## 1 Get Started
1.1 Introduction ................................................. 3
1.2 What You Need .............................................. 3
   1.2.1 Hardware ............................................... 3
   1.2.2 Software ............................................... 13
1.3 Installation ................................................. 13
   1.3.1 IDE ....................................................... 13
   1.3.2 Manual Installation .................................... 14
1.4 Build Your First Project ................................. 45

## 2 API Reference
2.1 API Conventions ............................................. 47
   2.1.1 Error handling ......................................... 47
   2.1.2 Configuration structures ............................... 47
   2.1.3 Private APIs ........................................... 48
   2.1.4 Components in example projects ....................... 48
   2.1.5 API Stability ........................................... 49
2.2 Application Protocols ................................. 50
   2.2.1 ASIO port ............................................... 50
   2.2.2 ESP-Modbus ............................................. 50
   2.2.3 ESP-MQTT ............................................... 51
   2.2.4 ESP-TLS ................................................ 66
   2.2.5 ESP HTTP Client ..................................... 81
   2.2.6 ESP Local Control .................................... 95
   2.2.7 ESP Serial Slave Link ................................. 105
   2.2.8 ESP x509 Certificate Bundle ......................... 119
   2.2.9 HTTP Server ........................................... 121
   2.2.10 HTTPS Server ......................................... 147
   2.2.11 ICMP Echo ............................................. 150
   2.2.12 mDNS Service ......................................... 155
   2.2.13 Mbed TLS ............................................. 155
   2.2.14 IP Network Layer .................................... 157
2.3 Bluetooth API ............................................... 157
   2.3.1 BT COMMON ............................................. 157
   2.3.2 BT LE .................................................... 163
   2.3.3 Controller && VHCI ................................... 286
   2.3.4 ESP-BLE-MESH ......................................... 295
   2.3.5 NimBLE-based host APIs ............................... 576
2.4 Error Codes Reference ............................. 578
2.5 Networking APIs ................................. 585
   2.5.1 Wi-Fi ..................................................... 585
   2.5.2 Ethernet .................................................. 688
   2.5.3 Thread .................................................... 717
   2.5.4 ESP-NETIF ............................................. 724
   2.5.5 IP Network Layer ..................................... 754

This is the documentation for Espressif IoT Development Framework (esp-idf). ESP-IDF is the official development framework for the ESP32, ESP32-S and ESP32-C Series SoCs.

This document describes using ESP-IDF with the ESP32-C3 SoC.

Chapter 1

Get Started

This document is intended to help you set up the software development environment for the hardware based on the ESP32-C3 chip by Espressif. After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then for building and flashing firmware onto an ESP32-C3 board.

Note: This is documentation for the master branch (latest version) of ESP-IDF. This version is under continual development. Stable version documentation is available, as well as other ESP-IDF Versions.

1.1 Introduction

ESP32-C3 is a system on a chip that integrates the following features:

- Wi-Fi (2.4 GHz band)
- Bluetooth Low Energy
- High performance 32-bit RISC-V single-core processor
- Multiple peripherals
- Built-in security hardware

Powered by 40 nm technology, ESP32-C3 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32-C3 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.

1.2 What You Need

1.2.1 Hardware

- An ESP32-C3 board.
- USB cable - USB A / micro USB B.
- Computer running Windows, Linux, or macOS.

Note: Currently, some of the development boards are using USB Type C connectors. Be sure you have the correct cable to connect your board!
Chapter 1. Get Started

If you have one of ESP32-C3 official development boards listed below, you can click on the link to learn more about the hardware.

**ESP32-C3-DevKitM-1**

This user guide will help you get started with ESP32-C3-DevKitM-1 and will also provide more in-depth information. ESP32-C3-DevKitM-1 is an entry-level development board based on ESP32-C3-MINI-1, a module named for its small size. This board integrates complete Wi-Fi and Bluetooth LE functions.

Most of the I/O pins on the ESP32-C3-MINI-1 module are broken out to the pin headers on both sides of this board for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-C3-DevKitM-1 on a breadboard.

![ESP32-C3-DevKitM-1](image)

**Fig. 1: ESP32-C3-DevKitM-1**

The document consists of the following major sections:

- **Getting Started**: Overview of ESP32-C3-DevKitM-1 and hardware/software setup instructions to get started.
- **Hardware Reference**: More detailed information about the ESP32-C3-DevKitM-1’s hardware.
- **Hardware Revision Details**: Revision history, known issues, and links to user guides for previous versions (if any) of ESP32-C3-DevKitM-1.
- **Related Documents**: Links to related documentation.

**Getting Started**  This section provides a brief introduction of ESP32-C3-DevKitM-1, instructions on how to do the initial hardware setup and how to flash firmware onto it.

**Description of Components**  The key components of the board are described in a counter-clockwise direction.
### Key Component

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP32-C3-MINI-1</td>
<td>ESP32-C3-MINI-1 is a general-purpose Wi-Fi and Bluetooth LE combo module that comes with a PCB antenna. At the core of this module is ESP32-C3FN4, a chip that has an embedded flash of 4 MB. Since flash is packaged in the ESP32-C3FN4 chip, rather than integrated into the module, ESP32-C3-MINI-1 has a smaller package size.</td>
</tr>
<tr>
<td>5 V to 3.3 V LDO</td>
<td>Power regulator that converts a 5 V supply into a 3.3 V output.</td>
</tr>
<tr>
<td>5 V Power On LED</td>
<td>Turns on when the USB power is connected to the board.</td>
</tr>
<tr>
<td>Pin Headers</td>
<td>All available GPIO pins (except for the SPI bus for flash) are broken out to the pin headers on the board. For details, please see Header Block.</td>
</tr>
<tr>
<td>Boot Button</td>
<td>Download button. Holding down Boot and then pressing Reset initiates Firmware Download mode for downloading firmware through the serial port.</td>
</tr>
<tr>
<td>Micro-USB Port</td>
<td>USB interface. Power supply for the board as well as the communication interface between a computer and the ESP32-C3FN4 chip.</td>
</tr>
<tr>
<td>Reset Button</td>
<td>Press this button to restart the system.</td>
</tr>
<tr>
<td>USB-to-UART Bridge</td>
<td>Single USB-UART bridge chip provides transfer rates up to 3 Mbps.</td>
</tr>
<tr>
<td>RGB LED</td>
<td>Addressable RGB LED, driven by GPIO8.</td>
</tr>
</tbody>
</table>

### Start Application Development

Before powering up your ESP32-C3-DevKitM-1, please make sure that it is in good condition with no obvious signs of damage.

### Required Hardware

- ESP32-C3-DevKitM-1
- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS

### Note

Be sure to use an appropriate USB cable. Some cables are for charging only and do not provide the needed data lines nor work for programming the boards.
Software Setup  Please proceed to Get Started, where Section Installation will quickly help you set up the development environment and then flash an application example onto your ESP32-C3-DevKitM-1.

Contents and Packaging

Retail Orders  If you order one or several samples, each ESP32-C3-DevKitM-1 comes in an individual package in either antistatic bag or any packaging depending on your retailer. For retail orders, please go to https://www.espressif.com/en/contact-us/get-samples.

Wholesale Orders  If you order in bulk, the boards come in large cardboard boxes. For wholesale orders, please go to https://www.espressif.com/en/contact-us/sales-questions.

Hardware Reference

Block Diagram  The block diagram below shows the components of ESP32-C3-DevKitM-1 and their interconnections.

Power Supply Options  There are three mutually exclusive ways to provide power to the board:

- Micro-USB Port, default power supply
- 5V and GND pin headers
- 3V3 and GND pin headers

It is recommended to use the first option: Micro-USB Port.

Header Block  The two tables below provide the Name and Function of the pin headers on both sides of the board (J1 and J3). The pin header names are shown in ESP32-C3-DevKitM-1 - front. The numbering is the same as in the ESP32-C3-DevKitM-1 Schematic (PDF).

---

1. P: Power supply; I: Input; O: Output; T: High impedance.
2. GPIO2, GPIO8, and GPIO9 are strapping pins of the ESP32-C3FN4 chip. These pins are used to control several chip functions depending on binary voltage values applied to the pins during chip power-up or system reset. For description and application of the strapping pins, please refer to Section Strapping Pins in ESP32-C3 Datasheet.
This user guide will help you get started with ESP32-C3-DevKitC-02 and will also provide more in-depth information. ESP32-C3-DevKitC-02 is an entry-level development board based on ESP32-C3-WROOM-02, a general-purpose module with 4 MB SPI flash. This board integrates complete Wi-Fi and Bluetooth LE functions.

Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-C3-DevKitC-02 on a breadboard.

The document consists of the following major sections:

- **Getting Started**: Overview of ESP32-C3-DevKitC-02 and hardware/software setup instructions to get started.
- **Hardware Reference**: More detailed information about the ESP32-C3-DevKitC-02’s hardware.
- **Hardware Revision Details**: Revision history, known issues, and links to user guides for previous versions (if any) of ESP32-C3-DevKitC-02.
- **Related Documents**: Links to related documentation.

**Getting Started**

This section provides a brief introduction of ESP32-C3-DevKitC-02, instructions on how to do the initial hardware setup and how to flash firmware onto it.

**Description of Components**

The key components of the board are described in a counter-clockwise direction.

### 1.2.2 Software

To start using ESP-IDF on **ESP32-C3**, install the following software:

- **Toolchain** to compile code for ESP32-C3
- **Build tools** - CMake and Ninja to build a full **Application** for ESP32-C3
- **ESP-IDF** that essentially contains API (software libraries and source code) for ESP32-C3 and scripts to operate the **Toolchain**

### 1.3 Installation

To install all the required software, we offer some different ways to facilitate this task. Choose from one of the available options.

#### 1.3.1 IDE

**Note:** We highly recommend installing the ESP-IDF through your favorite IDE.

- Eclipse Plugin
- VSCode Extension
1.3.2 Manual Installation

For the manual procedure, please select according to your operating system.

Standard Setup of Toolchain for Windows

Introduction ESP-IDF requires some prerequisite tools to be installed so you can build firmware for supported chips. The prerequisite tools include Python, Git, cross-compilers, CMake and Ninja build tools.

For this Getting Started we’re going to use the Command Prompt, but after ESP-IDF is installed you can use Eclipse Plugin or another graphical IDE with CMake support instead.

Note: Limitations: - The installation path of ESP-IDF and ESP-IDF Tools must not be longer than 90 characters. Too long installation paths might result in a failed build. - The installation path of Python or ESP-IDF must not contain white spaces or parentheses. - The installation path of Python or ESP-IDF should not contain special characters (non-ASCII) unless the operating system is configured with “Unicode UTF-8” support.

System Administrator can enable the support via Control Panel - Change date, time, or number formats - Administrative tab - Change system locale - check the option “Beta: Use Unicode UTF-8 for worldwide language support” - Ok and reboot the computer.

ESP-IDF Tools Installer The easiest way to install ESP-IDF’s prerequisites is to download one of ESP-IDF Tools Installers.

What is the usecase for Online and Offline Installer Online Installer is very small and allows the installation of all available releases of ESP-IDF. The installer will download only necessary dependencies including Git For Windows during the installation process. The installer stores downloaded files in the cache directory $userprofile%\. espressif

Offline Installer does not require any network connection. The installer contains all required dependencies including Git For Windows.

Components of the installation The installer deploys the following components:

- Embedded Python
- Cross-compilers
- OpenOCD
- CMake and Ninja build tools
- ESP-IDF
The installer also allows reusing the existing directory with ESP-IDF. The recommended directory is `%userprofile%\Desktop\esp-idf` where `%userprofile%` is your home directory.

**Launching ESP-IDF Environment** At the end of the installation process you can check out option Run ESP-IDF PowerShell Environment or Run ESP-IDF Command Prompt (cmd.exe). The installer will launch ESP-IDF environment in selected prompt.

Run ESP-IDF PowerShell Environment:

![Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF PowerShell Environment](image)

Fig. 9: Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF PowerShell Environment

Run ESP-IDF Command Prompt (cmd.exe):

Using the Command Prompt For the remaining Getting Started steps, we’re going to use the Windows Command Prompt.

ESP-IDF Tools Installer also creates a shortcut in the Start menu to launch the ESP-IDF Command Prompt. This shortcut launches the Command Prompt (cmd.exe) and runs `export.bat` script to set up the environment variables (PATH, IDF_PATH and others). Inside this command prompt, all the installed tools are available.

Note that this shortcut is specific to the ESP-IDF directory selected in the ESP-IDF Tools Installer. If you have multiple ESP-IDF directories on the computer (for example, to work with different versions of ESP-IDF), you have two options to use them:

1. Create a copy of the shortcut created by the ESP-IDF Tools Installer, and change the working directory of the new shortcut to the ESP-IDF directory you wish to use.
2. Alternatively, run `cmd.exe`, then change to the ESP-IDF directory you wish to use, and run `export.bat`. Note that unlike the previous option, this way requires Python and Git to be present in PATH. If you get errors related to Python or Git not being found, use the first option.
Chapter 1. Get Started

Checking if Python packages are up to date...
Python requirements from C:\Users\test\esp\esp-idf\requirements.txt are satisfied.

Done! You can now compile ESP-IDF projects.
Go to the project directory and run:

idf.py build

C:\Users\test\esp\esp-idf>
Chapter 1. Get Started

First Steps on ESP-IDF  Now since all requirements are met, the next topic will guide you on how to start your first project.

This guide will help you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32-C3 and build, flash, and monitor the device output.

Note: If you have not yet installed ESP-IDF, please go to Installation and follow the instruction in order to get all the software needed to use this guide.

Start a Project  Now you are ready to prepare your application for ESP32-C3. You can start with get-started/hello_world project from examples directory in ESP-IDF.

Important: The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

Copy the project get-started/hello_world to ~/esp directory:

```
  cd %userprofile%\esp
  xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

Note: There is a range of example projects in the examples directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place without copying them first.

Connect Your Device  Now connect your ESP32-C3 board to the computer and check under which serial port the board is visible.

Serial port names start with COM in Windows.

If you are not sure how to check the serial port name, please refer to Establish Serial Connection with ESP32-C3 for full details.

Note: Keep the port name handy as you will need it in the next steps.

Configure Your Project  Navigate to your hello_world directory, set ESP32-C3 as the target, and run the project configuration utility menuconfig.

Windows

```
  cd %userprofile%\esp\hello_world
  idf.py set-target esp32c3
  idf.py menuconfig
```

After opening a new project, you should first set the target with idf.py set-target esp32c3. Note that existing builds and configurations in the project, if any, will be cleared and initialized in this process. The target may be saved in the environment variable to skip this step at all. See Select the Target Chip: set-target for additional information.

If the previous steps have been done correctly, the following menu appears:

You are using this menu to set up project specific variables, e.g., Wi-Fi network name and password, the processor speed, etc. Setting up the project with menuconfig may be skipped for “hello_world”, since this example runs with default configuration.
Chapter 1. Get Started

Fig. 13: Project configuration - Home window

Note: The colors of the menu could be different in your terminal. You can change the appearance with the option --style. Please run idf.py menuconfig --help for further information.

Build the Project

Build the project by running:

```
idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1
Project build complete. To flash, run this command:
../../../.components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
--flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
--bin build 0x10000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
--partition-table.bin
or run 'idf.py -p PORT flash'
```

If there are no errors, the build will finish by generating the firmware binary .bin files.

Flash onto the Device

To flash the binaries that you just built for the ESP32-C3 in the previous step, you need to run the following command:
Chapter 1. Get Started

idf.py -p PORT flash

Replace PORT with your ESP32-C3 board’s USB port name. If the PORT is not defined, the idf.py will try to connect automatically using the available USB ports.

For more information on idf.py arguments, see idf.py.

Note: The option flash automatically builds and flashes the project, so running idf.py build is not necessary.

Encountered Issues While Flashing? See this Flashing Troubleshooting page or Establish Serial Connection with ESP32-C3 for more detailed information.

Normal Operation

When flashing, you will see the output log similar to the following:

```
...
esptool.py --chip esp32c3 -p /dev/ttyUSB0 -b 460800 --before=default_reset --after=hard_reset write_flash --flash_mode dio --flash_freq 80m --flash_size 2MB -0x8000 partition_table/partition-table.bin 0x0 bootloader/bootloader.bin 0x10000 hello_world.bin
esptool.py v3.0
Serial port /dev/ttyUSB0
Connecting.... Chip is ESP32-C3
Features: Wi-Fi
Crystal is 40MHz
MAC: 7c:df:a1:40:02:a4
Uploading stub...
Running stub...
Stub running...
Changing baud rate to 460800
Changed.

Wrote 145520 bytes (71984 compressed) at 0x00010000 in 2.3 seconds (effective 504.4 kbit/s)...
Hash of data verified.
Leaving...
Hard resetting via RTS pin...
Done
```

If there are no issues by the end of the flash process, the board will reboot and start up the “hello_world” application.

If you’d like to use the Eclipse or VS Code IDE instead of running idf.py, check out Eclipse Plugin, VSCode Extension.
Monitor the Output  
To check if “hello_world” is indeed running, type idf.py -p PORT monitor (Do not forget to replace PORT with your serial port name).

This command launches the **IDF Monitor** application:

```
$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_world/build/hello_world.elf"...
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun 8 2016 00:22:57
rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
... idf_monitor on <PORT> 115200 ---
... Hello world!
... Restarting in 10 seconds...
... This is esp32c3 chip with 1 CPU core(s), WiFi/BLE, silicon revision 0, 2MB...
--- external flash
Minimum free heap size: 337332 bytes
... Restarting in 9 seconds...
... Restarting in 8 seconds...
... Restarting in 7 seconds...
```

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

To exit IDF monitor use the shortcut Ctrl+].

**Note:** You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:

- **IDF Monitor** for handy shortcuts and more details on using IDF monitor.
- idf.py for a full reference of idf.py commands and options.

**That’s all that you need to get started with ESP32-C3!**

Now you are ready to try some other examples, or go straight to developing your own applications.

**Important:** Some of examples do not support ESP32-C3 because required hardware is not included in ESP32-C3 so it cannot be supported.

If building an example, please check the README file for the Supported Targets table. If this is present including ESP32-C3 target, or the table does not exist at all, the example will work on ESP32-C3.

**Additional Tips**

**Permission issues /dev/ttyUSB0**  
With some Linux distributions, you may get the **Failed to open port /dev/ttyUSB0** error message when flashing the ESP32-C3. *This can be solved by adding the current user to the dialout group.*
**Python compatibility** ESP-IDF supports Python 3.7 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from sources or the use of a Python version management system such as pyenv.

**Flash Erase** Erasing the flash is also possible. To erase the entire flash memory you can run the following command:

```
idf.py -p PORT erase-flash
```

For erasing the OTA data, if present, you can run this command:

```
idf.py -p PORT erase-otadata
```

The flash erase command can take a while to be done. Do not disconnect your device while the flash erasing is in progress.

**Related Documents** For advanced users who want to customize the install process:

- Updating ESP-IDF tools on Windows
- Establish Serial Connection with ESP32-C3
- Eclipse Plugin
- VSCode Extension
- IDF Monitor

**Updating ESP-IDF tools on Windows**

**Install ESP-IDF tools using a script** From the Windows Command Prompt, change to the directory where ESP-IDF is installed. Then run:

```
install.bat
```

For Powershell, change to the directory where ESP-IDF is installed. Then run:

```
install.ps1
```

This will download and install the tools necessary to use ESP-IDF. If the specific version of the tool is already installed, no action will be taken. The tools are downloaded and installed into a directory specified during ESP-IDF Tools Installer process. By default, this is

```
C:\Users\username\.espressif
```

**Add ESP-IDF tools to PATH using an export script** ESP-IDF tools installer creates a Start menu shortcut for “ESP-IDF Command Prompt”. This shortcut opens a Command Prompt window where all the tools are already available.

In some cases, you may want to work with ESP-IDF in a Command Prompt window which wasn’t started using that shortcut. If this is the case, follow the instructions below to add ESP-IDF tools to PATH.

In the command prompt where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute export.bat:

```
cd %userprofile%/esp/esp-idf
export.bat
```

Alternatively in the Powershell where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute export.ps1:

```
cd ~/esp/esp-idf
export.ps1
```

When this is done, the tools will be available in this command prompt.
Establish Serial Connection with ESP32-C3

Establishing a serial connection with the ESP32-C3 target device could be done using USB-to-UART bridge or USB peripheral supported in ESP32-C3.

Some development boards have the USB-to-UART bridge installed. If a board does not have a bridge then an external bridge may be used.

Supported USB Peripheral  The ESP32-C3 supports the USB peripheral. In this case, the USB-to-UART bridge is not needed and the device can be flashed directly.

![Diagram of SoC with Supported USB](image1)

**Fig. 14: SoC with Supported USB**

Apart from the USB peripheral, some development boards also include the USB-to-UART bridge.

**USB-to-UART Bridge on Development Board**  For boards with an installed USB-to-UART bridge, the connection between the personal computer and the bridge is USB and between the bridge and ESP32-C3 is UART.

![Diagram of Development Board with USB-to-UART Bridge](image2)

**Fig. 15: Development Board with USB-to-UART Bridge**

**External USB-to-UART Bridge**  Sometimes the USB-to-UART bridge is external. This is often used in small development boards or finished products when space and costs are crucial.

**Flash using USB**  For the ESP32-C3, the USB peripheral is available, allowing you to flash the binaries without the need for an external USB-to-UART bridge.
Chapter 1. Get Started

The USB on the ESP32-C3 uses the GPIO19 for D+ and GPIO18 for D-.

**Note:** The ESP32-C3 supports only USB CDC and JTAG.

If you are flashing for the first time, you need to get the ESP32-C3 into the download mode manually. To do so, press and hold the **BOOT** button and then press the **RESET** button once. After that release the **BOOT** button.

**Flash using UART**  This section provides guidance on how to establish a serial connection between ESP32-C3 and PC using USB-to-UART Bridge, either installed on the development board or external.

**Connect ESP32-C3 to PC**  Connect the ESP32-C3 board to the PC using the USB cable. If device driver does not install automatically, identify USB-to-UART bridge on your ESP32-C3 board (or external converter dongle), search for drivers in internet and install them.

Below is the list of USB to serial converter chips installed on most of the ESP32-C3 boards produced by Espressif together with links to the drivers:

- CP210x: [CP210x USB to UART Bridge VCP Drivers](#)
- FTDI: [FTDI Virtual COM Port Drivers](#)

Please check the board user guide for specific USB-to-UART bridge chip used. The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with an operating system and automatically installed upon connecting the board to the PC.

For devices downloaded using a USB-to-UART bridge, you can run the following command including the optional argument to define the baud rate.

```bash
idf.py -p PORT [-b BAUD] flash
```

You can change the flasher baud rate by replacing **BAUD** with the baud rate you need. The default baud rate is 460800.

**Note:** If the device does not support the auto download mode, you need to get into the download mode manually. To do so, press and hold the **BOOT** button and then press the **RESET** button once. After that release the **BOOT** button.

**Check port on Windows**  Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32-C3 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT

---

Fig. 16: External USB-to-UART Bridge
Fig. 17: USB to UART bridge of ESP32-DevKitC in Windows Device Manager
Fig. 18: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager
Chapter 1. Get Started

Check port on Linux and macOS  To check the device name for the serial port of your ESP32-C3 board (or external converter dongle), run this command two times, first with the board / dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

Linux

`ls /dev/tty*`

macOS

`ls /dev/cu.*`

Note: macOS users: if you don’t see the serial port then check you have the USB/serial drivers installed. See Section Connect ESP32-C3 to PC for links to drivers. For macOS High Sierra (10.13), you may also have to explicitly allow the drivers to load. Open System Preferences -> Security & Privacy -> General and check if there is a message shown here about “System Software from developer …” where the developer name is Silicon Labs or FTDI.

Adding user to dialout on Linux  The currently logged user should have read and write access the serial port over USB. On most Linux distributions, this is done by adding the user to dialout group with the following command:

```
sudo usermod -a -G dialout $USER
```

on Arch Linux this is done by adding the user to uucp group with the following command:

```
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.

Verify serial connection  Now verify that the serial connection is operational. You can do this using a serial terminal program by checking if you get any output on the terminal after resetting ESP32-C3.

The default console baud rate on ESP32-C3 is 115200.

Windows and Linux  In this example we will use PuTTY SSH Client that is available for both Windows and Linux. You can use other serial programs and set communication parameters like below.

Run terminal and set identified serial port. Baud rate = 115200 (if needed, change this to the default baud rate of the chip in use), data bits = 8, stop bits = 1, and parity = N. Below are example screenshots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

Then open serial port in terminal and check, if you see any log printed out by ESP32-C3. The log contents will depend on application loaded to ESP32-C3, see Example Output.

Note: Close the serial terminal after verification that communication is working. If you keep the terminal session open, the serial port will be inaccessible for uploading firmware later.

macOS  To spare you the trouble of installing a serial terminal program, macOS offers the screen command.

- As discussed in Check port on Linux and macOS, run:

  `ls /dev/cu.*`

- You should see similar output:
Fig. 19: Setting Serial Communication in PuTTY on Windows
Fig. 20: Setting Serial Communication in PuTTY on Linux
**Chapter 1. Get Started**

<table>
<thead>
<tr>
<th>Device Names</th>
</tr>
</thead>
<tbody>
<tr>
<td>/dev/cu.Bluetooth-Incoming-Port</td>
</tr>
</tbody>
</table>

- The output will vary depending on the type and the number of boards connected to your PC. Then pick the device name of your board and run (if needed, change “115200” to the default baud rate of the chip in use):

  ```
  screen /dev/cu.device_name 115200
  ```

  Replace `device_name` with the name found running `ls /dev/cu.*`.

- What you are looking for is some log displayed by the `screen`. The log contents will depend on application loaded to ESP32-C3, see *Example Output*. To exit the `screen` session type Ctrl-A + \. 

  **Note:** Do not forget to exit the `screen` session after verifying that the communication is working. If you fail to do it and just close the terminal window, the serial port will be inaccessible for uploading firmware later.

**Example Output**  
An example log is shown below. Reset the board if you do not see anything.

```
ets Jun 8 2016 00:22:57
rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configskip: 0, SPIWP:0x00
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0xe0000000,len:8
load:0xe0000010,len:3464
load:0xe0078000,len:7828
load:0xe0080000,len:252
entry 0xe0000034
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10
...
```

If you can see readable log output, it means serial connection is working and you are ready to proceed with installation and finally upload an application to ESP32-C3.

**Note:** For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32-C3 will boot and produce serial output. This depends on the hardware itself, most development boards (including all Espressif boards) do not have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the esptool documentation for more details.

If you got here from *Step 5. First Steps on ESP-IDF* when installing s/w for ESP32-C3 development, then you can continue with *Step 5. First Steps on ESP-IDF*.

**Flashing Troubleshooting**

**Failed to Connect**  
If you run the given command and see errors such as “Failed to connect”, there might be several reasons for this. One of the reasons might be issues encountered by `esptool.py`, the utility that is called by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple solution to try is to manually reset as described below. If it does not help, you can find more details about possible issues in the `esptool troubleshooting` page.

`esptool.py` resets ESP32-C3 automatically by asserting DTR and RTS control lines of the USB-to-UART bridge, i.e., FT232 or CP210x (for more information, see *Establish Serial Connection with ESP32-C3*). The DTR and RTS
control lines are in turn connected to GPIO9 and CHIP_PU (EN) pins of ESP32-C3, thus changes in the voltage levels of DTR and RTS will boot ESP32-C3 into Firmware Download mode. As an example, check the schematic for the ESP32 DevKitC development board.

In general, you should have no problems with the official esp-idf development boards. However, esptool.py is not able to reset your hardware automatically in the following cases:

- Your hardware does not have the DTR and RTS lines connected to GPIO9 and CHIP_PU.
- The DTR and RTS lines are configured differently.
- There are no such serial control lines at all.

Depending on the kind of hardware you have, it may also be possible to manually put your ESP32-C3 board into Firmware Download mode (reset).

- For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an ESP-IDF development board, hold down the Boot button (GPIO9) and press the EN button (CHIP_PU).
- For other types of hardware, try pulling GPIO9 down.

**IDF Monitor**

IDF Monitor is mainly a serial terminal program which relays serial data to and from the target device’s serial port. It also provides some IDF-specific features.

IDF Monitor can be launched from an IDF project by running `idf.py monitor`.

**Keyboard Shortcuts** For easy interaction with IDF Monitor, use the keyboard shortcuts given in the table.
<table>
<thead>
<tr>
<th>Keyboard Shortcut</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl+J</td>
<td>Exit the program</td>
<td></td>
</tr>
<tr>
<td>Ctrl+T</td>
<td>Menu escape key</td>
<td>Press and follow it by one of the keys given below.</td>
</tr>
<tr>
<td>• Ctrl+T</td>
<td>Send the menu character itself to remote</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+J</td>
<td>Send the exit character itself to remote</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+P</td>
<td>Reset target into bootloader to pause app via RTS line</td>
<td>Resets the target, into bootloader via the RTS line (if connected), so that the board runs nothing. Useful when you need to wait for another device to startup.</td>
</tr>
<tr>
<td>• Ctrl+R</td>
<td>Reset target board via RTS</td>
<td>Resets the target board and re-starts the application via the RTS line (if connected).</td>
</tr>
<tr>
<td>• Ctrl+F</td>
<td>Build and flash the project</td>
<td>Pauses idf_monitor to run the project flash target, then resumes idf_monitor. Any changed source files are recompiled and then re-flashed. Target encrypted-flash is run if idf_monitor was started with argument -E.</td>
</tr>
<tr>
<td>• Ctrl+A (or A)</td>
<td>Build and flash the app only</td>
<td>Pauses idf_monitor to run the app-flash target, then resumes idf_monitor. Similar to the flash target, but only the main app is built and re-flashed. Target encrypted-app-flash is run if idf_monitor was started with argument -E.</td>
</tr>
<tr>
<td>• Ctrl+Y</td>
<td>Stop/resume log output printing on screen</td>
<td>Discards all incoming serial data while activated. Allows to quickly pause and examine log output without quitting the monitor.</td>
</tr>
<tr>
<td>• Ctrl+L</td>
<td>Stop/resume log output saved to file</td>
<td>Creates a file in the project directory and the output is written to that file until this is disabled with the same keyboard shortcut (or IDF Monitor exits).</td>
</tr>
<tr>
<td>• Ctrl+I (or I)</td>
<td>Stop/resume printing timestamps</td>
<td>IDF Monitor can print a timestamp in the beginning of each line. The timestamp format can be changed by the --timestamp-format command line argument.</td>
</tr>
<tr>
<td>• Ctrl+H (or H)</td>
<td>Display all keyboard shortcuts</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+X (or X)</td>
<td>Exit the program</td>
<td></td>

</table>

Any keys pressed, other than Ctrl-] and Ctrl-T, will be sent through the serial port.

**IDF-specific features**

**Automatic Address Decoding** Whenever ESP-IDF outputs a hexadecimal code address of the form 0x4_______, IDF Monitor uses addr2line_ to look up the location in the source code and find the function name.

If an ESP-IDF app crashes and panics, a register dump and backtrace is produced, such as the following:
abort() was called at PC 0x42067cd5 on core 0

Stack dump detected

(continues on next page)
To decode each address, IDF Monitor runs the following command in the background:

```
riscv32-esp-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS
```
A target can be configured to run GDBStub in the background by setting the `CONFIG_ESP_SYSTEM_PANIC` to `GDBStub` on runtime. GDBStub will run in the background until a Ctrl+C message is sent over the serial port and causes the GDBStub to break (i.e., stop the execution of) the program, thus allowing GDBStub to handle debugging commands.

Furthermore, the panic handler can be configured to run GDBStub on a crash by setting the `CONFIG_ESP_SYSTEM_PANIC` to `GDBStub` on panic. When a crash occurs, GDBStub will output a special string pattern over the serial port to indicate that it is running.

In both cases (i.e., sending the Ctrl+C message, or receiving the special string pattern), IDF Monitor will automatically launch GDB in order to allow the user to send debugging commands. After GDB exits, the target is reset via the RTS serial line. If this line is not connected, users can reset their target (by pressing the board’s Reset button).

**Note:** In the background, IDF Monitor runs the following command to launch GDB:

```
riscv32-esp-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex...
--interrupt build/PROJECT.elf :idf_target:'Hello NAME chip'
```

### Output Filtering

IDF monitor can be invoked as `idf.py monitor --print-filter="xyz"`, where `--print-filter` is the parameter for output filtering. The default value is an empty string, which means that everything is printed.

Restrictions on what to print can be specified as a series of `<tag>:`<log_level>` items where `<tag>` is the tag string and `<log_level>` is a character from the set `{N, E, W, I, D, V, *}` referring to a level for logging.

For example, `PRINT_FILTER="tag1:W"` matches and prints only the outputs written with `ESP_LOGW("tag1", ...)` or at lower verbosity level, i.e. `ESP_LOGE("tag1", ...)`. Not specifying a `<log_level>` or using `*` defaults to Verbose level.

**Note:** Use primary logging to disable at compilation the outputs you do not need through the logging library. Output filtering with IDF monitor is a secondary solution which can be useful for adjusting the filtering options without recompiling the application.

Your app tags must not contain spaces, asterisks *, or colons : to be compatible with the output filtering feature.

If the last line of the output in your app is not followed by a carriage return, the output filtering might get confused, i.e., the monitor starts to print the line and later finds out that the line should not have been written. This is a known issue and can be avoided by always adding a carriage return (especially when no output follows immediately afterwards).

### Examples of Filtering Rules:

- `*` can be used to match any tags. However, the string `PRINT_FILTER="*:I tag1:E"` with regards to `tag1` prints errors only, because the rule for `tag1` has a higher priority over the rule for `*`.
- The default (empty) rule is equivalent to `*:V` because matching every tag at the Verbose level or lower means matching everything.
- `*:N` suppresses not only the outputs from logging functions, but also the prints made by `printf`, etc. To avoid this, use `*:E` or a higher verbosity level.
- Rules `"tag1:V", "tag1:v", "tag1:*, "tag1:*"`, and `"tag1"` are equivalent.
- Rule `"tag1:W tag1:E"` is equivalent to `"tag1:E"` because any consequent occurrence of the same tag name overwrites the previous one.
- Rule `"tag1:I tag2:W"` only prints `tag1` at the Info verbosity level or lower and `tag2` at the Warning verbosity level or lower.
- Rule `"tag1:I tag2:W tag3:N"` is essentially equivalent to the previous one because `tag3:N` specifies that `tag3` should not be printed.
- `tag3:N` in the rule `"tag1:I tag2:W tag3:N:*:V"` is more meaningful because without `tag3:N` the `tag3` messages could have been printed; the errors for `tag1` and `tag2` will be printed at the specified (or lower) verbosity level and everything else will be printed by default.
A More Complex Filtering Example  The following log snippet was acquired without any filtering options:

```
load:0x40078000,len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID_ → 1
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The captured output for the filtering options `PRINT_FILTER="wifi esp_image:E light_driver:I"` is given below:

```
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The options `"PRINT_FILTER="light_driver:D esp_image:N boot:N cpu_start:N vfs:N wifi:N *:V" show the following output:

```
load:0x40078000,len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

Known Issues with IDF Monitor

Issues Observed on Windows

- Arrow keys, as well as some other keys, do not work in GDB due to Windows Console limitations.
- Occasionally, when “idf.py” exits, it might stall for up to 30 seconds before IDF Monitor resumes.
- When “gdb” is run, it might stall for a short time before it begins communicating with the GDBStub.

Standard Toolchain Setup for Linux and macOS

Installation Step by Step  This is a detailed roadmap to walk you through the installation process.

Setting up Development Environment  These are the steps for setting up the ESP-IDF for your ESP32-C3.

- **Step 1. Install Prerequisites**
- **Step 2. Get ESP-IDF**
- **Step 3. Set up the tools**
- **Step 4. Set up the environment variables**
- **Step 5. First Steps on ESP-IDF**

**Step 1. Install Prerequisites**  In order to use ESP-IDF with the ESP32-C3, you need to install some software packages based on your Operating System. This setup guide will help you on getting everything installed on Linux and macOS based systems.
Chapter 1. Get Started

For Linux Users To compile using ESP-IDF you will need to get the following packages. The command to run depends on which distribution of Linux you are using:

- Ubuntu and Debian:
  
  ```
  sudo apt-get install git wget flex bison gperf python3 python3-venv cmake
  -ninja-build ccache libffi-dev libssl-dev dfu-util libusb-1.0-0
  ```

- CentOS 7 & 8:
  
  ```
  sudo yum -y update && sudo yum install git wget flex bison gperf python3 cmake
  -ninja-build ccache dfu-util libusb
  ```

CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

- Arch:
  
  ```
  sudo pacman -S --needed gcc git make flex bison gperf python cmake ninja
  -ccache dfu-util libusb
  ```

Note:

- CMake version 3.16 or newer is required for use with ESP-IDF. Run “tools/idf_tools.py install cmake” to install a suitable version if your OS versions doesn’t have one.
- If you do not see your Linux distribution in the above list then please check its documentation to find out which command to use for package installation.

For macOS Users ESP-IDF will use the version of Python installed by default on macOS.

- Install CMake & Ninja build:
  - If you have HomeBrew, you can run:
    
    ```
    brew install cmake ninja dfu-util
    ```
  - If you have MacPorts, you can run:
    
    ```
    sudo port install cmake ninja dfu-util
    ```
  - Otherwise, consult the CMake and Ninja home pages for macOS installation downloads.

- It is strongly recommended to also install ccache for faster builds. If you have HomeBrew, this can be done via brew install ccache or sudo port install ccache on MacPorts.

Note: If an error like this is shown during any step:

Then you will need to install the XCode command line tools to continue. You can install these by running xcode-select --install.

Apple M1 Users If you use Apple M1 platform and see an error like this:

```WARNING: directory for tool xtensa-esp32-elf version esp-2021r2-patch3-8.4.0 is present, but tool was not found
ERROR: tool xtensa-esp32-elf has no installed versions. Please run 'install.sh' to install it.
```
zsh: bad CPU type in executable: ~/.espressif/tools/xtensa-esp32-elf/esp-2021r2-\patch3-8.4.0/xtensa-esp32-elf/bin/xtensa-esp32-elf-gcc

Then you will need to install Apple Rosetta 2 by running

```
/usr/sbin/softwareupdate --install-rosetta --agree-to-license
```

### Installing Python 3

Based on macOS Catalina 10.15 release notes, use of Python 2.7 is not recommended and Python 2.7 will not be included by default in future versions of macOS. Check what Python you currently have:

```
python --version
```

If the output is like `Python 2.7.17`, your default interpreter is Python 2.7. If so, also check if Python 3 isn’t already installed on your computer:

```
python3 --version
```

If the above command returns an error, it means Python 3 is not installed.

Below is an overview of the steps to install Python 3.

- Installing with HomeBrew can be done as follows:

  ```
brew install python3
  ```

- If you have MacPorts, you can run:

  ```
sudo port install python38
  ```

### Step 2. Get ESP-IDF

To build applications for the ESP32-C3, you need the software libraries provided by Espressif in ESP-IDF repository.

To get ESP-IDF, navigate to your installation directory and clone the repository with `git clone`, following instructions below specific to your operating system.

Open Terminal, and run the following commands:

```
mkdir -p ~/esp
cd ~/esp
git clone --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into `~/esp/esp-idf`

Consult ESP-IDF Versions for information about which ESP-IDF version to use in a given situation.

### Step 3. Set up the tools

Aside from the ESP-IDF, you also need to install the tools used by ESP-IDF, such as the compiler, debugger, Python packages, etc, for projects supporting ESP32-C3.

```
cd ~/esp/esp-idf
./install.sh esp32c3
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish esp32c3
```

The above commands install tools for ESP32-C3 only. If you intend to develop projects for more chip targets then you should list all of them and run for example:
Chapter 1. Get Started

```bash
cd ~/esp/esp-idf
./install.sh esp32,esp32s2
```

or with Fish shell

```bash
cd ~/esp/esp-idf
./install.fish esp32,esp32s2
```

In order to install tools for all supported targets please run the following command:

```bash
cd ~/esp/esp-idf
./install.sh all
```

or with Fish shell

```bash
cd ~/esp/esp-idf
./install.fish all
```

**Note:** For macOS users, if an error like this is shown during any step:

```bash
<urlopen error [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed: unable...
   --to get local issuer certificate (_ssl.c:xxx)
```

You may run `Install Certificates.command` in the Python folder of your computer to install certificates. For details, see Download Error While Installing ESP-IDF Tools.

**Alternative File Downloads** The tools installer downloads a number of files attached to GitHub Releases. If accessing GitHub is slow then it is possible to set an environment variable to prefer Espressif’s download server for GitHub asset downloads.

**Note:** This setting only controls individual tools downloaded from GitHub releases, it doesn’t change the URLs used to access any Git repositories.

To prefer the Espressif download server when installing tools, use the following sequence of commands when running `install.sh`:

```bash
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

**Customizing the tools installation path** The scripts introduced in this step install compilation tools required by ESP-IDF inside the user home directory: `$HOME/.espressif` on Linux. If you wish to install the tools into a different directory, set the environment variable `IDF_TOOLS_PATH` before running the installation scripts. Make sure that your user account has sufficient permissions to read and write this path.

If changing the `IDF_TOOLS_PATH`, make sure it is set to the same value every time the Install script (`install.bat`, `install.ps1` or `install.sh`) and an Export script (`export.bat`, `export.ps1` or `export.sh`) are executed.

**Step 4. Set up the environment variables** The installed tools are not yet added to the PATH environment variable. To make the tools usable from the command line, some environment variables must be set. ESP-IDF provides another script which does that.

In the terminal where you are going to use ESP-IDF, run:
Chapter 1. Get Started

You can execute ESP-IDF using . export.sh

or for fish (supported only since fish version 3.0.0):

Note the space between the leading dot and the path!

If you plan to use esp-idf frequently, you can create an alias for executing export.sh:

1. Copy and paste the following command to your shell’s profile (.profile, .bashrc, .zprofile, etc.)

   ```bash
   alias get_idf='. $HOME/esp/esp-idf/export.sh'
   ```

2. Refresh the configuration by restarting the terminal session or by running `source [path to profile]`, for example, `source ~/.bashrc`.

Now you can run `get_idf` to set up or refresh the esp-idf environment in any terminal session.

Technically, you can add `export.sh` to your shell’s profile directly; however, it is not recommended. Doing so activates IDF virtual environment in every terminal session (including those where IDF is not needed), defeating the purpose of the virtual environment and likely affecting other software.

**Step 5. First Steps on ESP-IDF** Now since all requirements are met, the next topic will guide you on how to start your first project.

This guide will help you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32-C3 and build, flash, and monitor the device output.

**Note:** If you have not yet installed ESP-IDF, please go to [Installation](#) and follow the instruction in order to get all the software needed to use this guide.

**Start a Project** Now you are ready to prepare your application for ESP32-C3. You can start with `get-started/hello_world` project from examples directory in ESP-IDF.

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

Copy the project `get-started/hello_world` to `~/esp` directory:

```bash
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

**Note:** There is a range of example projects in the examples directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place without copying them first.

**Connect Your Device** Now connect your ESP32-C3 board to the computer and check under which serial port the board is visible.

Serial ports have the following naming patterns:

- **Linux:** starting with `/dev/tty`
- **macOS:** starting with `/dev/cu`

If you are not sure how to check the serial port name, please refer to [Establish Serial Connection with ESP32-C3](#) for full details.
Chapter 1. Get Started

**Note:** Keep the port name handy as you will need it in the next steps.

**Configure Your Project** Navigate to your `hello_world` directory, set ESP32-C3 as the target, and run the project configuration utility `menuconfig`.

```bash
cd ~/esp/hello_world
idf.py set-target esp32c3
idf.py menuconfig
```

After opening a new project, you should first set the target with `idf.py set-target esp32c3`. Note that existing builds and configurations in the project, if any, will be cleared and initialized in this process. The target may be saved in the environment variable to skip this step at all. See `Select the Target Chip: set-target` for additional information.

If the previous steps have been done correctly, the following menu appears:

![Fig. 21: Project configuration - Home window](image)

You are using this menu to set up project specific variables, e.g., Wi-Fi network name and password, the processor speed, etc. Setting up the project with `menuconfig` may be skipped for “hello_world”, since this example runs with default configuration.

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

**Build the Project** Build the project by running:

```bash
idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.

```bash
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
```

(continues on next page)
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...
... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
..../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
--flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
--bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
--partition-table.bin
or run 'idf.py -p PORT flash'

If there are no errors, the build will finish by generating the firmware binary .bin files.

Flash onto the Device To flash the binaries that you just built for the ESP32-C3 in the previous step, you need to run the following command:

```
idf.py -p PORT flash
```

Replace PORT with your ESP32-C3 board’s USB port name. If the PORT is not defined, the `idf.py` will try to connect automatically using the available USB ports.

For more information on `idf.py` arguments, see `idf.py`.

**Note:** The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

Encountered Issues While Flashing? See this Flashing Troubleshooting page or Establish Serial Connection with ESP32-C3 for more detailed information.

Normal Operation When flashing, you will see the output log similar to the following:

```
...
esptool.py --chip esp32c3c -p /dev/ttyUSB0 -b 460800 --before=default_reset --
--after-hard_reset write_flash --flash_mode dio --flash_freq 80m --flash_size 2MB...
--0x8000 partition_table/partition-table.bin 0x0 bootloader/bootloader.bin 0x10000...
--hello_world.bin
esptool.py v3.0

Done

If there are no issues by the end of the flash process, the board will reboot and start up the “hello_world” application.

If you’d like to use the Eclipse or VS Code IDE instead of running `idf.py`, check out Eclipse Plugin, VSCode Extension.

Monitor the Output To check if “hello_world” is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace PORT with your serial port name).

This command launches the IDF Monitor application:

```
$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_world/build/hello_world.elf"...
---- idf_monitor on <PORT> 115200 ----
---- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ----
ets Jun 8 2016 00:22:57
rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
... 
```

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

```
...

```

To exit IDF monitor use the shortcut Ctrl+].

Note: You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor 
```
See also:

- **IDF Monitor** for handy shortcuts and more details on using IDF monitor.
- **idf.py** for a full reference of **idf.py** commands and options.

**That’s all that you need to get started with ESP32-C3!**

Now you are ready to try some other **examples**, or go straight to developing your own applications.

---

**Important:** Some of examples do not support ESP32-C3 because required hardware is not included in ESP32-C3 so it cannot be supported.

If building an example, please check the README file for the **Supported Targets** table. If this is present including ESP32-C3 target, or the table does not exist at all, the example will work on ESP32-C3.

---

**Additional Tips**

**Permission issues /dev/ttyUSB0** With some Linux distributions, you may get the **Failed to open port /dev/ttyUSB0** error message when flashing the ESP32-C3. **This can be solved by adding the current user to the dialout group.**

**Python compatibility** ESP-IDF supports Python 3.7 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from sources or the use of a Python version management system such as **pyenv**.

**Flash Erase** Erasing the flash is also possible. To erase the entire flash memory you can run the following command:

```
idf.py -p PORT erase-flash
```

For erasing the OTA data, if present, you can run this command:

```
idf.py -p PORT erase-otadata
```

The flash erase command can take a while to be done. Do not disconnect your device while the flash erasing is in progress.

**Tip: Updating ESP-IDF** It is recommended to update ESP-IDF from time to time, as newer versions fix bugs and/or provide new features. Please note that each ESP-IDF major and minor release version has an associated support period, and when one release branch is approaching end of life (EOL), all users are encouraged to upgrade their projects to more recent ESP-IDF releases, to find out more about support periods, see **ESP-IDF Versions**.

The simplest way to do the update is to delete the existing esp-idf folder and clone it again, as if performing the initial installation described in **Step 2. Get ESP-IDF**.

Another solution is to update only what has changed. **The update procedure depends on the version of ESP-IDF you are using.**

After updating ESP-IDF, execute the Install script again, in case the new ESP-IDF version requires different versions of tools. See instructions at **Step 3. Set up the tools**.

Once the new tools are installed, update the environment using the Export script. See instructions at **Step 4. Set up the environment variables**.

1.4 Build Your First Project

If you already have the ESP-IDF installed and not using IDE, you can build your first project from the command line following the Start a Project on Windows or Start a Project on Linux and macOS.
Chapter 2

API Reference

2.1 API Conventions

This document describes conventions and assumptions common to ESP-IDF Application Programming Interfaces (APIs).

ESP-IDF provides several kinds of programming interfaces:

- C functions, structures, enums, type definitions and preprocessor macros declared in public header files of ESP-IDF components. Various pages in the API Reference section of the programming guide contain descriptions of these functions, structures and types.
- Build system functions, predefined variables and options. These are documented in the build system guide.
- Kconfig options can be used in code and in the build system (CMakeLists.txt) files.
- Host tools and their command line parameters are also part of ESP-IDF interface.

ESP-IDF consists of components written specifically for ESP-IDF as well as third-party libraries. In some cases, an ESP-IDF-specific wrapper is added to the third-party library, providing an interface that is either simpler or better integrated with the rest of ESP-IDF facilities. In other cases, the original API of the third-party library is presented to the application developers.

Following sections explain some of the aspects of ESP-IDF APIs and their usage.

2.1.1 Error handling

Most ESP-IDF APIs return error codes defined with esp_err_t type. See Error Handling section for more information about error handling approaches. Error Code Reference contains the list of error codes returned by ESP-IDF components.

2.1.2 Configuration structures

Important: Correct initialization of configuration structures is an important part in making the application compatible with future versions of ESP-IDF.

Most initialization or configuration functions in ESP-IDF take as an argument a pointer to a configuration structure. For example:
Initialization functions never store the pointer to the configuration structure, so it is safe to allocate the structure on the stack.

The application must initialize all fields of the structure. The following is incorrect:

```c
esp_timer_create_args_t my_timer_args;
my_timer_args.callback = &my_timer_callback;
/* Incorrect! Fields .arg and .name are not initialized */
esp_timer_create(&my_timer_args, &my_timer);
```

Most ESP-IDF examples use C99 designated initializers for structure initialization, since they provide a concise way of setting a subset of fields, and zero-initializing the remaining fields:

```c
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    /* Correct, fields .arg and .name are zero-initialized */
};
```

C++ language doesn’t support the designated initializers syntax until C++20, however GCC compiler partially supports it as an extension. When using ESP-IDF APIs in C++ code, you may consider using the following pattern:

```c
esp_timer_create_args_t my_timer_args = {};
/* All the fields are zero-initialized */
my_timer_args.callback = &my_timer_callback;
```

**Default initializers**

For some configuration structures, ESP-IDF provides macros for setting default values of fields:

```c
httpd_config_t config = HTTPD_DEFAULT_CONFIG();
/* HTTPD_DEFAULT_CONFIG expands to a designated initializer. */
    Now all fields are set to the default values.
    Any field can still be modified: */
config.server_port = 8081;
httpd_handle_t server;
esp_err_t err = httpd_start(&server, &config);
```

It is recommended to use default initializer macros whenever they are provided for a particular configuration structure.

### 2.1.3 Private APIs

Certain header files in ESP-IDF contain APIs intended to be used only in ESP-IDF source code, and not by the applications. Such header files often contain `private` or `esp_private` in their name or path. Certain components, such as `hal` only contain private APIs.

Private APIs may be removed or changed in an incompatible way between minor or patch releases.

### 2.1.4 Components in example projects

ESP-IDF examples contain a variety of projects demonstrating usage of ESP-IDF APIs. In order to reduce code duplication in the examples, a few common helpers are defined inside components that are used by multiple examples.
This includes components located in common_components directory, as well as some of the components located in the examples themselves. These components are not considered to be part of the ESP-IDF API.

It is not recommended to reference these components directly in custom projects (via EXTRA_COMPONENT_DIRS build system variable), as they may change significantly between ESP-IDF versions. When starting a new project based on an ESP-IDF example, copy both the project and the common components it depends on out of ESP-IDF, and treat the common components as part of the project. Note that the common components are written with examples in mind, and might not include all the error handling required for production applications. Take time to read the code and understand if it applicable to your use case.

2.1.5 API Stability

ESP-IDF uses Semantic Versioning as explained in the versions page.

Minor and bugfix releases of ESP-IDF guarantee compatibility with previous releases. The sections below explain different aspects and limitations to compatibility.

Source level compatibility

ESP-IDF guarantees source level compatibility of C functions, structures, enums, type definitions and preprocessor macros declared in public header files of ESP-IDF components. Source level compatibility implies that the application can be recompiled with the newer version of ESP-IDF without changes.

The following changes are allowed between minor versions and do not break source level compatibility:

- Deprecating functions (using the deprecated attribute) and header files (using a preprocessor #warning). Deprecations are listed in ESP-IDF release notes. It is recommended to update the source code to use the newer functions or files that replace the deprecated ones, however this is not mandatory. Deprecated functions and files can be removed in major versions of ESP-IDF.
- Renaming components, moving source and header files between components — provided that the build system ensures that correct files are still found.
- Renaming Kconfig options. Kconfig system renaming mechanism ensures that the original Kconfig option names can still be used by the application in sdkconfig file, CMake files and source code.

Lack of binary compatibility

ESP-IDF does not guarantee binary compatibility between releases. This means that if a precompiled library is built with one ESP-IDF version, it is not guaranteed to work the same way with the next minor or bugfix release. The following are the possible changes that keep source level compatibility but not binary compatibility:

- Changing numerical values for C enum members.
- Adding new structure members or changing the order of members. See Configuration structures for tips that help ensure compatibility.
- Replacing an extern function with a static inline one with the same signature, or vice versa.
- Replacing a function-like macro with a compatible C function.

Other exceptions from compatibility

While we try to make upgrading to a new ESP-IDF version easy, there are parts of ESP-IDF that may change between minor versions in an incompatible way. We appreciate issue reports about any unintended breaking changes that don’t fall into the categories below.

- Private APIs.
- Components in example projects.
- Features clearly marked as “beta”, “preview”, or “experimental”.
- Changes made to mitigate security issues or to replace insecure default behaviors with a secure ones.
Features which were never functional. For example, if it was never possible to use a certain function or an enumeration value, it may get renamed (as part of fixing it) or removed. This includes software features which depend on non-functional chip hardware features.

- Unexpected or undefined behavior (for example, due to missing validation of argument ranges) that is not documented explicitly may be fixed/changed.
- Location of Kconfig options in menuconfig.
- Location and names of example projects.

## 2.2 Application Protocols

### 2.2.1 ASIO port

Asio is a cross-platform C++ library, see [https://think-async.com/Asio/](https://think-async.com/Asio/). It provides a consistent asynchronous model using a modern C++ approach.

The ESP-IDF component ASIO has been moved from ESP-IDF since version v5.0 to a separate repository:

- ASIO component on GitHub

**Hosted Documentation**

The documentation can be found on the link below:

- ASIO documentation (English)

### 2.2.2 ESP-Modbus

The Espressif ESP-Modbus Library (esp-modbus) supports Modbus communication in the networks based on RS485, Wi-Fi, Ethernet interfaces. The ESP-IDF component freemodbus has been moved from ESP-IDF since version v5.0 to a separate repository:

- ESP-Modbus component on GitHub

**Hosted Documentation**

The documentation can be found on the link below:

- ESP-Modbus documentation (English)

**Application Example**

The examples below demonstrate the ESP-Modbus library of serial, TCP ports for slave and master implementations accordingly.

- protocols/modbus/serial/mb_slave
- protocols/modbus/serial/mb_master
- protocols/modbus/tcp/mb_tcp_slave
- protocols/modbus/tcp/mb_tcp_master

Please refer to the specific example README.md for details.
Protocol References

2.2.3 ESP-MQTT

Overview

ESP-MQTT is an implementation of [MQTT](mqtt.org) protocol client (MQTT is a lightweight publish/subscribe messaging protocol).

Features

- Supports MQTT over TCP, SSL with mbedts, MQTT over Websocket, MQTT over Websocket Secure.
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)
- Support subscribing, publishing, authentication, last will messages, keep alive pings and all 3 QoS levels (it should be a fully functional client).

Application Example

- protocols/mqtt/tcp: MQTT over tcp, default port 1883
- protocols/mqtt/ssl: MQTT over tls, default port 8883
- protocols/mqtt/ssl_ds: MQTT over tls using digital signature peripheral for authentication, default port 8883.
- protocols/mqtt/ssl_mutual_auth: MQTT over tls using certificates for authentication, default port 8883
- protocols/mqtt/ssl_psk: MQTT over tls using pre-shared keys for authentication, default port 8883.
- protocols/mqtt/ws: MQTT over Websocket, default port 80
- protocols/mqtt/wss: MQTT over Websocket Secure, default port 443

Configuration

The configuration is made by setting fields in `esp_mqtt_client_config_t` struct. The configuration struct has the following sub structs to configure different aspects of the client operation.

- `broker` - Allow to set address and security verification.
- `credentials` - Client credentials for authentication.
- `session` - Configuration for MQTT session aspects.
- `network` - Networking related configuration.
- `task` - Allow to configure FreeRTOS task.
- `buffer` - Buffer size for input and output.

In the following session the most common aspects are detailed.

Broker

Address  Broker address can be set by usage of `broker.address` struct. The configuration can be made by usage of `uri` field or the combination of `hostname, transport and port`. Optionally, `path` could be set, this field is useful in websocket connections.

The `uri` field is used in the following format `scheme://hostname:port/path`. - Currently support `mqtt, mqtts, ws, wss` schemes - MQTT over TCP samples:

- `mqtt://mqtt.eclipseprojects.io`: MQTT over TCP, default port 1883:
- `mqtt://mqtt.eclipseprojects.io:1884` MQTT over TCP, port 1884:
• `mqtt://username:password@mqtt.eclipseprojects.io:1884` MQTT over TCP, port 1884, with username and password

• MQTT over SSL samples:
  - `mqtts://mqtt.eclipseprojects.io` MQTT over SSL, port 8883
  - `mqtts://mqtt.eclipseprojects.io:8884` MQTT over SSL, port 8884

• MQTT over Websocket samples:
  - `ws://mqtt.eclipseprojects.io:80/mqtt`

• MQTT over Websocket Secure samples:
  - `wss://mqtt.eclipseprojects.io:443/mqtt`

• Minimal configurations:

```c
const esp_mqtt_client_config_t mqtt_cfg = {
  .broker.address.uri = "mqtt://mqtt.eclipseprojects.io",
};
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler, ...
  &client);
esp_mqtt_client_start(client);
```

• Note: By default mqtt client uses event loop library to post related mqtt events (connected, subscribed, published, etc.)

**Verification** For secure connections TLS is used, and to guarantee Broker's identity the broker verification struct must be set. The broker certificate may be set in PEM or DER format. To select DER the equivalent _len field must be set, otherwise a NULL terminated string in PEM format should be provided to certificate field.

• Get certificate from server, example: `mqtt.eclipseprojects.io openssl s_client -showcerts -connect mqtt.eclipseprojects.io:8883 </dev/null 2>/dev/null openssl x509 -outform PEM >mqtt_eclipse_org.pem`

• Check the sample application: `examples/mqtt_ssl`

• Configuration:

```c
const esp_mqtt_client_config_t mqtt_cfg = {
  .broker = {
    .address.uri = "mqtts://mqtt.eclipseprojects.io:8883",
    .verification.certificate = (&mqtt.eclipse_org.pem_start,
  const char*)mqtt_eclipse_org.pem_start,
  },
};
```

To details on other fields check the Reference API and **TLS Server verification**.

**Client Credentials** All client related credentials are under the credentials field.

• `username`: pointer to the username used for connecting to the broker, can also be set by URI.

• `client_id`: pointer to the client id, defaults to `ESP32_%CHIPID%` where `%CHIPID%` are the last 3 bytes of MAC address in hex format

**Authentication** It`s possible to set authentication parameters through the authentication field. The client supports the following authentication methods:

• Using a password by setting `authentication.password`.

• Mutual authentication with TLS by setting `authentication.certificate` and `authentication.key`, both can be provided in PEM or DER format.

• Using secure element available in ESP32-WROOM-32SE, setting `authentication.use_secure_element`.

• Using Digital Signature Peripheral available in some Espressif devices, setting `authentication.ds_data`. 
Session  For MQTT session related configurations section fields should be used.

Last Will and Testament  MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the esp_mqtt_client_config_t.

- **topic**: pointer to the LWT message topic
- **msg**: pointer to the LWT message
- **msg_len**: length of the LWT message, required if msg is not null-terminated
- **qos**: quality of service for the LWT message
- **retain**: specifies the retain flag of the LWT message

Change settings in Project Configuration Menu  The settings for MQTT can be found using idf.py menu-config, under Component config -> ESP-MQTT Configuration

The following settings are available:
- **CONFIG_MQTT_PROTOCOL_311**: Enables 3.1.1 version of MQTT protocol
- **CONFIG_MQTT_TRANSPORT_SSL, CONFIG_MQTT_TRANSPORT_WEBSOCKET**: Enables specific MQTT transport layer, such as SSL, WEBSOCKET, WEBSOCKET_SECURE
- **CONFIG_MQTT_CUSTOM_OUTBOX**: Disables default implementation of mqtt_outbox, so a specific implementation can be supplied

Events

The following events may be posted by the MQTT client:

- **MQTT_EVENT_BEFORE_CONNECT**: The client is initialized and about to start connecting to the broker.
- **MQTT_EVENT_CONNECTED**: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
- **MQTT_EVENT_DISCONNECTED**: The client has aborted the connection due to being unable to read or write data, e.g. because the server is unavailable.
- **MQTT_EVENT_SUBSCRIBED**: The broker has acknowledged the client’s subscribe request. The event data will contain the message ID of the subscribe message.
- **MQTT_EVENT_UNSUBSCRIBED**: The broker has acknowledged the client’s unsubscribe request. The event data will contain the message ID of the unsubscribe message.
- **MQTT_EVENT_PUBLISHED**: The broker has acknowledged the client’s publish message. This will only be posted for Quality of Service level 1 and 2, as level 0 does not use acknowledgements. The event data will contain the message ID of the publish message.
- **MQTT_EVENT_DATA**: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer multiple MQTT_EVENT_DATA will be posted and current_data_offset and total_data_len from event data updated to keep track of the fragmented message.
- **MQTT_EVENT_ERROR**: The client has encountered an error. esp_mqtt_error_type_t from error_handle in the event data can be used to further determine the type of the error. The type of error will determine which parts of the error_handle struct is filled.

API Reference

Header File

- components/mqtt/esp-mqtt/include/mqtt_client.h

Functions

```c
esp_mqtt_client_handle_t esp_mqtt_client_init(const esp_mqtt_client_config_t *config)
```

Creates MQTT client handle based on the configuration.
**Chapter 2. API Reference**

**Parameters** config – MQTT configuration structure

**Returns** mqtt_client_handle if successfully created, NULL on error

```c
esp_err_t esp_mqtt_client_set_uri(esp_mqtt_client_handle_t client, const char *uri)
```

Sets MQTT connection URI. This API is usually used to overrides the URI configured in esp_mqtt_client_init.

**Parameters**
- client – MQTT client handle
- uri

**Returns** ESP_FAIL if URI parse error, ESP_OK on success

```c
esp_err_t esp_mqtt_client_start(esp_mqtt_client_handle_t client)
```

Starts MQTT client with already created client handle.

**Parameters** client – MQTT client handle

**Returns** ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL on other error

```c
esp_err_t esp_mqtt_client_reconnect(esp_mqtt_client_handle_t client)
```

This api is typically used to force reconnection upon a specific event.

**Parameters** client – MQTT client handle

**Returns** ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state

```c
esp_err_t esp_mqtt_client_disconnect(esp_mqtt_client_handle_t client)
```

This api is typically used to force disconnection from the broker.

**Parameters** client – MQTT client handle

**Returns** ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization

```c
esp_err_t esp_mqtt_client_stop(esp_mqtt_client_handle_t client)
```

Stops MQTT client tasks.

**Notes:**
- Cannot be called from the MQTT event handler

```c
int esp_mqtt_client_subscribe(esp_mqtt_client_handle_t client, const char *topic, int qos)
```

Subscribe the client to defined topic with defined qos.

**Notes:**
- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a MQTT event callback i.e. internal MQTT task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.

**Parameters**
- client – MQTT client handle
- topic
- qos – /* TODO describe parameters

**Returns** message_id of the subscribe message on success -1 on failure

```c
int esp_mqtt_client_unsubscribe(esp_mqtt_client_handle_t client, const char *topic)
```

Unsubscribe the client from defined topic.

**Notes:**
- Client must be connected to send unsubscribe message
Chapter 2. API Reference

• It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

**Parameters**
- `client` - `MQTT` client handle
- `topic` -

**Returns** message_id of the subscribe message on success -1 on failure

```c
int esp_mqtt_client_publish (esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain)
```

Client to send a publish message to the broker.

**Notes:**
- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
- Client doesn’t have to be connected for this API to work, enqueuing the messages with qos>1 (returning -1 for all the qos=0 messages if disconnected). If `MQTT_SKIP_PUBLISH_IF_DISCONNECTED` is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

**Parameters**
- `client` - `MQTT` client handle
- `topic` - topic string
- `data` - payload string (set to NULL, sending empty payload message)
- `len` - data length, if set to 0, length is calculated from payload string
- `qos` - QoS of publish message
- `retain` - retain flag

**Returns** message_id of the publish message (for QoS 0 message_id will always be zero) on success. -1 on failure.

```c
int esp_mqtt_client_enqueue (esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain, bool store)
```

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also used for qos=0 messages if store=true.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the `esp_mqtt_client_publish()` which sends the publish message immediately in the user task’s context). Thus, it could be used as a non blocking version of `esp_mqtt_client_publish()`.

**Parameters**
- `client` - `MQTT` client handle
- `topic` - topic string
- `data` - payload string (set to NULL, sending empty payload message)
- `len` - data length, if set to 0, length is calculated from payload string
- `qos` - QoS of publish message
- `retain` - retain flag
- `store` - if true, all messages are enqueued; otherwise only QoS 1 and QoS 2 are enqueued

**Returns** message_id if queued successfully, -1 otherwise

```c
esp_err_t esp_mqtt_client_destroy (esp_mqtt_client_handle_t client)
```

Destroys the client handle.

**Notes:**
- Cannot be called from the `MQTT` event handler

**Parameters**
- `client` - `MQTT` client handle

**Returns** ESP_OK ESP_ERR_INVALID_ARG on wrong initialization
**esp_err_t esp_mqtt_set_config** *(esp_mqtt_client_handle_t *client, const esp_mqtt_client_config_t *config)*

Set configuration structure, typically used when updating the config (i.e. on “before_connect” event).

**Parameters**
- `client` - MQTT client handle
- `config` - MQTT configuration structure

**Returns**
- ESP_ERR_NO_MEM if failed to allocate
- ESP_ERR_INVALID_ARG if conflicts on transport configuration
- ESP_OK on success

**esp_err_t esp_mqtt_client_register_event** *(esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler, void *event_handler_arg)*

Registers MQTT event.

**Parameters**
- `client` - MQTT client handle
- `event` - event type
- `event_handler` - handler callback
- `event_handler_arg` - handlers context

**Returns**
- ESP_ERR_NO_MEM if failed to allocate
- ESP_ERR_INVALID_ARG on wrong initialization
- ESP_OK on success

**int esp_mqtt_client_get_outbox_size** *(esp_mqtt_client_handle_t client)*

Get outbox size.

**Parameters**
- `client` - MQTT client handle

**Returns**
- outbox size 0 on wrong initialization

**Structures**

**struct esp_mqtt_error_codes**

MQTT error code structure to be passed as a contextual information into ERROR event

Important: This structure extends esp_tls_last_error error structure and is backward compatible with it (so might be down-casted and treated as esp_tls_last_error error, but recommended to update applications if used this way previously)

Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

- `error_type`  - related member variables
- `note`  - MQTT_ERROR_TYPE_TCP_TRANSPORT
- `esp_tls_last_esp_err`  - esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno
- `Error reported from tcp_transport.esp-tls`  - MQTT_ERROR_TYPE_CONNECTION_REFUSED
- `connect_return_code`  - Internal error reported from MQTT broker on connection

**Public Members**

**esp_err_t esp_tls_last_esp_err**

Last esp_err code reported from esp-tls component

**int esp_tls_stack_err**

tls specific error code reported from underlying tls stack

**int esp_tls_cert_verify_flags**

tls flags reported from underlying tls stack during certificate verification
**esp_mqtt_error_type_t** `error_type`
error type referring to the source of the error

**esp_mqtt_connect_return_code_t** `connect_return_code`
connection refused error code reported from MQTT* broker on connection

**int** `esp_transport_sock_errno`
erro from the underlying socket

**struct** `esp_mqtt_event_t`
*MQTT* event configuration structure

### Public Members

**esp_mqtt_event_id_t** `event_id`
*MQTT* event type

**esp_mqtt_client_handle_t** `client`
*MQTT* client handle for this event

char `*data`
Data associated with this event

**int** `data_len`
Length of the data for this event

**int** `total_data_len`
Total length of the data (longer data are supplied with multiple events)

**int** `current_data_offset`
Actual offset for the data associated with this event

char `*topic`
Topic associated with this event

**int** `topic_len`
Length of the topic for this event associated with this event

**int** `msg_id`
*MQTT* message id of message

**int** `session_present`
*MQTT* session_present flag for connection event

**esp_mqtt_error_codes_t** `*error_handle`
esp-mqtt error handle including esp-tls errors as well as internal *MQTT* errors
bool retain
    Retained flag of the message associated with this event

int qos
    QoS of the messages associated with this event

bool dup
    dup flag of the message associated with this event

`esp_mqtt_protocol_ver` protocol_ver
    MQTT protocol version used for connection, defaults to value from menuconfig

struct `esp_mqtt_client_config_t`
    MQTT client configuration structure

    • Default values can be set via menuconfig
    • All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related len field set to 0. DER format requires a related len field set to the correct length.

**Public Members**

struct `esp_mqtt_client_config_t::broker_t` broker
    Broker address and security verification

struct `esp_mqtt_client_config_t::credentials_t` credentials
    User credentials for broker

struct `esp_mqtt_client_config_t::session_t` session
    MQTT session configuration.

struct `esp_mqtt_client_config_t::network_t` network
    Network configuration

struct `esp_mqtt_client_config_t::task_t` task
    FreeRTOS task configuration.

struct `esp_mqtt_client_config_t::buffer_t` buffer
    Buffer size configuration.

struct `broker_t`
    Broker related configuration

**Public Members**

struct `esp_mqtt_client_config_t::broker_t::address_t` address
    Broker address configuration
struct esp_mqtt_client_config_t

verification_t verification

Security verification of the broker

struct address_t

Broker address

- uri have precedence over other fields
- If uri isn’t set at least hostname, transport and port should.

Public Members

cnst char *uri

Complete MQTT broker URI

cnst char *hostname

Hostname, to set ipv4 pass it as string)

esp_mqtt_transport_t transport

Selects transport

const char *path

Path in the URI

uint32_t port

MQTT server port

struct verification_t

Broker identity verification

If fields are not set broker’s identity isn’t verified. it’s recommended to set the options in this struct for security reasons.

Public Members

bool use_global_ca_store

Use a global ca_store, look esp-tls documentation for details.

esp_err_t (*crt_bundle_attach)(void *conf)

Pointer to ESP x509 Certificate Bundle attach function for the usage of certificate bundles.

cnst char *certificate

Certificate data, default is NULL, not required to verify the server.

size_t certificate_len

Length of the buffer pointed to by certificate.
const struct psk_key_hint *psk_hint_key

Pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). PSK is enabled only if there are no other ways to verify broker.

bool skip_cert_common_name_check

Skip any validation of server certificate CN field, this reduces the security of TLS and makes the MQTT client susceptible to MITM attacks

const char **alpn_protos

NULL-terminated list of supported application protocols to be used for ALPN

struct buffer_t

Client buffer size configuration

Client have two buffers for input and output respectively.

Public Members

int size

size of MQTT send/receive buffer

int out_size

size of MQTT output buffer. If not defined, defaults to the size defined by buffer_size

struct credentials_t

Client related credentials for authentication.

Public Members

const char *username

MQTT username

const char *client_id

Set MQTT client identifier. Ignored if set_null_client_id == true If NULL set the default client id. Default client id is ESP32_CHIPID% where CHIPID% are last 3 bytes of MAC address in hex format

bool set_null_client_id

Selects a NULL client id

struct esp_mqtt_client_config_t::credentials_t::authentication_t authentication

Client authentication

struct authentication_t

Client authentication

Fields related to client authentication by broker

For mutual authentication using TLS, user could select certificate and key, secure element or digital signature peripheral if available.
Public Members

const char *password
        MQTT password

const char *certificate
        Certificate for ssl mutual authentication, not required if mutual authentication is not needed.
        Must be provided with key.

size_t certificate_len
        Length of the buffer pointed to by certificate.

const char *key
        Private key for SSL mutual authentication, not required if mutual authentication is not needed.
        If it is not NULL, also certificate has to be provided.

size_t key_len
        Length of the buffer pointed to by key.

const char *key_password
        Client key decryption password, not PEM nor DER, if provided key_password_len must
        be correctly set.

int key_password_len
        Length of the password pointed to by key_password

bool use_secure_element
        Enable secure element, available in ESP32-ROOM-32SE, for SSL connection

void *ds_data
        Carrier of handle for digital signature parameters, digital signature peripheral is available in
        some Espressif devices.

struct network_t
        Network related configuration

Public Members

int reconnect_timeout_ms
        Reconnect to the broker after this value in milliseconds if auto reconnect is not disabled (defaults to
        10s)

int timeout_ms
        Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s).

int refresh_connection_after_ms
        Refresh connection after this value (in milliseconds)
bool **disable_auto_reconnect**

Client will reconnect to server (when errors/disconnect). Set **disable_auto_reconnect=true** to disable

struct **session_t**

MQTT Session related configuration

**Public Members**

struct **esp_mqtt_client_config_t::**session::**last_will**

Last will configuration

bool **disable_clean_session**

MQTT clean session, default clean_session is true

int **keepalive**

MQTT keepalive, default is 120 seconds

bool **disable_keepalive**

Set **disable_keepalive=true** to turn off keep-alive mechanism, keepalive is active by default. Note: setting the config value keepalive to 0 doesn’t disable keepalive feature, but uses a default keepalive period

**esp_mqtt_protocol_ver_t** **protocol_ver**

MQTT protocol version used for connection.

int **message_retransmit_timeout**

timeout for retransmitting of failed packet

struct **last_will_t**

Last Will and Testament message configuration.

**Public Members**

const char * **topic**

LWT (Last Will and Testament) message topic

const char * **msg**

LWT message, may be NULL terminated

int **msg_len**

LWT message length, if msg isn’t NULL terminated must have the correct length

int **qos**

LWT message QoS

int **retain**

LWT retained message flag

Chapter 2. API Reference

struct task_t
Client task configuration

Public Members

int priority
MQTT task priority

int stack_size
MQTT task stack size

Macros

MQTT_ERROR_TYPE_ESP_TLS
MQTT_ERROR_TYPE_TCP_TRANSPORT error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from MQTT_ERROR_TYPE_ESP_TLS layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility

Type Definitions

typedef struct esp_mqtt_client *esp_mqtt_client_handle_t

typedef enum esp_mqtt_event_id_t esp_mqtt_event_id_t
    MQTT event types.
    User event handler receives context data in esp_mqtt_event_t structure with
    • client - MQTT client handle
    • various other data depending on event type

typedef enum esp_mqtt_connect_return_code_t esp_mqtt_connect_return_code_t
    MQTT connection error codes propagated via ERROR event

typedef enum esp_mqtt_error_type_t esp_mqtt_error_type_t
    MQTT connection error codes propagated via ERROR event

typedef enum esp_mqtt_transport_t esp_mqtt_transport_t

 typedef enum esp_mqtt_protocol_ver_t esp_mqtt_protocol_ver_t
    MQTT protocol version used for connection

typedef struct esp_mqtt_error_codes esp_mqtt_error_codes_t
    MQTT error code structure to be passed as a contextual information into ERROR event
    Important: This structure extends esp_tls_last_error error structure and is backward compatible with it (so might be down-casted and treated as esp_tls_last_error error, but recommended to update applications if used this way previously)
    Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:
    error_type | related member variables | note | MQTT_ERROR_TYPE_TCP_TRANSPORT | esp_tls_lastesp_err, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno | Error reported from

Submit Document Feedback
tcp_transport/esp-tls | | MQTT_ERROR_TYPE_CONNECTION_REFUSED | connect_return_code | Internal error reported from MQTT broker on connection |

typedef struct esp_mqtt_event_t esp_mqtt_event_t
MQTT event configuration structure

typedef esp_mqtt_event_t *esp_mqtt_event_handle_t

typedef esp_err_t (*mqtt_event_callback_t)(esp_mqtt_event_handle_t event)

typedef struct esp_mqtt_client_config_t esp_mqtt_client_config_t
MQTT client configuration structure

- Default values can be set via menuconfig
- All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related len field set to 0. DER format requires a related len field set to the correct length.

Enumerations

enum esp_mqtt_event_id_t
MQTT event types.

User event handler receives context data in esp_mqtt_event_t structure with

- client - MQTT client handle
- various other data depending on event type

Values:

enumerator MQTT_EVENT_ANY
enumerator MQTT_EVENT_ERROR
- on error event, additional context: connection return code, error handle from esp_tls (if supported)

enumerator MQTT_EVENT_CONNECTED
- connected event, additional context: session_present flag

enumerator MQTT_EVENT_DISCONNECTED
- disconnected event

enumerator MQTT_EVENT_SUBSCRIBED
- subscribed event, additional context:
  - msg_id message id
  - data pointer to the received data
  - data_len length of the data for this event

enumerator MQTT_EVENT_UNSUBSCRIBED
- unsubscribed event
enumerator `MQTT_EVENT_PUBLISHED`
    published event, additional context: msg_id

enumerator `MQTT_EVENT_DATA`
    data event, additional context:
    • msg_id message id
    • topic pointer to the received topic
    • topic_len length of the topic
    • data pointer to the received data
    • data_len length of the data for this event
    • current_data_offset offset of the current data for this event
    • total_data_len total length of the data received
    • retain retain flag of the message
    • qos QoS level of the message
    • dup dup flag of the message
Note: Multiple MQTT_EVENT_DATA could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

enumerator `MQTT_EVENT_BEFORE_CONNECT`
    The event occurs before connecting

enumerator `MQTT_EVENT_DELETED`
    Notification on delete of one message from the internal outbox, if the message couldn’t have been sent and acknowledged before expiring defined in OUTBOX_EXPIRED_TIMEOUT_MS. (events are not posted upon deletion of successfully acknowledged messages)
    • This event id is posted only if MQTT_REPORT_DELETED_MESSAGES==1
    • Additional context: msg_id (id of the deleted message).

enum `esp_mqtt_connect_return_code_t`
    MQTT connection error codes propagated via ERROR event
    Values:

enumerator `MQTT_CONNECTION_ACCEPTED`
    Connection accepted

enumerator `MQTT_CONNECTION_REFUSE_PROTOCOL`
    MQTT connection refused reason: Wrong protocol

enumerator `MQTT_CONNECTION_REFUSE_ID_REJECTED`
    MQTT connection refused reason: ID rejected

enumerator `MQTT_CONNECTION_REFUSE_SERVER_UNAVAILABLE`
    MQTT connection refused reason: Server unavailable

enumerator `MQTT_CONNECTION_REFUSE_BAD_USERNAME`
    MQTT connection refused reason: Wrong user

enumerator `MQTT_CONNECTION_REFUSE_NOT_AUTHORIZED`
    MQTT connection refused reason: Wrong username or password
enum esp_mqtt_error_type_t
  
MQTT connection error codes propagated via ERROR event
  
Values:

enumerator MQTT_ERROR_TYPE_NONE

enumerator MQTT_ERROR_TYPE_TCP_TRANSPORT

enumerator MQTT_ERROR_TYPE_CONNECTION_REFUSED

enum esp_mqtt_transport_t
  
Values:

enumerator MQTT_TRANSPORT_UNKNOWN

enumerator MQTT_TRANSPORT_OVER_TCP
  
MQTT over TCP, using scheme: MQTT

enumerator MQTT_TRANSPORT_OVER_SSL
  
MQTT over SSL, using scheme: MQTTs

enumerator MQTT_TRANSPORT_OVER_WS
  
MQTT over Websocket, using scheme:: ws

enumerator MQTT_TRANSPORT_OVER_WSS
  
MQTT over Websocket Secure, using scheme: wss

enum esp_mqtt_protocol_ver_t
  
MQTT protocol version used for connection
  
Values:

enumerator MQTT_PROTOCOL_UNDEFINED

enumerator MQTT_PROTOCOL_V_3_1

enumerator MQTT_PROTOCOL_V_3_1_1

enumerator MQTT_PROTOCOL_V_5

## 2.2.4 ESP-TLS

### Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection among others. All the configuration can be specified in the esp_tls_cfg_t data structure. Once done, TLS communication can be conducted using the following APIs:
Chapter 2. API Reference

- `esp_tls_init()`: for initializing the TLS connection handle.
- `esp_tls_conn_new_sync()`: for opening a new blocking TLS connection.
- `esp_tls_conn_new_async()`: for opening a new non-blocking TLS connection.
- `esp_tls_conn_read()`: for reading from the connection.
- `esp_tls_conn_write()`: for writing into the connection.
- `esp_tls_conn_destroy()`: for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: protocols/https_request.

Tree structure for ESP-TLS component

```
├── esp_tls.c
├── esp_tls.h
├── esp_tls_mbedtls.c
├── esp_tls_wolfssl.c
└── private_include
    ├── esp_tls_mbedtls.h
    └── esp_tls_wolfssl.h
```

The ESP-TLS component has a file `esp-tls/esp_tls.h` which contain the public API headers for the component. Internally ESP-TLS component uses one of the two SSL/TLS Libraries between mbedtls and wolfssl for its operation. API specific to mbedtls are present in `esp-tls/private_include/esp_tls_mbedtls.h` and API specific to wolfssl are present in `esp-tls/private_include/esp_tls_wolfssl.h`.

TLS Server verification

The ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer’s server certificate or with the help of pre-shared keys. The user should select only one of the following options in the `esp_tls_cfg_t` structure for TLS server verification. If no option is selected then client will return a fatal error by default at the time of the TLS connection setup.

- **cacert_buf** and **cacert_bytes**: The CA certificate can be provided in a buffer to the `esp_tls_cfg_t` structure. The ESP-TLS will use the CA certificate present in the buffer to verify the server. The following variables in `esp_tls_cfg_t` structure must be set.
  - `cacert_buf` - pointer to the buffer which contains the CA cert.
  - `cacert_bytes` - size of the CA certificate in bytes.

- **use_global_ca_store**: The `global_ca_store` can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set `use_global_ca_store = true` in their respective `esp_tls_cfg_t` structure. See API Reference section below on information regarding different API used for initializing and setting up the `global_ca_store`.

- **crt_bundle_attach**: The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at [ESP x509 Certificate Bundle](#)

- **psk_hint_key**: To use pre-shared keys for server verification, `CONFIG_ESP_TLS_PSK_VERIFICATION` should be enabled in the ESP-TLS menuconfig. Then the pointer to PSK hint and key should be provided to the `esp_tls_cfg_t` structure. The ESP-TLS will use the PSK for server verification only when no other option regarding the server verification is selected.

- **skip server verification**: This is an insecure option provided in the ESP-TLS for testing purpose. The option can be set by enabling `CONFIG_ESP_TLS_INSECURE` and `CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY` in the ESP-TLS menuconfig. When this option is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the `esp_tls_cfg_t` structure. **WARNING**:Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca_store etc.
Underlying SSL/TLS Library Options

The ESP-TLS component has an option to use mbedtls or wolfssl as their underlying SSL/TLS library. By default only mbedtls is available and is used, wolfssl SSL/TLS library is available publicly at https://github.com/espressif/esp-wolfssl. The repository provides wolfssl component in binary format, it also provides few examples which are useful for understanding the API. Please refer the repository README.md for information on licensing and other options. Please see below option for using wolfssl in your project.

Note: As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.

How to use wolfssl with ESP-IDF

There are two ways to use wolfssl in your project

1) Directly add wolfssl as a component in your project with following three commands.:  

```
(First change directory (cd) to your project directory)
mkdir components
cd components
git clone https://github.com/espressif/esp-wolfssl.git
```

2) Add wolfssl as an extra component in your project.

   • Download wolfssl with:

```
git clone https://github.com/espressif/esp-wolfssl.git
```

   • Include esp-wolfssl in ESP-IDF with setting EXTRA_COMPONENT_DIRS in CMakeLists.txt of your project as done in wolfssl/examples. For reference see Optional Project variables in build-system.

After above steps, you will have option to choose wolfssl as underlying SSL/TLS library in configuration menu of your project as follows:

```
idf.py menuconfig -> ESP-TLS -> choose SSL/TLS Library -> mbedtls/wolfssl
```

Comparison between mbedtls and wolfssl

The following table shows a typical comparison between wolfssl and mbedtls when protocols/https_request example (which has server authentication) was run with both SSL/TLS libraries and with all respective configurations set to default. (mbedtls IN_CONTENT length and OUT_CONTENT length were set to 16384 bytes and 4096 bytes respectively)

<table>
<thead>
<tr>
<th>Property</th>
<th>Wolfssl</th>
<th>Mbedtls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Heap Consumed</td>
<td>~19 Kb</td>
<td>~37 Kb</td>
</tr>
<tr>
<td>Task Stack Used</td>
<td>~2.2 Kb</td>
<td>~3.6 Kb</td>
</tr>
<tr>
<td>Bin size</td>
<td>~858 Kb</td>
<td>~736 Kb</td>
</tr>
</tbody>
</table>

Note: These values are subject to change with change in configuration options and version of respective libraries.

Digital Signature with ESP-TLS

ESP-TLS provides support for using the Digital Signature (DS) with ESP32-C3. Use of the DS for TLS is supported only when ESP-TLS is used with mbedtlsTLS (default stack) as its underlying SSL/TLS stack. For more details on Digital Signature, please refer to the Digital Signature Documentation. The technical details of Digital Signature such
as how to calculate private key parameters can be found in ESP32-C3 Technical Reference Manual > Digital Signature (DS) [PDF]. The DS peripheral must be configured before it can be used to perform Digital Signature, see Configure the DS Peripheral in Digital Signature.

The DS peripheral must be initialized with the required encrypted private key parameters (obtained when the DS peripheral is configured). ESP-TLS internally initializes the DS peripheral when provided with the required DS context (DS parameters). Please see the below code snippet for passing the DS context to esp-tls context. The DS context passed to the esp-tls context should not be freed till the TLS connection is deleted.

```c
#include "esp_tls.h"
esp_ds_data_ctx_t *ds_ctx;
/* initialize ds_ctx with encrypted private key parameters, which can be read from
   the nvs or provided through the application code */
esp_tls_cfg_t cfg = {
    .clientcert_buf = /* the client cert */,
    .clientcert_bytes = /* length of the client cert */,
    /* other configurations options */
    .ds_data = (void *)ds_ctx,
};
```

**Note:** When using Digital Signature for the TLS connection, along with the other required params, only the client cert (`clientcert_buf`) and the DS params (`ds_data`) are required and the client key (`clientkey_buf`) can be set to NULL.

- An example of mutual authentication with the DS peripheral can be found at `ssl mutual auth` which internally uses (ESP-TLS) for the TLS connection.

### API Reference

#### Header File

- components/esp-tls/esp_tls.h

#### Functions

- `esp_tls_t *esp_tls_init` (void)
  
  Create TLS connection.

  This function allocates and initializes esp-tls structure handle.

  **Returns**  
  Tls Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

- `esp_tls_t *esp_tls_conn_http_new` (const char *url, const esp_tls_cfg_t *cfg)
  
  Create a new blocking TLS/SSL connection with a given “HTTP” url.

  **Note:** This API is present for backward compatibility reasons. Alternative function with the same functionality is `esp_tls_conn_http_new_sync` (and its asynchronous version `esp_tls_conn_http_new_async`)

  **Parameters**

  - `url` - [in] url of host.
  - `cfg` - [in] TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to ‘esp_tls_cfg_t’. At a minimum, this structure should be zero-initialized.

  **Returns**  
  pointer to esp_tls_t, or NULL if connection couldn’t be opened.

- `int esp_tls_conn_new_sync` (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
  
  Create a new blocking TLS/SSL connection.

  This function establishes a TLS/SSL connection with the specified host in blocking manner.
Chapter 2. API Reference

Parameters

- **hostname** – [in] Hostname of the host.
- **hostlen** – [in] Length of hostname.
- **port** – [in] Port number of the host.
- **cfg** – [in] TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.
- **tls** – [in] Pointer to esp-tls as esp-tls handle.

Returns

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

```c
int esp_tls_conn_http_new_sync (const char *url, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```

Create a new blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as esp_tls_conn_new_sync() API. However this API accepts host’s url.

Parameters

- **url** – [in] url of host.
- **cfg** – [in] TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.
- **tls** – [in] Pointer to esp-tls as esp-tls handle.

Returns

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

```c
int esp_tls_conn_new_async (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```

Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn’t wait for the connection to get established.

Parameters

- **hostname** – [in] Hostname of the host.
- **hostlen** – [in] Length of hostname.
- **port** – [in] Port number of the host.
- **cfg** – [in] TLS configuration as esp_tls_cfg_t. non_block member of this structure should be set to be true.
- **tls** – [in] pointer to esp-tls as esp-tls handle.

Returns

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

```c
int esp_tls_conn_http_new_async (const char *url, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```

Create a new non-blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as esp_tls_conn_new_async() API. However this API accepts host’s url.

Parameters

- **url** – [in] url of host.
- **cfg** – [in] TLS configuration as esp_tls_cfg_t.
- **tls** – [in] pointer to esp-tls as esp-tls handle.

Returns

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.
ssize_t esp_tls_conn_write(esp_tls_t *tls, const void *data, size_t datalen)

Write from buffer ‘data’ into specified tls connection.

Parameters
• tls -[in] pointer to esp-tls as esp-tls handle.
• data - [in] Buffer from which data will be written.
• datalen -[in] Length of data buffer.

Returns
• >=0 if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
• <0 if write operation was not successful, because either an error occurred or an action must be taken by the calling process.
• ESP_TLS_ERR_SSL_WANT_READ/ ESP_TLS_ERR_SSL_WANT_WRITE if the handshake is incomplete and waiting for data to be available for reading. In this case this functions needs to be called again when the underlying transport is ready for operation.

ssize_t esp_tls_conn_read(esp_tls_t *tls, void*data, size_t datalen)

Read from specified tls connection into the buffer ‘data’.

Parameters
• tls -[in] pointer to esp-tls as esp-tls handle.
• data - [in] Buffertoholdreaddata.
• datalen -[in] Length of datalbuffer.

Returns
• >0 if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
• 0 if read operation was not successful. The underlying connection was closed.
• <0 if read operation was not successful, because either an error occurred or an action must be taken by the calling process.

int esp_tls_conn_destroy(esp_tls_t *tls)

Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with esp_tls_conn_new_sync() (or esp_tls_conn_http_new_sync()) and esp_tls_conn_new_async() (or esp_tls_conn_http_new_async()) APIs.

Parameters tls -[in] pointer to esp-tls as esp-tls handle.

Returns
- 0 on success
- -1 if socket error or an invalid argument

ssize_t esp_tls_get_bytes_avail(esp_tls_t *tls)

Return thenumber of application data bytes remaining to be read from the current record.

This API is a wrapper over mbedtls’s mbedtls_ssl_get_bytes_avail() API.

Parameters tls -[in] pointer to esp-tls as esp-tls handle.

Returns
• -1 in case of invalid arg
• bytes available in the application data record read buffer

esp_err_t esp_tls_get_conn_sockfd(esp_tls_t *tls, int *sockfd)

Returns the connection socket file descriptor from esp_tls session.

Parameters
• tls -[in] handle to esp-tls context
• sockfd -[out] int pointer to sockfd value.

Returns
- ESP_OK on success and value of sockfd will be updated with socket file descriptor for connection
- ESP_ERR_INVALID_ARG if (tls == NULL || sockfd == NULL)

void *esp_tls_get_ssl_context(esp_tls_t *tls)

Returns the ssl context.
Parameters **tls** - [in] handle to esp_tls context

Returns - ssl_ctx pointer to ssl context of underlying TLS layer on success
  - NULL in case of error

.esp_err_t esp_tls_init_global_ca_store (void)

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling esp_tls_set_global_ca_store(). To be effective, this function must be called before any call to esp_tls_set_global_ca_store().

Returns
  - ESP_OK if creating global CA store was successful.
  - ESP_ERR_NO_MEM if an error occured when allocating the mbedtls resources.

.esp_err_t esp_tls_set_global_ca_store (const unsigned char *cacert_pem_buf, const unsigned int cacert_pem_bytes)

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls esp_tls_init_global_ca_store() if it has not already been called. The application must call this function before calling esp_tls_conn_new().

Parameters
  - **cacert_pem_buf** - [in] Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.
  - **cacert_pem_bytes** - [in] Length of the buffer.

Returns
  - ESP_OK if adding certificates was successful.
  - Other if an error occured or an action must be taken by the calling process.

void esp_tls_free_global_ca_store (void)

Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

.esp_err_t esp_tls_get_and_clear_last_error (esp_tls_error_handle_t h, int *esp_tls_code, int *esp_tls_flags)

Returns last error in esp_tls with detailed mbedtls related error codes. The error information is cleared internally upon return.

Parameters
  - **h** - [in] esp-tls error handle.
  - **esp_tls_code** - [out] last error code returned from mbedtls api (set to zero if none)
    This pointer could be NULL if caller does not care about esp_tls_code
  - **esp_tls_flags** - [out] last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

Returns
  - ESP_ERR_INVALID_STATE if invalid parameters
  - ESP_OK (0) if no error occurred
  - specific error code (based on ESP_ERR_ESP_TLS_BASE) otherwise

.esp_err_t esp_tls_get_and_clear_error_type (esp_tls_error_handle_t h, esp_tls_error_type_t err_type, int *error_code)

Returns the last error captured in esp_tls of a specific type The error information is cleared internally upon return.

Parameters
  - **h** - [in] esp-tls error handle.
  - **err_type** - [in] specific error type
Chapter 2. API Reference

- **error_code** [out] last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

**Returns**
- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK if a valid error returned and was cleared

```c
esp_err_t esp_tls_get_error_handle (esp_tls_t *tls, esp_tls_error_handle_t *error_handle)
```

Returns the ESP-TLS error_handle.

**Parameters**
- **tls** [in] handle to esp_tls context
- **error_handle** [out] pointer to the error handle.

**Returns**
- ESP_OK on success and error_handle will be updated with the ESP-TLS error handle.
- ESP_ERR_INVALID_ARG if (tls == NULL || error_handle == NULL)

```c
mbedtls_x509_crt* esp_tls_get_global_ca_store (void)
```

Get the pointer to the global CA store currently being used.

The application must first call esp_tls_set_global_ca_store(). Then the same CA store could be used by the application for APIs other than esp_tls.

**Note:** Modifying the pointer might cause a failure in verifying the certificates.

---

**Returns**
- Pointer to the global CA store currently being used if successful.
- NULL if there is no global CA store set.

```c
esp_err_t esp_tls_plain_tcp_connect (const char* host, int hostlen, int port, const esp_tls_cfg_t *cfg,
                                    esp_tls_error_handle_t error_handle, int *sockfd)
```

Creates a plain TCP connection, returning a valid socket fd on success or an error handle.

**Parameters**
- **host** [in] Hostname of the host.
- **hostlen** [in] Length of hostname.
- **port** [in] Port number of the host.
- **cfg** [in] ESP-TLS configuration as esp_tls_cfg_t.
- **error_handle** [out] ESP-TLS error handle holding potential errors occurred during connection
- **sockfd** [out] Socket descriptor if successfully connected on TCP layer

**Returns** ESP_OK on success ESP_ERR_INVALID_ARG if invalid output parameters ESP-TLS based error codes on failure

**Structures**

```c
struct psk_key_hint
```

ESP-TLS preshared key and hint structure.

**Public Members**

```c
const uint8_t *key
```

key in PSK authentication mode in binary format

```c
const size_t key_size
```

length of the key
const char *hint
    hint in PSK authentication mode in string format

struct tls_keep_alive_cfg
    esp-tls client session ticket ctx
    Keep alive parameters structure

Public Members

bool keep_alive_enable
    Enable keep-alive timeout

int keep_alive_idle
    Keep-alive idle time (second)

int keep_alive_interval
    Keep-alive interval time (second)

int keep_alive_count
    Keep-alive packet retry send count

struct esp_tls_cfg
    ESP-TLS configuration parameters.

Note: Note about format of certificates:

• This structure includes certificates of a Certificate Authority, of client or server as well as private keys,
  which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated
  (with NULL character included in certificate size).
• Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be
  only one certificate in case of DER format
• Variables names of certificates and private key buffers and sizes are defined as unions providing backward
  compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was
  supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

Public Members

const char **alpn_protos
    Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that
    should be negotiated. The format is length followed by protocol name. For the most common cases the
    following is ok: const char **alpn_protos = { "h2", NULL };
    • where ‘h2’ is the protocol name

const unsigned char *cacert_buf
    Certificate Authority’s certificate in a buffer. Format may be PEM or DER, depending on mbedtls-
    support This buffer should be NULL terminated in case of PEM
const unsigned char *cacert_pem_buf
    CA certificate buffer legacy name

unsigned int cacert_bytes
    Size of Certificate Authority certificate pointed to by cacert_buf (including NULL-terminator in case of PEM format)

unsigned int cacert_pem_bytes
    Size of Certificate Authority certificate legacy name

const unsigned char *clientcert_buf
    Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char *clientcert_pem_buf
    Client certificate legacy name

unsigned int clientcert_bytes
    Size of client certificate pointed to by clientcert_pem_buf (including NULL-terminator in case of PEM format)

unsigned int clientcert_pem_bytes
    Size of client certificate legacy name

const unsigned char *clientkey_buf
    Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char *clientkey_pem_buf
    Client key legacy name

unsigned int clientkey_bytes
    Size of client key pointed to by clientkey_pem_buf (including NULL-terminator in case of PEM format)

unsigned int clientkey_pem_bytes
    Size of client key legacy name

const unsigned char *clientkey_password
    Client key decryption password string

unsigned int clientkey_password_len
    String length of the password pointed to by clientkey_password

bool non_block
    Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

bool use_secure_element
    Enable this option to use secure element or atecc608a chip (Integrated with ESP32-WROOM-32SE)
int timeout_ms
    Network timeout in milliseconds. Note: If this value is not set, by default the timeout is set to 10 seconds. If you wish that the session should wait indefinitely then please use a larger value e.g., INT32_MAX

bool use_global_ca_store
    Use a global ca_store for all the connections in which this bool is set.

const char *common_name
    If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.

bool skip_common_name
    Skip any validation of server certificate CN field

tls_keep_alive_cfg_t *keep_alive_cfg
    Enable TCP keep-alive timeout for SSL connection

const psk_hint_key_t *psk_hint_key
    Pointer to PSK hint and key. if not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

esp_err_t (*crt_bundle_attach)(void *conf)
    Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

void *ds_data
    Pointer for digital signature peripheral context

bool is_plain_tcp
    Use non-TLS connection: When set to true, the esp-tls uses plain TCP transport rather then TLS/SSL connection. Note, that it is possible to connect using a plain tcp transport directly with esp_tls_plain_tcp_connect() API

struct ifreq *if_name
    The name of interface for data to go through. Use the default interface without setting

Type Definitions

typedef enum esp_tls_conn_state esp_tls_conn_state_t
    ESP-TLS Connection State.

typedef enum esp_tls_role esp_tls_role_t

typedef struct psk_key_hint psk_hint_key_t
    ESP-TLS preshared key and hint structure.

typedef struct tls_keep_alive_cfg tls_keep_alive_cfg_t
    esp-tls client session ticket ctx
    Keep alive parameters structure
typedef struct esp_tls_cfg esp_tls_cfg_t

ESP-TLS configuration parameters.

**Note:** Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
- Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format.
- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

typedef struct esp_tls esp_tls_t

**Enumerations**

enum esp_tls_conn_state

ESP-TLS Connection State.

*Values:*

- enumerator ESP_TLS_INIT
- enumerator ESP_TLS_CONNECTING
- enumerator ESP_TLS_HANDSHAKE
- enumerator ESP_TLS_FAIL
- enumerator ESP_TLS_DONE

enum esp_tls_role

*Values:*

- enumerator ESP_TLS_CLIENT
- enumerator ESP_TLS_SERVER

**Header File**

- components/esp-tls/esp_tls_errors.h

**Structures**

struct esp_tls_last_error

Error structure containing relevant errors in case tls error occurred.
Chapter 2. API Reference

Public Members

```c
esp_err_t last_error
```
error code (based on ESP_ERR_ESP_TLS_BASE) of the last occurred error

```c
int esp_tls_error_code
```
esp_tls error code from last esp_tls failed api

```c
int esp_tls_flags
```
last certification verification flags

Macros

```c
ESP_ERR_ESP_TLS_BASE
```
Starting number of ESP-TLS error codes

```c
ESP_ERR_ESP_TLS_CANNOT_RESOLVE_HOSTNAME
```
Error if hostname couldn’t be resolved upon tls connection

```c
ESP_ERR_ESP_TLS_CANNOT_CREATE_SOCKET
```
Failed to create socket

```c
ESP_ERR_ESP_TLS_UNSUPPORTED_PROTOCOL_FAMILY
```
Unsupported protocol family

```c
ESP_ERR_ESP_TLS_FAILED_CONNECT_TO_HOST
```
Failed to connect to host

```c
ESP_ERR_ESP_TLS_SOCKET_SETOPT_FAILED
```
Failed to set/get socket option

```c
ESP_ERR_ESP_TLS_CONNECTION_TIMEOUT
```
new connection in esp_tls_low_level_conn connection timeouted

```c
ESP_ERR_ESP_TLS_SE_FAILED
```

```c
ESP_ERR_ESP_TLS_TCP_CLOSED_FIN
```

```c
ESP_ERR_MBEDTLS_CERT_PARTLY_OK
```
mbedtls parse certificates was partly successful

```c
ESP_ERR_MBEDTLS_CTR_DRBG_SEED_FAILED
```
mbedtls api returned error

```c
ESP_ERR_MBEDTLS_SSL_SET_HOSTNAME_FAILED
```
mbedtls api returned error

```c
ESP_ERR_MBEDTLS_SSL_CONFIG_DEFAULTS_FAILED
```
mbedtls api returned error
ESP_ERR_MBEDTLS_SSL_CONF_ALPN_PROTOCOLS_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_X509_CRT_PARSE_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_CONF_own_cert_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_SETUP_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_WRITE_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_PK_PARSE_KEY_FAILED
mbedtls api returned failed

ESP_ERR_MBEDTLS_SSL_HANDSHAKE_FAILED
mbedtls api returned failed

ESP_ERR_MBEDTLS_SSL_CONF_PSK_FAILED
mbedtls api returned failed

ESP_ERR_MBEDTLS_SSL_TICKET_SETUP_FAILED
mbedtls api returned failed

ESP_ERR_WOLFSSL_SSL_SET_HOSTNAME_FAILED
wolfSSL api returned error

ESP_ERR_WOLFSSL_SSL_CONF_ALPN_PROTOCOLS_FAILED
wolfSSL api returned error

ESP_ERR_WOLFSSL_CERT_VERIFY_SETUP_FAILED
wolfSSL api returned error

ESP_ERR_WOLFSSL_KEY_VERIFY_SETUP_FAILED
wolfSSL api returned error

ESP_ERR_WOLFSSL_SSL_HANDSHAKE_FAILED
wolfSSL api returned failed

ESP_ERR_WOLFSSL_CTX_SETUP_FAILED
wolfSSL api returned failed

ESP_ERR_WOLFSSL_SSL_SETUP_FAILED
wolfSSL api returned failed
ESP_ERR_WOLFSSL_SSL_WRITE_FAILED
wolfSSL api returned failed

ESP_TLS_ERR_SSL_WANT_READ
Definition of errors reported from IO API (potentially non-blocking) in case of error:
• esp_tls_conn_read()
• esp_tls_conn_write()

ESP_TLS_ERR_SSL_WANT_WRITE

ESP_TLS_ERR_SSL_TIMEOUT

Type Definitions
typedef struct esp_tls_last_error *esp_tls_error_handle_t
typedef struct esp_tls_last_error esp_tls_last_error_t
Error structure containing relevant errors in case tls error occurred.

Enumerations
enum esp_tls_error_type_t
Definition of different types/sources of error codes reported from different components
Values:
  enumerator ESP_TLS_ERR_TYPE_UNKNOWN
  enumerator ESP_TLS_ERR_TYPE_SYSTEM
      System error &8212; errno
  enumerator ESP_TLS_ERR_TYPE_MBEDTLS
      Error code from mbedtlsTLS library
  enumerator ESP_TLS_ERR_TYPE_MBEDTLS_CERT_FLAGS
      Certificate flags defined in mbedtlsTLS
  enumerator ESP_TLS_ERR_TYPE_ESP
      ESP-IDF error type &8212; esp_err_t
  enumerator ESP_TLS_ERR_TYPE_WOLFSSL
      Error code from wolfSSL library
  enumerator ESP_TLS_ERR_TYPE_WOLFSSL_CERT_FLAGS
      Certificate flags defined in wolfSSL
  enumerator ESP_TLS_ERR_TYPE_MAX
      Last err type &8212; invalid entry
2.2.5 ESP HTTP Client

Overview

`esp_http_client` provides an API for making HTTP/S requests from ESP-IDF applications. The steps to use this API are as follows:

- `esp_http_client_init()`: Creates an `esp_http_client_config_t` instance i.e. a HTTP client handle based on the given `esp_http_client_config_t` configuration. This function must be the first to be called; default values will be assumed for the configuration values that are not explicitly defined by the user.
- `esp_http_client_perform()`: Performs all operations of the esp_http_client - opening the connection, exchanging data and closing the connection (as required), while blocking the current task until its completion. All related events will be invoked through the event handler (as specified in `esp_http_client_config_t`).
- `esp_http_client_cleanup()`: Closes the connection (if any) and frees up all the memory allocated to the HTTP client instance. This must be the last function to be called after the completion of operations.

Application Example

Simple example that uses ESP HTTP Client to make HTTP/S requests at `protocols/esp_http_client`.

Basic HTTP request

Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example for implementation details.

Persistent Connections

Persistent connection means that the HTTP client can re-use the same connection for several exchanges. If the server does not request to close the connection with the `Connection: close` header, the connection is not dropped but is instead kept open and used for further requests.

To allow ESP HTTP client to take full advantage of persistent connections, one should make as many requests as possible using the same handle instance.

Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example. Here, once the connection is created, multiple requests (GET, POST, PUT, etc.) are made before the connection is closed.

HTTPS Request

ESP HTTP client supports SSL connections using `mbedtls`, with the `url` configuration starting with `https` scheme or `transport_type` set to `HTTP_TRANSPORT_OVER_SSL`. HTTPS support can be configured via `CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS` (enabled by default).

**Note:** While making HTTPS requests, if server verification is needed, additional root certificate (in PEM format) needs to be provided to the `cert_pem` member in `esp_http_client_config_t` configuration. Users can also use the ESP x509 Certificate Bundle for server verification using the `crt_bundle_attach` member of the `esp_http_client_config_t` configuration.

Check out the example functions `https_with_url` and `https_with_hostname_path` in the application example. (Implementation details of the above note are found here)
HTTP Stream

Some applications need to open the connection and control the exchange of data actively (data streaming). In such cases, the application flow is different from regular requests. Example flow is given below:

- `esp_http_client_init()`: Create a HTTP client handle
- `esp_http_client_set_*` or `esp_http_client_delete_*`: Modify the HTTP connection parameters (optional)
- `esp_http_client_open()`: Open the HTTP connection with `write_len` parameter (content length that needs to be written to server), set `write_len=0` for read-only connection
- `esp_http_client_write()`: Write data to server with a maximum length equal to `write_len` of `esp_http_client_open()` function; no need to call this function for `write_len=0`
- `esp_http_client_fetch_headers()`: Read the HTTP Server response headers, after sending the request headers and server data (if any). Returns the `content-length` from the server and can be succeeded by `esp_http_client_get_status_code()` for getting the HTTP status of the connection.
- `esp_http_client_read()`: Read the HTTP stream
- `esp_http_client_close()`: Close the connection
- `esp_http_client_cleanup()`: Release allocated resources

Check out the example function `http_perform_as_stream_reader` in the application example for implementation details.

HTTP Authentication

ESP HTTP client supports both Basic and Digest Authentication.

- Users can provide the username and password in the `url` or the `username` and `password` members of the `esp_http_client_config_t` configuration. For `auth_type = HTTP_AUTH_TYPE_BASIC`, the HTTP client takes only 1 perform operation to pass the authentication process.
- If `auth_type = HTTP_AUTH_TYPE_NONE`, but the `username` and `password` fields are present in the configuration, the HTTP client takes 2 perform operations. The client will receive the 401 Unauthorized header in its first attempt to connect to the server. Based on this information, it decides which authentication method to choose and performs it in the second operation.

- Check out the example functions `http_auth_basic`, `http_auth_basic_redirect` (for Basic authentication) and `http_auth_digest` (for Digest authentication) in the application example for implementation details.

Examples of Authentication Configuration

- Authentication with URI

```c
esp_http_client_config_t config = {
  .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
  .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

- Authentication with username and password entry

```c
esp_http_client_config_t config = {
  .url = "http://httpbin.org/basic-auth/user/passwd",
  .username = "user",
  .password = "passwd",
  .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

API Reference

Functions

`esp_http_client_init(const esp_http_client_config_t *config)`

Start a HTTP session. This function must be the first function to call, and it returns a `esp_http_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_http_client_cleanup` when the operation is complete.

**Parameters**

- `config` - [in] The configurations, see `http_client_config_t`

**Returns**

- `esp_http_client_handle_t`
- `NULL` if any errors

`esp_http_client_perform(esp_http_client_handle_t client)`

Invoke this function after `esp_http_client_init` and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same `esp_http_client_handle_t` as input as the `esp_http_client_init` call returned. `esp_http_client_perform` performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking `esp_http_client_perform()`, `is_async` member of `esp_http_client_config_t` must be set while making a call to `esp_http_client_init()` API. You can do any amount of calls to `esp_http_client_perform` while using the same `esp_http_client_handle_t`. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. `esp_http_client` will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use `esp_http_client_set_**` between the invokes to set options for the following `esp_http_client_perform`.

**Note:** You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several `esp_http_client_handle_t`. This function include `esp_http_client_open` -&gt; `esp_http_client_write` -&gt; `esp_http_client_fetch_headers` -&gt; `esp_http_client_read` (and option) `esp_http_client_close`.

**Parameters**

- `client` - The `esp_http_client` handle

**Returns**

- `ESP_OK` on successful
- `ESP_FAIL` on error

`esp_http_client_set_url(esp_http_client_handle_t client, const char *url)`

Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

**Parameters**

- `client` - [in] The `esp_http_client` handle
- `url` - [in] The url

**Returns**

- `ESP_OK`
- `ESP_FAIL`

`esp_http_client_set_post_field(esp_http_client_handle_t client, const char *data, int len)`

Set post data, this function must be called before `esp_http_client_perform`. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

**Parameters**

- `client` - [in] The `esp_http_client` handle
- `data` - [in] post data pointer
- `len` - [in] post length

Chapter 2. API Reference

Returns
• ESP_OK
• ESP_FAIL

int esp_http_client_get_post_field(esp_http_client_handle_t client, char **data)
Get current post field information.

Parameters
• client - [in] The client
• data - [out] Point to post data pointer

Returns
Size of post data

esp_err_t esp_http_client_set_header(esp_http_client_handle_t client, const char *key, const char *value)
Set http request header, this function must be called after esp_http_client_init and before any perform function.

Parameters
• client - [in] The esp_http_client handle
• key - [in] The header key
• value - [in] The header value

Returns
• ESP_OK
• ESP_FAIL

esp_err_t esp_http_client_get_header(esp_http_client_handle_t client, const char *key, char **value)
Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after esp_http_client_init.

Parameters
• client - [in] The esp_http_client handle
• key - [in] The header key
• value - [out] The header value

Returns
• ESP_OK
• ESP_FAIL

esp_err_t esp_http_client_get_username(esp_http_client_handle_t client, char **value)
Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after esp_http_client_init.

Parameters
• client - [in] The esp_http_client handle
• value - [out] The username value

Returns
• ESP_OK
• ESP_ERR_INVALID_ARG

esp_err_t esp_http_client_set_username(esp_http_client_handle_t client, const char *username)
Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

Parameters
• client - [in] The esp_http_client handle
• username - [in] The username value

Returns
• ESP_OK
• ESP_ERR_INVALID_ARG

esp_err_t esp_http_client_get_password(esp_http_client_handle_t client, char **value)
Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after esp_http_client_init.
Chapter 2. API Reference

Parameters
• client -[in] The esp_http_client handle
• value -[out] The password value

Returns
• ESP_OK
• ESP_ERR_INVALID_ARG

`esp_err_t esp_http_client_set_password (esp_http_client_handle_t client, const char *password)`
Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

Parameters
• client -[in] The esp_http_client handle
• password -[in] The password value

Returns
• ESP_OK
• ESP_ERR_INVALID_ARG

`esp_err_t esp_http_client_set_auth_type (esp_http_client_handle_t client, esp_http_client_auth_type_t auth_type)`
Set http request auth_type.

Parameters
• client -[in] The esp_http_client handle
• auth_type -[in] The esp_http_client auth type

Returns
• ESP_OK
• ESP_ERR_INVALID_ARG

`int esp_http_client_get_errno (esp_http_client_handle_t client)`
Get HTTP client session errno.

Parameters
client -[in] The esp_http_client handle

Returns
• (-1) if invalid argument
• errno

`esp_err_t esp_http_client_set_method (esp_http_client_handle_t client, esp_http_client_method_t method)`
Set http request method.

Parameters
• client -[in] The esp_http_client handle
• method -[in] The method

Returns
• ESP_OK
• ESP_ERR_INVALID_ARG

`esp_err_t esp_http_client_set_timeout_ms (esp_http_client_handle_t client, int timeout_ms)`
Set http request timeout.

Parameters
• client -[in] The esp_http_client handle
• timeout_ms -[in] The timeout value

Returns
• ESP_OK
• ESP_ERR_INVALID_ARG

`esp_err_t esp_http_client_delete_header (esp_http_client_handle_t client, const char *key)`
Delete http request header.

Parameters
• client -[in] The esp_http_client handle
- **key** - [in] The key

**Returns**
- ESP_OK
- ESP_FAIL

`esp_err_t esp_http_client_open(esp_http_client_handle_t client, int write_len)`

This function will open the connection, write all header strings and return.

**Parameters**
- **client** - [in] The esp_http_client handle
- **write_len** - [in] HTTP Content length need to write to the server

**Returns**
- ESP_OK
- ESP_FAIL

`int esp_http_client_write(esp_http_client_handle_t client, const char* buffer, int len)`

This function will write data to the HTTP connection previously opened by `esp_http_client_open()`.

**Parameters**
- **client** - [in] The esp_http_client handle
- **buffer** - The buffer
- **len** - [in] This value must not be larger than the `write_len` parameter provided to `esp_http_client_open()`

**Returns**
- (-1) if any errors
- Length of data written

`int64_t esp_http_client_fetch_headers(esp_http_client_handle_t client)`

This function need to call after `esp_http_client_open()`, it will read from http stream, process all receive headers.

**Parameters**
- **client** - [in] The esp_http_client handle

**Returns**
- (0) if stream doesn’t contain content-length header, or chunked encoding (checked by `esp_http_client_is_chunked_response`) 
- (-1: ESP_FAIL) if any errors 
- (-ESP_ERR_HTTP_EAGAIN = -0x7007) if call is timed-out before any data was ready 
- Download data length defined by content-length header

`bool esp_http_client_is_chunked_response(esp_http_client_handle_t client)`

Check response data is chunked.

**Parameters**
- **client** - [in] The esp_http_client handle

**Returns** true or false

`int esp_http_client_read(esp_http_client_handle_t client, char *buffer, int len)`

Read data from http stream.

**Note:** (-ESP_ERR_HTTP_EAGAIN = -0x7007) is returned when call is timed-out before any data was ready

**Parameters**
- **client** - [in] The esp_http_client handle
- **buffer** - The buffer
- **len** - [in] The length

**Returns**
- (-1) if any errors
- Length of data was read

`int esp_http_client_get_status_code(esp_http_client_handle_t client)`

Get http response status code, the valid value if this function invoke after `esp_http_client_perform`
Parameters client  – [in] The esp_http_client handle

Returns  Status code

int64_t esp_http_client_get_content_length (esp_http_client_handle_t client)

Get http response content length (from header Content-Length) the valid value if this function invoke after
esp_http_client_perform

Parameters client  – [in] The esp_http_client handle

Returns

• (-1) Chunked transfer
• Content-Length value as bytes

esp_err_t esp_http_client_close (esp_http_client_handle_t client)

Close http connection, still kept all http request resources.

Parameters client  – [in] The esp_http_client handle

Returns

• ESP_OK
• ESP_FAIL

esp_err_t esp_http_client_cleanup (esp_http_client_handle_t client)

This function must be the last function to call for an session. It is the opposite of the esp_http_client_init
function and must be called with the same handle as input that a esp_http_client_init call returned. This might
close all connections this handle has used and possibly has kept open until now. Don’t call this function if
you intend to transfer more files, re-using handles is a key to good performance with esp_http_client.

Parameters client  – [in] The esp_http_client handle

Returns

• ESP_OK
• ESP_FAIL

esp_http_client_transport_t esp_http_client_get_transport_type (esp_http_client_handle_t client)

Get transport type.

Parameters client  – [in] The esp_http_client handle

Returns

• HTTP_TRANSPORT_UNKNOWN
• HTTP_TRANSPORT_OVER_TCP
• HTTP_TRANSPORT_OVER_SSL

esp_err_t esp_http_client_set_redirection (esp_http_client_handle_t client)

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided
by the server. This function will set the current URL to redirect to enable client to execute the redirection
request.

Parameters client  – [in] The esp_http_client handle

Returns

• ESP_OK
• ESP_FAIL

void esp_http_client_add_auth (esp_http_client_handle_t client)

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

Note: There is a possibility of receiving body message with redirection status codes, thus make sure to flush
off body data after calling this API.

Parameters client  – [in] The esp_http_client handle

bool esp_http_client_is_complete_data_received (esp_http_client_handle_t client)

Checks if entire data in the response has been read without any error.
Parameters **client** - [in] The esp_http_client handle

Returns
- true
- false

int esp_http_client_read_response (esp_http_client_handle_t client, char *buffer, int len)

Helper API to read larger data chunks This is a helper API which internally calls `esp_http_client_read` multiple times till the end of data is reached or till the buffer gets full.

Parameters
- **client** - [in] The esp_http_client handle
- **buffer** - The buffer
- **len** - [in] The buffer length

Returns
- Length of data was read

**esp_err_t** esp_http_client_flush_response (esp_http_client_handle_t client, int *len)

Process all remaining response data This uses an internal buffer to repeatedly receive, parse, and discard response data until complete data is processed. As no additional user-supplied buffer is required, this may be preferable to `esp_http_client_read_response` in situations where the content of the response may be ignored.

Parameters
- **client** - [in] The esp_http_client handle
- **len** - Length of data discarded

Returns
- ESP_OK If successful, len will have discarded length
- ESP_FAIL If failed to read response
- ESP_ERR_INVALID_ARG If the client is NULL

**esp_err_t** esp_http_client_get_url (esp_http_client_handle_t client, char *url, const int len)

Get URL from client.

Parameters
- **client** - [in] The esp_http_client handle
- **url** - [inout] The buffer to store URL
- **len** - [in] The buffer length

Returns
- ESP_OK
- ESP_FAIL

**esp_err_t** esp_http_client_get_chunk_length (esp_http_client_handle_t client, int *len)

Get Chunk-Length from client.

Parameters
- **client** - [in] The esp_http_client handle
- **len** - [out] Variable to store length

Returns
- ESP_OK If successful, len will have length of current chunk
- ESP_FAIL If the server is not a chunked server
- ESP_ERR_INVALID_ARG If the client or len are NULL

**Structures**

struct esp_http_client_event

HTTP Client events data.

**Public Members**
**Chapter 2. API Reference**

*esp_http_client_event_id* `event_id`

- `event_id`, to know the cause of the event

*esp_http_client_handle_t* `client`

- `esp_http_client_handle_t context`

void *`data`

- `data of the event`

int `data_len`

- `data length of data`

void *`user_data`

- `user_data context, from esp_http_client_config_t user_data`

char *`header_key`

- `For HTTP_EVENT_ON_HEADER event_id, it’s store current http header key`

char *`header_value`

- `For HTTP_EVENT_ON_HEADER event_id, it’s store current http header value`

struct `esp_http_client_config_t`

- HTTP configuration.

**Public Members**

const char *`url`

- HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

const char *`host`

- Domain or IP as string

int `port`

- Port to connect, default depend on esp_http_client_transport_t (80 or 443)

const char *`username`

- Using for Http authentication

const char *`password`

- Using for Http authentication

*esp_http_client_auth_type_t* `auth_type`

- Http authentication type, see esp_http_client_auth_type_t

const char *`path`

- HTTP Path, if not set, default is /
const char *query
    HTTP query

const char *cert_pem
    SSL server certification, PEM format as string, if the client requires to verify server

size_t cert_len
    Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert_pem
    SSL client certification, PEM format as string, if the server requires to verify client

size_t client_cert_len
    Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

const char *client_key_pem
    SSL client key, PEM format as string, if the server requires to verify client

size_t client_key_len
    Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

const char *client_key_password
    Client key decryption password string

size_t client_key_password_len
    String length of the password pointed to by client_key_password

const char *user_agent
    The User Agent string to send with HTTP requests

exp_http_client_method_t method
    HTTP Method

int timeout_ms
    Network timeout in milliseconds

bool disable_auto_redirect
    Disable HTTP automatic redirects

int max_redirection_count
    Max number of redirections on receiving HTTP redirect status code, using default value if zero

int max_authorization_retries
    Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables authorization retry if -1

http_event_handle_cb event_handler
    HTTP Event Handle
**esp_http_client_transport_t**

- **transport_type**
  HTTP transport type, see `esp_http_client_transport_t`

- **buffer_size**
  HTTP receive buffer size

- **buffer_size_tx**
  HTTP transmit buffer size

- **user_data**
  HTTP user_data context

- **is_async**
  Set asynchronous mode, only supported with HTTPS for now

- **use_global_ca_store**
  Use a global ca_store for all the connections in which this bool is set.

- **skip_cert_common_name_check**
  Skip any validation of server certificate CN field

**esp_err_t** (*crt_bundle_attach*)(void *conf)

- Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

- **keep_alive_enable**
  Enable keep-alive timeout

- **keep_alive_idle**
  Keep-alive idle time. Default is 5 (second)

- **keep_alive_interval**
  Keep-alive interval time. Default is 5 (second)

- **keep_alive_count**
  Keep-alive packet retry send count. Default is 3 counts

- **if_name**
  The name of interface for data to go through. Use the default interface without setting

### Macros

- **DEFAULT_HTTP_BUF_SIZE**

- **ESP_ERR_HTTP_BASE**
  Starting number of HTTP error codes

- **ESP_ERR_HTTP_MAX_REDIRECT**
  The error exceeds the number of HTTP redirects
Chapter 2. API Reference

**ESP_ERR_HTTP_CONNECT**
Error open the HTTP connection

**ESP_ERR_HTTP_WRITE_DATA**
Error write HTTP data

**ESP_ERR_HTTP_FETCH_HEADER**
Error read HTTP header from server

**ESP_ERR_HTTP_INVALID_TRANSPORT**
There are no transport support for the input scheme

**ESP_ERR_HTTP_CONNECTING**
HTTP connection hasn’t been established yet

**ESP_ERR_HTTP_EAGAIN**
Mapping of errno EAGAIN to esp_err_t

**ESP_ERR_HTTP_CONNECTION_CLOSED**
Read FIN from peer and the connection closed

### Type Definitions

```c
typedef struct esp_http_client *esp_http_client_handle_t

typedef struct esp_http_client_event *esp_http_client_event_handle_t

typedef struct esp_http_client_event esp_http_client_event_t
    HTTP Client events data.

typedef esp_err_t (*http_event_handle_cb)(esp_http_client_event_t *evt)
```

### Enumerations

```c
enum esp_http_client_event_id_t
    HTTP Client events id.

    Values:

    enumerator HTTP_EVENT_ERROR
        This event occurs when there are any errors during execution

    enumerator HTTP_EVENT_ON_CONNECTED
        Once the HTTP has been connected to the server, no data exchange has been performed

    enumerator HTTP_EVENT_HEADERS_SENT
        After sending all the headers to the server

    enumerator HTTP_EVENT_HEADER_SENT
        This header has been kept for backward compatability and will be deprecated in future versions esp-idf
```
enumerator **HTTP_EVENT_ON_HEADER**
   Occurs when receiving each header sent from the server

enumerator **HTTP_EVENT_ON_DATA**
   Occurs when receiving data from the server, possibly multiple portions of the packet

enumerator **HTTP_EVENT_ON_FINISH**
   Occurs when finish a HTTP session

enumerator **HTTP_EVENT_DISCONNECTED**
   The connection has been disconnected

enumerator **HTTP_EVENT_REDIRECT**
   Intercepting HTTP redirects to handle them manually

enum **esp_http_client_transport_t**
   HTTP Client transport.
   
   Values:

   enumerator **HTTP_TRANSPORT_UNKNOWN**
      Unknown

   enumerator **HTTP_TRANSPORT_OVER_TCP**
      Transport over tcp

   enumerator **HTTP_TRANSPORT_OVER_SSL**
      Transport over ssl

enum **esp_http_client_method_t**
   HTTP method.
   
   Values:

   enumerator **HTTP_METHOD_GET**
      HTTP GET Method

   enumerator **HTTP_METHOD_POST**
      HTTP POST Method

   enumerator **HTTP_METHOD_PUT**
      HTTP PUT Method

   enumerator **HTTP_METHOD_PATCH**
      HTTP PATCH Method

   enumerator **HTTP_METHOD_DELETE**
      HTTP DELETE Method

   enumerator **HTTP_METHOD_HEAD**
      HTTP HEAD Method
enumerator HTTP_METHOD_NOTIFY
    HTTP NOTIFY Method

enumerator HTTP_METHOD_SUBSCRIBE
    HTTP SUBSCRIBE Method

enumerator HTTP_METHOD_UNSUBSCRIBE
    HTTP UNSUBSCRIBE Method

enumerator HTTP_METHOD_OPTIONS
    HTTP OPTIONS Method

enumerator HTTP_METHOD_COPY
    HTTP COPY Method

enumerator HTTP_METHOD_MOVE
    HTTP MOVE Method

enumerator HTTP_METHOD_LOCK
    HTTP LOCK Method

enumerator HTTP_METHOD_UNLOCK
    HTTP UNLOCK Method

enumerator HTTP_METHOD_PROPFIND
    HTTP PROPFIND Method

enumerator HTTP_METHOD_PROPPATCH
    HTTP PROPPATCH Method

enumerator HTTP_METHOD_MKCOL
    HTTP MKCOL Method

enumerator HTTP_METHOD_MAX

enum esp_http_client_auth_type_t
    HTTP Authentication type.
    
    Values:

enumerator HTTP_AUTH_TYPE_NONE
    No authentication

enumerator HTTP_AUTH_TYPE_BASIC
    HTTP Basic authentication

enumerator HTTP_AUTH_TYPE_DIGEST
    HTTP Digest authentication
```c
enum HttpStatus_Code
    Enum for the HTTP status codes.
    Values:

type HttpStatus_Ok

enumerator HttpStatus_MultipleChoices

enumerator HttpStatus_MovedPermanently

enumerator HttpStatus_Found

enumerator HttpStatus_SeeOther

enumerator HttpStatus_TemporaryRedirect

enumerator HttpStatus_PermanentRedirect

enumerator HttpStatus_BadRequest

enumerator HttpStatus_Unauthorized

enumerator HttpStatus_Forgidden

enumerator HttpStatus_NotFound

enumerator HttpStatus_InternalError
```

### 2.2.6 ESP Local Control

**Overview**

ESP Local Control (esp_local_ctrl) component in ESP-IDF provides capability to control an ESP device over Wi-Fi + HTTPS or BLE. It provides access to application defined properties that are available for reading / writing via a set of configurable handlers.

Initialization of the esp_local_ctrl service over BLE transport is performed as follows:

```c
esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = & (protocomm_ble_config_t) {
            .device_name = SERVICE_NAME,
            .service_uuid = {
                /* LSB <----------------------------- MSB */
                0x21, 0xd5, 0x3b, 0x8d, 0xbd, 0x75, 0x68, 0x8a,
                0x3d, 0x4a, 0xe2, 0xe1, 0x98, 0x3d
            }
        }
    }
};
```

(continues on next page)
Similarly for HTTPS transport:

```c
/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char servercert_start[] asm("_binary_servercert_pem_
    → start");
extern const unsigned char servercert_end[] asm("_binary_servercert_pem_
    → end");
https_conf.servercert = servercert_start;
https_conf.servercert_len = servercert_end - servercert_start;

/* Load server private key */
extern const unsigned char prvtkey_pem_start[] asm("_binary_prvtkey_pem_
    → start");
extern const unsigned char prvtkey_pem_end[] asm("_binary_prvtkey_pem_
    → end");
https_conf.prvtkey_pem = prvtkey_pem_start;
https_conf.prvtkey_len = prvtkey_pem_end - prvtkey_pem_start;

esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_HTTPD,
    .transport_config = {
        .httpd = &https_conf
    },
    .proto_sec = {
        .version = PROTOCOL_SEC0,
        .custom_handle = NULL,
        .pop = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};
```
(continues on next page)
You may set security for transport in ESP local control using following options:

1. **PROTOCOL_SEC2**: specifies that SRP6a based key exchange and end to end encryption based on AES-GCM is used. This is the most preferred option as it adds a robust security with Augmented PAKE protocol i.e. SRP6a.
2. **PROTOCOL_SEC1**: specifies that Curve25519 based key exchange and end to end encryption based on AES-CTR is used.
3. **PROTOCOL_SEC0**: specifies that data will be exchanged as a plain text (no security).
4. **PROTOCOL_SEC_CUSTOM**: you can define your own security requirement. Please note that you will also have to provide `custom_handle` of type `protocomm_security_t *` in this context.

**Note:** The respective security schemes need to be enabled through the project configuration menu. Please refer to the Enabling protocomm security version section in Protocol Communication for more details.

### Creating a property

Now that we know how to start the esp_local_ctrl service, let’s add a property to it. Each property must have a unique name (string), a type (e.g. enum), flags (bit fields) and size.

The size is to be kept 0, if we want our property value to be of variable length (e.g. if its a string or bytestream). For fixed length property value data-types, like int, float, etc., setting the size field to the right value, helps esp_local_ctrl to perform internal checks on arguments received with write requests.

The interpretation of type and flags fields is totally up-to the application, hence they may be used as enumerations, bit-fields, or even simple integers. One way is to use type values to classify properties, while flags to specify characteristics of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines `TYPE_TIMESTAMP` and `READONLY`, which are used for setting the type and flags fields here.

```c
/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name = "timestamp",
    .type = TYPE_TIMESTAMP,
    .size = sizeof(int32_t),
    .flags = READONLY,
    .ctx = func_get_time,
    .ctx_free_fn = NULL
};
/* Now register the property */
esp_local_ctrl_add_property(&timestamp);
```

Also notice that there is a ctx field, which is set to point to some custom `func_get_time()`. This can be used inside the property get / set handlers to retrieve timestamp.

Here is an example of `get_prop_values()` handler, which is used for retrieving the timestamp.

```c
static esp_err_t get_prop_values(size_t props_count, const esp_local_ctrl_prop_t *props, esp_local_ctrl_prop_val_t *prop_values, void *usr_ctx)
{
    (continues on next page)
```
for (uint32_t i = 0; i < props_count; i++) {
    ESP_LOGI(TAG, "Reading %s", props[i].name);
    if (props[i].type == TYPE_TIMESTAMP) {
        /* Obtain the timer function from ctx */
        int32_t (*func_get_time)(void) = props[i].ctx;

        /* Use static variable for saving the value.
         * This is essential because the value has to be
         * valid even after this function returns.
         * Alternative is to use dynamic allocation
         * and set the free_fn field */
        static int32_t ts = func_get_time();
        prop_values[i].data = &ts;
    }
}
return ESP_OK;
}

Here is an example of set_prop_values() handler. Notice how we restrict from writing to read-only properties.

static esp_err_t set_property_values(size_t props_count,
                                      const esp_local_ctrl_prop_t *props,
                                      const esp_local_ctrl_prop_val_t *prop_values,
                                      void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s",
                     props[i].name);
            return ESP_ERR_INVALID_ARG;
        }
    } else {
        ESP_LOGI(TAG, "Setting %s", props[i].name);
        /* For keeping it simple, lets only log the incoming data */
        ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data,
                                  prop_values[i].size, ESP_LOG_INFO);
    }
}
return ESP_OK;
}

For complete example see protocols/esp_local_ctrl

**Client Side Implementation**

The client side implementation will establish a protobuf session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the esp_local_ctrl service. The service will translate these messages into requests and then call the appropriate handlers (set / get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the esp_local_ctrl service:

1. **get_prop_count** : This should simply return the total number of properties supported by the service
2. **get_prop_values** : This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices
3. **set_prop_values** : This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client
should first call `get_prop_count` and then `get_prop_values`, hence form an index to name mapping for all properties. Now when calling `set_prop_values` for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index to name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by `esp_local_ctrl` are listed below:

<table>
<thead>
<tr>
<th>Endpoint Name (BLE + GATT Server)</th>
<th>URI (HTTPS Server + mDNS)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_local_ctrl/version</td>
<td>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/version</td>
<td>Endpoint used for retrieving version string</td>
</tr>
<tr>
<td>esp_local_ctrl/control</td>
<td>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/control</td>
<td>Endpoint used for sending / receiving control messages</td>
</tr>
</tbody>
</table>

### API Reference

#### Header File

- components/esp_local_ctrl/include/esp_local_ctrl.h

#### Functions

**const esp_local_ctrl_transport_t **esp_local_ctrl_get_transport_ble** (void)

Function for obtaining BLE transport mode.

**const esp_local_ctrl_transport_t **esp_local_ctrl_get_transport_httpd** (void)

Function for obtaining HTTPD transport mode.

**esp_err_t esp_local_ctrl_start** (const esp_local_ctrl_config_t *config)

Start local control service.

- **Parameters config** – *in* Pointer to configuration structure
- **Returns**
  - ESP_OK : Success
  - ESP_FAIL : Failure

**esp_err_t esp_local_ctrl_stop** (void)

Stop local control service.

**esp_err_t esp_local_ctrl_add_property** (const esp_local_ctrl_prop_t *prop)

Add a new property.

This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option `max_properties`

- **Parameters prop** – *in* Property description structure
- **Returns**
  - ESP_OK : Success
  - ESP_FAIL : Failure

**esp_err_t esp_local_ctrl_remove_property** (const char *name)

Remove a property.

This finds a property by name, and releases the internal resources which are associated with it.

- **Parameters name** – *in* Name of the property to remove
- **Returns**
  - ESP_OK : Success
• ESP_ERR_NOT_FOUND : Failure

const esp_local_ctrl_prop_t *esp_local_ctrl_get_property (const char *name)

Get property description structure by name.

This API may be used to get a property’s context structure esp_local_ctrl_prop_t when its name is known.

Parameters name [in] Name of the property to find

Returns
• Pointer to property
• NULL if not found

esp_err_t esp_local_ctrl_set_handler (const char* ep_name, protocomm_req_handler_t handler, void *user_ctx)

Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

Parameters
• ep_name [in] Name of the endpoint
• handler [in] Endpoint handler function
• user_ctx [in] User data

Returns
• ESP_OK : Success
• ESP_FAIL : Failure

Unions

union esp_local_ctrl_transport_config_t

#include <esp_local_ctrl.h> Transport mode (BLE/HTTPD) configuration.

Public Members

esp_local_ctrl_transport_config_ble_t *ble

This is same as protocomm_ble_config_t. See protocomm_ble.h for available configuration parameters.

esp_local_ctrl_transport_config_httpd_t *httpd

This is same as httpd_ssl_config_t. See esp_https_server.h for available configuration parameters.

Structures

struct esp_local_ctrl_prop

Property description data structure, which is to be populated and passed to the esp_local_ctrl_add_property() function.

Once a property is added, its structure is available for read-only access inside get_prop_values() and set_prop_values() handlers.
Public Members

char *name
Unique name of property

uint32_t type
Type of property. This may be set to application defined enums

size_t size
Size of the property value, which:
- if zero, the property can have values of variable size
- if non-zero, the property can have values of fixed size only, therefore, checks are performed internally
  by esp_local_ctrl when setting the value of such a property

uint32_t flags
Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only /
constant

void *ctx
Pointer to some context data relevant for this property. This will be available for use inside the
get_prop_values and set_prop_values handlers as a part of this property structure. When
set, this is valid throughout the lifetime of a property, till either the property is removed or the
esp_local_ctrl service is stopped.

void (*ctx_free_fn)(void *ctx)
Function used by esp_local_ctrl to internally free the property context when
esp_local_ctrl_remove_property() or esp_local_ctrl_stop() is called.

struct esp_local_ctrl_prop_val
Property value data structure. This gets passed to the get_prop_values() and set_prop_values() handlers for the purpose of retrieving or setting the present value of a property.

Public Members

void *data
Pointer to memory holding property value

size_t size
Size of property value

void (*free_fn)(void *data)
This may be set by the application in get_prop_values() handler to tell esp_local_ctrl
to call this function on the data pointer above, for freeing its resources after sending the
get_prop_values response.

struct esp_local_ctrl_handlers
Handlers for receiving and responding to local control commands for getting and setting properties.
Public Members

```c
esp_err_t (*get_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[],
esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)
```

Handler function to be implemented for retrieving current values of properties.

**Note:** If any of the properties have fixed sizes, the size field of corresponding element in `prop_values` need to be set.

```c
Param props_count [in] Total elements in the props array
Param props [in] Array of properties, the current values for which have been requested by the client
Param prop_values [out] Array of empty property values, the elements of which need to be populated with the current values of those properties specified by props argument
Param usr_ctx [in] This provides value of the `usr_ctx` field of esp_local_ctrl_handlers_t structure
Return Returning different error codes will convey the corresponding protocol level errors to the client:
• ESP_OK : Success
• ESP_ERR_INVALID_ARG : InvalidArgument
• ESP_ERR_INVALID_STATE : InvalidProto
• All other error codes : InternalError
```

```c
esp_err_t (*set_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[], const
esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)
```

Handler function to be implemented for changing values of properties.

**Note:** If any of the properties have variable sizes, the size field of the corresponding element in `prop_values` must be checked explicitly before making any assumptions on the size.

```c
Param props_count [in] Total elements in the props array
Param props [in] Array of properties, the values for which the client requests to change
Param prop_values [in] Array of property values, the elements of which need to be used for updating those properties specified by props argument
Param usr_ctx [in] This provides value of the `usr_ctx` field of esp_local_ctrl_handlers_t structure
Return Returning different error codes will convey the corresponding protocol level errors to the client:
• ESP_OK : Success
• ESP_ERR_INVALID_ARG : InvalidArgument
• ESP_ERR_INVALID_STATE : InvalidProto
• All other error codes : InternalError
```

```c
void *usr_ctx
```

Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the `esp_local_ctrl` service, and freed only when the service is stopped.

```c
void (*usr_ctx_free_fn)(void *usr_ctx)
```

Pointer to function which will be internally invoked on `usr_ctx` for freeing the context resources when `esp_local_ctrl_stop()` is called.
struct esp_local_ctrl_proto_sec_cfg
  Protocom security configs

**Public Members**

```c
esp_local_ctrl_proto_sec_t version
```
This sets protocom security version, sec0/sec1 or custom. If custom, user must provide handle via `proto_sec_custom_handle` below.

```c
void *custom_handle
```
Custom security handle if security is set custom via `proto_sec` above. This handle must follow `protocomm_security_t` signature.

```c
const void *pop
```
Proof of possession to be used for local control. Could be NULL.

```c
const void *sec_params
```
Pointer to security params (NULL if not needed). This is not needed for protocomm security 0. This pointer should hold the struct of type `esp_local_ctrl_security1_params_t` for protocomm security 1 and `esp_local_ctrl_security2_params_t` for protocomm security 2 respectively. Could be NULL.

### `struct esp_local_ctrl_config`
Configuration structure to pass to `esp_local_ctrl_start()`

**Public Members**

```c
const esp_local_ctrl_transport_t *transport
```
Transport layer over which service will be provided.

```c
esp_local_ctrl_transport_config_t transport_config
```
Transport layer over which service will be provided.

```c
esp_local_ctrl_proto_sec_cfg_t proto_sec
```
Security version and POP.

```c
esp_local_ctrl_handlers_t handlers
```
Register handlers for responding to get/set requests on properties.

```c
size_t max_properties
```
This limits the number of properties that are available at a time.

### Macros

- `ESP_LOCAL_CTRL_TRANSPORT_BLE`
- `ESP_LOCAL_CTRL_TRANSPORT_HTTPD`
Type Definitions

typedef struct esp_local_ctrl_prop esp_local_ctrl_prop_t

Property description data structure, which is to be populated and passed to the esp_local_ctrl_add_property() function.

Once a property is added, its structure is available for read-only access inside get_prop_values() and set_prop_values() handlers.

typedef struct esp_local_ctrl_prop_val esp_local_ctrl_prop_val_t

Property value data structure. This gets passed to the get_prop_values() and set_prop_values() handlers for the purpose of retrieving or setting the present value of a property.

typedef struct esp_local_ctrl_handlers esp_local_ctrl_handlers_t

Handlers for receiving and responding to local control commands for getting and setting properties.

typedef struct esp_local_ctrl_transport esp_local_ctrl_transport_t

Transport mode (BLE/HTTPD) over which the service will be provided.

This is forward declaration of a private structure, implemented internally by esp_local_ctrl.

typedef struct protocomm_ble_config esp_local_ctrl_transport_config_ble_t

Configuration for transport mode BLE.

This is a forward declaration for protocomm_ble_config_t. To use this, application must set CONFIG_BT_BLUEDROID_ENABLED and include protocomm_ble.h.

typedef struct httpd_ssl_config esp_local_ctrl_transport_config_httpd_t

Configuration for transport mode HTTPD.

This is a forward declaration for httpd_ssl_config_t. To use this, application must set CONFIG_ESP_HTTPS_SERVER_ENABLE and include esp_https_server.h

typedef enum esp_local_ctrl_proto_sec esp_local_ctrl_proto_sec_t

Security types for esp_local_control.

typedef protocomm_security1_params_t esp_local_ctrl_security1_params_t

typedef protocomm_security2_params_t esp_local_ctrl_security2_params_t

typedef struct esp_local_ctrl_proto_sec_cfg esp_local_ctrl_proto_sec_cfg_t

Protocom security configs

typedef struct esp_local_ctrl_config esp_local_ctrl_config_t

Configuration structure to pass to esp_local_ctrl_start()

Enumerations

define enum esp_local_ctrl_proto_sec

Security types for esp_local_control.

Values:

enumerator PROTOCOM_SEC0
2.2.7 ESP Serial Slave Link

Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The esp_serial_slave_link component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an esp_serial_slave_link device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

Espressif Device protocols

For more details about Espressif device protocols, see the following documents.

ESP SPI Slave HD (Half Duplex) Mode Protocol

Introduction  In the half duplex mode, the master has to use the protocol defined by the slave to communicate with the slave. Each transaction may consist of the following phases (list by the order they should exist):

- **Command**: 8-bit, master to slave
  This phase determines the rest phases of the transactions. See Supported Commands.
- **Address**: 8-bit, master to slave, optional
  For some commands (WRBUF, RDBUF), this phase specifies the address of the shared buffer to write to/read from. For other commands with this phase, they are meaningless but still have to exist in the transaction.
- **Dummy**: 8-bit, floating, optional
  This phase is the turnaround time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to the master.
- **Data**: variable length, the direction is also determined by the command.
  This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The direction means which side (master or slave) controls the MOSI, MISO, WP, and HD pins.
Data IO Modes  In some IO modes, more data wires can be used to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in the 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here are the modes supported by the ESP32-S2 SPI slave and the wire number used in corresponding modes.

<table>
<thead>
<tr>
<th>Mode</th>
<th>command WN</th>
<th>address WN</th>
<th>dummy cycles</th>
<th>data WN</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-bit</td>
<td>1</td>
<td>1</td>
<td>1</td>

<td>4</td>
<td>4</td>
<td>4</td>
</tr>
<tr>
<td>QPI</td>
<td>4</td>
<td>4</td>
<td>4</td>
<td>4</td>
</tr>
</tbody>
</table>

Normally, which mode is used is determined by the command sent by the master (See Supported Commands), except the QPI mode.

QPI Mode  The QPI mode is a special state of the SPI Slave. The master can send the ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it’s not compatible with the normal modes. The master should only send QPI commands when the slave is in QPI mode. To exit from the QPI mode, master can send the EXQPI command.

Supported Commands

Note: The command name is in a master-oriented direction. For example, WRBUF means master writes the buffer of slave.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Command</th>
<th>Address</th>
<th>Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>WRBUF</td>
<td>Write buffer</td>
<td>0x01</td>

</tr>
<tr>
<td>RDBUF</td>
<td>Read buffer</td>
<td>0x02</td>
<td>Buf addr</td>
<td>slave to master, no longer than buffer size</td>
</tr>
<tr>
<td>WRDMA</td>
<td>Write DMA</td>
<td>0x03</td>
<td>8 bits</td>
<td>master to slave, no longer than length provided by slave</td>
</tr>
<tr>
<td>RDDMA</td>
<td>Read DMA</td>
<td>0x04</td>
<td>8 bits</td>
<td>slave to master, no longer than length provided by slave</td>
</tr>
<tr>
<td>SEG_DONE</td>
<td>Segments done</td>
<td>0x05</td>
<td>•</td>
<td>•</td>
</tr>
<tr>
<td>ENQPI</td>
<td>Enter QPI mode</td>
<td>0x06</td>
<td>•</td>
<td>•</td>
</tr>
<tr>
<td>WR_DONE</td>
<td>Write segments done</td>
<td>0x07</td>
<td>•</td>
<td>•</td>
</tr>
<tr>

<td>Interrupt</td>
<td>0x08</td>
<td>•</td>
<td>•</td>
</tr>
<tr>
<td>CMD9</td>
<td>Interrupt</td>
<td>0x09</td>
<td>•</td>
<td>•</td>
</tr>
<tr>
<td>CMDA</td>
<td>Interrupt</td>
<td>0x0A</td>
<td>•</td>
<td>•</td>
</tr>
<tr>
<td>EXQPI</td>
<td>Exit QPI mode</td>
<td>0xDD</td>
<td>•</td>
<td>•</td>
</tr>
</tbody>
</table>
Moreover, WRBUF, RDBUF, WRDMA, RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0xA1 means WRBUF in QIO mode.

<table>
<thead>
<tr>
<th>Mode</th>
<th>Mask</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-bit</td>
<td>0x00</td>
</tr>
<tr>
<td>DOUT</td>
<td>0x10</td>
</tr>
<tr>
<td>DIO</td>
<td>0x50</td>
</tr>
<tr>
<td>QOUT</td>
<td>0x20</td>
</tr>
<tr>
<td>QIO</td>
<td>0xA0</td>
</tr>
<tr>
<td>QPI</td>
<td>0xA0</td>
</tr>
</tbody>
</table>

**Segment Transaction Mode**  Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave load onto the DMA, the master is allowed to read or write in segments. This way the master doesn’t have to prepare a large buffer as the size of data provided by the slave. After the master finishes reading/writing a buffer, it has to send the corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is WR_DONE (0x07) for the WRDMA and CMD8 (0x08) for the RDDMA.

Here’s an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA
2. The master do seven RDDMA transactions, each of them is 512 bytes long, and reads the first 3584 bytes from the slave
3. The master do the last RDDMA transaction of 512 bytes (equal, longer, or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.
4. The master sends CMD8 to the slave
5. The slave loads another 4092 bytes of data onto the RDDMA
6. The master can start new reading transactions after it sends the CMD8

**Terminology**

- **ESSL**: Abbreviation for ESP Serial Slave Link, the component described by this document.
- **Master**: The device running the `esp_serial_slave_link` component.
- **ESSL device**: a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- **ESSL device handle**: a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.

The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- **ESP slave**: the slave device connected to the bus, which ESSL component is designed to communicate with.
- **Bus**: The bus over which the master and the slave communicate with each other.
- **Slave protocol**: The special communication protocol specified by Espressif HW/SW over the bus.
- **TX buffer num**: a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- **RX data size**: a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

**Services provided by ESP slave**

There are some common services provided by the Espressif slaves:

1. **Tohost Interrupts**: The slave can inform the master about certain events by the interrupt line. (optional)
2. Frhost Interrupts: The master can inform the slave about certain events.
3. Tx FIFO (master to slave): the slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.
   The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.
4. Rx FIFO (slave to master): the slave can receive data from the master in units of receiving buffers.
   The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. Shared registers: the master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave’s model. See SPI Slave Capabilities of Espressif chips for more details.

Initialization of ESP Serial Slave Link

**ESP SDIO Slave** The ESP SDIO slave link (ESSL SDIO) devices relies on the sdmmc component. It includes the usage of communicating with ESP SDIO Slave device via SDSPI feature. The ESSL device should be initialized as below:

1. Initialize a sdmmc card (see `Document of SDMMC driver` for more details).
2. Call `sdmmc_card_init()` to initialize the card.
3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.
4. Call `essl_init()` to do initialization of the SDIO part.
5. Call `essl_wait_for_ready()` to wait for the slave to be ready.

**ESP SPI Slave**

Note: If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the SDIO interface instead.

Hasn’t been supported yet.

**APIs**

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

**Tohost Interrupts (optional)**

1. Call `essl_get_intr_ena()` to know which events will trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that will trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.

**Frhost Interrupts**

1. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.
Chapter 2. API Reference

**TX FIFO**

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it tries to send packets to the slave, until the slave has enough buffer or timeout.

2. Call `essl_send_packet()` to send data to the slave.

**RX FIFO**

1. Call `essl_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it will update the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_data_size` keeps 0, until timeout.

2. Call `essl_get_packet()` to receive data from the slave.

**Reset counters (Optional)**

Call `essl_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.

**Application Example**

The example below shows how ESP32-C3 SDIO host and slave communicate with each other. The host use the ESSL SDIO.

Please refer to the specific example README.md for details.

**API Reference**

**Header File**

- `components/esp_serial_slave_link/include/esp_serial_slave_link/essl.h`

**Functions**

- `esp_err_t essl_init(essl_handle_t handle, uint32_t wait_ms)`
  
  Initialize the slave.

  **Parameters**
  - `handle` - Handle of an ESSL device.
  - `wait_ms` - Millisecond to wait before timeout, will not wait at all if set to 0-9.

  **Returns**
  - ESP_OK: If success
  - ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
  - Other value returned from lower layer init.

- `esp_err_t essl_wait_for_ready(essl_handle_t handle, uint32_t wait_ms)`
  
  Wait for interrupt of an ESSL slave device.

  **Parameters**
  - `handle` - Handle of an ESSL device.
  - `wait_ms` - Millisecond to wait before timeout, will not wait at all if set to 0-9.

  **Returns**
  - ESP_OK: If success
  - ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
  - One of the error codes from SDMMC host controller
**Chapter 2. API Reference**

`esp_err_t essl_get_tx_buffer_num(essl_handle_t handle, uint32_t*out_tx_num, uint32_t wait_ms)`

Get buffer num for the host to send data to the slave. The buffers are size of `buffer_size`.

**Parameters**
- **handle** – Handle of a ESSL device.
- **out_tx_num** – Output of buffer num that host can send data to ESSL slave.
- **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

`esp_err_t essl_get_rx_data_size(essl_handle_t handle, uint32_t*out_rx_size, uint32_t wait_ms)`

Get the size, in bytes, of the data that the ESSL slave is ready to send.

**Parameters**
- **handle** – Handle of an ESSL device.
- **out_rx_size** – Output of data size to read from slave, in bytes
- **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

`esp_err_t essl_reset_cnt(essl_handle_t handle)`

Reset the counters of this component. Usually you don’t need to do this unless you know the slave is reset.

**Parameters**
- **handle** – Handle of an ESSL device.

**Returns**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init.

`esp_err_t essl_send_packet(essl_handle_t handle, const void *start, size_t length, uint32_t wait_ms)`

Send a packet to the ESSL Slave. The Slave receives the packet into buffers whose size is `buffer_size` (configured during initialization).

**Parameters**
- **handle** – Handle of an ESSL device.
- **start** – Start address of the packet to send
- **length** – Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init or other argument is not valid.
- ESP_ERR_TIMEOUT: No buffer to use, or error from SDMMC host controller.
- ESP_ERR_NOT_FOUND: Slave is not ready for receiving.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

`esp_err_t essl_get_packet(essl_handle_t handle, void*out_data, size_t size, size_t*out_length, uint32_t wait_ms)`

Get a packet from ESSL slave.

**Parameters**
- **handle** – Handle of an ESSL device.
- **out_data** – [out] Data output address
- **size** – The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns ESP_ERR_NOT_FINISHED
Chapter 2. API Reference

- **out_length** [out] Output of length the data actually received from slave.
- **wait_ms** Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK Success: All the data has been read from the slave.
- ESP_ERR_INVALID_ARG: Invalid argument, The handle is not initialized or the other arguments are invalid.
- ESP_ERR_NOT_FINISHED: Read was successful, but there is still data remaining.
- ESP_ERR_NOT_FOUND: Slave is not ready to send data.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
  - One of the error codes from SDMMC/SPI host controller.

```c
esp_err_t essl_write_reg(essl_handle_t handle, uint8_t addr, uint8_t value, uint8_t* value_o, uint32_t wait_ms)
```
Write general purpose R/W registers (8-bit) of ESSL slave.

**Note:** sdio 28-31 are reserved, the lower API helps to skip.

**Parameters**
- **handle** Handle of an ESSL device.
- **addr** Address of register to write. For SDIO, valid address: 0-59. For SPI, see `essl_spi.h`
- **value** Value to write to the register.
- **value_o** Output of the returned written value.
- **wait_ms** Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

```c
esp_err_t essl_read_reg(essl_handle_t handle, uint8_t addr, uint8_t* value_o, uint32_t wait_ms)
```
Read general purpose R/W registers (8-bit) of ESSL slave.

**Parameters**
- **handle** Handle of an ESSL device.
- **addr** Address of register to read. For SDIO, Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read). For SPI, see `essl_spi.h`
- **value_o** Output value read from the register.
- **wait_ms** Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

```c
esp_err_t essl_wait_int(essl_handle_t handle, uint32_t wait_ms)
```
wait for an interrupt of the slave

**Parameters**
- **handle** Handle of an ESSL device.
- **wait_ms** Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: If interrupt is triggered.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- ESP_ERR_TIMEOUT: No interrupts before timeout.

```c
esp_err_t essl_clear_intr(essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)
```
Clear interrupt bits of ESSL slave. All the bits set in the mask will be cleared, while other bits will stay the same.

**Parameters**
- **handle** Handle of an ESSL device.
- **intr_mask** Mask of interrupt bits to clear.
• **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

```c
esp_err_t essl_get_intr (essl_handle_t handle, uint32_t *intr_raw, uint32_t *intr_st, uint32_t wait_ms)
```

Get interrupt bits of ESSL slave.

**Parameters**
- **handle** – Handle of an ESSL device.
- **intr_raw** – Output of the raw interrupt bits. Set to NULL if only masked bits are read.
- **intr_st** – Output of the masked interrupt bits. Set to NULL if only raw bits are read.
- **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: Success
- ESP_INVALID_ARG: If both **intr_raw** and **intr_st** are NULL.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

```c
esp_err_t essl_set_intr_ena (essl_handle_t handle, uint32_t ena_mask, uint32_t wait_ms)
```

Set interrupt enable bits of ESSL slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

**Parameters**
- **handle** – Handle of an ESSL device.
- **ena_mask** – Mask of the interrupt bits to enable.
- **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

```c
esp_err_t essl_get_intr_ena (essl_handle_t handle, uint32_t *ena_mask_o, uint32_t wait_ms)
```

Get interrupt enable bits of ESSL slave.

**Parameters**
- **handle** – Handle of an ESSL device.
- **ena_mask_o** – Output of interrupt bit enable mask.
- **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: Success
- One of the error codes from SDMMC host controller

```c
esp_err_t essl_send_slave_intr (essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)
```

Send interrupts to slave. Each bit of the interrupt will be triggered.

**Parameters**
- **handle** – Handle of an ESSL device.
- **intr_mask** – Mask of interrupt bits to send to slave.
- **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Type Definitions**

typedef struct essl_dev_t *essl_handle_t

Handle of an ESSL device.
Chapter 2. API Reference

Header File
• components/esp_serial_slave_link/include/esp_serial_slave_link/essl_sdio.h

Functions

\texttt{esp\_err\_t essl\_sdio\_init\_dev(essl\_handle\_t *out\_handle, const essl\_sdio\_config\_t *config)}

Initialize the ESSL SDIO device and get its handle.

\textbf{Parameters}
• out\_handle - Output of the handle.
• config - Configuration for the ESSL SDIO device.

\textbf{Returns}
• ESP\_OK: on success
• ESP\_ERR\_NO\_MEM: memory exhausted.

\texttt{esp\_err\_t essl\_sdio\_deinit\_dev(essl\_handle\_t handle)}

Deinitialize and free the space used by the ESSL SDIO device.

\textbf{Parameters} handle – Handle of the ESSL SDIO device to deinit.

\textbf{Returns}
• ESP\_OK: on success
• ESP\_ERR\_INVALID\_ARG: wrong handle passed

Structures

\texttt{struct essl\_sdio\_config\_t}

Configuration for the ESSL SDIO device.

Public Members

\texttt{sdmmc\_card\_t *card}

The initialized sdmmc card pointer of the slave.

\texttt{int recv\_buffer\_size}

The pre-negotiated recv buffer size used by both the host and the slave.

Header File

• components/esp_serial_slave_link/include/esp_serial_slave_link/essl_spi.h

Functions

\texttt{esp\_err\_t essl\_spi\_init\_dev(essl\_handle\_t *out\_handle, const essl\_spi\_config\_t *init\_config)}

Initialize the ESSL SPI device function list and get its handle.

\textbf{Parameters}
• out\_handle - [out] Output of the handle
• init\_config - Configuration for the ESSL SPI device

\textbf{Returns}
• ESP\_OK: On success
• ESP\_ERR\_NO\_MEM: Memory exhausted
• ESP\_ERR\_INVALID\_STATE: SPI driver is not initialized
• ESP\_ERR\_INVALID\_ARG: Wrong register ID

\texttt{esp\_err\_t essl\_spi\_deinit\_dev(essl\_handle\_t handle)}

Deinitialize the ESSL SPI device and free the memory used by the device.

\textbf{Parameters} handle – Handle of the ESSL SPI device
## Returns

- **ESP_OK**: On success
- **ESP_ERR_INVALID_STATE**: ESSL SPI is not in use

### esp_err_t essl_spi_read_reg(void *arg, uint8_t addr, uint8_t *out_value, uint32_t wait_ms)

Read from the shared registers.

**Note**: The registers for Master/Slave synchronization are reserved. Do not use them. (see `rx_sync_reg` in `essl_spi_config_t`)

### Parameters

- **arg** – Context of the component. (Member `arg` from `essl_handle_t`)
- **addr** – Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1).
- **out_value** – [out] Read buffer for the shared registers.
- **wait_ms** – Time to wait before timeout (reserved for future use, user should set this to 0).

### Returns

- **ESP_OK**: success
- **ESP_ERR_INVALID_STATE**: ESSL SPI has not been initialized.
- **ESP_ERR_INVALID_ARG**: The address argument is not valid. See note1.
- **or other return value from**: `cpp:func:spi_device_transmit`

### esp_err_t essl_spi_get_packet(void *arg, void *out_data, size_t size, uint32_t wait_ms)

Get a packet from Slave.

**Parameters**

- **arg** – Context of the component. (Member `arg` from `essl_handle_t`)
- **out_data** – [out] Output data address
- **size** – The size of the output data.
- **wait_ms** – Time to wait before timeout (reserved for future use, user should set this to 0).

### Returns

- **ESP_OK**: On Success
- **ESP_ERR_INVALID_STATE**: ESSL SPI has not been initialized.
- **ESP_ERR_INVALID_ARG**: The output data address is neither DMA capable nor 4 byte-aligned
- **ESP_ERR_INVALID_SIZE**: Master requires `size` bytes of data but Slave did not load enough bytes.

### esp_err_t essl_spi_write_reg(void *arg, uint8_t addr, uint8_t value, uint8_t *out_value, uint32_t wait_ms)

Write to the shared registers.

**Note**: The registers for Master/Slave synchronization are reserved. Do not use them. (see `tx_sync_reg` in `essl_spi_config_t`)

**Note**: Feature of checking the actual written value (`out_value`) is not supported.

### Parameters

- **arg** – Context of the component. (Member `arg` from `essl_handle_t`)

---

Submit Document Feedback
**Address of the shared registers.** (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1)

**Buffer for data to send, should be align to 4.**

**Not supported, should be set to NULL.**

**Time to wait before timeout (reserved for future use, user should set this to 0).**

**ESP_OK: success**

**ESSLSPI has not been initialized.**

**The address argument is not valid. See note 1.**

**Should set out_value to NULL. See note 2.**

**or other return value from:cpp:func:spi_device_transmit.**

### esp_err_t essl_spi_send_packet (void *arg, const void *data, size_t size, uint32_t wait_ms)

Send a packet to Slave.

**Parameters**

- **arg** – Context of the component. (Member arg from essl_handle_t)
- **data** – Address of the data to send
- **size** – Size of the data to send.
- **wait_ms** – Time to wait before timeout (reserved for future use, user should set this to 0).

**Returns**

- **ESP_OK:** On success
- **ESP_ERR_INVALID_STATE:** ESSL SPI has not been initialized.
- **ESP_ERR_INVALID_ARG:** The address argument is not valid. See note 1.
- **ESP_ERR_NOT_SUPPORTED:** Should set out_value to NULL. See note 2.
- **or other return value from:cpp:func:spi_device_transmit.**

### void essl_spi_reset_cnt (void *arg)

Reset the counter in Master context.

**Note:** Shall only be called if the slave has reset its counter. Else, Slave and Master would be desynchronized

### esp_err_t essl_spi_rdbuf (spi_device_handle_t spi, uint8_t *out_data, int addr, int len, uint32_t flags)

Read the shared buffer from the slave in ISR way.

**Note:** The slave’s HW doesn’t guarantee the data in one SPI transaction is consistent. It sends data in unit of byte. In other words, if the slave SW attempts to update the shared register when a rdbuf SPI transaction is in-flight, the data got by the master will be the combination of bytes of different writes of slave SW.

**Note:** out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

**Parameters**

- **spi** – SPI device handle representing the slave
- **out_data** [out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** – Address of the slave shared buffer
- **len** – Length to read
Chapter 2. API Reference

• flags – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns
• ESP_OK: on success
• or other return value from \cpp\func:spl_device_transmit.

\texttt{esp_err_t essl_spi_rdbuf_polling(} \texttt{spi_device_handle_t spi, uint8_t *out_data, int addr, int len, uint32_t flags)}

Read the shared buffer from the slave in polling way.

\textbf{Note:} \texttt{out_data} should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the \texttt{len} is shorter than a word.

Parameters
• spi – SPI device handle representing the slave
• out_data – [out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
• addr – Address of the slave shared buffer
• len – Length to read
• flags – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns
• ESP_OK: on success
• or other return value from \cpp\func:spl_device_transmit.

\texttt{esp_err_t essl_spi_wrbuf(} \texttt{spi_device_handle_t spi, const uint8_t* data, int addr, int len, uint32_t flags)}

Write the shared buffer of the slave in ISR way.

\textbf{Note:} \texttt{out_data} should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the \texttt{len} is shorter than a word.

Parameters
• spi – SPI device handle representing the slave
• data – Buffer for data to send, strongly suggested to be in the DRAM
• addr – Address of the slave shared buffer,
• len – Length to write
• flags – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns
• ESP_OK: success
• or other return value from \cpp\func:spl_device_transmit.

\texttt{esp_err_t essl_spi_wrbuf_polling(} \texttt{spi_device_handle_t spi, const uint8_t* data, int addr, int len, uint32_t flags)}

Write the shared buffer of the slave in polling way.

\textbf{Note:} \texttt{out_data} should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the \texttt{len} is shorter than a word.

Parameters
• spi – SPI device handle representing the slave
• data – Buffer for data to send, strongly suggested to be in the DRAM
• addr – Address of the slave shared buffer,
Chapter 2. API Reference

- **len** – Length to write
- **flags** – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: success
- or other return value from `cpp:func:spi_device_polling_transmit`

```c
esp_err_t essl_spi_rddma (spi_device_handle_t spi, uint8_t*out_data, int len, int seg_len, uint32_t flags)
```

Receive long buffer in segments from the slave through its DMA.

**Note:** This function combines several `cpp:func:essl_spi_rddma_seg` and one `cpp:func:essl_spi_rddma_done` at the end. Used when the slave is working in segment mode.

**Parameters**
- **spi** – SPI device handle representing the slave
- **out_data** – [out] Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- **len** – Total length of data to receive.
- **seg_len** – Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the rddma_done will still be sent.)
- **flags** – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: success
- or other return value from `cpp:func:spi_device_transmit`

```c
esp_err_t essl_spi_rddma_seg (spi_device_handle_t spi, uint8_t*out_data, int seg_len, uint32_t flags)
```

Read one data segment from the slave through its DMA.

**Note:** To read long buffer, call `cpp:func:essl_spi_rddma` instead.

**Parameters**
- **spi** – SPI device handle representing the slave
- **out_data** – [out] Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- **seg_len** – Length of this segment
- **flags** – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: success
- or other return value from `cpp:func:spi_device_transmit`

```c
esp_err_t essl_spi_rddma_done (spi_device_handle_t spi, uint32_t flags)
```

Send the rddma_done command to the slave. Upon receiving this command, the slave will stop sending the current buffer even there are data unsent, and maybe prepare the next buffer to send.

**Note:** This is required only when the slave is working in segment mode.

**Parameters**
- **spi** – SPI device handle representing the slave
- **flags** – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: success
- or other return value from `cpp:func:spi_device_transmit`
esp_err_t essl_spi_wrdma (spi_device_handle_t spi, const uint8_t *data, int len, int seg_len, uint32_t flags)

Send long buffer in segments to the slave through its DMA.

Note: This function combines several :cpp:func:essl_spi_wrdma_seg and one :cpp:func:essl_spi_wrdma_done at the end. Used when the slave is working in segment mode.

Parameters
- spi --SPI device handle representing the slave
- data --Buffer for data to send, strongly suggested to be in the DRAM
- len --Total length of data to send.
- seg_len --Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the wrdma_done will still be sent.)
- flags --SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns
- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.

esp_err_t essl_spi_wrdma_seg (spi_device_handle_t spi, const uint8_t *data, int seg_len, uint32_t flags)

Send one data segment to the slave through its DMA.

Note: To send long buffer, call :cpp:func:essl_spi_wrdma instead.

Parameters
- spi --SPI device handle representing the slave
- data --Buffer for data to send, strongly suggested to be in the DRAM
- seg_len --Length of this segment
- flags --SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns
- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.

esp_err_t essl_spi_wrdma_done (spi_device_handle_t spi, uint32_t flags)

Send the wrdma_done command to the slave. Upon receiving this command, the slave will stop receiving, process the received data, and maybe prepare the next buffer to receive.

Note: This is required only when the slave is working in segment mode.

Parameters
- spi --SPI device handle representing the slave
- flags --SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns
- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.

Structures

struct essl_spi_config_t

Configuration of ESSL SPI device.
Public Members

`spi_device_handle_t *spi`

Pointer to SPI device handle.

`uint32_t tx_buf_size`

The pre-negotiated Master TX buffer size used by both the host and the slave.

`uint8_t tx_sync_reg`

The pre-negotiated register ID for Master-TX-SLAVE-RX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

`uint8_t rx_sync_reg`

The pre-negotiated register ID for Master-RX-Slave-TX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

### 2.2.8 ESP x509 Certificate Bundle

**Overview**

The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification.

**Note:** The bundle is currently not available when using WolfSSL.

The bundle comes with the complete list of root certificates from Mozilla’s NSS root certificate store. Using the `gen_crt_bundle.py` python utility the certificates’ subject name and public key are stored in a file and embedded in the ESP32-C3 binary.

When generating the bundle you may choose between:

- The full root certificate bundle from Mozilla, containing more than 130 certificates. The current bundle was updated Tue Jul 19 03:12:06 2022 GMT.
- A pre-selected filter list of the name of the most commonly used root certificates, reducing the amount of certificates to around 35 while still having around 90% coverage according to market share statistics.

In addition it is possible to specify a path to a certificate file or a directory containing certificates which then will be added to the generated bundle.

**Note:** Trusting all root certificates means the list will have to be updated if any of the certificates are retracted. This includes removing them from `cacrt_all.pem`.

**Configuration**

Most configuration is done through menuconfig. CMake will generate the bundle according to the configuration and embed it.

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: automatically build and attach the bundle.
- `CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE`: decide which certificates to include from the complete root list.
- `CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH`: specify the path of any additional certificates to embed in the bundle.

To enable the bundle when using ESP-TLS simply pass the function pointer to the bundle attach function:
This is done to avoid embedding the certificate bundle unless activated by the user.

If using mbedTLS directly then the bundle may be activated by directly calling the attach function during the setup process:

```c
mbedtls_ssl_config conf;
mbedtls_ssl_config_init(&conf);
esp_crt_bundle_attach(&conf);
```

**Generating the List of Root Certificates**

The list of root certificates comes from Mozilla’s NSS root certificate store, which can be found [here](#). The list can be downloaded and created by running the script `mk-ca-bundle.pl` that is distributed as a part of curl. Another alternative would be to download the finished list directly from the curl website: CA certificates extracted from Mozilla

The common certificates bundle were made by selecting the authorities with a market share of more than 1% from w3Tech’s SSL Survey. These authorities were then used to pick the names of the certificates for the filter list, `cmn_crtAuthorities.csv`, from this list provided by Mozilla.

**Updating the Certificate Bundle**

The bundle is embedded into the app and can be updated along with the app by an OTA update. If you want to include a more up-to-date bundle than the bundle currently included in ESP-IDF, then the certificate list can be downloaded from Mozilla as described in *Generating the List of Root Certificates*. 

**Application Example**

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection using the certificate bundle with two custom certificates added for verification: [protocols/https_x509_bundle](#).

HTTPS example that uses ESP-TLS and the default bundle: [protocols/https_request](#).

HTTPS example that uses mbedTLS and the default bundle: [protocols/https_mbedtls](#).

**API Reference**

**Header File**

- components/mbedtls/esp_crt_bundle/include/esp_crt_bundle.h

**Functions**

```c
esp_err_t esp_crt_bundle_attach (void *conf)
```

Attach and enable use of a bundle for certificate verification.

Attach and enable use of a bundle for certificate verification through a verification callback. If no specific bundle has been set through `esp_crt_bundle_set()` it will default to the bundle defined in menuconfig and embedded in the binary.

**Parameters**

- `conf` - [in] The config struct for the SSL connection.

**Returns**

- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.
void esp_crt_bundle_detach (mbedtls_ssl_config *conf)
    Disable and dealloc the certification bundle.

    Removes the certificate verification callback and deallocates used resources

    Parameters
    conf [in] The config struct for the SSL connection.

esp_err_t esp_crt_bundle_set (const uint8_t *x509_bundle, size_t bundle_size)
    Set the default certificate bundle used for verification.

    Overrides the default certificate bundle only in case of successful initialization. In most use cases the bundle
    should be set through menuconfig. The bundle needs to be sorted by subject name since binary search is used
    to find certificates.

    Parameters
    • x509_bundle [in] A pointer to the certificate bundle.
    • bundle_size [in] Size of the certificate bundle in bytes.

    Returns
    • ESP_OK if adding certificates was successful.
    • Other if an error occurred or an action must be taken by the calling process.

### 2.2.9 HTTP Server

#### Overview

The HTTP Server component provides an ability for running a lightweight web server on ESP32-C3. Following are
detailed steps to use the API exposed by HTTP Server:

- **httpd_start():** Creates an instance of HTTP server, allocate memory/resources for it depending upon
the specified configuration and outputs a handle to the server instance. The server has both, a listening socket
(TCP) for HTTP traffic, and a control socket (UDP) for control signals, which are selected in a round robin
fashion in the server task loop. The task priority and stack size are configurable during server instance creation
by passing httpd_config_t structure to httpd_start(). TCP traffic is parsed as HTTP requests and, depending
on the requested URI, user registered handlers are invoked which are supposed to send back HTTP response
packets.

- **httpd_stop():** This stops the server with the provided handle and frees up any associated mem-
ory/resources. This is a blocking function that first signals a halt to the server task and then waits for the
task to terminate. While stopping, the task will close all open connections, remove registered URI handlers
and reset all session context data to empty.

- **httpd_register_uri_handler():** A URI handler is registered by passing object of type
httpd_uri_t structure which has members including uri name, method type (eg. HTTPD_GET/
HTTPD_POST/HTTPD_PUT etc.), function pointer of type esp_err_t *handler (httpd_req_t
*req) and user_ctx pointer to user context data.

#### Application Example

```c
/* Our URI handler function to be called during GET /uri request */
esp_err_t get_handler (httpd_req_t *req)
{
    /* Send a simple response */
    const char resp[] = "URI GET Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}
/* Our URI handler function to be called during POST /uri request */
```
(continues on next page)
esp_err_t post_handler(httpd_req_t *req)
{
    /* Destination buffer for content of HTTP POST request. */
    /* httpd_req_recv() accepts char* only, but content could */
    /* as well be any binary data (needs type casting). */
    /* In case of string data, null termination will be absent, and */
    /* content length would give length of string */
    char content[100];

    /* Truncate if content length larger than the buffer */
    size_t recv_size = MIN(req->content_len, sizeof(content));

    int ret = httpd_req_recv(req, content, recv_size);
    if (ret <= 0) /* 0 return value indicates connection closed */
    /* Check if timeout occurred */
    if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
        /* In case of timeout one can choose to retry calling */
        /* httpd_req_recv(), but to keep it simple, here we */
        /* respond with an HTTP 408 (Request Timeout) error */
        httpd_resp_send_408(req);
    }
    /* In case of error, returning ESP_FAIL will */
    /* ensure that the underlying socket is closed */
    return ESP_FAIL;
}

/* Send a simple response */
const char resp[] = "URI POST Response";
httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
return ESP_OK;

/* URI handler structure for GET /uri */
httpd_uri_t uri_get = {
    .uri = "/uri",
    .method = HTTP_GET,
    .handler = get_handler,
    .user_ctx = NULL
};

/* URI handler structure for POST /uri */
httpd_uri_t uri_post = {
    .uri = "/uri",
    .method = HTTP_POST,
    .handler = post_handler,
    .user_ctx = NULL
};

/* Function for starting the webserver */
httpd_handle_t start_webserver(void)
{
    /* Generate default configuration */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* Empty handle to esp_http_server */
    httpd_handle_t server = NULL;

    /* Start the httpd server */
    if (httpd_start(&server, &config) == ESP_OK) {
        /* Register URI handlers */
        httpd_register_uri_handler(server, &uri_get);
    }

    return ESP_OK;
}
httpd_register_uri_handler(server, &uri_post);
} /* If server failed to start, handle will be NULL */
return server;

void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* Stop the httpd server */
        httpd_stop(server);
    }
}

Simple HTTP Server Example Check HTTP server example under protocols/http_server/simple where handling of arbitrary content lengths, reading request headers and URL query parameters, and setting response headers is demonstrated.

Persistent Connections

HTTP server features persistent connections, allowing for the re-use of the same connection (session) for several transfers, all while maintaining context specific data for the session. Context data may be allocated dynamically by the handler in which case a custom function may need to be specified for freeing this data when the connection/session is closed.

Persistent Connections Example

/* Custom function to free context */
void free_ctx_func(void *ctx)
{
    /* Could be something other than free */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* Create session's context if not already available */
    if (! req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /* Pointer to context data */
        req->free_ctx = free_ctx_func; /* Function to free context data */
    }

    /* Access context data */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *)req->sess_ctx;
    /* Respond */
    ................
    ................
    return ESP_OK;
}

Check the example under protocols/http_server/persistent_sockets.
Chapter 2. API Reference

Websocket Server

The HTTP server component provides websocket support. The websocket feature can be enabled in menuconfig using the CONFIG_HTTPD_WS_SUPPORT option. Please refer to the protocols/http_server/ws_echo_server example which demonstrates usage of the websocket feature.

API Reference

Header File

- components/esp_http_server/include/esp_http_server.h

Functions

```c
esp_err_t httpd_register_uri_handler(httpd_handle_t handle, const httpd_uri_t *uri_handler)
```

Registers a URI handler.

Example usage:

```c
esp_err_t my_uri_handler(httpd_req_t* req)
{
    // Recv, Process and Send
    ....
    ....
    ....
    // Fail condition
    if (....) {
        // Return fail to close session
        return ESP_FAIL;
    }
    // On success
    return ESP_OK;
}

// URI handler structure
httpd_uri_t my_uri {
    .uri = "my_uri/path/xyz",
    .method = HTTPD_GET,
    .handler = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
    // If failed to register handler
    ....
}
```

Note: URI handlers can be registered in real time as long as the server handle is valid.

Parameters

- **handle** [in] handle to HTTPD server instance
- **uri_handler** [in] pointer to handler that needs to be registered

Returns

- ESP_OK: On successfully registering the handler
- ESP_ERR_INVALID_ARG: Null arguments
• ESP_ERR_HTTPD_HANDLERS_FULL: If no slots left for new handler
• ESP_ERR_HTTPD_HANDLER_EXISTS: If handler with same URI and method is already registered

`esp_err_t httpd_unregister_uri_handler(httpd_handle_t handle, const char* uri, httpd_method_t method)`

Unregister a URI handler.

**Parameters**
- `handle` - [in] handle to HTTPD server instance
- `uri` - [in] URI string
- `method` - [in] HTTP method

**Returns**
- ESP_OK: On successfully deregistering the handler
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_NOT_FOUND: Handler with specified URI and method not found

`esp_err_t httpd_unregister_uri(httpd_handle_t handle, const char* uri)`

Unregister all URI handlers with the specified uri string.

**Parameters**
- `handle` - [in] handle to HTTPD server instance
- `uri` - [in] uri string specifying all handlers that need to be deregistered

**Returns**
- ESP_OK: On successfully deregistering all such handlers
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_NOT_FOUND: No handler registered with specified uri string

`esp_err_t httpd_sess_set_recv_override(httpd_handle_t hd, int sockfd, httpd_recv_func_t recv_func)`

Overwrite web server’s receive function (by session FD)

This function overrides the web server’s receive function. This same function is used to read HTTP request packets.

**Note:** This API is supposed to be called either from the context of
- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()

**Parameters**
- `hd` - [in] HTTPD instance handle
- `sockfd` - [in] Session socket FD
- `recv_func` - [in] The receive function to be set for this session

**Returns**
- ESP_OK: On successfully registering override
- ESP_ERR_INVALID_ARG: Null arguments

`esp_err_t httpd_sess_set_send_override(httpd_handle_t hd, int sockfd, httpd_send_func_t send_func)`

Overwrite web server’s send function (by session FD)

This function overrides the web server’s send function. This same function is used to send out any response to any HTTP request.

**Note:** This API is supposed to be called either from the context of
- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()
Chapter 2. API Reference

- **hd** - [in] HTTPD instance handle
- **sockfd** - [in] Session socket FD
- **send_func** - [in] The send function to be set for this session

**Returns**
- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

```c
esp_err_t httpd_sess_set_pending_override(httpd_handle_t hd, int sockfd, httpd_pending_func_t pending_func)
```

Override web server’s pending function (by session FD)

This function overrides the web server’s pending function. This function is used to test for pending bytes in a socket.

**Note:** This API is supposed to be called either from the context of
- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()

**Parameters**
- hd - [in] HTTPD instance handle
- sockfd - [in] Session socket FD
- pending_func - [in] The receive function to be set for this session

**Returns**
- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

```c
int httpd_req_to_sockfd(httpd_req_t *r)
```

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, i.e.: httpd_sess_get_ctx(), httpd_sess_trigger_close(), httpd_sess_update_lru_counter().

**Note:** This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.

**Parameters**  
- r - [in] The request whose socket descriptor should be found

**Returns**
- Socket descriptor : The socket descriptor for this request
- -1 : Invalid/NULL request pointer

```c
int httpd_req_recv(httpd_req_t *r, char *buf, size_t buf_len)
```

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use content_len provided in httpd_req_t structure to know the length of data to be fetched. If content_len is too large for the buffer then user may have to make multiple calls to this function, each time fetching ‘buf_len’ number of bytes, while the pointer to content data is incremented internally by the same number.

**Note:**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
• Presently Chunked Encoding is not supported

### Parameters
- `r` [in] The request being responded to
- `buf` [in] Pointer to a buffer that the data will be read into
- `buf_len` [in] Length of the buffer

### Returns
- Bytes: Number of bytes read into the buffer successfully
- 0: Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket recv()

```c
size_t httpd_req_get_hdr_value_len(httpd_req_t *r, const char *field)
```

Search for a field in request headers and return the string length of its value.

**Note:**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.

### Parameters
- `r` [in] The request being responded to
- `field` [in] The header field to be searched in the request

### Returns
- Length: If field is found in the request URL
- Zero: Field not found / Invalid request / Null arguments

```c
esp_err_t httpd_req_get_hdr_value_str(httpd_req_t *r, const char *field, char *val, size_t val_size)
```

Get the value string of a field from the request headers.

**Note:**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
- Use httpd_req_get_hdr_value_len() to know the right buffer length

### Parameters
- `r` [in] The request being responded to
- `field` [in] The field to be searched in the header
- `val` [out] Pointer to the buffer into which the value will be copied if the field is found
- `val_size` [in] Size of the user buffer “val”

### Returns
- ESP_OK: Field found in the request header and value string copied
- ESP_ERR_NOT_FOUND: Key not found
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_INVALID_REQ: Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC: Value string truncated
### `size_t httpd_req_get_url_query_len (httpd_req_t *r)`

Get Query string length from the request URL.

**Note:** This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.

**Parameters**
- `r` - [in] The request being responded to

**Returns**
- Length: Query is found in the request URL
- Zero: Query not found / Null arguments / Invalid request

### `esp_err_t httpd_req_get_url_query_str (httpd_req_t *r, char*buf, size_t buf_len)`

Get Query string from the request URL.

**Note:**
- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using `httpd_req_get_hdr_value_str()` to know the ‘Content-Type’ (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
- Prior to calling this function, one can use `httpd_req_get_url_query_len()` to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string.

**Parameters**
- `r` - [in] The request being responded to
- `buf` - [out] Pointer to the buffer into which the query string will be copied (if found)
- `buf_len` - [in] Length of output buffer

**Returns**
- ESP_OK: Query is found in the request URL and copied to buffer
- ESP_ERR_NOT_FOUND: Query not found
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_INVALID_REQ: Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC: Query string truncated

### `esp_err_t httpd_query_key_value (const char*qry, const char*key, char*val, size_t val_size)`

Helper function to get a URL query tag from a query string of the type param1=val1&param2=val2.

**Note:**
- The components of URL query tag (keys and values) are not URL decoded. The user must check for ‘Content-Type’ field in the request headers and then depending upon the specified encoding (URL encoded or otherwise) apply the appropriate decoding algorithm.
- If actual value size is greater than `val_size`, then the value is truncated, accompanied by truncation error as return value.

**Parameters**
- `qry` - [in] Pointer to query string
- `key` - [in] The key to be searched in the query string
- `val` - [out] Pointer to the buffer into which the value will be copied if the key is found
• val_size [in] Size of the user buffer “val”

Returns
• ESP_OK : Key is found in the URL query string and copied to buffer
• ESP_ERR_NOT_FOUND : Key not found
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

esp_err_t httpd_req_get_cookie_val (httpd_req_t *req, const char *cookie_name, char *val, size_t *val_size)

Get the value string of a cookie value from the “Cookie” request headers by cookie name.

Parameters
• req [in] Pointer to the HTTP request
• cookie_name [in] The cookie name to be searched in the request
• val [out] Pointer to the buffer into which the value of cookie will be copied if the cookie is found
• val_size [inout] Pointer to size of the user buffer “val”. This variable will contain cookie length if ESP_OK is returned and required buffer length incase ESP_ERR_HTTPD_RESULT_TRUNC is returned.

Returns
• ESP_OK : Key is found in the cookie string and copied to buffer
• ESP_ERR_NOT_FOUND : Key not found
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

bool httpd_uri_match_wildcard (const char *uri_template, const char *uri_to_match, size_t match_upto)

Test if a URI matches the given wildcard template.

Template may end with “?” to make the previous character optional (typically a slash), “*” for a wildcard match, and “?*” to make the previous character optional, and if present, allow anything to follow.

Example:
• * matches everything
• /foo/? matches /foo and /foo/
• /foo/* (sans the backslash) matches /foo/ and /foo/bar, but not /foo or /foo
• /foo/*? or /foo/*? (sans the backslash) matches /foo/, /foo/bar, and also /foo, but not /foox or /fo

The special characters “?” and “*” anywhere else in the template will be taken literally.

Parameters
• uri_template [in] URI template (pattern)
• uri_to_match [in] URI to be matched
• match_upto [in] how many characters of the URI buffer to test (there may be trailing query string etc.)

Returns true if a match was found

esp_err_t httpd_resp_send (httpd_req_t *r, const char *buf, ssize_t buf_len)

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use httpd_resp_send_chunk() instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers: httpd_resp_set_status() - for setting the HTTP status string, httpd_resp_set_type() - for setting the Content Type, httpd_resp_set_hdr() - for appending any additional field value entries in the response header

Note:
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once this API is called, the request has been responded to.
• No additional data can then be sent for the request.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Parameters
• r [in] The request being responded to
• buf [in] Buffer from where the content is to be fetched
• buf_len [in] Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

Returns
• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null request pointer
• ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request

static inline esp_err_t httpd_resp_sendstr (httpd_req_t *r, const char *str)

API to send a complete string as HTTP response.

This API simply calls http_resp_send with buffer length set to string length assuming the buffer contains a null terminated string

Parameters
• r [in] The request being responded to
• str [in] String to be sent as response body
Returns

- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null request pointer
- ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request

static inline esp_err_t httpd_resp_sendstr_chunk (httpd_req_t *r, const char *str)

API to send a string as an HTTP response chunk.

This API simply calls http_resp_send_chunk with buffer length set to string length assuming the buffer contains a null terminated string.

Parameters

- **r** -[in] The request being responded to
- **str** -[in] String to be sent as response body (NULL to finish response packet)

Returns

- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null request pointer
- ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request

esp_err_t httpd_resp_set_status (httpd_req_t *r, const char *status)

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the ‘200 OK’ response is sent as the response.

Note:

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- This API only sets the status to this value. The status isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the status string is valid till send function is called.

Parameters

- **r** -[in] The request being responded to
- **status** -[in] The HTTP status code of this response

Returns

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

esp_err_t httpd_resp_set_type (httpd_req_t *r, const char *type)

API to set the HTTP content type.

This API sets the ‘Content Type’ field of the response. The default content type is ‘text/html’.

Note:

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- This API only sets the content type to this value. The type isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the type string is valid till send function is called.

Parameters
**API Reference**

- **r [in]** The request being responded to
- **type [in]** The Content Type of the response

**Returns**
- ESP_OK : On success
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

```c
esp_err_t httpd_resp_set_hdr(httpd_req_t *r, const char *field, const char *value)
```

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

**Note:**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- The header isn’t sent out until any of the send APIs is executed.
- The maximum allowed number of additional headers is limited to value of max_resp_headers in config structure.
- Make sure that the lifetime of the field value strings are valid till send function is called.

**Parameters**
- **r [in]** The request being responded to
- **field [in]** The field name of the HTTP header
- **value [in]** The value of this HTTP header

**Returns**
- ESP_OK : On successfully appending new header
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_HDR : Total additional headers exceed max allowed
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

```c
esp_err_t httpd_resp_send_err(httpd_req_t *req, httpd_err_code_t error, const char *msg)
```

For sending out error code in response to HTTP request.

**Note:**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Parameters**
- **req [in]** Pointer to the HTTP request for which the response needs to be sent
- **error [in]** Error type to send
- **msg [in]** Error message string (pass NULL for default message)

**Returns**
- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

```c
static inline esp_err_t httpd_resp_send_404(httpd_req_t *r)
```

Helper function for HTTP 404.
Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note:

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Parameters  

\( r \) - [in] The request being responded to

Returns

- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

static inline \( \text{esp_err_t} \) httpd_resp_send_408 (httpd_req_t *\( r \))

Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note:

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Parameters  

\( r \) - [in] The request being responded to

Returns

- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

static inline \( \text{esp_err_t} \) httpd_resp_send_500 (httpd_req_t *\( r \))

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note:

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
int httpd_send (httpd_req_t *r, const char *buf, size_t buf_len)

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually, and HTTP delimeters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

Note:

• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn’t have to call this API, but you would rather use either of : httpd_resp_send(), httpd_resp_send_chunk()

Parameters
• r –[in] The request being responded to
• buf –[in] Buffer from where the fully constructed packet is to be read
• buf_len –[in] Length of the buffer

Returns
• Bytes : Number of bytes that were sent successfully
• HTTPD_SOCK_ERR_INVALID : Invalid arguments
• HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket send()
• HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()

int httpd_socket_send (httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)

A low level API to send data on a given socket

This internally calls the default send function, or the function registered by httpd_sess_set_send_override().

Note: This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous data is to be sent over a socket.

Parameters
• hd –[in] server instance
• sockfd –[in] session socket file descriptor
• buf –[in] buffer with bytes to send
• buf_len –[in] data size
• flags –[in] flags for the send() function

Returns
• Bytes : The number of bytes sent successfully
• HTTPD_SOCK_ERR_INVALID : Invalid arguments
• HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket send()
• HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()

int httpd_socket_recv (httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)

A low level API to receive data from a given socket

This internally calls the default recv function, or the function registered by httpd_sess_set_recv_override().
Note: This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.

Parameters

- **hd** - [in] server instance
- **sockfd** - [in] session socket file descriptor
- **buf** - [in] buffer with bytes to send
- **buf_len** - [in] data size
- **flags** - [in] flags for the send() function

Returns

- Bytes: The number of bytes received successfully
- 0: Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket recv()

```c
esp_err_t httpd_register_err_handler(httpd_handle_t handle, httpd_err_code_t error, httpd_err_handler_func_t handler_fn)
```

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by httpd_err_code_t. See prototype httpd_err_handler_func_t above for details.

Parameters

- **handle** - [in] HTTP server handle
- **error** - [in] Error type
- **handler_fn** - [in] User implemented handler function (Pass NULL to unset any previously set handler)

Returns

- ESP_OK: handler registered successfully
- ESP_ERR_INVALID_ARG: invalid error code or server handle

```c
esp_err_t httpd_start(httpd_handle_t *handle, const httpd_config_t *config)
```

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

Example usage:

```c
// Function for starting the web server
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
    httpd_handle_t server = NULL;

    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    // If server failed to start, handle will be NULL
    return server;
}
```
**Parameters**

- `config`  
  Configuration for new instance of the server

- `handle`  
  Handle to newly created instance of the server. NULL on error

**Returns**

- ESP_OK : Instance created successfully
- ESP_ERR_INVALID_ARG : Null argument(s)
- ESP_ERR_HTTPD_ALLOC_MEM : Failed to allocate memory for instance
- ESP_ERR_HTTPD_TASK : Failed to launch server task

```c
esp_err_t httpd_stop(httpd_handle_t handle)
```

Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

```c
// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
    // Ensure handle is non NULL
    if (server != NULL) {
        // Stop the httpd server
        httpd_stop(server);
    }
}
```

**Parameters**

- `handle`  
  Handle to server returned by `httpd_start`

**Returns**

- ESP_OK : Server stopped successfully
- ESP_ERR_INVALID_ARG : Handle argument is Null

```c
esp_err_t httpd_queue_work(httpd_handle_t handle, httpd_work_fn_t work, void*arg)
```

Queue execution of a function in HTTPD’s context.

This API queues a work function for asynchronous execution

**Note:** Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

**Parameters**

- `handle`  
  Handle to server returned by `httpd_start`

```c
void* httpd_sess_get_ctx(httpd_handle_t handle, int sockfd)
```

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the `httpd_req_t` structure. But, there are cases where the web server’s send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

**Parameters**

- `handle`  
  Handle to server returned by `httpd_start`
- `sockfd` [in] The socket descriptor for which the context should be extracted.

**Returns**
- `void*` : Pointer to the context associated with this session
- `NULL` : Empty context / Invalid handle / Invalid socket fd

```c
void httpd_sess_set_ctx (httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)
```

Set session context by socket descriptor.

**Parameters**
- `handle` [in] Handle to server returned by httpd_start
- `sockfd` [in] The socket descriptor for which the context should be extracted.
- `ctx` [in] Context object to assign to the session
- `free_fn` [in] Function that should be called to free the context

```c
void *httpd_sess_get_transport_ctx (httpd_handle_t handle, int sockfd)
```

Get session ‘transport’ context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

**See also:**
- `httpd_sess_get_ctx()`

```c
void httpd_sess_set_transport_ctx (httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)
```

Set session ‘transport’ context by socket descriptor.

**See also:**
- `httpd.sess_set_ctx()`

```c
void *httpd_get_global_user_ctx (httpd_handle_t handle)
```

Get HTTPD global user context (it was set in the server config struct)

**Parameters**
- `handle` [in] Handle to server returned by httpd_start

**Returns**
- `global user context`

```c
void *httpd_get_global_transport_ctx (httpd_handle_t handle)
```

Get HTTPD global transport context (it was set in the server config struct)

**Parameters**
- `handle` [in] Handle to server returned by httpd_start

**Returns**
- `global transport context`
**esp_err_t** `httpd_sess_trigger_close` *(httpd_handle_t handle, int sockfd)*

Trigger an httpd session close externally.

**Note:** Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

**Parameters**
- **handle** [in] Handle to server returned by httpd_start
- **sockfd** [in] The socket descriptor of the session to be closed

**Returns**
- **ESP_OK** : On successfully initiating closure
- **ESP_FAIL** : Failure to queue work
- **ESP_ERR_NOT_FOUND** : Socket fd not found
- **ESP_ERR_INVALID_ARG** : Null arguments

**esp_err_t** `httpd_sess_update_lru_counter` *(httpd_handle_t handle, int sockfd)*

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

**Note:** Calling this API is only necessary if the LRU Purge Enable option is enabled.

**Parameters**
- **handle** [in] Handle to server returned by httpd_start
- **sockfd** [in] The socket descriptor of the session for which LRU counter is to be updated

**Returns**
- **ESP_OK** : Socket found and LRU counter updated
- **ESP_ERR_NOT_FOUND** : Socket not found
- **ESP_ERR_INVALID_ARG** : Null arguments

**esp_err_t** `httpd_get_client_list` *(httpd_handle_t handle, size_t* fds, int* client_fds)*

Returns list of current socket descriptors of active sessions.

**Note:** Size of provided array has to be equal or greater than maximum number of opened sockets, configured upon initialization with max_open_sockets field in httpd_config_t structure.

**Parameters**
- **handle** [in] Handle to server returned by httpd_start
- **fds** [inout] In: Size of provided client_fds array Out: Number of valid client fds returned in client_fds.
- **client_fds** [out] Array of client fds

**Returns**
- **ESP_OK** : Successfully retrieved session list
- **ESP_ERR_INVALID_ARG** : Wrong arguments or list is longer than provided array
Chapter 2. API Reference

Structures

struct httpd_config

HTTP Server Configuration Structure.

Note: Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

Public Members

unsigned task_priority

Priority of FreeRTOS task which runs the server

size_t stack_size

The maximum stack size allowed for the server task

BaseType_t core_id

The core the HTTP server task will run on

uint16_t server_port

TCP Port number for receiving and transmitting HTTP traffic

uint16_t ctrl_port

UDP Port number for asynchronously exchanging control signals between various components of the server

uint16_t max_open_sockets

Max number of sockets/clients connected at any time

uint16_t max_uri_handlers

Maximum allowed uri handlers

uint16_t max_resp_headers

Maximum allowed additional headers in HTTP response

uint16_t backlog_conn

Number of backlog connections

bool lru_purge_enable

Purge “Least Recently Used” connection

uint16_t recv_wait_timeout

Timeout for recv function (in seconds)

uint16_t send_wait_timeout

Timeout for send function (in seconds)
void *global_user_ctx

Global user context.

This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the httpd_req_t struct.

When shutting down, the server frees up the user context by calling free() on the global_user_ctx field. If you wish to use a custom function for freeing the global user context, please specify that here.

httpd_free_ctx_fn_t global_user_ctx_free_fn

Free function for global user context

void *global_transport_ctx

Global transport context.

Similar to global_user_ctx, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using free(), unless global_transport_ctx_free_fn is specified.

httpd_free_ctx_fn_t global_transport_ctx_free_fn

Free function for global transport context

httpd_open_func_t open_fn

Custom session opening callback.

Called on a new session socket just after accept(), but before reading any data.

This is an opportunity to set up e.g. SSL encryption using global_transport_ctx and the send/recv/pending session overrides.

If a context needs to be maintained between these functions, store it in the session using httpd_sess_set_transport_ctx() and retrieve it later with httpd_sess_get_transport_ctx()

Returning a value other than ESP_OK will immediately close the new socket.

httpd_close_func_t close_fn

Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket. This is a place for custom de-init code common to all sockets.

The server will only close the socket if no custom session closing callback is set. If a custom callback is used, close(sockfd) should be called in here for most cases.

Set the user or transport context to NULL if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

httpd_uri_match_func_t uri_match_fn

URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using httpd_register_uri_handler()

Available options are: 1) NULL : Internally do basic matching using strncmp() 2) httpd_uri_match_wildcard() : URI wildcard matcher

Users can implement their own matching functions (See description of the httpd_uri_match_func_t function prototype)
struct httpd_req
    HTTP Request Data Structure.

**Public Members**

`httpd_handle_t` **handle**
    Handle to server instance

`int` **method**
    The type of HTTP request, -1 if unsupported method

`const char uri[HTTPD_MAX_URI_LEN + 1]`
    The URI of this request (1 byte extra for null termination)

`size_t` **content_len**
    Length of the request body

`void *` **aux**
    Internally used members

`void *` **user_ctx**
    User context pointer passed during URI registration.

`void *` **sess_ctx**
    Session Context Pointer
    A session context. Contexts are maintained across ‘sessions’ for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.
    By default, this is NULL. URI Handlers can set this to any meaningful value.
    If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling free(), unless free_ctx function is set.

`httpd_free_ctx_fn_t` **free_ctx**
    Pointer to free context hook
    Function to free session context
    If the web server’s socket closes, it frees up the session context by calling free() on the sess_ctx member.
    If you wish to use a custom function for freeing the session context, please specify that here.

`bool` **ignore_sess_ctx_changes**
    Flag indicating if Session Context changes should be ignored
    By default, if you change the sess_ctx in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of sess_ctx yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling free_ctx or free()) only if the socket gets closed.

struct httpd_uri
    Structure for URI handler.
Chapter 2. API Reference

**Public Members**

- `const char *uri`
  The URI to handle

- `httpd_method_t method`
  Method supported by the URI

- `esp_err_t (*handler)(httpd_req_t *)`
  Handler to call for supported request method. This must return ESP_OK, or else the underlying socket will be closed.

- `void *user_ctx`
  Pointer to user context data which will be available to handler

**Macros**

- `HTTPD_MAX_REQ_HDR_LEN`

- `HTTPD_MAX_URI_LEN`

- `HTTPD_SOCK_ERR_FAIL`

- `HTTPD_SOCK_ERR_INVALID`

- `HTTPD_SOCK_ERR_TIMEOUT`

- `HTTPD_200`
  HTTP Response 200

- `HTTPD_204`
  HTTP Response 204

- `HTTPD_207`
  HTTP Response 207

- `HTTPD_400`
  HTTP Response 400

- `HTTPD_404`
  HTTP Response 404

- `HTTPD_408`
  HTTP Response 408

- `HTTPD_500`
  HTTP Response 500
HTTPD_TYPE_JSON
HTTP Content type JSON

HTTPD_TYPE_TEXT
HTTP Content type text/HTML

HTTPD_TYPE_OCTET
HTTP Content type octet-stream

HTTPD_DEFAULT_CONFIG()

ESP_ERR_HTTPD_BASE
Starting number of HTTPD error codes

ESP_ERR_HTTPD_HANDLERS_FULL
All slots for registering URI handlers have been consumed

ESP_ERR_HTTPD_HANDLER_EXISTS
URI handler with same method and target URI already registered

ESP_ERR_HTTPD_INVALID_REQ
Invalid request pointer

ESP_ERR_HTTPD_RESULT_TRUNC
Result string truncated

ESP_ERR_HTTPD_RESP_HDR
Response header field larger than supported

ESP_ERR_HTTPD_RESP_SEND
Error occurred while sending response packet

ESP_ERR_HTTPD_ALLOC_MEM
Failed to dynamically allocate memory for resource

ESP_ERR_HTTPD_TASK
Failed to launch server task/thread

HTTPD_RESP_USE_STRLEN

Type Definitions

typedef struct httpd_req httpd_req_t
HTTP Request Data Structure.

typedef struct httpd_uri httpd_uri_t
Structure for URI handler.
typedef int (*httpd_send_func_t)(httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)
Prototype for HTTPDs low-level send function.

**Note:** User specified send function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_send() function

- **Param** hd [in] server instance
- **Param** sockfd [in] session socket file descriptor
- **Param** buf [in] buffer with bytes to send
- **Param** buf_len [in] data size
- **Param** flags [in] flags for the send() function

**Return**
- Bytes : The number of bytes sent successfully
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()

typedef int (*httpd_recv_func_t)(httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)
Prototype for HTTPDs low-level recv function.

**Note:** User specified recv function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_req_recv() function

- **Param** hd [in] server instance
- **Param** sockfd [in] session socket file descriptor
- **Param** buf [in] buffer with bytes to send
- **Param** buf_len [in] data size
- **Param** flags [in] flags for the send() function

**Return**
- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

typedef int (*httpd_pending_func_t)(httpd_handle_t hd, int sockfd)
Prototype for HTTPDs low-level “get pending bytes” function.

**Note:** User specified pending function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will be handled accordingly in the server task.

- **Param** hd [in] server instance
- **Param** sockfd [in] session socket file descriptor

**Return**
- Bytes : The number of bytes waiting to be received
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket pending()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket pending()
typedef esp_err_t (*httpd_err_handler_func_t)(httpd_req_t *req, httpd_err_code_t error)

Function prototype for HTTP error handling.

This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

**Note:**

- If implemented, the server will not automatically send out HTTP error response codes, therefore, httpd.resp.send.err() must be invoked inside this function if user wishes to generate HTTP error responses.
- When invoked, the validity of uri, method, content.len and user_ctx fields of the httpd_req_t parameter is not guaranteed as the HTTP request may be partially received/parsed.
- The function must return ESP_OK if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type HTTPD_500_INTERNAL_SERVER_ERROR and the socket closed anyway.

**Param req [in]** HTTP request for which the error needs to be handled
**Param error [in]** Error type

**Return**

- ESP_OK : error handled successful
- ESP_FAIL : failure indicates that the underlying socket needs to be closed

typedef void *httpd_handle_t

HTTP Server Instance Handle.

Every instance of the server will have a unique handle.

typedef enum http_method httpd_method_t

HTTP Method Type wrapper over “enum http_method” available in “http_parser” library.

typedef void (*httpd_free_ctx_fn_t)(void *ctx)

Prototype for freeing context data (if any)

**Param ctx [in]** object to free

typedef esp_err_t (*httpd_open_func_t)(httpd_handle_t hd, int sockfd)

Function prototype for opening a session.

Called immediately after the socket was opened to set up the send/recv functions and other parameters of the socket.

**Param hd [in]** server instance
**Param sockfd [in]** session socket file descriptor

**Return**

- ESP_OK : On success
- Any value other than ESP_OK will signal the server to close the socket immediately

typedef void (*httpd_close_func_t)(httpd_handle_t hd, int sockfd)

Function prototype for closing a session.

**Note:** It’s possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.
Chapter 2. API Reference

**Param hd** [in] server instance

**Param sockfd** [in] session socket file descriptor

typedef bool (*httpd_uri_match_func_t)(const char *reference_uri, const char *uri_to_match, size_t match_upto)

Function prototype for URI matching.

**Param reference_uri** [in] URI/template with respect to which the other URI is matched

**Param uri_to_match** [in] URI/template being matched to the reference URI/template

**Param match_upto** [in] For specifying the actual length of uri_to_match up to which the matching algorithm is to be applied (The maximum value is strlen(uri_to_match), independent of the length of reference_uri)

**Return** true on match

typedef struct httpd_config httpd_config_t

HTTP Server Configuration Structure.

**Note:** Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

typedef void (*httpd_work_fn_t)(void *arg)

Prototype of the HTTPD work function Please refer to httpd_queue_work() for more details.

**Param arg** [in] The arguments for this work function

**Enumerations**

enum httpd_err_code_t

Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.

**Values:**

enumerator HTTPD_500_INTERNAL_SERVER_ERROR

enumerator HTTPD_501_METHOD_NOT_IMPLEMENTED

enumerator HTTPD_505_VERSION_NOT_SUPPORTED

enumerator HTTPD_400_BAD_REQUEST

enumerator HTTPD_401_UNAUTHORIZED

enumerator HTTPD_403_FORBIDDEN

enumerator HTTPD_404_NOT_FOUND

enumerator HTTPD_405_METHOD_NOT_ALLOWED

enumerator HTTPD_408_REQ_TIMEOUT
Chapter 2. API Reference

enumerator HTTPD_411_LENGTH_REQUIRED

enumerator HTTPD_414_URI_TOO_LONG

enumerator HTTPD_431_REQ_HDR_FIELDS_TOO_LARGE

enumerator HTTPD_ERR_CODE_MAX

2.2.10 HTTPS Server

Overview

This component is built on top of HTTP Server. The HTTPS server takes advantage of hook registration functions in the regular HTTP server to provide callback function for SSL session.

All documentation for HTTP Server applies also to a server you create this way.

Used APIs

The following APIs of HTTP Server should not be used with HTTPS Server, as they are used internally to handle secure sessions and to maintain internal state:

- “send”, “receive” and “pending” callback registration functions - secure socket handling
  - httpd_sess_set_send_override()
  - httpd_sess_set_recv_override()
  - httpd_sess_set_pending_override()

- “transport context” - both global and session
  - httpd_sess_get_transport_ctx() - returns SSL used for the session
  - httpd_sess_set_transport_ctx()
  - httpd_get_global_transport_ctx() - returns the shared SSL context
  - httpd_config::global_transport_ctx
  - httpd_config::global_transport_ctx_free_fn
  - httpd_config::open_fn - used to set up secure sockets

Everything else can be used without limitations.

Usage

Please see the example protocols/https_server to learn how to set up a secure server.

Basically, all you need is to generate a certificate, embed it into the firmware, and pass the init struct into the start function after the certificate address and lengths are correctly configured in the init struct.

The server can be started with or without SSL by changing a flag in the init struct - httpd_ssl_config::transport_mode. This could be used, e.g., for testing or in trusted environments where you prefer speed over security.

Performance

The initial session setup can take about two seconds, or more with slower clock speed or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).
API Reference

Header File

• components/esp_https_server/include/esp_https_server.h

Functions

\texttt{esp\_err\_t httpd\_ssl\_start (httpd\_handle\_t \*handle, httpd\_ssl\_config\_t \*config)}

Create a SSL capable HTTP server (secure mode may be disabled in config)

Parameters

• \texttt{config} - [inout] - server config, must not be const. Does not have to stay valid after calling this function.

• \texttt{handle} - [out] - storage for the server handle, must be a valid pointer

Returns

success

\texttt{esp\_err\_t httpd\_ssl\_stop (httpd\_handle\_t handle)}

Stop the server. Blocks until the server is shut down.

Parameters \texttt{handle} - [in]

Returns

• ESP_OK: Server stopped successfully

• ESP.ERR.INVALID_ARG: Invalid argument

• ESP.FAIL: Failure to shut down server

Structures

\texttt{struct esp\_https\_server\_user\_cb\_arg}

Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.

Public Members

\texttt{httpd\_ssl\_user\_cb\_state} \texttt{user\_cb\_state}

State of user callback

\texttt{esp\_tls\_t} \texttt{tls}

ESP-TLS connection handle

\texttt{struct httpd\_ssl\_config}

HTTPS server config struct

Please use HTTPD_SSL_CONFIG_DEFAULT() to initialize it.

Public Members

\texttt{httpd\_config\_t} \texttt{httpd}

Underlying HTTPD server config

Parameters like task stack size and priority can be adjusted here.

\texttt{const uint8\_t} \texttt{\*server\_cert}

Server certificate
size_t servercert_len
   Server certificate byte length

const uint8_t *cacert_pem
   CA certificate ((CA used to sign clients, or client cert itself)

size_t cacert_len
   CA certificate byte length

const uint8_t *prvtkey_pem
   Private key

size_t prvtkey_len
   Private key byte length

httpd_ssl_transport_mode_t transport_mode
   Transport Mode (default secure)

uint16_t port_secure
   Port used when transport mode is secure (default 443)

uint16_t port_insecure
   Port used when transport mode is insecure (default 80)

bool session_tickets
   Enable tls session tickets

bool use_secure_element
   Enable secure element for server session

esp_https_server_user_cb *user_cb
   User callback for esp_https_server

**Macros**

HTTPD_SSL_CONFIG_DEFAULT ()
   Default config struct init

   (http_server default config had to be copied for customization)

   Notes:
   
   • port is set when starting the server, according to ‘transport_mode’
   • one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
   • SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
   • Stack size may need adjustments depending on the user application

**Type Definitions**

typedef struct esp_https_server_user_cb_arg esp_https_server_user_cb_arg_t
   Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.
typedef void esp_https_server_user_cb (esp_https_server_user_cb_arg_t *user_cb)
    Callback function prototype Can be used to get connection or client information (SSL context) E.g. Client certificate, Socket FD, Connection state, etc.

    **Param user_cb** Callback data struct

typedef struct httpd_ssl_config httpd_ssl_config_t

**Enumerations**

enum httpd_ssl_transport_mode_t
    Values:
    - enumerator HTTPD_SSL_TRANSPORT_SECURE
    - enumerator HTTPD_SSL_TRANSPORT_INSECURE

enum httpd_ssl_user_cb_state_t
    Indicates the state at which the user callback is executed, i.e at session creation or session close.
    Values:
    - enumerator HTTPD_SSL_USER_CB_SESS_CREATE
    - enumerator HTTPD_SSL_USER_CB_SESS_CLOSE

### 2.2.11 ICMP Echo

**Overview**

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network util ping is implemented based on the ICMP packets with the type field value of 0, also called Echo Reply.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g. packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending/parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

**Create a new ping session** To create a ping session, you need to fill in the esp_ping_config_t configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the esp_ping_callbacks_t structure.

Example method to create a new ping session and register callbacks:

```c
static void test_onPing_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
}
```
(continues on next page)
```c
uint16_t seqno;
uint32_t elapsed_time, recv_len;
ip_addr_t target_addr;

esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_time));
printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms
", recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}
```

```c
static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
  uint16_t seqno;
ip_addr_t target_addr;
  esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
  esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
  printf("From %s icmp_seq=%d timeout
", inet_ntoa(target_addr.u_addr.ip4), seqno);
}
```

```c
static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
  uint32_t transmitted;
  uint32_t received;
  uint32_t total_time_ms;
  esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted, sizeof(transmitted));
  esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
  esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_time_ms));
  printf("%d packets transmitted, %d received, time %dms\n", transmitted, received, total_time_ms);
}
```

```c
void initialize_ping()
{
  /* convert URL to IP address */
ip_addr_t target_addr;
  struct addrinfo hint;
  struct addrinfo *res = NULL;
  memset(&hint, 0, sizeof(hint));
  memset(&target_addr, 0, sizeof(target_addr));
  getaddrinfo("www.espressif.com", NULL, &hint, &res);
  struct in_addr addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
  inet_addr_to_ip4addr(&target_addr, &addr4);
  freeaddrinfo(res);

  esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
  ping_config.target_addr = target_addr; // target IP address
  ping_config.count = ESP_PING_COUNT_INFINITE; // ping in infinite mode, esp_ping_stop can stop it

  /* set callback functions */
  esp_ping_callbacks_t cbs;
  cbs.on_ping_success = test_on_ping_success;
```

(continues on next page)
cbs.on_ping_timeout = test_on_ping_timeout;
cbs.on_ping_end = test_on_ping_end;
cbs.cb_args = "foo"; // arguments that will feed to all callback functions,
// can be NULL
  cbs.cb_args = eth_event_group;
  esp_ping_handle_t ping;
  esp_ping_new_session(&ping_config, &cbs, &ping);
}

Start and Stop ping session You can start and stop ping session with the handle returned by esp_ping_new_session. Note that, the ping session won't start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

Delete a ping session If a ping session won't be used any more, you can delete it with esp_ping_delete_session. Please make sure the ping session is in stop state (i.e. you have called esp_ping_stop before or the ping session has finished all the procedures) when you call this function.

Get runtime statistics As the example code above, you can call esp_ping_get_profile to get different runtime statistics of ping session in the callback function.

Application Example

ICMP echo example: protocols/icmp_echo

API Reference

Header File

- components/lwip/include/apps/ping/ping_sock.h

Functions

esp_err_t esp_ping_new_session(const esp_ping_config_t *config, const esp_ping_callbacks_t *cbs, esp_ping_handle_t *hdl_out)

Create a ping session.

Parameters

- config – ping configuration
- cbs – a bunch of callback functions invoked by internal ping task
- hdl_out – handle of ping session

Returns

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. configuration is null, etc)
- ESP_ERR_NO_MEM: out of memory
- ESP_FAIL: other internal error (e.g. socket error)
- ESP_OK: create ping session successfully, user can take the ping handle to do follow-on jobs

esp_err_t esp_ping_delete_session(esp_ping_handle_t hdl)

Delete a ping session.

Parameters hdl – handle of ping session

Returns

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: delete ping session successfully

```c
esp_err_t esp_ping_start(esp_ping_handle_t hdl)
    Start the ping session.
    Parameters hdl – handle of ping session
    Returns
        • ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
        • ESP_OK: start ping session successfully
```

```c
esp_err_t esp_ping_stop(esp_ping_handle_t hdl)
    Stop the ping session.
    Parameters hdl – handle of ping session
    Returns
        • ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
        • ESP_OK: stop ping session successfully
```

```c
esp_err_t esp_ping_get_profile(esp_ping_handle_t hdl, esp_ping_profile_t profile, void* data, uint32_t size)
    Get runtime profile of ping session.
    Parameters
        • hdl – handle of ping session
        • profile – type of profile
        • data – profile data
        • size – profile data size
    Returns
        • ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
        • ESP_ERR_INVALID_SIZE: the actual profile data size doesn’t match the “size” parameter
        • ESP_OK: get profile successfully
```

**Structures**

struct esp_ping_callbacks_t
    Type of “ping” callback functions.

    **Public Members**

    void *cb_args
        arguments for callback functions

    void (*on_ping_success)(esp_ping_handle_t hdl, void *args)
        Invoked by internal ping thread when received ICMP echo reply packet.

    void (*on_ping_timeout)(esp_ping_handle_t hdl, void *args)
        Invoked by internal ping thread when receive ICMP echo reply packet timeout.

    void (*on_ping_end)(esp_ping_handle_t hdl, void *args)
        Invoked by internal ping thread when a ping session is finished.

struct esp_ping_config_t
    Type of “ping” configuration.
Chapter 2. API Reference

Public Members

uint32_t count
   A “ping” session contains count procedures

uint32_t interval_ms
   Milliseconds between each ping procedure

uint32_t timeout_ms
   Timeout value (in milliseconds) of each ping procedure

uint32_t data_size
   Size of the data next to ICMP packet header

int tos
   Type of Service, a field specified in the IP header

int ttl
   Time to Live, a field specified in the IP header

ip_addr_t target_addr
   Target IP address, either IPv4 or IPv6

uint32_t task_stack_size
   Stack size of internal ping task

uint32_t task_prio
   Priority of internal ping task

uint32_t interface
   Netif index, interface=0 means NETIF_NO_INDEX

Macros

ESP_PING_DEFAULT_CONFIG()
   Default ping configuration.

ESP_PING_COUNT_INFINITE
   Set ping count to zero will ping target infinitely

Type Definitions

typedef void *esp_ping_handle_t
   Type of “ping” session handle.

Enumerations

gen esp_ping_profile_t
   Profile of ping session.
   Values:
enumerator **ESP_PING_PROF_SEQNO**
   Sequence number of a ping procedure

enumerator **ESP_PING_PROF_TOS**
   Type of service of a ping procedure

enumerator **ESP_PING_PROF_TTL**
   Time to live of a ping procedure

enumerator **ESP_PING_PROF_REQUEST**
   Number of request packets sent out

enumerator **ESP_PING_PROF_REPLY**
   Number of reply packets received

enumerator **ESP_PING_PROF_IPADDR**
   IP address of replied target

enumerator **ESP_PING_PROF_SIZE**
   Size of received packet

enumerator **ESP_PING_PROF_TIMEGAP**
   Elapsed time between request and reply packet

enumerator **ESP_PING_PROF_DURATION**
   Elapsed time of the whole ping session

### 2.2.12 mDNS Service

mDNS is a multicast UDP service that is used to provide local network service and host discovery.
The ESP-IDF component **mDNS** has been moved from ESP-IDF since version v5.0 to a separate repository:
- mDNS component on GitHub

**Hosted Documentation**

The documentation can be found on the link below:
- mDNS documentation

### 2.2.13 Mbed TLS

**Mbed TLS** is a C library that implements cryptographic primitives, X.509 certificate manipulation and the SSL/TLS and DTLS protocols. Its small code footprint makes it suitable for embedded systems.

**Note:** ESP-IDF uses a fork of Mbed TLS which includes a few patches (related to hardware routines of certain modules like bignum (MPI) and ECC) over vanilla Mbed TLS.

Mbed TLS supports SSL 3.0 up to TLS 1.3 and DTLS 1.0 to 1.2 communication by providing the following:
Chapter 2. API Reference

- TCP/IP communication functions: listen, connect, accept, read/write.
- SSL/TLS communication functions: init, handshake, read/write.
- X.509 functions: CRT, CRL and key handling
- Random number generation
- Hashing
- Encryption/decryption

**Note:** Mbed TLS is in the process of migrating all the documentation to a single place. In the meantime, users can find the documentation at the old Mbed TLS site.

Mbed TLS Support in ESP-IDF

Please find the information about the Mbed TLS versions present in different branches of ESP-IDF here.

**Note:** Please refer the ESP-IDF Migration Guide to migrate from Mbed TLS version 2.x to version 3.0 or greater.

Application Examples

Examples in ESP-IDF use ESP-TLS which provides a simplified API interface for accessing the commonly used TLS functionality.

Refer to the examples protocols/https_server/simple (Simple HTTPS server) and protocols/https_request (Make HTTPS requests) for more information.

If the Mbed TLS API is to be used directly, refer to the example protocols/https_mbedtls.

Alternatives

ESP-TLS acts as an abstraction layer over the underlying SSL/TLS library and thus has an option to use Mbed TLS or wolfSSL as the underlying library. By default, only Mbed TLS is available and used in ESP-IDF whereas wolfSSL is available publicly at https://github.com/espressif/esp-wolfSSL with the upstream submodule pointer.

Please refer to ESP-TLS: Underlying SSL/TLS Library Options docs for more information on this and comparison of Mbed TLS and wolfSSL.

Important Config Options

Following is a brief list of important config options accessible at Component Config -> mbedTLS. The full list of config options can be found here.

- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_2`: Support for TLS 1.2
- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`: Support for TLS 1.3
- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: Support for trusted root certificate bundle (more about this: ESP x509 Certificate Bundle)
- `CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS`: Support for TLS Session Resumption: Client session tickets
- `CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS`: Support for TLS Session Resumption: Server session tickets
- `CONFIG_MBEDTLS_HARDWARE_SHA`: Support for hardware SHA acceleration
- `CONFIG_MBEDTLS_HARDWARE_AES`: Support for hardware AES acceleration
- `CONFIG_MBEDTLS_HARDWARE_MPI`: Support for hardware MPI (bignum) acceleration
Note: Mbed TLS v3.0.0 and later support only TLS 1.2 and TLS 1.3 (SSL 3.0, TLS 1.0, TLS 1.1 and DTLS 1.0 are not supported). The support for TLS 1.3 is experimental and only supports the client-side. More information about this can be found out here.

Performance and Memory Tweaks

Reducing Heap Usage  The following table shows typical memory usage with different configs when the protocols/https_request example (with Server Validation enabled) was run with Mbed TLS as the SSL/TLS library.

<table>
<thead>
<tr>
<th>Mbed Test</th>
<th>TLS Related Configs</th>
<th>Heap Usage (approx.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>NA</td>
<td>42196 B</td>
</tr>
<tr>
<td>Enable SSL Variable Length</td>
<td>CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH</td>
<td>42120 B</td>
</tr>
<tr>
<td>Disable Keep Peer Certificate</td>
<td>CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE</td>
<td>38533 B</td>
</tr>
<tr>
<td>Enable Dynamic TX/RX Buffer</td>
<td>CONFIG_MBEDTLS_DYNAMIC_BUFFER CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA CONFIG_MBEDTLS_DYNAMIC_FREE_CA_CERT</td>
<td>22013 B</td>
</tr>
</tbody>
</table>

Note: These values are subject to change with change in configuration options and versions of Mbed TLS.

Reducing Binary Size  Under Component Config -> mbedTLS, there are multiple Mbed TLS features which are enabled by default but can be disabled if not needed to save code size. More information can about this can be found in Minimizing Binary Size docs.

Code examples for this API section are provided in the protocols directory of ESP-IDF examples.

2.2.14 IP Network Layer

Documentation for IP Network Layer protocols (below the Application Protocol layer) are provided in Networking APIs.

2.3 Bluetooth API

2.3.1 BT COMMON

BT GENERIC DEFINES

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_btdefs.h
Structures

struct esp_bt_uuid_t
UUID type.

Public Members

uint16_t len
UUID length, 16bit, 32bit or 128bit

uint16_t uuid16
16bit UUID

uint32_t uuid32
32bit UUID

uint8_t uuid128[ESP_UUID_LEN_128]
128bit UUID

union esp_bt_uuid_t::[anonymous] uuid
UUID

Macros

ESP_BLUEDROID_STATUS_CHECK (status)

ESP_BT_OCTET16_LEN

ESP_BT_OCTET8_LEN

ESP_DEFAULT_GATT_IF
Default GATT interface id.

ESP_BLE_PRIM_ADV_INT_MIN
Minimum advertising interval for undirected and low duty cycle directed advertising

ESP_BLE_PRIM_ADV_INT_MAX
Maximum advertising interval for undirected and low duty cycle directed advertising

ESP_BLE_CONN_INT_MIN
relate to BTM_BLE_CONN_INT_MIN in stack/btm_ble_api.h

ESP_BLE_CONN_INT_MAX
relate to BTM_BLE_CONN_INT_MAX in stack/btm_ble_api.h

ESP_BLE_CONN_LATENCY_MAX
relate to ESP_BLE_CONN_LATENCY_MAX in stack/btm_ble_api.h

ESP_BLE_CONN_SUP_TOUT_MIN
relate to BTM_BLE_CONN_SUP_TOUT_MIN in stack/btm_ble_api.h
Chapter 2. API Reference

ESP_BLE_CONN_SUP_TOUT_MAX
relate to ESP_BLE_CONN_SUP_TOUT_MAX in stack/btm_ble_api.h

ESP_BLE_CONN_PARAM_UNDEF

ESP_BLE_SCAN_PARAM_UNDEF

ESP_BLE_IS_VALID_PARAM (x, min, max)
Check the param is valid or not.

ESP_UUID_LEN_16

ESP_UUID_LEN_32

ESP_UUID_LEN_128

ESP_BD_ADDR_LEN
Bluetooth address length.

ESP_BLE_ENC_KEY_MASK
Used to exchange the encryption key in the init key & response key.

ESP_BLE_ID_KEY_MASK
Used to exchange the IRK key in the init key & response key.

ESP_BLE_CSR_KEY_MASK
Used to exchange the CSRK key in the init key & response key.

ESP_BLE_LINK_KEY_MASK
Used to exchange the link key(this key just used in the BLE & BR/EDR coexist mode) in the init key & response key.

ESP_APP_ID_MIN
Minimum of the application id.

ESP_APP_ID_MAX
Maximum of the application id.

ESP_BD_ADDR_STR

ESP_BD_ADDR_HEX (addr)

Type Definitions
typedef uint8_t esp_bt_octet16_t[ESP_BT_OCTET16_LEN]
typedef uint8_t esp_bt_octet8_t[ESP_BT_OCTET8_LEN]
typedef uint8_t esp_link_key[ESP_BT_OCTET16_LEN]
typedef uint8_t esp_bd_addr_t[ESP_BD_ADDR_LEN]
  Bluetooth device address.

typedef uint8_t esp_ble_key_mask_t

**Enumerations**

enum esp_bt_status_t
  Status Return Value.
  *Values:*

  - enumerator ESP_BT_STATUS_SUCCESS
  - enumerator ESP_BT_STATUS_FAIL
  - enumerator ESP_BT_STATUS_NOT_READY
  - enumerator ESP_BT_STATUS_NOMEM
  - enumerator ESP_BT_STATUS_BUSY
  - enumerator ESP_BT_STATUS_DONE
  - enumerator ESP_BT_STATUS_UNSUPPORTED
  - enumerator ESP_BT_STATUS_PARM_INVALID
  - enumerator ESP_BT_STATUS_UNHANDLED
  - enumerator ESP_BT_STATUS_AUTH_FAILURE
  - enumerator ESP_BT_STATUS_RMT_DEV_DOWN
  - enumerator ESP_BT_STATUS_AUTH_REJECTED
  - enumerator ESP_BT_STATUS_INVALID_STATIC_RAND_ADDR
  - enumerator ESP_BT_STATUS_PENDING
  - enumerator ESP_BT_STATUS_UNACCEPT_CONN_INTERVAL
  - enumerator ESP_BT_STATUS_PARAM_OUT_OF_RANGE
  - enumerator ESP_BT_STATUS_TIMEOUT
enumerator ESP_BT_STATUS_PEER_LE_DATA_LEN_UNSUPPORTED
enumerator ESP_BT_STATUS_CONTROL_LE_DATA_LEN_UNSUPPORTED
enumerator ESP_BT_STATUS_ERR_ILLEGAL_PARAMETER_FMT
enumerator ESP_BT_STATUS_MEMORY_FULL
enumerator ESP_BT_STATUS_EIR_TOO_LARGE

enum esp_bt_dev_type_t
    Bluetooth device type.
    Values:
    enumerator ESP_BT_DEVICE_TYPE_BREDR
    enumerator ESP_BT_DEVICE_TYPE_BLE
    enumerator ESP_BT_DEVICE_TYPE_DUMO

enum esp_ble_addr_type_t
    BLE device address type.
    Values:
    enumerator BLE_ADDR_TYPE_PUBLIC
    enumerator BLE_ADDR_TYPE_RANDOM
    enumerator BLE_ADDR_TYPE_RPA_PUBLIC
    enumerator BLE_ADDR_TYPE_RPA_RANDOM

enum esp_ble_wl_addr_type_t
    white list address type
    Values:
    enumerator BLE_WL_ADDR_TYPE_PUBLIC
    enumerator BLE_WL_ADDR_TYPE_RANDOM

BT MAIN API

API Reference

Header File
    • components/bt/host/bluedroid/api/include/api/esp_bt_main.h
Functions

`esp_bluedroid_status_t esp_bluedroid_get_status(void)`

Get bluetooth stack status.

Returns

- Bluetooth stack status

`esp_err_t esp_bluedroid_enable(void)`

Enable bluetooth, must after esp_bluedroid_init().

Returns

- ESP_OK: Succeed
- Other: Failed

`esp_err_t esp_bluedroid_disable(void)`

Disable bluetooth, must prior to esp_bluedroid_deinit().

Returns

- ESP_OK: Succeed
- Other: Failed

`esp_err_t esp_bluedroid_init(void)`

Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

Returns

- ESP_OK: Succeed
- Other: Failed

`esp_err_t esp_bluedroid_deinit(void)`

Deinit and free the resource for bluetooth, must be after every bluetooth stuff.

Returns

- ESP_OK: Succeed
- Other: Failed

Enumerations

```
enum esp_bluedroid_status_t
{
    ESP_BLUE_DROID_STATUS_UNINITIALIZED, // Bluetooth not initialized
    ESP_BLUE_DROID_STATUS_INITIALIZED,    // Bluetooth initialized but not enabled
    ESP_BLUE_DROID_STATUS_ENABLED        // Bluetooth initialized and enabled
};
```

BT DEVICE APIs

Overview

Bluetooth device reference APIs.

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_bt_device.h
Chapter 2. API Reference

Functions

const uint8_t *esp_bt_dev_get_address (void)
Get bluetooth device address. Must use after “esp_bluedroid_enable”.

Returns bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled

esp_err_t esp_bt_dev_set_device_name (const char *name)
Set bluetooth device name. This function should be called after esp_bluedroid_enable() completes successfully.
A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

Parameters name –[in] : device name to be set

Returns

• ESP_OK : Succeed
• ESP_ERR_INVALID_ARG: if name is NULL pointer or empty, or string length out of limit
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL : others

2.3.2 BT LE

GAP API

Application Example Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

• This is a SMP security client demo and its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.
  – bluetooth/bluedroid/ble/gatt_security_client
  – GATT Security Client Example Walkthrough
• This is a SMP security server demo and its tutorial. This demo initiates its security parameters and acts as a GATT server, which can send a pair request to the peer device and then complete the encryption procedure.
  – bluetooth/bluedroid/ble/gatt_security_server
  – GATT Security Server Example Walkthrough

API Reference

Header File

• components/bt/host/bluedroid/api/include/api/esp_gap_ble_api.h

Functions

esp_err_t esp_ble_gap_register_callback (esp_gap_ble_cb_t callback)
This function is called to occur gap event, such as scan result.

Parameters callback –[in] callback function

Returns

• ESP_OK : success
• other : failed

esp_err_t esp_ble_gap_config_adv_data (esp_ble_adv_data_t *adv_data)
This function is called to override the BTA default ADV parameters.

Parameters adv_data –[in] Pointer to User defined ADV data structure. This memory space can not be freed until callback of config_adv_data is received.

Returns

• ESP_OK : success
• other : failed
**esp_err_t esp_ble_gap_set_scan_params (esp_ble_scan_params_t *scan_params)**

This function is called to set scan parameters.

**Parameters** scan_params - [in] Pointer to User defined scan_params data structure. This memory space cannot be freed until callback of set_scan_params

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_start_scanning (uint32_t duration)**

This procedure keep the device scanning the peer device which advertising on the air.

**Parameters** duration - [in] Keeping the scanning time, the unit is second.

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_stop_scanning (void)**

This function call to stop the device scanning the peer device which advertising on the air.

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_start_advertising (esp_ble_adv_params_t *adv_params)**

This function is called to start advertising.

**Parameters** adv_params - [in] pointer to User defined adv_params data structure.

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_stop_advertising (void)**

This function is called to stop advertising.

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_update_conn_params (esp_ble_conn_update_params_t *params)**

Update connection parameters, can only be used when connection is up.

**Parameters** params - [in] - connection update parameters

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_set_pkt_data_len (esp_bd_addr_t remote_device, uint16_t tx_data_length)**

This function is to set maximum LE data packet size.

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_set_rand_addr (esp_bd_addr_t rand_addr)**

This function sets the static Random Address and Non-Resolvable Private Address for the application.

**Parameters** rand_addr - [in] the random address which should be setting

**Returns**
- ESP_OK : success
- other : failed
**esp_err_t esp_ble_gap_clear_rand_addr**(void)

This function clears the random address for the application.

**Returns**

- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_config_local_privacy**(bool privacy_enable)

Enable/disable privacy on the local device.

**Parameters**

privacy_enable - [in] - enable/disable privacy on remote device.

**Returns**

- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_config_local_icon**(uint16_t icon)

set local gap appearance icon

**Parameters**

icon - [in] - External appearance value, these values are defined by the Bluetooth SIG, please refer to https://specificationrefs.bluetooth.com/assigned-values/Appearance%20Values.pdf

**Returns**

- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_update_whitelist**(bool add_remove, esp_bd_addr_t remote_bda, esp_ble_wl_addr_type_t wl_addr_type)

Add or remove device from white list.

**Parameters**

- add_remove - [in] the value is true if added the ble device to the white list, and false remove to the white list.
- remote_bda - [in] the remote device address add/remove from the white list.
- wl_addr_type - [in] whitelist address type

**Returns**

- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_clear_whitelist**(void)

Clear all white list.

**Returns**

- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_get_whitelist_size**(uint16_t *length)

Get the whitelist size in the controller.

**Parameters**

length - [out] the white list length.

**Returns**

- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_set_prefer_conn_params**(esp_bd_addr_t bd_addr, uint16_t min_conn_int, uint16_t max_conn_int, uint16_t slave_latency, uint16_t supervision_tout)

This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

**Parameters**

- bd_addr - [in] BD address of the peripheral
- min_conn_int - [in] minimum preferred connection interval
- max_conn_int - [in] maximum preferred connection interval
• slave_latency - [in] preferred slave latency
• supervision_tout - [in] preferred supervision timeout

Returns
• ESP_OK : success
• other : failed

*esp_err_t* esp_ble_gap_set_device_name (const char *name)

Set device name to the local device.

Parameters name - [in] - device name.

Returns
• ESP_OK : success
• other : failed

*esp_err_t* esp_ble_gap_get_local_used_addr (esp_bd_addr_t local_used_addr, uint8_t *addr_type)

This function is called to get local used address and address type. uint8_t *esp_bt_dev_get_address(void) get the public address.

Parameters
• local_used_addr - [in] - current local used ble address (six bytes)
• addr_type - [in] - ble address type

Returns
• ESP_OK : success
• other : failed

uint8_t *esp_ble_resolve_adv_data (uint8_t *adv_data, uint8_t type, uint8_t *length)

This function is called to get ADV data for a specific type.

Parameters
• adv_data - [in] - pointer of ADV data which to be resolved
• type - [in] - finding ADV data type
• length - [out] - return the length of ADV data not including type

Returns
• ESP_OK : success
• other : failed

*esp_err_t* esp_ble_gap_config_adv_data_raw (uint8_t *raw_data, uint32_t raw_data_len)

This function is called to set raw advertising data. User need to fill ADV data by self.

Parameters
• raw_data - [in] : raw advertising data
• raw_data_len - [in] : raw advertising data length, less than 31 bytes

Returns
• ESP_OK : success
• other : failed

*esp_err_t* esp_ble_gap_config_scan_rsp_data_raw (uint8_t *raw_data, uint32_t raw_data_len)

This function is called to set raw scan response data. User need to fill scan response data by self.

Parameters
• raw_data - [in] : raw scan response data
• raw_data_len - [in] : raw scan response data length, less than 31 bytes

Returns
• ESP_OK : success
• other : failed

*esp_err_t* esp_ble_gap_read_rssi (esp_bd_addr_t remote_addr)

This function is called to read the RSSI of remote device. The address of link policy results are returned in the gap callback function with ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT event.

Parameters remote_addr - [in] - The remote connection device address.

Returns
• ESP_OK : success
• other : failed
**esp_err_t esp_ble_gap_add_duplicate_scan_exceptional_device** *(esp_ble_duplicate_exceptional_info_type_t type, esp_duplicate_info_t device_info)*

This function is called to add a device info into the duplicate scan exceptional list.

**Parameters**
- **type** - [in] device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t. When type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV, device_info is invalid.
- **device_info** - [in] the device information.

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_remove_duplicate_scan_exceptional_device** *(esp_ble_duplicate_exceptional_info_type_t type, esp_duplicate_info_t device_info)*

This function is called to remove a device info from the duplicate scan exceptional list.

**Parameters**
- **type** - [in] device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t. When type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV, device_info is invalid.
- **device_info** - [in] the device information.

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_clean_duplicate_scan_exceptional_list** *(esp_duplicate_scan_exceptional_list_type_t list_type)*

This function is called to clean the duplicate scan exceptional list. This API will delete all device information in the duplicate scan exceptional list.

**Parameters**
- **list_type** - [in] duplicate scan exceptional list type, the value can be one or more of esp_duplicate_scan_exceptional_list_type_t.

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_set_security_param** *(esp_ble_sm_param_t param_type, void *value, uint8_t len)*

Set a GAP security parameter value. Overrides the default value.

Secure connection is highly recommended to avoid some major vulnerabilities like 'Impersonation in the Pin Pairing Protocol' (CVE-2020-26555) and 'Authentication of the LE Legacy Pairing Protocol'.

To accept only 'secure connection mode', it is necessary do as:

---

1. Set bit 'ESP_LE_AUTH_REQ_SC_ONLY' ('param_type' is 'ESP_BLE_SM_AUTHEN_REQ_MODE'), bit 'ESP_LE_AUTH_BOND' and bit 'ESP_LE_AUTH_REQ_MITM' is optional as required.

---

2. Set to 'ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE' ('param_type' is 'ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH').
Parameters
- `param_type` [in]: the type of the param which to be set
- `value` [in]: the param value
- `len` [in]: the length of the param value

Returns
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_security_rsp(esp_bd_addr_t bd_addr, bool accept)**
Grant security request access.

Parameters
- `bd_addr` [in]: BD address of the peer
- `accept` [in]: accept the security request or not

Returns
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_set_encryption(esp_bd_addr_t bd_addr, esp_ble_sec_act_t sec_act)**
Set a gap parameter value. Use this function to change the default GAP parameter values.

Parameters
- `bd_addr` [in]: the address of the peer device need to encryption
- `sec_act` [in]: This is the security action to indicate what kind of BLE security level is required for the BLE link if the BLE is supported

Returns
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_passkey_reply(esp_bd_addr_t bd_addr, bool accept, uint32_t passkey)**
Reply the key value to the peer device in the legacy connection stage.

Parameters
- `bd_addr` [in]: BD address of the peer
- `accept` [in]: passkey entry successful or declined.
- `passkey` [in]: passkey value, must be a 6 digit number, can be lead by 0.

Returns
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_confirm_reply(esp_bd_addr_t bd_addr, bool accept)**
Reply the confirm value to the peer device in the secure connection stage.

Parameters
- `bd_addr` [in]: BD address of the peer device
- `accept` [in]: numberstocomparearesameordifferent.

Returns
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_remove_bond_device(esp_bd_addr_t bd_addr)**
Removes a device from the security database list of peer device. It manages unpairing event while connected.

Parameters
- `bd_addr` [in]: BD address of the peer device

Returns
- ESP_OK: success
- other: failed

**int esp_ble_get_bond_device_num(void)**
Get the device number from the security database list of peer device. It will return the device bonded number immediately.

Returns
- >= 0: bonded devices number.
- ESP_FAIL: failed

**esp_err_t esp_ble_get_bond_device_list(int *dev_num, esp_ble_bond_dev_t *dev_list)**
Get the device from the security database list of peer device. It will return the device bonded information immediately.

**Parameters**

- `dev_num` - [inout] Indicate the `dev_list` array(buffer) size as input. If `dev_num` is large enough, it means the actual number as output. Suggest that `dev_num` value equal to `esp_ble_get_bond_device_num()`.
- `dev_list` - [out] an array(buffer) of `esp_ble_bond_dev_t` type. Use for storing the bonded devices address. The `dev_list` should be allocated by who call this API.

**Returns**

- ESP_OK : success
- other : failed

`esp_err_t esp_ble_oob_req_reply (esp_bd_addr_t bd_addr, uint8_t* TK, uint8_t len)`

This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_OOB_REQ_EVT.

**Parameters**

- `bd_addr` - [in] BD address of the peer device.
- `TK` - [in] TK value, the TK value shall be a 128-bit random number
- `len` - [in] length of tk, should always be 128-bit

**Returns**

- ESP_OK : success
- other : failed

`esp_err_t esp_ble_gap_disconnect (esp_bd_addr_t remote_device)`

This function is to disconnect the physical connection of the peer device gattc may have multiple virtual GATT server connections when multiple app_id registered. `esp_ble_gattc_close (esp_gatt_if_t gattc_if, uint16_t conn_id)` only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. `esp_ble_gap_disconnect(esp_bd_addr_t remote_device)` disconnect the physical connection directly.

**Parameters**

- `remote_device` - [in] : BD address of the peer device

**Returns**

- ESP_OK : success
- other : failed

`esp_err_t esp_ble_get_current_conn_params (esp_bd_addr_t bd_addr, esp_gap_conn_params_t *conn_params)`

This function is called to read the connection parameters information of the device.

**Parameters**

- `bd_addr` - [in] BD address of the peer device.
- `conn_params` - [out] the connection parameters information

**Returns**

- ESP_OK : success
- other : failed

`esp_err_t esp_gap_ble_set_channels (esp_gap_ble_channels channels)`

BLE set channels.

**Parameters**

- `channels` - [in] The n th such field (in the range 0 to 36) contains the value for the link layer channel index n. 0 means channel n is bad. 1 means channel n is unknown. The most significant bits are reserved and shall be set to 0. At least one channel shall be marked as unknown.

**Returns**

- ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

`esp_err_t esp_gap_ble_set_authorization (esp_bd_addr_t bd_addr, bool authorize)`

This function is called to authorized a link after Authentication(MITM protection)

**Parameters**

- `bd_addr` - [in] BD address of the peer device.
- `authorize` - [out] Authorized the link or not.

**Returns**

- ESP_OK : success
- other : failed

`esp_err_t esp_ble_gap_read_phy (esp_bd_addr_t bd_addr)`
This function is used to read the current transmitter PHY and receiver PHY on the connection identified by remote address.

**Parameters**

- `bd_addr` [in]: BD address of the peer device

**Returns**

- `ESP_OK`: success
- `other`: failed

```c
esp_err_t esp_ble_gap_set_preferred_default_phy(esp_ble_gap_phy_mask_t tx_phy_mask,
                                             esp_ble_gap_phy_mask_t rx_phy_mask)
```

This function is used to allows the Host to specify its preferred values for the transmitter PHY and receiver PHY to be used for all subsequent connections over the LE transport.

**Parameters**

- `tx_phy_mask` [in]: indicates the transmitter PHYs that the Host prefers the Controller to use
- `rx_phy_mask` [in]: indicates the receiver PHYs that the Host prefers the Controller to use

**Returns**

- `ESP_OK`: success
- `other`: failed

```c
esp_err_t esp_ble_gap_set_preferred_phy(esp_bd_addr_t bd_addr,
                                        esp_ble_gap_all_phys_t all_phys_mask,
                                        esp_ble_gap_phy_mask_t tx_phy_mask,
                                        esp_ble_gap_phy_mask_t rx_phy_mask,
                                        esp_ble_gap_prefer_phy_options_t phy_options)
```

This function is used to set the PHY preferences for the connection identified by the remote address. The Controller might not be able to make the change (e.g., because the peer does not support the requested PHY) or may decide that the current PHY is preferable.

**Parameters**

- `bd_addr` [in]: remote address
- `all_phys_mask` [in]: a bit field that allows the Host to specify
- `tx_phy_mask` [in]: a bit field that indicates the transmitter PHYs that the Host prefers the Controller to use
- `rx_phy_mask` [in]: a bit field that indicates the receiver PHYs that the Host prefers the Controller to use
- `phy_options` [in]: a bit field that allows the Host to specify options for PHYs

**Returns**

- `ESP_OK`: success
- `other`: failed

```c
esp_err_t esp_ble_gap_ext_adv_set_rand_addr(uint8_t instance, esp_bd_addr_t rand_addr)
```

This function is used by the Host to set the random device address specified by the Random_Address parameter.

**Parameters**

- `instance` [in]: Used to identify an advertising set
- `rand_addr` [in]: Random Device Address

**Returns**

- `ESP_OK`: success
- `other`: failed

```c
esp_err_t esp_ble_gap_ext_adv_set_params(uint8_t instance, const esp_ble_gap_ext_adv_params_t *params)
```

This function is used by the Host to set the advertising parameters.

**Parameters**

- `instance` [in]: identifies the advertising set whose parameters are being configured.
- `params` [in]: advertising parameters

**Returns**

- `ESP_OK`: success
- `other`: failed

```c
esp_err_t esp_ble_gap_config_ext_adv_data_raw(uint8_t instance, uint16_t length, const uint8_t *data)
```

This function is used to set the data used in advertising PDUs that have a data field.
Chapter 2. API Reference

Parameters
• instance [in]: identifies the advertising set whose data are being configured
• length [in]: data length
• data [in]: data information

Returns
- ESP_OK: success
• other: failed

dntf err_t esp_ble_gap_config_ext_scan_rsp_data_raw(uint8_t instance, uint16_t length, const uint8_t *scan_rsp_data)

This function is used to provide scan response data used in scanning response PDUs.

Parameters
• instance [in]: identifies the advertising set whose response data are being configured.
• length [in]: response data length
• scan_rsp_data [in]: response data information

Returns
- ESP_OK: success
• other: failed

dntf err_t esp_ble_gap_ext_adv_start(uint8_t num_adv, const esp_ble_gap_ext_adv_t *ext_adv)

This function is used to request the Controller to enable one or more advertising sets using the advertising sets identified by the instance parameter.

Parameters
• num_adv [in]: Number of advertising sets to enable or disable
• ext_adv [in]: adv parameters

Returns
- ESP_OK: success
• other: failed

dntf err_t esp_ble_gap_ext_adv_stop(uint8_t num_adv, const uint8_t *ext_adv_inst)

This function is used to request the Controller to disable one or more advertising sets using the advertising sets identified by the instance parameter.

Parameters
• num_adv [in]: Number of advertising sets to enable or disable
• ext_adv_inst [in]: ext adv instance

Returns
- ESP_OK: success
• other: failed

dntf err_t esp_ble_gap_ext_adv_set_remove(uint8_t instance)

This function is used to remove an advertising set from the Controller.

Parameters instance [in]: Used to identify an advertising set

Returns
- ESP_OK: success
• other: failed

dntf err_t esp_ble_gap_ext_adv_set_clear(void)

This function is used to remove all existing advertising sets from the Controller.

Returns
- ESP_OK: success
• other: failed

dntf err_t esp_ble_gap_periodic_adv_set_params(uint8_t instance, const esp_ble_gap_periodic_adv_params_t *params)

This function is used by the Host to set the parameters for periodic advertising.

Parameters
• instance [in]: identifies the advertising set whose periodic advertising parameters are being configured.
• params [in]: periodic adv parameters

Returns
- ESP_OK: success
• other: failed
**esp_err_t esp_ble_gap_config_periodic_adv_data_raw** (uint8_t instance, uint16_t length, const uint8_t *data)

This function is used to set the data used in periodic advertising PDUs.

**Parameters**
- **instance** [in]: identifies the advertising set whose periodic advertising parameters are being configured.
- **length** [in]: the length of periodic data
- **data** [in]: periodic data information

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_periodic_adv_start** (uint8_t instance)

This function is used to request the Controller to enable the periodic advertising for the advertising set specified.

**Parameters**
- **instance** [in]: Used to identify an advertising set

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_periodic_adv_stop** (uint8_t instance)

This function is used to request the Controller to disable the periodic advertising for the advertising set specified.

**Parameters**
- **instance** [in]: Used to identify an advertising set

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_set_ext_scan_params** (const esp_ble_ext_scan_params_t *params)

This function is used to set the extended scan parameters to be used on the advertising channels.

**Parameters**
- **params** [in]: scan parameters

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_start_ext_scan** (uint32_t duration, uint16_t period)

This function is used to enable scanning.

**Parameters**
- **duration** [in]: Scan duration
- **period** [in]: Time interval from when the Controller started its last Scan Duration until it begins the subsequent Scan Duration.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_stop_ext_scan** (void)

This function is used to disable scanning.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_periodic_adv_create_sync** (const esp_ble_gap_periodic_adv_sync_params_t *params)

This function is used to synchronize with periodic advertising from an advertiser and begin receiving periodic advertising packets.

**Parameters**
- **params** [in]: sync parameters

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_periodic_adv_sync_cancel** (void)

This function is used to cancel the LE_Periodic_Advertising_Create_Sync command while it is pending.

**Returns**
- ESP_OK: success
- other: failed
**esp_err_t** `esp_ble_gap_periodic_adv_sync_terminate` *(uint16_t sync_handle)*

This function is used to stop reception of the periodic advertising identified by the Sync Handle parameter.

**Parameters**
- `sync_handle` - [in]: identify the periodic advertiser

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t** `esp_ble_gap_periodic_adv_add_dev_to_list` *(esp_ble_addr_type_t addr_type, esp_bd_addr_t addr, uint8_t sid)*

This function is used to add a single device to the Periodic Advertiser list stored in the Controller.

**Parameters**
- `addr_type` - [in]: address type
- `addr` - [in]: Device Address
- `sid` - [in]: Advertising SID subfield in the ADI field used to identify the Periodic Advertising

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t** `esp_ble_gap_periodic_adv_remove_dev_from_list` *(esp_ble_addr_type_t addr_type, esp_bd_addr_t addr, uint8_t sid)*

This function is used to remove one device from the list of Periodic Advertisers stored in the Controller. Removals from the Periodic Advertisers List take effect immediately.

**Parameters**
- `addr_type` - [in]: address type
- `addr` - [in]: Device Address
- `sid` - [in]: Advertising SID subfield in the ADI field used to identify the Periodic Advertising

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t** `esp_ble_gap_periodic_adv_clear_dev` *(void)*

This function is used to remove all devices from the list of Periodic Advertisers in the Controller.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t** `esp_ble_gap_prefer_ext_connect_params_set` *(esp_bd_addr_t addr, esp_ble_gap_phy_mask_t phy_mask, const esp_ble_gap_conn_params_t *phy_1m_conn_params, const esp_ble_gap_conn_params_t *phy_2m_conn_params, const esp_ble_gap_conn_params_t *phy_coded_conn_params)*

This function is used to set aux connection parameters.

**Parameters**
- `addr` - [in]: device address
- `phy_mask` - [in]: indicates the PHY(s) on which the advertising packets should be received on the primary advertising channel and the PHYs for which connection parameters have been specified.
- `phy_1m_conn_params` - [in]: Scan connectable advertisements on the LE 1M PHY. Connection parameters for the LE 1M PHY are provided.
- `phy_2m_conn_params` - [in]: Connection parameters for the LE 2M PHY are provided.
- `phy_coded_conn_params` - [in]: Scan connectable advertisements on the LE Coded PHY. Connection parameters for the LE Coded PHY are provided.

**Returns**
- ESP_OK: success
- other: failed

```

**Public Members**

- `esp_bt_status_t status`
  - Indicate the add or remove whitelist operation success status

- `esp_ble_wl_operation_t wl_operation`
  - The value is ESP_BLE_WHITELIST_ADD if add address to whitelist operation success, ESP_BLE_WHITELIST_REMOVE if remove address from the whitelist operation success

---
Chapter 2. API Reference

Structures

struct esp_ble_adv_params_t
Advertising parameters.

Public Members

uint16_t adv_int_min
Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

uint16_t adv_int_max
Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

esp_ble_adv_type_t adv_type
Advertising type

esp_ble_addr_type_t own_addr_type
Owner bluetooth device address type

esp_bd_addr_t peer_addr
Peer device bluetooth device address

esp_ble_addr_type_t peer_addr_type
Peer device bluetooth device address type, only support public address type and random address type

esp_ble_adv_channel_t channel_map
Advertising channel map

esp_ble_adv_filter_t adv_filter_policy
Advertising filter policy

struct esp_ble_adv_data_t
Advertising data content, according to “Supplement to the Bluetooth Core Specification”.

Public Members

bool set_scan_rsp
Set this advertising data as scan response or not

bool include_name
Advertising data include device name or not

bool include_txpower
Advertising data include TX power
int **min_interval**
Advertising data show slave preferred connection min interval. The connection interval in the following manner: `connIntervalMin = Conn_Interval_Min * 1.25 ms` Conn_Interval_Min range: 0x0006 to 0x0C80 Value of 0xFFFF indicates no specific minimum. Values not defined above are reserved for future use.

int **max_interval**
Advertising data show slave preferred connection max interval. The connection interval in the following manner: `connIntervalMax = Conn_Interval_Max * 1.25 ms` Conn_Interval_Max range: 0x0006 to 0x0C80 Conn_Interval_Max shall be equal to or greater than the Conn_Interval_Min. Value of 0xFFFF indicates no specific maximum. Values not defined above are reserved for future use.

int **appearance**
External appearance of device

uint16_t **manufacturer_len**
Manufacturer data length

uint8_t **p_manufacturer_data**
Manufacturer data point

uint16_t **service_data_len**
Service data length

uint8_t **p_service_data**
Service data point

uint16_t **service_uuid_len**
Service uuid length

uint8_t **p_service_uuid**
Service uuid array point

uint8_t **flag**
Advertising flag of discovery mode, see BLE_ADV_DATA_FLAG detail

struct esp_ble_scan_params_t
Ble scan parameters.

**Public Members**

*esp_ble_scan_type_t** scan_type
Scan type

*esp_ble_addr_type_t** own_addr_type
Owner address type

*esp_ble_scan_filter_t** scan_filter_policy
Scan filter policy
**uint16_t** `scan_interval`

Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10.24 seconds

**uint16_t** `scan_window`

Scan window. The duration of the LE scan. LE_Scan_Window shall be less than or equal to LE_Scan_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10240 msec

`esp_ble_scan_duplicate_t` `scan_duplicate`

The Scan_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (BLE_SCAN_DUPLICATE_ENABLE) to the Host, or if the Link Layer should generate advertising reports for each packet received

**struct esp_gap_conn_params_t**

connection parameters information

**Public Members**

**uint16_t** `interval`

connection interval

**uint16_t** `latency`

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

**uint16_t** `timeout`

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N * 10 msec Time Range: 100 msec to 32 seconds

**struct esp_ble_conn_update_params_t**

Connection update parameters.

**Public Members**

`esp_bd_addr_t` `bda`

Bluetooth device address

**uint16_t** `min_int`

Min connection interval

**uint16_t** `max_int`

Max connection interval

**uint16_t** `latency`

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3
uint16_t timeout
  Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
  Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct esp_ble_pkt_data_length_params_t
  BLE pkt date length keys.

  Public Members

  uint16_t rx_len
    pkt rx data length value

  uint16_t tx_len
    pkt tx data length value

struct esp_ble_penc_keys_t
  BLE encryption keys.

  Public Members

  esp_bt_octet16_t ltk
    The long term key

  esp_bt_octet8_t rand
    The random number

  uint16_t ediv
    The ediv value

  uint8_t sec_level
    The security level of the security link

  uint8_t key_size
    The key size(7~16) of the security link

struct esp_ble_pcsrk_keys_t
  BLE CSRK keys.

  Public Members

  uint32_t counter
    The counter

  esp_bt_octet16_t csrk
    The csrk key
uint8_t sec_level
    The security level

struct esp_ble_pid_keys_t
    BLE pid keys.

Public Members

  esp_bt_octet16_t irk
    The irk value

  esp_ble_addr_type_t addr_type
    The address type

  esp_bd_addr_t static_addr
    The static address

struct esp_ble_lenc_keys_t
    BLE Encryption reproduction keys.

Public Members

  esp_bt_octet16_t ltk
    The long term key

uint16_t div
    The div value

uint8_t key_size
    The key size of the security link

uint8_t sec_level
    The security level of the security link

struct esp_ble_lcsrk_keys
    BLE SRK keys.

Public Members

  uint32_t counter
    The counter value

uint16_t div
    The div value
uint8_t sec_level
   The security level of the security link

esp_bt_octet16_t csrk
   The csrk key value

struct esp_ble_sec_key_notif_t
   Structure associated with ESP_KEY_NOTIF_EVT.

   **Public Members**

   esp_bd_addr_t bd_addr
      peer address

   uint32_t passkey
      the numeric value for comparison. If just_works, do not show this number to UI

struct esp_ble_sec_req_t
   Structure of the security request.

   **Public Members**

   esp_bd_addr_t bd_addr
      peer address

struct esp_ble_bond_key_info_t
   struct type of the bond key information value

   **Public Members**

   esp_ble_key_mask_t key_mask
      the key mask to indicate which key is present

   esp_ble_penc_keys_t penc_key
      received peer encryption key

   esp_ble_pcsrk_keys_t pcsrk_key
      received peer device SRK

   esp_ble_pid_keys_t pid_key
      peer device ID key

struct esp_ble_bond_dev_t
   struct type of the bond device value
Public Members

```c
esp_bd_addr_t bd_addr
   peer address
```

```c
esp_ble_bond_key_info_t bond_key
   the bond key information
```

```c
struct esp_ble_key_t
   union type of the security key value
```

Public Members

```c
esp_bd_addr_t bd_addr
   peer address
```

```c
esp_ble_key_type_t key_type
   key type of the security link
```

```c
esp_ble_key_value_t p_key_value
   the pointer to the key value
```

```c
struct esp_ble_local_id_keys_t
   structure type of the ble local id keys value
```

Public Members

```c
esp_bt_octet16_t ir
   the 16 bits of the ir value
```

```c
esp_bt_octet16_t irk
   the 16 bits of the ir key value
```

```c
esp_bt_octet16_t dhk
   the 16 bits of the dh key value
```

```c
struct esp_ble_auth_cmpl_t
   Structure associated with ESP_AUTH_CMPL_EVT.
```

Public Members

```c
esp_bd_addr_t bd_addr
   BD address peer device.
```

```c
bool key_present
   Valid link key value in key element
```
esp_link_key key
  Link key associated with peer device.

uint8_t key_type
  The type of Link Key

bool success
  TRUE of authentication succeeded, FALSE if failed.

uint8_t fail_reason
  The HCI reason/error code for when success=FALSE

esp_ble_addr_type_t addr_type
  Peer device address type

esp_bt_dev_type_t dev_type
  Device type

esp_ble_auth_req_t auth_mode
  authentication mode

struct esp_ble_gap_ext_adv_params_t
  ext adv parameters

Public Members

esp_ble_ext_adv_type_mask_t type
  ext adv type

uint32_t interval_min
  ext adv minimum interval

uint32_t interval_max
  ext adv maximum interval

esp_ble_adv_channel_t channel_map
  ext adv channel map

esp_ble_addr_type_t own_addr_type
  ext adv own address type

esp_ble_addr_type_t peer_addr_type
  ext adv peer address type

esp_bd_addr_t peer_addr
  ext adv peer address
```c
esp_ble_adv_filter_t filter_policy
  ext adv filter policy

int8_t tx_power
  ext adv tx power

esp_ble_gap_pri_phy_t primary_phy
  ext adv primary phy

uint8_t max_skip
  ext adv maximum skip

esp_ble_gap_phy_t secondary_phy
  ext adv secondary phy

uint8_t sid
  ext adv sid

bool scan_req_notif
  ext adv scan request event notify

struct esp_ble_ext_scan_cfg_t
  ext scan config

Public Members

esp_ble_scan_type_t scan_type
  ext scan type

uint16_t scan_interval
  ext scan interval

uint16_t scan_window
  ext scan window

struct esp_ble_ext_scan_params_t
  ext scan parameters

Public Members

esp_ble_addr_type_t own_addr_type
  ext scan own address type

esp_ble_scan_filter_t filter_policy
  ext scan filter policy
```
\texttt{esp\_ble\_scan\_duplicate\_t \textbf{scan\_duplicate}}

ext scan duplicate scan

\texttt{esp\_ble\_ext\_scan\_cfg\_mask\_t \textbf{cfg\_mask}}

ext scan config mask

\texttt{esp\_ble\_ext\_scan\_cfg\_t \textbf{uncoded\_cfg}}

ext scan uncoded config parameters

\texttt{esp\_ble\_ext\_scan\_cfg\_t \textbf{coded\_cfg}}

ext scan coded config parameters

\texttt{struct esp\_ble\_gap\_conn\_params\_t}

create extend connection parameters

\textbf{Public Members}

\texttt{uint16\_t \textbf{scan\_interval}}

init scan interval

\texttt{uint16\_t \textbf{scan\_window}}

init scan window

\texttt{uint16\_t \textbf{interval\_min}}

minimum interval

\texttt{uint16\_t \textbf{interval\_max}}

maximum interval

\texttt{uint16\_t \textbf{latency}}

ext scan type

\texttt{uint16\_t \textbf{supervision\_timeout}}

connection supervision timeout

\texttt{uint16\_t \textbf{min\_ce\_len}}

minimum ce length

\texttt{uint16\_t \textbf{max\_ce\_len}}

maximum ce length

\texttt{struct esp\_ble\_gap\_ext\_adv\_t}

extend adv enable parameters

\textbf{Public Members}
`uint8_t instance`  
advertising handle

`int duration`  
advertising duration

`int max_events`  
maximum number of extended advertising events

struct `esp_ble_gap_periodic_adv_params_t`  
periodic adv parameters

**Public Members**

`uint16_t interval_min`  
periodic advertising minimum interval

`uint16_t interval_max`  
periodic advertising maximum interval

`uint8_t properties`  
periodic advertising properties

struct `esp_ble_gap_periodic_adv_sync_params_t`  
periodic adv sync parameters

**Public Members**

`esp_ble_gap_sync_t filter_policy`  
periodic advertising sync filter policy

`uint8_t sid`  
periodic advertising sid

`esp_ble_addr_type_t addr_type`  
periodic advertising address type

`esp_bd_addr_t addr`  
periodic advertising address

`uint16_t skip`  
the maximum number of periodic advertising events that can be skipped

`uint16_t sync_timeout`  
synchronization timeout

struct `esp_ble_gap_ext_adv_reprot_t`  
extend adv report parameters
Public Members

`esp_ble_gap_adv_type_t event_type`
extend advertising type

`uint8_t addr_type`
extend advertising address type

`esp_bd_addr_t addr`
extend advertising address

`esp_ble_gap_pri_phy_t primary_phy`
extend advertising primary phy

`esp_ble_gap_phy_t secondly_phy`
extend advertising secondary phy

`uint8_t sid`
extend advertising sid

`uint8_t tx_power`
extend advertising tx power

`int8_t rssi`
extend advertising rssi

`uint16_t per_adv_interval`
periodic advertising interval

`uint8_t dir_addr_type`
direct address type

`esp_bd_addr_t dir_addr`
direct address

`esp_ble_gap_ext_adv_data_status_t data_status`
data type

`uint8_t adv_data_len`
extend advertising data length

`uint8_t adv_data[251]`
extend advertising data

`struct esp_ble_gap_periodic_adv_report_t`
periodic adv report parameters
Chapter 2. API Reference

**Public Members**

uint16_t `sync_handle`
periodic advertising train handle

uint8_t `tx_power`
periodic advertising tx power

int8_t `rssi`
periodic advertising rssi

*esp_ble_gap_ext_adv_data_status_t* `data_status`
periodic advertising data type

uint8_t `data_length`
periodic advertising data length

uint8_t `data[251]`
periodic advertising data

**Public Members**

uint8_t `status`
periodic advertising sync status

uint16_t `sync_handle`
periodic advertising train handle

uint8_t `sid`
periodic advertising sid

*esp_ble_addr_type_t* `addr_type`
periodic advertising address type

*esp_bd_addr_t* `adv_addr`
periodic advertising address

*esp_ble_gap_phy_t* `adv_phy`
periodic advertising adv phy type

uint16_t `period_adv_interval`
periodic advertising interval

uint8_t `adv_clk_accuracy`
periodic advertising clock accuracy
Chapter 2. API Reference

### Macros

**ESP_BLE_ADV_FLAG_LIMIT_DISC**
BLE_ADV_DATA_FLAG data flag bit definition used for advertising data flag.

**ESP_BLE_ADV_FLAG_GEN_DISC**

**ESP_BLE_ADV_FLAG_BREDR_NOT_SPT**

**ESP_BLE_ADV_FLAG_DMT_CONTROLLER_SPT**

**ESP_BLE_ADV_FLAG_DMT_HOST_SPT**

**ESP_BLE_ADV_FLAG_NON_LIMIT_DISC**

**ESP_LE_KEY_NONE**
relate to BTM_LE_KEY_xxx in stack/btm_api.h
No encryption key

**ESP_LE_KEY_PENC**
encryption key, encryption information of peer device

**ESP_LE_KEY_PID**
identity key of the peer device

**ESP_LE_KEY_PCSRK**
peer SRK

**ESP_LE_KEY_PLK**
Link key

**ESP_LE_KEY_LLK**
peer link key

**ESP_LE_KEY_LENC**
master role security information: div

**ESP_LE_KEY_LID**
master device ID key

**ESP_LE_KEY_LCSRK**
local CSRK has been deliver to peer

**ESP_LE_AUTH_NO_BOND**
relate to BTM_LE_AUTH_xxx in stack/btm_api.h
0 no bondingv

**ESP_LE_AUTH_BOND**
1 << 0 device in the bonding with peer
Chapter 2. API Reference

ESP_LE_AUTH_REQ_MITM
1 << 2 man in the middle attack

ESP_LE_AUTH_REQ_BOND_MITM
0101 banding with man in the middle attack

ESP_LE_AUTH_REQ_SC_ONLY
1 << 3 secure connection

ESP_LE_AUTH_REQ_SC_BOND
1001 secure connection with band

ESP_LE_AUTH_REQ_SC_MITM
1100 secure conn with MITM

ESP_LE_AUTH_REQ_SC_MITM_BOND
1101 SC with MITM and Bonding

ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_DISABLE
authentication disable

ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE
authentication enable

ESP_BLE_OOB_DISABLE
disable the out of bond

ESP_BLE_OOB_ENABLE
enable the out of bond

ESP_IO_CAP_OUT
relate to BTM_IO_CAP_xxx in stack/btm_api.h
DisplayOnly

ESP_IO_CAP_IO
DisplayYesNo

ESP_IO_CAP_IN
KeyboardOnly

ESP_IO_CAP_NONE
NoInputNoOutput

ESP_IO_CAP_KBDISP
Keyboard display

ESP_BLE_APPEARANCE_UNKNOWN
relate to BTM_BLE_APPEARANCE_UNKNOWN in stack/btm_ble_api.h
ESP_BLE_APPEARANCE_GENERIC_PHONE
    relate to BTM_BLE_APPEARANCE_GENERIC_PHONE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_COMPUTER
    relate to BTM_BLE_APPEARANCE_GENERIC_COMPUTER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_WATCH
    relate to BTM_BLE_APPEARANCE_GENERIC_WATCH in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_SPORTS_WATCH
    relate to BTM_BLE_APPEARANCE_SPORTS_WATCH in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_CLOCK
    relate to BTM_BLE_APPEARANCE_GENERIC_CLOCK in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_DISPLAY
    relate to BTM_BLE_APPEARANCE_GENERIC_DISPLAY in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_REMOTE
    relate to BTM_BLE_APPEARANCE_GENERIC_REMOTE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_EYEGLASSES
    relate to BTM_BLE_APPEARANCE_GENERIC_EYEGLASSES in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_TAG
    relate to BTM_BLE_APPEARANCE_GENERIC_TAG in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_KEYRING
    relate to BTM_BLE_APPEARANCE_GENERIC_KEYRING in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_MEDIA_PLAYER
    relate to BTM_BLE_APPEARANCE_GENERIC_MEDIA_PLAYER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_BARCODE_SCANNER
    relate to BTM_BLE_APPEARANCE_GENERIC_BARCODE_SCANNER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_THERMOMETER
    relate to BTM_BLE_APPEARANCE_GENERIC_THERMOMETER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_THERMOMETER_EAR
    relate to BTM_BLE_APPEARANCE_THERMOMETER_EAR in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_HEART_RATE
    relate to BTM_BLE_APPEARANCE_GENERIC_HEART_RATE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HEART_RATE_BELT
    relate to BTM_BLE_APPEARANCE_HEART_RATE_BELT in stack/btm_ble_api.h
ESP_BLE_APPEARANCE_GENERIC_BLOOD_PRESSURE
    relate to BTM_BLE_APPEARANCE_GENERIC_BLOOD_PRESSURE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_BLOOD_PRESSURE_ARM
    relate to BTM_BLE_APPEARANCE_BLOOD_PRESSURE_ARM in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_BLOOD_PRESSURE_WRIST
    relate to BTM_BLE_APPEARANCE_BLOOD_PRESSURE_WRIST in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_HID
    relate to BTM_BLE_APPEARANCE_GENERIC_HID in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_KEYBOARD
    relate to BTM_BLE_APPEARANCE_HID_KEYBOARD in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_MOUSE
    relate to BTM_BLE_APPEARANCE_HID_MOUSE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_JOYSTICK
    relate to BTM_BLE_APPEARANCE_HID_JOYSTICK in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_GAMEPAD
    relate to BTM_BLE_APPEARANCE_HID_GAMEPAD in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_DIGITIZER_TABLET
    relate to BTM_BLE_APPEARANCE_HID_DIGITIZER_TABLET in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_CARD_READER
    relate to BTM_BLE_APPEARANCE_HID_CARD_READER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_DIGITAL_PEN
    relate to BTM_BLE_APPEARANCE_HID_DIGITAL_PEN in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_BARCODE_SCANNER
    relate to BTM_BLE_APPEARANCE_HID_BARCODE_SCANNER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_GLUCOSE
    relate to BTM_BLE_APPEARANCE_GENERIC_GLUCOSE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_WALKING
    relate to BTM_BLE_APPEARANCE_GENERIC_WALKING in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_WALKING_IN_SHOE
    relate to BTM_BLE_APPEARANCE_WALKING_IN_SHOE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_WALKING_ON_SHOE
    relate to BTM_BLE_APPEARANCE_WALKING_ON_SHOE in stack/btm_ble_api.h
ESP_BLE_APPEARANCE_WALKING_ON_HIP
relate to BTM_BLE_APPEARANCE_WALKING_ON_HIP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_CYCLING
relate to BTM_BLE_APPEARANCE_GENERIC_CYCLING in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_COMPUTER
relate to BTM_BLE_APPEARANCE_CYCLING_COMPUTER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_SPEED
relate to BTM_BLE_APPEARANCE_CYCLING_SPEED in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_CADENCE
relate to BTM_BLE_APPEARANCE_CYCLING_CADENCE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_POWER
relate to BTM_BLE_APPEARANCE_CYCLING_POWER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_SPEED_CADENCE
relate to BTM_BLE_APPEARANCE_CYCLING_SPEED_CADENCE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_PULSE_OXIMETER
relate to BTM_BLE_APPEARANCE_GENERIC_PULSE_OXIMETER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_PULSE_OXIMETER_FINGERTIP
relate to BTM_BLE_APPEARANCE_PULSE_OXIMETER_FINGERTIP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_PULSE_OXIMETER_WRIST
relate to BTM_BLE_APPEARANCE_PULSE_OXIMETER_WRIST in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_WEIGHT
relate to BTM_BLE_APPEARANCE_GENERIC_WEIGHT in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_PERSONAL_MOBILITY_DEVICE
relate to BTM_BLE_APPEARANCE_GENERIC_PERSONAL_MOBILITY_DEVICE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_POWERED_WHEELCHAIR
relate to BTM_BLE_APPEARANCE_POWERED_WHEELCHAIR in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_MOBILITY_SCOOTER
relate to BTM_BLE_APPEARANCE_MOBILITY_SCOOTER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_CONTINUOUS_GLUCOSE_MONITOR
relate to BTM_BLE_APPEARANCE GENERIC_CONTINUOUS_GLUCOSE_MONITOR in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_INSULIN_PUMP
relate to BTM_BLE_APPEARANCE GENERIC INSULIN_PUMP in stack/btm_ble_api.h
Chapter 2. API Reference

**ESP_BLE_APPEARANCE_INSULIN_PUMP_DURABLE_PUMP**
relate to BTM_BLE_APPEARANCE_INSULIN_PUMP_DURABLE_PUMP in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_INSULIN_PUMP_PATCH_PUMP**
relate to BTM_BLE_APPEARANCE_INSULIN_PUMP_PATCH_PUMP in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_INSULIN_PEN**
relate to BTM_BLE_APPEARANCE_INSULIN_PEN in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_GENERIC_MEDICATION_DELIVERY**
relate to BTM_BLE_APPEARANCE GENERIC MEDICATION DELIVERY in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_GENERIC_OUTDOOR_SPORTS**
relate to BTM_BLE_APPEARANCE GENERIC OUTDOOR SPORTS in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION**
relate to BTM_BLE_APPEARANCE OUTDOOR SPORTS LOCATION in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_AND_NAV**
relate to BTM_BLE_APPEARANCE OUTDOOR SPORTS LOCATION AND NAV in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD**
relate to BTM_BLE_APPEARANCE OUTDOOR SPORTS LOCATION POD in stack/btm_ble_api.h

**ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD_AND_NAV**
relate to BTM_BLE_APPEARANCE OUTDOOR SPORTS LOCATION POD AND NAV in stack/btm_ble_api.h

**ESP_GAP_BLE_CHANNELS_LEN**
channel length

**ESP_GAP_BLE_ADD_WHITELIST_COMPLETE_EVT**
This is the old name, just for backwards compatibility.

**ESP_BLE_ADV_DATA_LEN_MAX**
Advertising data maximum length.

**ESP_BLE_SCAN_RSP_DATA_LEN_MAX**
Scan response data maximum length.

**BLE_BIT (n)**

**ESP_BLE_GAP_SET_EXT_ADV_PROP_NONCONN_NONSCANNABLE_UNDIRECTED**
Non-Connectable and Non-Scannable Undirected advertising

**ESP_BLE_GAP_SET_EXT_ADV_PROP_CONNECTABLE**
Connectable advertising
ESP_BLE_GAP_SET_EXT_ADV_PROP_SCANNABLE
Scannable advertising

ESP_BLE_GAP_SET_EXT_ADV_PROP_DIRECTED
Directed advertising

ESP_BLE_GAP_SET_EXT_ADV_PROP_HD_DIRECTED
High Duty Cycle Directed Connectable advertising (<= 3.75 ms Advertising Interval)

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY
Use legacy advertising PDUs

ESP_BLE_GAP_SET_EXT_ADV_PROP_ANON_ADV
Omit advertiser’s address from all PDUs (“anonymous advertising”)

ESP_BLE_GAP_SET_EXT_ADV_PROP_INCLUDE_TX_PWR
Include TxPower in the extended header of the advertising PDU

ESP_BLE_GAP_SET_EXT_ADV_PROP_MASK
Reserved for future use If extended advertising PDU types are being used (bit 4 = 0) then: The advertisement shall not be both connectable and scannable. High duty cycle directed connectable advertising (<= 3.75 ms advertising interval) shall not be used (bit 3 = 0) ADV_IND

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_IND
ADV_DIRECT_IND (low duty cycle)

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_LD_DIR
ADV_DIRECT_IND (high duty cycle)

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_HD_DIR
ADV_SCAN_IND

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_SCAN
ADV_NONCONN_IND

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_NONCONN

ESP_BLE_GAP_PHY_1M
Secondery Advertisement PHY is LE1M

ESP_BLE_GAP_PHY_2M
Secondery Advertisement PHY is LE2M

ESP_BLE_GAP_PHY_CODED
Secondery Advertisement PHY is LE Coded

ESP_BLE_GAP_NO_PREFER_TRANSMIT_PHY
No Prefer TX PHY supported by controller
ESP_BLE_GAP_NO_PREFER_RECEIVE_PHY
No Prefer RX PHY supported by controller

ESP_BLE_GAP_PRI_PHY_1M
Primary phy only support 1M and LE coded phy.
Primary Phy is LE1M

ESP_BLE_GAP_PRI_PHY_CODED
Primary Phy is LE CODED

ESP_BLE_GAP_PHY_1M_PREF_MASK
The Host prefers use the LE1M transmitter or reciever PHY

ESP_BLE_GAP_PHY_2M_PREF_MASK
The Host prefers use the LE2M transmitter or reciever PHY

ESP_BLE_GAP_PHY_CODED_PREF_MASK
The Host prefers use the LE CODED transmitter or reciever PHY

ESP_BLE_GAP_PHY_OPTIONS_NO_PREF
The Host has no preferred coding when transmitting on the LE Coded PHY

ESP_BLE_GAP_PHY_OPTIONS_PREF_S2_CODING
The Host prefers that S=2 coding be used when transmitting on the LE Coded PHY

ESP_BLE_GAP_PHY_OPTIONS_PREF_S8_CODING
The Host prefers that S=8 coding be used when transmitting on the LE Coded PHY

ESP_BLE_GAP_EXT_SCAN_CFG_UNCODE_MASK
Scan Advertisements on the LE1M PHY

ESP_BLE_GAP_EXT_SCAN_CFG_CODE_MASK
Scan advertisements on the LE coded PHY

ESP_BLE_GAP_EXT_ADV_DATA_COMPLETE
Advertising data.
extended advertising data compete

ESP_BLE_GAP_EXT_ADV_DATA_INCOMPLETE
extended advertising data incomplete

ESP_BLE_GAP_EXT_ADV_DATA_TRUNCATED
extended advertising data truncated mode

ESP_BLE_GAP_SYNC_POLICY__BY_ADV_INFO
Advertising SYNC policy.
sync policy by advertising info
Chapter 2. API Reference

**ESP_BLE_GAP_SYNC_POLICY_BY_PERIODIC_LIST**
periodic advertising sync policy

**ESP_BLE_ADV_REPORT_EXT_ADV_IND**
Advertising report.
advertising report with extended advertising indication type

**ESP_BLE_ADV_REPORT_EXT_SCAN_IND**
advertising report with extended scan indication type

**ESP_BLE_ADV_REPORT_EXT_DIRECT_ADV**
advertising report with extended direct advertising indication type

**ESP_BLE_ADV_REPORT_EXT_SCAN_RSP**
advertising report with extended scan response indication type Bluetooth 5.0, Vol 2, Part E, 7.7.65.13

**ESP_BLE_LEGACY_ADV_TYPE_IND**
advertising report with legacy advertising indication type

**ESP_BLE_LEGACY_ADV_TYPE_DIRECT_IND**
advertising report with legacy direct indication type

**ESP_BLE_LEGACY_ADV_TYPE_SCAN_IND**
advertising report with legacy scan indication type

**ESP_BLE_LEGACY_ADV_TYPE_NONCON_IND**
advertising report with legacy non connectable indication type

**ESP_BLE_LEGACY_ADV_TYPE_SCAN_RSP_TO_ADV_IND**
advertising report with legacy scan response indication type

**ESP_BLE_LEGACY_ADV_TYPE_SCAN_RSP_TO_ADV_SCAN_IND**
advertising report with legacy advertising with scan response indication type

**Type Definitions**

typedef uint8_t esp_ble_key_type_t

typedef uint8_t esp_ble_auth_req_t
combination of the above bit pattern

.typedef uint8_t esp_ble_io_cap_t
combination of the io capability

typedef uint8_t esp_gap_ble_channels[ESP_GAP_BLE_CHANNELS_LEN]

typedef uint8_t esp_duplicate_info_t[ESP_BD_ADDR_LEN]
typedef uint16_t esp_ble_ext_adv_type_mask_t

typedef uint8_t esp_ble_gap_phy_t

typedef uint8_t esp_ble_gap_all_phys_t

typedef uint8_t esp_ble_gap_pri_phy_t

typedef uint8_t esp_ble_gap_phy_mask_t

typedef uint16_t esp_ble_gap_prefer_phy_options_t

typedef uint8_t esp_ble_ext_scan_cfg_mask_t

typedef uint8_t esp_ble_gap_ext_adv_data_status_t

typedef uint8_t esp_ble_gap_sync_t

typedef uint8_t esp_ble_gap_adv_type_t

typedef void (*esp_gap_ble_cb_t)(esp_gap_ble_cb_event_t event, esp_ble_gap_cb_param_t *param)

GAP callback function type.

Param event : Event type
Param param : Point to callback parameter, currently is union type

Enumerations

enum esp_gap_ble_cb_event_t
GAP BLE callback event type.
Values:

enumerator ESP_GAP_BLE_ADV_DATA_SET_COMPLETE_EVT
When advertising data set complete, the event comes

enumerator ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT
When scan response data set complete, the event comes

enumerator ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT
When scan parameters set complete, the event comes

enumerator ESP_GAP_BLE_SCAN_RESULT_EVT
When one scan result ready, the event comes each time

enumerator ESP_GAP_BLE_ADV_DATA_RAW_SET_COMPLETE_EVT
When raw advertising data set complete, the event comes
enumerator **ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT**
   When raw advertising data set complete, the event comes

enumerator **ESP_GAP_BLE_ADV_START_COMPLETE_EVT**
   When start advertising complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_START_COMPLETE_EVT**
   When start scan complete, the event comes

enumerator **ESP_GAP_BLE_AUTH_CMPL_EVT**
   Authentication complete indication.

enumerator **ESP_GAP_BLE_KEY_EVT**
   BLE key event for peer device keys

enumerator **ESP_GAP_BLE_SEC_REQ_EVT**
   BLE security request

enumerator **ESP_GAP_BLE_PASSKEY_NOTIF_EVT**
   passkey notification event

enumerator **ESP_GAP_BLE_PASSKEY_REQ_EVT**
   passkey request event

enumerator **ESP_GAP_BLE_OOB_REQ_EVT**
   OOB request event

enumerator **ESP_GAP_BLE_LOCAL_IR_EVT**
   BLE local IR event

enumerator **ESP_GAP_BLE_LOCAL_ER_EVT**
   BLE local ER event

enumerator **ESP_GAP_BLE_NC_REQ_EVT**
   Numeric Comparison request event

enumerator **ESP_GAP_BLE_ADV_STOP_COMPLETE_EVT**
   When stop adv complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT**
   When stop scan complete, the event comes

enumerator **ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT**
   When set the static rand address complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT**
   When update connection parameters complete, the event comes
enumerator **ESP_GAP_BLE_SET_PKT_LENGTH_COMPLETE_EVT**
   When set packet length complete, the event comes

enumerator **ESP_GAP_BLE_SET_LOCAL_PRIVACY_COMPLETE_EVT**
   When enable/disable privacy on the local device complete, the event comes

enumerator **ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT**
   When remove the bond device complete, the event comes

enumerator **ESP_GAP_BLE_CLEAR_BOND_DEV_COMPLETE_EVT**
   When clear the bond device clear complete, the event comes

enumerator **ESP_GAP_BLE_GET_BOND_DEV_COMPLETE_EVT**
   When get the bond device list complete, the event comes

enumerator **ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT**
   When read the rssi complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT**
   When add or remove whitelist complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT**
   When update duplicate exceptional list complete, the event comes

enumerator **ESP_GAP_BLE_SET_CHANNELS_EVT**
   When setting BLE channels complete, the event comes

enumerator **ESP_GAP_BLE_READ_PHY_COMPLETE_EVT**
   When reading phy complete, this event comes

enumerator **ESP_GAP_BLE_SET_PREFERRED_DEFAULT_PHY_COMPLETE_EVT**
   When preferred default phy complete, this event comes

enumerator **ESP_GAP_BLE_SET_PREFERRED_PHY_COMPLETE_EVT**
   When preferred phy complete, this event comes

enumerator **ESP_GAP_BLE_EXT_ADV_SET_RAND_ADDR_COMPLETE_EVT**
   When extended set random address complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_SET_PARAMS_COMPLETE_EVT**
   When extended advertising parameter complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_DATA_SET_COMPLETE_EVT**
   When extended advertising data complete, the event comes

enumerator **ESP_GAP_BLE_EXT_SCAN_RSP_DATA_SET_COMPLETE_EVT**
   When extended scan response data complete, the event comes
enumerator `ESP_GAP_BLE_EXT_ADV_START_COMPLETE_EVT`
when extended advertising start complete, the event comes

enumerator `ESP_GAP_BLE_EXT_ADV_STOP_COMPLETE_EVT`
when extended advertising stop complete, the event comes

enumerator `ESP_GAP_BLE_EXT_ADV_SET_REMOVE_COMPLETE_EVT`
when extended advertising set remove complete, the event comes

enumerator `ESP_GAP_BLE_EXT_ADV_SET_CLEAR_COMPLETE_EVT`
when extended advertising set clear complete, the event comes

enumerator `ESP_GAP_BLE_EXT_ADV_PERIODIC_ADV_SET_PARAMS_COMPLETE_EVT`
when periodic advertising parameter complete, the event comes

enumerator `ESP_GAP_BLE_PERIODIC_ADV_DATA_SET_COMPLETE_EVT`
when periodic advertising data complete, the event comes

enumerator `ESP_GAP_BLE_PERIODIC_ADV_START_COMPLETE_EVT`
when periodic advertising start complete, the event comes

enumerator `ESP_GAP_BLE_PERIODIC_ADV_STOP_COMPLETE_EVT`
when periodic advertising stop complete, the event comes

enumerator `ESP_GAP_BLE_PERIODIC_ADV_CREATE_SYNC_COMPLETE_EVT`
when periodic advertising create sync complete, the event comes

enumerator `ESP_GAP_BLE_PERIODIC_ADV_SYNC_CANCEL_COMPLETE_EVT`
when extended advertising sync cancel complete, the event comes

enumerator `ESP_GAP_BLE_PERIODIC_ADV_SYNC_TERMINATE_COMPLETE_EVT`
when extended advertising sync terminate complete, the event comes

enumerator `ESP_GAP_BLE_PERIODIC_ADV_ADD_DEV_COMPLETE_EVT`
when extended advertising add device complete, the event comes

enumerator `ESP_GAP_BLE_PERIODIC_ADV_REMOVE_DEV_COMPLETE_EVT`
when extended advertising remove device complete, the event comes

enumerator `ESP_GAP_BLE_PERIODIC_ADV_CLEAR_DEV_COMPLETE_EVT`
when extended advertising clear device, the event comes

enumerator `ESP_GAP_BLE_PERIODIC_ADV_SET_EXT_SCAN_PARAMS_COMPLETE_EVT`
when extended scan parameter complete, the event comes

enumerator `ESP_GAP_BLE_EXT_SCAN_START_COMPLETE_EVT`
when extended scan start complete, the event comes
enumerator `ESP_GAP_BLE_EXT_SCAN_STOP_COMPLETE_EVT`
when extended scan stop complete, the event comes

denominator `ESP_GAP_BLE_PREFER_EXT_CONN_PARAMS_SET_COMPLETE_EVT`
when extended prefer connection parameter set complete, the event comes

denominator `ESP_GAP_BLE_PHY_UPDATE_COMPLETE_EVT`
when ble phy update complete, the event comes

denominator `ESP_GAP_BLE_EXT_ADV_REPORT_EVT`
when extended advertising report complete, the event comes

denominator `ESP_GAP_BLE_SCAN_TIMEOUT_EVT`
when scan timeout complete, the event comes

denominator `ESP_GAP_BLE_ADV_TERMINATED_EVT`
when advertising terminate data complete, the event comes

denominator `ESP_GAP_BLE_SCAN_REQ_RECEIVED_EVT`
when scan req received complete, the event comes

denominator `ESP_GAP_BLE_CHANNEL_SELECT_ALGORITHM_EVT`
when channel select algorithm complete, the event comes

denominator `ESP_GAP_BLE_PERIODIC_ADV_REPORT_EVT`
when periodic report advertising complete, the event comes

denominator `ESP_GAP_BLE_PERIODIC_ADV_SYNC_LOST_EVT`
when periodic advertising sync lost complete, the event comes

denominator `ESP_GAP_BLE_PERIODIC_ADV_SYNC_ESTAB_EVT`
when periodic advertising sync establish complete, the event comes

denominator `ESP_GAP_BLE_EVT_MAX`
when maximum advertising event complete, the event comes

denumber `esp_ble_adv_data_type`
The type of advertising data(not adv_type)

Values:

denominator `ESP_BLE_AD_TYPE_FLAG`

denominator `ESP_BLE_AD_TYPE_16SRV_PART`

denominator `ESP_BLE_AD_TYPE_16SRV_CMPL`

denominator `ESP_BLE_AD_TYPE_32SRV_PART`
enumerator ESP_BLE_AD_TYPE_32SRV_CMPL

enumerator **ESP_BLE_AD_TYPE_CHAN_MAP_UPDATE**

enumerator **ESP_BLE_AD_TYPE_MANUFACTURER_SPECIFIC_TYPE**

enum **esp_ble_adv_type_t**

Advertising mode.

*Values:*

enumerator **ADV_TYPE_IND**

enumerator **ADV_TYPE_DIRECT_IND_HIGH**

enumerator **ADV_TYPE_SCAN_IND**

enumerator **ADV_TYPE_NONCONN_IND**

enumerator **ADV_TYPE DIRECT IND LOW**

enum **esp_ble_adv_channel_t**

Advertising channel mask.

*Values:*

enumerator **ADV_CHNL_37**

enumerator **ADV_CHNL_38**

enumerator **ADV_CHNL_39**

enumerator **ADV_CHNL_ALL**

enum **esp_ble_adv_filter_t**

*Values:*

enumerator ADV_FILTER_ALLOW_SCAN_ANY_CON_ANY
    Allow both scan and connection requests from anyone.

enumerator ADV_FILTER_ALLOW_SCAN_WLST_CON_ANY
    Allow both scan req from White List devices only and connection req from anyone.

enumerator ADV_FILTER_ALLOW_SCAN_ANY_CON_WLST
    Allow both scan req from anyone and connection req from White List devices only.

enumerator ADV_FILTER_ALLOW_SCAN_WLST_CON_WLST
    Allow scan and connection requests from White List devices only.

enum esp_ble_sec_act_t
    Values:

    enumerator ESP_BLE_SEC_ENCRYPT
        relate to BTA_DM_BLE_SEC_ENCRYPT in bta/bta_api.h. If the device has already bonded, the stack will used LTK to encrypt with the remote device directly. Else if the device hasn’t bonded, the stack will used the default authentication request used the esp_ble_gap_set_security_param function set by the user.

    enumerator ESP_BLE_SEC_ENCRYPT_NO_MITM
        relate to BTA_DM_BLE_SEC_ENCRYPT_NO_MITM in bta/bta_api.h. If the device has already bonded, the stack will check the LTK Whether the authentication request has been met, if met, used the LTK to encrypt with the remote device directly, else Re-pair with the remote device. Else if the device hasn’t bonded, the stack will used NO MITM authentication request in the current link instead of used the authreq in the esp_ble_gap_set_security_param function set by the user.

    enumerator ESP_BLE_SEC_ENCRYPT_MITM
        relate to BTA_DM_BLE_SEC_ENCRYPT_MITM in bta/bta_api.h. If the device has already bonded, the stack will check the LTK Whether the authentication request has been met, if met, used the LTK to encrypt with the remote device directly, else Re-pair with the remote device. Else if the device hasn’t bonded, the stack will used MITM authentication request in the current link instead of used the authreq in the esp_ble_gap_set_security_param function set by the user.

enum esp_ble_sm_param_t
    Values:

    enumerator ESP_BLE_SM_PASSKEY
        Authentication requirements of local device

    enumerator ESP_BLE_SM_AUTHEN_REQ_MODE
        The IO capability of local device

    enumerator ESP_BLE_SM_IOCAP_MODE
        Initiator Key Distribution/Generation

    enumerator ESP_BLE_SM_SET_INIT_KEY
        Responder Key Distribution/Generation
enumerator **ESP_BLE_SM_SET_RSP_KEY**
    Maximum Encryption key size to support

enumerator **ESP_BLE_SM_MAX_KEY_SIZE**
    Minimum Encryption key size requirement from Peer

enumerator **ESP_BLE_SM_MIN_KEY_SIZE**
    Set static Passkey

enumerator **ESP_BLE_SM_SET_STATIC_PASSKEY**
    Reset static Passkey

enumerator **ESP_BLE_SM_CLEAR_STATIC_PASSKEY**
    Accept only specified SMP Authentication requirement

enumerator **ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH**
    Enable/Disable OOB support

enumerator **ESP_BLE_SM_OOB_SUPPORT**
    Appl encryption key size

enumerator **ESP_BLE_APP_ENC_KEY_SIZE**
    authentication max param

enumerator **ESP_BLE_SM_MAX_PARAM**

enum **esp_ble_scan_type_t**
    Ble scan type.
    
    Values:
    
    enumerator **BLE_SCAN_TYPE_PASSIVE**
        Passive scan
    
    enumerator **BLE_SCAN_TYPE_ACTIVE**
        Active scan

enum **esp_ble_scan_filter_t**
    Ble scan filter type.
    
    Values:
    
    enumerator **BLE_SCAN_FILTER_ALLOW_ALL**
        Accept all:
        
        i. advertisement packets except directed advertising packets not addressed to this device (default).

    enumerator **BLE_SCAN_FILTER_ALLOW_ONLY_WLST**
        Accept only:
        
        i. advertisement packets from devices where the advertiser’s address is in the White list.
        ii. Directed advertising packets which are not addressed for this device shall be ignored.
enumerantor `BLE_SCAN_FILTER_ALLOW_UND_RPA_DIR`

Accept all:

i. undirected advertisement packets, and
ii. directed advertising packets where the initiator address is a resolvable private address, and
iii. directed advertising packets addressed to this device.

enumerantor `BLE_SCAN_FILTER_ALLOW_WLIST_RPA_DIR`

Accept all:

i. advertisement packets from devices where the advertiser’s address is in the White list, and
ii. directed advertising packets where the initiator address is a resolvable private address, and
iii. directed advertising packets addressed to this device.

eum `esp_ble_scan_duplicate_t`

Ble scan duplicate type.

Values:

enumerantor `BLE_SCAN_DUPLICATE_DISABLE`

the Link Layer should generate advertising reports to the host for each packet received

enumerantor `BLE_SCAN_DUPLICATE_ENABLE`

the Link Layer should filter out duplicate advertising reports to the Host

enumerantor `BLE_SCAN_DUPLICATE_MAX`

0x02 –0xFF, Reserved for future use

eum `esp_gap_search_evt_t`

Sub Event of ESP_GAP_BLE_SCAN_RESULT_EVT.

Values:

enumerantor `ESP_GAP_SEARCH_INQ_RES_EVT`

Inquiry result for a peer device.

enumerantor `ESP_GAP_SEARCH_INQ_CMPL_EVT`

Inquiry complete.

enumerantor `ESP_GAP_SEARCH_DISC_RES_EVT`

Discovery result for a peer device.

enumerantor `ESP_GAP_SEARCH_DISC_BLE_RES_EVT`

Discovery result for BLE GATT based service on a peer device.

enumerantor `ESP_GAP_SEARCH_DISC_CMPL_EVT`

Discovery complete.

enumerantor `ESP_GAP_SEARCH_DI_DISC_CMPL_EVT`

Discovery complete.
enumerator ESP_GAP_SEARCH_SEARCH_CANCEL_CMPL_EVT
   Search cancelled

enumerator ESP_GAP_SEARCH_INQ_DISCARD_NUM_EVT
   The number of pkt discarded by flow control

enum esp_ble_evt_type_t
   Ble scan result event type, to indicate the result is scan response or advertising data or other.
   Values:

   enumerator ESP_BLE_EVT_CONN_ADV
      Connectable undirected advertising (ADV_IND)

   enumerator ESP_BLE_EVT_CONN_DIR_ADV
      Connectable directed advertising (ADV_DIRECT_IND)

   enumerator ESP_BLE_EVT_DISC_ADV
      Scannable undirected advertising (ADV_SCAN_IND)

   enumerator ESP_BLE_EVT_NON_CONN_ADV
      Non connectable undirected advertising (ADV_NONCONN_IND)

   enumerator ESP_BLE_EVT_SCAN_RSP
      Scan Response (SCAN_RSP)

enum esp_ble wl_operation_t
   Values:

   enumerator ESP_BLE_WHITELIST_REMOVE
      remove mac from whitelist

   enumerator ESP_BLE_WHITELIST_ADD
      add address to whitelist

enum esp bt_duplicate_exceptional_subcode_type_t
   Values:

   enumerator ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_ADD
      Add device info into duplicate scan exceptional list

   enumerator ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_REMOVE
      Remove device info from duplicate scan exceptional list

   enumerator ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN
      Clean duplicate scan exceptional list

enum esp_ble_duplicate_exceptional_info_type_t
   Values:
Chapter 2. API Reference

**Scope and Description**

**GATT DEFINES**

**API Reference**

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_gatt_defs.h

**Unions**

union **esp_gatt_rsp_t**

```
#include <esp_gatt_defs.h> GATT remote read request response type.
```
Chapter 2. API Reference

**Public Members**

`esp_gatt_value_t attr_value`
- Gatt attribute structure

`uint16_t handle`
- Gatt attribute handle

**Structures**

```
struct esp_gatt_id_t
    Gatt id, include uuid and instance id.
```

**Public Members**

`esp_bt_uuid_t uuid`
- UUID

`uint8_t inst_id`
- Instance id

```
struct esp_gatt_svc_id_t
    Gatt service id, include id (uuid and instance id) and primary flag.
```

**Public Members**

`esp_gatt_id_t id`
- Gatt id, include uuid and instance id

```
bool is_primary
    This service is primary or not
```

```
struct esp_attr_desc_t
    Attribute description (used to create database)
```

**Public Members**

`uint16_t uuid_length`
- UUID length

```
uint8_t *uuid_p
    UUID value
```

`uint16_t perm`
- Attribute permission
uint16_t \texttt{max\_length} \quad \text{Maximum length of the element}

uint16_t \texttt{length} \quad \text{Current length of the element}

uint8_t* \texttt{value} \quad \text{Element value array}

\begin{verbatim}
struct esp_attr_control_t
attribute auto response flag
\end{verbatim}

\textbf{Public Members}

uint8_t \texttt{auto\_rsp} \quad \text{if auto_rsp set to ESP\_GATT\_RSP\_BY\_APP, means the response of Write/Read operation will by replied by application. if auto_rsp set to ESP\_GATT\_AUTO\_RSP, means the response of Write/Read operation will be replied by GATT stack automatically.}

\begin{verbatim}
struct esp_gatts_attr_db_t
attribute type added to the gatt server database
\end{verbatim}

\textbf{Public Members}

\begin{verbatim}
 esp_attr_control_t \texttt{attr\_control}
The attribute control type
\end{verbatim}

\begin{verbatim}
 esp_attr_desc_t \texttt{att\_desc}
The attribute type
\end{verbatim}

\begin{verbatim}
struct esp_attr_value_t
set the attribute value type
\end{verbatim}

\textbf{Public Members}

uint16_t \texttt{attr\_max\_len} \quad \text{attribute max value length}

uint16_t \texttt{attr\_len} \quad \text{attribute current value length}

uint8_t* \texttt{attr\_value} \quad \text{the pointer to attribute value}

\begin{verbatim}
struct esp_gatts_incl_svc_desc_t
Gatt include service entry element.
\end{verbatim}
Public Members

uint16_t \textbf{start_hdl}
\begin{center}
Gatt start handle value of included service
\end{center}

uint16_t \textbf{end_hdl}
\begin{center}
Gatt end handle value of included service
\end{center}

uint16_t \textbf{uuid}
\begin{center}
Gatt attribute value UUID of included service
\end{center}

\textbf{struct esp_gatts_incl128_svc_desc_t}
\begin{center}
Gatt include 128 bit service entry element.
\end{center}

Public Members

uint16_t \textbf{start_hdl}
\begin{center}
Gatt start handle value of included 128 bit service
\end{center}

uint16_t \textbf{end_hdl}
\begin{center}
Gatt end handle value of included 128 bit service
\end{center}

\textbf{struct esp_gatt_value_t}
\begin{center}
Gatt attribute value.
\end{center}

Public Members

uint8_t \textbf{value}[ESP_GATT_MAX_ATTR_LEN]
\begin{center}
Gatt attribute value
\end{center}

uint16_t \textbf{handle}
\begin{center}
Gatt attribute handle
\end{center}

uint16_t \textbf{offset}
\begin{center}
Gatt attribute value offset
\end{center}

uint16_t \textbf{len}
\begin{center}
Gatt attribute value length
\end{center}

uint8_t \textbf{auth_req}
\begin{center}
Gatt authentication request
\end{center}

\textbf{struct esp_gatt_conn_params_t}
\begin{center}
Connection parameters information.
\end{center}
Chapter 2. API Reference

Public Members

uint16_t interval
connection interval

uint16_t latency
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeout
Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct esp_gattc_multi_t
read multiple attribute

Public Members

uint8_t num_attr
The number of the attribute

uint16_t handles[ESP_GATT_MAX_READ_MULTI_HANDLES]
The handles list

struct esp_gattc_db_elem_t
data base attribute element

Public Members

esp_gatt_db_attr_type_t type
The attribute type

uint16_t attribute_handle
The attribute handle, it’s valid for all of the type

uint16_t start_handle
The service start handle, it’s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

uint16_t end_handle
The service end handle, it’s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

esp_gatt_char_prop_t properties
The characteristic properties, it’s valid only when the type = ESP_GATT_DB_CHARACTERISTIC

esp_bt_uuid_t uuid
The attribute uuid, it’s valid for all of the type
Chapter 2. API Reference

```c
struct esp_gattc_service_elem_t
  service element

Public Members

bool is_primary
  The service flag, true if the service is primary service, else is secondary service

uint16_t start_handle
  The start handle of the service

uint16_t end_handle
  The end handle of the service

esp.btuuid_t uuid
  The uuid of the service

struct esp_gattc_char_elem_t
  characteristic element

Public Members

uint16_t char_handle
  The characteristic handle

esp.gatt.char.prop_t properties
  The characteristic properties

esp.btuuid_t uuid
  The characteristic uuid

struct esp_gattc_descr_elem_t
  descriptor element

Public Members

uint16_t handle
  The characteristic descriptor handle

esp.btuuid_t uuid
  The characteristic descriptor uuid

struct esp_gattc_incl_svc_elem_t
  include service element
```
Chapter 2. API Reference

Public Members

uint16_t handle
The include service current attribute handle

uint16_t incl_srvc_s_handle
The start handle of the service which has been included

uint16_t incl_srvc_e_handle
The end handle of the service which has been included

esp_bt_uuid_t uuid
The include service uuid

ESP_GATT_CHAR_PROP_BIT_INDICATE
ESP_GATT_CHAR_PROP_BIT_AUTH
ESP_GATT_CHAR_PROP_BIT_EXT_PROP
ESP_GATT_MAX_ATTR_LEN
    GATT maximum attribute length.
ESP_GATT_RSP_BY_APP
ESP_GATT_AUTO_RSP
ESP_GATT_IF_NONE
    If callback report gattc_if/gatts_if as this macro, means this event is not correspond to any app

Type Definitions
typedef uint16_t esp_gatt_perm_t

typedef uint8_t esp_gatt_char_prop_t

typedef uint8_t esp_gatt_if_t
    Gatt interface type, different application on GATT client use different gatt_if
Enumerations

enum esp_gatt_prep_write_type
    Attribute write data type from the client.
    Values:

    enumerator ESP_GATT_PREP_WRITE_CANCEL
        Prepare write cancel

    enumerator ESP_GATT_PREP_WRITE_EXEC
        Prepare write execute

enum esp_gatt_status_t
    GATT success code and error codes.
    Values:

    enumerator ESP_GATT_OK
    enumerator ESP_GATT_INVALID_HANDLE
    enumerator ESP_GATT_READ_NOT_PERMIT
    enumerator ESP_GATT_WRITE_NOT_PERMIT
    enumerator ESP_GATT_INVALID_PDU
    enumerator ESP_GATT_INSUF_AUTHENTICATION
    enumerator ESP_GATT_REQ_NOT_SUPPORTED
    enumerator ESP_GATT_INVALID_OFFSET
    enumerator ESP_GATT_INSUF_AUTHORIZATION
    enumerator ESP_GATT_PREPARE_Q_FULL
    enumerator ESP_GATT_NOT_FOUND
    enumerator ESP_GATT_NOT_LONG
    enumerator ESP_GATT_INSUF_KEY_SIZE
    enumerator ESP_GATT_INVALID_ATTR_LEN
    enumerator ESP_GATT_ERR_UNLIKELY
    enumerator ESP_GATT_INSUF_ENCRYPTION
enumerator ESP_GATT_UNSUPPORT_GRP_TYPE
enumerator ESP_GATT_INSUF_RESOURCE
enumerator ESP_GATT_NO_RESOURCES
enumerator ESP_GATT_INTERNAL_ERROR
enumerator ESP_GATT_WRONG_STATE
enumerator ESP_GATT_DB_FULL
enumerator ESP_GATT_BUSY
enumerator ESP_GATT_ERROR
enumerator ESP_GATT_CMD_STARTED
enumerator ESP_GATT_ILLEGAL_PARAMETER
enumerator ESP_GATT_PENDING
enumerator ESP_GATT_AUTH_FAIL
enumerator ESP_GATT_MORE
enumerator ESP_GATT_INVALID_CFG
enumerator ESP_GATT_SERVICE_STARTED
enumerator ESP_GATT_ENCRYPTED_MITM
enumerator ESP_GATT_ENCRYPTED_NO_MITM
enumerator ESP_GATT_NOT_ENCRYPTED
enumerator ESP_GATT_CONGESTED
enumerator ESP_GATT_DUP_REG
enumerator ESP_GATT_ALREADY_OPEN
enumerator ESP_GATT_CANCEL
enumerator ESP_GATT_STACK_RSP
enumerator ESP_GATT_APP_RSP

enumerator ESP_GATT_UNKNOWN_ERROR

enumerator ESP_GATT_CCC_CFG_ERR

enumerator ESP_GATT_PRC_IN_PROGRESS

enumerator ESP_GATT_OUT_OF_RANGE

enum esp_gatt_conn_reason_t
    Gatt Connection reason enum.
    Values:

    enumerator ESP_GATT_CONN_UNKNOWN
        Gatt connection unknown

    enumerator ESP_GATT_CONN_L2C_FAILURE
        General L2cap failure

    enumerator ESP_GATT_CONN_TIMEOUT
        Connection timeout

    enumerator ESP_GATT_CONN_TERMINATE_PEER_USER
        Connection terminate by peer user

    enumerator ESP_GATT_CONN_TERMINATE_LOCAL_HOST
        Connection terminated by local host

    enumerator ESP_GATT_CONN_FAIL_ESTABLISH
        Connection fail to establish

    enumerator ESP_GATT_CONN_LMP_TIMEOUT
        Connection fail for LMP response tout

    enumerator ESP_GATT_CONN_CONN_CANCEL
        L2CAP connection cancelled

    enumerator ESP_GATT_CONN_NONE
        No connection to cancel

enum esp_gatt_auth_req_t
    Gatt authentication request type.
    Values:

    enumerator ESP_GATT_AUTH_REQ_NONE
enumerator **ESP_GATT_AUTH_REQ_NO_MITM**

enumerator **ESP_GATT_AUTH_REQ_MITM**

enumerator **ESP_GATT_AUTH_REQ_SIGNED_NO_MITM**

enumerator **ESP_GATT_AUTH_REQ_SIGNED_MITM**

enum **esp_service_source_t**

Values:

enumerator **ESP_GATT_SERVICE_FROM_REMOTE_DEVICE**

enumerator **ESP_GATT_SERVICE_FROM_NVS_FLASH**

enumerator **ESP_GATT_SERVICE_FROM_UNKNOWN**

enum **esp_gatt_write_type_t**

Gatt write type.

Values:

enumerator **ESP_GATT_WRITE_TYPE_NO_RSP**

Gatt write attribute need no response

enumerator **ESP_GATT_WRITE_TYPE_RSP**

Gatt write attribute need remote response

enum **esp_gatt_db_attr_type_t**

the type of attribute element

Values:

enumerator **ESP_GATT_DB_PRIMARY_SERVICE**

Gattc primary service attribute type in the cache

enumerator **ESP_GATT_DB_SECONDARY_SERVICE**

Gattc secondary service attribute type in the cache

enumerator **ESP_GATT_DB_CHARACTERISTIC**

Gattc characteristic attribute type in the cache

enumerator **ESP_GATT_DB_DESCRIPTOR**

Gattc characteristic descriptor attribute type in the cache

enumerator **ESP_GATT_DB_INCLUDED_SERVICE**

Gattc include service attribute type in the cache
enumerator **ESP_GATT_DB_ALL**

Gatc all the attribute (primary service & secondary service & include service & char & descriptor) type in the cache

### GATT SERVER API

**Application Example**  Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT server demo and its tutorial. This demo creates a GATT service with an attribute table, which releases the user from adding attributes one by one. This is the recommended method of adding attributes.
  - bluetooth/bluedroid/ble/gatt_server_service_table
  - **GATT Server Service Table Example Walkthrough**
- This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by one as defined by Bluedroid. The recommended method of adding attributes is presented in example above.
  - bluetooth/bluedroid/ble/gatt_server
  - **GATT Server Example Walkthrough**
- This is a BLE SPP-Like demo. This demo, which acts as a GATT server, can receive data from UART and then send the data to the peer device automatically.
  - bluetooth/bluedroid/ble/ble_spp_server

### API Reference

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_gatts_api.h

**Functions**

*esp_err_t* **esp_ble_gatts_register_callback**( *esp_gatts_cb_t callback*)

This function is called to register application callbacks with BTA GATTS module.

**Returns**

- ESP_OK : success
- other : failed

*esp_err_t* **esp_ble_gatts_app_register**( *uint16_t app_id*)

This function is called to register application identifier.

**Returns**

- ESP_OK : success
- other : failed

*esp_err_t* **esp_ble_gatts_app_unregister**( *esp_gatt_if_t gatts_if*)

unregister with GATT Server.

**Parameters**

* gatts_if [in] GATT server access interface

**Returns**

- ESP_OK : success
- other : failed

*esp_err_t* **esp_ble_gatts_create_service**( *esp_gatt_if_t gatts_if, esp_gatt_srvc_id_t *service_id, uint16_t num_handle*)

Create a service. When service creation is done, a callback event ESP_GATTS_CREATE_EVT is called to report status and service ID to the profile. The service ID obtained in the callback function needs to be used when adding included service and characteristics/descriptors into the service.

**Parameters**

- * gatts_if [in] GATT server access interface
• service_id [in] service ID.
• num_handle [in] number of handle requested for this service.

Returns
• ESP_OK : success
• other : failed

\texttt{esp_err_t esp\_ble\_gatts\_create\_attr\_tab}(const esp\_gatts\_attr\_db\_t *gatts\_attr\_db, esp\_gatt\_if\_t gatts\_if, uint16\_t max\_nb\_attr, uint8\_t srvc\_inst\_id)

Create a service attribute tab.

Parameters
• gatts\_attr\_db [in] the pointer to the service attr tab
• gatts\_if [in] GATT server access interface
• max\_nb\_attr [in] the number of attribute to be added to the service database.
• srvc\_inst\_id [in] the instance id of the service

Returns
• ESP_OK : success
• other : failed

\texttt{esp\_err\_t esp\_ble\_gatts\_add\_included\_service}(uint16\_t service\_handle, uint16\_t included\_service\_handle)

This function is called to add an included service. This function have to be called between ‘esp\_ble\_gatts\_create\_service’ and ‘esp\_ble\_gatts\_add\_char’. After included service is included, a callback event ESP\_GATTS\_ADD\_INCL\_SRVC\_EVT is reported the included service ID.

Parameters
• service\_handle [in] service handle to which this included service is to be added.
• included\_service\_handle [in] the service ID to be included.

Returns
• ESP_OK : success
• other : failed

\texttt{esp\_err\_t esp\_ble\_gatts\_add\_char}(uint16\_t service\_handle, esp\_bt\_uuid\_t *char\_uuid, esp\_gatt\_perm\_t perm, esp\_gatt\_char\_prop\_t property, esp\_attr\_value\_t *char\_val, esp\_attr\_control\_t *control)

This function is called to add a characteristic into a service.

Parameters
• service\_handle [in] service handle to which this included service is to be added.
• char\_uuid [in] : Characteristic UUID.
• perm [in] : Characteristic value declaration attribute permission.
• property [in] : Characteristic Properties
• char\_val [in] : Characteristic value
• control [in] : attribute response control byte

Returns
• ESP_OK : success
• other : failed

\texttt{esp\_err\_t esp\_ble\_gatts\_add\_char\_descr}(uint16\_t service\_handle, esp\_bt\_uuid\_t *descr\_uuid, esp\_gatt\_perm\_t perm, esp\_attr\_value\_t *char\_descr\_val, esp\_attr\_control\_t *control)

This function is called to add characteristic descriptor. When it’s done, a callback event ESP\_GATTS\_ADD\_DESCR\_EVT is called to report the status and an ID number for this descriptor.

Parameters
• service\_handle [in] service handle to which this characteristic descriptor is to be added.
• perm [in] descriptor access permission.
• descr\_uuid [in] descriptor UUID.
• char\_descr\_val [in] : Characteristic descriptor value
• control [in] : attribute response control byte
Chapter 2. API Reference

**Returns**
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gatts_delete_service (uint16_t service_handle)`
This function is called to delete a service. When this is done, a callback event ESP_GATTS_DELETE_EVT is report with the status.

- **Parameters**
  - service_handle - [in] service_handle to be deleted.

- **Returns**
  - ESP_OK: success
  - other: failed

`esp_err_t esp_ble_gatts_start_service (uint16_t service_handle)`
This function is called to start a service.

- **Parameters**
  - service_handle - [in] the service handle to be started.

- **Returns**
  - ESP_OK: success
  - other: failed

`esp_err_t esp_ble_gatts_stop_service (uint16_t service_handle)`
This function is called to stop a service.

- **Parameters**
  - service_handle - [in] - service to be topped.

- **Returns**
  - ESP_OK: success
  - other: failed

`esp_err_t esp_ble_gatts_send_indicate (esp_gatt_if_t gatts_if, uint16_t conn_id, uint16_t attr_handle, uint16_t value_len, uint8_t* value, bool need_confirm)`
Send indicate or notify to GATT client. Set param need_confirm as false will send notification, otherwise indication.

- **Parameters**
  - gatts_if - [in] GATT server access interface
  - conn_id - [in] - connection id to indicate.
  - attr_handle - [in] - attribute handle to indicate.
  - value_len - [in] - indicate value length.
  - value - [in] value to indicate.
  - need_confirm - [in] - Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

- **Returns**
  - ESP_OK: success
  - other: failed

`esp_err_t esp_ble_gatts_send_response (esp_gatt_if_t gatts_if, uint16_t conn_id, uint32_t trans_id, esp_gatt_status_t status, esp_gatt_rsp_t *rsp)`
This function is called to send a response to a request.

- **Parameters**
  - gatts_if - [in] GATT server access interface
  - trans_id - [in] - transfer id
  - status - [in] - response status
  - rsp - [in] - response data.

- **Returns**
  - ESP_OK: success
  - other: failed

`esp_err_t esp_ble_gatts_set_attr_value (uint16_t attr_handle, uint16_t length, const uint8_t* value)`
This function is called to set the attribute value by the application.
### Chapter 2. API Reference

#### Parameters
- **attr_handle** – [in] the attribute handle which to be set
- **length** – [in] the value length
- **value** – [in] the pointer to the attribute value

#### Returns
- ESP_OK : success
- other : failed

**esp_gatt_status_t esp_ble_gatts_get_attr_value**(uint16_t attr_handle, uint16_t *length, const uint8_t **value)

Retrieve attribute value.

#### Parameters
- **attr_handle** – [in] Attribute handle.
- **length** – [out] pointer to the attribute value length
- **value** – [out] Pointer to attribute value payload, the value cannot be modified by user

#### Returns
- ESP_GATT_OK : success
- other : failed

**esp_err_t esp_ble_gatts_open**(esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda, bool is_direct)

Open a direct open connection or add a background auto connection.

#### Parameters
- **gatts_if** – [in] GATT server access interface
- **remote_bda** – [in] remote device bluetooth device address.
- **is_direct** – [in] direct connection or background auto connection

#### Returns
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gatts_close**(esp_gatt_if_t gatts_if, uint16_t conn_id)

Close a connection a remote device.

#### Parameters
- **gatts_if** – [in] GATT server access interface
- **conn_id** – [in] connection ID to be closed.

#### Returns
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gatts_send_service_change_indication**(esp_gatt_if_t gatts_if, esp Bd_addr_t remote_bda)

Send service change indication.

#### Parameters
- **gatts_if** – [in] GATT server access interface
- **remote_bda** – [in] remote device bluetooth device address. If remote_bda is NULL then it will send service change indication to all the connected devices and if not then to a specific device

#### Returns
- ESP_OK : success
- other : failed

#### Unions

**union esp_ble_gatts_cb_param_t**

```c
#include <esp_gatts_api.h> Gatt server callback parameters union.
```
Chapter 2. API Reference

Public Members

struct esp_ble_gatts_cb_param_t::gatts_reg_evt_param reg
    Gatt server callback param of ESP_GATTS_REG_EVT

Type Definitions

typedef void (*esp_gatts_cb_t)(esp_gatts_cb_event_t event, esp_gatt_if_t gatts_if, esp_ble_gatts_cb_param_t *param)

GATT Server callback function type.

- **Param event**: Event type
- **Param gatts_if**: GATT server access interface, normally different gatts_if correspond to different profile
- **Param param**: Point to callback parameter, currently is union type

Enumerations

enum esp_gatts_cb_event_t

GATT Server callback function events.

*Values:*

- **enumerator ESP_GATTS_REG_EVT**
  When register application id, the event comes

- **enumerator ESP_GATTS_READ_EVT**
  When gatt client request read operation, the event comes

- **enumerator ESP_GATTS_WRITE_EVT**
  When gatt client request write operation, the event comes

- **enumerator ESP_GATTS_EXEC_WRITE_EVT**
  When gatt client request execute write, the event comes

- **enumerator ESP_GATTS_MTU_EVT**
  When set mtu complete, the event comes

- **enumerator ESP_GATTS_CONF_EVT**
  When receive confirm, the event comes

- **enumerator ESP_GATTS_UNREG_EVT**
  When unregister application id, the event comes

- **enumerator ESP_GATTS_CREATE_EVT**
  When create service complete, the event comes

- **enumerator ESP_GATTS_ADD_INCL_SRVC_EVT**
  When add included service complete, the event comes

- **enumerator ESP_GATTS_ADD_CHAR_EVT**
  When add characteristic complete, the event comes

- **enumerator ESP_GATTS_ADD_CHAR_DESCR_EVT**
  When add descriptor complete, the event comes
enumerator **ESP_GATTS_DELETE_EVT**
   When delete service complete, the event comes

enumerator **ESP_GATTS_START_EVT**
   When start service complete, the event comes

enumerator **ESP_GATTS_STOP_EVT**
   When stop service complete, the event comes

enumerator **ESP_GATTS_CONNECT_EVT**
   When gatt client connect, the event comes

enumerator **ESP_GATTS_DISCONNECT_EVT**
   When gatt client disconnect, the event comes

enumerator **ESP_GATTS_OPEN_EVT**
   When connect to peer, the event comes

enumerator **ESP_GATTS_CANCEL_OPEN_EVT**
   When disconnect from peer, the event comes

enumerator **ESP_GATTS_CLOSE_EVT**
   When gatt server close, the event comes

enumerator **ESP_GATTS_LISTEN_EVT**
   When gatt listen to be connected the event comes

enumerator **ESP_GATTS_CONGEST_EVT**
   When congest happen, the event comes

enumerator **ESP_GATTS_RESPONSE_EVT**
   When gatt send response complete, the event comes

enumerator **ESP_GATTS_CREAT_ATTR_TAB_EVT**
   When gatt create table complete, the event comes

enumerator **ESP_GATTS_SET_ATTR_VAL_EVT**
   When gatt set attr value complete, the event comes

enumerator **ESP_GATTS_SEND_SERVICE_CHANGE_EVT**
   When gatt send service change indication complete, the event comes

---

**GATT CLIENT API**

**Application Example**

Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
  - bluetooth/bluedroid/ble/gatt_client
Chapter 2. API Reference

- GATT Client Example Walkthrough
  - This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
    - bluetooth/bluedroid/ble/gattc_multi_connect
  - GATT Client Multi-connection Example Walkthrough
  - This is a BLE SPP-Like demo. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.
    - bluetooth/bluedroid/ble/ble_spp_client

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_gattc_api.h

Functions

```c
esp_err_t esp_ble_gattc_register_callback (esp_gattc_cb_t callback)
```

This function is called to register application callbacks with GATTC module.

**Parameters**

- `callback` - [in]: pointer to the application callback function.

**Returns**

- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_app_register (uint16_t app_id)
```

This function is called to register application callbacks with GATTC module.

**Parameters**

- `app_id` - [in]: Application Identify (UUID), for different application

**Returns**

- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_app_unregister (esp_gatt_if_t gattc_if)
```

This function is called to unregister an application from GATTC module.

**Parameters**

**Returns**

- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_open (esp_gatt_if_t gattc_if, esp_bd_addr_t remote_bda, esp_ble_addr_type_t remote_addr_type, bool is_direct)
```

Open a direct connection or add a background auto connection.

**Parameters**

- `remote_bda` - [in] remote device bluetooth device address.
- `remote_addr_type` - [in] remote device bluetooth device the address type.
- `is_direct` - [in] direct connection or background auto connection(by now, background auto connection is not supported).

**Returns**

- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattcAux_open (esp_gatt_if_t gattc_if, esp_bd_addr_t remote_bda, esp_ble_addr_type_t remote_addr_type, bool is_direct)
```
**esp_err_t esp_ble_gattc_close**(esp_gatt_if_t gattc_if, uint16_t conn_id)

Close the virtual connection to the GATT server. gattc may have multiple virtual GATT server connections when multiple app_id registered, this API only close one virtual GATT server connection. If there exist other virtual GATT server connections, it does not disconnect the physical connection. If you want to disconnect the physical connection directly, you can use esp_ble_gap_disconnect(esp_bd_addr_t remote_device).

**Parameters**
- conn_id - [in] connection ID to be closed.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gattc_send_mtu_req**(esp_gatt_if_t gattc_if, uint16_t conn_id)

Configure the MTU size in the GATT channel. This can be done only once per connection. Before using, use esp_ble_gatt_set_local_mtu() to configure the local MTU size.

**Parameters**
- conn_id - [in] connection ID.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gattc_search_service**(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_bt_uuid_t *filter_uuid)

This function is called to get service from local cache. This function report service search result by a callback event, and followed by a service search complete event.

**Parameters**
- conn_id - [in] connection ID.
- filter_uuid - [in] a UUID of the service application is interested in. If Null, discover for all services.

**Returns**
- ESP_OK: success
- other: failed

**esp_gatt_status_t esp_ble_gattc_get_service**(esp_gatt_if_t gattc_if, uint16_t conn_id, esp.bt.uuid_t *svc_uuid, esp.gattc.service_elem_t *result, uint16_t *count, uint16_t offset)

Find all the service with the given service uuid in the gattc cache, if the svc_uuid is NULL, find all the service. Note: It just get service from local cache, won’t get from remote devices. If want to get it from remote device, need to used the esp_ble_gatt_cache_refresh, then call esp_ble_gattc_get_service again.

**Parameters**
- conn_id - [in] connection ID which identify the server.
- svc_uuid - [in] the pointer to the service uuid.
- result - [out] The pointer to the service which has been found in the gattc cache.
- count - [in/out] input the number of service want to find, it will output the number of service has been found in the gattc cache with the given service uuid.
- offset - [in] Offset of the service position to get.

**Returns**
- ESP_OK: success
- other: failed

**esp_gatt_status_t esp_ble_gattc_get_all_char**(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp.gattc.char_elem_t *result, uint16_t *count, uint16_t offset)

Submit Document Feedback
Find all the characteristic with the given service in the gattc cache Note: It just get characteristic from local cache, won’t get from remote devices.

**Parameters**
- **gattc_if** [in] Gatt client access interface.
- **conn_id** [in] connection ID which identify the server.
- **start_handle** [in] the attribute start handle.
- **end_handle** [in] the attribute end handle
- **result** [out] The pointer to the characteristic in the service.
- **count** [inout] input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.
- **offset** [in] Offset of the characteristic position to get.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_all_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_gattc_descr_elem_t *result, uint16_t *count, uint16_t offset)
```

Find all the descriptor with the given characteristic in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

**Parameters**
- **gattc_if** [in] Gatt client access interface.
- **conn_id** [in] connection ID which identify the server.
- **char_handle** [in] the given characteristic handle
- **result** [out] The pointer to the descriptor in the characteristic.
- **count** [inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
- **offset** [in] Offset of the descriptor position to get.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_char_by_uuid(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_gattc_char_elem_t *result, uint16_t *count)
```

Find the characteristic with the given characteristic uuid in the gattc cache Note: It just get characteristic from local cache, won’t get from remote devices.

**Parameters**
- **gattc_if** [in] Gatt client access interface.
- **conn_id** [in] connection ID which identify the server.
- **start_handle** [in] the attribute start handle
- **end_handle** [in] the attribute end handle
- **char_uuid** [in] the characteristic uuid
- **result** [out] The pointer to the characteristic in the service.
- **count** [inout] input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_descr_by_uuid(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic uuid in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.
cache, won’t get from remote devices.

**Parameters**
- `conn_id` - [in] connection ID which identify the server.
- `start_handle` - [in] the attribute start handle
- `end_handle` - [in] the attribute end handle
- `char_uuid` - [in] the characteristic uuid.
- `descr_uuid` - [in] the descriptor uuid.
- `result` - [out] The pointer to the descriptor in the given characteristic.
- `count` - [inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_descr_by_char_handle(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic handle in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

**Parameters**
- `conn_id` - [in] connection ID which identify the server.
- `char_handle` - [in] the characteristic handle.
- `descr_uuid` - [in] the descriptor uuid.
- `result` - [out] The pointer to the descriptor in the given characteristic.
- `count` - [inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_include_service(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t *incl_uuid, esp_gattc_incl_svc_elem_t *result, uint16_t *count)
```

Find the include service with the given service handle in the gattc cache Note: It just get include service from local cache, won’t get from remote devices.

**Parameters**
- `conn_id` - [in] connection ID which identify the server.
- `start_handle` - [in] the attribute start handle
- `end_handle` - [in] the attribute end handle
- `incl_uuid` - [in] the include service uuid
- `result` - [out] The pointer to the include service in the given service.
- `count` - [inout] input the number of include service want to find, it will output the number of include service has been found in the gattc cache with the given service.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_attr_count(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gatt_db_attr_type_t type, uint16_t start_handle, uint16_t end_handle, uint16_t char_handle, uint16_t *count)
```
Find the attribute count with the given service or characteristic in the gattc cache.

**Parameters**
- `conn_id` - [in] connection ID which identify the server.
- `type` - [in] the attribute type.
- `start_handle` - [in] the attribute start handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- `end_handle` - [in] the attribute end handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- `char_handle` - [in] the characteristic handle, this parameter valid when the type is ESP_GATT_DB_DESCRIPTOR. If the type isn’t ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore.
- `count` - [out] output the number of attribute has been found in the gattc cache with the given attribute type.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_db(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_gattc_db_elem_t *db, uint16_t *count)
```

This function is called to get the GATT database. Note: It just get attribute data base from local cache, won’t get from remote devices.

**Parameters**
- `start_handle` - [in] the attribute start handle
- `end_handle` - [in] the attribute end handle
- `conn_id` - [in] connection ID which identify the server.
- `db` - [in] output parameter which will contain the GATT database copy. Caller is responsible for freeing it.
- `count` - [in] number of elements in database.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_read_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, esp_gatt_auth_req_t auth_req)
```

This function is called to read a service’s characteristics of the given characteristic handle.

**Parameters**
- `conn_id` - [in] : connection ID.
- `handle` - [in] : characteristic handle to read.
- `auth_req` - [in] : authenticate request type

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_read_by_type(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_by_uuid_t *uuid, esp_gatt_auth_req_t auth_req)
```

This function is called to read a service’s characteristics of the given characteristic UUID.

**Parameters**
- `conn_id` - [in] : connection ID.
- `start_handle` - [in] : the attribute start handle.
- `end_handle` - [in] : the attribute end handle
- `uuid` - [in] : The UUID of attribute which will be read.
• **auth_req** [in]: authenticate request type

**Returns**

• ESP_OK: success
• other: failed

```c
esp_err_t esp_ble_gattc_read_multiple(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gattc_multi_t *read_multi, esp_gatt_auth_req_t auth_req)
```

This function is called to read multiple characteristic or characteristic descriptors.

**Parameters**

- **gattc_if** [in]: Gatt client access interface.
- **conn_id** [in]: connection ID.
- **read_multi** [in]: pointer to the read multiple parameter.
- **auth_req** [in]: authenticate request type

**Returns**

- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_read_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, esp_gatt_auth_req_t auth_req)
```

This function is called to read a characteristics descriptor.

**Parameters**

- **gattc_if** [in]: Gatt client access interface.
- **conn_id** [in]: connection ID.
- **handle** [in]: descriptor handle to read.
- **auth_req** [in]: authenticate request type

**Returns**

- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_write_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, esp_gatt_write_type_t write_type, esp_gatt_auth_req_t auth_req)
```

This function is called to write characteristic value.

**Parameters**

- **gattc_if** [in]: Gatt client access interface.
- **conn_id** [in]: connection ID.
- **handle** [in]: characteristic handle to write.
- **value_len** [in]: length of the value to be written.
- **value** [in]: the value to be written.
- **write_type** [in]: the type of attribute write operation.
- **auth_req** [in]: authentication request.

**Returns**

- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_write_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, esp_gatt_write_type_t write_type, esp_gatt_auth_req_t auth_req)
```

This function is called to write characteristic descriptor value.

**Parameters**

- **gattc_if** [in]: Gatt client access interface.
- **conn_id** [in]: connection ID.
- **handle** [in]: descriptor handle to write.
- **value_len** [in]: length of the value to be written.
- **value** [in]: the value to be written.
- **write_type** [in]: the type of attribute write operation.
- **auth_req** [in]: authentication request.
### Returns

- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_prepare_write(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle,
uint16_t offset, uint16_t value_len, uint8_t* value,
esp_gatt_auth_req_t auth_req)
```

This function is called to prepare write a characteristic value.

#### Parameters

- `conn_id` - [in]: connection ID.
- `handle` - [in]: characteristic handle to prepare write.
- `offset` - [in]: offset of the write value.
- `value_len` - [in] length of the value to be written.
- `value` - [in]: the value to be written.
- `auth_req` - [in]: authentication request.

### Returns

- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_prepare_write_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id,
uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t* value,
esp_gatt_auth_req_t auth_req)
```

This function is called to prepare write a characteristic descriptor value.

#### Parameters

- `conn_id` - [in]: connection ID.
- `handle` - [in]: characteristic descriptor handle to prepare write.
- `offset` - [in]: offset of the write value.
- `value_len` - [in] length of the value to be written.
- `value` - [in]: the value to be written.
- `auth_req` - [in]: authentication request.

### Returns

- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_execute_write(esp_gatt_if_t gattc_if, uint16_t conn_id,
bool is_execute)
```

This function is called to execute write a prepare write sequence.

#### Parameters

- `conn_id` - [in]: connection ID.
- `is_execute` - [in]: execute or cancel.

### Returns

- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_register_for_notify(esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda,
uint16_t handle)
```

This function is called to register for notification of a service.

#### Parameters

- `server_bda` - [in]: target GATT server.
- `handle` - [in]: GATT characteristic handle.

### Returns

- ESP_OK: registration succeeds
- other: failed
**esp_err_t esp_ble_gattc_unregister_for_notify** (esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda, uint16_t handle)

This function is called to de-register for notification of a service.

**Parameters**
- `gattc_if` [in]: Gatt client access interface.
- `server_bda` [in]: target GATT server.
- `handle` [in]: GATT characteristic handle.

**Returns**
- ESP_OK: unregister succeeds
- other: failed

**esp_err_t esp_ble_gattc_cache_refresh** (esp_bd_addr_t remote_bda)

Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

**Parameters**
- `remote_bda` [in]: remote device BD address.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gattc_cache_assoc** (esp_gatt_if_t gattc_if, esp_bd_addr_t src_addr, esp_bd_addr_t assoc_addr, bool is_assoc)

Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device’s attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address mains that device want to used the database has stored in the local cache. The source address mains that device want to share the database to the associated address device.

**Parameters**
- `gattc_if` [in]: Gatt client access interface.
- `src_addr` [in]: the source address which provide the attribute table.
- `assoc_addr` [in]: the associated device address which went to share the attribute table with the source address.
- `is_assoc` [in]: true add the associated device address, false remove the associated device address.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gattc_cache_get_addr_list** (esp_gatt_if_t gattc_if)

Get the address list which has store the attribute table in the gattc cache. There will callback ESP_GATTC_GET_ADDR_LIST_EVT event when get address list complete.

**Parameters**
- `gattc_if` [in]: Gatt client access interface.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gattc_cache_clean** (esp_bd_addr_t remote_bda)

Clean the service cache of this device in the gattc stack.

**Parameters**
- `remote_bda` [in]: remote device BD address.

**Returns**
- ESP_OK: success
- other: failed

**Unions**
union `esp_ble_gattc_cb_param_t`

#include <esp_gattc_api.h> Gatt client callback parameters union.

**Public Members**

struct `esp_ble_gattc_cb_param_t::gattc_reg_evt_param reg`

Gatt client callback param of ESP_GATTC_REG_EVT

struct `esp_ble_gattc_cb_param_t::gattc_open_evt_param open`

Gatt client callback param of ESP_GATTC_OPEN_EVT

struct `esp_ble_gattc_cb_param_t::gattc_close_evt_param close`

Gatt client callback param of ESP_GATTC_CLOSE_EVT

struct `esp_ble_gattc_cb_param_t::gattc_cfg_mtu_evt_param cfg_mtu`

Gatt client callback param of ESP_GATTC_CFG_MTU_EVT

struct `esp_ble_gattc_cb_param_t::gattc_search_cmplEvt_param search_cmpl`

Gatt client callback param of ESP_GATTC_SEARCH_CMPL_EVT

struct `esp_ble_gattc_cb_param_t::gattc_search_resEvt_param search_res`

Gatt client callback param of ESP_GATTC_SEARCH_RES_EVT

struct `esp_ble_gattc_cb_param_t::gattc_read_charEvt_param read`

Gatt client callback param of ESP_GATTC_READ_CHAR_EVT

struct `esp_ble_gattc_cb_param_t::gattc_write_evt_param write`

Gatt client callback param of ESP_GATTC_WRITE_DESCR_EVT

struct `esp_ble_gattc_cb_param_t::gattc_exec_cmplEvt_param exec_cmpl`

Gatt client callback param of ESP_GATTC_EXEC_EVT

struct `esp_ble_gattc_cb_param_t::gattc_notify_evt_param notify`

Gatt client callback param of ESP_GATTC_NOTIFY_EVT

struct `esp_ble_gattc_cb_param_t::gattc_srvc_chg_evt_param srcv_chg`

Gatt client callback param of ESP_GATTC_SRVC_CHG_EVT

struct `esp_ble_gattc_cb_param_t::gattc_congest_evt_param congest`

Gatt client callback param of ESP_GATTC_CONGEST_EVT

struct `esp_ble_gattc_cb_param_t::gattc_reg_for_notify_evt_param reg_for_notify`

Gatt client callback param of ESP_GATTC_REG_FOR_NOTIFY_EVT

struct `esp_ble_gattc_cb_param_t::gattc_unreg_for_notify_evt_param unreg_for_notify`

Gatt client callback param of ESP_GATTC_UNREG_FOR_NOTIFY_EVT

```c
struct esp_ble_gattc_cb_param_t::gattc_connect_evt_param connect
    Gatt client callback param of ESP_GATTC_CONNECT_EVT

struct esp_ble_gattc_cb_param_t::gattc_disconnect_evt_param disconnect
    Gatt client callback param of ESP_GATTC_DISCONNECT_EVT

struct esp_ble_gattc_cb_param_t::gattc_set_assoc_addr_cmp_evt_param set_assoc_cmp
    Gatt client callback param of ESP_GATTC_SET_ASSOC_EVT

struct esp_ble_gattc_cb_param_t::gattc_get_addr_list_evt_param get_addr_list
    Gatt client callback param of ESP_GATTC_GET_ADDR_LIST_EVT

struct esp_ble_gattc_cb_param_t::gattc_queue_full_evt_param queue_full
    Gatt client callback param of ESP_GATTC_QUEUE_FULL_EVT

struct esp_ble_gattc_cb_param_t::gattc_dis_srvc_cmpl_evt_param dis_srvc_cmpl
    Gatt client callback param of ESP_GATTC_DIS_SRVC_CMPL_EVT

struct gattc_cfg_mtu_evt_param

Type Definitions

typedef void (*esp_gattc_cb_t)(esp_gattc_cb_event_t event, esp_gatt_if_t gattc_if, esp_ble_gattc_cb_param_t *param)

GATT Client callback function type.

- **Param event**: Event type
- **Param gattc_if**: GATT client access interface, normally different gattc_if correspond to different profile
- **Param param**: Point to callback parameter, currently is union type

Enumerations

```c
enum esp_gattc_cb_event_t
```

GATT Client callback function events.

**Values:**

- **enumerator ESP_GATTC_REG_EVT**
  When GATT client is registered, the event comes

- **enumerator ESP_GATTC_UNREG_EVT**
  When GATT client is unregistered, the event comes
enumerator \texttt{ESP\_GATTC\_OPEN\_EVT}
When GATT virtual connection is set up, the event comes

enumerator \texttt{ESP\_GATTC\_READ\_CHAR\_EVT}
When GATT characteristic is read, the event comes

enumerator \texttt{ESP\_GATTC\_WRITE\_CHAR\_EVT}
When GATT characteristic write operation completes, the event comes

enumerator \texttt{ESP\_GATTC\_CLOSE\_EVT}
When GATT virtual connection is closed, the event comes

enumerator \texttt{ESP\_GATTC\_SEARCH\_CMPL\_EVT}
When GATT service discovery is completed, the event comes

enumerator \texttt{ESP\_GATTC\_SEARCH\_RES\_EVT}
When GATT service discovery result is got, the event comes

enumerator \texttt{ESP\_GATTC\_READ\_DESCR\_EVT}
When GATT characteristic descriptor read completes, the event comes

enumerator \texttt{ESP\_GATTC\_WRITE\_DESCR\_EVT}
When GATT characteristic descriptor write completes, the event comes

enumerator \texttt{ESP\_GATTC\_NOTIFY\_EVT}
When GATT notification or indication arrives, the event comes

enumerator \texttt{ESP\_GATTC\_PREP\_WRITE\_EVT}
When GATT prepare-write operation completes, the event comes

enumerator \texttt{ESP\_GATTC\_EXEC\_EVT}
When write execution completes, the event comes

enumerator \texttt{ESP\_GATTC\_ACL\_EVT}
When ACL connection is up, the event comes

enumerator \texttt{ESP\_GATTC\_CANCELED\_OPEN\_EVT}
When GATT client ongoing connection is cancelled, the event comes

enumerator \texttt{ESP\_GATTC\_SRVC\_CHG\_EVT}
When “service changed” occurs, the event comes

enumerator \texttt{ESP\_GATTC\_ENC\_CMPL\_CB\_EVT}
When encryption procedure completes, the event comes

enumerator \texttt{ESP\_GATTC\_CFG\_MTU\_EVT}
When configuration of MTU completes, the event comes
enumerator **ESP_GATTC_ADV_DATA_EVT**  
When advertising of data, the event comes

denumerator **ESP_GATTC_MULT_ADV_ENB_EVT**  
When multi-advertising is enabled, the event comes

denumerator **ESP_GATTC_MULT_ADV_UPD_EVT**  
When multi-advertising parameters are updated, the event comes

denumerator **ESP_GATTC_MULT_ADV_DATA_EVT**  
When multi-advertising data arrives, the event comes

denumerator **ESP_GATTC_MULT_ADV_DIS_EVT**  
When multi-advertising is disabled, the event comes

denumerator **ESP_GATTC_CONGEST_EVT**  
When GATT connection congestion comes, the event comes

denumerator **ESP_GATTC_BTH_SCAN_ENB_EVT**  
When batch scan is enabled, the event comes

denumerator **ESP_GATTC_BTH_SCAN_CFG_EVT**  
When batch scan storage is configured, the event comes

denumerator **ESP_GATTC_BTH_SCAN_RD_EVT**  
When Batch scan read event is reported, the event comes

denumerator **ESP_GATTC_BTH_SCAN_THR_EVT**  
When Batch scan threshold is set, the event comes

denumerator **ESP_GATTC_BTH_SCAN_PARAM_EVT**  
When Batch scan parameters are set, the event comes

denumerator **ESP_GATTC_BTH_SCAN_DIS_EVT**  
When Batch scan is disabled, the event comes

denumerator **ESP_GATTC_SCAN_FLT_CFG_EVT**  
When Scan filter configuration completes, the event comes

denumerator **ESP_GATTC_SCAN_FLT_PARAM_EVT**  
When Scan filter parameters are set, the event comes

denumerator **ESP_GATTC_SCAN_FLT_STATUS_EVT**  
When Scan filter status is reported, the event comes

denumerator **ESP_GATTC_ADV_VSC_EVT**  
When advertising vendor spec content event is reported, the event comes
enumerator **ESP_GATTC_REG_FOR_NOTIFY_EVT**  
When register for notification of a service completes, the event comes

enumerator **ESP_GATTC_UNREG_FOR_NOTIFY_EVT**  
When unregister for notification of a service completes, the event comes

enumerator **ESP_GATTC_CONNECT_EVT**  
When the ble physical connection is set up, the event comes

enumerator **ESP_GATTC_DISCONNECT_EVT**  
When the ble physical connection disconnected, the event comes

enumerator **ESP_GATTC_READ_MULTIPLE_EVT**  
When the ble characteristic or descriptor multiple complete, the event comes

enumerator **ESP_GATTC_QUEUE_FULL_EVT**  
When the gattc command queue full, the event comes

enumerator **ESP_GATTC_SET_ASSOC_EVT**  
When the ble gattc set the associated address complete, the event comes

enumerator **ESP_GATTC_GET_ADDR_LIST_EVT**  
When the ble get gattc address list in cache finish, the event comes

enumerator **ESP_GATTC_DIS_SRVC_CMPL_EVT**  
When the ble discover service complete, the event comes

**BLUFI API**

**Overview**  BLUFI is a profile based GATT to config ESP32 WIFI to connect/disconnect AP or setup a softap and etc. Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.
2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the “Key Exchange/Negotiation” procedure.

**Application Example**  Check bluetooth folder in ESP-IDF examples, which contains the following application:

- This is the BLUFI demo. This demo can set ESP32’s wifi to softap/station/softap&station mode and config wifi connections - bluetooth/blufi

**API Reference**

**Header File**

- components/bt/common/api/include/api/esp_blufi_api.h
Functions

`esp_err_t esp_blufi_register_callbacks (esp_blufi_callbacks_t *callbacks)`
This function is called to receive blufi callback event.

Parameters `callbacks` [in] callback functions

Returns ESP_OK - success, other - failed

`esp_err_t esp_blufi_profile_init (void)`
This function is called to initialize blufi_profile.

Returns ESP_OK - success, other - failed

`esp_err_t esp_blufi_profile_deinit (void)`
This function is called to de-initialize blufi_profile.

Returns ESP_OK - success, other - failed

`esp_err_t esp_blufi_send_wifi_conn_report (wifi_mode_t opmode, esp_blufi_sta_conn_state_t sta_conn_state, uint8_t softap_conn_num, esp_blufi_extra_info_t *extra_info)`
This function is called to send wifi connection report.

Parameters
- `opmode` : wifi opmode
- `sta_conn_state` : station is already in connection or not
- `softap_conn_num` : softap connection number
- `extra_info` : extra information, such as sta_ssid, softap_ssid and etc.

Returns ESP_OK - success, other - failed

`esp_err_t esp_blufi_send_wifi_list (uint16_t apCount, esp_blufi_ap_record_t *list)`
This function is called to send wifi list.

Parameters
- `apCount` : wifi list count
- `list` : wifi list

Returns ESP_OK - success, other - failed

`uint16_t esp_blufi_get_version (void)`
Get BLUFI profile version.

Returns Most 8bit significant is Great version, Least 8bit is Sub version

`esp_err_t esp_blufi_send_error_info (esp_blufi_error_state_t state)`
This function is called to send blufi error information.

Parameters `state` : error state

Returns ESP_OK - success, other - failed

`esp_err_t esp_blufi_send_custom_data (uint8_t *data, uint32_t data_len)`
This function is called to custom data.

Parameters
- `data` : custom data value
- `data_len` : the length of custom data

Returns ESP_OK - success, other - failed

Unions

union esp_blufi_cb_param_t

BSSID of station interface

bool sta_bssid_set
is BSSID of station interface set

uint8_t *sta_ssid
SSID of station interface

int sta_ssid_len
length of SSID of station interface

uint8_t *sta_passwd
password of station interface

int sta_passwd_len
length of password of station interface

uint8_t *softap_ssid
SSID of softap interface

int softap_ssid_len
length of SSID of softap interface

uint8_t *softap_passwd
password of station interface

int softap_passwd_len
length of password of station interface

uint8_t softap_authmode
authentication mode of softap interface

bool softap_authmode_set
is authentication mode of softap interface set

uint8_t softap_max_conn_num
max connection number of softap interface

bool softap_max_conn_num_set
is max connection number of softap interface set

uint8_t softap_channel
channel of softap interface

bool softap_channel_set
is channel of softap interface set
struct `esp_blufi_ap_record_t`
   Description of an WiFi AP.

   **Public Members**

   `uint8_t ssid[33]`
   SSID of AP

   `int8_t rssi`
   signal strength of AP

struct `esp_blufi_callbacks_t`
   BLUFI callback functions type.

   **Public Members**

   `esp_blufi_event_cb_t event_cb`
   BLUFI event callback

   `esp_blufi_negotiate_data_handler_t negotiate_data_handler`
   BLUFI negotiate data function for negotiate share key

   `esp_blufi_encrypt_func_t encrypt_func`
   BLUFI encrypt data function with share key generated by negotiate_data_handler

   `esp_blufi_decrypt_func_t decrypt_func`
   BLUFI decrypt data function with share key generated by negotiate_data_handler

   `esp_blufi_checksum_func_t checksum_func`
   BLUFI check sum function (FCS)

**Macros**

`ESP_BLUFI_BD_ADDR_LEN`
   Bluetooth address length.

**Type Definitions**

typedef `uint8_t esp_blufi_bd_addr_t[ESP_BLUFI_BD_ADDR_LEN]`
   Bluetooth device address.

typedef void (*`esp_blufi_event_cb_t`(esp_blufi_cb_event_t event, esp_blufi_cb_param_t *param))
   BLUFI event callback function type.

   `Param event` : Event type
   `Param param` : Point to callback parameter, currently is union type
typedef void (*esp_blufi_negotiate_data_handler_t)(uint8_t*data, int len, uint8_t**output_data, int *output_len, bool *need_free)

BLUFI negotiate data handler.

Param data : data from phone
Param len : length of data from phone
Param output_data : data want to send to phone
Param output_len : length of data want to send to phone
Param need_free : output reporting if memory needs to be freed or not *

typedef int (*esp_blufi_encrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)

BLUFI encrypt the data after negotiate a share key.

Param iv8 : initial vector(8bit), normally, blufi core will input packet sequence number
Param crypt_data : plain text and encrypted data, the encrypt function must support autochthonous encrypt
Param crypt_len : length of plain text
Return Nonnegative number is encrypted length, if error, return negative number;

typedef int (*esp_blufi_decrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)

BLUFI decrypt the data after negotiate a share key.

Param iv8 : initial vector(8bit), normally, blufi core will input packet sequence number
Param crypt_data : encrypted data and plain text, the encrypt function must support autochthonous decrypt
Param crypt_len : length of encrypted text
Return Nonnegative number is decrypted length, if error, return negative number;

typedef uint16_t (*esp_blufi_checksum_func_t)(uint8_t iv8, uint8_t *data, int len)

BLUFI checksum.

Param iv8 : initial vector(8bit), normally, blufi core will input packet sequence number
Param data : data need to checksum
Param len : length of data

Enumerations

enum esp_blufi_cb_event_t

Values:

enumerator **ESP_BLUFI_INIT_SECURITY_ERROR**

enumerator **ESP_BLUFI_DH_MALLOC_ERROR**

enumerator **ESP_BLUFI_DH_PARAM_ERROR**

enumerator **ESP_BLUFI_READ_PARAM_ERROR**

enumerator **ESP_BLUFI_MAKE_PUBLIC_ERROR**

enumerator **ESP_BLUFI_DATA_FORMAT_ERROR**

enumerator **ESP_BLUFI_CALC_MD5_ERROR**
2.3.3 Controller && VHCI

Application Example

Check `bluetooth/hci` folder in ESP-IDF examples, which contains the following application:

- This is a BLE advertising demo with virtual HCI interface. Send `reset/ADV_PARAM/ADV_DATA/ADV_ENABLE` HCI command for BLE advertising. *bluetooth/hci/controller_vhci_ble_adv*

API Reference

Header File

- `components/bt/include/esp32/include/esp_bt.h`

Functions

**esp_err_t esp_ble_tx_power_set** *(esp_ble_power_type_t power_type, esp_power_level_t power_level)*

Set BLE TX power. Connection Tx power should only be set after connection created.

- **Parameters**
  - `power_type` - The type of which tx power, could set Advertising/Connection/Default and etc
  - `power_level` - Power level(index) corresponding to absolute value(dbm)
- **Returns**
  - ESP_OK - success, other - failed

**esp_power_level_t esp_ble_tx_power_get** *(esp_ble_power_type_t power_type)*

Get BLE TX power. Connection Tx power should only be get after connection created.

- **Parameters**
  - `power_type` - The type of which tx power, could set Advertising/Connection/Default and etc
- **Returns**
  - >=0 - Power level, <0 - Invalid

**esp_err_t esp_bredr_tx_power_set** *(esp_power_level_t min_power_level, esp_power_level_t max_power_level)*

Set BR/EDR TX power. BR/EDR power control will use the power in range of minimum value and maximum value. The power level will effect the global BR/EDR TX power, such inquire, page, connection and so on. Please call the function after esp_bt_controller_enable and before any function which cause RF do TX. So you can call the function before doing discovery, profile init and so on. For example, if you want BR/EDR use the new TX power to do inquire, you should call this function before inquire. Another word, If call this function when BR/EDR is in inquire(ING), please do inquire again after call this function. Default minimum power level is ESP_PWR_LVL_N0, and maximum power level is ESP_PWR_LVL_P3.

- **Parameters**
  - `min_power_level` - The minimum power level
  - `max_power_level` - The maximum power level
- **Returns**
  - ESP_OK - success, other - failed

**esp_err_t esp_bredr_tx_power_get** *(esp_power_level_t *min_power_level, esp_power_level_t *max_power_level)*

Get BR/EDR TX power. If the argument is not NULL, then store the corresponding value.

- **Parameters**
  - `min_power_level` - The minimum power level
  - `max_power_level` - The maximum power level
- **Returns**
  - ESP_OK - success, other - failed

**esp_err_t esp_bredr_sco_datapath_set** *(esp_sco_data_path_t data_path)*

Set default SCO data path. Should be called after controller is enabled, and before (e)SCO link is established.

- **Parameters**
  - `data_path` - SCO data path
Chapter 2. API Reference

Returns ESP_OK - success, other - failed

*esp_err_t esp_bt_controller_init*(esp_bt_controller_config_t *cfg)

Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.

Parameters

- **cfg**: Initial configuration of BT controller. Different from previous version, there's a mode and some connection configuration in "cfg" to configure controller work mode and allocate the resource which is needed.

Returns ESP_OK - success, other - failed

*esp_err_t esp_bt_controller_deinit*(void)

De-initialize BT controller to free resource and delete task. You should stop advertising and scanning, as well as disconnect all existing connections before de-initializing BT controller.

This function should be called only once, after any other BT functions are called.

Returns ESP_OK - success, other - failed

*esp_err_t esp_bt_controller_enable*(esp_bt_mode_t mode)

Enable BT controller. Due to a known issue, you cannot call esp_bt_controller_enable() a second time to change the controller mode dynamically. To change controller mode, call esp_bt_controller_disable() and then call esp_bt_controller_enable() with the new mode.

Parameters

- **mode**: the mode (BLE/BT/BTDM) to enable. For compatible of API, retain this argument. This mode must be equal as the mode in "cfg" of esp_bt_controller_init().

Returns ESP_OK - success, other - failed

*esp_err_t esp_bt_controller_disable*(void)

Disable BT controller.

Returns ESP_OK - success, other - failed

*esp_err_t esp_bt_controller_get_status*(void)

Get BT controller is initialised/de-initialised/enabled/disabled.

Returns status value

bool esp_vhci_host_check_send_available*(void)

esp_vhci_host_check_send_available used for check actively if the host can send packet to controller or not.

Returns true for ready to send, false means cannot send packet

void esp_vhci_host_send_packet*(uint8_t *data, uint16_t len)

esp_vhci_host_send_packet host send packet to controller

Should not call this function from within a critical section or when the scheduler is suspended.

Parameters

- **data**: the packet point
- **len**: the packet length

*esp_err_t esp_vhci_host_register_callback*(const esp_vhci_host_callback_t *callback)

esp_vhci_host_register_callback register the vhci reference callback struct defined by vhci_host_callback structure.

Parameters

- **callback**: esp_vhci_host_callback type variable

Returns ESP_OK - success, ESP_FAIL - failed

*esp_err_t esp_bt_controller_mem_release*(esp_bt_mode_t mode)

esp_bt_controller_mem_release release the controller memory as per the mode

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k bytes.

esp_bt_controller_mem_release(mode) should be called only before esp_bt_controller_init() or after esp_bt_controller_deinit().
Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If the app calls esp_bt_controller_enable(ESP_BT_MODE_BLE) to use BLE only then it is safe to call esp_bt_controller_mem_release(ESP_BT_MODE_CLASSIC_BT) at initialization time to free unused BT Classic memory.

If the mode is ESP_BT_MODE_BTDM, then it may be useful to call API esp_bt_mem_release(ESP_BT_MODE_BTDM) instead, which internally calls esp_bt_controller_mem_release(ESP_BT_MODE_BTDM) and additionally releases the BSS and data consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation of esp_bt_mem_release() function

### Parameters
mode - the mode want to release memory

### Returns
ESP_OK - success, other - failed

```c
esp_err_t esp_bt_mem_release(esp_bt_mode_t mode)
```

esp_bt_mem_release release controller memory and BSS and data section of the BT/BLE host stack as per the mode

This function first releases controller memory by internally calling esp_bt_controller_mem_release(). Additionally, if the mode is set to ESP_BT_MODE_BTDM, it also releases the BSS and data consumed by the BT/BLE host stack to heap

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call esp_bt_mem_release(ESP_BT_MODE_BTDM) before esp_bt_controller_init or after esp_bt_controller_deinit.

For example, if a user only uses bluetooth for setting the WiFi configuration, and does not use bluetooth in the rest of the product operation” . In such cases, after receiving the WiFi configuration, you can disable/deinit bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:

```c
esp_bluedroid_disable();
esp_bluedroid_deinit();
esp_bt_controller_disable();
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);
```

**Note:** In case of NimBLE host, to release BSS and data memory to heap, the mode needs to be set to ESP_BT_MODE_BTDM as controller is dual mode.

```c
esp_err_t esp_bt_sleep_enable(esp_bt_mode_t mode)
```

enable bluetooth to enter modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

There are currently two options for bluetooth modem sleep, one is ORIG mode, and another is EVED Mode. EVED Mode is intended for BLE only.

For ORIG mode: Bluetooth modem sleep is enabled in controller start up by default if CONFIG_CTRL_BTDM_MODEM_SLEEP is set and “ORIG mode” is selected. In ORIG modem sleep mode,
bluetooth controller will switch off some components and pause to work every now and then, if there is no
event to process; and wakeup according to the scheduled interval and resume the work. It can also wakeup
earlier upon external request using function “esp_bt_controller_wakeup_request”.

**Returns**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_bt_sleep_disable (void)
```

disable bluetooth modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

If esp_bt_sleep_disable() is called, bluetooth controller will not be allowed to enter modem sleep;

If ORIG modem sleep mode is in use, if this function is called, bluetooth controller may not immediately wake
up if it is dormant then. In this case, esp_bt_controller_wakeup_request() can be used to shorten the time for
wakeup.

**Returns**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_scan_duplicate_list_flush (void)
```

Manually clear scan duplicate list.

Note that scan duplicate list will be automatically cleared when the maximum amount of device in the filter is
reached the amount of device in the filter can be configured in menuconfig.

**Note:** This function name is incorrectly spelled, it will be fixed in release 5.x version.

**Returns**
- ESP_OK : success
- other : failed

```c
void esp_wifi_bt_power_domain_on (void)
```

bt Wi-Fi power domain power on

```c
void esp_wifi_bt_power_domain_off (void)
```

bt Wi-Fi power domain power off

**Structures**

```c
struct esp_bt_controller_config_t
```

Controller config options, depend on config mask. Config mask indicate which functions enabled, this means
some options or parameters of some functions enabled by config mask.

**Public Members**

```c
tuint16_t controller_task_stack_size
```

Bluetooth controller task stack size

```c
tuint8_t controller_task_prio
```

Bluetooth controller task priority
uint8_t hci_uart_no
   If use UART1/2 as HCI IO interface, indicate UART number

uint32_t hci_uart_baudrate
   If use UART1/2 as HCI IO interface, indicate UART baudrate

uint8_t scan_duplicate_mode
   scan duplicate mode

uint8_t scan_duplicate_type
   scan duplicate type

uint16_t normal_adv_size
   Normal adv size for scan duplicate

uint16_t mesh_adv_size
   Mesh adv size for scan duplicate

uint16_t send_adv_reserved_size
   Controller minimum memory value

uint32_t controller_debug_flag
   Controller debug log flag

uint8_t mode
   Controller mode: BR/EDR, BLE or Dual Mode

uint8_t ble_max_conn
   BLE maximum connection numbers

uint8_t bt_max_acl_conn
   BR/EDR maximum ACL connection numbers

uint8_t bt_sco_datapath
   SCO data path, i.e. HCI or PCM module

bool auto_latency
   BLE auto latency, used to enhance classic BT performance

bool bt_legacy_auth_vs_evt
   BR/EDR Legacy auth complete event required to protect from BIAS attack

uint8_t bt_max_sync_conn
   BR/EDR maximum ACL connection numbers. Effective in menuconfig

uint8_t ble_sca
   BLE low power crystal accuracy index
Chapter 2. API Reference

#include "esp_bt.h"

uint8_t pcm_role
    PCM role (master & slave)

uint8_t pcm_polar
    PCM polar trig (falling clk edge & rising clk edge)

bool hli
    Using high level interrupt or not

uint32_t magic
    Magic number

struct esp_vhci_host_callback
    esp_vhci_host_callback used for vhci call host function to notify what host need to do

Public Members

void (*notify_host_send_available)(void)
    callback used to notify that the host can send packet to controller

int (*notify_host_recv)(uint8_t*data, uint16_t len)
    callback used to notify that the controller has a packet to send to the host

Macros

ESP_BT_CONTROLLER_CONFIG_MAGIC_VAL
BT_CONTROLLER_INIT_CONFIG_DEFAULT()

Type Definitions

typedef struct esp_vhci_host_callback esp_vhci_host_callback_t
    esp_vhci_host_callback used for vhci call host function to notify what host need to do

Enumerations

defined esp_bt_mode_t
    Bluetooth mode for controller enable/disable.
    Values:

    enumerator ESP_BT_MODE_IDLE
        Bluetooth is not running

    enumerator ESP_BT_MODE_BLE
        Run BLE mode

    enumerator ESP_BT_MODE_CLASSIC_BT
        Run Classic BT mode
enumerator **ESP_BT_MODE_BTDM**

Run dual mode

eNum [anonymous]

BLE sleep clock accuracy (SCA), values for ble_sca field in `esp_bt_controller_config_t`, currently only ESP_BLE_SCA_500PPM and ESP_BLE_SCA_250PPM are supported.

**Values:**

enumerator **ESP_BLE_SCA_500PPM**

BLE SCA at 500ppm

enumerator **ESP_BLE_SCA_250PPM**

BLE SCA at 250ppm

enumerator **ESP_BLE_SCA_150PPM**

BLE SCA at 150ppm

enumerator **ESP_BLE_SCA_100PPM**

BLE SCA at 100ppm

enumerator **ESP_BLE_SCA_75PPM**

BLE SCA at 75ppm

enumerator **ESP_BLE_SCA_50PPM**

BLE SCA at 50ppm

enumerator **ESP_BLE_SCA_30PPM**

BLE SCA at 30ppm

enumerator **ESP_BLE_SCA_20PPM**

BLE SCA at 20ppm

eNum **esp_bt_controller_status_t**

Bluetooth controller enable/disable/initialised/de-initialised status.

**Values:**

enumerator **ESP_BT_CONTROLLER_STATUS_IDLE**

enumerator **ESP_BT_CONTROLLER_STATUS_INITED**

enumerator **ESP_BT_CONTROLLER_STATUS_ENABLED**

enumerator **ESP_BT_CONTROLLER_STATUS_NUM**

eNum **esp_ble_power_type_t**

BLE tx power type ESP_BLE_PWR_TYPE_CONN_HDL0-8: for each connection, and only be set after connection completed. when disconnect, the correspond TX power is not effected. ESP_BLE_PWR_TYPE_ADV : for advertising/scan response. ESP_BLE_PWR_TYPE_SCAN : for scan. ESP_BLE_PWR_TYPE_DEFAULT : if each connection’s TX power is not set, it will use this default value.
if neither in scan mode nor in adv mode, it will use this default value. If none of power type is set, system will use ESP_PWR_LVL_P3 as default for ADV/SCAN/CONN0-9.

Values:

enumerator ESP_BLE_PWR_TYPE_CONN_HDL0
   For connection handle 0

enumerator ESP_BLE_PWR_TYPE_CONN_HDL1
   For connection handle 1

enumerator ESP_BLE_PWR_TYPE_CONN_HDL2
   For connection handle 2

enumerator ESP_BLE_PWR_TYPE_CONN_HDL3
   For connection handle 3

enumerator ESP_BLE_PWR_TYPE_CONN_HDL4
   For connection handle 4

enumerator ESP_BLE_PWR_TYPE_CONN_HDL5
   For connection handle 5

enumerator ESP_BLE_PWR_TYPE_CONN_HDL6
   For connection handle 6

enumerator ESP_BLE_PWR_TYPE_CONN_HDL7
   For connection handle 7

enumerator ESP_BLE_PWR_TYPE_CONN_HDL8
   For connection handle 8

enumerator ESP_BLE_PWR_TYPE_ADV
   For advertising

enumerator ESP_BLE_PWR_TYPE_SCAN
   For scan

enumerator ESP_BLE_PWR_TYPE_DEFAULT
   For default, if not set other, it will use default value

enumerator ESP_BLE_PWR_TYPE_NUM
   TYPE numbers

enum esp_power_level_t
   Bluetooth TX power level(index), it’s just a index corresponding to power(dbm).

Values:

enumerator ESP_PWR_LVL_N12
   Corresponding to -12dbm
enumerator **ESP_PWR_LVL_N9**  
Corresponding to -9dbm

denumerator **ESP_PWR_LVL_N6**  
Corresponding to -6dbm

denumerator **ESP_PWR_LVL_N3**  
Corresponding to -3dbm

denumerator **ESP_PWR_LVL_N0**  
Corresponding to 0dbm

denumerator **ESP_PWR_LVL_P3**  
Corresponding to +3dbm

denumerator **ESP_PWR_LVL_P6**  
Corresponding to +6dbm

denumerator **ESP_PWR_LVL_P9**  
Corresponding to +9dbm

denumerator **ESP_PWR_LVL_N14**  
Backward compatibility! Setting to -14dbm will actually result to -12dbm

denumerator **ESP_PWR_LVL_N11**  
Backward compatibility! Setting to -11dbm will actually result to -9dbm

denumerator **ESP_PWR_LVL_N8**  
Backward compatibility! Setting to -8dbm will actually result to -6dbm

denumerator **ESP_PWR_LVL_N5**  
Backward compatibility! Setting to -5dbm will actually result to -3dbm

denumerator **ESP_PWR_LVL_N2**  
Backward compatibility! Setting to -2dbm will actually result to 0dbm

denumerator **ESP_PWR_LVL_P1**  
Backward compatibility! Setting to +1dbm will actually result to +3dbm

denumerator **ESP_PWR_LVL_P4**  
Backward compatibility! Setting to +4dbm will actually result to +6dbm

denumerator **ESP_PWR_LVL_P7**  
Backward compatibility! Setting to +7dbm will actually result to +9dbm

enum **esp_sco_data_path_t**  
Bluetooth audio data transport path.

*Values:*
2.3.4 ESP-BLE-MESH

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.

For an ESP32 to join and work on an ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an unprovisioned device, will join the ESP-BLE-MESH network and become an ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.

Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH Provisioner, which could provision unprovisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section Getting Started with ESP-BLE-MESH. If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section ESP-BLE-MESH Architecture.

Application Examples and Demos

Please refer to Sections ESP-BLE-MESH Examples and ESP-BLE-MESH Demo Videos.

API Reference

ESP-BLE-MESH APIs are divided into the following parts:

- ESP-BLE-MESH Definitions
- ESP-BLE-MESH Core API Reference
- ESP-BLE-MESH Models API Reference

ESP-BLE-MESH Definitions

This section contains only one header file, which lists the following items of ESP-BLE-MESH.

- ID of all the models and related message opcodes
- Structs of model, element and Composition Data
- Structs of used by ESP-BLE-MESH Node/Provisioner for provisioning
- Structs used to transmit/receive messages
- Event types and related event parameters

Header File

- components/bt/esp_ble_mesh/api/esp_ble_mesh defs.h

Unions

union esp_ble_mesh_prov_cb_param_t

#include <esp_ble_mesh_defs.h> BLE Mesh Node/Provisioner callback parameters union.
Public Members

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_delete_node_with_addr_comp_param
provisioner_delete_node_with_addr_comp
  Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT

int err_code
  Indicate the result of enabling/disabling to receive heartbeat messages by the Provisioner
  Indicate the result of setting the heartbeat filter type by the Provisioner
  Indicate the result of setting the heartbeat filter address by the Provisioner
  Indicate the result of directly erasing settings by the Provisioner
  Indicate the result of opening settings with index by the Provisioner
  Indicate the result of opening settings with user id by the Provisioner
  Indicate the result of closing settings with index by the Provisioner
  Indicate the result of closing settings with user id by the Provisioner
  Indicate the result of deleting settings with index by the Provisioner
  Indicate the result of deleting settings with user id by the Provisioner

bool enable
  Indicate enabling or disabling receiving heartbeat messages
struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_enable_heartbeat_recv_comp

ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT

uint8_t type
Type of the filter used for receiving heartbeat messages

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_set_heartbeat_filter_type_comp

ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT

uint8_t op
Operation (add, remove, clean)

uint16_t hb_src
Heartbeat source address

uint16_t hb_dst
Heartbeat destination address

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_set_heartbeat_filter_info_comp

ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT

uint8_t init_ttl
Heartbeat InitTTL

uint8_t rx_ttl
Heartbeat RxTTL

uint8_t hops
Heartbeat hops (InitTTL - RxTTL + 1)

uint16_t feature
Bit field of currently active features of the node

int8_t rssi
RSSI of the heartbeat message

struct esp_ble_mesh_prov_cb_param_t::[anonymous]
provisioner_recv_heartbeat

ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT

struct `ble_mesh_friend_friendship_terminate_param`  
`#include <esp_ble_mesh_defs.h>` ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT.
Public Types

enum [anonymous]
This enum value is the reason of friendship termination on the friend node side
Values:

enumerator ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_ESTABLISH_FAIL
Friend Offer has been sent, but Friend Offer is not received within 1 second, friendship fails to be established

enumerator ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_POLL_TIMEOUT
Friendship is established, PollTimeout timer expires and no Friend Poll/Sub Add/Sub Remove is received

enumerator ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_REQ
Receive Friend Request from existing Low Power Node

enumerator ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_CLEAR
Receive Friend Clear from other friend node

enumerator ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_DISABLE
Friend feature disabled or corresponding NetKey is deleted

Public Members

uint16_t lpn_addr
Low Power Node unicast address

denum esp_ble_mesh_prov_cb_param_t::ble_mesh_friend_friendship_terminate_param::[anonymous]
reason
This enum value is the reason of friendship termination on the friend node side Friendship terminated reason

Context of the message

struct ble_mesh_server_model_update_state_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT.

Public Members

int err_code
Indicate the result of updating server model state

*esp_ble_mesh_model_t model
Pointer to the server model which state value is updated

*esp_ble_mesh_server_state_type_t type
Type of the updated server state

Structures

struct esp_ble_mesh_deinit_param_t
BLE Mesh deinit parameters

Public Members

bool erase_flash
Indicate if erasing flash when deinit mesh stack

struct esp_ble_mesh_elem_t
Abstraction that describes a BLE Mesh Element. This structure is associated with struct bt_mesh_elem in mesh_access.h

Public Members

uint16_t element_addr
Element Address, assigned during provisioning.
const uint16_t \texttt{location}  
Location Descriptor (GATT Bluetooth Namespace Descriptors)

const uint8_t \texttt{sig\_model\_count} 
SIG Model count

const uint8_t \texttt{vnd\_model\_count} 
Vendor Model count

\texttt{esp\_ble\_mesh\_model\_t *} \texttt{sig\_models}  
SIG Models

\texttt{esp\_ble\_mesh\_model\_t *} \texttt{vnd\_models}  
Vendor Models

\texttt{struct esp\_ble\_mesh\_model\_pub\_t}  
Abstraction that describes a model publication context. This structure is associated with struct \texttt{bt\_mesh\_model\_pub} in mesh_access.h

**Public Members**

\texttt{esp\_ble\_mesh\_model\_t *} \texttt{model}  
Pointer to the model to which the context belongs. Initialized by the stack.

\texttt{uint16\_t publish\_addr}  
Publish Address.

\texttt{uint16\_t app\_idx}  
Publish AppKey Index.

\texttt{uint16\_t cred}  
Friendship Credentials Flag.

\texttt{uint16\_t send\_rel}  
Force reliable sending (segment acks)

\texttt{uint8\_t ttl}  
Publish Time to Live.

\texttt{uint8\_t retransmit}  
Retransmit Count & Interval Steps.

\texttt{uint8\_t period}  
Publish Period.

\texttt{uint8\_t period\_div}  
Divisor for the Period.
uint8_t \texttt{fast\_period}
Use FastPeriodDivisor

uint8_t \texttt{count}
Retransmissions left.

uint32_t \texttt{period\_start}
Start of the current period.

struct net_buf_simple *\texttt{msg}
Publication buffer, containing the publication message.
This will get correctly created when the publication context has been defined using the ESP_BLE_MESH_MODEL_PUB_DEFINE macro.
ESP_BLE_MESH_MODEL_PUB_DEFINE(name, size);

\texttt{esp\_ble\_mesh\_cb\_t} \texttt{update}
Callback used to update publish message. Initialized by the stack.

struct k_delayed_work \texttt{timer}
Publish Period Timer. Initialized by the stack.

uint8_t \texttt{dev\_role}
Role of the device that is going to publish messages

struct \texttt{esp\_ble\_mesh\_model\_op\_t}
Abstraction that describes a model operation context. This structure is associated with struct bt_mesh_model_op in mesh_access.h

**Public Members**

const uint32_t \texttt{opcode}
Message opcode

const size_t \texttt{min\_len}
Message minimum length

\texttt{esp\_ble\_mesh\_cb\_t} \texttt{param\_cb}
Callback used to handle message. Initialized by the stack.

struct \texttt{esp\_ble\_mesh\_model\_cbs\_t}
Abstraction that describes a model callback structure. This structure is associated with struct bt_mesh_model_cb in mesh_access.h.

**Public Members**

\texttt{esp\_ble\_mesh\_cb\_t} \texttt{init\_cb}
Callback used during model initialization. Initialized by the stack.
struct esp_ble_mesh_model
Abstraction that describes a Mesh Model instance. This structure is associated with struct bt_mesh_model in mesh_access.h

Public Members

const uint16_t model_id
16-bit model identifier

uint16_t company_id
16-bit company identifier

uint16_t model_id
16-bit model identifier

struct esp_ble_mesh_model::[anonymous]::[anonymous] vnd
Structure encapsulating a model ID with a company ID

union esp_ble_mesh_model::[anonymous] [anonymous]
Model ID

uint8_t element_idx
Internal information, mainly for persistent storage Belongs to Nth element

uint8_t model_idx
Is the Nth model in the element

uint16_t flags
Information about what has changed

esp_ble_mesh_elem_t *element
The Element to which this Model belongs

esp_ble_mesh_model_pub_t *const pub
Model Publication

uint16_t keys[CONFIG_BLE_MESH_MODEL_KEY_COUNT]
AppKey List

uint16_t groups[CONFIG_BLE_MESH_MODEL_GROUP_COUNT]
Subscription List (group or virtual addresses)

esp_ble_mesh_model_op_t *op
Model operation context

esp_ble_mesh_model_cbs_t *cb
Model callback structure
void *user_data
    Model-specific user data

struct esp_ble_mesh_msg_ctx_t
    Message sending context. This structure is associated with struct bt_mesh_msg_ctx in mesh_access.h

Public Members

uint16_t net_idx
    NetKey Index of the subnet through which to send the message.

uint16_t app_idx
    AppKey Index for message encryption.

uint16_t addr
    Remote address.

uint16_t recv_dst
    Destination address of a received message. Not used for sending.

int8_t recv_rssi
    RSSI of received packet. Not used for sending.

uint8_t recv_ttl
    Received TTL value. Not used for sending.

uint8_t send_rel
    Force sending reliably by using segment acknowledgement

uint8_t send_ttl
    TTL, or ESP_BLE_MESH_TTL_DEFAULT for default TTL.

uint32_t recv_op
    Opcode of a received message. Not used for sending message.

esp_ble_mesh_model_t *model
    Model corresponding to the message, no need to be initialized before sending message

bool srv_send
    Indicate if the message is sent by a node server model, no need to be initialized before sending message

struct esp_ble_mesh_prov_t
    Provisioning properties & capabilities. This structure is associated with struct bt_mesh_prov in mesh_access.h

struct esp_ble_mesh_comp_t
    Node Composition data context. This structure is associated with struct bt_mesh_comp in mesh_access.h
Public Members

`uint16_t cid`  
16-bit SIG-assigned company identifier

`uint16_t pid`  
16-bit vendor-assigned product identifier

`uint16_t vid`  
16-bit vendor-assigned product version identifier

`size_t element_count`  
Element count

`esp_ble_mesh_elem_t *elements`  
A sequence of elements

struct `esp_ble_mesh_unprov_dev_add_t`  
Information of the device which is going to be added for provisioning.

Public Members

`esp_ble_mesh_bd_addr_t addr`  
Device address

`esp_ble_mesh_addr_type_t addr_type`  
Device address type

`uint8_t uuid[16]`  
Device UUID

`uint16_t oob_info`  
Device OOB Info ADD_DEV_START_PROV_NOW_FLAG shall not be set if the bearer has both PB-ADV and PB-GATT enabled

`esp_ble_mesh_prov_bearer_t bearer`  
Provisioning Bearer

struct `esp_ble_mesh_device_delete_t`  
Information of the device which is going to be deleted.

Public Members

`esp_ble_mesh_bd_addr_t addr`  
Device address

`esp_ble_mesh_addr_type_t addr_type`  
Device address type
uint8_t uuid[16]
   Device UUID

uint8_t flag
   BIT0: device address; BIT1: device UUID

struct esp_ble_mesh_prov_data_info_t
   Information of the provisioner which is going to be updated.

Public Members

uint16_t net_idx
   NetKey Index

uint8_t flags
   Flags

uint32_t iv_index
   IV Index

uint8_t flag
   BIT0: net_idx; BIT1: flags; BIT2: iv_index

struct esp_ble_mesh_node_t
   Information of the provisioned node

Public Members

esp_ble_mesh_bd_addr_t addr
   Node device address

esp_ble_mesh_addr_type_t addr_type
   Node device address type

uint8_t dev_uuid[16]
   Device UUID

uint16_t oob_info
   Node OOB information

uint16_t unicast_addr
   Node unicast address

uint8_t element_num
   Node element number
Chapter 2. API Reference

uint16_t net_idx
    Node NetKey Index

uint8_t flags
    Node key refresh flag and iv update flag

uint32_t iv_index
    Node IV Index

uint8_t dev_key[16]
    Node device key

cchar name[ESP_BLE_MESH_NODE_NAME_MAX_LEN + 1]
    Node name

uint16_t comp_length
    Length of Composition Data

uint8_t *comp_data
    Value of Composition Data

struct esp_ble_mesh_fast_prov_info_t
    Context of fast provisioning which need to be set.

Public Members

uint16_t unicast_min
    Minimum unicast address used for fast provisioning

uint16_t unicast_max
    Maximum unicast address used for fast provisioning

uint16_t net_idx
    Netkey index used for fast provisioning

uint8_t flags
    Flags used for fast provisioning

uint32_t iv_index
    IV Index used for fast provisioning

uint8_t offset
    Offset of the UUID to be compared

uint8_t match_len
    Length of the UUID to be compared
uint8_t **match_val[16]
Value of UUID to be compared

struct esp_ble_mesh_heartbeat_filter_info_t
Context of Provisioner heartbeat filter information to be set

**Public Members**

uint16_t **hb_src**
Heartbeat source address (unicast address)

uint16_t **hb_dst**
Heartbeat destination address (unicast address or group address)

struct esp_ble_mesh_client_op_pair_t
BLE Mesh client models related definitions.
Client model Get/Set message opcode and corresponding Status message opcode

**Public Members**

uint32_t **cli_op**
The client message opcode

uint32_t **status_op**
The server status opcode corresponding to the client message opcode

struct esp_ble_mesh_client_t
Client Model user data context.

**Public Members**

esp_ble_mesh_model_t **model**
Pointer to the client model. Initialized by the stack.

int **op_pair_size**
Size of the op_pair

const esp_ble_mesh_client_op_pair_t **op_pair**
Table containing get/set message opcode and corresponding status message opcode

uint32_t **publish_status**
Callback used to handle the received unsolicited message. Initialized by the stack.

void * **internal_data**
Pointer to the internal data of client model
uint8_t msg_role
    Role of the device (Node/Provisioner) that is going to send messages

struct esp_ble_mesh_client_common_param_t
    Common parameters of the messages sent by Client Model.

**Public Members**

*esp_ble_mesh_opcode_t* opcode
    Message opcode

*esp_ble_mesh_model_t* model
    Pointer to the client model structure

*esp_ble_mesh_msg_ctx_t* ctx
    The context used to send message

int32_t msg_timeout
    Timeout value (ms) to get response to the sent message Note: if using default timeout value in menuconfig, make sure to set this value to 0

uint8_t msg_role
    Role of the device - Node/Provisioner

struct esp_ble_mesh_state_transition_t
    Parameters of the server model state transition

**Public Functions**

BLE_MESH_ATOMIC_DEFINE (flag, ESP_BLE_MESH_SERVER_FLAG_MAX)
    Flag used to indicate if the transition timer has been started internally.
    If the model which contains *esp_ble_mesh_state_transition_t* sets “set_auto_rsp” to ESP_BLE_MESH_SERVER_RSP_BY_APP, the handler of the timer shall be initialized by the users.
    And users can use this flag to indicate whether the timer is started or not.

**Public Members**

bool just_started
    Indicate if the state transition has just started

uint8_t trans_time
    State transition time

uint8_t remain_time
    Remaining time of state transition
uint8_t delay
    Delay before starting state transition

uint32_t quo_tt
    Duration of each divided transition step

uint32_t counter
    Number of steps which the transition duration is divided

uint32_t total_duration
    State transition total duration

int64_t start_timestamp
    Time when the state transition is started

struct k_delayed_work timer
    Timer used for state transition

struct esp_ble_mesh_last_msg_info_t
    Parameters of the server model received last same set message.

**Public Members**

uint8_t tid
    Transaction number of the last message

uint16_t src
    Source address of the last message

uint16_t dst
    Destination address of the last message

int64_t timestamp
    Time when the last message is received

struct esp_ble_mesh_server_rsp_ctrl_t
    Parameters of the Server Model response control

**Public Members**

uint8_t get_auto_rsp
    BLE Mesh Server Response Option.

i. If get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Get messages need to be replied by the application;
ii. If get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Get messages will be replied by the server models;
iii. If set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Set messages need to be replied by the application;
iv. If set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Set messages will be replied by the server models;
v. If status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Server Status messages need to be replied by the application;
vi. If status_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Server Status messages will be replied by the server models; Response control for Client Get messages

```c
uint8_t set_auto_rsp
Response control for Client Set messages
```

```c
uint8_t status_auto_rsp
Response control for Server Status messages
```

**Macros**

`ESP_BLE_MESH_SDU_MAX_LEN`

`< The maximum length of a BLE Mesh message, including Opcode, Payload and TransMIC Length of a short Mesh MIC.`

`ESP_BLE_MESH_MIC_SHORT`

`Length of a long Mesh MIC.`

`ESP_BLE_MESH_MIC_LONG`

`The maximum length of a BLE Mesh provisioned node name`

`ESP_BLE_MESH_NODE_NAME_MAX_LEN`

`The maximum length of a BLE Mesh unprovisioned device name`

`ESP_BLE_MESH_DEVICE_NAME_MAX_LEN`

`The maximum length of settings user id`

`ESP_BLE_MESH_SETTINGS_UID_SIZE`

`Invalid settings index`

`ESP_BLE_MESH_INVALID_SETTINGS_IDX`

`Define the BLE Mesh octet 16 bytes size`

`ESP_BLE_MESH_OCTET16_LEN`

`ESP_BLE_MESH_OCTET8_LEN`

`ESP_BLE_MESH_CID_NVAL`

`Special TTL value to request using configured default TTL`

`ESP_BLE_MESH_TTL_DEFAULT`

`Maximum allowed TTL value`

`ESP_BLE_MESH_TTL_MAX`
ESP_BLE_MESH_ADDR_UNASSIGNED

ESP_BLE_MESH_ADDR_ALL_NODES

ESP_BLE_MESH_ADDR_PROXIES

ESP_BLE_MESH_ADDR_FRIENDS

ESP_BLE_MESH_ADDR_RELAYS

ESP_BLE_MESH_KEY_UNUSED

ESP_BLE_MESH_KEY_DEV

ESP_BLE_MESH_KEY_PRIMARY

ESP_BLE_MESH_KEY_ANY
  Primary Network Key index

ESP_BLE_MESH_NET_PRIMARY
  Relay state value

ESP_BLE_MESH_RELAY_DISABLED

ESP_BLE_MESH_RELAY_ENABLED

ESP_BLE_MESH_RELAY_NOT_SUPPORTED
  Beacon state value

ESP_BLE_MESH_BEACON_DISABLED

ESP_BLE_MESH_BEACON_ENABLED
  GATT Proxy state value

ESP_BLE_MESH_GATT_PROXY_DISABLED

ESP_BLE_MESH_GATT_PROXY_ENABLED

ESP_BLE_MESH_GATT_PROXY_NOT_SUPPORTED
  Friend state value

ESP_BLE_MESH_FRIEND_DISABLED

ESP_BLE_MESH_FRIEND_ENABLED

ESP_BLE_MESH_FRIEND_NOT_SUPPORTED
  Node identity state value
ESP_BLE_MESH_NODE_IDENTITY_STOPPED

ESP_BLE_MESH_NODE_IDENTITY_RUNNING

ESP_BLE_MESH_NODE_IDENTITY_NOT_SUPPORTED

Supported features

ESP_BLE_MESH_FEATURE_RELAY

ESP_BLE_MESH_FEATURE_PROXY

ESP_BLE_MESH_FEATURE_FRIEND

ESP_BLE_MESH_FEATURE_LOW_POWER

ESP_BLE_MESH_FEATURE_ALL_SUPPORTED

ESP_BLE_MESH_ADDR_IS_UNICAST(addr)

ESP_BLE_MESH_ADDR_IS_GROUP(addr)

ESP_BLE_MESH_ADDR_IS_VIRTUAL(addr)

ESP_BLE_MESH_ADDR_IS_RFU(addr)

ESP_BLE_MESH_INVALID_NODE_INDEX

ESP_BLE_MESH_TRANSMIT(count, int_ms)

Encode transmission count & interval steps.

Note: For example, ESP_BLE_MESH_TRANSMIT(2, 20) means that the message will be sent about 90ms (count is 3, step is 1, interval is 30 ms which includes 10ms of advertising interval random delay).

Parameters
  • count – Number of retransmissions (first transmission is excluded).
  • int_ms – Interval steps in milliseconds. Must be greater than 0 and a multiple of 10.

Returns BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

ESP_BLE_MESH_GET_TRANSMIT_COUNT(transmit)

Decode transmit count from a transmit value.

Parameters
  • transmit – Encoded transmit count & interval value.

Returns Transmission count (actual transmissions equal to N + 1).

ESP_BLE_MESH_GET_TRANSMIT_INTERVAL(transmit)

Decode transmit interval from a transmit value.

Parameters
  • transmit – Encoded transmit count & interval value.

Returns Transmission interval in milliseconds.
**ESP_BLE_MESH_PUBLISH_TRANSMIT** (count, int_ms)

Encode Publish Retransmit count & interval steps.

**Parameters**
- **count** — Number of retransmissions (first transmission is excluded).
- **int_ms** — Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

**Returns**
BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

**ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_COUNT** (transmit)

Decode Publish Retransmit count from a given value.

**Parameters**
- **transmit** — Encoded Publish Retransmit count & interval value.

**Returns**
Retransmission count (actual transmissions equal to N + 1).

**ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_INTERVAL** (transmit)

Decode Publish Retransmit interval from a given value.

Callbacks which are not needed to be initialized by users (set with 0 and will be initialized internally)

**Parameters**
- **transmit** — Encoded Publish Retransmit count & interval value.

**Returns**
Transmission interval in milliseconds.

**ESP_BLE_MESH_PROV_STATIC_OOB_MAX_LEN**

Maximum length of string used by Output OOB authentication

**ESP_BLE_MESH_PROV_OUTPUT_OOB_MAX_LEN**

Maximum length of string used by Output OOB authentication

**ESP_BLE_MESH_PROV_INPUT_OOB_MAX_LEN**

Macros used to define message opcode

**ESP_BLE_MESH_MODEL_OP_1** (b0)

**ESP_BLE_MESH_MODEL_OP_2** (b0, b1)

**ESP_BLE_MESH_MODEL_OP_3** (b0, cid)

This macro is associated with BLE_MESH_MODEL_CB in mesh_access.h

**ESP_BLE_MESH_SIG_MODEL** (_id, _op, _pub, _user_data)

This macro is associated with BLE_MESH_MODEL_VND_CB in mesh_access.h

**ESP_BLE_MESH_VENDOR_MODEL** (_company, _id, _op, _pub, _user_data)

**ESP_BLE_MESH_ELEMENT** (_loc, _mods, _vnd_mods)

Helper to define a BLE Mesh element within an array.

In case the element has no SIG or Vendor models, the helper macro ESP_BLE_MESH_MODEL_NONE can be given instead.

**Note:** This macro is associated with BLE_MESH_ELEM in mesh_access.h

**Parameters**
- **_loc** — Location Descriptor.
- **_mods** — Array of SIG models.
- **_vnd_mods** — Array of vendor models.
Chapter 2. API Reference

ESP_BLE_MESH_PROV (uuid, sta_val, sta_val_len, out_size, out_act, in_size, in_act)

ESP_BLE_MESH_ADDR_TYPE_RPA_PUBLIC

ESP_BLE_MESH_ADDR_TYPE_RPA_RANDOM

ESP_BLE_MESH_MODEL_PUB_DEFINE (_name, _msg_len, _role)

Define a model publication context.

Parameters
• _name – Variable name given to the context.
• _msg_len – Length of the publication message.
• _role – Role of the device which contains the model.

ESP_BLE_MESH_MODEL_OP (_opcode, _min_len)

Define a model operation context.

Parameters
• _opcode – Message opcode.
• _min_len – Message minimum length.

ESP_BLE_MESH_MODEL_OP_END

Define the terminator for the model operation table. Each model operation struct array must use this terminator as the end tag of the operation unit.

ESP_BLE_MESH_MODEL_NONE

Helper to define an empty model array. This structure is associated with BLE_MESH_MODEL_NONE in mesh_access.h

ADD_DEV_RM_AFTER_PROV_FLAG

Device will be removed from queue after provisioned successfully

ADD_DEV_START_PROV_NOW_FLAG

Start provisioning device immediately

ADD_DEV_FLUSHABLE_DEV_FLAG

Device can be remove when queue is full and new device is going to added

DEL_DEV_ADDR_FLAG

DEL_DEV_UUID_FLAG

Type Definitions

typedef uint8_t esp_ble_mesh_octet16_t[ESP_BLE_MESH_OCTET16_LEN]
   Define the BLE Mesh octet 16 bytes size

typedef uint8_t esp_ble_mesh_octet8_t[ESP_BLE_MESH_OCTET8_LEN]
   Invalid Company ID

typedef uint32_t esp_ble_mesh_cb_t

typedef uint8_t UINT8

typedef uint16_t UINT16
typedef uint32_t       UINT32
typedef uint64_t       UINT64
typedef UINT8 BT_OCTET32[BT_OCTET32_LEN]
typedef uint8_t        BD_ADDR[BD_ADDR_LEN]
typedef uint8_t        esp_ble_mesh_bd_addr_t[BD_ADDR_LEN]
typedef uint8_t        esp_ble_mesh_addr_type_t
                        BLE device address type.
typedef struct esp_ble_mesh_model esp_ble_mesh_model_t

typedef uint8_t        esp_ble_mesh_dev_add_flag_t

typedef uint32_t        esp_ble_mesh_opcode_config_client_get_t
                        esp_ble_mesh_opcode_config_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to
                        locate the opcodes used by esp_ble_mesh_config_client_get_state. The following opcodes will only be used in
                        the esp_ble_mesh_config_client_get_state function.

typedef uint32_t        esp_ble_mesh_opcode_config_client_set_t
                        esp_ble_mesh_opcode_config_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to
                        locate the opcodes used by esp_ble_mesh_config_client_set_state. The following opcodes will only be used in
                        the esp_ble_mesh_config_client_set_state function.

typedef uint32_t        esp_ble_mesh_opcode_config_status_t
                        esp_ble_mesh_opcode_config_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate
                        the opcodes used by the Config Model messages. The following opcodes are used by the BLE Mesh Config
                        Server Model internally to respond to the Config Client Model’s request messages.

typedef uint8_t        esp_ble_mesh_cfg_status_t
                        This typedef is only used to indicate the status code contained in some of the Configuration Server Model status
                        message.

typedef uint32_t        esp_ble_mesh_opcode_health_client_get_t
                        esp_ble_mesh_opcode_health_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to
                        locate the opcodes used by esp_ble_mesh_health_client_get_state. The following opcodes will only be used in
                        the esp_ble_mesh_health_client_get_state function.

typedef uint32_t        esp_ble_mesh_opcode_health_client_set_t
                        esp_ble_mesh_opcode_health_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to
                        locate the opcodes used by esp_ble_mesh_health_client_set_state. The following opcodes will only be used in
                        the esp_ble_mesh_health_client_set_state function.

typedef uint32_t        esp_ble_mesh_health_model_status_t
                        esp_ble_mesh_health_model_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate
                        the opcodes used by the Health Model messages. The following opcodes are used by the BLE Mesh Health
                        Server Model internally to respond to the Health Client Model’s request messages.
typedef uint32_t esp_ble_mesh_generic_message_opcode_t

esp_ble_mesh_generic_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_generic_client_get_state & esp_ble_mesh_generic_client_set_state. Generic OnOff Message Opcode

typedef uint32_t esp_ble_mesh_sensor_message_opcode_t

esp_ble_mesh_sensor_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_sensor_client_get_state & esp_ble_mesh_sensor_client_set_state. Sensor Message Opcode

typedef uint32_t esp_ble_mesh_time_scene_message_opcode_t

esp_ble_mesh_time_scene_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_time_scene_client_get_state & esp_ble_mesh_time_scene_client_set_state. Time Message Opcode

typedef uint32_t esp_ble_mesh_light_message_opcode_t

esp_ble_mesh_light_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_light_client_get_state & esp_ble_mesh_light_client_set_state. Light Lightness Message Opcode

typedef uint32_t esp_ble_mesh_opcode_t

End of defines of esp_ble_mesh_opcode_t

typedef uint8_t esp_ble_mesh_model_status_t

This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.

Enumerations

enum esp_ble_mesh_cb_type_t

Values:

enumerator ESP_BLE_MESH_PROV_OOB_IN_MANUAL
enumerator ESP_BLE_MESH_PROV_OOB_ON_DEV

e num esp_ble_mesh_dev_role_t

   Values:

enumerator ROLE_NODE
enumerator ROLE_PROVISIONER
enumerator ROLE_FAST_PROV

e num esp_ble_mesh_fast_prov_action_t

   Values:

enumerator FAST_PROV_ACT_NONE
enumerator FAST_PROV_ACT_ENTER
enumerator FAST_PROV_ACT_SUSPEND
enumerator FAST_PROV_ACT_EXIT
enumerator FAST_PROV_ACT_MAX
enum esp_ble_mesh_proxy_filter_type_t
    Values:

    enumerator PROXY_FILTER_WHITELIST
    enumerator PROXY_FILTER_BLACKLIST

enum esp_ble_mesh_prov_cb_event_t
    Values:

    enumerator ESP_BLE_MESH_PROV_REGISTER_COMP_EVT
        Initialize BLE Mesh provisioning capabilities and internal data information completion event

    enumerator ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT
        Set the unprovisioned device name completion event

    enumerator ESP_BLE_MESH_NODE_PROV_ENABLE_COMP_EVT
        Enable node provisioning functionality completion event

    enumerator ESP_BLE_MESH_NODE_PROV_DISABLE_COMP_EVT
        Disable node provisioning functionality completion event

    enumerator ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT
        Establish a BLE Mesh link event

    enumerator ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT
        Close a BLE Mesh link event

    enumerator ESP_BLE_MESH_NODE_PROV_OOB_PUB_KEY_EVT
        Generate Node input OOB public key event

    enumerator ESP_BLE_MESH_NODE_PROV_OUTPUT_NUMBER_EVT
        Generate Node Output Number event

    enumerator ESP_BLE_MESH_NODE_PROV_OUTPUT_STRING_EVT
        Generate Node Output String event

    enumerator ESP_BLE_MESH_NODE_PROV_INPUT_EVT
        Event requiring the user to input a number or string

    enumerator ESP_BLE_MESH_NODE_PROV_COMPLETE_EVT
        Provisioning done event

    enumerator ESP_BLE_MESH_NODE_PROV_RESET_EVT
        Provisioning reset event

    enumerator ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT
        Node set oob public key completion event
enumerator **ESP_BLE_MESH_NODE_PROV_INPUT_NUMBER_COMP_EVT**  
Node input number completion event

enumerator **ESP_BLE_MESH_NODE_PROV_INPUT_STRING_COMP_EVT**  
Node input string completion event

enumerator **ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT**  
Enable BLE Mesh Proxy Identity advertising completion event

enumerator **ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT**  
Enable BLE Mesh GATT Proxy Service completion event

enumerator **ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT**  
Disable BLE Mesh GATT Proxy Service completion event

enumerator **ESP_BLE_MESH_NODE_ADDLOCAL_NET_KEY_COMP_EVT**  
Node add NetKey locally completion event

enumerator **ESP_BLE_MESH_NODE_ADD_LOCAL_APP_KEY_COMP_EVT**  
Node add AppKey locally completion event

enumerator **ESP_BLE_MESH_NODE_BIND_APP_KEY_TO_MODEL_COMP_EVT**  
Node bind AppKey to model locally completion event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT**  
Provisioner enable provisioning functionality completion event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT**  
Provisioner disable provisioning functionality completion event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_RECV_UNPROV_ADV_PKT_EVT**  
Provisioner receives unprovisioned device beacon event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT**  
Provisioner read unprovisioned device OOB public key event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_INPUT_EVT**  
Provisioner input value for provisioning procedure event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_OUTPUT_EVT**  
Provisioner output value for provisioning procedure event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_LINK_OPEN_EVT**  
Provisioner establish a BLE Mesh link event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_LINK_CLOSE_EVT**  
Provisioner close a BLE Mesh link event
enumerator **ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT**
Provisioner provisioning done event

enumerator **ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT**
Provisioner add a device to the list which contains devices that are waiting/going to be provisioned completion event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT**
Provisioner start to provision an unprovisioned device completion event

enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_DEV_COMP_EVT**
Provisioner delete a device from the list, close provisioning link with the device completion event

enumerator **ESP_BLE_MESH_PROVISIONER_SET_DEV_UUID_MATCH_COMP_EVT**
Provisioner set the value to be compared with part of the unprovisioned device UUID completion event

enumerator **ESP_BLE_MESH_PROVISIONER_SET_PROV_DATA_INFO_COMP_EVT**
Provisioner set net_idx/flags/iv_index used for provisioning completion event

enumerator **ESP_BLE_MESH_PROVISIONER_SET_STATIC_OOB_VALUE_COMP_EVT**
Provisioner set static oob value used for provisioning completion event

enumerator **ESP_BLE_MESH_PROVISIONER_SET_PRIMARY_ELEM_ADDR_COMP_EVT**
Provisioner set unicast address of primary element completion event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT**
Provisioner read unprovisioned device OOB public key completion event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT**
Provisioner input number completion event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT**
Provisioner input string completion event

enumerator **ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT**
Provisioner set node name completion event

enumerator **ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT**
Provisioner add local app key completion event

enumerator **ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT**
Provisioner update local app key completion event

enumerator **ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT**
Provisioner bind local model with local app key completion event

enumerator **ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT**
Provisioner add local network key completion event
enumerator **ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT**
Provisioner update local network key completion event

enumerator **ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT**
Provisioner store node composition data completion event

enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT**
Provisioner delete node with uuid completion event

enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT**
Provisioner delete node with unicast address completion event

enumerator **ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT**
Provisioner start to receive heartbeat message completion event

enumerator **ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT**
Provisioner set the heartbeat filter type completion event

enumerator **ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT**
Provisioner set the heartbeat filter information completion event

enumerator **ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT**
Provisioner receive heartbeat message event

enumerator **ESP_BLE_MESH_PROVISIONER_DIRECT_ERASE_SETTINGS_COMP_EVT**
Provisioner directly erase settings completion event

enumerator **ESP_BLE_MESH_PROVISIONER_OPEN SETTINGS_WITH_INDEX_COMP_EVT**
Provisioner open settings with index completion event

enumerator **ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT**
Provisioner open settings with user id completion event

enumerator **ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT**
Provisioner close settings with index completion event

enumerator **ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT**
Provisioner close settings with user id completion event

enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT**
Provisioner delete settings with index completion event

enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT**
Provisioner delete settings with user id completion event

enumerator **ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT**
Set fast provisioning information (e.g. unicast address range, net_idx, etc.) completion event
enumerator ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT
    Set fast provisioning action completion event

enumerator ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT
    Receive Heartbeat message event

enumerator ESP_BLE_MESH_LPN_ENABLE_COMP_EVT
    Enable Low Power Node completion event

enumerator ESP_BLE_MESH_LPN_DISABLE_COMP_EVT
    Disable Low Power Node completion event

enumerator ESP_BLE_MESH_LPN_POLL_COMP_EVT
    Low Power Node send Friend Poll completion event

enumerator ESP_BLE_MESH_LPN_FRIENDSHIP_ESTABLISH_EVT
    Low Power Node establishes friendship event

enumerator ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT
    Low Power Node terminates friendship event

enumerator ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT
    Friend Node establishes friendship event

enumerator ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT
    Friend Node terminates friendship event

enumerator ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT
    Proxy Client receives Network ID advertising packet event

enumerator ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT
    Proxy Client establishes connection successfully event

enumerator ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT
    Proxy Client terminates connection successfully event

enumerator ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT
    Proxy Client receives Proxy Filter Status event

enumerator ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT
    Proxy Client connect completion event

enumerator ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT
    Proxy Client disconnect completion event

enumerator ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT
    Proxy Client set filter type completion event
enumerator **ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT**
Proxy Client add filter address completion event

denumerator **ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT**
Proxy Client remove filter address completion event

denumerator **ESP_BLE_MESH_PROXY_SERVER_CONNECTED_EVT**
Proxy Server establishes connection successfully event

denumerator **ESP_BLE_MESH_PROXY_SERVER_DISCONNECTED_EVT**
Proxy Server terminates connection successfully event

denumerator **ESP_BLE_MESH_MODEL_SUBSCRIBE_GROUP_ADDR_COMP_EVT**
Local model subscribes group address completion event

denumerator **ESP_BLE_MESH_MODEL_UNSUBSCRIBE_GROUP_ADDR_COMP_EVT**
Local model unsubscribes group address completion event

denumerator **ESP_BLE_MESH_DEINIT_MESH_COMP_EVT**
De-initialize BLE Mesh stack completion event

denumerator **ESP_BLE_MESH_PROV_EVT_MAX**

**Enum [anonymous]**
BLE Mesh server models related definitions.
This enum value is the flag of transition timer operation

**Values:**

denumerator **ESP_BLE_MESH_SERVER_TRANS_TIMER_START**

denumerator **ESP_BLE_MESH_SERVER_FLAG_MAX**

**Enum esp_ble_mesh_server_state_type_t**
This enum value is the type of server model states

**Values:**

denumerator **ESP_BLE_MESH_GENERIC_ONOFF_STATE**

denumerator **ESP_BLE_MESH_GENERIC_LEVEL_STATE**

denumerator **ESP_BLE_MESH_GENERIC_ONPOWERUP_STATE**

denumerator **ESP_BLE_MESH_GENERIC_POWER_actual_STATE**

denumerator **ESP_BLE_MESH_LIGHT_LIGHTNESS_actual_STATE**
enumerator ESP_BLE_MESH_LIGHT_LIGHTNESS_LINEAR_STATE
enumerator ESP_BLE_MESH_LIGHT_CTL_LIGHTNESS_STATE
enumerator ESP_BLE_MESH_LIGHT_CTL_TEMP_DELTA_UV_STATE
enumerator ESP_BLE_MESH_LIGHT_HSL_STATE
enumerator ESP_BLE_MESH_LIGHT_HSL_LIGHTNESS_STATE
enumerator ESP_BLE_MESH_LIGHT_HSL_HUE_STATE
enumerator ESP_BLE_MESH_LIGHT_HSL_SATURATION_STATE
enumerator ESP_BLE_MESH_LIGHT_XYL_LIGHTNESS_STATE
enumerator ESP_BLE_MESH_LIGHT_LC_LIGHT_ONOFF_STATE
enumerator ESP_BLE_MESH_SERVER_MODEL_STATE_MAX

enum esp_ble_mesh_model_cb_event_t

Values:

enumerator ESP_BLE_MESH_MODEL_OPERATION_EVT
User-defined models receive messages from peer devices (e.g. get, set, status, etc) event
enumerator ESP_BLE_MESH_MODEL_SEND_COMP_EVT
User-defined models send messages completion event
enumerator ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT
User-defined models publish messages completion event
enumerator ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT
User-defined client models receive publish messages event
enumerator ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT
Timeout event for the user-defined client models that failed to receive response from peer server models
enumerator ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT
When a model is configured to publish messages periodically, this event will occur during every publish period
enumerator ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT
Server models update state value completion event
enumerator ESP_BLE_MESH_MODEL_EVT_MAX
**Chapter 2. API Reference**

**ESP-BLE-MESH Core API Reference**

This section contains ESP-BLE-MESH Core related APIs, which can be used to initialize ESP-BLE-MESH stack, provision, send/publish messages, etc.

This API reference covers six components:

- **ESP-BLE-MESH Stack Initialization**
- **Reading of Local Data Information**
- **Low Power Operation (Updating)**
- **Send/Publish Messages, add Local AppKey, etc.**
- **ESP-BLE-MESH Node/Provisioner Provisioning**
- **ESP-BLE-MESH GATT Proxy Server**

**ESP-BLE-MESH Stack Initialization**

**Header File**

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_common_api.h

**Functions**

```c
esp_err_t esp_ble_mesh_init (esp_ble_mesh_prov_t *prov, esp_ble_mesh_comp_t *comp)
```

Initialize BLE Mesh module. This API initializes provisioning capabilities and composition data information.

*Note:* After calling this API, the device needs to call esp_ble_mesh_prov_enable() to enable provisioning functionality again.

**Parameters**

- **prov** [in] Pointer to the device provisioning capabilities. This pointer must remain valid during the lifetime of the BLE Mesh device.
- **comp** [in] Pointer to the device composition data information. This pointer must remain valid during the lifetime of the BLE Mesh device.

**Returns**

ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_deinit (esp_ble_mesh_deinit_param_t *param)
```

De-initialize BLE Mesh module.

*Note:* This function shall be invoked after esp_ble_mesh_client_model_deinit().

**Parameters**

- **param** [in] Pointer to the structure of BLE Mesh deinit parameters.

**Returns**

ESP_OK on success or error code otherwise.

**Reading of Local Data Information**

**Header File**

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_local_data_operation_api.h

**Functions**

int32_t esp_ble_mesh_get_model_publish_period (esp_mesh_model_t *model)

Get the model publish period, the unit is ms.

Parameters model [-in] Model instance pointer.

Returns Publish period value on success, 0 or (negative) error code from errno.h on failure.

uint16_t esp_ble_mesh_get_primary_element_address (void)

Get the address of the primary element.

Returns Address of the primary element on success, or ESP_BLE_MESH_ADDR_UNASSIGNED on failure which means the device has not been provisioned.

uint16_t *esp_ble_mesh_is_model_subscribed_to_group (esp_ble_mesh_model_t *model, uint16_t group_addr)

Check if the model has subscribed to the given group address. Note: E.g., once a status message is received and the destination address is a group address, the model uses this API to check if it is successfully subscribed to the given group address.

Parameters

• model [-in] Pointer to the model.
• group_addr [-in] Group address.

Returns Pointer to the group address within the Subscription List of the model on success, or NULL on failure which means the model has not subscribed to the given group address. Note: With the pointer to the group address returned, you can reset the group address to 0x0000 in order to unsubscribe the model from the group.

esp_ble_mesh_elem_t *esp_ble_mesh_find_element (uint16_t element_addr)

Find the BLE Mesh element pointer via the element address.

Parameters element_addr [-in] Element address.

Returns Pointer to the element on success, or NULL on failure.

uint8_t esp_ble_mesh_get_element_count (void)

Get the number of elements that have been registered.

Returns Number of elements.

esp_ble_mesh_model_t *esp_ble_mesh_find_vendor_model (const esp_ble_mesh_elem_t *element, uint16_t company_id, uint16_t model_id)

Find the Vendor specific model with the given element, the company ID and the Vendor Model ID.

Parameters

• element [-in] Element to which the model belongs.
• company_id [-in] A 16-bit company identifier assigned by the Bluetooth SIG.

Returns Pointer to the Vendor Model on success, or NULL on failure which means the Vendor Model is not found.

esp_ble_mesh_model_t *esp_ble_mesh_find_sig_model (const esp_ble_mesh_elem_t *element, uint16_t model_id)

Find the SIG model with the given element and Model id.

Parameters

• element [-in] Element to which the model belongs.
• model_id [-in] SIG model identifier.

Returns Pointer to the SIG Model on success, or NULL on failure which means the SIG Model is not found.

const esp_ble_mesh_comp_t *esp_ble_mesh_get_composition_data (void)

Get the Composition data which has been registered.

Returns Pointer to the Composition data on success, or NULL on failure which means the Composition data is not initialized.
Chapter 2. API Reference

**esp_err_t esp_ble_mesh_model_subscribe_group_addr** (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)

A local model of node or Provisioner subscribes a group address.

**Note:** This function shall not be invoked before node is provisioned or Provisioner is enabled.

**Parameters**

- **element_addr** [in] Unicast address of the element to which the model belongs.
- **company_id** [in] A 16-bit company identifier.
- **group_addr** [in] The group address to be subscribed.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_model_unsubscribe_group_addr** (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)

A local model of node or Provisioner unsubscribes a group address.

**Note:** This function shall not be invoked before node is provisioned or Provisioner is enabled.

**Parameters**

- **element_addr** [in] Unicast address of the element to which the model belongs.
- **company_id** [in] A 16-bit company identifier.
- **group_addr** [in] The subscribed group address.

**Returns** ESP_OK on success or error code otherwise.

**const uint8_t** *esp_ble_mesh_node_get_local_net_key** (uint16_t net_idx)

This function is called by Node to get the local NetKey.

**Parameters**

- **net_idx** [in] NetKey index.

**Returns** NetKey on success, or NULL on failure.

**const uint8_t** *esp_ble_mesh_node_get_local_app_key** (uint16_t app_idx)

This function is called by Node to get the local AppKey.

**Parameters**

- **app_idx** [in] AppKey index.

**Returns** AppKey on success, or NULL on failure.

**esp_err_t esp_ble_mesh_node_add_local_net_key** (const uint8_t net_key[16], uint16_t net_idx)

This function is called by Node to add a local NetKey.

**Note:** This function can only be called after the device is provisioned.

**Parameters**

- **net_key** [in] NetKey to be added.
- **net_idx** [in] NetKey Index.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_node_add_local_app_key** (const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)

This function is called by Node to add a local AppKey.
Note: The net_idx must be an existing one. This function can only be called after the device is provisioned.

Parameters
- `app_key` [in] AppKey to be added.

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_node_bind_app_key_to_local_model(uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t app_idx)
```

This function is called by Node to bind AppKey to model locally.

Note: If going to bind app_key with local vendor model, the company_id shall be set to 0xFFFF. This function can only be called after the device is provisioned.

Parameters
- `element_addr` [in] Node local element address
- `company_id` [in] Node local company id
- `model_id` [in] Node local model id
- `app_idx` [in] Node local appkey index

Returns ESP_OK on success or error code otherwise.

Low Power Operation (Updating)

Header File
- `components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_low_power_api.h`

Functions

```c
esp_err_t esp_ble_mesh_lpn_enable(void)
```
Enable BLE Mesh device LPN functionality.

Note: This API enables LPN functionality. Once called, the proper Friend Request will be sent.

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_lpn_disable(bool force)
```
Disable BLE Mesh device LPN functionality.

Parameters
- `force` [in] when disabling LPN functionality, use this flag to indicate whether directly clear corresponding information or just send friend clear to disable it if friendship has already been established.

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_lpn_poll(void)
```
LPN tries to poll messages from the Friend Node.

Note: The Friend Poll message is sent by a Low Power node to ask the Friend node to send a message that it has stored for the Low Power node. Users can call this API to send Friend Poll message manually. If this API is not invoked, the bottom layer of the Low Power node will send Friend Poll before the PollTimeout timer.
expires. If the corresponding Friend Update is received and MD is set to 0, which means there are no messages for the Low Power node, then the Low Power node will stop scanning.

**Returns**  ESP_OK on success or error code otherwise.

**Send/Publish Messages, add Local AppKey, etc.**

**Header File**

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_networking_api.h

**Functions**

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_err_t esp_ble_mesh_register_custom_model_callback (esp_ble_mesh_model_cb_t callback)</td>
<td>Register BLE Mesh callback for user-defined models’ operations. This callback can report the following events generated for the user-defined models:</td>
</tr>
</tbody>
</table>
| - Call back the messages received by user-defined client and server models to the application layer;  
- If users call esp_ble_mesh_server/client_model_send, this callback notifies the application layer of the send_complete event;  
- If user-defined client model sends a message that requires response, and the response message is received after the timer expires, the response message will be reported to the application layer as published by a peer device;  
- If the user-defined client model fails to receive the response message during a specified period of time, a timeout event will be reported to the application layer. |

**Note:** The client models (i.e. Config Client model, Health Client model, Generic Client models, Sensor Client model, Scene Client model and Lighting Client models) that have been realized internally have their specific register functions. For example, esp_ble_mesh_register_config_client_callback is the register function for Config Client Model.

**Parameters** callback -[in] Pointer to the callback function.

**Returns**  ESP_OK on success or error code otherwise.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_err_t esp_ble_mesh_model_msg_opcode_init (uint8_t *data, uint32_t opcode)</td>
<td>Add the message opcode to the beginning of the model message before sending or publishing the model message.</td>
</tr>
</tbody>
</table>

**Note:** This API is only used to set the opcode of the message.

**Parameters**

- data -[in] Pointer to the message data.  
- opcode -[in] The message opcode.

**Returns**  ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_client_model_init (esp_ble_mesh_model_t *model)**

Initialize the user-defined client model. All user-defined client models shall call this function to initialize the client model internal data. Node: Before calling this API, the op_pair_size and op_pair variabled within the user_data(defined using esp_ble_mesh_client_t ) of the client model need to be initialized.

**Parameters** model -[in] BLE Mesh Client model to which the message belongs.

**Returns**  ESP_OK on success or error code otherwise.
**esp_err_t esp_ble_mesh_client_model_deinit (esp_ble_mesh_model_t *model)**

De-initialize the user-defined client model.

**Note:** This function shall be invoked before esp_ble_mesh_deinit() is called.

**Parameters**
- `model` - [in] Pointer of the Client model.

**Returns**
- ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_server_model_send_msg (esp_ble_mesh_model_t *model,**
  esp_ble_mesh_msg_ctx_t *ctx,**
  uint32_t opcode,**
  uint16_t length,**
  uint8_t* data)**

Send server model messages (such as server model status messages).

**Parameters**
- `model` - [in] BLE Mesh Server Model to which the message belongs.
- `ctx` - [in] Message context, includes keys, TTL, etc.
- `length` - [in] Message length (exclude the message opcode).
- `data` - [in] Parameters of Access Payload (exclude the message opcode) to be sent.

**Returns**
- ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_client_model_send_msg (esp_ble_mesh_model_t *model,**
  esp_ble_mesh_msg_ctx_t *ctx,**
  uint32_t opcode,**
  uint16_t length,**
  uint8_t* data,**
  int32_t msg_timeout,**
  bool need_rsp,**
  esp_ble_mesh_dev_role_t device_role)**

Send client model message (such as model get, set, etc).

**Parameters**
- `model` - [in] BLE Mesh Client Model to which the message belongs.
- `ctx` - [in] Message context, includes keys, TTL, etc.
- `length` - [in] Message length (exclude the message opcode).
- `data` - [in] Parameters of the Access Payload (exclude the message opcode) to be sent.
- `msg_timeout` - [in] Time to get response to the message (in milliseconds).
- `need_rsp` - [in] TRUE if the opcode requires the peer device to reply, FALSE otherwise.
- `device_role` - [in] Role of the device (Node/Provisioner) that sends the message.

**Returns**
- ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_model_publish (esp_ble_mesh_model_t *model,**
  uint32_t opcode,**
  uint16_t length,**
  uint8_t* data,**
  esp_ble_mesh_dev_role_t device_role)**

Send a model publication message.

**Note:** Before calling this function, the user needs to ensure that the model publication message (esp_ble_mesh_model_pub_t::msg) contains a valid message to be sent. And if users want to update the publishing message, this API should be called in ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT with the message updated.

**Parameters**
- `length` - [in] Message length (exclude the message opcode).
- `data` - [in] Parameters of the Access Payload (exclude the message opcode) to be sent.
- `device_role` - [in] Role of the device (node/provisioner) publishing the message of the type esp_ble_mesh_dev_role_t.
Chapter 2. API Reference

**Returns** ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_server_model_update_state(esp_ble_mesh_model_t *model, esp_ble_mesh_server_state_type_t type, esp_ble_mesh_server_state_value_t *value)`

Update a server model state value. If the model publication state is set properly (e.g., publish address is set to a valid address), it will publish corresponding status message.

**Note:** Currently this API is used to update bound state value, not for all server model states.

**Parameters**
- **model** - [in] Server model which is going to update the state.
- **type** - [in] Server model state type.
- **value** - [in] Server model state value.

**Returns** ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_node_local_reset(void)`

Reset the provisioning procedure of the local BLE Mesh node.

**Note:** All provisioning information in this node will be deleted and the node needs to be reprovisioned. The API function esp_ble_mesh_node_prov_enable() needs to be called to start a new provisioning procedure.

**Returns** ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_set_node_name(uint16_t index, const char* name)`

This function is called to set the node (provisioned device) name.

**Note:** index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

**Parameters**
- **index** - [in] Index of the node in the node queue.
- **name** - [in] Name (end by '\0') to be set for the node.

**Returns** ESP_OK on success or error code otherwise.

`const char* esp_ble_mesh_provisioner_get_node_name(uint16_t index)`

This function is called to get the node (provisioned device) name.

**Note:** index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

**Parameters**
- **index** - [in] Index of the node in the node queue.

**Returns** Node name on success, or NULL on failure.

`uint16_t esp_ble_mesh_provisioner_get_node_index(const char *name)`

This function is called to get the node (provisioned device) index.

**Parameters**
- **name** - [in] Name of the node (end by '\0').

**Returns** Node index on success, or an invalid value (0xFFFF) on failure.

`esp_err_t esp_ble_mesh_provisioner_store_node_comp_data(uint16_t unicast_addr, uint8_t *data, uint16_t length)`

This function is called to store the Composition Data of the node.
Parameters

- **unicast_addr** - [in] Element address of the node
- **data** - [in] Pointer of Composition Data
- **length** - [in] Length of Composition Data

Returns ESP_OK on success or error code otherwise.

```c
esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_uuid (const uint8_t uuid[16])
```

This function is called to get the provisioned node information with the node device UUID.

**Parameters**

- **uuid** - [in] Device UUID of the node

**Returns**

Pointer of the node info struct or NULL on failure.

```c
esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_addr (uint16_t unicast_addr)
```

This function is called to get the provisioned node information with the node unicast address.

**Parameters**

- **unicast_addr** - [in] Unicast address of the node

**Returns**

Pointer of the node info struct or NULL on failure.

```c
esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_name (const char *name)
```

This function is called to get the provisioned node information with the node name.

**Parameters**

- **name** - [in] Name of the node (end by ‘\0’).

**Returns**

Pointer of the node info struct or NULL on failure.

```c
uint16_t esp_ble_mesh_provisioner_get_prov_node_count (void)
```

This function is called by Provisioner to get provisioned node count.

**Returns**

Number of the provisioned nodes.

```c
const esp_ble_mesh_node_t **esp_ble_mesh_provisioner_get_node_table_entry (void)
```

This function is called by Provisioner to get the entry of the node table.

**Returns**

Pointer to the start of the node table.

```c
esp_err_t esp_ble_mesh_provisioner_delete_node_with_uuid (const uint8_t uuid[16])
```

This function is called to delete the provisioned node information with the node device UUID.

**Parameters**

- **uuid** - [in] Device UUID of the node

**Returns**

ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_delete_node_with_addr (uint16_t unicast_addr)
```

This function is called to delete the provisioned node information with the node unicast address.

**Parameters**

- **unicast_addr** - [in] Unicast address of the node

**Returns**

ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_add_local_app_key (const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)
```

This function is called to add a local AppKey for Provisioner.

**Note:** app_key: If set to NULL, app_key will be generated internally. net_idx: Should be an existing one. app_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new app_idx will be generated internally.
Chapter 2. API Reference

reported via an event.

Parameters

- `app_key` - [in] The app key to be set for the local BLE Mesh stack.
- `app_idx` - [in] The app key index.

Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_update_local_app_key` (const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)

This function is used to update a local AppKey for Provisioner.

Parameters

- `app_key` - [in] Value of the AppKey.
- `net_idx` - [in] Corresponding NetKey Index.
- `app_idx` - [in] The AppKey Index

Returns ESP_OK on success or error code otherwise.

`const uint8_t* esp_ble_mesh_provisioner_get_local_app_key` (uint16_t net_idx, uint16_t app_idx)

This function is called by Provisioner to get the local app key value.

Parameters

- `net_idx` - [in] Network key index.
- `app_idx` - [in] Application key index.

Returns Appkey on success, or NULL on failure.

`esp_err_t esp_ble_mesh_provisioner_bind_app_key_to_local_model` (uint16_t element_addr, uint16_t app_idx, uint16_t model_id, uint16_t company_id)

This function is called by Provisioner to bind own model with proper app key.

Note: company_id: If going to bind app_key with local vendor model, company_id should be set to 0xFFFF.

Parameters

- `element_addr` - [in] Provisioner local element address
- `app_idx` - [in] Provisioner local appkey index
- `model_id` - [in] Provisioner local model id
- `company_id` - [in] Provisioner local company id

Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_add_local_net_key` (const uint8_t net_key[16], uint16_t net_idx)

This function is called by Provisioner to add local network key.

Note: net_key: If set to NULL, net_key will be generated internally. net_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new net_idx will be reported via an event.

Parameters

- `net_key` - [in] The network key to be added to the Provisioner local BLE Mesh stack.

Returns ESP_OK on success or error code otherwise.
Chapter 2. API Reference

`esp_err_t esp_ble_mesh_provisioner_update_local_net_key(const uint8_t net_key[16], uint16_t net_idx)`

This function is called by Provisioner to update a local network key.

**Parameters**

**Returns**
- ESP_OK on success or error code otherwise.

`const uint8_t* esp_ble_mesh_provisioner_get_local_net_key(uint16_t net_idx)`

This function is called by Provisioner to get the local network key value.

**Parameters**

**Returns**
- Network key on success, or NULL on failure.

`esp_err_t esp_ble_mesh_provisioner_recv_heartbeat(bool enable)`

This function is called by Provisioner to enable or disable receiving heartbeat messages.

**Note:** If enabling receiving heartbeat message successfully, the filter will be an empty rejectlist by default, which means all heartbeat messages received by the Provisioner will be reported to the application layer.

**Parameters**
- `enable` – [in] Enable or disable receiving heartbeat messages.

**Returns**
- ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_set_heartbeat_filter_type(uint8_t type)`

This function is called by Provisioner to set the heartbeat filter type.

**Note:**
1. If the filter type is not the same with the current value, then all the filter entries will be cleaned.
   a. If the previous type is rejectlist, and changed to acceptlist, then the filter will be an empty acceptlist, which means no heartbeat messages will be reported. Users need to add SRC or DST into the filter entry, then heartbeat messages from the SRC or to the DST will be reported.

**Parameters**
- `type` – [in] Heartbeat filter type (acceptlist or rejectlist).

**Returns**
- ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_set_heartbeat_filter_info(uint8_t op, esp_ble_mesh_heartbeat_filter_info_t *info)`

This function is called by Provisioner to add or remove a heartbeat filter entry.

**Note:**
1. If the operation is “ADD”, the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.
   a. If only one of them is set, the filter entry will use the configured SRC or DST to filter heartbeat messages.
   b. If both of them are set, the SRC and DST will both be used to decide if a heartbeat message will be handled.
• If SRC or DST already exists in some filter entry, then the corresponding entry will be cleaned firstly, then a new entry will be allocated to store the information.

**Parameters**

- op [in] Add or REMOVE
- info [in] Heartbeat filter entry information, including: hb_src - Heartbeat source address; hb_dst - Heartbeat destination address;

**Returns**

ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_direct_erase_settings (void)`

This function is called by Provisioner to directly erase the mesh information from nvs namespace.

**Note:** This function can be invoked when the mesh stack is not initialized or has been de-initialized.

**Returns**

ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_open_settings_with_index (uint8_t index)`

This function is called by Provisioner to open a nvs namespace for storing mesh information.

**Note:** Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

**Parameters**

- index [in] Settings index.

**Returns**

ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_open_settings_with_uid (const char* uid)`

This function is called by Provisioner to open a nvs namespace for storing mesh information.

**Note:** Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

**Parameters**

- uid [in] Settings userid.

**Returns**

ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_close_settings_with_index (uint8_t index, bool erase)`

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

**Note:**

1. Before closing the nvs namespace, it must be open.
   
a. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.

b. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.

c. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) .......

**Parameters**

- index [in] Settings index.
- erase [in] Indicate if erasing mesh information.
Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_close_settings_with_uid` (const char *uid, bool erase)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

**Note:** 1. Before closing the nvs namespace, it must be open.

a. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides being cleaned from the mesh stack.
b. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
c. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) .......

**Parameters**

- **uid** –[in] Settings user id.
- **erase** –[in] Indicate if erasing mesh information.

**Returns** ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_delete_settings_with_index` (uint8_t index)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

**Note:** When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

**Parameters** index –[in] Settings index.

**Returns** ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_delete_settings_with_uid` (const char *uid)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

**Note:** When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

**Parameters** uid –[in] Settings user id.

**Returns** ESP_OK on success or error code otherwise.

const char *`esp_ble_mesh_provisioner_get_settings_uid` (uint8_t index)

This function is called by Provisioner to get settings user id.

**Parameters** index –[in] Settings index.

**Returns** Setting user id on success or NULL on failure.

`uint8_t esp_ble_mesh_provisioner_get_settings_index` (const char *uid)

This function is called by Provisioner to get settings index.

**Parameters** uid –[in] Settings user id.

**Returns** Settings index.
Chapter 2. API Reference

```c
uint8_t esp_ble_mesh_provisioner_get_free_settings_count (void)
This function is called by Provisioner to get the number of free settings
user id.

Returns  Number of free settings user id.
```

```c
const uint8_t* esp_ble_mesh_get_fast_prov_app_key(uint16_t net_idx, uint16_t app_idx)
This function is called to get fast provisioning application key.

Parameters
• net_idx  –[in] Network key index.
• app_idx  –[in] Application key index.

Returns  Application key on success, or NULL on failure.
```

Type Definitions
```c
typedef void (*esp_ble_mesh_model_cb_t)(esp_ble_mesh_model_cb_event_t event,
  esp_ble_mesh_model_cb_param_t *param)
: event, event code of user-defined model events; param, parameters of user-defined model events
```

ESP-BLE-MESH Node/Provisioner Provisioning

Header File
```c
• components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_provisioning_api.h
```

Functions
```c
esp_err_t esp_ble_mesh_register_prov_callback(esp_ble_mesh_prov_cb_t callback)
Register BLE Mesh provisioning callback.

Parameters  callback  –[in] Pointer to the callback function.

Returns  ESP_OK on success or error code otherwise.
```

```c
bool esp_ble_mesh_node_is_provisioned (void)
Check if a device has been provisioned.

Returns  TRUE if the device is provisioned, FALSE if the device is unprovisioned.
```

```c
esp_err_t esp_ble_mesh_node_prov_enable(esp_ble_mesh_prov_bearer_t bearers)
Enable specific provisioning bearers to get the device ready for provisioning.

Parameters  bearers  –Bit-wise OR of provisioning bearers.

Returns  ESP_OK on success or error code otherwise.
```

```c
esp_err_t esp_ble_mesh_node_prov_disable(esp_ble_mesh_prov_bearer_t bearers)
Disable specific provisioning bearers to make a device inaccessible for provisioning.

Parameters  bearers  –Bit-wise OR of provisioning bearers.

Returns  ESP_OK on success or error code otherwise.
```

```c
esp_err_t esp_ble_mesh_node_set_oob_pub_key(uint8_t pub_key_x[32], uint8_t pub_key_y[32],
  uint8_t private_key[32])
Unprovisioned device set own oob public key & private key pair.

Note:  In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends
that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys. So as
```
an unprovisioned device, it should use this function to input the Public Key exchanged through the out-of-band mechanism.

**Parameters**
- **pub_key_x** – *in* Unprovisioned device’s Public Key X
- **pub_key_y** – *in* Unprovisioned device’s Public Key Y
- **private_key** – *in* Unprovisioned device’s Private Key

**Returns**
- ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_node_input_number**(uint32_t number)

Provide provisioning input OOB number.

**Note:** This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_NUMBER as the action.

**Parameters**
- **number** – *in* Number input by device.

**Returns**
- ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_node_input_string**(const char* string)

Provide provisioning input OOB string.

**Note:** This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_STRING as the action.

**Parameters**
- **string** – *in* String input by device.

**Returns**
- ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_set_unprovisioned_device_name**(const char* name)

Using this function, an unprovisioned device can set its own device name, which will be broadcasted in its advertising data.

**Note:** This API applicable to PB-GATT mode only by setting the name to the scan response data, it doesn’t apply to PB-ADV mode.

**Parameters**
- **name** – *in* Unprovisioned device name

**Returns**
- ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_provisioner_read_oob_pub_key**(uint8_t link_idx, uint8_t* pub_key_x[32], uint8_t* pub_key_y[32])

Provisioner inputs unprovisioned device’s oob public key.

**Note:** In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys.

**Parameters**
- **link_idx** – *in* The provisioning link index
- **pub_key_x** – *in* Unprovisioned device’s Public Key X
- **pub_key_y** – *in* Unprovisioned device’s Public Key Y

**Returns**
- ESP_OK on success or error code otherwise.
**esp_err_t esp_ble_mesh_provisioner_input_string** (const char* string, uint8_t link_idx)

Provide provisioning input OOB string.

This is intended to be called after the esp_ble_mesh_prov_t prov.input_num
->callback has been called with ESP_BLE_MESH_ENTER_STRING as the argument.

**Parameters**

- **string** [in] String input by Provisioner.
- **link_idx** [in] The provisioning link index.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_provisioner_input_number** (uint32_t number, uint8_t link_idx)

Provide provisioning input OOB number.

This is intended to be called after the esp_ble_mesh_prov_t prov.input_num
->callback has been called with ESP_BLE_MESH_ENTER_NUMBER as the argument.

**Parameters**

- **number** [in] Number input by Provisioner.
- **link_idx** [in] The provisioning link index.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_provisioner_prov_enable** (esp_ble_mesh_prov_bearer_t bearers)

Enable one or more provisioning bearers.

**Note:** PB-ADV: Enable BLE scan. PB-GATT: Initialize corresponding BLE Mesh Proxy info.

**Parameters** **bearers** [in] Bit-wise OR of provisioning bearers.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_provisioner_prov_disable** (esp_ble_mesh_prov_bearer_t bearers)

Disable one or more provisioning bearers.

**Note:** PB-ADV: Disable BLE scan. PB-GATT: Break any existing BLE Mesh Provisioning connections.

**Parameters** **bearers** [in] Bit-wise OR of provisioning bearers.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_provisioner_add_unprov_dev** (esp_ble_mesh_unprov_dev_add_t *add_dev, esp_ble_mesh_dev_add_flag_t flags)

Add unprovisioned device info to the unprov_dev queue.

**Note:** 1. Currently address type only supports public address and static random address.
a. If device UUID and/or device address as well as address type already exist in the device queue, but the bearer is different from the existing one, add operation will also be successful and it will update the provision bearer supported by the device.

b. For example, if the Provisioner wants to add an unprovisioned device info before receiving its unprovisioned device beacon or Mesh Provisioning advertising packets, the Provisioner can use this API to add the device info with each one or both of device UUID and device address added. When the Provisioner gets the device’s advertising packets, it will start provisioning the device internally.
   - In this situation, the Provisioner can set bearers with each one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled, and cannot set flags with ADD_DEV_START_PROV_NOW_FLAG enabled.

c. Another example is when the Provisioner receives the unprovisioned device’s beacon or Mesh Provisioning advertising packets, the advertising packets will be reported on to the application layer using the callback registered by the function esp_ble_mesh_register_prov_callback. And in the callback, the Provisioner can call this API to start provisioning the device.
   - If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device address can be added, bearers shall be set with ESP_BLE_MESH_PROV_ADV enabled and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
   - If the Provisioner uses PB-GATT to provision, both the device UUID and device address need to be added, bearers shall be set with ESP_BLE_MESH_PROV_GATT enabled, and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
   - If the Provisioner just wants to store the unprovisioned device info when receiving its advertising packets and start to provision it the next time (e.g. after receiving its advertising packets again), then it can add the device info with either one or both of device UUID and device address included. Bearers can be set with either one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled (recommend to enable the bearer which will receive its advertising packets, because if the other bearer is enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
   - Note: ESP_BLE_MESH_PROV_ADV, ESP_BLE_MESH_PROV_GATT and ADD_DEV_START_PROV_NOW_FLAG can not be enabled at the same time.

### Parameters

- **add_dev** – [in] Pointer to a struct containing the device information
- **flags** – [in] Flags indicate several operations on the device information
  - Remove device information from queue after device has been provisioned (BIT0)
  - Start provisioning immediately after device is added to queue (BIT1)
  - Device can be removed if device queue is full (BIT2)

### Returns

- ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_prov_device_with_addr(
    const uint8_t uuid[16],
    esp_ble_mesh_bd_addr_t addr,
    esp_ble_mesh_addr_type_t addr_type,
    esp_ble_mesh_prov_bearer_t bearer,
    uint16_t oob_info,
    uint16_t unicast_addr
)
```

Provision an unprovisioned device and assign a fixed unicast address for it in advance.

### Note:

1. Currently address type only supports public address and static random address.

a. Bearer must be equal to ESP_BLE_MESH_PROV_ADV or ESP_BLE_MESH_PROV_GATT, since Provisioner will start to provision a device immediately once this function is invoked. And the input bearer must be identical with the one within the parameters of the ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT event.

b. If this function is used by a Provisioner to provision devices, the application should take care of the assigned unicast address and avoid overlap of the unicast addresses of different nodes.
c. Recommend to use only one of the functions “esp_ble_mesh_provisioner_add_unprov_dev” and
“esp_ble_mesh_provisioner_prov_device_with_addr” by a Provisioner.

Parameters
- **uuid** - [in] Device UUID of the unprovisioned device
- **addr** - [in] Device address of the unprovisioned device
- **addr_type** - [in] Device address type of the unprovisioned device
- **bearer** - [in] Provisioning bearer going to be used by Provisioner
- **oob_info** - [in] OOB info of the unprovisioned device
- **unicast_addr** - [in] Unicast address going to be allocated for the unprovisioned device

Returns Zero on success or (negative) error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_delete_dev (esp_ble_mesh_device_delete_t *del_dev)`
Delete device from queue, and reset current provisioning link with the device.

Note: If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate
the provisioning procedure. Either one of the device address or device UUID can be used as input.

Parameters **del_dev** - [in] Pointer to a struct containing the device information.
Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_set_dev_uuid_match (const uint8_t*match_val, uint8_t match_len, uint8_t offset, bool prov_after_match)`
This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

Parameters
- **match_val** - [in] Value to be compared with the part of the device UUID.
- **match_len** - [in] Length of the compared match value.
- **offset** - [in] Offset of the device UUID to be compared (based on zero).
- **prov_after_match** - [in] Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.

Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_set_prov_data_info (esp_ble_mesh_prov_data_info_t *prov_data_info)`
This function is called by Provisioner to set provisioning data information before starting to provision.

Parameters **prov_data_info** - [in] Pointer to a struct containing net_idx or flags or iv_index.
Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_set_static_oob_value (const uint8_t *value, uint8_t length)`
This function is called by Provisioner to set static oob value used for provisioning.

AuthValues selected using a cryptographically secure random or pseudorandom number generator and having
the maximum permitted entropy (128-bits) will be most difficult to brute-force. AuthValues with reduced
entropy or generated in a predictable manner will not grant the same level of protection against this vulnerability.
Selecting a new AuthValue with each provisioning attempt can also make it more difficult to launch a brute-force attack by requiring the attacker to restart the search with each provisioning attempt (CVE-2020-26556).

Note: The Bluetooth SIG recommends that mesh implementations enforce a randomly selected AuthValue
using all of the available bits, where permitted by the implementation. A large entropy helps ensure that a
brute-force of the AuthValue, even a static AuthValue, cannot normally be completed in a reasonable time (CVE-2020-26557).

**Parameters**
- **value** [in] Pointer to the static oob value.
- **length** [in] Length of the static oob value.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_set_primary_elem_addr (uint16_t addr)
```
This function is called by Provisioner to set own Primary element address.

**Note:** This API must be invoked when BLE Mesh initialization is completed successfully, and can be invoked before Provisioner functionality is enabled. Once this API is invoked successfully, the prov_unicast_addr value in the struct `esp_ble_mesh_prov_t` will be ignored, and Provisioner will use this address as its own primary element address. And if the unicast address going to assigned for the next unprovisioned device is smaller than the input address + element number of Provisioner, then the address for the next unprovisioned device will be recalculated internally.

**Parameters** **addr** [in] Unicast address of the Primary element of Provisioner.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_set_fast_prov_info (esp_ble_mesh_fast_prov_info_t *fast_prov_info)
```
This function is called to set provisioning data information before starting fast provisioning.

**Parameters** **fast_prov_info** [in] Pointer to a struct containing unicast address range, net_idx, etc.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_set_fast_prov_action (esp_ble_mesh_fast_prov_action_t action)
```
This function is called to start/suspend/exit fast provisioning.

**Parameters** **action** [in] fast provisioning action (i.e. enter, suspend, exit).

**Returns** ESP_OK on success or error code otherwise.

### Type Definitions

typedef void (*esp_ble_mesh_prov_cb_t) (esp_ble_mesh_prov_cb_event_t event,
esp_ble_mesh_prov_cb_param_t *param)

: event, event code of provisioning events; param, parameters of provisioning events

typedef void (*esp_ble_mesh_prov_adv_cb_t) (const esp_ble_mesh_bd_addr_t addr, const
esp_ble_mesh_adv_type_t addr_type, const uint8_t adv_type, const uint8_t *dev_uuid, uint16_t oob_info,
esp_ble_mesh_prov_bearer_t bearer)

Callback for Provisioner that received advertising packets from unprovisioned devices which are not in the unprovisioned device queue.

Report on the unprovisioned device beacon and mesh provisioning service adv data to application.

**Param** **addr** [in] Pointer to the unprovisioned device address.

**Param** **addr_type** [in] Unprovisioned device address type.

**Param** **adv_type** [in] Adv packet type(ADV_IND or ADV_NONCONN_IND).

**Param** **dev_uuid** [in] Unprovisioned device UUID pointer.

**Param** **oob_info** [in] OOB information of the unprovisioned device.

**Param** **bearer** [in] Adv packet received from PB-GATT or PB-ADV bearer.

**ESP-BLE-MESH GATT Proxy Server**
Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_proxy_api.h

Functions

**esp_err_t esp_ble_mesh_proxy_identity_enable (void)**

Enable advertising with Node Identity.

*Note:* This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising using Node Identity for the next 60 seconds, and after 60s Network ID will be advertised. Under normal conditions, the BLE Mesh Proxy Node Identity and Network ID advertising will be enabled automatically by BLE Mesh stack after the device is provisioned.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_proxy_gatt_enable (void)**

Enable BLE Mesh GATT Proxy Service.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_proxy_gatt_disable (void)**

Disconnect the BLE Mesh GATT Proxy connection if there is any, and disable the BLE Mesh GATT Proxy Service.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_proxy_client_connect (esp_ble_mesh_bd_addr_t addr, esp_ble_mesh_addr_type_t addr_type, uint16_t net_idx)**

Proxy Client creates a connection with the Proxy Server.

**Parameters**

- *addr* - [in] Device address of the Proxy Server.
- *addr_type* - [in] Device address type (public or static random).

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_proxy_client_disconnect (uint8_t conn_handle)**

Proxy Client terminates a connection with the Proxy Server.

**Parameters** *conn_handle* - [in] Proxy connection handle.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_proxy_client_set_filter_type (uint8_t conn_handle, uint16_t net_idx, esp_ble_mesh_proxy_filter_type_t filter_type)**

Proxy Client sets the filter type of the Proxy Server.

**Parameters**

- *conn_handle* - [in] Proxy connection handle.
- *net_idx* - [in] Corresponding NetKey Index.
- *filter_type* - [in] whitelist or blacklist.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_proxy_client_add_filter_addr (uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num)**

Proxy Client adds address to the Proxy Server filter list.

**Parameters**
Chapter 2. API Reference

• conn_handle  - [in] Proxy connection handle.
• net_idx  - [in] Corresponding NetKey Index.
• addr  - [in] Pointer to the filter address.
• addr_num  - [in] Number of the filter address.

Returns ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_proxy_client_remove_filter_addr(uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num)

Proxy Client removes address from the Proxy Server filter list.

Parameters

• conn_handle  - [in] Proxy connection handle.
• net_idx  - [in] Corresponding NetKey Index.
• addr  - [in] Pointer to the filter address.
• addr_num  - [in] Number of the filter address.

Returns ESP_OK on success or error code otherwise.

ESP-BLE-MESH Models API Reference

This section contains ESP-BLE-MESH Model related APIs, event types, event parameters, etc.

There are six categories of models:

• Configuration Client/Server Models
• Health Client/Server Models
• Generic Client/Server Models
• Sensor Client/Server Models
• Time and Scenes Client/Server Models
• Lighting Client/Server Models

Note: Definitions related to Server Models are being updated, and will be released soon.

Configuration Client/Server Models

Header File

• components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_config_model_api.h

Functions

esp_err_t esp_ble_mesh_register_config_client_callback(esp_ble_mesh_cfg_client_cb_t callback)

Register BLE Mesh Config Client Model callback.

Parameters callback  - [in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_register_config_server_callback(esp_ble_mesh_cfg_server_cb_t callback)

Register BLE Mesh Config Server Model callback.

Parameters callback  - [in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_config_client_get_state(*params, esp_ble_mesh_cfg_client_get_state_t *get_state)
Chapter 2. API Reference

Get the value of Config Server Model states using the Config Client Model get messages.

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_get_t in esp_ble_mesh_defs.h

**Parameters**

- `params` [in] Pointer to BLE Mesh common client parameters.
- `get_state` [in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_config_client_set_state(esp_ble_mesh_client_common_param_t *params,
                                              esp_ble_mesh_cfg_client_set_state_t *set_state)
```

Set the value of the Configuration Server Model states using the Config Client Model set messages.

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_set_t in esp_ble_mesh_defs.h

**Parameters**

- `params` [in] Pointer to BLE Mesh common client parameters.
- `set_state` [in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

**Returns** ESP_OK on success or error code otherwise.

**Unions**

```c
union esp_ble_mesh_cfg_client_get_state_t
#include <esp_ble_mesh_config_model_api.h>  For ESP_BLE_MESH_MODEL_OP_BEACON_GET
ESP_BLE_MESH_MODEL_OP_COMPOSITION_DATA_GET
ESP_BLE_MESH_MODEL_OP_DEFAULT_TTL_GET
ESP_BLE_MESH_MODEL_OP_GATT_PROXY_GET
ESP_BLE_MESH_MODEL_OP_RELAY_GET
ESP_BLE_MESH_MODEL_OP_MODEL_PUB_GET
ESP_BLE_MESH_MODEL_OP_FRIEND_GET
ESP_BLE_MESH_MODEL_OP_HEARTBEAT_PUB_GET ESP_BLE_MESH_MODEL_OP_HEARTBEAT_SUB_GET
```

the `get_state` parameter in the esp_ble_mesh_config_client_get_state function should not be set to NULL.

**Public Members**

```c

    Relay Mode state

uint8_t relay_retransmit
    Relay Retransmit state

uint8_t beacon
    Secure Network Beacon state

uint8_t gatt_proxy
    GATT Proxy state

uint8_t friend_state
    Friend state

uint8_t default_ttl
    Default TTL

struct k_delayed_work timer
    Heartbeat Publication timer

uint16_t dst
    Destination address for Heartbeat messages

uint16_t count
    Number of Heartbeat messages to be sent
    Number of Heartbeat messages received

uint8_t period
    Period for sending Heartbeat messages

uint8_t ttl
    TTL to be used when sending Heartbeat messages

uint16_t feature
    Bit field indicating features that trigger Heartbeat messages when changed

uint16_t net_idx
    NetKey Index used by Heartbeat Publication

struct esp_ble_mesh_cfg_srv::[anonymous] heartbeat_pub
    Heartbeat Publication

int64_t expiry
    Timestamp when Heartbeat subscription period is expired
uint16_t src
Source address for Heartbeat messages

uint8_t min_hops
Minimum hops when receiving Heartbeat messages

uint8_t max_hops
Maximum hops when receiving Heartbeat messages

`esp_ble_mesh_cb_t heartbeat_recv_cb`
Optional heartbeat subscription tracking function

`struct esp_ble_mesh_cfgsrv::[anonymous] heartbeat_sub`
Heartbeat Subscription

`struct esp_ble_mesh_cfg_composition_data_get_t`
Parameters of Config Composition Data Get.

**Public Members**

uint8_t page
Page number of the Composition Data.

`struct esp_ble_mesh_cfg_model_pub_get_t`
Parameters of Config Model Publication Get.

**Public Members**

uint16_t element_addr
The element address

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

`struct esp_ble_mesh_cfg_sig_model_sub_get_t`
Parameters of Config SIG Model Subscription Get.

The model id
Chapter 2. API Reference

Public Members

uint16_t element_addr
The element address

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_kr_phase_get_t
Parameters of Config Key Refresh Phase Get.

Public Members

uint16_t net_idx
The network key index

struct esp_ble_mesh_cfg_lpn_polltimeout_get_t
Parameters of Config Low Power Node PollTimeout Get.

Public Members

uint16_t lpn_addr
The unicast address of the Low Power node

struct esp_ble_mesh_cfg_beacon_set_t
Parameters of Config Beacon Set.

Public Members

uint8_t beacon
New Secure Network Beacon state

struct esp_ble_mesh_cfg_default_ttl_set_t
Parameters of Config Default TTL Set.

Public Members

uint8_t ttl
The default TTL state value

struct esp_ble_mesh_cfg_friend_set_t
Parameters of Config Friend Set.
Public Members

uint8_t \texttt{friend\_state}

The friend state value

struct \texttt{esp\_ble\_mesh\_cfg\_gatt\_proxy\_set\_t}

Parameters of Config GATT Proxy Set.

Public Members

uint8_t \texttt{gatt\_proxy}

The GATT Proxy state value

struct \texttt{esp\_ble\_mesh\_cfg\_relay\_set\_t}

Parameters of Config Relay Set.

Public Members

uint8_t \texttt{relay}

The relay value

uint8_t \texttt{relay\_retransmit}

The relay retransmit value

struct \texttt{esp\_ble\_mesh\_cfg\_net\_key\_add\_t}

Parameters of Config NetKey Add.

Public Members

uint16_t \texttt{net\_idx}

The network key index

uint8_t \texttt{net\_key}[16]

The network key value

struct \texttt{esp\_ble\_mesh\_cfg\_app\_key\_add\_t}

Parameters of Config AppKey Add.

Public Members

uint16_t \texttt{net\_idx}

The network key index

uint16_t \texttt{app\_idx}

The app key index
uint8_t app_key[16]
    The app key value

struct esp_ble_mesh_cfg_model_app_bind_t
    Parameters of Config Model App Bind.

Public Members

uint16_t element_addr
    The element address

uint16_t model_app_idx
    Index of the app key to bind with the model

uint16_t model_id
    The model id

uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_pub_set_t
    Parameters of Config Model Publication Set.

Public Members

uint16_t element_addr
    The element address

uint16_t publish_addr
    Value of the publish address

uint16_t publish_app_idx
    Index of the application key

bool cred_flag
    Value of the Friendship Credential Flag

uint8_t publish_ttl
    Default TTL value for the publishing messages

uint8_t publish_period
    Period for periodic status publishing

uint8_t publish_retransmit
    Number of retransmissions and number of 50-millisecond steps between retransmissions
uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_add_t
Parameters of Config Model Subscription Add.

Public Members

uint16_t element_addr
The element address

uint16_t sub_addr
The address to be added to the Subscription List

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_delete_t
Parameters of Config Model Subscription Delete.

Public Members

uint16_t element_addr
The element address

uint16_t sub_addr
The address to be removed from the Subscription List

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_overwrite_t
Parameters of Config Model Subscription Overwrite.

Public Members
**Public Members**

- **uint16_t element_addr**
  - The element address

- **uint16_t sub_addr**
  - The address to be added to the Subscription List

- **uint16_t model_id**
  - The model id

- **uint16_t company_id**
  - The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_model_sub_va_add_t**

Parameters of Config Model Subscription Virtual Address Add.

**Public Members**

- **uint16_t element_addr**
  - The element address

- **uint8_t label_uuid[16]**
  - The Label UUID of the virtual address to be added to the Subscription List

- **uint16_t model_id**
  - The model id

- **uint16_t company_id**
  - The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_model_sub_va_delete_t**

Parameters of Config Model Subscription Virtual Address Delete.

**Public Members**

- **uint16_t element_addr**
  - The element address

- **uint8_t label_uuid[16]**
  - The Label UUID of the virtual address to be removed from the Subscription List

- **uint16_t model_id**
  - The model id

- **uint16_t company_id**
  - The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_model_sub_va_overwrite_t**

Parameters of Config Model Subscription Virtual Address Overwrite.
Chapter 2. API Reference

Public Members

`uint16_t element_addr`
   The element address

`uint8_t label_uuid[16]`
   The Label UUID of the virtual address to be added to the Subscription List

`uint16_t model_id`
   The model id

`uint16_t company_id`
   The company id, if not a vendor model, shall set to 0xFFFF

`struct esp_ble_mesh_cfg_model_pub_va_set_t`
   Parameters of Config Model Publication Virtual Address Set.

Public Members

`uint16_t element_addr`
   The element address

`uint8_t label_uuid[16]`
   Value of the Label UUID publish address

`uint16_t publish_app_idx`
   Index of the application key

`bool cred_flag`
   Value of the Friendship Credential Flag

`uint8_t publish_ttl`
   Default TTL value for the publishing messages

`uint8_t publish_period`
   Period for periodic status publishing

`uint8_t publish_retransmit`
   Number of retransmissions and number of 50-millisecond steps between retransmissions

`uint16_t model_id`
   The model id

`uint16_t company_id`
   The company id, if not a vendor model, shall set to 0xFFFF

`struct esp_ble_mesh_cfg_model_sub_delete_all_t`
   Parameters of Config Model Subscription Delete All.
Chapter 2. API Reference

Public Members

```c
uint16_t element_addr
    The element address
```

```c
uint16_t model_id
    The model id
```

```c
uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF
```

```c
struct esp_ble_mesh_cfg_net_key_update_t
    Parameters of Config NetKey Update.
```

Public Members

```c
uint16_t net_idx
    The network key index
```

```c
uint8_t net_key[16]
    The network key value
```

```c
struct esp_ble_mesh_cfg_net_key_delete_t
    Parameters of Config NetKey Delete.
```

Public Members

```c
uint16_t net_idx
    The network key index
```

```c
struct esp_ble_mesh_cfg_app_key_update_t
    Parameters of Config AppKey Update.
```

Public Members

```c
uint16_t net_idx
    The network key index
```

```c
uint16_t app_idx
    The app key index
```

```c
uint8_t app_key[16]
    The app key value
```

```c
struct esp_ble_mesh_cfg_app_key_delete_t
    Parameters of Config AppKey Delete.
```
Chapter 2. API Reference

**Public Members**

```c
uint16_t net_idx

The network key index
```

```c
uint16_t app_idx

The app key index
```

**struct esp_ble_mesh_cfg_node_identity_set_t**

Parameters of Config Node Identity Set.

**Public Members**

```c
uint16_t net_idx

The network key index
```

```c
uint8_t identity

New Node Identity state
```

**struct esp_ble_mesh_cfg_model_app_unbind_t**

Parameters of Config Model App Unbind.

**Public Members**

```c
uint16_t element_addr

The element address
```

```c
uint16_t model_app_idx

Index of the app key to bind with the model
```

```c
uint16_t model_id

The model id
```

```c
uint16_t company_id

The company id, if not a vendor model, shall set to 0xFFFF
```

**struct esp_ble_mesh_cfg_kr_phase_set_t**

Parameters of Config Key Refresh Phase Set.

**Public Members**

```c
uint16_t net_idx

The network key index
```

```c
uint8_t transition

New Key Refresh Phase Transition
```
Chapter 2. API Reference

struct esp_ble_mesh_cfg_net_transmit_set_t
Parameters of Config Network Transmit Set.

Public Members

uint8_t net_transmit
Network Transmit State

struct esp_ble_mesh_cfg_heartbeat_pub_set_t
Parameters of Config Model Heartbeat Publication Set.

Public Members

uint16_t dst
Destination address for Heartbeat messages

uint8_t count
Number of Heartbeat messages to be sent

uint8_t period
Period for sending Heartbeat messages

uint8_t ttl
TTL to be used when sending Heartbeat messages

uint16_t feature
Bit field indicating features that trigger Heartbeat messages when changed

uint16_t net_idx
NetKey Index

struct esp_ble_mesh_cfg_heartbeat_sub_set_t
Parameters of Config Model Heartbeat Subscription Set.

Public Members

uint16_t src
Source address for Heartbeat messages

uint16_t dst
Destination address for Heartbeat messages

uint8_t period
Period for receiving Heartbeat messages

struct esp_ble_mesh_cfg_beacon_status_cb_t
Parameter of Config Beacon Status
Chapter 2. API Reference

Public Members

uint8_t beacon
  Secure Network Beacon state value

struct esp_ble_mesh_cfg_comp_data_status_cb_t
  Parameters of Config Composition Data Status

Public Members

uint8_t page
  Page number of the Composition Data

struct net_buf_simple *composition_data
  Pointer to Composition Data for the identified page

struct esp_ble_mesh_cfg_default_ttl_status_cb_t
  Parameter of Config Default TTL Status

Public Members

uint8_t default_ttl
  Default TTL state value

struct esp_ble_mesh_cfg_gatt_proxy_status_cb_t
  Parameter of Config GATT Proxy Status

Public Members

uint8_t gatt_proxy
  GATT Proxy state value

struct esp_ble_mesh_cfg_relay_status_cb_t
  Parameters of Config Relay Status

Public Members

uint8_t relay
  Relay state value

uint8_t retransmit
  Relay retransmit value (number of retransmissions and number of 10-millisecond steps between retransmissions)

struct esp_ble_mesh_cfg_model_pub_status_cb_t
  Parameters of Config Model Publication Status
Public Members

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element

uint16_t publish_addr
Value of the publish address

uint16_t app_idx
Index of the application key

bool cred_flag
Value of the Friendship Credential Flag

uint8_t ttl
Default TTL value for the outgoing messages

uint8_t period
Period for periodic status publishing

uint8_t transmit
Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct esp_ble_mesh_cfg_model_sub_status_cb_t
Parameters of Config Model Subscription Status

Public Members

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element

uint16_t sub_addr
Value of the address

uint16_t company_id
Company ID
uint16_t \texttt{model\_id}

Model ID

\textbf{struct} \texttt{esp\_ble\_mesh\_cfg\_net\_key\_status\_cb\_t}

Parameters of Config NetKey Status

\textbf{Public Members}

uint8_t \texttt{status}

Status Code for the request message

uint16_t \texttt{net\_idx}

Index of the NetKey

\textbf{struct} \texttt{esp\_ble\_mesh\_cfg\_app\_key\_status\_cb\_t}

Parameters of Config AppKey Status

\textbf{Public Members}

uint8_t \texttt{status}

Status Code for the request message

uint16_t \texttt{net\_idx}

Index of the NetKey

uint16_t \texttt{app\_idx}

Index of the application key

\textbf{struct} \texttt{esp\_ble\_mesh\_cfg\_mod\_app\_status\_cb\_t}

Parameters of Config Model App Status

\textbf{Public Members}

uint8_t \texttt{status}

Status Code for the request message

uint16_t \texttt{element\_addr}

Address of the element

uint16_t \texttt{app\_idx}

Index of the application key

uint16_t \texttt{company\_id}

Company ID
uint16_t model_id
   Model ID

struct esp_ble_mesh_cfg_friend_status_cb_t
   Parameter of Config Friend Status

   Public Members

   uint8_t friend_state
      Friend state value

struct esp_ble_mesh_cfg_hb_pub_status_cb_t
   Parameters of Config Heartbeat Publication Status

   Public Members

   uint8_t status
      Status Code for the request message

   uint16_t dst
      Destination address for Heartbeat messages

   uint8_t count
      Number of Heartbeat messages remaining to be sent

   uint8_t period
      Period for sending Heartbeat messages

   uint8_t ttl
      TTL to be used when sending Heartbeat messages

   uint16_t features
      Features that trigger Heartbeat messages when changed

   uint16_t net_idx
      Index of the NetKey

struct esp_ble_mesh_cfg_hb_sub_status_cb_t
   Parameters of Config Heartbeat Subscription Status

   Public Members

   uint8_t status
      Status Code for the request message
**Chapter 2. API Reference**

```c
uint16_t src
    Source address for Heartbeat messages

uint16_t dst
    Destination address for Heartbeat messages

uint8_t period
    Remaining Period for processing Heartbeat messages

uint8_t count
    Number of Heartbeat messages received

uint8_t min_hops
    Minimum hops when receiving Heartbeat messages

uint8_t max_hops
    Maximum hops when receiving Heartbeat messages
```

```c
struct esp_ble_mesh_cfg_net_trans_status_cb_t
    Parameters of Config Network Transmit Status
```

**Public Members**

```c
uint8_t net_trans_count
    Number of transmissions for each Network PDU originating from the node

uint8_t net_trans_step
    Maximum hops when receiving Heartbeat messages
```

```c
struct esp_ble_mesh_cfg_model_sub_list_cb_t
    Parameters of Config SIG/Vendor Subscription List
```

**Public Members**

```c
uint8_t status
    Status Code for the request message

uint16_t element_addr
    Address of the element

uint16_t company_id
    Company ID

uint16_t model_id
    Model ID
```
struct net_buf_simple *sub_addr
   A block of all addresses from the Subscription List

struct esp_ble_mesh_cfg_net_key_list_cb_t
   Parameter of Config NetKey List

   **Public Members**

struct net_buf_simple *net_idx
   A list of NetKey Indexes known to the node

struct esp_ble_mesh_cfg_app_key_list_cb_t
   Parameters of Config AppKey List

   **Public Members**

   uint8_t status
      Status Code for the request message

   uint16_t net_idx
      NetKey Index of the NetKey that the AppKeys are bound to

   struct net_buf_simple *app_idx
      A list of AppKey indexes that are bound to the NetKey identified by NetKeyId

struct esp_ble_mesh_cfg_node_id_status_cb_t
   Parameters of Config Node Identity Status

   **Public Members**

   uint8_t status
      Status Code for the request message

   uint16_t net_idx
      Index of the NetKey

   uint8_t identity
      Node Identity state

struct esp_ble_mesh_cfg_model_app_list_cb_t
   Parameters of Config SIG/Vendor Model App List

   **Public Members**

   uint8_t status
      Status Code for the request message
Chapter 2. API Reference

`uint16_t element_addr`
Address of the element

`uint16_t company_id`
Company ID

`uint16_t model_id`
Model ID

`struct net_buf_simple *app_idx`
All AppKey indexes bound to the Model

`struct esp_ble_mesh_cfg_kr_phase_status_cb_t`
Parameters of Config Key Refresh Phase Status

**Public Members**

`uint8_t status`
Status Code for the request message

`uint16_t net_idx`
Index of the NetKey

`uint8_t phase`
Key Refresh Phase state

`struct esp_ble_mesh_cfg_lpn_pollto_status_cb_t`
Parameters of Config Low Power Node PollTimeout Status

**Public Members**

`uint16_t lpn_addr`
The unicast address of the Low Power node

`int32_t poll_timeout`
The current value of the PollTimeout timer of the Low Power node

`struct esp_ble_mesh_cfg_client_cb_param_t`
Configuration Client Model callback parameters

**Public Members**

`int error_code`
Appropriate error code
Chapter 2. API Reference

`esp_ble_mesh_client_common_param_t *params`

The client common parameters

`esp_ble_mesh_cfg_client_common_cb_param_t status_cb`

The config status message callback values

```c
struct esp_ble_mesh_state_change_cfg_mod_pub_set_t
```

Configuration Server model related context.

**Public Members**

```c
uint16_t element_addr
```

Element Address

```c
uint16_t pub_addr
```

Publish Address

```c
uint16_t app_idx
```

AppKey Index

```c
bool cred_flag
```

Friendship Credential Flag

```c
uint8_t pub_ttl
```

Publish TTL

```c
uint8_t pub_period
```

Publish Period

```c
uint8_t pub_retransmit
```

Publish Retransmit

```c
uint16_t company_id
```

Company ID

```c
uint16_t model_id
```

Model ID

```c
struct esp_ble_mesh_state_change_cfg_model_sub_add_t
```

Parameters of Config Model Subscription Add

**Public Members**

```c
uint16_t element_addr
```

Element Address
Chapter 2. API Reference

```c
uint16_t sub_addr
    Subscription Address

uint16_t company_id
    Company ID

uint16_t model_id
    Model ID

struct esp_ble_mesh_state_change_cfg_model_sub_delete_t
    Parameters of Config Model Subscription Delete

Public Members

uint16_t element_addr
    Element Address

uint16_t sub_addr
    Subscription Address

uint16_t company_id
    Company ID

uint16_t model_id
    Model ID

struct esp_ble_mesh_state_change_cfg_netkey_add_t
    Parameters of Config NetKey Add

Public Members

uint16_t net_idx
    NetKey Index

uint8_t net_key[16]
    NetKey

struct esp_ble_mesh_state_change_cfg_netkey_update_t
    Parameters of Config NetKey Update

Public Members

uint16_t net_idx
    NetKey Index
```
chapter 2. API Reference

uint8_t net_key[16]
    NetKey

struct esp_ble_mesh_state_change_cfg_netkey_delete_t
    Parameter of Config NetKey Delete

    Public Members

    uint16_t net_idx
        NetKey Index

struct esp_ble_mesh_state_change_cfg_appkey_add_t
    Parameters of Config AppKey Add

    Public Members

    uint16_t net_idx
        NetKey Index

    uint16_t app_idx
        AppKey Index

    uint8_t app_key[16]
        AppKey

struct esp_ble_mesh_state_change_cfg_appkey_update_t
    Parameters of Config AppKey Update

    Public Members

    uint16_t net_idx
        NetKey Index

    uint16_t app_idx
        AppKey Index

    uint8_t app_key[16]
        AppKey

struct esp_ble_mesh_state_change_cfg_appkey_delete_t
    Parameters of Config AppKey Delete

    Public Members

    uint16_t net_idx
        NetKey Index
Chapter 2. API Reference

```c
uint16_t app_idx
    AppKey Index

struct esp_ble_mesh_state_change_cfg_model_app_bind_t
    Parameters of Config Model App Bind

    Public Members

    uint16_t element_addr
        Element Address

    uint16_t app_idx
        AppKey Index

    uint16_t company_id
        Company ID

    uint16_t model_id
        Model ID

struct esp_ble_mesh_state_change_cfg_model_app_unbind_t
    Parameters of Config Model App Unbind

    Public Members

    uint16_t element_addr
        Element Address

    uint16_t app_idx
        AppKey Index

    uint16_t company_id
        Company ID

    uint16_t model_id
        Model ID

struct esp_ble_mesh_state_change_cfg_kr_phase_set_t
    Parameters of Config Key Refresh Phase Set

    Public Members

    uint16_t net_idx
        NetKey Index
```
uint8_t kr_phase
    New Key Refresh Phase Transition

struct esp_ble_mesh_cfg_server_cb_param_t
    Configuration Server model callback parameters

Public Members

    esp_ble_mesh_model_t *model
    Pointer to the server model structure

    esp_ble_mesh_msg_ctx_t *ctx
    Context of the received message

    esp_ble_mesh_cfg_server_cb_value_t value
    Value of the received configuration messages

Macros

ESP_BLE_MESH_MODEL_CFG_SRV (srv_data)
    Define a new Config Server Model.

    Parameters
        • srv_data - Pointer to a unique Config Server Model user_data.
    Returns New Config Server Model instance.

ESP_BLE_MESH_MODEL_CFG_CLI (cli_data)
    Define a new Config Client Model.

    Parameters
        • cli_data - Pointer to a unique struct esp_ble_mesh_client_t.
    Returns New Config Client Model instance.

Type Definitions

typedef struct esp_ble_mesh_cfg_srv esp_ble_mesh_cfg_srv_t
    Configuration Server Model context

typedef void (*esp_ble_mesh_cfg_client_cb_t) (esp_ble_mesh_cfg_client_cb_event_t event,
    esp_ble_mesh_cfg_client_cb_param_t *param)
    Bluetooth Mesh Config Client and Server Model functions.
    Configuration Client Model callback function type

    Param event Event type
    Param param Pointer to callback parameter
typedef void (*esp_ble_mesh_cfg_server_cb_t)(esp_ble_mesh_cfg_server_cb_event_t event, esp_ble_mesh_cfg_server_cb_param_t *param)

Configuration Server Model callback function type.

- **Param event**: Event type
- **Param param**: Pointer to callback parameter

### Enumerations

**enum esp_ble_mesh_cfg_client_cb_event_t**

This enum value is the event of Configuration Client Model

Values:

- **enumerator ESP_BLE_MESH_CFG_CLIENT_GET_STATE_EVT**
- **enumerator ESP_BLE_MESH_CFG_CLIENT_SET_STATE_EVT**
- **enumerator ESP_BLE_MESH_CFG_CLIENT_PUBLISH_EVT**
- **enumerator ESP_BLE_MESH_CFG_CLIENT_TIMEOUT_EVT**
- **enumerator ESP_BLE_MESH_CFG_CLIENT_EVT_MAX**

**enum esp_ble_mesh_cfg_server_cb_event_t**

This enum value is the event of Configuration Server model

Values:

- **enumerator ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT**
- **enumerator ESP_BLE_MESH_CFG_SERVER_EVT_MAX**

### Health Client/Server Models

**Header File**

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_health_model_api.h

**Functions**

- `esp_err_t esp_ble_mesh_register_health_client_callback (esp_ble_mesh_health_client_cb_t callback)`

  Register BLE Mesh Health Model callback, the callback will report Health Client & Server Model events.

  - **Parameters callback**: [in] Pointer to the callback function.
  - **Returns** ESP_OK on success or error code otherwise.

- `esp_err_t esp_ble_mesh_register_health_server_callback (esp_ble_mesh_health_server_cb_t callback)`

  Register BLE Mesh Health Server Model callback.

  - **Parameters callback**: [in] Pointer to the callback function.
  - **Returns** ESP_OK on success or error code otherwise.
Chapter 2. API Reference

**esp_err_t esp_ble_mesh_health_client_get_state**

### Parameters
- **params** [in] Pointer to BLE Mesh common client parameters.
- **get_state** [in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

### Returns
ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_health_client_set_state**

### Parameters
- **params** [in] Pointer to BLE Mesh common client parameters.
- **set_state** [in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

### Returns
ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_health_server_fault_update**

### Parameters
- **element** [in] The element to which the Health Server Model belongs.

### Returns
ESP_OK on success or error code otherwise.

**Unions**

<table>
<thead>
<tr>
<th>union esp_ble_mesh_health_client_get_state_t</th>
</tr>
</thead>
</table>
| #include `<esp_ble_mesh_health_model_api.h>` For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET ESP_BLE_MESH_MODEL_OP_ATTENTION_GET ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_GET the get_state parameter in the esp_ble_mesh_health_client_get_state function should not be set to NULL.

**Public Members**

  ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_ON_EVT

- `esp_ble_mesh_health_attention_off_cb_t attention_off`
  ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT

### Structures

```c
struct esp_ble_mesh_health_srv_cb_t
  ESP BLE Mesh Health Server callback
```

#### Public Members

```c
esp_ble_mesh_cb_t fault_clear
  Clear health registered faults. Initialized by the stack.
```

```c
esp_ble_mesh_cb_t fault_test
  Run a specific health test. Initialized by the stack.
```

```c
esp_ble_mesh_cb_t attention_on
  Health attention on callback. Initialized by the stack.
```

```c
esp_ble_mesh_cb_t attention_off
  Health attention off callback. Initialized by the stack.
```

```c
struct esp_ble_mesh_health_test_t
  ESP BLE Mesh Health Server test Context
```

#### Public Members

```c
uint8_t id_count
  Number of Health self-test ID
```

```c
const uint8_t *test_ids
  Array of Health self-test IDs
```

```c
uint16_t company_id
  Company ID used to identify the Health Fault state
```

```c
uint8_t prev_test_id
  Current test ID of the health fault test
```

```c
uint8_t current_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]
  Array of current faults
```

```c
uint8_t registered_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]
  Array of registered faults
```
struct `esp_ble_mesh_health_srv_t`

ESP BLE Mesh Health Server Model Context

**Public Members**

`esp_ble_mesh_model_t *model`

Pointer to Health Server Model

`esp_ble_mesh_health_srv_cb_t health_cb`

Health callback struct

`struct k_delayed_work attention_timer`

Attention Timer state

`bool attention_timer_start`

Attention Timer start flag

`esp_ble_mesh_health_test_t health_test`

Health Server fault test

struct `esp_ble_mesh_health_fault_get_t`

Parameter of Health Fault Get

**Public Members**

`uint16_t company_id`

Bluetooth assigned 16-bit Company ID

struct `esp_ble_mesh_health_attention_set_t`

Parameter of Health Attention Set

**Public Members**

`uint8_t attention`

Value of the Attention Timer state

struct `esp_ble_mesh_health_period_set_t`

Parameter of Health Period Set

**Public Members**

`uint8_t fast_period_divisor`

Divider for the Publish Period

struct `esp_ble_mesh_health_fault_test_t`

Parameter of Health Fault Test
### Public Members

```c
uint16_t company_id
    Bluetooth assigned 16-bit Company ID
```

```c
uint8_t test_id
    ID of a specific test to be performed
```

```c
struct esp_ble_mesh_health_fault_clear_t
    Parameter of Health Fault Clear
```

### Public Members

```c
uint16_t company_id
    Bluetooth assigned 16-bit Company ID
```

```c
struct esp_ble_mesh_health_current_status_cb_t
    Parameters of Health Current Status
```

### Public Members

```c
uint8_t test_id
    ID of a most recently performed test
```

```c
uint16_t company_id
    Bluetooth assigned 16-bit Company ID
```

```c
struct net_buf_simple *fault_array
    FaultArray field contains a sequence of 1-octet fault values
```

```c
struct esp_ble_mesh_health_fault_status_cb_t
    Parameters of Health Fault Status
```

### Public Members

```c
uint8_t test_id
    ID of a most recently performed test
```

```c
uint16_t company_id
    Bluetooth assigned 16-bit Company ID
```

```c
struct net_buf_simple *fault_array
    FaultArray field contains a sequence of 1-octet fault values
```

```c
struct esp_ble_mesh_health_period_status_cb_t
    Parameter of Health Period Status
```
Chapter 2. API Reference

Public Members

uint8_t fast_period_divisor
Divider for the Publish Period

struct esp_ble_mesh_health_attention_status_cb_t
Parameter of Health Attention Status

Public Members

uint8_t attention
Value of the Attention Timer state

struct esp_ble_mesh_health_client_cb_param_t
Health Client Model callback parameters

Public Members

int error_code
Appropriate error code

esp_ble_mesh_client_common_param_t *params
The client common parameters.

esp_ble_mesh_health_client_common_cb_param_t status_cb
The health message status callback values

struct esp_ble_mesh_health_fault_update_comp_cb_t
Parameter of publishing Health Current Status completion event

Public Members

int error_code
The result of publishing Health Current Status

esp_ble_mesh_elem_t *element
Pointer to the element which contains the Health Server Model

struct esp_ble_mesh_health_fault_clear_cb_t
Parameters of Health Fault Clear event

Public Members

esp_ble_mesh_model_t *model
Pointer to the Health Server Model
uint16_t company_id
    Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_fault_test_cb_t
    Parameters of Health Fault Test event

    Public Members

    esp_ble_mesh_model_t *model
        Pointer to the Health Server Model

    uint8_t test_id
        ID of a specific test to be performed

    uint16_t company_id
        Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_attention_on_cb_t
    Parameter of Health Attention On event

    Public Members

    esp_ble_mesh_model_t *model
        Pointer to the Health Server Model

    uint8_t time
        Duration of attention timer on (in seconds)

struct esp_ble_mesh_health_attention_off_cb_t
    Parameter of Health Attention Off event

    Public Members

    esp_ble_mesh_model_t *model
        Pointer to the Health Server Model

Macros

ESP_BLE_MESH_MODEL_HEALTH_SRV (srv, pub)
    Define a new Health Server Model.

    Note: The Health Server Model can only be included by a Primary Element.

    Parameters
    • srv – Pointer to the unique struct esp_ble_mesh_health_srv_t.
    • pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.

    Returns New Health Server Model instance.
ESP_BLE_MESH_MODEL_HEALTH_CLI (cli_data)
Define a new Health Client Model.

Note: This API needs to be called for each element on which the application needs to have a Health Client Model.

Parameters
• cli_data - Pointer to the unique struct esp_ble_mesh_client_t.

Returns New Health Client Model instance.

ESP_BLE_MESH_HEALTH_PUB_DEFINE (_name, _max, _role)
A helper to define a health publication context

Parameters
• _name - Name given to the publication context variable.
• _max - Maximum number of faults the element can have.
• _role - Role of the device which contains the model.

ESP_BLE_MESH_HEALTH_STANDARD_TEST
SIG identifier of Health Fault Test. 0x01~0xFF: Vendor Specific Test.

ESP_BLE_MESH_NO_FAULT
Fault values of Health Fault Test. 0x33 ~ 0x7F: Reserved for Future Use. 0x80 ~ 0xFF: Vendor Specific Warning/Error.

ESP_BLE_MESH_BATTERY_LOW_WARNING

Type Definitions
typedef void (*esp_ble_mesh_health_client_cb_t)(esp_ble_mesh_health_client_cb_event_t event,
   esp_ble_mesh_health_client_cb_param_t *param)

   Bluetooth Mesh Health Client and Server Model function.
   Health Client Model callback function type
   Param event  Event type
   Param param  Pointer to callback parameter
typedef void (*esp_ble_mesh_health_server_cb_t)(esp_ble_mesh_health_server_cb_event_t event,
   esp_ble_mesh_health_server_cb_param_t *param)

   Health Server Model callback function type.
   Param event  Event type
   Param param  Pointer to callback parameter
Enumerations

enum esp_ble_mesh_health_client_cb_event_t
This enum value is the event of Health Client Model
Values:

enumerator ESP_BLE_MESH_HEALTH_CLIENT_GET_STATE_EVT
enumerator ESP_BLE_MESH_HEALTH_CLIENT_SET_STATE_EVT
enumerator ESP_BLE_MESH_HEALTH_CLIENT_PUBLISH_EVT
enumerator ESP_BLE_MESH_HEALTH_CLIENT_TIMEOUT_EVT
enumerator ESP_BLE_MESH_HEALTH_CLIENT_EVT_MAX

enum esp_ble_mesh_health_server_cb_event_t
This enum value is the event of Health Server Model
Values:

terator ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT
enumerator ESP_BLE_MESH_HEALTH_SERVER_FAULT_CLEAR_EVT
enumerator ESP_BLE_MESH_HEALTH_SERVER_FAULT_TEST_EVT
enumerator ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_ON_EVT
enumerator ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT
enumerator ESP_BLE_MESH_HEALTH_SERVER_EVT_MAX

Generic Client/Server Models

Header File

• components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_generic_model_api.h

Functions

esp_err_t esp_ble_mesh_register_generic_client_callback (esp_ble_mesh_generic_client_cb_t callback)
Register BLE Mesh Generic Client Model callback.

Parameters callback – [in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_generic_client_get_state (esp_ble_mesh_client_common_param_t *params,
    esp_ble_mesh_generic_client_get_state_t *get_state)
Get the value of Generic Server Model states using the Generic Client Model get messages.

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_generic_message_opcode_t` in `esp_ble_mesh_defs.h`

**Parameters**
- **params** [in] Pointer to BLE Mesh common client parameters.
- **get_state** [in] Pointer to generic get message value. Shall not be set to NULL.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_generic_client_set_state(esp_ble_mesh_client_common_param_t *params,
                                                esp_ble_mesh_generic_client_set_state_t *set_state)
```

Set the value of Generic Server Model states using the Generic Client Model set messages.

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_generic_message_opcode_t` in `esp_ble_mesh_defs.h`

**Parameters**
- **params** [in] Pointer to BLE Mesh common client parameters.
- **set_state** [in] Pointer to generic set message value. Shall not be set to NULL.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_register_generic_server_callback(esp_ble_mesh_generic_server_cb_t callback)
```

Register BLE Mesh Generic Server Model callback.

**Parameters**
- **callback** [in] Pointer to the callback function.

**Returns** ESP_OK on success or error code otherwise.

**Unions**

```c
union esp_ble_mesh_generic_client_get_state_t
#include <esp_ble_mesh_generic_model_api.h> Generic Client Model get message union.
```

**Public Members**

Structures

struct esp_ble_mesh_gen_onoff_set_t
  Bluetooth Mesh Generic Client Model Get and Set parameters structure.
  Parameters of Generic OnOff Set.

  **Public Members**

  bool op_en
    Indicate if optional parameters are included

  uint8_t onoff
    Target value of Generic OnOff state

  uint8_t tid
    Transaction ID

  uint8_t trans_time
    Time to complete state transition (optional)

  uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_level_set_t
  Parameters of Generic Level Set.

  **Public Members**

  bool op_en
    Indicate if optional parameters are included

  int16_t level
    Target value of Generic Level state

  uint8_t tid
    Transaction ID

  uint8_t trans_time
    Time to complete state transition (optional)

  uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_delta_set_t
  Parameters of Generic Delta Set.
Public Members

bool op_en
   Indicate if optional parameters are included

int32_t level
   Delta change of Generic Level state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_move_set_t
   Parameters of Generic Move Set.

Public Members

bool op_en
   Indicate if optional parameters are included

int16_t delta_level
   Delta Level step to calculate Move speed for Generic Level state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_def_trans_time_set_t
   Parameter of Generic Default Transition Time Set.

Public Members

uint8_t trans_time
   The value of the Generic Default Transition Time state

struct esp_ble_mesh_gen_onpowerup_set_t
   Parameter of Generic OnPowerUp Set.
Public Members

```c
uint8_t onpowerup
```

The value of the Generic OnPowerUp state

```c
struct esp_ble_mesh_gen_power_level_set_t
```

Parameters of Generic Power Level Set.

Public Members

```c
bool op_en
```

Indicate if optional parameters are included

```c
uint16_t power
```

Target value of Generic Power Actual state

```c
uint8_t tid
```

Transaction ID

```c
uint8_t trans_time
```

Time to complete state transition (optional)

```c
uint8_t delay
```

Indicate message execution delay (C.1)

```c
struct esp_ble_mesh_gen_power_default_set_t
```

Parameter of Generic Power Default Set.

Public Members

```c
uint16_t power
```

The value of the Generic Power Default state

```c
struct esp_ble_mesh_gen_power_range_set_t
```

Parameters of Generic Power Range Set.

Public Members

```c
uint16_t range_min
```

Value of Range Min field of Generic Power Range state

```c
uint16_t range_max
```

Value of Range Max field of Generic Power Range state

```c
struct esp_ble_mesh_gen_loc_global_set_t
```

Parameters of Generic Location Global Set.
Public Members

int32_t global_latitude
Global Coordinates (Latitude)

int32_t global_longitude
Global Coordinates (Longitude)

int16_t global_altitude
Global Altitude

struct esp_ble_mesh_gen_loc_local_set_t
Parameters of Generic Location Local Set.

Public Members

int16_t local_north
Local Coordinates (North)

int16_t local_east
Local Coordinates (East)

int16_t local_altitude
Local Altitude

uint8_t floor_number
Floor Number

uint16_t uncertainty
Uncertainty

struct esp_ble_mesh_gen_user_property_get_t
Parameter of Generic User Property Get.

Public Members

uint16_t property_id
Property ID identifying a Generic User Property

struct esp_ble_mesh_gen_user_property_set_t
Parameters of Generic User Property Set.

Public Members

uint16_t property_id
Property ID identifying a Generic User Property
struct net_buf_simple *property_value
    Raw value for the User Property

struct esp_ble_mesh_gen_admin_property_get_t
    Parameter of Generic Admin Property Get.

    **Public Members**

    uint16_t property_id
        Property ID identifying a Generic Admin Property

    struct esp_ble_mesh_gen_admin_property_set_t
        Parameters of Generic Admin Property Set.

    **Public Members**

    uint16_t property_id
        Property ID identifying a Generic Admin Property

    uint8_t user_access
        Enumeration indicating user access

    struct net_buf_simple *property_value
        Raw value for the Admin Property

struct esp_ble_mesh_gen_manufacturer_property_get_t
    Parameter of Generic Manufacturer Property Get.

    **Public Members**

    uint16_t property_id
        Property ID identifying a Generic Manufacturer Property

struct esp_ble_mesh_gen_manufacturer_property_set_t
    Parameters of Generic Manufacturer Property Set.

    **Public Members**

    uint16_t property_id
        Property ID identifying a Generic Manufacturer Property

    uint8_t user_access
        Enumeration indicating user access

struct esp_ble_mesh_gen_client_properties_get_t
    Parameter of Generic Client Properties Get.
Chapter 2. API Reference

**Public Members**

```c
uint16_t property_id
    A starting Client Property ID present within an element
```

```c
struct esp_ble_mesh_gen_onoff_status_cb_t
    Bluetooth Mesh Generic Client Model Get and Set callback parameters structure.
    Parameters of Generic OnOff Status.
```

**Public Members**

```c
bool op_en
    Indicate if optional parameters are included
```

```c
uint8_t present_onoff
    Current value of Generic OnOff state
```

```c
uint8_t target_onoff
    Target value of Generic OnOff state (optional)
```

```c
uint8_t remain_time
    Time to complete state transition (C.1)
```

```c
struct esp_ble_mesh_gen_level_status_cb_t
    Parameters of Generic Level Status.
```

**Public Members**

```c
bool op_en
    Indicate if optional parameters are included
```

```c
int16_t present_level
    Current value of Generic Level state
```

```c
int16_t target_level
    Target value of the Generic Level state (optional)
```

```c
uint8_t remain_time
    Time to complete state transition (C.1)
```

```c
struct esp_ble_mesh_gen_def_trans_time_status_cb_t
    Parameter of Generic Default Transition Time Status.
```

**Public Members**
uint8_t trans_time
    The value of the Generic Default Transition Time state

struct esp_ble_mesh_gen_onpowerup_status_cb_t

    Public Members

    uint8_t onpowerup
        The value of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_level_status_cb_t
    Parameters of Generic Power Level Status.

    Public Members

    bool op_en
        Indicate if optional parameters are included

    uint16_t present_power
        Current value of Generic Power Actual state

    uint16_t target_power
        Target value of Generic Power Actual state (optional)

    uint8_t remain_time
        Time to complete state transition (C.1)

struct esp_ble_mesh_gen_power_last_status_cb_t
    Parameter of Generic Power Last Status.

    Public Members

    uint16_t power
        The value of the Generic Power Last state

struct esp_ble_mesh_gen_power_default_status_cb_t
    Parameter of Generic Power Default Status.

    Public Members

    uint16_t power
        The value of the Generic Default Last state

struct esp_ble_mesh_gen_power_range_status_cb_t
    Parameters of Generic Power Range Status.
Chapter 2. API Reference

Public Members

```c
uint8_t status_code
  Status Code for the request message
```

```c
uint16_t range_min
  Value of Range Min field of Generic Power Range state
```

```c
uint16_t range_max
  Value of Range Max field of Generic Power Range state
```

```c
struct esp_ble_mesh_gen_battery_status_cb_t
  Parameters of Generic Battery Status.
```

Public Members

```c
uint32_t battery_level
  Value of Generic Battery Level state
```

```c
uint32_t time_to_discharge
  Value of Generic Battery Time to Discharge state
```

```c
uint32_t time_to_charge
  Value of Generic Battery Time to Charge state
```

```c
uint32_t flags
  Value of Generic Battery Flags state
```

```c
struct esp_ble_mesh_gen_loc_global_status_cb_t
  Parameters of Generic Location Global Status.
```

Public Members

```c
int32_t global_latitude
  Global Coordinates (Latitude)
```

```c
int32_t global_longitude
  Global Coordinates (Longitude)
```

```c
int16_t global_altitude
  Global Altitude
```

```c
struct esp_ble_mesh_gen_loc_local_status_cb_t
  Parameters of Generic Location Local Status.
```
Public Members

int16_t local_north
Local Coordinates (North)

int16_t local_east
Local Coordinates (East)

int16_t local_altitude
Local Altitude

uint8_t floor_number
Floor Number

uint16_t uncertainty
Uncertainty

struct esp_ble_mesh_gen_user_properties_status_cb_t
Parameter of Generic User Properties Status.

Public Members

struct net_buf_simple *property_ids
Buffer contains a sequence of N User Property IDs

struct esp_ble_mesh_gen_user_property_status_cb_t
Parameters of Generic User Property Status.

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID identifying a Generic User Property

uint8_t user_access
Enumeration indicating user access (optional)

struct net_buf_simple *property_value
Raw value for the User Property (C.1)

struct esp_ble_mesh_gen_admin_properties_status_cb_t
Parameter of Generic Admin Properties Status.
Public Members

struct net_buf_simple *property_ids
Buffer contains a sequence of N Admin Property IDs

struct esp_ble_mesh_gen_admin_property_status_cb_t
Parameters of Generic Admin Property Status.

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID identifying a Generic Admin Property

uint8_t user_access
Enumeration indicating user access (optional)

struct net_buf_simple *property_value
Raw value for the Admin Property (C.1)

struct esp_ble_mesh_gen_manufacturer_properties_status_cb_t
Parameter of Generic Manufacturer Properties Status.

Public Members

struct net_buf_simple *property_ids
Buffer contains a sequence of N Manufacturer Property IDs

struct esp_ble_mesh_gen_manufacturer_property_status_cb_t
Parameters of Generic Manufacturer Property Status.

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

uint8_t user_access
Enumeration indicating user access (optional)

struct net_buf_simple *property_value
Raw value for the Manufacturer Property (C.1)
struct esp_ble_mesh_gen_client_properties_status_cb_t
Parameter of Generic Client Properties Status.

**Public Members**

struct net_buf_simple *property_ids
Buffer contains a sequence of N Client Property IDs

struct esp_ble_mesh_generic_client_cb_param_t
Generic Client Model callback parameters

**Public Members**

int error_code
Appropriate error code

*esp_ble_mesh_client_common_param_t* *params*
The client common parameters.

*esp_ble_mesh_gen_client_status_cb_t* status_cb
The generic status message callback values

struct esp_ble_mesh_gen_onoff_state_t
Parameters of Generic OnOff state

**Public Members**

uint8_t onoff
The present value of the Generic OnOff state

uint8_t target_onoff
The target value of the Generic OnOff state

struct esp_ble_mesh_gen_onoff_srv_t
User data of Generic OnOff Server Model

**Public Members**

*esp_ble_mesh_model_t* *model*
Pointer to the Generic OnOff Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* *rsp_ctrl*
Response control of the server model received messages

*esp_ble_mesh_gen_onoff_state_t* state
Parameters of the Generic OnOff state
Chapter 2. API Reference

```c
esp_ble_mesh_last_msg_info_t last
    Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
    Parameters of state transition

struct esp_ble_mesh_gen_level_state_t
    Parameters of Generic Level state
```

**Public Members**

```c
int16_t level
    The present value of the Generic Level state

int16_t target_level
    The target value of the Generic Level state

int16_t last_level
    When a new transaction starts, level should be set to last_last, and use “level + incoming delta” to calculate the target level. In another word, “last_level” is used to record “level” of the last transaction, and “last_delta” is used to record the previously received delta_level value. The last value of the Generic Level state

int32_t last_delta
    The last delta change of the Generic Level state

bool move_start
    Indicate if the transition of the Generic Level state has been started

bool positive
    Indicate if the transition is positive or negative

struct esp_ble_mesh_gen_level_srv_t
    User data of Generic Level Server Model
```

**Public Members**

```c
esp_ble_mesh_model_t *model
    Pointer to the Generic Level Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_gen_level_state_t state
    Parameters of the Generic Level state

esp_ble_mesh_last_msg_info_t last
    Parameters of the last received set message
```
**esp_ble_mesh_state_transition_t** transition

Parameters of state transition

**int32_t** tt_delta_level

Delta change value of level state transition

**struct esp_ble_mesh_gen_def_trans_time_state_t**

Parameter of Generic Default Transition Time state

**Public Members**

**uint8_t** trans_time

The value of the Generic Default Transition Time state

**struct esp_ble_mesh_gen_def_trans_time_srv_t**

User data of Generic Default Transition Time Server Model

**Public Members**

**esp_ble_mesh_model_t** *model

Pointer to the Generic Default Transition Time Server Model. Initialized internally.

**esp_ble_mesh_server_rsp_ctrl_t** rsp_ctrl

Response control of the server model received messages

**esp_ble_mesh_gen_def_trans_time_state_t** state

Parameters of the Generic Default Transition Time state

**struct esp_ble_mesh_gen_onpowerup_state_t**

Parameter of Generic OnPowerUp state

**Public Members**

**uint8_t** onpowerup

The value of the Generic OnPowerUp state

**struct esp_ble_mesh_gen_power_onoff_srv_t**

User data of Generic Power OnOff Server Model

**Public Members**

**esp_ble_mesh_model_t** *model

Pointer to the Generic Power OnOff Server Model. Initialized internally.

**esp_ble_mesh_server_rsp_ctrl_t** rsp_ctrl

Response control of the server model received messages
Chapter 2. API Reference

\begin{verbatim}
    esp_ble_mesh_gen_onpowerup_state_t *state
    Parameters of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_onoff_setup_srv_t
    User data of Generic Power OnOff Setup Server Model

Public Members

    esp_ble_mesh_model_t *model
    Pointer to the Generic Power OnOff Setup Server Model. Initialized internally.

    esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

    esp_ble_mesh_gen_onpowerup_state_t *state
    Parameters of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_level_state_t
    Parameters of Generic Power Level state

Public Members

    uint16_t power_actual
    The present value of the Generic Power Actual state

    uint16_t target_power_actual
    The target value of the Generic Power Actual state

    uint16_t power_last
    The value of the Generic Power Last state

    uint16_t power_default
    The value of the Generic Power Default state

    uint8_t status_code
    The status code of setting Generic Power Range state

    uint16_t power_range_min
    The minimum value of the Generic Power Range state

    uint16_t power_range_max
    The maximum value of the Generic Power Range state

struct esp_ble_mesh_gen_power_level_srv_t
    User data of Generic Power Level Server Model
\end{verbatim}
Public Members

`esp_ble_mesh_model_t *model`
- Pointer to the Generic Power Level Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
- Response control of the server model received messages

`esp_ble_mesh_gen_power_level_state_t *state`
- Parameters of the Generic Power Level state

`esp_ble_mesh_last_msg_info_t *last`
- Parameters of the last received set message

`esp_ble_mesh_state_transition_t *transition`
- Parameters of state transition

`int32_t tt_delta_level`
- Delta change value of level state transition

`struct esp_ble_mesh_gen_power_level_setup_srv_t`
- User data of Generic Power Level Setup Server Model

Public Members

`esp_ble_mesh_model_t *model`
- Pointer to the Generic Power Level Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
- Response control of the server model received messages

`esp_ble_mesh_gen_power_level_state_t *state`
- Parameters of the Generic Power Level state

`struct esp_ble_mesh_gen_battery_state_t`
- Parameters of Generic Battery state

Public Members

`uint32_t battery_level`
- The value of the Generic Battery Level state

`uint32_t time_to_discharge`
- The value of the Generic Battery Time to Discharge state

`uint32_t time_to_charge`
- The value of the Generic Battery Time to Charge state
uint32_t battery_flags
   The value of the Generic Battery Flags state

struct esp_ble_mesh_gen_battery_srv_t
   User data of Generic Battery Server Model

Public Members

esp_ble_mesh_model_t *model
   Pointer to the Generic Battery Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
   Response control of the server model received messages

esp_ble_mesh_gen_battery_state_t *state
   Parameters of the Generic Battery state

struct esp_ble_mesh_gen_location_state_t
   Parameters of Generic Location state

Public Members

int32_t global_latitude
   The value of the Global Latitude field

int32_t global_longitude
   The value of the Global Longitude field

int16_t global_altitude
   The value of the Global Altitude field

int16_t local_north
   The value of the Local North field

int16_t local_east
   The value of the Local East field

int16_t local_altitude
   The value of the Local Altitude field

uint8_t floor_number
   The value of the Floor Number field

uint16_t uncertainty
   The value of the Uncertainty field

struct esp_ble_mesh_gen_location_srv_t
   User data of Generic Location Server Model
Public Members

`esp_ble_mesh_model_t *model`
Point to the Generic Location Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_gen_location_state_t *state`
Parameters of the Generic Location state

`struct esp_ble_mesh_gen_location_setup_srv_t`
User data of Generic Location Setup Server Model

Public Members

`esp_ble_mesh_model_t *model`
Point to the Generic Location Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_gen_location_state_t *state`
Parameters of the Generic Location state

`struct esp_ble_mesh_gen_location_setup_srv_t`
User data of Generic Location Setup Server Model

Public Members

`uint16_t id`
The value of User/Admin/Manufacturer Property ID

`uint8_t user_access`
The value of User Access field

`uint8_t admin_access`
The value of Admin Access field

`uint8_t manu_access`
The value of Manufacturer Access field

`struct net_buf_simple *val`
The value of User/Admin/Manufacturer Property

`struct esp_ble_mesh_gen_user_prop_srv_t`
User data of Generic User Property Server Model
Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Generic User Property Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`uint8_t property_count`
Generic User Property count

`esp_ble_mesh_generic_property_t *properties`
Parameters of the Generic User Property state

struct `esp_ble_mesh_gen_admin_prop_srv_t`
User data of Generic Admin Property Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Generic Admin Property Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`uint8_t property_count`
Generic Admin Property count

`esp_ble_mesh_generic_property_t *properties`
Parameters of the Generic Admin Property state

struct `esp_ble_mesh_gen_manu_prop_srv_t`
User data of Generic Manufacturer Property Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Generic Manufacturer Property Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`uint8_t property_count`
Generic Manufacturer Property count

`esp_ble_mesh_generic_property_t *properties`
Parameters of the Generic Manufacturer Property state
struct `esp_ble_mesh_gen_client_prop_srv_t`
User data of Generic Client Property Server Model

**Public Members**

`esp_ble_mesh_model_t *model`
Pointer to the Generic Client Property Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t * rsp_ctrl`
Response control of the server model received messages

`uint8_t id_count`
Generic Client Property ID count

`uint16_t *property_ids`
Parameters of the Generic Client Property state

struct `esp_ble_mesh_state_change_gen_onoff_set_t`
Parameter of Generic OnOff Set state change event

**Public Members**

`uint8_t onoff`
The value of Generic OnOff state

struct `esp_ble_mesh_state_change_gen_level_set_t`
Parameter of Generic Level Set state change event

**Public Members**

`int16_t level`
The value of Generic Level state

struct `esp_ble_mesh_state_change_gen_delta_set_t`
Parameter of Generic Delta Set state change event

**Public Members**

`int16_t level`
The value of Generic Level state

struct `esp_ble_mesh_state_change_gen_move_set_t`
Parameter of Generic Move Set state change event
Public Members

```c
int16_t level
```

The value of Generic Level state

```c
struct esp_ble_mesh_state_change_gen_def_trans_time_set_t
```

Parameter of Generic Default Transition Time Set state change event

Public Members

```c
uint8_t trans_time
```

The value of Generic Default Transition Time state

```c
struct esp_ble_mesh_state_change_gen_onpowerup_set_t
```

Parameter of Generic OnPowerUp Set state change event

Public Members

```c
uint8_t onpowerup
```

The value of Generic OnPowerUp state

```c
struct esp_ble_mesh_state_change_gen_power_level_set_t
```

Parameter of Generic Power Level Set state change event

Public Members

```c
uint16_t power
```

The value of Generic Power Actual state

```c
struct esp_ble_mesh_state_change_gen_power_default_set_t
```

Parameter of Generic Power Default Set state change event

Public Members

```c
uint16_t power
```

The value of Generic Power Default state

```c
struct esp_ble_mesh_state_change_gen_power_range_set_t
```

Parameters of Generic Power Range Set state change event

Public Members

```c
uint16_t range_min
```

The minimum value of Generic Power Range state
uint16_t range_max
The maximum value of Generic Power Range state

struct esp_ble_mesh_state_change_gen_loc_global_set_t
Parameters of Generic Location Global Set state change event

Public Members

int32_t latitude
The Global Latitude value of Generic Location state

int32_t longitude
The Global Longitude value of Generic Location state

int16_t altitude
The Global Altitude value of Generic Location state

struct esp_ble_mesh_state_change_gen_loc_local_set_t
Parameters of Generic Location Local Set state change event

Public Members

int16_t north
The Local North value of Generic Location state

int16_t east
The Local East value of Generic Location state

int16_t altitude
The Local Altitude value of Generic Location state

uint8_t floor_number
The Floor Number value of Generic Location state

uint16_t uncertainty
The Uncertainty value of Generic Location state

struct esp_ble_mesh_state_change_gen_user_property_set_t
Parameters of Generic User Property Set state change event

Public Members

uint16_t id
The property id of Generic User Property state
struct net_buf_simple *value
   The property value of Generic User Property state

struct esp_ble_mesh_state_change_gen_admin_property_set_t
   Parameters of Generic Admin Property Set state change event

Public Members

uint16_t id
   The property id of Generic Admin Property state

uint8_t access
   The property access of Generic Admin Property state

struct net_buf_simple *value
   The property value of Generic Admin Property state

struct esp_ble_mesh_state_change_gen_manu_property_set_t
   Parameters of Generic Manufacturer Property Set state change event

Public Members

uint16_t id
   The property id of Generic Manufacturer Property state

uint8_t access
   The property value of Generic Manufacturer Property state

struct esp_ble_mesh_server_recv_gen_user_property_get_t
   Context of the received Generic User Property Get message

Public Members

uint16_t property_id
   Property ID identifying a Generic User Property

struct esp_ble_mesh_server_recv_gen_admin_property_get_t
   Context of the received Generic Admin Property Get message

Public Members

uint16_t property_id
   Property ID identifying a Generic Admin Property

struct esp_ble_mesh_server_recv_gen_manufacturer_property_get_t
   Context of the received Generic Manufacturer Property message
Public Members

uint16_t property_id
  Property ID identifying a Generic Manufacturer Property

struct esp_ble_mesh_server_recv_gen_client_properties_get_t
  Context of the received Generic Client Properties Get message

Public Members

uint16_t property_id
  A starting Client Property ID present within an element

struct esp_ble_mesh_server_recv_gen_onoff_set_t
  Context of the received Generic OnOff Set message

Public Members

bool op_en
  Indicate if optional parameters are included

uint8_t onoff
  Target value of Generic OnOff state

uint8_t tid
  Transaction ID

uint8_t trans_time
  Time to complete state transition (optional)

uint8_t delay
  Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_level_set_t
  Context of the received Generic Level Set message

Public Members

bool op_en
  Indicate if optional parameters are included

int16_t level
  Target value of Generic Level state

uint8_t tid
  Transaction ID
Chapter 2. API Reference

```c
uint8_t trans_time
  // Time to complete state transition (optional)

uint8_t delay
  // Indicate message execution delay (C.1)
```

```c
struct esp_ble_mesh_server_recv_gen_delta_set_t
  // Context of the received Generic Delta Set message

Public Members

bool op_en
  // Indicate if optional parameters are included

int32_t delta_level
  // Delta change of Generic Level state

uint8_t tid
  // Transaction ID

uint8_t trans_time
  // Time to complete state transition (optional)

uint8_t delay
  // Indicate message execution delay (C.1)
```

```c
struct esp_ble_mesh_server_recv_gen_move_set_t
  // Context of the received Generic Move Set message

Public Members

bool op_en
  // Indicate if optional parameters are included

int16_t delta_level
  // Delta Level step to calculate Move speed for Generic Level state

uint8_t tid
  // Transaction ID

uint8_t trans_time
  // Time to complete state transition (optional)

uint8_t delay
  // Indicate message execution delay (C.1)
```

```c
struct esp_ble_mesh_server_recv_gen_def_trans_time_set_t
  // Context of the received Generic Default Transition Time Set message
```
Public Members

uint8_t trans_time
The value of the Generic Default Transition Time state

struct esp_ble_mesh_server_recv_gen_onpowerup_set_t
Context of the received Generic OnPowerUp Set message

Public Members

uint8_t onpowerup
The value of the Generic OnPowerUp state

struct esp_ble_mesh_server_recv_gen_power_level_set_t
Context of the received Generic Power Level Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t power
Target value of Generic Power Actual state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_power_default_set_t
Context of the received Generic Power Default Set message

Public Members

uint16_t power
The value of the Generic Power Default state

struct esp_ble_mesh_server_recv_gen_power_range_set_t
Context of the received Generic Power Range Set message
Public Members

`uint16_t range_min`

Value of Range Min field of Generic Power Range state

`uint16_t range_max`

Value of Range Max field of Generic Power Range state

`struct esp_ble_mesh_server_recv_gen_loc_global_set_t`

Context of the received Generic Location Global Set message

Public Members

`int32_t global_latitude`

Global Coordinates (Latitude)

`int32_t global_longitude`

Global Coordinates (Longitude)

`int16_t global_altitude`

Global Altitude

`struct esp_ble_mesh_server_recv_gen_loc_local_set_t`

Context of the received Generic Location Local Set message

Public Members

`int16_t local_north`

Local Coordinates (North)

`int16_t local_east`

Local Coordinates (East)

`int16_t local_altitude`

Local Altitude

`uint8_t floor_number`

Floor Number

`uint16_t uncertainty`

Uncertainty

`struct esp_ble_mesh_server_recv_gen_user_property_set_t`

Context of the received Generic User Property Set message
Chapter 2. API Reference

Public Members

uint16_t property_id
Property ID identifying a Generic User Property

struct net_buf_simple *property_value
Raw value for the User Property

struct esp_ble_mesh_server_recv_gen_admin_property_set_t
Context of the received Generic Admin Property Set message

Public Members

uint16_t property_id
Property ID identifying a Generic Admin Property

uint8_t user_access
Enumeration indicating user access

struct net_buf_simple *property_value
Raw value for the Admin Property

struct esp_ble_mesh_server_recv_gen_manufacturer_property_set_t
Context of the received Generic Manufacturer Property Set message

Public Members

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

uint8_t user_access
Enumeration indicating user access

struct esp_ble_mesh_generic_server_cb_param_t
Generic Server Model callback parameters

Public Members

esp_ble_mesh_model_t *model
Pointer to Generic Server Models

esp_ble_mesh_msg_ctx_t ctx
Context of the received messages

esp_ble_mesh_generic_server_cb_value_t value
Value of the received Generic Messages
Macros

ESP_BLE_MESH_MODEL_GEN_ONOFF_CLI (cli_pub, cli_data)

Define a new Generic OnOff Client Model.

Note: This API needs to be called for each element on which the application needs to have a Generic OnOff Client Model.

Parameters

- **cli_pub** - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** - Pointer to the unique struct `esp_ble_mesh_client_t`.

Returns New Generic OnOff Client Model instance.

ESP_BLE_MESH_MODEL_GEN_LEVEL_CLI (cli_pub, cli_data)

Define a new Generic Level Client Model.

Note: This API needs to be called for each element on which the application needs to have a Generic Level Client Model.

Parameters

- **cli_pub** - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** - Pointer to the unique struct `esp_ble_mesh_client_t`.

Returns New Generic Level Client Model instance.

ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_CLI (cli_pub, cli_data)

Define a new Generic Default Transition Time Client Model.

Note: This API needs to be called for each element on which the application needs to have a Generic Default Transition Time Client Model.

Parameters

- **cli_pub** - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** - Pointer to the unique struct `esp_ble_mesh_client_t`.

Returns New Generic Default Transition Time Client Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_CLI (cli_pub, cli_data)

Define a new Generic Power OnOff Client Model.

Note: This API needs to be called for each element on which the application needs to have a Generic Power OnOff Client Model.

Parameters

- **cli_pub** - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** - Pointer to the unique struct `esp_ble_mesh_client_t`.

Returns New Generic Power OnOff Client Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_CLI (cli_pub, cli_data)

Define a new Generic Power Level Client Model.

Note: This API needs to be called for each element on which the application needs to have a Generic Power Level Client Model.
Chapter 2. API Reference

Parameters
- **cli_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** – Pointer to the unique struct `esp_ble_mesh_client_t`.

Returns New Generic Power Level Client Model instance.

**ESP_BLE_MESH_MODEL_GEN_BATTERY_CLI** (cli_pub, cli_data)
Define a new Generic Battery Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic Battery Client Model.

Parameters
- **cli_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** – Pointer to the unique struct `esp_ble_mesh_client_t`.

Returns New Generic Battery Client Model instance.

**ESP_BLE_MESH_MODEL_GEN_LOCATION_CLI** (cli_pub, cli_data)
Define a new Generic Location Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic Location Client Model.

Parameters
- **cli_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** – Pointer to the unique struct `esp_ble_mesh_client_t`.

Returns New Generic Location Client Model instance.

**ESP_BLE_MESH_MODEL_GEN_PROPERTY_CLI** (cli_pub, cli_data)
Define a new Generic Property Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic Property Client Model.

Parameters
- **cli_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** – Pointer to the unique struct `esp_ble_mesh_client_t`.

Returns New Generic Location Client Model instance.

**ESP_BLE_MESH_MODEL_GEN_ONOFF_SRV** (srv_pub, srv_data)
Generic Server Models related context.
Define a new Generic OnOff Server Model.

**Note:** 1. The Generic OnOff Server Model is a root model.
   a. This model shall support model publication and model subscription.

Parameters
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_gen_onoff_srv_t`.

Returns New Generic OnOff Server Model instance.
Chapter 2. API Reference

**ESP_BLE_MESH_MODEL_GEN_LEVEL_SRV** (srv_pub, srv_data)
Define a new Generic Level Server Model.

**Note:**
1. The Generic Level Server Model is a root model.
   a. This model shall support model publication and model subscription.

**Parameters**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_gen_level_srv_t`.

**Returns**
New Generic Level Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_SRV** (srv_pub, srv_data)
Define a new Generic Default Transition Time Server Model.

**Note:**
1. The Generic Default Transition Time Server Model is a root model.
   a. This model shall support model publication and model subscription.

**Parameters**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_gen_def_trans_time_srv_t`.

**Returns**
New Generic Default Transition Time Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SRV** (srv_pub, srv_data)
Define a new Generic Power OnOff Server Model.

**Note:**
1. The Generic Power OnOff Server model extends the Generic OnOff Server model. When this model is present on an element, the corresponding Generic Power OnOff Setup Server model shall also be present.
   a. This model may be used to represent a variety of devices that do not fit any of the model descriptions that have been defined but support the generic properties of On/Off.
   b. This model shall support model publication and model subscription.

**Parameters**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_gen_power_onoff_srv_t`.

**Returns**
New Generic Power OnOff Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SETUP_SRV** (srv_pub, srv_data)
Define a new Generic Power OnOff Setup Server Model.

**Note:**
   a. This model shall support model subscription.

**Parameters**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_gen_power_onoff_setup_srv_t`.

**Returns**
Chapter 2. API Reference

**ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SRV** (srv_pub, srv_data)
Define a new Generic Power Level Server Model.

**Note:** 1. The Generic Power Level Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Generic Power Level Setup Server model shall also be present.

   a. This model shall support model publication and model subscription.

**Parameters**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_gen_power_level_srv_t`.

**Returns** New Generic Power Level Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SETUP_SRV** (srv_pub, srv_data)
Define a new Generic Power Level Setup Server Model.

**Note:** 1. The Generic Power Level Setup Server model extends the Generic Power Level Server model and the Generic Power OnOff Setup Server model.

   a. This model shall support model subscription.

**Parameters**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_gen_power_level_setup_srv_t`.

**Returns** New Generic Power Level Setup Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_BATTERY_SRV** (srv_pub, srv_data)
Define a new Generic Battery Server Model.

**Note:** 1. The Generic Battery Server Model is a root model.

   a. This model shall support model publication and model subscription.
   b. The model may be used to represent an element that is powered by a battery.

**Parameters**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_gen_battery_srv_t`.

**Returns** New Generic Battery Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_LOCATION_SRV** (srv_pub, srv_data)
Define a new Generic Location Server Model.

**Note:** 1. The Generic Location Server model is a root model. When this model is present on an Element, the corresponding Generic Location Setup Server model shall also be present.

   a. This model shall support model publication and model subscription.
   b. The model may be used to represent an element that knows its location (global or local).

**Parameters**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_gen_location_srv_t`.

**Returns** New Generic Location Server Model instance.
ESP_BLE_MESH_MODEL_GEN_LOCATION_SETUP_SRV (srv_pub, srv_data)
Define a new Generic Location Setup Server Model.

**Note:** 1. The Generic Location Setup Server model extends the Generic Location Server model.
   a. This model shall support model subscription.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_gen_location_setup_srv_t`.

**Returns** New Generic Location Setup Server Model instance.

ESP_BLE_MESH_MODEL_GEN_USER_PROP_SRV (srv_pub, srv_data)
Define a new Generic User Property Server Model.

**Note:** 1. The Generic User Property Server model is a root model.
   a. This model shall support model publication and model subscription.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_gen_user_prop_srv_t`.

**Returns** New Generic User Property Server Model instance.

ESP_BLE_MESH_MODEL_GEN_ADMIN_PROP_SRV (srv_pub, srv_data)
Define a new Generic Admin Property Server Model.

**Note:** 1. The Generic Admin Property Server model extends the Generic User Property Server model.
   a. This model shall support model publication and model subscription.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_gen_admin_prop_srv_t`.

**Returns** New Generic Admin Property Server Model instance.

ESP_BLE_MESH_MODEL_GEN_MANUFACTURER_PROP_SRV (srv_pub, srv_data)
Define a new Generic Manufacturer Property Server Model.

**Note:** 1. The Generic Manufacturer Property Server model extends the Generic User Property Server model.
   a. This model shall support model publication and model subscription.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_gen_manu_prop_srv_t`.

**Returns** New Generic Manufacturer Property Server Model instance.

ESP_BLE_MESH_MODEL_GEN_CLIENT_PROP_SRV (srv_pub, srv_data)
Define a new Generic User Property Server Model.

**Note:** 1. The Generic Client Property Server model is a root model.
Chapter 2. API Reference

a. This model shall support model publication and model subscription.

**Parameters**
- `srv_pub` - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` - Pointer to the unique struct `esp_ble_mesh_gen_client_prop_srv_t`.

**Returns** New Generic Client Property Server Model instance.

**Type Definitions**

```c
typedef void (*esp_ble_mesh_generic_client_cb_t)(
    esp_ble_mesh_generic_client_cb_event_t event,
    esp_ble_mesh_generic_client_cb_param_t *param)
```

Bluetooth Mesh Generic Client Model function.

Generic Client Model callback function type

- `Param event` - Event type
- `Param param` - Pointer to callback parameter

```c
typedef void (*esp_ble_mesh_generic_server_cb_t)(
    esp_ble_mesh_generic_server_cb_event_t event,
    esp_ble_mesh_generic_server_cb_param_t *param)
```

Bluetooth Mesh Generic Server Model function.

Generic Server Model callback function type

- `Param event` - Event type
- `Param param` - Pointer to callback parameter

**Enumerations**

```c
enum esp_ble_mesh_generic_client_cb_event_t
```

This enum value is the event of Generic Client Model

**Values:**

- enumerator `ESP_BLE_MESH_GENERIC_CLIENT_GET_STATE_EVT`
- enumerator `ESP_BLE_MESH_GENERIC_CLIENT_SET_STATE_EVT`
- enumerator `ESP_BLE_MESH_GENERIC_CLIENT_PUBLISH_EVT`
- enumerator `ESP_BLE_MESH_GENERIC_CLIENT_TIMEOUT_EVT`
- enumerator `ESP_BLE_MESH_GENERIC_CLIENT_EVT_MAX`

```c
enum esp_ble_mesh_gen_user_prop_access_t
```

This enum value is the access value of Generic User Property

**Values:**

- enumerator `ESP_BLE_MESH_GEN_USER_ACCESS_PROHIBIT`
- enumerator `ESP_BLE_MESH_GEN_USER_ACCESS_READ`
- enumerator `ESP_BLE_MESH_GEN_USER_ACCESS_WRITE`
enumerator **ESP_BLE_MESH_GEN_USER_ACCESS_READ_WRITE**

enum **esp_ble_mesh_gen_admin_prop_access_t**

This enum value is the access value of Generic Admin Property

Values:

enumerator **ESP_BLE_MESH_GEN_ADMIN_NOT_USER_PROP**

enumerator **ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ**

enumerator **ESP_BLE_MESH_GEN_ADMIN_ACCESS_WRITE**

enumerator **ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ_WRITE**

enum **esp_ble_mesh_gen_manu_prop_access_t**

This enum value is the access value of Generic Manufacturer Property

Values:

enumerator **ESP_BLE_MESH_GEN_MANU_NOT_USER_PROP**

enumerator **ESP_BLE_MESH_GEN_MANU_ACCESS_READ**

enum **esp_ble_mesh_generic_server_cb_event_t**

This enum value is the event of Generic Server Model

Values:

enumerator **ESP_BLE_MESH_GENERIC_SERVER_STATE_CHANGE_EVT**

i. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Generic Get messages are received.

ii. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_GENERIC_SERVER_RECV_GET_MSG_EVT**

When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Generic Get messages are received.

enumerator **ESP_BLE_MESH_GENERIC_SERVER_RECV_SET_MSG_EVT**

When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_GENERIC_SERVER_EVT_MAX**

Chapter 2. API Reference

**Functions**

`esp_err_t esp_ble_mesh_register_sensor_client_callback (esp_ble_mesh_sensor_client_cb_t callback)`

Register BLE Mesh Sensor Client Model callback.

**Parameters**
- `callback` - [in] Pointer to the callback function.

**Returns**
- ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_sensor_client_get_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_sensor_client_get_state_t *get_state)`

Get the value of Sensor Server Model states using the Sensor Client Model get messages.

**Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_sensor_message_opcode_t` in `esp_ble_mesh_defs.h`

**Parameters**
- `params` - [in] Pointer to BLE Mesh common client parameters.
- `get_state` - [in] Pointer to sensor get message value. Shall not be set to NULL.

**Returns**
- ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_sensor_client_set_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_sensor_client_set_state_t *set_state)`

Set the value of Sensor Server Model states using the Sensor Client Model set messages.

**Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_sensor_message_opcode_t` in `esp_ble_mesh_defs.h`

**Parameters**
- `params` - [in] Pointer to BLE Mesh common client parameters.
- `set_state` - [in] Pointer to sensor set message value. Shall not be set to NULL.

**Returns**
- ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_register_sensor_server_callback (esp_ble_mesh_sensor_server_cb_t callback)`

Register BLE Mesh Sensor Server Model callback.

**Parameters**
- `callback` - [in] Pointer to the callback function.

**Returns**
- ESP_OK on success or error code otherwise.

**Unions**

`union esp_ble_mesh_sensor_client_get_state_t`

```
#include <esp_ble_mesh_sensor_model_api.h> Sensor Client Model get message union.
```

**Public Members**

`esp_ble_mesh_sensor_descriptor_get_t descriptor_get`

For ESP_BLE_MESH_MODEL_OP_SENSOR_DESCRIPTOR_GET

`esp_ble_mesh_sensor_cadence_get_t cadence_get`

For ESP_BLE_MESH_MODEL_OP_SENSOR_CADENCE_GET

   Parameter of Sensor Cadence Get
```

Public Members

```c:uint16_t property_id
   Property ID of a sensor
```

```c
struct esp_ble_mesh_sensor_cadence_set_t
   Parameters of Sensor Cadence Set
```
Public Members

uint16_t property_id
    Property ID for the sensor

uint8_t fast_cadence_period_divisor
    Divisor for the publish period

uint8_t status_trigger_type
    The unit and format of the Status Trigger Delta fields

struct net_buf_simple *status_trigger_delta_down
    Delta down value that triggers a status message

struct net_buf_simple *status_trigger_delta_up
    Delta up value that triggers a status message

uint8_t status_min_interval
    Minimum interval between two consecutive Status messages

struct net_buf_simple *fast_cadence_low
    Low value for the fast cadence range

struct net_buf_simple *fast_cadence_high
    Fast value for the fast cadence range

struct esp_ble_mesh_sensor_settings_get_t
    Parameter of Sensor Settings Get

Public Members

uint16_t sensor_property_id
    Property ID of a sensor

struct esp_ble_mesh_sensor_setting_get_t
    Parameters of Sensor Setting Get

Public Members

uint16_t sensor_property_id
    Property ID of a sensor

uint16_t sensor_setting_property_id
    Setting ID identifying a setting within a sensor

struct esp_ble_mesh_sensor_setting_set_t
    Parameters of Sensor Setting Set
Chapter 2. API Reference

Public Members

uint16_t sensor_property_id
Property ID identifying a sensor

uint16_t sensor_setting_property_id
Setting ID identifying a setting within a sensor

struct net_buf_simple *sensor_setting_raw
Raw value for the setting

struct esp_ble_mesh_sensor_get_t
Parameters of Sensor Get

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID for the sensor (optional)

struct esp_ble_mesh_sensor_column_get_t
Parameters of Sensor Column Get

Public Members

uint16_t property_id
Property identifying a sensor

struct net_buf_simple *raw_value_x
Raw value identifying a column

struct esp_ble_mesh_sensor_series_get_t
Parameters of Sensor Series Get

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property identifying a sensor

struct net_buf_simple *raw_value_x1
Raw value identifying a starting column (optional)
struct net_buf_simple *raw_value_x2
    Raw value identifying an ending column (C.1)

struct esp_ble_mesh_sensor_descriptor_status_cb_t
    Bluetooth Mesh Sensor Client Model Get and Set callback parameters structure.
    Parameter of Sensor Descriptor Status

**Public Members**

struct net_buf_simple *descriptor
    Sequence of 8-octet sensor descriptors (optional)

struct esp_ble_mesh_sensor_cadence_status_cb_t
    Parameters of Sensor Cadence Status

**Public Members**

uint16_t property_id
    Property for the sensor

struct net_buf_simple *sensor_cadence_value
    Value of sensor cadence state

struct esp_ble_mesh_sensor_settings_status_cb_t
    Parameters of Sensor Settings Status

**Public Members**

uint16_t sensor_property_id
    Property ID identifying a sensor

struct net_buf_simple *sensor_setting_property_ids
    A sequence of N sensor setting property IDs (optional)

struct esp_ble_mesh_sensor_setting_status_cb_t
    Parameters of Sensor Setting Status

**Public Members**

bool op_en
    Indicate id optional parameters are included

uint16_t sensor_property_id
    Property ID identifying a sensor
Chapter 2. API Reference

uint16_t sensor_setting_property_id
Setting ID identifying a setting within a sensor

uint8_t sensor_setting_access
Read/Write access rights for the setting (optional)

struct net_buf_simple *sensor_setting_raw
Raw value for the setting

struct esp_ble_mesh_sensor_status_cb_t
Parameter of Sensor Status

Public Members

struct net_buf_simple *marshalled_sensor_data
Value of sensor data state (optional)

struct esp_ble_mesh_sensor_column_status_cb_t
Parameters of Sensor Column Status

Public Members

uint16_t property_id
Property identifying a sensor and the Y axis

struct net_buf_simple *sensor_column_value
Left values of sensor column status

struct esp_ble_mesh_sensor_series_status_cb_t
Parameters of Sensor Series Status

Public Members

uint16_t property_id
Property identifying a sensor and the Y axis

struct net_buf_simple *sensor_series_value
Left values of sensor series status

struct esp_ble_mesh_sensor_client_cb_param_t
Sensor Client Model callback parameters

Public Members
int error_code
0: success, otherwise failure. For the error code values please refer to errno.h file. A negative sign is added to the standard error codes in errno.h.

esp_ble_mesh_client_common_param_t *params
The client common parameters.

esp_ble_mesh_sensor_client_status_cb_t status_cb
The sensor status message callback values

struct esp_ble_mesh_sensor_descriptor_t
Parameters of Sensor Descriptor state

Public Members

uint32_t positive_tolerance
The value of Sensor Positive Tolerance field

uint32_t negative_tolerance
The value of Sensor Negative Tolerance field

uint32_t sampling_function
The value of Sensor Sampling Function field

uint8_t measure_period
The value of Sensor Measurement Period field

uint8_t update_interval
The value of Sensor Update Interval field

struct esp_ble_mesh_sensor_setting_t
Parameters of Sensor Setting state

Public Members

uint16_t property_id
The value of Sensor Setting Property ID field

uint8_t access
The value of Sensor Setting Access field

struct net_buf_simple *raw
The value of Sensor Setting Raw field

struct esp_ble_mesh_sensor_cadence_t
Parameters of Sensor Cadence state
Public Members

```c
uint8_t period_divisor
    The value of Fast Cadence Period Divisor field
```

```c
uint8_t trigger_type
    The value of Status Trigger Type field
```

```c
struct net_buf_simple *trigger_delta_down
    Note: The parameter “size” in trigger_delta_down, trigger_delta_up, fast_cadence_low & fast_cadence_high indicates the exact length of these four parameters, and they are associated with the Sensor Property ID. Users need to initialize the “size” precisely. The value of Status Trigger Delta Down field
```

```c
struct net_buf_simple *trigger_delta_up
    The value of Status Trigger Delta Up field
```

```c
uint8_t min_interval
    The value of Status Min Interval field
```

```c
struct net_buf_simple *fast_cadence_low
    The value of Fast Cadence Low field
```

```c
struct net_buf_simple *fast_cadence_high
    The value of Fast Cadence High field
```

```c
struct esp_ble_mesh_sensor_data_t
    Parameters of Sensor Data state
```

Public Members

```c
uint8_t format
    Format A: The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
    Format B: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero. The value of the Sensor Data format
```

```c
uint8_t length
    The value of the Sensor Data length
```

```c
struct net_buf_simple *raw_value
    The value of Sensor Data raw value
```

```c
struct esp_ble_mesh_sensor_series_column_t
    Parameters of Sensor Series Column state
```

Public Members

    Sensor state count

esp_ble_mesh_sensor_state_t *states
    Parameters of the Sensor states

struct esp_ble_mesh_sensor_setup_srv_t
    User data of Sensor Setup Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Sensor Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
    Response control of the server model received messages

const uint8_t state_count
    Sensor state count

esp_ble_mesh_sensor_state_t *states
    Parameters of the Sensor states

struct esp_ble_mesh_state_change_sensor_cadence_set_t
    Parameters of Sensor Cadence Set state change event

Public Members

uint16_t property_id
    The value of Sensor Property ID state

uint8_t period_divisor
    The value of Fast Cadence Period Divisor state

uint8_t trigger_type
    The value of Status Trigger Type state

struct net_buf_simple *trigger_delta_down
    The value of Status Trigger Delta Down state

struct net_buf_simple *trigger_delta_up
    The value of Status Trigger Delta Up state

uint8_t min_interval
    The value of Status Min Interval state
struct net_buf_simple *fast_cadence_low
The value of Fast Cadence Low state

struct net_buf_simple *fast_cadence_high
The value of Fast Cadence High state

struct esp_ble_mesh_state_change_sensor_setting_set_t
Parameters of Sensor Setting Set state change event

Public Members

uint16_t property_id
The value of Sensor Property ID state

uint16_t setting_property_id
The value of Sensor Setting Property ID state

struct net_buf_simple *setting_value
The value of Sensor Property Value state

struct esp_ble_mesh_server_recv_sensor_descriptor_get_t
Context of the received Sensor Descriptor Get message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID of a sensor (optional)

struct esp_ble_mesh_server_recv_sensor_cadence_get_t
Context of the received Sensor Cadence Get message

Public Members

uint16_t property_id
Property ID of a sensor

struct esp_ble_mesh_server_recv_sensor_settings_get_t
Context of the received Sensor Settings Get message

Public Members

uint16_t property_id
Property ID of a sensor
### struct esp_ble_mesh_server_recv_sensor_setting_get_t
Context of the received Sensor Setting Get message

**Public Members**

- **uint16_t property_id**
  Property ID of a sensor

- **uint16_t setting_property_id**
  Setting ID identifying a setting within a sensor

### struct esp_ble_mesh_server_recv_sensor_get_t
Context of the received Sensor Get message

**Public Members**

- **bool op_en**
  Indicate if optional parameters are included

- **uint16_t property_id**
  Property ID for the sensor (optional)

### struct esp_ble_mesh_server_recv_sensor_column_get_t
Context of the received Sensor Column Get message

**Public Members**

- **uint16_t property_id**
  Property identifying a sensor

- **struct net_buf_simple *raw_value_x**
  Raw value identifying a column

### struct esp_ble_mesh_server_recv_sensor_series_get_t
Context of the received Sensor Series Get message

**Public Members**

- **bool op_en**
  Indicate if optional parameters are included

- **uint16_t property_id**
  Property identifying a sensor

- **struct net_buf_simple *raw_value**
  Raw value containing X1 and X2 (optional)
Chapter 2. API Reference

struct esp_ble_mesh_server_recv_sensor_cadence_set_t
Context of the received Sensor Cadence Set message

Public Members

uint16_t property_id
Property ID for the sensor

struct net_buf_simple *cadence
Value of Sensor Cadence state

struct esp_ble_mesh_server_recv_sensor_setting_set_t
Context of the received Sensor Setting Set message

Public Members

uint16_t property_id
Property ID identifying a sensor

uint16_t setting_property_id
Setting ID identifying a setting within a sensor

struct net_buf_simple *setting_raw
Raw value for the setting

struct esp_ble_mesh_sensor_server_cb_param_t
Sensor Server Model callback parameters

Public Members

esp_ble_mesh_model_t *model
Pointer to Sensor Server Models

esp_ble_mesh_msg_ctx_t ctx
Context of the received messages

esp_ble_mesh_sensor_server_cb_value_t value
Value of the received Sensor Messages

Macros

ESP_BLE_MESH_MODEL_SENSOR_CLI (cli_pub, cli_data)
Define a new Sensor Client Model.

Note: This API needs to be called for each element on which the application needs to have a Sensor Client Model.
Chapter 2. API Reference

Parameters
- `cli_pub` - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` - Pointer to the unique struct `esp_ble_mesh_client_t`.

Returns  New Sensor Client Model instance.

**ESP_BLE_MESH_MODEL_SENSOR_SRV** `(srv_pub, srv_data)`
Sensor Server Models related context.
Define a new Sensor Server Model.

**Note:** 1. The Sensor Server model is a root model. When this model is present on an element, the corresponding Sensor Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.

Parameters
- `srv_pub` - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` - Pointer to the unique struct `esp_ble_mesh_sensor_srv_t`.

Returns  New Sensor Server Model instance.

**ESP_BLE_MESH_MODEL_SENSOR_SETUP_SRV** `(srv_pub, srv_data)`
Define a new Sensor Setup Server Model.

**Note:** 1. The Sensor Setup Server model extends the Sensor Server model.
   a. This model shall support model publication and model subscription.

Parameters
- `srv_pub` - Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` - Pointer to the unique struct `esp_ble_mesh_sensor_setup_srv_t`.

Returns  New Sensor Setup Server Model instance.

**ESP_BLE_MESH_INVALID_SENSOR_PROPERTY_ID**
Invalid Sensor Property ID

**ESP_BLE_MESH_SENSOR_PROPERTY_ID_LEN**
Length of Sensor Property ID

**ESP_BLE_MESH_SENSOR_DESCRIPTOR_LEN**
Length of Sensor Descriptor state

**ESP_BLE_MESH_SENSOR_UNSPECIFIED_POS_TOLERANCE**
Unspecified Sensor Positive Tolerance

**ESP_BLE_MESH_SENSOR_UNSPECIFIED_NEG_TOLERANCE**
Unspecified Sensor Negative Tolerance

**ESP_BLE_MESH_SENSOR_NOT_APPL_MEASURE_PERIOD**
Not applicable Sensor Measurement Period

**ESP_BLE_MESH_SENSOR_NOT_APPL_UPDATE_INTERVAL**
Not applicable Sensor Update Interval
**ESP_BLE_MESH_INVALID_SENSOR_SETTING_PROPERTY_ID**
Invalid Sensor Setting Property ID

**ESP_BLE_MESH_SENSOR_SETTING_PROPERTY_ID_LEN**
Length of Sensor Setting Property ID

**ESP_BLE_MESH_SENSOR_SETTING_ACCESS_LEN**
Length of Sensor Setting Access

**ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ**
Sensor Setting Access - Read

**ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ_WRITE**
Sensor Setting Access - Read & Write

**ESP_BLE_MESH_SENSOR_DIVISOR_TRIGGER_TYPE_LEN**
Length of Sensor Divisor Trigger Type

**ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_LEN**
Length of Sensor Status Min Interval

**ESP_BLE_MESH_SENSOR_PERIOD_DIVISOR_MAX_VALUE**
Maximum value of Sensor Period Divisor

**ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_MAX**
Maximum value of Sensor Status Min Interval

**ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_CHAR**
Sensor Status Trigger Type - Format Type of the characteristic that the Sensor Property ID state references

**ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_UINT16**
Sensor Status Trigger Type - Format Type “uint16”

**ESP_BLE_MESH_SENSOR_DATA_FORMAT_A**
Sensor Data Format A

**ESP_BLE_MESH_SENSOR_DATA_FORMAT_B**
Sensor Data Format B

**ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID_LEN**
MPID length of Sensor Data Format A

**ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID_LEN**
MPID length of Sensor Data Format B

**ESP_BLE_MESH_SENSOR_DATA_ZERO_LEN**
Zero length of Sensor Data.

Note: The Length field is a 1-based uint7 value (valid range 0x0-0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
**ESP_BLE_MESH_GETSENSOR_DATA_FORMAT(_data)**

Get format of the sensor data.

**Note:** Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the format of the corresponding sensor data.

**Parameters**
- **_data** – Pointer to the start of the sensor data.

**Returns** Format of the sensor data.

**ESP_BLE_MESH_GETSENSOR_DATA_LENGTH(_data, _fmt)**

Get length of the sensor data.

**Note:** Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the length of the corresponding sensor data.

**Parameters**
- **_data** – Pointer to the start of the sensor data.
- **_fmt** – Format of the sensor data.

**Returns** Length (zero-based) of the sensor data.

**ESP_BLE_MESH_GETSENSOR_DATAPROPERTY_ID(_data, _fmt)**

Get Sensor Property ID of the sensor data.

**Note:** Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting Sensor Property ID of the corresponding sensor data.

**Parameters**
- **_data** – Pointer to the start of the sensor data.
- **_fmt** – Format of the sensor data.

**Returns** Sensor Property ID of the sensor data.

**ESP_BLE_MESHSENSOR_DATAFORMAT_A_MPID(_len, _id)**

Generate a MPID value for sensor data with Format A.

**Note:** 1. The Format field is 0b0 and indicates that Format A is used.
   a. The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
   b. The Property ID is an 11-bit bit field representing 11 LSb of a Property ID.
   c. This format may be used for Property Values that are not longer than 16 octets and for Property IDs less than 0x800.

**Parameters**
- **_len** – Length of Sensor Raw value.
- **_id** – Sensor Property ID.

**Returns** 2-octet MPID value for sensor data with Format A.

**ESP_BLE_MESHSENSOR_DATAFORMAT_B_MPID(_len, _id)**

Generate a MPID value for sensor data with Format B.

**Note:** 1. The Format field is 0b1 and indicates Format B is used.
a. The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
b. The Property ID is a 16-bit bit field representing a Property ID.
c. This format may be used for Property Values not longer than 128 octets and for any Property IDs. Property values longer than 128 octets are not supported by the Sensor Status message.
d. Exclude the generated 1-octet value, the 2-octet Sensor Property ID

Parameters

- `__len` - Length of Sensor Raw value.
- `__id` - Sensor Property ID.

Returns 3-octet MPID value for sensor data with Format B.

Type Definitions

typedef void (*esp_ble_mesh_sensor_client_cb_t)(esp_ble_mesh_sensor_client_cb_event_t event, esp_ble_mesh_sensor_client_cb_param_t *param)

  Bluetooth Mesh Sensor Client Model function.
  
  Parameters:
  - `event` - Event type
  - `param` - Pointer to callback parameter

  typedef void (*esp_ble_mesh_sensor_server_cb_t)(esp_ble_mesh_sensor_server_cb_event_t event, esp_ble_mesh_sensor_server_cb_param_t *param)

  Bluetooth Mesh Sensor Server Model function.
  
  Parameters:
  - `event` - Event type
  - `param` - Pointer to callback parameter

Enumerations

typedef enum esp_ble_mesh_sensor_client_cb_event_t

  This enum value is the event of Sensor Client Model

  Values:

  - `ESP_BLE_MESH_SENSOR_CLIENT_GET_STATE_EVT`
  - `ESP_BLE_MESH_SENSOR_CLIENT_SET_STATE_EVT`
  - `ESP_BLE_MESH_SENSOR_CLIENT_PUBLISH_EVT`
  - `ESP_BLE_MESH_SENSOR_CLIENT_TIMEOUT_EVT`
  - `ESP_BLE_MESH_SENSOR_CLIENT_EVT_MAX`

  typedef enum esp_ble_mesh_sensor_sample_func

  This enum value is value of Sensor Sampling Function

  Values:

  - `ESP_BLE_MESH_SAMPLE_FUNC_UNSPECIFIED`
enumerator ESP_BLE_MESH_SAMPLE_FUNC_INSTANTANEOUS
enumerator ESP_BLE_MESH_SAMPLE_FUNC_ARITHMETIC_MEAN
enumerator ESP_BLE_MESH_SAMPLE_FUNC_RMS
enumerator ESP_BLE_MESH_SAMPLE_FUNC_MAXIMUM
enumerator ESP_BLE_MESH_SAMPLE_FUNC_MINIMUM
enumerator ESP_BLE_MESH_SAMPLE_FUNC_ACCUMULATED
enumerator ESP_BLE_MESH_SAMPLE_FUNC_COUNT

denum esp_ble_mesh_sensor_server_cb_event_t

This enum value is the event of Sensor Server Model

Values:

enumerator ESP_BLE_MESH_SENSOR_SERVER_STATE_CHANGE_EVT

i. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Sensor Get messages are received.
ii. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

enumerator ESP_BLE_MESH_SENSOR_SERVER_RECV_GET_MSG_EVT

When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Get messages are received.

enumerator ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT

When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

enumerator ESP_BLE_MESH_SENSOR_SERVER_EVT_MAX

Time and Scenes Client/Server Models

Header File

• components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_time_scene_model_api.h

Functions

esp_err_t esp_ble_mesh_register_time_scene_client_callback(esp_ble_mesh_time_scene_client_cb_t callback)

Register BLE Mesh Time Scene Client Model callback.

Parameters callback –[in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.
**Chapter 2. API Reference**

```c
esp_err_t esp_ble_mesh_time_scene_client_get_state(esp_ble_mesh_client_common_param_t *params,
                                                  esp_ble_mesh_time_scene_client_get_state_t *get_state)
```

Get the value of Time Scene Server Model states using the Time Scene Client Model get messages.

**Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_time_scene_message_opcode_t in esp_ble_mesh_defs.h

**Parameters**
- `params` [in] Pointer to BLE Mesh common client parameters.
- `get_state` [in] Pointer to time scene get message value. Shall not be set to NULL.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_time_scene_client_set_state(esp_ble_mesh_client_common_param_t *params,
                                                   esp_ble_mesh_time_scene_client_set_state_t *set_state)
```

Set the value of Time Scene Server Model states using the Time Scene Client Model set messages.

**Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_time_scene_message_opcode_t in esp_ble_mesh_defs.h

**Parameters**
- `params` [in] Pointer to BLE Mesh common client parameters.
- `set_state` [in] Pointer to time scene set message value. Shall not be set to NULL.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_register_time_scene_server_callback(esp_ble_mesh_time_scene_server_cb_t callback)
```

Register BLE Mesh Time and Scenes Server Model callback.

**Parameters** `callback` [in] Pointer to the callback function.

**Returns** ESP_OK on success or error code otherwise.

**Unions**

```c
union esp_ble_mesh_time_scene_client_get_state_t
    #include <esp_ble_mesh_time_scene_model_api.h> Time Scene Client Model get message union.

### Structures

**struct esp_ble_mesh_time_set_t**

Bluetooth Mesh Time Scene Client Model Get and Set parameters structure.

#### Parameters of Time Set

**Public Members**

- `uint8_t tai_seconds[5]`
  
  The current TAI time in seconds

- `uint8_t sub_second`
  
  The sub-second time in units of 1/256 second

- `uint8_t uncertainty`
  
  The estimated uncertainty in 10-millisecond steps

- `uint16_t time_authority`
  
  0 = No Time Authority, 1 = Time Authority

- `uint16_t tai_utc_delta`
  
  Current difference between TAI and UTC in seconds

- `uint8_t time_zone_offset`
  
  The local time zone offset in 15-minute increments

**struct esp_ble_mesh_time_zone_set_t**

Parameters of Time Zone Set

#### Public Members

- `uint8_t time_zone_offset_new`
  
  Upcoming local time zone offset

- `uint8_t tai_zone_change[5]`
  
  TAI Seconds time of the upcoming Time Zone Offset change

**struct esp_ble_mesh_tai_utc_delta_set_t**

Parameters of TAI-UTC Delta Set

#### Public Members

- `uint16_t tai_utc_delta_new`
  
  Upcoming difference between TAI and UTC in seconds
Chapter 2. API Reference

uint16_t padding
    Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]
    TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_time_role_set_t
    Parameter of Time Role Set

    Public Members

    uint8_t time_role
        The Time Role for the element

struct esp_ble_mesh_scene_store_t
    Parameter of Scene Store

    Public Members

    uint16_t scene_number
        The number of scenes to be stored

struct esp_ble_mesh_scene_recall_t
    Parameters of Scene Recall

    Public Members

    bool op_en
        Indicate if optional parameters are included

    uint16_t scene_number
        The number of scenes to be recalled

    uint8_t tid
        Transaction ID

    uint8_t trans_time
        Time to complete state transition (optional)

    uint8_t delay
        Indicate message execution delay (C.1)

struct esp_ble_mesh_scene_delete_t
    Parameter of Scene Delete
**Public Members**

`uint16_t scene_number`

The number of scenes to be deleted

**struct esp_ble_mesh_scheduler_act_get_t**

Parameter of Scheduler Action Get

**Public Members**

`uint8_t index`

Index of the Schedule Register entry to get

**struct esp_ble_mesh_scheduler_act_set_t**

Parameters of Scheduler Action Set

**Public Members**

`uint64_t index`

Index of the Schedule Register entry to set

`uint64_t year`

Scheduled year for the action

`uint64_t month`

Scheduled month for the action

`uint64_t day`

Scheduled day of the month for the action

`uint64_t hour`

Scheduled hour for the action

`uint64_t minute`

Scheduled minute for the action

`uint64_t second`

Scheduled second for the action

`uint64_t day_of_week`

Schedule days of the week for the action

`uint64_t action`

Action to be performed at the scheduled time

`uint64_t trans_time`

Transition time for this action
uint16_t scene_number
    Transition time for this action

struct esp_ble_mesh_time_status_cb_t
    Bluetooth Mesh Time Scene Client Model Get and Set callback parameters structure.
    Parameters of Time Status

Public Members

uint8_t tai_seconds[5]
    The current TAI time in seconds

uint8_t sub_second
    The sub-second time in units of 1/256 second

uint8_t uncertainty
    The estimated uncertainty in 10-millisecond steps

uint16_t time_authority
    0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta
    Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
    The local time zone offset in 15-minute increments

struct esp_ble_mesh_time_zone_status_cb_t
    Parameters of Time Zone Status

Public Members

uint8_t time_zone_offset_curr
    Current local time zone offset

uint8_t time_zone_offset_new
    Upcoming local time zone offset

uint8_t tai_zone_change[5]
    TAI Second time of the upcoming Time Zone Offset change

struct esp_ble_mesh_tai_utc_delta_status_cb_t
    Parameters of TAI-UTC Delta Status
Chapter 2. API Reference

Public Members

uint16_t tai_utc_delta_curr
Current difference between TAI and UTC in seconds

uint16_t padding_1
Always 0b0. Other values are Prohibited.

uint16_t tai_utc_delta_new
Upcoming difference between TAI and UTC in seconds

uint16_t padding_2
Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]
TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_time_role_status_cb_t
Parameter of Time Role Status

Public Members

uint8_t time_role
The Time Role for the element

struct esp_ble_mesh_scene_status_cb_t
Parameters of Scene Status

Public Members

bool op_en
Indicate if optional parameters are included

uint8_t status_code
Status code of the last operation

uint16_t current_scene
Scene Number of the current scene

uint16_t target_scene
Scene Number of the target scene (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_scene_register_status_cb_t
Parameters of Scene Register Status
**Public Members**

`uint8_t status_code`
Status code for the previous operation

`uint16_t current_scene`
Scene Number of the current scene

`struct net_buf_simple *scenes`
A list of scenes stored within an element

`struct esp_ble_mesh_scheduler_status_cb_t`
Parameter of Scheduler Status

**Public Members**

`uint16_t schedules`
Bit field indicating defined Actions in the Schedule Register

`struct esp_ble_mesh_scheduler_act_status_cb_t`
Parameters of Scheduler Action Status

**Public Members**

`uint64_t index`
Enumerates (selects) a Schedule Register entry

`uint64_t year`
Scheduled year for the action

`uint64_t month`
Scheduled month for the action

`uint64_t day`
Scheduled day of the month for the action

`uint64_t hour`
Scheduled hour for the action

`uint64_t minute`
Scheduled minute for the action

`uint64_t second`
Scheduled second for the action

`uint64_t day_of_week`
Scheduled days of the week for the action
uint64_t action
     Action to be performed at the scheduled time

uint64_t trans_time
     Transition time for this action

uint16_t scene_number
     Transition time for this action

struct esp_ble_mesh_time_scene_client_cb_param_t
     Time Scene Client Model callback parameters

Public Members

int error_code
     Appropriate error code

esp_ble_mesh_client_common_param_t *params
     The client common parameters.

esp_ble_mesh_time_scene_client_status_cb_t status_cb
     The scene status message callback values

struct esp_ble_mesh_time_state_t
     Parameters of Time state

Public Members

uint8_t tai_seconds[5]
     The value of the TAI Seconds state

uint8_t subsecond
     The value of the Subsecond field

uint8_t uncertainty
     The value of the Uncertainty field

uint8_t time_zone_offset_curr
     The value of the Time Zone Offset Current field

uint8_t time_zone_offset_new
     The value of the Time Zone Offset New state

uint8_t tai_zone_change[5]
     The value of the TAI of Zone Chaneg field
uint16_t time_authority
    The value of the Time Authority bit

uint16_t tai_utc_delta_curr
    The value of the TAI-UTC Delta Current state

uint16_t tai_utc_delta_new
    The value of the TAI-UTC Delta New state

uint8_t tai_delta_change[5]
    The value of the TAI of Delta Change field

struct esp_ble_mesh_time_state_t::[anonymous] time
    Parameters of the Time state

uint8_t time_role
    The value of the Time Role state

struct esp_ble_mesh_time_srv_t
    User data of Time Server Model

**Public Members**

*esp_ble_mesh_model_t* model
    Pointer to the Time Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* rsp_ctrl
    Response control of the server model received messages

*esp_ble_mesh_time_state_t* state
    Parameters of the Time state

struct esp_ble_mesh_time_setup_srv_t
    User data of Time Setup Server Model

**Public Members**

*esp_ble_mesh_model_t* model
    Pointer to the Time Setup Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* rsp_ctrl
    Response control of the server model received messages

*esp_ble_mesh_time_state_t* state
    Parameters of the Time state
struct esp_ble_mesh_scene_register_t

a. Scene Store is an operation of storing values of a present state of an element.
b. The structure and meaning of the stored state is determined by a model. States to be stored are specified by each model.
c. The Scene Store operation shall persistently store all values of all states marked as Stored with Scene for all models present on all elements of a node.
d. If a model is extending another model, the extending model shall determine the Stored with Scene behavior of that model. Parameters of Scene Register state

Public Members

uint16_t scene_number
The value of the Scene Number

uint8_t scene_type
The value of the Scene Type

struct net_buf_simple *scene_value
Scene value may use a union to represent later, the union contains structures of all the model states which can be stored in a scene. The value of the Scene Value

struct esp_ble_mesh_scenes_state_t
Parameters of Scenes state.

Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states of an element can be stored as a scene and can be recalled later from the scene memory.

A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container associated with it, are determined by a model.

The Scenes state change may start numerous parallel model transitions. In that case, each individual model handles the transition internally.

The scene transition is defined as a group of individual model transitions started by a Scene Recall operation. The scene transition is in progress when at least one transition from the group of individual model transitions is in progress.

Public Members

const uint16_t scene_count
The Scenes state’s scene count

esp_ble_mesh_scene_register_t *scenes
Parameters of the Scenes state

uint16_t current_scene
The Current Scene state is a 16-bit value that contains either the Scene Number of the currently active scene or a value of 0x0000 when no scene is active.

When a Scene Store operation or a Scene Recall operation completes with success, the Current Scene state value shall be to the Scene Number used during that operation.
When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Current Scene state shall be set to 0x0000.

When any of the element’s state that is marked as “Stored with Scene” has changed not as a result of a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.

When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The value of the Current Scene state

uint16_t target_scene

The Target Scene state is a 16-bit value that contains the target Scene Number when a scene transition is in progress.

When the scene transition is in progress and the target Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Target Scene state shall be set to 0x0000.

When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.

When the scene transition is not in progress, the value of the Target Scene state shall be set to 0x0000. The value of the Target Scene state

uint8_t status_code

The status code of the last scene operation

bool in_progress

Indicate if the scene transition is in progress

struct esp_ble_mesh_scene_srv_t

User data of Scene Server Model

struct esp_ble_mesh_scene_setup_srv_t

User data of Scene Setup Server Model
Public Members

\textit{esp\_ble\_mesh\_model\_t *model}  
Point to the Scene Setup Server Model. Initialized internally.

\textit{esp\_ble\_mesh\_server\_rsp\_ctrl\_t *rsp\_ctrl}  
Response control of the server model received messages

\textit{esp\_ble\_mesh\_scenes\_state\_t *state}  
Parameters of the Scenes state

\textbf{Public Members}

\textbf{bool in\_use}  
Indicate if the registered schedule is in use

\textbf{uint64\_t year}  
The value of Scheduled year for the action

\textbf{uint64\_t month}  
The value of Scheduled month for the action

\textbf{uint64\_t day}  
The value of Scheduled day of the month for the action

\textbf{uint64\_t hour}  
The value of Scheduled hour for the action

\textbf{uint64\_t minute}  
The value of Scheduled minute for the action

\textbf{uint64\_t second}  
The value of Scheduled second for the action

\textbf{uint64\_t day\_of\_week}  
The value of Schedule days of the week for the action

\textbf{uint64\_t action}  
The value of Action to be performed at the scheduled time

\textbf{uint64\_t trans\_time}  
The value of Transition time for this action

\textbf{uint16\_t scene\_number}  
The value of Scene Number to be used for some actions
struct esp_ble_mesh_scheduler_state_t
Parameters of Scheduler state

Public Members

const uint8_t schedule_count
Scheduler count

esp_ble_mesh_schedule_register_t *schedules
Up to 16 scheduled entries

struct esp_ble_mesh_scheduler_srv_t
User data of Scheduler Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Scheduler Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_scheduler_state_t *state
Parameters of the Scheduler state

struct esp_ble_mesh_scheduler_setup_srv_t
User data of Scheduler Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Scheduler Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_scheduler_state_t *state
Parameters of the Scheduler state

struct esp_ble_mesh_state_change_time_set_t
Parameters of Time Set state change event

Public Members

uint8_t tai_seconds[5]
The current TAI time in seconds
Chapter 2. API Reference

uint8_t subsecond
The sub-second time in units of 1/256 second

uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t time_authority
0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta_curr
Current difference between TAI and UTC in seconds

uint8_t time_zone_offset_curr
The local time zone offset in 15-minute increments

struct esp_ble_mesh_state_change_time_status_t
Parameters of Time Status state change event

Public Members

uint8_t tai_seconds[5]
The current TAI time in seconds

uint8_t subsecond
The sub-second time in units of 1/256 second

uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t time_authority
0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta_curr
Current difference between TAI and UTC in seconds

uint8_t time_zone_offset_curr
The local time zone offset in 15-minute increments

struct esp_ble_mesh_state_change_time_zone_set_t
Parameters of Time Zone Set state change event

Public Members

uint8_t time_zone_offset_new
Upcoming local time zone offset
uint8_t \texttt{tai\_zone\_change}[5]  
TAI Seconds time of the upcoming Time Zone Offset change

\textbf{struct} \texttt{esp\_ble\_mesh\_state\_change\_tai\_utc\_delta\_set\_t}  
Parameters of TAI UTC Delta Set state change event

\textbf{Public Members}

uint16_t \texttt{tai\_utc\_delta\_new}  
Upcoming difference between TAI and UTC in seconds

uint8_t \texttt{tai\_delta\_change}[5]  
TAI Seconds time of the upcoming TAI-UTC Delta change

\textbf{struct} \texttt{esp\_ble\_mesh\_state\_change\_time\_role\_set\_t}  
Parameter of Time Role Set state change event

\textbf{Public Members}

uint8_t \texttt{time\_role}  
The Time Role for the element

\textbf{struct} \texttt{esp\_ble\_mesh\_state\_change\_scene\_store\_t}  
Parameter of Scene Store state change event

\textbf{Public Members}

uint16_t \texttt{scene\_number}  
The number of scenes to be stored

\textbf{struct} \texttt{esp\_ble\_mesh\_state\_change\_scene\_recall\_t}  
Parameter of Scene Recall state change event

\textbf{Public Members}

uint16_t \texttt{scene\_number}  
The number of scenes to be recalled

\textbf{struct} \texttt{esp\_ble\_mesh\_state\_change\_scene\_delete\_t}  
Parameter of Scene Delete state change event

\textbf{Public Members}

uint16_t \texttt{scene\_number}  
The number of scenes to be deleted
struct esp_ble_mesh_state_change_scheduler_act_set_t
Parameter of Scheduler Action Set state change event

Public Members

uint64_t index
Index of the Schedule Register entry to set

uint64_t year
Scheduled year for the action

uint64_t month
Scheduled month for the action

uint64_t day
Scheduled day of the month for the action

uint64_t hour
Scheduled hour for the action

uint64_t minute
Scheduled minute for the action

uint64_t second
Scheduled second for the action

uint64_t day_of_week
Scheduled days of the week for the action

uint64_t action
Action to be performed at the scheduled time

uint64_t trans_time
Transition time for this action

uint16_t scene_number
Scene number to be used for some actions

struct esp_ble_mesh_server_recv_scheduler_act_get_t
Context of the received Scheduler Action Get message

Public Members

uint8_t index
Index of the Schedule Register entry to get

struct esp_ble_mesh_server_recv_time_set_t
Context of the received Time Set message
Public Members

uint8_t **tai_seconds**[5]
   The current TAI time in seconds

uint8_t **subsecond**
   The sub-second time in units of 1/256 second

uint8_t **uncertainty**
   The estimated uncertainty in 10-millisecond steps

uint16_t **time_authority**
   0 = No Time Authority, 1 = Time Authority

uint16_t **tai_utc_delta**
   Current difference between TAI and UTC in seconds

uint8_t **time_zone_offset**
   The local time zone offset in 15-minute increments

struct **esp_ble_mesh_server_recv_time_zone_set_t**
   Context of the received TimeZone Set message

Public Members

uint8_t **time_zone_offset_new**
   Upcoming local time zone offset

uint8_t **tai_zone_change**[5]
   TAI Seconds time of the upcoming Time Zone Offset change

struct **esp_ble_mesh_server_recv_tai_utc_delta_set_t**
   Context of the received TAI UTC Delta Set message

Public Members

uint16_t **tai_utc_delta_new**
   Upcoming difference between TAI and UTC in seconds

uint16_t **padding**
   Always 0b0. Other values are Prohibited.

uint8_t **tai_delta_change**[5]
   TAI Seconds time of the upcoming TAI-UTC Delta change

struct **esp_ble_mesh_server_recv_time_role_set_t**
   Context of the received Time Role Set message
Public Members

```c
uint8_t time_role
```
The Time Role for the element

```c
struct esp_ble_mesh_server_recv_scene_store_t
```
Context of the received Scene Store message

Public Members

```c
uint16_t scene_number
```
The number of scenes to be stored

```c
struct esp_ble_mesh_server_recv_scene_recall_t
```
Context of the received Scene Recall message

Public Members

```c
bool op_en
```
Indicate if optional parameters are included

```c
uint16_t scene_number
```
The number of scenes to be recalled

```c
uint8_t tid
```
Transaction ID

```c
uint8_t trans_time
```
Time to complete state transition (optional)

```c
uint8_t delay
```
Indicate message execution delay (C.1)

```c
struct esp_ble_mesh_server_recv_scene_delete_t
```
Context of the received Scene Delete message

Public Members

```c
uint16_t scene_number
```
The number of scenes to be deleted

```c
struct esp_ble_mesh_server_recv_scheduler_act_set_t
```
Context of the received Scheduler Action Set message

### Public Members

- **uint64_t index**
  - Index of the Schedule Register entry to set

- **uint64_t year**
  - Scheduled year for the action

- **uint64_t month**
  - Scheduled month for the action

- **uint64_t day**
  - Scheduled day of the month for the action

- **uint64_t hour**
  - Scheduled hour for the action

- **uint64_t minute**
  - Scheduled minute for the action

- **uint64_t second**
  - Scheduled second for the action

- **uint64_t day_of_week**
  - Scheduled day of the week for the action

- **uint64_t action**
  - Action to be performed at the scheduled time

- **uint64_t trans_time**
  - Transition time for this action

- **uint16_t scene_number**
  - Scene number to be used for some actions

### struct esp_ble_mesh_server_recv_time_status_t

- **Context of the received Time Status message**

### Public Members

- **uint8_t tai_seconds[5]**
  - The current TAI time in seconds

- **uint8_t subsecond**
  - The sub-second time in units of 1/256 second

- **uint8_t uncertainty**
  - The estimated uncertainty in 10-millisecond steps

**uint16_t** time_authority

0 = No Time Authority, 1 = Time Authority

**uint16_t** tai_utc_delta

Current difference between TAI and UTC in seconds

**uint8_t** time_zone_offset

The local time zone offset in 15-minute increments

**struct esp_ble_mesh_time_scene_server_cb_param_t**

Time Scene Server Model callback parameters

**Public Members**

**esp_ble_mesh_model_t** *model

Pointer to Time and Scenes Server Models

**esp_ble_mesh_msg_ctx_t** ctx

Context of the received messages

**esp_ble_mesh_time_scene_server_cb_value_t** value

Value of the received Time and Scenes Messages

**Macros**

ESP_BLE_MESH_MODEL_TIME_CLI(cli_pub, cli_data)

Define a new Time Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Time Client Model.

**Parameters**

- **cli_pub** – Pointer to the unique struct esp_ble_mesh_model_pub_t.
- **cli_data** – Pointer to the unique struct esp_ble_mesh_client_t.

**Returns** New Time Client Model instance.

ESP_BLE_MESH_MODEL_SCENE_CLI(cli_pub, cli_data)

Define a new Scene Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Scene Client Model.

**Parameters**

- **cli_pub** – Pointer to the unique struct esp_ble_mesh_model_pub_t.
- **cli_data** – Pointer to the unique struct esp_ble_mesh_client_t.

**Returns** New Scene Client Model instance.
ESP_BLE_MESH_MODEL_SCHEDULER_CLI (cli_pub, cli_data)
Define a new Scheduler Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Scheduler Client Model.

**Parameters**
- `cli_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` – Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns**
New Scheduler Client Model instance.

ESP_BLE_MESH_MODEL_TIME_SRV (srv_pub, srv_data)
Time Scene Server Models related context.
Define a new Time Server Model.

**Note:** 1. The Time Server model is a root model. When this model is present on an Element, the corresponding Time Setup Server model shall also be present.

   a. This model shall support model publication and model subscription.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_time_srv_t`.

**Returns**
New Time Server Model instance.

ESP_BLE_MESH_MODEL_TIME_SETUP_SRV (srv_data)
Define a new Time Setup Server Model.

**Note:** 1. The Time Setup Server model extends the Time Server model. Time is sensitive information that is propagated across a mesh network.

   a. Only an authorized Time Client should be allowed to change the Time and Time Role states. A dedicated application key Bluetooth SIG Proprietary should be used on the Time Setup Server to restrict access to the server to only authorized Time Clients.
   b. This model does not support subscribing nor publishing.

**Parameters**
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_time_setup_srv_t`.

**Returns**

ESP_BLE_MESH_MODEL_SCENE_SRV (srv_pub, srv_data)
Define a new Scene Server Model.

**Note:** 1. The Scene Server model is a root model. When this model is present on an Element, the corresponding Scene Setup Server model shall also be present.

   a. This model shall support model publication and model subscription.
   b. The model may be present only on the Primary element of a node.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_scene_srv_t`. 
Returns
New Scene Server Model instance.

ESP_BLE_MESH_MODEL_SCENE_SETUP_SRV (srv_pub, srv_data)
Define a new Scene Setup Server Model.

Note: 1. The Scene Setup Server model extends the Scene Server model and the Generic Default Transition Time Server model.
   a. This model shall support model subscription.
   b. The model may be present only on the Primary element of a node.

Parameters
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_scene_setup_srv_t`.

Returns
New Scene Setup Server Model instance.

ESP_BLE_MESH_MODEL_SCHEDULER_SRV (srv_pub, srv_data)
Define a new Scheduler Server Model.

Note: 1. The Scheduler Server model extends the Scene Server model. When this model is present on an Element, the corresponding Scheduler Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.
   b. The model may be present only on the Primary element of a node.
   c. The model requires the Time Server model shall be present on the element.

Parameters
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_scheduler_srv_t`.

Returns
New Scheduler Server Model instance.

ESP_BLE_MESH_MODEL_SCHEDULER_SETUP_SRV (srv_pub, srv_data)
Define a new Scheduler Setup Server Model.

Note: 1. The Scheduler Setup Server model extends the Scheduler Server and the Scene Setup Server models.
   a. This model shall support model subscription.
   b. The model may be present only on the Primary element of a node.

Parameters
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_scheduler_setup_srv_t`.

Returns
New Scheduler Setup Server Model instance.

ESP_BLE_MESH_UNKNOWN_TAI_SECONDS
Unknown TAI Seconds

ESP_BLE_MESH_UNKNOWN_TAI_ZONE_CHANGE
Unknown TAI of Zone Change

ESP_BLE_MESH_UNKNOWN_TAI_DELTA_CHANGE
Unknown TAI of Delta Change
**ESP_BLE_MESH_TAI_UTC_DELTA_MAX_VALUE**
Maximum TAI-UTC Delta value

**ESP_BLE_MESH_TAI_SECONDS_LEN**
Length of TAI Seconds

**ESP_BLE_MESH_TAI_OF_ZONE_CHANGE_LEN**
Length of TAI of Zone Change

**ESP_BLE_MESH_TAI_OF_DELTA_CHANGE_LEN**
Length of TAI of Delta Change

**ESP_BLE_MESH_INVALID_SCENE_NUMBER**
Invalid Scene Number

**ESP_BLE_MESH_SCENE_NUMBER_LEN**
Length of the Scene Number

**ESP_BLE_MESH_SCHEDULE_YEAR_ANY_YEAR**
Any year of the Scheduled year

**ESP_BLE_MESH_SCHEDULE_DAY_ANY_DAY**
Any day of the Scheduled day

**ESP_BLE_MESH_SCHEDULE_HOUR_ANY_HOUR**
Any hour of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_HOUR_ONCE_A_DAY**
Any hour of the Scheduled Day

**ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_HOUR**
Any minute of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_MIN**
Every 15 minutes of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_MIN**
Every 20 minutes of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_HOUR**
Once of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_MIN**
Any second of the Scheduled minute

**ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_SEC**
Every 15 seconds of the Scheduled minute
Chapter 2. API Reference

**ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_SEC**
Every 20 seconds of the Scheduled minute

**ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_MIN**
Once of the Scheduled minute

**ESP_BLE_MESH_SCHEDULE_ACT_TURN_OFF**
Scheduled Action - Turn Off

**ESP_BLE_MESH_SCHEDULE_ACT_TURN_ON**
Scheduled Action - Turn On

**ESP_BLE_MESH_SCHEDULE_ACT_SCENE_RECALL**
Scheduled Action - Scene Recall

**ESP_BLE_MESH_SCHEDULE_ACT_NO_ACTION**
Scheduled Action - No Action

**ESP_BLE_MESH_SCHEDULE_SCENE_NO_SCENE**
Scheduled Scene - No Scene

**ESP_BLE_MESH_SCHEDULE_ENTRY_MAX_INDEX**
Maximum number of Scheduled entries

**ESP_BLE_MESH_TIME_NONE**
Time Role - None

**ESP_BLE_MESH_TIME_AUTHORITY**
Time Role - Mesh Time Authority

**ESP_BLE_MESH_TIME_RELAY**
Time Role - Mesh Time Relay

**ESP_BLE_MESH_TIME_CLINET**
Time Role - Mesh Time Client

**ESP_BLE_MESH_SCENE_SUCCESS**
Scene operation - Success

**ESP_BLE_MESH_SCENE_REG_FULL**
Scene operation - Scene Register Full

**ESP_BLE_MESH_SCENE_NOT_FOUND**
Scene operation - Scene Not Found

**Type Definitions**
Chapter 2. API Reference

typedef void (*esp_ble_mesh_time_scene_client_cb_t)(esp_ble_mesh_time_scene_client_cb_event_t event, esp_ble_mesh_time_scene_client_cb_param_t *param)

Bluetooth Mesh Time Scene Client Model function.

Time Scene Client Model callback function type

Param event  Event type
Param param  Pointer to callback parameter

typedef void (*esp_ble_mesh_time_scene_server_cb_t)(esp_ble_mesh_time_scene_server_cb_event_t event, esp_ble_mesh_time_scene_server_cb_param_t *param)

Bluetooth Mesh Time and Scenes Server Model function.

Time Scene Server Model callback function type

Param event  Event type
Param param  Pointer to callback parameter

Enumerations

enum esp_ble_mesh_time_scene_client_cb_event_t

This enum value is the event of Time Scene Client Model

Values:

enumerator ESP_BLE_MESH_TIME_SCENE_CLIENT_GET_STATE_EVT
enumerator ESP_BLE_MESH_TIME_SCENE_CLIENT_SET_STATE_EVT
enumerator ESP_BLE_MESH_TIME_SCENE_CLIENT_PUBLISH_EVT
enumerator ESP_BLE_MESH_TIME_SCENE_CLIENT_TIMEOUT_EVT
enumerator ESP_BLE_MESH_TIME_SCENE_CLIENT_EVT_MAX

enum esp_ble_mesh_time_scene_server_cb_event_t

This enum value is the event of Time Scene Server Model

Values:

enumerator ESP_BLE_MESH_TIME_SCENE_SERVER_STATE_CHANGE_EVT

i. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Time Scene Get messages are received.

ii. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

enumerator ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_GET_MSG_EVT

When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RESP_BY_APP, this event will be callback to the application layer when Time Scene Get messages are received.

enumerator ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_SET_MSG_EVT

When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RESP_BY_APP, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.
Chapter 2. API Reference

enumerator **ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_STATUS_MSG_EVT**

When `status_auto_rsp` is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Time Status message is received.

enumerator **ESP_BLE_MESH_TIME_SCENE_SERVER_EVT_MAX**

# Lighting Client/Server Models

## Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_lighting_model_api.h

## Functions

### esp_err_t esp_ble_mesh_register_light_client_callback (esp_ble_mesh_light_client_cb_t callback)

Register BLE Mesh Light Client Model callback.

**Parameters**
- `callback` [in] Pointer to the callback function.

**Returns**
- ESP_OK on success or error code otherwise.

### esp_err_t esp_ble_mesh_light_client_get_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_light_client_get_state_t *get_state)

Get the value of Light Server Model states using the Light Client Model get messages.

**Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h

**Parameters**
- `params` [in] Pointer to BLE Mesh common client parameters.
- `get_state` [in] Pointer of light get message value. Shall not be set to NULL.

**Returns**
- ESP_OK on success or error code otherwise.

### esp_err_t esp_ble_mesh_light_client_set_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_light_client_set_state_t *set_state)

Set the value of Light Server Model states using the Light Client Model set messages.

**Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h

**Parameters**
- `params` [in] Pointer to BLE Mesh common client parameters.
- `set_state` [in] Pointer of light set message value. Shall not be set to NULL.

**Returns**
- ESP_OK on success or error code otherwise.

### esp_err_t esp_ble_mesh_register_lighting_server_callback (esp_ble_mesh_lighting_server_cb_t callback)

Register BLE Mesh Lighting Server Model callback.

**Parameters**
- `callback` [in] Pointer to the callback function.

**Returns**
- ESP_OK on success or error code otherwise.

   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_light_hsl_hue_set_t
   Parameters of Light HSL Hue Set

   Public Members

   bool op_en
      Indicate if optional parameters are included

   uint16_t hue
      Target value of light hsl hue state

   uint8_t tid
      Transaction ID

   uint8_t trans_time
      Time to complete state transition (optional)

   uint8_t delay
      Indicate message execution delay (C.1)

struct esp_ble_mesh_light_hsl_saturation_set_t
   Parameters of Light HSL Saturation Set

   Public Members

   bool op_en
      Indicate if optional parameters are included

   uint16_t saturation
      Target value of light hsl hue state
**uint8_t tid**
Transaction ID

**uint8_t trans_time**
Time to complete state transition (optional)

**uint8_t delay**
Indicate message execution delay (C.1)

`struct esp_ble_mesh_light_hsl_default_set_t`
Parameters of Light HSL Default Set

**Public Members**

`uint16_t lightness`
Value of light lightness default state

`uint16_t hue`
Value of light hue default state

`uint16_t saturation`
Value of light saturation default state

`struct esp_ble_mesh_light_hsl_range_set_t`
Parameters of Light HSL Range Set

**Public Members**

`uint16_t hue_range_min`
Value of hue range min field of light hsl hue range state

`uint16_t hue_range_max`
Value of hue range max field of light hsl hue range state

`uint16_t saturation_range_min`
Value of saturation range min field of light hsl saturation range state

`uint16_t saturation_range_max`
Value of saturation range max field of light hsl saturation range state

`struct esp_ble_mesh_light_xyl_set_t`
Parameters of Light xyL Set

**Public Members**
bool op_en
   Indicate whether optional parameters included

tuint16_t xyl_lightness
   The target value of the Light xyL Lightness state

tuint16_t xyl_x
   The target value of the Light xyL x state

tuint16_t xyl_y
   The target value of the Light xyL y state

tuint8_t tid
   Transaction Identifier

tuint8_t trans_time
   Time to complete state transition (optional)

tuint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_light_xyl_default_set_t
   Parameters of Light xyL Default Set

   Public Members

   tuint16_t lightness
      The value of the Light Lightness Default state

   tuint16_t xyl_x
      The value of the Light xyL x Default state

   tuint16_t xyl_y
      The value of the Light xyL y Default state

struct esp_ble_mesh_light_xyl_range_set_t
   Parameters of Light xyL Range Set

   Public Members

   tuint16_t xyl_x_range_min
      The value of the xyL x Range Min field of the Light xyL x Range state

   tuint16_t xyl_x_range_max
      The value of the xyL x Range Max field of the Light xyL x Range state
uint16_t \textit{xyl\_y\_range\_min} \\
The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t \textit{xyl\_y\_range\_max} \\
The value of the xyL y Range Max field of the Light xyL y Range state

\textbf{struct esp\_ble\_mesh\_light\_lc\_mode\_set\_t} \\
Parameter of Light LC Mode Set

\textbf{Public Members}

uint8_t \textit{mode} \\
The target value of the Light LC Mode state

\textbf{struct esp\_ble\_mesh\_light\_lc\_om\_set\_t} \\
Parameter of Light LC OM Set

\textbf{Public Members}

uint8_t \textit{mode} \\
The target value of the Light LC Occupancy Mode state

\textbf{struct esp\_ble\_mesh\_light\_lc\_light\_onoff\_set\_t} \\
Parameters of Light LC Light OnOff Set

\textbf{Public Members}

bool \textit{op\_en} \\
Indicate whether optional parameters included

uint8_t \textit{light\_onoff} \\
The target value of the Light LC Light OnOff state

uint8_t \textit{tid} \\
Transaction Identifier

uint8_t \textit{trans\_time} \\
Time to complete state transition (optional)

uint8_t \textit{delay} \\
Indicate message execution delay (C.1)

\textbf{struct esp\_ble\_mesh\_light\_lc\_property\_get\_t} \\
Parameter of Light LC Property Get
Public Members

```c
uint16_t property_id
    Property ID identifying a Light LC Property
```

```c
struct esp_ble_mesh_light_lc_property_set_t
    Parameters of Light LC Property Set
```

Public Members

```c
uint16_t property_id
    Property ID identifying a Light LC Property
```

```c
struct net_buf_simple *property_value
    Raw value for the Light LC Property
```

```c
struct esp_ble_mesh_light_lightness_status_cb_t
    Bluetooth Mesh Light Lightness Client Model Get and Set callback parameters structure.
    Parameters of Light Lightness Status
```

Public Members

```c
bool op_en
    Indicate if optional parameters are included
```

```c
uint16_t present_lightness
    Current value of light lightness actual state
```

```c
uint16_t target_lightness
    Target value of light lightness actual state (optional)
```

```c
uint8_t remain_time
    Time to complete state transition (C.1)
```

```c
struct esp_ble_mesh_light_lightness_linear_status_cb_t
    Parameters of Light Lightness Linear Status
```

Public Members

```c
bool op_en
    Indicate if optional parameters are included
```

```c
uint16_t present_lightness
    Current value of light lightness linear state
```
```c
uint16_t target_lightness
    Target value of light lightness linear state (optional)

uint8_t remain_time
    Time to complete state transition (C.1)

struct esp_ble_mesh_light_lightness_last_status_cb_t
    Parameter of Light Lightness Last Status

Public Members

uint16_t lightness
    The value of the Light Lightness Last state

struct esp_ble_mesh_light_lightness_default_status_cb_t
    Parameter of Light Lightness Default Status

Public Members

uint16_t lightness
    The value of the Light Lightness default State

struct esp_ble_mesh_light_lightness_range_status_cb_t
    Parameters of Light Lightness Range Status

Public Members

uint8_t status_code
    Status Code for the request message

uint16_t range_min
    Value of range min field of light lightness range state

uint16_t range_max
    Value of range max field of light lightness range state

struct esp_ble_mesh_light_ctl_status_cb_t
    Parameters of Light CTL Status

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t present_ctl_lightness
    Current value of light ctl lightness state```
uint16_t present_ctl_temperature
  Current value of light ctl temperature state

uint16_t target_ctl_lightness
  Target value of light ctl lightness state (optional)

uint16_t target_ctl_temperature
  Target value of light ctl temperature state (C.1)

uint8_t remain_time
  Time to complete state transition (C.1)

struct esp_ble_mesh_light_ctl_temperature_status_cb_t
  Parameters of Light CTL Temperature Status

  Public Members

  bool op_en
  Indicate if optional parameters are included

  uint16_t present_ctl_temperature
  Current value of light ctl temperature state

  uint16_t present_ctl_delta_uv
  Current value of light ctl delta UV state

  uint16_t target_ctl_temperature
  Target value of light ctl temperature state (optional)

  uint16_t target_ctl_delta_uv
  Target value of light ctl delta UV state (C.1)

  uint8_t remain_time
  Time to complete state transition (C.1)

struct esp_ble_mesh_light_ctl_temperature_range_status_cb_t
  Parameters of Light CTL Temperature Range Status

  Public Members

  uint8_t status_code
  Status code for the request message

  uint16_t range_min
  Value of temperature range min field of light ctl temperature range state
uint16_t `range_max`
Value of temperature range max field of light ctl temperature range state

`struct esp_ble_mesh_light_ctl_default_status_cb_t`
Parameters of Light CTL Default Status

**Public Members**

- uint16_t `lightness`
Value of light lightness default state
- uint16_t `temperature`
Value of light temperature default state
- int16_t `delta_uv`
Value of light delta UV default state

`struct esp_ble_mesh_light_hsl_status_cb_t`
Parameters of Light HSL Status

**Public Members**

- bool `op_en`
Indicate if optional parameters are included
- uint16_t `hsl_lightness`
Current value of light hsl lightness state
- uint16_t `hsl_hue`
Current value of light hsl hue state
- uint16_t `hsl_saturation`
Current value of light hsl saturation state
- uint8_t `remain_time`
Time to complete state transition (optional)

`struct esp_ble_mesh_light_hsl_target_status_cb_t`
Parameters of Light HSL Target Status

**Public Members**

- bool `op_en`
Indicate if optional parameters are included
Chapter 2. API Reference

uint16_t hsl_lightness_target
Target value of light hsl lightness state

uint16_t hsl_hue_target
Target value of light hsl hue state

uint16_t hsl_saturation_target
Target value of light hsl saturation state

uint8_t remain_time
Time to complete state transition (optional)

struct esp_ble_mesh_light_hsl_hue_status_cb_t
Parameters of Light HSL Hue Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_hue
Current value of light hsl hue state

uint16_t target_hue
Target value of light hsl hue state (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_hsl_saturation_status_cb_t
Parameters of Light HSL Saturation Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_saturation
Current value of light hsl saturation state

uint16_t target_saturation
Target value of light hsl saturation state (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_hsl_default_status_cb_t
Parameters of Light HSL Default Status
Chapter 2. API Reference

Public Members

`uint16_t lightness`
Value of light lightness default state

`uint16_t hue`
Value of light hue default state

`uint16_t saturation`
Value of light saturation default state

`struct esp_ble_mesh_light_hsl_range_status_cb_t`
Parameters of Light HSL Range Status

Public Members

`uint8_t status_code`
Status code for the request message

`uint16_t hue_range_min`
Value of hue range min field of light hsl hue range state

`uint16_t hue_range_max`
Value of hue range max field of light hsl hue range state

`uint16_t saturation_range_min`
Value of saturation range min field of light hsl saturation range state

`uint16_t saturation_range_max`
Value of saturation range max field of light hsl saturation range state

`struct esp_ble_mesh_light_xyl_status_cb_t`
Parameters of Light xyL Status

Public Members

`bool op_en`
Indicate whether optional parameters included

`uint16_t xyl_lightness`
The present value of the Light xyL Lightness state

`uint16_t xyl_x`
The present value of the Light xyL x state

`uint16_t xyl_y`
The present value of the Light xyL y state
Chapter 2. API Reference

uint8_t **remain_time**
Time to complete state transition (optional)

struct esp_ble_mesh_light_xyl_target_status_cb_t
Parameters of Light xyL Target Status

**Public Members**

bool **op_en**
Indicate whether optional parameters included

uint16_t **target_xyl_lightness**
The target value of the Light xyL Lightness state

uint16_t **target_xyl_x**
The target value of the Light xyL x state

uint16_t **target_xyl_y**
The target value of the Light xyL y state

uint8_t **remain_time**
Time to complete state transition (optional)

struct esp_ble_mesh_light_xyl_default_status_cb_t
Parameters of Light xyL Default Status

**Public Members**

uint16_t **lightness**
The value of the Light Lightness Default state

uint16_t **xyl_x**
The value of the Light xyL x Default state

uint16_t **xyl_y**
The value of the Light xyL y Default state

struct esp_ble_mesh_light_xyl_range_status_cb_t
Parameters of Light xyL Range Status

**Public Members**

uint8_t **status_code**
Status Code for the requesting message
uint16_t *xyl_x_range_min
    The value of the xyl x Range Min field of the Light xyL x Range state

uint16_t *xyl_x_range_max
    The value of the xyl x Range Max field of the Light xyL x Range state

uint16_t *xyl_y_range_min
    The value of the xyl y Range Min field of the Light xyL y Range state

uint16_t *xyl_y_range_max
    The value of the xyl y Range Max field of the Light xyL y Range state

struct esp_ble_mesh_light_lc_mode_status_cb_t
    Parameter of Light LC Mode Status

    Public Members

    uint8_t mode
        The present value of the Light LC Mode state

struct esp_ble_mesh_light_lc_om_status_cb_t
    Parameter of Light LC OM Status

    Public Members

    uint8_t mode
        The present value of the Light LC Occupancy Mode state

struct esp_ble_mesh_light_lc_light_onoff_status_cb_t
    Parameters of Light LC Light OnOff Status

    Public Members

    bool op_en
        Indicate whether optional parameters included

    uint8_t present_light_onoff
        The present value of the Light LC Light OnOff state

    uint8_t target_light_onoff
        The target value of the Light LC Light OnOff state (Optional)

    uint8_t remain_time
        Time to complete state transition (C.1)

struct esp_ble_mesh_light_lc_property_status_cb_t
    Parameters of Light LC Property Status
Public Members

```c
uint16_t property_id
    Property ID identifying a Light LC Property
```

```c
struct net_buf_simple *property_value
    Raw value for the Light LC Property
```

```c
struct esp_ble_mesh_light_client_cb_param_t
    Lighting Client Model callback parameters
```

Public Members

```c
int error_code
    Appropriate error code
```

```c
esp_ble_mesh_client_common_param_t *params
    The client common parameters.
```

```c
esp_ble_mesh_light_client_status_cb_t status_cb
    The light status message callback values
```

```c
struct esp_ble_mesh_light_lightness_state_t
    Parameters of Light Lightness state
```

Public Members

```c
uint16_t lightness_linear
    The present value of Light Lightness Linear state
```

```c
uint16_t target_lightness_linear
    The target value of Light Lightness Linear state
```

```c
uint16_t lightness_actual
    The present value of Light Lightness Actual state
```

```c
uint16_t target_lightness_actual
    The target value of Light Lightness Actual state
```

```c
uint16_t lightness_last
    The value of Light Lightness Last state
```

```c
uint16_t lightness_default
    The value of Light Lightness Default state
```

```c
uint8_t status_code
    The status code of setting Light Lightness Range state
```
uint16_t lightness_range_min
The minimum value of Light Lightness Range state

uint16_t lightness_range_max
The maximum value of Light Lightness Range state

struct esp_ble_mesh_light_lightness_srv_t
User data of Light Lightness Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting Lightness Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_lightness_state_t *state
Parameters of the Light Lightness state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t actual_transition
Parameters of state transition

esp_ble_mesh_state_transition_t linear_transition
Parameters of state transition

int32_t tt_delta_lightness_actual
Delta change value of lightness actual state transition

int32_t tt_delta_lightness_linear
Delta change value of lightness linear state transition

struct esp_ble_mesh_light_lightness_setup_srv_t
User data of Light Lightness Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting Lightness Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages
## Chapter 2. API Reference

### `esp_ble_mesh_light_lightness_state_t` *state*

Parameters of the Light Lightness state

### struct `esp_ble_mesh_light_ctl_state_t`

Parameters of Light CTL state

#### Public Members

- `uint16_t lightness`
  
The present value of Light CTL Lightness state

- `uint16_t target_lightness`
  
The target value of Light CTL Lightness state

- `uint16_t temperature`
  
The present value of Light CTL Temperature state

- `uint16_t target_temperature`
  
The target value of Light CTL Temperature state

- `int16_t delta_uv`
  
The present value of Light CTL Delta UV state

- `int16_t target_delta_uv`
  
The target value of Light CTL Delta UV state

- `uint8_t status_code`
  
The status code of setting Light CTL Temperature Range state

- `uint16_t temperature_range_min`
  
The minimum value of Light CTL Temperature Range state

- `uint16_t temperature_range_max`
  
The maximum value of Light CTL Temperature Range state

- `uint16_t lightness_default`
  
The value of Light Lightness Default state

- `uint16_t temperature_default`
  
The value of Light CTL Temperature Default state

- `int16_t delta_uv_default`
  
The value of Light CTL Delta UV Default state

### struct `esp_ble_mesh_light_ctl_srv_t`

User data of Light CTL Server Model
Chapter 2. API Reference

Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the Lighting CTL Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`  
Response control of the server model received messages.

` esp_ble_mesh_light_ctl_state_t *state`  
Parameters of the Light CTL state.

`esp_ble_mesh_last_msg_info_t last`  
Parameters of the last received set message.

`esp_ble_mesh_state_transition_t *transition`  
Parameters of state transition.

`int32_t tt_delta_lightness`  
Delta change value of lightness state transition.

`int32_t tt_delta_temperature`  
Delta change value of temperature state transition.

`int32_t tt_delta_delta_uv`  
Delta change value of delta uv state transition.

`struct esp_ble_mesh_light_ctl_setup_srv_t`  
User data of Light CTL Setup Server Model.

Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the Lighting CTL Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`  
Response control of the server model received messages.

`esp_ble_mesh_light_ctl_state_t *state`  
Parameters of the Light CTL state.

`struct esp_ble_mesh_light_ctl_temp_srv_t`  
User data of Light CTL Temperature Server Model.

Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the Lighting CTL Temperature Server Model. Initialized internally.
Chapter 2. API Reference

```
exp_ble_mesh_server_rsp_ctrl_t * rsp_ctrl
    Response control of the server model received messages

exp_ble_mesh_light_ctl_state_t * state
    Parameters of the Light CTL state

exp_ble_mesh_last_msg_info_t last
    Parameters of the last received set message

exp_ble_mesh_state_transition_t * transition
    Parameters of state transition

int32_t tt_delta_temperature
    Delta change value of temperature state transition

int32_t tt_delta_delta_uv
    Delta change value of delta uv state transition

struct esp_ble_mesh_light_hsl_state_t
    Parameters of Light HSL state

Public Members

uint16_t lightness
    The present value of Light HSL Lightness state

uint16_t target_lightness
    The target value of Light HSL Lightness state

uint16_t hue
    The present value of Light HSL Hue state

uint16_t target_hue
    The target value of Light HSL Hue state

uint16_t saturation
    The present value of Light HSL Saturation state

uint16_t target_saturation
    The target value of Light HSL Saturation state

uint16_t lightness_default
    The value of Light Lightness Default state

uint16_t hue_default
    The value of Light HSL Hue Default state
```
uint16_t saturation_default
    The value of Light HSL Saturation Default state

uint8_t status_code
    The status code of setting Light HSL Hue & Saturation Range state

uint16_t hue_range_min
    The minimum value of Light HSL Hue Range state

uint16_t hue_range_max
    The maximum value of Light HSL Hue Range state

uint16_t saturation_range_min
    The minimum value of Light HSL Saturation state

uint16_t saturation_range_max
    The maximum value of Light HSL Saturation state

struct esp_ble_mesh_light_hsl_srv_t
    User data of Light HSL Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Lighting HSL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t *state
    Parameters of the Light HSL state

esp_ble_mesh_last_msg_info_t last
    Parameters of the last received set message

esp_ble_mesh_state_transition_t *transition
    Parameters of state transition

int32_t tt_delta_lightness
    Delta change value of lightness state transition

int32_t tt_delta_hue
    Delta change value of hue state transition

int32_t tt_delta_saturation
    Delta change value of saturation state transition

struct esp_ble_mesh_light_hsl_setup_srv_t
    User data of Light HSL Setup Server Model
Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting HSL Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`
Parameters of the Light HSL state

User data of Light HSL Hue Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting HSL Hue Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`
Parameters of the Light HSL state

User data of Light HSL Saturation Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting HSL Saturation Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`
Parameters of the Light HSL state
**`esp_ble_mesh_last_msg_info_t` last**
Parameters of the last received set message

**`esp_ble_mesh_state_transition_t` transition**
Parameters of state transition

**`int32_t tt_delta_saturation`**
Delta change value of saturation state transition

**`struct esp_ble_mesh_light_xyl_state_t`**
Parameters of Light xyL state

### Public Members

**`uint16_t lightness`**
The present value of Light xyL Lightness state

**`uint16_t target_lightness`**
The target value of Light xyL Lightness state

**`uint16_t x`**
The present value of Light xyL x state

**`uint16_t target_x`**
The target value of Light xyL x state

**`uint16_t y`**
The present value of Light xyL y state

**`uint16_t target_y`**
The target value of Light xyL y state

**`uint16_t lightness_default`**
The value of Light Lightness Default state

**`uint16_t x_default`**
The value of Light xyL x Default state

**`uint16_t y_default`**
The value of Light xyL y Default state

**`uint8_t status_code`**
The status code of setting Light xyL x & y Range state

**`uint16_t x_range_min`**
The minimum value of Light xyL x Range state
Chapter 2. API Reference

uint16_t x_range_max
The maximum value of Light xyL x Range state

uint16_t y_range_min
The minimum value of Light xyL y Range state

uint16_t y_range_max
The maximum value of Light xyL y Range state

struct esp_ble_mesh_light_xyl_srv_t
User data of Light xyL Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting xyL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_xyl_state_t *state
Parameters of the Light xyL state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t *transition
Parameters of state transition

int32_t tt_delta_lightness
Delta change value of lightness state transition

int32_t tt_delta_x
Delta change value of x state transition

int32_t tt_delta_y
Delta change value of y state transition

struct esp_ble_mesh_light_xyl_setup_srv_t
User data of Light xyL Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting xyL Setup Server Model. Initialized internally.
**esp_ble_mesh_server_rsp_ctrl_t**

Response control of the server model received messages

**esp_ble_mesh_light_xyl_state_t** *

Parameters of the Light xyl state

**Public Members**

`uint32_t mode`

0b0 The controller is turned off.
- The binding with the Light Lightness state is disabled. 0b1 The controller is turned on.
- The binding with the Light Lightness state is enabled. The value of Light LC Mode state

`uint32_t occupancy_mode`

The value of Light LC Occupancy Mode state

`uint32_t light_onoff`

The present value of Light LC Light OnOff state

`uint32_t target_light_onoff`

The target value of Light LC Light OnOff state

`uint32_t occupancy`

The value of Light LC Occupancy state

`uint32_t ambient_luxlevel`

The value of Light LC Ambient LuxLevel state

`uint16_t linear_output`

i. Light LC Linear Output = max((Lightness Out)^2/65535, Regulator Output)
ii. If the Light LC Mode state is set to 0b1, the binding is enabled and upon a change of the Light LC Linear Output state, the following operation shall be performed: Light Lightness Linear = Light LC Linear Output
iii. If the Light LC Mode state is set to 0b0, the binding is disabled (i.e., upon a change of the Light LC Linear Output state, no operation on the Light Lightness Linear state is performed). The value of Light LC Linear Output state

**struct esp_ble_mesh_light_lc_state_t**

Parameters of Light LC states

**Public Members**

**esp_ble_mesh_light_lc_property_state_t**

Parameters of Light Property states. The Light LC Property states are read / write states that determine the configuration of a Light Lightness Controller. Each state is represented by a device property and is controlled by Light LC Property messages.

**Public Members**
uint32_t time_occupancy_delay
A timing state that determines the delay for changing the Light LC Occupancy state upon receiving a Sensor Status message from an occupancy sensor. The value of Light LC Time Occupancy Delay state

uint32_t timeFadeOn
A timing state that determines the time the controlled lights fade to the level determined by the Light LC Lightness On state. The value of Light LC Time Fade On state

uint32_t timeRunOn
A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness On state. The value of Light LC Time Run On state

uint32_t timeFade
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness On state to the level determined by the Light Lightness Prolong state. The value of Light LC Time Fade state

uint32_t timeProlong
A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness Prolong state. The value of Light LC Time Prolong state

uint32_t timeFadeStandbyAuto
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is automatic. The value of Light LC Time Fade Standby Auto state

uint32_t timeFadeStandbyManual
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is triggered by a change in the Light LC Light OnOff state. The value of Light LC Time Fade Standby Manual state

uint16_t lightnessOn
A lightness state that determines the perceptive light lightness at the Occupancy and Run internal controller states. The value of Light LC Lightness On state

uint16_t lightnessProlong
A lightness state that determines the light lightness at the Prolong internal controller state. The value of Light LC Lightness Prolong state

uint16_t lightnessStandby
A lightness state that determines the light lightness at the Standby internal controller state. The value of Light LC Lightness Standby state

uint16_t ambientLuxlevelOn
A uint16 state representing the Ambient LuxLevel level that determines if the controller transitions from the Light Control Standby state. The value of Light LC Ambient LuxLevel On state

uint16_t ambientLuxlevelProlong
A uint16 state representing the required Ambient LuxLevel level in the Prolong state. The value of Light LC Ambient LuxLevel Prolong state
Chapter 2. API Reference

```c
uint16_t ambient_luxlevel_standby
A uint16 state representing the required Ambient LuxLevel level in the Standby state. The value of Light LC Ambient LuxLevel Standby state

float regulator_kiu
A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than LuxLevel Out. Valid range: 0.0 ~ 1000.0. The default value is 250.0. The value of Light LC Regulator Kiu state

float regulator_kid
A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 25.0. The value of Light LC Regulator Kid state

float regulator_kpu
A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpu state

float regulator_kpd
A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpd state

int8_t regulator_accuracy
A int8 state representing the percentage accuracy of the Light LC PI Feedback Regulator. Valid range: 0.0 ~ 100.0. The default value is 2.0. The value of Light LC Regulator Accuracy state

uint32_t set_occupancy_to_1_delay
If the message Raw field contains a Raw Value for the Time Since Motion Sensed device property, which represents a value less than or equal to the value of the Light LC Occupancy Delay state, it shall delay setting the Light LC Occupancy state to 0b1 by the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value. The value of the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value

struct esp_ble_mesh_light_lc_state_machine_t
Parameters of Light LC state machine

Public Members

uint8_t fade_on
The value of transition time of Light LC Time Fade On

uint8_t fade
The value of transition time of Light LC Time Fade
```
uint8_t `fade_standby_auto`
   The value of transition time of Light LC Time Fade Standby Auto

uint8_t `fade_standby_manual`
   The value of transition time of Light LC Time Fade Standby Manual

struct `esp_ble_mesh_light_lc_state_machine_t`::[anonymous] `trans_time`
   The Fade On, Fade, Fade Standby Auto, and Fade Standby Manual states are transition states that define the transition of the Lightness Out and Lux Level Out states. This transition can be started as a result of the Light LC State Machine change or as a result of receiving the Light LC Light OnOff Set or Light LC Light Set Unacknowledged message. The value of transition time

`esp_ble_mesh_lc_state_t` `state`
   The value of Light LC state machine state

struct `k_delayed_work` `timer`
   Timer of Light LC state machine

struct `esp_ble_mesh_light_control_t`
   Parameters of Light Lightness controller

**Public Members**

`esp_ble_mesh_light_lc_state_t` `state`
   Parameters of Light LC state

`esp_ble_mesh_light_lc_property_state_t` `prop_state`
   Parameters of Light LC Property state

`esp_ble_mesh_light_lc_state_machine_t` `state_machine`
   Parameters of Light LC state machine

struct `esp_ble_mesh_light_lc_srv_t`
   User data of Light LC Server Model

**Public Members**

`esp_ble_mesh_model_t` *`model`
   Pointer to the Lighting LC Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t` `rsp_ctrl`
   Response control of the server model received messages

`esp_ble_mesh_light_control_t` *`lc`
   Parameters of the Light controller

`esp_ble_mesh_last_msg_info_t` `last`
   Parameters of the last received set message
Chapter 2. API Reference

```c
esp_ble_mesh_state_transition_t transition
Parameters of state transition
```

```c
struct esp_ble_mesh_light_lc_setup_srv_t
User data of Light LC Setup Server Model
```

### Public Members

```c
esp_ble_mesh_model_t *model
Pointer to the Lighting LC Setup Server Model. Initialized internally.
```

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages
```

```c
esp_ble_mesh_light_control_t *lc
Parameters of the Light controller
```

```c
struct esp_ble_mesh_state_change_light_lightness_set_t
Parameter of Light Lightness Actual state change event
```

### Public Members

```c
uint16_t lightness
The value of Light Lightness Actual state
```

```c
struct esp_ble_mesh_state_change_light_lightness_linear_set_t
Parameter of Light Lightness Linear state change event
```

### Public Members

```c
uint16_t lightness
The value of Light Lightness Linear state
```

```c
struct esp_ble_mesh_state_change_light_lightness_default_set_t
Parameter of Light Lightness Default state change event
```

### Public Members

```c
uint16_t lightness
The value of Light Lightness Default state
```

```c
struct esp_ble_mesh_state_change_light_lightness_range_set_t
Parameters of Light Lightness Range state change event
```
Public Members

`uint16_t range_min`

The minimum value of Light Lightness Range state

`uint16_t range_max`

The maximum value of Light Lightness Range state

struct `esp_ble_mesh_state_change_light_ctl_set_t`

Parameters of Light CTL state change event

Public Members

`uint16_t lightness`

The value of Light CTL Lightness state

`uint16_t temperature`

The value of Light CTL Temperature state

`int16_t delta_uv`

The value of Light CTL Delta UV state

struct `esp_ble_mesh_state_change_light_ctl_temperature_set_t`

Parameters of Light CTL Temperature state change event

Public Members

`uint16_t temperature`

The value of Light CTL Temperature state

`int16_t delta_uv`

The value of Light CTL Delta UV state

struct `esp_ble_mesh_state_change_light_ctl_temperature_range_set_t`

Parameters of Light CTL Temperature Range state change event

Public Members

`uint16_t range_min`

The minimum value of Light CTL Temperature Range state

`uint16_t range_max`

The maximum value of Light CTL Temperature Range state

struct `esp_ble_mesh_state_change_light_ctl_default_set_t`

Parameters of Light CTL Default state change event
**Public Members**

`uint16_t lightness`

The value of Light Lightness Default state

`uint16_t temperature`

The value of Light CTL Temperature Default state

`int16_t delta_uv`

The value of Light CTL Delta UV Default state

```
struct esp_ble_mesh_state_change_light_hsl_set_t
Parameters of Light HSL state change event
```

**Public Members**

`uint16_t lightness`

The value of Light HSL Lightness state

`uint16_t hue`

The value of Light HSL Hue state

`uint16_t saturation`

The value of Light HSL Saturation state

```
struct esp_ble_mesh_state_change_light_hsl_hue_set_t
Parameter of Light HSL Hue state change event
```

**Public Members**

`uint16_t hue`

The value of Light HSL Hue state

```
struct esp_ble_mesh_state_change_light_hsl_saturation_set_t
Parameter of Light HSL Saturation state change event
```

**Public Members**

`uint16_t saturation`

The value of Light HSL Saturation state

```
struct esp_ble_mesh_state_change_light_hsl_default_set_t
Parameters of Light HSL Default state change event
```
Public Members

```c
uint16_t lightness
```

The value of Light HSL Lightness Default state

```c
uint16_t hue
```

The value of Light HSL Hue Default state

```c
uint16_t saturation
```

The value of Light HSL Saturation Default state

```c
struct esp_ble_mesh_state_change_light_hsl_range_set_t
```

Parameters of Light HSL Range state change event

Public Members

```c
uint16_t hue_range_min
```

The minimum hue value of Light HSL Range state

```c
uint16_t hue_range_max
```

The maximum hue value of Light HSL Range state

```c
uint16_t saturation_range_min
```

The minimum saturation value of Light HSL Range state

```c
uint16_t saturation_range_max
```

The maximum saturation value of Light HSL Range state

```c
struct esp_ble_mesh_state_change_light_xyl_set_t
```

Parameters of Light xyL state change event

Public Members

```c
uint16_t lightness
```

The value of Light xyL Lightness state

```c
uint16_t x
```

The value of Light xyL x state

```c
uint16_t y
```

The value of Light xyL y state

```c
struct esp_ble_mesh_state_change_light_xyl_default_set_t
```

Parameters of Light xyL Default state change event
Public Members

uint16_t lightness
The value of Light Lightness Default state

uint16_t x
The value of Light xyL x Default state

uint16_t y
The value of Light xyL y Default state

struct esp_ble_mesh_state_change_light_xyl_range_set_t
Parameters of Light xyL Range state change event

Public Members

uint16_t x_range_min
The minimum value of Light xyL x Range state

uint16_t x_range_max
The maximum value of Light xyL x Range state

uint16_t y_range_min
The minimum value of Light xyL y Range state

uint16_t y_range_max
The maximum value of Light xyL y Range state

struct esp_ble_mesh_state_change_light_lc_mode_set_t
Parameter of Light LC Mode state change event

Public Members

uint8_t mode
The value of Light LC Mode state

struct esp_ble_mesh_state_change_light_lc_om_set_t
Parameter of Light LC Occupancy Mode state change event

Public Members

uint8_t mode
The value of Light LC Occupancy Mode state

struct esp_ble_mesh_state_change_light_lc_light_onoff_set_t
Parameter of Light LC Light OnOff state change event
Public Members

uint8_t onoff
The value of Light LC Light OnOff state

struct esp_ble_mesh_state_change_light_lc_property_set_t
Parameters of Light LC Property state change event

Public Members

uint16_t property_id
The property id of Light LC Property state

struct net_buf_simple *property_value
The property value of Light LC Property state

struct esp_ble_mesh_state_change_sensor_status_t
Parameters of Sensor Status state change event

Public Members

uint16_t property_id
The value of Sensor Property ID

uint8_t occupancy
The value of Light LC Occupancy state

uint32_t set_occupancy_to_1_delay
The value of Light LC Set Occupancy to 1 Delay state

uint32_t ambient_luxlevel
The value of Light LC Ambient Luxlevel state

union esp_ble_mesh_state_change_sensor_status_t::{anonymous} state
Parameters of Sensor Status related state

struct esp_ble_mesh_server_recv_light_lc_property_get_t
Context of the received Light LC Property Get message

Public Members

uint16_t property_id
Property ID identifying a Light LC Property

struct esp_ble_mesh_server_recv_light_lightness_set_t
Context of the received Light Lightness Set message
Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t lightness
   Target value of light lightness actual state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lightness_linear_set_t
   Context of the received Light Lightness Linear Set message

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t lightness
   Target value of light lightness linear state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lightness_default_set_t
   Context of the received Light Lightness Default Set message

Public Members

uint16_t lightness
   The value of the Light Lightness Default state

struct esp_ble_mesh_server_recv_light_lightness_range_set_t
   Context of the received Light Lightness Range Set message
## Public Members

```c
uint16_t range_min
    Value of range min field of light lightness range state
```

```c
uint16_t range_max
    Value of range max field of light lightness range state
```

```c
struct esp_ble_mesh_server_recv_light_ctl_set_t
    Context of the received Light CTL Set message
```

### Public Members

```c
bool op_en
    Indicate if optional parameters are included
```

```c
uint16_t lightness
    Target value of light ctl lightness state
```

```c
uint16_t temperature
    Target value of light ctl temperature state
```

```c
int16_t delta_uv
    Target value of light ctl delta UV state
```

```c
uint8_t tid
    Transaction ID
```

```c
uint8_t trans_time
    Time to complete state transition (optional)
```

```c
uint8_t delay
    Indicate message execution delay (C.1)
```

```c
struct esp_ble_mesh_server_recv_light_ctl_temperature_set_t
    Context of the received Light CTL Temperature Set message
```

### Public Members

```c
bool op_en
    Indicate if optional parameters are included
```

```c
uint16_t temperature
    Target value of light ctl temperature state
```

```c
int16_t delta_uv
    Target value of light ctl delta UV state
```
uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_ctl_temperature_range_set_t
Context of the received Light CTL Temperature Range Set message

**Public Members**

uint16_t range_min
Value of temperature range min field of light ctl temperature range state

uint16_t range_max
Value of temperature range max field of light ctl temperature range state

struct esp_ble_mesh_server_recv_light_ctl_default_set_t
Context of the received Light CTL Default Set message

**Public Members**

uint16_t lightness
Value of light lightness default state

uint16_t temperature
Value of light temperature default state

int16_t delta_uv
Value of light delta UV default state

struct esp_ble_mesh_server_recv_light_hsl_set_t
Context of the received Light HSL Set message

**Public Members**

bool op_en
Indicate if optional parameters are included

uint16_t lightness
Target value of light hsl lightness state
uint16_t hue
   Target value of light hsl hue state

uint16_t saturation
   Target value of light hsl saturation state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_hue_set_t
   Context of the received Light HSL Hue Set message

**Public Members**

bool op_en
   Indicate if optional parameters are included

uint16_t hue
   Target value of light hsl hue state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_saturation_set_t
   Context of the received Light HSL Saturation Set message

**Public Members**

bool op_en
   Indicate if optional parameters are included

uint16_t saturation
   Target value of light hsl hue state

uint16_t saturation_range_max
Value of saturation range max field of light hsl saturation range state
```

```
struct esp_ble_mesh_server_recv_light_xyl_set_t
Context of the received Light xyl Set message
```

**Public Members**
bool op_en
    Indicate whether optional parameters included

uint16_t lightness
    The target value of the Light xyL Lightness state

uint16_t x
    The target value of the Light xyL x state

uint16_t y
    The target value of the Light xyL y state

uint8_t tid
    Transaction Identifier

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_xyl_default_set_t
    Context of the received Light xyL Default Set message

Public Members

uint16_t lightness
    The value of the Light Lightness Default state

uint16_t x
    The value of the Light xyL x Default state

uint16_t y
    The value of the Light xyL y Default state

struct esp_ble_mesh_server_recv_light_xyl_range_set_t
    Context of the received Light xyL Range Set message

Public Members

uint16_t x_range_min
    The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t x_range_max
    The value of the xyL x Range Max field of the Light xyL x Range state
Chapter 2. API Reference

uint16_t y_range_min
The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t y_range_max
The value of the xyL y Range Max field of the Light xyL y Range state

struct esp_ble_mesh_server_recv_light_lc_mode_set_t
Context of the received Light LC Mode Set message

**Public Members**

uint8_t mode
The target value of the Light LC Mode state

struct esp_ble_mesh_server_recv_light_lc_om_set_t
Context of the received Light OM Set message

**Public Members**

uint8_t mode
The target value of the Light LC Occupancy Mode state

struct esp_ble_mesh_server_recv_light_lc_light_onoff_set_t
Context of the received Light LC Light OnOff Set message

**Public Members**

bool op_en
Indicate whether optional parameters included

uint8_t light_onoff
The target value of the Light LC Light OnOff state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lc_property_set_t
Context of the received Light LC Property Set message
Public Members

uint16_t property_id
    Property ID identifying a Light LC Property

struct net_buf_simple *property_value
    Raw value for the Light LC Property

struct esp_ble_mesh_server_recv_sensor_status_t
    Context of the received Sensor Status message

Public Members

struct net_buf_simple *data
    Value of sensor data state (optional)

struct esp_ble_mesh_lighting_server_cb_param_t
    Lighting Server Model callback parameters

Public Members

esp_ble_mesh_model_t *model
    Pointer to Lighting Server Models

esp_ble_mesh_msg_ctx_t ctx
    Context of the received messages

esp_ble_mesh_lighting_server_cb_value_t value
    Value of the received Lighting Messages

Macros

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_CLI (cli_pub, cli_data)
    Define a new Light Lightness Client Model.

    Note: This API needs to be called for each element on which the application needs to have a Light Lightness Client Model.

    Parameters
        • cli_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
        • cli_data – Pointer to the unique struct esp_ble_mesh_client_t.
    Returns
        New Light Lightness Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_CLI (cli_pub, cli_data)
    Define a new Light CTL Client Model.

    Note: This API needs to be called for each element on which the application needs to have a Light CTL Client Model.
Chapter 2. API Reference

Parameters
- cli_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data – Pointer to the unique struct esp_ble_mesh_client_t.

Returns New Light CTL Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_HSL_CLI (cli_pub, cli_data)
Define a new Light HSL Client Model.

Note: This API needs to be called for each element on which the application needs to have a Light HSL Client Model.

Parameters
- cli_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data – Pointer to the unique struct esp_ble_mesh_client_t.

Returns New Light HSL Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_XYL_CLI (cli_pub, cli_data)
Define a new Light xyl Client Model.

Note: This API needs to be called for each element on which the application needs to have a Light xyl Client Model.

Parameters
- cli_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data – Pointer to the unique struct esp_ble_mesh_client_t.

Returns New Light xyl Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LC_CLI (cli_pub, cli_data)
Define a new Light LC Client Model.

Note: This API needs to be called for each element on which the application needs to have a Light LC Client Model.

Parameters
- cli_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data – Pointer to the unique struct esp_ble_mesh_client_t.

Returns New Light LC Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SRV (srv_pub, srv_data)
Lighting Server Models related context.
Define a new Light Lightness Server Model.

Note: 1. The Light Lightness Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Light Lightness Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.

Parameters
- srv_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data – Pointer to the unique struct esp_ble_mesh_light_lightness_srv_t.
Chapter 2. API Reference

Returns New Light Lightness Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SETUP_SRV (srv_pub, srv_data)
Define a new Light Lightness Setup Server Model.

Note: 1. The Light Lightness Setup Server model extends the Light Lightness Server model and the Generic Power OnOff Setup Server model.
   a. This model shall support model subscription.

Parameters
* srv_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
* srv_data – Pointer to the unique struct esp_ble_mesh_light_lightness_setup_srv_t.

Returns New Light Lightness Setup Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_SRV (srv_pub, srv_data)
Define a new Light CTL Server Model.

Note: 1. The Light CTL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light CTL Temperature Server model and the corresponding Light CTL Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.
   b. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding Light CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.

Parameters
* srv_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
* srv_data – Pointer to the unique struct esp_ble_mesh_light_ctl_srv_t.

Returns New Light CTL Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_SETUP_SRV (srv_pub, srv_data)
Define a new Light CTL Setup Server Model.

Note: 1. The Light CTL Setup Server model extends the Light CTL Server and the Light Lightness Setup Server.
   a. This model shall support model subscription.

Parameters
* srv_pub – Pointer to the unique struct esp_ble_mesh_model_pub_t.
* srv_data – Pointer to the unique struct esp_ble_mesh_light_ctl_setup_srv_t.

Returns New Light CTL Setup Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_TEMP_SRV (srv_pub, srv_data)
Define a new Light CTL Temperature Server Model.

Note: 1. The Light CTL Temperature Server model extends the Generic Level Server model.
   a. This model shall support model publication and model subscription.
Parameters

- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_light_ctl_temp_srv_t`.

Returns
New Light CTL Temperature Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SRV (srv_pub, srv_data)
Define a new Light HSL Server Model.

Note: 1. The Light HSL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light HSL Hue Server model and the corresponding Light HSL Saturation Server model and the corresponding Light HSL Setup Server model shall also be present.

   a. This model shall support model publication and model subscription.

   b. The model requires three elements: the main element and the Hue element and the Saturation element. The Hue element contains the corresponding Light HSL Hue Server model and an instance of a Generic Level state bound to the Light HSL Hue state on the Hue element. The Saturation element contains the corresponding Light HSL Saturation Server model and an instance of a Generic Level state bound to the Light HSL Saturation state on the Saturation element. The Light HSL Hue state on the Hue element is bound to the Light HSL state on the main element and the Light HSL Saturation state on the Saturation element is bound to the Light HSL state on the main element.

Parameters

- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_light_hsl_srv_t`.

Returns
New Light HSL Setup Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SETUP_SRV (srv_pub, srv_data)
Define a new Light HSL Setup Server Model.

Note: 1. The Light HSL Setup Server model extends the Light HSL and the Light Lightness Setup Server.

   a. This model shall support model subscription.

Parameters

- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_light_hsl_setup_srv_t`.

Returns
New Light HSL Hue Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_HSL_HUE_SRV (srv_pub, srv_data)
Define a new Light HSL Hue Server Model.

Note: 1. The Light HSL Hue Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

   a. This model shall support model publication and model subscription.

Parameters

- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_light_hsl_hue_srv_t`.

Returns
New Light HSL Hue Server Model instance.
Chapter 2. API Reference

**ESP_BLE_MESH_MODEL_LIGHT_HSL_SAT_SRV** (srv_pub, srv_data)
Define a new Light HSL Saturation Server Model.

**Note:** 1. The Light HSL Saturation Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

a. This model shall support model publication and model subscription.

**Parameters**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_light_hsl_sat_srv_t`.

**Returns** New Light HSL Saturation Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_XYL_SRV** (srv_pub, srv_data)
Define a new Light xYL Server Model.

**Note:** 1. The Light xYL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light xYL Setup Server model shall also be present.

a. This model shall support model publication and model subscription.

**Parameters**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_light_xyl_srv_t`.

**Returns** New Light xYL Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_XYL_SETUP_SRV** (srv_pub, srv_data)
Define a new Light xYL Setup Server Model.

**Note:** 1. The Light xYL Setup Server model extends the Light xYL Server and the Light Lightness Setup Server.

a. This model shall support model subscription.

**Parameters**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_light_xyl_setup_srv_t`.

**Returns** New Light xYL Setup Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_LC_SRV** (srv_pub, srv_data)
Define a new Light LC Server Model.

**Note:** 1. The Light LC (Lightness Control) Server model extends the Light Lightness Server model and the Generic OnOff Server model. When this model is present on an Element, the corresponding Light LC Setup Server model shall also be present.

a. This model shall support model publication and model subscription.
b. This model may be used to represent an element that is a client to a Sensor Server model and controls the Light Lightness Actual state via defined state bindings.

**Parameters**
- **srv_pub** – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** – Pointer to the unique struct `esp_ble_mesh_light_lc_srv_t`.
Returns New Light LC Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_LC_SETUP_SRV**

(srv_pub, srv_data)

Define a new Light LC Setup Server Model.

**Note:**
1. The Light LC (Lightness Control) Setup model extends the Light LC Server model.
   a. This model shall support model publication and model subscription.
   b. This model may be used to configure setup parameters for the Light LC Server model.

**Parameters**
- `srv_pub` – Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` – Pointer to the unique struct `esp_ble_mesh_light_lc_setup_srv_t`.

**Returns** New Light LC Setup Server Model instance.

**Type Definitions**

```c
typedef void (*esp_ble_mesh_light_client_cb_t)(
    esp_ble_mesh_light_client_cb_event_t event,
    esp_ble_mesh_light_client_cb_param_t *param)

    Bluetooth Mesh Light Client Model function.

    Lighting Client Model callback function type

    **Param event** Event type

    **Param param** Pointer to callback parameter

typedef void (*esp_ble_mesh_lighting_server_cb_t)(
    esp_ble_mesh_lighting_server_cb_event_t event,
    esp_ble_mesh_lighting_server_cb_param_t *param)

    Bluetooth Mesh Lighting Server Model function.

    Lighting Server Model callback function type

    **Param event** Event type

    **Param param** Pointer to callback parameter
```

**Enumerations**

```c
enum esp_ble_mesh_light_client_cb_event_t

    This enum value is the event of Lighting Client Model

    **Values:**

    enumerator ESP_BLE_MESH_LIGHT_CLIENT_GET_STATE_EVT

    enumerator ESP_BLE_MESH_LIGHT_CLIENT_SET_STATE_EVT

    enumerator ESP_BLE_MESH_LIGHT_CLIENT_PUBLISH_EVT

    enumerator ESP_BLE_MESH_LIGHT_CLIENT_TIMEOUT_EVT

    enumerator ESP_BLE_MESH_LIGHT_CLIENT_EVT_MAX

enum esp_ble_mesh_lc_state_t

    This enum value is the Light LC State Machine states

    **Values:**
```

    enumerator \texttt{ESP\_BLE\_MESH\_LIGHTING\_SERVER\_RECV\_STATUS\_MSG\_EVT} 
        When status_auto_rsp is set to ESP\_BLE\_MESH\_SERVER\_RSP\_BY\_APP, this event will be callback to the application layer when Sensor Status message is received.

    enumerator \texttt{ESP\_BLE\_MESH\_LIGHTING\_SERVER\_EVT\_MAX} 
\end{verbatim}

### 2.3.5 NimBLE-based host APIs

#### Overview

Apache MyNewt NimBLE is a highly configurable and BT SIG qualifiable BLE stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and FreeRTOS. The underlying controller is still the same (as in case of Bluedroid) providing VHCI interface. Refer to NimBLE user guide for a complete list of features and additional information on NimBLE stack. Most features
of NimBLE including BLE Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.

**Architecture**

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.

![Fig. 1: ESP NimBLE Stack](image)

**Threading Model**

The NimBLE host can run inside the application thread or can have its own independent thread. This flexibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function `nimble_port_freertos_init`. This behavior can be changed by overriding the same function. For BLE Mesh, additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.

**Programming Sequence**

To begin with, make sure that the NimBLE stack is enabled from menuconfig choose NimBLE for the Bluetooth host.

Typical programming sequence with NimBLE stack consists of the following steps:

- Initialize NVS flash using `nvs_flash_init()` API. This is because ESP controller uses NVS during initialization.
- Initialize the host and controller stack using `nimble_port_init`.
- Initialize the required NimBLE host configuration parameters and callbacks
- Perform application specific tasks/initiation
- Run the thread for host stack using `nimble_port_freertos_init`

This documentation does not cover NimBLE APIs. Refer to [NimBLE tutorial](#) for more details on the programming sequence/NimBLE APIs for different scenarios.

**API Reference**

**Header File**

- components/bt/host/nimble/esp-hci/include/esp_nimble_hci.h

**Functions**
Chapter 2. API Reference

**esp_err_t esp_nimble_hci_init (void)**
Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.
This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

**Returns**
- ESP_OK if the initialization is successful
- Appropriate error code from esp_err_t in case of an error

**esp_err_t esp_nimble_hci_deinit (void)**
Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

**Note:** This function should be called after the NimBLE host is deinitialized.

**Returns**
- ESP_OK if the deinitialization is successful
- Appropriate error codes from esp_err_t in case of an error

**Macros**

BLE_HCI_UART_H4_NONE
BLE_HCI_UART_H4_CMD
BLE_HCI_UART_H4_ACL
BLE_HCI_UART_H4_SCO

**BLE_HCI_UART_H4_EVT**
ESP-IDF currently supports two host stacks. The Bluedroid based stack (default) supports classic Bluetooth as well as BLE. On the other hand, Apache NimBLE based stack is BLE only. For users to make a choice:

- For usecases involving classic Bluetooth as well as BLE, Bluedroid should be used.
- For BLE-only usecases, using NimBLE is recommended. It is less demanding in terms of code footprint and runtime memory, making it suitable for such scenarios.

Code examples for this API section are provided in the bluetooth/bluedroid directory of ESP-IDF examples.
The following examples contain detailed walkthroughs:

- GATT Client Example Walkthrough
- GATT Server Service Table Example Walkthrough
- GATT Server Example Walkthrough
- GATT Security Client Example Walkthrough
- GATT Security Server Example Walkthrough
- GATT Client Multi-connection Example Walkthrough

### 2.4 Error Codes Reference

This section lists various error code constants defined in ESP-IDF.

For general information about error codes in ESP-IDF, see *Error Handling*.

*ESP_FAIL* (-1): Generic esp_err_t code indicating failure

*ESP_OK* (0): esp_err_t value indicating success (no error)
Chapter 2. API Reference

**ESP_ERR_NO_MEM (0x101):** Out of memory

**ESP_ERR_INVALID_ARG (0x102):** Invalid argument

**ESP_ERR_INVALID_STATE (0x103):** Invalid state

**ESP_ERR_INVALID_SIZE (0x104):** Invalid size

**ESP_ERR_NOT_FOUND (0x105):** Requested resource not found

**ESP_ERR_NOT_SUPPORTED (0x106):** Operation or feature not supported

**ESP_ERR_TIMEOUT (0x107):** Operation timed out

**ESP_ERR_INVALID_RESPONSE (0x108):** Received response was invalid

**ESP_ERR_INVALID_CRC (0x109):** CRC or checksum was invalid

**ESP_ERR_INVALID_VERSION (0x10a):** Version was invalid

**ESP_ERR_INVALID_MAC (0x10b):** MAC address was invalid

**ESP_ERR_NOT_FINISHED (0x10c):** There are items remained to retrieve

**ESP_ERR_NVS_BASE (0x1100):** Starting number of error codes

**ESP_ERR_NVS_NOT_INITIALIZED (0x1101):** The storage driver is not initialized

**ESP_ERR_NVS_NOT_FOUND (0x1102):** A requested entry couldn’t be found or namespace doesn’t exist yet and mode is NVS_READONLY

**ESP_ERR_NVS_TYPE_MISMATCH (0x1103):** The type of set or get operation doesn’t match the type of value stored in NVS

**ESP_ERR_NVS_READ_ONLY (0x1104):** Storage handle was opened as read only

**ESP_ERR_NVS_NOT_ENOUGH_SPACE (0x1105):** There is not enough space in the underlying storage to save the value

**ESP_ERR_NVS_INVALID_NAME (0x1106):** Namespace name doesn’t satisfy constraints

**ESP_ERR_NVS_INVALID_HANDLE (0x1107):** Handle has been closed or is NULL

**ESP_ERR_NVS_REMOVE_FAILED (0x1108):** The value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

**ESP_ERR_NVS_KEY_TOO_LONG (0x1109):** Key name is too long

**ESP_ERR_NVS_PAGE_FULL (0x110a):** Internal error; never returned by nvs API functions

**ESP_ERR_NVS_INVALID_STATE (0x110b):** NVS is in an inconsistent state due to a previous error. Call nvs_flash_init and nvs_open again, then retry.

**ESP_ERR_NVS_INVALID_LENGTH (0x110c):** String or blob length is not sufficient to store data

**ESP_ERR_NVS_NO_FREE_PAGES (0x110d):** NVS partition doesn’t contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs_flash_init again.

**ESP_ERR_NVS_VALUE_TOO_LONG (0x110e):** Value doesn’t fit into the entry or string or blob length is longer than supported by the implementation

**ESP_ERR_NVS_PART_NOT_FOUND (0x110f):** Partition with specified name is not found in the partition table

**ESP_ERR_NVS_NEW_VERSION_FOUND (0x1110):** NVS partition contains data in new format and cannot be recognized by this version of code

**ESP_ERR_NVS_XTS_ENCR_FAILED (0x1111):** XTS encryption failed while writing NVS entry

**ESP_ERR_NVS_XTS_DECR_FAILED (0x1112):** XTS decryption failed while reading NVS entry

**ESP_ERR_NVS_XTS_CFG_FAILED (0x1113):** XTS configuration setting failed

**ESP_ERR_NVS_XTS_CFG_NOT_FOUND (0x1114):** XTS configuration not found
Chapter 2. API Reference

ESP_ERR_NVS_ENCR_NOT_SUPPORTED (0x1115): NVS encryption is not supported in this version
ESP_ERR_NVS_KEYS_NOT_INITIALIZED (0x1116): NVS key partition is uninitialized
ESP_ERR_NVS_CORRUPT_KEY_PART (0x1117): NVS key partition is corrupt
ESP_ERR_NVS_CONTENT_DIFFERS (0x1118): Internal error; never returned by nvs API functions. NVS key is different in comparison
ESP_ERR_NVS_WRONG_ENCRYPTION (0x1119): NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.
ESP_ERR_ULP_BASE (0x1200): Offset for ULP-related error codes
ESP_ERR_ULP_SIZE_TOO_BIG (0x1201): Program doesn’t fit into RTC memory reserved for the ULP
ESP_ERR_ULP_INVALID_LOAD_ADDR (0x1202): Load address is outside of RTC memory reserved for the ULP
ESP_ERR_ULP_DUPLICATE_LABEL (0x1203): More than one label with the same number was defined
ESP_ERR_ULP_UNDEFINED_LABEL (0x1204): Branch instructions references an undefined label
ESP_ERR_ULP_BRANCH_OUT_OF_RANGE (0x1205): Branch target is out of range of B instruction (try replacing with BX)
ESP_ERR_OTA_BASE (0x1500): Base error code for ota_ops api
ESP_ERR_OTA_PARTITION_CONFLICT (0x1501): Error if request was to write or erase the current running partition
ESP_ERR_OTA_SELECT_INFO_INVALID (0x1502): Error if OTA data partition contains invalid content
ESP_ERR_OTA_VALIDATE_FAILED (0x1503): Error if OTA app image is invalid
ESP_ERR_OTA_SMALL_SEC_VER (0x1504): Error if the firmware has a secure version less than the running firmware.
ESP_ERR_OTA_ROLLBACK_FAILED (0x1505): Error if flash does not have valid firmware in passive partition and hence rollback is not possible
ESP_ERR_OTA_ROLLBACK_INVALID_STATE (0x1506): Error if current active firmware is still marked in pending validation state (ESP_OTA_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible
ESP_ERR_EFUSE (0x1600): Base error code for efuse api.
ESP_OK_EFUSE_CNT (0x1601): OK the required number of bits is set.
ESP_ERR_EFUSE_CNT_IS_FULL (0x1602): Error field is full.
ESP_ERR_EFUSE_REPEATED_PROG (0x1603): Error repeated programming of programmed bits is strictly forbidden.
ESP_ERR_CODING (0x1604): Error while a encoding operation.
ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS (0x1605): Error not enough unused key blocks available
ESP_ERR_DAMAGED_READING (0x1606): Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.
ESP_ERR_IMAGE_BASE (0x2000)
ESP_ERR_IMAGE_FLASH_FAIL (0x2001)
ESP_ERR_IMAGE_INVALID (0x2002)
ESP_ERR_WIFI_BASE (0x3000): Starting number of WiFi error codes
ESP_ERR_WIFI_NOT_INIT (0x3001): WiFi driver was not installed by esp_wifi_init
ESP_ERR_WIFI_NOT_STARTED (0x3002): WiFi driver was not started by esp_wifi_start
ESP_ERR_WIFI_NOT_STOPPED (0x3003): WiFi driver was not stopped by esp_wifi_stop
Chapter 2. API Reference

ESP_ERR_WIFI_IF (0x3004): WiFi interface error
ESP_ERR_WIFI_MODE (0x3005): WiFi mode error
ESP_ERR_WIFI_STATE (0x3006): WiFi internal state error
ESP_ERR_WIFI_CONN (0x3007): WiFi internal control block of station or soft-AP error
ESP_ERR_WIFI_NVS (0x3008): WiFi internal NVS module error
ESP_ERR_WIFI_MAC (0x3009): MAC address is invalid
ESP_ERR_WIFI_SSID (0x300a): SSID is invalid
ESP_ERR_WIFI_PASSWORD (0x300b): Password is invalid
ESP_ERR_WIFI_TIMEOUT (0x300c): Timeout error
ESP_ERR_WIFI_WAKE_FAIL (0x300d): WiFi is in sleep state (RF closed) and wakeup fail
ESP_ERR_WIFI_WOULD_BLOCK (0x300e): The caller would block
ESP_ERR_WIFI_NOT_CONNECT (0x300f): Station still in disconnect status
ESP_ERR_WIFI_POST (0x3012): Failed to post the event to WiFi task
ESP_ERR_WIFI_INIT_STATE (0x3013): Invalid WiFi state when init/deinit is called
ESP_ERR_WIFI_STOP_STATE (0x3014): Returned when WiFi is stopping
ESP_ERR_WIFI_NOT_ASSOC (0x3015): The WiFi connection is not associated
ESP_ERR_WIFI_TX_DISALLOW (0x3016): The WiFi TX is disallowed
ESP_ERR_WIFI_REGISTRAR (0x3033): WPS registrar is not supported
ESP_ERR_WIFI_WPS_TYPE (0x3034): WPS type error
ESP_ERR_WIFI_WPS_SM (0x3035): WPS state machine is not initialized
ESP_ERR_ESPNOW_BASE (0x3064): ESPNOW error number base.
ESP_ERR_ESPNOW_NOT_INIT (0x3065): ESPNOW is not initialized.
ESP_ERR_ESPNOW_ARG (0x3066): Invalid argument
ESP_ERR_ESPNOW_NO_MEM (0x3067): Out of memory
ESP_ERR_ESPNOW_FULL (0x3068): ESPNOW peer list is full
ESP_ERR_ESPNOW_NOT_FOUND (0x3069): ESPNOW peer is not found
ESP_ERR_ESPNOW_INTERNAL (0x306a): Internal error
ESP_ERR_ESPNOW_EXIST (0x306b): ESPNOW peer has existed
ESP_ERR_ESPNOW_IF (0x306c): Interface error
ESP_ERR_DPP_FAILURE (0x3097): Generic failure during DPP Operation
ESP_ERR_DPP_TX_FAILURE (0x3098): DPP Frame Tx failed OR not Aced
ESP_ERR_DPP_INVALID_ATTR (0x3099): Encountered invalid DPP Attribute
ESP_ERR_MESH_BASE (0x4000): Starting number of MESH error codes
ESP_ERR_MESH_WIFI_NOT_START (0x4001)
ESP_ERR_MESH_NOT_INIT (0x4002)
ESP_ERR_MESH_NOT_CONFIG (0x4003)

2.5 Networking APIs

2.5.1 Wi-Fi

ESP-NOW

**Overview** ESP-NOW is a kind of connectionless Wi-Fi communication protocol that is defined by Espressif. In ESP-NOW, application data is encapsulated in a vendor-specific action frame and then transmitted from one Wi-Fi device to another without connection. CTR with CBC-MAC Protocol (CCMP) is used to protect the action frame for security. ESP-NOW is widely used in smart light, remote controlling, sensor, etc.

**Frame Format** ESP-NOW uses a vendor-specific action frame to transmit ESP-NOW data. The default ESP-NOW bitrate is 1 Mbps. The format of the vendor-specific action frame is as follows:

<table>
<thead>
<tr>
<th>MAC Header</th>
<th>Category Code</th>
<th>Organization Identifier</th>
<th>Random Values</th>
<th>Vendor Specific Content</th>
<th>FCS</th>
</tr>
</thead>
<tbody>
<tr>
<td>24 bytes</td>
<td>1 byte</td>
<td>3 bytes</td>
<td>4 bytes</td>
<td>255 bytes</td>
<td>4 bytes</td>
</tr>
</tbody>
</table>

- Category Code: The Category Code field is set to the value (127) indicating the vendor-specific category.
- Organization Identifier: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- Random Value: The Random Value field is used to prevent relay attacks.
- Vendor Specific Content: The Vendor Specific Content contains vendor-specific fields as follows:

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Organization Identifier</th>
<th>Type</th>
<th>Version</th>
<th>Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 byte</td>
<td>1 byte</td>
<td>3 bytes</td>
<td>1 byte</td>
<td>1 byte</td>
<td>0-250 bytes</td>
</tr>
</tbody>
</table>

- Element ID: The Element ID field is set to the value (221), indicating the vendor-specific element.
- Length: The length is the total length of Organization Identifier, Type, Version and Body.
- Organization Identifier: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- Type: The Type field is set to the value (4) indicating ESP-NOW.
- Version: The Version field is set to the version of ESP-NOW.
- Body: The Body contains the ESP-NOW data.

As ESP-NOW is connectionless, the MAC header is a little different from that of standard frames. The FromDS and ToDS bits of FrameControl field are both 0. The first address field is set to the destination address. The second address field is set to the source address. The third address field is set to broadcast address (0xff:0xff:0xff:0xff:0xff:0xff).

**Security**

ESP-NOW uses the CCMP method, which is described in IEEE Std. 802.11-2012, to protect the vendor-specific action frame.

- PMK is used to encrypt LMK with the AES-128 algorithm. Call `esp_now_set_pmk()` to set PMK. If PMK is not set, a default PMK will be used.
Chapter 2. API Reference

- LMK of the paired device is used to encrypt the vendor-specific action frame with the CCMP method. The maximum number of different LMKs is six. If the LMK of the paired device is not set, the vendor-specific action frame will not be encrypted.

Encrypting multicast vendor-specific action frame is not supported.

**Initialization and De-initialization** Call `esp_now_init()` to initialize ESP-NOW and `esp_now_deinit()` to de-initialize ESP-NOW. ESP-NOW data must be transmitted after Wi-Fi is started, so it is recommended to start Wi-Fi before initializing ESP-NOW and stop Wi-Fi after de-initializing ESP-NOW. When `esp_now_deinit()` is called, all of the information of paired devices will be deleted.

**Add Paired Device** Call `esp_now_add_peer()` to add the device to the paired device list before you send data to this device. If security is enabled, the LMK must be set. You can send ESP-NOW data via both the Station and the SoftAP interface. Make sure that the interface is enabled before sending ESP-NOW data.

The maximum number of paired devices is 20, and the paired encryption devices are no more than 10, the default is 6.

A device with a broadcast MAC address must be added before sending broadcast data. The range of the channel of paired devices is from 0 to 14. If the channel is set to 0, data will be sent on the current channel. Otherwise, the channel must be set as the channel that the local device is on.

**Send ESP-NOW Data** Call `esp_now_send()` to send ESP-NOW data and `esp_now_register_send_cb()` to register sending callback function. It will return `ESP_NOW_SEND_SUCCESS` in sending callback function if the data is received successfully on the MAC layer. Otherwise, it will return `ESP_NOW_SEND_FAIL`. Several reasons can lead to ESP-NOW fails to send data. For example, the destination device doesn’t exist; the channels of the devices are not the same; the action frame is lost when transmitting on the air, etc. It is not guaranteed that application layer can receive the data. If necessary, send back ack data when receiving ESP-NOW data. If receiving ack data timeouts, retransmit the ESP-NOW data. A sequence number can also be assigned to ESP-NOW data to drop the duplicate data.

If there is a lot of ESP-NOW data to send, call `esp_now_send()` to send less than or equal to 250 bytes of data once a time. Note that too short interval between sending two ESP-NOW data may lead to disorder of sending callback function. So, it is recommended that sending the next ESP-NOW data after the sending callback function of the previous sending has returned. The sending callback function runs from a high-priority Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

**Receiving ESP-NOW Data** Call `esp_now_register_recv_cb()` to register receiving callback function. Call the receiving callback function when receiving ESP-NOW. The receiving callback function also runs from the Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

**Config ESP-NOW Rate** Call `esp_wifi_config_espnow_rate()` to config ESPNOW rate of specified interface. Make sure that the interface is enabled before config rate. This API should be called after `esp_wifi_start()`.

**Application Examples**

- Example of sending and receiving ESP-NOW data between two devices: wifi/espnow.
- For more application examples of how to use ESP-NOW, please visit ESP-NOW repository.

**API Reference**
Chapter 2. API Reference

Header File

- components/esp_wifi/include/esp_now.h

Functions

`esp_err_t esp_now_init (void)`

Initialize ESPNOW function.

- **Returns**
  - ESP_OK: succeed
  - ESP_ERR_ESPNOW_INTERNAL: Internal error

`esp_err_t esp_now_deinit (void)`

De-initialize ESPNOW function.

- **Returns**
  - ESP_OK: succeed

`esp_err_t esp_now_get_version (uint32_t *version)`

Get the version of ESPNOW.

- **Parameters**
  - version – ESPNOW version

- **Returns**
  - ESP_OK: succeed
  - ESP_ERR_ESPNOW_ARG: invalid argument

`esp_err_t esp_now_register_recv_cb (esp_now_recv_cb_t cb)`

Register callback function of receiving ESPNOW data.

- **Parameters**
  - cb – callback function of receiving ESPNOW data

- **Returns**
  - ESP_OK: succeed
  - ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
  - ESP_ERR_ESPNOW_INTERNAL: internal error

`esp_err_t esp_now_unregister_recv_cb (void)`

Unregister callback function of receiving ESPNOW data.

- **Returns**
  - ESP_OK: succeed
  - ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized

`esp_err_t esp_now_register_send_cb (esp_now_send_cb_t cb)`

Register callback function of sending ESPNOW data.

- **Parameters**
  - cb – callback function of sending ESPNOW data

- **Returns**
  - ESP_OK: succeed
  - ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
  - ESP_ERR_ESPNOW_INTERNAL: internal error

`esp_err_t esp_now_unregister_send_cb (void)`

Unregister callback function of sending ESPNOW data.

- **Returns**
  - ESP_OK: succeed
  - ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized

`esp_err_t esp_now_send (const uint8_t *peer_addr, const uint8_t *data, size_t len)`

Send ESPNOW data.

- **Attention**
  1. If peer_addr is not NULL, send data to the peer whose MAC address matches peer_addr
  2. If peer_addr is NULL, send data to all of the peers that are added to the peer list
Attention 3. The maximum length of data must be less than ESP_NOW_MAX_DATA_LEN
Attention 4. The buffer pointed to by data argument does not need to be valid after esp_now_send returns

Parameters
- `peer_addr` - peer MAC address
- `data` - data to send
- `len` - length of data

Returns
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_INTERNAL: internal error
- ESP_ERR_ESPNOW_NO_MEM: out of memory, when this happens, you can delay a while before sending the next data
- ESP_ERR_ESPNOW_NOT_FOUND: peer is not found
- ESP_ERR_ESPNOW_IF: current WiFi interface doesn’t match that of peer

`esp_err_t esp_now_add_peer` (const `esp_now_peer_info_t *peer)
Add a peer to peer list.

Parameters `peer` - peer information

Returns
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_FULL: peer list is full
- ESP_ERR_ESPNOW_NO_MEM: out of memory
- ESP_ERR_ESPNOW_EXIST: peer has existed

`esp_err_t esp_now_del_peer` (const `uint8_t *peer_addr`
Delete a peer from peer list.

Parameters `peer_addr` - peer MAC address

Returns
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

`esp_err_t esp_now_mod_peer` (const `esp_now_peer_info_t *peer`
Modify a peer.

Parameters `peer` - peer information

Returns
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_FULL: peer list is full

`esp_err_t esp_wifi_config_espnow_rate`(`wifi_interface_t ifx, wifi_phy_rate_t rate`
Config ESPNOW rate of specified interface.

Attention 1. This API should be called after esp_wifi_start().

Parameters
- `ifx` - Interface to be configured.
- `rate` - Phy rate to be configured.

Returns
- ESP_OK: succeed
Chapter 2. API Reference

- others: failed

**esp_err_t esp_now_get_peer** (const uint8_t *peer_addr, esp_now_peer_info_t *peer)

Get a peer whose MAC address matches peer_addr from peer list.

Parameters
- **peer_addr** - peer MAC address
- **peer** - peer information

Returns
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

**esp_err_t esp_now_fetch_peer** (bool from_head, esp_now_peer_info_t *peer)

Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

Parameters
- **from_head** - fetch from head of list or not
- **peer** - peer information

Returns
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

**bool esp_now_is_peer_exist** (const uint8_t *peer_addr)

Peer exists or not.

Parameters **peer_addr** - peer MAC address

Returns
- true: peer exists
- false: peer not exists

**esp_err_t esp_now_get_peer_num** (esp_now_peer_num_t *num)

Get the number of peers.

Parameters **num** - number of peers

Returns
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument

**esp_err_t esp_now_set_pmk** (const uint8_t *pmk)

Set the primary master key.

Attention 1. primary master key is used to encrypt local master key

Parameters **pmk** - primary master key

Returns
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument

**esp_err_t esp_now_set_wake_window** (uint16_t window)

Set wake window for esp_now to wake up in interval unit.
Attention 1. This configuration could work at connected status. When ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work at disconnected status.

Attention 2. Default value is the maximum.

Parameters

window – Milliseconds would the chip keep waked each interval, from 0 to 65535.

Returns

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

Structures

struct esp_now_peer_info

ESPNOW peer information parameters.

Public Members

uint8_t peer_addr[ESP_NOW_ETH_ALEN]

ESPNOW peer MAC address that is also the MAC address of station or softap

uint8_t lmk[ESP_NOW_KEY_LEN]

ESPNOW peer local master key that is used to encrypt data

uint8_t channel

Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

wifi_interface_t ifidx

Wi-Fi interface that peer uses to send/receive ESPNOW data

bool encrypt

ESPNOW data that this peer sends/receives is encrypted or not

void *priv

ESPNOW peer private data

struct esp_now_peer_num

Number of ESPNOW peers which exist currently.

Public Members

int total_num

Total number of ESPNOW peers, maximum value is ESP_NOW_MAX_TOTAL_PEER_NUM

int encrypt_num

Number of encrypted ESPNOW peers, maximum value is ESP_NOW_MAX_ENCRYPT_PEER_NUM
Chapter 2. API Reference

Macros

ESP_ERR_ESPNOW_BASE
ESP NOW error number base.

ESP_ERR_ESPNOW_NOT_INIT
ESP NOW is not initialized.

ESP_ERR_ESPNOW_ARG
Invalid argument

ESP_ERR_ESPNOW_NO_MEM
Out of memory

ESP_ERR_ESPNOW_FULL
ESP NOW peer list is full

ESP_ERR_ESPNOW_NOT_FOUND
ESP NOW peer is not found

ESP_ERR_ESPNOW_INTERNAL
Internal error

ESP_ERR_ESPNOW_EXIST
ESP NOW peer has existed

ESP_ERR_ESPNOW_IF
Interface error

ESP_NOW_ETH_ALEN
Length of ESP NOW peer MAC address

ESP_NOW_KEY_LEN
Length of ESP NOW peer local master key

ESP_NOW_MAX_TOTAL_PEER_NUM
Maximum number of ESP NOW total peers

ESP_NOW_MAX_ENCRYPT_PEER_NUM
Maximum number of ESP NOW encrypted peers

ESP_NOW_MAX_DATA_LEN
Maximum length of ESP NOW data which is sent very time

Type Definitions

typedef struct esp_now_peer_info esp_now_peer_info_t
ESP NOW peer information parameters.

typedef struct esp_now_peer_num esp_now_peer_num_t
Number of ESP NOW peers which exist currently.
typedef void (*esp_now_recv_cb_t)(const uint8_t*mac_addr, const uint8_t*data, int data_len)
Callback function of receiving ESPNOW data.

- **Param mac_addr** peer MAC address
- **Param data** received data
- **Param data_len** length of received data

typedef void (*esp_now_send_cb_t)(const uint8_t*mac_addr, esp_now_send_status_t status)
Callback function of sending ESPNOW data.

- **Param mac_addr** peer MAC address
- **Param status** status of sending ESPNOW data (succeed or fail)

**Enumerations**

enum esp_now_send_status_t
Status of sending ESPNOW data.

**Values:**

- **enumerator ESP_NOW_SEND_SUCCESS**
  Send ESPNOW data successfully

- **enumerator ESP_NOW_SEND_FAIL**
  Send ESPNOW data fail

**ESP-WIFI-MESH Programming Guide**

This is a programming guide for ESP-WIFI-MESH, including the API reference and coding examples. This guide is split into the following parts:

1. *ESP-WIFI-MESH Programming Model*
2. *Writing an ESP-WIFI-MESH Application*
3. *Self Organized Networking*
4. *Application Examples*
5. *API Reference*

For documentation regarding the ESP-WIFI-MESH protocol, please see the *ESP-WIFI-MESH API Guide*. For more information about ESP-WIFI-MESH Development Framework, please see ESP-WIFI-MESH Development Framework.

**ESP-WIFI-MESH Programming Model**

**Software Stack** The ESP-WIFI-MESH software stack is built atop the Wi-Fi Driver/FreeRTOS and may use the LwIP Stack in some instances (i.e. the root node). The following diagram illustrates the ESP-WIFI-MESH software stack.

**System Events** An application interfaces with ESP-WIFI-MESH via *ESP-WIFI-MESH Events*. Since ESP-WIFI-MESH is built atop the Wi-Fi stack, it is also possible for the application to interface with the Wi-Fi driver via the *Wi-Fi Event Task*. The following diagram illustrates the interfaces for the various System Events in an ESP-WIFI-MESH application.

The *mesh_event_id_t* defines all possible ESP-WIFI-MESH events and can indicate events such as the connection/disconnection of parent/child. Before ESP-WIFI-MESH events can be used, the application must register...
a **Mesh Events handler** via `esp_event_handler_register()` to the default event task. The Mesh Events handler that is registered contain handlers for each ESP-WIFI-MESH event relevant to the application.

Typical use cases of mesh events include using events such as `MESH_EVENT_PARENT_CONNECTED` and `MESH_EVENT_CHILD_CONNECTED` to indicate when a node can begin transmitting data upstream and downstream respectively. Likewise, `IP_EVENT_STA_GOT_IP` and `IP_EVENT_STA_LOST_IP` can be used to indicate when the root node can and cannot transmit data to the external IP network.

**Warning:** When using ESP-WIFI-MESH under self-organized mode, users must ensure that no calls to WiFi API are made. This is due to the fact that the self-organizing mode will internally make WiFi API calls to connect/disconnect(scan etc). Any Wi-Fi calls from the application (including calls from callbacks and handlers of Wi-Fi events) may interfere with ESP-WIFI-MESH’s self-organizing behavior. Therefore, users should not call Wi-Fi APIs after `esp_mesh_start()` is called, and before `esp_mesh_stop()` is called.

**LwIP & ESP-WIFI-MESH** The application can access the ESP-WIFI-MESH stack directly without having to go through the LwIP stack. The LwIP stack is only required by the root node to transmit/receive data to/from an external IP network. However, since every node can potentially become the root node (due to automatic root node selection), each node must still initialize the LwIP stack.

Each node that could become root is required to initialize LwIP by calling `esp_netif_init()`. In order to prevent non-root node access to LwIP, the application should not create or register any network interfaces using `esp_netif` APIs.

ESP-WIFI-MESH requires a root node to be connected with a router. Therefore, in the event that a node becomes the root, the **corresponding handler must start the DHCP client service and immediately obtain an IP address**. Doing so will allow other nodes to begin transmitting/receiving packets to/from
Writing an ESP-WIFI-MESH Application The prerequisites for starting ESP-WIFI-MESH is to initialize LwIP and Wi-Fi. The following code snippet demonstrates the necessary prerequisite steps before ESP-WIFI-MESH itself can be initialized.

```c
ESP_ERROR_CHECK(esp_netif_init());
/* event initialization */
ESP_ERROR_CHECK(esp_event_loop_create_default());
/* Wi-Fi initialization */
wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
ESP_ERROR_CHECK(esp_wifi_init(&config));
/* register IP events handler */
ESP_ERROR_CHECK(esp_event_handler_register(IP_EVENT, IP_EVENT_STA_GOT_IP, &ip_
  →event_handler, NULL));
ESP_ERROR_CHECK(esp_wifi_set_storage(WIFI_STORAGE_FLASH));
ESP_ERROR_CHECK(esp_wifi_start());
```

After initializing LwIP and Wi-Fi, the process of getting an ESP-WIFI-MESH network up and running can be summarized into the following three steps:

1. **Initialize Mesh**
2. **Configuring an ESP-WIFI-MESH Network**
3. **Start Mesh**

### Initialize Mesh

The following code snippet demonstrates how to initialize ESP-WIFI-MESH

```c
/* mesh initialization */
ESP_ERROR_CHECK(esp_mesh_init());
/* register mesh events handler */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_
  →event_handler, NULL));
```

### Configuring an ESP-WIFI-MESH Network

ESP-WIFI-MESH is configured via `esp_mesh_set_config()` which receives its arguments using the `mesh_cfg_t` structure. The structure contains the following parameters used to configure ESP-WIFI-MESH:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel</td>
<td>Range from 1 to 14</td>
</tr>
<tr>
<td>Mesh ID</td>
<td>ID of ESP-WIFI-MESH Network, see <code>mesh_addr_t</code></td>
</tr>
<tr>
<td>Router</td>
<td>Router Configuration, see <code>mesh_router_t</code></td>
</tr>
<tr>
<td>Mesh AP</td>
<td>Mesh AP Configuration, see <code>mesh_ap_cfg_t</code></td>
</tr>
<tr>
<td>Crypto Functions</td>
<td>Crypto Functions for Mesh IE, see <code>mesh_crypto_funcs_t</code></td>
</tr>
</tbody>
</table>

The following code snippet demonstrates how to configure ESP-WIFI-MESH.

```c
/* Enable the Mesh IE encryption by default */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
/* mesh ID */
memcpy((uint8_t *) &cfg.mesh_id, MESH_ID, 6);
/* channel (must match the router’s channel) */
cfg.channel = CONFIG_MESH_CHANNEL;
/* router */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *) &cfg.router.ssid, CONFIG_MESH_ROUTER_SSID, cfg.router.ssid_len);
```
Chapter 2. API Reference

(continued from previous page)

memcpy((uint8_t *)&cfg.router.password, CONFIG_MESH_ROUTER_PASSWD, strlen(CONFIG_MESH_ROUTER_PASSWD));
/* mesh softAP */
cfg.mesh_ap.max_connection = CONFIG_MESH_AP_CONNECTIONS;
memcpy((uint8_t *)&cfg.mesh_ap.password, CONFIG_MESH_AP_PASSWD, strlen(CONFIG_MESH_AP_PASSWD));
ESP_ERROR_CHECK(esp_mesh_set_config(&cfg));

Start Mesh  The following code snippet demonstrates how to start ESP-WIFI-MESH.

/* mesh start */
ESP_ERROR_CHECK(esp_mesh_start());

After starting ESP-WIFI-MESH, the application should check for ESP-WIFI-MESH events to determine when it has connected to the network. After connecting, the application can start transmitting and receiving packets over the ESP-WIFI-MESH network using esp_mesh_send() and esp_mesh_recv().

Self Organized Networking  Self organized networking is a feature of ESP-WIFI-MESH where nodes can autonomously scan/select/connect/reconnect to other nodes and routers. This feature allows an ESP-WIFI-MESH network to operate with high degree of autonomy by making the network robust to dynamic network topologies and conditions. With self organized networking enabled, nodes in an ESP-WIFI-MESH network are able to carry out the following actions without autonomously:

- Selection or election of the root node (see Automatic Root Node Selection in Building a Network)
- Selection of a preferred parent node (see Parent Node Selection in Building a Network)
- Automatic reconnection upon detecting a disconnection (see Intermediate Parent Node Failure in Managing a Network)

When self organized networking is enabled, the ESP-WIFI-MESH stack will internally make calls to Wi-Fi APIs. Therefore, the application layer should not make any calls to Wi-Fi APIs whilst self organized networking is enabled as doing so would risk interfering with ESP-WIFI-MESH.

Toggling Self Organized Networking  Self organized networking can be enabled or disabled by the application at runtime by calling the esp_mesh_set_self_organized() function. The function has the two following parameters:

- bool enable specifies whether to enable or disable self organized networking.
- bool select_parent specifies whether a new parent node should be selected when enabling self organized networking. Selecting a new parent has different effects depending the node type and the node’s current state. This parameter is unused when disabling self organized networking.

Disabling Self Organized Networking  The following code snippet demonstrates how to disable self organized networking.

//Disable self organized networking
esp_mesh_set_self_organized(false, false);

ESP-WIFI-MESH will attempt to maintain the node’s current Wi-Fi state when disabling self organized networking.

- If the node was previously connected to other nodes, it will remain connected.
- If the node was previously disconnected and was scanning for a parent node or router, it will stop scanning.
- If the node was previously attempting to reconnect to a parent node or router, it will stop reconnecting.

Enabling Self Organized Networking  ESP-WIFI-MESH will attempt to maintain the node’s current Wi-Fi state when enabling self organized networking. However, depending on the node type and whether a new parent is selected, the Wi-Fi state of the node can change. The following table shows effects of enabling self organized networking.
## Select Parent

<table>
<thead>
<tr>
<th>Select Parent</th>
<th>Is Root Node</th>
<th>Effects</th>
</tr>
</thead>
</table>
| N             | N            | • Nodes already connected to a parent node will remain connected.  
• Nodes previously scanning for a parent node will stop scanning. Call `esp_mesh_connect()` to restart. |
| Y             |              | • A root node already connected to router will stay connected.  
• A root node disconnected from router will need to call `esp_mesh_connect()` to reconnect. |
| Y             | N            | • Nodes without a parent node will automatically select a preferred parent and connect.  
• Nodes already connected to a parent node will disconnect, reselect a preferred parent node, and connect. |
| Y             |              | • For a root node to connect to a parent node, it must give up its role as root. Therefore, a root node will disconnect from the router and all child nodes, select a preferred parent node, and connect. |

The following code snippet demonstrates how to enable self organized networking.

```c
// Enable self organized networking and select a new parent
esp_mesh_set_self_organized(true, true);
...

// Enable self organized networking and manually reconnect
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();
```

### Calling Wi-Fi API

There can be instances in which an application may want to directly call Wi-Fi API whilst using ESP-WIFI-MESH. For example, an application may want to manually scan for neighboring APs. However, self organized networking must be disabled before the application calls any Wi-Fi APIs. This will prevent the ESP-WIFI-MESH stack from attempting to call any Wi-Fi APIs and potentially interfering with the application’s calls.

Therefore, application calls to Wi-Fi APIs should be placed in between calls of `esp_mesh_set_self_organized()` which disable and enable self organized networking. The following code snippet demonstrates how an application can safely call `esp_wifi_scan_start()` whilst using...
Application Examples  ESP-IDF contains these ESP-WIFI-MESH example projects:

**The Internal Communication Example** demonstrates how to set up a ESP-WIFI-MESH network and have the root node send a data packet to every node within the network.

**The Manual Networking Example** demonstrates how to use ESP-WIFI-MESH without the self-organizing features. This example shows how to program a node to manually scan for a list of potential parent nodes and select a parent node based on custom criteria.

API Reference

Header File

- components/esp_wifi/include/esp_mesh.h

Functions

**esp_err_t esp_mesh_init (void)**

Mesh initialization.

- Check whether Wi-Fi is started.
- Initialize mesh global variables with default values.

**Attention** This API shall be called after Wi-Fi is started.

**Returns**

- ESP_OK
- ESP_FAIL
### esp_err_t esp_mesh_deinit (void)
Mesh de-initialization.

- Release resources **and** stop the mesh

**Returns**
- ESP_OK
- ESP_FAIL

### esp_err_t esp_mesh_start (void)
Start mesh.

- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

**Attention**
This API shall be called after mesh initialization and configuration.

**Returns**
- ESP_OK
- ESP_FAIL
- ESP.ERR_MESH.NOT_INIT
- ESP.ERR_MESH.NOT_CONFIG
- ESP.ERR_MESH.NO_MEMORY

### esp_err_t esp_mesh_stop (void)
Stop mesh.

- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.
- Stop mesh network management service.
- Unregister mesh packets receive callback.
- Delete TX and RX queues.
- Release resources.
- Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.
- Set Wi-Fi Power Save type to WIFI_PS_NONE.

**Returns**
- ESP_OK
- ESP_FAIL

### esp_err_t esp_mesh_send (const mesh_addr_t *to, const mesh_data_t *data, int flag, const mesh_opt_t opt[], int opt_count)
Send a packet over the mesh network.

- Send a packet to any device in the mesh network.
- Send a packet to external IP network.
**Attention**  This API is not reentrant.

**Parameters**

- **to** - [in] the address of the final destination of the packet
  - If the packet is to the root, set this parameter to NULL.
  - If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.
- **data** - [in] pointer to a sending mesh packet
  - Field size should not exceed MESH_MPS. Note that the size of one mesh packet should not exceed MESH_MTU.
  - Field proto should be set to data protocol in use (default is MESH_PROTO_BIN for binary).
  - Field tos should be set to transmission tos (type of service) in use (default is MESH_TOS_P2P for point-to-point reliable).
- **flag** - [in] bitmap for data sent
  - Speed up the route search
    - If the packet is to the root and “to” parameter is NULL, set this parameter to 0.
    - If the packet is to an internal device, MESH_DATA_P2P should be set.
    - If the packet is to the root ( “to” parameter isn’t NULL) or to external IP network, MESH_DATA_TODS should be set.
    - If the packet is from the root to an internal device, MESH_DATA_FROMDS should be set.
  - Specify whether this API is block or non-block, block by default
    - If needs non-blocking, MESH_DATA_NONBLOCK should be set. Otherwise, may use esp_mesh_send_block_time() to specify a blocking time.
  - In the situation of the root change, MESH_DATA_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn’t read out in time by esp_mesh_recv_toDS(). Generally, we suggest esp_mesh_recv_toDS() is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading esp_mesh_recv_toDS() which avoids unnecessary memory copy.
- **opt** - [in] options
  - In case of sending a packet to a certain group, MESH_OPT_SEND_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
  - Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH_OPT_RECV_DS_ADDR is required to attach the target DS address.
- **opt_count** - [in] option count
  - Currently, this API only takes one option, so opt_count is only supported to be 1.

**Returns**

- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_DISCONNECTED
- ESP_ERR_MESH_OPT_UNKNOWN
- ESP_ERR_MESH_EXCEED_MTU
- ESP_ERR_MESH_NO_MEMORY
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_NO_ROUTE_FOUND
- ESP_ERR_MESH_DISCARD

```c
esp_err_t esp_mesh_send_block_time (uint32_t time_ms)
```
Set blocking time of esp_mesh_send()

**Attention** This API shall be called before mesh is started.

**Parameters**
- `time_ms` **[in]** blocking time of esp_mesh_send(), unit: ms

**Returns**
- ESP_OK

```c
esp_err_t esp_mesh_recv(mesh_addr_t *from, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t *opt[], int opt_count)
```

Receive a packet targeted self over the mesh network.

`flag` could be MESH_DATA_FROMDS or MESH_DATA_TODS.

**Attention** Mesh RX queue should be checked regularly to avoid running out of memory.
- Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications.

**Parameters**
- `from` **[out]** the address of the original source of the packet
- `data` **[out]** pointer to the received mesh packet
  - Field proto is the data protocol in use. Should follow it to parse the received data.
  - Field tos is the transmission tos (type of service) in use.
- `timeout_ms` **[in]** wait time if a packet isn’t immediately available (0: no wait, port-MAX_DELAY: wait forever)
- `flag` **[out]** bitmap for data received
  - MESH_DATA_FROMDS represents data from external IP network
  - MESH_DATA_TODS represents data directed upward within the mesh network
- `opt` **[out]** options desired to receive
  - MESH_OPT_RECV_DS_ADDR attaches the DS address
- `opt_count` **[in]** option count desired to receive
  - Currently, this API only takes one option, so `opt_count` is only supported to be 1.

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD

```c
esp_err_t esp_mesh_recv_toDS(mesh_addr_t *from, mesh_addr_t *to, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t *opt[], int opt_count)
```

Receive a packet targeted to external IP network.

- Root uses this API to receive packets destined to external IP network
- Root forwards the received packets to the final destination via socket.
- If no socket connection is ready to send out the received packets and this esp_mesh_recv_toDS() hasn’t been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using esp_mesh_set_xon_qsize() users may configure the RX queue size, default: 32. If this size is too large, and esp_mesh_recv_toDS() isn’t called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.
flag could be MESH_DATA_TODS.

Attention This API is only called by the root.

**Parameters**
- **from** - [out] the address of the original source of the packet
- **to** - [out] the address contains remote IP address and port (IPv4:PORT)
- **data** - [out] pointer to the received packet
  - Contain the protocol and applications should follow it to parse the data.
- **timeout_ms** - [in] wait time if a packet isn’t immediately available (0:no wait, port-MAX_DELAY:wait forever)
- **flag** - [out] bitmap for data received
  - MESH_DATA_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.
- **opt** - [out] options desired to receive
- **opt_count** - [in] option count desired to receive

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD
- ESP_ERR_MESH_RECV_RELEASE

```c
esp_err_t esp_mesh_set_config(const mesh_cfg_t *config)
```

Set mesh stack configuration.

- Use MESH_INIT_CONFIG_DEFAULT() to initialize the default values, mesh IE is encrypted by default.
- Mesh network is established on a fixed channel (1-14).
- Mesh event callback is mandatory.
- Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
- Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn’t set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn’t handle roots connected with different BSSID. Because users might have such requirements of setting up routers with same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. max_connection of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

Attention This API shall be called before mesh is started after mesh is initialized.

### Parameters config - [in] pointer to mesh stack configuration

### Returns
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

```c
esp_err_t esp_mesh_get_config(mesh_cfg_t *config)
```

Get mesh stack configuration.
Parameters `config` -[out] pointer to mesh stack configuration

Returns
• ESP_OK
• ESP_ERR_MESH_ARGUMENT

```c
esp_err_t esp_mesh_set_router(const mesh_router_t *router)
```

Get router configuration.

**Attention** This API is used to dynamically modify the router configuration after mesh is configured.

Parameters `router` -[in] pointer to router configuration

Returns
• ESP_OK
• ESP_ERR_MESH_ARGUMENT

```c
esp_err_t esp_mesh_get_router(mesh_router_t *router)
```

Get router configuration.

Parameters `router` -[out] pointer to router configuration

Returns
• ESP_OK
• ESP_ERR_MESH_ARGUMENT

```c
esp_err_t esp_mesh_set_id(const mesh_addr_t *id)
```

Set mesh network ID.

**Attention** This API is used to dynamically modify the mesh network ID.

Parameters `id` -[in] pointer to mesh network ID

Returns
• ESP_OK
• ESP_ERR_MESH_ARGUMENT: invalid argument

```c
esp_err_t esp_mesh_get_id(mesh_addr_t *id)
```

Get mesh network ID.

Parameters `id` -[out] pointer to mesh network ID

Returns
• ESP_OK
• ESP_ERR_MESH_ARGUMENT

```c
esp_err_t esp_mesh_set_type(mesh_type_t type)
```

Designate device type over the mesh network.

• MESH_IDLE: designates a device as a self-organized node for a mesh network
• MESH_ROOT: designates the root node for a mesh network
• MESH_LEAF: designates a device as a standalone Wi-Fi station that connects to a parent
• MESH_STA: designates a device as a standalone Wi-Fi station that connects to a router

Parameters `type` -[in] device type

Returns
• ESP_OK
• ESP_ERR_MESH_NOT_ALLOWED
*mesh_type_t* `esp_mesh_get_type(void)`

Get device type over mesh network.

**Attention** This API shall be called after having received the event `MESH_EVENT_PARENT_CONNECTED`.

**Returns** mesh type

*esp_err_t* `esp_mesh_set_max_layer(int max_layer)`

Set network max layer value.

- for tree topology, the max is 25.
- for chain topology, the max is 1000.
- Network max layer limits the max hop count.

**Attention** This API shall be called before mesh is started.

**Parameters**

- `max_layer` - [in] max layer value

**Returns**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

`int esp_mesh_get_max_layer(void)`

Get max layer value.

**Returns** max layer value

*esp_err_t* `esp_mesh_set_ap_password(const uint8_t *pwd, int len)`

Set mesh softAP password.

**Attention** This API shall be called before mesh is started.

**Parameters**

- `pwd` - [in] pointer to the password
- `len` - [in] password length

**Returns**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

*esp_err_t* `esp_mesh_set_ap_authmode(wifi_auth_mode_t authmode)`

Set mesh softAP authentication mode.

**Attention** This API shall be called before mesh is started.

**Parameters**

- `authmode` - [in] authentication mode

**Returns**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED
**wifi_auth_mode** int esp_mesh_get_ap_authmode(void)
Get mesh softAP authentication mode.

**Returns** authentication mode

**esp_err** int esp_mesh_set_ap_connections(int connections)
Set mesh max connection value.

- Set mesh softAP max connection = mesh max connection + non-mesh max connection

**Attention** This API shall be called before mesh is started.

**Parameters** connections [in] the number of max connections

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

int esp_mesh_get_ap_connections(void)
Get mesh max connection configuration.

**Returns** the number of mesh max connections

int esp_mesh_get_non_mesh_connections(void)
Get non-mesh max connection configuration.

**Returns** the number of non-mesh max connections

int esp_mesh_get_layer(void)
Get current layer value over the mesh network.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Returns** layer value

**esp_err** int esp_mesh_get_parent_bssid(mesh_addr_t *bssid)
Get the parent BSSID.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Parameters** bssid [out] pointer to parent BSSID

**Returns**
- ESP_OK
- ESP_FAIL

bool esp_mesh_is_root(void)
Return whether the device is the root node of the network.

**Returns** true/false

**esp_err** int esp_mesh_set_self_organized(bool enable, bool select_parent)
Enable/disable self-organized networking.
• Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
• Self-organized networking is enabled by default.
• If self-organized is disabled, users should set a parent for the device via esp_mesh_set_parent().

**Attention** This API is used to dynamically modify whether to enable the self organizing.

**Parameters**
- **enable** - [in] enable or disable self-organized networking
- **select_parent** - [in] Only valid when self-organized networking is enabled.
  - if select_parent is set to true, the root will give up its mesh root status and search for a new parent like other non-root devices.

**Returns**
- ESP_OK
- ESP_FAIL

bool esp_mesh_get_self_organized (void)
Return whether enable self-organized networking or not.

**Returns** true/false

**esp_err_t esp_mesh_waive_root** (const mesh_vote_t *vote, int reason)
Cause the root device to give up (waive) its mesh root status.

• A device is elected root primarily based on RSSI from the external router.
• If external router conditions change, users can call this API to perform a root switch.
• In this API, users could specify a desired root address to replace itself or specify an attempts value to ask current root to initiate a new round of voting. During the voting, a better root candidate would be expected to find to replace the current one.
• If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better root candidate is found, keep the current one. If a better candidate is found, the new better one will send a root switch request to the current root, current root will respond with a root switch acknowledgment.
• After that, the new candidate will connect to the router to be a new root, the previous root will disconnect with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

**Attention** This API is only called by the root.

**Parameters**
- **vote** - [in] vote configuration
  - If this parameter is set NULL, the vote will perform the default 15 times.
  - Field percentage threshold is 0.9 by default.
  - Field is_rc_specified shall be false.
  - Field attempts shall be at least 15 times.
- **reason** - [in] only accept MESH_VOTE_REASON_ROOT_INITIATED for now

**Returns**
- ESP_OK
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_DISCARD
- ESP_FAIL

**esp_err_t esp_mesh_set_vote_percentage** (float percentage)
Set vote percentage threshold for approval of being a root (default:0.9)
During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

**Attention**  This API shall be called before mesh is started.

**Parameters**  percentage  
-vote percentage threshold

**Returns**
- ESP_OK
- ESP_FAIL

```c
float esp_mesh_get_vote_percentage (void)
```

Get vote percentage threshold for approval of being a root.

**Returns**  percentage threshold

```c
esp_err_t esp_mesh_set_ap_assoc_expire (int seconds)
```

Set mesh softAP associate expired time (default:10 seconds)

- If mesh softAP hasn’t received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
- If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

**Parameters**  seconds  
-in the expired time

**Returns**
- ESP_OK
- ESP_FAIL

```c
int esp_mesh_get_ap_assoc_expire (void)
```

Get mesh softAP associate expired time.

**Returns**  seconds

```c
int esp_mesh_get_total_node_num (void)
```

Get total number of devices in current network (including the root)

**Attention**  The returned value might be incorrect when the network is changing.

**Returns**  total number of devices (including the root)

```c
int esp_mesh_get_routing_table_size (void)
```

Get the number of devices in this device’s sub-network (including self)

**Returns**  the number of devices over this device’s sub-network (including self)

```c
esp_err_t esp_mesh_get_routing_table (mesh_addr_t *mac, int len, int *size)
```

Get routing table of this device’s sub-network (including itself)

**Parameters**
- mac  
-[out] pointer to routing table
- len  
-[in] routing table size (in bytes)
- size  
-[out] pointer to the number of devices in routing table (including itself)

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

```c
esp_err_t esp_mesh_post_toDS_state (bool reachable)
```

Post the toDS state to the mesh stack.
**Attention** This API is only for the root.

**Parameters** reachable - [in] this state represents whether the root is able to access external IP network

**Returns**
- ESP_OK
- ESP_FAIL

```c
esp_err_t esp_mesh_get_tx_pending (mesh_tx_pending_t *pending)
```
Return the number of packets pending in the queue waiting to be sent by the mesh stack.

**Parameters** pending - [out] pointer to the TX pending

**Returns**
- ESP_OK
- ESP_FAIL

```c
esp_err_t esp_mesh_get_rx_pending (mesh_rx_pending_t *pending)
```
Return the number of packets available in the queue waiting to be received by applications.

**Parameters** pending - [out] pointer to the RX pending

**Returns**
- ESP_OK
- ESP_FAIL

```c
int esp_mesh_available_txupQ_num (const mesh_addr_t *addr, uint32_t *xseqno_in)
```
Return the number of packets could be accepted from the specified address.

**Parameters**
- addr - [in] self address or an associate children address
- xseqno_in - [out] sequence number of the last received packet from the specified address

**Returns** the number of upQ for a certain address

```c
esp_err_t esp_mesh_set_xon_qsize (int qsize)
```
Set the number of queue.

**Attention** This API shall be called before mesh is started.

**Parameters** qsize - [in] default:32 (min:16)

**Returns**
- ESP_OK
- ESP_FAIL

```c
int esp_mesh_get_xon_qsize (void)
```
Get queue size.

**Returns** the number of queue

```c
esp_err_t esp_mesh_allow_root_conflicts (bool allowed)
```
Set whether allow more than one root existing in one network.

**Parameters** allowed - [in] allow or not

**Returns**
- ESP_OK
- ESP_WIFI_ERR_NOT_INIT
- ESP_WIFI_ERR_NOT_START

```c
bool esp_mesh_is_root_conflicts_allowed (void)
```
Check whether allow more than one root to exist in one network.

**Returns** true/false
**esp_err_t esp_mesh_set_group_id(const mesh_addr_t *addr, int num)**

Set group ID addresses.

**Parameters**
- **addr** [in] pointer to new group ID addresses
- **num** [in] the number of group ID addresses

**Returns**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

**esp_err_t esp_mesh_delete_group_id(const mesh_addr_t *addr, int num)**

Delete group ID addresses.

**Parameters**
- **addr** [in] pointer to deleted group ID address
- **num** [in] the number of group ID addresses

**Returns**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

**int esp_mesh_get_group_num(void)**

Get the number of group ID addresses.

**Returns** the number of group ID addresses

**esp_err_t esp_mesh_get_group_list(mesh_addr_t *addr, int num)**

Get group ID addresses.

**Parameters**
- **addr** [out] pointer to group ID addresses
- **num** [in] the number of group ID addresses

**Returns**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

**bool esp_mesh_is_my_group(const mesh_addr_t *addr)**

Check whether the specified group address is my group.

**Returns** true/false

**esp_err_t esp_mesh_set_capacity_num(int num)**

Set mesh network capacity (max:1000, default:300)

**Attention** This API shall be called before mesh is started.

**Parameters** **num** [in] mesh network capacity

**Returns**
- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED
- ESP_MESH_ERR_ARGUMENT

**int esp_mesh_get_capacity_num(void)**

Get mesh network capacity.

**Returns** mesh network capacity

**esp_err_t esp_mesh_set_ie_crypto_funcs(const mesh_crypto_funcs_t *crypto_funcs)**

Set mesh IE crypto functions.

**Attention** This API can be called at any time after mesh is initialized.
Chapter 2. API Reference

Parameters `crypto_funcs` - [in] crypto functions for mesh IE
- If `crypto_funcs` is set to NULL, mesh IE is no longer encrypted.

Returns
- ESP_OK

`esp_err_t esp_mesh_set_ie_crypto_key (const char *key, int len)`
Set mesh IE crypto key.

Attention This API can be called at any time after mesh is initialized.

Parameters
- `key` - [in] ASCII crypto key
- `len` - [in] length in bytes, range: 8~64

Returns
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

`esp_err_t esp_mesh_get_ie_crypto_key (char *key, int len)`
Get mesh IE crypto key.

Parameters
- `key` - [out] ASCII crypto key
- `len` - [in] length in bytes, range: 8~64

Returns
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

`esp_err_t esp_mesh_set_root_healing_delay (int delay_ms)`
Set delay time before starting root healing.

Parameters `delay_ms` - [in] delay time in milliseconds

Returns
- ESP_OK

`int esp_mesh_get_root_healing_delay (void)`
Get delay time before network starts root healing.

Returns delay time in milliseconds

`esp_err_t esp_mesh_fix_root (bool enable)`
Enable network Fixed Root Setting.

- Enabling fixed root disables automatic election of the root node via voting.
- All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
- If Fixed Root is enabled, users should make sure a root node is designated for the network.

Parameters `enable` - [in] enable or not

Returns
- ESP_OK

`bool esp_mesh_is_root_fixed (void)`
Check whether network Fixed Root Setting is enabled.

- Enable/disable network Fixed Root Setting by API `esp_mesh_fix_root()`.
- Network Fixed Root Setting also changes with the “flag” value in parent networking IE.

Returns true/false
\textbf{esp_err_t esp_mesh_set_parent} (const \texttt{wifi_config_t *parent}, const \texttt{mesh_addr_t *parent_mesh_id},
\texttt{mesh_type_t my_type}, int my_layer)

Set a specified parent for the device.

\textbf{Attention} This API can be called at any time after mesh is configured.

\textbf{Parameters}
\begin{itemize}
\item \texttt{parent} – [in] parent configuration, the SSID and the channel of the parent are mandatory.
  \begin{itemize}
  \item If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise the device will never find this specified parent.
  \end{itemize}
\item \texttt{parent_mesh_id} – [in] parent mesh ID,
  \begin{itemize}
  \item If this value is not set, the original mesh ID is used.
  \end{itemize}
\item \texttt{my_type} – [in] mesh type
  \begin{itemize}
  \item MESH_STA is not supported.
  \item If the parent set for the device is the same as the router in the network configuration, then my_type shall set MESH_ROOT and my_layer shall set MESH_ROOT_LAYER.
  \end{itemize}
\item \texttt{my_layer} – [in] mesh layer
  \begin{itemize}
  \item my_layer of the device may change after joining the network.
  \item If my_type is set MESH_NODE, my_layer shall be greater than MESH_ROOT_LAYER.
  \item If my_type is set MESH_LEAF, the device becomes a standalone Wi-Fi station and no longer has the ability to extend the network.
  \end{itemize}
\end{itemize}

\textbf{Returns}
\begin{itemize}
\item ESP_OK
\item ESP_ERR_ARGUMENT
\item ESP_ERR_MESH_NOT_CONFIG
\end{itemize}

\textbf{esp_err_t esp_mesh_scan_get_ap_ie_len} (int *len)

Get mesh networking IE length of one AP.

\textbf{Parameters} \texttt{len} – [out] mesh networking IE length

\textbf{Returns}
\begin{itemize}
\item ESP_OK
\item ESP_ERR_WIFI_NOT_INIT
\item ESP_ERR_WIFI_ARG
\item ESP_ERR_WIFI_FAIL
\end{itemize}

\textbf{esp_err_t esp_mesh_scan_get_ap_record} (\texttt{wifi_ap_record_t *ap_record}, void *buffer)

Get AP record.

\textbf{Attention} Different from esp_wifi_scan_get_ap_record(), this API only gets one of APs scanned each time. See "manual_networking" example.

\textbf{Parameters}
\begin{itemize}
\item \texttt{ap_record} – [out] pointer to one AP record
\item \texttt{buffer} – [out] pointer to the mesh networking IE of this AP
\end{itemize}

\textbf{Returns}
\begin{itemize}
\item ESP_OK
\item ESP_ERR_WIFI_NOT_INIT
\item ESP_ERR_WIFI_ARG
\item ESP_ERR_WIFI_FAIL
\end{itemize}

\textbf{esp_err_t esp_mesh_flush_upstream_packets} (void)

Flush upstream packets pending in to_parent queue and to_parent_p2p queue.

\textbf{Returns}
\begin{itemize}
\item ESP_OK
\end{itemize}
\textit{esp_err_t} \textbf{esp\_mesh\_get\_subnet\_nodes\_num} (const \textit{mesh\_addr\_t} *child\_mac, int *nodes\_num)

Get the number of nodes in the subnet of a specific child.

\textbf{Parameters}
- \textit{child\_mac} ⚪ \texttt{[in]} an associated child address of this device
- \textit{nodes\_num} ⚪ \texttt{[out]} pointer to the number of nodes in the subnet of a specific child

\textbf{Returns}
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

\textit{esp_err_t} \textbf{esp\_mesh\_get\_subnet\_nodes\_list} (const \textit{mesh\_addr\_t} *child\_mac, \textit{mesh\_addr\_t} *nodes, int nodes\_num)

Get nodes in the subnet of a specific child.

\textbf{Parameters}
- \textit{child\_mac} ⚪ \texttt{[in]} an associated child address of this device
- \textit{nodes} ⚪ \texttt{[out]} pointer to nodes in the subnet of a specific child
- \textit{nodes\_num} ⚪ \texttt{[in]} the number of nodes in the subnet of a specific child

\textbf{Returns}
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

\textit{esp_err_t} \textbf{esp\_mesh\_disconnect} (void)

Disconnect from current parent.

\textbf{Returns}
- ESP_OK

\textit{esp_err_t} \textbf{esp\_mesh\_connect} (void)

Connect to current parent.

\textbf{Returns}
- ESP_OK

\textit{esp_err_t} \textbf{esp\_mesh\_flush\_scan\_result} (void)

Flush scan result.

\textbf{Returns}
- ESP_OK

\textit{esp.errt} \textbf{esp\_mesh\_switch\_channel} (const uint8\_t *new\_bssid, int csa\_new\_chan, int csa\_count)

Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
- Set how many beacons with CSA IE will be sent before changing a new channel
- Enable the channel switch function

\textbf{Attention} This API is only called by the root.

\textbf{Parameters}
- \textit{new\_bssid} ⚪ \texttt{[in]} the new router BSSID if the router changes
- \textit{csa\_new\_chan} ⚪ \texttt{[in]} the new channel number to which the whole network is moving
- \textit{csa\_count} ⚪ \texttt{[in]} channel switch period(beacon count), unit is based on beacon interval of its softAP, the default value is 15.

\textbf{Returns}
- ESP_OK
**esp_err_t esp_mesh_get_router_bssid** (uint8_t* router_bssid)

Get the router BSSID.

**Parameters**

router_bssid - [out] pointer to the router BSSID

**Returns**

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG

**int64_t esp_mesh_get_tsf_time** (void)

Get the TSF time.

**Returns**

the TSF time

**esp_err_t esp_mesh_set_topology** (esp_mesh_topology_t topo)

Set mesh topology. The default value is MESH_TOPO_TREE.

- MESH_TOPO_CHAIN supports up to 1000 layers

**Attention** This API shall be called before mesh is started.

**Parameters**

topo - [in] MESH_TOPO_TREE or MESH_TOPO_CHAIN

**Returns**

- ESP_OK
- ESP_MESH_ERR_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**esp_mesh_topology_t esp_mesh_get_topology** (void)

Get mesh topology.

**Returns**

MESH_TOPO_TREE or MESH_TOPO_CHAIN

**esp_err_t esp_mesh_enable_ps** (void)

Enable mesh Power Save function.

**Attention** This API shall be called before mesh is started.

**Returns**

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

**esp_err_t esp_mesh_disable_ps** (void)

Disable mesh Power Save function.

**Attention** This API shall be called before mesh is started.

**Returns**

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

**bool esp_mesh_is_ps_enabled** (void)

Check whether the mesh Power Save function is enabled.

**Returns**

true/false
bool esp_mesh_is_device_active (void)

Check whether the device is in active state.

• If the device is not in active state, it will neither transmit nor receive frames.

Returns true/false

esp_err_t esp_mesh_set_active_duty_cycle (int dev_duty, int dev_duty_type)

Set the device duty cycle and type.

• The range of dev_duty values is 1 to 100. The default value is 10.
• dev_duty = 100, the PS will be stopped.
• dev_duty is better to not less than 5.
• dev_duty_type could be MESH_PSDEVICE_DUTY_REQUEST or MESH_PSDEVICE_DUTY_DEMAND.
• If dev_duty_type is set to MESH_PSDEVICE_DUTY_REQUEST, the device will use a nwk_duty provided by the network.
• If dev_duty_type is set to MESH_PSDEVICE_DUTY_DEMAND, the device will use the specified dev_duty.

Attention This API can be called at any time after mesh is started.

Parameters
• dev_duty [in] device duty cycle
• dev_duty_type [in] device PS duty cycle type, not accept MESH_PSNETWORK_DUTY_MASTER

Returns
• ESP_OK
• ESP_FAIL

esp_err_t esp_mesh_get_active_duty_cycle (int *dev_duty, int *dev_duty_type)

Get device duty cycle and type.

Parameters
• dev_duty [out] device duty cycle
• dev_duty_type [out] device PS duty cycle type

Returns
• ESP_OK

esp_err_t esp_mesh_set_network_duty_cycle (int nwk_duty, int duration_mins, int applied_rule)

Set the network duty cycle, duration and rule.

• The range of nwk_duty values is 1 to 100. The default value is 10.
• nwk_duty is the network duty cycle the entire network or the up-link path will use. A device that successfully sets the nwk_duty is known as a NWK-DUTY-MASTER.
• duration_mins specifies how long the specified nwk_duty will be used. Once duration_mins expires, the root will take over as the NWK-DUTY-MASTER. If an existing NWK-DUTY-MASTER leaves the network, the root will take over as the NWK-DUTY-MASTER again.
• duration_mins = (-1) represents nwk_duty will be used until a new NWK-DUTY-MASTER with a different nwk_duty appears.
• Only the root can set duration_mins to (-1).
• If applied_rule is set to MESH_PSNETWORK_DUTY_APPLIED_ENTIRE, the nwk_duty will be used by the entire network.
Chapter 2. API Reference

• If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_UPLINK, the nwk_duty will only be used by the up-link path nodes.
• The root does not accept MESH_PS_NETWORK_DUTY_APPLIED_UPLINK.
• A nwk_duty with duration_mins(-1) set by the root is the default network duty cycle used by the entire network.

Attention This API can be called at any time after mesh is started.
• In self-organized network, if this API is called before mesh is started in all devices, (1)nwk_duty shall be set to the same value for all devices; (2)duration_mins shall be set to (-1); (3)applied_rule shall be set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE; after the voted root appears, the root will become the NWK-DUTY-MASTER and broadcast the nwk_duty and its identity of NWK-DUTY-MASTER.
• If the root is specified (FIXED-ROOT), call this API in the root to provide a default nwk_duty for the entire network.
• After joins the network, any device can call this API to change the nwk_duty, duration_mins or applied_rule.

Parameters
• nwk_duty  ⚶  [in] network duty cycle
• duration_mins  ⚶  [in] duration (unit: minutes)
• applied_rule  ⚶  [in] only support MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

Returns
• ESP_OK
• ESP_FAIL

```c
esp_err_t esp_mesh_get_network_duty_cycle (int *nwk_duty, int *duration_mins, int *dev_duty_type, int *applied_rule)
```

Get the network duty cycle, duration, type and rule.

Parameters
• nwk_duty  ⚶  [out] current network duty cycle
• duration_mins  ⚶  [out] the duration of current nwk_duty
• dev_duty_type  ⚶  [out] if it includes MESH_PS_DEVICE_DUTY_MASTER, this device is the current NWK-DUTY-MASTER.
• applied_rule  ⚶  [out] MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

Returns
• ESP_OK

```c
int esp_mesh_get_running_active_duty_cycle (void)
```

Get the running active duty cycle.

• The running active duty cycle of the root is 100.
• If duty type is set to MESH_PS_DEVICE_DUTY_REQUEST, the running active duty cycle is nwk_duty provided by the network.
• If duty type is set to MESH_PS_DEVICE_DUTY_DEMAND, the running active duty cycle is dev_duty specified by the users.
• In a mesh network, devices are typically working with a certain duty-cycle (transmitting, receiving and sleep) to reduce the power consumption. The running active duty cycle decides the amount of awake time within a beacon interval. At each start of beacon interval, all devices wake up, broadcast beacons, and transmit packets if they do have pending packets for their parents or for their children. Note that Low-duty-cycle means devices may not be active in most of the time, the latency of data transmission might be greater.

Returns the running active duty cycle
```c
esp_err_t esp_mesh_ps_duty_signaling(int fwd_times)
    Duty signaling.

    Parameters fwd_times [in] the times of forwarding duty signaling packets
    Returns
    • ESP_OK

Unions

union mesh_addr_t
    #include <esp_mesh.h> Mesh address.

    Public Members

    uint8_t addr[6]
        mac address

    mip_t mip
        mip address

union mesh_event_info_t
    #include <esp_mesh.h> Mesh event information.

    Public Members

    mesh_event_channel_switch_t channel_switch
        channel switch

    mesh_event_child_connected_t child_connected
        child connected

    mesh_event_child_disconnected_t child_disconnected
        child disconnected

    mesh_event_routing_table_change_t routing_table
        routing table change

    mesh_event_connected_t connected
        parent connected

    mesh_eventDisconnected_t disconnected
        parent disconnected

    mesh_event_no_parent_found_t no_parent
        no parent found

    mesh_event_layer_change_t layer_change
        layer change
```

Chapter 2. API Reference

**mesh_event_toDS_state_t** toDS_state

toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to be MESH_TODS_REACHABLE.

**mesh_event_vote_started_t** vote_started

vote started

**mesh_event_root_address_t** root_addr

root address

**mesh_event_root_switch_req_t** switch_req

root switch request

**mesh_event_root_conflict_t** root_conflict

other powerful root

**mesh_event_root_fixed_t** root_fixed

fixed root

**mesh_event_scan_done_t** scan_done

scan done

**mesh_event_network_state_t** network_state

network state, such as whether current mesh network has a root.

**mesh_event_find_network_t** find_network

network found that can join

**mesh_event_router_switch_t** router_switch

new router information

**mesh_event_ps_duty_t** ps_duty

PS duty information

union **mesh_rc_config_t**

#include <esp_mesh.h> Vote address configuration.

**Public Members**

int **attempts**

max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)

**mesh_addr_t** rc_addr

a new root address specified by users for API esp_mesh_waive_root()
Structures

struct mip_t
    IP address and port.

    Public Members

    ip4_addr_t ip4
        IP address

    uint16_t port
        port

struct mesh_event_channel_switch_t
    Channel switch information.

    Public Members

    uint8_t channel
        new channel

struct mesh_event_connected_t
    Parent connected information.

    Public Members

    wifi_event_sta_connected_t connected
        parent information, same as Wi-Fi event SYSTEM_EVENT_STA_CONNECTED does

    uint16_t self_layer
        layer

    uint8_t duty
        parent duty

struct mesh_event_no_parent_found_t
    No parent found information.

    Public Members

    int scan_times
        scan times being through

struct mesh_event_layer_change_t
    Layer change information.
Chapter 2. API Reference

Public Members

```c
uint16_t new_layer
```
new layer

struct `mesh_event_vote_started_t`
vote started information

Public Members

```c
int reason
```
vote reason, vote could be initiated by children or by the root itself

```c
int attempts
```
max vote attempts before stopped

```c
mesh_addr_t rc_addr
```
root address specified by users via API `esp_mesh_waive_root()`

struct `mesh_event_find_network_t`
find a mesh network that this device can join

Public Members

```c
uint8_t channel
```
channel number of the new found network

```c
uint8_t router_bssid[6]
```
router BSSID

struct `mesh_event_root_switch_req_t`
Root switch request information.

Public Members

```c
int reason
```
root switch reason, generally root switch is initialized by users via API `esp_mesh_waive_root()`

```c
mesh_addr_t rc_addr
```
the address of root switch requester

struct `mesh_event_root_conflict_t`
Other powerful root address.
Public Members

```c
t int8_t rssi
    rssi with router
```

```c
t uint16_t capacity
    the number of devices in current network
```

```c
t uint8_t addr[6]
    other powerful root address
```

```c
struct mesh_event_routing_table_change_t
    Routing table change.
```

Public Members

```c
t uint16_t rt_size_new
    the new value
```

```c
t uint16_t rt_size_change
    the changed value
```

```c
struct mesh_event_root_fixed_t
    Root fixed.
```

Public Members

```c
bool is_fixed
    status
```

```c
struct mesh_event_scan_done_t
    Scan done event information.
```

Public Members

```c
t uint8_t number
    the number of APs scanned
```

```c
struct mesh_event_network_state_t
    Network state information.
```

Public Members

```c
bool is_rootless
    whether current mesh network has a root
```
struct mesh_event_ps_duty_t
    PS duty information.

    **Public Members**

    uint8_t duty
        parent or child duty

    mesh_event_child_connected_t child_connected
        child info

struct mesh_opt_t
    Mesh option.

    **Public Members**

    uint8_t type
        option type

    uint16_t len
        option length

    uint8_t* val
        option value

struct mesh_data_t
    Mesh data for esp_mesh_send() and esp_mesh_recv() 

    **Public Members**

    uint8_t* data
        data

    uint16_t size
        data size

    mesh_proto_t proto
        data protocol

    mesh_fos_t tos
        data type of service

struct mesh_router_t
    Router configuration.
Public Members

uint8_t **ssid[32]
SSID

uint8_t **ssid_len
length of SSID

uint8_t **bssid[6]
BSSID, if this value is specified, users should also specify "allow_router_switch".

uint8_t **password[64]
password

bool **allow_router_switch
if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after "fail" (mesh_attempts_t) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

struct **mesh_ap_cfg_t
Mesh softAP configuration.

Public Members

uint8_t **password[64]
mesh softAP password

uint8_t **max_connection
max number of stations allowed to connect in, default 6, max 10 = max_connection + non-mesh_max_connection max mesh connections

uint8_t **nonmesh_max_connection
max non-mesh connections

struct **mesh_cfg_t
Mesh initialization configuration.

Public Members

uint8_t **channel
channel, the mesh network on

bool **allow_channel_switch
if this value is set, when "fail" (mesh_attempts_t) times is reached, device will change to a full channel scan for a network that could join. The default value is false.
Chapter 2. API Reference

mesh_addr_t mesh_id
mesh network identification

mesh_router_t router
router configuration

mesh_ap_cfg_t mesh_ap
mesh softAP configuration

crypto_funcs_t *crypto_funcs
crypto functions

struct mesh_vote_t
Vote.

Public Members

float percentage
vote percentage threshold for approval of being a root

bool is_rc_specified
if true, rc_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make
network start root election.

mesh_rc_config_t config
vote address configuration

struct mesh_tx_pending_t
The number of packets pending in the queue waiting to be sent by the mesh stack.

Public Members

int to_parent
to parent queue

int to_parent_p2p
to parent (P2P) queue

int to_child
to child queue

int to_child_p2p
to child (P2P) queue

int mgmt
management queue
int broadcast
broadcast and multicast queue

struct mesh_rx_pending_t
The number of packets available in the queue waiting to be received by applications.

Public Members

int toDS
to external DS

int toSelf
to self

Macros

MESH_ROOT_LAYER
root layer value

MESH_MTU
max transmit unit(in bytes)

MESH_MPS
max payload size(in bytes)

ESP_ERR_MESH_WIFI_NOT_START
Mesh error code definition.
Wi-Fi isn’t started

ESP_ERR_MESH_NOT_INIT
mesh isn’t initialized

ESP_ERR_MESH_NOT_CONFIG
mesh isn’t configured

ESP_ERR_MESH_NOT_START
mesh isn’t started

ESP_ERR_MESH_NOT_SUPPORT
not supported yet

ESP_ERR_MESH_NOT_ALLOWED
operation is not allowed

ESP_ERR_MESH_NO_MEMORY
out of memory
ESP_ERR_MESH_ARGUMENT
illegal argument

ESP_ERR_MESH_EXCEED_MTU
packet size exceeds MTU

ESP_ERR_MESH_TIMEOUT
timeout

ESP_ERR_MESH_DISCONNECTED
disconnected with parent on station interface

ESP_ERR_MESH_QUEUE_FAIL
queue fail

ESP_ERR_MESH_QUEUE_FULL
queue full

ESP_ERR_MESH_NO_PARENT_FOUND
no parent found to join the mesh network

ESP_ERR_MESH_NO_ROUTE_FOUND
no route found to forward the packet

ESP_ERR_MESH_OPTION_NULL
no option found

ESP_ERR_MESH_OPTION_UNKNOWN
unknown option

ESP_ERR_MESH_XON_NO_WINDOW
no window for software flow control on upstream

ESP_ERR_MESH_INTERFACE
low-level Wi-Fi interface error

ESP_ERR_MESH_DISCARD_DUPLICATE
discard the packet due to the duplicate sequence number

ESP_ERR_MESH_DISCARD
discard the packet

ESP_ERR_MESH_VOTING
vote in progress

ESP_ERR_MESH_XMIT
XMIT
**ESP_ERR_MESH_QUEUE_READ**
error in reading queue

**ESP_ERR_MESH_PS**
mesh PS is not specified as enable or disable

**ESP_ERR_MESH_RECV_RELEASE**
release esp_mesh_recv_toDS

**MESH_DATA_ENC**
Flags bitmap for esp_mesh_send() and esp_mesh_recv()
data encrypted (Unimplemented)

**MESH_DATA_P2P**
point-to-point delivery over the mesh network

**MESH_DATA_FROMDS**
receive from external IP network

**MESH_DATA_TODS**
identify this packet is target to external IP network

**MESH_DATA_NONBLOCK**
esp_mesh_send() non-block

**MESH_DATA_DROP**
in the situation of the root having been changed, identify this packet can be dropped by new root

**MESH_DATA_GROUP**
identify this packet is target to a group address

**MESH_OPT_SEND_GROUP**
Option definitions for esp_mesh_send() and esp_mesh_recv()
data transmission by group; used with esp_mesh_send() and shall have payload

**MESH_OPT_RECV_DS_ADDR**
return a remote IP address; used with esp_mesh_send() and esp_mesh_recv()

**MESH_ASSOC_FLAG_VOTE_IN_PROGRESS**
Flag of mesh networking IE.
vote in progress

**MESH_ASSOC_FLAG_NETWORK_FREE**
no root in current network

**MESH_ASSOC_FLAG_ROOTS_FOUND**
root conflict is found
**MESH_ASSOC_FLAG_ROOT_FIXED**
fixed root

**MESH_PS_DEVICE_DUTY_REQUEST**
Mesh PS (Power Save) duty cycle type.
requests to join a network PS without specifying a device duty cycle. After the device joins the network, a network duty cycle will be provided by the network

**MESH_PS_DEVICE_DUTY_DEMAND**
requests to join a network PS and specifies a demanded device duty cycle

**MESH_PS_NETWORK_DUTY_MASTER**
indicates the device is the NWK-DUTY-MASTER (network duty cycle master)

**MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE**
Mesh PS (Power Save) duty cycle applied rule.

**MESH_PS_NETWORK_DUTY_APPLIED_UPLINK**

**MESH_INIT_CONFIG_DEFAULT**

---

**Type Definitions**

typedef mesh_addr_t mesh_event_root_address_t
    Root address.

typedef wifi_event_sta_disconnected_t mesh_event_disconnected_t
    Parent disconnected information.

typedef wifi_event_ap_staconnected_t mesh_event_child_connected_t
    Child connected information.

typedef wifi_event_ap_stadisconnected_t mesh_event_child_disconnected_t
    Child disconnected information.

typedef wifi_event_sta_connected_t mesh_event_router_switch_t
    New router information.

**Enumerations**

enum mesh_event_id_t
    Enumerated list of mesh event id.
    Values:

    enumerator MESH_EVENT_STARTED
        mesh is started

    enumerator MESH_EVENT_STOPPED
        mesh is stopped

enumerator `MESH_EVENT_CHANNEL_SWITCH`
channel switch

enumerator `MESH_EVENT_CHILD_CONNECTED`
a child is connected on softAP interface

enumerator `MESH_EVENT_CHILD_DISCONNECTED`
a child is disconnected on softAP interface

enumerator `MESH_EVENT_ROUTING_TABLE_ADD`
routing table is changed by adding newly joined children

enumerator `MESH_EVENT_ROUTING_TABLE_REMOVE`
routing table is changed by removing leave children

enumerator `MESH EVENT_PARENT_CONNECTED`
parent is connected on station interface

enumerator `MESH EVENT_PARENT_DISCONNECTED`
parent is disconnected on station interface

enumerator `MESH_EVENT_NO_PARENT_FOUND`
no parent found

enumerator `MESH_EVENT_LAYER_CHANGE`
layer changes over the mesh network

enumerator `MESH_EVENT_TODS_STATE`
state represents whether the root is able to access external IP network

enumerator `MESH_EVENT_VOTE_STARTED`
the process of voting a new root is started either by children or by the root

enumerator `MESH_EVENT_VOTE_STOPPED`
the process of voting a new root is stopped

enumerator `MESH_EVENT_ROOT_ADDRESS`
the root address is obtained. It is posted by mesh stack automatically.

enumerator `MESH_EVENT_ROOT_SWITCH_REQ`
root switch request sent from a new voted root candidate

enumerator `MESH_EVENT_ROOT_SWITCH_ACK`
root switch acknowledgment responds the above request sent from current root

enumerator `MESH_EVENT_ROOT_ASKED_YIELD`
the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a new parent for this device. If self organized is enabled, this device will find a new parent by itself, users could ignore this event.
enumerator **MESH_EVENT_ROOT_FIXED**

   when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent’s. Fixed Root Setting of each device is variable as that setting changes of the root.

enumerator **MESH_EVENT_SCAN_DONE**

   if self-organized networking is disabled, user can call esp_wifi_scan_start() to trigger this event, and add the corresponding scan done handler in this event.

enumerator **MESH_EVENT_NETWORK_STATE**

   network state, such as whether current mesh network has a root.

enumerator **MESH_EVENT_STOP_RECONNECTION**

   the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

enumerator **MESH_EVENT_FIND_NETWORK**

   when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

enumerator **MESH_EVENT_ROUTER_SWITCH**

   if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.

enumerator **MESH_EVENT_PS_PARENT_DUTY**

   parent duty

enumerator **MESH_EVENT_PS_CHILD_DUTY**

   child duty

enumerator **MESH_EVENT_PS_DEVICE_DUTY**

   device duty

enumerator **MESH_EVENT_MAX**

enum **mesh_type_t**

   Device type.

   *Values:*

enumerator **MESH_IDLE**

   hasn’t joined the mesh network yet

enumerator **MESH_ROOT**

   the only sink of the mesh network. Has the ability to access external IP network

enumerator **MESH_NODE**

   intermediate device. Has the ability to forward packets over the mesh network

enumerator **MESH_LEAF**

   has no forwarding ability
enumerator **MESH_STA**
   connect to router with a standalone Wi-Fi station mode, no network expansion capability

enum **mesh_proto_t**
   Protocol of transmitted application data.
   
   *Values:*
   
   enumerator **MESH_PROTO_BIN**
      binary
   
   enumerator **MESH_PROTO_HTTP**
      HTTP protocol
   
   enumerator **MESH_PROTO_JSON**
      JSON format
   
   enumerator **MESH_PROTO_MQTT**
      MQTT protocol
   
   enumerator **MESH_PROTO_AP**
      IP network mesh communication of node’s AP interface
   
   enumerator **MESH_PROTO_STA**
      IP network mesh communication of node’s STA interface

enum **mesh_tos_t**
   For reliable transmission, mesh stack provides three type of services.
   
   *Values:*
   
   enumerator **MESH_TOS_P2P**
      provide P2P (point-to-point) retransmission on mesh stack by default
   
   enumerator **MESH_TOS_E2E**
      provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)
   
   enumerator **MESH_TOS_DEF**
      no retransmission on mesh stack

enum **mesh_vote_reason_t**
   Vote reason.
   
   *Values:*
   
   enumerator **MESH VOTE_REASON_ROOT_INITIATED**
      vote is initiated by the root
   
   enumerator **MESH VOTE_REASON_CHILD_INITIATED**
      vote is initiated by children
enum mesh_disconnect_reason_t
Mesh disconnect reason code.

Values:

enumerator MESH_REASON_CYCLIC
cyclic is detected

enumerator MESH_REASON_PARENT_IDLE
parent is idle

enumerator MESH_REASON_LEAF
the connected device is changed to a leaf

enumerator MESH_REASON_DIFF_ID
in different mesh ID

enumerator MESH_REASON_ROOTS
root conflict is detected

enumerator MESH_REASON_PARENT_STOPPED
parent has stopped the mesh

enumerator MESH_REASON_SCAN_FAIL
scan fail

enumerator MESH_REASON_IE_UNKNOWN
unknown IE

enumerator MESH_REASON_WAIVE_ROOT
waive root

enumerator MESH_REASON_PARENT_WORSE
parent with very poor RSSI

enumerator MESH_REASON_EMPTY_PASSWORD
use an empty password to connect to an encrypted parent

enumerator MESH_REASON_PARENT_UNENCRYPTED
connect to an unencrypted parent/router

enum esp_mesh_topology_t
Mesh topology.

Values:

enumerator MESH_TOPO_TREE
tree topology
Chapter 2. API Reference

enumerator **MESH_TOPO_CHAIN**

    chain topology

enum **mesh_event_toDS_state_t**

    The reachability of the root to a DS (distribute system)

    **Values:**

    enumerator **MESH_TODS_UNREACHABLE**

        the root isn’t able to access external IP network

    enumerator **MESH_TODS_REACHABLE**

        the root is able to access external IP network

**SmartConfig**

The SmartConfig™ is a provisioning technology developed by TI to connect a new Wi-Fi device to a Wi-Fi network. It uses a mobile app to broadcast the network credentials from a smartphone, or a tablet, to an un-provisioned Wi-Fi device.

The advantage of this technology is that the device does not need to directly know SSID or password of an Access Point (AP). This information is provided using the smartphone. This is particularly important to headless device and systems, due to their lack of a user interface.

If you are looking for other options to provision your ESP32-C3 devices, check *Provisioning API*.

**Application Example**  Connect ESP32-C3 to target AP using SmartConfig: `wifi/smart_config`.

**API Reference**

**Header File**

- components/esp_wifi/include/esp_smartconfig.h

**Functions**

const char * **esp_smartconfig_get_version** (void)

    Get the version of SmartConfig.

    **Returns**

    - SmartConfig version const char.

**esp_err_t** **esp_smartconfig_start** (const **smartconfig_start_config_t** *config)

    Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniffer special packets from the air that containing SSID and password of target AP.

    **Attention** 1. This API can be called in station or softAP-station mode.

    **Attention** 2. Can not call esp_smartconfig_start twice before it finish, please call esp_smartconfig_stop first.

    **Parameters**

    - **config** – pointer to smartconfig start configure structure

    **Returns**

    - ESP_OK: succeed
    - others: fail
**esp_err_t esp_smartconfig_stop** (void)

Stop SmartConfig, free the buffer taken by esp_smartconfig_start.

**Attention** Whether connect to AP succeed or not, this API should be called to free memory taken by smartconfig_start.

**Returns**
- ESP_OK: succeed
- others: fail

**esp_err_t esp_esptouch_set_timeout** (uint8_t time_s)

Set timeout of SmartConfig process.

**Attention** Timing starts from SC_STATUS_FIND_CHANNEL status. SmartConfig will restart if timeout.

**Parameters**
- time_s – range 15s~255s, offset: 45s.

**Returns**
- ESP_OK: succeed
- others: fail

**esp_err_t esp_smartconfig_set_type** (smartconfig_type_t type)

Set protocol type of SmartConfig.

**Attention** If users need to set the SmartConfig type, please set it before calling esp_smartconfig_start.

**Parameters**
- type – Choose from the smartconfig_type_t.

**Returns**
- ESP_OK: succeed
- others: fail

**esp_err_t esp_smartconfig_fast_mode** (bool enable)

Set mode of SmartConfig. default normal mode.

**Attention** 1. Please call it before API esp_smartconfig_start.
**Attention** 2. Fast mode have corresponding APP(phone).
**Attention** 3. Two mode is compatible.

**Parameters**
- enable – false-disable(default); true-enable;

**Returns**
- ESP_OK: succeed
- others: fail

**esp_err_t esp_smartconfig_get_rvd_data** (uint8_t *rvd_data, uint8_t len)

Get reserved data of ESPTouch v2.

**Parameters**
- rvd_data – reserved data
- len – length of reserved data

**Returns**
- ESP_OK: succeed
- others: fail
**Structures**

```c
struct smartconfig_event_got_ssid_pswd_t
    Argument structure for SC_EVENT_GOT_SSID_PSWD event
```

**Public Members**

- `uint8_t ssid[32]`
  SSID of the AP. Null terminated string.

- `uint8_t password[64]`
  Password of the AP. Null terminated string.

- `bool bssid_set`
  whether set MAC address of target AP or not.

- `uint8_t bssid[6]`
  MAC address of target AP.

```c
smartconfig_type_t type
    Type of smartconfig(ESPTouch or AirKiss).
```

- `uint8_t token`
  Token from cellphone which is used to send ACK to cellphone.

- `uint8_t cellphone_ip[4]`
  IP address of cellphone.

```c
struct smartconfig_start_config_t
    Configure structure for esp_smartconfig_start
```

**Public Members**

- `bool enable_log`
  Enable smartconfig logs.

- `bool esp_touch_v2_enable_crypt`
  Enable ESPTouch v2 crypt.

- `char *esp_touch_v2_key`
  ESPTouch v2 crypt key, len should be 16.

**Macros**

```c
SMARTCONFIG_START_CONFIG_DEFAULT()
```
Enumerations

enum smartconfig_type_t

Values:

enumerator SC_TYPE_ESPTOUCH
    protocol: ESPTouch

counterenum SC_TYPE_AIRKISS
    protocol: AirKiss

counterenum SC_TYPE_ESPTOUCH_AIRKISS
    protocol: ESPTouch and AirKiss

counterenum SC_TYPE_ESPTOUCH_V2
    protocol: ESPTouch v2

enum smartconfig_event_t

Smartconfig event declarations

Values:

enumerator SC_EVENT_SCAN_DONE
    ESP32 station smartconfig has finished to scan for APs

counterenumerator SC_EVENT_FOUND_CHANNEL
    ESP32 station smartconfig has found the channel of the target AP

counterenumerator SC_EVENT_GOT_SSID_PSWD
    ESP32 station smartconfig got the SSID and password

counterenumerator SC_EVENT_SEND_ACK_DONE
    ESP32 station smartconfig has sent ACK to cellphone

Wi-Fi

Introduction The Wi-Fi libraries provide support for configuring and monitoring the ESP32-C3 Wi-Fi networking functionality. This includes configuration for:

- Station mode (aka STA mode or Wi-Fi client mode). ESP32-C3 connects to an access point.
- AP mode (aka Soft-AP mode or Access Point mode). Stations connect to the ESP32-C3.
- Station/AP-coexistence mode (ESP32-C3 is concurrently an access point and a station connected to another access point).
- Various security modes for the above (WPA, WPA2, WEP, etc.)
- Scanning for access points (active & passive scanning).
- Promiscuous mode for monitoring of IEEE802.11 Wi-Fi packets.

Application Examples Several application examples demonstrating the functionality of Wi-Fi library are provided in wifi directory of ESP-IDF repository. Please check the README for more details.
API Reference

Header File

• components/esp_wifi/include/esp_wifi.h

Functions

`esp_err_t esp_wifi_init(const wifi_init_config_t *config)`

Initialize WiFi Allocate resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc. This WiFi also starts WiFi task.

**Attention** 1. This API must be called before all other WiFi API can be called
**Attention** 2. Always use WIFI_INIT_CONFIG_DEFAULT macro to initialize the configuration to default values, this can guarantee all the fields get correct value when more fields are added into wifi_init_config_t in future release. If you want to set your own initial values, overwrite the default values which are set by WIFI_INIT_CONFIG_DEFAULT. Please be notified that the field ‘magic’ of wifi_init_config_t should always be WIFI_INIT_CONFIG_MAGIC!

**Parameters** config – pointer to WiFi initialized configuration structure; can point to a temporary variable.

**Returns**

• ESP_OK: succeed
• ESP_ERR_NO_MEM: out of memory
• others: refer to error code esp_err.h

`esp_err_t esp_wifi_deinit(void)`

Deinit WiFi Free all resource allocated in esp_wifi_init and stop WiFi task.

**Attention** 1. This API should be called if you want to remove WiFi driver from the system

**Returns**

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

`esp_err_t esp_wifi_set_mode(wifi_mode_t mode)`

Set the WiFi operating mode.

```
Set the WiFi operating mode as station, soft-AP or station+soft-AP, The default mode is station mode.
```

**Parameters** mode – WiFi operating mode

**Returns**

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
• others: refer to error code in esp_err.h

`esp_err_t esp_wifi_get_mode(wifi_mode_t *mode)`

Get current operating mode of WiFi.

**Parameters** mode – [out] store current WiFi mode

**Returns**

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_start (void)
```
Start WiFi according to current configuration If mode is WIFI_MODE_STA, it create station control block and start station If mode is WIFI_MODE_AP, it create soft-AP control block and start soft-AP If mode is WIFI_MODE_APSTA, it creates soft-AP and station control block and start soft-AP and station.

Returns
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_NO_MEM: out of memory
• ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
• ESP_FAIL: other WiFi internal errors

```c
esp_err_t esp_wifi_stop (void)
```
Stop WiFi If mode is WIFI_MODE_STA, it stop station and free station control block If mode is WIFI_MODE_AP, it stop soft-AP and free soft-AP control block If mode is WIFI_MODE_APSTA, it stop station/soft-AP and free station/soft-AP control block.

Returns
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```c
esp_err_t esp_wifi_restore (void)
```
Restore WiFi stack persistent settings to default values.
This function will reset settings made using the following APIs:
• esp_wifi_set_bandwidth,
• esp_wifi_set_protocol,
• esp_wifi_set_config related
• esp_wifi_set_mode

Returns
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```c
esp_err_t esp_wifi_connect (void)
```
Connect the ESP32 WiFi station to the AP.

Attention 1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
Attention 2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to disconnect.
Attention 3. The scanning triggered by esp_wifi_scan_start() will not be effective until connection between ESP32 and the AP is established. If ESP32 is scanning and connecting at the same time, ESP32 will abort scanning and return a warning message and error number ESP_ERR_WIFI_STATE. If you want to do reconnection after ESP32 received disconnect event, remember to add the maximum retry time, otherwise the called scan will not work. This is especially true when the AP doesn’t exist, and you still try reconnection after ESP32 received disconnect event with the reason code WIFI_REASON_NO_AP_FOUND.

Returns
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
• ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
• ESP_ERR_WIFI_SSID: SSID of AP which station connects is invalid

```c
esp_err_t esp_wifi_disconnect (void)
```
Disconnect the ESP32 WiFi station from the AP.
Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi was not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_FAIL: other WiFi internal errors

`esp_err_t esp_wifi_clear_fast_connect (void)`
Currently this API is just a stub API.

Returns

- ESP_OK: succeed
- others: fail

`esp_err_t esp_wifi_deauth_sta (uint16_t aid)`
deauthenticate all stations or associated id equals to aid

Parameters

- `aid` – when `aid` is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is `aid`

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong

`esp_err_t esp_wifi_scan_start (const wifi_scan_config_t *config, bool block)`
Scan all available APs.

Attention If this API is called, the found APs are stored in WiFi driver dynamic allocated memory and the will be freed in esp_wifi_scan_get_ap_records, so generally, call esp_wifi_scan_get_ap_records to cause the memory to be freed once the scan is done.

Attention The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

Parameters

- `config` – configuration of scanning
- `block` – if block is true, this API will block the caller until the scan is done, otherwise it will return immediately

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_WIFI_TIMEOUT: blocking scan is timeout
- ESP_ERR_WIFI_STATE: wifi still connecting when invoke esp_wifi_scan_start
- others: refer to error code in esp_err.h

`esp_err_t esp_wifi_scan_stop (void)`
Stop the scan in process.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

`esp_err_t esp_wifi_scan_get_ap_num (uint16_t *number)`
Get number of APs found in last scan.

Attention This API can only be called when the scan is completed, otherwise it may get wrong value.
Parameters **number** -[out] store number of APIs found in last scan

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_scan_get_ap_records (uint16_t *number, wifi_ap_record_t *ap_records)
```

Get AP list found in last scan.

Parameters
- **number** - [inout] As input param, it stores max AP number ap_records can hold. As output param, it receives the actual AP number this API returns.
- **ap_records** - wifi_ap_record_t array to hold the found APs

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory

```c
esp_err_t esp_wifi_clear_ap_list (void)
```

Clear AP list found in last scan.

**Attention** When the obtained ap list fails, bss info must be cleared, otherwise it may cause memory leakage.

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_sta_get_ap_info (wifi_ap_record_t *ap_info)
```

Get information of AP which the ESP32 station is associated with.

**Attention** When the obtained country information is empty, it means that the AP does not carry country information

Parameters **ap_info** -the wifi_ap_record_t to hold AP information sta can get the connected ap’ s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lir in the wifi_ap_record_t struct. For example, phy_11b = 1 imply that ap support 802.11b mode

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_CONN: The station interface don’ t initialized
- ESP_ERR_WIFI_NOT_CONNECT: The station is in disconnect status

```c
esp_err_t esp_wifi_set_ps (wifi_ps_type_t type)
```

Set current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

Parameters **type** -power save type

Returns ESP_OK: succeed
**esp_err_t esp_wifi_get_ps (wifi_ps_type_t *type)**

Get current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

**Parameters**
- `type` - [out] store current power save type

**Returns**
- ESP_OK: succeed

**esp_err_t esp_wifi_set_protocol (wifi_interface_t ifx, uint8_t protocol_bitmap)**

Set protocol type of specified interface. The default protocol is (WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROTOCOL_11N).

**Attention** Support 802.11b or 802.11bg or 802.11bgn or LR mode

**Parameters**
- `ifx` - interfaces
- `protocol_bitmap` - WiFi protocol bitmap

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- others: refer to error codes in esp_err.h

**esp_err_t esp_wifi_get_protocol (wifi_interface_t ifx, uint8_t *protocol_bitmap)**

Get the current protocol bitmap of the specified interface.

**Parameters**
- `ifx` - interface
- `protocol_bitmap` - [out] store current WiFi protocol bitmap of interface ifx

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

**esp_err_t esp_wifi_set_bandwidth (wifi_interface_t ifx, wifi_bandwidth_t bw)**

Set the bandwidth of ESP32 specified interface.

**Attention** 1. API return false if try to configure an interface that is not enabled
2. WIFI_BW_HT40 is supported only when the interface support 11N

**Parameters**
- `ifx` - interface to be configured
- `bw` - bandwidth

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

**esp_err_t esp_wifi_get_bandwidth (wifi_interface_t ifx, wifi_bandwidth_t *bw)**

Get the bandwidth of ESP32 specified interface.
## Chapter 2. API Reference

**Attention** 1. API return false if try to get a interface that is not enable

### Parameters
- `ifx` - interface to be configured
- `bw` - [out] store bandwidth of interface ifx

### Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_set_channel (uint8_t primary, wifi_second_chan_t second)
```

Set primary/secondary channel of ESP32.

**Attention** 1. This API should be called after esp_wifi_start()

**Attention** 2. When ESP32 is in STA mode, this API should not be called when STA is scanning or connecting to an external AP

**Attention** 3. When ESP32 is in softAP mode, this API should not be called when softAP has connected to external STAs

**Attention** 4. When ESP32 is in STA+softAP mode, this API should not be called when in the scenarios described above

### Parameters
- `primary` - for HT20, primary is the channel number, for HT40, primary is the primary channel
- `second` - for HT20, second is ignored, for HT40, second is the second channel

### Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_get_channel (uint8_t* primary, wifi_second_chan_t* second)
```

Get the primary/secondary channel of ESP32.

**Attention** 1. API return false if try to get a interface that is not enable

### Parameters
- `primary` - store current primary channel
- `second` - [out] store current second channel

### Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_set_country (const wifi_country_t* country)
```

Configure country info

**Attention** 1. It is discouraged to call this API since this doesn’t validate the per-country rules, it’s up to the user to fill in all fields according to local regulations. Please use esp_wifi_set_country_code instead.

**Attention** 2. The default country is “01” (world safe mode) `{ .cc=”01”, .schan=1, .nchan=11, .policy=WIFI_COUNTRY_POLICY_AUTO }`.

**Attention** 3. The third octect of country code string is one of the following: ‘ ‘, ‘O’, ‘I’, ‘X’, otherwise it is considered as ‘ ‘.
### Attention 4.
When the country policy is WIFI_COUNTRY_POLICY_AUTO, the country info of the AP to which the station is connected is used. E.g. if the configured country info is \{.cc="US", .schan=1, .nchan=11\} and the country info of the AP to which the station is connected is \{.cc="JP", .schan=1, .nchan=14\} then the country info that will be used is \{.cc="JP", .schan=1, .nchan=14\}. If the station disconnected from the AP the country info is set back to the country info of the station automatically, \{.cc="US", .schan=1, .nchan=11\} in the example.

### Attention 5.
When the country policy is WIFI_COUNTRY_POLICY_MANUAL, then the configured country info is used always.

### Attention 6.
When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

### Attention 7.
The country configuration is stored into flash.

### Attention 8.
When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

#### Parameters
- **country** - the configured country info

#### Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_get_country(wifi_country_t *country)
```
Get the current country info

#### Parameters
- **country** - country info

#### Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_set_mac(wifi_interface_t ifx, const uint8_t mac[6])
```
Set MAC address of the ESP32 WiFi station or the soft-AP interface.

#### Attention 1.
This API can only be called when the interface is disabled

#### Attention 2.
ESP32 soft-AP and station have different MAC addresses, do not set them to be the same.

#### Attention 3.
The bit 0 of the first byte of ESP32 MAC address can not be 1. For example, the MAC address can set to be “1a:XX:XX:XX:XX:XX”, but can not be “15:XX:XX:XX:XX:XX”.

#### Parameters
- **ifx** - interface
- **mac** - the MAC address

#### Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MAC: invalid mac address
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- others: refer to error codes in esp_err.h

```c
esp_err_t esp_wifi_get_mac(wifi_interface_t ifx, uint8_t mac[6])
```
Get mac of specified interface.

#### Parameters
- **ifx** - interface
- **mac** - [out] store mac of the interface ifx

#### Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

**esp_err_t esp_wifi_set_promiscuous_rx_cb (wifi_promiscuous_cb_t cb)**

Register the RX callback function in the promiscuous mode.

Each time a packet is received, the registered callback function will be called.

**Parameters**
- cb – callback

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**esp_err_t esp_wifi_set_promiscuous (bool en)**

Enable the promiscuous mode.

**Parameters**
- en – false - disable, true - enable

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**esp_err_t esp_wifi_get_promiscuous (bool *en)**

Get the promiscuous mode.

**Parameters**
- en – [out] store the current status of promiscuous mode

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**esp_err_t esp_wifi_set_promiscuous_filter (const wifi_promiscuous_filter_t *filter)**

Enable the promiscuous mode packet type filter.

**Note:** The default filter is to filter all packets except WIFI_PKT_MISC

**Parameters**
- filter – the packet type filtered in promiscuous mode.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**esp_err_t esp_wifi_get_promiscuous_filter (wifi_promiscuous_filter_t *filter)**

Get the promiscuous filter.

**Parameters**
- filter – [out] store the current status of promiscuous filter

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**esp_err_t esp_wifi_set_promiscuous_ctrl_filter (const wifi_promiscuous_filter_t *filter)**

Enable subtype filter of the control packet in promiscuous mode.

**Note:** The default filter is to filter none control packet.

**Parameters**
- filter – the subtype of the control packet filtered in promiscuous mode.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
**esp_err_t esp_wifi_get_promiscuous_ctrl_filter (wifi_promiscuous_filter_t *filter)**

Get the subtype filter of the control packet in promiscuous mode.

**Parameters**

- `filter` - [out] store the current status of subtype filter of the control packet in promiscuous mode

**Returns**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

**esp_err_t esp_wifi_set_config (wifi_interface_t interface, wifi_config_t *conf)**

Set the configuration of the ESP32 STA or AP.

**Attention**

1. This API can be called only when specified interface is enabled, otherwise, API fail
2. For station configuration, bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.
3. ESP32 is limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the ESP32 station.

**Parameters**

- `interface` - interface
- `conf` - station or soft-AP configuration

**Returns**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MODE: invalid mode
- ESP_ERR_WIFI_PASSWORD: invalid password
- ESP_ERR_WIFI_NVS: WiFi internal NVS error
- others: refer to the erro code in esp_err.h

**esp_err_t esp_wifi_get_config (wifi_interface_t interface, wifi_config_t *conf)**

Get configuration of specified interface.

**Parameters**

- `interface` - interface
- `conf` - [out] station or soft-AP configuration

**Returns**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

**esp_err_t esp_wifi_ap_get_sta_list (wifi_sta_list_t *sta)**

Get STAs associated with soft-AP.

**Attention**

SSC only API

**Parameters**

- `sta` - [out] station list ap can get the connected sta’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the wifi_sta_info_t struct. For example, phy_11b = 1 imply that sta support 802.11b mode

**Returns**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
• ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

```c
esp_err_t esp_wifi_ap_get_sta_aid(const uint8_t mac[6], uint16_t *aid)
```
Get AID of STA connected with soft-AP.

**Parameters**
- `mac` - STA's mac address
- `aid` - [out] Store the AID corresponding to STA mac

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NOT_FOUND: Requested resource not found
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

```c
esp_err_t esp_wifi_set_storage(wifi_storage_t storage)
```
Set the WiFi API configuration storage type.

**Attention** 1. The default value is WIFI_STORAGE_FLASH

**Parameters**
- `storage` - Storage type

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_set_vendor_ie(bool enable, wifi_vendor_ie_type_t type, wifi_vendor_ie_id_t idx, const void *vnd_ie)
```
Set 802.11 Vendor-Specific Information Element.

**Parameters**
- `enable` - If true, specified IE is enabled. If false, specified IE is removed.
- `type` - Information Element type. Determines the frame type to associate with the IE.
- `idx` - Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
- `vnd_ie` - Pointer to vendor specific element data. First 6 bytes should be a header with fields matching `vendor_ie_data_t`. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init()
- ESP_ERR_INVALID_ARG: Invalid argument, including if first byte of vnd_ie is not WIFI_VENDOR_IE_ELEMENT_ID (0xDD) or second byte is an invalid length.
- ESP_ERR_NO_MEM: Out of memory

```c
esp_err_t esp_wifi_set_vendor_ie_cb(esp_vendor_ie_cb_t cb, void *ctx)
```
Register Vendor-Specific Information Element monitoring callback.

**Parameters**
- `cb` - Callback function
- `ctx` - Context argument, passed to callback function.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```c
esp_err_t esp_wifi_set_max_tx_power(int8_t power)
```
Set maximum transmitting power after WiFi start.
**Attention** 1. Maximum power before wifi startup is limited by PHY init data bin.

**Attention** 2. The value set by this API will be mapped to the max_tx_power of the structure `wifi_country_t` variable.

**Attention** 3. Mapping Table `{Power, max_tx_power} = {{8, 2}, {20, 5}, {28, 7}, {34, 8}, {44, 11}, {52, 13}, {56, 14}, {60, 15}, {66, 16}, {72, 18}, {80, 20}}`.

**Attention** 4. Param power unit is 0.25dBm, range is `[8, 84]` corresponding to 2dBm - 20dBm.

**Attention** 5. Relationship between set value and actual value. As follows: `{set value range, actual value} = {{[8, 19], 8}, {[20, 27], 20}, {[28, 33], 28}, {[34, 43], 34}, {[44, 51], 44}, {[52, 55], 52}, {[56, 59], 56}, {[60, 65], 60}, {[66, 71], 66}, {[72, 79], 72}, {[80, 84], 80}}`.

**Parameters** `power` - Maximum WiFi transmitting power.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by `esp_wifi_start`
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is out of range

```c
esp_err_t esp_wifi_get_max_tx_power (int8_t *power)
```
Get maximum transmitting power after WiFi start.

**Parameters** `power` - Maximum WiFi transmitting power, unit is 0.25dBm.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by `esp_wifi_start`
- ESP_ERR_WIFI_ARG: invalid argument

```c
esp_err_t esp_wifi_set_event_mask (uint32_t mask)
```
Set mask to enable or disable some WiFi events.

**Attention** 1. Mask can be created by logical OR of various `WIFI_EVENT_MASK` constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.

**Attention** 2. Default WiFi event mask is `WIFI_EVENT_MASK_AP_PROBEREQRECVED`.

**Attention** 3. There may be lots of stations sending probe request data around. Don’t unmask this event unless you need to receive probe request data.

**Parameters** `mask` - WiFi event mask.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by `esp_wifi_init`

```c
esp_err_t esp_wifi_get_event_mask (uint32_t *mask)
```
Get mask of WiFi events.

**Parameters** `mask` - WiFi event mask.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP_ERR_WIFI_ARG: invalid argument

```c
esp_err_t esp_wifi_80211_tx (wifi_interface_t ifx, const void *buffer, int len, bool en_sys_seq)
```
Send raw ieee80211 data.

**Attention** Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

**Parameters**
The Wi-Fi driver supports the following APIs for CSI data operations:

- **ifx** - Interface if the Wi-Fi mode is Station, the ifx should be WIFI_IF_STA. If the Wi-Fi mode is SoftAP, the ifx should be WIFI_IF_AP. If the Wi-Fi mode is Station+SoftAP, the ifx should be WIFI_IF_STA or WIFI_IF_AP. If the ifx is wrong, the API returns ESP_ERR_WIFI_IF.

- **buffer** - Raw ieee80211 buffer

- **len** - The length of raw buffer, the len must be <= 1500 Bytes and >= 24 Bytes

- **en_sys_seq** - Indicate whether use the internal sequence number. If en_sys_seq is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if esp_wifi_80211_tx is called before the Wi-Fi connection has been set up, both en_sys_seq=true and en_sys_seq=false are fine. However, if the API is called after the Wi-Fi connection has been set up, en_sys_seq must be true, otherwise ESP_ERR_WIFI_ARG is returned.

**Returns**

- ESP_OK: success
- ESP_ERR_WIFI_IF: Invalid interface
- ESP_ERR_INVALID_ARG: Invalid parameter
- ESP_ERR_WIFI_NO_MEM: out of memory

```c
esp_err_t esp_wifi_set_csi_rx_cb (wifi_csi_cb_t cb, void*ctx)
```

Register the RX callback function of CSI data.

Each time a CSI data is received, the callback function will be called.

**Parameters**

- **cb** - Callback
- **ctx** - Context argument, passed to callback function

**Returns**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```c
esp_err_t esp_wifi_set_csi_config (const wifi_csi_config_t *config)
```

Set CSI data configuration.

**Parameters**

- **config** - Configuration

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: Invalid argument

```c
esp_err_t esp_wifi_set_csi (bool en)
```

Enable or disable CSI.

**Parameters**

- **en** - true - enable, false - disable
**esp_err_t esp_wifi_set_ant_gpio** (const wifi_ant_gpio_config_t *config)

Set antenna GPIO configuration.

**Parameters** config – Antenna GPIO configuration.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: Invalid argument, e.g. parameter is NULL, invalid GPIO number etc

**esp_err_t esp_wifi_get_ant_gpio** (wifi_ant_gpio_config_t *config)

Get current antenna GPIO configuration.

**Parameters** config – Antenna GPIO configuration.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL

**esp_err_t esp_wifi_set_ant** (const wifi_ant_config_t *config)

Set antenna configuration.

**Parameters** config – Antenna configuration.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: Invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

**esp_err_t esp_wifi_get_ant** (wifi_ant_config_t *config)

Get current antenna configuration.

**Parameters** config – Antenna configuration.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL

**int64_t esp_wifi_get_tsf_time** (wifi_interface_t interface)

Get the TSF time In Station mode or SoftAP+Station mode if station is not connected or station doesn’t receive at least one beacon after connected, will return 0.

**Attention** Enabling power save may cause the return value inaccurate, except WiFi modem sleep

**Parameters** interface – The interface whose tsf_time is to be retrieved.

**Returns** 0 or the TSF time

**esp_err_t esp_wifi_set_inactive_time** (wifi_interface_t ifx, uint16_t sec)

Set the inactive time of the ESP32 STA or AP.

**Attention** 1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.

**Attention** 2. For SoftAP, If the softAP doesn’t receive any data from the connected STA during inactive time, the softAP will force deauth the STA. Default is 300s.

**Attention** 3. The inactive time configuration is not stored into flash

**Parameters**
- **ifx** – interface to be configured.
- **sec** – Inactive time. Unit seconds.
Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument, For Station, if sec is less than 3. For SoftAP, if sec is less than 10.

```c
esp_err_t esp_wifi_get_inactive_time(wifi_interface_t ifx, uint16_t* sec)
```
Get inactive time of specified interface.

**Parameters**

- `ifx` – Interface to be configured.
- `sec` – Inactive time. Unit seconds.

**Returns**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

```c
esp_err_t esp_wifi_statis_dump(uint32_t modules)
```
Dump WiFi statistics.

**Parameters**

- `modules` – statistic modules to be dumped

**Returns**

- ESP_OK: succeed
- others: failed

```c
esp_err_t esp_wifi_set_rssi_threshold(int32_t rssi)
```
Set RSSI threshold below which APP will get an event.

**Attention** This API needs to be called every time after WIFI_EVENT_STA_BSS_RSSI_LOW event is received.

**Parameters**

- `rssi` – threshold value in dbm between -100 to 0

**Returns**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

```c
esp_err_t esp_wifi_ftm_initiate_session(wifi_ftm_initiator_cfg_t *cfg)
```
Start an FTM Initiator session by sending FTM request If successful, event WIFI_EVENT_FTM_REPORT is generated with the result of the FTM procedure.

**Attention** Use this API only in Station mode

**Parameters**

- `cfg` – FTM Initiator session configuration

**Returns**

- ESP_OK: succeed
- others: failed

```c
esp_err_t esp_wifi_ftm_end_session(void)
```
End the ongoing FTM Initiator session.

**Attention** This API works only on FTM Initiator

**Returns**

- ESP_OK: succeed
Chapter 2.  API Reference

- others: failed

**esp_err_t esp_wifi_ftm_resp_set_offset (int16_t offset_cm)**

Set offset in cm for FTM Responder. An equivalent offset is calculated in picoseconds and added in TOD of FTM Measurement frame (T1).

**Attention** Use this API only in AP mode before performing FTM as responder

**Parameters**
- **offset_cm** – T1 Offset to be added in centimeters

**Returns**
- ESP_OK: succeed
- others: failed

**esp_err_t esp_wifi_config_11b_rate (wifi_interface_t ifx, bool disable)**

Enable or disable 11b rate of specified interface.

**Attention**
1. This API should be called after esp_wifi_init() and before esp_wifi_start().
2. Only when really need to disable 11b rate call this API otherwise don’t call this.

**Parameters**
- **ifx** – Interface to be configured.
- **disable** – true means disable 11b rate while false means enable 11b rate.

**Returns**
- ESP_OK: succeed
- others: failed

**esp_err_t esp_wifi_connectionless_module_set_wake_interval (uint16_t wake_interval)**

Set wake interval for connectionless modules to wake up periodically.

**Attention**
1. Only one wake interval for all connectionless modules.
2. This configuration could work at connected status. When ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work at disconnected status.
3. Event WIFI_EVENT_CONNECTIONLESS_MODULE_WAKE_INTERVAL_START would be posted each time wake interval starts.
4. Recommend to configure interval in multiples of hundred. (e.g. 100ms)

**Parameters**
- **wake_interval** – Milliseconds after would the chip wake up, from 1 to 65535.

**esp_err_t esp_wifi_set_country_code (const char* country, bool ieee80211d_enabled)**

configure country

**Attention**
1. When ieee80211d_enabled, the country info of the AP to which the station is connected is used. E.g. if the configured country is US and the country info of the AP to which the station is connected is JP then the country info that will be used is JP. If the station disconnected from the AP the country info is set back to the country info of the station automatically, US in the example.
2. When ieee80211d_enabled is disabled, then the configured country info is used always.
3. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.
4. The country configuration is stored into flash.
5. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

Attention 7. When country code “01” (world safe mode) is set, SoftAP mode won’t contain country IE.

Attention 8. The default country is “01” (world safe mode) and iee80211d_enabled is TRUE.

Attention 9. The third octect of country code string is one of the following: ‘ ‘, ‘O’, ‘I’, ‘X’, otherwise it is considered as ‘ ‘.

Parameters
- country—the configured country ISO code
- iee80211d_enabled—802.11d is enabled or not

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```
esp_err_t esp_wifi_get_country_code(char *country)
```
get the current country code

Parameters country—country code

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```
esp_err_t esp_wifi_config_80211_tx_rate(wifi_interface_t ifx, wifi_phy_rate_t rate)
```
Config 80211 tx rate of specified interface.

Attention 1. This API should be called after esp_wifi_init() and before esp_wifi_start().

Parameters
- ifx—Interface to be configured.
- rate—Phy rate to be configured.

Returns
- ESP_OK: succeed
- others: failed

```
esp_err_t esp_wifi_disable_pmf_config(wifi_interface_t ifx)
```
Disable PMF configuration for specified interface.

Attention This API should be called after esp_wifi_set_config() and before esp_wifi_start().

Parameters ifx—Interface to be configured.

Returns
- ESP_OK: succeed
- others: failed

```
Structures

struct wifi_init_config_t

WiFi stack configuration parameters passed to esp_wifi_init call.
Public Members

wifi_osi_funcs_t *osi_funcs
   WiFi OS functions

**Type Definitions**

typedef void (*wifi_promiscuous_cb_t)(void *buf, wifi_promiscuous_pkt_type_t type)

The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

- **Param buf** Data received. Type of data in buffer (wifi_promiscuous_pkt_t or wifi_pkt_rx_ctrl_t) indicated by ‘type’ parameter.
- **Param type** promiscuous packet type.

typedef void (*esp_vendor_ie_cb_t)(void *ctx, wifi_vendor_ie_type_t type, const uint8_t sa[6], const vendor_ie_data_t *vnd_ie, int rssi)

Function signature for received Vendor-Specific Information Element callback.

- **Param ctx** Context argument, as passed to esp_wifi_set_vendor_ie_cb() when registering callback function.
- **Param type** Information element type, based on frame type received.
- **Param sa** Source 802.11 address.
- **Param vnd_ie** Pointer to the vendor specific element data received.
- **Param rssi** Received signal strength indication.

typedef void (*wifi_csi_cb_t)(void *ctx, wifi_csi_info_t *data)

The RX callback function of Channel State Information(CSI) data.

```
Each time a CSI data is received, the callback function will be called.
```

- **Param ctx** context argument, passed to esp_wifi_set_csi_rx_cb() when registering callback function.
- **Param data** CSI data received. The memory that it points to will be deallocated after callback function returns.
Chapter 2. API Reference

Header File

- components/esp_wifi/include/esp_wifi_types.h

Unions

union wifi_config_t

#include <esp_wifi_types.h> Configuration data for ESP32 AP or STA.

The usage of this union (for ap or sta configuration) is determined by the accompanying interface argument passed to esp_wifi_set_config() or esp_wifi_get_config()

Public Members

wifi_ap_config_t ap
collection of AP

wifi_sta_config_t sta
collection of STA

Structures

struct wifi_country_t

Structure describing WiFi country-based regional restrictions.

Public Members

char cc[3]
country code string

uint8_t schan
start channel

uint8_t nchan
total channel number

int8_t max_tx_power
This field is used for getting WiFi maximum transmitting power, call esp_wifi_set_max_tx_power to set the maximum transmitting power.

wifi_country_policy_t policy
country policy

struct wifi_active_scan_time_t
Range of active scan times per channel.

Public Members
uint32_t min
minimum active scan time per channel, units: millisecond

uint32_t max
maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct wifi_scan_time_t
Aggregate of active & passive scan time per channel.

**Public Members**

* wifi_active_scan_time_t active
  active scan time per channel, units: millisecond.

uint32_t passive
passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct wifi_scan_config_t
Parameters for an SSID scan.

**Public Members**

* uint8_t *ssid
  SSID of AP

* uint8_t *bssid
  MAC address of AP

* uint8_t channel
  channel, scan the specific channel

* bool show_hidden
  enable to scan AP whose SSID is hidden

* wifi_scan_type_t scan_type
  scan type, active or passive

* wifi_scan_time_t scan_time
  scan time per channel

struct wifi_ap_record_t
Description of a WiFi AP.
Chapter 2. API Reference

Public Members

```c
uint8_t bssid[6]
    MAC address of AP

uint8_t ssid[33]
    SSID of AP

uint8_t primary
    channel of AP

wifi_second_chan_t second
    secondary channel of AP

int8_t rssi
    signal strength of AP

wifi_auth_mode_t authmode
    authmode of AP

wifi_cipher_type_t pairwise_cipher
    pairwise cipher of AP

wifi_cipher_type_t group_cipher
    group cipher of AP

wifi_ant_t ant
    antenna used to receive beacon from AP

uint32_t phy_11b
    bit: 0 flag to identify if 11b mode is enabled or not

uint32_t phy_11g
    bit: 1 flag to identify if 11g mode is enabled or not

uint32_t phy_11n
    bit: 2 flag to identify if 11n mode is enabled or not

uint32_t phy_lr
    bit: 3 flag to identify if low rate is enabled or not

uint32_t wps
    bit: 4 flag to identify if WPS is supported or not

uint32_t ftm_responder
    bit: 5 flag to identify if FTM is supported in responder mode

uint32_t ftm_initiator
    bit: 6 flag to identify if FTM is supported in initiator mode
```
**Chapter 2. API Reference**

```c
uint32_t reserved
    bit: 7..31 reserved

wifi_country_t country
    country information of AP
```

```c
struct wifi_scan_threshold_t
    Structure describing parameters for a WiFi fast scan.
```

**Public Members**

```c
int8_t rssi
    The minimum rssi to accept in the fast scan mode
```

```c
wifi_auth_mode_t authmode
    The weakest authmode to accept in the fast scan mode. Note: Incase this value is not set and password is set as per WPA2 standards (password len >= 8), it will be defaulted to WPA2 and device won’t connect to deprecated WEP/WPA networks. Please set authmode threshold as WIFI_AUTH_WEP/WIFI_AUTH_WPA_PSK to connect to WEP/WPA networks
```

```c
struct wifi_pmf_config_t
    Configuration structure for Protected Management Frame
```

**Public Members**

```c
bool capable
    Deprecated variable. Device will always connect in PMF mode if other device also advertizes PMF capability.
```

```c
bool required
    Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable devices.
```

```c
struct wifi_ap_config_t
    Soft-AP configuration settings for the ESP32.
```

**Public Members**

```c
uint8_t ssid[32]
    SSID of ESP32 soft-AP. If ssid_len field is 0, this must be a Null terminated string. Otherwise, length is set according to ssid_len.
```

```c
uint8_t password[64]
    Password of ESP32 soft-AP.
```

```c
uint8_t ssid_len
    Optional length of SSID field.
```
Chapter 2. API Reference

```c
uint8_t channel
    Channel of ESP32 soft-AP

wifi_auth_mode_t authmode
    Auth mode of ESP32 soft-AP. Do not support AUTH_WEP in soft-AP mode

uint8_t ssid_hidden
    Broadcast SSID or not, default 0, broadcast the SSID

uint8_t max_connection
    Max number of stations allowed to connect in, default 4, max 10

uint16_t beacon_interval
    Beacon interval which should be multiples of 100. Unit: TU(time unit, 1 TU = 1024 us). Range: 100 ~ 60000. Default value: 100

wifi_cipher_type_t pairwise_cipher
    Pairwise cipher of SoftAP, group cipher will be derived using this. cipher values are valid starting from WIFI_CIPHER_TYPE_TKIP, enum values before that will be considered as invalid and default cipher suites(TKIP+CCMP) will be used. Valid cipher suites in SoftAP mode are WIFI_CIPHER_TYPE_TKIP, WIFI_CIPHER_TYPE_CCMP and WIFI_CIPHER_TYPE_TKIP_CCMP.

bool ftm_responder
    Enable FTM Responder mode

wifi_pmf_config_t pmf_cfg
    Configuration for Protected Management Frame
```

```c
struct wifi_sta_config_t
    STA configuration settings for the ESP32.

Public Members
```

```c
uint8_t ssid[32]
    SSID of target AP.

uint8_t password[64]
    Password of target AP.

wifi_scan_method_t scan_method
    do all channel scan or fast scan

bool bssid_set
    whether set MAC address of target AP or not. Generally, station_config.bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

uint8_t bssid[6]
    MAC address of target AP
```
uint8_t channel
channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If the channel of AP is unknown, set it to 0.

uint16_t listen_interval
Listen interval for ESP32 station to receive beacon when WIFI_PS_MAX_MODEM is set. Units: AP beacon intervals. Defaults to 3 if set to 0.

wifi_sort_method_t sort_method
sort the connect AP in the list by rssi or security mode

wifi_scan_threshold_t threshold
When sort_method is set, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.

wifi_pmf_config_t pmf_cfg
Configuration for Protected Management Frame. Will be advertised in RSN Capabilities in RSN IE.

uint32_t rm_enabled
Whether Radio Measurements are enabled for the connection

uint32_t btm_enabled
Whether BSS Transition Management is enabled for the connection

uint32_t mbo_enabled
Whether MBO is enabled for the connection

uint32_t ft_enabled
Whether FT is enabled for the connection

uint32_t owe_enabled
Whether OWE is enabled for the connection

uint32_t reserved
Reserved for future feature set

wifi_sae_pwe_method_t sae_pwe_h2e
Whether SAE hash to element is enabled

struct wifi_sta_info_t
Description of STA associated with AP.

Public Members

uint8_t mac[6]
mac address
int8_t rssi
   current average rssi of sta connected

uint32_t phy_11b
   bit: 0 flag to identify if 11b mode is enabled or not

uint32_t phy_11g
   bit: 1 flag to identify if 11g mode is enabled or not

uint32_t phy_11n
   bit: 2 flag to identify if 11n mode is enabled or not

uint32_t phy_lr
   bit: 3 flag to identify if low rate is enabled or not

uint32_t is_mesh_child
   bit: 4 flag to identify mesh child

uint32_t reserved
   bit: 5..31 reserved

struct wifi_sta_list_t
   List of stations associated with the ESP32 Soft-AP.

Public Members

wifi_sta_info_t sta[ESP_WIFI_MAX_CONN_NUM]
   station list

int num
   number of stations in the list (other entries are invalid)

struct vendor_ie_data_t
   Vendor Information Element header.
   The first bytes of the Information Element will match this header. Payload follows.

Public Members

uint8_t element_id
   Should be set to WIFI_VENDOR_IE_ELEMENT_ID (0xDD)

uint8_t length
   Length of all bytes in the element data following this field. Minimum 4.

uint8_t vendor_oui[3]
   Vendor identifier (OUI).
uint8_t vendor_oui_type
    Vendor-specific OUI type.

uint8_t payload[0]
    Payload. Length is equal to value in ‘length’ field, minus 4.

struct wifi_pkt_rx_ctrl_t
    Received packet radio metadata header, this is the common header at the beginning of all promiscuous mode RX callback buffers.

**Public Members**

signed rssi
    Received Signal Strength Indicator (RSSI) of packet. unit: dBm

unsigned rate
    PHY rate encoding of the packet. Only valid for non HT(11bg) packet

unsigned __pad0__
    reserved

unsigned sig_mode
    0: non HT(11bg) packet; 1: HT(11n) packet; 3: VHT(11ac) packet

unsigned __pad1__
    reserved

unsigned mcs
    Modulation Coding Scheme. If is HT(11n) packet, shows the modulation, range from 0 to 76(MSC0 ~ MCS76)

unsigned cwb
    Channel Bandwidth of the packet. 0: 20MHz; 1: 40MHz

unsigned __pad2__
    reserved

unsigned smoothing
    reserved

unsigned not_sounding
    reserved

unsigned __pad3__
    reserved

unsigned aggregation
    Aggregation. 0: MPDU packet; 1: AMPDU packet
unsigned *stbc*
    Space Time Block Code(STBC). 0: non STBC packet; 1: STBC packet

unsigned *fec_coding*
    Flag is set for 11n packets which are LDPC

unsigned *sgi*
    Short Guide Interval(SGI). 0: Long GI; 1: Short GI

unsigned __pad4__
    reserved

unsigned *ampdu_cnt*
    ampdu cnt

unsigned *channel*
    primary channel on which this packet is received

unsigned *secondary_channel*
    secondary channel on which this packet is received. 0: none; 1: above; 2: below

unsigned __pad5__
    reserved

unsigned *timestamp*
    timestamp. The local time when this packet is received. It is precise only if modem sleep or light sleep is not enabled. unit: microsecond

unsigned __pad6__
    reserved

signed *noise_floor*
    noise floor of Radio Frequency Module(RF). unit: dBm

unsigned __pad7__
    reserved

unsigned __pad8__
    reserved

unsigned __pad9__
    reserved

unsigned *ant*
    antenna number from which this packet is received. 0: WiFi antenna 0; 1: WiFi antenna 1

unsigned __pad10__
    reserved
Chapter 2. API Reference

unsigned __pad11__
reserved

unsigned __pad12__
reserved

unsigned sig_len
length of packet including Frame Check Sequence (FCS)

unsigned __pad13__
reserved

unsigned rx_state
state of the packet. 0: no error; others: error numbers which are not public

struct wifi_promiscuous_pkt_t
Payload passed to ‘buf’ parameter of promiscuous mode RX callback.

Public Members

wifi_pkt_rx_ctrl_t rx_ctrl
metadata header

uint8_t payload[0]
Data or management payload. Length of payload is described by rx_ctrl.sig_len. Type of content determined by packet type argument of callback.

struct wifi_promiscuous_filter_t
Mask for filtering different packet types in promiscuous mode.

Public Members

uint32_t filter_mask
OR of one or more filter values WIFI_PROMIS_FILTER_*

struct wifi_csi_config_t
Channel state information (CSI) configuration type.

Public Members

bool lltf_en
enable to receive legacy long training field (lltf) data. Default enabled

bool httf_en
enable to receive HT long training field (httf) data. Default enabled
bool stbc_htltf2_en
enable to receive space time block code HT long training field (stbc-htltf2) data. Default enabled

bool ltf_merge_en
enable to generate hltf data by averaging lltf and ht_ltf data when receiving HT packet. Otherwise, use ht_ltf data directly. Default enabled

bool channel_filter_en
enable to turn on channel filter to smooth adjacent sub-carrier. Disable it to keep independence of adjacent sub-carrier. Default enabled

bool manu_scale
manually scale the CSI data by left shifting or automatically scale the CSI data. If set true, please set the shift bits. false: automatically. true: manually. Default false

uint8_t shift
manually left shift bits of the scale of the CSI data. The range of the left shift bits is 0~15

struct wifi_csi_info_t
CSI data type.

Public Members

wifi_pkt_rx_ctrl_t rx_ctrl
received packet radio metadata header of the CSI data

uint8_t mac[6]
source MAC address of the CSI data

bool first_word_invalid
first four bytes of the CSI data is invalid or not

int8_t *buf
buffer of CSI data

uint16_t len
length of CSI data

struct wifi_ant_gpio_t
WiFi GPIO configuration for antenna selection.

Public Members

uint8_t gpio_select
Whether this GPIO is connected to external antenna switch

uint8_t gpio_num
The GPIO number that connects to external antenna switch
struct wifi_ant_gpio_config_t
WiFi GPIOs configuration for antenna selection.

Public Members

wifi_ant_gpio_t gpio_cfg[4]
The configurations of GPIOs that connect to external antenna switch

struct wifi_ant_config_t
WiFi antenna configuration.

Public Members

wifi_ant_mode_t rx_ant_mode
WiFi antenna mode for receiving

wifi_ant_t rx_ant_default
Default antenna mode for receiving, it’s ignored if rx_ant_mode is not WIFI_ANT_MODE_AUTO

wifi_ant_mode_t tx_ant_mode
WiFi antenna mode for transmission, it can be set to WIFI_ANT_MODE_AUTO only if rx_ant_mode is set to WIFI_ANT_MODE_AUTO

uint8_t enabled_ant0
Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT0

uint8_t enabled_ant1
Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT1

struct wifi_action_tx_req_t
Action Frame Tx Request.

Public Members

wifi_interface_t ifx
WiFi interface to send request to

uint8_t dest_mac[6]
Destination MAC address

bool no_ack
Indicates no ack required

wifi_action_rx_cb_t rx_cb
Rx Callback to receive any response
uint32_t data_len
Length of the appended Data

uint8_t data[0]
Appended Data payload

struct wifi_ftm_initiator_cfg_t
FTM Initiator configuration.

Public Members

uint8_t resp_mac[6]
MAC address of the FTM Responder

uint8_t channel
Primary channel of the FTM Responder

uint8_t frm_count
No. of FTM frames requested in terms of 4 or 8 bursts (allowed values - 0(No pref), 16, 24, 32, 64)

uint16_t burst_period
Requested time period between consecutive FTM bursts in 100’s of milliseconds (0 - No pref)

struct wifi_event_sta_scan_done_t
Argument structure for WIFI_EVENT_SCAN_DONE event

Public Members

uint32_t status
status of scanning APs: 0 — success, 1 - failure

uint8_t number
number of scan results

uint8_t scan_id
scan sequence number, used for block scan

struct wifi_event_sta_connected_t
Argument structure for WIFI_EVENT_STA_CONNECTED event

Public Members

uint8_t ssid[32]
SSID of connected AP
**Chapter 2. API Reference**

```c
uint8_t ssid_len
SSID length of connected AP

uint8_t bssid[6]
BSSID of connected AP

uint8_t channel
channel of connected AP

wifi_auth_mode_t authmode
authentication mode used by AP
```

**struct wifi_event_sta_disconnected_t**
Argument structure for WIFI_EVENT_STA_DISCONNECTED event

**Public Members**

```c
uint8_t ssid[32]
SSID of disconnected AP

uint8_t ssid_len
SSID length of disconnected AP

uint8_t bssid[6]
BSSID of disconnected AP

uint8_t reason
reason of disconnection
```

**struct wifi_event_sta_authmode_change_t**
Argument structure for WIFI_EVENT_STA_AUTHMODE_CHANGE event

**Public Members**

```c
wifi_auth_mode_t old_mode
the old auth mode of AP

wifi_auth_mode_t new_mode
the new auth mode of AP
```

**struct wifi_event_sta_wps_er_pin_t**
Argument structure for WIFI_EVENT_STA_WPS_ER_PIN event

**Public Members**
uint8_t pin_code[8]
    PIN code of station in enrollee mode

struct wifi_event_sta_wps_er_success_t
    Argument structure for WIFI_EVENT_STA_WPS_ER_SUCCESS event

    **Public Members**

    uint8_t ap_cred_cnt
        Number of AP credentials received

    uint8_t ssid[MAX_SSID_LEN]
        SSID of AP

    uint8_t passphrase[MAX_PASSPHRASE_LEN]
        Passphrase for the AP

    struct wifi_event_sta_wps_er_success_t::[anonymous] ap_cred[MAX_WPS_AP_CRED]
        All AP credentials received from WPS handshake

struct wifi_event_ap_staconnected_t
    Argument structure for WIFI_EVENT_AP_STACONNECTED event

    **Public Members**

    uint8_t mac[6]
        MAC address of the station connected to ESP32 soft-AP

    uint8_t aid
        the aid that ESP32 soft-AP gives to the station connected to

    bool is_mesh_child
        flag to identify mesh child

struct wifi_event_ap_stadisconnected_t
    Argument structure for WIFI_EVENT_AP_STADISCONNECTED event

    **Public Members**

    uint8_t mac[6]
        MAC address of the station disconnects to ESP32 soft-AP

    uint8_t aid
        the aid that ESP32 soft-AP gave to the station disconnects to
bool is_mesh_child
flag to identify mesh child

struct wifi_event_ap_probe_req_rx_t
Argument structure for WIFI_EVENT_AP_PROBEREQRECVED event

Public Members

int rssi
Received probe request signal strength

uint8_t mac[6]
MAC address of the station which send probe request

struct wifi_event_bss_rssi_low_t
Argument structure for WIFI_EVENT_STA_BSS_RSSI_LOW event

Public Members

int32_t rssi
RSSI value of bss

struct wifi_ftm_report_entry_t
Argument structure for

Public Members

uint8_t dlog_token
Dialog Token of the FTM frame

int8_t rssi
RSSI of the FTM frame received

uint32_t rtt
Round Trip Time in pSec with a peer

uint64_t t1
Time of departure of FTM frame from FTM Responder in pSec

uint64_t t2
Time of arrival of FTM frame at FTM Initiator in pSec

uint64_t t3
Time of departure of ACK from FTM Initiator in pSec
uint64_t t4
    Time of arrival of ACK at FTM Responder in pSec

struct wifi_event_ftm_report_t
    Argument structure for WIFI_EVENT_FTM_REPORT event

    Public Members

    uint8_t peer_mac[6]
        MAC address of the FTM Peer

    wifi_ftm_status_t status
        Status of the FTM operation

    uint32_t rtt_raw
        Raw average Round-Trip-Time with peer in Nano-Seconds

    uint32_t rtt_est
        Estimated Round-Trip-Time with peer in Nano-Seconds

    uint32_t dist_est
        Estimated one-way distance in Centi-Meters

    wifi_ftm_report_entry_t *ftm_report_data
        Pointer to FTM Report with multiple entries, should be freed after use

    uint8_t ftm_report_num_entries
        Number of entries in the FTM Report data

struct wifi_event_action_tx_status_t
    Argument structure for WIFI_EVENT_ACTION_TX_STATUS event

    Public Members

    wifi_interface_t ifx
        WiFi interface to send request to

    uint32_t context
        Context to identify the request

    uint8_t da[6]
        Destination MAC address

    uint8_t status
        Status of the operation

struct wifi_event_roc_done_t
    Argument structure for WIFI_EVENT_ROC_DONE event
Public Members

```c
uint32_t context
```
Context to identify the request

Macros

```c
WIFI_OFFCHAN_TX_REQ
WIFI_OFFCHAN_TX_CANCEL
WIFI_ROC_REQ
WIFI_ROC_CANCEL
WIFI_PROTOCOL_11B
WIFI_PROTOCOL_11G
WIFI_PROTOCOL_11N
WIFI_PROTOCOL_LR
ESP_WIFI_MAX_CONN_NUM
```
max number of stations which can connect to ESP32 soft-AP

```c
WIFI_VENDOR_IE_ELEMENT_ID
```

```c
WIFI_PROMIS_FILTER_MASK_ALL
```
filter all packets

```c
WIFI_PROMIS_FILTER_MASK_MGMT
```
filter the packets with type of WIFI_PKT_MGMT

```c
WIFI_PROMIS_FILTER_MASK_CTRL
```
filter the packets with type of WIFI_PKT_CTRL

```c
WIFI_PROMIS_FILTER_MASK_DATA
```
filter the packets with type of WIFI_PKT_DATA

```c
WIFI_PROMIS_FILTER_MASK_MISC
```
filter the packets with type of WIFI_PKT_MISC

```c
WIFI_PROMIS_FILTER_MASK_DATA_MPDU
```
filter the MPDU which is a kind of WIFI_PKT_DATA

```c
WIFI_PROMIS_FILTER_MASK_DATA_AMPDU
```
filter the AMPDU which is a kind of WIFI_PKT_DATA
WIFI_PROMIS_FILTER_MASK_FCSFAIL
   filter the FCS failed packets, do not open it in general

WIFI_PROMIS_CTRL_FILTER_MASK_ALL
   filter all control packets

WIFI_PROMIS_CTRL_FILTER_MASK_WRAPPER
   filter the control packets with subtype of Control Wrapper

WIFI_PROMIS_CTRL_FILTER_MASK_BAR
   filter the control packets with subtype of Block Ack Request

WIFI_PROMIS_CTRL_FILTER_MASK_BA
   filter the control packets with subtype of Block Ack

WIFI_PROMIS_CTRL_FILTER_MASK_PSPOLL
   filter the control packets with subtype of PS-Poll

WIFI_PROMIS_CTRL_FILTER_MASK_RTS
   filter the control packets with subtype of RTS

WIFI_PROMIS_CTRL_FILTER_MASK_CTS
   filter the control packets with subtype of CTS

WIFI_PROMIS_CTRL_FILTER_MASK_ACK
   filter the control packets with subtype of ACK

WIFI_PROMIS_CTRL_FILTER_MASK_CFEND
   filter the control packets with subtype of CF-END

WIFI_PROMIS_CTRL_FILTER_MASK_CFENDACK
   filter the control packets with subtype of CF-END+CF-ACK

WIFI_EVENT_MASK_ALL
   mask all WiFi events

WIFI_EVENT_MASK_NONE
   mask none of the WiFi events

WIFI_EVENT_MASK_AP_PROBEREQRECVED
   mask SYSTEM_EVENT_AP_PROBERQRECVED event

MAX_SSID_LEN

MAX_PASSPHRASE_LEN

MAX_WPS_AP_CRED
WIFI_STATIS_BUFFER

WIFI_STATIS_RXTX

WIFI_STATIS_HW

WIFI_STATIS_DIAG

WIFI_STATIS_PS

WIFI_STATIS_ALL

Type Definitions

typedef int (*wifi_action_rx_cb_t)(uint8_t*hdr,uint8_t*payload,size_tlen,uint8_t channel)

The Rx callback function of Action Tx operations.

- **Param hdr** pointer to the IEEE 802.11 Header structure
- **Param payload** pointer to the Payload following 802.11 Header
- **Param len** length of the Payload
- **Param channel** channel number the frame is received on

Enumerations

enum wifi_mode_t

- **Values:**
  - enumerator WIFI_MODE_NULL  
    null mode
  - enumerator WIFI_MODE_STA  
    WiFi station mode
  - enumerator WIFI_MODE_AP  
    WiFi soft-AP mode
  - enumerator WIFI_MODE_APSTA  
    WiFi station + soft-AP mode
  - enumerator WIFI_MODE_MAX

enum wifi_interface_t

- **Values:**
  - enumerator WIFI_IF_STA
  - enumerator WIFI_IF_AP
enum wifi_country_policy_t

Values:

eenumerator WIFI_COUNTRY_POLICY_AUTO
Country policy is auto, use the country info of AP to which the station is connected

eenumerator WIFI_COUNTRY_POLICY_MANUAL
Country policy is manual, always use the configured country info

enum wifi_auth_mode_t

Values:

eenumerator WIFI_AUTH_OPEN
authenticate mode: open

eenumerator WIFI_AUTH_WEP
authenticate mode: WEP

eenumerator WIFI_AUTH_WPA_PSK
authenticate mode: WPA_PSK

eenumerator WIFI_AUTH_WPA2_PSK
authenticate mode: WPA2_PSK

eenumerator WIFI_AUTH_WPA_WPA2_PSK
authenticate mode: WPA_WPA2_PSK

eenumerator WIFI_AUTH_WPA2_ENTERPRISE
authenticate mode: WPA2_ENTERPRISE

eenumerator WIFI_AUTH_WPA3_PSK
authenticate mode: WPA3_PSK

eenumerator WIFI_AUTH_WPA2_WPA3_PSK
authenticate mode: WPA2_WPA3_PSK

eenumerator WIFI_AUTH_WAPI_PSK
authenticate mode: WAPI_PSK

eenumerator WIFI_AUTH_OWE
authenticate mode: OWE

eenumerator WIFI_AUTH_MAX

enum wifi_err_reason_t

Values:

eenumerator WIFI_REASON_UNSPECIFIED
enumerator WIFI_REASON_AUTH_EXPIRE
enumerator WIFI_REASON_AUTH_LEAVE
enumerator WIFI_REASON_ASSOC_EXPIRE
enumerator WIFI_REASON_ASSOC_TOOMANY
enumerator WIFI_REASON_NOT_AUTHED
enumerator WIFI_REASON_NOT_ASSOCED
enumerator WIFI_REASON_ASSOC_LEAVE
enumerator WIFI_REASON_ASSOC_NOT_AUTHED
enumerator WIFI_REASON_DISASSOC_PWRCAP_BAD

enumerator WiFi_REASON_HANDSHAKE_TIMEOUT
enumerator WiFi_REASON_CONNECTION_FAIL
enumerator WiFi_REASON_AP_TSF_RESET
enumerator WiFi_REASON_ROAMING

enum wifi_second_chan_t
Values:

enumerator WiFi_SECOND_CHAN_NONE
the channel width is HT20

enumerator WiFi_SECOND_CHAN_ABOVE
the channel width is HT40 and the secondary channel is above the primary channel

enumerator WiFi_SECOND_CHAN_BELOW
the channel width is HT40 and the secondary channel is below the primary channel

enum wifi_scan_type_t
Values:

enumerator WiFi_SCAN_TYPE_ACTIVE
active scan

enumerator WiFi_SCAN_TYPE_PASSIVE
passive scan

enum wifi_cipher_type_t
Values:

enumerator WiFi_CIPHER_TYPE_NONE
the cipher type is none

enumerator WiFi_CIPHER_TYPE_WEP40
the cipher type is WEP40
enumerator WIFI_CIPHER_TYPE_WEP104
  the cipher type is WEP104

denumerator WIFI_CIPHER_TYPE_TKIP
  the cipher type is TKIP

denumerator WIFI_CIPHER_TYPE_CCMP
  the cipher type is CCMP

denumerator WIFI_CIPHER_TYPE_TKIP_CCMP
  the cipher type is TKIP and CCMP

denumerator WIFI_CIPHER_TYPE_AES_CMAC128
  the cipher type is AES-CMAC-128

denumerator WIFI_CIPHER_TYPE_SMS4
  the cipher type is SMS4

denumerator WIFI_CIPHER_TYPE_GCMP
  the cipher type is GCMP

denumerator WIFI_CIPHER_TYPE_GCMP256
  the cipher type is GCMP-256

denumerator WIFI_CIPHER_TYPE_AES_GMAC128
  the cipher type is AES-GMAC-128

denumerator WIFI_CIPHER_TYPE_AES_GMAC256
  the cipher type is AES-GMAC-256

denumerator WIFI_CIPHER_TYPE_UNKNOWN
  the cipher type is unknown

denum wifi_ant_t
  WiFi antenna.
  
  Values:

  enumerator WIFI_ANT_ANT0
    WiFi antenna 0

  enumerator WIFI_ANT_ANT1
    WiFi antenna 1

  enumerator WIFI_ANT_MAX
    Invalid WiFi antenna

enum wifi_scan_method_t
  WiFi Scan method.
  
  Values:
enumerator WIFI_FAST_SCAN
Do fast scan, scan will end after find SSID match AP

enumerator WIFI_ALL_CHANNEL_SCAN
All channel scan, scan will end after scan all the channel

def wifi_sort_method_t
Values:

enumerator WIFI_CONNECT_AP_BY_SIGNAL
Sort match AP in scan list by RSSI

enumerator WIFI_CONNECT_AP_BY_SECURITY
Sort match AP in scan list by security mode

def wifi_ps_type_t
Values:

enumerator WIFI_PS_NONE
No power save

enumerator WIFI_PS_MIN_MODEM
Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period

enumerator WIFI_PS_MAX_MODEM
Maximum modem power saving. In this mode, interval to receive beacons is determined by the listen_interval parameter in wifi_sta_config_t

def wifi_bandwidth_t
Values:

enumerator WIFI_BW_HT20

enumerator WIFI_BW_HT40

def wifi_sae_pwe_method_t
Configuration for SAE PWE derivation
Values:

enumerator WPA3_SAE_PWE_UNSPECIFIED

enumerator WPA3_SAE_PWE_HUNT_AND_PECK

enumerator WPA3_SAE_PWE_HASH_TO_ELEMENT

enumerator WPA3_SAE_PWE_BOTH
enum wifi_storage_t

Values:

enumerator WIFI_STORAGE_FLASH
    all configuration will store in both memory and flash

enumerator WIFI_STORAGE_RAM
    all configuration will only store in the memory

enum wifi_vendor_ie_type_t

Vendor Information Element type.
Determines the frame type that the IE will be associated with.

Values:

enumerator WIFI_VND_IE_TYPE_BEACON

enumerator WIFI_VND_IE_TYPE_PROBE_REQ

enumerator WIFI_VND_IE_TYPE_PROBE_RESP

enumerator WIFI_VND_IE_TYPE_ASSOC_REQ

enumerator WIFI_VND_IE_TYPE_ASSOC_RESP

enum wifi_vendor_ie_id_t

Vendor Information Element index.
Each IE type can have up to two associated vendor ID elements.

Values:

enumerator WIFI_VND_IE_ID_0

enumerator WIFI_VND_IE_ID_1

enum wifi_promiscuous_pkt_type_t

Promiscuous frame type.
Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.

Values:

enumerator WIFI_PKT_MGMT
    Management frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t

enumerator WIFI_PKT_CTRL
    Control frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t

enumerator WIFI_PKT_DATA
    Data frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t
enumerator WIFI_PKT_MISC

Other type, such as MIMO etc. ‘buf’ argument is wifi_promiscuous_pkt_t but the payload is zero length.

enum wifi_ant_mode_t

WiFi antenna mode.

Values:

enumerator WIFI_ANT_MODE_ANT0

Enable WiFi antenna 0 only

enumerator WIFI_ANT_MODE_ANT1

Enable WiFi antenna 1 only

enumerator WIFI_ANT_MODE_AUTO

Enable WiFi antenna 0 and 1, automatically select an antenna

enumerator WIFI_ANT_MODE_MAX

Invalid WiFi enabled antenna

enum wifi_phy_rate_t

WiFi PHY rate encodings.

Values:

enumerator WIFI_PHY_RATE_1M_L

1 Mbps with long preamble

enumerator WIFI_PHY_RATE_2M_L

2 Mbps with long preamble

enumerator WIFI_PHY_RATE_5M_L

5.5 Mbps with long preamble

enumerator WIFI_PHY_RATE_11M_L

11 Mbps with long preamble

enumerator WIFI_PHY_RATE_2M_S

2 Mbps with short preamble

enumerator WIFI_PHY_RATE_5M_S

5.5 Mbps with short preamble

enumerator WIFI_PHY_RATE_11M_S

11 Mbps with short preamble

enumerator WIFI_PHY_RATE_48M

48 Mbps
enumerator **WIFI_PHY_RATE_24M**
24 Mbps

enumerator **WIFI_PHY_RATE_12M**
12 Mbps

enumerator **WIFI_PHY_RATE_6M**
6 Mbps

enumerator **WIFI_PHY_RATE_54M**
54 Mbps

enumerator **WIFI_PHY_RATE_36M**
36 Mbps

enumerator **WIFI_PHY_RATE_18M**
18 Mbps

enumerator **WIFI_PHY_RATE_9M**
9 Mbps

enumerator **WIFI_PHY_RATE_MCS0_LGI**
MCS0 with long GI, 6.5 Mbps for 20MHz, 13.5 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS1_LGI**
MCS1 with long GI, 13 Mbps for 20MHz, 27 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS2_LGI**
MCS2 with long GI, 19.5 Mbps for 20MHz, 40.5 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS3_LGI**
MCS3 with long GI, 26 Mbps for 20MHz, 54 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS4_LGI**
MCS4 with long GI, 39 Mbps for 20MHz, 81 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS5_LGI**
MCS5 with long GI, 52 Mbps for 20MHz, 108 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS6_LGI**
MCS6 with long GI, 58.5 Mbps for 20MHz, 121.5 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS7_LGI**
MCS7 with long GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS0_SGI**
MCS0 with short GI, 7.2 Mbps for 20MHz, 15 Mbps for 40MHz
enumerator WIFI_PHY_RATE_MCS1_SGI
MCS1 with short GI, 14.4 Mbps for 20MHz, 30 Mbps for 40MHz

enumerator WIFI_PHY_RATE_MCS2_SGI
MCS2 with short GI, 21.7 Mbps for 20MHz, 45 Mbps for 40MHz

enumerator WIFI_PHY_RATE_MCS3_SGI
MCS3 with short GI, 28.9 Mbps for 20MHz, 60 Mbps for 40MHz

enumerator WIFI_PHY_RATE_MCS4_SGI
MCS4 with short GI, 43.3 Mbps for 20MHz, 90 Mbps for 40MHz

enumerator WIFI_PHY_RATE_MCS5_SGI
MCS5 with short GI, 57.8 Mbps for 20MHz, 120 Mbps for 40MHz

enumerator WIFI_PHY_RATE_MCS6_SGI
MCS6 with short GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

enumerator WIFI_PHY_RATE_MCS7_SGI
MCS7 with short GI, 72.2 Mbps for 20MHz, 150 Mbps for 40MHz

enumerator WIFI_PHY_RATE_LORA_250K
250 Kbps

enumerator WIFI_PHY_RATE_LORA_500K
500 Kbps

enumerator WIFI_PHY_RATE_MAX

enum wifi_event_t
WiFi event declarations

Values:

enumerator WIFI_EVENT_WIFI_READY
ESP32 WiFi ready

everator WIFI_EVENT_SCAN_DONE
ESP32 finish scanning AP

enumerator WIFI_EVENT_STA_START
ESP32 station start

enumerator WIFI_EVENT_STA_STOP
ESP32 station stop

enumerator WIFI_EVENT_STA_CONNECTED
ESP32 station connected to AP
enumerator **WIFI_EVENT_STA_DISCONNECTED**
ESP32 station disconnected from AP

enumerator **WIFI_EVENT_STA_AUTHMODE_CHANGE**
the auth mode of AP connected by ESP32 station changed

enumerator **WIFI_EVENT_STA_WPS_ER_SUCCESS**
ESP32 station wps succeeds in enrollee mode

enumerator **WIFI_EVENT_STA_WPS_ER_FAILED**
ESP32 station wps fails in enrollee mode

enumerator **WIFI_EVENT_STA_WPS_ER_TIMEOUT**
ESP32 station wps timeout in enrollee mode

enumerator **WIFI_EVENT_STA_WPS_ER_PIN**
ESP32 station wps pin code in enrollee mode

enumerator **WIFI_EVENT_STA_WPS_ER_PBC_OVERLAP**
ESP32 station wps overlap in enrollee mode

enumerator **WIFI_EVENT_AP_START**
ESP32 soft-AP start

enumerator **WIFI_EVENT_AP_STOP**
ESP32 soft-AP stop

enumerator **WIFI_EVENT_AP_STACONNECTED**
a station connected to ESP32 soft-AP

enumerator **WIFI_EVENT_AP_STADISCONNECTED**
a station disconnected from ESP32 soft-AP

enumerator **WIFI_EVENT_AP_PROBEREQRECVED**
Receive probe request packet in soft-AP interface

enumerator **WIFI_EVENT_FTM_REPORT**
Receive report of FTM procedure

enumerator **WIFI_EVENT_STA_BSS_RSSI_LOW**
AP’s RSSI crossed configured threshold

enumerator **WIFI_EVENT_ACTION_TX_STATUS**
Status indication of Action Tx operation

enumerator **WIFI_EVENT_ROC_DONE**
Remain-on-Channel operation complete
enumerator **WIFI_EVENT_STA_BEACON_TIMEOUT**
ESP32 station beacon timeout

enumerator **WIFI_EVENT_CONNECTIONLESS_MODULE_WAKE_INTERVAL_START**
ESP32 connectionless module wake interval start

enumerator **WIFI_EVENT_MAX**
Invalid WiFi event ID

enum **wifi_event_sta_wps_fail_reason_t**
Argument structure for WIFI_EVENT_STA_WPS_ER_FAILED event

*Values:*

enumerator **WPS_FAIL_REASON_NORMAL**
ESP32 WPS normal fail reason

enumerator **WPS_FAIL_REASON_RECV_M2D**
ESP32 WPS receive M2D frame

enumerator **WPS_FAIL_REASON_MAX**

enum **wifi_ftm_status_t**
FTM operation status types.

*Values:*

enumerator **FTM_STATUS_SUCCESS**
FTM exchange is successful

enumerator **FTM_STATUS_UNSUPPORTED**
Peer does not support FTM

enumerator **FTM_STATUS_CONF_REJECTED**
Peer rejected FTM configuration in FTM Request

enumerator **FTM_STATUS_NO_RESPONSE**
Peer did not respond to FTM Requests

enumerator **FTM_STATUS_FAIL**
Unknown error during FTM exchange

**Wi-Fi Easy Connect™ (DPP)**

Wi-Fi Easy Connect™, also known as Device Provisioning Protocol (DPP) or Easy Connect, is a provisioning protocol certified by Wi-Fi Alliance. It is a secure and standardized provisioning protocol for configuration of Wi-Fi Devices. With Easy Connect adding a new device to a network is as simple as scanning a QR Code. This reduces complexity and enhances user experience while onboarding devices without UI like Smart Home and IoT products. Unlike old protocols like WiFi Protected Setup (WPS), Wi-Fi Easy Connect incorporates strong encryption through public key cryptography to ensure networks remain secure as new devices are added. Easy Connect brings many benefits in the User Experience:
• Simple and intuitive to use; no lengthy instructions to follow for new device setup
• No need to remember and enter passwords into the device being provisioned
• Works with electronic or printed QR codes, or human-readable strings
• Supports both WPA2 and WPA3 networks

Please refer to Wi-Fi Alliance’s official page on Easy Connect for more information.

ESP32-C3 supports Enrollee mode of Easy Connect with QR Code as the provisioning method. A display is required to display this QR Code. Users can scan this QR Code using their capable device and provision the ESP32-C3 to their Wi-Fi network. The provisioning device needs to be connected to the AP which need not support Wi-Fi Easy Connect™. Easy Connect is still an evolving protocol. Of known platforms that support the QR Code method are some Android smartphones with Android 10 or higher. To use Easy Connect no additional App needs to be installed on the supported smartphone.

**Application Example** Example on how to provision ESP32-C3 using a supported smartphone: wifi/wifi_easy_connect/dpp-enrollee.

**API Reference**

**Header File**

- components/wpa_supplicant/esp_supplicant/include/esp_dpp.h

**Functions**

```c
esp_err_t esp_supp_dpp_init (esp_supp_dpp_event_cb_t evt_cb)
```

Initialize DPP Supplicant. 

Starts DPP Supplicant and initializes related Data Structures.

return

- ESP_OK: Success
- ESP_FAIL: Failure

**Parameters**

- `evt_cb` – Callback function to receive DPP related events

```c
void esp_supp_dpp_deinit (void)
```

De-initialize DPP Supplicant.

Frees memory from DPP Supplicant Data Structures.

```c
esp_err_t esp_supp_dpp_bootstrap_gen (const char* chan_list, esp_supp_dpp_bootstrap_t type, const char* key, const char* info)
```

Generates Bootstrap Information as an Enrollee.

Generates Out Of Band Bootstrap information as an Enrollee which can be used by a DPP Configurator to provision the Enrollee.

**Parameters**

- `chan_list` – List of channels device will be available on for listening
- `type` – Bootstrap method type, only QR Code method is supported for now.
• **key** *(Optional)* 32 byte Raw Private Key for generating a Bootstrapping Public Key

• **info** *(Optional)* Ancillary Device Information like Serial Number

**Returns**

• ESP_OK: Success

• ESP_FAIL: Failure

```c
esp_err_t esp_supp_dpp_start_listen(void)
```

Start listening on Channels provided during `esp_supp_dpp_bootstrap_gen`.

**Returns**

• ESP_OK: Success

• ESP_FAIL: Generic Failure

• ESP_ERR_INVALID_STATE: ROC attempted before WiFi is started

• ESP_ERR_NO_MEM: Memory allocation failed while posting ROC request

```c
void esp_supp_dpp_stop_listen(void)
```

Stop listening on Channels.

**Returns**

• ESP_OK: Success

• ESP_FAIL: Generic Failure

• ESP_ERR_INVALID_STATE: ROC attempted before WiFi is started

• ESP_ERR_NO_MEM: Memory allocation failed while posting ROC request

**Macros**

- **ESP_ERR_DPP_FAILURE**
  Generic failure during DPP Operation

- **ESP_ERR_DPP_TX_FAILURE**
  DPP Frame Tx failed OR not Acked

- **ESP_ERR_DPP_INVALID_ATTR**
  Encountered invalid DPP Attribute

**Type Definitions**

```c
typedef enum dpp_bootstrap_type esp_supp_dpp_bootstrap_t
```

Types of Bootstrap Methods for DPP.

```c
typedef void (*esp_supp_dpp_event_cb_t)(esp_supp_dpp_event_t evt, void *data)
```

Callback function for receiving DPP Events from Supplicant.

**Param** `evt` DPP event ID

**Param** `data` Event data payload

**Enumerations**
enum **dpp_bootstrap_type**

Types of Bootstrap Methods for DPP.

*Values:*

enumerator **DPP_BOOTSTRAP_QR_CODE**

QR Code Method

enumerator **DPP_BOOTSTRAP_PKEX**

Proof of Knowledge Method

enumerator **DPP_BOOTSTRAP_NFC_URI**

NFC URI record Method

enum **esp_supp_dpp_event_t**

Types of Callback Events received from DPP Supplicant.

*Values:*

enumerator **ESP_SUPP_DPP_URI_READY**

URI is ready through Bootstrapping

enumerator **ESP_SUPP_DPP_CFG_RECVD**

Config received via DPP Authentication

enumerator **ESP_SUPP_DPP_FAIL**

DPP Authentication failure

Code examples for the Wi-Fi API are provided in the wifi directory of ESP-IDF examples.

Code examples for ESP-WIFI-MESH are provided in the mesh directory of ESP-IDF examples.

### 2.5.2 Ethernet

**Ethernet**

**Overview**

ESP-IDF provides a set of consistent and flexible APIs to support both internal Ethernet MAC (EMAC) controller and external SPI-Ethernet modules.

This programming guide is split into the following sections:

1. *Basic Ethernet Concepts*
2. *Configure MAC and PHY*
3. *Connect Driver to TCP/IP Stack*
4. *Misc control of Ethernet driver*

**Basic Ethernet Concepts**

Ethernet is an asynchronous Carrier Sense Multiple Access with Collision Detect (CSMA/CD) protocol/interface. It is generally not well suited for low power applications. However, with ubiquitous deployment, internet connectivity, high data rates and limitless rage expandability, Ethernet can accommodate nearly all wired communications.

Normal IEEE 802.3 compliant Ethernet frames are between 64 and 1518 bytes in length. They are made up of five or six different fields: a destination MAC address (DA), a source MAC address (SA), a type/length field, data...
payload, an optional padding field and a Cyclic Redundancy Check (CRC). Additionally, when transmitted on the Ethernet medium, a 7-byte preamble field and Start-of-Frame (SOF) delimiter byte are appended to the beginning of the Ethernet packet.

Thus the traffic on the twist-pair cabling will appear as shown below:

![Ethernet Data Frame Format](image)

### Preamble and Start-of-Frame Delimiter
The preamble contains seven bytes of \(55H\), it allows the receiver to lock onto the stream of data before the actual frame arrives. The Start-of-Frame Delimiter (SFD) is a binary sequence \(10101011\) (as seen on the physical medium). It is sometimes considered to be part of the preamble.

When transmitting and receiving data, the preamble and SFD bytes will automatically be generated or stripped from the packets.

### Destination Address
The destination address field contains a 6-byte length MAC address of the device that the packet is directed to. If the Least Significant bit in the first byte of the MAC address is set, the address is a multi-cast destination. For example, 01-00-00-00-F0-00 and 33-45-67-89-AB-CD are multi-cast addresses, while 00-00-00-00-F0-00 and 32-45-67-89-AB-CD are not. Packets with multi-cast destination addresses are designed to arrive and be important to a selected group of Ethernet nodes. If the destination address field is the reserved multi-cast address, i.e. FF-FF-FF-FF-FF, the packet is a broadcast packet and it will be directed to everyone sharing the network. If the Least Significant bit in the first byte of the MAC address is clear, the address is a uni-cast address and will be designed for usage by only the addressed node.

Normally the EMAC controller incorporates receive filters which can be used to discard or accept packets with multi-cast, broadcast and/or uni-cast destination addresses. When transmitting packets, the host controller is responsible for writing the desired destination address into the transmit buffer.

### Source Address
The source address field contains a 6-byte length MAC address of the node which created the Ethernet packet. Users of Ethernet must generate a unique MAC address for each controller used. MAC addresses...
consist of two portions. The first three bytes are known as the Organizationally Unique Identifier (OUI). OUIs are distributed by the IEEE. The last three bytes are address bytes at the discretion of the company that purchased the OUI. More information about MAC Address used in ESP-IDF, please see MAC Address Allocation.

When transmitting packets, the assigned source MAC address must be written into the transmit buffer by the host controller.

**Type / Length** The type/length field is a 2-byte field, if the value in this field is \(<= 1500\) (decimal), it is considered a length field and it specifies the amount of non-padding data which follows in the data field. If the value is \(>= 1536\), it represents the protocol the following packet data belongs to. The following are the most common type values:

- IPv4 = 0800H
- IPv6 = 86DDH
- ARP = 0806H

Users implementing proprietary networks may choose to treat this field as a length field, while applications implementing protocols such as the Internet Protocol (IP) or Address Resolution Protocol (ARP), should program this field with the appropriate type defined by the protocol’s specification when transmitting packets.

**Payload** The payload field is a variable length field, anywhere from 0 to 1500 bytes. Larger data packets will violate Ethernet standards and will be dropped by most Ethernet nodes. This field contains the client data, such as an IP datagram.

**Padding and FCS** The padding field is a variable length field added to meet IEEE 802.3 specification requirements when small data payloads are used. The DA, SA, type, payload and padding of an Ethernet packet must be no smaller than 60 bytes. Adding the required 4-byte FCS field, packets must be no smaller than 64 bytes. If the data field is less than 46 bytes long, a padding field is required.

The FCS field is a 4-byte field which contains an industry standard 32-bit CRC calculated with the data from the DA, SA, type, payload and padding fields. Given the complexity of calculating a CRC, the hardware normally will automatically generate a valid CRC and transmit it. Otherwise, the host controller must generate the CRC and place it in the transmit buffer.

Normally, the host controller does not need to concern itself with padding and the CRC which the hardware E MAC will also be able to automatically generate when transmitting and verify when receiving. However, the padding and CRC fields will be written into the receive buffer when packets arrive, so they may be evaluated by the host controller if needed.

**Note:** Besides the basic data frame described above, there’re two other common frame types in 10/100 Mbps Ethernet: control frames and VLAN tagged frames. They’re not supported in ESP-IDF.

**Configure MAC and PHY** Ethernet driver is composed of two parts: MAC and PHY.

We need to setup necessary parameters for MAC and PHY respectively based on your Ethernet board design and then combine the two together, completing the driver installation.

Configuration for MAC is described in `eth_mac_config_t`, including:

- `eth_mac_config_t::sw_reset_timeout_ms`: software reset timeout value, in milliseconds, typically MAC reset should be finished within 100ms.
- `eth_mac_config_t::rx_task_stack_size` and `eth_mac_config_t::rx_task_prio`: the MAC driver creates a dedicated task to process incoming packets, these two parameters are used to set the stack size and priority of the task.
- `eth_mac_config_t::flags`: specifying extra features that the MAC driver should have, it could be useful in some special situations. The value of this field can be OR’d with macros prefixed with
Chapter 2. API Reference

ETH_MAC_FLAG_. For example, if the MAC driver should work when cache is disabled, then you should configure this field with ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE.

Configuration for PHY is described in eth_phy_config_t, including:

- `eth_phy_config_t::phy_addr`: multiple PHY device can share the same SMI bus, so each PHY needs a unique address. Usually this address is configured during hardware design by pulling up/down some PHY strapping pins. You can set the value from 0 to 15 based on your Ethernet board. Especially, if the SMI bus is shared by only one PHY device, setting this value to -1 can enable the driver to detect the PHY address automatically.
- `eth_phy_config_t::reset_timeout_ms`: reset timeout value, in milliseconds, typically PHY reset should be finished within 100ms.
- `eth_phy_config_t::autonego_timeout_ms`: auto-negotiation timeout value, in milliseconds. Ethernet driver will start negotiation with the peer Ethernet node automatically, to determine to duplex and speed mode. This value usually depends on the ability of the PHY device on your board.
- `eth_phy_config_t::reset_gpio_num`: if your board also connect the PHY reset pin to one of the GPIO, then set it here. Otherwise, set this field to -1.

ESP-IDF provides a default configuration for MAC and PHY in macro ETH_MAC_DEFAULT_CONFIG and ETH_PHY_DEFAULT_CONFIG.

Create MAC and PHY Instance Ethernet driver is implemented in an Object-Oriented style. Any operation on MAC and PHY should be based on the instance of them two.

SPI-Ethernet Module

```c
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // apply default MAC
  // configuration
eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG(); // apply default PHY
  // configuration
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR; // alter the PHY
  // address according to your board design
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO; // alter the GPIO
  // used for PHY reset
// Install GPIO interrupt service (as the SPI-Ethernet module is interrupt driven)
gpio_install_isr_service(0);
// SPI bus configuration
spi_device_handle_t spi_handle = NULL;
spi_bus_config_t buscfg = {
  .miso_io_num = CONFIG_EXAMPLE_ETH_SPI_MISO_GPIO,
  .mosi_io_num = CONFIG_EXAMPLE_ETH_SPI_MOSI_GPIO,
  .sclk_io_num = CONFIG_EXAMPLE_ETH_SPI_SCLK_GPIO,
  .quadwp_io_num = -1,
  .quadhd_io_num = -1,
};
ESP_ERROR_CHECK(spi_bus_initialize(CONFIG_EXAMPLE_ETH_SPI_HOST, &buscfg, 1));
// Configure SPI device
spi_device_interface_config_t spi_devcfg = {
  .mode = 0,
  .clock_speed_hz = CONFIG_EXAMPLE_ETH_SPI_CLOCK_MHZ * 1000 * 1000,
  .spics_io_num = CONFIG_EXAMPLE_ETH_SPI_CS_GPIO,
  .queue_size = 20
};
/* dm9051 ethernet driver is based on spi driver */
ext_dm9051_config_t dm9051_config = ETH_DM9051_DEFAULT_CONFIG(CONFIG_EXAMPLE_ETH_
  --SPI_HOST, &spi_devcfg);
dm9051_config.int_gpio_num = CONFIG_EXAMPLE_ETH_SPI_INT_GPIO;
esp_eth_mac_t *mac = esp_eth_mac_new_dm9051(dm9051_config, &mac_config);
esp_eth_phy_t *phy = esp_eth_phy_new_dm9051(&phy_config);
```
Chapter 2. API Reference

Note:

- When creating MAC and PHY instance for SPI-Ethernet modules (e.g. DM9051), the constructor function must have the same suffix (e.g. `esp_eth_mac_new_dm9051` and `esp_eth_phy_new_dm9051`). This is because we don’t have other choices but the integrated PHY.
- The SPI device configuration (i.e. `spi_device_interface_config_t`) may slightly differ for other Ethernet modules or to meet SPI timing on specific PCB. Please check our module’s spec and the examples in esp-idf.

Install Driver  To install the Ethernet driver, we need to combine the instance of MAC and PHY and set some additional high-level configurations (i.e. not specific to either MAC or PHY) in `esp_eth_config_t`:

- `esp_eth_config_t::mac`: instance that created from MAC generator (e.g. `esp_eth_mac_new_esp32()`).
- `esp_eth_config_t::phy`: instance that created from PHY generator (e.g. `esp_eth_phy_new_ip101()`).
- `esp_eth_config_t::check_link_period_ms`: Ethernet driver starts an OS timer to check the link status periodically. This field is used to set the interval, in milliseconds.
- `esp_eth_config_t::stack_input`: In most of Ethernet IoT applications, any Ethernet frame that received by driver should be passed to upper layer (e.g. TCP/IP stack). This field is set to a function which is responsible to deal with the incoming frames. You can even update this field at runtime via function `esp_eth_update_input_path()` after driver installation.
- `esp_eth_config_t::on_lowlevel_init_done` and `esp_eth_config_t::on_lowlevel_deinit_done`: These two fields are used to specify the hooks which get invoked when low level hardware has been initialized or de-initialized.

ESP-IDF provides a default configuration for driver installation in macro `ETH_DEFAULT_CONFIG`.

```
esp_eth_config_t config = ETH_DEFAULT_CONFIG(mac, phy); // apply default driver configuration
esp_eth_handle_t eth_handle = NULL; // after driver installed, we will get the handle of the driver
esp_eth_driver_install(&config, &eth_handle); // install driver
```

Ethernet driver also includes event-driven model, which will send useful and important event to user space. We need to initialize the event loop before installing the Ethernet driver. For more information about event-driven programming, please refer to ESP Event.

```
/** Event handler for Ethernet events */
static void ethevent_handler(void *arg, esp_event_base_t event_base, int32_t event_id, void *event_data)
{
    uint8_t mac_addr[6] = {0};
    /* we can get the ethernet driver handle from event data */
    esp_eth_handle_t eth_handle = *(esp_eth_handle_t *)event_data;

    switch (event_id) {
    case ETHERNET_EVENT_CONNECTED:
        esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
        ESP_LOGI(TAG, "Ethernet Link Up");
        ESP_LOGI(TAG, "Ethernet HW Addr %02x:%02x:%02x:%02x:%02x:%02x",
                 mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_addr[5]);
        break;
    case ETHERNET_EVENT_DISCONNECTED:
        ESP_LOGI(TAG, "Ethernet Link Down");
        break;
    case ETHERNET_EVENT_START:
        ESP_LOGI(TAG, "Ethernet Started");
        break;
    (continues on next page)
```
**Case** ETHERNET_EVENT_STOP:

```c
case ETHERNET_EVENT_STOP:
    ESP_LOGI(TAG, "Ethernet Stopped");
    break;
default:
    break;
}
```

The **Start Ethernet Driver** is used to start the Ethernet immediately after its installation.

```c
esp_eth_start(eth_handle); // start Ethernet driver state machine
```

**Connect Driver to TCP/IP Stack**

Up until now, we have installed the Ethernet driver. From the view of OSI (Open System Interconnection), we’re still on layer 2 (i.e., Data Link Layer). We can detect link up and down events, we can gain MAC address in user space, but we can’t obtain IP address, let alone send HTTP request. The TCP/IP stack used in ESP-IDF is called LwIP, for more information about it, please refer to LwIP.

To connect Ethernet driver to TCP/IP stack, these three steps need to follow:

1. Create network interface for Ethernet driver
2. Attach the network interface to Ethernet driver
3. Register IP event handlers

More information about network interface, please refer to Network Interface.
Warning: It is recommended to fully initialize the Ethernet driver and network interface prior registering user’s Ethernet/IP event handlers, i.e. register the event handlers as the last thing prior starting the Ethernet driver. Such approach ensures that Ethernet/IP events get executed first by the Ethernet driver or network interface and so the system is in expected state when executing user’s handlers.

Misc control of Ethernet driver  The following functions should only be invoked after the Ethernet driver has been installed.

- Stop Ethernet driver: `esp_eth_stop()`
- Update Ethernet data input path: `esp_eth_update_input_path()`
- Misc get/set of Ethernet driver attributes: `esp_eth_ioctl()`

```c
/* get MAC address */
uint8_t mac_addr[6];
mempset(mac_addr, 0, sizeof(mac_addr));
esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
ESP_LOGI(TAG, "Ethernet MAC Address: %02x:%02x:%02x:%02x:%02x:%02x",
        mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_addr[5]);

/* get PHY address */
int phy_addr = -1;
esp_eth_ioctl(eth_handle, ETH_CMD_G_PHY_ADDR, &phy_addr);
ESP_LOGI(TAG, "Ethernet PHY Address: %d", phy_addr);
```

Flow control  Ethernet on MCU usually has a limitation in the number of frames it can handle during network congestion, because of the limitation in RAM size. A sending station might be transmitting data faster than the peer end can accept it. Ethernet flow control mechanism allows the receiving node to signal the sender requesting suspension of transmissions until the receiver catches up. The magic behind that is the pause frame, which was defined in IEEE 802.3x.

Pause frame is a special Ethernet frame used to carry the pause command, whose EtherType field is 0x8808, with the Control opcode set to 0x0001. Only stations configured for full-duplex operation may send pause frames. When a station wishes to pause the other end of a link, it sends a pause frame to the 48-bit reserved multicast address of 01-80-C2-00-00-01. The pause frame also includes the period of pause time being requested, in the form of a two-byte integer, ranging from 0 to 65535.

After Ethernet driver installation, the flow control feature is disabled by default. You can enable it by:

```c
bool flow_ctrl_enable = true;
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, &flow_ctrl_enable);
```

One thing should be kept in mind, is that the pause frame ability will be advertised to peer end by PHY during auto negotiation. Ethernet driver sends pause frame only when both sides of the link support it.

Application Examples

- Ethernet basic example: `ethernet/basic`.
- Ethernet iperf example: `ethernet/iperf`.
- Ethernet to Wi-Fi AP “router” : `ethernet/eth2ap`.
- Most of protocol examples should also work for Ethernet: `protocols`.

Advanced Topics
Custom PHY Driver  

There are multiple PHY manufactures with their wide portfolios of chips available. The ESP-IDF already supports several PHY chips however one can easily get to a point where none of them satisfies user’s actual needs due to either price, features, stock availability etc.

Luckily, a management interface between EMAC and PHY is standardized by IEEE 802.3 in 22.2.4 Management functions section. It defines provisions of so called “MII Management Interface” for the purposes of controlling the PHY and gathering status from the PHY. A set of management registers is defined to control chip behavior, link properties, auto-negotiation configuration etc. This basic management functionality is addressed by esp_eth/src/esp_eth_phy_802_3.c in ESP-IDF and so it makes a creation of new custom PHY chip driver quite a simple task.

Note: Always consult with PHY datasheets since some PHY chips may not comply with IEEE 802.3, Section 22.2.4. It does not mean you are not able to create a custom PHY driver, it will just require more effort. You will have to define all PHY management functions.

Majority of PHY management functionality required by the ESP-IDF Ethernet driver is covered by the esp_eth/src/esp_eth_phy_802_3.c however, the following may require developing chip specific management functions:

• link status which is almost always chip specific,
• chip initialization, even though it is not strictly required, should be customized to at least ensure that expected chip is used and
• chip specific features configuration.

Steps to create custom PHY driver:

1. Define vendor specific registry layout based on PHY datasheet. See esp_eth/src/esp_eth_phy_ip101.c as an example.
2. Prepare derived PHY management object infostructure which
   • must contain at least parent IEEE 802.3 phy_802_3_t object and
   • optionally contain additional variables needed to support non-IEEE 802.3 or customized functionality. See esp_eth/src/esp_eth_phy_ksz80xx.c as an example.
3. Define chip specific management call-back functions.
4. Initialize parent IEEE 802.3 object and re-assign chip specific management call-back functions.

Once you finish the new custom PHY driver implementation, consider sharing it among with other users via IDF Component Registry.

API Reference

Header File

• components/esp_eth/include/esp_eth.h

Header File

• components/esp_eth/include/esp_eth_driver.h

Functions

esp_err_t esp_eth_driver_install (const esp_eth_config_t *config, esp_eth_handle_t *out_hdl)

Install Ethernet driver.

Parameters

• config - [in] configuration of the Ethernet driver
• out_hdl - [out] handle of Ethernet driver

Returns

• ESP_OK: install esp_eth driver successfully
• ESP_ERR_INVALID_ARG: install esp_eth driver failed because of some invalid argument
• ESP_ERR_NO_MEM: install esp_eth driver failed because there’s no memory for driver
• ESP_FAIL: install esp_eth driver failed because some other error occurred

```
esp_err_t esp_eth_driver_uninstall (esp_eth_handle_t hdl)
```

Uninstall Ethernet driver.

**Note:** It’s not recommended to uninstall Ethernet driver unless it won’t get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

**Parameters**

| **hdl** | [in] handle of Ethernet driver |

**Returns**

- ESP_OK: uninstall esp_eth driver successfully
- ESP_ERR_INVALID_ARG: uninstall esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: uninstall esp_eth driver failed because it has more than one reference
- ESP_FAIL: uninstall esp_eth driver failed because some other error occurred

```
esp_err_t esp_eth_start (esp_eth_handle_t hdl)
```

Start Ethernet driver **ONLY** in standalone mode (i.e. without TCP/IP stack)

**Note:** This API will start driver state machine and internal software timer (for checking link status).

**Parameters**

| **hdl** | [in] handle of Ethernet driver |

**Returns**

- ESP_OK: start esp_eth driver successfully
- ESP_ERR_INVALID_ARG: start esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: start esp_eth driver failed because driver has started already
- ESP_FAIL: start esp_eth driver failed because some other error occurred

```
esp_err_t esp_eth_stop (esp_eth_handle_t hdl)
```

Stop Ethernet driver.

**Note:** This function does the opposite operation of `esp_eth_start`.

**Parameters**

| **hdl** | [in] handle of Ethernet driver |

**Returns**

- ESP_OK: stop esp_eth driver successfully
- ESP_ERR_INVALID_ARG: stop esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: stop esp_eth driver failed because driver has not started yet
- ESP_FAIL: stop esp_eth driver failed because some other error occurred

```
esp_err_t esp_eth_update_input_path (esp_eth_handle_t hdl, esp_err_t (*stack_input)(esp_eth_handle_t hdl, uint8_t *buffer, uint32_t length, void *priv), void *priv)
```

Update Ethernet data input path (i.e. specify where to pass the input buffer)
Note: After install driver, Ethernet still don’t know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

**Parameters**

- `hdl` - [in] handle of Ethernet driver
- `stack_input` - [in] function pointer, which does the actual process on incoming packets
- `priv` - [in] private resource, which gets passed to `stack_input` callback without any modification

**Returns**

- `ESP_OK`: update input path successfully
- `ESP_ERR_INVALID_ARG`: update input path failed because of some invalid argument
- `ESP_FAIL`: update input path failed because some other error occurred

```c
esp_err_t esp_eth_transmit(esp_eth_handle_t hdl, void *buf, size_t length)
```

General Transmit.

**Parameters**

- `hdl` - [in] handle of Ethernet driver
- `buf` - [in] buffer of the packet to transfer
- `length` - [in] length of the buffer to transfer

**Returns**

- `ESP_OK`: transmit frame buffer successfully
- `ESP_ERR_INVALID_ARG`: transmit frame buffer failed because of some invalid argument
- `ESP_ERR_INVALID_STATE`: invalid driver state (e.i. driver is not started)
- `ESP_ERR_TIMEOUT`: transmit frame buffer failed because HW was not get available in predefined period
- `ESP_FAIL`: transmit frame buffer failed because some other error occurred

```c
esp_err_t esp_eth_transmit_vargs(esp_eth_handle_t hdl, uint32_t argc, ...)
```

Special Transmit with variable number of arguments.

**Parameters**

- `hdl` - [in] handle of Ethernet driver
- `argc` - [in] number variable arguments
- `...` - variable arguments

**Returns**

- `ESP_OK`: transmit successfull
- `ESP_ERR_INVALID_STATE`: invalid driver state (e.i. driver is not started)
- `ESP_ERR_TIMEOUT`: transmit frame buffer failed because HW was not get available in predefined period
- `ESP_FAIL`: transmit frame buffer failed because some other error occurred

```c
esp_err_t esp_eth_ioctl(esp_eth_handle_t hdl, esp_eth_io_cmd_t cmd, void *data)
```

Misc IO function of Ethernet driver.

The following common IO control commands are supported:

- `ETH_CMD_S_MAC_ADDR` sets Ethernet interface MAC address. `data` argument is pointer to MAC address buffer with expected size of 6 bytes.
- `ETH_CMD_G_MAC_ADDR` gets Ethernet interface MAC address. `data` argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.
- `ETH_CMD_S_PHY_ADDR` sets PHY address in range of <0-31>. `data` argument is pointer to memory of `uint32_t` datatype from where the configuration option is read.
- `ETH_CMD_G_PHY_ADDR` gets PHY address. `data` argument is pointer to memory of `uint32_t` datatype to which the PHY address is to be stored.
• ETH_CMD_S_AUTONEGO enables or disables Ethernet link speed and duplex mode autonegotiation. data argument is pointer to memory of bool datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped.

• ETH_CMD_G_AUTONEGO gets current configuration of the Ethernet link speed and duplex mode autonegotiation. data argument is pointer to memory of bool datatype to which the current configuration is to be stored.

• ETH_CMD_S_SPEED sets the Ethernet link speed. data argument is pointer to memory of eth_speed_t datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.

• ETH_CMD_G_SPEED gets current Ethernet link speed. data argument is pointer to memory of eth_speed_t datatype to which the speed is to be stored.

• ETH_CMD_S_PROMISCUOUS sets/resets Ethernet interface promiscuous mode. data argument is pointer to memory of bool datatype from which the configuration option is read.

• ETH_CMD_S_FLOW_CTRL sets/resets Ethernet interface flow control. data argument is pointer to memory of bool datatype from which the configuration option is read.

• ETH_CMD_S_PHY_LOOPBACK sets/resets PHY to/from loopback mode. data argument is pointer to memory of bool datatype from which the configuration option is read.

• Note that additional control commands may be available for specific MAC or PHY chips. Please consult specific MAC or PHY documentation or driver code.

Parameters
• hdl – [in] handle of Ethernet driver
• cmd – [in] IO control command
• data – [inout] address of data for set command or address where to store the data when used with get command

Returns
• ESP_OK: process io command successfully
• ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
• ESP_FAIL: process io command failed because some other error occurred
• ESP_ERR_NOT_SUPPORTED: requested feature is not supported

esp_err_t esp_eth_increase_reference (esp_eth_handle_t hdl)
Increase Ethernet driver reference.

Note: Ethernet driver handle can be obtained by os timer, netif, etc. It’s dangerous when thread A is using Ethernet but thread B uninstall the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won’t be uninstalled during your using time.

Parameters hdl – [in] handle of Ethernet driver

Returns
• ESP_OK: increase reference successfully
• ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

esp_err_t esp_eth_decrease_reference (esp_eth_handle_t hdl)
Decrease Ethernet driver reference.

Parameters hdl – [in] handle of Ethernet driver

Returns
• ESP_OK: increase reference successfully
• ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

**Structures**

```c
struct esp_eth_config_t
```
Configuration of Ethernet driver.

**Public Members**

```c
esp_eth_mac_t *mac
```
Ethernet MAC object.

```c
esp_eth_phy_t *phy
```
Ethernet PHY object.

```c
uint32_t check_link_period_ms
```
Period time of checking Ethernet link status.

```c
esp_err_t (*stack_input)(esp_eth_handle_t eth_handle, uint8_t*buffer, uint32_t length, void *priv)
```
Input frame buffer to user’s stack.

**Param**

- **eth_handle** [in] handle of Ethernet driver
- **buffer** [in] frame buffer that will get input to upper stack
- **length** [in] length of the frame buffer

**Return**

- ESP_OK: input frame buffer to upper stack successfully
- ESP_FAIL: error occurred when inputting buffer to upper stack

```c
esp_err_t (*on_lowlevel_init_done)(esp_eth_handle_t eth_handle)
```
Callback function invoked when lowlevel initialization is finished.

**Param**

- **eth_handle** [in] handle of Ethernet driver

**Return**

- ESP_OK: process extra lowlevel initialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel initialization

```c
esp_err_t (*on_lowlevel_deinit_done)(esp_eth_handle_t eth_handle)
```
Callback function invoked when lowlevel deinitialization is finished.

**Param**

- **eth_handle** [in] handle of Ethernet driver

**Return**

- ESP_OK: process extra lowlevel deinitialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel deinitialization

```c
esp_err_t (*read_phy_reg)(esp_eth_handle_t eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)
```
Read PHY register.

**Note:** Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC’s SMI interface.
Chapter 2. API Reference

**Param phy_addr [in]** PHY chip address (0~31)
**Param phy_reg [in]** PHY register index code
**Param reg_value [out]** PHY register value

**Return**
- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

```c
esp_err_t (*write_phy_reg)(esp_eth_handle_t eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)
```
Write PHY register.

**Note:** Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC’s SMI interface.

**Param eth_handle [in]** handle of Ethernet driver
**Param phy_addr [in]** PHY chip address (0~31)
**Param phy_reg [in]** PHY register index code
**Param reg_value [in]** PHY register value

**Return**
- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

**Macros**

```c
#define ETH_DEFAULT_CONFIG (emac, ephy)
```
Default configuration for Ethernet driver.

**Type Definitions**

```c
typedef void *esp_eth_handle_t
```
Handle of Ethernet driver.

**Enumerations**

```c
enum esp_eth_io_cmd_t
```
Command list for ioctl API.

**Values:**

- enumerator ETH_CMD_G_MAC_ADDR
  Get MAC address

- enumerator ETH_CMD_S_MAC_ADDR
  Set MAC address

- enumerator ETH_CMD_G_PHY_ADDR
  Get PHY address
enumerator **ETH_CMD_S_PHY_ADDR**  
Set PHY address

enumerator **ETH_CMD_G_AUTONEGO**  
Get PHY Auto Negotiation

enumerator **ETH_CMD_S_AUTONEGO**  
Set PHY Auto Negotiation

enumerator **ETH_CMD_G_SPEED**  
Get Speed

enumerator **ETH_CMD_S_SPEED**  
Set Speed

enumerator **ETH_CMD_S_PROMISCUOUS**  
Set promiscuous mode

enumerator **ETH_CMD_S_FLOW_CTRL**  
Set flow control

enumerator **ETH_CMD_G_DUPLEX_MODE**  
Get Duplex mode

enumerator **ETH_CMD_S_DUPLEX_MODE**  
Set Duplex mode

enumerator **ETH_CMD_S_PHY_LOOPBACK**  
Set PHY loopback

enumerator **ETH_CMD_CUSTOM_MAC_CMDS**

enumerator **ETH_CMD_CUSTOM_PHY_CMDS**

**Header File**

- components/esp_eth/include/esp_eth_com.h

**Structures**

struct **esp_eth_mediator_s**  
Ethernet mediator.

**Public Members**

`esp_err_t (*phy_reg_read)(esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)`  
Read PHY register.
**Chapter 2. API Reference**

**Param eth** [in] mediator of Ethernet driver
**Param phy_addr** [in] PHY Chip address (0~31)
**Param phy_reg** [in] PHY register index code
**Param reg_value** [out] PHY register value

**Return**
- ESP_OK: read PHY register successfully
- ESP_FAIL: read PHY register failed because some error occurred

*esp_err_t (*phy_reg_write)(esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)*

Write PHY register.

**Param eth** [in] mediator of Ethernet driver
**Param phy_addr** [in] PHY Chip address (0~31)
**Param phy_reg** [in] PHY register index code
**Param reg_value** [in] PHY register value

**Return**
- ESP_OK: write PHY register successfully
- ESP_FAIL: write PHY register failed because some error occurred

*esp_err_t (*stack_input)(esp_eth_mediator_t *eth, uint8_t *buffer, uint32_t length)*

Deliver packet to upper stack.

**Param eth** [in] mediator of Ethernet driver
**Param buffer** [in] packet buffer
**Param length** [in] length of the packet

**Return**
- ESP_OK: deliver packet to upper stack successfully
- ESP_FAIL: deliver packet failed because some error occurred

*esp_err_t (*on_state_changed)(esp_eth_mediator_t *eth, esp_eth_state_t state, void *args)*

Callback on Ethernet state changed.

**Param eth** [in] mediator of Ethernet driver
**Param state** [in] new state
**Param args** [in] optional argument for the new state

**Return**
- ESP_OK: process the new state successfully
- ESP_FAIL: process the new state failed because some error occurred

**Type Definitions**

typedef struct esp_eth_mediator_s esp_eth_mediator_t

Ethernet mediator.

**Enumerations**

enum esp_eth_state_t

Ethernet driver state.

Values:

enumerator ETH_STATE_LLINIT

Lowlevel init done
enumerator ETH_STATE_DEINIT
    Deinit done
enumerator ETH_STATE_LINK
    Link status changed
enumerator ETH_STATE_SPEED
    Speed updated
enumerator ETH_STATE_DUPLEX
    Duplex updated
enumerator ETH_STATE_PAUSE
    Pause ability updated

enum eth_event_t
    Ethernet event declarations.
    Values:
    enumerator ETHERNET_EVENT_START
        Ethernet driver start
    enumerator ETHERNET_EVENT_STOP
        Ethernet driver stop
    enumerator ETHERNET_EVENT_CONNECTED
        Ethernet got a valid link
    enumerator ETHERNET_EVENT_DISCONNECTED
        Ethernet lost a valid link

Header File

**struct esp_eth_mac_s**

Ethernet MAC.

**Public Members**

```c
esp_err_t (*set_mediator)(esp_eth_mac_t *mac, esp_eth_mediator_t *eth)
```

Set mediator for Ethernet MAC.

- **Param** mac [in] Ethernet MAC instance
- **Param** eth [in] Ethernet mediator

**Return**

- ESP_OK: set mediator for Ethernet MAC successfully
- ESP_ERR_INVALID_ARG: set mediator for Ethernet MAC failed because of invalid argument

```c
esp_err_t (*init)(esp_eth_mac_t *mac)
```

Initialize Ethernet MAC.

- **Param** mac [in] Ethernet MAC instance

**Return**

- ESP_OK: initialize Ethernet MAC successfully
- ESP_ERR_TIMEOUT: initialize Ethernet MAC failed because of timeout
- ESP_FAIL: initialize Ethernet MAC failed because some other error occurred

```c
esp_err_t (*deinit)(esp_eth_mac_t *mac)
```

Deinitialize Ethernet MAC.

- **Param** mac [in] Ethernet MAC instance

**Return**

- ESP_OK: deinitialize Ethernet MAC successfully
- ESP_FAIL: deinitialize Ethernet MAC failed because some other error occurred

```c
esp_err_t (*start)(esp_eth_mac_t *mac)
```

Start Ethernet MAC.

- **Param** mac [in] Ethernet MAC instance

**Return**

- ESP_OK: start Ethernet MAC successfully
- ESP_FAIL: start Ethernet MAC failed because some other error occurred

```c
esp_err_t (*stop)(esp_eth_mac_t *mac)
```

Stop Ethernet MAC.

- **Param** mac [in] Ethernet MAC instance

**Return**

- ESP_OK: stop Ethernet MAC successfully
Chapter 2. API Reference

- ESP_FAIL: stop Ethernet MAC failed because some error occurred

`esp_err_t (*transmit)(esp_eth_mac_t *mac, uint8_t *buf, uint32_t length)`
Transmit packet from Ethernet MAC.

**Note:** Returned error codes may differ for each specific MAC chip.

- Param `mac` [in] Ethernet MAC instance
- Param `buf` [in] packet buffer to transmit
- Param `length` [in] length of packet
- Return
  - ESP_OK: transmit packet successfully
  - ESP_ERR_INVALID_SIZE: number of actually sent bytes differs to expected
  - ESP_FAIL: transmit packet failed because some other error occurred

`esp_err_t (*transmit_vargs)(esp_eth_mac_t *mac, uint32_t argc, va_list args)`
Transmit packet from Ethernet MAC constructed with special parameters at Layer2.

**Note:** Typical intended use case is to make possible to construct a frame from multiple higher layer buffers without a need of buffer reallocations. However, other use cases are not limited.

**Note:** Returned error codes may differ for each specific MAC chip.

- Param `mac` [in] Ethernet MAC instance
- Param `argc` [in] number variable arguments
- Param `args` [in] variable arguments
- Return
  - ESP_OK: transmit packet successfully
  - ESP_ERR_INVALID_SIZE: number of actually sent bytes differs to expected
  - ESP_FAIL: transmit packet failed because some other error occurred

`esp_err_t (*receive)(esp_eth_mac_t *mac, uint8_t *buf, uint32_t *length)`
Receive packet from Ethernet MAC.

**Note:** Memory of `buf` is allocated in the Layer2, make sure it get free after process.

**Note:** Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

- Param `mac` [in] Ethernet MAC instance
- Param `buf` [out] packet buffer which will preserve the received frame
- Param `length` [out] length of the received packet
- Return
  - ESP_OK: receive packet successfully
  - ESP_ERR_INVALID_ARG: receive packet failed because of invalid argument
  - ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
  - ESP_FAIL: receive packet failed because some other error occurred
esp_err_t (*read_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)

Read PHY register.

Param mac [in] Ethernet MAC instance
Param phy_addr [in] PHY chip address (0~31)
Param phy_reg [in] PHY register index code
Param reg_value [out] PHY register value

Return
• ESP_OK: read PHY register successfully
• ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
• ESP_ERR_INVALID_STATE: read PHY register failed because of wrong state of MAC
• ESP_ERR_TIMEOUT: read PHY register failed because of timeout
• ESP_FAIL: read PHY register failed because some other error occurred

esp_err_t (*write_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)

Write PHY register.

Param mac [in] Ethernet MAC instance
Param phy_addr [in] PHY chip address (0~31)
Param phy_reg [in] PHY register index code
Param reg_value [in] PHY register value

Return
• ESP_OK: write PHY register successfully
• ESP_ERR_INVALID_STATE: write PHY register failed because of wrong state of MAC
• ESP_ERR_TIMEOUT: write PHY register failed because of timeout
• ESP_FAIL: write PHY register failed because some other error occurred

esp_err_t (*set_addr)(esp_eth_mac_t *mac, uint8_t *addr)

Set MAC address.

Param mac [in] Ethernet MAC instance
Param addr [in] MAC address

Return
• ESP_OK: set MAC address successfully
• ESP_ERR_INVALID_ARG: set MAC address failed because of invalid argument
• ESP_FAIL: set MAC address failed because some other error occurred

esp_err_t (*get_addr)(esp_eth_mac_t *mac, uint8_t *addr)

Get MAC address.

Param mac [in] Ethernet MAC instance
Param addr [out] MAC address

Return
• ESP_OK: get MAC address successfully
• ESP_ERR_INVALID_ARG: get MAC address failed because of invalid argument
• ESP_FAIL: get MAC address failed because some other error occurred

esp_err_t (*set_speed)(esp_eth_mac_t *mac, eth_speed_t speed)

Set speed of MAC.

Param mac [in] Ethernet MAC instance
Param speed [in] MAC speed

Return
• ESP_OK: set MAC speed successfully
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG: set MAC speed failed because of invalid argument
- ESP_FAIL: set MAC speed failed because some other error occurred

```c
esp_err_t (*set_duplex)(esp_eth_mac_t *mac, eth_duplex_t duplex)
```

Set duplex mode of MAC.

- **Param mac** [in] Ethernet MAC instance
- **Param duplex** [in] MAC duplex

**Return**
- ESP_OK: set MAC duplex mode successfully
- ESP_ERR_INVALID_ARG: set MAC duplex failed because of invalid argument
- ESP_FAIL: set MAC duplex failed because some other error occurred

```c
esp_err_t (*set_link)(esp_eth_mac_t *mac, eth_link_t link)
```

Set link status of MAC.

- **Param mac** [in] Ethernet MAC instance
- **Param link** [in] Link status

**Return**
- ESP_OK: set link status successfully
- ESP_ERR_INVALID_ARG: set link status failed because of invalid argument
- ESP_FAIL: set link status failed because some other error occurred

```c
esp_err_t (*set_promiscuous)(esp_eth_mac_t *mac, bool enable)
```

Set promiscuous of MAC.

- **Param mac** [in] Ethernet MAC instance
- **Param enable** [in] set true to enable promiscuous mode; set false to disable promiscuous mode

**Return**
- ESP_OK: set promiscuous mode successfully
- ESP_FAIL: set promiscuous mode failed because some error occurred

```c
esp_err_t (*enable_flow_ctrl)(esp_eth_mac_t *mac, bool enable)
```

Enable flow control on MAC layer or not.

- **Param mac** [in] Ethernet MAC instance
- **Param enable** [in] set true to enable flow control; set false to disable flow control

**Return**
- ESP_OK: set flow control successfully
- ESP_FAIL: set flow control failed because some error occurred

```c
esp_err_t (*set_peer_pause_ability)(esp_eth_mac_t *mac, uint32_t ability)
```

Set the PAUSE ability of peer node.

- **Param mac** [in] Ethernet MAC instance
- **Param ability** [in] zero indicates that pause function is supported by link partner; non-zero indicates that pause function is not supported by link partner

**Return**
- ESP_OK: set peer pause ability successfully
- ESP_FAIL: set peer pause ability failed because some error occurred

```c
esp_err_t (*custom_ioctl)(esp_eth_mac_t *mac, uint32_t cmd, void *data)
```

Custom IO function of MAC driver. This function is intended to extend common options of esp_eth_ioctl to cover specifics of MAC chip.

**Note:** This function may not be assigned when the MAC chip supports only most common set of
configuration options.

```c
Param mac [in] Ethernet MAC instance
Param cmd [in] IO control command
Param data [inout] address of data for set command or address where to store the data when used with get command
Return
• ESP_OK: process io command successfully
• ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
• ESP_FAIL: process io command failed because some other error occurred
• ESP_ERR_NOT_SUPPORTED: requested feature is not supported
```

```c
esp_err_t (*del)(esp_eth_mac_t *mac)
```
Free memory of Ethernet MAC.

```c
Param mac [in] Ethernet MAC instance
Return
• ESP_OK: free Ethernet MAC instance successfully
• ESP_FAIL: free Ethernet MAC instance failed because some error occurred
```

```c
struct eth_mac_config_t
```
Configuration of Ethernet MAC object.

**Public Members**

```c
uint32_t sw_reset_timeout_ms
```
Software reset timeout value (Unit: ms)

```c
uint32_t rx_task_stack_size
```
Stack size of the receive task

```c
uint32_t rx_task_prio
```
Priority of the receive task

```c
uint32_t flags
```
Flags that specify extra capability for mac driver

**Macros**

```c
ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE
MAC driver can work when cache is disabled
```

```c
ETH_MAC_FLAG_PIN_TO_CORE
Pin MAC task to the CPU core where driver installation happened
```

```c
ETH_MAC_DEFAULT_CONFIG()
```
Default configuration for Ethernet MAC object.

**Type Definitions**

```c
typedef struct esp_eth_mac_s esp_eth_mac_t
```
Ethernet MAC.
Enumerations

```c
enum emac_rmii_clock_mode_t

RMII Clock Mode Options.

Values:

enumerator EMAC_CLK_DEFAULT
    Default values configured using Kconfig are going to be used when "Default" selected.

enumerator EMAC_CLK_EXT_IN
    Input RMII Clock from external. EMAC Clock GPIO number needs to be configured when this option is selected.

Note: MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.
```

```c
enumerator EMAC_CLK_OUT

Output RMII Clock from internal APLL Clock. EMAC Clock GPIO number needs to be configured when this option is selected.

enum emac_rmii_clock_gpio_t

RMII Clock GPIO number Options.

Values:

enumerator EMAC_CLK_IN_GPIO
    MAC will get RMII clock from outside at this GPIO.

Note: ESP32 only supports GPIO0 to input the RMII clock.
```

enumerator EMAC_APPL_CLK_OUT_GPIO

Output RMII Clock from internal APLL Clock available at GPIO0.

Note: GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn’t have directly relationship with EMAC peripheral. Sometimes this clock won’t work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don’t select GPIO0 output mode for stability.

enumerator EMAC_CLK_OUT_GPIO

Output RMII Clock from internal APLL Clock available at GPIO16.

enumerator EMAC_CLK_OUT_180_GPIO

Inverted Output RMII Clock from internal APLL Clock available at GPIO17.

Header File
```
• components/esp_eth/include/esp_eth_phy.h
```
Functions

```c
esp_eth_phy_t *esp_eth_phy_new_ip101 (const eth_phy_config_t *config)
```
Create a PHY instance of IP101.

**Parameters**
- `config` [-in] configuration of PHY

**Returns**
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

```c
esp_eth_phy_t *esp_eth_phy_new_rtl8201 (const eth_phy_config_t *config)
```
Create a PHY instance of RTL8201.

**Parameters**
- `config` [-in] configuration of PHY

**Returns**
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

```c
esp_eth_phy_t *esp_eth_phy_new_lan87xx (const eth_phy_config_t *config)
```
Create a PHY instance of LAN87xx.

**Parameters**
- `config` [-in] configuration of PHY

**Returns**
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

```c
esp_eth_phy_t *esp_eth_phy_new_dp83848 (const eth_phy_config_t *config)
```
Create a PHY instance of DP83848.

**Parameters**
- `config` [-in] configuration of PHY

**Returns**
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

```c
esp_eth_phy_t *esp_eth_phy_new_ksz80xx (const eth_phy_config_t *config)
```
Create a PHY instance of KSZ80xx.

The phy model from the KSZ80xx series is detected automatically. If the driver is unable to detect a supported model, `NULL` is returned.

Currently, the following models are supported: KSZ8001, KSZ8021, KSZ8031, KSZ8041, KSZ8051, KSZ8061, KSZ8081, KSZ8091

**Parameters**
- `config` [-in] configuration of PHY

**Returns**
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Structures

```c
struct esp_eth_phy_s
```
Ethernet PHY.

Public Members

```c
esp_err_t (*set_mediator)(esp_eth_phy_t *phy, esp_eth_mediator_t *mediator)
```
Set mediator for PHY.

**Param**
- `phy` [in] Ethernet PHY instance
- `mediator` [in] mediator of Ethernet driver

**Return**
- ESP_OK: set mediator for Ethernet PHY instance successfully
**ESP_ERR_INVALID_ARG**: set mediator for Ethernet PHY instance failed because of some invalid arguments

```c
esp_err_t (*reset)(esp_eth_phy_t *phy)
```

Software Reset Ethernet PHY.

**Param phy** [in] Ethernet PHY instance

**Return**

- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

```c
esp_err_t (*reset_hw)(esp_eth_phy_t *phy)
```

Hardware Reset Ethernet PHY.

**Note:** Hardware reset is mostly done by pull down and up PHY’s nRST pin

```c
esp_err_t (*init)(esp_eth_phy_t *phy)
```

Initialize Ethernet PHY.

**Param phy** [in] Ethernet PHY instance

**Return**

- ESP_OK: initialize Ethernet PHY successfully
- ESP_FAIL: initialize Ethernet PHY failed because some error occurred

```c
esp_err_t (*deinit)(esp_eth_phy_t *phy)
```

Deinitialize Ethernet PHY.

**Param phy** [in] Ethernet PHY instance

**Return**

- ESP_OK: deinitialize Ethernet PHY successfully
- ESP_FAIL: deinitialize Ethernet PHY failed because some error occurred

```c
esp_err_t (*autonego_ctrl)(esp_eth_phy_t *phy, eth_phy_autoneg_cmd_t cmd, bool *autonego_en_stat)
```

Configure auto negotiation.

**Param phy** [in] Ethernet PHY instance

**Param cmd** [in] Configuration command, it is possible to Enable (restart), Disable or get current status of PHY auto negotiation

**Param autonego_en_stat** [out] Address where to store current status of auto negotiation configuration

**Return**

- ESP_OK: restart auto negotiation successfully
- ESP_FAIL: restart auto negotiation failed because some error occurred
- ESP_ERR_INVALID_ARG: invalid command

```c
esp_err_t (*get_link)(esp_eth_phy_t *phy)
```

Get Ethernet PHY link status.

**Param phy** [in] Ethernet PHY instance

**Return**
Chapter 2. API Reference

- ESP_OK: get Ethernet PHY link status successfully
- ESP_FAIL: get Ethernet PHY link status failed because some error occurred

```c
esp_err_t (*pwrctl)(esp_eth_phy_t *phy, bool enable)
```

Power control of Ethernet PHY.

- Param phy [in] Ethernet PHY instance
- Param enable [in] set true to power on Ethernet PHY; set false to power off Ethernet PHY

```c
esp_err_t (*set_addr)(esp_eth_phy_t *phy, uint32_t addr)
```

Set PHY chip address.

- Param phy [in] Ethernet PHY instance
- Param addr [in] PHY chip address

```c
esp_err_t (*get_addr)(esp_eth_phy_t *phy, uint32_t *addr)
```

Get PHY chip address.

- Param phy [in] Ethernet PHY instance
- Param addr [out] PHY chip address

```c
esp_err_t (*advertise_pause_ability)(esp_eth_phy_t *phy, uint32_t ability)
```

Advertise pause function supported by MAC layer.

- Param phy [in] Ethernet PHY instance
- Param addr [out] Pause ability

```c
esp_err_t (*loopback)(esp_eth_phy_t *phy, bool enable)
```

Sets the PHY to loopback mode.

- Param phy [in] Ethernet PHY instance
- Param enable [in] enables or disables PHY loopback

```c
esp_err_t (*set_speed)(esp_eth_phy_t *phy, eth_speed_t speed)
```

Sets PHY speed mode.

- Note: Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

```c
Param phy [in] Ethernet PHY instance
```
**Param speed** [in] Speed mode to be set

**Return**
- ESP_OK: PHY instance speed mode has been configured successfully
- ESP_FAIL: PHY instance speed mode configuration failed because some error occurred

`esp_err_t (*setDuplex)(esp_eth_phy_t *phy, eth_duplex_t duplex)`

Sets PHY duplex mode.

**Note:** Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

**Param phy** [in] Ethernet PHY instance

**Param duplex** [in] Duplex mode to be set

**Return**
- ESP_OK: PHY instance duplex mode has been configured successfully
- ESP_FAIL: PHY instance duplex mode configuration failed because some error occurred

`esp_err_t (*custom_ioctl)(esp_eth_phy_t *phy, uint32_t cmd, void *data)`

Custom IO function of PHY driver. This function is intended to extend common options of esp_eth_ioctl to cover specifics of PHY chip.

**Note:** This function may not be assigned when the PHY chip supports only most common set of configuration options.

**Param phy** [in] Ethernet PHY instance

**Param cmd** [in] IO control command

**Param data** [inout] address of data for set command or address where to store the data when used with get command

**Return**
- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred
- ESP_ERR_NOT_SUPPORTED: requested feature is not supported

`esp_err_t (*del)(esp_eth_phy_t *phy)`

Free memory of Ethernet PHY instance.

**Param phy** [in] Ethernet PHY instance

**Return**
- ESP_OK: free PHY instance successfully
- ESP_FAIL: free PHY instance failed because some error occurred

**Public Members**

```c
int32_t phy_addr
```

PHY address, set -1 to enable PHY address detection at initialization stage
uint32_t reset_timeout_ms
    Reset timeout value (Unit: ms)

uint32_t autonego_timeout_ms
    Auto-negotiation timeout value (Unit: ms)

int reset_gpio_num
    Reset GPIO number, -1 means no hardware reset

Macros
ESP_ETH_PHY_ADDR_AUTO
    ETH_PHY_DEFAULT_CONFIG()
        Default configuration for Ethernet PHY object.

Type Definitions
typedef struct esp_eth_phy_s esp_eth_phy_t
    Ethernet PHY.

Enumerations
enum eth_phy_autoneg_cmd_t
    Auto-negotiation control commands.
        Values:
        enumerator ESP_ETH_PHY_AUTONEGO_RESTART
        enumerator ESP_ETH_PHY_AUTONEGO_EN
        enumerator ESP_ETH_PHY_AUTONEGO_DIS
        enumerator ESP_ETH_PHY_AUTONEGO_G_STAT

Header File
    • components/esp_eth/include/esp_eth_phy_802_3.h

Functions
esp_err_t esp_eth_phy_802_3_reset_hw (phy_802_3_t *phy_802_3, uint32_t reset_assert_us)
    Performs hardware reset with specific reset pin assertion time.
        Parameters
            • phy_802_3 – IEEE 802.3 PHY object infostructure
            • reset_assert_us – Hardware reset pin assertion time
        Returns
            • ESP_OK: reset Ethernet PHY successfully
esp_err_t esp_eth_phy_802_3_detect_phy_addr (esp_eth_mediator_t *eth, int *detected_addr)

Detect PHY address.

**Parameters**
- *eth* – Mediator of Ethernet driver
- *detected_addr* – [out] a valid address after detection

**Returns**
- ESP_OK: detectphyaddress successfully
- ESP_ERR_INVALID_ARG: invalid parameter
- ESP_ERR_NOT_FOUND: can’t detect any PHY device
- ESP_FAIL: detect phy address failed because some error occurred

esp_err_t esp_eth_phy_802_3_basic_phy_init (phy_802_3_t *phy_802_3)

Performs basic PHY chip initialization.

**Note:** It should be called as the first function in PHY specific driver instance

**Parameters**
- phy_802_3 – IEEE 802.3 PHY object infostructure

**Returns**
- ESP_OK: initialized Ethernet PHY successfully
- ESP_FAIL: initialization of Ethernet PHY failed because some error occurred
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NOT_FOUND: PHY device not detected
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation

esp_err_t esp_eth_phy_802_3_basic_phy_deinit (phy_802_3_t *phy_802_3)

Performs basic PHY chip de-initialization.

**Note:** It should be called as the last function in PHY specific driver instance

**Parameters**
- phy_802_3 – IEEE 802.3 PHY object infostructure

**Returns**
- ESP_OK: de-initialized Ethernet PHY successfully
- ESP_FAIL: de-initialization of Ethernet PHY failed because some error occurred
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation

esp_err_t esp_eth_phy_802_3_read_oui (phy_802_3_t *phy_802_3, uint32_t *oui)

Reads raw content of OUI field.

**Parameters**
- phy_802_3 – IEEE 802.3 PHY object infostructure
- oui – [out] OUI value

**Returns**
- ESP_OK: OUI field read successfully
- ESP_FAIL: OUI field read failed because some error occurred
- ESP_ERR_INVALID_ARG: invalid oui argument
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation

esp_err_t esp_eth_phy_802_3_read_manufac_info (phy_802_3_t *phy_802_3, uint8_t *model, uint8_t *rev)

Reads manufacturer’s model and revision number.

**Parameters**
Chapter 2. API Reference

- **phy_802_3** - IEEE 802.3 PHY object infostructure
- **model** - [out] Manufacturer’s model number (can be NULL when not required)
- **rev** - [out] Manufacturer’s revision number (can be NULL when not required)

**Returns**
- ESP_OK: Manufacturer’s info read successfully
- ESP_FAIL: Manufacturer’s info read failed because some error occurred
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation

```c
phy_802_3_t *esp_eth_phy_into_phy_802_3(esp_eth_phy_t *phy)
```

Returns address to parent IEEE 802.3 PHY object infostructure.

**Parameters**
- **phy** - Ethernet PHY instance

**Returns**
- phy_802_3_t* - address to parent IEEE 802.3 PHY object infostructure

```c
esp_err_t esp_eth_phy_802_3_obj_config_init(phy_802_3_t *phy_802_3, const eth_phy_config_t *config)
```

Initializes configuration of parent IEEE 802.3 PHY object infostructure.

**Parameters**
- **phy_802_3** - Address to IEEE 802.3 PHY object infostructure
- **config** - Configuration of the IEEE 802.3 PHY object

**Returns**
- ESP_OK: configuration initialized successfully
- ESP_ERR_INVALID_ARG: invalid config argument

**Structures**

```c
struct phy_802_3_t
```

IEEE 802.3 PHY object infostructure.

**Public Members**

```c
esp_eth_phy_t *parent
```

Parent Ethernet PHY instance

```c
esp_eth_mediator_t *eth
```

Mediator of Ethernet driver

```c
int addr
```

PHY address

```c
uint32_t reset_timeout_ms
```

Reset timeout value (Unit: ms)

```c
uint32_t autonego_timeout_ms
```

Auto-negotiation timeout value (Unit: ms)

```c
eth_link_t link_status
```

Current Link status

```c
int reset_gpio_num
```

Reset GPIO number, -1 means no hardware reset
Chapter 2. API Reference

Header File

- components/esp/include/esp_netif_glue.h

Functions

`esp_eth_netif_glue_handle_t esp_eth_new_netif_glue(esp_eth_handle_t eth_hdl)`
Create a netif glue for Ethernet driver.

**Note:** netif glue is used to attach io driver to TCP/IP netif

**Parameters**
- `eth_hdl` - Ethernet driver handle

**Returns**
- `glue object`, which inherits `esp_netif_driver_base_t`

`esp_err_t esp_eth_del_netif_glue(esp_eth_netif_glue_handle_t eth_netif_glue)`
Delete netif glue of Ethernet driver.

**Parameters**
- `eth_netif_glue` - netif glue

**Returns**
- `ESP_OK`: delete netif glue successfully

Type Definitions

typedef struct esp_eth_netif_glue_t *esp_eth_netif_glue_handle_t

Handle of netif glue - an intermediate layer between netif and Ethernet driver.

Code examples for the Ethernet API are provided in the `ethernet` directory of ESP-IDF examples.

2.5.3 Thread

Thread

**Introduction**
Thread is an IP-based mesh networking protocol. It’s based on the 802.15.4 physical and MAC layer.

**Application Examples**
The `openthread` directory of ESP-IDF examples contains the following applications:

- The OpenThread interactive shell `openthread/ot_cli`
- The Thread border router `openthread/ot_br`
- The Thread radio co-processor `openthread/ot_rcp`

**API Reference**
For manipulating the Thread network, the OpenThread api shall be used. The OpenThread api docs can be found at the [OpenThread official website](#).

ESP-IDF provides extra apis for launching and managing the OpenThread stack, binding to network interfaces and border routing features.

Header File

- components/openthread/include/esp_openthread.h

Functions
**esp_err_t esp_openthread_init** (const esp_openthread_platform_config_t *init_config)

Initializes the full OpenThread stack.

**Note:** The OpenThread instance will also be initialized in this function.

**Parameters**
- **init_config** — [in] The initialization configuration.

**Returns**
- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_ARG if radio or host connection mode not supported
- ESP_ERR_INVALID_STATE if already initialized

**esp_err_t esp_openthreadLaunchMainloop** (void)

Launches the OpenThread main loop.

**Note:** This function will not return unless error happens when running the OpenThread stack.

**Returns**
- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_FAIL on other failures

**esp_err_t esp_openthread_deinit** (void)

This function performs OpenThread stack and platform driver deinitialization.

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized

**otInstance** *esp_openthreadGetinstance** (void)

This function acquires the underlying OpenThread instance.

**Note:** This function can be called on other tasks without lock.

**Returns**
- The OpenThread instance pointer

**Header File**

- components/openthread/include/esp_openthread_types.h

**Structures**

**struct esp_openthread_mainloop_context_t**

This structure represents a context for a select() based mainloop.

**Public Members**

**fd_set read_fds**

The read file descriptors
Chapter 2. API Reference

fd_set write_fds
    The write file descriptors

fd_set error_fds
    The error file descriptors

int max_fd
    The max file descriptor

struct timeval timeout
    The timeout

struct esp_openthread_uart_config_t
    The uart port config for OpenThread.

**Public Members**

`uart_port_t port`
    UART port number

`uart_config_t uart_config`
    UART configuration, see `uart_config_t` docs

int rx_pin
    UART RX pin

int tx_pin
    UART TX pin

struct esp_openthread_radio_config_t
    The OpenThread radio configuration.

**Public Members**

`esp_openthread_radio_mode_t radio_mode`
    The radio mode

`esp_openthread_uart_config_t radio_uart_config`
    The uart configuration to RCP

struct esp_openthread_host_connection_config_t
    The OpenThread host connection configuration.

**Public Members**

OpenThread stack joined TREL IPv6 multicast group

enum **esp_openthread_radio_mode_t**
The radio mode of OpenThread.

*Values:*

enumerator **RADIO_MODE_NATIVE**
Use the native 15.4 radio

enumerator **RADIO_MODE_UART_RCP**
UART connection to a 15.4 capable radio co-processor (RCP)

enumerator **RADIO_MODE_SPI_RCP**
SPI connection to a 15.4 capable radio co-processor (RCP)

enum **esp_openthread_host_connection_mode_t**
How OpenThread connects to the host.

*Values:*

enumerator **HOST_CONNECTION_MODE_NONE**
Disable host connection

enumerator **HOST_CONNECTION_MODE_CLI_UART**
CLI UART connection to the host
enumerator **HOST_CONNECTION_MODE_RCP_UART**

RCP UART connection to the host

**Header File**

- components/openthread/include/esp_openthread_lock.h

**Functions**

**esp_err_t** **esp_openthread_lock_init** (void)

This function initializes the OpenThread API lock.

**Returns**

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_STATE if already initialized

**void** **esp_openthread_lock_deinit** (void)

This function deinitializes the OpenThread API lock.

**bool** **esp_openthread_lock_acquire** (TickType_t block_ticks)

This function acquires the OpenThread API lock.

**Note:** Every OT APIs that takes an otInstance argument MUST be protected with this API lock except that the call site is in OT callbacks.

**Parameters** block_ticks - [in] The maximum number of RTOS ticks to wait for the lock.

**Returns**

- True on lock acquired
- False on failing to acquire the lock with the timeout.

**void** **esp_openthread_lock_release** (void)

This function releases the OpenThread API lock.

**Header File**

- components/openthread/include/esp_openthread_netif_glue.h

**Functions**

**void** * **esp_openthread_netif_glue_init** (const esp_openthread_platform_config_t *config)

This function initializes the OpenThread network interface glue.

**Parameters** config - [in] The platform configuration.

**Returns**

- glue pointer on success
- NULL on failure

**void** **esp_openthread_netif_glue_deinit** (void)

This function deinitializes the OpenThread network interface glue.

**esp_netif_t** * **esp_openthread_get_netif** (void)

This function acquires the OpenThread netif.

**Returns** The OpenThread netif or NULL if not initialized.
Chapter 2. API Reference

Macros

```c
ESP_NETIF_INHERENT_DEFAULT_OPENTHREAD()
```

Default configuration reference of OT esp-netif.

```c
ESP_NETIF_DEFAULT_OPENTHREAD()
```

Header File

- components/openthread/include/esp_openthread_border_router.h

Functions

```c
void esp_openthread_set_backbone_netif(esp_netif_t *backbone_netif)
```

Sets the backbone interface used for border routing.

**Note:** This function must be called before esp_openthread_init

**Parameters** backbone_netif – [in] The backbone network interface (WiFi or ethernet)

```c
esp_err_t esp_openthread_border_router_init()
```

Initializes the border router features of OpenThread.

**Note:** Calling this function will make the device behave as an OpenThread border router. Kconfig option CONFIG_OPENTHREAD_BORDER_ROUTER is required.

**Returns**

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if feature not supported
- ESP_ERR_INVALID_STATE if already initialized
- ESP_FAIL on other failures

```c
esp_err_t esp_openthread_border_router_deinit()
```

Deinitializes the border router features of OpenThread.

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized
- ESP_FAIL on other failures

```c
esp_netif_t *esp_openthread_get_backbone_netif()
```

Gets the backbone interface of OpenThread border router.

**Returns**

- The backbone interface or NULL if border router not initialized.

```c
void esp_openthread_register_rcp_failure_handler(esp_openthread_rcp_failure_handler handler)
```

Registers the callback for RCP failure.

```c
void esp_openthread_rcp_deinit()
```

Deinitializes the connection to RCP.

Thread is an IPv6-based mesh networking technology for IoT. Code examples for the Thread API are provided in the openthread directory of ESP-IDF examples.
2.5.4 ESP-NETIF

ESP-NETIF

The purpose of ESP-NETIF library is twofold:

- It provides an abstraction layer for the application on top of the TCP/IP stack. This will allow applications to choose between IP stacks in the future.
- The APIs it provides are thread safe, even if the underlying TCP/IP stack APIs are not.

ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation agnostic and different implementations are possible.

Some ESP-NETIF API functions are intended to be called by application code, for example to get/set interface IP addresses, configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called from the default network event handlers.

ESP-NETIF architecture

![ESP-NETIF Architecture Diagram](continues on next page)
### Data and event flow in the diagram

- **Initialization line from user code to ESP-NETIF and communication driver**
- **Data packets going from communication media to TCP/IP stack and back**
- **Events aggregated in ESP-NETIF propagates to driver, user code and network stack**
- **User settings and runtime configuration**

### ESP-NETIF interaction

#### A) User code, boiler plate

Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and outlined as below:

**A) Initialization code**

1) Initializes IO driver
2) Creates a new instance of ESP-NETIF and configure with
   - ESP-NETIF specific options (flags, behaviour, name)
   - Network stack options (netif init and input functions, not publicly available)
   - IO driver specific options (transmit, free rx buffer functions, IO driver handle)
3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
4) Configures event handlers
   - use default handlers for common interfaces defined in IO drivers; or define a specific handlers for customised behaviour/new interfaces
   - register handlers for app related events (such as IP lost/acquired)

**B) Interaction with network interfaces using ESP-NETIF API**

- Getting and setting TCP/IP related parameters (DHCP, IP, etc)
- Receiving IP events (connect/disconnect)
- Controlling application lifecycle (set interface up/down)

#### B) Communication driver, IO driver, media driver

Communication driver plays these two important roles in relation with ESP-NETIF:

1) Event handlers: Define behaviour patterns of interaction with ESP-NETIF (for example: ethernet link-up -> turn netif on)
2) Glue IO layer: Adapts the input/output functions to use ESP-NETIF transmit, receive and free receive buffer
   - Installs driver_transmit to appropriate ESP-NETIF object, so that outgoing packets from network stack are passed to the IO driver
   - Calls `esp_netif_receive()` to pass incoming data to network stack
C) ESP-NETIF

ESP-NETIF is an intermediary between an IO driver and a network stack, connecting packet data path between these two. As that it provides a set of interfaces for attaching a driver to ESP-NETIF object (runtime) and configuring a network stack (compile time). In addition to that a set of API is provided to control network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface could be divided into these 6 groups:

1) Initialization APIs (to create and configure ESP-NETIF instance)
2) Input/Output API (for passing data between IO driver and network stack)
3) Event or Action API
   • Used for network interface lifecycle management
   • ESP-NETIF provides building blocks for designing event handlers
4) Setters and Getters for basic network interface properties
5) Network stack abstraction: enabling user interaction with TCP/IP stack
   • Set interface up or down
   • DHCP server and client API
   • DNS API
6) Driver conversion utilities

D) Network stack

Network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

E) ESP-NETIF L2 TAP Interface

The ESP-NETIF L2 TAP interface is ESP-IDF mechanism utilized to access Data Link Layer (L2 per OSI/ISO) for frame reception and transmission from user application. Its typical usage in embedded world might be implementation of non-IP related protocols such as PTP, Wake on LAN and others. Note that only Ethernet (IEEE 802.3) is currently supported.

From user perspective, the ESP-NETIF L2 TAP interface is accessed using file descriptors of VFS which provides a file-like interfacing (using functions like `open()`, `read()`, `write()`, etc). Refer to Virtual filesystem component to learn more.

There is only one ESP-NETIF L2 TAP interface device (path name) available. However multiple file descriptors with different configuration can be opened at a time since the ESP-NETIF L2 TAP interface can be understood as generic entry point to Layer 2 infrastructure. Important is then specific configuration of particular file descriptor. It can be configured to give an access to specific Network Interface identified by `if_key` (e.g. `ETH_DEF`) and to filter only specific frames based on their type (e.g. Ethernet type in case of IEEE 802.3). Filtering only specific frames is crucial since the ESP-NETIF L2 TAP needs to exist along with IP stack and so the IP related traffic (IP, ARP, etc.) should not be passed directly to the user application. Even though such option is still configurable, it is not recommended in standard use cases. Filtering is also advantageous from a perspective the user’s application gets access only to frame types it is interested in and the remaining traffic is either passed to other L2 TAP file descriptors or to IP stack.

ESP-NETIF L2 TAP Interface Usage Manual

Initialization

To be able to use the ESP-NETIF L2 TAP interface, it needs to be enabled in Kconfig by `CONFIG_ESP_NETIF_L2_TAP` first and then registered by `esp_vfs_l2tap_intf_register()` prior usage of any VFS function.

`open()` Once the ESP-NETIF L2 TAP is registered, it can be opened at path name “/dev/net/tap”. The same path name can be opened multiple times up to `CONFIG_ESP_NETIF_L2_TAP_MAX_FDS` and multiple file descriptors with different configuration may access the Data Link Layer frames.

The ESP-NETIF L2 TAP can be opened with `O_NONBLOCK` file status flag to the `read()` does not block. Note that the `write()` may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed. The file status flag can be retrieved and modified using `fcntl()`.
On success, `open()` returns the new file descriptor (a nonnegative integer). On error, -1 is returned and `errno` is set to indicate the error.

**ioctl()** The newly opened ESP-NETIF L2 TAP file descriptor needs to be configured prior its usage since it is not bounded to any specific Network Interface and no frame type filter is configured. The following configuration options are available to do so:

- **L2TAP_S_INTF_DEVICE** - bounds the file descriptor to specific Network Interface which is identified by its `if_key`. ESP-NETIF Network Interface `if_key` is passed to `ioctl()` as the third parameter. Note that default Network Interfaces `if_key`s used in ESP-IDF can be found in `esp_netif/include/esp_netif_defaults.h`.
- **L2TAP_S_DEVICE_DRV_HNDL** - is other way how to bound the file descriptor to specific Network Interface. In this case the Network interface is identified directly by IO Driver handle (e.g. `esp_eth_handle_t` in case of Ethernet). The IO Driver handle is passed to `ioctl()` as the third parameter.
- **L2TAP_S_RCV_FILTER** - sets the filter to frames with this type to be passed to the file descriptor. In case of Ethernet frames, the frames are to be filtered based on Length/Ethernet type field. In case the filter value is set less than or equal to 0x05DC, the Ethernet type field is considered to represent IEEE802.3 Length Field and all frames with values in interval <0, 0x05DC> at that field are to be passed to the file descriptor. The IEEE802.2 logical link control (LLC) resolution is then expected to be performed by user’s application. In case the filter value is set greater than 0x05DC, the Ethernet type field is considered to represent protocol identification and only frames which are equal to the set value are to be passed to the file descriptor.

All above set configuration options have getter counterpart option to read the current settings.

```
Warning: The file descriptor needs to be firstly bounded to specific Network Interface by L2TAP_S_INTF_DEVICE or L2TAP_SDEVICE_DRV_HNDL to be L2TAP_S_RCV_FILTER option available.
```

Note: VLAN tagged frames are currently not recognized. If user needs to process VLAN tagged frames, they need set filter to be equal to VLAN tag (i.e. 0x8100 or 0x88A8) and process the VLAN tagged frames in user application.

Note: L2TAP_SDEVICE_DRV_HNDL is particularly useful when user’s application does not require usage of IP stack and so ESP-NETIF is not required to be initialized too. As a result, Network Interface cannot be identified by its `if_key` and hence it needs to be identified directly by its IO Driver handle.

On success, `ioctl()` returns 0. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**EACCES** - option change is denied in this state (e.g. file descriptor has not be bounded to Network interface yet).

**EINVAL** - invalid configuration argument. Ethernet type filter is already used by other file descriptor on that same Network interface.

**ENODEV** - no such Network Interface which is tried to be assigned to the file descriptor exists.

**ENOSYS** - unsupported operation, passed configuration option does not exists.

**fcntl()** `fcntl()` is used to manipulate with properties of opened ESP-NETIF L2 TAP file descriptor.

The following commands manipulate the status flags associated with file descriptor:

- **F_GETFD** - the function returns the file descriptor flags, the third argument is ignored.
- **F_SETFD** - sets the file descriptor flags to the value specified by the third argument. Zero is returned.

On error, -1 is returned, and `errno` is set to indicate the error.
**read()**

Opened and configured ESP-NETIF L2 TAP file descriptor can be accessed by `read()` to get inbound frames. The read operation can be either blocking or non-blocking based on actual state of `O_NONBLOCK` file status flag. When the file status flag is set blocking, the read operation waits until a frame is received and context is switched to other task. When the file status flag is set non-blocking, the read operation returns immediately. In such case, either a frame is returned if it was already queued or the function indicates the queue is empty. The number of queued frames associated with one file descriptor is limited by `CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE` Kconfig option. Once the number of queued frames reach configured threshold, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

On success, `read()` returns the number of bytes read. Zero is returned when size of the destination buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**ENOSYS** - unsupported command.

**write()**

A raw Data Link Layer frame can be sent to Network Interface via opened and configured ESP-NETIF L2 TAP file descriptor. User’s application is responsible to construct the whole frame except for fields which are added automatically by the physical interface device. The following fields need to be constructed by the user’s application in case of Ethernet link: source/destination MAC addresses, Ethernet type, actual protocol header and user data. See below for more information about Ethernet frame structure.

```
+-------------------+-------------------+-------------+----------------------------
| Destination MAC   | Source MAC        | Type/Length | Payload (protocol header/
| data) ...         |                   |             | data) ...                   |
+-------------------+-------------------+-------------+----------------------------
```

In other words, there is no additional frame processing performed by the ESP-NETIF L2 TAP interface. It only checks the Ethernet type of the frame is the same as the filter configured in the file descriptor. If the Ethernet type is different, an error is returned and the frame is not sent. Note that the `write()` may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed.

On success, `write()` returns the number of bytes written. Zero is returned when size of the input buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**EAGAIN** - the file descriptor has been marked non-blocking (`O_NONBLOCK`), and the read would block.

**close()**

Opened ESP-NETIF L2 TAP file descriptor can be closed by the `close()` to free its allocated resources. The ESP-NETIF L2 TAP implementation of `close()` may block. On the other hand, it is thread safe and can be called from different task than the file descriptor is actually used. If such situation occurs and one task is blocked in I/O operation and another task tries to close the file descriptor, the first task is unblocked. The first’s task read operation then ends with error.

On success, `close()` returns zero. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.
select()  Select is used in a standard way, just `CONFIG_VFS_SUPPORT_SELECT` needs to be enabled to be the `select()` function available.

**ESP-NETIF programmer’s manual** Please refer to the example section for basic initialization of default interfaces:

- WiFi Station: wifi/getting_started/station/main/station_example_main.c
- Ethernet: ethernet/basic/main/ethernet_example_main.c
- L2 TAP: protocols/l2tap/main/l2tap_main.c
- WiFi Access Point: wifi/getting_started/softAP/main/softap_example_main.c

For more specific cases please consult this guide: *ESP-NETIF Custom I/O Driver*.

**WiFi default initialization** The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in separate APIs to facilitate simple startup code for most applications:

- `esp_netif_create_default_wifi_sta()`  
- `esp_netif_create_default_wifi_ap()`

Please note that these functions return the `esp_netif` handle, i.e. a pointer to a network interface object allocated and configured with default settings, which as a consequence, means that:

- The created object has to be destroyed if a network de-initialization is provided by an application using `esp_netif_destroy_default_wifi()`.
- These default interfaces must not be created multiple times, unless the created handle is deleted using `esp_netif_destroy()`.
- When using Wifi in AP+STA mode, both these interfaces has to be created.

**API Reference**

**Header File**

- components/esp_netif/include/esp_netif.h

**Functions**

- `esp_err_t esp_netif_init(void)`  
  Initialize the underlying TCP/IP stack.

  **Note:** This function should be called exactly once from application code, when the application starts up.

  **Returns**
  - ESP_OK on success
  - ESP_FAIL if initializing failed

- `esp_err_t esp_netif_deinit(void)`  
  Deinitialize the esp-netif component (and the underlying TCP/IP stack)

  **Note:** De-initialization is not supported yet

  **Returns**
  - ESP_ERR_INVALID_STATE if esp_netif not initialized
  - ESP_ERR_NOT_SUPPORTED otherwise
**esp_netif_t** *esp_netif_new(const esp_netif_config_t *esp_netif_config)*

Creates an instance of new esp-netif object based on provided config.

**Parameters**

esp_netif_config – pointer esp-netif configuration

**Returns**

• pointer to esp-netif object on success
• NULL otherwise

void **esp_netif_destroy**(esp_netif_t *esp_netif)**

Destroys the esp_netif object.

**Parameters**

esp_netif – [in] pointer to the object to be deleted

**esp_err_t** **esp_netif_set_driver_config**(esp_netif_t *esp_netif, const esp_netif_driver_ifconfig_t *driver_config)**

Configures driver related options of esp_netif object.

**Parameters**

• esp_netif – [inout] pointer to the object to be configured
• driver_config – [in] pointer esp-netif io driver related configuration

**Returns**

• ESP_OK on success
• ESP_ERR_ESP_NETIF_INVALID_PARAMS if invalid parameters provided

**esp_err_t** **esp_netif_attach**(esp_netif_t *esp_netif, esp_netif_iodriver_handle driver_handle)**

Attaches esp_netif instance to the io driver handle.

Calling this function enables connecting specific esp_netif object with already initialized io driver to update esp_netif object with driver specific configuration (i.e. calls post_attach callback, which typically sets io driver callbacks to esp_netif instance and starts the driver)

**Parameters**

• esp_netif – [inout] pointer to esp_netif object to be attached
• driver_handle – [in] pointer to the driver handle

**Returns**

• ESP_OK on success
• ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED if driver’s post_attach callback failed

**esp_err_t** **esp_netif_receive**(esp_netif_t *esp_netif, void *buffer, size_t len, void *eb)**

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

**Parameters**

• esp_netif – [in] Handle to esp-netif instance
• buffer – [in] Received data
• len – [in] Length of the data frame
• eb – [in] Pointer to internal buffer (used in Wi-Fi driver)

**Returns**

• ESP_OK

void **esp_netif_action_start**(void *esp_netif, esp_netif_base_t base, int32_t event_id, void *data)**

Default building block for network interface action upon IO driver start event Creates network interface, if AUTOUP enabled turns the interface on, if DHCPS enabled starts dhcp server.

**Note:** This API can be directly used as event handler

**Parameters**

• esp_netif – [in] Handle to esp-netif instance
Chapter 2. API Reference

- base
- event_id
- data

void esp_netif_action_stop (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver stop event.

Note: This API can be directly used as event handler

Parameters
- esp_netif – [in] Handle to esp-netif instance
- base –
- event_id –
- data –

void esp_netif_action_connected (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver connected event.

Note: This API can be directly used as event handler

Parameters
- esp_netif – [in] Handle to esp-netif instance
- base –
- event_id –
- data –

void esp_netif_action_disconnected (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver disconnected event.

Note: This API can be directly used as event handler

Parameters
- esp_netif – [in] Handle to esp-netif instance
- base –
- event_id –
- data –

void esp_netif_action_got_ip (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon network got IP event.

Note: This API can be directly used as event handler

Parameters
- esp_netif – [in] Handle to esp-netif instance
- base –
- event_id –
- data –
void esp_netif_action_join_ip6_multicast_group (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 multicast group join.

Note: This API can be directly used as event handler

Parameters
- esp_netif –[in] Handle to esp-netif instance
- base –
- event_id –
- data –

void esp_netif_action_leave_ip6_multicast_group (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 multicast group leave.

Note: This API can be directly used as event handler

Parameters
- esp_netif –[in] Handle to esp-netif instance
- base –
- event_id –
- data –

void esp_netif_action_add_ip6_address (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 address added by the underlying stack.

Note: This API can be directly used as event handler

Parameters
- esp_netif –[in] Handle to esp-netif instance
- base –
- event_id –
- data –

void esp_netif_action_remove_ip6_address (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 address removed by the underlying stack.

Note: This API can be directly used as event handler

Parameters
- esp_netif –[in] Handle to esp-netif instance
- base –
- event_id –
- data –
**esp_err_t esp_netif_set_default_netif (esp_netif_t *esp_netif)**

Manual configuration of the default netif.

This API overrides the automatic configuration of the default interface based on the route_prio. If the selected netif is set default using this API, no other interface could be set-default disregarding its route_prio number (unless the selected netif gets destroyed).

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance

**Returns**
- ESP_OK on success

**esp_err_t esp_netif_set_mac (esp_netif_t *esp_netif, uint8_t mac[])**

Set the mac address for the interface instance.

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance
- `mac` - [in] Desired mac address for the related network interface

**Returns**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

**esp_err_t esp_netif_get_mac (esp_netif_t *esp_netif, uint8_t mac[])**

Get the mac address for the interface instance.

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance
- `mac` - [out] Resultant mac address for the related network interface

**Returns**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

**esp_err_t esp_netif_set_hostname (esp_netif_t *esp_netif, const char *hostname)**

Set the hostname of an interface.

The configured hostname overrides the default configuration value CONFIG_LWIP_LOCAL_HOSTNAME. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects.

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance

**Returns**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

**esp_err_t esp_netif_get_hostname (esp_netif_t *esp_netif, const char **hostname)**

Get interface hostname.

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance
- `hostname` - [out] Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

**Returns**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

**bool esp_netif_is_netif_up (esp_netif_t *esp_netif)**

Test if supplied interface is up or down.
Parameters `esp_netif` – [in] Handle to esp-netif instance

Returns
  - true - Interface is up
  - false - Interface is down

```c
esp_err_t esp_netif_get_ip_info(esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)
```

Get interface’s IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance.

Parameters
  - `esp_netif` – [in] Handle to esp-netif instance
  - `ip_info` – [out] If successful, IP information will be returned in this argument.

Returns
  - ESP_OK
  - ESP_ERR_ESP_NETIF_INVALID_PARAMS

```c
esp_err_t esp_netif_get_old_ip_info(esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)
```

Get interface’s old IP information.

Returns an “old” IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

Parameters
  - `esp_netif` – [in] Handle to esp-netif instance
  - `ip_info` – [out] If successful, IP information will be returned in this argument.

Returns
  - ESP_OK
  - ESP_ERR_ESP_NETIF_INVALID_PARAMS

```c
esp_err_t esp_netif_set_ip_info(esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)
```

Set interface’s IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

Note: DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

Note: Calling this interface for may generate a SYSTEM_EVENT_STA_GOT_IP or SYSTEM_EVENT_ETH_GOT_IP event.

Parameters
  - `esp_netif` – [in] Handle to esp-netif instance
  - `ip_info` – [in] IP information to set on the specified interface

Returns
  - ESP_OK
  - ESP_ERR_ESP_NETIF_INVALID_PARAMS
  - ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED If DHCP server or client is still running
**esp_err_t esp_netif_set_old_ip_info(esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)**

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the “IP lost timer” will expire (after the configured interval) and set the old IP information to zero.

**Parameters**
- `esp_netif` [in] Handle to esp-netif instance
- `ip_info` [in] Store the old IP information for the specified interface

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**int esp_netif_get_netif_impl_index(esp_netif_t *esp_netif)**

Get net interface index from network stack implementation.

---

**Note:** This index could be used in `setsockopt()` to bind socket with multicast interface

**Parameters** `esp_netif` [in] Handle to esp-netif instance

**Returns** implementation specific index of interface represented with supplied `esp_netif`

**esp_err_t esp_netif_get_netif_impl_name(esp_netif_t *esp_netif, char *name)**

Get net interface name from network stack implementation.

---

**Note:** This name could be used in `setsockopt()` to bind socket with appropriate interface

**Parameters**
- `esp_netif` [in] Handle to esp-netif instance
- `name` [out] Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**esp_err_t esp_netif_dhcps_option(esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)**

Set or Get DHCP server option.

**Parameters**
- `esp_netif` [in] Handle to esp-netif instance
- `opt_op` [in] ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- `opt_id` [in] Option index to get or set, must be one of the supported enum values.
- `opt_val` [inout] Pointer to the option parameter.
- `opt_len` [in] Length of the option parameter.

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
**Chapter 2. API Reference**

- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

```
esp_err_t esp_netif_dhcpc_option(esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op,
                                 esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)
```

Set or Get DHCP client option.

**Parameters**

- `esp_netif` - [in] Handle to esp-netif instance
- `opt_op` - [in] ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- `opt_id` - [in] Option index to get or set, must be one of the supported enum values.
- `opt_val` - [inout] Pointer to the option parameter.
- `opt_len` - [in] Length of the option parameter.

**Returns**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

```
esp_err_t esp_netif_dhcpc_start(esp_netif_t *esp_netif)
```

Start DHCP client (only if enabled in interface object)

**Note:** The default event handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events call this function.

**Parameters**

- `esp_netif` - [in] Handle to esp-netif instance

**Returns**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED
- ESP_ERR_ESP_NETIF_DHCP_STARTED

```
esp_err_t esp_netif_dhcpc_stop(esp_netif_t *esp_netif)
```

Stop DHCP client (only if enabled in interface object)

**Note:** Calling `action_netif_stop()` will also stop the DHCP Client if it is running.

**Parameters**

- `esp_netif` - [in] Handle to esp-netif instance

**Returns**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_IF_NOT_READY

```
esp_err_t esp_netif_dhcpc_get_status(esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)
```

Get DHCP client status.

**Parameters**

- `esp_netif` - [in] Handle to esp-netif instance
- `status` - [out] If successful, the status of DHCP client will be returned in this argument.

**Returns**

- ESP_OK

```
esp_err_t esp_netif_dhcps_get_status(esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)
```

Get DHCP Server status.

**Parameters**

...
Chapter 2. API Reference

- `esp_netif` [in] Handle to `esp-netif` instance
- `status` [out] If successful, the status of the DHCP server will be returned in this argument.

**Returns**
- ESP_OK

`esp_err_t esp_netif_dhcps_start (esp_netif_t *esp_netif)`
Start DHCP server (only if enabled in interface object)

**Parameters**
- `esp_netif` [in] Handle to `esp-netif` instance

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

`esp_err_t esp_netif_dhcps_stop (esp_netif_t *esp_netif)`
Stop DHCP server (only if enabled in interface object)

**Parameters**
- `esp_netif` [in] Handle to `esp-netif` instance

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

`esp_err_t esp_netif_dhcps_get_clients_by_mac (esp_netif_t *esp_netif, int num, esp_netif_pair_mac_ip_t *mac_ip_pair)`
Populate IP addresses of clients connected to DHCP server listed by their MAC addresses.

**Parameters**
- `esp_netif` [in] Handle to `esp-netif` instance
- `num` [in] Number of clients with specified MAC addresses in the array of pairs
- `mac_ip_pair` [inout] Array of pairs of MAC and IP addresses (MAC are inputs, IP outputs)

**Returns**
- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS on invalid params
- ESP_ERR_NOT_SUPPORTED if DHCP server not enabled

`esp_err_t esp_netif_set_dns_info (esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)`
Set DNS Server information.

This function behaves differently if DHCP server or client is enabled

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

- The default Main DNS server is typically the IP of the DHCP server itself.
- This function can override it by setting server type ESP_NETIF_DNS_MAIN.
- Other DNS Server types are not supported for the DHCP server.
- To propagate the DNS info to client, please stop the DHCP server before using this API.

**Parameters**
- `esp_netif` [in] Handle to `esp-netif` instance
- `type` [in] Type of DNS Server to set: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- `dns` [in] DNS Server address to set
Returns

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

```c
esp_err_t esp_netif_get_dns_info (esp_netif_t *esp_netif, esp_netif_dns_type_t type,
                                  esp_netif_dns_info_t *dns)
```

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.

This may be result of a previous call to `esp_netif_set_dns_info()`. If the interface’s DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

Parameters

- `esp_netif` ⚶ [in] Handle to esp-netif instance
- `type` ⚶ [in] Type of DNS Server to get: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- `dns` ⚶ [out] DNS Server result is written here on success

Returns

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

```c
esp_err_t esp_netif_create_ip6_linklocal (esp_netif_t *esp_netif)
```

Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.

This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a SYSTEM_EVENT_GOT_IP6 event will be sent.

Parameters `esp_netif` ⚶ [in] Handle to esp-netif instance

Returns

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

```c
esp_err_t esp_netif_get_ip6_linklocal (esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)
```

Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

Parameters

- `esp_netif` ⚶ [in] Handle to esp-netif instance
- `if_ip6` ⚶ [out] IPv6 information will be returned in this argument if successful.

Returns

- ESP_OK
- ESP_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

```c
esp_err_t esp_netif_get_ip6_global (esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)
```

Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

Parameters

- `esp_netif` ⚶ [in] Handle to esp-netif instance
- `if_ip6` ⚶ [out] IPv6 information will be returned in this argument if successful.

Returns

- ESP_OK
- ESP_FAIL If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.
int esp_netif_get_all_ip6(esp_netif_t *esp_netif, esp_ip6_addr_t if_ip6[])
Get all IPv6 addresses of the specified interface.

Parameters
- esp_netif ⚶ [in] Handle to esp-netif instance
- if_ip6 ⚶ [out] Array of IPv6 addresses will be copied to the argument

Returns number of returned IPv6 addresses

void esp_netif_set_ip4_addr (esp_ip4_addr_t *addr, uint8_t a, uint8_t b, uint8_t c, uint8_t d)
Sets IPv4 address to the specified octets.

Parameters
- addr ⚶ [out] IP address to be set
- a – the first octet (127 for IP 127.0.0.1)
- b –
- c –
- d –

char *esp_ip4addr_ntoa (const esp_ip4_addr_t *addr, char *buf, int buflen)
Converts numeric IP address into decimal dotted ASCII representation.

Parameters
- addr ⚶ [in] IP address in network order to convert
- buf – target buffer where the string is stored
- buflen – length of buf

Returns either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small

uint32_t esp_ip4addr_aton (const char *addr)
Ascii internet address interpretation routine. The value returned is in network order.

Parameters addr – IP address in ascii representation (e.g. “127.0.0.1”)

Returns ip address in network order

esp_err_t esp_netif_str_to_ip4 (const char *src, esp_ip4_addr_t *dst)
Converts Ascii internet IPv4 address into esp_ip4_addr_t.

Parameters
- src ⚶ [in] IPv4 address in ascii representation (e.g. “127.0.0.1”)
- dst ⚶ [out] Address of the target esp_ip4_addr_t structure to receive converted address

Returns
- ESP_OK on success
- ESP_FAIL if conversion failed
- ESP_ERR_INVALID_ARG if invalid parameter is passed into

esp_err_t esp_netif_str_to_ip6 (const char *src, esp_ip6_addr_t *dst)
Converts Ascii internet IPv6 address into esp_ip6_addr_t. Zeros in the IP address can be stripped or completely omitted: “2001:db8:85a3:0:0:0:2:1” or “2001:db8::2:1”

Parameters
- src ⚶ [in] IPv6 address in ascii representation (e.g. “2001:db8:85a3:0:0:0:0:0:0:0:0:0:0:0:0:2:1”)
- dst ⚶ [out] Address of the target esp_ip6_addr_t structure to receive converted address

Returns
- ESP_OK on success
- ESP_FAIL if conversion failed
- ESP_ERR_INVALID_ARG if invalid parameter is passed into

esp_netif_iodriver_handle esp_netif_get_io_driver (esp_netif_t *esp_netif)
Gets media driver handle for this esp-netif instance.

Parameters esp_netif ⚶ [in] Handle to esp-netif instance

Returns opaque pointer of related IO driver
esp_netif_t *esp_netif_get_handle_from_ifkey(const char *if_key)

Searches over a list of created objects to find an instance with supplied if key.

**Parameters**
- **if_key** - Textual description of network interface

**Returns**
Handle to esp-netif instance

esp_netif_flags_t esp_netif_get_flags(esp_netif_t *esp_netif)

Returns configured flags for this interface.

**Parameters**
- **esp_netif** - [in] Handle to esp-netif instance

**Returns**
Configuration flags

const char *esp_netif_get_ifkey(esp_netif_t *esp_netif)

Returns configured interface key for this esp-netif instance.

**Parameters**
- **esp_netif** - [in] Handle to esp-netif instance

**Returns**
Textual description of related interface

const char *esp_netif_get_desc(esp_netif_t *esp_netif)

Returns configured interface type for this esp-netif instance.

**Parameters**
- **esp_netif** - [in] Handle to esp-netif instance

**Returns**
Enumerated type of this interface, such as station, AP, ethernet

int esp_netif_get_route_prio(esp_netif_t *esp_netif)

Returns configured routing priority number.

**Parameters**
- **esp_netif** - [in] Handle to esp-netif instance

**Returns**
Integer representing the instance’s route-prio, or -1 if invalid parameters

int32_t esp_netif_get_event_id(esp_netif_t *esp_netif, esp_netif_ip_event_type_t event_type)

Returns configured event for this esp-netif instance and supplied event type.

**Parameters**
- **esp_netif** - [in] Handle to esp-netif instance
- **event_type** - (either get or lost IP)

**Returns**
specific event id which is configured to be raised if the interface lost or acquired IP address
-1 if supplied event_type is not known

esp_netif_t *esp_netif_next(esp_netif_t *esp_netif)

Iterates over list of interfaces. Returns first netif if NULL given as parameter.

**Parameters**
- **esp_netif** - [in] Handle to esp-netif instance

**Returns**
First netif from the list if supplied parameter is NULL, next one otherwise

size_t esp_netif_get_nr_of_ifs(void)

Returns number of registered esp_netif objects.

**Returns**
Number of esp_netifs

void esp_netif_netstack_buf_ref(void *netstack_buf)

increase the reference counter of net stack buffer

**Parameters**
- **netstack_buf** - [in] the net stack buffer

void esp_netif_netstack_buf_free(void *netstack_buf)

free the netstack buffer

**Parameters**
- **netstack_buf** - [in] the net stack buffer

**Header File**

    IP address, netmask, gateway IP address
```

```c
    bool ip_changed
    Whether the assigned IP has changed or not
```

```c
struct ip_event_got_ip6_t
    Event structure for IP_EVENT_GOT_IP6 event
```
Chapter 2. API Reference

Public Members

```
esp_netif_t *esp_netif
   Pointer to corresponding esp-netif object
```

```
esp_netif_ip6_info_t ip6_info
   IPv6 address of the interface
```

```
int ip_index
   IPv6 address index
```

```
struct ip_event_add_ip6_t
   Event structure for ADD_IP6 event
```

Public Members

```
esp_ip6_addr_t addr
   The address to be added to the interface
```

```
bool preferred
   The default preference of the address
```

```
struct ip_event_ap_staipassigned_t
   Event structure for IP_EVENT_AP_STAIPASSIGNED event
```

Public Members

```
esp_netif_t *esp_netif
   Pointer to the associated netif handle
```

```
esp_ip4_addr_t ip
   IP address which was assigned to the station
```

```
uint8_t mac[6]
   MAC address of the connected client
```

```
struct bridgeif_config
   LwIP bridge configuration
```

Public Members

```
uint16_t max_fdb_dyn_entries
   maximum number of entries in dynamic forwarding database
```

```
uint16_t max_fdb_sta_entries
   maximum number of entries in static forwarding database
```
```
uint8_t max_ports
  maximum number of ports the bridge can consist of

struct esp_netif_inherent_config
  ESP-netif inherent config parameters.

Public Members

esp_netif_flags_t flags
  flags that define esp-netif behavior

uint8_t mac[6]
  initial mac address for this interface

const esp_netif_ip_info_t *ip_info
  initial ip address for this interface

uint32_t get_ip_event
  event id to be raised when interface gets an IP

uint32_t lost_ip_event
  event id to be raised when interface losts its IP

const char *if_key
  string identifier of the interface

const char *if_desc
  textual description of the interface

int route_prio
  numeric priority of this interface to become a default routing if (if other netifs are up). A higher value of route_prio indicates a higher priority

bridgeif_config_t *bridge_info
  LwIP bridge configuration

struct esp_netif_driver_base_s
  ESP-netif driver base handle.

Public Members

esp_err_t (*post_attach)(esp_netif_t *netif, esp_netif_iodriver_handle h)
  post attach function pointer

esp_netif_t *netif
  netif handle
```
struct **esp_netif_driver_ifconfig**
Specific IO driver configuration.

**Public Members**

*esp_netif_iodriver_handle* **handle**
io-driver handle

*esp_err_t (**transmit**)**(void *h, void *buffer, size_t len)**
transmit function pointer

*esp_err_t (**transmit_wrap**)**(void *h, void *buffer, size_t len, void *netstack_buffer)**
transmit wrap function pointer

void (**driver_free_rx_buffer**)**(void *h, void *buffer)**
free rx buffer function pointer

struct **esp_netif_config**
Generic esp_netif configuration.

**Public Members**

const *esp_netif_inherent_config_t* **base**
base config

const *esp_netif_driver_ifconfig_t* **driver**
driver config

const *esp_netif_netstack_config_t* **stack**
stack config

struct **esp_netif_pair_mac_ip_t**
DHCP client’s addr info (pair of MAC and IP address)

**Public Members**

uint8_t **mac[6]**
Clients MAC address

*esp_ip4_addr_t* **ip**
Clients IP address

**Macros**

**ESP_ERR_ESP_NETIF_BASE**
Definition of ESP-NETIF based errors.

ESP-netif driver base handle.

typedef struct esp_netif_driver_ifconfig esp_netif_driver_ifconfig_t

Specific L3 network stack configuration.

typedef esp_err_t (*esp_netif_receive_t)(esp_netif_t *esp_netif, void *buffer, size_t len, void *eb)
ESP-NETIF Receive function type.

Enumerations

enum esp_netif_dns_type_t
Type of DNS server.

Values:

enumerator ESP_NETIF_DNS_MAIN
DNS main server address

enumerator ESP_NETIF_DNS_BACKUP
DNS backup server address (Wi-Fi STA and Ethernet only)

enumerator ESP_NETIF_DNS_FALLBACK
DNS fallback server address (Wi-Fi STA and Ethernet only)

enumerator ESP_NETIF_DNS_MAX

enum esp_netif_dhcp_status_t
Status of DHCP client or DHCP server.

Values:

enumerator ESP_NETIF_DHCP_INIT
DHCP client/server is in initial state (not yet started)

enumerator ESP_NETIF_DHCP_STARTED
DHCP client/server has been started

enumerator ESP_NETIF_DHCP_STOPPED
DHCP client/server has been stopped

enumerator ESP_NETIF_DHCP_STATUS_MAX
enum `esp_netif_dhcp_option_mode_t`

Mode for DHCP client or DHCP server option functions.

Values:

enumerator `ESP_NETIF_OP_START`

enumerator `ESP_NETIF_OP_SET`  
Set option

enumerator `ESP_NETIF_OP_GET`  
Get option

enumerator `ESP_NETIF_OP_MAX`

enum `esp_netif_dhcp_option_id_t`

Supported options for DHCP client or DHCP server.

Values:

enumerator `ESP_NETIF_SUBNET_MASK`  
Network mask

enumerator `ESP_NETIF_DOMAIN_NAME_SERVER`  
Domain name server

enumerator `ESP_NETIF_ROUTER_SOLICITATION_ADDRESS`  
Solicitation router address

enumerator `ESP_NETIF_REQUESTED_IP_ADDRESS`  
Request specific IP address

enumerator `ESP_NETIF_IP_ADDRESS_LEASE_TIME`  
Request IP address lease time

enumerator `ESP_NETIF_IP_REQUEST_RETRY_TIME`  
Request IP address retry counter

enumerator `ESP_NETIF_VENDOR_CLASS_IDENTIFIER`  
Vendor Class Identifier of a DHCP client

enumerator `ESP_NETIF_VENDOR_SPECIFIC_INFO`  
Vendor Specific Information of a DHCP server

enum `ip_event_t`

IP event declarations

Values:

enumerator `IP_EVENT_STA_GOT_IP`  
station got IP from connected AP
enumerator IP_EVENT_STA_LOST_IP
    station lost IP and the IP is reset to 0

enumerator IP_EVENT_AP_STAIPASSIGNED
    soft-AP assign an IP to a connected station

enumerator IP_EVENT_GOT_IP6
    station or ap or ethernet interface v6IP addr is preferred

enumerator IP_EVENT_ETH_GOT_IP
    ethernet got IP from connected AP

enumerator IP_EVENT_ETH_LOST_IP
    ethernet lost IP and the IP is reset to 0

enumerator IP_EVENT_PPP_GOT_IP
    PPP interface got IP

enumerator IP_EVENT_PPP_LOST_IP
    PPP interface lost IP

enum esp_netif_flags
    Values:

    enumerator ESP_NETIF_DHCP_CLIENT

    enumerator ESP_NETIF_DHCP_SERVER

    enumerator ESP_NETIF_FLAG_AUTOUP

    enumerator ESP_NETIF_FLAG_GARP

    enumerator ESP_NETIF_FLAG_EVENT_IP_MODIFIED

    enumerator ESP_NETIF_FLAG_IS_PPP

    enumerator ESP_NETIF_FLAG_IS_BRIDGE

enum esp_netif_ip_event_type
    Values:

    enumerator ESP_NETIF_IP_EVENT_GOT_IP

    enumerator ESP_NETIF_IP_EVENT_LOST_IP

Header File
- components/esp_netif/include/esp_netif_ip_addr.h
Functions

`esp_ip6_addr_type_t esp_netif_ip6_get_addr_type(esp_ip6_addr_t *ip6_addr)`
Get the IPv6 address type.

**Parameters**
- `ip6_addr` - [in] IPv6 type

**Returns**
IPv6 type in form of enum `esp_ip6_addr_type_t`

static inline void `esp_netif_ip_addr_copy(esp_ip_addr_t *dest, const esp_ip_addr_t *src)`
Copy IP addresses.

**Parameters**
- `dest` - [out] destination IP
- `src` - [in] source IP

Structures

struct `esp_ip6_addr`
IPv6 address.

**Public Members**

- `uint32_t addr[4]`
  IPv6 address
- `uint8_t zone`
  zone ID

struct `esp_ip4_addr`
IPv4 address.

**Public Members**

- `uint32_t addr`
  IPv4 address

struct `_ip_addr`
IP address.

**Public Members**

- `esp_ip6_addr_t ip6`
  IPv6 address type
- `esp_ip4_addr_t ip4`
  IPv4 address type
- `union _ip_addr::[anonymous] u_addr`
  IP address union
- `uint8_t type`
  ipaddress type
Macros

  \texttt{Parameters config – L2 TAP virtual filesystem driver configuration. Default base path}
  \texttt{/dev/net/tap is used when this parameter is NULL.}
  \texttt{Returns esp\_err\_t}
  \texttt{\textbullet \ ESP\_OK on success}

  \item \texttt{esp\_err\_t \texttt{esp\_vfs\_l2tap\_intf\_unregister} (const char \*base\_path)}
  \texttt{\textit{Removes L2 TAP virtual filesystem driver.}}
  \texttt{Parameters base\_path – Base path to the L2 TAP virtual filesystem driver. Default path}
  \texttt{/dev/net/tap is used when this parameter is NULL.}
  \texttt{Returns esp\_err\_t}
  \texttt{\textbullet \ ESP\_OK on success}

  \item \texttt{esp\_err\_t \texttt{esp\_vfs\_l2tap\_eth\_filter} (l2tap\_iodriver\_handle driver\_handle, void \*buff, size\_t \*size)}
  \texttt{\textit{Filters received Ethernet L2 frames into L2 TAP infrastructure.}}
  \texttt{Parameters}
  \texttt{\textbullet \ driver\_handle – handle of driver at which the frame was received}
  \texttt{\textbullet \ buff – received L2 frame}
  \texttt{\textbullet \ size – input length of the L2 frame which is set to 0 when frame is filtered into L2 TAP}
\end{itemize}
**Returns** esp_err_t
- ESP_OK is always returned

**Structures**

struct l2tap_vfs_config_t
L2Tap VFS config parameters.

**Public Members**

const char * `base_path`
vfs base path

**Macros**

L2TAP_VFS_DEFAULT_PATH

**WiFi default API reference**

**Header File**

- components/esp_wifi/include/esp_wifi_default.h
Chapter 2. API Reference

Functions

`esp_err_t esp_netif_attach_wifi_station(esp_netif_t *esp_netif)`
Attaches wifi station interface to supplied netif.

Parameters
- `esp_netif` — instance to attach the wifi station to

Returns
- ESP_OK on success
- ESP_FAIL if attach failed

`esp_err_t esp_netif_attach_wifi_ap(esp_netif_t *esp_netif)`
Attaches wifi soft AP interface to supplied netif.

Parameters
- `esp_netif` — instance to attach the wifi AP to

Returns
- ESP_OK on success
- ESP_FAIL if attach failed

`esp_err_t esp_wifi_set_default_wifi_sta_handlers(void)`
Sets default wifi event handlers for STA interface.

Returns
- ESP_OK on success, error returned from esp_event_handler_register if failed

`esp_err_t esp_wifi_set_default_wifi_ap_handlers(void)`
Sets default wifi event handlers for AP interface.

Returns
- ESP_OK on success, error returned from esp_event_handler_register if failed

`esp_err_t esp_wifi_clear_default_wifi_driver_and_handlers(void *esp_netif)`
Clears default wifi event handlers for supplied network interface.

Parameters
- `esp_netif` — instance of corresponding if object

Returns
- ESP_OK on success, error returned from esp_event_handler_register if failed

`esp_netif_t *esp_netif_create_default_wifi_ap(void)`
Creates default WIFI AP. In case of any init error this API aborts.

Note: The API creates esp_netif object with default WiFi access point config, attaches the netif to wifi and registers default wifi handlers.

Returns pointer to esp-netif instance

`esp_netif_t *esp_netif_create_default_wifi_sta(void)`
Creates default WIFI STA. In case of any init error this API aborts.

Note: The API creates esp_netif object with default WiFi station config, attaches the netif to wifi and registers default wifi handlers.

Returns pointer to esp-netif instance

`void esp_netif_destroy_default_wifi(void *esp_netif)`
Destroys default WIFI netif created with esp_netif_create_default_wifi_…() API.

Note: This API unregisters wifi handlers and detaches the created object from the wifi. (this function is a no-operation if esp_netif is NULL)
### Parameters

`esp_netif` - [in] object to detach from WiFi and destroy

```c
esp_netif_t *esp_netif_create_wifi (wifi_interface_t wifi_if, esp_netif_inherent_config_t *esp_netif_config)
```

Creates esp_netif WiFi object based on the custom configuration.

**Attention** This API DOES NOT register default handlers!

**Parameters**

- `wifi_if` - [in] type of wifi interface
- `esp_netif_config` - inherent esp-netif configuration pointer

**Returns** pointer to esp-netif instance

```c
esp_err_t esp_netif_create_default_wifi_mesh_netifs (esp_netif_t **p_netif_sta, esp_netif_t **p_netif_ap)
```

Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled.

Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.

**Parameters**

- `p_netif_sta` - [out] pointer where the resultant STA interface is saved (if non NULL)
- `p_netif_ap` - [out] pointer where the resultant AP interface is saved (if non NULL)

**Returns** ESP_OK on success

### 2.5.5 IP Network Layer

#### ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with esp-netif connection capabilities. By convention the I/O driver has to register itself as an esp-netif driver and thus holds a dependency on esp-netif component and is responsible for providing data path functions, post-attach callback and in most cases also default event handlers to define network interface actions based on driver’s lifecycle transitions.

**Packet input/output** As shown in the diagram, the following three API functions for the packet data path must be defined for connecting with esp-netif:

- `esp_netif_transmit()`
- `esp_netif_free_rx_buffer()`
- `esp_netif_receive()`

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e. they get called from esp-netif (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver’s code simply calls `esp_netif_receive()` on a new data received event.

**Post attach callback** A final part of the network interface initialization consists of attaching the esp-netif instance to the I/O driver, by means of calling the following API:

```c
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle_t __driver_handle);
```
It is assumed that the `esp_netif_iiodriver_handle` is a pointer to driver’s object, a struct derived from `struct esp_netif_driver_base_s`, so that the first member of I/O driver structure must be this base structure with pointers to

- post-attach function callback
- related `esp_netif` instance

As a consequence the I/O driver has to create an instance of the struct per below:

```c
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base;  // !< base structure reserved as...
    esp_netif_driver_t* driver_impl;  // !< handle of driver...
    struct implementation* h;  // !< handle of driver...
} my_netif_driver_t;
```

with actual values of `my_netif_driver_t::base.post_attach` and the actual drivers handle `my_netif_driver_t::h`. So when the `esp_netif_attach()` gets called from the initialization code, the post-attach callback from I/O driver’s code gets executed to mutually register callbacks between esp-netif and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```c
static esp_err_t my_post_attach_start(esp_netif_t *esp_netif, void *args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
    my_driver_start(driver->driver_impl);
    return ESP_OK;
}
```

**Default handlers**  I/O drivers also typically provide default definitions of lifecycle behaviour of related network interfaces based on state transitions of I/O drivers. For example `driver start -> network start`, etc. An example of such a default handler is provided below:

```c
esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_netif_t *esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_EVENT_STOP, esp_netif);
    return ESP_OK;
}
```

**Network stack connection**  The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the esp-netif, specifically from its TCP/IP stack connecting layer.

Note, that IDF provides several network stack configurations for the most common network interfaces, such as for the WiFi station or Ethernet. These configurations are defined in `esp_netif/include/esp_netif_defaults.h` and should be sufficient for most network drivers. (In rare cases, expert users might want to define custom lwIP based interface layers; it is possible, but an explicit dependency to lwIP needs to be set)

The following API reference outlines these network stack interaction with the esp-netif:
Header File

- components/esp_netif/include/esp_netif_net_stack.h

Functions

```c
esp_netif_t *esp_netif_get_handle_from_netif_impl (void *dev)
```

Returns esp-netif handle.

**Parameters**
- `dev` - [in] opaque ptr to network interface of specific TCP/IP stack

```c
void *esp_netif_get_netif_impl (esp_netif_t *esp_netif)
```

Returns network stack specific implementation handle (if supported)

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance

**Returns**
- handle to related network stack netif handle

```c
esp_err_t esp_netif_set_link_speed (esp_netif_t *esp_netif, uint32_t speed)
```

Set link-speed for the specified network interface.

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance
- `speed` - [in] Link speed in bit/s

**Returns**
- ESP_OK on success

```c
esp_err_t esp_netif_transmit (esp_netif_t *esp_netif, void *data, size_t len)
```

Outputs packets from the TCP/IP stack to the media to be transmitted.

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance
- `data` - [in] Data to be transmitted
- `len` - [in] Length of the data frame

**Returns**
- ESP_OK on success, an error passed from the I/O driver otherwise

```c
esp_err_t esp_netif_transmit_wrap (esp_netif_t *esp_netif, void *data, size_t len, void *netstack_buf)
```

Outputs packets from the TCP/IP stack to the media to be transmitted.

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance
- `data` - [in] Data to be transmitted
- `len` - [in] Length of the data frame
- `netstack_buf` - [in] net stack buffer

**Returns**
- ESP_OK on success, an error passed from the I/O driver otherwise

```c
void esp_netif_free_rx_buffer (void *esp_netif, void *buffer)
```

Free the rx buffer allocated by the media driver.

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance
- `buffer` - [in] Rx buffer pointer

Code examples for TCP/IP socket APIs are provided in the protocols/sockets directory of ESP-IDF examples.
2.5.6 Application Layer

Documentation for Application layer network protocols (above the IP Network layer) are provided in Application Protocols.

2.6 Peripherals API

2.6.1 Analog to Digital Converter (ADC) Oneshot Mode Driver

Introduction

The Analog to Digital Converter is an on-chip sensor which is able to measure analog signals from dedicated analog IO pads.

The ADC on ESP32-C3 can be used in scenario(s) like:

- Generate one-shot ADC conversion result
- Generate continuous ADC conversion results

This guide will introduce ADC oneshot mode conversion.

Functional Overview

The following sections of this document cover the typical steps to install and operate an ADC:

- **Resource Allocation** - covers which parameters should be set up to get an ADC handle and how to recycle the resources when ADC finishes working.
- **Unit Configuration** - covers the parameters that should be set up to configure the ADC unit, so as to get ADC conversion raw result.
- **Read Conversion Result** - covers how to get ADC conversion raw result.
- **Hardware Limitations** - describes the ADC related hardware limitations.
- **Power Management** - covers power management related.
- **IRAM Safe** - describes tips on how to read ADC conversion raw result when cache is disabled.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

Resource Allocation

The ADC oneshot mode driver is implemented based on ESP32-C3 SAR ADC module. Different ESP chips might have different number of independent ADCs. From oneshot mode driver’s point of view, an ADC instance is represented by `adc_oneshot_unit_handle_t`.

To install an ADC instance, set up the required initial configuration structure `adc_oneshot_unit_init_cfg_t`:

- `adc_oneshot_unit_init_cfg_t::unit_id` selects the ADC. Please refer to the datasheet to know dedicated analog IOs for this ADC.
- `adc_oneshot_unit_init_cfg_t::ulp_mode` sets if the ADC will be working under ULP mode.

After setting up the initial configurations for the ADC, call `adc_oneshot_new_unit()` with the prepared `adc_oneshot_unit_init_cfg_t`. This function will return an ADC unit handle, if the allocation is successful.

This function may fail due to various errors such as invalid arguments, insufficient memory, etc. Specifically, when the to-be-allocated ADC instance is registered already, this function will return `ESP_ERR_NOT_FOUND` error. Number of available ADC(s) is recorded by `SOC_ADC_PERIPH_NUM`.
Chapter 2. API Reference

If a previously created ADC instance is no longer required, you should recycle the ADC instance by calling `adc_oneshot_del_unit()`, related hardware and software resources will be recycled as well.

Create an ADC Unit Handle under Normal OneShot Mode

```c
adc_oneshot_unit_handle_t adc1_handle;
dacloneshot_unit_init_cfg_t init_config1 = {
  .unit_id = ADC_UNIT_1,
  .ulp_mode = ADC_ULP_MODE_DISABLE,
};
ESP_ERROR_CHECK(adc_oneshot_new_unit(&init_config1, &adc1_handle));
```

Recycle the ADC Unit

```c
ESP_ERROR_CHECK(adc_oneshot_del_unit(adc1_handle));
```

Unit Configuration After an ADC instance is created, set up the `adc_oneshot_chan_cfg_t` to configure ADC IOs to measure analog signal:

- `adc_oneshot_chan_cfg_t::atten`, ADC attenuation. Refer to the On-Chip Sensor chapter in TRM.
- `adc_oneshot_chan_cfg_t::bitwidth`, the bitwidth of the raw conversion result.

Note: For the IO corresponding ADC channel number. Check datasheet to know the ADC IOs. On the other hand, `adc_continuous_io_to_channel()` and `adc_continuous_channel_to_io()` can be used to know the ADC channels and ADC IOs.

To make these settings take effect, call `adc_oneshot_config_channel()` with above configuration structure. You should specify an ADC channel to be configured as well. Especially, this `adc_oneshot_config_channel()` can be called multiple times to configure different ADC channels. Driver will save these per channel configurations internally.

Configure Two ADC Channels

```c
adc_oneshot_chan_cfg_t config = {
  .bitwidth = ADC_BITWIDTH_DEFAULT,
  .atten = ADC_ATTEN_DB_11,
};
ESP_ERROR_CHECK(adc_oneshot_config_channel(adc1_handle, EXAMPLE_ADC1_CHAN0, &config));
ESP_ERROR_CHECK(adc_oneshot_config_channel(adc1_handle, EXAMPLE_ADC1_CHAN1, &config));
```

Read Conversion Result After above configurations, the ADC is ready to measure the analog signal(s) from the configured ADC channel(s). Call `adc_oneshot_read()` to get the conversion raw result of an ADC channel.

- `adc_oneshot_read()` is safer. ADC(s) are shared by some other drivers / peripherals, see Hardware Limitations. This function takes some mutexes, to avoid concurrent hardware usage. Therefore, this function should not be used in an ISR context. This function may fail when the ADC is in use by other drivers / peripherals, and return `ESP_ERR_TIMEOUT`. Under this condition, the ADC raw result is invalid.

These two functions will both fail due to invalid arguments.

The ADC conversion results read from these two functions are raw data. To calculate the voltage based on the ADC raw results, this formula can be used:

\[
V_{out} = D_{out} \times \frac{V_{max}}{D_{max}} \quad (1)
\]
where:

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vout</td>
<td>Digital output result, standing for the voltage.</td>
</tr>
<tr>
<td>Dout</td>
<td>ADC raw digital reading result.</td>
</tr>
<tr>
<td>Vmax</td>
<td>Maximum measurable input analog voltage, this is related to the ADC attenuation, please refer to the On-Chip Sensor chapter in TRM.</td>
</tr>
<tr>
<td>Dmax</td>
<td>Maximum of the output ADC raw digital reading result, which is $2^\text{bitwidth}$, where bitwidth is the :cpp:member::adc_oneshot_chan_cfg_t::bitwidth configured before.</td>
</tr>
</tbody>
</table>

To do further calibration to convert the ADC raw result to voltage in mV, please refer to calibration doc *Analog to Digital Converter (ADC) Calibration Driver*.

**Read Raw Result**

```c
ESP_ERROR_CHECK(adc_oneshot_read(adc1_handle, EXAMPLE_ADC1_CHAN0, &adc_raw[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN0, adc_raw[0][0]);
ESP_ERROR_CHECK(adc_oneshot_read(adc1_handle, EXAMPLE_ADC1_CHAN1, &adc_raw[0][1]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN1, adc_raw[0][1]);
```

**Hardware Limitations**

- Random Number Generator uses ADC as an input source. When ADC `adc_oneshot_read()` works, the random number generated from RNG will be less random.
- A specific ADC unit can only work under one operating mode at any one time, either Continuous Mode or Oneshot Mode. `adc_oneshot_read()` has provided the protection.
- ADC2 is also used by the Wi-Fi. `adc_oneshot_read()` has provided the protection between Wi-Fi driver and ADC continuous mode driver.

**Power Management** When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system clock frequency may be adjusted when the system is in an idle state. However, the ADC oneshot mode driver works in a polling routine, the `adc_oneshot_read()` will poll the CPU until the function returns. During this period of time, the task in which ADC oneshot mode driver resides won’t be blocked. Therefore the clock frequency is stable when reading.

**IRAM Safe** By default, all the ADC oneshot mode driver APIs are not supposed to be run when the Cache is disabled (Cache may be disabled due to many reasons, such as Flash writing/erasing, OTA, etc.). If these APIs executes when the Cache is disabled, you will probably see errors like Illegal Instruction or Load/Store Prohibited.

**Thread Safety**

- `adc_oneshot_new_unit()`
- `adc_oneshot_config_channel()`
- `adc_oneshot_read()`

Above functions are guaranteed to be thread safe. Therefore, you can call them from different RTOS tasks without protection by extra locks.

- `adc_oneshot_del_unit()` is not thread safe. Besides, concurrently calling this function may result in failures of above thread-safe APIs.
Chapter 2. API Reference

Kconfig Options

- CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM controls where to place the ADC fast read function (IRAM or Flash), see IRAM Safe for more details.

Application Examples

- ADC oneshot mode example: peripherals/adc/oneshot_read.

API Reference

Header File

- components/hal/include/hal/adc_types.h

Structures

struct adc_digi_pattern_config_t
ADC digital controller pattern configuration.

Public Members

uint8_t atten
    Attenuation of this ADC channel.

uint8_t channel
    ADC channel.

uint8_t unit
    ADC unit.

uint8_t bit_width
    ADC output bit width.

struct adc_digi_output_data_t
ADC digital controller (DMA mode) output data format. Used to analyze the acquired ADC (DMA) data.

Public Members

uint32_t data
    ADC real output data info. Resolution: 12 bit.

uint32_t reserved12
    Reserved12.

uint32_t channel
    ADC channel index info. If (channel < ADC_CHANNEL_MAX), The data is valid. If (channel > ADC_CHANNEL_MAX), The data is invalid.
Chapter 2. API Reference

uint32_t unit
ADC unit index info. 0: ADC1; 1: ADC2.

uint32_t reserved17_31
Reserved17.

struct adc_digi_output_data_t::[anonymous]::[anonymous] type2
When the configured output format is 12bit.

uint32_t val
Raw data value

Enumerations

enum adc_unit_t
ADC unit.
Values:

enumerator ADC_UNIT_1
SAR ADC 1.

enumerator ADC_UNIT_2
SAR ADC 2.

eenum adc_channel_t
ADC channels.
Values:

enumerator ADC_CHANNEL_0
ADC channel.

enumerator ADC_CHANNEL_1
ADC channel.

enumerator ADC_CHANNEL_2
ADC channel.

enumerator ADC_CHANNEL_3
ADC channel.

enumerator ADC_CHANNEL_4
ADC channel.

enumerator ADC_CHANNEL_5
ADC channel.

enumerator ADC_CHANNEL_6
ADC channel.
enumerator ADC_CHANNEL_7
ADC channel.

enumerator ADC_CHANNEL_8
ADC channel.

enumerator ADC_CHANNEL_9
ADC channel.

enum adc_atten_t
ADC attenuation parameter. Different parameters determine the range of the ADC.

Values:

enumerator ADC_ATTEN_DB_0
No input attenuation, ADC can measure up to approx.

enumerator ADC_ATTEN_DB_2_5
The input voltage of ADC will be attenuated extending the range of measurement by about 2.5 dB (1.33 x)

enumerator ADC_ATTEN_DB_6
The input voltage of ADC will be attenuated extending the range of measurement by about 6 dB (2 x)

enumerator ADC_ATTEN_DB_11
The input voltage of ADC will be attenuated extending the range of measurement by about 11 dB (3.55 x)

enum adc_bitwidth_t

Values:

enumerator ADC_BITWIDTH_DEFAULT
Default ADC output bits, max supported width will be selected.

enumerator ADC_BITWIDTH_9
ADC output width is 9Bit.

enumerator ADC_BITWIDTH_10
ADC output width is 10Bit.

enumerator ADC_BITWIDTH_11
ADC output width is 11Bit.

enumerator ADC_BITWIDTH_12
ADC output width is 12Bit.

enumerator ADC_BITWIDTH_13
ADC output width is 13Bit.
enum adc_ulp_mode_t

Values:

enumerator ADC_ULP_MODE_DISABLE
ADC ULP mode is disabled.

enumerator ADC_ULP_MODE_FSM
ADC is controlled by ULP FSM.

enumerator ADC_ULP_MODE_RISCV
ADC is controlled by ULP RISCV.

enum adc_digi_convert_mode_t
ADC digital controller (DMA mode) work mode.

Values:

enumerator ADC_CONV_SINGLE_UNIT_1
Only use ADC1 for conversion.

enumerator ADC_CONV_SINGLE_UNIT_2
Only use ADC2 for conversion.

enumerator ADC_CONV_BOTH_UNIT
Use Both ADC1 and ADC2 for conversion simultaneously.

enumerator ADC_CONV_ALTER_UNIT
Use both ADC1 and ADC2 for conversion by turn. e.g. ADC1 -> ADC2 -> ADC1 -> ADC2 ···

enum adc_digi_output_format_t
ADC digital controller (DMA mode) output data format option.

Values:

enumerator ADC_DIGI_OUTPUT_FORMAT_TYPE1
See adc_digi_output_data_t.type1

enumerator ADC_DIGI_OUTPUT_FORMAT_TYPE2
See adc_digi_output_data_t.type2

Header File

- components/esp_adc/include/esp_adc/adc_oneshot.h

Functions

esp_err_t adc_oneshot_new_unit (const adc_oneshot_unit_init_cfg_t *init_config,
adc_oneshot_unit_handle_t *ret_unit)

Create a handle to a specific ADC unit.

Note: This API is thread-safe. For more details, see ADC programming guide
**Parameters**

- `init_config` [in] Driver initial configurations
- `ret_unit` [out] ADC unit handle

**Returns**

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_NO_MEM: No memory
- ESP_ERR_NOT_FOUND: The ADC peripheral to be claimed is already in use

```c
esp_err_t adc_oneshot_config_channel (adc_oneshot_unit_handle_t handle, adc_channel_t channel, const adc_oneshot_chan_cfg_t *config)
```

Set ADC oneshot mode required configurations.

**Note:** This API is thread-safe. For more details, see ADC programming guide

**Parameters**

- `handle` [in] ADC handle
- `channel` [in] ADC channel to be configured
- `config` [in] ADC configurations

**Returns**

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments

```c
esp_err_t adc_oneshot_read (adc_oneshot_unit_handle_t handle, adc_channel_t chan, int *out_raw)
```

Get one ADC conversion raw result.

**Note:** This API is thread-safe. For more details, see ADC programming guide

**Note:** This API should NOT be called in an ISR context

**Parameters**

- `handle` [in] ADC handle
- `chan` [in] ADC channel
- `out_raw` [out] ADC conversion raw result

**Returns**

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_TIMEOUT: Timeout, the ADC result is invalid

```c
esp_err_t adc_oneshot_del_unit (adc_oneshot_unit_handle_t handle)
```

Delete the ADC unit handle.

**Note:** This API is thread-safe. For more details, see ADC programming guide

**Parameters**

- `handle` [in] ADC handle

**Returns**

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_NOT_FOUND: The ADC peripheral to be disclaimed isn’t in use
**esp_err_t adc_oneshot_io_to_channel** (int io_num, *adc_unit_t* unit_id, *adc_channel_t* channel)

Get ADC channel from the given GPIO number.

**Parameters**
- `io_num` - [in] GPIO number
- `unit_id` - [out] ADC unit
- `channel` - [out] ADC channel

**Returns**
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_NOT_FOUND: The IO is not a valid ADC pad

**esp_err_t adc_oneshot_channel_to_io** (*adc_unit_t* unit_id, *adc_channel_t* channel, int *io_num)

Get GPIO number from the given ADC channel.

**Parameters**
- `unit_id` - [in] ADC unit
- `channel` - [in] ADC channel
- `io_num` - [out] GPIO number
- `-` - ESP_OK: On success
- `-` - ESP_ERR_INVALID_ARG: Invalid argument

**Structures**

**struct adc_oneshot_unit_init_cfg_t**

ADC oneshot driver initial configurations.

**Public Members**

```c
adc_unit_t unit_id
```

ADC unit.

```c
adc_ulp_mode_t ulp_mode
```

ADC controlled by ULP, see `adc_ulp_mode_t`

**struct adc_oneshot_chan_cfg_t**

ADC channel configurations.

**Public Members**

```c
adc_atten_t atten
```

ADC attenuation.

```c
adc_bitwidth_t bitwidth
```

ADC conversion result bits.

**Type Definitions**

```c
typedef struct adc_oneshot_unit_ctx_t* adc_oneshot_unit_handle_t
```

Type of ADC unit handle for oneshot mode.
2.6.2 Analog to Digital Converter (ADC) Continuous Mode Driver

Introduction

The Analog to Digital Converter is an on-chip sensor which is able to measure analog signals from specific analog IO pads.

The ADC on ESP32-C3 can be used in scenario(s) like:
- Generate one-shot ADC conversion result
- Generate continuous ADC conversion results

This guide will introduce ADC continuous mode conversion.

Driver Concepts

ADC continuous mode conversion is made up with multiple Conversion Frames.

- Conversion Frame: One Conversion Frame contains multiple Conversion Results. Conversion Frame size is configured in `adc_continuous_new_handle()`, in bytes.
- Conversion Result: One Conversion Result contains multiple bytes (see `SOC_ADC_DIGI_RESULT_BYTES`). Its structure is `adc_digi_output_data_t`, including ADC unit, ADC channel and raw data.

Functional Overview

The following sections of this document cover the typical steps to install the ADC continuous mode driver, and read ADC conversion results from group of ADC channels continuously:

- **Resource Allocation** - covers which parameters should be set up to initialize the ADC continuous mode driver and how to deinitialize it.
- **ADC Configurations** - describes how to configure the ADC(s) to make it work under continuous mode.
- **ADC Control** - describes ADC control functions.
- **Register Event Callbacks** - describes how to hook user specific code to an ADC continuous mode event callback function.
- **Read Conversion Result** - covers how to get ADC conversion result.
- **Hardware Limitations** - describes the ADC related hardware limitations.
- **Power Management** - covers power management related.
- **IRAM Safe** - covers the IRAM safe functions.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.

Resource Allocation

The ADC continuous mode driver is implemented based on ESP32-C3 SAR ADC module. Different ESP targets might have different number of independent ADCs.

To create an ADC continuous mode driver handle, set up the required configuration structure `adc_continuous_handle_cfg_t`:

- `adc_continuous_handle_cfg_t::max_store_buf_size` set the maximum size (in bytes) of the pool that the driver saves ADC conversion result into. If this pool is full, new conversion results will be lost.
- `adc_continuous_handle_cfg_t::conv_frame_size` set the size of the ADC conversion frame, in bytes.
After setting up above configurations for the ADC, call `adc_continuous_new_handle()` with the prepared `adc_continuous_handle_cfg_t`. This function may fail due to various errors such as invalid arguments, insufficient memory, etc.

Especially, when this function returns `ESP_ERR_NOT_FOUND`, this means there is no free GDMA channel.

If the ADC continuous mode driver is no longer used, you should deinitialize the driver by calling `adc_continuous_deinit()`.

### Initialize the ADC Continuous Mode Driver

```c
adc_continuous_handle_cfg_t adc_config = {
    .max_store_buf_size = 1024,
    .conv_frame_size = 100,
};
ESP_ERROR_CHECK(adc_continuous_new_handle(&adc_config));
```

### Recycle the ADC Unit

```c
ESP_ERROR_CHECK(adc_continuous_deinit());
```

### ADC Configurations

After the ADC continuous mode driver is initialized, set up the `adc_continuous_config_t` to configure ADC IOs to measure analog signal:

- `adc_continuous_config_t::pattern_num`, number of ADC channels that will be used.
- `adc_continuous_config_t::adc_pattern`, list of configs for each ADC channel that will be used, see below description.
- `adc_continuous_config_t::sample_freq_hz`, expected ADC sampling frequency in Hz.
- `adc_continuous_config_t::conv_mode`, continuous conversion mode.
- `adc_continuous_config_t::format`, conversion output format.

For `adc_digi_pattern_config_t`:

- `adc_digi_pattern_config_t::atten`, ADC attenuation. Refer to the On-Chip Sensor chapter in TRM.
- `adc_digi_pattern_config_t::channel`, the IO corresponding ADC channel number. See below note.
- `adc_digi_pattern_config_t::unit`, the ADC that the IO is subordinate to.
- `adc_digi_pattern_config_t::bit_width`, the bitwidth of the raw conversion result.

**Note:** For the IO corresponding ADC channel number. Check datasheet to acquire the ADC IOs. On the other hand, `adc_continuous_io_to_channel()` and `adc_continuous_channel_to_io()` can be used to acquire the ADC channels and ADC IOs.

To make these settings take effect, call `adc_continuous_config()` with the configuration structure above. This API may fail due to reasons like `ESP_ERR_INVALID_ARG`. When it returns `ESP_ERR_INVALID_STATE`, this means the ADC continuous mode driver is started, you shouldn’t call this API at this moment.

See ADC continuous mode example `peripherals/adc/continuous_read` to see configuration codes.

### ADC Control

**Start and Stop** Calling `adc_continuous_start()` will make the ADC start to measure analog signals from the configured ADC channels, and generate the conversion results. On the contrary, calling `adc_continuous_stop()` will stop the ADC conversion.

```c
ESP_ERROR_CHECK(adc_continuous_stop());
```
Register Event Callbacks  By calling `adc_continuous_register_event_callbacks()`, you can hook your own function to the driver ISR. Supported event callbacks are listed in `adc_continuous_evt_cbs_t` - `adc_continuous_evt_cbs_t::on_conv_done`, this is invoked when one conversion frame finishes. - `adc_continuous_evt_cbs_t::on_pool_ovf`, this is invoked when internal pool is full. Newer conversion results will be discarded.

As above callbacks are called in an ISR context, you should always ensure the callback function is suitable for an ISR context. Blocking logics should not appear in these callbacks. Callback function prototype is declared in `adc_continuous_callback_t`.

You can also register your own context when calling `adc_continuous_register_event_callbacks()`, by the parameter `user_data`. This user data will be passed to the callback functions directly.

This function may fail due to reasons like `ESP_ERR_INVALID_ARG`. Specially, when `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, this error may indicate that the callback functions aren’t in internal RAM. Check error log to know this. Besides, when it fails due to `ESP_ERR_INVALID_STATE`, this means the ADC continuous mode driver is started, you shouldn’t add callback at this moment.

Conversion Done Event  The driver will fill in the event data of a `adc_continuous_evt_cbs_t::on_conv_done` event. Event data contains a buffer pointer to a conversion frame buffer, together with the size. Refer to `adc_continuous_evt_data_t` to know the event data structure.

Note:  It is worth noting that, the data buffer `adc_continuous_evt_data_t::conv_frame_buffer` is maintained by the driver itself. Therefore, never free this piece of memory.

Note:  When the Kconfig option `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, the registered callbacks and the functions called by the callbacks should be placed in IRAM. The involved variables should be placed in internal RAM as well.

Pool Overflow Event  The ADC continuous mode driver has an internal pool to save the conversion results. When the pool is full, a pool overflow event will emerge. Under this condition, the driver won’t fill in the event data. This usually happens the speed to read data from the pool (by calling `adc_continuous_read()`) is much slower than the ADC conversion speed.

Read Conversion Result  After calling `adc_continuous_start()`, the ADC continuous conversion starts. Call `adc_continuous_read()` to get the conversion results of the ADC channels. You need to provide a buffer to get the raw results.

This function will try to read the expected length of conversion results each time.

- If the requested length isn’t reached, the function will still move the data from the internal pool to the buffer you prepared. Therefore, check the `out_length` to know the actual size of conversion results.
- If there is no conversion result generated in the internal pool, the function will block for `timeout_ms` until the conversion results are generated. If there is still no generated results, the function will return `ESP_ERR_TIMEOUT`.
- If the generated results fill up the internal pool, new generated results will be lost. Next time when the `adc_continuous_read()` is called, this function will return `ESP_ERR_INVALID_STATE` indicating this situation.

This API aims to give you a chance to read all the ADC continuous conversion results.

The ADC conversion results read from above function are raw data. To calculate the voltage based on the ADC raw results, this formula can be used:

\[
V_{\text{out}} = \frac{\text{Dout} \times V_{\text{max}}}{D_{\text{max}}} \quad (1)
\]
where:

<table>
<thead>
<tr>
<th>Vout</th>
<th>Digital output result, standing for the voltage.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dout</td>
<td>ADC raw digital reading result.</td>
</tr>
<tr>
<td>Vmax</td>
<td>Maximum measurable input analog voltage, this is related to the ADC attenuation, please refer to the On-Chip Sensor chapter in TRM.</td>
</tr>
<tr>
<td>Dmax</td>
<td>Maximum of the output ADC raw digital reading result, which is $2^{\text{bitwidth}}$, where bitwidth is the \texttt{adc_digi_pattern_config_t::bit_width} configured before.</td>
</tr>
</tbody>
</table>

To do further calibration to convert the ADC raw result to voltage in mV, please refer to calibration doc *Analog to Digital Converter (ADC) Calibration Driver*.

**Hardware Limitations**

- A specific ADC unit can only work under one operating mode at any one time, either Continuous Mode or Oneshot Mode. \texttt{adc_continuous_start()} has provided the protection.
- Random Number Generator uses ADC as an input source. When ADC continuous mode driver works, the random number generated from RNG will be less random.
- ADC2 is also used by the Wi-Fi. \texttt{adc_continuous_start()} has provided the protection between Wi-Fi driver and ADC continuous mode driver.

**Power Management**  When power management is enabled (i.e. \texttt{CONFIG_PM_ENABLE} is on), the APB clock frequency may be adjusted when the system is in an idle state, thus potentially changing the behavior of ADC continuous conversion.

However, the continuous mode driver can prevent this change by acquiring a power management lock of type \texttt{ESP_PM_APB_FREQ_MAX}. The lock is acquired after the continuous conversion is started by \texttt{adc_continuous_start()}. Similarly, the lock will be released after \texttt{adc_continuous_stop()}. Therefore, \texttt{adc_continuous_start()} and \texttt{adc_continuous_stop()} should appear in pairs, otherwise the power management will be out of action.

**IRAM Safe**  All the ADC continuous mode driver APIs are not IRAM-safe. They are not supposed to be run when the Cache is disabled. By enabling the Kconfig option \texttt{CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE}, driver internal ISR handler is IRAM-safe, which means even when the Cache is disabled, the driver will still save the conversion results into its internal pool.

**Thread Safety**  ADC continuous mode driver APIs are not guaranteed to be thread safe. However, the share hardware mutual exclusion is provided by the driver. See *Hardware Limitations* for more details.

**Application Examples**

- ADC continuous mode example: peripherals/adc/continuous_read.

**API Reference**

**Header File**

- components/esp_adc/include/esp_adc/adc_continuous.h
Functions

**esp_err_t adc_continuous_new_handle**(const *adc_continuous_handle_cfg_t* hdl_config, *adc_continuous_handle_t* ret_handle)

Initialize ADC continuous driver and get a handle to it.

**Parameters**
- **hdl_config** -[in] Pointer to ADC initialization config. Refer to *adc_continuous_handle_cfg_t*.
- **ret_handle** -[out] ADC continuous mode driver handle

**Returns**
- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_NO_MEM If out of memory
- ESP_OK On success

**esp_err_t adc_continuous_config**(adc_continuous_handle_t handle, const *adc_continuous_config_t* config)

Set ADC continuous mode required configurations.

**Parameters**
- **handle** -[in] ADC continuous mode driver handle
- **config** -[in] Refer to *adc_digi_config_t*.

**Returns**
- ESP_ERR_INVALID_STATE: Driver state is invalid, you shouldn’t call this API at this moment
- ESP_ERR_INVALID_ARG: If the combination of arguments is invalid.
- ESP_OK: On success

**esp_err_t adc_continuous_register_event_callbacks**(adc_continuous_handle_t handle, const *adc_continuousEvt_cb_s_t* cbs, void *user_data)

Register callbacks.

**Note:** User can deregister a previously registered callback by calling this function and setting the to-be-deregistered callback member int the **cbs** structure to NULL.

**Note:** When CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables (including **user_data**) should be in internal RAM as well.

**Note:** You should only call this API when the ADC continuous mode driver isn’t started. Check return value to know this.

**Parameters**
- **handle** -[in] ADC continuous mode driver handle
- **cbs** -[in] Group of callback functions
- **user_data** -[in] User data, which will be delivered to the callback functions directly

**Returns**
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_INVALID_STATE: Driver state is invalid, you shouldn’t call this API at this moment

**esp_err_t adc_continuous_start**(adc_continuous_handle_t handle)

Start the ADC under continuous mode. After this, the hardware starts working.
**Parameters** handle - [in] ADC continuous mode driver handle

**Returns**
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

```c
esp_err_t adc_continuous_read(adc_continuous_handle_t handle, uint8_t *buf, uint32_t length_max, uint32_t *out_length, uint32_t timeout_ms)
```

Read bytes from ADC under continuous mode.

**Parameters**
- handle - [in] ADC continuous mode driver handle
- buf - [out] Conversion result buffer to read from ADC. Suggest convert to `adc_digi_output_data_t` for ADC Conversion Results. See @brief Driver Backgrounds to know this concept.
- length_max - [in] Expected length of the Conversion Results read from the ADC, in bytes.
- out_length - [out] Real length of the Conversion Results read from the ADC via this API, in bytes.
- timeout_ms - [in] Time to wait for data via this API, in millisecond.

**Returns**
- ESP_ERR_INVALID_STATE Driver state is invalid. Usually it means the ADC sampling rate is faster than the task processing rate.
- ESP_ERR_TIMEOUT Operation timed out
- ESP_OK On success

```c
esp_err_t adc_continuous_stop(adc_continuous_handle_t handle)
```

Stop the ADC. After this, the hardware stops working.

**Parameters** handle - [in] ADC continuous mode driver handle

**Returns**
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

```c
esp_err_t adc_continuous_deinit(adc_continuous_handle_t handle)
```

Deinitialize the ADC continuous driver.

**Parameters** handle - [in] ADC continuous mode driver handle

**Returns**
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

```c
esp_err_t adc_continuous_io_to_channel(int io_num, adc_unit_t *unit_id, adc_channel_t *channel)
```

Get ADC channel from the given GPIO number.

**Parameters**
- io_num - [in] GPIO number
- unit_id - [out] ADC unit
- channel - [out] ADC channel

**Returns**
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_NOT_FOUND: The IO is not a valid ADC pad

```c
esp_err_t adc_continuous_channel_to_io(adc_unit_t unit_id, adc_channel_t channel, int *io_num)
```

Get GPIO number from the given ADC channel.

**Parameters**
- unit_id - [in] ADC unit
- channel - [in] ADC channel
- io_num - [out] GPIO number
- - - ESP_OK: On success
- - ESP_ERR_INVALID_ARG: Invalid argument
Structures

struct _adc_continuous_handle_cfg_t
ADC continuous mode driver initial configurations.

Public Members

uint32_t max_store_buf_size
Max length of the conversion Results that driver can store, in bytes.

uint32_t conv_frame_size
Conversion frame size, in bytes. This should be in multiples of
SOC_ADC_DIGI_DATA_BYTES_PER_CONV.

struct _adc_continuous_config_t
ADC continuous mode driver configurations.

Public Members

uint32_t pattern_num
Number of ADC channels that will be used.

adc_digi_pattern_config_t *adc_pattern
List of configs for each ADC channel that will be used.

uint32_t sample_freq_hz
The expected ADC sampling frequency in Hz. Please refer to soc/soc_caps.h to know available
sampling frequency range

adc_digi_convert_mode_t conv_mode
ADC DMA conversion mode, see adc_digi_convert_mode_t.

adc_digi_output_format_t format
ADC DMA conversion output format, see adc_digi_output_format_t.

struct _adc_continuous_evt_data_t
Event data structure.

Note: The conv_frame_buffer is maintained by the driver itself, so never free this piece of memory.

Public Members

uint8_t *conv_frame_buffer
Pointer to conversion result buffer for one conversion frame.

uint32_t size
Conversion frame size.
struct \texttt{adc\_continuous\_evt\_cbs\_t}
Group of ADC continuous mode callbacks.

\textbf{Note:} These callbacks are all running in an ISR environment.

\textbf{Note:} When CONFIG\_ADC\_CONTINUOUS\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables should be in internal RAM as well.

\section*{Public Members}

\begin{verbatim}
\texttt{adc\_continuous\_callback\_t on\_conv\_done}
Event callback, invoked when one conversion frame is done. See @brief Driver Backgrounds to know conversion frame concept.

\texttt{adc\_continuous\_callback\_t on\_pool\_ovf}
Event callback, invoked when the internal pool is full.
\end{verbatim}

\section*{Macros}

\texttt{ADC\_MAX\_DELAY}
Driver Backgrounds.

\section*{Type Definitions}

\begin{verbatim}
typedef struct \texttt{adc\_continuous\_ctx\_t} *\texttt{adc\_continuous\_handle\_t}
Type of adc continuous mode driver handle.
typedef bool (*\texttt{adc\_continuous\_callback\_t})(\texttt{adc\_continuous\_handle\_t} handle, const \texttt{adc\_continuous\_evt\_data\_t} *edata, void *user\_data)
Prototype of ADC continuous mode event callback.
\end{verbatim}

\begin{verbatim}
\begin{itemize}
\item \texttt{Param handle [in]} ADC continuous mode driver handle
\item \texttt{Param edata [in]} Pointer to ADC continuous mode event data
\item \texttt{Param user\_data [in]} User registered context, registered when in
\item \texttt{Prototype adc\_continuous\_register\_event\_callbacks()}
\item \texttt{Return} Whether a high priority task is woken up by this function
\end{itemize}
\end{verbatim}

\section{2.6.3 Analog to Digital Converter (ADC) Calibration Driver}

\section*{Introduction}

Based on series of comparisons with the reference voltage, ESP32-C3 ADC determines each bit of the output digital result. Per design the ESP32-C3 ADC reference voltage is 1100 mV, however the true reference voltage can range from 1000 mV to 1200 mV among different chips. This guide will introduce an ADC calibration driver to minimize this difference.
Chapter 2. API Reference

Functional Overview

The following sections of this document cover the typical steps to install and use the ADC calibration driver:

- **Calibration Scheme Creation** - covers how to create a calibration scheme handle and delete the calibration scheme handle.
- **Calibration Configuration** - covers how to configure the calibration driver to calculate necessary characteristics used for calibration.
- **Result Conversion** - covers how to convert ADC raw result to calibrated result.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.
- **Minimize Noise** - describes a general way to minimize the noise.

**Calibration Scheme Creation**  
The ADC calibration driver provides ADC calibration scheme(s). From calibration driver’s point of view, an ADC calibration scheme is created to an ADC calibration handle `adc_cali_handle_t`. `adc_cali_check_scheme()` can be used to know which calibration scheme is supported on the chip. For those users who are already aware of the supported scheme, this step can be skipped. Just call the corresponding function to create the scheme handle.

For those users who use their custom ADC calibration schemes, you could either modify this function `adc_cali_check_scheme()`, or just skip this step and call your custom creation function.

**ADC Calibration Curve Fitting Scheme**  
ESP32-C3 supports `ADC_CALI_SCHEME_VER_CURVE_FITTING` scheme. To create this scheme, set up `adc_cali_curve_fitting_config_t` first.

- `adc_cali_curve_fitting_config_t::unit_id`, the ADC that your ADC raw results are from.
- `adc_cali_curve_fitting_config_t::atten`, ADC attenuation that your ADC raw results use.
- `adc_cali_curve_fitting_config_t::bitwidth`, the ADC raw result bitwidth.

After setting up the configuration structure, call `adc_cali_create_scheme_curve_fitting()` to create a Curve Fitting calibration scheme handle. This function may fail due to reasons such as `ESP_ERR_INVALID_ARG` or `ESP_ERR_NO_MEM`. Especially, when the function return `ESP_ERR_NOT_SUPPORTED`, this means the calibration scheme required eFuse bits are not burnt on your board.

**Create Curve Fitting Scheme**

```c
ESP_LOGI(TAG, "calibration scheme version is %s", "Curve Fitting");
adc_cali_curve_fitting_config_t cali_config = {
    .unit_id = unit,
    .atten = atten,
    .bitwidth = ADC_BITWIDTH_DEFAULT,
};
ESP_ERROR_CHECK(adc_cali_create_scheme_curve_fitting(&cali_config, &handle));
```

When the ADC calibration is no longer used, please delete the calibration scheme driver from the calibration handle by calling `adc_cali_delete_scheme_curve_fitting()`.  

**Delete Curve Fitting Scheme**

```c
ESP_LOGI(TAG, "delete %s calibration scheme", "Curve Fitting");
ESP_ERROR_CHECK(adc_cali_delete_scheme_curve_fitting(handle));
```

**Note:**  
For users who want to use their custom calibration schemes, you could provide a creation function to create your calibration scheme handle. Check the function table `adc_cali_scheme_t` in components/esp_adc/interface/adc_cali_interface.h to know the ESP ADC calibration interface.
Result Conversion

After setting up the calibration characteristics, you can call `adc_cali_raw_to_voltage()` to convert the ADC raw result into calibrated result. The calibrated result is in the unit of mV. This function may fail due to invalid argument. Especially, if this function returns `ESP_ERR_INVALID_STATE`, this means the calibration scheme isn’t created. You need to create a calibration scheme handle, use `adc_cali_check_scheme()` to know the supported calibration scheme. On the other hand, you could also provide a custom calibration scheme and create the handle.

Get Voltage

```c
ESP_ERROR_CHECK(adc_cali_raw_to_voltage(adc_cali_handle, adc_raw[0][0], &voltage[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Cali Voltage: %d mV", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN0, voltage[0][0]);
```

Thread Safety

The factory function `esp_adc_cali_new_scheme()` is guaranteed to be thread safe by the driver. Therefore, you can call them from different RTOS tasks without protection by extra locks.

Other functions that take the `adc_cali_handle_t` as the first positional parameter are not thread safe, you should avoid calling them from multiple tasks.

Minimize Noise

The ESP32-C3 ADC can be sensitive to noise leading to large discrepancies in ADC readings. Depending on the usage scenario, you may need to connect a bypass capacitor (e.g. a 100 nF ceramic capacitor) to the ADC input pad in use, to minimize noise. Besides, multisampling may also be used to further mitigate the effects of noise.

API Reference

Header File

- `components/esp_adc/include/esp_adc/adc_cali.h`

Functions

```c
esp_err_t adc_cali_check_scheme(adc_cali_scheme_ver_t *scheme_mask)
Check the supported ADC calibration scheme.

Parameters

- `scheme_mask` - [out] Supported ADC calibration scheme(s)

Returns

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_NOT_SUPPORTED: No supported calibration scheme
```

```c
esp_err_t adc_cali_raw_to_voltage(adc_cali_handle_t handle, int raw, int *voltage)
Convert ADC raw data to calibrated voltage.

Parameters

- `handle` - [in] ADC calibration handle
- `raw` - [in] ADC raw data
- `voltage` - [out] Calibrated ADC voltage (in mV)

Returns

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_INVALID_STATE: Invalid state, scheme didn’t registered
```

Type Definitions

```c
typedef struct adc_cali_scheme_t *adc_cali_handle_t
ADC calibration handle.
```
Chapter 2. API Reference

Enumerations

enum adc_cali_scheme_ver_t
ADC calibration scheme.

Values:

enumerator ADC_CALI_SCHEME_VER_LINE_FITTING
Line fitting scheme.

enumerator ADC_CALI_SCHEME_VER_CURVE_FITTING
Curve fitting scheme.

Header File

- components/esp_adc/include/esp_adc/adc_cali_scheme.h

2.6.4 Clock Tree

This section lists definitions of the ESP32-C3’s supported root clocks and module clocks. These definitions are commonly used in the driver configuration, to help user select a proper source clock for the peripheral.

Root Clocks

Root clocks generate reliable clock signals. These clock signals then pass through various gates, muxes, dividers, or multipliers to become the clock sources for every functional module: the CPU core(s), WIFI, BT, the RTC, and the peripherals.

ESP32-C3’s root clocks are listed in soc_root_clk_t:

- Internal 17.5MHz RC Oscillator (RC_FAST)
  This RC oscillator generates a ~17.5MHz clock signal output as the RC_FAST_CLK. The ~17.5MHz signal output is also passed into a configurable divider, which by default divides the input clock frequency by 256, to generate a RC_FAST_D256_CLK. The exact frequency of RC_FAST_CLK can be computed in runtime through calibration on the RC_FAST_D256_CLK.
- External 40MHz Crystal (XTAL)
- Internal 136kHz RC Oscillator (RC_SLOW)
  This RC oscillator generates a ~136kHz clock signal output as the RC_SLOW_CLK. The exact frequency of this clock can be computed in runtime through calibration.
- External 32kHz Crystal - optional (XTAL32K)
  The clock source for this XTAL32K_CLK can be either a 32kHz crystal connecting to the XTAL_32K_P and XTAL_32K_N pins or a 32kHz clock signal generated by an external circuit. The external signal must be connected to the XTAL_32K_P pin. XTAL32K_CLK can also be calibrated to get its exact frequency.

Typically, the frequency of the signal generated from a RC oscillator circuit is less accurate and more sensitive to environment comparing to the signal generated from a crystal. ESP32-C3 provides several clock source options for the RTC_SLOW_CLK, and users can make the choice based on the requirements for system time accuracy and power consumption (refer to RTC Timer Clock Sources for more details).

Module Clocks

ESP32-C3’s available module clocks are listed in soc_module_clk_t. Each module clock has a unique ID. You can get more information on each clock by checking the documented enum value.
Chapter 2. API Reference

API Reference

Header File

- components/soc/esp32c3/include/soc/clk_tree_defs.h

Macros

**SOC_CLK_RC_FAST_FREQ_APPROX**

Approximate RC_FAST_CLK frequency in Hz

**SOC_CLK_RC_SLOW_FREQ_APPROX**

Approximate RC_SLOW_CLK frequency in Hz

**SOC_CLK_RC_FAST_D256_FREQ_APPROX**

Approximate RC_FAST_D256_CLK frequency in Hz

**SOC_CLK_XTAL32K_FREQ_APPROX**

Approximate XTAL32K_CLK frequency in Hz

**SOC_GPTIMER_CLKS**

Array initializer for all supported clock sources of GPTimer.

The following code can be used to iterate all possible clocks:

```c
soc_periph_gptimer_clk_src_t gptimer_clks[] = (soc_periph_gptimer_clk_src_t*)SOC_GPTIMER_CLKS;
for (size_t i = 0; i < sizeof(gptimer_clks) / sizeof(gptimer_clks[0]); i++) {
    soc_periph_gptimer_clk_src_t clk = gptimer_clks[i];
    // Test GPTimer with the clock `clk`
}
```

**SOC_RMT_CLKS**

Array initializer for all supported clock sources of RMT.

**SOC_TEMP_SENSOR_CLKS**

Array initializer for all supported clock sources of Temperature Sensor.

**SOC_I2S_CLKS**

Array initializer for all supported clock sources of I2S.

**SOC_I2C_CLKS**

Array initializer for all supported clock sources of I2C.

**SOC_SDM_CLKS**

Array initializer for all supported clock sources of SDM.

Enumerations

```c
enum soc_root_clk_t
{
    Root clock.
    Values:
```

Submit Document Feedback
Chapter 2. API Reference

enumerator **SOC_ROOT_CLK_INT_RC_FAST**
Internal 17.5MHz RC oscillator

enumerator **SOC_ROOT_CLK_INT_RC_SLOW**
Internal 136kHz RC oscillator

enumerator **SOC_ROOT_CLK_EXT_XTAL**
External 40MHz crystal

enumerator **SOC_ROOT_CLK_EXT_XTAL32K**
External 32kHz crystal/clock signal

enum **soc_cpu_clk_src_t**
CPU_CLK mux inputs, which are the supported clock sources for the CPU_CLK.

<table>
<thead>
<tr>
<th>Values</th>
</tr>
</thead>
</table>
| enumerator **SOC_CPU_CLK_SRC_XTAL**
Select XTAL_CLK as CPU_CLK source |
| enumerator **SOC_CPU_CLK_SRC_PLL**
Select PLL_CLK as CPU_CLK source (PLL_CLK is the output of 40MHz crystal oscillator frequency multiplier, can be 480MHz or 320MHz) |
| enumerator **SOC_CPU_CLK_SRC_RC_FAST**
Select RC_FAST_CLK as CPU_CLK source |
| enumerator **SOC_CPU_CLK_SRC_INVALID**
Invalid CPU_CLK source |

Note: Enum values are matched with the register field values on purpose

enum **soc_rtc_slow_clk_src_t**
RTC_SLOW_CLK mux inputs, which are the supported clock sources for the RTC_SLOW_CLK.

<table>

Select XTAL32K_CLK as RTC_SLOW_CLK source |
| enumerator **SOC_RTC_SLOW_CLK_SRC_RC_FAST_D256**
Select RC_FAST_D256_CLK (referred as FOSC_DIV or 8m_d256/8md256 in TRM and reg. description) as RTC_SLOW_CLK source |

Note: Enum values are matched with the register field values on purpose
Chapter 2. API Reference

enumerator **SOC_RTC_SLOW_CLK_SRC_INVALID**
Invalid RTC_SLOW_CLK source

enum **soc_rtc_fast_clk_src_t**
RTC_FAST_CLK mux inputs, which are the supported clock sources for the RTC_FAST_CLK.

**Note:** Enum values are matched with the register field values on purpose

**Values:**

enumerator **SOC_RTC_FAST_CLK_SRC_XTAL_D2**
Select XTAL_D2_CLK (may referred as XTAL_CLK_DIV_2) as RTC_FAST_CLK source

enumerator **SOC_RTC_FAST_CLK_SRC_XTAL_DIV**
Alias name for **SOC_RTC_FAST_CLK_SRC_XTAL_D2**

enumerator **SOC_RTC_FAST_CLK_SRC_RC_FAST**
Select RC_FAST_CLK as RTC_FAST_CLK source

enumerator **SOC_RTC_FAST_CLK_SRC_INVALID**
Invalid RTC_FAST_CLK source

enum **soc_module_clk_t**
Supported clock sources for modules (CPU, peripherals, RTC, etc.)

**Note:** enum starts from 1, to save 0 for special purpose

**Values:**

enumerator **SOC_MOD_CLK_CPU**
CPU_CLK can be sourced from XTAL, PLL, or RC_FAST by configuring soc_cpu_clk_src_t

enumerator **SOC_MOD_CLK_RTC_FAST**
RTC_FAST_CLK can be sourced from XTAL_D2 or RC_FAST by configuring soc_rtc_fast_clk_src_t

enumerator **SOC_MOD_CLK_RTC_SLOW**
RTC_SLOW_CLK can be sourced from RC_SLOW, XTAL32K, or RC_FAST_D256 by configuring soc_rtc_slow_clk_src_t

enumerator **SOC_MOD_CLK_APB**
APB_CLK is highly dependent on the CPU_CLK source

enumerator **SOC_MOD_CLK_PLL_F80M**
PLL_F80M_CLK is derived from PLL, and has a fixed frequency of 80MHz

enumerator **SOC_MOD_CLK_PLL_F160M**
PLL_F160M_CLK is derived from PLL, and has a fixed frequency of 160MHz
enumerator **SOC_MOD_CLK_PLL_D2**
PLL_D2_CLK is derived from PLL, it has a fixed divider of 2

enumerator **SOC_MOD_CLK_XTAL32K**
XTAL32K_CLK comes from the external 32kHz crystal, passing a clock gating to the peripherals

enumerator **SOC_MOD_CLK_RC_FAST**
RC_FAST_CLK comes from the internal 20MHz rc oscillator, passing a clock gating to the peripherals

enumerator **SOC_MOD_CLK_RC_FAST_D256**
RC_FAST_D256_CLK comes from the internal 20MHz rc oscillator, divided by 256, and passing a clock gating to the peripherals

enumerator **SOC_MOD_CLK_XTAL**
XTAL_CLK comes from the external 40MHz crystal

enum **soc_periph_gptimer_clk_src_t**
Type of GPTimer clock source.
*Values:*

enumerator **GPTIMER_CLK_SRC_APB**
Select APB as the source clock

enumerator **GPTIMER_CLK_SRC_XTAL**
Select XTAL as the source clock

enumerator **GPTIMER_CLK_SRC_DEFAULT**
Select APB as the default choice

enum **soc_periph_tg_clk_src_legacy_t**
Type of Timer Group clock source, reserved for the legacy timer group driver.
*Values:*

enumerator **TIMER_SRC_CLK_APB**
Timer group clock source is APB

enumerator **TIMER_SRC_CLK_XTAL**
Timer group clock source is XTAL

enumerator **TIMER_SRC_CLK_DEFAULT**
Timer group clock source default choice is APB

enum **soc_periph_rmt_clk_src_t**
Type of RMT clock source.
*Values:*

enumerator **RMT_CLK_SRC_APB**
Select APB as the source clock
enumerator RMT_CLK_SRC_RC_FAST
    Select RC_FAST as the source clock

enumerator RMT_CLK_SRC_XTAL
    Select XTAL as the source clock

enumerator RMT_CLK_SRC_DEFAULT
    Select APB as the default choice

eenum soc_periph_rmt_clk_src_legacy_t
    Type of RMT clock source, reserved for the legacy RMT driver.
    Values:

enumerator RMT_BASECLK_APB
    RMT source clock is APB

enumerator RMT_BASECLK_XTAL
    RMT source clock is XTAL

enumerator RMT_BASECLK_DEFAULT
    RMT source clock default choice is APB

eenum soc_periph_temperature_sensor_clk_src_t
    Type of Temp Sensor clock source.
    Values:

enumerator TEMPERATURE_SENSOR_CLK_SRC_XTAL
    Select XTAL as the source clock

enumerator TEMPERATURE_SENSOR_CLK_SRC_RC_FAST
    Select RC_FAST as the source clock

enumerator TEMPERATURE_SENSOR_CLK_SRC_DEFAULT
    Select XTAL as the default choice

eenum soc_periph_uart_clk_src_legacy_t
    Type of UART clock source, reserved for the legacy UART driver.
    Values:

enumerator UART_SCLK_APB
    UART source clock is APB CLK

enumerator UART_SCLK_RTC
    UART source clock is RC_FAST

enumerator UART_SCLK_XTAL
    UART source clock is XTAL
2.6.5 GPIO & RTC GPIO

Overview

The ESP32-C3 chip features 22 physical GPIO pins (GPIO0 ~ GPIO21). Each pin can be used as a general-purpose I/O, or be connected to an internal peripheral signal. Through GPIO matrix and IO MUX, peripheral input signals can be from any IO pins, and peripheral output signals can be routed to any IO pins. Together these modules provide highly configurable I/O. For more details, see ESP32-C3 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX) [PDF].

The table below provides more information on pin usage, and please note the comments in the table for GPIOs with restrictions.
GPIO | Analog Function | Comment
---|---|---
GPIO0 | ADC1_CH0 | RTC
GPIO1 | ADC1_CH1 | RTC
GPIO2 | ADC1_CH2 | Strapping pin: RTC
GPIO3 | ADC1_CH3 | RTC
GPIO4 | ADC1_CH4 | RTC
GPIO5 | ADC2_CH0 | RTC
GPIO6 |  |  
GPIO7 |  |  
GPIO8 |  | Strapping pin
GPIO9 |  | Strapping pin
GPIO10 |  |  
GPIO11 |  |  
GPIO12 | SPI0/1 |  
GPIO13 | SPI0/1 |  
GPIO14 | SPI0/1 |  
GPIO15 | SPI0/1 |  
GPIO16 | SPI0/1 |  
GPIO17 | SPI0/1 |  
GPIO18 | USB-JTAG |  
GPIO19 | USB-JTAG |  
GPIO20 |  |  
GPIO21 |  |  

**Note:**
- Strapping pin: GPIO2, GPIO8 and GPIO9 are strapping pins. For more information, please refer to ESP32-C3 datasheet.
- SPI0/1: GPIO12-17 are usually used for SPI flash and PSRAM and are not recommended for other uses.
- USB-JTAG: GPIO 18 and 19 are used by USB-JTAG by default. In order to use them as GPIOs, USB-JTAG will be disabled by the drivers.
- RTC: GPIO0-5 can be used when in Deep-sleep mode.

**Application Example**

GPIO output and input interrupt example: peripherals/gpio/generic_gpio.

**API Reference - Normal GPIO**

**Header File**

- components/driver/include/driver/gpio.h

**Functions**

```c
esp_err_t gpio_config(const gpio_config_t *pGPIOConfig)
```

- Configure GPIO's Mode, pull-up, PullDown, IntrType

**Parameters**

- `pGPIOConfig` - Pointer to GPIO configure struct

**Returns**

- ESP_OK on success, ESP_ERR_INVALID_ARG otherwise
**Chapter 2. API Reference**

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t gpio_reset_pin(gpio_num_t gpio_num)`

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

**Note:** This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

**Parameters**
- `gpio_num` – GPIO number.

**Returns**
- Always return ESP_OK.

`esp_err_t gpio_set_intr_type(gpio_num_t gpio_num, gpio_int_type_t intr_type)`

GPIO set interrupt trigger type.

**Parameters**
- `gpio_num` – GPIO number. If you want to set the trigger type of e.g. of GPIO16, `gpio_num` should be GPIO_NUM_16 (16);
- `intr_type` – Interrupt type, select from gpio_int_type_t

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t gpio_intr_enable(gpio_num_t gpio_num)`

Enable GPIO module interrupt signal.

**Note:** ESP32: Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi and Bluetooth with sleep mode enabled. Please refer to the comments of `adc1_get_raw`. Please refer to Section 3.11 of ESP32 ECO and Workarounds for Bugs for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

**Parameters**
- `gpio_num` – GPIO number. If you want to enable an interrupt on e.g. GPIO16, `gpio_num` should be GPIO_NUM_16 (16);

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t gpio_intr_disable(gpio_num_t gpio_num)`

Disable GPIO module interrupt signal.

**Note:** This function is allowed to be executed when Cache is disabled within ISR context, by enabling `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`

**Parameters**
- `gpio_num` – GPIO number. If you want to disable the interrupt of e.g. GPIO16, `gpio_num` should be GPIO_NUM_16 (16);

**Returns**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t gpio_set_level(gpio_num_t gpio_num, uint32_t level)`

GPIO set output level.
## Chapter 2. API Reference

**Note:** This function is allowed to be executed when Cache is disabled within ISR context, by enabling `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`

</tbody>
</table>
• **intr_type** - GPIO wake-up type. Only GPIO_INTR_LOW_LEVEL or GPIO_INTR_HIGH_LEVEL can be used.

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

` esp_err_t gpio_wakeup_disable (gpio_num_t gpio_num)`

Disable GPIO wake-up function.

**Parameters**

- **gpio_num** - GPIO number

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

` esp_err_t gpio_isr_register (void (*fn)(void*), void*arg, int intr_alloc_flags, gpio_isr_handle_t*handle)`

Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative gpio_install_isr_service() and gpio_isr_handler_add() API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the **interrupt allocation functions**.

**Parameters**

- **fn** - Interrupt handler function.
- **arg** - Parameter for handler function
- **intr_alloc_flags** - Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- **handle** - Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags

` esp_err_t gpio_pullup_en (gpio_num_t gpio_num)`

Enable pull-up on GPIO.

**Parameters**

- **gpio_num** - GPIO number

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

` esp_err_t gpio_pullup_dis (gpio_num_t gpio_num)`

Disable pull-up on GPIO.

**Parameters**

- **gpio_num** - GPIO number

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

` esp_err_t gpio_pulldown_en (gpio_num_t gpio_num)`

Enable pull-down on GPIO.

**Parameters**

- **gpio_num** - GPIO number

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

` esp_err_t gpio_pulldown_dis (gpio_num_t gpio_num)`

Disable pull-down on GPIO.

**Parameters**

- **gpio_num** - GPIO number

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
Chapter 2. API Reference

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

*esp_err_t gpio_install_isr_service*(int intr_alloc_flags)

Install the GPIO driver’s ETS_GPIO_INTR_SOURCE ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with *gpio_isr_register()- if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the *gpio_isr_handler_add() function.

**Parameters**
intr_alloc_flags - Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

**Returns**
- ESP_OK Success
- ESP_ERR_NO_MEM No memory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_INVALID_ARG GPIO error

*void gpio_uninstall_isr_service*(void)

Uninstall the driver’s GPIO ISR service, freeing related resources.

*esp_err_t gpio_isr_handler_add*(gpio_num_t gpio_num, gpio_isr_t isr_handler, void *args)

Add ISR handler for the corresponding GPIO pin.

Call this function after using *gpio_install_isr_service()* to install the driver’s GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with IRAM_ATTR, unless you pass the ESP_INTR_FLAG_IRAM flag when allocating the ISR in *gpio_install_isr_service()*.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

**Parameters**
- gpio_num - GPIO number
- isr_handler - ISR handler function for the corresponding GPIO number.
- args - parameter for ISR handler.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

*esp_err_t gpio_isr_handler_remove*(gpio_num_t gpio_num)

Remove ISR handler for the corresponding GPIO pin.

**Parameters**
- gpio_num - GPIO number

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

*esp_err_t gpio_set_drive_capability*(gpio_num_t gpio_num, gpio_drive_cap_t strength)

Set GPIO pad drive capability.

**Parameters**
- gpio_num - GPIO number, only support output GPIOs
- strength - Drive capability of the pad

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
**Chapter 2. API Reference**

---

**esp_err_t gpio_get_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t *strength)**

Get GPIO pad drive capability.

**Parameters**

- **gpio_num** – GPIO number, only support output GPIOs
- **strength** – Pointer to accept drive capability of the pad

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t gpio_hold_en (gpio_num_t gpio_num)**

Enable gpio pad hold function.

The gpio pad hold function works in both input and output modes, but must be output-capable gpios. If pad hold enabled: in output mode: the output level of the pad will be force locked and can not be changed. in input mode: the input value read will not change, regardless the changes of input signal.

The state of digital gpio cannot be held during Deep-sleep, and it will resume the hold function when the chip wakes up from Deep-sleep. If the digital gpio also needs to be held during Deep-sleep, `gpio_deep_sleep_hold_en` should also be called.

Power down or call `gpio_hold_dis` will disable this function.

**Parameters**

- **gpio_num** – GPIO number, only support output-capable GPIOs

**Returns**

- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

**esp_err_t gpio_hold_dis (gpio_num_t gpio_num)**

Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don’t want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level (because gpio18 is input mode by default). If you don’t want this behavior, you should configure gpio18 as output mode and set it to high level before calling `gpio_hold_dis`.

**Parameters**

- **gpio_num** – GPIO number, only support output-capable GPIOs

**Returns**

- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

**void gpio_deep_sleep_hold_en (void)**

Enable all digital gpio pad hold function during Deep-sleep.

When the chip is in Deep-sleep mode, all digital gpio will hold the state before sleep, and when the chip is woken up, the status of digital gpio will not be held. Note that the pad hold feature only works when the chip is in Deep-sleep mode, when not in sleep mode, the digital gpio state can be changed even you have called this function.

Power down or call `gpio_hold_dis` will disable this function, otherwise, the digital gpio hold feature works as long as the chip enter Deep-sleep.

**void gpio_deep_sleep_hold_dis (void)**

Disable all digital gpio pad hold function during Deep-sleep.

**void gpio_iomux_in (uint32_t gpio_num, uint32_t signal_idx)**

Set pad input to a peripheral signal through the IOMUX.

**Parameters**

- **gpio_num** – GPIO number of the pad.
- **signal_idx** – Peripheral signal id to input. One of the *IN_IDX signals in soc/gpio_sig_map.h.*
void gpio_iomux_out (uint8_t gpio_num, int func, bool oen_inv)

Set peripheral output to an GPIO pad through the IOMUX.

Parameters

• gpio_num - gpio_num GPIO number of the pad.
• func - The function number of the peripheral pin to output pin. One of the FUNC_X_*
  of specified pin (X) in soc/io_mux_reg.h.
• oen_inv - True if the output enable needs to be inverted, otherwise False.

esp_err_t gpio_force_hold_all (void)

Force hold digital and rtc gpio pad.

Note: GPIO force hold, whether the chip in sleep mode or wakeup mode.

esp_err_t gpio_force_unhold_all (void)

Force unhold digital and rtc gpio pad.

Note: GPIO force unhold, whether the chip in sleep mode or wakeup mode.

esp_err_t gpio_sleep_sel_en (gpio_num_t gpio_num)

Enable SLP_SEL to change GPIO status automatically in lightsleep.

Parameters gpio_num - GPIO number of the pad.

Returns

• ESP_OK Success

esp_err_t gpio_sleep_sel_dis (gpio_num_t gpio_num)

Disable SLP_SEL to change GPIO status automatically in lightsleep.

Parameters gpio_num - GPIO number of the pad.

Returns

• ESP_OK Success

esp_err_t gpio_sleep_set_direction (gpio_num_t gpio_num, gpio_mode_t mode)

GPIO set direction at sleep.

Configure GPIO direction, such as output_only, input_only, output_and_input

Parameters

• gpio_num - Configure GPIO pins number, it should be GPIO number. If you want to
  set direction of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
• mode - GPIO direction

Returns

• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO error

esp_err_t gpio_sleep_set_pull_mode (gpio_num_t gpio_num, gpio_pull_mode_t pull)

Configure GPIO pull-up/pull-down resistors at sleep.

Note: ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

Parameters

• gpio_num - GPIO number. If you want to set pull up or down mode for e.g. GPIO16,
  gpio_num should be GPIO_NUM_16 (16);
• pull - GPIO pull up/down mode.

Returns
### Variables

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` : Parameter error

### Functions

#### `esp_err_t gpio_deep_sleep_wakeup_enable (gpio_num_t gpio_num, gpio_int_type_t intr_type)`
Enable GPIO deep-sleep wake-up function.

**Note:** Called by the SDK. User shouldn’t call this directly in the APP.

#### Parameters
- `gpio_num` - GPIO number.
- `intr_type` - GPIO wake-up type. Only `GPIO_INTR_LOW_LEVEL` or `GPIO_INTR_HIGH_LEVEL` can be used.

#### Returns
- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### `esp_err_t gpio_deep_sleep_wakeup_disable (gpio_num_t gpio_num)`
Disable GPIO deep-sleep wake-up function.

#### Parameters
- `gpio_num` - GPIO number

#### Returns
- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

### Structures

**struct gpio_config_t**

Configuration parameters of GPIO pad for `gpio_config` function.

#### Public Members

- `uint64_t pin_bit_mask`
  GPIO pin: set with bit mask, each bit maps to a GPIO

- `gpio_mode_t mode`
  GPIO mode: set input/output mode

- `gpio_pullup_t pull_up_en`
  GPIO pull-up

- `gpio_pulldown_t pull_down_en`
  GPIO pull-down

- `gpio_int_type_t intr_type`
  GPIO interrupt type

### Macros

- `GPIO_PIN_COUNT`
- `GPIO_IS_VALID_GPIO (gpio_num)`
  Check whether it is a valid GPIO number.
**GPIO_IS_VALID_OUTPUT_GPIO** (gpio_num)
Check whether it can be a valid GPIO number of output mode.

**GPIO_IS_DEEP_SLEEP_WAKEUP_VALID_GPIO** (gpio_num)

**Type Definitions**

```c
typedef intr_handle_t gpio_isr_handle_t

typedef void (*gpio_isr_t)(void *arg)
        GPIO interrupt handler.
        
        **Param arg**  User registered data
```

**Header File**

- components/hal/include/hal/gpio_types.h

2.6.6 General Purpose Timer (GPTimer)

Introduction

GPTimer (General Purpose Timer) is the driver of ESP32-C3 Timer Group peripheral. The hardware timer features high resolution and flexible alarm action. The behavior when the internal counter of a timer reaches a specific target value is called a timer alarm. When a timer alarms, a user registered per-timer callback would be called.

Typically, a general purpose timer can be used in scenarios like:

• Free running as a wall clock, fetching a high-resolution timestamp at any time and any places
• Generate periodalarms, triggerevents periodically
• Generate one-shot alarm, respond in target time

Functional Overview

The following sections of this document cover the typical steps to install and operate a timer:

• Resource Allocation - covers which parameters should be set up to get a timer handle and how to recycle the resources when GPTimer finishes working.
• Set and Get Count Value - covers how to force the timer counting from a start point and how to get the count value at anytime.
• Set up Alarm Action - covers the parameters that should be set up to enable the alarm event.
• Register Event Callbacks - covers how to hook user specific code to the alarm event callback function.
• Enable and Disable Timer - covers how to enable and disable the timer.
• Start and Stop Timer - shows some typical use cases that start the timer with different alarm behavior.
• Power Management - describes how different source clock selections can affect power consumption.
• IRAM Safe - describes tips on how to make the timer interrupt and IO control functions work better along with a disabled cache.
• Thread Safety - lists which APIs are guaranteed to be thread safe by the driver.
• Kconfig Options - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

Resource Allocation  Different ESP chips might have different numbers of independent timer groups, and within each group, there could also be several independent timers.¹

A GPTimer instance is represented by gptimer_handle_t. The driver behind will manage all available hardware resources in a pool, so that you do not need to care about which timer and which group it belongs to.

To install a timer instance, there is a configuration structure that needs to be given in advance: gptimer_config_t:

¹ Different ESP chip series might have different numbers of GPTimer instances. For more details, please refer to ESP32-C3 Technical Reference Manual > Chapter Timer Group (TIMG) [PDF]. The driver will not forbid you from applying for more timers, but it will return error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g. gptimer_new_timer()).
Chapter 2. API Reference

- `gptimer_config_t::clk_src` selects the source clock for the timer. The available clocks are listed in `gptimer_clock_source_t`, you can only pick one of them. For the effect on power consumption of different clock source, please refer to Section Power Management.
- `gptimer_config_t::direction` sets the counting direction of the timer, supported directions are listed in `gptimer_count_direction_t`, you can only pick one of them.
- `gptimer_config_t::resolution_hz` sets the resolution of the internal counter. Each count step is equivalent to \(1 / \text{resolution}_hz\) seconds.
- Optional `gptimer_config_t::intr_shared` sets whether or not mark the timer interrupt source as a shared one. For the pros/cons of a shared interrupt, you can refer to Interrupt Handling.

With all the above configurations set in the structure, the structure can be passed to `gptimer_new_timer()` which will instantiate the timer instance and return a handle of the timer.

The function can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free timers (i.e. all hardware resources have been used up), then `ESP_ERR_NOT_FOUND` will be returned. The total number of available timers is represented by the `SOC_TIMER_GROUP_TOTAL_TIMERS` and its value will depend on the ESP chip.

If a previously created GPTimer instance is no longer required, you should recycle the timer by calling `gptimer_del_timer()`. This will allow the underlying HW timer to be used for other purposes. Before deleting a GPTimer handle, please disable it by `gptimer_disable()` in advance or make sure it has not enabled yet by `gptimer_enable()`.

**Creating a GPTimer Handle with Resolution of 1 MHz**

```c
gptimer_handle_t gptimer = NULL;
gptimer_config_t timer_config = {
    .clk_src = GPTIMER_CLK_SRC_DEFAULT,
    .direction = GPTIMER_COUNT_UP,
    .resolution_hz = 1 * 1000 * 1000, // 1MHz, 1 tick = 1us
};
ESP_ERROR_CHECK(gptimer_new_timer(&timer_config, &gptimer));
```

**Set and Get Count Value** When the GPTimer is created, the internal counter will be reset to zero by default. The counter value can be updated asynchronously by `gptimer_set_raw_count()`. The maximum count value is dependent on the bit width of the hardware timer, which is also reflected by the SOC macro `SOC_TIMER_GROUP_COUNTER_BIT_WIDTH`. When updating the raw count of an active timer, the timer will immediately start counting from the new value.

Count value can be retrieved by `gptimer_get_raw_count()`, at any time.

**Set up Alarm Action** For most of the use cases of GPTimer, you should set up the alarm action before starting the timer, except for the simple wall-clock scenario, where a free running timer is enough. To set up the alarm action, you should configure several members of `gptimer_alarm_config_t` based on how you make use of the alarm event:

- `gptimer_alarm_config_t::alarm_count` sets the target count value that will trigger the alarm event. You should also take the counting direction into consideration when setting the alarm value. Specially, `gptimer_alarm_config_t::alarm_count` and `gptimer_alarm_config_t::reload_count` cannot be set to the same value when `gptimer_alarm_config_t::auto_reload_on_alarm` is true, as keeping reload with a target alarm count is meaningless.
- `gptimer_alarm_config_t::reload_count` sets the count value to be reloaded when the alarm event happens. This configuration only takes effect when `gptimer_alarm_config_t::auto_reload_on_alarm` is set to true.
- `gptimer_alarm_config_t::auto_reload_on_alarm` flag sets whether to enable the auto-reload feature. If enabled, the hardware timer will reload the value of `gptimer_alarm_config_t::reload_count` into counter immediately when an alarm event happens.
To make the alarm configurations take effect, you should call `gptimer_set_alarm_action()`. Especially, if `gptimer_alarm_config_t` is set to `NULL`, the alarm function will be disabled.

**Note:** If an alarm value is set and the timer has already exceeded this value, the alarm will be triggered immediately.

**Register Event Callbacks** After the timer starts up, it can generate a specific event (e.g. the "Alarm Event") dynamically. If you have some functions that should be called when the event happens, please hook your function to the interrupt service routine by calling `gptimer_register_event_callbacks()`. All supported event callbacks are listed in `gptimer_event_callbacks_t`:

- `gptimer_event_callbacks_t::on_alarm` sets a callback function for alarm events. As this function is called within the ISR context, you must ensure that the function does not attempt to block (e.g., by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The function prototype is declared in `gptimer_alarm_cb_t`.

You can save your own context to `gptimer_register_event_callbacks()` as well, via the parameter `user_data`. The user data will be directly passed to the callback function.

This function will lazy install the interrupt service for the timer but not enable it. So please call this function before `gptimer_enable()`, otherwise the `ESP_ERR_INVALID_STATE` error will be returned. See Section **Enable and Disable Timer** for more information.

**Enable and Disable Timer** Before doing IO control to the timer, you needs to enable the timer first, by calling `gptimer_enable()`. This function will:

- Switch the timer driver state from `init` to `enable`.
- Enable the interrupt service if it has been lazy installed by `gptimer_register_event_callbacks()`.
- Acquire a proper power management lock if a specific clock source (e.g. APB clock) is selected. See Section **Power Management** for more information.

Calling `gptimer_disable()` will do the opposite, that is, put the timer driver back to the `init` state, disable the interrupts service and release the power management lock.

**Start and Stop Timer** The basic IO operation of a timer is to start and stop. Calling `gptimer_start()` can make the internal counter work, while calling `gptimer_stop()` can make the counter stop working. The following illustrates how to start a timer with or without an alarm event.

**Start Timer as a Wall Clock**

```c
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
// Retrieve the timestamp at any time
uint64_t count;
ESP_ERROR_CHECK(gptimer_get_raw_count(gptimer, &count));
```

**Trigger Period Events**

```c
typedef struct {
   uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Retrieve the count value from event data
```
example_queue_element_t ele = {
    .event_count = edata->count_value
};

// Optional: send the event data to other task by OS queue
// Do not introduce complex logics in callbacks
// Suggest dealing with event data in the main loop, instead of in this_
->callback
xQueueSendFromISR(queue, &ele, &high_task_awoken);

return high_task_awoken == pdTRUE;
}
gptimer_alarm_config_t alarm_config = {
    .reload_count = 0,  // counter will reload with 0 on alarm event
    .alarm_count = 1000000, // period = 1s @resolution 1MHz
    .flags.auto_reload_on_alarm = true,  // enable auto-reload
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));

Trigger One-Shot Event

typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
->event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Stop timer the sooner the better
gptimer_stop(timer);
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}
gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1 * 1000 * 1000, // alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
Dynamic Alarm Update  Alarm value can be updated dynamically inside the ISR handler callback, by changing `gptimer_alarm_event_data_t::alarm_value`. Then the alarm value will be updated after the callback function returns.

```c
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_data;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // reconfigure alarm value
    gptimer_alarm_config_t alarm_config = {
        .alarm_count = edata->alarm_value + 1000000, // alarm in next 1s
    };
    gptimer_set_alarm_action(timer, &alarm_config);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

void example_timer_alarm_isr(gptimer_handle_t timer)
{
    gptimer_alarm_config_t alarm_config = {
        .alarm_count = 1000000, // initial alarm target = 1s @resolution 1MHz
    };
    ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));
    gptimer_event_callbacks_t cbs = {
        .on_alarm = example_timer_on_alarm_cb, // register user callback
    };
    ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
    ESP_ERROR_CHECK(gptimer_enable(gptimer));
    ESP_ERROR_CHECK(gptimer_start(gptimer, &alarm_config));
}
```

Power Management  When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system will adjust the APB frequency before going into Light-sleep mode, thus potentially changing the period of a GPTimer’s counting step and leading to inaccurate time keeping.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever the driver creates a GPTimer instance that has selected `GPTIMER_CLK_SRC_APB` as its clock source, the driver will guarantee that the power management lock is acquired when enabling the timer by `gptimer_enable()`. Likewise, the driver releases the lock when `gptimer_disable()` is called for that timer.

If other gptimer clock sources are selected such as `GPTIMER_CLK_SRC_XTAL`, then the driver will not install power management lock. The XTAL clock source is more suitable for a low power application as long as the source clock can still provide sufficient resolution.

IRAM Safe  By default, the GPTimer interrupt will be deferred when the cache is disabled because of writing or erasing the flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option `CONFIG_GPTIMER_ISR_IRAM_SAFE` that will:

- Enable the interrupt being serviced even when the cache is disabled
Chapter 2. API Reference

- Place all functions that used by the ISR into IRAM\(^2\)
- Place driver object into DRAM (in case it is mapped to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled, but will come at the cost of increased IRAM consumption.

There is another Kconfig option `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So, these functions can also be executable when the cache is disabled. These IO control functions are as follows:

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_set_alarm_action()`

**Thread Safety**  The factory function `gptimer_new_timer()` is guaranteed to be thread safe by the driver, which means, you can call it from different RTOS tasks without protection by extra locks.

The following functions are allowed to run under ISR context, as the driver uses a critical section to prevent them being called concurrently in the task and ISR.

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_set_alarm_action()`

Other functions that take `gptimer_handle_t` as the first positional parameter, are not treated as thread safe, which means you should avoid calling them from multiple tasks.

**Kconfig Options**

- `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` controls where to place the GPTimer control functions (IRAM or flash), see Section IRAM Safe for more information.
- `CONFIG_GPTIMER_ISR_IRAM_SAFE` controls whether the default ISR handler can work when the cache is disabled, see Section IRAM Safe for more information.
- `CONFIG_GPTIMER_ENABLE_DEBUG_LOG` is used to enabled the debug log output. Enable this option will increase the firmware binary size.

**Application Examples**

- Typical use cases of GPTimer are listed in the example `peripherals/timer_group/gptimer`.

**API Reference**

**Header File**

- `components/driver/include/driver/gptimer.h`

**Functions**

```c
esp_err_t gptimer_new_timer(const gptimer_config_t *config, gptimer_handle_t *ret_timer)
```

Create a new General Purpose Timer, and return the handle.

---

\(^2\)`gptimer_event_callbacks_t::on_alarm` callback and the functions invoked by the callback should also be placed in IRAM, please take care of them by yourself.
Parameters

- `config` [in] GPTimer configuration
- `ret_timer` [out] Returned timer handle

Returns

- ESP_OK: Create GPTimer successfully
- ESP_ERR_INVALID_ARG: Create GPTimer failed because of invalid argument
- ESP_ERR_NO_MEM: Create GPTimer failed because out of memory
- ESP_ERR_NOT_FOUND: Create GPTimer failed because all hardware timers are used up and no more free one
- ESP_FAIL: Create GPTimer failed because of other error

```c
esp_err_t gptimer_del_timer(gptimer_handle_t timer)
```

Delete the GPTimer handle.

**Note:** A timer can’t be in the enable state when this function is invoked. See also `gptimer_disable` for how to disable a timer.

Parameters

- `timer` [in] Timer handle created by `gptimer_new_timer`

Returns

- ESP_OK: Delete GPTimer successfully
- ESP_ERR_INVALID_ARG: Delete GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete GPTimer failed because the timer is not in init state
- ESP_FAIL: Delete GPTimer failed because of other error

```c
esp_err_t gptimer_set_raw_count(gptimer_handle_t timer, uint64_t value)
```

Set GPTimer raw count value.

**Note:** When updating the raw count of an active timer, the timer will immediately start counting from the new value.

**Note:** This function is allowed to be executed when Cache is disabled, by enabling `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM`

Parameters

- `timer` [in] Timer handle created by `gptimer_new_timer`
- `value` [in] Count value to be set

Returns

- ESP_OK: Set GPTimer raw count value successfully
- ESP_ERR_INVALID_ARG: Set GPTimer raw count value failed because of invalid argument
- ESP_FAIL: Set GPTimer raw count value failed because of other error

```c
esp_err_t gptimer_get_raw_count(gptimer_handle_t timer, uint64_t *value)
```

Get GPTimer raw count value.

**Note:** This function will trigger a software capture event and then return the captured count value.
Note: With the raw count value and the resolution set in the `gptimer_config_t`, you can convert the count value into seconds.

Note: This function is allowed to run within ISR context

Note: This function is allowed to be executed when Cache is disabled, by enabling CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM

Parameters
- `timer` [in] Timer handle created by `gptimer_new_timer`
- `value` [out] Returned GPTimer count value

Returns
- ESP_OK: Get GPTimer raw count value successfully
- ESP_ERR_INVALID_ARG: Get GPTimer raw count value failed because of invalid argument
- ESP_FAIL: Get GPTimer raw count value failed because of other error

```c
esp_err_t gptimer_register_event_callbacks(gptimer_handle_t timer, const gptimer_event_callbacks_t *cbs, void *user_data)
```

Set callbacks for GPTimer.

Note: User registered callbacks are expected to be runnable within ISR context

Note: The first call to this function needs to be before the call to `gptimer_enable`

Note: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

Parameters
- `timer` [in] Timer handle created by `gptimer_new_timer`
- `cbs` [in] Group of callback functions
- `user_data` [in] User data, which will be passed to callback functions directly

Returns
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set event callbacks failed because the timer is not in init state
- ESP_FAIL: Set event callbacks failed because of other error

```c
esp_err_t gptimer_set_alarm_action(gptimer_handle_t timer, const gptimer_alarm_config_t *config)
```

Set alarm event actions for GPTimer.

Note: This function is allowed to run within ISR context, so that user can set new alarm action immediately in the ISR callback.
Chapter 2. API Reference

**Note:** This function is allowed to be executed when Cache is disabled, by enabling `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM`

### Parameters
- `timer` [in] Timer handle created by `gptimer_new_timer`
- `config` [in] Alarm configuration, especially, set config to NULL means disabling the alarm function

### Returns
- ESP_OK: Set alarm action for GPTimer successfully
- ESP_ERR_INVALID_ARG: Set alarm action for GPTimer failed because of invalid argument
- ESP_FAIL: Set alarm action for GPTimer failed because of other error

```c
esp_err_t gptimer_enable (gptimer_handle_t timer)
```

Enable GPTimer.

**Note:** This function will transit the timer state from init to enable.

**Note:** This function will enable the interrupt service, if it’s lazy installed in `gptimer_register_event_callbacks`.

**Note:** This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the `gptimer_config_t`, while `CONFIG_PM_ENABLE` is enabled.

**Note:** Enable a timer doesn’t mean to start it. See also `gptimer_start` for how to make the timer start counting.

### Parameters
- `timer` [in] Timer handle created by `gptimer_new_timer`

### Returns
- ESP_OK: Enable GPTimer successfully
- ESP_ERR_INVALID_ARG: Enable GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable GPTimer failed because the timer is already enabled
- ESP_FAIL: Enable GPTimer failed because of other error

```c
esp_err_t gptimer_disable (gptimer_handle_t timer)
```

Disable GPTimer.

**Note:** This function will do the opposite work to the `gptimer_enable`

**Note:** Disable a timer doesn’t mean to stop it. See also `gptimer_stop` for how to make the timer stop counting.

### Parameters
- `timer` [in] Timer handle created by `gptimer_new_timer`

### Returns
- ESP_OK: Disable GPTimer successfully
- ESP_ERR_INVALID_ARG: Disable GPTimer failed because of invalid argument
• ESP_ERR_INVALID_STATE: Disable GPTimer failed because the timer is not enabled yet
• ESP_FAIL: Disable GPTimer failed because of other error

`esp_err_t gptimer_start (gptimer_handle_t timer)`
Start GPTimer (internal counter starts counting)

**Note:** This function should be called when the timer is in the enable state (i.e. after calling `gptimer_enable`)

**Note:** This function is allowed to run within ISR context

**Note:** This function will be placed into IRAM if `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is on, so that it’s allowed to be executed when Cache is disabled

**Parameters**
- `timer` [in] Timer handle created by `gptimer_new_timer`

**Returns**
- ESP_OK: Start GPTimer successfully
- ESP_ERR_INVALID_ARG: Start GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Start GPTimer failed because the timer is not enabled yet
- ESP_FAIL: Start GPTimer failed because of other error

`esp_err_t gptimer_stop (gptimer_handle_t timer)`
Stop GPTimer (internal counter stops counting)

**Note:** This function should be called when the timer is in the enable state (i.e. after calling `gptimer_enable`)

**Note:** This function is allowed to run within ISR context

**Note:** This function will be placed into IRAM if `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is on, so that it’s allowed to be executed when Cache is disabled

**Parameters**
- `timer` [in] Timer handle created by `gptimer_new_timer`

**Returns**
- ESP_OK: Stop GPTimer successfully
- ESP_ERR_INVALID_ARG: Stop GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Stop GPTimer failed because the timer is not enabled yet
- ESP_FAIL: Stop GPTimer failed because of other error

**Structures**

`struct gptimer_alarm_event_data_t`
GPTimer alarm event data.

**Public Members**
Chapter 2. API Reference

```c
uint64_t count_value
    Current count value

uint64_t alarm_value
    Current alarm value

struct gptimer_event_callbacks_t
    Group of supported GPTimer callbacks.
```

**Note:** The callbacks are all running under ISR environment

**Note:** When CONFIG_GPTIMER_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM.

### Public Members

```c
struct gptimer_alarm_cb_t on_alarm
    Timer alarm callback
```

### Public Members

```c
struct gptimer_config_t
    General Purpose Timer configuration.
```

### Public Members

```c
struct gptimer_clock_source_t clk_src
    GPTimer clock source

struct gptimer_count_direction_t direction
    Count direction

uint32_t resolution_hz
    Counter resolution (working frequency) in Hz, hence, the step size of each count tick equals to (1 / resolution_hz) seconds

uint32_t intr_shared
    Set true, the timer interrupt number can be shared with other peripherals

struct gptimer_config_t::[anonymous] flags
    GPTimer config flags
```

### Public Members

```c
struct gptimer_alarm_config_t
    General Purpose Timer alarm configuration.
```

### Public Members
Chapter 2. API Reference

```c
uint64_t alarm_count
    Alarm target count value

uint64_t reload_count
    Alarm reload count value, effect only when auto_reload_on_alarm is set to true

uint32_t auto_reload_on_alarm
    Reload the count value by hardware, immediately at the alarm event

struct gptimer_alarm_config_t::[anonymous] flags
    Alarm config flags
```

### Type Definitions

typedef struct gptimer_t *gptimer_handle_t
    Type of General Purpose Timer handle.

typedef bool (*gptimer_alarm_cb_t)(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
    Timer alarm callback prototype.

    - **Param timer** [in] Timer handle created by gptimer_new_timer
    - **Param edata** [in] Alarm event data, fed by driver
    - **Param user_ctx** [in] User data, passed from gptimer_register_event_callbacks
    - **Return** Whether a high priority task has been waken up by this function

### Header File

- components/hal/include/hal/timer_types.h

### Type Definitions

typedef soc_periph_gptimer_clk_src_t gptimer_clock_source_t
    GPTimer clock source.

---

**Note:** User should select the clock source based on the power and resolution requirement

### Enumerations

enum gptimer_count_direction_t
    GPTimer count direction.

    - **Values:**

        - enumerator GPTIMER_COUNT_DOWN
            Decrease count value

        - enumerator GPTIMER_COUNT_UP
            Increase count value
2.6.7 Dedicated GPIO

Overview

The dedicated GPIO is designed for CPU interaction with GPIO matrix and IO MUX. Any GPIO that is configured as “dedicated” can be accessed by CPU instructions directly, which makes it easy to achieve a high GPIO flip speed, and simulate serial/parallel interface in a bit-banging way. As toggling a GPIO in this “CPU Dedicated” way costs few overhead, it would be great for cases like performance measurement using an oscilloscope.

Create/Destroy GPIO Bundle

A GPIO bundle is a group of GPIOs, which can be manipulated at the same time in one CPU cycle. The maximal number of GPIOs that a bundle can contain is limited by each CPU. What’s more, the GPIO bundle has a strong relevance to the CPU which it derives from. **Any operations on the GPIO bundle should be put inside a task which is running on the same CPU core to the GPIO bundle belongs to.** Likewise, only those ISRs who are installed on the same CPU core are allowed to do operations on that GPIO bundle.

**Note:** Dedicated GPIO is more of a CPU peripheral, so it has a strong relationship with CPU core. It’s highly recommended to install and operate GPIO bundle in a pin-to-core task. For example, if GPIOA is connected to CPU0, and the dedicated GPIO instruction is issued from CPU1, then it’s impossible to control GPIOA.

To install a GPIO bundle, one needs to call `dedic_gpio_new_bundle()` to allocate the software resources and connect the dedicated channels to user selected GPIOs. Configurations for a GPIO bundle are covered in `dedic_gpio_bundle_config_t` structure:

- `gpio_array`: An array that contains GPIO number.
- `array_size`: Element number of `gpio_array`.
- `flags`: Extra flags to control the behavior of GPIO Bundle.
  - `in_en` and `out_en` are used to select whether to enable the input and output function (note, they can be enabled together).
  - `in_invert` and `out_invert` are used to select whether to invert the GPIO signal.

The following code shows how to install a output only GPIO bundle:

```c
// configure GPIO
const int bundleA_gpios[] = {0, 1};
gpio_config_t io_conf = {
    .mode = GPIO_MODE_OUTPUT,
};
for (int i = 0; i < sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]); i++) {
    io_conf.pin_bit_mask = 1ULL << bundleA_gpios[i];
    gpio_config(&io_conf);
}
// Create bundleA, output only
dedic_gpio_bundle_handle_t bundleA = NULL;
dedic_gpio_bundle_config_t bundleA_config = {
    .gpio_array = bundleA_gpios,
    .array_size = sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]),
    .flags = {
        .out_en = 1,
    },
};
ESP_ERROR_CHECK(dedic_gpio_new_bundle(&bundleA_config, &bundleA));
```

To uninstall the GPIO bundle, one needs to call `dedic_gpio_del_bundle()`.

Note: **dedic_gpio_new_bundle()** doesn’t cover any GPIO pad configuration (e.g. pull up/down, drive ability, output/input enable), so before installing a dedicated GPIO bundle, you have to configure the GPIO separately using GPIO driver API (e.g. **gpio_config()**). For more information about GPIO driver, please refer to **GPIO API Reference**.

**GPIO Bundle Operations**

<table>
<thead>
<tr>
<th>Operations</th>
<th>Functions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Write to GPIOs in the bundle by mask</td>
<td><strong>dedic_gpio_bundle_write()</strong></td>
</tr>
<tr>
<td>Read the value that output from the given GPIO bundle</td>
<td><strong>dedic_gpio_bundle_read_out()</strong></td>
</tr>
<tr>
<td>Read the value that input to the given GPIO bundle</td>
<td><strong>dedic_gpio_bundle_read_in()</strong></td>
</tr>
</tbody>
</table>

Note: Using the above functions might not get a high GPIO flip speed because of the overhead of function calls and the bit operations involved inside. Users can try **Manipulate GPIOs by Writing Assembly Code** instead to reduce the overhead but should take care of the thread safety by themselves.

**Manipulate GPIOs by Writing Assembly Code**

For advanced users, they can always manipulate the GPIOs by writing assembly code or invoking CPU Low Level APIs. The usual procedure could be:

1. Allocate a GPIO bundle: **dedic_gpio_new_bundle()**
2. Query the mask occupied by that bundle: **dedic_gpio_get_out_mask()** or/and **dedic_gpio_get_in_mask()**
3. Call CPU LL apis (e.g. **dedic_gpio_cpu_ll_write_mask**) or write assembly code with that mask
4. The fasted way of toggling IO is to use the dedicated “set/clear” instructions:
   - Set bits of GPIO: **csrrsi rd, csr, imm[4:0]**
   - Clear bits of GPIO: **csrrci rd, csr, imm[4:0]**
   - Note: Can only control the lowest 4 GPIO channels

For details of supported dedicated GPIO instructions, please refer to [ESP32-C3 Technical Reference Manual > ESP-RISC-V CPU](https://www.espressif.com/sites/default/files POSSIBILITY: [PDF].)

Some of the dedicated CPU instructions are also wrapped inside **hal/dedic_gpio_cpu_ll.h** as helper inline functions.

Note: Writing assembly code in application could make your code hard to port between targets, because those customized instructions are not guaranteed to remain the same format on different targets.

**API Reference**

**Header File**

- components/driver/include/driver/dedic_gpio.h

**Functions**

```c
esp_err_t dedic_gpio_get_out_mask(dedic_gpio_bundle_handle_t bundle, uint32_t *mask)
```

Get allocated channel mask.
Chapter 2. API Reference

Note: Each bundle should have at least one mask (in or/and out), based on bundle configuration.

Note: With the returned mask, user can directly invoke LL function like “dedic_gpio_cpu_ll_write_mask” or write assembly code with dedicated GPIO instructions, to get better performance on GPIO manipulation.

### Parameters
- **bundle** [in] Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”
- **mask** [out] Returned mask value for on specific direction (in or out)

### Returns
- ESP_OK: Get channel mask successfully
- ESP_ERR_INVALID_ARG: Get channel mask failed because of invalid argument
- ESP_FAIL: Get channel mask failed because of other error

**esp_err_t dedic_gpio_get_in_mask (dedic_gpio_bundle_handle_t bundle, uint32_t *mask)**

**esp_err_t dedic_gpio_new_bundle (const dedic_gpio_bundle_config_t *config, dedic_gpio_bundle_handle_t *ret_bundle)**

Create GPIO bundle and return the handle.

Note: One has to enable at least input or output mode in “config” parameter.

### Parameters
- **config** [in] Configuration of GPIO bundle
- **ret_bundle** [out] Returned handle of the new created GPIO bundle

### Returns
- ESP_OK: Create GPIO bundle successfully
- ESP_ERR_INVALID_ARG: Create GPIO bundle failed because of invalid argument
- ESP_ERR_NO_MEM: Create GPIO bundle failed because of no capable memory
- ESP_ERR_NOT_FOUND: Create GPIO bundle failed because of no enough continuous dedicated channels
- ESP_FAIL: Create GPIO bundle failed because of other error

**esp_err_t dedic_gpio_del_bundle (dedic_gpio_bundle_handle_t bundle)**

Destory GPIO bundle.

### Parameters
- **bundle** [in] Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”

### Returns
- ESP_OK: Destory GPIO bundle successfully
- ESP_ERR_INVALID_ARG: Destory GPIO bundle failed because of invalid argument
- ESP_FAIL: Destory GPIO bundle failed because of other error

**void dedic_gpio_bundle_write (dedic_gpio_bundle_handle_t bundle, uint32_t mask, uint32_t value)**

Write value to GPIO bundle.

Note: The mask is seen from the view of GPIO bundle. For example, bundleA contains [GPIO10, GPIO12, GPIO17], to set GPIO17 individually, the mask should be 0x04.

Note: For performance reasons, this function doesn’t check the validity of any parameters, and is placed in IRAM.
Chapter 2. API Reference

- **bundle** - [in] Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”
- **mask** - [in] Mask of the GPIOs to be written in the given bundle
- **value** - [in] Value to write to given GPIO bundle, low bit represents low member in the bundle

uint32_t dedic_gpio_bundle_read_out (dedic_gpio_bundle_handle_t bundle)

Read the value that output from the given GPIO bundle.

**Note:** For performance reasons, this function doesn’t check the validity of any parameters, and is placed in IRAM.

**Parameters**
- **bundle** - [in] Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”

**Returns** Value that output from the GPIO bundle, low bit represents low member in the bundle

uint32_t dedic_gpio_bundle_read_in (dedic_gpio_bundle_handle_t bundle)

Read the value that input to the given GPIO bundle.

**Note:** For performance reasons, this function doesn’t check the validity of any parameters, and is placed in IRAM.

**Parameters**
- **bundle** - [in] Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”

**Returns** Value that input to the GPIO bundle, low bit represents low member in the bundle

**Structures**

struct dedic_gpio_bundle_config_t

Type of Dedicated GPIO bundle configuration.

**Public Members**

const int *gpio_array

Array of GPIO numbers, gpio_array[0] ~ gpio_array[size-1] <=> low_dedic_channel_num ~ high_dedic_channel_num

size_t array_size

Number of GPIOs in gpio_array

unsigned int in_en

Enable input

unsigned int in_invert

Invert input signal

unsigned int out_en

Enable output

unsigned int out_invert

Invert output signal
struct dedic_gpio_bundle_config_t::[anonymous] flags

Flags to control specific behaviour of GPIO bundle

Type Definitions

typedef struct dedic_gpio_bundle_t *dedic_gpio_bundle_handle_t

Type of Dedicated GPIO bundle.

2.6.8 Hash-based Message Authentication Code (HMAC)

The HMAC (Hash-based Message Authentication Code) module provides hardware acceleration for SHA256-HMAC generation using a key burned into an eFuse block. HMACs work with pre-shared secret keys and provide authenticity and integrity to a message.

For more detailed information on the application workflow and the HMAC calculation process, see ESP32-C3 Technical Reference Manual > HMAC Accelerator (HMAC) [PDF].

Generalized Application Scheme

Let there be two parties, A and B. They want to verify the authenticity and integrity of messages sent between each other. Before they can start sending messages, they need to exchange the secret key via a secure channel. To verify A’s messages, B can do the following:

- A calculates the HMAC of the message it wants to send.
- A sends the message and the HMAC to B.
- B calculates HMAC of the received message itself.
- B checks whether the received and calculated HMACs match. If they do match, the message is authentic.

However, the HMAC itself isn’t bound to this use case. It can also be used for challenge-response protocols supporting HMAC or as a key input for further security modules (see below), etc.

HMAC on the ESP32-C3

On the ESP32-C3, the HMAC module works with a secret key burnt into the eFuses. This eFuse key can be made completely inaccessible for any resources outside the cryptographic modules, thus avoiding key leakage.

Furthermore, the ESP32-C3 has three different application scenarios for its HMAC module:

1. HMAC is generated for software use
2. HMAC is used as a key for the Digital Signature (DS) module
3. HMAC is used for enabling the soft-disabled JTAG interface

The first mode is called Upstream mode, while the last two modes are called Downstream modes.

eFuse Keys for HMAC  Six physical eFuse blocks can be used as keys for the HMAC module: block 4 up to block 9. The enum hmac_key_id_t in the API maps them to HMAC_KEY0 … HMAC_KEY5. Each key has a corresponding eFuse parameter key purpose determining for which of the three HMAC application scenarios (see below) the key may be used:

<table>
<thead>
<tr>
<th>Key Purpose</th>
<th>Application Scenario</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>HMAC generated for software use</td>
</tr>
<tr>
<td>7</td>
<td>HMAC used as a key for the Digital Signature (DS) module</td>
</tr>
<tr>
<td>6</td>
<td>HMAC used for enabling the soft-disabled JTAG interface</td>
</tr>
<tr>
<td>5</td>
<td>HMAC both as a key for the DS module and for enabling JTAG</td>
</tr>
</tbody>
</table>

This is to prevent the usage of a key for a different function than originally intended.
To calculate an HMAC, the software has to provide the ID of the key block containing the secret key as well as the key purpose (see ESP32-C3 Technical Reference Manual > eFuse Controller (eFuse) [PDF]). Before the HMAC key calculation, the HMAC module looks up the purpose of the provided key block. The calculation only proceeds if the purpose of the provided key block matches the purpose stored in the eFuses of the key block provided by the ID.

**HMAC Generation for Software**  Key Purpose value: 8

In this case, the HMAC is given out to the software (e.g. to authenticate a message).

The API to calculate the HMAC is `esp_hmac_calculate()`. The input arguments for the function are the message, message length and the eFuse key block ID which contains the secret and has efuse key purpose set to Upstream mode.

**HMAC for Digital Signature**  Key Purpose values: 7, 5

The HMAC can be used as a key derivation function to decrypt private key parameters which are used by the Digital Signature module. A standard message is used by the hardware in that case. The user only needs to provide the eFuse key block and purpose on the HMAC side (additional parameters are required for the Digital Signature component in that case). Neither the key nor the actual HMAC are ever exposed to outside the HMAC module and DS component. The calculation of the HMAC and its hand-over to the DS component happen internally.

For more details, see ESP32-C3 Technical Reference Manual > Digital Signature (DS) [PDF].

**HMAC for Enabling JTAG**  Key Purpose values: 6, 5

The third application is using the HMAC as a key to enable JTAG if it was soft-disabled before. Following is the procedure to re-enable the JTAG

**Setup**

1. Generate a 256-bit HMAC secret key to use for JTAG re-enable.
2. Write the key to an eFuse block with key purpose HMAC_DOWN_ALL (5) or HMAC_DOWN_JTAG (6). This can be done using the `ets_efuse_write_key()` function in the firmware or using espfuse.py from the host.
3. Configure the eFuse key block to be read protected using the `esp_efuse_set_read_protect()`, so that software cannot read back the value.
4. Burn the “soft JTAG disable” bit/bits on ESP32-C3. This will permanently disable JTAG unless the correct key value is provided by software.

**Note:** The API `esp_efuse_write_field_cnt(ESP_EFUSE_SOFT_DIS_JTAG, ESP_EFUSE_SOFT_DIS_JTAG[0]>>bit_count)` can be used to burn “soft JTAG disable” bits on ESP32-C3.

**JTAG enable**

1. The key to re-enable JTAG is the output of the HMAC-SHA256 function using the secret key in eFuse and 32 0x00 bytes as the message.
2. Pass this key value when calling the `esp_hmac_jtag_enable()` function from the firmware.
3. To re-disable JTAG in the firmware, reset the system or call `esp_hmac_jtag_disable()`.

For more details, see ESP32-C3 Technical Reference Manual > HMAC Accelerator (HMAC) [PDF].

**Application Outline**

Following code is an outline of how to set an eFuse key and then use it to calculate an HMAC for software usage. We use `ets_efuse_write_key()` to set physical key block 4 in the eFuse for the HMAC module together with its purpose. `ETS_EFUSE_KEY_PURPOSE_HMAC_UP` (8) means that this key can only be used for HMAC generation for software usage:
Now we can use the saved key to calculate an HMAC for software usage.

```c
#include "esp_hmac.h"

uint8_t hmac[32];
const char *message = "Hello, HMAC!";
const size_t msg_len = 12;

esp_err_t result = esp_hmac_calculate(HMAC_KEY4, message, msg_len, hmac);
if (result == ESP_OK) {
    // HMAC written to hmac now
} else {
    // failure calculating HMAC
}
```

### API Reference

#### Header File
- components/esp_hw_support/include/soc/esp32c3/esp_hmac.h

#### Functions

```c
esp_err_t esp_hmac_calculate(hmac_key_id_t key_id, const void *message, size_t message_len, uint8_t *hmac)
```

Calculate the HMAC of a given message.

Calculate the HMAC `hmac` of a given message `message` with length `message_len`. SHA256 is used for the calculation (fixed on ESP32S2).

**Note:** Uses the HMAC peripheral in “upstream” mode.

#### Parameters
- `key_id` - Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to the HMAC upstream purpose value.
- `message` - the message for which to calculate the HMAC
- `message_len` - message length return ESP_ERR_INVALID_STATE if unsuccessful
- `hmac` - [out] the hmac result; the buffer behind the provided pointer must be a writeable buffer of 32 bytes

#### Returns
- ESP_OK, if the calculation was successful,
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG if message or hmac is a nullptr or if key_id out of range
- ESP_FAIL, if the hmac calculation failed

**esp_err_t esp_hmac_jtag_enable(hmac_key_id_t key_id, const uint8_t* token)**

Use HMAC peripheral in Downstream mode to re-enable the JTAG, if it is not permanently disabled by HW. In downstream mode, HMAC calculations performed by peripheral are used internally and not provided back to user.

**Note**: Return value of the API does not indicate the JTAG status.

**Parameters**
- **key_id** – Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to HMAC downstream purpose.
- **token** – Pre calculated HMAC value of the 32-byte 0x00 using SHA-256 and the known private HMAC key. The key is already programmed to a eFuse key block. The key block number is provided as the first parameter to this function.

**Returns**
- ESP_OK, if the key_purpose of the key_id matches to HMAC downstream mode. The API returns success even if calculated HMAC does not match with the provided token. However, The JTAG will be re-enabled only if the calculated HMAC value matches with provided token, otherwise JTAG will remain disabled.
- ESP_FAIL, if the key_purpose of the key_id is not set to HMAC downstream purpose or JTAG is permanently disabled by EFUSE_HARD_DIS_JTAG eFuse parameter.
- ESP_ERR_INVALID_ARG, invalid input arguments

**esp_err_t esp_hmac_jtag_disable(void)**

Disable the JTAG which might be enabled using the HMAC downstream mode. This function just clears the result generated by calling esp_hmac_jtag_enable() API.

**Returns**
- ESP_OK return ESP_OK after writing the HMAC_SET_INVALIDATE_JTAG_REG with value 1.

**Enumerations**

enum **hmac_key_id_t**

The possible efuse keys for the HMAC peripheral

**Values**:

- enumerator HMAC_KEY0
- enumerator HMAC_KEY1
- enumerator HMAC_KEY2
- enumerator HMAC_KEY3
- enumerator HMAC_KEY4
- enumerator HMAC_KEY5
- enumerator HMAC_KEY_MAX
2.6.9  Digital Signature (DS)

The Digital Signature (DS) module provides hardware acceleration of signing messages based on RSA. It uses pre-encrypted parameters to calculate a signature. The parameters are encrypted using HMAC as a key-derivation function. In turn, the HMAC uses eFuses as input key. The whole process happens in hardware so that neither the decryption key for the RSA parameters nor the input key for the HMAC key derivation function can be seen by the software while calculating the signature.

For more detailed information on the hardware involved in signature calculation and the registers used, see ESP32-C3 Technical Reference Manual > Digital Signature (DS) [PDF].

Private Key Parameters

The private key parameters for the RSA signature are stored in flash. To prevent unauthorized access, they are AES-encrypted. The HMAC module is used as a key-derivation function to calculate the AES encryption key for the private key parameters. In turn, the HMAC module uses a key from the eFuses key block which can be read-protected to prevent unauthorized access as well.

Upon signature calculation invocation, the software only specifies which eFuse key to use, the corresponding eFuse key purpose, the location of the encrypted RSA parameters and the message.

Key Generation

Both the HMAC key and the RSA private key have to be created and stored before the DS peripheral can be used. This needs to be done in software on the ESP32-C3 or alternatively on a host. For this context, the IDF provides esp_efuse_write_block() to set the HMAC key and esp_hmac_calculate() to encrypt the private RSA key parameters.

You can find instructions on how to calculate and assemble the private key parameters in ESP32-C3 Technical Reference Manual > Digital Signature (DS) [PDF].

Signature Calculation with IDF

For more detailed information on the workflow and the registers used, see ESP32-C3 Technical Reference Manual > Digital Signature (DS) [PDF].

Three parameters need to be prepared to calculate the digital signature:

1. the eFuse key block ID which is used as key for the HMAC,
2. the location of the encrypted private key parameters,
3. and the message to be signed.

Since the signature calculation takes some time, there are two possible API versions to use in IDF. The first one is esp_ds_sign() and simply blocks until the calculation is finished. If software needs to do something else during the calculation, esp_ds_start_sign() can be called, followed by periodic calls to esp_ds_is_busy() to check when the calculation has finished. Once the calculation has finished, esp_ds_finish_sign() can be called to get the resulting signature.

The APIs esp_ds_sign() and esp_ds_start_sign() calculate a plain RSA signature with help of the DS peripheral. This signature needs to be converted to appropriate format for further use. For example, MbedTLS SSL stack supports PKCS#1 format. The API esp_ds_rsa_sign() can be used to obtain the signature directly in the PKCS#1 v1.5 format. It internally uses esp_ds_start_sign() and converts the signature into PKCS#1 v1.5 format.

Note: Note that this is only the basic DS building block, the message length is fixed. To create signatures of arbitrary messages, the input is normally a hash of the actual message, padded up to the required length. An API to do this is planned in the future.
Configure the DS peripheral for a TLS connection

The DS peripheral on ESP32-C3 chip must be configured before it can be used for a TLS connection. The configuration involves the following steps -

1) Randomly generate a 256 bit value called the *Initialization Vector* (IV).
2) Randomly generate a 256 bit value called the *HMAC_KEY*.
3) Calculate the encrypted private key parameters from the client private key (RSA) and the parameters generated in the above steps.
4) Then burn the 256 bit *HMAC_KEY* on the efuse, which can only be read by the DS peripheral.

For more details, see ESP32-C3 Technical Reference Manual > Digital Signature (DS) [PDF].

To configure the DS peripheral for development purposes, you can use the `esp-secure-cert-tool`.

The encrypted private key parameters obtained after the DS peripheral configuration are then to be kept in flash. Furthermore, they are to be passed to the DS peripheral which makes use of those parameters for the Digital Signature operation. The application then needs to read the ds data from the flash which has been done through the API’s provided by the `esp_secure_cert_mgr` component. Please refer the component/README. for more details.

The process of initializing the DS peripheral and then performing the Digital Signature operation is done internally with help of ESP-TLS. Please refer to Digital Signature with ESP-TLS in ESP-TLS for more details. As mentioned in the ESP-TLS documentation, the application only needs to provide the encrypted private key parameters to the esp_tls context (as `ds_data`), which internally performs all necessary operations for initializing the DS peripheral and then performing the DS operation.

Example for SSL Mutual Authentication using DS

The example `ssl_ds` shows how to use the DS peripheral for mutual authentication. The example uses `mqtt_client` (Implemented through ESP-MQTT) to connect to broker test.mosquitto.org using ssl transport with mutual authentication. The ssl part is internally performed with ESP-TLS. See example README for more details.

API Reference

Header File

- components/esp_hw_support/include/soc/esp32c3/esp_ds.h

Functions

```c
esp_err_t esp_ds_sign(const void* message, const esp_ds_data_t* data, hmac_key_id_t key_id, void* signature)
```

Sign the message with a hardware key from specific key slot. The function calculates a plain RSA signature with help of the DS peripheral. The RSA encryption operation is as follows: \( Z = XY \mod M \) where, \( Z \) is the signature, \( X \) is the input message, \( Y \) and \( M \) are the RSA private key parameters.

This function is a wrapper around `esp_ds_finish_sign()` and `esp_ds_start_sign()`, so do not use them in parallel. It blocks until the signing is finished and then returns the signature.

**Note:** This function locks the HMAC, SHA, AES and RSA components during its entire execution time.

**Parameters**

- `message` – the message to be signed; its length should be \((data->rsa_length + 1)\times 4\) bytes
- `data` – the encrypted signing key data (AES encrypted RSA key + IV)
- `key_id` – the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- `signature` – the destination of the signature, should be \((data->rsa_length + 1)\times 4\) bytes long
Chapter 2. API Reference

Returns

- ESP_OK if successful, the signature was written to the parameter \texttt{signature}.
- ESP_ERR_INVALID_ARG if one of the parameters is NULL or \texttt{data->rsa_length} is too long or 0
- ESP_ERR_HW_CRYPTO_DS_HMAC_FAIL if there was an HMAC failure during retrieval of the decryption key
- ESP_ERR_NO_MEM if there hasn’t been enough memory to allocate the context object
- ESP_ERR_HW_CRYPTO_DS_INVALID_KEY if there’s a problem with passing the HMAC key to the DS component
- ESP_ERR_HW_CRYPTO_DS_INVALID_DIGEST if the message digest didn’t match; the signature is invalid.
- ESP_ERR_HW_CRYPTO_DS_INVALID_PADDING if the message padding is incorrect, the signature can be read though since the message digest matches.

### \texttt{esp_err_t esp_ds_start_sign}(const void *\texttt{message}, \texttt{const esp_ds_data_t *} \texttt{data}, hmac_key_id_t \texttt{key_id}, esp_ds_context_t **\texttt{esp_ds_ctx})

Start the signing process.

This function yields a context object which needs to be passed to \texttt{esp_ds_finish_sign()} to finish the signing process. The function calculates a plain RSA signature with help of the DS peripheral. The RSA encryption operation is as follows: \( Z = XY \mod M \) where, \( Z \) is the signature, \( X \) is the input message, \( Y \) and \( M \) are the RSA private key parameters.

**Note:** This function locks the HMAC, SHA, AES and RSA components, so the user has to ensure to call \texttt{esp_ds_finish_sign()} in a timely manner.

### Parameters

- \texttt{message} – the message to be signed; its length should be \((\texttt{data->rsa_length} + 1) \times 4\) bytes
- \texttt{data} – the encrypted signing key data (AES encrypted RSA key + IV)
- \texttt{key_id} – the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- \texttt{esp_ds_ctx} – the context object which is needed for finishing the signing process later

### Returns

- ESP_OK if successful, the ds operation was started now and has to be finished with \texttt{esp_ds_finish_sign()}
- ESP_ERR_INVALID_ARG if one of the parameters is NULL or \texttt{data->rsa_length} is too long or 0
- ESP_ERR_HW_CRYPTO_DS_HMAC_FAIL if there was an HMAC failure during retrieval of the decryption key
- ESP_ERR_NO_MEM if there hasn’t been enough memory to allocate the context object
- ESP_ERR_HW_CRYPTO_DS_INVALID_KEY if there’s a problem with passing the HMAC key to the DS component

### \texttt{bool esp_ds_is_busy}(void)

Return true if the DS peripheral is busy, otherwise false.

**Note:** Only valid if \texttt{esp_ds_start_sign()} was called before.

### \texttt{esp_err_t esp_ds_finish_sign}(void *\texttt{signature}, \texttt{esp_ds_context_t *\texttt{esp_ds_ctx})

Finish the signing process.

### Parameters

- \texttt{signature} – the destination of the signature, should be \((\texttt{data->rsa_length} + 1) \times 4\) bytes long
- \texttt{esp_ds_ctx} – the context object retrieved by \texttt{esp_ds_start_sign()}

### Returns
• ESP_OK if successful, the ds operation has been finished and the result is written to signature.
• ESP_ERR_INVALID_ARG if one of the parameters is NULL
• ESP_ERR_HW_CRYPTO_DS_INVALID_DIGEST if the message digest didn’t match; the signature is invalid. This means that the encrypted RSA key parameters are invalid, indicating that they may have been tampered with or indicating a flash error, etc.
• ESP_ERR_HW_CRYPTO_DS_INVALID_PADDING if the message padding is incorrect, the signature can be read though since the message digest matches (see TRM for more details).

```
esp_err_t esp_ds_encrypt_params (esp_ds_data_t *data, const void* iv, const esp_ds_p_data_t *p_data, const void *key)
```

Encrypt the private key parameters.

The encryption is a prerequisite step before any signature operation can be done. It is not strictly necessary to use this encryption function, the encryption could also happen on an external device.

**Parameters**

- `data` - Output buffer to store encrypted data, suitable for later use generating signatures. The allocated memory must be in internal memory and word aligned since it’s filled by DMA. Both is asserted at run time.
- `iv` - Pointer to 16 byte IV buffer, will be copied into ‘data’. Should be randomly generated bytes each time.
- `p_data` - Pointer to input plaintext key data. The expectation is this data will be deleted after this process is done and ‘data’ is stored.
- `key` - Pointer to 32 bytes of key data. Type determined by key_type parameter. The expectation is the corresponding HMAC key will be stored to efuse and then permanently erased.

**Returns**

- ESP_OK if successful, the ds operation has been finished and the result is written to signature.
- ESP_ERR_INVALID_ARG if one of the parameters is NULL or p_data->rsa_length is too long

**Structures**

```
struct esp_digital_signature_data
```

Encrypted private key data. Recommended to store in flash in this format.

**Note:** This struct has to match to one from the ROM code! This documentation is mostly taken from there.

**Public Members**

```
esp_digital_signature_length_t rsa_length
```

RSA LENGTH register parameters (number of words in RSA key & operands, minus one). Max value 127 (for RSA 3072).

This value must match the length field encrypted and stored in ‘c’, or invalid results will be returned. (The DS peripheral will always use the value in ‘c’, not this value, so an attacker can’t alter the DS peripheral results this way, it will just truncate or extend the message and the resulting signature in software.)

**Note:** In IDF, the enum type length is the same as of type unsigned, so they can be used interchangably. See the ROM code for the original declaration of struct ets_ds_data_t.
Chapter 2. API Reference

uint32_t iv[ESP_DS_IV_BIT_LEN / 32]
IV value used to encrypt `c`

uint8_t c[ESP_DS_C_LEN]
Encrypted Digital Signature parameters. Result of AES-CBC encryption of plaintext values. Includes an encrypted message digest.

struct esp_ds_p_data_t
Plaintext parameters used by Digital Signature.
This is only used for encrypting the RSA parameters by calling esp_ds_encrypt_params(). Afterwards, the result can be stored in flash or in other persistent memory. The encryption is a prerequisite step before any signature operation can be done.

Public Members

uint32_t Y[ESP_DS_SIGNATURE_MAX_BIT_LEN / 32]
RSA exponent.

uint32_t M[ESP_DS_SIGNATURE_MAX_BIT_LEN / 32]
RSA modulus.

uint32_t Rb[ESP_DS_SIGNATURE_MAX_BIT_LEN / 32]
RSA r inverse operand.

uint32_t M_prime
RSA M prime operand.

uint32_t length
RSA length in words (32 bit)

Macros

ESP32C3_ERR_HW_CRYPTO_DS_HMAC_FAIL
HMAC peripheral problem

ESP32C3_ERR_HW_CRYPTO_DS_INVALID_KEY
given HMAC key isn’t correct, HMAC peripheral problem

ESP32C3_ERR_HW_CRYPTO_DS_INVALID_DIGEST
message digest check failed, result is invalid

ESP32C3_ERR_HW_CRYPTO_DS_INVALID_PADDING
padding check failed, but result is produced anyway and can be read

ESP_DS_IV_BIT_LEN

ESP_DS_IV_LEN
Chapter 2. API Reference

ESP_DS_SIGNATURE_MAX_BIT_LEN
ESP_DS_SIGNATURE_MD_BIT_LEN
ESP_DS_SIGNATURE_M_PRIME_BIT_LEN
ESP_DS_SIGNATURE_L_BIT_LEN
ESP_DS_SIGNATURE_PADDING_BIT_LEN
ESP_DS_C_LEN

Type Definitions
typedef struct esp_ds_context esp_ds_context_t
typedef struct esp_digital_signature_data esp_ds_data_t

Encrypted private key data. Recommended to store in flash in this format.

Note: This struct has to match to one from the ROM code! This documentation is mostly taken from there.

Enumerations
enum esp_digital_signature_length_t

Values:

enumerator ESP_DS_RSA_1024
enumerator ESP_DS_RSA_2048
enumerator ESP_DS_RSA_3072

2.6.10 Inter-Integrated Circuit (I2C)

Overview

I2C is a serial, synchronous, half-duplex communication protocol that allows co-existence of multiple masters and slaves on the same bus. The I2C bus consists of two lines: serial data line (SDA) and serial clock (SCL). Both lines require pull-up resistors.

With such advantages as simplicity and low manufacturing cost, I2C is mostly used for communication of low-speed peripheral devices over short distances (within one foot).

ESP32-C3 has 1 I2C controller (also referred to as port), responsible for handling communications on the I2C bus. A single I2C controller can operate as master or slave.
Chapter 2. API Reference

Driver Features

I2C driver governs communications of devices over the I2C bus. The driver supports the following features:

- Reading and writing bytes in Master mode
- Slave mode
- Reading and writing to registers which are in turn read/written by the master

Driver Usage

The following sections describe typical steps of configuring and operating the I2C driver:

1. **Configuration** - set the initialization parameters (master or slave mode, GPIO pins for SDA and SCL, clock speed, etc.)
2. **Install Driver** - activate the driver on one of the two I2C controllers as a master or slave
3. Depending on whether you configure the driver for a master or slave, choose the appropriate item
   a) **Communication as Master** - handle communications (master)
   b) **Communication as Slave** - respond to messages from the master (slave)
4. **Interrupt Handling** - configure and service I2C interrupts
5. **Customized Configuration** - adjust default I2C communication parameters (timings, bit order, etc.)
6. **Error Handling** - how to recognize and handle driver configuration and communication errors
7. **Delete Driver** - release resources used by the I2C driver when communication ends

Configuration  To establish I2C communication, start by configuring the driver. This is done by setting the parameters of the structure `i2c_config_t`:

- Set I2C mode of operation - master or slave from `i2c_mode_t`
- Configure communication pins
  - Assign GPIO pins for SDA and SCL signals
  - Set whether to enable ESP32-C3’s internal pull-ups
- (Master only) Set I2C clock speed
- (Slave only) Configure the following
  - Whether to enable 10 bit address mode
  - Define slave address

After that, initialize the configuration for a given I2C port. For this, call the function `i2c_param_config()` and pass to it the port number and the structure `i2c_config_t`.

Configuration example (master):

```c
int i2c_master_port = 0;
i2c_config_t conf = {
    .mode = I2C_MODE_MASTER,
    .sda_io_num = I2C_MASTER_SDA_IO,  // select GPIO specific to your project
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_MASTER_SCL_IO,   // select GPIO specific to your project
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .master.clk_speed = I2C_MASTER_FREQ_HZ, // select frequency specific to your project
    .clk_flags = 0,                      // flags to choose I2C source clock here
};
```

Configuration example (slave):
```
int i2c_slave_port = I2C_SLAVE_NUM;
i2c_config_t conf_slave = {
    .sda_io_num = I2C_SLAVE_SDA_IO,  // select GPIO specific to your project
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_SLAVE_SCL_IO,  // select GPIO specific to your project
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .mode = I2C_MODE_SLAVE,
    .slave.addr_10bit_en = 0,
    .slave.slave_addr = ESP_SLAVE_ADDR,  // address of your project
    .clk_flags = 0,
};
```

At this stage, `i2c_param_config()` also sets a few other I2C configuration parameters to default values that are defined by the I2C specification. For more details on the values and how to modify them, see Customized Configuration.

**Source Clock Configuration** Clock sources allocator is added for supporting different clock sources. The clock allocator will choose one clock source that meets all the requirements of frequency and capability (as requested in `i2c_config_t::clk_flags`).

When `i2c_config_t::clk_flags` is 0, the clock allocator will select only according to the desired frequency. If no special capabilities are needed, such as APB, you can configure the clock allocator to select the source clock only according to the desired frequency. For this, set `i2c_config_t::clk_flags` to 0. For clock characteristics, see the table below.

**Note:** A clock is not a valid option, if it doesn’t meet the requested capabilities, i.e. any bit of requested capabilities (clk_flags) is 0 in the clock’s capabilities.

**Table 2: Characteristics of ESP32-C3 clock sources**

<table>
<thead>
<tr>
<th>Clock name</th>
<th>MAX freq for SCL</th>
<th>Clock capabilities</th>
</tr>
</thead>
<tbody>
<tr>
<td>XTAL 40 MHz</td>
<td>2 MHz</td>
<td>/</td>
</tr>
<tr>
<td>RTC 20 MHz</td>
<td>1 MHz</td>
<td>I2C_SCLK_SRC_FLAG_AWARE_DFS, I2C_SCLK_SRC_FLAG_LIGHT_SLEEP</td>
</tr>
</tbody>
</table>

Explanations for `i2c_config_t::clk_flags` are as follows:

1. **I2C_SCLK_SRC_FLAG_AWARE_DFS**: Clock’s baud rate will not change while APB clock is changing.
2. **I2C_SCLK_SRC_FLAG_LIGHT_SLEEP**: It supports Light-sleep mode, which APB clock cannot do.
3. Some flags may not be supported on ESP32-C3, reading technical reference manual before using it.

**Note:** The clock frequency of SCL in master mode should not be larger than max frequency for SCL mentioned in the table above.

**Note:** The clock frequency of SCL will be influenced by the pull-up resistors and wire capacitance (or might slave capacitance) together. Therefore, users need to choose correct pull-up resistors by themselves to make the frequency accurate. It is recommended by I2C protocol that the pull-up resistors commonly range from 1KOhms to 10KOhms, but different frequencies need different resistors.

Generally speaking, the higher frequency is selected, the smaller resistor should be used (but not less than 1KOhms). This is because high resistor will decline the current, which will lengthen the rising time and reduce the frequency.
Usually, range 2KOhms to 5KOhms is what we recommend, but users also might need to make some adjustment depends on their reality.

**Install Driver**  After the I2C driver is configured, install it by calling the function `i2c_driver_install()` with the following parameters:

- Port number, one of the two port numbers from `i2c_port_t`
- master or slave, selected from `i2c_mode_t`
- (Slave only) Size of buffers to allocate for sending and receiving data. As I2C is a master-centric bus, data can only go from the slave to the master at the master’s request. Therefore, the slave will usually have a send buffer where the slave application writes data. The data remains in the send buffer to be read by the master at the master’s own discretion.
- Flags for allocating the interrupt (see ESP_INTR_FLAG_* values in `esp_hw_support/include/esp_intr_alloc.h`)

**Communication as Master**  After installing the I2C driver, ESP32-C3 is ready to communicate with other I2C devices.

ESP32-C3’s I2C controller operating as master is responsible for establishing communication with I2C slave devices and sending commands to trigger a slave to action, for example, to take a measurement and send the readings back to the master.

For better process organization, the driver provides a container, called a “command link”, that should be populated with a sequence of commands and then passed to the I2C controller for execution.

**Master Write**  The example below shows how to build a command link for an I2C master to send n bytes to a slave.

![Fig. 5: I2C command link - master write example](image)

The following describes how a command link for a “master write” is set up and what comes inside:

1. Create a command link with `i2c_cmd_link_create()`.

   Then, populate it with the series of data to be sent to the slave:
   a) **Start bit** - `i2c_master_start()`
   b) **Slave address** - `i2c_master_write_byte()`. The single byte address is provided as an argument of this function call.
   c) **Data** - One or more bytes as an argument of `i2c_master_write()`
d) **Stop bit - `i2c_master_stop()`**

Both functions `i2c_master_write_byte()` and `i2c_master_write()` have an additional argument specifying whether the master should ensure that it has received the ACK bit.

2. Trigger the execution of the command link by I2C controller by calling `i2c_master_cmd_begin()`. Once the execution is triggered, the command link cannot be modified.

3. After the commands are transmitted, release the resources used by the command link by calling `i2c_cmd_link_delete()`.

**Master Read**  The example below shows how to build a command link for an I2C master to read \( n \) bytes from a slave.

Fig. 6: I2C command link - master read example

Compared to writing data, the command link is populated in Step 4 not with `i2c_master_write...` functions but with `i2c_master_read_byte()` and/or `i2c_master_read()`. Also, the last read in Step 5 is configured so that the master does not provide the ACK bit.

**Indicating Write or Read**  After sending a slave address (see Step 3 on both diagrams above), the master either writes or reads from the slave.

The information on what the master will actually do is hidden in the least significant bit of the slave’s address.

For this reason, the command link sent by the master to write data to the slave contains the address ```ESP_SLAVE_ADDR << 1 | I2C_MASTER_WRITE``` and looks as follows:

```c
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

Likewise, the command link to read from the slave looks as follows:

```c
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);
```

**Communication as Slave**  After installing the I2C driver, ESP32-C3 is ready to communicate with other I2C devices.

The API provides the following functions for slaves

- **`i2c_slave_read_buffer()`**

Whenever the master writes data to the slave, the slave will automatically store it in the receive buffer. This allows the slave application to call the function `i2c_slave_read_buffer()` at its own discretion. This function also has a parameter to specify block time if no data is in the receive buffer. This will allow the slave application to wait with a specified timeout for data to arrive to the buffer.
• **i2c_slave_write_buffer()**
  
  The send buffer is used to store all the data that the slave wants to send to the master in FIFO order. The data stays there until the master requests for it. The function `i2c_slave_write_buffer()` has a parameter to specify block time if the send buffer is full. This will allow the slave application to wait with a specified timeout for the adequate amount of space to become available in the send buffer.

  A code example showing how to use these functions can be found in `peripherals/i2c`.

**Interrupt Handling**  
During driver installation, an interrupt handler is installed by default.

**Customized Configuration**  
As mentioned at the end of Section **Configuration**, when the function `i2c_param_config()` initializes the driver configuration for an I2C port, it also sets several I2C communication parameters to default values defined in the **I2C specification**. Some other related parameters are pre-configured in registers of the I2C controller.

All these parameters can be changed to user-defined values by calling dedicated functions given in the table below. Please note that the timing values are defined in APB clock cycles. The frequency of APB is specified in `$I2C_APB_CLK_FREQ$`.

<table>
<thead>
<tr>
<th>Parameters to Change</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>High time and low time for SCL pulses</td>
<td><code>i2c_set_period()</code></td>
</tr>
<tr>
<td>SCL and SDA signal timing used during generation of <strong>start</strong> signals</td>
<td><code>i2c_set_start_timing()</code></td>
</tr>
<tr>
<td>SCL and SDA signal timing used during generation of <strong>stop</strong> signals</td>
<td><code>i2c_set_stop_timing()</code></td>
</tr>
<tr>
<td>Timing relationship between SCL and SDA signals when slave samples, as well as when master toggles</td>
<td><code>i2c_set_data_timing()</code></td>
</tr>
<tr>
<td>I2C timeout</td>
<td><code>i2c_set_timeout()</code></td>
</tr>
<tr>
<td>Choice between transmitting / receiving the LSB or MSB first, choose one of the modes defined in <code>i2c_trans_mode_t</code></td>
<td><code>i2c_set_data_mode()</code></td>
</tr>
</tbody>
</table>

Each of the above functions has a _get_ counterpart to check the currently set value. For example, to check the I2C timeout value, call `i2c_get_timeout()`.

To check the default parameter values which are set during the driver configuration process, please refer to the file `driver/i2c.c` and look for defines with the suffix _DEFAULT_.

You can also select different pins for SDA and SCL signals and alter the configuration of pull-ups with the function `i2c_set_pin()`. If you want to modify already entered values, use the function `i2c_param_config()`.

**Note:**  
ESP32-C3’s internal pull-ups are in the range of tens of kOhm, which is, in most cases, insufficient for use as I2C pull-ups. Users are advised to use external pull-ups with values described in the **I2C specification**.

**Error Handling**  
The majority of I2C driver functions either return `ESP_OK` on successful completion or a specific error code on failure. It is a good practice to always check the returned values and implement error handling. The driver also prints out log messages that contain error details, e.g., when checking the validity of entered configuration. For details please refer to the file `driver/i2c.c` and look for defines with the suffix _ERR_STR_.

Use dedicated interrupts to capture communication failures. For instance, if a slave stretches the clock for too long while preparing the data to send back to master, the interrupt `I2C_TIME_OUT_INT` will be triggered. For detailed information, see **Interrupt Handling**.

In case of a communication failure, you can reset the internal hardware buffers by calling the functions `i2c_reset_tx_fifo()` and `i2c_reset_rx_fifo()` for the send and receive buffers respectively.
Delete Driver  When the I2C communication is established with the function `i2c_driver_install()` and is not required for some substantial amount of time, the driver may be deinitialized to release allocated resources by calling `i2c_driver_delete()`.

Before calling `i2c_driver_delete()` to remove i2c driver, please make sure that all threads have stopped using the driver in any way, because this function does not guarantee thread safety.

Application Example

I2C examples: peripherals/i2c.

API Reference

Header File

- components/driver/include/driver/i2c.h

Functions

```c
esp_err_t i2c_driver_install(i2c_port_t i2c_num, i2c_mode_t mode, size_t slv_rx_buf_len, size_t slv_tx_buf_len, int intr_alloc_flags)
```

Install an I2C driver.

**Note:** Not all Espressif chips can support slave mode (e.g. ESP32C2)

**Note:** In master mode, if the cache is likely to be disabled (such as write flash) and the slave is time-sensitive, ESP_INTR_FLAG_IRAM is suggested to be used. In this case, please use the memory allocated from internal RAM in i2c read and write function, because we can not access the psram (if psram is enabled) in interrupt handle function when cache is disabled.

**Parameters**

- **i2c_num** - I2C port number
- **mode** - I2C mode (either master or slave).
- **slv_rx_buf_len** - Receiving buffer size. Only slave mode will use this value, it is ignored in master mode.
- **slv_tx_buf_len** - Sending buffer size. Only slave mode will use this value, it is ignored in master mode.
- **intr_alloc_flags** - Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver installation error

```c
esp_err_t i2c_driver_delete(i2c_port_t i2c_num)
```

Delete I2C driver.

**Note:** This function does not guarantee thread safety. Please make sure that no thread will continuously hold semaphores before calling the delete function.

**Parameters**  **i2c_num** - I2C port to delete

**Returns**

- ESP_OK Success
**esp_err_t i2c_param_config(i2c_port_t i2c_num, const i2c_config_t *i2c_conf)**

Configure an I2C bus with the given configuration.

**Parameters**
- `i2c_num` - I2C port to configure
- `i2c_conf` - Pointer to the I2C configuration

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t i2c_reset_tx_fifo(i2c_port_t i2c_num)**

Reset I2C tx hardware fifo

**Parameters**
- `i2c_num` - I2C port number

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t i2c_reset_rx_fifo(i2c_port_t i2c_num)**

Reset I2C rx fifo

**Parameters**
- `i2c_num` - I2C port number

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t i2c_set_pin(i2c_port_t i2c_num, int sda_io_num, int scl_io_num, bool sda_pullup_en, bool scl_pullup_en, i2c_mode_t mode)**

Configure GPIO pins for I2C SCK and SDA signals.

**Parameters**
- `i2c_num` - I2C port number
- `sda_io_num` - GPIO number for I2C SDA signal
- `scl_io_num` - GPIO number for I2C SCL signal
- `sda_pullup_en` - Enable the internal pullup for SDA pin
- `scl_pullup_en` - Enable the internal pullup for SCL pin
- `mode` - I2C mode

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t i2c_master_write_to_device(i2c_port_t i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, TickType_t ticks_to_wait)**

Perform a write to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc… It shall only be called in I2C master mode.

**Parameters**
- `i2c_num` - I2C port number to perform the transfer on
- `device_address` - 7-bit address
- `write_buffer` - Bytes to send on the bus
- `write_size` - Size, in bytes, of the write buffer
- `ticks_to_wait` - Maximum ticks to wait before issuing a timeout.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasnt’ t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.
```c
esp_err_t i2c_master_read_from_device(i2c_port_t i2c_num, uint8_t device_address, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)
```

Perform a read to a device connected to a particular I2C port. This function is a wrapper to i2c_master_start(), i2c_master_write(), i2c_master_read(), etc… It shall only be called in I2C master mode.

**Parameters**
- **i2c_num** – I2C port number to perform the transfer on
- **device_address** – I2C device’s 7-bit address
- **read_buffer** – Buffer to store the bytes received on the bus
- **read_size** – Size, in bytes, of the read buffer
- **ticks_to_wait** – Maximum ticks to wait before issuing a timeout.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

```c
esp_err_t i2c_master_write_read_device(i2c_port_t i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)
```

Perform a write followed by a read to a device on the I2C bus. A repeated start signal is used between the write and read, thus, the bus is not released until the two transactions are finished. This function is a wrapper to i2c_master_start(), i2c_master_write(), i2c_master_read(), etc… It shall only be called in I2C master mode.

**Parameters**
- **i2c_num** – I2C port number to perform the transfer on
- **device_address** – I2C device’s 7-bit address
- **write_buffer** – Bytes to send on the bus
- **write_size** – Size, in bytes, of the write buffer
- **read_buffer** – Buffer to store the bytes received on the bus
- **read_size** – Size, in bytes, of the read buffer
- **ticks_to_wait** – Maximum ticks to wait before issuing a timeout.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

```c
i2c_cmd_handle_t i2c_cmd_link_create_static(uint8_t *buffer, uint32_t size)
```

Create and initialize an I2C commands list with a given buffer. All the allocations for data or signals (START, STOP, ACK, …) will be performed within this buffer. This buffer must be valid during the whole transaction. After finishing the I2C transactions, it is required to call i2c_cmd_link_delete_static().

**Note:** It is highly advised to not allocate this buffer on the stack. The size of the data used underneath may increase in the future, resulting in a possible stack overflow as the macro I2C_LINK_RECOMMENDED_SIZE would also return a bigger value. A better option is to use a buffer allocated statically or dynamically (with malloc).

**Parameters**
- **buffer** – Buffer to use for commands allocations
- **size** – Size in bytes of the buffer

**Returns** Handle to the I2C command link or NULL if the buffer provided is too small, please use I2C_LINK_RECOMMENDED_SIZE macro to get the recommended size for the buffer.
Chapter 2. API Reference

```c
i2c_cmd_link_t i2c_cmd_link_create(void)

Create and initialize an I2C commands list with a given buffer. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete()` to release and return the resources. The required bytes will be dynamically allocated.

**Returns** Handle to the I2C command link or NULL in case of insufficient dynamic memory.

```c
void i2c_cmd_link_delete_static(i2c_cmd_handle_t cmd_handle)

Free the I2C commands list allocated statically with `i2c_cmd_link_create_static()`.

**Parameters**
- `cmd_handle` - I2C commands list allocated statically. This handle should be created thanks to `i2c_cmd_link_create_static()` function.

```c
void i2c_cmd_link_delete(i2c_cmd_handle_t cmd_handle)

Free the I2C commands list.

**Parameters**
- `cmd_handle` - I2C commands list. This handle should be created thanks to `i2c_cmd_link_create()` function.

```c
esp_err_t i2c_master_start(i2c_cmd_handle_t cmd_handle)

Queue a “START signal” to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

**Parameters**
- `cmd_handle` - I2C commands list

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

```c
esp_err_t i2c_master_write_byte(i2c_cmd_handle_t cmd_handle, uint8_t data, bool ack_en)

Queue a “write byte” command to the commands list. A single byte will be sent on the I2C port. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Parameters**
- `cmd_handle` - I2C commands list
- `data` - Byte to send on the port
- `ack_en` - Enable ACK signal

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

```c
esp_err_t i2c_master_write(i2c_cmd_handle_t cmd_handle, const uint8_t* data, size_t data_len, bool ack_en)

Queue a “write (multiple) bytes” command to the commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Parameters**
- `cmd_handle` - I2C commands list
- `data` - Bytes to send. This buffer shall remain valid until the transaction is finished. If the PSRAM is enabled and `intr_flag` is set to ESP_INTR_FLAG_IRAM, `data` should be allocated from internal RAM.
- `data_len` - Length, in bytes, of the data buffer
- `ack_en` - Enable ACK signal

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap
Queue a “read byte” command to the commands list. A single byte will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Parameters**
- `cmd_handle` - I2C commands list
- `data` - Pointer where the received byte will be stored. This buffer shall remain **valid** until the transaction is finished.
- `ack` - ACK signal

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

Queue a “read (multiple) bytes” command to the commands list. Multiple bytes will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Parameters**
- `cmd_handle` - I2C commands list
- `data` - Pointer where the received bytes will be stored. This buffer shall remain **valid** until the transaction is finished.
- `data_len` - Size, in bytes, of the `data` buffer
- `ack` - ACK signal

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

Queue a “STOP signal” to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

**Parameters**
- `cmd_handle` - I2C commands list

**Returns**
- ESP_OK Success
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.
int i2c_slave_write_buffer ( i2c_port_t i2c_num, const uint8_t* data, int size, TickType_t ticks_to_wait )

Write bytes to internal ringbuffer of the I2C slave data. When the TX fifo empty, the ISR will fill the hardware FIFO with the internal ringbuffer’s data.

Note: This function shall only be called in I2C slave mode.

Parameters

- **i2c_num** – I2C port number
- **data** – Bytes to write into internal buffer
- **size** – Size, in bytes, of data buffer
- **ticks_to_wait** – Maximum ticks to wait.

Returns

- ESP_FAIL (-1) Parameter error
- Other (>=0) The number of data bytes pushed to the I2C slave buffer.

int i2c_slave_read_buffer ( i2c_port_t i2c_num, uint8_t* data, size_t max_size, TickType_t ticks_to_wait )

Read bytes from I2C internal buffer. When the I2C bus receives data, the ISR will copy them from the hardware RX FIFO to the internal ringbuffer. Calling this function will then copy bytes from the internal ringbuffer to the data user buffer.

Note: This function shall only be called in I2C slave mode.

Parameters

- **i2c_num** – I2C port number
- **data** – Buffer to fill with ringbuffer’s bytes
- **max_size** – Maximum bytes to read
- **ticks_to_wait** – Maximum waiting ticks

Returns

- ESP_FAIL(-1) Parameter error
- Other(>=0) The number of data bytes read from I2C slave buffer.

esp_err_t i2c_set_period ( i2c_port_t i2c_num, int high_period, int low_period )

Set I2C master clock period.

Parameters

- **i2c_num** – I2C port number
- **high_period** – Clock cycle number during SCL is high level, high_period is a 14 bit value
- **low_period** – Clock cycle number during SCL is low level, low_period is a 14 bit value

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t i2c_get_period ( i2c_port_t i2c_num, int * high_period, int * low_period )

Get I2C master clock period.

Parameters

- **i2c_num** – I2C port number
- **high_period** – Pointer to get clock cycle number during SCL is high level, will get a 14 bit value
- **low_period** – Pointer to get clock cycle number during SCL is low level, will get a 14 bit value

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
\texttt{esp_err_t i2c_filter_enable(i2c_port_t i2c_num, uint8_t cyc_num)}

Enable hardware filter on I2C bus. Sometimes the I2C bus is disturbed by high frequency noise (about 20ns), or the rising edge of the SCL clock is very slow, these may cause the master state machine to break. Enable hardware filter can filter out high frequency interference and make the master more stable.

\textbf{Note:} Enable filter will slow down the SCL clock.

\textbf{Parameters}
- i2c_num – I2C port number to filter
- cyc_num – the APB cycles need to be filtered (0 <= cyc_num <= 7). When the period of a pulse is less than cyc_num * APB_cycle, the I2C controller will ignore this pulse.

\textbf{Returns}
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

\texttt{esp_err_t i2c_filter_disable(i2c_port_t i2c_num)}

Disable filter on I2C bus.

\textbf{Parameters} i2c_num – I2C port number

\textbf{Returns}
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

\texttt{esp_err_t i2c_set_start_timing(i2c_port_t i2c_num, int setup_time, int hold_time)}

set I2C master start signal timing

\textbf{Parameters}
- i2c_num – I2C port number
- setup_time – clock number between the falling-edge of SDA and rising-edge of SCL for start mark, it’s a 10-bit value.
- hold_time – clock num between the falling-edge of SDA and falling-edge of SCL for start mark, it’s a 10-bit value.

\textbf{Returns}
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

\texttt{esp_err_t i2c_get_start_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)}

get I2C master start signal timing

\textbf{Parameters}
- i2c_num – I2C port number
- setup_time – pointer to get setup time
- hold_time – pointer to get hold time

\textbf{Returns}
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

\texttt{esp_err_t i2c_set_stop_timing(i2c_port_t i2c_num, int setup_time, int hold_time)}

set I2C master stop signal timing

\textbf{Parameters}
- i2c_num – I2C port number
- setup_time – clock num between the rising-edge of SCL and the rising-edge of SDA, it’s a 10-bit value.
- hold_time – clock number after the STOP bit’s rising-edge, it’s a 14-bit value.

\textbf{Returns}
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
**esp_err_t i2c_get_stop_timing** (i2c_port_t i2c_num, int *setup_time, int *hold_time)

get I2C master stop signal timing

**Parameters**
- i2c_num – I2C port number
- setup_time – pointer to get setup time.
- hold_time – pointer to get hold time.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t i2c_set_data_timing** (i2c_port_t i2c_num, int sample_time, int hold_time)

set I2C data signal timing

**Parameters**
- i2c_num – I2C port number
- sample_time – clock number I2C used to sample data on SDA after the rising-edge of SCL, it’s a 10-bit value
- hold_time – clock number I2C used to hold the data after the falling-edge of SCL, it’s a 10-bit value

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t i2c_get_data_timing** (i2c_port_t i2c_num, int *sample_time, int *hold_time)

get I2C data signal timing

**Parameters**
- i2c_num – I2C port number
- sample_time – pointer to get sample time
- hold_time – pointer to get hold time

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t i2c_set_timeout** (i2c_port_t i2c_num, int timeout)

set I2C timeout value

**Parameters**
- i2c_num – I2C port number
- timeout – timeout value for I2C bus (unit: APB 80Mhz clock cycle)

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t i2c_get_timeout** (i2c_port_t i2c_num, int *timeout)

get I2C timeout value

**Parameters**
- i2c_num – I2C port number
- timeout – pointer to get timeout value

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t i2c_set_data_mode** (i2c_port_t i2c_num, i2c_trans_mode_t tx_trans_mode, i2c_trans_mode_t rx_trans_mode)

set I2C data transfer mode

**Parameters**
- i2c_num – I2C port number
- tx_trans_mode – I2C sending data mode
- rx_trans_mode – I2C receiving data mode
• rx_trans_mode – I2C receiving data mode

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

```
esp_err_t i2c_get_data_mode(i2c_port_t i2c_num, i2c_trans_mode_t *tx_trans_mode, i2c_trans_mode_t *rx_trans_mode)
```

get I2C data transfer mode

Parameters
• i2c_num – I2C port number
• tx_trans_mode – pointer to get I2C sending data mode
• rx_trans_mode – pointer to get I2C receiving data mode

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Structures

struct i2c_config_t
I2C initialization parameters.

Public Members

*i2c_mode_t* mode
I2C mode

int sda_io_num
GPIO number for I2C sda signal

int scl_io_num
GPIO number for I2C scl signal

bool sda_pullup_en
Internal GPIO pull mode for I2C sda signal

bool scl_pullup_en
Internal GPIO pull mode for I2C scl signal

uint32_t clk_speed
I2C clock frequency for master mode, (no higher than 1MHz for now)

struct i2c_config_t::[anonymous]::[anonymous] master
I2C master config

uint8_t addr_10bit_en
I2C 10bit address mode enable for slave mode

uint16_t slave_addr
I2C address for slave mode
uint32_t maxmum_speed
    I2C expected clock speed from SCL.

struct i2c_config_t::[anonymous]::[anonymous] slave
    I2C slave config

uint32_t clk_flags
    Bitwise of I2C_SCLK_SRC_FLAG_*FOR_DFS* for clk source choice

Macros

I2C_APB_CLK_FREQ
    I2C source clock is APB clock, 80MHz

I2C_SCLK_SRC_FLAG_FOR_NORMAL
    Any one clock source that is available for the specified frequency may be chosen

I2C_SCLK_SRC_FLAG_AWARE_DFS
    For REF tick clock, it won’t change with APB.

I2C_SCLK_SRC_FLAG_LIGHT_SLEEP
    For light sleep mode.

I2C_INTERNAL_STRUCT_SIZE
    Minimum size, in bytes, of the internal private structure used to describe I2C commands link.

I2C_LINK_RECOMMENDED_SIZE (TRANSACTIONS)
    The following macro is used to determine the recommended size of the buffer to pass to i2c_cmd_link_create_static() function. It requires one parameter, TRANSACTIONS, describing the number of transactions intended to be performed on the I2C port. For example, if one wants to perform a read on an I2C device register, TRANSACTIONS must be at least 2, because the commands required are the following:

    • write device register
    • read register content

    Signals such as “(repeated) start”, “stop”, “nack”, “ack” shall not be counted.

Type Definitions

typedef void *i2c_cmd_handle_t
    I2C command handle

Header File

    • components/hal/include/hal/i2c_types.h

Structures

struct i2c_hal_clk_config_t
    Data structure for calculating I2C bus timing.
Chapter 2. API Reference

Public Members

uint16_t clkm_div
    I2C core clock devider

uint16_t scl_low
    I2C scl low period

uint16_t scl_high
    I2C scl high period

uint16_t scl_wait_high
    I2C scl wait_high period

uint16_t sda_hold
    I2C scl low period

uint16_t sda_sample
    I2C sda sample time

uint16_t setup
    I2C start and stop condition setup period

uint16_t hold
    I2C start and stop condition hold period

uint16_t tout
    I2C bus timeout period

struct i2c_hal_timing_config_t
    Timing configuration structure. Used for I2C reset internally.

Public Members

int high_period
    high_period time

int low_period
    low_period time

int wait_high_period
    wait_high_period time

int rstart_setup
    restart setup

int start_hold
    start hold time
int stop_setup
    stop setup

int stop_hold
    stop hold time

int sda_sample
    high_period time

int sda_hold
    sda hold time

int timeout
    timeout value

Type Definitions
typedef soc_periph_i2c_clk_src_t i2c_clock_source_t
I2C group clock source.

Enumerations
c enum i2c_port_t
    I2C port number, can be I2C_NUM_0 ~ (I2C_NUM_MAX-1).
    Values:
        enumerator I2C_NUM_0
            I2C port 0
        enumerator I2C_NUM_MAX
            I2C port max
c enum i2c_mode_t
    Values:
        enumerator I2C_MODE_SLAVE
            I2C slave mode
        enumerator I2C_MODE_MASTER
            I2C master mode
        enumerator I2C_MODE_MAX

c enum i2c_rw_t
    Values:
        enumerator I2C_MASTER_WRITE
            I2C write data
Chapter 2. API Reference

enumerator I2C_MASTER_READ
   I2C read data

enum i2c_trans_mode_t
   Values:

   enumerator I2C_DATA_MODE_MSB_FIRST
      I2C data msb first

   enumerator I2C_DATA_MODE_LSB_FIRST
      I2C data lsb first

2.6.11 Inter-IC Sound (I2S)

Introduction

I2S (Inter-IC Sound) is a serial, synchronous communication protocol that is usually used for transmitting audio data between two digital audio devices.

ESP32-C3 contains one I2S peripheral(s). These peripherals can be configured to input and output sample data via the I2S driver.

An I2S bus that communicate in Standard or TDM mode consists of the following lines:
• **MCLK**: Master clock line. It’s an optional signal depends on slave side, mainly used for offering a reference clock to the I2S slave device.
• **BCLK**: Bit clock line. The bit clock for data line.
• **WS**: Word(Slot) select line. It is usually used to identify the vocal tract except PDM mode.
• **DIN/DOUT**: Serial data input/output line. (Data will loopback internally if din and dout are set to a same GPIO)

And for the I2S bus that communicate in PDM mode, the lines are:

• **CLK**: PDM clock line.
• **DIN/DOUT**: Serial data input/output line.

Each I2S controller has the following features that can be configured by the I2S driver:

• Operation as system master or slave
• Capable of acting as transmitter or receiver
• DMA controller that allows for streaming sample data without requiring the CPU to copy each data sample

Each controller has separate rx and tx channel. That means they are able to work under different clock and slot configurations with separate GPIO pins. Note that although the internal MCLK of tx channel and rx channel are separate on a controller, the output MCLK signal can only be attached to one channel. If two different MCLK output is required, they must be allocated on different I2S controller.

### I2S File Structure

```

Legend:
- **Includes**
- **Public Header**
- **Private Header**
- **Source File**
```

Public headers that need to be included in the I2S application

• **i2s.h**: The header file of legacy I2S APIs (for apps using legacy driver).
• **i2s_std.h**: The header file that provides standard communication mode specific APIs (for apps using new driver with standard mode).
• **i2s_pdm.h**: The header file that provides PDM communication mode specific APIs (for apps using new driver with PDM mode).
• **i2s_tdm.h**: The header file that provides TDM communication mode specific APIs (for apps using new driver with TDM mode).

**Note**: The legacy driver can’t coexist with the new driver. Including i2s.h to use the legacy driver or the other three headers to use the new driver. The legacy driver might be removed in future.
Public headers that have been included in the headers above

- `i2s_types_legacy.h`: The legacy public types that only used in the legacy driver.
- `i2s_types.h`: The header file that provides public types.
- `i2s_common.h`: The header file that provides common APIs for all communication modes.

### I2S Clock

#### Clock Source

- `i2s_clock_src_t::I2S_CLK_SRC_DEFAULT`: Default PLL clock.
- `i2s_clock_src_t::I2S_CLK_SRC_PLL_160M`: 160 MHz PLL clock.

#### Clock Terminology

- **sample rate**: The number of sampled data in one second per slot.
- **sclk**: Source clock frequency. It is the frequency of the clock source.
- **mclk**: Master clock frequency. bclk is generate from this clock, mclk is mostly needed in the case that requires the MCLK signal as a reference clock to synchronize BCLK and WS between I2S master role and slave role.
- **bclk**: Bit clock frequency. Every tick of this clock stands for one data bit on data pin. It means there will be 8/16/24/32 bclk ticks in one slot, because the number of bclk ticks in one slot is equal to the `i2s_std_slot_config_t::slot_bit_width`.
- **lrck / ws**: Left/Right clock or word select clock. For non-PDM mode, its frequency is equal to the sample rate.

**Note:** Normally mclk should be the multiple of sample rate and bclk at the same time. This field `i2s_std_clk_config_t::mclk_multiple` means the multiple of mclk to the sample rate. If `slot_bit_width` is set to `I2S_SLOT_BIT_WIDTH_24BIT`, to keep mclk a multiple to the bclk, `i2s_std_clk_config_t::mclk_multiple` should be set to `I2S_MCLK_MULTIPLE_384`, otherwise the ws will be inaccurate. But in the most other cases, `I2S_MCLK_MULTIPLE_256` should be enough.

### I2S Communication Mode

**Standard Mode** Standard mode always has left and right two sound channels which are called ‘slots’. These slots can support 8/16/24/32 bits width sample data. And the communication format for the slots mainly includes these following formats:

- **Philip Format**: Data signal have one bit shift comparing to the WS(word select) signal. And the duty of WS signal is 50%.
Chapter 2. API Reference

Standard Philip Timing Diagram

- **MSB Format**: Almost same as philip format, but its data have no shift.

Standard MSB Timing Diagram

- **PCM Short Format**: Data have one bit shift and meanwhile WS signal becomes a pulse lasting one BCLK(Bit Clock) cycle.

Standard PCM Timing Diagram

PDM Mode (TX)  PDM(Pulse-density Modulation) mode for tx channel can convert PCM data into PDM format which always has left and right slots. PDM TX can only support 16 bits width sample data. PDM TX only needs CLK pin for clock signal and DOUT pin for data signal (i.e. WS and SD signal in the following figure, the BCK signal is an internal bit sampling clock, not needed between PDM devices). This mode allows user to configure the up-sampling parameters `i2s_pdm_tx_clk_config_t::up_sample_fp` and `i2s_pdm_tx_clk_config_t::up_sample_fs`. The up-sampling rate can be calculated by `up_sample_rate = fp / fs`, there are up-sampling modes in PDM TX:

- **Fixed Clock Frequency**: In this mode the up-sampling rate will change according to the sample rate. Setting `fp = 960` and `fs = sample_rate / 100`, then the clock frequency(Fpdm) on CLK pin will be fixed to 128 * 48 KHz = 6.144 MHz, note that this frequency is not equal to the sample rate(Fpcm).
- **Fixed Up-sampling Rate**: In this mode the up-sampling rate is fixed to 2. Setting `fp = 960` and `fs = 480`, then the clock frequency(Fpdm) on CLK pin will be 128 * sample_rate.
**TDM Mode**  TDM (Time Division Multiplexing) mode supports up to 16 slots, these slots can be enabled by `i2s_tdm_slot_config_t::slot_mask`. But due to the hardware limitation, only up to 4 slots are supported while the slot is set to 32 bit-width, and 8 slots for 16 bit-width, 16 slots for 8 bit-width. The slot communication format of TDM is almost same as standard mode, but there are some small differences between them.

- **Philip Format**: Data signal have one bit shift comparing to the WS (word select) signal. And no matter how many slots are contained in one frame, the duty of WS signal will always keep 50%.

- **MSB Format**: Almost same as philip format, but its data have no shift.

- **PCM Short Format**: Data have one bit shift and meanwhile WS signal becomes a pulse lasting one BCLK (Bit Clock) cycle for every frame.

- **PCM Long Format**: Data have one bit shift and meanwhile WS signal will lasting one slot bit width for every frame. For example, if there are 4 slots enabled, then the duty of WS will be 25%, and if there are 5 slots, it will be 20%.
Functional Overview

The I2S driver offers the following services:

**Resources Management**  There are three levels’ resources in I2S driver:

- **platform level**: Resources of all I2S controllers in the current target.
- **controller level**: Resources in one I2S controller.
- **channel level**: Resources of tx or rx channel in one I2S controller.

The public APIs are all channel level APIs, the channel handle `i2s_chan_handle_t` can help user to manage the resources under a specific channel without considering the other two levels. The other two upper levels’ resources are private and will be managed by the driver automatically. Users can call `i2s_new_channel()` to allocate a channel handle and call `i2s_del_channel()` to delete it.

**Power Management**  When the power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system will adjust or stop the source clock of I2S before going into light sleep, thus potentially changing the I2S signals and leading to transmitting or receiving invalid data.

I2S driver can prevent the system from changing or stopping the source clock by acquiring a power management lock. When the source clock is generated from APB, the lock type will be set to `esp_pm_lock_type_t::ESP_PM_APB_FREQ_MAX` and when the source clock is APLL (if target support APLL), it will be set to `esp_pm_lock_type_t::ESP_PM_NO_LIGHT_SLEEP`. Whenever user is reading or writing via I2S (i.e. calling `i2s_channel_read()` or `i2s_channel_write()`), the driver will guarantee that the power management lock is acquired. Likewise, the driver releases the lock after reading or writing finished.

**Finite-State Machine**  There are three states for an I2S channel, they are registered, ready, and running. Their relationship is shown in the following diagram:

The `<mode>` in the diagram can be replaced by corresponding I2S communication mode like `std` for standard two-slot mode, for other information of communication mode, please refer to the *I2S Communication Mode* section.

**Data Transport**  The data transport of I2S peripheral, including sending and receiving, is realized by DMA. Before transporting data, please call `i2s_channel_enable()` to enable the specific channel. When the sent or received data reach the size of one DMA buffer, `I2S_OUT_EOF` or `I2S_IN_SUC_EOF` interrupt will be triggered. Note that the DMA buffer size is not equal to `i2s_chan_config_t::dma_frame_num`, one frame here means all the sampled data in one WS circle. Therefore, `dma_buffer_size = dma_frame_num * slot_num * slot_bit_width / 8`. For the transmit case, users can input the data by calling `i2s_channel_write()`. This function will help users to copy the data from the source buffer to the DMA tx buffer and wait for the transmission finished. Then it’ll repeat until the sent bytes reach the given size. For the receive case, the function `i2s_channel_read()` will wait for receiving the message queue which contains the DMA buffer address, it will help users to copy the data from DMA rx buffer to the destination buffer.
Both `i2s_channel_write()` and `i2s_channel_read()` are blocking functions, they will keep waiting until the whole source buffer are sent or the whole destination buffer loaded, unless they exceed the max blocking time, then the error code `ESP_ERR_TIMEOUT` will return in this case. To send or receive data asynchronously, callbacks can be registered by `i2s_channel_register_event_callback()`, users are able to access the DMA buffer directly in the callback function instead of transmitting or receiving by the two blocking functions. However, please be aware that it is an interrupt callback, don’t do complex logic, floating operation or call non-reentrant functions in the callback.

**Configuration Setting** Users can initialize a channel by corresponding function (i.e. `i2s_channel_init_std_mode()`, `i2s_channel_init_pdm_rx_mode()`, `i2s_channel_init_pdm_tx_mode()` or `i2s_channel_init_tdm_mode()`), the channel will be initialized to the specific mode. If the configurations need to be updated after initialization, `i2s_channel_disable()` has to be called first to ensure the channel has stopped, and then calling corresponding `reconfig` functions, like `i2s_channel_reconfig_std_slot()`, `i2s_channel_reconfig_std_clock()`, `i2s_channel_reconfig_std_gpio()`.

**IRAM Safe** By default, the I2S interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the EOF interrupt will not get executed in time, which is not expected in a real-time application.

There’s a Kconfig option `CONFIG_I2S_ISR_IRAM_SAFE` that will:

1. Enable the interrupt being serviced even when cache is disabled
2. Place driver object into DRAM (in case it’s linked to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.
Thread Safety  All the public I2S APIs are guaranteed to be thread safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks. Notice that I2S driver uses mutex lock to ensure the thread safety, thus these APIs are not allowed to be used in ISR.

Kconfig Options

- CONFIG_I2S_ISR_IRAM_SAFE controls whether the default ISR handler can work when cache is disabled, see IRAM Safe for more information.
- CONFIG_I2S_SUPPRESS_DEPRECATE_WARN controls whether to suppress the compiling warning message while using the legacy I2S driver.
- CONFIG_I2S_ENABLE_DEBUG_LOG is used to enabled the debug log output. Enable this option will increase the firmware binary size.

Application Example

The examples of the I2S driver can be found in the directory peripherals/i2s. Here are some simple usages of each mode:

Standard TX/RX Usage  Different slot communication formats can be generated by following helper macros for standard mode. As described above, there are three formats in standard mode, their helper macros are:

- I2S_STD_PHILIP_SLOT_DEFAULT_CONFIG
- I2S_STD_PCM_SLOT_DEFAULT_CONFIG
- I2S_STD_MSB_SLOT_DEFAULT_CONFIG

The clock config helper macro is:

- I2S_STD_CLK_DEFAULT_CONFIG

Please refer to Standard Mode for STD API information. And for more details, please refer to driver/include/driver/i2s_std.h.

STD TX Mode  Take 16-bit data width for example, when the data in a uint 16_t writing buffer are:

| data 0 | data 1 | data 2 | data 3 | data 4 | data 5 | data 6 | data 7 | ...
|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| 0x0001 | 0x0002 | 0x0003 | 0x0004 | 0x0005 | 0x0006 | 0x0007 | 0x0008 | ...

Here is the table of the real data on the line with different i2s_std_slot_config_t::slot_mode and i2s_std_slot_config_t::slot_mask

</table>

Note:  Similar for 8-bit and 32-bit data width, the type of the buffer is better to be uint8_t and uint32_t type. But specially, when the data width is 24-bit, the data buffer should aligned with 3-byte(i.e. every 3 bytes stands for a 24-bit data in one slot), additionally, i2s_chan_config_t::dma_frame_num, i2s_std_clk_config_t::mclk_multiple and the writing buffer size should be the multiple of 3, otherwise the data on the line or the sample rate will be incorrect.
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
/* Get the default channel configuration by helper macro.
* This helper macro is defined in 'i2s_common.h' and shared by all the i2s
→communication mode.

<td>0x0008</td>
</tr>
</tbody>
</table>

Note: 8-bit, 24-bit and 32-bit are similar as 16-bit, the data bit-width in the receiving buffer are equal to the data bit-width on the line. Additionally, when using 24-bit data width, `i2s_chan_config_t::dma_frame_num`, `i2s_std_clk_config_t::mclk_multiple` and the receiving buffer size should be the multiple of 3, otherwise the data on the line or the sample rate will be incorrect.

```c
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t rx_handle;

/* Get the default channel configuration by helper macro. */
/* This helper macro is defined in 'i2s_common.h' and shared by all the i2s_ communication mode. */
/* It can help to specify the I2S role, and port id */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_ MASTER);

/* Allocate a new rx channel and get the handle of this channel */
i2s_new_channel(&chan_cfg, NULL, &rx_handle);

/* Setting the configurations, the slot configuration and clock configuration can be generated by the macros */
/* These two helper macros is defined in 'i2s_std.h' which can only be used in STD mode. */
/* They can help to specify the slot and clock configurations for initialization or updating */
i2s_std_config_t std_cfg = {
 .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
 .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_ MODE_STEREO),
 .gpio_cfg = {
   .mclk = I2S_GPIO_UNUSED,
   .bclk = GPIO_NUM_4,
   .ws = GPIO_NUM_5,
   .dout = I2S_GPIO_UNUSED,
   .din = GPIO_NUM_19,
   .invert_flags = {
     .mclk_inv = false,
     .bclk_inv = false,
     .ws_inv = false,
   },
 },
/* Initialize the channel */
i2s_channel_init_std_mode(rx_handle, &std_cfg);

/* Before read data, start the rx channel first */
```

(continues on next page)
Chapter 2. API Reference

(continued from previous page)

```c
i2s_channel_enable(rx_handle);
i2s_channel_read(rx_handle, desc_buf, bytes_to_read, bytes_read, ticks_to_wait);

/* Have to stop the channel before deleting it */
i2s_channel_disable(rx_handle);
/* If the handle is not needed any more, delete it to release the channel_→resources */
i2s_del_channel(rx_handle);
```

**PDM TX usage**  For PDM mode in tx channel, the slot configuration helper macro is:

- `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`

The clock configuration helper macro is:

- `I2S_PDM_TX_CLK_DEFAULT_CONFIG`

Please refer to *PDM Mode* for PDM TX API information. And for more details, please refer to `driver/include/driver/i2s_pdm.h`.

The PDM data width is fixed to 16-bit, when the data in a `int16_t` writing buffer are:

| data 0 | data 1 | data 2 | data 3 | data 4 | data 5 | data 6 | data 7 | ...
|-------|-------|-------|-------|-------|-------|-------|-------|-----
| 0x0001 | 0x0002 | 0x0003 | 0x0004 | 0x0005 | 0x0006 | 0x0007 | 0x0008 |     |

Here is the table of the real data on the line with different `i2s_pdm_tx_slot_config_t::slot_mode` and `i2s_pdm_tx_slot_config_t::line_mode` (The PDM format on the line is transferred to PCM format for easier comprehension).

**Note:** There are three line modes for PDM TX mode, they are `I2S_PDM_TX_ONE_LINE_CODEC`, `I2S_PDM_TX_ONE_LINE_DAC` and `I2S_PDM_TX_TWO_LINE_DAC`. One-line codec is for the PDM codecs those require clock signal, the PDM codec can differentiate the left and right slots by the clock level, and the other two are used to driver power amplifiers directly with a low-pass filter, they do not need the clock signal, so there are two lines to differentiate the left and right slots. Additionally, for the mono mode of one-line codec, the slot can be force to change to the right by setting the clock invert flag in gpio configuration.

```c
#include "driver/i2s_pdm.h"
#include "driver/gpio.h"

/* Allocate an I2S tx channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_0, I2S_ROLE_MASTER);
i2s_new_channel(&chan_cfg, &tx_handle, NULL);
/* Init the channel into PDM TX mode */
i2s_pdm_tx_config_t pdm_tx_cfg = {
```

(continues on next page)
.clk_cfg = I2S_PDM_TX_CLK_DEFAULT_CONFIG(36000),
.slot_cfg = I2S_PDM_TX_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_-
    MODE_MONO),
.gpio_cfg = {
    .clk = GPIO_NUM_5,
    .dout = GPIO_NUM_18,
    .invert_flags = {
        .clk_inv = false,
    },
},
};
i2s_channel_init_pdm_tx_mode(tx_handle, &pdm_tx_cfg);
...

TDM TX/RX usage Different slot communication formats can be generated by following helper macros for TDM mode. As described above, there are four formats in TDM mode, their helper macros are:

- I2S_TDM_PHILIP_SLOT_DEFAULT_CONFIG
- I2S_TDM_MSB_SLOT_DEFAULT_CONFIG
- I2S_TDM_PCM_SHORT_SLOT_DEFAULT_CONFIG
- I2S_TDM_PCM_LONG_SLOT_DEFAULT_CONFIG

The clock config helper macro is:

- I2S_TDM_CLK_DEFAULT_CONFIG

Please refer to TDM Mode for TDM API information. And for more details, please refer to driver/include/driver/i2s_tdm.h.

TDM TX Mode

```c
#include "driver/i2s_tdm.h"
#include "driver/gpio.h"

/* Allocate an I2S tx channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_-
    MASTER);
i2s_new_channel(&chan_cfg, tx_handle, NULL);

/* Init the channel into TDM mode */
i2s_tdm_config_t tdm_cfg = {
    .clk_cfg = I2S_TDM_CLK_DEFAULT_CONFIG(44100),
    .slot_cfg = I2S_TDM_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_-
        MODE_STEREO,
        I2S_TDM_SLOT0 | I2S_TDM_SLOT1 | I2S_TDM_SLOT2 | I2S_TDM_SLOT3),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
i2s_channel_init_tdm_mode(tx_handle, &tdm_cfg);
```
Chapter 2. API Reference

(continued from previous page)

TDM RX Mode

```c
#include "driver/i2s_tdm.h"
#include "driver/gpio.h"

/* Set the channel mode to TDM */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_CONFIG(I2S_ROLE_MASTER, I2S_COMM_MODE_TDM, &i2s_pin);
i2s_new_channel(&chan_cfg, NULL, &rx_handle);

/* Init the channel into TDM mode */
i2s_tdm_config_t tdm_cfg = {
   .clk_cfg = I2S_TDM_CLK_DEFAULT_CONFIG(44100),
   .slot_cfg = I2S_TDM_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_MODE_STEREO, 
                                             I2S_TDM_SLOT0 | I2S_TDM_SLOT1 | I2S_TDM_SLOT2 | I2S_TDM_SLOT3),
   .gpio_cfg = {
      .mclk = I2S_GPIO_UNUSED,
      .bclk = GPIO_NUM_4,
      .ws = GPIO_NUM_5,
      .dout = I2S_GPIO_UNUSED,
      .din = GPIO_NUM_18,
      .invert_flags = {
         .mclk_inv = false,
         .bclk_inv = false,
         .ws_inv = false,
      },
   },
};
i2s_channel_init_tdm_mode(rx_handle, &tdm_cfg);
```

Full-duplex  Full-duplex mode will register tx and rx channel in an I2S port at the same time, and they will share the BCLK and WS signal. Currently STD and TDM communication mode are able to adopt full-duplex mode in following way, but PDM full-duplex is not supported because PDM TX and RX clock are not same. Note that one handle can only stand for one channel, the slot and clock configurations for both tx and rx channel should be set one by one. Here is an example of how to allocate a pair of full-duplex channels:

```c
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;

/* Allocate a pair of I2S channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_MASTER);
/* Allocate for tx and rx channel at the same time, then they will work in full-duplex mode */
i2s_new_channel(&chan_cfg, &tx_handle, &rx_handle);
/* Set the configurations for BOTH TWO channels, since tx and rx channel have to be same in full-duplex mode */
i2s_std_config_t std_cfg = {
```
Simplex Mode To allocate a channel in simplex mode, \texttt{i2s_new_channel()} should be called for each channel. The clock and gpio pins of TX/RX channel on ESP32-C3 are separate, they can be configured in different modes and clocks, and they are able to coexist on a same I2S port in simplex mode. So PDM duplex can be realized by registering PDM TX simplex and PDM RX simplex on a same I2S port. But in this way, PDM TX/RX might work with different clocks, take care when configuring the gpio pins and clocks.

The following example offers a use case for the simplex mode, but note that, although the internal MCLK signals for tx and rx channel are separate, the output MCLK can only be bound to one of them if they are from a same controller, if both channel initialized MCLK, it depends on which is initialized later.

```c
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_0, I2S_ROLE_MASTER);
i2s_new_channel(chan_cfg, &tx_handle, NULL);
i2s_std_config_t std_tx_cfg = {
  .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
  .slot_cfg = I2S_STD_PHILIP_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S SLOT_MODE_STEREO),
  .gpio_cfg = {
    .mclk = GPIO_NUM_0,
    .bclk = GPIO_NUM_4,
    .ws = GPIO_NUM_5,
    .dout = GPIO_NUM_18,
    .din = GPIO_NUM_19,
    .invert_flags = {
      .mclk_inv = false,
      .bclk_inv = false,
      .ws_inv = false,
    },
  },
};
i2s_init_channel(tx_handle, &std_cfg);
i2s_init_channel(rx_handle, &std_cfg);
i2s_channel_enable(tx_handle);
i2s_channel_enable(rx_handle);
```

(continues on next page)
Application Notes

How to Prevent Data Lost  For the applications that need a high frequency sample rate, sometimes the massive throughput of receiving data may cause data lost. Users can receive data lost event by registering isr callback function to receive event queue:

```c
static IRAM_ATTR bool i2s_rx_queue_overflow_callback(i2s_chan_handle_t *handle, i2s_event_data_t *event, void *user_ctx)
{
    // handle rx queue overflow event ...
    return false;
}
```

Please follow these steps to prevent data lost:

1. Determine the interrupt interval. Generally, when data lost happened, the interval should be the bigger the better, it can help to reduce the interrupt times, i.e., dma_frame_num should be as big as possible while the DMA buffer size won’t exceed its maximum value 4092. The relationships are:

   \[
   \text{interrupt\_interval (unit: sec)} = \frac{\text{dma\_frame\_num}}{\text{sample\_rate}}
   \]

   \[
   \text{dma\_buffer\_size} = \frac{\text{dma\_frame\_num} \times \text{slot\_num} \times \text{data\_bit\_width}}{8} \leq 4092
   \]

2. Determine the \text{dma\_desc\_num}. The \text{dma\_desc\_num} is decided by the max time of \text{i2s\_channel\_read polling cycle}, all the received data are supposed to be stored between two
i2s_channel_read. This cycle can be measured by a timer or an outputting gpio signal. The relationship is:

\[
dma_{\text{desc\_num}} > \frac{\text{polling\_cycle}}{\text{interrupt\_interval}}
\]

3. Determine the receiving buffer size. The receiving buffer that offered by user in i2s_channel_read should be able to take all the data in all dma buffers, that means it should be bigger than the total size of all the dma buffers:

\[
\text{recv\_buffer\_size} > \text{dma\_desc\_num} \times \text{dma\_buffer\_size}
\]

For example, if there is an I2S application, and the known values are:

| sample_rate | 144000 Hz |
| data_bit_width | 32 bits |
| slot_num | 2 |
| polling_cycle | 10ms |

Then the parameters dma_frame_num, dma_desc_num and recv_buf_size can be calculated according to the given known values:

\[
dma_{\text{frame\_num}} \times \text{slot\_num} \times \frac{\text{data\_bit\_width}}{8} = \text{dma\_buffer\_size} < 4092
\]
\[
dma_{\text{frame\_num}} < 511
\]
\[
\text{interrupt\_interval} = \frac{\text{dma\_frame\_num}}{\text{sample\_rate}} = 511 / 144000 = 0.003549 \text{ s} \approx 3.549 \text{ ms}
\]
\[
dma_{\text{desc\_num}} > \frac{\text{polling\_cycle}}{\text{interrupt\_interval}} = \text{ceil}(10 / 3.549) = \text{ceil}(2.818) = 3
\]
\[
\text{recv\_buffer\_size} > \text{dma\_desc\_num} \times \text{dma\_buffer\_size} = 3 \times 4092 = 12276 \text{ bytes}
\]

**API Reference**

**Standard Mode**

**Header File**

- components/driver/include/driver/i2s_std.h

**Functions**

\[\text{esp\_err\_t} \ i2s\_channel\_init\_std\_mode\ (i2s\_chan\_handle\_t \ handle, \ const \ i2s\_std\_config\_t \ *std\_cfg)\]

Initialize i2s channel to standard mode.

**Note:** Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

**Parameters**

- **handle** [in] I2S channel handler
- **std_cfg** [in] Configurations for standard mode, including clock, slot and gpio The clock configuration can be generated by the helper macro I2S_STD_CLK_DEFAULT_CONFIG The slot configuration can be generated by the helper macro I2S_STD_PHILIP_SLOT_DEFAULT_CONFIG, I2S_STD_PCM_SLOT_DEFAULT_CONFIG or I2S_STD_MSB_SLOT_DEFAULT_CONFIG

**Returns**

- ESP_OK Initialize successfully
- ESP_ERR_NO_MEM No memory for storing the channel information
- ESP_ERR_INVALID_ARG NULL pointer or invalid configuration
- ESP_ERR_INVALID_STATE This channel is not registered
**esp_err_t** `i2s_channel_reconfig_std_clock` *(i2s-chan_handle_t* handle, *const i2s_std_clk_config_t* clk_cfg)*

Reconfigure the I2S clock for standard mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if I2S has started.

**Note:** The input channel handle has to be initialized to standard mode, i.e., ‘i2s_channel_init_std_mode’ has been called before reconfiguring

**Parameters**

- **handle** - [in] I2S channel handler
- **clk_cfg** - [in] Standard mode clock configuration, can be generated by
  ```c
  I2S_STD_CLK_DEFAULT_CONFIG
  ```

**Returns**

- **ESP_OK** Set clock successfully
- **ESP_ERR_INVALID_ARG** NULL pointer, invalid configuration or not standard mode
- **ESP_ERR_INVALID_STATE** This channel is not initialized or not stopped

**esp_err_t** `i2s_channel_reconfig_std_slot` *(i2s_chan_handle_t* handle, *const i2s_std_slot_config_t* slot_cfg)*

Reconfigure the I2S slot for standard mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if I2S has started.

**Note:** The input channel handle has to be initialized to standard mode, i.e., ‘i2s_channel_init_std_mode’ has been called before reconfiguring

**Parameters**

- **handle** - [in] I2S channel handler
- **slot_cfg** - [in] Standard mode slot configuration, can be generated by
  ```c
  I2S_STD_PHILIP_SLOT_DEFAULT_CONFIG,
  I2S_STD_PCM_SLOT_DEFAULT_CONFIG and I2S_STD_MSB_SLOT_DEFAULT_CONFIG.
  ```

**Returns**

- **ESP_OK** Set clock successfully
- **ESP_ERR_NO_MEM** No memory for DMA buffer
- **ESP_ERR_INVALID_ARG** NULL pointer, invalid configuration or not standard mode
- **ESP_ERR_INVALID_STATE** This channel is not initialized or not stopped

**esp_err_t** `i2s_channel_reconfig_std_gpio` *(i2s_chan_handle_t* handle, *const i2s_std_gpio_config_t* gpio_cfg)*

Reconfigure the I2S gpio for standard mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if I2S has started.
Chapter 2. API Reference

Note: The input channel handle has to be initialized to standard mode, i.e., ‘i2s_channel_init_std_mode’ has been called before reconfiguring

Parameters
- **handle** - [in] I2S channel handler
- **gpio_cfg** - [in] Standard mode gpio configuration, specified by user

Returns
- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not standard mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

Structures

```c
struct i2s_std_slot_config_t
I2S slot configuration for standard mode.
```

Public Members

```c
data_bit_width_t data_bit_width
I2S sample data bit width (valid data bits per sample)
```

```c
slot_bit_width_t slot_bit_width
I2S slot bit width (total bits per slot)
```

```c
slot_mode_t slot_mode
Set mono or stereo mode with I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO In TX direction, mono means the written buffer contains only one slot data and stereo means the written buffer contains both left and right data
```

```c
slot_mask_t slot_mask
Select the left, right or both slot
```

```c
ws_width_t ws_width
WS signal width (i.e. the number of clk ticks that ws signal is high)
```

```c
ws_pol
WS signal polarity, set true to enable high lever first
```

```c
bit_shift
Set to enbale bit shift in Philip mode
```

```c
left_align
Set to enable left alignment
```

```c
big_endian
Set to enable big endian
```

```c
bit_order_lsb
Set to enable lsb first
```
struct `i2s_std_clk_config_t`
I2S clock configuration for standard mode.

**Public Members**

- `uint32_t sample_rate_hz`
  I2S sample rate

- `i2s_clock_src_t clk_src`
  Choose clock source

- `i2s_mclk_multiple_t mclk_multiple`
  The multiple of mclk to the sample rate. Default is 256 in the helper macro, it can satisfy most of cases, but please set this field a multiple of 3 (like 384) when using 24-bit data width, otherwise the sample rate might be inaccurate.

struct `i2s_std_gpio_config_t`
I2S standard mode GPIO pins configuration.

**Public Members**

- `gpio_num_t mclk`
  MCK pin, output

- `gpio_num_t bclk`
  BCK pin, input in slave role, output in master role

- `gpio_num_t ws`
  WS pin, input in slave role, output in master role

- `gpio_num_t dout`
  DATA pin, output

- `gpio_num_t din`
  DATA pin, input

- `uint32_t mclk_inv`
  Set 1 to invert the mclk output

- `uint32_t bclk_inv`
  Set 1 to invert the bclk input/output

- `uint32_t ws_inv`
  Set 1 to invert the ws input/output

- struct `i2s_std_gpio_config_t`::[anonymous] `invert_flags`
  GPIO pin invert flags
struct i2s_std_config_t
I2S standard mode major configuration that including clock/slot/gpio configuration.

Public Members

i2s_std_clk_config_t clk_cfg
Standard mode clock configuration, can be generated by macro I2S_STD_CLK_DEFAULT_CONFIG

i2s_std_slot_config_t slot_cfg
Standard mode slot configuration, can be generated by macros I2S_STD_[mode]_SLOT_DEFAULT_CONFIG, [mode] can be replaced with PHILIP/MSB/PCM

i2s_std_gpio_config_t gpio_cfg
Standard mode gpio configuration, specified by user

Macros

I2S_STD_PHILIP_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)
Philip format in 2 slots.
This file is specified for I2S standard communication mode Features:
• Philip/MSB/PCM are supported in standard mode
• Fixed to 2 slots

Parameters
• bits_per_sample – i2s data bit width
• mono_or_stereo – I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_STD_PCM_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)
PCM(short) format in 2 slots.

Note: PCM(long) is sample as philip in 2 slots

Parameters
• bits_per_sample – i2s data bit width
• mono_or_stereo – I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_STD_MSB_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)
MSB format in 2 slots.

Parameters
• bits_per_sample – i2s data bit width
• mono_or_stereo – I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_STD_CLK_DEFAULT_CONFIG (rate)
i2s default standard clock configuration

Note: Please set the mclk_multiple to I2S_MCLK_MULTIPLE_384 while using 24 bits data width Otherwise the sample rate might be imprecise since the bclk division is not a integer

Parameters
• rate – sample rate
PDM Mode

Header File

- components/driver/include/driver/i2s_pdm.h

Functions

```c
esp_err_t i2s_channel_init_pdm_tx_mode (i2s_chan_handle_t handle, const i2s_pdm_tx_config_t *pdm_tx_cfg)
```

Initialize i2s channel to PDM TX mode.

**Note:** Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

**Parameters**

- `handle` [in] I2S tx channel handler
- `pdm_tx_cfg` [in] Configurations for PDM TX mode, including clock, slot and gpio. The clock configuration can be generated by the helper macro `I2S_PDM_TX_CLK_DEFAULT_CONFIG`. The slot configuration can be generated by the helper macro `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`.

**Returns**

- `ESP_OK` Initialize successfully
- `ESP_ERR_NO_MEM` No memory for storing the channel information
- `ESP_ERR_INVALID_ARG` NULL pointer or invalid configuration
- `ESP_ERR_INVALID_STATE` This channel is not registered

```c
esp_err_t i2s_channel_reconfig_pdm_tx_clock (i2s_chan_handle_t handle, const i2s_pdm_tx_clk_config_t *clk_cfg)
```

Reconfigure the I2S clock for PDM TX mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started. This function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

**Parameters**

- `handle` [in] I2S tx channel handler
- `clk_cfg` [in] PDM TX mode clock configuration, can be generated by `I2S_PDM_TX_CLK_DEFAULT_CONFIG`.

**Returns**

- `ESP_OK` Set clock successfully
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not PDM mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

```c
esp_err_t i2s_channel_reconfig_pdm_tx_slot (i2s_chan_handle_t handle, const i2s_pdm_tx_slot_config_t *slot_cfg)
```

Reconfigure the I2S slot for PDM TX mode.

**Note:** The input channel handle has to be initialized to PDM TX mode, i.e., ‘i2s_channel_init_pdm_tx_mode’ has been called before reconfiguring.
**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started. This function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

**Note:** The input channel handle has to be initialized to PDM TX mode, i.e., ‘i2s_channel_init_pdm_tx_mode’ has been called before reconfiguring

### Parameters
- `handle` - [in] I2S tx channel handler
- `slot_cfg` - [in] PDM TX mode slot configuration, can be generated by `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`

### Returns
- ESP_OK Set clock successfully
- ESP_ERR_NO_MEM No memory for DMA buffer
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

```c
esp_err_t i2s_channel_reconfig_pdm_tx_gpio(i2s_chan_handle_t handle, const i2s_pdm_tx_gpio_config_t *gpio_cfg)
```

Reconfigure the I2S gpio for PDM TX mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started. This function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

**Note:** The input channel handle has to be initialized to PDM TX mode, i.e., ‘i2s_channel_init_pdm_tx_mode’ has been called before reconfiguring

### Parameters
- `handle` - [in] I2S tx channel handler
- `gpio_cfg` - [in] PDM TX mode gpio configuration, specified by user

### Returns
- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

### Structures

```c
struct i2s_pdm_tx_slot_config_t
```

I2S slot configuration for pdm tx mode.

### Public Members

- `i2s_data_bit_width_t data_bit_width`  
  I2S sample data bit width (valid data bits per sample), only support 16 bits for PDM mode

- `i2s_slot_bit_width_t slot_bit_width`  
  I2S slot bit width (total bits per slot), only support 16 bits for PDM mode
Chapter 2. API Reference

i2s_slot_mode_t slot_mode
Set mono or stereo mode with I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO For PDM TX mode, mono means the data buffer only contains one slot data, Stereo means the data buffer contains two slots data.

uint32_t sd_prescale
Sigma-delta filter prescale.

i2s_pdm_sig_scale_t sd_scale
Sigma-delta filter scaling value.

i2s_pdm_sig_scale_t hp_scale
High pass filter scaling value.

i2s_pdm_sig_scale_t lp_scale
Low pass filter scaling value.

i2s_pdm_sig_scale_t sinc_scale
Sinc filter scaling value.

i2s_pdm_tx_line_mode_t line_mode
PDM TX line mode, on-line codec, one-line dac, two-line dac mode can be selected.

bool hp_en
High pass filter enable.

float hp_cut_off_freq_hz
High pass filter cut-off frequency, range 23.3Hz ~ 185Hz, see cut-off frequency sheet above.

uint32_t sd_dither
Sigma-delta filter dither.

uint32_t sd_dither2
Sigma-delta filter dither2.

struct i2s_pdm_tx_clk_config_t
I2S clock configuration for pdm tx mode.

Public Members

uint32_t sample_rate_hz
I2S sample rate.

i2s_clock_src_t clk_src
Choose clock source.

i2s_mclk_multiple_t mclk_multiple
The multiple of mclk to the sample rate.
## Chapter 2. API Reference

```c
uint32_t up_sample_fp
Up-sampling param fp

uint32_t up_sample_fs
Up-sampling param fs
```

```c
struct i2s_pdm_tx_gpio_config_t
I2S PDM tx mode GPIO pins configuration.
```

### Public Members

```c
gpio_num_t clk
PDM clk pin, output
```

```c
gpio_num_t dout
DATA pin, output
```

```c
gpio_num_t dout2
The second data pin for the DAC dual-line mode, only take effect when the line mode is
I2S_PDM_TX_TWO_LINE_DAC
```

```c
uint32_t clk_inv
Set 1 to invert the clk output
```

```c
struct i2s_pdm_tx_gpio_config_t::[anonymous] invert_flags
GPIO pin invert flags
```

```c
struct i2s_pdm_tx_config_t
I2S PDM TX mode major configuration that including clock/slot/gpio configuration.
```

### Public Members

```c
i2s_pdm_tx_clk_config_t clk_cfg
PDM TX clock configurations, can be generated by macro I2S_PDM_TX_CLK_DEFAULT_CONFIG
```

```c
i2s_pdm_tx_slot_config_t slot_cfg
PDM TX slot configurations, can be generated by macro I2S_PDM_TX_SLOT_DEFAULT_CONFIG
```

```c
i2s_pdm_tx_gpio_config_t gpio_cfg
PDM TX gpio configurations, specified by user
```

### Macros

**I2S_PDM_TX_SLOT_DEFAULT_CONFIG** (bits_per_sample, mono_or_stereo)

PDM style in 2 slots(TX)

This file is specified for I2S PDM communication mode Features:

- Only support PDM tx/rx mode
- Fixed to 2 slots
Chapter 2. API Reference

- Data bit width only support 16 bits

Parameters
- `bits_per_sample` - i2s data bit width, only support 16 bits for PDM mode
- `mono_or_stereo` - I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

**I2S_PDM_TX_CLK_DEFAULT_CONFIG**(rate)

i2s default pdm tx clock configuration

**Note:** TX PDM can only be set to the following two up-sampling rate configurations: 1: fp = 960, fs = sample_rate_hz / 100, in this case, Fpdm = 128*48000 2: fp = 960, fs = 480, in this case, Fpdm = 128*Fpcm = 128*sample_rate_hz If the pdm receiver do not care the pdm serial clock, it’s recommended set Fpdm = 128*48000. Otherwise, the second configuration should be adopted.

Parameters
- `rate` - sample rate

TDM Mode

Header File
- components/driver/include/driver/i2s_tdm.h

Functions

**esp_err_t i2s_channel_init_tdm_mode**(i2s_chan_handle_t handle, const i2s_tdm_config_t *tdm_cfg)

Initialize i2s channel to TDM mode.

**Note:** Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

Parameters
- `handle` - [in] I2S channel handler
- `tdm_cfg` - [in] Configurations for TDM mode, including clock, slot and gpio The clock configuration can be generated by the helper macro I2S_TDM_CLK_DEFAULT_CONFIG The slot configuration can be generated by the helper macro I2S_TDM_PHILIP_SLOT_DEFAULT_CONFIG, I2S_TDM_PCM_SHORT_SLOT_DEFAULT_CONFIG, I2S_TDM_PCM_LONG_SLOT_DEFAULT_CONFIG or I2S_TDM_MSB_SLOT_DEFAULT_CONFIG

Returns
- ESP_OK Initialize successfully
- ESP_ERR_NO_MEM No memory for storing the channel information
- ESP_ERR_INVALID_ARG NULL pointer or invalid configuration
- ESP_ERR_INVALID_STATE This channel is not registered

**esp_err_t i2s_channel_reconfig_tdm_clock**(i2s_chan_handle_t handle, const i2s_tdm_clk_config_t *clk_cfg)

Reconfigure the i2s clock for TDM mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.
Chapter 2. API Reference

**Note:** The input channel handle has to be initialized to TDM mode, i.e., `i2s_channel_init_tdm_mode` has been called before reconfiguring.

**Parameters**
- `handle` - [in] I2S channel handler
- `clk_cfg` - [in] Standard mode clock configuration, can be generated by `I2S_TDM_CLK_DEFAULT_CONFIG`

**Returns**
- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not TDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

```c
esp_err_t i2s_channel_reconfig_tdm_slot(i2s_chan_handle_t handle, const i2s_tdm_slot_config_t *slot_cfg)
```

Reconfigure the I2S slot for TDM mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. `i2s_channel_disable` should be called before calling this function if i2s has started.

**Note:** The input channel handle has to be initialized to TDM mode, i.e., `i2s_channel_init_tdm_mode` has been called before reconfiguring.

**Parameters**
- `handle` - [in] I2S channel handler
- `slot_cfg` - [in] Standard mode slot configuration, can be generated by `I2S_TDM_PHILIP_SLOT_DEFAULT_CONFIG`, `I2S_TDM_PCM_SHORT_SLOT_DEFAULT_CONFIG`, `I2S_TDM_PCM_LONG_SLOT_DEFAULT_CONFIG` or `I2S_TDM_MSB_SLOT_DEFAULT_CONFIG`.

**Returns**
- ESP_OK Set clock successfully
- ESP_ERR_NO_MEM No memory for DMA buffer
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not TDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

```c
esp_err_t i2s_channel_reconfig_tdm_gpio(i2s_chan_handle_t handle, const i2s_tdm_gpio_config_t *gpio_cfg)
```

Reconfigure the I2S gpio for TDM mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. `i2s_channel_disable` should be called before calling this function if i2s has started.

**Note:** The input channel handle has to be initialized to TDM mode, i.e., `i2s_channel_init_tdm_mode` has been called before reconfiguring.

**Parameters**
- `handle` - [in] I2S channel handler
• `gpio_cfg` - [in] Standard mode gpio configuration, specified by user

**Returns**

- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not TDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

**Structures**

```c
struct i2s_tdm_slot_config_t
I2S slot configuration for tdm mode.
```

**Public Members**

```c
i2s_data_bit_width_t data_bit_width
I2S sample data bit width (valid data bits per sample)
```

```c
i2s_slot_bit_width_t slot_bit_width
I2S slot bit width (total bits per slot)
```

```c
i2s_slot_mode_t slot_mode
Set mono or stereo mode with I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO
```

```c
i2s_tdm_slot_mask_t slot_mask
Slot mask. Activating slots by setting 1 to corresponding bits. When the activated slots is not consecutive, those data in unactivated slots will be ignored
```

```c
uint32_t ws_width
WS signal width (i.e. the number of beclk ticks that ws signal is high)
```

```c
bool ws_pol
WS signal polarity, set true to enable high lever first
```

```c
bool bit_shift
Set true to enable bit shift in Philip mode
```

```c
bool left_align
Set true to enable left alignment
```

```c
bool big_endian
Set true to enable big endian
```

```c
bool bit_order_lsb
Set true to enable lsb first
```

```c
bool skip_mask
Set true to enable skip mask. If it is enabled, only the data of the enabled channels will be sent, otherwise all data stored in DMA TX buffer will be sent
```
Chapter 2. API Reference

```c
uint32_t total_slot
I2S total number of slots. If it is smaller than the biggest activated channel number, it will be set to this number automatically.

struct i2s_tdm_clk_config_t
I2S clock configuration for tdm mode.

Public Members

uint32_t sample_rate_hz
I2S sample rate

i2s_clock_src_t clk_src
Choose clock source

i2s_mclk_multiple_t mclk_multiple
The multiple of mclk to the sample rate

struct i2s_tdm_gpio_config_t
I2S TDM mode GPIO pins configuration.

Public Members

gpio_num_t mclk
MCK pin, output

gpio_num_t bclk
BCK pin, input in slave role, output in master role

gpio_num_t ws
WS pin, input in slave role, output in master role

gpio_num_t dout
DATA pin, output

gpio_num_t din
DATA pin, input

uint32_t mclk_inv
Set 1 to invert the mclk output

uint32_t bclk_inv
Set 1 to invert the bclk input/output

uint32_t ws_inv
Set 1 to invert the ws input/output
```
struct i2s_tdm_gpio_config_t::[anonymous] invertflags

  GPIO pin invert flags

struct i2s_tdm_config_t

  I2S TDM mode major configuration that including clock/slot/gpio configuration.

Public Members

i2s_tdm_clk_config_t clk_cfg

  TDM mode clock configuration, can be generated by macro I2S_TDM_CLK_DEFAULT_CONFIG

i2s_tdm_slot_config_t slot_cfg

  TDM mode slot configuration, can be generated by macros I2S_TDM_[mode]_SLOT_DEFAULT_CONFIG, [mode] can be replaced with PHILIP/MSB/PCM_SHORT/PCM_LONG

i2s_tdm_gpio_config_t gpio_cfg

  TDM mode gpio configuration, specified by user

Macros

I2S_TDM_AUTO_SLOT_NUM

  This file is specified for I2S TDM communication mode Features:
  * More than 2 slots

I2S_TDM_AUTO_WS_WIDTH

I2S_TDM_PHILIP_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo, mask)

  Philip format in active slot that enabled by mask.

  Parameters
  * bits_per_sample  - i2s data bit width
  * mono_or_stereo   - I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO
  * mask  - active slot mask

I2S_TDM_MSB_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo, mask)

  MSB format in active slot enabled that by mask.

  Parameters
  * bits_per_sample  - i2s data bit width
  * mono_or_stereo   - I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO
  * mask  - active slot mask

I2S_TDM_PCM_SHORT_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo, mask)

  PCM(short) format in active slot that enabled by mask.

  Parameters
  * bits_per_sample  - i2s data bit width
  * mono_or_stereo   - I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO
  * mask  - active slot mask

I2S_TDM_PCM_LONG_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo, mask)

  PCM(long) format in active slot that enabled by mask.

  Parameters
  * bits_per_sample  - i2s data bit width
  * mono_or_stereo   - I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO
Chapter 2. API Reference

- **mask** - active slot mask

**I2S_TDM_CLK_DEFAULT_CONFIG** (rate)

i2s default tdm clock configuration

**Note:** Please set the mclk_multiple to I2S_MCLK_MULTIPLE_384 while the data width in slot configuration is set to 24 bits. Otherwise, the sample rate might be imprecise since the belk division is not an integer.

**Parameters**
- **rate** - sample rate

### I2S Driver

**Header File**

- **components/driver/include/driver/i2s_common.h**

**Functions**

```c
esp_err_t i2s_new_channel( const i2s_chan_config_t *chan_cfg, i2s_chan_handle_t *ret_tx_handle, i2s_chan_handle_t *ret_rx_handle )
```

Allocate new I2S channel(s)

**Note:** The new created I2S channel handle will be REGISTERED state after it is allocated successfully.

**Note:** When the port id in channel configuration is I2S_NUM_AUTO, driver will allocate I2S port automatically on one of the i2s controller, otherwise, driver will try to allocate the new channel on the selected port.

**Note:** If both tx_handle and rx_handle are not NULL, it means this I2S controller will work at full-duplex mode, the rx and tx channels will be allocated on a same I2S port in this case. Note that some configurations of tx/rx channel are shared on ESP32 and ESP32S2, so please make sure they are working at same condition and under same status(start/stop). Currently, full-duplex mode can’t guarantee tx/rx channels write/read synchronously, they can only share the clock signals for now.

**Note:** If tx_handle OR rx_handle is NULL, it means this I2S controller will work at simplex mode. For ESP32 and ESP32S2, the whole I2S controller (i.e. both rx and tx channel) will be occupied, even if only one of rx or tx channel is registered. For the other targets, another channel on this controller will still available.

**Parameters**
- **chan_cfg** - [in] I2S controller channel configurations
- **ret_tx_handle** - [out] I2S channel handler used for managing the sending channel (optional)
- **ret_rx_handle** - [out] I2S channel handler used for managing the receiving channel (optional)

**Returns**
- ESP_OK Allocate new channel(s) success
- ESP_ERR_NOT_SUPPORTED The communication mode is not supported on the current chip
- ESP_ERR_INVALID_ARG NULL pointer or illegal parameter in i2s_chan_config_t
• ESP_ERR_NOT_FOUND No available I2S channel found

```c
esp_err_t i2s_del_channel(i2s_chan_handle_t handle)
```

Delete the i2s channel.

**Note:** Only allowed to be called when the i2s channel is at REGISTERED or READY state (i.e., it should stop before deleting it).

**Note:** Resource will be free automatically if all channels in one port are deleted

**Parameters**
- `handle` [in] I2S channel handler

**Returns**
- ESP_OK Delete successfully
- ESP_ERR_INVALID_ARG NULL pointer

```c
esp_err_t i2s_channel_get_info(i2s_chan_handle_t handle, i2s_chan_info_t *chan_info)
```

Get I2S channel information.

**Parameters**
- `handle` [in] I2S channel handler
- `chan_info` [out] I2S channel basic information

**Returns**
- ESP_OK Get i2s channel information success
- ESP_ERR_NOT_FOUND The input handle doesn’t match any registered I2S channels, it may not an i2s channel handle or not available any more
- ESP_ERR_INVALID_ARG The input handle or chan_info pointer is NULL

```c
esp_err_t i2s_channel_enable(i2s_chan_handle_t handle)
```

Enable the i2s channel.

**Note:** Only allowed to be called when the channel state is READY, (i.e., channel has been initialized, but not started) the channel will enter RUNNING state once it is enabled successfully.

**Note:** Enable the channel can start the I2S communication on hardware. It will start outputting bclk and ws signal. For mclk signal, it will start to output when initialization is finished

**Parameters**
- `handle` [in] I2S channel handler

**Returns**
- ESP_OK Start successfully
- ESP_ERR_INVALID_ARG NULL pointer
- ESP_ERR_INVALID_STATE This channel has not initialized or already started

```c
esp_err_t i2s_channel_disable(i2s_chan_handle_t handle)
```

Disable the i2s channel.

**Note:** Only allowed to be called when the channel state is READY / RUNNING, (i.e., channel has been initialized) the channel will enter READY state once it is disabled successfully.

**Note:** Disable the channel can stop the I2S communication on hardware. It will stop bclk and ws signal but not mclk signal

**Parameters**
- `handle` [in] I2S channel handler
**Returns**

- ESP_OK Stop successfully
- ESP_ERR_INVALID_ARG NULL pointer
- ESP_ERR_INVALID_STATE This channel has not stated

```c
esp_err_t i2s_channel_write(i2s_chan_handle_t handle, const void *src, size_t size, size_t *bytes_written, uint32_t timeout_ms)
```

I2S write data.

**Note:** Only allowed to be called when the channel state is RUNNING, (i.e., tx channel has been started and is not writing now) but the RUNNING only stands for the software state, it doesn’t mean there is no the signal transporting on line.

**Parameters**

- handle - [in] I2S channel handler
- src - [in] The pointer of sent data buffer
- size - [in] Max data buffer length
- bytes_written - [out] Byte number that actually be sent
- timeout_ms - [in] Max block time

**Returns**

- ESP_OK Write successfully
- ESP_ERR_INVALID_ARG NULL pointer or this handle is not tx handle
- ESP_ERR_TIMEOUT Writing timeout, no writing event received from ISR within ticks_to_wait
- ESP_ERR_INVALID_STATE I2S is not ready to write

```c
esp_err_t i2s_channel_read(i2s_chan_handle_t handle, void *dest, size_t size, size_t *bytes_read, uint32_t timeout_ms)
```

I2S read data.

**Note:** Only allowed to be called when the channel state is RUNNING but the RUNNING only stands for the software state, it doesn’t mean there is no the signal transporting on line.

**Parameters**

- handle - [in] I2S channel handler
- dest - [in] The pointer of receiving data buffer
- size - [in] Max data buffer length
- bytes_read - [out] Byte number that actually be read
- timeout_ms - [in] Max block time

**Returns**

- ESP_OK Read successfully
- ESP_ERR_INVALID_ARG NULL pointer or this handle is not rx handle
- ESP_ERR_TIMEOUT Reading timeout, no reading event received from ISR within ticks_to_wait
- ESP_ERR_INVALID_STATE I2S is not ready to read

```c
esp_err_t i2s_channel_register_event_callback(i2s_chan_handle_t handle, const i2s_event_callbacks_t *callbacks, void *user_data)
```

Set event callbacks for I2S channel.

**Note:** Only allowed to be called when the channel state is REGISTARED / READY, (i.e., before channel starts)
Note: User can deregister a previously registered callback by calling this function and setting the callback member in the `callbacks` structure to NULL.

Note: When `CONFIG_I2S_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM or internal RAM as well.

### Parameters

- `handle` - [in] I2S channel handler
- `callbacks` - [in] Group of callback functions
- `user_data` - [in] User data, which will be passed to callback functions directly

### Returns

- `ESP_OK` Set event callbacks successfully
- `ESP_ERR_INVALID_ARG` Set event callbacks failed because of invalid argument
- `ESP_ERR_INVALID_STATE` Set event callbacks failed because the current channel state is not `REGISTARED` or `READY`

### Structures

**struct i2s_event_callbacks_t**

Group of I2S callbacks.

Note: The callbacks are all running under ISR environment

Note: When `CONFIG_I2S_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

### Public Members

**i2s_isr_callback_t on_recv**

Callback of data received event, only for rx channel. The event data includes DMA buffer address and size that just finished receiving data.

**i2s_isr_callback_t on_recv_q_ovf**

Callback of receiving queue overflowed event, only for rx channel. The event data includes buffer size that has been overwritten.

**i2s_isr_callback_t on_sent**

Callback of data sent event, only for tx channel. The event data includes DMA buffer address and size that just finished sending data.

**i2s_isr_callback_t on_send_q_ovf**

Callback of sending queue overflowed event, only for tx channel. The event data includes buffer size that has been overwritten.

**struct i2s_chan_config_t**

I2S controller channel configuration.
Public Members

*i2s_port_t* `id`
I2S port id

*i2s_role_t* `role`
I2S role, I2S_ROLE_MASTER or I2S_ROLE_SLAVE

uint32_t `dma_desc_num`
I2S DMA buffer number, it is also the number of DMA descriptor

uint32_t `dma_frame_num`
I2S frame number in one DMA buffer. One frame means one-time sample data in all slots, it should be the multiple of \(3\) when the data bit width is 24.

bool `auto_clear`
Set to auto clear DMA TX buffer, i2s will always send zero automatically if no data to send

struct *i2s_chan_info_t*
I2S channel information.

Public Members

*i2s_port_t* `id`
I2S port id

*i2s_role_t* `role`
I2S role, I2S_ROLE_MASTER or I2S_ROLE_SLAVE

*i2s_dir_t* `dir`
I2S channel direction

*i2s_comm_mode_t* `mode`
I2S channel communication mode

*i2s_chan_handle_t* `pair_chan`
I2S pair channel handle in duplex mode, always NULL in simplex mode

Macros

`I2S_CHANNEL_DEFAULT_CONFIG`(i2s_num, i2s_role)
get default I2S property

`I2S_GPIO_UNUSED`
Used in i2s_gpio_config_t for signals which are not used

I2S Types
Chapter 2. API Reference

Header File

- components/driver/include/driver/i2s_types.h

Structures

struct i2s_event_data_t

Event structure used in I2S event queue.

Public Members

void *data

The pointer of DMA buffer that just finished sending or receiving for on_recv and on_sent callback
NULL for on_recv_q_ovf and on_send_q_ovf callback

size_t size

The buffer size of DMA buffer when success to send or receive, also the buffer size that dropped when
queue overflow. It is related to the dma_frame_num and data_bit_width, typically it is fixed when
data_bit_width is not changed.

Type Definitions

typedef struct i2s_channel_t *i2s_chan_handle_t

i2s channel handle, the control unit of the i2s driver

typedef bool (*i2s_isr_callback_t)(i2s_chan_handle_t handle, i2s_event_data_t *event, void *user_ctx)

I2S event callback.

Param handle [in] I2S channel handle, created from i2s_new_channel()
Param event [in] I2S event data
Param user_ctx [in] User registered context, passed from
i2s_channel_register_event_callback()
Return Whether a high priority task has been waken up by this callback function

Enumerations

enum i2s_port_t

I2S controller port number, the max port number is (SOC_I2S_NUM -1).

Values:

enumerator I2S_NUM_0

I2S controller port 0

enumerator I2S_NUM_AUTO

Select whichever port is available

enum i2s_comm_mode_t

I2S controller communication mode.

Values:

enumerator I2S_COMM_MODE_STD

I2S controller using standard communication mode, support philip/MSB/PCM format
enumerator **I2S_COMM_MODE_PDM**  
I2S controller using PDM communication mode, support PDM output or input

enumerator **I2S_COMM_MODE_TDM**  
I2S controller using TDM communication mode, support up to 16 slots per frame

enumerator **I2S_COMM_MODE_NONE**  
Unspecified I2S controller mode

enum **i2s_mclk_multiple_t**  
The multiple of mclk to sample rate.  

*Values:*  

enumerator **I2S_MCLK_MULTIPLE_128**  
mclk = sample_rate * 128

enumerator **I2S_MCLK_MULTIPLE_256**  
mclk = sample_rate * 256

enumerator **I2S_MCLK_MULTIPLE_384**  
mclk = sample_rate * 384

enumerator **I2S_MCLK_MULTIPLE_512**  
mclk = sample_rate * 512

**Header File**  
- components/hal/include/hal/i2s_types.h

**Type Definitions**  
typedef **soc_periph_i2s_clk_src_t**  
i2s_clock_src_t  
I2S clock source

**Enumerations**  
enum **i2s_slot_mode_t**  
I2S channel slot mode.  

*Values:*  

enumerator **I2S_SLOT_MODE_MONO**  
I2S channel slot format mono, transmit same data in all slots for tx mode, only receive the data in the first slots for rx mode.

enumerator **I2S_SLOT_MODE_STEREO**  
I2S channel slot format stereo, transmit different data in different slots for tx mode, receive the data in all slots for rx mode.
enum *i2s_dir_t*

I2S channel direction.

*Values:*

enumerator *I2S_DIR_RX*

I2S channel direction RX

enumerator *I2S_DIR_TX*

I2S channel direction TX

enum *i2s_role_t*

I2S controller role.

*Values:*

enumerator *I2S_ROLE_MASTER*

I2S controller master role, bclk and ws signal will be set to output

enumerator *I2S_ROLE_SLAVE*

I2S controller slave role, bclk and ws signal will be set to input

enum *i2s_data_bit_width_t*

Available data bit width in one slot.

*Values:*

enumerator *I2S_DATA_BIT_WIDTH_8BIT*

I2S channel data bit-width: 8

enumerator *I2S_DATA_BIT_WIDTH_16BIT*

I2S channel data bit-width: 16

enumerator *I2S_DATA_BIT_WIDTH_24BIT*

I2S channel data bit-width: 24

enumerator *I2S_DATA_BIT_WIDTH_32BIT*

I2S channel data bit-width: 32

enum *i2s_slot_bit_width_t*

Total slot bit width in one slot.

*Values:*

enumerator *I2S_SLOT_BIT_WIDTH_AUTO*

I2S channel slot bit-width equals to data bit-width

enumerator *I2S_SLOT_BIT_WIDTH_8BIT*

I2S channel slot bit-width: 8

enumerator *I2S_SLOT_BIT_WIDTH_16BIT*

I2S channel slot bit-width: 16
enumerator **I2S SLOT BIT_WIDTH_24BIT**
I2S channel slot bit-width: 24

enumerator **I2S SLOT BIT_WIDTH_32BIT**
I2S channel slot bit-width: 32

e num **i2s_pcm_compress_t**
A/U-law decompress or compress configuration.

**Values:**

enumerator **I2S_PCM_DISABLE**
Disable A/U law decompress or compress

enumerator **I2S_PCM_A_DECOMPRESS**
A-law decompress

enumerator **I2S_PCM_A_COMPRESS**
A-law compress

enumerator **I2S_PCM_U_DECOMPRESS**
U-law decompress

enumerator **I2S_PCM_U_COMPRESS**
U-law compress

e num **i2s_pdm_sig_scale_t**
pdm tx signal scaling mode

**Values:**

enumerator **I2S_PDM_SIG_SCALING_DIV_2**
I2S TX PDM signal scaling: /2

enumerator **I2S_PDM_SIG_SCALING_MUL_1**
I2S TX PDM signal scaling: x1

enumerator **I2S_PDM_SIG_SCALING_MUL_2**
I2S TX PDM signal scaling: x2

enumerator **I2S_PDM_SIG_SCALING_MUL_4**
I2S TX PDM signal scaling: x4

e num **i2s_pdm_tx_line_mode_t**
PDM TX line mode.

**Note:** For the standard codec mode, PDM pins are connect to a codec which requires both clock signal and data signal. For the DAC output mode, PDM data signal can be connected to a power amplifier directly with a low-pass filter, normally, DAC output mode doesn’t need the clock signal.

**Values:**
Chapter 2. API Reference

enumerator **I2S_PDM_TX_ONE_LINE_CODEC**
Standard PDM format output, left and right slot data on a single line

enumerator **I2S_PDM_TX_ONE_LINE_DAC**
PDM DAC format output, left or right slot data on a single line

enumerator **I2S_PDM_TX_TWO_LINE_DAC**
PDM DAC format output, left and right slot data on separated lines

enum **i2s_std_slot_mask_t**
I2S slot select in standard mode.

**Note:** It has different meanings in tx/rx/mono/stereo mode, and it may have different behaviors on different targets. For the details, please refer to the I2S API reference

**Values:**

enumerator **I2S_STD_SLOT_LEFT**
I2S transmits or receives left slot

enumerator **I2S_STD_SLOT_RIGHT**
I2S transmits or receives right slot

enumerator **I2S_STD_SLOT_BOTH**
I2S transmits or receives both left and right slot

enum **i2s_pdm_slot_mask_t**
I2S slot select in PDM mode.

**Values:**

enumerator **I2S_PDM_SLOT_RIGHT**
I2S PDM only transmits or receives the PDM device whose ‘select’ pin is pulled up

enumerator **I2S_PDM_SLOT_LEFT**
I2S PDM only transmits or receives the PDM device whose ‘select’ pin is pulled down

enumerator **I2S_PDM_SLOT_BOTH**
I2S PDM transmits or receives both two slots

enum **i2s_tdm_slot_mask_t**
tdm slot number

**Note:** Multiple slots in TDM mode. For TX module, only the active slot send the audio data, the inactive slot send a constant or will be skipped if ‘skip_msk’ is set. For RX module, only receive the audio data in active slots, the data in inactive slots will be ignored. the bit map of active slot can not exceed (0x1<<total_slot_num). e.g: slot_mask = (I2S_TDM_SLOT0 | I2S_TDM_SLOT3), here the active slot number is 2 and total_slot is not supposed to be smaller than 4.

**Values:**
enumerator I2S_TDM_SLOT0  
I2S slot 0 enabled

enumerator I2S_TDM_SLOT1  
I2S slot 1 enabled

enumerator I2S_TDM_SLOT2  
I2S slot 2 enabled

enumerator I2S_TDM_SLOT3  
I2S slot 3 enabled

enumerator I2S_TDM_SLOT4  
I2S slot 4 enabled

enumerator I2S_TDM_SLOT5  
I2S slot 5 enabled

enumerator I2S_TDM_SLOT6  
I2S slot 6 enabled

enumerator I2S_TDM_SLOT7  
I2S slot 7 enabled

enumerator I2S_TDM_SLOT8  
I2S slot 8 enabled

enumerator I2S_TDM_SLOT9  
I2S slot 9 enabled

enumerator I2S_TDM_SLOT10  
I2S slot 10 enabled

enumerator I2S_TDM_SLOT11  
I2S slot 11 enabled

enumerator I2S_TDM_SLOT12  
I2S slot 12 enabled

enumerator I2S_TDM_SLOT13  
I2S slot 13 enabled

enumerator I2S_TDM_SLOT14  
I2S slot 14 enabled

enumerator I2S_TDM_SLOT15  
I2S slot 15 enabled
2.6.12 LCD

Introduction

ESP chips can generate various kinds of timings that needed by common LCDs on the market, like SPI LCD, I80 LCD (a.k.a Intel 8080 parallel LCD), RGB/SRGB LCD, I2C LCD, etc. The esp_lcd component is officially to support those LCDs with a group of universal APIs across chips.

Functional Overview

In esp_lcd, an LCD panel is represented by esp_lcd_panel_handle_t, which plays the role of an abstract frame buffer, regardless of the frame memory is allocated inside ESP chip or in external LCD controller. Based on the location of the frame buffer, the LCD panel allocation functions are mainly grouped into the following categories:

- **RGB LCD panel** - is simply based on a group of specific synchronous signals indicating where to start and stop a frame.
- **Controller based LCD panel** involves multiple steps to get a panel handle, like bus allocation, IO device registration and controller driver install.

After we get the LCD handle, the remaining LCD operations are the same for different LCD interfaces and vendors.

Application Example

LCD examples are located under: peripherals/lcd:

- Universal SPI LCD example with SPI touch - peripherals/lcd/spi_lcd_touch
- Jpeg decoding and LCD display - peripherals/lcd/tjpgd
- i80 controller based LCD and LVGL animation UI - peripherals/lcd/i80_controller
- RGB panel example with scatter chart UI - peripherals/lcd/rgb_panel
- I2C interfaced OLED display scrolling text - peripherals/lcd/i2c_oled

Other LCD drivers

Drivers for some LCD and touch controllers are available in IDF Component Registry. The list of available and planned drivers with links is in this table.

API Reference

Header File

- components/hal/include/hal/lcd_types.h

Enumerations

- enum lcd_color_rgb_endian_t
  - RGB color endian.
  - Values:

  - enumerator LCD_RGB_ENDIAN_RGB
    - RGB data endian: RGB
  - enumerator LCD_RGB_ENDIAN_BGR
    - RGB data endian: BGR
enum lcd_color_space_t
LCD color space.
Values:

enumerator LCD_COLOR_SPACE_RGB
Color space: RGB

enumerator LCD_COLOR_SPACE_YUV
Color space: YUV

enum lcd_color_range_t
LCD color range.
Values:

enumerator LCD_COLOR_RANGE_LIMIT
Limited color range

enumerator LCD_COLOR_RANGE_FULL
Full color range

enum lcd_yuv_sample_t
YUV sampling method.
Values:

enumerator LCD_YUV_SAMPLE_422
YUV 4:2:2 sampling

enumerator LCD_YUV_SAMPLE_420
YUV 4:2:0 sampling

enumerator LCD_YUV_SAMPLE_411
YUV 4:1:1 sampling

enum lcd_yuv_conv_std_t
The standard used for conversion between RGB and YUV.
Values:

enumerator LCD_YUV_CONV_STD_BT601
YUV<>RGB conversion standard: BT.601

enumerator LCD_YUV_CONV_STD_BT709
YUV<>RGB conversion standard: BT.709

Header File
• components/esp_lcd/include/esp_lcd_types.h
Type Definitions

typedef struct esp_lcd_panel_io_t *esp_lcd_panel_io_handle_t
    Type of LCD panel IO handle

typedef struct esp_lcd_panel_t *esp_lcd_panel_handle_t
    Type of LCD panel handle

Header File

- components/esp_lcd/include/esp_lcd_panel_io.h

Functions

```c
esp_err_t esp_lcd_panel_io_rx_param(esp_lcd_panel_io_handle_t io, int lcd_cmd, void *param, size_t param_size)
```

Transmit LCD command and receive corresponding parameters.

**Note:** Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

**Parameters**

- **io** [in] LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd_cmd** [in] The specific LCD command, set to -1 if no command needed
- **param** [out] Buffer for the command data
- **param_size** [in] Size of param buffer

**Returns**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

```c
esp_err_t esp_lcd_panel_io_tx_param(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *param, size_t param_size)
```

Transmit LCD command and corresponding parameters.

**Note:** Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

**Parameters**

- **io** [in] LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd_cmd** [in] The specific LCD command (set to -1 if no command needed - only in SPI and I2C)
- **param** [in] Buffer that holds the command specific parameters, set to NULL if no parameter is needed for the command
- **param_size** [in] Size of param in memory, in bytes, set to zero if no parameter is needed for the command

**Returns**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success
esp_err_t esp_lcd_panel_io_tx_color(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *color, size_t color_size)

Transmit LCD RGB data.

**Note:** This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the color buffer. Recycling of color buffer should be done in the callback on_color_trans_done().

**Parameters**
- `io` - [in] LCD panel IO handle, which is created by factory API like esp_lcd_new_panel_io_spi()
- `lcd_cmd` - [in] The specific LCD command
- `color` - [in] Buffer that holds the RGB color data
- `color_size` - [in] Size of color in memory, in bytes

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

esp_err_t esp_lcd_panel_io_del(esp_lcd_panel_io_handle_t io)

Destroy LCD panel IO handle (deinitialize panel and free all corresponding resource)

**Parameters**
- `io` - [in] LCD panel IO handle, which is created by factory API like esp_lcd_new_panel_io_spi()

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

esp_err_t esp_lcd_new_panel_io_spi(esp_lcd_spi_bus_handle_t bus, const esp_lcd_panel_io_spi_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)

Create LCD panel IO handle, for SPI interface.

**Parameters**
- `bus` - [in] SPI bus handle
- `io_config` - [in] IO configuration, for SPI interface
- `ret_io` - [out] Returned IO handle

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

esp_err_t esp_lcd_new_panel_io_i2c(esp_lcd_i2c_bus_handle_t bus, const esp_lcd_panel_io_i2c_config_t *io_config, esp_lcd_panel_io_i2c_config_t *i2c_config, esp_lcd_panel_io_i2c_handle_t *ret_io)

Create LCD panel IO handle, for I2C interface.

**Parameters**
- `bus` - [in] I2C bus handle
- `io_config` - [in] IO configuration, for I2C interface
- `ret_io` - [out] Returned IO handle

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Structures**

struct esp_lcd_panel_io_event_data_t
Type of LCD panel IO event data.
struct esp_lcd_panel_io_spi_config_t

Panel IO configuration structure, for SPI interface.

**Public Members**

- int cs_gpio_num
  - GPIO used for CS line

- int dc_gpio_num
  - GPIO used to select the D/C line, set this to -1 if the D/C line not controlled by manually pulling high/low GPIO

- int spi_mode
  - Traditional SPI mode (0~3)

- unsigned int pclk_hz
  - Frequency of pixel clock

- size_t trans_queue_depth
  - Size of internal transaction queue

- esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done
  - Callback invoked when color data transfer has finished

- void *user_ctx
  - User private data, passed directly to on_color_trans_done’s user_ctx

- int lcd_cmd_bits
  - Bit-width of LCD command

- int lcd_param_bits
  - Bit-width of LCD parameter

- unsigned int dc_low_on_data
  - If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

- unsigned int octal_mode
  - transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

- unsigned int isb_first
  - transmit LSB bit first

- struct esp_lcd_panel_io_spi_config_t::[anonymous] flags
  - Extra flags to fine-tune the SPI device

struct esp_lcd_panel_io_i2c_config_t

Panel IO configuration structure, for I2C interface.
Public Members

```c
uint32_t dev_addr
    I2C device address
```

```c
typedef esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done
    Callback invoked when color data transfer has finished
```

```c
void *user_ctx
    User private data, passed directly to on_color_trans_done’s user_ctx
```

```c
size_t control_phase_bytes
    I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes
```

```c
unsigned int dc_bit_offset
    Offset of the D/C selection bit in control phase
```

```c
int lcd_cmd_bits
    Bit-width of LCD command
```

```c
int lcd_param_bits
    Bit-width of LCD parameter
```

```c
unsigned int dc_low_on_data
    If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa
```

```c
unsigned int disable_control_phase
    If this flag is enabled, the control phase isn’t used
```

```c
struct esp_lcd_panel_io_i2c_config_t::[anonymous] flags
    Extra flags to fine-tune the I2C device
```

Type Definitions

```c
typedef void *esp_lcd_spi_bus_handle_t
    Type of LCD SPI bus handle
```

```c
typedef void *esp_lcd_i2c_bus_handle_t
    Type of LCD I2C bus handle
```

```c
typedef struct esp_lcd_i80_bus_t *esp_lcd_i80_bus_handle_t
    Type of LCD intel 8080 bus handle
```

```c
typedef bool (*esp_lcd_panel_io_color_trans_done_cb_t)(esp_lcd_panel_io_handle_t panel_io,
    esp_lcd_panel_io_event_data_t *edata, void *user_ctx)
    Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.
```

Param panel_io [in] LCD panel IO handle, which is created by factory API like esp_lcd_new_panel_io_spi()

Param edata [in] Panel IO event data, fed by driver

Param user_ctx [in] User data, passed from esp_lcd_panel_io_xxx_config_t

Return Whether a high priority task has been waken up by this function
Chapter 2. API Reference

Header File

- components/esp_lcd/include/esp_lcd_panel_ops.h

Functions

```c
esp_err_t esp_lcd_panel_reset(esp_lcd_panel_handle_t panel)
```
Reset LCD panel.

**Note:** Panel reset must be called before attempting to initialize the panel using `esp_lcd_panel_init()`. 

**Parameters**

- `panel` - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**Returns**

- ESP_OK on success

```c
esp_err_t esp_lcd_panel_init(esp_lcd_panel_handle_t panel)
```
Initialize LCD panel.

**Note:** Before calling this function, make sure the LCD panel has finished the reset stage by `esp_lcd_panel_reset()`. 

**Parameters**

- `panel` - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**Returns**

- ESP_OK on success

```c
esp_err_t esp_lcd_panel_del(esp_lcd_panel_handle_t panel)
```
Deinitialize the LCD panel.

**Parameters**

- `panel` - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**Returns**

- ESP_OK on success

```c
esp_err_t esp_lcd_panel_draw_bitmap(esp_lcd_panel_handle_t panel, int x_start, int y_start, int x_end, int y_end, const void* color_data)
```
Draw bitmap on LCD panel.

**Parameters**

- `panel` - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- `x_start` - [in] Start index on x-axis (x_start included)
- `y_start` - [in] Start index on y-axis (y_start included)
- `x_end` - [in] End index on x-axis (x_end not included)
- `y_end` - [in] End index on y-axis (y_end not included)
- `color_data` - [in] RGB color data that will be dumped to the specific window range

**Returns**

- ESP_OK on success

```c
esp_err_t esp_lcd_panel_mirror(esp_lcd_panel_handle_t panel, bool mirror_x, bool mirror_y)
```
Mirror the LCD panel on specific axis.

**Note:** Combined with `esp_lcd_panel_swap_xy()`, one can realize screen rotation

**Parameters**
• panel -[in] LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
• mirror_x - [in] Whether the panel will be mirrored about the x axis
• mirror_y - [in] Whether the panel will be mirrored about the y axis

Returns
• ESP_OK on success
• ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

esp_err_t esp_lcd_panel_swap_xy (esp_lcd_panel_handle_t panel, bool swap_axes)
Swap/Exchange x and y axis.

Note: Combined with esp_lcd_panel_mirror(), one can realize screen rotation

Parameters
• panel -[in] LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
• swap_axes -[in] Whether to swap the x and y axis

Returns
• ESP_OK on success
• ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

esp_err_t esp_lcd_panel_set_gap (esp_lcd_panel_handle_t panel, int x_gap, int y_gap)
Set extra gap in x and y axis.
The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively of the actual contents displayed.

Note: Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.

Parameters
• panel -[in] LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
• x_gap -[in] Extra gap on x axis, in pixels
• y_gap -[in] Extra gap on y axis, in pixels

Returns
• ESP_OK on success

esp_err_t esp_lcd_panel_invert_color (esp_lcd_panel_handle_t panel, bool invert_color_data)
Invert the color (bit-wise invert the color data line)

Parameters
• panel -[in] LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
• invert_color_data -[in] Whether to invert the color data

Returns
• ESP_OK on success

esp_err_t esp_lcd_panel_disp_on_off (esp_lcd_panel_handle_t panel, bool on_off)
Turn on or off the display.

Parameters
• panel -[in] LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
• on_off -[in] True to turns on display, False to turns off display

Returns
• ESP_OK on success
**ESP_ERR_NOT_SUPPORTED** if this function is not supported by the panel

```c
esp_err_t esp_lcd_panel_disp_off(esp_lcd_panel_handle_t panel, bool off)
```

Turn off the display.

**Parameters**
- `panel` - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- `off` - [in] Whether to turn off the screen

**Returns**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

---

**Header File**
- `components/esp_lcd/include/esp_lcd_panel_rgb.h`

**Header File**
- `components/esp_lcd/include/esp_lcd_panel_vendor.h`

---

**Functions**

```c
esp_err_t esp_lcd_new_panel_st7789(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model ST7789.

**Parameters**
- `io` - [in] LCD panel IO handle
- `panel_dev_config` - [in] general panel device configuration
- `ret_panel` - [out] Returned LCD panel handle

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

```c
esp_err_t esp_lcd_new_panel_nt35510(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model NT35510.

**Parameters**
- `io` - [in] LCD panel IO handle
- `panel_dev_config` - [in] general panel device configuration
- `ret_panel` - [out] Returned LCD panel handle

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

```c
esp_err_t esp_lcd_new_panel_ssd1306(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model SSD1306.

**Parameters**
- `io` - [in] LCD panel IO handle
- `panel_dev_config` - [in] general panel device configuration
- `ret_panel` - [out] Returned LCD panel handle

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Structures

struct esp_lcd_panel_dev_config_t
Configuration structure for panel device.

Public Members

int reset_gpio_num
GPIO used to reset the LCD panel, set to -1 if it’s not used

color_space
Set RGB color space, please use rgb_endian instead

rgb_endian
Set RGB data endian: RGB or BGR

unsigned int bits_per_pixel
Color depth, in bpp

unsigned int reset_active_high
Setting this if the panel reset is high level active

flags
LCD panel config flags

vendor_config
vendor specific configuration, optional, left as NULL if not used

2.6.13 LED Control (LEDC)

Introduction

The LED control (LEDC) peripheral is primarily designed to control the intensity of LEDs, although it can also be used to generate PWM signals for other purposes. It has 6 channels which can generate independent waveforms that can be used, for example, to drive RGB LED devices.

The PWM controller can automatically increase or decrease the duty cycle gradually, allowing for fades without any processor interference.
Functionality Overview

Setting up a channel of the LEDC is done in three steps. Note that unlike ESP32, ESP32-C3 only supports configuring channels in “low speed” mode.

1. **Timer Configuration** by specifying the PWM signal’s frequency and duty cycle resolution.
2. **Channel Configuration** by associating it with the timer and GPIO to output the PWM signal.
3. **Change PWM Signal** that drives the output in order to change LED’s intensity. This can be done under the full control of software or with hardware fading functions.

As an optional step, it is also possible to set up an interrupt on fade end.

**Timer Configuration** Setting the timer is done by calling the function `ledc_timer_config()` and passing the data structure `ledc_timer_config_t` that contains the following configuration settings:

- Speed mode (value must be `LEDC_LOW_SPEED_MODE`)
- Timer number `ledc_timer_t`
- PWM signal frequency
- Resolution of PWM duty
- Source clock `ledc_clk_cfg_t`

The frequency and the duty resolution are interdependent. The higher the PWM frequency, the lower the duty resolution which is available, and vice versa. This relationship might be important if you are planning to use this API for purposes other than changing the intensity of LEDs. For more details, see Section Supported Range of Frequency and Duty Resolutions.

The source clock can also limit the PWM frequency. The higher the source clock frequency, the higher the maximum PWM frequency can be configured.

**Table 4:** Characteristics of ESP32-C3 LEDC source clocks

Chapter 2. API Reference

**Note:**

1. On ESP32-C3, if RTCxM_CLK is chosen as the LEDC clock source, an internal calibration will be performed to get the exact frequency of the clock. This ensures the accuracy of output PWM signal frequency.

2. For ESP32-C3, all timers share one clock source. In other words, it is impossible to use different clock sources for different timers.

**Channel Configuration**  When the timer is set up, configure the desired channel (one out of `ledc_channel_t`). This is done by calling the function `ledc_channel_config()`. Similar to the timer configuration, the channel setup function should be passed a structure `ledc_channel_config_t` that contains the channel’s configuration parameters.

At this point, the channel should start operating and generating the PWM signal on the selected GPIO, as configured in `ledc_channel_config_t`, with the frequency specified in the timer settings and the given duty cycle. The channel operation (signal generation) can be suspended at any time by calling the function `ledc_stop()`.

**Change PWM Signal**  Once the channel starts operating and generating the PWM signal with the constant duty cycle and frequency, there are a couple of ways to change this signal. When driving LEDs, primarily the duty cycle is changed to vary the light intensity.

The following two sections describe how to change the duty cycle using software and hardware fading. If required, the signal’s frequency can also be changed; it is covered in Section Change PWM Frequency.

**Note:** All the timers and channels in the ESP32-C3’s LED PWM Controller only support low speed mode. Any change of PWM settings must be explicitly triggered by software (see below).

**Change PWM Duty Cycle Using Software**  To set the duty cycle, use the dedicated function `ledc_set_duty()`. After that, call `ledc_update_duty()` to activate the changes. To check the currently set value, use the corresponding `_get_` function `ledc_get_duty()`.

Another way to set the duty cycle, as well as some other channel parameters, is by calling `ledc_channel_config()` covered in Section Channel Configuration.

The range of the duty cycle values passed to functions depends on selected duty_resolution and should be from 0 to 
\(2^{\text{duty_resolution}} - 1\). For example, if the selected duty resolution is 10, then the duty cycle values can range from 0 to 1023. This provides the resolution of ~0.1%.

**Change PWM Duty Cycle using Hardware**  The LEDC hardware provides the means to gradually transition from one duty cycle value to another. To use this functionality, enable fading with `ledc_fade_func_install()` and then configure it by calling one of the available fading functions:

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

Start fading with `ledc_fade_start()`. A fade can be operated in blocking or non-blocking mode, please check `ledc_fade_mode_t` for the difference between the two available fade modes. Note that with either fade mode, the next fade or fixed-duty update will not take effect until the last fade finishes or is stopped. `ledc_fade_stop()` has to be called to stop a fade that is in progress.

To get a notification about the completion of a fade operation, a fade end callback function can be registered for each channel by calling `ledc_cb_register()` after the fade service being installed.

If not required anymore, fading and an associated interrupt can be disabled with `ledc_fade_func_uninstall()`.
Change PWM Frequency  The LEDC API provides several ways to change the PWM frequency “on the fly”:

- Set the frequency by calling `ledc_set_freq()`. There is a corresponding function `ledc_get_freq()` to check the current frequency.
- Change the frequency and the duty resolution by calling `ledc_bind_channel_timer()` to bind some other timer to the channel.
- Change the channel’s timer by calling `ledc_channel_config()`.

More Control Over PWM  There are several lower level timer-specific functions that can be used to change PWM settings:

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

The first two functions are called “behind the scenes” by `ledc_channel_config()` to provide a startup of a timer after it is configured.

Use Interrupts  When configuring an LEDC channel, one of the parameters selected within `ledc_channel_config_t` is `ledc_intr_type_t` which triggers an interrupt on fade completion.

For registration of a handler to address this interrupt, call `ledc_isr_register()`.

Supported Range of Frequency and Duty Resolutions

The LED PWM Controller is designed primarily to drive LEDs. It provides a large flexibility of PWM duty cycle settings. For instance, the PWM frequency of 5 kHz can have the maximum duty resolution of 13 bits. This means that the duty can be set anywhere from 0 to 100% with a resolution of ~0.012% (2 ** 13 = 8192 discrete levels of the LED intensity). Note, however, that these parameters depend on the clock signal clocking the LED PWM Controller timer which in turn clocks the channel (see timer configuration and the ESP32-C3 Technical Reference Manual > LED PWM Controller (LEDC) [PDF]).

The LEDC can be used for generating signals at much higher frequencies that are sufficient enough to clock other devices, e.g., a digital camera module. In this case, the maximum available frequency is 40 MHz with duty resolution of 1 bit. This means that the duty cycle is fixed at 50% and cannot be adjusted.

The LEDC API is designed to report an error when trying to set a frequency and a duty resolution that exceed the range of LEDC’s hardware. For example, an attempt to set the frequency to 20 MHz and the duty resolution to 3 bits will result in the following error reported on a serial monitor:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try...
    → reducing freq_hz or duty_resolution. div_param=128
```

In such a situation, either the duty resolution or the frequency must be reduced. For example, setting the duty resolution to 2 will resolve this issue and will make it possible to set the duty cycle at 25% steps, i.e., at 25%, 50% or 75%.

The LEDC driver will also capture and report attempts to configure frequency/duty resolution combinations that are below the supported minimum, e.g.:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try...
    → increasing freq_hz or duty_resolution. div_param=128000000
```

The duty resolution is normally set using `ledc_timer_bit_t`. This enumeration covers the range from 10 to 15 bits. If a smaller duty resolution is required (from 10 down to 1), enter the equivalent numeric values directly.
Application Example

The LEDC change duty cycle and fading control example: peripherals/ledc/ledc_fade.
The LEDC basic example: peripherals/ledc/ledc_basic.

API Reference

Header File

- components/driver/include/driver/ledc.h

Functions

```c
esp_err_t ledc_channel_config(const ledc_channel_config_t *ledc_conf)
```

LED channel configuration Configure LEDC channel with the given channel/output
gpio_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.

**Parameters**
- ledc_conf - Pointer of LEDC channel configure struct

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t ledc_timer_config(const ledc_timer_config_t *timer_conf)
```

LED timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty_resolution.

**Parameters**
- timer_conf - Pointer of LEDC timer configure struct

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Cannot find a proper pre-dividernumber base on the given frequency and the
current duty_resolution.

```c
esp_err_t ledc_update_duty(ledc_mode_t speed_mode, ledc_channel_t channel)
```

LED update channel parameters.

**Note:** Call this function to activate the LEDC updated parameters. After ledc_set_duty, we need to call this function to update the settings. And the new LEDC parameters don’t take effect until the next PWM cycle.

**Note:** ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update

**Parameters**
- speed_mode - Select the LEDC channel group with specified speed mode. Note that
  not all targets support high speed mode.
- channel - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from
  ledc_channel_t

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t ledc_set_pin(int gpio_num, ledc_mode_t speed_mode, ledc_channel_t ledc_channel)
```

Set LEDC output gpio.
Note: This function only routes the LEDC signal to GPIO through matrix, other LEDC resources initialization are not involved. Please use `ledc_channel_config()` instead to fully configure a LEDC channel.

Parameters
- `gpio_num` - The LEDC output gpio
- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `ledc_channel` - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t ledc_stop(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t idle_level)
```

LEDC stop. Disable LEDC output, and set idle level.

Parameters
- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel` - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `idle_level` - Set output idle level after LEDC stops.

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t ledc_set_freq(ledc_mode_t speed_mode, ledc_timer_t timer_num, uint32_t freq_hz)
```

LEDC set channel frequency (Hz)

Parameters
- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `timer_num` - LEDC timer index (0-3), select from `ledc_timer_t`
- `freq_hz` - Set the LEDC frequency

Returns
- ESP_OK Success
- ESP(ERR)_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

```c
uint32_t ledc_get_freq(ledc_mode_t speed_mode, ledc_timer_t timer_num)
```

LEDC get channel frequency (Hz)

Parameters
- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `timer_num` - LEDC timer index (0-3), select from `ledc_timer_t`

Returns
- 0 error
- Others Current LEDC frequency

```c
esp_err_t ledc_set_duty_with_hpoint(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)
```

LEDC set duty and hpoint value Only after calling `ledc_update_duty` will the duty update.

Note: `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is
ledc_set_duty_and_update

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **duty** - Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution) - 1]
- **hpont** - Set the LEDC hpont value(max: 0xffff)

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

int ledc_get_hpoint (ledc_mode_t speed_mode, ledc_channel_t channel)

LEDC get hpont value, the counter value when the output is set high level.

**Parameters**
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

**Returns**
- LEDC_ERR_VAL if parameter error
- Others Current hpont value of LEDC channel

**esp_err_t ledc_set_duty (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty)**

LEDC set duty This function do not change the hpont value of this channel. if needed, please call ledc_set_duty_with_hpont. only after calling ledc_update_duty will the duty update.

**Note:** ledc_set_duty, ledc_set_duty_with_hpont and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update.

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **duty** - Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution) - 1]

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

uint32_t ledc_get_duty (ledc_mode_t speed_mode, ledc_channel_t channel)

LEDC get duty This function returns the duty at the present PWM cycle. You shouldn’t expect the function to return the new duty in the same cycle of calling ledc_update_duty, because duty update doesn’t take effect until the next cycle.
Parameters

- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

Returns

- LEDC_ERR_DUTY if parameter error
- Others Current LEDC duty

```c
esp_err_t ledc_set_fade (lede_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, ledc_duty_direction_t fade_direction, uint32_t step_num, uint32_t duty_cycle_num, uint32_t duty_scale)
```

LEDC set gradient Set LEDC gradient, After the function calls the ledc_update_duty function, the function can take effect.

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **duty** - Set the start of the gradient duty, the range of duty setting is [0, (2**duty_resolution) - 1]
- **fade_direction** - Set the direction of the gradient
- **step_num** - Set the number of the gradient
- **duty_cycle_num** - Set how many LEDC tick each time the gradient lasts
- **duty_scale** - Set gradient change amplitude

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t ledc_isr_register (void (*fn)(void*), void *arg, int intr_alloc_flags, ledc_isr_handle_t *handle)
```

Register LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

Parameters

- **fn** - Interrupt handler function.
- **arg** - User-supplied argument passed to the handler function.
- **intr_alloc_flags** - Flags used to allocate the interrupt. One or multiple (ORed) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- **handle** - Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

```c
esp_err_t ledc_timer_set (lede_mode_t speed_mode, ledc_timer_t timer_sel, uint32_t clock_divider, uint32_t duty_resolution, ledc_clk_src_t clk_src)
```

Configure LEDC settings.

Parameters

- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** - Timer index (0-3), there are 4 timers in LEDC module
- **clock_divider** - Timer clock divide value, the timer clock is divided from the selected clock source
Chapter 2. API Reference

- **duty_resolution** – Resolution of duty setting in number of bits. The range of duty values is \([0, (2**\text{duty\_resolution})]\)
- **clk_src** – Select LEDC source clock.

**Returns**
- (-1) Parameter error
- Other Current LEDC duty

**esp_err_t ledc_timer_rst (ledc_mode_t speed_mode, ledc_timer_t timer_sel)**

Reset LEDC timer.

**Parameters**
- **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** – LEDC timer index (0-3), select from ledc_timer_t

**Returns**
- **ESP_ERR_INVALID_ARG** Parameter error
- **ESP_OK** Success

**esp_err_t ledc_timer_pause (ledc_mode_t speed_mode, ledc_timer_t timer_sel)**

Pause LEDC timer counter.

**Parameters**
- **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** – LEDC timer index (0-3), select from ledc_timer_t

**Returns**
- **ESP_ERR_INVALID_ARG** Parameter error
- **ESP_OK** Success

**esp_err_t ledc_timer_resume (ledc_mode_t speed_mode, ledc_timer_t timer_sel)**

Resume LEDC timer.

**Parameters**
- **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** – LEDC timer index (0-3), select from ledc_timer_t

**Returns**
- **ESP_ERR_INVALID_ARG** Parameter error
- **ESP_OK** Success

**esp_err_t ledc_bind_channel_timer (ledc_mode_t speed_mode, ledc_channel_t channel, ledc_timer_t timer_sel)**

Bind LEDC channel with the selected timer.

**Parameters**
- **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** – LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **timer_sel** – LEDC timer index (0-3), select from ledc_timer_t

**Returns**
- **ESP_ERR_INVALID_ARG** Parameter error
- **ESP_OK** Success

**esp_err_t ledc_set_fade_with_step (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num)**

Set LEDC fade function.

**Note:** Call ledc_fade_func_install() once before calling this function. Call ledc_fade_start() after this to start fading.
Note: `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`.

---

Note: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

**Parameters**

- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel` - LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `target_duty` - Target duty of fading [0, (2**duty_resolution) - 1]
- `scale` - Controls the increase or decrease step scale.
- `cycle_num` - Increase or decrease the duty every cycle_num cycles

**Returns**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

```
esp_err_t ledc_set_fade_with_time(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, int max_fade_time_ms)
```

Set LEDC fade function, with a limited time.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

---

Note: `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`.

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

**Parameters**

- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel` - LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `target_duty` - Target duty of fading [0, (2**duty_resolution) - 1]
- `max_fade_time_ms` - The maximum time of the fading (ms).

**Returns**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

```
esp_err_t ledc_fade_func_install(int intr_alloc_flags)
```

Install LEDC fade function. This function will occupy interrupt of LEDC module.
Chapter 2. API Reference

Parameters **intr_alloc_flags** - Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

Returns
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function already installed.

void **ledc_fade_func_uninstall** (void)
Uninstall LEDC fade function.

**esp_err_t ledc_fade_start** (lede_mode_t speed_mode, lede_channel_t channel, lede_fade_mode_t fade_mode)
Start LEDC fading.

Note: Call ledc_fade_func_install() once before calling this function. Call this API right after ledc_set_fade_with_time or ledc_set_fade_with_step before to start fading.

Note: Starting fade operation with this API is not thread-safe, use with care.

Note: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Parameters
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel number
- **fade_mode** - Whether to block until fading done. See lede_types.h lede_fade_mode_t for more info. Note that this function will not return until fading to the target duty if LEDC_FADE_WAIT_DONE mode is selected.

Returns
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_ERR_INVALID_ARG Parameter error.

**esp_err_t ledc_fade_stop** (lede_mode_t speed_mode, lede_channel_t channel)
Stop LEDC fading. Duty of the channel will stay at its present value.

Note: This API can be called if a new fixed duty or a new fade want to be set while the last fade operation is still running in progress.

Note: Call this API will abort the fading operation only if it was started by calling ledc_fade_start with LEDC_FADE_NO_WAIT mode.

Note: If a fade was started with LEDC_FADE_WAIT_DONE mode, calling this API afterwards is no use in stopping the fade. Fade will continue until it reaches the target duty.

Parameters
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel number
Returns

- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_ERR_INVALID_ARG Parameter error.

`esp_err_t ledc_set_duty_and_update (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)`

A thread-safe API to set duty for LEDC channel and return when duty updated.

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**

- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel` - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `duty` - Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution) - 1]
- `hpoint` - Set the LEDC hpoint value (max: 0xffffffff)

**Note:** Call `ledc_fade_func_install()` once, before calling this function.

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**

- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel` - LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `target_duty` - Target duty of fading [0, (2**duty_resolution) - 1]
- `max_fade_time_ms` - The maximum time of the fading (ms).
- `fade_mode` - choose blocking or non-blocking mode

**Returns**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

`esp_err_t ledc_set_fade_step_and_start (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num, ledc_fade_mode_t fade_mode)`

A thread-safe API to set and start LEDC fade function.

**Note:** Call `ledc_fade_func_install()` once before calling this function.
Note: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **target_duty** - Target duty of fading [0, (2**duty_resolution) - 1]
- **scale** - Controls the increase or decrease step scale.
- **cycle_num** - Increase or decrease the duty every cycle_num cycles
- **fade_mode** - Choose blocking or non-blocking mode

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

```c
esp_err_t ledc_cb_register (ledc_mode_t speed_mode, ledc_channel_t channel, ledc_cbs_t *cbs, void *user_arg)
```

Note: The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.

Parameters

- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **cbs** - Group of LEDC callback functions
- **user_arg** - User registered data for the callback function

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

Structures

```c
struct ledc_channel_config_t
```
Configuration parameters of LEDC channel for ledc_channel_config function.

Public Members

- **gpio_num**
  the LED output gpio_num, if you want to use gpio16, gpio_num = 16

- **ledc_mode_t speed_mode**
  LEDC speed speed_mode, high-speed mode or low-speed mode
Chapter 2. API Reference

`ledc_channel_t` *channel*

LEDC channel (0 - 7)

`ledc_intr_type_t` *intr_type*

configure interrupt, Fade interrupt enable or Fade interrupt disable

`ledc_timer_t` *timer_sel*

Select the timer source of channel (0 - 3)

uint32_t *duty*

LEDC channel duty, the range of duty setting is [0, (2**duty_resolution)]

int *hpoint*

LEDC channel hpoint value, the max value is 0xffffff

unsigned int *output_invert*

Enable (1) or disable (0) gpio output invert

struct `ledc_channel_config_t`::[anonymous] *flags*

LEDC flags

struct `ledc_timer_config_t`

Configuration parameters of LEDC Timer timer for `ledc_timer_config` function.

**Public Members**

`ledc_mode_t` *speed_mode*

LEDC speed speed_mode, high-speed mode or low-speed mode

`ledc_timer_bit_t` *duty_resolution*

LEDC channel duty resolution

`ledc_timer_t` *timer_num*

The timer source of channel (0 - 3)

uint32_t *freq_hz*

LEDC timer frequency (Hz)

`ledc_clk_cfg_t` *clk_cfg*

Configure LEDC source clock from `ledc_clk_cfg_t`. Note that LEDC_USE_RTC8M_CLK and LEDC_USE_XTAL_CLK are non-timer-specific clock sources. You can not have one LEDC timer uses RTC8M_CLK as the clock source and have another LEDC timer uses XTAL_CLK as its clock source. All chips except esp32 and esp32s2 do not have timer-specific clock sources, which means clock source for all timers must be the same one.

struct `ledc_cb_param_t`

LEDC callback parameter.
Chapter 2. API Reference

Public Members

```c
ledc_cb_event_t event
    Event name
```

```c
uint32_t speed_mode
    Speed mode of the LEDC channel group
```

```c
uint32_t channel
    LEDC channel (0 - LEDC_CHANNEL_MAX-1)
```

```c
uint32_t duty
    LEDC current duty of the channel, the range of duty is [0, (2**duty_resolution) - 1]
```

```c
struct ledc_cbs_t
    Group of supported LEDC callbacks.
```

**Note:** The callbacks are all running under ISR environment

Public Members

```c
ledc_cb_t fade_cb
    LEDC fade_end callback function
```

Macros

```c
LEDC_APB_CLK_HZ
    Frequency of one of the LEDC peripheral clock sources, APB_CLK.
```

**Note:** This macro should have no use in your application, we keep it here only for backward compatible

**LEDC_ERR_DUTY**

**LEDC_ERR_VAL**

Type Definitions

```c
typedef intr_handle_t ledc_isr_handle_t
```

```c
typedef bool (*ledc_cb_t)(const ledc_cb_param_t *param, void *user_arg)
    Type of LEDC event callback.
```

- **Param param** LEDC callback parameter
- **Param user_arg** User registered data
Enumerations

enum **ledc_cb_event_t**
   LEDC callback event type.
   
   Values:
   
   enumerator **LEDC_FADE_END_EVT**
   LEDC fade end event

Header File

- components/hal/include/hal/ledc_types.h

Enumerations

enum **ledc_mode_t**
 Values:

 enumerator **LEDC_LOW_SPEED_MODE**
 LEDC low speed speed_mode

enumerator **LEDC_SPEED_MODE_MAX**
LEDC speed limit

enum **ledc_intr_type_t**
 Values:

enumerator **LEDC_INTR_DISABLE**
 Disable LEDC interrupt

enumerator **LEDC_INTR_FADE_END**
 Enable LEDC interrupt

enumerator **LEDC_INTR_MAX**

enum **ledc_duty_direction_t**
Values:

enumerator **LEDC_DUTY_DIR_DECREASE**
 LEDC duty decrease direction

enumerator **LEDC_DUTY_DIR_INCREASE**
 LEDC duty increase direction

enumerator **LEDC_DUTY_DIR_MAX**

enum **ledc_slow_clk_sel_t**
 Values:
Chapter 2. API Reference

enumerator **LEDC_SLOW_CLK_RTC8M**
LEDC low speed timer clock source is 8MHz RTC clock

enumerator **LEDC_SLOW_CLK_APB**
LEDC low speed timer clock source is 80MHz APB clock

enumerator **LEDC_SLOW_CLK_XTAL**
LEDC low speed timer clock source XTAL clock

given **ledc_clk_cfg_t**
In theory, the following enumeration shall be placed in LEDC driver’s header. However, as the next enumeration, `ledc_clk_src_t`, makes the use of some of these values and to avoid mutual inclusion of the headers, we must define it here.
Values:

enumerator **LEDC_AUTO_CLK**
The driver will automatically select the source clock based on the giving resolution and duty parameter when init the timer

enumerator **LEDC_USE_APB_CLK**
LEDC timer select APB clock as source clock

enumerator **LEDC_USE_RTC8M_CLK**
LEDC timer select RTC8M_CLK as source clock. Only for low speed channels and this parameter must be the same for all low speed channels

enumerator **LEDC_USE_XTAL_CLK**
LEDC timer select XTAL clock as source clock

given **ledc_clk_src_t**
Values:

enumerator **LEDC_APB_CLK**
LEDC timer clock divided from APB clock (80Mhz)

enumerator **LEDC_SCLK**
Selecting this value for LEDC_TICK_SEL_TIMER let the hardware take its source clock from LEDC_APB_CLK_SEL

given **ledc_timer_t**
Values:

enumerator **LEDC_TIMER_0**
LEDC timer 0

enumerator **LEDC_TIMER_1**
LEDC timer 1
Chapter 2. API Reference

enumerator **LEDC_TIMER_2**
    LEDC timer 2

enumerator **LEDC_TIMER_3**
    LEDC timer 3

enumerator **LEDC_TIMER_MAX**

enum **ledc_channel_t**

Values:

enumerator **LEDC_CHANNEL_0**
    LEDC channel 0

enumerator **LEDC_CHANNEL_1**
    LEDC channel 1

enumerator **LEDC_CHANNEL_2**
    LEDC channel 2

enumerator **LEDC_CHANNEL_3**
    LEDC channel 3

enumerator **LEDC_CHANNEL_4**
    LEDC channel 4

enumerator **LEDC_CHANNEL_5**
    LEDC channel 5

enumerator **LEDC_CHANNEL_MAX**

enum **ledc_timer_bit_t**

Values:

enumerator **LEDC_TIMER_1_BIT**
    LEDC PWM duty resolution of 1 bits

enumerator **LEDC_TIMER_2_BIT**
    LEDC PWM duty resolution of 2 bits

enumerator **LEDC_TIMER_3_BIT**
    LEDC PWM duty resolution of 3 bits

enumerator **LEDC_TIMER_4_BIT**
    LEDC PWM duty resolution of 4 bits

enumerator **LEDC_TIMER_5_BIT**
    LEDC PWM duty resolution of 5 bits
Chapter 2. API Reference

enumerator LEDC_TIMER_6_BIT
LEDC PWM duty resolution of 6 bits

enumerator LEDC_TIMER_7_BIT
LEDC PWM duty resolution of 7 bits

enumerator LEDC_TIMER_8_BIT
LEDC PWM duty resolution of 8 bits

enumerator LEDC_TIMER_9_BIT
LEDC PWM duty resolution of 9 bits

enumerator LEDC_TIMER_10_BIT
LEDC PWM duty resolution of 10 bits

enumerator LEDC_TIMER_11_BIT
LEDC PWM duty resolution of 11 bits

enumerator LEDC_TIMER_12_BIT
LEDC PWM duty resolution of 12 bits

enumerator LEDC_TIMER_13_BIT
LEDC PWM duty resolution of 13 bits

enumerator LEDC_TIMER_14_BIT
LEDC PWM duty resolution of 14 bits

enumerator LEDC_TIMER_BIT_MAX

enum ledc_fade_mode_t

Values:

enumerator LEDC_FADE_NO_WAIT
LEDC fade function will return immediately

enumerator LEDC_FADE_WAIT_DONE
LEDC fade function will block until fading to the target duty

enumerator LEDC_FADE_MAX

2.6.14 Remote Control Transceiver (RMT)

Introduction

The RMT (Remote Control Transceiver) peripheral was designed to act as an infrared transceiver. However, due to the flexibility of its data format, the functionality of RMT can be extended to a versatile and general purpose transceiver. From the perspective of network layering, the RMT hardware contains both physical and data link layer. The physical layer defines the communication media and bit signal representation. The data link layer defines the format of an RMT frame. The minimal data unit in the frame is called RMT symbol, which is represented by rmt_symbol_word_t in the driver.
Chapter 2. API Reference

ESP32-C3 contains multiple channels in the RMT peripheral. Each channel can be configured as either transmitter or receiver, independently.

Typically, the RMT peripheral can be used in the following scenarios:

- Transmit or receive infrared signals, with any IR protocols, e.g. NEC
- General purpose sequence generator
- Transmit signals in a hardware controlled loop, with finite or infinite number of times
- Multi-channel simultaneous transmission
- Modulate the carrier to the output signal or demodulate the carrier from the input signal

**Layout of RMT Symbols**  The RMT hardware defines data in its own pattern—the RMT symbol. Each symbol consists of two pairs of two values. The first value in a pair describes the signal duration in RMT ticks and is 15 bits long. The second provides the signal level (high or low) and is contained in a single bit, as shown below:

![Fig. 8: Structure of RMT symbols (L - signal level)](image)

**RMT Transmitter Overview**  The data path and control path of an RMT TX channel is illustrated in the figure below:

![Fig. 9: RMT Transmitter Overview](image)

The driver will encode user’s data into RMT data format, then the RMT transmitter can generate the waveforms according to the encoding artifacts. It is also possible to modulate a high frequency carrier signal before being routed to a GPIO pad.

**RMT Receiver Overview**  The data path and control path of an RMT RX channel is illustrated in the figure below:

---

1 Different ESP chip series might have different number of RMT channels. Please refer to the [TRM] for details. The driver won’t forbid you from applying for more RMT channels, but it will return error when there’s no hardware resources available. Please always check the return value when doing Resource Allocation.
The RMT receiver can sample incoming signals into RMT data format, and store the data in memory. It’s feasible to tell the receiver the basic characteristics of the incoming signal, so that the signal’s stop condition can be recognized, and signal glitches and noise can be filtered out. The RMT peripheral also supports demodulating the high frequency carrier from the base signal.

Functional Overview

Description of the RMT functionality is divided into the following sections:

- **Resource Allocation** - covers how to allocate RMT channels with properly set of configurations. It also covers how to recycle the resources when they finished working.
- **Carrier Modulation and Demodulation** - describes how to modulate carrier for TX channel and demodulate carrier for RX channel.
- **Register Event Callbacks** - covers how to hook user specific code to RMT channel specific events.
- **Enable and Disable channel** - shows how to enable and disable the RMT channel.
- **Initiate TX Transaction** - describes the steps to initiate a transaction for TX channel.
- **Initiate RX Transaction** - describes the steps to initiate a transaction for RX channel.
- **Multiple Channels Simultaneous Transmission** - describes how to collect multiple channels into a sync group and start transaction at the same time.
- **RMT Encoder** - focuses on how to write a customized encoder in a combination way, with the help of the primitive encoders provided by the driver.
- **Power Management** - describes how different source clock will affect power consumption.
- **IRAM Safe** - describes tips on how to make the RMT interrupt work better along with a disabled cache.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can bring different effects to the driver.

Resource Allocation

Both RMT TX and RX channels are represented by `rmt_channel_handle_t` in the driver. The available channels are managed in a resource pool, which will hand out a free channel on request.

Install RMT TX Channel

To install an RMT TX channel, there’s a configuration structure that needs to be given in advance: `rmt_tx_channel_config_t`:

- `rmt_tx_channel_config_t::gpio_num` sets the GPIO number used by the transmitter.
- `rmt_tx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock will also be used by other channels, which means user should ensure this configuration is same when allocating other channels, regardless of TX or RX. For the effect on power consumption of different clock source, please refer to Power Management section.
- `rmt_tx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of RMT signal is calculated based on this tick.
• `rmt_tx_channel_config_t::mem_block_symbols` sets the size of the dedicated memory block or DMA buffer that is used to store RMT encoding artifacts.
• `rmt_tx_channel_config_t::trans_queue_depth` sets the depth of internal transaction queue, the deeper the queue, the more transactions can be prepared in the backlog.
• `rmt_tx_channel_config_t::invert_out` is used to decide whether to invert the RMT signal before sending it to the GPIO pad.
• `rmt_tx_channel_config_t::with_dma` is used to indicate if the channel needs a DMA backend. A channel with DMA attached can offload the CPU by a lot. However, DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter `ESP_ERR_NOT_SUPPORTED` error.
• `rmt_tx_channel_config_t::io_loop_back` enables both the GPIO’s input and output ability through the GPIO matrix peripheral. Meanwhile, if both TX and RX channels are bound to the same GPIO, then monitoring of the data transmission line can be realized.
• `rmt_tx_channel_config_t::io_od_mode` configures the GPIO as open-drain mode. It is useful for simulating bi-directional buses, such as 1-wire bus, combined with `rmt_tx_channel_config_t::io_loop_back`.

Once the `rmt_tx_channel_config_t` structure is populated with mandatory parameters, users can call `rmt_new_tx_channel()` to allocate and initialize a TX channel. This function will return an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function will return `ESP_ERR_NOT_FOUND` error. If some feature (e.g. DMA backend) is not supported by hardware, it will return `ESP_ERR_NOT_SUPPORTED` error.

```c
rmt_channel_handle_t tx_chan = NULL;
rmt_tx_channel_config_t tx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT, // select source clock
    .gpio_num = 0, // GPIO number
    .mem_block_symbols = 64, // memory block size, 64 * 4 = 256Bytes
    .resolution_hz = 1 * 1000 * 1000, // 1MHz tick resolution, i.e. 1 tick = 1us
    .trans_queue_depth = 4, // set the number of transactions that can pend in the background
    .flags.invert_out = false, // don't invert output signal
    .flags.with_dma = false, // don't need DMA backend
};
ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_chan));
```

### Install RMT RX Channel

To install an RMT RX channel, there’s a configuration structure that needs to be given in advance: `rmt_rx_channel_config_t`:

• `rmt_rx_channel_config_t::gpio_num` sets the GPIO number used by the receiver.
• `rmt_rx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock will also be used by other channels, which means user should ensure this configuration is same when allocating other channels, regardless of TX or RX. For the effect on power consumption of different clock source, please refer to `Power Management` section.
• `rmt_rx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of RMT signal is calculated based on this tick.
• `rmt_rx_channel_config_t::mem_block_symbols` sets the size of the dedicated memory block or DMA buffer that used to store RMT encoding artifacts.
• `rmt_rx_channel_config_t::invert_in` is used to decide whether to invert the input signals before they going into RMT receiver. The inversion is done by GPIO matrix instead of by the RMT peripheral.
• `rmt_rx_channel_config_t::with_dma` is used to indicate if the channel needs a DMA backend. A channel with DMA attached can offload the CPU by a lot. However, DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter `ESP_ERR_NOT_SUPPORTED` error.
• `rmt_rx_channel_config_t::io_loop_back` is for debugging purposes only. It enables both the GPIO’s input and output ability through the GPIO matrix peripheral. Meanwhile, if both TX and RX channels are bound to the same GPIO, then monitoring of the data transmission line can be realized.

Once the `rmt_rx_channel_config_t` structure is populated with mandatory parameters, users can call
rmt_new_rx_channel() to allocate and initialize a RX channel. This function will return an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function will return ESP_ERR_NOT_FOUND error. If some feature (e.g. DMA backend) is not supported by hardware, it will return ESP_ERR_NOT_SUPPORTED error.

```c
rmt_channel_handle_t rx_chan = NULL;
rmt_rx_channel_config_t rx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT, // select source clock
    .resolution_hz = 1 * 1000 * 1000, // 1MHz tick resolution, i.e. 1 tick = 1us
    .mem_block_symbols = 64, // memory block size, 64 * 4 = 256Bytes
    .gpio_num = 2, // GPIO number
    .flags.invert_in = false, // don't invert input signal
    .flags.with_dma = false, // don't need DMA backend
};
ESP_ERROR_CHECK(rmt_new_rx_channel(&rx_chan_config, &rx_chan));
```

Uninstall RMT Channel If a previously installed RMT channel is no longer needed, it’s recommended to recycle the resources by calling rmt_del_channel(), which in return allows the underlying hardware to be usable for other purposes.

Carrier Modulation and Demodulation The RMT transmitter can generate a carrier wave and modulate it onto the base signal. Compared to the base signal, the carrier frequency is usually high. In addition, user can only set the frequency and duty cycle for the carrier. The RMT receiver can demodulate the carrier from the incoming signal. Note that, carrier modulation and demodulation is not supported on all ESP chips, please refer to [TRM] before configuring the carrier, or you might encounter a ESP_ERR_NOT_SUPPORTED error.

Carrier related configurations lie in rmt_carrier_config_t:

- `rmt_carrier_config_t::frequency_hz` sets the carrier frequency, in Hz.
- `rmt_carrier_config_t::duty_cycle` sets the carrier duty cycle.
- `rmt_carrier_config_t::polarity_active_low` sets the carrier polarity, i.e. on which level the carrier is applied.
- `rmt_carrier_config_t::always_on` sets whether to output the carrier even when the data transmission has finished. This configuration is only valid for TX channel.

Note: For RX channel, we shouldn’t set the carrier frequency exactly to the theoretical value. It’s recommended to leave a tolerance for the carrier frequency. For example, in the snippet below, we set the frequency to 25KHz, instead of the 38KHz that configured on the TX side. The reason is that reflection and refraction will occur when a signal travels through the air, leading to the a distortion on the receiver side.

```c
rmt_carrier_config_t tx_carrier_cfg = {
    .duty_cycle = 0.33, // duty cycle 33%
    .frequency_hz = 38000, // 38KHz
    .flags.polarity_active_low = false, // carrier should modulated to high level
};
// modulate carrier to TX channel
ESP_ERROR_CHECK(rmt_apply_carrier(tx_chan, &tx_carrier_cfg));
```

```c
rmt_carrier_config_t rx_carrier_cfg = {
    .duty_cycle = 0.33, // duty cycle 33%
    .frequency_hz = 25000, // 25KHz carrier, should be smaller than transmitter's carrier frequency
    .flags.polarity_active_low = false, // the carrier is modulated to high level
};
// demodulate carrier from RX channel
ESP_ERROR_CHECK(rmt_apply_carrier(rx_chan, &rx_carrier_cfg));
```
Register Event Callbacks When an RMT channel finishes transmitting or receiving, a specific event will be generated and notify the CPU by interrupt. If you have some function that needs to be called when those events occurred, you can hook your function to the ISR (Interrupt Service Routine) by calling `rmt_tx_register_event_callbacks()` and `rmt_rx_register_event_callbacks()` for TX and RX channel respectively. Since the registered callback functions are called in the interrupt context, user should ensure the callback function doesn’t attempt to block (e.g. by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The callback function has a boolean return value, to tell the caller whether a high priority task is woke up by it.

TX channel supported event callbacks are listed in the `rmt_tx_event_callbacks_t`:

- `rmt_tx_event_callbacks_t::on_trans_done` sets a callback function for trans done event. The function prototype is declared in `rmt_tx_done_callback_t`.

RX channel supported event callbacks are listed in the `rmt_rx_event_callbacks_t`:

- `rmt_rx_event_callbacks_t::on_recv_done` sets a callback function for receive complete event. The function prototype is declared in `rmt_rx_done_callback_t`.

User can save own context in `rmt_tx_register_event_callbacks()` and `rmt_rx_register_event_callbacks()` as well, via the parameter `user_data`. The user data will be directly passed to each callback function.

In the callback function, users can fetch the event specific data that is filled by the driver in the `edata`. Note that the `edata` pointer is only valid for the duration of the callback.

The TX done event data is defined in `rmt_tx_done_event_data_t`:

- `rmt_tx_done_event_data_t::num_symbols` tells the number of transmitted RMT symbols. This also reflects the size of encoding artifacts.

The RX complete event data is defined in `rmt_rx_done_event_data_t`:

- `rmt_rx_done_event_data_t::received_symbols` points to the received RMT symbols. These symbols are saved in the `buffer` parameter of `rmt_receive()` function. User shouldn’t free this receive buffer before the callback returns.
- `rmt_rx_done_event_data_t::num_symbols` tells the number of received RMT symbols. This value won’t be bigger than `buffer_size` parameter of `rmt_receive()` function. If the `buffer_size` is not sufficient to accommodate all the received RMT symbols, the driver will truncate it.

Enable and Disable channel `rmt_enable()` must be called in advanced before transmitting or receiving RMT symbols. For transmitters, enabling a channel will enable a specific interrupt and prepare the hardware to dispatch transactions. For RX channels, enabling a channel will enable an interrupt, but the receiver is not started during this time, as it has no idea about the characteristics of the incoming signals. The receiver will be started in `rmt_receive()`.

`rmt_disable()` does the opposite work by disabling the interrupt and clearing pending status. The transmitter and receiver will be disabled as well.

```c
ESP_ERROR_CHECK(rmt_enable(tx_chan));
ESP_ERROR_CHECK(rmt_enable(rx_chan));
```

Initiate TX Transaction RMT is a special communication peripheral as it’s unable to transmit raw byte streams like SPI and I2C. RMT can only send data in its own format `rmt_symbol_word_t`. However, the hardware doesn’t help to convert the user data into RMT symbols, this can only be done in software — by the so-called RMT Encoder. The encoder is responsible for encoding user data into RMT symbols and then write to RMT memory block or DMA buffer. For how to create an RMT encoder, please refer to RMT Encoder.

Once we got an encoder, we can initiate a TX transaction by calling `rmt_transmit()`. This function takes several positional parameters like channel handle, encoder handle, payload buffer. Besides that, we also need to provide a transmission specific configuration in `rmt_transmit_config_t`: 

```c
```
• **rmt_transmit_config_t::loop_count** sets the number of transmission loop. After the transmitter finished one round of transmission, it can restart the same transmission again if this value is not set to zero. As the loop is controlled by hardware, the RMT channel can be used to generate many periodic sequences at the cost of a very little CPU intervention. Specially, setting **rmt_transmit_config_t::loop_count** to -1 means an infinite loop transmission. In this situation, the channel won’t stop until manually call of **rmt_disable()**. And the trans done event won’t be generated as well. If **rmt_transmit_config_t::loop_count** is set to a positive number, the trans done event won’t be generated until target number of loop transmission have finished. Note that, the **loop transmit** feature is not supported on all ESP chips, please refer to [TRM] before you configure this option. Or you might encounter **ESP_ERR_NOT_SUPPORTED** error.

• **rmt_transmit_config_t::eot_level** sets the output level when the transmitter finishes working or stops working by calling **rmt_disable()**.

**Note:** There’s a limitation in the transmission size if the **rmt_transmit_config_t::loop_count** is set to non-zero (i.e. to enable the loop feature). The encoded RMT symbols should not exceed the capacity of RMT hardware memory block size. Or you might see error message like encoding artifacts can’t exceed hw memory block for loop transmission. If you have to start a large transaction by loop, you can try either:

- Increase the **rmt_tx_channel_config_t::mem_block_symbols**. This approach doesn’t work if the DMA backend is also enabled.
- Customize an encoder and construct a forever loop in the encoding function. See also **RMT Encoder**.

Internally, **rmt_transmit()** will construct a transaction descriptor and send to a job queue, which will be dispatched in the ISR. So it is possible that the transaction is not started yet when **rmt_transmit()** returns. To ensure all pending transaction to complete, user can use **rmt_tx_wait_all_done()**.

**Multiple Channels Simultaneous Transmission** In some real-time control applications, we don’t want any time drift in between when startup multiple TX channels. For example, to make two robotic arms move simultaneously. The RMT driver can help to manage this by creating a so-called **Sync Manager**. The sync manager is represented by **rmt_sync_manager_handle_t** in the driver. The procedure of RMT sync transmission is shown as follows:

![Fig. 11: RMT TX Sync](image)

**Install RMT Sync Manager** To create a sync manager, user needs to tell which channels are going to be managed in the **rmt_sync_manager_config_t**:  

- **rmt_sync_manager_config_t::tx_channel_array** points to the array of TX channels to be managed.
• `rmt_sync_manager_config_t::array_size` sets the number of channels to be managed.

`rmt_new_sync_manager()` can return a manager handle on success. This function could also fail due to various errors such as invalid arguments, etc. Specially, when the sync manager has been installed before, and there’re no hardware resources to create another manager, this function will report `ESP_ERR_NOT_FOUND` error. In addition, if the sync manager is not supported by the hardware, it will report `ESP_ERR_NOT_SUPPORTED` error. Please refer to [TRM] before using the sync manager feature.

**Start Transmission Simultaneously** For any managed TX channel, it won’t start the machine until all the channels in the `rmt_sync_manager_config_t::tx_channel_array` are called with `rmt_transmit()`. Before that, the channel is just put in a waiting state. Different channel usually take different time to finish the job if the transaction is different, which results in a loss of sync. So user needs to call `rmt_sync_reset()` to pull the channels back to the starting line again before restarting a simultaneous transmission.

Calling `rmt_del_sync_manager()` can recycle the sync manager and enable the channels to initiate transactions independently afterwards.

```c
rmt_channel_handle_t tx_channels[2] = {NULL}; // declare two channels
int tx_gpio_number[2] = {0, 2};
// install channels one by one
for (int i = 0; i < 2; i++) {
    rmt_tx_channel_config_t tx_chan_config = {
        .clk_src = RMT_CLK_SRC_DEFAULT,  // select source clock
        .gpio_num = tx_gpio_number[i], // GPIO number
        .mem_block_symbols = 64, // memory block size, 64 * 4 = 256Bytes
        .resolution_hz = 1 * 1000 * 1000, // 1MHz resolution
        .trans_queue_depth = 1, // set the number of transactions that...
             //can pend in the background
    };
    ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_channels[i]));
}
// install sync manager
rmt_sync_manager_handle_t synchro = NULL;
rmt_sync_manager_config_t synchro_config = {
    .tx_channel_array = tx_channels,
    .array_size = sizeof(tx_channels) / sizeof(tx_channels[0]),
};
ESP_ERROR_CHECK(rmt_new_sync_manager(&synchro_config, &synchro));
ESP_ERROR_CHECK(rmt_transmit(tx_channels[0], led_strip_encoders[0], led_data, led_
     //num * 3, &transmit_config));
//tx_channels[0] won't start transmission until call of `rmt_transmit()` for tx_  
     //channels[1] returns
ESP_ERROR_CHECK(rmt_transmit(tx_channels[1], led_strip_encoders[1], led_data, led_
     //num * 3, &transmit_config));
```

**Initiate RX Transaction** As also discussed in the Enable and Disable channel, the RX channel still doesn’t get ready to receive RMT symbols even user calls `rmt_enable()`. User needs to specify the basic characteristics of the incoming signals in `rmt_receive_config_t`:

• `rmt_receive_config_t::signal_range_min_ns` specifies the minimal valid pulse duration (either high or low level). A pulse whose width is smaller than this value will be treated as glitch and ignored by the hardware.

• `rmt_receive_config_t::signal_range_max_ns` specifies the maximum valid pulse duration (either high or low level). A pulse whose width is bigger than this value will be treated as Stop Signal, and the receiver will generate receive complete event immediately.

The RMT receiver will start the RX machine after user calls `rmt_receive()` with the provided configuration above. Note that, this configuration is transaction specific, which means, to start a new round of reception, user needs to sets the `rmt_receive_config_t` again. The receiver saves the incoming signals into its internal memory block or DMA buffer, in the format of `rmt_symbol_word_t`.  

Espressif Systems 914 Release v5.1-dev-644-g867745a05c
Due to the limited size of memory block, the RMT receiver will notify the driver to copy away the accumulated symbols in a ping-pong way.

The copy destination should be provided in the `buffer` parameter of `rmt_receive()` function. If this buffer size is not sufficient, the receiver can continue to work but later incoming symbols will be dropped and report an error message: user buffer too small, received symbols truncated. Please take care of the lifecycle of the buffer parameter, user shouldn’t recycle the buffer before the receiver finished or stopped working.

The receiver will be stopped by the driver when it finishes working (i.e. received a signal whose duration is bigger than `rmt_receive_config_t::signal_range_max_ns`). User needs to call `rmt_receive()` again to restart the receiver, is necessary. User can get the received data in the `rmt_rx_event_callbacks_t::on_recv_done` callback. See also Register Event Callbacks for more information.

```c
static bool example_rmt_rx_done_callback(rmt_channel_handle_t channel, const rmt_rx_done_event_data_t *edata, void *user_data)
{
    BaseType_t high_task_wakeup = pdFALSE;
    QueueHandle_t receive_queue = (QueueHandle_t)user_data;
    // send the received RMT symbols to the parser task
    xQueueSendFromISR(receive_queue, edata, &high_task_wakeup);
    // return whether any task is woken up
    return high_task_wakeup = pdTRUE;
}

QueueHandle_t receive_queue = xQueueCreate(1, sizeof(rmt_rx_done_event_data_t));
rmt_rx_event_callbacks_t cbs = {
    .on_recv_done = example_rmt_rx_done_callback,
};
ESP_ERROR_CHECK(rmt_rx_register_event_callbacks(rx_channel, &cbs, receive_queue));

// the following timing requirement is based on NEC protocol
rmt_receive_config_t receive_config = {
    .signal_range_min_ns = 1250, // the shortest duration for NEC signal is ~560us, 1250ns < 560us, valid signal won't be treated as noise
    .signal_range_max_ns = 12000000, // the longest duration for NEC signal is ~9000us, 12000000ns > 9000us, the receive won’t stop early
};
rmt_symbol_word_t raw_symbols[64]; // 64 symbols should be sufficient for a standard NEC frame
// ready to receive
ESP_ERROR_CHECK(rmt_receive(rx_channel, raw_symbols, sizeof(raw_symbols), &receive_config));
// wait for RX done signal
rmt_rx_done_event_data_t rx_data;
xQueueReceive(receive_queue, &rx_data, portMAX_DELAY);
// parse the receive symbols
example_parse_nec_frame(rx_data.received_symbols, rx_data.num_symbols);
```

**RMT Encoder**  
An RMT encoder is part of the RMT TX transaction, whose responsibility is to generate and write the correct RMT symbols into hardware memory (or DMA buffer) at specific time. There’re some special restrictions for an encoding function:

- An encoding function might be called for several times within a single transaction. This is because the target RMT memory block can’t accommodate all the artifacts at once. We have to use the memory in a ping-pong way, thus the encoding session is divided into multiple parts. This requires the encoder to be stateful.
- The encoding function is running in the ISR context. To speed up the encoding session, it’s high recommend to put the encoding function into IRAM. This can also avoid the cache miss during encoding.

To help get started with RMT driver faster, some commonly used encoders are provided out-of-the box. They can either work alone or chained together into a new encoder. See also Composite Pattern for the principle behind. The
driver has defined the encoder interface in `rmt_encoder_t`, it contains the following functions:

- `rmt_encoder_t::encode` is the fundamental function of an encoder. This is where the encoding session happens. Please note, the `rmt_encoder_t::encode` function might be called for multiple times within a single transaction. The encode function should return the state of current encoding session. The supported states are listed in the `rmt_encode_state_t`. If the result contains `RMT_ENCODING_COMPLETE`, it means the current encoder has finished work. If the result contains `RMT_ENCODING_MEM_FULL`, we need to yield from current session, as there’s no space to save more encoding artifacts.
- `rmt_encoder_t::reset` should reset the encoder state back to initial. The RMT encoder is stateful, if RMT transmitter stopped manually without its corresponding encoder being reset, then the following encoding session can be wrong. This function is also called implicitly in `rmt_disable()`.
- `rmt_encoder_t::del` function should free the resources allocated by the encoder.

**Copy Encoder** A copy encoder is created by calling `rmt_new_copy_encoder()`. Copy encoder’s main functionality is to copy the RMT symbols from user space into the driver layer. It’s usually used to encode const data (i.e. data won’t change at runtime after initialization), for example, the leading code in the IR protocol.

A configuration structure `rmt_copy_encoder_config_t` should be provided in advance before calling `rmt_new_copy_encoder()`. Currently, this configuration is reserved for future expansion.

**Bytes Encoder** A bytes encoder is created by calling `rmt_new_bytes_encoder()`. Bytes encoder’s main functionality is to convert the user space byte stream into RMT symbols dynamically. It’s usually used to encode dynamic data, for example, the address and command fields in the IR protocol.

A configuration structure `rmt_bytes_encoder_config_t` should be provided in advance before calling `rmt_new_bytes_encoder()`:

- `rmt_bytes_encoder_config_t::bit0` and `rmt_bytes_encoder_config_t::bit1` are necessary to tell to the encoder how to represent bit zero and bit one in the format of `rmt_symbol_word_t`.
- `rmt_bytes_encoder_config_t::msb_first` sets the encoding order for of byte. If it is set to true, the encoder will encode the Most Significant Bit first. Otherwise, it will encode the Least Significant Bit first.

Besides the primitive encoders provided by the driver, user can implement his own encoder by chaining the existing encoders together. A common encoder chain is shown as follows:

![Fig. 12: RMT Encoder Chain](image)

**Customize RMT Encoder for NEC Protocol** In this section, we will demonstrate on how to write an NEC encoder. The NEC IR protocol uses pulse distance encoding of the message bits. Each pulse burst is 562.5µs in length,
logical bits are transmitted as follows. It is worth mentioning, the bytes of data bits are sent least significant bit first.

- Logical 0: a 562.5µs pulse burst followed by a 562.5µs space, with a total transmit time of 1.125ms
- Logical 1: a 562.5µs pulse burst followed by a 1.6875ms space, with a total transmit time of 2.25ms

When a key is pressed on the remote controller, the message transmitted consists of the following, in order:

- 9ms leading pulse burst (also called the “AGC pulse”)
- 4.5ms space
- 8-bit address for the receiving device
- 8-bit logical inverse of the address
- 8-bit command
- 8-bit logical inverse of the command
- a final 562.5µs pulse burst to signify the end of message transmission

Then we can construct the NEC `rmt_encoder_t::encode` function in the same order, for example:

```cpp
// IR NEC scan code representation
typedef struct {
    uint16_t address;
    uint16_t command;
} ir_nec_scan_code_t;

// construct a encoder by combining primitive encoders
typedef struct {
    rmt_encoder_t base; // the base "class", declares the standard encoder interface
    rmt_encoder_t *copy_encoder; // use the copy_encoder to encode the leading and ending pulse
    rmt_encoder_t *bytes_encoder; // use the bytes_encoder to encode the address and command data
    rmt_symbol_word_t nec_leading_symbol; // NEC leading code with RMT representation
    rmt_symbol_word_t nec_ending_symbol; // NEC ending code with RMT representation
    int state; // record the current encoding state (i.e. we're in which encoding phase)
} rmt_ir_nec_encoder_t;

static size_t rmt_encode_ir_nec(rmt_encoder_t *encoder, rmt_channel_handle_t *channel, const void *primary_data, size_t data_size, rmt_encode_state_t *ret_state) {
    rmt_ir_nec_encoder_t *nec_encoder = __containerof(encoder, rmt_ir_nec_encoder_t, base);
    rmt_encode_state_t session_state = 0;
    rmt_encode_state_t state = 0;
    size_t encoded_symbols = 0;
    ir_nec_scan_code_t *scan_code = (ir_nec_scan_code_t *)primary_data;
    rmt_encoder_handle_t copy_encoder = nec_encoder->copy_encoder;
    rmt_encoder_handle_t bytes_encoder = nec_encoder->bytes_encoder;
    switch (nec_encoder->state) {
    case 0: // send leading code
        encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_encoder->nec_leading_symbol);
        break;
    (continues on next page)
```c
sizeof(rmt_symbol_word_t), &
- session_state);
  if (session_state & RMT_ENCODING_COMPLETE) {
    nec_encoder->state = 1; // we can only switch to next state when
    - current encoder finished
  }
  if (session_state & RMT_ENCODING_MEM_FULL) {
    state |= RMT.Encoding_MEM_FULL;
    goto out; // yield if there's no free space to put other encoding...
- artifacts
  }
  // fall-through
  case 1: // send address
    encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_
    - code->address, sizeof(uint16_t), &session_state);
    if (session_state & RMT.Encoding_COMPLETE) {
      nec_encoder->state = 2; // we can only switch to next state when
      - current encoder finished
    }
    if (session_state & RMT Encoding_MEM_FULL) {
      state |= RMT-Encoding_MEM_FULL;
      goto out; // yield if there's no free space to put other encoding...
- artifacts
    }
    // fall-through
    case 2: // send command
      encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_
      - code->command, sizeof(uint16_t), &session_state);
      if (session_state & RMT-Encoding_COMPLETE) {
        nec_encoder->state = 3; // we can only switch to next state when
        - current encoder finished
      }
      if (session_state & RMT-Encoding_MEM_FULL) {
        state |= RMT-Encoding_MEM_FULL;
        goto out; // yield if there's no free space to put other encoding...
- artifacts
      }
      // fall-through
      case 3: // send ending code
        encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_
        - encoder->nec_ending_symbol, sizeof(rmt_symbol_word_t), &
        - session_state);
        if (session_state & RMT-Encoding COMPLETE) {
          nec_encoder->state = 0; // back to the initial encoding session
          state |= RMT-Encoding COMPLETE; // telling the caller the NEC encoding
          - has finished
        }
        if (session_state & RMT-Encoding_MEM_FULL) {
          state |= RMT-Encoding_MEM_FULL;
          goto out; // yield if there's no free space to put other encoding...
- artifacts
        }
      }
      out:
      *ret_state = state;
      return encoded_symbols;
}
```

A full sample code can be found in peripherals/rmt/ir_nec_transceiver. In the above snippet, we use a `switch-case` plus several `goto` statements to implement a `state machine`. With this pattern, user can construct a lot more complex IR protocols.
Power Management  When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system will adjust the APB frequency before going into light sleep, thus potentially changing the resolution of RMT internal counter.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever user creates an RMT channel that has selected `RMT_CLK_SRC_APB` as the clock source, the driver will guarantee that the power management lock is acquired after the channel enabled by `rmt_enable()`. Likewise, the driver releases the lock after `rmt_disable()` is called for the same channel. This also reveals that the `rmt_enable()` and `rmt_disable()` should appear in pairs.

If the channel clock source is selected to others like `RMT_CLK_SRC_XTAL`, then the driver won’t install power management lock for it, which is more suitable for a low power application as long as the source clock can still provide sufficient resolution.

IRAM Safe  By default, the RMT interrupt will be deferred when the Cache is disabled for reasons like writing/erasing the main Flash. Thus the transaction done interrupt will not get executed in time, which is not expected in a real-time application. What’s worse, when the RMT transaction relies on ping-pong interrupt to successively encode or copy RMT symbols, such delayed response can lead to an unpredictable result.

There’s a Kconfig option `CONFIG_RMT_ISR_IRAM_SAFE` that will:

1. Enable the interrupt being serviced even when cache is disabled
2. Place all functions that used by the ISR into IRAM
3. Place driver object into DRAM (in case it’s mapped to PSRAM by accident)

This Kconfig option will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

Thread Safety  The factory function `rmt_new_tx_channel()`, `rmt_new_rx_channel()` and `rmt_new_sync_manager()` are guaranteed to be thread safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks. Other functions that take the `rmt_channel_handle_t` and `rmt_sync_manager_handle_t` as the first positional parameter, are not thread safe. which means the user should avoid calling them from multiple tasks.

Kconfig Options

- `CONFIG_RMT_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see also `IRAM Safe` for more information.
- `CONFIG_RMT_ENABLE_DEBUG_LOG` is used to enabled the debug log at the cost of increased firmware binary size.

Application Examples

- RMT based RGB LED strip customized encoder: `peripherals/rmt/led_strip`
- RMT IR NEC protocol encoding and decoding: `peripherals/rmt/ir_nec_transceiver`
- RMT transactions in queue: `peripherals/rmt/musical_buzzer`
- RMT based stepper motor with S-curve algorithm: : `peripherals/rmt/stepper_motor`
- RMT infinite loop for driving DShot ESC: `peripherals/rmt/dshot_esc`
- RMT simulate 1-wire protocol (take DS18B20 as example): `peripherals/rmt/onewire_ds18b20`

API Reference

Header File

- `components/driver/include/driver/rmt_tx.h`
**Functions**

*esp_err_t* rmt_new_tx_channel(const *config, rmt_channel_handle_t *ret_chan)

Create a RMT TX channel.

**Parameters**
- `config` [in]: TX channel configurations
- `ret_chan` [out]: Returned generic RMT channel handle

**Returns**
- ESP_OK: Create RMT TX channel successfully
- ESP_ERR_INVALID_ARG: Create RMT TX channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT TX channel failed because of out of memory
- ESP_ERR_NOT_FOUND: Create RMT TX channel failed because all RMT channels are used up and no more free one
- ESP_ERR_NOT_SUPPORTED: Create RMT TX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- ESP_FAIL: Create RMT TX channel failed because of other error

*esp_err_t* rmt_transmit(rmt_channel_handle_t tx_channel, rmt_encoder_handle_t encoder, const void *payload, size_t payload_bytes, const *config)

Transmit data by RMT TX channel.

**Parameters**
- `tx_channel` [in]: RMT TX channel that created by rmt_new_tx_channel()
- `encoder` [in]: RMT encoder that created by various factory APIs like rmt_new_bytes_encoder()
- `payload` [in]: The raw data to be encoded into RMT symbols
- `payload_bytes` [in]: Size of the payload in bytes
- `config` [in]: Transmission specific configuration

**Returns**
- ESP_OK: Transmit data successfully
- ESP_ERR_INVALID_ARG: Transmit data failed because of invalid argument
- ESP_ERR_INVALID_STATE: Transmit data failed because channel is not enabled
- ESP_ERR_NOT_SUPPORTED: Transmit data failed because some feature is not supported by hardware, e.g. unsupported loop count
- ESP_FAIL: Transmit data failed because of other error

*esp_err_t* rmt_tx_wait_all_done(rmt_channel_handle_t tx_channel, int timeout_ms)

Wait for all pending TX transactions done.

**Parameters**
- `tx_channel` [in]: RMT TX channel that created by rmt_new_tx_channel()
- `timeout_ms` [in]: Wait timeout, in ms. Specially, -1 means to wait forever.

**Returns**
- ESP_OK: Flush transactions successfully
- ESP_ERR_INVALID_ARG: Flush transactions failed because of invalid argument

---

**Note:** This function will construct a transaction descriptor and push to a queue. The transaction will not start immediately until it’s dispatched in the ISR. If there’re too many transactions pending in the queue, this function will block until the queue has free space.

---

**Note:** The data to be transmitted will be encoded into RMT symbols by the specific encoder.

---

**Parameters**
- `tx_channel` [in]: RMT TX channel that created by rmt_new_tx_channel()
- `encoder` [in]: RMT encoder that created by various factory APIs like rmt_new_bytes_encoder()
- `payload` [in]: The raw data to be encoded into RMT symbols
- `payload_bytes` [in]: Size of the payload in bytes
- `config` [in]: Transmission specific configuration

**Returns**
- ESP_OK: Transmit data successfully
- ESP_ERR_INVALID_ARG: Transmit data failed because of invalid argument
- ESP_ERR_INVALID_STATE: Transmit data failed because channel is not enabled
- ESP_ERR_NOT_SUPPORTED: Transmit data failed because some feature is not supported by hardware, e.g. unsupported loop count
- ESP_FAIL: Transmit data failed because of other error

---

**Parameters**
- `tx_channel` [in]: RMT TX channel that created by rmt_new_tx_channel()
- `timeout_ms` [in]: Wait timeout, in ms. Specially, -1 means to wait forever.

**Returns**
- ESP_OK: Flush transactions successfully
- ESP_ERR_INVALID_ARG: Flush transactions failed because of invalid argument
Chapter 2. API Reference

- ESP_ERR_TIMEOUT: Flush transactions failed because of timeout
- ESP_FAIL: Flush transactions failed because of other error

```c
esp_err_t rmt_tx_register_event_callbacks(rmt_channel_handle_t tx_channel, const rmt_tx_event_callbacks_t *cbs, void *user_data)
```

Set event callbacks for RMT TX channel.

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

**Note:** When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

**Parameters**
- `tx_channel` - [in] RMT generic channel that created by `rmt_new_tx_channel()`
- `cbs` - [in] Group of callback functions
- `user_data` - [in] User data, which will be passed to callback functions directly

**Returns**
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

```c
esp_err_t rmt_new_sync_manager(const rmt_sync_manager_config_t *config, rmt_sync_manager_handle_t *ret_synchro)
```

Create a synchronization manager for multiple TX channels, so that the managed channel can start transmitting at the same time.

**Note:** All the channels to be managed should be enabled by `rmt_enable()` before put them into sync manager.

**Parameters**
- `config` - [in] Synchronization manager configuration
- `ret_synchro` - [out] Returned synchronization manager handle

**Returns**
- ESP_OK: Create sync manager successfully
- ESP_ERR_INVALID_ARG: Create sync manager failed because of invalid argument
- ESP_ERR_NOT_SUPPORTED: Create sync manager failed because it is not supported by hardware
- ESP_ERR_INVALID_STATE: Create sync manager failed because not all channels are enabled
- ESP_ERR_NO_MEM: Create sync manager failed because out of memory
- ESP_ERR_NOT_FOUND: Create sync manager failed because all sync controllers are used up and no more free one
- ESP_FAIL: Create sync manager failed because of other error

```c
esp_err_t rmt_del_sync_manager(rmt_sync_manager_handle_t synchro)
```

Delete synchronization manager.

**Parameters**
- `synchro` - [in] Synchronization manager handle returned from `rmt_new_sync_manager()`

**Returns**
- ESP_OK: Delete the synchronization manager successfully
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG: Delete the synchronization manager failed because of invalid argument
- ESP_FAIL: Delete the synchronization manager failed because of other error

```c
esp_err_t rmt_sync_reset(rmt_sync_manager_handle_t synchro)
```
Reset synchronization manager.

**Parameters**

- `synchro` *[in]* Synchronization manager handle returned from `rmt_new_sync_manager()`

**Returns**

- ESP_OK: Reset the synchronization manager successfully
- ESP_ERR_INVALID_ARG: Reset the synchronization manager failed because of invalid argument
- ESP_FAIL: Reset the synchronization manager failed because of other error

### Structures

**struct rmt_tx_event_callbacks_t**

Group of RMT TX callbacks.

**Note:** The callbacks are all running under ISR environment

**Note:** When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

### Public Members

#### rmt_tx_done_callback_t on_trans_done

Event callback, invoked when transmission is finished.

**struct rmt_tx_channel_config_t**

RMT TX channel specific configuration.

### Public Members

- `int gpio_num`
  
  GPIO number used by RMT TX channel. Set to -1 if unused

- `rmt_clock_source_t clk_src`
  
  Clock source of RMT TX channel, channels in the same group must use the same clock source

- `uint32_t resolution_hz`
  
  Channel clock resolution, in Hz

- `size_t mem_block_symbols`
  
  Size of memory block, in number of `rmt_symbol_word_t`, must be an even

- `size_t trans_queue_depth`
  
  Depth of internal transfer queue, increase this value can support more transfers pending in the background
uint32_t invert_out
   Whether to invert the RMT channel signal before output to GPIO pad

uint32_t with_dma
   If set, the driver will allocate an RMT channel with DMA capability

uint32_t io_loop_back
   The signal output from the GPIO will be fed to the input path as well

uint32_t io_od_mode
   Configure the GPIO as open-drain mode

struct rmt_tx_channel_config_t::[anonymous] flags
   TX channel config flags

struct rmt_transmit_config_t
   RMT transmit specific configuration.

**Public Members**

int loop_count
   Specify the times of transmission in a loop, -1 means transmitting in an infinite loop

uint32_t eot_level
   Set the output level for the “End Of Transmission”

struct rmt_transmit_config_t::[anonymous] flags
   Transmit config flags

struct rmt_sync_manager_config_t
   Synchronous manager configuration.

**Public Members**

const rmt_channel_handle_t *tx_channel_array
   Array of TX channels that are about to be managed by a synchronous controller

size_t array_size
   Size of the tx_channel_array

**Header File**

- components/driver/include(driver/rmt_rx.h)
Functions

**esp_err_t rmt_new_rx_channel** (const rmt_rx_channel_config_t *config, rmt_channel_handle_t *ret_chan)

Create a RMT RX channel.

**Parameters**
- **config** - [in] RX channel configurations
- **ret_chan** - [out] Returned generic RMT channel handle

**Returns**
- ESP_OK: Create RMT RX channel successfully
- ESP_ERR_INVALID_ARG: Create RMT RX channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT RX channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create RMT RX channel failed because all RMT channels are used up and no more free one
- ESP_ERR_NOT_SUPPORTED: Create RMT RX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- ESP_FAIL: Create RMT RX channel failed because of other error

**esp_err_t rmt_receive** (rmt_channel_handle_t rx_channel, void *buffer, size_t buffer_size, const rmt_receive_config_t *config)

Initiate a receive job for RMT RX channel.

**Note:** This function is non-blocking, it initiates a new receive job and then returns. User should check the received data from the on_recv_done callback that registered by rmt_rx_register_event_callbacks().

**Parameters**
- **rx_channel** - [in] RMT RX channel that created by rmt_new_rx_channel()
- **buffer** - [in] The buffer to store the received RMT symbols
- **buffer_size** - [in] size of the buffer, in bytes
- **config** - [in] Receive specific configurations

**Returns**
- ESP_OK: Initiate receive job successfully
- ESP_ERR_INVALID_ARG: Initiate receive job failed because of invalid argument
- ESP_ERR_INVALID_STATE: Initiate receive job failed because channel is not enabled
- ESP_FAIL: Initiate receive job failed because of other error

**esp_err_t rmt_rx_register_event_callbacks** (rmt_channel_handle_t rx_channel, const rmt_rx_event_callbacks_t *cbs, void *user_data)

Set callbacks for RMT RX channel.

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the cbs structure to NULL.

**Note:** When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The user_data should also reside in SRAM.

**Parameters**
- **rx_channel** - [in] RMT generic channel that created by rmt_new_rx_channel()
- **cbs** - [in] Group of callback functions
- **user_data** - [in] User data, which will be passed to callback functions directly

**Returns**
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
• ESP_FAIL: Set event callbacks failed because of other error

**Structures**

`struct rmt_rx_event_callbacks_t`

Group of RMT RX callbacks.

**Note:** The callbacks are all running under ISR environment

**Note:** When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

**Public Members**

`rmt_rx_done_callback_t on_recv_done`

Event callback, invoked when one RMT channel receiving transaction completes

`struct rmt_rx_channel_config_t`

RMT RX channel specific configuration.

**Public Members**

`int gpio_num`

GPIO number used by RMT RX channel. Set to -1 if unused

`rmt_clock_source_t clk_src`

Clock source of RMT RX channel, channels in the same group must use the same clock source

`uint32_t resolution_hz`

Channel clock resolution, in Hz

`size_t mem_block_symbols`

Size of memory block, in number of `rmt_symbol_word_t`, must be an even

`uint32_t invert_in`

Whether to invert the incoming RMT channel signal

`uint32_t with_dma`

If set, the driver will allocate an RMT channel with DMA capability

`uint32_t io_loop_back`

For debug/test, the signal output from the GPIO will be fed to the input path as well

`struct rmt_rx_channel_config_t::[anonymous] flags`

RX channel config flags

`struct rmt_receive_config_t`

RMT receive specific configuration.
Public Members

```c
uint32_t signal_range_min_ns

A pulse whose width is smaller than this threshold will be treated as glitch and ignored
```

```c
uint32_t signal_range_max_ns

RMT will stop receiving if one symbol level has kept more than signal_range_max_ns
```

Header File

- components/driver/include/driver/rmt_common.h

Functions

```c
esp_err_t rmt_del_channel (rmt_channel_handle_t channel)

Delete an RMT channel.
```

**Parameters**

- `channel` - [in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

**Returns**

- ESP_OK: Delete RMT channel successfully
- ESP_ERR_INVALID_ARG: Delete RMT channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete RMT channel failed because it is still in working
- ESP_FAIL: Delete RMT channel failed because of other error

```c
esp_err_t rmt_apply_carrier (rmt_channel_handle_t channel, const rmt_carrier_config_t *config)

Apply modulation feature for TX channel or demodulation feature for RX channel.
```

**Parameters**

- `channel` - [in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`
- `config` - [in] Carrier configuration. Specially, a NULL config means to disable the carrier modulation or demodulation feature

**Returns**

- ESP_OK: Apply carrier configuration successfully
- ESP_ERR_INVALID_ARG: Apply carrier configuration failed because of invalid argument
- ESP_FAIL: Apply carrier configuration failed because of other error

```c
esp_err_t rmt_enable (rmt_channel_handle_t channel)

Enable the RMT channel.
```

**Note:** This function will acquire a PM lock that might be installed during channel allocation

**Parameters**

- `channel` - [in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

**Returns**

- ESP_OK: Enable RMT channel successfully
- ESP_ERR_INVALID_ARG: Enable RMT channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable RMT channel failed because it’s enabled already
- ESP_FAIL: Enable RMT channel failed because of other error

```c
esp_err_t rmt_disable (rmt_channel_handle_t channel)

Disable the RMT channel.
```

**Note:** This function will release a PM lock that might be installed during channel allocation
### Parameters
channel - [in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

### Returns
- ESP_OK: Disable RMT channel successfully
- ESP_ERR_INVALID_ARG: Disable RMT channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable RMT channel failed because it's not enabled yet
- ESP_FAIL: Disable RMT channel failed because of other error

### Structures

```c
struct rmt_carrier_config_t
```

RMT carrier wave configuration (for either modulation or demodulation)

### Public Members

```c
uint32_t frequency_hz
```
Carrier wave frequency, in Hz, 0 means disabling the carrier

```c
float duty_cycle
```
Carrier wave duty cycle (0~100%)

```c
uint32_t polarity_active_low
```
Specify the polarity of carrier, by default it's modulated to base signal's high level

```c
uint32_t always_on
```
If set, the carrier can always exist even there's not transfer undergoing

```c
struct rmt_carrier_config_t::[anonymous] flags
```
Carrier config flags

### Header File
- `components/driver/include/driver/rmt_encoder.h`

### Functions

```c
esp_err_t rmt_new_bytes_encoder(const rmt_bytes_encoder_config_t *config, rmt_encoder_handle_t *ret_encoder)
```
Create RMT bytes encoder, which can encode byte stream into RMT symbols.

#### Parameters
- `config` - [in] Bytes encoder configuration
- `ret_encoder` - [out] Returned encoder handle

#### Returns
- ESP_OK: Create RMT bytes encoder successfully
- ESP_ERR_INVALID_ARG: Create RMT bytes encoder failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT bytes encoder failed because out of memory
- ESP_FAIL: Create RMT bytes encoder failed because of other error

```c
esp_err_t rmt_new_copy_encoder(const rmt_copy_encoder_config_t *config, rmt_encoder_handle_t *ret_encoder)
```
Create RMT copy encoder, which copies the given RMT symbols into RMT memory.

#### Parameters
Chapter 2. API Reference

• `config` [in] Copy encoder configuration
• `ret_encoder` [out] Returned encoder handle

**Returns**
- ESP_OK: Create RMT copy encoder successfully
- ESP_ERR_INVALID_ARG: Create RMT copy encoder failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT copy encoder failed because out of memory
- ESP_FAIL: Create RMT copy encoder failed because of other error

`esp_err_t rmt_del_encoder(rmt_encoder_handle_t encoder)`
Delete RMT encoder.

**Parameters**
- `encoder` [in] RMT encoder handle, created by e.g `rmt_new_bytes_encoder()`

**Returns**
- ESP_OK: Delete RMT encoder successfully
- ESP_ERR_INVALID_ARG: Delete RMT encoder failed because of invalid argument
- ESP_FAIL: Delete RMT encoder failed because of other error

`esp_err_t rmt_encoder_reset(rmt_encoder_handle_t encoder)`
Reset RMT encoder.

**Parameters**
- `encoder` [in] RMT encoder handle, created by e.g `rmt_new_bytes_encoder()`

**Returns**
- ESP_OK: Reset RMT encoder successfully
- ESP_ERR_INVALID_ARG: Reset RMT encoder failed because of invalid argument
- ESP_FAIL: Reset RMT encoder failed because of other error

**Public Members**

`size_t(*encode)(rmt_encoder_t *encoder, rmt_channel_handle_t tx_channel, const void *primary_data, size_t data_size, rmt_encode_state_t *ret_state)`
Encode the user data into RMT symbols and write into RMT memory.

---

**Note:** The encoding function will also be called from an ISR context, thus the function must not call any blocking API.

---

**Note:** It’s recommended to put this function implementation in the IRAM, to achieve a high performance and less interrupt latency.

---

**Param**
- `encoder` [in] Encoder handle
- `tx_channel` [in] RMT TX channel handle, returned from `rmt_new_tx_channel()`
- `primary_data` [in] App data to be encoded into RMT symbols
- `data_size` [in] Size of primary_data, in bytes
- `ret_state` [out] Returned current encoder’s state

**Return** Number of RMT symbols that the primary data has been encoded into
\texttt{esp_err_t (*reset)(rmt_encoder_t *encoder)}
Reset encoding state.
\begin{description}
\item[Param encoder [in]] Encoder handle
\item[Return]
\begin{itemize}
\item ESP_OK: reset encoder successfully
\item ESP_FAIL: reset encoder failed
\end{itemize}
\end{description}

\texttt{esp_err_t (*del)(rmt_encoder_t *encoder)}
Delete encoder object.
\begin{description}
\item[Param encoder [in]] Encoder handle
\item[Return]
\begin{itemize}
\item ESP_OK: delete encoder successfully
\item ESP_FAIL: delete encoder failed
\end{itemize}
\end{description}

\begin{verbatim}
struct rmt_bytes_encoder_config_t
Bytes encoder configuration.
\end{verbatim}

**Public Members**

\texttt{rmt_symbol_word_t bit0}
How to represent BIT0 in RMT symbol

\texttt{rmt_symbol_word_t bit1}
How to represent BIT1 in RMT symbol

\texttt{uint32_t msb_first}
Whether to encode MSB bit first

\begin{verbatim}
struct rmt_bytes_encoder_config_t::[anonymous] flags
Encoder config flag
\end{verbatim}

\begin{verbatim}
struct rmt_copy_encoder_config_t
Copy encoder configuration.
\end{verbatim}

**Type Definitions**

typedef struct rmt_encoder_t rmt_encoder_t
Type of RMT encoder.

**Enumerations**

\begin{verbatim}
enum rmt_encode_state_t
RMT encoding state.
\end{verbatim}
\begin{itemize}
\item RMT_ENCODING_COMPLETE
The encoding session is finished, the caller can continue with subsequent encoding
\end{itemize}
enumerator RMT_ENCODING_MEM_FULL
The encoding artifact memory is full, the caller should return from current encoding session

Header File
- components/driver/include/driver/rmt_types.h

Structures
struct rmt_tx_done_event_data_t
Type of RMT TX done event data.

Public Members

size_t num_symbols
The number of transmitted RMT symbols (only one round is counted if it’s a loop transmission)

struct rmt_rx_done_event_data_t
Type of RMT RX done event data.

Public Members

rmt_symbol_word_t *received_symbols
Point to the received RMT symbols

size_t num_symbols
The number of received RMT symbols

Type Definitions

typedef struct rmt_channel_t *rmt_channel_handle_t
Type of RMT channel handle.

typedef struct rmt_sync_manager_t *rmt_sync_manager_handle_t
Type of RMT synchronization manager handle.

typedef struct rmt_encoder_t *rmt_encoder_handle_t
Type of RMT encoder handle.

typedef bool (*rmt_tx_done_callback_t)(rmt_channel_handle_t tx_chan, const rmt_tx_done_event_data_t *edata, void *user_ctx)
Prototype of RMT event callback.

Param tx_chan [in] RMT channel handle, created from rmt_new_tx_channel()
Param edata [in] Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.
Param user_ctx [in] User registered context, passed from rmt_tx_register_event_callbacks()
Return Whether a high priority task has been waken up by this callback function
typedef bool (*rmt_rx_done_callback_t)(rmt_channel_handle_t rx_chan, const rmt_rx_done_event_data_t *edata, void *user_ctx)

Prototype of RMT event callback.

**Param rx_chan [in]** RMT channel handle, created from rmt_new_rx_channel()

**Param edata [in]** Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.

**Param user_ctx [in]** User registered context, passed from rmt_rx_register_event_callbacks()

**Return** Whether a high priority task has been waken up by this function

**Header File**

- components/hal/include/hal/rmt_types.h

**Unions**

union rmt_symbol_word_t

#include <rmt_types.h> The layout of RMT symbol stored in memory, which is decided by the hardware design.

Level of the second part

struct rmt_symbol_word_t::[anonymous] [anonymous]

unsigned int val

Equivalent unsigned value for the RMT symbol

**Type Definitions**

typedef soc_periph_rmt_clk_src_t rmt_clock_source_t

RMT group clock source.

**Note:** User should select the clock source based on the power and resolution requirement
2.6.15 SD SPI Host Driver

Overview

The SD SPI host driver allows communicating with one or more SD cards by the SPI Master driver which makes use of the SPI host. Each card is accessed through an SD SPI device represented by an `sdspi_dev_handle_t` Spi_handle returned when attaching the device to an SPI bus by calling `sdspi_host_init_device`. The bus should be already initialized before (by `spi_bus_initialize`).

With the help of SPI Master driver based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks.

The SD SPI driver uses software-controlled CS signal.

How to Use

Firstly, use the macro `SDSPI_DEVICE_CONFIG_DEFAULT` to initialize a structure `sdspi_device_config_t`, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which is same as the pin mappings of SDMMC host driver. Modify the host and pins of the structure to desired value. Then call `sdspi_host_init_device` to initialize the SD SPI device and attach to its bus.

Then use `SDSPI_HOST_DEFAULT` macro to initialize a `sdmmc_host_t` structure, which is used to store the state and configurations of upper layer (SD/SDIO/MMC driver). Modify the slot parameter of the structure to the SD SPI device `spi_handle` just returned from `sdspi_host_init_device`. Call `sdmmc_card_init` with the `sdmmc_host_t` to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!

Other Details

Only the following driver’s API functions are normally used by most applications:

- `sdspi_host_init()`
- `sdspi_host_init_device()`
- `sdspi_host_remove_device()`
- `sdspi_host_deinit()`

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the `sdmmc_host_t` structure. For more details, see the SD/SDIO/MMC Driver.

**Note:** SD over SPI does not support speeds above `SDMMC_FREQ_DEFAULT` due to the limitations of the SPI driver.

**Warning:** If you want to share the SPI bus among SD card and other SPI devices, there are some restrictions, see Sharing the SPI bus among SD card and other SPI devices.

Related Docs

**Sharing the SPI bus among SD card and other SPI devices**   The SD card has a SPI mode, which allows it to be communicated to as a SPI device. But there are some restrictions that we need to pay attention to.

**Pin loading of other devices**   When adding more devices onto the same bus, the overall pin loading increases. The loading consists of AC loading (pin capacitor) and DC loading (pull-ups).
Chapter 2. API Reference

**AC loading**  SD cards, which are designed for high-speed communications, have small pin capacitors (AC loading) to work until 50MHz. However, the other attached devices will increase the pin’s AC loading.

Heavy AC loading of a pin may prevent the pin from being toggled quickly. By using an oscilloscope, you will see the edges of the pin become smoother and not ideal any more (the gradient of the edge is smaller). The setup timing requirements of an SD card may be violated when the card is connected to such bus. Even worse, the clock from the host may not be recognized by the SD card and other SPI devices on the same bus.

This issue may be more obvious if other attached devices are not designed to work at the same frequency as the SD card, because they may have larger pin capacitors.

To see if your pin AC loading is too heavy, you can try the following tests:

(Terminology: **launch edge**: at which clock edge the data start to toggle; **latch edge**: at which clock edge the data is supposed to be sampled by the receiver, for SD card, it’s the rising edge.)

1. Use an oscilloscope to see the clock and compare the data line to the clock. - If you see the clock is not fast enough (for example, the rising/falling edge is longer than 1/4 of the clock cycle), it means the clock is skewed too much. - If you see the data line unstable before the latch edge of the clock, it means the load of the data line is too large.
   You may also observed the corresponding phenomenon (data delayed largely from launching edge of clock) with logic analyzers. But it’s not as obvious as with an oscilloscope.
2. Try to use slower clock frequency.
   If the lower frequency can work while the higher frequency can’t, it’s an indication of the AC loading on the pins is too large.

If the AC loading of the pins is too large, you can either use other faster devices (with lower pin load) or slow down the clock speed.

**DC loading**  The pull-ups required by SD cards are usually around 10 kOhm to 50 kOhm, which may be too strong for some other SPI devices.

Check the specification of your device about its DC output current, it should be larger than 700uA, otherwise the device output may not be read correctly.

**Initialization sequence**

**Note:**  If you see any problem in the following steps, please make sure the timing is correct first. You can try to slow down the clock speed (SDMMC_FREQ_PROBING = 400 KHz for SD card) to avoid the influence of pin AC loading (see above section).

When using an SD card with other SPI devices on the same SPI bus, due to the restrictions of the SD card startup flow, the following initialization sequence should be followed: (See also storage/sd_card)

1. Initialize the SPI bus properly by *spi_bus_initialize*.
2. Tie the CS lines of all other devices than the SD card to high. This is to avoid conflicts to the SD card in the following step.
   You can do this by either:
   1. Attach devices to the SPI bus by calling *spi_bus_add_device*. This function will initialize the GPIO that is used as CS to the idle level: high.
   2. Initialize GPIO on the CS pin that needs to be tied up before actually adding a new device.
   3. Rely on the internal/external pull-up (not recommended) to pull-up all the CS pins when the GPIOs of ESP are not initialized yet. You need to check carefull the pull-up is strong enough and there are no other pull-downs that will influence the pull-up (For example, internal pull-down should be enabled).
3. Mount the card to the filesystem by calling *esp_vfs_fat_sdspi_mount*.
   This step will put the SD card into the SPI mode, which SHOULD be done before all other SPI communications on the same bus. Otherwise the card will stay in the SD mode, in which mode it may randomly respond to any SPI communications on the bus, even when its CS line is not addressed.
   If you want to test this behavior, please also note that, once the card is put into SPI mode, it will not return to SD mode before next power cycle, i.e. powered down and powered up again.
4. Now you can talk to other SPI devices freely!
Chapter 2. API Reference

API Reference

Header File

- components/driver/include/driver/sdspi_host.h

Functions

**esp_err_t sdspi_host_init**(void)

Initialize SD SPI driver.

**Note:** This function is not thread safe

**Returns**

- ESP_OK on success
- other error codes may be returned in future versions

**esp_err_t sdspi_host_init_device**(const sdspi_device_config_t *dev_config, sdspi_dev_handle_t *out_handle)

Attach and initialize an SD SPI device on the specific SPI bus.

**Note:** This function is not thread safe

**Note:** Initialize the SPI bus by **spi_bus_initialize()** before calling this function.

**Note:** The SDIO over sdspi needs an extra interrupt line. Call **gpio_install_isr_service()** before this function.

**Parameters**

- **dev_config** - pointer to device configuration structure
- **out_handle** - Output of the handle to the sdspi device.

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if sdspi_host_init_device has invalid arguments
- ESP_ERR_NO_MEM if memory cannot be allocated
- other errors from the underlying spi_master and gpio drivers

**esp_err_t sdspi_host_remove_device**(sdspi_dev_handle_t handle)

Remove an SD SPI device.

**Parameters**

- **handle** – Handle of the SD SPI device

**Returns**

- Always ESP_OK

**esp_err_t sdspi_host_do_transaction**(sdspi_dev_handle_t handle, sdmmc_command_t *cmdinfo)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Note:** This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdspi_host_do_transaction as long as other sdspi_host_* functions are not called.
Chapter 2. API Reference

Parameters

- handle - Handle of the sdspi device
- cmdinfo - pointer to structure describing command and data to transfer

Returns

- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
- ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response

```c
esp_err_t sdspi_host_set_card_clk (sdspi_dev_handle_t host, uint32_t freq_khz)
```
Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

**Note:** This function is not thread safe

Parameters

- host - Handle of the sdspi device
- freq_khz - card clock frequency, in kHz

Returns

- ESP_OK on success
- other error codes may be returned in the future

```c
esp_err_t sdspi_host_deinit (void)
```
Release resources allocated using sdspi_host_init.

**Note:** This function is not thread safe

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdspi_host_init function has not been called

```c
esp_err_t sdspi_host_io_int_enable (sdspi_dev_handle_t handle)
```
Enable SDIO interrupt.

**Parameters** handle - Handle of the sdspi device

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdspi_host_init function has not been called

```c
esp_err_t sdspi_host_io_int_wait (sdspi_dev_handle_t handle, TickType_t timeout_ticks)
```
Wait for SDIO interrupt until timeout.

**Parameters**

- handle - Handle of the sdspi device
- timeout_ticks - Ticks to wait before timeout.

**Returns**

- ESP_OK on success

**Structures**

```c
struct sdspi_device_config_t
```
Extra configuration for SD SPI device.
Public Members

`spi_host_device_t host_id`
SPI host to use, SPIx_HOST (see spi_types.h).

`gpio_num_t gpio_cs`
GPIO number of CS signal.

`gpio_num_t gpio_cd`
GPIO number of card detect signal.

`gpio_num_t gpio_wp`
GPIO number of write protect signal.

`gpio_num_t gpio_int`
GPIO number of interrupt line (input) for SDIO card.

Macros

`SDSPI_DEFAULT_HOST`
Default `sdmmc_host_t` structure initializer for SD over SPI driver.
Uses SPI mode and max frequency set to 20MHz
‘slot’ should be set to an sdspi device initialized by `sdspi_host_init_device()`.

`SDSPI_SLOT_NO_CS`
indicates that card select line is not used

`SDSPI_SLOT_NO_CD`
indicates that card detect line is not used

`SDSPI_SLOT_NO_WP`
indicates that write protect line is not used

`SDSPI_SLOT_NO_INT`
indicates that interrupt line is not used

`SDSPI_DEVICE_CONFIG_DEFAULT()`
Macro defining default configuration of SD SPI device.

Type Definitions

`typedef int sdspi_dev_handle_t`
Handle representing an SD SPI device.
2.6.16 Sigma-Delta Modulation (SDM)

Introduction

ESP32-C3 has a second-order sigma-delta modulator, which can generate independent PDM pulses to multiple channels. Please refer to the TRM to check how many hardware channels are available.\(^1\)

Typically, a Sigma-Delta modulated channel can be used in scenarios like:

- LED dimming
- Simple DAC (8-bit), with the help of an active RC low-pass filter
- Class D amplifier, with the help of a half-bridge or full-bridge circuit plus an LC low-pass filter

Functional Overview

The following sections of this document cover the typical steps to install and operate a SDM channel:

- **Resource Allocation** - covers which parameters should be set up to get a channel handle and how to recycle the resources when it finishes working.
- **Enable and Disable Channel** - covers how to enable and disable the channel.
- **Set Equivalent Duty Cycle** - describes how to set the equivalent duty cycle of the PDM pulses.
- **Power Management** - describes how different source clock selections can affect power consumption.
- **IRAM Safe** - lists which functions are supposed to work even when the cache is disabled.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

Resource Allocation  A SDM channel is represented by `sdm_channel_handle_t`. Each channel is capable to output the binary, hardware generated signal with the sigma-delta modulation. The driver manages all available channels in a pool, so that users don’t need to manually assign a fixed channel to a GPIO.

To install a SDM channel, you should call `sdm_new_channel()` to get a channel handle. Channel specific configurations are passed in the `sdm_config_t` structure:

- `sdm_config_t::gpio_num` sets the GPIO that the PDM pulses will output from
- `sdm_config_t::clk_src` selects the source clock for the SDM module. Note that, all channels should select the same clock source.
- `sdm_config_t::sample_rate_hz` sets the sample rate of the SDM module.
- `sdm_config_t::invert_out` sets whether to invert the output signal.
- `sdm_config_t::io_loop_back` is for debugging purposes only. It enables both the GPIO’s input and output ability through the GPIO matrix peripheral.

The function `sdm_new_channel()` can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free channels (i.e. all hardware SDM channels have been used up), then `ESP_ERR_NOT_FOUND` will be returned.

If a previously created SDM channel is no longer required, you should recycle it by calling `sdm_del_channel()`. It allows the underlying HW channel to be used for other purposes. Before deleting a SDM channel handle, you should disable it by `sdm_channel_disable()` in advance or make sure it has not enabled yet by `sdm_channel_enable()`.

Creating a SDM Channel with Sample Rate of 1MHz

```c
sdm_channel_handle_t chan = NULL;
sdm_config_t config = {
    .clk_src = SDM_CLK_SRC_DEFAULT,
// (continues on next page)
```

\(^1\) Different ESP chip series might have different numbers of SDM channels. Please refer to Chapter GPIO and IOMUX in ESP32-C3 Technical Reference Manual for more details. The driver won’t forbid you from applying for more channels, but it will return error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g. `sdm_new_channel()`).
Enable and Disable Channel  Before doing further IO control to the SDM channel, you should enable it first, by calling `sdm_channel_enable()`. Internally, this function will:

- switch the channel state from `init` to `enable`
- acquire a proper power management lock if a specific clock source (e.g. APB clock) is selected. See also `Power management` for more information.

On the contrary, calling `sdm_channel_disable()` will do the opposite, that is, put the channel back to the `init` state and release the power management lock.

Set Equivalent Duty Cycle  For the output PDM signals, the duty cycle refers to the percentage of high level cycles to the whole statistical period. The average output voltage from the channel is calculated by $V_{out} = VDD_{IO} / 256 \times \text{duty} + VDD_{IO} / 2$. Thus the range of the `duty` input parameter of `sdm_channel_set_duty()` is from -128 to 127 (eight bit signed integer). For example, if zero value is set, then the output signal's duty will be about 50%.

Power Management  When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system will adjust the APB frequency before going into light sleep, thus potentially changing the sample rate of the sigma-delta modulator.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever the driver creates a SDM channel instance that has selected `SDM_CLK_SRC_APB` as its clock source, the driver will guarantee that the power management lock is acquired when enable the channel by `sdm_channel_enable()`. Likewise, the driver releases the lock when `sdm_channel_disable()` is called for that channel.

IRAM Safe  There’s a Kconfig option `CONFIG_SDM_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are listed as follows:

- `sdm_channel_set_duty()`

Thread Safety  The factory function `sdm_new_channel()` is guaranteed to be thread safe by the driver, which means, user can call it from different RTOS tasks without protection by extra locks. The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

- `sdm_channel_set_duty()`

Other functions that take the `sdm_channel_handle_t` as the first positional parameter, are not treated as thread safe. Which means the user should avoid calling them from multiple tasks.

Kconfig Options

- `CONFIG_SDM_CTRL_FUNC_IN_IRAM` controls where to place the SDM channel control functions (IRAM or Flash), see `IRAM Safe` for more information.
- `CONFIG_SDM_ENABLE_DEBUG_LOG` is used to enabled the debug log output. Enable this option will increase the firmware binary size.
Convert to analog signal (Optional)

Typically, if the sigma-delta signal is connected to an LED, you don’t have to add any filter between them (because our eyes are a low pass filter naturally). However, if you want to check the real voltage or watch the analog waveform, you need to design an analog low pass filter. Also, it is recommended to use an active filter instead of a passive filter to gain better isolation and not lose too much voltage.

For example, you can take the following Sallen-Key topology Low Pass Filter as a reference.

![Sallen-Key topology Low Pass Filter](image)

**Fig. 14: Sallen-Key Low Pass Filter**

Application Example

- LED driven by a GPIO that is modulated with Sigma-Delta: peripherals/sigma_delta.

API Reference

Header File

- components/driver/include/driver/sdm.h

Functions

```c
esp_err_t sdm_new_channel(const sdm_config_t *config, sdm_channel_handle_t *ret_chan)
```

Create a new Sigma Delta channel.

**Parameters**

- `config` [in] SDM configuration
- `ret_chan` [out] Returned SDM channel handle

**Returns**

- ESP_OK: Create SDM channel successfully
- ESP_ERR_INVALID_ARG: Create SDM channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create SDM channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create SDM channel failed because all channels are used up and no more free one
• ESP_FAIL: Create SDM channel failed because of other error

```c
esp_err_t sdm_del_channel (sdm_channel_handle_t chan)
```
Deletethe Sigma Delta channel.

**Parameters**
- `chan` - [in] SDM channel created by `sdm_new_channel`

**Returns**
- ESP_OK: Delete the SDM channel successfully
- ESP_ERR_INVALID_ARG: Delete the SDM channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete the SDM channel failed because the channel is not in init state
- ESP_FAIL: Delete the SDM channel failed because of other error

```c
esp_err_t sdm_channel_enable (sdm_channel_handle_t chan)
```
Enable the Sigma Delta channel.

**Note:** This function will transit the channel state from init to enable.

**Note:** This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the `sdm_config_t`, while `CONFIG_PM_ENABLE` is enabled.

**Parameters**
- `chan` - [in] SDM channel created by `sdm_new_channel`

**Returns**
- ESP_OK: Enable SDM channel successfully
- ESP_ERR_INVALID_ARG: Enable SDM channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable SDM channel failed because the channel is already enabled
- ESP_FAIL: Enable SDM channel failed because of other error

```c
esp_err_t sdm_channel_disable (sdm_channel_handle_t chan)
```
Disable the Sigma Delta channel.

**Note:** This function will do the opposite work to the `sdm_channel_enable()`

**Parameters**
- `chan` - [in] SDM channel created by `sdm_new_channel`

**Returns**
- ESP_OK: Disable SDM channel successfully
- ESP_ERR_INVALID_ARG: Disable SDM channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable SDM channel failed because the channel is not enabled yet
- ESP_FAIL: Disable SDM channel failed because of other error

```c
esp_err_t sdm_channel_set_duty (sdm_channel_handle_t chan, int8_t duty)
```
Set the duty cycle of the PDM output signal.

**Note:** For PDM signals, duty cycle refers to the percentage of high level cycles to the whole statistical period. The average output voltage could be $V_{out} = \frac{V_{DD\_IO}}{256} \times duty + \frac{V_{DD\_IO}}{2}$

**Note:** If the duty is set to zero, the output signal is like a 50% duty cycle square wave, with a frequency around $(\text{sample\_rate\_hz} / 4)$. 

```c
  ```
Note: The duty is proportional to the equivalent output voltage after a low-pass-filter.

Note: This function is allowed to run within ISR context

Note: This function will be placed into IRAM if CONFIG_SDM_CTRL_FUNC_IN_IRAM is on, so that it’s allowed to be executed when Cache is disabled

Parameters
- chan - [in] SDM channel created by sdm_new_channel
- duty - [in] Equivalent duty cycle of the PDM output signal, ranges from -128 to 127. But the range of [-90, 90] can provide a better randomness.

Returns
- ESP_OK: Set duty cycle successfully
- ESP_ERR_INVALID_ARG: Set duty cycle failed because of invalid argument
- ESP_FAIL: Set duty cycle failed because of other error

Structures
struct sdm_config_t
 Sigma Delta channel configuration.

Public Members

int gpio_num
 GPIO number

sdm_clock_source_t clk_src
 Clock source

uint32_t sample_rate_hz
 Sample rate in Hz, it determines how frequent the modulator outputs a pulse

uint32_t invert_out
 Whether to invert the output signal

uint32_t io_loop_back
 For debug/test, the signal output from the GPIO will be fed to the input path as well

struct sdm_config_t::[anonymous] flags
 Extra flags

Type Definitions
typedef struct sdm_channel_t *sdm_channel_handle_t
 Type of Sigma Delta channel handle.
Header File

- components/hal/include/hal/sdm_types.h

Type Definitions

typedef soc_periph_sdm_clk_src_t sdm_clock_source_t

2.6.17 SPI Master Driver

SPI Master driver is a program that controls ESP32-C3’s SPI peripherals while they function as masters.

Overview of ESP32-C3’s SPI peripherals

ESP32-C3 integrates 3 SPI peripherals.

- SPI0 and SPI1 are used internally to access the ESP32-C3’s attached flash memory. Both controllers share the same SPI bus signals, and there is an arbiter to determine which can access the bus. Currently, SPI Master driver does not support SPI1 bus.

- SPI2 is a general purpose SPI controller. It has an independent signal bus with the same name. The bus has 6 CS lines to drive up to 6 SPI slaves.

Terminology

The terms used in relation to the SPI master driver are given in the table below.
Chapter 2. API Reference

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Host</strong></td>
<td>The SPI controller peripheral inside ESP32-C3 that initiates SPI transmissions over the bus, and acts as an SPI Master.</td>
</tr>
<tr>
<td><strong>Device</strong></td>
<td>SPI slave device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO, and SCLK signals, but is only active on the bus when the Host asserts the Device’s individual CS line.</td>
</tr>
<tr>
<td><strong>Bus</strong></td>
<td>A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MOSI, MISO, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.</td>
</tr>
<tr>
<td><strong>MOSI</strong></td>
<td>Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device. Also data0 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>MISO</strong></td>
<td>Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host. Also data1 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>SCLK</strong></td>
<td>Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.</td>
</tr>
<tr>
<td><strong>CS</strong></td>
<td>Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.</td>
</tr>
<tr>
<td><strong>QUADWP</strong></td>
<td>Protect signal. Used for 4-bit (qio/qout) transactions. Also for data2 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>QUADHD</strong></td>
<td>Hold signal. Used for 4-bit (qio/qout) transactions. Also for data3 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>DATA4</strong></td>
<td>Data4 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>DATA5</strong></td>
<td>Data5 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>DATA6</strong></td>
<td>Data6 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>DATA7</strong></td>
<td>Data7 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>Assertion</strong></td>
<td>The action of activating a line.</td>
</tr>
<tr>
<td><strong>De-assertion</strong></td>
<td>The action of returning the line back to inactive (back to idle) status.</td>
</tr>
<tr>
<td><strong>Transaction</strong></td>
<td>One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.</td>
</tr>
<tr>
<td><strong>Launch edge</strong></td>
<td>Edge of the clock at which the source register launches the signal onto the line.</td>
</tr>
<tr>
<td><strong>Latch edge</strong></td>
<td>Edge of the clock at which the destination register latches in the signal.</td>
</tr>
</tbody>
</table>

**Driver Features**

The SPI master driver governs communications of Hosts with Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see **SPI Bus Lock**.

**Warning:** The SPI master driver has the concept of multiple Devices connected to a single bus (sharing a single ESP32-C3 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread safe. However, if multiple tasks try to access the same SPI Device, the driver is **not thread-safe**. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time.
- Add a mutex lock around the shared Device using **xSemaphoreCreateMutex**.

**SPI Features**
Chapter 2. API Reference

SPI Master

SPI Bus Lock  To realize the multiplexing of different devices from different drivers, including SPI Master, SPI Flash, etc., an SPI bus lock is applied on each SPI bus. Drivers can attach their devices onto the bus with the arbitration of the lock.

Each bus lock is initialized with a BG (background) service registered. All devices that request transactions on the bus should wait until the BG is successfully disabled.

- For SPI1 bus, the BG is the cache. The bus lock will disable the cache before device operations start, and enable it again after device releases the lock. No devices on SPI1 is allowed to use ISR, since it is meaningless for the task to yield to other tasks when the cache is disabled. The SPI Master driver hasn’t supported SPI1 bus. Only SPI Flash driver can attach to the bus.
- For other buses, the driver may register its ISR as the BG. When a device task requests for exclusive use of the bus, the bus lock will block the task and try to disable ISR. After ISR is successfully disabled, the bus lock will then unblock the device task and allow it to exclusively use the bus. When the task releases the lock, the lock will also try to resume ISR if there are pending transactions in ISR.

SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

<table>
<thead>
<tr>
<th>Phase</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Com-</td>
<td>In this phase, a command (0-16 bit) is written to the bus by the Host.</td>
</tr>
<tr>
<td>mand</td>
<td></td>
</tr>
<tr>
<td>Ad-</td>
<td>In this phase, an address (0-32 bit) is transmitted over the bus by the Host.</td>
</tr>
<tr>
<td>dress</td>
<td></td>
</tr>
<tr>
<td>Write</td>
<td>Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.</td>
</tr>
<tr>
<td>Dummy</td>
<td>This phase is configurable and is used to meet the timing requirements.</td>
</tr>
<tr>
<td>Read</td>
<td>Device sends data to its Host.</td>
</tr>
</tbody>
</table>

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the read and write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the read and write phases are not simultaneous (one direction at a time). The lengths of the write and read phases are determined by `spi_transaction_t::length` and `spi_transaction_t::rxlength` respectively.

The command and address phases are optional, as not every SPI device requires a command and/or address. This is reflected in the Device’s configuration: if `spi_device_interface_config_t::command_bits` and/or `spi_device_interface_config_t::address_bits` are set to zero, no command or address phase will occur.

The read and write phases can also be optional, as not every transaction requires both writing and reading data. If `spi_transaction_t::rx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the read phase is skipped. If `spi_transaction_t::tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the write phase is skipped.
The driver supports two types of transactions: the interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see *Notes on Sending Mixed Transactions to the Same Device*.

**Interrupt Transactions** Interrupt transactions will block the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver will automatically handle them one-by-one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions complete.

**Polling Transactions** Polling transactions do not use interrupts. The routine keeps polling the SPI Host’s status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they will need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1 us to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see *Bus Acquiring*.

**Transaction Line Mode** Supported line modes for ESP32-C3 are listed as follows, to make use of these modes, set the member `flags` in the struct `spi_transaction_t` as shown in the *Transaction Flag* column. If you want to check if corresponding IO pins are set or not, set the member `flags` in the `spi_bus_config_t` as shown in the *Bus IO setting Flag* column.

<table>
<thead>
<tr>

<td>SPI_TRANS_MODE_QIO</td>
<td>SPI_TRANS_MULTILINE_ADDR</td>
</tr>
</tbody>
</table>

**Command and Address Phases** During the command and address phases, the members `spi_transaction_t::cmd` and `spi_transaction_t::addr` are sent to the bus, nothing is read at this time. The default lengths of the command and address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the command and address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::flags` and configure the rest of base as usual. Then the length of each phase will be equal to `spi_transaction_ext_t::command_bits` and `spi_transaction_ext_t::address_bits` set in the struct `spi_transaction_ext_t`.

*Notes on Sending Mixed Transactions to the Same Device* If your Device requires both transaction types, ensure that the transaction routine is blocking the CPU. If not, the CPU may become idle, causing the Device to hang.

*Bus Acquiring* When wrapping a series of polling transactions, ensure that the `spi_device_acquire_bus()` function is called before starting the transactions. This prevents the Queue from blocking the CPU and allows the transactions to complete.

*Command and Address Phases* When declaring the `spi_transaction_ext_t` struct, ensure that the `command_bits` and `address_bits` are set to the correct lengths for your Device and application requirements. Additionally, ensure that the `flags` in the `spi_transaction_ext_t::base` member are set to `SPI_TRANS_VARIABLE_CMD` and/or `SPI_TRANS_VARIABLE_ADDR` if variable lengths are required.

*Submit Document Feedback*
If the command and address phase need to be as the same number of lines as data phase, you need to set `SPI_TRANS_MULTILINE_CMD` and/or `SPI_TRANS_MULTILINE_ADDR` to the `flags` member in the struct `spi_transaction_t`. Also see *Transaction Line Mode*.

**Write and Read Phases** Normally, the data that needs to be transferred to or from a Device will be read from or written to a chunk of memory indicated by the members `spi_transaction_t::rx_buffer` and `spi_transaction_t::tx_buffer`. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory. If *external PSRAM is enabled*, this means using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.
2. 32-bit aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

If using more than one data lines to transmit, please set `SPI_DEVICE_HALFDUPLEX` flag for the member `flags` in the struct `spi_device_interface_config_t`. And the member `flags` in the struct `spi_transaction_t` should be set as described in *Transaction Line Mode*.

**Note:** Half-duplex transactions with both read and write phases are not supported. Please use full duplex mode.

**Bus Acquiring** Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other devices until the bus is released. To acquire and release a bus, use the functions `spi_device_acquire_bus()` and `spi_device_release_bus()`.

**Driver Usage**

- Initialize an SPI bus by calling the function `spi_bus_initialize()`. Make sure to set the correct I/O pins in the struct `spi_bus_config_t`. Set the signals that are not needed to -1.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the device might need with the parameter `dev_config`. You should now have obtained the Device’s handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
  - **Interrupt** Either queue all transactions by calling the function `spi_device_queue_trans()` and, at a later time, query the result using the function `spi_device_get_trans_result()`, or handle all requests synchronously by feeding them into `spi_device_transmit()`.
  - **Polling** Call the function `spi_device_polling_transmit()` to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using `spi_device_polling_start()` and `spi_device_polling_end()`.

- (Optional) To perform back-to-back transactions with a Device, call the function `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()` after the transactions have been sent.
- (Optional) To unload the driver for a certain Device, call `spi_bus_remove_device()` with the Device handle as an argument.
- (Optional) To remove the driver for a bus, make sure no more drivers are attached and call `spi_bus_free()`.

The example code for the SPI master driver can be found in the `peripherals/spi_master` directory of ESP-IDF examples.

**Transactions with Data Not Exceeding 32 Bits** When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the
 spi_transaction_t::tx_data member and setting the SPI_TRANS_USE_TXDATA flag on the transmission. For received data, use spi_transaction_t::rx_data and set SPI_TRANS_USE_RXDATA. In both cases, do not touch the spi_transaction_t::tx_buffer or spi_transaction_t::rx_buffer members, because they use the same memory locations as spi_transaction_t::tx_data and spi_transaction_t::rx_data.

Transactions with Integers Other Than uint8_t An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB first used in rare cases. If a value less than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if 0b00010 needs to be sent, it should be written into a uint8_t variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional “random” bits, so the reading must be performed correctly.

On top of that, ESP32-C3 is a little-endian chip, which means that the least significant byte of uint16_t and uint32_t variables is stored at the smallest address. Hence, if uint16_t is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has the size differing from uint8_t arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- SPI_SWAP_DATA_TX for data to be transmitted
- SPI_SWAP_DATA_RX for data received

Notes on Sending Mixed Transactions to the Same Device To reduce coding complexity, send only one type of transactions (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function spi_device_polling_end() after spi_device_polling_start() to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with spi_device_polling_transmit() so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call spi_device_polling_start(). To do that, you can keep calling spi_device_get_trans_result() until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

Transfer Speed Considerations

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

Transaction Duration Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transaction.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.
For interrupt transactions, the CPU can switch to other tasks when a transaction is in progress. This saves the CPU time but increases the transaction duration. See Interrupt Transactions. For polling transactions, it does not block the task but allows to do polling when the transaction is in progress. For more information, see Polling Transactions.

If DMA is enabled, setting up the linked list requires about 2 us per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2 us, but the transaction length is limited to 64 bytes for both write and read.

Typical transaction duration for one byte of data are given below.

- Interrupt Transaction via DMA: 28 µs.
- Interrupt Transaction via CPU: 27 µs.
- Polling Transaction via DMA: 10 µs.
- Polling Transaction via CPU: 9 µs.

**SPI Clock Frequency**  
Transferring each byte takes eight times the clock period $8/f_{spi}$.

**Cache Miss**  
The default config puts only the ISR into the IRAM. Other SPI related functions, including the driver itself and the callback, might suffer from cache misses and will need to wait until the code is read from flash. Select `CONFIG_SPI_MASTER_IN_IRAM` to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache misses.

For an interrupt transaction, the overall cost is $20 + 8n/f_{spi}[MHz][us]$ for $n$ bytes transferred in one transaction. Hence, the transferring speed is: $n/(20 + 8n/f_{spi})$. An example of transferring speed at 8 MHz clock speed is given in the following table.

<table>
<thead>
<tr>
<th>Frequency (MHz)</th>
<th>Transaction Interval (us)</th>
<th>Transaction Length (bytes)</th>
<th>Total Time (us)</th>
<th>Total Speed (KBps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>25</td>
<td>1</td>
<td>26</td>
<td>38.5</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>8</td>
<td>33</td>
<td>242.4</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>16</td>
<td>41</td>
<td>490.2</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>64</td>
<td>89</td>
<td>719.1</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>128</td>
<td>153</td>
<td>836.6</td>
</tr>
</tbody>
</table>

When a transaction length is short, the cost of transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable `CONFIG_SPI_MASTER_ISR_IN_IRAM` and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations will be handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache miss. For more details, see IRAM-Safe Interrupt Handlers.

**Application Example**

The code example for using the SPI master half duplex mode to read/write a AT93C46D EEPROM (8-bit mode) can be found in the `peripherals/spi_master/hd_eeprom` directory of ESP-IDF examples.

**API Reference - SPI Common**

**Header File**

Chapter 2. API Reference

**Structures**

```c
struct spi_line_mode_t
    Line mode of SPI transaction phases: CMD, ADDR, DOUT/DIN.
```

**Public Members**

```c
uint8_t cmd_lines
    The line width of command phase, e.g. 2-line-cmd-phase.

uint8_t addr_lines
    The line width of address phase, e.g. 1-line-addr-phase.

uint8_t data_lines
    The line width of data phase, e.g. 4-line-data-phase.
```

**Enumerations**

```c
enum spi_host_device_t
    Enum with the three SPI peripherals that are software-accessible in it.
    Values:

    enumerator SPI1_HOST
        SPI1.

    enumerator SPI2_HOST
        SPI2.

    enumerator SPI3_HOST
        SPI3.

    enumerator SPI_HOST_MAX
        invalid host value
```

```c
enum spi_clock_source_t
    Values:

    enumerator SPI_CLK_APB
        Select APB as the source clock.

    enumerator SPI_CLK_XTAL
        Select XTAL as the source clock.
```

```c
enum spi_event_t
    SPI Events.
    Values:

    enumerator SPI_EV_BUF_TX
        The buffer has sent data to master.
```
enumerator **SPI_EV_BUF_RX**
   The buffer has received data from master.

enumerator **SPI_EV_SEND_DMA_READY**
   Slave has loaded its TX data buffer to the hardware (DMA).

enumerator **SPI_EV_SEND**
   Master has received certain number of data, the number is determined by Master.

enumerator **SPI_EV_RECV_DMA_READY**
   Slave has loaded its RX data buffer to the hardware (DMA).

enumerator **SPI_EV_RECV**
   Slave has received certain number of data from master, the number is determined by Master.

enumerator **SPI_EV_CMD9**
   Received CMD9 from master.

enumerator **SPI_EV_CMDA**
   Received CMDA from master.

enumerator **SPI_EV_TRANS**
   A transaction has done.

enum **spi_command_t**
   SPI command.
   
   **Values:**
   
   enumerator **SPI_CMD_HD_WRBUF**
   enumerator **SPI_CMD_HD_RDBUF**
   enumerator **SPI_CMD_HD_WRDMA**
   enumerator **SPI_CMD_HD_RDDMA**
   enumerator **SPI_CMD_HD_SEG_END**
   enumerator **SPI_CMD_HD_EN_QPI**
   enumerator **SPI_CMD_HD_WR_END**
   enumerator **SPI_CMD_HD_INT0**
   enumerator **SPI_CMD_HD_INT1**
   enumerator **SPI_CMD_HD_INT2**
Header File

- components/driver/include/driver/spi_common.h

Functions

`esp_err_t spi_bus_initialize (spi_host_device_t host_id, const spi_bus_config_t *bus_config, spi_dma_chan_t dma_chan)`

Initialize a SPI bus.

**Warning:** SPI0/1 is not supported

**Warning:** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning:** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

**Parameters**

- `host_id` - SPI peripheral that controls this bus
- `bus_config` - Pointer to a `spi_bus_config_t` struct specifying how the host should be initialized
- `dma_chan` - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting SPI_DMA_DISABLED limits the size of transactions.
  - Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.
  - Set to SPI_DMA_CH_AUTO to let the driver to allocate the DMA channel.

**Returns**

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

`esp_err_t spi_bus_free (spi_host_device_t host_id)`

Free a SPI bus.

**Warning:** In order for this to succeed, all devices have to be removed first.

**Parameters** `host_id` - SPI peripheral to free

**Returns**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if bus hasn’t been initialized before, or not all devices on the bus are freed
- ESP_OK on success

**Structures**

```c
struct spi_bus_config_t
```

This is a configuration structure for a SPI bus.

---

Espressif Systems 951 Release v5.1-dev-644-g867745a05c

Submit Document Feedback
You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO_MUX or are -1. In that case, the IO_MUX is used, allowing for >40MHz speeds.

**Note:** Be advised that the slave driver does not use the quadwp/quadhd lines and fields in `spi_bus_config_t` referring to these lines will be ignored and can thus safely be left uninitialized.

### Public Members

```c
int mosi_io_num
   // GPIO pin for Master Out Slave In (=spi_d) signal, or -1 if not used.

int data0_io_num
   // GPIO pin for spi data0 signal in quad/octal mode, or -1 if not used.

int miso_io_num
   // GPIO pin for Master In Slave Out (=spi_q) signal, or -1 if not used.

int data1_io_num
   // GPIO pin for spi data1 signal in quad/octal mode, or -1 if not used.

int sclk_io_num
   // GPIO pin for SPI Clock signal, or -1 if not used.

int quadwp_io_num
   // GPIO pin for WP (Write Protect) signal, or -1 if not used.

int data2_io_num
   // GPIO pin for spi data2 signal in quad/octal mode, or -1 if not used.

int quadhd_io_num
   // GPIO pin for HD (Hold) signal, or -1 if not used.

int data3_io_num
   // GPIO pin for spi data3 signal in quad/octal mode, or -1 if not used.

int data4_io_num
   // GPIO pin for spi data4 signal in octal mode, or -1 if not used.

int data5_io_num
   // GPIO pin for spi data5 signal in octal mode, or -1 if not used.

int data6_io_num
   // GPIO pin for spi data6 signal in octal mode, or -1 if not used.

int data7_io_num
   // GPIO pin for spi data7 signal in octal mode, or -1 if not used.
```
**Chapter 2. API Reference**

**int max_transfer_sz**

Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to SOC_SPI_MAXIMUM_BUFFER_SIZE if DMA is disabled.

**uint32_t flags**

Abilities of bus to be checked by the driver. Or-ed value of SPICOMMON_BUSFLAG_* flags.

**int intr_flags**

Interrupt flag for the bus to set the priority, and IRAM attribute, see esp_intr_alloc.h. Note that the EDGE, INTRDISABLED attribute are ignored by the driver. Note that if ESP_INTR_FLAG_IRAM is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

**Macros**

**SPI_MAX_DMA_LEN**

**SPI_SWAP_DATA_TX**(DATA, LEN)

Transform unsigned integer of length <= 32 bits to the format which can be sent by the SPI driver directly.

E.g. to send 9 bits of data, you can:

```c
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points tx_buffer to &data.

**Parameters**

- **DATA** - Data to be sent, can be uint8_t, uint16_t or uint32_t.
- **LEN** - Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.

**SPI_SWAP_DATA_RX**(DATA, LEN)

Transform received data of length <= 32 bits to the format of an unsigned integer.

E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```c
uint16_t data = SPI_SWAP_DATA_RX(*((uint32_t*)t->rx_data, 15);
```

**Parameters**

- **DATA** - Data to be rearranged, can be uint8_t, uint16_t or uint32_t.
- **LEN** - Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.

**SPICOMMON_BUSFLAG_SLAVE**

Initialize I/O in slave mode.

**SPICOMMON_BUSFLAG_MASTER**

Initialize I/O in master mode.

**SPICOMMON_BUSFLAG_IOMUX_PINS**

Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

**SPICOMMON_BUSFLAG_GPIO_PINS**

Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.
SPICOMMON_BUSFLAG_SCLK
Check existing of SCLK pin. Or indicates CLK line initialized.

SPICOMMON_BUSFLAG_MISO
Check existing of MISO pin. Or indicates MISO line initialized.

SPICOMMON_BUSFLAG_MOSI
Check existing of MOSI pin. Or indicates MOSI line initialized.

SPICOMMON_BUSFLAG_DUAL
Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

SPICOMMON_BUSFLAG_WPHD
Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

SPICOMMON_BUSFLAG_QUAD
Check existing of MOSI/MISO/HP/HD pins as output. Or indicates bus able to work under QIO mode.

SPICOMMON_BUSFLAG_IO4_IO7
Check existing of IO4-IO7 pins. Or indicates IO4-IO7 pins initialized.

SPICOMMON_BUSFLAG_OCTAL
Check existing of MOSI/MISO/HP/HID/SPIIO4/SPIIO5/SPIIO6/SPIIO7 pins as output. Or indicates bus able to work under octal mode.

SPICOMMON_BUSFLAG_NATIVE_PINS

Type Definitions
typedef spi_common_dma_t spi_dma_channel_t

Enumerations
enum spi_common_dma_t
SPI DMA channels.
Values:

enumerator SPI_DMA_DISABLED
Do not enable DMA for SPI.

denumerator SPI_DMA_CH_AUTO
Enable DMA, channel is automatically selected by driver.

API Reference - SPI Master

Header File
• components/driver/include/driver/spi_master.h
Functions

`esp_err_t spi_bus_add_device(spi_host_device_t host_id, const spi_device_interface_config_t *dev_config, spi_device_handle_t *handle)`

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

**Note:** While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

**Parameters**
- `host_id` - SPI peripheral to allocate device on
- `dev_config` - SPI interface protocol config for the device
- `handle` - Pointer to variable to hold the device handle

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid or configuration combination is not supported (e.g. `dev_config->post_cb` isn’t set while flag `SPI_DEVICE_NO_RETURN_RESULT` is enabled)
- ESP_ERR_NOT_FOUND if host doesn’t have any free CS slots
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

`esp_err_t spi_bus_remove_device(spi_device_handle_t handle)`

Remove a device from the SPI bus.

**Parameters**
- `handle` - Device handle to free

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if device already is freed
- ESP_OK on success

`esp_err_t spi_device_queue_trans(spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)`

Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

**Note:** Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Parameters**
- `handle` - Device handle obtained using `spi_host_add_dev`
- `trans_desc` - Description of transaction to execute
- `ticks_to_wait` - Ticks to wait until there’s room in the queue; use `portMAX_DELAY` to never time out.

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first)
- ESP_ERR_TIMEOUT if there was no room in the queue before `ticks_to_wait` expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
- ESP_OK on success

`esp_err_t spi_device_get_trans_result(spi_device_handle_t handle, spi_transaction_t **trans_desc, TickType_t ticks_to_wait)`
Get the result of a SPI transaction queued earlier by `spi_device_queue_trans`.
This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

**Parameters**
- `handle` - Device handle obtained using `spi_host_add_dev`
- `trans_desc` - Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by `spi_device_get_trans_result`.
- `ticks_to_wait` - Ticks to wait until there’s a returned item; use `portMAX_DELAY` to never time out.

**Returns**
- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if there was no completed transaction before `ticks_to_wait` expired
- `ESP_OK` on success

```
esp_err_t spi_device_transmit (spi_device_handle_t handle, spi_transaction_t *trans_desc)
```
Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_queue_trans()` followed by `spi_device_get_trans_result()`. Do not use this when there is still a transaction separately queued (started) from `spi_device_queue_trans()` or polling_start/transmit that hasn’t been finalized.

**Note:** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

```
Parameters
- `handle` - Device handle obtained using `spi_host_add_dev`
- `trans_desc` - Description of transaction to execute

Returns
- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success
```
```
esp_err_t spi_device_polling_start (spi_device_handle_t handle, spi_transaction_t *trans_desc,
           TickType_t ticks_to_wait)
```
Immediately start a polling transaction.

**Note:** Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

```
Parameters
- `handle` - Device handle obtained using `spi_host_add_dev`
- `trans_desc` - Description of transaction to execute
- `ticks_to_wait` - Ticks to wait until there’s room in the queue; currently only portMAX_DELAY is supported.

Returns
- `ESP_ERR_INVALID_ARG` if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first)
- `ESP_ERR_TIMEOUT` if the device cannot get control of the bus before `ticks_to_wait` expired
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions are not finished
- `ESP_OK` on success
```
**esp_err_t** **spi_device_polling_end**(spi_device_handle_t handle, TickType_t ticks_to_wait)

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

**Parameters**
- **handle** - Device handle obtained using spi_host_add_dev
- **ticks_to_wait** - Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if the transaction cannot finish before ticks_to_wait expired
- ESP_OK on success

**esp_err_t** **spi_device_polling_transmit**(spi_device_handle_t handle, spi_transaction_t *trans_desc)

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling spi_device_polling_start() followed by spi_device_polling_end(). Do not use this when there is still a transaction that hasn’t been finalized.

**Note:** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultanously.

**Parameters**
- **handle** - Device handle obtained using spi_host_add_dev
- **trans_desc** - Description of transaction to execute

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**esp_err_t** **spi_device_acquire_bus**(spi_device_handle_t device, TickType_t wait)

Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until spi_device_release_bus is called.

**Note:** The function will wait until all the existing transactions have been sent.

**Parameters**
- **device** - The device to occupy the bus.
- **wait** - Time to wait before the the bus is occupied by the device. Currently MUST set to portMAX_DELAY.

**Returns**
- ESP_ERR_INVALID_ARG: wait is not set to portMAX_DELAY.
- ESP_OK: Success.

**void** **spi_device_release_bus**(spi_device_handle_t dev)

Release the SPI bus occupied by the device. All other devices can start sending transactions.

**Parameters**
- **dev** - The device to release the bus.

**int** **spi_get_actual_clock**(int fapb, int hz, int duty_cycle)

Calculate the working frequency that is most close to desired frequency.

**Parameters**
- **fapb** - The frequency of apb clock, should be APB_CLK_FREQ.
- **hz** - Desired working frequency
- **duty_cycle** - Duty cycle of the spi clock
Returns  Actual working frequency that most fit.

```c
void spi_get_timing(bool gpio_is_used, int input_delay_ns, int eff_clk, int *dummy_o, int *cycles_remain_o)
```

Calculate the timing settings of specified frequency and settings.

**Note:** If `*dummy_o` is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

### Parameters
- `gpio_is_used` - True if using GPIO matrix, or False if iomux pins are used.
- `input_delay_ns` - Input delay from SCLK launch edge to MISO data valid.
- `eff_clk` - Effective clock frequency (in Hz) from `spi_get_actual_clock()`.
- `dummy_o` - Address of dummy bits used output. Set to NULL if not needed.
- `cycles_remain_o` - Address of cycles remaining (after dummy bits are used) output.
  - `-1` If too many cycles remaining, suggest to compensate half a clock.
  - `0` If no remaining cycles or dummy bits are not used.
  - Positive value: cycles suggest to compensate.

```c
int spi_get_freq_limit(bool gpio_is_used, int input_delay_ns)
```

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

**Parameters**
- `gpio_is_used` - True if using GPIO matrix, or False if native pins are used.
- `input_delay_ns` - Input delay from SCLK launch edge to MISO data valid.

**Returns** Frequency limit of current configurations.

### Structures

**struct spi_device_interface_config_t**

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

#### Public Members

- `uint8_t command_bits`  
  Default amount of bits in command phase (0-16), used when `SPI_TRANS_VARIABLE_CMD` is not used, otherwise ignored.

- `uint8_t address_bits`  
  Default amount of bits in address phase (0-64), used when `SPI_TRANS_VARIABLE_ADDR` is not used, otherwise ignored.

- `uint8_t dummy_bits`  
  Amount of dummy bits to insert between address and data phase.

- `uint8_t mode`  
  SPI mode, representing a pair of (CPOL, CPHA) configuration:
  - `0`: (0, 0)
  - `1`: (0, 1)
  - `2`: (1, 0)
  - `3`: (1, 1)
uint16_t duty_cycle_pos
Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

uint16_t cs_ena_pretrans
Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

uint8_t cs_ena_posttrans
Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

int clock_speed_hz
Clock speed, divisors of 80MHz, in Hz. See SPI_MASTER_FREQ_\*.

int input_delay_ns
Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it’s suggest to have the right value.

int spics_io_num
CS GPIO pin for this device, or -1 if not used.

uint32_t flags
Bitwise OR of SPI_DEVICE_\* flags.

int queue_size
Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_device_queue_trans but not yet finished using spi_device_get_trans_result) at the same time.

transaction_cb_t pre_cb
Callback to be called before a transmission is started.
This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

transaction_cb_t post_cb
Callback to be called after a transmission has completed.
This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

struct spi_transaction_t
This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

Public Members

uint32_t flags
Bitwise OR of SPI_TRANS_\* flags.

uint16_t cmd

Command data, of which the length is set in the command_bits of spi_device_interface_config_t.

NOTE: this field, used to be “command” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

Example: write 0x0123 and command_bits=12 to send command 0x12, 0x3_ (in previous version, you may have to write 0x3_12).

uint64_t addr

Address data, of which the length is set in the address_bits of spi_device_interface_config_t.

NOTE: this field, used to be “address” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

Example: write 0x123400 and address_bits=24 to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

size_t length

Total data length, in bits.

size_t rxlength

Total data length received, should be not greater than length in full-duplex mode (0 defaults this to the value of length).

void **user

User-defined variable. Can be used to store eg transaction ID.

const void **tx_buffer

Pointer to transmit buffer, or NULL for no MOSI phase.

uint8_t tx_data[4]

If SPI_TRANS_USE_TXDATA is set, data set here is sent directly from this variable.

void **rx_buffer

Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

uint8_t rx_data[4]

If SPI_TRANS_USE_RXDATA is set, data is received directly to this variable.

struct spi_transaction_ext_t

This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to SPI_TRANS_VARIABLE_CMD_ADR to use the bit length here.

Public Members

struct spi_transaction_t base

Transaction data, so that pointer to spi_transaction_t can be converted into spi_transaction_ext_t.

uint8_t command_bits

The command length in this transaction, in bits.
uint8_t **address_bits**

The address length in this transaction, in bits.

uint8_t **dummy_bits**

The dummy length in this transaction, in bits.

**Macros**

**SPI_MASTER_FREQ_8M**

SPI master clock is divided by 80MHz apb clock. Below defines are example frequencies, and are accurate. Be free to specify a random frequency, it will be rounded to closest frequency (to macros below if above 8MHz).

**SPI_MASTER_FREQ_8M**

8MHz

**SPI_MASTER_FREQ_9M**

8.89MHz

**SPI_MASTER_FREQ_10M**

10MHz

**SPI_MASTER_FREQ_11M**

11.43MHz

**SPI_MASTER_FREQ_13M**

13.33MHz

**SPI_MASTER_FREQ_16M**

16MHz

**SPI_MASTER_FREQ_20M**

20MHz

**SPI_MASTER_FREQ_26M**

26.67MHz

**SPI_MASTER_FREQ_40M**

40MHz

**SPI_MASTER_FREQ_80M**

80MHz

**SPI_DEVICE_TXBIT_LSBFIRST**

Transmit command/address/data LSB first instead of the default MSB first.

**SPI_DEVICE_RXBIT_LSBFIRST**

Receive data LSB first instead of the default MSB first.

**SPI_DEVICE_BIT_LSBFIRST**

Transmit and receive LSB first.
**SPI_DEVICE_3WIRE**
Use MOSI (=spid) for both sending and receiving data.

**SPI_DEVICE_POSITIVE_CS**
Make CS positive during a transaction instead of negative.

**SPI_DEVICE_HALFDUPLEX**
Transmit data before receiving it, instead of simultaneously.

**SPI_DEVICE_CLK_AS_CS**
Output clock on CS line if CS is active.

**SPI_DEVICE_NO_DUMMY**
There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).
- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you’re going to work with output only, or read without dummy bits at your own risk.

**SPI_DEVICE_DDRCLK**

**SPI_DEVICE_NO_RETURN_RESULT**
Don’t return the descriptor to the host on completion (use post_cb to notify instead)

**SPI_TRANS_MODE_DIO**
Transmit/receive data in 2-bit mode.

**SPI_TRANS_MODE_QIO**
Transmit/receive data in 4-bit mode.

**SPI_TRANS_USE_RXDATA**
Receive into rx_data member of spi_transaction_t instead into memory at rx_buffer.

**SPI_TRANS_USE_TXDATA**
Transmit tx_data member of spi_transaction_t instead of data at tx_buffer. Do not set tx_buffer when using this.

**SPI_TRANS_MODE_DIOQIO_ADDR**
Also transmit address in mode selected by SPI_MODE_DIO/SPI_MODE_QIO.

**SPI_TRANS_VARIABLE_CMD**
Use the command_bits in spi_transaction_ext_t rather than default value in spi_device_interface_config_t.

**SPI_TRANS_VARIABLE_ADDR**
Use the address_bits in spi_transaction_ext_t rather than default value in spi_device_interface_config_t.
**SPI_TRANS_VARIABLE_DUMMY**
Use the `dummy_bits` in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

**SPI_TRANS_CS_KEEP_ACTIVE**
Keep CS active after data transfer.

**SPI_TRANS_MULTILINE_CMD**
The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase).

**SPI_TRANS_MODE_OCT**
Transmit/receive data in 8-bit mode.

**SPI_TRANS_MULTILINE_ADDR**
The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase).

### Type Definitions

```c
typedef struct spi_transaction_t spi_transaction_t

typedef void (*transaction_cb_t)(spi_transaction_t *trans)

typedef struct spi_device_t *spi_device_handle_t
Handle for a device on a SPI bus.
```

### 2.6.18 SPI Slave Driver

SPI Slave driver is a program that controls ESP32-C3’s SPI peripherals while they function as slaves.

### Overview of ESP32-C3’s SPI peripherals

ESP32-C3 integrates one general purpose SPI controller which can be used as a slave node driven by an off-chip SPI master. The controller is called SPI2 and has an independent signal bus with the same name.

### Terminology

The terms used in relation to the SPI slave driver are given in the table below.
<table>
<thead>

</thead>
<tbody>
<tr>
<td>Host</td>
<td>The SPI controller peripheral external to ESP32-C3 that initiates SPI transmissions over the bus, and acts as an SPI Master.</td>
</tr>
<tr>
<td>Device</td>
<td>SPI slave device (general purpose SPI controller). Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.</td>
</tr>
<tr>
<td>Bus</td>
<td>A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.</td>
</tr>
<tr>
<td>MISO</td>
<td>Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.</td>
</tr>
<tr>
<td>MOSI</td>
<td>Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device.</td>
</tr>
<tr>
<td>SCLK</td>
<td>Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.</td>
</tr>
<tr>
<td>CS</td>
<td>Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.</td>
</tr>
<tr>
<td>QUADWP</td>
<td>Write Protect signal. Only used for 4-bit (qio/qout) transactions.</td>
</tr>
<tr>
<td>QUADHD</td>
<td>Hold signal. Only used for 4-bit (qio/qout) transactions.</td>
</tr>
<tr>
<td>Assertion</td>
<td>The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called de-assertion.</td>
</tr>
<tr>
<td>Transaction</td>
<td>One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.</td>
</tr>
<tr>
<td>Launch Edge</td>
<td>Edge of the clock at which the source register launches the signal onto the line.</td>
</tr>
<tr>
<td>Latch Edge</td>
<td>Edge of the clock at which the destination register latches in the signal.</td>
</tr>
</tbody>
</table>

**Driver Features**

The SPI slave driver allows using the SPI peripherals as full-duplex Devices. The driver can send/receive transactions up to 64 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some known issues related to DMA.

**SPI Transactions**

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.

The attributes of a transaction are determined by the configuration structure for an SPI peripheral acting as a slave device spi_slave_interface_config_t, and transaction configuration structure spi_slave_transaction_t.

As not every transaction requires both writing and reading data, you have a choice to configure the spi_transaction_t structure for TX only, RX only, or TX and RX transactions. If spi_slave_transaction_t::rx_buffer is set to NULL, the read phase will be skipped. If spi_slave_transaction_t::tx_buffer is set to NULL, the write phase will be skipped.

**Note:** A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see Transaction Interval.
Driver Usage

- Initialize an SPI peripheral as a Device by calling the function `spi_slave_initialize`. Make sure to set the correct I/O pins in the struct `bus_config`. Set the unused signals to −1.
- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.
- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

Transaction Data and Master/Slave Length Mismatches

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `spi_slave_transaction_t::rx_buffer` and `spi_slave_transaction_t::tx_buffer`. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by `spi_slave_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction’s length is determined by the clock and CS lines driven by the Host. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `spi_slave_transaction_t::length` member will be sent and received. In this case, `spi_slave_transaction_t::trans_len` is set to `spi_slave_transaction_t::length` instead of the actual transaction length. To meet the actual transaction length requirements, set `spi_slave_transaction_t::length` to a value greater than the maximum `spi_slave_transaction_t::trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

Speed and Timing Considerations

Transaction Interval  The ESP32-C3 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device’s response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in `peripherals/spi_slave`.

SCLK Frequency Requirements  The SPI slaves are designed to operate at up to 60 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

Restrictions and Known Issues

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied.
   Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.
Application Example

The code example for Device/Host communication can be found in the peripherals/spi_slave directory of ESP-IDF examples.

API Reference

Header File

- components/driver/include/driver/spi_slave.h

Functions

```c
esp_err_t spi_slave_initialize(spi_host_device_t host, const spi_bus_config_t *bus_config, const spi_slave_interface_config_t *slave_config, spi_dma_chan_t dma_chan)
```

Initialize a SPI bus as a slave interface.

**Warning:** SPI0/1 is not supported

**Warning:** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning:** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

**Parameters**

- `host` - SPI peripheral to use as a SPI slave interface
- `bus_config` - Pointer to a `spi_bus_config_t` struct specifying how the host should be initialized
- `slave_config` - Pointer to a `spi_slave_interface_config_t` struct specifying the details for the slave interface
- `dma_chan` - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.  
  - Selecting SPI_DMA_DISABLED limits the size of transactions.  
  - Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.  
  - Set to SPI_DMA_CH_AUTO to let the driver to allocate the DMA channel.

**Returns**

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

```c
esp_err_t spi_slave_free(spi_host_device_t host)
```

Free a SPI bus claimed as a SPI slave interface.

**Parameters** `host` - SPI peripheral to free

**Returns**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if not all devices on the bus are freed
- ESP_OK on success
**esp_err_t** **spi_slave_queue_trans**( **spi_host_device_t** host, const **spi_slave_transaction_t** *trans_desc, 
**TickType_t** ticks_to_wait)

Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via `spi_slave_initialize`.) This function may block if the queue is full (depending on the `ticks_to_wait` parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in `trans_desc` to the SPI slave driver; the application is not to access this memory until `spi_slave_queue_trans` is called to hand ownership back to the application.

**Parameters**

- **host** - SPI peripheral that is acting as a slave
- **trans_desc** - Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait** - Ticks to wait until there’s room in the queue; use `portMAX_DELAY` to never time out.

**Returns**

- **ESP_ERR_INVALID_ARG** if parameter is invalid
- **ESP_OK** on success

**esp_err_t** **spi_slave_get_trans_result**( **spi_host_device_t** host, **spi_slave_transaction_t** **trans_desc**, 
**TickType_t** ticks_to_wait)

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with `spi_slave_queue_trans`) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by `spi_slave_queue_trans`.

**Parameters**

- **host** - SPI peripheral to that is acting as a slave
- **trans_desc** - [out] Pointer to variable able to contain a pointer to the description of the transaction that is executed
- **ticks_to_wait** - Ticks to wait until there’s a returned item; use `portMAX_DELAY` to never time out.

**Returns**

- **ESP_ERR_INVALID_ARG** if parameter is invalid
- **ESP_OK** on success

**esp_err_t** **spi_slave_transmit**( **spi_host_device_t** host, **spi_slave_transaction_t** *trans_desc, **TickType_t** 
**ticks_to_wait**)

Do a SPI transaction.

Essentially does the same as `spi_slave_queue_trans` followed by `spi_slave_get_trans_result`. Do not use this when there is still a transaction queued that hasn’t been finalized using `spi_slave_get_trans_result`.

**Parameters**

- **host** - SPI peripheral to that is acting as a slave
- **trans_desc** - Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait** - Ticks to wait until there’s a returned item; use `portMAX_DELAY` to never time out.

**Returns**

- **ESP_ERR_INVALID_ARG** if parameter is invalid
- **ESP_OK** on success
Chapter 2. API Reference

Structures

struct `spi_slave_interface_config_t`
This is a configuration for a SPI host acting as a slave device.

Public Members

```c
int spics_io_num
```
CS GPIO pin for this device.

```c
uint32_t flags
```
Bitwise OR of SPI_SLAVE_* flags.

```c
int queue_size
```
Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_slave_queue_trans but not yet finished using spi_slave_get_trans_result) at the same time.

```c
uint8_t mode
```
SPI mode, representing a pair of (CPOL, CPHA) configuration:
- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

```c
slave_transaction_cb_t post_setup_cb
```
Callback called after the SPI registers are loaded with new data.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

```c
slave_transaction_cb_t post_trans_cb
```
Callback called after a transaction is done.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

struct `spi_slave_transaction_t`
This structure describes one SPI transaction

Public Members

```c
size_t length
```
Total data length, in bits.

```c
size_t trans_len
```
Transaction data length, in bits.

```c
const void *tx_buffer
```
Pointer to transmit buffer, or NULL for no MOSI phase.
void *rx_buffer

Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (rx_buffer % 4 == 0), and has length of a multiple of 4 bytes.

void *user

User-defined variable. Can be used to store eg transaction ID.

Macros

SPI_SLAVE_TXBIT_LSBFIRST

Transmit command/address/data LSB first instead of the default MSB first.

SPI_SLAVE_RXBIT_LSBFIRST

Receive data LSB first instead of the default MSB first.

SPI_SLAVE_BIT_LSBFIRST

Transmit and receive LSB first.

Type Definitions

typedef struct spi_slave_transaction_t spi_slave_transaction_t

typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)

2.6.19 Temperature Sensor

Introduction

The ESP32-C3 has a built-in sensor used to measure the chip’s internal temperature. The temperature sensor module contains an 8-bit Sigma-Delta ADC and a DAC to compensate for the temperature offset. Due to restrictions of hardware, the sensor has predefined measurement ranges with specific measurement errors. See the table below for details.

<table>
<thead>
<tr>
<th>predefined range (°C)</th>
<th>error (°C)</th>
</tr>
</thead>
<tbody>
<tr>
<td>50 ~ 125</td>
<td>&lt; 3</td>
</tr>
<tr>
<td>20 ~ 100</td>
<td>&lt; 2</td>
</tr>
<tr>
<td>-10 ~ 80</td>
<td>&lt; 1</td>
</tr>
<tr>
<td>-30 ~ 50</td>
<td>&lt; 2</td>
</tr>
<tr>
<td>-40 ~ 20</td>
<td>&lt; 3</td>
</tr>
</tbody>
</table>

Note: The temperature sensor is designed primarily to measure the temperature changes inside the chip. The temperature value depends on factors like microcontroller clock frequency or I/O load. Generally, the chip’s internal temperature might be higher than the ambient temperature.

Functional Overview

- **Resource Allocation** - covers which parameters should be set up to get a temperature sensor handle and how to recycle the resources when temperature sensor finishes working.
- **Enable and Disable Temperature Sensor** - covers how to enable and disable the temperature sensor.
- **Get Temperature Value** - covers how to get the real-time temperature value.
• **Power Management** - covers how temperature sensor is affected when changing power mode (i.e. light sleep).
• **Thread Safety** - covers how to make the driver to be thread safe.

**Resource Allocation** The ESP32-C3 has just one built-in temperature sensor hardware. The temperature sensor instance is represented by `temperature_sensor_handle_t`, which is also the bond of the context. It would always be the parameter of the temperature APIs with the information of hardware and configurations, so user can just create a pointer of type `temperature_sensor_handle_t` and passing to APIs as needed.

In order to install a built-in temperature sensor instance, the first thing is to evaluate the temperature range in your detection environment (For example: if the testing environment is in a room, the range you evaluate might be 10°C ~ 30°C; if the testing in a lamp bulb, the range you evaluate might be 60°C ~ 110°C). Based on that, the following configuration structure should be defined in advance: `temperature_sensor_config_t`:

- **range_min**. The minimum value of testing range you have evaluated.
- **range_max**. The maximum value of testing range you have evaluated.

After the ranges are set, the structure could be passed to `temperature_sensor_install()`, which will instantiate the temperature sensor instance and return a handle.

As mentioned above, different measure ranges have different measurement errors. The user doesn’t need to care about the measurement error because we have an internal mechanism to choose the minimum error according to the given range.

If the temperature sensor is no longer needed, you need to call `temperature_sensor_uninstall()` to free the temperature sensor resource.

**Creating a Temperature Sensor Handle**

- Step1: Evaluate the testing range. In this example, the range is 20°C ~ 50°C.
- Step2: Configure the range and obtain a handle

```c
temperature_sensor_handle_t temp_handle = NULL;
temperature_sensor_config_t temp_sensor = {
  .range_min = 20,
  .range_max = 50,
};
ESP_ERROR_CHECK(temperature_sensor_install(&temp_sensor, &temp_handle));
```

**Enable and Disable Temperature Sensor**

1. Enable the temperature sensor by calling `temperature_sensor_enable()`. The internal temperature sensor circuit will start to work. The driver state will transit from init to enable.
2. To Disable the temperature sensor, please call `temperature_sensor_disable()`.

**Get Temperature Value** After the temperature sensor is enabled by `temperature_sensor_enable()`, user can get the current temperature by calling `temperature_sensor_get_celsius()`.

```c
// Enable temperature sensor
ESP_ERROR_CHECK(temperature_sensor_enable(temp_handle));

// Get converted sensor data
float tsens_out;
ESP_ERROR_CHECK(temperature_sensor_get_celsius(temp_handle, &tsens_out));
printf("Temperature in %f °C\n", tsens_out);
// Disable the temperature sensor if it’s not needed and save the power
ESP_ERROR_CHECK(temperature_sensor_disable(temp_handle));
```

**Power Management** When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), temperature sensor will still keep working because it uses XTAL clock (on ESP32-C3) or RTC clock (on ESP32-S2/S3).
Thread Safety  In temperature sensor we don’t add any protection to keep the thread safe. Because from the common usage, temperature sensor should only be called in one task. If you must use this driver in different tasks, please add extra locks to protect it.

Unexpected Behaviors

1. The value user gets from the chip is usually different from the ambient temperature. It is because the temperature sensor is built inside the chip. To some extent, it measures the temperature of the chip.
2. When installing the temperature sensor, the driver gives a ‘the boundary you gave cannot meet the range of internal temperature sensor’ error feedback. It is because the built-in temperature sensor has testing limit. The error due to setting temperature_sensor_config_t:
   (1) Totally out of range, like 200 °C ~ 300 °C.
   (2) Cross the boundary of each predefined measurement. like 40 °C ~ 110 °C.

Application Example

• Temperature sensor reading example: peripherals/temp_sensor.

API Reference

Header File

• components/driver/include/driver/temperature_sensor.h

Functions

esp_err_t temperature_sensor_install (const temperature_sensor_config_t *tsens_config,
                                    temperature_sensor_handle_t *ret_tsens)

Install temperature sensor driver.

Parameters

• tsens_config – Pointer to config structure.
• ret_tsens – Return the pointer of temperature sensor handle.

Returns

• ESP_OK if succeed

esp_err_t temperature_sensor_uninstall (temperature_sensor_handle_t tsens)

Uninstall the temperature sensor driver.

Parameters tsens -The handle created by temperature_sensor_install().

Returns

• ESP_OK if succeed.

esp_err_t temperature_sensor_enable (temperature_sensor_handle_t tsens)

Enable the temperature sensor.

Parameters tsens -The handle created by temperature_sensor_install().

Returns

• ESP_OK Success
• ESP_ERR_INVALID_STATE if temperature sensor is enabled already.

esp_err_t temperature_sensor_disable (temperature_sensor_handle_t tsens)

Disable temperature sensor.

Parameters tsens -The handle created by temperature_sensor_install().

Returns

• ESP_OK Success
• ESP_ERR_INVALID_STATE if temperature sensor is not enabled yet.
**esp_err_t** `temperature_sensor_get_celsius`(temperature_sensor_handle_t tsens, float *out_celsius)

Read temperature sensor data that is converted to degrees Celsius.

**Note:** Should not be called from interrupt.

**Parameters**

- `tsens` - The handle created by `temperature_sensor_install()`.
- `out_celsius` - The measure output value.

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG invalid arguments
- ESP_ERR_INVALID_STATE Temperature sensor is not enabled yet.
- ESP_FAIL Parse the sensor data into ambient temperature failed (e.g. out of the range).

**Structures**

```c
struct temperature_sensor_config_t

Configuration of measurement range for the temperature sensor.
```

**Note:** If you see the log the boundary you gave cannot meet the range of internal temperature sensor. You may need to refer to predefined range listed doc api-reference/peripherals/Temperature sensor.

**Public Members**

```c
int range_min

the minimum value of the temperature you want to test
```

```c
int range_max

the maximum value of the temperature you want to test
```

```c
temperature_sensor_clk_src_t clk_src

the clock source of the temperature sensor.
```

**Macros**

`TEMPPAATURE_SENSOR_CONFIG_DEFAULT`(min, max)

`temperature_sensor_config_t` default constructure

**Type Definitions**

```c
typedef struct temperature_sensor_obj_t *temperature_sensor_handle_t

Type of temperature sensor driver handle.
```

### 2.6.20 Two-Wire Automotive Interface (TWAI)

**Overview**

The Two-Wire Automotive Interface (TWAI) is a real-time serial communication protocol suited for automotive and industrial applications. It is compatible with ISO11898-1 Classical frames, thus can support Standard Frame Format
(11-bit ID) and Extended Frame Format (29-bit ID). The ESP32-C3’s peripherals contains a TWAI controller that can be configured to communicate on a TWAI bus via an external transceiver.

**Warning:** The TWAI controller is not compatible with ISO11898-1 FD Format frames, and will interpret such frames as errors.

This programming guide is split into the following sections:

**Sections**

- **Two-Wire Automotive Interface (TWAI)**
  - Overview
  - TWAI Protocol Summary
  - Signals Lines and Transceiver
  - Driver Configuration
  - Driver Operation
  - Examples
  - API Reference

**TWAI Protocol Summary**

The TWAI is a multi-master, multi-cast, asynchronous, serial communication protocol. TWAI also supports error detection and signalling, and inbuilt message prioritization.

**Multi-master:** Any node on the bus can initiate the transfer of a message.

**Multi-cast:** When a node transmits a message, all nodes on the bus will receive the message (i.e., broadcast) thus ensuring data consistency across all nodes. However, some nodes can selectively choose which messages to accept via the use of acceptance filtering (multi-cast).

**Asynchronous:** The bus does not contain a clock signal. All nodes on the bus operate at the same bit rate and synchronize using the edges of the bits transmitted on the bus.

**Error Detection and Signalling:** Every node will constantly monitor the bus. When any node detects an error, it will signal the detection by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This will result in an error detection being propagated to all nodes on the bus.

**Message Priorities:** Messages contain an ID field. If two or more nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID value will win arbitration of the bus. All other nodes will become receivers ensuring that there is at most one transmitter at any time.

**TWAI Messages**

TWAI Messages are split into Data Frames and Remote Frames. Data Frames are used to deliver a data payload to other nodes, whereas a Remote Frame is used to request a Data Frame from other nodes (other nodes can optionally respond with a Data Frame). Data and Remote Frames have two frame formats known as **Extended Frame** and **Standard Frame** which contain a 29-bit ID and an 11-bit ID respectively. A TWAI message consists of the following fields:

- 29-bit or 11-bit ID: Determines the priority of the message (lower value has higher priority).
- Data Length Code (DLC) between 0 to 8: Indicates the size (in bytes) of the data payload for a Data Frame, or the amount of data to request for a Remote Frame.
- Up to 8 bytes of data for a Data Frame (should match DLC).

**Error States and Counters**

The TWAI protocol implements a feature known as “fault confinement” where a persistently erroneous node will eventually eliminate itself form the bus. This is implemented by requiring every node to maintain two internal error counters known as the **Transmit Error Counter** (TEC) and the **Receive Error Counter** (REC). The two error counters are incremented and decremented according to a set of rules (where the
counters increase on an error, and decrease on a successful message transmission/reception). The values of the counters are used to determine a node’s error state, namely Error Active, Error Passive, and Bus-Off.

**Error Active:** A node is Error Active when both TEC and REC are less than 128 and indicates that the node is operating normally. Error Active nodes are allowed to participate in bus communications, and will actively signal the detection of any errors by automatically transmitting an Active Error Flag over the bus.

**Error Passive:** A node is Error Passive when either the TEC or REC becomes greater than or equal to 128. Error Passive nodes are still able to take part in bus communications, but will instead transmit a Passive Error Flag upon detection of an error.

**Bus-Off:** A node becomes Bus-Off when the TEC becomes greater than or equal to 256. A Bus-Off node is unable to influence the bus in any manner (essentially disconnected from the bus) thus eliminating itself from the bus. A node will remain in the Bus-Off state until it undergoes bus-off recovery.

**Signals Lines and Transceiver**

The TWAI controller does not contain an integrated transceiver. Therefore, to connect the TWAI controller to a TWAI bus, an external transceiver is required. The type of external transceiver used should depend on the application’s physical layer specification (e.g. using SN65HVD23x transceivers for ISO 11898-2 compatibility).

The TWAI controller’s interface consists of 4 signal lines known as TX, RX, BUS-OFF, and CLKOUT. These four signal lines can be routed through the GPIO Matrix to the ESP32-C3’s GPIO pads.

![Fig. 15: Signal lines of the TWAI controller](image)

**TX and RX:** The TX and RX signal lines are required to interface with an external transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0V), and a recessive bit as a high logic level (3.3V).

**BUS-OFF:** The BUS-OFF signal line is optional and is set to a low logic level (0V) whenever the TWAI controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3V) otherwise.

**CLKOUT:** The CLKOUT signal line is optional and outputs a prescaled version of the controller’s source clock (APB Clock).

**Note:** An external transceiver must internally loopback the TX to RX such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the TWAI controller to interpret differences in logic levels between the two signal lines as a loss in arbitration or a bit error.
Driver Configuration

This section covers how to configure the TWAI driver.

Operating Modes  The TWAI driver supports the following modes of operations:

Normal Mode: The normal operating mode allows the TWAI controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another node is required when transmitting a message.

No Ack Mode: The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required for a message transmission to be considered successful. This mode is useful when self testing the TWAI controller (loopback of transmissions).

Listen Only Mode: This mode will prevent the TWAI controller from influencing the bus. Therefore, transmission of messages/acknowledgement/error frames will be disabled. However the TWAI controller will still be able to receive messages but will not acknowledge the message. This mode is suited for bus monitor applications.

Alerts  The TWAI driver contains an alert feature that is used to notify the application layer of certain TWAI controller or TWAI bus events. Alerts are selectively enabled when the TWAI driver is installed, but can be reconfigured during runtime by calling `twai_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `twai_read_alerts()`. The TWAI driver supports the following alerts:

<table>
<thead>
<tr>
<th>Alert Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TWAI_ALERT_TX_IDLE</td>
<td>No more messages queued for transmission</td>
</tr>
<tr>
<td>TWAI_ALERT_TX_SUCCESS</td>
<td>The previous transmission was successful</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_DATA</td>
<td>A frame has been received and added to the RX queue</td>
</tr>
<tr>
<td>TWAI_ALERT_BELOW_ERR_WARN</td>
<td>Both error counters have dropped below error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_ERR_ACTIVE</td>
<td>TWAI controller has become error active</td>
</tr>
<tr>
<td>TWAI_ALERT_RECOVERY_IN_PROGRESS</td>
<td>TWAI controller is undergoing bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_RECOVERED</td>
<td>TWAI controller has successfully completed bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_ARB_LOST</td>
<td>The previous transmission lost arbitration</td>
</tr>
<tr>
<td>TWAI_ALERT_ABOVE_ERR_WARN</td>
<td>One of the error counters have exceeded the error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_ERROR</td>
<td>A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus</td>
</tr>
<tr>
<td>TWAI_ALERT_TX_FAILED</td>
<td>The previous transmission has failed</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_QUEUE_FULL</td>
<td>The RX queue is full causing a received frame to be lost</td>
</tr>
<tr>
<td>TWAI_ALERT_ERR_PASS</td>
<td>TWAI controller has become error passive</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_OFF</td>
<td>Bus-off condition occurred. TWAI controller can no longer influence bus</td>
</tr>
</tbody>
</table>

Note:  The TWAI controller’s error warning limit is used to preemptively warn the application of bus errors before the error passive state is reached. By default, the TWAI driver sets the error warning limit to 96. The TWAI_ALERT_ABOVE_ERR_WARN is raised when the TEC or REC becomes larger than or equal to the error warning limit. The TWAI_ALERT_BELOW_ERR_WARN is raised when both TEC and REC return back to values below 96.

Note:  When enabling alerts, the TWAI_ALERT_AND_LOG flag can be used to cause the TWAI driver to log any raised alerts to UART. However, alert logging is disabled and TWAI_ALERT_AND_LOG if the CONFIG_TWAI_ISR_IN_IRAM option is enabled (see Placing ISR into IRAM).

Note:  The TWAI_ALERT_ALL and TWAI_ALERT_NONE macros can also be used to enable/disable all alerts.
Bit Timing  The operating bit rate of the TWAI driver is configured using the `twai_timing_config_t` structure. The period of each bit is made up of multiple time quanta, and the period of a time quantum is determined by a prescaled version of the TWAI controller’s source clock. A single bit contains the following segments in the following order:

1. The Synchronization Segment consists of a single time quantum
2. Timing Segment 1 consists of 1 to 16 time quanta before sample point
3. Timing Segment 2 consists of 1 to 8 time quanta after sample point

The Baudrate Prescaler is used to determine the period of each time quantum by dividing the TWAI controller’s source clock (80 MHz APB clock). On the ESP32-C3, the brp can be any even number from 2 to 16384.

![Fig. 16: Bit timing configuration for 500kbit/s given BRP = 8](image)

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling Triple Sampling will cause 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The Synchronization Jump Width is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. sjw can range from 1 to 4.

**Note:** Multiple combinations of brp, tseg_1, tseg_2, and sjw can achieve the same bit rate. Users should tune these values to the physical characteristics of their bus by taking into account factors such as propagation delay, node information processing time, and phase errors.

Bit timing macro initializers are also available for commonly used bit rates. The following macro initializers are provided by the TWAI driver.

- TWAI_TIMING_CONFIG_1MBITS()
- TWAI_TIMING_CONFIG_800KBITS()
- TWAI_TIMING_CONFIG_500KBITS()
- TWAI_TIMING_CONFIG_250KBITS()
- TWAI_TIMING_CONFIG_125KBITS()
- TWAI_TIMING_CONFIG_100KBITS()
- TWAI_TIMING_CONFIG_50KBITS()
- TWAI_TIMING_CONFIG_25KBITS()
- TWAI_TIMING_CONFIG_20KBITS()
- TWAI_TIMING_CONFIG_16KBITS()
- TWAI_TIMING_CONFIG_12_5KBITS()
- TWAI_TIMING_CONFIG_10KBITS()
- TWAI_TIMING_CONFIG_5KBITS()
- TWAI_TIMING_CONFIG_1KBITS()

**Acceptance Filter**  The TWAI controller contains a hardware acceptance filter which can be used to filter messages of a particular ID. A node that filters out a message will not receive the message, but will still acknowledge it. Acceptance filters can make a node more efficient by filtering out messages sent over the bus that are irrelevant to the
node. The acceptance filter is configured using two 32-bit values within `twai_filter_config_t` known as the acceptance code and the acceptance mask.

The acceptance code specifies the bit sequence which a message’s ID, RTR, and data bytes must match in order for the message to be received by the TWAI controller. The acceptance mask is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for a messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under Single or Dual Filter Mode. Single Filter Mode will use the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame’s 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

![Fig. 17: Bit layout of single filter mode (Right side MSBit)](image)

Dual Filter Mode will use the acceptance code and mask to define two separate filters allowing for increased flexibility of ID’s to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Dual Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

![Fig. 18: Bit layout of dual filter mode (Right side MSBit)](image)

Disabling TX Queue The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `twai_general_config_t` to 0. This will allow applications that do not require message transmission to save a small amount of memory when using the TWAI driver.

Placing ISR into IRAM The TWAI driver’s ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the TWAI driver’s functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR will continue to:

- Read received messages from the RX buffer and place them into the driver’s RX queue.
- Load messages pending transmission from the driver’s TX queue and write them into the TX buffer.

To place the TWAI driver’s ISR, users must do the following:

- Enable the `CONFIG_TWAI_ISR_IN_IRAM` option using `idf.py` menuconfig.
- When calling `twai_driver_install()`, the `intr_flags` member of `twai_general_config_t` should set the `ESP_INTR_FLAG_IRAM` set.

**Note:** When the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled, the TWAI driver will no longer log any alerts (i.e., the TWAI_ALERT_AND_LOG flag will not have any effect).
**Driver Operation**

The TWAI driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

![State transition diagram of the TWAI driver](image)

**Fig. 19: State transition diagram of the TWAI driver (see table below)**

</tr>
</tbody>
</table>

**Driver States**

**Uninstalled:** In the uninstalled state, no memory is allocated for the driver and the TWAI controller is powered OFF.

**Stopped:** In this state, the TWAI controller is powered ON and the TWAI driver has been installed. However the TWAI controller will be unable to take part in any bus activities such as transmitting, receiving, or acknowledging messages.

**Running:** In the running state, the TWAI controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore the TWAI controller will be able to transmit error frames upon detection of errors on the bus.

**Bus-Off:** The bus-off state is automatically entered when the TWAI controller’s Transmit Error Counter becomes greater than or equal to 256. The bus-off state indicates the occurrence of severe errors on the bus or in the TWAI controller. Whilst in the bus-off state, the TWAI controller will be unable to take part in any bus activities. To exit the bus-off state, the TWAI controller must undergo the bus recovery process.

**Recovering:** The recovering state is entered when the TWAI controller undergoes bus recovery. The TWAI controller/TWAI driver will remain in the recovering state until the 128 occurrences of 11 consecutive recessive bits is observed on the bus.

**Message Fields and Flags**

The TWAI driver distinguishes different types of messages by using the various bit field members of the `twai_message_t` structure. These bit field members determine whether a message is in standard or extended format, a remote frame, and the type of transmission to use when transmitting such a message.

These bit field members can also be toggled using the the `flags` member of `twai_message_t` and the following message flags:
<table>
<thead>
<tr>
<th>Message Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TWAI_MSG_FLAG_EXTD</td>
<td>Message is in Extended Frame Format (29bit ID)</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_RTR</td>
<td>Message is a Remote Frame (Remote Transmission Request)</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_RTR</td>
<td>Message of remote frame.</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_SS</td>
<td>Transmit message using Single Shot Transmission (Message will not be re-transmitted upon error or loss of arbitration). Unused for received message.</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_SELF</td>
<td>Transmit message using Self Reception Request (Transmitted message will also be received by the same node). Unused for received message.</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_DLC_NON_COMP</td>
<td>Message’s Data length code is larger than 8. This will break compliance with TWAI</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_NONE</td>
<td>Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.</td>
</tr>
</tbody>
</table>

### Examples

#### Configuration & Installation
The following code snippet demonstrates how to configure, install, and start the TWAI driver via the use of the various configuration structures, macro initializers, the `twai_driver_install()` function, and the `twai_start()` function.

```c
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main()
{
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_NUM_22, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install TWAI driver
    if (twai_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
        return;
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start TWAI driver
    if (twai_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }

    ...
}
```

The usage of macro initializers is not mandatory and each of the configuration structures can be manually.

#### Message Transmission
The following code snippet demonstrates how to transmit a message via the usage of the `twai_message_t` type and `twai_transmit()` function.

```c
#include "driver/twai.h"
...
```
//Configure message to transmit
    twai_message_t message;
    message.identifier = 0xAAAA;
    message.extd = 1;
    message.data_length_code = 4;
    for (int i = 0; i < 4; i++) {
        message.data[i] = 0;
    }

//Queue message for transmission
if (twai_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}

Message Reception  The following code snippet demonstrates how to receive a message via the usage of the
twai_message_t type and twai_receive() function.

#include "driver/twai.h"
...

//Wait for message to be received
    twai_message_t message;
if (twai_receive(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}

//Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}
printf("ID is %d\n", message.identifier);
if (!message.rtr) {
    for (int i = 0; i < message.data_length_code; i++) {
        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}

Reconfiguring and Reading Alerts  The following code snippet demonstrates how to reconfigure and read TWAI
driver alerts via the use of the twai_reconfigure_alerts() and twai_read_alerts() functions.

#include "driver/twai.h"
...

//Reconfigure alerts to detect Error Passive and Bus-Off error states
    uint32_t alerts_to_enable = TWAI_ALERT_ERR_PASS | TWAI_ALERT_BUS_OFF;
if (twai_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts");
}
Stop and Uninstall  The following code demonstrates how to stop and uninstall the TWAI driver via the use of the 
twai_stop() and twai_driver_uninstall() functions.

```
#include "driver/twai.h"
...
//Stop the TWAI driver
if (twai_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

//Uninstall the TWAI driver
if (twai_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}
```

Multiple ID Filter Configuration  The acceptance mask in twai_filter_config_t can be configured such 
that two or more IDs will be accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting 
bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the 
IDs.

The following example shows how the calculate the acceptance mask given multiple IDs:

```
ID1 = 11'b101 1010 0000
ID2 = 11'b101 1010 0001
ID3 = 11'b101 1010 0100
ID4 = 11'b101 1010 1000
//Acceptance Mask
MASK = 11'b000 0000 1101
```

Application Examples  Network Example: The TWAI Network example demonstrates communication between 
two ESP32-C3s using the TWAI driver API. One TWAI node acts as a network master that initiates and ceases 
the transfer of a data from another node acting as a network slave. The example can be found via peripherals/twai/twai_network.

Alert and Recovery Example: This example demonstrates how to use the TWAI driver’s alert and bus-off re-
covery API. The example purposely introduces errors on the bus to put the TWAI controller into the Bus-Off state. 
An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via peripherals/twai/twai_alert_and_recovery.

Self Test Example: This example uses the No Acknowledge Mode and Self Reception Request to cause the TWAI 
controller to send and simultaneously receive a series of messages. This example can be used to verify if the connec-
tions between the TWAI controller and the external transceiver are working correctly. The example can be found via peripherals/twai/twai_self_test.
Chapter 2. API Reference

API Reference

Header File

- components/hal/include/hal/twai_types.h

Structures

struct twai_message_t

Structure to store a TWAI message.

Note: The flags member is deprecated

Public Members

uint32_t extd

Extended Frame Format (29bit ID)

uint32_t rtr

Message is a Remote Frame

uint32_t ss

Transmit as a Single Shot Transmission. Unused for received.

uint32_t self

Transmit as a Self Reception Request. Unused for received.

uint32_t dlc_non_comp

Message’s Data length code is larger than 8. This will break compliance with ISO 11898-1

uint32_t reserved

Reserved bits

uint32_t flags

Deprecated: Alternate way to set bits using message flags

uint32_t identifier

11 or 29 bit identifier

uint8_t data_length_code

Data length code

uint8_t data[TWAI_FRAME_MAX_DLC]

Data bytes (not relevant in RTR frame)

struct twai_timing_config_t

Structure for bit timing configuration of the TWAI driver.

Note: Macro initializers are available for this structure
Chapter 2. API Reference

Public Members

uint32_t brp
Baudrate prescaler (i.e., APB clock divider). Any even number from 2 to 128 for ESP32, 2 to 32768 for ESP32S2. For ESP32 Rev 2 or later, multiples of 4 from 132 to 256 are also supported

uint8_t tseg_1
Timing segment 1 (Number of time quanta, between 1 to 16)

uint8_t tseg_2
Timing segment 2 (Number of time quanta, 1 to 8)

uint8_t sjw
Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

bool triple_sampling
Enables triple sampling when the TWAI controller samples a bit

struct twai_filter_config_t
Structure for acceptance filter configuration of the TWAI driver (see documentation)

Note: Macro initializers are available for this structure

Public Members

uint32_t acceptance_code
32-bit acceptance code

uint32_t acceptance_mask
32-bit acceptance mask

bool single_filter
Use Single Filter Mode (see documentation)

Macros

TWAI_EXTD_ID_MASK
TWAI Constants.
Bit mask for 29 bit Extended Frame Format ID

TWAI_STD_ID_MASK
Bit mask for 11 bit Standard Frame Format ID

TWAI_FRAME_MAX_DLC
Max data bytes allowed in TWAI

TWAI_FRAME_EXTD_ID_LEN_BYTES
EFF ID requires 4 bytes (29bit)
**TWAI_FRAME_STD_ID_LEN_BYTES**

SFF ID requires 2 bytes (11bit)

**TWAI_ERR_PASS_THRESH**

Error counter threshold for error passive

**Enumerations**

```c
enum twai_mode_t
{
    TWAI_MODE_NORMAL, // Normal operating mode where TWAI controller can send/receive/acknowledge messages
    TWAI_MODE_NO_ACK, // Transmission does not require acknowledgment. Use this mode for self testing
    TWAI_MODE_LISTEN_ONLY // The TWAI controller will not influence the bus (No transmissions or acknowledgments) but can receive messages
};
```

**Header File**

- components/driver/include/driver/twai.h

**Functions**

```c
esp_err_t twai_driver_install(const twai_general_config_t *g_config, const twai_timing_config_t *t_config, const twai_filter_config_t *f_config)
```

Install TWAI driver.

This function installs the TWAI driver using three configuration structures. The required memory is allocated and the TWAI driver is placed in the stopped state after running this function.

**Note:** Macro initializers are available for the configuration structures (see documentation)

**Note:** To reinstall the TWAI driver, call `twai_driver_uninstall()` first

**Parameters**

- `g_config` [in] General configuration structure
- `t_config` [in] Timing configuration structure
- `f_config` [in] Filter configuration structure

**Returns**

- ESP_OK: Successfully installed TWAI driver
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_NO_MEM: Insufficient memory
- ESP_ERR_INVALID_STATE: Driver is already installed
esp_err_t twai_driver_uninstall (void)

Uninstall the TWAI driver.

This function uninstalls the TWAI driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

**Warning:** The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

**Returns**
- ESP_OK: Successfully uninstalled TWAI driver
- ESP_ERR_INVALID_STATE: Driver is not in stopped/bus-off state, or is not installed

esp_err_t twai_start (void)

Start the TWAI driver.

This function starts the TWAI driver, putting the TWAI driver into the running state. This allows the TWAI driver to participate in TWAI bus activities such as transmitting/receiving messages. The TX and RX queue are reset in this function, clearing any messages that are unread or pending transmission. This function can only be called when the TWAI driver is in the stopped state.

**Returns**
- ESP_OK: TWAI driver is now running
- ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed

esp_err_t twai_stop (void)

Stop the TWAI driver.

This function stops the TWAI driver, preventing any further message from being transmitted or received until twai_start() is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the TWAI driver is in the running state.

**Warning:** A message currently being transmitted/received on the TWAI bus will be ceased immediately. This may lead to other TWAI nodes interpreting the unfinished message as an error.

**Returns**
- ESP_OK: TWAI driver is now Stopped
- ESP_ERR_INVALID_STATE: Driver is not in running state, or is not installed

esp_err_t twai_transmit (const twai_message_t *message, TickType_t ticks_to_wait)

Transmit a TWAI message.

This function queues a TWAI message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the TWAI driver is in the running state and cannot be called under Listen Only Mode.

**Note:** This function does not guarantee that the transmission is successful. The TX_SUCCESS/TX_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

**Note:** The TX_IDLE alert can be used to alert the application when no other messages are awaiting transmission.
### Chapter 2. API Reference

#### Parameters
- **message** – [in] Message to transmit
- **ticks_to_wait** – [in] Number of FreeRTOS ticks to block on the TX queue

#### Returns
- ESP_OK: Transmission successfully queued/initiated
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_TIMEOUT: Timed out waiting for space on TX queue
- ESP_FAIL: TX queue is disabled and another message is currently transmitting
- ESP_ERR_INVALID_STATE: TWAI driver is not in running state, or is not installed
- ESP_ERR_NOT_SUPPORTED: Listen Only Mode does not support transmissions

### esp_err_t twai_receive(twai_message_t *message, TickType_t ticks_to_wait)

Receive a TWAI message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue.

**Warning:** The flags field of the received message should be checked to determine if the received message contains any data bytes.

#### Parameters
- **message** – [out] Received message
- **ticks_to_wait** – [in] Number of FreeRTOS ticks to block on RX queue

#### Returns
- ESP_OK: Messages successfully received from RX queue
- ESP_ERR_TIMEOUT: Timed out waiting for message
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

### esp_err_t twai_read_alerts(uint32_t* alerts, TickType_t ticks_to_wait)

Read TWAI driver alerts.

This function will read the alerts raised by the TWAI driver. If no alert has been issued when this function is called, this function will block until an alert occurs or until it timeouts.

**Note:** Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

#### Parameters
- **alerts** – [out] Bit field of raised alerts (see documentation for alert flags)
- **ticks_to_wait** – [in] Number of FreeRTOS ticks to block for alert

#### Returns
- ESP_OK: Alerts read
- ESP_ERR_TIMEOUT: Timed out waiting for alerts
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

### esp_err_t twai_reconfigure_alerts(uint32_t alerts_enabled, uint32_t* current_alerts)

Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

#### Parameters
- **alerts_enabled** – [in] Bit field of alerts to enable (see documentation for alert flags)
- **current_alerts** – [out] Bit field of currently raised alerts. Set to NULL if unused
Returns

- ESP_OK: Alerts reconfigured
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

```
esp_err_t twai_initiate_recovery (void)
```

Start the bus recovery process.

This function initiates the bus recovery process when the TWAI driver is in the bus-off state. Once initiated, the TWAI driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the TWAI bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

**Note:** The BUS_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

Returns

- ESP_OK: Bus recovery started
- ESP_ERR_INVALID_STATE: TWAI driver is not in the bus-off state, or is not installed

```
esp_err_t twai_get_status_info (twai_status_info_t *status_info)
```

Get current status information of the TWAI driver.

**Parameters**

- `status_info` - [out] Status information

**Returns**

- ESP_OK: Status information retrieved
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

```
esp_err_t twai_clear_transmit_queue (void)
```

Clear the transmit queue.

This function will clear the transmit queue of all messages.

**Note:** The transmit queue is automatically cleared when `twai_stop()` or `twai_initiate_recovery()` is called.

Returns

- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed or TX queue is disabled

```
esp_err_t twai_clear_receive_queue (void)
```

Clear the receive queue.

This function will clear the receive queue of all messages.

**Note:** The receive queue is automatically cleared when `twai_start()` is called.

Returns

- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Structures**

```
struct twai_general_config_t
```

Structure for general configuration of the TWAI driver.
Chapter 2. API Reference

Note: Macro initializers are available for this structure

Public Members

twai_mode_t mode
    Mode of TWAI controller

gpio_num_t tx_io
    Transmit GPIO number

gpio_num_t rx_io
    Receive GPIO number

gpio_num_t clkout_io
    CLKOUT GPIO number (optional, set to -1 if unused)

gpio_num_t bus_off_io
    Bus off indicator GPIO number (optional, set to -1 if unused)

uint32_t tx_queue_len
    Number of messages TX queue can hold (set to 0 to disable TX Queue)

uint32_t rx_queue_len
    Number of messages RX queue can hold

uint32_t alerts_enabled
    Bit field of alerts to enable (see documentation)

uint32_t clkout-divider
    CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

int intr_flags
    Interrupt flags to set the priority of the driver’s ISR. Note that to use the ESP_INTR_FLAG_IRAM, the CONFIG_TWAI_ISR_IN_IRAM option should be enabled first.

struct twai_status_info_t
    Structure to store status information of TWAI driver.

Public Members

twai_state_t state
    Current state of TWAI controller (Stopped/Running/Bus-Off/Recovery)

uint32_t msgs_to_tx
    Number of messages queued for transmission or awaiting transmission completion
Chapter 2. API Reference

```c
uint32_t msgs_to_rx
    Number of messages in RX queue waiting to be read

uint32_t tx_error_counter
    Current value of Transmit Error Counter

uint32_t rx_error_counter
    Current value of Receive Error Counter

uint32_t tx_failed_count
    Number of messages that failed transmissions

uint32_t rx_missed_count
    Number of messages that were lost due to a full RX queue (or errata workaround if enabled)

uint32_t rx_overrun_count
    Number of messages that were lost due to a RX FIFO overrun

uint32_t arb_lost_count
    Number of instances arbitration was lost

uint32_t bus_error_count
    Number of instances a bus error has occurred
```

**Macros**

**TWAI_IO_UNUSED**

Marks GPIO as unused in TWAI configuration

**Enumerations**

cenum twai_state_t
    TWAI driver states.

    Values:

    enumerator TWAI_STATE_STOPPED
        Stopped state. The TWAI controller will not participate in any TWAI bus activities

    enumerator TWAI_STATE_RUNNING
        Running state. The TWAI controller can transmit and receive messages

    enumerator TWAI_STATE_BUS_OFF
        Bus-off state. The TWAI controller cannot participate in bus activities until it has recovered

    enumerator TWAI_STATE_RECOVERING
        Recovering state. The TWAI controller is undergoing bus recovery
2.6.21 Universal Asynchronous Receiver/Transmitter (UART)

Overview

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e., timing requirements and data framing) using widely-adopted asynchronous serial communication interfaces, such as RS232, RS422, RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex data exchange among different devices.

The ESP32-C3 chip has two UART controllers (also referred to as port), each featuring an identical set of registers to simplify programming and for more flexibility.

Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering, number of stop bits, parity bit etc. All the controllers are compatible with UART-enabled devices from various manufacturers and can also support Infrared Data Association protocols (IrDA).

Functional Overview

The following overview describes how to establish communication between an ESP32-C3 and other UART devices using the functions and data types of the UART driver. The overview reflects a typical programming workflow and is broken down into the sections provided below:

1. **Setting Communication Parameters** - Setting baud rate, data bits, stop bits, etc.
2. **Setting Communication Pins** - Assigning pins for connection to a device.
3. **Driver Installation** - Allocating ESP32-C3’s resources for the UART driver.
4. **Running UART Communication** - Sending / receiving data
5. **Using Interrupts** - Triggering interrupts on specific communication events
6. **Deleting a Driver** - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional.

The UART driver’s functions identify each of the UART controllers using `uart_port_t`. This identification is needed for all the following function calls.

**Setting Communication Parameters**  UART communication parameters can be configured all in a single step or individually in multiple steps.

**Single Step**  Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```c
const uart_port_t uart_num = UART_NUM_1;
uart_config_t uart_config = {
  .baud_rate = 115200,
  .data_bits = UART_DATA_8_BITS,
  .parity = UART_PARITY_DISABLE,
  .stop_bits = UART_STOP_BITS_1,
  .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
  .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

For more information on how to configure the hardware flow control options, please refer to `peripherals/uart/uart_echo`.

**Multiple Steps**  Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.
### Table 6: Functions for Configuring specific parameters individually

<table>
<thead>
<tr>
<th>Parameter to Configure</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baud rate</td>
<td><code>uart_set_baudrate()</code></td>
</tr>
<tr>
<td>Number of transmitted bits</td>
<td><code>uart_set_word_length()</code> selected out of <code>uart_word_length_t</code></td>
</tr>
<tr>
<td>Parity control</td>
<td><code>uart_set_parity()</code> selected out of <code>uart_parity_t</code></td>
</tr>
<tr>
<td>Number of stop bits</td>
<td><code>uart_set_stop_bits()</code> selected out of <code>uart_stop_bits_t</code></td>
</tr>
<tr>
<td>Hardware flow control mode</td>
<td><code>uart_set_hw_flow_ctrl()</code> selected out of <code>uart_hw_flowcontrol_t</code></td>
</tr>
<tr>
<td>Communication mode</td>
<td><code>uart_set_mode()</code> selected out of <code>uart_mode_t</code></td>
</tr>
</tbody>
</table>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the current baud rate value, call `uart_get_baudrate()`.

### Setting Communication Pins

After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function `uart_set_pin()` and specify the GPIO pin numbers to which the driver should route the Tx, Rx, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro `UART_PIN_NO_CHANGE`.

The same macro should be specified for pins that will not be used.

```c
// Set UART pins(TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_1, 
4, 5, 18, 19));
```

### Driver Installation

Once the communication pins are set, install the driver by calling `uart_driver_install()` and specify the following parameters:

- Size of Tx ring buffer
- Size of Rx ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function will allocate the required internal resources for the UART driver.

```c
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_1, uart_buffer_size, 
  uart_buffer_size, 10, &uart_queue, 0));
```

Once this step is complete, you can connect the external UART device and check the communication.

### Running UART Communication

Serial communication is controlled by each UART controller’s finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into Tx FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into Rx FIFO buffer
3. Read the data from Rx FIFO buffer

Therefore, an application will be limited to writing and reading data from a respective buffer using `uart_write_bytes()` and `uart_read_bytes()` respectively, and the FSM will do the rest.
Transmitting  After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer’s address and data length to it. The function will copy the data to the Tx ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the Tx FIFO buffer, an interrupt service routine (ISR) moves the data from the Tx ring buffer to the Tx FIFO buffer in the background. The code below demonstrates the use of this function.

```c
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A ‘serial break signal’ means holding the Tx line low for a period longer than one data frame.

```c
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the Tx FIFO buffer is `uart_tx_chars()` unlike `uart_write_bytes()`, this function will not block until space is available. Instead, it will write all data which can immediately fit into the hardware Tx FIFO, and then return the number of bytes that were written.

There is a ‘companion’ function `uart_wait_tx_done()` that monitors the status of the Tx FIFO buffer and returns once it is empty.

```c
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_1;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_ticks (TickType_t)
```

Receiving  Once the data is received by the UART and saved in the Rx FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the Rx FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```c
// Read data from UART.
const uart_port_t uart_num = UART_NUM_1;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)length));
length = uart_read_bytes(uart_num, data, length, 100);
```

If the data in the Rx FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

Software Flow Control  If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

Communication Mode Selection  The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver will handle the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```c
// Setup UART in RS485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

Using Interrupts  There are many interrupts that can be generated following specific UART states or detected errors. The full list of available interrupts is provided in `ESP32-C3 Technical Reference Manual > UART Controller`
(UART) > UART Interrupts and UHCI Interrupts [PDF]. You can enable or disable specific interrupts by calling `uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively.

The `uart_driver_install()` function installs the driver’s internal interrupt handler to manage the Tx and Rx ring buffers and provides high-level API functions like events (see below).

The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection**: There are several events defined in `uart_event_type_t` that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling `uart_driver_install()` described in Driver Installation. An example of using Event detection can be found in `peripherals/uart/uart_events`.

- **FIFO space threshold or transmission timeout reached**: The Tx and Rx FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
  - Configure respective threshold values of the buffer length and timeout by entering them in the structure `uart_intr_config_t` and calling `uart_intr_config()`
  - Enable the interrupts using the functions `uart_enable_tx_intr()` and `uart_enable_rx_intr()`
  - Disable these interrupts using the corresponding functions `uart_disable_tx_intr()` or `uart_disable_rx_intr()`

- **Pattern detection**: An interrupt triggered on detecting a ‘pattern’ of the same character being received/sent repeatedly for a number of times. This functionality is demonstrated in the example `peripherals/uart/uart_events`. It can be used, e.g., to detect a command string followed by a specific number of identical characters (the ‘pattern’) added at the end of the command string. The following functions are available:
  - Configure and enable this interrupt using `uart_enable_pattern_det_intr()`
  - Disable the interrupt using `uart_disable_pattern_det_intr()`

**Macros** The API also defines several macros. For example, `UART_FIFO_LEN` defines the length of hardware FIFO buffers; `UART_BITRATE_MAX` gives the maximum baud rate supported by the UART controllers, etc.

**Deleting a Driver** If the communication established with `uart_driver_install()` is no longer required, the driver can be removed to free allocated resources by calling `uart_driver_delete()`.

**Overview of RS485 specific communication options**

**Note:** The following section will use `[UART_REGISTER_NAME].[UART_FIELD_BIT]` to refer to UART register fields/bits. For more information on a specific option bit, see ESP32-C3 Technical Reference Manual > UART Controller (UART) > Register Summary [PDF]. Use the register name to navigate to the register description and then find the field/bit.

- UART_RS485_CONF_REG.UART_RS485_EN: setting this bit enables RS485 communication mode support.
- UART_RS485_CONF_REG.UART_RS485TX_RX_EN: if this bit is set, the transmitter’s output signal loops back to the receiver’s input signal.
- UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32-C3’s RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt UART_RS485_CLASH_INT if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts UART_RS485_FRM_ERR_INT and UART_RS485_PARITY_ERR_INT can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is
supported in the UART driver and can be used by selecting the `UART_MODE_RS485_APP_CTRL` mode (see the function `uart_set_mode()`).

The collision detection feature can work with circuit A and circuit C (see Section *Interface Connection Options*). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the user application. Use the function `uart_get_collision_flag()` to check if the collision detection flag has been raised.

The ESP32-C3 UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the ~RE/DE input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the `UART_MODE_RS485_HALF_DUPLEX` mode when calling `uart_set_mode()`.

Once the host starts writing data to the Tx FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

### Interface Connection Options
This section provides example schematics to demonstrate the basic aspects of ESP32-C3’s RS485 interface connection.

**Note:**
- The schematics below do not necessarily contain all required elements.
- The analog devices ADM483 & ADM2483 are examples of common RS485 transceivers and can be replaced with other similar transceivers.

#### Circuit A: Collision Detection Circuit

```
VCC ---------------+  
|  
+----------| R  |  
|           | B  |  
RXD <------| D  |  
|           | A  |  
TXD ------>| DE |  
|           | /RE|  
RTS ------->|  |  
ESP | |  
| |  
GND GND  
```

This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the UART peripheral when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is enabled.

#### Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection

```
VCC ---------------+  
|  
+----------| R  |  
|           | B  |  
RXD <------| D  |  
|           | A  |  
TXD ------>| DE |  
|           | /RE|  
RTS ------->|  |  
ESP | |  
| |  
GND GND  
```

(continues on next page)
This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit UART_RS485_CONF_REG.UART_RS485TX_RX_EN is set. The bit UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN is not applicable in this case.

**Circuit C: Auto Switching Transmitter/Receiver**

![Circuit Diagram]

This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN to 1 and UART_RS485_CONF_REG.UART_RS485TX_RX_EN to 0. This setup can work in any RS485 UART mode or even in UART_MODE_UART.

**Application Examples**

The table below describes the code examples available in the directory peripherals/uart/.

<table>
<thead>

**API Reference**

**Header File**

---

(continued from previous page)
Components

- components/driver/include/driver/uart.h

Functions

**esp_err_t uart_driver_install** (uart_port_t uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, QueueHandle_t *uart_queue, int intr_alloc_flags)

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

**Note:** Rx_buffer_size should be greater than UART_FIFO_LEN. Tx_buffer_size should be either zero or greater than UART_FIFO_LEN.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `rx_buffer_size` - UART RX ring buffer size.
- `tx_buffer_size` - UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- `queue_size` - UART event queue size/depth.
- `uart_queue` - UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
- `intr_alloc_flags` - Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info. Do not set ESP_INTR_FLAG_IRAM here (the driver’s ISR handler is not located in IRAM)

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_driver_delete** (uart_port_t uart_num)

Uninstall UART driver.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

**bool uart_is_driver_installed** (uart_port_t uart_num)

Checks whether the driver is installed or not.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).

**Returns**
- true driver is installed
- false driver is not installed

**esp_err_t uart_set_word_length** (uart_port_t uart_num, uart_word_length_t data_bit)

Set UART data bits.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `data_bit` - UART data bits

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_get_word_length** (uart_port_t uart_num, uart_word_length_t *data_bit)

Get the UART data bit configuration.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
• **data_bit** – Pointer to accept value of UART data bits.

**Returns**

• ESP_FAIL Parameter error
• ESP_OK Success, result will be put in (*data_bit)

```c
esp_err_t uart_set_stop_bits (uart_port_t uart_num, uart_stop_bits_t stop_bits)
```

Set UART stop bits.

**Parameters**

• **uart_num** – UART port number, the max port number is (UART_NUM_MAX -1).
• **stop_bits** – UART stop bits

**Returns**

• ESP_OK Success
• ESP_FAIL Fail

```c
esp_err_t uart_get_stop_bits (uart_port_t uart_num, uart_stop_bits_t *stop_bits)
```

Get the UART stop bit configuration.

**Parameters**

• **uart_num** – UART port number, the max port number is (UART_NUM_MAX -1).
• **stop_bits** – Pointer to accept value of UART stop bits.

**Returns**

• ESP_FAIL Parameter error
• ESP_OK Success

```c
esp_err_t uart_set_parity (uart_port_t uart_num, uart_parity_t parity_mode)
```

Set UART parity mode.

**Parameters**

• **uart_num** – UART port number, the max port number is (UART_NUM_MAX -1).
• **parity_mode** – the enum of uart parity configuration

**Returns**

• ESP_FAIL Parameter error
• ESP_OK Success

```c
esp_err_t uart_get_parity (uart_port_t uart_num, uart_parity_t *parity_mode)
```

Get the UART parity mode configuration.

**Parameters**

• **uart_num** – UART port number, the max port number is (UART_NUM_MAX -1).
• **parity_mode** – Pointer to accept value of UART parity mode.

**Returns**

• ESP_FAIL Parameter error
• ESP_OK Success

```c
esp_err_t uart_get_sclk_freq (uart_sclk_t sclk, uint32_t*out_freq_hz)
```

Get the frequency of a clock source for the UART.

**Parameters**

• **sclk** – Clock source
• **out_freq_hz** – [out] Output of frequency, in Hz

**Returns**

• ESP_ERR_INVALID_ARG: if the clock source is not supported
• otherwise ESP_OK

```c
esp_err_t uart_set_baudrate (uart_port_t uart_num, uint32_t baudrate)
```

Set UART baud rate.

**Parameters**

• **uart_num** – UART port number, the max port number is (UART_NUM_MAX -1).
• **baudrate** – UART baud rate.

**Returns**

• ESP_FAIL Parameter error
• ESP_OK Success

```
esp_err_t uart_get_baudrate (uart_port_t uart_num, uint32_t *baudrate)
```

Get the UART baud rate configuration.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `baudrate` - Pointer to accept value of UART baud rate

**Returns**
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*baudrate)

```
esp_err_t uart_set_line_inverse (uart_port_t uart_num, uint32_t inverse_mask)
```

Set UART line inverse mode.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `inverse_mask` - Choose the wires that need to be inverted. Using the ORred mask of `uart_signal_inv_t`

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```
esp_err_t uart_set_hw_flow_ctrl (uart_port_t uart_num, uart_hw_flowcontrol_t flow_ctrl, uint8_t rx_thresh)
```

Set hardware flow control.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `flow_ctrl` - Hardware flow control mode
- `rx_thresh` - Threshold of Hardware RX flow control (0 ~ UART_FIFO_LEN). Only when UART_HW_FLOWCTRL_RTS is set, will the rx_thresh value be set.

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```
esp_err_t uart_set_sw_flow_ctrl (uart_port_t uart_num, bool enable, uint8_t rx_thresh_xon, uint8_t rx_thresh_xoff)
```

Set software flow control.

**Parameters**
- `uart_num` - UART_NUM_0, UART_NUM_1 or UART_NUM_2
- `enable` - switch on or off
- `rx_thresh_xon` - low water mark
- `rx_thresh_xoff` - high water mark

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```
esp_err_t uart_get_hw_flow_ctrl (uart_port_t uart_num, uart_hw_flowcontrol_t *flow_ctrl)
```

Get the UART hardware flow control configuration.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).

**Returns**
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*flow_ctrl)

```
esp_err_t uart_clear_intr_status (uart_port_t uart_num, uint32_t clr_mask)
```

Clear UART interrupt status.

**Parameters**
• uart_num – UART port number, the max port number is (UART_NUM_MAX -1).
• clr_mask – Bit mask of the interrupt status to be cleared.

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

```c
esp_err_t uart_enable_intr_mask(uart_port_t uart_num, uint32_t enable_mask)
```

Set UART interrupt enable.

Parameters
• uart_num – UART port number, the max port number is (UART_NUM_MAX -1).
• enable_mask – Bit mask of the enable bits.

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

```c
esp_err_t uart_disable_intr_mask(uart_port_t uart_num, uint32_t disable_mask)
```

Clear UART interrupt enable bits.

Parameters
• uart_num – UART port number, the max port number is (UART_NUM_MAX -1).
• disable_mask – Bit mask of the disable bits.

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

```c
esp_err_t uart_enable_rx_intr(uart_port_t uart_num)
```

Enable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

Parameters
• uart_num – UART port number, the max port number is (UART_NUM_MAX -1).

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

```c
esp_err_t uart_disable_rx_intr(uart_port_t uart_num)
```

Disable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

Parameters
• uart_num – UART port number, the max port number is (UART_NUM_MAX -1).

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

```c
esp_err_t uart_disable_tx_intr(uart_port_t uart_num)
```

Disable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

Parameters
• uart_num – UART port number

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

```c
esp_err_t uart_enable_tx_intr(uart_port_t uart_num, int enable, int thresh)
```

Enable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

Parameters
• uart_num – UART port number, the max port number is (UART_NUM_MAX -1).
• enable – 1: enable; 0: disable
• thresh – Threshold of TX interrupt, 0 ~ UART_FIFO_LEN

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

```c
esp_err_t uart_set_pin(uart_port_t uart_num, int tx_io_num, int rx_io_num, int rts_io_num, int cts_io_num)
```
Assign signals of a UART peripheral to GPIO pins.

**Note:** If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UART0’s default TX pin and GPIO3 is UART0’s default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

**Note:** Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

**Parameters**
- `uart_num` - UART port number, the max port number is `(UART_NUM_MAX -1)`.  
- `tx_io_num` - UART TX pin GPIO number.  
- `rx_io_num` - UART RX pin GPIO number.  
- `rts_io_num` - UART RTS pin GPIO number.  
- `cts_io_num` - UART CTS pin GPIO number.

**Returns**
- ESP_OK Success  
- ESP_FAIL Parameter error

```
esp_err_t uart_set_rts(uart_port_t uart_num, int level)
```
Manually set the UART RTS pin level.

**Note:** UART must be configured with hardware flow control disabled.

**Parameters**
- `uart_num` - UART port number, the max port number is `(UART_NUM_MAX -1)`.  
- `level` -1: RTS output low (active); 0: RTS output high (block)

**Returns**
- ESP_OK Success  
- ESP_FAIL Parameter error

```
esp_err_t uart_set_dtr(uart_port_t uart_num, int level)
```
Manually set the UART DTR pin level.

**Parameters**
- `uart_num` - UART port number, the max port number is `(UART_NUM_MAX -1)`.  
- `level` -1: DTR output low; 0: DTR output high

**Returns**
- ESP_OK Success  
- ESP_FAIL Parameter error

```
esp_err_t uart_set_tx_idle_num(uart_port_t uart_num, uint16_t idle_num)
```
Set UART idle interval after tx FIFO is empty.

**Parameters**
- `uart_num` - UART port number, the max port number is `(UART_NUM_MAX -1)`.  
- `idle_num` - idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

**Returns**
- ESP_OK Success
Chapter 2. API Reference

- ESP_FAIL Parameter error

```c
esp_err_t uart_param_config(uart_port_t uart_num, const uart_config_t *uart_config)
```

Set UART configuration parameters.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `uart_config` - UART parameter settings

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_intr_config(uart_port_t uart_num, const uart_intr_config_t *intr_conf)
```

Configure UART interrupts.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `intr_conf` - UART interrupt settings

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_wait_tx_done(uart_port_t uart_num, TickType_t ticks_to_wait)
```

Wait until UART TX FIFO is empty.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `ticks_to_wait` - Timeout, count in RTOS ticks

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error
- ESP_ERR_TIMEOUT Timeout

```c
int uart_tx_chars(uart_port_t uart_num, const char *buffer, uint32_t len)
```

Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

**Note:** This function should only be used when UART TX buffer is not enabled.

```c
int uart_write_bytes(uart_port_t uart_num, const void *src, size_t size)
```

Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `src` - data buffer address
Chapter 2. API Reference

- **size** — data length to send

**Returns**
- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

```c
int uart_write_bytes_with_break (uart_port_t uart_num, const void *src, size_t size, int brk_len)
```

Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

**Parameters**
- **uart_num** — UART port number, the max port number is (UART_NUM_MAX -1).
- **src** — data buffer address
- **size** — data length to send
- **brk_len** — break signal duration (unit: the time it takes to send one bit at current baudrate)

**Returns**
- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

```c
int uart_read_bytes (uart_port_t uart_num, void *buf, uint32_t length, TickType_t ticks_to_wait)
```

UART read bytes from UART buffer.

**Parameters**
- **uart_num** — UART port number, the max port number is (UART_NUM_MAX -1).
- **buf** — pointer to the buffer.
- **length** — data length
- **ticks_to_wait** — sTimeout, count in RTOS ticks

**Returns**
- (-1) Error
- OTHERS (>=0) The number of bytes read from UART FIFO

```c
esp_err_t uart_flush (uart_port_t uart_num)
```

Alias of uart_flush_input. UART ring buffer flush. This will discard all data in the UART RX buffer.

**Note:** Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use uart_wait_tx_done function.

```c
esp_err_t uart_flush_input (uart_port_t uart_num)
```

Clear input buffer, discard all the data is in the ring-buffer.

**Note:** In order to send all the data in tx FIFO, we can use uart_wait_tx_done function.

**Parameters**
- **uart_num** — UART port number, the max port number is (UART_NUM_MAX -1).

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
ESP_OK
```
Chapter 2. API Reference

`esp_err_t uart_get_buffered_data_len(uart_port_t uart_num, size_t *size)`

UART get RX ring buffer cached data length.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `size` - Pointer of size_t to accept cached data length

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

`esp_err_t uart_get_tx_buffer_free_size(uart_port_t uart_num, size_t *size)`

UART get TX ring buffer free space size.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `size` - Pointer of size_t to accept the free space size

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t uart_disable_pattern_det_intr(uart_port_t uart_num)`

UART disable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detects a series of one same character, the interrupt will be triggered.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

`esp_err_t uart_enable_pattern_det_baud_intr(uart_port_t uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)`

UART enable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detect a series of one same character, the interrupt will be triggered.

**Parameters**
- `uart_num` - UART port number.
- `pattern_chr` - character of the pattern.
- `chr_num` - number of the character, 8bit value.
- `chr_tout` - timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at_cmd char.
- `post_idle` - idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at_cmd char.
- `pre_idle` - idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at_cmd char.

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

`int uart_pattern_pop_pos(uart_port_t uart_num)`

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.
### Chapter 2. API Reference

**Note:** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

#### Parameters
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX - 1).

#### Returns
- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

```c
int uart_pattern_get_pos(uart_port_t uart_num)
```

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue. This function do nothing to the queue.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos. It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

**Note:** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

#### Parameters
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX - 1).

#### Returns
- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

```c
esp_err_t uart_pattern_queue_reset(uart_port_t uart_num, int queue_length)
```

Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

**Parameters**
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX - 1).
- **queue_length**: Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

**Returns**
- ESP_ERR_NO_MEM No enough memory
- ESP_ERR_INVALID_STATE Driver not installed
- ESP_FAIL Parameter error
- ESP_OK Success

```c
esp_err_t uart_set_mode(uart_port_t uart_num, uart_mode_t mode)
```

UART set communication mode.

**Note:** This function must be executed after uart_driver_install(), when the driver object is initialized.

**Parameters**
- **uart_num**: Uart number to configure, the max port number is (UART_NUM_MAX - 1).
- **mode**: UART UART mode to set

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
**esp_err_t uart_set_rx_full_threshold (uart_port_t uart_num, int threshold)**

Set uart threshold value for RX fifo full.

**Note:** If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced.

**Parameters**

- **uart_num** – UART_NUM_0, UART_NUM_1 or UART_NUM_2
- **threshold** – Threshold value above which RX fifo full interrupt is generated

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

**esp_err_t uart_set_tx_empty_threshold (uart_port_t uart_num, int threshold)**

Set uart threshold values for TX fifo empty.

**Parameters**

- **uart_num** – UART_NUM_0, UART_NUM_1 or UART_NUM_2
- **threshold** – Threshold value below which TX fifo empty interrupt is generated

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

**esp_err_t uart_set_rx_timeout (uart_port_t uart_num, const uint8_t tout_thresh)**

UART set threshold timeout for TOUT feature.

**Parameters**

- **uart_num** – Uart number to configure, the max port number is (UART_NUM_MAX -1).
- **tout_thresh** – This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout_threhs = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART_RXFIFO_TOUT_INT interrupt is triggered. If tout_threhs == 0, the TOUT feature is disabled.

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

**esp_err_t uart_get_collision_flag (uart_port_t uart_num, bool *collision_flag)**

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by collision_flag. *collision_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after uart_write_bytes()).

**Parameters**

- **uart_num** – Uart number to configure the max port number is (UART_NUM_MAX -1).
- **collision_flag** – Pointer to variable of type bool to return collision flag.

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t uart_set_wakeup_threshold (uart_port_t uart_num, int wakeup_threshold)**

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.
Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter ‘a’ with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when ‘a’ is sent, set wakeup_threshold=3.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To make sure that UART has correct baud rate all the time, select UART_SCLK_REF_TICK or UART_SCLK_XTAL as UART clock source in `uart_config_t::source_clk`.

**Note:** in ESP32, the wakeup signal can only be input via IO_MUX (i.e. GPIO3 should be configured as function_1 to wake up UART0, GPIO9 should be configured as function_5 to wake up UART1), UART2 does not support light sleep wakeup feature.

### Parameters
- **uart_num** - UART number, the max port number is (UART_NUM_MAX - 1).
- **wakeup_threshold** - number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

### Returns
- ESP_OK on success
- ESP_ERR_INVALID_ARG if uart_num is incorrect or wakeup_threshold is outside of [3, 0x3ff] range.

#### esp_err_t uart_get_wakeup_threshold (uart_port_t uart_num, int *out_wakeup_threshold)
Get the number of RX pin signal edges for light sleep wakeup.

See description of `uart_set_wakeup_threshold` for the explanation of UART wakeup feature.

### Parameters
- **uart_num** - UART number, the max port number is (UART_NUM_MAX - 1).
- **out_wakeup_threshold** - [out] output, set to the current value of wakeup threshold for the given UART.

### Returns
- ESP_OK on success
- ESP_ERR_INVALID_ARG if out_wakeup_threshold is NULL

#### esp_err_t uart_wait_tx_idle_polling (uart_port_t uart_num)
Wait until UART tx memory empty and the last char send ok (polling mode).

### Returns
- ESP_OK on success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

### Parameters **uart_num** - UART number

#### esp_err_t uart_set_loop_back (uart_port_t uart_num, bool loop_back_en)
Configure TX signal loop back to RX module, just for the test usage.

### Returns
- ESP_OK on success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed
Chapter 2. API Reference

Parameters

- **uart_num** - UART number
- **loop_back_en** - Set true to enable the loop back function, else set it false.

void **uart_set_always_rx_timeout** (**uart_port_t** uart_num, **bool** always_rx_timeout_en)

Configure behavior of UART RX timeout interrupt.

When `always_rx_timeout` is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

Parameters

- **uart_num** - UART number
- **always_rx_timeout_en** - Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

Structures

struct **uart_intr_config_t**

UART interrupt configuration parameters for `uart_intr_config` function.

Public Members

- `intr_enable_mask`  
  UART interrupt enable mask, choose from `UART_XXXX_INT_ENA_M` under `UART_INT_ENA_REG(i)`, connect with bit-or operator

- `rx_timeout_thresh`  
  UART timeout interrupt threshold (unit: time of sending one byte)

- `txfifo_empty_intr_thresh`  
  UART TX empty interrupt threshold.

- `rx fifo_full_thresh`  
  UART RX full interrupt threshold.

struct **uart_event_t**

Event structure used in UART event queue.

Public Members

- `uart_event_type_t` **type**  
  UART event type

- `size_t` **size**  
  UART data size for UART_DATA event

- `bool` **timeout_flag**  
  UART data read timeout flag for UART_DATA event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.
Chapter 2. API Reference

**Macros**

UART_NUM_0
UART port 0

UART_NUM_1
UART port 1

UART_NUM_MAX
UART port max

UART_PIN_NO_CHANGE

UART_FIFO_LEN
Length of the UART HW FIFO.

UART_BITRATE_MAX
Maximum configurable bitrate.

**Type Definitions**

typedef intr_handle_t uart_isr_handle_t

**Enumerations**

eenum uart_event_type_t
UART event types used in the ring buffer.

Values:

enumerator UART_DATA
UART data event

enumerator UART_BREAK
UART break event

enumerator UART_BUFFER_FULL
UART RX buffer full event

enumerator UART_FIFO_OVF
UART FIFO overflow event

enumerator UART_FRAME_ERR
UART RX frame error event

enumerator UART_PARITY_ERR
UART RX parity event

enumerator UART_DATA_BREAK
UART TX data and break event
enum UART_PATTERN_DET
    UART pattern detected

enum UART_WAKEUP
    UART wakeup event

enum UART_EVENT_MAX
    UART event max index

**Header File**
- `components/hal/include/hal/uart_types.h`

**Structures**

```c
struct uart_at_cmd_t
    UART AT cmd char configuration parameters Note that this function may different on different chip. Please refer to the TRM at configuration.

**Public Members**

```c
uint8_t cmd_char
    UART AT cmd char

uint8_t char_num
    AT cmd char repeat number

uint32_t gap_tout
    gap time(in baud-rate) between AT cmd char

uint32_t pre_idle
    the idle time(in baud-rate) between the non AT char and first AT char

uint32_t post_idle
    the idle time(in baud-rate) between the last AT char and the none AT char
```

```c
struct uart_sw_flowctrl_t
    UART software flow control configuration parameters.

**Public Members**

```c
uint8_t xon_char
    Xon flow control char

uint8_t xoff_char
    Xoff flow control char
```
uint8_t xon_thrd
    If the software flow control is enabled and the data amount in rxfifo is less than xon_thrd, an xon_char
    will be sent

uint8_t xoff_thrd
    If the software flow control is enabled and the data amount in rxfifo is more than xoff_thrd, an xoff_char
    will be sent

struct uart_config_t
    UART configuration parameters for uart_param_config function.

Public Members

int baud_rate
    UART baud rate

data_bits
    UART byte size

parity
    UART parity mode

stop_bits
    UART stop bits

flow_ctrl
    UART HW flow control mode (cts/rts)

rx_flow_ctrl_thresh
    UART HW RTS threshold

source_clk
    UART source clock selection

Type Definitions

typedef int uart_port_t
    UART port number, can be UART_NUM_0 ~ (UART_NUM_MAX -1).

typedef soc_periph_uart_clk_src_legacy_t uart_sclk_t
    UART source clock.

Enumerations

enum uart_mode_t
    UART mode selection.
    Values:
enumerator UART_MODE_UART
  mode: regular UART mode

enumerator UART_MODE_RS485_HALF_DUPLEX
  mode: half duplex RS485 UART mode control by RTS pin

enumerator UART_MODE_IRDA
  mode: IRDA UART mode

enumerator UART_MODE_RS485_COLLISION_DETECT
  mode: RS485 collision detection UART mode (used for test purposes)

enumerator UART_MODE_RS485_APP_CTRL
  mode: application control RS485 UART mode (used for test purposes)

enum uart_word_length_t
  UART word length constants.
  Values:

  enumerator UART_DATA_5_BITS
    word length: 5bits

  enumerator UART_DATA_6_BITS
    word length: 6bits

  enumerator UART_DATA_7_BITS
    word length: 7bits

  enumerator UART_DATA_8_BITS
    word length: 8bits

  enumerator UART_DATA_BITS_MAX

enum uart_stop_bits_t
  UART stop bits number.
  Values:

  enumerator UART_STOP_BITS_1
    stop bit: 1bit

  enumerator UART_STOP_BITS_1_5
    stop bit: 1.5bits

  enumerator UART_STOP_BITS_2
    stop bit: 2bits

  enumerator UART_STOP_BITS_MAX
enum `uart_parity_t`

UART parity constants.

Values:

- `UART_PARITY_DISABLE` - Disable UART parity
- `UART_PARITY_EVEN` - Enable UART even parity
- `UART_PARITY_ODD` - Enable UART odd parity

enum `uart_hw_flowcontrol_t`

UART hardware flow control modes.

Values:

- `UART_HW_FLOWCTRL_DISABLE` - disable hardware flow control
- `UART_HW_FLOWCTRL_RTS` - enable RX hardware flow control (rts)
- `UART_HW_FLOWCTRL_CTS` - enable TX hardware flow control (cts)
- `UART_HW_FLOWCTRL_CTS_RTS` - enable hardware flow control
- `UART_HW_FLOWCTRL_MAX` -

enum `uart_signal_inv_t`

UART signal bitmap.

Values:

- `UART_SIGNAL_INV_DISABLE` - Disable UART signal inverse
- `UART_SIGNAL_IRDA_TX_INV` - inverse the UART irda_tx signal
- `UART_SIGNAL_IRDA_RX_INV` - inverse the UART irda_rx signal
- `UART_SIGNAL_RXD_INV` - inverse the UART rxd signal
enumerator UART_SIGNAL_CTS_INV
   inverse the UART cts signal

enumerator UART_SIGNAL_DSR_INV
   inverse the UART dsr signal

enumerator UART_SIGNAL_TXD_INV
   inverse the UART txd signal

enumerator UART_SIGNAL_RTS_INV
   inverse the UART rts signal

enumerator UART_SIGNAL_DTR_INV
   inverse the UART dtr signal

GPIO Lookup Macros  The UART peripherals have dedicated IO_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of finding and assigning IO_MUX pins. You choose a macro based on either the IO_MUX pin number, or a required UART channel name, and the macro will return the matching counterpart for you. See some examples below.

**Note:** These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

1. UART_NUM_2_TXD_DIRECT_GPIO_NUM returns the IO_MUX pin number of UART channel 2 TXD pin (pin 17)
2. UART_GPIO19_DIRECT_CHANNEL returns the UART number of GPIO 19 when connected to the UART peripheral via IO_MUX (this is UART_NUM_0)
3. UART_CTS_GPIO19_DIRECT_CHANNEL returns the UART number of GPIO 19 when used as the UART CTS pin via IO_MUX (this is UART_NUM_0). Similar to the above macro but specifies the pin function which is also part of the IO_MUX assignment.

Header File
- components/soc/esp32c3/include/soc/uart_channel.h

Macros
- UART_GPIO21_DIRECT_CHANNEL
- UART_NUM_0_TXD_DIRECT_GPIO_NUM
- UART_GPIO20_DIRECT_CHANNEL
- UART_NUM_0_RXD_DIRECT_GPIO_NUM
- UART_TXD_GPIO21_DIRECT_CHANNEL
- UART_RXD_GPIO20_DIRECT_CHANNEL

Code examples for this API section are provided in the peripherals directory of ESP-IDF examples.
2.7 Project Configuration

2.7.1 Introduction

ESP-IDF uses kconfiglib which is a Python-based extension to the Kconfig system which provides a compile-time project configuration mechanism. Kconfig is based around options of several types: integer, string, boolean. Kconfig files specify dependencies between options, default values of the options, the way the options are grouped together, etc.

For the complete list of available features please see Kconfig and kconfiglib extensions.

2.7.2 Project Configuration Menu

Application developers can open a terminal-based project configuration menu with the idf.py menuconfig build target.

After being updated, this configuration is saved inside sdkconfig file in the project root directory. Based on sdkconfig, application build targets will generate sdkconfig.h file in the build directory, and will make sdkconfig options available to the project build system and source files.

2.7.3 Using sdkconfig.defaults

In some cases, such as when sdkconfig file is under revision control, the fact that sdkconfig file gets changed by the build system may be inconvenient. The build system offers a way to avoid this, in the form of sdkconfig.defaults file. This file is never touched by the build system, and can be created manually or automatically.

It can contain all the options which matter for the given application and are different from the default ones. The format is the same as that of the sdkconfig file. sdkconfig.defaults can be created manually when one remembers all the changed configurations. Otherwise, the file can be generated automatically by running the idf.py save-defconfig command.

Once sdkconfig.defaults is created, sdkconfig can be deleted and added to the ignore list of the revision control system (e.g. .gitignore file for git). Project build targets will automatically create sdkconfig file, populated with the settings from sdkconfig.defaults file, and the rest of the settings will be set to their default values. Note that the build process will not override settings that are already in sdkconfig by ones from sdkconfig.defaults. For more information, see Custom sdkconfig defaults.

2.7.4 Kconfig Formatting Rules

The following attributes of Kconfig files are standardized:

- Within any menu, option names should have a consistent prefix. The prefix length is currently set to at least 3 characters.
- The indentation style is 4 characters created by spaces. All sub-items belonging to a parent item are indented by one level deeper. For example, menu is indented by 0 characters, the config inside of the menu by 4 characters, the help of the config by 8 characters and the text of the help by 12 characters.
- No trailing spaces are allowed at the end of the lines.
- The maximum length of options is set to 40 characters.
- The maximum length of lines is set to 120 characters.

Format checker
tools/check_kconfigs.py is provided for checking the Kconfig formatting rules. The checker checks all Kconfig and Kconfig.projbuild files in the ESP-IDF directory and generates a new file with suffix .new with some recommendations how to fix issues (if there are any). Please note that the checker cannot correct all rules and the responsibility of the developer is to check and make final corrections in order to pass the tests. For
example, indentations will be corrected if there isn’t some misleading previous formatting but it cannot come up with a common prefix for options inside a menu.

### 2.7.5 Backward Compatibility of Kconfig Options

The standard Kconfig tools ignore unknown options in `sdkconfig`. So if a developer has custom settings for options which are renamed in newer ESP-IDF releases then the given setting for the option would be silently ignored. Therefore, several features have been adopted to avoid this:

1. `confgen.py` is used by the tool chain to pre-process `sdkconfig` files before anything else, for example `menuconfig`, would read them. As the consequence, the settings for old options will be kept and not ignored.
2. `confgen.py` recursively finds all `sdkconfig.rename` files in ESP-IDF directory which contain old and new Kconfig option names. Old options are replaced by new ones in the `sdkconfig` file. Renames that should only appear for a single target can be placed in a target specific rename file: `sdkconfig.rename.TARGET`, where `TARGET` is the target name, e.g. `sdkconfig.rename.esp32s2`.
3. `confgen.py` post-processes `sdkconfig` files and generates all build outputs (`sdkconfig.h`, `sdkconfig.cmake`, `auto.conf`) by adding a list of compatibility statements, i.e. value of the old option is set the value of the new option (after modification). This is done in order to not break customer codes where old option might still be used.
4. Deprecated options and their replacements are automatically generated by `confgen.py`.

### 2.7.6 Configuration Options Reference

Subsequent sections contain the list of available ESP-IDF options, automatically generated from Kconfig files. Note that depending on the options selected, some options listed here may not be visible by default in the interface of `menuconfig`.

By convention, all option names are upper case with underscores. When Kconfig generates `sdkconfig` and `sdkconfig.h` files, option names are prefixed with `CONFIG_`. So if an option `ENABLE_FOO` is defined in a Kconfig file and selected in `menuconfig`, then `sdkconfig` and `sdkconfig.h` files will have `CONFIG_ENABLE_FOO` defined. In this reference, option names are also prefixed with `CONFIG_`, same as in the source code.

#### Build type

Contains:

- `CONFIG_APP_BUILD_TYPE`
- `CONFIG_APP_REPRODUCIBLE_BUILD`
- `CONFIG_APP_NO_BLOBS`

**CONFIG_APP_BUILD_TYPE**

Application build type

*Found in: Build type*

Select the way the application is built.

By default, the application is built as a binary file in a format compatible with the ESP-IDF bootloader. In addition to this application, 2nd stage bootloader is also built. Application and bootloader binaries can be written into flash and loaded/executed from there.

Another option, useful for only very small and limited applications, is to only link the .elf file of the application, such that it can be loaded directly into RAM over JTAG. Note that since IRAM and DRAM sizes are very limited, it is not possible to build any complex application this way. However for kinds of testing and debugging, this option may provide faster iterations, since the application does not need to be written into flash. Note that at the moment, ESP-IDF does not contain all the startup code required to initialize the CPUs and ROM memory (data/bss). Therefore it is necessary to execute a bit of ROM code prior to executing the application. A gdbinit file may look as follows (for ESP32):

```plaintext
Espressif Systems 1015 Release v5.1-dev-644-g867745af05c
Submit Document Feedback
```
# Connect to a running instance of OpenOCD target remote:3333
# Reset and halt the target
# Run to a specific point in ROM code, where most of initialization is complete.
# Load the application into RAM
# Run till app_main tb

Execute this gdbinit file as follows:

tensa-esp32-elf-gdb build/app-name.elf -x gdbinit

Example gdbinit files for other targets can be found in tools/test_apps/system/gdb_loadable_elf/

Recommended sdkconfig.defaults for building loadable ELF files is as follows. CONFIG_APP_BUILD_TYPE_ELF_RAM is required, other options help reduce application memory footprint.

CONFIG_APP_BUILD_TYPE_ELF_RAM=y
CONFIG_VFS_SUPPORT_TERMIOS=y
CONFIG_NEWLIB_NANO_FORMAT=y
CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT=y
CONFIG_ESP_DEBUG_STUBS_ENABLE=y
CONFIG_ESP_ERR_TO_NAME_LOOKUP=

Available options:
- Default (binary application + 2nd stage bootloader) (APP_BUILD_TYPE_APP_2NDBOOT)
- ELF file, loadable into RAM (EXPERIMENTAL) (APP_BUILD_TYPE_ELF_RAM)

CONFIG_APP_REPRODUCIBLE_BUILD

Enable reproducible build

Found in: Build type

If enabled, all date, time, and path information would be eliminated. A .gdbinit file would be create automatically. (or will be append if you have one already)

Default value:
- No (disabled)

CONFIG_APP_NO_BLOBS

No Binary Blobs

Found in: Build type

If enabled, this disables the linking of binary libraries in the application build. Note that after enabling this Wi-Fi/Bluetooth will not work.

Default value:
- No (disabled)

Bootloader config

Contains:
- CONFIG_BOOTLOADER_LOG_LEVEL
- CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION
- CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE
- CONFIG_BOOTLOADER_REGION_PROTECTION_ENABLE
- CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT
- CONFIG_BOOTLOADER_APP_TEST
- CONFIG_BOOTLOADER_FACTORY_RESET
- CONFIG_BOOTLOADER_HOLD_TIME_GPIO
- CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC
- CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS
- CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON
CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION

Bootloader optimization Level

*Found in: Bootloader config*

This option sets compiler optimization level (gcc -O argument) for the bootloader.

- The default “Size” setting will add the -Os flag to CFLAGS.
- The “Debug” setting will add the -Og flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.

Note that custom optimization levels may be unsupported.

**Available options:**
- Size (-Os) (BOOTLOADER_COMPILER_OPTIMIZATION_SIZE)
- Debug (-Og) (BOOTLOADER_COMPILER_OPTIMIZATION_DEBUG)
- Optimize for performance (-O2) (BOOTLOADER_COMPILER_OPTIMIZATION_PERF)
- Debug without optimization (-O0) (BOOTLOADER_COMPILER_OPTIMIZATION_NONE)

CONFIG_BOOTLOADER_LOG_LEVEL

Bootloader log verbosity

*Found in: Bootloader config*

Specify how much output to see in bootloader logs.

**Available options:**
- No output (BOOTLOADER_LOG_LEVEL_NONE)
- Error (BOOTLOADER_LOG_LEVEL_ERROR)
- Warning (BOOTLOADER_LOG_LEVEL_WARN)
- Info (BOOTLOADER_LOG_LEVEL_INFO)
- Debug (BOOTLOADER_LOG_LEVEL_DEBUG)
- Verbose (BOOTLOADER_LOG_LEVEL_VERBOSE)

CONFIG_BOOTLOADER_VDDSDIO_BOOST

VDDSDIO LDO voltage

*Found in: Bootloader config*

If this option is enabled, and VDDSDIO LDO is set to 1.8V (using eFuse or MTDI bootstrapping pin), bootloader will change LDO settings to output 1.9V instead. This helps prevent flash chip from browning out during flash programming operations.

This option has no effect if VDDSDIO is set to 3.3V, or if the internal VDDSDIO regulator is disabled via eFuse.

**Available options:**
- 1.8V (BOOTLOADER_VDDSDIO_BOOST_1_8V)
- 1.9V (BOOTLOADER_VDDSDIO_BOOST_1_9V)

CONFIG_BOOTLOADER_FACTORY_RESET

GPIO triggers factory reset

*Found in: Bootloader config*
Allows to reset the device to factory settings: - clear one or more data partitions; - boot from “factory” partition. The factory reset will occur if there is a GPIO input held at the configured level while device starts up. See settings below.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET**
Number of the GPIO input for factory reset

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

The selected GPIO will be configured as an input with internal pull-up enabled (note that on some SoCs, not all pins have an internal pull-up, consult the hardware datasheet for details.) To trigger a factory reset, this GPIO must be held high or low (as configured) on startup.

**Default value:**
- 4 if CONFIG_BOOTLOADER_FACTORY_RESET

**CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LEVEL**
Factory reset GPIO level

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

Pin level for factory reset, can be triggered on low or high.

**Available options:**
- Reset on GPIO low (BOOTLOADER_FACTORY_RESET_PIN_LOW)
- Reset on GPIO high (BOOTLOADER_FACTORY_RESET_PIN_HIGH)

**CONFIG_BOOTLOADER OTA_DATA_ERASE**
Clear OTA data on factory reset (select factory partition)

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

The device will boot from “factory” partition (or OTA slot 0 if no factory partition is present) after a factory reset.

**CONFIG_BOOTLOADER_DATA_FACTORY_RESET**
Comma-separated names of partitions to clear on factory reset

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

Allows customers to select which data partitions will be erased while factory reset.

Specify the names of partitions as a comma-delimited with optional spaces for readability. (Like this: “nvs, phy_init, …”) Make sure that the name specified in the partition table and here are the same. Partitions of type “app” cannot be specified here.

**Default value:**
- “nvs” if CONFIG_BOOTLOADER_FACTORY_RESET

**CONFIG_BOOTLOADER_APP_TEST**
GPIO triggers boot from test app partition

*Found in: Bootloader config*

Allows to run the test app from “TEST” partition. A boot from “test” partition will occur if there is a GPIO input pulled low while device starts up. See settings below.
Default value:
- No (disabled) if `CONFIG_BOOTLOADER_APPANTI_ROLLBACK`

**CONFIG_BOOTLOADER_NUM_PIN_APP_TEST**

Number of the GPIO input to boot TEST partition

*Found in: Bootloader config > CONFIG_BOOTLOADER_APPTEST*

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the old application will boot. (factory or OTA[x]). Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

**Range:**
- from 0 to 39 if `CONFIG_BOOTLOADER_APP_TEST`

**Default value:**
- 18 if `CONFIG_BOOTLOADER_APP_TEST`

**CONFIG_BOOTLOADER_APP_TEST_PIN_LEVEL**

App test GPIO level

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_TEST*

Pin level for app test, can be triggered on low or high.

**Available options:**
- Enter test app on GPIO low (BOOTLOADER_APP_TEST_PIN_LOW)
- Enter test app on GPIO high (BOOTLOADER_APP_TEST_PIN_HIGH)

**CONFIG_BOOTLOADER_HOLD_TIME_GPIO**

Hold time of GPIO for reset/test mode (seconds)

*Found in: Bootloader config*

The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

**Default value:**
- 5 if `CONFIG_BOOTLOADER_FACTORY_RESET || CONFIG_BOOTLOADER_APP_TEST`

**CONFIG_BOOTLOADER_REGION_PROTECTION_ENABLE**

Enable protection for unmapped memory regions

*Found in: Bootloader config*

Protects the unmapped memory regions of the entire address space from unintended accesses. This will ensure that an exception will be triggered whenever the CPU performs a memory operation on unmapped regions of the address space.

**Default value:**
- Yes (enabled)

**CONFIG_BOOTLOADER_WDT_ENABLE**

Use RTC watchdog in start code

*Found in: Bootloader config*

Tracks the execution time of startup code. If the execution time is exceeded, the RTC_WDT will restart system. It is also useful to prevent a lock up in start code caused by an unstable power source. NOTE:
Tracks the execution time starts from the bootloader code - re-set timeout, while selecting the source for slow_clk - and ends calling app_main. Re-set timeout is needed due to WDT uses a SLOW_CLK clock source. After changing a frequency slow_clk a time of WDT needs to re-set for new frequency. slow_clk depends on RTC_CLK_SRC (INTERNAL_RC or EXTERNALCRYSTAL).

**Default value:**
- Yes (enabled)

**CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE**

Allows RTC watchdog disable in user code

*Found in:* Bootloader config > CONFIG_BOOTLOADER_WDT_ENABLE

If this option is set, the ESP-IDF app must explicitly reset, feed, or disable the rtc_wdt in the app’s own code. If this option is not set (default), then rtc_wdt will be disabled by ESP-IDF before calling the app_main() function.

Use function rtc_wdt_feed() for resetting counter of rtc_wdt. Use function rtc_wdt_disable() for disabling rtc_wdt.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_WDT_TIME_MS**

Timeout for RTC watchdog (ms)

*Found in:* Bootloader config > CONFIG_BOOTLOADER_WDT_ENABLE

Verify that this parameter is correct and more then the execution time. Pay attention to options such as reset to factory, trigger test partition and encryption on boot - these options can increase the execution time. Note: RTC_WDT will reset while encryption operations will be performed.

**Range:**
- from 0 to 120000

**Default value:**
- 9000

**CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE**

Enable app rollback support

*Found in:* Bootloader config

After updating the app, the bootloader runs a new app with the ESP_OTA_IMG_PENDING_VERIFY state set. This state prevents the re-run of this app. After the first boot of the new app in the user code, the function should be called to confirm the operability of the app or vice versa about its non-operability. If the app is working, then it is marked as valid. Otherwise, it is marked as not valid and rolls back to the previous working app. A reboot is performed, and the app is booted before the software update. Note: If during the first boot a new app the power goes out or the WDT works, then roll back will happen. Rollback is possible only between the apps with the same security versions.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK**

Enable app anti-rollback support

*Found in:* Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE

This option prevents rollback to previous firmware/application image with lower security version.
**Default value:**
- No (disabled) if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE`

**CONFIG_BOOTLOADER_APP_SECURE_VERSION**

eFuse secure version of app

*Found in:* Bootloader config > `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` > `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

The secure version is the sequence number stored in the header of each firmware. The security version is set in the bootloader, version is recorded in the eFuse field as the number of set ones. The allocated number of bits in the efuse field for storing the security version is limited (see `BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD` option).

Bootloader: When bootloader selects an app to boot, an app is selected that has a security version greater or equal that recorded in eFuse field. The app is booted with a higher (or equal) secure version.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.

Your partition table should has a scheme with ota_0 + ota_1 (without factory).

**Default value:**
- 0 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

**CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD**

Size of the eFuse secure version field

*Found in:* Bootloader config > `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` > `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

The size of the eFuse secure version field. Its length is limited to 32 bits for ESP32 and 16 bits for ESP32-S2. This determines how many times the security version can be increased.

**Range:**
- from 1 to 16 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

**Default value:**
- 16 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

**CONFIG_BOOTLOADER_EFUSE_SECURE_VERSION_EMULATE**

Emulate operations with eFuse secure version (only test)

*Found in:* Bootloader config > `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` > `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

This option allows to emulate read/write operations with all eFuses and eFuse secure version. It allows to test anti-rollback implementation without permanent write eFuse bits. There should be an entry in partition table with following details: `emul_efuse, data, efuse, , 0x2000`.

This option enables: EFUSE_VIRTUAL and EFUSE_VIRTUAL_KEEP_IN_FLASH.

**Default value:**
- No (disabled) if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

**CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP**

Skip image validation when exiting deep sleep

*Found in:* Bootloader config
This option disables the normal validation of an image coming out of deep sleep (checksums, SHA256, and signature). This is a trade-off between wakeup performance from deep sleep, and image integrity checks.

Only enable this if you know what you are doing. It should not be used in conjunction with using deep_sleep() entry and changing the active OTA partition as this would skip the validation upon first load of the new OTA partition.

It is possible to enable this option with Secure Boot if “allow insecure options” is enabled, however it’s strongly recommended to NOT enable it as it may allow a Secure Boot bypass.

**Default value:**
- No (disabled) if \((\text{CONFIG\_SECURE\_BOOT} \land \text{CONFIG\_SECURE\_BOOT\_INSECURE}) \lor \text{CONFIG\_SECURE\_BOOT})\)

**CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_ON\_POWER\_ON**

Skip image validation from power on reset (READ HELP FIRST)

*Found in: Bootloader config*

Some applications need to boot very quickly from power on. By default, the entire app binary is read from flash and verified which takes up a significant portion of the boot time.

Enabling this option will skip validation of the app when the SoC boots from power on. Note that in this case it’s not possible for the bootloader to detect if an app image is corrupted in the flash, therefore it’s not possible to safely fall back to a different app partition. Flash corruption of this kind is unlikely but can happen if there is a serious firmware bug or physical damage.

Following other reset types, the bootloader will still validate the app image. This increases the chances that flash corruption resulting in a crash can be detected following soft reset, and the bootloader will fall back to a valid app image. To increase the chances of successfully recovering from a flash corruption event, keep the option \(\text{BOOTLOADER\_WDT\_ENABLED}\) enabled and consider also enabling \(\text{BOOTLOADER\_WDT\_DISABLE\_IN\_USER\_CODE}\) - then manually disable the RTC Watchdog once the app is running. In addition, enable both the Task and Interrupt watchdog timers with reset options set.

**Default value:**
- No (disabled)

**CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_ALWAYS**

Skip image validation always (READ HELP FIRST)

*Found in: Bootloader config*

Selecting this option prevents the bootloader from ever validating the app image before booting it. Any flash corruption of the selected app partition will make the entire SoC unbootable.

Although flash corruption is a very rare case, it is not recommended to select this option. Consider selecting “Skip image validation from power on reset” instead. However, if boot time is the only important factor then it can be enabled.

**Default value:**
- No (disabled)

**CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC**

Reserve RTC FAST memory for custom purposes

*Found in: Bootloader config*

This option allows the customer to place data in the RTC FAST memory, this area remains valid when rebooted, except for power loss. This memory is located at a fixed address and is available for both the bootloader and the application. (The application and bootloader must be compiled with the same option). The RTC FAST memory has access only through PRO\_CPU.
**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC_SIZE**

Size in bytes for custom purposes

*Found in:* Bootloader config > CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC

This option reserves in RTC FAST memory the area for custom purposes. If you want to create your own bootloader and save more information in this area of memory, you can increase it. It must be a multiple of 4 bytes. This area (rtc_retain_mem_t) is reserved and has access from the bootloader and an application.

**Default value:**
- 0 if CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC

**CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT**

Enable the support for flash chips of XMC (READ HELP FIRST)

*Found in:* Bootloader config

Perform the startup flow recommended by XMC. Please consult XMC for the details of this flow. XMC chips will be forbidden to be used, when this option is disabled.

**DON’T DISABLE THIS UNLESS YOU KNOW WHAT YOU ARE DOING.**

**Default value:**
- Yes (enabled)

**Security features**

Contains:

- CONFIG_SECURE_BOOT_INSECURE
- CONFIG_SECURE_SIGNED_APPS_SCHEME
- CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT
- CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP
- CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_SIZE
- CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE
- CONFIG_SECURE_FLASH_ENC_ENABLED
- CONFIG_SECURE_BOOT
- CONFIG_SECURE_BOOTLOADER_KEY_ENCODING
- Potentially insecure options
- CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT
- CONFIG_SECURE_BOOT_VERIFICATION_KEY
- CONFIG_SECURE_BOOTLOADER_MODE
- CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES
- CONFIG_SECURE_UART_ROM_DL_MODE
- CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT

**CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT**

Require signed app images

*Found in:* Security features

Require apps to be signed to verify their integrity.

This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can
be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement.

**CONFIG_SECURE_SIGNED_APPS_SCHEME**

App Signing Scheme

*Found in: Security features*

Select the Secure App signing scheme. Depends on the Chip Revision. There are two secure boot versions:

1. **Secure boot V1**
   - Legacy custom secure boot scheme. Supported in ESP32 SoC.

2. **Secure boot V2**
   - RSA based secure boot scheme. Supported in ESP32-ECO3 (ESP32 Chip Revision 3 onwards), ESP32-S2, ESP32-C3, ESP32-S3 SoCs.
   - ECDSA based secure boot scheme. Supported in ESP32-C2 SoC.

**Available options:**

- **ECDSA (SECURE_SIGNED_APPS_ECDSA_SCHEME)**
  Embeds the ECDSA public key in the bootloader and signs the application with an ECDSA key. Refer to the documentation before enabling.

- **RSA (SECURE_SIGNED_APPS_RSA_SCHEME)**
  Appends the RSA-3072 based Signature block to the application. Refer to <Secure Boot Version 2 documentation link> before enabling.

- **ECDSA (V2) (SECURE_SIGNED_APPS_ECDSA_V2_SCHEME)**
  For Secure boot V2 (e.g., ESP32-C2 SoC), appends ECDSA based signature block to the application. Refer to documentation before enabling.

**CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_SIZE**

ECDSA key size

*Found in: Security features*

Select the ECDSA key size. Two key sizes are supported

- 192 bit key using NISTP192 curve
- 256 bit key using NISTP256 curve (Recommended)

The advantage of using 256 bit key is the extra randomness which makes it difficult to be bruteforced compared to 192 bit key. At present, both key sizes are practically implausible to bruteforce.

**Available options:**

- Using ECC curve NISTP192 (SECURE_BOOT_ECDSA_KEY_LEN_192_BITS)
- Using ECC curve NISTP256 (Recommended) (SECURE_BOOT_ECDSA_KEY_LEN_256_BITS)

**CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT**

Bootloader verifies app signatures

*Found in: Security features*

If this option is set, the bootloader will be compiled with code to verify that an app is signed before booting it.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn’t add significant security by itself so most users will want to leave it disabled.

**Default value:**

- No (disabled) if `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT` && `SECURE_SIGNED_APPS_ECDSA_SCHEME`
CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT

Verify app signature on update

*Found in: Security features*

If this option is set, any OTA updated apps will have the signature verified before being considered valid.

When enabled, the signature is automatically checked whenever the esp_ota_ops.h APIs are used for OTA updates, or esp_image_format.h APIs are used to verify apps.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.

**Default value:**
- Yes (enabled) if `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT`

CONFIG_SECURE_BOOT

Enable hardware Secure Boot in bootloader (READ DOCS FIRST)

*Found in: Security features*

Build a bootloader which enables Secure Boot on first boot.

Once enabled, Secure Boot will not boot a modified bootloader. The bootloader will only load a partition table or boot an app if the data has a verified digital signature. There are implications for reflashing updated apps once secure boot is enabled.

When enabling secure boot, JTAG and ROM BASIC Interpreter are permanently disabled by default.

**Default value:**
- No (disabled)

CONFIG_SECURE_BOOT_VERSION

Select secure boot version

*Found in: Security features > CONFIG_SECURE_BOOT*

Select the Secure Boot Version. Depends on the Chip Revision. Secure Boot V2 is the new RSA / ECDSA based secure boot scheme.

- RSA based scheme is supported in ESP32 (Revision 3 onwards), ESP32-S2, ESP32-C3 (ECO3), ESP32-S3.
- ECDSA based scheme is supported in ESP32-C2 SoC.

Please note that, RSA or ECDSA secure boot is property of specific SoC based on its HW design, supported crypto accelerators, die-size, cost and similar parameters. Please note that RSA scheme has requirement for bigger key sizes but at the same time it is comparatively faster than ECDSA verification.

Secure Boot V1 is the AES based (custom) secure boot scheme supported in ESP32 SoC.

**Available options:**
- Enable Secure Boot version 1 (SECURE_BOOT_V1_ENABLED)
  Build a bootloader which enables secure boot version 1 on first boot. Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.
- Enable Secure Boot version 2 (SECURE_BOOT_V2_ENABLED)
  Build a bootloader which enables Secure Boot version 2 on first boot. Refer to Secure Boot V2 section of the ESP-IDF Programmer’s Guide for this version before enabling.
CONFIG_SECURE_BOOTLOADER_MODE

Secure bootloader mode

Found in: Security features

Available options:

- One-time flash (SECURE_BOOTLOADER_ONE_TIME_FLASH)
  ON first boot, the bootloader will generate a key which is not readable externally or by software.
  A digest is generated from the bootloader image itself. This digest will be verified on each subsequent boot.
  Enabling this option means that the bootloader cannot be changed after the first time it is booted.

- Reflashable (SECURE_BOOTLOADER_REFLASHABLE)
  Generate a reusable secure bootloader key, derived (via SHA-256) from the secure boot signing key.
  This allows the secure bootloader to be re-flashed by anyone with access to the secure boot signing key.
  This option is less secure than one-time flash, because a leak of the digest key from one device allows reflashing of any device that uses it.

CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES

Sign binaries during build

Found in: Security features

Once secure boot or signed app requirement is enabled, app images are required to be signed.

If enabled (default), these binary files are signed as part of the build process. The file named in “Secure boot private signing key” will be used to sign the image.

If disabled, unsigned app/partition data will be built. They must be signed manually using espsecure.py. Version 1 to enable ECDSA Based Secure Boot and Version 2 to enable RSA based Secure Boot. (for example, on a remote signing server.)

CONFIG_SECURE_BOOT_SIGNING_KEY

Secure boot private signing key

Found in: Security features > CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES

Path to the key file used to sign app images.

Key file is an ECDSA private key (NIST256p curve) in PEM format for Secure Boot V1. Key file is an RSA private key in PEM format for Secure Boot V2.

Path is evaluated relative to the project directory.

You can generate a new signing key by running the following command: espsecure.py generate_signing_key secure_boot_signing_key.pem

See the Secure Boot section of the ESP-IDF Programmer’s Guide for this version for details.

Default value:

- “secure_boot_signing_key.pem” if CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES

CONFIG_SECURE_BOOT_VERIFICATION_KEY

Secure boot public signature verification key

Found in: Security features

Path to a public key file used to verify signed images. Secure Boot V1: This ECDSA public key is compiled into the bootloader and/or app, to verify app images. Secure Boot V2: This RSA public key is compiled into the signature block at the end of the bootloader/app.
Key file is in raw binary format, and can be extracted from a PEM formatted private key using the espsecure.py extract_public_key command.

Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.

**CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE**

Enable Aggressive key revoke strategy

*Found in: Security features*

If this option is set, ROM bootloader will revoke the public key digest burned in eFuse block if it fails to verify the signature of software bootloader with it. Revocation of keys does not happen when enabling secure boot. Once secure boot is enabled, key revocation checks will be done on subsequent boot-up, while verifying the software bootloader

This feature provides a strong resistance against physical attacks on the device.

**NOTE:** Once a digest slot is revoked, it can never be used again to verify an image. This can lead to permanent bricking of the device, in case all keys are revoked because of signature verification failure.

**Default value:**
- No (disabled) if `CONFIG_SECURE_BOOT`

**CONFIG_SECURE_BOOTLOADER_KEY_ENCODING**

Hardware Key Encoding

*Found in: Security features*

In reflashable secure bootloader mode, a hardware key is derived from the signing key (with SHA-256) and can be written to eFuse with espefuse.py.

Normally this is a 256-bit key, but if 3/4 Coding Scheme is used on the device then the eFuse key is truncated to 192 bits.

This configuration item doesn’t change any firmware code, it only changes the size of key binary which is generated at build time.

**Available options:**
- No encoding (256 bit key) (SECURE_BOOTLOADER_KEY_ENCODING_256BIT)
- 3/4 encoding (192 bit key) (SECURE_BOOTLOADER_KEY_ENCODING_192BIT)

**CONFIG_SECURE_BOOT_INSECURE**

Allow potentially insecure options

*Found in: Security features*

You can disable some of the default protections offered by secure boot, in order to enable testing or a custom combination of security features.

Only enable these options if you are very sure.

Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.

**Default value:**
- No (disabled) if `CONFIG_SECURE_BOOT`

**CONFIG_SECURE_FLASH_ENC_ENABLED**

Enable flash encryption on boot (READ DOCS FIRST)

*Found in: Security features*

If this option is set, flash contents will be encrypted by the bootloader on first boot.
Note: After first boot, the system will be permanently encrypted. Re-flashing an encrypted system is complicated and not always possible. Read Flash Encryption before enabling.

Default value:
• No (disabled)

**CONFIG_SECURE_FLASH_ENCRYPTION_KEYSIZE**

Size of generated AES-XTS key

*Found in: Security features > CONFIG_SECURE_FLASH_ENC_ENABLED*

Size of generated AES-XTS key.

• AES-128 uses a 256-bit key (32 bytes) derived from 128 bits (16 bytes) burned in half Efuse key block. Internally, it calculates SHA256(128 bits)
• AES-128 uses a 256-bit key (32 bytes) which occupies one Efuse key block.
• AES-256 uses a 512-bit key (64 bytes) which occupies two Efuse key blocks.

This setting is ignored if either type of key is already burned to Efuse before the first boot. In this case, the pre-burned key is used and no new key is generated.

**Available options:**
• AES-128 key derived from 128 bits (SHA256(128 bits)) (SECURE_FLASH_ENCRYPTION_AES128_DERIVED)
• AES-128 (256-bit key) (SECURE_FLASH_ENCRYPTION_AES128)
• AES-256 (512-bit key) (SECURE_FLASH_ENCRYPTION_AES256)

**CONFIG_SECURE_FLASH_ENCRYPTION_MODE**

Enable usage mode

*Found in: Security features > CONFIG_SECURE_FLASH_ENC_ENABLED*

By default Development mode is enabled which allows ROM download mode to perform flash encryption operations (plaintext is sent to the device, and it encrypts it internally and writes ciphertext to flash.) This mode is not secure, it’s possible for an attacker to write their own chosen plaintext to flash.

Release mode should always be selected for production or manufacturing. Once enabled it’s no longer possible for the device in ROM Download Mode to use the flash encryption hardware.

Refer to the Flash Encryption section of the ESP-IDF Programmer’s Guide for details.

**Available options:**
• Development (NOT SECURE) (SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT)
• Release (SECURE_FLASH_ENCRYPTION_MODE_RELEASE)

**Potentially insecure options** Contains:
• CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS
• CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION
• CONFIG_SECURE_BOOT_ALLOW_JTAG
• CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC
• CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE
• CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS
• CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED
CONFIG_SECURE_BOOT_ALLOW_JTAG

Allow JTAG Debugging

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable JTAG (across entire chip) on first boot when either secure boot or flash encryption is enabled.

Setting this option leaves JTAG on for debugging, which negates all protections of flash encryption and some of the protections of secure boot.

Only set this option in testing environments.

**Default value:**
- No (disabled) if CONFIG_SECURE_BOOT_INSECURE || SEC
  CURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION

Allow app partition length not 64KB aligned

*Found in: Security features > Potentially insecure options*

If not set (default), app partition size must be a multiple of 64KB. App images are padded to 64KB length, and the bootloader checks any trailing bytes after the signature (before the next 64KB boundary) have not been written. This is because flash cache maps entire 64KB pages into the address space. This prevents an attacker from appending unverified data after the app image in the flash, causing it to be mapped into the address space.

Setting this option allows the app partition length to be unaligned, and disables padding of the app image to this length. It is generally not recommended to set this option, unless you have a legacy partitioning scheme which doesn’t support 64KB aligned partition lengths.

CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS

Allow additional read protecting of efuses

*Found in: Security features > Potentially insecure options*

If not set (default, recommended), on first boot the bootloader will burn the WR_DIS_RD_DIS efuse when Secure Boot is enabled. This prevents any more efuses from being read protected.

If this option is set, it will remain possible to write the EFUSE_RD_DIS efuse field after Secure Boot is enabled. This may allow an attacker to read-protect the BLK2 efuse (for ESP32) and BLOCK4-BLOCK10 (i.e. BLOCK_KEY0-BLOCK_KEY5)(for other chips) holding the public key digest, causing an immediate denial of service and possibly allowing an additional fault injection attack to bypass the signature protection.

**NOTE:** Once a BLOCK is read-protected, the application will read all zeros from that block

**NOTE:** If “UART ROM download mode (Permanently disabled (recommended))” or “UART ROM download mode (Permanently switch to Secure mode (recommended))” is set, then it is **NOT** possible to read/write efuses using espefuse.py utility. However, efuse can be read/written from the application

CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS

Leave unused digest slots available (not revoke)

*Found in: Security features > Potentially insecure options*

If not set (default), during startup in the app all unused digest slots will be revoked. To revoke unused slot will be called esp_efuse_set_digest_revoke(num_digest) for each digest. Revoking unused digest slots makes ensures that no trusted keys can be added later by an attacker. If set, it means that you have a plan to use unused digests slots later.
Default value:
  • No (disabled) if `CONFIG_SECURE_BOOT_INSECURE`

`CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC`
Leave UART bootloader encryption enabled

*Found in: Security features > Potentially insecure options*
If not set (default), the bootloader will permanently disable UART bootloader encryption access on first boot. If set, the UART bootloader will still be able to access hardware encryption.

It is recommended to only set this option in testing environments.

Default value:
  • No (disabled) if `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

`CONFIG_SECURE_FLASH_UART_BOOTLOADER.Allow CACHE`
Leave UART bootloader flash cache enabled

*Found in: Security features > Potentially insecure options*
If not set (default), the bootloader will permanently disable UART bootloader flash cache access on first boot. If set, the UART bootloader will still be able to access the flash cache.

Only set this option in testing environments.

Default value:
  • No (disabled) if `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

`CONFIG_SECURE_FLASH_FLASH_ALREADY_ENABLED`
Require flash encryption to be already enabled

*Found in: Security features > Potentially insecure options*
If not set (default), and flash encryption is not yet enabled in eFuses, the 2nd stage bootloader will enable flash encryption: generate the flash encryption key and program eFuses. If this option is set, and flash encryption is not yet enabled, the bootloader will error out and reboot. If flash encryption is enabled in eFuses, this option does not change the bootloader behavior.

Only use this option in testing environments, to avoid accidentally enabling flash encryption on the wrong device. The device needs to have flash encryption already enabled using espfuse.py.

Default value:
  • No (disabled) if `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

`CONFIG_SECURE_FLASH_CHECK_ENC.EN_IN_APP`
Check Flash Encryption enabled on app startup

*Found in: Security features*
If set (default), in an app during startup code, there is a check of the flash encryption eFuse bit is on (as the bootloader should already have set it). The app requires this bit is on to continue work otherwise abort.

If not set, the app does not care if the flash encryption eFuse bit is set or not.

Default value:
  • Yes (enabled) if `CONFIG_SECURE_FLASH_ENC_ENABLED`
CONFIG_SECURE_UART_ROM_DL_MODE
UART ROM download mode

*Found in: Security features*

**Available options:**

- UART ROM download mode (Permanently disabled (recommended)) (SECURE_DISABLE_ROM_DL_MODE)
  If set, during startup the app will burn an eFuse bit to permanently disable the UART ROM Download Mode. This prevents any future use of esptool.py, espfuse.py and similar tools. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.
  It is recommended to enable this option in any production application where Flash Encryption and/or Secure Boot is enabled and access to Download Mode is not required.
  It is also possible to permanently disable Download Mode by calling esp_efuse_disable_rom_download_mode() at runtime.

- UART ROM download mode (Permanently switch to Secure mode (recommended)) (SECURE_ENABLE_SECURE_ROM_DL_MODE)
  If set, during startup the app will burn an eFuse bit to permanently switch the UART ROM Download Mode into a separate Secure Download mode. This option can only work if Download Mode is not already disabled by eFuse.
  Secure Download mode limits the use of Download Mode functions to simple flash read, write and erase operations, plus a command to return a summary of currently enabled security features.
  Secure Download mode is not compatible with the esptool.py flasher stub feature, espfuse.py, read/writing memory or registers, encrypted download, or any other features that interact with unsupported Download Mode commands.
  Secure Download mode should be enabled in any application where Flash Encryption and/or Secure Boot is enabled. Disabling this option does not immediately cancel the benefits of the security features, but it increases the potential “attack surface” for an attacker to try and bypass them with a successful physical attack.
  It is also possible to enable secure download mode at runtime by calling esp_efuse_enable_rom_secure_download_mode()
  Note: Secure Download mode is not available for ESP32 (includes revisions till ECO3).

- UART ROM download mode (Enabled (not recommended)) (SECURE_INSECURE_ALLOW_DL_MODE)
  This is a potentially insecure option. Enabling this option will allow the full UART download mode to stay enabled. This option SHOULD NOT BE ENABLED for production use cases.

**Application manager**

Contains:

- CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR
- CONFIG_APP_EXCLUDE_PROJECT_VER_VAR
- CONFIG_APP_PROJECT_VER_FROM_CONFIG
- CONFIG_APP_RETRIEVE_LEN_ELF_SHA
- CONFIG_APP_COMPILE_TIME_DATE

**CONFIG_APP_COMPILE_TIME_DATE**

Use time/date stamp for app

*Found in: Application manager*

If set, then the app will be built with the current time/date stamp. It is stored in the app description structure. If not set, time/date stamp will be excluded from app image. This can be useful for getting the same binary image files made from the same source, but at different times.

**Default value:**
• Yes (enabled)

**CONFIG_APP_EXCLUDE_PROJECT_VER_VAR**
Exclude PROJECT_VER from firmware image

*Found in: Application manager*

The PROJECT_VER variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

**Default value:**
• No (disabled)

**CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR**
Exclude PROJECT_NAME from firmware image

*Found in: Application manager*

The PROJECT_NAME variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

**Default value:**
• No (disabled)

**CONFIG_APP_PROJECT_VER_FROM_CONFIG**
Get the project version from Kconfig

*Found in: Application manager*

If this is enabled, then config item APP_PROJECT_VER will be used for the variable PROJECT_VER. Other ways to set PROJECT_VER will be ignored.

**Default value:**
• No (disabled)

**CONFIG_APP_PROJECT_VER**
Project version

*Found in: Application manager > CONFIG_APP_PROJECT_VER_FROM_CONFIG*

Project version

**Default value:**
• 1 if CONFIG_APP_PROJECT_VER_FROM_CONFIG

**CONFIG_APP_RETRIEVE_LEN_ELF_SHA**
The length of APP ELF SHA is stored in RAM(chars)

*Found in: Application manager*

At startup, the app will read this many hex characters from the embedded APP ELF SHA-256 hash value and store it in static RAM. This ensures the app ELF SHA-256 value is always available if it needs to be printed by the panic handler code. Changing this value will change the size of a static buffer, in bytes.

**Range:**
• from 8 to 64

**Default value:**
• 16
Boot ROM Behavior

Contains:

• `CONFIG_BOOT_ROM_LOG_SCHEME`

**CONFIG_BOOT_ROM_LOG_SCHEME**

Permanently change Boot ROM output

*Found in: Boot ROM Behavior*

Controls the Boot ROM log behavior. The rom log behavior can only be changed for once, specific eFuse bit(s) will be burned at app boot stage.

**Available options:**

• Always Log (BOOT_ROM_LOG_ALWAYS_ON)
  Always print ROM logs, this is the default behavior.

• Permanently disable logging (BOOT_ROM_LOG_ALWAYS_OFF)
  Don’t print ROM logs.

• Log on GPIO High (BOOT_ROM_LOG_ON_GPIO_HIGH)
  Print ROM logs when GPIO level is high during startup. The GPIO number is chip dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.

• Log on GPIO Low (BOOT_ROM_LOG_ON_GPIO_LOW)
  Print ROM logs when GPIO level is low during startup. The GPIO number is chip dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.

Serial flasher config

Contains:

• `CONFIG_ESPTOOLPY_AFTER`
• `CONFIG_ESPTOOLPY_BEFORE`
• `CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE`
• `CONFIG_ESPTOOLPY_NO_STUB`
• `CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE`
• `CONFIG_ESPTOOLPY_FLASHSIZE`
• `CONFIG_ESPTOOLPY_FLASHMODE`
• `CONFIG_ESPTOOLPY_FLASHFREQ`

**CONFIG_ESPTOOLPY_NO_STUB**

Disable download stub

*Found in: Serial flasher config*

The flasher tool sends a precompiled download stub first by default. That stub allows things like compressed downloads and more. Usually you should not need to disable that feature

**Default value:**

• No (disabled)

**CONFIG_ESPTOOLPY_FLASHMODE**

Flash SPI mode

*Found in: Serial flasher config*

Mode the flash chip is flashed in, as well as the default mode for the binary to run in.

**Available options:**

• QIO (ESPTOOLPY_FLASHMODE_QIO)
Chapter 2. API Reference

- QOUT (ESPTOOLPY_FLASHMODE_QOUT)
- DIO (ESPTOOLPY_FLASHMODE_DIO)
- DOUT (ESPTOOLPY_FLASHMODE_DOUT)
- OPI (ESPTOOLPY_FLASHMODE_OPI)

**CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE**

Flash Sampling Mode

*Found in: Serial flasher config*

**Available options:**

- STR Mode (ESPTOOLPY_FLASH_SAMPLE_MODE_STR)
- DTR Mode (ESPTOOLPY_FLASH_SAMPLE_MODE_DTR)

**CONFIG_ESPTOOLPY_FLASHFREQ**

Flash SPI speed

*Found in: Serial flasher config*

**Available options:**

- 120 MHz (ESPTOOLPY_FLASHFREQ_120M)
- 80 MHz (ESPTOOLPY_FLASHFREQ_80M)
- 60 MHz (ESPTOOLPY_FLASHFREQ_60M)
- 48 MHz (ESPTOOLPY_FLASHFREQ_48M)
- 40 MHz (ESPTOOLPY_FLASHFREQ_40M)
- 30 MHz (ESPTOOLPY_FLASHFREQ_30M)
- 26 MHz (ESPTOOLPY_FLASHFREQ_26M)
- 24 MHz (ESPTOOLPY_FLASHFREQ_24M)
- 20 MHz (ESPTOOLPY_FLASHFREQ_20M)
- 15 MHz (ESPTOOLPY_FLASHFREQ_15M)

**CONFIG_ESPTOOLPY_FLASHSIZE**

Flash size

*Found in: Serial flasher config*

SPI flash size, in megabytes

**Available options:**

- 1 MB (ESPTOOLPY_FLASHSIZE_1MB)
- 2 MB (ESPTOOLPY_FLASHSIZE_2MB)
- 4 MB (ESPTOOLPY_FLASHSIZE_4MB)
- 8 MB (ESPTOOLPY_FLASHSIZE_8MB)
- 16 MB (ESPTOOLPY_FLASHSIZE_16MB)
- 32 MB (ESPTOOLPY_FLASHSIZE_32MB)
- 64 MB (ESPTOOLPY_FLASHSIZE_64MB)
- 128 MB (ESPTOOLPY_FLASHSIZE_128MB)

**CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE**

Detect flash size when flashing bootloader

*Found in: Serial flasher config*

If this option is set, flashing the project will automatically detect the flash size of the target chip and update the bootloader image before it is flashed.

Enabling this option turns off the image protection against corruption by a SHA256 digest. Updating the bootloader image before flashing would invalidate the digest.
**Default value:**
- No (disabled)

**CONFIG_ESPTOOLPY_BEFORE**

Before flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 before flashing.

Automatic reset depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

**Available options:**
- Reset to bootloader (ESPTOOLPY_BEFORE_RESET)
- No reset (ESPTOOLPY_BEFORE_NORESET)

**CONFIG_ESPTOOLPY_AFTER**

After flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 after flashing.

Automatic reset depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

**Available options:**
- Reset after flashing (ESPTOOLPY_AFTER_RESET)
- Stay in bootloader (ESPTOOLPY_AFTER_NORESET)

**Partition Table**

Contains:
- `CONFIG_PARTITION_TABLE_CUSTOM_FILENAME`
- `CONFIG_PARTITION_TABLE_MD5`
- `CONFIG_PARTITION_TABLE_OFFSET`
- `CONFIG_PARTITION_TABLE_TYPE`

**CONFIG_PARTITION_TABLE_TYPE**

Partition Table

*Found in: Partition Table*

The partition table to flash to the ESP32. The partition table determines where apps, data and other resources are expected to be found.

The predefined partition table CSV descriptions can be found in the components/partition_table directory. These are mostly intended for example and development use, it’s expect that for production use you will copy one of these CSV files and create a custom partition CSV for your application.

**Available options:**
- Single factory app, no OTA (PARTITION_TABLE_SINGLE_APP)
  This is the default partition table, designed to fit into a 2MB or larger flash with a single 1MB app partition.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp.csv
  This partition table is not suitable for an app that needs OTA (over the air update) capability.
• Single factory app (large), no OTA (PARTITION_TABLE_SINGLE_APP_LARGE)
  This is a variation of the default partition table, that expands the 1MB app partition size to
  1.5MB to fit more code.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_large.csv
  This partition table is not suitable for an app that needs OTA (over the air update) capability.
• Factory app, two OTA definitions (PARTITION_TABLE_TWO_OTA)
  This is a basic OTA-enabled partition table with a factory app partition plus two OTA app
  partitions. All are 1MB, so this partition table requires 4MB or larger flash size.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_two_ota.csv
• Custom partition table CSV (PARTITION_TABLE_CUSTOM)
  Specify the path to the partition table CSV to use for your project.
  Consult the Partition Table section in the ESP-IDF Programmers Guide for more information.
• Single factory app, no OTA, encrypted NVS (PARTITION_TABLE_SINGLE_APP_ENCRYPTED_NVS)
  This is a variation of the default “Single factory app, no OTA” partition table that supports
  encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF
  Programmers Guide for more information.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_encr_nvs.csv
• Single factory app (large), no OTA, encrypted NVS (PARTITION_TABLE_SINGLE_APP_LARGE_ENC_NVS)
  This is a variation of the “Single factory app (large), no OTA” partition table that supports
  encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF
  Programmers Guide for more information.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_large_encr_nvs.csv
• Factory app, two OTA definitions, encrypted NVS (PARTITION_TABLE_TWO_OTA_ENCRYPTED_NVS)
  This is a variation of the “Factory app, two OTA definitions” partition table that supports
  encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF
  Programmers Guide for more information.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_two_ota_encr_nvs.csv

**CONFIG_PARTITION_TABLE_CUSTOM_FILENAME**

Custom partition CSV file

*Found in: Partition Table*

Name of the custom partition CSV filename. This path is evaluated relative to the project root directory.

*Default value:*

• “partitions.csv”

**CONFIG_PARTITION_TABLE_OFFSET**

Offset of partition table

*Found in: Partition Table*

The address of partition table (by default 0x8000). Allows you to move the partition table, it gives more
space for the bootloader. Note that the bootloader and app will both need to be compiled with the same
PARTITION_TABLE_OFFSET value.

This number should be a multiple of 0x1000.

Note that partition offsets in the partition table CSV file may need to be changed if this value is set to a
higher value. To have each partition offset adapt to the configured partition table offset, leave all partition
offsets blank in the CSV file.

**Default value:**
- “0x8000”

**CONFIG_PARTITION_TABLE_MD5**
Generate an MD5 checksum for the partition table

*Found in: Partition Table*

Generate an MD5 checksum for the partition table for protecting the integrity of the table. The generation should be turned off for legacy bootloaders which cannot recognize the MD5 checksum in the partition table.

**Default value:**
- Yes (enabled)

**Compiler options**

Contains:

- `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`
- `CONFIG_COMPILER_FLOAT_LIB_FROM`
- `CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT`
- `CONFIG_COMPILER_DUMPRTL_FILES`
- `CONFIG_COMPILER_SAVE_RESTORE_LIBCALLS`
- `CONFIG_COMPILER_WARN_WRITE_STRINGS`
- `CONFIG_COMPILER_CXX_EXCEPTIONS`
- `CONFIG_COMPILER_CXX_RTTI`
- `CONFIG_COMPILER_OPTIMIZATION`
- `CONFIG_COMPILER_HIDE_PATHS_MACROS`
- `CONFIG_COMPILER_STACK_CHECK_MODE`

**CONFIG_COMPILER_OPTIMIZATION**

Optimization Level

*Found in: Compiler options*

This option sets compiler optimization level (gcc -O argument) for the app.

- The “Default” setting will add the -Og flag to CFLAGS.
- The “Size” setting will add the -Os flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.

The “Size” setting cause the compiled code to be smaller and faster, but may lead to difficulties of correlating code addresses to source file lines when debugging.

The “Performance” setting causes the compiled code to be larger and faster, but will be easier to correlated code addresses to source file lines.

“None” with -O0 produces compiled code without optimization.

Note that custom optimization levels may be unsupported.

Compiler optimization for the IDF bootloader is set separately, see the BOOT-LOADER_COMPILER_OPTIMIZATION setting.

**Available options:**

- Debug (-Og) (COMPILER_OPTIMIZATION_DEFAULT)
- Optimize for size (-Os) (COMPILER_OPTIMIZATION_SIZE)
- Optimize for performance (-O2) (COMPILER_OPTIMIZATION_PERF)
• Debug without optimization (-O0) (COMPILER_OPTIMIZATION_NONE)

**CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL**

Assertion level

*Found in: Compiler options*

Assertions can be:

- Enabled. Failure will print verbose assertion details. This is the default.
- Set to “silent” to save code size (failed assertions will abort() but user needs to use the aborting address to find the line number with the failed assertion.)
- Disabled entirely (not recommended for most configurations.) -DNDEBUG is added to CPPFLAGS in this case.

**Available options:**

- Enabled (COMPILER_OPTIMIZATION_ASSERTIONS_ENABLE)
  Enable assertions. Assertion content and line number will be printed on failure.
- Silent (saves code size) (COMPILER_OPTIMIZATION_ASSERTIONS_SILENT)
  Enable silent assertions. Failed assertions will abort(), user needs to use the aborting address to find the line number with the failed assertion.
- Disabled (sets -DNDEBUG) (COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE)
  If assertions are disabled, -DNDEBUG is added to CPPFLAGS.

**CONFIG_COMPILER_FLOAT_LIB_FROM**

Compiler float lib source

*Found in: Compiler options*

In the soft-fp part of libgcc, riscv version is written in C, and handles all edge cases in IEEE754, which makes it larger and performance is slow.

RVfplib is an optimized RISC-V library for FP arithmetic on 32-bit integer processors, for single and double-precision FP. RVfplib is “fast”, but it has a few exceptions from IEEE 754 compliance.

**Available options:**

- libgcc (COMPILER_FLOAT_LIB_FROM_GCCLIB)
- librVfp (COMPILER_FLOAT_LIB_FROM_RVFPLIB)

**CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT**

Disable messages in ESP_RETURN_ON_* and ESP_EXIT_ON_* macros

*Found in: Compiler options*

If enabled, the error messages will be discarded in following check macros:

- ESP_RETURN_ON_ERROR
- ESP_EXIT_ON_ERROR
- ESP_RETURN_ON_FALSE
- ESP_EXIT_ON_FALSE

**Default value:**

- No (disabled)

**CONFIG_COMPILER_HIDE_PATHS_MACROS**

Replace ESP-IDF and project paths in binaries

*Found in: Compiler options*

When expanding the __FILE__ and __BASE_FILE__ macros, replace paths inside ESP-IDF with paths relative to the placeholder string “IDF”, and convert paths inside the project directory to relative paths.
Chapter 2. API Reference

This allows building the project with assertions or other code that embeds file paths, without the binary containing the exact path to the IDF or project directories.

This option passes -fmacro-prefix-map options to the GCC command line. To replace additional paths in your binaries, modify the project CMakeLists.txt file to pass custom -fmacro-prefix-map or -ffile-prefix-map arguments.

**Default value:**
- Yes (enabled)

**CONFIG_COMPILER_CXX_EXCEPTIONS**

Enable C++ exceptions

*Found in: Compiler options*

Enabling this option compiles all IDF C++ files with exception support enabled.

Disabling this option disables C++ exception support in all compiled files, and any libstdc++ code which throws an exception will abort instead.

Enabling this option currently adds an additional ~500 bytes of heap overhead when an exception is thrown in user code for the first time.

**Default value:**
- No (disabled)

**CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE**

Emergency Pool Size

*Found in: Compiler options > CONFIG_COMPILER_CXX_EXCEPTIONS*

Size (in bytes) of the emergency memory pool for C++ exceptions. This pool will be used to allocate memory for thrown exceptions when there is not enough memory on the heap.

**Default value:**
- 0 if CONFIG_COMPILER_CXX_EXCEPTIONS

**CONFIG_COMPILER_CXX_RTTI**

Enable C++ run-time type info (RTTI)

*Found in: Compiler options*

Enabling this option compiles all C++ files with RTTI support enabled. This increases binary size (typically by tens of kB) but allows using dynamic_cast conversion and typeid operator.

**Default value:**
- No (disabled)

**CONFIG_COMPILER_STACK_CHECK_MODE**

Stack smashing protection mode

*Found in: Compiler options*

Stack smashing protection mode. Emit extra code to check for buffer overflows, such as stack smashing attacks. This is done by adding a guard variable to functions with vulnerable objects. The guards are initialized when a function is entered and then checked when the function exits. If a guard check fails, program is halted. Protection has the following modes:
In NORMAL mode (GCC flag: -fstack-protector) only functions that call alloca, and functions with buffers larger than 8 bytes are protected.

STRONG mode (GCC flag: -fstack-protector-strong) is like NORMAL, but includes additional functions to be protected—those that have local array definitions, or have references to local frame addresses.

In OVERALL mode (GCC flag: -fstack-protector-all) all functions are protected.

Modes have the following impact on code performance and coverage:

- performance: NORMAL > STRONG > OVERALL
- coverage: NORMAL < STRONG < OVERALL

The performance impact includes increasing the amount of stack memory required for each task.

**Available options:**
- None (COMPILER_STACK_CHECK_MODE_NONE)
- Normal (COMPILER_STACK_CHECK_MODE_NORM)
- Strong (COMPILER_STACK_CHECK_MODE_STRONG)
- Overall (COMPILER_STACK_CHECK_MODE_ALL)

**CONFIG_COMPILER_WARN_WRITE_STRINGS**

Enable -Wwrite-strings warning flag

*Found in: Compiler options*

Adds -Wwrite-strings flag for the C/C++ compilers.

For C, this gives string constants the type `const char[]` so that copying the address of one into a non-const `char *` pointer produces a warning. This warning helps to find at compile time code that tries to write into a string constant.

For C++, this warns about the deprecated conversion from string literals to `char *`.

**Default value:**
- No (disabled)

**CONFIG_COMPILER_SAVE_RESTORE_LIBCALLS**

Enable -msave-restore flag to reduce code size

*Found in: Compiler options*

Adds -msave-restore to C/C++ compilation flags.

When this flag is enabled, compiler will call library functions to save/restore registers in function prologues/epilogues. This results in lower overall code size, at the expense of slightly reduced performance.

This option can be enabled for RISC-V targets only.

**CONFIG_COMPILER_DUMP_RTL_FILES**

Dump RTL files during compilation

*Found in: Compiler options*

If enabled, RTL files will be produced during compilation. These files can be used by other tools, for example to calculate call graphs.

**Component config**

Contains:

- ADC and ADC Calibration
- Application Level Tracing

Application Level Tracing Contains:

- CONFIG_APPTRACE_DESTINATION1
- CONFIG_APPTRACE_DESTINATION2
- FreeRTOS SystemView Tracing
- CONFIG_APPTRACE_GCOV_ENABLE
- CONFIG_APPTRACE_BUF_SIZE
- CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX
- CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH
- CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO
• CONFIG_APPTRACE_UART_BAUDRATE
• CONFIG_APPTRACE_UART_RX_GPIO
• CONFIG_APPTRACE_UART_RX_BUFF_SIZE
• CONFIG_APPTRACE_UART_TASK_PRIO
• CONFIG_APPTRACE_UART_TX_MSG_SIZE
• CONFIG_APPTRACE_UART_TX_GPIO
• CONFIG_APPTRACE_UART_TX_BUFF_SIZE

CONFIG_APPTRACE_DESTINATION1

Data Destination 1

*Found in: Component config > Application Level Tracing*

Select destination for application trace: JTAG or none (to disable).

**Available options:**

- JTAG (APTRACE_DEST_JTAG)
- None (APTRACE_DEST_NONE)

CONFIG_APPTRACE_DESTINATION2

Data Destination 2

*Found in: Component config > Application Level Tracing*

Select destination for application trace: UART(XX) or none (to disable).

**Available options:**

- UART0 (APTRACE_DEST_UART0)
- UART1 (APTRACE_DEST_UART1)
- UART2 (APTRACE_DEST_UART2)
- USB_CDC (APTRACE_DEST_USB_CDC)
- None (APTRACE_DEST_UART_NONE)

CONFIG_APPTRACE_UART_TX_GPIO

UART TX on GPIO#

*Found in: Component config > Application Level Tracing*

This GPIO is used for UART TX pin.

CONFIG_APPTRACE_UART_RX_GPIO

UART RX on GPIO#

*Found in: Component config > Application Level Tracing*

This GPIO is used for UART RX pin.

CONFIG_APPTRACE_UART_BAUDRATE

UART baud rate

*Found in: Component config > Application Level Tracing*

This baud rate is used for UART.

The app’s maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.
CONFIG_APPTRACE_UART_RX_BUFF_SIZE

UART RX ring buffer size

Found in: Component config > Application Level Tracing

Size of the UART input ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer. The data placed to this buffer before sent out to the interface.

CONFIG_APPTRACE_UART_TX_BUFF_SIZE

UART TX ring buffer size

Found in: Component config > Application Level Tracing

Size of the UART output ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer.

CONFIG_APPTRACE_UART_TX_MSG_SIZE

UART TX message size

Found in: Component config > Application Level Tracing

Maximum size of the single message to transfer.

CONFIG_APPTRACE_UART_TASK_PRIO

UART Task Priority

Found in: Component config > Application Level Tracing

UART task priority. In case of high events rate, this parameter could be changed up to (config-MAX_PRIORITIES-1).

Range:

- from 1 to 32

Default value:

- 1

CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO

Timeout for flushing last trace data to host on panic

Found in: Component config > Application Level Tracing

Timeout for flushing last trace data to host in case of panic. In ms. Use -1 to disable timeout and wait forever.

CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH

Threshold for flushing last trace data to host on panic

Found in: Component config > Application Level Tracing

Threshold for flushing last trace data to host on panic in post-mortem mode. This is minimal amount of data needed to perform flush. In bytes.

CONFIG_APPTRACE_BUF_SIZE

Size of the apptrace buffer

Found in: Component config > Application Level Tracing

Size of the memory buffer for trace data in bytes.
CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX

Size of the pending data buffer

*Found in: Component config > Application Level Tracing*

Size of the buffer for events in bytes. It is useful for buffering events from the time critical code (scheduler, ISRs etc). If this parameter is 0 then events will be discarded when main HW buffer is full.

**FreeRTOS SystemView Tracing**

Contains:

- `CONFIG_APPTRACE_SV_CPU`
- `CONFIG_APPTRACE_SV_EVT_ISR_ENTER_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_ISR_EXIT_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_ISR_TO_SCHED_ENABLE`
- `CONFIG_APPTRACE_SV_MAX_TASKS`
- `CONFIG_APPTRACE_SV_EVT_IDLE_ENABLE`
- `CONFIG_APPTRACE_SV_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_CREATE_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_START_EXEC_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_START_READY_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_STOP_EXEC_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_STOP_READY_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_TERMINATE_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TIMER_ENTER_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TIMER_EXIT_ENABLE`
- `CONFIG_APPTRACE_SV_TS_SOURCE`
- `CONFIG_APPTRACE_SV_EVT_OVERFLOW_ENABLE`
- `CONFIG_APPTRACE_SV_BUF_WAIT_TMO`

**CONFIG_APPTRACE_SV_ENABLE**

SystemView Tracing Enable

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables support for SEGGER SystemView tracing functionality.

**CONFIG_APPTRACE_SV_DEST**

SystemView destination

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

SystemView with transfer data through defined interface.

**Available options:**

- Data destination JTAG (APPTRACE_SV_DEST_JTAG)
  Send SEGGER SystemView events through JTAG interface.
- Data destination UART (APPTRACE_SV_DEST_UART)
  Send SEGGER SystemView events through UART interface.

**CONFIG_APPTRACE_SV_CPU**

CPU to trace

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Define the CPU to trace by SystemView.

**Available options:**
• CPU0 (APPTRACE_SV_DEST_CPU_0) 
  Send SEGGER SystemView events for Pro CPU.
• CPU1 (APPTRACE_SV_DEST_CPU_1) 
  Send SEGGER SystemView events for App CPU.

CONFIG_APPTRACE_SV_TS_SOURCE

Timer to use as timestamp source

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

SystemView needs to use a hardware timer as the source of timestamps when tracing. This option selects the timer for it.

*Available options:*
• CPU cycle counter (CCOUNT) (APPTRACE_SV_TS_SOURCE_CCOUNT)
• General Purpose Timer (Timer Group) (APPTRACE_SV_TS_SOURCE_GPTIMER)
• esp_timer high resolution timer (APTRACE_SV_TS_SOURCE_ESP_TIMER)

CONFIG_APPTRACE_SV_MAX_TASKS

Maximum supported tasks

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Configures maximum supported tasks in sysview debug

CONFIG_APPTRACE_SV_BUF_WAIT_TMO

Trace buffer wait timeout

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Configures timeout (in us) to wait for free space in trace buffer. Set to -1 to wait forever and avoid lost events.

CONFIG_APPTRACE_SV_EVT_OVERFLOW_ENABLE

Trace Buffer Overflow Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Trace Buffer Overflow” event.

CONFIG_APPTRACE_SV_EVT_ISR_ENTER_ENABLE

ISR Enter Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “ISR Enter” event.

CONFIG_APPTRACE_SV_EVT_ISR_EXIT_ENABLE

ISR Exit Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “ISR Exit” event.
CONFIG_APPTRACE_SV_EVT_ISR_TO_SCHED_ENABLE
 ISR Exit to Scheduler Event
 Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing
 Enables “ISR to Scheduler” event.

CONFIG_APPTRACE_SV_EVT_TASK_START_EXEC_ENABLE
 Task Start Execution Event
 Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing
 Enables “Task Start Execution” event.

CONFIG_APPTRACE_SV_EVT_TASK_STOP_EXEC_ENABLE
 Task Stop Execution Event
 Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing
 Enables “Task Stop Execution” event.

CONFIG_APPTRACE_SV_EVT_TASK_START_READY_ENABLE
 Task Start Ready State Event
 Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing
 Enables “Task Start Ready State” event.

CONFIG_APPTRACE_SV_EVT_TASK_STOP_READY_ENABLE
 Task Stop Ready State Event
 Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing
 Enables “Task Stop Ready State” event.

CONFIG_APPTRACE_SV_EVT_TASK_CREATE_ENABLE
 Task Create Event
 Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing
 Enables “Task Create” event.

CONFIG_APPTRACE_SV_EVT_TASK_TERMINATE_ENABLE
 Task Terminate Event
 Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing
 Enables “Task Terminate” event.

CONFIG_APPTRACE_SV_EVT_IDLE_ENABLE
 System Idle Event
 Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing
 Enables “System Idle” event.
CONFIG_APPTRACE_SV_EVT_TIMER_ENTER_ENABLE

Timer Enter Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Timer Enter” event.

CONFIG_APPTRACE_SV_EVT_TIMER_EXIT_ENABLE

Timer Exit Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Timer Exit” event.

CONFIG_APPTRACE_GCOV_ENABLE

GCOV to Host Enable

*Found in: Component config > Application Level Tracing*

Enables support for GCOV data transfer to host.

Bluetooth   Contains:

- **Bluedroid Options**
- **CONFIG_BT_ENABLED**
- **Controller Options**
- **NimBLE Options**

CONFIG_BT_ENABLED

Bluetooth

*Found in: Component config > Bluetooth*

Select this option to enable Bluetooth and show the submenu with Bluetooth configuration choices.

CONFIG_BT_HOST

Host

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED*

This helps to choose Bluetooth host stack

**Available options:**

- Bluedroid - Dual-mode (BT_BLUEDROID_ENABLED)
  
  This option is recommended for classic Bluetooth or for dual-mode usecases
- NimBLE - BLE only (BT_NIMBLE_ENABLED)
  
  This option is recommended for BLE only usecases to save on memory
- Disabled (BT_CONTROLLER_ONLY)
  
  This option is recommended when you want to communicate directly with the controller (without any host) or when you are using any other host stack not supported by Espressif (not mentioned here).
Chapter 2. API Reference

**CONFIG_BT_CONTROLLER**

Controller

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED*

This helps to choose Bluetooth controller stack

**Available options:**

- Enabled (BT_CONTROLLER_ENABLED)
  
  This option is recommended for Bluetooth controller usecases

- Disabled (BT_CONTROLLER_DISABLED)
  
  This option is recommended for Bluetooth Host only usecases

**Bluedroid Options**

Contains:

- `CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK`
- `CONFIG_BT_BLUEDROID_MEM_DEBUG`
- `CONFIG_BT_BTU_TASK_STACK_SIZE`
- `CONFIG_BT_BTU_TASK_STACK_SIZE`
- `CONFIG_BT_BLE_ENABLED`
- `BT_DEBUG_LOG_LEVEL`
- `CONFIG_BT_ACL_CONNECTIONS`
- `CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST`
- `CONFIG_BT_STACK_NO_LOG`
- `CONFIG_BT_BLE_42_FEATURES_SUPPORTED`
- `CONFIG_BT_BLE_50_FEATURES_SUPPORTED`
- `CONFIG_BT_MULTI_CONNECTION_ENABALE`
- `CONFIG_BT_MAX_DEVICE_NAME_LEN`
- `CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN`
- `CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE`
- `CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT`
- `CONFIG_BT_BLE_RPA_SUPPORTED`
- `CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY`

**CONFIG_BT_BTU_TASK_STACK_SIZE**

Bluetooth event (callback to application) task stack size

*Found in: Component config > Bluetooth > Bluedroid Options*

This select btctask stack size

**Default value:**

- 3072 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE**

The cpu core which Bluedroid run

*Found in: Component config > Bluetooth > Bluedroid Options*

Which the cpu core to run Bluedroid. Can choose core0 and core1. Can not specify no-affinity.

**Available options:**

- Core 0 (PRO CPU) (BT_BLUEDROID_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BT_BLUEDROID_PINNED_TO_CORE_1)

**CONFIG_BT_BTU_TASK_STACK_SIZE**
Bluetooth Bluedroid Host Stack task stack size

*Found in: Component config > Bluetooth > Bluedroid Options*

This select btu task stack size

**Default value:**
- 4096 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_BLUEDROID_MEM_DEBUG**

Bluedroid memory debug

*Found in: Component config > Bluetooth > Bluedroid Options*

Bluedroid memory debug

**Default value:**
- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_ENABLED**

Bluetooth Low Energy

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Bluetooth Low Energy

**Default value:**
- Yes (enabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_GATTS_ENABLE**

Include GATT server module(GATTS)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED*

This option can be disabled when the app work only on gatt client mode

**Default value:**
- Yes (enabled) if CONFIG_BT_BLE_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_GATTS_PPCP_CHAR_GAP**

Enable Peripheral Preferred Connection Parameters characteristic in GAP service

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

This enables “Peripheral Preferred Connection Parameters” characteristic (UUID: 0x2A04) in GAP service that has connection parameters like min/max connection interval, slave latency and supervision timeout multiplier

**Default value:**
- No (disabled) if CONFIG_BT_GATTS_ENABLE && BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_BLUFI_ENABLE**

Include blufi function

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

This option can be close when the app does not require blufi function.

**Default value:**
• No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_GATT_MAX_SR_PROFILES**

Max GATT Server Profiles

*Found in: Component config > Bluetooth > Bluedroid Options > `CONFIG_BT_BLE_ENABLED` > `CONFIG_BT_GATTS_ENABLE`*

Maximum GATT Server Profiles Count

**Range:**
- from 1 to 32 if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

**Default value:**
- 8 if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_GATT_MAX_SR_ATTRIBUTES**

Max GATT Service Attributes

*Found in: Component config > Bluetooth > Bluedroid Options > `CONFIG_BT_BLE_ENABLED` > `CONFIG_BT_GATTS_ENABLE`*

Maximum GATT Service Attributes Count

**Range:**
- from 1 to 500 if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

**Default value:**
- 100 if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_MODE**

GATT Service Change Mode

*Found in: Component config > Bluetooth > Bluedroid Options > `CONFIG_BT_BLE_ENABLE` > `CONFIG_BT_GATTS_ENABLE`*

Service change indication mode for GATT Server.

**Available options:**
- GATTs manually send service change indication (`BT_GATTS_SEND_SERVICE_CHANGE_MANUAL`)
  - Manually send service change indication through API `esp_ble_gatts_send_service_change_indication()`
- GATTs automatically send service change indication (`BT_GATTS_SEND_SERVICE_CHANGE_AUTO`)
  - Let Bluedroid handle the service change indication internally

**CONFIG_BT_GATTC_ENABLE**

Include GATT client module (GATTC)

*Found in: Component config > Bluetooth > Bluedroid Options > `CONFIG_BT_BLE_ENABLE`*

This option can be close when the app works only on gatt server mode

**Default value:**
- Yes (enabled) if `CONFIG_BT_BLE_ENABLE` && `BT_BLUEDROID_ENABLED`
**CONFIG_BT_GATTC_CACHE_NVS_FLASH**

Save gattc cache data to nvs flash

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE*

This select can save gattc cache data to nvs flash

**Default value:**
- No (disabled) if `CONFIG_BT_GATTC_ENABLE` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_GATTC_CONNECT_RETRY_COUNT**

The number of attempts to reconnect if the connection establishment failed

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE*

The number of attempts to reconnect if the connection establishment failed

**Range:**
- from 0 to 7 if `CONFIG_BT_GATTC_ENABLE` && `BT_BLUEDROID_ENABLED`

**Default value:**
- 3 if `CONFIG_BT_GATTC_ENABLE` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_BLE_SMP_ENABLE**

Include BLE security module(SMP)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED*

This option can be close when the app not used the ble security connect.

**Default value:**
- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_SMP_SLAVE_CON_PARAMS_UPD_ENABLE**

Slave enable connection parameters update during pairing

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_BLE_SMP_ENABLE*

In order to reduce the pairing time, slave actively initiates connection parameters update during pairing.

**Default value:**
- No (disabled) if `CONFIG_BT_BLE_SMP_ENABLE` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_STACK_NO_LOG**

Disable BT debug logs (minimize bin size)

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can save the rodata code size

**Default value:**
- No (disabled) if `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`
**BT DEBUG LOG LEVEL**

Contains:

- `CONFIG_BT_LOG_A2D_TRACE_LEVEL`
- `CONFIG_BT_LOG_APPL_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVCT_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVDT_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVRC_TRACE_LEVEL`
- `CONFIG_BT_LOG_BLUFI_TRACE_LEVEL`
- `CONFIG_BT_LOG_BNEP_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTFC_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTIF_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTM_TRACE_LEVEL`
- `CONFIG_BT_LOG_GAP_TRACE_LEVEL`
- `CONFIG_BT_LOG_GATT_TRACE_LEVEL`
- `CONFIG_BT_LOG_HCI_TRACE_LEVEL`
- `CONFIG_BT_LOG_HID_TRACE_LEVEL`
- `CONFIG_BT_LOG_L2CAP_TRACE_LEVEL`
- `CONFIG_BT_LOG_MCA_TRACE_LEVEL`
- `CONFIG_BT_LOG_OSI_TRACE_LEVEL`
- `CONFIG_BT_LOG_PAN_TRACE_LEVEL`
- `CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL`
- `CONFIG_BT_LOG_SDP_TRACE_LEVEL`
- `CONFIG_BT_LOG_SMP_TRACE_LEVEL`

**CONFIG_BT_LOG_HCI_TRACE_LEVEL**

HCI layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for HCI layer

**Available options:**

- NONE (BT_LOG_HCI_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_HCI_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_HCI_TRACE_LEVEL_WARNING)
- API (BT_LOG_HCI_TRACE_LEVEL_API)
- EVENT (BT_LOG_HCI_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_HCI_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_HCI_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_BTM_TRACE_LEVEL**

BTM layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BTM layer

**Available options:**

- NONE (BT_LOG_BTM_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BTM_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BTM_TRACE_LEVEL_WARNING)
- API (BT_LOG_BTM_TRACE_LEVEL_API)
- EVENT (BT_LOG_BTM_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BTM_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BTM_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_L2CAP_TRACE_LEVEL**
L2CAP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for L2CAP layer

**Available options:**
- NONE (BT_LOG_L2CAP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_L2CAP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_L2CAP_TRACE_LEVEL_WARNING)
- API (BT_LOG_L2CAP_TRACE_LEVEL_API)
- EVENT (BT_LOG_L2CAP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_L2CAP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_L2CAP_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_RF COMM_TRACE_LEVEL**

RFCOMM layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for RFCOMM layer

**Available options:**
- NONE (BT_LOG_RFCOMM_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_RFCOMM_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_RFCOMM_TRACE_LEVEL_WARNING)
- API (BT_LOG_RFCOMM_TRACE_LEVEL_API)
- EVENT (BT_LOG_RFCOMM_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_RFCOMM_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_RFCOMM_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_SDP_TRACE_LEVEL**

SDP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for SDP layer

**Available options:**
- NONE (BT_LOG_SDP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_SDP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_SDP_TRACE_LEVEL_WARNING)
- API (BT_LOG_SDP_TRACE_LEVEL_API)
- EVENT (BT_LOG_SDP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_SDP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_SDP_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_GAP_TRACE_LEVEL**

GAP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for GAP layer

**Available options:**
- NONE (BT_LOG_GAP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_GAP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_GAP_TRACE_LEVEL_WARNING)
- API (BT_LOG_GAP_TRACE_LEVEL_API)
- EVENT (BT_LOG_GAP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_GAP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_GAP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BNEP_TRACE_LEVEL

BNEP layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BNEP layer

Available options:
• NONE (BT_LOG_BNEP_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_BNEP_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_BNEP_TRACE_LEVEL_WARNING)
• API (BT_LOG_BNEP_TRACE_LEVEL_API)
• EVENT (BT_LOG_BNEP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BNEP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BNEP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_PAN_TRACE_LEVEL

PAN layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for PAN layer

Available options:
• NONE (BT_LOG_PAN_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_PAN_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_PAN_TRACE_LEVEL_WARNING)
• API (BT_LOG_PAN_TRACE_LEVEL_API)
• EVENT (BT_LOG_PAN_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_PAN_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_PAN_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_A2D_TRACE_LEVEL

A2D layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for A2D layer

Available options:
• NONE (BT_LOG_A2D_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_A2D_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_A2D_TRACE_LEVEL_WARNING)
• API (BT_LOG_A2D_TRACE_LEVEL_API)
• EVENT (BT_LOG_A2D_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_A2D_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_A2D_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVDT_TRACE_LEVEL

AVDT layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for AVDT layer

Available options:
### CONFIG_BT_LOG_AVCT_TRACE_LEVEL

**AVCT layer**

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for AVCT layer

**Available options:**

- NONE (BT_LOG_AVCT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVCT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVCT_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVCT_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVCT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVCT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVCT_TRACE_LEVEL_VERBOSE)

### CONFIG_BT_LOG_AVRC_TRACE_LEVEL

**AVRC layer**

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for AVRC layer

**Available options:**

- NONE (BT_LOG_AVRC_TRACE LEVEL_NONE)
- ERROR (BT_LOG_AVRC_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVRC_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVRC_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVRC_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVRC_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVRC_TRACE_LEVEL_VERBOSE)

### CONFIG_BT_LOG_MCA_TRACE_LEVEL

**MCA layer**

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for MCA layer

**Available options:**

- NONE (BT_LOG_MCA_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_MCA_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_MCA_TRACE_LEVEL_WARNING)
- API (BT_LOG_MCA_TRACE_LEVEL_API)
- EVENT (BT_LOG_MCA_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_MCA_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_MCA_TRACE_LEVEL_VERBOSE)
CONFIG_BT_LOG_HID_TRACE_LEVEL

HID layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for HID layer

Available options:
- NONE (BT_LOG_HID_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_HID_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_HID_TRACE_LEVEL_WARNING)
- API (BT_LOG_HID_TRACE_LEVEL_API)
- EVENT (BT_LOG_HID_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_HID_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_HID_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_APPL_TRACE_LEVEL

APPL layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for APPL layer

Available options:
- NONE (BT_LOG_APPL_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_APPL_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_APPL_TRACE_LEVEL_WARNING)
- API (BT_LOG_APPL_TRACE_LEVEL_API)
- EVENT (BT_LOG_APPL_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_APPL_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_APPL_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_GATT_TRACE_LEVEL

GATT layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for GATT layer

Available options:
- NONE (BT_LOG_GATT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_GATT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_GATT_TRACE_LEVEL_WARNING)
- API (BT_LOG_GATT_TRACE_LEVEL_API)
- EVENT (BT_LOG_GATT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_GATT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_GATT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_SMP_TRACE_LEVEL

SMP layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for SMP layer

Available options:
- NONE (BT_LOG_SMP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_SMP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_SMP_TRACE_LEVEL_WARNING)
- API (BT_LOG_SMP_TRACE_LEVEL_API)
• EVENT (BT_LOG_SMP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_SMP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_SMP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTIF_TRACE_LEVEL

BTIF layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BTIF layer

Available options:
• NONE (BT_LOG_BTIF_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_BTIF_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_BTIF_TRACE_LEVEL_WARNING)
• API (BT_LOG_BTIF_TRACE_LEVEL_API)
• EVENT (BT_LOG_BTIF_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BTIF_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BTIF_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTC_TRACE_LEVEL

BTC layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BTC layer

Available options:
• NONE (BT_LOG_BTC_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_BTC_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_BTC_TRACE_LEVEL_WARNING)
• API (BT_LOG_BTC_TRACE_LEVEL_API)
• EVENT (BT_LOG_BTC_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BTC_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BTC_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_OSI_TRACE_LEVEL

OSI layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for OSI layer

Available options:
• NONE (BT_LOG_OSI_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_OSI_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_OSI_TRACE_LEVEL_WARNING)
• API (BT_LOG_OSI_TRACE_LEVEL_API)
• EVENT (BT_LOG_OSI_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_OSI_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_OSI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BLUFI_TRACE_LEVEL

BLUFI layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BLUFI layer
Available options:
- NONE (BT_LOG_BLUFI_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BLUFI_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BLUFI_TRACE_LEVEL_WARNING)
- API (BT_LOG_BLUFI_TRACE_LEVEL_API)
- EVENT (BT_LOG_BLUFI_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BLUFI_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BLUFI_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_ACL_CONNECTIONS**

BT/BLE MAX ACL CONNECTIONS (1-7)

*Found in: Component config > Bluetooth > Bluedroid Options*

Maximum BT/BLE connection count

**Range:**
- from 1 to 7 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**Default value:**
- 4 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_MULTI_CONNECTION_ENABLE**

Enable BLE multi-connections

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable this option if there are multiple connections

**Default value:**
- Yes (enabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST**

BT/BLE will first malloc the memory from the PSRAM

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can save the internal RAM if there have the PSRAM

**Default value:**
- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY**

Use dynamic memory allocation in BT/BLE stack

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can make the allocation of memory will become more flexible

**Default value:**
- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK**

BLE queue congestion check

*Found in: Component config > Bluetooth > Bluedroid Options*

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.
Default value:
• No (disabled) if BT_BLUE_DROID_ENABLED && BT_BLUE_DROID_ENABLED

**CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN**

Report adv data and scan response individually when BLE active scan

*Found in: Component config > Bluetooth > Blue_droid Options*

Originally, when doing BLE active scan, Bluedroid will not report adv to application layer until receive scan response. This option is used to disable the behavior. When enable this option, Bluedroid will report adv data or scan response to application layer immediately.

# Memory reserved at start of DRAM for Bluetooth stack

Default value:
• No (disabled) if BT_BLUE_DROID_ENABLED && (BT_DM_CTRL_MODE_BTDM || BT_DM_CTRL_MODE_BLE_ONLY) && BT_BLUE_DROID_ENABLED

**CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT**

Timeout of BLE connection establishment

*Found in: Component config > Bluetooth > Blue_droid Options*

Bluetooth Connection establishment maximum time, if connection time exceeds this value, the connection establishment fails, ESP_GATTC_OPEN_EVT or ESP_GATTS_OPEN_EVT is triggered.

**Range:**
• from 1 to 60 if BT_BLUE_DROID_ENABLED && BT_BLUE_DROID_ENABLED

Default value:
• 30 if BT_BLUE_DROID_ENABLED && BT_BLUE_DROID_ENABLED

**CONFIG_BT_MAX_DEVICE_NAME_LEN**

length of bluetooth device name

*Found in: Component config > Bluetooth > Blue_droid Options*

Bluetooth Device name length shall be no larger than 248 octets, If the broadcast data cannot contain the complete device name, then only the shortname will be displayed, the rest parts that can’t fit in will be truncated.

**Range:**
• from 32 to 248 if BT_BLUE_DROID_ENABLED && BT_BLUE_DROID_ENABLED

Default value:
• 32 if BT_BLUE_DROID_ENABLED && BT_BLUE_DROID_ENABLED

**CONFIG_BT_BLE_RPA_SUPPORTED**

Update RPA to Controller

*Found in: Component config > Bluetooth > Blue_droid Options*

This enables controller RPA list function. For ESP32, ESP32 only support network privacy mode. If this option is enabled, ESP32 will only accept advertising packets from peer devices that contain private address, HW will not receive the advertising packets contain identity address after IRK changed. If this option is disabled, address resolution will be performed in the host, so the functions that require controller to resolve address in the white list cannot be used. This option is disabled by default on ESP32, please enable or disable this option according to your own needs.

For ESP32C3, ESP32S3, ESP32H2 and ESP32C2, devices support network privacy mode and device privacy mode, users can switch the two modes according to their own needs. So this option is enabled by default.
**Default value:**
- Yes (enabled) if `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED` CONFIG_BT_BLE_50_FEATURES_SUPPORTED

Enable BLE 5.0 features

*Found in: Component config > Bluetooth > Blueroid Options*

This enables BLE 5.0 features, this option only support esp32c3/esp32s3 chip

**Default value:**
- Yes (enabled) if `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_BLE_42_FEATURES_SUPPORTED**

Enable BLE 4.2 features

*Found in: Component config > Bluetooth > Blueroid Options*

This enables BLE 4.2 features.

**Default value:**
- No (disabled) if `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

**NimBLE Options**

Contains:

- `CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME`
- `CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS`
- `CONFIG_BT_NIMBLE_WHITELIST_SIZE`
- `CONFIG_BT_NIMBLE_COEX_PHY_CODED_TX_RX_TLIM`
- `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT`
- `CONFIG_BT_NIMBLE_ROLE_BROADCASTER`
- `CONFIG_BT_NIMBLE_ROLE_CENTRAL`
- `CONFIG_BT_NIMBLE_MESH`
- `CONFIG_BT_NIMBLE_ROLE_OBSERVER`
- `CONFIG_BT_NIMBLE_ROLE_PERIPHERAL`
- `CONFIG_BT_NIMBLE_SECURITY_ENABLE`
- `CONFIG_BT_NIMBLE_BLUFI_ENABLE`
- `CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT`
- `CONFIG_BT_NIMBLE_USE_ESP_TIMER`
- `CONFIG_BT_NIMBLE_DEBUG`
- `CONFIG_BT_NIMBLE_HOST_BASED_PRIVACY`
- `CONFIG_BT_NIMBLE_HS_FLOW_CTRL`
- `CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE`
- `CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN`
- `CONFIG_BT_NIMBLE_MAX_BONDS`
- `CONFIG_BT_NIMBLE_MAX_CCCDS`
- `CONFIG_BT_NIMBLE_MAX_CONNECTIONS`
- `CONFIG_BT_NIMBLE_12CAP_COC_MAX_NUM`
- `CONFIG_BT_NIMBLE_GATT_MAX_PROCS`
- `CONFIG_BT_NIMBLE_MEM_ALLOC_MODE`
- **Memory Settings**
- `CONFIG_BT_NIMBLE_LOG_LEVEL`
- `CONFIG_BT_NIMBLE_HOST_TASK_STACK_SIZE`
- `CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS`
- `CONFIG_BT_NIMBLE_NVSM_PERSIST`
- `CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU`
- `CONFIG_BT_NIMBLE_RPA_TIMEOUT`
- `CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE`
- `CONFIG_BT_NIMBLE_TEST_THROUGHPUT_TEST`
**CONFIG_BT_NIMBLE_MEM_ALLOC_MODE**

Memory allocation strategy

*Found in: Component config > Bluetooth > NimBLE Options*

Allocation strategy for NimBLE host stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

**Available options:**

- Internal memory (BT_NIMBLE_MEM_ALLOC_MODE_INTERNAL)
- External SPIRAM (BT_NIMBLE_MEM_ALLOC_MODE_EXTERNAL)
- Default alloc mode (BT_NIMBLE_MEM_ALLOC_MODE_DEFAULT)
- Internal IRAM (BT_NIMBLE_MEM_ALLOC_MODE_IRAM_8BIT) Allows to use IRAM memory region as 8bit accessible region.

Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

**CONFIG_BT_NIMBLE_LOG_LEVEL**

NimBLE Host log verbosity

*Found in: Component config > Bluetooth > NimBLE Options*

Select NimBLE log level. Please make a note that the selected NimBLE log verbosity can not exceed the level set in “Component config -> Log output -> Default log verbosity”.

**Available options:**

- No logs (BT_NIMBLE_LOG_LEVEL_NONE)
- Error logs (BT_NIMBLE_LOG_LEVEL_ERROR)
- Warning logs (BT_NIMBLE_LOG_LEVEL_WARNING)
- Info logs (BT_NIMBLE_LOG_LEVEL_INFO)
- Debug logs (BT_NIMBLE_LOG_LEVEL_DEBUG)

**CONFIG_BT_NIMBLE_MAX_CONNECTIONS**

Maximum number of concurrent connections

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of concurrent BLE connections. For ESP32, user is expected to configure BTDM_CTRL_BLE_MAX_CONN from controller menu along with this option. Similarly for ESP32-C3 or ESP32-S3, user is expected to configure BT_CTRL_BLE_MAX_ACT from controller menu.

**Range:**

- from 1 to 8 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**Default value:**

- 3 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MAX_BONDS**

Maximum number of bonds to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of bonds to save for peer security and our security

**Default value:**

- 3 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_MAX_CCCDS
Maximum number of CCC descriptors to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of CCC descriptors to save

**Default value:**
- 8 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM
Maximum number of connection oriented channels

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of BLE Connection Oriented Channels. When set to (0), BLE COC is not compiled in

**Range:**
- from 0 to 9 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**Default value:**
- 0 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE
The CPU core on which NimBLE host will run

*Found in: Component config > Bluetooth > NimBLE Options*

The CPU core on which NimBLE host will run. You can choose Core 0 or Core 1. Cannot specify no-affinity

**Available options:**
- Core 0 (PRO CPU) (BT_NIMBLE_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BT_NIMBLE_PINNED_TO_CORE_1)

CONFIG_BT_NIMBLE_HOST_TASK_STACK_SIZE
NimBLE Host task stack size

*Found in: Component config > Bluetooth > NimBLE Options*

This configures stack size of NimBLE host task

**Default value:**
- 5120 if CONFIG_BLE_MESH && BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
- 4096 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ROLE_CENTRAL
Enable BLE Central role

*Found in: Component config > Bluetooth > NimBLE Options*

Enables central role

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_ROLE_PERIPHERAL
Enable BLE Peripheral role

Found in: Component config > Bluetooth > NimBLE Options

Enable peripheral role

Default value:
• Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ROLE_BROADCASTER
Enable BLE Broadcaster role

Found in: Component config > Bluetooth > NimBLE Options

Enables broadcaster role

Default value:
• Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ROLE_OBSERVER
Enable BLE Observer role

Found in: Component config > Bluetooth > NimBLE Options

Enables observer role

Default value:
• Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_NVS_PERSIST
Persist the BLE Bonding keys in NVS

Found in: Component config > Bluetooth > NimBLE Options

Enable this flag to make bonding persistent across device reboots

Default value:
• No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SECURITY_ENABLE
Enable BLE SM feature

Found in: Component config > Bluetooth > NimBLE Options

Enable BLE sm feature

Default value:
• Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Contains:
• CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_ENCRYPTION
• CONFIG_BT_NIMBLE_SM_LEGACY
• CONFIG_BT_NIMBLE_SM_SC
**CONFIG_BT_NIMBLE_SM_LEGACY**

Security manager legacy pairing

*Found in:*  Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE

Enable security manager legacy pairing

**Default value:**

- Yes (enabled) if CONFIG_BT_NIMBLE_SECURITY_ENABLE && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_SM_SC**

Security manager secure connections (4.2)

*Found in:*  Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE

Enable security manager secure connections

**Default value:**

- Yes (enabled) if CONFIG_BT_NIMBLE_SECURITY_ENABLE && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_SM_SC_DEBUG_KEYS**

Use predefined public-private key pair

*Found in:*  Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE > CONFIG_BT_NIMBLE_SM_SC

If this option is enabled, SM uses predefined DH key pair as described in Core Specification, Vol. 3, Part H, 2.3.5.6.1. This allows to decrypt air traffic easily and thus should only be used for debugging.

**Default value:**

- No (disabled) if CONFIG_BT_NIMBLE_SECURITY_ENABLE && CONFIG_BT_NIMBLE_SM_SC && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_ENCRYPTION**

Enable LE encryption

*Found in:*  Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE

Enable encryption connection

**Default value:**

- Yes (enabled) if CONFIG_BT_NIMBLE_SECURITY_ENABLE && BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_DEBUG**

Enable extra runtime asserts and host debugging

*Found in:*  Component config > Bluetooth > NimBLE Options

This enables extra runtime asserts and host debugging

**Default value:**

- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME

BLE GAP default device name

*Found in: Component config > Bluetooth > NimBLE Options*

The Device Name characteristic shall contain the name of the device as an UTF-8 string. This name can be changed by using API `ble_svc_gap_device_name_set()`

**Default value:**
- “nimble” if `BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN

Maximum length of BLE device name in octets

*Found in: Component config > Bluetooth > NimBLE Options*

Device Name characteristic value shall be 0 to 248 octets in length

**Default value:**
- 31 if `BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU

Preferred MTU size in octets

*Found in: Component config > Bluetooth > NimBLE Options*

This is the default value of ATT MTU indicated by the device during an ATT MTU exchange. This value can be changed using API `ble_att_set_preferred_mtu()`

**Default value:**
- 256 if `BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE

External appearance of the device

*Found in: Component config > Bluetooth > NimBLE Options*

Standard BLE GAP Appearance value in HEX format e.g. 0x02C0

**Default value:**
- 0 if `BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`

**Memory Settings**

Contains:

- `CONFIG_BT_NIMBLE_ACL_BUF_COUNT`
- `CONFIG_BT_NIMBLE_ACL_BUF_SIZE`
- `CONFIG_BT_NIMBLE_HCI_EVT_BUF_SIZE`
- `CONFIG_BT_NIMBLE_HCI_EVT_HI_BUF_COUNT`
- `CONFIG_BT_NIMBLE_HCI_EVT_LO_BUF_COUNT`
- `CONFIG_BT_NIMBLE_MSYS_1_BLOCK_COUNT`
- `CONFIG_BT_NIMBLE_MSYS_1_BLOCK_SIZE`
- `CONFIG_BT_NIMBLE_MSYS_2_BLOCK_COUNT`
- `CONFIG_BT_NIMBLE_MSYS_2_BLOCK_SIZE`
Chapter 2. API Reference

CONFIG_BT_NIMBLE_MSYS_1_BLOCK_COUNT

MSYS_1 Block Count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

MSYS is a system-level mbuf registry. For prepare write & prepare responses MBUFs are allocated out of msys_1 pool. For NIMBLE_MESH enabled cases, this block count is increased by 8 than user defined count.

**Default value:**
- 12 if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MSYS_1_BLOCK_SIZE

MSYS_1 Block Size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

Dynamic memory size of block 1

**Default value:**
- 256 if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MSYS_2_BLOCK_COUNT

MSYS_2 Block Count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

Dynamic memory count

**Default value:**
- 24 if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MSYS_2_BLOCK_SIZE

MSYS_2 Block Size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

Dynamic memory size of block 2

**Default value:**
- 320 if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ACL_BUF_COUNT

ACL Buffer count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

The number of ACL data buffers.

**Default value:**
- 24 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ACL_BUF_SIZE

ACL Buffer size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This is the maximum size of the data portion of HCI ACL data packets. It does not include the HCI data header (of 4 bytes)

**Default value:**
Chapter 2. API Reference

• 255 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HCI_EVT_BUF_SIZE

HCI Event Buffer size

Found in: Component config > Bluetooth > NimBLE Options > Memory Settings

This is the size of each HCI event buffer in bytes. In case of extended advertising, packets can be fragmented. 257 bytes is the maximum size of a packet.

Default value:
• 257 if CONFIG_BT_NIMBLE_EXT_ADV && BT_NIMBLE_ENABLED &&
  BT_NIMBLE_ENABLED
• 70 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HCI_EVT_HI_BUF_COUNT

High Priority HCI Event Buffer count

Found in: Component config > Bluetooth > NimBLE Options > Memory Settings

This is the high priority HCI events’ buffer size. High-priority event buffers are for everything except advertising reports. If there are no free high-priority event buffers then host will try to allocate a low-priority buffer instead.

Default value:
• 30 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HCI_EVT_LO_BUF_COUNT

Low Priority HCI Event Buffer count

Found in: Component config > Bluetooth > NimBLE Options > Memory Settings

This is the low priority HCI events’ buffer size. Low-priority event buffers are only used for advertising reports. If there are no free low-priority event buffers, then an incoming advertising report will get dropped.

Default value:
• 8 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_GATT_MAX_PROCS

Maximum number of GATT client procedures

Found in: Component config > Bluetooth > NimBLE Options

Maximum number of GATT client procedures that can be executed.

Default value:
• 4 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_FLOW_CTRL

Enable Host Flow control

Found in: Component config > Bluetooth > NimBLE Options

Enable Host Flow control

Default value:
• No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_HS_FLOW_CTRL_ITVL
Host Flow control interval

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL

Host flow control interval in msecs

**Default value:**
- 1000 if CONFIG_BT_NIMBLE_HS_FLOW_CTRL && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_THRESH
Host Flow control threshold

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL

Host flow control threshold, if the number of free buffers are at or below this threshold, send an immediate number-of-completed-packets event

**Default value:**
- 2 if CONFIG_BT_NIMBLE_HS_FLOW_CTRL && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_TX_ON_DISCONNECT
Host Flow control on disconnect

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL

Enable this option to send number-of-completed-packets event to controller after disconnection

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_HS_FLOW_CTRL && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_RPA_TIMEOUT
RPA timeout in seconds

*Found in:* Component config > Bluetooth > NimBLE Options

Time interval between RPA address change. This is applicable in case of Host based RPA

**Range:**
- from 1 to 41400 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**Default value:**
- 900 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH
Enable BLE mesh functionality

*Found in:* Component config > Bluetooth > NimBLE Options

Enable BLE Mesh functionality

**Default value:**
- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Contains:
- CONFIG_BT_NIMBLE_MESH_PROVISIONER
- CONFIG_BT_NIMBLE_MESH_PROV
- CONFIG_BT_NIMBLE_MESH_GATT_PROXY
- CONFIG_BT_NIMBLE_MESH_FRIEND
- CONFIG_BT_NIMBLE_MESH_LOW_POWER
- CONFIG_BT_NIMBLE_MESH_PROXY
- `CONFIG_BT_NIMBLE_MESH_RELAY`
- `CONFIG_BT_NIMBLE_MESH_DEVICE_NAME`
- `CONFIG_BT_NIMBLE_MESH_NODE_COUNT`

**CONFIG_BT_NIMBLE_MESH_PROXY**

Enable mesh proxy functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable proxy. This is automatically set whenever NIMBLE_MESH_PB_GATT or NIMBLE_MESH_GATT_PROXY is set

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MESH_PROV**

Enable BLE mesh provisioning

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable mesh provisioning

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH` && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MESH_PB_ADV**

Enable mesh provisioning over advertising bearer

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV*

Enable this option to allow the device to be provisioned over the advertising bearer

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH_PROV` && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MESH_PB_GATT**

Enable mesh provisioning over GATT bearer

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV*

Enable this option to allow the device to be provisioned over the GATT bearer

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH_PROV` && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MESH_GATT_PROXY**

Enable GATT Proxy functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

This option enables support for the Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH` && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_MESH_RELAY
Enable mesh relay functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Support for acting as a Mesh Relay Node

**Default value:**
- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_LOW_POWER
Enable mesh low power mode

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable this option to be able to act as a Low Power Node

**Default value:**
- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_FRIEND
Enable mesh friend functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable this option to be able to act as a Friend Node

**Default value:**
- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_DEVICE_NAME
Set mesh device name

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

This value defines Bluetooth Mesh device/node name

**Default value:**
- “nimble-mesh-node” if `CONFIG_BT_NIMBLE_MESH` && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_NODE_COUNT
Set mesh node count

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Defines mesh node count.

**Default value:**
- 1 if `CONFIG_BT_NIMBLE_MESH` && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_PROVISIONER
Enable BLE mesh provisioner

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable mesh provisioner.

**Default value:**
- 0 if `CONFIG_BT_NIMBLE_MESH` && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS
Override TinyCrypt with mbedTLS for crypto computations

*Found in: Component config > Bluetooth > NimBLE Options*
Enable this option to choose mbedTLS instead of TinyCrypt for crypto computations.

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS
BLE host stop timeout in msec

*Found in: Component config > Bluetooth > NimBLE Options*
BLE Host stop procedure timeout in milliseconds.

**Default value:**
- 2000 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HOST_BASED_PRIVACY
Enable host based privacy for random address.

*Found in: Component config > Bluetooth > NimBLE Options*
Use this option to do host based Random Private Address resolution. If this option is disabled then controller based privacy is used.

**Default value:**
- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT
Enable connection reattempts on connection establishment error

*Found in: Component config > Bluetooth > NimBLE Options*
Enable to make the NimBLE host to reattempt GAP connection on connection establishment failure.

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_CONN_REATTEMPT
Maximum number connection reattempts

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT*
Defines maximum number of connection reattempts.

**Range:**
- from 1 to 7 if BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT && BT_NIMBLE_ENABLED

**Default value:**
- 3 if BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT
Enable BLE 5 feature

Default value:
• Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Contains:
• CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_2M_PHY
• CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_CODED_PHY
• CONFIG_BT_NIMBLE_EXT_ADV
• CONFIG_BT_NIMBLE_MAX_PERIODIC_SYNCS

CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_2M_PHY
Enable 2M Phy

Default value:
• Yes (enabled) if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_CODED_PHY
Enable coded Phy

Default value:
• Yes (enabled) if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_EXT_ADV
Enable extended advertising

Default value:
• No (disabled) if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_EXT_ADV_INSTANCES
Maximum number of extended advertising instances.
Change this option to set maximum number of extended advertising instances. Minimum there is always one instance of advertising. Enter how many more advertising instances you want.

**Range:**
- from 0 to 4 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

**Default value:**
- 1 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`
- 0 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_EXT_ADV_MAX_SIZE**

Maximum length of the advertising data.

*Found in:* Component config > Bluetooth > NimBLE Options > `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` > `CONFIG_BT_NIMBLE_EXT_ADV`

Defines the length of the extended adv data. The value should not exceed 1650.

**Range:**
- from 0 to 1650 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

**Default value:**
- 1650 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`
- 0 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV**

Enable periodic advertisement.

*Found in:* Component config > Bluetooth > NimBLE Options > `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` > `CONFIG_BT_NIMBLE_EXT_ADV`

Enable this option to start periodic advertisement.

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_PERIODIC_ADV_SYNC_TRANSFER**

Enable Transer Sync Events

*Found in:* Component config > Bluetooth > NimBLE Options > `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` > `CONFIG_BT_NIMBLE_EXT_ADV` > `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV`

This enables controller transfer periodic sync events to host

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MAX_PERIODIC_SYNCS**

Maximum number of periodic advertising synchs

*Found in:* Component config > Bluetooth > NimBLE Options > `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT`
Set this option to set the upper limit for number of periodic sync connections. This should be less than maximum connections allowed by controller.

**Range:**
- from 0 to 8 if `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `BT_NIMBLE_ENABLED`

**Default value:**
- 1 if `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV` && `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `BT_NIMBLE_ENABLED`
- 0 if `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_COEX_PHY_CODED_TX_RX_TLIM**

Coexistence: limit on MAX Tx/Rx time for coded-PHY connection

*Found in: Component config > Bluetooth > NimBLE Options*

When using PHY-Coded in BLE connection, limitation on max tx/rx time can be applied to better avoid dramatic performance deterioration of Wi-Fi.

**Available options:**
- Force Enable (BT_NIMBLE_COEX_PHY_CODED_TX_RX_TLIM_EN)
  Always enable the limitation on max tx/rx time for Coded-PHY connection
- Force Disable (BT_NIMBLE_COEX_PHY_CODED_TX_RX_TLIM_DIS)
  Disable the limitation on max tx/rx time for Coded-PHY connection

**CONFIG_BT_NIMBLE_WHITELIST_SIZE**

BLE white list size

*Found in: Component config > Bluetooth > NimBLE Options*

BLE list size

**Range:**
- from 1 to 15 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**Default value:**
- 12 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_TEST_THROUGHPUT_TEST**

Throughput Test Mode enable

*Found in: Component config > Bluetooth > NimBLE Options*

Enable the throughput test mode

**Default value:**
- No (disabled) if `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_BLUFI_ENABLE**

Enable blufi functionality

*Found in: Component config > Bluetooth > NimBLE Options*

Set this option to enable blufi functionality.

**Default value:**
- No (disabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`
Chapter 2. API Reference

CONFIG_BT_NIMBLE_USE_ESP_TIMER

Enable Esp Timer for Nimble

Found in: Component config > Bluetooth > NimBLE Options

Set this option to use Esp Timer which has higher priority timer instead of FreeRTOS timer

Default value:
- Yes (enabled) if BT_NIMBLE_ENABLED

Controller Options

Contains:
- CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP
- CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL
- CONFIG_BT_CTRL_BLE_MAX_ACT
- CONFIG_BT_CTRL_BLE_SCAN_DUPL
- CONFIG_BT_CTRL_BLE_STATIC_ACL_TX_BUF_NB
- CONFIG_BT_CTRL_HW_CCA_VAL
- CONFIG_BT_CTRL_COEX_PHY_Coded_TX_RX_TLIM
- CONFIG_BT_CTRL_CE_LENGTH_TYPE
- CONFIG_BT_CTRL_RX_ANTENNA_INDEX
- CONFIG_BT_CTRL_TX_ANTENNA_INDEX
- CONFIG_BT_CTRL_AGC_RECCORRECT_EN
- CONFIG_BT_CTRL_HCI_MODE_CHOICE
- CONFIG_BT_CTRL_HW_CCA
- MODEM SLEEP Options
- CONFIG_BT_CTRL_ADV_DUP_FILT_MAX

CONFIG_BT_CTRL_BLE_MAX_ACT

BLE Max Instances

Found in: Component config > Bluetooth > Controller Options

BLE maximum activities of bluetooth controller, both of connections, scan, sync and adv(periodic adv, multi-adv).

Range:
- from 1 to 10 if BT_CONTROLLER_ENABLED

Default value:
- 10 if BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_BLE_STATIC_ACL_TX_BUF_NB

BLE static ACL TX buffer numbers

Found in: Component config > Bluetooth > Controller Options

BLE ACL buffer have two methods to be allocated. One is persistent allocating (allocate when controller initialise, never free until controller de-initialise) another is dynamically allocating (allocate before TX and free after TX).

Range:
- from 0 to 12 if BT_CONTROLLER_ENABLED

Default value:
- 0 if BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_HCI_MODE_CHOICE
Chapter 2. API Reference

HCl mode

**Found in:** Component config > Bluetooth > Controller Options

Specify HCl mode as VHCI or UART(H4)

**Available options:**
- **VHCI (BT_CTRL_HCI_MODE_VHCI)**
  Normal option. Mostly, choose this VHCI when bluetooth host run on ESP32C3, too.
- **UART(H4) (BT_CTRL_HCI_MODE_UART_H4)**
  If use external bluetooth host which run on other hardware and use UART as the HCI interface, choose this option.

**CONFIG_BT_CTRL_ADV_DUP_FILT_MAX**

The maximum number of 5.0 extend duplicate scan filter

**Found in:** Component config > Bluetooth > Controller Options

The maximum number of suplicate scan filter

**Range:**
- from 1 to 500 if BT_CONTROLLER_ENABLED

**Default value:**
- 30 if BT_CONTROLLER_ENABLED

**CONFIG_BT_CTRL_HW_CCA**

HW CCA check enable

**Found in:** Component config > Bluetooth > Controller Options

It enables HW CCA feature in controller

**Default value:**
- No (disabled) if BT_CONTROLLER_ENABLED

**CONFIG_BT_CTRL_HW_CCA_VAL**

CCA threshold value

**Found in:** Component config > Bluetooth > Controller Options

It is the threshold value of HW CCA, if the value is 30, it means CCA threshold is -30 dBm.

**Range:**
- from 20 to 60 if BT_CONTROLLER_ENABLED

**Default value:**
- 20 if BT_CONTROLLER_ENABLED

**CONFIG_BT_CTRL_CE_LENGTH_TYPE**

Connection event length determination method

**Found in:** Component config > Bluetooth > Controller Options

Specify connection event length determination

**Available options:**
- **ORIGINAL (BT_CTRL_CE_LENGTH_TYPE_ORIG)**
- **Use CE parameter for HCI command (BT_CTRL_CE_LENGTH_TYPE_CE)**
- **Use Espressif self-defined method (BT_CTRL_CE_LENGTH_TYPE_SD)**
Chapter 2. API Reference

**CONFIG_BT_CTRL_TX_ANTENNA_INDEX**

default Tx antenna used

*Found in: Component config > Bluetooth > Controller Options*

Specify default Tx antenna used for bluetooth

**Available options:**
- Antenna 0 (BT_CTRL_TX_ANTENNA_INDEX_0)
- Antenna 1 (BT_CTRL_TX_ANTENNA_INDEX_1)

**CONFIG_BT_CTRL_RX_ANTENNA_INDEX**

default Rx antenna used

*Found in: Component config > Bluetooth > Controller Options*

Specify default Rx antenna used for bluetooth

**Available options:**
- Antenna 0 (BT_CTRL_RX_ANTENNA_INDEX_0)
- Antenna 1 (BT_CTRL_RX_ANTENNA_INDEX_1)

**CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL**

BLE default Tx power level

*Found in: Component config > Bluetooth > Controller Options*

Specify default Tx power level

**Available options:**
- -24dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N24)
- -21dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N21)
- -18dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N18)
- -15dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N15)
- -12dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N12)
- -9dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N9)
- -6dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N6)
- -3dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N3)
- 0dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N0)
- +3dBm (BT_CTRL_DFT_TX_POWER_LEVEL_P3)
- +6dBm (BT_CTRL_DFT_TX_POWER_LEVEL_P6)
- +9dBm (BT_CTRL_DFT_TX_POWER_LEVEL_P9)
- +12dBm (BT_CTRL_DFT_TX_POWER_LEVEL_P12)
- +15dBm (BT_CTRL_DFT_TX_POWER_LEVEL_P15)
- +18dBm (BT_CTRL_DFT_TX_POWER_LEVEL_P18)
- +21dBm (BT_CTRL_DFT_TX_POWER_LEVEL_P21)

**CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP**

BLE adv report flow control supported

*Found in: Component config > Bluetooth > Controller Options*

The function is mainly used to enable flow control for advertising reports. When it is enabled, advertising reports will be discarded by the controller if the number of unprocessed advertising reports exceeds the size of BLE adv report flow control.

**Default value:**
- Yes (enabled) if BT_CONTROLLER_ENABLED
CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM
BLE adv report flow control number

*Found in:* Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP

The number of unprocessed advertising report that bluetooth host can save. If you set BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM to a small value, this may cause adv packets lost. If you set BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM to a large value, bluetooth host may cache a lot of adv packets and this may cause system memory run out. For example, if you set it to 50, the maximum memory consumed by host is 35 * 50 bytes. Please set BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM according to your system free memory and handle adv packets as fast as possible, otherwise it will cause adv packets lost.

*Range:* • from 50 to 1000 if CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP && BT_CONTROLLER_ENABLED

*Default value:* • 100 if CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP && BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_BLE_ADV_REPORT_DISCARD_THRESHOLD
BLE adv lost event threshold value

*Found in:* Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP

When adv report flow control is enabled, The ADV lost event will be generated when the number of ADV packets lost in the controller reaches this threshold. It is better to set a larger value. If you set BT_CTRL_BLE_ADV_REPORT_DISCARD_THRESHOLD to a small value or printf every adv lost event, it may cause adv packets lost more.

*Range:* • from 1 to 1000 if CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP && BT_CONTROLLER_ENABLED

*Default value:* • 20 if CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP && BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_BLE_SCAN_DUPL
BLE Scan Duplicate Options

*Found in:* Component config > Bluetooth > Controller Options

This select enables parameters setting of BLE scan duplicate.

*Default value:* • Yes (enabled) if BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_SCAN_DUPL_TYPE
Scan Duplicate Type

*Found in:* Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_BLE_SCAN_DUPL

Scan duplicate have three ways. one is “Scan Duplicate By Device Address”, This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once. Another way is “Scan Duplicate By Device Address And Advertising Data”. This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported. The last way is “Scan Duplicate By Advertising Data” . This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.
Available options:

- **Scan Duplicate By Device Address (BT_CTRL_SCAN_DUPL_TYPE_DEVICE)**
  This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once.

- **Scan Duplicate By Advertising Data (BT_CTRL_SCAN_DUPL_TYPE_DATA)**
  This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.

- **Scan Duplicate By Device Address And Advertising Data (BT_CTRL_SCAN_DUPL_TYPE_DATA_DEVICE)**
  This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported.

**CONFIG_BT_CTRL_SCAN_DUPL_CACHE_SIZE**

Maximum number of devices in scan duplicate filter

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_BLE_SCAN_DUPL*

Maximum number of devices which can be recorded in scan duplicate filter. When the maximum amount of device in the filter is reached, the cache will be refreshed.

*Range:*
- from 10 to 1000 if **CONFIG_BT_CTRL_BLE_SCAN_DUPL** && **BT_CONTROLLER_ENABLED**

*Default value:*
- 100 if **CONFIG_BT_CTRL_BLE_SCAN_DUPL** && **BT_CONTROLLER_ENABLED**

**CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN**

Special duplicate scan mechanism for BLE Mesh scan

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_BLE_SCAN_DUPL*

This enables the BLE scan duplicate for special BLE Mesh scan.

*Default value:*
- No (disabled) if **CONFIG_BT_CTRL_BLE_SCAN_DUPL** && **BT_CONTROLLER_ENABLED**

**CONFIG_BT_CTRL_MESH_DUPL_SCAN_CACHE_SIZE**

Maximum number of Mesh adv packets in scan duplicate filter

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_BLE_SCAN_DUPL > CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN*

Maximum number of adv packets which can be recorded in duplicate scan cache for BLE Mesh. When the maximum amount of device in the filter is reached, the cache will be refreshed.

*Range:*
- from 10 to 1000 if **CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN** && **BT_CONTROLLER_ENABLED**

*Default value:*
- 100 if **CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN** && **BT_CONTROLLER_ENABLED**

**CONFIG_BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM**

Coexistence: limit on MAX Tx/Rx time for coded-PHY connection

*Found in: Component config > Bluetooth > Controller Options*
When using PHY-Coded in BLE connection, limitation on max tx/rx time can be applied to better avoid dramatic performance deterioration of Wi-Fi.

Available options:
- Force Enable (BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM_EN)
  Always enable the limitation on max tx/rx time for Coded-PHY connection
- Force Disable (BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM_DIS)
  Disable the limitation on max tx/rx time for Coded-PHY connection

MODEM SLEEP Options  Contains:
- CONFIG_BT_CTRL_MODEM_SLEEP
- CONFIG_BT_CTRL_MAIN_XTAL_PU_DURING_LIGHT_SLEEP

CONFIG_BT_CTRL_MODEM_SLEEP
Bluetooth modem sleep

Found in: Component config > Bluetooth > Controller Options > MODEM SLEEP Options

Enable/disable bluetooth controller low power mode. Modem sleep is not supported to be used with UART HCI.

Default value:
- No (disabled) if BT_CTRL_HCI_MODE_UART_H4 && BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_MODEM_SLEEP_MODE_1
Bluetooth Modem sleep Mode 1

Found in: Component config > Bluetooth > Controller Options > MODEM SLEEP Options > CONFIG_BT_CTRL_MODEM_SLEEP

Mode 1 is the currently supported sleep mode. In this mode, bluetooth controller sleeps between and BLE events. A low power clock is used to maintain bluetooth reference clock.

Default value:
- Yes (enabled) if CONFIG_BT_CTRL_MODEM_SLEEP && BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_LOW_POWER_CLOCK
Bluetooth low power clock

Found in: Component config > Bluetooth > Controller Options > MODEM SLEEP Options > CONFIG_BT_CTRL_MODEM_SLEEP > CONFIG_BT_CTRL_MODEM_SLEEP_MODE_1

Select the low power clock source for bluetooth controller

Available options:
- Main crystal (BT_CTRL_LPCLK_SEL_MAIN_XTAL)
  Main crystal can be used as low power clock for bluetooth modem sleep. If this option is selected, bluetooth modem sleep can work under Dynamic Frequency Scaling (DFS) enabled, and bluetooth can work under light sleep enabled. Main crystal has a relatively better performance than other bluetooth low power clock sources.
- External 32kHz crystal (BT_CTRL_LPCLK_SEL_EXT_32K_XTAL)
  External 32kHz crystal has a nominal frequency of 32.768kHz and provides good frequency stability. If used as Bluetooth low power clock, External 32kHz can support Bluetooth modem sleep to be used with both DFS and light sleep.
Chapter 2. API Reference

- Internal 150kHz RC oscillator (BT_CTRL_LPCLK_SEL_RTC_SLOW)
  Internal 150kHz RC oscillator. The accuracy of this clock is a lot larger than 500ppm which is required in Bluetooth communication, so don’t select this option in scenarios such as BLE connection state.

**CONFIG_BT_CTRL_MAIN_XTAL_PU_DURING_LIGHT_SLEEP**

Power up main XTAL during light sleep

*Found in: Component config > Bluetooth > Controller Options > MODEM SLEEP Options*

If this option is selected, the main crystal will power up during light sleep when the low power clock selects an external 32kHz crystal but the external 32kHz crystal does not exist or the low power clock selects the main crystal.

**Default value:**

- No (disabled) if (BT_CTRL_LPCLK_SEL_MAIN_XTAL || BT_CTRL_LPCLK_SEL_EXT_32K_XTAL) && CONFIG_FREERTOS_USE_TICKLESS_IDLE && BT_CONTROLLER_ENABLED

**CONFIG_BT_CTRL_AGC_RECORRECT_EN**

Enable HW AGC recorrect

*Found in: Component config > Bluetooth > Controller Options*

Enable uncoded phy AGC recorrect

**Default value:**

- No (disabled) if BT_CONTROLLER_ENABLED

**CONFIG_BT_CTRL_CODED_AGC_RECORRECT_EN**

Enable coded phy AGC recorrect

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_AGC_RECORRECT_EN*

Enable coded phy AGC recorrect

**Default value:**

- No (disabled) if CONFIG_BT_CTRL_AGC_RECORRECT_EN && BT_CONTROLLER_ENABLED

**CONFIG_BLE_MESH**

ESP BLE Mesh Support

*Found in: Component config*

This option enables ESP BLE Mesh support. The specific features that are available may depend on other features that have been enabled in the stack, such as Bluetooth Support, Bluedroid Support & GATT support.

Contains:

- **BLE Mesh and BLE coexistence support**
- **CONFIG_BLE_MESH_GATT_PROXY_CLIENT**
- **CONFIG_BLE_MESH_GATT_PROXY_SERVER**
- **BLE Mesh NET BUF DEBUG LOG LEVEL**
- **CONFIG_BLE_MESH_PROV**
- **CONFIG_BLE_MESH_PROXY**
- **BLE Mesh specific test option**
- **BLE Mesh STACK DEBUG LOG LEVEL**
Chapter 2. API Reference

- CONFIG_BLE_MESH_NO_LOG

- CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT

**CONFIG_BLE_MESH_HCI_5_0**

Support sending 20ms non-connectable adv packets

*Found in: Component config > CONFIG_BLE_MESH*

It is a temporary solution and needs further modifications.

**Default value:**

- Yes (enabled) if CONFIG_BLE_MESH

**CONFIG_BLE_MESH_USE_DUPLICATE_SCAN**

Support Duplicate Scan in BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow using specific duplicate scan filter in BLE Mesh, and Scan Duplicate Type must be set by choosing the option in the Bluetooth Controller section in menuconfig, which is “Scan Duplicate By Device Address and Advertising Data”.

**Default value:**

- Yes (enabled) if BT_BLUEDROID_ENABLED && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_MEM_ALLOC_MODE**
Memory allocation strategy

**Found in:** Component config > CONFIG_BLE_MESH

Allocation strategy for BLE Mesh stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

**Available options:**

- Internal DRAM (BLE_MESH_MEM_ALLOC_MODE_INTERNAL)
- External SPIRAM (BLE_MESH_MEM_ALLOC_MODE_EXTERNAL)
- Default alloc mode (BLE_MESH_MEM_ALLOC_MODE_DEFAULT)
  
  Enable this option to use the default memory allocation strategy when external SPIRAM is enabled. See the SPIRAM options for more details.
- Internal IRAM (BLE_MESH_MEM_ALLOC_MODE_IRAM_8BIT)
  
  Allows to use IRAM memory region as 8bit accessible region. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

**CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC**

Enable FreeRTOS static allocation

**Found in:** Component config > CONFIG_BLE_MESH

Enable this option to use FreeRTOS static allocation APIs for BLE Mesh, which provides the ability to use different dynamic memory (i.e. SPIRAM or IRAM) for FreeRTOS objects. If this option is disabled, the FreeRTOS static allocation APIs will not be used, and internal DRAM will be allocated for FreeRTOS objects.

**Default value:**

- No (disabled) if ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC_MODE**

Memory allocation for FreeRTOS objects

**Found in:** Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC

Choose the memory to be used for FreeRTOS objects.

**Available options:**

- External SPIRAM (BLE_MESH_FREERTOS_STATIC_ALLOC_EXTERNAL)
  
  If enabled, BLE Mesh allocates dynamic memory from external SPIRAM for FreeRTOS objects, i.e. mutex, queue, and task stack. External SPIRAM can only be used for task stack when SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY is enabled. See the SPIRAM options for more details.
- Internal IRAM (BLE_MESH_FREERTOS_STATIC_ALLOC_IRAM_8BIT)
  
  If enabled, BLE Mesh allocates dynamic memory from internal IRAM for FreeRTOS objects, i.e. mutex, queue. Note: IRAM region cannot be used as task stack.
CONFIG_BLE_MESH_DEINIT
Support de-initialize BLE Mesh stack

*Found in:* Component config > CONFIG_BLE_MESH

If enabled, users can use the function esp_ble_mesh_deinit() to de-initialize the whole BLE Mesh stack.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH

**BLE Mesh and BLE coexistence support**
Contains:
- CONFIG_BLE_MESH_SUPPORT_BLE_SCAN
- CONFIG_BLE_MESH_SUPPORT_BLE_ADV

CONFIG_BLE_MESH_SUPPORT_BLE_ADV
Support sending normal BLE advertising packets

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support

When selected, users can send normal BLE advertising packets with specific API.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_BLE_ADV_BUF_COUNT
Number of advertising buffers for BLE advertising packets

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support > CONFIG_BLE_MESH_SUPPORT_BLE_ADV

Number of advertising buffers for BLE packets available.

**Range:**
- from 1 to 255 if CONFIG_BLE_MESH_SUPPORT_BLE_ADV & CONFIG_BLE_MESH

**Default value:**
- 3 if CONFIG_BLE_MESH_SUPPORT_BLE_ADV & CONFIG_BLE_MESH

CONFIG_BLE_MESH_SUPPORT_BLE_SCAN
Support scanning normal BLE advertising packets

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support

When selected, users can register a callback and receive normal BLE advertising packets in the application layer.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_FAST_PROV
Enable BLE Mesh Fast Provisioning

*Found in:* Component config > CONFIG_BLE_MESH

Enable this option to allow BLE Mesh fast provisioning solution to be used. When there are multiple unprovisioned devices around, fast provisioning can greatly reduce the time consumption of the whole provisioning process. When this option is enabled, and after an unprovisioned device is provisioned into a node successfully, it can be changed to a temporary Provisioner.

**Default value:**
• No (disabled) if CONFIG_BLE_MESH

**CONFIG_BLE_MESH_NODE**

Support for BLE Mesh Node

*Found in: Component config > CONFIG_BLE_MESH*

Enable the device to be provisioned into a node. This option should be enabled when an unprovisioned device is going to be provisioned into a node and communicate with other nodes in the BLE Mesh network.

**CONFIG_BLE_MESH_PROVISIONER**

Support for BLE Mesh Provisioner

*Found in: Component config > CONFIG_BLE_MESH*

Enable the device to be a Provisioner. The option should be enabled when a device is going to act as a Provisioner and provision unprovisioned devices into the BLE Mesh network.

**CONFIG_BLE_MESH_WAIT_FOR_PROV_MAX_DEV_NUM**

Maximum number of unprovisioned devices that can be added to device queue

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many unprovisioned devices can be added to device queue for provisioning. Users can use this option to define the size of the queue in the bottom layer which is used to store unprovisioned device information (e.g. Device UUID, address).

**Range:**
- from 1 to 100 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

**Default value:**
- 10 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_MAX_PROV_NODES**

Maximum number of devices that can be provisioned by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned by a Provisioner. This value indicates the maximum number of unprovisioned devices which can be provisioned by a Provisioner. For instance, if the value is 6, it means the Provisioner can provision up to 6 unprovisioned devices. Theoretically a Provisioner without the limitation of its memory can provision up to 32766 unprovisioned devices, here we limit the maximum number to 100 just to limit the memory used by a Provisioner. The bigger the value is, the more memory it will cost by a Provisioner to store the information of nodes.

**Range:**
- from 1 to 1000 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

**Default value:**
- 10 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_PBA_SAME_TIME**

Maximum number of PB-ADV running at the same time by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-ADV. For examples, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-ADV at the same time.
Range:
- from 1 to 10 if `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

Default value:
- 2 if `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PBG_SAME_TIME**

Maximum number of PB-GATT running at the same time by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-GATT. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-GATT at the same time.

Range:
- from 1 to 5 if `CONFIG_BLE_MESH_PB_GATT` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

Default value:
- 1 if `CONFIG_BLE_MESH_PB_GATT` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROVISIONER_SUBNET_COUNT**

Maximum number of mesh subnets that can be created by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many subnets per network a Provisioner can create. Indeed, this value decides the number of network keys which can be added by a Provisioner.

Range:
- from 1 to 4096 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

Default value:
- 3 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROVISIONER_APP_KEY_COUNT**

Maximum number of application keys that can be owned by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many application keys the Provisioner can have. Indeed, this value decides the number of the application keys which can be added by a Provisioner.

Range:
- from 1 to 4096 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

Default value:
- 3 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROVISIONER_RECV_HB**

Support receiving Heartbeat messages

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

When this option is enabled, Provisioner can call specific functions to enable or disable receiving Heartbeat messages and notify them to the application layer.

Default value:
- No (disabled) if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`
CONFIG_BLE_MESH_PROVISIONER_RECV_HB_FILTER_SIZE

Maximum number of filter entries for receiving Heartbeat messages

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER > CONFIG_BLE_MESH_PROVISIONER_RECV_HB

This option specifies how many heartbeat filter entries Provisioner supports. The heartbeat filter (acceptlist or rejectlist) entries are used to store a list of SRC and DST which can be used to decide if a heartbeat message will be processed and notified to the application layer by Provisioner. Note: The filter is an empty rejectlist by default.

Range:
• from 1 to 1000 if CONFIG_BLE_MESH_PROVISIONER_RECV_HB && CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

Default value:
• 3 if CONFIG_BLE_MESH_PROVISIONER_RECV_HB && CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_PROV

BLE Mesh Provisioning support

Found in: Component config > CONFIG_BLE_MESH

Enable this option to support BLE Mesh Provisioning functionality. For BLE Mesh, this option should be always enabled.

Default value:
• Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_PB_ADV

Provisioning support using the advertising bearer (PB-ADV)

Found in: Component config > CONFIG_BLE_MESH

Enable this option to allow the device to be provisioned over the advertising bearer. This option should be enabled if PB-ADV is going to be used during provisioning procedure.

Default value:
• Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_UNPROVISIONED_BEACON_INTERVAL

Interval between two consecutive Unprovisioned Device Beacon

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PB_ADV

This option specifies the interval of sending two consecutive unprovisioned device beacon, users can use this option to change the frequency of sending unprovisioned device beacon. For example, if the value is 5, it means the unprovisioned device beacon will send every 5 seconds. When the option of BLE_MESH_FAST_PROV is selected, the value is better to be 3 seconds, or less.

Range:
• from 1 to 100 if CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH_PB_ADV && CONFIG_BLE_MESH

Default value:
• 5 if CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH_PB_ADV && CONFIG_BLE_MESH
• 3 if CONFIG_BLE_MESH_FAST_PROV && CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH_PB_ADV && CONFIG_BLE_MESH
CONFIG_BLE_MESH_PB_GATT

Provisioning support using GATT (PB-GATT)

Found in: Component config > CONFIG_BLE_MESH

Enable this option to allow the device to be provisioned over GATT. This option should be enabled if PB-GATT is going to be used during provisioning procedure.

# Virtual option enabled whenever any Proxy protocol is needed

CONFIG_BLE_MESH_PROXY

BLE Mesh Proxy protocol support

Found in: Component config > CONFIG_BLE_MESH

Enable this option to support BLE Mesh Proxy protocol used by PB-GATT and other proxy pdu transmission.

Default value:
• Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_GATT_PROXY_SERVER

BLE Mesh GATT Proxy Server

Found in: Component config > CONFIG_BLE_MESH

This option enables support for Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network. This option should be enabled if a node is going to be a Proxy Server.

Default value:
• Yes (enabled) if CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH

CONFIG_BLE_MESH_NODE_ID_TIMEOUT

Node Identity advertising timeout

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER

This option determines for how long the local node advertises using Node Identity. The given value is in seconds. The specification limits this to 60 seconds and lists it as the recommended value as well. So leaving the default value is the safest option. When an unprovisioned device is provisioned successfully and becomes a node, it will start to advertise using Node Identity during the time set by this option. And after that, Network ID will be advertised.

Range:
• from 1 to 60 if CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH

Default value:
• 60 if CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_PROXY_FILTER_SIZE

Maximum number of filter entries per Proxy Client

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER

This option specifies how many Proxy Filter entries the local node supports. The entries of Proxy filter (whitelist or blacklist) are used to store a list of addresses which can be used to decide which messages will be forwarded to the Proxy Client by the Proxy Server.

Range:
**CONFIG_BLE_MESH_GATT_PROXY_CLIENT**

BLE Mesh GATT Proxy Client

*Found in: Component config > CONFIG_BLE_MESH*

This option enables support for Mesh GATT Proxy Client. The Proxy Client can use the GATT bearer to send mesh messages to a node that supports the advertising bearer.

*Default value:*

- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SETTINGS**

Store BLE Mesh configuration persistently

*Found in: Component config > CONFIG_BLE_MESH*

When selected, the BLE Mesh stack will take care of storing/restoring the BLE Mesh configuration persistently in flash. If the device is a BLE Mesh node, when this option is enabled, the configuration of the device will be stored persistently, including unicast address, NetKey, AppKey, etc. And if the device is a BLE Mesh Provisioner, the information of the device will be stored persistently, including the information of provisioned nodes, NetKey, AppKey, etc.

*Default value:*

- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_STORE_TIMEOUT**

Delay (in seconds) before storing anything persistently

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines in seconds how soon any pending changes are actually written into persistent storage (flash) after a change occurs. The option allows nodes to delay a certain period of time to save proper information to flash. The default value is 0, which means information will be stored immediately once there are updates.

*Range:*

- from 0 to 1000000 if `CONFIG_BLE_MESH_SETTINGS` & `CONFIG_BLE_MESH`

*Default value:*

- 0 if `CONFIG_BLE_MESH_SETTINGS` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SEQ_STORE_RATE**

How often the sequence number gets updated in storage

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines how often the local sequence number gets updated in persistent storage (i.e. flash). e.g. a value of 100 means that the sequence number will be stored to flash on every 100th increment. If the node sends messages very frequently a higher value makes more sense, whereas if the node sends infrequently a value as low as 0 (update storage for every increment) can make sense. When the stack gets initialized it will add sequence number to the last stored one, so that it starts off with a value that’s guaranteed to be larger than the last one used before power off.

*Range:*

- from 0 to 1000000 if `CONFIG_BLE_MESH_SETTINGS` & `CONFIG_BLE_MESH`
Default value:
• 0 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

### CONFIG_BLE_MESH_RPL_STORE_TIMEOUT

Minimum frequency that the RPL gets updated in storage

*Found in: Component config > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS`*

This value defines in seconds how soon the RPL (Replay Protection List) gets written to persistent storage after a change occurs. If the node receives messages frequently, then a large value is recommended. If the node receives messages rarely, then the value can be as low as 0 (which means the RPL is written into the storage immediately). Note that if the node operates in a security-sensitive case, and there is a risk of sudden power-off, then a value of 0 is strongly recommended. Otherwise, a power loss before RPL being written into the storage may introduce message replay attacks and system security will be in a vulnerable state.

**Range:**
• from 0 to 1000000 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

Default value:
• 0 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

### CONFIG_BLE_MESH_SETTINGS_BACKWARD_COMPATIBILITY

A specific option for settings backward compatibility

*Found in: Component config > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS`*

This option is created to solve the issue of failure in recovering node information after mesh stack updates. In the old version mesh stack, there is no key of “mesh/role” in nvs. In the new version mesh stack, key of “mesh/role” is added in nvs, recovering node information needs to check “mesh/role” key in nvs and implements selective recovery of mesh node information. Therefore, there may be failure in recovering node information during node restarting after OTA.

The new version mesh stack adds the option of “mesh/role” because we have added the support of storing Provisioner information, while the old version only supports storing node information.

If users are updating their nodes from old version to new version, we recommend enabling this option, so that system could set the flag in advance before recovering node information and make sure the node information recovering could work as expected.

Default value:
• No (disabled) if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

### CONFIG_BLE_MESH_SPECIFIC_PARTITION

Use a specific NVS partition for BLE Mesh

*Found in: Component config > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS`*

When selected, the mesh stack will use a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using nvs_flash_init_partition() API, and the partition must exists in the csv file. When Provisioner needs to store a large amount of nodes’ information in the flash (e.g. more than 20), this option is recommended to be enabled.

Default value:
• No (disabled) if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`
CONFIG_BLE_MESH_PARTITION_NAME

Name of the NVS partition for BLE Mesh

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_SPECIFIC_PARTITION

This value defines the name of the specified NVS partition used by the mesh stack.

Default value:

- “ble_mesh” if CONFIG_BLE_MESH_SPECIFIC_PARTITION && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE

Support using multiple NVS namespaces by Provisioner

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS

When selected, Provisioner can use different NVS namespaces to store different instances of mesh information. For example, if in the first room, Provisioner uses NetKey A, AppKey A and provisions three devices, these information will be treated as mesh information instance A. When the Provisioner moves to the second room, it uses NetKey B, AppKey B and provisions two devices, then the information will be treated as mesh information instance B. Here instance A and instance B will be stored in different namespaces. With this option enabled, Provisioner needs to use specific functions to open the corresponding NVS namespace, restore the mesh information, release the mesh information or erase the mesh information.

Default value:

- No (disabled) if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

CONFIG_BLE_MESH_MAX_NVS_NAMESPACE

Maximum number of NVS namespaces

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE

This option specifies the maximum NVS namespaces supported by Provisioner.

Range:

- from 1 to 255 if CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

Default value:

- 2 if CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

CONFIG_BLE_MESH_SUBNET_COUNT

Maximum number of mesh subnets per network

Found in: Component config > CONFIG_BLE_MESH

This option specifies how many subnets a Mesh network can have at the same time. Indeed, this value decides the number of the network keys which can be owned by a node.

Range:

- from 1 to 4096 if CONFIG_BLE_MESH

Default value:

- 3 if CONFIG_BLE_MESH
Chapter 2. API Reference

**CONFIG_BLE_MESH_APP_KEY_COUNT**

Maximum number of application keys per network

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies how many application keys the device can store per network. Indeed, this value decides the number of the application keys which can be owned by a node.

**Range:**

- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_MODEL_KEY_COUNT**

Maximum number of application keys per model

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum number of application keys to which each model can be bound.

**Range:**

- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_MODEL_GROUP_COUNT**

Maximum number of group address subscriptions per model

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum number of addresses to which each model can be subscribed.

**Range:**

- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LABEL_COUNT**

Maximum number of Label UUIDs used for Virtual Addresses

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies how many Label UUIDs can be stored. Indeed, this value decides the number of the Virtual Addresses can be supported by a node.

**Range:**

- from 0 to 4096 if `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_CRPL**

Maximum capacity of the replay protection list

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum capacity of the replay protection list. It is similar to Network message cache size, but has a different purpose. The replay protection list is used to prevent a node from replay attack, which will store the source address and sequence number of the received mesh messages. For Provisioner, the replay protection list size should not be smaller than the maximum number of nodes whose information can be stored. And the element number of each node should also be taken into
consideration. For example, if Provisioner can provision up to 20 nodes and each node contains two
elements, then the replay protection list size of Provisioner should be at least 40.

**Range:**
- from 2 to 65535 if `CONFIG_BLE_MESH`

**Default value:**
- 10 if `CONFIG_BLE_MESH`

### CONFIG_BLE_MESH_MSG_CACHE_SIZE

Network message cache size

*Found in: Component config > CONFIG_BLE_MESH*

Number of messages that are cached for the network. This helps prevent unnecessary decryption operations and unnecessary relays. This option is similar to Replay protection list, but has a different purpose. A node is not required to cache the entire Network PDU and may cache only part of it for tracking, such as values for SRC/SEQ or others.

**Range:**
- from 2 to 65535 if `CONFIG_BLE_MESH`

**Default value:**
- 10 if `CONFIG_BLE_MESH`

### CONFIG_BLE_MESH_ADV_BUF_COUNT

Number of advertising buffers

*Found in: Component config > CONFIG_BLE_MESH*

Number of advertising buffers available. The transport layer reserves ADV_BUF_COUNT - 3 buffers for outgoing segments. The maximum outgoing SDU size is 12 times this value (out of which 4 or 8 bytes are used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC, or 52 bytes using an 8-byte MIC.

**Range:**
- from 6 to 256 if `CONFIG_BLE_MESH`

**Default value:**
- 60 if `CONFIG_BLE_MESH`

### CONFIG_BLE_MESH_IVU_DIVIDER

Divider for IV Update state refresh timer

*Found in: Component config > CONFIG_BLE_MESH*

When the IV Update state enters Normal operation or IV Update in Progress, we need to keep track of how many hours has passed in the state, since the specification requires us to remain in the state at least for 96 hours (Update in Progress has an additional upper limit of 144 hours).

In order to fulfill the above requirement, even if the node might be powered off once in a while, we need to store persistently how many hours the node has been in the state. This doesn’t necessarily need to happen every hour (thanks to the flexible duration range). The exact cadence will depend a lot on the ways that the node will be used and what kind of power source it has.

Since there is no single optimal answer, this configuration option allows specifying a divider, i.e. how many intervals the 96 hour minimum gets split into. After each interval the duration that the node has been in the current state gets stored to flash. E.g. the default value of 4 means that the state is saved every 24 hours (96 / 4).

**Range:**
- from 2 to 96 if `CONFIG_BLE_MESH`
Default value:

- 4 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_TX_SEG_MSG_COUNT**

Maximum number of simultaneous outgoing segmented messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of simultaneous outgoing multi-segment and/or reliable messages. The default value is 1, which means the device can only send one segmented message at a time. And if another segmented message is going to be sent, it should wait for the completion of the previous one. If users are going to send multiple segmented messages at the same time, this value should be configured properly.

*Range:*

- from 1 to 255 if `CONFIG_BLE_MESH`

**Default value:**

- 1 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_RX_SEG_MSG_COUNT**

Maximum number of simultaneous incoming segmented messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of simultaneous incoming multi-segment and/or reliable messages. The default value is 1, which means the device can only receive one segmented message at a time. And if another segmented message is going to be received, it should wait for the completion of the previous one. If users are going to receive multiple segmented messages at the same time, this value should be configured properly.

*Range:*

- from 1 to 255 if `CONFIG_BLE_MESH`

**Default value:**

- 1 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_RX_SDU_MAX**

Maximum incoming Upper Transport Access PDU length

*Found in: Component config > CONFIG_BLE_MESH*

Maximum incoming Upper Transport Access PDU length. Leave this to the default value, unless you really need to optimize memory usage.

*Range:*

- from 36 to 384 if `CONFIG_BLE_MESH`

**Default value:**

- 384 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_TX_SEG_MAX**

Maximum number of segments in outgoing messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of segments supported for outgoing messages. This value should typically be fine-tuned based on what models the local node supports, i.e. what’s the largest message payload that the node needs to be able to send. This value affects memory and call stack consumption, which is why the default is lower than the maximum that the specification would allow (32 segments).
The maximum outgoing SDU size is 12 times this number (out of which 4 or 8 bytes is used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC and 52 bytes using an 8-byte MIC.

Be sure to specify a sufficient number of advertising buffers when setting this option to a higher value. There must be at least three more advertising buffers (BLE_MESH_ADV_BUF_COUNT) as there are outgoing segments.

**Range:**
- from 2 to 32 if CONFIG_BLE_MESH

**Default value:**
- 32 if CONFIG_BLE_MESH

### CONFIG_BLE_MESH_RELAY

Relay support

*Found in: Component config > CONFIG_BLE_MESH*

Support for acting as a Mesh Relay Node. Enabling this option will allow a node to support the Relay feature, and the Relay feature can still be enabled or disabled by proper configuration messages. Disabling this option will let a node not support the Relay feature.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH

### CONFIG_BLE_MESH_RELAY_ADV_BUF

Use separate advertising buffers for relay packets

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY*

When selected, self-send packets will be put in a high-priority queue and relay packets will be put in a low-priority queue.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH_RELAY && CONFIG_BLE_MESH

### CONFIG_BLE_MESH_RELAY_ADV_BUF_COUNT

Number of advertising buffers for relay packets

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY > CONFIG_BLE_MESH_RELAY_ADV_BUF*

Number of advertising buffers for relay packets available.

**Range:**
- from 6 to 256 if CONFIG_BLE_MESH_RELAY_ADV_BUF && CONFIG_BLE_MESH_RELAY && CONFIG_BLE_MESH

**Default value:**
- 60 if CONFIG_BLE_MESH_RELAY_ADV_BUF && CONFIG_BLE_MESH_RELAY && CONFIG_BLE_MESH

### CONFIG_BLE_MESH_LOW_POWER

Support for Low Power features

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to operate as a Low Power Node. If low power consumption is required by a node, this option should be enabled. And once the node enters the mesh network, it will try to find a Friend node and establish a friendship.
**CONFIG_BLE_MESH_LPN_ESTABLISHMENT**

Perform Friendship establishment using low power

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Perform the Friendship establishment using low power with the help of a reduced scan duty cycle. The downside of this is that the node may miss out on messages intended for it until it has successfully set up Friendship with a Friend node. When this option is enabled, the node will stop scanning for a period of time after a Friend Request or Friend Poll is sent, so as to reduce more power consumption.

*Default value:*

- No (disabled) if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_AUTO**

Automatically start looking for Friend nodes once provisioned

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Once provisioned, automatically enable LPN functionality and start looking for Friend nodes. If this option is disabled LPN mode needs to be manually enabled by calling `bt_mesh_lpn_set(true)`. When an unprovisioned device is provisioned successfully and becomes a node, enabling this option will trigger the node starts to send Friend Request at a certain period until it finds a proper Friend node.

*Default value:*

- No (disabled) if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_AUTO_TIMEOUT**

Time from last received message before going to LPN mode

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER > CONFIG_BLE_MESH_LPN_AUTO*

Time in seconds from the last received message, that the node waits out before starting to look for Friend nodes.

*Range:*

- from 0 to 3600 if `CONFIG_BLE_MESH_LPN_AUTO` && `CONFIG_BLE_MESH_LPN_AUTO` && `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

*Default value:*

- 15 if `CONFIG_BLE_MESH_LPN_AUTO` && `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_RETRY_TIMEOUT**

Retry timeout for Friend requests

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Time in seconds between Friend Requests, if a previous Friend Request did not yield any acceptable Friend Offers.

*Range:*

- from 1 to 3600 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

*Default value:*

- 6 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_RSSI_FACTOR**
RSSIFactor, used in Friend Offer Delay calculation

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The contribution of the RSSI, measured by the Friend node, used in Friend Offer Delay calculations. $0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5$. RSSIFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**
- from 0 to 3 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**Default value:**
- 0 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

---

**CONFIG_BLE_MESH_LPN_RECV_WIN_FACTOR**

Receive Window Factor, used in Friend Offer Delay calculation

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The contribution of the supported Receive Window used in Friend Offer Delay calculations. $0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5$. ReceiveWindowFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**
- from 0 to 3 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**Default value:**
- 0 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

---

**CONFIG_BLE_MESH_LPN_MIN_QUEUE_SIZE**

Minimum size of the acceptable friend queue (MinQueueSizeLog)

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The MinQueueSizeLog field is defined as $\log_2(N)$, where $N$ is the minimum number of maximum size Lower Transport PDUs that the Friend node can store in its Friend Queue. As an example, MinQueueSizeLog value 1 gives $N = 2$, and value 7 gives $N = 128$.

**Range:**
- from 1 to 7 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**Default value:**
- 1 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

---

**CONFIG_BLE_MESH_LPN_RECV_DELAY**

Receive delay requested by the local node

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The ReceiveDelay is the time between the Low Power node sending a request and listening for a response. This delay allows the Friend node time to prepare the response. The value is in units of milliseconds.

**Range:**
- from 10 to 255 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**Default value:**
- 100 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

---

**CONFIG_BLE_MESH_LPN_POLL_TIMEOUT**

The value of the PollTimeout timer

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*
PollTimeout timer is used to measure time between two consecutive requests sent by a Low Power node. If no requests are received the Friend node before the PollTimeout timer expires, then the friendship is considered terminated. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds. The smaller the value, the faster the Low Power node tries to get messages from corresponding Friend node and vice versa.

**Range:**
- from 10 to 244735 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**Default value:**
- 300 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

### CONFIG_BLE_MESH_LPN_INIT_POLL_TIMEOUT

The starting value of the PollTimeout timer

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The initial value of the PollTimeout timer when Friendship is to be established for the first time. After this, the timeout gradually grows toward the actual PollTimeout, doubling in value for each iteration. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds.

**Range:**
- from 10 to if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**Default value:**
- if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

### CONFIG_BLE_MESH_LPN_SCAN_LATENCY

Latency for enabling scanning

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Latency (in milliseconds) is the time it takes to enable scanning. In practice, it means how much time in advance of the Receive Window, the request to enable scanning is made.

**Range:**
- from 0 to 50 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**Default value:**
- 10 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

### CONFIG_BLE_MESH_LPN_GROUPS

Number of groups the LPN can subscribe to

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Maximum number of groups to which the LPN can subscribe.

**Range:**
- from 0 to 16384 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

**Default value:**
- 8 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`

### CONFIG_BLE_MESH_FRIEND

Support for Friend feature

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to be able to act as a Friend Node.
**CONFIG_BLE_MESH_FRIEND_RECV_WIN**

Friend Receive Window

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Receive Window in milliseconds supported by the Friend node.

**Range:**
- from 1 to 255 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**
- 255 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FRIEND_QUEUE_SIZE**

Minimum number of buffers supported per Friend Queue

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Minimum number of buffers available to be stored for each local Friend Queue. This option decides the size of each buffer which can be used by a Friend node to store messages for each Low Power node.

**Range:**
- from 2 to 65536 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**
- 16 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FRIEND_SUB_LIST_SIZE**

Friend Subscription List Size

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Size of the Subscription List that can be supported by a Friend node for a Low Power node. And Low Power node can send Friend Subscription List Add or Friend Subscription List Remove messages to the Friend node to add or remove subscription addresses.

**Range:**
- from 0 to 1023 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FRIEND_LPN_COUNT**

Number of supported LPN nodes

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Number of Low Power Nodes with which a Friend can have Friendship simultaneously. A Friend node can have friendship with multiple Low Power nodes at the same time, while a Low Power node can only establish friendship with only one Friend node at the same time.

**Range:**
- from 1 to 1000 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**
- 2 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FRIEND_SEG_RX**

Number of incomplete segment lists per LPN

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Number of incomplete segment lists tracked for each Friends’ LPN. In other words, this determines from how many elements can segmented messages destined for the Friend queue be received simultaneously.
Range:
  • from 1 to 1000 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

Default value:
  • 1 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

`CONFIG_BLE_MESH_NO_LOG`
Disables BLE Mesh debug logs (minimize bin size)

*Found in: Component config > `CONFIG_BLE_MESH`*
Select this to save the BLE Mesh related rodata code size. Enabling this option will disable the output of BLE Mesh debug log.

Default value:
  • No (disabled) if `CONFIG_BLE_MESH` && `CONFIG_BLE_MESH`

**BLE Mesh STACK DEBUG LOG LEVEL**  Contains:

  • `CONFIG_BLE_MESH_STACK_TRACE_LEVEL`

**`CONFIG_BLE_MESH_STACK_TRACE_LEVEL`**

*BLE_MESH_STACK*

*Found in: Component config > `CONFIG_BLE_MESH` > BLE Mesh STACK DEBUG LOG LEVEL*

Define BLE Mesh trace level for BLE Mesh stack.

Available options:
  • NONE (BLE_MESH_TRACE_LEVEL_NONE)
  • ERROR (BLE_MESH_TRACE_LEVEL_ERROR)
  • WARNING (BLE_MESH_TRACE_LEVEL_WARNING)
  • INFO (BLE_MESH_TRACE_LEVEL_INFO)
  • DEBUG (BLE_MESH_TRACE_LEVEL_DEBUG)
  • VERBOSE (BLE_MESH_TRACE_LEVEL_VERBOSE)

**BLE Mesh NET BUF DEBUG LOG LEVEL**  Contains:

  • `CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL`

**`CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL`**

*BLE_MESH_NET_BUF*

*Found in: Component config > `CONFIG_BLE_MESH` > BLE Mesh NET BUF DEBUG LOG LEVEL*

Define BLE Mesh trace level for BLE Mesh net buffer.

Available options:
  • NONE (BLE_MESH_NET_BUF_TRACE_LEVEL_NONE)
  • ERROR (BLE_MESH_NET_BUF_TRACE_LEVEL_ERROR)
  • WARNING (BLE_MESH_NET_BUF_TRACE_LEVEL_WARNING)
  • INFO (BLE_MESH_NET_BUF_TRACE_LEVEL_INFO)
  • DEBUG (BLE_MESH_NET_BUF_TRACE_LEVEL_DEBUG)
  • VERBOSE (BLE_MESH_NET_BUF_TRACE_LEVEL_VERBOSE)
CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT

Timeout (ms) for client message response

*Found in: Component config > CONFIG_BLE_MESH*

Timeout value used by the node to get response of the acknowledged message which is sent by the client model. This value indicates the maximum time that a client model waits for the response of the sent acknowledged messages. If a client model uses 0 as the timeout value when sending acknowledged messages, then the default value will be used which is four seconds.

*Range:*  
- from 100 to 1200000 if `CONFIG_BLE_MESH`

*Default value:*  
- 4000 if `CONFIG_BLE_MESH`

Support for BLE Mesh Foundation models  
Contains:

- `CONFIG_BLE_MESH_CFG_CLI`
- `CONFIG_BLE_MESH_HEALTH_CLI`
- `CONFIG_BLE_MESH_HEALTH_SRV`

CONFIG_BLE_MESH_CFG_CLI

Configuration Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Configuration Client model.

CONFIG_BLE_MESH_HEALTH_CLI

Health Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Client model.

CONFIG_BLE_MESH_HEALTH_SRV

Health Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Server model.

*Default value:*  
- Yes (enabled) if `CONFIG_BLE_MESH`

Support for BLE Mesh Client/Server models  
Contains:

- `CONFIG_BLE_MESH_GENERIC_BATTERY_CLI`
- `CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI`
- `CONFIG_BLE_MESH_GENERIC_LEVEL_CLI`
- `CONFIG_BLE_MESH_GENERIC_LOCATION_CLI`
- `CONFIG_BLE_MESH_GENERIC_ONOFF_CLI`
- `CONFIG_BLE_MESH_GENERIC_POWER_LEVEL_CLI`
- `CONFIG_BLE_MESH_GENERIC_POWER_ONOFF_CLI`
- `CONFIG_BLE_MESH_GENERIC_PROPERTY_CLI`
- `CONFIG_BLE_MESH_GENERIC_SERVER`
- `CONFIG_BLE_MESH_LIGHT_CTL_CLI`
- `CONFIG_BLE_MESH_LIGHT_HSL_CLI`
- `CONFIG_BLE_MESH_LIGHT_LC_CLI`
Chapter 2: API Reference

- `CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI`
- `CONFIG_BLE_MESH_LIGHT_XYL_CLI`
- `CONFIG_BLE_MESH_LIGHTING_SERVER`
- `CONFIG_BLE_MESH_SCENE_CLI`
- `CONFIG_BLE_MESH_SCHEDULER_CLI`
- `CONFIG_BLE_MESH_SENSOR_CLI`
- `CONFIG_BLE_MESH_SENSOR_SERVER`
- `CONFIG_BLE_MESH_TIME_SCENE_SERVER`
- `CONFIG_BLE_MESH_TIME_CLI`

**CONFIG_BLE_MESH_GENERIC_ONOFF_CLI**

Generic OnOff Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic OnOff Client model.

**CONFIG_BLE_MESH_GENERIC_LEVEL_CLI**

Generic Level Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Level Client model.

**CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI**

Generic Default Transition Time Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Default Transition Time Client model.

**CONFIG_BLE_MESH_GENERIC_POWER_ONOFF_CLI**

Generic Power OnOff Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Power OnOff Client model.

**CONFIG_BLE_MESH_GENERIC_POWER_LEVEL_CLI**

Generic Power Level Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Power Level Client model.

**CONFIG_BLE_MESH_GENERIC_BATTERY_CLI**

Generic Battery Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Battery Client model.
CONFIG_BLE_MESH_GENERIC_LOCATION_CLI
Generic Location Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Generic Location Client model.

CONFIG_BLE_MESH_GENERIC_PROPERTY_CLI
Generic Property Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Generic Property Client model.

CONFIG_BLE_MESH_SENSOR_CLI
Sensor Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Sensor Client model.

CONFIG_BLE_MESH_TIME_CLI
Time Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Time Client model.

CONFIG_BLE_MESH_SCENE_CLI
Scene Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Scene Client model.

CONFIG_BLE_MESH_SCHEDULER_CLI
Scheduler Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Scheduler Client model.

CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI
Light Lightness Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Light Lightness Client model.

CONFIG_BLE_MESH_LIGHT_CTL_CLI
Light CTL Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Light CTL Client model.
Chapter 2. API Reference

**CONFIG_BLE_MESH_LIGHT_HSL_CLI**

Light HSL Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light HSL Client model.

**CONFIG_BLE_MESH_LIGHT_XYL_CLI**

Light XYL Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light XYL Client model.

**CONFIG_BLE_MESH_LIGHT_LC_CLI**

Light LC Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light LC Client model.

**CONFIG_BLE_MESH_GENERIC_SERVER**

Generic server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic server models.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SENSOR_SERVER**

Sensor server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Sensor server models.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_TIME_SCENE_SERVER**

Time and Scenes server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Time and Scenes server models.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LIGHTING_SERVER**

Lighting server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Lighting server models.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`
**CONFIG_BLE_MESH_IV_UPDATE_TEST**

Test the IV Update Procedure

*Found in: Component config > CONFIG_BLE_MESH*

This option removes the 96 hour limit of the IV Update Procedure and lets the state to be changed at any time. If IV Update test mode is going to be used, this option should be enabled.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

**BLE Mesh specific test option**  
Contains:
- `CONFIG_BLE_MESH_DEBUG`
- `CONFIG_BLE_MESH_SHELL`
- `CONFIG_BLE_MESH_SELF_TEST`

**CONFIG_BLE_MESH_SELF_TEST**

Perform BLE Mesh self-tests

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

This option adds extra self-tests which are run every time BLE Mesh networking is initialized.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_TEST_AUTO_ENTER_NETWORK**

Unprovisioned device enters mesh network automatically

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_SELF_TEST*

With this option enabled, an unprovisioned device can automatically enters mesh network using a specific test function without the provisioning procedure. And on the Provisioner side, a test function needs to be invoked to add the node information into the mesh stack.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH_SELF_TEST` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_TEST_USE_WHITE_LIST**

Use white list to filter mesh advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_SELF_TEST*

With this option enabled, users can use white list to filter mesh advertising packets while scanning.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_SELF_TEST` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SHELL**

Enable BLE Mesh shell

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

Activate shell module that provides BLE Mesh commands to the console.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`
CONFIG_BLE_MESH_DEBUG

Enable BLE Mesh debug logs

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option

Enable debug logs for the BLE Mesh functionality.

Default value:
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_DEBUG_NET

Network layer debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Network layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_TRANS

Transport layer debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Transport layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_BEACON

Beacon debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Beacon-related debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_CRYPTO

Crypto debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable cryptographic debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_PROV

Provisioning debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Provisioning debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_ACCESS

Access layer debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Access layer debug logs for the BLE Mesh functionality.
Chapter 2. API Reference

CONFIG_BLE_MESH_DEBUG_MODEL

Foundation model debug

*Found in:* \textit{Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG}  
Enable Foundation Models debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_ADV

Advertising debug

*Found in:* \textit{Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG}  
Enable advertising debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_LOW_POWER

Low Power debug

*Found in:* \textit{Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG}  
Enable Low Power debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_FRIEND

Friend debug

*Found in:* \textit{Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG}  
Enable Friend debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_PROXY

Proxy debug

*Found in:* \textit{Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG}  
Enable Proxy protocol debug logs for the BLE Mesh functionality.

**Driver Configurations**  
Contains:

- GPIO Configuration
- GPTimer Configuration
- I2S Configuration
- Legacy ADC Configuration
- MCPWM Configuration
- PCNT Configuration
- RMT Configuration
- Sigma Delta Modulator Configuration
- SPI Configuration
- Temperature sensor Configuration
- TWAI Configuration
- UART Configuration
Legacy ADC Configuration  Contains:

- `CONFIG_ADC_DISABLE_DAC`
- Legacy ADC Calibration Configuration
- `CONFIG_ADC_SUPPRESS_DEPRECATE_WARN`

**CONFIG_ADC_DISABLE_DAC**
Enable DAC when ADC2 is used on GPIO 25 and 26

*Found in: Component config > Driver Configurations > Legacy ADC Configuration*

If this is set, the ADC2 driver will disable the output of the DAC corresponding to the specified channel. This is the default value.

For testing, disable this option so that we can measure the output of DAC by internal ADC.

**Default value:**
- Yes (enabled) if SOC_DAC_SUPPORTED

**CONFIG_ADC_SUPPRESS_DEPRECATE_WARN**
Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > Legacy ADC Configuration*

Whether to suppress the deprecation warnings when using legacy adc driver (driver/adc.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

Legacy ADC Calibration Configuration  Contains:

- `CONFIG_ADC_CALI_SUPPRESS_DEPRECATE_WARN`

**CONFIG_ADC_CALI_SUPPRESS_DEPRECATE_WARN**
Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > Legacy ADC Configuration > Legacy ADC Calibration Configuration*

Whether to suppress the deprecation warnings when using legacy adc calibration driver (esp_adc_cal.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

**SPI Configuration**  Contains:

- `CONFIG_SPI_MASTER_ISR_IN_IRAM`
- `CONFIG_SPI_SLAVE_ISR_IN_IRAM`
- `CONFIG_SPI_MASTER_IN_IRAM`
- `CONFIG_SPI_SLAVE_IN_IRAM`
**CONFIG_SPI_MASTER_IN_IRAM**

Place transmitting functions of SPI master into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*

Normally only the ISR of SPI master is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there’s some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue_trans, get_trans_result` and `transmit` functions into the IRAM to avoid possible cache miss.

During unit test, this is enabled to measure the ideal case of api.

**Default value:**
- No (disabled)

**CONFIG_SPI_MASTER_ISR_IN_IRAM**

Place SPI master ISR function into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*

Place the SPI master ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

**Default value:**
- Yes (enabled)

**CONFIG_SPI_SLAVE_IN_IRAM**

Place transmitting functions of SPI slave into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*

Normally only the ISR of SPI slave is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there’s some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue_trans, get_trans_result` and `transmit` functions into the IRAM to avoid possible cache miss.

**Default value:**
- No (disabled)

**CONFIG_SPI_SLAVE_ISR_IN_IRAM**

Place SPI slave ISR function into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*

Place the SPI slave ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

**Default value:**
- Yes (enabled)

**TWAI Configuration**

Contains:

- **CONFIG_TWAI_ISR_IN_IRAM**
CONFIG_TWAI_ISR_IN_IRAM

Place TWAI ISR function into IRAM

Found in: Component config > Driver Configurations > TWAI Configuration

Place the TWAI ISR in to IRAM. This will allow the ISR to avoid cache misses, and also be able to run whilst the cache is disabled (such as when writing to SPI Flash). Note that if this option is enabled:

- Users should also set the ESP_INTR_FLAG_IRAM in the driver configuration structure when installing the driver (see docs for specifics).
- Alert logging (i.e., setting of the TWAI_ALERT_AND_LOG flag) will have no effect.

Default value:
- No (disabled)

Temperature sensor Configuration  Contains:

- CONFIG_TEMP_SENSOR_ENABLE_DEBUG_LOG
- CONFIG_TEMPSENSOR_SUPPRESS_DEPRECATE_WARN

CONFIG_TEMPSENSOR_SUPPRESS_DEPRECATE_WARN

Suppress legacy driver deprecated warning

Found in: Component config > Driver Configurations > Temperature sensor Configuration

Wether to suppress the deprecation warnings when using legacy temperature sensor driver (driver/temp_sensor.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

Default value:
- No (disabled)

CONFIG_TEMPSENSOR_ENABLE_DEBUG_LOG

Enable debug log

Found in: Component config > Driver Configurations > Temperature sensor Configuration

Wether to enable the debug log message for temperature sensor driver. Note that, this option only controls the temperature sensor driver log, won’t affect other drivers.

Default value:
- No (disabled)

UART Configuration  Contains:

- CONFIG_UART_ISR_IN_IRAM

CONFIG_UART_ISR_IN_IRAM

Place UART ISR function into IRAM

Found in: Component config > Driver Configurations > UART Configuration

If this option is not selected, UART interrupt will be disabled for a long time and may cause data lost when doing spi flash operation.

Default value:
- No (disabled) if CONFIG_RINGBUF_PLACE_ISR_FUNCTIONS_INTO_FLASH
GPIO Configuration  Contains:

- `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`

**CONFIG_GPIO_CTRL_FUNC_IN_IRAM**

Place GPIO control functions into IRAM

*Found in: Component config > Driver Configurations > GPIO Configuration*

Place GPIO control functions (like `intr_disable/set_level`) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.

**Default value:**

- No (disabled)

Sigma Delta Modulator Configuration  Contains:

- `CONFIG_SDM_ENABLE_DEBUG_LOG`
- `CONFIG_SDM_CTRL_FUNC_IN_IRAM`
- `CONFIG_SDM_SUPPRESS_DEPRECATE_WARN`

**CONFIG_SDM_CTRL_FUNC_IN_IRAM**

Place SDM control functions into IRAM

*Found in: Component config > Driver Configurations > Sigma Delta Modulator Configuration*

Place SDM control functions (like `set_duty`) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

**CONFIG_SDM_SUPPRESS_DEPRECATE_WARN**

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > Sigma Delta Modulator Configuration*

Wether to suppress the deprecation warnings when using legacy sigma delta driver. If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

**CONFIG_SDM_ENABLE_DEBUG_LOG**

Enable debug log

*Found in: Component config > Driver Configurations > Sigma Delta Modulator Configuration*

Wether to enable the debug log message for SDM driver. Note that, this option only controls the SDM driver log, won’t affect other drivers.

**Default value:**

- No (disabled)
GPTimer Configuration  Contains:

- `CONFIG_GPTIMER_ENABLE_DEBUG_LOG`
- `CONFIG_GPTIMER_ISR_IRAM_SAFE`
- `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM`
- `CONFIG_GPTIMER_SUPPRESS_DEPRECATE_WARN`

**CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM**

Place GPTimer control functions into IRAM

*Found in: Component config > Driver Configurations > GPTimer Configuration*

Place GPTimer control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled)

**CONFIG_GPTIMER_ISR_IRAM_SAFE**

GPTimer ISR IRAM-Safe

*Found in: Component config > Driver Configurations > GPTimer Configuration*

Ensure the GPTimer interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
- No (disabled)

**CONFIG_GPTIMER_SUPPRESS_DEPRECATE_WARN**

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > GPTimer Configuration*

Whether to suppress the deprecation warnings when using legacy timer group driver (driver/timer.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

**CONFIG_GPTIMER_ENABLE_DEBUG_LOG**

Enable debug log

*Found in: Component config > Driver Configurations > GPTimer Configuration*

Whether to enable the debug log message for GPTimer driver. Note that, this option only controls the GPTimer driver log, won’t affect other drivers.

**Default value:**
- No (disabled)

PCNT Configuration  Contains:

- `CONFIG_PCNT_ENABLE_DEBUG_LOG`
- `CONFIG_PCNT_ISR_IRAM_SAFE`
- `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`
- `CONFIG_PCNT_SUPPRESS_DEPRECATE_WARN`
CONFIG_PCNT_CTRL_FUNC_IN_IRAM

Place PCNT control functions into IRAM

Found in: Component config > Driver Configurations > PCNT Configuration

Place PCNT control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

Default value:
- No (disabled) if SOC_PCNT_SUPPORTED

CONFIG_PCNT_ISR_IRAM_SAFE

PCNT ISR IRAM-Safe

Found in: Component config > Driver Configurations > PCNT Configuration

Ensure the PCNT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

Default value:
- No (disabled) if SOC_PCNT_SUPPORTED

CONFIG_PCNT_SUPPRESS_DEPRECATE_WARN

Suppress legacy driver deprecated warning

Found in: Component config > Driver Configurations > PCNT Configuration

Whether to suppress the deprecation warnings when using legacy PCNT driver (driver/pcnt.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

Default value:
- No (disabled) if SOC_PCNT_SUPPORTED

CONFIG_PCNT_ENABLE_DEBUG_LOG

Enable debug log

Found in: Component config > Driver Configurations > PCNT Configuration

Whether to enable the debug log message for PCNT driver. Note that, this option only controls the PCNT driver log, won’t affect other drivers.

Default value:
- No (disabled) if SOC_PCNT_SUPPORTED

RMT Configuration

Contains:

- CONFIG_RMT_ENABLE_DEBUG_LOG
- CONFIG_RMT_ISR_IRAM_SAFE
- CONFIG_RMT_SUPPRESS_DEPRECATE_WARN

CONFIG_RMT_ISR_IRAM_SAFE

RMT ISR IRAM-Safe

Found in: Component config > Driver Configurations > RMT Configuration

Ensure the RMT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).
**Default value:**
- No (disabled)

**CONFIG_RMT_SUPPRESS_DEPRECATE_WARN**
Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > RMT Configuration*

Whether to suppress the deprecation warnings when using legacy rmt driver (driver/rmt.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

*Default value:*
- No (disabled)

**CONFIG_RMT_ENABLE_DEBUG_LOG**
Enable debug log

*Found in: Component config > Driver Configurations > RMT Configuration*

Whether to enable the debug log message for RMT driver. Note that, this option only controls the RMT driver log, won’t affect other drivers.

*Default value:*
- No (disabled)

**MCPWM Configuration**  Contains:
- `CONFIG_MCPWM_ENABLE_DEBUG_LOG`
- `CONFIG_MCPWM_ISR_IRAM_SAFE`
- `CONFIG_MCPWM_SUPPRESS_DEPRECATE_WARN`

**CONFIG_MCPWM_ISR_IRAM_SAFE**
Place MCPWM ISR function into IRAM

*Found in: Component config > Driver Configurations > MCPWM Configuration*

This will ensure the MCPWM interrupt handle is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write)

*Default value:*
- No (disabled) if SOC_MCPWM_SUPPORTED

**CONFIG_MCPWM_SUPPRESS_DEPRECATE_WARN**
Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > MCPWM Configuration*

Whether to suppress the deprecation warnings when using legacy MCPWM driver (driver/mcpwm.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

*Default value:*
- No (disabled) if SOC_MCPWM_SUPPORTED
CONFIG_MCPWM_ENABLE_DEBUG_LOG

Enable debug log

*Found in: Component config > Driver Configurations > MCPWM Configuration*

Wether to enable the debug log message for MCPWM driver. Note that, this option only controls the MCPWM driver log, won’t affect other drivers.

**Default value:**
* No (disabled) if SOC_MCPWM_SUPPORTED

I2S Configuration  Contains:

- CONFIG_I2S_ENABLE_DEBUG_LOG
- CONFIG_I2S_ISR_IRAM_SAFE
- CONFIG_I2S_SUPPRESS_DEPRECATE_WARN

CONFIG_I2S_ISR_IRAM_SAFE

I2S ISR IRAM-Safe

*Found in: Component config > Driver Configurations > I2S Configuration*

Ensure the I2S interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
* No (disabled)

CONFIG_I2S_SUPPRESS_DEPRECATE_WARN

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > I2S Configuration*

Enable this option will suppress the deprecation warnings of using APIs in legacy I2S driver.

**Default value:**
* No (disabled)

CONFIG_I2S_ENABLE_DEBUG_LOG

Enable I2S debug log

*Found in: Component config > Driver Configurations > I2S Configuration*

Wether to enable the debug log message for I2S driver. Note that, this option only controls the I2S driver log, will not affect other drivers.

**Default value:**
* No (disabled)

eFuse Bit Manager  Contains:

- CONFIG_EFUSE_VIRTUAL
- CONFIG_EFUSE_CUSTOM_TABLE
**CONFIG_EFUSE_CUSTOM_TABLE**

Use custom eFuse table

*Found in: Component config > eFuse Bit Manager*

Allows to generate a structure for eFuse from the CSV file.

**Default value:**
- No (disabled)

**CONFIG_EFUSE_CUSTOM_TABLE_FILENAME**

Custom eFuse CSV file

*Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_CUSTOM_TABLE*

Name of the custom eFuse CSV filename. This path is evaluated relative to the project root directory.

**Default value:**
- “main/esp_efuse_custom_table.csv” if CONFIG_EFUSE_CUSTOM_TABLE

**CONFIG_EFUSE_VIRTUAL**

Simulate eFuse operations in RAM

*Found in: Component config > eFuse Bit Manager*

If “n” - No virtual mode. All eFuse operations are real and use eFuse registers. If “y” - The virtual mode is enabled and all eFuse operations (read and write) are redirected to RAM instead of eFuse registers. All permanent changes (via eFuse) are disabled. Log output will state changes that would be applied, but they will not be.

During startup, the eFuses are copied into RAM. This mode is useful for fast tests.

**Default value:**
- No (disabled)

**CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH**

Keep eFuses in flash

*Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_VIRTUAL*

In addition to the “Simulate eFuse operations in RAM” option, this option just adds a feature to keep eFuses after reboots in flash memory. To use this mode the partition_table should have the efuse partition. partition.csv: “efuse_em, data, efuse, , 0x2000,”

During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This mode is useful when need to keep changes after reboot (testing secure_boot and flash_encryption).

**ESP-TLS**

Contains:
- CONFIG_ESP_TLS_INSECURE
- CONFIG_ESP_TLS_LIBRARY_CHOOSE
- CONFIG_ESP_TLS_CLIENT_SESSION_TICKETS
- CONFIG_ESP_DEBUG_WOLFSSL
- CONFIG_ESP_TLS_SERVER
- CONFIG_ESP_TLS_PSK_VERIFICATION
- CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY
- CONFIG_ESP_TLS_USE_DS_PERIPHERAL
CONFIG_ESP_TLS_LIBRARY_CHOOSE

Choose SSL/TLS library for ESP-TLS (See help for more Info)

*Found in: Component config > ESP-TLS*

The ESP-TLS APIs support multiple backend TLS libraries. Currently mbedTLS and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

**Available options:**
- mbedTLS (ESP_TLS_USINGMBEDTLS)
- wolfSSL (License info in wolfSSL directory README) (ESP_TLS_USING_WOLFSSL)

CONFIG_ESP_TLS_USE_DS_PERIPHERAL

Use Digital Signature (DS) Peripheral with ESP-TLS

*Found in: Component config > ESP-TLS*

Enable use of the Digital Signature Peripheral for ESP-TLS. The DS peripheral can only be used when it is appropriately configured for TLS. Consult the ESP-TLS documentation in ESP-IDF Programming Guide for more details.

**Default value:**
- Yes (enabled)

CONFIG_ESP_TLS_CLIENT_SESSION_TICKETS

Enable client session tickets

*Found in: Component config > ESP-TLS*

Enable session ticket support as specified in RFC5077.

CONFIG_ESP_TLS_SERVER

Enable ESP-TLS Server

*Found in: Component config > ESP-TLS*

Enable support for creating server side SSL/TLS session, available for mbedTLS as well as wolfSSL TLS library.

CONFIG_ESP_TLS_SERVER_SESSION_TICKETS

Enable server session tickets

*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_SERVER*

Enable session ticket support as specified in RFC5077.

CONFIG_ESP_TLS_SERVER_SESSION_TICKET_TIMEOUT

Server session ticket timeout in seconds

*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_SERVER > CONFIG_ESP_TLS_SERVER_SESSION_TICKETS*

Sets the session ticket timeout used in the tls server.

**Default value:**
- 86400 if CONFIG_ESP_TLS_SERVER_SESSION_TICKETS
CONFIG_ESP_TLS_SERVER_MIN_AUTH_MODE_OPTIONAL

ESP-TLS Server: Set minimum Certificate Verification mode to Optional

*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_SERVER*

When this option is enabled, the peer (here, the client) certificate is checked by the server, however the handshake continues even if verification failed. By default, the peer certificate is not checked and ignored by the server.

`mbedtls_ssl_get_verify_result()` can be called after the handshake is complete to retrieve status of verification.

CONFIG_ESP_TLS_PSK_VERIFICATION

Enable PSK verification

*Found in: Component config > ESP-TLS*

Enable support for pre shared key ciphers, supported for both mbedTLS as well as wolfSSL TLS library.

CONFIG_ESP_TLS_INSECURE

Allow potentially insecure options

*Found in: Component config > ESP-TLS*
