLE_MESH_LPN_GROUPS**

Number of groups the LPN can subscribe to

*Found in:* Component config > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_LOW_POWER`

Maximum number of groups to which the LPN can subscribe.

**Range:**
- from 0 to 16384 if `CONFIG_BLE_MESH_LOW_POWER` & `CONFIG_BLE_MESH_LOW_POWER` & `CONFIG_BLE_MESH_LOW_POWER`

**Default value:**
- 8 if `CONFIG_BLE_MESH_LOW_POWER` & `CONFIG_BLE_MESH_LOW_POWER` & `CONFIG_BLE_MESH_LOW_POWER`

**CONFIG_BLE_MESH_FRIEND**

Support for Friend feature

*Found in:* Component config > `CONFIG_BLE_MESH`

Enable this option to be able to act as a Friend Node.
CONFIG_BLE_MESH_FRIEND_RECV_WIN

Friend Receive Window

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND

Receive Window in milliseconds supported by the Friend node.

Range:
- from 1 to 255 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH

Default value:
- 255 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH

CONFIG_BLE_MESH_FRIEND_QUEUE_SIZE

Minimum number of buffers supported per Friend Queue

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND

Minimum number of buffers available to be stored for each local Friend Queue. This option decides the size of each buffer which can be used by a Friend node to store messages for each Low Power node.

Range:
- from 2 to 65536 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH

Default value:
- 16 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH

CONFIG_BLE_MESH_FRIEND_SUB_LIST_SIZE

Friend Subscription List Size

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND

Size of the Subscription List that can be supported by a Friend node for a Low Power node. And Low Power node can send Friend Subscription List Add or Friend Subscription List Remove messages to the Friend node to add or remove subscription addresses.

Range:
- from 0 to 1023 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH

Default value:
- 3 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH

CONFIG_BLE_MESH_FRIEND_LPN_COUNT

Number of supported LPN nodes

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND

Number of Low Power Nodes with which a Friend can have Friendship simultaneously. A Friend node can have friendship with multiple Low Power nodes at the same time, while a Low Power node can only establish friendship with only one Friend node at the same time.

Range:
- from 1 to 1000 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH

Default value:
- 2 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH

CONFIG_BLE_MESH_FRIEND_SEG_RX

Number of incomplete segment lists per LPN

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND

Number of incomplete segment lists tracked for each Friends’ LPN. In other words, this determines from how many elements can segmented messages destined for the Friend queue be received simultaneously.
Range:
- from 1 to 1000 if \texttt{CONFIG\_BLE\_MESH\_FRIEND} && \texttt{CONFIG\_BLE\_MESH}

Default value:
- 1 if \texttt{CONFIG\_BLE\_MESH\_FRIEND} && \texttt{CONFIG\_BLE\_MESH}

\texttt{CONFIG\_BLE\_MESH\_NO\_LOG}

Disable BLE Mesh debug logs (minimize bin size)

\textit{Found in: Component config > CONFIG\_BLE\_MESH}

Select this to save the BLE Mesh related rodata code size. Enabling this option will disable the output of BLE Mesh debug log.

Default value:
- No (disabled) if \texttt{CONFIG\_BLE\_MESH} && \texttt{CONFIG\_BLE\_MESH}

\texttt{BLE Mesh STACK DEBUG LOG LEVEL} \quad \text{Contains:}
- \texttt{CONFIG\_BLE\_MESH\_STACK\_TRACE\_LEVEL}

\texttt{CONFIG\_BLE\_MESH\_STACK\_TRACE\_LEVEL}

\texttt{BLE\_MESH\_STACK}

\textit{Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh STACK DEBUG LOG LEVEL}

Define BLE Mesh trace level for BLE Mesh stack.

Available options:
- NONE (\texttt{BLE\_MESH\_TRACE\_LEVEL\_NONE})
- ERROR (\texttt{BLE\_MESH\_TRACE\_LEVEL\_ERROR})
- WARNING (\texttt{BLE\_MESH\_TRACE\_LEVEL\_WARNING})
- INFO (\texttt{BLE\_MESH\_TRACE\_LEVEL\_INFO})
- DEBUG (\texttt{BLE\_MESH\_TRACE\_LEVEL\_DEBUG})
- VERBOSE (\texttt{BLE\_MESH\_TRACE\_LEVEL\_VERBOSE})

\texttt{BLE Mesh NET BUF DEBUG LOG LEVEL} \quad \text{Contains:}
- \texttt{CONFIG\_BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL}

\texttt{CONFIG\_BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL}

\texttt{BLE\_MESH\_NET\_BUF}

\textit{Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh NET BUF DEBUG LOG LEVEL}

Define BLE Mesh trace level for BLE Mesh net buffer.

Available options:
- NONE (\texttt{BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_NONE})
- ERROR (\texttt{BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_ERROR})
- WARNING (\texttt{BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_WARNING})
- INFO (\texttt{BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_INFO})
- DEBUG (\texttt{BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_DEBUG})
- VERBOSE (\texttt{BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_VERBOSE})
CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT

Timeout(ms) for client message response

*Found in: Component config > CONFIG_BLE_MESH*

Timeout value used by the node to get response of the acknowledged message which is sent by the client model. This value indicates the maximum time that a client model waits for the response of the sent acknowledged messages. If a client model uses 0 as the timeout value when sending acknowledged messages, then the default value will be used which is four seconds.

**Range:**
- from 100 to 1200000 if CONFIG_BLE_MESH

**Default value:**
- 4000 if CONFIG_BLE_MESH

**Support for BLE Mesh Foundation models**

Contains:

- CONFIG_BLE_MESH_CFG_CLI
- CONFIG_BLE_MESH_HEALTH_CLI
- CONFIG_BLE_MESH_HEALTH_SRV

CONFIG_BLE_MESH_CFG_CLI

Configuration Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Configuration Client model.

CONFIG_BLE_MESH_HEALTH_CLI

Health Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Client model.

CONFIG_BLE_MESH_HEALTH_SRV

Health Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Server model.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH

**Support for BLE Mesh Client/Server models**

Contains:

- CONFIG_BLE_MESH_GENERIC_BATTERY_CLI
- CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI
- CONFIG_BLE_MESH_GENERIC_LEVEL_CLI
- CONFIG_BLE_MESH_GENERIC_LOCATION_CLI
- CONFIG_BLE_MESH_GENERIC_ONOFF_CLI

**CONFIG_BLE_MESH_GENERIC_ONOFF_CLI**

Generic OnOff Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic OnOff Client model.

**CONFIG_BLE_MESH_GENERIC_LEVEL_CLI**

Generic Level Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Level Client model.

**CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI**

Generic Default Transition Time Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Default Transition Time Client model.

**CONFIG_BLE_MESH_GENERIC_POWER_ONOFF_CLI**

Generic Power OnOff Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Power OnOff Client model.

**CONFIG_BLE_MESH_GENERIC_POWER_LEVEL_CLI**

Generic Power Level Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Power Level Client model.

**CONFIG_BLE_MESH GENERIC_BATTERY_CLI**

Generic Battery Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Battery Client model.
**CONFIG_BLE_MESH_GENERIC_LOCATION_CLI**

Generic Location Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Location Client model.

**CONFIG_BLE_MESH_GENERIC_PROPERTY_CLI**

Generic Property Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Property Client model.

**CONFIG_BLE_MESH_SENSOR_CLI**

Sensor Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Sensor Client model.

**CONFIG_BLE_MESH_TIME_CLI**

Time Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Time Client model.

**CONFIG_BLE_MESH_SCENE_CLI**

Scene Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Scene Client model.

**CONFIG_BLE_MESH_SCHEDULER_CLI**

Scheduler Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Scheduler Client model.

**CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI**

Light Lightness Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light Lightness Client model.

**CONFIG_BLE_MESH_LIGHT_CTL_CLI**

Light CTL Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light CTL Client model.
CONFIG_BLE_MESH_LIGHT_HSL_CLI

Light HSL Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Light HSL Client model.

CONFIG_BLE_MESH_LIGHT_XYL_CLI

Light XYL Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Light XYL Client model.

CONFIG_BLE_MESH_LIGHT_LC_CLI

Light LC Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Light LC Client model.

CONFIG_BLE_MESH_GENERIC_SERVER

Generic server models

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Generic server models.

Default value:
• Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_SENSOR_SERVER

Sensor server models

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Sensor server models.

Default value:
• Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_TIME_SCENE_SERVER

Time and Scenes server models

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Time and Scenes server models.

Default value:
• Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_LIGHTING_SERVER

Lighting server models

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Lighting server models.

Default value:
• Yes (enabled) if CONFIG_BLE_MESH
CONFIG_BLE_MESH_IV_UPDATE_TEST

Test the IV Update Procedure

*Found in: Component config > CONFIG_BLE_MESH*

This option removes the 96 hour limit of the IV Update Procedure and lets the state to be changed at any time. If IV Update test mode is going to be used, this option should be enabled.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

**BLE Mesh specific test option** Contains:

- CONFIG_BLE_MESH_DEBUG
- CONFIG_BLE_MESH_SHELL
- CONFIG_BLE_MESH_SELF_TEST

CONFIG_BLE_MESH_SELF_TEST

Perform BLE Mesh self-tests

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

This option adds extra self-tests which are run every time BLE Mesh networking is initialized.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_TEST_AUTO_ENTER_NETWORK

Unprovisioned device enters mesh network automatically

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_SELF_TEST*

With this option enabled, an unprovisioned device can automatically enter the mesh network using a specific test function without the provisioning procedure. And on the Provisioner side, a test function needs to be invoked to add the node information into the mesh stack.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH_SELF_TEST && CONFIG_BLE_MESH

CONFIG_BLE_MESH_TEST_USE_WHITE_LIST

Use white list to filter mesh advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_SELF_TEST*

With this option enabled, users can use white list to filter mesh advertising packets while scanning.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH_SELF_TEST && CONFIG_BLE_MESH

CONFIG_BLE_MESH_SHELL

Enable BLE Mesh shell

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

Activate shell module that provides BLE Mesh commands to the console.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH
Chapter 2. API Reference

CONFIG_BLE_MESH_DEBUG

Enable BLE Mesh debug logs

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option

Enable debug logs for the BLE Mesh functionality.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_DEBUG_NET

Network layer debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Network layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_TRANS

Transport layer debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Transport layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_BEACON

Beacon debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Beacon-related debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_CRYPTO

Crypto debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable cryptographic debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_prov

Provisioning debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Provisioning debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_ACCESS

Access layer debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Access layer debug logs for the BLE Mesh functionality.
CONFIG_BLE_MESH_DEBUG_MODEL

Foundation model debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Foundation Models debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_ADV

Advertising debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable advertising debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_LOW_POWER

Low Power debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Low Power debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_FRIEND

Friend debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Friend debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_PROXY

Proxy debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Proxy protocol debug logs for the BLE Mesh functionality.

Driver configurations Contains:

- ADC configuration
- GDMA Configuration
- GPTimer Configuration
- MCPWM configuration
- SPI configuration
- TWAI configuration
- UART configuration

ADC configuration Contains:

- CONFIG_ADC_DISABLE_DAC
- CONFIG_ADC_FORCE_XPD_FSM
Chapter 2. API Reference

**CONFIG_ADC_FORCE_XPD_FSM**

Use the FSM to control ADC power

*Found in: Component config > Driver configurations > ADC configuration*

ADC power can be controlled by the FSM instead of software. This allows the ADC to be shut off when it is not working leading to lower power consumption. However using the FSM control ADC power will increase the noise of ADC.

**Default value:**
- No (disabled)

**CONFIG_ADC_DISABLE_DAC**

Disable DAC when ADC2 is used on GPIO 25 and 26

*Found in: Component config > Driver configurations > ADC configuration*

If this is set, the ADC2 driver will disable the output of the DAC corresponding to the specified channel. This is the default value.

For testing, disable this option so that we can measure the output of DAC by internal ADC.

**Default value:**
- Yes (enabled)

**MCPWM configuration**

Contains:
- **CONFIG_MCPWM_ISR_IN_IRAM**

**CONFIG_MCPWM_ISR_IN_IRAM**

Place MCPWM ISR function into IRAM

*Found in: Component config > Driver configurations > MCPWM configuration*

If this option is not selected, the MCPWM interrupt will be deferred when the Cache is in a disabled state (e.g. Flash write/erase operation).

Note that if this option is selected, all user registered ISR callbacks should never try to use cache as well. (with IRAM_ATTR)

**Default value:**
- No (disabled)

**SPI configuration**

Contains:
- **CONFIG_SPI_MASTER_ISR_IN_IRAM**
- **CONFIG_SPI_SLAVE_ISR_IN_IRAM**
- **CONFIG_SPI_MASTER_IN_IRAM**
- **CONFIG_SPI_SLAVE_IN_IRAM**

**CONFIG_SPI_MASTER_IN_IRAM**

Place transmitting functions of SPI master into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Normally only the ISR of SPI master is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there’s some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put queue\_trans, get\_trans, result and transmit functions into the IRAM to avoid possible cache miss.
During unit test, this is enabled to measure the ideal case of api.

**Default value:**
- No (disabled)

**CONFIG_SPI_MASTER_ISR_IN_IRAM**
Place SPI master ISR function into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Place the SPI master ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add ESP_INTR_FLAG_IRAM when initializing the driver.

**Default value:**
- Yes (enabled)

**CONFIG_SPI_SLAVE_ISR_IN_IRAM**
Place SPI slave ISR function into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Place the SPI slave ISR into IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add ESP_INTR_FLAG_IRAM when initializing the driver.

**Default value:**
- Yes (enabled)

**CONFIG_TWAI_ISR_IN_IRAM**
Place TWAI ISR function into IRAM

*Found in: Component config > Driver configurations > TWAI configuration*

Place the TWAI ISR in to IRAM. This will allow the ISR to avoid cache misses, and also be able to run whilst the cache is disabled (such as when writing to SPI Flash). Note that if this option is enabled: - Users should also set the ESP_INTR_FLAG_IRAM in the driver configuration structure when installing the driver (see docs for specifics). - Alert logging (i.e., setting of the TWAI_ALERT_AND_LOG flag) will have no effect.

**Default value:**
- No (disabled)

**TWAI configuration** Contains:

- **CONFIG_TWAI_ISR_IN_IRAM**
Chapter 2. API Reference

- No (disabled)

**UART configuration**  Contains:
  - `CONFIG_UART_ISR_IN_IRAM`

**CONFIG_UART_ISR_IN_IRAM**

Place UART ISR function into IRAM

*Found in: Component config > Driver configurations > UART configuration*

If this option is not selected, UART interrupt will be disabled for a long time and may cause data lost when doing spi flash operation.

**Default value:**  
- No (disabled)

**GDMA Configuration**  Contains:
  - `CONFIG_GDMA_ISR_IRAM_SAFE`
  - `CONFIG_GDMA_CTRL_FUNC_IN_IRAM`

**CONFIG_GDMA_CTRL_FUNC_IN_IRAM**

Place GDMA control functions into IRAM

*Found in: Component config > Driver configurations > GDMA Configuration*

Place GDMA control functions (like start/stop/append/reset) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**  
- No (disabled)

**CONFIG_GDMA_ISR_IRAM_SAFE**

GDMA ISR IRAM-Safe

*Found in: Component config > Driver configurations > GDMA Configuration*

This will ensure the GDMA interrupt handler is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write).

**Default value:**  
- No (disabled)

**GPTimer Configuration**  Contains:
  - `CONFIG_GPTIMER_ISR(IRAM_SAFE)`
  - `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM`
  - `CONFIG_GPTIMER_SUPPRESS_DEPRECATE_WARN`

**CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM**

Place GPTimer control functions into IRAM

*Found in: Component config > Driver configurations > GPTimer Configuration*
Place GPTimer control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled)

**CONFIG_GPTIMER_ISR_IRAM_SAFE**

GPTimer ISR IRAM-Safe

*Found in: Component config > Driver configurations > GPTimer Configuration*

This will ensure the GPTimer interrupt handle is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write)

**Default value:**
- No (disabled)

**CONFIG_GPTIMER.Suppress_Deprecate_Warn**

Suppress legacy driver deprecated warning

*Found in: Component config > Driver configurations > GPTimer Configuration*

Whether to suppress the deprecation warnings when using legacy timer group driver (driver/timer.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

**eFuse Bit Manager** Contains:

- **CONFIG_EFUSE_VIRTUAL**
- **CONFIG_EFUSE_CUSTOM_TABLE**

**CONFIG_EFUSE_CUSTOM_TABLE**

Use custom eFuse table

*Found in: Component config > eFuse Bit Manager*

Allows to generate a structure for eFuse from the CSV file.

**Default value:**
- No (disabled)

**CONFIG_EFUSE_CUSTOM_TABLE_FILENAME**

Custom eFuse CSV file

*Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_CUSTOM_TABLE*

Name of the custom eFuse CSV filename. This path is evaluated relative to the project root directory.

**Default value:**
- “main/esp_efuse_custom_table.csv” if **CONFIG_EFUSE_CUSTOM_TABLE**
CONFIG_EFUSE_VIRTUAL

Simulate eFuse operations in RAM

*Found in: Component config > eFuse Bit Manager*

If “n” - No virtual mode. All eFuse operations are real and use eFuse registers. If “y” - The virtual mode is enabled and all eFuse operations (read and write) are redirected to RAM instead of eFuse registers, all permanent changes (via eFuse) are disabled. Log output will state changes that would be applied, but they will not be.

During startup, the eFuses are copied into RAM. This mode is useful for fast tests.

**Default value:**
- No (disabled)

CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH

Keep eFuses in flash

*Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_VIRTUAL*

In addition to the “Simulate eFuse operations in RAM” option, this option just adds a feature to keep eFuses after reboots in flash memory. To use this mode the partition_table should have the efuse partition. partion.csv: “efuse_em, data, efuse, , 0x2000,”

During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This mode is useful when need to keep changes after reboot (testing secure_boot and flash_encryption).

ESP-TLS Contains:
- CONFIG_ESP_TLS_INSECURE
- CONFIG_ESP_TLS_LIBRARY_CHOOSE
- CONFIG_ESP_TLS_CLIENT_SESSION_TICKETS
- CONFIG_ESP_DEBUG_WOLFSSL
- CONFIG_ESP_TLS_SERVER
- CONFIG_ESP_TLS_PSK_VERIFICATION
- CONFIG_ESP_TLS_SERVER_SESSION_TICKETS
- CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY
- CONFIG_ESP_TLS_USE_DS_PERIPHERAL

CONFIG_ESP_TLS_LIBRARY_CHOOSE

Choose SSL/TLS library for ESP-TLS (See help for more Info)

*Found in: Component config > ESP-TLS*

The ESP-TLS APIs support multiple backend TLS libraries. Currently mbedTLS and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

**Available options:**
- mbedTLS (ESP_TLS_USINGMBEDTLS)
- wolfSSL (License info in wolfSSL directory README) (ESP_TLS_USING_WOLFSSL)

CONFIG_ESP_TLS_USE_DS_PERIPHERAL

Use Digital Signature (DS) Peripheral with ESP-TLS

*Found in: Component config > ESP-TLS*
Enable use of the Digital Signature Peripheral for ESP-TLS. The DS peripheral can only be used when it is appropriately configured for TLS. Consult the ESP-TLS documentation in ESP-IDF Programming Guide for more details.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_TLS_SERVER**
Enable ESP-TLS Server

*Found in: Component config > ESP-TLS*

Enable support for creating server side SSL/TLS session, available for mbedTLS as well as wolfSSL TLS library.

**Default value:**
- No (disabled)

**CONFIG_ESP_TLS_CLIENT_SESSION_TICKETS**
Enable client session tickets

*Found in: Component config > ESP-TLS*

Enable session ticket support as specified in RFC5077.

**Default value:**
- No (disabled)

**CONFIG_ESP_TLS_SERVER_SESSION_TICKETS**
Enable server session tickets

*Found in: Component config > ESP-TLS*

Enable session ticket support as specified in RFC5077

**Default value:**
- No (disabled) if `CONFIG_ESP_TLS_SERVER && ESP_TLS_USING_MBEDTLS && CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS`

**CONFIG_ESP_TLS_SERVER_SESSION_TICKET_TIMEOUT**
Server session ticket timeout in seconds

*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_SERVER_SESSION_TICKETS*

Sets the session ticket timeout used in the tls server.

**Default value:**
- 86400 if `CONFIG_ESP_TLS_SERVER_SESSION_TICKETS`

**CONFIG_ESP_TLS_PSK_VERIFICATION**
Enable PSK verification

*Found in: Component config > ESP-TLS*

Enable support for pre shared key ciphers, supported for both mbedTLS as well as wolfSSL TLS library.

**Default value:**
- No (disabled)
CONFIG_ESP_TLS_INSECURE

Allow potentially insecure options

*Found in: Component config > ESP-TLS*

You can enable some potentially insecure options. These options should only be used for testing purposes. Only enable these options if you are very sure.

CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY

Skip server certificate verification by default (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_INSECURE*

After enabling this option the esp-tls client will skip the server certificate verification by default. Note that this option will only modify the default behaviour of esp-tls client regarding server cert verification. The default behaviour should only be applicable when no other option regarding the server cert verification is opted in the esp-tls config (e.g. crt_bundle_attach, use_global_ca_store etc.). WARNING : Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca_store etc.

CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY

Enable SMALL_CERT_VERIFY

*Found in: Component config > ESP-TLS*

Enables server verification with Intermediate CA cert, does not authenticate full chain of trust upto the root CA cert (After Enabling this option client only needs to have Intermediate CA certificate of the server to authenticate server, root CA cert is not necessary).

**Default value:**
- Yes (enabled) if ESP_TLS_USING_WOLFSSL

CONFIG_ESP_DEBUG_WOLFSSL

Enable debug logs for wolfSSL

*Found in: Component config > ESP-TLS*

Enable detailed debug prints for wolfSSL SSL library.

**Default value:**
- No (disabled) if ESP_TLS_USING_WOLFSSL

ESP32C3-Specific Contains:

- CONFIG_ESP32C3_DEFAULT_CPU_FREQ_MHZ
- CONFIG_ESP32C3_BROWNOUT_DET
- CONFIG_ESP32C3_DEBUG_OCDAWARE
- CONFIG_ESP32C3_REV_MIN
- CONFIG_ESP32C3_NO_BLOBS
- CONFIG_ESP32C3_RTC_CLK_CAL_CYCLES
- CONFIG_ESP32C3_RTC_CLK_SRC
- CONFIG_ESP32C3_TIME_SYSCALL
CONFIG_ESP32C3_DEFAULT_CPU_FREQ_MHZ

CPU frequency

*Found in: Component config > ESP32C3-Specific*

CPU frequency to be set on application startup.

*Available options:*
- 40 MHz (ESP32C3_DEFAULT_CPU_FREQ_40)
- 80 MHz (ESP32C3_DEFAULT_CPU_FREQ_80)
- 160 MHz (ESP32C3_DEFAULT_CPU_FREQ_160)

CONFIG_ESP32C3_REV_MIN

Minimum Supported ESP32-C3 Revision

*Found in: Component config > ESP32C3-Specific*

Minimum revision that ESP-IDF would support.

Only supporting higher chip revisions can reduce binary size.

*Available options:*
- Rev 0 (ESP32C3_REV_MIN_0)
- Rev 1 (ESP32C3_REV_MIN_1)
- Rev 2 (ESP32C3_REV_MIN_2)
- Rev 3 (ESP32C3_REV_MIN_3)

CONFIG_ESP32C3_DEBUG_OCD_AWARE

Make exception and panic handlers JTAG/OCD aware

*Found in: Component config > ESP32C3-Specific*

The FreeRTOS panic and unhandled exception handlers can detect a JTAG OCD debugger and instead of panicking, have the debugger stop on the offending instruction.

*Default value:*
- Yes (enabled)

CONFIG_ESP32C3_BROWNOUT_DET

Hardware brownout detect & reset

*Found in: Component config > ESP32C3-Specific*

The ESP32-C3 has a built-in brownout detector which can detect if the voltage is lower than a specific value. If this happens, it will reset the chip in order to prevent unintended behaviour.

*Default value:*
- Yes (enabled)

CONFIG_ESP32C3_BROWNOUT_DET_LVL_SEL

Brownout voltage level

*Found in: Component config > ESP32C3-Specific > CONFIG_ESP32C3_BROWNOUT_DET*

The brownout detector will reset the chip when the supply voltage is approximately below this level. Note that there may be some variation of brownout voltage level between each chip.

#The voltage levels here are estimates, more work needs to be done to figure out the exact voltages #of the brownout threshold levels.

*Available options:*
Chapter 2. API Reference

• 2.51V (ESP32C3_BROWNOUT_DET_LVL_SEL_7)
• 2.64V (ESP32C3_BROWNOUT_DET_LVL_SEL_6)
• 2.76V (ESP32C3_BROWNOUT_DET_LVL_SEL_5)
• 2.92V (ESP32C3_BROWNOUT_DET_LVL_SEL_4)
• 3.10V (ESP32C3_BROWNOUT_DET_LVL_SEL_3)
• 3.27V (ESP32C3_BROWNOUT_DET_LVL_SEL_2)

CONFIG_ESP32C3_TIME_SYSCALL

Timers used for gettimeofday function

*Found in: Component config > ESP32C3-Specific*

This setting defines which hardware timers are used to implement ‘gettimeofday’ and ‘time’ functions in C library.

• If both high-resolution (systimer) and RTC timers are used, timekeeping will continue in deep sleep. Time will be reported at 1 microsecond resolution. This is the default, and the recommended option.
• If only high-resolution timer (systimer) is used, gettimeofday will provide time at microsecond resolution. Time will not be preserved when going into deep sleep mode.
• If only RTC timer is used, timekeeping will continue in deep sleep, but time will be measured at 6.6 microsecond resolution. Also the gettimeofday function itself may take longer to run.
• If no timers are used, gettimeofday and time functions return -1 and set errno to ENOSYS.
• When RTC is used for timekeeping, two RTC_STORE registers are used to keep time in deep sleep mode.

*Available options:*

• RTC and high-resolution timer (ESP32C3_TIME_SYSCALL_USE_RTC_SYSTIMER)
• RTC (ESP32C3_TIME_SYSCALL_USE_RTC)
• High-resolution timer (ESP32C3_TIME_SYSCALL_USE_SYSTIMER)
• None (ESP32C3_TIME_SYSCALL_USE_NONE)

CONFIG_ESP32C3_RTC_CLK_SRC

RTC clock source

*Found in: Component config > ESP32C3-Specific*

Choose which clock is used as RTC clock source.

*Available options:*

• Internal 150kHz RC oscillator (ESP32C3_RTC_CLK_SRC_INT_RC)
• External 32kHz crystal (ESP32C3_RTC_CLK_SRC_EXT_CRYST)
• External 32kHz oscillator at 32K_XP pin (ESP32C3_RTC_CLK_SRC_EXT_OSC)
• Internal 8MHz oscillator, divided by 256 (~32kHz) (ESP32C3_RTC_CLK_SRC_INT_8MD256)

CONFIG_ESP32C3_RTC_CLK_CAL_CYCLES

Number of cycles for RTC_SLOW_CLK calibration

*Found in: Component config > ESP32C3-Specific*

When the startup code initializes RTC_SLOW_CLK, it can perform calibration by comparing the RTC_SLOW_CLK frequency with main XTAL frequency. This option sets the number of RTC_SLOW_CLK cycles measured by the calibration routine. Higher numbers increase calibration precision, which may be important for applications which spend a lot of time in deep sleep. Lower numbers reduce startup time.

When this option is set to 0, clock calibration will not be performed at startup, and approximate clock frequencies will be assumed:
• 150000 Hz if internal RC oscillator is used as clock source. For this use value 1024.
• 32768 Hz if the 32k crystal oscillator is used. For this use value 3000 or more. In case more value will help improve the definition of the launch of the crystal. If the crystal could not start, it will be switched to internal RC.

Range:
• from 0 to 27000 if ESP32C3_RTC_CLK_SRC_EXT_CRYS || ESP32C3_RTC_CLK_SRC_EXT_OSC || ESP32C3_RTC_CLK_SRC_INT_8MD256
• from 0 to 32766

Default value:
• 3000 if ESP32C3_RTC_CLK_SRC_EXT_CRYS || ESP32C3_RTC_CLK_SRC_EXT_OSC || ESP32C3_RTC_CLK_SRC_INT_8MD256
• 1024

CONFIG_ESP32C3_NO_BLOBS

No Binary Blobs

Found in: Component config > ESP32C3-Specific

If enabled, this disables the linking of binary libraries in the application build. Note that after enabling this Wi-Fi/Bluetooth will not work.

Default value:
• No (disabled) if CONFIG_BT_ENABLED

ADC-Calibration

Common ESP-related Contains:

• CONFIG_ESP_ERR_TO_NAME_LOOKUP

CONFIG_ESP_ERR_TO_NAME_LOOKUP

Enable lookup of error code strings

Found in: Component config > Common ESP-related

Functions esp_err_to_name() and esp_err_to_name_r() return string representations of error codes from a pre-generated lookup table. This option can be used to turn off the use of the look-up table in order to save memory but this comes at the price of sacrificing distinguishable (meaningful) output string representations.

Default value:
• Yes (enabled)

Ethernet Contains:

• CONFIG_ETH_USE_OPENETH
• CONFIG_ETH_USE_SPIETHERNET

CONFIG_ETH_USE_SPIETHERNET

Support SPI to Ethernet Module

Found in: Component config > Ethernet

ESP-IDF can also support some SPI-Ethernet modules.

Default value:
• Yes (enabled)
Chapter 2. API Reference

Contains:

- `CONFIG_ETH_SPI_ETHERNET_DM9051`
- `CONFIG_ETH_SPI_ETHERNET_KSZ8851SNL`
- `CONFIG_ETH_SPI_ETHERNET_W5500`

**CONFIG_ETH_SPI_ETHERNET_DM9051**

Use DM9051

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*

DM9051 is a fast Ethernet controller with an SPI interface. It’s also integrated with a 10/100M PHY and MAC. Select this to enable DM9051 driver.

**CONFIG_ETH_SPI_ETHERNET_W5500**

Use W5500 (MAC RAW)

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*

W5500 is a HW TCP/IP embedded Ethernet controller. TCP/IP stack, 10/100 Ethernet MAC and PHY are embedded in a single chip. However the driver in ESP-IDF only enables the RAW MAC mode, making it compatible with the software TCP/IP stack. Say yes to enable W5500 driver.

**CONFIG_ETH_SPI_ETHERNET_KSZ8851SNL**

Use KSZ8851SNL

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*

The KSZ8851SNL is a single-chip Fast Ethernet controller consisting of a 10/100 physical layer transceiver (PHY), a MAC, and a Serial Peripheral Interface (SPI). Select this to enable KSZ8851SNL driver.

**CONFIG_ETH_USE_OPENETH**

Support OpenCores Ethernet MAC (for use with QEMU)

*Found in: Component config > Ethernet*

OpenCores Ethernet MAC driver can be used when an ESP-IDF application is executed in QEMU. This driver is not supported when running on a real chip.

**Default value:**
- No (disabled)

Contains:

- `CONFIG_ETH_OPENETH_DMA_RX_BUFFER_NUM`
- `CONFIG_ETH_OPENETH_DMA_TX_BUFFER_NUM`

**CONFIG_ETH_OPENETH_DMA_RX_BUFFER_NUM**

Number of Ethernet DMA Rx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_OPENETH*

Number of DMA receive buffers, each buffer is 1600 bytes.

**Range:**
- from 1 to 64 if `CONFIG_ETH_USE_OPENETH`

**Default value:**
- 4 if `CONFIG_ETH_USE_OPENETH`
CONFIG_ETH_OPENETH_DMA_TX_BUFFER_NUM

Number of Ethernet DMA Tx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_OPENETH*

Number of DMA transmit buffers, each buffer is 1600 bytes.

*Range:*
- from 1 to 64 if CONFIG_ETH_USE_OPENETH

*Default value:*
- 1 if CONFIG_ETH_USE_OPENETH

**Event Loop Library**

Contains:
- CONFIG_ESP_EVENT_LOOP_PROFILING
- CONFIG_ESP_EVENT_POST_FROM_ISR

CONFIG_ESP_EVENT_LOOP_PROFILING

Enable event loop profiling

*Found in: Component config > Event Loop Library*

Enables collections of statistics in the event loop library such as the number of events posted to/recieved by an event loop, number of callbacks involved, number of events dropped to to a full event loop queue, run time of event handlers, and number of times/run time of each event handler.

*Default value:*
- No (disabled)

CONFIG_ESP_EVENT_POST_FROM_ISR

Support posting events from ISRs

*Found in: Component config > Event Loop Library*

Enable posting events from interrupt handlers.

*Default value:*
- Yes (enabled)

CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR

Support posting events from ISRs placed in IRAM

*Found in: Component config > Event Loop Library > CONFIG_ESP_EVENT_POST_FROM_ISR*

Enable posting events from interrupt handlers placed in IRAM. Enabling this option places API functions esp_event_post and esp_event_post_to in IRAM.

*Default value:*
- Yes (enabled)

**GDB Stub**

Contains:
- CONFIG_ESP_GDBSTUB_SUPPORT_TASKS
CONFIG_ESP_GDBSTUB_SUPPORT_TASKS

Enable listing FreeRTOS tasks through GDB Stub

*Found in: Component config > GDB Stub*

If enabled, GDBStub can supply the list of FreeRTOS tasks to GDB. Thread list can be queried from GDB using ‘`info threads`’ command. Note that if GDB task lists were corrupted, this feature may not work. If GDBStub fails, try disabling this feature.

CONFIG_ESP_GDBSTUB_MAX_TASKS

Maximum number of tasks supported by GDB Stub

*Found in: Component config > GDB Stub > CONFIG_ESP_GDBSTUB_SUPPORT_TASKS*

Set the number of tasks which GDB Stub will support.

*Default value:* 32 if `CONFIG_ESP_GDBSTUB_SUPPORT_TASKS`

ESP HTTP client Contains:

- `CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH`
- `CONFIG_ESP_HTTP_CLIENT_ENABLE_DIGEST_AUTH`
- `CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS`

CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS

Enable https

*Found in: Component config > ESP HTTP client*

This option will enable https protocol by linking esp-tls library and initializing SSL transport

*Default value:* Yes (enabled)

CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH

Enable HTTP Basic Authentication

*Found in: Component config > ESP HTTP client*

This option will enable HTTP Basic Authentication. It is disabled by default as Basic auth uses unencrypted encoding, so it introduces a vulnerability when not using TLS

*Default value:* No (disabled)

CONFIG_ESP_HTTP_CLIENT_ENABLE_DIGEST_AUTH

Enable HTTP Digest Authentication

*Found in: Component config > ESP HTTP client*

This option will enable HTTP Digest Authentication. It is enabled by default, but use of this configuration is not recommended as the password can be derived from the exchange, so it introduces a vulnerability when not using TLS

*Default value:* No (disabled)
HTTP Server  Contains:

- `CONFIG_HTTPD_PURGE_BUF_LEN`
- `CONFIG_HTTPD_LOG_PURGE_DATA`
- `CONFIG_HTTPD_MAX_REQ_HDR_LEN`
- `CONFIG_HTTPD_MAX_URI_LEN`
- `CONFIG_HTTPD_ERR_RESP_NO_DELAY`
- `CONFIG_HTTPD_WS_SUPPORT`

**CONFIG_HTTPD_MAX_REQ_HDR_LEN**

Max HTTP Request Header Length

*Found in: Component config > HTTP Server*

This sets the maximum supported size of headers section in HTTP request packet to be processed by the server.

**Default value:**
- 512

**CONFIG_HTTPD_MAX_URI_LEN**

Max HTTP URI Length

*Found in: Component config > HTTP Server*

This sets the maximum supported size of HTTP request URI to be processed by the server.

**Default value:**
- 512

**CONFIG_HTTPD_ERR_RESP_NO_DELAY**

Use TCP_NODELAY socket option when sending HTTP error responses

*Found in: Component config > HTTP Server*

Using TCP_NODEALY socket option ensures that HTTP error response reaches the client before the underlying socket is closed. Please note that turning this off may cause multiple test failures.

**Default value:**
- Yes (enabled)

**CONFIG_HTTPD_PURGE_BUF_LEN**

Length of temporary buffer for purging data

*Found in: Component config > HTTP Server*

This sets the size of the temporary buffer used to receive and discard any remaining data that is received from the HTTP client in the request, but not processed as part of the server HTTP request handler.

If the remaining data is larger than the available buffer size, the buffer will be filled in multiple iterations. The buffer should be small enough to fit on the stack, but large enough to avoid excessive iterations.

**Default value:**
- 32
**CONFIG_HTTPD_LOG_PURGE_DATA**

Log purged content data at Debug level

*Found in: Component config > HTTP Server*

Enabling this will log discarded binary HTTP request data at Debug level. For large content data this may not be desirable as it will clutter the log.

**Default value:**
- No (disabled)

**CONFIG_HTTPD_WS_SUPPORT**

WebSocket server support

*Found in: Component config > HTTP Server*

This sets the WebSocket server support.

**Default value:**
- No (disabled)

**ESP HTTPS OTA** Contains:

- **CONFIG_ESP_HTTPS_OTA_ALLOW_HTTP**
- **CONFIG_ESP_HTTPS_OTA_DECRYPT_CB**

**CONFIG_ESP_HTTPS_OTA_DECRYPT_CB**

Provide decryption callback

*Found in: Component config > ESP HTTPS OTA*

Exposes an additional callback whereby firmware data could be decrypted before being processed by OTA update component. This can help to integrate external encryption related format and removal of such encapsulation layer from firmware image.

**Default value:**
- No (disabled)

**CONFIG_ESP_HTTPS_OTA_ALLOW_HTTP**

Allow HTTP for OTA (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

*Found in: Component config > ESP HTTPS OTA*

It is highly recommended to keep HTTPS (along with server certificate validation) enabled. Enabling this option comes with potential risk of:
- Non-encrypted communication channel with server
- Accepting firmware upgrade image from server with fake identity

**Default value:**
- No (disabled)

**ESP HTTPS server** Contains:

- **CONFIG_ESP_HTTPS_SERVER_ENABLE**
CONFIG_ESP_HTTPS_SERVER_ENABLE

Enable ESP_HTTPS_SERVER component

Found in: Component config > ESP HTTPS server

Enable ESP HTTPS server component

Hardware Settings  Contains:

- MAC Config
- RTC Clock Config
- Sleep Config

MAC Config  Contains:

- CONFIG_ESP32C3_UNIVERSAL_MAC_ADDRESSES

CONFIG_ESP32C3_UNIVERSAL_MAC_ADDRESSES

Number of universally administered (by IEEE) MAC address

Found in: Component config > Hardware Settings > MAC Config

Configure the number of universally administered (by IEEE) MAC addresses.

During initialization, MAC addresses for each network interface are generated or derived from a single base MAC address.

If the number of universal MAC addresses is four, all four interfaces (WiFi station, WiFi softap, Bluetooth and Ethernet) receive a universally administered MAC address. These are generated sequentially by adding 0, 1, 2 and 3 (respectively) to the final octet of the base MAC address.

If the number of universal MAC addresses is two, only two interfaces (WiFi station and Bluetooth) receive a universally administered MAC address. These are generated sequentially by adding 0 and 1 (respectively) to the base MAC address. The remaining two interfaces (WiFi softap and Ethernet) receive local MAC addresses. These are derived from the universal WiFi station and Bluetooth MAC addresses, respectively.

When using the default (Espressif-assigned) base MAC address, either setting can be used. When using a custom universal MAC address range, the correct setting will depend on the allocation of MAC addresses in this range (either 2 or 4 per device.)

Note that ESP32-C3 has no integrated Ethernet MAC. Although it’s possible to use the esp_read_mac() API to return a MAC for Ethernet, this can only be used with an external MAC peripheral.

Available options:

- Two (ESP32C3_UNIVERSAL_MAC_ADDRESSES_TWO)
- Four (ESP32C3_UNIVERSAL_MAC_ADDRESSES_FOUR)

Sleep Config  Contains:

- CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND
- CONFIG_ESP_SLEEP_GPIO_RESET_WORKAROUND
- CONFIG_ESP_SLEEP_POWER_DOWN_FLASH
- CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND

CONFIG_ESP_SLEEP_POWER_DOWN_FLASH

Power down flash in light sleep when there is no SPIRAM

Found in: Component config > Hardware Settings > Sleep Config
If enabled, chip will try to power down flash as part of esp_light_sleep_start(), which costs more time when chip wakes up. Can only be enabled if there is no SPIRAM configured. This option will in fact consider VDD_SDIO auto power value (ESP_PD_OPTION_AUTO) as OFF. Also, it is possible to force a power domain to stay ON during light sleep by using esp_sleep_pd_config() function.

**Default value:**
- Yes (enabled) if SPIRAM

**CONFIG_ESP_SLEEP_GPIO_RESET_WORKAROUND**

Light sleep GPIO reset workaround

*Found in: Component config > Hardware Settings > Sleep Config*

Esp32c3 and esp32s3 will reset at wake-up if GPIO is received a small electrostatic pulse during light sleep, with specific condition

- GPIO needs to be configured as input-mode only
- The pin receives a small electrostatic pulse, and reset occurs when the pulse voltage is higher than 6 V

For GPIO set to input mode only, it is not a good practice to leave it open/floating. The hardware design needs to controlled it with determined supply or ground voltage is necessary.

This option provides a software workaround for this issue. Configure to isolate all GPIO pins in sleep state.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND**

PSRAM leakage current workaround in light sleep

*Found in: Component config > Hardware Settings > Sleep Config*

When the CS pin of SPIRAM is not pulled up, the sleep current will increase during light sleep. If the CS pin of SPIRAM has an external pull-up, you do not need to select this option, otherwise, you should enable this option.

**CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND**

Flash leakage current workaround in light sleep

*Found in: Component config > Hardware Settings > Sleep Config*

When the CS pin of Flash is not pulled up, the sleep current will increase during light sleep. If the CS pin of Flash has an external pull-up, you do not need to select this option, otherwise, you should enable this option.

**RTC Clock Config**

Contains:

- **CONFIG_RTC_CLOCK_BBPLL_POWER_ON_WITH_USB**

**CONFIG_RTC_CLOCK_BBPLL_POWER_ON_WITH_USB**

Keep BBPLL clock always work

*Found in: Component config > Hardware Settings > RTC Clock Config*

When the chip goes sleep or software reset, the clock source would change to XTAL and switch off the BBPLL clock for saving power. However, this might make the USB_SERIAL_JTAG down which depends on BBPLL as its unique clock source. Therefore, this is used for keeping bbpll clock always on when USB_SERIAL_JTAG PORT is using. If you want to use USB_SERIAL_JTAG under sw_reset
case or sleep-wakeup case, you should select this option. But be aware that this might increase the power consumption.

**Default value:**
- Yes (enabled)

**LCD and Touch Panel** Contains:
- **LCD Peripheral Configuration**

**LCD Peripheral Configuration** Contains:
- **CONFIG_LCD_PANEL_IO_FORMAT_BUF_SIZE**

**CONFIG_LCD_PANEL_IO_FORMAT_BUF_SIZE**

LCD panel io format buffer size

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

LCD driver allocates an internal buffer to transform the data into a proper format, because of the endian order mismatch. This option is to set the size of the buffer, in bytes.

**Default value:**
- 32

**ESP NETIF Adapter** Contains:
- **CONFIG_ESP_NETIF_TCPIP_ADAPTER_COMPATIBLE_LAYER**
- **CONFIG_ESP_NETIF_L2_TAP**
- **CONFIG_ESP_NETIF_IP_LOST_TIMER_INTERVAL**
- **CONFIG_ESP_NETIF_USE_TCPIP_STACK_LIB**

**CONFIG_ESP_NETIF_IP_LOST_TIMER_INTERVAL**

IP Address lost timer interval (seconds)

*Found in: Component config > ESP NETIF Adapter*

The value of 0 indicates the IP lost timer is disabled, otherwise the timer is enabled. The IP address may be lost because of some reasons, e.g. when the station disconnects from soft-AP, or when DHCP IP renew fails etc. If the IP lost timer is enabled, it will be started everytime the IP is lost. Event SYSTEM_EVENT_STA_LOST_IP will be raised if the timer expires. The IP lost timer is stopped if the station get the IP again before the timer expires.

**Range:**
- from 0 to 65535

**Default value:**
- 120

**CONFIG_ESP_NETIF_USE_TCPIP_STACK_LIB**

TCP/IP Stack Library

*Found in: Component config > ESP NETIF Adapter*

Choose the TCP/IP Stack to work, for example, LwIP, uIP, etc.

**Available options:**
- LwIP (ESP_NETIF_TCPIP_LWIP)  
LwIP is a small independent implementation of the TCP/IP protocol suite.
**Chapter 2. API Reference**

- **Loopback (ESP_NETIF_LOOPBACK)**
  Dummy implementation of esp-netif functionality which connects driver transmit to receive function. This option is for testing purpose only

**CONFIG_ESP_NETIF_TCPIP_ADAPTER_COMPATIBLE_LAYER**
Enable backward compatible tcpip_adapter interface

*Found in: Component config > ESP NETIF Adapter*

Backward compatible interface to tcpip_adapter is enabled by default to support legacy TCP/IP stack initialisation code. Disable this option to use only esp-netif interface.

*Default value:*
- Yes (enabled)

**CONFIG_ESP_NETIF_L2_TAP**
Enable netif L2 TAP support

*Found in: Component config > ESP NETIF Adapter*

A user program can read/write link layer (L2) frames from/to ESP TAP device. The ESP TAP device can be currently associated only with Ethernet physical interfaces.

**CONFIG_ESP_NETIF_L2_TAP_MAX_FDS**
Maximum number of opened L2 TAP File descriptors

*Found in: Component config > ESP NETIF Adapter > CONFIG_ESP_NETIF_L2_TAP*

Maximum number of opened File descriptors (FD's) associated with ESP TAP device. ESP TAP FD's take up a certain amount of memory, and allowing fewer FD's to be opened at the same time conserves memory.

*Range:*
- from 1 to 10 if `CONFIG_ESP_NETIF_L2_TAP`

*Default value:*
- 5 if `CONFIG_ESP_NETIF_L2_TAP`

**CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE**
Size of L2 TAP Rx queue

*Found in: Component config > ESP NETIF Adapter > CONFIG_ESP_NETIF_L2_TAP*

Maximum number of frames queued in opened File descriptor. Once the queue is full, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

*Range:*
- from 1 to 100 if `CONFIG_ESP_NETIF_L2_TAP`

*Default value:*
- 20 if `CONFIG_ESP_NETIF_L2_TAP`

**PHY**
Contains:
- `CONFIG_ESP_PHY_ENABLE_USB`
- `CONFIG_ESP_PHY_MAX_WIFI_TX_POWER`
- `CONFIG_ESP_PHY_MAC_BB_PD`
- `CONFIG_ESP_PHY_REDUCE_TX_POWER`
- `CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE`
- `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`
**CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE**

Store phy calibration data in NVS

*Found in: Component config > PHY*

If this option is enabled, NVS will be initialized and calibration data will be loaded from there. PHY calibration will be skipped on deep sleep wakeup. If calibration data is not found, full calibration will be performed and stored in NVS. Normally, only partial calibration will be performed. If this option is disabled, full calibration will be performed.

If it’s easy that your board calibrate bad data, choose ‘n’. Two cases for example, you should choose ‘n’: 1. If your board is easy to be booted up with antenna disconnected. 2. Because of your board design, each time when you do calibration, the result are too unstable. If unsure, choose ‘y’.

*Default value:*
- Yes (enabled)

**CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION**

Use a partition to store PHY init data

*Found in: Component config > PHY*

If enabled, PHY init data will be loaded from a partition. When using a custom partition table, make sure that PHY data partition is included (type: ‘data’, subtype: ‘phy’). With default partition tables, this is done automatically. If PHY init data is stored in a partition, it has to be flashed there, otherwise runtime error will occur.

If this option is not enabled, PHY init data will be embedded into the application binary.

If unsure, choose ‘n’.

*Default value:*
- No (disabled)

Contains:

- `CONFIG_ESP_PHY_DEFAULT_INIT_IF_INVALID`
- `CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN`

**CONFIG_ESP_PHY_DEFAULT_INIT_IF_INVALID**

Reset default PHY init data if invalid

*Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION*

If enabled, PHY init data will be restored to default if it cannot be verified successfully to avoid endless bootloops.

If unsure, choose ‘n’.

*Default value:*
- No (disabled) if `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`

**CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN**

Support multiple PHY init data bin

*Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION*

If enabled, the corresponding PHY init data type can be automatically switched according to the country code. China’s PHY init data bin is used by default. Can be modified by country information in API esp_wifi_set_country(). The priority of switching the PHY init data type is: 1. Country configured by API esp_wifi_set_country() and the parameter policy is WIFI_COUNTRY_POLICY_MANUAL. 2. Country notified by the connected AP. 3. Country configured by API esp_wifi_set_country() and the parameter policy is WIFI_COUNTRY_POLICY_AUTO.
Default value:
- No (disabled) if `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION` & `CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN_EMBED`

**CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN_EMBED**

Support embedded multiple phy init data bin to app bin

*Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION > CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN*

If enabled, multiple phy init data bin will embedded into app bin If not enabled, multiple phy init data bin will still leave alone, and need to be flashed by users.

Default value:
- No (disabled) if `CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN` & `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`

**CONFIG_ESP_PHY_INIT_DATA_ERROR**

Terminate operation when PHY init data error

*Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION > CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN*

If enabled, when an error occurs while the PHY init data is updated, the program will terminate and restart. If not enabled, the PHY init data will not be updated when an error occurs.

Default value:
- No (disabled) if `CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN` & `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`

**CONFIG_ESP_PHY_MAX_WIFI_TX_POWER**

Max WiFi TX power (dBm)

*Found in: Component config > PHY*

Set maximum transmit power for WiFi radio. Actual transmit power for high data rates may be lower than this setting.

**Range:**
- from 10 to 20

**Default value:**
- 20

**CONFIG_ESP_PHY_MAC_BB_PD**

Power down MAC and baseband of Wi-Fi and Bluetooth when PHY is disabled

*Found in: Component config > PHY*

If enabled, the MAC and baseband of Wi-Fi and Bluetooth will be powered down when PHY is disabled. Enabling this setting reduces power consumption by a small amount but increases RAM use by approximately 4 KB(Wi-Fi only), 2 KB(Bluetooth only) or 5.3 KB(Wi-Fi + Bluetooth).

Default value:
- No (disabled) if `CONFIG_FREERTOS_USE_TICKLESS_IDLE`
**CONFIG_ESP_PHY_REDUCE_TX_POWER**

Reduce PHY TX power when brownout reset

*Found in: Component config > PHY*

When brownout reset occurs, reduce PHY TX power to keep the code running.

**Default value:**
- Yes (enabled) if ESP32_BROWNOUT_DET

**CONFIG_ESP_PHY_ENABLE_USB**

Enable USB when phy init

*Found in: Component config > PHY*

When using USB Serial/JTAG/OTG/CDC, PHY should enable USB, otherwise USB module can not work properly. Notice: Enabling this configuration option will slightly impact wifi performance.

**Default value:**
- Yes (enabled)
- No (disabled)

**Power Management**

Contains:

- **CONFIG_PM_SLP_DISABLE_GPIO**
- **CONFIG_PM_POWER_DOWN_CPU_IN_LIGHT_SLEEP**
- **CONFIG_PM_SLP_IRAM_OPT**
- **CONFIG_PMRTOS_IDLE_OPT**
- **CONFIG_PM_ENABLE**

**CONFIG_PM_ENABLE**

Support for power management

*Found in: Component config > Power Management*

If enabled, application is compiled with support for power management. This option has run-time overhead (increased interrupt latency, longer time to enter idle state), and it also reduces accuracy of RTOS ticks and timers used for timekeeping. Enable this option if application uses power management APIs.

**Default value:**
- No (disabled)

**CONFIG_PM_DFS_INIT_AUTO**

Enable dynamic frequency scaling (DFS) at startup

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, startup code configures dynamic frequency scaling. Max CPU frequency is set to DEFAULT_CPU_FREQ_MHZ setting, min frequency is set to XTAL frequency. If disabled, DFS will not be active until the application configures it using esp_pm_configure function.

**Default value:**
- No (disabled) if **CONFIG_PM_ENABLE**
CONFIG_PM_PROFILING

Enable profiling counters for PM locks

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, esp_pm_* functions will keep track of the amount of time each of the power management locks has been held, and esp_pm_dump_locks function will print this information. This feature can be used to analyze which locks are preventing the chip from going into a lower power state, and see what time the chip spends in each power saving mode. This feature does incur some run-time overhead, so should typically be disabled in production builds.

**Default value:**
- No (disabled) if CONFIG_PM_ENABLE

CONFIG_PM_TRACE

Enable debug tracing of PM using GPIOs

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, some GPIOs will be used to signal events such as RTOS ticks, frequency switching, entry/exit from idle state. Refer to pm_trace.c file for the list of GPIOs. This feature is intended to be used when analyzing/debugging behavior of power management implementation, and should be kept disabled in applications.

**Default value:**
- No (disabled) if CONFIG_PM_ENABLE

CONFIG_PM_SLP_IRAM_OPT

Put lightsleep related codes in internal RAM

*Found in: Component config > Power Management*

If enabled, about 1.8KB of lightsleep related source code would be in IRAM and chip would sleep longer for 760us at most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

CONFIG_PM_RTOS_IDLE_OPT

Put RTOS IDLE related codes in internal RAM

*Found in: Component config > Power Management*

If enabled, about 260B of RTOS_IDLE related source code would be in IRAM and chip would sleep longer for 40us at most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

CONFIG_PM_SLP_DISABLE_GPIO

Disable all GPIO when chip at sleep

*Found in: Component config > Power Management*

This feature is intended to disable all GPIO pins at automatic sleep to get a lower power mode. If enabled, chips will disable all GPIO pins at automatic sleep to reduce about 200~300 uA current. If you want to specifically use some pins normally as chip wakes when chip sleeps, you can call ‘gpio_sleep_set_direction’ and ‘gpio_sleep_set_pull_mode’ to have a different GPIO configuration at sleep. Warning: If you want to enable this option on ESP32, you should enable GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL at first, otherwise you will not be able to switch pullup/pulldown mode.
**CONFIG_PM_POWER_DOWN_CPU_IN_LIGHT_SLEEP**

Power down CPU in light sleep

*Found in: Component config > Power Management*

If enabled, the CPU will be powered down in light sleep. On esp32c3 soc, enabling this option will consume 1.68 KB of internal RAM and will reduce sleep current consumption by about 100 uA. On esp32s3 soc, enabling this option will consume 8.58 KB of internal RAM and will reduce sleep current consumption by about 650 uA.

**Default value:**
- Yes (enabled)

**ESP System Settings**

Contains:

- `CONFIG_ESP_SYSTEM_RTC_EXT_XTAL_BOOTSTRAP_CYCLES`
- `CONFIG_ESP_CONSOLE_UART`
- `CONFIG_ESP_CONSOLE_SECONDARY`
- `CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP`
- `CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE`
- `CONFIG_ESP_SYSTEM_USE_EH_FRAME`
- `CONFIG_ESP_TASK_WDT`
- `CONFIG_ESP_XT_WDT`
- `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL`
- `CONFIG_ESP_INT_WDT`
- `CONFIG_ESP_MAIN_TASK_AFFINITY`
- `CONFIG_ESP_MAIN_TASK_STACK_SIZE`
- Memory protection
- `CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE`
- `CONFIG_ESP_DEBUG_STUBS_ENABLE`
- `CONFIG_ESP_SYSTEM_PANIC`
- `CONFIG_ESP_PANIC_HANDLER_IRAM`
- `CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE`
- `CONFIG_ESP_CONSOLE_UART_BAUDRATE`
- `CONFIG_ESP_CONSOLE_UART_NUM`
- `CONFIG_ESP_CONSOLE_UART_RX_GPIO`
- `CONFIG_ESP_CONSOLE_UART_TX_GPIO`

**CONFIG_ESP_SYSTEM_PANIC**

Panic handler behaviour

*Found in: Component config > ESP System Settings*

If FreeRTOS detects unexpected behaviour or an unhandled exception, the panic handler is invoked. Configure the panic handler’s action here.

**Available options:**

- Print registers and halt (ESP_SYSTEM_PANIC_PRINT_HALT)
  Outputs the relevant registers over the serial port and halt the processor. Needs a manual reset to restart.
- Print registers and reboot (ESP_SYSTEM_PANIC_PRINT_REBOOT)
  Outputs the relevant registers over the serial port and immediately reset the processor.
- Silent reboot (ESP_SYSTEM_PANIC_SILENT_REBOOT)
  Just resets the processor without outputting anything
- GDBStub on panic (ESP_SYSTEM_PANIC_GDBSTUB)
  Invoke gdbstub on the serial port, allowing for gdb to attach to it to do a postmortem of the crash.
- GDBStub at runtime (ESP_SYSTEM_GDBSTUB_RUNTIME)
Invoke gdbstub on the serial port, allowing for gdb to attach to it and to do a debug on runtime. This feature will switch system to single core mode.

**CONFIG_ESP_SYSTEM_RTC_EXT_XTAL_BOOTSTRAP_CYCLES**

Bootstrap cycles for external 32kHz crystal

*Found in: Component config > ESP System Settings*

To reduce the startup time of an external RTC crystal, we bootstrap it with a 32kHz square wave for a fixed number of cycles. Setting 0 will disable bootstrapping (if disabled, the crystal may take longer to start up or fail to oscillate under some conditions).

If this value is too high, a faulty crystal may initially start and then fail. If this value is too low, an otherwise good crystal may not start.

To accurately determine if the crystal has started, set a larger “Number of cycles for RTC_SLOW_CLK calibration” (about 3000).

**CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP**

Enable RTC fast memory for dynamic allocations

*Found in: Component config > ESP System Settings*

This config option allows to add RTC fast memory region to system heap with capability similar to that of DRAM region but without DMA. This memory will be consumed first per heap initialization order by early startup services and scheduler related code. Speed wise RTC fast memory operates on APB clock and hence does not have much performance impact.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_SYSTEM_USE_EH_FRAME**

Generate and use eh_frame for backtracing

*Found in: Component config > ESP System Settings*

Generate DWARF information for each function of the project. These information will parsed and used to perform backtracing when panics occur. Activating this option will activate asynchronous frame unwinding and generation of both .eh_frame and .eh_frame_hdr sections, resulting in a bigger binary size (20% to 100% larger). The main purpose of this option is to be able to have a backtrace parsed and printed by the program itself, regardless of the serial monitor used. This option shall NOT be used for production.

**Default value:**
- No (disabled)

**Memory protection** Contains:

- **CONFIG_ESP_SYSTEM_MEMPROT_FEATURE**

**CONFIG_ESP_SYSTEM_MEMPROT_FEATURE**

Enable memory protection

*Found in: Component config > ESP System Settings > Memory protection*

If enabled, the permission control module watches all the memory access and fires the panic handler if a permission violation is detected. This feature automatically splits the SRAM memory into data
and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_SYSTEM_MEMPROT_FEATURE_LOCK**
Lock memory protection settings

*Found in: Component config > ESP System Settings > Memory protection > CONFIG_ESPSYSTEM_MEMPROT_FEATURE*

Once locked, memory protection settings cannot be changed anymore. The lock is reset only on the chip startup.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE**
System event queue size

*Found in: Component config > ESP System Settings*

Config system event queue size in different application.

**Default value:**
- 32

**CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE**
Event loop task stack size

*Found in: Component config > ESP System Settings*

Config system event task stack size in different application.

**Default value:**
- 2304

**CONFIG_ESP_MAIN_TASK_STACK_SIZE**
Main task stack size

*Found in: Component config > ESP System Settings*

Configure the “main task” stack size. This is the stack of the task which calls app_main(). If app_main() returns then this task is deleted and its stack memory is freed.

**Default value:**
- 3584

**CONFIG_ESP_MAIN_TASK_AFFINITY**
Main task core affinity

*Found in: Component config > ESP System Settings*

Configure the “main task” core affinity. This is the used core of the task which calls app_main(). If app_main() returns then this task is deleted.

**Available options:**
- CPU0 (ESP_MAIN_TASK_AFFINITY_CPU0)
• CPU1 (ESP_MAIN_TASK_AFFINITY_CPU1)
• No affinity (ESP_MAIN_TASK_AFFINITY_NO_AFFINITY)

CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE

Minimal allowed size for shared stack

*Found in: Component config > ESP System Settings*

Minimal value of size, in bytes, accepted to execute a expression with shared stack.

**Default value:**
• 2048

CONFIG_ESP_CONSOLE_UART

Channel for console output

*Found in: Component config > ESP System Settings*

Select where to send console output (through stdout and stderr).

- Default is to use UART0 on pre-defined GPIOs.
- If “Custom” is selected, UART0 or UART1 can be chosen, and any pins can be selected.
- If “None” is selected, there will be no console output on any UART, except for initial output from ROM bootloader. This ROM output can be suppressed by GPIO strapping or EFUSE, refer to chip datasheet for details.
- On chips with USB OTG peripheral, “USB CDC” option redirects output to the CDC port. This option uses the CDC driver in the chip ROM. This option is incompatible with TinyUSB stack.
- On chips with an USB serial/JTAG debug controller, selecting the option for that redirects output to the CDC/ACM (serial port emulation) component of that device.

**Available options:**
• Default: UART0 (ESP_CONSOLE_UART_DEFAULT)
• USB CDC (ESP_CONSOLE_USB_CDC)
• USB Serial/JTAG Controller (ESP_CONSOLE_USB_SERIAL_JTAG)
• Custom UART (ESP_CONSOLE_UART_CUSTOM)
• None (ESP_CONSOLE_NONE)

CONFIG_ESP_CONSOLE_SECONDARY

Channel for console secondary output

*Found in: Component config > ESP System Settings*

This secondary option supports output through other specific port like USB_SERIAL_JTAG when UART0 port as a primary is selected but not connected. This secondary output currently only supports non-blocking mode without using REPL. If you want to output in blocking mode with REPL or input through this secondary port, please change the primary config to this port in Channel for console output menu.

**Available options:**
• No secondary console (ESP_CONSOLE_SECONDARY_NONE)
• USB_SERIAL_JTAG PORT (ESP_CONSOLE_SECONDARY_USB_SERIAL_JTAG)
  This option supports output through USB_SERIAL_JTAG port when the UART0 port is not connected. The output currently only supports non-blocking mode without using the console. If you want to output in blocking mode with REPL or input through USB_SERIAL_JTAG port, please change the primary config to ESP_CONSOLE_USB_SERIAL_JTAG above.
CONFIG_ESP_CONSOLE_UART_NUM

UART peripheral to use for console output (0-1)

*Found in:* Component config > ESP System Settings

This UART peripheral is used for console output from the ESP-IDF Bootloader and the app.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

Due to an ESP32 ROM bug, UART2 is not supported for console output via esp_rom_printf.

**Available options:**
- UART0 (ESP_CONSOLE_UART_CUSTOM_NUM_0)
- UART1 (ESP_CONSOLE_UART_CUSTOM_NUM_1)

CONFIG_ESP_CONSOLE_UART_TX_GPIO

UART TX on GPIO#

*Found in:* Component config > ESP System Settings

This GPIO is used for console UART TX output in the ESP-IDF Bootloader and the app (including boot log output and default standard output and standard error of the app).

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**
- from 0 to 46 if ESP_CONSOLE_UART_CUSTOM

**Default value:**
- 21 if ESP_CONSOLE_UART_CUSTOM
- 43 if ESP_CONSOLE_UART_CUSTOM

CONFIG_ESP_CONSOLE_UART_RX_GPIO

UART RX on GPIO#

*Found in:* Component config > ESP System Settings

This GPIO is used for UART RX input in the ESP-IDF Bootloader and the app (including default default standard input of the app).

Note: The default ESP-IDF Bootloader configures this pin but doesn’t read anything from the UART.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**
- from 0 to 46 if ESP_CONSOLE_UART_CUSTOM

**Default value:**
- 20 if ESP_CONSOLE_UART_CUSTOM
- 44 if ESP_CONSOLE_UART_CUSTOM

CONFIG_ESP_CONSOLE_UART_BAUDRATE

UART console baud rate

*Found in:* Component config > ESP System Settings

This baud rate is used by both the ESP-IDF Bootloader and the app (including boot log output and default standard input/output/error of the app).

The app’s maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently
accurate. If Power Management is enabled, REF_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

Range:
- from 1200 to 4000000 if CONFIG_PM_ENABLE
- from 1200 to 1000000 if CONFIG_PM_ENABLE

Default value:
- 115200

**CONFIG_ESP_INT_WDT**

Interrupt watchdog

*Found in: Component config > ESP System Settings*

This watchdog timer can detect if the FreeRTOS tick interrupt has not been called for a certain time, either because a task turned off interrupts and did not turn them on for a long time, or because an interrupt handler did not return. It will try to invoke the panic handler first and failing that reset the SoC.

Default value:
- Yes (enabled)

**CONFIG_ESP_INT_WDT_TIMEOUT_MS**

Interrupt watchdog timeout (ms)

*Found in: Component config > ESP System Settings > CONFIG_ESP_INT_WDT*

The timeout of the watchdog, in milliseconds. Make this higher than the FreeRTOS tick rate.

Range:
- from 10 to 10000

Default value:
- 300 if ESP32_SPIRAM_SUPPORT && CONFIG_ESP_INT_WDT
- 800 if ESP32_SPIRAM_SUPPORT && CONFIG_ESP_INT_WDT

**CONFIG_ESP_INT_WDT_CHECK_CPU1**

Also watch CPU1 tick interrupt

*Found in: Component config > ESP System Settings > CONFIG_ESP_INT_WDT*

Also detect if interrupts on CPU 1 are disabled for too long.

Default value:
- Yes (enabled)

**CONFIG_ESP_TASK_WDT**

Initialize Task Watchdog Timer on startup

*Found in: Component config > ESP System Settings*

The Task Watchdog Timer can be used to make sure individual tasks are still running. Enabling this option will cause the Task Watchdog Timer to be initialized automatically at startup. The Task Watchdog timer can be initialized after startup as well (see Task Watchdog Timer API Reference)

Default value:
- Yes (enabled)
**CONFIG_ESP_TASK_WDT_PANIC**

Invoke panic handler on Task Watchdog timeout

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT*

If this option is enabled, the Task Watchdog Timer will be configured to trigger the panic handler when it times out. This can also be configured at run time (see Task Watchdog Timer API Reference)

**Default value:**
- No (disabled)

**CONFIG_ESP_TASK_WDT_TIMEOUT_S**

Task Watchdog timeout period (seconds)

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT*

Timeout period configuration for the Task Watchdog Timer in seconds. This is also configurable at run time (see Task Watchdog Timer API Reference)

**Range:**
- from 1 to 60

**Default value:**
- 5

**CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0**

Watch CPU0 Idle Task

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT*

If this option is enabled, the Task Watchdog Timer will watch the CPU0 Idle Task. Having the Task Watchdog watch the Idle Task allows for detection of CPU starvation as the Idle Task not being called is usually a symptom of CPU starvation. Starvation of the Idle Task is detrimental as FreeRTOS household tasks depend on the Idle Task getting some runtime every now and then.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU1**

Watch CPU1 Idle Task

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT*

If this option is enabled, the Task Watchdog Timer will watch the CPU1 Idle Task.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_XT_WDT**

Initialize XTAL32K watchdog timer on startup

*Found in: Component config > ESP System Settings*

This watchdog timer can detect oscillation failure of the XTAL32K_CLK. When such a failure is detected the hardware can be set up to automatically switch to BACKUP32K_CLK and generate an interrupt.
**CONFIG_ESP_XT_WDT_TIMEOUT**

XTAL32K watchdog timeout period

*Found in: Component config > ESP System Settings > CONFIG_ESP_XT_WDT*

Timeout period configuration for the XTAL32K watchdog timer based on RTC_CLK.

**Range:**
- from 1 to 255 if `CONFIG_ESP_XT_WDT`

**Default value:**
- 200 if `CONFIG_ESP_XT_WDT`

**CONFIG_ESP_XT_WDT_BACKUP_CLK_ENABLE**

Automatically switch to BACKUP32K_CLK when timer expires

*Found in: Component config > ESP System Settings > CONFIG_ESP_XT_WDT*

Enable this to automatically switch to BACKUP32K_CLK as the source of RTC_SLOW_CLK when the watchdog timer expires.

**Default value:**
- Yes (enabled) if `CONFIG_ESP_XT_WDT`

**CONFIG_ESP_PANIC_HANDLER_IRAM**

Place panic handler code in IRAM

*Found in: Component config > ESP System Settings*

If this option is disabled (default), the panic handler code is placed in flash not IRAM. This means that if ESP-IDF crashes while flash cache is disabled, the panic handler will automatically re-enable flash cache before running GDB Stub or Core Dump. This adds some minor risk, if the flash cache status is also corrupted during the crash.

If this option is enabled, the panic handler code (including required UART functions) is placed in IRAM. This may be necessary to debug some complex issues with crashes while flash cache is disabled (for example, when writing to SPI flash) or when flash cache is corrupted when an exception is triggered.

**Default value:**
- No (disabled)

**CONFIG_ESP_DEBUG_STUBS_ENABLE**

OpenOCD debug stubs

*Found in: Component config > ESP System Settings*

Debug stubs are used by OpenOCD to execute pre-compiled onboard code which does some useful debugging stuff, e.g. GCOV data dump.

**Default value:**
- “COMPILER_OPTIMIZATION_LEVEL_DEBUG” if ESP32_TRAX && ESP32S2_TRAX && ESP32S3_TRAX

**CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL**

Interrupt level to use for Interrupt Watchdog and other system checks

*Found in: Component config > ESP System Settings*

Interrupt level to use for Interrupt Watchdog and other system checks.

**Available options:**
Chapter 2. API Reference

- Level 5 interrupt (ESP_SYSTEM_CHECK_INT_LEVEL_5)
  Using level 5 interrupt for Interrupt Watchdog and other system checks.
- Level 4 interrupt (ESP_SYSTEM_CHECK_INT_LEVEL_4)
  Using level 4 interrupt for Interrupt Watchdog and other system checks.

**IPC (Inter-Processor Call)** Contains:
- `CONFIG_ESP_IPC_TASK_STACK_SIZE`
- `CONFIG_ESP_IPC_USES_CALLERS_PRIORITY`

**CONFIG_ESP_IPC_TASK_STACK_SIZE**
Inter-Processor Call (IPC) task stack size

*Found in: Component config > IPC (Inter-Processor Call)*

Configure the IPC tasks stack size. An IPC task runs on each core (in dual core mode), and allows for cross-core function calls. See IPC documentation for more details. The default IPC stack size should be enough for most common simple use cases. However, users can increase/decrease the stack size to their needs.

**Range:**
- from 512 to 65536

**Default value:**
- 1024

**CONFIG_ESP_IPC_USES_CALLERS_PRIORITY**
IPC runs at caller’s priority

*Found in: Component config > IPC (Inter-Processor Call)*

If this option is not enabled then the IPC task will keep behavior same as prior to that of ESP-IDF v4.0, hence IPC task will run at (configMAX_PRIORITIES - 1) priority.

**Default value:**
- Yes (enabled)

**High resolution timer (esp_timer)** Contains:
- `CONFIG_ESP_TIMER_PROFILING`
- `CONFIG_ESP_TIMER_TASK_STACK_SIZE`
- `CONFIG_ESP_TIMER_INTERRUPT_LEVEL`
- `CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD`

**CONFIG_ESP_TIMER_PROFILING**
Enable esp_timer profiling features

*Found in: Component config > High resolution timer (esp_timer)*

If enabled, esp_timer_dump will dump information such as number of times the timer was started, number of times the timer has triggered, and the total time it took for the callback to run. This option has some effect on timer performance and the amount of memory used for timer storage, and should only be used for debugging/testing purposes.

**Default value:**
- No (disabled)
**CONFIG_ESP_TIMER_TASK_STACK_SIZE**

High-resolution timer task stack size

*Found in: Component config > High resolution timer (esp_timer)*

Configure the stack size of “timer_task” task. This task is used to dispatch callbacks of timers created using ets_timer and esp_timer APIs. If you are seeing stack overflow errors in timer task, increase this value.

Note that this is not the same as FreeRTOS timer task. To configure FreeRTOS timer task size, see “FreeRTOS timer task stack size” option in “FreeRTOS” menu.

**Range:**
- from 2048 to 65536

**Default value:**
- 3584

**CONFIG_ESP_TIMER_INTERRUPT_LEVEL**

Interrupt level

*Found in: Component config > High resolution timer (esp_timer)*

It sets the interrupt level for esp_timer ISR in range 1..3. A higher level (3) helps to decrease the ISR esp_timer latency.

**Range:**
- from 1 to 1

**Default value:**
- 1

**CONFIG_ESP_TIMER_SUPPORTS_ISR.Dispatch_METHOD**

Support ISR dispatch method

*Found in: Component config > High resolution timer (esp_timer)*

Allows using ESP_TIMER_ISR dispatch method (ESP_TIMER_TASK dispatch method is also available).
- ESP_TIMER_TASK - Timer callbacks are dispatched from a high-priority esp_timer task.
- ESP_TIMER_ISR - Timer callbacks are dispatched directly from the timer interrupt handler. The ISR dispatch can be used, in some cases, when a callback is very simple or need a lower-latency.

**Default value:**
- No (disabled)

**Wi-Fi**

Contains:

- CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE
- CONFIG_ESP32_WIFI_SOFTAP_Beacon_MAX_LEN
- CONFIG_ESP32_WIFI_CACHE_TX_BUFFER_NUM
- CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM
- CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM
- CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM
- CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM
- CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE
- CONFIG_ESP32_WIFI_SW_COEXIST_ENABLE
- CONFIG_ESP32_WIFI_TX_BUFFER
- CONFIG_ESP32_WIFI_Ampdu_RX_ENABLED
- CONFIG_ESP32_WIFI_Ampdu_TX_ENABLED
- CONFIG_ESP32_WIFI_AMSDU_TX_ENABLED
- CONFIG_ESP32_WIFI_CSI_ENABLED
- CONFIG_ESP_WIFIEXTERNAL_COEXIST_ENABLE
Chapter 2. API Reference

- `CONFIG_ESP_WIFI_FTM_ENABLE`
- `CONFIG_ESP_WIFI_GCMP_SUPPORT`
- `CONFIG_ESP_WIFI_GMAC_SUPPORT`
- `CONFIG_ESP32_WIFI_IRAM_OPT`
- `CONFIG_ESP32_WIFI_MGMT_SBUF_NUM`
- `CONFIG_ESP32_WIFI_NVS_ENABLED`
- `CONFIG_ESP32_WIFI_RX_IRAM_OPT`
- `CONFIG_ESP_WIFI_SLP_IRAM_OPT`
- `CONFIG_ESP_WIFI_SOFTAP_SUPPORT`
- `CONFIG_ESP32_WIFI_TASK_CORE_ID`

**CONFIG_ESP32_WIFI_SW_COEXIST_ENABLE**

Software controls WiFi/Bluetooth coexistence

`Found in: Component config > Wi-Fi`

If enabled, WiFi & Bluetooth coexistence is controlled by software rather than hardware. Recommended for heavy traffic scenarios. Both coexistence configuration options are automatically managed, no user intervention is required. If only Bluetooth is used, it is recommended to disable this option to reduce binary file size.

**Default value:**
- Yes (enabled) if `CONFIG_BT_ENABLED`

**CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM**

Max number of WiFi static RX buffers

`Found in: Component config > Wi-Fi`

Set the number of WiFi static RX buffers. Each buffer takes approximately 1.6KB of RAM. The static rx buffers are allocated when esp_wifi_init is called, they are not freed until esp_wifi_deinit is called.

WiFi hardware use these buffers to receive all 802.11 frames. A higher number may allow higher throughput but increases memory use. If ESP32_WIFI_AMPDU_RX_ENABLED is enabled, this value is recommended to set equal or bigger than ESP32_WIFI_RX_BA_WIN in order to achieve better throughput and compatibility with both stations and APs.

**Range:**
- from 2 to 25

**Default value:**
- 10 if SPIRAM_TRY_ALLOCATE_WIFI_LWIP
- 16 if SPIRAM_TRY_ALLOCATE_WIFI_LWIP

**CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM**

Max number of WiFi dynamic RX buffers

`Found in: Component config > Wi-Fi`

Set the number of WiFi dynamic RX buffers, 0 means unlimited RX buffers will be allocated (provided sufficient free RAM). The size of each dynamic RX buffer depends on the size of the received data frame.

For each received data frame, the WiFi driver makes a copy to an RX buffer and then delivers it to the high layer TCP/IP stack. The dynamic RX buffer is freed after the higher layer has successfully received the data frame.

For some applications, WiFi data frames may be received faster than the application can process them. In these cases we may run out of memory if RX buffer number is unlimited (0).

If a dynamic RX buffer limit is set, it should be at least the number of static RX buffers.
Range:
• from 0 to 128 if CONFIG_LWIP_WND_SCALE
• from 0 to 1024 if CONFIG_LWIP_WND_SCALE
Default value:
• 32

CONFIG_ESP32_WIFI_TX_BUFFER
Type of WiFi TX buffers

Found in: Component config > Wi-Fi

Select type of WiFi TX buffers:

If “Static” is selected, WiFi TX buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static TX buffer is fixed to about 1.6KB.

If “Dynamic” is selected, each WiFi TX buffer is allocated as needed when a data frame is delivered to the WiFi driver from the TCP/IP stack. The buffer is freed after the data frame has been sent by the WiFi driver. The size of each dynamic TX buffer depends on the length of each data frame sent by the TCP/IP layer.

If PSRAM is enabled, “Static” should be selected to guarantee enough WiFi TX buffers. If PSRAM is disabled, “Dynamic” should be selected to improve the utilization of RAM.

Available options:
• Static (ESP32_WIFI_STATIC_TX_BUFFER)
• Dynamic (ESP32_WIFI_DYNAMIC_TX_BUFFER)

CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM
Max number of WiFi static TX buffers

Found in: Component config > Wi-Fi

Set the number of WiFi static TX buffers. Each buffer takes approximately 1.6KB of RAM. The static RX buffers are allocated when esp_wifi_init() is called, they are not released until esp_wifi_deinit() is called.

For each transmitted data frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

Range:
• from 1 to 64 if ESP32_WIFI_STATIC_TX_BUFFER
Default value:
• 16 if ESP32_WIFI_STATIC_TX_BUFFER

CONFIG_ESP32_WIFI_CACHE_TX_BUFFER_NUM
Max number of WiFi cache TX buffers

Found in: Component config > Wi-Fi

Set the number of WiFi cache TX buffer number.

For each TX packet from uplayer, such as LWIP etc, WiFi driver needs to allocate a static TX buffer and makes a copy of uplayer packet. If WiFi driver fails to allocate the static TX buffer, it caches the uplayer packets to a dedicated buffer queue, this option is used to configure the size of the cached TX queue.

Range:
• from 16 to 128 if ESP32_SPIRAM_SUPPORT || ESP32S2_SPIRAM_SUPPORT || ESP32S3_SPIRAM_SUPPORT
**CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM**

Max number of WiFi dynamic TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi dynamic TX buffers. The size of each dynamic TX buffer is not fixed, it depends on the size of each transmitted data frame.

For each transmitted frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications, especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

*Range:*

• from 1 to 128

*Default value:*

• 32

**CONFIG_ESP32_WIFI_CSI_ENABLED**

WiFi CSI(Channel State Information)

*Found in: Component config > Wi-Fi*

Select this option to enable CSI(Channel State Information) feature. CSI takes about CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM KB of RAM. If CSI is not used, it is better to disable this feature in order to save memory.

*Default value:*

• No (disabled)

**CONFIG_ESP32_WIFI_AMPDU_TX_ENABLED**

WiFi AMPDU TX

*Found in: Component config > Wi-Fi*

Select this option to enable AMPDU TX feature

*Default value:*

• Yes (enabled)

**CONFIG_ESP32_WIFI_TX_BA_WIN**

WiFi AMPDU TX BA window size

*Found in: Component config > Wi-Fi > CONFIG_ESP32_WIFI_AMPDU_TX_ENABLED*

Set the size of WiFi Block Ack TX window. Generally a bigger value means higher throughput but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP TX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12.

*Range:*

• from 2 to 32

*Default value:*

• 6
CONFIG_ESP32_WIFI_AMPU_RX_ENABLED

WiFi AMPDU RX

*Found in: Component config > Wi-Fi*

Select this option to enable AMPDU RX feature

**Default value:**
- Yes (enabled)

CONFIG_ESP32_WIFI_RX_BA_WIN

WiFi AMPDU RX BA window size

*Found in: Component config > Wi-Fi > CONFIG_ESP32_WIFI_AMPU_RX_ENABLED*

Set the size of WiFi Block Ack RX window. Generally a bigger value means higher throughput and better compatibility but more memory. Most of the time we should NOT change the default value unless special reason, e.g. test the maximum UDP RX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12. If PSRAM is used and WiFi memory is preferred to allocate in PSRAM first, the default and minimum value should be 16 to achieve better throughput and compatibility with both stations and APs.

**Range:**
- from 2 to 32

**Default value:**
- 6 if SPIRAM_TRY_ALLOCATE_WIFI_LWIP && CONFIG_ESP32_WIFI_AMPU_RX_ENABLED
- 16 if SPIRAM_TRY_ALLOCATE_WIFI_LWIP && CONFIG_ESP32_WIFI_AMPU_RX_ENABLED

CONFIG_ESP32_WIFI_AMSDU_TX_ENABLED

WiFi AMSDU TX

*Found in: Component config > Wi-Fi*

Select this option to enable AMSDU TX feature

**Default value:**
- No (disabled) if ESP32_SPIRAM_SUPPORT || ESP32S2_SPIRAM_SUPPORT || ESP32S3_SPIRAM_SUPPORT

CONFIG_ESP32_WIFI_NVS_ENABLED

WiFi NVS flash

*Found in: Component config > Wi-Fi*

Select this option to enable WiFi NVS flash

**Default value:**
- Yes (enabled)

CONFIG_ESP32_WIFI_TASK_CORE_ID

WiFi Task Core ID

*Found in: Component config > Wi-Fi*

Pinned WiFi task to core 0 or core 1.

**Available options:**
- Core 0 (ESP32_WIFI_TASK_PINNED_TO_CORE_0)
Chapter 2. API Reference

- Core 1 (ESP32_WIFI_TASK_PINNED_TO_CORE_1)

**CONFIG_ESP32_WIFI_SOFTAP_Beacon_MAX_LEN**

Max length of WiFi SoftAP Beacon

*Found in: Component config > Wi-Fi*

ESP-MESH utilizes beacon frames to detect and resolve root node conflicts (see documentation). However, the default length of a beacon frame can simultaneously hold only five root node identifier structures, meaning that a root node conflict of up to five nodes can be detected at one time. In the occurrence of more root nodes conflict involving more than five root nodes, the conflict resolution process will detect five of the root nodes, resolve the conflict, and re-detect more root nodes. This process will repeat until all root node conflicts are resolved. However this process can generally take a very long time.

To counter this situation, the beacon frame length can be increased such that more root nodes can be detected simultaneously. Each additional root node will require 36 bytes and should be added on top of the default beacon frame length of 752 bytes. For example, if you want to detect 10 root nodes simultaneously, you need to set the beacon frame length as 932 (752+36*5).

Setting a longer beacon length also assists with debugging as the conflicting root nodes can be identified more quickly.

*Range:*
  - from 752 to 1256

*Default value:*
  - 752

**CONFIG_ESP32_WIFI_MGMT_SBUF_NUM**

WiFi mgmt short buffer number

*Found in: Component config > Wi-Fi*

Set the number of WiFi management short buffer.

*Range:*
  - from 6 to 32

*Default value:*
  - 32

**CONFIG_ESP32_WIFI_IRAM_OPT**

WiFi IRAM speed optimization

*Found in: Component config > Wi-Fi*

Select this option to place frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 10Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

*Default value:*
  - No (disabled) if CONFIG_BT_ENABLED && ESP32_SPIRAM_SUPPORT
  - Yes (enabled)

**CONFIG_ESP32_WIFI_RX_IRAM_OPT**

WiFi RX IRAM speed optimization

*Found in: Component config > Wi-Fi*

Select this option to place frequently called Wi-Fi library RX functions in IRAM. When this option is disabled, more than 17Kbytes of IRAM memory will be saved but Wi-Fi performance will be reduced.

*Default value:*

Submit Document Feedback
• No (disabled) if CONFIG_BT_ENABLED && ESP32_SPIRAM_SUPPORT
• Yes (enabled)

CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE
Enable WPA3-Personal

*Found in: Component config > Wi-Fi*

Select this option to allow the device to establish a WPA3-Personal connection with eligible AP’s. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

*Default value:*
• Yes (enabled)

CONFIG_ESP_WIFI_SLP_IRAM_OPT
WiFi SLP IRAM speed optimization

*Found in: Component config > Wi-Fi*

Select this option to place called Wi-Fi library TBTT process and receive beacon functions in IRAM. Some functions can be put in IRAM either by ESP32_WIFI_IRAM_OPT and ESP32_WIFI_RX_IRAM_OPT, or this one. If already enabled ESP32_WIFI_IRAM_OPT, the other 7.3KB IRAM memory would be taken by this option. If already enabled ESP32_WIFI_RX_IRAM_OPT, the other 1.3KB IRAM memory would be taken by this option. If neither of them are enabled, the other 7.4KB IRAM memory would be taken by this option. Wi-Fi power-save mode average current would be reduced if this option is enabled.

CONFIG_ESP_WIFI_SLP_DEFAULT_MIN_ACTIVE_TIME
Minimum active time

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_IRAM_OPT*

The minimum timeout for waiting to receive data, unit: milliseconds.

*Range:*
• from 8 to 60 if CONFIG_ESP_WIFI_SLP_IRAM_OPT

*Default value:*
• 50 if CONFIG_ESP_WIFI_SLP_IRAM_OPT

CONFIG_ESP_WIFI_SLP_DEFAULT_MAX_ACTIVE_TIME
Maximum keep alive time

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_IRAM_OPT*

The maximum time that wifi keep alive, unit: seconds.

*Range:*
• from 10 to 60 if CONFIG_ESP_WIFI_SLP_IRAM_OPT

*Default value:*
• 10 if CONFIG_ESP_WIFI_SLP_IRAM_OPT

CONFIG_ESP_WIFI_FTM_ENABLE
WiFi FTM

*Found in: Component config > Wi-Fi*

Enable feature Fine Timing Measurement for calculating WiFi Round-Trip-Time (RTT).
Chapter 2. API Reference

Default value:
• No (disabled)

**CONFIG_ESP_WIFI_FTM_INITIATOR_SUPPORT**

FTM Initiator support

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_FTM_ENABLE*

Default value:
• Yes (enabled) if `CONFIG_ESP_WIFI_FTM_ENABLE`

**CONFIG_ESP_WIFI_FTM_RESPONDER_SUPPORT**

FTM Responder support

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_FTM_ENABLE*

Default value:
• Yes (enabled) if `CONFIG_ESP_WIFI_FTM_ENABLE`

**CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE**

Power Management for station at disconnected

*Found in: Component config > Wi-Fi*

Select this option to enable power management for station when disconnected. Chip will do modem-sleep when rf module is not in use any more.

**CONFIG_ESP_WIFI_EXTERNAL_COEXIST_ENABLE**

WiFi External Coexistence

*Found in: Component config > Wi-Fi*

If enabled, HW External coexistence arbitration is managed by GPIO pins. It can support three types of wired combinations so far which are 1-wired/2-wired/3-wired. User can select GPIO pins in application code with configure interfaces.

This function depends on BT-off because currently we don’t support external coex and internal coex simultaneously.

Default value:
• No (disabled) if `CONFIG_BT_ENABLED`

**CONFIG_ESP_WIFI_GCMP_SUPPORT**

WiFi GCMP Support(GCMP128 and GCMP256)

*Found in: Component config > Wi-Fi*

Select this option to enable GCMP support. GCMP support is compulsory for WiFi Suite-B support.

Default value:
• No (disabled)

**CONFIG_ESP_WIFI_GMAC_SUPPORT**

WiFi GMAC Support(GMAC128 and GMAC256)

*Found in: Component config > Wi-Fi*

Select this option to enable GMAC support. GMAC support is compulsory for WiFi 192 bit certification.
**Default value:**
- No (disabled)

**CONFIG_ESP_WIFI_SOFTAP_SUPPORT**

WiFi SoftAP Support

*Found in: Component config > Wi-Fi*

WiFi module can be compiled without SoftAP to save code size.

**Default value:**
- Yes (enabled)

**Core dump** Contains:
- **CONFIG_ESP_COREDUMP_CHECK_BOOT**
- **CONFIG_ESP_COREDUMP_DATA_FORMAT**

- **CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART**
- **CONFIG_ESP_COREDUMP_UART_DELAY**
- **CONFIG_ESP_COREDUMP_CODEC**
- **CONFIG_ESP_COREDUMP_MAX_TASKS_NUM**
- **CONFIG_ESP_COREDUMP_STACK_SIZE**
- **CONFIG_ESP_COREDUMP_SUMMARY_STACKDUMP_SIZE**

**CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART**

Data destination

*Found in: Component config > Core dump*

Select place to store core dump: flash, uart or none (to disable core dumps generation).

Core dumps to Flash are not available if PSRAM is used for task stacks.

If core dump is configured to be stored in flash and custom partition table is used add corresponding entry to your CSV. For examples, please see predefined partition table CSV descriptions in the components/partition_table directory.

**Available options:**
- Flash (ESP_COREDUMP_ENABLE_TO_FLASH)
- UART (ESP_COREDUMP_ENABLE_TO_UART)
- None (ESP_COREDUMP_ENABLE_TO_NONE)

**CONFIG_ESP_COREDUMP_DATA_FORMAT**

Core dump data format

*Found in: Component config > Core dump*

Select the data format for core dump.

**Available options:**
- Binary format (ESP_COREDUMP_DATA_FORMAT_BIN)
- ELF format (ESP_COREDUMP_DATA_FORMAT_ELF)

**CONFIG_ESP_COREDUMP_CHECKSUM**

Core dump data integrity check

*Found in: Component config > Core dump*

Select the integrity check for the core dump.
Chapter 2. API Reference

Available options:
- Use CRC32 for integrity verification (ESP_COREDUMP_CHECKSUM_CRC32)
- Use SHA256 for integrity verification (ESP_COREDUMP_CHECKSUM_SHA256)

CONFIG_ESP_COREDUMP_CHECK_BOOT

Check core dump data integrity on boot

Found in: Component config > Core dump

When enabled, if any data are found on the flash core dump partition, they will be checked by calculating their checksum.

Default value:
- Yes (enabled) if ESP_COREDUMP_ENABLE_TO_FLASH

CONFIG_ESP_COREDUMP_MAX_TASKS_NUM

Maximum number of tasks

Found in: Component config > Core dump

Maximum number of tasks snapshots in core dump.

CONFIG_ESP_COREDUMP_UART_DELAY

Delay before print to UART

Found in: Component config > Core dump

Config delay (in ms) before printing core dump to UART. Delay can be interrupted by pressing Enter key.

Default value:
- 0 if ESP_COREDUMP_ENABLE_TO_UART

CONFIG_ESP_COREDUMP_STACK_SIZE

Reserved stack size

Found in: Component config > Core dump

Size of the memory to be reserved for core dump stack. If 0 core dump process will run on the stack of crashed task/ISR, otherwise special stack will be allocated. To ensure that core dump itself will not overflow task/ISR stack set this to the value above 800. NOTE: It eats DRAM.

CONFIG_ESP_COREDUMP_SUMMARY_STACKDUMP_SIZE

Size of the stack dump buffer

Found in: Component config > Core dump

Size of the buffer that would be reserved for extracting backtrace info summary. This buffer will contain the stack dump of the crashed task. This dump is useful in generating backtrace

Range:
- from 512 to 4096 if ESP_COREDUMP_DATA_FORMAT_ELF && ESP_COREDUMP_ENABLE_TO_FLASH

Default value:
- 1024 if ESP_COREDUMP_DATA_FORMAT_ELF && ESP_COREDUMP_ENABLE_TO_FLASH
CONFIG_ESP_COREDUMP_DECODE
Handling of UART core dumps in IDF Monitor

*Found in: Component config > Core dump*

**Available options:**
- Decode and show summary (info_corefile) (ESP_COREDUMP_DECODE_INFO)
- Don’t decode (ESP_COREDUMP_DECODE_DISABLE)

FAT Filesystem support  
**Contains:**
- CONFIG_FATFS_API_ENCODING
- CONFIG_FATFS_USE_FASTSEEK
- CONFIG_FATFS_CHOOSE_TYPE
- CONFIG_FATFS_LONG_FILENAMES
- CONFIG_FATFS_MAX_LFN
- CONFIG_FATFS_FS_LOCK
- CONFIG_FATFS_VOLUME_COUNT
- CONFIG_FATFS_CHOOSE_CODEPAGE
- CONFIG_FATFSALLOC_PREFER_EXTRAM
- CONFIG_FATFS_SECTOR_SIZE
- CONFIG_FATFS_SECTORS_PER_CLUSTER
- CONFIG_FATFS_TIMEOUT_MS
- CONFIG_FATFS_PER_FILE_CACHE

CONFIG_FATFS_VOLUME_COUNT
Number of volumes

*Found in: Component config > FAT Filesystem support*

Number of volumes (logical drives) to use.

**Range:**
- from 1 to 10

**Default value:**
- 2

CONFIG_FATFS_SECTOR_SIZE
Sector size

*Found in: Component config > FAT Filesystem support*

Specify the size of the sector in bytes for FATFS partition generator.

**Available options:**
- 512 (FATFS_SECTOR_512)
- 1024 (FATFS_SECTOR_1024)
- 2048 (FATFS_SECTOR_2048)
- 4096 (FATFS_SECTOR_4096)

CONFIG_FATFS_SECTORS_PER_CLUSTER
Sectors per cluster

*Found in: Component config > FAT Filesystem support*

This value specifies how many sectors there are in one cluster.

**Available options:**
- 1 (FATFS_SECTORS_PER_CLUSTER_1)
• 2 (FATFS_SECTORS_PER_CLUSTER_2)
• 4 (FATFS_SECTORS_PER_CLUSTER_4)
• 8 (FATFS_SECTORS_PER_CLUSTER_8)
• 16 (FATFS_SECTORS_PER_CLUSTER_16)
• 32 (FATFS_SECTORS_PER_CLUSTER_32)
• 64 (FATFS_SECTORS_PER_CLUSTER_64)
• 128 (FATFS_SECTORS_PER_CLUSTER_128)

**CONFIG_FATFS_CHOOSE_CODEPAGE**

OEM Code Page

*Found in: Component config > FAT Filesystem support*

OEM code page used for file name encodings.

If “Dynamic” is selected, code page can be chosen at runtime using f_setcp function. Note that choosing this option will increase application size by ~480kB.

**Available options:**

- Dynamic (all code pages supported) (FATFS_CODEPAGE_DYNAMIC)
- US (CP437) (FATFS_CODEPAGE_437)
- Arabic (CP720) (FATFS_CODEPAGE_720)
- Greek (CP737) (FATFS_CODEPAGE_737)
- KBL (CP771) (FATFS_CODEPAGE_771)
- Baltic (CP775) (FATFS_CODEPAGE_775)
- Latin 1 (CP850) (FATFS_CODEPAGE_850)
- Latin 2 (CP852) (FATFS_CODEPAGE_852)
- Cyrillic (CP855) (FATFS_CODEPAGE_855)
- Turkish (CP857) (FATFS_CODEPAGE_857)
- Portuguese (CP860) (FATFS_CODEPAGE_860)
- Icelandic (CP861) (FATFS_CODEPAGE_861)
- Hebrew (CP862) (FATFS_CODEPAGE_862)
- Canadian French (CP863) (FATFS_CODEPAGE_863)
- Arabic (CP864) (FATFS_CODEPAGE_864)
- Nordic (CP865) (FATFS_CODEPAGE_865)
- Russian (CP866) (FATFS_CODEPAGE_866)
- Greek 2 (CP869) (FATFS_CODEPAGE_869)
- Japanese (DBCS) (CP932) (FATFS_CODEPAGE_932)
- Simplified Chinese (DBCS) (CP936) (FATFS_CODEPAGE_936)
- Korean (DBCS) (CP949) (FATFS_CODEPAGE_949)
- Traditional Chinese (DBCS) (CP950) (FATFS_CODEPAGE_950)

**CONFIG_FATFS_CHOOSE_TYPE**

FAT type

*Found in: Component config > FAT Filesystem support*

If user specifies automatic detection of the FAT type, the FATFS generator will determine the type by the size.

**Available options:**

- Select a suitable FATFS type automatically. (FATFS_AUTO_TYPE)
- FAT12 (FATFS_FAT12)
- FAT16 (FATFS_FAT16)

**CONFIG_FATFS_LONG_FILENAMES**

Long filename support
Found in: Component config > FAT Filesystem support

Support long filenames in FAT. Long filename data increases memory usage. FATFS can be configured to store the buffer for long filename data in stack or heap (Currently not supported by FATFS partition generator).

Available options:
- No long filenames (FATFS_LFN_NONE)
- Long filename buffer in heap (FATFS_LFN_HEAP)
- Long filename buffer on stack (FATFS_LFN_STACK)

CONFIG_FATFS_MAX_LFN

Max long filename length

Found in: Component config > FAT Filesystem support

Maximum long filename length. Can be reduced to save RAM.

Range:
- from 12 to 255

Default value:
- 255

CONFIG_FATFS_API_ENCODING

API character encoding

Found in: Component config > FAT Filesystem support

Choose encoding for character and string arguments/returns when using FATFS APIs. The encoding of arguments will usually depend on text editor settings.

Available options:
- API uses ANSI/OEM encoding (FATFS_API_ENCODING_ANSI_OEM)
- API uses UTF-16 encoding (FATFS_API_ENCODING_UTF_16)
- API uses UTF-8 encoding (FATFS_API_ENCODING_UTF_8)

CONFIG_FATFS_FS_LOCK

Number of simultaneously open files protected by lock function

Found in: Component config > FAT Filesystem support

This option sets the FATFS configuration value _FS_LOCK. The option _FS_LOCK switches file lock function to control duplicated file open and illegal operation to open objects.

* 0: Disable file lock function. To avoid volume corruption, application should avoid illegal open, remove and rename to the open objects.
* >0: Enable file lock function. The value defines how many files/sub-directories can be opened simultaneously under file lock control.

Note that the file lock control is independent of re-entrancy.

Range:
- from 0 to 65535

Default value:
- 0
CONFIG_FATFS_TIMEOUT_MS

Timeout for acquiring a file lock, ms

*Found in: Component config > FAT Filesystem support*

This option sets FATFS configuration value _FS_TIMEOUT, scaled to milliseconds. Sets the number of milliseconds FATFS will wait to acquire a mutex when operating on an open file. For example, if one task is performing a lengthy operation, another task will wait for the first task to release the lock, and timeout after amount of time set by this option.

*Default value:*
  * 10000

CONFIG_FATFS_PER_FILE_CACHE

Use separate cache for each file

*Found in: Component config > FAT Filesystem support*

This option affects FATFS configuration value _FS_TINY.

If this option is set, _FS_TINY is 0, and each open file has its own cache, size of the cache is equal to the _MAX_SS variable (512 or 4096 bytes). This option uses more RAM if more than 1 file is open, but needs less reads and writes to the storage for some operations.

If this option is not set, _FS_TINY is 1, and single cache is used for all open files, size is also equal to _MAX_SS variable. This reduces the amount of heap used when multiple files are open, but increases the number of read and write operations which FATFS needs to make.

*Default value:*
  * Yes (enabled)

CONFIG_FATFS_ALLOC_PREFER_EXTRAM

Perfer external RAM when allocating FATFS buffers

*Found in: Component config > FAT Filesystem support*

When the option is enabled, internal buffers used by FATFS will be allocated from external RAM. If the allocation from external RAM fails, the buffer will be allocated from the internal RAM. Disable this option if optimizing for performance. Enable this option if optimizing for internal memory size.

*Default value:*
  * Yes (enabled) if SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC

CONFIG_FATFS_USE_FASTSEEK

Enable fast seek algorithm when using seek function through VFS FAT

*Found in: Component config > FAT Filesystem support*

The fast seek feature enables fast backward/long seek operations without FAT access by using an in-memory CLMT (cluster link map table). Please note, fast-seek is only allowed for read-mode files, if a file is opened in write-mode, the seek mechanism will automatically fallback to the default implementation.

*Default value:*
  * No (disabled)
CONFIG_FATFS_FAST_SEEK_BUFFER_SIZE

Fast seek CLMT buffer size

*Found in: Component config > FAT Filesystem support > CONFIG_FATFS_USE_FASTSEEK*

If fast seek algorithm is enabled, this defines the size of CLMT buffer used by this algorithm in 32-bit word units. This value should be chosen based on prior knowledge of maximum elements of each file entry would store.

**Default value:**
- 64 if `CONFIG_FATFS_USE_FASTSEEK`

**Modbus configuration**

Contains:
- `CONFIG_FMB_COMM_MODE_ASCII_EN`
- `CONFIG_FMB_COMM_MODE_RTU_EN`
- `CONFIG_FMB_COMM_MODE_TCP_EN`
- `CONFIG_FMB_CONTROLLER_NOTIFY_QUEUE_SIZE`
- `CONFIG_FMB_CONTROLLER_NOTIFY_TIMEOUT`
- `CONFIG_FMB_CONTROLLER_SLAVE_ID_SUPPORT`
- `CONFIG_FMB_CONTROLLER_STACK_SIZE`
- `CONFIG_FMB_PORT_TASK_PRIO`
- `CONFIG_FMB_PORT_TASK_STACK_SIZE`
- `CONFIG_FMB_QUEUE_LENGTH`
- `CONFIG_FMB_SERIAL_BUF_SIZE`
- `CONFIG_FMB_EVENT_QUEUE_TIMEOUT`
- `CONFIG_FMB_TIMER_PORT_ENABLED`
- `CONFIG_FMB_PORT_TASK_AFFINITY`
- `CONFIG_FMB_TIMER_USE_ISR_DISPATCH_METHOD`
- `CONFIG_FMB_SERIAL_ASCII_BITS_PER_SYMB`
- `CONFIG_FMB_SERIAL_ASCII_TIMEOUT_RESPOND_MS`
- `CONFIG_FMB_MASTER_DELAY_MS_CONVERT`
- `CONFIG_FMB_MASTER_TIMEOUT_MS_RESPOND`

**CONFIG_FMB_COMM_MODE_TCP_EN**

Enable Modbus stack support for TCP communication mode

*Found in: Component config > Modbus configuration*

Enable Modbus TCP option for stack.

**Default value:**
- Yes (enabled)

**CONFIG_FMB_TCP_PORT_DEFAULT**

Modbus TCP port number

*Found in: Component config > Modbus configuration > CONFIG_FMB_COMM_MODE_TCP_EN*

Modbus default port number used by Modbus TCP stack

**Range:**
- from 0 to 65535

**Default value:**
- 502
**CONFIG_FMB_TCP_PORT_MAX_CONN**

Maximum allowed connections for TCP stack

Found in: *Component config > Modbus configuration > CONFIG_FMB_COMM_MODE_TCP_EN*

Maximum allowed connections number for Modbus TCP stack. This is used by Modbus master and slave port layer to establish connections. This parameter may decrease performance of Modbus stack and can cause increasing of processing time (increase only if absolutely necessary).

Range:
- from 1 to 6

Default value:
- 5

**CONFIG_FMB_TCP_CONNECTION_TOUT_SEC**

Modbus TCP connection timeout

Found in: *Component config > Modbus configuration > CONFIG_FMB_COMM_MODE_TCP_EN*

Modbus TCP connection timeout in seconds. Once expired the current connection with the client will be closed and Modbus slave will be waiting for new connection to accept.

Range:
- from 1 to 3600

Default value:
- 20

**CONFIG_FMB_COMM_MODE_RTU_EN**

Enable Modbus stack support for RTU mode

Found in: *Component config > Modbus configuration*

Enable RTU Modbus communication mode option for Modbus serial stack.

Default value:
- Yes (enabled)

**CONFIG_FMB_COMM_MODE_ASCII_EN**

Enable Modbus stack support for ASCII mode

Found in: *Component config > Modbus configuration*

Enable ASCII Modbus communication mode option for Modbus serial stack.

Default value:
- Yes (enabled)

**CONFIG_FMB_MASTER_TIMEOUT_MS_RESPOND**

Slave respond timeout (Milliseconds)

Found in: *Component config > Modbus configuration*

If master sends a frame which is not broadcast, it has to wait sometime for slave response. If slave is not respond in this time, the master will process timeout error.

Range:
- from 50 to 3000

Default value:
- 150
CONFIG_FMB_MASTER_DELAY_MS_CONVERT
Slave conversion delay (Milliseconds)

*Found in: Component config > Modbus configuration*

If master sends a broadcast frame, it has to wait conversion time to delay, then master can send next frame.

**Range:**
- from 50 to 400

**Default value:**
- 200

CONFIG_FMB_QUEUE_LENGTH
Modbus serial task queue length

*Found in: Component config > Modbus configuration*

Modbus serial driver queue length. It is used by event queue task. See the serial driver API for more information.

**Range:**
- from 0 to 200

**Default value:**
- 20

CONFIG_FMB_PORT_TASK_STACK_SIZE
Modbus port task stack size

*Found in: Component config > Modbus configuration*

Modbus port task stack size for rx/tx event processing. It may be adjusted when debugging is enabled (for example).

**Range:**
- from 2048 to 8192

**Default value:**
- 4096

CONFIG_FMB_SERIAL_BUF_SIZE
Modbus serial task RX/TX buffer size

*Found in: Component config > Modbus configuration*

Modbus serial task RX and TX buffer size for UART driver initialization. This buffer is used for modbus frame transfer. The Modbus protocol maximum frame size is 256 bytes. Bigger size can be used for non standard implementations.

**Range:**
- from 0 to 2048

**Default value:**
- 256

CONFIG_FMB_SERIAL_ASCII_BITS_PER_SYMB
Number of data bits per ASCII character

*Found in: Component config > Modbus configuration*

This option defines the number of data bits per ASCII character.
CONFIG_FMB_SERIAL_ASCII_TIMEOUT_RESPOND_MS

Response timeout for ASCII communication mode (ms)

*Found in: Component config > Modbus configuration*

This option defines response timeout of slave in milliseconds for ASCII communication mode. Thus the timeout will expire and allow the master program to handle the error.

**Range:**
- from 300 to 2000

**Default value:**
- 1000

CONFIG_FMB_PORT_TASK_PRIO

Modbus port task priority

*Found in: Component config > Modbus configuration*

Modbus port data processing task priority. The priority of Modbus controller task is equal to (CONFIG_FMB_PORT_TASK_PRIO - 1).

**Range:**
- from 3 to 23

**Default value:**
- 10

CONFIG_FMB_PORT_TASK_AFFINITY

Modbus task affinity

*Found in: Component config > Modbus configuration*

Allows setting the core affinity of the Modbus controller task, i.e. whether the task is pinned to particular CPU, or allowed to run on any CPU.

**Available options:**
- No affinity (FMB_PORT_TASK_AFFINITY_NO_AFFINITY)
- CPU0 (FMB_PORT_TASK_AFFINITY_CPU0)
- CPU1 (FMB_PORT_TASK_AFFINITY_CPU1)

CONFIG_FMB_CONTROLLER_SLAVE_ID_SUPPORT

Modbus controller slave ID support

*Found in: Component config > Modbus configuration*

Modbus slave ID support enable. When enabled the Modbus <Report Slave ID> command is supported by stack.

**Default value:**
- Yes (enabled)
Chapter 2. API Reference

**CONFIG_FMB_CONTROLLER_SLAVE_ID**

Modbus controller slave ID

*Found in:* Component config > Modbus configuration > CONFIG_FMB_CONTROLLER_SLAVE_ID_SUPPORT

Modbus slave ID value to identify modbus device in the network using <Report Slave ID> command. Most significant byte of ID is used as short device ID and other three bytes used as long ID.

**Range:**
- from 0 to 4294967295

**Default value:**
- “0x00112233”

**CONFIG_FMB_CONTROLLER_NOTIFY_TIMEOUT**

Modbus controller notification timeout (ms)

*Found in:* Component config > Modbus configuration

Modbus controller notification timeout in milliseconds. This timeout is used to send notification about accessed parameters.

**Range:**
- from 0 to 200

**Default value:**
- 20

**CONFIG_FMB_CONTROLLER_NOTIFY_QUEUE_SIZE**

Modbus controller notification queue size

*Found in:* Component config > Modbus configuration

Modbus controller notification queue size. The notification queue is used to get information about accessed parameters.

**Range:**
- from 0 to 200

**Default value:**
- 20

**CONFIG_FMB_CONTROLLER_STACK_SIZE**

Modbus controller stack size

*Found in:* Component config > Modbus configuration

Modbus controller task stack size. The Stack size may be adjusted when debug mode is used which requires more stack size (for example).

**Range:**
- from 0 to 8192

**Default value:**
- 4096

**CONFIG_FMB_EVENT_QUEUE_TIMEOUT**

Modbus stack event queue timeout (ms)

*Found in:* Component config > Modbus configuration

Modbus stack event queue timeout in milliseconds. This may help to optimize Modbus stack event processing time.
**CONFIG_FMB_TIMER_PORT_ENABLED**

Modbus stack use timer for 3.5T symbol time measurement

*Found in: Component config > Modbus configuration*

If this option is set the Modbus stack uses timer for T3.5 time measurement. Else the internal UART TOUT timeout is used for 3.5T symbol time measurement.

*Default value:*

- No (disabled)

**CONFIG_FMB_TIMER_USE_ISR_DISPATCH_METHOD**

Modbus timer uses ISR dispatch method

*Found in: Component config > Modbus configuration*

If this option is set the Modbus stack uses ISR dispatch method to send timeout events from the callback function called from ISR. This option has dependency with the UART_ISR_IN_IRAM option which places UART interrupt handler into IRAM to prevent delays related to processing of UART events.

*Default value:*

- No (disabled)

**FreeRTOS**

Contains:

- CONFIG_FREERTOS_CHECK_STACKOVERFLOW
- CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER
- CONFIG_FREERTOS_INTERRUPT_BACKTRACE
- CONFIG_FREERTOS_OPTIMIZED_SCHEDULER
- CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS

- CONFIG_FREERTOS_HZ
- CONFIG_FREERTOS_USE_TICKLESS_IDLE
- CONFIG_FREERTOS_USE_IDLE_HOOK
- CONFIG_FREERTOS_USE_TICK_HOOK
- CONFIG_FREERTOS_CORETIMER
Chapter 2. API Reference

**CONFIG_FREERTOS_UNICORE**

Run FreeRTOS only on first core

*Found in: Component config > FreeRTOS*

This version of FreeRTOS normally takes control of all cores of the CPU. Select this if you only want to start it on the first core. This is needed when e.g. another process needs complete control over the second core.

# This invisible config value sets the value of tskNO_AFFINITY in task.h. # Intended to be used as a constant from other Kconfig files. # Value is (32-bit) INT_MAX.

**CONFIG_FREERTOS_CORETIMER**

Xtensa timer to use as the FreeRTOS tick source

*Found in: Component config > FreeRTOS*

FreeRTOS needs a timer with an associated interrupt to use as the main tick source to increase counters, run timers and do pre-emptive multitasking with. There are multiple timers available to do this, with different interrupt priorities. Check

**Available options:**

- Timer 0 (int 6, level 1) (FREERTOS_CORETIMER_0)
  Select this to use timer 0
- Timer 1 (int 15, level 3) (FREERTOS_CORETIMER_1)
  Select this to use timer 1
- SYSTIMER 0 (level 1) (FREERTOS_CORETIMER_SYSTIMER_LVL1)
  Select this to use systimer with the 1 interrupt priority.
- SYSTIMER 0 (level 3) (FREERTOS_CORETIMER_SYSTIMER_LVL3)
  Select this to use systimer with the 3 interrupt priority.

**CONFIG_FREERTOS_OPTIMIZED_SCHEDULER**

Enable FreeRTOS platform optimized scheduler

*Found in: Component config > FreeRTOS*

On most platforms there are instructions can speedup the ready task searching. Enabling this option the FreeRTOS with this instructions support will be built.

**Default value:**
- Yes (enabled)

**CONFIG_FREERTOS_HZ**

Tick rate (Hz)

*Found in: Component config > FreeRTOS*

Select the tick rate at which FreeRTOS does pre-emptive context switching.

**Range:**
- from 1 to 1000

**Default value:**
- 100

**CONFIG_FREERTOS_ASSERT_ON_UNTESTED_FUNCTION**

Halt when an SMP-untested function is called

*Found in: Component config > FreeRTOS*
Some functions in FreeRTOS have not been thoroughly tested yet when moving to the SMP implementation of FreeRTOS. When this option is enabled, these functions will throw an assert().

**Default value:**
- Yes (enabled)

**CONFIG_FREERTOS_CHECK_STACKOVERFLOW**

Check for stack overflow

*Found in: Component config > FreeRTOS*

FreeRTOS can check for stack overflows in threads and trigger an user function called vApplicationStackOverflowHook when this happens.

**Available options:**
- No checking (FREERTOS_CHECK_STACKOVERFLOW_NONE)
