Note: `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

Note: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from *ledc_channel_t*
- **target_duty** -- Target duty of fading [0, (2**duty_resolution)]
- **scale** -- Controls the increase or decrease step scale.
- **cycle_num** -- increase or decrease the duty every cycle_num cycles

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

esp_err_t **ledc_set_fade_with_time** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t target_duty, int max_fade_time_ms)

Set LEDC fade function, with a limited time.

Note: Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

Note: `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

Note: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **target_duty** -- Target duty of fading [0, (2**duty_resolution)]
- **max_fade_time_ms** -- The maximum time of the fading (ms).

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

esp_err_t **ledc_fade_func_install** (int intr_alloc_flags)

Install LEDC fade function. This function will occupy interrupt of LEDC module.

Parameters **intr_alloc_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See `esp_intr_alloc.h` for more info.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Intr flag error
- ESP_ERR_NOT_FOUND Failed to find available interrupt source
- ESP_ERR_INVALID_STATE Fade function already installed

void **ledc_fade_func_uninstall** (void)

Uninstall LEDC fade function.

esp_err_t **ledc_fade_start** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *ledc_fade_mode_t* fade_mode)

Start LEDC fading.

Note: Call `ledc_fade_func_install()` once before calling this function. Call this API right after `ledc_set_fade_with_time` or `ledc_set_fade_with_step` before to start fading.

Note: Starting fade operation with this API is not thread-safe, use with care.

Note: For ESP32, hardware does not support any duty change while a fade operation is running in progress

on that channel. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel number
- **fade_mode** -- Whether to block until fading done. See `ledc_types.h` `ledc_fade_mode_t` for more info. Note that this function will not return until fading to the target duty if `LEDC_FADE_WAIT_DONE` mode is selected.

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Channel not initialized or fade function not installed.
- `ESP_ERR_INVALID_ARG` Parameter error.

esp_err_t **ledc_fade_stop** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel)

Stop LEDC fading. The duty of the channel is guaranteed to be fixed at most one PWM cycle after the function returns.

Note: This API can be called if a new fixed duty or a new fade want to be set while the last fade operation is still running in progress.

Note: Call this API will abort the fading operation only if it was started by calling `ledc_fade_start` with `LEDC_FADE_NO_WAIT` mode.

Note: If a fade was started with `LEDC_FADE_WAIT_DONE` mode, calling this API afterwards has no use in stopping the fade. Fade will continue until it reaches the target duty.

Parameters

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel number

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Channel not initialized
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Fade function init error

esp_err_t **ledc_set_duty_and_update** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *uint32_t* duty, *uint32_t* hpoint)

A thread-safe API to set duty for LEDC channel and return when duty updated.

Note: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - `LEDC_CHANNEL_MAX-1`), select from `ledc_channel_t`
- **duty** -- Set the LEDC duty, the range of duty setting is `[0, (2**duty_resolution)]`
- **hpoint** -- Set the LEDC hpoint value, the range is `[0, (2**duty_resolution)-1]`

Returns

- ESP_OK Success
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Fade function init error

esp_err_t **ledc_set_fade_time_and_start** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t target_duty, uint32_t max_fade_time_ms, *ledc_fade_mode_t* fade_mode)

A thread-safe API to set and start LEDC fade function, with a limited time.

Note: Call `ledc_fade_func_install()` once, before calling this function.

Note: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **target_duty** -- Target duty of fading [0, (2**duty_resolution)]
- **max_fade_time_ms** -- The maximum time of the fading (ms).
- **fade_mode** -- choose blocking or non-blocking mode

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

esp_err_t **ledc_set_fade_step_and_start** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num, *ledc_fade_mode_t* fade_mode)

A thread-safe API to set and start LEDC fade function.

Note: Call `ledc_fade_func_install()` once before calling this function.

Note: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **target_duty** -- Target duty of fading [0, (2**duty_resolution)]
- **scale** -- Controls the increase or decrease step scale.
- **cycle_num** -- increase or decrease the duty every cycle_num cycles
- **fade_mode** -- choose blocking or non-blocking mode

Returns

- ESP_OK Success

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_INVALID_STATE` Channel not initialized
- `ESP_FAIL` Fade function init error

esp_err_t **ledc_cb_register** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *ledc_cbs_t* *cbs, void *user_arg)

LEDC callback registration function.

Note: The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.

Parameters

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **cbs** -- Group of LEDC callback functions
- **user_arg** -- user registered data for the callback function

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_INVALID_STATE` Channel not initialized
- `ESP_FAIL` Fade function init error

esp_err_t **ledc_set_multi_fade** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, `uint32_t` start_duty, `const ledc_fade_param_config_t` *fade_params_list, `uint32_t` list_len)

Set a LEDC multi-fade.

Note: Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

Note: This function is not thread-safe, do not call it to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_multi_fade_and_start`

Note: This function does not prohibit from duty overflow. User should take care of this by themselves. If duty overflow happens, the PWM signal will suddenly change from 100% duty cycle to 0%, or the other way around.

Parameters

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **start_duty** -- Set the start of the gradient duty, the range of duty setting is [0, (2**duty_resolution)]
- **fade_params_list** -- Pointer to the array of fade parameters for a multi-fade
- **list_len** -- Length of the `fade_params_list`, i.e. number of fade ranges for a multi-fade (1 - SOC_LEDC_GAMMA_CURVE_FADE_RANGE_MAX)

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

esp_err_t **ledc_set_multi_fade_and_start** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t start_duty, const *ledc_fade_param_config_t* *fade_params_list, uint32_t list_len, *ledc_fade_mode_t* fade_mode)

A thread-safe API to set and start LEDC multi-fade function.

Note: Call `ledc_fade_func_install()` once before calling this function.

Note: Fade will always begin from the current duty cycle. Make sure it is stable and synchronized to the desired initial value before calling this function. Otherwise, you may see unexpected duty change.

Note: This function does not prohibit from duty overflow. User should take care of this by themselves. If duty overflow happens, the PWM signal will suddenly change from 100% duty cycle to 0%, or the other way around.

Parameters

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **start_duty** -- Set the start of the gradient duty, the range of duty setting is [0, (2*duty_resolution)]
- **fade_params_list** -- Pointer to the array of fade parameters for a multi-fade
- **list_len** -- Length of the `fade_params_list`, i.e. number of fade ranges for a multi-fade (1 - SOC_LEDC_GAMMA_CURVE_FADE_RANGE_MAX)
- **fade_mode** -- Choose blocking or non-blocking mode

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

esp_err_t **ledc_fill_multi_fade_param_list** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t start_duty, uint32_t end_duty, uint32_t linear_phase_num, uint32_t max_fade_time_ms, uint32_t (*gamma_correction_operator)(uint32_t), uint32_t fade_params_list_size, *ledc_fade_param_config_t* *fade_params_list, uint32_t *hw_fade_range_num)

Helper function to fill the fade params for a multi-fade. Useful if desires a gamma curve fading.

Note: The fade params are calculated based on the given `start_duty` and `end_duty`. If the duty is not at the start duty (gamma-corrected) when the fade begins, you may see undesired brightness change. Therefore, please always remember that when passing the `fade_params` to either `ledc_set_multi_fade` or `ledc_set_multi_fade_and_start`, the `start_duty` argument has to be the gamma-corrected `start_duty`.

Parameters

- **speed_mode** -- **[in]** Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- **[in]** LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **start_duty** -- **[in]** Duty cycle [0, (2**duty_resolution)] where the multi-fade begins with. This value should be a non-gamma-corrected duty cycle.
- **end_duty** -- **[in]** Duty cycle [0, (2**duty_resolution)] where the multi-fade ends with. This value should be a non-gamma-corrected duty cycle.
- **linear_phase_num** -- **[in]** Number of linear fades to simulate a gamma curved fade (1 - SOC_LEDC_GAMMA_CURVE_FADE_RANGE_MAX)
- **max_fade_time_ms** -- **[in]** The maximum time of the fading (ms).
- **gamma_correction_operator** -- **[in]** User provided gamma correction function. The function argument should be able to take any value within [0, (2**duty_resolution)]. And returns the gamma-corrected duty cycle.
- **fade_params_list_size** -- **[in]** The size of the `fade_params_list` user allocated (1 - SOC_LEDC_GAMMA_CURVE_FADE_RANGE_MAX)
- **fade_params_list** -- **[out]** Pointer to the array of `ledc_fade_param_config_t` structure
- **hw_fade_range_num** -- **[out]** Number of fade ranges for this multi-fade

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Required number of hardware ranges exceeds the size of the `ledc_fade_param_config_t` array user allocated

`esp_err_t ledc_read_fade_param` (`ledc_mode_t` speed_mode, `ledc_channel_t` channel, `uint32_t` range, `uint32_t *dir`, `uint32_t *cycle`, `uint32_t *scale`, `uint32_t *step`)

Get the fade parameters that are stored in gamma ram for a certain fade range.

Gamma ram is where saves the fade parameters for each fade range. The fade parameters are written in during fade configuration. When fade begins, the duty will change according to the parameters in gamma ram.

Parameters

- **speed_mode** -- **[in]** Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- **[in]** LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **range** -- **[in]** Range index (0 - (SOC_LEDC_GAMMA_CURVE_FADE_RANGE_MAX-1)), it specifies to which range in gamma ram to read
- **dir** -- **[out]** Pointer to accept fade direction value
- **cycle** -- **[out]** Pointer to accept fade cycle value
- **scale** -- **[out]** Pointer to accept fade scale value
- **step** -- **[out]** Pointer to accept fade step value

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized

Structures

struct `ledc_channel_config_t`

Configuration parameters of LEDC channel for `ledc_channel_config` function.

Public Members

int **gpio_num**

the LEDC output gpio_num, if you want to use gpio16, gpio_num = 16

ledc_mode_t **speed_mode**

LEDC speed speed_mode, high-speed mode (only exists on esp32) or low-speed mode

ledc_channel_t **channel**

LEDC channel (0 - LEDC_CHANNEL_MAX-1)

ledc_intr_type_t **intr_type**

configure interrupt, Fade interrupt enable or Fade interrupt disable

ledc_timer_t **timer_sel**

Select the timer source of channel (0 - LEDC_TIMER_MAX-1)

uint32_t **duty**

LEDC channel duty, the range of duty setting is [0, (2**duty_resolution)]

int **hpoint**

LEDC channel hpoint value, the range is [0, (2**duty_resolution)-1]

ledc_sleep_mode_t **sleep_mode**

choose the desired behavior for the LEDC channel in Light-sleep

unsigned int **output_invert**

Enable (1) or disable (0) gpio output invert

struct *ledc_channel_config_t*::[anonymous] **flags**

LEDC flags

struct **ledc_timer_config_t**

Configuration parameters of LEDC timer for ledc_timer_config function.

Public Members

ledc_mode_t **speed_mode**

LEDC speed speed_mode, high-speed mode (only exists on esp32) or low-speed mode

ledc_timer_bit_t **duty_resolution**

LEDC channel duty resolution

ledc_timer_t **timer_num**

The timer source of channel (0 - LEDC_TIMER_MAX-1)

uint32_t **freq_hz**

LEDC timer frequency (Hz)

***ledc_clk_cfg_t* clk_cfg**

Configure LEDC source clock from `ledc_clk_cfg_t`. Note that `LEDC_USE_RC_FAST_CLK` and `LEDC_USE_XTAL_CLK` are non-timer-specific clock sources. You can not have one LEDC timer uses `RC_FAST_CLK` as the clock source and have another LEDC timer uses `XTAL_CLK` as its clock source. All chips except `esp32` and `esp32s2` do not have timer-specific clock sources, which means clock source for all timers must be the same one.

bool deconfigure

Set this field to de-configure a LEDC timer which has been configured before. Note that it will not check whether the timer wants to be de-configured is binded to any channel. Also, the timer has to be paused first before it can be de-configured. When this field is set, `duty_resolution`, `freq_hz`, `clk_cfg` fields are ignored.

struct ledc_cb_param_t

LEDC callback parameter.

Public Members***ledc_cb_event_t* event**

Event name

uint32_t speed_mode

Speed mode of the LEDC channel group

uint32_t channel

LEDC channel (0 - `LEDC_CHANNEL_MAX-1`)

uint32_t duty

LEDC current duty of the channel, the range of duty is $[0, (2^{**}duty_resolution)]$

struct ledc_cbs_t

Group of supported LEDC callbacks.

Note: The callbacks are all running under ISR environment

Public Members***ledc_cb_t* fade_cb**

LEDC `fade_end` callback function

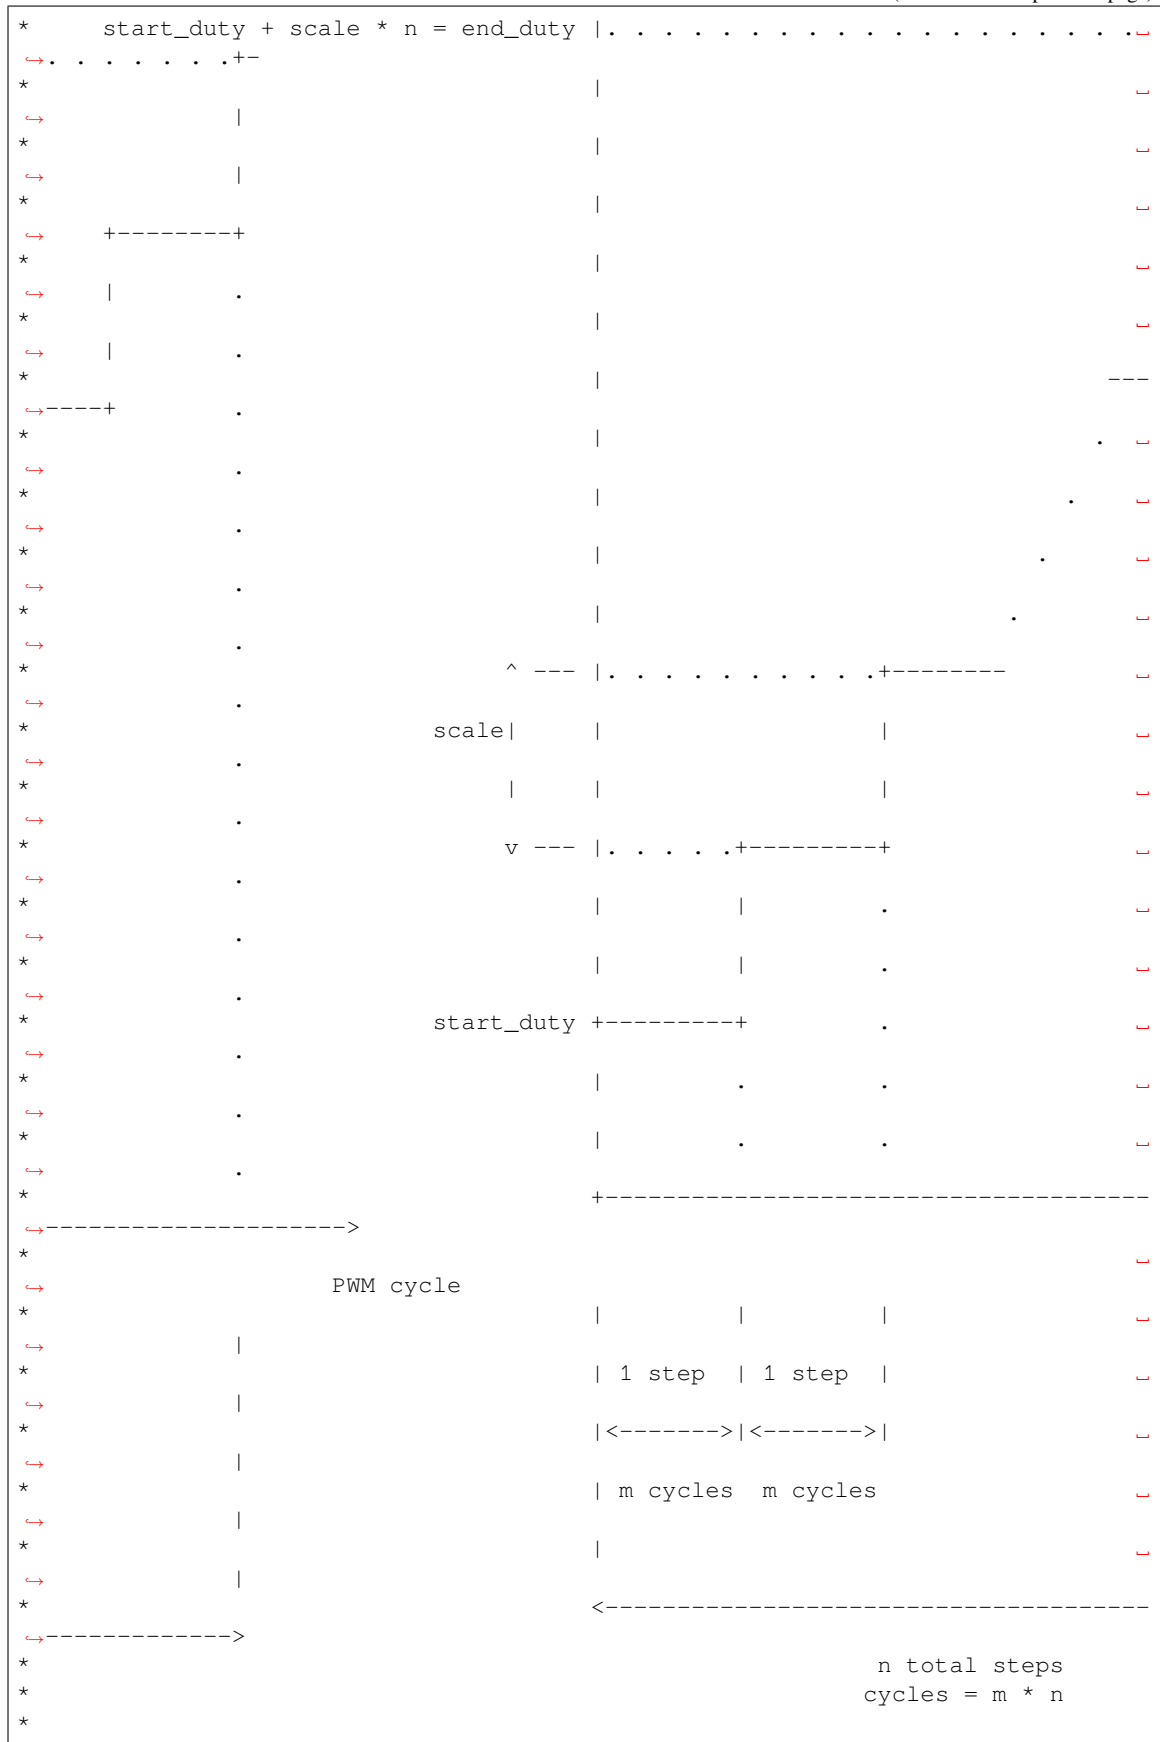

struct ledc_fade_param_config_t

Structure for the fade parameters for one hardware fade to be written to gamma wr register.

*	duty ^	ONE HW LINEAR FADE
*		
*		
*		
*		

(continues on next page)

(continued from previous page)

Note: Be aware of the maximum value available on each element

Public Members

uint32_t **dir**

Duty change direction. Set 1 as increase, 0 as decrease

uint32_t **cycle_num**

Number of PWM cycles of each step [0, 2**SOC_LEDC_FADE_PARAMS_BIT_WIDTH-1]

uint32_t **scale**

Duty change of each step [0, 2**SOC_LEDC_FADE_PARAMS_BIT_WIDTH-1]

uint32_t **step_num**

Total number of steps in one hardware fade [0, 2**SOC_LEDC_FADE_PARAMS_BIT_WIDTH-1]

Macros

LEDC_ERR_DUTY

LEDC_ERR_VAL

Type Definitions

typedef *intr_handle_t* **ledc_isr_handle_t**

typedef bool (***ledc_cb_t**)(const *ledc_cb_param_t* *param, void *user_arg)

Type of LEDC event callback.

Param param LEDC callback parameter

Param user_arg User registered data

Return Whether a high priority task has been waken up by this function

Enumerations

enum **ledc_sleep_mode_t**

Strategies to be applied to the LEDC channel during system Light-sleep period.

Values:

enumerator **LEDC_SLEEP_MODE_NO_ALIVE_NO_PD**

The default mode: no LEDC output, and no power off the LEDC power domain.

enumerator **LEDC_SLEEP_MODE_NO_ALIVE_ALLOW_PD**

The low-power-consumption mode: no LEDC output, and allow to power off the LEDC power domain. This can save power, but at the expense of more RAM being consumed to save register context. This option is only available on targets that support TOP domain to be powered down.

enumerator **LEDC_SLEEP_MODE_KEEP_ALIVE**

The high-power-consumption mode: keep LEDC output when the system enters Light-sleep.

enumerator **LEDC_SLEEP_MODE_INVALID**

Invalid LEDC sleep mode strategy

enum **ledc_cb_event_t**

LEDC callback event type.

Values:

enumerator **LEDC_FADE_END_EVT**

LEDC fade end event

Header File

- [components/hal/include/hal/ledc_types.h](#)
- This header file can be included with:

```
#include "hal/ledc_types.h"
```

Type Definitions

typedef *soc_periph_ledc_clk_src_legacy_t* **ledc_clk_cfg_t**

LEDC clock source configuration struct.

In theory, the following enumeration shall be placed in LEDC driver's header. However, as the next enumeration, `ledc_clk_src_t`, makes the use of some of these values and to avoid mutual inclusion of the headers, we must define it here.

Enumerations

enum **ledc_mode_t**

Values:

enumerator **LEDC_LOW_SPEED_MODE**

LEDC low speed speed_mode

enumerator **LEDC_SPEED_MODE_MAX**

LEDC speed limit

enum **ledc_intr_type_t**

Values:

enumerator **LEDC_INTR_DISABLE**

Disable LEDC interrupt

enumerator **LEDC_INTR_FADE_END**

Enable LEDC interrupt

enumerator **LEDC_INTR_MAX**

enum **ledc_duty_direction_t**

Values:

enumerator **LEDC_DUTY_DIR_DECREASE**

LEDC duty decrease direction

enumerator **LEDC_DUTY_DIR_INCREASE**

LEDC duty increase direction

enumerator **LEDC_DUTY_DIR_MAX**

enum **ledc_slow_clk_sel_t**

LEDC global clock sources.

Values:

enumerator **LEDC_SLOW_CLK_RC_FAST**

LEDC low speed timer clock source is RC_FAST clock

enumerator **LEDC_SLOW_CLK_PLL_DIV**

LEDC low speed timer clock source is a PLL_DIV clock

enumerator **LEDC_SLOW_CLK_XTAL**

LEDC low speed timer clock source XTAL clock

enumerator **LEDC_SLOW_CLK_RTC8M**

Alias of 'LEDC_SLOW_CLK_RC_FAST'

enum **ledc_clk_src_t**

LEDC timer-specific clock sources.

Note: Setting numeric values to match `ledc_clk_cfg_t` values are a hack to avoid collision with `LEDC_AUTO_CLK` in the driver, as these enums have very similar names and user may pass one of these by mistake.

Values:

enumerator **LEDC_SCLK**

Selecting this value for `LEDC_TICK_SEL_TIMER` let the hardware take its source clock from `LEDC_CLK_SEL`

enum **ledc_timer_t**

Values:

enumerator **LEDC_TIMER_0**

LEDC timer 0

enumerator **LEDC_TIMER_1**

LEDC timer 1

enumerator **LEDC_TIMER_2**

LEDC timer 2

enumerator **LEDC_TIMER_3**

LEDC timer 3

enumerator **LEDC_TIMER_MAX**

enum **ledc_channel_t**

Values:

enumerator **LEDC_CHANNEL_0**

LEDC channel 0

enumerator **LEDC_CHANNEL_1**

LEDC channel 1

enumerator **LEDC_CHANNEL_2**

LEDC channel 2

enumerator **LEDC_CHANNEL_3**

LEDC channel 3

enumerator **LEDC_CHANNEL_4**

LEDC channel 4

enumerator **LEDC_CHANNEL_5**

LEDC channel 5

enumerator **LEDC_CHANNEL_MAX**

enum **ledc_timer_bit_t**

Values:

enumerator **LEDC_TIMER_1_BIT**

LEDC PWM duty resolution of 1 bits

enumerator **LEDC_TIMER_2_BIT**

LEDC PWM duty resolution of 2 bits

enumerator **LEDC_TIMER_3_BIT**

LEDC PWM duty resolution of 3 bits

enumerator **LEDC_TIMER_4_BIT**

LEDC PWM duty resolution of 4 bits

enumerator **LEDC_TIMER_5_BIT**

LEDC PWM duty resolution of 5 bits

enumerator **LEDC_TIMER_6_BIT**

LEDC PWM duty resolution of 6 bits

enumerator **LEDC_TIMER_7_BIT**

LEDC PWM duty resolution of 7 bits

enumerator **LEDC_TIMER_8_BIT**

LEDC PWM duty resolution of 8 bits

enumerator **LEDC_TIMER_9_BIT**

LEDC PWM duty resolution of 9 bits

enumerator **LEDC_TIMER_10_BIT**

LEDC PWM duty resolution of 10 bits

enumerator **LEDC_TIMER_11_BIT**

LEDC PWM duty resolution of 11 bits

enumerator **LEDC_TIMER_12_BIT**

LEDC PWM duty resolution of 12 bits

enumerator **LEDC_TIMER_13_BIT**

LEDC PWM duty resolution of 13 bits

enumerator **LEDC_TIMER_14_BIT**

LEDC PWM duty resolution of 14 bits

enumerator **LEDC_TIMER_15_BIT**

LEDC PWM duty resolution of 15 bits

enumerator **LEDC_TIMER_16_BIT**

LEDC PWM duty resolution of 16 bits

enumerator **LEDC_TIMER_17_BIT**

LEDC PWM duty resolution of 17 bits

enumerator **LEDC_TIMER_18_BIT**

LEDC PWM duty resolution of 18 bits

enumerator **LEDC_TIMER_19_BIT**

LEDC PWM duty resolution of 19 bits

enumerator **LEDC_TIMER_20_BIT**

LEDC PWM duty resolution of 20 bits

enumerator **LEDC_TIMER_BIT_MAX**

enum **ledc_fade_mode_t**

Values:

enumerator **LEDC_FADE_NO_WAIT**

LEDC fade function will return immediately

enumerator **LEDC_FADE_WAIT_DONE**

LEDC fade function will block until fading to the target duty

enumerator **LEDC_FADE_MAX**

2.6.16 Motor Control Pulse Width Modulator (MCPWM)

The MCPWM peripheral is a versatile PWM generator, which contains various submodules to make it a key element in power electronic applications like motor control, digital power, and so on. Typically, the MCPWM peripheral can be used in the following scenarios:

- Digital motor control, e.g., brushed/brushless DC motor, RC servo motor
- Switch mode-based digital power conversion
- Power DAC, where the duty cycle is equivalent to a DAC analog value
- Calculate external pulse width, and convert it into other analog values like speed, distance
- Generate Space Vector PWM (SVPWM) signals for Field Oriented Control (FOC)

The main submodules are listed in the following diagram:

Fig. 17: MCPWM Overview

- **MCPWM Timer:** The time base of the final PWM signal. It also determines the event timing of other submodules.
- **MCPWM Operator:** The key module that is responsible for generating the PWM waveforms. It consists of other submodules, like comparator, PWM generator, dead time, and carrier modulator.
- **MCPWM Comparator:** The compare module takes the time-base count value as input, and continuously compares it to the threshold value configured. When the timer is equal to any of the threshold values, a compare event will be generated and the MCPWM generator can update its level accordingly.
- **MCPWM Generator:** One MCPWM generator can generate a pair of PWM waves, complementarily or independently, based on various events triggered by other submodules like MCPWM Timer and MCPWM Comparator.
- **MCPWM Fault:** The fault module is used to detect the fault condition from outside, mainly via the GPIO matrix. Once the fault signal is active, MCPWM Operator will force all the generators into a predefined state to protect the system from damage.
- **MCPWM Sync:** The sync module is used to synchronize the MCPWM timers, so that the final PWM signals generated by different MCPWM generators can have a fixed phase difference. The sync signal can be routed from the GPIO matrix or from an MCPWM Timer event.
- **Dead Time:** This submodule is used to insert extra delay to the existing PWM edges generated in the previous steps.

- **Carrier Modulation:** The carrier submodule can modulate a high-frequency carrier signal into PWM waveforms by the generator and dead time submodules. This capability is mandatory for controlling the power-switching elements.
- **Brake:** MCPWM operator can set how to brake the generators when a particular fault is detected. You can shut down the PWM output immediately or regulate the PWM output cycle by cycle, depending on how critical the fault is.
- **MCPWM Capture:** This is a standalone submodule that can work even without the above MCPWM operators. The capture consists one dedicated timer and several independent channels, with each channel connected to the GPIO. A pulse on the GPIO triggers the capture timer to store the time-base count value and then notify you by an interrupt. Using this feature, you can measure a pulse width precisely. What is more, the capture timer can also be synchronized by the MCPWM Sync submodule.

Functional Overview

Description of the MCPWM functionality is divided into the following sections:

- *Resource Allocation and Initialization* - covers how to allocate various MCPWM objects, like timers, operators, comparators, generators and so on. These objects are the basis of the following IO setting and control functions.
- *Timer Operations and Events* - describes control functions and event callbacks supported by the MCPWM timer.
- *Comparator Operations and Events* - describes control functions and event callbacks supported by the MCPWM comparator.
- *Generator Actions on Events* - describes how to set actions for MCPWM generators on particular events that are generated by the MCPWM timer and comparators.
- *Generator Configurations for Classical PWM Waveforms* - demonstrates some classical PWM waveforms that can be achieved by configuring generator actions.
- *Dead Time* - describes how to set dead time for MCPWM generators.
- *Dead Time Configurations for Classical PWM Waveforms* - demonstrates some classical PWM waveforms that can be achieved by configuring dead time.
- *Carrier Modulation* - describes how to set and modulate a high frequency onto the final PWM waveforms.
- *Faults and Brake Actions* - describes how to set brake actions for MCPWM operators on particular fault events.
- *Generator Force Actions* - describes how to control the generator output level asynchronously in a forceful way.
- *Synchronization* - describes how to synchronize the MCPWM timers and get a fixed phase difference between the generated PWM signals.
- *Capture* - describes how to use the MCPWM capture module to measure the pulse width of a signal.
- *ETM Event and Task* - describes what the events and tasks can be connected to the ETM channel.
- *Power Management* - describes how different source clocks affects power consumption.
- *IRAM Safe* - describes tips on how to make the RMT interrupt work better along with a disabled cache.
- *Thread Safety* - lists which APIs are guaranteed to be thread-safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can bring different effects to the driver.

Resource Allocation and Initialization As displayed in the diagram above, the MCPWM peripheral consists of several submodules. Each submodule has its own resource allocation, which is described in the following sections.

MCPWM Timers You can allocate a MCPWM timer object by calling `mcpwm_new_timer()` function, with a configuration structure `mcpwm_timer_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_timer_config_t::group_id` specifies the MCPWM group ID. The ID should belong to [0, `SOC_MCPWM_GROUPS` - 1] range. Please note, timers located in different groups are totally independent.
- `mcpwm_timer_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_timer_config_t::clk_src` sets the clock source of the timer.
- `mcpwm_timer_config_t::resolution_hz` sets the expected resolution of the timer. The driver internally sets a proper divider based on the clock source and the resolution.
- `mcpwm_timer_config_t::count_mode` sets the count mode of the timer.

- `mcpwm_timer_config_t::period_ticks` sets the period of the timer, in ticks (the tick resolution is set in the `mcpwm_timer_config_t::resolution_hz`).
- `mcpwm_timer_config_t::update_period_on_empty` sets whether to update the period value when the timer counts to zero.
- `mcpwm_timer_config_t::update_period_on_sync` sets whether to update the period value when the timer takes a sync signal.

The `mcpwm_new_timer()` will return a pointer to the allocated timer object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free timers in the MCPWM group, this function will return the `ESP_ERR_NOT_FOUND` error.¹

On the contrary, calling the `mcpwm_del_timer()` function will free the allocated timer object.

MCPWM Operators You can allocate a MCPWM operator object by calling `mcpwm_new_operator()` function, with a configuration structure `mcpwm_operator_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_operator_config_t::group_id` specifies the MCPWM group ID. The ID should belong to `[0, SOC_MCPWM_GROUPS - 1]` range. Please note, operators located in different groups are totally independent.
- `mcpwm_operator_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_operator_config_t::update_gen_action_on_tez` sets whether to update the generator action when the timer counts to zero. Here and below, the timer refers to the one that is connected to the operator by `mcpwm_operator_connect_timer()`.
- `mcpwm_operator_config_t::update_gen_action_on_tep` sets whether to update the generator action when the timer counts to peak.
- `mcpwm_operator_config_t::update_gen_action_on_sync` sets whether to update the generator action when the timer takes a sync signal.
- `mcpwm_operator_config_t::update_dead_time_on_tez` sets whether to update the dead time when the timer counts to zero.
- `mcpwm_operator_config_t::update_dead_time_on_tep` sets whether to update the dead time when the timer counts to the peak.
- `mcpwm_operator_config_t::update_dead_time_on_sync` sets whether to update the dead time when the timer takes a sync signal.

The `mcpwm_new_operator()` will return a pointer to the allocated operator object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free operators in the MCPWM group, this function will return the `ESP_ERR_NOT_FOUND` error.¹

On the contrary, calling `mcpwm_del_operator()` function will free the allocated operator object.

MCPWM Comparators You can allocate a MCPWM comparator object by calling the `mcpwm_new_comparator()` function, with a MCPWM operator handle and configuration structure `mcpwm_comparator_config_t` as the parameter. The operator handle is created by `mcpwm_new_operator()`. The configuration structure is defined as:

- `mcpwm_comparator_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_comparator_config_t::update_cmp_on_tez` sets whether to update the compare threshold when the timer counts to zero.
- `mcpwm_comparator_config_t::update_cmp_on_tep` sets whether to update the compare threshold when the timer counts to the peak.
- `mcpwm_comparator_config_t::update_cmp_on_sync` sets whether to update the compare threshold when the timer takes a sync signal.

¹ Different ESP chip series might have a different number of MCPWM resources (e.g., groups, timers, comparators, operators, generators, triggers and so on). Please refer to the [TRM] for details. The driver does not forbid you from applying for more MCPWM resources, but it returns an error when there are no hardware resources available. Please always check the return value when doing *Resource Allocation and Initialization*.

The `mcpwm_new_comparator()` will return a pointer to the allocated comparator object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free comparators in the MCPWM operator, this function will return the `ESP_ERR_NOT_FOUND` error.¹

On the contrary, calling the `mcpwm_del_comparator()` function will free the allocated comparator object.

There's another kind of comparator called "Event Comparator", which **can not** control the final PWM directly but only generates the ETM events at a configurable time stamp. You can allocate an event comparator by calling the `mcpwm_new_event_comparator()` function. This function will return the same handle type as `mcpwm_new_comparator()`, but with a different configuration structure `mcpwm_event_comparator_config_t`. For more information, please refer to *ETM Event and Task*.

MCPWM Generators You can allocate a MCPWM generator object by calling the `mcpwm_new_generator()` function, with a MCPWM operator handle and configuration structure `mcpwm_generator_config_t` as the parameter. The operator handle is created by `mcpwm_new_operator()`. The configuration structure is defined as:

- `mcpwm_generator_config_t::gen_gpio_num` sets the GPIO number used by the generator.
- `mcpwm_generator_config_t::invert_pwm` sets whether to invert the PWM signal.
- `mcpwm_generator_config_t::pull_up` and `mcpwm_generator_config_t::pull_down` controls whether to enable the internal pull-up and pull-down resistors accordingly.

The `mcpwm_new_generator()` will return a pointer to the allocated generator object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free generators in the MCPWM operator, this function will return the `ESP_ERR_NOT_FOUND` error.^{Page 1184, 1}

On the contrary, calling the `mcpwm_del_generator()` function will free the allocated generator object.

MCPWM Faults There are two types of faults: A fault signal reflected from the GPIO and a fault generated by software.

To allocate a GPIO fault object, you can call the `mcpwm_new_gpio_fault()` function, with the configuration structure `mcpwm_gpio_fault_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_gpio_fault_config_t::group_id` sets the MCPWM group ID. The ID should belong to [0, `SOC_MCPWM_GROUPS` - 1] range. Please note, GPIO faults located in different groups are totally independent, i.e., GPIO faults in group 0 can not be detected by the operator in group 1.
- `mcpwm_gpio_fault_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_gpio_fault_config_t::gpio_num` sets the GPIO number used by the fault.
- `mcpwm_gpio_fault_config_t::active_level` sets the active level of the fault signal.
- `mcpwm_gpio_fault_config_t::pull_up` and `mcpwm_gpio_fault_config_t::pull_down` set whether to pull up and/or pull down the GPIO internally.

The `mcpwm_new_gpio_fault()` will return a pointer to the allocated fault object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free GPIO faults in the MCPWM group, this function will return the `ESP_ERR_NOT_FOUND` error.^{Page 1184, 1}

Software fault object can be used to trigger a fault by calling the function `mcpwm_soft_fault_activate()` instead of waiting for a real fault signal on the GPIO. A software fault object can be allocated by calling the `mcpwm_new_soft_fault()` function, with configuration structure `mcpwm_soft_fault_config_t` as the parameter. Currently, this configuration structure is left for future purposes.

The `mcpwm_new_soft_fault()` function will return a pointer to the allocated fault object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there is no memory left for the fault object, this function will return the `ESP_ERR_NO_MEM` error. Although the software fault and GPIO fault are of different types, the returned fault handle is of the same type.

On the contrary, calling the `mcpwm_del_fault()` function will free the allocated fault object, this function works for both software and GPIO fault.

MCPWM Sync Sources The sync source is what can be used to synchronize the MCPWM timer and MCPWM capture timer. There are three types of sync sources: a sync source reflected from the GPIO, a sync source generated by software, and a sync source generated by an MCPWM timer event.

To allocate a GPIO sync source, you can call the `mcpwm_new_gpio_sync_src()` function, with configuration structure `mcpwm_gpio_sync_src_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_gpio_sync_src_config_t::group_id` sets the MCPWM group ID. The ID should belong to `[0, SOC_MCPWM_GROUPS - 1]` range. Please note, the GPIO sync sources located in different groups are totally independent, i.e., GPIO sync source in group 0 can not be detected by the timers in group 1.
- `mcpwm_gpio_sync_src_config_t::gpio_num` sets the GPIO number used by the sync source.
- `mcpwm_gpio_sync_src_config_t::active_neg` sets whether the sync signal is active on falling edges.
- `mcpwm_gpio_sync_src_config_t::pull_up` and `mcpwm_gpio_sync_src_config_t::pull_down` set whether to pull up and/or pull down the GPIO internally.

The `mcpwm_new_gpio_sync_src()` will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free GPIO sync sources in the MCPWM group, this function will return the `ESP_ERR_NOT_FOUND` error. Page 1184, 1

To allocate a timer event sync source, you can call the `mcpwm_new_timer_sync_src()` function, with configuration structure `mcpwm_timer_sync_src_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_timer_sync_src_config_t::timer_event` specifies on what timer event to generate the sync signal.
- `mcpwm_timer_sync_src_config_t::propagate_input_sync` sets whether to propagate the input sync signal (i.e., the input sync signal will be routed to its sync output).

The `mcpwm_new_timer_sync_src()` will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return an error code. Specifically, if a sync source has been allocated from the same timer before, this function will return the `ESP_ERR_INVALID_STATE` error.

Last but not least, to allocate a software sync source, you can call the `mcpwm_new_soft_sync_src()` function, with configuration structure `mcpwm_soft_sync_config_t` as the parameter. Currently, this configuration structure is left for future purposes.

`mcpwm_new_soft_sync_src()` will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there is no memory left for the sync source object, this function will return the `ESP_ERR_NO_MEM` error. Please note, to make a software sync source take effect, do not forget to call `mcpwm_soft_sync_activate()`.

On the contrary, calling the `mcpwm_del_sync_src()` function will free the allocated sync source object. This function works for all types of sync sources.

MCPWM Capture Timer and Channels The MCPWM group has a dedicated timer which is used to capture the timestamp when a specific event occurred. The capture timer is connected to several independent channels, each channel is assigned a GPIO.

To allocate a capture timer, you can call the `mcpwm_new_capture_timer()` function, with configuration structure `mcpwm_capture_timer_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_capture_timer_config_t::group_id` sets the MCPWM group ID. The ID should belong to `[0, SOC_MCPWM_GROUPS - 1]` range.
- `mcpwm_capture_timer_config_t::clk_src` sets the clock source of the capture timer.
- `mcpwm_capture_timer_config_t::resolution_hz` The driver internally will set a proper divider based on the clock source and the resolution. If it is set to 0, the driver will pick an appropriate resolution on its own, and you can subsequently view the current timer resolution via `mcpwm_capture_timer_get_resolution()`.

The `mcpwm_new_capture_timer()` will return a pointer to the allocated capture timer object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there is no free capture timer left in the MCPWM group, this function will return the `ESP_ERR_NOT_FOUND` error. Page 1184, 1

Next, to allocate a capture channel, you can call the `mcpwm_new_capture_channel()` function, with a capture timer handle and configuration structure `mcpwm_capture_channel_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_capture_channel_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_capture_channel_config_t::gpio_num` sets the GPIO number used by the capture channel.
- `mcpwm_capture_channel_config_t::prescale` sets the prescaler of the input signal.
- `mcpwm_capture_channel_config_t::extra_capture_channel_flags::pos_edge` and `mcpwm_capture_channel_config_t::extra_capture_channel_flags::neg_edge` set whether to capture on the positive and/or falling edge of the input signal.
- `mcpwm_capture_channel_config_t::extra_capture_channel_flags::pull_up` and `mcpwm_capture_channel_config_t::extra_capture_channel_flags::pull_down` set whether to pull up and/or pull down the GPIO internally.
- `mcpwm_capture_channel_config_t::extra_capture_channel_flags::invert_cap_signal` sets whether to invert the capture signal.

The `mcpwm_new_capture_channel()` will return a pointer to the allocated capture channel object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there is no free capture channel left in the capture timer, this function will return the `ESP_ERR_NOT_FOUND` error.

On the contrary, calling `mcpwm_del_capture_channel()` and `mcpwm_del_capture_timer()` will free the allocated capture channel and timer object accordingly.

MCPWM Interrupt Priority MCPWM allows configuring interrupts separately for timer, operator, comparator, fault, and capture events. The interrupt priority is determined by the respective `config_t::intr_priority`. Additionally, events within the same MCPWM group share a common interrupt source. When registering multiple interrupt events, the interrupt priorities need to remain consistent.

Note: When registering multiple interrupt events within an MCPWM group, the driver will use the interrupt priority of the first registered event as the MCPWM group's interrupt priority.

Timer Operations and Events

Update Period The timer period is initialized by the `mcpwm_timer_config_t::period_ticks` parameter in `mcpwm_timer_config_t`. You can update the period at runtime by calling `mcpwm_timer_set_period()` function. The new period will take effect based on how you set the `mcpwm_timer_config_t::update_period_on_empty` and `mcpwm_timer_config_t::update_period_on_sync` parameters in `mcpwm_timer_config_t`. If none of them are set, the timer period will take effect immediately.

Register Timer Event Callbacks The MCPWM timer can generate different events at runtime. If you have some function that should be called when a particular event happens, you should hook your function to the interrupt service routine by calling `mcpwm_timer_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_timer_event_cb_t`. All supported event callbacks are listed in the `mcpwm_timer_event_callbacks_t`:

- `mcpwm_timer_event_callbacks_t::on_full` sets the callback function for the timer when it counts to peak value.
- `mcpwm_timer_event_callbacks_t::on_empty` sets the callback function for the timer when it counts to zero.
- `mcpwm_timer_event_callbacks_t::on_stop` sets the callback function for the timer when it is stopped.

The callback functions above are called within the ISR context, so they should **not** attempt to block. For example, you may make sure that only FreeRTOS APIs with the `ISR` suffix are called within the function.

The parameter `user_data` of the `mcpwm_timer_register_event_callbacks()` function is used to save your own context. It is passed to each callback function directly.

This function will lazy the install interrupt service for the MCPWM timer without enabling it. It is only allowed to be called before `mcpwm_timer_enable()`, otherwise the `ESP_ERR_INVALID_STATE` error will be returned. See also [Enable and Disable timer](#) for more information.

Enable and Disable Timer Before doing IO control to the timer, you need to enable the timer first, by calling `mcpwm_timer_enable()`. This function:

- switches the timer state from **init** to **enable**.
- enables the interrupt service if it has been lazy installed by `mcpwm_timer_register_event_callbacks()`.
- acquire a proper power management lock if a specific clock source (e.g., PLL_160M clock) is selected. See also [Power management](#) for more information.

On the contrary, calling `mcpwm_timer_disable()` will put the timer driver back to the **init** state, disable the interrupt service and release the power management lock.

Start and Stop Timer The basic IO operation of a timer is to start and stop. Calling `mcpwm_timer_start_stop()` with different `mcpwm_timer_start_stop_cmd_t` commands can start the timer immediately or stop the timer at a specific event. What is more, you can even start the timer for only one round, which means, the timer will count to peak value or zero, and then stop itself.

Connect Timer with Operator The allocated MCPWM timer should be connected with an MCPWM operator by calling `mcpwm_operator_connect_timer()`, so that the operator can take that timer as its time base, and generate the required PWM waves. Please make sure the MCPWM timer and operator are in the same group. Otherwise, this function will return the `ESP_ERR_INVALID_ARG` error.

Comparator Operations and Events

Register Comparator Event Callbacks The MCPWM comparator can inform you when the timer counter equals the compare value. If you have some function that should be called when this event happens, you should hook your function to the interrupt service routine by calling `mcpwm_comparator_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_compare_event_cb_t`. All supported event callbacks are listed in the `mcpwm_comparator_event_callbacks_t`:

- `mcpwm_comparator_event_callbacks_t::on_reach` sets the callback function for the comparator when the timer counter equals the compare value.

The callback function provides event-specific data of type `mcpwm_compare_event_data_t` to you. The callback function is called within the ISR context, so it should **not** attempt to block. For example, you may make sure that only FreeRTOS APIs with the `ISR` suffix are called within the function.

The parameter `user_data` of `mcpwm_comparator_register_event_callbacks()` function is used to save your own context. It is passed to the callback function directly.

This function will lazy the installation of interrupt service for the MCPWM comparator, whereas the service can only be removed in `mcpwm_del_comparator`.

Note: It is not supported to register event callbacks for an **Event Comparator** because it can not generate any interrupt.

Set Compare Value You can set the compare value for the MCPWM comparator at runtime by calling `mcpwm_comparator_set_compare_value()`. There are a few points to note:

- A new compare value might not take effect immediately. The update time for the compare value is set by `mcpwm_comparator_config_t::update_cmp_on_tez` or `mcpwm_comparator_config_t::update_cmp_on_tep` or `mcpwm_comparator_config_t::update_cmp`.
- Make sure the operator has connected to one MCPWM timer already by `mcpwm_operator_connect_timer()`. Otherwise, it will return the error code `ESP_ERR_INVALID_STATE`.
- The compare value should not exceed the timer's count peak, otherwise, the compare event will never get triggered.

Generator Actions on Events

Set Generator Action on Timer Event One generator can set multiple actions on different timer events, by calling `mcpwm_generator_set_actions_on_timer_event()` with a variable number of action configurations. The action configuration is defined in `mcpwm_gen_timer_event_action_t`:

- `mcpwm_gen_timer_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_timer_event_action_t::event` specifies the timer event. The supported timer events are listed in `mcpwm_timer_event_t`.
- `mcpwm_gen_timer_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

There is a helper macro `MCPWM_GEN_TIMER_EVENT_ACTION` to simplify the construction of a timer event action entry.

Please note, the argument list of `mcpwm_generator_set_actions_on_timer_event()` **must** be terminated by `MCPWM_GEN_TIMER_EVENT_ACTION_END`.

You can also set the timer action one by one by calling `mcpwm_generator_set_action_on_timer_event()` without varargs.

Set Generator Action on Compare Event One generator can set multiple actions on different compare events, by calling `mcpwm_generator_set_actions_on_compare_event()` with a variable number of action configurations. The action configuration is defined in `mcpwm_gen_compare_event_action_t`:

- `mcpwm_gen_compare_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_compare_event_action_t::comparator` specifies the comparator handle. See [MCPWM Comparators](#) for how to allocate a comparator.
- `mcpwm_gen_compare_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

There is a helper macro `MCPWM_GEN_COMPARE_EVENT_ACTION` to simplify the construction of a compare event action entry.

Please note, the argument list of `mcpwm_generator_set_actions_on_compare_event()` **must** be terminated by `MCPWM_GEN_COMPARE_EVENT_ACTION_END`.

You can also set the compare action one by one by calling `mcpwm_generator_set_action_on_compare_event()` without varargs.

Set Generator Action on Fault Event One generator can set action on fault based trigger events, by calling `mcpwm_generator_set_action_on_fault_event()` with an action configurations. The action configuration is defined in `mcpwm_gen_fault_event_action_t`:

- `mcpwm_gen_fault_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.

- `mcpwm_gen_fault_event_action_t::fault` specifies the fault used for the trigger. See [MCPWM Faults](#) for how to allocate a fault.
- `mcpwm_gen_fault_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

When no free trigger slot is left in the operator to which the generator belongs, this function will return the `ESP_ERR_NOT_FOUND` error. Page 1184, 1

The trigger only support GPIO fault. when the input is not a GPIO fault, this function will return the `ESP_ERR_NOT_SUPPORTED` error.

There is a helper macro `MCPWM_GEN_FAULT_EVENT_ACTION` to simplify the construction of a trigger event action entry.

Please note, fault event does not have variadic function like `mcpwm_generator_set_actions_on_fault_event()`.

Set Generator Action on Sync Event One generator can set action on sync based trigger events, by calling `mcpwm_generator_set_action_on_sync_event()` with an action configurations. The action configuration is defined in `mcpwm_gen_sync_event_action_t`:

- `mcpwm_gen_sync_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_sync_event_action_t::sync` specifies the sync source used for the trigger. See [MCPWM Sync Sources](#) for how to allocate a sync source.
- `mcpwm_gen_sync_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

When no free trigger slot is left in the operator to which the generator belongs, this function will return the `ESP_ERR_NOT_FOUND` error. Page 1184, 1

The trigger only support one sync action, regardless of the kinds. When set sync actions more than once, this function will return the `ESP_ERR_INVALID_STATE` error.

There is a helper macro `MCPWM_GEN_SYNC_EVENT_ACTION` to simplify the construction of a trigger event action entry.

Please note, sync event does not have variadic function like `mcpwm_generator_set_actions_on_sync_event()`.

Generator Configurations for Classical PWM Waveforms This section will demonstrate the classical PWM waveforms that can be generated by the pair of generators. The code snippet that is used to generate the waveforms is also provided below the diagram. Some general summary:

- The **Symmetric** or **Asymmetric** of the waveforms is determined by the count mode of the MCPWM timer.
- The **active level** of the waveform pair is determined by the level of the PWM with a smaller duty cycle.
- The period of the PWM waveform is determined by the timer's period and count mode.
- The duty cycle of the PWM waveform is determined by the generator's various action combinations.

Dead Time In power electronics, the rectifier and inverter are commonly used. This requires the use of a rectifier bridge and an inverter bridge. Each bridge arm has two power electronic devices, such as MOSFET, IGBT, etc. The two MOSFETs on the same arm can not conduct at the same time, otherwise there will be a short circuit. The fact is that, although the PWM wave shows it is turning off the switch, the MOSFET still needs a small time window to make that happen. This requires an extra delay to be added to the existing PWM wave generated by setting *Generator Actions on Events*.

The dead time driver works like a **decorator**. This is also reflected in the function parameters of `mcpwm_generator_set_dead_time()`, where it takes the primary generator handle (`in_generator`), and returns a new generator (`out_generator`) after applying the dead time. Please note, if the `out_generator` and `in_generator` are the same, it means you are adding the time delay to the PWM waveform in an "in-place" fashion. In turn, if the `out_generator` and `in_generator` are different, it means you are deriving a new PWM waveform from the existing `in_generator`.

Dead time specific configuration is listed in the `mcpwm_dead_time_config_t` structure:

- `mcpwm_dead_time_config_t::posedge_delay_ticks` and `mcpwm_dead_time_config_t::negedge_delay_ticks` set the number of ticks to delay the PWM waveform on the rising and falling edge. Specifically, setting both of them to zero means bypassing the dead time module. The resolution of the dead time tick is the same as the timer that is connected with the operator by `mcpwm_operator_connect_timer()`.
- `mcpwm_dead_time_config_t::invert_output` sets whether to invert the signal after applying the dead time, which can be used to control the delay edge polarity.

Warning: Due to the hardware limitation, one delay module (either `posedge delay` or `negedge delay`) can not be applied to multiple MCPWM generators at the same time. e.g., the following configuration is **invalid**:

```

mcpwm_dead_time_config_t dt_config = {
    .posedge_delay_ticks = 10,
};
// Set posedge delay to generator A
mcpwm_generator_set_dead_time(mcpwm_gen_a, mcpwm_gen_a, &dt_config);
// NOTE: This is invalid, you can not apply the posedge delay to another
↪generator
mcpwm_generator_set_dead_time(mcpwm_gen_b, mcpwm_gen_b, &dt_config);

```

However, you can apply `posedge delay` to generator A and `negedge delay` to generator B. You can also set both `posedge delay` and `negedge delay` for generator B, while letting generator A bypass the dead time module. Note that if `negedge delay` and `posedge delay` are both set for generator A, generator B will not be available. Where generator A is the first generator requested through the operator handle and generator B is the second generator requested through an operator handle.

Note: It is also possible to generate the required dead time by setting *Generator Actions on Events*, especially by controlling edge placement using different comparators. However, if the more classical edge delay-based dead time with polarity control is required, then the dead time submodule should be used.

Dead Time Configurations for Classical PWM Waveforms This section demonstrates the classical PWM waveforms that can be generated by the dead time submodule. The code snippet that is used to generate the waveforms is also provided below the diagram.

```

Carrier Modulation The MCPWM operator has a carrier submodule that can be used if galvanic isolation from the motor driver is required (e.g., isolated digital power application) by passing the PWM output signals through transformers. Any of the PWM output signals may be at 100% duty and not changing whenever a motor is required to run steadily at the full load. Coupling with non-alternating signals with a transformer is problematic, so the signals are modulated by the carrier submodule to create an AC waveform, to make the coupling possible.

To configure the carrier submodule, you can call `mcpwm_operator_apply_carrier()`, and provide configuration structure `mcpwm_carrier_config_t`:

- `mcpwm_carrier_config_t::clk_src` sets the clock source of the carrier.
- `mcpwm_carrier_config_t::frequency_hz` indicates carrier frequency in Hz.
- `mcpwm_carrier_config_t::duty_cycle` indicates the duty cycle of the carrier. Note that, the supported choices of the duty cycle are discrete, the driver searches for the nearest one based on your configuration.
- `mcpwm_carrier_config_t::first_pulse_duration_us` indicates the duration of the first pulse in microseconds. The resolution of the first pulse duration is determined by the carrier frequency you set in the `mcpwm_carrier_config_t::frequency_hz`. The first pulse duration can not be zero, and it has to be at least one period of the carrier. A longer pulse width can help conduct the inductance quicker.
- `mcpwm_carrier_config_t::invert_before_modulate` and `mcpwm_carrier_config_t::invert_after_modulate` set whether to invert the carrier output before and after modulation.

Specifically, the carrier submodule can be disabled by calling `mcpwm_operator_apply_carrier()` with a NULL configuration.

Faults and Brake Actions The MCPWM operator is able to sense external signals with information about the failure of the motor, the power driver or any other device connected. These failure signals are encapsulated into MCPWM fault objects.

You should determine possible failure modes of the motor and what action should be performed on detection of a particular fault, e.g., drive all outputs low for a brushed motor, lock current state for a stepper motor, etc. Because of this action, the motor should be put into a safe state to reduce the likelihood of damage caused by the fault.

Set Operator Brake Mode on Fault The way that MCPWM operator reacts to the fault is called **Brake**. The MCPWM operator can be configured to perform different brake modes for each fault object by calling `mcpwm_operator_set_brake_on_fault()`. Specific brake configuration is passed as a structure `mcpwm_brake_config_t`:

- `mcpwm_brake_config_t::fault` sets which fault the operator should react to.
- `mcpwm_brake_config_t::brake_mode` sets the brake mode that should be used for the fault. The supported brake modes are listed in the `mcpwm_operator_brake_mode_t`. For `MCPWM_OPER_BRAKE_MODE_CBC` mode, the operator recovers itself automatically as long as the fault disappears. You can specify the recovery time in `mcpwm_brake_config_t::cbc_recover_on_tez` and `mcpwm_brake_config_t::cbc_recover_on_tep`. For `MCPWM_OPER_BRAKE_MODE_OST` mode, the operator can not recover even though the fault disappears. You have to call `mcpwm_operator_recover_from_fault()` to manually recover it.

Set Generator Action on Brake Event One generator can set multiple actions on different brake events, by calling `mcpwm_generator_set_actions_on_brake_event()` with a variable number of action configurations. The action configuration is defined in `mcpwm_gen_brake_event_action_t`:

- `mcpwm_gen_brake_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_brake_event_action_t::brake_mode` specifies the brake mode. The supported brake modes are listed in the `mcpwm_operator_brake_mode_t`.
- `mcpwm_gen_brake_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

There is a helper macro `MCPWM_GEN_BRAKE_EVENT_ACTION` to simplify the construction of a brake event action entry.

Please note, the argument list of `mcpwm_generator_set_actions_on_brake_event()` **must** be terminated by `MCPWM_GEN_BRAKE_EVENT_ACTION_END`.

You can also set the brake action one by one by calling `mcpwm_generator_set_action_on_brake_event()` without varargs.

Register Fault Event Callbacks The MCPWM fault detector can inform you when it detects a valid fault or a fault signal disappears. If you have some function that should be called when such an event happens, you should hook your function to the interrupt service routine by calling `mcpwm_fault_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_fault_event_cb_t`. All supported event callbacks are listed in the `mcpwm_fault_event_callbacks_t`:

- `mcpwm_fault_event_callbacks_t::on_fault_enter` sets the callback function that will be called when a fault is detected.
- `mcpwm_fault_event_callbacks_t::on_fault_exit` sets the callback function that will be called when a fault is cleared.

The callback function is called within the ISR context, so it should **not** attempt to block. For example, you may make sure that only FreeRTOS APIs with the `ISR` suffix are called within the function.

The parameter `user_data` of `mcpwm_fault_register_event_callbacks()` function is used to save your own context. It is passed to the callback function directly.

This function will lazy the install interrupt service for the MCPWM fault, whereas the service can only be removed in `mcpwm_del_fault`.

Register Brake Event Callbacks The MCPWM operator can inform you when it is going to take a brake action. If you have some function that should be called when this event happens, you should hook your function to the interrupt service routine by calling `mcpwm_operator_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_brake_event_cb_t`. All supported event callbacks are listed in the `mcpwm_operator_event_callbacks_t`:

- `mcpwm_operator_event_callbacks_t::on_brake_cbc` sets the callback function that will be called when the operator is going to take a **CBC** action.
- `mcpwm_operator_event_callbacks_t::on_brake_ost` sets the callback function that will be called when the operator is going to take an **OST** action.

The callback function is called within the ISR context, so it should **not** attempt to block. For example, you may make sure that only FreeRTOS APIs with the `ISR` suffix are called within the function.

The parameter `user_data` of the `mcpwm_operator_register_event_callbacks()` function is used to save your own context. It will be passed to the callback function directly.

This function will lazy the install interrupt service for the MCPWM operator, whereas the service can only be removed in `mcpwm_del_operator`.

Generator Force Actions Software can override generator output level at runtime, by calling `mcpwm_generator_set_force_level()`. The software force level always has a higher priority than other event actions set in e.g., `mcpwm_generator_set_actions_on_timer_event()`.

- Set the `level` to -1 means to disable the force action, and the generator's output level will be controlled by the event actions again.
- Set the `hold_on` to true, and the force output level will keep alive until it is removed by assigning `level` to -1.
- Set the `hole_on` to false, the force output level will only be active for a short time, and any upcoming event can override it.

Synchronization When a sync signal is taken by the MCPWM timer, the timer will be forced into a pre-defined **phase**, where the phase is determined by count value and count direction. You can set the sync phase by calling `mcpwm_timer_set_phase_on_sync()`. The sync phase configuration is defined in `mcpwm_timer_sync_phase_config_t` structure:

- `mcpwm_timer_sync_phase_config_t::sync_src` sets the sync signal source. See *MCPWM Sync Sources* for how to create a sync source object. Specifically, if this is set to `NULL`, the driver will disable the sync feature for the MCPWM timer.
- `mcpwm_timer_sync_phase_config_t::count_value` sets the count value to load when the sync signal is taken.
- `mcpwm_timer_sync_phase_config_t::direction` sets the count direction when the sync signal is taken.

Note: When the MCPWM timer is working in `MCPWM_TIMER_COUNT_MODE_UP_DOWN` mode, special attention needs to be taken. In this mode, counter range `[0 -> peak-1]` belongs to the **increment** phase, and counter range `[peak -> 1]` belongs to the **decrement** phase. Thus if you set the `mcpwm_timer_sync_phase_config_t::count_value` to zero, you may also want to set the `mcpwm_timer_sync_phase_config_t::direction` to `MCPWM_TIMER_DIRECTION_UP`. Otherwise, the timer will be continue with the decrement phase, and the count value underflows to `peak`.

Likewise, the *MCPWM Capture Timer* can be synced as well. You can set the sync phase for the capture timer by calling `mcpwm_capture_timer_set_phase_on_sync()`. The sync phase configuration is defined in `mcpwm_capture_timer_sync_phase_config_t` structure:

- `mcpwm_capture_timer_sync_phase_config_t::sync_src` sets the sync signal source. See *MCPWM Sync Sources* for how to create a sync source object. Specifically, if this is set to `NULL`, the driver will disable the sync feature for the MCPWM capture timer.
- `mcpwm_capture_timer_sync_phase_config_t::count_value` sets the count value to load when the sync signal is taken.
- `mcpwm_capture_timer_sync_phase_config_t::direction` sets the count direction when the sync signal is taken. Note that, different from MCPWM Timer, the capture timer can only support one count direction: `MCPWM_TIMER_DIRECTION_UP`.

Fig. 18: GPIO Sync All MCPWM Timers

Sync Timers by GPIO

```

static void example_setup_sync_strategy(mcpwm_timer_handle_t timers[])
{
    mcpwm_sync_handle_t gpio_sync_source = NULL;
    mcpwm_gpio_sync_src_config_t gpio_sync_config = {
        .group_id = 0, // GPIO fault should be in the same group of
        ↳the above timers
        .gpio_num = EXAMPLE_SYNC_GPIO,
        .flags.pull_down = true,
        .flags.active_neg = false, // By default, a posedge pulse can trigger a
        ↳sync event
    };
    ESP_ERROR_CHECK(mcpwm_new_gpio_sync_src(&gpio_sync_config, &gpio_sync_source));

    mcpwm_timer_sync_phase_config_t sync_phase_config = {
        .count_value = 0, // sync phase: target count value
        .direction = MCPWM_TIMER_DIRECTION_UP, // sync phase: count direction
        .sync_src = gpio_sync_source, // sync source
    };
    for (int i = 0; i < 3; i++) {
        ESP_ERROR_CHECK(mcpwm_timer_set_phase_on_sync(timers[i], &sync_phase_
        ↳config));
    }
}
  
```

Capture The basic functionality of MCPWM capture is to record the time when any pulse edge of the capture signal turns active. Then you can get the pulse width and convert it into other physical quantities like distance or speed in the capture callback function. For example, in the BLDC (Brushless DC, see figure below) scenario, you can use the capture submodule to sense the rotor position from the Hall sensor.

The capture timer is usually connected to several capture channels. Please refer to [MCPWM Capture Timer and Channels](#) for more information about resource allocation.

Fig. 19: MCPWM BLDC with Hall Sensor

Register Capture Event Callbacks The MCPWM capture channel can inform you when there is a valid edge detected on the signal. You have to register a callback function to get the timer count value of the captured moment, by calling `mcpwm_capture_channel_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_capture_event_cb_t`. All supported capture callbacks are listed in the `mcpwm_capture_event_callbacks_t`:

- `mcpwm_capture_event_callbacks_t::on_cap` sets the callback function for the capture channel when a valid edge is detected.

The callback function provides event-specific data of type `mcpwm_capture_event_data_t`, so that you can get the edge of the capture signal in `mcpwm_capture_event_data_t::cap_edge` and the count value of that moment in `mcpwm_capture_event_data_t::cap_value`. To convert the capture count into a timestamp, you need to know the resolution of the capture timer by calling `mcpwm_capture_timer_get_resolution()`.

The callback function is called within the ISR context, so it should **not** attempt to block. For example, you may make sure that only FreeRTOS APIs with the `ISR` suffix are called within the function.

The parameter `user_data` of `mcpwm_capture_channel_register_event_callbacks()` function is used to save your context. It is passed to the callback function directly.

This function will lazy install interrupt service for the MCPWM capture channel, whereas the service can only be removed in `mcpwm_del_capture_channel`.

Enable and Disable Capture Channel The capture channel is not enabled after allocation by `mcpwm_new_capture_channel()`. You should call `mcpwm_capture_channel_enable()` and `mcpwm_capture_channel_disable()` accordingly to enable or disable the channel. If the interrupt service is lazy installed during registering event callbacks for the channel in `mcpwm_capture_channel_register_event_callbacks()`, `mcpwm_capture_channel_enable()` will enable the interrupt service as well.

Enable and Disable Capture Timer Before doing IO control to the capture timer, you need to enable the timer first, by calling `mcpwm_capture_timer_enable()`. Internally, this function:

- switches the capture timer state from **init** to **enable**.
- acquires a proper power management lock if a specific clock source (e.g., APB clock) is selected. See also [Power management](#) for more information.

On the contrary, calling `mcpwm_capture_timer_disable()` will put the timer driver back to **init** state, and release the power management lock.

Start and Stop Capture Timer The basic IO operation of a capture timer is to start and stop. Calling `mcpwm_capture_timer_start()` can start the timer and calling `mcpwm_capture_timer_stop()` can stop the timer immediately.

Trigger a Software Capture Event Sometimes, the software also wants to trigger a "fake" capture event. The `mcpwm_capture_channel_trigger_soft_catch()` is provided for that purpose. Please note that, even though it is a "fake" capture event, it can still cause an interrupt, thus your capture event callback function gets invoked as well.

ETM Event and Task MCPWM comparator is able to generate events that can interact with the [ETM](#) module. The supported events are listed in the `mcpwm_comparator_etm_event_type_t`. You can call `mcpwm_comparator_new_etm_event()` to get the corresponding ETM event handle.

For how to connect the event and task to an ETM channel, please refer to the [ETM](#) documentation.

Power Management When power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will adjust the PLL and APB frequency before going into Light-sleep, thus potentially changing the period of an MCPWM timers' counting step and leading to inaccurate time-keeping.

However, the driver can prevent the system from going into Light-sleep by acquiring a power management lock of type `ESP_PM_NO_LIGHT_SLEEP`. Whenever the driver creates an MCPWM timer instance that has selected PLL as its clock source, the driver guarantees that the power management lock is acquired when enabling the timer by `mcpwm_timer_enable()`. On the contrary, the driver releases the lock when `mcpwm_timer_disable()` is called for that timer.

Likewise, whenever the driver creates an MCPWM capture timer instance, the driver guarantees that the power management lock is acquired when enabling the timer by `mcpwm_capture_timer_enable()`. And releases the lock in `mcpwm_capture_timer_disable()`.

ESP32-C5 supports to retain the MCPWM register context before entering **Light-sleep** and restore them after woke up. Which means you don't have to re-init the MCPWM driver after the **Light-sleep**.

This feature can be enabled by setting the flag `mcpwm_timer_config_t::allow_pd` or `mcpwm_capture_timer_config_t::allow_pd`. It will allow the system to power down the MCPWM in Light-sleep, meanwhile save the MCPWM register context. It can help to save more power consumption with some extra cost of the memory.

IRAM Safe By default, the MCPWM interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the event callback functions will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option `CONFIG_MCPWM_ISR_IRAM_SAFE` that:

- enables the interrupt to be serviced even when the cache is disabled
- places all functions used by the ISR into IRAM²
- places the driver object into DRAM (in case it is mapped to PSRAM by accident)

This allows the interrupt to run while the cache is disabled but comes at the cost of increased IRAM consumption.

² The callback function and the sub-functions invoked by itself should also be placed in IRAM. You need to take care of this by yourself.

There is another Kconfig option `CONFIG_MCPWM_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So, these functions can also be executable when the cache is disabled. The IO control function is as follows:

- `mcpwm_comparator_set_compare_value()`
- `mcpwm_timer_set_period()`

Thread Safety The factory functions like `mcpwm_new_timer()` are guaranteed to be thread-safe by the driver, which means, you can call it from different RTOS tasks without protection by extra locks.

The following function is allowed to run under the ISR context, as the driver uses a critical section to prevent them from being called concurrently in the task and ISR.

- `mcpwm_comparator_set_compare_value()`
- `mcpwm_timer_set_period()`

Other functions that are not related to *Resource Allocation and Initialization*, are not thread-safe. Thus, you should avoid calling them in different tasks without mutex protection.

Kconfig Options

- `CONFIG_MCPWM_ISR_IRAM_SAFE` controls whether the default ISR handler can work when the cache is disabled, see *IRAM Safe* for more information.
- `CONFIG_MCPWM_CTRL_FUNC_IN_IRAM` controls where to place the MCPWM control functions (IRAM or flash), see *IRAM Safe* for more information.
- `CONFIG_MCPWM_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enabling this option will increase the firmware binary size.

Application Examples

- [peripherals/mcpwm/mcpwm_bdc_speed_control](#) demonstrates how to drive a brushed DC motor using two specific PWM signals, measure the motor speed with a photoelectric encoder, and maintain a stable motor speed using a simple PID algorithm.
- [peripherals/mcpwm/mcpwm_bldc_hall_control](#) demonstrates how to use the MCPWM peripheral to control a BLDC motor using a six-step commutation scheme, with the motor's spin direction and speed being adjusted based on the readings from a Hall sensor.
- [peripherals/mcpwm/mcpwm_capture_hc_sr04](#) demonstrates how to use the MCPWM peripheral's capture module to decode the pulse width signals from an HC-SR04 sonar sensor, which can measure distance based on the width of the pulse.
- [peripherals/mcpwm/mcpwm_foc_svpwm_open_loop](#) demonstrates how to use the MCPWM peripheral to generate three pairs of PWM signals for Field-Oriented Control (FOC), which can be used to drive a BLDC or PMSM motor, or a three-phase power inverter, using an open-loop FOC algorithm.
- [peripherals/mcpwm/mcpwm_servo_control](#) demonstrates how to control a typical RC Servo by sending a PWM signal using the MCPWM driver, with the servo rotating from -60° to 60° and then turning back again.
- [peripherals/mcpwm/mcpwm_sync](#) demonstrates how to generate three PWMs in perfect synchronization using MCPWM timers, with options to synchronize the timers via GPIO, Timer TEZ, or software.

API Reference

Header File

- `components/esp_driver_mcpwm/include/driver/mcpwm_timer.h`
- This header file can be included with:

```
#include "driver/mcpwm_timer.h"
```

- This header file is a part of the API provided by the `esp_driver_mcpwm` component. To declare that your component depends on `esp_driver_mcpwm`, add the following to your `CMakeLists.txt`:

REQUIRES esp_driver_mcpwm
```

or

```
PRIV_REQUIRES esp_driver_mcpwm
```

Functions

esp_err_t **mcpwm_new_timer** (const *mcpwm_timer_config_t* *config, *mcpwm_timer_handle_t* *ret_timer)

Create MCPWM timer.

Parameters

- **config** -- [in] MCPWM timer configuration
- **ret_timer** -- [out] Returned MCPWM timer handle

Returns

- ESP_OK: Create MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Create MCPWM timer failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM timer failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM timer failed because all hardware timers are used up and no more free one
- ESP_FAIL: Create MCPWM timer failed because of other error

esp_err_t **mcpwm_del_timer** (*mcpwm_timer_handle_t* timer)

Delete MCPWM timer.

Parameters **timer** -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

Returns

- ESP_OK: Delete MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM timer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete MCPWM timer failed because timer is not in init state
- ESP_FAIL: Delete MCPWM timer failed because of other error

esp_err_t **mcpwm_timer_set_period** (*mcpwm_timer_handle_t* timer, *uint32_t* period_ticks)

Set a new period for MCPWM timer.

Note: If `mcpwm_timer_config_t::update_period_on_empty` and `mcpwm_timer_config_t::update_period_on_sync` are not set, the new period will take effect immediately. Otherwise, the new period will take effect when timer counts to zero or on sync event.

Note: You may need to use `mcpwm_comparator_set_compare_value` to set a new compare value for MCPWM comparator in order to keep the same PWM duty cycle.

Parameters

- **timer** -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer`
- **period_ticks** -- [in] New period in count ticks

Returns

- ESP_OK: Set new period for MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Set new period for MCPWM timer failed because of invalid argument
- ESP_FAIL: Set new period for MCPWM timer failed because of other error

esp_err_t **mcpwm_timer_enable** (*mcpwm_timer_handle_t* timer)

Enable MCPWM timer.

Parameters **timer** -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

Returns

- ESP_OK: Enable MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Enable MCPWM timer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable MCPWM timer failed because timer is enabled already
- ESP_FAIL: Enable MCPWM timer failed because of other error

esp_err_t **mcpwm_timer_disable** (*mcpwm_timer_handle_t* timer)

Disable MCPWM timer.

Parameters **timer** -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

Returns

- ESP_OK: Disable MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Disable MCPWM timer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable MCPWM timer failed because timer is disabled already
- ESP_FAIL: Disable MCPWM timer failed because of other error

esp_err_t **mcpwm_timer_start_stop** (*mcpwm_timer_handle_t* timer, *mcpwm_timer_start_stop_cmd_t* command)

Send specific start/stop commands to MCPWM timer.

Parameters

- **timer** -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- **command** -- [in] Supported command list for MCPWM timer

Returns

- ESP_OK: Start or stop MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Start or stop MCPWM timer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Start or stop MCPWM timer failed because timer is not enabled
- ESP_FAIL: Start or stop MCPWM timer failed because of other error

esp_err_t **mcpwm_timer_register_event_callbacks** (*mcpwm_timer_handle_t* timer, const *mcpwm_timer_event_callbacks_t* *cbs, void *user_data)

Set event callbacks for MCPWM timer.

Note: The first call to this function needs to be before the call to `mcpwm_timer_enable`

Note: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

Parameters

- **timer** -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- **cbs** -- [in] Group of callback functions
- **user_data** -- [in] User data, which will be passed to callback functions directly

Returns

- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set event callbacks failed because timer is not in init state
- ESP_FAIL: Set event callbacks failed because of other error

esp_err_t **mcpwm_timer_set_phase_on_sync** (*mcpwm_timer_handle_t* timer, const *mcpwm_timer_sync_phase_config_t* *config)

Set sync phase for MCPWM timer.

Parameters

- **timer** -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- **config** -- [in] MCPWM timer sync phase configuration

Returns

- `ESP_OK`: Set sync phase for MCPWM timer successfully
- `ESP_ERR_INVALID_ARG`: Set sync phase for MCPWM timer failed because of invalid argument
- `ESP_FAIL`: Set sync phase for MCPWM timer failed because of other error

Structures

struct **mcpwm_timer_event_callbacks_t**

Group of supported MCPWM timer event callbacks.

Note: The callbacks are all running under ISR environment

Public Members

mcpwm_timer_event_cb_t **on_full**

callback function when MCPWM timer counts to peak value

mcpwm_timer_event_cb_t **on_empty**

callback function when MCPWM timer counts to zero

mcpwm_timer_event_cb_t **on_stop**

callback function when MCPWM timer stops

struct **mcpwm_timer_config_t**

MCPWM timer configuration.

Public Members

int **group_id**

Specify from which group to allocate the MCPWM timer

mcpwm_timer_clock_source_t **clk_src**

MCPWM timer clock source

uint32_t **resolution_hz**

Counter resolution in Hz The step size of each count tick equals to $(1 / \text{resolution_hz})$ seconds

mcpwm_timer_count_mode_t **count_mode**

Count mode

uint32_t **period_ticks**

Number of count ticks within a period

int **intr_priority**

MCPWM timer interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t **update_period_on_empty**

Whether to update period when timer counts to zero

uint32_t **update_period_on_sync**

Whether to update period on sync event

uint32_t **allow_pd**

Set to allow power down. When this flag set, the driver will backup/restore the MCPWM registers before/after entering/exist sleep mode. By this approach, the system can power off MCPWM's power domain. This can save power, but at the expense of more RAM being consumed.

struct *mcpwm_timer_config_t*::[anonymous] **flags**

Extra configuration flags for timer

struct **mcpwm_timer_sync_phase_config_t**

MCPWM Timer sync phase configuration.

Public Members

mcpwm_sync_handle_t **sync_src**

The sync event source. Set to NULL will disable the timer being synced by others

uint32_t **count_value**

The count value that should lock to upon sync event

mcpwm_timer_direction_t **direction**

The count direction that should lock to upon sync event

Header File

- [components/esp_driver_mcpwm/include/driver/mcpwm_oper.h](#)
- This header file can be included with:

```
#include "driver/mcpwm_oper.h"
```

- This header file is a part of the API provided by the `esp_driver_mcpwm` component. To declare that your component depends on `esp_driver_mcpwm`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_mcpwm
```

or

```
PRIV_REQUIRES esp_driver_mcpwm
```

Functions

esp_err_t **mcpwm_new_operator** (const *mcpwm_operator_config_t* *config, *mcpwm_oper_handle_t* *ret_oper)

Create MCPWM operator.

Parameters

- **config** -- [in] MCPWM operator configuration
- **ret_oper** -- [out] Returned MCPWM operator handle

Returns

- ESP_OK: Create MCPWM operator successfully

- `ESP_ERR_INVALID_ARG`: Create MCPWM operator failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create MCPWM operator failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create MCPWM operator failed because can't find free resource
- `ESP_FAIL`: Create MCPWM operator failed because of other error

esp_err_t `mcpwm_del_operator` (*mcpwm_oper_handle_t* oper)

Delete MCPWM operator.

Parameters `oper` -- [in] MCPWM operator, allocated by `mcpwm_new_operator()`

Returns

- `ESP_OK`: Delete MCPWM operator successfully
- `ESP_ERR_INVALID_ARG`: Delete MCPWM operator failed because of invalid argument
- `ESP_FAIL`: Delete MCPWM operator failed because of other error

esp_err_t `mcpwm_operator_connect_timer` (*mcpwm_oper_handle_t* oper, *mcpwm_timer_handle_t* timer)

Connect MCPWM operator and timer, so that the operator can be driven by the timer.

Parameters

- `oper` -- [in] MCPWM operator handle, allocated by `mcpwm_new_operator()`
- `timer` -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

Returns

- `ESP_OK`: Connect MCPWM operator and timer successfully
- `ESP_ERR_INVALID_ARG`: Connect MCPWM operator and timer failed because of invalid argument
- `ESP_FAIL`: Connect MCPWM operator and timer failed because of other error

esp_err_t `mcpwm_operator_set_brake_on_fault` (*mcpwm_oper_handle_t* oper, const *mcpwm_brake_config_t* *config)

Set brake method for MCPWM operator.

Parameters

- `oper` -- [in] MCPWM operator, allocated by `mcpwm_new_operator()`
- `config` -- [in] MCPWM brake configuration

Returns

- `ESP_OK`: Set trip for operator successfully
- `ESP_ERR_INVALID_ARG`: Set trip for operator failed because of invalid argument
- `ESP_FAIL`: Set trip for operator failed because of other error

esp_err_t `mcpwm_operator_recover_from_fault` (*mcpwm_oper_handle_t* oper, *mcpwm_fault_handle_t* fault)

Try to make the operator recover from fault.

Note: To recover from fault or escape from trip, you make sure the fault signal has disappeared already. Otherwise the recovery can't succeed.

Parameters

- `oper` -- [in] MCPWM operator, allocated by `mcpwm_new_operator()`
- `fault` -- [in] MCPWM fault handle

Returns

- `ESP_OK`: Recover from fault successfully
- `ESP_ERR_INVALID_ARG`: Recover from fault failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Recover from fault failed because the fault source is still active
- `ESP_FAIL`: Recover from fault failed because of other error

esp_err_t **mcpwm_operator_register_event_callbacks** (*mcpwm_oper_handle_t* oper, const *mcpwm_operator_event_callbacks_t* *cbs, void *user_data)

Set event callbacks for MCPWM operator.

Note: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

Parameters

- **oper** -- **[in]** MCPWM operator handle, allocated by `mcpwm_new_operator()`
- **cbs** -- **[in]** Group of callback functions
- **user_data** -- **[in]** User data, which will be passed to callback functions directly

Returns

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_FAIL`: Set event callbacks failed because of other error

esp_err_t **mcpwm_operator_apply_carrier** (*mcpwm_oper_handle_t* oper, const *mcpwm_carrier_config_t* *config)

Apply carrier feature for MCPWM operator.

Parameters

- **oper** -- **[in]** MCPWM operator, allocated by `mcpwm_new_operator()`
- **config** -- **[in]** MCPWM carrier specific configuration

Returns

- `ESP_OK`: Set carrier for operator successfully
- `ESP_ERR_INVALID_ARG`: Set carrier for operator failed because of invalid argument
- `ESP_FAIL`: Set carrier for operator failed because of other error

Structures

struct **mcpwm_operator_config_t**

MCPWM operator configuration.

Public Members

int **group_id**

Specify from which group to allocate the MCPWM operator

int **intr_priority**

MCPWM operator interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t **update_gen_action_on_tez**

Whether to update generator action when timer counts to zero

uint32_t **update_gen_action_on_tep**

Whether to update generator action when timer counts to peak

uint32_t **update_gen_action_on_sync**

Whether to update generator action on sync event

uint32_t **update_dead_time_on_tez**

Whether to update dead time when timer counts to zero

uint32_t **update_dead_time_on_tep**

Whether to update dead time when timer counts to peak

uint32_t **update_dead_time_on_sync**

Whether to update dead time on sync event

struct *mcpwm_operator_config_t*::[anonymous] **flags**

Extra configuration flags for operator

struct **mcpwm_brake_config_t**

MCPWM brake configuration structure.

Public Members

mcpwm_fault_handle_t **fault**

Which fault causes the operator to brake

mcpwm_operator_brake_mode_t **brake_mode**

Brake mode

uint32_t **cbc_recover_on_tez**

Recovery CBC brake state on tez event

uint32_t **cbc_recover_on_tep**

Recovery CBC brake state on tep event

struct *mcpwm_brake_config_t*::[anonymous] **flags**

Extra flags for brake configuration

struct **mcpwm_operator_event_callbacks_t**

Group of supported MCPWM operator event callbacks.

Note: The callbacks are all running under ISR environment

Public Members

mcpwm_brake_event_cb_t **on_brake_cbc**

callback function when mcpwm operator brakes in CBC

mcpwm_brake_event_cb_t **on_brake_ost**

callback function when mcpwm operator brakes in OST

struct **mcpwm_carrier_config_t**

MCPWM carrier configuration structure.

Public Members

mcpwm_carrier_clock_source_t **clk_src**

MCPWM carrier clock source

uint32_t **frequency_hz**

Carrier frequency in Hz

uint32_t **first_pulse_duration_us**

The duration of the first PWM pulse, in us

float **duty_cycle**

Carrier duty cycle

uint32_t **invert_before_modulate**

Invert the raw signal

uint32_t **invert_after_modulate**

Invert the modulated signal

struct *mcpwm_carrier_config_t*::[anonymous] **flags**

Extra flags for carrier configuration

Header File

- `components/esp_driver_mcpwm/include/driver/mcpwm_cmpr.h`
- This header file can be included with:

```
#include "driver/mcpwm_cmpr.h"
```

- This header file is a part of the API provided by the `esp_driver_mcpwm` component. To declare that your component depends on `esp_driver_mcpwm`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_mcpwm
```

or

```
PRIV_REQUIRES esp_driver_mcpwm
```

Functions

esp_err_t **mcpwm_new_comparator** (*mcpwm_oper_handle_t* oper, const *mcpwm_comparator_config_t* *config, *mcpwm_cmpr_handle_t* *ret_cmpr)

Create MCPWM comparator.

Parameters

- **oper** -- [in] MCPWM operator, allocated by `mcpwm_new_operator()`, the new comparator will be allocated from this operator
- **config** -- [in] MCPWM comparator configuration
- **ret_cmpr** -- [out] Returned MCPWM comparator

Returns

- `ESP_OK`: Create MCPWM comparator successfully
- `ESP_ERR_INVALID_ARG`: Create MCPWM comparator failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create MCPWM comparator failed because out of memory

- `ESP_ERR_NOT_FOUND`: Create MCPWM comparator failed because can't find free resource
- `ESP_FAIL`: Create MCPWM comparator failed because of other error

esp_err_t `mcpwm_del_comparator` (*mcpwm_cmpr_handle_t* cmpr)

Delete MCPWM comparator.

Parameters `cmpr` -- **[in]** MCPWM comparator handle, allocated by `mcpwm_new_comparator()`

Returns

- `ESP_OK`: Delete MCPWM comparator successfully
- `ESP_ERR_INVALID_ARG`: Delete MCPWM comparator failed because of invalid argument
- `ESP_FAIL`: Delete MCPWM comparator failed because of other error

esp_err_t `mcpwm_new_event_comparator` (*mcpwm_oper_handle_t* oper, const *mcpwm_event_comparator_config_t* *config, *mcpwm_cmpr_handle_t* *ret_cmpr)

Create MCPWM event comparator.

Parameters

- `oper` -- **[in]** MCPWM operator, allocated by `mcpwm_new_operator()`, the new event comparator will be allocated from this operator
- `config` -- **[in]** MCPWM comparator configuration
- `ret_cmpr` -- **[out]** Returned MCPWM event comparator

Returns

- `ESP_OK`: Create MCPWM event comparator successfully
- `ESP_ERR_INVALID_ARG`: Create MCPWM event comparator failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create MCPWM event comparator failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create MCPWM event comparator failed because can't find free resource
- `ESP_FAIL`: Create MCPWM event comparator failed because of other error

esp_err_t `mcpwm_comparator_register_event_callbacks` (*mcpwm_cmpr_handle_t* cmpr, const *mcpwm_comparator_event_callbacks_t* *cbs, void *user_data)

Set event callbacks for MCPWM comparator.

Note: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to `NULL`.

Parameters

- `cmpr` -- **[in]** MCPWM comparator handle, allocated by `mcpwm_new_comparator()`
- `cbs` -- **[in]** Group of callback functions
- `user_data` -- **[in]** User data, which will be passed to callback functions directly

Returns

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_FAIL`: Set event callbacks failed because of other error

esp_err_t `mcpwm_comparator_set_compare_value` (*mcpwm_cmpr_handle_t* cmpr, *uint32_t* cmp_ticks)

Set MCPWM comparator's compare value.

Parameters

- `cmpr` -- **[in]** MCPWM comparator handle, allocated by `mcpwm_new_comparator()`
- `cmp_ticks` -- **[in]** The new compare value

Returns

- ESP_OK: Set MCPWM compare value successfully
- ESP_ERR_INVALID_ARG: Set MCPWM compare value failed because of invalid argument (e.g. the `cmp_ticks` is out of range)
- ESP_ERR_INVALID_STATE: Set MCPWM compare value failed because the operator doesn't have a timer connected
- ESP_FAIL: Set MCPWM compare value failed because of other error

Structures

struct `mcpwm_comparator_config_t`

MCPWM comparator configuration.

Public Members

int `intr_priority`

MCPWM comparator interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t `update_cmp_on_tez`

Whether to update compare value when timer count equals to zero (tez)

uint32_t `update_cmp_on_tep`

Whether to update compare value when timer count equals to peak (tep)

uint32_t `update_cmp_on_sync`

Whether to update compare value on sync event

struct `mcpwm_comparator_config_t::[anonymous] flags`

Extra configuration flags for comparator

struct `mcpwm_event_comparator_config_t`

MCPWM event comparator configuration.

struct `mcpwm_comparator_event_callbacks_t`

Group of supported MCPWM compare event callbacks.

Note: The callbacks are all running under ISR environment

Public Members

`mcpwm_compare_event_cb_t on_reach`

ISR callback function which would be invoked when counter reaches compare value

Header File

- [components/esp_driver_mcpwm/include/driver/mcpwm_gen.h](#)
- This header file can be included with:

```
#include "driver/mcpwm_gen.h"
```

- This header file is a part of the API provided by the `esp_driver_mcpwm` component. To declare that your component depends on `esp_driver_mcpwm`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_mcpwm
```

or

```
PRIV_REQUIRES esp_driver_mcpwm
```

Functions

`esp_err_t mcpwm_new_generator` (*mcpwm_oper_handle_t* oper, const *mcpwm_generator_config_t* *config, *mcpwm_gen_handle_t* *ret_gen)

Allocate MCPWM generator from given operator.

Parameters

- **oper** -- [in] MCPWM operator, allocated by `mcpwm_new_operator()`
- **config** -- [in] MCPWM generator configuration
- **ret_gen** -- [out] Returned MCPWM generator

Returns

- `ESP_OK`: Create MCPWM generator successfully
- `ESP_ERR_INVALID_ARG`: Create MCPWM generator failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create MCPWM generator failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create MCPWM generator failed because can't find free resource
- `ESP_FAIL`: Create MCPWM generator failed because of other error

`esp_err_t mcpwm_del_generator` (*mcpwm_gen_handle_t* gen)

Delete MCPWM generator.

Parameters **gen** -- [in] MCPWM generator handle, allocated by `mcpwm_new_generator()`

Returns

- `ESP_OK`: Delete MCPWM generator successfully
- `ESP_ERR_INVALID_ARG`: Delete MCPWM generator failed because of invalid argument
- `ESP_FAIL`: Delete MCPWM generator failed because of other error

`esp_err_t mcpwm_generator_set_force_level` (*mcpwm_gen_handle_t* gen, int level, bool hold_on)

Set force level for MCPWM generator.

Note: The force level will be applied to the generator immediately, regardless any other events that would change the generator's behaviour.

Note: If the `hold_on` is true, the force level will retain forever, until user removes the force level by setting the force level to `-1`.

Note: If the `hold_on` is false, the force level can be overridden by the next event action.

Note: The force level set by this function can be inverted by GPIO matrix or dead-time module. So the level set here doesn't equal to the final output level.

Parameters

- **gen** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **level** -- **[in]** GPIO level to be applied to MCPWM generator, specially, -1 means to remove the force level
- **hold_on** -- **[in]** Whether the forced PWM level should retain (i.e. will remain unchanged until manually remove the force level)

Returns

- **ESP_OK**: Set force level for MCPWM generator successfully
- **ESP_ERR_INVALID_ARG**: Set force level for MCPWM generator failed because of invalid argument
- **ESP_FAIL**: Set force level for MCPWM generator failed because of other error

esp_err_t `mcpwm_generator_set_action_on_timer_event` (*mcpwm_gen_handle_t* gen, *mcpwm_gen_timer_event_action_t* ev_act)

Set generator action on MCPWM timer event.

Parameters

- **gen** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** -- **[in]** MCPWM timer event action, can be constructed by `MCPWM_GEN_TIMER_EVENT_ACTION` helper macro

Returns

- **ESP_OK**: Set generator action successfully
- **ESP_ERR_INVALID_ARG**: Set generator action failed because of invalid argument
- **ESP_ERR_INVALID_STATE**: Set generator action failed because of timer is not connected to operator
- **ESP_FAIL**: Set generator action failed because of other error

esp_err_t `mcpwm_generator_set_actions_on_timer_event` (*mcpwm_gen_handle_t* gen, *mcpwm_gen_timer_event_action_t* ev_act, ...)

Set generator actions on multiple MCPWM timer events.

Note: This is an aggregation version of `mcpwm_generator_set_action_on_timer_event`, which allows user to set multiple actions in one call.

Parameters

- **gen** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** -- **[in]** MCPWM timer event action list, must be terminated by `MCPWM_GEN_TIMER_EVENT_ACTION_END()`

Returns

- **ESP_OK**: Set generator actions successfully
- **ESP_ERR_INVALID_ARG**: Set generator actions failed because of invalid argument
- **ESP_ERR_INVALID_STATE**: Set generator actions failed because of timer is not connected to operator
- **ESP_FAIL**: Set generator actions failed because of other error

esp_err_t `mcpwm_generator_set_action_on_compare_event` (*mcpwm_gen_handle_t* generator, *mcpwm_gen_compare_event_action_t* ev_act)

Set generator action on MCPWM compare event.

Parameters

- **generator** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** -- **[in]** MCPWM compare event action, can be constructed by `MCPWM_GEN_COMPARE_EVENT_ACTION` helper macro

Returns

- ESP_OK: Set generator action successfully
- ESP_ERR_INVALID_ARG: Set generator action failed because of invalid argument
- ESP_FAIL: Set generator action failed because of other error

esp_err_t **mcpwm_generator_set_actions_on_compare_event** (*mcpwm_gen_handle_t* generator, *mcpwm_gen_compare_event_action_t* ev_act, ...)

Set generator actions on multiple MCPWM compare events.

Note: This is an aggregation version of `mcpwm_generator_set_action_on_compare_event`, which allows user to set multiple actions in one call.

Parameters

- **generator** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** -- **[in]** MCPWM compare event action list, must be terminated by `MCPWM_GEN_COMPARE_EVENT_ACTION_END()`

Returns

- ESP_OK: Set generator actions successfully
- ESP_ERR_INVALID_ARG: Set generator actions failed because of invalid argument
- ESP_FAIL: Set generator actions failed because of other error

esp_err_t **mcpwm_generator_set_action_on_brake_event** (*mcpwm_gen_handle_t* generator, *mcpwm_gen_brake_event_action_t* ev_act)

Set generator action on MCPWM brake event.

Parameters

- **generator** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** -- **[in]** MCPWM brake event action, can be constructed by `MCPWM_GEN_BRAKE_EVENT_ACTION` helper macro

Returns

- ESP_OK: Set generator action successfully
- ESP_ERR_INVALID_ARG: Set generator action failed because of invalid argument
- ESP_FAIL: Set generator action failed because of other error

esp_err_t **mcpwm_generator_set_actions_on_brake_event** (*mcpwm_gen_handle_t* generator, *mcpwm_gen_brake_event_action_t* ev_act, ...)

Set generator actions on multiple MCPWM brake events.

Note: This is an aggregation version of `mcpwm_generator_set_action_on_brake_event`, which allows user to set multiple actions in one call.

Parameters

- **generator** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** -- **[in]** MCPWM brake event action list, must be terminated by `MCPWM_GEN_BRAKE_EVENT_ACTION_END()`

Returns

- ESP_OK: Set generator actions successfully
- ESP_ERR_INVALID_ARG: Set generator actions failed because of invalid argument
- ESP_FAIL: Set generator actions failed because of other error

esp_err_t **mcpwm_generator_set_action_on_fault_event** (*mcpwm_gen_handle_t* generator, *mcpwm_gen_fault_event_action_t* ev_act)

Set generator action on MCPWM Fault event.

Parameters

- **generator** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** -- **[in]** MCPWM trigger event action, can be constructed by `MCPWM_GEN_FAULT_EVENT_ACTION` helper macro

Returns

- `ESP_OK`: Set generator action successfully
- `ESP_ERR_INVALID_ARG`: Set generator action failed because of invalid argument
- `ESP_FAIL`: Set generator action failed because of other error

esp_err_t **mcpwm_generator_set_action_on_sync_event** (*mcpwm_gen_handle_t* generator, *mcpwm_gen_sync_event_action_t* ev_act)

Set generator action on MCPWM Sync event.

Note: The trigger only support one sync action, regardless of the kinds. Should not call this function more than once.

Parameters

- **generator** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** -- **[in]** MCPWM trigger event action, can be constructed by `MCPWM_GEN_SYNC_EVENT_ACTION` helper macro

Returns

- `ESP_OK`: Set generator action successfully
- `ESP_ERR_INVALID_ARG`: Set generator action failed because of invalid argument
- `ESP_FAIL`: Set generator action failed because of other error

esp_err_t **mcpwm_generator_set_dead_time** (*mcpwm_gen_handle_t* in_generator, *mcpwm_gen_handle_t* out_generator, const *mcpwm_dead_time_config_t* *config)

Set dead time for MCPWM generator.

Note: Due to a hardware limitation, you can't set rising edge delay for both MCPWM generator 0 and 1 at the same time, otherwise, there will be a conflict inside the dead time module. The same goes for the falling edge setting. But you can set both the rising edge and falling edge delay for the same MCPWM generator.

Parameters

- **in_generator** -- **[in]** MCPWM generator, before adding the dead time
- **out_generator** -- **[in]** MCPWM generator, after adding the dead time
- **config** -- **[in]** MCPWM dead time configuration

Returns

- `ESP_OK`: Set dead time for MCPWM generator successfully
- `ESP_ERR_INVALID_ARG`: Set dead time for MCPWM generator failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set dead time for MCPWM generator failed because of invalid state (e.g. delay module is already in use by other generator)
- `ESP_FAIL`: Set dead time for MCPWM generator failed because of other error

Structures

struct **mcpwm_generator_config_t**

MCPWM generator configuration.

Public Members

int **gen_gpio_num**

The GPIO number used to output the PWM signal

uint32_t **invert_pwm**

Whether to invert the PWM signal (done by GPIO matrix)

uint32_t **io_loop_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32_t **io_od_mode**

Configure the GPIO as open-drain mode

uint32_t **pull_up**

Whether to pull up internally

uint32_t **pull_down**

Whether to pull down internally

struct *mcpwm_generator_config_t*::[anonymous] **flags**

Extra configuration flags for generator

struct **mcpwm_gen_timer_event_action_t**

Generator action on specific timer event.

Public Members

mcpwm_timer_direction_t **direction**

Timer direction

mcpwm_timer_event_t **event**

Timer event

mcpwm_generator_action_t **action**

Generator action should perform

struct **mcpwm_gen_compare_event_action_t**

Generator action on specific comparator event.

Public Members

mcpwm_timer_direction_t **direction**

Timer direction

mcpwm_cmpr_handle_t **comparator**

Comparator handle

mcpwm_generator_action_t **action**

Generator action should perform

struct **mcpwm_gen_brake_event_action_t**

Generator action on specific brake event.

Public Members

mcpwm_timer_direction_t **direction**

Timer direction

mcpwm_operator_brake_mode_t **brake_mode**

Brake mode

mcpwm_generator_action_t **action**

Generator action should perform

struct **mcpwm_gen_fault_event_action_t**

Generator action on specific fault event.

Public Members

mcpwm_timer_direction_t **direction**

Timer direction

mcpwm_fault_handle_t **fault**

Which fault as the trigger. Only support GPIO fault

mcpwm_generator_action_t **action**

Generator action should perform

struct **mcpwm_gen_sync_event_action_t**

Generator action on specific sync event.

Public Members

mcpwm_timer_direction_t **direction**

Timer direction

mcpwm_sync_handle_t **sync**

Which sync as the trigger

mcpwm_generator_action_t **action**

Generator action should perform

struct **mcpwm_dead_time_config_t**

MCPWM dead time configuration structure.

Public Members

uint32_t **posedge_delay_ticks**

delay time applied to rising edge, 0 means no rising delay time

uint32_t **negedge_delay_ticks**

delay time applied to falling edge, 0 means no falling delay time

uint32_t **invert_output**

Invert the signal after applied the dead time

struct *mcpwm_dead_time_config_t*::[anonymous] **flags**

Extra flags for dead time configuration

Macros

MCPWM_GEN_TIMER_EVENT_ACTION (dir, ev, act)

Help macros to construct a *mcpwm_gen_timer_event_action_t* entry.

MCPWM_GEN_TIMER_EVENT_ACTION_END ()

MCPWM_GEN_COMPARE_EVENT_ACTION (dir, cmp, act)

Help macros to construct a *mcpwm_gen_compare_event_action_t* entry.

MCPWM_GEN_COMPARE_EVENT_ACTION_END ()

MCPWM_GEN_BRAKE_EVENT_ACTION (dir, mode, act)

Help macros to construct a *mcpwm_gen_brake_event_action_t* entry.

MCPWM_GEN_BRAKE_EVENT_ACTION_END ()

MCPWM_GEN_FAULT_EVENT_ACTION (dir, flt, act)

Help macros to construct a *mcpwm_gen_fault_event_action_t* entry.

MCPWM_GEN_SYNC_EVENT_ACTION (dir, syn, act)

Help macros to construct a *mcpwm_gen_sync_event_action_t* entry.

or

PRIV_REQUIRES esp_driver_mcpwm

Functions

esp_err_t **mcpwm_new_gpio_fault** (const *mcpwm_gpio_fault_config_t* *config, *mcpwm_fault_handle_t* *ret_fault)

Create MCPWM GPIO fault.

Parameters

- **config** -- [in] MCPWM GPIO fault configuration
- **ret_fault** -- [out] Returned GPIO fault handle

Returns

- ESP_OK: Create MCPWM GPIO fault successfully
- ESP_ERR_INVALID_ARG: Create MCPWM GPIO fault failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM GPIO fault failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM GPIO fault failed because can't find free resource
- ESP_FAIL: Create MCPWM GPIO fault failed because of other error

esp_err_t **mcpwm_new_soft_fault** (const *mcpwm_soft_fault_config_t* *config, *mcpwm_fault_handle_t* *ret_fault)

Create MCPWM software fault.

Parameters

- **config** -- [in] MCPWM software fault configuration
- **ret_fault** -- [out] Returned software fault handle

Returns

- ESP_OK: Create MCPWM software fault successfully
- ESP_ERR_INVALID_ARG: Create MCPWM software fault failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM software fault failed because out of memory
- ESP_FAIL: Create MCPWM software fault failed because of other error

esp_err_t **mcpwm_del_fault** (*mcpwm_fault_handle_t* fault)

Delete MCPWM fault.

Parameters **fault** -- [in] MCPWM fault handle allocated by `mcpwm_new_gpio_fault()` or `mcpwm_new_soft_fault()`

Returns

- ESP_OK: Delete MCPWM fault successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM fault failed because of invalid argument
- ESP_FAIL: Delete MCPWM fault failed because of other error

esp_err_t **mcpwm_soft_fault_activate** (*mcpwm_fault_handle_t* fault)

Activate the software fault, trigger the fault event for once.

Parameters **fault** -- [in] MCPWM soft fault, allocated by `mcpwm_new_soft_fault()`

Returns

- ESP_OK: Trigger MCPWM software fault event successfully
- ESP_ERR_INVALID_ARG: Trigger MCPWM software fault event failed because of invalid argument
- ESP_FAIL: Trigger MCPWM software fault event failed because of other error

esp_err_t **mcpwm_fault_register_event_callbacks** (*mcpwm_fault_handle_t* fault, const *mcpwm_fault_event_callbacks_t* *cbs, void *user_data)

Set event callbacks for MCPWM fault.

Note: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

Parameters

- **fault** -- **[in]** MCPWM GPIO fault handle, allocated by `mcpwm_new_gpio_fault()`
- **cbs** -- **[in]** Group of callback functions
- **user_data** -- **[in]** User data, which will be passed to callback functions directly

Returns

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_FAIL`: Set event callbacks failed because of other error

Structures

struct **mcpwm_gpio_fault_config_t**

MCPWM GPIO fault configuration structure.

Public Members

int **group_id**

In which MCPWM group that the GPIO fault belongs to

int **intr_priority**

MCPWM GPIO fault interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

int **gpio_num**

GPIO used by the fault signal

uint32_t **active_level**

On which level the fault signal is treated as active

uint32_t **io_loop_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32_t **pull_up**

Whether to pull up internally

uint32_t **pull_down**

Whether to pull down internally

struct *mcpwm_gpio_fault_config_t*::[anonymous] **flags**

Extra configuration flags for GPIO fault

struct **mcpwm_soft_fault_config_t**

MCPWM software fault configuration structure.

struct **mcpwm_fault_event_callbacks_t**

Group of supported MCPWM fault event callbacks.

Note: The callbacks are all running under ISR environment

Public Members

[*mcpwm_fault_event_cb_t on_fault_enter*](#)

ISR callback function that would be invoked when fault signal becomes active

[*mcpwm_fault_event_cb_t on_fault_exit*](#)

ISR callback function that would be invoked when fault signal becomes inactive

- This header file can be included with:

```
#include "driver/mcpwm_sync.h"
```

- This header file is a part of the API provided by the `esp_driver_mcpwm` component. To declare that your component depends on `esp_driver_mcpwm`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_mcpwm
```

or

```
PRIV_REQUIRES esp_driver_mcpwm
```

Functions

[*esp_err_t mcpwm_new_timer_sync_src*](#) (*mcpwm_timer_handle_t* timer, const *mcpwm_timer_sync_src_config_t* *config, *mcpwm_sync_handle_t* *ret_sync)

Create MCPWM timer sync source.

Parameters

- **timer** -- **[in]** MCPWM timer handle, allocated by `mcpwm_new_timer()`
- **config** -- **[in]** MCPWM timer sync source configuration
- **ret_sync** -- **[out]** Returned MCPWM sync handle

Returns

- `ESP_OK`: Create MCPWM timer sync source successfully
- `ESP_ERR_INVALID_ARG`: Create MCPWM timer sync source failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create MCPWM timer sync source failed because out of memory
- `ESP_ERR_INVALID_STATE`: Create MCPWM timer sync source failed because the timer has created a sync source before
- `ESP_FAIL`: Create MCPWM timer sync source failed because of other error

[*esp_err_t mcpwm_new_gpio_sync_src*](#) (const *mcpwm_gpio_sync_src_config_t* *config, *mcpwm_sync_handle_t* *ret_sync)

Create MCPWM GPIO sync source.

Parameters

- **config** -- **[in]** MCPWM GPIO sync source configuration
- **ret_sync** -- **[out]** Returned MCPWM GPIO sync handle

Returns

- **ESP_OK**: Create MCPWM GPIO sync source successfully
- **ESP_ERR_INVALID_ARG**: Create MCPWM GPIO sync source failed because of invalid argument
- **ESP_ERR_NO_MEM**: Create MCPWM GPIO sync source failed because out of memory
- **ESP_ERR_NOT_FOUND**: Create MCPWM GPIO sync source failed because can't find free resource
- **ESP_FAIL**: Create MCPWM GPIO sync source failed because of other error

esp_err_t **mcpwm_new_soft_sync_src** (const *mcpwm_soft_sync_config_t* *config, *mcpwm_sync_handle_t* *ret_sync)

Create MCPWM software sync source.

Parameters

- **config** -- **[in]** MCPWM software sync source configuration
- **ret_sync** -- **[out]** Returned software sync handle

Returns

- **ESP_OK**: Create MCPWM software sync successfully
- **ESP_ERR_INVALID_ARG**: Create MCPWM software sync failed because of invalid argument
- **ESP_ERR_NO_MEM**: Create MCPWM software sync failed because out of memory
- **ESP_FAIL**: Create MCPWM software sync failed because of other error

esp_err_t **mcpwm_del_sync_src** (*mcpwm_sync_handle_t* sync)

Delete MCPWM sync source.

Parameters **sync** -- **[in]** MCPWM sync handle, allocated by `mcpwm_new_timer_sync_src()` or `mcpwm_new_gpio_sync_src()` or `mcpwm_new_soft_sync_src()`

Returns

- **ESP_OK**: Delete MCPWM sync source successfully
- **ESP_ERR_INVALID_ARG**: Delete MCPWM sync source failed because of invalid argument
- **ESP_FAIL**: Delete MCPWM sync source failed because of other error

esp_err_t **mcpwm_soft_sync_activate** (*mcpwm_sync_handle_t* sync)

Activate the software sync, trigger the sync event for once.

Parameters **sync** -- **[in]** MCPWM soft sync handle, allocated by `mcpwm_new_soft_sync_src()`

Returns

- **ESP_OK**: Trigger MCPWM software sync event successfully
- **ESP_ERR_INVALID_ARG**: Trigger MCPWM software sync event failed because of invalid argument
- **ESP_FAIL**: Trigger MCPWM software sync event failed because of other error

Structures

struct **mcpwm_timer_sync_src_config_t**

MCPWM timer sync source configuration.

Public Members

mcpwm_timer_event_t **timer_event**

Timer event, upon which MCPWM timer will generate the sync signal

uint32_t **propagate_input_sync**

The input sync signal would be routed to its sync output

struct *mcpwm_timer_sync_src_config_t*::[anonymous] **flags**

Extra configuration flags for timer sync source

struct **mcpwm_gpio_sync_src_config_t**

MCPWM GPIO sync source configuration.

Public Members

int **group_id**

MCPWM group ID

int **gpio_num**

GPIO used by sync source

uint32_t **active_neg**

Whether the sync signal is active on negedge, by default, the sync signal's posedge is treated as active

uint32_t **io_loop_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32_t **pull_up**

Whether to pull up internally

uint32_t **pull_down**

Whether to pull down internally

struct *mcpwm_gpio_sync_src_config_t*::[anonymous] **flags**

Extra configuration flags for GPIO sync source

struct **mcpwm_soft_sync_config_t**

MCPWM software sync configuration structure.

Header File

- [components/esp_driver_mcpwm/include/driver/mcpwm_cap.h](#)
- This header file can be included with:

```
#include "driver/mcpwm_cap.h"
```

- This header file is a part of the API provided by the `esp_driver_mcpwm` component. To declare that your component depends on `esp_driver_mcpwm`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_mcpwm
```

or

```
PRIV_REQUIRES esp_driver_mcpwm
```

Functions

esp_err_t **mcpwm_new_capture_timer** (const *mcpwm_capture_timer_config_t* *config,
mcpwm_cap_timer_handle_t *ret_cap_timer)

Create MCPWM capture timer.

Parameters

- **config** -- [in] MCPWM capture timer configuration
- **ret_cap_timer** -- [out] Returned MCPWM capture timer handle

Returns

- ESP_OK: Create MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Create MCPWM capture timer failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM capture timer failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM capture timer failed because can't find free resource
- ESP_FAIL: Create MCPWM capture timer failed because of other error

esp_err_t **mcpwm_del_capture_timer** (*mcpwm_cap_timer_handle_t* cap_timer)

Delete MCPWM capture timer.

Parameters **cap_timer** -- [in] MCPWM capture timer, allocated by *mcpwm_new_capture_timer()*

Returns

- ESP_OK: Delete MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM capture timer failed because of invalid argument
- ESP_FAIL: Delete MCPWM capture timer failed because of other error

esp_err_t **mcpwm_capture_timer_enable** (*mcpwm_cap_timer_handle_t* cap_timer)

Enable MCPWM capture timer.

Parameters **cap_timer** -- [in] MCPWM capture timer handle, allocated by *mcpwm_new_capture_timer()*

Returns

- ESP_OK: Enable MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Enable MCPWM capture timer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable MCPWM capture timer failed because timer is enabled already
- ESP_FAIL: Enable MCPWM capture timer failed because of other error

esp_err_t **mcpwm_capture_timer_disable** (*mcpwm_cap_timer_handle_t* cap_timer)

Disable MCPWM capture timer.

Parameters **cap_timer** -- [in] MCPWM capture timer handle, allocated by *mcpwm_new_capture_timer()*

Returns

- ESP_OK: Disable MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Disable MCPWM capture timer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable MCPWM capture timer failed because timer is disabled already
- ESP_FAIL: Disable MCPWM capture timer failed because of other error

esp_err_t **mcpwm_capture_timer_start** (*mcpwm_cap_timer_handle_t* cap_timer)

Start MCPWM capture timer.

Parameters **cap_timer** -- [in] MCPWM capture timer, allocated by *mcpwm_new_capture_timer()*

Returns

- ESP_OK: Start MCPWM capture timer successfully

- `ESP_ERR_INVALID_ARG`: Start MCPWM capture timer failed because of invalid argument
- `ESP_FAIL`: Start MCPWM capture timer failed because of other error

esp_err_t `mcpwm_capture_timer_stop` (*mcpwm_cap_timer_handle_t* cap_timer)

Stop MCPWM capture timer.

Parameters `cap_timer` -- **[in]** MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`

Returns

- `ESP_OK`: Stop MCPWM capture timer successfully
- `ESP_ERR_INVALID_ARG`: Stop MCPWM capture timer failed because of invalid argument
- `ESP_FAIL`: Stop MCPWM capture timer failed because of other error

esp_err_t `mcpwm_capture_timer_get_resolution` (*mcpwm_cap_timer_handle_t* cap_timer, `uint32_t` *out_resolution)

Get MCPWM capture timer resolution, in Hz.

Parameters

- `cap_timer` -- **[in]** MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`
- `out_resolution` -- **[out]** Returned capture timer resolution, in Hz

Returns

- `ESP_OK`: Get capture timer resolution successfully
- `ESP_ERR_INVALID_ARG`: Get capture timer resolution failed because of invalid argument
- `ESP_FAIL`: Get capture timer resolution failed because of other error

esp_err_t `mcpwm_capture_timer_set_phase_on_sync` (*mcpwm_cap_timer_handle_t* cap_timer, `const mcpwm_capture_timer_sync_phase_config_t` *config)

Set sync phase for MCPWM capture timer.

Parameters

- `cap_timer` -- **[in]** MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`
- `config` -- **[in]** MCPWM capture timer sync phase configuration

Returns

- `ESP_OK`: Set sync phase for MCPWM capture timer successfully
- `ESP_ERR_INVALID_ARG`: Set sync phase for MCPWM capture timer failed because of invalid argument
- `ESP_FAIL`: Set sync phase for MCPWM capture timer failed because of other error

esp_err_t `mcpwm_new_capture_channel` (*mcpwm_cap_timer_handle_t* cap_timer, `const mcpwm_capture_channel_config_t` *config, *mcpwm_cap_channel_handle_t* *ret_cap_channel)

Create MCPWM capture channel.

Note: The created capture channel won't be enabled until calling `mcpwm_capture_channel_enable`

Parameters

- `cap_timer` -- **[in]** MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`, will be connected to the new capture channel
- `config` -- **[in]** MCPWM capture channel configuration
- `ret_cap_channel` -- **[out]** Returned MCPWM capture channel

Returns

- `ESP_OK`: Create MCPWM capture channel successfully

- `ESP_ERR_INVALID_ARG`: Create MCPWM capture channel failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create MCPWM capture channel failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create MCPWM capture channel failed because can't find free resource
- `ESP_FAIL`: Create MCPWM capture channel failed because of other error

esp_err_t `mcpwm_del_capture_channel` (*mcpwm_cap_channel_handle_t* cap_channel)

Delete MCPWM capture channel.

Parameters `cap_channel` -- [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

Returns

- `ESP_OK`: Delete MCPWM capture channel successfully
- `ESP_ERR_INVALID_ARG`: Delete MCPWM capture channel failed because of invalid argument
- `ESP_FAIL`: Delete MCPWM capture channel failed because of other error

esp_err_t `mcpwm_capture_channel_enable` (*mcpwm_cap_channel_handle_t* cap_channel)

Enable MCPWM capture channel.

Note: This function will transit the channel state from init to enable.

Note: This function will enable the interrupt service, if it's lazy installed in `mcpwm_capture_channel_register_event_callbacks()`.

Parameters `cap_channel` -- [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

Returns

- `ESP_OK`: Enable MCPWM capture channel successfully
- `ESP_ERR_INVALID_ARG`: Enable MCPWM capture channel failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Enable MCPWM capture channel failed because the channel is already enabled
- `ESP_FAIL`: Enable MCPWM capture channel failed because of other error

esp_err_t `mcpwm_capture_channel_disable` (*mcpwm_cap_channel_handle_t* cap_channel)

Disable MCPWM capture channel.

Parameters `cap_channel` -- [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

Returns

- `ESP_OK`: Disable MCPWM capture channel successfully
- `ESP_ERR_INVALID_ARG`: Disable MCPWM capture channel failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable MCPWM capture channel failed because the channel is not enabled yet
- `ESP_FAIL`: Disable MCPWM capture channel failed because of other error

esp_err_t `mcpwm_capture_channel_register_event_callbacks` (*mcpwm_cap_channel_handle_t* cap_channel, const *mcpwm_capture_event_callbacks_t* *cbs, void *user_data)

Set event callbacks for MCPWM capture channel.

Note: The first call to this function needs to be before the call to `mcpwm_capture_channel_enable`

Note: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

Parameters

- **cap_channel** -- [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`
- **cbs** -- [in] Group of callback functions
- **user_data** -- [in] User data, which will be passed to callback functions directly

Returns

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set event callbacks failed because the channel is not in init state
- `ESP_FAIL`: Set event callbacks failed because of other error

`esp_err_t mcpwm_capture_channel_trigger_soft_catch(mcpwm_cap_channel_handle_t cap_channel)`

Trigger a catch by software.

Parameters **cap_channel** -- [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

Returns

- `ESP_OK`: Trigger software catch successfully
- `ESP_ERR_INVALID_ARG`: Trigger software catch failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Trigger software catch failed because the channel is not enabled yet
- `ESP_FAIL`: Trigger software catch failed because of other error

Structures

struct **mcpwm_capture_timer_config_t**

MCPWM capture timer configuration structure.

Public Members

int **group_id**

Specify from which group to allocate the capture timer

`mcpwm_capture_clock_source_t` **clk_src**

MCPWM capture timer clock source

uint32_t **resolution_hz**

Resolution of capture timer

uint32_t **allow_pd**

Set to allow power down. When this flag set, the driver will backup/restore the MCPWM registers before/after entering/exist sleep mode. By this approach, the system can power off MCPWM's power domain. This can save power, but at the expense of more RAM being consumed.

struct *mcpwm_capture_timer_config_t*::[anonymous] **flags**

Extra configuration flags for timer

struct **mcpwm_capture_timer_sync_phase_config_t**

MCPWM Capture timer sync phase configuration.

Public Members

mcpwm_sync_handle_t **sync_src**

The sync event source

uint32_t **count_value**

The count value that should lock to upon sync event

mcpwm_timer_direction_t **direction**

The count direction that should lock to upon sync event

struct **mcpwm_capture_channel_config_t**

MCPWM capture channel configuration structure.

Public Members

int **gpio_num**

GPIO used capturing input signal

int **intr_priority**

MCPWM capture interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t **prescale**

Prescale of input signal, effective frequency = cap_input_clk/prescale

struct *mcpwm_capture_channel_config_t*::*extra_capture_channel_flags* **flags**

Extra configuration flags for capture channel

struct **extra_capture_channel_flags**

Extra configuration flags for capture channel.

Public Members

uint32_t **pos_edge**

Whether to capture on positive edge

uint32_t **neg_edge**

Whether to capture on negative edge

uint32_t **pull_up**

Whether to pull up internally

uint32_t **pull_down**

Whether to pull down internally

uint32_t **invert_cap_signal**

Invert the input capture signal

uint32_t **io_loop_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32_t **keep_io_conf_at_exit**

Deprecated. Driver won't change the GPIO configuration in deinilization.

struct **mcpwm_capture_event_callbacks_t**

Group of supported MCPWM capture event callbacks.

Note: The callbacks are all running under ISR environment

Public Members

mcpwm_capture_event_cb_t **on_cap**

Callback function that would be invoked when capture event occurred

```

or

```
PRIV_REQUIRES esp_driver_mcpwm
```

Functions

esp_err_t **mcpwm_comparator_new_etm_event** (*mcpwm_cmpr_handle_t* cmpr, const *mcpwm_cmpr_etm_event_config_t* *config, *esp_etm_event_handle_t* *out_event)

Get the ETM event for MCPWM comparator.

Note: The created ETM event object can be deleted later by calling `esp_etm_del_event`

Parameters

- **cmpr** -- [in] MCPWM comparator, allocated by `mcpwm_new_comparator()` or `mcpwm_new_event_comparator()`
- **config** -- [in] MCPWM ETM comparator event configuration
- **out_event** -- [out] Returned ETM event handle

Returns

- **ESP_OK**: Get ETM event successfully
- **ESP_ERR_INVALID_ARG**: Get ETM event failed because of invalid argument
- **ESP_FAIL**: Get ETM event failed because of other error

Structures

struct **mcpwm_cmpr_etm_event_config_t**

MCPWM event comparator ETM event configuration.

Public Members

mcpwm_comparator_etm_event_type_t **event_type**

MCPWM comparator ETM event type

Header File

- `components/esp_driver_mcpwm/include/driver/mcpwm_types.h`
- This header file can be included with:

```
#include "driver/mcpwm_types.h"
```

```
REQUIRES esp_driver_mcpwm
```

or

```
PRIV_REQUIRES esp_driver_mcpwm
```

Structures

struct **mcpwm_timer_event_data_t**

MCPWM timer event data.

Public Members

uint32_t **count_value**

MCPWM timer count value

mcpwm_timer_direction_t **direction**

MCPWM timer count direction

struct **mcpwm_brake_event_data_t**

MCPWM brake event data.

struct **mcpwm_fault_event_data_t**

MCPWM fault event data.

struct **mcpwm_compare_event_data_t**

MCPWM compare event data.

Public Members

uint32_t **compare_ticks**

Compare value

mcpwm_timer_direction_t **direction**

Count direction

struct **mcpwm_capture_event_data_t**

MCPWM capture event data.

Public Members

uint32_t **cap_value**

Captured value

mcpwm_capture_edge_t **cap_edge**

Capture edge

Type Definitions

typedef struct mcpwm_timer_t ***mcpwm_timer_handle_t**

Type of MCPWM timer handle.

typedef struct mcpwm_oper_t ***mcpwm_oper_handle_t**

Type of MCPWM operator handle.

typedef struct mcpwm_cmpr_t ***mcpwm_cmpr_handle_t**

Type of MCPWM comparator handle.

typedef struct mcpwm_gen_t ***mcpwm_gen_handle_t**

Type of MCPWM generator handle.

typedef struct mcpwm_fault_t ***mcpwm_fault_handle_t**

Type of MCPWM fault handle.

typedef struct mcpwm_sync_t ***mcpwm_sync_handle_t**

Type of MCPWM sync handle.

typedef struct mcpwm_cap_timer_t ***mcpwm_cap_timer_handle_t**

Type of MCPWM capture timer handle.

typedef struct mcpwm_cap_channel_t ***mcpwm_cap_channel_handle_t**

Type of MCPWM capture channel handle.

```
typedef bool (*mcpwm_timer_event_cb_t)(mcpwm_timer_handle_t timer, const
mcpwm_timer_event_data_t *edata, void *user_ctx)
```

MCPWM timer event callback function.

Param timer [in] MCPWM timer handle

Param edata [in] MCPWM timer event data, fed by driver

Param user_ctx [in] User data, set in `mcpwm_timer_register_event_callbacks()`

Return Whether a high priority task has been waken up by this function

```
typedef bool (*mcpwm_brake_event_cb_t)(mcpwm_oper_handle_t oper, const mcpwm_brake_event_data_t
*edata, void *user_ctx)
```

MCPWM operator brake event callback function.

Param oper [in] MCPWM operator handle

Param edata [in] MCPWM brake event data, fed by driver

Param user_ctx [in] User data, set in `mcpwm_operator_register_event_callbacks()`

Return Whether a high priority task has been waken up by this function

```
typedef bool (*mcpwm_fault_event_cb_t)(mcpwm_fault_handle_t fault, const mcpwm_fault_event_data_t
*edata, void *user_ctx)
```

MCPWM fault event callback function.

Param fault MCPWM fault handle

Param edata MCPWM fault event data, fed by driver

Param user_ctx User data, set in `mcpwm_fault_register_event_callbacks()`

Return whether a task switch is needed after the callback returns

```
typedef bool (*mcpwm_compare_event_cb_t)(mcpwm_cmpr_handle_t comparator, const
mcpwm_compare_event_data_t *edata, void *user_ctx)
```

MCPWM comparator event callback function.

Param comparator MCPWM comparator handle

Param edata MCPWM comparator event data, fed by driver

Param user_ctx User data, set in `mcpwm_comparator_register_event_callbacks()`

Return Whether a high priority task has been waken up by this function

```
typedef bool (*mcpwm_capture_event_cb_t)(mcpwm_cap_channel_handle_t cap_channel, const
mcpwm_capture_event_data_t *edata, void *user_ctx)
```

MCPWM capture event callback function.

Param cap_channel MCPWM capture channel handle

Param edata MCPWM capture event data, fed by driver

Param user_ctx User data, set in `mcpwm_capture_channel_register_event_callbacks()`

Return Whether a high priority task has been waken up by this function

Header File

- [components/hal/include/hal/mcpwm_types.h](#)
- This header file can be included with:

```
#include "hal/mcpwm_types.h"
```

Type Definitions

```
typedef soc_periph_mcpwm_timer_clk_src_t mcpwm_timer_clock_source_t
```

MCPWM timer clock source.

typedef *soc_periph_mcpwm_capture_clk_src_t* **mcpwm_capture_clock_source_t**
MCPWM capture clock source.

typedef *soc_periph_mcpwm_carrier_clk_src_t* **mcpwm_carrier_clock_source_t**
MCPWM carrier clock source.

Enumerations

enum **mcpwm_timer_direction_t**
MCPWM timer count direction.

Values:

enumerator **MCPWM_TIMER_DIRECTION_UP**
Counting direction: Increase

enumerator **MCPWM_TIMER_DIRECTION_DOWN**
Counting direction: Decrease

enum **mcpwm_timer_event_t**
MCPWM timer events.

Values:

enumerator **MCPWM_TIMER_EVENT_EMPTY**
MCPWM timer counts to zero (i.e. counter is empty)

enumerator **MCPWM_TIMER_EVENT_FULL**
MCPWM timer counts to peak (i.e. counter is full)

enumerator **MCPWM_TIMER_EVENT_INVALID**
MCPWM timer invalid event

enum **mcpwm_timer_count_mode_t**
MCPWM timer count modes.

Values:

enumerator **MCPWM_TIMER_COUNT_MODE_PAUSE**
MCPWM timer paused

enumerator **MCPWM_TIMER_COUNT_MODE_UP**
MCPWM timer counting up

enumerator **MCPWM_TIMER_COUNT_MODE_DOWN**
MCPWM timer counting down

enumerator **MCPWM_TIMER_COUNT_MODE_UP_DOWN**
MCPWM timer counting up and down

enum **mcpwm_timer_start_stop_cmd_t**

MCPWM timer commands, specify the way to start or stop the timer.

Values:

enumerator **MCPWM_TIMER_STOP_EMPTY**

MCPWM timer stops when next count reaches zero

enumerator **MCPWM_TIMER_STOP_FULL**

MCPWM timer stops when next count reaches peak

enumerator **MCPWM_TIMER_START_NO_STOP**

MCPWM timer starts counting, and don't stop until received stop command

enumerator **MCPWM_TIMER_START_STOP_EMPTY**

MCPWM timer starts counting and stops when next count reaches zero

enumerator **MCPWM_TIMER_START_STOP_FULL**

MCPWM timer starts counting and stops when next count reaches peak

enum **mcpwm_generator_action_t**

MCPWM generator actions.

Values:

enumerator **MCPWM_GEN_ACTION_KEEP**

Generator action: Keep the same level

enumerator **MCPWM_GEN_ACTION_LOW**

Generator action: Force to low level

enumerator **MCPWM_GEN_ACTION_HIGH**

Generator action: Force to high level

enumerator **MCPWM_GEN_ACTION_TOGGLE**

Generator action: Toggle level

enum **mcpwm_operator_brake_mode_t**

MCPWM operator brake mode.

Values:

enumerator **MCPWM_OPER_BRAKE_MODE_CBC**

Brake mode: CBC (cycle by cycle)

enumerator **MCPWM_OPER_BRAKE_MODE_OST**

Brake mode: OST (one shot)

enumerator **MCPWM_OPER_BRAKE_MODE_INVALID**

MCPWM operator invalid brake mode

enum `mcpwm_capture_edge_t`

MCPWM capture edge.

Values:

enumerator `MCPWM_CAP_EDGE_POS`

Capture on the positive edge

enumerator `MCPWM_CAP_EDGE_NEG`

Capture on the negative edge

enum `mcpwm_comparator_etm_event_type_t`

MCPWM comparator specific events that supported by the ETM module.

Values:

enumerator `MCPWM_CMPR_ETM_EVENT_EQUAL`

The count value equals the value of comparator

enumerator `MCPWM_CMPR_ETM_EVENT_MAX`

Maximum number of comparator events

2.6.17 Parallel IO

Introduction

The Parallel IO peripheral is a general purpose parallel interface that can be used to connect to external devices such as LED matrix, LCD display, Printer and Camera. The peripheral has independent TX and RX units. Each unit can have up to 8 or 16 data signals plus 1 or 2 clock signals.¹

The TX and RX driver of Parallel IO peripheral are designed separately, you can include `driver/parlio_tx.h` or `driver/parlio_rx.h` to use any of them.

Application Examples

- [peripherals/parlio/parlio_rx/logic_analyzer](#) demonstrates how to implement a logic analyzer using the Parallel IO RX peripheral, which can sample data on multiple GPIOs in parallel at a high rate, and provides options to probe either internal or external signals and output the raw data via flash or TCP stream.
- [peripherals/parlio/parlio_tx/simple_rgb_led_matrix](#) demonstrates how to use the Parallel IO TX unit of ESP32-C5 to drive a RGB LED Matrix board with a HUB75 interface, using the LVGL library to display simple UI elements.

API Reference

Header File

- [components/esp_driver_parlio/include/driver/parlio_tx.h](#)

¹ Different ESP chip series might have different numbers of PARLIO TX/RX instances, and the maximum data bus can also be different. For more details, please refer to [ESP32-C5 Technical Reference Manual](#) > Chapter [Parallel IO \(PARLIO\)](#) [PDF]. The driver does not forbid you from applying for more driver objects, but it returns error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g., `parlio_new_tx_unit()`).

- This header file can be included with:

```
#include "driver/parlio_tx.h"
```

- This header file is a part of the API provided by the `esp_driver_parlio` component. To declare that your component depends on `esp_driver_parlio`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_parlio
```

or

```
PRIV_REQUIRES esp_driver_parlio
```

Functions

esp_err_t **parlio_new_tx_unit** (const *parlio_tx_unit_config_t* *config, *parlio_tx_unit_handle_t* *ret_unit)

Create a Parallel IO TX unit.

Parameters

- **config** -- [in] Parallel IO TX unit configuration
- **ret_unit** -- [out] Returned Parallel IO TX unit handle

Returns

- `ESP_OK`: Create Parallel IO TX unit successfully
- `ESP_ERR_INVALID_ARG`: Create Parallel IO TX unit failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create Parallel IO TX unit failed because of out of memory
- `ESP_ERR_NOT_FOUND`: Create Parallel IO TX unit failed because all TX units are used up and no more free one
- `ESP_ERR_NOT_SUPPORTED`: Create Parallel IO TX unit failed because some feature is not supported by hardware, e.g. clock gating
- `ESP_FAIL`: Create Parallel IO TX unit failed because of other error

esp_err_t **parlio_del_tx_unit** (*parlio_tx_unit_handle_t* unit)

Delete a Parallel IO TX unit.

Parameters **unit** -- [in] Parallel IO TX unit that created by `parlio_new_tx_unit`

Returns

- `ESP_OK`: Delete Parallel IO TX unit successfully
- `ESP_ERR_INVALID_ARG`: Delete Parallel IO TX unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Delete Parallel IO TX unit failed because it is still in working
- `ESP_FAIL`: Delete Parallel IO TX unit failed because of other error

esp_err_t **parlio_tx_unit_enable** (*parlio_tx_unit_handle_t* unit)

Enable the Parallel IO TX unit.

Note: This function will transit the driver state from init to enable

Note: This function will acquire a PM lock that might be installed during channel allocation

Note: If there're transaction pending in the queue, this function will pick up the first one and start the transfer

Parameters **unit** -- [in] Parallel IO TX unit that created by `parlio_new_tx_unit`

Returns

- `ESP_OK`: Enable Parallel IO TX unit successfully

- `ESP_ERR_INVALID_ARG`: Enable Parallel IO TX unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Enable Parallel IO TX unit failed because it is already enabled
- `ESP_FAIL`: Enable Parallel IO TX unit failed because of other error

esp_err_t **parlio_tx_unit_disable** (*parlio_tx_unit_handle_t* unit)

Disable the Parallel IO TX unit.

Note: This function will transit the driver state from enable to init

Note: This function will release the PM lock that might be installed during channel allocation

Note: If one transaction is undergoing, this function will terminate it immediately

Parameters **unit** -- **[in]** Parallel IO TX unit that created by `parlio_new_tx_unit`

Returns

- `ESP_OK`: Disable Parallel IO TX unit successfully
- `ESP_ERR_INVALID_ARG`: Disable Parallel IO TX unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable Parallel IO TX unit failed because it's not enabled yet
- `ESP_FAIL`: Disable Parallel IO TX unit failed because of other error

esp_err_t **parlio_tx_unit_register_event_callbacks** (*parlio_tx_unit_handle_t* tx_unit, const *parlio_tx_event_callbacks_t* *cbs, void *user_data)

Set event callbacks for Parallel IO TX unit.

Note: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to `NULL`.

Note: When `CONFIG_PARLIO_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

Parameters

- **tx_unit** -- **[in]** Parallel IO TX unit that created by `parlio_new_tx_unit`
- **cbs** -- **[in]** Group of callback functions
- **user_data** -- **[in]** User data, which will be passed to callback functions directly

Returns

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_FAIL`: Set event callbacks failed because of other error

esp_err_t **parlio_tx_unit_transmit** (*parlio_tx_unit_handle_t* tx_unit, const void *payload, size_t payload_bits, const *parlio_transmit_config_t* *config)

Transmit data on by Parallel IO TX unit.

Note: After the function returns, it doesn't mean the transaction is finished. This function only constructs a transaction structure and push into a queue.

Parameters

- **tx_unit** -- [in] Parallel IO TX unit that created by `parlio_new_tx_unit`
- **payload** -- [in] Pointer to the data to be transmitted
- **payload_bits** -- [in] Length of the data to be transmitted, in bits
- **config** -- [in] Transmit configuration

Returns

- `ESP_OK`: Transmit data successfully
- `ESP_ERR_INVALID_ARG`: Transmit data failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Transmit data failed because the Parallel IO TX unit is not enabled
- `ESP_FAIL`: Transmit data failed because of other error

`esp_err_t parlio_tx_unit_wait_all_done` (`parlio_tx_unit_handle_t` tx_unit, int timeout_ms)

Wait for all pending TX transactions done.

Parameters

- **tx_unit** -- [in] Parallel IO TX unit that created by `parlio_new_tx_unit`
- **timeout_ms** -- [in] Timeout in milliseconds, -1 means to wait forever

Returns

- `ESP_OK`: All pending TX transactions is finished and recycled
- `ESP_ERR_INVALID_ARG`: Wait for all pending TX transactions done failed because of invalid argument
- `ESP_ERR_TIMEOUT`: Wait for all pending TX transactions done timeout
- `ESP_FAIL`: Wait for all pending TX transactions done failed because of other error

Structures

struct `parlio_tx_unit_config_t`

Parallel IO TX unit configuration.

Public Members

`parlio_clock_source_t clk_src`

Parallel IO internal clock source

`gpio_num_t clk_in_gpio_num`

If the clock source is input from external, set the corresponding GPIO number. Otherwise, set to -1 and the driver will use the internal `clk_src` as clock source. This option has higher priority than `clk_src`

`uint32_t input_clk_src_freq_hz`

Frequency of the input clock source, valid only if `clk_in_gpio_num` is not -1

`uint32_t output_clk_freq_hz`

Frequency of the output clock. It's divided from either internal `clk_src` or external clock source

`size_t data_width`

Parallel IO data width, can set to 1/2/4/8/..., but can't bigger than `PAR-LIO_TX_UNIT_MAX_DATA_WIDTH`

`gpio_num_t data_gpio_nums[PARLIO_TX_UNIT_MAX_DATA_WIDTH]`

Parallel IO data GPIO numbers, if any GPIO is not used, you can set it to -1

`gpio_num_t clk_out_gpio_num`

GPIO number of the output clock signal, the clock is synced with TX data

`gpio_num_t valid_gpio_num`

GPIO number of the valid signal, which stays high when transferring data. Note that, the valid signal will always occupy the MSB data bit

`size_t trans_queue_depth`

Depth of internal transaction queue

`size_t max_transfer_size`

Maximum transfer size in one transaction, in bytes. This decides the number of DMA nodes will be used for each transaction

`size_t dma_burst_size`

DMA burst size, in bytes

`parlio_sample_edge_t sample_edge`

Parallel IO sample edge

`parlio_bit_pack_order_t bit_pack_order`

Set the order of packing the bits into bytes (only works when `data_width < 8`)

`uint32_t clk_gate_en`

Enable TX clock gating, the output clock will be controlled by the MSB bit of the data bus, i.e. by `data_gpio_nums[PARLIO_TX_UNIT_MAX_DATA_WIDTH-1]`. High level to enable the clock output, low to disable

`uint32_t io_loop_back`

For debug/test, the signal output from the GPIO will be fed to the input path as well

`uint32_t allow_pd`

Set to allow power down. When this flag set, the driver will backup/restore the PARLIO registers before/after entering/exist sleep mode. By this approach, the system can power off PARLIO's power domain. This can save power, but at the expense of more RAM being consumed.

struct `parlio_tx_unit_config_t`::[anonymous] **flags**

Extra configuration flags

struct `parlio_tx_done_event_data_t`

Type of Parallel IO TX done event data.

struct `parlio_tx_event_callbacks_t`

Group of Parallel IO TX callbacks.

Note: The callbacks are all running under ISR environment

Note: When CONFIG_PARLIO_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

Public Members

parlio_tx_done_callback_t on_trans_done

Event callback, invoked when one transmission is finished

struct **parlio_transmit_config_t**

Parallel IO transmit configuration.

Public Members

uint32_t **idle_value**

The value on the data line when the parallel IO is in idle state

uint32_t **queue_nonblocking**

If set, when the transaction queue is full, driver will not block the thread but return directly

struct *parlio_transmit_config_t*::[anonymous] **flags**

Transmit specific config flags

Type Definitions

typedef bool (**parlio_tx_done_callback_t**)(*parlio_tx_unit_handle_t* tx_unit, const *parlio_tx_done_event_data_t* *edata, void *user_ctx)

Prototype of parlio tx event callback.

Param tx_unit [in] Parallel IO TX unit that created by *parlio_new_tx_unit*

Param edata [in] Point to Parallel IO TX event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.

Param user_ctx [in] User registered context, passed from *parlio_tx_unit_register_event_callbacks*

Return Whether a high priority task has been waken up by this callback function

Header File

- `components/esp_driver_parlio/include/driver/parlio_rx.h`
- This header file can be included with:

```
#include "driver/parlio_rx.h"
```

- This header file is a part of the API provided by the `esp_driver_parlio` component. To declare that your component depends on `esp_driver_parlio`, add the following to your CMakeLists.txt:

```
REQUIRES esp_driver_parlio
```

or

```
PRIV_REQUIRES esp_driver_parlio
```

Functions

esp_err_t **parlio_new_rx_unit** (const *parlio_rx_unit_config_t* *config, *parlio_rx_unit_handle_t* *ret_unit)

Create a Parallel IO RX unit.

Parameters

- **config** -- **[in]** Parallel IO RX unit configuration
- **ret_unit** -- **[out]** Returned Parallel IO RX unit handle

Returns

- **ESP_ERR_INVALID_ARG** Invalid arguments in the parameter list or the rx unit configuration
- **ESP_ERR_NOT_FOUND** No available rx unit found
- **ESP_ERR_NO_MEM** No enough memory for the rx unit resources
- **ESP_OK** Success to allocate the rx unit

esp_err_t **parlio_del_rx_unit** (*parlio_rx_unit_handle_t* rx_unit)

Delete a Parallel IO RX unit.

Parameters **rx_unit** -- **[in]** Parallel IO RX unit handle that created by `parlio_new_rx_unit`

Returns

- **ESP_ERR_INVALID_ARG** rx_unit is NULL
- **ESP_ERR_INVALID_STATE** The rx unit is enabled, can't delete an enabled rx unit
- **ESP_OK** Success to delete the rx unit

esp_err_t **parlio_new_rx_level_delimiter** (const *parlio_rx_level_delimiter_config_t* *config, *parlio_rx_delimiter_handle_t* *ret_delimiter)

Create a level delimiter.

Note: This function only allocate the software resources, the hardware configurations will lazy installed while the transaction that using this delimiter start processing

Note: The enable signal must be aligned with the valid data.

Note: There're at most `SOC_PARLIO_RX_UNIT_MAX_DATA_WIDTH - 1` IO pins left for RXD

Parameters

- **config** -- **[in]** Level delimiter configuration
- **ret_delimiter** -- **[out]** Returned delimiter handle

Returns

- **ESP_ERR_INVALID_ARG** Invalid arguments in the parameter list or the level delimiter configuration
- **ESP_ERR_NO_MEM** No enough memory for the level delimiter resources
- **ESP_OK** Success to allocate the level delimiter

esp_err_t **parlio_new_rx_pulse_delimiter** (const *parlio_rx_pulse_delimiter_config_t* *config, *parlio_rx_delimiter_handle_t* *ret_delimiter)

Create a pulse delimiter.

Note: This function only allocate the software resources, the hardware configurations will lazy installed while the transaction that using this delimiter start processing

Note: There're at most `SOC_PARLIO_RX_UNIT_MAX_DATA_WIDTH - 1` IO pins left for RXD

Parameters

- **config** -- **[in]** Pulse delimiter configuration
- **ret_delimiter** -- **[out]** Returned delimiter handle

Returns

- ESP_ERR_INVALID_ARG Invalid arguments in the parameter list or the pulse delimiter configuration
- ESP_ERR_NO_MEM No enough memory for the pulse delimiter resources
- ESP_OK Success to allocate the pulse delimiter

esp_err_t **parlio_new_rx_soft_delimiter** (const *parlio_rx_soft_delimiter_config_t* *config, *parlio_rx_delimiter_handle_t* *ret_delimiter)

Create a pulse delimiter.

Note: This function only allocate the software resources, the hardware configurations will lazy installed while the transaction that using this delimiter start processing

Parameters

- **config** -- **[in]** Soft delimiter configuration
- **ret_delimiter** -- **[out]** Returned delimiter handle

Returns

- ESP_ERR_INVALID_ARG Invalid arguments in the parameter list or the soft delimiter configuration
- ESP_ERR_NO_MEM No enough memory for the soft delimiter resources
- ESP_OK Success to allocate the soft delimiter

esp_err_t **parlio_rx_soft_delimiter_start_stop** (*parlio_rx_unit_handle_t* rx_unit, *parlio_rx_delimiter_handle_t* delimiter, bool start_stop)

Start/stop the soft delimiter.

Note: Soft delimiter need to start or stop manually because it has no validating/enabling signal to indicate the data has started or stopped

Parameters

- **rx_unit** -- **[in]** Parallel IO RX unit handle that created by `parlio_new_rx_unit`
- **delimiter** -- **[in]** Delimiter handle
- **start_stop** -- **[in]** Set true to start, set false to stop

Returns

- ESP_ERR_INVALID_ARG Invalid arguments in the parameter list or not soft delimiter
- ESP_ERR_INVALID_STATE The rx unit not enabled
- ESP_OK Success to start or stop the soft delimiter

esp_err_t **parlio_del_rx_delimiter** (*parlio_rx_delimiter_handle_t* delimiter)

Delete the delimiter.

Note: To delete the delimiter safely, please delete it after disable all the RX units

Parameters **delimiter** -- **[in]** Delimiter handle**Returns**

- ESP_ERR_INVALID_ARG The input delimiter is NULL
- ESP_ERR_INVALID_STATE The delimiter is on receiving
- ESP_OK Success to delete the delimiter

esp_err_t **parlio_rx_unit_enable** (*parlio_rx_unit_handle_t* rx_unit, bool reset_queue)

Enable the Parallel IO RX unit.

Parameters

- **rx_unit** -- **[in]** Parallel IO RX unit handle that created by `parlio_new_rx_unit`
- **reset_queue** -- **[in]** Whether to reset the receiving queue. If set to false, the legacy receive transactions in the queue are still available, If set to true, the legacy receive transactions in the queue are dropped.

Returns

- `ESP_ERR_INVALID_ARG` The input rx_unit is NULL
- `ESP_ERR_INVALID_STATE` The rx unit has been enabled
- `ESP_OK` Success to enable the rx unit

esp_err_t **parlio_rx_unit_disable** (*parlio_rx_unit_handle_t* rx_unit)

Disable the Parallel IO RX unit.

Parameters **rx_unit** -- **[in]** Parallel IO RX unit handle that created by `parlio_new_rx_unit`

Returns

- `ESP_ERR_INVALID_ARG` The input rx_unit is NULL
- `ESP_ERR_INVALID_STATE` The rx unit has been disabled
- `ESP_OK` Success to disable the rx unit

esp_err_t **parlio_rx_unit_receive** (*parlio_rx_unit_handle_t* rx_unit, void *payload, size_t payload_size, const *parlio_receive_config_t* *recv_cfg)

Receive data by Parallel IO RX unit.

Note: This is a non-blocking and asynchronous function. To block or realize synchronous receive, please call `parlio_rx_unit_wait_all_done` after this function

Note: The receive transaction will start immediately when there is not other transaction on receiving, Otherwise it will be sent to the transaction queue to wait for the bus.

Parameters

- **rx_unit** -- **[in]** Parallel IO RX unit handle that created by `parlio_new_rx_unit`
- **payload** -- **[in]** The payload buffer pointer
- **payload_size** -- **[in]** The size of the payload buffer, in bytes.
- **recv_cfg** -- **[in]** The configuration of this receive transaction

Returns

- `ESP_ERR_INVALID_ARG` Invalid arguments in the parameter list or the receive configuration
- `ESP_ERR_NO_MEM` No memory for the internal DMA buffer (only when `parlio_receive_config_t::indirect_mount` enabled)
- `ESP_ERR_INVALID_STATE` Transaction queue is full, failed to queue the current transaction. Or the internal buffer is under using by an infinite transaction, can't allocate a new one
- `ESP_OK` Success to queue the current receiving transaction

esp_err_t **parlio_rx_unit_wait_all_done** (*parlio_rx_unit_handle_t* rx_unit, int timeout_ms)

Wait for all pending RX transactions done.

Note: This function will block until all receiving transactions done or timeout. When timeout occurs, either the timeout limitation too short for all transactions done, or the peripheral got stuck and no more interrupts trigger (e.g., external clock stopped).

Parameters

- **rx_unit** -- **[in]** Parallel IO RX unit handle that created by `parlio_new_rx_unit`
- **timeout_ms** -- **[in]** Timeout in milliseconds, -1 means to wait forever (software timeout)

Returns

- `ESP_ERR_INVALID_ARG` The input `rx_unit` is NULL
- `ESP_ERR_TIMEOUT` Wait for all transactions done timeout
- `ESP_OK` All transaction done

`esp_err_t parlio_rx_unit_register_event_callbacks` (`parlio_rx_unit_handle_t` rx_unit, const `parlio_rx_event_callbacks_t` *cbs, void *user_data)

Register event callbacks for Parallel IO RX unit.

Parameters

- **rx_unit** -- **[in]** Parallel IO RX unit handle that created by `parlio_new_rx_unit`
- **cbs** -- **[in]** Callback group, set callback to NULL to deregister the corresponding callback (callback group pointer shouldn't be NULL)
- **user_data** -- **[in]** User specified data that will be transported to the callbacks

Returns

- `ESP_ERR_INVALID_ARG` The input `rx_unit` is NULL
- `ESP_ERR_INVALID_STATE` The rx unit has been enabled, callback should be registered before enabling the unit
- `ESP_OK` Success to register the callbacks

Structures

struct `parlio_rx_unit_config_t`

Parallel IO RX unit configuration.

Public Members

size_t `trans_queue_depth`

Depth of internal transaction queue

size_t `max_recv_size`

Maximum receive size in one transaction, in bytes. This decides the number of DMA nodes will be used for each transaction

size_t `data_width`

Parallel IO data width, can set to 1/2/4/8/..., but can't be greater than `PARLIO_RX_UNIT_MAX_DATA_WIDTH`

`parlio_clock_source_t` `clk_src`

Parallel IO clock source

uint32_t `ext_clk_freq_hz`

The external source clock frequency. Only be valid when select `PARLIO_CLK_SRC_EXTERNAL` as clock source

uint32_t `exp_clk_freq_hz`

The expected sample/bit clock frequency, which is divided from the internal or external clock regarding the clock source

gpio_num_t clk_in_gpio_num

The the external clock input pin. Only be valid when select `PARLIO_CLK_SRC_EXTERNAL` as clock source. Set to -1 if not needed

gpio_num_t clk_out_gpio_num

The sample/bit clock output pin. Set to -1 if not needed

gpio_num_t valid_gpio_num

GPIO number of the valid signal. The signal on this pin is used to indicate whether the data on the data lines are valid. Only takes effect when using level or pulse delimiter, set to -1 if only use the soft delimiter

gpio_num_t data_gpio_nums[PARLIO_RX_UNIT_MAX_DATA_WIDTH]

Parallel IO data GPIO numbers, set to -1 if it's not used, The driver will take [0 .. (data_width - 1)] as the data pins

uint32_t free_clk

Whether the input external clock is a free-running clock. A free-running clock will always keep running (e.g. I2S bclk), a non-free-running clock will start when there are data transporting and stop when the bus idle (e.g. SPI). This flag only takes effect when select `PARLIO_CLK_SRC_EXTERNAL` as clock source

uint32_t clk_gate_en

Enable RX clock gating, only available when the clock direction is output(not supported on ESP32-C6) the output clock will be controlled by the valid gpio, i.e. high level of valid gpio to enable the clock output, low to disable

uint32_t io_loop_back

For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32_t io_no_init

Deprecated. Driver won't change the GPIO configuration in inilization.

uint32_t allow_pd

Set to allow power down. When this flag set, the driver will backup/restore the `PARLIO` registers before/after entering/exist sleep mode. By this approach, the system can power off `PARLIO`'s power domain. This can save power, but at the expense of more RAM being consumed.

struct *parlio_rx_unit_config_t*::[anonymous] flags

RX driver flags

struct *parlio_rx_level_delimiter_config_t*

Configuration of level delimiter.

Public Members**uint32_t valid_sig_line_id**

The data line id of valid/enable signal. The selected data line will be used as the valid/enable signal (i.e. level signal) in this delimiter. As the line of valid/enable signal is shared with the data line, this `line_id` will be conflict with the data line if set the id within 'data_width', therefore the range is (data_width, `PARLIO_RX_UNIT_MAX_DATA_WIDTH`].

parlio_sample_edge_t **sample_edge**

Parallel IO sample edge

parlio_bit_pack_order_t **bit_pack_order**

Set how we pack the bits into one bytes

uint32_t **eof_data_len**

Set the data length to trigger the End Of Frame (EOF, i.e. transaction done) interrupt, if the data length is set to 0, that mean the EOF will only triggers when the enable signal inactivated

uint32_t **timeout_ticks**

The number of source clock ticks to trigger timeout interrupt. Set 0 to disable the receive timeout interrupt
The timeout counter starts when the valid/enable signal is invalid/disabled.

uint32_t **active_low_en**

Set true to set the valid signal active when the level is low, otherwise, the valid signal becomes active when its level is high

struct *parlio_rx_level_delimiter_config_t*::[anonymous] **flags**

Extra flags

struct **parlio_rx_pulse_delimiter_config_t**

Configuration of pulse delimiter.

Public Members

uint32_t **valid_sig_line_id**

The data line id of valid/enable signal. The selected data line will be used as the valid/enable signal (i.e. pulse signal) in this delimiter. As the line of valid/enable signal is shared with the data line, this line_id will be conflict with the data line if set the id within 'data_width', therefore the range is (data_width, PARLIO_RX_UNIT_MAX_DATA_WIDTH].

parlio_sample_edge_t **sample_edge**

Parallel IO sample edge

parlio_bit_pack_order_t **bit_pack_order**

Set how we pack the bits into one bytes

uint32_t **eof_data_len**

Set the data length to trigger the End Of Frame (EOF, i.e. transaction done) interrupt, if the data length is set to 0, that mean the EOF will only triggers when the end pulse detected, please ensure there is an end pulse for a frame and `has_end_pulse` flag is set

uint32_t **timeout_ticks**

The number of source clock ticks to trigger timeout interrupt. Set 0 to disable the receive timeout interrupt
The timeout counter starts when the valid/enable signal is invalid/disabled.

uint32_t **start_bit_included**

Whether data bit is included in the start pulse

uint32_t **end_bit_included**

Whether data bit is included in the end pulse, only valid when `has_end_pulse` is true

uint32_t **has_end_pulse**

Whether there's an end pulse to terminate the transaction, if no, the transaction will be terminated by user configured transaction length

uint32_t **pulse_invert**

Whether to invert the pulse

struct *parlio_rx_pulse_delimiter_config_t*::[anonymous] **flags**

Extra flags

struct **parlio_rx_soft_delimiter_config_t**

Configuration of soft delimiter.

Public Members

parlio_sample_edge_t **sample_edge**

Parallel IO sample edge

parlio_bit_pack_order_t **bit_pack_order**

Set how we pack the bits into one bytes, set 1 to pack the bits into a byte from LSB, otherwise from MSB

uint32_t **eof_data_len**

Set the data length to trigger the End Of Frame (EOF, i.e. transaction done) interrupt, if the data length is set to 0, that mean the EOF will only triggers when the end pulse detected, please ensure there is an end pulse for a frame and *parlio_rx_pulse_delimiter_config_t::has_end_pulse* flag is set

uint32_t **timeout_ticks**

The number of APB clock ticks to trigger timeout interrupt. Set 0 to disable the receive timeout interrupt

struct **parlio_receive_config_t**

Configuration of a receive transaction.

Public Members

parlio_rx_delimiter_handle_t **delimiter**

The delimiter of this receiving transaction

uint32_t **partial_rx_en**

Whether this is an infinite transaction that supposed to receive continuously and partially

uint32_t **indirect_mount**

This flag only take effect when `partial_rx_en` is enabled. Enable this flag, an INTERNAL DMA buffer will be mounted to the DMA descriptor instead, The data will be copy to the payload in every interrupt. So that to guarantee the payload buffer is valid during the `on_receive_done` callback. Either

`partial_rx_en` or `indirect_mount` is disabled, the user given finite payload will be mounted to the DMA descriptor directly. By default, the user given receive payload will be mounted to the DMA descriptor directly.

struct *parlio_receive_config_t*::[anonymous] **flags**
Extra flags

struct **parlio_rx_event_data_t**
Event callback data.

Public Members

parlio_rx_delimiter_handle_t **delimiter**
The current delimiter of this receiving event

void ***data**
The data buffer address that just finished receiving

size_t **recv_bytes**
The number of received bytes in the data buffer

struct **parlio_rx_event_callbacks_t**
Parallel IO RX event callbacks.

Public Members

parlio_rx_callback_t **on_partial_receive**
Callback of received partial data

parlio_rx_callback_t **on_receive_done**
Callback of receiving transaction done

parlio_rx_callback_t **on_timeout**
Callback of hardware receiving timeout

Type Definitions

typedef bool (***parlio_rx_callback_t**)(*parlio_rx_unit_handle_t* rx_unit, const *parlio_rx_event_data_t* *edata, void *user_data)

The template of the Parallel IO RX callback function.

Param rx_unit [in] Parallel IO RX unit handle that given from ISR

Param edata [in] The event data that given from ISR

Param user_data [in] The user specified data that given while registering the callbacks

Return

- True: to awake high priority tasks
- False: not to awake high priority tasks

Header File

- [components/esp_driver_parlio/include/driver/parlio_types.h](#)
- This header file can be included with:

```
#include "driver/parlio_types.h"
```

- This header file is a part of the API provided by the `esp_driver_parlio` component. To declare that your component depends on `esp_driver_parlio`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_parlio
```

or

```
PRIV_REQUIRES esp_driver_parlio
```

Type Definitions

typedef struct parlio_tx_unit_t ***parlio_tx_unit_handle_t**

Type of Parallel IO TX unit handle.

typedef struct parlio_rx_unit_t ***parlio_rx_unit_handle_t**

Type of Parallel IO RX unit handle.

typedef struct parlio_rx_delimiter_t ***parlio_rx_delimiter_handle_t**

Type of Parallel IO RX frame delimiter handle.

Header File

- [components/hal/include/hal/parlio_types.h](#)
- This header file can be included with:

```
#include "hal/parlio_types.h"
```

Macros

PARLIO_TX_UNIT_MAX_DATA_WIDTH

Maximum data width of TX unit.

PARLIO_RX_UNIT_MAX_DATA_WIDTH

Maximum data width of RX unit.

Type Definitions

typedef *soc_periph_parlio_clk_src_t* **parlio_clock_source_t**

Parallel IO clock source.

Note: User should select the clock source based on the power and resolution requirement

Enumerations

enum **parlio_sample_edge_t**

Parallel IO sample edge.

Values:

enumerator **PARLIO_SAMPLE_EDGE_NEG**

Sample data on falling edge of clock

enumerator **PARLIO_SAMPLE_EDGE_POS**

Sample data on rising edge of clock

enum **parlio_bit_pack_order_t**

Parallel IO bit packing order.

Data in memory: Byte 0: MSB < B0.7 B0.6 B0.5 B0.4 B0.3 B0.2 B0.1 B0.0 > LSB Byte 1: MSB < B1.7 B1.6 B1.5 B1.4 B1.3 B1.2 B1.1 B1.0 > LSB

Output on line (PARLIO_BIT_PACK_ORDER_LSB): Cycle 0 Cycle 1 Cycle 2 → time GPIO 0: B0.0 B0.4 B1.0 GPIO 1: B0.1 B0.5 B1.1 GPIO 2: B0.2 B0.6 B1.2 GPIO 3: B0.3 B0.7 B1.3

Output on line (PARLIO_BIT_PACK_ORDER_MSB): Cycle 0 Cycle 1 Cycle 2 → time GPIO 0: B0.4 B0.0 B1.4 GPIO 1: B0.5 B0.1 B1.5 GPIO 2: B0.6 B0.2 B1.6 GPIO 3: B0.7 B0.3 B1.7

Values:

enumerator **PARLIO_BIT_PACK_ORDER_LSB**

Bit pack order: LSB

enumerator **PARLIO_BIT_PACK_ORDER_MSB**

Bit pack order: MSB

2.6.18 Pulse Counter (PCNT)

Introduction

The PCNT (Pulse Counter) module is designed to count the number of rising and/or falling edges of input signals. The ESP32-C5 contains multiple pulse counter units in the module.¹ Each unit is in effect an independent counter with multiple channels, where each channel can increment/decrement the counter on a rising/falling edge. Furthermore, each channel can be configured separately.

PCNT channels can react to signals of **edge** type and **level** type, however for simple applications, detecting the edge signal is usually sufficient. PCNT channels can be configured react to both pulse edges (i.e., rising and falling edge), and can be configured to increase, decrease or do nothing to the unit's counter on each edge. The level signal is the so-called **control signal**, which is used to control the counting mode of the edge signals that are attached to the same channel. By combining the usage of both edge and level signals, a PCNT unit can act as a **quadrature decoder**.

Besides that, PCNT unit is equipped with a separate glitch filter, which is helpful to remove noise from the signal.

Typically, a PCNT module can be used in scenarios like:

- Calculate periodic signal's frequency by counting the pulse numbers within a time slice
- Decode quadrature signals into speed and direction

Functional Overview

Description of the PCNT functionality is divided into the following sections:

- *Resource Allocation* - covers how to allocate PCNT units and channels with properly set of configurations. It also covers how to recycle the resources when they finished working.

¹ Different ESP chip series might have different number of PCNT units and channels. Please refer to the [TRM] for details. The driver does not forbid you from applying for more PCNT units and channels, but it returns error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g., `pcnt_new_unit()`).

- *Set Up Channel Actions* - covers how to configure the PCNT channel to behave on different signal edges and levels.
- *Watch Points* - describes how to configure PCNT watch points (i.e., tell PCNT unit to trigger an event when the count reaches a certain value).
- *Watch Step* - describes how to configure PCNT watch step (i.e., tell PCNT unit to trigger an event when the count increment reaches a certain value).
- *Register Event Callbacks* - describes how to hook your specific code to the watch point event callback function.
- *Set Glitch Filter* - describes how to enable and set the timing parameters for the internal glitch filter.
- *Use External Clear Signal* - describes how to set the parameters for the external clear signal.
- *Enable and Disable Unit* - describes how to enable and disable the PCNT unit.
- *Unit IO Control* - describes IO control functions of PCNT unit, like enable glitch filter, start and stop unit, get and clear count value.
- *Power Management* - describes what functionality will prevent the chip from going into low power mode.
- *IRAM Safe* - describes tips on how to make the PCNT interrupt and IO control functions work better along with a disabled cache.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

Resource Allocation The PCNT unit and channel are represented by `pcnt_unit_handle_t` and `pcnt_channel_handle_t` respectively. All available units and channels are maintained by the driver in a resource pool, so you do not need to know the exact underlying instance ID.

Install PCNT Unit To install a PCNT unit, there is a configuration structure that needs to be given in advance: `pcnt_unit_config_t`:

- `pcnt_unit_config_t::low_limit` and `pcnt_unit_config_t::high_limit` specify the range for the internal hardware counter. The counter will reset to zero automatically when it crosses either the high or low limit.
- `pcnt_unit_config_t::accum_count` sets whether to create an internal accumulator for the counter. This is helpful when you want to extend the counter's width, which by default is 16 bit at most, defined in the hardware. See also *Compensate Overflow Loss* for how to use this feature to compensate the overflow loss.
- `pcnt_unit_config_t::en_step_notify_up` Configure whether to enable watch step to count in the positive direction.
- `pcnt_unit_config_t::en_step_notify_down` Configure whether to enable watch step to count in the negative direction.
- `pcnt_unit_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.

Note: Since all PCNT units share the same interrupt source, when installing multiple PCNT units make sure that the interrupt priority `pcnt_unit_config_t::intr_priority` is the same for each unit.

Unit allocation and initialization is done by calling a function `pcnt_new_unit()` with `pcnt_unit_config_t` as an input parameter. The function will return a PCNT unit handle only when it runs correctly. Specifically, when there are no more free PCNT units in the pool (i.e., unit resources have been used up), then this function will return `ESP_ERR_NOT_FOUND` error. The total number of available PCNT units is recorded by `SOC_PCNT_UNITS_PER_GROUP` for reference.

If a previously created PCNT unit is no longer needed, it is recommended to recycle the resource by calling `pcnt_del_unit()`. Which in return allows the underlying unit hardware to be used for other purposes. Before deleting a PCNT unit, one should ensure the following prerequisites:

- The unit is in the init state, in other words, the unit is either disabled by `pcnt_unit_disable()` or not enabled yet.
- The attached PCNT channels are all removed by `pcnt_del_channel()`.

```
#define EXAMPLE_PCNT_HIGH_LIMIT 100
#define EXAMPLE_PCNT_LOW_LIMIT -100

pcnt_unit_config_t unit_config = {
    .high_limit = EXAMPLE_PCNT_HIGH_LIMIT,
    .low_limit = EXAMPLE_PCNT_LOW_LIMIT,
};
pcnt_unit_handle_t pcnt_unit = NULL;
ESP_ERROR_CHECK(pcnt_new_unit(&unit_config, &pcnt_unit));
```

Install PCNT Channel To install a PCNT channel, you must initialize a `pcnt_chan_config_t` structure in advance, and then call `pcnt_new_channel()`. The configuration fields of the `pcnt_chan_config_t` structure are described below:

- `pcnt_chan_config_t::edge_gpio_num` and `pcnt_chan_config_t::level_gpio_num` specify the GPIO numbers used by **edge** type signal and **level** type signal. Please note, either of them can be assigned to `-1` if it is not actually used, and thus it will become a **virtual IO**. For some simple pulse counting applications where one of the level/edge signals is fixed (i.e., never changes), you can reclaim a GPIO by setting the signal as a virtual IO on channel allocation. Setting the level/edge signal as a virtual IO causes that signal to be internally routed to a fixed High/Low logic level, thus allowing you to save a GPIO for other purposes.
- `pcnt_chan_config_t::virt_edge_io_level` and `pcnt_chan_config_t::virt_level_io_level` specify the virtual IO level for **edge** and **level** input signal, to ensure a deterministic state for such control signal. Please note, they are only valid when either `pcnt_chan_config_t::edge_gpio_num` or `pcnt_chan_config_t::level_gpio_num` is assigned to `-1`.
- `pcnt_chan_config_t::invert_edge_input` and `pcnt_chan_config_t::invert_level_input` are used to decide whether to invert the input signals before they going into PCNT hardware. The invert is done by GPIO matrix instead of PCNT hardware.

Channel allocating and initialization is done by calling a function `pcnt_new_channel()` with the above `pcnt_chan_config_t` as an input parameter plus a PCNT unit handle returned from `pcnt_new_unit()`. This function will return a PCNT channel handle if it runs correctly. Specifically, when there are no more free PCNT channel within the unit (i.e., channel resources have been used up), then this function will return `ESP_ERR_NOT_FOUND` error. The total number of available PCNT channels within the unit is recorded by `SOC_PCNT_CHANNELS_PER_UNIT` for reference. Note that, when install a PCNT channel for a specific unit, one should ensure the unit is in the init state, otherwise this function will return `ESP_ERR_INVALID_STATE` error.

If a previously created PCNT channel is no longer needed, it is recommended to recycle the resources by calling `pcnt_del_channel()`. Which in return allows the underlying channel hardware to be used for other purposes.

```
#define EXAMPLE_CHAN_GPIO_A 0
#define EXAMPLE_CHAN_GPIO_B 2

pcnt_chan_config_t chan_config = {
    .edge_gpio_num = EXAMPLE_CHAN_GPIO_A,
    .level_gpio_num = EXAMPLE_CHAN_GPIO_B,
};
pcnt_channel_handle_t pcnt_chan = NULL;
ESP_ERROR_CHECK(pcnt_new_channel(pcnt_unit, &chan_config, &pcnt_chan));
```

Set Up Channel Actions The PCNT will increase/decrease/hold its internal count value when the input pulse signal toggles. You can set different actions for edge signal and/or level signal.

- `pcnt_channel_set_edge_action()` function is to set specific actions for rising and falling edge of the signal attached to the `pcnt_chan_config_t::edge_gpio_num`. Supported actions are listed in `pcnt_channel_edge_action_t`.
- `pcnt_channel_set_level_action()` function is to set specific actions for high and low level of the signal attached to the `pcnt_chan_config_t::level_gpio_num`. Supported ac-

tions are listed in `pcnt_channel_level_action_t`. This function is not mandatory if the `pcnt_chan_config_t::level_gpio_num` is set to `-1` when allocating PCNT channel by `pcnt_new_channel()`.

```
// decrease the counter on rising edge, increase the counter on falling edge
ESP_ERROR_CHECK(pcnt_channel_set_edge_action(pcnt_chan, PCNT_CHANNEL_EDGE_ACTION_
↪DECREASE, PCNT_CHANNEL_EDGE_ACTION_INCREASE));
// keep the counting mode when the control signal is high level, and reverse the_
↪counting mode when the control signal is low level
ESP_ERROR_CHECK(pcnt_channel_set_level_action(pcnt_chan, PCNT_CHANNEL_LEVEL_ACTION_
↪KEEP, PCNT_CHANNEL_LEVEL_ACTION_INVERSE));
```

Watch Points Each PCNT unit can be configured to watch several different values that you are interested in. The value to be watched is also called **Watch Point**. The watch point itself can not exceed the range set in `pcnt_unit_config_t` by `pcnt_unit_config_t::low_limit` and `pcnt_unit_config_t::high_limit`. When the counter reaches either watch point, a watch event will be triggered and notify you by interrupt if any watch event callback has ever registered in `pcnt_unit_register_event_callbacks()`. See [Register Event Callbacks](#) for how to register event callbacks.

The watch point can be added and removed by `pcnt_unit_add_watch_point()` and `pcnt_unit_remove_watch_point()`. The commonly-used watch points are: **zero cross**, **maximum/minimum count** and other threshold values. The number of available watch point is limited, `pcnt_unit_add_watch_point()` will return error `ESP_ERR_NOT_FOUND` if it can not find any free hardware resource to save the watch point. You can not add the same watch point for multiple times, otherwise it will return error `ESP_ERR_INVALID_STATE`.

It is recommended to remove the unused watch point by `pcnt_unit_remove_watch_point()` to recycle the watch point resources.

```
// add zero across watch point
ESP_ERROR_CHECK(pcnt_unit_add_watch_point(pcnt_unit, 0));
// add high limit watch point
ESP_ERROR_CHECK(pcnt_unit_add_watch_point(pcnt_unit, EXAMPLE_PCNT_HIGH_LIMIT));
```

Watch Step PCNT unit can be configured to watch a specific value increment (can be positive or negative) that you are interested in. The function of watching value increment is also called **Watch Step**. To install watch step requires enabling `pcnt_unit_config_t::en_step_notify_up` or `pcnt_unit_config_t::en_step_notify_down`. The step interval itself can not exceed the range set in `pcnt_unit_config_t` by `pcnt_unit_config_t::low_limit` and `pcnt_unit_config_t::high_limit`. When the counter increment reaches step interval, a watch event will be triggered and notify you by interrupt if any watch event callback has ever registered in `pcnt_unit_register_event_callbacks()`. See [Register Event Callbacks](#) for how to register event callbacks.

The watch step can be added and removed by `pcnt_unit_add_watch_step()` and `pcnt_unit_remove_watch_step()`. You can not add multiple watch step, otherwise it will return error `ESP_ERR_INVALID_STATE`.

It is recommended to remove the unused watch step by `pcnt_unit_remove_watch_step()` to recycle the watch step resources.

Note: When a watch step and a watch point are triggered at the same time (i.e. at the same absolute point), the callback function only gets called by once.

The step increment will be reset to 0 when the count reaches the high/low limit value. Please do not rely too much on the exact step interval.

```
// add positive direction watch step with 100 step intervals
ESP_ERROR_CHECK(pcnt_unit_add_watch_step(pcnt_unit, 100));
```

Register Event Callbacks When PCNT unit reaches any enabled watch point, specific event will be generated and notify the CPU by interrupt. If you have some function that want to get executed when event happens, you should hook your function to the interrupt service routine by calling `pcnt_unit_register_event_callbacks()`. All supported event callbacks are listed in the `pcnt_event_callbacks_t`:

- `pcnt_event_callbacks_t::on_reach` sets a callback function for watch point event. As this function is called within the ISR context, you must ensure that the function does not attempt to block (e.g., by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The function prototype is declared in `pcnt_watch_cb_t`.

You can save their own context to `pcnt_unit_register_event_callbacks()` as well, via the parameter `user_ctx`. This user data will be directly passed to the callback functions.

In the callback function, the driver will fill in the event data of specific event. For example, the watch point event or watch step event data is declared as `pcnt_watch_event_data_t`:

- `pcnt_watch_event_data_t::watch_point_value` saves the count value when the event triggered.
- `pcnt_watch_event_data_t::zero_cross_mode` saves how the PCNT unit crosses the zero point in the latest time. The possible zero cross modes are listed in the `pcnt_unit_zero_cross_mode_t`. Usually different zero cross mode means different **counting direction** and **counting step size**.

Registering callback function results in lazy installation of interrupt service, thus this function should only be called before the unit is enabled by `pcnt_unit_enable()`. Otherwise, it can return `ESP_ERR_INVALID_STATE` error.

```
static bool example_pcnt_on_reach(pcnt_unit_handle_t unit, const pcnt_watch_event_
↳data_t *edata, void *user_ctx)
{
    BaseType_t high_task_wakeup;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // send watch point to queue, from this interrupt callback
    xQueueSendFromISR(queue, &(edata->watch_point_value), &high_task_wakeup);
    // return whether a high priority task has been waken up by this function
    return (high_task_wakeup == pdTRUE);
}

pcnt_event_callbacks_t cbs = {
    .on_reach = example_pcnt_on_reach,
};
QueueHandle_t queue = xQueueCreate(10, sizeof(int));
ESP_ERROR_CHECK(pcnt_unit_register_event_callbacks(pcnt_unit, &cbs, queue));
```

Set Glitch Filter The PCNT unit features filters to ignore possible short glitches in the signals. The parameters that can be configured for the glitch filter are listed in `pcnt_glitch_filter_config_t`:

- `pcnt_glitch_filter_config_t::max_glitch_ns` sets the maximum glitch width, in nano seconds. If a signal pulse's width is smaller than this value, then it will be treated as noise and will not increase/decrease the internal counter.

You can enable the glitch filter for PCNT unit by calling `pcnt_unit_set_glitch_filter()` with the filter configuration provided above. Particularly, you can disable the glitch filter later by calling `pcnt_unit_set_glitch_filter()` with a NULL filter configuration.

This function should be called when the unit is in the init state. Otherwise, it will return `ESP_ERR_INVALID_STATE` error.

Note: The glitch filter operates using the APB clock. To ensure the counter does not miss any pulses, the maximum glitch width should be longer than one APB_CLK cycle (typically 12.5 ns if APB is 80 MHz). Since the APB frequency can change with Dynamic Frequency Scaling (DFS), the filter may not function as expected in such cases. Therefore, the driver installs a power management lock for each PCNT unit. For more details on the power management strategy used in the PCNT driver, please refer to [Power Management](#).

```
pcnt_glitch_filter_config_t filter_config = {
    .max_glitch_ns = 1000,
};
ESP_ERROR_CHECK(pcnt_unit_set_glitch_filter(pcnt_unit, &filter_config));
```

Use External Clear Signal The PCNT unit can receive a clear signal from the GPIO. The parameters that can be configured for the clear signal are listed in [pcnt_clear_signal_config_t](#):

- [pcnt_clear_signal_config_t::clear_signal_gpio_num](#) specify the GPIO numbers used by **clear** signal. The default active level is high, and the input mode is pull-down enabled.
- [pcnt_clear_signal_config_t::invert_clear_signal](#) is used to decide whether to invert the input signal before it going into PCNT hardware. The invert is done by GPIO matrix instead of PCNT hardware. The input mode is pull-up enabled when the input signal is inverted.

This signal acts in the same way as calling [pcnt_unit_clear_count\(\)](#), but is not subject to software latency, and is suitable for use in situations with low latency requirements. Also please note, the flip frequency of this signal can not be too high.

```
pcnt_clear_signal_config_t clear_signal_config = {
    .clear_signal_gpio_num = PCNT_CLEAR_SIGNAL_GPIO,
};
ESP_ERROR_CHECK(pcnt_unit_set_clear_signal(pcnt_unit, &clear_signal_config));
```

Enable and Disable Unit Before doing IO control to the PCNT unit, you need to enable it first, by calling [pcnt_unit_enable\(\)](#). Internally, this function:

- switches the PCNT driver state from **init** to **enable**.
- enables the interrupt service if it has been lazy installed in [pcnt_unit_register_event_callbacks\(\)](#).
- acquires a proper power management lock if it has been installed. See also [Power Management](#) for more information.

On the contrary, calling [pcnt_unit_disable\(\)](#) will do the opposite, that is, put the PCNT driver back to the **init** state, disable the interrupts service and release the power management lock.

Unit IO Control

Start/Stop and Clear Calling [pcnt_unit_start\(\)](#) makes the PCNT unit start to work, increase or decrease counter according to pulse signals. On the contrary, calling [pcnt_unit_stop\(\)](#) will stop the PCNT unit but retain current count value. Instead, clearing counter can only be done by calling [pcnt_unit_clear_count\(\)](#).

Note, [pcnt_unit_start\(\)](#) and [pcnt_unit_stop\(\)](#) should be called when the unit has been enabled by [pcnt_unit_enable\(\)](#). Otherwise, it will return [ESP_ERR_INVALID_STATE](#) error.

Get Count Value You can read current count value at any time by calling [pcnt_unit_get_count\(\)](#). The returned count value is a **signed** integer, where the sign can be used to reflect the direction.

```
int pulse_count = 0;
ESP_ERROR_CHECK(pcnt_unit_get_count(pcnt_unit, &pulse_count));
```

Compensate Overflow Loss The internal hardware counter will be cleared to zero automatically when it reaches high or low limit. If you want to compensate for that count loss and extend the counter's bit-width, you can:

1. Enable `pcnt_unit_config_t::accum_count` when installing the PCNT unit.
2. Add the high/low limit as the *Watch Points* or add watch step as the *Watch Step*.
3. Now, the returned count value from the `pcnt_unit_get_count()` function not only reflects the hardware's count value, but also accumulates the high/low overflow loss to it.

Note: `pcnt_unit_clear_count()` resets the accumulated count value as well.

Power Management When power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system adjusts the APB frequency before entering light sleep, which can cause the PCNT glitch filter to misinterpret valid signals as noise.

To prevent this, the driver can acquire a power management lock of type `ESP_PM_APB_FREQ_MAX`, ensuring the APB frequency remains constant. This lock is acquired when the PCNT unit is enabled via `pcnt_unit_enable()` and released when the unit is disabled via `pcnt_unit_disable()`.

IRAM Safe By default, the PCNT interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option `CONFIG_PCNT_ISR_IRAM_SAFE` that:

1. Enables the interrupt being serviced even when cache is disabled
2. Places all functions that used by the ISR into IRAM²
3. Places driver object into DRAM (in case it is mapped to PSRAM by accident)

This allows the interrupt to run while the cache is disabled but comes at the cost of increased IRAM consumption.

There is another Kconfig option `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are as follows:

- `pcnt_unit_start()`
- `pcnt_unit_stop()`
- `pcnt_unit_clear_count()`
- `pcnt_unit_get_count()`

Thread Safety The factory functions `pcnt_new_unit()` and `pcnt_new_channel()` are guaranteed to be thread safe by the driver, which means, you can call them from different RTOS tasks without protection by extra locks.

The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

- `pcnt_unit_start()`
- `pcnt_unit_stop()`
- `pcnt_unit_clear_count()`
- `pcnt_unit_get_count()`

Other functions that take the `pcnt_unit_handle_t` and `pcnt_channel_handle_t` as the first positional parameter, are not treated as thread safe. This means you should avoid calling them from multiple tasks.

² `pcnt_event_callbacks_t::on_reach` callback and the functions invoked by itself should also be placed in IRAM, you need to take care of them by themselves.

Kconfig Options

- `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` controls where to place the PCNT control functions (IRAM or Flash), see *IRAM Safe* for more information.
- `CONFIG_PCNT_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see *IRAM Safe* for more information.
- `CONFIG_PCNT_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enabling this option increases the firmware binary size.

Application Examples

- [peripherals/pcnt/rotary_encoder](#) demonstrates how to use the PCNT peripheral to decode the differential signals generated from a common rotary encoder, EC11, and how to configure the rotary encoder to wake the system from light-sleep.

API Reference

Header File

- `components/esp_driver_pcnt/include/driver/pulse_cnt.h`
- This header file can be included with:

```
#include "driver/pulse_cnt.h"
```

- This header file is a part of the API provided by the `esp_driver_pcnt` component. To declare that your component depends on `esp_driver_pcnt`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_pcnt
```

or

```
PRIV_REQUIRES esp_driver_pcnt
```

Functions

`esp_err_t pcnt_new_unit` (const `pcnt_unit_config_t` *config, `pcnt_unit_handle_t` *ret_unit)

Create a new PCNT unit, and return the handle.

Note: The newly created PCNT unit is put in the init state.

Parameters

- **config** -- [in] PCNT unit configuration
- **ret_unit** -- [out] Returned PCNT unit handle

Returns

- `ESP_OK`: Create PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Create PCNT unit failed because of invalid argument (e.g. high/low limit value out of the range)
- `ESP_ERR_NO_MEM`: Create PCNT unit failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create PCNT unit failed because all PCNT units are used up and no more free one
- `ESP_FAIL`: Create PCNT unit failed because of other error

`esp_err_t pcnt_del_unit` (`pcnt_unit_handle_t` unit)

Delete the PCNT unit handle.

Note: A PCNT unit can't be in the enable state when this function is invoked. See also `pcnt_unit_disable()` for how to disable a unit.

Parameters **unit** -- [in] PCNT unit handle created by `pcnt_new_unit()`

Returns

- `ESP_OK`: Delete the PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Delete the PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Delete the PCNT unit failed because the unit is not in init state or some PCNT channel is still in working
- `ESP_FAIL`: Delete the PCNT unit failed because of other error

esp_err_t `pcnt_unit_set_glitch_filter` (*pcnt_unit_handle_t* unit, const *pcnt_glitch_filter_config_t* *config)

Set glitch filter for PCNT unit.

Note: The glitch filter module is clocked from APB, and APB frequency can be changed during DFS, which in return make the filter out of action. So this function will lazy-install a PM lock internally when the power management is enabled. With this lock, the APB frequency won't be changed. The PM lock can be uninstalled in `pcnt_del_unit()`.

Note: This function should be called when the PCNT unit is in the init state (i.e. before calling `pcnt_unit_enable()`)

Parameters

- **unit** -- [in] PCNT unit handle created by `pcnt_new_unit()`
- **config** -- [in] PCNT filter configuration, set config to NULL means disabling the filter function

Returns

- `ESP_OK`: Set glitch filter successfully
- `ESP_ERR_INVALID_ARG`: Set glitch filter failed because of invalid argument (e.g. glitch width is too big)
- `ESP_ERR_INVALID_STATE`: Set glitch filter failed because the unit is not in the init state
- `ESP_FAIL`: Set glitch filter failed because of other error

esp_err_t `pcnt_unit_set_clear_signal` (*pcnt_unit_handle_t* unit, const *pcnt_clear_signal_config_t* *config)

Set clear signal for PCNT unit.

Note: The function of clear signal is the same as `pcnt_unit_clear_count()`. High-level Active

Parameters

- **unit** -- [in] PCNT unit handle created by `pcnt_new_unit()`
- **config** -- [in] PCNT clear signal configuration, set config to NULL means disabling the clear signal

Returns

- `ESP_OK`: Set clear signal successfully
- `ESP_ERR_INVALID_ARG`: Set clear signal failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set clear signal failed because set clear signal repeatedly or disable clear signal before set it
- `ESP_FAIL`: Set clear signal failed because of other error

esp_err_t `pcnt_unit_enable` (*pcnt_unit_handle_t* unit)

Enable the PCNT unit.

Note: This function will transit the unit state from init to enable.

Note: This function will enable the interrupt service, if it's lazy installed in `pcnt_unit_register_event_callbacks()`.

Note: This function will acquire the PM lock if it's lazy installed in `pcnt_unit_set_glitch_filter()`.

Note: Enable a PCNT unit doesn't mean to start it. See also `pcnt_unit_start()` for how to start the PCNT counter.

Parameters `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`

Returns

- `ESP_OK`: Enable PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Enable PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Enable PCNT unit failed because the unit is already enabled
- `ESP_FAIL`: Enable PCNT unit failed because of other error

esp_err_t `pcnt_unit_disable` (*pcnt_unit_handle_t* unit)

Disable the PCNT unit.

Note: This function will do the opposite work to the `pcnt_unit_enable()`

Note: Disable a PCNT unit doesn't mean to stop it. See also `pcnt_unit_stop()` for how to stop the PCNT counter.

Parameters `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`

Returns

- `ESP_OK`: Disable PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Disable PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable PCNT unit failed because the unit is not enabled yet
- `ESP_FAIL`: Disable PCNT unit failed because of other error

esp_err_t `pcnt_unit_start` (*pcnt_unit_handle_t* unit)

Start the PCNT unit, the counter will start to count according to the edge and/or level input signals.

Note: This function should be called when the unit is in the enable state (i.e. after calling `pcnt_unit_enable()`)

Note: This function is allowed to run within ISR context

Note: This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` is on, so that it's allowed to be executed when Cache is disabled

Parameters `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`

Returns

- `ESP_OK`: Start PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Start PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Start PCNT unit failed because the unit is not enabled yet
- `ESP_FAIL`: Start PCNT unit failed because of other error

esp_err_t `pcnt_unit_stop` (*pcnt_unit_handle_t* unit)

Stop PCNT from counting.

Note: This function should be called when the unit is in the enable state (i.e. after calling `pcnt_unit_enable()`)

Note: The stop operation won't clear the counter. Also see `pcnt_unit_clear_count()` for how to clear pulse count value.

Note: This function is allowed to run within ISR context

Note: This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it is allowed to be executed when Cache is disabled

Parameters `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`

Returns

- `ESP_OK`: Stop PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Stop PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Stop PCNT unit failed because the unit is not enabled yet
- `ESP_FAIL`: Stop PCNT unit failed because of other error

esp_err_t `pcnt_unit_clear_count` (*pcnt_unit_handle_t* unit)

Clear PCNT pulse count value to zero.

Note: It's recommended to call this function after adding a watch point by `pcnt_unit_add_watch_point()`, so that the newly added watch point is effective immediately.

Note: This function is allowed to run within ISR context

Note: This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it's allowed to be executed when Cache is disabled

Parameters `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`

Returns

- `ESP_OK`: Clear PCNT pulse count successfully

- `ESP_ERR_INVALID_ARG`: Clear PCNT pulse count failed because of invalid argument
- `ESP_FAIL`: Clear PCNT pulse count failed because of other error

esp_err_t `pcnt_unit_get_count` (*pcnt_unit_handle_t* unit, int *value)

Get PCNT count value.

Note: This function is allowed to run within ISR context

Note: This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it's allowed to be executed when Cache is disabled

Parameters

- **unit** -- [in] PCNT unit handle created by `pcnt_new_unit()`
- **value** -- [out] Returned count value

Returns

- `ESP_OK`: Get PCNT pulse count successfully
- `ESP_ERR_INVALID_ARG`: Get PCNT pulse count failed because of invalid argument
- `ESP_FAIL`: Get PCNT pulse count failed because of other error

esp_err_t `pcnt_unit_register_event_callbacks` (*pcnt_unit_handle_t* unit, const *pcnt_event_callbacks_t* *cbs, void *user_data)

Set event callbacks for PCNT unit.

Note: User registered callbacks are expected to be runnable within ISR context

Note: The first call to this function needs to be before the call to `pcnt_unit_enable`

Note: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

Parameters

- **unit** -- [in] PCNT unit handle created by `pcnt_new_unit()`
- **cbs** -- [in] Group of callback functions
- **user_data** -- [in] User data, which will be passed to callback functions directly

Returns

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set event callbacks failed because the unit is not in init state
- `ESP_FAIL`: Set event callbacks failed because of other error

esp_err_t `pcnt_unit_add_watch_point` (*pcnt_unit_handle_t* unit, int watch_point)

Add a watch point for PCNT unit, PCNT will generate an event when the counter value reaches the watch point value.

Parameters

- **unit** -- [in] PCNT unit handle created by `pcnt_new_unit()`
- **watch_point** -- [in] Value to be watched

Returns

- `ESP_OK`: Add watch point successfully

- `ESP_ERR_INVALID_ARG`: Add watch point failed because of invalid argument (e.g. the value to be watched is out of the limitation set in `pcnt_unit_config_t`)
- `ESP_ERR_INVALID_STATE`: Add watch point failed because the same watch point has already been added
- `ESP_ERR_NOT_FOUND`: Add watch point failed because no more hardware watch point can be configured
- `ESP_FAIL`: Add watch point failed because of other error

`esp_err_t pcnt_unit_remove_watch_point` (`pcnt_unit_handle_t` unit, int watch_point)

Remove a watch point for PCNT unit.

Parameters

- **unit** -- [in] PCNT unit handle created by `pcnt_new_unit()`
- **watch_point** -- [in] Watch point value

Returns

- `ESP_OK`: Remove watch point successfully
- `ESP_ERR_INVALID_ARG`: Remove watch point failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Remove watch point failed because the watch point was not added by `pcnt_unit_add_watch_point()` yet
- `ESP_FAIL`: Remove watch point failed because of other error

`esp_err_t pcnt_unit_add_watch_step` (`pcnt_unit_handle_t` unit, int step_interval)

Add a step notify for PCNT unit, PCNT will generate an event when the incremental (can be positive or negative) of counter value reaches the step interval.

Parameters

- **unit** -- [in] PCNT unit handle created by `pcnt_new_unit()`
- **step_interval** -- [in] PCNT step notify interval value

Returns

- `ESP_OK`: Add step notify successfully
- `ESP_ERR_INVALID_ARG`: Add step notify failed because of invalid argument (e.g. the value incremental to be watched is out of the limitation set in `pcnt_unit_config_t`)
- `ESP_ERR_INVALID_STATE`: Add step notify failed because the step notify has already been added
- `ESP_FAIL`: Add step notify failed because of other error

`esp_err_t pcnt_unit_remove_watch_step` (`pcnt_unit_handle_t` unit)

Remove a step notify for PCNT unit.

Parameters **unit** -- [in] PCNT unit handle created by `pcnt_new_unit()`

Returns

- `ESP_OK`: Remove step notify successfully
- `ESP_ERR_INVALID_ARG`: Remove step notify failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Remove step notify failed because the step notify was not added by `pcnt_unit_add_watch_step()` yet
- `ESP_FAIL`: Remove step notify failed because of other error

`esp_err_t pcnt_new_channel` (`pcnt_unit_handle_t` unit, const `pcnt_chan_config_t` *config, `pcnt_channel_handle_t` *ret_chan)

Create PCNT channel for specific unit, each PCNT has several channels associated with it.

Note: This function should be called when the unit is in init state (i.e. before calling `pcnt_unit_enable()`)

Parameters

- **unit** -- [in] PCNT unit handle created by `pcnt_new_unit()`
- **config** -- [in] PCNT channel configuration
- **ret_chan** -- [out] Returned channel handle

Returns

- `ESP_OK`: Create PCNT channel successfully
- `ESP_ERR_INVALID_ARG`: Create PCNT channel failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create PCNT channel failed because of insufficient memory
- `ESP_ERR_NOT_FOUND`: Create PCNT channel failed because all PCNT channels are used up and no more free one
- `ESP_ERR_INVALID_STATE`: Create PCNT channel failed because the unit is not in the init state
- `ESP_FAIL`: Create PCNT channel failed because of other error

esp_err_t `pcnt_del_channel` (*pcnt_channel_handle_t* chan)

Delete the PCNT channel.

Parameters `chan` -- **[in]** PCNT channel handle created by `pcnt_new_channel()`

Returns

- `ESP_OK`: Delete the PCNT channel successfully
- `ESP_ERR_INVALID_ARG`: Delete the PCNT channel failed because of invalid argument
- `ESP_FAIL`: Delete the PCNT channel failed because of other error

esp_err_t `pcnt_channel_set_edge_action` (*pcnt_channel_handle_t* chan, *pcnt_channel_edge_action_t* pos_act, *pcnt_channel_edge_action_t* neg_act)

Set channel actions when edge signal changes (e.g. falling or rising edge occurred). The edge signal is input from the `edge_gpio_num` configured in `pcnt_chan_config_t`. We use these actions to control when and how to change the counter value.

Parameters

- `chan` -- **[in]** PCNT channel handle created by `pcnt_new_channel()`
- `pos_act` -- **[in]** Action on posedge signal
- `neg_act` -- **[in]** Action on negedge signal

Returns

- `ESP_OK`: Set edge action for PCNT channel successfully
- `ESP_ERR_INVALID_ARG`: Set edge action for PCNT channel failed because of invalid argument
- `ESP_FAIL`: Set edge action for PCNT channel failed because of other error

esp_err_t `pcnt_channel_set_level_action` (*pcnt_channel_handle_t* chan, *pcnt_channel_level_action_t* high_act, *pcnt_channel_level_action_t* low_act)

Set channel actions when level signal changes (e.g. signal level goes from high to low). The level signal is input from the `level_gpio_num` configured in `pcnt_chan_config_t`. We use these actions to control when and how to change the counting mode.

Parameters

- `chan` -- **[in]** PCNT channel handle created by `pcnt_new_channel()`
- `high_act` -- **[in]** Action on high level signal
- `low_act` -- **[in]** Action on low level signal

Returns

- `ESP_OK`: Set level action for PCNT channel successfully
- `ESP_ERR_INVALID_ARG`: Set level action for PCNT channel failed because of invalid argument
- `ESP_FAIL`: Set level action for PCNT channel failed because of other error

Structures

struct `pcnt_watch_event_data_t`

PCNT watch event data.

Public Members

int **watch_point_value**

Watch point value that triggered the event

pcnt_unit_zero_cross_mode_t **zero_cross_mode**

Zero cross mode

struct **pcnt_event_callbacks_t**

Group of supported PCNT callbacks.

Note: The callbacks are all running under ISR environment

Note: When CONFIG_PCNT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM.

Public Members

pcnt_watch_cb_t **on_reach**

Called when PCNT unit counter reaches any watch point or step notify

struct **pcnt_unit_config_t**

PCNT unit configuration.

Public Members

int **low_limit**

Low limitation of the count unit, should be lower than 0

int **high_limit**

High limitation of the count unit, should be higher than 0

int **intr_priority**

PCNT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t **accum_count**

Whether to accumulate the count value when overflows at the high/low limit

uint32_t **en_step_notify_up**

Enable step notify in the positive direction

uint32_t **en_step_notify_down**

Enable step notify in the negative direction

struct *pcnt_unit_config_t*::[anonymous] **flags**

Extra flags

struct **pcnt_chan_config_t**
PCNT channel configuration.

Public Members

int **edge_gpio_num**
GPIO number used by the edge signal, input mode with pull up enabled. Set to -1 if unused

int **level_gpio_num**
GPIO number used by the level signal, input mode with pull up enabled. Set to -1 if unused

uint32_t **invert_edge_input**
Invert the input edge signal

uint32_t **invert_level_input**
Invert the input level signal

uint32_t **virt_edge_io_level**
Virtual edge IO level, 0: low, 1: high. Only valid when edge_gpio_num is set to -1

uint32_t **virt_level_io_level**
Virtual level IO level, 0: low, 1: high. Only valid when level_gpio_num is set to -1

uint32_t **io_loop_back**
For debug/test, the signal output from the GPIO will be fed to the input path as well. Note that this flag is deprecated, will be removed in IDF v6.0. Instead, you can configure the output mode by calling `gpio_config()` first, and then do PCNT channel configuration. Necessary configurations for the IO to be used as the PCNT input will be appended.

struct *pcnt_chan_config_t*::[anonymous] **flags**
Channel config flags

struct **pcnt_glitch_filter_config_t**
PCNT glitch filter configuration.

Public Members

uint32_t **max_glitch_ns**
Pulse width smaller than this threshold will be treated as glitch and ignored, in the unit of ns

struct **pcnt_clear_signal_config_t**
PCNT clear signal configuration.

Public Members

int **clear_signal_gpio_num**
GPIO number used by the clear signal, the default active level is high, input mode with pull down enabled

uint32_t **invert_clear_signal**

Invert the clear input signal and set input mode with pull up

uint32_t **io_loop_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well. Note that this flag is deprecated, will be removed in IDF v6.0. Instead, you can configure the output mode by calling `gpio_config()` first, and then do PCNT channel configuration. Necessary configurations for the IO to be used as the PCNT input will be appended.

struct *pcnt_clear_signal_config_t*::[anonymous] **flags**

clear signal config flags

Type Definitions

typedef struct pcnt_unit_t ***pcnt_unit_handle_t**

Type of PCNT unit handle.

typedef struct pcnt_chan_t ***pcnt_channel_handle_t**

Type of PCNT channel handle.

typedef bool (***pcnt_watch_cb_t**)(*pcnt_unit_handle_t* unit, const *pcnt_watch_event_data_t* *edata, void *user_ctx)

PCNT watch event callback prototype.

Note: The callback function is invoked from an ISR context, so it should meet the restrictions of not calling any blocking APIs when implementing the callback. e.g. must use ISR version of FreeRTOS APIs.

Param unit [in] PCNT unit handle

Param edata [in] PCNT event data, fed by the driver

Param user_ctx [in] User data, passed from `pcnt_unit_register_event_callbacks()`

Return Whether a high priority task has been woken up by this function

Header File

- [components/hal/include/hal/pcnt_types.h](#)
- This header file can be included with:

```
#include "hal/pcnt_types.h"
```

Enumerations

enum **pcnt_channel_level_action_t**

PCNT channel action on control level.

Values:

enumerator **PCNT_CHANNEL_LEVEL_ACTION_KEEP**

Keep current count mode

enumerator **PCNT_CHANNEL_LEVEL_ACTION_INVERSE**

Invert current count mode (increase -> decrease, decrease -> increase)

enumerator **PCNT_CHANNEL_LEVEL_ACTION_HOLD**

Hold current count value

enum **pcnt_channel_edge_action_t**

PCNT channel action on signal edge.

Values:

enumerator **PCNT_CHANNEL_EDGE_ACTION_HOLD**

Hold current count value

enumerator **PCNT_CHANNEL_EDGE_ACTION_INCREASE**

Increase count value

enumerator **PCNT_CHANNEL_EDGE_ACTION_DECREASE**

Decrease count value

enum **pcnt_unit_zero_cross_mode_t**

PCNT unit zero cross mode.

Values:

enumerator **PCNT_UNIT_ZERO_CROSS_POS_ZERO**

start from positive value, end to zero, i.e. +N->0

enumerator **PCNT_UNIT_ZERO_CROSS_NEG_ZERO**

start from negative value, end to zero, i.e. -N->0

enumerator **PCNT_UNIT_ZERO_CROSS_NEG_POS**

start from negative value, end to positive value, i.e. -N->+M

enumerator **PCNT_UNIT_ZERO_CROSS_POS_NEG**

start from positive value, end to negative value, i.e. +N->-M

enumerator **PCNT_UNIT_ZERO_CROSS_INVALID**

invalid zero cross mode

2.6.19 Remote Control Transceiver (RMT)

Introduction

The RMT (Remote Control Transceiver) peripheral was designed to act as an infrared transceiver. However, due to the flexibility of its data format, RMT can be extended to a versatile and general-purpose transceiver, transmitting or receiving many other types of signals. From the perspective of network layering, the RMT hardware contains both physical and data link layers. The physical layer defines the communication media and bit signal representation. The data link layer defines the format of an RMT frame. The minimal data unit in the frame is called the **RMT symbol**, which is represented by `rmt_symbol_word_t` in the driver.

ESP32-C5 contains multiple channels in the RMT peripheral¹. Each channel can be independently configured as either transmitter or receiver.

Typically, the RMT peripheral can be used in the following scenarios:

- Transmit or receive infrared signals, with any IR protocols, e.g., NEC
- General-purpose sequence generator
- Transmit signals in a hardware-controlled loop, with a finite or infinite number of times
- Multi-channel simultaneous transmission
- Modulate the carrier to the output signal or demodulate the carrier from the input signal

Layout of RMT Symbols The RMT hardware defines data in its own pattern -- the **RMT symbol**. The diagram below illustrates the bit fields of an RMT symbol. Each symbol consists of two pairs of two values. The first value in the pair is a 15-bit value representing the signal's duration in units of RMT ticks. The second in the pair is a 1-bit value representing the signal's logic level, i.e., high or low.

Fig. 20: Structure of RMT symbols (L - signal level)

RMT Transmitter Overview The data path and control path of an RMT TX channel is illustrated in the figure below:

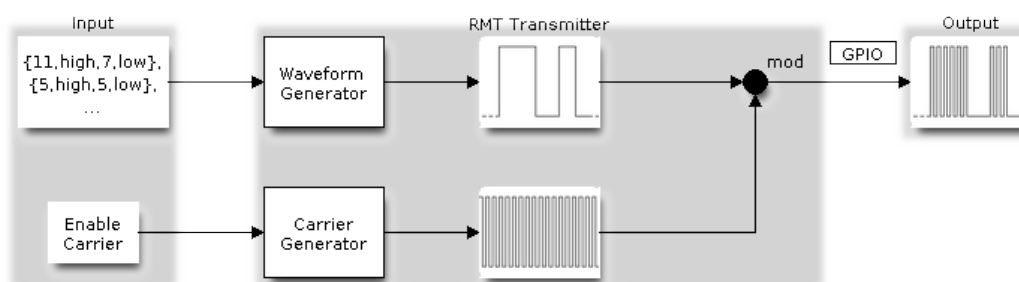

Fig. 21: RMT Transmitter Overview

The driver encodes the user's data into RMT data format, then the RMT transmitter can generate the waveforms according to the encoding artifacts. It is also possible to modulate a high-frequency carrier signal before being routed to a GPIO pad.

RMT Receiver Overview The data path and control path of an RMT RX channel is illustrated in the figure below:

¹ Different ESP chip series might have different numbers of RMT channels. Please refer to [TRM] for details. The driver does not forbid you from applying for more RMT channels, but it returns an error when there are no hardware resources available. Please always check the return value when doing [Resource Allocation](#).

Fig. 22: RMT Receiver Overview

The RMT receiver can sample incoming signals into RMT data format, and store the data in memory. It is also possible to tell the receiver the basic characteristics of the incoming signal, so that the signal's stop condition can be recognized, and signal glitches and noise can be filtered out. The RMT peripheral also supports demodulating the high-frequency carrier from the base signal.

Functional Overview

The description of the RMT functionality is divided into the following sections:

- *Resource Allocation* - covers how to allocate and properly configure RMT channels. It also covers how to recycle channels and other resources when they are no longer used.
- *Carrier Modulation and Demodulation* - describes how to modulate and demodulate the carrier signals for TX and RX channels respectively.
- *Register Event Callbacks* - covers how to register user-provided event callbacks to receive RMT channel events.
- *Enable and Disable Channel* - shows how to enable and disable the RMT channel.
- *Initiate TX Transaction* - describes the steps to initiate a transaction for a TX channel.
- *Initiate RX Transaction* - describes the steps to initiate a transaction for an RX channel.
- *Multiple Channels Simultaneous Transmission* - describes how to collect multiple channels into a sync group so that their transmissions can be started simultaneously.
- *RMT Encoder* - focuses on how to write a customized encoder by combining multiple primitive encoders that are provided by the driver.
- *Power Management* - describes how different clock sources affects power consumption.
- *IRAM Safe* - describes how disabling the cache affects the RMT driver, and tips to mitigate it.
- *Thread Safety* - lists which APIs are guaranteed to be thread-safe by the driver.
- *Kconfig Options* - describes the various Kconfig options supported by the RMT driver.

Resource Allocation Both RMT TX and RX channels are represented by `rmt_channel_handle_t` in the driver. The driver internally manages which channels are available and hands out a free channel on request.

Install RMT TX Channel To install an RMT TX channel, there is a configuration structure that needs to be given in advance `rmt_tx_channel_config_t`. The following list describes each member of the configuration structure.

- `rmt_tx_channel_config_t::gpio_num` sets the GPIO number used by the transmitter.
- `rmt_tx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock is also used by other channels, which means the user should ensure this configuration is the same when allocating other channels, regardless of TX or RX. For the effect on the power consumption of different clock sources, please refer to the *Power Management* section.

- `rmt_tx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of the RMT signal is calculated based on this **tick**.
- `rmt_tx_channel_config_t::mem_block_symbols` has a slightly different meaning based on if the DMA backend is enabled or not.
 - If the DMA is enabled via `rmt_tx_channel_config_t::with_dma`, then this field controls the size of the internal DMA buffer. To achieve a better throughput and smaller CPU overhead, you can set a larger value, e.g., 1024.
 - If DMA is not used, this field controls the size of the dedicated memory block owned by the channel, which should be at least 48.
- `rmt_tx_channel_config_t::trans_queue_depth` sets the depth of the internal transaction queue, the deeper the queue, the more transactions can be prepared in the backlog.
- `rmt_tx_channel_config_t::invert_out` is used to decide whether to invert the RMT signal before sending it to the GPIO pad.
- `rmt_tx_channel_config_t::with_dma` enables the DMA backend for the channel. Using the DMA allows a significant amount of the channel's workload to be offloaded from the CPU. However, the DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.
- `rmt_tx_channel_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the driver will use an interrupt with low or medium priority (priority level may be one of 1,2 or 3), otherwise use the priority indicated by `rmt_tx_channel_config_t::intr_priority`. Please use the number form (1,2,3), not the bitmask form ((1<<1),(1<<2),(1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until `rmt_del_channel()` is called.
- `rmt_tx_channel_config_t::allow_pd` configures if the driver allows the system to power down the peripheral in light sleep mode. Before entering sleep, the system will backup the RMT register context, which will be restored later when the system exit the sleep mode. Powering down the peripheral can save more power, but at the cost of more memory consumed to save the register context. It's a tradeoff between power consumption and memory consumption. This configuration option relies on specific hardware feature, if you enable it on an unsupported chip, you will see error message like not able to power down in light sleep.

Once the `rmt_tx_channel_config_t` structure is populated with mandatory parameters, users can call `rmt_new_tx_channel()` to allocate and initialize a TX channel. This function returns an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function returns `ESP_ERR_NOT_FOUND` error. If some feature (e.g., DMA backend) is not supported by the hardware, it returns `ESP_ERR_NOT_SUPPORTED` error.

```
rmt_channel_handle_t tx_chan = NULL;
rmt_tx_channel_config_t tx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT,    // select source clock
    .gpio_num = 0,                    // GPIO number
    .mem_block_symbols = 64,          // memory block size, 64 * 4 = 256 Bytes
    .resolution_hz = 1 * 1000 * 1000, // 1 MHz tick resolution, i.e., 1 tick = 1 μs
    .trans_queue_depth = 4,           // set the number of transactions that can
    ↪pend in the background
    .flags.invert_out = false,        // do not invert output signal
    .flags.with_dma = false,          // do not need DMA backend
};
ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_chan));
```

Install RMT RX Channel To install an RMT RX channel, there is a configuration structure that needs to be given in advance `rmt_rx_channel_config_t`. The following list describes each member of the configuration structure.

- `rmt_rx_channel_config_t::gpio_num` sets the GPIO number used by the receiver.
- `rmt_rx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock is also used by other channels, which means the user should ensure this configuration is the same when allocating other channels, regardless of TX or RX. For the effect on the power consumption of different clock sources, please refer to the [Power Management](#) section.

- `rmt_rx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of the RMT signal is calculated based on this **tick**.
- `rmt_rx_channel_config_t::mem_block_symbols` has a slightly different meaning based on whether the DMA backend is enabled.
 - If the DMA is enabled via `rmt_rx_channel_config_t::with_dma`, this field controls the maximum size of the DMA buffer.
 - If DMA is not used, this field controls the size of the dedicated memory block owned by the channel, which should be at least 48.
- `rmt_rx_channel_config_t::invert_in` is used to invert the input signals before it is passed to the RMT receiver. The inversion is done by the GPIO matrix instead of by the RMT peripheral.
- `rmt_rx_channel_config_t::with_dma` enables the DMA backend for the channel. Using the DMA allows a significant amount of the channel's workload to be offloaded from the CPU. However, the DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.
- `rmt_rx_channel_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the driver will use an interrupt with low or medium priority (priority level may be one of 1,2 or 3), otherwise use the priority indicated by `rmt_rx_channel_config_t::intr_priority`. Please use the number form (1,2,3), not the bitmask form ((1<<1),(1<<2),(1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until `rmt_del_channel()` is called.
- `rmt_rx_channel_config_t::allow_pd` configures if the driver allows the system to power down the peripheral in light sleep mode. Before entering sleep, the system will backup the RMT register context, which will be restored later when the system exit the sleep mode. Powering down the peripheral can save more power, but at the cost of more memory consumed to save the register context. It's a tradeoff between power consumption and memory consumption. This configuration option relies on specific hardware feature, if you enable it on an unsupported chip, you will see error message like not able to power down in light sleep.

Once the `rmt_rx_channel_config_t` structure is populated with mandatory parameters, users can call `rmt_new_rx_channel()` to allocate and initialize an RX channel. This function returns an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function returns `ESP_ERR_NOT_FOUND` error. If some feature (e.g., DMA backend) is not supported by the hardware, it returns `ESP_ERR_NOT_SUPPORTED` error.

```
rmt_channel_handle_t rx_chan = NULL;
rmt_rx_channel_config_t rx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT, // select source clock
    .resolution_hz = 1 * 1000 * 1000, // 1 MHz tick resolution, i.e., 1 tick = 1 μs
    .mem_block_symbols = 64, // memory block size, 64 * 4 = 256 Bytes
    .gpio_num = 2, // GPIO number
    .flags.invert_in = false, // do not invert input signal
    .flags.with_dma = false, // do not need DMA backend
};
ESP_ERROR_CHECK(rmt_new_rx_channel(&rx_chan_config, &rx_chan));
```

Note: Due to a software limitation in the GPIO driver, when both TX and RX channels are bound to the same GPIO, ensure the RX Channel is initialized before the TX Channel. If the TX Channel was set up first, then during the RX Channel setup, the previous RMT TX Channel signal will be overridden by the GPIO control signal.

Uninstall RMT Channel If a previously installed RMT channel is no longer needed, it is recommended to recycle the resources by calling `rmt_del_channel()`, which in return allows the underlying software and hardware resources to be reused for other purposes.

Carrier Modulation and Demodulation The RMT transmitter can generate a carrier wave and modulate it onto the message signal. Compared to the message signal, the carrier signal's frequency is significantly higher. In addition, the user can only set the frequency and duty cycle for the carrier signal. The RMT receiver can demodulate the carrier

signal from the incoming signal. Note that, carrier modulation and demodulation are not supported on all ESP chips, please refer to [TRM] before configuring the carrier, or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.

Carrier-related configurations lie in `rmt_carrier_config_t`:

- `rmt_carrier_config_t::frequency_hz` sets the carrier frequency, in Hz.
- `rmt_carrier_config_t::duty_cycle` sets the carrier duty cycle.
- `rmt_carrier_config_t::polarity_active_low` sets the carrier polarity, i.e., on which level the carrier is applied.
- `rmt_carrier_config_t::always_on` sets whether to output the carrier even when the data transmission has finished. This configuration is only valid for the TX channel.

Note: For the RX channel, we should not set the carrier frequency exactly to the theoretical value. It is recommended to leave a tolerance for the carrier frequency. For example, in the snippet below, we set the frequency to 25 KHz, instead of the 38 KHz configured on the TX side. The reason is that reflection and refraction occur when a signal travels through the air, leading to distortion on the receiver side.

```
rmt_carrier_config_t tx_carrier_cfg = {
    .duty_cycle = 0.33,           // duty cycle 33%
    .frequency_hz = 38000,       // 38 KHz
    .flags.polarity_active_low = false, // carrier should be modulated to high_
    ↪level
};
// modulate carrier to TX channel
ESP_ERROR_CHECK(rmt_apply_carrier(tx_chan, &tx_carrier_cfg));

rmt_carrier_config_t rx_carrier_cfg = {
    .duty_cycle = 0.33,           // duty cycle 33%
    .frequency_hz = 25000,       // 25 KHz carrier, should be smaller than_
    ↪the transmitter's carrier frequency
    .flags.polarity_active_low = false, // the carrier is modulated to high level
};
// demodulate carrier from RX channel
ESP_ERROR_CHECK(rmt_apply_carrier(rx_chan, &rx_carrier_cfg));
```

Register Event Callbacks When an event occurs on an RMT channel (e.g., transmission or receiving is completed), the CPU is notified of this event via an interrupt. If you have some function that needs to be called when a particular events occur, you can register a callback for that event to the RMT driver's ISR (Interrupt Service Routine) by calling `rmt_tx_register_event_callbacks()` and `rmt_rx_register_event_callbacks()` for TX and RX channel respectively. Since the registered callback functions are called in the interrupt context, the user should ensure the callback function does not block, e.g., by making sure that only FreeRTOS APIs with the `FromISR` suffix are called from within the function. The callback function has a boolean return value used to indicate whether a higher priority task has been unblocked by the callback.

The TX channel-supported event callbacks are listed in the `rmt_tx_event_callbacks_t`:

- `rmt_tx_event_callbacks_t::on_trans_done` sets a callback function for the "trans-done" event. The function prototype is declared in `rmt_tx_done_callback_t`.

The RX channel-supported event callbacks are listed in the `rmt_rx_event_callbacks_t`:

- `rmt_rx_event_callbacks_t::on_recv_done` sets a callback function for "receive-done" event. The function prototype is declared in `rmt_rx_done_callback_t`.

Note: The "receive-done" is not equivalent to "receive-finished". This callback can also be called at a "partial-receive-done" time, for many times during one receive transaction.

Users can save their own context in `rmt_tx_register_event_callbacks()` and `rmt_rx_register_event_callbacks()` as well, via the parameter `user_data`. The user data is

directly passed to each callback function.

In the callback function, users can fetch the event-specific data that is filled by the driver in the `edata`. Note that the `edata` pointer is **only** valid during the callback, please do not try to save this pointer and use that outside of the callback function.

The TX-done event data is defined in `rmt_tx_done_event_data_t`:

- `rmt_tx_done_event_data_t::num_symbols` indicates the number of transmitted RMT symbols. This also reflects the size of the encoding artifacts. Please note, this value accounts for the EOF symbol as well, which is appended by the driver to mark the end of one transaction.

The RX-complete event data is defined in `rmt_rx_done_event_data_t`:

- `rmt_rx_done_event_data_t::received_symbols` points to the received RMT symbols. These symbols are saved in the `buffer` parameter of the `rmt_receive()` function. Users should not free this receive buffer before the callback returns. If you also enabled the partial receive feature, then the user buffer will be used as a "second level buffer", where its content can be overwritten by data comes in afterwards. In this case, you should copy the received data to another place if you want to keep it or process it later.
- `rmt_rx_done_event_data_t::num_symbols` indicates the number of received RMT symbols. This value is not larger than the `buffer_size` parameter of `rmt_receive()` function. If the `buffer_size` is not sufficient to accommodate all the received RMT symbols, the driver only keeps the maximum number of symbols that the buffer can hold, and excess symbols are discarded or ignored.
- `rmt_rx_done_event_data_t::is_last` indicates whether the current received buffer is the last one in the transaction. This is useful when you enable the partial reception feature by `rmt_receive_config_t::extra_rmt_receive_flags::en_partial_rx`.

Enable and Disable Channel `rmt_enable()` must be called in advance before transmitting or receiving RMT symbols. For TX channels, enabling a channel enables a specific interrupt and prepares the hardware to dispatch transactions. For RX channels, enabling a channel enables an interrupt, but the receiver is not started during this time, as the characteristics of the incoming signal have yet to be specified. The receiver is started in `rmt_receive()`.

`rmt_disable()` does the opposite by disabling the interrupt and clearing any pending interrupts. The transmitter and receiver are disabled as well.

```
ESP_ERROR_CHECK(rmt_enable(tx_chan));
ESP_ERROR_CHECK(rmt_enable(rx_chan));
```

Initiate TX Transaction RMT is a special communication peripheral, as it is unable to transmit raw byte streams like SPI and I2C. RMT can only send data in its own format `rmt_symbol_word_t`. However, the hardware does not help to convert the user data into RMT symbols, this can only be done in software by the so-called **RMT Encoder**. The encoder is responsible for encoding user data into RMT symbols and then writing to the RMT memory block or the DMA buffer. For how to create an RMT encoder, please refer to *RMT Encoder*.

Once you created an encoder, you can initiate a TX transaction by calling `rmt_transmit()`. This function takes several positional parameters like channel handle, encoder handle, and payload buffer. Besides, you also need to provide a transmission-specific configuration in `rmt_transmit_config_t`:

- `rmt_transmit_config_t::loop_count` sets the number of transmission loops. After the transmitter has finished one round of transmission, it can restart the same transmission again if this value is not set to zero. As the loop is controlled by hardware, the RMT channel can be used to generate many periodic sequences with minimal CPU intervention.
 - Setting `rmt_transmit_config_t::loop_count` to `-1` means an infinite loop transmission. In this case, the channel does not stop until `rmt_disable()` is called. The "trans-done" event is not generated as well.
 - Setting `rmt_transmit_config_t::loop_count` to a positive number means finite number of iterations. In this case, the "trans-done" event is when the specified number of iterations have completed.

Note: The **loop transmit** feature is not supported on all ESP chips, please refer to [TRM] before you configure this option, or you might encounter `ESP_ERR_NOT_SUPPORTED` error.

- `rmt_transmit_config_t::eot_level` sets the output level when the transmitter finishes working or stops working by calling `rmt_disable()`.
- `rmt_transmit_config_t::queue_nonblocking` sets whether to wait for a free slot in the transaction queue when it is full. If this value is set to `true`, then the function will return with an error code `ESP_ERR_INVALID_STATE` when the queue is full. Otherwise, the function will block until a free slot is available in the queue.

Note: There is a limitation in the transmission size if the `rmt_transmit_config_t::loop_count` is set to non-zero, i.e., to enable the loop feature. The encoded RMT symbols should not exceed the capacity of the RMT hardware memory block size, or you might see an error message like `encoding artifacts can't exceed hw memory block for loop transmission`. If you have to start a large transaction by loop, you can try either of the following methods.

- Increase the `rmt_tx_channel_config_t::mem_block_symbols`. This approach does not work if the DMA backend is also enabled.
 - Customize an encoder and construct an infinite loop in the encoding function. See also *RMT Encoder*.
-

Internally, `rmt_transmit()` constructs a transaction descriptor and sends it to a job queue, which is dispatched in the ISR. So it is possible that the transaction is not started yet when `rmt_transmit()` returns. You cannot recycle or modify the payload buffer until the transaction is finished. You can get the transaction completion event by registering a callback function via `rmt_tx_register_event_callbacks()`. To ensure all pending transactions to complete, you can also use `rmt_tx_wait_all_done()`.

Multiple Channels Simultaneous Transmission In some real-time control applications (e.g., to make two robotic arms move simultaneously), you do not want any time drift between different channels. The RMT driver can help to manage this by creating a so-called **Sync Manager**. The sync manager is represented by `rmt_sync_manager_handle_t` in the driver. The procedure of RMT sync transmission is shown as follows:

Fig. 23: RMT TX Sync

Install RMT Sync Manager To create a sync manager, the user needs to tell which channels are going to be managed in the `rmt_sync_manager_config_t`:

- `rmt_sync_manager_config_t::tx_channel_array` points to the array of TX channels to be managed.

- `rmt_sync_manager_config_t::array_size` sets the number of channels to be managed.

`rmt_new_sync_manager()` can return a manager handle on success. This function could also fail due to various errors such as invalid arguments, etc. Especially, when the sync manager has been installed before, and there are no hardware resources to create another manager, this function reports `ESP_ERR_NOT_FOUND` error. In addition, if the sync manager is not supported by the hardware, it reports a `ESP_ERR_NOT_SUPPORTED` error. Please refer to [TRM] before using the sync manager feature.

Start Transmission Simultaneously For any managed TX channel, it does not start the machine until `rmt_transmit()` has been called on all channels in `rmt_sync_manager_config_t::tx_channel_array`. Before that, the channel is just put in a waiting state. TX channels will usually complete their transactions at different times due to differing transactions, thus resulting in a loss of sync. So before restarting a simultaneous transmission, the user needs to call `rmt_sync_reset()` to synchronize all channels again.

Calling `rmt_del_sync_manager()` can recycle the sync manager and enable the channels to initiate transactions independently afterward.

```
rmt_channel_handle_t tx_channels[2] = {NULL}; // declare two channels
int tx_gpio_number[2] = {0, 2};
// install channels one by one
for (int i = 0; i < 2; i++) {
    rmt_tx_channel_config_t tx_chan_config = {
        .clk_src = RMT_CLK_SRC_DEFAULT, // select source clock
        .gpio_num = tx_gpio_number[i], // GPIO number
        .mem_block_symbols = 64, // memory block size, 64 * 4 = 256 Bytes
        .resolution_hz = 1 * 1000 * 1000, // 1 MHz resolution
        .trans_queue_depth = 1, // set the number of transactions that
        ↪ can pend in the background
    };
    ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_channels[i]));
}
// enable the channels
for (int i = 0; i < 2; i++) {
    ESP_ERROR_CHECK(rmt_enable(tx_channels[i]));
}
// install sync manager
rmt_sync_manager_handle_t synchro = NULL;
rmt_sync_manager_config_t synchro_config = {
    .tx_channel_array = tx_channels,
    .array_size = sizeof(tx_channels) / sizeof(tx_channels[0]),
};
ESP_ERROR_CHECK(rmt_new_sync_manager(&synchro_config, &synchro));

ESP_ERROR_CHECK(rmt_transmit(tx_channels[0], led_strip_encoders[0], led_data, led_
    ↪ num * 3, &transmit_config));
// tx_channels[0] does not start transmission until call of `rmt_transmit()` for
    ↪ tx_channels[1] returns
ESP_ERROR_CHECK(rmt_transmit(tx_channels[1], led_strip_encoders[1], led_data, led_
    ↪ num * 3, &transmit_config));
```

Initiate RX Transaction As also discussed in the *Enable and Disable Channel*, calling `rmt_enable()` does not prepare an RX to receive RMT symbols. The user needs to specify the basic characteristics of the incoming signals in `rmt_receive_config_t`:

- `rmt_receive_config_t::signal_range_min_ns` specifies the minimal valid pulse duration in either high or low logic levels. A pulse width that is smaller than this value is treated as a glitch, and ignored by the hardware.
- `rmt_receive_config_t::signal_range_max_ns` specifies the maximum valid pulse duration in either high or low logic levels. A pulse width that is bigger than this value is treated as **Stop Signal**, and the receiver generates receive-complete event immediately.

- If the incoming packet is long, that they cannot be stored in the user buffer at once, you can enable the partial reception feature by setting `rmt_receive_config_t::extra_rmt_receive_flags::en_partial_rx` to true. In this case, the driver invokes `rmt_rx_event_callbacks_t::on_recv_done` callback multiple times during one transaction, when the user buffer is **almost full**. You can check the value of `:cpp:member::rmt_rx_done_event_data_t::is_last` to know if the transaction is about to finish. Please note this features is not supported on all ESP series chips because it relies on hardware abilities like "ping-pong receive" or "DMA receive".

The RMT receiver starts the RX machine after the user calls `rmt_receive()` with the provided configuration above. Note that, this configuration is transaction specific, which means, to start a new round of reception, the user needs to set the `rmt_receive_config_t` again. The receiver saves the incoming signals into its internal memory block or DMA buffer, in the format of `rmt_symbol_word_t`.

Due to the limited size of the memory block, the RMT receiver notifies the driver to copy away the accumulated symbols in a ping-pong way.

The copy destination should be provided in the `buffer` parameter of `rmt_receive()` function. If this buffer overflows due to an insufficient buffer size, the receiver can continue to work, but overflowed symbols are dropped and the following error message is reported: `user buffer too small, received symbols truncated`. Please take care of the lifecycle of the `buffer` parameter, ensuring that the buffer is not recycled before the receiver is finished or stopped.

The receiver is stopped by the driver when it finishes working, i.e., receive a signal whose duration is bigger than `rmt_receive_config_t::signal_range_max_ns`. The user needs to call `rmt_receive()` again to restart the receiver, if necessary. The user can get the received data in the `rmt_rx_event_callbacks_t::on_recv_done` callback. See also [Register Event Callbacks](#) for more information.

```

```

RMT Encoder An RMT encoder is part of the RMT TX transaction, whose responsibility is to generate and write the correct RMT symbols into hardware memory or DMA buffer at a specific time. There are some special restrictions for an encoding function:

- During a single transaction, the encoding function may be called multiple times. This is necessary because the target RMT memory block cannot hold all the artifacts at once. To overcome this limitation, the driver utilizes a **ping-pong** approach, where the encoding session is divided into multiple parts. This means that the encoder needs to **keep track of its state** to continue encoding from where it left off in the previous part.
- The encoding function is running in the ISR context. To speed up the encoding session, it is highly recommended to put the encoding function into IRAM. This can also avoid the cache miss during encoding.

To help get started with the RMT driver faster, some commonly used encoders are provided out-of-the-box. They can either work alone or be chained together into a new encoder. See also [Composite Pattern](#) for the principle behind it. The driver has defined the encoder interface in `rmt_encoder_t`, it contains the following functions:

- `rmt_encoder_t::encode` is the fundamental function of an encoder. This is where the encoding session happens.
 - The function might be called multiple times within a single transaction. The encode function should return the state of the current encoding session.
 - The supported states are listed in the `rmt_encode_state_t`. If the result contains `RMT_ENCODING_COMPLETE`, it means the current encoder has finished work.
 - If the result contains `RMT_ENCODING_MEM_FULL`, the program needs to yield from the current session, as there is no space to save more encoding artifacts.
- `rmt_encoder_t::reset` should reset the encoder state back to the initial state (the RMT encoder is stateful).
 - If the RMT transmitter is manually stopped without resetting its corresponding encoder, subsequent encoding session can be erroneous.
 - This function is also called implicitly in `rmt_disable()`.
- `rmt_encoder_t::del` should free the resources allocated by the encoder.

Copy Encoder A copy encoder is created by calling `rmt_new_copy_encoder()`. A copy encoder's main functionality is to copy the RMT symbols from user space into the driver layer. It is usually used to encode `const` data, i.e., data does not change at runtime after initialization such as the leading code in the IR protocol.

A configuration structure `rmt_copy_encoder_config_t` should be provided in advance before calling `rmt_new_copy_encoder()`. Currently, this configuration is reserved for future expansion, and has no specific use or setting items for now.

Bytes Encoder A bytes encoder is created by calling `rmt_new_bytes_encoder()`. The bytes encoder's main functionality is to convert the user space byte stream into RMT symbols dynamically. It is usually used to encode dynamic data, e.g., the address and command fields in the IR protocol.

A configuration structure `rmt_bytes_encoder_config_t` should be provided in advance before calling `rmt_new_bytes_encoder()`:

- `rmt_bytes_encoder_config_t::bit0` and `rmt_bytes_encoder_config_t::bit1` are necessary to specify the encoder how to represent bit zero and bit one in the format of `rmt_symbol_word_t`.
- `rmt_bytes_encoder_config_t::msb_first` sets the bit endianness of each byte. If it is set to true, the encoder encodes the **Most Significant Bit** first. Otherwise, it encodes the **Least Significant Bit** first.

Besides the primitive encoders provided by the driver, the user can implement his own encoder by chaining the existing encoders together. A common encoder chain is shown as follows:

Fig. 24: RMT Encoder Chain

Simple Callback Encoder A simple callback encoder is created by calling `rmt_new_simple_encoder()`. The simple callback encoder allows you to provide a callback that reads data from userspace and writes symbols to the output stream without having to chain other encoders. The callback itself gets a pointer to the data passed to `rmt_transmit()`, a counter indicating the amount of symbols already written by the callback in this transmission, and a pointer where to write the encoded RMT symbols as well as the free space there. If the space is not enough for the callback to encode something, it can return 0 and the RMT will wait for previous symbols to be transmitted and call the callback again, now with more space available. If the callback successfully writes RMT symbols, it should return the number of symbols written.

A configuration structure `rmt_simple_encoder_config_t` should be provided in advance before calling `rmt_new_simple_encoder()`:

- `rmt_simple_encoder_config_t::callback` and `rmt_simple_encoder_config_t::arg` provide the callback function and an opaque argument that will be passed to that function.
- `rmt_simple_encoder_config_t::min_chunk_size` specifies the minimum amount of free space, in symbols, the encoder will be always be able to write some data to. In other words, when this amount of free space is passed to the encoder, it should never return 0 (except when the encoder is done encoding symbols).

While the functionality of an encoding process using the simple callback encoder can usually also realized by chaining other encoders, the simple callback can be more easy to understand and maintain than an encoder chain.

Customize RMT Encoder for NEC Protocol This section demonstrates how to write an NEC encoder. The NEC IR protocol uses pulse distance encoding of the message bits. Each pulse burst is $562.5 \mu\text{s}$ in length, logical bits are transmitted as follows. It is worth mentioning that the least significant bit of each byte is sent first.

- Logical 0: a $562.5 \mu\text{s}$ pulse burst followed by a $562.5 \mu\text{s}$ space, with a total transmit time of 1.125 ms
- Logical 1: a $562.5 \mu\text{s}$ pulse burst followed by a 1.6875 ms space, with a total transmit time of 2.25 ms

When a key is pressed on the remote controller, the transmitted message includes the following elements in the specified order:

- 9 ms leading pulse burst, also called the "AGC pulse"
- 4.5 ms space
- 8-bit address for the receiving device
- 8-bit logical inverse of the address
- 8-bit command
- 8-bit logical inverse of the command

Fig. 25: IR NEC Frame

- a final 562.5 μ s pulse burst to signify the end of message transmission

Then you can construct the NEC `rmt_encoder_t::encode` function in the same order, for example:

```
// IR NEC scan code representation
typedef struct {
    uint16_t address;
    uint16_t command;
} ir_nec_scan_code_t;

// construct an encoder by combining primitive encoders
typedef struct {
    rmt_encoder_t base; // the base "class" declares the standard_
    ↪encoder interface
    rmt_encoder_t *copy_encoder; // use the copy_encoder to encode the leading_
    ↪and ending pulse
    rmt_encoder_t *bytes_encoder; // use the bytes_encoder to encode the address_
    ↪and command data
    rmt_symbol_word_t nec_leading_symbol; // NEC leading code with RMT_
    ↪representation
    rmt_symbol_word_t nec_ending_symbol; // NEC ending code with RMT_
    ↪representation
    int state; // record the current encoding state, i.e., we are in which_
    ↪encoding phase
} rmt_ir_nec_encoder_t;

static size_t rmt_encode_ir_nec(rmt_encoder_t *encoder, rmt_channel_handle_t_
    ↪channel, const void *primary_data, size_t data_size, rmt_encode_state_t *ret_
    ↪state)
{
    rmt_ir_nec_encoder_t *nec_encoder = __containerof(encoder, rmt_ir_nec_encoder_
    ↪t, base);
    rmt_encode_state_t session_state = RMT_ENCODING_RESET;
    rmt_encode_state_t state = RMT_ENCODING_RESET;
    size_t encoded_symbols = 0;
    ir_nec_scan_code_t *scan_code = (ir_nec_scan_code_t *)primary_data;
    rmt_encoder_handle_t copy_encoder = nec_encoder->copy_encoder;
    rmt_encoder_handle_t bytes_encoder = nec_encoder->bytes_encoder;
    switch (nec_encoder->state) {
        case 0: // send leading code
            encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_
            ↪encoder->nec_leading_symbol,
                sizeof(rmt_symbol_word_t), &
            ↪session_state);
            if (session_state & RMT_ENCODING_COMPLETE) {
                nec_encoder->state = 1; // we can only switch to the next state when_
            ↪the current encoder finished
            }
            if (session_state & RMT_ENCODING_MEM_FULL) {
                state |= RMT_ENCODING_MEM_FULL;
                goto out; // yield if there is no free space to put other encoding_
            ↪artifacts
            }
    }
}
```

(continues on next page)

```

// fall-through
case 1: // send address
    encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_
↪code->address, sizeof(uint16_t), &session_state);
    if (session_state & RMT_ENCODING_COMPLETE) {
        nec_encoder->state = 2; // we can only switch to the next state when
↪the current encoder finished
    }
    if (session_state & RMT_ENCODING_MEM_FULL) {
        state |= RMT_ENCODING_MEM_FULL;
        goto out; // yield if there is no free space to put other encoding
↪artifacts
    }
// fall-through
case 2: // send command
    encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_
↪code->command, sizeof(uint16_t), &session_state);
    if (session_state & RMT_ENCODING_COMPLETE) {
        nec_encoder->state = 3; // we can only switch to the next state when
↪the current encoder finished
    }
    if (session_state & RMT_ENCODING_MEM_FULL) {
        state |= RMT_ENCODING_MEM_FULL;
        goto out; // yield if there is no free space to put other encoding
↪artifacts
    }
// fall-through
case 3: // send ending code
    encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_
↪encoder->nec_ending_symbol,
                                                sizeof(rmt_symbol_word_t), &
↪session_state);
    if (session_state & RMT_ENCODING_COMPLETE) {
        nec_encoder->state = RMT_ENCODING_RESET; // back to the initial
↪encoding session
        state |= RMT_ENCODING_COMPLETE; // telling the caller the NEC encoding
↪has finished
    }
    if (session_state & RMT_ENCODING_MEM_FULL) {
        state |= RMT_ENCODING_MEM_FULL;
        goto out; // yield if there is no free space to put other encoding
↪artifacts
    }
}
out:
    *ret_state = state;
    return encoded_symbols;
}

```

A full sample code can be found in [peripherals/rmt/ir_nec_transceiver](#). In the above snippet, we use a switch-case and several goto statements to implement a [Finite-state machine](#). With this pattern, users can construct much more complex IR protocols.

Power Management When power management is enabled, i.e., `CONFIG_PM_ENABLE` is on, the system may adjust or disable the clock source before going to sleep. As a result, the time base inside the RMT can't work as expected.

The driver can prevent the above issue by creating a power management lock. The lock type is set based on different clock sources. The driver will acquire the lock in `rmt_enable()`, and release it in `rmt_disable()`. That means, any RMT transactions in between these two functions are guaranteed to work correctly and stable.

Besides the potential changes to the clock source, when the power management is enabled, the system can also power down the RMT hardware before sleep. Set `rmt_tx_channel_config_t::allow_pd` and `rmt_rx_channel_config_t::allow_pd` to `true` to enable the power down feature. RMT registers will be backed up before sleep and restored after wake up. Please note, enabling this option will increase the memory consumption.

IRAM Safe By default, the RMT interrupt is deferred when the Cache is disabled for reasons like writing or erasing the main Flash. Thus the transaction-done interrupt does not get handled in time, which is not acceptable in a real-time application. What is worse, when the RMT transaction relies on **ping-pong** interrupt to successively encode or copy RMT symbols, a delayed interrupt can lead to an unpredictable result.

There is a Kconfig option `CONFIG_RMT_ISR_IRAM_SAFE` that has the following features:

1. Enable the interrupt being serviced even when the cache is disabled
2. Place all functions used by the ISR into IRAM²
3. Place the driver object into DRAM in case it is mapped to PSRAM by accident

This Kconfig option allows the interrupt handler to run while the cache is disabled but comes at the cost of increased IRAM consumption.

Another Kconfig option `CONFIG_RMT_RECV_FUNC_IN_IRAM` can place `rmt_receive()` into the IRAM as well. So that the receive function can be used even when the flash cache is disabled.

Thread Safety The factory function `rmt_new_tx_channel()`, `rmt_new_rx_channel()` and `rmt_new_sync_manager()` are guaranteed to be thread-safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks. Other functions that take the `rmt_channel_handle_t` and `rmt_sync_manager_handle_t` as the first positional parameter, are not thread-safe, which means the user should avoid calling them from multiple tasks.

The following functions are allowed to use under ISR context as well.

- `rmt_receive()`

Kconfig Options

- `CONFIG_RMT_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see also *IRAM Safe* for more information.
- `CONFIG_RMT_ENABLE_DEBUG_LOG` is used to enable the debug log at the cost of increased firmware binary size.
- `CONFIG_RMT_RECV_FUNC_IN_IRAM` controls where to place the RMT receive function (IRAM or Flash), see *IRAM Safe* for more information.

Application Examples

- [peripherals/rmt/led_strip](#) demonstrates how to use the RMT peripheral to drive a WS2812 LED strip, which is able to change the number of LEDs and the chasing effect.
- [peripherals/rmt/led_strip_simple_encoder](#) demonstrates how to use the RMT peripheral to drive a WS2812 LED strip by implementing a callback that converts RGB pixels into a format recognized by the hardware.
- [peripherals/rmt/ir_nec_transceiver](#) demonstrates how to use the RMT peripheral to implement the encoding and decoding of remote IR NEC protocol.
- [peripherals/rmt/dshot_esc](#) demonstrates how to use the RMT TX channel to achieve infinite loop transmission. It constructs an RMT encoder for the DShot digital protocol. This protocol is primarily used for communication between flight controllers and electronic speed controllers, offering greater resistance to electrical noise compared to traditional analog protocols.

² The callback function, e.g., `rmt_tx_event_callbacks_t::on_trans_done`, and the functions invoked by itself should also reside in IRAM, users need to take care of this by themselves.

- [peripherals/rmt/onewire](#) demonstrates how to simulate the 1-wire hardware protocol by using the `onewire_bus` library, and read data from multiple DS18B20 temperature sensors on the bus. This library is built upon a pair of transmit and receive channels of the RMT peripheral.
- [peripherals/rmt/musical_buzzer](#) demonstrates how to use the RMT TX channel to drive a passive buzzer to play simple music. Each musical note is represented by a constant frequency of PWM signal with a fixed duration.
- [peripherals/rmt/stepper_motor](#) demonstrates how to use the RMT peripheral to drive a STEP/DIR interfaced stepper motor controller (such as DRV8825). After programming the RMT encoder, S-curve profile can be implemented for desired acceleration, constant speed, and deceleration phases, thereby smoothly driving the stepper motor.

FAQ

- Why the RMT transmits more data than expected?
The encoding for the RMT transmission is carried out within the ISR context. Should the RMT encoding process be prolonged (for example, through logging or tracing the procedure) or if it is delayed due to interrupt latency and preemptive interrupts, the hardware transmitter might read from the memory before the encoder has written to it. Consequently, the transmitter would end up sending outdated data. Although it's not possible to instruct the transmitter to pause and wait, this issue can be mitigated by employing a combination of the following strategies:
 - Increase the `rmt_tx_channel_config_t::mem_block_symbols`, in steps of 48.
 - Place the encoding function in the IRAM with `IRAM_ATTR` attribute.
 - Enable the `rmt_tx_channel_config_t::with_dma` if DMA is available.
 - Install the RMT driver on a separate CPU core to avoid competing for the same CPU resources with other interrupt heavy peripherals (e.g. WiFi, Bluetooth).

Functions

`esp_err_t rmt_new_tx_channel` (const `rmt_tx_channel_config_t` *config, `rmt_channel_handle_t` *ret_chan)
Create a RMT TX channel.

Parameters

- **config** -- [in] TX channel configurations
- **ret_chan** -- [out] Returned generic RMT channel handle

Returns

- `ESP_OK`: Create RMT TX channel successfully
- `ESP_ERR_INVALID_ARG`: Create RMT TX channel failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create RMT TX channel failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create RMT TX channel failed because all RMT channels are used up and no more free one
- `ESP_ERR_NOT_SUPPORTED`: Create RMT TX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware

- `ESP_FAIL`: Create RMT TX channel failed because of other error

`esp_err_t rmt_transmit` (`rmt_channel_handle_t` tx_channel, `rmt_encoder_handle_t` encoder, const void *payload, `size_t` payload_bytes, const `rmt_transmit_config_t` *config)

Transmit data by RMT TX channel.

Note: This function constructs a transaction descriptor then pushes to a queue. The transaction will not start immediately if there's another one under processing. Based on the setting of `rmt_transmit_config_t::queue_nonblocking`, if there're too many transactions pending in the queue, this function can block until it has free slot, otherwise just return quickly.

Note: The payload data to be transmitted will be encoded into RMT symbols by the specific `encoder`.

Note: You CAN'T modify the `payload` during the transmission, it should be kept valid until the transmission is finished.

Parameters

- `tx_channel` -- **[in]** RMT TX channel that created by `rmt_new_tx_channel()`
- `encoder` -- **[in]** RMT encoder that created by various factory APIs like `rmt_new_bytes_encoder()`
- `payload` -- **[in]** The raw data to be encoded into RMT symbols
- `payload_bytes` -- **[in]** Size of the `payload` in bytes
- `config` -- **[in]** Transmission specific configuration

Returns

- `ESP_OK`: Transmit data successfully
- `ESP_ERR_INVALID_ARG`: Transmit data failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Transmit data failed because channel is not enabled
- `ESP_ERR_NOT_SUPPORTED`: Transmit data failed because some feature is not supported by hardware, e.g. unsupported loop count
- `ESP_FAIL`: Transmit data failed because of other error

`esp_err_t rmt_tx_wait_all_done` (`rmt_channel_handle_t` tx_channel, int timeout_ms)

Wait for all pending TX transactions done.

Note: This function will block forever if the pending transaction can't be finished within a limited time (e.g. an infinite loop transaction). See also `rmt_disable()` for how to terminate a working channel.

Parameters

- `tx_channel` -- **[in]** RMT TX channel that created by `rmt_new_tx_channel()`
- `timeout_ms` -- **[in]** Wait timeout, in ms. Specially, -1 means to wait forever.

Returns

- `ESP_OK`: Flush transactions successfully
- `ESP_ERR_INVALID_ARG`: Flush transactions failed because of invalid argument
- `ESP_ERR_TIMEOUT`: Flush transactions failed because of timeout
- `ESP_FAIL`: Flush transactions failed because of other error

`esp_err_t rmt_tx_register_event_callbacks` (`rmt_channel_handle_t` tx_channel, const `rmt_tx_event_callbacks_t` *cbs, void *user_data)

Set event callbacks for RMT TX channel.

Note: User can deregister a previously registered callback by calling this function and setting the callback

member in the `cbs` structure to `NULL`.

Note: When `CONFIG_RMT_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

Parameters

- **tx_channel** -- **[in]** RMT generic channel that created by `rmt_new_tx_channel()`
- **cbs** -- **[in]** Group of callback functions
- **user_data** -- **[in]** User data, which will be passed to callback functions directly

Returns

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_FAIL`: Set event callbacks failed because of other error

esp_err_t **rmt_new_sync_manager** (const *rmt_sync_manager_config_t* *config, *rmt_sync_manager_handle_t* *ret_synchro)

Create a synchronization manager for multiple TX channels, so that the managed channel can start transmitting at the same time.

Note: All the channels to be managed should be enabled by `rmt_enable()` before put them into sync manager.

Parameters

- **config** -- **[in]** Synchronization manager configuration
- **ret_synchro** -- **[out]** Returned synchronization manager handle

Returns

- `ESP_OK`: Create sync manager successfully
- `ESP_ERR_INVALID_ARG`: Create sync manager failed because of invalid argument
- `ESP_ERR_NOT_SUPPORTED`: Create sync manager failed because it is not supported by hardware
- `ESP_ERR_INVALID_STATE`: Create sync manager failed because not all channels are enabled
- `ESP_ERR_NO_MEM`: Create sync manager failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create sync manager failed because all sync controllers are used up and no more free one
- `ESP_FAIL`: Create sync manager failed because of other error

esp_err_t **rmt_del_sync_manager** (*rmt_sync_manager_handle_t* synchro)

Delete synchronization manager.

Parameters **synchro** -- **[in]** Synchronization manager handle returned from `rmt_new_sync_manager()`

Returns

- `ESP_OK`: Delete the synchronization manager successfully
- `ESP_ERR_INVALID_ARG`: Delete the synchronization manager failed because of invalid argument
- `ESP_FAIL`: Delete the synchronization manager failed because of other error

esp_err_t **rmt_sync_reset** (*rmt_sync_manager_handle_t* synchro)

Reset synchronization manager.

Parameters **synchro** -- **[in]** Synchronization manager handle returned from `rmt_new_sync_manager()`

Returns

- ESP_OK: Reset the synchronization manager successfully
- ESP_ERR_INVALID_ARG: Reset the synchronization manager failed because of invalid argument
- ESP_FAIL: Reset the synchronization manager failed because of other error

Structures

struct **rmt_tx_event_callbacks_t**

Group of RMT TX callbacks.

Note: The callbacks are all running under ISR environment

Note: When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

Public Members

rmt_tx_done_callback_t **on_trans_done**

Event callback, invoked when transmission is finished

struct **rmt_tx_channel_config_t**

RMT TX channel specific configuration.

Public Members

gpio_num_t **gpio_num**

GPIO number used by RMT TX channel. Set to -1 if unused

rmt_clock_source_t **clk_src**

Clock source of RMT TX channel, channels in the same group must use the same clock source

uint32_t **resolution_hz**

Channel clock resolution, in Hz

size_t **mem_block_symbols**

Size of memory block, in number of *rmt_symbol_word_t*, must be an even. In the DMA mode, this field controls the DMA buffer size, it can be set to a large value; In the normal mode, this field controls the number of RMT memory block that will be used by the channel.

size_t **trans_queue_depth**

Depth of internal transfer queue, increase this value can support more transfers pending in the background

int **intr_priority**

RMT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t **invert_out**

Whether to invert the RMT channel signal before output to GPIO pad

uint32_t **with_dma**

If set, the driver will allocate an RMT channel with DMA capability

uint32_t **io_loop_back**

The signal output from the GPIO will be fed to the input path as well

uint32_t **io_od_mode**

Configure the GPIO as open-drain mode

uint32_t **allow_pd**

If set, driver allows the power domain to be powered off when system enters sleep mode. This can save power, but at the expense of more RAM being consumed to save register context.

struct *rmt_tx_channel_config_t*::[anonymous] **flags**

TX channel config flags

struct **rmt_transmit_config_t**

RMT transmit specific configuration.

Public Members

int **loop_count**

Specify the times of transmission in a loop, -1 means transmitting in an infinite loop

uint32_t **eot_level**

Set the output level for the "End Of Transmission"

uint32_t **queue_nonblocking**

If set, when the transaction queue is full, driver will not block the thread but return directly

struct *rmt_transmit_config_t*::[anonymous] **flags**

Transmit specific config flags

struct **rmt_sync_manager_config_t**

Synchronous manager configuration.

Public Members

const *rmt_channel_handle_t****tx_channel_array**

Array of TX channels that are about to be managed by a synchronous controller

size_t **array_size**

Size of the `tx_channel_array`

Header File

- `components/esp_driver_rmt/include/driver/rmt_rx.h`
- This header file can be included with:

```
#include "driver/rmt_rx.h"
```

- This header file is a part of the API provided by the `esp_driver_rmt` component. To declare that your component depends on `esp_driver_rmt`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_rmt
```

or

```
PRIV_REQUIRES esp_driver_rmt
```

Functions

`esp_err_t rmt_new_rx_channel` (const `rmt_rx_channel_config_t` *config, `rmt_channel_handle_t` *ret_chan)

Create a RMT RX channel.

Parameters

- **config** -- [in] RX channel configurations
- **ret_chan** -- [out] Returned generic RMT channel handle

Returns

- `ESP_OK`: Create RMT RX channel successfully
- `ESP_ERR_INVALID_ARG`: Create RMT RX channel failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create RMT RX channel failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create RMT RX channel failed because all RMT channels are used up and no more free one
- `ESP_ERR_NOT_SUPPORTED`: Create RMT RX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- `ESP_FAIL`: Create RMT RX channel failed because of other error

`esp_err_t rmt_receive` (`rmt_channel_handle_t` rx_channel, void *buffer, size_t buffer_size, const `rmt_receive_config_t` *config)

Initiate a receive job for RMT RX channel.

Note: This function is non-blocking, it initiates a new receive job and then returns. User should check the received data from the `on_recv_done` callback that registered by `rmt_rx_register_event_callbacks()`.

Note: This function can also be called in ISR context.

Note: If you want this function to work even when the flash cache is disabled, please enable the `CONFIG_RMT_RECV_FUNC_IN_IRAM` option.

Parameters

- **rx_channel** -- [in] RMT RX channel that created by `rmt_new_rx_channel()`
- **buffer** -- [in] The buffer to store the received RMT symbols
- **buffer_size** -- [in] size of the buffer, in bytes
- **config** -- [in] Receive specific configurations

Returns

- `ESP_OK`: Initiate receive job successfully
- `ESP_ERR_INVALID_ARG`: Initiate receive job failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Initiate receive job failed because channel is not enabled
- `ESP_FAIL`: Initiate receive job failed because of other error

esp_err_t **rmt_rx_register_event_callbacks** (*rmt_channel_handle_t* rx_channel, const *rmt_rx_event_callbacks_t* *cbs, void *user_data)

Set callbacks for RMT RX channel.

Note: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

Note: When `CONFIG_RMT_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

Parameters

- **rx_channel** -- [in] RMT generic channel that created by `rmt_new_rx_channel()`
- **cbs** -- [in] Group of callback functions
- **user_data** -- [in] User data, which will be passed to callback functions directly

Returns

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_FAIL`: Set event callbacks failed because of other error

Structures

struct **rmt_rx_event_callbacks_t**

Group of RMT RX callbacks.

Note: The callbacks are all running under ISR environment

Note: When `CONFIG_RMT_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

Public Members

rmt_rx_done_callback_t **on_recv_done**

Event callback, invoked when the RMT channel reception is finished or partial data is received

struct **rmt_rx_channel_config_t**

RMT RX channel specific configuration.

Public Members

gpio_num_t **gpio_num**

GPIO number used by RMT RX channel. Set to -1 if unused

rmt_clock_source_t **clk_src**

Clock source of RMT RX channel, channels in the same group must use the same clock source

uint32_t **resolution_hz**

Channel clock resolution, in Hz

size_t **mem_block_symbols**

Size of memory block, in number of *rmt_symbol_word_t*, must be an even. In the DMA mode, this field controls the DMA buffer size, it can be set to a large value (e.g. 1024); In the normal mode, this field controls the number of RMT memory block that will be used by the channel.

int **intr_priority**

RMT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t **invert_in**

Whether to invert the incoming RMT channel signal

uint32_t **with_dma**

If set, the driver will allocate an RMT channel with DMA capability

uint32_t **io_loop_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32_t **allow_pd**

If set, driver allows the power domain to be powered off when system enters sleep mode. This can save power, but at the expense of more RAM being consumed to save register context.

struct *rmt_rx_channel_config_t*::[anonymous] **flags**

RX channel config flags

struct **rmt_receive_config_t**

RMT receive specific configuration.

Public Members

uint32_t **signal_range_min_ns**

A pulse whose width is smaller than this threshold will be treated as glitch and ignored

uint32_t **signal_range_max_ns**

RMT will stop receiving if one symbol level has kept more than *signal_range_max_ns*

struct *rmt_receive_config_t*::*extra_rmt_receive_flags* **flags**

Receive specific config flags

struct **extra_rmt_receive_flags**

Receive specific flags.

Public Members

uint32_t en_partial_rx

Set this flag if the incoming data is very long, and the driver can only receive the data piece by piece, because the user buffer is not sufficient to save all the data.

Header File

- [components/esp_driver_rmt/include/driver/rmt_common.h](#)
- This header file can be included with:

```
#include "driver/rmt_common.h"
```

- This header file is a part of the API provided by the `esp_driver_rmt` component. To declare that your component depends on `esp_driver_rmt`, add the following to your `CMakeLists.txt`:

REQUIRES esp_driver_rmt
```

or

```
PRIV_REQUIRES esp_driver_rmt
```

Functions

[esp_err_t rmt_del_channel](#) ([rmt_channel_handle_t](#) channel)

Delete an RMT channel.

Parameters **channel** -- **[in]** RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

Returns

- `ESP_OK`: Delete RMT channel successfully
- `ESP_ERR_INVALID_ARG`: Delete RMT channel failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Delete RMT channel failed because it is still in working
- `ESP_FAIL`: Delete RMT channel failed because of other error

[esp_err_t rmt_apply_carrier](#) ([rmt_channel_handle_t](#) channel, const [rmt_carrier_config_t](#) *config)

Apply modulation feature for TX channel or demodulation feature for RX channel.

Parameters

- **channel** -- **[in]** RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`
- **config** -- **[in]** Carrier configuration. Specially, a NULL config means to disable the carrier modulation or demodulation feature

Returns

- `ESP_OK`: Apply carrier configuration successfully
- `ESP_ERR_INVALID_ARG`: Apply carrier configuration failed because of invalid argument
- `ESP_FAIL`: Apply carrier configuration failed because of other error

[esp_err_t rmt_enable](#) ([rmt_channel_handle_t](#) channel)

Enable the RMT channel.

Note: This function will acquire a PM lock that might be installed during channel allocation

Parameters **channel** -- **[in]** RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

Returns

- `ESP_OK`: Enable RMT channel successfully
- `ESP_ERR_INVALID_ARG`: Enable RMT channel failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Enable RMT channel failed because it's enabled already
- `ESP_FAIL`: Enable RMT channel failed because of other error

esp_err_t **rmt_disable** (*rmt_channel_handle_t* channel)

Disable the RMT channel.

Note: This function will release a PM lock that might be installed during channel allocation

Parameters **channel** -- **[in]** RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

Returns

- `ESP_OK`: Disable RMT channel successfully
- `ESP_ERR_INVALID_ARG`: Disable RMT channel failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable RMT channel failed because it's not enabled yet
- `ESP_FAIL`: Disable RMT channel failed because of other error

Structures

struct **rmt_carrier_config_t**

RMT carrier wave configuration (for either modulation or demodulation)

Public Members

uint32_t **frequency_hz**

Carrier wave frequency, in Hz, 0 means disabling the carrier

float **duty_cycle**

Carrier wave duty cycle (0~100%)

uint32_t **polarity_active_low**

Specify the polarity of carrier, by default it's modulated to base signal's high level

uint32_t **always_on**

If set, the carrier can always exist even there's not transfer undergoing

struct *rmt_carrier_config_t*::[anonymous] **flags**

Carrier config flags

Header File

REQUIRES esp_driver_rmt
```

or

```
PRIV_REQUIRES esp_driver_rmt
```

Functions

esp_err_t **rmt_new_bytes_encoder** (const *rmt_bytes_encoder_config_t* *config, *rmt_encoder_handle_t* *ret_encoder)

Create RMT bytes encoder, which can encode byte stream into RMT symbols.

Parameters

- **config** -- **[in]** Bytes encoder configuration
- **ret_encoder** -- **[out]** Returned encoder handle

Returns

- ESP_OK: Create RMT bytes encoder successfully
- ESP_ERR_INVALID_ARG: Create RMT bytes encoder failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT bytes encoder failed because out of memory
- ESP_FAIL: Create RMT bytes encoder failed because of other error

esp_err_t **rmt_bytes_encoder_update_config** (*rmt_encoder_handle_t* bytes_encoder, const *rmt_bytes_encoder_config_t* *config)

Update the configuration of the bytes encoder.

Note: The configurations of the bytes encoder is also set up by `rmt_new_bytes_encoder()`. This function is used to update the configuration of the bytes encoder at runtime.

Parameters

- **bytes_encoder** -- **[in]** Bytes encoder handle, created by e.g. `rmt_new_bytes_encoder()`
- **config** -- **[in]** Bytes encoder configuration

Returns

- ESP_OK: Update RMT bytes encoder successfully
- ESP_ERR_INVALID_ARG: Update RMT bytes encoder failed because of invalid argument
- ESP_FAIL: Update RMT bytes encoder failed because of other error

esp_err_t **rmt_new_copy_encoder** (const *rmt_copy_encoder_config_t* *config, *rmt_encoder_handle_t* *ret_encoder)

Create RMT copy encoder, which copies the given RMT symbols into RMT memory.

Parameters

- **config** -- **[in]** Copy encoder configuration
- **ret_encoder** -- **[out]** Returned encoder handle

Returns

- ESP_OK: Create RMT copy encoder successfully
- ESP_ERR_INVALID_ARG: Create RMT copy encoder failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT copy encoder failed because out of memory
- ESP_FAIL: Create RMT copy encoder failed because of other error

esp_err_t **rmt_new_simple_encoder** (const *rmt_simple_encoder_config_t* *config, *rmt_encoder_handle_t* *ret_encoder)

Create RMT simple callback encoder, which uses a callback to convert incoming data into RMT symbols.

Parameters

- **config** -- **[in]** Simple callback encoder configuration
- **ret_encoder** -- **[out]** Returned encoder handle

Returns

- ESP_OK: Create RMT simple callback encoder successfully
- ESP_ERR_INVALID_ARG: Create RMT simple callback encoder failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT simple callback encoder failed because out of memory

- ESP_FAIL: Create RMT simple callback encoder failed because of other error

esp_err_t **rmt_del_encoder** (*rmt_encoder_handle_t* encoder)

Delete RMT encoder.

Parameters **encoder** -- [in] RMT encoder handle, created by e.g
`rmt_new_bytes_encoder()`

Returns

- ESP_OK: Delete RMT encoder successfully
- ESP_ERR_INVALID_ARG: Delete RMT encoder failed because of invalid argument
- ESP_FAIL: Delete RMT encoder failed because of other error

esp_err_t **rmt_encoder_reset** (*rmt_encoder_handle_t* encoder)

Reset RMT encoder.

Parameters **encoder** -- [in] RMT encoder handle, created by e.g
`rmt_new_bytes_encoder()`

Returns

- ESP_OK: Reset RMT encoder successfully
- ESP_ERR_INVALID_ARG: Reset RMT encoder failed because of invalid argument
- ESP_FAIL: Reset RMT encoder failed because of other error

void ***rmt_alloc_encoder_mem** (size_t size)

A helper function to allocate a proper memory for RMT encoder.

Parameters **size** -- Size of memory to be allocated

Returns Pointer to the allocated memory if the allocation is successful, NULL otherwise

Structures

struct **rmt_encoder_t**

Interface of RMT encoder.

Public Members

size_t (***encode**)(*rmt_encoder_t* *encoder, *rmt_channel_handle_t* tx_channel, const void *primary_data, size_t data_size, *rmt_encode_state_t* *ret_state)

Encode the user data into RMT symbols and write into RMT memory.

Note: The encoding function will also be called from an ISR context, thus the function must not call any blocking API.

Note: It's recommended to put this function implementation in the IRAM, to achieve a high performance and less interrupt latency.

Param encoder [in] Encoder handle

Param tx_channel [in] RMT TX channel handle, returned from
`rmt_new_tx_channel()`

Param primary_data [in] App data to be encoded into RMT symbols

Param data_size [in] Size of primary_data, in bytes

Param ret_state [out] Returned current encoder's state

Return Number of RMT symbols that the primary data has been encoded into

esp_err_t (***reset**)(*rmt_encoder_t* *encoder)

Reset encoding state.

Param encoder [in] Encoder handle

Return

- ESP_OK: reset encoder successfully
- ESP_FAIL: reset encoder failed

esp_err_t (***del**)(*rmt_encoder_t* *encoder)

Delete encoder object.

Param encoder [in] Encoder handle

Return

- ESP_OK: delete encoder successfully
- ESP_FAIL: delete encoder failed

struct **rmt_bytes_encoder_config_t**

Bytes encoder configuration.

Public Members

rmt_symbol_word_t **bit0**

How to represent BIT0 in RMT symbol

rmt_symbol_word_t **bit1**

How to represent BIT1 in RMT symbol

uint32_t **msb_first**

Whether to encode MSB bit first

struct *rmt_bytes_encoder_config_t*::[anonymous] **flags**

Encoder config flag

struct **rmt_copy_encoder_config_t**

Copy encoder configuration.

struct **rmt_simple_encoder_config_t**

Simple callback encoder configuration.

Public Members

rmt_encode_simple_cb_t **callback**

Callback to call for encoding data into RMT items

void ***arg**

Opaque user-supplied argument for callback

size_t **min_chunk_size**

Minimum amount of free space, in RMT symbols, the encoder needs in order to guarantee it always returns non-zero. Defaults to 64 if zero / not given.

Type Definitions

```
typedef size_t (*rmt_encode_simple_cb_t)(const void *data, size_t data_size, size_t symbols_written,
size_t symbols_free, rmt_symbol_word_t *symbols, bool *done, void *arg)
```

Callback for simple callback encoder.

This will get called to encode the data stream of given length (as passed to `rmt_transmit` by the user) into symbols to be sent by the hardware.

The callback will be initially called with `symbol_pos=0`. If the callback encodes `N` symbols and finishes, the next callback will always be with `symbols_written=N`. If the callback then encodes `M` symbols, the next callback will always be with `symbol_pos=N+M`, etc. The only exception is when the encoder is reset (e.g. to begin a new transaction) in which case `symbol_pos` will always restart at 0.

If the amount of free space in the symbol buffer (as indicated by `symbols_free`) is too low, the function can return 0 as result and the RMT will call the function again once there is more space available. Note that the callback should eventually return non-0 if called with free space of `rmt_simple_encoder_config_t::min_chunk_size` or more. It is acceptable to return 0 for a given free space `N`, then on the next call (possibly with a larger free buffer space) return less or more than `N` symbols.

When the transaction is done (all `data_size` data is encoded), the callback can indicate this by setting `*done` to true. This can either happen on the last callback call that returns an amount of symbols encoded, or on a callback that returns zero. In either case, the callback will not be called again for this transaction.

Param data [in] Data pointer, as passed to `rmt_transmit()`

Param data_size [in] Size of the data, as passed to `rmt_transmit()`

Param symbols_written [in] Current position in encoded stream, in symbols

Param symbols_free [in] The maximum amount of symbols that can be written into the `symbols` buffer

Param symbols [out] Symbols to be sent to the RMT hardware

Param done [out] Setting this to true marks this transaction as finished

Param arg Opaque argument

Return Amount of symbols encoded in this callback round. 0 if more space is needed.

Enumerations

```
enum rmt_encode_state_t
```

RMT encoding state.

Values:

```
enumerator RMT_ENCODING_RESET
```

The encoding session is in reset state

```
enumerator RMT_ENCODING_COMPLETE
```

The encoding session is finished, the caller can continue with subsequent encoding

```
enumerator RMT_ENCODING_MEM_FULL
```

The encoding artifact memory is full, the caller should return from current encoding session

Header File

- `components/esp_driver_rmt/include/driver/rmt_types.h`
- This header file can be included with:

```
#include "driver/rmt_types.h"
```

- This header file is a part of the API provided by the `esp_driver_rmt` component. To declare that your component depends on `esp_driver_rmt`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_rmt
```

or

```
PRIV_REQUIRES esp_driver_rmt
```

Structures

struct **rmt_tx_done_event_data_t**

Type of RMT TX done event data.

Public Members

size_t **num_symbols**

The number of transmitted RMT symbols, including one EOF symbol, which is appended by the driver to mark the end of a transmission. For a loop transmission, this value only counts for one round.

struct **rmt_rx_done_event_data_t**

Type of RMT RX done event data.

Public Members

rmt_symbol_word_t ***received_symbols**

Point to the received RMT symbols

size_t **num_symbols**

The number of received RMT symbols

uint32_t **is_last**

Indicating if the current received data are the last part of the transaction

struct *rmt_rx_done_event_data_t*::[anonymous] **flags**

Extra flags

Type Definitions

typedef struct *rmt_channel_t* ***rmt_channel_handle_t**

Type of RMT channel handle.

typedef struct *rmt_sync_manager_t* ***rmt_sync_manager_handle_t**

Type of RMT synchronization manager handle.

typedef struct *rmt_encoder_t* ***rmt_encoder_handle_t**

Type of RMT encoder handle.

typedef bool (***rmt_tx_done_callback_t**)(*rmt_channel_handle_t* tx_chan, const *rmt_tx_done_event_data_t* *edata, void *user_ctx)

Prototype of RMT event callback.

Param tx_chan [in] RMT channel handle, created from `rmt_new_tx_channel()`

Param edata [in] Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.

Param user_ctx [in] User registered context, passed from `rmt_tx_register_event_callbacks()`

Return Whether a high priority task has been waken up by this callback function

```
typedef bool (*rmt_rx_done_callback_t)(rmt_channel_handle_t rx_chan, const  
rmt_rx_done_event_data_t *edata, void *user_ctx)
```

Prototype of RMT event callback.

Param rx_chan [in] RMT channel handle, created from `rmt_new_rx_channel()`

Param edata [in] Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.

Param user_ctx [in] User registered context, passed from `rmt_rx_register_event_callbacks()`

Return Whether a high priority task has been waken up by this function

Header File

- [components/hal/include/hal/rmt_types.h](#)
- This header file can be included with:

```
#include "hal/rmt_types.h"
```

Unions

```
union rmt_symbol_word_t
```

`#include <rmt_types.h>` The layout of RMT symbol stored in memory, which is decided by the hardware design.

Public Members

`uint16_t duration0`

Duration of level0

`uint16_t level0`

Level of the first part

`uint16_t duration1`

Duration of level1

`uint16_t level1`

Level of the second part

struct `rmt_symbol_word_t`::[anonymous] [**anonymous**]

`uint32_t val`

Equivalent unsigned value for the RMT symbol

Type Definitions

typedef *soc_periph_rmt_clk_src_t* **rmt_clock_source_t**

RMT group clock source.

Note: User should select the clock source based on the power and resolution requirement

2.6.20 SD SPI Host Driver

Overview

The SD SPI host driver allows communication with one or more SD cards using the SPI Master driver, which utilizes the SPI host. Each card is accessed through an SD SPI device, represented by an SD SPI handle *sdspi_dev_handle_t*, which returns when the device is attached to an SPI bus by calling *sdspi_host_init_device()*. It is important to note that the SPI bus should be initialized beforehand by *spi_bus_initialize()*.

With the help of *SPI Master Driver* the SD SPI host driver based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks.

The SD SPI driver uses software-controlled CS signal.

How to Use

Firstly, use the macro *SDSPI_DEVICE_CONFIG_DEFAULT* to initialize the structure *sdspi_device_config_t*, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which are the same as the pin mappings of the SDMMC host driver. Modify the host and pins of the structure to desired value. Then call *sdspi_host_init_device* to initialize the SD SPI device and attach to its bus.

Then use the *SDSPI_HOST_DEFAULT* macro to initialize the *sdmmc_host_t* structure, which is used to store the state and configurations of the upper layer (SD/SDIO/MMC driver). Modify the *slot* parameter of the structure to the SD SPI device SD SPI handle just returned from *sdspi_host_init_device*. Call *sdmmc_card_init* with the *sdmmc_host_t* to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!

Other Details

Only the following driver's API functions are normally used by most applications:

- *sdspi_host_init()*
- *sdspi_host_init_device()*
- *sdspi_host_remove_device()*
- *sdspi_host_deinit()*

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the *sdmmc_host_t* structure. For more details, see *SD/SDIO/MMC Driver*.

Note: SD over SPI does not support speeds above *SDMMC_FREQ_DEFAULT* due to the limitations of the SPI driver.

Warning: If you want to share the SPI bus among SD card and other SPI devices, there are some restrictions, see *Sharing the SPI Bus Among SD Cards and Other SPI Devices*.

Sharing the SPI Bus Among SD Cards and Other SPI Devices

The SD card has an SPI mode, enabling it to function as an SPI device, but there are some restrictions that we need to pay attention to.

Pin Loading of Other Devices When adding more devices onto the same bus, the overall pin loading increases. The loading consists of AC loading (pin capacitor) and DC loading (pull-ups).

AC Loading SD cards, designed for high-speed communications, have small pin capacitors (AC loading) to work until 50 MHz. However, the other attached devices will increase the pin's AC loading.

Heavy AC loading of a pin may prevent the pin from being toggled quickly. By using an oscilloscope, you will see the edges of the pin become smoother, i.e., the gradient of the edge is smaller. The setup timing requirements of an SD card may be violated when the card is connected to a bus with a high AC load. Even worse, high AC loads may cause the SD card and other SPI devices to fail to properly resolve clock signals from the host, affecting communication stability.

This issue may be more obvious if other attached devices are not designed to work at the same frequency as the SD card, because they may have larger pin capacitors. The larger the pin capacity, the greater the pin response time, the smaller the max frequency the SD bus can work.

To see if your pin AC loading is too heavy, you can try the following tests:

Terminology:

- **launch edge:** at which clock edge the data starts to toggle;
- **latch edge:** at which clock edge the data is supposed to be sampled by the receiver. For SD card, it is the rising edge.

1. Use an oscilloscope to see the clock and compare the data line to the clock.
 - If you see the clock is not fast enough, e.g., the rising/falling edge is longer than 1/4 of the clock cycle, it means the clock is skewed too much.
 - If you see the data line unstable before the latch edge of the clock, it means the load of the data line is too large.

You may also observe the corresponding phenomenon that data delayed largely from the launching edge of the clock with logic analyzers. But it is not as obvious as with an oscilloscope.

2. Try to use a slower clock frequency.

If the lower frequency can work while the higher frequency cannot, it is an indication that the AC loading on the pins is too large.

If the AC loading of the pins is too large, you can either use other faster devices with lower pin load or slow down the clock speed.

DC Loading The pull-ups required by SD cards are usually around 10 kOhm to 50 kOhm, which may be too strong for some other SPI devices.

Check the specification of your device about its DC output current, it should be larger than 700 μ A, otherwise, the device output may not be read correctly.

Initialization Sequence

Note: If you see any problem in the following steps, please make sure the timing is correct first. You can try to slow down the clock speed, such as setting `SDMMC_FREQ_PROBING` to 400 kHz for SD card, to avoid the influence of pin AC loading, as discussed in the previous section.

When using an SD card with other SPI devices on the same SPI bus, due to the restrictions of the SD card startup flow, the following initialization sequence should be followed. Refer to [storage/sd_card](#) for further details.

1. Initialize the SPI bus properly by `spi_bus_initialize()`.
2. Tie the CS lines of all other devices than the SD card to idle state (by default it's high). This is to avoid conflicts with the SD card in the following step.

You can do this by either:

1. Attach devices to the SPI bus by calling `spi_bus_add_device()`. This function will by default initialize the GPIO that is used as CS to the idle level: high.
 2. Initialize GPIO on the CS pin that needs to be tied up before actually adding a new device.
 3. Rely on the internal/external pull-up (**not recommended**) to pull up all the CS pins when the GPIOs of ESP are not initialized yet. You need to check carefully the pull-up is strong enough and there are no other pull-downs that will influence the pull-up. For example, internal pull-down should be enabled.
3. Mount the card to the filesystem by calling `esp_vfs_fat_sdspi_mount()`. This step will put the SD card into the SPI mode, which **should** be done before all other SPI communications on the same bus. Otherwise, the card will stay in the SD mode, in which mode it may randomly respond to any SPI communications on the bus, even when its CS line is not addressed.
- If you want to test this behavior, please also note that, once the card is put into SPI mode, it will not return to SD mode before the next power cycle, i.e., powered down and powered up again.
4. Now you can talk to other SPI devices freely!

API Reference

Header File

- `components/esp_driver_sdspi/include/driver/sdspi_host.h`
- This header file can be included with:

```
#include "driver/sdspi_host.h"
```

- This header file is a part of the API provided by the `esp_driver_sdspi` component. To declare that your component depends on `esp_driver_sdspi`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_sdspi
```

or

```
PRIV_REQUIRES esp_driver_sdspi
```

Functions

`esp_err_t sdspi_host_init` (void)

Initialize SD SPI driver.

Note: This function is not thread safe

Returns

- `ESP_OK` on success
- other error codes may be returned in future versions

`esp_err_t sdspi_host_init_device` (const `sdspi_device_config_t` *dev_config, `sdspi_dev_handle_t` *out_handle)

Attach and initialize an SD SPI device on the specific SPI bus.

Note: This function is not thread safe

Note: Initialize the SPI bus by `spi_bus_initialize()` before calling this function.

Note: The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

Parameters

- **dev_config** -- pointer to device configuration structure
- **out_handle** -- Output of the handle to the sdspi device.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if `sdspi_host_init_device` has invalid arguments
- ESP_ERR_NO_MEM if memory can not be allocated
- other errors from the underlying `spi_master` and `gpio` drivers

esp_err_t **sdspi_host_remove_device** (*sdspi_dev_handle_t* handle)

Remove an SD SPI device.

Parameters **handle** -- Handle of the SD SPI device

Returns Always ESP_OK

esp_err_t **sdspi_host_do_transaction** (*sdspi_dev_handle_t* handle, `sdmmc_command_t *cmdinfo`)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

Note: This function is not thread safe w.r.t. `init/deinit` functions, and bus width/clock speed configuration functions. Multiple tasks can call `sdspi_host_do_transaction` as long as other `sdspi_host_*` functions are not called.

Parameters

- **handle** -- Handle of the sdspi device
- **cmdinfo** -- pointer to structure describing command and data to transfer

Returns

- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
- ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response

esp_err_t **sdspi_host_set_card_clk** (*sdspi_dev_handle_t* host, `uint32_t freq_khz`)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

Note: This function is not thread safe

Parameters

- **host** -- Handle of the sdspi device
- **freq_khz** -- card clock frequency, in kHz

Returns

- ESP_OK on success
- other error codes may be returned in the future

esp_err_t **sdspi_host_get_real_freq** (*sdspi_dev_handle_t* handle, int *real_freq_khz)

Calculate working frequency for specific device.

Parameters

- **handle** -- SDSPI device handle
- **real_freq_khz** -- [out] output parameter to hold the calculated frequency (in kHz)

Returns

- ESP_ERR_INVALID_ARG : handle is NULL or invalid or real_freq_khz parameter is NULL
- ESP_OK : Success

esp_err_t **sdspi_host_deinit** (void)

Release resources allocated using sdspi_host_init.

Note: This function is not thread safe

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdspi_host_init function has not been called

esp_err_t **sdspi_host_io_int_enable** (*sdspi_dev_handle_t* handle)

Enable SDIO interrupt.

Parameters **handle** -- Handle of the sdspi device

Returns

- ESP_OK on success

esp_err_t **sdspi_host_io_int_wait** (*sdspi_dev_handle_t* handle, TickType_t timeout_ticks)

Wait for SDIO interrupt until timeout.

Parameters

- **handle** -- Handle of the sdspi device
- **timeout_ticks** -- Ticks to wait before timeout.

Returns

- ESP_OK on success

esp_err_t **sdspi_host_get_dma_info** (int slot, esp_dma_mem_info_t *dma_mem_info)

Get the DMA memory information for the host driver.

Parameters

- **slot** -- [in] Not used
- **dma_mem_info** -- [out] DMA memory information structure

Returns

- ESP_OK: ON success.
- ESP_ERR_INVALID_ARG: Invalid argument.

Structures

struct **sdspi_device_config_t**

Extra configuration for SD SPI device.

Public Members

spi_host_device_t **host_id**

SPI host to use, SPIx_HOST (see spi_types.h).

gpio_num_t **gpio_cs**

GPIO number of CS signal.

gpio_num_t **gpio_cd**

GPIO number of card detect signal.

gpio_num_t **gpio_wp**

GPIO number of write protect signal.

gpio_num_t **gpio_int**

GPIO number of interrupt line (input) for SDIO card.

bool **gpio_wp_polarity**

GPIO write protect polarity 0 means "active low", i.e. card is protected when the GPIO is low; 1 means "active high", i.e. card is protected when GPIO is high.

uint16_t **duty_cycle_pos**

Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

Macros

SDSPI_DEFAULT_HOST

SDSPI_DEFAULT_DMA

SDSPI_HOST_DEFAULT ()

Default sdmmc_host_t structure initializer for SD over SPI driver.

Uses SPI mode and max frequency set to 20MHz

'slot' should be set to an sdspi device initialized by sdspi_host_init_device ().

SDSPI_SLOT_NO_CS

indicates that card select line is not used

SDSPI_SLOT_NO_CD

indicates that card detect line is not used

SDSPI_SLOT_NO_WP

indicates that write protect line is not used

SDSPI_SLOT_NO_INT

indicates that interrupt line is not used

SDSPI_IO_ACTIVE_LOW

SDSPI_DEVICE_CONFIG_DEFAULT ()

Macro defining default configuration of SD SPI device.

Type Definitions

```
typedef int sdspi_dev_handle_t
    Handle representing an SD SPI device.
```

2.6.21 Sigma-Delta Modulation (SDM)

Introduction

ESP32-C5 has a second-order sigma-delta modulator, which can generate independent PDM pulses to multiple channels. Please refer to the TRM to check how many hardware channels are available.¹

Delta-sigma modulation converts an analog voltage signal into a pulse frequency, or pulse density, which can be understood as pulse-density modulation (PDM) (refer to [Delta-sigma modulation on Wikipedia](#)).

Typically, a Sigma-Delta modulated channel can be used in scenarios like:

- LED dimming
- Simple DAC (8-bit), with the help of an active RC low-pass filter
- Class D amplifier, with the help of a half-bridge or full-bridge circuit plus an LC low-pass filter

Functional Overview

The following sections of this document cover the typical steps to install and operate an SDM channel:

- *Resource Allocation* - covers how to initialize and configure an SDM channel and how to recycle the resources when it finishes working.
- *Enable and Disable Channel* - covers how to enable and disable the channel.
- *Set Pulse Density* - describes how to set the equivalent duty cycle of the PDM pulses.
- *Power Management* - describes how different source clock selections can affect power consumption.
- *IRAM Safe* - lists which functions are supposed to work even when the cache is disabled.
- *Thread Safety* - lists which APIs are guaranteed to be thread-safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

Resource Allocation In ESP-IDF, the information and attributes of SDM channels are managed and accessed through specific data structures, where the data structure is called `sdm_channel_handle_t`. Each channel is capable to output the binary, hardware-generated signal with the sigma-delta modulation. The driver manages all available channels in a pool so that there is no need to manually assign a fixed channel to a GPIO.

To install an SDM channel, you should call `sdm_new_channel()` to get a channel handle. Channel-specific configurations are passed in the `sdm_config_t` structure:

- `sdm_config_t::gpio_num` sets the GPIO that the PDM pulses output from.
- `sdm_config_t::clk_src` selects the source clock for the SDM module. Note that, all channels should select the same clock source.
- `sdm_config_t::sample_rate_hz` sets the sample rate of the SDM module. A higher sample rate can help to output signals with higher SNR (Signal to Noise Ratio), and easier to restore the original signal after the filter.
- `sdm_config_t::invert_out` sets whether to invert the output signal.

¹ Different ESP chip series might have different numbers of SDM channels. Please refer to Chapter [GPIO and IOMUX](#) in ESP32-C5 Technical Reference Manual for more details. The driver does not forbid you from applying for more channels, but it will return an error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g., `sdm_new_channel()`).

The function `sdm_new_channel()` can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free channels (i.e., all hardware SDM channels have been used up), `ESP_ERR_NOT_FOUND` will be returned.

If a previously created SDM channel is no longer required, you should recycle it by calling `sdm_del_channel()`. It allows the underlying HW channel to be used for other purposes. Before deleting an SDM channel handle, you should disable it by `sdm_channel_disable()` in advance or make sure it has not been enabled yet by `sdm_channel_enable()`.

Creating an SDM Channel with a Sample Rate of 1 MHz

```
sdm_channel_handle_t chan = NULL;
sdm_config_t config = {
    .clk_src = SDM_CLK_SRC_DEFAULT,
    .sample_rate_hz = 1 * 1000 * 1000,
    .gpio_num = 0,
};
ESP_ERROR_CHECK(sdm_new_channel(&config, &chan));
```

Enable and Disable Channel Before doing further IO control to the SDM channel, you should enable it first, by calling `sdm_channel_enable()`. Internally, this function:

- switches the channel state from **init** to **enable**
- acquires a proper power management lock if a specific clock source (e.g., APB clock) is selected. See also [Power Management](#) for more information.

On the contrary, calling `sdm_channel_disable()` does the opposite, that is, put the channel back to the **init** state and releases the power management lock.

Set Pulse Density For the output PDM signals, the pulse density decides the output analog voltage that is restored by a low-pass filter. The restored analog voltage from the channel is calculated by $V_{out} = VDD_{IO} / 256 * duty + VDD_{IO} / 2$. The range of the quantized density input parameter of `sdm_channel_set_pulse_density()` is from -128 to 127 (8-bit signed integer). Depending on the value of the `density` parameter, the duty cycle of the output signal will be changed accordingly. For example, if a zero value is set, then the output signal's duty will be around 50%.

Power Management When power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will adjust the APB frequency before going into Light-sleep, thus potentially changing the sample rate of the sigma-delta modulator.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever the driver creates an SDM channel instance that has selected `SDM_CLK_SRC_APB` as its clock source, the driver guarantees that the power management lock is acquired when enabling the channel by `sdm_channel_enable()`. Likewise, the driver releases the lock when `sdm_channel_disable()` is called for that channel.

IRAM Safe There is a Kconfig option `CONFIG_SDM_CTRL_FUNC_IN_IRAM` that can put commonly-used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are listed as follows:

- `sdm_channel_set_pulse_density()`

Thread Safety The factory function `sdm_new_channel()` is guaranteed to be thread-safe by the driver, which means, the user can call it from different RTOS tasks without protection by extra locks.

The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

- `sdm_channel_set_pulse_density()`

Other functions that take the `sdm_channel_handle_t` as the first positional parameter, are not treated as thread-safe. This means the user should avoid calling them from multiple tasks.

Kconfig Options

- `CONFIG_SDM_CTRL_FUNC_IN_IRAM` controls where to place the SDM channel control functions (IRAM or Flash), see *IRAM Safe* for more information.
- `CONFIG_SDM_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enabling this option increases the firmware binary size.

Convert to an Analog Signal (Optional)

Typically, if a Sigma-Delta signal is connected to an LED to adjust the brightness, you do not have to add any filter between them, because our eyes have their own low-pass filters for changes in light intensity. However, if you want to check the real voltage or watch the analog waveform, you need to design an analog low-pass filter. Also, it is recommended to use an active filter instead of a passive filter to gain better isolation and not lose too much voltage.

For example, you can take the following Sallen-Key topology Low Pass Filter as a reference.

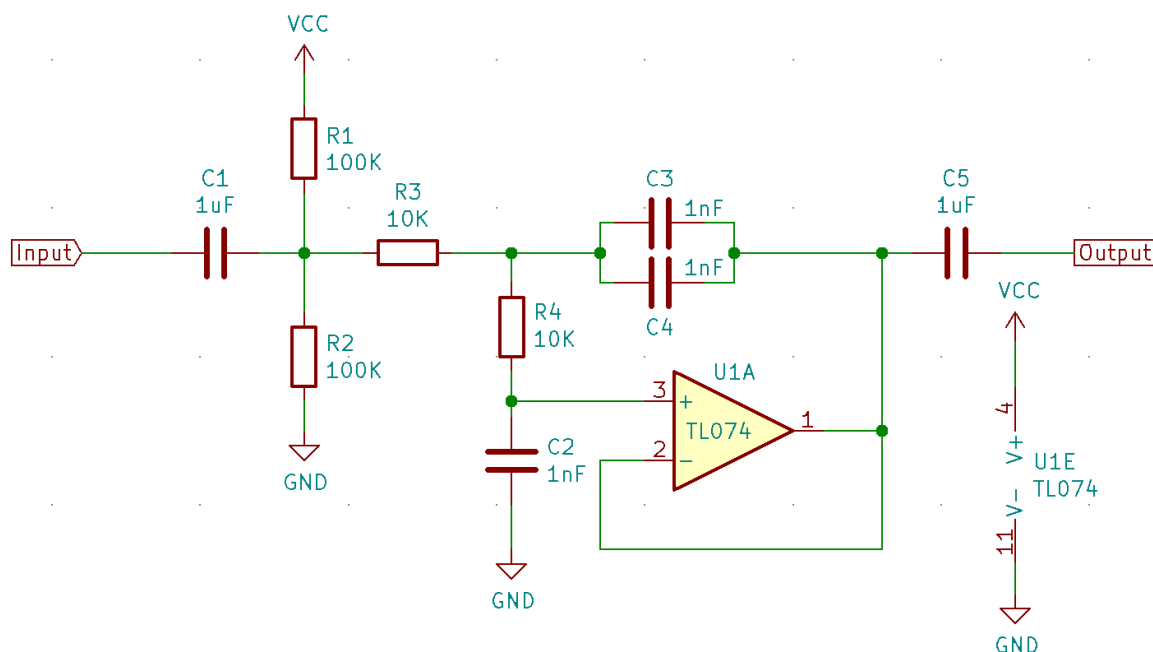

Fig. 26: Sallen-Key Low Pass Filter

(Refer to [peripherals/sigma_delta/sdm_dac/README.md](#) to see the waveforms before and after filtering.)

Application Examples

- [peripherals/sigma_delta/sdm_dac](#) demonstrates how to use the sigma-delta driver to act as an 8-bit DAC, and output a 100 Hz sine wave.
- [peripherals/sigma_delta/sdm_led](#) demonstrates how to use the sigma-delta driver to control the brightness of an LED or LCD backlight.

```

Functions

esp_err_t **sdm_new_channel** (const *sdm_config_t* *config, *sdm_channel_handle_t* *ret_chan)

Create a new Sigma Delta channel.

Parameters

- **config** -- [in] SDM configuration
- **ret_chan** -- [out] Returned SDM channel handle

Returns

- **ESP_OK**: Create SDM channel successfully
- **ESP_ERR_INVALID_ARG**: Create SDM channel failed because of invalid argument
- **ESP_ERR_NO_MEM**: Create SDM channel failed because out of memory
- **ESP_ERR_NOT_FOUND**: Create SDM channel failed because all channels are used up and no more free one
- **ESP_FAIL**: Create SDM channel failed because of other error

esp_err_t **sdm_del_channel** (*sdm_channel_handle_t* chan)

Delete the Sigma Delta channel.

Parameters **chan** -- [in] SDM channel created by `sdm_new_channel`

Returns

- **ESP_OK**: Delete the SDM channel successfully
- **ESP_ERR_INVALID_ARG**: Delete the SDM channel failed because of invalid argument
- **ESP_ERR_INVALID_STATE**: Delete the SDM channel failed because the channel is not in init state
- **ESP_FAIL**: Delete the SDM channel failed because of other error

esp_err_t **sdm_channel_enable** (*sdm_channel_handle_t* chan)

Enable the Sigma Delta channel.

Note: This function will transit the channel state from init to enable.

Note: This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the *sdm_config_t*, while `CONFIG_PM_ENABLE` is enabled.

Parameters **chan** -- [in] SDM channel created by `sdm_new_channel`

Returns

- **ESP_OK**: Enable SDM channel successfully
- **ESP_ERR_INVALID_ARG**: Enable SDM channel failed because of invalid argument
- **ESP_ERR_INVALID_STATE**: Enable SDM channel failed because the channel is already enabled

- `ESP_FAIL`: Enable SDM channel failed because of other error

`esp_err_t sdm_channel_disable(sdm_channel_handle_t chan)`

Disable the Sigma Delta channel.

Note: This function will do the opposite work to the `sdm_channel_enable()`

Parameters `chan` -- **[in]** SDM channel created by `sdm_new_channel`

Returns

- `ESP_OK`: Disable SDM channel successfully
- `ESP_ERR_INVALID_ARG`: Disable SDM channel failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable SDM channel failed because the channel is not enabled yet
- `ESP_FAIL`: Disable SDM channel failed because of other error

`esp_err_t sdm_channel_set_pulse_density(sdm_channel_handle_t chan, int8_t density)`

Set the pulse density of the PDM output signal.

Note: The raw output signal requires a low-pass filter to restore it into analog voltage, the restored analog output voltage could be $V_{out} = VDD_{IO} / 256 * density + VDD_{IO} / 2$

Note: This function is allowed to run within ISR context

Note: This function will be placed into IRAM if `CONFIG_SDM_CTRL_FUNC_IN_IRAM` is on, so that it's allowed to be executed when Cache is disabled

Parameters

- `chan` -- **[in]** SDM channel created by `sdm_new_channel`
- `density` -- **[in]** Quantized pulse density of the PDM output signal, ranges from -128 to 127. But the range of [-90, 90] can provide a better randomness.

Returns

- `ESP_OK`: Set pulse density successfully
- `ESP_ERR_INVALID_ARG`: Set pulse density failed because of invalid argument
- `ESP_FAIL`: Set pulse density failed because of other error

`esp_err_t sdm_channel_set_duty(sdm_channel_handle_t chan, int8_t duty)`

The alias function of `sdm_channel_set_pulse_density`, it decides the pulse density of the output signal.

Note: `sdm_channel_set_pulse_density` has a more appropriate name compare this alias function, suggest to turn to `sdm_channel_set_pulse_density` instead

Parameters

- `chan` -- **[in]** SDM channel created by `sdm_new_channel`
- `duty` -- **[in]** Actually it's the quantized pulse density of the PDM output signal

Returns

- `ESP_OK`: Set duty cycle successfully
- `ESP_ERR_INVALID_ARG`: Set duty cycle failed because of invalid argument
- `ESP_FAIL`: Set duty cycle failed because of other error

Structures

struct **sdm_config_t**

Sigma Delta channel configuration.

Public Members

int **gpio_num**

GPIO number

sdm_clock_source_t **clk_src**

Clock source

uint32_t **sample_rate_hz**

Over sample rate in Hz, it determines the frequency of the carrier pulses

uint32_t **invert_out**

Whether to invert the output signal

uint32_t **io_loop_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

struct *sdm_config_t*::[anonymous] **flags**

Extra flags

Type Definitions

typedef struct sdm_channel_t ***sdm_channel_handle_t**

Type of Sigma Delta channel handle.

Header File

- [components/hal/include/hal/sdm_types.h](#)
- This header file can be included with:

```
#include "hal/sdm_types.h"
```

Type Definitions

typedef *soc_periph_sdm_clk_src_t* **sdm_clock_source_t**

2.6.22 SPI Flash API

Overview

The `spi_flash` component contains API functions related to reading, writing, erasing, and memory mapping for data in the external flash.

For higher-level API functions which work with partitions defined in the *partition table*, see *Partitions API*

Note: `esp_partition_*` APIs are recommended to be used instead of the lower level `esp_flash_*` API functions when accessing the main SPI flash chip, since they conduct bounds checking and are guaranteed to calculate correct offsets in flash based on the information in the partition table. `esp_flash_*` functions can still be used directly when accessing an external (secondary) SPI flash chip.

Different from the API before ESP-IDF v4.0, the functionality of `esp_flash_*` APIs is not limited to the "main" SPI flash chip (the same SPI flash chip from which program runs). With different chip pointers, you can access external flash chips connected to not only SPI0/1 but also other SPI buses like SPI2.

Note: Instead of going through the cache connected to the SPI0 peripheral, most `esp_flash_*` APIs go through other SPI peripherals like SPI1, SPI2, etc. This makes them able to access not only the main flash, but also external (secondary) flash.

However, due to the limitations of the cache, operations through the cache are limited to the main flash. The address range limitation for these operations is also on the cache side. The cache is not able to access external flash chips or address range above its capabilities. These cache operations include: mmap, encrypted read/write, executing code or access to variables in the flash.

Note: Flash APIs after ESP-IDF v4.0 are no longer **atomic**. If a write operation occurs during another on-going read operation, and the flash addresses of both operations overlap, the data returned from the read operation may contain both old data and new data (that was updated written by the write operation).

Note: Encrypted flash operations are only supported with the main flash chip (and not with other flash chips, that is on SPI1 with different CS, or on other SPI buses). Reading through cache is only supported on the main flash, which is determined by the HW.

Support for Features of Flash Chips

Quad/Dual Mode Chips Features of different flashes are implemented in different ways and thus need special support. The fast/slow read and Dual mode (DOUT/DIO) of almost all flashes with 24-bit address are supported, because they do not need any vendor-specific commands.

Quad mode (QIO/QOUT) is supported on the following chip types:

1. ISSI
2. GD
3. MXIC
4. FM
5. Winbond
6. XMC
7. BOYA

Note: Only when one flash series listed above is supported by ESP32-C5, this flash series is supported by the chip driver by default. You can use `Component config > SPI Flash driver > Auto-detect flash chips` in `menuconfig` to enable/disable a flash series.

Optional Features

Optional Features for Flash

Some features are not supported on all ESP chips and flash chips. You can check the list below for more information:

- [Auto Suspend & Resume](#)
- [Flash Unique ID](#)
- [High Performance Mode of QSPI Flash Chips](#)
- [32-bit Address Support of QSPI Flash Chips](#)
- [OPI Flash Support](#)

Note: When Flash optional features listed in this page are used, aside from the capability of ESP chips and ESP-IDF version you are using, you will also need to make sure these features are supported by flash chips used:

- If you are using an official Espressif modules/SiP, please make sure that they support the above features by referring to the [datasheet](#). Otherwise, please contact [Espressif's business team](#) to know if we can supply such products for you.
 - If you are making your own modules with your own bought flash chips and need features listed above, please contact your vendor to see if they support those features, and make sure that the chips can be supplied continuously.
-

Attention: This document only shows that ESP-IDF code has supported the features of those flash chips. It is not a list of stable flash chips certified by Espressif. If you build your own hardware with your own bought flash chips (even with features listed in this page), you need to validate the reliability of flash chips yourself.

Auto Suspend & Resume This feature is only supported on ESP32-S3, ESP32-C2, ESP32-C3, ESP32-C6, and ESP32-H2 for now.

The support for ESP32-P4 may be added in the future.

List of flash chips that support this feature:

1. XM25QxxC series
2. GD25QxxE series
3. FM25Q32

Attention: There are multiple limitations about the auto-suspend feature, please do read [Flash Auto Suspend Feature](#) for more information before you enable this feature.

Flash Unique ID This feature is supported on all Espressif chips.

Unique ID is not flash id, which means flash has 64-bit unique ID for each device. The instruction to read the unique ID (4Bh) accesses a factory-set read-only 64-bit number that is unique to each flash device. This ID number helps you to recognize each device. Not all flash vendors support this feature. If you try to read the unique ID on a chip which does not have this feature, the behavior is not determined.

List of flash chips that support this feature:

1. ISSI
2. GD
3. TH
4. FM
5. Winbond
6. XMC
7. BOYA

High Performance Mode of QSPI Flash Chips This feature is only supported on ESP32-S3 for now.

The support for ESP32-S2, ESP32-C3, ESP32-C6, ESP32-H2, and ESP32-P4 may be added in the future.

Note: This section is provided for QSPI flash chips. Octal flash used on ESP-chips supports High Performance mode by default so far, please refer to *OPI Flash Support* for the list of supported octal flash chips.

32-bit Address Support of QSPI Flash Chips This feature is supported on all Espressif chips (see restrictions to application below).

Note: This section is provided for QSPI flash chips. The 32-bit address support of Octal flash chips are considered as part of the Octal flash support. Please refer to *OPI Flash Support* for the list of supported octal flash chips.

Most NOR flash chips used by Espressif chips use 24-bits address, which can cover 16 MB memory. However, for larger memory (usually equal to or larger than 32 MB), flash uses a 32-bits address to address memory region higher than 16 MB. Unfortunately, 32-bits address chips have vendor-specific commands, so we need to support the chips one by one.

List of Flash chips that support this feature:

1. W25Q256
2. GD25Q256

Restrictions

Important: Over 16 MB space on flash mentioned above can be only used for `data saving`, like file system.

Mapping data/instructions to 32-bit physical address space (so as to be accessed by the CPU) needs the support of MMU. However ESP32-C5 doesn't support this feature. Only ESP32-S3 and ESP32-P4 supports this up to now.

OPI Flash Support This feature is only supported on ESP32-S3 for now.

OPI flash means that the flash chip supports octal peripheral interface, which has octal I/O pins. Different octal flash has different configurations and different commands. Hence, it is necessary to carefully check the support list.

There are some features that are not supported by all flash chips, or not supported by all Espressif chips. These features include:

- 32-bit address flash - usually means that the flash has higher capacity (equal to or larger than 16 MB) that needs longer addresses.
- Flash unique ID - means that flash supports its unique 64-bit ID.
- Suspend & Resume - means that flash can accept suspend/resume command during its writing/erasing. The ESP32-C5 may keep the cache on when the flash is being written/erased and suspend it to read its contents randomly.

If you want to use these features, please ensure both ESP32-C5 and ALL flash chips in your product support these features. For more details, refer to *Optional Features for Flash*.

You may also customise your own flash chip driver. See *Overriding Default Chip Drivers* for more details.

Overriding Default Chip Drivers

Warning: Customizing SPI Flash Chip Drivers is considered an "expert" feature. Users should only do so at their own risk. (See the notes below)

During the SPI Flash driver's initialization (i.e., `esp_flash_init()`), there is a chip detection step during which the driver iterates through a Default Chip Driver List and determine which chip driver can properly support the currently connected flash chip. The Default Chip Drivers are provided by the ESP-IDF, thus are updated in together with each ESP-IDF version. However ESP-IDF also allows users to customize their own chip drivers.

Users should note the following when customizing chip drivers:

1. You may need to rely on some non-public ESP-IDF functions, which have slight possibility to change between ESP-IDF versions. On the one hand, these changes may be useful bug fixes for your driver, on the other hand, they may also be breaking changes (i.e., breaks your code).
2. Some ESP-IDF bug fixes to other chip drivers are not automatically applied to your own custom chip drivers.
3. If the protection of flash is not handled properly, there may be some random reliability issues.
4. If you update to a newer ESP-IDF version that has support for more chips, you will have to manually add those new chip drivers into your custom chip driver list. Otherwise the driver will only search for the drivers in custom list you provided.

Steps For Creating Custom Chip Drivers and Overriding the ESP-IDF Default Driver List

1. Enable the `CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST` config option. This prevents compilation and linking of the Default Chip Driver List (`default_registered_chips`) provided by ESP-IDF. Instead, the linker searches for the structure of the same name (`default_registered_chips`) that must be provided by the user.
2. Add a new component in your project, e.g., `custom_chip_driver`.
3. Copy the necessary chip driver files from the `spi_flash` component in ESP-IDF. This may include:
 - `spi_flash_chip_drivers.c` (to provide the `default_registered_chips` structure)
 - Any of the `spi_flash_chip_*.c` files that matches your own flash model best
 - `CMakeLists.txt` and `linker.lf` files

Modify the files above properly. Including:

- Change the `default_registered_chips` variable to non-static and remove the `#ifdef` logic around it.
- Update `linker.lf` file to rename the fragment header and the library name to match the new component.
- If reusing other drivers, some header names need prefixing with `spi_flash/` when included from outside `spi_flash` component.

Note:

- When writing your own flash chip driver, you can set your flash chip capabilities through `spi_flash_chip_***(vendor)_get_caps` and points the function pointer `get_chip_caps` for protection to the `spi_flash_chip_***_get_caps` function. The steps are as follows.
 1. Please check whether your flash chip have the capabilities listed in `spi_flash_caps_t` by checking the flash datasheet.
 2. Write a function named `spi_flash_chip_***(vendor)_get_caps`. Take the example below as a reference (if the flash support suspend and read unique id).
 3. Points the pointer `get_chip_caps` (in `spi_flash_chip_t`) to the function mentioned above.

```
spi_flash_caps_t spi_flash_chip_***(vendor)_get_caps(esp_flash_t *chip)
{
    spi_flash_caps_t caps_flags = 0;
    // 32-bit-address flash is not supported
    flash-suspend is supported
    caps_flags |= SPI_FLASH_CHIP_CAP_SUSPEND;
    // flash read unique id.
    caps_flags |= SPI_FLASH_CHIP_CAP_UNIQUE_ID;
    return caps_flags;
}
```

```
const spi_flash_chip_t esp_flash_chip_eon = {  
    // Other function pointers  
    .get_chip_caps = spi_flash_chip_eon_get_caps,  
};
```

- You also can see how to implement this in the example [storage/custom_flash_driver](#). This example demonstrates how to override the default chip driver list.
-

4. Write a new `CMakeLists.txt` file for the `custom_chip_driver` component, including an additional line to add a linker dependency from `spi_flash` to `custom_chip_driver`:

```
idf_component_register(SRCS "spi_flash_chip_drivers.c"  
                      "spi_flash_chip_mychip.c" # modify as needed  
                      REQUIRES hal  
                      PRIV_REQUIRES spi_flash  
                      LDFRAGMENTS linker.lf)  
idf_component_add_link_dependency(FROM spi_flash)
```

- An example of this component `CMakeLists.txt` can be found in [storage/custom_flash_driver/components/custom_chip_driver/CMakeLists.txt](#)
5. The `linker.lf` is used to put every chip driver that you are going to use whilst cache is disabled into internal RAM. See [Linker Script Generation](#) for more details. Make sure this file covers all the source files that you add.
 6. Build your project, and you will see the new flash driver is used.

Initializing a Flash Device

To use the `esp_flash_*` APIs, you need to initialise a flash chip on a certain SPI bus, as shown below:

1. Call `spi_bus_initialize()` to properly initialize an SPI bus. This function initializes the resources (I/O, DMA, interrupts) shared among devices attached to this bus.
2. Call `spi_bus_add_flash_device()` to attach the flash device to the bus. This function allocates memory and fills the members for the `esp_flash_t` structure. The CS I/O is also initialized here.
3. Call `esp_flash_init()` to actually communicate with the chip. This also detects the chip type, and influence the following operations.

Note: Multiple flash chips can be attached to the same bus now.

SPI Flash Access API

This is the set of API functions for working with data in flash:

- `esp_flash_read()` reads data from flash to RAM
- `esp_flash_write()` writes data from RAM to flash
- `esp_flash_erase_region()` erases specific region of flash
- `esp_flash_erase_chip()` erases the whole flash
- `esp_flash_get_chip_size()` returns flash chip size, in bytes, as configured in `menuconfig`

Generally, try to avoid using the raw SPI flash functions to the "main" SPI flash chip in favour of *partition-specific functions*.

SPI Flash Size

The SPI flash size is configured by writing a field in the ESP-IDF second stage bootloader image header, flashed at offset `0x1000`.

By default, the SPI flash size is detected by `esptool.py` when this bootloader is written to flash, and the header is updated with the correct size. Alternatively, it is possible to generate a fixed flash size by setting `CONFIG_ESPTOOLPY_FLASHSIZE` in the project configuration.

If it is necessary to override the configured flash size at runtime, it is possible to set the `chip_size` member of the `g_rom_flashchip` structure. This size is used by `esp_flash_*` functions (in both software & ROM) to check the bounds.

Concurrency Constraints for Flash on SPI1

Concurrency Constraints for Flash on SPI1

The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI Flash driver). Hence, operations to SPI1 will cause significant influence to the whole system. This kind of operations include calling SPI Flash API or other drivers on SPI1 bus, any operations like read/write/erase or other user defined SPI operations, regardless to the main flash or other SPI slave devices.

On ESP32-C5, the config option `CONFIG_SPI_FLASH_AUTO_SUSPEND` allows the cache to read flash concurrently with SPI1 operations. This is an optional feature that depends on special SPI Flash models, hence disabled by default. See [Flash Auto Suspend Feature](#) for more details.

If this option is disabled, the caches must be disabled while reading/writing/erasing operations. There are some constraints using driver on the SPI1 bus, see [When the Caches Are Disabled](#). These constraints will cause more IRAM/DRAM usages.

On ESP32-C5, the config options `CONFIG_SPIRAM_XIP_FROM_PSRAM` (disabled by default) allows the cache to read/write PSRAM concurrently with SPI1 operations. See [XIP from PSRAM Feature](#) for more details.

If these options are disabled, the caches must be disabled while reading/writing/erasing operations. There are some constraints using driver on the SPI1 bus, see [When the Caches Are Disabled](#). These constraints will cause more IRAM/DRAM usages.

When the Caches Are Disabled Under this condition, all CPUs should always execute code and access data from internal RAM. The APIs documented in this file will disable the caches automatically and transparently.

Note: When `CONFIG_SPIRAM_XIP_FROM_PSRAM` is enabled, these APIs will not disable the caches.

The way that these APIs disable the caches also disables non-IRAM-safe interrupts. These will be restored until the Flash operation completes.

See also [OS Functions](#) and [SPI Bus Lock](#).

There are no such constraints and impacts for flash chips on other SPI buses than SPI0/1.

For differences between internal RAM (e.g., IRAM, DRAM) and flash cache, please refer to the [application memory layout](#) documentation.

IRAM-Safe Interrupt Handlers For interrupt handlers which need to execute when the cache is disabled (e.g., for low latency operations), set the `ESP_INTR_FLAG_IRAM` flag when the [interrupt handler is registered](#).

You must ensure that all data and functions accessed by these interrupt handlers, including the ones that handlers call, are located in IRAM or DRAM. See [How to Place Code in IRAM](#).

If a function or symbol is not correctly put into IRAM/DRAM, and the interrupt handler reads from the flash cache during a flash operation, it will cause a crash due to Illegal Instruction exception (for code which should be in IRAM) or garbage data to be read (for constant data which should be in DRAM).

Note: When working with strings in ISRs, it is not advised to use `printf` and other output functions. For debugging purposes, use `ESP_DRAM_LOGE()` and similar macros when logging from ISRs. Make sure that both TAG and

format string are placed into DRAM in that case.

Non-IRAM-Safe Interrupt Handlers If the `ESP_INTR_FLAG_IRAM` flag is not set when registering, the interrupt handler will not get executed when the caches are disabled. Once the caches are restored, the non-IRAM-safe interrupts will be re-enabled. After this moment, the interrupt handler will run normally again. This means that as long as caches are disabled, users will not see the corresponding hardware event happening.

When DMA Read Data from Flash When DMA is reading data from Flash, erase/write operations from SPI1 take higher priority in hardware, resulting in unpredictable data read by DMA if auto-suspend is not enabled. It is recommended to stop DMA access to Flash before erasing or writing to it. If DMA cannot be stopped (for example, the LCD needs to continuously refresh image data stored in Flash), it is advisable to copy such data to PSRAM or internal SRAM.

Flash Auto Suspend Feature

Important:

1. The flash chip you are using should have a suspend/resume feature.
2. The MSPI hardware should support the auto-suspend feature, i.e., hardware can send suspend command automatically.

If you use suspend feature on an unsupported chip, it may cause a severe crash. Therefore, we strongly suggest you reading the flash chip datasheets first. Ensure the flash chip satisfies the following conditions at minimum.

1. With the current software implementation, SUS bit in status registers should in SR2 bit7 or SR bit15.
 2. With the current software implementation, suspend command should be 75H, with resume command being 7AH.
 3. When the flash is successfully suspended, all address of the flash, except from the section/block being erased, can be read correctly. At this state, resume can be sent immediately as well.
 4. When the flash is successfully resumed, another suspend can be sent immediately at this state.
-

When `CONFIG_SPI_FLASH_AUTO_SUSPEND` is enabled, the caches will be kept enabled. They would be disabled if `CONFIG_SPI_FLASH_AUTO_SUSPEND` is disabled. The hardware handles the arbitration between SPI0 and SPI1. If the SPI1 operation is short, such as a reading operation, the CPU and the cache will wait until the SPI1 operation is completed. However, during processes like erasing, page programming, or status register writing (e.g., SE, PP, and WRSR), an auto suspend will happen, interrupting the ongoing flash operation. This allows the CPU to access data from the cache and flash within limited time.

This approach allows certain code/variables to be stored in flash/PSRAM instead of IRAM/DRAM, while still being executable during flash erasing. This reduces the usage of IRAM/DRAM.

Please note that this feature comes with the overhead of flash suspend/resume. Frequent interruptions during flash erasing can significantly prolong the erasing process. To avoid this, you may use FreeRTOS task priorities to ensure that only real-time critical tasks are executed at a higher priority than flash erasing, allowing the flash erasing to complete in reasonable time.

There are three kinds of code:

1. Critical code: inside IRAM/DRAM. This kind of code usually has high performance requirements, related to cache/flash/PSRAM, or is called very often.
2. Cached code: inside flash/PSRAM. This kind of code has lower performance requirements or is called less often. They will execute during erasing, with some overhead.
3. Low-priority code: inside flash/PSRAM and disabled during erasing. This kind of code should be forbidden from being executed to avoid affecting the flash erasing, by setting a lower task priority than the erasing task.

Regarding the flash suspend feature usage and corresponding response time delay, please also see the [system/flash_suspend](#) example.

Note: The flash auto suspend feature relies heavily on strict timing. You can see it as a kind of optimization plan, which means that you cannot use it in every situation, like high requirement of real-time system or triggering interrupt very frequently (e.g., LCD flush, bluetooth, Wi-Fi, etc.). You should take following steps to evaluate what kind of ISR can be used together with flash suspend.

As you can see from the diagram, two key values should be noted:

1. **ISR time:** The ISR time cannot be very long, at least not larger than the value you set in `IWDTCR`. But it will significantly lengthen the erasing/writing completion time.
2. **ISR interval:** ISR cannot be triggered very often. The most important time is the **ISR interval minus ISR time** (from point b to point c in the diagram). During this time, SPI1 will send resume command to restart the operation. However, it needs a time t_{sus} for preparation, and the typical value of t_{sus} is about **40 us**. If SPI1 cannot resume the operation but another suspend command comes, it will cause CPU starve and `TWDT` may be triggered.

The t_{sus} time mentioned in point 2 can be found by looking through the flash datasheets, usually in the AC CHARACTERISTICS section. Users need to make sure that the t_{sus} value obtained from the datasheets is not greater than the `CONFIG_SPI_FLASH_SUSPEND_TSUS_VAL_US` value in `Kconfig`.

Furthermore, the flash suspend might be delayed. If both the CPU and the cache access the flash via SPI0 frequently and SPI1 sends the suspend command frequently as well, the efficiency of MSPI data transfer will be influenced. So, we have a **lock** inside to prevent this. When SPI1 sends the suspend command, SPI0 will take over memory SPI bus and take the lock. After SPI0 finishes sending data, it will retain control of the memory SPI bus until the lock delay period time finishes. During this lock delay period, if there is any other SPI0 transaction, then the SPI0 transaction will be proceeded and a new lock delay period will start. Otherwise, SPI0 will release the memory bus and start SPI0/1 arbitration.

XIP from PSRAM Feature If `CONFIG_SPIRAM_XIP_FROM_PSRAM` is enabled, the flash `.text` sections (used for instructions) and the flash `.rodata` sections (used for read only data) will be placed in PSRAM.

The corresponding virtual memory range will be mapped to PSRAM.

If both of the above options are enabled, the Cache won't be disabled during an SPI1 Flash operation. You don't need to make sure ISRs, ISR callbacks and involved data are placed in internal RAM.

Attention: The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI flash driver). Hence, calling SPI Flash API on SPI1 bus (including the main flash) causes significant influence to the whole system. See [Concurrency Constraints for Flash on SPI1](#) for more details.

SPI Flash Encryption

It is possible to encrypt the contents of SPI flash and have it transparently decrypted by hardware.

Refer to the [Flash Encryption documentation](#) for more details.

Memory Mapping API

ESP32-C5 features memory hardware which allows regions of flash memory to be mapped into instruction and data address spaces. This mapping works only for read operations. It is not possible to modify contents of flash memory by writing to a mapped memory region.

Mapping happens in 64 KB pages. Memory mapping hardware can map flash into the data address space and the instruction address space. See the technical reference manual for more details and limitations about memory mapping hardware.

Note that some pages are used to map the application itself into memory, so the actual number of available pages may be less than the capability of the hardware.

Reading data from flash using a memory mapped region is the only way to decrypt contents of flash when *flash encryption* is enabled. Decryption is performed at the hardware level.

Memory mapping API are declared in `spi_flash_mmap.h` and `esp_partition.h`:

- `spi_flash_mmap()` maps a region of physical flash addresses into instruction space or data space of the CPU.
- `spi_flash_munmap()` unmaps previously mapped region.
- `esp_partition_mmap()` maps part of a partition into the instruction space or data space of the CPU.

Differences between `spi_flash_mmap()` and `esp_partition_mmap()` are as follows:

- `spi_flash_mmap()` must be given a 64 KB aligned physical address.
- `esp_partition_mmap()` may be given any arbitrary offset within the partition. It adjusts the returned pointer to mapped memory as necessary.

Note that since memory mapping happens in pages, it may be possible to read data outside of the partition provided to `esp_partition_mmap`, regardless of the partition boundary.

Note: mmap is supported by cache, so it can only be used on main flash.

SPI Flash Implementation

The `esp_flash_t` structure holds chip data as well as three important parts of this API:

1. The host driver, which provides the hardware support to access the chip;
2. The chip driver, which provides compatibility service to different chips;
3. The OS functions, provide support of some OS functions (e.g., lock, delay) in different stages (1st/2nd boot, or the app).

Host Driver The host driver relies on an interface (`spi_flash_host_driver_t`) defined in the `spi_flash_types.h` (in the `hal/include/hal` folder). This interface provides some common functions to communicate with the chip.

In other files of the SPI HAL, some of these functions are implemented with existing ESP32-C5 memory-spi functionalities. However, due to the speed limitations of ESP32-C5, the HAL layer cannot provide high-speed implementations to some reading commands (so the support for it was dropped). The files (`memspi_host_driver.h` and `.c`) implement the high-speed version of these commands with the `common_command` function provided in the HAL, and wrap these functions as `spi_flash_host_driver_t` for upper layer to use.

You can also implement your own host driver, even with the GPIO. As long as all the functions in the `spi_flash_host_driver_t` are implemented, the `esp_flash` API can access the flash regardless of the low-level hardware.

Chip Driver The chip driver, defined in `spi_flash_chip_driver.h`, wraps basic functions provided by the host driver for the API layer to use.

Some operations need some commands to be sent first, or read some status afterwards. Some chips need different commands or values, or need special communication ways.

There is a type of chip called `generic_chip` which stands for common chips. Other special chip drivers can be developed on the base of the generic chip.

The chip driver relies on the host driver.

Warning: This document is not updated for ESP32C5 yet, so some of the content may not be correct.
This warning was automatically inserted due to the source file being in the `add_warnings_pages` list.

OS Functions

SPI Features

SPI Master

SPI Bus Lock To realize the multiplexing of different devices from different drivers, including SPI Master, SPI Flash, etc., an SPI bus lock is applied on each SPI bus. Drivers can attach their devices to the bus with the arbitration of the lock.

Each bus lock is initialized with a BG (background) service registered. All devices that request transactions on the bus should wait until the BG is successfully disabled.

- For the SPI1 bus, the BG is the cache. The bus lock disables the cache before device operations start, and enables it again after the device releases the lock. No devices on SPI1 are allowed to use ISR, since it is meaningless for the task to yield to other tasks when the cache is disabled. The SPI Master driver has not supported SPI1 bus. Only the SPI Flash driver can attach to the bus.
- For other buses, the driver can register the ISR as a BG. If a device task requests exclusive bus access, the bus lock will block the task, disable the ISR, and then unblock the task. After the task releases the lock, the lock will try to re-enable the ISR if there are still pending transactions in the ISR.

Currently the OS function layer provides entries of a lock and delay.

The lock (see [SPI Bus Lock](#)) is used to resolve the conflicts among the access of devices on the same SPI bus, and the SPI Flash chip access. E.g.

1. On SPI1 bus, the cache (used to fetch the data (code) in the Flash and PSRAM) should be disabled when the flash chip on the SPI0/1 is being accessed.
2. On the other buses, the flash driver needs to disable the ISR registered by SPI Master driver, to avoid conflicts.
3. Some devices of SPI Master driver may require to use the bus monopolized during a period (especially when the device does not have a CS wire, or the wire is controlled by software like SDSPI driver).

The delay is used by some long operations which requires the master to wait or polling periodically.

The top API wraps these the chip driver and OS functions into an entire component, and also provides some argument checking.

OS functions can also help to avoid a watchdog timeout when erasing large flash areas. During this time, the CPU is occupied with the flash erasing task. This stops other tasks from being executed. Among these tasks is the idle task to feed the watchdog timer (WDT). If the configuration option [CONFIG_ESP_TASK_WDT_PANIC](#) is selected and the flash operation time is longer than the watchdog timeout period, the system will reboot.

It is pretty hard to totally eliminate this risk, because the erasing time varies with different flash chips, making it hard to be compatible in flash drivers. Therefore, users need to pay attention to it. Please use the following guidelines:

1. It is recommended to enable the [CONFIG_SPI_FLASH_YIELD_DURING_ERASE](#) option to allow the scheduler to re-schedule during erasing flash memory. Besides, following parameters can also be used.
 - Increase [CONFIG_SPI_FLASH_ERASE_YIELD_TICKS](#) or decrease [CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS](#) in menuconfig.
 - You can also increase [CONFIG_ESP_TASK_WDT_TIMEOUT_S](#) in menuconfig for a larger watchdog timeout period. However, with larger watchdog timeout period, previously detected timeouts may no longer be detected.
2. Please be aware of the consequences of enabling the [CONFIG_ESP_TASK_WDT_PANIC](#) option when doing long-running SPI flash operations which triggers the panic handler when it times out. However, this option can also help dealing with unexpected exceptions in your application. Please decide whether this is needed to be enabled according to actual condition.

3. During your development, please carefully review the actual flash operation according to the specific requirements and time limits on erasing flash memory of your projects. Always allow reasonable redundancy based on your specific product requirements when configuring the flash erasing timeout threshold, thus improving the reliability of your product.

Implementation Details

In order to perform some flash operations, it is necessary to make sure that both CPUs are not running any code from flash for the duration of the flash operation:

- In a single-core setup, the SDK needs to disable interrupts or scheduler before performing the flash operation.
- In a dual-core setup, the SDK needs to make sure that both CPUs are not running any code from flash.

When SPI flash API is called on CPU A (can be PRO or APP), start the `spi_flash_op_block_func` function on CPU B using the `esp_ipc_call` API. This API wakes up a high priority task on CPU B and tells it to execute a given function, in this case, `spi_flash_op_block_func`. This function disables cache on CPU B and signals that the cache is disabled by setting the `s_flash_op_can_start` flag. Then the task on CPU A disables cache as well and proceeds to execute flash operation.

While a flash operation is running, interrupts can still run on CPUs A and B. It is assumed that all interrupt code is placed into RAM. Once the interrupt allocation API is added, a flag should be added to request the interrupt to be disabled for the duration of a flash operations.

Once the flash operation is complete, the function on CPU A sets another flag, `s_flash_op_complete`, to let the task on CPU B know that it can re-enable cache and release the CPU. Then the function on CPU A re-enables the cache on CPU A as well and returns control to the calling code.

Additionally, all API functions are protected with a mutex (`s_flash_op_mutex`).

In a single core environment (`CONFIG_FREERTOS_UNICORE` enabled), you need to disable both caches, so that no inter-CPU communication can take place.

SPI Flash API ESP-IDF Version vs Chip-ROM Version

There is a set of SPI flash drivers in Chip-ROM which you can use by enabling `CONFIG_SPI_FLASH_ROM_IMPL`. Most of the ESP-IDF SPI flash driver code are in internal RAM, therefore enabling this option frees some internal RAM usage. Note that if you enable this option, this means some SPI flash driver features and bugfixes that are done in ESP-IDF might not be included in the Chip-ROM version.

Feature Supported by ESP-IDF but Not in Chip-ROM

- Octal flash chip support. See [OPI Flash Support](#) for details.
- 32-bit-address support for GD25Q256. Note that this feature is an optional feature, please do read [32-bit Address Support of QSPI Flash Chips](#) for details.
- TH flash chip support.
- Kconfig option `CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED`.
- `CONFIG_SPI_FLASH_VERIFY_WRITE`, enabling this option helps you detect bad writing.
- `CONFIG_SPI_FLASH_LOG_FAILED_WRITE`, enabling this option prints the bad writing.
- `CONFIG_SPI_FLASH_WARN_SETTING_ZERO_TO_ONE`, enabling this option checks if you are writing zero to one.
- `CONFIG_SPI_FLASH_DANGEROUS_WRITE`, enabling this option checks for flash programming to certain protected regions like bootloader, partition table or application itself.

- [*CONFIG_SPI_FLASH_ENABLE_COUNTERS*](#), enabling this option to collect performance data for ESP-IDF SPI flash driver APIs.
- [*CONFIG_SPI_FLASH_AUTO_SUSPEND*](#), enabling this option to automatically suspend or resume a long flash operation when short flash operation happens. Note that this feature is an optional feature, please do read [Auto Suspend & Resume](#) for more limitations.

Bugfixes Introduced in ESP-IDF but Not in Chip-ROM

- Detected flash physical size correctly, for larger than 256 MBit flash chips. (Commit ID: b4964279d44f73cce7cfd5cf684567fbdfd6fd9e)

API Reference - SPI Flash

Header File

- `components/spi_flash/include/esp_flash_spi_init.h`
- This header file can be included with:

```
#include "esp_flash_spi_init.h"
```

- This header file is a part of the API provided by the `spi_flash` component. To declare that your component depends on `spi_flash`, add the following to your `CMakeLists.txt`:

```
REQUIRES spi_flash
```

or

```
PRIV_REQUIRES spi_flash
```

Functions

`esp_err_t spi_bus_add_flash_device(esp_flash_t **out_chip, const esp_flash_spi_device_config_t *config)`

Add a SPI Flash device onto the SPI bus.

The bus should be already initialized by `spi_bus_initialization`.

Parameters

- `out_chip` -- Pointer to hold the initialized chip.
- `config` -- Configuration of the chips to initialize.

Returns

- `ESP_ERR_INVALID_ARG`: `out_chip` is NULL, or some field in the config is invalid.
- `ESP_ERR_NO_MEM`: failed to allocate memory for the chip structures.
- `ESP_OK`: success.

`esp_err_t spi_bus_remove_flash_device(esp_flash_t *chip)`

Remove a SPI Flash device from the SPI bus.

Parameters `chip` -- The flash device to remove.

Returns

- `ESP_ERR_INVALID_ARG`: The chip is invalid.
- `ESP_OK`: success.

Structures

struct `esp_flash_spi_device_config_t`

Configurations for the SPI Flash to init.

Public Members

spi_host_device_t **host_id**

Bus to use.

int **cs_io_num**

GPIO pin to output the CS signal.

esp_flash_io_mode_t **io_mode**

IO mode to read from the Flash.

enum *esp_flash_speed_s* **speed**

Speed of the Flash clock. Replaced by `freq_mhz`.

int **input_delay_ns**

Input delay of the data pins, in ns. Set to 0 if unknown.

int **cs_id**

CS line ID, ignored when not `host_id` is not `SPI1_HOST`, or `CONFIG_SPI_FLASH_SHARE_SPI1_BUS` is enabled. In this case, the CS line used is automatically assigned by the SPI bus lock.

int **freq_mhz**

The frequency of flash chip(MHZ)

Header File

PRIV_REQUIRES spi_flash
```

Functions

esp_err_t **esp_flash_init** (*esp_flash_t* *chip)

Initialise SPI flash chip interface.

This function must be called before any other API functions are called for this chip.

Note: Only the `host` and `read_mode` fields of the chip structure must be initialised before this function is called. Other fields may be auto-detected if left set to zero or `NULL`.

Note: If the `chip->drv` pointer is `NULL`, `chip` `chip_drv` will be auto-detected based on its manufacturer & product IDs. See `esp_flash_registered_flash_drivers` pointer for details of this process.

Parameters **chip** -- Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

Returns `ESP_OK` on success, or a flash error code if initialisation fails.

bool **esp_flash_chip_driver_initialized** (const *esp_flash_t* *chip)

Check if appropriate chip driver is set.

Parameters **chip** -- Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

Returns true if set, otherwise false.

esp_err_t **esp_flash_read_id** (*esp_flash_t* *chip, uint32_t *out_id)

Read flash ID via the common "RDID" SPI flash command.

ID is a 24-bit value. Lower 16 bits of 'id' are the chip ID, upper 8 bits are the manufacturer ID.

Parameters

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **out_id** -- [out] Pointer to receive ID value.

Returns `ESP_OK` on success, or a flash error code if operation failed.

esp_err_t **esp_flash_get_size** (*esp_flash_t* *chip, uint32_t *out_size)

Detect flash size based on flash ID.

Note: 1. Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn't follow this convention, the size may be incorrectly detected.

- a. The `out_size` returned only stands for The `out_size` stands for the size in the binary image header. If you want to get the real size of the chip, please call `esp_flash_get_physical_size` instead.

Parameters

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **out_size** -- [out] Detected size in bytes, standing for the size in the binary image header.

Returns `ESP_OK` on success, or a flash error code if operation failed.

esp_err_t **esp_flash_get_physical_size** (*esp_flash_t* *chip, uint32_t *flash_size)

Detect flash size based on flash ID.

Note: Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn't follow this convention, the size may be incorrectly detected.

Parameters

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **flash_size** -- [out] Detected size in bytes.

Returns `ESP_OK` on success, or a flash error code if operation failed.

esp_err_t **esp_flash_read_unique_chip_id** (*esp_flash_t* *chip, uint64_t *out_id)

Read flash unique ID via the common "RDUID" SPI flash command.

ID is a 64-bit value.

Note: This is an optional feature, which is not supported on all flash chips. READ PROGRAMMING GUIDE FIRST!

Parameters

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`.
- **out_id** -- [out] Pointer to receive unique ID value.

Returns

- ESP_OK on success, or a flash error code if operation failed.
- ESP_ERR_NOT_SUPPORTED if the chip doesn't support read id.

esp_err_t **esp_flash_erase_chip** (*esp_flash_t* *chip)

Erase flash chip contents.

Parameters **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`

Returns

- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- ESP_ERR_NOT_ALLOWED if a read-only partition is present.
- Other flash error code if operation failed.

esp_err_t **esp_flash_erase_region** (*esp_flash_t* *chip, uint32_t start, uint32_t len)

Erase a region of the flash chip.

Sector size is specified in `chip->drv->sector_size` field (typically 4096 bytes.) ESP_ERR_INVALID_ARG will be returned if the start & length are not a multiple of this size.

Erase is performed using block (multi-sector) erases where possible (block size is specified in `chip->drv->block_erase_size` field, typically 65536 bytes). Remaining sectors are erased using individual sector erase commands.

Parameters

- **chip** -- Pointer to identify flash chip. If NULL, `esp_flash_default_chip` is substituted. Must have been successfully initialised via `esp_flash_init()`
- **start** -- Address to start erasing flash. Must be sector aligned.
- **len** -- Length of region to erase. Must also be sector aligned.

Returns

- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- ESP_ERR_NOT_ALLOWED if the address range (`start + len`) overlaps with a read-only partition address space
- Other flash error code if operation failed.

esp_err_t **esp_flash_get_chip_write_protect** (*esp_flash_t* *chip, bool *write_protected)

Read if the entire chip is write protected.

Note: A correct result for this flag depends on the SPI flash chip model and `chip_drv` in use (via the '`chip->drv`' field).

Parameters

- **chip** -- Pointer to identify flash chip. If NULL, `esp_flash_default_chip` is substituted. Must have been successfully initialised via `esp_flash_init()`

- **write_protected** -- [out] Pointer to boolean, set to the value of the write protect flag.

Returns ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_set_chip_write_protect** (*esp_flash_t* *chip, bool write_protect)

Set write protection for the SPI flash chip.

Some SPI flash chips may require a power cycle before write protect status can be cleared. Otherwise, write protection can be removed via a follow-up call to this function.

Note: Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the 'chip->drv' field).

Parameters

- **chip** -- Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init()
- **write_protect** -- Boolean value for the write protect flag

Returns ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_get_protectable_regions** (const *esp_flash_t* *chip, const *esp_flash_region_t* **out_regions, uint32_t *out_num_regions)

Read the list of individually protectable regions of this SPI flash chip.

Note: Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the 'chip->drv' field).

Parameters

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **out_regions** -- [out] Pointer to receive a pointer to the array of protectable regions of the chip.
- **out_num_regions** -- [out] Pointer to an integer receiving the count of protectable regions in the array returned in 'regions'.

Returns ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_get_protected_region** (*esp_flash_t* *chip, const *esp_flash_region_t* *region, bool *out_protected)

Detect if a region of the SPI flash chip is protected.

Note: It is possible for this result to be false and write operations to still fail, if protection is enabled for the entire chip.

Note: Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the 'chip->drv' field).

Parameters

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **region** -- Pointer to a struct describing a protected region. This must match one of the regions returned from esp_flash_get_protectable_regions(...).

- **out_protected** -- [out] Pointer to a flag which is set based on the protected status for this region.

Returns ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_set_protected_region** (*esp_flash_t* *chip, const *esp_flash_region_t* *region, bool protect)

Update the protected status for a region of the SPI flash chip.

Note: It is possible for the region protection flag to be cleared and write operations to still fail, if protection is enabled for the entire chip.

Note: Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the 'chip->drv' field).

Parameters

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **region** -- Pointer to a struct describing a protected region. This must match one of the regions returned from esp_flash_get_protectable_regions(...).
- **protect** -- Write protection flag to set.

Returns ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_read** (*esp_flash_t* *chip, void *buffer, uint32_t address, uint32_t length)

Read data from the SPI flash chip.

There are no alignment constraints on buffer, address or length.

Note: If on-chip flash encryption is used, this function returns raw (ie encrypted) data. Use the flash cache to transparently decrypt data.

Parameters

- **chip** -- Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init()
- **buffer** -- Pointer to a buffer where the data will be read. To get better performance, this should be in the DRAM and word aligned.
- **address** -- Address on flash to read from. Must be less than chip->size field.
- **length** -- Length (in bytes) of data to read.

Returns

- ESP_OK: success
- ESP_ERR_NO_MEM: Buffer is in external PSRAM which cannot be concurrently accessed, and a temporary internal buffer could not be allocated.
- or a flash error code if operation failed.

esp_err_t **esp_flash_write** (*esp_flash_t* *chip, const void *buffer, uint32_t address, uint32_t length)

Write data to the SPI flash chip.

There are no alignment constraints on buffer, address or length.

Parameters

- **chip** -- Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init()

- **address** -- Address on flash to write to. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** -- Pointer to a buffer with the data to write. To get better performance, this should be in the DRAM and word aligned.
- **length** -- Length (in bytes) of data to write.

Returns

- ESP_OK on success
- ESP_FAIL, bad write, this will be detected only when CONFIG_SPI_FLASH_VERIFY_WRITE is enabled
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- ESP_ERR_NOT_ALLOWED if the address range (address –address + length) overlaps with a read-only partition address space
- Other flash error code if operation failed.

esp_err_t **esp_flash_write_encrypted** (*esp_flash_t* *chip, uint32_t address, const void *buffer, uint32_t length)

Encrypted and write data to the SPI flash chip using on-chip hardware flash encryption.

Note: Both address & length must be 16 byte aligned, as this is the encryption block size

Parameters

- **chip** -- Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted write is not supported.
- **address** -- Address on flash to write to. 16 byte aligned. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** -- Pointer to a buffer with the data to write.
- **length** -- Length (in bytes) of data to write. 16 byte aligned.

Returns

- ESP_OK: on success
- ESP_FAIL: bad write, this will be detected only when CONFIG_SPI_FLASH_VERIFY_WRITE is enabled
- ESP_ERR_NOT_SUPPORTED: encrypted write not supported for this chip.
- ESP_ERR_INVALID_ARG: Either the address, buffer or length is invalid.
- ESP_ERR_NOT_ALLOWED if the address range (address –address + length) overlaps with a read-only partition address space

esp_err_t **esp_flash_read_encrypted** (*esp_flash_t* *chip, uint32_t address, void *out_buffer, uint32_t length)

Read and decrypt data from the SPI flash chip using on-chip hardware flash encryption.

Parameters

- **chip** -- Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted read is not supported.
- **address** -- Address on flash to read from.
- **out_buffer** -- Pointer to a buffer for the data to read to.
- **length** -- Length (in bytes) of data to read.

Returns

- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted read not supported for this chip.

static inline bool **esp_flash_is_quad_mode** (const *esp_flash_t* *chip)

Returns true if chip is configured for Quad I/O or Quad Fast Read.

Parameters **chip** -- Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

Returns true if flash works in quad mode, otherwise false

Structures

struct **esp_flash_region_t**

Structure for describing a region of flash.

Public Members

uint32_t **offset**

Start address of this region.

uint32_t **size**

Size of the region.

struct **esp_flash_os_functions_t**

OS-level integration hooks for accessing flash chips inside a running OS.

It's in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn't be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

Public Members

esp_err_t (***start**)(void *arg)

Called before commencing any flash operation. Does not need to be recursive (ie is called at most once for each call to 'end').

esp_err_t (***end**)(void *arg)

Called after completing any flash operation.

esp_err_t (***region_protected**)(void *arg, size_t start_addr, size_t size)

Called before any erase/write operations to check whether the region is limited by the OS

esp_err_t (***delay_us**)(void *arg, uint32_t us)

Delay for at least 'us' microseconds. Called in between 'start' and 'end'.

void (***get_temp_buffer**)(void *arg, size_t request_size, size_t *out_size)

Called for get temp buffer when buffer from application cannot be directly read into/write from.

void (***release_temp_buffer**)(void *arg, void *temp_buf)

Called for release temp buffer.

esp_err_t (***check_yield**)(void *arg, uint32_t chip_status, uint32_t *out_request)

Yield to other tasks. Called during erase operations.

Return ESP_OK means yield needs to be called (got an event to handle), while ESP_ERR_TIMEOUT means skip yield.

esp_err_t (***yield**)(void *arg, uint32_t *out_status)

Yield to other tasks. Called during erase operations.

`int64_t (*get_system_time)(void *arg)`

Called for get system time.

`void (*set_flash_op_status)(uint32_t op_status)`

Call to set flash operation status

struct **esp_flash_t**

Structure to describe a SPI flash chip connected to the system.

Structure must be initialized before use (passed to `esp_flash_init()`). It's in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn't be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

Public Members

`spi_flash_host_inst_t *host`

Pointer to hardware-specific "host_driver" structure. Must be initialized before used.

const `spi_flash_chip_t *chip_drv`

Pointer to chip-model-specific "adapter" structure. If NULL, will be detected during initialisation.

const `esp_flash_os_functions_t *os_func`

Pointer to os-specific hook structure. Call `esp_flash_init_os_functions()` to setup this field, after the host is properly initialized.

void `*os_func_data`

Pointer to argument for os-specific hooks. Left NULL and will be initialized with `os_func`.

`esp_flash_io_mode_t read_mode`

Configured SPI flash read mode. Set before `esp_flash_init` is called.

`uint32_t size`

Size of SPI flash in bytes. If 0, size will be detected during initialisation. Note: this stands for the size in the binary image header. If you want to get the flash physical size, please call `esp_flash_get_physical_size`.

`uint32_t chip_id`

Detected chip id.

`uint32_t busy`

This flag is used to verify chip's status.

`uint32_t hpm_dummy_ena`

This flag is used to verify whether flash works under HPM status.

`uint32_t reserved_flags`

reserved.

Macros

`SPI_FLASH_YIELD_REQ_YIELD`

`SPI_FLASH_YIELD_REQ_SUSPEND`

`SPI_FLASH_YIELD_STA_RESUME`

`SPI_FLASH_OS_IS_ERASING_STATUS_FLAG`

Type Definitions

typedef struct *spi_flash_chip_t* **spi_flash_chip_t**

Header File

- `components/spi_flash/include/spi_flash_mmap.h`
- This header file can be included with:

```
#include "spi_flash_mmap.h"
```

- This header file is a part of the API provided by the `spi_flash` component. To declare that your component depends on `spi_flash`, add the following to your `CMakeLists.txt`:

```
REQUIRES spi_flash
```

or

```
PRIV_REQUIRES spi_flash
```

Functions

esp_err_t **spi_flash_mmap** (size_t *src_addr*, size_t *size*, *spi_flash_mmap_memory_t* *memory*, const void ***out_ptr*, *spi_flash_mmap_handle_t* **out_handle*)

Map region of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configures them to map the requested region of flash memory into the address space. It may reuse MMU pages which already provide the required mapping.

As with any allocator, if `mmap/munmap` are heavily used then the address space may become fragmented. To troubleshoot issues with page allocation, use `spi_flash_mmap_dump()` function.

Parameters

- **src_addr** -- Physical address in flash where requested region starts. This address *must* be aligned to 64kB boundary (`SPI_FLASH_MMU_PAGE_SIZE`)
- **size** -- Size of region to be mapped. This size will be rounded up to a 64kB boundary
- **memory** -- Address space where the region should be mapped (data or instruction)
- **out_ptr** -- [out] Output, pointer to the mapped memory region
- **out_handle** -- [out] Output, handle which should be used for `spi_flash_munmap` call

Returns `ESP_OK` on success, `ESP_ERR_NO_MEM` if pages can not be allocated

esp_err_t **spi_flash_mmap_pages** (const int **pages*, size_t *page_count*, *spi_flash_mmap_memory_t* *memory*, const void ***out_ptr*, *spi_flash_mmap_handle_t* **out_handle*)

Map sequences of pages of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configures them to map the indicated pages of flash memory contiguously into address space. In this respect, it works in a similar way as `spi_flash_mmap()` but it allows mapping a (maybe non-contiguous) set of pages into a contiguous region of memory.

Parameters

- **pages** -- An array of numbers indicating the 64kB pages in flash to be mapped contiguously into memory. These indicate the indexes of the 64kB pages, not the byte-size addresses as used in other functions. Array must be located in internal memory.
- **page_count** -- Number of entries in the pages array
- **memory** -- Address space where the region should be mapped (instruction or data)
- **out_ptr** -- [out] Output, pointer to the mapped memory region
- **out_handle** -- [out] Output, handle which should be used for `spi_flash_munmap` call

Returns

- ESP_OK on success
- ESP_ERR_NO_MEM if pages can not be allocated
- ESP_ERR_INVALID_ARG if pagecount is zero or pages array is not in internal memory

void **spi_flash_munmap** (*spi_flash_mmap_handle_t* handle)

Release region previously obtained using `spi_flash_mmap`.

Note: Calling this function will not necessarily unmap memory region. Region will only be unmapped when there are no other handles which reference this region. In case of partially overlapping regions it is possible that memory will be unmapped partially.

Parameters **handle** -- Handle obtained from `spi_flash_mmap`

void **spi_flash_mmap_dump** (void)

Display information about mapped regions.

This function lists handles obtained using `spi_flash_mmap`, along with range of pages allocated to each handle. It also lists all non-zero entries of MMU table and corresponding reference counts.

uint32_t **spi_flash_mmap_get_free_pages** (*spi_flash_mmap_memory_t* memory)

get free pages number which can be mmap

This function will return number of free pages available in mmu table. This could be useful before calling actual `spi_flash_mmap` (maps flash range to DCache or ICache memory) to check if there is sufficient space available for mapping.

Parameters **memory** -- memory type of MMU table free page

Returns number of free pages which can be mmaped

size_t **spi_flash_cache2phys** (const void *cached)

Given a memory address where flash is mapped, return the corresponding physical flash offset.

Cache address does not have have been assigned via `spi_flash_mmap()`, any address in memory mapped flash space can be looked up.

Parameters **cached** -- Pointer to flashed cached memory.

Returns

- SPI_FLASH_CACHE2PHYS_FAIL If cache address is outside flash cache region, or the address is not mapped.
- Otherwise, returns physical offset in flash

const void ***spi_flash_phys2cache** (size_t phys_offs, *spi_flash_mmap_memory_t* memory)

Given a physical offset in flash, return the address where it is mapped in the memory space.

Physical address does not have to have been assigned via `spi_flash_mmap()`, any address in flash can be looked up.

Note: Only the first matching cache address is returned. If MMU flash cache table is configured so multiple entries point to the same physical address, there may be more than one cache address corresponding to that physical address. It is also possible for a single physical address to be mapped to both the IROM and DROM regions.

Note: This function doesn't impose any alignment constraints, but if memory argument is SPI_FLASH_MMAP_INST and phys_offs is not 4-byte aligned, then reading from the returned pointer will result in a crash.

Parameters

- **phys_offs** -- Physical offset in flash memory to look up.
- **memory** -- Address space type to look up a flash cache address mapping for (instruction or data)

Returns

- NULL if the physical address is invalid or not mapped to flash cache of the specified memory type.
- Cached memory address (in IROM or DROM space) corresponding to phys_offs.

Macros

ESP_ERR_FLASH_OP_FAIL

This file contains spi_flash_mmap_xx APIs, mainly for doing memory mapping to an SPI0-connected external Flash, as well as some helper functions to convert between virtual and physical address

ESP_ERR_FLASH_OP_TIMEOUT

SPI_FLASH_SEC_SIZE

SPI Flash sector size

SPI_FLASH_MMU_PAGE_SIZE

Flash cache MMU mapping page size

SPI_FLASH_CACHE2PHYS_FAIL

Type Definitions

```
typedef uint32_t spi_flash_mmap_handle_t
```

Opaque handle for memory region obtained from spi_flash_mmap.

Enumerations

```
enum spi_flash_mmap_memory_t
```

Enumeration which specifies memory space requested in an mmap call.

Values:

enumerator **SPI_FLASH_MMAP_DATA**

map to data memory, allows byte-aligned access

enumerator **SPI_FLASH_MMAP_INST**

map to instruction memory, allows only 4-byte-aligned access

Header File

- [components/hal/include/hal/spi_flash_types.h](#)
- This header file can be included with:

```
#include "hal/spi_flash_types.h"
```

Structures

struct **spi_flash_trans_t**

Definition of a common transaction. Also holds the return value.

Public Members

uint8_t **reserved**

Reserved, must be 0.

uint8_t **mosi_len**

Output data length, in bytes.

uint8_t **miso_len**

Input data length, in bytes.

uint8_t **address_bitlen**

Length of address in bits, set to 0 if command does not need an address.

uint32_t **address**

Address to perform operation on.

const uint8_t ***mosi_data**

Output data to save.

uint8_t ***miso_data**

[out] Input data from slave, little endian

uint32_t **flags**

Flags for this transaction. Set to 0 for now.

uint16_t **command**

Command to send.

uint8_t **dummy_bitlen**

Basic dummy bits to use.

uint32_t **io_mode**

Flash working mode when `SPI_FLASH_IGNORE_BASEIO` is specified.

struct **spi_flash_sus_cmd_conf**

Configuration structure for the flash chip suspend feature.

Public Members

uint32_t **sus_mask**
SUS/SUS1/SUS2 bit in flash register.

uint32_t **cmd_rdsr**
Read flash status register(2) command.

uint32_t **sus_cmd**
Flash suspend command.

uint32_t **res_cmd**
Flash resume command.

uint32_t **reserved**
Reserved, set to 0.

struct **spi_flash_encryption_t**
Structure for flash encryption operations.

Public Members

void (***flash_encryption_enable**)(void)
Enable the flash encryption.

void (***flash_encryption_disable**)(void)
Disable the flash encryption.

void (***flash_encryption_data_prepare**)(uint32_t address, const uint32_t *buffer, uint32_t size)
Prepare flash encryption before operation.

Note: address and buffer must be 8-word aligned.

Param address The destination address in flash for the write operation.

Param buffer Data for programming

Param size Size to program.

void (***flash_encryption_done**)(void)
flash data encryption operation is done.

void (***flash_encryption_destroy**)(void)
Destroy encrypted result

bool (***flash_encryption_check**)(uint32_t address, uint32_t length)
Check if is qualified to encrypt the buffer

Param address the address of written flash partition.

Param length Buffer size.

struct **spi_flash_host_inst_t**
SPI Flash Host driver instance

Public Members

const struct *spi_flash_host_driver_s* ***driver**

Pointer to the implementation function table.

struct **spi_flash_host_driver_s**

Host driver configuration and context structure.

Public Members

esp_err_t (***dev_config**)(*spi_flash_host_inst_t* *host)

Configure the device-related register before transactions. This saves some time to re-configure those registers when we send continuously

esp_err_t (***common_command**)(*spi_flash_host_inst_t* *host, *spi_flash_trans_t* *t)

Send an user-defined spi transaction to the device.

esp_err_t (***read_id**)(*spi_flash_host_inst_t* *host, uint32_t *id)

Read flash ID.

void (***erase_chip**)(*spi_flash_host_inst_t* *host)

Erase whole flash chip.

void (***erase_sector**)(*spi_flash_host_inst_t* *host, uint32_t start_address)

Erase a specific sector by its start address.

void (***erase_block**)(*spi_flash_host_inst_t* *host, uint32_t start_address)

Erase a specific block by its start address.

esp_err_t (***read_status**)(*spi_flash_host_inst_t* *host, uint8_t *out_sr)

Read the status of the flash chip.

esp_err_t (***set_write_protect**)(*spi_flash_host_inst_t* *host, bool wp)

Disable write protection.

void (***program_page**)(*spi_flash_host_inst_t* *host, const void *buffer, uint32_t address, uint32_t length)

Program a page of the flash. Check `max_write_bytes` for the maximum allowed writing length.

bool (***supports_direct_write**)(*spi_flash_host_inst_t* *host, const void *p)

Check whether the SPI host supports direct write.

When cache is disabled, SPI1 doesn't support directly write when buffer isn't internal.

int (***write_data_slicer**)(*spi_flash_host_inst_t* *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)

Slicer for write data. The `program_page` should be called iteratively with the return value of this function.

Param address Beginning flash address to write

Param len Length request to write

Param align_addr Output of the aligned address to write to

Param page_size Physical page size of the flash chip

Return Length that can be actually written in one `program_page` call

`esp_err_t (*read)(spi_flash_host_inst_t *host, void *buffer, uint32_t address, uint32_t read_len)`

Read data from the flash. Check `max_read_bytes` for the maximum allowed reading length.

`bool (*supports_direct_read)(spi_flash_host_inst_t *host, const void *p)`

Check whether the SPI host supports direct read.

When cache is disabled, SPI1 doesn't support directly read when the given buffer isn't internal.

`int (*read_data_slicer)(spi_flash_host_inst_t *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)`

Slicer for read data. The `read` should be called iteratively with the return value of this function.

Param address Beginning flash address to read

Param len Length request to read

Param align_addr Output of the aligned address to read

Param page_size Physical page size of the flash chip

Return Length that can be actually read in one `read` call

`uint32_t (*host_status)(spi_flash_host_inst_t *host)`

Check the host status, 0:busy, 1:idle, 2:suspended.

`esp_err_t (*configure_host_io_mode)(spi_flash_host_inst_t *host, uint32_t command, uint32_t addr_bitlen, int dummy_bitlen_base, spi_flash_io_mode_t io_mode)`

Configure the host to work at different read mode. Responsible to compensate the timing and set IO mode.

`void (*poll_cmd_done)(spi_flash_host_inst_t *host)`

Internal use, poll the HW until the last operation is done.

`esp_err_t (*flush_cache)(spi_flash_host_inst_t *host, uint32_t addr, uint32_t size)`

For some host (SPI1), they are shared with a cache. When the data is modified, the cache needs to be flushed. Left NULL if not supported.

`void (*check_suspend)(spi_flash_host_inst_t *host)`

Suspend check erase/program operation, reserved for ESP32-C3 and ESP32-S3 spi flash ROM IMPL.

`void (*resume)(spi_flash_host_inst_t *host)`

Resume flash from suspend manually

`void (*suspend)(spi_flash_host_inst_t *host)`

Set flash in suspend status manually

`esp_err_t (*sus_setup)(spi_flash_host_inst_t *host, const spi_flash_sus_cmd_conf *sus_conf)`

Suspend feature setup for setting cmd and status register mask.

Macros

SPI_FLASH_TRANS_FLAG_CMD16

Send command of 16 bits.

SPI_FLASH_TRANS_FLAG_IGNORE_BASEIO

Not applying the basic io mode configuration for this transaction.

SPI_FLASH_TRANS_FLAG_BYTE_SWAP

Used for DTR mode, to swap the bytes of a pair of rising/falling edge.

SPI_FLASH_TRANS_FLAG_PE_CMD

Indicates that this transaction is to erase/program flash chip.

SPI_FLASH_CONFIG_CONF_BITS

OR the `io_mode` with this mask, to enable the dummy output feature or replace the first several dummy bits into address to meet the requirements of conf bits. (Used in DIO/QIO/OIO mode)

SPI_FLASH_OPI_FLAG

A flag for flash work in opi mode, the io mode below are opi, above are SPI/QSPI mode. DO NOT use this value in any API.

SPI_FLASH_READ_MODE_MIN

Slowest io mode supported by ESP32, currently SlowRd.

Type Definitions

```
typedef enum esp_flash_speed_s esp_flash_speed_t
```

SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the `ESP_FLASH_SPEED_MAX-1` or highest frequency supported by your flash, and decrease the speed until the probing success.

```
typedef struct spi_flash_host_driver_s spi_flash_host_driver_t
```

Enumerations

```
enum esp_flash_speed_s
```

SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the `ESP_FLASH_SPEED_MAX-1` or highest frequency supported by your flash, and decrease the speed until the probing success.

Values:

```
enumerator ESP_FLASH_5MHZ
```

The flash runs under 5MHz.

```
enumerator ESP_FLASH_10MHZ
```

The flash runs under 10MHz.

```
enumerator ESP_FLASH_20MHZ
```

The flash runs under 20MHz.

enumerator **ESP_FLASH_26MHZ**

The flash runs under 26MHz.

enumerator **ESP_FLASH_40MHZ**

The flash runs under 40MHz.

enumerator **ESP_FLASH_80MHZ**

The flash runs under 80MHz.

enumerator **ESP_FLASH_120MHZ**

The flash runs under 120MHz, 120MHz can only be used by main flash after timing tuning in system. Do not use this directly in any API.

enumerator **ESP_FLASH_SPEED_MAX**

The maximum frequency supported by the host is `ESP_FLASH_SPEED_MAX-1`.

enum **esp_flash_io_mode_t**

Mode used for reading from SPI flash.

Values:

enumerator **SPI_FLASH_SLOWRD**

Data read using single I/O, some limits on speed.

enumerator **SPI_FLASH_FASTRD**

Data read using single I/O, no limit on speed.

enumerator **SPI_FLASH_DOUT**

Data read using dual I/O.

enumerator **SPI_FLASH_DIO**

Both address & data transferred using dual I/O.

enumerator **SPI_FLASH_QOUT**

Data read using quad I/O.

enumerator **SPI_FLASH_QIO**

Both address & data transferred using quad I/O.

enumerator **SPI_FLASH_OPI_STR**

Only support on OPI flash, flash read and write under STR mode.

enumerator **SPI_FLASH_OPI_DTR**

Only support on OPI flash, flash read and write under DTR mode.

enumerator **SPI_FLASH_READ_MODE_MAX**

The fastest io mode supported by the host is `ESP_FLASH_READ_MODE_MAX-1`.

Header File

- `components/hal/include/hal/esp_flash_err.h`
- This header file can be included with:

```
#include "hal/esp_flash_err.h"
```

Macros

ESP_ERR_FLASH_NOT_INITIALISED

`esp_flash_chip_t` structure not correctly initialised by `esp_flash_init()`.

ESP_ERR_FLASH_UNSUPPORTED_HOST

Requested operation isn't supported via this host SPI bus (`chip->spi` field).

ESP_ERR_FLASH_UNSUPPORTED_CHIP

Requested operation isn't supported by this model of SPI flash chip.

ESP_ERR_FLASH_PROTECTED

Write operation failed due to chip's write protection being enabled.

Enumerations

enum [anonymous]

Values:

enumerator **ESP_ERR_FLASH_SIZE_NOT_MATCH**

The chip doesn't have enough space for the current partition table.

enumerator **ESP_ERR_FLASH_NO_RESPONSE**

Chip did not respond to the command, or timed out.

Header File

- `components/spi_flash/include/esp_spi_flash_counters.h`
- This header file can be included with:

```
#include "esp_spi_flash_counters.h"
```

- This header file is a part of the API provided by the `spi_flash` component. To declare that your component depends on `spi_flash`, add the following to your `CMakeLists.txt`:

```
REQUIRES spi_flash
```

or

```
PRIV_REQUIRES spi_flash
```

Functions

void **esp_flash_reset_counters** (void)

Reset SPI flash operation counters.

void **spi_flash_reset_counters** (void)

void **esp_flash_dump_counters** (FILE *stream)

Print SPI flash operation counters.

void **spi_flash_dump_counters** (void)

const *esp_flash_counters_t* ***esp_flash_get_counters** (void)

Return current SPI flash operation counters.

Returns pointer to the *esp_flash_counters_t* structure holding values of the operation counters

const *spi_flash_counters_t* ***spi_flash_get_counters** (void)

Structures

struct **esp_flash_counter_t**

Structure holding statistics for one type of operation

Public Members

uint32_t **count**

number of times operation was executed

uint32_t **time**

total time taken, in microseconds

uint32_t **bytes**

total number of bytes

struct **esp_flash_counters_t**

Structure for counters of flash actions

Public Members

esp_flash_counter_t **read**

counters for read action, like `esp_flash_read`

esp_flash_counter_t **write**

counters for write action, like `esp_flash_write`

esp_flash_counter_t **erase**

counters for erase action, like `esp_flash_erase`

Type Definitions

typedef *esp_flash_counter_t* **spi_flash_counter_t**

typedef *esp_flash_counters_t* **spi_flash_counters_t**

API Reference - Flash Encrypt

Header File

- `components/bootloader_support/include/esp_flash_encrypt.h`
- This header file can be included with:

```
#include "esp_flash_encrypt.h"
```

- This header file is a part of the API provided by the `bootloader_support` component. To declare that your component depends on `bootloader_support`, add the following to your `CMakeLists.txt`:

```
REQUIRES bootloader_support
```

or

```
PRIV_REQUIRES bootloader_support
```

Functions

bool **esp_flash_encryption_enabled** (void)

Is flash encryption currently enabled in hardware?

Flash encryption is enabled if the `FLASH_CRYPT_CNT` efuse has an odd number of bits set.

Returns true if flash encryption is enabled.

esp_err_t **esp_flash_encrypt_check_and_update** (void)

bool **esp_flash_encrypt_state** (void)

Returns the Flash Encryption state and prints it.

Returns True - Flash Encryption is enabled False - Flash Encryption is not enabled

bool **esp_flash_encrypt_initialized_once** (void)

Checks if the first initialization was done.

If the first initialization was done then `FLASH_CRYPT_CNT != 0`

Returns true - the first initialization was done false - the first initialization was NOT done

esp_err_t **esp_flash_encrypt_init** (void)

The first initialization of Flash Encryption key and related eFuses.

Returns `ESP_OK` if all operations succeeded

esp_err_t **esp_flash_encrypt_contents** (void)

Encrypts flash content.

Returns `ESP_OK` if all operations succeeded

esp_err_t **esp_flash_encrypt_enable** (void)

Activates Flash encryption on the chip.

It burns `FLASH_CRYPT_CNT` eFuse based on the `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_RELEASE` option.

Returns `ESP_OK` if all operations succeeded

bool **esp_flash_encrypt_is_write_protected** (bool print_error)

Returns True if the write protection of `FLASH_CRYPT_CNT` is set.

Parameters `print_error` -- Print error if it is write protected

Returns true - if `FLASH_CRYPT_CNT` is write protected

esp_err_t **esp_flash_encrypt_region** (uint32_t src_addr, size_t data_length)

Encrypt-in-place a block of flash sectors.

Note: This function resets `RTC_WDT` between operations with sectors.

Parameters

- **src_addr** -- Source offset in flash. Should be multiple of 4096 bytes.

- **data_length** -- Length of data to encrypt in bytes. Will be rounded up to next multiple of 4096 bytes.

Returns ESP_OK if all operations succeeded, ESP_ERR_FLASH_OP_FAIL if SPI flash fails, ESP_ERR_FLASH_OP_TIMEOUT if flash times out.

void **esp_flash_write_protect_crypt_cnt** (void)

Write protect FLASH_CRYPT_CNT.

Intended to be called as a part of boot process if flash encryption is enabled but secure boot is not used. This should protect against serial re-flashing of an unauthorised code in absence of secure boot.

Note: On ESP32 V3 only, write protecting FLASH_CRYPT_CNT will also prevent disabling UART Down-load Mode. If both are wanted, call esp_efuse_disable_rom_download_mode() before calling this function.

esp_flash_enc_mode_t **esp_get_flash_encryption_mode** (void)

Return the flash encryption mode.

The API is called during boot process but can also be called by application to check the current flash encryption mode of ESP32

Returns

void **esp_flash_encryption_init_checks** (void)

Check the flash encryption mode during startup.

Verifies the flash encryption config during startup:

- Correct any insecure flash encryption settings if hardware Secure Boot is enabled.
- Log warnings if the efuse config doesn't match the project config in any way

Note: This function is called automatically during app startup, it doesn't need to be called from the app.

bool **esp_flash_encryption_cfg_verify_release_mode** (void)

Returns the verification status for all physical security features of flash encryption in release mode.

If the device has flash encryption feature configured in the release mode, then it is highly recommended to call this API in the application startup code. This API verifies the sanity of the eFuse configuration against the release (production) mode of the flash encryption feature.

Returns

- True - all eFuses are configured correctly
- False - not all eFuses are configured correctly.

void **esp_flash_encryption_set_release_mode** (void)

Switches Flash Encryption from "Development" to "Release".

If already in "Release" mode, the function will do nothing. If flash encryption efuse is not enabled yet then abort. It burns:

- "disable encrypt in dl mode"
- set FLASH_CRYPT_CNT efuse to max

Enumerations

enum **esp_flash_enc_mode_t**

Values:

enumerator `ESP_FLASH_ENC_MODE_DISABLED`

enumerator `ESP_FLASH_ENC_MODE_DEVELOPMENT`

enumerator `ESP_FLASH_ENC_MODE_RELEASE`

2.6.23 SPI Master Driver

SPI Master driver is a program that controls ESP32-C5's General Purpose SPI (GP-SPI) peripheral(s) when it functions as a master.

For more hardware information about the GP-SPI peripheral(s), see [ESP32-C5 Technical Reference Manual > SPI Controller \[PDF\]](#).

Terminology

The terms used in relation to the SPI Master driver are given in the table below.

Term	Definition
Host	The SPI controller peripheral inside ESP32-C5 initiates SPI transmissions over the bus and acts as an SPI Master.
Device	SPI slave Device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO, and SCLK signals but is only active on the bus when the Host asserts the Device's individual CS line.
Bus	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in a daisy-chain manner.
MOSI	Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device. Also data0 signal in Octal/OPI mode.
MISO	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host. Also data1 signal in Octal/OPI mode.
SCLK	Serial Clock. The oscillating signal generated by a Host keeps the transmission of data bits in sync.
CS	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
QUADWP	Write Protect signal. Used for 4-bit (qio/qout) transactions. Also for the data2 signal in Octal/OPI mode.
QUADHD	Hold signal. Used for 4-bit (qio/qout) transactions. Also for the data3 signal in Octal/OPI mode.
DATA4	Data4 signal in Octal/OPI mode.
DATA5	Data5 signal in Octal/OPI mode.
DATA6	Data6 signal in Octal/OPI mode.
DATA7	Data7 signal in Octal/OPI mode.
Assertion	The action of activating a line.
De-assertion	The action of returning the line back to inactive (back to idle) status.
Transaction	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
Launch Edge	Edge of the clock at which the source register launches the signal onto the line.
Latch Edge	Edge of the clock at which the destination register latches in the signal.

Driver Features

The SPI Master driver governs the communications between Hosts and Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see [SPI Bus Lock](#).

Warning: The SPI Master driver allows multiple Devices to be connected on a same SPI bus (sharing a single ESP32-C5 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread-safe. However, if multiple tasks try to access the same SPI Device, the driver is **not thread-safe**. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time. You can use `spi_bus_config_t::isr_cpu_id` to register the SPI ISR to the same core as SPI peripheral-related tasks to ensure thread safety.
- Add a mutex lock around the shared Device using `xSemaphoreCreateMutex`.

SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

Phase	Description
Command	In this phase, a command (0-16 bit) is written to the bus by the Host.
Address	In this phase, an address (0-32 bit) is transmitted over the bus by the Host.
Dummy	This phase is configurable and is used to meet the timing requirements.
Write	Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.
Read	Device sends data to its Host.

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, Device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the Read and Write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the Read and Write phases are not simultaneous (one direction at a time). The lengths of the Write and Read phases are determined by `spi_transaction_t::length` and `spi_transaction_t::rxlength` respectively.

The Command and Address phases are optional, as not every SPI Device requires a command and/or address. This is reflected in the Device's configuration: if `spi_device_interface_config_t::command_bits` and/or `spi_device_interface_config_t::address_bits` are set to zero, no Command or Address phase will occur.

The Read and Write phases can also be optional, as not every transaction requires both writing and reading data. If `spi_transaction_t::rx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the Read phase

is skipped. If `spi_transaction_t::tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the Write phase is skipped.

The driver supports two types of transactions: interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see [Notes on Sending Mixed Transactions to the Same Device](#).

Interrupt Transactions Interrupt transactions blocks the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver automatically handles them one by one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions are complete.

Polling Transactions Polling transactions do not use interrupts. The routine keeps polling the SPI Host's status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1 μ s to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see [Bus Acquiring](#).

Transaction Line Mode Supported line modes for ESP32-C5 are listed as follows, to make use of these modes, set the member `flags` in the struct `spi_transaction_t` as shown in the Transaction Flag column. If you want to check if corresponding IO pins are set or not, set the member `flags` in the `spi_bus_config_t` as shown in the Bus IO setting Flag column.

Mode name	Command Line Width	Address Line Width	Data Line Width	Transaction Flag	Bus IO Setting Flag
Normal SPI	1	1	1	0	0
Dual Output	1	1	2	<code>SPI_TRANS_MODE_SHTOCM-</code>	<code>MON_BUSFLAG_DUAL</code>
Dual I/O	1	2	2	<code>SPI_TRANS_MODE_SHTOCM-</code> <code>SPI_TRANS_MULTIMON_BUSFLAG_DUAL</code>	<code>MON_BUSFLAG_DUAL</code>
Quad Output	1	1	4	<code>SPI_TRANS_MODE_SHTOCM-</code>	<code>MON_BUSFLAG_QUAD</code>
Quad I/O	1	4	4	<code>SPI_TRANS_MODE_SHTOCM-</code> <code>SPI_TRANS_MULTIMON_BUSFLAG_QUAD</code>	<code>MON_BUSFLAG_QUAD</code>

Command and Address Phases During the Command and Address phases, the members `spi_transaction_t::cmd` and `spi_transaction_t::addr` are sent to the bus, nothing is read at this time. The default lengths of the Command and Address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the Command and Address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::base` and configure the rest of base as usual. Then the length of each phase will be equal to `spi_transaction_ext_t::command_bits` and `spi_transaction_ext_t::address_bits` set in the struct `spi_transaction_ext_t`.

If the Command and Address phase need to have the same number of lines as the data phase, you need to set `SPI_TRANS_MULTILINE_CMD` and/or `SPI_TRANS_MULTILINE_ADDR` to the `flags` member in the struct `spi_transaction_t`. Also see [Transaction Line Mode](#).

Write and Read Phases Normally, the data that needs to be transferred to or from a Device is read from or written to a chunk of memory indicated by the members `spi_transaction_t::rx_buffer` and `spi_transaction_t::tx_buffer`. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory (`MALLOC_CAP_DMA`), see [DMA-Capable Memory](#).
2. 32-bit aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

If using more than one data line to transmit, please set `SPI_DEVICE_HALFDUPLEX` flag for the member `flags` in the struct `spi_device_interface_config_t`. And the member `flags` in the struct `spi_transaction_t` should be set as described in [Transaction Line Mode](#).

Note: Half-duplex transactions with both Read and Write phases are not supported. Please use full duplex mode.

Bus Acquiring Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other Devices until the bus is released. To acquire and release a bus, use the functions `spi_device_acquire_bus()` and `spi_device_release_bus()`.

Sleep Retention ESP32-C5 supports to retain the SPI register context before entering **light sleep** and restore them after waking up. This means you don't have to re-init the SPI driver after the light sleep.

This feature can be enabled by setting the flag `SPICOMMON_BUSFLAG_SLP_ALLOW_PD`. It will allow the system to power down the SPI in light sleep, meanwhile save the register context. It can help to save more power consumption with some extra cost of the memory.

Driver Usage

- Initialize an SPI bus by calling the function `spi_bus_initialize()`. Make sure to set the correct I/O pins in the struct `spi_bus_config_t`. Set the signals that are not needed to `-1`.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the Device might need with the parameter `dev_config`. You should now have obtained the Device's handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
 - **Interrupt** Either queue all transactions by calling the function `spi_device_queue_trans()` and, at a later time, query the result using the function `spi_device_get_trans_result()`, or handle all requests synchronously by feeding them into `spi_device_transmit()`.
 - **Polling** Call the function `spi_device_polling_transmit()` to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using `spi_device_polling_start()` and `spi_device_polling_end()`.
- (Optional) To perform back-to-back transactions with a Device, call the function `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()` after the transactions have been sent.
- (Optional) To remove a certain Device from the bus, call `spi_bus_remove_device()` with the Device handle as an argument.
- (Optional) To remove the driver from the bus, make sure no more devices are attached and call `spi_bus_free()`.

The example code for the SPI Master driver can be found in the [peripherals/spi_master](#) directory of ESP-IDF examples.

Transactions with Data Not Exceeding 32 Bits When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the `spi_transaction_t::tx_data` member and setting the `SPI_TRANS_USE_TXDATA` flag on the transmission. For received data, use `spi_transaction_t::rx_data` and set `SPI_TRANS_USE_RXDATA`. In both cases, do not touch the `spi_transaction_t::tx_buffer` or `spi_transaction_t::rx_buffer` members, because they use the same memory locations as `spi_transaction_t::tx_data` and `spi_transaction_t::rx_data`.

Transactions with Integers Other than `uint8_t` An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB is first used in rare cases. If a value of fewer than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if `0b00010` needs to be sent, it should be written into a `uint8_t` variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional "random" bits, so the reading must be performed correctly.

On top of that, ESP32-C5 is a little-endian chip, which means that the least significant byte of `uint16_t` and `uint32_t` variables is stored at the smallest address. Hence, if `uint16_t` is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has a size differing from `uint8_t` arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- `SPI_SWAP_DATA_TX` for data to be transmitted
- `SPI_SWAP_DATA_RX` for data received

Notes on Sending Mixed Transactions to the Same Device To reduce coding complexity, send only one type of transaction (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function `spi_device_polling_end()` after `spi_device_polling_start()` to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with `spi_device_polling_transmit()` so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call `spi_device_polling_start()`. To do that, you can keep calling `spi_device_get_trans_result()` until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

GPIO Matrix and IO_MUX Most of the chip's peripheral signals have a direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it.

When an SPI Host is set to 80 MHz or lower frequencies, routing SPI pins via the GPIO matrix will behave the same compared to routing them via IOMUX.

The IO_MUX pins for SPI buses are given below.

Pin Name	GPIO Number (SPI2)
CS0 ¹	10
SCLK	6
MISO	2
MOSI	7
QUADWP	5
QUADHD	4

Transfer Speed Considerations

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

Transaction Duration Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transactions.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For **interrupt transactions**, the CPU can switch to other tasks when a transaction is in progress. This saves CPU time but increases the transaction duration. See *Interrupt Transactions*. For **polling transactions**, it does not block the task but allows to do polling when the transaction is in progress. For more information, see *Polling Transactions*.

If DMA is enabled, setting up the linked list requires about 2 μ s per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2 μ s, but the transaction length is limited to 64 bytes for both write and read.

The typical transaction duration for one byte of data is given below.

- Interrupt Transaction via DMA: 24 μ s.
- Interrupt Transaction via CPU: 22 μ s.
- Polling Transaction via DMA: 15 μ s.
- Polling Transaction via CPU: 12 μ s.

Note that these data are tested with *CONFIG_SPI_MASTER_ISR_IN_IRAM* enabled. SPI transaction related code are placed in the internal memory. If this option is turned off (for example, for internal memory optimization), the transaction duration may be affected.

SPI Clock Frequency The clock source of the GPSPI peripherals can be selected by setting `spi_device_handle_t::cfg::clock_source`. You can refer to *spi_clock_source_t* to know the supported clock sources.

By default driver sets `spi_device_handle_t::cfg::clock_source` to `SPI_CLK_SRC_DEFAULT`. This usually stands for the highest frequency among GPSPI clock sources. Its value is different among chips.

The actual clock frequency of a Device may not be exactly equal to the number you set, it is re-calculated by the driver to the nearest hardware-compatible number, and not larger than the clock frequency of the clock source. You can call *spi_device_get_actual_freq()* to know the actual frequency computed by the driver.

The theoretical maximum transfer speed of the Write or Read phase can be calculated according to the table below:

¹ Only the first Device attached to the bus can use the CS0 pin.

Line Width of Write/Read phase	Speed (Bps)
1-Line	$SPI\ Frequency / 8$
2-Line	$SPI\ Frequency / 4$
4-Line	$SPI\ Frequency / 2$

The transfer speed calculation of other phases (Command, Address, Dummy) is similar.

Cache Missing The default config puts only the ISR into the IRAM. Other SPI-related functions, including the driver itself and the callback, might suffer from cache misses and need to wait until the code is read from flash. Select `CONFIG_SPI_MASTER_IN_IRAM` to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache missing.

Note: SPI driver implementation is based on FreeRTOS APIs, to use `CONFIG_SPI_MASTER_IN_IRAM`, you should not enable `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH`.

For an interrupt transaction, the overall cost is $20+8n/F_{spi}[MHz]$ [μs] for n bytes transferred in one transaction. Hence, the transferring speed is: $n/(20+8n/F_{spi})$. An example of transferring speed at 8 MHz clock speed is given in the following table.

Frequency (MHz)	Transaction Interval (μs)	Transaction Length (bytes)	Total Time (μs)	Total Speed (KBps)
8	25	1	26	38.5
8	25	8	33	242.4
8	25	16	41	490.2
8	25	64	89	719.1
8	25	128	153	836.6

When a transaction length is short, the cost of the transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable `CONFIG_SPI_MASTER_ISR_IN_IRAM` and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations are handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache missing. For more details, see [IRAM-Safe Interrupt Handlers](#).

Application Examples

- [peripherals/spi_master/hd_eeprom](#) demonstrates how to use the SPI master half duplex mode to read/write an AT93C46D EEPROM (8-bit mode) on ESP32-C5.
- [peripherals/spi_master/lcd](#) demonstrates how to use the SPI master driver to display an animation on the LCD. With the help of the DMA, we can do render and flush in parallel. This example also illustrates using the SPI transaction hook function to drive the D/C signal level.

Header File

- `components/hal/include/hal/spi_types.h`
- This header file can be included with:

```
#include "hal/spi_types.h"
```

Structures

struct **spi_line_mode_t**

Line mode of SPI transaction phases: CMD, ADDR, DOUT/DIN.

Public Members

uint8_t **cmd_lines**

The line width of command phase, e.g. 2-line-cmd-phase.

uint8_t **addr_lines**

The line width of address phase, e.g. 1-line-addr-phase.

uint8_t **data_lines**

The line width of data phase, e.g. 4-line-data-phase.

Type Definitions

typedef *soc_periph_spi_clk_src_t* **spi_clock_source_t**

Type of SPI clock source.

Enumerations

enum **spi_host_device_t**

Enum with the three SPI peripherals that are software-accessible in it.

Values:

enumerator **SPI1_HOST**

SPI1.

enumerator **SPI2_HOST**

SPI2.

enumerator **SPI_HOST_MAX**

invalid host value

enum **spi_event_t**

SPI Events.

Values:

enumerator **SPI_EV_BUF_TX**

The buffer has sent data to master.

enumerator **SPI_EV_BUF_RX**

The buffer has received data from master.

enumerator **SPI_EV_SEND_DMA_READY**

Slave has loaded its TX data buffer to the hardware (DMA).

enumerator **SPI_EV_SEND**

Master has received certain number of the data, the number is determined by Master.

enumerator **SPI_EV_RECV_DMA_READY**

Slave has loaded its RX data buffer to the hardware (DMA).

enumerator **SPI_EV_RECV**

Slave has received certain number of data from master, the number is determined by Master.

enumerator **SPI_EV_CMD9**

Received CMD9 from master.

enumerator **SPI_EV_CMDA**

Received CMDA from master.

enumerator **SPI_EV_TRANS**

A transaction has done.

enum **spi_command_t**

SPI command.

Values:

enumerator **SPI_CMD_HD_WRBUF**

enumerator **SPI_CMD_HD_RDBUF**

enumerator **SPI_CMD_HD_WRDMA**

enumerator **SPI_CMD_HD_RDDMA**

enumerator **SPI_CMD_HD_SEG_END**

enumerator **SPI_CMD_HD_EN_QPI**

enumerator **SPI_CMD_HD_WR_END**

enumerator **SPI_CMD_HD_INT0**

enumerator **SPI_CMD_HD_INT1**

enumerator **SPI_CMD_HD_INT2**

```
REQUIRES esp_driver_spi
```

or

```
PRIV_REQUIRES esp_driver_spi
```

Functions

`esp_err_t spi_bus_initialize` (*spi_host_device_t* host_id, const *spi_bus_config_t* *bus_config, *spi_dma_chan_t* dma_chan)

Initialize a SPI bus.

Warning: SPI0/1 is not supported

Warning: If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

Warning: The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

Parameters

- **host_id** -- SPI peripheral that controls this bus
- **bus_config** -- Pointer to a *spi_bus_config_t* struct specifying how the host should be initialized
- **dma_chan** -- - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
 - Selecting `SPI_DMA_DISABLED` limits the size of transactions.
 - Set to `SPI_DMA_DISABLED` if only the SPI flash uses this bus.
 - Set to `SPI_DMA_CH_AUTO` to let the driver to allocate the DMA channel.

Returns

- `ESP_ERR_INVALID_ARG` if configuration is invalid
- `ESP_ERR_INVALID_STATE` if host already is in use
- `ESP_ERR_NOT_FOUND` if there is no available DMA channel
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

`esp_err_t spi_bus_free` (*spi_host_device_t* host_id)

Free a SPI bus.

Warning: In order for this to succeed, all devices have to be removed first.

Parameters **host_id** -- SPI peripheral to free

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_INVALID_STATE` if bus hasn't been initialized before, or not all devices on the bus are freed
- `ESP_OK` on success

```
void *spi_bus_dma_memory_alloc (spi_host_device_t host_id, size_t size, uint32_t extra_heap_caps)
```

Helper function for malloc DMA capable memory for SPI driver.

Note: This API will take care of the cache and hardware alignment internally. To free/release memory allocated by this helper function, simply calling `free()`

Parameters

- **host_id** -- [in] SPI peripheral who will using the memory
- **size** -- [in] Size in bytes, the amount of memory to allocate
- **extra_heap_caps** -- [in] Extra heap caps based on MALLOC_CAP_DMA

Returns Pointer to the memory if allocated successfully

Structures

```
struct spi_bus_config_t
```

This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO_MUX or are -1. In that case, the IO_MUX is used. On ESP32, using GPIO matrix will bring about 25ns of input delay, which may cause incorrect read for >40MHz speeds.

Note: Be advised that the slave driver does not use the quadwp/quadhd lines and fields in *spi_bus_config_t* referring to these lines will be ignored and can thus safely be left uninitialized.

Public Members

```
int mosi_io_num
```

GPIO pin for Master Out Slave In (=spi_d) signal, or -1 if not used.

```
int data0_io_num
```

GPIO pin for spi data0 signal in quad/octal mode, or -1 if not used.

```
int miso_io_num
```

GPIO pin for Master In Slave Out (=spi_q) signal, or -1 if not used.

```
int data1_io_num
```

GPIO pin for spi data1 signal in quad/octal mode, or -1 if not used.

```
int sclk_io_num
```

GPIO pin for SPI Clock signal, or -1 if not used.

```
int quadwp_io_num
```

GPIO pin for WP (Write Protect) signal, or -1 if not used.

```
int data2_io_num
```

GPIO pin for spi data2 signal in quad/octal mode, or -1 if not used.

int **quadhd_io_num**

GPIO pin for HD (Hold) signal, or -1 if not used.

int **data3_io_num**

GPIO pin for spi data3 signal in quad/octal mode, or -1 if not used.

int **data4_io_num**

GPIO pin for spi data4 signal in octal mode, or -1 if not used.

int **data5_io_num**

GPIO pin for spi data5 signal in octal mode, or -1 if not used.

int **data6_io_num**

GPIO pin for spi data6 signal in octal mode, or -1 if not used.

int **data7_io_num**

GPIO pin for spi data7 signal in octal mode, or -1 if not used.

bool **data_io_default_level**

Output data IO default level when no transaction.

int **max_transfer_sz**

Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to `SOC_SPI_MAXIMUM_BUFFER_SIZE` if DMA is disabled.

uint32_t **flags**

Abilities of bus to be checked by the driver. Or-ed value of `SPICOMMON_BUSFLAG_*` flags.

esp_intr_cpu_affinity_t **isr_cpu_id**

Select cpu core to register SPI ISR.

int **intr_flags**

Interrupt flag for the bus to set the priority, and IRAM attribute, see `esp_intr_alloc.h`. Note that the `EDGE`, `INTRDISABLED` attribute are ignored by the driver. Note that if `ESP_INTR_FLAG_IRAM` is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

Macros

SPI_MAX_DMA_LEN

SPI_SWAP_DATA_TX (DATA, LEN)

Transform unsigned integer of length ≤ 32 bits to the format which can be sent by the SPI driver directly.

E.g. to send 9 bits of data, you can:

```
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points `tx_buffer` to `&data`.

Parameters

- **DATA** -- Data to be sent, can be `uint8_t`, `uint16_t` or `uint32_t`.
- **LEN** -- Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.

SPI_SWAP_DATA_RX (DATA, LEN)

Transform received data of length ≤ 32 bits to the format of an unsigned integer.

E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```
uint16_t data = SPI_SWAP_DATA_RX(*(uint32_t*)t->rx_data, 15);
```

Parameters

- **DATA** -- Data to be rearranged, can be `uint8_t`, `uint16_t` or `uint32_t`.
- **LEN** -- Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.

SPICOMMON_BUSFLAG_SLAVE

Initialize I/O in slave mode.

SPICOMMON_BUSFLAG_MASTER

Initialize I/O in master mode.

SPICOMMON_BUSFLAG_IOMUX_PINS

Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

SPICOMMON_BUSFLAG_GPIO_PINS

Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.

SPICOMMON_BUSFLAG_SCLK

Check existing of SCLK pin. Or indicates CLK line initialized.

SPICOMMON_BUSFLAG_MISO

Check existing of MISO pin. Or indicates MISO line initialized.

SPICOMMON_BUSFLAG_MOSI

Check existing of MOSI pin. Or indicates MOSI line initialized.

SPICOMMON_BUSFLAG_DUAL

Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

SPICOMMON_BUSFLAG_WPHD

Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

SPICOMMON_BUSFLAG_QUAD

Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

SPICOMMON_BUSFLAG_IO4_IO7

Check existing of IO4~IO7 pins. Or indicates IO4~IO7 pins initialized.

SPICOMMON_BUSFLAG_OCTAL

Check existing of MOSI/MISO/WP/HD/SPIIO4/SPIIO5/SPIIO6/SPIIO7 pins as output. Or indicates bus able to work under octal mode.

SPICOMMON_BUSFLAG_NATIVE_PINS

SPICOMMON_BUSFLAG_SLP_ALLOW_PD

Allow to power down the peripheral during light sleep, and auto recover then.

Type Definitions

```
typedef spi_common_dma_t spi_dma_chan_t
```

Enumerations

```
enum spi_common_dma_t
```

SPI DMA channels.

Values:

```
enumerator SPI_DMA_DISABLED
```

Do not enable DMA for SPI.

```
enumerator SPI_DMA_CH_AUTO
```

Enable DMA, channel is automatically selected by driver.

API Reference - SPI Master**Header File**

- [components/esp_driver_spi/include/driver/spi_master.h](#)
- This header file can be included with:

```
#include "driver/spi_master.h"
```

- This header file is a part of the API provided by the `esp_driver_spi` component. To declare that your component depends on `esp_driver_spi`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_spi
```

or

```
PRIV_REQUIRES esp_driver_spi
```

Functions

```
esp_err_t spi_bus_add_device (spi_host_device_t host_id, const spi_device_interface_config_t *dev_config,  
                               spi_device_handle_t *handle)
```

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

There's no notable delay on chips other than ESP32.

Note: On ESP32, due to the delay of GPIO matrix, the maximum frequency SPI Master can correctly samples the slave's output is lower than the case using IOMUX. Typical maximum frequency communicating with an ideal slave without data output delay: 80MHz (IOMUX pins) and 26MHz (GPIO matrix pins). With the help of extra dummy cycles in half-duplex mode, the delay can be compensated by setting `input_delay_ns` in `dev_config` structure correctly.

Parameters

- **host_id** -- SPI peripheral to allocate device on
- **dev_config** -- SPI interface protocol config for the device
- **handle** -- Pointer to variable to hold the device handle

Returns

- **ESP_ERR_INVALID_ARG** if parameter is invalid or configuration combination is not supported (e.g. `dev_config->post_cb` isn't set while flag `SPI_DEVICE_NO_RETURN_RESULT` is enabled)
- **ESP_ERR_INVALID_STATE** if selected clock source is unavailable or spi bus not initialized
- **ESP_ERR_NOT_FOUND** if host doesn't have any free CS slots
- **ESP_ERR_NO_MEM** if out of memory
- **ESP_OK** on success

esp_err_t **spi_bus_remove_device** (*spi_device_handle_t* handle)

Remove a device from the SPI bus.

Parameters **handle** -- Device handle to free

Returns

- **ESP_ERR_INVALID_ARG** if parameter is invalid
- **ESP_ERR_INVALID_STATE** if device already is freed
- **ESP_OK** on success

esp_err_t **spi_device_queue_trans** (*spi_device_handle_t* handle, *spi_transaction_t* *trans_desc, TickType_t ticks_to_wait)

Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

Note: Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

Parameters

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans_desc** -- Description of transaction to execute
- **ticks_to_wait** -- Ticks to wait until there's room in the queue; use `portMAX_DELAY` to never time out.

Returns

- **ESP_ERR_INVALID_ARG** if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first) or set flag `SPI_TRANS_DMA_BUFFER_ALIGN_MANUAL` but tx or rx buffer not DMA-capable, or `addr&len` not align to cache line size
- **ESP_ERR_TIMEOUT** if there was no room in the queue before `ticks_to_wait` expired
- **ESP_ERR_NO_MEM** if allocating DMA-capable temporary buffer failed
- **ESP_ERR_INVALID_STATE** if previous transactions are not finished
- **ESP_OK** on success

esp_err_t **spi_device_get_trans_result** (*spi_device_handle_t* handle, *spi_transaction_t* **trans_desc, TickType_t ticks_to_wait)

Get the result of a SPI transaction queued earlier by `spi_device_queue_trans`.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or reuse the buffers.

Parameters

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans_desc** -- Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is

returned by `spi_device_get_trans_result`.

- **ticks_to_wait** -- Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NOT_SUPPORTED` if flag `SPI_DEVICE_NO_RETURN_RESULT` is set
- `ESP_ERR_TIMEOUT` if there was no completed transaction before `ticks_to_wait` expired
- `ESP_OK` on success

esp_err_t **spi_device_transmit** (*spi_device_handle_t* handle, *spi_transaction_t* *trans_desc)

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_queue_trans()` followed by `spi_device_get_trans_result()`. Do not use this when there is still a transaction separately queued (started) from `spi_device_queue_trans()` or `polling_start/transmit` that hasn't been finalized.

Note: This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

Parameters

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans_desc** -- Description of transaction to execute

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

esp_err_t **spi_device_polling_start** (*spi_device_handle_t* handle, *spi_transaction_t* *trans_desc, TickType_t ticks_to_wait)

Immediately start a polling transaction.

Note: Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

Parameters

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans_desc** -- Description of transaction to execute
- **ticks_to_wait** -- Ticks to wait until there's room in the queue; currently only `portMAX_DELAY` is supported.

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first) or set flag `SPI_TRANS_DMA_BUFFER_ALIGN_MANUAL` but tx or rx buffer not DMA-capable, or `addr&len` not align to cache line size
- `ESP_ERR_TIMEOUT` if the device cannot get control of the bus before `ticks_to_wait` expired
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions are not finished
- `ESP_OK` on success

esp_err_t **spi_device_polling_end** (*spi_device_handle_t* handle, TickType_t ticks_to_wait)

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

Parameters

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **ticks_to_wait** -- Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if the transaction cannot finish before `ticks_to_wait` expired
- `ESP_OK` on success

esp_err_t **spi_device_polling_transmit** (*spi_device_handle_t* handle, *spi_transaction_t* *trans_desc)

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_polling_start()` followed by `spi_device_polling_end()`. Do not use this when there is still a transaction that hasn't been finalized.

Note: This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

Parameters

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans_desc** -- Description of transaction to execute

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if the device cannot get control of the bus
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions of same device are not finished
- `ESP_OK` on success

esp_err_t **spi_device_acquire_bus** (*spi_device_handle_t* device, TickType_t wait)

Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until `spi_device_release_bus` is called.

Note: The function will wait until all the existing transactions have been sent.

Parameters

- **device** -- The device to occupy the bus.
- **wait** -- Time to wait before the the bus is occupied by the device. Currently MUST set to `portMAX_DELAY`.

Returns

- `ESP_ERR_INVALID_ARG` : `wait` is not set to `portMAX_DELAY`.
- `ESP_OK` : Success.

void **spi_device_release_bus** (*spi_device_handle_t* dev)

Release the SPI bus occupied by the device. All other devices can start sending transactions.

Parameters **dev** -- The device to release the bus.

esp_err_t **spi_device_get_actual_freq** (*spi_device_handle_t* handle, int *freq_khz)

Calculate working frequency for specific device.

Parameters

- **handle** -- SPI device handle
- **freq_khz** -- [out] output parameter to hold calculated frequency in kHz

Returns

- `ESP_ERR_INVALID_ARG` : `handle` or `freq_khz` parameter is NULL
- `ESP_OK` : Success

int **spi_get_actual_clock** (int fapb, int hz, int duty_cycle)

Calculate the working frequency that is most close to desired frequency.

Parameters

- **fapb** -- The frequency of apb clock, should be `APB_CLK_FREQ`.
- **hz** -- Desired working frequency
- **duty_cycle** -- Duty cycle of the spi clock

Returns Actual working frequency that most fit.

void **spi_get_timing** (bool gpio_is_used, int input_delay_ns, int eff_clk, int *dummy_o, int *cycles_remain_o)

Calculate the timing settings of specified frequency and settings.

Note: If `**dummy_o` is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

Parameters

- **gpio_is_used** -- True if using GPIO matrix, or False if iomux pins are used.
- **input_delay_ns** -- Input delay from SCLK launch edge to MISO data valid.
- **eff_clk** -- Effective clock frequency (in Hz) from `spi_get_actual_clock()`.
- **dummy_o** -- Address of dummy bits used output. Set to NULL if not needed.
- **cycles_remain_o** -- Address of cycles remaining (after dummy bits are used) output.
 - -1 If too many cycles remaining, suggest to compensate half a clock.
 - 0 If no remaining cycles or dummy bits are not used.
 - positive value: cycles suggest to compensate.

int **spi_get_freq_limit** (bool gpio_is_used, int input_delay_ns)

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

Parameters

- **gpio_is_used** -- True if using GPIO matrix, or False if native pins are used.
- **input_delay_ns** -- Input delay from SCLK launch edge to MISO data valid.

Returns Frequency limit of current configurations.

esp_err_t **spi_bus_get_max_transaction_len** (*spi_host_device_t* host_id, size_t *max_bytes)

Get max length (in bytes) of one transaction.

Parameters

- **host_id** -- SPI peripheral
- **max_bytes** -- [out] Max length of one transaction, in bytes

Returns

- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Invalid argument

Structures

struct **spi_device_interface_config_t**

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

Public Members

uint8_t **command_bits**

Default amount of bits in command phase (0-16), used when `SPI_TRANS_VARIABLE_CMD` is not used, otherwise ignored.

uint8_t address_bits

Default amount of bits in address phase (0-64), used when `SPI_TRANS_VARIABLE_ADDR` is not used, otherwise ignored.

uint8_t dummy_bits

Amount of dummy bits to insert between address and data phase.

uint8_t mode

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

***spi_clock_source_t* clock_source**

Select SPI clock source, `SPI_CLK_SRC_DEFAULT` by default.

uint16_t duty_cycle_pos

Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

uint16_t cs_ena_pretrans

Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

uint8_t cs_ena_posttrans

Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

int clock_speed_hz

SPI clock speed in Hz. Derived from `clock_source`.

int input_delay_ns

Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it's suggest to have the right value.

int spics_io_num

CS GPIO pin for this device, or -1 if not used.

uint32_t flags

Bitwise OR of `SPI_DEVICE_*` flags.

int queue_size

Transaction queue size. This sets how many transactions can be 'in the air' (queued using `spi_device_queue_trans` but not yet finished using `spi_device_get_trans_result`) at the same time.

***transaction_cb_t* pre_cb**

Callback to be called before a transmission is started.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

transaction_cb_t **post_cb**

Callback to be called after a transmission has completed.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

struct **spi_transaction_t**

This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

Public Members

uint32_t **flags**

Bitwise OR of `SPI_TRANS_*` flags.

uint16_t **cmd**

Command data, of which the length is set in the `command_bits` of *spi_device_interface_config_t*.

NOTE: this field, used to be "command" in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

Example: write 0x0123 and `command_bits=12` to send command 0x12, 0x3_ (in previous version, you may have to write 0x3_12).

uint64_t **addr**

Address data, of which the length is set in the `address_bits` of *spi_device_interface_config_t*.

NOTE: this field, used to be "address" in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF3.0.

Example: write 0x123400 and `address_bits=24` to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

size_t **length**

Total data length, in bits.

size_t **rxlength**

Total data length received, should be not greater than `length` in full-duplex mode (0 defaults this to the value of `length`).

void ***user**

User-defined variable. Can be used to store eg transaction ID.

const void ***tx_buffer**

Pointer to transmit buffer, or NULL for no MOSI phase.

uint8_t **tx_data**[4]

If `SPI_TRANS_USE_TXDATA` is set, data set here is sent directly from this variable.

void ***rx_buffer**

Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

uint8_t **rx_data**[4]

If SPI_TRANS_USE_RXDATA is set, data is received directly to this variable.

struct **spi_transaction_ext_t**

This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to SPI_TRANS_VARIABLE_CMD_ADR to use the bit length here.

Public Members

struct *spi_transaction_t* **base**

Transaction data, so that pointer to *spi_transaction_t* can be converted into *spi_transaction_ext_t*.

uint8_t **command_bits**

The command length in this transaction, in bits.

uint8_t **address_bits**

The address length in this transaction, in bits.

uint8_t **dummy_bits**

The dummy length in this transaction, in bits.

Macros

SPI_MASTER_FREQ_8M

SPI common used frequency (in Hz)

Note: SPI peripheral only has an integer divider, and the default clock source can be different on other targets, so the actual frequency may be slightly different from the desired frequency. 8MHz

SPI_MASTER_FREQ_9M

8.89MHz

SPI_MASTER_FREQ_10M

10MHz

SPI_MASTER_FREQ_11M

11.43MHz

SPI_MASTER_FREQ_13M

13.33MHz

SPI_MASTER_FREQ_16M

16MHz

SPI_MASTER_FREQ_20M

20MHz

SPI_MASTER_FREQ_26M

26.67MHz

SPI_MASTER_FREQ_40M

40MHz

SPI_MASTER_FREQ_80M

80MHz

SPI_DEVICE_TXBIT_LSBFIRST

Transmit command/address/data LSB first instead of the default MSB first.

SPI_DEVICE_RXBIT_LSBFIRST

Receive data LSB first instead of the default MSB first.

SPI_DEVICE_BIT_LSBFIRST

Transmit and receive LSB first.

SPI_DEVICE_3WIRE

Use MOSI (=spid) for both sending and receiving data.

SPI_DEVICE_POSITIVE_CS

Make CS positive during a transaction instead of negative.

SPI_DEVICE_HALFDUPLEX

Transmit data before receiving it, instead of simultaneously.

SPI_DEVICE_CLK_AS_CS

Output clock on CS line if CS is active.

SPI_DEVICE_NO_DUMMY

There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).

- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you're going to work with output only, or read without dummy bits at your own risk.

SPI_DEVICE_DDRCLK

SPI_DEVICE_NO_RETURN_RESULT

Don't return the descriptor to the host on completion (use post_cb to notify instead)

SPI_TRANS_MODE_DIO

Transmit/receive data in 2-bit mode.

SPI_TRANS_MODE_QIO

Transmit/receive data in 4-bit mode.

SPI_TRANS_USE_RXDATA

Receive into rx_data member of *spi_transaction_t* instead into memory at rx_buffer.

SPI_TRANS_USE_TXDATA

Transmit tx_data member of *spi_transaction_t* instead of data at tx_buffer. Do not set tx_buffer when using this.

SPI_TRANS_MODE_DIOQIO_ADDR

Also transmit address in mode selected by SPI_MODE_DIO/SPI_MODE_QIO.

SPI_TRANS_VARIABLE_CMD

Use the command_bits in *spi_transaction_ext_t* rather than default value in *spi_device_interface_config_t*.

SPI_TRANS_VARIABLE_ADDR

Use the address_bits in *spi_transaction_ext_t* rather than default value in *spi_device_interface_config_t*.

SPI_TRANS_VARIABLE_DUMMY

Use the dummy_bits in *spi_transaction_ext_t* rather than default value in *spi_device_interface_config_t*.

SPI_TRANS_CS_KEEP_ACTIVE

Keep CS active after data transfer.

SPI_TRANS_MULTILINE_CMD

The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase)

SPI_TRANS_MODE_OCT

Transmit/receive data in 8-bit mode.

SPI_TRANS_MULTILINE_ADDR

The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase)

SPI_TRANS_DMA_BUFFER_ALIGN_MANUAL

By default driver will automatically re-alloc dma buffer if it doesn't meet hardware alignment or dma_capable requirements, this flag is for you to disable this feature, you will need to take care of the alignment otherwise driver will return you error ESP_ERR_INVALID_ARG.

Type Definitions

```
typedef void (*transaction_cb_t)(spi_transaction_t *trans)
```

```
typedef struct spi_device_t *spi_device_handle_t
```

Handle for a device on a SPI bus.

2.6.24 SPI Slave Driver

SPI Slave driver is a program that controls ESP32-C5's General Purpose SPI (GP-SPI) peripheral(s) when it functions as a slave.

For more hardware information about the GP-SPI peripheral(s), see [ESP32-C5 Technical Reference Manual > SPI Controller \[PDF\]](#).

Terminology

The terms used in relation to the SPI slave driver are given in the table below.

Term	Definition
Host	The SPI controller peripheral external to ESP32-C5 that initiates SPI transmissions over the bus, and acts as an SPI Master.
Device	SPI slave device (general purpose SPI controller). Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device's individual CS line.
Bus	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
MISO	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.
MOSI	Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device.
SCLK	Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
CS	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
QUADWP	Write Protect signal. Only used for 4-bit (qio/qout) transactions.
QUADHD	Hold signal. Only used for 4-bit (qio/qout) transactions.
Assertion	The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called de-assertion .
Transaction	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
Launch Edge	Edge of the clock at which the source register launches the signal onto the line.
Latch Edge	Edge of the clock at which the destination register latches in the signal.

Driver Features

The SPI slave driver allows using the SPI peripherals as full-duplex Devices. The driver can send/receive transactions up to 64 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some *known issues* related to DMA.

The SPI slave driver supports registering the SPI ISR to a certain CPU core. If multiple tasks try to access the same SPI Device simultaneously, it is recommended that your application be refactored so that each SPI peripheral is only accessed by a single task at a time. Please also use `spi_bus_config_t::isr_cpu_id` to register the SPI ISR to the same core as SPI peripheral related tasks to ensure thread safety.

SPI Transactions

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the

MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.

The attributes of a transaction are determined by the configuration structure for an SPI peripheral acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`.

As not every transaction requires both writing and reading data, you can choose to configure the `spi_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::rx_buffer` is set to NULL, the read phase will be skipped. Similarly, if `spi_slave_transaction_t::tx_buffer` is set to NULL, the write phase will be skipped.

Note: A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see [Transaction Interval](#).

Driver Usage

- Initialize an SPI peripheral as a Device by calling the function `spi_slave_initialize()`. Make sure to set the correct I/O pins in the struct `bus_config`. Set the unused signals to `-1`.
- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.
- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

Transaction Data and Master/Slave Length Mismatches

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `spi_slave_transaction_t::rx_buffer` and `spi_slave_transaction_t::tx_buffer`. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by `spi_slave_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction's length is determined by the clock and CS lines driven by the Host. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `spi_slave_transaction_t::length` member will be sent and received. In this case, `spi_slave_transaction_t::trans_len` is set to `spi_slave_transaction_t::length` instead of the actual transaction length. To meet the actual transaction length requirements, set `spi_slave_transaction_t::length` to a value greater than the maximum `spi_slave_transaction_t::trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

GPIO Matrix and IO_MUX Most of chip's peripheral signals have direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it.

When an SPI Host is set to 80 MHz or lower frequencies, routing SPI pins via GPIO matrix will behave the same compared to routing them via IO_MUX.

The IO_MUX pins for SPI buses are given below.

Pin Name	GPIO Number (SPI2)
CS0	10
SCLK	6
MISO	2
MOSI	7
QUADWP	5
QUADHD	4

Speed and Timing Considerations

Transaction Interval The ESP32-C5 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device's response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in [peripherals/spi_slave](#).

SCLK Frequency Requirements The SPI slaves are designed to operate at up to 60 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

Restrictions and Known Issues

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied.

Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.

Application Examples

The code example for Device/Host communication can be found in the [peripherals/spi_slave](#) directory of ESP-IDF examples.

- **example** `peripherals/spi_slave/receiver` demonstrates how to configure an SPI slave to receive data from an SPI master and implement handshaking to manage data transfer readiness.
- **example** `peripherals/spi_slave/sender` demonstrate how to configure an SPI master to send data to an SPI slave and use handshaking to ensure proper timing for data transmission.

Functions

esp_err_t **spi_slave_initialize** (*spi_host_device_t* host, const *spi_bus_config_t* *bus_config, const *spi_slave_interface_config_t* *slave_config, *spi_dma_chan_t* dma_chan)

Initialize a SPI bus as a slave interface.

Warning: SPI0/1 is not supported

Warning: If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

Warning: The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

Parameters

- **host** -- SPI peripheral to use as a SPI slave interface
- **bus_config** -- Pointer to a *spi_bus_config_t* struct specifying how the host should be initialized
- **slave_config** -- Pointer to a *spi_slave_interface_config_t* struct specifying the details for the slave interface
- **dma_chan** -- - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
 - Selecting `SPI_DMA_DISABLED` limits the size of transactions.
 - Set to `SPI_DMA_DISABLED` if only the SPI flash uses this bus.
 - Set to `SPI_DMA_CH_AUTO` to let the driver to allocate the DMA channel.

Returns

- `ESP_ERR_INVALID_ARG` if configuration is invalid
- `ESP_ERR_INVALID_STATE` if host already is in use
- `ESP_ERR_NOT_FOUND` if there is no available DMA channel
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

esp_err_t **spi_slave_free** (*spi_host_device_t* host)

Free a SPI bus claimed as a SPI slave interface.

Parameters **host** -- SPI peripheral to free

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_INVALID_STATE` if not all devices on the bus are freed
- `ESP_OK` on success

esp_err_t **spi_slave_queue_trans** (*spi_host_device_t* host, const *spi_slave_transaction_t* *trans_desc, TickType_t ticks_to_wait)

Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via `spi_slave_initialize`.) This function may block if the queue is full (depending on the `ticks_to_wait` parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in `trans_desc` to the SPI slave driver; the application is not to access this memory until `spi_slave_queue_trans` is called to hand ownership back to the application.

Note: On esp32, if trans length not WORD aligned, the rx buffer last word memory will still be overwritten by DMA HW

Parameters

- **host** -- SPI peripheral that is acting as a slave
- **trans_desc** -- Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait** -- Ticks to wait until there's room in the queue; use `portMAX_DELAY` to never time out.

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NO_MEM` if set flag `SPI_SLAVE_TRANS_DMA_BUFFER_ALIGN_AUTO` but there is no free memory
- `ESP_ERR_INVALID_STATE` if sync data between Cache and memory failed
- `ESP_OK` on success

`esp_err_t spi_slave_get_trans_result` (*spi_host_device_t* host, *spi_slave_transaction_t* **trans_desc, TickType_t ticks_to_wait)

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with `spi_slave_queue_trans`) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or reuse the buffers.

It is mandatory to eventually use this function for any transaction queued by `spi_slave_queue_trans`.

Parameters

- **host** -- SPI peripheral to that is acting as a slave
- **trans_desc** -- [out] Pointer to variable able to contain a pointer to the description of the transaction that is executed
- **ticks_to_wait** -- Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NOT_SUPPORTED` if flag `SPI_SLAVE_NO_RETURN_RESULT` is set
- `ESP_OK` on success

`esp_err_t spi_slave_transmit` (*spi_host_device_t* host, *spi_slave_transaction_t* *trans_desc, TickType_t ticks_to_wait)

Do a SPI transaction.

Essentially does the same as `spi_slave_queue_trans` followed by `spi_slave_get_trans_result`. Do not use this when there is still a transaction queued that hasn't been finalized using `spi_slave_get_trans_result`.

Parameters

- **host** -- SPI peripheral to that is acting as a slave
- **trans_desc** -- Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait** -- Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

Structures

struct **spi_slave_interface_config_t**

This is a configuration for a SPI host acting as a slave device.

Public Members

int **spics_io_num**

CS GPIO pin for this device.

uint32_t **flags**

Bitwise OR of SPI_SLAVE_* flags.

int **queue_size**

Transaction queue size. This sets how many transactions can be 'in the air' (queued using spi_slave_queue_trans but not yet finished using spi_slave_get_trans_result) at the same time.

uint8_t **mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

slave_transaction_cb_t **post_setup_cb**

Callback called after the SPI registers are loaded with new data.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

slave_transaction_cb_t **post_trans_cb**

Callback called after a transaction is done.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

struct **spi_slave_transaction_t**

This structure describes one SPI transaction

Public Members

uint32_t **flags**

Bitwise OR of SPI_SLAVE_TRANS_* flags.

size_t **length**

Total data length, in bits.

size_t **trans_len**

Transaction data length, in bits.

const void ***tx_buffer**

Pointer to transmit buffer, or NULL for no MOSI phase.

void ***rx_buffer**

Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (`rx_buffer%4==0`), and has length of a multiple of 4 bytes.

void ***user**

User-defined variable. Can be used to store eg transaction ID.

Macros

SPI_SLAVE_TXBIT_LSBFIRST

Transmit command/address/data LSB first instead of the default MSB first.

SPI_SLAVE_RXBIT_LSBFIRST

Receive data LSB first instead of the default MSB first.

SPI_SLAVE_BIT_LSBFIRST

Transmit and receive LSB first.

SPI_SLAVE_NO_RETURN_RESULT

Don't return the descriptor to the host on completion (use `post_trans_cb` to notify instead)

SPI_SLAVE_TRANS_DMA_BUFFER_ALIGN_AUTO

Automatically re-malloc dma buffer if user buffer doesn't meet hardware alignment or `dma_capable`, this process may loss some memory and performance.

Type Definitions

```
typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)
```

2.6.25 SPI Slave Half Duplex

Introduction

The Half Duplex (HD) Mode is a special mode provided by ESP SPI Slave peripheral. Under this mode, the hardware provides more services than the Full Duplex (FD) Mode (the mode for general-purpose SPI transactions, see [SPI Slave Driver](#)). These services reduce the CPU load and the response time of SPI Slave. However, it is important to note that the communication format is determined by the hardware and is always in a half-duplex configuration, allowing only one-way data transfer at any given time. Hence, the mode is named Half Duplex Mode due to this characteristic.

When conducting an SPI transaction, transactions can be classified into several types based on the **command** phase of the transaction. Each transaction may consist of the following phases: command, address, dummy, and data. The command phase is mandatory, while the other phases may be determined by the command field. During the command, address, and dummy phases, the bus is always controlled by the master (usually the host), while the direction of the data phase depends on the command. The data phase can be either an input phase, where the master writes data to the slave (e.g., the host sends data to the slave), or an output phase, where the master reads data from the slave (e.g., the host receives data from the slave).

Protocol About the details of how master should communicate with the SPI Slave, see *ESP SPI Slave HD (Half Duplex) Mode Protocol*.

Through these different transactions, the slave provides these services to the master:

- A DMA channel for the master to write a great amount of data to the slave.
- A DMA channel for the master to read a great amount of data from the slave.
- Several general purpose registers, shared between the master and the slave.
- Several general purpose interrupts, for the master to interrupt the SW of the slave.

Terminology

- Transaction
- Channel
- Sending
- Receiving
- Data Descriptor

Driver Feature

- Transaction read/write by master in segments
- Queues for data to send and received

Driver Usage

Slave Initialization Call `spi_slave_hd_init()` to initialize the SPI bus as well as the peripheral and the driver. The SPI Slave exclusively uses the SPI peripheral, pins of the bus before it is deinitialized, which means other devices are unable to use the above resources during initialization. Thus, to ensure SPI resources are correctly occupied and the connections work properly, most configurations of the slave should be done as soon as the slave is initialized.

The `spi_bus_config_t` specifies how the bus should be initialized, while `spi_slave_hd_slot_config_t` specifies how the SPI Slave driver should work.

Deinitialization (Optional) Call `spi_slave_hd_deinit()` to uninstall the driver. The resources, including the pins, SPI peripheral, internal memory used by the driver, and interrupt sources, are released by the `deinit()` function.

Send/Receive Data by DMA Channels To send data to the master through the sending DMA channel, the application should properly wrap the data in an `spi_slave_hd_data_t` descriptor structure before calling `spi_slave_hd_queue_trans()` with the data descriptor and the channel argument of `SPI_SLAVE_CHAN_TX`. The pointers to descriptors are stored in the queue, and the data is sent to the master in the same order they are enqueued using `spi_slave_hd_queue_trans()`, upon receiving the master's `Rd_DMA` command.

The application should check the result of data sending by calling `spi_slave_hd_get_trans_res()` with the channel set as `SPI_SLAVE_CHAN_TX`. This function blocks until the transaction with the command `Rd_DMA` from the master successfully completes (or timeout). The `out_trans` argument of the function outputs the pointer of the data descriptor which is just finished, providing information about the sending.

Receiving data from the master through the receiving DMA channel is quite similar. The application calls `spi_slave_hd_queue_trans()` with proper data descriptor and the channel argument of `SPI_SLAVE_CHAN_RX`. And the application calls the `spi_slave_hd_get_trans_res()` later to get the descriptor to the receiving buffer before it handles the data in the receiving buffer.

Note: This driver itself does not have an internal buffer for the data to send or just received. The application should provide data buffer for driver via data descriptors to send to the master, or to receive data from the master.

The application has to properly keep the data descriptor as well as the buffer it points, after the descriptor is successfully sent into the driver internal queue by `spi_slave_hd_queue_trans()`, and before returned by `spi_slave_hd_get_trans_res()`. During this period, the hardware as well as the driver may read or write to the buffer and the descriptor when required at any time.

Please note that, when using this driver for data transfer, the buffer does not have to be fully sent or filled before it is terminated. For example, in the segment transaction mode, the master has to send CMD7 to terminate a `Wr_DMA` transaction or send CMD8 to terminate an `Rd_DMA` transaction (in segments), no matter whether the send (receive) buffer is used up (full) or not.

Using Data Descriptor with Customized User Arguments Sometimes you may have initiator (sending data descriptor) and closure (handling returned descriptors) functions in different places. When you get the returned data descriptor in the closure, you may need some extra information when handling the finished data descriptor. For example, you may want to know which round it is for the returned descriptor when you send the same piece of data several times.

Set the `arg` member in the data descriptor to a variable indicating the transaction by force casting, or point it to a structure that wraps all the information you may need when handling the sending/receiving data. Then you can get what you need in your closure.

Using Callbacks

Note: These callbacks are called in the ISR, so the required operations need to be processed quickly and returned as soon as possible to ensure that the system is functioning properly. You may need to be very careful to write the code in the ISR.

Since the interrupt handling is executed concurrently with the application, long delays or blocking may cause the system to respond slower or lead to unpredictable behavior. Therefore, when writing callback functions, avoid using operations that may cause delays or blocking, e.g., waiting, sleeping, resource locking, etc.

The `spi_slave_hd_callback_config_t` member in the `spi_slave_hd_slot_config_t` configuration structure passed when initializing the SPI Slave HD driver, allows you to have callbacks for each event you may concern.

The corresponding interrupt for each callback that is not `NULL` is enabled, so that the callbacks can be called immediately when the events happen. You do not need to provide callbacks for the unconcerned events.

The `arg` member in the configuration structure can help you pass some context to the callback or indicate the specific SPI Slave instance when using the same callbacks for multiple SPI Slave peripherals. You can set the `arg` member to a variable that indicates the SPI Slave instance by performing a forced type casting or point it to a context structure. All the callbacks are called with this `arg` argument you set when the callbacks are initialized.

There are two other arguments: the `event` and the `awoken`.

- The `event` passes the information of the current event to the callback. The `spi_slave_hd_event_t` type contains the information of the event, for example, event type, the data descriptor just finished (The `data argument` is very useful in this case!).
- The `awoken` argument serves as an output parameter. It informs the ISR that tasks have been awakened after the callback function, and the ISR should call `portYIELD_FROM_ISR()` to schedule these tasks. Simply pass the `awoken` argument to all FreeRTOS APIs that may unblock tasks, and the value of `awoken` will be returned to the ISR.

Writing/Reading Shared Registers Call `spi_slave_hd_write_buffer()` to write the shared buffer, and `spi_slave_hd_read_buffer()` to read the shared buffer.

Note: On ESP32-C5, the shared registers are read/written in words by the application but read/written in bytes by the master. There is no guarantee four continuous bytes read from the master are from the same word written by the slave's application. It is also possible that if the slave reads a word while the master is writing bytes of the word, the slave may get one word with half of them just written by the master, and the other half has not been written into.

The master can confirm that the word is not in transition by reading the word twice and comparing the values.

For the slave, it is more difficult to ensure the word is not in transition because the process of master writing four bytes can be very long (32 SPI clocks). You can put some CRC in the last (largest address) byte of a word so that when the byte is written, the word is sure to be all written.

Due to the conflicts that may be among read/write from SW (worse if there are multi-cores) and master, it is suggested that a word is only used in one direction (only written by the master or only written by the slave).

Receiving General Purpose Interrupts from the Master When the master sends CMD8, CMD9 or CMDA, the slave corresponding is triggered. Currently the CMD8 is permanently used to indicate the termination of Rd_DMA segments. To receive general-purpose interrupts, register callbacks for CMD9 and CMDA when the slave is initialized, see [Using Callbacks](#).

Application Examples

The code example for Device/Host communication can be found in the [peripherals/spi_slave_hd](#) directory of ESP-IDF examples.

- **example** [peripherals/spi_slave_hd/append_mode](#) demonstrates how to use the SPI Slave HD driver and ESSL driver to communicate (ESSL driver is an encapsulated layer based on SPI Master driver to communicate with halfduplex mode SPI Slave).
- **example** [peripherals/spi_slave_hd/segment_mode](#) demonstrate two ways to use the SPI Slave Halfduplex Segment Mode: Using the SPI Slave Halfduplex driver with two tasks repeating transactions with the SPI Master, and using the ESP Serial Slave Link APIs for multiple exchanges with the slave.

API Reference

Header File

- [components/esp_driver_spi/include/driver/spi_slave_hd.h](#)
- This header file can be included with:

```
#include "driver/spi_slave_hd.h"
```

- This header file is a part of the API provided by the `esp_driver_spi` component. To declare that your component depends on `esp_driver_spi`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_spi
```

or

```
PRIV_REQUIRES esp_driver_spi
```

Functions

`esp_err_t spi_slave_hd_init` ([spi_host_device_t](#) host_id, const [spi_bus_config_t](#) *bus_config, const [spi_slave_hd_slot_config_t](#) *config)

Initialize the SPI Slave HD driver.

Parameters

- **host_id** -- The host to use
- **bus_config** -- Bus configuration for the bus used
- **config** -- Configuration for the SPI Slave HD driver

Returns

- ESP_OK: on success
- ESP_ERR_INVALID_ARG: invalid argument given

- `ESP_ERR_INVALID_STATE`: function called in invalid state, may be some resources are already in use
- `ESP_ERR_NOT_FOUND` if there is no available DMA channel
- `ESP_ERR_NO_MEM`: memory allocation failed
- or other return value from `esp_intr_alloc`

esp_err_t **spi_slave_hd_deinit** (*spi_host_device_t* host_id)

Deinitialize the SPI Slave HD driver.

Parameters `host_id` -- The host to deinitialize the driver

Returns

- `ESP_OK`: on success
- `ESP_ERR_INVALID_ARG`: if the `host_id` is not correct

esp_err_t **spi_slave_hd_queue_trans** (*spi_host_device_t* host_id, *spi_slave_chan_t* chan, *spi_slave_hd_data_t* *trans, TickType_t timeout)

Queue transactions (segment mode)

Parameters

- `host_id` -- Host to queue the transaction
- `chan` -- `SPI_SLAVE_CHAN_TX` or `SPI_SLAVE_CHAN_RX`
- `trans` -- Transaction descriptors
- `timeout` -- Timeout before the data is queued

Returns

- `ESP_OK`: on success
- `ESP_ERR_INVALID_ARG`: The input argument is invalid. Can be the following reason:
 - The buffer given is not DMA capable
 - The length of data is invalid (not larger than 0, or exceed the max transfer length)
 - The transaction direction is invalid
- `ESP_ERR_TIMEOUT`: Cannot queue the data before timeout. Master is still processing previous transaction.
- `ESP_ERR_INVALID_STATE`: Function called in invalid state. This API should be called under segment mode.

esp_err_t **spi_slave_hd_get_trans_res** (*spi_host_device_t* host_id, *spi_slave_chan_t* chan, *spi_slave_hd_data_t* **out_trans, TickType_t timeout)

Get the result of a data transaction (segment mode)

Note: This API should be called successfully the same times as the `spi_slave_hd_queue_trans`.

Parameters

- `host_id` -- Host to queue the transaction
- `chan` -- Channel to get the result, `SPI_SLAVE_CHAN_TX` or `SPI_SLAVE_CHAN_RX`
- `out_trans` -- [out] Pointer to the transaction descriptor (*spi_slave_hd_data_t*) passed to the driver before. Hardware has finished this transaction. Member `trans_len` indicates the actual number of bytes of received data, it's meaningless for TX.
- `timeout` -- Timeout before the result is got

Returns

- `ESP_OK`: on success
- `ESP_ERR_INVALID_ARG`: Function is not valid
- `ESP_ERR_TIMEOUT`: There's no transaction done before timeout
- `ESP_ERR_INVALID_STATE`: Function called in invalid state. This API should be called under segment mode.

void **spi_slave_hd_read_buffer** (*spi_host_device_t* host_id, int addr, uint8_t *out_data, size_t len)

Read the shared registers.

Parameters

- `host_id` -- Host to read the shared registers

- **addr** -- Address of register to read, 0 to SOC_SPI_MAXIMUM_BUFFER_SIZE-1
- **out_data** -- [out] Output buffer to store the read data
- **len** -- Length to read, not larger than SOC_SPI_MAXIMUM_BUFFER_SIZE-addr

void **spi_slave_hd_write_buffer** (*spi_host_device_t* host_id, int addr, uint8_t *data, size_t len)

Write the shared registers.

Parameters

- **host_id** -- Host to write the shared registers
- **addr** -- Address of register to write, 0 to SOC_SPI_MAXIMUM_BUFFER_SIZE-1
- **data** -- Buffer holding the data to write
- **len** -- Length to write, SOC_SPI_MAXIMUM_BUFFER_SIZE-addr

esp_err_t **spi_slave_hd_append_trans** (*spi_host_device_t* host_id, *spi_slave_chan_t* chan, *spi_slave_hd_data_t* *trans, TickType_t timeout)

Load transactions (append mode)

Note: In this mode, user transaction descriptors will be appended to the DMA and the DMA will keep processing the data without stopping

Parameters

- **host_id** -- Host to load transactions
- **chan** -- SPI_SLAVE_CHAN_TX or SPI_SLAVE_CHAN_RX
- **trans** -- Transaction descriptor
- **timeout** -- Timeout before the transaction is loaded

Returns

- ESP_OK: on success
- ESP_ERR_INVALID_ARG: The input argument is invalid. Can be the following reason:
 - The buffer given is not DMA capable
 - The length of data is invalid (not larger than 0, or exceed the max transfer length)
 - The transaction direction is invalid
- ESP_ERR_TIMEOUT: Master is still processing previous transaction. There is no available transaction for slave to load
- ESP_ERR_INVALID_STATE: Function called in invalid state. This API should be called under append mode.

esp_err_t **spi_slave_hd_get_append_trans_res** (*spi_host_device_t* host_id, *spi_slave_chan_t* chan, *spi_slave_hd_data_t* **out_trans, TickType_t timeout)

Get the result of a data transaction (append mode)

Note: This API should be called the same times as the `spi_slave_hd_append_trans`

Parameters

- **host_id** -- Host to load the transaction
- **chan** -- SPI_SLAVE_CHAN_TX or SPI_SLAVE_CHAN_RX
- **out_trans** -- [out] Pointer to the transaction descriptor (*spi_slave_hd_data_t*) passed to the driver before. Hardware has finished this transaction. Member `trans_len` indicates the actual number of bytes of received data, it's meaningless for TX.
- **timeout** -- Timeout before the result is got

Returns

- ESP_OK: on success
- ESP_ERR_INVALID_ARG: Function is not valid
- ESP_ERR_TIMEOUT: There's no transaction done before timeout
- ESP_ERR_INVALID_STATE: Function called in invalid state. This API should be called under append mode.

Structures

struct **spi_slave_hd_data_t**

Descriptor of data to send/receive.

Public Members

uint8_t ***data**

Buffer to send, must be DMA capable.

size_t **len**

Len of data to send/receive. For receiving the buffer length should be multiples of 4 bytes, otherwise the extra part will be truncated.

size_t **trans_len**

For RX direction, it indicates the data actually received. For TX direction, it is meaningless.

uint32_t **flags**

Bitwise OR of SPI_SLAVE_HD_TRANS_* flags.

void ***arg**

Extra argument indicating this data.

struct **spi_slave_hd_event_t**

Information of SPI Slave HD event.

Public Members

spi_event_t **event**

Event type.

spi_slave_hd_data_t ***trans**

Corresponding transaction for SPI_EV_SEND and SPI_EV_RECV events.

struct **spi_slave_hd_callback_config_t**

Callback configuration structure for SPI Slave HD.

Public Members

slave_cb_t **cb_buffer_tx**

Callback when master reads from shared buffer.

slave_cb_t **cb_buffer_rx**

Callback when master writes to shared buffer.

slave_cb_t **cb_send_dma_ready**

Callback when TX data buffer is loaded to the hardware (DMA)

***slave_cb_t* cb_sent**

Callback when data are sent.

***slave_cb_t* cb_recv_dma_ready**

Callback when RX data buffer is loaded to the hardware (DMA)

***slave_cb_t* cb_recv**

Callback when data are received.

***slave_cb_t* cb_cmd9**

Callback when CMD9 received.

***slave_cb_t* cb_cmdA**

Callback when CMDA received.

void *arg

Argument indicating this SPI Slave HD peripheral instance.

struct **spi_slave_hd_slot_config_t**

Configuration structure for the SPI Slave HD driver.

Public Members

uint8_t **mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

uint32_t **spics_io_num**

CS GPIO pin for this device.

uint32_t **flags**

Bitwise OR of SPI_SLAVE_HD_* flags.

uint32_t **command_bits**

command field bits, multiples of 8 and at least 8.

uint32_t **address_bits**

address field bits, multiples of 8 and at least 8.

uint32_t **dummy_bits**

dummy field bits, multiples of 8 and at least 8.

uint32_t **queue_size**

Transaction queue size. This sets how many transactions can be 'in the air' (queued using spi_slave_hd_queue_trans but not yet finished using spi_slave_hd_get_trans_result) at the same time.

spi_dma_chan_t **dma_chan**

DMA channel to used.

spi_slave_hd_callback_config_t **cb_config**

Callback configuration.

Macros

SPI_SLAVE_HD_TRANS_DMA_BUFFER_ALIGN_AUTO

Automatically re-alloc dma buffer if user buffer doesn't meet hardware alignment or dma_capable, this process may lose some memory and performance.

SPI_SLAVE_HD_TXBIT_LSBFIRST

Transmit command/address/data LSB first instead of the default MSB first.

SPI_SLAVE_HD_RXBIT_LSBFIRST

Receive data LSB first instead of the default MSB first.

SPI_SLAVE_HD_BIT_LSBFIRST

Transmit and receive LSB first.

SPI_SLAVE_HD_APPEND_MODE

Adopt DMA append mode for transactions. In this mode, users can load(append) DMA descriptors without stopping the DMA.

Type Definitions

typedef bool (**spi_slave_cb_t**)(void *arg, *spi_slave_hd_event_t* *event, BaseType_t *awoken)

Callback for SPI Slave HD.

Enumerations

enum **spi_slave_chan_t**

Channel of SPI Slave HD to do data transaction.

Values:

enumerator **SPI_SLAVE_CHAN_TX**

The output channel (RDDMA)

enumerator **SPI_SLAVE_CHAN_RX**

The input channel (WRDMA)

2.6.26 Temperature Sensor

Introduction

The ESP32-C5 has a built-in sensor used to measure the chip's internal temperature. The temperature sensor module contains an 8-bit Sigma-Delta analog-to-digital converter (ADC) and a digital-to-analog converter (DAC) to compensate for the temperature measurement.

Due to restrictions of hardware, the sensor has predefined measurement ranges with specific measurement errors. See the table below for details.

Predefined Range (°C)	Error (°C)
50 ~ 125	< 3
20 ~ 100	< 2
-10 ~ 80	< 1
-30 ~ 50	< 2
-40 ~ 20	< 3

Note: The temperature sensor is designed primarily to measure the temperature changes inside the chip. The internal temperature of a chip is usually higher than the ambient temperature, and is affected by factors such as the microcontroller's clock frequency or I/O load, and the external thermal environment.

Functional Overview

The description of the temperature sensor functionality is divided into the following sections:

- *Resource Allocation* - covers which parameters should be set up to get a temperature sensor handle and how to recycle the resources when the temperature sensor finishes working.
- *Enable and Disable Temperature Sensor* - covers how to enable and disable the temperature sensor.
- *Get Temperature Value* - covers how to get the real-time temperature value.
- *Install Temperature Threshold Callback* - describes how to register a temperature threshold callback.
- *Power Management* - covers how the temperature sensor is affected when changing power mode (e.g., Light-sleep mode).
- *IRAM Safe* - describes tips on how to make the temperature sensor interrupt work better along with a disabled cache.
- *Thread Safety* - covers how to make the driver to be thread-safe.

Resource Allocation The ESP32-C5 has just one built-in temperature sensor hardware. The temperature sensor instance is represented by `temperature_sensor_handle_t`, which is also the bond of the context. By using `temperature_sensor_handle_t`, the temperature sensor properties can be accessed and modified in different function calls to control and manage the temperature sensor. The variable would always be the parameter of the temperature APIs with the information of hardware and configurations, so you can just create a pointer of type `temperature_sensor_handle_t` and passing to APIs as needed.

In order to install a built-in temperature sensor instance, the first thing is to evaluate the temperature range in your detection environment. For example, if the testing environment is in a room, the range you evaluate might be 10 °C ~ 30 °C; if the testing in a lamp bulb, the range you evaluate might be 60 °C ~ 110 °C. Based on that, configuration structure `temperature_sensor_config_t` should be defined in advance:

- `range_min`: The minimum value of the testing range you have evaluated.
- `range_max`: The maximum value of the testing range you have evaluated.
- `allow_pd` configures if the driver allows the system to power down the peripheral in light sleep mode. Before entering sleep, the system will backup the temperature sensor register context, which will be restored later when the system exit the sleep mode. Powering down the peripheral can save more power, but at the cost of more memory consumed to save the register context. It's a tradeoff between power consumption and memory consumption. This configuration option relies on specific hardware feature, if you enable it on an unsupported chip, you will see error message like `not able to power down in light sleep`.

After the ranges are set, the structure could be passed to `temperature_sensor_install()`, which will instantiate the temperature sensor instance and return a handle.

As mentioned above, different measure ranges have different measurement errors. You do not need to care about the measurement error because we have an internal mechanism to choose the minimum error according to the given range.

If the temperature sensor is no longer needed, you need to call `temperature_sensor_uninstall()` to free the temperature sensor resource.

Creating a Temperature Sensor Handle

- Step 1: Evaluate the testing range. In this example, the range is 20 °C ~ 50 °C.
- Step 2: Configure the range and obtain a handle.

```
temperature_sensor_handle_t temp_handle = NULL;
temperature_sensor_config_t temp_sensor_config = TEMPERATURE_SENSOR_CONFIG_
↳DEFAULT(20, 50);
ESP_ERROR_CHECK(temperature_sensor_install(&temp_sensor_config, &temp_handle));
```

Enable and Disable Temperature Sensor

1. Enable the temperature sensor by calling `temperature_sensor_enable()`. The internal temperature sensor circuit will start to work. The driver state will transit from init to enable.
2. To Disable the temperature sensor, please call `temperature_sensor_disable()`.

Get Temperature Value After the temperature sensor is enabled by `temperature_sensor_enable()`, you can get the current temperature by calling `temperature_sensor_get_celsius()`.

```
// Enable temperature sensor
ESP_ERROR_CHECK(temperature_sensor_enable(temp_handle));
// Get converted sensor data
float tsens_out;
ESP_ERROR_CHECK(temperature_sensor_get_celsius(temp_handle, &tsens_out));
printf("Temperature in %f °C\n", tsens_out);
// Disable the temperature sensor if it is not needed and save the power
ESP_ERROR_CHECK(temperature_sensor_disable(temp_handle));
```

Install Temperature Threshold Callback ESP32-C5 supports automatically triggering to monitor the temperature value continuously. When the temperature value reaches a given threshold, an interrupt will happen. Thus you can install your own interrupt callback functions to do what they want, e.g., alarm, restart, etc. The following information indicates how to prepare a threshold callback.

- `temperature_sensor_event_callbacks_t::on_threshold`: As this function is called within the ISR context, you must ensure that the function does not attempt to block, e.g., by making sure that only FreeRTOS APIs with the ISR suffix are called from within the function, etc. The function prototype is declared in `temperature_thres_cb_t`.

You can save your own context to `temperature_sensor_register_callbacks()` as well, via the parameter `user_arg`. The user data will be directly passed to the callback function.

```
IRAM_ATTR static bool temp_sensor_monitor_cbs(temperature_sensor_handle_t tsens,
↳const temperature_sensor_threshold_event_data_t *edata, void *user_data)
{
    ESP_DRAM_LOGI("tsens", "Temperature value is higher or lower than threshold,
↳value is %d\n...\n\n", edata->celsius_value);
    return false;
}
```

(continues on next page)

(continued from previous page)

```
// Callback configurations
temperature_sensor_abs_threshold_config_t threshold_cfg = {
    .high_threshold = 50,
    .low_threshold = -10,
};
// Set absolute value monitor threshold.
temperature_sensor_set_absolute_threshold(temp_sensor, &threshold_cfg);
// Register interrupt callback
temperature_sensor_event_callbacks_t cbs = {
    .on_threshold = temp_sensor_monitor_cbs,
};
// Install temperature callback.
temperature_sensor_register_callbacks(temp_sensor, &cbs, NULL);
```

Power Management As the temperature sensor does not use the APB clock, it will keep working no matter if the power management is enabled with `CONFIG_PM_ENABLE`.

IRAM Safe By default, the temperature sensor interrupt will be deferred when the cache is disabled for reasons like writing/erasing flash. Thus the event callback functions will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option `CONFIG_TEMP_SENSOR_ISR_IRAM_SAFE` that will:

1. Enable the interrupt that is being serviced even when the cache is disabled.
2. Place all functions that are used by the ISR into IRAM.

This allows the interrupt to run while the cache is disabled but comes at the cost of increased IRAM consumption.

Thread Safety In the temperature sensor driver, we do not add any protection to ensure the thread safety, because typically this driver is only supposed to be used in one task. If you have to use this driver in different tasks, please add extra locks to protect it.

Unexpected Behaviors

1. The value you get from the chip is usually different from the ambient temperature. It is because the temperature sensor is built inside the chip. To some extent, it measures the temperature of the chip.
2. When installing the temperature sensor, the driver may print the boundary you gave cannot meet the range of internal temperature sensor. It is because the built-in temperature sensor has a testing limit. The error comes from the incorrect configuration of `temperature_sensor_config_t` as follow:
 - (1) Totally out of range, like 200 °C ~ 300 °C.
 - (2) Cross the boundary of each predefined measurement. like 40 °C ~ 110 °C.

Application Examples

- [peripherals/temperature_sensor/temp_sensor](#) demonstrates how to use the built-in temperature sensor, showing the measurement range and error based on different DAC levels and offsets.
- [peripherals/temperature_sensor/temp_sensor_monitor](#) demonstrates how to use the temperature sensor to automatically monitor temperature values continuously, triggering an interrupt when a specific value is reached or when the change between two consecutive samplings is larger/smaller than the settings.

API Reference

Header File

- `components/esp_driver_tsens/include/driver/temperature_sensor.h`
- This header file can be included with:

```
#include "driver/temperature_sensor.h"
```

- This header file is a part of the API provided by the `esp_driver_tsens` component. To declare that your component depends on `esp_driver_tsens`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_tsens
```

or

```
PRIV_REQUIRES esp_driver_tsens
```

Functions

esp_err_t **temperature_sensor_install** (const *temperature_sensor_config_t* **tsens_config*,
temperature_sensor_handle_t **ret_tsens*)

Install temperature sensor driver.

Parameters

- **tsens_config** -- Pointer to config structure.
- **ret_tsens** -- Return the pointer of temperature sensor handle.

Returns

- ESP_OK if succeed

esp_err_t **temperature_sensor_uninstall** (*temperature_sensor_handle_t* *tsens*)

Uninstall the temperature sensor driver.

Parameters **tsens** -- The handle created by `temperature_sensor_install()`.

Returns

- ESP_OK if succeed.

esp_err_t **temperature_sensor_enable** (*temperature_sensor_handle_t* *tsens*)

Enable the temperature sensor.

Parameters **tsens** -- The handle created by `temperature_sensor_install()`.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_STATE if temperature sensor is enabled already.

esp_err_t **temperature_sensor_disable** (*temperature_sensor_handle_t* *tsens*)

Disable temperature sensor.

Parameters **tsens** -- The handle created by `temperature_sensor_install()`.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_STATE if temperature sensor is not enabled yet.

esp_err_t **temperature_sensor_get_celsius** (*temperature_sensor_handle_t* *tsens*, float **out_celsius*)

Read temperature sensor data that is converted to degrees Celsius.

Note: Should not be called from interrupt.

Parameters

- **tsens** -- The handle created by `temperature_sensor_install()`.
- **out_celsius** -- The measure output value.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG invalid arguments
- ESP_ERR_INVALID_STATE Temperature sensor is not enabled yet.
- ESP_FAIL Parse the sensor data into ambient temperature failed (e.g. out of the range).

esp_err_t **temperature_sensor_set_absolute_threshold** (*temperature_sensor_handle_t* tsens, const *temperature_sensor_abs_threshold_config_t* *abs_cfg)

Set temperature sensor absolute mode automatic monitor.

Note: This function should not be called with `temperature_sensor_set_delta_threshold`.

Parameters

- **tsens** -- The handle created by `temperature_sensor_install()`.
- **abs_cfg** -- Configuration of temperature sensor absolute mode interrupt, see *temperature_sensor_abs_threshold_config_t*.

Returns

- ESP_OK: Set absolute threshold successfully.
- ESP_ERR_INVALID_STATE: Set absolute threshold failed because of wrong state.
- ESP_ERR_INVALID_ARG: Set absolute threshold failed because of invalid argument.

esp_err_t **temperature_sensor_set_delta_threshold** (*temperature_sensor_handle_t* tsens, const *temperature_sensor_delta_threshold_config_t* *delta_cfg)

Set temperature sensor differential mode automatic monitor.

Note: This function should not be called with `temperature_sensor_set_absolute_threshold`.

Parameters

- **tsens** -- The handle created by `temperature_sensor_install()`.
- **delta_cfg** -- Configuration of temperature sensor delta mode interrupt, see *temperature_sensor_delta_threshold_config_t*.

Returns

- ESP_OK: Set differential value threshold successfully.
- ESP_ERR_INVALID_STATE: Set absolute threshold failed because of wrong state.
- ESP_ERR_INVALID_ARG: Set differential value threshold failed because of invalid argument.

esp_err_t **temperature_sensor_register_callbacks** (*temperature_sensor_handle_t* tsens, const *temperature_sensor_event_callbacks_t* *cbs, void *user_arg)

Install temperature sensor interrupt callback. Temperature sensor interrupt will be enabled at same time.

Parameters

- **tsens** -- The handle created by `temperature_sensor_install()`.
- **cbs** -- Pointer to the group of temperature sensor interrupt callbacks.
- **user_arg** -- Callback argument.

Returns

- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

Structures

struct **temperature_sensor_config_t**

Configuration of measurement range for the temperature sensor.

Note: If you see the log the boundary you gave cannot meet the range of internal temperature sensor. You may need to refer to predefined range listed doc `api-reference/peripherals/Temperature sensor`.

Public Members

int **range_min**

the minimum value of the temperature you want to test

int **range_max**

the maximum value of the temperature you want to test

temperature_sensor_clk_src_t **clk_src**

the clock source of the temperature sensor.

uint32_t **allow_pd**

If set, the driver will backup/restore the temperature sensor registers before/after entering/exist sleep mode. By this approach, the system can power off temperature sensor's power domain. This can save power, but at the expense of more RAM being consumed

struct *temperature_sensor_config_t*::[anonymous] **flags**

Temperature sensor config flags

struct **temperature_sensor_threshold_event_data_t**

Temperature sensor event data.

Public Members

int **celsius_value**

Celsius value in interrupt callback.

temperature_val_intr_condition_t **intr_condition**

Can be used to judge temperature sensor interrupts in which reason

struct **temperature_sensor_event_callbacks_t**

Group of temperature sensor callback functions, all of them will be run in ISR.

Public Members

temperature_thres_cb_t **on_threshold**

Temperature value interrupt callback

struct **temperature_sensor_abs_threshold_config_t**

Config options for temperature value absolute interrupt.

Public Members

float **high_threshold**

High threshold value(Celsius). Interrupt will be triggered if temperature value is higher than this value

float **low_threshold**

Low threshold value(Celsius). Interrupt will be triggered if temperature value is lower than this value

struct **temperature_sensor_delta_threshold_config_t**

Config options for temperature value delta interrupt.

Public Members

float **increase_delta**

Interrupt will be triggered if the temperature increment of two consecutive samplings if larger than `increase_delta`

float **decrease_delta**

Interrupt will be triggered if the temperature decrement of two consecutive samplings if smaller than `decrease_delta`

Macros

TEMPERATURE_SENSOR_CONFIG_DEFAULT (min, max)

temperature_sensor_config_t default constructor

Type Definitions

typedef struct temperature_sensor_obj_t ***temperature_sensor_handle_t**

Type of temperature sensor driver handle.

typedef bool (***temperature_thres_cb_t**)(*temperature_sensor_handle_t* tsens, const *temperature_sensor_threshold_event_data_t* *edata, void *user_data)

Callback for temperature sensor threshold interrupt.

Param tsens [in] The handle created by `temperature_sensor_install()`.

Param edata [in] temperature sensor event data, fed by driver.

Param user_data [in] User data, set in `temperature_sensor_register_callbacks()`.

Return Whether a high priority task has been waken up by this function.

Enumerations

enum **temperature_val_intr_condition_t**

Enum for temperature sensor interrupt condition.

Values:

enumerator **TEMPERATURE_VAL_HIGHER_THAN_HIGH_THRESHOLD**

temperature sensor value is higher than high threshold

enumerator **TEMPERATURE_VAL_LOWER_THAN_LOW_THRESHOLD**

temperature sensor value is lower than low threshold

Header File

- `components/hal/include/hal/temperature_sensor_types.h`
- This header file can be included with:

```
#include "hal/temperature_sensor_types.h"
```

Type Definitions

```
typedef soc_periph_temperature_sensor_clk_src_t temperature_sensor_clk_src_t  
    temperature sensor clock source
```

Enumerations

```
enum temperature_sensor_etm_event_type_t  
    temperature sensor event types enum
```

Values:

```
enumerator TEMPERATURE_SENSOR_EVENT_OVER_LIMIT  
    Temperature sensor over limit event
```

```
enumerator TEMPERATURE_SENSOR_EVENT_MAX  
    Maximum number of temperature sensor events
```

```
enum temperature_sensor_etm_task_type_t  
    temperature sensor task types enum
```

Values:

```
enumerator TEMPERATURE_SENSOR_TASK_START  
    Temperature sensor start task
```

```
enumerator TEMPERATURE_SENSOR_TASK_STOP  
    Temperature sensor stop task
```

```
enumerator TEMPERATURE_SENSOR_TASK_MAX  
    Maximum number of temperature sensor tasks
```

2.6.27 Universal Asynchronous Receiver/Transmitter (UART)

Introduction

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e., timing requirements and data framing) using widely-adopted asynchronous serial communication interfaces, such as RS232, RS422, and RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex data exchange among different devices.

The ESP32-C5 chip has 2 UART controllers (also referred to as port), each featuring an identical set of registers to simplify programming and for more flexibility.

Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering, number of stop bits, parity bit, etc. All the regular UART controllers are compatible with UART-enabled devices from various manufacturers and can also support Infrared Data Association (IrDA) protocols.

Additionally, the ESP32-C5 chip has one low-power (LP) UART controller. It is the cut-down version of regular UART. Usually, the LP UART controller only support basic UART functionality with a much smaller RAM size, and does not support IrDA or RS485 protocols. For a full list of difference between UART and LP UART, please refer to the [ESP32-C5 Technical Reference Manual > UART Controller \(UART\) > Features \[PDF\]](#).

Functional Overview

The overview describes how to establish communication between an ESP32-C5 and other UART devices using the functions and data types of the UART driver. A typical programming workflow is broken down into the sections provided below:

1. [Set Communication Parameters](#) - Setting baud rate, data bits, stop bits, etc.
2. [Set Communication Pins](#) - Assigning pins for connection to a device
3. [Install Drivers](#) - Allocating ESP32-C5's resources for the UART driver
4. [Run UART Communication](#) - Sending/receiving data
5. [Use Interrupts](#) - Triggering interrupts on specific communication events
6. [Deleting a Driver](#) - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional.

Additionally, when using the LP UART Controller you need to pay attention to [Use LP UART Controller with HP Core](#).

The UART driver's functions identify each of the UART controllers using `uart_port_t`. This identification is needed for all the following function calls.

Set Communication Parameters UART communication parameters can be configured all in a single step or individually in multiple steps.

Single Step Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```
const uart_port_t uart_num = UART_NUM_1;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

For more information on how to configure the hardware flow control options, please refer to [peripherals/uart/uart_echo](#).

Additionally, `uart_config_t::backup_before_sleep` can be set to enable the backup of the UART configuration registers before entering sleep and restore these registers after exiting sleep. This allows the UART to continue working properly after waking up even when the UART module power domain is entirely off during sleep. This option implies an balance between power consumption and memory usage. If the power consumption is not a concern, you can disable this option to save memory.

Multiple Steps Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.

Table 3: Functions for Configuring specific parameters individually

Parameter to Configure	Function
Baud rate	<code>uart_set_baudrate()</code>
Number of transmitted bits	<code>uart_set_word_length()</code> selected out of <code>uart_word_length_t</code>
Parity control	<code>uart_set_parity()</code> selected out of <code>uart_parity_t</code>
Number of stop bits	<code>uart_set_stop_bits()</code> selected out of <code>uart_stop_bits_t</code>
Hardware flow control mode	<code>uart_set_hw_flow_ctrl()</code> selected out of <code>uart_hw_flowcontrol_t</code>
Communication mode	<code>uart_set_mode()</code> selected out of <code>uart_mode_t</code>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the current baud rate value, call `uart_get_baudrate()`.

Set Communication Pins After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function `uart_set_pin()` and specify the GPIO pin numbers to which the driver should route the TX, RX, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro `UART_PIN_NO_CHANGE`.

The same macro `UART_PIN_NO_CHANGE` should be specified for pins that will not be used.

```
// Set UART pins (TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_1, 4, 5, 18, 19));
```

Install Drivers Once the communication pins are set, install the driver by calling `uart_driver_install()` and specify the following parameters:

- UART port number
- Size of TX ring buffer
- Size of RX ring buffer
- Pointer to store the event queue handle
- Event queue size
- Flags to allocate an interrupt

The function allocates the required internal resources for the UART driver.

```
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_1, uart_buffer_size, \
                                   uart_buffer_size, 10, &uart_queue, 0));
```

Once this step is complete, you can connect the external UART device and check the communication.

Run UART Communication Serial communication is controlled by each UART controller's finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into TX FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it

2. FSM writes the data into RX FIFO buffer
3. Read the data from RX FIFO buffer

Therefore, an application only writes and reads data from a specific buffer using `uart_write_bytes()` and `uart_read_bytes()` respectively, and the FSM does the rest.

Transmit Data After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer's address and data length to it. The function copies the data to the TX ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the TX FIFO buffer, an interrupt service routine (ISR) moves the data from the TX ring buffer to the TX FIFO buffer in the background. The code below demonstrates the use of this function.

```
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A 'serial break signal' means holding the TX line low for a period longer than one data frame.

```
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the TX FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function does not block until space is available. Instead, it writes all data which can immediately fit into the hardware TX FIFO, and then return the number of bytes that were written.

There is a 'companion' function `uart_wait_tx_done()` that monitors the status of the TX FIFO buffer and returns once it is empty.

```
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_1;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_
↳ticks (TickType_t)
```

Receive Data Once the data is received by the UART and saved in the RX FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the RX FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```
// Read data from UART.
const uart_port_t uart_num = UART_NUM_1;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```

If the data in the RX FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

Software Flow Control If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

Communication Mode Selection The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver handles the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

Use Interrupts There are many interrupts that can be generated depending on specific UART states or detected errors. The full list of available interrupts is provided in *ESP32-C5 Technical Reference Manual > UART Controller (UART) > UART Interrupts* and *UHCI Interrupts* [PDF]. You can enable or disable specific interrupts by calling `uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively.

The UART driver provides a convenient way to handle specific interrupts by wrapping them into corresponding events. Events defined in `uart_event_type_t` can be reported to a user application using the FreeRTOS queue functionality.

To receive the events that have happened, call `uart_driver_install()` and get the event queue handle returned from the function. Please see the above *code snippet* as an example.

The processed events include the following:

- **FIFO overflow** (`UART_FIFO_OVF`): The RX FIFO can trigger an interrupt when it receives more data than the FIFO can store.
 - (Optional) Configure the full threshold of the FIFO space by entering it in the structure `uart_intr_config_t` and call `uart_intr_config()` to set the configuration. This can help the data stored in the RX FIFO can be processed timely in the driver to avoid FIFO overflow.
 - Enable the interrupts using the functions `uart_enable_rx_intr()`.
 - Disable these interrupts using the corresponding functions `uart_disable_rx_intr()`.

```
const uart_port_t uart_num = UART_NUM_1;
// Configure a UART interrupt threshold and timeout
uart_intr_config_t uart_intr = {
    .intr_enable_mask = UART_INTR_RXFIFO_FULL | UART_INTR_RXFIFO_TOUT,
    .rxfifo_full_thresh = 100,
    .rx_timeout_thresh = 10,
};
ESP_ERROR_CHECK(uart_intr_config(uart_num, &uart_intr));

// Enable UART RX FIFO full threshold and timeout interrupts
ESP_ERROR_CHECK(uart_enable_rx_intr(uart_num));
```

- **Pattern detection** (`UART_PATTERN_DET`): An interrupt triggered on detecting a 'pattern' of the same character being received/sent repeatedly. It can be used, e.g., to detect a command string with a specific number of identical characters (the 'pattern') at the end. The following functions are available:
 - Configure and enable this interrupt using `uart_enable_pattern_det_baud_intr()`
 - Disable the interrupt using `uart_disable_pattern_det_intr()`

```
//Set UART pattern detect function
uart_enable_pattern_det_baud_intr(EX_UART_NUM, '+', PATTERN_CHR_NUM, 9, 0, 0);
```

- **Other events:** The UART driver can report other events such as data receiving (`UART_DATA`), ring buffer full (`UART_BUFFER_FULL`), detecting NULL after the stop bit (`UART_BREAK`), parity check error (`UART_PARITY_ERR`), and frame error (`UART_FRAME_ERR`).

The strings inside of brackets indicate corresponding event names. An example of how to handle various UART events can be found in [peripherals/uart/uart_events](#).

Deleting a Driver If the communication established with `uart_driver_install()` is no longer required, the driver can be removed to free allocated resources by calling `uart_driver_delete()`.

Macros The API also defines several macros. For example, `UART_HW_FIFO_LEN` defines the length of hardware FIFO buffers; `UART_BITRATE_MAX` gives the maximum baud rate supported by the UART controllers, etc.

Use LP UART Controller with HP Core The UART driver also supports to control the LP UART controller when the chip is in active mode. The configuration steps for the LP UART are the same as the steps for a normal UART controller, except:

- The port number for the LP UART controller is defined by `LP_UART_NUM_0`.
- The available clock sources for the LP UART controller can be found in [lp_uart_sclk_t](#).
- The size of the hardware FIFO for the LP UART controller is much smaller, which is defined in [SOC_LP_UART_FIFO_LEN](#).
- The GPIO pins for the LP UART controller are unalterable, because there is no LP GPIO matrix on the target. Please see **ESP32-C5 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO MUX) > LP IO MUX Functions List** [PDF] for the specific pin numbers.

Overview of RS485 Specific Communication Options

Note: The following section uses `[UART_REGISTER_NAME] . [UART_FIELD_BIT]` to refer to UART register fields/bits. For more information on a specific option bit, see **ESP32-C5 Technical Reference Manual > UART Controller (UART) > Register Summary** [PDF]. Use the register name to navigate to the register description and then find the field/bit.

- `UART_RS485_CONF_REG.UART_RS485_EN`: setting this bit enables RS485 communication mode support.
- `UART_RS485_CONF_REG.UART_RS485TX_RX_EN`: if this bit is set, the transmitter's output signal loops back to the receiver's input signal.
- `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN`: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32-C5's RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt `UART_RS485_CLASH_INT` if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts `UART_RS485_FRM_ERR_INT` and `UART_RS485_PARITY_ERR_INT` can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is supported in the UART driver and can be used by selecting the `UART_MODE_RS485_APP_CTRL` mode (see the function `uart_set_mode()`).

The collision detection feature can work with circuit A and circuit C (see Section [Interface Connection Options](#)). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the user application. Use the function `uart_get_collision_flag()` to check if the collision detection flag has been raised.

The ESP32-C5 UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the RE/DE input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the `UART_MODE_RS485_HALF_DUPLEX` mode when calling `uart_set_mode()`.

Once the host starts writing data to the TX FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

Interface Connection Options This section provides example schematics to demonstrate the basic aspects of ESP32-C5's RS485 interface connection.

Note:

- The schematics below do **not** necessarily contain **all required elements**.
- The **analog devices** ADM483 & ADM2483 are examples of common RS485 transceivers and **can be replaced** with other similar transceivers.

Circuit A: Collision Detection Circuit

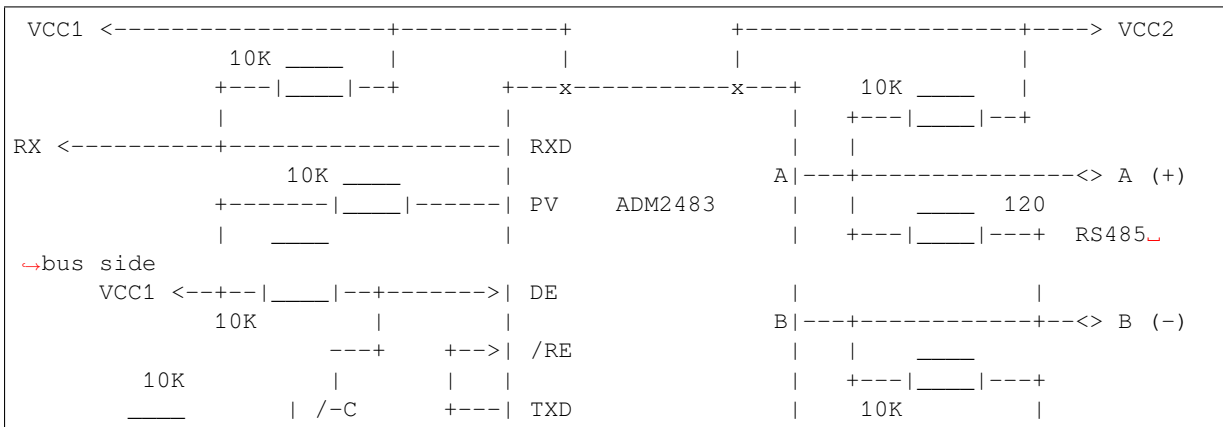

This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the UART peripheral when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is enabled.

Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection

This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is set. The bit `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` is not applicable in this case.

Circuit C: Auto Switching Transmitter/Receiver

(continues on next page)

(continued from previous page)

This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` to 1 and `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` to 0. This setup can work in any RS485 UART mode or even in `UART_MODE_UART`.

Application Examples

- [peripherals/uart/uart_async_rxtxtasks](#) demonstrates how to use two asynchronous tasks for communication via the same UART interface, with one task transmitting "Hello world" periodically and the other task receiving and printing data from the UART.
- [peripherals/uart/uart_echo](#) demonstrates how to use the UART interfaces to echo back any data received on the configured UART.
- [peripherals/uart/uart_echo_rs485](#) demonstrates how to use the ESP32's UART software driver in RS485 half duplex transmission mode to echo any data it receives on UART port back to the sender in the RS485 network, requiring external connection of bus drivers.
- [peripherals/uart/uart_events](#) demonstrates how to use the UART driver to handle special UART events, read data from UART0, and echo it back to the monitoring console.
- [peripherals/uart/uart_repl](#) demonstrates how to use and connect two UARTs, allowing the UART used for stdout to send commands and receive replies from another console UART without human interaction.
- [peripherals/uart/uart_select](#) demonstrates the use of `select()` for synchronous I/O multiplexing on the UART interface, allowing for non-blocking read and write from/to various sources such as UART and sockets, where a ready resource can be served without being blocked by a busy resource.
- [peripherals/uart/nmea0183_parser](#) demonstrates how to parse NMEA-0183 data streams from GPS/BDS/GLONASS modules using the ESP UART Event driver and ESP event loop library, and output common information such as UTC time, latitude, longitude, altitude, and speed.

API Reference

Header File

- `components/esp_driver_uart/include/driver/uart.h`
- This header file can be included with:

```
#include "driver/uart.h"
```

- This header file is a part of the API provided by the `esp_driver_uart` component. To declare that your component depends on `esp_driver_uart`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_uart
```

or

```
PRIV_REQUIRES esp_driver_uart
```

Functions

`esp_err_t uart_driver_install (uart_port_t uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, QueueHandle_t *uart_queue, int intr_alloc_flags)`

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

Note: `Rx_buffer_size` should be greater than `UART_HW_FIFO_LEN(uart_num)`. `Tx_buffer_size` should be either zero or greater than `UART_HW_FIFO_LEN(uart_num)`.

Parameters

- **uart_num** -- UART port number, the max port number is (`UART_NUM_MAX - 1`).
- **rx_buffer_size** -- UART RX ring buffer size.
- **tx_buffer_size** -- UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- **queue_size** -- UART event queue size/depth.
- **uart_queue** -- UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to `NULL`, driver will not use an event queue.
- **intr_alloc_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info. Do not set `ESP_INTR_FLAG_IRAM` here (the driver's ISR handler is not located in IRAM)

Returns

- `ESP_OK` Success
- `ESP_FAIL` Parameter error

esp_err_t **uart_driver_delete** (*uart_port_t* uart_num)

Uninstall UART driver.

Parameters **uart_num** -- UART port number, the max port number is (`UART_NUM_MAX - 1`).

Returns

- `ESP_OK` Success
- `ESP_FAIL` Parameter error

bool **uart_is_driver_installed** (*uart_port_t* uart_num)

Checks whether the driver is installed or not.

Parameters **uart_num** -- UART port number, the max port number is (`UART_NUM_MAX - 1`).

Returns

- true driver is installed
- false driver is not installed

esp_err_t **uart_set_word_length** (*uart_port_t* uart_num, *uart_word_length_t* data_bit)

Set UART data bits.

Parameters

- **uart_num** -- UART port number, the max port number is (`UART_NUM_MAX - 1`).
- **data_bit** -- UART data bits

Returns

- `ESP_OK` Success
- `ESP_FAIL` Parameter error

esp_err_t **uart_get_word_length** (*uart_port_t* uart_num, *uart_word_length_t* *data_bit)

Get the UART data bit configuration.

Parameters

- **uart_num** -- UART port number, the max port number is (`UART_NUM_MAX - 1`).
- **data_bit** -- Pointer to accept value of UART data bits.

Returns

- `ESP_FAIL` Parameter error
- `ESP_OK` Success, result will be put in (`*data_bit`)

esp_err_t **uart_set_stop_bits** (*uart_port_t* uart_num, *uart_stop_bits_t* stop_bits)

Set UART stop bits.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **stop_bits** -- UART stop bits

Returns

- ESP_OK Success
- ESP_FAIL Fail

esp_err_t **uart_get_stop_bits** (*uart_port_t* uart_num, *uart_stop_bits_t* *stop_bits)

Get the UART stop bit configuration.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **stop_bits** -- Pointer to accept value of UART stop bits.

Returns

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*stop_bit)

esp_err_t **uart_set_parity** (*uart_port_t* uart_num, *uart_parity_t* parity_mode)

Set UART parity mode.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **parity_mode** -- the enum of uart parity configuration

Returns

- ESP_FAIL Parameter error
- ESP_OK Success

esp_err_t **uart_get_parity** (*uart_port_t* uart_num, *uart_parity_t* *parity_mode)

Get the UART parity mode configuration.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **parity_mode** -- Pointer to accept value of UART parity mode.

Returns

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*parity_mode)

esp_err_t **uart_get_sclk_freq** (*uart_sclk_t* sclk, uint32_t *out_freq_hz)

Get the frequency of a clock source for the HP UART port.

Parameters

- **sclk** -- Clock source
- **out_freq_hz** -- [out] Output of frequency, in Hz

Returns

- ESP_ERR_INVALID_ARG: if the clock source is not supported
- otherwise ESP_OK

esp_err_t **uart_set_baudrate** (*uart_port_t* uart_num, uint32_t baudrate)

Set UART baud rate.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **baudrate** -- UART baud rate.

Returns

- ESP_FAIL Parameter error
- ESP_OK Success

esp_err_t **uart_get_baudrate** (*uart_port_t* uart_num, uint32_t *baudrate)

Get the UART baud rate configuration.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **baudrate** -- Pointer to accept value of UART baud rate

Returns

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*baudrate)

esp_err_t **uart_set_line_inverse** (*uart_port_t* uart_num, uint32_t inverse_mask)

Set UART line inverse mode.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **inverse_mask** -- Choose the wires that need to be inverted. Using the ORred mask of *uart_signal_inv_t*

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_hw_flow_ctrl** (*uart_port_t* uart_num, *uart_hw_flowcontrol_t* flow_ctrl, uint8_t rx_thresh)

Set hardware flow control.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **flow_ctrl** -- Hardware flow control mode
- **rx_thresh** -- Threshold of Hardware RX flow control (0 ~ UART_HW_FIFO_LEN(uart_num)). Only when UART_HW_FLOWCTRL_RTS is set, will the rx_thresh value be set.

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_sw_flow_ctrl** (*uart_port_t* uart_num, bool enable, uint8_t rx_thresh_xon, uint8_t rx_thresh_xoff)

Set software flow control.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1)
- **enable** -- switch on or off
- **rx_thresh_xon** -- low water mark
- **rx_thresh_xoff** -- high water mark

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_get_hw_flow_ctrl** (*uart_port_t* uart_num, *uart_hw_flowcontrol_t* *flow_ctrl)

Get the UART hardware flow control configuration.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **flow_ctrl** -- Option for different flow control mode.

Returns

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*flow_ctrl)

esp_err_t **uart_clear_intr_status** (*uart_port_t* uart_num, uint32_t clr_mask)

Clear UART interrupt status.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **clr_mask** -- Bit mask of the interrupt status to be cleared.

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_enable_intr_mask** (*uart_port_t* uart_num, uint32_t enable_mask)

Set UART interrupt enable.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **enable_mask** -- Bit mask of the enable bits.

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_disable_intr_mask** (*uart_port_t* uart_num, uint32_t disable_mask)

Clear UART interrupt enable bits.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **disable_mask** -- Bit mask of the disable bits.

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_enable_rx_intr** (*uart_port_t* uart_num)

Enable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

Parameters **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_disable_rx_intr** (*uart_port_t* uart_num)

Disable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

Parameters **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_disable_tx_intr** (*uart_port_t* uart_num)

Disable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

Parameters **uart_num** -- UART port number

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_enable_tx_intr** (*uart_port_t* uart_num, int enable, int thresh)

Enable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **enable** -- 1: enable; 0: disable
- **thresh** -- Threshold of TX interrupt, 0 ~ UART_HW_FIFO_LEN(uart_num)

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_pin** (*uart_port_t* uart_num, int tx_io_num, int rx_io_num, int rts_io_num, int cts_io_num)

Assign signals of a UART peripheral to GPIO pins.

Note: If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UART0's default TX pin and GPIO3 is UART0's default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

Note: Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **tx_io_num** -- UART TX pin GPIO number.
- **rx_io_num** -- UART RX pin GPIO number.
- **rts_io_num** -- UART RTS pin GPIO number.
- **cts_io_num** -- UART CTS pin GPIO number.

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t `uart_set_rts` (*uart_port_t* uart_num, int level)

Manually set the UART RTS pin level.

Note: UART must be configured with hardware flow control disabled.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **level** -- 1: RTS output low (active); 0: RTS output high (block)

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t `uart_set_dtr` (*uart_port_t* uart_num, int level)

Manually set the UART DTR pin level.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **level** -- 1: DTR output low; 0: DTR output high

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t `uart_set_tx_idle_num` (*uart_port_t* uart_num, uint16_t idle_num)

Set UART idle interval after tx FIFO is empty.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **idle_num** -- idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_param_config** (*uart_port_t* uart_num, const *uart_config_t* *uart_config)

Set UART configuration parameters.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **uart_config** -- UART parameter settings

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_intr_config** (*uart_port_t* uart_num, const *uart_intr_config_t* *intr_conf)

Configure UART interrupts.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **intr_conf** -- UART interrupt settings

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_wait_tx_done** (*uart_port_t* uart_num, TickType_t ticks_to_wait)

Wait until UART TX FIFO is empty.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **ticks_to_wait** -- Timeout, count in RTOS ticks

Returns

- ESP_OK Success
- ESP_FAIL Parameter error
- ESP_ERR_TIMEOUT Timeout

int **uart_tx_chars** (*uart_port_t* uart_num, const char *buffer, uint32_t len)

Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

Note: This function should only be used when UART TX buffer is not enabled.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **buffer** -- data buffer address
- **len** -- data length to send

Returns

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart_write_bytes** (*uart_port_t* uart_num, const void *src, size_t size)

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx_buffer_size' is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the 'tx_buffer_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **src** -- data buffer address
- **size** -- data length to send

Returns

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart_write_bytes_with_break** (*uart_port_t* uart_num, const void *src, size_t size, int brk_len)

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx_buffer_size' is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the 'tx_buffer_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **src** -- data buffer address
- **size** -- data length to send
- **brk_len** -- break signal duration(unit: the time it takes to send one bit at current baudrate)

Returns

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart_read_bytes** (*uart_port_t* uart_num, void *buf, uint32_t length, TickType_t ticks_to_wait)

UART read bytes from UART buffer.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **buf** -- pointer to the buffer.
- **length** -- data length
- **ticks_to_wait** -- sTimeout, count in RTOS ticks

Returns

- (-1) Error
- OTHERS (>=0) The number of bytes read from UART buffer

esp_err_t **uart_flush** (*uart_port_t* uart_num)

Alias of `uart_flush_input`. UART ring buffer flush. This will discard all data in the UART RX buffer.

Note: Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

Parameters **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_flush_input** (*uart_port_t* uart_num)

Clear input buffer, discard all the data is in the ring-buffer.

Note: In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

Parameters **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_get_buffered_data_len** (*uart_port_t* uart_num, size_t *size)

UART get RX ring buffer cached data length.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **size** -- Pointer of size_t to accept cached data length

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_get_tx_buffer_free_size** (*uart_port_t* uart_num, size_t *size)

UART get TX ring buffer free space size.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **size** -- Pointer of size_t to accept the free space size

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **uart_disable_pattern_det_intr** (*uart_port_t* uart_num)

UART disable pattern detect function. Designed for applications like 'AT commands'. When the hardware detects a series of one same character, the interrupt will be triggered.

Parameters **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_enable_pattern_det_baud_intr** (*uart_port_t* uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)

UART enable pattern detect function. Designed for applications like 'AT commands'. When the hardware detect a series of one same character, the interrupt will be triggered.

Parameters

- **uart_num** -- UART port number.
- **pattern_chr** -- character of the pattern.
- **chr_num** -- number of the character, 8bit value.
- **chr_tout** -- timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at_cmd char.
- **post_idle** -- idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at_cmd char
- **pre_idle** -- idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at_cmd char.

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

int **uart_pattern_pop_pos** (*uart_port_t* uart_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application's responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

Note: If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

Parameters `uart_num` -- UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

`int uart_pattern_get_pos (uart_port_t uart_num)`

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, This function do nothing to the queue.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application's responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

Note: If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

Parameters `uart_num` -- UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

`esp_err_t uart_pattern_queue_reset (uart_port_t uart_num, int queue_length)`

Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

Parameters

- `uart_num` -- UART port number, the max port number is (UART_NUM_MAX -1).
- `queue_length` -- Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

Returns

- ESP_ERR_NO_MEM No enough memory
- ESP_ERR_INVALID_STATE Driver not installed
- ESP_FAIL Parameter error
- ESP_OK Success

`esp_err_t uart_set_mode (uart_port_t uart_num, uart_mode_t mode)`

UART set communication mode.

Note: This function must be executed after `uart_driver_install()`, when the driver object is initialized.

Parameters

- `uart_num` -- Uart number to configure, the max port number is (UART_NUM_MAX -1).
- `mode` -- UART UART mode to set

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **uart_set_rx_full_threshold** (*uart_port_t* uart_num, int threshold)

Set uart threshold value for RX fifo full.

Note: If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1)
- **threshold** -- Threshold value above which RX fifo full interrupt is generated

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

esp_err_t **uart_set_tx_empty_threshold** (*uart_port_t* uart_num, int threshold)

Set uart threshold values for TX fifo empty.

Parameters

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1)
- **threshold** -- Threshold value below which TX fifo empty interrupt is generated

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

esp_err_t **uart_set_rx_timeout** (*uart_port_t* uart_num, const uint8_t tout_thresh)

UART set threshold timeout for TOUT feature.

Parameters

- **uart_num** -- Uart number to configure, the max port number is (UART_NUM_MAX -1).
- **tout_thresh** -- This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout_thresh = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART_RXFIFO_TOUT_INT interrupt is triggered. If tout_thresh == 0, the TOUT feature is disabled.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

esp_err_t **uart_get_collision_flag** (*uart_port_t* uart_num, bool *collision_flag)

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by collision_flag. *collision_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after uart_write_bytes()).

Parameters

- **uart_num** -- Uart number to configure the max port number is (UART_NUM_MAX -1).
- **collision_flag** -- Pointer to variable of type bool to return collision flag.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **uart_set_wakeup_threshold** (*uart_port_t* uart_num, int wakeup_threshold)

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold,

system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter 'a' with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when 'a' is sent, set `wakeup_threshold=3`.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To ensure that UART has correct Baud rate all the time, it is necessary to select a source clock which has a fixed frequency and remains active during sleep. For the supported clock sources of the chips, please refer to `uart_sclk_t` or `soc_periph_uart_clk_src_legacy_t`

Note: in ESP32, the wakeup signal can only be input via IO_MUX (i.e. GPIO3 should be configured as `function_1` to wake up UART0, GPIO9 should be configured as `function_5` to wake up UART1), UART2 does not support light sleep wakeup feature.

Parameters

- **uart_num** -- UART number, the max port number is (UART_NUM_MAX -1).
- **wakeup_threshold** -- number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if `uart_num` is incorrect or `wakeup_threshold` is outside of [3, 0x3ff] range.

esp_err_t **uart_get_wakeup_threshold** (*uart_port_t* uart_num, int *out_wakeup_threshold)

Get the number of RX pin signal edges for light sleep wakeup.

See description of `uart_set_wakeup_threshold` for the explanation of UART wakeup feature.

Parameters

- **uart_num** -- UART number, the max port number is (UART_NUM_MAX -1).
- **out_wakeup_threshold** -- [out] output, set to the current value of wakeup threshold for the given UART.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if `out_wakeup_threshold` is NULL

esp_err_t **uart_wait_tx_idle_polling** (*uart_port_t* uart_num)

Wait until UART tx memory empty and the last char send ok (polling mode).

•

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

Parameters `uart_num` -- UART number

esp_err_t **uart_set_loop_back** (*uart_port_t* uart_num, bool loop_back_en)

Configure TX signal loop back to RX module, just for the test usage.

•

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

Parameters

- **uart_num** -- UART number
- **loop_back_en** -- Set true to enable the loop back function, else set it false.

void **uart_set_always_rx_timeout** (*uart_port_t* uart_num, bool always_rx_timeout_en)

Configure behavior of UART RX timeout interrupt.

When always_rx_timeout is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

Parameters

- **uart_num** -- UART number
- **always_rx_timeout_en** -- Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

Structures

struct **uart_config_t**

UART configuration parameters for uart_param_config function.

Public Members

int **baud_rate**

UART baud rate

uart_parity_t **parity**

UART parity mode

uart_stop_bits_t **stop_bits**

UART stop bits

uart_hw_flowcontrol_t **flow_ctrl**

UART HW flow control mode (cts/rts)

uint8_t **rx_flow_ctrl_thresh**

UART HW RTS threshold

uart_sclk_t **source_clk**

UART source clock selection

lp_uart_sclk_t **lp_source_clk**

LP_UART source clock selection

uint32_t **allow_pd**

If set, driver allows the power domain to be powered off when system enters sleep mode. This can save power, but at the expense of more RAM being consumed to save register context.

uint32_t **backup_before_sleep**

Deprecated:

, same meaning as `allow_pd`

struct *uart_config_t*::[anonymous] **flags**

Configuration flags

struct **uart_intr_config_t**

UART interrupt configuration parameters for `uart_intr_config` function.

Public Members

uint32_t **intr_enable_mask**

UART interrupt enable mask, choose from `UART_XXXX_INT_ENA_M` under `UART_INT_ENA_REG(i)`, connect with bit-or operator

uint8_t **rx_timeout_thresh**

UART timeout interrupt threshold (unit: time of sending one byte)

uint8_t **txfifo_empty_intr_thresh**

UART TX empty interrupt threshold.

uint8_t **rxfifo_full_thresh**

UART RX full interrupt threshold.

struct **uart_event_t**

Event structure used in UART event queue.

Public Members

uart_event_type_t **type**

UART event type

size_t **size**

UART data size for `UART_DATA` event

bool **timeout_flag**

UART data read timeout flag for `UART_DATA` event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.

Macros

UART_PIN_NO_CHANGE

UART_FIFO_LEN

Length of the HP UART HW FIFO.

UART_HW_FIFO_LEN (uart_num)

Length of the UART HW FIFO.

UART_BITRATE_MAX

Maximum configurable bitrate.

Type Definitions

typedef *intr_handle_t* **uart_isr_handle_t**

Enumerations

enum **uart_event_type_t**

UART event types used in the ring buffer.

Values:

enumerator **UART_DATA**

Triggered when the receiver either takes longer than rx_timeout_thresh to receive a byte, or when more data is received than what rxfifo_full_thresh specifies

enumerator **UART_BREAK**

Triggered when the receiver detects a NULL character

enumerator **UART_BUFFER_FULL**

Triggered when RX ring buffer is full

enumerator **UART_FIFO_OVF**

Triggered when the received data exceeds the capacity of the RX FIFO

enumerator **UART_FRAME_ERR**

Triggered when the receiver detects a data frame error

enumerator **UART_PARITY_ERR**

Triggered when a parity error is detected in the received data

enumerator **UART_DATA_BREAK**

Internal event triggered to signal a break after data transmission

enumerator **UART_PATTERN_DET**

Triggered when a specified pattern is detected in the incoming data

enumerator **UART_WAKEUP**

Triggered when a wakeup signal is detected

enumerator **UART_EVENT_MAX**

Maximum index for UART events

Header File

- [components/hal/include/hal/uart_types.h](#)
- This header file can be included with:

```
#include "hal/uart_types.h"
```

Structures

struct **uart_at_cmd_t**

UART AT cmd char configuration parameters Note that this function may different on different chip. Please refer to the TRM at configuration.

Public Members

uint8_t **cmd_char**

UART AT cmd char

uint8_t **char_num**

AT cmd char repeat number

uint32_t **gap_tout**

gap time(in baud-rate) between AT cmd char

uint32_t **pre_idle**

the idle time(in baud-rate) between the non AT char and first AT char

uint32_t **post_idle**

the idle time(in baud-rate) between the last AT char and the none AT char

struct **uart_sw_flowctrl_t**

UART software flow control configuration parameters.

Public Members

uint8_t **xon_char**

Xon flow control char

uint8_t **xoff_char**

Xoff flow control char

uint8_t **xon_thrd**

If the software flow control is enabled and the data amount in rxfifo is less than xon_thrd, an xon_char will be sent

uint8_t **xoff_thrd**

If the software flow control is enabled and the data amount in rxfifo is more than xoff_thrd, an xoff_char will be sent

Type Definitions

typedef *soc_periph_uart_clk_src_legacy_t* **uart_sclk_t**

UART source clock.

typedef *soc_periph_lp_uart_clk_src_t* **lp_uart_sclk_t**

LP_UART source clock.

Enumerations

enum **uart_port_t**

UART port number, can be UART_NUM_0 ~ (UART_NUM_MAX -1).

Values:

enumerator **UART_NUM_0**

UART port 0

enumerator **UART_NUM_1**

UART port 1

enumerator **LP_UART_NUM_0**

LP UART port 0

enumerator **UART_NUM_MAX**

UART port max

enum **uart_mode_t**

UART mode selection.

Values:

enumerator **UART_MODE_UART**

mode: regular UART mode

enumerator **UART_MODE_RS485_HALF_DUPLEX**

mode: half duplex RS485 UART mode control by RTS pin

enumerator **UART_MODE_IRDA**

mode: IRDA UART mode

enumerator **UART_MODE_RS485_COLLISION_DETECT**

mode: RS485 collision detection UART mode (used for test purposes)

enumerator **UART_MODE_RS485_APP_CTRL**

mode: application control RS485 UART mode (used for test purposes)

enum **uart_word_length_t**

UART word length constants.

Values:

enumerator **UART_DATA_5_BITS**

word length: 5bits

enumerator **UART_DATA_6_BITS**

word length: 6bits

enumerator **UART_DATA_7_BITS**

word length: 7bits

enumerator **UART_DATA_8_BITS**

word length: 8bits

enumerator **UART_DATA_BITS_MAX**

enum **uart_stop_bits_t**

UART stop bits number.

Values:

enumerator **UART_STOP_BITS_1**

stop bit: 1bit

enumerator **UART_STOP_BITS_1_5**

stop bit: 1.5bits

enumerator **UART_STOP_BITS_2**

stop bit: 2bits

enumerator **UART_STOP_BITS_MAX**

enum **uart_parity_t**

UART parity constants.

Values:

enumerator **UART_PARITY_DISABLE**

Disable UART parity

enumerator **UART_PARITY_EVEN**

Enable UART even parity

enumerator **UART_PARITY_ODD**

Enable UART odd parity

enum **uart_hw_flowcontrol_t**

UART hardware flow control modes.

Values:

enumerator **UART_HW_FLOWCTRL_DISABLE**

disable hardware flow control

enumerator **UART_HW_FLOWCTRL_RTS**

enable RX hardware flow control (rts)

enumerator **UART_HW_FLOWCTRL_CTS**

enable TX hardware flow control (cts)

enumerator **UART_HW_FLOWCTRL_CTS_RTS**

enable hardware flow control

enumerator **UART_HW_FLOWCTRL_MAX**

enum **uart_signal_inv_t**

UART signal bit map.

Values:

enumerator **UART_SIGNAL_INV_DISABLE**

Disable UART signal inverse

enumerator **UART_SIGNAL_IRDA_TX_INV**

inverse the UART irda_tx signal

enumerator **UART_SIGNAL_IRDA_RX_INV**

inverse the UART irda_rx signal

enumerator **UART_SIGNAL_RXD_INV**

inverse the UART rxd signal

enumerator **UART_SIGNAL_CTS_INV**

inverse the UART cts signal

enumerator **UART_SIGNAL_DSR_INV**

inverse the UART dsr signal

enumerator **UART_SIGNAL_TXD_INV**

inverse the UART txd signal

enumerator **UART_SIGNAL_RTS_INV**

inverse the UART rts signal

enumerator **UART_SIGNAL_DTR_INV**

inverse the UART dtr signal

GPIO Lookup Macros The UART peripherals have dedicated IO_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of finding and assigning IO_MUX pins. You choose a macro based on either the IO_MUX pin number, or a required UART channel name, and the macro returns the matching counterpart for you. See some examples below.

Note: These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

1. `UART_NUM_2_TXD_DIRECT_GPIO_NUM` returns the IO_MUX pin number of UART channel 2 TXD pin (pin 17)
2. `UART_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when connected to the UART peripheral via IO_MUX (this is `UART_NUM_0`)
3. `UART_CTS_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when used as the UART CTS pin via IO_MUX (this is `UART_NUM_0`). It is similar to the above macro but specifies the pin function which is also part of the IO_MUX assignment.

Header File

- `components/soc/esp32c5/include/soc/uart_channel.h`
- This header file can be included with:

```
#include "soc/uart_channel.h"
```

Macros

`UART_GPIO11_DIRECT_CHANNEL`

`UART_NUM_0_TXD_DIRECT_GPIO_NUM`

`UART_GPIO12_DIRECT_CHANNEL`

`UART_NUM_0_RXD_DIRECT_GPIO_NUM`

`UART_TXD_GPIO11_DIRECT_CHANNEL`

`UART_RXD_GPIO12_DIRECT_CHANNEL`

Code examples for this API section are provided in the [peripherals](#) directory of ESP-IDF examples.

2.7 Provisioning API

2.7.1 Protocol Communication

Overview

The Protocol Communication (protocomm) component manages secure sessions and provides the framework for multiple transports. The application can also use the protocomm layer directly to have application-specific extensions for the provisioning or non-provisioning use cases.

Following features are available for provisioning:

- Communication security at the application level
 - `protocomm_security0` (no security)
 - `protocomm_security1` (Curve25519 key exchange + AES-CTR encryption/decryption)
 - `protocomm_security2` (SRP6a-based key exchange + AES-GCM encryption/decryption)
- Proof-of-possession (support with `protocomm_security1` only)
- Salt and Verifier (support with `protocomm_security2` only)

Protocomm internally uses protobuf (protocol buffers) for secure session establishment. Users can choose to implement their own security (even without using protobuf). Protocomm can also be used without any security layer.

Protocomm provides the framework for various transports:

- Bluetooth LE
- Wi-Fi (SoftAP + HTTPD)
- Console, in which case the handler invocation is automatically taken care of on the device side. See Transport Examples below for code snippets.

Note that for `protocomm_security1` and `protocomm_security2`, the client still needs to establish sessions by performing the two-way handshake.

See [Unified Provisioning](#) for more details about the secure handshake logic.

Enabling Protocomm Security Version

The protocomm component provides a project configuration menu to enable/disable support of respective security versions. The respective configuration options are as follows:

- Support `protocomm_security0`, with no security: `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0`, this option is enabled by default.
- Support `protocomm_security1` with Curve25519 key exchange + AES-CTR encryption/decryption: `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1`, this option is enabled by default.
- Support `protocomm_security2` with SRP6a-based key exchange + AES-GCM encryption/decryption: `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2`.

Note: Enabling multiple security versions at once offers the ability to control them dynamically but also increases the firmware size.

SoftAP + HTTP Transport Example with Security 2

For sample usage, see `wifi_provisioning/src/scheme_softap.c`.

```
/* The endpoint handler to be registered with protocomm. This simply echoes back
↳the received data. */
esp_err_t echo_req_handler (uint32_t session_id,
                            const uint8_t *inbuf, ssize_t inlen,
                            uint8_t **outbuf, ssize_t *outlen,
                            void *priv_data)
{
    /* Session ID may be used for persistence. */
    printf("Session ID : %d", session_id);
```

(continues on next page)

(continued from previous page)

```

/* Echo back the received data. */
*outlen = inlen;          /* Output the data length updated. */
*outbuf = malloc(inlen); /* This is to be deallocated outside. */
memcpy(*outbuf, inbuf, inlen);

/* Private data that was passed at the time of endpoint creation. */
uint32_t *priv = (uint32_t *) priv_data;
if (priv) {
    printf("Private data : %d", *priv);
}

return ESP_OK;
}

    protocomm_ble_stop(pc);

    protocomm_delete(pc);
}

```

API Reference

Header File

- [components/protocomm/include/common/protocomm.h](#)
- This header file can be included with:

```
#include "protocomm.h"
```

- This header file is a part of the API provided by the `protocomm` component. To declare that your component depends on `protocomm`, add the following to your `CMakeLists.txt`:

```
REQUIRES protocomm
```

or

```
PRIV_REQUIRES protocomm
```

Functions

`protocomm_t` ***protocomm_new** (void)

Create a new `protocomm` instance.

This API will return a new dynamically allocated `protocomm` instance with all elements of the `protocomm_t` structure initialized to `NULL`.

Returns

- `protocomm_t*` : On success
- `NULL` : No memory for allocating new instance

void **protocomm_delete** (`protocomm_t` *pc)

Delete a `protocomm` instance.

This API will deallocate a `protocomm` instance that was created using `protocomm_new()`.

Parameters `pc` -- [in] Pointer to the `protocomm` instance to be deleted

`esp_err_t` **protocomm_add_endpoint** (`protocomm_t` *pc, const char *ep_name, `protocomm_req_handler_t` h, void *priv_data)

Add endpoint request handler for a `protocomm` instance.

This API will bind an endpoint handler function to the specified endpoint name, along with any private data that needs to be pass to the handler at the time of call.

Note:

- An endpoint must be bound to a valid `protocomm` instance, created using `protocomm_new()`.
 - This function internally calls the registered `add_endpoint()` function of the selected transport which is a member of the `protocomm_t` instance structure.
-

Parameters

- **pc** -- **[in]** Pointer to the `protocomm` instance
- **ep_name** -- **[in]** Endpoint identifier(name) string
- **h** -- **[in]** Endpoint handler function
- **priv_data** -- **[in]** Pointer to private data to be passed as a parameter to the handler function on call. Pass NULL if not needed.

Returns

- `ESP_OK` : Success
- `ESP_FAIL` : Error adding endpoint / Endpoint with this name already exists
- `ESP_ERR_NO_MEM` : Error allocating endpoint resource
- `ESP_ERR_INVALID_ARG` : Null instance/name/handler arguments

esp_err_t **protocomm_remove_endpoint** (*protocomm_t* *pc, const char *ep_name)

Remove endpoint request handler for a `protocomm` instance.

This API will remove a registered endpoint handler identified by an endpoint name.

Note:

- This function internally calls the registered `remove_endpoint()` function which is a member of the `protocomm_t` instance structure.
-

Parameters

- **pc** -- **[in]** Pointer to the `protocomm` instance
- **ep_name** -- **[in]** Endpoint identifier(name) string

Returns

- `ESP_OK` : Success
- `ESP_ERR_NOT_FOUND` : Endpoint with specified name doesn't exist
- `ESP_ERR_INVALID_ARG` : Null instance/name arguments

esp_err_t **protocomm_open_session** (*protocomm_t* *pc, uint32_t session_id)

Allocates internal resources for new transport session.

Note:

- An endpoint must be bound to a valid `protocomm` instance, created using `protocomm_new()`.
-

Parameters

- **pc** -- **[in]** Pointer to the `protocomm` instance
- **session_id** -- **[in]** Unique ID for a communication session

Returns

- `ESP_OK` : Request handled successfully
- `ESP_ERR_NO_MEM` : Error allocating internal resource
- `ESP_ERR_INVALID_ARG` : Null instance/name arguments

esp_err_t **protocomm_close_session** (*protocomm_t* *pc, uint32_t session_id)

Frees internal resources used by a transport session.

Note:

- An endpoint must be bound to a valid `protocomm` instance, created using `protocomm_new()`.
-

Parameters

- **pc** -- **[in]** Pointer to the protocomm instance
- **session_id** -- **[in]** Unique ID for a communication session

Returns

- ESP_OK : Request handled successfully
- ESP_ERR_INVALID_ARG : Null instance/name arguments

esp_err_t **protocomm_req_handle** (*protocomm_t* *pc, const char *ep_name, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)

Calls the registered handler of an endpoint session for processing incoming data and generating the response.

Note:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
 - Resulting output buffer must be deallocated by the caller.
-

Parameters

- **pc** -- **[in]** Pointer to the protocomm instance
- **ep_name** -- **[in]** Endpoint identifier(name) string
- **session_id** -- **[in]** Unique ID for a communication session
- **inbuf** -- **[in]** Input buffer contains input request data which is to be processed by the registered handler
- **inlen** -- **[in]** Length of the input buffer
- **outbuf** -- **[out]** Pointer to internally allocated output buffer, where the resulting response data output from the registered handler is to be stored
- **outlen** -- **[out]** Buffer length of the allocated output buffer

Returns

- ESP_OK : Request handled successfully
- ESP_FAIL : Internal error in execution of registered handler
- ESP_ERR_NO_MEM : Error allocating internal resource
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn't exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

esp_err_t **protocomm_set_security** (*protocomm_t* *pc, const char *ep_name, const *protocomm_security_t* *sec, const void *sec_params)

Add endpoint security for a protocomm instance.

This API will bind a security session establisher to the specified endpoint name, along with any proof of possession that may be required for authenticating a session client.

Note:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
 - The choice of security can be any `protocomm_security_t` instance. Choices `protocomm_security0` and `protocomm_security1` and `protocomm_security2` are readily available.
-

Parameters

- **pc** -- **[in]** Pointer to the protocomm instance
- **ep_name** -- **[in]** Endpoint identifier(name) string
- **sec** -- **[in]** Pointer to endpoint security instance
- **sec_params** -- **[in]** Pointer to security params (NULL if not needed) The pointer should contain the security params struct of appropriate security version. For protocomm security version 1 and 2 `sec_params` should contain pointer to struct of type pro-

tocomm_security1_params_t and protocmm_security2_params_t respectively. The contents of this pointer must be valid till the security session has been running and is not closed.

Returns

- ESP_OK : Success
- ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_INVALID_STATE : Security endpoint already set
- ESP_ERR_NO_MEM : Error allocating endpoint resource
- ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

esp_err_t **protocmm_unset_security** (*protocmm_t* *pc, const char *ep_name)

Remove endpoint security for a protocmm instance.

This API will remove a registered security endpoint identified by an endpoint name.

Parameters

- **pc** -- **[in]** Pointer to the protocmm instance
- **ep_name** -- **[in]** Endpoint identifier(name) string

Returns

- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn't exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

esp_err_t **protocmm_set_version** (*protocmm_t* *pc, const char *ep_name, const char *version)

Set endpoint for version verification.

This API can be used for setting an application specific protocol version which can be verified by clients through the endpoint.

Note:

- An endpoint must be bound to a valid protocmm instance, created using `protocmm_new()`.
-

Parameters

- **pc** -- **[in]** Pointer to the protocmm instance
- **ep_name** -- **[in]** Endpoint identifier(name) string
- **version** -- **[in]** Version identifier(name) string

Returns

- ESP_OK : Success
- ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_INVALID_STATE : Version endpoint already set
- ESP_ERR_NO_MEM : Error allocating endpoint resource
- ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

esp_err_t **protocmm_unset_version** (*protocmm_t* *pc, const char *ep_name)

Remove version verification endpoint from a protocmm instance.

This API will remove a registered version endpoint identified by an endpoint name.

Parameters

- **pc** -- **[in]** Pointer to the protocmm instance
- **ep_name** -- **[in]** Endpoint identifier(name) string

Returns

- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn't exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

Type Definitions

```
typedef esp_err_t (*protocomm_req_handler_t)(uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)
```

Function prototype for protocomm endpoint handler.

```
typedef struct protocomm protocomm_t
```

This structure corresponds to a unique instance of protocomm returned when the API `protocomm_new()` is called. The remaining Protocomm APIs require this object as the first parameter.

Note: Structure of the protocomm object is kept private

Header File

- `components/protocomm/include/security/protocomm_security.h`
- This header file can be included with:

```
#include "protocomm_security.h"
```

- This header file is a part of the API provided by the `protocomm` component. To declare that your component depends on `protocomm`, add the following to your `CMakeLists.txt`:

```
REQUIRES protocomm
```

or

```
PRIV_REQUIRES protocomm
```

Structures

```
struct protocomm_security1_params
```

Protocomm Security 1 parameters: Proof Of Possession.

Public Members

```
const uint8_t *data
```

Pointer to buffer containing the proof of possession data

```
uint16_t len
```

Length (in bytes) of the proof of possession data

```
struct protocomm_security2_params
```

Protocomm Security 2 parameters: Salt and Verifier.

Public Members

```
const char *salt
```

Pointer to the buffer containing the salt

```
uint16_t salt_len
```

Length (in bytes) of the salt

const char ***verifier**

Pointer to the buffer containing the verifier

uint16_t **verifier_len**

Length (in bytes) of the verifier

struct **protocomm_security**

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

Note: This structure should not have any dynamic members to allow re-entrancy

Public Members

int **ver**

Unique version number of security implementation

esp_err_t (***init**)(*protocomm_security_handle_t* *handle)

Function for initializing/allocating security infrastructure

esp_err_t (***cleanup**)(*protocomm_security_handle_t* handle)

Function for deallocating security infrastructure

esp_err_t (***new_transport_session**)(*protocomm_security_handle_t* handle, uint32_t session_id)

Starts new secure transport session with specified ID

esp_err_t (***close_transport_session**)(*protocomm_security_handle_t* handle, uint32_t session_id)

Closes a secure transport session with specified ID

esp_err_t (***security_req_handler**)(*protocomm_security_handle_t* handle, const void *sec_params, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)

Handler function for authenticating connection request and establishing secure session

esp_err_t (***encrypt**)(*protocomm_security_handle_t* handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)

Function which implements the encryption algorithm

esp_err_t (***decrypt**)(*protocomm_security_handle_t* handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)

Function which implements the decryption algorithm

Type Definitions

typedef struct *protocomm_security1_params* **protocomm_security1_params_t**

Protocomm Security 1 parameters: Proof Of Possession.

typedef *protocomm_security1_params_t* **protocomm_security_pop_t**

typedef struct *protocomm_security2_params* **protocomm_security2_params_t**

Protocomm Security 2 parameters: Salt and Verifier.

typedef void ***protocomm_security_handle_t**

typedef struct *protocomm_security* **protocomm_security_t**

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

Note: This structure should not have any dynamic members to allow re-entrancy

Enumerations

enum **protocomm_security_session_event_t**

Events generated by the protocomm security layer.

These events are generated while establishing secured session.

Values:

enumerator **PROTOCOLM_SECURITY_SESSION_SETUP_OK**

Secured session established successfully

enumerator **PROTOCOLM_SECURITY_SESSION_INVALID_SECURITY_PARAMS**

Received invalid (NULL) security parameters (username / client public-key)

enumerator **PROTOCOLM_SECURITY_SESSION_CREDENTIALS_MISMATCH**

Received incorrect credentials (username / PoP)

```

or

```
PRIV_REQUIRES protocomm
```

Functions

esp_srp_handle_t ***esp_srp_init** (*esp_ng_type_t* ng)

Initialize srp context for given NG type.

Note: the handle gets freed with `esp_srp_free`

Parameters **ng** -- NG type given by `esp_ng_type_t`

Returns `esp_srp_handle_t*` srp handle

void **esp_srp_free** (*esp_srp_handle_t* *hd)

free `esp_srp_context`

Parameters **hd** -- handle to be free

esp_err_t **esp_srp_srv_pubkey** (*esp_srp_handle_t* *hd, const char *username, int username_len, const char *pass, int pass_len, int salt_len, char **bytes_B, int *len_B, char **bytes_salt)

Returns B (pub key) and salt. [Step2.b].

Note: `*bytes_B` MUST NOT BE FREED BY THE CALLER

Note: `*bytes_salt` MUST NOT BE FREE BY THE CALLER

Parameters

- **hd** -- `esp_srp` handle
- **username** -- Username not expected NULL terminated
- **username_len** -- Username length
- **pass** -- Password not expected to be NULL terminated
- **pass_len** -- Password length
- **salt_len** -- Salt length
- **bytes_B** -- Public Key returned
- **len_B** -- Length of the public key
- **bytes_salt** -- Salt bytes generated

Returns `esp_err_t` ESP_OK on success, appropriate error otherwise

`esp_err_t esp_srp_gen_salt_verifier` (`const char *username`, `int username_len`, `const char *pass`, `int pass_len`, `char **bytes_salt`, `int salt_len`, `char **verifier`, `int *verifier_len`)

Generate salt-verifier pair, given username, password and salt length.

Note: if API has returned ESP_OK, salt and verifier generated need to be freed by caller

Note: Usually, username and password are not saved on the device. Rather salt and verifier are generated outside the device and are embedded. this convenience API can be used to generate salt and verifier on the fly for development use case. OR for devices which intentionally want to generate different password each time and can send it to the client securely. e.g., a device has a display and it shows the pin

Parameters

- **username** -- [in] username
- **username_len** -- [in] length of the username
- **pass** -- [in] password
- **pass_len** -- [in] length of the password
- **bytes_salt** -- [out] generated salt on successful generation, or NULL
- **salt_len** -- [in] salt length
- **verifier** -- [out] generated verifier on successful generation, or NULL
- **verifier_len** -- [out] length of the generated verifier

Returns `esp_err_t` ESP_OK on success, appropriate error otherwise

`esp_err_t esp_srp_set_salt_verifier` (`esp_srp_handle_t *hd`, `const char *salt`, `int salt_len`, `const char *verifier`, `int verifier_len`)

Set the Salt and Verifier pre-generated for a given password. This should be used only if the actual password is not available. The public key can then be generated using `esp_srp_srv_pubkey_from_salt_verifier()` and not `esp_srp_srv_pubkey()`

Parameters

- **hd** -- `esp_srp_handle`
- **salt** -- pre-generated salt bytes
- **salt_len** -- length of the salt bytes
- **verifier** -- pre-generated verifier
- **verifier_len** -- length of the verifier bytes

Returns `esp_err_t` ESP_OK on success, appropriate error otherwise

`esp_err_t esp_srp_srv_pubkey_from_salt_verifier` (`esp_srp_handle_t *hd`, `char **bytes_B`, `int *len_B`)

Returns B (pub key)[Step2.b] when the salt and verifier are set using *esp_srp_set_salt_verifier()*

Note: *bytes_B MUST NOT BE FREED BY THE CALLER

Parameters

- **hd** -- esp_srp handle
- **bytes_B** -- Key returned to the called
- **len_B** -- Length of the key returned

Returns esp_err_t ESP_OK on success, appropriate error otherwise

esp_err_t **esp_srp_get_session_key** (*esp_srp_handle_t* *hd, char *bytes_A, int len_A, char **bytes_key, uint16_t *len_key)

Get session key in *bytes_key given by len in *len_key. [Step2.c].

This calculated session key is used for further communication given the proofs are exchanged/authenticated with *esp_srp_exchange_proofs*

Note: *bytes_key MUST NOT BE FREED BY THE CALLER

Parameters

- **hd** -- esp_srp handle
- **bytes_A** -- Private Key
- **len_A** -- Private Key length
- **bytes_key** -- Key returned to the caller
- **len_key** -- length of the key in *bytes_key

Returns esp_err_t ESP_OK on success, appropriate error otherwise

esp_err_t **esp_srp_exchange_proofs** (*esp_srp_handle_t* *hd, char *username, uint16_t username_len, char *bytes_user_proof, char *bytes_host_proof)

Complete the authentication. If this step fails, the session_key exchanged should not be used.

This is the final authentication step in SRP algorithm [Step4.1, Step4.b, Step4.c]

Parameters

- **hd** -- esp_srp handle
- **username** -- Username not expected NULL terminated
- **username_len** -- Username length
- **bytes_user_proof** -- param in
- **bytes_host_proof** -- parameter out (should be SHA512_DIGEST_LENGTH) bytes in size

Returns esp_err_t ESP_OK if user's proof is ok and subsequently bytes_host_proof is populated with our own proof.

Type Definitions

```
typedef struct esp_srp_handle esp_srp_handle_t
```

esp_srp handle as the result of *esp_srp_init*

The handle is returned by *esp_srp_init* on successful init. It is then passed for subsequent API calls as an argument. *esp_srp_free* can be used to clean up the handle. After *esp_srp_free* the handle becomes invalid.

Enumerations

enum **esp_ng_type_t**

Large prime+generator to be used for the algorithm.

Values:

enumerator **ESP_NG_3072**

Header File

- [components/protocomm/include/transport/protocomm_httpd.h](#)
- This header file can be included with:

```
#include "protocomm_httpd.h"
```

- This header file is a part of the API provided by the `protocomm` component. To declare that your component depends on `protocomm`, add the following to your `CMakeLists.txt`:

```
REQUIRES protocomm
```

or

```
PRIV_REQUIRES protocomm
```

Functions

esp_err_t **protocomm_httpd_start** (*protocomm_t* *pc, const *protocomm_httpd_config_t* *config)

Start HTTPD protocomm transport.

This API internally creates a framework to allow endpoint registration and security configuration for the protocomm.

Note: This is a singleton. ie. Protocomm can have multiple instances, but only one instance can be bound to an HTTP transport layer.

Parameters

- **pc** -- **[in]** Protocomm instance pointer obtained from `protocomm_new()`
- **config** -- **[in]** Pointer to config structure for initializing HTTP server

Returns

- **ESP_OK** : Success
- **ESP_ERR_INVALID_ARG** : Null arguments
- **ESP_ERR_NOT_SUPPORTED** : Transport layer bound to another protocomm instance
- **ESP_ERR_INVALID_STATE** : Transport layer already bound to this protocomm instance
- **ESP_ERR_NO_MEM** : Memory allocation for server resource failed
- **ESP_ERR_HTTPD_*** : HTTP server error on start

esp_err_t **protocomm_httpd_stop** (*protocomm_t* *pc)

Stop HTTPD protocomm transport.

This API cleans up the HTTPD transport protocomm and frees all the handlers registered with the protocomm.

Parameters **pc** -- **[in]** Same protocomm instance that was passed to `protocomm_httpd_start()`

Returns

- **ESP_OK** : Success
- **ESP_ERR_INVALID_ARG** : Null / incorrect protocomm instance pointer

Unions

union **protocomm_httpd_config_data_t**

#include <protocomm_httpd.h> Protocomm HTTPD Configuration Data

Public Members

void ***handle**

HTTP Server Handle, if `ext_handle_provided` is set to true

protocomm_http_server_config_t **config**

HTTP Server Configuration, if a server is not already active

Structures

struct **protocomm_http_server_config_t**

Config parameters for protocomm HTTP server.

Public Members

uint16_t **port**

Port on which the HTTP server will listen

size_t **stack_size**

Stack size of server task, adjusted depending upon stack usage of endpoint handler

unsigned **task_priority**

Priority of server task

struct **protocomm_httpd_config_t**

Config parameters for protocomm HTTP server.

Public Members

bool **ext_handle_provided**

Flag to indicate if an external HTTP Server Handle has been provided. In such a case, protocomm will use the same HTTP Server and not start a new one internally.

protocomm_httpd_config_data_t **data**

Protocomm HTTPD Configuration Data

Macros

PROTOCOLM_HTTPD_DEFAULT_CONFIG ()

Header File

- [components/protocomm/include/transport/protocomm_ble.h](#)
- This header file can be included with:

```
#include "protocomm_ble.h"
```

- This header file is a part of the API provided by the `protocomm` component. To declare that your component depends on `protocomm`, add the following to your `CMakeLists.txt`:

```
REQUIRES protocomm
```

or

```
PRIV_REQUIRES protocomm
```

Functions

esp_err_t **protocomm_ble_start** (*protocomm_t* *pc, const *protocomm_ble_config_t* *config)

Start Bluetooth Low Energy based transport layer for provisioning.

Initialize and start required BLE service for provisioning. This includes the initialization for characteristics/service for BLE.

Parameters

- **pc** -- **[in]** Protocomm instance pointer obtained from `protocomm_new()`
- **config** -- **[in]** Pointer to config structure for initializing BLE

Returns

- `ESP_OK` : Success
- `ESP_FAIL` : Simple BLE start error
- `ESP_ERR_NO_MEM` : Error allocating memory for internal resources
- `ESP_ERR_INVALID_STATE` : Error in ble config
- `ESP_ERR_INVALID_ARG` : Null arguments

esp_err_t **protocomm_ble_stop** (*protocomm_t* *pc)

Stop Bluetooth Low Energy based transport layer for provisioning.

Stops service/task responsible for BLE based interactions for provisioning

Note: You might want to optionally reclaim memory from Bluetooth. Refer to the documentation of `esp_bt_mem_release` in that case.

Parameters **pc** -- **[in]** Same protocomm instance that was passed to `protocomm_ble_start()`

Returns

- `ESP_OK` : Success
- `ESP_FAIL` : Simple BLE stop error
- `ESP_ERR_INVALID_ARG` : Null / incorrect protocomm instance

Structures

struct **name_uuid**

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

Public Members

const char ***name**

Name of the handler, which is passed to protocomm layer

uint16_t **uuid**

UUID to be assigned to the BLE characteristic which is mapped to the handler

struct **protocomm_ble_event_t**

Structure for BLE events in Protocomm.

Public Members

uint16_t **evt_type**

This field indicates the type of BLE event that occurred.

uint16_t **conn_handle**

The handle of the relevant connection.

uint16_t **conn_status**

The status of the connection attempt; 0: the connection was successfully established. 0 BLE host error code: the connection attempt failed for the specified reason.

uint16_t **disconnect_reason**

Return code indicating the reason for the disconnect.

struct **protocomm_ble_config**

Config parameters for protocomm BLE service.

Public Members

char **device_name**[MAX_BLE_DEVNAME_LEN + 1]

BLE device name being broadcast at the time of provisioning

uint8_t **service_uuid**[BLE_UUID128_VAL_LENGTH]

128 bit UUID of the provisioning service

uint8_t ***manufacturer_data**

BLE device manufacturer data pointer in advertisement

ssize_t **manufacturer_data_len**

BLE device manufacturer data length in advertisement

ssize_t **nu_lookup_count**

Number of entries in the Name-UUID lookup table

protocomm_ble_name_uuid_t ***nu_lookup**

Pointer to the Name-UUID lookup table

unsigned **ble_bonding**

BLE bonding

unsigned **ble_sm_sc**

BLE security flag

unsigned **ble_link_encryption**

BLE security flag

uint8_t ***ble_addr**

BLE address

unsigned **keep_ble_on**

Flag to keep BLE on

unsigned **ble_notify**

BLE characteristic notify flag

Macros

MAX_BLE_DEVNAME_LEN

BLE device name cannot be larger than this value 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes

BLE_UUID128_VAL_LENGTH

MAX_BLE_MANUFACTURER_DATA_LEN

Theoretically, the limit for max manufacturer length remains same as BLE device name i.e. 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes However, manufacturer data goes along with BLE device name in scan response. So, it is important to understand the actual length should be smaller than (29 - (BLE device name length) - 2).

BLE_ADDR_LEN

Type Definitions

typedef struct *name_uuid* **protocomm_ble_name_uuid_t**

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

typedef struct *protocomm_ble_config* **protocomm_ble_config_t**

Config parameters for protocomm BLE service.

Enumerations

enum **protocomm_transport_ble_event_t**

Events generated by BLE transport.

These events are generated when the BLE transport is paired and disconnected.

Values:

enumerator **PROTOCOLM_TRANSPORT_BLE_CONNECTED**

enumerator **PROTOCOLM_TRANSPORT_BLE_DISCONNECTED**

2.7.2 Unified Provisioning

Overview

The unified provisioning support in the ESP-IDF provides an extensible mechanism to the developers to configure the device with the Wi-Fi credentials and/or other custom configuration using various transports and different security schemes. Depending on the use case, it provides a complete and ready solution for Wi-Fi network provisioning along with example iOS and Android applications. The developers can choose to extend the device-side and phone-app side implementations to accommodate their requirements for sending additional configuration data. The following are the important features of this implementation:

1. Extensible Protocol

The protocol is completely flexible and it offers the ability for the developers to send custom configuration in the provisioning process. The data representation is also left to the application to decide.

2. Transport Flexibility

The protocol can work on Wi-Fi (SoftAP + HTTP server) or on Bluetooth LE as a transport protocol. The framework provides an ability to add support for any other transport easily as long as command-response behavior can be supported on the transport.

3. Security Scheme Flexibility

It is understood that each use case may require different security scheme to secure the data that is exchanged in the provisioning process. Some applications may work with SoftAP that is WPA2 protected or Bluetooth LE with the "just-works" security. Or the applications may consider the transport to be insecure and may want application-level security. The unified provisioning framework allows the application to choose the security as deemed suitable.

4. Compact Data Representation

The protocol uses [Google Protobufs](#) as a data representation for session setup and Wi-Fi provisioning. They provide a compact data representation and ability to parse the data in multiple programming languages in native format. Please note that this data representation is not forced on application-specific data and the developers may choose the representation of their choice.

Typical Provisioning Process

Deciding on Transport

The unified provisioning subsystem supports Wi-Fi (SoftAP+HTTP server) and Bluetooth LE (GATT based) transport schemes. The following points need to be considered while selecting the best possible transport for provisioning:

1. The Bluetooth LE-based transport has the advantage of maintaining an intact communication channel between the device and the client during the provisioning, which ensures reliable provisioning feedback.
2. The Bluetooth LE-based provisioning implementation makes the user experience better from the phone apps as on Android and iOS both, the phone app can discover and connect to the device without requiring the user to go out of the phone app.
3. However, the Bluetooth LE transport consumes about 110 KB memory at runtime. If the product does not use the Bluetooth LE or Bluetooth functionality after provisioning is done, almost all the memory can be reclaimed and added into the heap.
4. The SoftAP-based transport is highly interoperable. However, there are a few considerations:
 - The device uses the same radio to host the SoftAP and also to connect to the configured AP. Since these could potentially be on different channels, it may cause connection status updates not to be reliably received by the phone
 - The phone (client) has to disconnect from its current AP in order to connect to the SoftAP. The original network will get restored only when the provisioning process is complete, and the softAP is taken down.
5. The SoftAP transport does not require much additional memory for the Wi-Fi use cases.

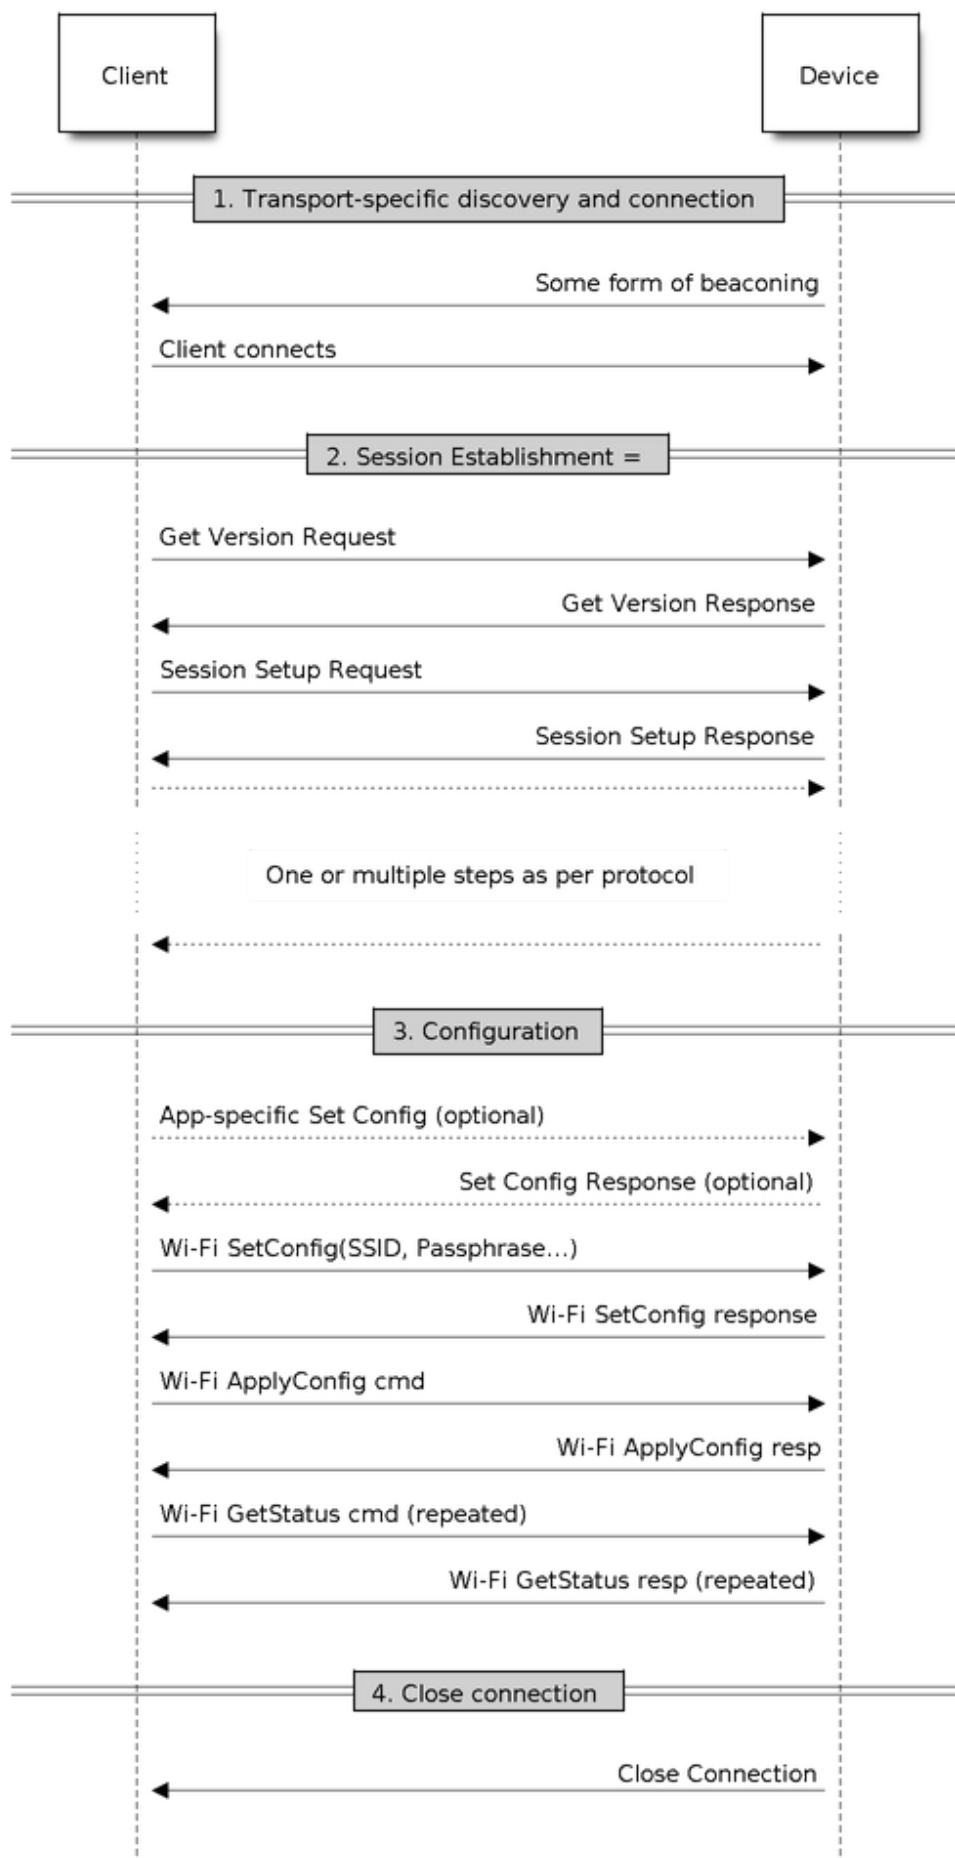

Fig. 27: Typical Provisioning Process

6. The SoftAP-based provisioning requires the phone-app user to go to `System Settings` to connect to the Wi-Fi network hosted by the device in the iOS system. The discovery (scanning) as well as connection APIs are not available for the iOS applications.

Deciding on Security

Depending on the transport and other constraints, the security scheme needs to be selected by the application developers. The following considerations need to be given from the provisioning-security perspective:

1. The configuration data sent from the client to the device and the response have to be secured.
2. The client should authenticate the device that it is connected to.
3. The device manufacturer may choose proof-of-possession (PoP), a unique per-device secret to be entered on the provisioning client as a security measure to make sure that only the user can provision the device in their possession.

There are two levels of security schemes, of which the developer may select one or a combination, depending on requirements.

1. Transport Security

For SoftAP provisioning, developers may choose WPA2-protected security with unique per-device passphrase. Unique per-device passphrase can also act as a proof-of-possession. For Bluetooth LE, the "just-works" security can be used as a transport-level security after assessing its provided level of security.

2. Application Security

The unified provisioning subsystem provides the application-level security (*Security 1 Scheme*) that provides data protection and authentication through PoP, if the application does not use the transport-level security, or if the transport-level security is not sufficient for the use case.

Device Discovery

The advertisement and device discovery is left to the application and depending on the protocol chosen, the phone apps and device-firmware application can choose appropriate method for advertisement and discovery.

For the SoftAP+HTTP transport, typically the SSID (network name) of the AP hosted by the device can be used for discovery.

For the Bluetooth LE transport, device name or primary service included in the advertisement or a combination of both can be used for discovery.

Architecture

The below diagram shows the architecture of unified provisioning:

It relies on the base layer called *Protocol Communication* (protocomm) which provides a framework for security schemes and transport mechanisms. The Wi-Fi Provisioning layer uses protocomm to provide simple callbacks to the application for setting the configuration and getting the Wi-Fi status. The application has control over implementation of these callbacks. In addition, the application can directly use protocomm to register custom handlers.

The application creates a protocomm instance which is mapped to a specific transport and specific security scheme. Each transport in the protocomm has a concept of an "end-point" which corresponds to the logical channel for communication for specific type of information. For example, security handshake happens on a different endpoint from the Wi-Fi configuration endpoint. Each end-point is identified using a string and depending on the transport internal representation of the end-point changes. In case of the SoftAP+HTTP transport, the end-point corresponds to URI, whereas in case of Bluetooth LE, the end-point corresponds to the GATT characteristic with specific UUID. Developers can create custom end-points and implement handler for the data that is received or sent over the same end-point.

Fig. 28: Unified Provisioning Architecture

Security Schemes

At present, the unified provisioning supports the following security schemes:

1. Security 0

No security (No encryption).

2. Security 1

Curve25519-based key exchange, shared key derivation and AES256-CTR mode encryption of the data. It supports two modes :

- a. Authorized - Proof of Possession (PoP) string used to authorize session and derive shared key.
- b. No Auth (Null PoP) - Shared key derived through key exchange only.

3. Security 2

SRP6a-based shared key derivation and AES256-GCM mode encryption of the data.

Note: The respective security schemes need to be enabled through the project configuration menu. Please refer to [Enabling Protocomm Security Version](#) for more details.

Security 1 Scheme

The Security 1 scheme details are shown in the below sequence diagram:

Security 2 Scheme

The Security 2 scheme is based on the Secure Remote Password (SRP6a) protocol, see [RFC 5054](#).

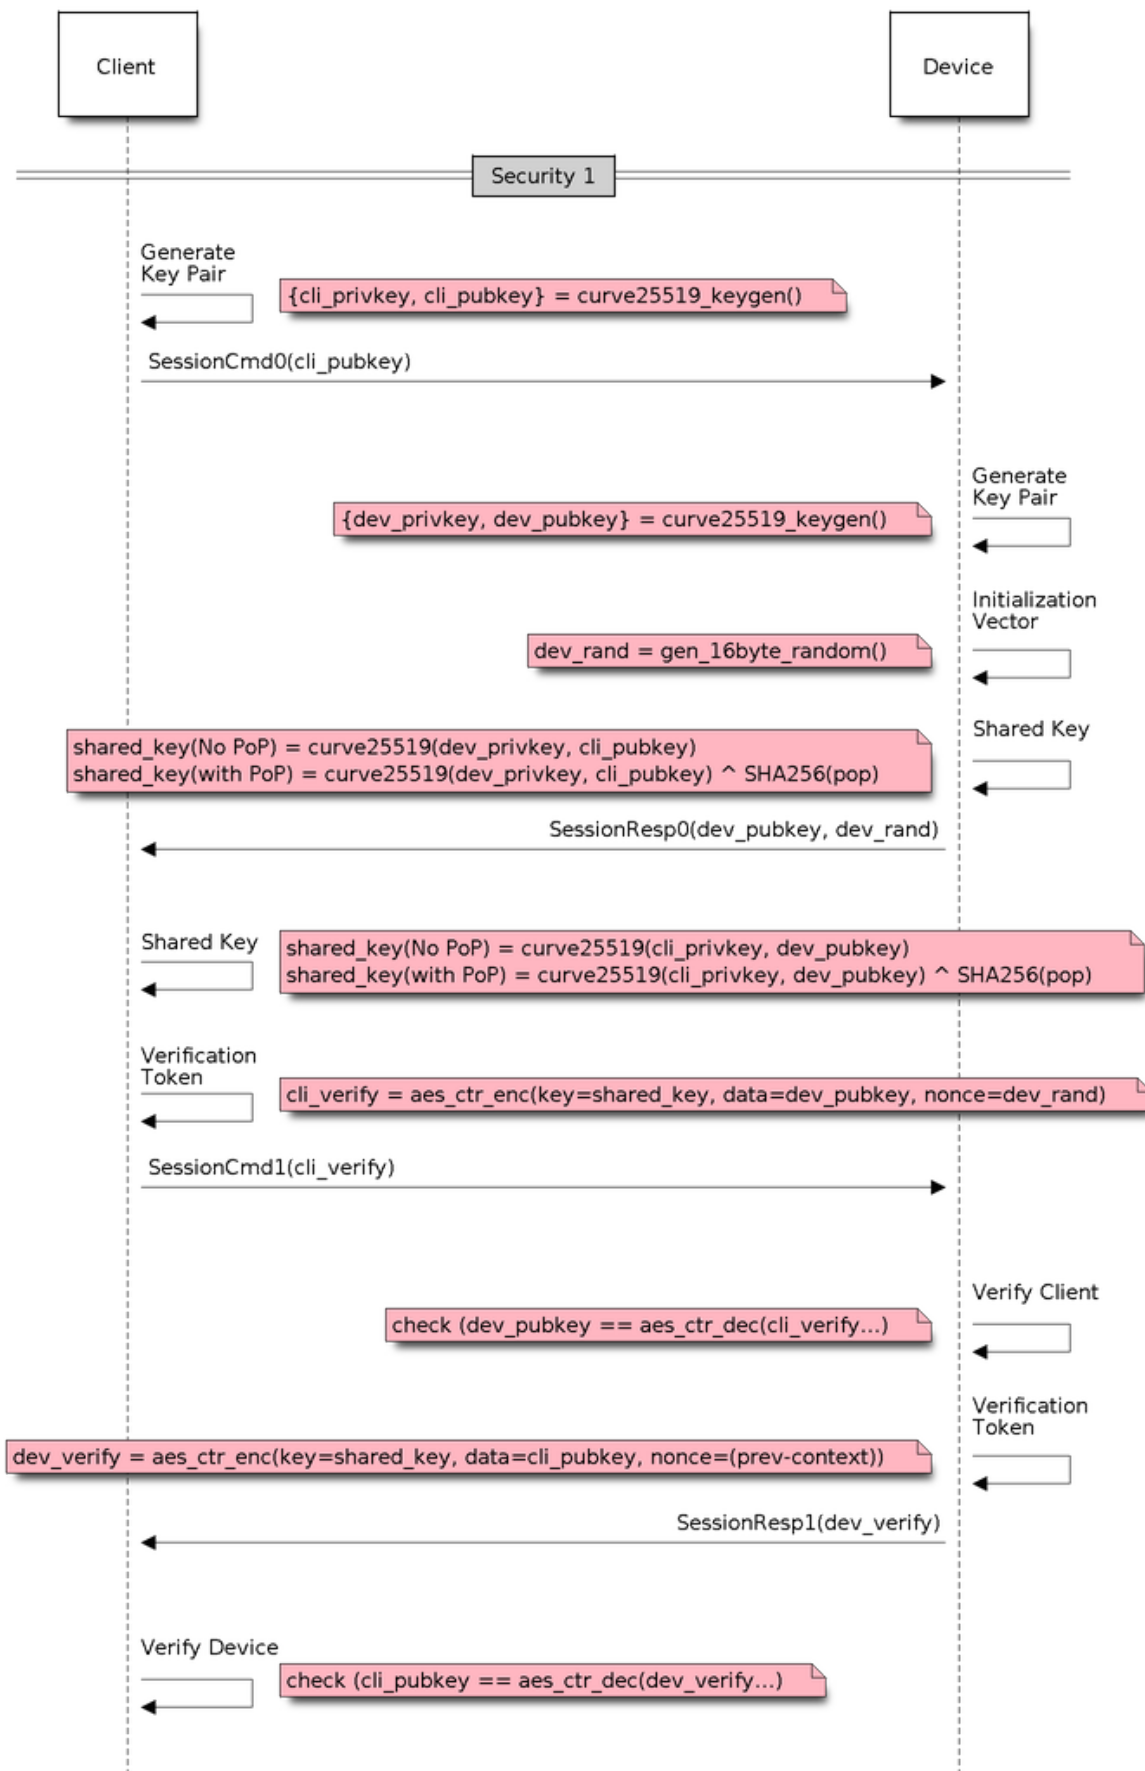

Fig. 29: Security 1

The protocol requires the Salt and Verifier to be generated beforehand with the help of the identifying username I and the plaintext password p . The Salt and Verifier are then stored on ESP32-C5.

- The password p and the username I are to be provided to the Phone App (Provisioning entity) by suitable means, e.g., QR code sticker.

Details about the Security 2 scheme are shown in the below sequence diagram:

Sample Code

Please refer to *Protocol Communication* and *Wi-Fi Provisioning* for API guides and code snippets on example usage.

Application implementation can be found as an example under [provisioning](#).

Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- **Android:**
 - [Bluetooth LE Provisioning app on Play Store](#).
 - [SoftAP Provisioning app on Play Store](#).
 - Source code on GitHub: [esp-idf-provisioning-android](#).
- **iOS:**
 - [Bluetooth LE Provisioning app on App Store](#).
 - [SoftAP Provisioning app on App Store](#).
 - Source code on GitHub: [esp-idf-provisioning-ios](#).
- Linux/macOS/Windows: [tools/esp_prov](#), a Python-based command line tool for provisioning.

The phone applications offer simple UI and are thus more user centric, while the command-line application is useful as a debugging tool for developers.

2.7.3 Wi-Fi Provisioning

Overview

This component provides APIs that control the Wi-Fi provisioning service for receiving and configuring Wi-Fi credentials over SoftAP or Bluetooth LE transport via secure *Protocol Communication* sessions. The set of `wifi_prov_mgr_` APIs help quickly implement a provisioning service that has necessary features with minimal amount of code and sufficient flexibility.

Initialization `wifi_prov_mgr_init()` is called to configure and initialize the provisioning manager, and thus must be called prior to invoking any other `wifi_prov_mgr_` APIs. Note that the manager relies on other components of ESP-IDF, namely NVS, TCP/IP, Event Loop and Wi-Fi, and optionally mDNS, hence these components must be initialized beforehand. The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

```
wifi_prov_mgr_config_t config = {
    .scheme = wifi_prov_scheme_ble,
    .scheme_event_handler = WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
};

ESP_ERROR_CHECK( wifi_prov_mgr_init(config) );
```

The configuration structure `wifi_prov_mgr_config_t` has a few fields to specify the desired behavior of the manager:

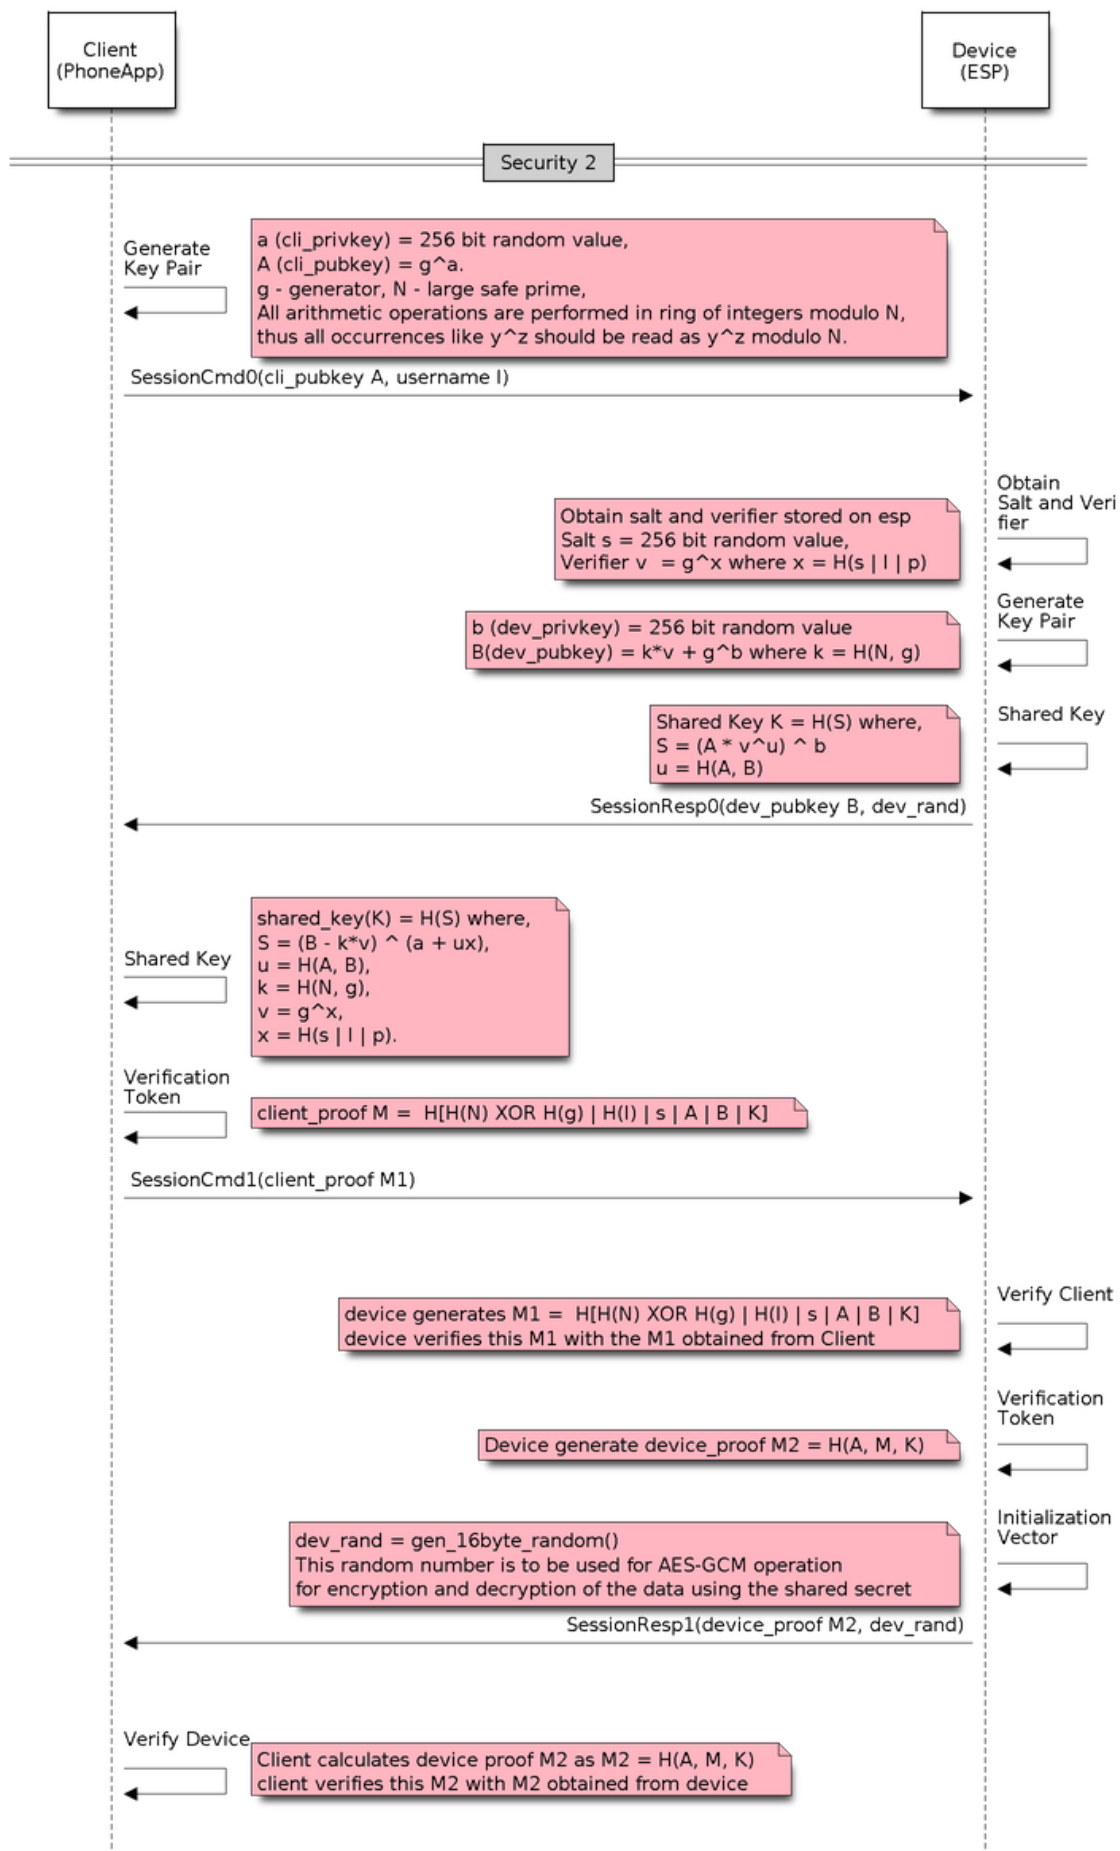

Fig. 30: Security 2

- `wifi_prov_mgr_config_t::scheme` - This is used to specify the provisioning scheme. Each scheme corresponds to one of the modes of transport supported by protocomm. Hence, support the following options:
 - `wifi_prov_scheme_ble` - Bluetooth LE transport and GATT Server for handling the provisioning commands.
 - `wifi_prov_scheme_softap` - Wi-Fi SoftAP transport and HTTP Server for handling the provisioning commands.
 - `wifi_prov_scheme_console` - Serial transport and console for handling the provisioning commands.
- `wifi_prov_mgr_config_t::scheme_event_handler`: An event handler defined along with the scheme. Choosing the appropriate scheme-specific event handler allows the manager to take care of certain matters automatically. Presently, this option is not used for either the SoftAP or Console-based provisioning, but is very convenient for Bluetooth LE. To understand how, we must recall that Bluetooth requires a substantial amount of memory to function, and once the provisioning is finished, the main application may want to reclaim back this memory (or part of it) if it needs to use either Bluetooth LE or classic Bluetooth. Also, upon every future reboot of a provisioned device, this reclamation of memory needs to be performed again. To reduce this complication in using `wifi_prov_scheme_ble`, the scheme-specific handlers have been defined, and depending upon the chosen handler, the Bluetooth LE/classic Bluetooth/BTDM memory is freed automatically when the provisioning manager is de-initialized. The available options are:
 - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM` - Free both classic Bluetooth and Bluetooth LE/BTDM memory. Used when the main application does not require Bluetooth at all.
 - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE` - Free only Bluetooth LE memory. Used when main application requires classic Bluetooth.
 - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT` - Free only classic Bluetooth. Used when main application requires Bluetooth LE. In this case freeing happens right when the manager is initialized.
 - `WIFI_PROV_EVENT_HANDLER_NONE` - Do not use any scheme specific handler. Used when the provisioning scheme is not Bluetooth LE, i.e., using SoftAP or Console, or when main application wants to handle the memory reclaiming on its own, or needs both Bluetooth LE and classic Bluetooth to function.
- `wifi_prov_mgr_config_t::app_event_handler` (Deprecated) - It is now recommended to catch `WIFI_PROV_EVENT` that is emitted to the default event loop handler. See definition of `wifi_prov_cb_event_t` for the list of events that are generated by the provisioning service. Here is an excerpt showing some of the provisioning events:

```
static void event_handler(void* arg, esp_event_base_t event_base,
                        int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT) {
        switch (event_id) {
            case WIFI_PROV_START:
                ESP_LOGI(TAG, "Provisioning started");
                break;
            case WIFI_PROV_CRED_RECV: {
                wifi_sta_config_t *wifi_sta_cfg = (wifi_sta_config_t_
↳*)event_data;
                ESP_LOGI(TAG, "Received Wi-Fi credentials"
                "\n\tSSID      : %s\n\tPassword : %s",
                (const char *) wifi_sta_cfg->ssid,
                (const char *) wifi_sta_cfg->password);
                break;
            }
            case WIFI_PROV_CRED_FAIL: {
                wifi_prov_sta_fail_reason_t *reason = (wifi_prov_sta_fail_
↳reason_t *)event_data;
                ESP_LOGE(TAG, "Provisioning failed!\n\tReason : %s"
                "\n\tPlease reset to factory and retry_
↳provisioning",
```

(continues on next page)

(continued from previous page)

```

        (*reason == WIFI_PROV_STA_AUTH_ERROR) ?
        "Wi-Fi station authentication failed" : "Wi-Fi_
↪access-point not found");
        break;
    }
    case WIFI_PROV_CRED_SUCCESS:
        ESP_LOGI(TAG, "Provisioning successful");
        break;
    case WIFI_PROV_END:
        /* De-initialize manager once provisioning is finished */
        wifi_prov_mgr_deinit();
        break;
    default:
        break;
    }
}
}
}

```

The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

Check the Provisioning State Whether the device is provisioned or not can be checked at runtime by calling `wifi_prov_mgr_is_provisioned()`. This internally checks if the Wi-Fi credentials are stored in NVS.

Note that presently the manager does not have its own NVS namespace for storage of Wi-Fi credentials, instead it relies on the `esp_wifi_` APIs to set and get the credentials stored in NVS from the default location.

If the provisioning state needs to be reset, any of the following approaches may be taken:

- The associated part of NVS partition has to be erased manually
- The main application must implement some logic to call `esp_wifi_` APIs for erasing the credentials at runtime
- The main application must implement some logic to force start the provisioning irrespective of the provisioning state

```

bool provisioned = false;
ESP_ERROR_CHECK( wifi_prov_mgr_is_provisioned(&provisioned) );

```

Start the Provisioning Service At the time of starting provisioning we need to specify a service name and the corresponding key, that is to say:

- A Wi-Fi SoftAP SSID and a passphrase, respectively, when the scheme is `wifi_prov_scheme_softap`.
- Bluetooth LE device name with the service key ignored when the scheme is `wifi_prov_scheme_ble`.

Also, since internally the manager uses `protocomm`, we have the option of choosing one of the security features provided by it:

- Security 1 is secure communication which consists of a prior handshake involving X25519 key exchange along with authentication using a proof of possession `pop`, followed by AES-CTR for encryption or decryption of subsequent messages.
- Security 0 is simply plain text communication. In this case the `pop` is simply ignored.

See [Unified Provisioning](#) for details about the security features.

```

const char *service_name = "my_device";
const char *service_key = "password";

wifi_prov_security_t security = WIFI_PROV_SECURITY_1;
const char *pop = "abcd1234";

ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_
↪name, service_key) );

```

The provisioning service automatically finishes only if it receives valid Wi-Fi AP credentials followed by successful connection of device to the AP with IP obtained. Regardless of that, the provisioning service can be stopped at any moment by making a call to `wifi_prov_mgr_stop_provisioning()`.

Note: If the device fails to connect with the provided credentials, it does not accept new credentials anymore, but the provisioning service keeps on running, only to convey failure to the client, until the device is restarted. Upon restart, the provisioning state turns out to be true this time, as credentials are found in NVS, but the device does fail again to connect with those same credentials, unless an AP with the matching credentials somehow does become available. This situation can be fixed by resetting the credentials in NVS or force starting the provisioning service. This has been explained above in [Check the Provisioning State](#).

Waiting for Completion Typically, the main application waits for the provisioning to finish, then de-initializes the manager to free up resources, and finally starts executing its own logic.

There are two ways for making this possible. The simpler way is to use a blocking call to `wifi_prov_mgr_wait()`.

```
// Start provisioning service
ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning( security, pop, service_
↳ name, service_key) );

// Wait for service to complete
wifi_prov_mgr_wait();

// Finally de-initialize the manager
wifi_prov_mgr_deinit();
```

The other way is to use the default event loop handler to catch `WIFI_PROV_EVENT` and call `wifi_prov_mgr_deinit()` when event ID is `WIFI_PROV_END`:

```
static void event_handler(void* arg, esp_event_base_t event_base,
                          int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT && event_id == WIFI_PROV_END) {
        /* De-initialize the manager once the provisioning is finished */
        wifi_prov_mgr_deinit();
    }
}
```

User Side Implementation When the service is started, the device to be provisioned is identified by the advertised service name, which, depending upon the selected transport, is either the Bluetooth LE device name or the SoftAP SSID.

When using SoftAP transport, for allowing service discovery, mDNS must be initialized before starting provisioning. In this case, the host name set by the main application is used, and the service type is internally set to `_esp_wifi_prov`.

When using Bluetooth LE transport, a custom 128-bit UUID should be set using `wifi_prov_scheme_ble_set_service_uuid()`. This UUID is to be included in the Bluetooth LE advertisement and corresponds to the primary GATT service that provides provisioning endpoints as GATT characteristics. Each GATT characteristic is formed using the primary service UUID as the base, with different auto-assigned 12th and 13th bytes, presumably counting from the 0th byte. Since an endpoint characteristic UUID is auto-assigned, it should not be used to identify the endpoint. Instead, client-side applications should identify the endpoints by reading the User Characteristic Description (0x2901) descriptor for each characteristic, which contains the endpoint name of the characteristic. For example, if the service UUID is set to `55cc035e-fb27-4f80-be02-3c60828b7451`, each endpoint characteristic is assigned a UUID like `55cc____-fb27-4f80-be02-3c60828b7451`, with unique values at the 12th and 13th bytes.

Once connected to the device, the provisioning-related protocomm endpoints can be identified as follows:

Table 4: Endpoints Provided by the Provisioning Service

Endpoint Name i.e., Bluetooth LE + GATT Server	URI, i.e., SoftAP + HTTP Server + mDNS	Description
prov-session	<a href="http://<mdns-hostname>.local/prov-session">http://<mdns-hostname>.local/prov-session	Security endpoint used for session establishment
prov-scan	http://wifi-prov.local/prov-scan	the endpoint used for starting Wi-Fi scan and receiving scan results
prov-ctrl	http://wifi-prov.local/prov-ctrl	the endpoint used for controlling Wi-Fi provisioning state
prov-config	<a href="http://<mdns-hostname>.local/prov-config">http://<mdns-hostname>.local/prov-config	the endpoint used for configuring Wi-Fi credentials on device
proto-ver	<a href="http://<mdns-hostname>.local/proto-ver">http://<mdns-hostname>.local/proto-ver	the endpoint for retrieving version info

Immediately after connecting, the client application may fetch the version/capabilities information from the `proto-ver` endpoint. All communications to this endpoint are unencrypted, hence necessary information, which may be relevant for deciding compatibility, can be retrieved before establishing a secure session. The response is in JSON format and looks like `:prov: { ver: v1.1, cap: [no_pop] }, my_app: { ver: 1.345, cap: [cloud, local_ctrl] }, ...`. Here label `prov` provides provisioning service version `ver` and capabilities `cap`. For now, only the `no_pop` capability is supported, which indicates that the service does not require proof of possession for authentication. Any application-related version or capabilities are given by other labels, e.g., `my_app` in this example. These additional fields are set using `wifi_prov_mgr_set_app_info()`.

User side applications need to implement the signature handshaking required for establishing and authenticating secure protocomm sessions as per the security scheme configured for use, which is not needed when the manager is configured to use protocomm security 0.

See [Unified Provisioning](#) for more details about the secure handshake and encryption used. Applications must use the `.proto` files found under `protocomm/proto`, which define the Protobuf message structures supported by `prov-session` endpoint.

Once a session is established, Wi-Fi credentials are configured using the following set of `wifi_config` commands, serialized as Protobuf messages with the corresponding `.proto` files that can be found under `wifi_provisioning/proto`:

- `get_status` - For querying the Wi-Fi connection status. The device responds with a status which is one of `connecting`, `connected` or `disconnected`. If the status is `disconnected`, a `disconnection_reason` is also to be included in the status response.
- `set_config` - For setting the Wi-Fi connection credentials.
- `apply_config` - For applying the credentials saved during `set_config` and starting the Wi-Fi station.

After session establishment, the client can also request Wi-Fi scan results from the device. The results returned is a list of AP SSIDs, sorted in descending order of signal strength. This allows client applications to display APs nearby to the device at the time of provisioning, and users can select one of the SSIDs and provide the password which is then sent using the `wifi_config` commands described above. The `wifi_scan` endpoint supports the following protobuf commands :

- `scan_start` - For starting Wi-Fi scan with various options:
 - `blocking` (input) - If true, the command returns only when the scanning is finished.
 - `passive` (input) - If true, the scan is started in passive mode, which may be slower, instead of active mode.
 - `group_channels` (input) - This specifies whether to scan all channels in one go when zero, or perform scanning of channels in groups, with 120 ms delay between scanning of consecutive groups, and the value of this parameter sets the number of channels in each group. This is useful when transport mode is SoftAP, where scanning all channels in one go may not give the Wi-Fi driver enough time to send out beacons, and hence may cause disconnection with any connected stations. When scanning in groups, the manager waits for at least 120 ms after completing the scan on a group of channels, and thus allows the driver to send out the beacons. For example, given that the total number of Wi-Fi channels is 14, then setting `group_channels` to 3 creates 5 groups, with each group having 3 channels, except the last

one which has $14 \% 3 = 2$ channels. So, when the scan is started, the first 3 channels will be scanned, followed by a 120 ms delay, and then the next 3 channels, and so on, until all the 14 channels have been scanned. One may need to adjust this parameter as having only a few channels in a group may increase the overall scan time, while having too many may again cause disconnection. Usually, a value of 4 should work for most cases. Note that for any other mode of transport, e.g., Bluetooth LE, this can be safely set to 0, and hence achieve the shortest overall scanning time.

- `period_ms` (input) - The scan parameter specifying how long to wait on each channel.
- `scan_status` - It gives the status of scanning process:
 - `scan_finished` (output) - When the scan has finished, this returns true.
 - `result_count` (output) - This gives the total number of results obtained till now. If the scan is yet happening, this number keeps on updating.
- `scan_result` - For fetching the scan results. This can be called even if the scan is still on going.
 - `start_index` (input) - Where the index starts from to fetch the entries from the results list.
 - `count` (input) - The number of entries to fetch from the starting index.
 - `entries` (output) - The list of entries returned. Each entry consists of `ssid`, `channel` and `rssi` information.

The client can also control the provisioning state of the device using `wifi_ctrl` endpoint. The `wifi_ctrl` endpoint supports the following protobuf commands:

- `ctrl_reset` - Resets internal state machine of the device and clears provisioned credentials only in case of provisioning failures.
- `ctrl_reprov` - Resets internal state machine of the device and clears provisioned credentials only in case the device is to be provisioned again for new credentials after a previous successful provisioning.

Additional Endpoints In case users want to have some additional protocomm endpoints customized to their requirements, this is done in two steps. First is creation of an endpoint with a specific name, and the second step is the registration of a handler for this endpoint. See [Protocol Communication](#) for the function signature of an endpoint handler. A custom endpoint must be created after initialization and before starting the provisioning service. Whereas, the protocomm handler is registered for this endpoint only after starting the provisioning service. Note that in the custom endpoint handler function, memory for the response of such protocomm endpoints should be allocated using heap as it gets freed by the protocomm layer once it has been sent by the transport layer.

```
wifi_prov_mgr_init(config);
wifi_prov_mgr_endpoint_create("custom-endpoint");
wifi_prov_mgr_start_provisioning(security, pop, service_name, service_
↪key);
wifi_prov_mgr_endpoint_register("custom-endpoint", custom_ep_handler, ↪
↪custom_ep_data);
```

When the provisioning service stops, the endpoint is unregistered automatically.

One can also choose to call `wifi_prov_mgr_endpoint_unregister()` to manually deactivate an endpoint at runtime. This can also be used to deactivate the internal endpoints used by the provisioning service.

When/How to Stop the Provisioning Service? The default behavior is that once the device successfully connects using the Wi-Fi credentials set by the `apply_config` command, the provisioning service stops, and Bluetooth LE or SoftAP turns off, automatically after responding to the next `get_status` command. If `get_status` command is not received by the device, the service stops after a 30 s timeout.

On the other hand, if device is not able to connect using the provided Wi-Fi credentials, due to incorrect SSID or passphrase, the service keeps running, and `get_status` keeps responding with disconnected status and reason for disconnection. Any further attempts to provide another set of Wi-Fi credentials, are to be rejected. These credentials are preserved, unless the provisioning service is force started, or NVS erased.

If this default behavior is not desired, it can be disabled by calling `wifi_prov_mgr_disable_auto_stop()`. Now the provisioning service stops only after an explicit call to `wifi_prov_mgr_stop_provisioning()`, which returns immediately after scheduling a task for stopping the service. The service stops after a certain delay and `WIFI_PROV_END` event gets emitted. This delay is specified by the argument to `wifi_prov_mgr_disable_auto_stop()`.

The customized behavior is useful for applications which want the provisioning service to be stopped some time after the Wi-Fi connection is successfully established. For example, if the application requires the device to connect to some cloud service and obtain another set of credentials, and exchange these credentials over a custom protocol endpoint, then after successfully doing so, stop the provisioning service by calling `wifi_prov_mgr_stop_provisioning()` inside the protocol handler itself. The right amount of delay ensures that the transport resources are freed only after the response from the protocol handler reaches the client side application.

Application Examples

- [provisioning/wifi_prov_mgr](#) demonstrates how to use the `wifi_provisioning` manager component to configure ESP32-C5 as a Wi-Fi station with specified credentials, using Bluetooth LE as the default transport for provisioning.

Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- **Android:**
 - [Bluetooth LE Provisioning app on Play Store](#).
 - [SoftAP Provisioning app on Play Store](#).
 - Source code on GitHub: [esp-idf-provisioning-android](#).
- **iOS:**
 - [Bluetooth LE Provisioning app on App Store](#).
 - [SoftAP Provisioning app on App Store](#).
 - Source code on GitHub: [esp-idf-provisioning-ios](#).
- Linux/MacOS/Windows: [tools/esp_prov](#), a Python-based command-line tool for provisioning.

The phone applications offer simple UI and are thus more user centric, while the command-line application is useful as a debugging tool for developers.

API Reference

Header File

- `components/wifi_provisioning/include/wifi_provisioning/manager.h`
- This header file can be included with:

```
#include "wifi_provisioning/manager.h"
```

- This header file is a part of the API provided by the `wifi_provisioning` component. To declare that your component depends on `wifi_provisioning`, add the following to your `CMakeLists.txt`:

```
REQUIRES wifi_provisioning
```

or

```
PRIV_REQUIRES wifi_provisioning
```

Functions

`esp_err_t wifi_prov_mgr_init (wifi_prov_mgr_config_t config)`

Initialize provisioning manager instance.

Configures the manager and allocates internal resources

Configuration specifies the provisioning scheme (transport) and event handlers

Event `WIFI_PROV_INIT` is emitted right after initialization is complete

Parameters `config` -- [in] Configuration structure

Returns

- ESP_OK : Success
- ESP_FAIL : Fail

void **wifi_prov_mgr_deinit** (void)

Stop provisioning (if running) and release resource used by the manager.

Event WIFI_PROV_DEINIT is emitted right after de-initialization is finished

If provisioning service is still active when this API is called, it first stops the service, hence emitting WIFI_PROV_END, and then performs the de-initialization

esp_err_t **wifi_prov_mgr_is_provisioned** (bool *provisioned)

Checks if device is provisioned.

This checks if Wi-Fi credentials are present on the NVS

The Wi-Fi credentials are assumed to be kept in the same NVS namespace as used by esp_wifi component

If one were to call esp_wifi_set_config() directly instead of going through the provisioning process, this function will still yield true (i.e. device will be found to be provisioned)

Note: Calling wifi_prov_mgr_start_provisioning() automatically resets the provision state, irrespective of what the state was prior to making the call.

Parameters provisioned -- [out] True if provisioned, else false

Returns

- ESP_OK : Retrieved provision state successfully
- ESP_FAIL : Wi-Fi not initialized
- ESP_ERR_INVALID_ARG : Null argument supplied

bool **wifi_prov_mgr_is_sm_idle** (void)

Checks whether the provisioning state machine is idle.

Returns True if state machine is idle, else false

esp_err_t **wifi_prov_mgr_start_provisioning** (*wifi_prov_security_t* security, const void *wifi_prov_sec_params, const char *service_name, const char *service_key)

Start provisioning service.

This starts the provisioning service according to the scheme configured at the time of initialization. For scheme :

- wifi_prov_scheme_ble : This starts protocomm_ble, which internally initializes BLE transport and starts GATT server for handling provisioning requests
- wifi_prov_scheme_softap : This activates SoftAP mode of Wi-Fi and starts protocomm_httpd, which internally starts an HTTP server for handling provisioning requests (If mDNS is active it also starts advertising service with type _esp_wifi_prov._tcp)

Event WIFI_PROV_START is emitted right after provisioning starts without failure

Note: This API will start provisioning service even if device is found to be already provisioned, i.e. wifi_prov_mgr_is_provisioned() yields true

Parameters

- **security** -- [in] Specify which protocomm security scheme to use :
 - WIFI_PROV_SECURITY_0 : For no security
 - WIFI_PROV_SECURITY_1 : x25519 secure handshake for session establishment followed by AES-CTR encryption of provisioning messages

- `WIFI_PROV_SECURITY_2`: SRP6a based authentication and key exchange followed by AES-GCM encryption/decryption of provisioning messages
- **wifi_prov_sec_params** -- **[in]** Pointer to security params (NULL if not needed). This is not needed for protocomm security 0. This pointer should hold the struct of type `wifi_prov_security1_params_t` for protocomm security 1 and `wifi_prov_security2_params_t` for protocomm security 2 respectively. This pointer and its contents should be valid till the provisioning service is running and has not been stopped or de-initiated.
- **service_name** -- **[in]** Unique name of the service. This translates to:
 - Wi-Fi SSID when provisioning mode is softAP
 - Device name when provisioning mode is BLE
- **service_key** -- **[in]** Key required by client to access the service (NULL if not needed). This translates to:
 - Wi-Fi password when provisioning mode is softAP
 - ignored when provisioning mode is BLE

Returns

- `ESP_OK` : Provisioning started successfully
- `ESP_FAIL` : Failed to start provisioning service
- `ESP_ERR_INVALID_STATE` : Provisioning manager not initialized or already started

void **wifi_prov_mgr_stop_provisioning** (void)

Stop provisioning service.

If provisioning service is active, this API will initiate a process to stop the service and return. Once the service actually stops, the event `WIFI_PROV_END` will be emitted.

If `wifi_prov_mgr_deinit()` is called without calling this API first, it will automatically stop the provisioning service and emit the `WIFI_PROV_END`, followed by `WIFI_PROV_DEINIT`, before returning.

This API will generally be used along with `wifi_prov_mgr_disable_auto_stop()` in the scenario when the main application has registered its own endpoints, and wishes that the provisioning service is stopped only when some protocomm command from the client side application is received.

Calling this API inside an endpoint handler, with sufficient `cleanup_delay`, will allow the response / acknowledgment to be sent successfully before the underlying protocomm service is stopped.

`cleanup_delay` is set when calling `wifi_prov_mgr_disable_auto_stop()`. If not specified, it defaults to 1000ms.

For straightforward cases, using this API is usually not necessary as provisioning is stopped automatically once `WIFI_PROV_CRED_SUCCESS` is emitted. Stopping is delayed (maximum 30 seconds) thus allowing the client side application to query for Wi-Fi state, i.e. after receiving the first query and sending `Wi-Fi state connected` response the service is stopped immediately.

void **wifi_prov_mgr_wait** (void)

Wait for provisioning service to finish.

Calling this API will block until provisioning service is stopped i.e. till event `WIFI_PROV_END` is emitted.

This will not block if provisioning is not started or not initialized.

[*esp_err_t*](#) **wifi_prov_mgr_disable_auto_stop** (uint32_t `cleanup_delay`)

Disable auto stopping of provisioning service upon completion.

By default, once provisioning is complete, the provisioning service is automatically stopped, and all endpoints (along with those registered by main application) are deactivated.

This API is useful in the case when main application wishes to close provisioning service only after it receives some protocomm command from the client side app. For example, after connecting to Wi-Fi, the device may want to connect to the cloud, and only once that is successfully, the device is said to be fully configured. But, then it is upto the main application to explicitly call `wifi_prov_mgr_stop_provisioning()` later when the device is fully configured and the provisioning service is no longer required.

Note: This must be called before executing `wifi_prov_mgr_start_provisioning()`

Parameters `cleanup_delay` -- **[in]** Sets the delay after which the actual cleanup of transport related resources is done after a call to `wifi_prov_mgr_stop_provisioning()` returns. Minimum allowed value is 100ms. If not specified, this will default to 1000ms.

Returns

- `ESP_OK` : Success
- `ESP_ERR_INVALID_STATE` : Manager not initialized or provisioning service already started

esp_err_t `wifi_prov_mgr_set_app_info` (const char *label, const char *version, const char **capabilities, size_t total_capabilities)

Set application version and capabilities in the JSON data returned by proto-ver endpoint.

This function can be called multiple times, to specify information about the various application specific services running on the device, identified by unique labels.

The provisioning service itself registers an entry in the JSON data, by the label "prov", containing only provisioning service version and capabilities. Application services should use a label other than "prov" so as not to overwrite this.

Note: This must be called before executing `wifi_prov_mgr_start_provisioning()`

Parameters

- `label` -- **[in]** String indicating the application name.
- `version` -- **[in]** String indicating the application version. There is no constraint on format.
- `capabilities` -- **[in]** Array of strings with capabilities. These could be used by the client side app to know the application registered endpoint capabilities
- `total_capabilities` -- **[in]** Size of capabilities array

Returns

- `ESP_OK` : Success
- `ESP_ERR_INVALID_STATE` : Manager not initialized or provisioning service already started
- `ESP_ERR_NO_MEM` : Failed to allocate memory for version string
- `ESP_ERR_INVALID_ARG` : Null argument

esp_err_t `wifi_prov_mgr_endpoint_create` (const char *ep_name)

Create an additional endpoint and allocate internal resources for it.

This API is to be called by the application if it wants to create an additional endpoint. All additional endpoints will be assigned UUIDs starting from 0xFF54 and so on in the order of execution.

protocomm handler for the created endpoint is to be registered later using `wifi_prov_mgr_endpoint_register()` after provisioning has started.

Note: This API can only be called BEFORE provisioning is started

Note: Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

Note: After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is

stopped and hence all endpoints are unregistered

Parameters **ep_name** -- **[in]** unique name of the endpoint

Returns

- ESP_OK : Success
- ESP_FAIL : Failure

esp_err_t **wifi_prov_mgr_endpoint_register** (const char *ep_name, *protocomm_req_handler_t* handler, void *user_ctx)

Register a handler for the previously created endpoint.

This API can be called by the application to register a protocomm handler to any endpoint that was created using `wifi_prov_mgr_endpoint_create()`.

Note: This API can only be called AFTER provisioning has started

Note: Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

Note: After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

Parameters

- **ep_name** -- **[in]** Name of the endpoint
- **handler** -- **[in]** Endpoint handler function
- **user_ctx** -- **[in]** User data

Returns

- ESP_OK : Success
- ESP_FAIL : Failure

void **wifi_prov_mgr_endpoint_unregister** (const char *ep_name)

Unregister the handler for an endpoint.

This API can be called if the application wants to selectively unregister the handler of an endpoint while the provisioning is still in progress.

All the endpoint handlers are unregistered automatically when the provisioning stops.

Parameters **ep_name** -- **[in]** Name of the endpoint

esp_err_t **wifi_prov_mgr_get_wifi_state** (*wifi_prov_sta_state_t* *state)

Get state of Wi-Fi Station during provisioning.

Parameters **state** -- **[out]** Pointer to `wifi_prov_sta_state_t` variable to be filled

Returns

- ESP_OK : Successfully retrieved Wi-Fi state
- ESP_FAIL : Provisioning app not running

esp_err_t **wifi_prov_mgr_get_wifi_disconnect_reason** (*wifi_prov_sta_fail_reason_t* *reason)

Get reason code in case of Wi-Fi station disconnection during provisioning.

Parameters **reason** -- **[out]** Pointer to `wifi_prov_sta_fail_reason_t` variable to be filled

Returns

- ESP_OK : Successfully retrieved Wi-Fi disconnect reason
- ESP_FAIL : Provisioning app not running

esp_err_t **wifi_prov_mgr_configure_sta** (*wifi_config_t* *wifi_cfg)

Runs Wi-Fi as Station with the supplied configuration.

Configures the Wi-Fi station mode to connect to the AP with SSID and password specified in config structure and sets Wi-Fi to run as station.

This is automatically called by provisioning service upon receiving new credentials.

If credentials are to be supplied to the manager via a different mode other than through protocomm, then this API needs to be called.

Event WIFI_PROV_CRED_RECV is emitted after credentials have been applied and Wi-Fi station started

Parameters *wifi_cfg* -- [in] Pointer to Wi-Fi configuration structure

Returns

- ESP_OK : Wi-Fi configured and started successfully
- ESP_FAIL : Failed to set configuration

esp_err_t **wifi_prov_mgr_reset_provisioning** (void)

Reset Wi-Fi provisioning config.

Calling this API will restore WiFi stack persistent settings to default values.

Returns

- ESP_OK : Reset provisioning config successfully
- ESP_FAIL : Failed to reset provisioning config

esp_err_t **wifi_prov_mgr_reset_sm_state_on_failure** (void)

Reset internal state machine and clear provisioned credentials.

This API should be used to restart provisioning ONLY in the case of provisioning failures without rebooting the device.

Returns

- ESP_OK : Reset provisioning state machine successfully
- ESP_FAIL : Failed to reset provisioning state machine
- ESP_ERR_INVALID_STATE : Manager not initialized

esp_err_t **wifi_prov_mgr_reset_sm_state_for_reprovision** (void)

Reset internal state machine and clear provisioned credentials.

This API can be used to restart provisioning ONLY in case the device is to be provisioned again for new credentials after a previous successful provisioning without rebooting the device.

Note: This API can be used only if provisioning auto-stop has been disabled using `wifi_prov_mgr_disable_auto_stop()`

Returns

- ESP_OK : Reset provisioning state machine successfully
- ESP_FAIL : Failed to reset provisioning state machine
- ESP_ERR_INVALID_STATE : Manager not initialized

Structures

struct **wifi_prov_event_handler_t**

Event handler that is used by the manager while provisioning service is active.

Public Members

wifi_prov_cb_func_t **event_cb**

Callback function to be executed on provisioning events

void ***user_data**

User context data to pass as parameter to callback function

struct **wifi_prov_scheme**

Structure for specifying the provisioning scheme to be followed by the manager.

Note: Ready to use schemes are available:

- *wifi_prov_scheme_ble* : for provisioning over BLE transport + GATT server
 - *wifi_prov_scheme_softap* : for provisioning over SoftAP transport + HTTP server
 - *wifi_prov_scheme_console* : for provisioning over Serial UART transport + Console (for debugging)
-

Public Members

esp_err_t (***prov_start**)(*protocomm_t* *pc, void *config)

Function which is to be called by the manager when it is to start the provisioning service associated with a *protocomm* instance and a scheme specific configuration

esp_err_t (***prov_stop**)(*protocomm_t* *pc)

Function which is to be called by the manager to stop the provisioning service previously associated with a *protocomm* instance

void (***new_config**)(void)

Function which is to be called by the manager to generate a new configuration for the provisioning service, that is to be passed to *prov_start()*

void (***delete_config**)(void *config)

Function which is to be called by the manager to delete a configuration generated using *new_config()*

esp_err_t (***set_config_service**)(void *config, const char *service_name, const char *service_key)

Function which is to be called by the manager to set the service name and key values in the configuration structure

esp_err_t (***set_config_endpoint**)(void *config, const char *endpoint_name, uint16_t uuid)

Function which is to be called by the manager to set a *protocomm* endpoint with an identifying name and UUID in the configuration structure

wifi_mode_t **wifi_mode**

Sets mode of operation of Wi-Fi during provisioning This is set to :

- *WIFI_MODE_APSTA* for SoftAP transport
- *WIFI_MODE_STA* for BLE transport

struct **wifi_prov_mgr_config_t**

Structure for specifying the manager configuration.

Public Members

wifi_prov_scheme_t **scheme**

Provisioning scheme to use. Following schemes are already available:

- `wifi_prov_scheme_ble` : for provisioning over BLE transport + GATT server
- `wifi_prov_scheme_softap` : for provisioning over SoftAP transport + HTTP server + mDNS (optional)
- `wifi_prov_scheme_console` : for provisioning over Serial UART transport + Console (for debugging)

wifi_prov_event_handler_t **scheme_event_handler**

Event handler required by the scheme for incorporating scheme specific behavior while provisioning manager is running. Various options may be provided by the scheme for setting this field. Use `WIFI_PROV_EVENT_HANDLER_NONE` when not used. When using scheme `wifi_prov_scheme_ble`, the following options are available:

- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM`
- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE`
- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT`

wifi_prov_event_handler_t **app_event_handler**

Event handler that can be set for the purpose of incorporating application specific behavior. Use `WIFI_PROV_EVENT_HANDLER_NONE` when not used.

Macros

`WIFI_PROV_EVENT_HANDLER_NONE`

Event handler can be set to none if not used.

Type Definitions

```
typedef void (*wifi_prov_cb_func_t)(void *user_data, wifi_prov_cb_event_t event, void *event_data)
```

```
typedef struct wifi_prov_scheme wifi_prov_scheme_t
```

Structure for specifying the provisioning scheme to be followed by the manager.

Note: Ready to use schemes are available:

- `wifi_prov_scheme_ble` : for provisioning over BLE transport + GATT server
 - `wifi_prov_scheme_softap` : for provisioning over SoftAP transport + HTTP server
 - `wifi_prov_scheme_console` : for provisioning over Serial UART transport + Console (for debugging)
-

```
typedef enum wifi_prov_security wifi_prov_security_t
```

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by protocomm

```
typedef protocomm_security2_params_t wifi_prov_security2_params_t
```

Security 2 params structure This needs to be passed when using `WIFI_PROV_SECURITY_2`.

Enumerations

enum `wifi_prov_cb_event_t`

Events generated by manager.

These events are generated in order of declaration and, for the stretch of time between initialization and de-initialization of the manager, each event is signaled only once

Values:

enumerator `WIFI_PROV_INIT`

Emitted when the manager is initialized

enumerator `WIFI_PROV_START`

Indicates that provisioning has started

enumerator `WIFI_PROV_SET_STA_CONFIG`

Emitted before accepting the wifi credentials to set the wifi configurations according to requirement.
NOTE - In this case event_data shall be populated with a pointer to `wifi_config_t`.

enumerator `WIFI_PROV_CRED_RECV`

Emitted when Wi-Fi AP credentials are received via `protocomm` endpoint `wifi_config`. The event data in this case is a pointer to the corresponding `wifi_sta_config_t` structure

enumerator `WIFI_PROV_CRED_FAIL`

Emitted when device fails to connect to the AP of which the credentials were received earlier on event `WIFI_PROV_CRED_RECV`. The event data in this case is a pointer to the disconnection reason code with type `wifi_prov_sta_fail_reason_t`

enumerator `WIFI_PROV_CRED_SUCCESS`

Emitted when device successfully connects to the AP of which the credentials were received earlier on event `WIFI_PROV_CRED_RECV`

enumerator `WIFI_PROV_END`

Signals that provisioning service has stopped

enumerator `WIFI_PROV_DEINIT`

Signals that manager has been de-initialized

enum `wifi_prov_security`

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by `protocomm`

Values:

enumerator `WIFI_PROV_SECURITY_0`

No security (plain-text communication)

enumerator `WIFI_PROV_SECURITY_1`

This secure communication mode consists of X25519 key exchange

- proof of possession (pop) based authentication
- AES-CTR encryption

enumerator **WIFI_PROV_SECURITY_2**

This secure communication mode consists of SRP6a based authentication and key exchange

- AES-GCM encryption/decryption

Header File

- [components/wifi_provisioning/include/wifi_provisioning/scheme_ble.h](#)
- This header file can be included with:

```
#include "wifi_provisioning/scheme_ble.h"
```

- This header file is a part of the API provided by the `wifi_provisioning` component. To declare that your component depends on `wifi_provisioning`, add the following to your CMakeLists.txt:

```
REQUIRES wifi_provisioning
```

or

```
PRIV_REQUIRES wifi_provisioning
```

Functions

void **wifi_prov_scheme_ble_event_cb_free_bt**(void *user_data, [wifi_prov_cb_event_t](#) event, void *event_data)

void **wifi_prov_scheme_ble_event_cb_free_ble**(void *user_data, [wifi_prov_cb_event_t](#) event, void *event_data)

void **wifi_prov_scheme_ble_event_cb_free_bt**(void *user_data, [wifi_prov_cb_event_t](#) event, void *event_data)

[esp_err_t](#) **wifi_prov_scheme_ble_set_service_uuid**(uint8_t *uuid128)

Set the 128 bit GATT service UUID used for provisioning.

This API is used to override the default 128 bit provisioning service UUID, which is 0000ffff-0000-1000-8000-00805f9b34fb.

This must be called before starting provisioning, i.e. before making a call to `wifi_prov_mgr_start_provisioning()`, otherwise the default UUID will be used.

Note: The data being pointed to by the argument must be valid at least till provisioning is started. Upon start, the manager will store an internal copy of this UUID, and this data can be freed or invalidated afterwards.

Parameters `uuid128` -- [in] A custom 128 bit UUID

Returns

- `ESP_OK` : Success
- `ESP_ERR_INVALID_ARG` : Null argument

[esp_err_t](#) **wifi_prov_mgr_keep_ble_on**(uint8_t is_on_after_ble_stop)

Keep the BLE on after provisioning.

This API is used to specify whether the BLE should remain on after the provisioning process has stopped.

This must be called before starting provisioning, i.e. before making a call to `wifi_prov_mgr_start_provisioning()`, otherwise the default behavior will be used.

Note: The value being pointed to by the argument must be valid at least until provisioning is started. Upon start, the manager will store an internal copy of this value, and this data can be freed or invalidated afterwards.

Parameters `is_on_after_ble_stop` -- [in] A boolean indicating if BLE should remain on after provisioning

Returns

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null argument

esp_err_t `wifi_prov_scheme_ble_set_mfg_data` (uint8_t *mfg_data, ssize_t mfg_data_len)

Set manufacturer specific data in scan response.

This must be called before starting provisioning, i.e. before making a call to `wifi_prov_mgr_start_provisioning()`.

Note: It is important to understand that length of custom manufacturer data should be within limits. The manufacturer data goes into scan response along with BLE device name. By default, BLE device name length is of 11 Bytes, however it can vary as per application use case. So, one has to honour the scan response data size limits i.e. $(mfg_data_len + 2) < 31 - (device_name_length + 2)$. If the `mfg_data` length exceeds this limit, the length will be truncated.

Parameters

- `mfg_data` -- [in] Custom manufacturer data
- `mfg_data_len` -- [in] Manufacturer data length

Returns

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null argument

esp_err_t `wifi_prov_scheme_ble_set_random_addr` (const uint8_t *rand_addr)

Set Bluetooth Random address.

This must be called before starting provisioning, i.e. before making a call to `wifi_prov_mgr_start_provisioning()`.

This API can be used in cases where a new identity address is to be used during provisioning. This will result in this device being treated as a new device by remote devices.

This API is only to be called to set random address. Re-invoking this API after provisioning is started will have no effect.

Note: This API will change the existing BD address for the device. The address once set will remain unchanged until BLE stack tear down happens when `wifi_prov_mgr_deinit` is invoked.

Parameters `rand_addr` -- [in] The static random address to be set of length 6 bytes.

Returns

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null argument

Macros

`WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM`

`WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE`

`WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT`

```
REQUIRES wifi_provisioning
```

or

```
PRIV_REQUIRES wifi_provisioning
```

Functions

void **wifi_prov_scheme_softap_set_httpd_handle** (void *handle)

Provide HTTPD Server handle externally.

Useful in cases wherein applications need the webserver for some different operations, and do not want the wifi provisioning component to start/stop a new instance.

Note: This API should be called before `wifi_prov_mgr_start_provisioning()`

Parameters `handle` -- [in] Handle to HTTPD server instance

Header File

```
REQUIRES wifi_provisioning
```

or

```
PRIV_REQUIRES wifi_provisioning
```

Functions

esp_err_t **wifi_prov_config_data_handler** (uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)

Handler for receiving and responding to requests from master.

This is to be registered as the `wifi_config` endpoint handler (protocomm proto-comm_req_handler_t) using `protocomm_add_endpoint()`

Structures

struct **wifi_prov_sta_conn_info_t**

WiFi STA connected status information.

Public Members

char **ip_addr**[IP4ADDR_STRLEN_MAX]

IP Address received by station

char **bssid**[6]

BSSID of the AP to which connection was established

char **ssid**[33]

SSID of the to which connection was established

uint8_t **channel**

Channel of the AP

uint8_t **auth_mode**

Authorization mode of the AP

struct **wifi_prov_config_get_data_t**

WiFi status data to be sent in response to `get_status` request from master.

Public Members

wifi_prov_sta_state_t **wifi_state**

WiFi state of the station

wifi_prov_sta_fail_reason_t **fail_reason**

Reason for disconnection (valid only when `wifi_state` is `WIFI_STATION_DISCONNECTED`)

wifi_prov_sta_conn_info_t **conn_info**

Connection information (valid only when `wifi_state` is `WIFI_STATION_CONNECTED`)

struct **wifi_prov_config_set_data_t**

WiFi config data received by slave during `set_config` request from master.

Public Members

char **ssid**[33]
SSID of the AP to which the slave is to be connected

char **password**[64]
Password of the AP

char **bssid**[6]
BSSID of the AP

uint8_t **channel**
Channel of the AP

struct **wifi_prov_config_handlers**

Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as `priv_data` for protocomm request handler (refer to `wifi_prov_config_data_handler()`) when calling `protocomm_add_endpoint()`.

Public Members

esp_err_t (***get_status_handler**)(*wifi_prov_config_get_data_t* *resp_data, *wifi_prov_ctx_t* **ctx)
Handler function called when connection status of the slave (in WiFi station mode) is requested

esp_err_t (***set_config_handler**)(const *wifi_prov_config_set_data_t* *req_data, *wifi_prov_ctx_t* **ctx)
Handler function called when WiFi connection configuration (eg. AP SSID, password, etc.) of the slave (in WiFi station mode) is to be set to user provided values

esp_err_t (***apply_config_handler**)(*wifi_prov_ctx_t* **ctx)
Handler function for applying the configuration that was set in `set_config_handler`. After applying the station may get connected to the AP or may fail to connect. The slave must be ready to convey the updated connection status information when `get_status_handler` is invoked again by the master.

wifi_prov_ctx_t ***ctx**
Context pointer to be passed to above handler functions upon invocation

Type Definitions

typedef struct *wifi_prov_ctx* **wifi_prov_ctx_t**

Type of context data passed to each get/set/apply handler function set in `wifi_prov_config_handlers` structure.

This is passed as an opaque pointer, thereby allowing it be defined later in application code as per requirements.

typedef struct *wifi_prov_config_handlers* **wifi_prov_config_handlers_t**

Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as `priv_data` for protocomm request handler (refer to `wifi_prov_config_data_handler()`) when calling `protocomm_add_endpoint()`.

Enumerations

enum `wifi_prov_sta_state_t`

WiFi STA status for conveying back to the provisioning master.

Values:

enumerator `WIFI_PROV_STA_CONNECTING`

enumerator `WIFI_PROV_STA_CONNECTED`

enumerator `WIFI_PROV_STA_DISCONNECTED`

enum `wifi_prov_sta_fail_reason_t`

WiFi STA connection fail reason.

Values:

enumerator `WIFI_PROV_STA_AUTH_ERROR`

enumerator `WIFI_PROV_STA_AP_NOT_FOUND`

Code examples for above API are provided in the [provisioning](#) directory of ESP-IDF examples.

Code example for above API is provided in [wifi/smart_config](#).

Code example for above API is provided in [wifi/wifi_easy_connect/dpp-enrollee](#).

2.8 Storage API

This section contains reference of the high-level storage APIs. They are based on low-level drivers such as SPI flash, SD/MMC.

- [Partitions API](#) allow block based access to SPI flash according to the [Partition Tables](#).
- [Non-Volatile Storage library \(NVS\)](#) implements a fault-tolerant wear-levelled key-value storage in SPI NOR flash.
- [Virtual File System \(VFS\)](#) library provides an interface for registration of file system drivers. SPIFFS, FAT and various other file system libraries are based on the VFS.
- [SPIFFS](#) is a wear-levelled file system optimized for SPI NOR flash, well suited for small partition sizes and low throughput
- [FAT](#) is a standard file system which can be used in SPI flash or on SD/MMC cards
- [Wear Levelling](#) library implements a flash translation layer (FTL) suitable for SPI NOR flash. It is used as a container for FAT partitions in flash.

For information about storage security, please refer to [Storage Security](#).

Note: It is suggested to use high-level APIs (`esp_partition` or `file system`) instead of low-level driver APIs to access the SPI NOR flash.

Due to the restriction of NOR flash and ESP hardware, accessing the main flash will affect the performance of the whole system. See *SPI Flash API* to learn more about the limitations.

Warning: This document is not updated for ESP32C5 yet, so some of the content may not be correct.

2.8.1 FAT Filesystem Support

ESP-IDF uses the [FatFs](#) library to work with FAT filesystems. FatFs resides in the `fatfs` component. Although the library can be used directly, many of its features can be accessed via VFS using the C standard library and POSIX API functions.

Additionally, FatFs has been modified to support the runtime pluggable disk I/O layer. This allows mapping of FatFs drives to physical disks at runtime.

Using FatFs with VFS

The header file `fatfs/vfs/esp_vfs_fat.h` defines the functions for connecting FatFs and VFS.

The function `esp_vfs_fat_register()` allocates a FATFS structure and registers a given path prefix in VFS. Subsequent operations on files starting with this prefix are forwarded to FatFs APIs.

The function `esp_vfs_fat_unregister_path()` deletes the registration with VFS, and frees the FATFS structure.

Most applications use the following workflow when working with `esp_vfs_fat_` functions:

1. Call `esp_vfs_fat_register()` to specify:
 - Path prefix where to mount the filesystem (e.g., `"/sdcard"`, `"/spiflash"`)
 - FatFs drive number
 - A variable which receives the pointer to the FATFS structure
2. Call `ff_diskio_register()` to register the disk I/O driver for the drive number used in Step 1.
3. To mount the filesystem using the same drive number which was passed to `esp_vfs_fat_register()`, call the FatFs function `f_mount()`. If the filesystem is not present on the target logical drive, `f_mount()` will fail with the `FR_NO_FILESYSTEM` error. In such case, call `f_mkfs()` to create a fresh FatFS structure on the drive first, and then call `f_mount()` again. Note that SD cards need to be partitioned with `f_fdisk()` prior to previously described steps. For more information, see [FatFs documentation](#).
4. Call the C standard library and POSIX API functions to perform such actions on files as open, read, write, erase, copy, etc. Use paths starting with the path prefix passed to `esp_vfs_fat_register()` (for example, `"/sdcard/hello.txt"`). The filesystem uses [8.3 filenames](#) format (SFN) by default. If you need to use long filenames (LFN), enable the `CONFIG_FATFS_LONG_FILENAMES` option. Please refer to [FatFs filenames](#) for more details.
5. Optionally, call the FatFs library functions directly. In this case, use paths without a VFS prefix, for example, `"/hello.txt"`.
6. Close all open files.
7. Call the FatFs function `f_mount()` for the same drive number with `NULL FATFS*` argument to unmount the filesystem.
8. Call the FatFs function `ff_diskio_register()` with `NULL ff_diskio_impl_t*` argument and the same drive number to unregister the disk I/O driver.
9. Call `esp_vfs_fat_unregister_path()` with the path where the file system is mounted to remove FatFs from VFS, and free the FATFS structure allocated in Step 1.

The convenience functions `esp_vfs_fat_sdmmc_mount()`, `esp_vfs_fat_sdspi_mount()`, and `esp_vfs_fat_sdcard_unmount()` wrap the steps described above and also handle SD card initialization. These functions are described in the next section.

Note: Because FAT filesystem does not support hardlinks, `link()` copies contents of the file instead. (This only applies to files on FatFs volumes.)

Using FatFs with VFS and SD Cards

The header file `fatfs/vfs/esp_vfs_fat.h` defines convenience functions `esp_vfs_fat_sdmmc_mount()`, `esp_vfs_fat_sdspi_mount()`, and `esp_vfs_fat_sdcard_unmount()`. These functions perform Steps 1–3 and 7–9 respectively and handle SD card initialization, but provide only limited error handling. Developers are encouraged to check its source code and incorporate more advanced features into production applications.

The convenience function `esp_vfs_fat_sdmmc_unmount()` unmounts the filesystem and releases the resources acquired by `esp_vfs_fat_sdmmc_mount()`.

Using FatFs with VFS in Read-Only Mode

The header file `fatfs/vfs/esp_vfs_fat.h` also defines the convenience functions `esp_vfs_fat_spiflash_mount_ro()` and `esp_vfs_fat_spiflash_unmount_ro()`. These functions perform Steps 1-3 and 7-9 respectively for read-only FAT partitions. These are particularly helpful for data partitions written only once during factory provisioning, which will not be changed by production application throughout the lifetime of the hardware.

Configuration options

The following configuration options are available for the FatFs component:

- **`CONFIG_FATFS_USE_FASTSEEK`** - If enabled, the POSIX `lseek()` function will be performed faster. The fast seek does not work for files in write mode, so to take advantage of fast seek, you should open (or close and then reopen) the file in read-only mode.
- **`CONFIG_FATFS_IMMEDIATE_FSYNC`** - If enabled, the FatFs will automatically call `f_sync()` to flush recent file changes after each call of `write()`, `pwrite()`, `link()`, `truncate()` and `ftruncate()` functions. This feature improves file-consistency and size reporting accuracy for the FatFs, at a price on decreased performance due to frequent disk operations.
- **`CONFIG_FATFS_LINK_LOCK`** - If enabled, this option guarantees the API thread safety, while disabling this option might be necessary for applications that require fast frequent small file operations (e.g., logging to a file). Note that if this option is disabled, the copying performed by `link()` will be non-atomic. In such case, using `link()` on a large file on the same volume in a different task is not guaranteed to be thread safe.

FatFS Disk IO Layer

FatFs has been extended with API functions that register the disk I/O driver at runtime.

These APIs provide implementation of disk I/O functions for SD/MMC cards and can be registered for the given FatFs drive number using the function `ff_diskio_register_sdmmc()`.

void **`ff_diskio_register`** (BYTE pdrv, const `ff_diskio_impl_t` *discio_impl)

Register or unregister diskio driver for given drive number.

When FATFS library calls one of `disk_XXX` functions for driver number pdrv, corresponding function in `discio_impl` for given pdrv will be called.

Parameters

- **`pdrv`** -- drive number
- **`discio_impl`** -- pointer to `ff_diskio_impl_t` structure with diskio functions or NULL to unregister and free previously registered drive

struct **ff_diskio_impl_t**

Structure of pointers to disk IO driver functions.

See FatFs documentation for details about these functions

Public Members

DSTATUS (***init**)(unsigned char pdrv)

disk initialization function

DSTATUS (***status**)(unsigned char pdrv)

disk status check function

DRESULT (***read**)(unsigned char pdrv, unsigned char *buff, uint32_t sector, unsigned count)

sector read function

DRESULT (***write**)(unsigned char pdrv, const unsigned char *buff, uint32_t sector, unsigned count)

sector write function

DRESULT (***ioctl**)(unsigned char pdrv, unsigned char cmd, void *buff)

function to get info about disk and do some misc operations

void **ff_diskio_register_sdmmc** (unsigned char pdrv, sdmmc_card_t *card)

Register SD/MMC diskio driver

Parameters

- **pdrv** -- drive number
- **card** -- pointer to sdmmc_card_t structure describing a card; card should be initialized before calling f_mount.

esp_err_t **ff_diskio_register_wl_partition** (unsigned char pdrv, *wl_handle_t* flash_handle)

Register spi flash partition

Parameters

- **pdrv** -- drive number
- **flash_handle** -- handle of the wear levelling partition.

esp_err_t **ff_diskio_register_raw_partition** (unsigned char pdrv, const *esp_partition_t* *part_handle)

Register spi flash partition

Parameters

- **pdrv** -- drive number
- **part_handle** -- pointer to raw flash partition.

FatFs Partition Generator

We provide a partition generator for FatFs ([wl_fatfsngen.py](#)) which is integrated into the build system and could be easily used in the user project.

The tool is used to create filesystem images on a host and populate it with content of the specified host folder.

The script is based on the partition generator ([fatfsngen.py](#)). Apart from generating partition, it can also initialize wear levelling.

The latest version supports both short and long file names, FAT12 and FAT16. The long file names are limited to 255 characters and can contain multiple periods (.) characters within the filename and additional characters +, , ; , =, [and] .

An in-depth description of the FatFs partition generator and analyzer can be found at [Generating and parsing FAT partition on host](#).

Build System Integration with FatFs Partition Generator It is possible to invoke FatFs generator directly from the CMake build system by calling `fatfs_create_spiflash_image`:

```
fatfs_create_spiflash_image(<partition> <base_dir> [FLASH_IN_PROJECT])
```

If you prefer generating partition without wear levelling support, you can use `fatfs_create_rawflash_image`:

```
fatfs_create_rawflash_image(<partition> <base_dir> [FLASH_IN_PROJECT])
```

`fatfs_create_spiflash_image` respectively `fatfs_create_rawflash_image` must be called from project's CMakeLists.txt.

If you decide for any reason to use `fatfs_create_rawflash_image` (without wear levelling support), beware that it supports mounting only in read-only mode in the device.

The arguments of the function are as follows:

1. `partition` - the name of the partition as defined in the partition table (e.g., [storage/fatfs/fatfsgen/partitions_example.csv](#)).
2. `base_dir` - the directory that will be encoded to FatFs partition and optionally flashed into the device. Beware that you have to specify the suitable size of the partition in the partition table.
3. flag `FLASH_IN_PROJECT` - optionally, users can have the image automatically flashed together with the app binaries, partition tables, etc. on `idf.py flash -p <PORT>` by specifying `FLASH_IN_PROJECT`.
4. flag `PRESERVE_TIME` - optionally, users can force preserving the timestamps from the source folder to the target image. Without preserving the time, every timestamp will be set to the FATFS default initial time (1st January 1980).
5. flag `ONE_FAT` - optionally, users can still choose to generate a FATFS volume with a single FAT (file allocation table) instead of two. This makes the free space in the FATFS volume a bit larger (by number of sectors used by `FAT * sector size`) but also more prone to corruption.

For example:

```
fatfs_create_spiflash_image(my_fatfs_partition my_folder FLASH_IN_PROJECT)
```

If `FLASH_IN_PROJECT` is not specified, the image will still be generated, but you will have to flash it manually using `esptool.py` or a custom build system target.

For an example, see [storage/fatfs/fatfsgen](#).

FatFs Partition Analyzer

([fatfparse.py](#)) is a partition analyzing tool for FatFs.

It is a reverse tool of ([fatfsgen.py](#)), i.e., it can generate the folder structure on the host based on the FatFs image.

Usage:

```
./fatfparse.py [-h] [--wl-layer {detect,enabled,disabled}] [--verbose] fatfs_
↪image.img
```

Parameter `--verbose` prints detailed information from boot sector of the FatFs image to the terminal before folder structure is generated.

FATFS Minimum Partition Size and Limits

The FATFS component supports FAT12, FAT16, and FAT32 file system types. The file system type is determined by the number of clusters (calculated as data sectors divided by sectors per cluster) on the volume. The minimum partition size is defined by the number of sectors allocated to FAT tables, root directories and data clusters.

- The minimum supported size for a FAT partition with wear leveling enabled is 32 KB for a sector size of 4096 bytes. For a sector size of 512 bytes, the minimum partition size varies based on the WL configuration: 20 KB for Performance mode and 28 KB for Safety mode (requiring 2 extra sectors).
- For a partition with wear leveling enabled, 4 sectors will be reserved for wear-leveling operations, and 4 sectors will be used by the FATFS (1 reserved sector, 1 FAT sector, 1 root directory sector and 1 data sector).
- Increasing the partition size will allocate additional data sectors, allowing for more storage space.
- For partition sizes less than 528 KB, 1 root directory sector will be allocated; for larger partitions, 4 root directory sectors will be used.
- By default, two FAT sectors are created, increasing the partition size by one sector to accommodate the extra FAT sector. To enable a single FAT sector, configure the `use_one_fat` option in `struct esp_vfs_fat_mount_config_t` (see [fatfs/vfs/esp_vfs_fat.h](#)). Enabling this option allows the minimum partition size to be reduced to 32 KB.
- The general formula for calculating the partition size for a wear-leveled partition is:

```
partition_size = Wear-leveling sectors * FLASH_SEC_SIZE + FATFS partition_
↪sectors * FAT_SEC_SIZE
```

Where:

- Wear-leveling sectors are fixed at 4
- FLASH_SEC_SIZE is 4096 bytes
- FATFS partition sectors include: 1 reserved sector + FAT sectors + root directory sectors + data sectors
- FAT_SEC_SIZE can be either 512 bytes or 4096 bytes, depending on the configuration
- For read-only partitions without wear leveling enabled and a sector size of 512 bytes, the minimum partition size can be reduced to as low as 2 KB.

Please refer [File System Considerations](#) for further details.

Application Examples

- [storage/fatfs/getting_started](#) demonstrates the minimal setup required to store persistent data on SPI flash using the FatFS, including mounting the file system, opening a file, performing basic read and write operations, and unmounting the file system.
- [storage/fatfs/fs_operations](#) demonstrates more advanced FatFS operations, including reading and writing files, creating, moving, and deleting files and directories, and inspecting file details.
- [storage/fatfs/ext_flash](#) demonstrates how to operate an external SPI flash formatted with FatFS, including initializing the SPI bus, configuring the flash chip, registering it as a partition, and performing read and write operations.

High-level API Reference

Header File

- [components/fatfs/vfs/esp_vfs_fat.h](#)
- This header file can be included with:

```
#include "esp_vfs_fat.h"
```

- This header file is a part of the API provided by the `fatfs` component. To declare that your component depends on `fatfs`, add the following to your `CMakeLists.txt`:

```
REQUIRES fatfs
```

or

`PRIV_REQUIRES fatfs`

Functions

esp_err_t **esp_vfs_fat_register_cfg** (const *esp_vfs_fat_conf_t* *conf, FATFS **out_fs)

Register FATFS with VFS component.

This function registers given FAT drive in VFS, at the specified base path. Input arguments are held in *esp_vfs_fat_conf_t* structure. If only one drive is used, *fat_drive* argument can be an empty string. Refer to FATFS library documentation on how to specify FAT drive. This function also allocates FATFS structure which should be used for *f_mount* call.

Note: This function doesn't mount the drive into FATFS, it just connects POSIX and C standard library IO function with FATFS. You need to mount desired drive into FATFS separately.

Parameters

- **conf** -- pointer to *esp_vfs_fat_conf_t* configuration structure
- **out_fs** -- **[out]** pointer to FATFS structure which can be used for FATFS *f_mount* call is returned via this argument.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if *esp_vfs_fat_register* was already called
- ESP_ERR_NO_MEM if not enough memory or too many VFSes already registered

esp_err_t **esp_vfs_fat_unregister_path** (const char *base_path)

Un-register FATFS from VFS.

Note: FATFS structure returned by *esp_vfs_fat_register* is destroyed after this call. Make sure to call *f_mount* function to unmount it before calling *esp_vfs_fat_unregister_path*. Difference between this function and the one above is that this one will release the correct drive, while the one above will release the last registered one

Parameters **base_path** -- path prefix where FATFS is registered. This is the same used when *esp_vfs_fat_register* was called

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if FATFS is not registered in VFS

esp_err_t **esp_vfs_fat_sdmmc_mount** (const char *base_path, const *sdmmc_host_t* *host_config, const void *slot_config, const *esp_vfs_fat_mount_config_t* *mount_config, *sdmmc_card_t* **out_card)

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes SDMMC driver or SPI driver with configuration in *host_config*
- initializes SD card with configuration in *slot_config*
- mounts FAT partition on SD card using FATFS library, with configuration in *mount_config*
- registers FATFS library with VFS, with prefix given by *base_path* variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

Note: Use this API to mount a card through SDSPI is deprecated. Please call *esp_vfs_fat_sdspi_mount* () instead for that case.

Parameters

- **base_path** -- path where partition should be registered (e.g. "/sdcard")
- **host_config** -- Pointer to structure describing SDMMC host. When using SDMMC peripheral, this structure can be initialized using SDMMC_HOST_DEFAULT() macro. When using SPI peripheral, this structure can be initialized using SD-SPI_HOST_DEFAULT() macro.
- **slot_config** -- Pointer to structure with slot configuration. For SDMMC peripheral, pass a pointer to sdmmc_slot_config_t structure initialized using SDMMC_SLOT_CONFIG_DEFAULT.
- **mount_config** -- pointer to structure with extra parameters for mounting FATFS
- **out_card** -- **[out]** if not NULL, pointer to the card information structure will be returned via this argument

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount was already called
- ESP_ERR_NO_MEM if memory can not be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

esp_err_t **esp_vfs_fat_sdspi_mount** (const char *base_path, const sdmmc_host_t *host_config_input, const *sdspi_device_config_t* *slot_config, const *esp_vfs_fat_mount_config_t* *mount_config, sdmmc_card_t **out_card)

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes an SPI Master device based on the SPI Master driver with configuration in slot_config, and attach it to an initialized SPI bus.
- initializes SD card with configuration in host_config_input
- mounts FAT partition on SD card using FATFS library, with configuration in mount_config
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

Note: This function try to attach the new SD SPI device to the bus specified in host_config. Make sure the SPI bus specified in host_config->slot have been initialized by spi_bus_initialize() before.

Parameters

- **base_path** -- path where partition should be registered (e.g. "/sdcard")
- **host_config_input** -- Pointer to structure describing SDMMC host. This structure can be initialized using SDSPI_HOST_DEFAULT() macro.
- **slot_config** -- Pointer to structure with slot configuration. For SPI peripheral, pass a pointer to *sdspi_device_config_t* structure initialized using SD-SPI_DEVICE_CONFIG_DEFAULT().
- **mount_config** -- pointer to structure with extra parameters for mounting FATFS
- **out_card** -- **[out]** If not NULL, pointer to the card information structure will be returned via this argument. It is suggested to hold this handle and use it to unmount the card later if needed. Otherwise it's not suggested to use more than one card at the same time and unmount one of them in your application.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount was already called
- ESP_ERR_NO_MEM if memory can not be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

esp_err_t **esp_vfs_fat_sdmmc_unmount** (void)

Unmount FAT filesystem and release resources acquired using `esp_vfs_fat_sdmmc_mount`.

Deprecated:

Use `esp_vfs_fat_sdcard_unmount()` instead.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_sdmmc_mount` hasn't been called

esp_err_t **esp_vfs_fat_sdcard_unmount** (const char *base_path, sdmmc_card_t *card)

Unmount an SD card from the FAT filesystem and release resources acquired using `esp_vfs_fat_sdmmc_mount()` or `esp_vfs_fat_sdspi_mount()`

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the card argument is unregistered
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_sdmmc_mount` hasn't been called

esp_err_t **esp_vfs_fat_sdcard_format_cfg** (const char *base_path, sdmmc_card_t *card, *esp_vfs_fat_mount_config_t* *cfg)

Format FAT filesystem with given configuration.

Note: This API should be only called when the FAT is already mounted.

Parameters

- **base_path** -- Path where partition should be registered (e.g. "/sdcard")
- **card** -- Pointer to the card handle, which should be initialised by calling `esp_vfs_fat_sdspi_mount` first
- **cfg** -- Pointer to structure with extra parameters for formatting FATFS (only relevant fields are used). If NULL, the previous configuration will be used.

Returns

- ESP_OK
- ESP_ERR_INVALID_STATE: FAT partition isn't mounted, call `esp_vfs_fat_sdmmc_mount` or `esp_vfs_fat_sdspi_mount` first
- ESP_ERR_NO_MEM: if memory can not be allocated
- ESP_FAIL: fail to format it, or fail to mount back

esp_err_t **esp_vfs_fat_sdcard_format** (const char *base_path, sdmmc_card_t *card)

Format FAT filesystem.

Note: This API should be only called when the FAT is already mounted.

Parameters

- **base_path** -- Path where partition should be registered (e.g. "/sdcard")
- **card** -- Pointer to the card handle, which should be initialised by calling `esp_vfs_fat_sdspi_mount` first

Returns

- ESP_OK
- ESP_ERR_INVALID_STATE: FAT partition isn't mounted, call `esp_vfs_fat_sdmmc_mount` or `esp_vfs_fat_sdspi_mount` first
- ESP_ERR_NO_MEM: if memory can not be allocated
- ESP_FAIL: fail to format it, or fail to mount back

esp_err_t **esp_vfs_fat_spiflash_mount_rw_wl** (const char *base_path, const char *partition_label, const *esp_vfs_fat_mount_config_t* *mount_config, *wl_handle_t* *wl_handle)

Convenience function to initialize FAT filesystem in SPI flash and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition_label. Partition label should be configured in the partition table.
- initializes flash wear levelling library on top of the given partition
- mounts FAT partition using FATFS library on top of flash wear levelling library
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact.

Parameters

- **base_path** -- path where FATFS partition should be mounted (e.g. "/spiflash")
- **partition_label** -- label of the partition which should be used
- **mount_config** -- pointer to structure with extra parameters for mounting FATFS
- **wl_handle** -- [out] wear levelling driver handle

Returns

- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_rw_wl was already called
- ESP_ERR_NO_MEM if memory can not be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from wear levelling library, SPI flash driver, or FATFS drivers

esp_err_t **esp_vfs_fat_spiflash_unmount_rw_wl** (const char *base_path, *wl_handle_t* wl_handle)

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_spiflash_mount_rw_wl.

Parameters

- **base_path** -- path where partition should be registered (e.g. "/spiflash")
- **wl_handle** -- wear levelling driver handle returned by esp_vfs_fat_spiflash_mount_rw_wl

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_rw_wl hasn't been called

esp_err_t **esp_vfs_fat_spiflash_format_cfg_rw_wl** (const char *base_path, const char *partition_label, *esp_vfs_fat_mount_config_t* *cfg)

Format FAT filesystem with given configuration.

Note: This API can be called when the FAT is mounted / not mounted. If this API is called when the FAT isn't mounted (by calling esp_vfs_fat_spiflash_mount_rw_wl), this API will first mount the FAT then format it, then restore back to the original state.

Parameters

- **base_path** -- Path where partition should be registered (e.g. "/spiflash")
- **partition_label** -- Label of the partition which should be used
- **cfg** -- Pointer to structure with extra parameters for formatting FATFS (only relevant fields are used). If NULL and mounted the previous configuration will be used. If NULL and unmounted the default configuration will be used.

Returns

- ESP_OK
- ESP_ERR_NO_MEM: if memory can not be allocated
- Other errors from esp_vfs_fat_spiflash_mount_rw_wl

esp_err_t **esp_vfs_fat_spiflash_format_rw_wl** (const char *base_path, const char *partition_label)
Format FAT filesystem.

Note: This API can be called when the FAT is mounted / not mounted. If this API is called when the FAT isn't mounted (by calling `esp_vfs_fat_spiflash_mount_rw_wl`), this API will first mount the FAT then format it, then restore back to the original state.

Parameters

- **base_path** -- Path where partition should be registered (e.g. "/spiflash")
- **partition_label** -- Label of the partition which should be used

Returns

- ESP_OK
- ESP_ERR_NO_MEM: if memory can not be allocated
- Other errors from `esp_vfs_fat_spiflash_mount_rw_wl`

esp_err_t **esp_vfs_fat_spiflash_mount_ro** (const char *base_path, const char *partition_label, const *esp_vfs_fat_mount_config_t* *mount_config)

Convenience function to initialize read-only FAT filesystem and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition_label. Partition label should be configured in the partition table.
- mounts FAT partition using FATFS library
- registers FATFS library with VFS, with prefix given by base_prefix variable

Note: Wear levelling is not used when FAT is mounted in read-only mode using this function.

Parameters

- **base_path** -- path where FATFS partition should be mounted (e.g. "/spiflash")
- **partition_label** -- label of the partition which should be used
- **mount_config** -- pointer to structure with extra parameters for mounting FATFS

Returns

- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_spiflash_mount_ro` was already called for the same partition
- ESP_ERR_NO_MEM if memory can not be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SPI flash driver, or FATFS drivers

esp_err_t **esp_vfs_fat_spiflash_unmount_ro** (const char *base_path, const char *partition_label)
Unmount FAT filesystem and release resources acquired using `esp_vfs_fat_spiflash_mount_ro`.

Parameters

- **base_path** -- path where partition should be registered (e.g. "/spiflash")
- **partition_label** -- label of partition to be unmounted

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_spiflash_mount_ro` hasn't been called

esp_err_t **esp_vfs_fat_info** (const char *base_path, uint64_t *out_total_bytes, uint64_t *out_free_bytes)
Get information for FATFS partition.

Parameters

- **base_path** -- Base path of the partition examined (e.g. "/spiflash")
- **out_total_bytes** -- [out] Size of the file system
- **out_free_bytes** -- [out] Free bytes available in the file system

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if partition not found
- ESP_FAIL if another FRESULT error (saved in errno)

esp_err_t **esp_vfs_fat_create_contiguous_file** (const char *base_path, const char *full_path, uint64_t size, bool alloc_now)

Create a file with contiguous space at given path.

Note: The file cannot exist before calling this function (or the file size has to be 0) For more information see documentation for `f_expand` from FATFS library

Parameters

- **base_path** -- Base path of the partition examined (e.g. "/spiflash")
- **full_path** -- Full path of the file (e.g. "/spiflash/ABC.TXT")
- **size** -- File size expanded to, number of bytes in size to prepare or allocate for the file
- **alloc_now** -- True == allocate space now, false == prepare to allocate –see `f_expand` from FATFS

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if invalid arguments (e.g. any of arguments are NULL or size lower or equal to 0)
- ESP_ERR_INVALID_STATE if partition not found
- ESP_FAIL if another FRESULT error (saved in errno)

esp_err_t **esp_vfs_fat_test_contiguous_file** (const char *base_path, const char *full_path, bool *is_contiguous)

Test if a file is contiguous in the FAT filesystem.

Parameters

- **base_path** -- Base path of the partition examined (e.g. "/spiflash")
- **full_path** -- Full path of the file (e.g. "/spiflash/ABC.TXT")
- **is_contiguous** -- [out] True == allocate space now, false == prepare to allocate –see `f_expand` from FATFS

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if invalid arguments (e.g. any of arguments are NULL)
- ESP_ERR_INVALID_STATE if partition not found
- ESP_FAIL if another FRESULT error (saved in errno)

Structures

struct **esp_vfs_fat_conf_t**

Configuration structure for `esp_vfs_fat_register`.

Public Members

const char ***base_path**

Path prefix where FATFS should be registered,

const char ***fat_drive**

FATFS drive specification; if only one drive is used, can be an empty string.

size_t **max_files**

Maximum number of files which can be open at the same time.

struct **esp_vfs_fat_mount_config_t**

Configuration arguments for `esp_vfs_fat_sdmmc_mount` and `esp_vfs_fat_spiflash_mount_rw_wl` functions.

Public Members

bool **format_if_mount_failed**

If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

int **max_files**

Max number of open files.

size_t **allocation_unit_size**

If `format_if_mount_failed` is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and $128 * \text{sector size}$. For SD cards, sector size is always 512 bytes. For `wear_levelling`, sector size is determined by `CONFIG_WL_SECTOR_SIZE` option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

bool **disk_status_check_enable**

Enables real `ff_disk_status` function implementation for SD cards (`ff_sdmmc_status`). Possibly slows down IO performance.

Try to enable if you need to handle situations when SD cards are not unmounted properly before physical removal or you are experiencing issues with SD cards.

Doesn't do anything for other memory storage media.

bool **use_one_fat**

Use 1 FAT (File Allocation Tables) instead of 2. This decreases reliability, but makes more space available (usually only one sector). Note that this option has effect only when the filesystem is formatted. When mounting an already-formatted partition, the actual number of FATs may be different.

Macros

VFS_FAT_MOUNT_DEFAULT_CONFIG ()

Type Definitions

typedef *esp_vfs_fat_mount_config_t* **esp_vfs_fat_sdmmc_mount_config_t**

2.8.2 Generating and Parsing FATFS on Host

This document is intended mainly for developers of Python tools `fatfsgen.py` and `fatfsparse.py`, and people with special interest in these tools and implementation of the FAT file system in ESP-IDF. If you are interested in using these tools, please refer to the user guide at [FatFs Partition Generator](#).

The FAT file system is composed of various logical units. The units are used to store general information about the file system, allocations, content of files and directories, and file's metadata. The tools `fatfsgen.py` and `fatfsparse.py` are used to implement the FAT file system while considering all these logical units, and they also provide support for wear levelling.

FAT File System Generator and Parser Design

This section describes particular units of the FAT file system generator and parser design. The implementation aims to create a valid model of the FAT structure with a focus on macro operations, generating and parsing the whole partition without modifying it in the run (mounting).

Class FATFS This is the most general entity responsible for modeling the FAT file system. It is composed of **FATFSState** (holding metadata and boot sector), **FAT** (holding file allocation table), and **Directory** (representing the root directory required by FAT12 and FAT16). The class processes all the requirements for the partition, analyses the local folder dedicated to transforming it into a binary image, and generates an internal representation of the local folder. Then, the class can generate a binary image from the internal FAT file system model.

Class WLFATFS The class extends the functionality of the class **FATFS**. It implements an encapsulation of the file system into the wear levelling, by adding the "dummy" sector for balancing the load (a redundant sector, see the section [Wear Levelling](#)), configuration sector and state sector. This class generates a binary FATFS partition with initialized wear levelling layer. For further analysis, it also provides an option to remove the wear levelling completely. The class is instantiated and invoked by the `wl_fatfsgen.py` script.

Class BootSectorState The instance of this class contains the metadata required for building a boot sector and BPB (BIOS Parameter Block). Boot sector is basically implemented for the cross-platform compatibility, i.e., when ESP chipsets are connected with other platforms, it will always follow all the FAT file system standards. However, during partition generation, chip does not consume the data in this boot sector and all the other data needed, as the data is constant. In other words, changing the fields with the prefix "BS" is usually unnecessary and often does not work. If you want to add new features, please focus on fields with the prefix "BPB". Another critical role of this class is to share access to the metadata and binary image over the whole class system. Because of this, every class in the system can access this singleton.

Class FATFSState The class **FATFSState** might be obsolete in the future, so developers could transfer its functionality into the **BootSectorState**. The class contains a reference to the **BootSectorState** and extends the data with some unknown information when creating a boot sector or unnecessary for the boot sector, such as the information generated when the file system supports long file names.

Class FAT FAT represents the File Allocation Table. FAT is a sequence of bytes spread over one or more sectors. The number of sectors is determined by the number of clusters and is calculated by the function `get_fat_sectors_count` in `utils.py`. The aim is to have as few sectors for one FAT as possible when you refer to every physical cluster in the file system. The FAT works as follows: For every physical cluster at `i * some_constant` address, FAT contains an entry at the `i`-th location which represents next address of the clusters in the file chain. Each version of the FAT file system uses a different size for FAT entries. FAT12 uses 12 bits per entry, thus 2 entries span 3 bytes. FAT16 uses 16 bits per entry, thus 1 entry spans 2 bytes. FAT32 uses 32 bits per FAT entry, thus one entry spans 4 bytes. All entries are in little-endian byte order.

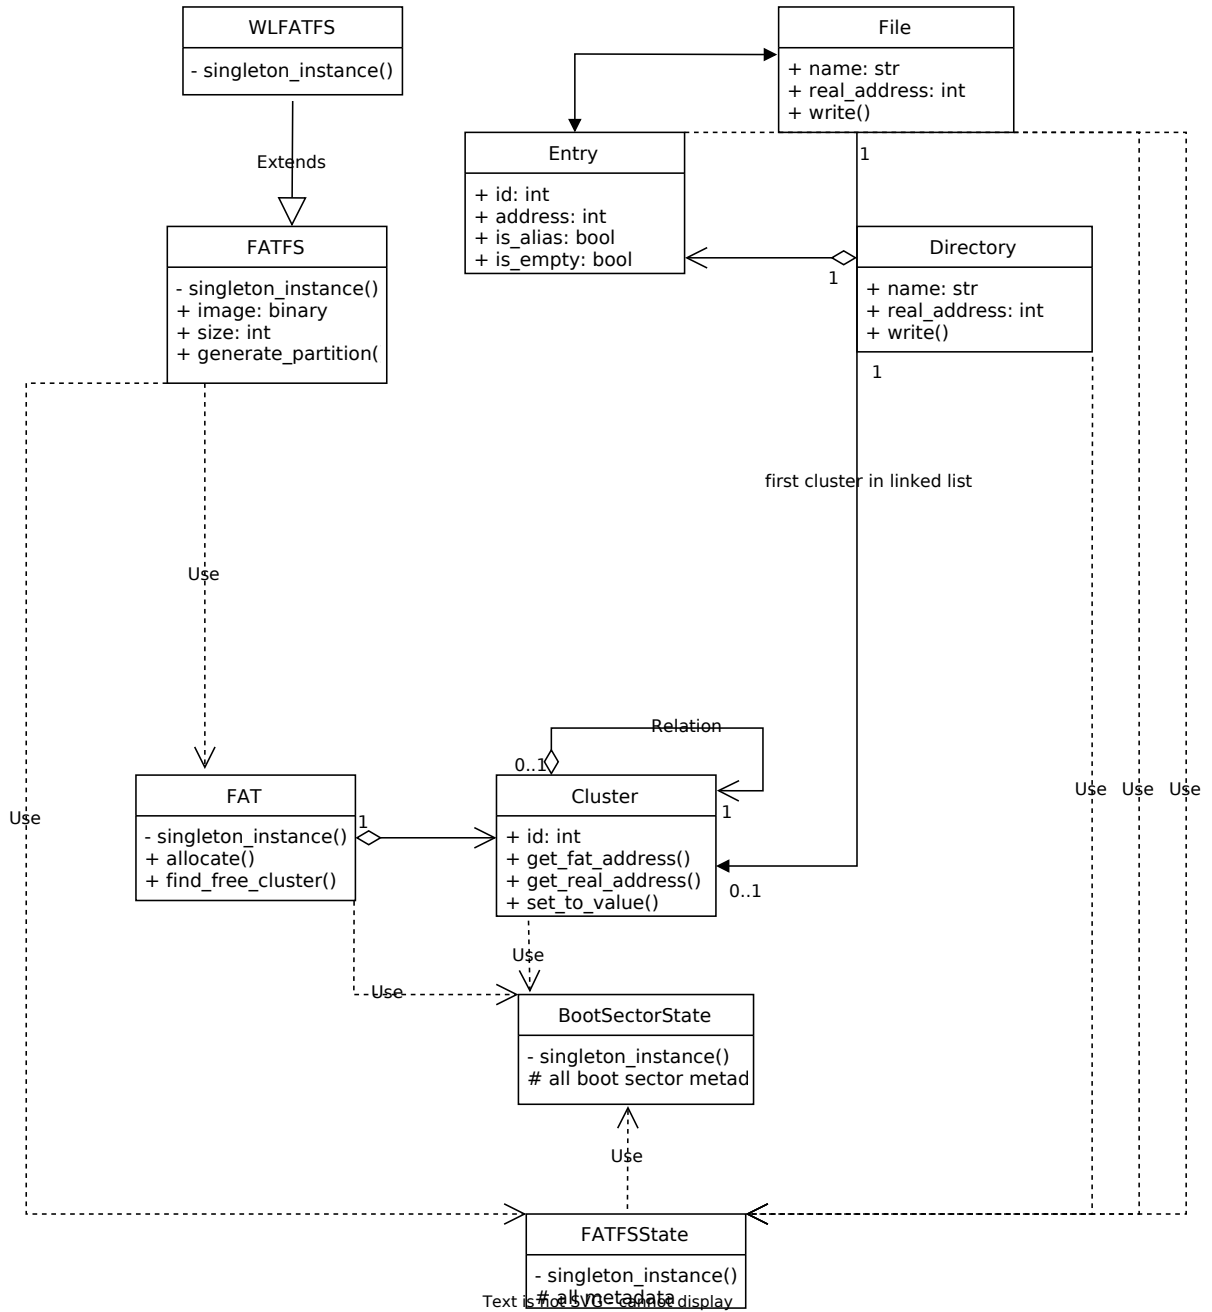

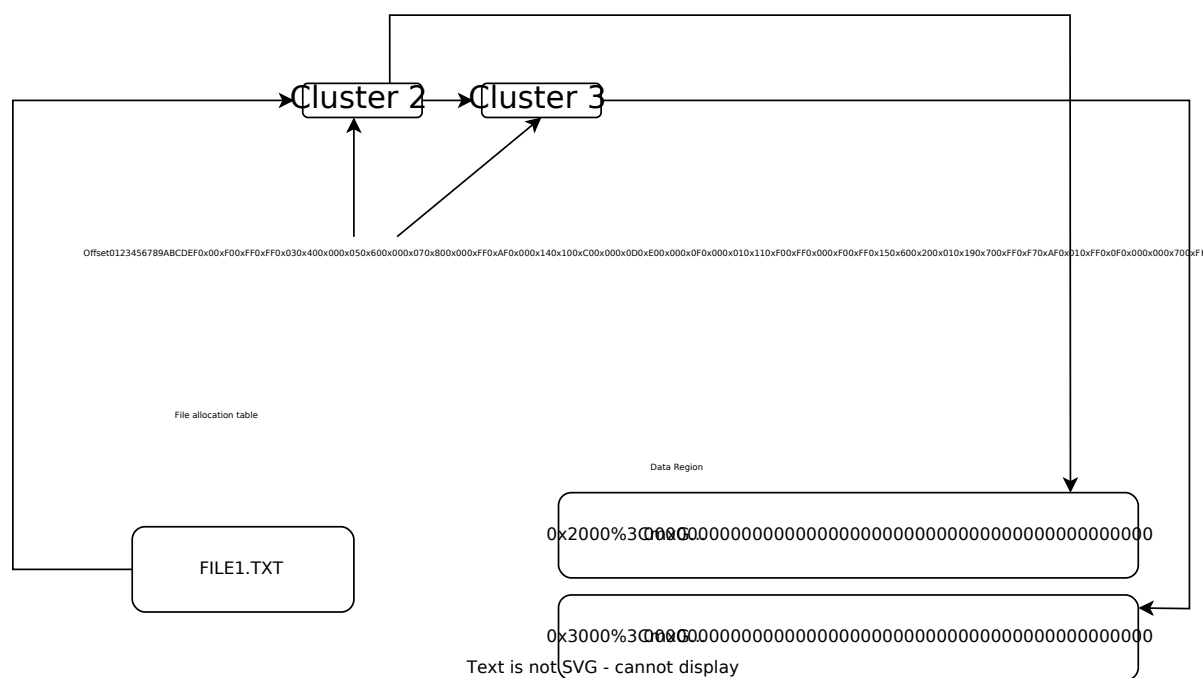

Fig. 31: FAT File System Generator and Parser Design Architecture

All zeros at the i -th entry indicates that corresponding cluster is free, while all ones at the i -th entry indicates that corresponding cluster is occupied and is the last cluster in the file chain. The other number at i -th entry determines the next cluster's address in the file chain. These clusters are not necessarily stored adjacent to one another in the memory but instead are often fragmented throughout the data region.

For partition generation, the file is divided into several parts to fit the cluster. Notice that the structure allocation of the files is a linked list. Every cluster in the file allocation chain has entry in the FAT which refers to the next cluster or the information about the last cluster in the file chain. As mentioned, FAT12 uses 12 bits per FAT entry, thus it can set a maximum number of 4096 clusters, as with 12 bits (one and a half bytes), it can enumerate 4096 clusters at most. However, because of other overhead, FAT12 can have 4085 clusters at most. Similarly, FAT16 can have 65525 clusters at most and for FAT32 can have 268435445 clusters at most (as practically only 28 bits out of 32 bits are used to denote each FAT entry). The current implementation doesn't allow forcibly redefining the FAT file system with less than 4085 clusters to FAT16, even though the documentation claims it is possible. Notice that it would be meaningless to define it vice versa, i.e., to FAT12 with more than 4085 clusters (which implies clusters on higher addresses being inaccessible).

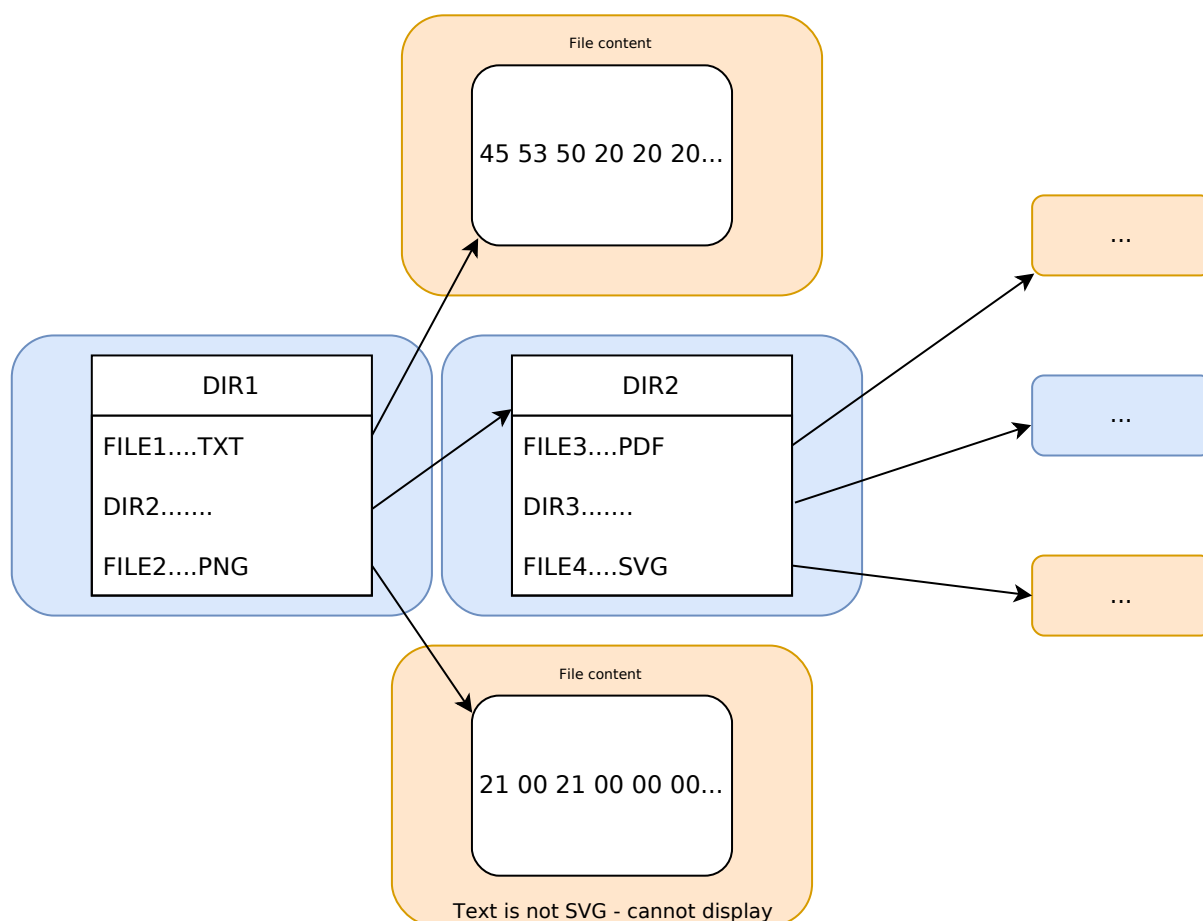

Class Cluster The **Cluster** class is responsible for accessing the FAT entries and the corresponding physical cluster. The class **FAT** is an aggregation of a particular number of **Cluster** instances. Every cluster is uniquely defined by the ID, which also determines its position in FAT and corresponding sectors in the data region. When the cluster is allocated, it includes a reference to a file or directory. It happens only if the cluster is the first in the allocation chain. The cluster contains information about whether it is empty and the last in the file allocation linked list. If not, it includes a reference to the next cluster in the linked list. In practical usage, the cluster doesn't need to access its file, but the other way around. The **File** or **Directory** accesses its cluster, to retrieve the entire content that might be chained.

Class Directory This class represents the file system directory. An instance of **Directory** contains the reference to the corresponding instance of **Cluster**, which has the first cluster in the allocation chain for the directory given. The root directory is a special case with a different count of sectors and a slightly different instantiation process. However, the root directory is still an instance of this class and is the only **Directory** instance associated with the class **FATFS** and **WLFATFS** respectively. The class **Directory** (except for the root directory) has one-to-one association with the class **Entry** that defines its entry in the parent directory. It also has an aggregation associated with the class **Entry**, because every directory contains multiple entries that consist of the actual directory's content (for example, aliases, files, and directories).

Class File Similar to the class **Directory**, **File** represents single file in the file system. This class has one-to-one association with its first cluster in the allocation chain. Through this cluster, the **File** class may access the corresponding physical address and thus modifying its content. Every file also has one-to-one association with **Entry** instance belonging to its parent directory.

Class Entry **Entry** encapsulates information about the file/directory name in the data region of corresponding parent directory. Every file system entity (File/Directory) has an entry. In case of the symlink, the entity can have multiple entries. The directory uses entries to access its descendant files and sub-directories, and enables traversing the tree structure. Except for that, **Entry** holds the name, extension, size, and information regarding the used file name size (long file names or file names 8.3), etc.

fatfsgen.py

`fatfsgen.py` generates FAT file systems on the host.

`fatfsgen.py` recursively traverses the given folder's directory structure and adds files and/or directories inside the binary partition. Users can set if the script generates the partition with wear levelling support, long file names support, and support for preserving the modification date and time from the original folder on the host.

The `./fatfsgen.py Espressif` command generates a simple binary partition with the default settings. Here `Espressif` is the local folder (containing files and/or sub-directories) from which binary image is generated.

There exist two scripts for that purpose, `fatfsgen.py` and `wl_fatfsgen.py`. The difference is that `wl_fatfsgen.py` firstly uses `fatfsgen.py` for generating the partition and then initializes wear leveling.

The script command line arguments are as follows:

```
fatfsgen.py [-h] [--output_file OUTPUT_FILE] [--partition_size PARTITION_SIZE] [--
↪sector_size {4096}] [--long_name_support] [--use_default_datetime] input_
↪directory

--output_file: path to the generated binary partition
--partition_size: defines the size of the binary partition (decimal, hexa or
↪binary number)
--sector_size: the size of the sector
--long_name_support: flag for supporting long file names
--use_default_datetime: this flag forces using default dates and times (date ==
↪0x2100, time == 0x0000), not using argument to preserve the original file system
↪metadata
input_directory: required argument, name of the directory being encoded to the
↪binary fat-compatible partition
```

fatfsparse.py

`fatfsparse.py` translates the binary image into the internal representation and generates the folder with equivalent content on the host. If user requires a parsing partition with initialized wear levelling, the `fatfsparse.py` will remove the wear levelling sectors using the function `remove_wl` provided by `wl_fatfsgen.py`. After the sectors are removed, parsing of the partition is the same as with no initial wear levelling.

`./fatfsparse.py fatfs_image.img` command yields the directory with the equivalent content as the binary data image `fatfs_image.img`.

The script command line arguments are as follows:

```
fatfsparse.py [-h] [--wl-layer {detect,enabled,disabled}] input_image

--wl-layer: indicates if wear leveling is enabled, disabled or should be detected
↪(detection is ambiguous)
input_image: path to binary image
```

The long file names can be detected automatically. However, the wear leveling cannot be 100% detected, because one partition can be valid either with or without wear leveling, according to the user's context. When the script finds wear leveling sectors (`cfg` and `state`), it assumes wear leveling is enabled, however it might be a false positive.

Features

FAT12/FAT16 The supported FAT types are FAT12 and FAT16. For smaller partitions, FAT12 is sufficient. The type is detected according to the count of clusters, and cannot be changed by the user. If there are less than 4085 clusters, the selected type is FAT12 (FAT's entries have 12 bits). For partitions with 4085 to 65526 clusters (with 4085 and 65526 excluded), the type is FAT16. Currently `fatfsgen.py` or `fatfsparse.py` cannot process file systems with more than 65525 clusters.

Wear Levelling There are two types of operations related to the wear levelling layer, initializing wear leveling records and removing wear leveling records during generation and parsing of the FAT file system image.

1. Initializing Wear Levelling

When a new image with wear leveling support is generated, the script initializes few extra sectors necessary for the wear leveling function.

- **The dummy sector:** This is an empty sector placed at the beginning of the partition and it will be ignored when file system is being mounted. The dummy sector copies the content of the next sector and then swaps its position with the next sector (or the first sector in case dummy sector was the last) after particular number of erase cycles. In this way, each FAT file system sector traverses across the whole range of flash partition, and thus the erase cycles corresponding to this sector gets distributed across the entire flash.
- **The state sector:** State sector has 64 byte data stored.

- pos: position of the dummy sector
- max_pos: number of sectors in the partition (excluding config and state sectors)
- move_count: indicates how many times dummy sector traversed through the entire flash
- access_count: count of sector erase cycles after which dummy sector will swap its position
- max_count: equal to `wl_config_t::updaterate`
- block_size: equal to `wl_config_t::page_size`
- version: equal to `wl_config_t::version`
- device_id: generated randomly when the state is first initialized
- reserved: 7 x 32-bit words, set to 0
- crc32: crc32 of all the previous fields, including reserved

Also, the state sector will be appended by 16-byte `pos update record` for every value of `pos`. Thus, this record will help us to determine the position of the dummy sector.

Since `erase + write` operation of the state sector is not atomic, we may lose the data if the power is cut off between "erase" and "write". However, two copies of the state are maintained to recover the state after the power outage. On each update, both copies are updated. Thus, after power outage, we can revert the original valid state.

- **The config sector: This sector contains the information about the partition used by the wear leveling layer.**

- start_addr: start address of partition (always 0)
- full_mem_size: size of the partition, including data, dummy, state x 2, config sectors. Value is in bytes
- page_size: equal to sector size (generally 4096)
- sector_size: always 4096 for the types of NOR flash supported by ESP-IDF
- updaterate: ESP-IDF always sets this to 16. Could be made a config option at some point
- wr_size: always set to 16
- version: current version is 2
- temp_buff_size: always set to 32 (This shouldn't actually have been stored in flash)
- crc: crc32 of all the previous values

2. Removing Wear Levelling While removing wear leveling records, we have to find the position of the dummy sector, and the original and valid orders of the partition (because traversing the dummy sector shuffles the partition). The script can remove other wear leveling sectors from the partition. Steps to remove wear leveling records are given below:

- Find the `pos`, position of the dummy sector, which will be determined by the number of `pos update records` in the state sector.
- Create the new image by removing dummy sector and merging remaining sectors before and after dummy sector.
- Then remove the wear leveling state sectors and config sector which are placed at the end of the partition.
- Reorder the new image to get its original order. `move_count` helps us to find the beginning of the partition. The partition will start at the position `end_of_partition - move_count`. Thus the beginning of the partition after removing wear leveling sectors will be `partition[end_of_partition - (move_count*page_size)]`.

File Names Encoding The protocol FAT supports two types of file names.

Short File Names (SFN) The SFN is mandatory for the implementation of file names. SFN refer to the 8.3 file name convention, with 8 characters for the file name and 3 characters for the extension. This pattern is case-insensitive, however, all file names are changed to uppercase in the inner representation of the generator. The entry describing the short file names is 32 bytes long and its structure is as follows:

Offset:	00 01 02 03 04 05 06 07 08 09 0A 0B 0C 0D 0E 0F	
0x000000:	46 49 4C 45 4E 41 4D 45 45 58 54 20 18 00 00 00	FILENAMEEXT.....
0x000010:	21 00 21 00 00 00 00 00 21 00 02 00 1E 00 00 00	!.....!.....

The entry denotes the file with 8.3 file name ("FILENAME.EXT") `__(0x00/00-0A)__` of size `0x1E = 30` bytes `__(0x10/0x0C)__,` with default times of modification and creation `(0x0021) __ (0x10/00,02 and 08)__. The relevant`

cluster for the file is located at `__0x02 (0x10/0A)__. Please notice that a character is encoded using one byte (e.g., __0x46 == 'F'__)`

Long File Names (LFN) The LFN supports 255 characters excluding the trailing `NULL`. The LFN supports any character as short file names with an additional period `.` and the following special characters: `+ , ; = []`. LFN uses UNICODE, so the character is encoded using 2 bytes.

The structure of one name encoded using LFN is as follows:

00003000:	42 65 00 2E 00 74 00 78 00 74 00 0F 00 43 FF FF	Be...t.x.t...C..
00003010:	FF FF FF FF FF FF FF FF FF 00 00 FF FF FF FF
00003020:	01 74 00 68 00 69 00 73 00 69 00 0F 00 43 73 00	.t.h.i.s.i...Cs.
00003030:	6C 00 6F 00 6E 00 67 00 66 00 00 00 69 00 6C 00	l.o.n.g.f...i.l.
00003040:	54 48 49 53 49 53 7E 31 54 58 54 20 00 00 D6 45	THISIS~1TXT...VE
00003050:	26 55 26 55 00 00 D6 45 26 55 02 00 1C 00 00 00	&U&U...VE&U.....

The above example encodes a file name `thisislongfile.txt`. The record is composed of multiple entries. The first entry contains metadata and is equivalent to the SFN entry. This entry might be final if the file name conforms to the 8.3 file name convention. In such scenarios, the SFN pattern is used. Otherwise, the generator adds various entries with the LFN structure above the SFN entry. These entries hold information about the file name and its checksum for consistency. Every LFN record can hold 13 characters (26 bytes). The file name is firstly cut into some amount of 13-character substrings and these are added above the SFN entry.

We add LFN entries in reversed order, so the first entry in the directory is the last part of the file name and the last is SFN entry. In the above example, we can see that the first entry contains text `e.txt`, while the others contain the beginning of the name `thisislongfil`. The first byte in LFN entries denotes an order or the sequence number (numbered from 1). To determine the first entry of the LFN, the first byte is masked with `0x40` (`first_byte = | 0x40`). The specification says that the last entry value will be ORed with `0x40` and it is the mark for the last entry. For example, when the record is the second and also the last in the LFN entry, its first byte is `0x42`.

The LFN entry is signed at field **DIR_Attr** with value `ATTR_READ_ONLY | ATTR_HIDDEN | ATTR_SYSTEM | ATTR_VOLUME_ID` (see the file `long_filename_utils.py`). The SFN entry (possibly also within LFN) contains either `ATTR_DIRECTORY` or `ATTR_ARCHIVE` in this field for directory or file respectively.

The LFN entry is tagged at the field **DIR_NTRes** with the value `0x00`. This is a sign of the SFN entry in the LFN record, if the entry is a whole SFN record, the value is `0x18`. As you can see in the first example, the value at this field is `0x18`, because the name `"FILENAME.EXT"` fits the SFN. However, the recent example showing `"thisislongfile.txt"` has value `0x00` at field **DIR_NTRes** in the last entry, since it is a LFN. The SFN needs to be unique. For that purpose, the `fatfsgen.py` uses the first 6 characters from the file name, concatenating with `~` and with ID denoting the order of the name with the same prefix. The ID is between 0 to 127, which is the maximal amount of files with the same prefix.

Calculation of the checksum is described and implemented in the `utils.py` by function `lfn_checksum`. The `fatfsparse.py` assumes that the LFN entries might not be right next to each other, but it assumes the relative order is preserved. The approach is first to find the SFN belonging to some LFN record (using **DIR_NTRes** field). From then, the script starts to search by moving upwards to the beginning of the respective sector, until it finds the last entry in the LFN record (the one with the first half byte equal to 4). The entries are distinguished by their checksums. When finished, the file name can be composed.

Date and Time in FAT File System The FAT file system protocol used by ESP-IDF does not preserve the date or time on the chips' media, so all the images extracted from the device have the same default timestamp for all the FAT-specified date-time fields (creation and the last modification timestamp as well as creation, last modification and last access dates).

There are a couple of fields in the SFN entry describing time, such as **DIR_CrtTime** and **DIR_WrtTime**. Some fields are ignored by the FAT implementation used by ESP-IDF (see the file `entry.py`). However, changes in the fields **DIR_WrtTime** and **DIR_WrtDate** are preserved in the chip. Both time and data entry are 16-bit, where the granularity of the time is 2 seconds.

Application Examples

- [storage/fatfs/fatfsgen](#) demonstrates how to use the FatFS partition generation tool to automatically create a FatFS image from a host folder during the building process.

Warning: This document is not updated for ESP32C5 yet, so some of the content may not be correct.

This warning was automatically inserted due to the source file being in the `add_warnings_pages` list.

2.8.3 Manufacturing Utility

Introduction

This utility is designed to create instances of factory NVS partition images on a per-device basis for mass manufacturing purposes. The NVS partition images are created from CSV files containing user-provided configurations and values.

Please note that this utility only creates manufacturing binary images which then need to be flashed onto your devices using:

- [esptool.py](#)
- **Flash Download tool (available on Windows only)**
 - Download and unzip it, and follow the instructions inside the `doc` folder.
- Direct flash programming using custom production tools.

Prerequisites

This utility is dependent on ESP-IDF's NVS Partition Generator Utility.

- **Operating System requirements:**
 - Linux / MacOS / Windows (standard distributions)
- **The following packages are needed to use this utility:**
 - [Python](#)

Note:

Before using this utility, please make sure that:

- The path to Python is added to the PATH environment variable.
 - You have installed the packages from `requirement.txt`, the file in the root of the ESP-IDF directory.
-

Workflow

CSV Configuration File

This file contains the configuration of the device to be flashed.

The data in the configuration file has the following format (the *REPEAT* tag is optional):

```
name1,namespace,      <-- First entry should be of type "namespace"
key1,type1,encoding1
key2,type2,encoding2,REPEAT
name2,namespace,
key3,type3,encoding3
key4,type4,encoding4
```

Note: The first line in this file should always be the namespace entry.

Each line should have three parameters: *key*, *type*, *encoding*, separated by a comma. If the *REPEAT* tag is present, the value corresponding to this key in the master value CSV file will be the same for all devices.

Please refer to README of the NVS Partition Generator Utility for detailed description of each parameter.

Below is a sample example of such a configuration file:

```
app,namespace,
firmware_key,data,hex2bin
serial_no,data,string,REPEAT
device_no,data,i32
```

Note:

Make sure there are no spaces:

- before and after ','
 - at the end of each line in a CSV file
-

Master Value CSV File

This file contains details of the devices to be flashed. Each line in this file corresponds to a device instance.

The data in the master value CSV file has the following format:

```
key1,key2,key3,....
value1,value2,value3,....
```

Note: The first line in the file should always contain the *key* names. All the keys from the configuration file should be present here in the **same order**. This file can have additional columns (keys). The additional keys will be treated as metadata and would not be part of the final binary files.

Each line should contain the *value* of the corresponding keys, separated by a comma. If the key has the *REPEAT* tag, its corresponding value **must** be entered in the second line only. Keep the entry empty for this value in the following lines.

The description of this parameter is as follows:

value Data value

Data value is the value of data corresponding to the key.

Below is a sample example of a master value CSV file:

```
id,firmware_key,serial_no,device_no
1,1a2b3c4d5e6faabb,A1,101
2,1a2b3c4d5e6fccdd,,102
3,1a2b3c4d5e6feeff,,103
```

Note: If the 'REPEAT' tag is present, a new master value CSV file will be created in the same folder as the input Master CSV File with the values inserted at each line for the key with the 'REPEAT' tag.

This utility creates intermediate CSV files which are used as input for the NVS partition utility to generate the binary files.

The format of this intermediate CSV file is as follows:

```
key,type,encoding,value
key,namespace, ,
key1,type1,encoding1,value1
key2,type2,encoding2,value2
```

An instance of an intermediate CSV file will be created for each device on an individual basis.

Running the utility

Usage:

```
python mfg_gen.py [-h] {generate,generate-key} ...
```

Optional Arguments:

No.	Parameter	Description
1	-h / --help	Show the help message and exit

Commands:

Run `mfg_gen.py {command} -h` for additional help

No.	Parameter	Description
1	generate	Generate NVS partition
2	generate-key	Generate keys for encryption

To generate factory images for each device (Default):

Usage:

```
python mfg_gen.py generate [-h] [--prefix_num start length] [--fileid FILEID] [--
↪version {1,2}] [--keygen]
                                [--inputkey INPUTKEY] [--outdir OUTDIR]
                                [--key_protect_hmac] [--kp_hmac_keygen]
                                [--kp_hmac_keyfile KP_HMAC_KEYFILE] [--kp_hmac_
↪inputkey KP_HMAC_INPUTKEY]
                                conf values prefix size
```

Positional Arguments:

Parameter	Description
conf	Path to configuration csv file to parse
values	Path to values csv file to parse
prefix	Unique name for each output filename prefix
size	Size of NVS partition in bytes (must be multiple of 4096)

Optional Arguments:

Parameter	Description
<code>-h / --help</code>	Show the help message and exit
<code>--prefix_num start length</code>	Prefix number start and length (in digits) to be added for each output filename. The number is used as monotonic counter, thus different for each file.
<code>--fileid FILEID</code>	Unique file identifier (any key in values file) for each filename suffix (Default: numeric value(1,2,3...))
<code>--version {1,2}</code>	Set multipage blob version. (Default: Version 2) Version 1 - Multipage blob support disabled. Version 2 - Multipage blob support enabled.
<code>--keygen</code>	Generates key for encrypting NVS partition
<code>--inputkey IN- PUTKEY</code>	File having key for encrypting NVS partition
<code>--outdir OUTDIR</code>	Output directory to store files created (Default: current directory)
<code>--key_protect_hmac</code>	If set, the NVS encryption key protection scheme based on HMAC peripheral is used; else the default scheme based on Flash Encryption is used
<code>--kp_hmac_keygen</code>	Generate the HMAC key for HMAC-based encryption scheme
<code>--kp_hmac_keyfile KP_HMAC_KEYFILE</code>	Path to output HMAC key file
<code>--kp_hmac_inputkey KP_HMAC_INPUTKEY</code>	File having the HMAC key for generating the NVS encryption keys

You can run the utility to generate factory images for each device using the command below. A sample CSV file is provided with the utility:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↪singlepage_blob.csv Sample 0x3000
```

The master value CSV file should have the path in the `file` type relative to the directory from which you are running the utility.

To generate encrypted factory images for each device:

You can run the utility to encrypt factory images for each device using the command below. A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↪singlepage_blob.csv Sample 0x3000 --keygen
```

Note: Encryption key of the following format `<outdir>/keys/keys-<prefix>-<fileid>.bin` is created. This newly created file having encryption keys in `keys/` directory is compatible with NVS key-partition structure. Refer to [NVS Key Partition](#) for more details.

- To generate an encrypted image using the HMAC-based scheme, the above command can be used along with some additional parameters.
 - Encrypt by allowing the utility to generate encryption keys and the HMAC-key:

```
python mfg_gen.py generate samples/sample_config.csv samples/
↪sample_values_singlepage_blob.csv Sample 0x3000 --keygen --key_
↪protect_hmac --kp_hmac_keygen
```

Note: Encryption key of the format <outdir>/keys/keys-<timestamp>.bin and HMAC key of the format <outdir>/keys/hmac-keys-<timestamp>.bin are created.

- Encrypt by allowing the utility to generate encryption keys with user-provided HMAC-key:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↪singlepage_blob.csv Sample 0x3000 --keygen --key_protect_hmac --kp_hmac_
↪inputkey testdata/sample_hmac_key.bin
```

Note: You can provide the custom filename for the HMAC key as well as the encryption key as a parameter.

- Encrypt by providing the encryption keys as input binary file:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↪singlepage_blob.csv Sample 0x3000 --inputkey keys/sample_keys.bin
```

To generate only encryption keys:

Usage:: python mfg_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]

Optional Arguments:

Parameter	Description
-h / --help	Show the help message and exit
--keyfile KEYFILE	Path to output encryption keys file
--outdir OUTDIR	Output directory to store files created. (Default: current directory)
--key_protect_hmac	If set, the NVS encryption key protection scheme based on HMAC peripheral is used; else the default scheme based on Flash Encryption is used
--kp_hmac_keygen	Generate the HMAC key for HMAC-based encryption scheme
--kp_hmac_keyfile KP_HMAC_KEYFILE	Path to output HMAC key file
--kp_hmac_inputkey KP_HMAC_INPUTKEY	File having the HMAC key for generating the NVS encryption keys

You can run the utility to generate only encryption keys using the command below:

```
python mfg_gen.py generate-key
```

Note: Encryption key of the following format <outdir>/keys/keys-<timestamp>.bin is created. Timestamp format is: %m-%d_%H-%M. To provide custom target filename use the --keyfile argument.

For generating encryption key for the HMAC-based scheme, the following commands can be used:

- Generate the HMAC key and the NVS encryption keys:

```
python mfg_gen.py generate-key --key_protect_hmac --kp_hmac_keygen
```

Note: Encryption key of the format <outdir>/keys/keys-<timestamp>.bin and HMAC key of the format <outdir>/keys/hmac-keys-<timestamp>.bin are created.

- Generate the NVS encryption keys, given the HMAC-key:

```
python mfg_gen.py generate-key --key_protect_hmac --kp_hmac_inputkey testdata/
↪sample_hmac_key.bin
```

Note: You can provide the custom filename for the HMAC key as well as the encryption key as a parameter.

Generated encryption key binary file can further be used to encrypt factory images created on the per device basis.

The default numeric value: 1,2,3... of the `fileid` argument corresponds to each line bearing device instance values in the master value CSV file.

While running the manufacturing utility, the following folders will be created in the specified `outdir` directory:

- `bin/` for storing the generated binary files
- `csv/` for storing the generated intermediate CSV files
- `keys/` for storing encryption keys (when generating encrypted factory images)

Warning: This document is not updated for ESP32C5 yet, so some of the content may not be correct.

This warning was automatically inserted due to the source file being in the `add_warnings_pages` list.

2.8.4 Non-Volatile Storage Library

Introduction

Non-volatile storage (NVS) library is designed to store key-value pairs in flash. This section introduces some concepts used by NVS.

Underlying Storage Currently, NVS uses a portion of main flash memory through the `esp_partition` API. The library uses all the partitions with `data` type and `nvs` subtype. The application can choose to use the partition with the label `nvs` through the `nvs_open()` API function or any other partition by specifying its name using the `nvs_open_from_partition()` API function.

Future versions of this library may have other storage backends to keep data in another flash chip (SPI or I2C), RTC, FRAM, etc.

Note: if an NVS partition is truncated (for example, when the partition table layout is changed), its contents should be erased. ESP-IDF build system provides a `idf.py erase-flash` target to erase all contents of the flash chip.

Note: NVS works best for storing many small values, rather than a few large values of the type 'string' and 'blob'. If you need to store large blobs or strings, consider using the facilities provided by the FAT filesystem on top of the wear levelling library.

Note: NVS component includes flash wear levelling by design. Set operations are appending new data to the free space after existing entries. Invalidation of old values doesn't require immediate flash erase operations. The organization of NVS space to pages and entries effectively reduces the frequency of flash erase to flash write operations by a factor of 126.

Large Amount of Data in NVS Although not recommended, NVS can store tens of thousands of keys and NVS partition can reach up to megabytes in size.

Note: NVS component leaves RAM footprint on the heap. The footprint depends on the size of the NVS partition on flash and the number of keys in use. For RAM usage estimation, please use the following approximate figures: each 1 MB of NVS flash partition consumes 22 KB of RAM and each 1000 keys consumes 5.5 KB of RAM.

Note: Duration of NVS initialization using `nvs_flash_init()` is proportional to the number of existing keys. Initialization of NVS requires approximately 0.5 seconds per 1000 keys.

By default, internal NVS allocates a heap in internal RAM. With a large NVS partition or big number of keys, the application can exhaust the internal RAM heap just on NVS overhead. Applications using modules with SPI-connected PSRAM can overcome this limitation by enabling the Kconfig option `CONFIG_NVS_ALLOCATE_CACHE_IN_SPIRAM` which redirects RAM allocation to the SPI-connected PSRAM. This option is available in the `nvs_flash` component of the menuconfig menu when SPIRAM is enabled and `CONFIG_SPIRAM_USE` is set to `CONFIG_SPIRAM_USE_CAPS_ALLOC...` note:: Using SPI-connected PSRAM slows down NVS API for integer operations by an approximate factor of 2.5.

Keys and Values NVS operates on key-value pairs. Keys are ASCII strings; the maximum key length is currently 15 characters. Values can have one of the following types:

- integer types: `uint8_t`, `int8_t`, `uint16_t`, `int16_t`, `uint32_t`, `int32_t`, `uint64_t`, `int64_t`
- zero-terminated string
- variable length binary data (blob)

Note: String values are currently limited to 4000 bytes. This includes the null terminator. Blob values are limited to 508,000 bytes or 97.6% of the partition size - 4000 bytes, whichever is lower.

Note: Before setting new or updating existing key-value pair, free entries in `nvs` pages have to be available. For integer types, at least one free entry has to be available. For the String value, at least one page capable of keeping the whole string in a contiguous row of free entries has to be available. For the Blob value, the size of new data has to be available in free entries.

Additional types, such as `float` and `double` might be added later.

Keys are required to be unique. Assigning a new value to an existing key replaces the old value and data type with the value and data type specified by a write operation.

A data type check is performed when reading a value. An error is returned if the data type expected by read operation does not match the data type of entry found for the key provided.

Namespaces To mitigate potential conflicts in key names between different components, NVS assigns each key-value pair to one of namespaces. Namespace names follow the same rules as key names, i.e., the maximum length is 15 characters. Furthermore, there can be no more than 254 different namespaces in one NVS partition. Namespace name is specified in the `nvs_open()` or `nvs_open_from_partition` call. This call returns an opaque handle, which is used in subsequent calls to the `nvs_get_*`, `nvs_set_*`, and `nvs_commit()` functions. This way, a handle is associated with a namespace, and key names will not collide with same names in other namespaces. Please note that the namespaces with the same name in different NVS partitions are considered as separate namespaces.

NVS Iterators Iterators allow to list key-value pairs stored in NVS, based on specified partition name, namespace, and data type.

There are the following functions available:

- `nvs_entry_find()` creates an opaque handle, which is used in subsequent calls to the `nvs_entry_next()` and `nvs_entry_info()` functions.
- `nvs_entry_next()` advances an iterator to the next key-value pair.
- `nvs_entry_info()` returns information about each key-value pair

In general, all iterators obtained via `nvs_entry_find()` have to be released using `nvs_release_iterator()`, which also tolerates NULL iterators.

`nvs_entry_find()` and `nvs_entry_next()` set the given iterator to NULL or a valid iterator in all cases except a parameter error occurred (i.e., return `ESP_ERR_NVS_NOT_FOUND`). In case of a parameter error, the given iterator will not be modified. Hence, it is best practice to initialize the iterator to NULL before calling `nvs_entry_find()` to avoid complicated error checking before releasing the iterator.

Security, Tampering, and Robustness NVS is not directly compatible with the ESP32-C5 flash encryption system. However, data can still be stored in encrypted form if NVS encryption is used together with ESP32-C5 flash encryption or with the help of the HMAC peripheral. Please refer to [NVS Encryption](#) for more details.

If NVS encryption is not used, it is possible for anyone with physical access to the flash chip to alter, erase, or add key-value pairs. With NVS encryption enabled, it is not possible to alter or add a key-value pair and get recognized as a valid pair without knowing corresponding NVS encryption keys. However, there is no tamper-resistance against the erase operation.

The library does try to recover from conditions when flash memory is in an inconsistent state. In particular, one should be able to power off the device at any point and time and then power it back on. This should not result in loss of data, except for the new key-value pair if it was being written at the moment of powering off. The library should also be able to initialize properly with any random data present in flash memory.

NVS Encryption

Please refer to the [NVS Encryption](#) guide for more details.

NVS Partition Generator Utility

This utility helps generate NVS partition binary files which can be flashed separately on a dedicated partition via a flashing utility. Key-value pairs to be flashed onto the partition can be provided via a CSV file. For more details, please refer to [NVS Partition Generator Utility](#).

Instead of calling the `nvs_partition_gen.py` tool manually, the creation of the partition binary files can also be done directly from CMake using the function `nvs_create_partition_image`:

```
nvs_create_partition_image(<partition> <csv> [FLASH_IN_PROJECT] [DEPENDS dep dep_
↪dep ...])
```

Positional Arguments:

Parameter	Description
<code>partition</code>	Name of the NVS partition
<code>csv</code>	Path to CSV file to parse

Optional Arguments:

Parameter	Description
<code>FLASH_IN_PROJECT</code>	Name of the NVS partition
<code>DEPENDS</code>	Specify files on which the command depends

If `FLASH_IN_PROJECT` is not specified, the image will still be generated, but you will have to flash it manually using `idf.py <partition>-flash` (e.g., if your partition name is `nvs`, then use `idf.py nvs-flash`).

`nvs_create_partition_image` must be called from one of the component `CMakeLists.txt` files. Currently, only non-encrypted partitions are supported.

Application Example

You can find code examples in the [storage](#) directory of ESP-IDF examples:

[storage/nvs_rw_value](#)

Demonstrates how to read a single integer value from, and write it to NVS.

The value checked in this example holds the number of the ESP32-C5 module restarts. The value's function as a counter is only possible due to its storing in NVS.

The example also shows how to check if a read/write operation was successful, or if a certain value has not been initialized in NVS. The diagnostic procedure is provided in plain text to help you track the program flow and capture any issues on the way.

[storage/nvs_rw_blob](#)

Demonstrates how to read a single integer value and a blob (binary large object), and write them to NVS to preserve this value between ESP32-C5 module restarts.

- `value` - tracks the number of the ESP32-C5 module soft and hard restarts.
- `blob` - contains a table with module run times. The table is read from NVS to dynamically allocated RAM. A new run time is added to the table on each manually triggered soft restart, and then the added run time is written to NVS. Triggering is done by pulling down GPIO0.

The example also shows how to implement the diagnostic procedure to check if the read/write operation was successful.

[storage/nvs_rw_value_cxx](#)

This example does exactly the same as [storage/nvs_rw_value](#), except that it uses the C++ NVS handle class.

Internals

Log of Key-Value Pairs NVS stores key-value pairs sequentially, with new key-value pairs being added at the end. When a value of any given key has to be updated, a new key-value pair is added at the end of the log and the old key-value pair is marked as erased.

Pages and Entries NVS library uses two main entities in its operation: pages and entries. Page is a logical structure which stores a portion of the overall log. Logical page corresponds to one physical sector of flash memory. Pages which are in use have a *sequence number* associated with them. Sequence numbers impose an ordering on pages. Higher sequence numbers correspond to pages which were created later. Each page can be in one of the following states:

Empty/uninitialized Flash storage for the page is empty (all bytes are `0xff`). Page is not used to store any data at this point and does not have a sequence number.

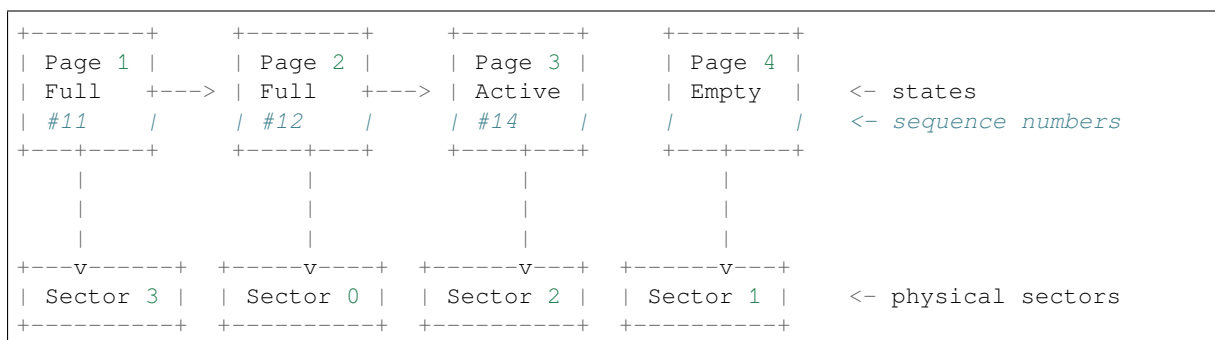

Active Flash storage is initialized, page header has been written to flash, page has a valid sequence number. Page has some empty entries and data can be written there. No more than one page can be in this state at any given moment.

Full Flash storage is in a consistent state and is filled with key-value pairs. Writing new key-value pairs into this page is not possible. It is still possible to mark some key-value pairs as erased.

Erasing Non-erased key-value pairs are being moved into another page so that the current page can be erased. This is a transient state, i.e., page should never stay in this state at the time when any API call returns. In case of a sudden power off, the move-and-erase process will be completed upon the next power-on.

Corrupted Page header contains invalid data, and further parsing of page data was canceled. Any items previously written into this page will not be accessible. The corresponding flash sector will not be erased immediately and will be kept along with sectors in **uninitialized** state for later use. This may be useful for debugging.

Mapping from flash sectors to logical pages does not have any particular order. The library will inspect sequence numbers of pages found in each flash sector and organize pages in a list based on these numbers.

Structure of a Page For now, we assume that flash sector size is 4096 bytes and that ESP32-C5 flash encryption hardware operates on 32-byte blocks. It is possible to introduce some settings configurable at compile-time (e.g., via menuconfig) to accommodate flash chips with different sector sizes (although it is not clear if other components in the system, e.g., SPI flash driver and SPI flash cache can support these other sizes).

Page consists of three parts: header, entry state bitmap, and entries themselves. To be compatible with ESP32-C5 flash encryption, the entry size is 32 bytes. For integer types, an entry holds one key-value pair. For strings and blobs, an entry holds part of key-value pair (more on that in the entry structure description).

The following diagram illustrates the page structure. Numbers in parentheses indicate the size of each part in bytes.

Page header and entry state bitmap are always written to flash unencrypted. Entries are encrypted if flash encryption feature of ESP32-C5 is used.

Page state values are defined in such a way that changing state is possible by writing 0 into some of the bits. Therefore it is not necessary to erase the page to change its state unless that is a change to the *erased* state.

The version field in the header reflects the NVS format version used. For backward compatibility reasons, it is decremented for every version upgrade starting at 0xff (i.e., 0xff for version-1, 0xfe for version-2 and so on).

CRC32 value in the header is calculated over the part which does not include a state value (bytes 4 to 28). The unused part is currently filled with 0xff bytes.

The following sections describe the structure of entry state bitmap and entry itself.

Entry and Entry State Bitmap Each entry can be in one of the following three states represented with two bits in the entry state bitmap. The final four bits in the bitmap (256 - 2 * 126) are not used.

Empty (2'b11) Nothing is written into the specific entry yet. It is in an uninitialized state (all bytes are 0xff).

Written (2'b10) A key-value pair (or part of key-value pair which spans multiple entries) has been written into the entry.

Erased (2'b00) A key-value pair in this entry has been discarded. Contents of this entry will not be parsed anymore.

Structure of Entry For values of primitive types (currently integers from 1 to 8 bytes long), entry holds one key-value pair. For string and blob types, entry holds part of the whole key-value pair. For strings, in case when a key-value pair spans multiple entries, all entries are stored in the same page. Blobs are allowed to span over multiple pages by dividing them into smaller chunks. For tracking these chunks, an additional fixed length metadata entry is stored called "blob index". Earlier formats of blobs are still supported (can be read and modified). However, once the blobs are modified, they are stored using the new format.

Individual fields in entry structure have the following meanings:

NS Namespace index for this entry. For more information on this value, see the section on namespaces implementation.

Type One byte indicating the value data type. See the `ItemType` enumeration in `nvs_flash/include/nvs_handle.hpp` for possible values.

Span Number of entries used by this key-value pair. For integer types, this is equal to 1. For strings and blobs, this depends on value length.

ChunkIndex Used to store the index of a blob-data chunk for blob types. For other types, this should be `0xff`.

CRC32 Checksum calculated over all the bytes in this entry, except for the CRC32 field itself.

Key Zero-terminated ASCII string containing a key name. Maximum string length is 15 bytes, excluding a zero terminator.

Data For integer types, this field contains the value itself. If the value itself is shorter than 8 bytes, it is padded to the right, with unused bytes filled with `0xff`.

For "blob index" entry, these 8 bytes hold the following information about data-chunks:

- **Size** (Only for blob index.) Size, in bytes, of complete blob data.
- **ChunkCount** (Only for blob index.) Total number of blob-data chunks into which the blob was divided during storage.
- **ChunkStart** (Only for blob index.) `ChunkIndex` of the first blob-data chunk of this blob. Subsequent chunks have `chunkIndex` incrementally allocated (step of 1).

For string and blob data chunks, these 8 bytes hold additional data about the value, which are described below:

- **Size** (Only for strings and blobs.) Size, in bytes, of actual data. For strings, this includes zero terminators.
- **CRC32** (Only for strings and blobs.) Checksum calculated over all bytes of data.

Variable length values (strings and blobs) are written into subsequent entries, 32 bytes per entry. The `Span` field of the first entry indicates how many entries are used.

Namespaces As mentioned above, each key-value pair belongs to one of the namespaces. Namespace identifiers (strings) are stored as keys of key-value pairs in namespace with index 0. Values corresponding to these keys are

indexes of these namespaces.

+-----+ NS=0 Type=uint8_t Key="wifi" Value=1	Entry describing namespace "wifi"
+-----+ NS=1 Type=uint32_t Key="channel" Value=6	Key "channel" in namespace "wifi"
+-----+ NS=0 Type=uint8_t Key="pwm" Value=2	Entry describing namespace "pwm"
+-----+ NS=2 Type=uint16_t Key="channel" Value=20	Key "channel" in namespace "pwm"
+-----+	

Item Hash List To reduce the number of reads from flash memory, each member of the Page class maintains a list of pairs: item index; item hash. This list makes searches much quicker. Instead of iterating over all entries, reading them from flash one at a time, *Page::findItem* first performs a search for the item hash in the hash list. This gives the item index within the page if such an item exists. Due to a hash collision, it is possible that a different item is found. This is handled by falling back to iteration over items in flash.

Each node in the hash list contains a 24-bit hash and 8-bit item index. Hash is calculated based on item namespace, key name, and ChunkIndex. CRC32 is used for calculation; the result is truncated to 24 bits. To reduce the overhead for storing 32-bit entries in a linked list, the list is implemented as a double-linked list of arrays. Each array holds 29 entries, for the total size of 128 bytes, together with linked list pointers and a 32-bit count field. The minimum amount of extra RAM usage per page is therefore 128 bytes; maximum is 640 bytes.

API Reference

Header File

- [components/nvs_flash/include/nvs_flash.h](#)
- This header file can be included with:

```
#include "nvs_flash.h"
```

- This header file is a part of the API provided by the `nvs_flash` component. To declare that your component depends on `nvs_flash`, add the following to your CMakeLists.txt:

```
REQUIRES nvs_flash
```

or

```
PRIV_REQUIRES nvs_flash
```

Functions

esp_err_t **nvs_flash_init** (void)

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled "nvs" in the partition table.

When "NVS_ENCRYPTION" is enabled in the menuconfig, this API enables the NVS encryption for the default NVS partition as follows

- Read security configurations from the first NVS key partition listed in the partition table. (NVS key partition is any "data" type partition which has the subtype value set to "nvs_keys")
- If the NVS key partition obtained in the previous step is empty, generate and store new keys in that NVS key partition.
- Internally call "nvs_flash_secure_init()" with the security configurations obtained/generated in the previous steps.

Post initialization NVS read/write APIs remain the same irrespective of NVS encryption.

Returns

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label "nvs" is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver
- error codes from nvs_flash_read_security_cfg API (when "NVS_ENCRYPTION" is enabled).
- error codes from nvs_flash_generate_keys API (when "NVS_ENCRYPTION" is enabled).
- error codes from nvs_flash_secure_init_partition API (when "NVS_ENCRYPTION" is enabled) .

esp_err_t **nvs_flash_init_partition** (const char *partition_label)

Initialize NVS flash storage for the specified partition.

Parameters *partition_label* -- [in] Label of the partition. Must be no longer than 16 characters.

Returns

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

esp_err_t **nvs_flash_init_partition_ptr** (const *esp_partition_t* *partition)

Initialize NVS flash storage for the partition specified by partition pointer.

Parameters *partition* -- [in] pointer to a partition obtained by the ESP partition API.

Returns

- ESP_OK if storage was successfully initialized
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_INVALID_ARG in case partition is NULL
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

esp_err_t **nvs_flash_deinit** (void)

Deinitialize NVS storage for the default NVS partition.

Default NVS partition is the partition with "nvs" label in the partition table.

Returns

- ESP_OK on success (storage was deinitialized)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage was not initialized prior to this call

esp_err_t **nvs_flash_deinit_partition** (const char *partition_label)

Deinitialize NVS storage for the given NVS partition.

Parameters *partition_label* -- [in] Label of the partition

Returns

- ESP_OK on success
- ESP_ERR_NVS_NOT_INITIALIZED if the storage for given partition was not initialized prior to this call

esp_err_t **nvs_flash_erase** (void)

Erase the default NVS partition.

Erases all contents of the default NVS partition (one with label "nvs").

Note: If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

Returns

- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no NVS partition labeled "nvs" in the partition table
- different error in case de-initialization fails (shouldn't happen)

esp_err_t **nvs_flash_erase_partition** (const char *part_name)

Erase specified NVS partition.

Erase all content of a specified NVS partition

Note: If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

Parameters **part_name** -- [in] Name (label) of the partition which should be erased

Returns

- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no NVS partition with the specified name in the partition table
- different error in case de-initialization fails (shouldn't happen)

esp_err_t **nvs_flash_erase_partition_ptr** (const *esp_partition_t* *partition)

Erase custom partition.

Erase all content of specified custom partition.

Note: If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

Parameters **partition** -- [in] pointer to a partition obtained by the ESP partition API.

Returns

- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no partition with the specified parameters in the partition table
- ESP_ERR_INVALID_ARG in case partition is NULL
- one of the error codes from the underlying flash storage driver

esp_err_t **nvs_flash_secure_init** (*nvs_sec_cfg_t* *cfg)

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled "nvs" in the partition table.

Parameters **cfg** -- [in] Security configuration (keys) to be used for NVS encryption/decryption. If cfg is NULL, no encryption is used.

Returns

- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label "nvs" is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

esp_err_t **nvs_flash_secure_init_partition** (const char *partition_label, *nvs_sec_cfg_t* *cfg)

Initialize NVS flash storage for the specified partition.

Parameters

- **partition_label** -- [in] Label of the partition. Note that internally, a reference to passed value is kept and it should be accessible for future operations
- **cfg** -- [in] Security configuration (keys) to be used for NVS encryption/decryption. If **cfg** is null, no encryption/decryption is used.

Returns

- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

esp_err_t **nvs_flash_generate_keys** (const *esp_partition_t* *partition, *nvs_sec_cfg_t* *cfg)

Generate and store NVS keys in the provided esp partition.

Parameters

- **partition** -- [in] Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **cfg** -- [out] Pointer to nvs security configuration structure. Pointer must be non-NULL. Generated keys will be populated in this structure.

Returns

- ESP_OK, if **cfg** was read successfully;
- ESP_ERR_INVALID_ARG, if partition or **cfg** is NULL;
- or error codes from `esp_partition_write/erase` APIs.

esp_err_t **nvs_flash_read_security_cfg** (const *esp_partition_t* *partition, *nvs_sec_cfg_t* *cfg)

Read NVS security configuration from a partition.

Note: Provided partition is assumed to be marked 'encrypted'.

Parameters

- **partition** -- [in] Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **cfg** -- [out] Pointer to nvs security configuration structure. Pointer must be non-NULL.

Returns

- ESP_OK, if **cfg** was read successfully;
- ESP_ERR_INVALID_ARG, if partition or **cfg** is NULL
- ESP_ERR_NVS_KEYS_NOT_INITIALIZED, if the partition is not yet written with keys.
- ESP_ERR_NVS_CORRUPT_KEY_PART, if the partition containing keys is found to be corrupt
- or error codes from `esp_partition_read` API.

esp_err_t **nvs_flash_register_security_scheme** (*nvs_sec_scheme_t* *scheme_cfg)

Registers the given security scheme for NVS encryption The scheme registered with `sec_scheme_id` by this API be used as the default security scheme for the "nvs" partition. Users will have to call this API explicitly in their application.

Parameters **scheme_cfg** -- [in] Pointer to the security scheme configuration structure that the user (or the `nvs_key_provider`) wants to register.

Returns

- ESP_OK, if security scheme registration succeeds;
- ESP_ERR_INVALID_ARG, if **scheme_cfg** is NULL;
- ESP_FAIL, if security scheme registration fails

nvs_sec_scheme_t ***nvs_flash_get_default_security_scheme** (void)

Fetch the configuration structure for the default active security scheme for NVS encryption.

Returns Pointer to the default active security scheme configuration (NULL if no scheme is registered yet i.e. active)

esp_err_t **nvs_flash_generate_keys_v2** (*nvs_sec_scheme_t* *scheme_cfg, *nvs_sec_cfg_t* *cfg)

Generate (and store) the NVS keys using the specified key-protection scheme.

Parameters

- **scheme_cfg** -- [in] Security scheme specific configuration
- **cfg** -- [out] Security configuration (encryption keys)

Returns

- ESP_OK, if cfg was populated successfully with generated encryption keys;
- ESP_ERR_INVALID_ARG, if scheme_cfg or cfg is NULL;
- ESP_FAIL, if the key generation process fails

esp_err_t **nvs_flash_read_security_cfg_v2** (*nvs_sec_scheme_t* *scheme_cfg, *nvs_sec_cfg_t* *cfg)

Read NVS security configuration set by the specified security scheme.

Parameters

- **scheme_cfg** -- [in] Security scheme specific configuration
- **cfg** -- [out] Security configuration (encryption keys)

Returns

- ESP_OK, if cfg was read successfully;
- ESP_ERR_INVALID_ARG, if scheme_cfg or cfg is NULL;
- ESP_FAIL, if the key reading process fails

Structures

struct **nvs_sec_cfg_t**

Key for encryption and decryption.

Public Members

uint8_t **eky**[NVS_KEY_SIZE]

XTS encryption and decryption key

uint8_t **tky**[NVS_KEY_SIZE]

XTS tweak key

struct **nvs_sec_scheme_t**

NVS encryption: Security scheme configuration structure.

Public Members

int **scheme_id**

Security Scheme ID (E.g. HMAC)

void ***scheme_data**

Scheme-specific data (E.g. eFuse block for HMAC-based key generation)

nvs_flash_generate_keys_t **nvs_flash_key_gen**

Callback for the nvs_flash_key_gen implementation

nvs_flash_read_cfg_t **nvs_flash_read_cfg**

Callback for the `nvs_flash_read_keys` implementation

Macros

NVS_KEY_SIZE

Type Definitions

typedef *esp_err_t* (***nvs_flash_generate_keys_t**)(const void *scheme_data, *nvs_sec_cfg_t* *cfg)

Callback function prototype for generating the NVS encryption keys.

typedef *esp_err_t* (***nvs_flash_read_cfg_t**)(const void *scheme_data, *nvs_sec_cfg_t* *cfg)

Callback function prototype for reading the NVS encryption keys.

Header File

- `components/nvs_flash/include/nvs.h`
- This header file can be included with:

```
#include "nvs.h"
```

- This header file is a part of the API provided by the `nvs_flash` component. To declare that your component depends on `nvs_flash`, add the following to your `CMakeLists.txt`:

```
REQUIRES nvs_flash
```

or

```
PRIV_REQUIRES nvs_flash
```

Functions

esp_err_t **nvs_set_i8** (*nvs_handle_t* handle, const char *key, int8_t value)

set int8_t value for given key

Set value for the key, given its name. Note that the actual storage will not be updated until `nvs_commit` is called. Regardless whether key-value pair is created or updated, function always requires at least one nvs available entry. See `nvs_get_stats`. After create type of operation, the number of available entries is decreased by one. After update type of operation, the number of available entries remains the same.

Parameters

- **handle** -- [in] Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- **key** -- [in] Key name. Maximum length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **value** -- [in] The value to set.

Returns

- `ESP_OK` if value was set successfully
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is NULL
- `ESP_ERR_NVS_READ_ONLY` if storage handle was opened as read only
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is not enough space in the underlying storage to save the value

- `ESP_ERR_NVS_REMOVE_FAILED` if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

`esp_err_t nvs_set_u8` (*nvs_handle_t* handle, const char *key, uint8_t value)

set uint8_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_i16` (*nvs_handle_t* handle, const char *key, int16_t value)

set int16_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_u16` (*nvs_handle_t* handle, const char *key, uint16_t value)

set uint16_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_i32` (*nvs_handle_t* handle, const char *key, int32_t value)

set int32_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_u32` (*nvs_handle_t* handle, const char *key, uint32_t value)

set uint32_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_i64` (*nvs_handle_t* handle, const char *key, int64_t value)

set int64_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_u64` (*nvs_handle_t* handle, const char *key, uint64_t value)

set uint64_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_str` (*nvs_handle_t* handle, const char *key, const char *value)

set string for given key

Sets string value for the key. Function requires whole space for new data to be available as contiguous entries in same nvs page. Operation consumes 1 overhead entry and 1 entry per each 32 characters of new string including zero character to be set. In case of value update for existing key, entries occupied by the previous value and overhead entry are returned to the pool of available entries. Note that storage of long string values can fail due to fragmentation of nvs pages even if `available_entries` returned by `nvs_get_stats` suggests enough overall space available. Note that the underlying storage will not be updated until `nvs_commit` is called.

Parameters

- **handle** -- **[in]** Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- **key** -- **[in]** Key name. Maximum length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **value** -- **[in]** The value to set. For strings, the maximum length (including null character) is 4000 bytes, if there is one complete page free for writing. This decreases, however, if the free space is fragmented.

Returns

- `ESP_OK` if value was set successfully
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if storage handle was opened as read only
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is not enough space in the underlying storage to save the value

- `ESP_ERR_NVS_REMOVE_FAILED` if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.
- `ESP_ERR_NVS_VALUE_TOO_LONG` if the string value is too long

`esp_err_t nvs_get_i8(nvs_handle_t handle, const char *key, int8_t *out_value)`

get int8_t value for given key

These functions retrieve value for the key, given its name. If key does not exist, or the requested variable type doesn't match the type which was used when setting a value, an error is returned.

In case of any error, out_value is not modified.

out_value has to be a pointer to an already allocated variable of the given type.

```
// Example of using nvs_get_i32:
int32_t max_buffer_size = 4096; // default value
esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
// if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
// have its default value.
```

Parameters

- **handle** -- **[in]** Handle obtained from `nvs_open` function.
- **key** -- **[in]** Key name. Maximum length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **out_value** -- Pointer to the output value. May be NULL for `nvs_get_str` and `nvs_get_blob`, in this case required length will be returned in length argument.

Returns

- `ESP_OK` if the value was retrieved successfully
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_NOT_FOUND` if the requested key doesn't exist
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is NULL
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_INVALID_LENGTH` if length is not sufficient to store data

`esp_err_t nvs_get_u8(nvs_handle_t handle, const char *key, uint8_t *out_value)`

get uint8_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i16(nvs_handle_t handle, const char *key, int16_t *out_value)`

get int16_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_u16(nvs_handle_t handle, const char *key, uint16_t *out_value)`

get uint16_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i32(nvs_handle_t handle, const char *key, int32_t *out_value)`

get int32_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_u32(nvs_handle_t handle, const char *key, uint32_t *out_value)`

get uint32_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i64` (*nvs_handle_t* handle, const char *key, int64_t *out_value)
get int64_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_u64` (*nvs_handle_t* handle, const char *key, uint64_t *out_value)
get uint64_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_str` (*nvs_handle_t* handle, const char *key, char *out_value, size_t *length)
get string value for given key

These functions retrieve the data of an entry, given its key. If key does not exist, or the requested variable type doesn't match the type which was used when setting a value, an error is returned.

In case of any error, `out_value` is not modified.

All functions expect `out_value` to be a pointer to an already allocated variable of the given type.

`nvs_get_str` and `nvs_get_blob` functions support WinAPI-style length queries. To get the size necessary to store the value, call `nvs_get_str` or `nvs_get_blob` with zero `out_value` and non-zero pointer to length. Variable pointed to by length argument will be set to the required length. For `nvs_get_str`, this length includes the zero terminator. When calling `nvs_get_str` and `nvs_get_blob` with non-zero `out_value`, length has to be non-zero and has to point to the length available in `out_value`. It is suggested that `nvs_get/set_str` is used for zero-terminated C strings, and `nvs_get/set_blob` used for arbitrary data structures.

```
// Example (without error checking) of using nvs_get_str to get a string into
↳dynamic array:
size_t required_size;
nvs_get_str(my_handle, "server_name", NULL, &required_size);
char* server_name = malloc(required_size);
nvs_get_str(my_handle, "server_name", server_name, &required_size);

// Example (without error checking) of using nvs_get_blob to get a binary data
into a static array:
uint8_t mac_addr[6];
size_t size = sizeof(mac_addr);
nvs_get_blob(my_handle, "dst_mac_addr", mac_addr, &size);
```

Parameters

- **handle** -- [in] Handle obtained from `nvs_open` function.
- **key** -- [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn't be empty.
- **out_value** -- [out] Pointer to the output value. May be NULL for `nvs_get_str` and `nvs_get_blob`, in this case required length will be returned in length argument.
- **length** -- [inout] A non-zero pointer to the variable holding the length of `out_value`. In case `out_value` a zero, will be set to the length required to hold the value. In case `out_value` is not zero, will be set to the actual length of the value written. For `nvs_get_str` this includes zero terminator.

Returns

- ESP_OK if the value was retrieved successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn't exist
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_INVALID_NAME if key name doesn't satisfy constraints
- ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data

`esp_err_t nvs_get_blob` (*nvs_handle_t* handle, const char *key, void *out_value, size_t *length)
get blob value for given key

This function behaves the same as `nvs_get_str`, except for the data type.

esp_err_t **nvs_open** (const char *namespace_name, *nvs_open_mode_t* open_mode, *nvs_handle_t* *out_handle)

Open non-volatile storage with a given namespace from the default NVS partition.

Multiple internal ESP-IDF and third party application modules can store their key-value pairs in the NVS module. In order to reduce possible conflicts on key names, each module can use its own namespace. The default NVS partition is the one that is labelled "nvs" in the partition table.

Parameters

- **namespace_name** -- **[in]** Namespace name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn't be empty.
- **open_mode** -- **[in]** NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- **out_handle** -- **[out]** If successful (return code is zero), handle will be returned in this argument.

Returns

- ESP_OK if storage handle was opened successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with label "nvs" is not found
- ESP_ERR_NVS_NOT_FOUND id namespace doesn't exist yet and mode is NVS_READONLY
- ESP_ERR_NVS_INVALID_NAME if namespace name doesn't satisfy constraints
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is no space for a new entry or there are too many different namespaces (maximum allowed different namespaces: 254)
- ESP_ERR_NOT_ALLOWED if the NVS partition is read-only and mode is NVS_READWRITE
- ESP_ERR_INVALID_ARG if out_handle is equal to NULL
- other error codes from the underlying storage driver

esp_err_t **nvs_open_from_partition** (const char *part_name, const char *namespace_name, *nvs_open_mode_t* open_mode, *nvs_handle_t* *out_handle)

Open non-volatile storage with a given namespace from specified partition.

The behaviour is same as nvs_open() API. However this API can operate on a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using nvs_flash_init_partition() API.

Parameters

- **part_name** -- **[in]** Label (name) of the partition of interest for object read/write/erase
- **namespace_name** -- **[in]** Namespace name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn't be empty.
- **open_mode** -- **[in]** NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- **out_handle** -- **[out]** If successful (return code is zero), handle will be returned in this argument.

Returns

- ESP_OK if storage handle was opened successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with specified name is not found
- ESP_ERR_NVS_NOT_FOUND id namespace doesn't exist yet and mode is NVS_READONLY
- ESP_ERR_NVS_INVALID_NAME if namespace name doesn't satisfy constraints
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is no space for a new entry or there are too many different namespaces (maximum allowed different namespaces: 254)

- `ESP_ERR_NOT_ALLOWED` if the NVS partition is read-only and mode is `NVS_READWRITE`
- `ESP_ERR_INVALID_ARG` if `out_handle` is equal to `NULL`
- other error codes from the underlying storage driver

esp_err_t `nvs_set_blob` (*nvs_handle_t* handle, const char *key, const void *value, size_t length)

set variable length binary value for given key

Sets variable length binary value for the key. Function uses 2 overhead and 1 entry per each 32 bytes of new data from the pool of available entries. See `nvs_get_stats`. In case of value update for existing key, space occupied by the existing value and 2 overhead entries are returned to the pool of available entries. Note that the underlying storage will not be updated until `nvs_commit` is called.

Parameters

- **handle** -- **[in]** Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- **key** -- **[in]** Key name. Maximum length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **value** -- **[in]** The value to set.
- **length** -- **[in]** length of binary value to set, in bytes; Maximum length is 508000 bytes or $(97.6\%$ of the partition size - 4000) bytes whichever is lower.

Returns

- `ESP_OK` if value was set successfully
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if storage handle was opened as read only
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is not enough space in the underlying storage to save the value
- `ESP_ERR_NVS_REMOVE_FAILED` if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of `nvs`, provided that flash operation doesn't fail again.
- `ESP_ERR_NVS_VALUE_TOO_LONG` if the value is too long

esp_err_t `nvs_find_key` (*nvs_handle_t* handle, const char *key, *nvs_type_t* *out_type)

Lookup key-value pair with given key name.

Note that function may indicate both existence of the key as well as the data type of NVS entry if it is found.

Parameters

- **handle** -- **[in]** Storage handle obtained with `nvs_open`.
- **key** -- **[in]** Key name. Maximum length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **out_type** -- **[out]** Pointer to the output variable populated with data type of NVS entry in case key was found. May be `NULL`, respective data type is then not provided.

Returns

- `ESP_OK` if NVS entry for key provided was found
- `ESP_ERR_NVS_NOT_FOUND` if the requested key doesn't exist
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- other error codes from the underlying storage driver

esp_err_t `nvs_erase_key` (*nvs_handle_t* handle, const char *key)

Erase key-value pair with given key name.

Note that actual storage may not be updated until `nvs_commit` function is called.

Parameters

- **handle** -- **[in]** Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

- **key** -- **[in]** Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn't be empty.

Returns

- ESP_OK if erase operation was successful
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if handle was opened as read only
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn't exist
- other error codes from the underlying storage driver

esp_err_t **nvs_erase_all** (*nvs_handle_t* handle)

Erase all key-value pairs in a namespace.

Note that actual storage may not be updated until `nvs_commit` function is called.

Parameters **handle** -- **[in]** Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

Returns

- ESP_OK if erase operation was successful
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if handle was opened as read only
- other error codes from the underlying storage driver

esp_err_t **nvs_commit** (*nvs_handle_t* handle)

Write any pending changes to non-volatile storage.

After setting any values, `nvs_commit()` must be called to ensure changes are written to non-volatile storage. Individual implementations may write to storage at other times, but this is not guaranteed.

Parameters **handle** -- **[in]** Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

Returns

- ESP_OK if the changes have been written successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- other error codes from the underlying storage driver

void **nvs_close** (*nvs_handle_t* handle)

Close the storage handle and free any allocated resources.

This function should be called for each handle opened with `nvs_open` once the handle is not in use any more. Closing the handle may not automatically write the changes to nonvolatile storage. This has to be done explicitly using `nvs_commit` function. Once this function is called on a handle, the handle should no longer be used.

Parameters **handle** -- **[in]** Storage handle to close

esp_err_t **nvs_get_stats** (const char *part_name, *nvs_stats_t* *nvs_stats)

Fill structure *nvs_stats_t*. It provides info about memory used by NVS.

This function calculates the number of used entries, free entries, available entries, total entries and number of namespaces in partition.

```
// Example of nvs_get_stats() to get overview of actual statistics of data_
→entries :
nvs_stats_t nvs_stats;
nvs_get_stats(NULL, &nvs_stats);
printf("Count: UsedEntries = (%lu), FreeEntries = (%lu), AvailableEntries = (
→%lu), AllEntries = (%lu)\n",
      nvs_stats.used_entries, nvs_stats.free_entries, nvs_stats.available_
→entries, nvs_stats.total_entries);
```

Parameters

- **part_name** -- [in] Partition name NVS in the partition table. If pass a NULL than will use NVS_DEFAULT_PART_NAME ("nvs").
- **nvs_stats** -- [out] Returns filled structure nvs_stats_t. It provides info about used memory the partition.

Returns

- ESP_OK if the changes have been written successfully. Return param nvs_stats will be filled.
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with label "name" is not found. Return param nvs_stats will be filled 0.
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return param nvs_stats will be filled 0.
- ESP_ERR_INVALID_ARG if nvs_stats is equal to NULL.
- ESP_ERR_INVALID_STATE if there is page with the status of INVALID. Return param nvs_stats will be filled not with correct values because not all pages will be counted. Counting will be interrupted at the first INVALID page.

esp_err_t **nvs_get_used_entry_count** (*nvs_handle_t* handle, *size_t* *used_entries)

Calculate all entries in a namespace.

An entry represents the smallest storage unit in NVS. Strings and blobs may occupy more than one entry. Note that to find out the total number of entries occupied by the namespace, add one to the returned value used_entries (if err is equal to ESP_OK). Because the name space entry takes one entry.

```
// Example of nvs_get_used_entry_count() to get amount of all key-value pairs.
↳in one namespace:
nvs_handle_t handle;
nvs_open("namespace1", NVS_READWRITE, &handle);
...
size_t used_entries;
size_t total_entries_namespace;
if(nvs_get_used_entry_count(handle, &used_entries) == ESP_OK){
// the total number of entries occupied by the namespace
total_entries_namespace = used_entries + 1;
}
```

Parameters

- **handle** -- [in] Handle obtained from nvs_open function.
- **used_entries** -- [out] Returns amount of used entries from a namespace.

Returns

- ESP_OK if the changes have been written successfully. Return param used_entries will be filled valid value.
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return param used_entries will be filled 0.
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL. Return param used_entries will be filled 0.
- ESP_ERR_INVALID_ARG if used_entries is equal to NULL.
- Other error codes from the underlying storage driver. Return param used_entries will be filled 0.

esp_err_t **nvs_entry_find** (const char *part_name, const char *namespace_name, *nvs_type_t* type, *nvs_iterator_t* *output_iterator)

Create an iterator to enumerate NVS entries based on one or more parameters.

```
// Example of listing all the key-value pairs of any type under specified
↳partition and namespace
nvs_iterator_t it = NULL;
esp_err_t res = nvs_entry_find(<nvs_partition_name>, <namespace>, NVS_TYPE_
↳ANY, &it);
```

(continues on next page)

(continued from previous page)

```

while(res == ESP_OK) {
nvs_entry_info_t info;
    nvs_entry_info(it, &info); // Can omit error check if parameters are
↳guaranteed to be non-NULL
    printf("key '%s', type '%d' \n", info.key, info.type);
    res = nvs_entry_next(&it);
}
nvs_release_iterator(it);

```

Parameters

- **part_name** -- **[in]** Partition name
- **namespace_name** -- **[in]** Set this value if looking for entries with a specific namespace. Pass NULL otherwise.
- **type** -- **[in]** One of `nvs_type_t` values.
- **output_iterator** -- **[out]** Set to a valid iterator to enumerate all the entries found. Set to NULL if no entry for specified criteria was found. If any other error except `ESP_ERR_INVALID_ARG` occurs, `output_iterator` is NULL, too. If `ESP_ERR_INVALID_ARG` occurs, `output_iterator` is not changed. If a valid iterator is obtained through this function, it has to be released using `nvs_release_iterator` when not used any more, unless `ESP_ERR_INVALID_ARG` is returned.

Returns

- `ESP_OK` if no internal error or programming error occurred.
- `ESP_ERR_NVS_NOT_FOUND` if no element of specified criteria has been found.
- `ESP_ERR_NO_MEM` if memory has been exhausted during allocation of internal structures.
- `ESP_ERR_INVALID_ARG` if any of the parameters is NULL. Note: don't release `output_iterator` in case `ESP_ERR_INVALID_ARG` has been returned

`esp_err_t nvs_entry_find_in_handle` (`nvs_handle_t` handle, `nvs_type_t` type, `nvs_iterator_t` *output_iterator)

Create an iterator to enumerate NVS entries based on a handle and type.

```

// Example of listing all the key-value pairs of any type under specified
↳handle (which defines a partition and namespace)
nvs_iterator_t it = NULL;
esp_err_t res = nvs_entry_find_in_handle(<nvs_handle>, NVS_TYPE_ANY, &it);
while(res == ESP_OK) {
nvs_entry_info_t info;
    nvs_entry_info(it, &info); // Can omit error check if parameters are
↳guaranteed to be non-NULL
    printf("key '%s', type '%d' \n", info.key, info.type);
    res = nvs_entry_next(&it);
}
nvs_release_iterator(it);

```

Parameters

- **handle** -- **[in]** Handle obtained from `nvs_open` function.
- **type** -- **[in]** One of `nvs_type_t` values.
- **output_iterator** -- **[out]** Set to a valid iterator to enumerate all the entries found. Set to NULL if no entry for specified criteria was found. If any other error except `ESP_ERR_INVALID_ARG` occurs, `output_iterator` is NULL, too. If `ESP_ERR_INVALID_ARG` occurs, `output_iterator` is not changed. If a valid iterator is obtained through this function, it has to be released using `nvs_release_iterator` when not used any more, unless `ESP_ERR_INVALID_ARG` is returned.

Returns

- ESP_OK if no internal error or programming error occurred.
- ESP_ERR_NVS_NOT_FOUND if no element of specified criteria has been found.
- ESP_ERR_NO_MEM if memory has been exhausted during allocation of internal structures.
- ESP_ERR_NVS_INVALID_HANDLE if unknown handle was specified.
- ESP_ERR_INVALID_ARG if output_iterator parameter is NULL. Note: don't release output_iterator in case ESP_ERR_INVALID_ARG has been returned

esp_err_t **nvs_entry_next** (*nvs_iterator_t* *iterator)

Advances the iterator to next item matching the iterator criteria.

Note that any copies of the iterator will be invalid after this call.

Parameters *iterator* -- **[inout]** Iterator obtained from `nvs_entry_find` or `nvs_entry_find_in_handle` function. Must be non-NULL. If any error except `ESP_ERR_INVALID_ARG` occurs, *iterator* is set to NULL. If `ESP_ERR_INVALID_ARG` occurs, *iterator* is not changed.

Returns

- ESP_OK if no internal error or programming error occurred.
- ESP_ERR_NVS_NOT_FOUND if no next element matching the iterator criteria.
- ESP_ERR_INVALID_ARG if *iterator* is NULL.
- Possibly other errors in the future for internal programming or flash errors.

esp_err_t **nvs_entry_info** (const *nvs_iterator_t* iterator, *nvs_entry_info_t* *out_info)

Fills *nvs_entry_info_t* structure with information about entry pointed to by the iterator.

Parameters

- *iterator* -- **[in]** Iterator obtained from `nvs_entry_find` or `nvs_entry_find_in_handle` function. Must be non-NULL.
- *out_info* -- **[out]** Structure to which entry information is copied.

Returns

- ESP_OK if all parameters are valid; current iterator data has been written to *out_info*
- ESP_ERR_INVALID_ARG if one of the parameters is NULL.

void **nvs_release_iterator** (*nvs_iterator_t* iterator)

Release iterator.

Parameters *iterator* -- **[in]** Release iterator obtained from `nvs_entry_find` or `nvs_entry_find_in_handle` or `nvs_entry_next` function. NULL argument is allowed.

Structures

struct **nvs_entry_info_t**

information about entry obtained from `nvs_entry_info` function

Public Members

char **namespace_name**[NVS_NS_NAME_MAX_SIZE]

Namespace to which key-value belong

char **key**[NVS_KEY_NAME_MAX_SIZE]

Key of stored key-value pair

nvs_type_t **type**

Type of stored key-value pair

struct **nvs_stats_t**

Note: Info about storage space NVS.

Public Members

size_t **used_entries**

Number of used entries.

size_t **free_entries**

Number of free entries. It includes also reserved entries.

size_t **available_entries**

Number of entries available for data storage.

size_t **total_entries**

Number of all entries.

size_t **namespace_count**

Number of namespaces.

Macros

ESP_ERR_NVS_BASE

Starting number of error codes

ESP_ERR_NVS_NOT_INITIALIZED

The storage driver is not initialized

ESP_ERR_NVS_NOT_FOUND

A requested entry couldn't be found or namespace doesn't exist yet and mode is NVS_READONLY

ESP_ERR_NVS_TYPE_MISMATCH

The type of set or get operation doesn't match the type of value stored in NVS

ESP_ERR_NVS_READ_ONLY

Storage handle was opened as read only

ESP_ERR_NVS_NOT_ENOUGH_SPACE

There is not enough space in the underlying storage to save the value

ESP_ERR_NVS_INVALID_NAME

Namespace name doesn't satisfy constraints

ESP_ERR_NVS_INVALID_HANDLE

Handle has been closed or is NULL

ESP_ERR_NVS_REMOVE_FAILED

The value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

ESP_ERR_NVS_KEY_TOO_LONG

Key name is too long

ESP_ERR_NVS_PAGE_FULL

Internal error; never returned by nvs API functions

ESP_ERR_NVS_INVALID_STATE

NVS is in an inconsistent state due to a previous error. Call `nvs_flash_init` and `nvs_open` again, then retry.

ESP_ERR_NVS_INVALID_LENGTH

String or blob length is not sufficient to store data

ESP_ERR_NVS_NO_FREE_PAGES

NVS partition doesn't contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call `nvs_flash_init` again.

ESP_ERR_NVS_VALUE_TOO_LONG

Value doesn't fit into the entry or string or blob length is longer than supported by the implementation

ESP_ERR_NVS_PART_NOT_FOUND

Partition with specified name is not found in the partition table

ESP_ERR_NVS_NEW_VERSION_FOUND

NVS partition contains data in new format and cannot be recognized by this version of code

ESP_ERR_NVS_XTS_ENCR_FAILED

XTS encryption failed while writing NVS entry

ESP_ERR_NVS_XTS_DECR_FAILED

XTS decryption failed while reading NVS entry

ESP_ERR_NVS_XTS_CFG_FAILED

XTS configuration setting failed

ESP_ERR_NVS_XTS_CFG_NOT_FOUND

XTS configuration not found

ESP_ERR_NVS_ENCR_NOT_SUPPORTED

NVS encryption is not supported in this version

ESP_ERR_NVS_KEYS_NOT_INITIALIZED

NVS key partition is uninitialized

ESP_ERR_NVS_CORRUPT_KEY_PART

NVS key partition is corrupt

ESP_ERR_NVS_WRONG_ENCRYPTION

NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

ESP_ERR_NVS_CONTENT_DIFFERS

Internal error; never returned by nvs API functions. NVS key is different in comparison

NVS_DEFAULT_PART_NAME

Default partition name of the NVS partition in the partition table

NVS_PART_NAME_MAX_SIZE

maximum length of partition name (excluding null terminator)

NVS_KEY_NAME_MAX_SIZE

Maximum length of NVS key name (including null terminator)

NVS_NS_NAME_MAX_SIZE

Maximum length of NVS namespace name (including null terminator)

NVS_GUARD_SYSVIEW_MACRO_EXPANSION_PUSH ()**NVS_GUARD_SYSVIEW_MACRO_EXPANSION_POP ()****Type Definitions**

2.8.5 NVS Encryption

Overview

This guide provides an overview of the NVS encryption feature. NVS encryption helps to achieve secure storage on the device flash memory.

Data stored in NVS partitions can be encrypted using XTS-AES in the manner similar to the one mentioned in disk encryption standard IEEE P1619. For the purpose of encryption, each entry is treated as one `sector` and relative address of the entry (w.r.t., partition-start) is fed to the encryption algorithm as `sector-number`.

NVS encryption can be facilitated by enabling `CONFIG_NVS_ENCRYPTION` and `CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME` > `CONFIG_NVS_SEC_KEY_PROTECT_USING_FLASH_ENC` or `CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC` depending on the scheme to be used.

NVS Encryption: Flash Encryption-Based Scheme

In this scheme, the keys required for NVS encryption are stored in yet another partition, which is protected using *Flash Encryption*. Therefore, enabling *Flash Encryption* becomes a prerequisite for NVS encryption here.

NVS encryption should be enabled when *Flash Encryption* is enabled because the Wi-Fi driver stores credentials (like SSID and passphrase) in the default NVS partition. It is important to encrypt them if platform-level encryption is already enabled.

For using NVS encryption using this scheme, the partition table must contain the *NVS Key Partition*. Two partition tables containing the *NVS Key Partition* are provided for NVS encryption under the partition table option (`menuconfig`>Partition Table). They can be selected with the project configuration menu (`idf.py menuconfig`). Please refer to the example [security/flash_encryption](#) for how to configure and use the NVS encryption feature.

NVS Key Partition An application requiring NVS encryption support (using the Flash Encryption-based scheme) needs to be compiled with a key-partition of the type `data` and subtype `nvs_keys`. This partition should be marked as `encrypted` and its size should be the minimum partition size (4 KB). Refer to *Partition Tables* for more details. Two additional partition tables which contain the *NVS Key Partition* are provided under the partition table option (`menuconfig`>Partition Table). They can be directly used for NVS encryption. The structure of these partitions is depicted below:

XTS encryption key (32)
XTS tweak key (32)
CRC32 (4)

The XTS encryption keys in the *NVS Key Partition* can be generated in one of the following two ways.

Generate the keys on ESP32-C5 chip itself

- When NVS encryption is enabled, the `nvs_flash_init()` API function can be used to initialize the encrypted default NVS partition. The API function internally generates the XTS encryption keys on the ESP chip. The API function finds the first *NVS Key Partition*.
- Then the API function automatically generates and stores the NVS keys in that partition by making use of the `nvs_flash_generate_keys()` API function provided by `nvs_flash/include/nvs_flash.h`. New keys are generated and stored only when the respective key partition is empty. The same key partition can then be used to read the security configurations for initializing a custom encrypted NVS partition with help of `nvs_flash_secure_init_partition()`.
- The API functions `nvs_flash_secure_init()` and `nvs_flash_secure_init_partition()` do not generate the keys internally. When these API functions are used for initializing encrypted NVS partitions, the keys can be generated after startup using the `nvs_flash_generate_keys()` API function provided by `nvs_flash.h`. The API function then writes those keys onto the key-partition in encrypted form.

Note: Please note that `nvs_keys` partition must be completely erased before you start the application in this approach. Otherwise the application may generate the `ESP_ERR_NVS_CORRUPT_KEY_PART` error code assuming that `nvs_keys` partition is not empty and contains malformed data. You can use the following command for this:

```
parttool.py --port PORT --partition-table-file=PARTITION_TABLE_FILE --
↳partition-table-offset PARTITION_TABLE_OFFSET erase_partition --
↳partition-type=data --partition-subtype=nvs_keys

# If Flash Encryption or Secure Boot are enabled then add "--esptool-
↳erase-args=force" to suppress the error:
# "Active security features detected, erasing flash is disabled as a
↳safety measure. Use --force to override ..."
parttool.py --port PORT --esptool-erase-args=force --partition-table-
↳file=PARTITION_TABLE_FILE --partition-table-offset PARTITION_TABLE_
↳OFFSET erase_partition --partition-type=data --partition-subtype=nvs_
↳keys
```

Use a pre-generated NVS key partition

This option will be required by the user when keys in the *NVS Key Partition* are not generated by the application. The *NVS Key Partition* containing the XTS encryption keys can be generated with the help of *NVS Partition Generator Utility*. Then the user can store the pre-generated key partition on the flash with help of the following two commands:

1. Build and flash the partition table

```
idf.py partition-table partition-table-flash
```

2. Store the keys in the *NVS Key Partition* (on the flash) with the help of *parttool.py* (see Partition Tool section in *partition-tables* for more details)

```
parttool.py --port PORT --partition-table-offset PARTITION_TABLE_OFFSET
↳write_partition --partition-name="name of nvs_key partition" --input
↳NVS_KEY_PARTITION_FILE

# If Flash Encryption or Secure Boot are enabled then add "--esptool-
↳erase-args=force" to suppress the error:
# "Active security features detected, erasing flash is disabled as a
↳safety measure. Use --force to override ..."
parttool.py --port PORT --esptool-erase-args=force --partition-table-
↳offset PARTITION_TABLE_OFFSET write_partition --partition-name="name of
↳nvs_key partition" --input NVS_KEY_PARTITION_FILE
```

Note: If the device is encrypted in flash encryption development mode and you want to renew the NVS key partition, you need to tell *parttool.py* to encrypt the NVS key partition and you also need to give it a pointer to the unencrypted partition table in your build directory (*build/partition_table*) since the partition table on the device is encrypted, too. You can use the following command:

```
parttool.py --esptool-write-args encrypt --port PORT --partition-table-
↳file=PARTITION_TABLE_FILE --partition-table-offset PARTITION_TABLE_
↳OFFSET write_partition --partition-name="name of nvs_key partition" --
↳input NVS_KEY_PARTITION_FILE

# If Flash Encryption or Secure Boot are enabled then add "--esptool-
↳erase-args=force" to suppress the error:
# "Active security features detected, erasing flash is disabled as a
↳safety measure. Use --force to override ..."
parttool.py --esptool-erase-args=force --esptool-write-args encrypt --
↳port PORT --partition-table-file=PARTITION_TABLE_FILE --partition-table-
↳offset PARTITION_TABLE_OFFSET write_partition --partition-name="name of
↳nvs_key partition" --input NVS_KEY_PARTITION_FILE
```

Since the key partition is marked as encrypted and *Flash Encryption* is enabled, the bootloader will encrypt this

partition using flash encryption key on the first boot.

It is possible for an application to use different keys for different NVS partitions and thereby have multiple key-partitions. However, it is a responsibility of the application to provide the correct key-partition and keys for encryption or decryption.

NVS Encryption: HMAC Peripheral-Based Scheme

In this scheme, the XTS keys required for NVS encryption are derived from an HMAC key programmed in eFuse with the purpose `esp_efuse_purpose_t::ESP_EFUSE_KEY_PURPOSE_HMAC_UP`. Since the encryption keys are derived at runtime, they are not stored anywhere in the flash. Thus, this feature does not require a separate *NVS Key Partition*.

Note: This scheme enables us to achieve secure storage on ESP32-C5 **without enabling flash encryption**.

Important: Please take note that this scheme uses one eFuse block for storing the HMAC key required for deriving the encryption keys.

- When NVS encryption is enabled, the `nvs_flash_init()` API function can be used to initialize the encrypted default NVS partition. The API function first checks whether an HMAC key is present at *CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID*.

Note: The valid range for the config *CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID* is from 0 (*hmac_key_id_t::HMAC_KEY0*) to 5 (*hmac_key_id_t::HMAC_KEY5*). By default, the config is set to 6 (*hmac_key_id_t::HMAC_KEY_MAX*), which have to be configured before building the user application.

- If no key is found, a key is generated internally and stored at the eFuse block specified at *CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID*.
- If a key is found with the purpose `esp_efuse_purpose_t::ESP_EFUSE_KEY_PURPOSE_HMAC_UP`, the same is used for the derivation of the XTS encryption keys.
- If the specified eFuse block is found to be occupied with a key with a purpose other than `esp_efuse_purpose_t::ESP_EFUSE_KEY_PURPOSE_HMAC_UP`, an error is thrown.
- The API `nvs_flash_init()` then automatically generates the NVS keys on demand by using the `nvs_flash_generate_keys_v2()` API function provided by the `nvs_flash/include/nvs_flash.h`. The same keys can also be used to read the security configurations (see `nvs_flash_read_security_cfg_v2()`) for initializing a custom encrypted NVS partition with help of `nvs_flash_secure_init_partition()`.
- The API functions `nvs_flash_secure_init()` and `nvs_flash_secure_init_partition()` do not generate the keys internally. When these API functions are used for initializing encrypted NVS partitions, the keys can be generated after startup using the `nvs_flash_generate_keys_v2()` API function or take and populate the NVS security configuration structure `nvs_sec_cfg_t` with `nvs_flash_read_security_cfg_v2()` and feed them into the above APIs.

Note: Users can program their own HMAC key in eFuse block beforehand by using the following command:

```
idf.py -p PORT efuse-burn-key <BLOCK_KEYN> <hmac_key_file.bin> HMAC_UP
```

Encrypted Read/Write

The same NVS API functions `nvs_get_*` or `nvs_set_*` can be used for reading of, and writing to an encrypted NVS partition as well.

Encrypt the default NVS partition

- To enable encryption for the default NVS partition, no additional step is necessary. When `CONFIG_NVS_ENCRYPTION` is enabled, the `nvs_flash_init()` API function internally performs some additional steps to enable encryption for the default NVS partition depending on the scheme being used (set by `CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME`).
- For the flash encryption-based scheme, the first *NVS Key Partition* found is used to generate the encryption keys while for the HMAC one, keys are generated using the HMAC key burnt in eFuse at `CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID` (refer to the API documentation for more details).

Alternatively, `nvs_flash_secure_init()` API function can also be used to enable encryption for the default NVS partition.

Encrypt a custom NVS partition

- To enable encryption for a custom NVS partition, `nvs_flash_secure_init_partition()` API function is used instead of `nvs_flash_init_partition()`.
- When `nvs_flash_secure_init()` and `nvs_flash_secure_init_partition()` API functions are used, the applications are expected to follow the steps below in order to perform NVS read/write operations with encryption enabled:
 1. Populate the NVS security configuration structure `nvs_sec_cfg_t`
 - For the Flash Encryption-based scheme
 - * Find key partition and NVS data partition using `esp_partition_find*` API functions.
 - * Populate the `nvs_sec_cfg_t` struct using the `nvs_flash_read_security_cfg()` or `nvs_flash_generate_keys()` API functions.
 - For the HMAC-based scheme
 - * Set the scheme-specific config data with `nvs_sec_config_hmac_t` and register the HMAC-based scheme with the API `nvs_sec_provider_register_hmac()` which will also populate the scheme-specific handle (see `nvs_sec_scheme_t`).
 - * Populate the `nvs_sec_cfg_t` struct using the `nvs_flash_read_security_cfg_v2()` or `nvs_flash_generate_keys_v2()` API functions.

```
nvs_sec_cfg_t cfg = {};
nvs_sec_scheme_t *sec_scheme_handle = NULL;

nvs_sec_config_hmac_t sec_scheme_cfg = {};
hmac_key_id_t hmac_key = HMAC_KEY0;
sec_scheme_cfg.hmac_key_id = hmac_key;

ret = nvs_sec_provider_register_hmac(&sec_scheme_cfg, &sec_scheme_
→handle);
if (ret != ESP_OK) {
    return ret;
}

ret = nvs_flash_read_security_cfg_v2(sec_scheme_handle, &cfg);
if (ret != ESP_OK) {
    if (ret == ESP_ERR_NVS_SEC_HMAC_KEY_NOT_FOUND) {
        ret = nvs_flash_generate_keys_v2(&sec_scheme_handle, &cfg);
        if (ret != ESP_OK) {
            ESP_LOGE(TAG, "Failed to generate NVS encr-keys!");
            return ret;
        }
    }
    ESP_LOGE(TAG, "Failed to read NVS security cfg!");
    return ret;
}
```

2. Initialise NVS flash partition using the `nvs_flash_secure_init()` or `nvs_flash_secure_init_partition()` API functions.

3. Open a namespace using the `nvs_open()` or `nvs_open_from_partition()` API functions.
4. Perform NVS read/write operations using `nvs_get_*` or `nvs_set_*`.
5. Deinitialise an NVS partition using `nvs_flash_deinit()`.

Note: While using the HMAC-based scheme, the above workflow can be used without enabling any of the config options for NVS encryption - `CONFIG_NVS_ENCRYPTION`, `CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME` -> `CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC` and `CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID` to encrypt the default as well as custom NVS partitions with `nvs_flash_secure_init()` API.

NVS Security Provider

The component `nvs_sec_provider` stores all the implementation-specific code for the NVS encryption schemes and would also accommodate any future schemes. This component acts as an interface to the `nvs_flash` component for the handling of encryption keys. `nvs_sec_provider` has a configuration menu of its own, based on which the selected security scheme and the corresponding settings are registered for the `nvs_flash` component.

This component offers factory functions with which a particular security scheme can be registered without having to worry about the APIs to generate and read the encryption keys (e.g., `nvs_sec_provider_register_hmac()`). Refer to the `security/nvs_encryption_hmac` example for API usage.

API Reference

Header File

- `components/nvs_sec_provider/include/nvs_sec_provider.h`
- This header file can be included with:

```
#include "nvs_sec_provider.h"
```

- This header file is a part of the API provided by the `nvs_sec_provider` component. To declare that your component depends on `nvs_sec_provider`, add the following to your `CMakeLists.txt`:

```
REQUIRES nvs_sec_provider
```

or

```
PRIV_REQUIRES nvs_sec_provider
```

Functions

`esp_err_t nvs_sec_provider_register_flash_enc` (const `nvs_sec_config_flash_enc_t` *`sec_scheme_cfg`, `nvs_sec_scheme_t` **`sec_scheme_handle_out`)

Register the Flash-Encryption based scheme for NVS Encryption.

Parameters

- `sec_scheme_cfg` -- [in] Security scheme specific configuration data
- `sec_scheme_handle_out` -- [out] Security scheme specific configuration handle

Returns

- `ESP_OK`, if `sec_scheme_handle_out` was populated successfully with the scheme configuration;
- `ESP_ERR_INVALID_ARG`, if `scheme_cfg_hmac` is `NULL`;
- `ESP_ERR_NO_MEM`, No memory for the scheme-specific handle `sec_scheme_handle_out`
- `ESP_ERR_NOT_FOUND`, if no `nvs_keys` partition is found

`esp_err_t nvs_sec_provider_register_hmac` (const `nvs_sec_config_hmac_t` *sec_scheme_cfg,
`nvs_sec_scheme_t` **sec_scheme_handle_out)

Register the HMAC-based scheme for NVS Encryption.

Parameters

- `sec_scheme_cfg` -- [in] Security scheme specific configuration data
- `sec_scheme_handle_out` -- [out] Security scheme specific configuration handle

Returns

- `ESP_OK`, if `sec_scheme_handle_out` was populated successfully with the scheme configuration;
- `ESP_ERR_INVALID_ARG`, if `sec_scheme_cfg_hmac` is `NULL`;
- `ESP_ERR_NO_MEM`, No memory for the scheme-specific handle `sec_scheme_handle_out`

`esp_err_t nvs_sec_provider_deregister` (`nvs_sec_scheme_t` *sec_scheme_handle)

Deregister the NVS encryption scheme registered with the given handle.

Parameters `sec_scheme_handle` -- [in] Security scheme specific configuration handle

Returns

- `ESP_OK`, if the scheme registered with `sec_scheme_handle` was deregistered successfully
- `ESP_ERR_INVALID_ARG`, if `sec_scheme_handle` is `NULL`;

Structures

struct `nvs_sec_config_flash_enc_t`

Flash encryption-based scheme specific configuration data.

Public Members

const `esp_partition_t` *`nvs_keys_part`

Partition of subtype `nvs_keys` holding the NVS encryption keys

struct `nvs_sec_config_hmac_t`

HMAC-based scheme specific configuration data.

Public Members

`hmac_key_id_t` `hmac_key_id`

HMAC Key ID used for generating the NVS encryption keys

Macros

`ESP_ERR_NVS_SEC_BASE`

Starting number of error codes

`ESP_ERR_NVS_SEC_HMAC_KEY_NOT_FOUND`

HMAC Key required to generate the NVS encryption keys not found

`ESP_ERR_NVS_SEC_HMAC_KEY_BLK_ALREADY_USED`

Provided eFuse block for HMAC key generation is already in use

ESP_ERR_NVS_SEC_HMAC_KEY_GENERATION_FAILED

Failed to generate/write the HMAC key to eFuse

ESP_ERR_NVS_SEC_HMAC_XTS_KEYS_DERIV_FAILED

Failed to derive the NVS encryption keys based on the HMAC-based scheme

NVS_SEC_PROVIDER_CFG_FLASH_ENC_DEFAULT ()

Helper for populating the Flash encryption-based scheme specific configuration data.

NVS_SEC_PROVIDER_CFG_HMAC_DEFAULT ()

Helper for populating the HMAC-based scheme specific configuration data.

Enumerations

enum **nvs_sec_scheme_id_t**

NVS Encryption Keys Protection Scheme.

Values:

enumerator **NVS_SEC_SCHEME_FLASH_ENC**

Protect NVS encryption keys using Flash Encryption

enumerator **NVS_SEC_SCHEME_HMAC**

Protect NVS encryption keys using HMAC peripheral

enumerator **NVS_SEC_SCHEME_MAX**

2.8.6 NVS Partition Generator Utility

Introduction

The utility `nvs_flash/nvs_partition_generator/nvs_partition_gen.py` creates a binary file, compatible with the NVS architecture defined in *Non-Volatile Storage Library*, based on the key-value pairs provided in a CSV file.

This utility is ideally suited for generating a binary blob, containing data specific to ODM/OEM, which can be flashed externally at the time of device manufacturing. This allows manufacturers to generate many instances of the same application firmware with customized parameters for each device, such as a serial number.

Prerequisites

To use this utility in encryption mode, install the following packages:

- `cryptography`

All the required packages are included in *requirements.txt* in the root of the ESP-IDF directory.

CSV File Format Each line of a CSV file should contain 4 parameters, separated by a comma. The table below describes each of these parameters.

No.	Parameter	Description	Notes
1	Key	Key of the data. The data can be accessed later from an application using this key.	
2	Type	Supported values are <code>file</code> , <code>data</code> , and <code>namespace</code> .	
3	Encoding	Supported values are: <code>u8</code> , <code>i8</code> , <code>u16</code> , <code>i16</code> , <code>u32</code> , <code>i32</code> , <code>u64</code> , <code>i64</code> , <code>string</code> , <code>hex2bin</code> , <code>base64</code> , and <code>binary</code> . This specifies how actual data values are encoded in the resulting binary file. The difference between the <code>string</code> and <code>binary</code> encoding is that <code>string</code> data is terminated with a NULL character, whereas <code>binary</code> data is not.	As of now, for the <code>file</code> type, only <code>hex2bin</code> , <code>base64</code> , <code>string</code> , and <code>binary</code> encoding is supported.
4	Value	Data value	Encoding and Value cells for the <code>namespace</code> field type should be empty. Encoding and Value of <code>namespace</code> are fixed and are not configurable. Any values in these cells are ignored.

Note: The first line of the CSV file should always be the column header and it is not configurable.

Below is an example dump of such a CSV file:

```
key,type,encoding,value      <-- column header
namespace_name,namespace,,  <-- First entry should be of type "namespace"
key1,data,u8,1
key2,file,string,/path/to/file
```

Note:

Make sure there are no spaces:

- before and after `'`
- at the end of each line in a CSV file

NVS Entry and Namespace Association

When a namespace entry is encountered in a CSV file, each following entry will be treated as part of that namespace until the next namespace entry is found. At this point, all the following entries will be treated as part of the new namespace.

Note: First entry in a CSV file should always be a namespace entry.

Multipage Blob Support

By default, binary blobs are allowed to span over multiple pages and are written in the format mentioned in Section *Structure of Entry*. If you intend to use the older format, the utility provides an option to disable this feature.

Encryption-Decryption Support

The NVS Partition Generator utility also allows you to create an encrypted binary file and decrypt an encrypted one. The utility uses the XTS-AES encryption. Please refer to *NVS Encryption* for more details.

Running the Utility

Usage:

```
python nvs_partition_gen.py [-h] {generate,generate-key,encrypt,decrypt} ...
```

Optional Arguments:

No.	Parameter	Description
1	-h / --help	Show the help message and exit

Commands:

Run `nvs_partition_gen.py {command} -h` for additional help

No.	Parameter	Description
1	generate	Generate NVS partition
2	generate-key	Generate keys for encryption
3	encrypt	Generate NVS encrypted partition
4	decrypt	Decrypt NVS encrypted partition

Generate NVS Partition (Default) Usage:

```
python nvs_partition_gen.py generate [-h] [--version {1,2}] [--outdir OUTDIR]
↪input output size
```

Positional Arguments:

Parameter	Description
input	Path to CSV file to parse
output	Path to output NVS binary file
size	Size of NVS partition in bytes (must be multiple of 4096)

Optional Arguments:

Parameter	Description
-h / --help	Show the help message and exit
--version {1,2}	Set multipage blob version (Default: Version 2) Version 1 - Multipage blob support disabled Version 2 - Multipage blob support enabled
--outdir OUTDIR	Output directory to store file created (Default: current directory)

You can run the utility to generate NVS partition using the command below. A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000
```

Generate Encryption Keys Partition Usage:

```
python nvs_partition_gen.py generate-key [-h] [--key_protect_hmac] [--kp_hmac_
↪keygen]
                                [--kp_hmac_keyfile KP_HMAC_KEYFILE] [--
↪kp_hmac_inputkey KP_HMAC_INPUTKEY]
                                [--keyfile KEYFILE] [--outdir OUTDIR]
```

Optional Arguments:

Parameter	Description
-h / --help	Show the help message and exit
--keyfile KEYFILE	Path to output encryption keys file
--outdir OUTDIR	Output directory to store files created. (Default: current directory)

Optional Arguments (HMAC scheme-specific):

Parameter	Description
--key_protect_hmac	If set, the NVS encryption key protection scheme based on HMAC peripheral is used; else the default scheme based on flash encryption is used
--kp_hmac_keygen	Generate the HMAC key for HMAC-based encryption scheme
--kp_hmac_keyfile KP_HMAC_KEYFILE	Path to output the HMAC key file
--kp_hmac_inputkey KP_HMAC_INPUTKEY	File having the HMAC key for generating the NVS encryption keys

You can run the utility to generate only the encryption key partition using the command below:

```
python nvs_partition_gen.py generate-key
```

For generating encryption key for the HMAC-based scheme, the following commands can be used:

- Generate the HMAC key and the NVS encryption keys:

```
python nvs_partition_gen.py generate-key --key_protect_hmac --kp_hmac_keygen
```

Note: Encryption key of the format <outdir>/keys/keys-<timestamp>.bin and HMAC key of the format <outdir>/keys/hmac-keys-<timestamp>.bin are created.

- Generate the NVS encryption keys, given the HMAC key:

```
python nvs_partition_gen.py generate-key --key_protect_hmac --kp_hmac_inputkey_
↪testdata/sample_hmac_key.bin
```

Note: You can provide the custom filename for the HMAC key as well as the encryption key as a parameter.

Generate Encrypted NVS Partition Usage:

```
python nvs_partition_gen.py encrypt [-h] [--version {1,2}] [--keygen]
                                [--keyfile KEYFILE] [--inputkey INPUTKEY] [--
↪outdir OUTDIR]
```

(continues on next page)

(continued from previous page)

```

[--key_protect_hmac] [--kp_hmac_keygen]
[--kp_hmac_keyfile KP_HMAC_KEYFILE] [--kp_hmac_
↪inputkey KP_HMAC_INPUTKEY]
input output size

```

Positional Arguments:

Parameter	Description
input	Path to CSV file to parse
output	Path to output NVS binary file
size	Size of NVS partition in bytes (must be multiple of 4096)

Optional Arguments:

Parameter	Description
-h / --help	Show the help message and exit
--version {1,2}	Set multipage blob version (Default: Version 2) Version 1 - Multipage blob support disabled Version 2 - Multipage blob support enabled
--keygen	Generates key for encrypting NVS partition
--keyfile KEYFILE	Path to output encryption keys file
--inputkey INPUTKEY	File having key for encrypting NVS partition
--outdir OUTDIR	Output directory to store file created (Default: current directory)

Optional Arguments (HMAC scheme-specific):

Parameter	Description
--key_protect_hmac	If set, the NVS encryption key protection scheme based on HMAC peripheral is used; else the default scheme based on flash encryption is used
--kp_hmac_keygen	Generate the HMAC key for HMAC-based encryption scheme
--kp_hmac_keyfile KP_HMAC_KEYFILE	Path to output HMAC key file
--kp_hmac_inputkey KP_HMAC_INPUTKEY	File having the HMAC key for generating the NVS encryption keys

You can run the utility to encrypt NVS partition using the command below. A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin_
↪0x3000 --keygen
```

Note: Encryption key of the format <outdir>/keys/keys-<timestamp>.bin is created.

- To generate an encrypted partition using the HMAC-based scheme, the above command can be used along with some additional parameters.
 - Encrypt by allowing the utility to generate encryption keys and the HMAC-key:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.
↪bin 0x3000 --keygen --key_protect_hmac --kp_hmac_keygen
```

Note: Encryption key of the format `<outdir>/keys/keys-<timestamp>.bin` and HMAC key of the format `<outdir>/keys/hmac-keys-<timestamp>.bin` are created.

- Encrypt by allowing the utility to generate encryption keys with user-provided HMAC-key:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.
↳bin 0x3000 --keygen --key_protect_hmac --kp_hmac_inputkey testdata/
↳sample_hmac_key.bin
```

Note: You can provide the custom filename for the HMAC key as well as the encryption key as a parameter.

- Encrypt by allowing the utility to generate encryption keys and store it in provided custom filename:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin.
↳0x3000 --keygen --keyfile sample_keys.bin
```

Note:

- Encryption key of the format `<outdir>/keys/sample_keys.bin` is created.
 - This newly created file having encryption keys in `keys/` directory is compatible with NVS key-partition structure. Refer to [NVS Key Partition](#) for more details.
-

- Encrypt by providing the encryption keys as input binary file:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin.
↳0x3000 --inputkey sample_keys.bin
```

Decrypt Encrypted NVS Partition Usage:

```
python nvs_partition_gen.py decrypt [-h] [--outdir OUTDIR] input key output
```

Positional Arguments:

Parameter	Description
input	Path to encrypted NVS partition file to parse
key	Path to file having keys for decryption
output	Path to output decrypted binary file

Optional Arguments:

Parameter	Description
-h / --help	Show the help message and exit
--outdir OUTDIR	Output directory to store files created. (Default: current directory)

You can run the utility to decrypt encrypted NVS partition using the command below:

```
python nvs_partition_gen.py decrypt sample_encr.bin sample_keys.bin sample_decr.bin
```

You can also provide the format version number:

- Multipage blob support disabled (Version 1)
- Multipage blob support enabled (Version 2)

Multipage Blob Support Disabled (Version 1) You can run the utility in this format by setting the version parameter to 1, as shown below. A sample CSV file for the same is provided with the utility:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000 -  
↪-version 1
```

Multipage Blob Support Enabled (Version 2) You can run the utility in this format by setting the version parameter to 2, as shown below. A sample CSV file for the same is provided with the utility:

```
python nvs_partition_gen.py generate sample_multipage_blob.csv sample.bin 0x4000 --  
↪version 2
```

Note:

- Minimum NVS Partition Size needed is 0x3000 bytes.
 - When flashing the binary onto the device, make sure it is consistent with the application's sdkconfig.
-

Caveats

- Utility does not check for duplicate keys and will write data pertaining to both keys. You need to make sure that the keys are distinct.
- Once a new page is created, no data will be written in the space left on the previous page. Fields in the CSV file need to be ordered in such a way as to optimize memory.
- 64-bit datatype is not yet supported.

2.8.7 NVS Partition Parser Utility

Introduction

The utility `nvs_flash/nvs_partition_tool/nvs_tool.py` loads and parses an NVS storage partition for easier debugging and data extraction. The utility also features integrity check which scans the partition for potential errors. Data blobs are encoded in `base64` format.

Encrypted Partitions

This utility does not support decryption. To decrypt the NVS partition, please use the *NVS Partition Generator Utility* which does support NVS partition encryption and decryption.

Usage

There are two output format styles available with the `-f` or `--format` option:

- `json` - All of the output is printed as a JSON.
- `text` - The output is printed as a human-readable text with different selectable output styles mentioned below.

For the `text` output format, the utility provides six different output styles with the `-d` or `--dump` option:

- *all* (default) - Prints all entries with metadata.
- *written* - Prints only written entries with metadata.
- *minimal* - Prints written *namespace:key = value* pairs.
- *namespaces* - Prints all written namespaces
- *blobs* - Prints all blobs and strings (reconstructs them if they are chunked).
- *storage_info* - Prints entry states count for every page.

Note: There is also a *none* option which will not print anything. This can be used with the integrity check option if the NVS partition contents are irrelevant.

The utility also provides an integrity check feature via the *-i* or *--integrity-check* option (available only with the *text* format as it would invalidate the *json* output). This feature scans through the entire partition and prints potential errors. It can be used with the *-d none* option which will print only the potential errors.

Warning: This document is not updated for ESP32C5 yet, so some of the content may not be correct. This warning was automatically inserted due to the source file being in the *add_warnings_pages* list.

2.8.8 SD/SDIO/MMC Driver

Overview

The SD/SDIO/MMC driver supports SD memory, SDIO cards, and eMMC chips. This is a protocol layer driver ([sdmmc/include/sdmmc_cmd.h](#)) which can work together with:

- SDSPI host driver ([esp_driver_sdspi/include/driver/sdspi_host.h](#)), see *SD SPI Host API* for more details.

Protocol Layer vs Host Layer The SDMMC protocol layer described in this document handles the specifics of the SD protocol, such as the card initialization flow and various data transfer command flows. The protocol layer works with the host via the `sdmmc_host_t` structure. This structure contains pointers to various functions of the host.

Host layer driver(s) implement the protocol layer driver by supporting these functions:

- Sending commands to slave devices
- Sending and receiving data
- Handling error conditions within the bus

Fig. 32: SD Host Side Component Architecture

Application Examples

- [storage/sd_card/sdspi](#) demonstrates how to operate an SD card formatted with the FatFS file system via the SPI interface.

Protocol Layer API

The protocol layer is given the `sdmmc_host_t` structure. This structure describes the SD/MMC host driver, lists its capabilities, and provides pointers to functions for the implementation driver. The protocol layer stores card-specific information in the `sdmmc_card_t` structure. When sending commands to the SD/MMC host driver, the protocol layer uses the `sdmmc_command_t` structure to describe the command, arguments, expected return values, and data to transfer if there is any.

Using API with SD Memory Cards

- To initialize the SDSPI host, call the host driver functions, e.g., `sdspi_host_init()`, `sdspi_host_init_slot()`.
- To initialize the card, call `sdmmc_card_init()` and pass to it the parameters `host` - the host driver information, and `card` - a pointer to the structure `sdmmc_card_t` which will be filled with information about the card when the function completes.
- To read and write sectors of the card, use `sdmmc_read_sectors()` and `sdmmc_write_sectors()` respectively and pass to it the parameter `card` - a pointer to the card information structure.
- If the card is not used anymore, call the host driver function to disable the host peripheral and free the resources allocated by the driver (`sdmmc_host_deinit` for SDMMC or `sdspi_host_deinit` for SDSPI).

eMMC Support ESP32-C5 does not have an SDMMC Host controller, and can only use SPI protocol for communication with cards. However, eMMC chips cannot be used over SPI. Therefore it is not possible to use eMMC chips with ESP32-C5.

Thread Safety Most applications need to use the protocol layer only in one task. For this reason, the protocol layer does not implement any kind of locking on the `sdmmc_card_t` structure, or when accessing SDMMC or SD SPI host drivers. Such locking is usually implemented on a higher layer, e.g., in the filesystem driver.

API Reference

Header File

- [components/sdmmc/include/sdmmc_cmd.h](#)
- This header file can be included with:

```
#include "sdmmc_cmd.h"
```

- This header file is a part of the API provided by the `sdmmc` component. To declare that your component depends on `sdmmc`, add the following to your `CMakeLists.txt`:

```
REQUIRES sdmmc
```

or

```
PRIV_REQUIRES sdmmc
```

Functions

esp_err_t **sdmmc_card_init** (const sdmmc_host_t *host, sdmmc_card_t *out_card)

Probe and initialize SD/MMC card using given host

Parameters

- **host** -- pointer to structure defining host controller
- **out_card** -- pointer to structure which will receive information about the card when the function completes

Returns

- ESP_OK on success
- One of the error codes from SDMMC host controller

void **sdmmc_card_print_info** (FILE *stream, const sdmmc_card_t *card)

Print information about the card to a stream.

Parameters

- **stream** -- stream obtained using fopen or fdopen
- **card** -- card information structure initialized using sdmmc_card_init

esp_err_t **sdmmc_get_status** (sdmmc_card_t *card)

Get status of SD/MMC card

Parameters **card** -- pointer to card information structure previously initialized using sdmmc_card_init

Returns

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_write_sectors** (sdmmc_card_t *card, const void *src, size_t start_sector, size_t sector_count)

Write given number of sectors to SD/MMC card

Parameters

- **card** -- pointer to card information structure previously initialized using sdmmc_card_init
- **src** -- pointer to data buffer to read data from; data size must be equal to sector_count * card->csd.sector_size
- **start_sector** -- sector where to start writing
- **sector_count** -- number of sectors to write

Returns

- ESP_OK on success or sector_count equal to 0
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_read_sectors** (sdmmc_card_t *card, void *dst, size_t start_sector, size_t sector_count)

Read given number of sectors from the SD/MMC card

Parameters

- **card** -- pointer to card information structure previously initialized using sdmmc_card_init
- **dst** -- pointer to data buffer to write into; buffer size must be at least sector_count * card->csd.sector_size
- **start_sector** -- sector where to start reading
- **sector_count** -- number of sectors to read

Returns

- ESP_OK on success or sector_count equal to 0
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_erase_sectors** (sdmmc_card_t *card, size_t start_sector, size_t sector_count, sdmmc_erase_arg_t arg)

Erase given number of sectors from the SD/MMC card

Note: When sdmmc_erase_sectors used with cards in SDSPI mode, it was observed that card requires re-init

after erase operation.

Parameters

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **start_sector** -- sector where to start erase
- **sector_count** -- number of sectors to erase
- **arg** -- erase command (CMD38) argument

Returns

- ESP_OK on success or sector_count equal to 0
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_can_discard**(sdmmc_card_t *card)

Check if SD/MMC card supports discard

Parameters **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`

Returns

- ESP_OK if supported by the card/device
- ESP_FAIL if not supported by the card/device

esp_err_t **sdmmc_can_trim**(sdmmc_card_t *card)

Check if SD/MMC card supports trim

Parameters **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`

Returns

- ESP_OK if supported by the card/device
- ESP_FAIL if not supported by the card/device

esp_err_t **sdmmc_mmc_can_sanitize**(sdmmc_card_t *card)

Check if SD/MMC card supports sanitize

Parameters **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`

Returns

- ESP_OK if supported by the card/device
- ESP_FAIL if not supported by the card/device

esp_err_t **sdmmc_mmc_sanitize**(sdmmc_card_t *card, uint32_t timeout_ms)

Sanitize the data that was unmapped by a Discard command

Note: Discard command has to precede sanitize operation. To discard, use `MMC_DICARD_ARG` with `sdmmc_erase_sectors` argument

Parameters

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **timeout_ms** -- timeout value in milliseconds required to sanitize the selected range of sectors.

Returns

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_full_erase**(sdmmc_card_t *card)

Erase complete SD/MMC card

Parameters **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`

Returns

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_read_byte** (sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t *out_byte)

Read one byte from an SDIO card using IO_RW_DIRECT (CMD52)

Parameters

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** -- IO function number
- **reg** -- byte address within IO function
- **out_byte** -- [out] output, receives the value read from the card

Returns

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_write_byte** (sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t in_byte, uint8_t *out_byte)

Write one byte to an SDIO card using IO_RW_DIRECT (CMD52)

Parameters

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** -- IO function number
- **reg** -- byte address within IO function
- **in_byte** -- value to be written
- **out_byte** -- [out] if not NULL, receives new byte value read from the card (read-after-write).

Returns

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_read_bytes** (sdmmc_card_t *card, uint32_t function, uint32_t addr, void *dst, size_t size)

Read multiple bytes from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in byte mode. For block mode, see `sdmmc_io_read_blocks`.

By default OP Code is set (incrementing address). To send CMD53 without this bit, OR the argument `addr` with `SDMMC_IO_FIXED_ADDR`.

Parameters

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** -- IO function number
- **addr** -- byte address within IO function where reading starts
- **dst** -- buffer which receives the data read from card. Aligned to 4 byte boundary unless `SDMMC_HOST_FLAG_ALLOC_ALIGNED_BUF` flag is set when calling `sdmmc_card_init`. The flag is mandatory when the buffer is behind the cache.
- **size** -- number of bytes to read, 1 to 512.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_write_bytes** (sdmmc_card_t *card, uint32_t function, uint32_t addr, const void *src, size_t size)

Write multiple bytes to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in byte mode. For block mode, see `sdmmc_io_write_blocks`.

By default OP Code is set (incrementing address). To send CMD53 without this bit, OR the argument `addr` with `SDMMC_IO_FIXED_ADDR`.

Parameters

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** -- IO function number
- **addr** -- byte address within IO function where writing starts
- **src** -- data to be written. Aligned to 4 byte boundary unless `SDMMC_HOST_FLAG_ALLOC_ALIGNED_BUF` flag is set when calling `sdmmc_card_init`. The flag is mandatory when the buffer is behind the cache.
- **size** -- number of bytes to write, 1 to 512.

Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_SIZE` if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

esp_err_t `sdmmc_io_read_blocks` (`sdmmc_card_t *card`, `uint32_t function`, `uint32_t addr`, `void *dst`, `size_t size`)

Read blocks of data from an SDIO card using `IO_RW_EXTENDED` (CMD53)

This function performs read operation using CMD53 in block mode. For byte mode, see `sdmmc_io_read_bytes`.

By default OP Code is set (incrementing address). To send CMD53 without this bit, OR the argument `addr` with `SDMMC_IO_FIXED_ADDR`.

Parameters

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** -- IO function number
- **addr** -- byte address within IO function where writing starts
- **dst** -- buffer which receives the data read from card. Aligned to 4 byte boundary, and also cache line size if the buffer is behind the cache.
- **size** -- number of bytes to read, must be divisible by the card block size.

Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_SIZE` if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

esp_err_t `sdmmc_io_write_blocks` (`sdmmc_card_t *card`, `uint32_t function`, `uint32_t addr`, `const void *src`, `size_t size`)

Write blocks of data to an SDIO card using `IO_RW_EXTENDED` (CMD53)

This function performs write operation using CMD53 in block mode. For byte mode, see `sdmmc_io_write_bytes`.

By default OP Code is set (incrementing address). To send CMD53 without this bit, OR the argument `addr` with `SDMMC_IO_FIXED_ADDR`.

Parameters

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** -- IO function number
- **addr** -- byte address within IO function where writing starts
- **src** -- data to be written. Aligned to 4 byte boundary, and also cache line size if the buffer is behind the cache.
- **size** -- number of bytes to write, must be divisible by the card block size.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_enable_int** (sdmmc_card_t *card)

Enable SDIO interrupt in the SDMMC host

Parameters **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`

Returns

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts

esp_err_t **sdmmc_io_wait_int** (sdmmc_card_t *card, TickType_t timeout_ticks)

Block until an SDIO interrupt is received

Slave uses D1 line to signal interrupt condition to the host. This function can be used to wait for the interrupt.

Parameters

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **timeout_ticks** -- time to wait for the interrupt, in RTOS ticks

Returns

- ESP_OK if the interrupt is received
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts
- ESP_ERR_TIMEOUT if the interrupt does not happen in `timeout_ticks`

esp_err_t **sdmmc_io_get_cis_data** (sdmmc_card_t *card, uint8_t *out_buffer, size_t buffer_size, size_t *inout_cis_size)

Get the data of CIS region of an SDIO card.

You may provide a buffer not sufficient to store all the CIS data. In this case, this function stores as much data into your buffer as possible. Also, this function will try to get and return the size required for you.

Parameters

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **out_buffer** -- Output buffer of the CIS data
- **buffer_size** -- Size of the buffer.
- **inout_cis_size** -- Mandatory, pointer to a size, input and output.
 - input: Limitation of maximum searching range, should be 0 or larger than `buffer_size`. The function searches for `CIS_CODE_END` until this range. Set to 0 to search infinitely.
 - output: The size required to store all the CIS data, if `CIS_CODE_END` is found.

Returns

- ESP_OK: on success
- ESP_ERR_INVALID_RESPONSE: if the card does not (correctly) support CIS.
- ESP_ERR_INVALID_SIZE: `CIS_CODE_END` found, but `buffer_size` is less than required size, which is stored in the `inout_cis_size` then.
- ESP_ERR_NOT_FOUND: if the `CIS_CODE_END` not found. Increase input value of `inout_cis_size` or set it to 0, if you still want to search for the end; output value of `inout_cis_size` is invalid in this case.
- and other error code return from `sdmmc_io_read_bytes`

esp_err_t **sdmmc_io_print_cis_info** (uint8_t *buffer, size_t buffer_size, FILE *fp)

Parse and print the CIS information of an SDIO card.

Note: Not all the CIS codes and all kinds of tuples are supported. If you see some unresolved code, you can add the parsing of these code in `sdmmc_io.c` and contribute to the IDF through the Github repository.

```
using sdmmc_card_init
```

Parameters

- **buffer** -- Buffer to parse
- **buffer_size** -- Size of the buffer.
- **fp** -- File pointer to print to, set to NULL to print to stdout.

Returns

- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: if the value from the card is not supported to be parsed.
- ESP_ERR_INVALID_SIZE: if the CIS size fields are not correct.

Macros**SDMMC_IO_FIXED_ADDR**

Call `sdmmc_io_read_bytes`, `sdmmc_io_write_bytes`, `sdmmc_io_read_blocks` or `sdmmc_io_write_blocks` APIs with address ORed by this flag to send CMD53 with OP Code clear (fixed address)

2.8.9 Partitions API

Overview

The `esp_partition` component has higher-level API functions which work with partitions defined in the [Partition Tables](#). These APIs are based on lower level API provided by [SPI Flash API](#).

Partition Table API

ESP-IDF projects use a partition table to maintain information about various regions of SPI flash memory (bootloader, various application binaries, data, filesystems). More information can be found in [Partition Tables](#).

This component provides API functions to enumerate partitions found in the partition table and perform operations on them. These functions are declared in `esp_partition.h`:

- `esp_partition_find()` checks a partition table for entries with specific type, returns an opaque iterator.
- `esp_partition_get()` returns a structure describing the partition for a given iterator.
- `esp_partition_next()` shifts the iterator to the next found partition.
- `esp_partition_iterator_release()` releases iterator returned by `esp_partition_find()`.
- `esp_partition_find_first()` is a convenience function which returns the structure describing the first partition found by `esp_partition_find()`.
- `esp_partition_read()`, `esp_partition_write()`, `esp_partition_erase_range()` are equivalent to `esp_flash_read()`, `esp_flash_write()`, `esp_flash_erase_region()`, but operate within partition boundaries.

Application Examples

- `storage/partition_api/partition_ops` demonstrates how to perform read, write, and erase operations on a partition table.
- `storage/partool` demonstrates how to use the partitions tool to perform operations such as reading, writing, erasing partitions, retrieving partition information, and dumping the entire partition table.
- `storage/partition_api/partition_find` demonstrates how to search the partition table and return matching partitions based on set constraints such as partition type, subtype, and label/name.
- `storage/partition_api/partition_mmap` demonstrates how to configure the MMU, map a partition into memory address space for read operations, and verify the data written and read.

See Also

- [Partition Tables](#)
- [Over The Air Updates \(OTA\)](#) provides high-level API for updating applications stored in flash.
- [Non-Volatile Storage Library](#) provides a structured API for storing small pieces of data in SPI flash.

API Reference - Partition Table

Header File

- `components/esp_partition/include/esp_partition.h`
- This header file can be included with:

```
#include "esp_partition.h"
```

- This header file is a part of the API provided by the `esp_partition` component. To declare that your component depends on `esp_partition`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_partition
```

or

```
PRIV_REQUIRES esp_partition
```

Functions

`esp_partition_iterator_t` **esp_partition_find** (`esp_partition_type_t` type, `esp_partition_subtype_t` subtype, `const char *label`)

Find partition based on one or more parameters.

Parameters

- **type** -- Partition type, one of `esp_partition_type_t` values or an 8-bit unsigned integer. To find all partitions, no matter the type, use `ESP_PARTITION_TYPE_ANY`, and set subtype argument to `ESP_PARTITION_SUBTYPE_ANY`.
- **subtype** -- Partition subtype, one of `esp_partition_subtype_t` values or an 8-bit unsigned integer. To find all partitions of given type, use `ESP_PARTITION_SUBTYPE_ANY`.

- **label** -- (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

Returns iterator which can be used to enumerate all the partitions found, or NULL if no partitions were found. Iterator obtained through this function has to be released using `esp_partition_iterator_release` when not used any more.

```
const esp_partition_t *esp_partition_find_first (esp_partition_type_t type, esp_partition_subtype_t subtype, const char *label)
```

Find first partition based on one or more parameters.

Parameters

- **type** -- Partition type, one of `esp_partition_type_t` values or an 8-bit unsigned integer. To find all partitions, no matter the type, use `ESP_PARTITION_TYPE_ANY`, and set subtype argument to `ESP_PARTITION_SUBTYPE_ANY`.
- **subtype** -- Partition subtype, one of `esp_partition_subtype_t` values or an 8-bit unsigned integer. To find all partitions of given type, use `ESP_PARTITION_SUBTYPE_ANY`.
- **label** -- (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

Returns pointer to `esp_partition_t` structure, or NULL if no partition is found. This pointer is valid for the lifetime of the application.

```
const esp_partition_t *esp_partition_get (esp_partition_iterator_t iterator)
```

Get `esp_partition_t` structure for given partition.

Parameters **iterator** -- Iterator obtained using `esp_partition_find`. Must be non-NULL.

Returns pointer to `esp_partition_t` structure. This pointer is valid for the lifetime of the application.

```
esp_partition_iterator_t esp_partition_next (esp_partition_iterator_t iterator)
```

Move partition iterator to the next partition found.

Any copies of the iterator will be invalid after this call.

Parameters **iterator** -- Iterator obtained using `esp_partition_find`. Must be non-NULL.

Returns NULL if no partition was found, valid `esp_partition_iterator_t` otherwise.

```
void esp_partition_iterator_release (esp_partition_iterator_t iterator)
```

Release partition iterator.

Parameters **iterator** -- Iterator obtained using `esp_partition_find`. The iterator is allowed to be NULL, so it is not necessary to check its value before calling this function.

```
const esp_partition_t *esp_partition_verify (const esp_partition_t *partition)
```

Verify partition data.

Given a pointer to partition data, verify this partition exists in the partition table (all fields match.)

This function is also useful to take partition data which may be in a RAM buffer and convert it to a pointer to the permanent partition data stored in flash.

Pointers returned from this function can be compared directly to the address of any pointer returned from `esp_partition_get()`, as a test for equality.

Parameters **partition** -- Pointer to partition data to verify. Must be non-NULL. All fields of this structure must match the partition table entry in flash for this function to return a successful match.

Returns

- If partition not found, returns NULL.
- If found, returns a pointer to the `esp_partition_t` structure in flash. This pointer is always valid for the lifetime of the application.

```
esp_err_t esp_partition_read (const esp_partition_t *partition, size_t src_offset, void *dst, size_t size)
```

Read data from the partition.

Partitions marked with an encryption flag will automatically be read and decrypted via a cache mapping.

Parameters

- **partition** -- Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **dst** -- Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least 'size' bytes long.
- **src_offset** -- Address of the data to be read, relative to the beginning of the partition.
- **size** -- Size of data to be read, in bytes.

Returns ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if `src_offset` exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

esp_err_t **esp_partition_write** (const *esp_partition_t* *partition, size_t dst_offset, const void *src, size_t size)

Write data to the partition.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `esp_partition_erase_range` function.

Partitions marked with an encryption flag will automatically be written via the `esp_flash_write_encrypted()` function. If writing to an encrypted partition, all write offsets and lengths must be multiples of 16 bytes. See the `esp_flash_write_encrypted()` function for more details. Unencrypted partitions do not have this restriction.

Note: Prior to writing to flash memory, make sure it has been erased with `esp_partition_erase_range` call.

Parameters

- **partition** -- Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **dst_offset** -- Address where the data should be written, relative to the beginning of the partition.
- **src** -- Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least 'size' bytes long.
- **size** -- Size of data to be written, in bytes.

Returns ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if `dst_offset` exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; ESP_ERR_NOT_ALLOWED, if partition is read-only; or one of error codes from lower-level flash driver.

esp_err_t **esp_partition_read_raw** (const *esp_partition_t* *partition, size_t src_offset, void *dst, size_t size)

Read data from the partition without any transformation/decryption.

Note: This function is essentially the same as `esp_partition_read()` above. It just never decrypts data but returns it as is.

Parameters

- **partition** -- Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **dst** -- Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least 'size' bytes long.
- **src_offset** -- Address of the data to be read, relative to the beginning of the partition.
- **size** -- Size of data to be read, in bytes.

Returns ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if `src_offset` exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

esp_err_t **esp_partition_write_raw** (const *esp_partition_t* *partition, size_t dst_offset, const void *src, size_t size)

Write data to the partition without any transformation/encryption.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `esp_partition_erase_range` function.

Note: This function is essentially the same as `esp_partition_write()` above. It just never encrypts data but writes it as is.

Note: Prior to writing to flash memory, make sure it has been erased with `esp_partition_erase_range` call.

Parameters

- **partition** -- Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **dst_offset** -- Address where the data should be written, relative to the beginning of the partition.
- **src** -- Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least 'size' bytes long.
- **size** -- Size of data to be written, in bytes.

Returns `ESP_OK`, if data was written successfully; `ESP_ERR_INVALID_ARG`, if `dst_offset` exceeds partition size; `ESP_ERR_INVALID_SIZE`, if write would go out of bounds of the partition; `ESP_ERR_NOT_ALLOWED`, if partition is read-only; or one of the error codes from lower-level flash driver.

esp_err_t `esp_partition_erase_range` (const *esp_partition_t* *partition, size_t offset, size_t size)

Erase part of the partition.

Parameters

- **partition** -- Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **offset** -- Offset from the beginning of partition where erase operation should start. Must be aligned to `partition->erase_size`.
- **size** -- Size of the range which should be erased, in bytes. Must be divisible by `partition->erase_size`.

Returns `ESP_OK`, if the range was erased successfully; `ESP_ERR_INVALID_ARG`, if iterator or `dst` are NULL; `ESP_ERR_INVALID_SIZE`, if erase would go out of bounds of the partition; `ESP_ERR_NOT_ALLOWED`, if partition is read-only; or one of error codes from lower-level flash driver.

esp_err_t `esp_partition_mmap` (const *esp_partition_t* *partition, size_t offset, size_t size, *esp_partition_mmap_memory_t* memory, const void **out_ptr, *esp_partition_mmap_handle_t* *out_handle)

Configure MMU to map partition into data memory.

Unlike `spi_flash_mmap` function, which requires a 64kB aligned base address, this function doesn't impose such a requirement. If offset results in a flash address which is not aligned to 64kB boundary, address will be rounded to the lower 64kB boundary, so that mapped region includes requested range. Pointer returned via `out_ptr` argument will be adjusted to point to the requested offset (not necessarily to the beginning of mmap-ed region).

To release mapped memory, pass handle returned via `out_handle` argument to `esp_partition_munmap` function.

Parameters

- **partition** -- Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **offset** -- Offset from the beginning of partition where mapping should start.

- **size** -- Size of the area to be mapped.
- **memory** -- Memory space where the region should be mapped
- **out_ptr** -- Output, pointer to the mapped memory region
- **out_handle** -- Output, handle which should be used for `esp_partition_munmap` call

Returns `ESP_OK`, if successful

void `esp_partition_munmap` (*esp_partition_mmap_handle_t* handle)

Release region previously obtained using `esp_partition_mmap`.

Note: Calling this function will not necessarily unmap memory region. Region will only be unmapped when there are no other handles which reference this region. In case of partially overlapping regions it is possible that memory will be unmapped partially.

Parameters **handle** -- Handle obtained from `spi_flash_mmap`

esp_err_t `esp_partition_get_sha256` (const *esp_partition_t* *partition, uint8_t *sha_256)

Get SHA-256 digest for required partition.

For apps with SHA-256 appended to the app image, the result is the appended SHA-256 value for the app image content. The hash is verified before returning, if app content is invalid then the function returns `ESP_ERR_IMAGE_INVALID`. For apps without SHA-256 appended to the image, the result is the SHA-256 of all bytes in the app image. For other partition types, the result is the SHA-256 of the entire partition.

Parameters

- **partition** -- [in] Pointer to info for partition containing app or data. (fields: address, size and type, are required to be filled).
- **sha_256** -- [out] Returned SHA-256 digest for a given partition.

Returns

- `ESP_OK`: In case of successful operation.
- `ESP_ERR_INVALID_ARG`: The size was 0 or the `sha_256` was NULL.
- `ESP_ERR_NO_MEM`: Cannot allocate memory for sha256 operation.
- `ESP_ERR_IMAGE_INVALID`: App partition doesn't contain a valid app image.
- `ESP_FAIL`: An allocation error occurred.

bool `esp_partition_check_identity` (const *esp_partition_t* *partition_1, const *esp_partition_t* *partition_2)

Check for the identity of two partitions by SHA-256 digest.

Parameters

- **partition_1** -- [in] Pointer to info for partition 1 containing app or data. (fields: address, size and type, are required to be filled).
- **partition_2** -- [in] Pointer to info for partition 2 containing app or data. (fields: address, size and type, are required to be filled).

Returns

- True: In case of the two firmware is equal.
- False: Otherwise

esp_err_t `esp_partition_register_external` (*esp_flash_t* *flash_chip, size_t offset, size_t size, const char *label, *esp_partition_type_t* type, *esp_partition_subtype_t* subtype, const *esp_partition_t* **out_partition)

Register a partition on an external flash chip.

This API allows designating certain areas of external flash chips (identified by the *esp_flash_t* structure) as partitions. This allows using them with components which access SPI flash through the `esp_partition` API.

Parameters

- **flash_chip** -- Pointer to the structure identifying the flash chip. If NULL then the internal flash chip is used (`esp_flash_default_chip`).

- **offset** -- Address in bytes, where the partition starts
- **size** -- Size of the partition in bytes
- **label** -- Partition name
- **type** -- One of the partition types (ESP_PARTITION_TYPE_*), or an integer. Note that applications can not be booted from external flash chips, so using ESP_PARTITION_TYPE_APP is not supported.
- **subtype** -- One of the partition subtypes (ESP_PARTITION_SUBTYPE_*), or an integer.
- **out_partition** -- [out] Output, if non-NULL, receives the pointer to the resulting *esp_partition_t* structure

Returns

- ESP_OK on success
- ESP_ERR_NO_MEM if memory allocation has failed
- ESP_ERR_INVALID_ARG if the new partition overlaps another partition on the same flash chip
- ESP_ERR_INVALID_SIZE if the partition doesn't fit into the flash chip size

esp_err_t **esp_partition_deregister_external** (const *esp_partition_t* *partition)

Deregister the partition previously registered using `esp_partition_register_external`.

Parameters *partition* -- pointer to the partition structure obtained from `esp_partition_register_external`,

Returns

- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition pointer is not found
- ESP_ERR_INVALID_ARG if the partition comes from the partition table
- ESP_ERR_INVALID_ARG if the partition was not registered using `esp_partition_register_external` function.

void **esp_partition_unload_all** (void)

Unload partitions and free space allocated by them.

uint32_t **esp_partition_get_main_flash_sector_size** (void)

Get the main flash sector size.

Returns

- SPI_FLASH_SEC_SIZE - For esp32xx target
- ESP_PARTITION_EMULATED_SECTOR_SIZE - For linux target

esp_err_t **esp_partition_copy** (const *esp_partition_t* *dest_part, uint32_t dest_offset, const *esp_partition_t* *src_part, uint32_t src_offset, size_t size)

Copy data from a source partition at a specific offset to a destination partition at a specific offset.

The destination offset must be aligned to the flash sector size (SPI_FLASH_SEC_SIZE = 0x1000). If "size" is SIZE_MAX, the entire destination partition (from dest_offset onward) will be erased, and the function will copy all of the source partition starting from src_offset into the destination. The function ensures that the destination partition is erased on sector boundaries (erase size is aligned up SPI_FLASH_SEC_SIZE).

This function does the following:

- erases the destination partition from dest_offset to the specified size (or the whole partition if "size" == SIZE_MAX),
- maps data from the source partition in chunks,
- writes the source data into the destination partition in corresponding chunks.

Parameters

- **dest_part** -- Pointer to a destination partition.
- **dest_offset** -- Offset in the destination partition where the data should be written (must be aligned to SPI_FLASH_SEC_SIZE = 0x1000).
- **src_part** -- Pointer to a source partition (must be located on internal flash).
- **src_offset** -- Offset in the source partition where the data should be read from.

- **size** -- Number of bytes to copy from the source partition to the destination partition. If "size" is SIZE_MAX, the function copies from src_offset to the end of the source partition and erases the entire destination partition (from dest_offset onward).

Returns ESP_OK, if the source partition was copied successfully to the destination partition; ESP_ERR_INVALID_ARG, if src_part or dest_part are incorrect, or if dest_offset is not sector aligned; ESP_ERR_INVALID_SIZE, if the copy would go out of bounds of the source or destination partition; ESP_ERR_NOT_ALLOWED, if the destination partition is read-only; or one of the error codes from the lower-level flash driver.

Structures

struct **esp_partition_t**

partition information structure

This is not the format in flash, that format is esp_partition_info_t.

However, this is the format used by this API.

Public Members

esp_flash_t ***flash_chip**

SPI flash chip on which the partition resides

esp_partition_type_t **type**

partition type (app/data)

esp_partition_subtype_t **subtype**

partition subtype

uint32_t **address**

starting address of the partition in flash

uint32_t **size**

size of the partition, in bytes

uint32_t **erase_size**

size the erase operation should be aligned to

char **label**[17]

partition label, zero-terminated ASCII string

bool **encrypted**

flag is set to true if partition is encrypted

bool **readonly**

flag is set to true if partition is read-only

Macros

ESP_PARTITION_SUBTYPE_OTA (i)

Convenience macro to get esp_partition_subtype_t value for the i-th OTA partition.

Type Definitions

typedef uint32_t **esp_partition_mmap_handle_t**

Opaque handle for memory region obtained from esp_partition_mmap.

typedef struct esp_partition_iterator_opaque_ ***esp_partition_iterator_t**

Opaque partition iterator type.

Enumerations

enum **esp_partition_mmap_memory_t**

Enumeration which specifies memory space requested in an mmap call.

Values:

enumerator **ESP_PARTITION_MMAP_DATA**

map to data memory (Vaddr0), allows byte-aligned access, (4 MB total - only for esp32)

enumerator **ESP_PARTITION_MMAP_INST**

map to instruction memory (Vaddr1-3), allows only 4-byte-aligned access, (11 MB total - only for esp32)

enum **esp_partition_type_t**

Partition type.

Note: Partition types with integer value 0x00-0x3F are reserved for partition types defined by ESP-IDF. Any other integer value 0x40-0xFE can be used by individual applications, without restriction.

Values:

enumerator **ESP_PARTITION_TYPE_APP**

Application partition type.

enumerator **ESP_PARTITION_TYPE_DATA**

Data partition type.

enumerator **ESP_PARTITION_TYPE_BOOTLOADER**

Bootloader partition type.

enumerator **ESP_PARTITION_TYPE_PARTITION_TABLE**

Partition table type.

enumerator **ESP_PARTITION_TYPE_ANY**

Used to search for partitions with any type.

enum **esp_partition_subtype_t**

Partition subtype.

Application-defined partition types (0x40-0xFE) can set any numeric subtype value.

Note: These ESP-IDF-defined partition subtypes apply to partitions of type ESP_PARTITION_TYPE_APP and ESP_PARTITION_TYPE_DATA.

Values:

enumerator **ESP_PARTITION_SUBTYPE_BOOTLOADER_PRIMARY**

Primary Bootloader.

enumerator **ESP_PARTITION_SUBTYPE_BOOTLOADER_OTA**

Temporary OTA storage for Bootloader, where the OTA uploads a new Bootloader image.

enumerator **ESP_PARTITION_SUBTYPE_BOOTLOADER_RECOVERY**

Recovery Bootloader.

enumerator **ESP_PARTITION_SUBTYPE_PARTITION_TABLE_PRIMARY**

Primary Partition table.

enumerator **ESP_PARTITION_SUBTYPE_PARTITION_TABLE_OTA**

Temporary OTA storage for Partition table, where the OTA uploads a new Partition table image.

enumerator **ESP_PARTITION_SUBTYPE_APP_FACTORY**

Factory application partition.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_MIN**

Base for OTA partition subtypes.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_0**

OTA partition 0.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_1**

OTA partition 1.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_2**

OTA partition 2.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_3**

OTA partition 3.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_4**

OTA partition 4.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_5**

OTA partition 5.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_6**

OTA partition 6.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_7**

OTA partition 7.

2.8.10 SPIFFS Filesystem

Overview

SPIFFS is a file system intended for SPI NOR flash devices on embedded targets. It supports wear levelling, file system consistency checks, and more.

Notes

- Currently, SPIFFS does not support directories, it produces a flat structure. If SPIFFS is mounted under `/spiffs`, then creating a file with the path `/spiffs/tmp/myfile.txt` will create a file called `/tmp/myfile.txt` in SPIFFS, instead of `myfile.txt` in the directory `/spiffs/tmp`.
- It is not a real-time stack. One write operation might take much longer than another.
- For now, it does not detect or handle bad blocks.
- SPIFFS is able to reliably utilize only around 75% of assigned partition space.
- When the filesystem is running out of space, the garbage collector is trying to find free space by scanning the filesystem multiple times, which can take up to several seconds per write function call, depending on required space. This is caused by the SPIFFS design and the issue has been reported multiple times (e.g., [here](#)) and in the official [SPIFFS github repository](#). The issue can be partially mitigated by the [SPIFFS configuration](#).
- When the garbage collector attempts to reclaim space by scanning the entire filesystem multiple times (usually 10 times by default), during each scan, the garbage collector frees up one block if available. Therefore, if the maximum number of runs set for the garbage collector is 'n' (configured by the `SPIFFS_GC_MAX_RUNS` option located in [SPIFFS configuration](#)), then n times the block size will become available for data writing. If you attempt to write data exceeding n times the block size, the write operation may fail and return an error.
- When the chip experiences a power loss during a file system operation it could result in SPIFFS corruption. However the file system still might be recovered via `esp_spiffs_check` function. More details in the official SPIFFS [FAQ](#).

Tools

spiffsgen.py `spiffsgen.py` is a write-only Python SPIFFS implementation used to create filesystem images from the contents of a host folder. To use `spiffsgen.py`, open Terminal and run:

```
python spiffsgen.py <image_size> <base_dir> <output_file>
```

The required arguments are as follows:

- **image_size**: size of the partition onto which the created SPIFFS image will be flashed.
- **base_dir**: directory for which the SPIFFS image needs to be created.
- **output_file**: SPIFFS image output file.

There are also other arguments that control image generation. Documentation on these arguments can be found in the tool's help:

```
python spiffsgen.py --help
```

These optional arguments correspond to a possible SPIFFS build configuration. To generate the right image, please make sure that you use the same arguments/configuration as were used to build SPIFFS. As a guide, the help output indicates the SPIFFS build configuration to which the argument corresponds. In cases when these arguments are not specified, the default values shown in the help output will be used.

When the image is created, it can be flashed using `esptool.py` or `parttool.py`.

Aside from invoking the `spiffsgen.py` standalone by manually running it from the command line or a script, it is also possible to invoke `spiffsgen.py` directly from the build system by calling `spiffs_create_partition_image`:

```
spiffs_create_partition_image(<partition> <base_dir> [FLASH_IN_PROJECT] [DEPENDS_↵
↵dep dep dep...])
```

This is more convenient as the build configuration is automatically passed to the tool, ensuring that the generated image is valid for that build. An example of this is while the **image_size** is required for the standalone invocation, only the **partition** name is required when using `spiffs_create_partition_image --` the image size is automatically obtained from the project's partition table.

`spiffs_create_partition_image` must be called from one of the component `CMakeLists.txt` files.

Optionally, users can opt to have the image automatically flashed together with the app binaries, partition tables, etc. on `idf.py flash` by specifying `FLASH_IN_PROJECT`. For example:

```
spiffs_create_partition_image(my_spiffs_partition my_folder FLASH_IN_PROJECT)
```

If `FLASH_IN_PROJECT/SPIFFS_IMAGE_FLASH_IN_PROJECT` is not specified, the image will still be generated, but you will have to flash it manually using `esptool.py`, `parttool.py`, or a custom build system target.

There are cases where the contents of the base directory itself is generated at build time. Users can use `DEPENDS/SPIFFS_IMAGE_DEPENDS` to specify targets that should be executed before generating the image:

```
add_custom_target(dep COMMAND ...)

spiffs_create_partition_image(my_spiffs_partition my_folder DEPENDS dep)
```

For an example, see [storage/spiffsgen](#). This example demonstrates how to use the SPIFFS image generation tool to automatically create an SPIFFS image from a host folder during building.

mkspiffs Another tool for creating SPIFFS partition images is `mkspiffs`. Similar to `spiffsgen.py`, it can be used to create an image from a given folder and then flash that image using `esptool.py`

For that, you need to obtain the following parameters:

- **Block Size**: 4096 (standard for SPI Flash)

- **Page Size:** 256 (standard for SPI Flash)
- **Image Size:** Size of the partition in bytes (can be obtained from a partition table)
- **Partition Offset:** Starting address of the partition (can be obtained from a partition table)

To pack a folder into a 1-Megabyte image, run:

```
mkspiiffs -c [src_folder] -b 4096 -p 256 -s 0x100000 spiiffs.bin
```

To flash the image onto ESP32-C5 at offset 0x110000, run:

```
python esptool.py --chip esp32c5 --port [port] --baud [baud] write_flash -z_
↪0x110000 spiiffs.bin
```

Note: You can configure the `write_flash` command of `esptool.py` to [write the spiiffs data to an external SPI flash chip](#) using the `--spi-connection <CLK>, <Q>, <D>, <HD>, <CS>` option. Just specify the GPIO pins assigned to the external flash, e.g., `python esptool.py write_flash --spi-connection 6, 7, 8, 9, 11 -z 0x110000 spiiffs.bin`.

Notes on Which SPIFFS Tool to Use The two tools presented above offer very similar functionality. However, there are reasons to prefer one over the other, depending on the use case.

Use `spiiffsgen.py` in the following cases:

1. If you want to simply generate a SPIFFS image during the build. `spiiffsgen.py` makes it very convenient by providing functions/commands from the build system itself.
2. If the host has no C/C++ compiler available, because `spiiffsgen.py` does not require compilation.

Use `mkspiiffs` in the following cases:

1. If you need to unpack SPIFFS images in addition to image generation. For now, it is not possible with `spiiffsgen.py`.
2. If you have an environment where a Python interpreter is not available, but a host compiler is available. Otherwise, a pre-compiled `mkspiiffs` binary can do the job. However, there is no build system integration for `mkspiiffs` and the user has to do the corresponding work: compiling `mkspiiffs` during build (if a pre-compiled binary is not used), creating build rules/targets for the output files, passing proper parameters to the tool, etc.

Application Example

An example of using SPIFFS is provided in the [storage/spiiffs](#) directory. This example initializes and mounts a SPIFFS partition, then writes and reads data from it using POSIX and C library APIs. See the README.md file in the example directory for more information.

High-level API Reference

Header File

- `components/spiiffs/include/esp_spiiffs.h`
- This header file can be included with:

```
#include "esp_spiiffs.h"
```

- This header file is a part of the API provided by the `spiiffs` component. To declare that your component depends on `spiiffs`, add the following to your CMakeLists.txt:

REQUIRES spiffs

or

PRIV_REQUIRES spiffs

Functions

esp_err_t **esp_vfs_spiffs_register** (const *esp_vfs_spiffs_conf_t* *conf)

Register and mount SPIFFS to VFS with given path prefix.

Parameters **conf** -- Pointer to *esp_vfs_spiffs_conf_t* configuration structure

Returns

- ESP_OK if success
- ESP_ERR_NO_MEM if objects could not be allocated
- ESP_ERR_INVALID_STATE if already mounted or partition is encrypted
- ESP_ERR_NOT_FOUND if partition for SPIFFS was not found
- ESP_FAIL if mount or format fails

esp_err_t **esp_vfs_spiffs_unregister** (const char *partition_label)

Unregister and unmount SPIFFS from VFS

Parameters **partition_label** -- Same label as passed to *esp_vfs_spiffs_register*.

Returns

- ESP_OK if successful
- ESP_ERR_INVALID_STATE already unregistered

bool **esp_spiffs_mounted** (const char *partition_label)

Check if SPIFFS is mounted

Parameters **partition_label** -- Optional, label of the partition to check. If not specified, first partition with subtype=spiffs is used.

Returns

- true if mounted
- false if not mounted

esp_err_t **esp_spiffs_format** (const char *partition_label)

Format the SPIFFS partition

Parameters **partition_label** -- Same label as passed to *esp_vfs_spiffs_register*.

Returns

- ESP_OK if successful
- ESP_FAIL on error

esp_err_t **esp_spiffs_info** (const char *partition_label, size_t *total_bytes, size_t *used_bytes)

Get information for SPIFFS

Parameters

- **partition_label** -- Same label as passed to *esp_vfs_spiffs_register*
- **total_bytes** -- [out] Size of the file system
- **used_bytes** -- [out] Current used bytes in the file system

Returns

- ESP_OK if success
- ESP_ERR_INVALID_STATE if not mounted

esp_err_t **esp_spiffs_check** (const char *partition_label)

Check integrity of SPIFFS

Parameters **partition_label** -- Same label as passed to *esp_vfs_spiffs_register*

Returns

- ESP_OK if successful
- ESP_ERR_INVALID_STATE if not mounted
- ESP_FAIL on error

`esp_err_t esp_spiffs_gc` (const char *partition_label, size_t size_to_gc)

Perform garbage collection in SPIFFS partition.

Call this function to run GC and ensure that at least the given amount of space is available in the partition. This function will fail with `ESP_ERR_NOT_FINISHED` if it is not possible to reclaim the requested space (that is, not enough free or deleted pages in the filesystem). This function will also fail if it fails to reclaim the requested space after `CONFIG_SPIFFS_GC_MAX_RUNS` number of GC iterations. On one GC iteration, SPIFFS will erase one logical block (4kB). Therefore the value of `CONFIG_SPIFFS_GC_MAX_RUNS` should be set at least to the maximum expected `size_to_gc`, divided by 4096. For example, if the application expects to make room for a 1MB file and calls `esp_spiffs_gc(label, 1024 * 1024)`, `CONFIG_SPIFFS_GC_MAX_RUNS` should be set to at least 256. On the other hand, increasing `CONFIG_SPIFFS_GC_MAX_RUNS` value increases the maximum amount of time for which any SPIFFS GC or write operation may potentially block.

Parameters

- **partition_label** -- Label of the partition to be garbage-collected. The partition must be already mounted.
- **size_to_gc** -- The number of bytes that the GC process should attempt to make available.

Returns

- `ESP_OK` on success
- `ESP_ERR_NOT_FINISHED` if GC fails to reclaim the size given by `size_to_gc`
- `ESP_ERR_INVALID_STATE` if the partition is not mounted
- `ESP_FAIL` on all other errors

Structures

struct **esp_vfs_spiffs_conf_t**

Configuration structure for `esp_vfs_spiffs_register`.

Public Members

const char ***base_path**

File path prefix associated with the filesystem.

const char ***partition_label**

Optional, label of SPIFFS partition to use. If set to `NULL`, first partition with subtype=`spiffs` will be used.

size_t **max_files**

Maximum files that could be open at the same time.

bool **format_if_mount_failed**

If true, it will format the file system if it fails to mount.

2.8.11 Virtual Filesystem Component

Overview

Virtual filesystem (VFS) component provides a unified interface for drivers which can perform operations on file-like objects. These can be real filesystems (FAT, SPIFFS, etc.) or device drivers which provide a file-like interface.

This component allows C library functions, such as `fopen` and `fprintf`, to work with FS drivers. At a high level, each FS driver is associated with some path prefix. When one of C library functions needs to open a file, the VFS component searches for the FS driver associated with the file path and forwards the call to that driver. VFS also forwards read, write, and other calls for the given file to the same FS driver.

For example, one can register a FAT filesystem driver with the `/fat` prefix and call `fopen("/fat/file.txt", "w")`. Then the VFS component calls the function `open` of the FAT driver and pass the argument `/file.txt` to it together with appropriate mode flags. All subsequent calls to C library functions for the returned `FILE*` stream will also be forwarded to the FAT driver.

FS Registration

To register an FS driver, an application needs to define an instance of the `esp_vfs_t` structure and populate it with function pointers to FS APIs:

```
esp_vfs_t myfs = {
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
    .open = &myfs_open,
    .fstat = &myfs_fstat,
    .close = &myfs_close,
    .read = &myfs_read,
};

ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

Depending on the way how the FS driver declares its API functions, either `read`, `write`, etc., or `read_p`, `write_p`, etc., should be used.

Case 1: API functions are declared without an extra context pointer (the FS driver is a singleton):

```
ssize_t myfs_write(int fd, const void * data, size_t size);

// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
// ... other members initialized

// When registering FS, context pointer (the third argument) is NULL:
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

Case 2: API functions are declared with an extra context pointer (the FS driver supports multiple instances):

```
ssize_t myfs_write(myfs_t* fs, int fd, const void * data, size_t size);

// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_CONTEXT_PTR,
    .write_p = &myfs_write,
// ... other members initialized

// When registering FS, pass the FS context pointer into the third argument
// (hypothetical myfs_mount function is used for illustrative purposes)
myfs_t* myfs_inst1 = myfs_mount(partition1->offset, partition1->size);
ESP_ERROR_CHECK(esp_vfs_register("/data1", &myfs, myfs_inst1));

// Can register another instance:
```

(continues on next page)

(continued from previous page)

```
myfs_t* myfs_inst2 = myfs_mount(partition2->offset, partition2->size);
ESP_ERROR_CHECK(esp_vfs_register("/data2", &myfs, myfs_inst2));
```

Synchronous Input/Output Multiplexing Synchronous input/output multiplexing by `select()` is supported in the VFS component. The implementation works in the following way.

1. `select()` is called with file descriptors which could belong to various VFS drivers.
2. The file descriptors are divided into groups each belonging to one VFS driver.
3. The file descriptors belonging to non-socket VFS drivers are handed over to the given VFS drivers by `start_select()`, described later on this page. This function represents the driver-specific implementation of `select()` for the given driver. This should be a non-blocking call which means the function should immediately return after setting up the environment for checking events related to the given file descriptors.
4. The file descriptors belonging to the socket VFS driver are handed over to the socket driver by `socket_select()` described later on this page. This is a blocking call which means that it will return only if there is an event related to socket file descriptors or a non-socket driver signals `socket_select()` to exit.
5. Results are collected from each VFS driver and all drivers are stopped by de-initialization of the environment for checking events.
6. The `select()` call ends and returns the appropriate results.

Non-Socket VFS Drivers If you want to use `select()` with a file descriptor belonging to a non-socket VFS driver, then you need to register the driver with functions `start_select()` and `end_select()` similarly to the following example:

```
// In definition of esp_vfs_t:
    .start_select = &uart_start_select,
    .end_select = &uart_end_select,
// ... other members initialized
```

`start_select()` is called for setting up the environment for detection of read/write/error conditions on file descriptors belonging to the given VFS driver.

`end_select()` is called to stop/deinitialize/free the environment which was setup by `start_select()`.

Note: `end_select()` might be called without a previous `start_select()` call in some rare circumstances. `end_select()` should fail gracefully if this is the case (i.e., should not crash but return an error instead).

Please refer to the reference implementation for the UART peripheral in `esp_driver_uart/src/uart_vfs.c` and most particularly to the functions `uart_vfs_dev_register()`, `uart_start_select()`, and `uart_end_select()` for more information.

Please check the following examples that demonstrate the use of `select()` with VFS file descriptors:

- [peripherals/uart/uart_select](#)
- [system/select](#)

Socket VFS Drivers A socket VFS driver is using its own internal implementation of `select()` and non-socket VFS drivers notify it upon read/write/error conditions.

A socket VFS driver needs to be registered with the following functions defined:

```
// In definition of esp_vfs_t:
    .socket_select = &lwip_select,
    .get_socket_select_semaphore = &lwip_get_socket_select_semaphore,
    .stop_socket_select = &lwip_stop_socket_select,
    .stop_socket_select_isr = &lwip_stop_socket_select_isr,
// ... other members initialized
```

`socket_select()` is the internal implementation of `select()` for the socket driver. It works only with file descriptors belonging to the socket VFS.

`get_socket_select_semaphore()` returns the signalization object (semaphore) which is used in non-socket drivers to stop the waiting in `socket_select()`.

`stop_socket_select()` call is used to stop the waiting in `socket_select()` by passing the object returned by `get_socket_select_semaphore()`.

`stop_socket_select_isr()` has the same functionality as `stop_socket_select()` but it can be used from ISR.

Please see [lwip/port/esp32xx/vfs_lwip.c](#) for a reference socket driver implementation using LWIP.

Note: If you use `select()` for socket file descriptors only then you can disable the `CONFIG_VFS_SUPPORT_SELECT` option to reduce the code size and improve performance.

You should not change the socket driver during an active `select()` call or you might experience some undefined behavior.

Paths

Each registered FS has a path prefix associated with it. This prefix can be considered as a "mount point" of this partition.

In case when mount points are nested, the mount point with the longest matching path prefix is used when opening the file. For instance, suppose that the following filesystems are registered in VFS:

- FS 1 on /data
- FS 2 on /data/static

Then:

- FS 1 will be used when opening a file called /data/log.txt
- FS 2 will be used when opening a file called /data/static/index.html
- Even if /index.html " does not exist in FS 2, FS 1 will **not** be searched for /static/index.html.

As a general rule, mount point names must start with the path separator (/) and must contain at least one character after path separator. However, an empty mount point name is also supported and might be used in cases when an application needs to provide a "fallback" filesystem or to override VFS functionality altogether. Such filesystem will be used if no prefix matches the path given.

VFS does not handle dots (.) in path names in any special way. VFS does not treat .. as a reference to the parent directory. In the above example, using a path /data/static/./log.txt will not result in a call to FS 1 to open /log.txt. Specific FS drivers (such as FATFS) might handle dots in file names differently.

When opening files, the FS driver receives only relative paths to files. For example:

1. The `myfs` driver is registered with /data as a path prefix.
2. The application calls `fopen("/data/config.json", ...)`.
3. The VFS component calls `myfs_open("/config.json", ...)`.
4. The `myfs` driver opens the /config.json file.

VFS does not impose any limit on total file path length, but it does limit the FS path prefix to `ESP_VFS_PATH_MAX` characters. Individual FS drivers may have their own filename length limitations.

File Descriptors

File descriptors are small positive integers from 0 to `FD_SETSIZE - 1`, where `FD_SETSIZE` is defined in `sys/select.h`. The largest file descriptors (configured by `CONFIG_LWIP_MAX_SOCKETS`) are reserved for sockets. The VFS component contains a lookup-table called `s_fd_table` for mapping global file descriptors to VFS driver indexes registered in the `s_vfs` array.

Standard I/O streams (`stdin`, `stdout`, `stderr`) are mapped to file descriptors 0, 1, and 2 respectively. For more information on standard I/O, see [Standard I/O and Console Output](#).

eventfd()

`eventfd()` call is a powerful tool to notify a `select()` based loop of custom events. The `eventfd()` implementation in ESP-IDF is generally the same as described in [man\(2\) eventfd](#) except for:

- `esp_vfs_eventfd_register()` has to be called before calling `eventfd()`
- Options `EFD_CLOEXEC`, `EFD_NONBLOCK` and `EFD_SEMAPHORE` are not supported in flags.
- Option `EFD_SUPPORT_ISR` has been added in flags. This flag is required to read and write the `eventfd` in an interrupt handler.

Note that creating an `eventfd` with `EFD_SUPPORT_ISR` will cause interrupts to be temporarily disabled when reading, writing the file and during the beginning and the ending of the `select()` when this file is set.

Minified VFS

To minimize RAM usage, an alternative version of `esp_vfs_register()` function, `esp_vfs_register_fs()` is provided. This version accepts `esp_vfs_fs_ops_t` instead of `esp_vfs_t` alongside separate argument for OR-ed flags. Unlike `esp_vfs_register()`, it can handle statically allocated struct, as long as the `ESP_VFS_FLAG_STATIC` is provided.

The `esp_vfs_fs_ops_t` is split into separate structs based on features (directory operations, select support, termios support, ...). The main struct contains the basic functions (`read`, `write`, ...), alongside pointers to the feature-specific structs. These pointers can be `NULL` indicating lack of support for all the functions provided by that struct, which decreases the required memory.

Internally the VFS component uses this version of API, with additional steps to convert the `esp_vfs_t` to `esp_vfs_fs_ops_t` upon registration.

Well Known VFS Devices

IDF defines several VFS devices that can be used by applications. These devices are, among others:

- `/dev/uart/<UART NUMBER>` - file mapping to an UART opened with the VFS driver. The UART number is the number of the UART peripheral.
- `/dev/null` - file that discards all data written to it and returns EOF when read. It is automatically created if `CONFIG_VFS_INITIALIZE_DEV_NULL` is enabled.
- `/dev/console` - file that is connected to the primary and secondary outputs specified in the menuconfig by `CONFIG_ESP_CONSOLE_UART` and `CONFIG_ESP_CONSOLE_SECONDARY` respectively. More information can be found here [Standard I/O and Console Output](#).

Application Examples

- [system/eventfd](#) demonstrates how to use `eventfd()` to collect events from tasks and ISRs in a `select()` based main loop, using two tasks and a timer ISR (interrupt service routine) callback.
- [system/select](#) demonstrates how to use synchronous I/O multiplexing with the `select()` function, using UART and socket file descriptors, and configuring both to act as loopbacks to receive messages sent from other tasks.
- [storage/semihost_vfs](#) demonstrates how to use the semihosting VFS driver, including registering a host directory, redirecting `stdout` from UART to a file on the host, and reading and printing the content of a text file.

API Reference

Header File

- [components/vfs/include/esp_vfs.h](#)
- This header file can be included with:

```
#include "esp_vfs.h"
```

- This header file is a part of the API provided by the `vfs` component. To declare that your component depends on `vfs`, add the following to your `CMakeLists.txt`:

```
REQUIRES vfs
```

or

```
PRIV_REQUIRES vfs
```

Functions

`ssize_t esp_vfs_write` (struct `_reent` *r, int fd, const void *data, size_t size)

These functions are to be used in newlib syscall table. They will be called by newlib when it needs to use any of the syscalls.

`off_t esp_vfs_lseek` (struct `_reent` *r, int fd, off_t size, int mode)

`ssize_t esp_vfs_read` (struct `_reent` *r, int fd, void *dst, size_t size)

`int esp_vfs_open` (struct `_reent` *r, const char *path, int flags, int mode)

`int esp_vfs_close` (struct `_reent` *r, int fd)

`int esp_vfs_fstat` (struct `_reent` *r, int fd, struct stat *st)

`int esp_vfs_stat` (struct `_reent` *r, const char *path, struct stat *st)

`int esp_vfs_link` (struct `_reent` *r, const char *n1, const char *n2)

`int esp_vfs_unlink` (struct `_reent` *r, const char *path)

`int esp_vfs_rename` (struct `_reent` *r, const char *src, const char *dst)

`int esp_vfs_utime` (const char *path, const struct utimbuf *times)

`esp_err_t esp_vfs_register` (const char *base_path, const `esp_vfs_t` *vfs, void *ctx)

Register a virtual filesystem for given path prefix.

Parameters

- **base_path** -- file path prefix associated with the filesystem. Must be a zero-terminated C string, may be empty. If not empty, must be up to `ESP_VFS_PATH_MAX` characters long, and at least 2 characters long. Name must start with a "/" and must not end with "/". For example, `"/data"` or `"/dev/spi"` are valid. These VFSes would then be called to handle file paths such as `"/data/myfile.txt"` or `"/dev/spi/0"`. In the special case of an empty `base_path`, a "fallback" VFS is registered. Such VFS will handle paths which are not matched by any other registered VFS.
- **vfs** -- Pointer to `esp_vfs_t`, a structure which maps syscalls to the filesystem driver functions. VFS component doesn't assume ownership of this pointer.
- **ctx** -- If `vfs->flags` has `ESP_VFS_FLAG_CONTEXT_PTR` set, a pointer which should be passed to VFS functions. Otherwise, `NULL`.

Returns `ESP_OK` if successful, `ESP_ERR_NO_MEM` if too many VFSes are registered.

esp_err_t **esp_vfs_register_fd_range** (const *esp_vfs_t* *vfs, void *ctx, int min_fd, int max_fd)

Special case function for registering a VFS that uses a method other than open() to open new file descriptors from the interval <min_fd; max_fd).

This is a special-purpose function intended for registering LWIP sockets to VFS.

Parameters

- **vfs** -- Pointer to *esp_vfs_t*. Meaning is the same as for esp_vfs_register().
- **ctx** -- Pointer to context structure. Meaning is the same as for esp_vfs_register().
- **min_fd** -- The smallest file descriptor this VFS will use.
- **max_fd** -- Upper boundary for file descriptors this VFS will use (the biggest file descriptor plus one).

Returns ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

esp_err_t **esp_vfs_register_with_id** (const *esp_vfs_t* *vfs, void *ctx, *esp_vfs_id_t* *vfs_id)

Special case function for registering a VFS that uses a method other than open() to open new file descriptors. In comparison with esp_vfs_register_fd_range, this function doesn't pre-registers an interval of file descriptors. File descriptors can be registered later, by using esp_vfs_register_fd.

Parameters

- **vfs** -- Pointer to *esp_vfs_t*. Meaning is the same as for esp_vfs_register().
- **ctx** -- Pointer to context structure. Meaning is the same as for esp_vfs_register().
- **vfs_id** -- Here will be written the VFS ID which can be passed to esp_vfs_register_fd for registering file descriptors.

Returns ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

esp_err_t **esp_vfs_unregister** (const char *base_path)

Unregister a virtual filesystem for given path prefix

Parameters **base_path** -- file prefix previously used in esp_vfs_register call

Returns ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn't been registered

esp_err_t **esp_vfs_unregister_with_id** (*esp_vfs_id_t* vfs_id)

Unregister a virtual filesystem with the given index

Parameters **vfs_id** -- The VFS ID returned by esp_vfs_register_with_id

Returns ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for the given index hasn't been registered

esp_err_t **esp_vfs_register_fd** (*esp_vfs_id_t* vfs_id, int *fd)

Special function for registering another file descriptor for a VFS registered by esp_vfs_register_with_id. This function should only be used to register permanent file descriptors (socket fd) that are not removed after being closed.

Parameters

- **vfs_id** -- VFS identifier returned by esp_vfs_register_with_id.
- **fd** -- The registered file descriptor will be written to this address.

Returns ESP_OK if the registration is successful, ESP_ERR_NO_MEM if too many file descriptors are registered, ESP_ERR_INVALID_ARG if the arguments are incorrect.

esp_err_t **esp_vfs_register_fd_with_local_fd** (*esp_vfs_id_t* vfs_id, int local_fd, bool permanent, int *fd)

Special function for registering another file descriptor with given local_fd for a VFS registered by esp_vfs_register_with_id.

Parameters

- **vfs_id** -- VFS identifier returned by esp_vfs_register_with_id.
- **local_fd** -- The fd in the local vfs. Passing -1 will set the local fd as the (*fd) value.
- **permanent** -- Whether the fd should be treated as permanent (not removed after close())
- **fd** -- The registered file descriptor will be written to this address.

Returns ESP_OK if the registration is successful, ESP_ERR_NO_MEM if too many file descriptors are registered, ESP_ERR_INVALID_ARG if the arguments are incorrect.

esp_err_t **esp_vfs_unregister_fd** (*esp_vfs_id_t* vfs_id, int fd)

Special function for unregistering a file descriptor belonging to a VFS registered by esp_vfs_register_with_id.

Parameters

- **vfs_id** -- VFS identifier returned by esp_vfs_register_with_id.
- **fd** -- File descriptor which should be unregistered.

Returns ESP_OK if the registration is successful, ESP_ERR_INVALID_ARG if the arguments are incorrect.

int **esp_vfs_select** (int nfdsets, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval *timeout)

Synchronous I/O multiplexing which implements the functionality of POSIX select() for VFS.

Parameters

- **nfdsets** -- Specifies the range of descriptors which should be checked. The first nfdsets descriptors will be checked in each set.
- **readfds** -- If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to read, and on output indicates which descriptors are ready to read.
- **writefds** -- If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to write, and on output indicates which descriptors are ready to write.
- **errorfds** -- If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for error conditions, and on output indicates which descriptors have error conditions.
- **timeout** -- If not NULL, then points to timeval structure which specifies the time period after which the functions should time-out and return. If it is NULL, then the function will not time-out. Note that the timeout period is rounded up to the system tick and incremented by one.

Returns The number of descriptors set in the descriptor sets, or -1 when an error (specified by errno) have occurred.

void **esp_vfs_select_triggered** (*esp_vfs_select_sem_t* sem)

Notification from a VFS driver about a read/write/error condition.

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to start_select.

Parameters **sem** -- semaphore structure which was passed to the driver by the start_select call

void **esp_vfs_select_triggered_isr** (*esp_vfs_select_sem_t* sem, BaseType_t *woken)

Notification from a VFS driver about a read/write/error condition (ISR version)

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to start_select.

Parameters

- **sem** -- semaphore structure which was passed to the driver by the start_select call
- **woken** -- is set to pdTRUE if the function wakes up a task with higher priority

ssize_t **esp_vfs_pread** (int fd, void *dst, size_t size, off_t offset)

Implements the VFS layer of POSIX pread()

Parameters

- **fd** -- File descriptor used for read
- **dst** -- Pointer to the buffer where the output will be written
- **size** -- Number of bytes to be read
- **offset** -- Starting offset of the read

Returns A positive return value indicates the number of bytes read. -1 is return on failure and errno is set accordingly.

ssize_t **esp_vfs_pwrite** (int fd, const void *src, size_t size, off_t offset)

Implements the VFS layer of POSIX pwrite()

Parameters

- **fd** -- File descriptor used for write
- **src** -- Pointer to the buffer from where the output will be read
- **size** -- Number of bytes to write
- **offset** -- Starting offset of the write

Returns A positive return value indicates the number of bytes written. -1 is return on failure and errno is set accordingly.

void **esp_vfs_dump_fds** (FILE *fp)

Dump the existing VFS FDs data to FILE* fp.

Dump the FDs in the format:

```

    <VFS Path Prefix>-<FD seen by App>-<FD seen by driver>

where:
    VFS Path Prefix    : file prefix used in the esp_vfs_register call
    FD seen by App    : file descriptor returned by the vfs to the application.
    ↪ for the path prefix
    FD seen by driver : file descriptor used by the driver for the same file.
    ↪ prefix.
```

Parameters fp -- File descriptor where data will be dumped

void **esp_vfs_dump_registered_paths** (FILE *fp)

Dump all registered FSs to the provided FILE*.

Dump the FSs in the format:

```

    <index>:<VFS Path Prefix> -> <VFS entry ptr>

where:
    index          : internal index in the table of registered FSs (the
    ↪ same as returned when registering fd with id)
    VFS Path Prefix : file prefix used in the esp_vfs_register call or "NULL"
    ↪ "
    VFS entry ptr   : pointer to the esp_vfs_fs_ops_t struct used
    ↪ internally when resolving the calls
```

Parameters fp -- File descriptor where data will be dumped

Structures

struct **esp_vfs_t**

VFS definition structure.

This structure should be filled with pointers to corresponding FS driver functions.

VFS component will translate all FDs so that the filesystem implementation sees them starting at zero. The caller sees a global FD which is prefixed with an pre-filesystem-implementation.

Some FS implementations expect some state (e.g. pointer to some structure) to be passed in as a first argument. For these implementations, populate the members of this structure which have `_p` suffix, set flags member to `ESP_VFS_FLAG_CONTEXT_PTR` and provide the context pointer to `esp_vfs_register` function. If the implementation doesn't use this extra argument, populate the members without `_p` suffix and set flags member to `ESP_VFS_FLAG_DEFAULT`.

If the FS driver doesn't provide some of the functions, set corresponding members to NULL.

Public Members

int **flags**

ESP_VFS_FLAG_CONTEXT_PTR and/or ESP_VFS_FLAG_READONLY_FS or
ESP_VFS_FLAG_DEFAULT

ssize_t (***write_p**)(void *p, int fd, const void *data, size_t size)

Write with context pointer

ssize_t (***write**)(int fd, const void *data, size_t size)

Write without context pointer

off_t (***lseek_p**)(void *p, int fd, off_t size, int mode)

Seek with context pointer

off_t (***lseek**)(int fd, off_t size, int mode)

Seek without context pointer

ssize_t (***read_p**)(void *ctx, int fd, void *dst, size_t size)

Read with context pointer

ssize_t (***read**)(int fd, void *dst, size_t size)

Read without context pointer

ssize_t (***pread_p**)(void *ctx, int fd, void *dst, size_t size, off_t offset)

pread with context pointer

ssize_t (***pread**)(int fd, void *dst, size_t size, off_t offset)

pread without context pointer

ssize_t (***pwrite_p**)(void *ctx, int fd, const void *src, size_t size, off_t offset)

pwrite with context pointer

ssize_t (***pwrite**)(int fd, const void *src, size_t size, off_t offset)

pwrite without context pointer

int (***open_p**)(void *ctx, const char *path, int flags, int mode)

open with context pointer

int (***open**)(const char *path, int flags, int mode)

open without context pointer

int (***close_p**)(void *ctx, int fd)

close with context pointer

int (***close**)(int fd)

close without context pointer

int (***fstat_p**)(void *ctx, int fd, struct *stat* *st)

fstat with context pointer

int (***fstat**)(int fd, struct *stat* *st)

fstat without context pointer

int (***stat_p**)(void *ctx, const char *path, struct *stat* *st)

stat with context pointer

int (***stat**)(const char *path, struct *stat* *st)

stat without context pointer

int (***link_p**)(void *ctx, const char *n1, const char *n2)

link with context pointer

int (***link**)(const char *n1, const char *n2)

link without context pointer

int (***unlink_p**)(void *ctx, const char *path)

unlink with context pointer

int (***unlink**)(const char *path)

unlink without context pointer

int (***rename_p**)(void *ctx, const char *src, const char *dst)

rename with context pointer

int (***rename**)(const char *src, const char *dst)

rename without context pointer

DIR *(***opendir_p**)(void *ctx, const char *name)

opendir with context pointer

DIR *(***opendir**)(const char *name)

opendir without context pointer

struct dirent *(***readdir_p**)(void *ctx, DIR *pdir)

readdir with context pointer

struct dirent *(***readdir**)(DIR *pdir)

readdir without context pointer

int (***readdir_r_p**)(void *ctx, DIR *pdir, struct dirent *entry, struct dirent **out_dirent)

readdir_r with context pointer

int (***readdir_r**)(DIR *pdir, struct dirent *entry, struct dirent **out_dirent)

readdir_r without context pointer

`long (*telldir_p)(void *ctx, DIR *pdir)`
tell`dir` with context pointer

`long (*telldir)(DIR *pdir)`
tell`dir` without context pointer

`void (*seekdir_p)(void *ctx, DIR *pdir, long offset)`
seek`dir` with context pointer

`void (*seekdir)(DIR *pdir, long offset)`
seek`dir` without context pointer

`int (*closedir_p)(void *ctx, DIR *pdir)`
close`dir` with context pointer

`int (*closedir)(DIR *pdir)`
close`dir` without context pointer

`int (*mkdir_p)(void *ctx, const char *name, mode_t mode)`
mk`dir` with context pointer

`int (*mkdir)(const char *name, mode_t mode)`
mk`dir` without context pointer

`int (*rmdir_p)(void *ctx, const char *name)`
rm`dir` with context pointer

`int (*rmdir)(const char *name)`
rm`dir` without context pointer

`int (*fcntl_p)(void *ctx, int fd, int cmd, int arg)`
fcntl with context pointer

`int (*fcntl)(int fd, int cmd, int arg)`
fcntl without context pointer

`int (*ioctl_p)(void *ctx, int fd, int cmd, va_list args)`
ioctl with context pointer

`int (*ioctl)(int fd, int cmd, va_list args)`
ioctl without context pointer

`int (*fsync_p)(void *ctx, int fd)`
fsync with context pointer

`int (*fsync)(int fd)`
fsync without context pointer

`int (*access_p)(void *ctx, const char *path, int amode)`
access with context pointer

`int (access)(const char *path, int amode)`
access without context pointer

`int (*truncate_p)(void *ctx, const char *path, off_t length)`
truncate with context pointer

`int (truncate)(const char *path, off_t length)`
truncate without context pointer

`int (*ftruncate_p)(void *ctx, int fd, off_t length)`
ftruncate with context pointer

`int (ftruncate)(int fd, off_t length)`
ftruncate without context pointer

`int (*utime_p)(void *ctx, const char *path, const struct utimbuf *times)`
utime with context pointer

`int (utime)(const char *path, const struct utimbuf *times)`
utime without context pointer

`int (*tcsetattr_p)(void *ctx, int fd, int optional_actions, const struct termios *p)`
tcsetattr with context pointer

`int (tcsetattr)(int fd, int optional_actions, const struct termios *p)`
tcsetattr without context pointer

`int (*tcgetattr_p)(void *ctx, int fd, struct termios *p)`
tcgetattr with context pointer

`int (tcgetattr)(int fd, struct termios *p)`
tcgetattr without context pointer

`int (*tcdrain_p)(void *ctx, int fd)`
tcdrain with context pointer

`int (tcdrain)(int fd)`
tcdrain without context pointer

`int (*tcflush_p)(void *ctx, int fd, int select)`
tcflush with context pointer

`int (tcflush)(int fd, int select)`
tcflush without context pointer

int (***tcflow_p**)(void *ctx, int fd, int action)

tcflow with context pointer

int (***tcflow**)(int fd, int action)

tcflow without context pointer

pid_t (***tcgetsid_p**)(void *ctx, int fd)

tcgetsid with context pointer

pid_t (***tcgetsid**)(int fd)

tcgetsid without context pointer

int (***tcsendbreak_p**)(void *ctx, int fd, int duration)

tcsendbreak with context pointer

int (***tcsendbreak**)(int fd, int duration)

tcsendbreak without context pointer

esp_err_t (***start_select**)(int nfd, fd_set *readfds, fd_set *writefds, fd_set *exceptfds,

esp_vfs_select_sem_t sem, void **end_select_args)

start_select is called for setting up synchronous I/O multiplexing of the desired file descriptors in the given VFS

int (***socket_select**)(int nfd, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval

*timeout)

socket select function for socket FDs with the functionality of POSIX select(); this should be set only for the socket VFS

void (***stop_socket_select**)(void *sem)

called by VFS to interrupt the socket_select call when select is activated from a non-socket VFS driver; set only for the socket driver

void (***stop_socket_select_isr**)(void *sem, BaseType_t *woken)

stop_socket_select which can be called from ISR; set only for the socket driver

void (***get_socket_select_semaphore**)(void)

end_select is called to stop the I/O multiplexing and deinitialize the environment created by start_select for the given VFS

esp_err_t (***end_select**)(void *end_select_args)

get_socket_select_semaphore returns semaphore allocated in the socket driver; set only for the socket driver

Macros

MAX_FDS

Maximum number of (global) file descriptors.

ESP_VFS_PATH_MAX

Maximum length of path prefix (not including zero terminator)

ESP_VFS_FLAG_DEFAULT

Default value of flags member in *esp_vfs_t* structure.

ESP_VFS_FLAG_CONTEXT_PTR

Flag which indicates that FS needs extra context pointer in syscalls.

ESP_VFS_FLAG_READONLY_FS

Flag which indicates that FS is located on read-only partition.

ESP_VFS_FLAG_STATIC

Flag which indicates that VFS structure should be freed upon unregistering.

Note: Free if false, do not free if true

Header File

- [components/vfs/include/esp_vfs_ops.h](#)
- This header file can be included with:

```
#include "esp_vfs_ops.h"
```

- This header file is a part of the API provided by the `vfs` component. To declare that your component depends on `vfs`, add the following to your `CMakeLists.txt`:

```
REQUIRES vfs
```

or

```
PRIV_REQUIRES vfs
```

Functions

esp_err_t **esp_vfs_register_fs** (const char *base_path, const *esp_vfs_fs_ops_t* *vfs, int flags, void *ctx)

Register a virtual filesystem for given path prefix.

Parameters

- **base_path** -- file path prefix associated with the filesystem. Must be a zero-terminated C string, may be empty. If not empty, must be up to `ESP_VFS_PATH_MAX` characters long, and at least 2 characters long. Name must start with a "/" and must not end with "/". For example, `"/data"` or `"/dev/spi"` are valid. These VFSes would then be called to handle file paths such as `"/data/myfile.txt"` or `"/dev/spi/0"`. In the special case of an empty `base_path`, a "fallback" VFS is registered. Such VFS will handle paths which are not matched by any other registered VFS.
- **vfs** -- Pointer to *esp_vfs_fs_ops_t*, a structure which maps syscalls to the filesystem driver functions. VFS component does not assume ownership of this struct, but see flags for more info
- **flags** -- Set of binary flags controlling how the registered FS should be treated
 - `ESP_VFS_FLAG_STATIC` - if this flag is specified VFS assumes the provided *esp_vfs_fs_ops_t* and all its subcomponents are statically allocated, if it is not enabled a deep copy of the provided struct will be created, which will be managed by the VFS component
 - `ESP_VFS_FLAG_CONTEXT_PTR` - If set, the VFS will use the context-aware versions of the filesystem operation functions (suffixed with `_p`) in *esp_vfs_fs_ops_t* and its subcomponents. The `ctx` parameter will be passed as the context argument when these functions are invoked.

- **ctx** -- Context pointer for fs operation functions, see the `ESP_VFS_FLAG_CONTEXT_PTR`. Should be `NULL` if not used.

Returns `ESP_OK` if successful, `ESP_ERR_NO_MEM` if too many FSes are registered.

`esp_err_t esp_vfs_register_fs_with_id` (const `esp_vfs_fs_ops_t` *vfs, int flags, void *ctx, `esp_vfs_id_t` *id)

Analog of `esp_vfs_register_with_id` which accepts `esp_vfs_fs_ops_t` instead.

`esp_err_t esp_vfs_unregister_fs` (const char *base_path)

Alias for `esp_vfs_unregister` for naming consistency

`esp_err_t esp_vfs_unregister_fs_with_id` (`esp_vfs_id_t` id)

Alias for `esp_vfs_unregister_with_id` for naming consistency

Structures

struct `esp_vfs_select_sem_t`

VFS semaphore type for `select()`

Public Members

bool `is_sem_local`

type of "sem" is `SemaphoreHandle_t` when true, defined by socket driver otherwise

void *`sem`

semaphore instance

struct `esp_vfs_dir_ops_t`

Struct containing function pointers to directory related functionality.

Public Members

int (*`stat_p`)(void *ctx, const char *path, struct `stat` *st)

stat with context pointer

int (*`stat`)(const char *path, struct `stat` *st)

stat without context pointer

int (*`link_p`)(void *ctx, const char *n1, const char *n2)

link with context pointer

int (*`link`)(const char *n1, const char *n2)

link without context pointer

int (*`unlink_p`)(void *ctx, const char *path)

unlink with context pointer

int (*`unlink`)(const char *path)

unlink without context pointer

int (***rename_p**)(void *ctx, const char *src, const char *dst)
rename with context pointer

int (**rename**)(const char *src, const char *dst)
rename without context pointer

DIR (***opendir_p**)(void *ctx, const char *name)
opendir with context pointer

DIR (***opendir**)(const char *name)
opendir without context pointer

struct dirent (***readdir_p**)(void *ctx, DIR *pdir)
readdir with context pointer

struct dirent (***readdir**)(DIR *pdir)
readdir without context pointer

int (***readdir_r_p**)(void *ctx, DIR *pdir, struct dirent *entry, struct dirent **out_dirent)
readdir_r with context pointer

int (***readdir_r**)(DIR *pdir, struct dirent *entry, struct dirent **out_dirent)
readdir_r without context pointer

long (***telldir_p**)(void *ctx, DIR *pdir)
telldir with context pointer

long (***telldir**)(DIR *pdir)
telldir without context pointer

void (***seekdir_p**)(void *ctx, DIR *pdir, long offset)
seekdir with context pointer

void (***seekdir**)(DIR *pdir, long offset)
seekdir without context pointer

int (***closedir_p**)(void *ctx, DIR *pdir)
closedir with context pointer

int (***closedir**)(DIR *pdir)
closedir without context pointer

int (***mkdir_p**)(void *ctx, const char *name, mode_t mode)
mkdir with context pointer

int (***mkdir**)(const char *name, mode_t mode)
mkdir without context pointer

int (***rmdir_p**)(void *ctx, const char *name)

rmdir with context pointer

int (***rmdir**)(const char *name)

rmdir without context pointer

int (***access_p**)(void *ctx, const char *path, int amode)

access with context pointer

int (***access**)(const char *path, int amode)

access without context pointer

int (***truncate_p**)(void *ctx, const char *path, off_t length)

truncate with context pointer

int (***truncate**)(const char *path, off_t length)

truncate without context pointer

int (***ftruncate_p**)(void *ctx, int fd, off_t length)

ftruncate with context pointer

int (***ftruncate**)(int fd, off_t length)

ftruncate without context pointer

int (***utime_p**)(void *ctx, const char *path, const struct utimbuf *times)

utime with context pointer

int (***utime**)(const char *path, const struct utimbuf *times)

utime without context pointer

struct **esp_vfs_termios_ops_t**

Struct containing function pointers to termios related functionality.

Public Members

int (***tcsetattr_p**)(void *ctx, int fd, int optional_actions, const struct termios *p)

tcsetattr with context pointer

int (***tcsetattr**)(int fd, int optional_actions, const struct termios *p)

tcsetattr without context pointer

int (***tcgetattr_p**)(void *ctx, int fd, struct termios *p)

tcgetattr with context pointer

int (***tcgetattr**)(int fd, struct termios *p)

tcgetattr without context pointer

int (***tcdrain_p**)(void *ctx, int fd)
tcdrain with context pointer

int (***tcdrain**)(int fd)
tcdrain without context pointer

int (***tcflush_p**)(void *ctx, int fd, int select)
tcflush with context pointer

int (***tcflush**)(int fd, int select)
tcflush without context pointer

int (***tcflow_p**)(void *ctx, int fd, int action)
tcflow with context pointer

int (***tcflow**)(int fd, int action)
tcflow without context pointer

pid_t (***tcgetsid_p**)(void *ctx, int fd)
tcgetsid with context pointer

pid_t (***tcgetsid**)(int fd)
tcgetsid without context pointer

int (***tcsendbreak_p**)(void *ctx, int fd, int duration)
tcsendbreak with context pointer

int (***tcsendbreak**)(int fd, int duration)
tcsendbreak without context pointer

struct **esp_vfs_select_ops_t**

Struct containing function pointers to select related functionality.

Public Members

esp_err_t (***start_select**)(int nfds, fd_set *readfds, fd_set *writefds, fd_set *exceptfds,
esp_vfs_select_sem_t sem, void **end_select_args)

start_select is called for setting up synchronous I/O multiplexing of the desired file descriptors in the given VFS

int (***socket_select**)(int nfds, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval *timeout)

socket select function for socket FDs with the functionality of POSIX select(); this should be set only for the socket VFS

void (***stop_socket_select**)(void *sem)

called by VFS to interrupt the socket_select call when select is activated from a non-socket VFS driver; set only for the socket driver

void (***stop_socket_select_isr**)(void *sem, BaseType_t *woken)

stop_socket_select which can be called from ISR; set only for the socket driver

void (***get_socket_select_semaphore**)(void)

end_select is called to stop the I/O multiplexing and deinitialize the environment created by start_select for the given VFS

esp_err_t (***end_select**)(void *end_select_args)

get_socket_select_semaphore returns semaphore allocated in the socket driver; set only for the socket driver

struct **esp_vfs_fs_ops_t**

Main struct of the minified vfs API, containing basic function pointers as well as pointers to the other subcomponents.

Public Members

ssize_t (***write_p**)(void *p, int fd, const void *data, size_t size)

Write with context pointer

ssize_t (***write**)(int fd, const void *data, size_t size)

Write without context pointer

off_t (***lseek_p**)(void *p, int fd, off_t size, int mode)

Seek with context pointer

off_t (***lseek**)(int fd, off_t size, int mode)

Seek without context pointer

ssize_t (***read_p**)(void *ctx, int fd, void *dst, size_t size)

Read with context pointer

ssize_t (***read**)(int fd, void *dst, size_t size)

Read without context pointer

ssize_t (***pread_p**)(void *ctx, int fd, void *dst, size_t size, off_t offset)

pread with context pointer

ssize_t (***pread**)(int fd, void *dst, size_t size, off_t offset)

pread without context pointer

ssize_t (***pwrite_p**)(void *ctx, int fd, const void *src, size_t size, off_t offset)

pwrite with context pointer

ssize_t (***pwrite**)(int fd, const void *src, size_t size, off_t offset)

pwrite without context pointer

int (***open_p**)(void *ctx, const char *path, int flags, int mode)

open with context pointer

int (***open**)(const char *path, int flags, int mode)

open without context pointer

int (***close_p**)(void *ctx, int fd)

close with context pointer

int (***close**)(int fd)

close without context pointer

int (***fstat_p**)(void *ctx, int fd, struct stat *st)

fstat with context pointer

int (***fstat**)(int fd, struct stat *st)

fstat without context pointer

int (***fcntl_p**)(void *ctx, int fd, int cmd, int arg)

fcntl with context pointer

int (***fcntl**)(int fd, int cmd, int arg)

fcntl without context pointer

int (***ioctl_p**)(void *ctx, int fd, int cmd, va_list args)

ioctl with context pointer

int (***ioctl**)(int fd, int cmd, va_list args)

ioctl without context pointer

int (***fsync_p**)(void *ctx, int fd)

fsync with context pointer

int (***fsync**)(int fd)

fsync without context pointer

esp_vfs_dir_ops_t ***dir**

pointer to the dir subcomponent

esp_vfs_termios_ops_t ***termios**

pointer to the termios subcomponent

esp_vfs_select_ops_t ***select**

pointer to the select subcomponent

Type Definitions

typedef int **esp_vfs_id_t**

Header File

- `components/vfs/include/esp_vfs_dev.h`
- This header file can be included with:

```
#include "esp_vfs_dev.h"
```

- This header file is a part of the API provided by the `vfs` component. To declare that your component depends on `vfs`, add the following to your `CMakeLists.txt`:

```
REQUIRES vfs
```

or

```
PRIV_REQUIRES vfs
```

Functions

void `esp_vfs_dev_uart_register` (void)

void `esp_vfs_dev_uart_use_nonblocking` (int `uart_num`)

void `esp_vfs_dev_uart_use_driver` (int `uart_num`)

int `esp_vfs_dev_uart_port_set_rx_line_endings` (int `uart_num`, `esp_line_endings_t` `mode`)

int `esp_vfs_dev_uart_port_set_tx_line_endings` (int `uart_num`, `esp_line_endings_t` `mode`)

void `esp_vfs_dev_uart_set_rx_line_endings` (`esp_line_endings_t` `mode`)

Set the line endings expected to be received on UART.

This specifies the conversion between line endings received on UART and newlines ('', LF) passed into `stdin`:

- `ESP_LINE_ENDINGS_CRLF`: convert CRLF to LF
- `ESP_LINE_ENDINGS_CR`: convert CR to LF
- `ESP_LINE_ENDINGS_LF`: no modification

Note: this function is not thread safe w.r.t. reading from UART

Parameters `mode` -- line endings expected on UART

void `esp_vfs_dev_uart_set_tx_line_endings` (`esp_line_endings_t` `mode`)

Set the line endings to sent to UART.

This specifies the conversion between newlines ('', LF) on `stdout` and line endings sent over UART:

- `ESP_LINE_ENDINGS_CRLF`: convert LF to CRLF
- `ESP_LINE_ENDINGS_CR`: convert LF to CR
- `ESP_LINE_ENDINGS_LF`: no modification

Note: this function is not thread safe w.r.t. writing to UART

Parameters `mode` -- line endings to send to UART

void `esp_vfs_usb_serial_jtag_use_driver` (void)

set VFS to use USB-SERIAL-JTAG driver for reading and writing

Note: application must configure USB-SERIAL-JTAG driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

void `esp_vfs_usb_serial_jtag_use_nonblocking` (void)

set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

Header File

- `components/esp_driver_uart/include/driver/uart_vfs.h`
- This header file can be included with:

```
#include "driver/uart_vfs.h"
```

- This header file is a part of the API provided by the `esp_driver_uart` component. To declare that your component depends on `esp_driver_uart`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_uart
```

or

```
PRIV_REQUIRES esp_driver_uart
```

Functions

void `uart_vfs_dev_register` (void)

Add `/dev/uart` virtual filesystem driver.

This function is called from startup code to enable serial output

int `uart_vfs_dev_port_set_rx_line_endings` (int `uart_num`, `esp_line_endings_t mode`)

Set the line endings expected to be received on specified UART.

This specifies the conversion between line endings received on UART and newlines ('', LF) passed into stdin:

- `ESP_LINE_ENDINGS_CRLF`: convert CRLF to LF
- `ESP_LINE_ENDINGS_CR`: convert CR to LF
- `ESP_LINE_ENDINGS_LF`: no modification

Note: this function is not thread safe w.r.t. reading from UART

Parameters

- `uart_num` -- the UART number
- `mode` -- line endings to send to UART

Returns 0 if succeeded, or -1 when an error (specified by `errno`) have occurred.

`int uart_vfs_dev_port_set_tx_line_endings` (int `uart_num`, `esp_line_endings_t` `mode`)

Set the line endings to sent to specified UART.

This specifies the conversion between newlines ('
, LF) on stdout and line endings sent over UART:

- `ESP_LINE_ENDINGS_CRLF`: convert LF to CRLF
- `ESP_LINE_ENDINGS_CR`: convert LF to CR
- `ESP_LINE_ENDINGS_LF`: no modification

Note: this function is not thread safe w.r.t. writing to UART

Parameters

- `uart_num` -- the UART number
- `mode` -- line endings to send to UART

Returns 0 if succeeded, or -1 when an error (specified by `errno`) have occurred.

`void uart_vfs_dev_use_nonblocking` (int `uart_num`)

set VFS to use simple functions for reading and writing UART

Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

Parameters `uart_num` -- UART peripheral number

`void uart_vfs_dev_use_driver` (int `uart_num`)

set VFS to use UART driver for reading and writing

Note: Application must configure UART driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

Parameters `uart_num` -- UART peripheral number

Header File

- [components/vfs/include/esp_vfs_eventfd.h](#)
- This header file can be included with:

```
#include "esp_vfs_eventfd.h"
```

REQUIRES vfs
```

or

```
PRIV_REQUIRES vfs
```

Functions

`esp_err_t esp_vfs_eventfd_register` (const `esp_vfs_eventfd_config_t` *`config`)

Registers the event vfs.

Returns `ESP_OK` if successful, `ESP_ERR_NO_MEM` if too many VFSes are registered.

esp_err_t **esp_vfs_eventfd_unregister** (void)

Unregisters the event vfs.

Returns ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn't been registered

int **eventfd** (unsigned int initval, int flags)

Structures

struct **esp_vfs_eventfd_config_t**

Eventfd vfs initialization settings.

Public Members

size_t **max_fds**

The maximum number of eventfds supported

Macros

EFD_SUPPORT_ISR

ESP_VFS_EVENTFD_CONFIG_DEFAULT ()

Header File

- `components/vfs/include/esp_vfs_null.h`
- This header file can be included with:

```
#include "esp_vfs_null.h"
```

- This header file is a part of the API provided by the `vfs` component. To declare that your component depends on `vfs`, add the following to your `CMakeLists.txt`:

```
REQUIRES vfs
```

or

```
PRIV_REQUIRES vfs
```

Functions

const *esp_vfs_t* ***esp_vfs_null_get_vfs** (void)

Get VFS structure for `/dev/null`.

Returns VFS structure for `/dev/null`

esp_err_t **esp_vfs_null_register** (void)

Register filesystem for `/dev/null`.

Returns ESP_OK on success; any other value indicates an error

2.8.12 Wear Levelling API

Overview

Most of flash memory and especially SPI flash that is used in ESP32-C5 has a sector-based organization and also has a limited number of erase/modification cycles per memory sector. The wear levelling component helps to distribute wear and tear among sectors more evenly without requiring any attention from the user.

The wear levelling component provides API functions related to reading, writing, erasing, and memory mapping of data in external SPI flash through the partition component. The component also has higher-level API functions which work with the FAT filesystem defined in *FAT filesystem*.

The wear levelling component, together with the FAT FS component, uses FAT FS sectors of 4096 bytes, which is a standard size for flash memory. With this size, the component shows the best performance but needs additional memory in RAM.

To save internal memory, the component has two additional modes which both use sectors of 512 bytes:

- **Performance mode.** Erase sector operation data is stored in RAM, the sector is erased, and then data is copied back to flash memory. However, if a device is powered off for any reason, all 4096 bytes of data is lost.
- **Safety mode.** The data is first saved to flash memory, and after the sector is erased, the data is saved back. If a device is powered off, the data can be recovered as soon as the device boots up.

The default settings are as follows:

- Sector size is 512 bytes
- Performance mode

You can change the settings through the configuration menu.

The wear levelling component does not cache data in RAM. The write and erase functions modify flash directly, and flash contents are consistent when the function returns.

Wear Levelling access API functions

This is the set of API functions for working with data in flash:

- `wl_mount` - initializes the wear levelling module and mounts the specified partition
- `wl_unmount` - unmounts the partition and deinitializes the wear levelling module
- `wl_erase_range` - erases a range of addresses in flash
- `wl_write` - writes data to a partition
- `wl_read` - reads data from a partition
- `wl_size` - returns the size of available memory in bytes
- `wl_sector_size` - returns the size of one sector

As a rule, try to avoid using raw wear levelling functions and use filesystem-specific functions instead.

Memory Size

The memory size is calculated in the wear levelling module based on partition parameters. The module uses some sectors of flash for internal data.

Application Examples

- [storage/wear_levelling](#) demonstrates how to use the wear levelling library and FatFS library to store files in a partition, as well as write and read data from these files using POSIX and C library APIs.

High-level API Reference

Header Files

- [fatfs/vfs/esp_vfs_fat.h](#)

High-level wear levelling functions `esp_vfs_fat_spiflash_mount_rw_wl()`, `esp_vfs_fat_spiflash_unmount_rw_wl()` and struct `esp_vfs_fat_mount_config_t` are described in *FAT Filesystem Support*.

Mid-level API Reference

Header File

- [components/wear_levelling/include/wear_levelling.h](#)
- This header file can be included with:

```
#include "wear_levelling.h"
```

- This header file is a part of the API provided by the `wear_levelling` component. To declare that your component depends on `wear_levelling`, add the following to your `CMakeLists.txt`:

```
REQUIRES wear_levelling
```

or

```
PRIV_REQUIRES wear_levelling
```

Functions

`esp_err_t wl_mount` (const `esp_partition_t` *partition, `wl_handle_t` *out_handle)

Mount WL for defined partition.

Parameters

- **partition** -- that will be used for access
- **out_handle** -- handle of the WL instance

Returns

- `ESP_OK`, if the WL allocation is successful;
- `ESP_ERR_INVALID_ARG`, if the arguments for WL configuration are not valid;
- `ESP_ERR_NO_MEM`, if the WL allocation fails because of insufficient memory;

`esp_err_t wl_unmount` (`wl_handle_t` handle)

Unmount WL for defined partition.

Parameters **handle** -- WL partition handle

Returns

- `ESP_OK`, if the operation is successful;
- or one of error codes from lower-level flash driver.

`esp_err_t wl_erase_range` (`wl_handle_t` handle, `size_t` start_addr, `size_t` size)

Erase part of the WL storage.

Parameters

- **handle** -- WL handle that are related to the partition
- **start_addr** -- Address from where erase operation should start. Must be aligned to the result of function `wl_sector_size(...)`.

- **size** -- Size of the range which should be erased, in bytes. Must be divisible by the result of function `wl_sector_size(...)`.

Returns

- `ESP_OK`, if the given range was erased successfully;
- `ESP_ERR_INVALID_ARG`, if iterator or `dst` are `NULL`;
- `ESP_ERR_INVALID_SIZE`, if erase would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

`esp_err_t wl_write (wl_handle_t handle, size_t dest_addr, const void *src, size_t size)`

Write data to the WL storage.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `wl_erase_range` function.

Note: Prior to writing to WL storage, make sure it has been erased with `wl_erase_range` call.

Parameters

- **handle** -- WL handle corresponding to the WL partition
- **dest_addr** -- Address where the data should be written, relative to the beginning of the partition.
- **src** -- Pointer to the source buffer. Pointer must be non-`NULL` and buffer must be at least 'size' bytes long.
- **size** -- Size of data to be written, in bytes.

Returns

- `ESP_OK`, if data was written successfully;
- `ESP_ERR_INVALID_ARG`, if `dst_offset` exceeds partition size;
- `ESP_ERR_INVALID_SIZE`, if write would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

`esp_err_t wl_read (wl_handle_t handle, size_t src_addr, void *dest, size_t size)`

Read data from the WL storage.

Parameters

- **handle** -- WL module instance that was initialized before
- **dest** -- Pointer to the buffer where data should be stored. The Pointer must be non-`NULL` and the buffer must be at least 'size' bytes long.
- **src_addr** -- Address of the data to be read, relative to the beginning of the partition.
- **size** -- Size of data to be read, in bytes.

Returns

- `ESP_OK`, if data was read successfully;
- `ESP_ERR_INVALID_ARG`, if `src_offset` exceeds partition size;
- `ESP_ERR_INVALID_SIZE`, if read would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

`size_t wl_size (wl_handle_t handle)`

Get the actual flash size in use for the WL storage partition.

Parameters **handle** -- WL module handle that was initialized before

Returns usable size, in bytes

`size_t wl_sector_size (wl_handle_t handle)`

Get sector size of the WL instance.

Parameters **handle** -- WL module handle that was initialized before

Returns sector size, in bytes

Macros

`WL_INVALID_HANDLE`

Type Definitions

```
typedef int32_t wl_handle_t
    wear levelling handle
```

2.8.13 Storage Security

Overview of Available Resources

Data privacy is achieved by using the *Flash Encryption* feature. This mechanism is currently used by FATFS and LittleFS and is recommended for new storage type implementations based on the Partitions API. NVS storage uses a proprietary *NVS encryption* implementation.

Workflows focused on overall system security are described in the *Security Features Enablement Workflows*. Workflows related to the combination of multiple secured storage components in one project are presented in the *Flash Encryption Example*.

Table 5: Relevant storage security examples

Link	Description
nvs_encryption_hmac	Demonstrates NVS encryption with an HMAC-based encryption key protection scheme.
flash_encryption	Provides a combined example showing the coexistence of NVS encryption, FATFS encryption, and encrypted custom data access via the Partitions API. Security related workflows for both development and production are also provided.

2.8.14 Examples

Table 6: NVS API examples

Code Example	Description
nvs_rw_blob	Shows the use of the C-style API to read and write blob data types in NVS flash.
nvs_rw_value	Shows the use of the C-style API to read and write integer data types in NVS flash.
nvs_rw_value_cxx	Shows the use of the C++-style API to read and write integer data types in NVS flash.
nvsgen	Demonstrates how to use the Python-based NVS image generation tool to create an NVS partition image from the contents of a CSV file.

Table 7: Common Filesystem API

Code Example	Description
fatfs/getting_started	Demonstrates basic common file API (stdio.h) usage over internal flash using FATFS.
fatfs/fs_operations	Demonstrates POSIX API for filesystem manipulation, such as moving, removing and renaming files.

Table 8: FATFS API examples

Code Example	Description
fatfsgen	Demonstrates the capabilities of Python-based tooling for FATFS images available on host computers.
ext_flash_fatfs	Demonstrates using FATFS over wear leveling on external flash.
wear_leveling	Demonstrates using FATFS over wear leveling on internal flash.

Table 9: SPIFFS API examples

Code Example	Description
spiffs	Shows the use of the SPIFFS API to initialize the filesystem and work with files using POSIX functions.
spiffsgen	Demonstrates the capabilities of Python-based tooling for SPIFFS images available on host computers.

Table 10: Partition API examples

Code Example	Description
partition_api	Provides an overview of API functions to look up particular partitions, perform basic I/O operations, and use partitions via CPU memory mapping.
parttool	Demonstrates the capabilities of Python-based tooling for partition images available on host computers.

Table 11: VFS related examples

Code Example	Description
littlefs	Shows the use of the LittleFS component to initialize the filesystem and work with a file using POSIX functions.
semihost_vfs	Demonstrates the use of the VFS API to let an ESP-based device access a file on a JTAG-connected host using POSIX functions.

2.9 System API

2.9.1 App Image Format

Application Image Structures

An application image consists of the following:

1. The `esp_image_header_t` structure describes the mode of SPI flash and the count of memory segments.
2. The `esp_image_segment_header_t` structure describes each segment, its length, and its location in ESP32-C5's memory, followed by the data with a length of `data_len`. The data offset for each segment in the image is calculated in the following way:
 - offset for 0 Segment = `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t)`
 - offset for 1 Segment = offset for 0 Segment + length of 0 Segment + `sizeof(esp_image_segment_header_t)`
 - offset for 2 Segment = offset for 1 Segment + length of 1 Segment + `sizeof(esp_image_segment_header_t)`
 - ...

The count of each segment is defined in the `segment_count` field that is stored in `esp_image_header_t`. The count cannot be more than `ESP_IMAGE_MAX_SEGMENTS`.

To get the list of your image segments, please run the following command:

```
esptool.py --chip esp32c5 image_info build/app.bin
```

```

esptool.py v2.3.1
Image version: 1
Entry point: 40080ea4
13 segments

```

For more details on the type of memory segments and their address ranges, see [ESP32-C5 Technical Reference Manual > System and Memory > Internal Memory \[PDF\]](#).

- The image has a single checksum byte after the last segment. This byte is written on a sixteen byte padded boundary, so the application image might need padding.
- If the `hash_appended` field from `esp_image_header_t` is set then a SHA256 checksum will be appended. The value of the SHA256 hash is calculated on the range from the first byte and up to this field. The length of this field is 32 bytes.
- If the option `CONFIG_SECURE_SIGNED_APPS_SCHEME` is set to ECDSA then the application image will have an additional 68 bytes for an ECDSA signature, which includes:
 - version word (4 bytes)

- signature data (64 bytes)
6. If the option `CONFIG_SECURE_SIGNED_APPS_SCHEME` is set to RSA or ECDSA (V2) then the application image will have an additional signature sector of 4 KB in size. For more details on the format of this signature sector, please refer to *Signature Block Format*.

Application Description

The DROM segment of the application binary starts with the `esp_app_desc_t` structure which carries specific fields describing the application:

- `magic_word`: the magic word for the `esp_app_desc_t` structure
- `secure_version`: see *Anti-rollback*
- `version`: see *App version*¹
- `project_name`: filled from `PROJECT_NAME`¹
- `time and date`: compile time and date
- `idf_ver`: version of ESP-IDF¹
- `app_elf_sha256`: contains SHA256 hash for the application ELF file

This structure is useful for identification of images uploaded via Over-the-Air (OTA) updates because it has a fixed offset = `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t)`. As soon as a device receives the first fragment containing this structure, it has all the information to determine whether the update should be continued with or not.

To obtain the `esp_app_desc_t` structure for the currently running application, use `esp_app_get_description()`.

To obtain the `esp_app_desc_t` structure for another OTA partition, use `esp_ota_get_partition_description()`.

Adding a Custom Structure to an Application

Users also have the opportunity to have similar structure with a fixed offset relative to the beginning of the image.

The following pattern can be used to add a custom structure to your image:

```
const __attribute__((section(".rodata_custom_desc"))) esp_custom_app_desc_t custom_
↪app_desc = { ... }
```

Offset for custom structure is `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t) + sizeof(esp_app_desc_t)`.

To guarantee that the custom structure is located in the image even if it is not used, you need to add `target_link_libraries(${COMPONENT_TARGET} "-u custom_app_desc")` into `CMakeLists.txt`.

API Reference

Header File

- `components/bootloader_support/include/esp_app_format.h`
- This header file can be included with:

```
#include "esp_app_format.h"
```

- This header file is a part of the API provided by the `bootloader_support` component. To declare that your component depends on `bootloader_support`, add the following to your `CMakeLists.txt`:

¹ The maximum length is 32 characters, including null-termination character. For example, if the length of `PROJECT_NAME` exceeds 31 characters, the excess characters will be disregarded.

```
REQUIRES bootloader_support
```

or

```
PRIV_REQUIRES bootloader_support
```

Structures

struct **esp_image_header_t**

Main header of binary image.

Public Members

uint8_t **magic**

Magic word ESP_IMAGE_HEADER_MAGIC

uint8_t **segment_count**

Count of memory segments

uint8_t **spi_mode**

flash read mode (esp_image_spi_mode_t as uint8_t)

uint8_t **spi_speed**

flash frequency (esp_image_spi_freq_t as uint8_t)

uint8_t **spi_size**

flash chip size (esp_image_flash_size_t as uint8_t)

uint32_t **entry_addr**

Entry address

uint8_t **wp_pin**

WP pin when SPI pins set via efuse (read by ROM bootloader, the IDF bootloader uses software to configure the WP pin and sets this field to 0xEE=disabled)

uint8_t **spi_pin_drv**[3]

Drive settings for the SPI flash pins (read by ROM bootloader)

esp_chip_id_t **chip_id**

Chip identification number

uint8_t **min_chip_rev**

Minimal chip revision supported by image After the Major and Minor revision eFuses were introduced into the chips, this field is no longer used. But for compatibility reasons, we keep this field and the data in it. Use min_chip_rev_full instead. The software interprets this as a Major version for most of the chips and as a Minor version for the ESP32-C3.

uint16_t **min_chip_rev_full**

Minimal chip revision supported by image, in format: major * 100 + minor

uint16_t **max_chip_rev_full**

Maximal chip revision supported by image, in format: major * 100 + minor

uint8_t **reserved**[4]

Reserved bytes in additional header space, currently unused

uint8_t **hash_appended**

If 1, a SHA256 digest "simple hash" (of the entire image) is appended after the checksum. Included in image length. This digest is separate to secure boot and only used for detecting corruption. For secure boot signed images, the signature is appended after this (and the simple hash is included in the signed data).

struct **esp_image_segment_header_t**

Header of binary image segment.

Public Members

uint32_t **load_addr**

Address of segment

uint32_t **data_len**

Length of data

Macros

ESP_IMAGE_HEADER_MAGIC

The magic word for the *esp_image_header_t* structure.

ESP_IMAGE_MAX_SEGMENTS

Max count of segments in the image.

Enumerations

enum **esp_chip_id_t**

ESP chip ID.

Values:

enumerator **ESP_CHIP_ID_ESP32**

chip ID: ESP32

enumerator **ESP_CHIP_ID_ESP32S2**

chip ID: ESP32-S2

enumerator **ESP_CHIP_ID_ESP32C3**

chip ID: ESP32-C3

enumerator **ESP_CHIP_ID_ESP32S3**

chip ID: ESP32-S3

enumerator **ESP_CHIP_ID_ESP32C2**

chip ID: ESP32-C2

enumerator **ESP_CHIP_ID_ESP32C6**

chip ID: ESP32-C6

enumerator **ESP_CHIP_ID_ESP32H2**

chip ID: ESP32-H2

enumerator **ESP_CHIP_ID_ESP32P4**

chip ID: ESP32-P4

enumerator **ESP_CHIP_ID_ESP32C5**

chip ID: ESP32-C5

enumerator **ESP_CHIP_ID_INVALID**

Invalid chip ID (we defined it to make sure the `esp_chip_id_t` is 2 bytes size)

enum **esp_image_spi_mode_t**

SPI flash mode, used in [esp_image_header_t](#).

Values:

enumerator **ESP_IMAGE_SPI_MODE_QIO**

SPI mode QIO

enumerator **ESP_IMAGE_SPI_MODE_QOUT**

SPI mode QOUT

enumerator **ESP_IMAGE_SPI_MODE_DIO**

SPI mode DIO

enumerator **ESP_IMAGE_SPI_MODE_DOUT**

SPI mode DOUT

enumerator **ESP_IMAGE_SPI_MODE_FAST_READ**

SPI mode FAST_READ

enumerator **ESP_IMAGE_SPI_MODE_SLOW_READ**

SPI mode SLOW_READ

enum **esp_image_spi_freq_t**

SPI flash clock division factor.

Values:

enumerator **ESP_IMAGE_SPI_SPEED_DIV_2**

The SPI flash clock frequency is divided by 2 of the clock source

enumerator **ESP_IMAGE_SPI_SPEED_DIV_3**

The SPI flash clock frequency is divided by 3 of the clock source

enumerator **ESP_IMAGE_SPI_SPEED_DIV_4**

The SPI flash clock frequency is divided by 4 of the clock source

enumerator **ESP_IMAGE_SPI_SPEED_DIV_1**

The SPI flash clock frequency equals to the clock source

enum **esp_image_flash_size_t**

Supported SPI flash sizes.

Values:

enumerator **ESP_IMAGE_FLASH_SIZE_1MB**

SPI flash size 1 MB

enumerator **ESP_IMAGE_FLASH_SIZE_2MB**

SPI flash size 2 MB

enumerator **ESP_IMAGE_FLASH_SIZE_4MB**

SPI flash size 4 MB

enumerator **ESP_IMAGE_FLASH_SIZE_8MB**

SPI flash size 8 MB

enumerator **ESP_IMAGE_FLASH_SIZE_16MB**

SPI flash size 16 MB

enumerator **ESP_IMAGE_FLASH_SIZE_32MB**

SPI flash size 32 MB

enumerator **ESP_IMAGE_FLASH_SIZE_64MB**

SPI flash size 64 MB

enumerator **ESP_IMAGE_FLASH_SIZE_128MB**

SPI flash size 128 MB

enumerator **ESP_IMAGE_FLASH_SIZE_MAX**

SPI flash size MAX

2.9.2 Bootloader Image Format

The bootloader image consists of the same structures as the application image, see [Application Image Structures](#). The only difference is in the [Bootloader Description](#) structure.

To get information about the bootloader image, please run the following command:

```
esptool.py --chip esp32c5 image_info build/bootloader/bootloader.bin --version 2
```

The resultant output will resemble the following:

```

File size: 26576 (bytes)

ESP32 image header
=====
Image version: 1
Entry point: 0x40080658
Segments: 4
Flash size: 2MB
Flash freq: 40m
Flash mode: DIO

ESP32 extended image header
=====
WP pin: 0xee
Flash pins drive settings: clk_drv: 0x0, q_drv: 0x0, d_drv: 0x0, cs0_drv: 0x0, hd_
↳drv: 0x0, wp_drv: 0x0
Chip ID: 0
Minimal chip revision: v0.0, (legacy min_rev = 0)
Maximal chip revision: v3.99

Segments information
=====

Bootloader information
=====
Bootloader version: 1
ESP-IDF: v5.1-dev-4304-gcb51a3b-dirty
Compile time: Mar 30 2023 19:14:17

```

Bootloader Description

The DRAM0 segment of the bootloader binary starts with the `esp_bootloader_desc_t` structure which carries specific fields describing the bootloader. This structure is located at a fixed offset = `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t)`.

- `magic_byte`: the magic byte for the `esp_bootloader_desc` structure
- `reserved`: reserved for the future IDF use
- `secure_version`: the secure version used by the bootloader anti-rollback feature, see [CONFIG_BOOTLOADER_ANTI_ROLLBACK_ENABLE](#).
- `version`: bootloader version, see [CONFIG_BOOTLOADER_PROJECT_VER](#)
- `idf_ver`: ESP-IDF version.¹
- `date and time`: compile date and time
- `reserved2`: reserved for the future IDF use

To get the `esp_bootloader_desc_t` structure from the running bootloader, use `esp_bootloader_get_description()`.

¹ The maximum length is 32 characters, including null-termination character.

To get the `esp_bootloader_desc_t` structure from a running application, use `esp_ota_get_bootloader_description()`.

API Reference

Header File

- `components/esp_bootloader_format/include/esp_bootloader_desc.h`
- This header file can be included with:

```
#include "esp_bootloader_desc.h"
```

- This header file is a part of the API provided by the `esp_bootloader_format` component. To declare that your component depends on `esp_bootloader_format`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_bootloader_format
```

or

```
PRIV_REQUIRES esp_bootloader_format
```

Functions

const `esp_bootloader_desc_t`***esp_bootloader_get_description** (void)

Return `esp_bootloader_desc` structure.

Intended for use by the bootloader.

Returns Pointer to `esp_bootloader_desc` structure.

Structures

struct **esp_bootloader_desc_t**

Bootloader description structure.

Public Members

uint8_t **magic_byte**

Magic byte `ESP_BOOTLOADER_DESC_MAGIC_BYTE`

uint8_t **reserved**[2]

reserved for IDF

uint8_t **secure_version**

The version used by bootloader anti-rollback feature

uint32_t **version**

Bootloader version

char **idf_ver**[32]

Version IDF

char **date_time**[24]

Compile date and time

uint8_t **reserved2**[16]
reserved for IDF

Macros

ESP_BOOTLOADER_DESC_MAGIC_BYTE

The magic byte for the esp_bootloader_desc structure that is in DRAM.

2.9.3 Application Level Tracing

Overview

ESP-IDF provides a useful feature for application behavior analysis called **Application Level Tracing**. The feature can be enabled in menuconfig and allows transfer of arbitrary data between the host and ESP32-C5 via JTAG interface with minimal overhead on program execution.

Developers can use this library to send application specific state of execution to the host, and receive commands or other types of information in the opposite direction at runtime. The main use cases of this library are:

1. Collecting application specific data, see [Application Specific Tracing](#).
2. Lightweight logging to the host, see [Logging to Host](#).
3. System behaviour analysis, see [System Behavior Analysis with SEGGER SystemView](#).

Application Examples

- [system/app_trace_to_plot](#) demonstrates how to use the Application Level Tracing Library to send and plot dummy sensor data to a host via JTAG, providing a faster alternative to logging via UART.
- [system/app_trace_basic](#) demonstrates how to use the Application Level Tracing Library to log messages to a host via JTAG, providing a faster alternative to UART logs.

API Reference

Header File

- [components/app_trace/include/esp_app_trace.h](#)
- This header file can be included with:

```
#include "esp_app_trace.h"
```

- This header file is a part of the API provided by the app_trace component. To declare that your component depends on app_trace, add the following to your CMakeLists.txt:

```
REQUIRES app_trace
```

or

```
PRIV_REQUIRES app_trace
```

Functions

esp_err_t **esp_apprtrace_init** (void)

Initializes application tracing module.

Note: Should be called before any `esp_apprtrace_xxx` call.

Returns ESP_OK on success, otherwise see `esp_err_t`

void **esp_apprtrace_down_buffer_config** (uint8_t *buf, uint32_t size)

Configures down buffer.

Note: Needs to be called before attempting to receive any data using `esp_apprtrace_down_buffer_get` and `esp_apprtrace_read`. This function does not protect internal data by lock.

Parameters

- **buf** -- Address of buffer to use for down channel (host to target) data.
- **size** -- Size of the buffer.

uint8_t ***esp_apprtrace_buffer_get** (*esp_apprtrace_dest_t* dest, uint32_t size, uint32_t tmo)

Allocates buffer for trace data. Once the data in the buffer is ready to be sent, `esp_apprtrace_buffer_put` must be called to indicate it.

Parameters

- **dest** -- Indicates HW interface to send data.
- **size** -- Size of data to write to trace buffer.
- **tmo** -- Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

Returns non-NULL on success, otherwise NULL.

esp_err_t **esp_apprtrace_buffer_put** (*esp_apprtrace_dest_t* dest, uint8_t *ptr, uint32_t tmo)

Indicates that the data in the buffer is ready to be sent. This function is a counterpart of and must be preceded by `esp_apprtrace_buffer_get`.

Parameters

- **dest** -- Indicates HW interface to send data. Should be identical to the same parameter in call to `esp_apprtrace_buffer_get`.
- **ptr** -- Address of trace buffer to release. Should be the value returned by call to `esp_apprtrace_buffer_get`.
- **tmo** -- Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

Returns ESP_OK on success, otherwise see `esp_err_t`

esp_err_t **esp_apprtrace_write** (*esp_apprtrace_dest_t* dest, const void *data, uint32_t size, uint32_t tmo)

Writes data to trace buffer.

Parameters

- **dest** -- Indicates HW interface to send data.
- **data** -- Address of data to write to trace buffer.
- **size** -- Size of data to write to trace buffer.
- **tmo** -- Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

Returns ESP_OK on success, otherwise see `esp_err_t`

int **esp_apprtrace_vprintf_to** (*esp_apprtrace_dest_t* dest, uint32_t tmo, const char *fmt, va_list ap)

vprintf-like function to send log messages to host via specified HW interface.

Parameters

- **dest** -- Indicates HW interface to send data.

- **tmo** -- Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.
- **fmt** -- Address of format string.
- **ap** -- List of arguments.

Returns Number of bytes written.

int **esp_apprtrace_vprintf** (const char *fmt, va_list ap)

vprintf-like function to send log messages to host.

Parameters

- **fmt** -- Address of format string.
- **ap** -- List of arguments.

Returns Number of bytes written.

esp_err_t **esp_apprtrace_flush** (*esp_apprtrace_dest_t* dest, uint32_t tmo)

Flushes remaining data in trace buffer to host.

Parameters

- **dest** -- Indicates HW interface to flush data on.
- **tmo** -- Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

Returns `ESP_OK` on success, otherwise see `esp_err_t`

esp_err_t **esp_apprtrace_flush_nolock** (*esp_apprtrace_dest_t* dest, uint32_t min_sz, uint32_t tmo)

Flushes remaining data in trace buffer to host without locking internal data. This is a special version of `esp_apprtrace_flush` which should be called from panic handler.

Parameters

- **dest** -- Indicates HW interface to flush data on.
- **min_sz** -- Threshold for flushing data. If current filling level is above this value, data will be flushed. TRAX destinations only.
- **tmo** -- Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

Returns `ESP_OK` on success, otherwise see `esp_err_t`

esp_err_t **esp_apprtrace_read** (*esp_apprtrace_dest_t* dest, void *data, uint32_t *size, uint32_t tmo)

Reads host data from trace buffer.

Parameters

- **dest** -- Indicates HW interface to read the data on.
- **data** -- Address of buffer to put data from trace buffer.
- **size** -- Pointer to store size of read data. Before call to this function pointed memory must hold requested size of data
- **tmo** -- Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

Returns `ESP_OK` on success, otherwise see `esp_err_t`

uint8_t ***esp_apprtrace_down_buffer_get** (*esp_apprtrace_dest_t* dest, uint32_t *size, uint32_t tmo)

Retrieves incoming data buffer if any. Once data in the buffer is processed, `esp_apprtrace_down_buffer_put` must be called to indicate it.

Parameters

- **dest** -- Indicates HW interface to receive data.
- **size** -- Address to store size of available data in down buffer. Must be initialized with requested value.
- **tmo** -- Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

Returns non-NULL on success, otherwise NULL.

esp_err_t **esp_apprtrace_down_buffer_put** (*esp_apprtrace_dest_t* dest, uint8_t *ptr, uint32_t tmo)

Indicates that the data in the down buffer is processed. This function is a counterpart of and must be preceded by `esp_apprtrace_down_buffer_get`.

Parameters

- **dest** -- Indicates HW interface to receive data. Should be identical to the same parameter in call to `esp_appttrace_down_buffer_get`.
- **ptr** -- Address of trace buffer to release. Should be the value returned by call to `esp_appttrace_down_buffer_get`.
- **tmo** -- Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

Returns `ESP_OK` on success, otherwise see `esp_err_t`

bool **esp_appttrace_host_is_connected** (*esp_appttrace_dest_t* dest)

Checks whether host is connected.

Parameters **dest** -- Indicates HW interface to use.

Returns true if host is connected, otherwise false

void ***esp_appttrace_fopen** (*esp_appttrace_dest_t* dest, const char *path, const char *mode)

Opens file on host. This function has the same semantic as 'fopen' except for the first argument.

Parameters

- **dest** -- Indicates HW interface to use.
- **path** -- Path to file.
- **mode** -- Mode string. See fopen for details.

Returns non zero file handle on success, otherwise 0

int **esp_appttrace_fclose** (*esp_appttrace_dest_t* dest, void *stream)

Closes file on host. This function has the same semantic as 'fclose' except for the first argument.

Parameters

- **dest** -- Indicates HW interface to use.
- **stream** -- File handle returned by `esp_appttrace_fopen`.

Returns Zero on success, otherwise non-zero. See fclose for details.

size_t **esp_appttrace_fwrite** (*esp_appttrace_dest_t* dest, const void *ptr, size_t size, size_t nmemb, void *stream)

Writes to file on host. This function has the same semantic as 'fwrite' except for the first argument.

Parameters

- **dest** -- Indicates HW interface to use.
- **ptr** -- Address of data to write.
- **size** -- Size of an item.
- **nmemb** -- Number of items to write.
- **stream** -- File handle returned by `esp_appttrace_fopen`.

Returns Number of written items. See fwrite for details.

size_t **esp_appttrace_fread** (*esp_appttrace_dest_t* dest, void *ptr, size_t size, size_t nmemb, void *stream)

Read file on host. This function has the same semantic as 'fread' except for the first argument.

Parameters

- **dest** -- Indicates HW interface to use.
- **ptr** -- Address to store read data.
- **size** -- Size of an item.
- **nmemb** -- Number of items to read.
- **stream** -- File handle returned by `esp_appttrace_fopen`.

Returns Number of read items. See fread for details.

int **esp_appttrace_fseek** (*esp_appttrace_dest_t* dest, void *stream, long offset, int whence)

Set position indicator in file on host. This function has the same semantic as 'fseek' except for the first argument.

Parameters

- **dest** -- Indicates HW interface to use.
- **stream** -- File handle returned by `esp_appttrace_fopen`.
- **offset** -- Offset. See fseek for details.
- **whence** -- Position in file. See fseek for details.

Returns Zero on success, otherwise non-zero. See `fseek` for details.

int `esp_apptrace_ftell` (`esp_apptrace_dest_t` dest, void *stream)

Get current position indicator for file on host. This function has the same semantic as 'ftell' except for the first argument.

Parameters

- **dest** -- Indicates HW interface to use.
- **stream** -- File handle returned by `esp_apptrace_fopen`.

Returns Current position in file. See `ftell` for details.

int `esp_apptrace_fstop` (`esp_apptrace_dest_t` dest)

Indicates to the host that all file operations are complete. This function should be called after all file operations are finished and indicate to the host that it can perform cleanup operations (close open files etc.).

Parameters **dest** -- Indicates HW interface to use.

Returns `ESP_OK` on success, otherwise see `esp_err_t`

int `esp_apptrace_feof` (`esp_apptrace_dest_t` dest, void *stream)

Test end-of-file indicator on a stream. This function has the same semantic as 'feof' except for the first argument.

Parameters

- **dest** -- Indicates HW interface to use.
- **stream** -- File handle returned by `esp_apptrace_fopen`.

Returns Non-Zero if end-of-file indicator is set for stream. See `feof` for details.

void `esp_gcov_dump` (void)

Triggers gcov info dump. This function waits for the host to connect to target before dumping data.

Enumerations

enum `esp_apptrace_dest_t`

Application trace data destinations bits.

Values:

enumerator `ESP_APPTRACE_DEST_JTAG`

JTAG destination.

enumerator `ESP_APPTRACE_DEST_TRAX`

xxx_TRAX name is obsolete, use more common xxx_JTAG

enumerator `ESP_APPTRACE_DEST_UART`

UART destination.

enumerator `ESP_APPTRACE_DEST_MAX`

enumerator `ESP_APPTRACE_DEST_NUM`

Header File

- [components/app_trace/include/esp_sysview_trace.h](#)
- This header file can be included with:

```
#include "esp_sysview_trace.h"
```

- This header file is a part of the API provided by the `app_trace` component. To declare that your component depends on `app_trace`, add the following to your `CMakeLists.txt`:

REQUIRES `app_trace`

or

PRIV_REQUIRES `app_trace`

Functions

static inline `esp_err_t esp_sysview_flush` (uint32_t tmo)

Flushes remaining data in SystemView trace buffer to host.

Parameters `tmo` -- Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

Returns `ESP_OK`.

int `esp_sysview_vprintf` (const char *format, va_list args)

vprintf-like function to send log messages to the host.

Parameters

- `format` -- Address of format string.
- `args` -- List of arguments.

Returns Number of bytes written.

`esp_err_t esp_sysview_heap_trace_start` (uint32_t tmo)

Starts SystemView heap tracing.

Parameters `tmo` -- Timeout (in us) to wait for the host to be connected. Use -1 to wait forever.

Returns `ESP_OK` on success, `ESP_ERR_TIMEOUT` if operation has been timed out.

`esp_err_t esp_sysview_heap_trace_stop` (void)

Stops SystemView heap tracing.

Returns `ESP_OK`.

void `esp_sysview_heap_trace_alloc` (void *addr, uint32_t size, const void *callers)

Sends heap allocation event to the host.

Parameters

- `addr` -- Address of allocated block.
- `size` -- Size of allocated block.
- `callers` -- Pointer to array with callstack addresses. Array size must be `CONFIG_HEAP_TRACING_STACK_DEPTH`.

void `esp_sysview_heap_trace_free` (void *addr, const void *callers)

Sends heap de-allocation event to the host.

Parameters

- `addr` -- Address of de-allocated block.
- `callers` -- Pointer to array with callstack addresses. Array size must be `CONFIG_HEAP_TRACING_STACK_DEPTH`.

2.9.4 Call Function with External Stack

Overview

A given function can be executed with a user-allocated stack space which is independent of current task stack. This mechanism can be used to save stack space wasted by tasks which call a common function with intensive stack usage such as `printf`. The given function can be called inside the shared stack space, which is a callback function deferred by calling `esp_execute_shared_stack_function()`, passing that function as a parameter.

Warning: `esp_execute_shared_stack_function()` does only minimal preparation of the provided shared stack memory. The function passed to it for execution on the shared stack space or any of that function's callees should not do any of the following:

- Use thread-local storage
- Call `vTaskDelete(NULL)` to delete the currently running task

Furthermore, backtraces will be wrong when called from the function running on the shared stack or any of its callees. The limitations are quite severe, so that we might deprecate `esp_execute_shared_stack_function()` in the future. If you have any use case which can only be implemented using `esp_execute_shared_stack_function()`, please open a [GitHub Issue](#).

Usage

`esp_execute_shared_stack_function()` takes four arguments:

- a mutex object allocated by the caller, which is used to protect if the same function shares its allocated stack
- a pointer to the top of stack used for that function
- the size of stack in bytes
- a pointer to the shared stack function

The user-defined function is deferred as a callback and can be called using the user-allocated space without taking space from current task stack.

The usage may look like the code below:

```
void external_stack_function(void)
{
    printf("Executing this printf from external stack! \n");
}

//Let us suppose we want to call printf using a separated stack space
//allowing the app to reduce its stack size.
void app_main()
{
    //Allocate a stack buffer, from heap or as a static form:
    StackType_t *shared_stack = malloc(8192 * sizeof(StackType_t));
    assert(shared_stack != NULL);

    //Allocate a mutex to protect its usage:
    SemaphoreHandle_t printf_lock = xSemaphoreCreateMutex();
    assert(printf_lock != NULL);

    //Call the desired function using the macro helper:
    esp_execute_shared_stack_function(printf_lock,
                                     shared_stack,
                                     8192,
                                     external_stack_function);

    vSemaphoreDelete(printf_lock);
    free(shared_stack);
}
```

API Reference

Header File

- `components/esp_system/include/esp_expression_with_stack.h`

- This header file can be included with:

```
#include "esp_expression_with_stack.h"
```

Functions

void **esp_execute_shared_stack_function** (*SemaphoreHandle_t* lock, void *stack, size_t stack_size, *shared_stack_function* function)

Calls function on user defined shared stack space.

After returning, the original stack is used again.

Note: if either lock, stack or stack size is invalid, the expression will be called using the current stack.

Warning: This function does minimal preparation of the provided piece of memory (*stack*). DO NOT do any of the following in *function* or any of its callees:

- Use Thread-local storage
- Use the Floating-point unit on ESP32-P4
- Use the AI co-processor on ESP32-P4
- Call `vTaskDelete(NULL)` (deleting the currently running task) Furthermore, backtraces will be wrong when called from *function* or any of its callees. The limitations are quite sever, so that we might deprecate this function in the future. If you have any use case which can only be implemented using this function, please open an issue on github.

Parameters

- **lock** -- Mutex object to protect in case of shared stack
- **stack** -- Pointer to user allocated stack
- **stack_size** -- Size of current stack in bytes
- **function** -- pointer to the shared stack function to be executed

Macros

ESP_EXECUTE_EXPRESSION_WITH_STACK (lock, stack, stack_size, expression)

Type Definitions

```
typedef void (*shared_stack_function)(void)
```

Warning: This document is not updated for ESP32C5 yet, so some of the content may not be correct.

This warning was automatically inserted due to the source file being in the *add_warnings_pages* list.

2.9.5 Chip Revision

Overview

ESP32-C5 may have different revisions. These revisions mainly fix some issues, and sometimes also bring new features to the chip. [Versioning Scheme](#) describes the versioning of these chip revisions, and the APIs to read the versions at runtime.

There are some considerations of compatibility among application, ESP-IDF version, and chip revisions:

- Applications may depend on some fixes/features provided by a chip revision.
- When using updated version of hardware, the hardware may be incompatible with earlier versions of ESP-IDF.

Compatibility Checks of ESP-IDF describes how the application can specify its chip revision requirements, and the way ESP-IDF checks the compatibility. After that, there is troubleshooting information for this mechanism.

Versioning Scheme

A chip's revision number is typically expressed as $vX.Y$, where:

- X means a **Major** wafer version. If it is changed, it means that the current software version is not compatible with this released chip and the software must be updated to use this chip.
- Y means a **Minor** wafer version. If it is changed that means the current software version is compatible with the released chip, and there is no need to update the software.

If a newly released chip does not contain breaking changes, the chip can run the same software as the previous chip. As such, the new chip's revision number will only increment the minor version while keeping the major version the same (e.g., $v1.1$ to $v1.2$).

Conversely, if a newly released chip contains breaking changes, the chip **cannot** run the same software as the previous chip. As such, the new chip's revision number will increment the major version and set the minor version to 0 (e.g., $v1.1$ to $v2.0$).

This versioning scheme was selected to indicate the derivation relationship of chip revisions, and clearly distinguish changes in chips between breaking changes and non-breaking changes.

ESP-IDF is designed to execute seamlessly on future chip minor revisions with the same logic as the chip's nearest previous minor revision. Thus, users can directly port their compiled binaries to newer MINOR chip revisions without upgrading their ESP-IDF version and re-compile the whole project.

When a binary is executed on a chip revision of unexpected MAJOR revision, the software is also able to report issues according to the MAJOR revision. The major and minor versioning scheme also allows hardware changes to be branchable.

Note: The current chip revision scheme using major and minor versions was introduced from ESP-IDF v5.0 onwards. Thus bootloaders built using earlier versions of ESP-IDF will still use the legacy chip revision scheme of wafer versions.

EFuse Bits for Chip Revisions Chips have several eFuse version fields:

- Major wafer version (`WAFER_VERSION_MAJOR` eFuse)
- Minor wafer version (`WAFER_VERSION_MINOR` eFuse)
- Ignore maximum wafer revision (`DISABLE_WAFER_VERSION_MAJOR` eFuse). See *Compatibility Checks of ESP-IDF* on how this is used.

Note: The previous versioning logic was based on a single eFuse version field (`WAFER_VERSION`). This approach makes it impossible to mark chips as breaking or non-breaking changes, and the versioning logic becomes linear.

EFuse Bits for eFuse Block Revisions eFuse block has version fields:

- Major eFuse block version (`BLK_VERSION_MAJOR` eFuse)
- Minor eFuse block version (`BLK_VERSION_MINOR` eFuse)
- Ignore maximum eFuse block revision (`DISABLE_BLK_VERSION_MAJOR` eFuse). See *Compatibility Checks of ESP-IDF* on how this is used.

Chip Revision APIs These APIs helps to get chip revision from eFuses:

- `efuse_hal_chip_revision()`. It returns revision in the `major * 100 + minor` format.
- `efuse_hal_get_major_chip_version()`. It returns Major revision of wafer.
- `efuse_hal_get_minor_chip_version()`. It returns Minor revision of wafer.

The following Kconfig definitions (in `major * 100 + minor` format) that can help add the chip revision dependency to the code:

- `CONFIG_ESP32C5_REV_MIN_FULLL`
- `CONFIG_ESP_REV_MIN_FULLL`
- `CONFIG_ESP32C5_REV_MAX_FULLL`
- `CONFIG_ESP_REV_MAX_FULLL`

EFuse Block Revision APIs These APIs helps to get eFuse block revision from eFuses:

- `efuse_hal_blk_version()`. It returns revision in the `major * 100 + minor` format.
- `efuse_ll_get_blk_version_major()`. It returns Major revision of eFuse block.
- `efuse_ll_get_blk_version_minor()`. It returns Minor revision of eFuse block.

The following Kconfig definitions (in `major * 100 + minor` format) that can help add the eFuse block revision dependency to the code:

- `CONFIG_ESP_EFUSE_BLOCK_REV_MIN_FULLL`
- `CONFIG_ESP_EFUSE_BLOCK_REV_MAX_FULLL`

Compatibility Checks of ESP-IDF

When building an application that needs to support multiple revisions of a particular chip, the minimum and maximum chip revision numbers supported by the build are specified via Kconfig.

The minimum chip revision can be configured via the `CONFIG_ESP32C5_REV_MIN` option. Specifying the minimum chip revision will limit the software to only run on a chip revisions that are high enough to support some features or bugfixes.

The maximum chip revision cannot be configured and is automatically determined by the current ESP-IDF version being used. ESP-IDF will refuse to boot any chip revision exceeding the maximum chip revision. Given that it is impossible for a particular ESP-IDF version to foresee all future chip revisions, the maximum chip revision is usually set to `maximum supported MAJOR version + 99`. The "Ignore Maximum Revision" eFuse can be set to bypass the maximum revision limitation. However, the software is not guaranteed to work if the maximum revision is ignored.

The eFuse block revision is similar to the chip revision, but it mainly affects the coefficients that are specified in the eFuse (e.g. ADC calibration coefficients).

Below is the information about troubleshooting when the chip revision fails the compatibility check. Then there are technical details of the checking and software behavior on earlier version of ESP-IDF.

Troubleshooting

1. If the second stage bootloader is run on a chip revision smaller than minimum revision specified in the image (i.e., the application), a reboot occurs. The following message will be printed:

```
Image requires chip rev >= v3.0, but chip is v1.0
```

To resolve this issue,

- Use a chip with the required minimum revision or higher.
 - Lower the `CONFIG_ESP32C5_REV_MIN` value and rebuild the image so that it is compatible with the chip revision being used.
2. If application does not match minimum and maximum chip revisions, a reboot occurs. The following message will be printed:

```
Image requires chip rev <= v2.99, but chip is v3.0
```

To resolve this issue, update ESP-IDF to a newer version that supports the chip's revision (`CONFIG_ESP32C5_REV_MAX_FULL`). Alternatively, set the `Ignore maximal revision` bit in eFuse or use a chip revision that is compatible with the current version of ESP-IDF.

Representing Revision Requirements of a Binary Image For the chip revision, the second stage bootloader and the application binary images contain the `esp_image_header_t` header, which stores information specifying the chip revisions that the image is permitted to run on. This header has 3 fields related to the chip revisions:

- `min_chip_rev` - Minimum chip MAJOR revision required by image (but for ESP32-C3 it is MINOR revision). Its value is determined by `CONFIG_ESP32C5_REV_MIN`.
- `min_chip_rev_full` - Minimum chip MINOR revision required by image in format: `major * 100 + minor`. Its value is determined by `CONFIG_ESP32C5_REV_MIN`.
- `max_chip_rev_full` - Maximum chip revision required by image in format: `major * 100 + minor`. Its value is determined by `CONFIG_ESP32C5_REV_MAX_FULL`. It can not be changed by user. Only Espressif can change it when a new version will be supported in ESP-IDF.

For the eFuse revision, the requirements are stored in `esp_app_desc_t`, which is contained in the application binary image. We only check the application image because the eFuse block revision mostly affects the ADC calibration, which does not really matter in the bootloader. There are 2 fields related to eFuse block revisions:

- `min_efuse_blk_rev_full` - Minimum eFuse block MINOR revision required by image in format: `major * 100 + minor`. Its value is determined by `CONFIG_ESP_EFUSE_BLOCK_REV_MIN_FULL`.
- `max_efuse_blk_rev_full` - Maximum eFuse block MINOR revision required by image in format: `major * 100 + minor`. Its value is determined by `CONFIG_ESP_EFUSE_BLOCK_REV_MAX_FULL`. It reflects whether the current IDF version supports this efuse block format or not, and should not be changed by the user.

Maximum And Minimum Revision Restrictions The order for checking the minimum and maximum revisions during application boot up is as follows:

1. The first stage (ROM) bootloader does not check minimum and maximum revision fields from `esp_image_header_t` before running the 2nd stage bootloader.
2. The initialization phase of the second stage bootloader checks that the second stage bootloader itself can be launched on the chip of this revision. It extracts the minimum revision from the header of the bootloader image and checks against the chip revision from eFuses. If the chip revision is less than the minimum revision, the bootloader refuses to boot up and aborts. The maximum revision is not checked at this phase.
3. Then the second stage bootloader checks the revision requirements of the application. It extracts the minimum and maximum revisions of the chip from the application image header, and the eFuse block from the segment header. Then the bootloader checks these versions against the chip and eFuse block revision from eFuses. If the these revisions are less than their minimum revision or higher than the maximum revision, the bootloader refuses to boot up and aborts. However, if the ignore maximum revision bit is set, the maximum revision constraint can be ignored. The ignore bits are set by the customer themselves when there is confirmation that the software is able to work with this chip revision or eFuse block revision.
4. Furthermore, at the OTA update stage, the running application checks if the new software matches the chip revision and eFuse block revision. It extracts the minimum and maximum chip revisions from the header of the new application image and the eFuse block constraints from the application description to check against the these revisions from eFuses. It checks for revisions matching in the same way that the bootloader does, so that the chip and eFuse block revisions are between their min and max revisions (logic of ignoring max revision also applies).

Backward Compatibility with Bootloaders Built by Older ESP-IDF Versions Please check the chip version using `esptool chip_id` command.

API Reference

Header File

- [components/hal/include/hal/efuse_hal.h](#)
- This header file can be included with:

```
#include "hal/efuse_hal.h"
```

Functions

void **efuse_hal_get_mac** (uint8_t *mac)

get factory mac address

uint32_t **efuse_hal_chip_revision** (void)

Returns chip version.

Returns Chip version in format: Major * 100 + Minor

uint32_t **efuse_hal_blk_version** (void)

Return block version.

Returns Block version in format: Major * 100 + Minor

bool **efuse_hal_flash_encryption_enabled** (void)

Is flash encryption currently enabled in hardware?

Flash encryption is enabled if the FLASH_CRYPT_CNT efuse has an odd number of bits set.

Returns true if flash encryption is enabled.

bool **efuse_hal_get_disable_wafer_version_major** (void)

Returns the status of whether the bootloader (and OTA) will check the maximum chip version or not.

Returns true - Skip the maximum chip version check.

bool **efuse_hal_get_disable_blk_version_major** (void)

Returns the status of whether the app start-up (and OTA) will check the efuse block version or not.

Returns true - Skip the efuse block version check.

uint32_t **efuse_hal_get_major_chip_version** (void)

Returns major chip version.

uint32_t **efuse_hal_get_minor_chip_version** (void)

Returns minor chip version.

void **efuse_hal_set_ecdsa_key** (int efuse_key_blk)

Set the efuse block that should be used as ECDSA private key.

Note: The efuse block must be burnt with key purpose ECDSA_KEY

Parameters **efuse_key_blk** -- Efuse key block number (Must be in [EFUSE_BLK_KEY0...EFUSE_BLK_KEY_MAX - 1] range)

2.9.6 Console

ESP-IDF provides `console` component, which includes building blocks needed to develop an interactive console over serial port. This component includes the following features:

- Line editing, provided by `linenoise` library. This includes handling of backspace and arrow keys, scrolling through command history, command auto-completion, and argument hints.
- Splitting of command line into arguments.
- Argument parsing, provided by `argtable3` library. This library includes APIs used for parsing GNU style command line arguments.
- Functions for registration and dispatching of commands.
- Functions to establish a basic REPL (Read-Evaluate-Print-Loop) environment.

Note: These features can be used together or independently. For example, it is possible to use line editing and command registration features, but use `getopt` or custom code for argument parsing, instead of `argtable3`. Likewise, it is possible to use simpler means of command input (such as `fgets`) together with the rest of the means for command splitting and argument parsing.

Note: When using a console application on a chip that supports a hardware USB serial interface, we suggest to disable the secondary serial console output. The secondary output will be output-only and consequently does not make sense in an interactive application.

Line Editing

Line editing feature lets users compose commands by typing them, erasing symbols using the `backspace` key, navigating within the command using the left/right keys, navigating to previously typed commands using the up/down keys, and performing autocompletion using the `tab` key.

Note: This feature relies on ANSI escape sequence support in the terminal application. As such, serial monitors which display raw UART data can not be used together with the line editing library. If you see `[6n` or similar escape sequence when running `system/console` example instead of a command prompt (e.g., `esp>`), it means that the serial monitor does not support escape sequences. Programs which are known to work are GNU `screen`, `minicom`, and `esp-idf-monitor` (which can be invoked using `idf.py monitor` from project directory).

Here is an overview of functions provided by `linenoise` library.

Configuration `Linenoise` library does not need explicit initialization. However, some configuration defaults may need to be changed before invoking the main line editing function.

- `linenoiseClearScreen()`
Clear terminal screen using an escape sequence and position the cursor at the top left corner.
- `linenoiseSetMultiLine()`
Switch between single line and multi line editing modes. In single line mode, if the length of the command exceeds the width of the terminal, the command text is scrolled within the line to show the end of the text. In this case the beginning of the text is hidden. Single line mode needs less data to be sent to refresh screen on each key press, so exhibits less glitching compared to the multi line mode. On the flip side, editing commands and copying command text from terminal in single line mode is harder. Default is single line mode.
- `linenoiseAllowEmpty()`
Set whether `linenoise` library returns a zero-length string (if `true`) or `NULL` (if `false`) for empty lines. By default, zero-length strings are returned.
- `linenoiseSetMaxLineLen()`

Set maximum length of the line for linenoise library. Default length is 4096 bytes. The default value can be updated to optimize RAM memory usage.

Main Loop

- `linenoise()`
In most cases, console applications have some form of read/eval loop. `linenoise()` is the single function which handles user's key presses and returns the completed line once the `enter` key is pressed. As such, it handles the `read` part of the loop.
- `linenoiseFree()`
This function must be called to release the command line buffer obtained from `linenoise()` function.

Hints and Completions

- `linenoiseSetCompletionCallback()`
When the user presses the `tab` key, linenoise library invokes the completion callback. The callback should inspect the contents of the command typed so far and provide a list of possible completions using calls to `linenoiseAddCompletion()` function. `linenoiseSetCompletionCallback()` function should be called to register this completion callback, if completion feature is desired. `console` component provides a ready made function to provide completions for registered commands, `esp_console_get_completion()` (see below).
- `linenoiseAddCompletion()`
Function to be called by completion callback to inform the library about possible completions of the currently typed command.
- `linenoiseSetHintsCallback()`
Whenever user input changes, linenoise invokes the hints callback. This callback can inspect the command line typed so far, and provide a string with hints (which can include list of command arguments, for example). The library then displays the hint text on the same line where editing happens, possibly with a different color.
- `linenoiseSetFreeHintsCallback()`
If the hint string returned by hints callback is dynamically allocated or needs to be otherwise recycled, the function which performs such cleanup should be registered via `linenoiseSetFreeHintsCallback()`.

History

- `linenoiseHistorySetMaxLen()`
This function sets the number of most recently typed commands to be kept in memory. Users can navigate the history using the up/down arrows keys.
- `linenoiseHistoryAdd()`
Linenoise does not automatically add commands to history. Instead, applications need to call this function to add command strings to the history.
- `linenoiseHistorySave()`
Function saves command history from RAM to a text file, for example on an SD card or on a filesystem in flash memory.
- `linenoiseHistoryLoad()`
Counterpart to `linenoiseHistorySave()`, loads history from a file.
- `linenoiseHistoryFree()`
Releases memory used to store command history. Call this function when done working with linenoise library.

Splitting of Command Line into Arguments

`console` component provides `esp_console_split_argv()` function to split command line string into arguments. The function returns the number of arguments found (`argc`) and fills an array of pointers which can be passed as `argv` argument to any function which accepts arguments in `argc, argv` format.

The command line is split into arguments according to the following rules:

- Arguments are separated by spaces
- If spaces within arguments are required, they can be escaped using `\` (backslash) character.

- Other escape sequences which are recognized are `\\` (which produces literal backslash) and `\"`, which produces a double quote.
- Arguments can be quoted using double quotes. Quotes may appear only in the beginning and at the end of the argument. Quotes within the argument must be escaped as mentioned above. Quotes surrounding the argument are stripped by `esp_console_split_argv` function.

Examples:

- `abc def 1 20 .3 > [abc, def, 1, 20, .3]`
- `abc "123 456" def > [abc, 123 456, def]`
- ``a\ b\\c\" > [a b\c"]`

Argument Parsing

For argument parsing, `console` component includes `argtable3` library. Please see [tutorial](#) for an introduction to `argtable3`. Github repository also includes [examples](#).

Command Registration and Dispatching

`console` component includes utility functions which handle registration of commands, matching commands typed by the user to registered ones, and calling these commands with the arguments given on the command line.

Application first initializes command registration module using a call to `esp_console_init()`, and calls `esp_console_cmd_register()` function to register command handlers.

For each command, application provides the following information (in the form of `esp_console_cmd_t` structure):

- Command name (string without spaces)
- Help text explaining what the command does
- Optional hint text listing the arguments of the command. If application uses `Argtable3` for argument parsing, hint text can be generated automatically by providing a pointer to `argtable` argument definitions structure instead.
- Command handler function (without context), or
- Command handler function (with context). If this function is given, an additional call to `esp_console_cmd_set_context()` must follow *before* the command may be called to initialize the context.

Note: You can either use a command handler function which takes a context or a command handler function which does not take a context, not both. If you use the command handler function which takes a context, you **MUST** call `esp_console_cmd_set_context()` to initialize its context, otherwise the function may access the uninitialized context.

A few other functions are provided by the command registration module:

- `esp_console_run()`
This function takes the command line string, splits it into `argc/argv` argument list using `esp_console_split_argv()`, looks up the command in the list of registered components, and if it is found, executes its handler.
- `esp_console_register_help_command()`
Adds help command to the list of registered commands. This command prints the list of all the registered commands, along with their arguments and help texts.
- `esp_console_get_completion()`
Callback function to be used with `linenoiseSetCompletionCallback()` from `linenoise` library. Provides completions to `linenoise` based on the list of registered commands.
- `esp_console_get_hint()`
Callback function to be used with `linenoiseSetHintsCallback()` from `linenoise` library. Provides argument hints for registered commands to `linenoise`.

Initialize Console REPL Environment

To establish a basic REPL environment, `console` component provides several useful APIs, combining those functions described above.

In a typical application, you only need to call `esp_console_new_repl_uart()` to initialize the REPL environment based on UART device, including driver install, basic console configuration, spawning a thread to do REPL task and register several useful commands (e.g., `help`).

After that, you can register your own commands with `esp_console_cmd_register()`. The REPL environment keeps in init state until you call `esp_console_start_repl()`.

Likewise, if your REPL environment is based on USB_SERIAL_JTAG device, you only need to call `esp_console_new_repl_usb_serial_jtag()` at first step. Then call other functions as usual.

Application Examples

- [system/console/basic](#) demonstrates how to use the REPL (Read-Eval-Print Loop) APIs of the Console Component to create an interactive shell on ESP32-C5, which can be controlled over a serial interface, supporting UART and USB interfaces, and can serve as a basis for applications requiring a command-line interface.
- [system/console/advanced](#) demonstrates how to use the Console Component to create an interactive shell on ESP32-C5, which can be controlled over a serial interface, supporting UART and USB interfaces, providing a basis for applications that require a command-line interface.

API Reference

Header File

- [components/console/esp_console.h](#)
- This header file can be included with:

```
#include "esp_console.h"
```

- This header file is a part of the API provided by the `console` component. To declare that your component depends on `console`, add the following to your CMakeLists.txt:

```
REQUIRES console
```

or

```
PRIV_REQUIRES console
```

Functions

`esp_err_t esp_console_init` (const `esp_console_config_t` *config)

initialize console module

Note: Call this once before using other console module features

Parameters `config` -- console configuration

Returns

- ESP_OK on success
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_STATE if already initialized
- ESP_ERR_INVALID_ARG if the configuration is invalid

esp_err_t **esp_console_deinit** (void)

de-initialize console module

Note: Call this once when done using console module functions

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized yet

esp_err_t **esp_console_cmd_register** (const *esp_console_cmd_t* *cmd)

Register console command.

Note: If the member `func_w_context` of `cmd` is set instead of `func`, then the member `context` is passed to the function pointed to by `func_w_context`.

Parameters `cmd` -- pointer to the command description; can point to a temporary value

Returns

- ESP_OK on success
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_ARG if command description includes invalid arguments
- ESP_ERR_INVALID_ARG if both `func` and `func_w_context` members of `cmd` are non-NULL
- ESP_ERR_INVALID_ARG if both `func` and `func_w_context` members of `cmd` are NULL

esp_err_t **esp_console_cmd_deregister** (const char *cmd_name)

Deregister console command.

Parameters `cmd_name` -- Name of the command to be deregistered. Must not be NULL, must not contain spaces.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if command is not registered

esp_err_t **esp_console_run** (const char *cmdline, int *cmd_ret)

Run command line.

Parameters

- `cmdline` -- command line (command name followed by a number of arguments)
- `cmd_ret` -- [out] return code from the command (set if command was run)

Returns

- ESP_OK, if command was run
- ESP_ERR_INVALID_ARG, if the command line is empty, or only contained whitespace
- ESP_ERR_NOT_FOUND, if command with given name wasn't registered
- ESP_ERR_INVALID_STATE, if `esp_console_init` wasn't called

size_t **esp_console_split_argv** (char *line, char **argv, size_t argv_size)

Split command line into arguments in place.

```
* - This function finds whitespace-separated arguments in the given input line.
*
*   'abc def 1 20 .3' -> [ 'abc', 'def', '1', '20', '.3' ]
*
* - Argument which include spaces may be surrounded with quotes. In this case
```

(continues on next page)

(continued from previous page)

```

*   spaces are preserved and quotes are stripped.
*
*   'abc "123 456" def' -> [ 'abc', '123 456', 'def' ]
*
* - Escape sequences may be used to produce backslash, double quote, and space:
*
*   'a\ b\\c\"' -> [ 'a b\c"' ]
*

```

Note: Pointers to at most `argv_size - 1` arguments are returned in `argv` array. The pointer after the last one (i.e. `argv[argc]`) is set to `NULL`.

Parameters

- **line** -- pointer to buffer to parse; it is modified in place
- **argv** -- array where the pointers to arguments are written
- **argv_size** -- number of elements in `argv_array` (max. number of arguments)

Returns number of arguments found (`argc`)

void **esp_console_get_completion** (const char *buf, *linenoiseCompletions* *lc)

Callback which provides command completion for linenoise library.

When using linenoise for line editing, command completion support can be enabled like this:

```
linenoiseSetCompletionCallback(&esp_console_get_completion);
```

Parameters

- **buf** -- the string typed by the user
- **lc** -- *linenoiseCompletions* to be filled in

const char ***esp_console_get_hint** (const char *buf, int *color, int *bold)

Callback which provides command hints for linenoise library.

When using linenoise for line editing, hints support can be enabled as follows:

```
linenoiseSetHintsCallback((linenoiseHintsCallback*) &esp_console_get_hint);
```

The extra cast is needed because `linenoiseHintsCallback` is defined as returning a `char*` instead of `const char*`.

Parameters

- **buf** -- line typed by the user
- **color** -- **[out]** ANSI color code to be used when displaying the hint
- **bold** -- **[out]** set to 1 if hint has to be displayed in bold

Returns string containing the hint text. This string is persistent and should not be freed (i.e. `linenoiseSetFreeHintsCallback` should not be used).

esp_err_t **esp_console_register_help_command** (void)

Register a 'help' command.

Default 'help' command prints the list of registered commands along with hints and help strings if no additional argument is given. If an additional argument is given, the help command will look for a command with the same name and only print the hints and help strings of that command.

Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE`, if `esp_console_init` wasn't called

esp_err_t **esp_console_set_help_verbose_level** (*esp_console_help_verbose_level_e* verbose_level)

Set the verbose level for 'help' command.

Set the verbose level for 'help' command. Higher verbose level shows more details. Valid `verbose_level` values are described in `esp_console_help_verbose_level_e` and must be lower than `ESP_CONSOLE_HELP_VERBOSE_LEVEL_MAX_NUM`.

Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG`, if invalid verbose level is provided

esp_err_t **esp_console_new_repl_uart** (const *esp_console_dev_uart_config_t* *dev_config, const *esp_console_repl_config_t* *repl_config, *esp_console_repl_t* **ret_repl)

Establish a console REPL environment over UART driver.

Attention This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying `linenoise` and `esp_console` functions.

Note: This is an all-in-one function to establish the environment needed for REPL, includes:

- Install the UART driver on the console UART (8n1, 115200, REF_TICK clock source)
- Configures the stdin/stdout to go through the UART driver
- Initializes `linenoise`
- Spawn new thread to run REPL in the background

Parameters

- **dev_config** -- [in] UART device configuration
- **repl_config** -- [in] REPL configuration
- **ret_repl** -- [out] return REPL handle after initialization succeed, return NULL otherwise

Returns

- `ESP_OK` on success
- `ESP_FAIL` Parameter error

esp_err_t **esp_console_new_repl_usb_serial_jtag** (const *esp_console_dev_usb_serial_jtag_config_t* *dev_config, const *esp_console_repl_config_t* *repl_config, *esp_console_repl_t* **ret_repl)

Establish a console REPL (Read-eval-print loop) environment over USB-SERIAL-JTAG.

Attention This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying `linenoise` and `esp_console` functions.

Note: This is an all-in-one function to establish the environment needed for REPL, includes:

- Initializes `linenoise`
- Spawn new thread to run REPL in the background

Parameters

- **dev_config** -- [in] USB-SERIAL-JTAG configuration
- **repl_config** -- [in] REPL configuration
- **ret_repl** -- [out] return REPL handle after initialization succeed, return NULL otherwise

Returns

- `ESP_OK` on success
- `ESP_FAIL` Parameter error

esp_err_t **esp_console_start_repl** (*esp_console_repl_t* *repl)

Start REPL environment.

Note: Once the REPL gets started, it won't be stopped until the user calls `repl->del(repl)` to destroy the REPL environment.

Parameters `repl` -- [in] REPL handle returned from `esp_console_new_repl_xxx`

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE, if repl has started already

Structures

struct **esp_console_config_t**

Parameters for console initialization.

Public Members

size_t **max_cmdline_length**

length of command line buffer, in bytes

size_t **max_cmdline_args**

maximum number of command line arguments to parse

uint32_t **heap_alloc_caps**

where to (e.g. MALLOC_CAP_SPIRAM) allocate heap objects such as cmds used by esp_console

int **hint_color**

ASCII color code of hint text.

int **hint_bold**

Set to 1 to print hint text in bold.

struct **esp_console_repl_config_t**

Parameters for console REPL (Read Eval Print Loop)

Public Members

uint32_t **max_history_len**

maximum length for the history

const char ***history_save_path**

file path used to save history commands, set to NULL won't save to file system

uint32_t **task_stack_size**

repl task stack size

uint32_t **task_priority**

repl task priority

BaseType_t **task_core_id**

repl task affinity, i.e. which core the task is pinned to

const char ***prompt**

prompt (NULL represents default: "esp> ")

size_t **max_cmdline_length**

maximum length of a command line. If 0, default value will be used

struct **esp_console_dev_uart_config_t**

Parameters for console device: UART.

Public Members

int **channel**

UART channel number (count from zero)

int **baud_rate**

Communication baud rate.

int **tx_gpio_num**

GPIO number for TX path, -1 means using default one.

int **rx_gpio_num**

GPIO number for RX path, -1 means using default one.

struct **esp_console_dev_usb_serial_jtag_config_t**

Parameters for console device: USB-SERIAL-JTAG.

Note: It's an empty structure for now, reserved for future

struct **esp_console_cmd_t**

Console command description.

Public Members

const char ***command**

Command name. Must not be NULL, must not contain spaces. The pointer must be valid until the call to `esp_console_deinit`.

const char ***help**

Help text for the command, shown by help command. If set, the pointer must be valid until the call to `esp_console_deinit`. If not set, the command will not be listed in 'help' output.

const char ***hint**

Hint text, usually lists possible arguments. If set to NULL, and 'argtable' field is non-NULL, hint will be generated automatically

esp_console_cmd_func_t **func**

Pointer to a function which implements the command.

Note: : Setting both `func` and `func_w_context` is not allowed.

void ***argtable**

Array or structure of pointers to `arg_xxx` structures, may be NULL. Used to generate hint text if 'hint' is set to NULL. Array/structure which this field points to must end with an `arg_end`. Only used for the duration of `esp_console_cmd_register` call.

esp_console_cmd_func_with_context_t **func_w_context**

Pointer to a context aware function which implements the command.

Note: : Setting both `func` and `func_w_context` is not allowed.

void ***context**

Context pointer to user-defined per-command context data. This is used if context aware function `func_w_context` is set.

struct **esp_console_repl_s**

Console REPL base structure.

Public Members

esp_err_t (***del**)(*esp_console_repl_t* *repl)

Delete console REPL environment.

Param repl [in] REPL handle returned from `esp_console_new_repl_xxx`

Return

- ESP_OK on success
- ESP_FAIL on errors

Macros

ESP_CONSOLE_CONFIG_DEFAULT ()

Default console configuration value.

ESP_CONSOLE_REPL_CONFIG_DEFAULT ()

Default console repl configuration value.

ESP_CONSOLE_DEV_UART_CONFIG_DEFAULT ()

ESP_CONSOLE_DEV_USB_SERIAL_JTAG_CONFIG_DEFAULT ()

Type Definitions

typedef struct *linenoiseCompletions* **linenoiseCompletions**

typedef int (***esp_console_cmd_func_t**)(int argc, char **argv)

Console command main function.

Param argc number of arguments

Param argv array with argc entries, each pointing to a zero-terminated string argument

Return console command return code, 0 indicates "success"

typedef int (***esp_console_cmd_func_with_context_t**)(void *context, int argc, char **argv)

Console command main function, with context.

Param context a user context given at invocation

Param argc number of arguments

Param argv array with argc entries, each pointing to a zero-terminated string argument

Return console command return code, 0 indicates "success"

typedef struct *esp_console_repl_s* **esp_console_repl_t**

Type defined for console REPL.

Enumerations

enum **esp_console_help_verbose_level_e**

Values:

enumerator **ESP_CONSOLE_HELP_VERBOSE_LEVEL_0**

enumerator **ESP_CONSOLE_HELP_VERBOSE_LEVEL_1**

enumerator **ESP_CONSOLE_HELP_VERBOSE_LEVEL_MAX_NUM**

2.9.7 eFuse Manager

Introduction

eFuse (Electronic Fuses) are microscopic one-time programmable fuses that can be "burned" (i.e., programmed) to store data into the ESP32-C5. eFuse bits are organized into different data fields, and these data fields could be used for system parameters (i.e., data parameters used by ESP-IDF of ESP32-C5) or user defined parameters.

The eFuse Manager component is a collection of tools and APIs that assist with defining, burning, accessing eFuses parameters. The notable tools and APIs include:

- A table format used to define eFuse data fields in CSV file.
- `efuse_table_gen.py` tool to generate C structure representation of eFuse data fields specified by the CSV file.
- Collection of C API to read/write eFuse data fields.

eFuse Manager vs `idf.py`

`idf.py` provides a subset of the functionality of the eFuse Manager via the `idf.py efuse-<subcommand>` commands. In this documentation, mostly `idf.py` based commands will be used, although you can still see some `espefuse.py` based commands for advanced or rare cases. To see all available commands, run `idf.py --help` and search for those prefixed with `efuse-`.

Hardware Description

The ESP32-C5 has a number of eFuses which can store system and user parameters. Each eFuse is a one-bit field which can be programmed to 1 after which it cannot be reverted back to 0. The eFuse bits are grouped into blocks of 256 bits, where each block is further divided into 8 32-bit registers. Some blocks are reserved for system parameters while the remaining blocks can be used for user parameters.

For more details, see *ESP32-C5 Technical Reference Manual > eFuse Controller (eFuse)* [PDF].

ESP32-C5 has 11 eFuse blocks each containing 256 bits (not all bits can be used for user parameters):

- EFUSE_BLK0 is used entirely for system parameters
- EFUSE_BLK1 is used entirely for system parameters
- EFUSE_BLK2 is used entirely for system parameters
- EFUSE_BLK3 (also named EFUSE_BLK_USER_DATA) can be used for user parameters
- EFUSE_BLK4 to EFUSE_BLK8 (also named EFUSE_BLK_KEY0 to EFUSE_BLK_KEY4) can be used to store keys for Secure Boot or Flash Encryption. If both features are unused, these blocks can be used for user parameters.
- EFUSE_BLK9 (also named EFUSE_BLK_KEY5) can be used to store keys for Secure Boot or Flash Encryption. If both features are unused, these blocks can be used for user parameters.
- EFUSE_BLK10 (also named EFUSE_BLK_SYS_DATA_PART2) is reserved for system parameters.

Defining eFuse Fields

eFuse fields are defined as a table of records in a CSV file according to a specific format. This record format provides the ability to form eFuse fields of any length and from any number of individual bits.

Moreover, the record format allows structured definition of eFuse fields consisting of sub-fields, meaning that a parent eFuse field may consist of multiple child eFuse fields occupying the same eFuse bits.

Record Format In simple cases, each record occupies a single row in the table. Each record contains the following values (i.e., columns):

```
# field_name, efuse_block(EFUSE_BLK0..EFUSE_BLK10), bit_start(0..255), bit_count(1..
↪.256), comment
```

- `field_name`
 - Name of the eFuse field.
 - The prefix `ESP_EFUSE_` is automatically added to the name, and this name will be used when referring to the field in C code.
 - `field_name` unique across all eFuse fields.
 - If this value is left empty, then this record is combined with the previous record. This allows you define an eFuse field with arbitrary bit ordering (see `MAC_FACTORY` field in the common table).
 - Using `.` will define a child eFuse field. See *Structured eFuse Fields* for more details.
- `efuse_block`
 - The eFuse field's block number. E.g., EFUSE_BLK0 to EFUSE_BLK10.
 - This determines which block the eFuse field is placed.
- `bit_start`
 - Bit offset (0 to 255) of the eFuse within the block.
 - `bit_start` is optional and can be omitted.

* In this case, it is set to `bit_start + bit_count` from the previous record, given that the previous record is in the same eFuse block.

* If the previous record is in a different eFuse block, an error will be generated.

- `bit_count`
 - The size of the eFuse field in bits (1 to N).
 - `bit_count` cannot be omitted.
 - If set to `MAX_BLK_LEN` the eFuse field's size will be the maximum allowable eFuse field size in the block.
- `comment`
 - Comment describing the eFuse field.
 - The comment is copied verbatim into the C header file.

If an eFuse field requires non-sequential bit ordering, then the eFuse field will span multiple records (i.e., multiple rows). The first record's `field_name` should specify the eFuse field's name, and the following records should leave `field_name` blank to indicate that they belong to the same eFuse field.

The following example demonstrates the records to specify the non-sequential eFuse field `MAC_FACTORY` followed by a regular eFuse field `MAC_FACTORY_CRC`:

```
# Factory MAC address #
#####
MAC_FACTORY,          EFUSE_BLK0,    72,    8,    Factory MAC addr [0]
,                    EFUSE_BLK0,    64,    8,    Factory MAC addr [1]
,                    EFUSE_BLK0,    56,    8,    Factory MAC addr [2]
,                    EFUSE_BLK0,    48,    8,    Factory MAC addr [3]
,                    EFUSE_BLK0,    40,    8,    Factory MAC addr [4]
,                    EFUSE_BLK0,    32,    8,    Factory MAC addr [5]
MAC_FACTORY_CRC,     EFUSE_BLK0,    80,    8,    CRC8 for factory MAC address
```

This eFuse fields will be made available in C code as `ESP_EFUSE_MAC_FACTORY` and `ESP_EFUSE_MAC_FACTORY_CRC`.

Structured eFuse Fields

Typically, an eFuse field represents a particular parameter. However, in some cases where an eFuse field consists of multiple sub-fields, it may be useful to have isolated access to those sub-fields. For example, if an eFuse field contained a floating point parameter, it may be useful to be access the sign, exponent, and mantissa fields of the floating as separate eFuse fields.

Therefore, it is possible for records to define eFuse fields in a structured manner using the `.` operator in `field_name`. For example, `XX.YY.ZZ` defines a eFuse field `ZZ` that is a child of eFuse field `YY` which in turn is a child field of eFuse field `XX`.

The following records demonstrate the definition of eFuse fields in a structured manner:

```
WR_DIS,                EFUSE_BLK0,    0,    32,    Write protection
WR_DIS.RD_DIS,         EFUSE_BLK0,    0,    1,    Write protection for_
↔RD_DIS
WR_DIS.FIELD_1,        EFUSE_BLK0,    1,    1,    Write protection for_
↔FIELD_1
WR_DIS.FIELD_2,        EFUSE_BLK0,    2,    4,    Write protection for_
↔FIELD_2 (includes B1 and B2)
WR_DIS.FIELD_2.B1,     EFUSE_BLK0,    2,    2,    Write protection for_
↔FIELD_2.B1
WR_DIS.FIELD_2.B2,     EFUSE_BLK0,    4,    2,    Write protection for_
↔FIELD_2.B2
WR_DIS.FIELD_3,        EFUSE_BLK0,    5,    1,    Write protection for_
↔FIELD_3
WR_DIS.FIELD_3.ALIAS,  EFUSE_BLK0,    5,    1,    Write protection for_
↔FIELD_3 (just a alias for WR_DIS.FIELD_3)
WR_DIS.FIELD_4,        EFUSE_BLK0,    7,    1,    Write protection for_
↔FIELD_4
```

(continues on next page)

Some things to note regarding the example above:

- The `WR_DIS` record defines the parent eFuse field. All the other records are child fields of `WR_DIS` due to their `WR_DIS.` prefix.
- The child fields must utilize the same bits as their parent field. Take note of `bit_start` and `bit_count` of the child and parent fields:
 - The bits of the child fields are always in the range of their parent field. For example, `WR_DIS.RD_DIS` and `WR_DIS.RD_DIS` occupy the first and second bit of `WR_DIS`.
 - Child fields cannot use overlapping bits (except for when aliasing).
- It is possible to create aliases as a child field. For example, `WR_DIS.FIELD_3.ALIAS` is a child field and alias of `WR_DIS.FIELD_3` as they both occupy the same bits.

All eFuse Fields are eventually converted to C structures via the `efuse_table_gen.py` tool. The C structure for each eFuse field will derive their identifier from the `field_name` of the eFuse field's record, where all `.` are replaced with `_`. For example, the C symbols for `WR_DIS.RD_DIS` and `WR_DIS.FIELD_2.B1` will be `ESP_EFUSE_WR_DIS_RD_DIS` and `ESP_EFUSE_WR_DIS_FIELD_2_B1` respectively.

The `efuse_table_gen.py` tool also checks that the fields do not overlap each other and must be within the range of a field. If there is a violation, then the following error is generated:

```
Field at USER_DATA, EFUSE_BLK3, 0, 256 intersected with SERIAL_NUMBER, EFUSE_BLK3, ↵
↵0, 32
```

In this case, the error can be resolved by making `SERIAL_NUMBER` a child field of `USER_DATA` via `USER_DATA.SERIAL_NUMBER`.

```
Field at FIELD, EFUSE_BLK3, 0, 50 out of range FIELD.MAJOR_NUMBER, EFUSE_BLK3, 60, ↵
↵32
```

In this case, the error can be resolved by changing `bit_start` for `FIELD.MAJOR_NUMBER` from 60 to 0 so that `MAJOR_NUMBER` overlaps with `FIELD`.

efuse_table_gen.py Tool

The `efuse_table_gen.py` tool is designed to generate C source files containing C structures (of type `esp_efuse_desc_t`) representing the eFuse fields defined in CSV files. Moreover, the tool also runs some checks on the provided CSV files before generation to ensure that:

- the names of the eFuse fields are unique
- the eFuse fields do not use overlapping bits

As mentioned previously, eFuse fields can be used to hold either system parameters or user parameters. Given that system parameter eFuse fields are inherently required by ESP-IDF and ESP32-C5, those eFuse fields are defined in a **common** CSV file (`esp_efuse_table.csv`) and distributed as part of ESP-IDF. For user parameter eFuse fields, users should define those fields in a **custom** CSV file (e.g., `esp_efuse_custom_table.csv`).

To generate C source files using the **common** CSV file, use the `idf.py efuse-common-table` or the following:

```
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py --idf_target esp32c5 esp32c5/esp_efuse_table.csv
```

The following C source/header files will be generated by the tool in `$IDF_PATH/components/efuse/esp32c5`:

- `esp_efuse_table.c` file containing the C structures of the system parameter eFuse fields
- `esp_efuse_table.h` file in the `include` folder. This header can be included by the application to use those C structures.

To generate C source files using a **custom** CSV file, use the command `idf.py efuse-custom-table` or the following:

```
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py --idf_target esp32c5 esp32c5/esp_efuse_table.csv PROJECT_PATH/
↪main/esp_efuse_custom_table.csv
```

The following C source/header files will be generated by the tool in PROJECT_PATH/main:

- esp_efuse_custom_table.c file containing the C structures of the user parameter eFuse fields
- esp_efuse_custom_table.h file in the include folder. This header can be included by the application to use those C structures.

To use the generated fields, you need to include two files:

```
#include "esp_efuse.h"
#include "esp_efuse_table.h" // or "esp_efuse_custom_table.h"
```

Supported Coding Schemes

Various coding schemes are supported by eFuses which can protect eFuses against data corruption by detecting and/or correcting for errors.

ESP32-C5 does not support selection of coding schemes. The following coding schemes are automatically applied to various eFuse blocks:

- None: Applied to EFUSE_BLK0
- RS: Applied to EFUSE_BLK1 - EFUSE_BLK10

None Coding Scheme The None coding scheme is automatically applied to EFUSE_BLK0. This scheme does not involve any encoding, but simply maintains four backups of EFUSE_BLK0 in hardware, meaning each bit is stored four times. As a result, EFUSE_BLK0 can be written many times.

This scheme is automatically applied by the hardware and is not visible to software.

RS Coding Scheme The RS coding scheme uses Reed-Solomon encoding and is automatically applied to EFUSE_BLK1 to EFUSE_BLK10. The coding scheme supports up to 6 bytes of automatic error correction.

Software encodes the 32-byte EFUSE_BLKx using RS (44, 32) to generate a 12-byte check-symbols, and then burn the EFUSE_BLKx and the check-symbols into eFuse at the same time.

The eFuse Controller automatically decodes the RS encoding and applies error correction when reading back the eFuse block. Because the RS check-symbols are generated across the entire 256-bit eFuse block, each block can only be written to one time. As a result of the check-symbols, Batch Writing Mode must be used.

Batch Writing Mode When writing to eFuse fields at run time, it may be necessary to use the Batch Writing Mode depending on the coding scheme used for eFuse block. Batch writing mode can be used as follows:

1. Enable batch writing mode by calling `esp_efuse_batch_write_begin()`
2. Write to the eFuse fields as usual using various `esp_efuse_write_...` functions.
3. Once all writes are complete, call `esp_efuse_batch_write_commit()` which burns prepared data to the eFuse blocks.

Warning: If there is already pre-written data in the eFuse block using the Reed-Solomon encoding scheme, then it is not possible to write anything extra (even if the required bits are empty) without breaking the previous data's checksums/check-symbols.

The checksums/check-symbols will be overwritten with new checksums/check-symbols and be completely destroyed (however, the payload eFuses are not damaged).

If you happen to find pre-written data in CUSTOM_MAC, SPI_PAD_CONFIG_HD, SPI_PAD_CONFIG_CS, etc., please contact Espressif to obtain the required pre-burnt eFuses.

FOR TESTING ONLY (NOT RECOMMENDED): You can ignore or suppress errors that violate encoding scheme data in order to burn the necessary bits in the eFuse block.

eFuse API

Access to the fields is via a pointer to the description structure. API functions have some basic operation:

- *esp_efuse_read_field_blob()* - returns an array of read eFuse bits.
- *esp_efuse_read_field_cnt()* - returns the number of bits programmed as "1".
- *esp_efuse_write_field_blob()* - writes an array.
- *esp_efuse_write_field_cnt()* - writes a required count of bits as "1".
- *esp_efuse_get_field_size()* - returns the number of bits by the field name.
- *esp_efuse_read_reg()* - returns value of eFuse register.
- *esp_efuse_write_reg()* - writes value to eFuse register.
- *esp_efuse_get_coding_scheme()* - returns eFuse coding scheme for blocks.
- *esp_efuse_read_block()* - reads a key from an eFuse block starting at the offset with required size.
- *esp_efuse_write_block()* - writes a key to an eFuse block starting at the offset with required size.
- *esp_efuse_batch_write_begin()* - set the batch mode of writing fields.
- *esp_efuse_batch_write_commit()* - writes all prepared data for batch writing mode and reset the batch writing mode.
- *esp_efuse_batch_write_cancel()* - reset the batch writing mode and prepared data.
- *esp_efuse_get_key_dis_read()* - Returns a read protection for the key block.
- *esp_efuse_set_key_dis_read()* - Sets a read protection for the key block.
- *esp_efuse_get_key_dis_write()* - Returns a write protection for the key block.
- *esp_efuse_set_key_dis_write()* - Sets a write protection for the key block.
- *esp_efuse_get_key_purpose()* - Returns the current purpose set for an eFuse key block.
- *esp_efuse_write_key()* - Programs a block of key data to an eFuse block.
- *esp_efuse_write_keys()* - Programs keys to unused eFuse blocks.
- *esp_efuse_find_purpose()* - Finds a key block with the particular purpose set.
- *esp_efuse_get_keypurpose_dis_write()* - Returns a write protection of the key purpose field for an eFuse key block (for esp32 always true).
- *esp_efuse_key_block_unused()* - Returns true if the key block is unused, false otherwise.
- *esp_efuse_destroy_block()* - Destroys the data in this eFuse block. There are two things to do: (1) if write protection is not set, then the remaining unset bits are burned, (2) set read protection for this block if it is not locked.

For frequently used fields, special functions are made, like this *esp_efuse_get_pkg_ver()*.

eFuse API for Keys

EFUSE_BLK_KEY0 - EFUSE_BLK_KEY5 are intended to keep up to 6 keys with a length of 256-bits. Each key has an ESP_EFUSE_KEY_PURPOSE_x field which defines the purpose of these keys. The purpose field is described in *esp_efuse_purpose_t*.

The purposes like ESP_EFUSE_KEY_PURPOSE_XTS_AES... are used for flash encryption.

The purposes like ESP_EFUSE_KEY_PURPOSE_SECURE_BOOT_DIGEST... are used for secure boot.

There are some eFuse APIs useful to work with states of keys:

- *esp_efuse_get_purpose_field()* - Returns a pointer to a key purpose for an eFuse key block.
- *esp_efuse_get_key()* - Returns a pointer to a key block.
- *esp_efuse_set_key_purpose()* - Sets a key purpose for an eFuse key block.
- *esp_efuse_set_keypurpose_dis_write()* - Sets a write protection of the key purpose field for an eFuse key block.
- *esp_efuse_find_unused_key_block()* - Search for an unused key block and return the first one found.

- `esp_efuse_count_unused_key_blocks()` - Returns the number of unused eFuse key blocks in the range EFUSE_BLK_KEY0 to EFUSE_BLK_KEY_MAX
- `esp_efuse_get_digest_revoke()` - Returns the status of the Secure Boot public key digest revocation bit.
- `esp_efuse_set_digest_revoke()` - Sets the Secure Boot public key digest revocation bit.
- `esp_efuse_get_write_protect_of_digest_revoke()` - Returns a write protection of the Secure Boot public key digest revocation bit.
- `esp_efuse_set_write_protect_of_digest_revoke()` - Sets a write protection of the Secure Boot public key digest revocation bit.

How to Add a New Field

1. Find free bits for field. Refer to the `esp_efuse_table.csv` file, running `idf.py show-efuse-table`, or running the following command:

```
$ ./efuse_table_gen.py esp32c5/esp_efuse_table.csv --info
Verifying efuse table...
Max number of bits in BLK 256
Sorted efuse table:
#      field_name          efuse_block      bit_start      bit_count
1      WR_DIS                 EFUSE_BLK0       0              32
2      WR_DIS.RD_DIS         EFUSE_BLK0       0              1
3      WR_DIS.DIS_ICACHE     EFUSE_BLK0       2              1
4      WR_DIS.DIS_USB_JTAG   EFUSE_BLK0       2              1
5      WR_DIS.DIS_FORCE_DOWNLOAD EFUSE_BLK0       2              1
6      WR_DIS.DIS_TWAI       EFUSE_BLK0       2              1
7      WR_DIS.JTAG_SEL_ENABLE EFUSE_BLK0       2              1
8      WR_DIS.DIS_PAD_JTAG   EFUSE_BLK0       2              1
9      WR_DIS.DIS_DOWNLOAD_MANUAL_ENCRYPT EFUSE_BLK0       2              1
↳1
10     WR_DIS.WDT_DELAY_SEL   EFUSE_BLK0       3              1
11     WR_DIS.SPI_BOOT_CRYPT_CNT EFUSE_BLK0       4              1
12     WR_DIS.SECURE_BOOT_KEY_REVOKE0 EFUSE_BLK0       5              1
13     WR_DIS.SECURE_BOOT_KEY_REVOKE1 EFUSE_BLK0       6              1
14     WR_DIS.SECURE_BOOT_KEY_REVOKE2 EFUSE_BLK0       7              1
15     WR_DIS.KEY_PURPOSE_0   EFUSE_BLK0       8              1
16     WR_DIS.KEY_PURPOSE_1   EFUSE_BLK0       9              1
17     WR_DIS.KEY_PURPOSE_2   EFUSE_BLK0       10             1
18     WR_DIS.KEY_PURPOSE_3   EFUSE_BLK0       11             1
19     WR_DIS.KEY_PURPOSE_4   EFUSE_BLK0       12             1
20     WR_DIS.KEY_PURPOSE_5   EFUSE_BLK0       13             1
21     WR_DIS.SEC_DPA_LEVEL   EFUSE_BLK0       14             1
22     WR_DIS.SECURE_BOOT_EN  EFUSE_BLK0       15             1
23     WR_DIS.SECURE_BOOT_AGGRESSIVE_REVOKE EFUSE_BLK0       16             1
↳1
24     WR_DIS.SPI_DOWNLOAD_MSPI_DIS EFUSE_BLK0       17             1
25     WR_DIS.FLASH_TPUW      EFUSE_BLK0       18             1
26     WR_DIS.DIS_DOWNLOAD_MODE EFUSE_BLK0       18             1
27     WR_DIS.DIS_DIRECT_BOOT EFUSE_BLK0       18             1

EFUSE_BLK5

[0 255]

EFUSE_BLK6

[0 255]

EFUSE_BLK7

[0 255]

(continues on next page)

(continued from previous page)

```
EFUSE_BLK8
[0 255]

EFUSE_BLK9
[0 255]
Note: Not printed ranges are free for using. (bits in EFUSE_BLK0 are reserved for ↪
↪Espressif)
```

The number of bits not included in square brackets are free (some bits are reserved by Espressif). All fields are checked for overlapping bits.

To add child fields to an existing field, *Structured eFuse Fields* can be used. The following example demonstrates adding of the the fields SERIAL_NUMBER, MODEL_NUMBER and HARDWARE_REV to an existing USER_DATA field by using the . operator:

USER_DATA.SERIAL_NUMBER,	EFUSE_BLK3,	0,	32,
USER_DATA.MODEL_NUMBER,	EFUSE_BLK3,	32,	10,
USER_DATA.HARDWARE_REV,	EFUSE_BLK3,	42,	10,

In general, to add new eFuse Fields:

1. Add a record for each eFuse field in CSV file.
2. Run the `show_efuse_table` command to check eFuse table.
3. To generate source files run the `efuse_common_table` or `efuse_custom_table` commands.

You may get errors such as intersects with or out of range. Please see how to solve them in the *Structured eFuse Fields* article.

Bit Order

The eFuses bit order is little endian (see the example below), meaning that eFuse bits are read and written from LSB to MSB:

```
$ idf.py efuse-dump

USER_DATA      (BLOCK3      ) [3 ] read_regs: 03020100 07060504 0B0A0908 ↪
↪0F0E0D0C 13121111 17161514 1B1A1918 1F1E1D1C
BLOCK4        (BLOCK4      ) [4 ] read_regs: 03020100 07060504 0B0A0908 ↪
↪0F0E0D0C 13121111 17161514 1B1A1918 1F1E1D1C

where is the register representation:

EFUSE_RD_USR_DATA0_REG = 0x03020100
EFUSE_RD_USR_DATA1_REG = 0x07060504
EFUSE_RD_USR_DATA2_REG = 0x0B0A0908
EFUSE_RD_USR_DATA3_REG = 0x0F0E0D0C
EFUSE_RD_USR_DATA4_REG = 0x13121111
EFUSE_RD_USR_DATA5_REG = 0x17161514
EFUSE_RD_USR_DATA6_REG = 0x1B1A1918
EFUSE_RD_USR_DATA7_REG = 0x1F1E1D1C

where is the byte representation:

byte[0] = 0x00, byte[1] = 0x01, ... byte[3] = 0x03, byte[4] = 0x04, ..., byte[31] ↪
↪= 0x1F
```

For example, CSV file describes the USER_DATA field, which occupies all 256 bits (a whole block).

USER_DATA,	EFUSE_BLK3,	0,	256,	User data
USER_DATA.FIELD1,	EFUSE_BLK3,	16,	16,	Field1
ID,	EFUSE_BLK4,	8,	3,	ID bit[0..2]
,	EFUSE_BLK4,	16,	2,	ID bit[3..4]
,	EFUSE_BLK4,	32,	3,	ID bit[5..7]

Thus, reading the eFuse USER_DATA block written as above gives the following results:

```
uint8_t buf[32] = { 0 };
esp_efuse_read_field_blob(ESP_EFUSE_USER_DATA, &buf, sizeof(buf) * 8);
// buf[0] = 0x00, buf[1] = 0x01, ... buf[31] = 0x1F

uint32_t field1 = 0;
size_t field1_size = ESP_EFUSE_USER_DATA[0]->bit_count; // can be used for this_
↳case because it only consists of one entry
esp_efuse_read_field_blob(ESP_EFUSE_USER_DATA, &field1, field1_size);
// field1 = 0x0302

uint32_t field1_1 = 0;
esp_efuse_read_field_blob(ESP_EFUSE_USER_DATA, &field1_1, 2); // reads only first_
↳2 bits
// field1 = 0x0002

uint8_t id = 0;
size_t id_size = esp_efuse_get_field_size(ESP_EFUSE_ID); // returns 6
// size_t id_size = ESP_EFUSE_USER_DATA[0]->bit_count; // cannot be used because_
↳it consists of 3 entries. It returns 3 not 6
esp_efuse_read_field_blob(ESP_EFUSE_ID, &id, id_size);
// id = 0x91
// b'100 10 001
//   [3] [2] [3]

uint8_t id_1 = 0;
esp_efuse_read_field_blob(ESP_EFUSE_ID, &id_1, 3);
// id = 0x01
// b'001
```

Get eFuses During Build

There is a way to get the state of eFuses at the build stage of the project. There are two CMake functions for this:

- `espefuse_get_json_summary()` - It calls the `espefuse.py summary --format json` command and returns a JSON string (it is not stored in a file).
- `espefuse_get_efuse()` - It finds a given eFuse name in the JSON string and returns its property.

The JSON string has the following properties:

```
{
  "MAC": {
    "bit_len": 48,
    "block": 0,
    "category": "identity",
    "description": "Factory MAC Address",
    "efuse_type": "bytes:6",
    "name": "MAC",
    "pos": 0,
    "readable": true,
    "value": "94:b9:7e:5a:6e:58 (CRC 0xe2 OK)",
    "word": 1,
    "writeable": true
  }
}
```

(continues on next page)

(continued from previous page)

```

    },
}

```

These functions can be used from a top-level project `CMakeLists.txt` ([system/efuse/CMakeLists.txt](#)):

```

# ...
project(hello_world)

espefuse_get_json_summary(efuse_json)
espefuse_get_efuse(ret_data ${efuse_json} "MAC" "value")
message("MAC:" ${ret_data})

```

The format of the `value` property is the same as shown in `espefuse.py summary` or `idf.py efuse-summary`.

```
MAC:94:b9:7e:5a:6e:58 (CRC 0xe2 OK)
```

There is an example test [system/efuse/CMakeLists.txt](#) which adds a custom target `efuse-filter`. This allows you to run the `idf.py efuse-filter` command to read the required eFuses (specified in the `efuse_names` list) at any time, not just during the project build.

Debug eFuse & Unit Tests

Virtual eFuses The Kconfig option `CONFIG_EFUSE_VIRTUAL` virtualizes eFuse values inside the eFuse Manager, so writes are emulated and no eFuse values are permanently changed. This can be useful for debugging and unit testing.

During startup, the eFuses are copied to RAM. All eFuse operations (read and write) are performed with RAM instead of the real eFuse registers.

In addition to the `CONFIG_EFUSE_VIRTUAL` option, there is the `CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH` option that adds a feature to keep eFuses in flash memory. To use this mode, the `partition_table` should have include an efuse partition in `partition.csv`:

```
efuse_em, data, efuse, , 0x2000,
```

During startup, the eFuses are copied from flash, or in case where flash is empty, copied from real eFuse to RAM and then write flash. This option allows keeping eFuses after reboots, making it possible to test Secure Boot and Flash Encryption features.

Flash Encryption Testing Flash encryption is a hardware feature that requires the physical burning of eFuses `key` and `FLASH_CRYPT_CNT`. If flash encryption is not actually enabled, then enabling the `CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH` option just provides testing possibilities and does not encrypt anything in the flash, even though the logs indicates that encryption happens.

The `bootloader_flash_write()` is adapted for this purpose. But if flash encryption is already enabled on the chip when the application is run, or if the bootloader is created with the `CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH` option, then the flash encryption/decryption operations will work properly. This means that data are encrypted as it is written into an encrypted flash partition and decrypted when they are read from an encrypted partition.

espefuse.py esptool includes a useful tool for reading/writing ESP32-C5 eFuse bits - [espefuse.py](#).

Part of the functionality of this tool is also provided directly by `idf.py` commands. For example, the `idf.py efuse-summary` command is equivalent to `espefuse.py summary`.

```

espefuse.py -p PORT summary

espefuse.py v4.8.dev4

=== Run "summary" command ===

Enumerations

enum **esp_efuse_block_t**

Type of eFuse blocks ESP32C5.

Values:

enumerator **EFUSE_BLK0**

Number of eFuse BLOCK0. REPEAT_DATA

enumerator **EFUSE_BLK1**

Number of eFuse BLOCK1. MAC_SPI_8M_SYS

enumerator **EFUSE_BLK2**

Number of eFuse BLOCK2. SYS_DATA_PART1

- enumerator **EFUSE_BLK_SYS_DATA_PART1**
Number of eFuse BLOCK2. SYS_DATA_PART1
- enumerator **EFUSE_BLK3**
Number of eFuse BLOCK3. USER_DATA
- enumerator **EFUSE_BLK_USER_DATA**
Number of eFuse BLOCK3. USER_DATA
- enumerator **EFUSE_BLK4**
Number of eFuse BLOCK4. KEY0
- enumerator **EFUSE_BLK_KEY0**
Number of eFuse BLOCK4. KEY0
- enumerator **EFUSE_BLK5**
Number of eFuse BLOCK5. KEY1
- enumerator **EFUSE_BLK_KEY1**
Number of eFuse BLOCK5. KEY1
- enumerator **EFUSE_BLK6**
Number of eFuse BLOCK6. KEY2
- enumerator **EFUSE_BLK_KEY2**
Number of eFuse BLOCK6. KEY2
- enumerator **EFUSE_BLK7**
Number of eFuse BLOCK7. KEY3
- enumerator **EFUSE_BLK_KEY3**
Number of eFuse BLOCK7. KEY3
- enumerator **EFUSE_BLK8**
Number of eFuse BLOCK8. KEY4
- enumerator **EFUSE_BLK_KEY4**
Number of eFuse BLOCK8. KEY4
- enumerator **EFUSE_BLK9**
Number of eFuse BLOCK9. KEY5
- enumerator **EFUSE_BLK_KEY5**
Number of eFuse BLOCK9. KEY5
- enumerator **EFUSE_BLK_KEY_MAX**
- enumerator **EFUSE_BLK10**
Number of eFuse BLOCK10. SYS_DATA_PART2

enumerator **EFUSE_BLK_SYS_DATA_PART2**

Number of eFuse BLOCK10. SYS_DATA_PART2

enumerator **EFUSE_BLK_MAX**

enum **esp_efuse_coding_scheme_t**

Type of coding scheme.

Values:

enumerator **EFUSE_CODING_SCHEME_NONE**

None

enumerator **EFUSE_CODING_SCHEME_RS**

Reed-Solomon coding

enum **esp_efuse_purpose_t**

Type of key purpose.

Values:

enumerator **ESP_EFUSE_KEY_PURPOSE_USER**

User purposes (software-only use)

enumerator **ESP_EFUSE_KEY_PURPOSE_ECDSA_KEY**

ECDSA private key (Expected in little endian order)

enumerator **ESP_EFUSE_KEY_PURPOSE_XTS_AES_128_KEY**

XTS_AES_128_KEY (flash/PSRAM encryption)

enumerator **ESP_EFUSE_KEY_PURPOSE_HMAC_DOWN_ALL**

HMAC Downstream mode

enumerator **ESP_EFUSE_KEY_PURPOSE_HMAC_DOWN_JTAG**

JTAG soft enable key (uses HMAC Downstream mode)

enumerator **ESP_EFUSE_KEY_PURPOSE_HMAC_DOWN_DIGITAL_SIGNATURE**

Digital Signature peripheral key (uses HMAC Downstream mode)

enumerator **ESP_EFUSE_KEY_PURPOSE_HMAC_UP**

HMAC Upstream mode

enumerator **ESP_EFUSE_KEY_PURPOSE_SECURE_BOOT_DIGEST0**

SECURE_BOOT_DIGEST0 (Secure Boot key digest)

enumerator **ESP_EFUSE_KEY_PURPOSE_SECURE_BOOT_DIGEST1**

SECURE_BOOT_DIGEST1 (Secure Boot key digest)

enumerator **ESP_EFUSE_KEY_PURPOSE_SECURE_BOOT_DIGEST2**

SECURE_BOOT_DIGEST2 (Secure Boot key digest)

enumerator **ESP_EFUSE_KEY_PURPOSE_MAX**
MAX PURPOSE

```

Functions

esp_err_t **esp_efuse_read_field_blob** (const *esp_efuse_desc_t* *field[], void *dst, size_t dst_size_bits)

Reads bits from EFUSE field and writes it into an array.

The number of read bits will be limited to the minimum value from the description of the bits in "field" structure or "dst_size_bits" required size. Use "esp_efuse_get_field_size()" function to determine the length of the field.

Note: Please note that reading in the batch mode does not show uncommitted changes.

Parameters

- **field** -- [in] A pointer to the structure describing the fields of efuse.
- **dst** -- [out] A pointer to array that will contain the result of reading.
- **dst_size_bits** -- [in] The number of bits required to read. If the requested number of bits is greater than the field, the number will be limited to the field size.

Returns

- **ESP_OK**: The operation was successfully completed.
- **ESP_ERR_INVALID_ARG**: Error in the passed arguments.

bool **esp_efuse_read_field_bit** (const *esp_efuse_desc_t* *field[])

Read a single bit eFuse field as a boolean value.

Note: The value must exist and must be a single bit wide. If there is any possibility of an error in the provided arguments, call `esp_efuse_read_field_blob()` and check the returned value instead.

Note: If assertions are enabled and the parameter is invalid, execution will abort

Note: Please note that reading in the batch mode does not show uncommitted changes.

Parameters **field** -- [in] A pointer to the structure describing the fields of efuse.

Returns

- **true**: The field parameter is valid and the bit is set.
- **false**: The bit is not set, or the parameter is invalid and assertions are disabled.

esp_err_t **esp_efuse_read_field_cnt** (const *esp_efuse_desc_t* *field[], size_t *out_cnt)

Reads bits from EFUSE field and returns number of bits programmed as "1".

If the bits are set not sequentially, they will still be counted.

Note: Please note that reading in the batch mode does not show uncommitted changes.

Parameters

- **field** -- [in] A pointer to the structure describing the fields of efuse.
- **out_cnt** -- [out] A pointer that will contain the number of programmed as "1" bits.

Returns

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

esp_err_t **esp_efuse_write_field_blob** (const *esp_efuse_desc_t* *field[], const void *src, size_t src_size_bits)

Writes array to EFUSE field.

The number of write bits will be limited to the minimum value from the description of the bits in "field" structure or "src_size_bits" required size. Use "esp_efuse_get_field_size()" function to determine the length of the field. After the function is completed, the writing registers are cleared.

Parameters

- **field** -- [in] A pointer to the structure describing the fields of efuse.
- **src** -- [in] A pointer to array that contains the data for writing.
- **src_size_bits** -- [in] The number of bits required to write.

Returns

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_err_t **esp_efuse_write_field_cnt** (const *esp_efuse_desc_t* *field[], size_t cnt)

Writes a required count of bits as "1" to EFUSE field.

If there are no free bits in the field to set the required number of bits to "1", ESP_ERR_EFUSE_CNT_IS_FULL error is returned, the field will not be partially recorded. After the function is completed, the writing registers are cleared.

Parameters

- **field** -- [in] A pointer to the structure describing the fields of efuse.
- **cnt** -- [in] Required number of programmed as "1" bits.

Returns

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.

esp_err_t **esp_efuse_write_field_bit** (const *esp_efuse_desc_t* *field[])

Write a single bit eFuse field to 1.

For use with eFuse fields that are a single bit. This function will write the bit to value 1 if it is not already set, or does nothing if the bit is already set.

This is equivalent to calling esp_efuse_write_field_cnt() with the cnt parameter equal to 1, except that it will return ESP_OK if the field is already set to 1.

Parameters **field** -- [in] Pointer to the structure describing the efuse field.

Returns

- ESP_OK: The operation was successfully completed, or the bit was already set to value 1.

- `ESP_ERR_INVALID_ARG`: Error in the passed arguments, including if the efuse field is not 1 bit wide.

`esp_err_t esp_efuse_set_write_protect (esp_efuse_block_t blk)`

Sets a write protection for the whole block.

After that, it is impossible to write to this block. The write protection does not apply to block 0.

Parameters `blk` -- **[in]** Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)

Returns

- `ESP_OK`: The operation was successfully completed.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments.
- `ESP_ERR_EFUSE_CNT_IS_FULL`: Not all requested cnt bits is set.
- `ESP_ERR_NOT_SUPPORTED`: The block does not support this command.

`esp_err_t esp_efuse_set_read_protect (esp_efuse_block_t blk)`

Sets a read protection for the whole block.

After that, it is impossible to read from this block. The read protection does not apply to block 0.

Parameters `blk` -- **[in]** Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)

Returns

- `ESP_OK`: The operation was successfully completed.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments.
- `ESP_ERR_EFUSE_CNT_IS_FULL`: Not all requested cnt bits is set.
- `ESP_ERR_NOT_SUPPORTED`: The block does not support this command.

`int esp_efuse_get_field_size (const esp_efuse_desc_t *field[])`

Returns the number of bits used by field.

Parameters `field` -- **[in]** A pointer to the structure describing the fields of efuse.

Returns Returns the number of bits used by field.

`uint32_t esp_efuse_read_reg (esp_efuse_block_t blk, unsigned int num_reg)`

Returns value of efuse register.

This is a thread-safe implementation. Example: EFUSE_BLK2_RDATA3_REG where (blk=2, num_reg=3)

Note: Please note that reading in the batch mode does not show uncommitted changes.

Parameters

- `blk` -- **[in]** Block number of eFuse.
- `num_reg` -- **[in]** The register number in the block.

Returns Value of register

`esp_err_t esp_efuse_write_reg (esp_efuse_block_t blk, unsigned int num_reg, uint32_t val)`

Write value to efuse register.

Apply a coding scheme if necessary. This is a thread-safe implementation. Example: EFUSE_BLK3_WDATA0_REG where (blk=3, num_reg=0)

Parameters

- `blk` -- **[in]** Block number of eFuse.
- `num_reg` -- **[in]** The register number in the block.
- `val` -- **[in]** Value to write.

Returns

- `ESP_OK`: The operation was successfully completed.
- `ESP_ERR_EFUSE_REPEATED_PROG`: Error repeated programming of programmed bits is strictly forbidden.

esp_efuse_coding_scheme_t **esp_efuse_get_coding_scheme** (*esp_efuse_block_t* blk)

Return efuse coding scheme for blocks.

Note: The coding scheme is applicable only to 1, 2 and 3 blocks. For 0 block, the coding scheme is always NONE.

Parameters **blk** -- [in] Block number of eFuse.

Returns Return efuse coding scheme for blocks

esp_err_t **esp_efuse_read_block** (*esp_efuse_block_t* blk, void *dst_key, size_t offset_in_bits, size_t size_bits)

Read key to efuse block starting at the offset and the required size.

Note: Please note that reading in the batch mode does not show uncommitted changes.

Parameters

- **blk** -- [in] Block number of eFuse.
- **dst_key** -- [in] A pointer to array that will contain the result of reading.
- **offset_in_bits** -- [in] Start bit in block.
- **size_bits** -- [in] The number of bits required to read.

Returns

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_err_t **esp_efuse_write_block** (*esp_efuse_block_t* blk, const void *src_key, size_t offset_in_bits, size_t size_bits)

Write key to efuse block starting at the offset and the required size.

Parameters

- **blk** -- [in] Block number of eFuse.
- **src_key** -- [in] A pointer to array that contains the key for writing.
- **offset_in_bits** -- [in] Start bit in block.
- **size_bits** -- [in] The number of bits required to write.

Returns

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits

uint32_t **esp_efuse_get_pkg_ver** (void)

Returns chip package from efuse.

Returns chip package

void **esp_efuse_reset** (void)

Reset efuse write registers.

Efuse write registers are written to zero, to negate any changes that have been staged here.

Note: This function is not threadsafe, if calling code updates efuse values from multiple tasks then this is caller's responsibility to serialise.

esp_err_t **esp_efuse_disable_rom_download_mode** (void)

Disable ROM Download Mode via eFuse.

Permanently disables the ROM Download Mode feature. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.

Note: Not all SoCs support this option. An error will be returned if called on an ESP32 with a silicon revision lower than 3, as these revisions do not support this option.

Note: If ROM Download Mode is already disabled, this function does nothing and returns success.

Returns

- ESP_OK If the eFuse was successfully burned, or had already been burned.
- ESP_ERR_NOT_SUPPORTED (ESP32 only) This SoC is not capable of disabling UART download mode
- ESP_ERR_INVALID_STATE (ESP32 only) This eFuse is write protected and cannot be written

esp_err_t **esp_efuse_set_rom_log_scheme** (*esp_efuse_rom_log_scheme_t* log_scheme)

Set boot ROM log scheme via eFuse.

Note: By default, the boot ROM will always print to console. This API can be called to set the log scheme only once per chip, once the value is changed from the default it can't be changed again.

Parameters **log_scheme** -- Supported ROM log scheme

Returns

- ESP_OK If the eFuse was successfully burned, or had already been burned.
- ESP_ERR_NOT_SUPPORTED (ESP32 only) This SoC is not capable of setting ROM log scheme
- ESP_ERR_INVALID_STATE This eFuse is write protected or has been burned already

esp_err_t **esp_efuse_enable_rom_secure_download_mode** (void)

Switch ROM Download Mode to Secure Download mode via eFuse.

Permanently enables Secure Download mode. This mode limits the use of ROM Download Mode functions to simple flash read, write and erase operations, plus a command to return a summary of currently enabled security features.

Note: If Secure Download mode is already enabled, this function does nothing and returns success.

Note: Disabling the ROM Download Mode also disables Secure Download Mode.

Returns

- ESP_OK If the eFuse was successfully burned, or had already been burned.
- ESP_ERR_INVALID_STATE ROM Download Mode has been disabled via eFuse, so Secure Download mode is unavailable.

uint32_t **esp_efuse_read_secure_version** (void)

Return secure_version from efuse field.

Returns Secure version from efuse field

bool **esp_efuse_check_secure_version** (uint32_t secure_version)

Check secure_version from app and secure_version and from efuse field.

Parameters **secure_version** -- Secure version from app.

Returns

- True: If version of app is equal or more then secure_version from efuse.

esp_err_t **esp_efuse_update_secure_version** (uint32_t secure_version)

Write efuse field by secure_version value.

Update the secure_version value is available if the coding scheme is None. Note: Do not use this function in your applications. This function is called as part of the other API.

Parameters **secure_version** -- [in] Secure version from app.

Returns

- ESP_OK: Successful.
- ESP_FAIL: secure version of app cannot be set to efuse field.
- ESP_ERR_NOT_SUPPORTED: Anti rollback is not supported with the 3/4 and Repeat coding scheme.

esp_err_t **esp_efuse_batch_write_begin** (void)

Set the batch mode of writing fields.

This mode allows you to write the fields in the batch mode when need to burn several efuses at one time. To enable batch mode call begin() then perform as usually the necessary operations read and write and at the end call commit() to actually burn all written efuses. The batch mode can be used nested. The commit will be done by the last commit() function. The number of begin() functions should be equal to the number of commit() functions.

Note: If batch mode is enabled by the first task, at this time the second task cannot write/read efuses. The second task will wait for the first task to complete the batch operation.

```
// Example of using the batch writing mode.

// set the batch writing mode
esp_efuse_batch_write_begin();

// use any writing functions as usual
esp_efuse_write_field_blob(ESP_EFUSE_...);
esp_efuse_write_field_cnt(ESP_EFUSE_...);
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_write_reg(EFUSE_BLKx, ...);
esp_efuse_write_block(EFUSE_BLKx, ...);
esp_efuse_write(ESP_EFUSE_1, 3); // ESP_EFUSE_1 == 1, here we write a new
↳value = 3. The changes will be burn by the commit() function.
esp_efuse_read...(ESP_EFUSE_1); // this function returns ESP_EFUSE_1 == 1
↳because uncommitted changes are not readable, it will be available only
↳after commit.
...

// esp_efuse_batch_write APIs can be called recursively.
esp_efuse_batch_write_begin();
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_batch_write_commit(); // the burn will be skipped here, it will be
↳done in the last commit().

...

// Write all of these fields to the efuse registers
esp_efuse_batch_write_commit();
esp_efuse_read...(ESP_EFUSE_1); // this function returns ESP_EFUSE_1 == 3.
```

Note: Please note that reading in the batch mode does not show uncommitted changes.

Returns

- ESP_OK: Successful.

esp_err_t **esp_efuse_batch_write_cancel** (void)

Reset the batch mode of writing fields.

It will reset the batch writing mode and any written changes.

Returns

- ESP_OK: Successful.
- ESP_ERR_INVALID_STATE: The batch mode was not set.

esp_err_t **esp_efuse_batch_write_commit** (void)

Writes all prepared data for the batch mode.

Must be called to ensure changes are written to the efuse registers. After this the batch writing mode will be reset.

Returns

- ESP_OK: Successful.
- ESP_ERR_INVALID_STATE: The deferred writing mode was not set.

bool **esp_efuse_block_is_empty** (*esp_efuse_block_t* block)

Checks that the given block is empty.

Returns

- True: The block is empty.
- False: The block is not empty or was an error.

bool **esp_efuse_get_key_dis_read** (*esp_efuse_block_t* block)

Returns a read protection for the key block.

Parameters **block** -- [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

Returns True: The key block is read protected False: The key block is readable.

esp_err_t **esp_efuse_set_key_dis_read** (*esp_efuse_block_t* block)

Sets a read protection for the key block.

Parameters **block** -- [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

Returns

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

bool **esp_efuse_get_key_dis_write** (*esp_efuse_block_t* block)

Returns a write protection for the key block.

Parameters **block** -- [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

Returns True: The key block is write protected False: The key block is writable.

esp_err_t **esp_efuse_set_key_dis_write** (*esp_efuse_block_t* block)

Sets a write protection for the key block.

Parameters **block** -- [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

Returns

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

- `ESP_ERR_EFUSE_REPEATED_PROG`: Error repeated programming of programmed bits is strictly forbidden.
- `ESP_ERR_CODING`: Error range of data does not match the coding scheme.

bool `esp_efuse_key_block_unused` (*esp_efuse_block_t* block)

Returns true if the key block is unused, false otherwise.

An unused key block is all zero content, not read or write protected, and has purpose 0 (`ESP_EFUSE_KEY_PURPOSE_USER`)

Parameters `block` -- key block to check.

Returns

- True if key block is unused,
- False if key block is used or the specified block index is not a key block.

bool `esp_efuse_find_purpose` (*esp_efuse_purpose_t* purpose, *esp_efuse_block_t* *block)

Find a key block with the particular purpose set.

Parameters

- `purpose` -- [in] Purpose to search for.
- `block` -- [out] Pointer in the range `EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX` which will be set to the key block if found. Can be NULL, if only need to test the key block exists.

Returns

- True: If found,
- False: If not found (value at block pointer is unchanged).

bool `esp_efuse_get_keypurpose_dis_write` (*esp_efuse_block_t* block)

Returns a write protection of the key purpose field for an efuse key block.

Note: For ESP32: no keypurpose, it returns always True.

Parameters `block` -- [in] A key block in the range `EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX`

Returns True: The key purpose is write protected. False: The key purpose is writeable.

esp_efuse_purpose_t `esp_efuse_get_key_purpose` (*esp_efuse_block_t* block)

Returns the current purpose set for an efuse key block.

Parameters `block` -- [in] A key block in the range `EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX`

Returns

- Value: If Successful, it returns the value of the purpose related to the given key block.
- `ESP_EFUSE_KEY_PURPOSE_MAX`: Otherwise.

const *esp_efuse_desc_t* **`esp_efuse_get_purpose_field` (*esp_efuse_block_t* block)

Returns a pointer to a key purpose for an efuse key block.

To get the value of this field use `esp_efuse_read_field_blob()` or `esp_efuse_get_key_purpose()`.

Parameters `block` -- [in] A key block in the range `EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX`

Returns Pointer: If Successful returns a pointer to the corresponding efuse field otherwise NULL.

const *esp_efuse_desc_t* **`esp_efuse_get_key` (*esp_efuse_block_t* block)

Returns a pointer to a key block.

Parameters `block` -- [in] A key block in the range `EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX`

Returns Pointer: If Successful returns a pointer to the corresponding efuse field otherwise NULL.

esp_err_t `esp_efuse_set_key_purpose` (*esp_efuse_block_t* block, *esp_efuse_purpose_t* purpose)

Sets a key purpose for an efuse key block.

Parameters

- **block** -- **[in]** A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
- **purpose** -- **[in]** Key purpose.

Returns

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_err_t **esp_efuse_set_keypurpose_dis_write** (*esp_efuse_block_t* block)

Sets a write protection of the key purpose field for an efuse key block.

Parameters **block** -- **[in]** A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

Returns

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_efuse_block_t **esp_efuse_find_unused_key_block** (void)

Search for an unused key block and return the first one found.

See esp_efuse_key_block_unused for a description of an unused key block.

Returns First unused key block, or EFUSE_BLK_KEY_MAX if no unused key block is found.

unsigned **esp_efuse_count_unused_key_blocks** (void)

Return the number of unused efuse key blocks in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX.

bool **esp_efuse_get_digest_revoke** (unsigned num_digest)

Returns the status of the Secure Boot public key digest revocation bit.

Parameters **num_digest** -- **[in]** The number of digest in range 0..2

Returns

- True: If key digest is revoked,
- False; If key digest is not revoked.

esp_err_t **esp_efuse_set_digest_revoke** (unsigned num_digest)

Sets the Secure Boot public key digest revocation bit.

Parameters **num_digest** -- **[in]** The number of digest in range 0..2

Returns

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

bool **esp_efuse_get_write_protect_of_digest_revoke** (unsigned num_digest)

Returns a write protection of the Secure Boot public key digest revocation bit.

Parameters **num_digest** -- **[in]** The number of digest in range 0..2

Returns True: The revocation bit is write protected. False: The revocation bit is writeable.

esp_err_t **esp_efuse_set_write_protect_of_digest_revoke** (unsigned num_digest)

Sets a write protection of the Secure Boot public key digest revocation bit.

Parameters **num_digest** -- **[in]** The number of digest in range 0..2

Returns

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.

- `ESP_ERR_CODING`: Error range of data does not match the coding scheme.

`esp_err_t esp_efuse_write_key` (`esp_efuse_block_t` block, `esp_efuse_purpose_t` purpose, const void *key, size_t key_size_bytes)

Program a block of key data to an efuse block.

The burn of a key, protection bits, and a purpose happens in batch mode.

Note: This API also enables the read protection efuse bit for certain key blocks like XTS-AES, HMAC, ECDSA etc. This ensures that the key is only accessible to hardware peripheral.

Note: For SoC's with capability `SOC_EFUSE_ECDSA_USE_HARDWARE_K` (e.g., ESP32-H2), this API writes an additional efuse bit for ECDSA key purpose to enforce hardware TRNG generated k mode in the peripheral.

Parameters

- **block** -- **[in]** Block to read purpose for. Must be in range `EFUSE_BLK_KEY0` to `EFUSE_BLK_KEY_MAX`. Key block must be unused (`esp_efuse_key_block_unused`).
- **purpose** -- **[in]** Purpose to set for this key. Purpose must be already unset.
- **key** -- **[in]** Pointer to data to write.
- **key_size_bytes** -- **[in]** Bytes length of data to write.

Returns

- `ESP_OK`: Successful.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments.
- `ESP_ERR_INVALID_STATE`: Error in efuses state, unused block not found.
- `ESP_ERR_EFUSE_REPEATED_PROG`: Error repeated programming of programmed bits is strictly forbidden.
- `ESP_ERR_CODING`: Error range of data does not match the coding scheme.

`esp_err_t esp_efuse_write_keys` (const `esp_efuse_purpose_t` purposes[], uint8_t keys[][32], unsigned number_of_keys)

Program keys to unused efuse blocks.

The burn of keys, protection bits, and purposes happens in batch mode.

Note: This API also enables the read protection efuse bit for certain key blocks like XTS-AES, HMAC, ECDSA etc. This ensures that the key is only accessible to hardware peripheral.

Note: For SoC's with capability `SOC_EFUSE_ECDSA_USE_HARDWARE_K` (e.g., ESP32-H2), this API writes an additional efuse bit for ECDSA key purpose to enforce hardware TRNG generated k mode in the peripheral.

Parameters

- **purposes** -- **[in]** Array of purposes (`purpose[number_of_keys]`).
- **keys** -- **[in]** Array of keys (`uint8_t keys[number_of_keys][32]`). Each key is 32 bytes long.
- **number_of_keys** -- **[in]** The number of keys to write (up to 6 keys).

Returns

- `ESP_OK`: Successful.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments.
- `ESP_ERR_INVALID_STATE`: Error in efuses state, unused block not found.
- `ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS`: Error not enough unused key blocks available

- `ESP_ERR_EFUSE_REPEATED_PROG`: Error repeated programming of programmed bits is strictly forbidden.
- `ESP_ERR_CODING`: Error range of data does not match the coding scheme.

esp_err_t **esp_secure_boot_read_key_digests** (*esp_secure_boot_key_digests_t* *trusted_key_digests)

Read key digests from efuse. Any revoked/missing digests will be marked as NULL.

Parameters `trusted_key_digests` -- **[out]** Trusted keys digests, stored in this parameter after successfully completing this function. The number of digests depends on the SOC's capabilities.

Returns

- `ESP_OK`: Successful.
- `ESP_FAIL`: If `trusted_keys` is NULL or there is no valid digest.

esp_err_t **esp_efuse_check_errors** (void)

Checks eFuse errors in BLOCK0.

It does a BLOCK0 check if eFuse `EFUSE_ERR_RST_ENABLE` is set. If BLOCK0 has an error, it prints the error and returns `ESP_FAIL`, which should be treated as `esp_restart`.

Note: Refers to ESP32-C3 only.

Returns

- `ESP_OK`: No errors in BLOCK0.
- `ESP_FAIL`: Error in BLOCK0 requiring reboot.

esp_err_t **esp_efuse_destroy_block** (*esp_efuse_block_t* block)

Destroys the data in the given efuse block, if possible.

Data destruction occurs through the following steps: 1) Destroy data in the block:

- If write protection is inactive for the block, then unset bits are burned.
- If write protection is active, the block remains unaltered. 2) Set read protection for the block if possible (check write-protection for `RD_DIS`). In this case, data becomes inaccessible, and the software reads it as all zeros. If write protection is enabled and read protection can not be set, data in the block remains readable (returns an error).

Do not use the batch mode with this function as it does the burning itself!

Parameters `block` -- **[in]** A key block in the range `EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX`

Returns

- `ESP_OK`: Successful.
- `ESP_FAIL`: Data remained readable because the block is write-protected and read protection can not be set.

Structures

struct **esp_efuse_desc_t**

Type definition for an eFuse field.

Public Members

esp_efuse_block_t **efuse_block**

Block of eFuse

uint8_t **bit_start**

Start bit [0..255]

uint16_t **bit_count**

Length of bit field [1..-]

struct **esp_secure_boot_key_digests_t**

Pointers to the trusted key digests.

The number of digests depends on the SOC's capabilities.

Public Members

const void ***key_digests**[3]

Pointers to the key digests

Macros

ESP_ERR_EFUSE

Base error code for efuse api.

ESP_OK_EFUSE_CNT

OK the required number of bits is set.

ESP_ERR_EFUSE_CNT_IS_FULL

Error field is full.

ESP_ERR_EFUSE_REPEATED_PROG

Error repeated programming of programmed bits is strictly forbidden.

ESP_ERR_CODING

Error while a encoding operation.

ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS

Error not enough unused key blocks available

ESP_ERR_DAMAGED_READING

Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.

Enumerations

enum **esp_efuse_rom_log_scheme_t**

Type definition for ROM log scheme.

Values:

enumerator **ESP_EFUSE_ROM_LOG_ALWAYS_ON**

Always enable ROM logging

enumerator **ESP_EFUSE_ROM_LOG_ON_GPIO_LOW**

ROM logging is enabled when specific GPIO level is low during start up

enumerator **ESP_EFUSE_ROM_LOG_ON_GPIO_HIGH**

ROM logging is enabled when specific GPIO level is high during start up

enumerator **ESP_EFUSE_ROM_LOG_ALWAYS_OFF**

Disable ROM logging permanently

2.9.8 Error Code and Helper Functions

This section lists definitions of common ESP-IDF error codes and several helper functions related to error handling.

For general information about error codes in ESP-IDF, see [Error Handling](#).

For the full list of error codes defined in ESP-IDF, see [Error Codes Reference](#).

API Reference

Header File

- [components/esp_common/include/esp_check.h](#)
- This header file can be included with:

```
#include "esp_check.h"
```

Macros

ESP_RETURN_ON_ERROR (x, log_tag, format, ...)

Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message and returns. In the future, we want to switch to C++20. We also want to become compatible with clang. Hence, we provide two versions of the following macros. The first one is using the GNU extension `##_VA_ARGS__`. The second one is using the C++20 feature `VA_OPT(,)`. This allows users to compile their code with standard C++20 enabled instead of the GNU extension. Below C++20, we haven't found any good alternative to using `##_VA_ARGS__`. Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message and returns.

ESP_RETURN_ON_ERROR_ISR (x, log_tag, format, ...)

A version of ESP_RETURN_ON_ERROR() macro that can be called from ISR.

ESP_RETURN_VOID_ON_ERROR (x, log_tag, format, ...)

Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message and returns. This macro is used when the function returns void.

ESP_RETURN_VOID_ON_ERROR_ISR (x, log_tag, format, ...)

A version of ESP_RETURN_VOID_ON_ERROR() macro that can be called from ISR.

ESP_GOTO_ON_ERROR (x, goto_tag, log_tag, format, ...)

Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message, sets the local variable 'ret' to the code, and then exits by jumping to 'goto_tag'.

ESP_GOTO_ON_ERROR_ISR (x, goto_tag, log_tag, format, ...)

A version of ESP_GOTO_ON_ERROR() macro that can be called from ISR.

ESP_RETURN_ON_FALSE (a, err_code, log_tag, format, ...)

Macro which can be used to check the condition. If the condition is not 'true', it prints the message and returns with the supplied 'err_code'.

ESP_RETURN_ON_FALSE_ISR (a, err_code, log_tag, format, ...)

A version of ESP_RETURN_ON_FALSE() macro that can be called from ISR.

ESP_RETURN_VOID_ON_FALSE (a, log_tag, format, ...)

Macro which can be used to check the condition. If the condition is not 'true', it prints the message and returns without a value.

ESP_RETURN_VOID_ON_FALSE_ISR (a, log_tag, format, ...)

A version of ESP_RETURN_VOID_ON_FALSE() macro that can be called from ISR.

ESP_GOTO_ON_FALSE (a, err_code, goto_tag, log_tag, format, ...)

Macro which can be used to check the condition. If the condition is not 'true', it prints the message, sets the local variable 'ret' to the supplied 'err_code', and then exits by jumping to 'goto_tag'.

ESP_GOTO_ON_FALSE_ISR (a, err_code, goto_tag, log_tag, format, ...)

A version of ESP_GOTO_ON_FALSE() macro that can be called from ISR.

Header File

- [components/esp_common/include/esp_err.h](#)
- This header file can be included with:

```
#include "esp_err.h"
```

Functions

const char ***esp_err_to_name** (*esp_err_t* code)

Returns string for esp_err_t error codes.

This function finds the error code in a pre-generated lookup-table and returns its string representation.

The function is generated by the Python script tools/gen_esp_err_to_name.py which should be run each time an esp_err_t error is modified, created or removed from the IDF project.

Parameters *code* -- esp_err_t error code

Returns string error message

const char ***esp_err_to_name_r** (*esp_err_t* code, char *buf, size_t buflen)

Returns string for esp_err_t and system error codes.

This function finds the error code in a pre-generated lookup-table of esp_err_t errors and returns its string representation. If the error code is not found then it is attempted to be found among system errors.

The function is generated by the Python script tools/gen_esp_err_to_name.py which should be run each time an esp_err_t error is modified, created or removed from the IDF project.

Parameters

- **code** -- esp_err_t error code
- **buf** -- [out] buffer where the error message should be written
- **buflen** -- Size of buffer buf. At most buflen bytes are written into the buf buffer (including the terminating null byte).

Returns buf containing the string error message

Macros

ESP_OK

esp_err_t value indicating success (no error)

ESP_FAIL

Generic esp_err_t code indicating failure

ESP_ERR_NO_MEM

Out of memory

ESP_ERR_INVALID_ARG

Invalid argument

ESP_ERR_INVALID_STATE

Invalid state

ESP_ERR_INVALID_SIZE

Invalid size

ESP_ERR_NOT_FOUND

Requested resource not found

ESP_ERR_NOT_SUPPORTED

Operation or feature not supported

ESP_ERR_TIMEOUT

Operation timed out

ESP_ERR_INVALID_RESPONSE

Received response was invalid

ESP_ERR_INVALID_CRC

CRC or checksum was invalid

ESP_ERR_INVALID_VERSION

Version was invalid

ESP_ERR_INVALID_MAC

MAC address was invalid

ESP_ERR_NOT_FINISHED

Operation has not fully completed

ESP_ERR_NOT_ALLOWED

Operation is not allowed

ESP_ERR_WIFI_BASE

Starting number of WiFi error codes

ESP_ERR_MESH_BASE

Starting number of MESH error codes

ESP_ERR_FLASH_BASE

Starting number of flash error codes

ESP_ERR_HW_CRYPTO_BASE

Starting number of HW cryptography module error codes

ESP_ERR_MEMPROT_BASE

Starting number of Memory Protection API error codes

ESP_ERROR_CHECK (x)

Macro which can be used to check the error code, and terminate the program in case the code is not ESP_OK. Prints the error code, error location, and the failed statement to serial output.

Disabled if assertions are disabled.

ESP_ERROR_CHECK_WITHOUT_ABORT (x)

Macro which can be used to check the error code. Prints the error code, error location, and the failed statement to serial output. In comparison with ESP_ERROR_CHECK(), this prints the same error message but isn't terminating the program.

Type Definitions

typedef int **esp_err_t**

2.9.9 ESP HTTPS OTA

Overview

esp_https_ota provides simplified APIs to perform firmware upgrades over HTTPS. It is an abstraction layer over the existing OTA APIs.

```
esp_err_t do_firmware_upgrade()
{
    esp_http_client_config_t config = {
        .url = CONFIG_FIRMWARE_UPGRADE_URL,
        .cert_pem = (char *)server_cert_pem_start,
    };
    esp_https_ota_config_t ota_config = {
        .http_config = &config,
    };
    esp_err_t ret = esp_https_ota(&ota_config);
    if (ret == ESP_OK) {
        esp_restart();
    } else {
        return ESP_FAIL;
    }
    return ESP_OK;
}
```

Server Verification

Please refer to [ESP-TLS: TLS Server Verification](#) for more information on server verification. The root certificate in PEM format needs to be provided to the `esp_http_client_config_t::cert_pem` member.

Note: The server-endpoint **root** certificate should be used for verification instead of any intermediate ones from the certificate chain. The reason is that the root certificate has the maximum validity and usually remains the same for a long period of time. Users can also use the `esp_http_client_config_t::crt_bundle_attach` member for verification by the ESP x509 Certificate Bundle feature, which covers most of the trusted root certificates.

Partial Image Download over HTTPS

To use the partial image download feature, enable `partial_http_download` configuration in `esp_https_ota_config_t`. When this configuration is enabled, firmware image will be downloaded in multiple HTTP requests of specified sizes. Maximum content length of each request can be specified by setting `max_http_request_size` to the required value.

This option is useful while fetching image from a service like AWS S3, where mbedTLS Rx buffer size (`CONFIG_MBEDTLS_SSL_IN_CONTENT_LEN`) can be set to a lower value which is not possible without enabling this configuration.

Default value of mbedTLS Rx buffer size is set to 16 KB. By using `partial_http_download` with `max_http_request_size` of 4 KB, size of mbedTLS Rx buffer can be reduced to 4 KB. With this configuration, memory saving of around 12 KB is expected.

Signature Verification

For additional security, signature of OTA firmware images can be verified. For more information, please refer to [Secure OTA Updates Without Secure Boot](#).

OTA Upgrades with Pre-Encrypted Firmware

Pre-encrypted firmware is a completely independent scheme from [Flash Encryption](#). Primary reasons for this are as follows:

- Flash encryption scheme recommends using per-device unique encryption key that is internally generated. This makes pre-encryption of the firmware on OTA update server infeasible.
- Flash encryption scheme depends on the flash offset and generates different ciphertext for different flash offset. And hence it becomes difficult to manage different OTA update images based on the partition slots like `ota_0`, `ota_1` etc.
- Even for devices where flash encryption is not enabled, it could be requirement that firmware image over OTA is still encrypted in nature.

Pre-encrypted firmware distribution ensures that the firmware image stays encrypted **in transit** from the server to the device (irrespective of the underlying transport security). First the pre-encrypted software layer will decrypt the firmware (received over network) on device and then re-encrypt the contents using platform flash encryption (if enabled) before writing to flash.

Design

- This scheme requires a unique RSA-3072 public-private key pair to be generated first. The public key stays on the OTA update server for encryption purpose and the private key is part of the device (e.g., embedded in firmware) for decryption purpose.
- Pre-encrypted firmware is encrypted using AES-GCM key which is then appended to the image as header (along with config parameters).
- Further the AES-GCM key gets encrypted using RSA public key and the resultant image gets hosted on the OTA update server.
- On the device side, first the AES-GCM key is retrieved by decrypting the image header using RSA private key available to the device.

- Finally, the contents of the image are decrypted using AES-GCM key (and config parameters) and written to the flash storage.

This whole workflow is managed by an external component `esp_encrypted_image` and it gets plugged into the OTA update framework through decryption callback (`esp_https_ota_config_t::decrypt_cb`) mechanism.

Note: The supported scheme is based on RSA-3072 and the private key on device side must be protected using platform security features.

OTA System Events

ESP HTTPS OTA has various events for which a handler can be triggered by the *Event Loop Library* when the particular event occurs. The handler has to be registered using `esp_event_handler_register()`. This helps the event handling for ESP HTTPS OTA.

`esp_https_ota_event_t` has all the events which can happen when performing OTA upgrade using ESP HTTPS OTA.

Event Handler Example

```

/* Event handler for catching system events */
static void event_handler(void* arg, esp_event_base_t event_base,
                          int32_t event_id, void* event_data)
{
    if (event_base == ESP_HTTPS_OTA_EVENT) {
        switch (event_id) {
            case ESP_HTTPS_OTA_START:
                ESP_LOGI(TAG, "OTA started");
                break;
            case ESP_HTTPS_OTA_CONNECTED:
                ESP_LOGI(TAG, "Connected to server");
                break;
            case ESP_HTTPS_OTA_GET_IMG_DESC:
                ESP_LOGI(TAG, "Reading Image Description");
                break;
            case ESP_HTTPS_OTA_VERIFY_CHIP_ID:
                ESP_LOGI(TAG, "Verifying chip id of new image: %d", *(esp_
↳chip_id_t *)event_data);
                break;
            case ESP_HTTPS_OTA_DECRYPT_CB:
                ESP_LOGI(TAG, "Callback to decrypt function");
                break;
            case ESP_HTTPS_OTA_WRITE_FLASH:
                ESP_LOGD(TAG, "Writing to flash: %d written", *(int_
↳*)event_data);
                break;
            case ESP_HTTPS_OTA_UPDATE_BOOT_PARTITION:
                ESP_LOGI(TAG, "Boot partition updated. Next Partition: %d
↳", *(esp_partition_subtype_t *)event_data);
                break;
            case ESP_HTTPS_OTA_FINISH:
                ESP_LOGI(TAG, "OTA finish");
                break;
            case ESP_HTTPS_OTA_ABORT:
                ESP_LOGI(TAG, "OTA abort");
                break;
        }
    }
}

```

Expected data type for different ESP HTTPS OTA events in the system event loop:

- `ESP_HTTPS_OTA_START` : NULL
- `ESP_HTTPS_OTA_CONNECTED` : NULL
- `ESP_HTTPS_OTA_GET_IMG_DESC` : NULL
- `ESP_HTTPS_OTA_VERIFY_CHIP_ID` : `esp_chip_id_t`
- `ESP_HTTPS_OTA_DECRYPT_CB` : NULL
- `ESP_HTTPS_OTA_WRITE_FLASH` : `int`
- `ESP_HTTPS_OTA_UPDATE_BOOT_PARTITION` : `esp_partition_subtype_t`
- `ESP_HTTPS_OTA_FINISH` : NULL
- `ESP_HTTPS_OTA_ABORT` : NULL

Application Examples

- [system/ota/pre_encrypted_ota](#) demonstrates how to perform OTA updates with pre-encrypted binary using the `esp_encrypted_img` component's APIs and tool, ensuring the confidentiality of the firmware on the network channel, but not its authenticity. To perform OTA upgrades with pre-encrypted firmware, please enable `CONFIG_ESP_HTTPS_OTA_DECRYPT_CB` in component `menuconfig`.
- [system/ota/advanced_https_ota](#) demonstrates how to use the Advanced HTTPS OTA update functionality on ESP32-C5 using the `esp_https_ota` component's APIs. For the applicable SoCs, please refer to [system/ota/advanced_https_ota/README.md](#).
- [system/ota/partitions_ota](#) demonstrates how to perform OTA updates for various partitions (app, bootloader, partition table, storage) using the `esp_https_ota` component's APIs.
- [system/ota/simple_ota_example](#) demonstrates how to use the `esp_https_ota` component's APIs to support firmware upgrades through specific networking interfaces such as Ethernet or Wi-Fi Station on ESP32-C5. For the applicable SoCs, please refer to [system/ota/simple_ota_example/README.md](#).

API Reference

Header File

- `components/esp_https_ota/include/esp_https_ota.h`
- This header file can be included with:

```
#include "esp_https_ota.h"
```

- This header file is a part of the API provided by the `esp_https_ota` component. To declare that your component depends on `esp_https_ota`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_https_ota
```

or

```
PRIV_REQUIRES esp_https_ota
```

Functions

`esp_err_t esp_https_ota` (const `esp_https_ota_config_t` *ota_config)

HTTPS OTA Firmware upgrade.

This function allocates HTTPS OTA Firmware upgrade context, establishes HTTPS connection, reads image data from HTTP stream and writes it to OTA partition and finishes HTTPS OTA Firmware upgrade operation. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to `cert_pem` member of `ota_config->http_config`.

Note: This API handles the entire OTA operation, so if this API is being used then no other APIs from `esp_https_ota` component should be called. If more information and control is needed during the HTTPS

OTA process, then one can use `esp_https_ota_begin` and subsequent APIs. If this API returns successfully, `esp_restart()` must be called to boot from the new firmware image.

Parameters `ota_config` -- [in] pointer to `esp_https_ota_config_t` structure.

Returns

- `ESP_OK`: OTA data updated, next reboot will use specified partition.
- `ESP_FAIL`: For generic failure.
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_OTA_VALIDATE_FAILED`: Invalid app image
- `ESP_ERR_NO_MEM`: Cannot allocate memory for OTA operation.
- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf's app_update component.

esp_err_t **esp_https_ota_begin** (const *esp_https_ota_config_t* *ota_config, *esp_https_ota_handle_t* *handle)

Start HTTPS OTA Firmware upgrade.

This function initializes ESP HTTPS OTA context and establishes HTTPS connection. This function must be invoked first. If this function returns successfully, then `esp_https_ota_perform` should be called to continue with the OTA process and there should be a call to `esp_https_ota_finish` on completion of OTA operation or on failure in subsequent operations. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to `cert_pem` member of `http_config`, which is a part of `ota_config`. In case of error, this API explicitly sets `handle` to `NULL`.

Note: This API is blocking, so setting `is_async` member of `http_config` structure will result in an error.

Parameters

- `ota_config` -- [in] pointer to `esp_https_ota_config_t` structure
- `handle` -- [out] pointer to an allocated data of type `esp_https_ota_handle_t` which will be initialised in this function

Returns

- `ESP_OK`: HTTPS OTA Firmware upgrade context initialised and HTTPS connection established
- `ESP_FAIL`: For generic failure.
- `ESP_ERR_INVALID_ARG`: Invalid argument (missing/incorrect config, certificate, etc.)
- For other return codes, refer documentation in app_update component and `esp_http_client` component in esp-idf.

esp_err_t **esp_https_ota_perform** (*esp_https_ota_handle_t* https_ota_handle)

Read image data from HTTP stream and write it to OTA partition.

This function reads image data from HTTP stream and writes it to OTA partition. This function must be called only if `esp_https_ota_begin()` returns successfully. This function must be called in a loop since it returns after every HTTP read operation thus giving you the flexibility to stop OTA operation midway.

Parameters `https_ota_handle` -- [in] pointer to `esp_https_ota_handle_t` structure

Returns

- `ESP_ERR_HTTPS_OTA_IN_PROGRESS`: OTA update is in progress, call this API again to continue.
- `ESP_OK`: OTA update was successful
- `ESP_FAIL`: OTA update failed
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_INVALID_VERSION`: Invalid chip revision in image header
- `ESP_ERR_OTA_VALIDATE_FAILED`: Invalid app image
- `ESP_ERR_NO_MEM`: Cannot allocate memory for OTA operation.

- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf's app_update component.

bool `esp_https_ota_is_complete_data_received` (*esp_https_ota_handle_t* https_ota_handle)

Checks if complete data was received or not.

Note: This API can be called just before `esp_https_ota_finish()` to validate if the complete image was indeed received.

Parameters `https_ota_handle` -- [in] pointer to `esp_https_ota_handle_t` structure

Returns

- false
- true

esp_err_t `esp_https_ota_finish` (*esp_https_ota_handle_t* https_ota_handle)

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context. This function switches the boot partition to the OTA partition containing the new firmware image.

Note: If this API returns successfully, `esp_restart()` must be called to boot from the new firmware image. `esp_https_ota_finish` should not be called after calling `esp_https_ota_abort`

Parameters `https_ota_handle` -- [in] pointer to `esp_https_ota_handle_t` structure

Returns

- `ESP_OK`: Clean-up successful
- `ESP_ERR_INVALID_STATE`
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_OTA_VALIDATE_FAILED`: Invalid app image

esp_err_t `esp_https_ota_abort` (*esp_https_ota_handle_t* https_ota_handle)

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context.

Note: `esp_https_ota_abort` should not be called after calling `esp_https_ota_finish`

Parameters `https_ota_handle` -- [in] pointer to `esp_https_ota_handle_t` structure

Returns

- `ESP_OK`: Clean-up successful
- `ESP_ERR_INVALID_STATE`: Invalid ESP HTTPS OTA state
- `ESP_FAIL`: OTA not started
- `ESP_ERR_NOT_FOUND`: OTA handle not found
- `ESP_ERR_INVALID_ARG`: Invalid argument

esp_err_t `esp_https_ota_get_img_desc` (*esp_https_ota_handle_t* https_ota_handle, *esp_app_desc_t* *new_app_info)

Reads app description from image header. The app description provides information like the "Firmware version" of the image.

Note: This API can be called only after `esp_https_ota_begin()` and before `esp_https_ota_perform()`. Calling this API is not mandatory.

Parameters

- **https_ota_handle** -- [in] pointer to `esp_https_ota_handle_t` structure
- **new_app_info** -- [out] pointer to an allocated `esp_app_desc_t` structure

Returns

- `ESP_ERR_INVALID_ARG`: Invalid arguments
- `ESP_ERR_INVALID_STATE`: Invalid state to call this API. `esp_https_ota_begin()` not called yet.
- `ESP_FAIL`: Failed to read image descriptor
- `ESP_OK`: Successfully read image descriptor

`esp_err_t esp_https_ota_get_bootloader_img_desc (esp_https_ota_handle_t https_ota_handle, esp_bootloader_desc_t *new_img_info)`

Reads bootloader description from image header. The bootloader description provides information like the "Bootloader version" of the image.

Note: This API can be called only after `esp_https_ota_begin()` and before `esp_https_ota_perform()`. Calling this API is not mandatory.

Parameters

- **https_ota_handle** -- [in] pointer to `esp_https_ota_handle_t` structure
- **new_img_info** -- [out] pointer to an allocated `esp_bootloader_desc_t` structure

Returns

- `ESP_ERR_INVALID_ARG`: Invalid arguments
- `ESP_ERR_INVALID_STATE`: Invalid state to call this API. `esp_https_ota_begin()` not called yet.
- `ESP_FAIL`: Failed to read image descriptor
- `ESP_OK`: Successfully read image descriptor

`int esp_https_ota_get_image_len_read (esp_https_ota_handle_t https_ota_handle)`

This function returns OTA image data read so far.

Note: This API should be called only if `esp_https_ota_perform()` has been called at least once or if `esp_https_ota_get_img_desc` has been called before.

Parameters **https_ota_handle** -- [in] pointer to `esp_https_ota_handle_t` structure

Returns

- -1 On failure
- total bytes read so far

`int esp_https_ota_get_status_code (esp_https_ota_handle_t https_ota_handle)`

This function returns the HTTP status code of the last HTTP response.

Note: This API should be called only after `esp_https_ota_begin()` has been called. This can be used to check the HTTP status code of the OTA download process.

Parameters **https_ota_handle** -- [in] pointer to `esp_https_ota_handle_t` structure

Returns

- -1 On failure
- HTTP status code

`int esp_https_ota_get_image_size (esp_https_ota_handle_t https_ota_handle)`

This function returns OTA image total size.

Note: This API should be called after `esp_https_ota_begin()` has been already called. This can be used to create some sort of progress indication (in combination with `esp_https_ota_get_image_len_read()`)

Parameters `https_ota_handle` -- [in] pointer to `esp_https_ota_handle_t` structure

Returns

- -1 On failure or chunked encoding
- total bytes of image

Structures

struct `decrypt_cb_arg_t`

ESP HTTPS OTA decrypt callback args.

Public Members

const char *`data_in`

Pointer to data to be decrypted

size_t `data_in_len`

Input data length

char *`data_out`

Pointer to data decrypted using callback, this will be freed after data is written to flash

size_t `data_out_len`

Output data length

struct `esp_https_ota_config_t`

ESP HTTPS OTA configuration.

Public Members

const *`esp_http_client_config_t`* *`http_config`

ESP HTTP client configuration

`http_client_init_cb_t` `http_client_init_cb`

Callback after ESP HTTP client is initialised

bool `bulk_flash_erase`

Erase entire flash partition during initialization. By default flash partition is erased during write operation and in chunk of 4K sector size

bool `partial_http_download`

Enable Firmware image to be downloaded over multiple HTTP requests

int `max_http_request_size`

Maximum request size for partial HTTP download

uint32_t **buffer_caps**

The memory capability to use when allocating the buffer for OTA update. Default capability is MAL-LOC_CAP_DEFAULT

decrypt_cb_t **decrypt_cb**

Callback for external decryption layer

void ***decrypt_user_ctx**

User context for external decryption layer

uint16_t **enc_img_header_size**

Header size of pre-encrypted ota image header

const *esp_partition_t* ***staging**

< Details of staging and final partitions for OTA update New image will be downloaded in this staging partition. If NULL then a free app partition (passive app partition) is selected as the staging partition.

const *esp_partition_t* ***final**

Final destination partition. Its type/subtype will be used for verification. If set to NULL, staging partition shall be set as the final partition.

bool **finalize_with_copy**

Flag to copy the staging image to the final partition at the end of OTA update

struct *esp_https_ota_config_t*::[anonymous] **partition**

Struct containing details about the staging and final partitions for OTA update.

Macros

ESP_ERR_HTTPS_OTA_BASE

ESP_ERR_HTTPS_OTA_IN_PROGRESS

Type Definitions

typedef void ***esp_https_ota_handle_t**

typedef *esp_err_t* (***http_client_init_cb_t**)(*esp_http_client_handle_t*)

typedef *esp_err_t* (***decrypt_cb_t**)(*decrypt_cb_arg_t* *args, void *user_ctx)

Enumerations

enum **esp_https_ota_event_t**

Events generated by OTA process.

Values:

enumerator **ESP_HTTPS_OTA_START**

OTA started

enumerator **ESP_HTTPS_OTA_CONNECTED**

Connected to server

enumerator **ESP_HTTPS_OTA_GET_IMG_DESC**

Read app/bootloader description from image header

enumerator **ESP_HTTPS_OTA_VERIFY_CHIP_ID**

Verify chip id of new image

enumerator **ESP_HTTPS_OTA_DECRYPT_CB**

Callback to decrypt function

enumerator **ESP_HTTPS_OTA_WRITE_FLASH**

Flash write operation

enumerator **ESP_HTTPS_OTA_UPDATE_BOOT_PARTITION**

Boot partition update after successful ota update

enumerator **ESP_HTTPS_OTA_FINISH**

OTA finished

enumerator **ESP_HTTPS_OTA_ABORT**

OTA aborted

2.9.10 Event Loop Library

Overview

The event loop library allows components to declare events so that other components can register handlers -- codes that executes when those events occur. This allows loosely-coupled components to attach desired behavior to state changes of other components without application involvement. This also simplifies event processing by serializing and deferring code execution to another context.

One common case is, if a high-level library is using the Wi-Fi library: it may subscribe to [ESP32 Wi-Fi Programming Model](#) directly and act on those events.

Note: Various modules of the Bluetooth stack deliver events to applications via dedicated callback functions instead of via the Event Loop Library.

Using `esp_event` APIs

There are two objects of concern for users of this library: events and event loops.

An event indicates an important occurrence, such as a successful Wi-Fi connection to an access point. A two-part identifier should be used when referencing events, see [declaring and defining events](#) for details. The event loop is the bridge between events and event handlers. The event source publishes events to the event loop using the APIs provided by the event loop library, and event handlers registered to the event loop respond to specific types of events.

Using this library roughly entails the following flow:

1. The user defines a function that should run when an event is posted to a loop. This function is referred to as the event handler, and should have the same signature as `esp_event_handler_t`.
2. An event loop is created using `esp_event_loop_create()`, which outputs a handle to the loop of type `esp_event_loop_handle_t`. Event loops created using this API are referred to as user event loops. There is, however, a special type of event loop called the default event loop which is discussed in *default event loop*.
3. Components register event handlers to the loop using `esp_event_handler_register_with()`. Handlers can be registered with multiple loops, see *notes on handler registration*.
4. Event sources post an event to the loop using `esp_event_post_to()`.
5. Components wanting to remove their handlers from being called can do so by unregistering from the loop using `esp_event_handler_unregister_with()`.
6. Event loops that are no longer needed can be deleted using `esp_event_loop_delete()`.

In code, the flow above may look like as follows:

```
// 1. Define the event handler
void run_on_event(void* handler_arg, esp_event_base_t base, int32_t id, void*
↳event_data)
{
    // Event handler logic
}

void app_main()
{
    // 2. A configuration structure of type esp_event_loop_args_t is needed to
↳specify the properties of the loop to be created. A handle of type esp_event_
↳loop_handle_t is obtained, which is needed by the other APIs to reference the
↳loop to perform their operations.
    esp_event_loop_args_t loop_args = {
        .queue_size = ...,
        .task_name = ...
        .task_priority = ...,
        .task_stack_size = ...,
        .task_core_id = ...
    };

    esp_event_loop_handle_t loop_handle;

    esp_event_loop_create(&loop_args, &loop_handle);

    // 3. Register event handler defined in (1). MY_EVENT_BASE and MY_EVENT_ID
↳specify a hypothetical event that handler run_on_event should execute when it
↳gets posted to the loop.
    esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_
↳on_event, ...);

    ...

    // 4. Post events to the loop. This queues the event on the event loop. At
↳some point, the event loop executes the event handler registered to the posted
↳event, in this case, run_on_event. To simplify the process, this example calls
↳esp_event_post_to from app_main, but posting can be done from any other task
↳(which is the more interesting use case).
    esp_event_post_to(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, ...);

    ...

    // 5. Unregistering an unneeded handler
    esp_event_handler_unregister_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_
↳on_event);

    ...
```

(continues on next page)

```
// 6. Deleting an unneeded event loop
esp_event_loop_delete(loop_handle);
}
```

Declaring and Defining Events

As mentioned previously, events consist of two-part identifiers: the event base and the event ID. The event base identifies an independent group of events; the event ID identifies the event within that group. Think of the event base and event ID as a person's last name and first name, respectively. A last name identifies a family, and the first name identifies a person within that family.

The event loop library provides macros to declare and define the event base easily.

Event base declaration:

```
ESP_EVENT_DECLARE_BASE(EVENT_BASE);
```

Event base definition:

```
ESP_EVENT_DEFINE_BASE(EVENT_BASE);
```

Note: In ESP-IDF, the base identifiers for system events are uppercase and are postfixed with `_EVENT`. For example, the base for Wi-Fi events is declared and defined as `WIFI_EVENT`, the Ethernet event base `ETHERNET_EVENT`, and so on. The purpose is to have event bases look like constants (although they are global variables considering the definitions of macros `ESP_EVENT_DECLARE_BASE` and `ESP_EVENT_DEFINE_BASE`).

For event IDs, declaring them as enumerations is recommended. Once again, for visibility, these are typically placed in public header files.

Event ID:

```
enum {
    EVENT_ID_1,
    EVENT_ID_2,
    EVENT_ID_3,
    ...
}
```

Default Event Loop

The default event loop is a special type of loop used for system events (Wi-Fi events, for example). The handle for this loop is hidden from the user, and the creation, deletion, handler registration/deregistration, and posting of events are done through a variant of the APIs for user event loops. The table below enumerates those variants, and the user event loops equivalent.

User Event Loops	Default Event Loops
<code>esp_event_loop_create()</code>	<code>esp_event_loop_create_default()</code>
<code>esp_event_loop_delete()</code>	<code>esp_event_loop_delete_default()</code>
<code>esp_event_handler_register_with()</code>	<code>esp_event_handler_register()</code>
<code>esp_event_handler_unregister_with()</code>	<code>esp_event_handler_unregister()</code>
<code>esp_event_post_to()</code>	<code>esp_event_post()</code>

If you compare the signatures for both, they are mostly similar except for the lack of loop handle specification for the default event loop APIs.

Other than the API difference and the special designation to which system events are posted, there is no difference in how default event loops and user event loops behave. It is even possible for users to post their own events to the default event loop, should the user opt to not create their own loops to save memory.

Notes on Handler Registration

It is possible to register a single handler to multiple events individually by using multiple calls to `esp_event_handler_register_with()`. For those multiple calls, the specific event base and event ID can be specified with which the handler should execute.

However, in some cases, it is desirable for a handler to execute on the following situations:

- (1) all events that get posted to a loop
- (2) all events of a particular base identifier

This is possible using the special event base identifier `ESP_EVENT_ANY_BASE` and special event ID `ESP_EVENT_ANY_ID`. These special identifiers may be passed as the event base and event ID arguments for `esp_event_handler_register_with()`.

Therefore, the valid arguments to `esp_event_handler_register_with()` are:

1. `<event base>`, `<event ID>` - handler executes when the event with base `<event base>` and event ID `<event ID>` gets posted to the loop
2. `<event base>`, `ESP_EVENT_ANY_ID` - handler executes when any event with base `<event base>` gets posted to the loop
3. `ESP_EVENT_ANY_BASE`, `ESP_EVENT_ANY_ID` - handler executes when any event gets posted to the loop

As an example, suppose the following handler registrations were performed:

```
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_
↳event_1, ...);
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, ESP_EVENT_ANY_ID, run_
↳on_event_2, ...);
esp_event_handler_register_with(loop_handle, ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID,
↳run_on_event_3, ...);
```

If the hypothetical event `MY_EVENT_BASE, MY_EVENT_ID` is posted, all three handlers `run_on_event_1`, `run_on_event_2`, and `run_on_event_3` would execute.

If the hypothetical event `MY_EVENT_BASE, MY_OTHER_EVENT_ID` is posted, only `run_on_event_2` and `run_on_event_3` would execute.

If the hypothetical event `MY_OTHER_EVENT_BASE, MY_OTHER_EVENT_ID` is posted, only `run_on_event_3` would execute.

Handler Un-Registering Itself In general, an event handler run by an event loop is **not allowed to do any registering/unregistering activity on that event loop**. There is one exception, though: un-registering itself is allowed for the handler. E.g., it is possible to do the following:

```
void run_on_event(void* handler_arg, esp_event_base_t base, int32_t id, void*
↳event_data)
{
    esp_event_loop_handle_t *loop_handle = (esp_event_loop_handle_t*) handler_arg;
    esp_event_handler_unregister_with(*loop_handle, MY_EVENT_BASE, MY_EVENT_ID,
↳run_on_event);
}

void app_main(void)
{
    esp_event_loop_handle_t loop_handle;
    esp_event_loop_create(&loop_args, &loop_handle);
```

(continues on next page)

(continued from previous page)

```

    esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_
↳ on_event, &loop_handle);
    // ... post-event MY_EVENT_BASE, MY_EVENT_ID and run loop at some point
}

```

Handler Registration and Handler Dispatch Order The general rule is that, for handlers that match a certain posted event during dispatch, those which are registered first also get executed first. The user can then control which handlers get executed first by registering them before other handlers, provided that all registrations are performed using a single task. If the user plans to take advantage of this behavior, caution must be exercised if there are multiple tasks registering handlers. While the 'first registered, first executed' behavior still holds true, the task which gets executed first also gets its handlers registered first. Handlers registered one after the other by a single task are still dispatched in the order relative to each other, but if that task gets pre-empted in between registration by another task that also registers handlers; then during dispatch those handlers also get executed in between.

Event Loop Profiling

A configuration option `CONFIG_ESP_EVENT_LOOP_PROFILING` can be enabled in order to activate statistics collection for all event loops created. The function `esp_event_dump()` can be used to output the collected statistics to a file stream. More details on the information included in the dump can be found in the `esp_event_dump()` API Reference.

Application Examples

- [system/esp_event/default_event_loop](#) demonstrates how to use the default event loop system of ESP32-C5 to post and handle events, including declaring and defining events, creating the default event loop, posting events to the loop, and registering/unregistering event handlers.
- [system/esp_event/user_event_loops](#) demonstrates how to create and use user event loops on ESP32-C5, including creating and running event loops, registering and unregistering handlers, and posting events, with the ability to handle different use cases beyond the default event loop.

API Reference

Header File

- [components/esp_event/include/esp_event.h](#)
- This header file can be included with:

```
#include "esp_event.h"
```

- This header file is a part of the API provided by the `esp_event` component. To declare that your component depends on `esp_event`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_event
```

or

```
PRIV_REQUIRES esp_event
```

Functions

`esp_err_t esp_event_loop_create` (const `esp_event_loop_args_t` *event_loop_args, `esp_event_loop_handle_t` *event_loop)

Create a new event loop.

Parameters

- `event_loop_args` -- [in] configuration structure for the event loop to create

- **event_loop** -- [out] handle to the created event loop

Returns

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: event_loop_args or event_loop was NULL
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- ESP_FAIL: Failed to create task loop
- Others: Fail

esp_err_t **esp_event_loop_delete** (*esp_event_loop_handle_t* event_loop)

Delete an existing event loop.

Parameters **event_loop** -- [in] event loop to delete, must not be NULL

Returns

- ESP_OK: Success
- Others: Fail

esp_err_t **esp_event_loop_create_default** (void)

Create default event loop.

Returns

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- ESP_ERR_INVALID_STATE: Default event loop has already been created
- ESP_FAIL: Failed to create task loop
- Others: Fail

esp_err_t **esp_event_loop_delete_default** (void)

Delete the default event loop.

Returns

- ESP_OK: Success
- Others: Fail

esp_err_t **esp_event_loop_run** (*esp_event_loop_handle_t* event_loop, TickType_t ticks_to_run)

Dispatch events posted to an event loop.

This function is used to dispatch events posted to a loop with no dedicated task, i.e. task name was set to NULL in event_loop_args argument during loop creation. This function includes an argument to limit the amount of time it runs, returning control to the caller when that time expires (or some time afterwards). There is no guarantee that a call to this function will exit at exactly the time of expiry. There is also no guarantee that events have been dispatched during the call, as the function might have spent all the allotted time waiting on the event queue. Once an event has been dequeued, however, it is guaranteed to be dispatched. This guarantee contributes to not being able to exit exactly at time of expiry as (1) blocking on internal mutexes is necessary for dispatching the dequeued event, and (2) during dispatch of the dequeued event there is no way to control the time occupied by handler code execution. The guaranteed time of exit is therefore the allotted time + amount of time required to dispatch the last dequeued event.

In cases where waiting on the queue times out, ESP_OK is returned and not ESP_ERR_TIMEOUT, since it is normal behavior.

Note: encountering an unknown event that has been posted to the loop will only generate a warning, not an error.

Parameters

- **event_loop** -- [in] event loop to dispatch posted events from, must not be NULL
- **ticks_to_run** -- [in] number of ticks to run the loop

Returns

- ESP_OK: Success
- Others: Fail

esp_err_t **esp_event_handler_register** (*esp_event_base_t* event_base, *int32_t* event_id, *esp_event_handler_t* event_handler, void *event_handler_arg)

Register an event handler to the system event loop (legacy).

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

- specific events: specify exact event_base and event_id
- all events of a certain base: specify exact event_base and use ESP_EVENT_ANY_ID as the event_id
- all events known by the loop: use ESP_EVENT_ANY_BASE for event_base and ESP_EVENT_ANY_ID as the event_id

Registering multiple handlers to events is possible. Registering a single handler to multiple events is also possible. However, registering the same handler to the same event multiple times would cause the previous registrations to be overwritten.

Note: the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

Parameters

- **event_base** -- [in] the base ID of the event to register the handler for
- **event_id** -- [in] the ID of the event to register the handler for
- **event_handler** -- [in] the handler function which gets called when the event is dispatched
- **event_handler_arg** -- [in] data, aside from event data, that is passed to the handler when it is called

Returns

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

esp_err_t **esp_event_handler_register_with** (*esp_event_loop_handle_t* event_loop, *esp_event_base_t* event_base, *int32_t* event_id, *esp_event_handler_t* event_handler, void *event_handler_arg)

Register an event handler to a specific loop (legacy).

This function behaves in the same manner as esp_event_handler_register, except the additional specification of the event loop to register the handler to.

Note: the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

Parameters

- **event_loop** -- [in] the event loop to register this handler function to, must not be NULL
- **event_base** -- [in] the base ID of the event to register the handler for
- **event_id** -- [in] the ID of the event to register the handler for
- **event_handler** -- [in] the handler function which gets called when the event is dispatched
- **event_handler_arg** -- [in] data, aside from event data, that is passed to the handler when it is called

Returns

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID

- Others: Fail

```
esp_err_t esp_event_handler_instance_register_with(esp_event_loop_handle_t event_loop,  
                                                  esp_event_base_t event_base, int32_t  
                                                  event_id, esp_event_handler_t  
                                                  event_handler, void *event_handler_arg,  
                                                  esp_event_handler_instance_t *instance)
```

Register an instance of event handler to a specific loop.

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

- specific events: specify exact event_base and event_id
- all events of a certain base: specify exact event_base and use ESP_EVENT_ANY_ID as the event_id
- all events known by the loop: use ESP_EVENT_ANY_BASE for event_base and ESP_EVENT_ANY_ID as the event_id

Besides the error, the function returns an instance object as output parameter to identify each registration. This is necessary to remove (unregister) the registration before the event loop is deleted.

Registering multiple handlers to events, registering a single handler to multiple events as well as registering the same handler to the same event multiple times is possible. Each registration yields a distinct instance object which identifies it over the registration lifetime.

Note: the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

Note: Calling this function with instance set to NULL is equivalent to calling esp_event_handler_register_with.

Parameters

- **event_loop** -- **[in]** the event loop to register this handler function to, must not be NULL
- **event_base** -- **[in]** the base ID of the event to register the handler for
- **event_id** -- **[in]** the ID of the event to register the handler for
- **event_handler** -- **[in]** the handler function which gets called when the event is dispatched
- **event_handler_arg** -- **[in]** data, aside from event data, that is passed to the handler when it is called
- **instance** -- **[out]** An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed, but the handler should be deleted when the event loop is deleted, instance can be NULL.

Returns

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID or instance is NULL
- Others: Fail

```
esp_err_t esp_event_handler_instance_register(esp_event_base_t event_base, int32_t event_id,  
                                             esp_event_handler_t event_handler, void  
                                             *event_handler_arg,  
                                             esp_event_handler_instance_t *instance)
```

Register an instance of event handler to the default loop.

This function does the same as `esp_event_handler_instance_register_with`, except that it registers the handler to the default event loop.

Note: the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called

Note: Calling this function with `instance` set to `NULL` is equivalent to calling `esp_event_handler_register`.

Parameters

- **event_base** -- **[in]** the base ID of the event to register the handler for
- **event_id** -- **[in]** the ID of the event to register the handler for
- **event_handler** -- **[in]** the handler function which gets called when the event is dispatched
- **event_handler_arg** -- **[in]** data, aside from event data, that is passed to the handler when it is called
- **instance** -- **[out]** An event handler instance object related to the registered event handler and data, can be `NULL`. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed, but the handler should be deleted when the event loop is deleted, `instance` can be `NULL`.

Returns

- `ESP_OK`: Success
- `ESP_ERR_NO_MEM`: Cannot allocate memory for the handler
- `ESP_ERR_INVALID_ARG`: Invalid combination of event base and event ID or instance is `NULL`
- Others: Fail

esp_err_t **esp_event_handler_unregister** (*esp_event_base_t* event_base, *int32_t* event_id, *esp_event_handler_t* event_handler)

Unregister a handler with the system event loop (legacy).

Unregisters a handler, so it will no longer be called during dispatch. Handlers can be unregistered for any combination of `event_base` and `event_id` which were previously registered. To unregister a handler, the `event_base` and `event_id` arguments must match exactly the arguments passed to `esp_event_handler_register()` when that handler was registered. Passing `ESP_EVENT_ANY_BASE` and/or `ESP_EVENT_ANY_ID` will only unregister handlers that were registered with the same wildcard arguments.

Note: When using `ESP_EVENT_ANY_ID`, handlers registered to specific event IDs using the same base will not be unregistered. When using `ESP_EVENT_ANY_BASE`, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

Parameters

- **event_base** -- **[in]** the base of the event with which to unregister the handler
- **event_id** -- **[in]** the ID of the event with which to unregister the handler
- **event_handler** -- **[in]** the handler to unregister

Returns `ESP_OK` success

Returns `ESP_ERR_INVALID_ARG` invalid combination of event base and event ID

Returns others fail

esp_err_t **esp_event_handler_unregister_with** (*esp_event_loop_handle_t* event_loop,
esp_event_base_t event_base, int32_t event_id,
esp_event_handler_t event_handler)

Unregister a handler from a specific event loop (legacy).

This function behaves in the same manner as `esp_event_handler_unregister`, except the additional specification of the event loop to unregister the handler with.

Parameters

- **event_loop** -- [in] the event loop with which to unregister this handler function, must not be NULL
- **event_base** -- [in] the base of the event with which to unregister the handler
- **event_id** -- [in] the ID of the event with which to unregister the handler
- **event_handler** -- [in] the handler to unregister

Returns

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

esp_err_t **esp_event_handler_instance_unregister_with** (*esp_event_loop_handle_t* event_loop,
esp_event_base_t event_base, int32_t
event_id, *esp_event_handler_instance_t*
instance)

Unregister a handler instance from a specific event loop.

Unregisters a handler instance, so it will no longer be called during dispatch. Handler instances can be unregistered for any combination of `event_base` and `event_id` which were previously registered. To unregister a handler instance, the `event_base` and `event_id` arguments must match exactly the arguments passed to `esp_event_handler_instance_register()` when that handler instance was registered. Passing `ESP_EVENT_ANY_BASE` and/or `ESP_EVENT_ANY_ID` will only unregister handler instances that were registered with the same wildcard arguments.

Note: When using `ESP_EVENT_ANY_ID`, handlers registered to specific event IDs using the same base will not be unregistered. When using `ESP_EVENT_ANY_BASE`, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

Parameters

- **event_loop** -- [in] the event loop with which to unregister this handler function, must not be NULL
- **event_base** -- [in] the base of the event with which to unregister the handler
- **event_id** -- [in] the ID of the event with which to unregister the handler
- **instance** -- [in] the instance object of the registration to be unregistered

Returns

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

esp_err_t **esp_event_handler_instance_unregister** (esp_event_base_t event_base, int32_t event_id,
esp_event_handler_instance_t instance)

Unregister a handler from the system event loop.

This function does the same as `esp_event_handler_instance_unregister_with`, except that it unregisters the handler instance from the default event loop.

Parameters

- **event_base** -- [in] the base of the event with which to unregister the handler
- **event_id** -- [in] the ID of the event with which to unregister the handler
- **instance** -- [in] the instance object of the registration to be unregistered

Returns

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

esp_err_t **esp_event_post** (esp_event_base_t event_base, int32_t event_id, const void *event_data, size_t event_data_size, TickType_t ticks_to_wait)

Posts an event to the system default event loop. The event loop library keeps a copy of event_data and manages the copy's lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

Parameters

- **event_base** -- **[in]** the event base that identifies the event
- **event_id** -- **[in]** the event ID that identifies the event
- **event_data** -- **[in]** the data, specific to the event occurrence, that gets passed to the handler
- **event_data_size** -- **[in]** the size of the event data
- **ticks_to_wait** -- **[in]** number of ticks to block on a full event queue

Returns

- ESP_OK: Success
- ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

esp_err_t **esp_event_post_to** (*esp_event_loop_handle_t* event_loop, esp_event_base_t event_base, int32_t event_id, const void *event_data, size_t event_data_size, TickType_t ticks_to_wait)

Posts an event to the specified event loop. The event loop library keeps a copy of event_data and manages the copy's lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

This function behaves in the same manner as esp_event_post, except the additional specification of the event loop to post the event to.

Parameters

- **event_loop** -- **[in]** the event loop to post to, must not be NULL
- **event_base** -- **[in]** the event base that identifies the event
- **event_id** -- **[in]** the event ID that identifies the event
- **event_data** -- **[in]** the data, specific to the event occurrence, that gets passed to the handler
- **event_data_size** -- **[in]** the size of the event data
- **ticks_to_wait** -- **[in]** number of ticks to block on a full event queue

Returns

- ESP_OK: Success
- ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

esp_err_t **esp_event_isr_post** (esp_event_base_t event_base, int32_t event_id, const void *event_data, size_t event_data_size, BaseType_t *task_unblocked)

Special variant of esp_event_post for posting events from interrupt handlers.

Note: this function is only available when CONFIG_ESP_EVENT_POST_FROM_ISR is enabled

Note: when this function is called from an interrupt handler placed in IRAM, this function should be placed in IRAM as well by enabling CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR

Parameters

- **event_base** -- **[in]** the event base that identifies the event
- **event_id** -- **[in]** the event ID that identifies the event
- **event_data** -- **[in]** the data, specific to the event occurrence, that gets passed to the handler
- **event_data_size** -- **[in]** the size of the event data; max is 4 bytes
- **task_unblocked** -- **[out]** an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

Returns

- ESP_OK: Success
- ESP_FAIL: Event queue for the default event loop full
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID, data size of more than 4 bytes
- Others: Fail

esp_err_t **esp_event_isr_post_to** (*esp_event_loop_handle_t* event_loop, *esp_event_base_t* event_base, *int32_t* event_id, *const void **event_data, *size_t* event_data_size, *BaseType_t **task_unblocked)

Special variant of `esp_event_post_to` for posting events from interrupt handlers.

Note: this function is only available when `CONFIG_ESP_EVENT_POST_FROM_ISR` is enabled

Note: when this function is called from an interrupt handler placed in IRAM, this function should be placed in IRAM as well by enabling `CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR`

Parameters

- **event_loop** -- **[in]** the event loop to post to, must not be NULL
- **event_base** -- **[in]** the event base that identifies the event
- **event_id** -- **[in]** the event ID that identifies the event
- **event_data** -- **[in]** the data, specific to the event occurrence, that gets passed to the handler
- **event_data_size** -- **[in]** the size of the event data
- **task_unblocked** -- **[out]** an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

Returns

- ESP_OK: Success
- ESP_FAIL: Event queue for the loop full
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID, data size of more than 4 bytes
- Others: Fail

esp_err_t **esp_event_dump** (FILE *file)

Dumps statistics of all event loops.

Dumps event loop info in the format:

```

event loop
  handler
  handler
  ...
event loop
  handler
  handler

```

(continues on next page)

(continued from previous page)

```

...

where:

event loop
  format: address,name rx:total_received dr:total_dropped
  where:
    address - memory address of the event loop
    name - name of the event loop, 'none' if no dedicated task
    total_received - number of successfully posted events
    total_dropped - number of events unsuccessfully posted due to queue.
↳being full

handler
  format: address ev:base,id inv:total_invoked run:total_runtime
  where:
    address - address of the handler function
    base,id - the event specified by event base and ID this handler.
↳executes
    total_invoked - number of times this handler has been invoked
    total_runtime - total amount of time used for invoking this handler

```

Note: this function is a noop when CONFIG_ESP_EVENT_LOOP_PROFILING is disabled

Parameters `file -- [in]` the file stream to output to

Returns

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- Others: Fail

Structures

struct **esp_event_loop_args_t**

Configuration for creating event loops.

Public Members

int32_t **queue_size**

size of the event loop queue

const char ***task_name**

name of the event loop task; if NULL, a dedicated task is not created for event loop

UBaseType_t **task_priority**

priority of the event loop task, ignored if task name is NULL

uint32_t **task_stack_size**

stack size of the event loop task, ignored if task name is NULL

BaseType_t **task_core_id**

core to which the event loop task is pinned to, ignored if task name is NULL

Header File

- [components/esp_event/include/esp_event_base.h](#)
- This header file can be included with:

```
#include "esp_event_base.h"
```

- This header file is a part of the API provided by the `esp_event` component. To declare that your component depends on `esp_event`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_event
```

or

```
PRIV_REQUIRES esp_event
```

Macros

ESP_EVENT_DECLARE_BASE (id)

ESP_EVENT_DEFINE_BASE (id)

ESP_EVENT_ANY_BASE

register handler for any event base

ESP_EVENT_ANY_ID

register handler for any event id

Type Definitions

typedef void ***esp_event_loop_handle_t**

a number that identifies an event with respect to a base

typedef void (***esp_event_handler_t**)(void *event_handler_arg, esp_event_base_t event_base, int32_t event_id, void *event_data)

function called when an event is posted to the queue

typedef void ***esp_event_handler_instance_t**

context identifying an instance of a registered event handler

2.9.11 FreeRTOS Overview

Overview

FreeRTOS is an open source RTOS (real-time operating system) kernel that is integrated into ESP-IDF as a component. Thus, all ESP-IDF applications and many ESP-IDF components are written based on FreeRTOS. The FreeRTOS kernel is ported to all architectures (i.e., Xtensa and RISC-V) available of ESP chips.

Furthermore, ESP-IDF provides different implementations of FreeRTOS in order to support SMP (Symmetric Multiprocessing) on multi-core ESP chips. This document provides an overview of the FreeRTOS component, the different FreeRTOS implementations offered by ESP-IDF, and the common aspects across all implementations.

Implementations

The [official FreeRTOS](#) (henceforth referred to as Vanilla FreeRTOS) is a single-core RTOS. In order to support the various multi-core ESP targets, ESP-IDF supports different FreeRTOS implementations as listed below:

ESP-IDF FreeRTOS ESP-IDF FreeRTOS is a FreeRTOS implementation based on Vanilla FreeRTOS v10.5.1, but contains significant modifications to support SMP. ESP-IDF FreeRTOS only supports two cores at most (i.e., dual core SMP), but is more optimized for this scenario by design. For more details regarding ESP-IDF FreeRTOS and its modifications, please refer to the [FreeRTOS \(IDF\)](#) document.

Note: ESP-IDF FreeRTOS is currently the default FreeRTOS implementation for ESP-IDF.

Amazon SMP FreeRTOS Amazon SMP FreeRTOS is an SMP implementation of FreeRTOS that is officially supported by Amazon. Amazon SMP FreeRTOS is able to support N-cores (i.e., more than two cores). Amazon SMP FreeRTOS can be enabled via the `CONFIG_FREERTOS_SMP` option. For more details regarding Amazon SMP FreeRTOS, please refer to the [official Amazon SMP FreeRTOS documentation](#).

Warning: The Amazon SMP FreeRTOS implementation (and its port in ESP-IDF) are currently in experimental/beta state. Therefore, significant behavioral changes and breaking API changes can occur.

Configuration

Kernel Configuration Vanilla FreeRTOS requires that ports and applications configure the kernel by adding various `#define config...` macro definitions to the `FreeRTOSConfig.h` header file. Vanilla FreeRTOS supports a list of kernel configuration options which allow various kernel behaviors and features to be enabled or disabled.

However, for all FreeRTOS ports in ESP-IDF, the `FreeRTOSConfig.h` header file is considered private and must not be modified by users. A large number of kernel configuration options in `FreeRTOSConfig.h` are hard-coded as they are either required/not supported by ESP-IDF. All kernel configuration options that are configurable by the user are exposed via `menuconfig` under `Component Config/FreeRTOS/Kernel`.

For the full list of user configurable kernel options, see [Kconfig Options Reference](#). The list below highlights some commonly used kernel configuration options:

- `CONFIG_FREERTOS_UNICORE` runs FreeRTOS only on Core 0. Note that this is **not equivalent to running Vanilla FreeRTOS**. Furthermore, this option may affect behavior of components other than `freertos`. For more details regarding the effects of running FreeRTOS on a single core, refer to [Single-Core Mode](#) (if using ESP-IDF FreeRTOS) or the official Amazon SMP FreeRTOS documentation. Alternatively, users can also search for occurrences of `CONFIG_FREERTOS_UNICORE` in the ESP-IDF components.

Note: As ESP32-C5 is a single core SoC, the `CONFIG_FREERTOS_UNICORE` configuration is always set.

- `CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY` enables backward compatibility with some FreeRTOS macros/types/functions that were deprecated from v8.0 onwards.

Port Configuration All other FreeRTOS related configuration options that are not part of the kernel configuration are exposed via `menuconfig` under `Component Config/FreeRTOS/Port`. These options configure aspects such as:

- The FreeRTOS ports themselves (e.g., tick timer selection, ISR stack size)
- Additional features added to the FreeRTOS implementation or ports

Using FreeRTOS

Application Entry Point Unlike Vanilla FreeRTOS, users of FreeRTOS in ESP-IDF **must never call** `vTaskStartScheduler()` and `vTaskEndScheduler()`. Instead, ESP-IDF starts FreeRTOS automatically. Users must define a `void app_main(void)` function which acts as the entry point for user's application and is automatically invoked on ESP-IDF startup.

- Typically, users would spawn the rest of their application's task from `app_main`.
- The `app_main` function is allowed to return at any point (i.e., before the application terminates).
- The `app_main` function is called from the `main` task.

Background Tasks During startup, ESP-IDF and the FreeRTOS kernel automatically create multiple tasks that run in the background (listed in the table below).

Table 12: List of Tasks Created During Startup

Task Name	Description	Stack Size	Affinity	Priority
Idle Tasks (IDLE _x)	An idle task (IDLE _x) is created for (and pinned to) each core, where _x is the core's number. _x is dropped when single-core configuration is enabled.	CONFIG_FREERTOS_IDLE_TASK_STACK_SIZE	Core 0	0
FreeRTOS Timer Task (Tmr Svc)	FreeRTOS will create the Timer Service/Daemon Task if any FreeRTOS Timer APIs are called by the application	CONFIG_FREERTOS_TIMER_TASK_STACK_SIZE	Core 0	CONFIG_FREERTOS_TIMER_TASK_PRIORITY
Main Task (main)	Task that simply calls <code>app_main</code> . This task will self delete when <code>app_main</code> returns	CONFIG_ESP_MAIN_TASK_STACK_SIZE	Core 0	1
IPC Tasks (ipcx)	When CONFIG_FREERTOS_UNICORE is false, an IPC task (ipcx) is created for (and pinned to) each core. IPC tasks are used to implement the Inter-processor Call (IPC) feature.	CONFIG_ESP_IPC_TASK_STACK_SIZE	Core 0	24
ESP Timer Task (esp_timer)	ESP-IDF creates the ESP Timer Task used to process ESP Timer callbacks	CONFIG_ESP_TIMER_TASK_STACK_SIZE	Core 0	22

Note: Note that if an application uses other ESP-IDF features (e.g., Wi-Fi or Bluetooth), those features may create their own background tasks in addition to the tasks listed in the table above.

FreeRTOS Additions

ESP-IDF provides some supplemental features to FreeRTOS such as Ring Buffers, ESP-IDF style Tick and Idle Hooks, and TLSP deletion callbacks. See [FreeRTOS \(Supplemental Features\)](#) for more details.

FreeRTOS Heap

Vanilla FreeRTOS provides its own [selection of heap implementations](#). However, ESP-IDF already implements its own heap (see [Heap Memory Allocation](#)), thus ESP-IDF does not make use of the heap implementations provided by Vanilla FreeRTOS. All FreeRTOS ports in ESP-IDF map FreeRTOS memory allocation or free calls (e.g., `pvPortMalloc()` and `pvPortFree()`) to ESP-IDF heap API (i.e., [heap_caps_malloc\(\)](#) and [heap_caps_free\(\)](#)). However, the FreeRTOS ports ensure that all dynamic memory allocated by FreeRTOS is placed in internal memory.

Note: If users wish to place FreeRTOS tasks/objects in external memory, users can use the following methods:

- Allocate the task or object using one of the `...CreateWithCaps()` API, such as `xTaskCreateWithCaps()` and `xQueueCreateWithCaps()` (see *IDF Additional API* for more details).
 - Manually allocate external memory for those objects using `heap_caps_malloc()`, then create the objects from the allocated memory using one of the `...CreateStatic()` FreeRTOS functions.
-

Application Examples

- [system/freertos/basic_freertos_smp_usage](#) demonstrates how to use basic FreeRTOS APIs for task creation, communication, synchronization, and batch processing within an SMP architecture on ESP32-C5.
- [system/freertos/real_time_stats](#) demonstrates how to use FreeRTOS's function `vTaskGetRunTimeStats()` to obtain CPU usage statistics of tasks with respect to a specified duration, rather than over the entire runtime of FreeRTOS.

2.9.12 FreeRTOS (IDF)

This document provides information regarding the dual-core SMP implementation of FreeRTOS inside ESP-IDF. This document is split into the following sections:

Sections

- *FreeRTOS (IDF)*
 - *Overview*
 - *Symmetric Multiprocessing*
 - *Tasks*
 - *SMP Scheduler*
 - *Critical Sections*
 - *Misc*
 - *Single-Core Mode*
 - *API Reference*

Overview

The original FreeRTOS (hereinafter referred to as **Vanilla FreeRTOS**) is a compact and efficient real-time operating system supported on numerous single-core MCUs and SoCs. However, to support dual-core ESP targets, such as ESP32, ESP32-S3, and ESP32-P4, ESP-IDF provides a unique implementation of FreeRTOS with dual-core symmetric multiprocessing (SMP) capabilities (hereinafter referred to as **IDF FreeRTOS**).

IDF FreeRTOS source code is based on Vanilla FreeRTOS v10.5.1 but contains significant modifications to both kernel behavior and API in order to support dual-core SMP. However, IDF FreeRTOS can also be configured for single-core by enabling the `CONFIG_FREERTOS_UNICORE` option (see *Single-Core Mode* for more details).

Note: This document assumes that the reader has a requisite understanding of Vanilla FreeRTOS, i.e., its features, behavior, and API usage. Refer to the [Vanilla FreeRTOS documentation](#) for more details.

Symmetric Multiprocessing

Basic Concepts Symmetric multiprocessing is a computing architecture where two or more identical CPU cores are connected to a single shared main memory and controlled by a single operating system. In general, an SMP system:

- has multiple cores running independently. Each core has its own register file, interrupts, and interrupt handling.
- presents an identical view of memory to each core. Thus, a piece of code that accesses a particular memory address has the same effect regardless of which core it runs on.

The main advantages of an SMP system compared to single-core or asymmetric multiprocessing systems are that:

- the presence of multiple cores allows for multiple hardware threads, thus increasing overall processing throughput.
- having symmetric memory means that threads can switch cores during execution. This, in general, can lead to better CPU utilization.

Although an SMP system allows threads to switch cores, there are scenarios where a thread must/should only run on a particular core. Therefore, threads in an SMP system also have a core affinity that specifies which particular core the thread is allowed to run on.

- A thread that is pinned to a particular core is only able to run on that core.
- A thread that is unpinned will be allowed to switch between cores during execution instead of being pinned to a particular core.

SMP on an ESP Target ESP targets such as ESP32, ESP32-S3, and ESP32-P4 are dual-core SMP SoCs. These targets have the following hardware features that make them SMP-capable:

- Two identical cores are known as Core 0 and Core 1. This means that the execution of a piece of code is identical regardless of which core it runs on.
- Symmetric memory (with some small exceptions).
 - If multiple cores access the same memory address simultaneously, their access will be serialized by the memory bus.
 - True atomic access to the same memory address is achieved via an atomic compare-and-swap instruction provided by the ISA.
- Cross-core interrupts that allow one core to trigger an interrupt on the other core. This allows cores to signal events to each other (such as requesting a context switch on the other core).

Note: Within ESP-IDF, Core 0 and Core 1 are sometimes referred to as `PRO_CPU` and `APP_CPU` respectively. The aliases exist in ESP-IDF as they reflect how typical ESP-IDF applications utilize the two cores. Typically, the tasks responsible for handling protocol related processing such as Wi-Fi or Bluetooth are pinned to Core 0 (thus the name `PRO_CPU`), whereas the tasks handling the remainder of the application are pinned to Core 1, (thus the name `APP_CPU`).

Tasks

Creation Vanilla FreeRTOS provides the following functions to create a task:

- `xTaskCreate()` creates a task. The task's memory is dynamically allocated.
- `xTaskCreateStatic()` creates a task. The task's memory is statically allocated, i.e., provided by the user.

However, in an SMP system, tasks need to be assigned a particular affinity. Therefore, ESP-IDF provides a `... PinnedToCore()` version of Vanilla FreeRTOS's task creation functions:

- `xTaskCreatePinnedToCore()` creates a task with a particular core affinity. The task's memory is dynamically allocated.
- `xTaskCreateStaticPinnedToCore()` creates a task with a particular core affinity. The task's memory is statically allocated, i.e., provided by the user.

The `...PinnedToCore()` versions of the task creation function API differ from their vanilla counterparts by having an extra `xCoreID` parameter that is used to specify the created task's core affinity. The valid values for core affinity are:

- 0, which pins the created task to Core 0
- 1, which pins the created task to Core 1
- `tskNO_AFFINITY`, which allows the task to be run on both cores

Note that IDF FreeRTOS still supports the vanilla versions of the task creation functions. However, these standard functions have been modified to essentially invoke their respective `...PinnedToCore()` counterparts while setting the core affinity to `tskNO_AFFINITY`.

Note: IDF FreeRTOS also changes the units of `ulStackDepth` in the task creation functions. Task stack sizes in Vanilla FreeRTOS are specified in a number of words, whereas in IDF FreeRTOS, the task stack sizes are specified in bytes.

Execution The anatomy of a task in IDF FreeRTOS is the same as in Vanilla FreeRTOS. More specifically, IDF FreeRTOS tasks:

- Can only be in one of the following states: Running, Ready, Blocked, or Suspended.
- Task functions are typically implemented as an infinite loop.
- Task functions should never return.

Deletion Task deletion in Vanilla FreeRTOS is called via `vTaskDelete()`. The function allows deletion of another task or the currently running task if the provided task handle is `NULL`. The actual freeing of the task's memory is sometimes delegated to the idle task if the task being deleted is the currently running task.

IDF FreeRTOS provides the same `vTaskDelete()` function. However, due to the dual-core nature, there are some behavioral differences when calling `vTaskDelete()` in IDF FreeRTOS:

- When deleting a task that is currently running on the other core, a yield is triggered on the other core, and the task's memory is freed by one of the idle tasks.
- A deleted task's memory is freed immediately if it is not running on either core.

Please avoid deleting a task that is running on another core as it is difficult to determine what the task is performing, which may lead to unpredictable behavior such as:

- Deleting a task that is holding a mutex.
- Deleting a task that has yet to free memory it previously allocated.

Where possible, please design your own application so that when calling `vTaskDelete()`, the deleted task is in a known state. For example:

- Tasks self-deleting via `vTaskDelete(NULL)` when their execution is complete and have also cleaned up all resources used within the task.
- Tasks placing themselves in the suspend state via `vTaskSuspend()` before being deleted by another task.

SMP Scheduler

The Vanilla FreeRTOS scheduler is best described as a **fixed priority preemptive scheduler with time slicing** meaning that:

- Each task is given a constant priority upon creation. The scheduler executes the highest priority ready-state task.
- The scheduler can switch execution to another task without the cooperation of the currently running task.
- The scheduler periodically switches execution between ready-state tasks of the same priority in a round-robin fashion. Time slicing is governed by a tick interrupt.

The IDF FreeRTOS scheduler supports the same scheduling features, i.e., Fixed Priority, Preemption, and Time Slicing, albeit with some small behavioral differences.

Fixed Priority In Vanilla FreeRTOS, when the scheduler selects a new task to run, it always selects the current highest priority ready-state task. In IDF FreeRTOS, each core independently schedules tasks to run. When a particular core selects a task, the core will select the highest priority ready-state task that can be run by the core. A task can be run by the core if:

- The task has a compatible affinity, i.e., is either pinned to that core or is unpinned.
- The task is not currently being run by another core.

However, please do not assume that the two highest priority ready-state tasks are always run by the scheduler, as a task's core affinity must also be accounted for. For example, given the following tasks:

- Task A of priority 10 pinned to Core 0
- Task B of priority 9 pinned to Core 0
- Task C of priority 8 pinned to Core 1

The resulting schedule will have Task A running on Core 0 and Task C running on Core 1. Task B is not run even though it is the second-highest priority task.

Preemption In Vanilla FreeRTOS, the scheduler can preempt the currently running task if a higher priority task becomes ready to execute. Likewise in IDF FreeRTOS, each core can be individually preempted by the scheduler if the scheduler determines that a higher-priority task can run on that core.

However, there are some instances where a higher-priority task that becomes ready can be run on multiple cores. In this case, the scheduler only preempts one core. The scheduler always gives preference to the current core when multiple cores can be preempted. In other words, if the higher priority ready task is unpinned and has a higher priority than the current priority of both cores, the scheduler will always choose to preempt the current core. For example, given the following tasks:

- Task A of priority 8 currently running on Core 0
- Task B of priority 9 currently running on Core 1
- Task C of priority 10 that is unpinned and was unblocked by Task B

The resulting schedule will have Task A running on Core 0 and Task C preempting Task B given that the scheduler always gives preference to the current core.

Time Slicing The Vanilla FreeRTOS scheduler implements time slicing, which means that if the current highest ready priority contains multiple ready tasks, the scheduler will switch between those tasks periodically in a round-robin fashion.

However, in IDF FreeRTOS, it is not possible to implement perfect Round Robin time slicing due to the fact that a particular task may not be able to run on a particular core due to the following reasons:

- The task is pinned to another core.
- For unpinned tasks, the task is already being run by another core.

Therefore, when a core searches the ready-state task list for a task to run, the core may need to skip over a few tasks in the same priority list or drop to a lower priority in order to find a ready-state task that the core can run.

The IDF FreeRTOS scheduler implements a Best Effort Round Robin time slicing for ready-state tasks of the same priority by ensuring that tasks that have been selected to run are placed at the back of the list, thus giving unselected tasks a higher priority on the next scheduling iteration (i.e., the next tick interrupt or yield).

The following example demonstrates the Best Effort Round Robin time slicing in action. Assume that:

- There are four ready-state tasks of the same priority AX, B0, C1, and D1 where:
 - The priority is the current highest priority with ready-state .
 - The first character represents the task's name, i.e., A, B, C, D.
 - The second character represents the task's core pinning, and X means unpinned.
- The task list is always searched from the head.

1. Starting state. None of the ready-state tasks have been selected to run.

Head [AX , B0 , C1 , D0] Tail

2. Core 0 has a tick interrupt and searches for a task to run. Task A is selected and moved to the back of the list.

3. Core 1 has a tick interrupt and searches for a task to run. Task B cannot be run due to incompatible affinity, so Core 1 skips to Task C. Task C is selected and moved to the back of the list.

4. Core 0 has another tick interrupt and searches for a task to run. Task B is selected and moved to the back of the list.

5. Core 1 has another tick and searches for a task to run. Task D cannot be run due to incompatible affinity, so Core 1 skips to Task A. Task A is selected and moved to the back of the list.

The implications to users regarding the Best Effort Round Robin time slicing:

- Users cannot expect multiple ready-state tasks of the same priority to run sequentially as is the case in Vanilla FreeRTOS. As demonstrated in the example above, a core may need to skip over tasks.
- However, given enough ticks, a task will eventually be given some processing time.
- If a core cannot find a task runnable task at the highest ready-state priority, it will drop to a lower priority to search for tasks.
- To achieve ideal round-robin time slicing, users should ensure that all tasks of a particular priority are pinned to the same core.

Tick Interrupts Vanilla FreeRTOS requires that a periodic tick interrupt occurs. The tick interrupt is responsible for:

- Incrementing the scheduler's tick count
- Unblocking any blocked tasks that have timed out
- Checking if time slicing is required, i.e., triggering a context switch
- Executing the application tick hook

In IDF FreeRTOS, each core receives a periodic interrupt and independently runs the tick interrupt. The tick interrupts on each core are of the same period but can be out of phase. However, the tick responsibilities listed above are not run by all cores:

- Core 0 executes all of the tick interrupt responsibilities listed above
- Core 1 only checks for time slicing and executes the application tick hook

Note: Core 0 is solely responsible for keeping time in IDF FreeRTOS. Therefore, anything that prevents Core 0 from incrementing the tick count, such as suspending the scheduler on Core 0, will cause the entire scheduler's timekeeping to lag behind.

Idle Tasks Vanilla FreeRTOS will implicitly create an idle task of priority 0 when the scheduler is started. The idle task runs when no other task is ready to run, and it has the following responsibilities:

- Freeing the memory of deleted tasks
- Executing the application idle hook

In IDF FreeRTOS, a separate pinned idle task is created for each core. The idle tasks on each core have the same responsibilities as their vanilla counterparts.

Scheduler Suspension Vanilla FreeRTOS allows the scheduler to be suspended/resumed by calling `vTaskSuspendAll()` and `xTaskResumeAll()` respectively. While the scheduler is suspended:

- Task switching is disabled but interrupts are left enabled.
- Calling any blocking/yielding function is forbidden, and time slicing is disabled.
- The tick count is frozen, but the tick interrupt still occurs to execute the application tick hook.

On scheduler resumption, `xTaskResumeAll()` catches up all of the lost ticks and unblock any timed-out tasks.

In IDF FreeRTOS, suspending the scheduler across multiple cores is not possible. Therefore when `vTaskSuspendAll()` is called on a particular core (e.g., core A):

- Task switching is disabled only on core A but interrupts for core A are left enabled.
- Calling any blocking/yielding function on core A is forbidden. Time slicing is disabled on core A.
- If an interrupt on core A unblocks any tasks, tasks with affinity to core A will go into core A's own pending ready task list. Unpinned tasks or tasks with affinity to other cores can be scheduled on cores with the scheduler running.
- If the scheduler is suspended on all cores, tasks unblocked by an interrupt will be directed to the pending ready task lists of their pinned cores. For unpinned tasks, they will be placed in the pending ready list of the core where the interrupt occurred.
- If core A is on Core 0, the tick count is frozen, and a pended tick count is incremented instead. However, the tick interrupt will still occur in order to execute the application tick hook.

When `xTaskResumeAll()` is called on a particular core (e.g., core A):

- Any tasks added to core A's pending ready task list will be resumed.
- If core A is Core 0, the pended tick count is unwound to catch up with the lost ticks.

Warning: Given that scheduler suspension on IDF FreeRTOS only suspends scheduling on a particular core, scheduler suspension is **NOT** a valid method of ensuring mutual exclusion between tasks when accessing shared data. Users should use proper locking primitives such as mutexes or spinlocks if they require mutual exclusion.

Critical Sections

Disabling Interrupts Vanilla FreeRTOS allows interrupts to be disabled and enabled by calling `taskDISABLE_INTERRUPTS` and `taskENABLE_INTERRUPTS` respectively. IDF FreeRTOS provides the same API. However, interrupts are only disabled or enabled on the current core.

Disabling interrupts is a valid method of achieving mutual exclusion in Vanilla FreeRTOS (and single-core systems in general). **However, in an SMP system, disabling interrupts is not a valid method of ensuring mutual exclusion.** Critical sections that utilize a spinlock should be used instead.

API Changes Vanilla FreeRTOS implements critical sections by disabling interrupts, which prevents preemptive context switches and the servicing of ISRs during a critical section. Thus a task/ISR that enters a critical section is guaranteed to be the sole entity to access a shared resource. Critical sections in Vanilla FreeRTOS have the following API:

- `taskENTER_CRITICAL()` enters a critical section by disabling interrupts
- `taskEXIT_CRITICAL()` exits a critical section by reenabling interrupts
- `taskENTER_CRITICAL_FROM_ISR()` enters a critical section from an ISR by disabling interrupt nesting
- `taskEXIT_CRITICAL_FROM_ISR()` exits a critical section from an ISR by reenabling interrupt nesting

However, in an SMP system, merely disabling interrupts does not constitute a critical section as the presence of other cores means that a shared resource can still be concurrently accessed. Therefore, critical sections in IDF FreeRTOS are implemented using spinlocks. To accommodate the spinlocks, the IDF FreeRTOS critical section APIs contain an additional spinlock parameter as shown below:

- Spinlocks are of `portMUX_TYPE` (**not to be confused to FreeRTOS mutexes**)
- `taskENTER_CRITICAL(&spinlock)` enters a critical from a task context
- `taskEXIT_CRITICAL(&spinlock)` exits a critical section from a task context
- `taskENTER_CRITICAL_ISR(&spinlock)` enters a critical section from an interrupt context
- `taskEXIT_CRITICAL_ISR(&spinlock)` exits a critical section from an interrupt context

Note: The critical section API can be called recursively, i.e., nested critical sections. Entering a critical section multiple times recursively is valid so long as the critical section is exited the same number of times it was entered. However, given that critical sections can target different spinlocks, users should take care to avoid deadlocking when entering critical sections recursively.

Spinlocks can be allocated statically or dynamically. As such, macros are provided for both static and dynamic initialization of spinlocks, as demonstrated by the following code snippets.

- Allocating a static spinlock and initializing it using `portMUX_INITIALIZER_UNLOCKED`:

```
// Statically allocate and initialize the spinlock
static portMUX_TYPE my_spinlock = portMUX_INITIALIZER_UNLOCKED;

void some_function(void)
{
    taskENTER_CRITICAL(&my_spinlock);
    // We are now in a critical section
    taskEXIT_CRITICAL(&my_spinlock);
}
```

- Allocating a dynamic spinlock and initializing it using `portMUX_INITIALIZE()`:

```
// Allocate the spinlock dynamically
portMUX_TYPE *my_spinlock = malloc(sizeof(portMUX_TYPE));
// Initialize the spinlock dynamically
portMUX_INITIALIZE(my_spinlock);

...

taskENTER_CRITICAL(my_spinlock);
// Access the resource
taskEXIT_CRITICAL(my_spinlock);
```

Implementation In IDF FreeRTOS, the process of a particular core entering and exiting a critical section is as follows:

- For `taskENTER_CRITICAL(&spinlock)` or `taskENTER_CRITICAL_ISR(&spinlock)`
 1. The core disables its interrupts or interrupt nesting up to `configMAX_SYSCALL_INTERRUPT_PRIORITY`.

2. The core then spins on the spinlock using an atomic compare-and-set instruction until it acquires the lock. A lock is acquired when the core is able to set the lock's owner value to the core's ID.
 3. Once the spinlock is acquired, the function returns. The remainder of the critical section runs with interrupts or interrupt nesting disabled.
- For `taskEXIT_CRITICAL(&spinlock)` or `taskEXIT_CRITICAL_ISR(&spinlock)`
 1. The core releases the spinlock by clearing the spinlock's owner value.
 2. The core re-enables interrupts or interrupt nesting.

Restrictions and Considerations Given that interrupts (or interrupt nesting) are disabled during a critical section, there are multiple restrictions regarding what can be done within critical sections. During a critical section, users should keep the following restrictions and considerations in mind:

- Critical sections should be kept as short as possible
 - The longer the critical section lasts, the longer a pending interrupt can be delayed.
 - A typical critical section should only access a few data structures and/or hardware registers.
 - If possible, defer as much processing and/or event handling to the outside of critical sections.
- FreeRTOS API should not be called from within a critical section
- Users should never call any blocking or yielding functions within a critical section

Misc

Single-Core Mode

Although IDF FreeRTOS is modified for dual-core SMP, IDF FreeRTOS can also be built for single-core by enabling the `CONFIG_FREERTOS_UNICORE` option.

For single-core targets (such as ESP32-S2 and ESP32-C3), the `CONFIG_FREERTOS_UNICORE` option is always enabled. For multi-core targets (such as ESP32 and ESP32-S3), `CONFIG_FREERTOS_UNICORE` can also be set, but will result in the application only running Core 0.

When building in single-core mode, IDF FreeRTOS is designed to be identical to Vanilla FreeRTOS, thus all aforementioned SMP changes to kernel behavior are removed. As a result, building IDF FreeRTOS in single-core mode has the following characteristics:

- All operations performed by the kernel inside critical sections are now deterministic (i.e., no walking of linked lists inside critical sections).
- Vanilla FreeRTOS scheduling algorithm is restored (including perfect Round Robin time slicing).
- All SMP specific data is removed from single-core builds.

SMP APIs can still be called in single-core mode. These APIs remain exposed to allow source code to be built for single-core and multi-core, without needing to call a different set of APIs. However, SMP APIs will not exhibit any SMP behavior in single-core mode, thus becoming equivalent to their single-core counterparts. For example:

- any `...ForCore(..., BaseType_t xCoreID)` SMP API will only accept 0 as a valid value for `xCoreID`.
- `...PinnedToCore()` task creation APIs will simply ignore the `xCoreID` core affinity argument.
- Critical section APIs will still require a spinlock argument, but no spinlock will be taken and critical sections revert to simply disabling/enabling interrupts.

API Reference

This section introduces FreeRTOS types, functions, and macros. It is automatically generated from FreeRTOS header files.

Task API

Header File

- `components/freertos/FreeRTOS-Kernel/include/freertos/task.h`
- This header file can be included with:

```
#include "freertos/task.h"
```

Functions

static inline BaseType_t **xTaskCreate** (TaskFunction_t pxTaskCode, const char *const pcName, const configSTACK_DEPTH_TYPE usStackDepth, void *const pvParameters, UBaseType_t uxPriority, *TaskHandle_t* *const pxCreatedTask)

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task's data structures. The second block is used by the task as its stack. If a task is created using `xTaskCreate()` then both blocks of memory are automatically dynamically allocated inside the `xTaskCreate()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a task is created using `xTaskCreateStatic()` then the application writer must provide the required memory. `xTaskCreateStatic()` therefore allows a task to be created without using any dynamic memory allocation.

See `xTaskCreateStatic()` for a version that does not use any dynamic memory allocation.

`xTaskCreate()` can only be used to create a task that has unrestricted access to the entire microcontroller memory map. Systems that include MPU support can alternatively create an MPU constrained task using `xTaskCreateRestricted()`.

Example usage:

```
// Task to be created.
void vTaskCode( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    static uint8_t ucParameterToPass;
    TaskHandle_t xHandle = NULL;

    // Create the task, storing the handle. Note that the passed parameter_
    ↪ucParameterToPass
    // must exist for the lifetime of the task, so in this case is declared static.
    ↪ If it was just an
    // an automatic stack variable it might no longer exist, or at least have been_
    ↪corrupted, by the time
    // the new task attempts to access it.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, &ucParameterToPass, tskIDLE_
    ↪PRIORITY, &xHandle );
    configASSERT( xHandle );

    // Use the handle to delete the task.
    if( xHandle != NULL )
    {
        vTaskDelete( xHandle );
    }
}
```

(continues on next page)

(continued from previous page)

```
}
}
```

Note: If `configNUMBER_OF_CORES > 1`, this function will create an unpinned task (see `taskNO_AFFINITY` for more details).

Note: If program uses thread local variables (ones specified with "`__thread`" keyword) then storage for them will be allocated on the task's stack.

Parameters

- **pxTaskCode** -- Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop).
- **pcName** -- A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by `configMAX_TASK_NAME_LEN` - default is 16.
- **usStackDepth** -- The size of the task stack specified as the NUMBER OF BYTES. Note that this differs from vanilla FreeRTOS.
- **pvParameters** -- Pointer that will be used as the parameter for the task being created.
- **uxPriority** -- The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit `portPRIVILEGE_BIT` of the priority parameter. For example, to create a privileged task at priority 2 the `uxPriority` parameter should be set to `(2 | portPRIVILEGE_BIT)`.
- **pxCreatedTask** -- Used to pass back a handle by which the created task can be referenced.

Returns `pdPASS` if the task was successfully created and added to a ready list, otherwise an error code defined in the file `projdefs.h`

```
static inline TaskHandle_t xTaskCreateStatic (TaskFunction_t pxTaskCode, const char *const pcName,
                                             const uint32_t ulStackDepth, void *const pvParameters,
                                             UBaseType_t uxPriority, StackType_t *const
                                             puxStackBuffer, StaticTask_t *const pxTaskBuffer)
```

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task's data structures. The second block is used by the task as its stack. If a task is created using `xTaskCreate()` then both blocks of memory are automatically dynamically allocated inside the `xTaskCreate()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a task is created using `xTaskCreateStatic()` then the application writer must provide the required memory. `xTaskCreateStatic()` therefore allows a task to be created without using any dynamic memory allocation.

Example usage:

```
// Dimensions the buffer that the task being created will use as its stack.
// NOTE: This is the number of bytes the stack will hold, not the number of
// words as found in vanilla FreeRTOS.
#define STACK_SIZE 200

// Structure that will hold the TCB of the task being created.
StaticTask_t xTaskBuffer;

// Buffer that the task being created will use as its stack. Note this is
// an array of StackType_t variables. The size of StackType_t is dependent on
// the RTOS port.
StackType_t xStack[ STACK_SIZE ];
```

(continues on next page)

```

// Function that implements the task being created.
void vTaskCode( void * pvParameters )
{
// The parameter value is expected to be 1 as 1 is passed in the
// pvParameters value in the call to xTaskCreateStatic().
    configASSERT( ( uint32_t ) pvParameters == 1UL );

for( ;; )
{
// Task code goes here.
}

}

// Function that creates a task.
void vOtherFunction( void )
{
    TaskHandle_t xHandle = NULL;

// Create the task without using any dynamic memory allocation.
    xHandle = xTaskCreateStatic(
        vTaskCode,          // Function that implements the task.
        "NAME",            // Text name for the task.
        STACK_SIZE,       // Stack size in bytes.
        ( void * ) 1,     // Parameter passed into the task.
        tskIDLE_PRIORITY, // Priority at which the task is created.
        xStack,           // Array to use as the task's stack.
        &xTaskBuffer );  // Variable to hold the task's data
        ↳structure.

// puxStackBuffer and pxTaskBuffer were not NULL, so the task will have
// been created, and xHandle will be the task's handle. Use the handle
// to suspend the task.
    vTaskSuspend( xHandle );
}

```

Note: If `configNUMBER_OF_CORES > 1`, this function will create an unpinned task (see `tskNO_AFFINITY` for more details).

Note: If program uses thread local variables (ones specified with `"__thread"` keyword) then storage for them will be allocated on the task's stack.

Parameters

- **pxTaskCode** -- Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop).
- **pcName** -- A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by `configMAX_TASK_NAME_LEN` in `FreeRTOSConfig.h`.
- **ulStackDepth** -- The size of the task stack specified as the NUMBER OF BYTES. Note that this differs from vanilla FreeRTOS.
- **pvParameters** -- Pointer that will be used as the parameter for the task being created.
- **uxPriority** -- The priority at which the task will run.
- **puxStackBuffer** -- Must point to a `StackType_t` array that has at least `ulStackDepth` indexes - the array will then be used as the task's stack, removing the need for the stack to be allocated dynamically.
- **pxTaskBuffer** -- Must point to a variable of type `StaticTask_t`, which will then be used to hold the task's data structures, removing the need for the memory to be allocated

dynamically.

Returns If neither `pxStackBuffer` nor `pxTaskBuffer` are NULL, then the task will be created and a handle to the created task is returned. If either `pxStackBuffer` or `pxTaskBuffer` are NULL then the task will not be created and NULL is returned.

void **vTaskAllocateMPURegions** (*TaskHandle_t* xTask, const MemoryRegion_t *const pxRegions)

Memory regions are assigned to a restricted task when the task is created by a call to `xTaskCreateRestricted()`. These regions can be redefined using `vTaskAllocateMPURegions()`.

Example usage:

```
// Define an array of MemoryRegion_t structures that configures an MPU region
// allowing read/write access for 1024 bytes starting at the beginning of the
// ucOneKByte array. The other two of the maximum 3 definable regions are
// unused so set to zero.
static const MemoryRegion_t xAltRegions[ portNUM_CONFIGURABLE_REGIONS ] =
{
    // Base address      Length      Parameters
    { ucOneKByte,      1024,      portMPU_REGION_READ_WRITE },
    { 0,                0,         0 },
    { 0,                0,         0 }
};

void vATask( void *pvParameters )
{
    // This task was created such that it has access to certain regions of
    // memory as defined by the MPU configuration. At some point it is
    // desired that these MPU regions are replaced with that defined in the
    // xAltRegions const struct above. Use a call to vTaskAllocateMPURegions()
    // for this purpose. NULL is used as the task handle to indicate that this
    // function should modify the MPU regions of the calling task.
    vTaskAllocateMPURegions( NULL, xAltRegions );

    // Now the task can continue its function, but from this point on can only
    // access its stack and the ucOneKByte array (unless any other statically
    // defined or shared regions have been declared elsewhere).
}
```

Parameters

- **xTask** -- The handle of the task being updated.
- **pxRegions** -- A pointer to a MemoryRegion_t structure that contains the new memory region definitions.

void **vTaskDelete** (*TaskHandle_t* xTaskToDelete)

INCLUDE_vTaskDelete must be defined as 1 for this function to be available. See the configuration section for more information.

Remove a task from the RTOS real time kernel's management. The task being deleted will be removed from all ready, blocked, suspended and event lists.

NOTE: The idle task is responsible for freeing the kernel allocated memory from tasks that have been deleted. It is therefore important that the idle task is not starved of microcontroller processing time if your application makes any calls to `vTaskDelete ()`. Memory allocated by the task code is not automatically freed, and should be freed before the task is deleted.

See the demo application file `death.c` for sample code that utilises `vTaskDelete ()`.

Example usage:

```

void vOtherFunction( void )
{
TaskHandle_t xHandle;

// Create the task, storing the handle.
xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
→);

// Use the handle to delete the task.
vTaskDelete( xHandle );
}

```

Parameters **xTaskToDelete** -- The handle of the task to be deleted. Passing NULL will cause the calling task to be deleted.

void **vTaskDelay** (const TickType_t xTicksToDelay)

Delay a task for a given number of ticks. The actual time that the task remains blocked depends on the tick rate. The constant `portTICK_PERIOD_MS` can be used to calculate real time from the tick rate - with the resolution of one tick period.

`INCLUDE_vTaskDelay` must be defined as 1 for this function to be available. See the configuration section for more information.

`vTaskDelay()` specifies a time at which the task wishes to unblock relative to the time at which `vTaskDelay()` is called. For example, specifying a block period of 100 ticks will cause the task to unblock 100 ticks after `vTaskDelay()` is called. `vTaskDelay()` does not therefore provide a good method of controlling the frequency of a periodic task as the path taken through the code, as well as other task and interrupt activity, will affect the frequency at which `vTaskDelay()` gets called and therefore the time at which the task next executes. See `xTaskDelayUntil()` for an alternative API function designed to facilitate fixed frequency execution. It does this by specifying an absolute time (rather than a relative time) at which the calling task should unblock.

Example usage:

```

void vTaskFunction( void * pvParameters )
{
// Block for 500ms.
const TickType_t xDelay = 500 / portTICK_PERIOD_MS;

for( ;; )
{
// Simply toggle the LED every 500ms, blocking between each toggle.
vToggleLED();
vTaskDelay( xDelay );
}
}

```

Parameters **xTicksToDelay** -- The amount of time, in tick periods, that the calling task should block.

BaseType_t **xTaskDelayUntil** (TickType_t *const pxPreviousWakeTime, const TickType_t xTimeIncrement)

`INCLUDE_xTaskDelayUntil` must be defined as 1 for this function to be available. See the configuration section for more information.

Delay a task until a specified time. This function can be used by periodic tasks to ensure a constant execution frequency.

This function differs from `vTaskDelay()` in one important aspect: `vTaskDelay()` will cause a task to block for the specified number of ticks from the time `vTaskDelay()` is called. It is therefore difficult to use `vTaskDelay`

() by itself to generate a fixed execution frequency as the time between a task starting to execute and that task calling `vTaskDelay()` may not be fixed [the task may take a different path though the code between calls, or may get interrupted or preempted a different number of times each time it executes].

Whereas `vTaskDelay()` specifies a wake time relative to the time at which the function is called, `xTaskDelayUntil()` specifies the absolute (exact) time at which it wishes to unblock.

The macro `pdMS_TO_TICKS()` can be used to calculate the number of ticks from a time specified in milliseconds with a resolution of one tick period.

Example usage:

```
// Perform an action every 10 ticks.
void vTaskFunction( void * pvParameters )
{
    TickType_t xLastWakeTime;
    const TickType_t xFrequency = 10;
    BaseType_t xWasDelayed;

    // Initialise the xLastWakeTime variable with the current time.
    xLastWakeTime = xTaskGetTickCount ();
    for ( ;; )
    {
        // Wait for the next cycle.
        xWasDelayed = xTaskDelayUntil( &xLastWakeTime, xFrequency );

        // Perform action here. xWasDelayed value can be used to determine
        // whether a deadline was missed if the code here took too long.
    }
}
```

Parameters

- **pxPreviousWakeTime** -- Pointer to a variable that holds the time at which the task was last unblocked. The variable must be initialised with the current time prior to its first use (see the example below). Following this the variable is automatically updated within `xTaskDelayUntil()`.
- **xTimeIncrement** -- The cycle time period. The task will be unblocked at time `*pxPreviousWakeTime + xTimeIncrement`. Calling `xTaskDelayUntil` with the same `xTimeIncrement` parameter value will cause the task to execute with a fixed interface period.

Returns Value which can be used to check whether the task was actually delayed. Will be `pdTRUE` if the task was delayed and `pdFALSE` otherwise. A task will not be delayed if the next expected wake time is in the past.

`BaseType_t xTaskAbortDelay (TaskHandle_t xTask)`

`INCLUDE_xTaskAbortDelay` must be defined as 1 in `FreeRTOSConfig.h` for this function to be available.

A task will enter the Blocked state when it is waiting for an event. The event it is waiting for can be a temporal event (waiting for a time), such as when `vTaskDelay()` is called, or an event on an object, such as when `xQueueReceive()` or `ulTaskNotifyTake()` is called. If the handle of a task that is in the Blocked state is used in a call to `xTaskAbortDelay()` then the task will leave the Blocked state, and return from whichever function call placed the task into the Blocked state.

There is no 'FromISR' version of this function as an interrupt would need to know which object a task was blocked on in order to know which actions to take. For example, if the task was blocked on a queue the interrupt handler would then need to know if the queue was locked.

Parameters `xTask` -- The handle of the task to remove from the Blocked state.

Returns If the task referenced by `xTask` was not in the Blocked state then `pdFAIL` is returned. Otherwise `pdPASS` is returned.

UBaseType_t **uxTaskPriorityGet** (const *TaskHandle_t* xTask)

INCLUDE_uxTaskPriorityGet must be defined as 1 for this function to be available. See the configuration section for more information.

Obtain the priority of any task.

Example usage:

```
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
    ↪);

    // ...

    // Use the handle to obtain the priority of the created task.
    // It was created with tskIDLE_PRIORITY, but may have changed
    // it itself.
    if( uxTaskPriorityGet( xHandle ) != tskIDLE_PRIORITY )
    {
        // The task has changed it's priority.
    }

    // ...

    // Is our priority higher than the created task?
    if( uxTaskPriorityGet( xHandle ) < uxTaskPriorityGet( NULL ) )
    {
        // Our priority (obtained using NULL handle) is higher.
    }
}
```

Parameters **xTask** -- Handle of the task to be queried. Passing a NULL handle results in the priority of the calling task being returned.

Returns The priority of xTask.

UBaseType_t **uxTaskPriorityGetFromISR** (const *TaskHandle_t* xTask)

A version of uxTaskPriorityGet() that can be used from an ISR.

eTaskState **eTaskGetState** (*TaskHandle_t* xTask)

INCLUDE_eTaskGetState must be defined as 1 for this function to be available. See the configuration section for more information.

Obtain the state of any task. States are encoded by the eTaskState enumerated type.

Parameters **xTask** -- Handle of the task to be queried.

Returns The state of xTask at the time the function was called. Note the state of the task might change between the function being called, and the functions return value being tested by the calling task.

void **vTaskGetInfo** (*TaskHandle_t* xTask, *TaskStatus_t* *pxTaskStatus, BaseType_t xGetFreeStackSize, *eTaskState* eState)

configUSE_TRACE_FACILITY must be defined as 1 for this function to be available. See the configuration section for more information.

Populates a TaskStatus_t structure with information about a task.

Example usage:

```
void vAFunction( void )
{
    TaskHandle_t xHandle;
    TaskStatus_t xTaskDetails;

    // Obtain the handle of a task from its name.
    xHandle = xTaskGetHandle( "Task_Name" );

    // Check the handle is not NULL.
    configASSERT( xHandle );

    // Use the handle to obtain further information about the task.
    vTaskGetInfo( xHandle,
                  &xTaskDetails,
                  pdTRUE, // Include the high water mark in xTaskDetails.
                  eInvalid ); // Include the task state in xTaskDetails.
}
```

Parameters

- **xTask** -- Handle of the task being queried. If xTask is NULL then information will be returned about the calling task.
- **pxTaskStatus** -- A pointer to the TaskStatus_t structure that will be filled with information about the task referenced by the handle passed using the xTask parameter.
- **xGetFreeStackSpace** -- The TaskStatus_t structure contains a member to report the stack high water mark of the task being queried. Calculating the stack high water mark takes a relatively long time, and can make the system temporarily unresponsive - so the xGetFreeStackSpace parameter is provided to allow the high water mark checking to be skipped. The high watermark value will only be written to the TaskStatus_t structure if xGetFreeStackSpace is not set to pdFALSE;
- **eState** -- The TaskStatus_t structure contains a member to report the state of the task being queried. Obtaining the task state is not as fast as a simple assignment - so the eState parameter is provided to allow the state information to be omitted from the TaskStatus_t structure. To obtain state information then set eState to eInvalid - otherwise the value passed in eState will be reported as the task state in the TaskStatus_t structure.

void **vTaskPrioritySet** (*TaskHandle_t* xTask, *UBaseType_t* uxNewPriority)

INCLUDE_vTaskPrioritySet must be defined as 1 for this function to be available. See the configuration section for more information.

Set the priority of any task.

A context switch will occur before the function returns if the priority being set is higher than the currently executing task.

Example usage:

```
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
    ↪ );

    // ...

    // Use the handle to raise the priority of the created task.
```

(continues on next page)

(continued from previous page)

```

vTaskPrioritySet( xHandle, tskIDLE_PRIORITY + 1 );

// ...

// Use a NULL handle to raise our priority to the same value.
vTaskPrioritySet( NULL, tskIDLE_PRIORITY + 1 );
}

```

Parameters

- **xTask** -- Handle to the task for which the priority is being set. Passing a NULL handle results in the priority of the calling task being set.
- **uxNewPriority** -- The priority to which the task will be set.

void **vTaskSuspend** (*TaskHandle_t* xTaskToSuspend)

INCLUDE_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.

Suspend any task. When suspended a task will never get any microcontroller processing time, no matter what its priority.

Calls to vTaskSuspend are not accumulative - i.e. calling vTaskSuspend () twice on the same task still only requires one call to vTaskResume () to ready the suspended task.

Example usage:

```

void vAFunction( void )
{
TaskHandle_t xHandle;

// Create a task, storing the handle.
xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
→);

// ...

// Use the handle to suspend the created task.
vTaskSuspend( xHandle );

// ...

// The created task will not run during this period, unless
// another task calls vTaskResume( xHandle ).

//...

// Suspend ourselves.
vTaskSuspend( NULL );

// We cannot get here unless another task calls vTaskResume
// with our handle as the parameter.
}

```

Parameters xTaskToSuspend -- Handle to the task being suspended. Passing a NULL handle will cause the calling task to be suspended.

void **vTaskResume** (*TaskHandle_t* xTaskToResume)

INCLUDE_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.

Resumes a suspended task.

A task that has been suspended by one or more calls to `vTaskSuspend ()` will be made available for running again by a single call to `vTaskResume ()`.

Example usage:

```
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle );

    // ...

    // Use the handle to suspend the created task.
    vTaskSuspend( xHandle );

    // ...

    // The created task will not run during this period, unless
    // another task calls vTaskResume( xHandle ).

    //...

    // Resume the suspended task ourselves.
    vTaskResume( xHandle );

    // The created task will once again get microcontroller processing
    // time in accordance with its priority within the system.
}
```

Parameters `xTaskToResume` -- Handle to the task being readied.

`BaseType_t xTaskResumeFromISR (TaskHandle_t xTaskToResume)`

`INCLUDE_xTaskResumeFromISR` must be defined as 1 for this function to be available. See the configuration section for more information.

An implementation of `vTaskResume()` that can be called from within an ISR.

A task that has been suspended by one or more calls to `vTaskSuspend ()` will be made available for running again by a single call to `xTaskResumeFromISR ()`.

`xTaskResumeFromISR()` should not be used to synchronise a task with an interrupt if there is a chance that the interrupt could arrive prior to the task being suspended - as this can lead to interrupts being missed. Use of a semaphore as a synchronisation mechanism would avoid this eventuality.

Parameters `xTaskToResume` -- Handle to the task being readied.

Returns `pdTRUE` if resuming the task should result in a context switch, otherwise `pdFALSE`. This is used by the ISR to determine if a context switch may be required following the ISR.

`void vTaskSuspendAll (void)`

Suspends the scheduler without disabling interrupts. Context switches will not occur while the scheduler is suspended.

After calling `vTaskSuspendAll ()` the calling task will continue to execute without risk of being swapped out until a call to `xTaskResumeAll ()` has been made.

API functions that have the potential to cause a context switch (for example, `xTaskDelayUntil()`, `xQueueSend()`, etc.) must not be called while the scheduler is suspended.

Example usage:

```

void vTask1( void * pvParameters )
{
for( ;; )
{
// Task code goes here.

// ...

// At some point the task wants to perform a long operation during
// which it does not want to get swapped out. It cannot use
// taskENTER_CRITICAL ()/taskEXIT_CRITICAL () as the length of the
// operation may cause interrupts to be missed - including the
// ticks.

// Prevent the real time kernel swapping out the task.
    vTaskSuspendAll ();

// Perform the operation here. There is no need to use critical
// sections as we have all the microcontroller processing time.
// During this time interrupts will still operate and the kernel
// tick count will be maintained.

// ...

// The operation is complete. Restart the kernel.
    xTaskResumeAll ();
}
}

```

BaseType_t **xTaskResumeAll** (void)

Resumes scheduler activity after it was suspended by a call to vTaskSuspendAll().

xTaskResumeAll() only resumes the scheduler. It does not unsuspend tasks that were previously suspended by a call to vTaskSuspend().

Example usage:

```

void vTask1( void * pvParameters )
{
for( ;; )
{
// Task code goes here.

// ...

// At some point the task wants to perform a long operation during
// which it does not want to get swapped out. It cannot use
// taskENTER_CRITICAL ()/taskEXIT_CRITICAL () as the length of the
// operation may cause interrupts to be missed - including the
// ticks.

// Prevent the real time kernel swapping out the task.
    vTaskSuspendAll ();

// Perform the operation here. There is no need to use critical
// sections as we have all the microcontroller processing time.
// During this time interrupts will still operate and the real
// time kernel tick count will be maintained.

```

(continues on next page)

(continued from previous page)

```

// ...

// The operation is complete. Restart the kernel. We want to force
// a context switch - but there is no point if resuming the scheduler
// caused a context switch already.
if( !xTaskResumeAll () )
{
    taskYIELD ();
}
}

```

Returns If resuming the scheduler caused a context switch then pdTRUE is returned, otherwise pdFALSE is returned.

TickType_t **xTaskGetTickCount** (void)

Returns The count of ticks since vTaskStartScheduler was called.

TickType_t **xTaskGetTickCountFromISR** (void)

This is a version of xTaskGetTickCount() that is safe to be called from an ISR - provided that TickType_t is the natural word size of the microcontroller being used or interrupt nesting is either not supported or not being used.

Returns The count of ticks since vTaskStartScheduler was called.

UBaseType_t **uxTaskGetNumberOfTasks** (void)

Returns The number of tasks that the real time kernel is currently managing. This includes all ready, blocked and suspended tasks. A task that has been deleted but not yet freed by the idle task will also be included in the count.

char ***pcTaskGetName** (*TaskHandle_t* xTaskToQuery)

Returns The text (human readable) name of the task referenced by the handle xTaskToQuery. A task can query its own name by either passing in its own handle, or by setting xTaskToQuery to NULL.

TaskHandle_t **xTaskGetHandle** (const char *pcNameToQuery)

NOTE: This function takes a relatively long time to complete and should be used sparingly.

Returns The handle of the task that has the human readable name pcNameToQuery. NULL is returned if no matching name is found. INCLUDE_xTaskGetHandle must be set to 1 in FreeRTOSConfig.h for pcTaskGetHandle() to be available.

BaseType_t **xTaskGetStaticBuffers** (*TaskHandle_t* xTask, StackType_t **ppuxStackBuffer, StaticTask_t **ppxTaskBuffer)

Retrieve pointers to a statically created task's data structure buffer and stack buffer. These are the same buffers that are supplied at the time of creation.

Parameters

- **xTask** -- The task for which to retrieve the buffers.
- **ppuxStackBuffer** -- Used to return a pointer to the task's stack buffer.
- **ppxTaskBuffer** -- Used to return a pointer to the task's data structure buffer.

Returns pdTRUE if buffers were retrieved, pdFALSE otherwise.

UBaseType_t **uxTaskGetStackHighWaterMark** (*TaskHandle_t* xTask)

INCLUDE_uxTaskGetStackHighWaterMark must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there has been (in words, so on a 32 bit machine a value of 1 means 4 bytes) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their return type. Using configSTACK_DEPTH_TYPE allows the user to determine the return type. It gets around the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications that expect an 8-bit return type.

Parameters **xTask** -- Handle of the task associated with the stack to be checked. Set xTask to NULL to check the stack of the calling task.

Returns The smallest amount of free stack space there has been (in words, so actual spaces on the stack rather than bytes) since the task referenced by xTask was created.

configSTACK_DEPTH_TYPE **uxTaskGetStackHighWaterMark2** (*TaskHandle_t* xTask)

INCLUDE_uxTaskGetStackHighWaterMark2 must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there has been (in words, so on a 32 bit machine a value of 1 means 4 bytes) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their return type. Using configSTACK_DEPTH_TYPE allows the user to determine the return type. It gets around the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications that expect an 8-bit return type.

Parameters **xTask** -- Handle of the task associated with the stack to be checked. Set xTask to NULL to check the stack of the calling task.

Returns The smallest amount of free stack space there has been (in words, so actual spaces on the stack rather than bytes) since the task referenced by xTask was created.

void **vTaskSetApplicationTaskTag** (*TaskHandle_t* xTask, *TaskHookFunction_t* pxHookFunction)

Sets pxHookFunction to be the task hook function used by the task xTask. Passing xTask as NULL has the effect of setting the calling tasks hook function.

TaskHookFunction_t **xTaskGetApplicationTaskTag** (*TaskHandle_t* xTask)

Returns the pxHookFunction value assigned to the task xTask. Do not call from an interrupt service routine - call xTaskGetApplicationTaskTagFromISR() instead.

TaskHookFunction_t **xTaskGetApplicationTaskTagFromISR** (*TaskHandle_t* xTask)

Returns the pxHookFunction value assigned to the task xTask. Can be called from an interrupt service routine.

void **vTaskSetThreadLocalStoragePointer** (*TaskHandle_t* xTaskToSet, BaseType_t xIndex, void *pvValue)

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish. The following two functions are used to set and query a pointer respectively.

void ***pvTaskGetThreadLocalStoragePointer** (*TaskHandle_t* xTaskToQuery, BaseType_t xIndex)

void **vApplicationGetIdleTaskMemory** (StaticTask_t **ppxIdleTaskTCBBuffer, StackType_t **ppxIdleTaskStackBuffer, uint32_t *puiIdleTaskStackSize)

This function is used to provide a statically allocated block of memory to FreeRTOS to hold the Idle Task TCB. This function is required when configSUPPORT_STATIC_ALLOCATION is set. For more information see this URI: https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION

Parameters

- **ppxIdleTaskTCBBuffer** -- A handle to a statically allocated TCB buffer
- **ppxIdleTaskStackBuffer** -- A handle to a statically allocated Stack buffer for the idle task

- **pulIdleTaskStackSize** -- A pointer to the number of elements that will fit in the allocated stack buffer

BaseType_t **xTaskCallApplicationTaskHook** (*TaskHandle_t* xTask, void *pvParameter)

Calls the hook function associated with xTask. Passing xTask as NULL has the effect of calling the Running tasks (the calling task) hook function.

pvParameter is passed to the hook function for the task to interpret as it wants. The return value is the value returned by the task hook function registered by the user.

TaskHandle_t **xTaskGetIdleTaskHandle** (void)

xTaskGetIdleTaskHandle() is only available if INCLUDE_xTaskGetIdleTaskHandle is set to 1 in FreeRTOSConfig.h.

Simply returns the handle of the idle task of the current core. It is not valid to call xTaskGetIdleTaskHandle() before the scheduler has been started.

UBaseType_t **uxTaskGetSystemState** (*TaskStatus_t* *const pxTaskStatusArray, const UBaseType_t uxArraySize, configRUN_TIME_COUNTER_TYPE *const pulTotalRunTime)

configUSE_TRACE_FACILITY must be defined as 1 in FreeRTOSConfig.h for uxTaskGetSystemState() to be available.

uxTaskGetSystemState() populates an TaskStatus_t structure for each task in the system. TaskStatus_t structures contain, among other things, members for the task handle, task name, task priority, task state, and total amount of run time consumed by the task. See the TaskStatus_t structure definition in this file for the full member list.

NOTE: This function is intended for debugging use only as its use results in the scheduler remaining suspended for an extended period.

Example usage:

```
// This example demonstrates how a human readable table of run time stats
// information is generated from raw data provided by uxTaskGetSystemState().
// The human readable table is written to pcWriteBuffer
void vTaskGetRunTimeStats( char *pcWriteBuffer )
{
    TaskStatus_t *pxTaskStatusArray;
    volatile UBaseType_t uxArraySize, x;
    configRUN_TIME_COUNTER_TYPE ulTotalRunTime, ulStatsAsPercentage;

    // Make sure the write buffer does not contain a string.
    pcWriteBuffer = 0x00;

    // Take a snapshot of the number of tasks in case it changes while this
    // function is executing.
    uxArraySize = uxTaskGetNumberOfTasks();

    // Allocate a TaskStatus_t structure for each task. An array could be
    // allocated statically at compile time.
    pxTaskStatusArray = pvPortMalloc( uxArraySize * sizeof( TaskStatus_t ) );

    if( pxTaskStatusArray != NULL )
    {
        // Generate raw status information about each task.
        uxArraySize = uxTaskGetSystemState( pxTaskStatusArray, uxArraySize, &
        ↪ulTotalRunTime );

        // For percentage calculations.
        ulTotalRunTime /= 100UL;
    }
}
```

(continues on next page)

(continued from previous page)

```

// Avoid divide by zero errors.
if( ulTotalRunTime > 0 )
    {
// For each populated position in the pxTaskStatusArray array,
// format the raw data as human readable ASCII data
for( x = 0; x < uxArraySize; x++ )
    {
// What percentage of the total run time has the task used?
// This will always be rounded down to the nearest integer.
// ulTotalRunTimeDiv100 has already been divided by 100.
        ulStatsAsPercentage = pxTaskStatusArray[ x ].ulRunTimeCounter_
→/ ulTotalRunTime;

if( ulStatsAsPercentage > 0UL )
    {
        sprintf( pcWriteBuffer, "%s\t\t%lu\t\t%lu%%\r\n",_
→pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter,_
→ulStatsAsPercentage );
    }
else
    {
// If the percentage is zero here then the task has
// consumed less than 1% of the total run time.
        sprintf( pcWriteBuffer, "%s\t\t%lu\t\t<1%%\r\n",_
→pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter );
    }

        pcWriteBuffer += strlen( ( char * ) pcWriteBuffer );
    }
}

// The array is no longer needed, free the memory it consumes.
vPortFree( pxTaskStatusArray );
}
}

```

Parameters

- **pxTaskStatusArray** -- A pointer to an array of TaskStatus_t structures. The array must contain at least one TaskStatus_t structure for each task that is under the control of the RTOS. The number of tasks under the control of the RTOS can be determined using the uxTaskGetNumberOfTasks() API function.
- **uxArraySize** -- The size of the array pointed to by the pxTaskStatusArray parameter. The size is specified as the number of indexes in the array, or the number of TaskStatus_t structures contained in the array, not by the number of bytes in the array.
- **pulTotalRunTime** -- If configGENERATE_RUN_TIME_STATS is set to 1 in FreeRTOSConfig.h then *pulTotalRunTime is set by uxTaskGetSystemState() to the total run time (as defined by the run time stats clock, see <https://www.FreeRTOS.org/rtos-run-time-stats.html>) since the target booted. pulTotalRunTime can be set to NULL to omit the total run time information.

Returns The number of TaskStatus_t structures that were populated by uxTaskGetSystemState(). This should equal the number returned by the uxTaskGetNumberOfTasks() API function, but will be zero if the value passed in the uxArraySize parameter was too small.

void **vTaskList** (char *pcWriteBuffer)

configUSE_TRACE_FACILITY and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. See the configuration section of the FreeRTOS.org website for more information.

NOTE 1: This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Lists all the current tasks, along with their current state and stack usage high water mark.

Tasks are reported as blocked ('B'), ready ('R'), deleted ('D') or suspended ('S').

PLEASE NOTE:

This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

`vTaskList()` calls `uxTaskGetSystemState()`, then formats part of the `uxTaskGetSystemState()` output into a human readable table that displays task: names, states, priority, stack usage and task number. Stack usage specified as the number of unused `StackType_t` words stack can hold on top of stack - not the number of bytes.

`vTaskList()` has a dependency on the `sprintf()` C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of `sprintf()` is provided in many of the FreeRTOS/Demo sub-directories in a file called `printf-stdarg.c` (note `printf-stdarg.c` does not provide a full `snprintf()` implementation!).

It is recommended that production systems call `uxTaskGetSystemState()` directly to get access to raw stats data, rather than indirectly through a call to `vTaskList()`.

Parameters `pcWriteBuffer` -- A buffer into which the above mentioned details will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

void **`vTaskGetRunTimeStats`** (char *pcWriteBuffer)

`configGENERATE_RUN_TIME_STATS` and `configUSE_STATS_FORMATTING_FUNCTIONS` must both be defined as 1 for this function to be available. The application must also then provide definitions for `portCONFIGURE_TIMER_FOR_RUN_TIME_STATS()` and `portGET_RUN_TIME_COUNTER_VALUE()` to configure a peripheral timer/counter and return the timers current count value respectively. The counter should be at least 10 times the frequency of the tick count.

NOTE 1: This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Setting `configGENERATE_RUN_TIME_STATS` to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the `portCONFIGURE_TIMER_FOR_RUN_TIME_STATS()` macro. Calling `vTaskGetRunTimeStats()` writes the total execution time of each task into a buffer, both as an absolute count value and as a percentage of the total system execution time.

NOTE 2:

This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

`vTaskGetRunTimeStats()` calls `uxTaskGetSystemState()`, then formats part of the `uxTaskGetSystemState()` output into a human readable table that displays the amount of time each task has spent in the Running state in both absolute and percentage terms.

`vTaskGetRunTimeStats()` has a dependency on the `sprintf()` C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of `sprintf()` is provided in many of the FreeRTOS/Demo sub-directories in a file called `printf-stdarg.c` (note `printf-stdarg.c` does not provide a full `snprintf()` implementation!).

It is recommended that production systems call `uxTaskGetSystemState()` directly to get access to raw stats data, rather than indirectly through a call to `vTaskGetRunTimeStats()`.

Parameters `pcWriteBuffer` -- A buffer into which the execution times will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

`configRUN_TIME_COUNTER_TYPE` **`ulTaskGetIdleRunTimeCounter`** (void)

`configGENERATE_RUN_TIME_STATS`, `configUSE_STATS_FORMATTING_FUNCTIONS` and `INCLUDE_xTaskGetIdleTaskHandle` must all be defined as 1 for these functions to be available. The application must also then provide definitions for `portCONFIGURE_TIMER_FOR_RUN_TIME_STATS()`

and `portGET_RUN_TIME_COUNTER_VALUE()` to configure a peripheral timer/counter and return the timers current count value respectively. The counter should be at least 10 times the frequency of the tick count.

Setting `configGENERATE_RUN_TIME_STATS` to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the `portCONFIGURE_TIMER_FOR_RUN_TIME_STATS()` macro. While `uxTaskGetSystemState()` and `vTaskGetRunTimeStats()` writes the total execution time of each task into a buffer, `ulTaskGetIdleRunTimeCounter()` returns the total execution time of just the idle task and `ulTaskGetIdleRunTimePercent()` returns the percentage of the CPU time used by just the idle task.

Note the amount of idle time is only a good measure of the slack time in a system if there are no other tasks executing at the idle priority, tickless idle is not used, and `configIDLE_SHOULD_YIELD` is set to 0.

Note: If `configNUMBER_OF_CORES > 1`, calling this function will query the idle task of the current core.

Returns The total run time of the idle task or the percentage of the total run time consumed by the idle task. This is the amount of time the idle task has actually been executing. The unit of time is dependent on the frequency configured using the `portCONFIGURE_TIMER_FOR_RUN_TIME_STATS()` and `portGET_RUN_TIME_COUNTER_VALUE()` macros.

`configRUN_TIME_COUNTER_TYPE` **ulTaskGetIdleRunTimePercent** (void)

BaseType_t **xTaskGenericNotifyWait** (UBaseType_t uxIndexToWaitOn, uint32_t ulBitsToClearOnEntry, uint32_t ulBitsToClearOnExit, uint32_t *pulNotificationValue, TickType_t xTicksToWait)

Waits for a direct to task notification to be pending at a given index within an array of direct to task notifications.

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for this function to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (uint32_t). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A notification sent to a task will remain pending until it is cleared by the task calling `xTaskNotifyWaitIndexed()` or `ulTaskNotifyTakeIndexed()` (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

A task can use `xTaskNotifyWaitIndexed()` to [optionally] block to wait for a notification to be pending, or `ulTaskNotifyTakeIndexed()` to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyWait()` is the original API function, and remains backward compatible by always

operating on the notification value at index 0 in the array. Calling `xTaskNotifyWait()` is equivalent to calling `xTaskNotifyWaitIndexed()` with the `uxIndexToWaitOn` parameter set to 0.

Parameters

- **uxIndexToWaitOn** -- The index within the calling task's array of notification values on which the calling task will wait for a notification to be received. `uxIndexToWaitOn` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotifyWait()` does not have this parameter and always waits for notifications on index 0.
- **ulBitsToClearOnEntry** -- Bits that are set in `ulBitsToClearOnEntry` value will be cleared in the calling task's notification value before the task checks to see if any notifications are pending, and optionally blocks if no notifications are pending. Setting `ulBitsToClearOnEntry` to `ULONG_MAX` (if `limits.h` is included) or `0xffffffffUL` (if `limits.h` is not included) will have the effect of resetting the task's notification value to 0. Setting `ulBitsToClearOnEntry` to 0 will leave the task's notification value unchanged.
- **ulBitsToClearOnExit** -- If a notification is pending or received before the calling task exits the `xTaskNotifyWait()` function then the task's notification value (see the `xTaskNotify()` API function) is passed out using the `pulNotificationValue` parameter. Then any bits that are set in `ulBitsToClearOnExit` will be cleared in the task's notification value (note `*pulNotificationValue` is set before any bits are cleared). Setting `ulBitsToClearOnExit` to `ULONG_MAX` (if `limits.h` is included) or `0xffffffffUL` (if `limits.h` is not included) will have the effect of resetting the task's notification value to 0 before the function exits. Setting `ulBitsToClearOnExit` to 0 will leave the task's notification value unchanged when the function exits (in which case the value passed out in `pulNotificationValue` will match the task's notification value).
- **pulNotificationValue** -- Used to pass the task's notification value out of the function. Note the value passed out will not be effected by the clearing of any bits caused by `ulBitsToClearOnExit` being non-zero.
- **xTicksToWait** -- The maximum amount of time that the task should wait in the Blocked state for a notification to be received, should a notification not already be pending when `xTaskNotifyWait()` was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro `pdMS_TO_TICKS(value_in_ms)` can be used to convert a time specified in milliseconds to a time specified in ticks.

Returns If a notification was received (including notifications that were already pending when `xTaskNotifyWait` was called) then `pdPASS` is returned. Otherwise `pdFAIL` is returned.

void **vTaskGenericNotifyGiveFromISR** (*TaskHandle_t* xTaskToNotify, *UBaseType_t* uxIndexToNotify, *BaseType_t* *pxHigherPriorityTaskWoken)

A version of `xTaskNotifyGiveIndexed()` that can be called from an interrupt service routine (ISR).

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for more details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for this macro to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

`vTaskNotifyGiveIndexedFromISR()` is intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given from an ISR using the `xSemaphoreGiveFromISR()` API function, the equivalent action that instead uses a task notification is `vTaskNotifyGiveIndexedFromISR()`.

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the `ulTaskNotifyTakeIndexed()` API function rather than the `xTaskNotifyWaitIndexed()` API function.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyFromISR()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling `xTaskNotifyGiveFromISR()` is equivalent to calling `xTaskNotifyGiveIndexedFromISR()` with the `uxIndexToNotify` parameter set to 0.

Parameters

- **xTaskToNotify** -- The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.
- **uxIndexToNotify** -- The index within the target task's array of notification values to which the notification is to be sent. `uxIndexToNotify` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotifyGiveFromISR()` does not have this parameter and always sends notifications to index 0.
- **pxHigherPriorityTaskWoken** -- `vTaskNotifyGiveFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE` if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If `vTaskNotifyGiveFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

BaseType_t **xTaskGenericNotifyStateClear** (*TaskHandle_t* xTask, UBaseType_t uxIndexToClear)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for these functions to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

If a notification is sent to an index within the array of notifications then the notification at that index is said to be 'pending' until it is read or explicitly cleared by the receiving task. `xTaskNotifyStateClearIndexed()` is the function that clears a pending notification without reading the notification value. The notification value at the same array index is not altered. Set `xTask` to `NULL` to clear the notification state of the calling task.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyStateClear()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling `xTaskNotifyStateClear()` is equivalent to calling `xTaskNotifyStateClearIndexed()` with the `uxIndexToNotify` parameter set to 0.

Parameters

- **xTask** -- The handle of the RTOS task that will have a notification state cleared. Set `xTask` to `NULL` to clear a notification state in the calling task. To obtain a task's handle create the task using `xTaskCreate()` and make use of the `pxCreatedTask` parameter, or create the task using `xTaskCreateStatic()` and store the returned value, or use the task's name in a call to `xTaskGetHandle()`.
- **uxIndexToClear** -- The index within the target task's array of notification values to act upon. For example, setting `uxIndexToClear` to 1 will clear the state of the notification at index 1 within the array. `uxIndexToClear` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `ulTaskNotifyStateClear()` does not have

this parameter and always acts on the notification at index 0.

Returns pdTRUE if the task's notification state was set to eNotWaitingNotification, otherwise pdFALSE.

uint32_t **ulTaskGenericNotifyValueClear** (*TaskHandle_t* xTask, UBaseType_t uxIndexToClear, uint32_t ulBitsToClear)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

ulTaskNotifyValueClearIndexed() clears the bits specified by the ulBitsToClear bit mask in the notification value at array index uxIndexToClear of the task referenced by xTask.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. ulTaskNotifyValueClear() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling ulTaskNotifyValueClear() is equivalent to calling ulTaskNotifyValueClearIndexed() with the uxIndexToClear parameter set to 0.

Parameters

- **xTask** -- The handle of the RTOS task that will have bits in one of its notification values cleared. Set xTask to NULL to clear bits in a notification value of the calling task. To obtain a task's handle create the task using xTaskCreate() and make use of the pxCreated-Task parameter, or create the task using xTaskCreateStatic() and store the returned value, or use the task's name in a call to xTaskGetHandle().
- **uxIndexToClear** -- The index within the target task's array of notification values in which to clear the bits. uxIndexToClear must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. ulTaskNotifyValueClear() does not have this parameter and always clears bits in the notification value at index 0.
- **ulBitsToClear** -- Bit mask of the bits to clear in the notification value of xTask. Set a bit to 1 to clear the corresponding bits in the task's notification value. Set ulBitsToClear to 0xffffffff (UINT_MAX on 32-bit architectures) to clear the notification value to 0. Set ulBitsToClear to 0 to query the task's notification value without clearing any bits.

Returns The value of the target task's notification value before the bits specified by ulBitsToClear were cleared.

void **vTaskSetTimeoutState** (Timeout_t *const pxTimeout)

Capture the current time for future use with xTaskCheckForTimeout().

Parameters **pxTimeout** -- Pointer to a timeout object into which the current time is to be captured. The captured time includes the tick count and the number of times the tick count has overflowed since the system first booted.

BaseType_t **xTaskCheckForTimeout** (Timeout_t *const pxTimeout, TickType_t *const pxTicksToWait)

Determines if pxTicksToWait ticks has passed since a time was captured using a call to vTaskSetTimeoutState(). The captured time includes the tick count and the number of times the tick count has overflowed.

Example Usage:

```
// Driver library function used to receive uxWantedBytes from an Rx buffer
// that is filled by a UART interrupt. If there are not enough bytes in the
// Rx buffer then the task enters the Blocked state until it is notified that
// more data has been placed into the buffer. If there is still not enough
// data then the task re-enters the Blocked state, and xTaskCheckForTimeout()
// is used to re-calculate the Block time to ensure the total amount of time
```

(continues on next page)

(continued from previous page)

```

// spent in the Blocked state does not exceed MAX_TIME_TO_WAIT. This
// continues until either the buffer contains at least uxWantedBytes bytes,
// or the total amount of time spent in the Blocked state reaches
// MAX_TIME_TO_WAIT - at which point the task reads however many bytes are
// available up to a maximum of uxWantedBytes.

size_t xUART_Receive( uint8_t *pucBuffer, size_t uxWantedBytes )
{
    size_t uxReceived = 0;
    TickType_t xTicksToWait = MAX_TIME_TO_WAIT;
    TimeOut_t xTimeOut;

    // Initialize xTimeOut. This records the time at which this function
    // was entered.
    vTaskSetTimeOutState( &xTimeOut );

    // Loop until the buffer contains the wanted number of bytes, or a
    // timeout occurs.
    while( UART_bytes_in_rx_buffer( pxUARTInstance ) < uxWantedBytes )
    {
        // The buffer didn't contain enough data so this task is going to
        // enter the Blocked state. Adjusting xTicksToWait to account for
        // any time that has been spent in the Blocked state within this
        // function so far to ensure the total amount of time spent in the
        // Blocked state does not exceed MAX_TIME_TO_WAIT.
        if( xTaskCheckForTimeOut( &xTimeOut, &xTicksToWait ) != pdFALSE )
        {
            //Timed out before the wanted number of bytes were available,
            // exit the loop.
            break;
        }

        // Wait for a maximum of xTicksToWait ticks to be notified that the
        // receive interrupt has placed more data into the buffer.
        ulTaskNotifyTake( pdTRUE, xTicksToWait );
    }

    // Attempt to read uxWantedBytes from the receive buffer into pucBuffer.
    // The actual number of bytes read (which might be less than
    // uxWantedBytes) is returned.
    uxReceived = UART_read_from_receive_buffer( pxUARTInstance,
                                                pucBuffer,
                                                uxWantedBytes );

    return uxReceived;
}

```

See also:

<https://www.FreeRTOS.org/xTaskCheckForTimeOut.html>

Parameters

- **pxTimeOut** -- The time status as captured previously using `vTaskSetTimeOutState`. If the timeout has not yet occurred, it is updated to reflect the current time status.
- **pxTicksToWait** -- The number of ticks to check for timeout i.e. if `pxTicksToWait` ticks have passed since `pxTimeOut` was last updated (either by `vTaskSetTimeOutState()` or `xTaskCheckForTimeOut()`), the timeout has occurred. If the timeout has not occurred, `pxTicksToWait` is updated to reflect the number of remaining ticks.

Returns If timeout has occurred, `pdTRUE` is returned. Otherwise `pdFALSE` is returned and `pxTicksToWait` is updated to reflect the number of remaining ticks.

BaseType_t **xTaskCatchUpTicks** (TickType_t xTicksToCatchUp)

This function corrects the tick count value after the application code has held interrupts disabled for an extended period resulting in tick interrupts having been missed.

This function is similar to vTaskStepTick(), however, unlike vTaskStepTick(), xTaskCatchUpTicks() may move the tick count forward past a time at which a task should be removed from the blocked state. That means tasks may have to be removed from the blocked state as the tick count is moved.

Parameters **xTicksToCatchUp** -- The number of tick interrupts that have been missed due to interrupts being disabled. Its value is not computed automatically, so must be computed by the application writer.

Returns pdTRUE if moving the tick count forward resulted in a task leaving the blocked state and a context switch being performed. Otherwise pdFALSE.

Structures

struct **xTASK_STATUS**

Used with the uxTaskGetSystemState() function to return the state of each task in the system.

Public Members

TaskHandle_t **xHandle**

The handle of the task to which the rest of the information in the structure relates.

const char ***pcTaskName**

A pointer to the task's name. This value will be invalid if the task was deleted since the structure was populated!

UBaseType_t **xTaskNumber**

A number unique to the task.

eTaskState **eCurrentState**

The state in which the task existed when the structure was populated.

UBaseType_t **uxCurrentPriority**

The priority at which the task was running (may be inherited) when the structure was populated.

UBaseType_t **uxBasePriority**

The priority to which the task will return if the task's current priority has been inherited to avoid unbounded priority inversion when obtaining a mutex. Only valid if configUSE_MUTEXES is defined as 1 in FreeRTOSConfig.h.

configRUN_TIME_COUNTER_TYPE **ulRunTimeCounter**

The total run time allocated to the task so far, as defined by the run time stats clock. See <https://www.FreeRTOS.org/rtos-run-time-stats.html>. Only valid when configGENERATE_RUN_TIME_STATS is defined as 1 in FreeRTOSConfig.h.

StackType_t ***pxStackBase**

Points to the lowest address of the task's stack area.

configSTACK_DEPTH_TYPE **usStackHighWaterMark**

The minimum amount of stack space that has remained for the task since the task was created. The closer this value is to zero the closer the task has come to overflowing its stack.

BaseType_t **xCoreID**

Core this task is pinned to (0, 1, or `tskNO_AFFINITY`). If `configNUMBER_OF_CORES == 1`, this will always be 0.

Macros

tskIDLE_PRIORITY

Defines the priority used by the idle task. This must not be modified.

tskNO_AFFINITY

Macro representing and unpinned (i.e., "no affinity") task in `xCoreID` parameters

taskVALID_CORE_ID (`xCoreID`)

Macro to check if an `xCoreID` value is valid

Returns `pdTRUE` if valid, `pdFALSE` otherwise.

taskYIELD ()

Macro for forcing a context switch.

taskENTER_CRITICAL (`x`)

Macro to mark the start of a critical code region. Preemptive context switches cannot occur when in a critical region.

NOTE: This may alter the stack (depending on the portable implementation) so must be used with care!

taskENTER_CRITICAL_FROM_ISR ()

taskENTER_CRITICAL_ISR (`x`)

taskEXIT_CRITICAL (`x`)

Macro to mark the end of a critical code region. Preemptive context switches cannot occur when in a critical region.

NOTE: This may alter the stack (depending on the portable implementation) so must be used with care!

taskEXIT_CRITICAL_FROM_ISR (`x`)

taskEXIT_CRITICAL_ISR (`x`)

taskDISABLE_INTERRUPTS ()

Macro to disable all maskable interrupts.

taskENABLE_INTERRUPTS ()

Macro to enable microcontroller interrupts.

taskSCHEDULER_SUSPENDED

Definitions returned by `xTaskGetSchedulerState()`. `taskSCHEDULER_SUSPENDED` is 0 to generate more optimal code when `configASSERT()` is defined as the constant is used in `assert()` statements.

taskSCHEDULER_NOT_STARTED

taskSCHEDULER_RUNNING

xTaskNotifyIndexed (`xTaskToNotify`, `uxIndexToNotify`, `ulValue`, `eAction`)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for these functions to be available.

Sends a direct to task notification to a task, with an optional value and action.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A task can use `xTaskNotifyWaitIndexed()` or `ulTaskNotifyTakeIndexed()` to [optionally] block to wait for a notification to be pending. The task does not consume any CPU time while it is in the Blocked state.

A notification sent to a task will remain pending until it is cleared by the task calling `xTaskNotifyWaitIndexed()` or `ulTaskNotifyTakeIndexed()` (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotify()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling `xTaskNotify()` is equivalent to calling `xTaskNotifyIndexed()` with the `uxIndexToNotify` parameter set to 0.

eSetBits - The target notification value is bitwise ORed with `ulValue`. `xTaskNotifyIndexed()` always returns `pdPASS` in this case.

eIncrement - The target notification value is incremented. `ulValue` is not used and `xTaskNotifyIndexed()` always returns `pdPASS` in this case.

eSetValueWithOverwrite - The target notification value is set to the value of `ulValue`, even if the task being notified had not yet processed the previous notification at the same array index (the task already had a notification pending at that index). `xTaskNotifyIndexed()` always returns `pdPASS` in this case.

eSetValueWithoutOverwrite - If the task being notified did not already have a notification pending at the same array index then the target notification value is set to `ulValue` and `xTaskNotifyIndexed()` will return `pdPASS`. If the task being notified already had a notification pending at the same array index then no action is performed and `pdFAIL` is returned.

eNoAction - The task receives a notification at the specified array index without the notification value at that index being updated. `ulValue` is not used and `xTaskNotifyIndexed()` always returns `pdPASS` in this case.

pulPreviousNotificationValue - Can be used to pass out the subject task's notification value before any bits are modified by the notify function.

Parameters

- **xTaskToNotify** -- The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.
- **uxIndexToNotify** -- The index within the target task's array of notification values to which the notification is to be sent. `uxIndexToNotify` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotify()` does not have this parameter and always sends notifications to index 0.
- **ulValue** -- Data that can be sent with the notification. How the data is used depends on the value of the `eAction` parameter.

- **eAction** -- Specifies how the notification updates the task's notification value, if at all. Valid values for eAction are as follows:

Returns Dependent on the value of eAction. See the description of the eAction parameter.

xTaskNotifyAndQueryIndexed (xTaskToNotify, uxIndexToNotify, ulValue, eAction, pulPreviousNotifyValue)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

xTaskNotifyAndQueryIndexed() performs the same operation as xTaskNotifyIndexed() with the addition that it also returns the subject task's prior notification value (the notification value at the time the function is called rather than when the function returns) in the additional pulPreviousNotifyValue parameter.

xTaskNotifyAndQuery() performs the same operation as xTaskNotify() with the addition that it also returns the subject task's prior notification value (the notification value as it was at the time the function is called, rather than when the function returns) in the additional pulPreviousNotifyValue parameter.

xTaskNotifyIndexedFromISR (xTaskToNotify, uxIndexToNotify, ulValue, eAction, pxHigherPriorityTaskWoken)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

A version of xTaskNotifyIndexed() that can be used from an interrupt service routine (ISR).

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyFromISR() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling xTaskNotifyFromISR() is equivalent to calling xTaskNotifyIndexedFromISR() with the uxIndexToNotify parameter set to 0.

eSetBits - The task's notification value is bitwise ORed with ulValue. xTaskNotify() always returns pdPASS in this case.

eIncrement - The task's notification value is incremented. ulValue is not used and xTaskNotify() always returns pdPASS in this case.

eSetValueWithOverwrite - The task's notification value is set to the value of `ulValue`, even if the task being notified had not yet processed the previous notification (the task already had a notification pending). `xTaskNotify()` always returns `pdPASS` in this case.

eSetValueWithoutOverwrite - If the task being notified did not already have a notification pending then the task's notification value is set to `ulValue` and `xTaskNotify()` will return `pdPASS`. If the task being notified already had a notification pending then no action is performed and `pdFAIL` is returned.

eNoAction - The task receives a notification without its notification value being updated. `ulValue` is not used and `xTaskNotify()` always returns `pdPASS` in this case.

Parameters

- **uxIndexToNotify** -- The index within the target task's array of notification values to which the notification is to be sent. `uxIndexToNotify` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotifyFromISR()` does not have this parameter and always sends notifications to index 0.
- **xTaskToNotify** -- The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.
- **ulValue** -- Data that can be sent with the notification. How the data is used depends on the value of the `eAction` parameter.
- **eAction** -- Specifies how the notification updates the task's notification value, if at all. Valid values for `eAction` are as follows:
- **pxHigherPriorityTaskWoken** -- `xTaskNotifyFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE` if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If `xTaskNotifyFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

Returns Dependent on the value of `eAction`. See the description of the `eAction` parameter.

xTaskNotifyAndQueryIndexedFromISR (`xTaskToNotify`, `uxIndexToNotify`, `ulValue`, `eAction`, `pulPreviousNotificationValue`, `pxHigherPriorityTaskWoken`)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`xTaskNotifyAndQueryIndexedFromISR()` performs the same operation as `xTaskNotifyIndexedFromISR()` with the addition that it also returns the subject task's prior notification value (the notification value at the time the function is called rather than at the time the function returns) in the additional `pulPreviousNotificationValue` parameter.

`xTaskNotifyAndQueryFromISR()` performs the same operation as `xTaskNotifyFromISR()` with the addition that it also returns the subject task's prior notification value (the notification value at the time the function is called rather than at the time the function returns) in the additional `pulPreviousNotificationValue` parameter.

xTaskNotifyWait (`ulBitsToClearOnEntry`, `ulBitsToClearOnExit`, `pulNotificationValue`, `xTicksToWait`)

xTaskNotifyWaitIndexed (`uxIndexToWaitOn`, `ulBitsToClearOnEntry`, `ulBitsToClearOnExit`, `pulNotificationValue`, `xTicksToWait`)

xTaskNotifyGiveIndexed (`xTaskToNotify`, `uxIndexToNotify`)

Sends a direct to task notification to a particular index in the target task's notification array in a manner similar to giving a counting semaphore.

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for more details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for these macros to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

`xTaskNotifyGiveIndexed()` is a helper macro intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given using the `xSemaphoreGive()` API function, the equivalent action that instead uses a task notification is `xTaskNotifyGiveIndexed()`.

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the `ulTaskNotifyTakeIndexed()` API function rather than the `xTaskNotifyWaitIndexed()` API function.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyGive()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling `xTaskNotifyGive()` is equivalent to calling `xTaskNotifyGiveIndexed()` with the `uxIndexToNotify` parameter set to 0.

Parameters

- **`xTaskToNotify`** -- The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.
- **`uxIndexToNotify`** -- The index within the target task's array of notification values to which the notification is to be sent. `uxIndexToNotify` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotifyGive()` does not have this parameter and always sends notifications to index 0.

Returns `xTaskNotifyGive()` is a macro that calls `xTaskNotify()` with the `eAction` parameter set to `eIncrement` - so `pdPASS` is always returned.

`vTaskNotifyGiveFromISR` (`xTaskToNotify`, `pxHigherPriorityTaskWoken`)

`vTaskNotifyGiveIndexedFromISR` (`xTaskToNotify`, `uxIndexToNotify`, `pxHigherPriorityTaskWoken`)

`ulTaskNotifyTakeIndexed` (`uxIndexToWaitOn`, `xClearCountOnExit`, `xTicksToWait`)

Waits for a direct to task notification on a particular index in the calling task's notification array in a manner similar to taking a counting semaphore.

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for this function to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

`ulTaskNotifyTakeIndexed()` is intended for use when a task notification is used as a faster and lighter weight binary or counting semaphore alternative. Actual FreeRTOS semaphores are taken using the `xSemaphoreTake()` API function, the equivalent action that instead uses a task notification is `ulTaskNotifyTakeIndexed()`.

When a task is using its notification value as a binary or counting semaphore other tasks should send notifications to it using the `xTaskNotifyGiveIndexed()` macro, or `xTaskNotifyIndex()` function with the `eAction` parameter set to `eIncrement`.

`ulTaskNotifyTakeIndexed()` can either clear the task's notification value at the array index specified by the `uxIndexToWaitOn` parameter to zero on exit, in which case the notification value acts like a binary semaphore, or decrement the notification value on exit, in which case the notification value acts like a counting semaphore.

A task can use `ulTaskNotifyTakeIndexed()` to [optionally] block to wait for a notification. The task does not consume any CPU time while it is in the Blocked state.

Where as `xTaskNotifyWaitIndexed()` will return when a notification is pending, `ulTaskNotifyTakeIndexed()` will return when the task's notification value is not zero.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `ulTaskNotifyTake()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling `ulTaskNotifyTake()` is equivalent to calling `ulTaskNotifyTakeIndexed()` with the `uxIndexToWaitOn` parameter set to 0.

Parameters

- **`uxIndexToWaitOn`** -- The index within the calling task's array of notification values on which the calling task will wait for a notification to be non-zero. `uxIndexToWaitOn` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotifyTake()` does not have this parameter and always waits for notifications on index 0.
- **`xClearCountOnExit`** -- if `xClearCountOnExit` is `pdFALSE` then the task's notification value is decremented when the function exits. In this way the notification value acts like a counting semaphore. If `xClearCountOnExit` is not `pdFALSE` then the task's notification value is cleared to zero when the function exits. In this way the notification value acts like a binary semaphore.
- **`xTicksToWait`** -- The maximum amount of time that the task should wait in the Blocked state for the task's notification value to be greater than zero, should the count not already be greater than zero when `ulTaskNotifyTake()` was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro `pdMS_TO_TICKS(value_in_ms)` can be used to convert a time specified in milliseconds to a time specified in ticks.

Returns The task's notification count before it is either cleared to zero or decremented (see the `xClearCountOnExit` parameter).

`xTaskNotifyStateClear` (`xTask`)

`xTaskNotifyStateClearIndexed` (`xTask`, `uxIndexToClear`)

`ulTaskNotifyValueClear` (`xTask`, `ulBitsToClear`)

`ulTaskNotifyValueClearIndexed` (`xTask`, `uxIndexToClear`, `ulBitsToClear`)

Type Definitions

```
typedef struct tskTaskControlBlock *TaskHandle_t
```

```
typedef BaseType_t (TaskHookFunction_t)(void*)
```

Defines the prototype to which the application task hook function must conform.

typedef struct *xTASK_STATUS* **TaskStatus_t**

Used with the uxTaskGetSystemState() function to return the state of each task in the system.

Enumerations

enum **eTaskState**

Task states returned by eTaskGetState.

Values:

enumerator **eRunning**

A task is querying the state of itself, so must be running.

enumerator **eReady**

The task being queried is in a ready or pending ready list.

enumerator **eBlocked**

The task being queried is in the Blocked state.

enumerator **eSuspended**

The task being queried is in the Suspended state, or is in the Blocked state with an infinite time out.

enumerator **eDeleted**

The task being queried has been deleted, but its TCB has not yet been freed.

enumerator **eInvalid**

Used as an 'invalid state' value.

enum **eNotifyAction**

Actions that can be performed when vTaskNotify() is called.

Values:

enumerator **eNoAction**

Notify the task without updating its notify value.

enumerator **eSetBits**

Set bits in the task's notification value.

enumerator **eIncrement**

Increment the task's notification value.

enumerator **eSetValueWithOverwrite**

Set the task's notification value to a specific value even if the previous value has not yet been read by the task.

enumerator **eSetValueWithoutOverwrite**

Set the task's notification value if the previous value has been read by the task.

enum eSleepModeStatus

Possible return values for eTaskConfirmSleepModeStatus().

Values:

enumerator eAbortSleep

A task has been made ready or a context switch pended since portSUPPRESS_TICKS_AND_SLEEP() was called - abort entering a sleep mode.

enumerator eStandardSleep

Enter a sleep mode that will not last any longer than the expected idle time.

Queue API**Header File**

- [components/freertos/FreeRTOS-Kernel/include/freertos/queue.h](#)
- This header file can be included with:

```
#include "freertos/queue.h"
```

Functions

BaseType_t **xQueueGenericSend** (*QueueHandle_t* xQueue, const void *const pvItemToQueue, TickType_t xTicksToWait, const BaseType_t xCopyPosition)

It is preferred that the macros xQueueSend(), xQueueSendToFront() and xQueueSendToBack() are used in place of calling this function directly.

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    // ...

    if( xQueue1 != 0 )
```

(continues on next page)

(continued from previous page)

```

{
// Send an uint32_t. Wait for 10 ticks for space to become
// available if necessary.
if( xQueueGenericSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10, ←
→queueSEND_TO_BACK ) != pdPASS )
{
// Failed to post the message, even after 10 ticks.
}
}

if( xQueue2 != 0 )
{
// Send a pointer to a struct AMessage object. Don't block if the
// queue is already full.
    pxMessage = &xMessage;
    xQueueGenericSend( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0, ←
→queueSEND_TO_BACK );
}

// ... Rest of task code.
}

```

Parameters

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** -- The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.
- **xCopyPosition** -- Can take the value queueSEND_TO_BACK to place the item at the back of the queue, or queueSEND_TO_FRONT to place the item at the front of the queue (for high priority messages).

Returns pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

BaseType_t **xQueuePeek** (*QueueHandle_t* xQueue, void *const pvBuffer, TickType_t xTicksToWait)

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to xQueueReceive().

This macro must not be used in an interrupt service routine. See xQueuePeekFromISR() for an alternative that can be called from an interrupt service routine.

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

QueueHandle_t xQueue;

```

(continues on next page)

```

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }

    // ...

    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = & xMessage;
    xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );

    // ... Rest of task code.
}

// Task to peek the data from the queue.
void vADifferentTask( void *pvParameters )
{
    struct AMessage *pxRxdMessage;

    if( xQueue != 0 )
    {
        // Peek a message on the created queue. Block for 10 ticks if a
        // message is not immediately available.
        if( xQueuePeek( xQueue, &( pxRxdMessage ), ( TickType_t ) 10 ) )
        {
            // pxRxdMessage now points to the struct AMessage variable posted
            // by vATask, but the item still remains on the queue.
        }
    }

    // ... Rest of task code.
}

```

Parameters

- **xQueue** -- The handle to the queue from which the item is to be received.
- **pvBuffer** -- Pointer to the buffer into which the received item will be copied.
- **xTicksToWait** -- The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required. xQueuePeek() will return immediately if xTicksToWait is 0 and the queue is empty.

Returns pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

BaseType_t **xQueuePeekFromISR** (*QueueHandle_t* xQueue, void *const pvBuffer)

A version of xQueuePeek() that can be called from an interrupt service routine (ISR).

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to xQueueReceive().

Parameters

- **xQueue** -- The handle to the queue from which the item is to be received.
- **pvBuffer** -- Pointer to the buffer into which the received item will be copied.

Returns pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

BaseType_t **xQueueReceive** (*QueueHandle_t* xQueue, void *const pvBuffer, TickType_t xTicksToWait)

Receive an item from a queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items are removed from the queue.

This function must not be used in an interrupt service routine. See xQueueReceiveFromISR for an alternative that can.

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }

    // ...

    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = & xMessage;
    xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );

    // ... Rest of task code.
}

// Task to receive from the queue.
void vADifferentTask( void *pvParameters )
{
    struct AMessage *pRxedMessage;

    if( xQueue != 0 )
    {
        // Receive a message on the created queue. Block for 10 ticks if a
        // message is not immediately available.
        if( xQueueReceive( xQueue, &( pRxedMessage ), ( TickType_t ) 10 ) )
        {
            // pRxedMessage now points to the struct AMessage variable posted
            // by vATask.
        }
    }
}

```

(continues on next page)

(continued from previous page)

```
// ... Rest of task code.
}
```

Parameters

- **xQueue** -- The handle to the queue from which the item is to be received.
- **pvBuffer** -- Pointer to the buffer into which the received item will be copied.
- **xTicksToWait** -- The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. `xQueueReceive()` will return immediately if `xTicksToWait` is zero and the queue is empty. The time is defined in tick periods so the constant `portTICK_PERIOD_MS` should be used to convert to real time if this is required.

Returns `pdTRUE` if an item was successfully received from the queue, otherwise `pdFALSE`.

`UBaseType_t uxQueueMessagesWaiting` (const `QueueHandle_t` xQueue)

Return the number of messages stored in a queue.

Parameters **xQueue** -- A handle to the queue being queried.

Returns The number of messages available in the queue.

`UBaseType_t uxQueueSpacesAvailable` (const `QueueHandle_t` xQueue)

Return the number of free spaces available in a queue. This is equal to the number of items that can be sent to the queue before the queue becomes full if no items are removed.

Parameters **xQueue** -- A handle to the queue being queried.

Returns The number of spaces available in the queue.

`void vQueueDelete` (`QueueHandle_t` xQueue)

Delete a queue - freeing all the memory allocated for storing of items placed on the queue.

Parameters **xQueue** -- A handle to the queue to be deleted.

`BaseType_t xQueueGenericSendFromISR` (`QueueHandle_t` xQueue, const void *const pvItemToQueue, `BaseType_t` *const pxHigherPriorityTaskWoken, const `BaseType_t` xCopyPosition)

It is preferred that the macros `xQueueSendFromISR()`, `xQueueSendToFrontFromISR()` and `xQueueSendToBackFromISR()` be used in place of calling this function directly. `xQueueGiveFromISR()` is an equivalent for use by semaphores that don't actually copy any data.

Post an item on a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWokenByPost;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWokenByPost = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );
```

(continues on next page)

(continued from previous page)

```

// Post each byte.
    xQueueGenericSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWokenByPost,
↪ queueSEND_TO_BACK );

} while( portINPUT_BYTE( BUFFER_COUNT ) );

// Now the buffer is empty we can switch context if necessary. Note that the
// name of the yield function required is port specific.
if( xHigherPriorityTaskWokenByPost )
{
    portYIELD_FROM_ISR();
}
}

```

Parameters

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** -- xQueueGenericSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueGenericSendFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.
- **xCopyPosition** -- Can take the value queueSEND_TO_BACK to place the item at the back of the queue, or queueSEND_TO_FRONT to place the item at the front of the queue (for high priority messages).

Returns pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

BaseType_t **xQueueGiveFromISR** (*QueueHandle_t* xQueue, BaseType_t *const pxHigherPriorityTaskWoken)

BaseType_t **xQueueReceiveFromISR** (*QueueHandle_t* xQueue, void *const pvBuffer, BaseType_t *const pxHigherPriorityTaskWoken)

Receive an item from a queue. It is safe to use this function from within an interrupt service routine.

Example usage:

```

QueueHandle_t xQueue;

// Function to create a queue and post some values.
void vAFunction( void *pvParameters )
{
    char cValueToPost;
    const TickType_t xTicksToWait = ( TickType_t )0xff;

    // Create a queue capable of containing 10 characters.
    xQueue = xQueueCreate( 10, sizeof( char ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }

    // ...

    // Post some characters that will be used within an ISR. If the queue
    // is full then this task will block for xTicksToWait ticks.
    cValueToPost = 'a';

```

(continues on next page)

(continued from previous page)

```

xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );
cValueToPost = 'b';
xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );

// ... keep posting characters ... this task may block when the queue
// becomes full.

cValueToPost = 'c';
xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );
}

// ISR that outputs all the characters received on the queue.
void vISR_Routine( void )
{
BaseType_t xTaskWokenByReceive = pdFALSE;
char cRxdChar;

while( xQueueReceiveFromISR( xQueue, ( void * ) &cRxdChar, &
↪xTaskWokenByReceive) )
{
// A character was received. Output the character now.
vOutputCharacter( cRxdChar );

// If removing the character from the queue woke the task that was
// posting onto the queue xTaskWokenByReceive will have been set to
// pdTRUE. No matter how many times this loop iterates only one
// task will be woken.
}

if( xTaskWokenByReceive != ( char ) pdFALSE;
{
taskYIELD ();
}
}

```

Parameters

- **xQueue** -- The handle to the queue from which the item is to be received.
- **pvBuffer** -- Pointer to the buffer into which the received item will be copied.
- **pxHigherPriorityTaskWoken** -- A task may be blocked waiting for space to become available on the queue. If xQueueReceiveFromISR causes such a task to unblock *pxTaskWoken will get set to pdTRUE, otherwise *pxTaskWoken will remain unchanged.

Returns pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

BaseType_t **xQueueIsQueueEmptyFromISR** (const *QueueHandle_t* xQueue)

Queries a queue to determine if the queue is empty. This function should only be used in an ISR.

Parameters **xQueue** -- The handle of the queue being queried

Returns pdFALSE if the queue is not empty, or pdTRUE if the queue is empty.

BaseType_t **xQueueIsQueueFullFromISR** (const *QueueHandle_t* xQueue)

Queries a queue to determine if the queue is full. This function should only be used in an ISR.

Parameters **xQueue** -- The handle of the queue being queried

Returns pdFALSE if the queue is not full, or pdTRUE if the queue is full.

UBaseType_t **uxQueueMessagesWaitingFromISR** (const *QueueHandle_t* xQueue)

A version of uxQueueMessagesWaiting() that can be called from an ISR. Return the number of messages stored in a queue.

Parameters **xQueue** -- A handle to the queue being queried.

Returns The number of messages available in the queue.

void **vQueueAddToRegistry** (*QueueHandle_t* xQueue, const char *pcQueueName)

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call `vQueueAddToRegistry()` add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger. If you are not using a kernel aware debugger then this function can be ignored.

`configQUEUE_REGISTRY_SIZE` defines the maximum number of handles the registry can hold. `configQUEUE_REGISTRY_SIZE` must be greater than 0 within `FreeRTOSConfig.h` for the registry to be available. Its value does not affect the number of queues, semaphores and mutexes that can be created - just the number that the registry can hold.

If `vQueueAddToRegistry` is called more than once with the same `xQueue` parameter, the registry will store the `pcQueueName` parameter from the most recent call to `vQueueAddToRegistry`.

Parameters

- **xQueue** -- The handle of the queue being added to the registry. This is the handle returned by a call to `xQueueCreate()`. Semaphore and mutex handles can also be passed in here.
- **pcQueueName** -- The name to be associated with the handle. This is the name that the kernel aware debugger will display. The queue registry only stores a pointer to the string - so the string must be persistent (global or preferably in ROM/Flash), not on the stack.

void **vQueueUnregisterQueue** (*QueueHandle_t* xQueue)

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call `vQueueAddToRegistry()` add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger, and `vQueueUnregisterQueue()` to remove the queue, semaphore or mutex from the register. If you are not using a kernel aware debugger then this function can be ignored.

Parameters **xQueue** -- The handle of the queue being removed from the registry.

const char ***pcQueueGetName** (*QueueHandle_t* xQueue)

The queue registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call `pcQueueGetName()` to look up and return the name of a queue in the queue registry from the queue's handle.

Parameters **xQueue** -- The handle of the queue the name of which will be returned.

Returns If the queue is in the registry then a pointer to the name of the queue is returned. If the queue is not in the registry then `NULL` is returned.

QueueSetHandle_t **xQueueCreateSet** (const `UBaseType_t` uxEventQueueLength)

Queue sets provide a mechanism to allow a task to block (pend) on a read operation from multiple queues or semaphores simultaneously.

See `FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c` for an example using this function.

A queue set must be explicitly created using a call to `xQueueCreateSet()` before it can be used. Once created, standard FreeRTOS queues and semaphores can be added to the set using calls to `xQueueAddToSet()`. `xQueueSelectFromSet()` is then used to determine which, if any, of the queues or semaphores contained in the set is in a state where a queue read or semaphore take operation would be successful.

Note 1: See the documentation on <https://www.FreeRTOS.org/RTOS-queue-sets.html> for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: An additional 4 bytes of RAM is required for each space in a every queue added to a queue set. Therefore counting semaphores that have a high maximum count value should not be added to a queue set.

Note 4: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to `xQueueSelectFromSet()` has first returned a handle to that set member.

Parameters **uxEventQueueLength** -- Queue sets store events that occur on the queues and semaphores contained in the set. `uxEventQueueLength` specifies the maximum number of

events that can be queued at once. To be absolutely certain that events are not lost `uxEventQueueLength` should be set to the total sum of the length of the queues added to the set, where binary semaphores and mutexes have a length of 1, and counting semaphores have a length set by their maximum count value. Examples:

- If a queue set is to hold a queue of length 5, another queue of length 12, and a binary semaphore, then `uxEventQueueLength` should be set to $(5 + 12 + 1)$, or 18.
- If a queue set is to hold three binary semaphores then `uxEventQueueLength` should be set to $(1 + 1 + 1)$, or 3.
- If a queue set is to hold a counting semaphore that has a maximum count of 5, and a counting semaphore that has a maximum count of 3, then `uxEventQueueLength` should be set to $(5 + 3)$, or 8.

Returns If the queue set is created successfully then a handle to the created queue set is returned. Otherwise NULL is returned.

BaseType_t **xQueueAddToSet** (*QueueSetMemberHandle_t* xQueueOrSemaphore, *QueueSetHandle_t* xQueueSet)

Adds a queue or semaphore to a queue set that was previously created by a call to `xQueueCreateSet()`.

See `FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c` for an example using this function.

Note 1: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to `xQueueSelectFromSet()` has first returned a handle to that set member.

Parameters

- **xQueueOrSemaphore** -- The handle of the queue or semaphore being added to the queue set (cast to an `QueueSetMemberHandle_t` type).
- **xQueueSet** -- The handle of the queue set to which the queue or semaphore is being added.

Returns If the queue or semaphore was successfully added to the queue set then `pdPASS` is returned. If the queue could not be successfully added to the queue set because it is already a member of a different queue set then `pdFAIL` is returned.

BaseType_t **xQueueRemoveFromSet** (*QueueSetMemberHandle_t* xQueueOrSemaphore, *QueueSetHandle_t* xQueueSet)

Removes a queue or semaphore from a queue set. A queue or semaphore can only be removed from a set if the queue or semaphore is empty.

See `FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c` for an example using this function.

Parameters

- **xQueueOrSemaphore** -- The handle of the queue or semaphore being removed from the queue set (cast to an `QueueSetMemberHandle_t` type).
- **xQueueSet** -- The handle of the queue set in which the queue or semaphore is included.

Returns If the queue or semaphore was successfully removed from the queue set then `pdPASS` is returned. If the queue was not in the queue set, or the queue (or semaphore) was not empty, then `pdFAIL` is returned.

QueueSetMemberHandle_t **xQueueSelectFromSet** (*QueueSetHandle_t* xQueueSet, const TickType_t xTicksToWait)

`xQueueSelectFromSet()` selects from the members of a queue set a queue or semaphore that either contains data (in the case of a queue) or is available to take (in the case of a semaphore). `xQueueSelectFromSet()` effectively allows a task to block (pend) on a read operation on all the queues and semaphores in a queue set simultaneously.

See `FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c` for an example using this function.

Note 1: See the documentation on <https://www.FreeRTOS.org/RTOS-queue-sets.html> for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to `xQueueSelectFromSet()` has first returned a handle to that set member.

Parameters

- **xQueueSet** -- The queue set on which the task will (potentially) block.
- **xTicksToWait** -- The maximum time, in ticks, that the calling task will remain in the Blocked state (with other tasks executing) to wait for a member of the queue set to be ready for a successful queue read or semaphore take operation.

Returns `xQueueSelectFromSet()` will return the handle of a queue (cast to a `QueueSetMemberHandle_t` type) contained in the queue set that contains data, or the handle of a semaphore (cast to a `QueueSetMemberHandle_t` type) contained in the queue set that is available, or NULL if no such queue or semaphore exists before the specified block time expires.

QueueSetMemberHandle_t **xQueueSelectFromSetFromISR** (*QueueSetHandle_t* xQueueSet)

A version of `xQueueSelectFromSet()` that can be used from an ISR.

Macros

xQueueCreate (`uxQueueLength`, `uxItemSize`)

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue's data structures. The second block is used to hold items placed into the queue. If a queue is created using `xQueueCreate()` then both blocks of memory are automatically dynamically allocated inside the `xQueueCreate()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a queue is created using `xQueueCreateStatic()` then the application writer must provide the memory that will get used by the queue. `xQueueCreateStatic()` therefore allows a queue to be created without using any dynamic memory allocation.

<https://www.FreeRTOS.org/Embedded-RTOS-Queues.html>

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
};

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );
    if( xQueue1 == 0 )
    {
        // Queue was not created and must not be used.
    }

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue2 == 0 )
    {
        // Queue was not created and must not be used.
    }

    // ... Rest of task code.
}

```

Parameters

- **uxQueueLength** -- The maximum number of items that the queue can contain.
- **uxItemSize** -- The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.

Returns If the queue is successfully create then a handle to the newly created queue is returned. If the queue cannot be created then 0 is returned.

xQueueCreateStatic (uxQueueLength, uxItemSize, pucQueueStorage, pxQueueBuffer)

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue's data structures. The second block is used to hold items placed into the queue. If a queue is created using xQueueCreate() then both blocks of memory are automatically dynamically allocated inside the xQueueCreate() function. (see <https://www.FreeRTOS.org/a00111.html>). If a queue is created using xQueueCreateStatic() then the application writer must provide the memory that will get used by the queue. xQueueCreateStatic() therefore allows a queue to be created without using any dynamic memory allocation.

<https://www.FreeRTOS.org/Embedded-RTOS-Queues.html>

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
};

#define QUEUE_LENGTH 10
#define ITEM_SIZE sizeof( uint32_t )

// xQueueBuffer will hold the queue structure.
StaticQueue_t xQueueBuffer;

// ucQueueStorage will hold the items posted to the queue. Must be at least
// [(queue length) * ( queue item size)] bytes long.
uint8_t ucQueueStorage[ QUEUE_LENGTH * ITEM_SIZE ];

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( QUEUE_LENGTH, // The number of items the queue can
    →hold.
                            ITEM_SIZE // The size of each item in the queue
    →hold the items in the queue.
                            &( ucQueueStorage[ 0 ] ), // The buffer that will
    →queue structure.
                            &xQueueBuffer ); // The buffer that will hold the

    // The queue is guaranteed to be created successfully as no dynamic memory
    // allocation is used. Therefore xQueue1 is now a handle to a valid queue.

    // ... Rest of task code.
}

```

Parameters

- **uxQueueLength** -- The maximum number of items that the queue can contain.
- **uxItemSize** -- The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for

each posted item. Each item on the queue must be the same size.

- **pucQueueStorage** -- If uxItemSize is not zero then pucQueueStorage must point to a uint8_t array that is at least large enough to hold the maximum number of items that can be in the queue at any one time - which is (uxQueueLength * uxItemsSize) bytes. If uxItemSize is zero then pucQueueStorage can be NULL.
- **pxQueueBuffer** -- Must point to a variable of type StaticQueue_t, which will be used to hold the queue's data structure.

Returns If the queue is created then a handle to the created queue is returned. If pxQueueBuffer is NULL then NULL is returned.

xQueueGetStaticBuffers (xQueue, ppucQueueStorage, ppxStaticQueue)

Retrieve pointers to a statically created queue's data structure buffer and storage area buffer. These are the same buffers that are supplied at the time of creation.

Parameters

- **xQueue** -- The queue for which to retrieve the buffers.
- **ppucQueueStorage** -- Used to return a pointer to the queue's storage area buffer.
- **ppxStaticQueue** -- Used to return a pointer to the queue's data structure buffer.

Returns pdTRUE if buffers were retrieved, pdFALSE otherwise.

xQueueSendToFront (xQueue, pvItemToQueue, xTicksToWait)

Post an item to the front of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    // ...

    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become
        // available if necessary.
        if( xQueueSendToFront( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }
}

```

(continues on next page)

(continued from previous page)

```

if( xQueue2 != 0 )
{
// Send a pointer to a struct AMessage object. Don't block if the
// queue is already full.
    pxMessage = & xMessage;
    xQueueSendToFront( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
}

// ... Rest of task code.
}

```

Parameters

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** -- The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

Returns pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

xQueueSendToBack (xQueue, pvItemToQueue, xTicksToWait)

This is a macro that calls xQueueGenericSend().

Post an item to the back of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    // ...

    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become
        // available if necessary.
    }
}

```

(continues on next page)

(continued from previous page)

```

if( xQueueSendToBack( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
    {
    // Failed to post the message, even after 10 ticks.
    }
}

if( xQueue2 != 0 )
    {
    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = &xMessage;
    xQueueSendToBack( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
    }

// ... Rest of task code.
}

```

Parameters

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** -- The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

Returns pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

xQueueSend (xQueue, pvItemToQueue, xTicksToWait)

This is a macro that calls xQueueGenericSend(). It is included for backward compatibility with versions of FreeRTOS.org that did not include the xQueueSendToFront() and xQueueSendToBack() macros. It is equivalent to xQueueSendToBack().

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
}

```

(continues on next page)

(continued from previous page)

```

xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

// ...

if( xQueue1 != 0 )
{
// Send an uint32_t. Wait for 10 ticks for space to become
// available if necessary.
if( xQueueSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
{
// Failed to post the message, even after 10 ticks.
}
}

if( xQueue2 != 0 )
{
// Send a pointer to a struct AMessage object. Don't block if the
// queue is already full.
pxMessage = &xMessage;
xQueueSend( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
}

// ... Rest of task code.
}

```

Parameters

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** -- The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

Returns pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

xQueueOverwrite (xQueue, pvItemToQueue)

Only for use with queues that have a length of one - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

This function must not be called from an interrupt service routine. See xQueueOverwriteFromISR () for an alternative which may be used in an ISR.

Example usage:

```

void vFunction( void *pvParameters )
{
QueueHandle_t xQueue;
uint32_t ulVarToSend, ulValReceived;

// Create a queue to hold one uint32_t value. It is strongly
// recommended *not* to use xQueueOverwrite() on queues that can
// contain more than one value, and doing so will trigger an assertion
// if configASSERT() is defined.
xQueue = xQueueCreate( 1, sizeof( uint32_t ) );

```

(continues on next page)

(continued from previous page)

```

// Write the value 10 to the queue using xQueueOverwrite().
ulVarToSend = 10;
xQueueOverwrite( xQueue, &ulVarToSend );

// Peeking the queue should now return 10, but leave the value 10 in
// the queue. A block time of zero is used as it is known that the
// queue holds a value.
ulValReceived = 0;
xQueuePeek( xQueue, &ulValReceived, 0 );

if( ulValReceived != 10 )
{
// Error unless the item was removed by a different task.
}

// The queue is still full. Use xQueueOverwrite() to overwrite the
// value held in the queue with 100.
ulVarToSend = 100;
xQueueOverwrite( xQueue, &ulVarToSend );

// This time read from the queue, leaving the queue empty once more.
// A block time of 0 is used again.
xQueueReceive( xQueue, &ulValReceived, 0 );

// The value read should be the last value written, even though the
// queue was already full when the value was written.
if( ulValReceived != 100 )
{
// Error!
}

// ...
}

```

Parameters

- **xQueue** -- The handle of the queue to which the data is being sent.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.

Returns xQueueOverwrite() is a macro that calls xQueueGenericSend(), and therefore has the same return values as xQueueSendToFront(). However, pdPASS is the only value that can be returned because xQueueOverwrite() will write to the queue even when the queue is already full.

xQueueSendToFrontFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR().

Post an item to the front of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```

void vBufferISR( void )
{
char cIn;
 BaseType_t xHigherPriorityTaskWoken;

```

(continues on next page)

(continued from previous page)

```

// We have not woken a task at the start of the ISR.
xHigherPriorityTaskWoken = pdFALSE;

// Loop until the buffer is empty.
do
{
// Obtain a byte from the buffer.
  cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

// Post the byte.
  xQueueSendToFrontFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
} while( portINPUT_BYTE( BUFFER_COUNT ) );

// Now the buffer is empty we can switch context if necessary.
if( xHigherPriorityTaskWoken )
{
  taskYIELD ();
}
}

```

Parameters

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** -- xQueueSendToFrontFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendToFromFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

Returns pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

xQueueSendToBackFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR().

Post an item to the back of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```

void vBufferISR( void )
{
  char cIn;
  BaseType_t xHigherPriorityTaskWoken;

  // We have not woken a task at the start of the ISR.
  xHigherPriorityTaskWoken = pdFALSE;

  // Loop until the buffer is empty.
  do
  {
  // Obtain a byte from the buffer.
    cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

```

(continues on next page)

(continued from previous page)

```

// Post the byte.
xQueueSendToBackFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );

} while( portINPUT_BYTE( BUFFER_COUNT ) );

// Now the buffer is empty we can switch context if necessary.
if( xHigherPriorityTaskWoken )
{
    taskYIELD ();
}
}

```

Parameters

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** -- xQueueSendToBackFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendToBackFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

Returns pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

xQueueOverwriteFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

A version of xQueueOverwrite() that can be used in an interrupt service routine (ISR).

Only for use with queues that can hold a single item - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

Example usage:

```

QueueHandle_t xQueue;

void vFunction( void *pvParameters )
{
    // Create a queue to hold one uint32_t value. It is strongly
    // recommended *not* to use xQueueOverwriteFromISR() on queues that can
    // contain more than one value, and doing so will trigger an assertion
    // if configASSERT() is defined.
    xQueue = xQueueCreate( 1, sizeof( uint32_t ) );
}

void vAnInterruptHandler( void )
{
    // xHigherPriorityTaskWoken must be set to pdFALSE before it is used.
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;
    uint32_t ulVarToSend, ulValReceived;

    // Write the value 10 to the queue using xQueueOverwriteFromISR().
    ulVarToSend = 10;
    xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

    // The queue is full, but calling xQueueOverwriteFromISR() again will still
    // pass because the value held in the queue will be overwritten with the
    // new value.
}

```

(continues on next page)

(continued from previous page)

```

ulVarToSend = 100;
xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

// Reading from the queue will now return 100.

// ...

if( xHigherPriorityTaskWoken == pdTRUE )
{
// Writing to the queue caused a task to unblock and the unblocked task
// has a priority higher than or equal to the priority of the currently
// executing task (the task this interrupt interrupted). Perform a context
// switch so this interrupt returns directly to the unblocked task.
    portYIELD_FROM_ISR(); // or portEND_SWITCHING_ISR() depending on the port.
}
}

```

Parameters

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** -- xQueueOverwriteFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueOverwriteFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

Returns xQueueOverwriteFromISR() is a macro that calls xQueueGenericSendFromISR(), and therefore has the same return values as xQueueSendToFrontFromISR(). However, pdPASS is the only value that can be returned because xQueueOverwriteFromISR() will write to the queue even when the queue is already full.

xQueueSendFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR(). It is included for backward compatibility with versions of FreeRTOS.org that did not include the xQueueSendToBackFromISR() and xQueueSendToFrontFromISR() macros.

Post an item to the back of a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```

void vBufferISR( void )
{
char cIn;
 BaseType_t xHigherPriorityTaskWoken;

// We have not woken a task at the start of the ISR.
xHigherPriorityTaskWoken = pdFALSE;

// Loop until the buffer is empty.
do
{
// Obtain a byte from the buffer.
    cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

```

(continues on next page)

(continued from previous page)

```

// Post the byte.
    xQueueSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );

} while( portINPUT_BYTE( BUFFER_COUNT ) );

// Now the buffer is empty we can switch context if necessary.
if( xHigherPriorityTaskWoken )
{
// Actual macro used here is port specific.
    portYIELD_FROM_ISR ();
}
}

```

Parameters

- **xQueue** -- The handle to the queue on which the item is to be posted.
- **pvItemToQueue** -- A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** -- xQueueSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

Returns pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

xQueueReset (xQueue)

Reset a queue back to its original empty state. The return value is now obsolete and is always set to pdPASS.

Type Definitions

```
typedef struct QueueDefinition *QueueHandle_t
```

```
typedef struct QueueDefinition *QueueSetHandle_t
```

Type by which queue sets are referenced. For example, a call to xQueueCreateSet() returns an xQueueSet variable that can then be used as a parameter to xQueueSelectFromSet(), xQueueAddToSet(), etc.

```
typedef struct QueueDefinition *QueueSetMemberHandle_t
```

Queue sets can contain both queues and semaphores, so the QueueSetMemberHandle_t is defined as a type to be used where a parameter or return value can be either an QueueHandle_t or an SemaphoreHandle_t.

Semaphore API**Header File**

- This header file can be included with:

```
#include "freertos/semphr.h"
```

Macros

semBINARY_SEMAPHORE_QUEUE_LENGTH

semSEMAPHORE_QUEUE_ITEM_LENGTH**semGIVE_BLOCK_TIME****vSemaphoreCreateBinary** (xSemaphore)

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! <https://www.FreeRTOS.org/RTOS-task-notifications.html>

This old vSemaphoreCreateBinary() macro is now deprecated in favour of the xSemaphoreCreateBinary() function. Note that binary semaphores created using the vSemaphoreCreateBinary() macro are created in a state such that the first call to 'take' the semaphore would pass, whereas binary semaphores created using xSemaphoreCreateBinary() are created in a state such that the the semaphore must first be 'given' before it can be 'taken'.

Macro that implements a semaphore by using the existing queue mechanism. The queue length is 1 as this is a binary semaphore. The data size is 0 as we don't want to actually store any data - we just want to know if the queue is empty or full.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously 'give' the semaphore while another continuously 'takes' the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see xSemaphoreCreateMutex().

Example usage:

```
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to vSemaphoreCreateBinary ().
    // This is a macro so pass the variable in directly.
    vSemaphoreCreateBinary( xSemaphore );

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

Parameters

- **xSemaphore** -- Handle to the created semaphore. Should be of type SemaphoreHandle_t.

xSemaphoreCreateBinary ()

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! <https://www.FreeRTOS.org/RTOS-task-notifications.html>

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using xSemaphoreCreateBinary() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateBinary() function. (see <https://www.FreeRTOS.org/a00111.html>). If a binary semaphore is created using xSemaphoreCreateBinaryStatic() then the application writer must provide the memory. xSemaphoreCreateBinaryStatic() therefore allows a binary semaphore to be created without using any dynamic memory allocation.

The old vSemaphoreCreateBinary() macro is now deprecated in favour of this xSemaphoreCreateBinary() function. Note that binary semaphores created using the vSemaphoreCreateBinary() macro are created in

a state such that the first call to 'take' the semaphore would pass, whereas binary semaphores created using `xSemaphoreCreateBinary()` are created in a state such that the semaphore must first be 'given' before it can be 'taken'.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously 'give' the semaphore while another continuously 'takes' the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see `xSemaphoreCreateMutex()`.

Example usage:

```
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateBinary().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateBinary();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

Returns Handle to the created semaphore, or NULL if the memory required to hold the semaphore's data structures could not be allocated.

xSemaphoreCreateBinaryStatic (pxStaticSemaphore)

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

NOTE: In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! <https://www.FreeRTOS.org/RTOS-task-notifications.html>

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using `xSemaphoreCreateBinary()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateBinary()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a binary semaphore is created using `xSemaphoreCreateBinaryStatic()` then the application writer must provide the memory. `xSemaphoreCreateBinaryStatic()` therefore allows a binary semaphore to be created without using any dynamic memory allocation.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously 'give' the semaphore while another continuously 'takes' the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see `xSemaphoreCreateMutex()`.

Example usage:

```
SemaphoreHandle_t xSemaphore = NULL;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateBinary().
    // The semaphore's data structures will be placed in the xSemaphoreBuffer
    // variable, the address of which is passed into the function. The
```

(continues on next page)

(continued from previous page)

```

// function's parameter is not NULL, so the function will not attempt any
// dynamic memory allocation, and therefore the function will not return
// return NULL.
xSemaphore = xSemaphoreCreateBinary( &xSemaphoreBuffer );

// Rest of task code goes here.
}

```

Parameters

- **pxStaticSemaphore** -- Must point to a variable of type `StaticSemaphore_t`, which will then be used to hold the semaphore's data structure, removing the need for the memory to be allocated dynamically.

Returns If the semaphore is created then a handle to the created semaphore is returned. If `pxSemaphoreBuffer` is `NULL` then `NULL` is returned.

xSemaphoreTake (`xSemaphore`, `xBlockTime`)

Macro to obtain a semaphore. The semaphore must have previously been created with a call to `xSemaphoreCreateBinary()`, `xSemaphoreCreateMutex()` or `xSemaphoreCreateCounting()`.

Example usage:

```

SemaphoreHandle_t xSemaphore = NULL;

// A task that creates a semaphore.
void vATask( void * pvParameters )
{
    // Create the semaphore to guard a shared resource.
    xSemaphore = xSemaphoreCreateBinary();
}

// A task that uses the semaphore.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.

    if( xSemaphore != NULL )
    {
        // See if we can obtain the semaphore. If the semaphore is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTake( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the semaphore and can now access the
            // shared resource.

            // ...

            // We have finished accessing the shared resource. Release the
            // semaphore.
            xSemaphoreGive( xSemaphore );
        }
        else
        {
            // We could not obtain the semaphore and can therefore not access
            // the shared resource safely.
        }
    }
}

```

Parameters

- **xSemaphore** -- A handle to the semaphore being taken - obtained when the semaphore was created.
- **xBlockTime** -- The time in ticks to wait for the semaphore to become available. The macro `portTICK_PERIOD_MS` can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. A block time of `portMAX_DELAY` can be used to block indefinitely (provided `INCLUDE_vTaskSuspend` is set to 1 in `FreeRTOSConfig.h`).

Returns `pdTRUE` if the semaphore was obtained. `pdFALSE` if `xBlockTime` expired without the semaphore becoming available.

xSemaphoreTakeRecursive (xMutex, xBlockTime)

Macro to recursively obtain, or 'take', a mutex type semaphore. The mutex must have previously been created using a call to `xSemaphoreCreateRecursiveMutex()`;

`configUSE_RECURSIVE_MUTEXES` must be set to 1 in `FreeRTOSConfig.h` for this macro to be available.

This macro must not be used on mutexes created using `xSemaphoreCreateMutex()`.

A mutex used recursively can be 'taken' repeatedly by the owner. The mutex doesn't become available again until the owner has called `xSemaphoreGiveRecursive()` for each successful 'take' request. For example, if a task successfully 'takes' the same mutex 5 times then the mutex will not be available to any other task until it has also 'given' the mutex back exactly five times.

Example usage:

```
SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
    xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.

    if( xMutex != NULL )
    {
        // See if we can obtain the mutex. If the mutex is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTakeRecursive( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the mutex and can now access the
            // shared resource.

            // ...
            // For some reason due to the nature of the code further calls to
            // xSemaphoreTakeRecursive() are made on the same mutex. In real
            // code these would not be just sequential calls as this would make
            // no sense. Instead the calls are likely to be buried inside
            // a more complex call structure.
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

            // The mutex has now been 'taken' three times, so will not be
            // available to another task until it has also been given back
            // three times. Again it is unlikely that real code would have
            // these calls sequentially, but instead buried in a more complex
```

(continues on next page)

(continued from previous page)

```

// call structure. This is just for illustrative purposes.
    xSemaphoreGiveRecursive( xMutex );
    xSemaphoreGiveRecursive( xMutex );
    xSemaphoreGiveRecursive( xMutex );

// Now the mutex can be taken by other tasks.
}
else
{
// We could not obtain the mutex and can therefore not access
// the shared resource safely.
}
}
}

```

Parameters

- **xMutex** -- A handle to the mutex being obtained. This is the handle returned by xSemaphoreCreateRecursiveMutex();
- **xBlockTime** -- The time in ticks to wait for the semaphore to become available. The macro portTICK_PERIOD_MS can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. If the task already owns the semaphore then xSemaphoreTakeRecursive() will return immediately no matter what the value of xBlockTime.

Returns pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without the semaphore becoming available.

xSemaphoreGive (xSemaphore)

Macro to release a semaphore. The semaphore must have previously been created with a call to xSemaphoreCreateBinary(), xSemaphoreCreateMutex() or xSemaphoreCreateCounting(). and obtained using sSemaphoreTake().

This macro must not be used from an ISR. See xSemaphoreGiveFromISR () for an alternative which can be used from an ISR.

This macro must also not be used on semaphores created using xSemaphoreCreateRecursiveMutex().

Example usage:

```

SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
// Create the semaphore to guard a shared resource.
xSemaphore = vSemaphoreCreateBinary();

if( xSemaphore != NULL )
{
if( xSemaphoreGive( xSemaphore ) != pdTRUE )
{
// We would expect this call to fail because we cannot give
// a semaphore without first "taking" it!
}

// Obtain the semaphore - don't block if the semaphore is not
// immediately available.
if( xSemaphoreTake( xSemaphore, ( TickType_t ) 0 ) )
{
// We now have the semaphore and can access the shared resource.

```

(continues on next page)

(continued from previous page)

```

// ...

// We have finished accessing the shared resource so can free the
// semaphore.
if( xSemaphoreGive( xSemaphore ) != pdTRUE )
    {
// We would not expect this call to fail because we must have
// obtained the semaphore to get here.
    }
    }
}
}

```

Parameters

- **xSemaphore** -- A handle to the semaphore being released. This is the handle returned when the semaphore was created.

Returns pdTRUE if the semaphore was released. pdFALSE if an error occurred. Semaphores are implemented using queues. An error can occur if there is no space on the queue to post a message - indicating that the semaphore was not first obtained correctly.

xSemaphoreGiveRecursive (xMutex)

Macro to recursively release, or 'give', a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex();

configUSE_RECURSIVE_MUTEXES must be set to 1 in FreeRTOSConfig.h for this macro to be available.

This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be 'taken' repeatedly by the owner. The mutex doesn't become available again until the owner has called xSemaphoreGiveRecursive() for each successful 'take' request. For example, if a task successfully 'takes' the same mutex 5 times then the mutex will not be available to any other task until it has also 'given' the mutex back exactly five times.

Example usage:

```

SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
// Create the mutex to guard a shared resource.
xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
// ... Do other things.

if( xMutex != NULL )
    {
// See if we can obtain the mutex. If the mutex is not available
// wait 10 ticks to see if it becomes free.
if( xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 ) == pdTRUE )
        {
// We were able to obtain the mutex and can now access the
// shared resource.

```

(continues on next page)

(continued from previous page)

```

// ...
// For some reason due to the nature of the code further calls to
// xSemaphoreTakeRecursive() are made on the same mutex. In real
// code these would not be just sequential calls as this would make
// no sense. Instead the calls are likely to be buried inside
// a more complex call structure.
    xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
    xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

// The mutex has now been 'taken' three times, so will not be
// available to another task until it has also been given back
// three times. Again it is unlikely that real code would have
// these calls sequentially, it would be more likely that the calls
// to xSemaphoreGiveRecursive() would be called as a call stack
// unwound. This is just for demonstrative purposes.
    xSemaphoreGiveRecursive( xMutex );
    xSemaphoreGiveRecursive( xMutex );
    xSemaphoreGiveRecursive( xMutex );

// Now the mutex can be taken by other tasks.
}
else
{
// We could not obtain the mutex and can therefore not access
// the shared resource safely.
}
}
}

```

Parameters

- **xMutex** -- A handle to the mutex being released, or 'given'. This is the handle returned by xSemaphoreCreateMutex();

Returns pdTRUE if the semaphore was given.

xSemaphoreGiveFromISR (xSemaphore, pxHigherPriorityTaskWoken)

Macro to release a semaphore. The semaphore must have previously been created with a call to xSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this macro.

This macro can be used from an ISR.

Example usage:

```

#define LONG_TIME 0xffff
#define TICKS_TO_WAIT 10
SemaphoreHandle_t xSemaphore = NULL;

// Repetitive task.
void vATask( void * pvParameters )
{
    for( ;; )
    {
// We want this task to run every 10 ticks of a timer. The semaphore
// was created before this task was started.

// Block waiting for the semaphore to become available.
if( xSemaphoreTake( xSemaphore, LONG_TIME ) == pdTRUE )

```

(continues on next page)

```

    {
    // It is time to execute.

    // ...

    // We have finished our task. Return to the top of the loop where
    // we will block on the semaphore until it is time to execute
    // again. Note when using the semaphore for synchronisation with an
    // ISR in this manner there is no need to 'give' the semaphore back.
    }
  }
}

// Timer ISR
void vTimerISR( void * pvParameters )
{
  static uint8_t ucLocalTickCount = 0;
  static BaseType_t xHigherPriorityTaskWoken;

  // A timer tick has occurred.

  // ... Do other time functions.

  // Is it time for vATask () to run?
  xHigherPriorityTaskWoken = pdFALSE;
  ucLocalTickCount++;
  if( ucLocalTickCount >= TICKS_TO_WAIT )
  {
    // Unblock the task by releasing the semaphore.
    xSemaphoreGiveFromISR( xSemaphore, &xHigherPriorityTaskWoken );

    // Reset the count so we release the semaphore again in 10 ticks time.
    ucLocalTickCount = 0;
  }

  if( xHigherPriorityTaskWoken != pdFALSE )
  {
    // We can force a context switch here. Context switching from an
    // ISR uses port specific syntax. Check the demo task for your port
    // to find the syntax required.
  }
}

```

Parameters

- **xSemaphore** -- A handle to the semaphore being released. This is the handle returned when the semaphore was created.
- **pxHigherPriorityTaskWoken** -- xSemaphoreGiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if giving the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

Returns pdTRUE if the semaphore was successfully given, otherwise errQUEUE_FULL.

xSemaphoreTakeFromISR (xSemaphore, pxHigherPriorityTaskWoken)

Macro to take a semaphore from an ISR. The semaphore must have previously been created with a call to xSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this macro.

This macro can be used from an ISR, however taking a semaphore from an ISR is not a common operation. It

is likely to only be useful when taking a counting semaphore when an interrupt is obtaining an object from a resource pool (when the semaphore count indicates the number of resources available).

Parameters

- **xSemaphore** -- A handle to the semaphore being taken. This is the handle returned when the semaphore was created.
- **pxHigherPriorityTaskWoken** -- xSemaphoreTakeFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if taking the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreTakeFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

Returns pdTRUE if the semaphore was successfully taken, otherwise pdFALSE

xSemaphoreCreateMutex()

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see <https://www.FreeRTOS.org/a00111.html>). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provide the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task 'taking' a semaphore MUST ALWAYS 'give' the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always 'gives' the semaphore and another always 'takes' the semaphore) and from within interrupt service routines.

Example usage:

```
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

Returns If the mutex was successfully created then a handle to the created semaphore is returned. If there was not enough heap to allocate the mutex data structures then NULL is returned.

xSemaphoreCreateMutexStatic(pxMutexBuffer)

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see <https://www.FreeRTOS.org/a00111.html>).

([//www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a mutex is created using `xSemaphoreCreateMutexStatic()` then the application writer must provide the memory. `xSemaphoreCreateMutexStatic()` therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the `xSemaphoreTake()` and `xSemaphoreGive()` macros. The `xSemaphoreTakeRecursive()` and `xSemaphoreGiveRecursive()` macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task 'taking' a semaphore MUST ALWAYS 'give' the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See `xSemaphoreCreateBinary()` for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always 'gives' the semaphore and another always 'takes' the semaphore) and from within interrupt service routines.

Example usage:

```
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void * pvParameters )
{
    // A mutex cannot be used before it has been created. xMutexBuffer is
    // into xSemaphoreCreateMutexStatic() so no dynamic memory allocation is
    // attempted.
    xSemaphore = xSemaphoreCreateMutexStatic( &xMutexBuffer );

    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
    // so there is no need to check it.
}
```

Parameters

- **pxMutexBuffer** -- Must point to a variable of type `StaticSemaphore_t`, which will be used to hold the mutex's data structure, removing the need for the memory to be allocated dynamically.

Returns If the mutex was successfully created then a handle to the created mutex is returned. If `pxMutexBuffer` was `NULL` then `NULL` is returned.

xSemaphoreCreateRecursiveMutex()

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using `xSemaphoreCreateRecursiveMutex()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateRecursiveMutex()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a recursive mutex is created using `xSemaphoreCreateRecursiveMutexStatic()` then the application writer must provide the memory that will get used by the mutex. `xSemaphoreCreateRecursiveMutexStatic()` therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the `xSemaphoreTakeRecursive()` and `xSemaphoreGiveRecursive()` macros. The `xSemaphoreTake()` and `xSemaphoreGive()` macros must not be used.

A mutex used recursively can be 'taken' repeatedly by the owner. The mutex doesn't become available again until the owner has called `xSemaphoreGiveRecursive()` for each successful 'take' request. For example, if a task successfully 'takes' the same mutex 5 times then the mutex will not be available to any other task until it has also 'given' the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task 'taking' a semaphore MUST ALWAYS 'give' the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See `xSemaphoreCreateBinary()` for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always 'gives' the semaphore and another always 'takes' the semaphore) and from within interrupt service routines.

Example usage:

```
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateRecursiveMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

Returns xSemaphore Handle to the created mutex semaphore. Should be of type `SemaphoreHandle_t`.

xSemaphoreCreateRecursiveMutexStatic (pxStaticSemaphore)

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using `xSemaphoreCreateRecursiveMutex()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateRecursiveMutex()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a recursive mutex is created using `xSemaphoreCreateRecursiveMutexStatic()` then the application writer must provide the memory that will get used by the mutex. `xSemaphoreCreateRecursiveMutexStatic()` therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the `xSemaphoreTakeRecursive()` and `xSemaphoreGiveRecursive()` macros. The `xSemaphoreTake()` and `xSemaphoreGive()` macros must not be used.

A mutex used recursively can be 'taken' repeatedly by the owner. The mutex doesn't become available again until the owner has called `xSemaphoreGiveRecursive()` for each successful 'take' request. For example, if a task successfully 'takes' the same mutex 5 times then the mutex will not be available to any other task until it has also 'given' the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task 'taking' a semaphore **MUST ALWAYS** 'give' the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See `xSemaphoreCreateBinary()` for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always 'gives' the semaphore and another always 'takes' the semaphore) and from within interrupt service routines.

Example usage:

```
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;
```

(continues on next page)

(continued from previous page)

```

void vATask( void * pvParameters )
{
    // A recursive semaphore cannot be used before it is created. Here a
    // recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic().
    // The address of xMutexBuffer is passed into the function, and will hold
    // the mutexes data structures - so no dynamic memory allocation will be
    // attempted.
    xSemaphore = xSemaphoreCreateRecursiveMutexStatic( &xMutexBuffer );

    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
    // so there is no need to check it.
}

```

Parameters

- **pxStaticSemaphore** -- Must point to a variable of type StaticSemaphore_t, which will then be used to hold the recursive mutex's data structure, removing the need for the memory to be allocated dynamically.

Returns If the recursive mutex was successfully created then a handle to the created recursive mutex is returned. If pxStaticSemaphore was NULL then NULL is returned.

xSemaphoreCreateCounting (uxMaxCount, uxInitialCount)

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! <https://www.FreeRTOS.org/RTOS-task-notifications.html>

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using xSemaphoreCreateCounting() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateCounting() function. (see <https://www.FreeRTOS.org/a00111.html>). If a counting semaphore is created using xSemaphoreCreateCountingStatic() then the application writer can instead optionally provide the memory that will get used by the counting semaphore. xSemaphoreCreateCountingStatic() therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will 'give' a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will 'take' a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it 'gives' the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

Example usage:

```

SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{

```

(continues on next page)

(continued from previous page)

```

SemaphoreHandle_t xSemaphore = NULL;

// Semaphore cannot be used before a call to xSemaphoreCreateCounting().
// The max value to which the semaphore can count should be 10, and the
// initial value assigned to the count should be 0.
xSemaphore = xSemaphoreCreateCounting( 10, 0 );

if( xSemaphore != NULL )
{
// The semaphore was created successfully.
// The semaphore can now be used.
}
}

```

Parameters

- **uxMaxCount** -- The maximum count value that can be reached. When the semaphore reaches this value it can no longer be 'given'.
- **uxInitialCount** -- The count value assigned to the semaphore when it is created.

Returns Handle to the created semaphore. Null if the semaphore could not be created.

xSemaphoreCreateCountingStatic (uxMaxCount, uxInitialCount, pxSemaphoreBuffer)

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! <https://www.FreeRTOS.org/RTOS-task-notifications.html>

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using `xSemaphoreCreateCounting()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateCounting()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a counting semaphore is created using `xSemaphoreCreateCountingStatic()` then the application writer must provide the memory. `xSemaphoreCreateCountingStatic()` therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will 'give' a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will 'take' a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it 'gives' the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

Example usage:

```

SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )

```

(continues on next page)

(continued from previous page)

```

{
SemaphoreHandle_t xSemaphore = NULL;

// Counting semaphore cannot be used before they have been created. Create
// a counting semaphore using xSemaphoreCreateCountingStatic(). The max
// value to which the semaphore can count is 10, and the initial value
// assigned to the count will be 0. The address of xSemaphoreBuffer is
// passed in and will be used to hold the semaphore structure, so no dynamic
// memory allocation will be used.
xSemaphore = xSemaphoreCreateCounting( 10, 0, &xSemaphoreBuffer );

// No memory allocation was attempted so xSemaphore cannot be NULL, so there
// is no need to check its value.
}

```

Parameters

- **uxMaxCount** -- The maximum count value that can be reached. When the semaphore reaches this value it can no longer be 'given'.
- **uxInitialCount** -- The count value assigned to the semaphore when it is created.
- **pxSemaphoreBuffer** -- Must point to a variable of type StaticSemaphore_t, which will then be used to hold the semaphore's data structure, removing the need for the memory to be allocated dynamically.

Returns If the counting semaphore was successfully created then a handle to the created counting semaphore is returned. If pxSemaphoreBuffer was NULL then NULL is returned.

vSemaphoreDelete (xSemaphore)

Delete a semaphore. This function must be used with care. For example, do not delete a mutex type semaphore if the mutex is held by a task.

Parameters

- **xSemaphore** -- A handle to the semaphore to be deleted.

xSemaphoreGetMutexHolder (xSemaphore)

If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type semaphore, or the mutex is available (not held by a task), return NULL.

Note: This is a good way of determining if the calling task is the mutex holder, but not a good way of determining the identity of the mutex holder as the holder may change between the function exiting and the returned value being tested.

xSemaphoreGetMutexHolderFromISR (xSemaphore)

If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type semaphore, or the mutex is available (not held by a task), return NULL.

uxSemaphoreGetCount (xSemaphore)

If the semaphore is a counting semaphore then uxSemaphoreGetCount() returns its current count value. If the semaphore is a binary semaphore then uxSemaphoreGetCount() returns 1 if the semaphore is available, and 0 if the semaphore is not available.

uxSemaphoreGetCountFromISR (xSemaphore)

semphr.h

```

UBaseType_t uxSemaphoreGetCountFromISR( SemaphoreHandle_t xSemaphore );

```

If the semaphore is a counting semaphore then uxSemaphoreGetCountFromISR() returns its current count value. If the semaphore is a binary semaphore then uxSemaphoreGetCountFromISR() returns 1 if the semaphore is available, and 0 if the semaphore is not available.

xSemaphoreGetStaticBuffer (xSemaphore, ppxSemaphoreBuffer)

Retrieve pointer to a statically created binary semaphore, counting semaphore, or mutex semaphore's data structure buffer. This is the same buffer that is supplied at the time of creation.

Parameters

- **xSemaphore** -- The semaphore for which to retrieve the buffer.
- **ppxSemaphoreBuffer** -- Used to return a pointer to the semaphore's data structure buffer.

Returns pdTRUE if buffer was retrieved, pdFALSE otherwise.

Type Definitions

typedef *QueueHandle_t* **SemaphoreHandle_t**

Timer API**Header File**

- [components/freertos/FreeRTOS-Kernel/include/freertos/timers.h](#)
- This header file can be included with:

```
#include "freertos/timers.h"
```

Functions

TimerHandle_t **xTimerCreate** (const char *const pcTimerName, const TickType_t xTimerPeriodInTicks, const BaseType_t xAutoReload, void *const pvTimerID, *TimerCallbackFunction_t* pxCallbackFunction)

Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using xTimerCreate() then the required memory is automatically dynamically allocated inside the xTimerCreate() function. (see <https://www.FreeRTOS.org/a00111.html>). If a software timer is created using xTimerCreateStatic() then the application writer must provide the memory that will get used by the software timer. xTimerCreateStatic() therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:

```
* #define NUM_TIMERS 5
*
* // An array to hold handles to the created timers.
* TimerHandle_t xTimers[ NUM_TIMERS ];
*
* // An array to hold a count of the number of times each timer expires.
* int32_t lExpireCounters[ NUM_TIMERS ] = { 0 };
*
* // Define a callback function that will be used by multiple timer instances.
* // The callback function does nothing but count the number of times the
* // associated timer expires, and stop the timer once the timer has expired
* // 10 times.
* void vTimerCallback( TimerHandle_t pxTimer )
```

(continues on next page)

(continued from previous page)

```

* {
* int32_t lArrayIndex;
* const int32_t xMaxExpiryCountBeforeStopping = 10;
*
* // Optionally do something if the pxTimer parameter is NULL.
* configASSERT( pxTimer );
*
* // Which timer expired?
* lArrayIndex = ( int32_t ) pvTimerGetTimerID( pxTimer );
*
* // Increment the number of times that pxTimer has expired.
* lExpireCounters[ lArrayIndex ] += 1;
*
* // If the timer has expired 10 times then stop it from running.
* if( lExpireCounters[ lArrayIndex ] == xMaxExpiryCountBeforeStopping )
* {
*     // Do not use a block time if calling a timer API function from a
*     // timer callback function, as doing so could cause a deadlock!
*     xTimerStop( pxTimer, 0 );
* }
* }
*
* void main( void )
* {
* int32_t x;
*
* // Create then start some timers. Starting the timers before the
↳scheduler
* // has been started means the timers will start running immediately that
* // the scheduler starts.
* for( x = 0; x < NUM_TIMERS; x++ )
* {
*     xTimers[ x ] = xTimerCreate( "Timer", // Just a text
↳name, not used by the kernel.
*                               ( 100 * ( x + 1 ) ), // The timer
↳period in ticks.
*                               pdTRUE, // The timers
↳will auto-reload themselves when they expire.
*                               ( void * ) x, // Assign each
↳timer a unique id equal to its array index.
*                               vTimerCallback // Each timer
↳calls the same callback when it expires.
*                               );
*
*     if( xTimers[ x ] == NULL )
*     {
*         // The timer was not created.
*     }
*     else
*     {
*         // Start the timer. No block time is specified, and even if one
↳was
*         // it would be ignored because the scheduler has not yet been
*         // started.
*         if( xTimerStart( xTimers[ x ], 0 ) != pdPASS )
*         {
*             // The timer could not be set into the Active state.
*         }
*     }
* }
* }

```

(continues on next page)

(continued from previous page)

```

* // ...
* // Create tasks here.
* // ...
*
* // Starting the scheduler will start the timers running as they have
→already
* // been set into the active state.
* vTaskStartScheduler();
*
* // Should not reach here.
* for( ;; );
* }
*

```

Parameters

- **pcTimerName** -- A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.
- **xTimerPeriodInTicks** -- The timer period. The time is defined in tick periods so the constant `portTICK_PERIOD_MS` can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then `xTimerPeriodInTicks` should be set to 100. Alternatively, if the timer must expire after 500ms, then `xPeriod` can be set to $(500 / \text{portTICK_PERIOD_MS})$ provided `configTICK_RATE_HZ` is less than or equal to 1000. Time timer period must be greater than 0.
- **xAutoReload** -- If `xAutoReload` is set to `pdTRUE` then the timer will expire repeatedly with a frequency set by the `xTimerPeriodInTicks` parameter. If `xAutoReload` is set to `pdFALSE` then the timer will be a one-shot timer and enter the dormant state after it expires.
- **pvTimerID** -- An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.
- **pxCallbackFunction** -- The function to call when the timer expires. Callback functions must have the prototype defined by `TimerCallbackFunction_t`, which is "void vCallbackFunction(TimerHandle_t xTimer);".

Returns If the timer is successfully created then a handle to the newly created timer is returned. If the timer cannot be created because there is insufficient FreeRTOS heap remaining to allocate the timer structures then `NULL` is returned.

TimerHandle_t **xTimerCreateStatic** (const char *const pcTimerName, const TickType_t xTimerPeriodInTicks, const BaseType_t xAutoReload, void *const pvTimerID, *TimerCallbackFunction_t* pxCallbackFunction, StaticTimer_t *pxTimerBuffer)

Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using `xTimerCreate()` then the required memory is automatically dynamically allocated inside the `xTimerCreate()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a software timer is created using `xTimerCreateStatic()` then the application writer must provide the memory that will get used by the software timer. `xTimerCreateStatic()` therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The `xTimerStart()`, `xTimerReset()`, `xTimerStartFromISR()`, `xTimerResetFromISR()`, `xTimerChangePeriod()` and `xTimerChangePeriodFromISR()` API functions can all be used to transition a timer into the active state.

Example usage:

```

*
* // The buffer used to hold the software timer's data structure.
* static StaticTimer_t xTimerBuffer;
*
* // A variable that will be incremented by the software timer's callback
* // function.
* UBaseType_t uxVariableToIncrement = 0;
*
* // A software timer callback function that increments a variable passed to
* // it when the software timer was created. After the 5th increment the
* // callback function stops the software timer.
* static void prvTimerCallback( TimerHandle_t xExpiredTimer )
* {
*     UBaseType_t *puxVariableToIncrement;
*     BaseType_t xReturned;
*
*     // Obtain the address of the variable to increment from the timer ID.
*     puxVariableToIncrement = ( UBaseType_t * ) pvTimerGetTimerID(
*     ↪xExpiredTimer );
*
*     // Increment the variable to show the timer callback has executed.
*     ( *puxVariableToIncrement )++;
*
*     // If this callback has executed the required number of times, stop the
*     // timer.
*     if( *puxVariableToIncrement == 5 )
*     {
*         // This is called from a timer callback so must not block.
*         xTimerStop( xExpiredTimer, staticDONT_BLOCK );
*     }
* }
*
* void main( void )
* {
*     // Create the software time. xTimerCreateStatic() has an extra parameter
*     // than the normal xTimerCreate() API function. The parameter is a
*     ↪pointer
*     // to the StaticTimer_t structure that will hold the software timer
*     // structure. If the parameter is passed as NULL then the structure
*     ↪will be
*     // allocated dynamically, just as if xTimerCreate() had been called.
*     xTimer = xTimerCreateStatic( "T1", // Text name for the task.
*     ↪ Helps debugging only. Not used by FreeRTOS.
*     xTimerPeriod, // The period of the
*     ↪timer in ticks.
*     pdTRUE, // This is an auto-reload
*     ↪timer.
*     ( void * ) &uxVariableToIncrement, // A
*     ↪variable incremented by the software timer's callback function
*     prvTimerCallback, // The function to
*     ↪execute when the timer expires.
*     &xTimerBuffer ); // The buffer that will
*     ↪hold the software timer structure.
*
*     // The scheduler has not started yet so a block time is not used.
*     xReturned = xTimerStart( xTimer, 0 );
*
*     // ...
*     // Create tasks here.
*     // ...
*
* }

```

(continues on next page)

(continued from previous page)

```

* // Starting the scheduler will start the timers running as they have
↳ already
* // been set into the active state.
* vTaskStartScheduler();
*
* // Should not reach here.
* for( ;; );
* }
*

```

Parameters

- **pcTimerName** -- A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.
- **xTimerPeriodInTicks** -- The timer period. The time is defined in tick periods so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000. The timer period must be greater than 0.
- **xAutoReload** -- If xAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the xTimerPeriodInTicks parameter. If xAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.
- **pvTimerID** -- An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.
- **pxCallbackFunction** -- The function to call when the timer expires. Callback functions must have the prototype defined by TimerCallbackFunction_t, which is "void vCallbackFunction(TimerHandle_t xTimer);".
- **pxTimerBuffer** -- Must point to a variable of type StaticTimer_t, which will be then be used to hold the software timer's data structures, removing the need for the memory to be allocated dynamically.

Returns If the timer is created then a handle to the created timer is returned. If pxTimerBuffer was NULL then NULL is returned.

void ***pvTimerGetTimerID**(const *TimerHandle_t* xTimer)

Returns the ID assigned to the timer.

IDs are assigned to timers using the pvTimerID parameter of the call to xTimerCreated() that was used to create the timer, and by calling the vTimerSetTimerID() API function.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

See the xTimerCreate() API function example usage scenario.

Parameters **xTimer** -- The timer being queried.

Returns The ID assigned to the timer being queried.

void **vTimerSetTimerID**(*TimerHandle_t* xTimer, void *pvNewID)

Sets the ID assigned to the timer.

IDs are assigned to timers using the pvTimerID parameter of the call to xTimerCreated() that was used to create the timer.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

See the `xTimerCreate()` API function example usage scenario.

Parameters

- **xTimer** -- The timer being updated.
- **pvNewID** -- The ID to assign to the timer.

BaseType_t **xTimerIsTimerActive** (*TimerHandle_t* xTimer)

Queries a timer to see if it is active or dormant.

A timer will be dormant if: 1) It has been created but not started, or 2) It is an expired one-shot timer that has not been restarted.

Timers are created in the dormant state. The `xTimerStart()`, `xTimerReset()`, `xTimerStartFromISR()`, `xTimerResetFromISR()`, `xTimerChangePeriod()` and `xTimerChangePeriodFromISR()` API functions can all be used to transition a timer into the active state.

Example usage:

```
* // This function assumes xTimer has already been created.
* void vAFunction( TimerHandle_t xTimer )
* {
*     if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and
*     equivalently "if( xTimerIsTimerActive( xTimer ) )"
*     {
*         // xTimer is active, do something.
*     }
*     else
*     {
*         // xTimer is not active, do something else.
*     }
* }
*
```

Parameters **xTimer** -- The timer being queried.

Returns `pdFALSE` will be returned if the timer is dormant. A value other than `pdFALSE` will be returned if the timer is active.

TaskHandle_t **xTimerGetTimerDaemonTaskHandle** (void)

Simply returns the handle of the timer service/daemon task. It is not valid to call `xTimerGetTimerDaemonTaskHandle()` before the scheduler has been started.

BaseType_t **xTimerPendFunctionCallFromISR** (*PendedFunction_t* xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, BaseType_t *pxHigherPriorityTaskWoken)

Used from application interrupt service routines to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in `timers.c` and is prefixed with 'Timer').

Ideally an interrupt service routine (ISR) is kept as short as possible, but sometimes an ISR either has a lot of processing to do, or needs to perform processing that is not deterministic. In these cases `xTimerPendFunctionCallFromISR()` can be used to defer processing of a function to the RTOS daemon task.

A mechanism is provided that allows the interrupt to return directly to the task that will subsequently execute the pended callback function. This allows the callback function to execute contiguously in time with the interrupt - just as if the callback had executed in the interrupt itself.

Example usage:

```

*
* // The callback function that will execute in the context of the daemon_
* ↪task.
* // Note callback functions must all use this same prototype.
* void vProcessInterface( void *pvParameter1, uint32_t ulParameter2 )
* {
*     BaseType_t xInterfaceToService;
*
*     // The interface that requires servicing is passed in the second
*     // parameter. The first parameter is not used in this case.
*     xInterfaceToService = ( BaseType_t ) ulParameter2;
*
*     // ...Perform the processing here...
* }
*
* // An ISR that receives data packets from multiple interfaces
* void vAnISR( void )
* {
*     BaseType_t xInterfaceToService, xHigherPriorityTaskWoken;
*
*     // Query the hardware to determine which interface needs processing.
*     xInterfaceToService = prvCheckInterfaces();
*
*     // The actual processing is to be deferred to a task. Request the
*     // vProcessInterface() callback function is executed, passing in the
*     // number of the interface that needs processing. The interface to
*     // service is passed in the second parameter. The first parameter is
*     // not used in this case.
*     xHigherPriorityTaskWoken = pdFALSE;
*     xTimerPendFunctionCallFromISR( vProcessInterface, NULL, ( uint32_t ) ↪
*     ↪xInterfaceToService, &xHigherPriorityTaskWoken );
*
*     // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
*     // switch should be requested. The macro used is port specific and will
*     // be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() - refer to
*     // the documentation page for the port being used.
*     portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
* }
*

```

Parameters

- **xFunctionToPend** -- The function to execute from the timer service/ daemon task. The function must conform to the PendedFunction_t prototype.
- **pvParameter1** -- The value of the callback function's first parameter. The parameter has a void * type to allow it to be used to pass any type. For example, unsigned longs can be cast to a void *, or the void * can be used to point to a structure.
- **ulParameter2** -- The value of the callback function's second parameter.
- **pxHigherPriorityTaskWoken** -- As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task (which is set using configTIMER_TASK_PRIORITY in FreeRTOSConfig.h) is higher than the priority of the currently running task (the task the interrupt interrupted) then *pxHigherPriorityTaskWoken will be set to pdTRUE within xTimerPendFunctionCallFromISR(), indicating that a context switch should be requested before the interrupt exits. For that reason *pxHigherPriorityTaskWoken must be initialised to pdFALSE. See the example code below.

Returns pdPASS is returned if the message was successfully sent to the timer daemon task, otherwise pdFALSE is returned.

BaseType_t **xTimerPendFunctionCall** (*PendedFunction_t* xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, TickType_t xTicksToWait)

Used to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in timers.c and is prefixed with 'Timer').

Parameters

- **xFunctionToPend** -- The function to execute from the timer service/ daemon task. The function must conform to the PendedFunction_t prototype.
- **pvParameter1** -- The value of the callback function's first parameter. The parameter has a void * type to allow it to be used to pass any type. For example, unsigned longs can be cast to a void *, or the void * can be used to point to a structure.
- **ulParameter2** -- The value of the callback function's second parameter.
- **xTicksToWait** -- Calling this function will result in a message being sent to the timer daemon task on a queue. xTicksToWait is the amount of time the calling task should remain in the Blocked state (so not using any processing time) for space to become available on the timer queue if the queue is found to be full.

Returns pdPASS is returned if the message was successfully sent to the timer daemon task, otherwise pdFALSE is returned.

const char ***pcTimerGetName** (*TimerHandle_t* xTimer)

Returns the name that was assigned to a timer when the timer was created.

Parameters **xTimer** -- The handle of the timer being queried.

Returns The name assigned to the timer specified by the xTimer parameter.

void **vTimerSetReloadMode** (*TimerHandle_t* xTimer, const BaseType_t xAutoReload)

Updates a timer to be either an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

Parameters

- **xTimer** -- The handle of the timer being updated.
- **xAutoReload** -- If xAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the timer's period (see the xTimerPeriodInTicks parameter of the xTimerCreate() API function). If xAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.

BaseType_t **xTimerGetReloadMode** (*TimerHandle_t* xTimer)

Queries a timer to determine if it is an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

Parameters **xTimer** -- The handle of the timer being queried.

Returns If the timer is an auto-reload timer then pdTRUE is returned, otherwise pdFALSE is returned.

UBaseType_t **uxTimerGetReloadMode** (*TimerHandle_t* xTimer)

Queries a timer to determine if it is an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

Parameters **xTimer** -- The handle of the timer being queried.

Returns If the timer is an auto-reload timer then pdTRUE is returned, otherwise pdFALSE is returned.

TickType_t **xTimerGetPeriod** (*TimerHandle_t* xTimer)

Returns the period of a timer.

Parameters **xTimer** -- The handle of the timer being queried.

Returns The period of the timer in ticks.

TickType_t **xTimerGetExpiryTime** (*TimerHandle_t* xTimer)

Returns the time in ticks at which the timer will expire. If this is less than the current tick count then the expiry time has overflowed from the current time.

Parameters **xTimer** -- The handle of the timer being queried.

Returns If the timer is running then the time in ticks at which the timer will next expire is returned. If the timer is not running then the return value is undefined.

BaseType_t **xTimerGetStaticBuffer** (*TimerHandle_t* xTimer, StaticTimer_t **ppxTimerBuffer)

Retrieve pointer to a statically created timer's data structure buffer. This is the same buffer that is supplied at the time of creation.

Parameters

- **xTimer** -- The timer for which to retrieve the buffer.
- **ppxTimerBuffer** -- Used to return a pointer to the timers's data structure buffer.

Returns pdTRUE if the buffer was retrieved, pdFALSE otherwise.

void **vApplicationGetTimerTaskMemory** (StaticTask_t **ppxTimerTaskTCBBuffer, StackType_t **ppxTimerTaskStackBuffer, uint32_t *pulTimerTaskStackSize)

This function is used to provide a statically allocated block of memory to FreeRTOS to hold the Timer Task TCB. This function is required when configSUPPORT_STATIC_ALLOCATION is set. For more information see this URI: https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION

Parameters

- **ppxTimerTaskTCBBuffer** -- A handle to a statically allocated TCB buffer
- **ppxTimerTaskStackBuffer** -- A handle to a statically allocated Stack buffer for the idle task
- **pulTimerTaskStackSize** -- A pointer to the number of elements that will fit in the allocated stack buffer

Macros

xTimerStart (xTimer, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerStart() starts a timer that was previously created using the xTimerCreate() API function. If the timer had already been started and was already in the active state, then xTimerStart() has equivalent functionality to the xTimerReset() API function.

Starting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called 'n' ticks after xTimerStart() was called, where 'n' is the timers defined period.

It is valid to call xTimerStart() before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when xTimerStart() was called.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerStart() to be available.

Example usage:

See the xTimerCreate() API function example usage scenario.

Parameters

- **xTimer** -- The handle of the timer being started/restarted.
- **xTicksToWait** -- Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the start command to be successfully sent to the timer command queue, should the queue already be full when xTimerStart() was called. xTicksToWait is ignored if xTimerStart() is called before the scheduler is started.

Returns pdFAIL will be returned if the start command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed

will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when `xTimerStart()` is actually called. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

xTimerStop (xTimer, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the `configTIMER_QUEUE_LENGTH` configuration constant.

`xTimerStop()` stops a timer that was previously started using either of the `The xTimerStart()`, `xTimerReset()`, `xTimerStartFromISR()`, `xTimerResetFromISR()`, `xTimerChangePeriod()` or `xTimerChangePeriodFromISR()` API functions.

Stopping a timer ensures the timer is not in the active state.

The `configUSE_TIMERS` configuration constant must be set to 1 for `xTimerStop()` to be available.

Example usage:

See the `xTimerCreate()` API function example usage scenario.

Parameters

- **xTimer** -- The handle of the timer being stopped.
- **xTicksToWait** -- Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the stop command to be successfully sent to the timer command queue, should the queue already be full when `xTimerStop()` was called. `xTicksToWait` is ignored if `xTimerStop()` is called before the scheduler is started.

Returns `pdFAIL` will be returned if the stop command could not be sent to the timer command queue even after `xTicksToWait` ticks had passed. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

xTimerChangePeriod (xTimer, xNewPeriod, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the `configTIMER_QUEUE_LENGTH` configuration constant.

`xTimerChangePeriod()` changes the period of a timer that was previously created using the `xTimerCreate()` API function.

`xTimerChangePeriod()` can be called to change the period of an active or dormant state timer.

The `configUSE_TIMERS` configuration constant must be set to 1 for `xTimerChangePeriod()` to be available.

Example usage:

```
* // This function assumes xTimer has already been created. If the timer
* // referenced by xTimer is already active when it is called, then the timer
* // is deleted. If the timer referenced by xTimer is not active when it is
* // called, then the period of the timer is set to 500ms and the timer is
* // started.
* void vAFunction( TimerHandle_t xTimer )
* {
*     if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and_
*     →equivalently "if( xTimerIsTimerActive( xTimer ) )"
*     {
```

(continues on next page)

(continued from previous page)

```

*      // xTimer is already active - delete it.
*      xTimerDelete( xTimer );
*  }
*  else
*  {
*      // xTimer is not active, change its period to 500ms. This will also
*      // cause the timer to start. Block for a maximum of 100 ticks if the
*      // change period command cannot immediately be sent to the timer
*      // command queue.
*      if( xTimerChangePeriod( xTimer, 500 / portTICK_PERIOD_MS, 100 ) ==_
↪pdPASS )
*      {
*          // The command was successfully sent.
*      }
*      else
*      {
*          // The command could not be sent, even after waiting for 100_
↪ticks
*          // to pass. Take appropriate action here.
*      }
*  }
* }
*

```

Parameters

- **xTimer** -- The handle of the timer that is having its period changed.
- **xNewPeriod** -- The new period for xTimer. Timer periods are specified in tick periods, so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xNewPeriod should be set to 100. Alternatively, if the timer must expire after 500ms, then xNewPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000.
- **xTicksToWait** -- Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the change period command to be successfully sent to the timer command queue, should the queue already be full when xTimerChangePeriod() was called. xTicksToWait is ignored if xTimerChangePeriod() is called before the scheduler is started.

Returns pdFAIL will be returned if the change period command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

xTimerDelete (xTimer, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerDelete() deletes a timer that was previously created using the xTimerCreate() API function.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerDelete() to be available.

Example usage:

See the xTimerChangePeriod() API function example usage scenario.

Parameters

- **xTimer** -- The handle of the timer being deleted.
- **xTicksToWait** -- Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the delete command to be successfully sent to the timer command queue, should the queue already be full when xTimerDelete() was called. xTicksToWait is ignored if xTimerDelete() is called before the scheduler is started.

Returns pdFAIL will be returned if the delete command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

xTimerReset (xTimer, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerReset() re-starts a timer that was previously created using the xTimerCreate() API function. If the timer had already been started and was already in the active state, then xTimerReset() will cause the timer to re-evaluate its expiry time so that it is relative to when xTimerReset() was called. If the timer was in the dormant state then xTimerReset() has equivalent functionality to the xTimerStart() API function.

Resetting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called 'n' ticks after xTimerReset() was called, where 'n' is the timers defined period.

It is valid to call xTimerReset() before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when xTimerReset() was called.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerReset() to be available.

Example usage:

```
* // When a key is pressed, an LCD back-light is switched on. If 5 seconds
↳pass
* // without a key being pressed, then the LCD back-light is switched off. In
* // this case, the timer is a one-shot timer.
*
* TimerHandle_t xBacklightTimer = NULL;
*
* // The callback function assigned to the one-shot timer. In this case the
* // parameter is not used.
* void vBacklightTimerCallback( TimerHandle_t pxTimer )
* {
*     // The timer expired, therefore 5 seconds must have passed since a key
*     // was pressed. Switch off the LCD back-light.
*     vSetBacklightState( BACKLIGHT_OFF );
* }
*
* // The key press event handler.
* void vKeyPressEventHandler( char cKey )
* {
*     // Ensure the LCD back-light is on, then reset the timer that is
*     // responsible for turning the back-light off after 5 seconds of
*     // key inactivity. Wait 10 ticks for the command to be successfully sent
*     // if it cannot be sent immediately.
*     vSetBacklightState( BACKLIGHT_ON );
*     if( xTimerReset( xBacklightTimer, 100 ) != pdPASS )
*     {
```

(continues on next page)

(continued from previous page)

```

*         // The reset command was not executed successfully. Take appropriate
*         // action here.
*     }
*
*     // Perform the rest of the key processing here.
* }
*
* void main( void )
* {
*     int32_t x;
*
*     // Create then start the one-shot timer that is responsible for turning
*     // the back-light off if no keys are pressed within a 5 second period.
*     xBacklightTimer = xTimerCreate( "BacklightTimer",           // Just a
↳text name, not used by the kernel.
*
↳timer period in ticks.
*                                     ( 5000 / portTICK_PERIOD_MS), // The
↳is a one-shot timer.
*                                     pdFALSE,                       // The timer
↳not used by the callback so can take any value.
*                                     0,                             // The id is
↳callback function that switches the LCD back-light off.
*                                     vBacklightTimerCallback       // The
*                                     );
*
*     if( xBacklightTimer == NULL )
*     {
*         // The timer was not created.
*     }
*     else
*     {
*         // Start the timer. No block time is specified, and even if one was
*         // it would be ignored because the scheduler has not yet been
*         // started.
*         if( xTimerStart( xBacklightTimer, 0 ) != pdPASS )
*         {
*             // The timer could not be set into the Active state.
*         }
*     }
*
*     // ...
*     // Create tasks here.
*     // ...
*
*     // Starting the scheduler will start the timer running as it has already
*     // been set into the active state.
*     vTaskStartScheduler();
*
*     // Should not reach here.
*     for( ;; );
* }
*

```

Parameters

- **xTimer** -- The handle of the timer being reset/started/restarted.
- **xTicksToWait** -- Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the reset command to be successfully sent to the timer command queue, should the queue already be full when xTimerReset() was called. xTicksToWait is ignored if xTimerReset() is called before the scheduler is started.

Returns pdFAIL will be returned if the reset command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command

was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when `xTimerStart()` is actually called. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

xTimerStartFromISR (xTimer, pxHigherPriorityTaskWoken)

A version of `xTimerStart()` that can be called from an interrupt service routine.

Example usage:

```
* // This scenario assumes xBacklightTimer has already been created. When a
* // key is pressed, an LCD back-light is switched on. If 5 seconds pass
* // without a key being pressed, then the LCD back-light is switched off. In
* // this case, the timer is a one-shot timer, and unlike the example given for
* // the xTimerReset() function, the key press event handler is an interrupt
* // service routine.
*
* // The callback function assigned to the one-shot timer. In this case the
* // parameter is not used.
* void vBacklightTimerCallback( TimerHandle_t pxTimer )
* {
*     // The timer expired, therefore 5 seconds must have passed since a key
*     // was pressed. Switch off the LCD back-light.
*     vSetBacklightState( BACKLIGHT_OFF );
* }
*
* // The key press interrupt service routine.
* void vKeyPressEventInterruptHandler( void )
* {
*     BaseType_t xHigherPriorityTaskWoken = pdFALSE;
*
*     // Ensure the LCD back-light is on, then restart the timer that is
*     // responsible for turning the back-light off after 5 seconds of
*     // key inactivity. This is an interrupt service routine so can only
*     // call FreeRTOS API functions that end in "FromISR".
*     vSetBacklightState( BACKLIGHT_ON );
*
*     // xTimerStartFromISR() or xTimerResetFromISR() could be called here
*     // as both cause the timer to re-calculate its expiry time.
*     // xHigherPriorityTaskWoken was initialised to pdFALSE when it was
*     // declared (in this function).
*     if( xTimerStartFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) !=
↳pdPASS )
*     {
*         // The start command was not executed successfully. Take appropriate
*         // action here.
*     }
*
*     // Perform the rest of the key processing here.
*
*     // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
*     // should be performed. The syntax required to perform a context switch
*     // from inside an ISR varies from port to port, and from compiler to
*     // compiler. Inspect the demos for the port you are using to find the
*     // actual syntax required.
*     if( xHigherPriorityTaskWoken != pdFALSE )
*     {
*         // Call the interrupt safe yield function here (actual function
*         // depends on the FreeRTOS port being used).

```

(continues on next page)

```
* }
* }
*
```

Parameters

- **xTimer** -- The handle of the timer being started/restarted.
- **pxHigherPriorityTaskWoken** -- The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerStartFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerStartFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/ daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerStartFromISR() function. If xTimerStartFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

Returns pdFAIL will be returned if the start command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStartFromISR() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

xTimerStopFromISR (xTimer, pxHigherPriorityTaskWoken)

A version of xTimerStop() that can be called from an interrupt service routine.

Example usage:

```
* // This scenario assumes xTimer has already been created and started. When
* // an interrupt occurs, the timer should be simply stopped.
*
* // The interrupt service routine that stops the timer.
* void vAnExampleInterruptServiceRoutine( void )
* {
* BaseType_t xHigherPriorityTaskWoken = pdFALSE;
*
* // The interrupt has occurred - simply stop the timer.
* // xHigherPriorityTaskWoken was set to pdFALSE where it was defined
* // (within this function). As this is an interrupt service routine, only
* // FreeRTOS API functions that end in "FromISR" can be used.
* if( xTimerStopFromISR( xTimer, &xHigherPriorityTaskWoken ) != pdPASS )
* {
* // The stop command was not executed successfully. Take appropriate
* // action here.
* }
*
* // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
* // should be performed. The syntax required to perform a context switch
* // from inside an ISR varies from port to port, and from compiler to
* // compiler. Inspect the demos for the port you are using to find the
* // actual syntax required.
* if( xHigherPriorityTaskWoken != pdFALSE )
* {
* // Call the interrupt safe yield function here (actual function
* // depends on the FreeRTOS port being used).
* }
* }
*
```

Parameters

- **xTimer** -- The handle of the timer being stopped.
- **pxHigherPriorityTaskWoken** -- The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerStopFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerStopFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/ daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerStopFromISR() function. If xTimerStopFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

Returns pdFAIL will be returned if the stop command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

xTimerChangePeriodFromISR (xTimer, xNewPeriod, pxHigherPriorityTaskWoken)

A version of xTimerChangePeriod() that can be called from an interrupt service routine.

Example usage:

```
* // This scenario assumes xTimer has already been created and started. When
* // an interrupt occurs, the period of xTimer should be changed to 500ms.
*
* // The interrupt service routine that changes the period of xTimer.
* void vAnExampleInterruptServiceRoutine( void )
* {
* BaseType_t xHigherPriorityTaskWoken = pdFALSE;
*
* // The interrupt has occurred - change the period of xTimer to 500ms.
* // xHigherPriorityTaskWoken was set to pdFALSE where it was defined
* // (within this function). As this is an interrupt service routine, only
* // FreeRTOS API functions that end in "FromISR" can be used.
* if( xTimerChangePeriodFromISR( xTimer, &xHigherPriorityTaskWoken ) !=
↳pdPASS )
* {
* // The command to change the timers period was not executed
* // successfully. Take appropriate action here.
* }
*
* // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
* // should be performed. The syntax required to perform a context switch
* // from inside an ISR varies from port to port, and from compiler to
* // compiler. Inspect the demos for the port you are using to find the
* // actual syntax required.
* if( xHigherPriorityTaskWoken != pdFALSE )
* {
* // Call the interrupt safe yield function here (actual function
* // depends on the FreeRTOS port being used).
* }
* }
*
```

Parameters

- **xTimer** -- The handle of the timer that is having its period changed.
- **xNewPeriod** -- The new period for xTimer. Timer periods are specified in tick periods, so the constant portTICK_PERIOD_MS can be used to convert a time that has been spec-

ified in milliseconds. For example, if the timer must expire after 100 ticks, then `xNewPeriod` should be set to 100. Alternatively, if the timer must expire after 500ms, then `xNewPeriod` can be set to $(500 / \text{portTICK_PERIOD_MS})$ provided `configTICK_RATE_HZ` is less than or equal to 1000.

- **pxHigherPriorityTaskWoken** -- The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling `xTimerChangePeriodFromISR()` writes a message to the timer command queue, so has the potential to transition the timer service/ daemon task out of the Blocked state. If calling `xTimerChangePeriodFromISR()` causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then `*pxHigherPriorityTaskWoken` will get set to `pdTRUE` internally within the `xTimerChangePeriodFromISR()` function. If `xTimerChangePeriodFromISR()` sets this value to `pdTRUE` then a context switch should be performed before the interrupt exits.

Returns `pdFAIL` will be returned if the command to change the timers period could not be sent to the timer command queue. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

xTimerResetFromISR (xTimer, pxHigherPriorityTaskWoken)

A version of `xTimerReset()` that can be called from an interrupt service routine.

Example usage:

```
* // This scenario assumes xBacklightTimer has already been created. When a
* // key is pressed, an LCD back-light is switched on. If 5 seconds pass
* // without a key being pressed, then the LCD back-light is switched off. In
* // this case, the timer is a one-shot timer, and unlike the example given for
* // the xTimerReset() function, the key press event handler is an interrupt
* // service routine.
*
* // The callback function assigned to the one-shot timer. In this case the
* // parameter is not used.
* void vBacklightTimerCallback( TimerHandle_t pxTimer )
* {
*     // The timer expired, therefore 5 seconds must have passed since a key
*     // was pressed. Switch off the LCD back-light.
*     vSetBacklightState( BACKLIGHT_OFF );
* }
*
* // The key press interrupt service routine.
* void vKeyPressEventInterruptHandler( void )
* {
*     BaseType_t xHigherPriorityTaskWoken = pdFALSE;
*
*     // Ensure the LCD back-light is on, then reset the timer that is
*     // responsible for turning the back-light off after 5 seconds of
*     // key inactivity. This is an interrupt service routine so can only
*     // call FreeRTOS API functions that end in "FromISR".
*     vSetBacklightState( BACKLIGHT_ON );
*
*     // xTimerStartFromISR() or xTimerResetFromISR() could be called here
*     // as both cause the timer to re-calculate its expiry time.
*     // xHigherPriorityTaskWoken was initialised to pdFALSE when it was
*     // declared (in this function).
*     if( xTimerResetFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) !=
↳pdPASS )
```

(continues on next page)

(continued from previous page)

```

*   {
*       // The reset command was not executed successfully. Take appropriate
*       // action here.
*   }
*
*   // Perform the rest of the key processing here.
*
*   // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
*   // should be performed. The syntax required to perform a context switch
*   // from inside an ISR varies from port to port, and from compiler to
*   // compiler. Inspect the demos for the port you are using to find the
*   // actual syntax required.
*   if( xHigherPriorityTaskWoken != pdFALSE )
*   {
*       // Call the interrupt safe yield function here (actual function
*       // depends on the FreeRTOS port being used).
*   }
* }
*

```

Parameters

- **xTimer** -- The handle of the timer that is to be started, reset, or restarted.
- **pxHigherPriorityTaskWoken** -- The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerResetFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerResetFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/ daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerResetFromISR() function. If xTimerResetFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

Returns pdFAIL will be returned if the reset command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerResetFromISR() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

Type Definitions

```
typedef struct tmrTimerControl *TimerHandle_t
```

```
typedef void (*TimerCallbackFunction_t)(TimerHandle_t xTimer)
```

Defines the prototype to which timer callback functions must conform.

```
typedef void (*PendedFunction_t)(void*, uint32_t)
```

Defines the prototype to which functions used with the xTimerPendFunctionCallFromISR() function must conform.

Event Group API

Header File

- [components/freertos/FreeRTOS-Kernel/include/freertos/event_groups.h](#)
- This header file can be included with:

```
#include "freertos/event_groups.h"
```

Functions

EventGroupHandle_t **xEventGroupCreate** (void)

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group's structure is stored. If an event groups is created using `xEventGroupCreate()` then the required memory is automatically dynamically allocated inside the `xEventGroupCreate()` function. (see <https://www.FreeRTOS.org/a00111.html>). If an event group is created using `xEventGroupCreateStatic()` then the application writer must instead provide the memory that will get used by the event group. `xEventGroupCreateStatic()` therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the `configUSE_16_BIT_TICKS` setting in `FreeRTOSConfig.h`. If `configUSE_16_BIT_TICKS` is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If `configUSE_16_BIT_TICKS` is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The `EventBits_t` type is used to store event bits within an event group.

Example usage:

```
// Declare a variable to hold the created event group.
EventGroupHandle_t xCreatedEventGroup;

// Attempt to create the event group.
xCreatedEventGroup = xEventGroupCreate();

// Was the event group created successfully?
if( xCreatedEventGroup == NULL )
{
    // The event group was not created because there was insufficient
    // FreeRTOS heap available.
}
else
{
    // The event group was created.
}
```

Returns If the event group was created then a handle to the event group is returned. If there was insufficient FreeRTOS heap available to create the event group then NULL is returned. See <https://www.FreeRTOS.org/a00111.html>

EventGroupHandle_t **xEventGroupCreateStatic** (StaticEventGroup_t *pxEventGroupBuffer)

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group's structure is stored. If an event groups is created using `xEventGroupCreate()` then the required memory is automatically dynamically allocated inside the `xEventGroupCreate()` function. (see <https://www.FreeRTOS.org/a00111.html>). If an event group is created using `xEventGroupCreateStatic()` then the application writer must instead provide the memory that will get used by the event group. `xEventGroupCreateStatic()` therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the `configUSE_16_BIT_TICKS` setting in `FreeRTOSConfig.h`. If `configUSE_16_BIT_TICKS` is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If `configUSE_16_BIT_TICKS` is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The `EventBits_t` type is used to store event bits within an event group.

Example usage:

```
// StaticEventGroup_t is a publicly accessible structure that has the same
// size and alignment requirements as the real event group structure. It is
// provided as a mechanism for applications to know the size of the event
// group (which is dependent on the architecture and configuration file
// settings) without breaking the strict data hiding policy by exposing the
// real event group internals. This StaticEventGroup_t variable is passed
// into the xSemaphoreCreateEventGroupStatic() function and is used to store
// the event group's data structures
StaticEventGroup_t xEventGroupBuffer;

// Create the event group without dynamically allocating any memory.
xEventGroup = xEventGroupCreateStatic( &xEventGroupBuffer );
```

Parameters **pxEventGroupBuffer** -- pxEventGroupBuffer must point to a variable of type StaticEventGroup_t, which will be then be used to hold the event group's data structures, removing the need for the memory to be allocated dynamically.

Returns If the event group was created then a handle to the event group is returned. If pxEventGroupBuffer was NULL then NULL is returned.

EventBits_t xEventGroupWaitBits (*EventGroupHandle_t* xEventGroup, const *EventBits_t* uxBitsToWaitFor, const *BaseType_t* xClearOnExit, const *BaseType_t* xWaitForAllBits, *TickType_t* xTicksToWait)

[Potentially] block to wait for one or more bits to be set within a previously created event group.

This function cannot be called from an interrupt.

Example usage:

```
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
EventBits_t uxBits;
const TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

// Wait a maximum of 100ms for either bit 0 or bit 4 to be set within
// the event group. Clear the bits before exiting.
uxBits = xEventGroupWaitBits(
    xEventGroup,    // The event group being tested.
    BIT_0 | BIT_4, // The bits within the event group to wait
    pdTRUE,        // BIT_0 and BIT_4 should be cleared before
    pdFALSE,       // Don't wait for both bits, either bit will
    xTicksToWait ); // Wait a maximum of 100ms for either bit to

if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
{
// xEventGroupWaitBits() returned because both bits were set.
}
else if( ( uxBits & BIT_0 ) != 0 )
{
// xEventGroupWaitBits() returned because just BIT_0 was set.
}
else if( ( uxBits & BIT_4 ) != 0 )
```

(continues on next page)

(continued from previous page)

```

    {
    // xEventGroupWaitBits() returned because just BIT_4 was set.
    }
else
    {
    // xEventGroupWaitBits() returned because xTicksToWait ticks passed
    // without either BIT_0 or BIT_4 becoming set.
    }
}

```

Parameters

- **xEventGroup** -- The event group in which the bits are being tested. The event group must have previously been created using a call to `xEventGroupCreate()`.
- **uxBitsToWaitFor** -- A bitwise value that indicates the bit or bits to test inside the event group. For example, to wait for bit 0 and/or bit 2 set `uxBitsToWaitFor` to `0x05`. To wait for bits 0 and/or bit 1 and/or bit 2 set `uxBitsToWaitFor` to `0x07`. Etc.
- **xClearOnExit** -- If `xClearOnExit` is set to `pdTRUE` then any bits within `uxBitsToWaitFor` that are set within the event group will be cleared before `xEventGroupWaitBits()` returns if the wait condition was met (if the function returns for a reason other than a timeout). If `xClearOnExit` is set to `pdFALSE` then the bits set in the event group are not altered when the call to `xEventGroupWaitBits()` returns.
- **xWaitForAllBits** -- If `xWaitForAllBits` is set to `pdTRUE` then `xEventGroupWaitBits()` will return when either all the bits in `uxBitsToWaitFor` are set or the specified block time expires. If `xWaitForAllBits` is set to `pdFALSE` then `xEventGroupWaitBits()` will return when any one of the bits set in `uxBitsToWaitFor` is set or the specified block time expires. The block time is specified by the `xTicksToWait` parameter.
- **xTicksToWait** -- The maximum amount of time (specified in 'ticks') to wait for one/all (depending on the `xWaitForAllBits` value) of the bits specified by `uxBitsToWaitFor` to become set. A value of `portMAX_DELAY` can be used to block indefinitely (provided `INCLUDE_vTaskSuspend` is set to 1 in `FreeRTOSConfig.h`).

Returns The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If `xEventGroupWaitBits()` returned because its timeout expired then not all the bits being waited for will be set. If `xEventGroupWaitBits()` returned because the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared in the case that `xClearOnExit` parameter was set to `pdTRUE`.

EventBits_t xEventGroupClearBits (*EventGroupHandle_t* xEventGroup, const *EventBits_t* uxBitsToClear)

Clear bits within an event group. This function cannot be called from an interrupt.

Example usage:

```

#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
EventBits_t uxBits;

// Clear bit 0 and bit 4 in xEventGroup.
    uxBits = xEventGroupClearBits(
                xEventGroup,    // The event group being updated.
                BIT_0 | BIT_4 ); // The bits being cleared.

if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {

```

(continues on next page)

(continued from previous page)

```

// Both bit 0 and bit 4 were set before xEventGroupClearBits() was
// called. Both will now be clear (not set).
}
else if( ( uxBits & BIT_0 ) != 0 )
{
// Bit 0 was set before xEventGroupClearBits() was called. It will
// now be clear.
}
else if( ( uxBits & BIT_4 ) != 0 )
{
// Bit 4 was set before xEventGroupClearBits() was called. It will
// now be clear.
}
else
{
// Neither bit 0 nor bit 4 were set in the first place.
}
}

```

Parameters

- **xEventGroup** -- The event group in which the bits are to be cleared.
- **uxBitsToClear** -- A bitwise value that indicates the bit or bits to clear in the event group. For example, to clear bit 3 only, set uxBitsToClear to 0x08. To clear bit 3 and bit 0 set uxBitsToClear to 0x09.

Returns The value of the event group before the specified bits were cleared.

EventBits_t xEventGroupSetBits (*EventGroupHandle_t* xEventGroup, const *EventBits_t* uxBitsToSet)

Set bits within an event group. This function cannot be called from an interrupt. xEventGroupSetBits-FromISR() is a version that can be called from an interrupt.

Setting bits in an event group will automatically unblock tasks that are blocked waiting for the bits.

Example usage:

```

#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
EventBits_t uxBits;

// Set bit 0 and bit 4 in xEventGroup.
uxBits = xEventGroupSetBits(
    xEventGroup, // The event group being updated.
    BIT_0 | BIT_4 ); // The bits being set.

if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
{
// Both bit 0 and bit 4 remained set when the function returned.
}
else if( ( uxBits & BIT_0 ) != 0 )
{
// Bit 0 remained set when the function returned, but bit 4 was
// cleared. It might be that bit 4 was cleared automatically as a
// task that was waiting for bit 4 was removed from the Blocked
// state.
}
else if( ( uxBits & BIT_4 ) != 0 )
{

```

(continues on next page)

(continued from previous page)

```

// Bit 4 remained set when the function returned, but bit 0 was
// cleared. It might be that bit 0 was cleared automatically as a
// task that was waiting for bit 0 was removed from the Blocked
// state.
    }
else
{
// Neither bit 0 nor bit 4 remained set. It might be that a task
// was waiting for both of the bits to be set, and the bits were
// cleared as the task left the Blocked state.
    }
}

```

Parameters

- **xEventGroup** -- The event group in which the bits are to be set.
- **uxBitsToSet** -- A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set uxBitsToSet to 0x08. To set bit 3 and bit 0 set uxBitsToSet to 0x09.

Returns The value of the event group at the time the call to xEventGroupSetBits() returns. There are two reasons why the returned value might have the bits specified by the uxBitsToSet parameter cleared. First, if setting a bit results in a task that was waiting for the bit leaving the blocked state then it is possible the bit will be cleared automatically (see the xClearBitOnExit parameter of xEventGroupWaitBits()). Second, any unblocked (or otherwise Ready state) task that has a priority above that of the task that called xEventGroupSetBits() will execute and may change the event group value before the call to xEventGroupSetBits() returns.

EventBits_t xEventGroupSync (*EventGroupHandle_t* xEventGroup, const *EventBits_t* uxBitsToSet, const *EventBits_t* uxBitsToWaitFor, *TickType_t* xTicksToWait)

Atomically set bits within an event group, then wait for a combination of bits to be set within the same event group. This functionality is typically used to synchronise multiple tasks, where each task has to wait for the other tasks to reach a synchronisation point before proceeding.

This function cannot be used from an interrupt.

The function will return before its block time expires if the bits specified by the uxBitsToWait parameter are set, or become set within that time. In this case all the bits specified by uxBitsToWait will be automatically cleared before the function returns.

Example usage:

```

// Bits used by the three tasks.
#define TASK_0_BIT    ( 1 << 0 )
#define TASK_1_BIT    ( 1 << 1 )
#define TASK_2_BIT    ( 1 << 2 )

#define ALL_SYNC_BITS ( TASK_0_BIT | TASK_1_BIT | TASK_2_BIT )

// Use an event group to synchronise three tasks. It is assumed this event
// group has already been created elsewhere.
EventGroupHandle_t xEventBits;

void vTask0( void *pvParameters )
{
EventBits_t uxReturn;
TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

for( ;; )
{
// Perform task functionality here.

```

(continues on next page)

```

// Set bit 0 in the event flag to note this task has reached the
// sync point. The other two tasks will set the other two bits defined
// by ALL_SYNC_BITS. All three tasks have reached the synchronisation
// point when all the ALL_SYNC_BITS are set. Wait a maximum of 100ms
// for this to happen.
    uxReturn = xEventGroupSync( xEventBits, TASK_0_BIT, ALL_SYNC_BITS,
↳xTicksToWait );

if( ( uxReturn & ALL_SYNC_BITS ) == ALL_SYNC_BITS )
    {
// All three tasks reached the synchronisation point before the call
// to xEventGroupSync() timed out.
        }
    }
}

void vTask1( void *pvParameters )
{
for( ;; )
    {
// Perform task functionality here.

// Set bit 1 in the event flag to note this task has reached the
// synchronisation point. The other two tasks will set the other two
// bits defined by ALL_SYNC_BITS. All three tasks have reached the
// synchronisation point when all the ALL_SYNC_BITS are set. Wait
// indefinitely for this to happen.
        xEventGroupSync( xEventBits, TASK_1_BIT, ALL_SYNC_BITS, portMAX_DELAY );

// xEventGroupSync() was called with an indefinite block time, so
// this task will only reach here if the synchronisation was made by all
// three tasks, so there is no need to test the return value.
    }
}

void vTask2( void *pvParameters )
{
for( ;; )
    {
// Perform task functionality here.

// Set bit 2 in the event flag to note this task has reached the
// synchronisation point. The other two tasks will set the other two
// bits defined by ALL_SYNC_BITS. All three tasks have reached the
// synchronisation point when all the ALL_SYNC_BITS are set. Wait
// indefinitely for this to happen.
        xEventGroupSync( xEventBits, TASK_2_BIT, ALL_SYNC_BITS, portMAX_DELAY );

// xEventGroupSync() was called with an indefinite block time, so
// this task will only reach here if the synchronisation was made by all
// three tasks, so there is no need to test the return value.
    }
}
}

```

Parameters

- **xEventGroup** -- The event group in which the bits are being tested. The event group must have previously been created using a call to `xEventGroupCreate()`.
- **uxBitsToSet** -- The bits to set in the event group before determining if, and possibly waiting for, all the bits specified by the `uxBitsToWait` parameter are set.
- **uxBitsToWaitFor** -- A bitwise value that indicates the bit or bits to test inside the

event group. For example, to wait for bit 0 and bit 2 set `uxBitsToWaitFor` to `0x05`. To wait for bits 0 and bit 1 and bit 2 set `uxBitsToWaitFor` to `0x07`. Etc.

- **`xTicksToWait`** -- The maximum amount of time (specified in 'ticks') to wait for all of the bits specified by `uxBitsToWaitFor` to become set.

Returns The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If `xEventGroupSync()` returned because its timeout expired then not all the bits being waited for will be set. If `xEventGroupSync()` returned because all the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared.

EventBits_t **`xEventGroupGetBitsFromISR`** (*EventGroupHandle_t* `xEventGroup`)

A version of `xEventGroupGetBits()` that can be called from an ISR.

Parameters **`xEventGroup`** -- The event group being queried.

Returns The event group bits at the time `xEventGroupGetBitsFromISR()` was called.

void **`vEventGroupDelete`** (*EventGroupHandle_t* `xEventGroup`)

Delete an event group that was previously created by a call to `xEventGroupCreate()`. Tasks that are blocked on the event group will be unblocked and obtain 0 as the event group's value.

Parameters **`xEventGroup`** -- The event group being deleted.

BaseType_t **`xEventGroupGetStaticBuffer`** (*EventGroupHandle_t* `xEventGroup`, StaticEventGroup_t **`**ppxEventGroupBuffer`**)

Retrieve a pointer to a statically created event groups's data structure buffer. It is the same buffer that is supplied at the time of creation.

Parameters

- **`xEventGroup`** -- The event group for which to retrieve the buffer.
- **`ppxEventGroupBuffer`** -- Used to return a pointer to the event groups's data structure buffer.

Returns `pdTRUE` if the buffer was retrieved, `pdFALSE` otherwise.

Macros

`xEventGroupClearBitsFromISR` (`xEventGroup`, `uxBitsToClear`)

A version of `xEventGroupClearBits()` that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed while interrupts are disabled, so protects event groups that are accessed from tasks by suspending the scheduler rather than disabling interrupts. As a result event groups cannot be accessed directly from an interrupt service routine. Therefore `xEventGroupClearBitsFromISR()` sends a message to the timer task to have the clear operation performed in the context of the timer task.

Example usage:

```
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

// An event group which it is assumed has already been created by a call to
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
    // Clear bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupClearBitsFromISR(
        xEventGroup,          // The event group being updated.
        BIT_0 | BIT_4 );    // The bits being set.
```

(continues on next page)

(continued from previous page)

```

if( xResult == pdPASS )
    {
    // The message was posted successfully.
        portYIELD_FROM_ISR(pdTRUE);
    }
}

```

Note: If this function returns pdPASS then the timer task is ready to run and a portYIELD_FROM_ISR(pdTRUE) should be executed to perform the needed clear on the event group. This behavior is different from xEventGroupSetBitsFromISR because the parameter xHigherPriorityTaskWoken is not present.

Parameters

- **xEventGroup** -- The event group in which the bits are to be cleared.
- **uxBitsToClear** -- A bitwise value that indicates the bit or bits to clear. For example, to clear bit 3 only, set uxBitsToClear to 0x08. To clear bit 3 and bit 0 set uxBitsToClear to 0x09.

Returns If the request to execute the function was posted successfully then pdPASS is returned, otherwise pdFALSE is returned. pdFALSE will be returned if the timer service queue was full.

xEventGroupSetBitsFromISR (xEventGroup, uxBitsToSet, pxHigherPriorityTaskWoken)

A version of xEventGroupSetBits() that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed in interrupts or from critical sections. Therefore xEventGroupSetBitsFromISR() sends a message to the timer task to have the set operation performed in the context of the timer task - where a scheduler lock is used in place of a critical section.

Example usage:

```

#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

// An event group which it is assumed has already been created by a call to
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
    BaseType_t xHigherPriorityTaskWoken, xResult;

    // xHigherPriorityTaskWoken must be initialised to pdFALSE.
    xHigherPriorityTaskWoken = pdFALSE;

    // Set bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupSetBitsFromISR(
        xEventGroup,    // The event group being updated.
        BIT_0 | BIT_4  // The bits being set.
        &xHigherPriorityTaskWoken );

    // Was the message posted successfully?
    if( xResult == pdPASS )
    {
    // If xHigherPriorityTaskWoken is now set to pdTRUE then a context

```

(continues on next page)

(continued from previous page)

```

// switch should be requested. The macro used is port specific and
// will be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() -
// refer to the documentation page for the port being used.
    portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
}

```

Parameters

- **xEventGroup** -- The event group in which the bits are to be set.
- **uxBitsToSet** -- A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set uxBitsToSet to 0x08. To set bit 3 and bit 0 set uxBitsToSet to 0x09.
- **pxHigherPriorityTaskWoken** -- As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task is higher than the priority of the currently running task (the task the interrupt interrupted) then *pxHigherPriorityTaskWoken will be set to pdTRUE by xEventGroupSetBitsFromISR(), indicating that a context switch should be requested before the interrupt exits. For that reason *pxHigherPriorityTaskWoken must be initialised to pdFALSE. See the example code below.

Returns If the request to execute the function was posted successfully then pdPASS is returned, otherwise pdFALSE is returned. pdFALSE will be returned if the timer service queue was full.

xEventGroupGetBits (xEventGroup)

Returns the current value of the bits in an event group. This function cannot be used from an interrupt.

Parameters

- **xEventGroup** -- The event group being queried.

Returns The event group bits at the time xEventGroupGetBits() was called.

Type Definitions

```
typedef struct EventGroupDef_t *EventGroupHandle_t
```

```
typedef TickType_t EventBits_t
```

Stream Buffer API**Header File**

- [components/freertos/FreeRTOS-Kernel/include/freertos/stream_buffer.h](#)
- This header file can be included with:

```
#include "freertos/stream_buffer.h"
```

Functions

BaseType_t **xStreamBufferGetStaticBuffers** (*StreamBufferHandle_t* xStreamBuffer, uint8_t **ppucStreamBufferStorageArea, StaticStreamBuffer_t **ppxStaticStreamBuffer)

Retrieve pointers to a statically created stream buffer's data structure buffer and storage area buffer. These are the same buffers that are supplied at the time of creation.

Parameters

- **xStreamBuffer** -- The stream buffer for which to retrieve the buffers.
- **ppucStreamBufferStorageArea** -- Used to return a pointer to the stream buffer's storage area buffer.

- **ppxStaticStreamBuffer** -- Used to return a pointer to the stream buffer's data structure buffer.

Returns pdTRUE if buffers were retrieved, pdFALSE otherwise.

size_t **xStreamBufferSend** (*StreamBufferHandle_t* xStreamBuffer, const void *pvTxData, size_t xDataLengthBytes, TickType_t xTicksToWait)

Sends bytes to a stream buffer. The bytes are copied into the stream buffer.

NOTE: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferSend() to write to a stream buffer from a task. Use xStreamBufferSendFromISR() to write to a stream buffer from an interrupt service routine (ISR).

Example use:

```
void vAFunction( StreamBufferHandle_t xStreamBuffer )
{
    size_t xBytesSent;
    uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
    char *pcStringToSend = "String to send";
    const TickType_t x100ms = pdMS_TO_TICKS( 100 );

    // Send an array to the stream buffer, blocking for a maximum of 100ms to
    // wait for enough space to be available in the stream buffer.
    xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) ucArrayToSend,
    ↪ sizeof( ucArrayToSend ), x100ms );

    if( xBytesSent != sizeof( ucArrayToSend ) )
    {
        // The call to xStreamBufferSend() times out before there was enough
        // space in the buffer for the data to be written, but it did
        // successfully write xBytesSent bytes.
    }

    // Send the string to the stream buffer. Return immediately if there is not
    // enough space in the buffer.
    xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) pcStringToSend,
    ↪ strlen( pcStringToSend ), 0 );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // The entire string could not be added to the stream buffer because
        // there was not enough free space in the buffer, but xBytesSent bytes
        // were sent. Could try again to send the remaining bytes.
    }
}
```

Parameters

- **xStreamBuffer** -- The handle of the stream buffer to which a stream is being sent.
- **pvTxData** -- A pointer to the buffer that holds the bytes to be copied into the stream buffer.
- **xDataLengthBytes** -- The maximum number of bytes to copy from pvTxData into the stream buffer.

- **xTicksToWait** -- The maximum amount of time the task should remain in the Blocked state to wait for enough space to become available in the stream buffer, should the stream buffer contain too little space to hold the another xDataLengthBytes bytes. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to port-MAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. If a task times out before it can write all xDataLengthBytes into the buffer it will still write as many bytes as possible. A task does not use any CPU time when it is in the blocked state.

Returns The number of bytes written to the stream buffer. If a task times out before it can write all xDataLengthBytes into the buffer it will still write as many bytes as possible.

size_t **xStreamBufferSendFromISR** (*StreamBufferHandle_t* xStreamBuffer, const void *pvTxData, size_t xDataLengthBytes, BaseType_t *const pxHigherPriorityTaskWoken)

Interrupt safe version of the API function that sends a stream of bytes to the stream buffer.

NOTE: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferSend() to write to a stream buffer from a task. Use xStreamBufferSendFromISR() to write to a stream buffer from an interrupt service routine (ISR).

Example use:

```
// A stream buffer that has already been created.
StreamBufferHandle_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
    size_t xBytesSent;
    char *pcStringToSend = "String to send";
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Attempt to send the string to the stream buffer.
    xBytesSent = xStreamBufferSendFromISR( xStreamBuffer,
                                           ( void * ) pcStringToSend,
                                           strlen( pcStringToSend ),
                                           &xHigherPriorityTaskWoken );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // There was not enough free space in the stream buffer for the entire
        // string to be written, ut xBytesSent bytes were written.
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xStreamBufferSendFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
```

(continues on next page)

(continued from previous page)

```
// variables value, and perform the context switch if necessary. Check the
// documentation for the port in use for port specific instructions.
portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

Parameters

- **xStreamBuffer** -- The handle of the stream buffer to which a stream is being sent.
- **pvTxData** -- A pointer to the data that is to be copied into the stream buffer.
- **xDataLengthBytes** -- The maximum number of bytes to copy from pvTxData into the stream buffer.
- **pxHigherPriorityTaskWoken** -- It is possible that a stream buffer will have a task blocked on it waiting for data. Calling xStreamBufferSendFromISR() can make data available, and so cause a task that was waiting for data to leave the Blocked state. If calling xStreamBufferSendFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xStreamBufferSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xStreamBufferSendFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. This will ensure that the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the example code below for an example.

Returns The number of bytes actually written to the stream buffer, which will be less than xDataLengthBytes if the stream buffer didn't have enough free space for all the bytes to be written.

size_t **xStreamBufferReceive** (*StreamBufferHandle_t* xStreamBuffer, void *pvRxData, size_t xBufferLengthBytes, TickType_t xTicksToWait)

Receives bytes from a stream buffer.

NOTE: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferReceive() to read from a stream buffer from a task. Use xStreamBufferReceiveFromISR() to read from a stream buffer from an interrupt service routine (ISR).

Example use:

```
void vAFunction( StreamBuffer_t xStreamBuffer )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    const TickType_t xBlockTime = pdMS_TO_TICKS( 20 );

    // Receive up to another sizeof( ucRxData ) bytes from the stream buffer.
    // Wait in the Blocked state (so not using any CPU processing time) for a
    // maximum of 100ms for the full sizeof( ucRxData ) number of bytes to be
    // available.
    xReceivedBytes = xStreamBufferReceive( xStreamBuffer,
                                          ( void * ) ucRxData,
    sizeof( ucRxData ),
                                          xBlockTime );
}
```

(continues on next page)

(continued from previous page)

```

if( xReceivedBytes > 0 )
{
// A ucRxData contains another xReceivedBytes bytes of data, which can
// be processed here....
}
}

```

Parameters

- **xStreamBuffer** -- The handle of the stream buffer from which bytes are to be received.
- **pvRxData** -- A pointer to the buffer into which the received bytes will be copied.
- **xBufferLengthBytes** -- The length of the buffer pointed to by the pvRxData parameter. This sets the maximum number of bytes to receive in one call. xStreamBufferReceive will return as many bytes as possible up to a maximum set by xBufferLengthBytes.
- **xTicksToWait** -- The maximum amount of time the task should remain in the Blocked state to wait for data to become available if the stream buffer is empty. xStreamBufferReceive() will return immediately if xTicksToWait is zero. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. A task does not use any CPU time when it is in the Blocked state.

Returns The number of bytes actually read from the stream buffer, which will be less than xBufferLengthBytes if the call to xStreamBufferReceive() timed out before xBufferLengthBytes were available.

size_t **xStreamBufferReceiveFromISR** (*StreamBufferHandle_t* xStreamBuffer, void *pvRxData, size_t xBufferLengthBytes, BaseType_t *const pxHigherPriorityTaskWoken)

An interrupt safe version of the API function that receives bytes from a stream buffer.

Use xStreamBufferReceive() to read bytes from a stream buffer from a task. Use xStreamBufferReceiveFromISR() to read bytes from a stream buffer from an interrupt service routine (ISR).

Example use:

```

// A stream buffer that has already been created.
StreamBuffer_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
uint8_t ucRxData[ 20 ];
size_t xReceivedBytes;
BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

// Receive the next stream from the stream buffer.
xReceivedBytes = xStreamBufferReceiveFromISR( xStreamBuffer,
( void * ) ucRxData,
sizeof( ucRxData ),
&xHigherPriorityTaskWoken );

if( xReceivedBytes > 0 )
{
// ucRxData contains xReceivedBytes read from the stream buffer.
// Process the stream here....
}
}

```

(continues on next page)

(continued from previous page)

```

// If xHigherPriorityTaskWoken was set to pdTRUE inside
// xStreamBufferReceiveFromISR() then a task that has a priority above the
// priority of the currently executing task was unblocked and a context
// switch should be performed to ensure the ISR returns to the unblocked
// task. In most FreeRTOS ports this is done by simply passing
// xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
// variables value, and perform the context switch if necessary. Check the
// documentation for the port in use for port specific instructions.
portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}

```

Parameters

- **xStreamBuffer** -- The handle of the stream buffer from which a stream is being received.
- **pvRxData** -- A pointer to the buffer into which the received bytes are copied.
- **xBufferLengthBytes** -- The length of the buffer pointed to by the pvRxData parameter. This sets the maximum number of bytes to receive in one call. xStreamBufferReceive will return as many bytes as possible up to a maximum set by xBufferLengthBytes.
- **pxHigherPriorityTaskWoken** -- It is possible that a stream buffer will have a task blocked on it waiting for space to become available. Calling xStreamBufferReceiveFromISR() can make space available, and so cause a task that is waiting for space to leave the Blocked state. If calling xStreamBufferReceiveFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xStreamBufferReceiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xStreamBufferReceiveFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. That will ensure the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

Returns The number of bytes read from the stream buffer, if any.

void **vStreamBufferDelete** (*StreamBufferHandle_t* xStreamBuffer)

Deletes a stream buffer that was previously created using a call to xStreamBufferCreate() or xStreamBufferCreateStatic(). If the stream buffer was created using dynamic memory (that is, by xStreamBufferCreate()), then the allocated memory is freed.

A stream buffer handle must not be used after the stream buffer has been deleted.

Parameters **xStreamBuffer** -- The handle of the stream buffer to be deleted.

BaseType_t **xStreamBufferIsFull** (*StreamBufferHandle_t* xStreamBuffer)

Queries a stream buffer to see if it is full. A stream buffer is full if it does not have any free space, and therefore cannot accept any more data.

Parameters **xStreamBuffer** -- The handle of the stream buffer being queried.

Returns If the stream buffer is full then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t **xStreamBufferIsEmpty** (*StreamBufferHandle_t* xStreamBuffer)

Queries a stream buffer to see if it is empty. A stream buffer is empty if it does not contain any data.

Parameters **xStreamBuffer** -- The handle of the stream buffer being queried.

Returns If the stream buffer is empty then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t **xStreamBufferReset** (*StreamBufferHandle_t* xStreamBuffer)

Resets a stream buffer to its initial, empty, state. Any data that was in the stream buffer is discarded. A stream buffer can only be reset if there are no tasks blocked waiting to either send to or receive from the stream buffer.

Parameters **xStreamBuffer** -- The handle of the stream buffer being reset.

Returns If the stream buffer is reset then pdPASS is returned. If there was a task blocked waiting to send to or read from the stream buffer then the stream buffer is not reset and pdFAIL is returned.

size_t **xStreamBufferSpacesAvailable** (*StreamBufferHandle_t* xStreamBuffer)

Queries a stream buffer to see how much free space it contains, which is equal to the amount of data that can be sent to the stream buffer before it is full.

Parameters **xStreamBuffer** -- The handle of the stream buffer being queried.

Returns The number of bytes that can be written to the stream buffer before the stream buffer would be full.

size_t **xStreamBufferBytesAvailable** (*StreamBufferHandle_t* xStreamBuffer)

Queries a stream buffer to see how much data it contains, which is equal to the number of bytes that can be read from the stream buffer before the stream buffer would be empty.

Parameters **xStreamBuffer** -- The handle of the stream buffer being queried.

Returns The number of bytes that can be read from the stream buffer before the stream buffer would be empty.

BaseType_t **xStreamBufferSetTriggerLevel** (*StreamBufferHandle_t* xStreamBuffer, size_t xTriggerLevel)

A stream buffer's trigger level is the number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task's block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task's block time expires. If a reading task's block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.

A trigger level is set when the stream buffer is created, and can be modified using xStreamBufferSetTriggerLevel().

Parameters

- **xStreamBuffer** -- The handle of the stream buffer being updated.
- **xTriggerLevel** -- The new trigger level for the stream buffer.

Returns If xTriggerLevel was less than or equal to the stream buffer's length then the trigger level will be updated and pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t **xStreamBufferSendCompletedFromISR** (*StreamBufferHandle_t* xStreamBuffer, BaseType_t *pxHigherPriorityTaskWoken)

For advanced users only.

The sbSEND_COMPLETED() macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbSEND_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xStreamBufferSendCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbSEND_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

Parameters

- **xStreamBuffer** -- The handle of the stream buffer to which data was written.
- **pxHigherPriorityTaskWoken** -- *pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xStreamBufferSendCompletedFromISR(). If calling xStreamBufferSendCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

Returns If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t **xStreamBufferReceiveCompletedFromISR** (*StreamBufferHandle_t* xStreamBuffer, BaseType_t *pxHigherPriorityTaskWoken)

For advanced users only.

The sbRECEIVE_COMPLETED() macro is called from within the FreeRTOS APIs when data is read out of a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbRECEIVE_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xStreamBufferReceiveCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbRECEIVE_COMPLETED(), and **MUST NOT BE USED AT ANY OTHER TIME**.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

Parameters

- **xStreamBuffer** -- The handle of the stream buffer from which data was read.
- **pxHigherPriorityTaskWoken** -- *pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xStreamBufferReceiveCompletedFromISR(). If calling xStreamBufferReceiveCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

Returns If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

Macros

xStreamBufferCreateWithCallback (xBufferSizeBytes, xTriggerLevelBytes, pxSendCompletedCallback, pxReceiveCompletedCallback)

Creates a new stream buffer using dynamically allocated memory. See xStreamBufferCreateStatic() for a version that uses statically allocated memory (memory that is allocated at compile time).

configSUPPORT_DYNAMIC_ALLOCATION must be set to 1 or left undefined in FreeRTOSConfig.h for xStreamBufferCreate() to be available.

Example use:

```
void vAFunction( void )
{
StreamBufferHandle_t xStreamBuffer;
const size_t xStreamBufferSizeBytes = 100, xTriggerLevel = 10;

// Create a stream buffer that can hold 100 bytes. The memory used to hold
// both the stream buffer structure and the data in the stream buffer is
// allocated dynamically.
xStreamBuffer = xStreamBufferCreate( xStreamBufferSizeBytes, xTriggerLevel );

if( xStreamBuffer == NULL )
{
// There was not enough heap memory space available to create the
// stream buffer.
}
else
{
// The stream buffer was created successfully and can now be used.
}
}
```

Parameters

- **xBufferSizeBytes** -- The total number of bytes the stream buffer will be able to hold at any one time.
- **xTriggerLevelBytes** -- The number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task's block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task's block time expires. If a reading task's block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.
- **pxSendCompletedCallback** -- Callback invoked when number of bytes at least equal to trigger level is sent to the stream buffer. If the parameter is NULL, it will use the default implementation provided by sbSEND_COMPLETED macro. To enable the callback, configUSE_SB_COMPLETED_CALLBACK must be set to 1 in FreeRTOSConfig.h.
- **pxReceiveCompletedCallback** -- Callback invoked when more than zero bytes are read from a stream buffer. If the parameter is NULL, it will use the default implementation provided by sbRECEIVE_COMPLETED macro. To enable the callback, configUSE_SB_COMPLETED_CALLBACK must be set to 1 in FreeRTOSConfig.h.

Returns If NULL is returned, then the stream buffer cannot be created because there is insufficient heap memory available for FreeRTOS to allocate the stream buffer data structures and storage area. A non-NULL value being returned indicates that the stream buffer has been created successfully - the returned value should be stored as the handle to the created stream buffer.

xStreamBufferCreateStaticWithCallback (xBufferSizeBytes, xTriggerLevelBytes, pucStreamBufferStorageArea, pxStaticStreamBuffer, pxSendCompletedCallback, pxReceiveCompletedCallback)

Creates a new stream buffer using statically allocated memory. See xStreamBufferCreate() for a version that uses dynamically allocated memory.

configSUPPORT_STATIC_ALLOCATION must be set to 1 in FreeRTOSConfig.h for xStreamBufferCreateStatic() to be available.

Example use:

```
// Used to dimension the array used to hold the streams. The available space
// will actually be one less than this, so 999.
#define STORAGE_SIZE_BYTES 1000

// Defines the memory that will actually hold the streams within the stream
// buffer.
static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];

// The variable used to hold the stream buffer structure.
StaticStreamBuffer_t xStreamBufferStruct;

void MyFunction( void )
{
    StreamBufferHandle_t xStreamBuffer;
    const size_t xTriggerLevel = 1;

    xStreamBuffer = xStreamBufferCreateStatic( sizeof( ucStorageBuffer ),
                                              xTriggerLevel,
                                              ucStorageBuffer,
                                              &xStreamBufferStruct );
}
```

(continues on next page)

(continued from previous page)

```

// As neither the pucStreamBufferStorageArea or pxStaticStreamBuffer
// parameters were NULL, xStreamBuffer will not be NULL, and can be used to
// reference the created stream buffer in other stream buffer API calls.

// Other code that uses the stream buffer can go here.
}

```

Parameters

- **xBufferSizeBytes** -- The size, in bytes, of the buffer pointed to by the pucStreamBufferStorageArea parameter.
- **xTriggerLevelBytes** -- The number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task's block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task's block time expires. If a reading task's block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.
- **pucStreamBufferStorageArea** -- Must point to a uint8_t array that is at least xBufferSizeBytes big. This is the array to which streams are copied when they are written to the stream buffer.
- **pxStaticStreamBuffer** -- Must point to a variable of type StaticStreamBuffer_t, which will be used to hold the stream buffer's data structure.
- **pxSendCompletedCallback** -- Callback invoked when number of bytes at least equal to trigger level is sent to the stream buffer. If the parameter is NULL, it will use the default implementation provided by sbSEND_COMPLETED macro. To enable the callback, configUSE_SB_COMPLETED_CALLBACK must be set to 1 in FreeRTOSConfig.h.
- **pxReceiveCompletedCallback** -- Callback invoked when more than zero bytes are read from a stream buffer. If the parameter is NULL, it will use the default implementation provided by sbRECEIVE_COMPLETED macro. To enable the callback, configUSE_SB_COMPLETED_CALLBACK must be set to 1 in FreeRTOSConfig.h.

Returns If the stream buffer is created successfully then a handle to the created stream buffer is returned. If either pucStreamBufferStorageArea or pxStaticstreamBuffer are NULL then NULL is returned.

Type Definitions

```
typedef struct StreamBufferDef_t *StreamBufferHandle_t
```

```
typedef void (*StreamBufferCallbackFunction_t)(StreamBufferHandle_t xStreamBuffer, BaseType_t xIsInsideISR, BaseType_t *const pxHigherPriorityTaskWoken)
```

Type used as a stream buffer's optional callback.

Message Buffer API**Header File**

- `components/freertos/FreeRTOS-Kernel/include/freertos/message_buffer.h`
- This header file can be included with:

```
#include "freertos/message_buffer.h"
```

Macros

xMessageBufferCreateWithCallback (xBufferSizeBytes, pxSendCompletedCallback, pxReceiveCompletedCallback)

Creates a new message buffer using dynamically allocated memory. See xMessageBufferCreateStatic() for a version that uses statically allocated memory (memory that is allocated at compile time).

configSUPPORT_DYNAMIC_ALLOCATION must be set to 1 or left undefined in FreeRTOSConfig.h for xMessageBufferCreate() to be available.

Example use:

```
void vAFunction( void )
{
    MessageBufferHandle_t xMessageBuffer;
    const size_t xMessageBufferSizeBytes = 100;

    // Create a message buffer that can hold 100 bytes. The memory used to hold
    // both the message buffer structure and the messages themselves is allocated
    // dynamically. Each message added to the buffer consumes an additional 4
    // bytes which are used to hold the length of the message.
    xMessageBuffer = xMessageBufferCreate( xMessageBufferSizeBytes );

    if( xMessageBuffer == NULL )
    {
        // There was not enough heap memory space available to create the
        // message buffer.
    }
    else
    {
        // The message buffer was created successfully and can now be used.
    }
}
```

Parameters

- **xBufferSizeBytes** -- The total number of bytes (not messages) the message buffer will be able to hold at any one time. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message's length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architectures a 10 byte message will take up 14 bytes of message buffer space.
- **pxSendCompletedCallback** -- Callback invoked when a send operation to the message buffer is complete. If the parameter is NULL or xMessageBufferCreate() is called without the parameter, then it will use the default implementation provided by sbSEND_COMPLETED macro. To enable the callback, configUSE_SB_COMPLETED_CALLBACK must be set to 1 in FreeRTOSConfig.h.
- **pxReceiveCompletedCallback** -- Callback invoked when a receive operation from the message buffer is complete. If the parameter is NULL or xMessageBufferCreate() is called without the parameter, it will use the default implementation provided by sbRECEIVE_COMPLETED macro. To enable the callback, configUSE_SB_COMPLETED_CALLBACK must be set to 1 in FreeRTOSConfig.h.

Returns If NULL is returned, then the message buffer cannot be created because there is insufficient heap memory available for FreeRTOS to allocate the message buffer data structures and storage area. A non-NULL value being returned indicates that the message buffer has been created successfully - the returned value should be stored as the handle to the created message buffer.

xMessageBufferCreateStaticWithCallback (xBufferSizeBytes, pucMessageBufferStorageArea, pxStaticMessageBuffer, pxSendCompletedCallback, pxReceiveCompletedCallback)

Creates a new message buffer using statically allocated memory. See xMessageBufferCreate() for a version that uses dynamically allocated memory.

Example use:

```
// Used to dimension the array used to hold the messages. The available space
// will actually be one less than this, so 999.
#define STORAGE_SIZE_BYTES 1000

// Defines the memory that will actually hold the messages within the message
// buffer.
static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];

// The variable used to hold the message buffer structure.
StaticMessageBuffer_t xMessageBufferStruct;

void MyFunction( void )
{
    MessageBufferHandle_t xMessageBuffer;

    xMessageBuffer = xMessageBufferCreateStatic( sizeof( ucStorageBuffer ),
                                                ucStorageBuffer,
                                                &xMessageBufferStruct );

    // As neither the pucMessageBufferStorageArea or pxStaticMessageBuffer
    // parameters were NULL, xMessageBuffer will not be NULL, and can be used to
    // reference the created message buffer in other message buffer API calls.

    // Other code that uses the message buffer can go here.
}
```

Parameters

- **xBufferSizeBytes** -- The size, in bytes, of the buffer pointed to by the `pucMessageBufferStorageArea` parameter. When a message is written to the message buffer an additional `sizeof(size_t)` bytes are also written to store the message's length. `sizeof(size_t)` is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture a 10 byte message will take up 14 bytes of message buffer space. The maximum number of bytes that can be stored in the message buffer is actually `(xBufferSizeBytes - 1)`.
- **pucMessageBufferStorageArea** -- Must point to a `uint8_t` array that is at least `xBufferSizeBytes` big. This is the array to which messages are copied when they are written to the message buffer.
- **pxStaticMessageBuffer** -- Must point to a variable of type `StaticMessageBuffer_t`, which will be used to hold the message buffer's data structure.
- **pxSendCompletedCallback** -- Callback invoked when a new message is sent to the message buffer. If the parameter is `NULL` or `xMessageBufferCreate()` is called without the parameter, then it will use the default implementation provided by `sbSEND_COMPLETED` macro. To enable the callback, `configUSE_SB_COMPLETED_CALLBACK` must be set to 1 in `FreeRTOSConfig.h`.
- **pxReceiveCompletedCallback** -- Callback invoked when a message is read from a message buffer. If the parameter is `NULL` or `xMessageBufferCreate()` is called without the parameter, it will use the default implementation provided by `sbRECEIVE_COMPLETED` macro. To enable the callback, `configUSE_SB_COMPLETED_CALLBACK` must be set to 1 in `FreeRTOSConfig.h`.

Returns If the message buffer is created successfully then a handle to the created message buffer is returned. If either `pucMessageBufferStorageArea` or `pxStaticmessageBuffer` are `NULL` then `NULL` is returned.

xMessageBufferGetStaticBuffers (`xMessageBuffer`, `ppucMessageBufferStorageArea`,
`ppxStaticMessageBuffer`)

Retrieve pointers to a statically created message buffer's data structure buffer and storage area buffer. These are the same buffers that are supplied at the time of creation.

Parameters

- **xMessageBuffer** -- The message buffer for which to retrieve the buffers.
- **ppucMessageBufferStorageArea** -- Used to return a pointer to the message buffer's storage area buffer.
- **ppxStaticMessageBuffer** -- Used to return a pointer to the message buffer's data structure buffer.

Returns pdTRUE if buffers were retrieved, pdFALSE otherwise.

xMessageBufferSend (xMessageBuffer, pvTxData, xDataLengthBytes, xTicksToWait)

Sends a discrete message to the message buffer. The message can be any length that fits within the buffer's free space, and is copied into the buffer.

NOTE: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferSend() to write to a message buffer from a task. Use xMessageBufferSendFromISR() to write to a message buffer from an interrupt service routine (ISR).

Example use:

```
void vAFunction( MessageBufferHandle_t xMessageBuffer )
{
    size_t xBytesSent;
    uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
    char *pcStringToSend = "String to send";
    const TickType_t x100ms = pdMS_TO_TICKS( 100 );

    // Send an array to the message buffer, blocking for a maximum of 100ms to
    // wait for enough space to be available in the message buffer.
    xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) ucArrayToSend,
    ↪ sizeof( ucArrayToSend ), x100ms );

    if( xBytesSent != sizeof( ucArrayToSend ) )
    {
        // The call to xMessageBufferSend() times out before there was enough
        // space in the buffer for the data to be written.
    }

    // Send the string to the message buffer. Return immediately if there is
    // not enough space in the buffer.
    xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) pcStringToSend,
    ↪ strlen( pcStringToSend ), 0 );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // The string could not be added to the message buffer because there was
        // not enough free space in the buffer.
    }
}
```

Parameters

- **xMessageBuffer** -- The handle of the message buffer to which a message is being sent.
- **pvTxData** -- A pointer to the message that is to be copied into the message buffer.

- **xDataLengthBytes** -- The length of the message. That is, the number of bytes to copy from pvTxData into the message buffer. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message's length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture setting xDataLengthBytes to 20 will reduce the free space in the message buffer by 24 bytes (20 bytes of message data and 4 bytes to hold the message length).
- **xTicksToWait** -- The maximum amount of time the calling task should remain in the Blocked state to wait for enough space to become available in the message buffer, should the message buffer have insufficient space when xMessageBufferSend() is called. The calling task will never block if xTicksToWait is zero. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. Tasks do not use any CPU time when they are in the Blocked state.

Returns The number of bytes written to the message buffer. If the call to xMessageBufferSend() times out before there was enough space to write the message into the message buffer then zero is returned. If the call did not time out then xDataLengthBytes is returned.

xMessageBufferSendFromISR (xMessageBuffer, pvTxData, xDataLengthBytes, pxHigherPriorityTaskWoken)

Interrupt safe version of the API function that sends a discrete message to the message buffer. The message can be any length that fits within the buffer's free space, and is copied into the buffer.

NOTE: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferSend() to write to a message buffer from a task. Use xMessageBufferSendFromISR() to write to a message buffer from an interrupt service routine (ISR).

Example use:

```
// A message buffer that has already been created.
MessageBufferHandle_t xMessageBuffer;

void vAnInterruptServiceRoutine( void )
{
    size_t xBytesSent;
    char *pcStringToSend = "String to send";
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Attempt to send the string to the message buffer.
    xBytesSent = xMessageBufferSendFromISR( xMessageBuffer,
                                           ( void * ) pcStringToSend,
                                           strlen( pcStringToSend ),
                                           &xHigherPriorityTaskWoken );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // The string could not be added to the message buffer because there was
        // not enough free space in the buffer.
    }
}
```

(continues on next page)

(continued from previous page)

```

// If xHigherPriorityTaskWoken was set to pdTRUE inside
// xMessageBufferSendFromISR() then a task that has a priority above the
// priority of the currently executing task was unblocked and a context
// switch should be performed to ensure the ISR returns to the unblocked
// task. In most FreeRTOS ports this is done by simply passing
// xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
// variables value, and perform the context switch if necessary. Check the
// documentation for the port in use for port specific instructions.
portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}

```

Parameters

- **xMessageBuffer** -- The handle of the message buffer to which a message is being sent.
- **pvTxData** -- A pointer to the message that is to be copied into the message buffer.
- **xDataLengthBytes** -- The length of the message. That is, the number of bytes to copy from pvTxData into the message buffer. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message's length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture setting xDataLengthBytes to 20 will reduce the free space in the message buffer by 24 bytes (20 bytes of message data and 4 bytes to hold the message length).
- **pxHigherPriorityTaskWoken** -- It is possible that a message buffer will have a task blocked on it waiting for data. Calling xMessageBufferSendFromISR() can make data available, and so cause a task that was waiting for data to leave the Blocked state. If calling xMessageBufferSendFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xMessageBufferSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xMessageBufferSendFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. This will ensure that the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

Returns The number of bytes actually written to the message buffer. If the message buffer didn't have enough free space for the message to be stored then 0 is returned, otherwise xDataLengthBytes is returned.

xMessageBufferReceive (xMessageBuffer, pvRxData, xBufferLengthBytes, xTicksToWait)

Receives a discrete message from a message buffer. Messages can be of variable length and are copied out of the buffer.

NOTE: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferReceive() to read from a message buffer from a task. Use xMessageBufferReceiveFromISR() to read from a message buffer from an interrupt service routine (ISR).

Example use:

```

void vAFunction( MessageBuffer_t xMessageBuffer )
{
uint8_t ucRxData[ 20 ];
size_t xReceivedBytes;
const TickType_t xBlockTime = pdMS_TO_TICKS( 20 );

// Receive the next message from the message buffer. Wait in the Blocked
// state (so not using any CPU processing time) for a maximum of 100ms for
// a message to become available.
xReceivedBytes = xMessageBufferReceive( xMessageBuffer,
                                        ( void * ) ucRxData,
                                        sizeof( ucRxData ),
                                        xBlockTime );

if( xReceivedBytes > 0 )
{
// A ucRxData contains a message that is xReceivedBytes long. Process
// the message here....
}
}

```

Parameters

- **xMessageBuffer** -- The handle of the message buffer from which a message is being received.
- **pvRxData** -- A pointer to the buffer into which the received message is to be copied.
- **xBufferLengthBytes** -- The length of the buffer pointed to by the pvRxData parameter. This sets the maximum length of the message that can be received. If xBufferLengthBytes is too small to hold the next message then the message will be left in the message buffer and 0 will be returned.
- **xTicksToWait** -- The maximum amount of time the task should remain in the Blocked state to wait for a message, should the message buffer be empty. xMessageBufferReceive() will return immediately if xTicksToWait is zero and the message buffer is empty. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. Tasks do not use any CPU time when they are in the Blocked state.

Returns The length, in bytes, of the message read from the message buffer, if any. If xMessageBufferReceive() times out before a message became available then zero is returned. If the length of the message is greater than xBufferLengthBytes then the message will be left in the message buffer and zero is returned.

xMessageBufferReceiveFromISR (xMessageBuffer, pvRxData, xBufferLengthBytes, pxHigherPriorityTaskWoken)

An interrupt safe version of the API function that receives a discrete message from a message buffer. Messages can be of variable length and are copied out of the buffer.

NOTE: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferReceive() to read from a message buffer from a task. Use xMessageBufferReceive-

FromISR() to read from a message buffer from an interrupt service routine (ISR).

Example use:

```
// A message buffer that has already been created.
MessageBuffer_t xMessageBuffer;

void vAnInterruptServiceRoutine( void )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Receive the next message from the message buffer.
    xReceivedBytes = xMessageBufferReceiveFromISR( xMessageBuffer,
                                                    ( void * ) ucRxData,
                                                    sizeof( ucRxData ),
                                                    &xHigherPriorityTaskWoken );

    if( xReceivedBytes > 0 )
    {
        // A ucRxData contains a message that is xReceivedBytes long. Process
        // the message here....
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xMessageBufferReceiveFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary. Check the
    // documentation for the port in use for port specific instructions.
    portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

Parameters

- **xMessageBuffer** -- The handle of the message buffer from which a message is being received.
- **pvRxData** -- A pointer to the buffer into which the received message is to be copied.
- **xBufferLengthBytes** -- The length of the buffer pointed to by the pvRxData parameter. This sets the maximum length of the message that can be received. If xBufferLengthBytes is too small to hold the next message then the message will be left in the message buffer and 0 will be returned.
- **pxHigherPriorityTaskWoken** -- It is possible that a message buffer will have a task blocked on it waiting for space to become available. Calling xMessageBufferReceiveFromISR() can make space available, and so cause a task that is waiting for space to leave the Blocked state. If calling xMessageBufferReceiveFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xMessageBufferReceiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xMessageBufferReceiveFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. That will ensure the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

Returns The length, in bytes, of the message read from the message buffer, if any.

vMessageBufferDelete (xMessageBuffer)

Deletes a message buffer that was previously created using a call to xMessageBufferCreate() or xMessage-

BufferCreateStatic(). If the message buffer was created using dynamic memory (that is, by xMessageBufferCreate()), then the allocated memory is freed.

A message buffer handle must not be used after the message buffer has been deleted.

Parameters

- **xMessageBuffer** -- The handle of the message buffer to be deleted.

xMessageBufferIsFull (xMessageBuffer)

Tests to see if a message buffer is full. A message buffer is full if it cannot accept any more messages, of any size, until space is made available by a message being removed from the message buffer.

Parameters

- **xMessageBuffer** -- The handle of the message buffer being queried.

Returns If the message buffer referenced by xMessageBuffer is full then pdTRUE is returned. Otherwise pdFALSE is returned.

xMessageBufferIsEmpty (xMessageBuffer)

Tests to see if a message buffer is empty (does not contain any messages).

Parameters

- **xMessageBuffer** -- The handle of the message buffer being queried.

Returns If the message buffer referenced by xMessageBuffer is empty then pdTRUE is returned. Otherwise pdFALSE is returned.

xMessageBufferReset (xMessageBuffer)

Resets a message buffer to its initial empty state, discarding any message it contained.

A message buffer can only be reset if there are no tasks blocked on it.

Parameters

- **xMessageBuffer** -- The handle of the message buffer being reset.

Returns If the message buffer was reset then pdPASS is returned. If the message buffer could not be reset because either there was a task blocked on the message queue to wait for space to become available, or to wait for a message to be available, then pdFAIL is returned.

xMessageBufferSpaceAvailable (xMessageBuffer)

message_buffer.h

```
size_t xMessageBufferSpaceAvailable( MessageBufferHandle_t xMessageBuffer );
```

Returns the number of bytes of free space in the message buffer.

Parameters

- **xMessageBuffer** -- The handle of the message buffer being queried.

Returns The number of bytes that can be written to the message buffer before the message buffer would be full. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message's length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so if xMessageBufferSpacesAvailable() returns 10, then the size of the largest message that can be written to the message buffer is 6 bytes.

xMessageBufferSpacesAvailable (xMessageBuffer)

xMessageBufferNextLengthBytes (xMessageBuffer)

Returns the length (in bytes) of the next message in a message buffer. Useful if xMessageBufferReceive() returned 0 because the size of the buffer passed into xMessageBufferReceive() was too small to hold the next message.

Parameters

- **xMessageBuffer** -- The handle of the message buffer being queried.

Returns The length (in bytes) of the next message in the message buffer, or 0 if the message buffer is empty.

xMessageBufferSendCompletedFromISR (xMessageBuffer, pxHigherPriorityTaskWoken)

For advanced users only.

The sbSEND_COMPLETED() macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbSEND_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xMessageBufferSendCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbSEND_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

Parameters

- **xMessageBuffer** -- The handle of the stream buffer to which data was written.
- **pxHigherPriorityTaskWoken** -- *pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xMessageBufferSendCompletedFromISR(). If calling xMessageBufferSendCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

Returns If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

xMessageBufferReceiveCompletedFromISR (xMessageBuffer, pxHigherPriorityTaskWoken)

For advanced users only.

The sbRECEIVE_COMPLETED() macro is called from within the FreeRTOS APIs when data is read out of a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbRECEIVE_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xMessageBufferReceiveCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbRECEIVE_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

Parameters

- **xMessageBuffer** -- The handle of the stream buffer from which data was read.
- **pxHigherPriorityTaskWoken** -- *pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xMessageBufferReceiveCompletedFromISR(). If calling xMessageBufferReceiveCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

Returns If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

Type Definitions

typedef *StreamBufferHandle_t* **MessageBufferHandle_t**

Type by which message buffers are referenced. For example, a call to xMessageBufferCreate() returns an MessageBufferHandle_t variable that can then be used as a parameter to xMessageBufferSend(), xMessageBufferReceive(), etc. Message buffer is essentially built as a stream buffer hence its handle is also set to same type as a stream buffer handle.

2.9.13 FreeRTOS (Supplemental Features)

ESP-IDF provides multiple features to supplement the features offered by FreeRTOS. These supplemental features are available on all FreeRTOS implementations supported by ESP-IDF (i.e., ESP-IDF FreeRTOS and Amazon SMP FreeRTOS). This document describes these supplemental features and is split into the following sections:

Contents

- *FreeRTOS (Supplemental Features)*
 - *Overview*
 - *Ring Buffers*
 - *ESP-IDF Tick and Idle Hooks*
 - *TLSP Deletion Callbacks*
 - *IDF Additional API*
 - *Component Specific Properties*
 - *API Reference*

Overview

ESP-IDF adds various new features to supplement the capabilities of FreeRTOS as follows:

- **Ring buffers:** Ring buffers provide a FIFO buffer that can accept entries of arbitrary lengths.
- **ESP-IDF Tick and Idle Hooks:** ESP-IDF provides multiple custom tick interrupt hooks and idle task hooks that are more numerous and more flexible when compared to FreeRTOS tick and idle hooks.
- **Thread Local Storage Pointer (TLSP) Deletion Callbacks:** TLSP Deletion callbacks are run automatically when a task is deleted, thus allowing users to clean up their TLSPs automatically.
- **IDF Additional API:** ESP-IDF specific functions added to augment the features of FreeRTOS.
- **Component Specific Properties:** Currently added only one component specific property `ORIG_INCLUDE_PATH`.

Ring Buffers

FreeRTOS provides stream buffers and message buffers as the primary mechanisms to send arbitrarily sized data between tasks and ISRs. However, FreeRTOS stream buffers and message buffers have the following limitations:

- Strictly single sender and single receiver
- Data is passed by copy
- Unable to reserve buffer space for a deferred send (i.e., send acquire)

Therefore, ESP-IDF provides a separate ring buffer implementation to address the issues above.

ESP-IDF ring buffers are strictly FIFO buffers that supports arbitrarily sized items. Ring buffers are a more memory efficient alternative to FreeRTOS queues in situations where the size of items is variable. The capacity of a ring buffer is not measured by the number of items it can store, but rather by the amount of memory used for storing items.

The ring buffer provides APIs to send an item, or to allocate space for an item in the ring buffer to be filled manually by the user. For efficiency reasons, **items are always retrieved from the ring buffer by reference**. As a result, all retrieved items **must also be returned** to the ring buffer by using `vRingbufferReturnItem()` or `vRingbufferReturnItemFromISR()`, in order for them to be removed from the ring buffer completely.

The ring buffers are split into the three following types:

No-Split buffers guarantee that an item is stored in contiguous memory and does not attempt to split an item under any circumstances. Use No-Split buffers when items must occupy contiguous memory. **Only this buffer type allows reserving buffer space for deferred sending**. Refer to the documentation of the functions `xRingbufferSendAcquire()` and `xRingbufferSendComplete()` for more details.

Allow-Split buffers allow an item to be split in two parts when wrapping around the end of the buffer if there is enough space at the tail and the head of the buffer combined to store the item. Allow-Split buffers are more memory efficient than No-Split buffers but can return an item in two parts when retrieving.

Byte buffers do not store data as separate items. All data is stored as a sequence of bytes, and any number of bytes can be sent or retrieved each time. Use byte buffers when separate items do not need to be maintained, e.g., a byte stream.

Note: No-Split buffers and Allow-Split buffers always store items at 32-bit aligned addresses. Therefore, when retrieving an item, the item pointer is guaranteed to be 32-bit aligned. This is useful especially when you need to send some data to the DMA.

Note: Each item stored in No-Split or Allow-Split buffers **requires an additional 8 bytes for a header**. Item sizes are also rounded up to a 32-bit aligned size, i.e., multiple of 4 bytes. However the true item size is recorded within the header. The sizes of No-Split and Allow-Split buffers will also be rounded up when created.

Usage The following example demonstrates the usage of `xRingbufferCreate()` and `xRingbufferSend()` to create a ring buffer and then send an item to it:

```
#include "freertos/ringbuf.h"
static char tx_item[] = "test_item";

...

//Create ring buffer
RingbufHandle_t buf_handle;
buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
if (buf_handle == NULL) {
    printf("Failed to create ring buffer\n");
}

//Send an item
UBaseType_t res = xRingbufferSend(buf_handle, tx_item, sizeof(tx_item), pdMS_
↳TO_TICKS(1000));
if (res != pdTRUE) {
    printf("Failed to send item\n");
}
```

The following example demonstrates the usage of `xRingbufferSendAcquire()` and `xRingbufferSendComplete()` instead of `xRingbufferSend()` to acquire memory on the ring buffer (of type `RINGBUF_TYPE_NOSPLIT`) and then send an item to it. This adds one more step, but allows getting the address of the memory to write to, and writing to the memory yourself.

```
#include "freertos/ringbuf.h"
#include "soc/lldesc.h"

typedef struct {
    lldesc_t dma_desc;
    uint8_t buf[1];
} dma_item_t;

#define DMA_ITEM_SIZE(N) (sizeof(lldesc_t)+((N)+3)&(~3))

...

//Retrieve space for DMA descriptor and corresponding data buffer
//This has to be done with SendAcquire, or the address may be different when
↳we copy
dma_item_t *item;
UBaseType_t res = xRingbufferSendAcquire(buf_handle,
    (void**) &item, DMA_ITEM_SIZE(buffer_size), pdMS_TO_
↳TICKS(1000));
```

(continues on next page)

(continued from previous page)

```

if (res != pdTRUE) {
    printf("Failed to acquire memory for item\n");
}
item->dma_desc = (lldesc_t) {
    .size = buffer_size,
    .length = buffer_size,
    .eof = 0,
    .owner = 1,
    .buf = item->buf,
};
//Actually send to the ring buffer for consumer to use
res = xRingbufferSendComplete(buf_handle, &item);
if (res != pdTRUE) {
    printf("Failed to send item\n");
}

```

The following example demonstrates retrieving and returning an item from a **No-Split ring buffer** using `xRingbufferReceive()` and `vRingbufferReturnItem()`

```

...

//Receive an item from no-split ring buffer
size_t item_size;
char *item = (char *)xRingbufferReceive(buf_handle, &item_size, pdMS_TO_
↪TICKS(1000));

//Check received item
if (item != NULL) {
    //Print item
    for (int i = 0; i < item_size; i++) {
        printf("%c", item[i]);
    }
    printf("\n");
    //Return Item
    vRingbufferReturnItem(buf_handle, (void *)item);
} else {
    //Failed to receive item
    printf("Failed to receive item\n");
}

```

The following example demonstrates retrieving and returning an item from an **Allow-Split ring buffer** using `xRingbufferReceiveSplit()` and `vRingbufferReturnItem()`

```

...

//Receive an item from allow-split ring buffer
size_t item_size1, item_size2;
char *item1, *item2;
BaseType_t ret = xRingbufferReceiveSplit(buf_handle, (void **)&item1, (void_
↪**)&item2, &item_size1, &item_size2, pdMS_TO_TICKS(1000));

//Check received item
if (ret == pdTRUE && item1 != NULL) {
    for (int i = 0; i < item_size1; i++) {
        printf("%c", item1[i]);
    }
    vRingbufferReturnItem(buf_handle, (void *)item1);
    //Check if item was split
    if (item2 != NULL) {
        for (int i = 0; i < item_size2; i++) {
            printf("%c", item2[i]);
        }
    }
}

```

(continues on next page)

(continued from previous page)

```

    }
    vRingbufferReturnItem(buf_handle, (void *)item2);
}
printf("\n");
} else {
    //Failed to receive item
    printf("Failed to receive item\n");
}
}

```

The following example demonstrates retrieving and returning an item from a **byte buffer** using `xRingbufferReceiveUpTo()` and `vRingbufferReturnItem()`

```

...
//Receive data from byte buffer
size_t item_size;
char *item = (char *)xRingbufferReceiveUpTo(buf_handle, &item_size, pdMS_TO_
↪TICKS(1000), sizeof(tx_item));

//Check received data
if (item != NULL) {
    //Print item
    for (int i = 0; i < item_size; i++) {
        printf("%c", item[i]);
    }
    printf("\n");
    //Return Item
    vRingbufferReturnItem(buf_handle, (void *)item);
} else {
    //Failed to receive item
    printf("Failed to receive item\n");
}
}

```

For ISR safe versions of the functions used above, call `xRingbufferSendFromISR()`, `xRingbufferReceiveFromISR()`, `xRingbufferReceiveSplitFromISR()`, `xRingbufferReceiveUpToFromISR()`, and `vRingbufferReturnItemFromISR()`.

Note: Two calls to `RingbufferReceive[UpTo][FromISR]()` are required if the bytes wraps around the end of the ring buffer.

Sending to Ring Buffer The following diagrams illustrate the differences between No-Split and Allow-Split buffers as compared to byte buffers with regard to sending items or data. The diagrams assume that three items of sizes **18**, **3**, and **27** bytes are sent respectively to a **buffer of 128 bytes**:

Fig. 33: Sending items to No-Split or Allow-Split ring buffers

For No-Split and Allow-Split buffers, a header of 8 bytes precedes every data item. Furthermore, the space occupied by each item is **rounded up to the nearest 32-bit aligned size** in order to maintain overall 32-bit alignment.

However, the true size of the item is recorded inside the header which will be returned when the item is retrieved.

Referring to the diagram above, the 18, 3, and 27 byte items are **rounded up to 20, 4, and 28 bytes** respectively. An 8 byte header is then added in front of each item.

Fig. 34: Sending items to byte buffers

Byte buffers treat data as a sequence of bytes and does not incur any overhead (no headers). As a result, all data sent to a byte buffer is merged into a single item.

Referring to the diagram above, the 18, 3, and 27 byte items are sequentially written to the byte buffer and **merged into a single item of 48 bytes**.

Using `SendAcquire` and `SendComplete` Items in No-Split buffers are acquired (by `SendAcquire`) in strict FIFO order and must be sent to the buffer by `SendComplete` for the data to be accessible by the consumer. Multiple items can be sent or acquired without calling `SendComplete`, and the items do not necessarily need to be completed in the order they were acquired. However, the receiving of data items must occur in FIFO order, therefore not calling `SendComplete` for the earliest acquired item prevents the subsequent items from being received.

The following diagrams illustrate what will happen when `SendAcquire` and `SendComplete` do not happen in the same order. At the beginning, there is already a data item of 16 bytes sent to the ring buffer. Then `SendAcquire` is called to acquire space of 20, 8, 24 bytes on the ring buffer.

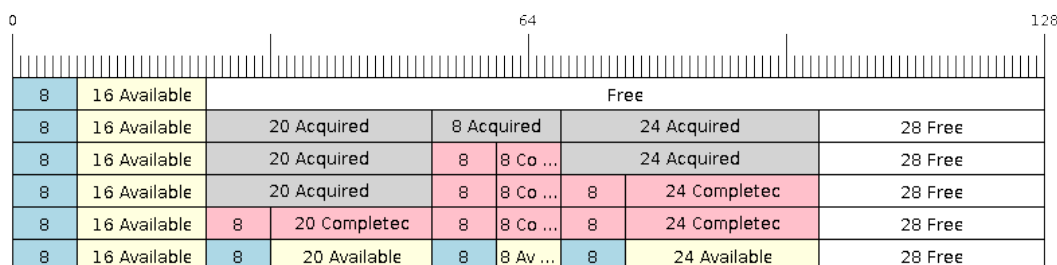

Fig. 35: `SendAcquire`/`SendComplete` items in No-Split ring buffers

After that, we fill (use) the buffers, and send them to the ring buffer by `SendComplete` in the order of 8, 24, 20. When 8 bytes and 24 bytes data are sent, the consumer still can only get the 16 bytes data item. Hence, if `SendComplete` is not called for the 20 bytes, it will not be available, nor will the data items following the 20 bytes item.

When the 20 bytes item is finally completed, all the 3 data items can be received now, in the order of 20, 8, 24 bytes, right after the 16 bytes item existing in the buffer at the beginning.

Allow-Split buffers and byte buffers do not allow using `SendAcquire` or `SendComplete` since acquired buffers are required to be complete (not wrapped).

Wrap Around The following diagrams illustrate the differences between No-Split, Allow-Split, and byte buffers when a sent item requires a wrap around. The diagrams assume a buffer of **128 bytes** with **56 bytes of free space that wraps around** and a sent item of **28 bytes**.

Fig. 36: Wrap around in No-Split buffers

No-Split buffers **only store an item in continuous free space and do not split an item under any circumstances**. When the free space at the tail of the buffer is insufficient to completely store the item and its header, the free space at the tail will be **marked as dummy data**. The buffer will then wrap around and store the item in the free space at the head of the buffer.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore, the 16 bytes is marked as dummy data and the item is written to the free space at the head of the buffer instead.

Fig. 37: Wrap around in Allow-Split buffers

Allow-Split buffers will attempt to **split the item into two parts** when the free space at the tail of the buffer is insufficient to store the item data and its header. Both parts of the split item will have their own headers, therefore incurring an extra 8 bytes of overhead.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore, the item is split into two parts (8 and 20 bytes) and written as two parts to the buffer.

Note: Allow-Split buffers treat both parts of the split item as two separate items, therefore call `xRingbufferReceiveSplit()` instead of `xRingbufferReceive()` to receive both parts of a split item in a thread safe manner.

Fig. 38: Wrap around in byte buffers

Byte buffers **store as much data as possible into the free space at the tail of buffer**. The remaining data will then be stored in the free space at the head of the buffer. No overhead is incurred when wrapping around in byte buffers.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to completely store the 28 bytes of data. Therefore, the 16 bytes of free space is filled with data, and the remaining 12 bytes are written

to the free space at the head of the buffer. The buffer now contains data in two separate continuous parts, and each continuous part is treated as a separate item by the byte buffer.

Retrieving/Returning The following diagrams illustrate the differences between No-Split and Allow-Split buffers as compared to byte buffers in retrieving and returning data:

Fig. 39: Retrieving/Returning items in No-Split and Allow-Split ring buffers

Items in No-Split buffers and Allow-Split buffers are **retrieved in strict FIFO order** and **must be returned** for the occupied space to be freed. Multiple items can be retrieved before returning, and the items do not necessarily need to be returned in the order they were retrieved. However, the freeing of space must occur in FIFO order, therefore not returning the earliest retrieved item prevents the space of subsequent items from being freed.

Referring to the diagram above, the **16, 20, and 8 byte items are retrieved in FIFO order**. However, the items are not returned in the order they were retrieved. First, the 20 byte item is returned followed by the 8 byte and the 16 byte items. The space is not freed until the first item, i.e., the 16 byte item is returned.

Fig. 40: Retrieving/Returning data in byte buffers

Byte buffers **do not allow multiple retrievals before returning** (every retrieval must be followed by a return before another retrieval is permitted). When using `xRingbufferReceive()` or `xRingbufferReceiveFromISR()`, all continuous stored data will be retrieved. `xRingbufferReceiveUpTo()` or `xRingbufferReceiveUpToFromISR()` can be used to restrict the maximum number of bytes retrieved. Since every retrieval must be followed by a return, the space is freed as soon as the data is returned.

Referring to the diagram above, the 38 bytes of continuous stored data at the tail of the buffer is retrieved, returned, and freed. The next call to `xRingbufferReceive()` or `xRingbufferReceiveFromISR()` then wraps around and does the same to the 30 bytes of continuous stored data at the head of the buffer.

Ring Buffers with Queue Sets Ring buffers can be added to FreeRTOS queue sets using `xRingbufferAddToQueueSetRead()` such that every time a ring buffer receives an item or data, the queue set is notified. Once

added to a queue set, every attempt to retrieve an item from a ring buffer should be preceded by a call to `xQueueSelectFromSet()`. To check whether the selected queue set member is the ring buffer, call `xRingbufferCanRead()`.

The following example demonstrates queue set usage with ring buffers:

```
#include "freertos/queue.h"
#include "freertos/ringbuf.h"

...

//Create ring buffer and queue set
RingbufHandle_t buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
QueueSetHandle_t queue_set = xQueueCreateSet(3);

//Add ring buffer to queue set
if (xRingbufferAddToQueueSetRead(buf_handle, queue_set) != pdTRUE) {
    printf("Failed to add to queue set\n");
}

...

//Block on queue set
QueueSetMemberHandle_t member = xQueueSelectFromSet(queue_set, pdMS_TO_
↳TICKS(1000));

//Check if member is ring buffer
if (member != NULL && xRingbufferCanRead(buf_handle, member) == pdTRUE) {
    //Member is ring buffer, receive item from ring buffer
    size_t item_size;
    char *item = (char *)xRingbufferReceive(buf_handle, &item_size, 0);

    //Handle item
    ...
} else {
    ...
}
```

Ring Buffers with Static Allocation The `xRingbufferCreateStatic()` can be used to create ring buffers with specific memory requirements (such as a ring buffer being allocated in external RAM). All blocks of memory used by a ring buffer must be manually allocated beforehand, then passed to the `xRingbufferCreateStatic()` to be initialized as a ring buffer. These blocks include the following:

- The ring buffer's data structure of type `StaticRingbuffer_t`.
- The ring buffer's storage area of size `xBufferSize`. Note that `xBufferSize` must be 32-bit aligned for No-Split and Allow-Split buffers.

The manner in which these blocks are allocated depends on the users requirements (e.g., all blocks being statically declared, or dynamically allocated with specific capabilities such as external RAM).

Note: When deleting a ring buffer created via `xRingbufferCreateStatic()`, the function `vRingbufferDelete()` will not free any of the memory blocks. This must be done manually by the user after `vRingbufferDelete()` is called.

The code snippet below demonstrates a ring buffer being allocated entirely in external RAM.

```
#include "freertos/ringbuf.h"
#include "freertos/semphr.h"
#include "esp_heap_caps.h"
```

(continues on next page)

```

#define BUFFER_SIZE      400      //32-bit aligned size
#define BUFFER_TYPE      RINGBUF_TYPE_NOSPLIT
...

//Allocate ring buffer data structure and storage area into external RAM
StaticRingbuffer_t *buffer_struct = (StaticRingbuffer_t *)heap_caps_
↳malloc(sizeof(StaticRingbuffer_t), MALLOC_CAP_SPIRAM);
uint8_t *buffer_storage = (uint8_t *)heap_caps_malloc(sizeof(uint8_t)*BUFFER_SIZE,↳
↳MALLOC_CAP_SPIRAM);

//Create a ring buffer with manually allocated memory
RingbufHandle_t handle = xRingbufferCreateStatic(BUFFER_SIZE, BUFFER_TYPE, buffer_
↳storage, buffer_struct);

...

//Delete the ring buffer after used
vRingbufferDelete(handle);

//Manually free all blocks of memory
free(buffer_struct);
free(buffer_storage);

```

ESP-IDF Tick and Idle Hooks

FreeRTOS allows applications to provide a tick hook and an idle hook at compile time:

- FreeRTOS tick hook can be enabled via the `CONFIG_FREERTOS_USE_TICK_HOOK` option. The application must provide the void `vApplicationTickHook(void)` callback.
- FreeRTOS idle hook can be enabled via the `CONFIG_FREERTOS_USE_IDLE_HOOK` option. The application must provide the void `vApplicationIdleHook(void)` callback.

However, the FreeRTOS tick hook and idle hook have the following draw backs:

- The FreeRTOS hooks are registered at compile time
- Only one of each hook can be registered
- On multi-core targets, the FreeRTOS hooks are symmetric, meaning each core's tick interrupt and idle tasks ends up calling the same hook

Therefore, ESP-IDF tick and idle hooks are provided to supplement the features of FreeRTOS tick and idle hooks. The ESP-IDF hooks have the following features:

- The hooks can be registered and deregistered at run-time
- Multiple hooks can be registered (with a maximum of 8 hooks of each type per core)
- On multi-core targets, the hooks can be asymmetric, meaning different hooks can be registered to each core

ESP-IDF hooks can be registered and deregistered using the following APIs:

- For tick hooks:
 - Register using `esp_register_freertos_tick_hook()` or `esp_register_freertos_tick_hook_for_cpu()`
 - Deregister using `esp_deregister_freertos_tick_hook()` or `esp_deregister_freertos_tick_hook_for_cpu()`
- For idle hooks:
 - Register using `esp_register_freertos_idle_hook()` or `esp_register_freertos_idle_hook_for_cpu()`
 - Deregister using `esp_deregister_freertos_idle_hook()` or `esp_deregister_freertos_idle_hook_for_cpu()`

Note: The tick interrupt stays active while the cache is disabled, therefore any tick hook (FreeRTOS or ESP-IDF) functions must be placed in internal RAM. Please refer to the [SPI flash API documentation](#) for more details.

TLSP Deletion Callbacks

Vanilla FreeRTOS provides a Thread Local Storage Pointers (TLSP) feature. These are pointers stored directly in the Task Control Block (TCB) of a particular task. TLSPs allow each task to have its own unique set of pointers to data structures. Vanilla FreeRTOS expects users to:

- set a task's TLSPs by calling `vTaskSetThreadLocalStoragePointer()` after the task has been created.
- get a task's TLSPs by calling `pvTaskGetThreadLocalStoragePointer()` during the task's lifetime.
- free the memory pointed to by the TLSPs before the task is deleted.

However, there can be instances where users may want the freeing of TLSP memory to be automatic. Therefore, ESP-IDF provides the additional feature of TLSP deletion callbacks. These user-provided deletion callbacks are called automatically when a task is deleted, thus allowing the TLSP memory to be cleaned up without needing to add the cleanup logic explicitly to the code of every task.

The TLSP deletion callbacks are set in a similar fashion to the TLSPs themselves.

- `vTaskSetThreadLocalStoragePointerAndDelCallback()` sets both a particular TLSP and its associated callback.
- Calling the Vanilla FreeRTOS function `vTaskSetThreadLocalStoragePointer()` simply sets the TLSP's associated Deletion Callback to `NULL`, meaning that no callback is called for that TLSP during task deletion.

When implementing TLSP callbacks, users should note the following:

- The callback **must never attempt to block or yield** and critical sections should be kept as short as possible.
- The callback is called shortly before a deleted task's memory is freed. Thus, the callback can either be called from `vTaskDelete()` itself, or from the idle task.

IDF Additional API

The `freertos/esp_additions/include/freertos/idf_additions.h` header contains FreeRTOS-related helper functions added by ESP-IDF. Users can include this header via `#include "freertos/idf_additions.h"`.

Component Specific Properties

Besides standard component variables that are available with basic cmake build properties, FreeRTOS component also provides arguments (only one so far) for simpler integration with other modules:

- `ORIG_INCLUDE_PATH` - contains an absolute path to freertos root include folder. Thus instead of `#include "freertos/FreeRTOS.h"` you can refer to headers directly: `#include "FreeRTOS.h"`.

API Reference

Ring Buffer API

Header File

- `components/esp_ringbuf/include/freertos/ringbuf.h`
- This header file can be included with:

```
#include "freertos/ringbuf.h"
```

- This header file is a part of the API provided by the `esp_ringbuf` component. To declare that your component depends on `esp_ringbuf`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_ringbuf
```

or

```
PRIV_REQUIRES esp_ringbuf
```

Functions

RingbufHandle_t **xRingbufferCreate** (size_t xBufferSize, *RingbufferType_t* xBufferType)

Create a ring buffer.

Note: xBufferSize of no-split/allow-split buffers will be rounded up to the nearest 32-bit aligned size.

Parameters

- **xBufferSize** -- [in] Size of the buffer in bytes. Note that items require space for a header in no-split/allow-split buffers
- **xBufferType** -- [in] Type of ring buffer, see documentation.

Returns A handle to the created ring buffer, or NULL in case of error.

RingbufHandle_t **xRingbufferCreateNoSplit** (size_t xItemSize, size_t xItemNum)

Create a ring buffer of type `RINGBUF_TYPE_NOSPLIT` for a fixed `item_size`.

This API is similar to `xRingbufferCreate()`, but it will internally allocate additional space for the headers.

Parameters

- **xItemSize** -- [in] Size of each item to be put into the ring buffer
- **xItemNum** -- [in] Maximum number of items the buffer needs to hold simultaneously

Returns A `RingbufHandle_t` handle to the created ring buffer, or NULL in case of error.

RingbufHandle_t **xRingbufferCreateStatic** (size_t xBufferSize, *RingbufferType_t* xBufferType, uint8_t *pucRingbufferStorage, *StaticRingbuffer_t* *pxStaticRingbuffer)

Create a ring buffer but manually provide the required memory.

Note: xBufferSize of no-split/allow-split buffers MUST be 32-bit aligned.

Parameters

- **xBufferSize** -- [in] Size of the buffer in bytes.
- **xBufferType** -- [in] Type of ring buffer, see documentation
- **pucRingbufferStorage** -- [in] Pointer to the ring buffer's storage area. Storage area must have the same size as specified by `xBufferSize`
- **pxStaticRingbuffer** -- [in] Pointed to a struct of type `StaticRingbuffer_t` which will be used to hold the ring buffer's data structure

Returns A handle to the created ring buffer

BaseType_t **xRingbufferSend** (*RingbufHandle_t* xRingbuffer, const void *pvItem, size_t xItemSize, TickType_t xTicksToWait)

Insert an item into the ring buffer.

Attempt to insert an item into the ring buffer. This function will block until enough free space is available or until it times out.

Note: For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

Note: For no-split/allow-split buffers, an `xItemSize` of 0 will result in an item with no data being set (i.e., item only contains the header). For byte buffers, an `xItemSize` of 0 will simply return `pdTRUE` without copying any data.

Parameters

- **xRingbuffer** -- [in] Ring buffer to insert the item into
- **pvItem** -- [in] Pointer to data to insert. NULL is allowed if `xItemSize` is 0.
- **xItemSize** -- [in] Size of data to insert.
- **xTicksToWait** -- [in] Ticks to wait for room in the ring buffer.

Returns

- `pdTRUE` if succeeded
- `pdFALSE` on time-out or when the data is larger than the maximum permissible size of the buffer

BaseType_t **xRingbufferSendFromISR** (*RingbufHandle_t* xRingbuffer, const void *pvItem, size_t xItemSize, BaseType_t *pxHigherPriorityTaskWoken)

Insert an item into the ring buffer in an ISR.

Attempt to insert an item into the ring buffer from an ISR. This function will return immediately if there is insufficient free space in the buffer.

Note: For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

Note: For no-split/allow-split buffers, an `xItemSize` of 0 will result in an item with no data being set (i.e., item only contains the header). For byte buffers, an `xItemSize` of 0 will simply return `pdTRUE` without copying any data.

Parameters

- **xRingbuffer** -- [in] Ring buffer to insert the item into
- **pvItem** -- [in] Pointer to data to insert. NULL is allowed if `xItemSize` is 0.
- **xItemSize** -- [in] Size of data to insert.
- **pxHigherPriorityTaskWoken** -- [out] Value pointed to will be set to `pdTRUE` if the function woke up a higher priority task.

Returns

- `pdTRUE` if succeeded
- `pdFALSE` when the ring buffer does not have space.

BaseType_t **xRingbufferSendAcquire** (*RingbufHandle_t* xRingbuffer, void **ppvItem, size_t xItemSize, TickType_t xTicksToWait)

Acquire memory from the ring buffer to be written to by an external source and to be sent later.

Attempt to allocate buffer for an item to be sent into the ring buffer. This function will block until enough free space is available or until it times out.

The item, as well as the following items `SendAcquire` or `Send` after it, will not be able to be read from the ring buffer until this item is actually sent into the ring buffer.

Note: Only applicable for no-split ring buffers now, the actual size of memory that the item will occupy will

be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

Note: An `xItemSize` of 0 will result in a buffer being acquired, but the buffer will have a size of 0.

Parameters

- **xRingbuffer** -- [in] Ring buffer to allocate the memory
- **ppvItem** -- [out] Double pointer to memory acquired (set to NULL if no memory were retrieved)
- **xItemSize** -- [in] Size of item to acquire.
- **xTicksToWait** -- [in] Ticks to wait for room in the ring buffer.

Returns

- `pdTRUE` if succeeded
- `pdFALSE` on time-out or when the data is larger than the maximum permissible size of the buffer

BaseType_t **xRingbufferSendComplete** (*RingbufHandle_t* xRingbuffer, void *pvItem)

Actually send an item into the ring buffer allocated before by `xRingbufferSendAcquire`.

Note: Only applicable for no-split ring buffers. Only call for items allocated by `xRingbufferSendAcquire`.

Parameters

- **xRingbuffer** -- [in] Ring buffer to insert the item into
- **pvItem** -- [in] Pointer to item in allocated memory to insert.

Returns

- `pdTRUE` if succeeded
- `pdFALSE` if fail for some reason.

void ***xRingbufferReceive** (*RingbufHandle_t* xRingbuffer, size_t *pxItemSize, TickType_t xTicksToWait)

Retrieve an item from the ring buffer.

Attempt to retrieve an item from the ring buffer. This function will block until an item is available or until it times out.

Note: A call to `vRingbufferReturnItem()` is required after this to free the item retrieved.

Note: It is possible to receive items with a `pxItemSize` of 0 on no-split/allow split buffers.

Parameters

- **xRingbuffer** -- [in] Ring buffer to retrieve the item from
- **pxItemSize** -- [out] Pointer to a variable to which the size of the retrieved item will be written.
- **xTicksToWait** -- [in] Ticks to wait for items in the ring buffer.

Returns

- Pointer to the retrieved item on success; `*pxItemSize` filled with the length of the item.
- NULL on timeout, `*pxItemSize` is untouched in that case.

void ***xRingbufferReceiveFromISR** (*RingbufHandle_t* xRingbuffer, size_t *pxItemSize)

Retrieve an item from the ring buffer in an ISR.

Attempt to retrieve an item from the ring buffer. This function returns immediately if there are no items available for retrieval

Note: A call to `vRingbufferReturnItemFromISR()` is required after this to free the item retrieved.

Note: Byte buffers do not allow multiple retrievals before returning an item

Note: Two calls to `RingbufferReceiveFromISR()` are required if the bytes wrap around the end of the ring buffer.

Note: It is possible to receive items with a `pxItemSize` of 0 on no-split/allow split buffers.

Parameters

- **xRingbuffer** -- **[in]** Ring buffer to retrieve the item from
- **pxItemSize** -- **[out]** Pointer to a variable to which the size of the retrieved item will be written.

Returns

- Pointer to the retrieved item on success; `*pxItemSize` filled with the length of the item.
- NULL when the ring buffer is empty, `*pxItemSize` is untouched in that case.

BaseType_t **xRingbufferReceiveSplit** (*RingbufHandle_t* xRingbuffer, void **ppvHeadItem, void **ppvTailItem, size_t *pxHeadItemSize, size_t *pxTailItemSize, TickType_t xTicksToWait)

Retrieve a split item from an allow-split ring buffer.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retrieved. If the item is split, both parts will be retrieved. This function will block until an item is available or until it times out.

Note: Call(s) to `vRingbufferReturnItem()` is required after this to free up the item(s) retrieved.

Note: This function should only be called on allow-split buffers

Note: It is possible to receive items with a `pxItemSize` of 0 on allow split buffers.

Parameters

- **xRingbuffer** -- **[in]** Ring buffer to retrieve the item from
- **ppvHeadItem** -- **[out]** Double pointer to first part (set to NULL if no items were retrieved)
- **ppvTailItem** -- **[out]** Double pointer to second part (set to NULL if item is not split)
- **pxHeadItemSize** -- **[out]** Pointer to size of first part (unmodified if no items were retrieved)
- **pxTailItemSize** -- **[out]** Pointer to size of second part (unmodified if item is not split)
- **xTicksToWait** -- **[in]** Ticks to wait for items in the ring buffer.

Returns

- pdTRUE if an item (split or unsplit) was retrieved
- pdFALSE when no item was retrieved

BaseType_t **xRingbufferReceiveSplitFromISR** (*RingbufHandle_t* xRingbuffer, void **ppvHeadItem, void **ppvTailItem, size_t *pxHeadItemSize, size_t *pxTailItemSize)

Retrieve a split item from an allow-split ring buffer in an ISR.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retrieved. If the item is split, both parts will be retrieved. This function returns immediately if there are no items available for retrieval

Note: Calls to `vRingbufferReturnItemFromISR()` is required after this to free up the item(s) retrieved.

Note: This function should only be called on allow-split buffers

Note: It is possible to receive items with a `pxItemSize` of 0 on allow split buffers.

Parameters

- **xRingbuffer** -- [in] Ring buffer to retrieve the item from
- **ppvHeadItem** -- [out] Double pointer to first part (set to NULL if no items were retrieved)
- **ppvTailItem** -- [out] Double pointer to second part (set to NULL if item is not split)
- **pxHeadItemSize** -- [out] Pointer to size of first part (unmodified if no items were retrieved)
- **pxTailItemSize** -- [out] Pointer to size of second part (unmodified if item is not split)

Returns

- `pdTRUE` if an item (split or unsplit) was retrieved
- `pdFALSE` when no item was retrieved

void ***xRingbufferReceiveUpTo** (*RingbufHandle_t* xRingbuffer, size_t *pxItemSize, TickType_t xTicksToWait, size_t xMaxSize)

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve.

Attempt to retrieve data from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will block until there is data available for retrieval or until it times out.

Note: A call to `vRingbufferReturnItem()` is required after this to free up the data retrieved.

Note: This function should only be called on byte buffers

Note: Byte buffers do not allow multiple retrievals before returning an item

Note: Two calls to `RingbufferReceiveUpTo()` are required if the bytes wrap around the end of the ring buffer.

Parameters

- **xRingbuffer** -- [in] Ring buffer to retrieve the item from
- **pxItemSize** -- [out] Pointer to a variable to which the size of the retrieved item will be written.
- **xTicksToWait** -- [in] Ticks to wait for items in the ring buffer.

- **xMaxSize** -- [in] Maximum number of bytes to return.

Returns

- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL on timeout, *pxItemSize is untouched in that case.

void ***xRingbufferReceiveUpToFromISR** (*RingbufHandle_t* xRingbuffer, size_t *pxItemSize, size_t xMaxSize)

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve. Call this from an ISR.

Attempt to retrieve bytes from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will return immediately if there is no data available for retrieval.

Note: A call to `vRingbufferReturnItemFromISR()` is required after this to free up the data received.

Note: This function should only be called on byte buffers

Note: Byte buffers do not allow multiple retrievals before returning an item

Parameters

- **xRingbuffer** -- [in] Ring buffer to retrieve the item from
- **pxItemSize** -- [out] Pointer to a variable to which the size of the retrieved item will be written.
- **xMaxSize** -- [in] Maximum number of bytes to return. Size of 0 simply returns NULL.

Returns

- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL when the ring buffer is empty, *pxItemSize is untouched in that case.

void **vRingbufferReturnItem** (*RingbufHandle_t* xRingbuffer, void *pvItem)

Return a previously-retrieved item to the ring buffer.

Note: If a split item is retrieved, both parts should be returned by calling this function twice

Parameters

- **xRingbuffer** -- [in] Ring buffer the item was retrieved from
- **pvItem** -- [in] Item that was received earlier

void **vRingbufferReturnItemFromISR** (*RingbufHandle_t* xRingbuffer, void *pvItem, BaseType_t *pxHigherPriorityTaskWoken)

Return a previously-retrieved item to the ring buffer from an ISR.

Note: If a split item is retrieved, both parts should be returned by calling this function twice

Parameters

- **xRingbuffer** -- [in] Ring buffer the item was retrieved from
- **pvItem** -- [in] Item that was received earlier
- **pxHigherPriorityTaskWoken** -- [out] Value pointed to will be set to `pdTRUE` if the function woke up a higher priority task.

void **xRingbufferDelete** (*RingbufHandle_t* xRingbuffer)

Delete a ring buffer.

Note: This function will not deallocate any memory if the ring buffer was created using `xRingbufferCreateStatic()`. Deallocation must be done manually by the user.

Parameters **xRingbuffer** -- [in] Ring buffer to delete

size_t **xRingbufferGetMaxItemSize** (*RingbufHandle_t* xRingbuffer)

Get maximum size of an item that can be placed in the ring buffer.

This function returns the maximum size an item can have if it was placed in an empty ring buffer.

Note: The max item size for a no-split buffer is limited to $((\text{buffer_size}/2) - \text{header_size})$. This limit is imposed so that an item of max item size can always be sent to an empty no-split buffer regardless of the internal positions of the buffer's read/write/free pointers.

Parameters **xRingbuffer** -- [in] Ring buffer to query

Returns Maximum size, in bytes, of an item that can be placed in a ring buffer.

size_t **xRingbufferGetCurFreeSize** (*RingbufHandle_t* xRingbuffer)

Get current free size available for an item/data in the buffer.

This gives the real time free space available for an item/data in the ring buffer. This represents the maximum size an item/data can have if it was currently sent to the ring buffer.

Note: An empty no-split buffer has a max current free size for an item that is limited to $((\text{buffer_size}/2) - \text{header_size})$. See API reference for `xRingbufferGetMaxItemSize()`.

Warning: This API is not thread safe. So, if multiple threads are accessing the same ring buffer, it is the application's responsibility to ensure atomic access to this API and the subsequent Send

Parameters **xRingbuffer** -- [in] Ring buffer to query

Returns Current free size, in bytes, available for an entry

BaseType_t **xRingbufferAddToQueueSetRead** (*RingbufHandle_t* xRingbuffer, *QueueSetHandle_t* xQueueSet)

Add the ring buffer to a queue set. Notified when data has been written to the ring buffer.

This function adds the ring buffer to a queue set, thus allowing a task to block on multiple queues/ring buffers. The queue set is notified when the new data becomes available to read on the ring buffer.

Parameters

- **xRingbuffer** -- [in] Ring buffer to add to the queue set
- **xQueueSet** -- [in] Queue set to add the ring buffer to

Returns

- pdTRUE on success, pdFALSE otherwise

static inline BaseType_t **xRingbufferCanRead** (*RingbufHandle_t* xRingbuffer, *QueueSetMemberHandle_t* xMember)

Check if the selected queue set member is a particular ring buffer.

This API checks if queue set member returned from `xQueueSelectFromSet()` is a particular ring buffer. If so, this indicates the ring buffer has items waiting to be retrieved.

Parameters

- **xRingbuffer** -- [in] Ring buffer to check
- **xMember** -- [in] Member returned from xQueueSelectFromSet

Returns

- pdTRUE when selected queue set member is the ring buffer
- pdFALSE otherwise.

BaseType_t **xRingbufferRemoveFromQueueSetRead** (*RingbufHandle_t* xRingbuffer, *QueueSetHandle_t* xQueueSet)

Remove the ring buffer from a queue set.

This function removes a ring buffer from a queue set. The ring buffer must have been previously added to the queue set using xRingbufferAddToQueueSetRead().

Parameters

- **xRingbuffer** -- [in] Ring buffer to remove from the queue set
- **xQueueSet** -- [in] Queue set to remove the ring buffer from

Returns

- pdTRUE on success
- pdFALSE otherwise

void **vRingbufferGetInfo** (*RingbufHandle_t* xRingbuffer, BaseType_t *uxFree, BaseType_t *uxRead, BaseType_t *uxWrite, BaseType_t *uxAcquire, BaseType_t *uxItemsWaiting)

Get information about ring buffer status.

Get information of a ring buffer's current status such as free/read/write/acquire pointer positions, and number of items waiting to be retrieved. Arguments can be set to NULL if they are not required.

Parameters

- **xRingbuffer** -- [in] Ring buffer handle
- **uxFree** -- [out] Pointer use to store free pointer position
- **uxRead** -- [out] Pointer use to store read pointer position
- **uxWrite** -- [out] Pointer use to store write pointer position
- **uxAcquire** -- [out] Pointer use to store acquire pointer position
- **uxItemsWaiting** -- [out] Pointer use to store number of items (bytes for byte buffer) waiting to be retrieved

void **xRingbufferPrintInfo** (*RingbufHandle_t* xRingbuffer)

Debugging function to print the internal pointers in the ring buffer.

Parameters **xRingbuffer** -- Ring buffer to show

BaseType_t **xRingbufferGetStaticBuffer** (*RingbufHandle_t* xRingbuffer, uint8_t **ppucRingbufferStorage, *StaticRingbuffer_t* **ppxStaticRingbuffer)

Retrieve the pointers to a statically created ring buffer.

Parameters

- **xRingbuffer** -- [in] Ring buffer
- **ppucRingbufferStorage** -- [out] Used to return a pointer to the queue's storage area buffer
- **ppxStaticRingbuffer** -- [out] Used to return a pointer to the queue's data structure buffer

Returns pdTRUE if buffers were retrieved, pdFALSE otherwise.

RingbufHandle_t **xRingbufferCreateWithCaps** (size_t xBufferSize, *RingbufferType_t* xBufferType, BaseType_t uxMemoryCaps)

Creates a ring buffer with specific memory capabilities.

This function is similar to xRingbufferCreate(), except that it allows the memory allocated for the ring buffer to have specific capabilities (e.g., MALLOC_CAP_INTERNAL).

Note: A queue created using this function must only be deleted using `vRingbufferDeleteWithCaps()`

Parameters

- **xBufferSize** -- **[in]** Size of the buffer in bytes
- **xBufferType** -- **[in]** Type of ring buffer, see documentation.
- **uxMemoryCaps** -- **[in]** Memory capabilities of the queue's memory (see `esp_heap_caps.h`)

Returns Handle to the created ring buffer or NULL on failure.

void **vRingbufferDeleteWithCaps** (*RingbufHandle_t* xRingbuffer)

Deletes a ring buffer previously created using `xRingbufferCreateWithCaps()`

Parameters **xRingbuffer** -- Ring buffer

Structures

struct **xSTATIC_RINGBUFFER**

Struct that is equivalent in size to the ring buffer's data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer's control data structure.

Type Definitions

typedef void ***RingbufHandle_t**

Type by which ring buffers are referenced. For example, a call to `xRingbufferCreate()` returns a `RingbufHandle_t` variable that can then be used as a parameter to `xRingbufferSend()`, `xRingbufferReceive()`, etc.

typedef struct *xSTATIC_RINGBUFFER* **StaticRingbuffer_t**

Struct that is equivalent in size to the ring buffer's data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer's control data structure.

Enumerations

enum **RingbufferType_t**

Values:

enumerator **RINGBUF_TYPE_NOSPLIT**

No-split buffers will only store an item in contiguous memory and will never split an item. Each item requires an 8 byte overhead for a header and will always internally occupy a 32-bit aligned size of space.

enumerator **RINGBUF_TYPE_ALLOWSPLIT**

Allow-split buffers will split an item into two parts if necessary in order to store it. Each item requires an 8 byte overhead for a header, splitting incurs an extra header. Each item will always internally occupy a 32-bit aligned size of space.

enumerator **RINGBUF_TYPE_BYTEBUF**

Byte buffers store data as a sequence of bytes and do not maintain separate items, therefore byte buffers have no overhead. All data is stored as a sequence of byte and any number of bytes can be sent or retrieved each time.

enumerator `RINGBUF_TYPE_MAX`

Hooks API

Header File

- [components/esp_system/include/esp_freertos_hooks.h](#)
- This header file can be included with:

```
#include "esp_freertos_hooks.h"
```

Functions

`esp_err_t esp_register_freertos_idle_hook_for_cpu` ([esp_freertos_idle_cb_t](#) new_idle_cb, `UBaseType_t` cpuid)

Register a callback to be called from the specified core's idle hook. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

Warning: Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

Parameters

- `new_idle_cb` -- **[in]** Callback to be called
- `cpuid` -- **[in]** id of the core

Returns

- `ESP_OK`: Callback registered to the specified core's idle hook
- `ESP_ERR_NO_MEM`: No more space on the specified core's idle hook to register callback
- `ESP_ERR_INVALID_ARG`: cpuid is invalid

`esp_err_t esp_register_freertos_idle_hook` ([esp_freertos_idle_cb_t](#) new_idle_cb)

Register a callback to the idle hook of the core that calls this function. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

Warning: Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

Parameters `new_idle_cb` -- **[in]** Callback to be called

Returns

- `ESP_OK`: Callback registered to the calling core's idle hook
- `ESP_ERR_NO_MEM`: No more space on the calling core's idle hook to register callback

`esp_err_t esp_register_freertos_tick_hook_for_cpu` ([esp_freertos_tick_cb_t](#) new_tick_cb, `UBaseType_t` cpuid)

Register a callback to be called from the specified core's tick hook.

Parameters

- `new_tick_cb` -- **[in]** Callback to be called
- `cpuid` -- **[in]** id of the core

Returns

- `ESP_OK`: Callback registered to specified core's tick hook

- ESP_ERR_NO_MEM: No more space on the specified core's tick hook to register the callback
- ESP_ERR_INVALID_ARG: cpuid is invalid

esp_err_t **esp_register_freertos_tick_hook** (*esp_freertos_tick_cb_t* new_tick_cb)

Register a callback to be called from the calling core's tick hook.

Parameters *new_tick_cb* -- [in] Callback to be called

Returns

- ESP_OK: Callback registered to the calling core's tick hook
- ESP_ERR_NO_MEM: No more space on the calling core's tick hook to register the callback

void **esp_deregister_freertos_idle_hook_for_cpu** (*esp_freertos_idle_cb_t* old_idle_cb,
UBaseType_t cpuid)

Unregister an idle callback from the idle hook of the specified core.

Parameters

- *old_idle_cb* -- [in] Callback to be unregistered
- *cpuid* -- [in] id of the core

void **esp_deregister_freertos_idle_hook** (*esp_freertos_idle_cb_t* old_idle_cb)

Unregister an idle callback. If the idle callback is registered to the idle hooks of both cores, the idle hook will be unregistered from both cores.

Parameters *old_idle_cb* -- [in] Callback to be unregistered

void **esp_deregister_freertos_tick_hook_for_cpu** (*esp_freertos_tick_cb_t* old_tick_cb,
UBaseType_t cpuid)

Unregister a tick callback from the tick hook of the specified core.

Parameters

- *old_tick_cb* -- [in] Callback to be unregistered
- *cpuid* -- [in] id of the core

void **esp_deregister_freertos_tick_hook** (*esp_freertos_tick_cb_t* old_tick_cb)

Unregister a tick callback. If the tick callback is registered to the tick hooks of both cores, the tick hook will be unregistered from both cores.

Parameters *old_tick_cb* -- [in] Callback to be unregistered

Type Definitions

```
typedef bool (*esp_freertos_idle_cb_t)(void)
```

```
typedef void (*esp_freertos_tick_cb_t)(void)
```

Functions

BaseType_t xTaskCreatePinnedToCore (TaskFunction_t pxTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, *TaskHandle_t* *const pxCreatedTask, const BaseType_t xCoreID)

Create a new task that is pinned to a particular core.

This function is similar to `xTaskCreate()`, but allows the creation of a pinned task. The task's pinned core is specified by the `xCoreID` argument. If `xCoreID` is set to `tskNO_AFFINITY`, then the task is unpinned and can run on any core.

Note: If (`configNUMBER_OF_CORES == 1`), setting `xCoreID` to `tskNO_AFFINITY` will be treated as 0.

Parameters

- **pxTaskCode** -- Pointer to the task entry function.
- **pcName** -- A descriptive name for the task.
- **ulStackDepth** -- The size of the task stack specified as the NUMBER OF BYTES. Note that this differs from vanilla FreeRTOS.
- **pvParameters** -- Pointer that will be used as the parameter for the task being created.
- **uxPriority** -- The priority at which the task should run.
- **pxCreatedTask** -- Used to pass back a handle by which the created task can be referenced.
- **xCoreID** -- The core to which the task is pinned to, or `tskNO_AFFINITY` if the task has no core affinity.

Returns `pdPASS` if the task was successfully created and added to a ready list, otherwise an error code defined in the file `projdefs.h`

***TaskHandle_t* xTaskCreateStaticPinnedToCore** (TaskFunction_t pxTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, StackType_t *const puxStackBuffer, StaticTask_t *const pxTaskBuffer, const BaseType_t xCoreID)

Create a new static task that is pinned to a particular core.

This function is similar to `xTaskCreateStatic()`, but allows the creation of a pinned task. The task's pinned core is specified by the `xCoreID` argument. If `xCoreID` is set to `tskNO_AFFINITY`, then the task is unpinned and can run on any core.

Note: If (`configNUMBER_OF_CORES == 1`), setting `xCoreID` to `tskNO_AFFINITY` will be treated as 0.

Parameters

- **pxTaskCode** -- Pointer to the task entry function.
- **pcName** -- A descriptive name for the task.
- **ulStackDepth** -- The size of the task stack specified as the NUMBER OF BYTES. Note that this differs from vanilla FreeRTOS.
- **pvParameters** -- Pointer that will be used as the parameter for the task being created.
- **uxPriority** -- The priority at which the task should run.
- **puxStackBuffer** -- Must point to a `StackType_t` array that has at least `ulStackDepth` indexes
- **pxTaskBuffer** -- Must point to a variable of type `StaticTask_t`, which will then be used to hold the task's data structures,
- **xCoreID** -- The core to which the task is pinned to, or `tskNO_AFFINITY` if the task has no core affinity.

Returns The task handle if the task was created, `NULL` otherwise.

BaseType_t **xTaskGetCoreID** (*TaskHandle_t* xTask)

Get the current core ID of a particular task.

Helper function to get the core ID of a particular task. If the task is pinned to a particular core, the core ID is returned. If the task is not pinned to a particular core, `tskNO_AFFINITY` is returned.

If `CONFIG_FREERTOS_UNICORE` is enabled, this function simply returns 0.

[refactor-todo] See if this needs to be deprecated (IDF-8145)(IDF-8164)

Note: If `CONFIG_FREERTOS_SMP` is enabled, please call `vTaskCoreAffinityGet()` instead.

Note: In IDF FreeRTOS when `configNUMBER_OF_CORES == 1`, this function will always return 0,

Parameters **xTask** -- The task to query

Returns The task's core ID or `tskNO_AFFINITY`

TaskHandle_t **xTaskGetCurrentTaskHandleForCore** (BaseType_t xCoreID)

Get the handle of the task currently running on a certain core.

Because of the nature of SMP processing, there is no guarantee that this value will still be valid on return and should only be used for debugging purposes.

[refactor-todo] See if this needs to be deprecated (IDF-8145)

Parameters **xCoreID** -- The core to query

Returns Handle of the current task running on the queried core

uint8_t ***pxTaskGetStackStart** (*TaskHandle_t* xTask)

Returns the start of the stack associated with xTask.

Returns the lowest stack memory address, regardless of whether the stack grows up or down.

[refactor-todo] Change return type to `StackType_t` (IDF-8158)

Parameters **xTask** -- Handle of the task associated with the stack returned. Set xTask to NULL to return the stack of the calling task.

Returns A pointer to the start of the stack.

void **vTaskSetThreadLocalStoragePointerAndDelCallback** (*TaskHandle_t* xTaskToSet, BaseType_t xIndex, void *pvValue, *TlsDeleteCallbackFunction_t* pvDelCallback)

Set local storage pointer and deletion callback.

Each task contains an array of pointers that is dimensioned by the `configNUM_THREAD_LOCAL_STORAGE_POINTERS` setting in `FreeRTOSConfig.h`. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Local storage pointers set for a task can reference dynamically allocated resources. This function is similar to `vTaskSetThreadLocalStoragePointer`, but provides a way to release these resources when the task gets deleted. For each pointer, a callback function can be set. This function will be called when task is deleted, with the local storage pointer index and value as arguments.

Parameters

- **xTaskToSet** -- Task to set thread local storage pointer for
- **xIndex** -- The index of the pointer to set, from 0 to `configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1`.
- **pvValue** -- Pointer value to set.
- **pvDelCallback** -- Function to call to dispose of the local storage pointer when the task is deleted.

BaseType_t **xTaskCreatePinnedToCoreWithCaps** (TaskFunction_t pvTaskCode, const char *const pcName, const configSTACK_DEPTH_TYPE usStackSize, void *const pvParameters, UBaseType_t uxPriority, *TaskHandle_t* *const pvCreatedTask, const BaseType_t xCoreID, UBaseType_t uxMemoryCaps)

Creates a pinned task where its stack has specific memory capabilities.

This function is similar to xTaskCreatePinnedToCore(), except that it allows the memory allocated for the task's stack to have specific capabilities (e.g., MALLOC_CAP_SPIRAM).

However, the specified capabilities will NOT apply to the task's TCB as a TCB must always be in internal RAM.

Parameters

- **pvTaskCode** -- Pointer to the task entry function
- **pcName** -- A descriptive name for the task
- **usStackSize** -- The size of the task stack specified as the number of bytes
- **pvParameters** -- Pointer that will be used as the parameter for the task being created.
- **uxPriority** -- The priority at which the task should run.
- **pvCreatedTask** -- Used to pass back a handle by which the created task can be referenced.
- **xCoreID** -- Core to which the task is pinned to, or tskNO_AFFINITY if unpinned.
- **uxMemoryCaps** -- Memory capabilities of the task stack's memory (see esp_heap_caps.h)

Returns pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

static inline BaseType_t **xTaskCreateWithCaps** (TaskFunction_t pvTaskCode, const char *const pcName, configSTACK_DEPTH_TYPE usStackSize, void *const pvParameters, UBaseType_t uxPriority, *TaskHandle_t* *pvCreatedTask, UBaseType_t uxMemoryCaps)

Creates a task where its stack has specific memory capabilities.

This function is similar to xTaskCreate(), except that it allows the memory allocated for the task's stack to have specific capabilities (e.g., MALLOC_CAP_SPIRAM).

However, the specified capabilities will NOT apply to the task's TCB as a TCB must always be in internal RAM.

Note: A task created using this function must only be deleted using vTaskDeleteWithCaps()

Parameters

- **pvTaskCode** -- Pointer to the task entry function
- **pcName** -- A descriptive name for the task
- **usStackSize** -- The size of the task stack specified as the number of bytes
- **pvParameters** -- Pointer that will be used as the parameter for the task being created.
- **uxPriority** -- The priority at which the task should run.
- **pvCreatedTask** -- Used to pass back a handle by which the created task can be referenced.
- **uxMemoryCaps** -- Memory capabilities of the task stack's memory (see esp_heap_caps.h)

Returns pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

void **vTaskDeleteWithCaps** (*TaskHandle_t* xTaskToDelete)

Deletes a task previously created using xTaskCreateWithCaps() or xTaskCreatePinnedToCoreWithCaps()

Note: It is recommended to use this API to delete tasks from another task's context, rather than self-deletion. When the task is being deleted, it is vital to ensure that it is not running on another core. This API must not be called from an interrupt context.

Parameters **xTaskToDelete** -- A handle to the task to be deleted

QueueHandle_t **xQueueCreateWithCaps** (UBaseType_t uxQueueLength, UBaseType_t uxItemSize, UBaseType_t uxMemoryCaps)

Creates a queue with specific memory capabilities.

This function is similar to xQueueCreate(), except that it allows the memory allocated for the queue to have specific capabilities (e.g., MALLOC_CAP_INTERNAL).

Note: A queue created using this function must only be deleted using vQueueDeleteWithCaps()

Parameters

- **uxQueueLength** -- The maximum number of items that the queue can contain.
- **uxItemSize** -- The number of bytes each item in the queue will require.
- **uxMemoryCaps** -- Memory capabilities of the queue's memory (see esp_heap_caps.h)

Returns Handle to the created queue or NULL on failure.

void **vQueueDeleteWithCaps** (*QueueHandle_t* xQueue)

Deletes a queue previously created using xQueueCreateWithCaps()

Parameters **xQueue** -- A handle to the queue to be deleted.

static inline *SemaphoreHandle_t* **xSemaphoreCreateBinaryWithCaps** (UBaseType_t uxMemoryCaps)

Creates a binary semaphore with specific memory capabilities.

This function is similar to vSemaphoreCreateBinary(), except that it allows the memory allocated for the binary semaphore to have specific capabilities (e.g., MALLOC_CAP_INTERNAL).

Note: A binary semaphore created using this function must only be deleted using vSemaphoreDeleteWithCaps()

Parameters **uxMemoryCaps** -- Memory capabilities of the binary semaphore's memory (see esp_heap_caps.h)

Returns Handle to the created binary semaphore or NULL on failure.

static inline *SemaphoreHandle_t* **xSemaphoreCreateCountingWithCaps** (UBaseType_t uxMaxCount, UBaseType_t uxInitialCount, UBaseType_t uxMemoryCaps)

Creates a counting semaphore with specific memory capabilities.

This function is similar to xSemaphoreCreateCounting(), except that it allows the memory allocated for the counting semaphore to have specific capabilities (e.g., MALLOC_CAP_INTERNAL).

Note: A counting semaphore created using this function must only be deleted using vSemaphoreDeleteWithCaps()

Parameters

- **uxMaxCount** -- The maximum count value that can be reached.
- **uxInitialCount** -- The count value assigned to the semaphore when it is created.

- **uxMemoryCaps** -- Memory capabilities of the counting semaphore's memory (see esp_heap_caps.h)

Returns Handle to the created counting semaphore or NULL on failure.

static inline *SemaphoreHandle_t* **xSemaphoreCreateMutexWithCaps** (UBaseType_t uxMemoryCaps)

Creates a mutex semaphore with specific memory capabilities.

This function is similar to xSemaphoreCreateMutex(), except that it allows the memory allocated for the mutex semaphore to have specific capabilities (e.g., MALLOC_CAP_INTERNAL).

Note: A mutex semaphore created using this function must only be deleted using vSemaphoreDeleteWithCaps()

Parameters **uxMemoryCaps** -- Memory capabilities of the mutex semaphore's memory (see esp_heap_caps.h)

Returns Handle to the created mutex semaphore or NULL on failure.

static inline *SemaphoreHandle_t* **xSemaphoreCreateRecursiveMutexWithCaps** (UBaseType_t uxMemoryCaps)

Creates a recursive mutex with specific memory capabilities.

This function is similar to xSemaphoreCreateRecursiveMutex(), except that it allows the memory allocated for the recursive mutex to have specific capabilities (e.g., MALLOC_CAP_INTERNAL).

Note: A recursive mutex created using this function must only be deleted using vSemaphoreDeleteWithCaps()

Parameters **uxMemoryCaps** -- Memory capabilities of the recursive mutex's memory (see esp_heap_caps.h)

Returns Handle to the created recursive mutex or NULL on failure.

void **vSemaphoreDeleteWithCaps** (*SemaphoreHandle_t* xSemaphore)

Deletes a semaphore previously created using one of the xSemaphoreCreate...WithCaps() functions.

Parameters **xSemaphore** -- A handle to the semaphore to be deleted.

static inline *StreamBufferHandle_t* **xStreamBufferCreateWithCaps** (size_t xBufferSizeBytes, size_t xTriggerLevelBytes, UBaseType_t uxMemoryCaps)

Creates a stream buffer with specific memory capabilities.

This function is similar to xStreamBufferCreate(), except that it allows the memory allocated for the stream buffer to have specific capabilities (e.g., MALLOC_CAP_INTERNAL).

Note: A stream buffer created using this function must only be deleted using vStreamBufferDeleteWithCaps()

Parameters

- **xBufferSizeBytes** -- The total number of bytes the stream buffer will be able to hold at any one time.
- **xTriggerLevelBytes** -- The number of bytes that must be in the stream buffer before unblocking
- **uxMemoryCaps** -- Memory capabilities of the stream buffer's memory (see esp_heap_caps.h)

Returns Handle to the created stream buffer or NULL on failure.

static inline void **vStreamBufferDeleteWithCaps** (*StreamBufferHandle_t* xStreamBuffer)

Deletes a stream buffer previously created using xStreamBufferCreateWithCaps()

Parameters **xStreamBuffer** -- A handle to the stream buffer to be deleted.

static inline *MessageBufferHandle_t* **xMessageBufferCreateWithCaps** (size_t xBufferSizeBytes,
UBaseType_t uxMemoryCaps)

Creates a message buffer with specific memory capabilities.

This function is similar to xMessageBufferCreate(), except that it allows the memory allocated for the message buffer to have specific capabilities (e.g., MALLOC_CAP_INTERNAL).

Note: A message buffer created using this function must only be deleted using vMessageBufferDeleteWithCaps()

Parameters

- **xBufferSizeBytes** -- The total number of bytes (not messages) the message buffer will be able to hold at any one time.
- **uxMemoryCaps** -- Memory capabilities of the message buffer's memory (see esp_heap_caps.h)

Returns Handle to the created message buffer or NULL on failure.

static inline void **vMessageBufferDeleteWithCaps** (*MessageBufferHandle_t* xMessageBuffer)

Deletes a stream buffer previously created using xMessageBufferCreateWithCaps()

Parameters **xMessageBuffer** -- A handle to the message buffer to be deleted.

EventGroupHandle_t **xEventGroupCreateWithCaps** (UBaseType_t uxMemoryCaps)

Creates an event group with specific memory capabilities.

This function is similar to xEventGroupCreate(), except that it allows the memory allocated for the event group to have specific capabilities (e.g., MALLOC_CAP_INTERNAL).

Note: An event group created using this function must only be deleted using vEventGroupDeleteWithCaps()

Parameters **uxMemoryCaps** -- Memory capabilities of the event group's memory (see esp_heap_caps.h)

Returns Handle to the created event group or NULL on failure.

void **vEventGroupDeleteWithCaps** (*EventGroupHandle_t* xEventGroup)

Deletes an event group previously created using xEventGroupCreateWithCaps()

Parameters **xEventGroup** -- A handle to the event group to be deleted.

Type Definitions

typedef void (***TlsDeleteCallbackFunction_t**)(int, void*)

Prototype of local storage pointer deletion callback.

2.9.14 Heap Memory Allocation

Stack and Heap

ESP-IDF applications use the common computer architecture patterns of **stack** (dynamic memory allocated by program control flow), **heap** (dynamic memory allocated by function calls), and **static memory** (memory allocated at compile time).

Because ESP-IDF is a multi-threaded RTOS environment, each RTOS task has its own stack. By default, each of these stacks is allocated from the heap when the task is created. See `xTaskCreateStatic()` for the alternative where stacks are statically allocated.

Because ESP32-C5 uses multiple types of RAM, it also contains multiple heaps with different capabilities. A capabilities-based memory allocator allows apps to make heap allocations for different purposes.

For most purposes, the C Standard Library's `malloc()` and `free()` functions can be used for heap allocation without any special consideration. However, in order to fully make use of all of the memory types and their characteristics, ESP-IDF also has a capabilities-based heap memory allocator. If you want to have a memory with certain properties (e.g., *DMA-Capable Memory* or executable-memory), you can create an OR-mask of the required capabilities and pass that to `heap_caps_malloc()`.

Memory Capabilities

The ESP32-C5 contains multiple types of RAM:

- DRAM (Data RAM) is memory that is connected to CPU's data bus and is used to hold data. This is the most common kind of memory accessed as a heap.
- IRAM (Instruction RAM) is memory that is connected to the CPU's instruction bus and usually holds executable data only (i.e., instructions). If accessed as generic memory, all accesses must be aligned to *32-Bit Accessible Memory*.
- D/IRAM is RAM that is connected to CPU's data bus and instruction bus, thus can be used either Instruction or Data RAM.

For more details on these internal memory types, see *Memory Types*.

It is also possible to connect external SPI RAM to the ESP32-C5. The *external RAM* is integrated into the ESP32-C5's memory map via the cache, and accessed similarly to DRAM.

All DRAM memory is single-byte accessible, thus all DRAM heaps possess the `MALLOC_CAP_8BIT` capability. Users can call `heap_caps_get_free_size(MALLOC_CAP_8BIT)` to get the free size of all DRAM heaps.

When calling `malloc()`, the ESP-IDF `malloc()` internally calls `heap_caps_malloc_default(size)`. This will allocate memory with the capability `MALLOC_CAP_DEFAULT`, which is byte-addressable.

Because `malloc()` uses the capabilities-based allocation system, memory allocated using `heap_caps_malloc()` can be freed by calling the standard `free()` function.

Available Heap

DRAM At startup, the DRAM heap contains all data memory that is not statically allocated by the app. Reducing statically-allocated buffers increases the amount of available free heap.

To find the amount of statically allocated memory, use the `idf.py size` command.

Note: At runtime, the available heap DRAM may be less than calculated at compile time, because, at startup, some memory is allocated from the heap before the FreeRTOS scheduler is started (including memory for the stacks of initial FreeRTOS tasks).

IRAM At startup, the IRAM heap contains all instruction memory that is not used by the app executable code.

The `idf.py size` command can be used to find the amount of IRAM used by the app.

D/IRAM Some memory in the ESP32-C5 is available as either DRAM or IRAM. If memory is allocated from a D/IRAM region, the free heap size for both types of memory will decrease.

Heap Sizes At startup, all ESP-IDF apps log a summary of all heap addresses (and sizes) at level Info:

```
I (252) heap_init: Initializing. RAM available for dynamic allocation:
I (259) heap_init: At 3FFAE6E0 len 00001920 (6 KiB): DRAM
I (265) heap_init: At 3FFB2EC8 len 0002D138 (180 KiB): DRAM
I (272) heap_init: At 3FFE0440 len 00003AE0 (14 KiB): D/IRAM
I (278) heap_init: At 3FFE4350 len 0001BCB0 (111 KiB): D/IRAM
I (284) heap_init: At 4008944C len 00016BB4 (90 KiB): IRAM
```

Finding Available Heap See [Heap Information](#).

Special Capabilities

DMA-Capable Memory Use the `MALLOC_CAP_DMA` flag to allocate memory which is suitable for use with hardware DMA engines (for example SPI and I2S). This capability flag excludes any external PSRAM.

The EDMA hardware feature allows DMA buffers to be placed in external PSRAM, but there may be additional alignment constraints. Consult the ESP32-C5 Technical Reference Manual for details. To allocate a DMA-capable external memory buffer, use the `MALLOC_CAP_SPIRAM | MALLOC_CAP_DMA` capabilities flags; the heap allocator will take care of alignment requirements imposed by the cache and DMA subsystems. If a peripheral has additional alignment requirements, you can use `heap_caps_aligned_alloc()` with the necessary alignment specified.

32-Bit Accessible Memory If a certain memory structure is only addressed in 32-bit units, for example, an array of ints or pointers, it can be useful to allocate it with the `MALLOC_CAP_32BIT` flag. This also allows the allocator to give out IRAM memory, which is sometimes unavailable for a normal `malloc()` call. This can help to use all the available memory in the ESP32-C5.

Memory allocated with `MALLOC_CAP_32BIT` can **only** be accessed via 32-bit reads and writes, any other type of access will generate a fatal `LoadStoreError` exception.

External SPI Memory When *external RAM* is enabled, external SPI RAM can be allocated using standard `malloc` calls, or via `heap_caps_malloc(MALLOC_CAP_SPIRAM)`, depending on the configuration. See [Configuring External RAM](#) for more details.

Thread Safety

Heap functions are thread-safe, meaning they can be called from different tasks simultaneously without any limitations.

It is technically possible to call `malloc`, `free`, and related functions from interrupt handler (ISR) context (see [Calling Heap-Related Functions from ISR](#)). However, this is not recommended, as heap function calls may delay other interrupts. It is strongly recommended to refactor applications so that any buffers used by an ISR are pre-allocated outside of the ISR. Support for calling heap functions from ISRs may be removed in a future update.

Calling Heap-Related Functions from ISR

The following functions from the heap component can be called from the interrupt handler (ISR):

- `heap_caps_malloc()`
- `heap_caps_malloc_default()`
- `heap_caps_realloc_default()`

- `heap_caps_malloc_prefer()`
- `heap_caps_realloc_prefer()`
- `heap_caps_calloc_prefer()`
- `heap_caps_free()`
- `heap_caps_realloc()`
- `heap_caps_calloc()`
- `heap_caps_aligned_alloc()`
- `heap_caps_aligned_free()`

Note: However, this practice is strongly discouraged.

Heap Tracing & Debugging

The following features are documented on the [Heap Memory Debugging](#) page:

- [Heap Information](#) (free space, etc.)
- [Heap Allocation and Free Function Hooks](#)
- [Heap Corruption Detection](#)
- [Heap Tracing](#) (memory leak detection, monitoring, etc.)

Implementation Notes

Knowledge about the regions of memory in the chip comes from the "SoC" component, which contains memory layout information for the chip, and the different capabilities of each region. Each region's capabilities are prioritized, so that (for example) dedicated DRAM and IRAM regions are used for allocations ahead of the more versatile D/IRAM regions.

Each contiguous region of memory contains its own memory heap. The heaps are created using the [multi_heap](#) functionality. `multi_heap` allows any contiguous region of memory to be used as a heap.

The heap capabilities allocator uses knowledge of the memory regions to initialize each individual heap. Allocation functions in the heap capabilities API will find the most appropriate heap for the allocation based on desired capabilities, available space, and preferences for each region's use, and then calling `multi_heap_malloc()` for the heap situated in that particular region.

Calling `free()` involves finding the particular heap corresponding to the freed address, and then call `multi_heap_free()` on that particular `multi_heap` instance.

API Reference - Heap Allocation

Header File

- `components/heap/include/esp_heap_caps.h`
- This header file can be included with:

```
#include "esp_heap_caps.h"
```

Functions

`esp_err_t heap_caps_register_failed_alloc_callback(esp_alloc_failed_hook_t callback)`

registers a callback function to be invoked if a memory allocation operation fails

Parameters `callback` -- caller defined callback to be invoked

Returns `ESP_OK` if callback was registered.

void ***heap_caps_malloc** (size_t size, uint32_t caps)

Allocate a chunk of memory which has the given capabilities.

Equivalent semantics to libc malloc(), for capability-aware memory.

Parameters

- **size** -- Size, in bytes, of the amount of memory to allocate
- **caps** -- Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

Returns A pointer to the memory allocated on success, NULL on failure

void **heap_caps_free** (void *ptr)

Free memory previously allocated via heap_caps_malloc() or heap_caps_realloc().

Equivalent semantics to libc free(), for capability-aware memory.

In IDF, free(p) is equivalent to heap_caps_free(p).

Parameters ptr -- Pointer to memory previously returned from heap_caps_malloc() or heap_caps_realloc(). Can be NULL.

void ***heap_caps_realloc** (void *ptr, size_t size, uint32_t caps)

Reallocate memory previously allocated via heap_caps_malloc() or heap_caps_realloc().

Equivalent semantics to libc realloc(), for capability-aware memory.

In IDF, realloc(p, s) is equivalent to heap_caps_realloc(p, s, MALLOC_CAP_8BIT).

'caps' parameter can be different to the capabilities that any original 'ptr' was allocated with. In this way, realloc can be used to "move" a buffer if necessary to ensure it meets a new set of capabilities.

Parameters

- **ptr** -- Pointer to previously allocated memory, or NULL for a new allocation.
- **size** -- Size of the new buffer requested, or 0 to free the buffer.
- **caps** -- Bitwise OR of MALLOC_CAP_* flags indicating the type of memory desired for the new allocation.

Returns Pointer to a new buffer of size 'size' with capabilities 'caps', or NULL if allocation failed.

void ***heap_caps_aligned_alloc** (size_t alignment, size_t size, uint32_t caps)

Allocate an aligned chunk of memory which has the given capabilities.

Equivalent semantics to libc aligned_alloc(), for capability-aware memory.

Parameters

- **alignment** -- How the pointer received needs to be aligned must be a power of two
- **size** -- Size, in bytes, of the amount of memory to allocate
- **caps** -- Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

Returns A pointer to the memory allocated on success, NULL on failure

void **heap_caps_aligned_free** (void *ptr)

Used to deallocate memory previously allocated with heap_caps_aligned_alloc.

Note: This function is deprecated, please consider using heap_caps_free() instead

Parameters ptr -- Pointer to the memory allocated

void ***heap_caps_aligned_calloc** (size_t alignment, size_t n, size_t size, uint32_t caps)

Allocate an aligned chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

Parameters

- **alignment** -- How the pointer received needs to be aligned must be a power of two

- **n** -- Number of continuing chunks of memory to allocate
- **size** -- Size, in bytes, of a chunk of memory to allocate
- **caps** -- Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory to be returned

Returns A pointer to the memory allocated on success, NULL on failure

void ***heap_caps_malloc** (size_t n, size_t size, uint32_t caps)

Allocate a chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

Equivalent semantics to `libc calloc()`, for capability-aware memory.

In IDF, `calloc(p)` is equivalent to `heap_caps_malloc(p, MALLOC_CAP_8BIT)`.

Parameters

- **n** -- Number of continuing chunks of memory to allocate
- **size** -- Size, in bytes, of a chunk of memory to allocate
- **caps** -- Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory to be returned

Returns A pointer to the memory allocated on success, NULL on failure

size_t **heap_caps_get_total_size** (uint32_t caps)

Get the total size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the total space they have.

Parameters **caps** -- Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

Returns total size in bytes

size_t **heap_caps_get_free_size** (uint32_t caps)

Get the total free size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the free space they have.

Note: Note that because of heap fragmentation it is probably not possible to allocate a single block of memory of this size. Use `heap_caps_get_largest_free_block()` for this purpose.

Parameters **caps** -- Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

Returns Amount of free bytes in the regions

size_t **heap_caps_get_minimum_free_size** (uint32_t caps)

Get the total minimum free memory of all regions with the given capabilities.

This adds all the low watermarks of the regions capable of delivering the memory with the given capabilities.

Note: Note the result may be less than the global all-time minimum available heap of this kind, as "low watermarks" are tracked per-region. Individual regions' heaps may have reached their "low watermarks" at different points in time. However, this result still gives a "worst case" indication for all-time minimum free heap.

Parameters **caps** -- Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

Returns Amount of free bytes in the regions

size_t **heap_caps_get_largest_free_block** (uint32_t caps)

Get the largest free block of memory able to be allocated with the given capabilities.

Returns the largest value of `s` for which `heap_caps_malloc(s, caps)` will succeed.

Parameters `caps` -- Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

Returns Size of the largest free block in bytes.

`esp_err_t heap_caps_monitor_local_minimum_free_size_start` (void)

Start monitoring the value of `minimum_free_bytes` from the moment this function is called instead of from startup.

Note: This allows to detect local lows of the `minimum_free_bytes` value that wouldn't be detected otherwise.

Returns `esp_err_t` `ESP_OK` if the function executed properly `ESP_FAIL` if called when monitoring already active

`esp_err_t heap_caps_monitor_local_minimum_free_size_stop` (void)

Stop monitoring the value of `minimum_free_bytes`. After this call the `minimum_free_bytes` value calculated from startup will be returned in `heap_caps_get_info` and `heap_caps_get_minimum_free_size`.

Returns `esp_err_t` `ESP_OK` if the function executed properly `ESP_FAIL` if called when monitoring not active

void `heap_caps_get_info` (`multi_heap_info_t` *info, uint32_t caps)

Get heap info for all regions with the given capabilities.

Calls `multi_heap_info()` on all heaps which share the given capabilities. The information returned is an aggregate across all matching heaps. The meanings of fields are the same as defined for `multi_heap_info_t`, except that `minimum_free_bytes` has the same caveats described in `heap_caps_get_minimum_free_size()`.

Parameters

- `info` -- Pointer to a structure which will be filled with relevant heap metadata.
- `caps` -- Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

void `heap_caps_print_heap_info` (uint32_t caps)

Print a summary of all memory with the given capabilities.

Calls `multi_heap_info` on all heaps which share the given capabilities, and prints a two-line summary for each, then a total summary.

Parameters `caps` -- Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

bool `heap_caps_check_integrity_all` (bool print_errors)

Check integrity of all heap memory in the system.

Calls `multi_heap_check` on all heaps. Optionally print errors if heaps are corrupt.

Calling this function is equivalent to calling `heap_caps_check_integrity` with the `caps` argument set to `MALLOC_CAP_INVALID`.

Note: Please increase the value of `CONFIG_ESP_INT_WDT_TIMEOUT_MS` when using this API with PSRAM enabled.

Parameters `print_errors` -- Print specific errors if heap corruption is found.

Returns True if all heaps are valid, False if at least one heap is corrupt.

bool `heap_caps_check_integrity` (uint32_t caps, bool print_errors)

Check integrity of all heaps with the given capabilities.

Calls `multi_heap_check` on all heaps which share the given capabilities. Optionally print errors if the heaps are corrupt.

See also `heap_caps_check_integrity_all` to check all heap memory in the system and `heap_caps_check_integrity_addr` to check memory around a single address.

Note: Please increase the value of `CONFIG_ESP_INT_WDT_TIMEOUT_MS` when using this API with PSRAM capability flag.

Parameters

- **caps** -- Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory
- **print_errors** -- Print specific errors if heap corruption is found.

Returns True if all heaps are valid, False if at least one heap is corrupt.

bool **heap_caps_check_integrity_addr** (intptr_t addr, bool print_errors)

Check integrity of heap memory around a given address.

This function can be used to check the integrity of a single region of heap memory, which contains the given address.

This can be useful if debugging heap integrity for corruption at a known address, as it has a lower overhead than checking all heap regions. Note that if the corrupt address moves around between runs (due to timing or other factors) then this approach won't work, and you should call `heap_caps_check_integrity` or `heap_caps_check_integrity_all` instead.

Note: The entire heap region around the address is checked, not only the adjacent heap blocks.

Parameters

- **addr** -- Address in memory. Check for corruption in region containing this address.
- **print_errors** -- Print specific errors if heap corruption is found.

Returns True if the heap containing the specified address is valid, False if at least one heap is corrupt or the address doesn't belong to a heap region.

void **heap_caps_malloc_extmem_enable** (size_t limit)

Enable `malloc()` in external memory and set limit below which `malloc()` attempts are placed in internal memory.

When external memory is in use, the allocation strategy is to initially try to satisfy smaller allocation requests with internal memory and larger requests with external memory. This sets the limit between the two, as well as generally enabling allocation in external memory.

Parameters **limit** -- Limit, in bytes.

void ***heap_caps_malloc_prefer** (size_t size, size_t num, ...)

Allocate a chunk of memory as preference in decreasing order.

Attention The variable parameters are bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory. This API prefers to allocate memory with the first parameter. If failed, allocate memory with the next parameter. It will try in this order until allocating a chunk of memory successfully or fail to allocate memories with any of the parameters.

Parameters

- **size** -- Size, in bytes, of the amount of memory to allocate
- **num** -- Number of variable parameters

Returns A pointer to the memory allocated on success, NULL on failure

void ***heap_caps_realloc_prefer** (void *ptr, size_t size, size_t num, ...)

Reallocate a chunk of memory as preference in decreasing order.

Parameters

- **ptr** -- Pointer to previously allocated memory, or NULL for a new allocation.
- **size** -- Size of the new buffer requested, or 0 to free the buffer.
- **num** -- Number of variable parameters

Returns Pointer to a new buffer of size 'size', or NULL if allocation failed.

void ***heap_caps_malloc_prefer** (size_t n, size_t size, size_t num, ...)

Allocate a chunk of memory as preference in decreasing order.

Parameters

- **n** -- Number of continuing chunks of memory to allocate
- **size** -- Size, in bytes, of a chunk of memory to allocate
- **num** -- Number of variable parameters

Returns A pointer to the memory allocated on success, NULL on failure

void **heap_caps_dump** (uint32_t caps)

Dump the full structure of all heaps with matching capabilities.

Prints a large amount of output to serial (because of locking limitations, the output bypasses stdout/stderr). For each (variable sized) block in each matching heap, the following output is printed on a single line:

- Block address (the data buffer returned by malloc is 4 bytes after this if heap debugging is set to Basic, or 8 bytes otherwise).
- Data size (the data size may be larger than the size requested by malloc, either due to heap fragmentation or because of heap debugging level).
- Address of next block in the heap.
- If the block is free, the address of the next free block is also printed.

Parameters **caps** -- Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

void **heap_caps_dump_all** (void)

Dump the full structure of all heaps.

Covers all registered heaps. Prints a large amount of output to serial.

Output is the same as for heap_caps_dump.

size_t **heap_caps_get_allocated_size** (void *ptr)

Return the size that a particular pointer was allocated with.

Note: The app will crash with an assertion failure if the pointer is not valid.

Parameters **ptr** -- Pointer to currently allocated heap memory. Must be a pointer value previously returned by heap_caps_malloc, malloc, calloc, etc. and not yet freed.

Returns Size of the memory allocated at this block.

void **heap_caps_walk** (uint32_t caps, *heap_caps_walker_cb_t* walker_func, void *user_data)

Function called to walk through the heaps with the given set of capabilities.

Parameters

- **caps** -- The set of capabilities assigned to the heaps to walk through
- **walker_func** -- Callback called for each block of the heaps being traversed
- **user_data** -- Opaque pointer to user defined data

void **heap_caps_walk_all** (*heap_caps_walker_cb_t* walker_func, void *user_data)

Function called to walk through all heaps defined by the heap component.

Parameters

- **walker_func** -- Callback called for each block of the heaps being traversed
- **user_data** -- Opaque pointer to user defined data

Structures

struct **walker_heap_info**

Structure used to store heap related data passed to the walker callback function.

Public Members

intptr_t **start**

Start address of the heap in which the block is located.

intptr_t **end**

End address of the heap in which the block is located.

struct **walker_block_info**

Structure used to store block related data passed to the walker callback function.

Public Members

void ***ptr**

Pointer to the block data.

size_t **size**

The size of the block.

bool **used**

Block status. True: used, False: free.

Macros

HEAP_IRAM_ATTR

MALLOC_CAP_EXEC

Flags to indicate the capabilities of the various memory systems.

Memory must be able to run executable code

MALLOC_CAP_32BIT

Memory must allow for aligned 32-bit data accesses.

MALLOC_CAP_8BIT

Memory must allow for 8/16/...-bit data accesses.

MALLOC_CAP_DMA

Memory must be able to accessed by DMA.

MALLOC_CAP_PID2

Memory must be mapped to PID2 memory space (PIDs are not currently used)

MALLOC_CAP_PID3

Memory must be mapped to PID3 memory space (PIDs are not currently used)

MALLOC_CAP_PID4

Memory must be mapped to PID4 memory space (PIDs are not currently used)

MALLOC_CAP_PID5

Memory must be mapped to PID5 memory space (PIDs are not currently used)

MALLOC_CAP_PID6

Memory must be mapped to PID6 memory space (PIDs are not currently used)

MALLOC_CAP_PID7

Memory must be mapped to PID7 memory space (PIDs are not currently used)

MALLOC_CAP_SPIRAM

Memory must be in SPI RAM.

MALLOC_CAP_INTERNAL

Memory must be internal; specifically it should not disappear when flash/spiram cache is switched off.

MALLOC_CAP_DEFAULT

Memory can be returned in a non-capability-specific memory allocation (e.g. malloc(), calloc()) call.

MALLOC_CAP_IRAM_8BIT

Memory must be in IRAM and allow unaligned access.

MALLOC_CAP_RETENTION

Memory must be able to accessed by retention DMA.

MALLOC_CAP_RTCRAM

Memory must be in RTC fast memory.

MALLOC_CAP_TCM

Memory must be in TCM memory.

MALLOC_CAP_DMA_DESC_AHB

Memory must be capable of containing AHB DMA descriptors.

MALLOC_CAP_DMA_DESC_AXI

Memory must be capable of containing AXI DMA descriptors.

MALLOC_CAP_CACHE_ALIGNED

Memory must be aligned to the cache line size of any intermediate caches.

MALLOC_CAP_INVALID

Memory can't be used / list end marker.

Type Definitions

typedef void (***esp_alloc_failed_hook_t**)(size_t size, uint32_t caps, const char *function_name)

callback called when an allocation operation fails, if registered

Param size in bytes of failed allocation

Param caps capabilities requested of failed allocation

Param function_name function which generated the failure

typedef struct *walker_heap_info* **walker_heap_info_t**

Structure used to store heap related data passed to the walker callback function.

typedef struct *walker_block_info* **walker_block_info_t**

Structure used to store block related data passed to the walker callback function.

typedef bool (***heap_caps_walker_cb_t**)(*walker_heap_info_t* heap_info, *walker_block_info_t* block_info, void *user_data)

Function callback used to get information of memory block during calls to `heap_caps_walk` or `heap_caps_walk_all`.

Param heap_info See `walker_heap_info_t`

Param block_info See `walker_block_info_t`

Param user_data Opaque pointer to user defined data

Return True to proceed with the heap traversal False to stop the traversal of the current heap and continue with the traversal of the next heap (if any)

API Reference - Initialisation

Header File

- `components/heap/include/esp_heap_caps_init.h`
- This header file can be included with:

```
#include "esp_heap_caps_init.h"
```

Functions

void **heap_caps_init** (void)

Initialize the capability-aware heap allocator.

This is called once in the IDF startup code. Do not call it at other times.

void **heap_caps_enable_nonos_stack_heaps** (void)

Enable heap(s) in memory regions where the startup stacks are located.

On startup, the pro/app CPUs have a certain memory region they use as stack, so we cannot do allocations in the regions these stack frames are. When FreeRTOS is completely started, they do not use that memory anymore and heap(s) there can be enabled.

esp_err_t **heap_caps_add_region** (intptr_t start, intptr_t end)

Add a region of memory to the collection of heaps at runtime.

Most memory regions are defined in `soc_memory_layout.c` for the SoC, and are registered via `heap_caps_init()`. Some regions can't be used immediately and are later enabled via `heap_caps_enable_nonos_stack_heaps()`.

Call this function to add a region of memory to the heap at some later time.

This function does not consider any of the "reserved" regions or other data in `soc_memory_layout`, caller needs to consider this themselves.

All memory within the region specified by start & end parameters must be otherwise unused.

The capabilities of the newly registered memory will be determined by the start address, as looked up in the regions specified in `soc_memory_layout.c`.

Use `heap_caps_add_region_with_caps()` to register a region with custom capabilities.

Note: Please refer to following example for memory regions allowed for addition to heap based on an existing region (address range for demonstration purpose only):

```
Existing region: 0x1000 <-> 0x3000
New region:      0x1000 <-> 0x3000 (Allowed)
New region:      0x1000 <-> 0x2000 (Allowed)
New region:      0x0000 <-> 0x1000 (Allowed)
New region:      0x3000 <-> 0x4000 (Allowed)
New region:      0x0000 <-> 0x2000 (NOT Allowed)
New region:      0x0000 <-> 0x4000 (NOT Allowed)
New region:      0x1000 <-> 0x4000 (NOT Allowed)
New region:      0x2000 <-> 0x4000 (NOT Allowed)
```

Parameters

- **start** -- Start address of new region.
- **end** -- End address of new region.

Returns `ESP_OK` on success, `ESP_ERR_INVALID_ARG` if a parameter is invalid, `ESP_ERR_NOT_FOUND` if the specified start address doesn't reside in a known region, or any error returned by `heap_caps_add_region_with_caps()`.

esp_err_t `heap_caps_add_region_with_caps` (const uint32_t caps[], intptr_t start, intptr_t end)

Add a region of memory to the collection of heaps at runtime, with custom capabilities.

Similar to `heap_caps_add_region()`, only custom memory capabilities are specified by the caller.

Note: Please refer to following example for memory regions allowed for addition to heap based on an existing region (address range for demonstration purpose only):

```
Existing region: 0x1000 <-> 0x3000
New region:      0x1000 <-> 0x3000 (Allowed)
New region:      0x1000 <-> 0x2000 (Allowed)
New region:      0x0000 <-> 0x1000 (Allowed)
New region:      0x3000 <-> 0x4000 (Allowed)
New region:      0x0000 <-> 0x2000 (NOT Allowed)
New region:      0x0000 <-> 0x4000 (NOT Allowed)
New region:      0x1000 <-> 0x4000 (NOT Allowed)
New region:      0x2000 <-> 0x4000 (NOT Allowed)
```

Parameters

- **caps** -- Ordered array of capability masks for the new region, in order of priority. Must have length `SOC_MEMORY_TYPE_NO_PRIOS`. Does not need to remain valid after the call returns.
- **start** -- Start address of new region.
- **end** -- End address of new region.

Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if a parameter is invalid
- `ESP_ERR_NO_MEM` if no memory to register new heap.
- `ESP_ERR_INVALID_SIZE` if the memory region is too small to fit a heap
- `ESP_FAIL` if region overlaps the start and/or end of an existing region

API Reference - Multi-Heap API

(Note: The multi-heap API is used internally by the heap capabilities allocator. Most ESP-IDF programs never need to call this API directly.)

Header File

- [components/heap/include/multi_heap.h](#)
- This header file can be included with:

```
#include "multi_heap.h"
```

Functions

void **multi_heap_aligned_alloc** (*multi_heap_handle_t* heap, size_t size, size_t alignment)
allocate a chunk of memory with specific alignment

Parameters

- **heap** -- Handle to a registered heap.
- **size** -- size in bytes of memory chunk
- **alignment** -- how the memory must be aligned

Returns pointer to the memory allocated, NULL on failure

void **multi_heap_malloc** (*multi_heap_handle_t* heap, size_t size)
malloc() a buffer in a given heap

Semantics are the same as standard malloc(), only the returned buffer will be allocated in the specified heap.

Parameters

- **heap** -- Handle to a registered heap.
- **size** -- Size of desired buffer.

Returns Pointer to new memory, or NULL if allocation fails.

void **multi_heap_aligned_free** (*multi_heap_handle_t* heap, void *p)
free() a buffer aligned in a given heap.

Note: This function is deprecated, consider using multi_heap_free() instead

Parameters

- **heap** -- Handle to a registered heap.
- **p** -- NULL, or a pointer previously returned from multi_heap_aligned_alloc() for the same heap.

void **multi_heap_free** (*multi_heap_handle_t* heap, void *p)
free() a buffer in a given heap.

Semantics are the same as standard free(), only the argument 'p' must be NULL or have been allocated in the specified heap.

Parameters

- **heap** -- Handle to a registered heap.
- **p** -- NULL, or a pointer previously returned from multi_heap_malloc() or multi_heap_realloc() for the same heap.

void **multi_heap_realloc** (*multi_heap_handle_t* heap, void *p, size_t size)
realloc() a buffer in a given heap.

Semantics are the same as standard realloc(), only the argument 'p' must be NULL or have been allocated in the specified heap.

Parameters

- **heap** -- Handle to a registered heap.
- **p** -- NULL, or a pointer previously returned from `multi_heap_malloc()` or `multi_heap_realloc()` for the same heap.
- **size** -- Desired new size for buffer.

Returns New buffer of 'size' containing contents of 'p', or NULL if reallocation failed.

`size_t multi_heap_get_allocated_size (multi_heap_handle_t heap, void *p)`

Return the size that a particular pointer was allocated with.

Parameters

- **heap** -- Handle to a registered heap.
- **p** -- Pointer, must have been previously returned from `multi_heap_malloc()` or `multi_heap_realloc()` for the same heap.

Returns Size of the memory allocated at this block. May be more than the original size argument, due to padding and minimum block sizes.

`multi_heap_handle_t multi_heap_register (void *start, size_t size)`

Register a new heap for use.

This function initialises a heap at the specified address, and returns a handle for future heap operations.

There is no equivalent function for deregistering a heap - if all blocks in the heap are free, you can immediately start using the memory for other purposes.

Parameters

- **start** -- Start address of the memory to use for a new heap.
- **size** -- Size (in bytes) of the new heap.

Returns Handle of a new heap ready for use, or NULL if the heap region was too small to be initialised.

`void multi_heap_set_lock (multi_heap_handle_t heap, void *lock)`

Associate a private lock pointer with a heap.

The lock argument is supplied to the `MULTI_HEAP_LOCK()` and `MULTI_HEAP_UNLOCK()` macros, defined in `multi_heap_platform.h`.

The lock in question must be recursive.

When the heap is first registered, the associated lock is NULL.

Parameters

- **heap** -- Handle to a registered heap.
- **lock** -- Optional pointer to a locking structure to associate with this heap.

`void multi_heap_dump (multi_heap_handle_t heap)`

Dump heap information to stdout.

For debugging purposes, this function dumps information about every block in the heap to stdout.

Parameters **heap** -- Handle to a registered heap.

`bool multi_heap_check (multi_heap_handle_t heap, bool print_errors)`

Check heap integrity.

Walks the heap and checks all heap data structures are valid. If any errors are detected, an error-specific message can be optionally printed to stderr. Print behaviour can be overridden at compile time by defining `MULTI_CHECK_FAIL_PRINTF` in `multi_heap_platform.h`.

Note: This function is not thread-safe as it sets a global variable with the value of `print_errors`.

Parameters

- **heap** -- Handle to a registered heap.
- **print_errors** -- If true, errors will be printed to stderr.

Returns true if heap is valid, false otherwise.

size_t **multi_heap_free_size** (*multi_heap_handle_t* heap)

Return free heap size.

Returns the number of bytes available in the heap.

Equivalent to the `total_free_bytes` member returned by `multi_heap_get_heap_info()`.

Note that the heap may be fragmented, so the actual maximum size for a single `malloc()` may be lower. To know this size, see the `largest_free_block` member returned by `multi_heap_get_heap_info()`.

Parameters **heap** -- Handle to a registered heap.

Returns Number of free bytes.

size_t **multi_heap_minimum_free_size** (*multi_heap_handle_t* heap)

Return the lifetime minimum free heap size.

Equivalent to the `minimum_free_bytes` member returned by `multi_heap_get_info()`.

Returns the lifetime "low watermark" of possible values returned from `multi_free_heap_size()`, for the specified heap.

Parameters **heap** -- Handle to a registered heap.

Returns Number of free bytes.

void **multi_heap_get_info** (*multi_heap_handle_t* heap, *multi_heap_info_t* *info)

Return metadata about a given heap.

Fills a *multi_heap_info_t* structure with information about the specified heap.

Parameters

- **heap** -- Handle to a registered heap.
- **info** -- Pointer to a structure to fill with heap metadata.

void ***multi_heap_aligned_alloc_offs** (*multi_heap_handle_t* heap, size_t size, size_t alignment, size_t offset)

Perform an aligned allocation from the provided offset.

Parameters

- **heap** -- The heap in which to perform the allocation
- **size** -- The size of the allocation
- **alignment** -- How the memory must be aligned
- **offset** -- The offset at which the alignment should start

Returns void* The ptr to the allocated memory

size_t **multi_heap_reset_minimum_free_bytes** (*multi_heap_handle_t* heap)

Reset the `minimum_free_bytes` value (setting it to `free_bytes`) and return the former value.

Parameters **heap** -- The heap in which the reset is taking place

Returns size_t the value of `minimum_free_bytes` before it is reset

void **multi_heap_restore_minimum_free_bytes** (*multi_heap_handle_t* heap, const size_t new_minimum_free_bytes_value)

Set the value of `minimum_free_bytes` to `new_minimum_free_bytes_value` or keep the current value of `minimum_free_bytes` if it is smaller than `new_minimum_free_bytes_value`.

Parameters

- **heap** -- The heap in which the restore is taking place
- **new_minimum_free_bytes_value** -- The value to restore the `minimum_free_bytes` to

void **multi_heap_walk** (*multi_heap_handle_t* heap, *multi_heap_walker_cb_t* walker_func, void *user_data)

Call the `tlsf_walk_pool` function of the heap given as parameter with the walker function passed as parameter.

Parameters

- **heap** -- The heap to traverse
- **walker_func** -- The walker to trigger on each block of the heap
- **user_data** -- Opaque pointer to user defined data

Structures

struct **multi_heap_info_t**

Structure to access heap metadata via `multi_heap_get_info`.

Public Members

size_t **total_free_bytes**

Total free bytes in the heap. Equivalent to `multi_free_heap_size()`.

size_t **total_allocated_bytes**

Total bytes allocated to data in the heap.

size_t **largest_free_block**

Size of the largest free block in the heap. This is the largest malloc-able size.

size_t **minimum_free_bytes**

Lifetime minimum free heap size. Equivalent to `multi_minimum_free_heap_size()`.

size_t **allocated_blocks**

Number of (variable size) blocks allocated in the heap.

size_t **free_blocks**

Number of (variable size) free blocks in the heap.

size_t **total_blocks**

Total number of (variable size) blocks in the heap.

Type Definitions

typedef struct multi_heap_info ***multi_heap_handle_t**

Opaque handle to a registered heap.

typedef bool (***multi_heap_walker_cb_t**)(void *block_ptr, size_t block_size, int block_used, void *user_data)

Callback called when walking the given heap blocks of memory.

Param block_ptr Pointer to the block data

Param block_size The size of the block

Param block_used Block status. 0: free, 1: allocated

Param user_data Opaque pointer to user defined data

Return True if the walker is expected to continue the heap traversal False if the walker is expected to stop the traversal of the heap

This warning was automatically inserted due to the source file being in the `add_warnings_pages` list.

2.9.15 Memory Management for MMU Supported Memory

Introduction

ESP32-C5 Memory Management Unit (MMU) is relatively simple. It can do memory address translation between physical memory addresses and virtual memory addresses. So CPU can access physical memories via virtual addresses. There are multiple types of virtual memory addresses, which have different capabilities.

ESP-IDF provides a memory mapping driver that manages the relation between these physical memory addresses and virtual memory addresses, so as to achieve some features such as reading from SPI flash via a pointer.

Memory mapping driver is actually a capabilities-based virtual memory address allocator that allows applications to make virtual memory address allocations for different purposes. In the following chapters, we call this driver `esp_mmap` driver.

ESP-IDF also provides a memory synchronization driver which can be used for potential memory desynchronization scenarios.

Physical Memory Types

Memory mapping driver currently supports mapping to following physical memory type(s):

- SPI flash
- PSRAM

Virtual Memory Capabilities

- `MMU_MEM_CAP_EXEC`: This capability indicates that the virtual memory address has the execute permission. Note this permission scope is within the MMU hardware.
- `MMU_MEM_CAP_READ`: This capability indicates that the virtual memory address has the read permission. Note this permission scope is within the MMU hardware.
- `MMU_MEM_CAP_WRITE`: This capability indicates that the virtual memory address has the write permission. Note this permission scope is within the MMU hardware.
- `MMU_MEM_CAP_32BIT`: This capability indicates that the virtual memory address allows for 32 bits or multiples of 32 bits access.
- `MMU_MEM_CAP_8BIT`: This capability indicates that the virtual memory address allows for 8 bits or multiples of 8 bits access.

You can call `esp_mmu_map_get_max_consecutive_free_block_size()` to know the largest consecutive mappable block size with certain capabilities.

Memory Management Drivers

Driver Concept

Terminology The virtual memory pool is made up with one or multiple virtual memory regions, see below figure:

- A virtual memory pool stands for the whole virtual address range that can be mapped to physical memory.
- A virtual memory region is a range of virtual address with same attributes.
- A virtual memory block is a piece of virtual address range that is dynamically mapped.
- A slot is the virtual address range between two virtual memory blocks.
- A physical memory block is a piece of physical address range that is to-be-mapped or already mapped to a virtual memory block.
- Dynamical mapping is done by calling `esp_mmap` driver API `esp_mmu_map()`. This API maps the given physical memory block to a virtual memory block which is allocated by the `esp_mmap` driver.

Relation Between Memory Blocks When mapping a physical memory block A, block A can have one of the following relations with another previously mapped physical memory block B:

- Enclosed: block A is completely enclosed within block B, see figure below:

- Identical: block A is completely the same as block B, see figure below:

Note that `esp_mmap` driver considers the identical scenario **the same as the enclosed scenario**.

- Overlapped: block A is overlapped with block B, see figure below:

There is a special condition, when block A entirely encloses block B, see figure below:

Note that `esp_mmap` driver considers this scenario **the same as the overlapped scenario**.

Driver Behaviour

Memory Map You can call `esp_mmu_map()` to do a dynamical mapping. This API can allocate a certain size of virtual memory block according to the virtual memory capabilities you selected, then map this virtual memory block to the physical memory block as you requested. The `esp_mmap` driver supports mapping to one or more types of physical memory, so you should specify the physical memory target when mapping.

By default, physical memory blocks and virtual memory blocks are one-to-one mapped. This means, when calling `esp_mmu_map()`:

- If it is the enclosed scenario, this API will return an `ESP_ERR_INVALID_STATE`. The `out_ptr` will be assigned to the start virtual memory address of the previously mapped one which encloses the to-be-mapped one.
- If it is the identical scenario, this API will behaves exactly the same as the enclosed scenario.
- If it is the overlapped scenario, this API will by default return an `ESP_ERR_INVALID_ARG`. This means, `esp_mmap` driver by default does not allow mapping a physical memory address to multiple virtual memory addresses.

Specially, you can use `ESP_MMU_MMAP_FLAG_PADDR_SHARED`. This flag stands for one-to-multiple mapping between a physical address and multiple virtual addresses:

- If it is the overlapped scenario, this API will allocate a new virtual memory block as requested, then map to the given physical memory block.

Memory Unmap You can call `esp_mmu_unmap()` to unmap a previously mapped memory block. This API returns an `ESP_ERR_NOT_FOUND` if you are trying to unmap a virtual memory block that is not mapped to any physical memory block yet.

Memory Address Conversion The `esp_mmap` driver provides two helper APIs to do the conversion between virtual memory address and physical memory address:

- `esp_mmu_vaddr_to_paddr()` converts virtual address to physical address.
- `esp_mmu_paddr_to_vaddr()` converts physical address to virtual address.

Memory Synchronization MMU supported physical memories can be accessed by one or multiple methods.

SPI flash can be accessed by SPI1 (ESP-IDF `esp_flash` driver APIs), or by pointers. ESP-IDF `esp_flash` driver APIs have already considered the memory synchronization, so users do not need to worry about this.

PSRAM can be accessed by pointers, hardware guarantees the data consistency when PSRAM is only accessed via pointers.

Thread Safety

APIs in `esp_mmu_map.h` are not guaranteed to be thread-safe.

APIs in `esp_cache.h` are guaranteed to be thread-safe.

API Reference

API Reference - ESP MMAP Driver

Header File

- `components/esp_mm/include/esp_mmu_map.h`
- This header file can be included with:

```
#include "esp_mmu_map.h"
```

- This header file is a part of the API provided by the `esp_mm` component. To declare that your component depends on `esp_mm`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_mm
```

or

```
PRIV_REQUIRES esp_mm
```

Functions

`esp_err_t esp_mmu_map(esp_paddr_t paddr_start, size_t size, mmu_target_t target, mmu_mem_caps_t caps, int flags, void **out_ptr)`

Map a physical memory block to external virtual address block, with given capabilities.

Note: This API does not guarantee thread safety

Parameters

- **paddr_start** -- [in] Start address of the physical memory block
- **size** -- [in] Size to be mapped. Size will be rounded up by to the nearest multiple of MMU page size
- **target** -- [in] Physical memory target you're going to map to, see `mmu_target_t`
- **caps** -- [in] Memory capabilities, see `mmu_mem_caps_t`
- **flags** -- [in] Mmap flags
- **out_ptr** -- [out] Start address of the mapped virtual memory

Returns

- `ESP_OK`
- `ESP_ERR_INVALID_ARG`: Invalid argument, see printed logs
- `ESP_ERR_NOT_SUPPORTED`: Only on ESP32, PSRAM is not a supported physical memory target
- `ESP_ERR_NOT_FOUND`: No enough size free block to use
- `ESP_ERR_NO_MEM`: Out of memory, this API will allocate some heap memory for internal usage

- `ESP_ERR_INVALID_STATE`: `paddr` is mapped already, this API will return corresponding `vaddr_start + new_block_offset` as per the previously mapped block. Only to-be-mapped `paddr` block is totally enclosed by a previously mapped block will lead to this error. (Identical scenario will behave similarly) `new_block_start new_block_end`
|-----New Block -----| |-----Block -----| `block_start block_end`

esp_err_t `esp_mmu_unmap` (void *ptr)

Unmap a previously mapped virtual memory block.

Note: This API does not guarantee thread safety

Parameters `ptr` -- [in] Start address of the virtual memory

Returns

- `ESP_OK`
- `ESP_ERR_INVALID_ARG`: Null pointer
- `ESP_ERR_NOT_FOUND`: `Vaddr` is not in external memory, or it's not mapped yet

esp_err_t `esp_mmu_map_get_max_consecutive_free_block_size` (mmu_mem_caps_t caps, mmu_target_t target, size_t *out_len)

Get largest consecutive free external virtual memory block size, with given capabilities and given physical target.

Parameters

- `caps` -- [in] Bitwise OR of `MMU_MEM_CAP_*` flags indicating the memory block
- `target` -- [in] Physical memory target you're going to map to, see `mmu_target_t`.
- `out_len` -- [out] Largest free block length, in bytes.

Returns

- `ESP_OK`
- `ESP_ERR_INVALID_ARG`: Invalid arguments, could be null pointer

esp_err_t `esp_mmu_map_dump_mapped_blocks` (FILE *stream)

Dump all the previously mapped blocks

Note: This API shall not be called from an ISR.

Note: This API does not guarantee thread safety

Parameters `stream` -- stream to print information to; use `stdout` or `stderr` to print to the console; use `fmemopen/open_memstream` to print to a string buffer.

Returns

- `ESP_OK`

esp_err_t `esp_mmu_vaddr_to_paddr` (void *vaddr, *esp_paddr_t* *out_paddr, mmu_target_t *out_target)

Convert virtual address to physical address.

Parameters

- `vaddr` -- [in] Virtual address
- `out_paddr` -- [out] Physical address
- `out_target` -- [out] Physical memory target, see `mmu_target_t`

Returns

- `ESP_OK`
- `ESP_ERR_INVALID_ARG`: Null pointer, or `vaddr` is not within external memory
- `ESP_ERR_NOT_FOUND`: `Vaddr` is not mapped yet

`esp_err_t esp_mmu_paddr_to_vaddr` (`esp_paddr_t` paddr, `mmu_target_t` target, `mmu_vaddr_t` type, void `**out_vaddr`)

Convert physical address to virtual address.

Parameters

- **paddr** -- **[in]** Physical address
- **target** -- **[in]** Physical memory target, see `mmu_target_t`
- **type** -- **[in]** Virtual address type, could be either instruction or data
- **out_vaddr** -- **[out]** Virtual address

Returns

- `ESP_OK`
- `ESP_ERR_INVALID_ARG`: Null pointer
- `ESP_ERR_NOT_FOUND`: Paddr is not mapped yet

`esp_err_t esp_mmu_paddr_find_caps` (`const esp_paddr_t` paddr, `mmu_mem_caps_t` *`out_caps`)

If the physical address is mapped, this API will provide the capabilities of the virtual address where the physical address is mapped to.

Note: : Only return value is `ESP_OK`(which means physically address is successfully mapped), then caps you get make sense.

Note: This API only check one page (see `CONFIG_MMU_PAGE_SIZE`), starting from the `paddr`

Parameters

- **paddr** -- **[in]** Physical address
- **out_caps** -- **[out]** Bitwise OR of `MMU_MEM_CAP_*` flags indicating the capabilities of a virtual address where the physical address is mapped to.

Returns

- `ESP_OK`: Physical address successfully mapped.
- `ESP_ERR_INVALID_ARG`: Null pointer
- `ESP_ERR_NOT_FOUND`: Physical address is not mapped successfully.

Macros

`ESP_MMU_MMAP_FLAG_PADDR_SHARED`

Share this mapping.

2.9.16 Heap Memory Debugging

Overview

ESP-IDF integrates tools for requesting *heap information*, *heap corruption detection*, and *heap tracing*. These can help track down memory-related bugs.

For general information about the heap memory allocator, see [Heap Memory Allocation](#).

Heap Information

To obtain information about the state of the heap, call the following functions:

- `heap_caps_get_free_size()` can be used to return the current free memory for different memory capabilities.
- `heap_caps_get_largest_free_block()` can be used to return the largest free block in the heap, which is also the largest single allocation currently possible. Tracking this value and comparing it to the total free heap allows you to detect heap fragmentation.
- `heap_caps_get_minimum_free_size()` can be used to track the heap "low watermark" since boot.
- `heap_caps_get_info()` returns a `multi_heap_info_t` structure, which contains the information from the above functions, plus some additional heap-specific data (number of allocations, etc.).
- `heap_caps_print_heap_info()` prints a summary of the information returned by `heap_caps_get_info()` to stdout.
- `heap_caps_dump()` and `heap_caps_dump_all()` output detailed information about the structure of each block in the heap. Note that this can be a large amount of output.

Heap Allocation and Free Function Hooks

Heap allocation and free detection hooks allow you to be notified of every successful allocation and free operation:

- Providing a definition of `esp_heap_trace_alloc_hook()` allows you to be notified of every successful memory allocation operation
- Providing a definition of `esp_heap_trace_free_hook()` allows you to be notified of every successful memory-free operations

This feature can be enabled by setting the `CONFIG_HEAP_USE_HOOKS` option. `esp_heap_trace_alloc_hook()` and `esp_heap_trace_free_hook()` have weak declarations (e.g., `__attribute__((weak))`), thus it is not necessary to provide declarations for both hooks. Given that it is technically possible to allocate and free memory from an ISR (**though strongly discouraged from doing so**), the `esp_heap_trace_alloc_hook()` and `esp_heap_trace_free_hook()` can potentially be called from an ISR.

It is not recommended to perform (or call API functions to perform) blocking operations or memory allocation/free operations in the hook functions. In general, the best practice is to keep the implementation concise and leave the heavy computation outside of the hook functions.

The example below shows how to define the allocation and free function hooks:

```
#include "esp_heap_caps.h"

void esp_heap_trace_alloc_hook(void* ptr, size_t size, uint32_t caps)
{
    ...
}

void esp_heap_trace_free_hook(void* ptr)
{
    ...
}

void app_main()
{
    ...
}
```

Heap Corruption Detection

Heap corruption detection allows you to detect various types of heap memory errors:

- Out-of-bound writes & buffer overflows
- Writes to freed memory
- Reads from freed or uninitialized memory

Assertions The heap implementation (`heap/multi_heap.c`, etc.) includes numerous assertions that will fail if the heap memory is corrupted. To detect heap corruption most effectively, ensure that assertions are enabled in the project configuration via the `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL` option.

If a heap integrity assertion fails, a line will be printed like `CORRUPT HEAP: multi_heap.c:225 detected at 0x3ffbb71c`. The memory address printed is the address of the heap structure that has corrupt content.

It is also possible to manually check heap integrity by calling `heap_caps_check_integrity_all()` or related functions. This function checks all of the requested heap memory for integrity and can be used even if assertions are disabled. If the integrity checks detects an error, it will print the error along with the address(es) of corrupt heap structures.

Memory Allocation Failed Hook Users can use `heap_caps_register_failed_alloc_callback()` to register a callback that is invoked every time an allocation operation fails.

Additionally, users can enable the `CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS`, which will automatically trigger a system abort if any allocation operation fails.

The example below shows how to register an allocation failure callback:

```
#include "esp_heap_caps.h"

void heap_caps_alloc_failed_hook(size_t requested_size, uint32_t caps, const char_
↳*function_name)
{
    printf("%s was called but failed to allocate %d bytes with 0x%X capabilities. \n
↳", function_name, requested_size, caps);
}

void app_main()
{
    ...
    esp_err_t error = heap_caps_register_failed_alloc_callback(heap_caps_alloc_
↳failed_hook);
    ...
    void *ptr = heap_caps_malloc(allocation_size, MALLOC_CAP_DEFAULT);
    ...
}
```

Finding Heap Corruption Memory corruption can be one of the hardest classes of bugs to find and fix, as the source of the corruption could be completely unrelated to the symptoms of the corruption. Here are some tips:

- A crash with a `CORRUPT HEAP :` message usually includes a stack trace, but this stack trace is rarely useful. The crash is the symptom of memory corruption when the system realizes the heap is corrupt. But usually, the corruption happens elsewhere and earlier in time.
- Increasing the heap memory debugging *Configuration* level to "Light impact" or "Comprehensive" gives you a more accurate message with the first corrupt memory address.
- Adding regular calls to `heap_caps_check_integrity_all()` or `heap_caps_check_integrity_addr()` in your code helps you pin down the exact time that the corruption happened. You can move these checks around to "close in on" the section of code that corrupted the heap.

- Based on the memory address that has been corrupted, you can use *JTAG debugging* to set a watchpoint on this address and have the CPU halt when it is written to.
- If you do not have JTAG, but you do know roughly when the corruption happens, set a watchpoint in software just beforehand via `esp_cpu_set_watchpoint()`. A fatal exception will occur when the watchpoint triggers. The following is an example of how to use the function - `esp_cpu_set_watchpoint(0, (void *)addr, 4, ESP_WATCHPOINT_STORE)`. Note that watchpoints are per-CPU and are set on the current running CPU only. So if you do not know which CPU is corrupting memory, call this function on both CPUs.
- For buffer overflows, *heap tracing* in `HEAP_TRACE_ALL` mode tells which callers are allocating which addresses from the heap. See *Heap Tracing To Find Heap Corruption* for more details. You can try to find the function that allocates memory with an address immediately before the corrupted address, since it is probably the function that overflows the buffer.
- Calling `heap_caps_dump()` or `heap_caps_dump_all()` can give an indication of what heap blocks are surrounding the corrupted region and may have overflowed or underflowed, etc.

Configuration Temporarily increasing the heap corruption detection level can give more detailed information about heap corruption errors.

In the project configuration menu, under `Component config`, there is a menu `Heap memory debugging`. The option `CONFIG_HEAP_CORRUPTION_DETECTION` can be set to one of the following three levels:

Basic (No Poisoning) This is the default level. By default, no special heap corruption features are enabled, but the provided assertions are enabled. A heap corruption error will be printed if any of the heap's internal data structures appear overwritten or corrupted. This usually indicates a buffer overrun or out-of-bounds write.

If assertions are enabled, an assertion will also trigger if a double-free occurs (the same memory is freed twice).

Calling `heap_caps_check_integrity()` in Basic mode checks the integrity of all heap structures, and print errors if any appear to be corrupted.

Light Impact At this level, heap memory is additionally "poisoned" with head and tail "canary bytes" before and after each block that is allocated. If an application writes outside the bounds of allocated buffers, the canary bytes will be corrupted, and the integrity check will fail.

The head canary word is `0xABBA1234` (`3412BAAB` in byte order), and the tail canary word is `0xBAAD5678` (`7856ADBA` in byte order).

With basic heap corruption checks, most out-of-bound writes can be detected and the number of overrun bytes before a failure is detected depends on the properties of the heap. However, the Light Impact mode is more precise as even a single-byte overrun can be detected.

Enabling light-impact checking increases the memory usage. Each individual allocation uses 9 to 12 additional bytes of memory depending on alignment.

Each time `heap_caps_free()` is called in Light Impact mode, the head and tail canary bytes of the buffer being freed are checked against the expected values.

When `heap_caps_check_integrity()` is called, all allocated blocks of heap memory have their canary bytes checked against the expected values.

In both cases, the functions involve checking that the first 4 bytes of an allocated block (before the buffer is returned to the user) should be the word `0xABBA1234`, and the last 4 bytes of the allocated block (after the buffer is returned to the user) should be the word `0xBAAD5678`.

Different values usually indicate buffer underrun or overrun. Overrun indicates that when writing to memory, the data written exceeds the size of the allocated memory, resulting in writing to an unallocated memory area; underrun indicates that when reading memory, the data read exceeds the allocated memory and reads data from an unallocated memory area.

Comprehensive This level incorporates the "light impact" detection features plus additional checks for uninitialized-access and use-after-free bugs. In this mode, all freshly allocated memory is filled with the pattern `0xCE`, and all freed memory is filled with the pattern `0xFE`.

Enabling Comprehensive mode has a substantial impact on runtime performance, as all memory needs to be set to the allocation patterns each time a `heap_caps_malloc()` or `heap_caps_free()` completes, and the memory also needs to be checked each time. However, this mode allows easier detection of memory corruption bugs which are much more subtle to find otherwise. It is recommended to only enable this mode when debugging, not in production.

Crashes in Comprehensive Mode If an application crashes when reading or writing an address related to `0xCE-CECECE` in Comprehensive mode, it indicates that it has read uninitialized memory. The application should be changed to either use `heap_caps calloc()` (which zeroes memory), or initialize the memory before using it. The value `0xCECECECE` may also be seen in stack-allocated automatic variables, because, in ESP-IDF, most task stacks are originally allocated from the heap, and in C, stack memory is uninitialized by default.

If an application crashes, and the exception register dump indicates that some addresses or values were `0xFEFE-FEFE`, this indicates that it is reading heap memory after it has been freed, i.e., a "use-after-free bug". The application should be changed to not access heap memory after it has been freed.

If a call to `heap_caps_malloc()` or `heap_caps_realloc()` causes a crash because it was expected to find the pattern `0xFEFEFEFEF` in free memory and a different pattern was found, it indicates that the app has a use-after-free bug where it is writing to memory that has already been freed.

Manual Heap Checks in Comprehensive Mode Calls to `heap_caps_check_integrity()` may print errors relating to `0xFEFEFEFEF`, `0xABBA1234`, or `0xBAAD5678`. In each case the checker is expected to find a given pattern, and will error out if not found:

- For free heap blocks, the checker expects to find all bytes set to `0xFE`. Any other values indicate a use-after-free bug where free memory has been incorrectly overwritten.
- For allocated heap blocks, the behavior is the same as for the Light Impact mode. The canary bytes `0xABBA1234` and `0xBAAD5678` are checked at the head and tail of each allocated buffer, and any variation indicates a buffer overrun or underrun.

Heap Task Tracking

Heap Task Tracking can be used to get per-task info for heap memory allocation. The application has to specify the heap capabilities for which the heap allocation is to be tracked.

Example code is provided in [system/heap_task_tracking](#).

Heap Tracing

Heap Tracing allows the tracing of code which allocates or frees memory. Two tracing modes are supported:

- Standalone. In this mode, traced data are kept on-board, so the size of the gathered information is limited by the buffer assigned for that purpose, and the analysis is done by the on-board code. There are a couple of APIs available for accessing and dumping collected info.
- Host-based. This mode does not have the limitation of the standalone mode, because traced data are sent to the host over JTAG connection using `app_trace` library. Later on, they can be analyzed using special tools.

Heap tracing can perform two functions:

- Leak checking: find memory that is allocated and never freed.
- Heap use analysis: show all functions that are allocating or freeing memory while the trace is running.

How to Diagnose Memory Leaks If you suspect a memory leak, the first step is to figure out which part of the program is leaking memory. Use the `heap_caps_get_free_size()` or related functions in [heap information](#) to track memory use over the life of the application. Try to narrow the leak down to a single function or sequence of functions where free memory always decreases and never recovers.

Standalone Mode Once you have identified the code which you think is leaking:

- Enable the `CONFIG_HEAP_TRACING_DEST` option.
- Call the function `heap_trace_init_standalone()` early in the program, to register a buffer that can be used to record the memory trace.
- Call the function `heap_trace_start()` to begin recording all mallocs or frees in the system. Call this immediately before the piece of code which you suspect is leaking memory.
- Call the function `heap_trace_stop()` to stop the trace once the suspect piece of code has finished executing. This state will stop the tracing of both allocations and frees.
- Call the function `heap_trace_alloc_pause()` to pause the tracing of new allocations while continuing to trace the frees. Call this immediately after the piece of code which you suspect is leaking memory to prevent any new allocations to be recorded.
- Call the function `heap_trace_dump()` to dump the results of the heap trace.

The following code snippet demonstrates how application code would typically initialize, start, and stop heap tracing:

```
#include "esp_heap_trace.h"

#define NUM_RECORDS 100
static heap_trace_record_t trace_record[NUM_RECORDS]; // This buffer must be in_
↳internal RAM

...

void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_standalone(trace_record, NUM_RECORDS) );
    ...
}

void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );

    do_something_you_suspect_is_leaking();

    ESP_ERROR_CHECK( heap_trace_stop() );
    heap_trace_dump();
    ...
}
```

The output from the heap trace has a similar format to the following example:

```
2 allocations trace (100 entry buffer)
32 bytes (@ 0x3ffaf214) allocated CPU 0 ccount 0x2e9b7384 caller
8 bytes (@ 0x3ffaf804) allocated CPU 0 ccount 0x2e9b79c0 caller
40 bytes 'leaked' in trace (2 allocations)
total allocations 2 total frees 0
```

Note: The above example output uses *IDF Monitor* to automatically decode PC addresses to their source files and line numbers.

The first line indicates how many allocation entries are in the buffer, compared to its total size.

In `HEAP_TRACE_LEAKS` mode, for each traced memory allocation that has not already been freed, a line is printed with:

- `XX bytes` is the number of bytes allocated.
- `@ 0x...` is the heap address returned from `heap_caps_malloc()` or `heap_caps_malloc()`.

- `Internal` or PSRAM is the general location of the allocated memory.
- `CPU x` is the CPU (0 or 1) running when the allocation was made.
- `ccount 0x...` is the CCOUNT (CPU cycle count) register value the allocation was made. The value is different for CPU 0 vs CPU 1.

Finally, the total number of the 'leaked' bytes (bytes allocated but not freed while the trace is running) is printed together with the total number of allocations it represents.

A warning will be printed if the trace buffer was not large enough to hold all the allocations happened. If you see this warning, consider either shortening the tracing period or increasing the number of records in the trace buffer.

Host-Based Mode Once you have identified the code which you think is leaking:

- In the project configuration menu, navigate to `Component settings > Heap Memory Debugging > CONFIG_HEAP_TRACING_DEST` and select `Host-Based`.
- In the project configuration menu, navigate to `Component settings > Application Level Tracing > CONFIG_APPTRACE_DESTINATION1` and select `Trace memory`.
- In the project configuration menu, navigate to `Component settings > Application Level Tracing > FreeRTOS SystemView Tracing` and enable `CONFIG_APPTRACE_SV_ENABLE`.
- Call the function `heap_trace_init_tohost()` early in the program, to initialize the JTAG heap tracing module.
- Call the function `heap_trace_start()` to begin recording all memory allocation and free calls in the system. Call this immediately before the piece of code which you suspect is leaking memory. In host-based mode, the argument to this function is ignored, and the heap tracing module behaves like `HEAP_TRACE_ALL` is passed, i.e., all allocations and deallocations are sent to the host.
- Call the function `heap_trace_stop()` to stop the trace once the suspect piece of code has finished executing.

The following code snippet demonstrates how application code would typically initialize, start, and stop host-based mode heap tracing:

```
#include "esp_heap_trace.h"

...

void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_tohost() );
    ...
}

void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );

    do_something_you_suspect_is_leaking();

    ESP_ERROR_CHECK( heap_trace_stop() );
    ...
}
```

To gather and analyze heap trace, do the following on the host:

1. Build the program and download it to the target as described in [Step 5. First Steps on ESP-IDF](#).
2. Run OpenOCD (see [JTAG Debugging](#)).

Note: In order to use this feature, you need OpenOCD version `v0.10.0-esp32-20181105` or later.

3. You can use GDB to start and/or stop tracing automatically. To do this you need to prepare a special `gdbinit` file:

```
target remote :3333

mon reset halt
maintenance flush register-cache

tb heap_trace_start
commands
mon esp sysview start file:///tmp/heap.svdat
c
end

tb heap_trace_stop
commands
mon esp sysview stop
end

c
```

Using this file GDB can connect to the target, reset it, and start tracing when the program hits breakpoint at `heap_trace_start()`. Tracing will be stopped when the program hits breakpoint at `heap_trace_stop()`. Traced data will be saved to `/tmp/heap_log.svdat`.

4. Run GDB using `riscv32-esp-elf-gdb -x gdbinit </path/to/program/elf>`.
5. Quit GDB when the program stops at `heap_trace_stop()`. Traced data are saved in `/tmp/heap.svdat`.
6. Run processing script `$IDF_PATH/tools/esp_app_trace/sysviewtrace_proc.py -p -b </path/to/program/elf> /tmp/heap_log.svdat`.

The output from the heap trace has a similar format to the following example:

```
Parse trace from '/tmp/heap.svdat'...
Stop parsing trace. (Timeout 0.000000 sec while reading 1 bytes!)
Process events from '['/tmp/heap.svdat']'...

Heap Tracing To Find Heap Corruption Heap tracing can also be used to help track down heap corruption. When a region in the heap is corrupted, it may be from some other part of the program that allocated memory at a nearby address.

If you have an approximate idea of when the corruption occurred, enabling heap tracing in `HEAP_TRACE_ALL` mode allows you to record all the memory allocation functions used and the corresponding allocation addresses.

Using heap tracing in this way is very similar to memory leak detection as described above. For memories that are allocated and not freed, the output is the same. However, records will also be shown for memory that has been freed.

Performance Impact Enabling heap tracing in menuconfig increases the code size of your program, and has a very small negative impact on the performance of heap allocation or free operations even when heap tracing is not running.

When heap tracing is running, heap allocation or free operations are substantially slower than when heap tracing is stopped. Increasing the depth of stack frames recorded for each allocation (see above) also increases this performance impact.

To mitigate the performance loss when the heap tracing is enabled and active, enable `CONFIG_HEAP_TRACE_HASH_MAP`. With this configuration enabled, a hash map mechanism will be used to handle the heap trace records, thus considerably decreasing the heap allocation or free execution time. The size of the hash map can be modified by setting the value of `CONFIG_HEAP_TRACE_HASH_MAP_SIZE`.

By default, the hash map is placed into internal RAM. It can also be placed into external RAM if `CONFIG_HEAP_TRACE_HASH_MAP_IN_EXT_RAM` is enabled. In order to enable this configuration, make sure to enable `CONFIG_SPIRAM` and `CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY`.

False-Positive Memory Leaks Not everything printed by `heap_trace_dump()` is necessarily a memory leak. The following cases may also be printed:

- Any memory that is allocated after `heap_trace_start()` but freed after `heap_trace_stop()` appears in the leaked dump.
- Allocations may be made by other tasks in the system. Depending on the timing of these tasks, it is quite possible that this memory is freed after `heap_trace_stop()` is called.
- The first time a task uses stdio - e.g., when it calls `heap_caps_printf()` - a lock, i.e., RTOS mutex semaphore, is allocated by the libc. This allocation lasts until the task is deleted.
- Certain uses of `heap_caps_printf()`, such as printing floating point numbers and allocating some memory from the heap on demand. These allocations last until the task is deleted.
- The Bluetooth, Wi-Fi, and TCP/IP libraries allocate heap memory buffers to handle incoming or outgoing data. These memory buffers are usually short-lived, but some may be shown in the heap leak trace if the data has been received or transmitted by the lower levels of the network during the heap tracing.
- TCP connections retain some memory even after they are closed due to the `TIME_WAIT` state. Once the `TIME_WAIT` period is completed, this memory will be freed.

One way to differentiate between "real" and "false positive" memory leaks is to call the suspect code multiple times while tracing is running, and look for patterns (multiple matching allocations) in the heap trace output.

Application Examples

- `system/heap_task_tracking` demonstrates the use of the heap task tracking feature to track heap memory allocated on a per-task basis.

API Reference - Heap Tracing

Header File

- `components/heap/include/esp_heap_trace.h`
- This header file can be included with:

```
#include "esp_heap_trace.h"
```

Functions

esp_err_t **heap_trace_init_standalone** (*heap_trace_record_t* *record_buffer, size_t num_records)

Initialise heap tracing in standalone mode.

This function must be called before any other heap tracing functions.

To disable heap tracing and allow the buffer to be freed, stop tracing and then call `heap_trace_init_standalone(NULL, 0)`;

Parameters

- **record_buffer** -- Provide a buffer to use for heap trace data. Note: External RAM is allowed, but it prevents recording allocations made from ISR's.
- **num_records** -- Size of the heap trace buffer, as number of record structures.

Returns

- `ESP_ERR_NOT_SUPPORTED` Project was compiled without heap tracing enabled in `menuconfig`.
- `ESP_ERR_INVALID_STATE` Heap tracing is currently in progress.
- `ESP_OK` Heap tracing initialised successfully.

esp_err_t **heap_trace_init_tohost** (void)

Initialise heap tracing in host-based mode.

This function must be called before any other heap tracing functions.

Returns

- `ESP_ERR_INVALID_STATE` Heap tracing is currently in progress.
- `ESP_OK` Heap tracing initialised successfully.

esp_err_t **heap_trace_start** (*heap_trace_mode_t* mode)

Start heap tracing. All heap allocations & frees will be traced, until `heap_trace_stop()` is called.

Note: `heap_trace_init_standalone()` must be called to provide a valid buffer, before this function is called.

Note: Calling this function while heap tracing is running will reset the heap trace state and continue tracing.

Parameters **mode** -- Mode for tracing.

- `HEAP_TRACE_ALL` means all heap allocations and frees are traced.
- `HEAP_TRACE_LEAKS` means only suspected memory leaks are traced. (When memory is freed, the record is removed from the trace buffer.)

Returns

- `ESP_ERR_NOT_SUPPORTED` Project was compiled without heap tracing enabled in `menuconfig`.
- `ESP_ERR_INVALID_STATE` A non-zero-length buffer has not been set via `heap_trace_init_standalone()`.
- `ESP_OK` Tracing is started.

esp_err_t **heap_trace_stop** (void)

Stop heap tracing.

Returns

- `ESP_ERR_NOT_SUPPORTED` Project was compiled without heap tracing enabled in `menuconfig`.
- `ESP_ERR_INVALID_STATE` Heap tracing was not in progress.
- `ESP_OK` Heap tracing stopped.

`esp_err_t heap_trace_alloc_pause` (void)

Pause heap tracing of allocations.

Note: This function puts the heap tracing in the state where the new allocations will no longer be traced but the free will still be. This can be used to e.g., strategically monitor a set of allocations to make sure each of them will get freed without polluting the list of records with unwanted allocations.

Returns

- `ESP_ERR_NOT_SUPPORTED` Project was compiled without heap tracing enabled in `menuconfig`.
- `ESP_ERR_INVALID_STATE` Heap tracing was not in progress.
- `ESP_OK` Heap tracing paused.

`esp_err_t heap_trace_resume` (void)

Resume heap tracing which was previously stopped.

Unlike `heap_trace_start()`, this function does not clear the buffer of any pre-existing trace records.

The heap trace mode is the same as when `heap_trace_start()` was last called (or `HEAP_TRACE_ALL` if `heap_trace_start()` was never called).

Returns

- `ESP_ERR_NOT_SUPPORTED` Project was compiled without heap tracing enabled in `menuconfig`.
- `ESP_ERR_INVALID_STATE` Heap tracing was already started.
- `ESP_OK` Heap tracing resumed.

`size_t heap_trace_get_count` (void)

Return number of records in the heap trace buffer.

It is safe to call this function while heap tracing is running.

`esp_err_t heap_trace_get` (`size_t` index, `heap_trace_record_t` *record)

Return a raw record from the heap trace buffer.

Note: It is safe to call this function while heap tracing is running, however in `HEAP_TRACE_LEAK` mode record indexing may skip entries unless heap tracing is stopped first.

Parameters

- **index** -- Index (zero-based) of the record to return.
- **record** -- **[out]** Record where the heap trace record will be copied.

Returns

- `ESP_ERR_NOT_SUPPORTED` Project was compiled without heap tracing enabled in `menuconfig`.
- `ESP_ERR_INVALID_STATE` Heap tracing was not initialised.
- `ESP_ERR_INVALID_ARG` Index is out of bounds for current heap trace record count.
- `ESP_OK` Record returned successfully.

void `heap_trace_dump` (void)

Dump heap trace record data to stdout.

Note: It is safe to call this function while heap tracing is running, however in `HEAP_TRACE_LEAK` mode the dump may skip entries unless heap tracing is stopped first.

void **heap_trace_dump_caps** (const uint32_t caps)

Dump heap trace from the memory of the capabilities passed as parameter.

Parameters caps -- Capability(ies) of the memory from which to dump the trace. Set `MALLOC_CAP_INTERNAL` to dump heap trace data from internal memory. Set `MALLOC_CAP_SPIRAM` to dump heap trace data from PSRAM. Set both to dump both heap trace data.

esp_err_t **heap_trace_summary** (*heap_trace_summary_t* *summary)

Get summary information about the result of a heap trace.

Note: It is safe to call this function while heap tracing is running.

Structures

struct **heap_trace_record_t**

Trace record data type. Stores information about an allocated region of memory.

Public Members

uint32_t **ccount**

CCOUNT of the CPU when the allocation was made. LSB (bit value 1) is the CPU number (0 or 1).

void ***address**

Address which was allocated. If NULL, then this record is empty.

size_t **size**

Size of the allocation.

void ***allocated_by**[CONFIG_HEAP_TRACING_STACK_DEPTH]

Call stack of the caller which allocated the memory.

void ***freed_by**[CONFIG_HEAP_TRACING_STACK_DEPTH]

Call stack of the caller which freed the memory (all zero if not freed.)

struct **heap_trace_summary_t**

Stores information about the result of a heap trace.

Public Members

heap_trace_mode_t **mode**

The heap trace mode we just completed / are running.

size_t **total_allocations**

The total number of allocations made during tracing.

size_t **total_frees**

The total number of frees made during tracing.

size_t **count**

The number of records in the internal buffer.

size_t **capacity**

The capacity of the internal buffer.

size_t **high_water_mark**

The maximum value that 'count' got to.

size_t **has_overflowed**

True if the internal buffer overflowed at some point.

Macros

CONFIG_HEAP_TRACING_STACK_DEPTH

Type Definitions

typedef struct *heap_trace_record_t* **heap_trace_record_t**

Trace record data type. Stores information about an allocated region of memory.

Enumerations

enum **heap_trace_mode_t**

Values:

enumerator **HEAP_TRACE_ALL**

enumerator **HEAP_TRACE_LEAKS**

2.9.17 ESP Timer (High Resolution Timer)

Overview

The ESP Timer feature allows for creating software timers and invoking their callback functions (dispatching callbacks) on timeout. ESP Timer is useful when user software needs to perform delayed or periodic actions, such as delayed device start/stop or periodic sampling of sensor data.

ESP Timer hides the complexity associated with managing multiple timers, dispatching callbacks, accounting for clock frequency changes (if dynamic frequency scaling is enabled), and maintaining correct time after light sleep.

For application scenarios that require better real-time performance (such as generating waveforms) or configurable timer resolution, it is recommended that *GPTimer* be used instead. Also, GPTimer has features not available in ESP Timer, such as event capture.

Finally, FreeRTOS has its own software timers. As explained in *FreeRTOS Timers*, they have much lower resolution compared to ESP Timer, but FreeRTOS timers are portable (non-dependent on ESP-IDF) which might be an advantage in some cases.

Features and Concepts

The ESP Timer API provides:

- One-shot and periodic timers
- Multiple callback dispatch methods
- Handling overdue callbacks
- Bit range: 52 bits
- Time resolution: one microsecond

One-Shot and Periodic Timers A one-shot timer invokes its callback function only once upon expiration and then stops operation. One-shot timers are useful for single delayed actions, such as turning off a device or reading a sensor after a specified time interval.

A periodic timer invokes its callback function upon expiration and restarts itself automatically, resulting in the callback function being invoked at a defined interval until the periodic timer is manually stopped. Periodic timers are useful for repeated actions, such as sampling sensor data, updating display information, or generating a waveform.

Callback Dispatch Methods Timer callbacks can be dispatched using the following methods:

- Task Dispatch method (default):
 - Dispatches timer callbacks from a single high-priority ESP Timer task (`esp_timer` task (notified by ISR) > callback).
 - Suitable for handling timer callbacks that are not time-critical.
- Interrupt Dispatch method (`ESP_TIMER_ISR`):
 - Dispatches timer callbacks directly from an interrupt handler (ISR > callback).
 - Suitable for simple, low-latency timer callbacks which take a few microseconds to run.
 - Ensures shorter delay between the event and the callback execution.
 - Not affected by other active tasks.

Task Dispatch Specifics The execution of callbacks in the ESP Timer task is serialized. Thus, when multiple timeouts occur simultaneously, the execution time of one callback will delay the execution of subsequent callbacks. For this reason, it is recommended to keep the callbacks short. If the callback needs to perform more work, the work should be deferred to a lower-priority task using FreeRTOS primitives, such as queues and semaphores.

If other FreeRTOS tasks with higher priority are running, such as an SPI flash operation, callback dispatching will be delayed until the ESP Timer task has a chance to run.

To maintain predictable and timely execution of tasks, callbacks should never attempt block (waiting for resources) or yield (give up control) operations, because such operations disrupt the serialized execution of callbacks.

Interrupt Dispatch Specifics Timers using the Interrupt Dispatch method have their callbacks executed from an interrupt handler. As interrupts can preempt all tasks, the Interrupt Dispatch method offers lower latency. Interrupt dispatched timer callbacks should never attempt to block and should not attempt to trigger a context switch via `portYIELD_FROM_ISR()`. Instead, the function `esp_timer_isr_dispatch_needs_yield()` should be used. The context switch will happen after all timers using the ISR dispatch method are processed.

While using interrupt dispatched timers, the standard logging or debugging methods, such as `printf` should be avoided. To debug an application or display certain information in the console, the ESP-IDF logging macros should be used, such as `ESP_DRAM_LOGI`, `ESP_EARLY_LOGI`, etc. These macros are specifically designed to work in various contexts, including interrupt service routines.

Obtaining Current Time The time passed since the initialization of ESP Timer can be obtained using the convenience function `esp_timer_get_time()`. The initialization happens shortly before the `app_main` function is called. This function is fast and has no locking mechanisms that could potentially introduce delays or conflicts. As a result, it can be useful for fine-grained timing, with the accuracy of 1 μ s, in tasks as well as in ISR routines.

Unlike the `gettimeofday()` function, `esp_timer_get_time()` has the following specifics:

- Upon wakeup from deep sleep, the initialization timer restarts from zero.
- The returned value has no timezone settings or daylight saving time adjustments.

System Integration

This section mainly covers some aspects of how to optimize the operation of ESP Timer and integrate it with other ESP-IDF features.

Timeout Value Limits As callback dispatching can never be instantaneous, the one-shot and periodic timers created with ESP Timer also have timeout value limits. These limits cannot be estimated precisely, because they depend on multiple factors.

For reference, the ESP32 running at 240 MHz and using the Task Dispatch method has the approximate minimum timeout values as follows:

- One-shot timers: ~20 μ s
 - If `esp_timer_start_once()` is called, this is the earliest time after which the system will be able to dispatch a callback.
- Periodic timers: ~50 μ s
 - Periodic software timers with a smaller timeout value would simply consume most of the CPU time, which is impractical.

The lower the CPU frequency, the higher the minimum timeout values will be. The general guideline is if the required timeout values are in the order of tens of microseconds, the user application needs to undergo thorough testing to ensure stable operation.

If the minimum timeout values slightly exceed the requirements, the Interrupt Dispatch method might offer an improvement.

For even smaller timeout values, for example, to generate or receive waveforms or do bit banging, the resolution of ESP Timer may be insufficient. In this case, it is recommended to use dedicated peripherals, such as *Parallel IO*, and their DMA features if available.

Sleep Mode Considerations If a timer is started, and there are no other tasks being executed during the wait time, the chip can be put into sleep to optimize power consumption.

Sleep can be induced in the following ways:

- **Automatic sleep** provided by *Power Management APIs*: If no tasks are being executed, the chip can automatically enter light sleep and automatically wake up at the appropriate time for ESP Timer to dispatch a pending callback.
- **Manual sleep** provided by *Sleep Mode APIs*: The chip can be put into sleep regardless of whether other tasks are being executed.

For manually induced sleep, the following sleep modes exist:

- **Deep-sleep mode**: ESP Timer is deactivated
 - The user application restarts from scratch upon wakeup from deep sleep. This makes deep sleep unsuitable for continuous ESP Timer operation. However, deep sleep can be used if the running timers are not expected to persist across wakeups.
- **Light-sleep mode**: ESP Timer is suspended
 - While in light sleep, ESP Timer counter and callbacks are suspended. Timekeeping is done by the RTC timer. Once the chip is woken up, the counter of ESP Timer is automatically advanced by the amount of time spent in sleep, then timekeeping and callback execution is resumed.
 - At this point, ESP Timer will attempt to dispatch all unhandled callbacks if there are any. It can potentially lead to the overflow of ESP Timer callback execution queue. This behavior may be undesirable for certain applications, and the ways to avoid it are covered in *Handling Callbacks in Light-sleep Mode*.

FreeRTOS Timers Although FreeRTOS provides [software timers](#), they have limitations:

- FreeRTOS timer resolution is bound by the [tick frequency](#), which is typically in the range of 100 to 1000 Hz.
- Timer callbacks are dispatched from a low-priority timer task that can be preempted by other tasks, leading to decreased timer precision and accuracy.

However, FreeRTOS timers are portable (non-dependent on ESP-IDF) and are written to be deterministic as they do not dispatch callbacks from ISRs.

ETM Events ESP Timer has connection to the [Event Task Matrix](#) (ETM) module. This module allows notifying a number of peripherals about events without involving CPU interrupts. Direct notifications reduce latency and decrease CPU workload. The function `esp_timer_new_etm_alarm_event()` can be called to get the corresponding ETM event handle.

Usage

While setting up your ESP-IDF project, make sure to:

- Add required component dependencies to your `CMakeLists.txt`.
- Include required header files in your `.c` files.
- (Optional) Set Kconfig options. For this, see [Kconfig Options](#) > [ESP Timer \(High Resolution Timer\)](#)

General Procedure The general procedure to create, start, stop, and delete a timer is as follows:

1. Create a timer
 - Define a timer handle using the type `esp_timer_handle_t`.
 - Set the timer configuration parameters by defining the structure `esp_timer_create_args_t` which also includes the callback function.

Note: It is recommended to keep callbacks as short as possible to avoid delaying other callbacks.

- To create a timer, call the function `esp_timer_create()`.
2. Start the timer in one-shot mode or periodic mode depending on your requirements
 - To start the timer in one-shot mode, call `esp_timer_start_once()`.
 - To start the timer in periodic mode, call `esp_timer_start_periodic()`; the timer will continue running until you explicitly stop it using `esp_timer_stop()`.

Note: When executing a start function, ensure that the timer is not running. If a timer is running, either call `esp_timer_restart()` or stop it first using `esp_timer_stop()` and then call one of the start functions.

- To stop the running timer, call the function `esp_timer_stop()`.
3. Stop the timer
4. Delete the timer
 - When the timer is no longer needed, delete it to free up memory using the function `esp_timer_delete()`.

Using the Interrupt Dispatch Method Out of the available [callback dispatch methods](#), if you choose the Interrupt Dispatch method, follow these steps:

1. Set Kconfig options
 - Enable `CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD`.
2. Create a timer
 - Set the timer configuration parameters by defining the structure `esp_timer_create_args_t`:

```
const esp_timer_create_args_t timer = {
    ... ,
    .dispatch_method = ESP_TIMER_ISR,
    ...
};
```

- To create a timer, call the function `esp_timer_create()`.

For further steps, refer to [General Procedure](#).

Handling Callbacks in Light-sleep Mode Light sleep allows you to save power while maintaining the ability to quickly wake up for specific actions. To use ESP Timer in conjunction with Light-sleep mode, see [Sleep Mode APIs](#).

During light sleep, to keep unhandled callbacks under control and avoid potential overflow of ESP Timer callback execution queue on wakeup, do one of the following:

- Prevent the invocation of callbacks in the first place: stop the timer before entering light sleep by using `esp_timer_stop()`.
- If calling the stop function is not desirable for any reason, use the option `esp_timer_create_args_t::skip_unhandled_events`. In this case, if a periodic timer expires one or more times during light sleep, then only one callback is executed on wakeup.

Debugging Timers The function `esp_timer_dump()` allows dumping information about either all or only running timers: the parameters for timers, the number of times the timers were started, triggered, skipped, and time taken by timer callbacks to execute. This information can be helpful in debugging.

To debug timers, use the following procedure:

1. Set Kconfig options for more detailed output:
 - Enable `CONFIG_ESP_TIMER_PROFILING`.

Note: Enabling this option increases code size and heap memory usage.

2. Wherever required in your code, call the function `esp_timer_dump()` to print the information and use it to debug your timers.
3. Once debugging is complete, consider disabling `CONFIG_ESP_TIMER_PROFILING`.

Troubleshooting

Unstable Callback Dispatch Time While dispatching the same callback function repeatedly, if the response time varies considerably, try to stabilize it by doing the following:

- Use the [Interrupt Dispatch method](#).

Significant Delays while Dispatching Callbacks If dispatching a callback function takes a considerable amount of time, the problem can lie in the callback function itself. More precisely, as all callback functions are processed one by one in a single `esp_timer` task, the delays might be caused by other callback functions earlier in the queue.

For this reason, make sure that all callback functions in your application can execute on their own quickly and without any blocking operations.

Repeated Callback Dispatches After Sleep If the callback functions are executed repeatedly upon wakeup from sleep, see [Handling Callbacks in Light-sleep Mode](#).

Stack Overflow While Dispatching Callbacks If you see a stack overflow error when executing a callback function, consider reducing the stack usage within your callback function. Alternatively, try increasing the size of the ESP Timer task stack by adjusting `CONFIG_ESP_TIMER_TASK_STACK_SIZE`.

Application Examples

- [system/esp_timer](#) creates and starts one-shot and periodic software timers, shows how they work with Light-sleep mode, and then stops and deletes the timers.

API Reference

Header File

- `components/esp_timer/include/esp_timer.h`
- This header file can be included with:

```
#include "esp_timer.h"
```

- This header file is a part of the API provided by the `esp_timer` component. To declare that your component depends on `esp_timer`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_timer
```

or

```
PRIV_REQUIRES esp_timer
```

Functions

`esp_err_t esp_timer_early_init` (void)

Minimal initialization of `esp_timer`.

This function can be called very early in startup process, after this call only `esp_timer_get_time()` function can be used.

Note: This function is called from startup code. Applications do not need to call this function before using other `esp_timer` APIs.

Returns

- `ESP_OK` on success

`esp_err_t esp_timer_init` (void)

Initialize `esp_timer` library.

This function will be called from startup code on every core. If Kconfig option `CONFIG_ESP_TIMER_ISR_AFFINITY` is set to `NO_AFFINITY`, it allocates the timer ISR on `MULTIPLE` cores and creates the timer task which can be run on any core.

Note: This function is called from startup code. Applications do not need to call this function before using other `esp_timer` APIs. Before calling this function, `esp_timer_early_init()` must be called by the startup code.

Returns

- `ESP_OK` on success
- `ESP_ERR_NO_MEM` if allocation has failed

- ESP_ERR_INVALID_STATE if already initialized
- other errors from interrupt allocator

esp_err_t **esp_timer_deinit** (void)

De-initialize esp_timer library.

Note: Normally this function should not be called from applications

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not yet initialized

esp_err_t **esp_timer_create** (const *esp_timer_create_args_t* *create_args, *esp_timer_handle_t* *out_handle)

Create an esp_timer instance.

Note: When timer no longer needed, delete it using *esp_timer_delete()*.

Parameters

- **create_args** -- Pointer to a structure with timer creation arguments. Not saved by the library, can be allocated on the stack.
- **out_handle** -- [out] Output, pointer to esp_timer_handle_t variable that holds the created timer handle.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if some of the create_args are not valid
- ESP_ERR_INVALID_STATE if esp_timer library is not initialized yet
- ESP_ERR_NO_MEM if memory allocation fails

esp_err_t **esp_timer_start_once** (*esp_timer_handle_t* timer, uint64_t timeout_us)

Start a one-shot timer.

Timer represented by `timer` should not be running when this function is called.

Parameters

- **timer** -- timer handle created using *esp_timer_create()*
- **timeout_us** -- timer timeout, in microseconds relative to the current moment

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if the timer is already running

esp_err_t **esp_timer_start_periodic** (*esp_timer_handle_t* timer, uint64_t period)

Start a periodic timer.

Timer represented by `timer` should not be running when this function is called. This function starts the timer which will trigger every `period` microseconds.

Parameters

- **timer** -- timer handle created using *esp_timer_create()*
- **period** -- timer period, in microseconds

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if the timer is already running

esp_err_t **esp_timer_restart** (*esp_timer_handle_t* timer, uint64_t timeout_us)

Restart a currently running timer.

Type of timer	Action
One-shot timer	Restarted immediately and times out once in <code>timeout_us</code> microseconds
Periodic timer	Restarted immediately with a new period of <code>timeout_us</code> microseconds

Parameters

- **timer** -- timer handle created using *esp_timer_create()*
- **timeout_us** -- Timeout in microseconds relative to the current time. In case of a periodic timer, also represents the new period.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if the timer is not running

esp_err_t **esp_timer_stop** (*esp_timer_handle_t* timer)

Stop a running timer.

This function stops the timer previously started using *esp_timer_start_once()* or *esp_timer_start_periodic()*.

Parameters **timer** -- timer handle created using *esp_timer_create()*

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if the timer is not running

esp_err_t **esp_timer_delete** (*esp_timer_handle_t* timer)

Delete an `esp_timer` instance.

The timer must be stopped before deleting. A one-shot timer which has expired does not need to be stopped.

Parameters **timer** -- timer handle created using *esp_timer_create()*

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if the timer is running

int64_t **esp_timer_get_time** (void)

Get time in microseconds since boot.

Returns Number of microseconds since the initialization of ESP Timer

int64_t **esp_timer_get_next_alarm** (void)

Get the timestamp of the next expected timeout.

Returns Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by *esp_timer_get_time()*.

int64_t **esp_timer_get_next_alarm_for_wake_up** (void)

Get the timestamp of the next expected timeout excluding those timers that should not interrupt light sleep (such timers have *esp_timer_create_args_t::skip_unhandled_events* enabled)

Returns Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by *esp_timer_get_time()*.

esp_err_t **esp_timer_get_period** (*esp_timer_handle_t* timer, uint64_t *period)

Get the period of a timer.

This function fetches the timeout period of a timer. For a one-shot timer, the timeout period will be 0.

Parameters

- **timer** -- timer handle created using *esp_timer_create()*

- **period** -- memory to store the timer period value in microseconds

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the arguments are invalid

esp_err_t **esp_timer_get_expiry_time** (*esp_timer_handle_t* timer, uint64_t *expiry)

Get the expiry time of a one-shot timer.

This function fetches the expiry time of a one-shot timer.

Note: Passing the timer handle of a periodic timer will result in an error.

Parameters

- **timer** -- timer handle created using *esp_timer_create()*
- **expiry** -- memory to store the timeout value in microseconds

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the arguments are invalid
- ESP_ERR_NOT_SUPPORTED if the timer type is periodic

esp_err_t **esp_timer_dump** (FILE *stream)

Dump the list of timers to a stream.

By default, this function prints the list of active (running) timers. The output format is:

| Name | Period | Alarm |

- Name —timer pointer
- Period —period of timer in microseconds, or 0 for one-shot timer
- Alarm - time of the next alarm in microseconds since boot, or 0 if the timer is not started

To print the list of all created timers, enable Kconfig option `CONFIG_ESP_TIMER_PROFILING`. In this case, the output format is:

| Name | Period | Alarm | Times_armed | Times_trigg | Times_skip | Cb_exec_time |

- Name —timer name
- Period —same as above
- Alarm —same as above
- Times_armed —number of times the timer was armed via `esp_timer_start_X`
- Times_triggered - number of times the callback was triggered
- Times_skipped - number of times the callback was skipped
- Callback_exec_time - total time taken by callback to execute, across all calls

Parameters **stream** -- stream (such as stdout) to which to dump the information

Returns

- ESP_OK on success
- ESP_ERR_NO_MEM if can not allocate temporary buffer for the output

void **esp_timer_isr_dispatch_need_yield** (void)

Requests a context switch from a timer callback function.

This only works for a timer that has an ISR dispatch method. The context switch will be called after all ISR dispatch timers have been processed.

bool **esp_timer_is_active** (*esp_timer_handle_t* timer)

Returns status of a timer, active or not.

This function is used to identify if the timer is still active (running) or not.

Parameters **timer** -- timer handle created using *esp_timer_create()*

Returns

- 1 if timer is still active (running)
- 0 if timer is not active

esp_err_t **esp_timer_new_etm_alarm_event** (*esp_etm_event_handle_t* *out_event)

Get the ETM event handle of esp_timer underlying alarm event.

Note: The created ETM event object can be deleted later using *esp_etm_del_event()*

Note: The ETM event is generated by the underlying hardware - systimer; therefore, if the esp_timer is not clocked by systimer, then no ETM event will be generated.

Parameters **out_event** -- [out] Returned ETM event handle

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Structures

struct **esp_timer_create_args_t**

Timer configuration passed to *esp_timer_create()*

Public Members

esp_timer_cb_t **callback**

Callback function to execute when timer expires.

void ***arg**

Argument to pass to callback.

esp_timer_dispatch_t **dispatch_method**

Dispatch callback from task or ISR; if not specified, esp_timer task.

const char ***name**

Timer name, used in *esp_timer_dump()* function.

bool **skip_unhandled_events**

Setting to skip unhandled events in light sleep for periodic timers.

Type Definitions

typedef struct esp_timer ***esp_timer_handle_t**

Opaque type representing a single timer handle.

typedef void (***esp_timer_cb_t**)(void *arg)

Timer callback function type.

Param arg pointer to opaque user-specific data

Enumerations

enum **esp_timer_dispatch_t**

Method to dispatch timer callback.

Values:

enumerator **ESP_TIMER_TASK**

Callback is dispatched from esp_timer task.

enumerator **ESP_TIMER_ISR**

Callback is dispatched from interrupt handler.

enumerator **ESP_TIMER_MAX**

Sentinel value for the number of callback dispatch methods.

2.9.18 Internal and Unstable APIs

This section is listing some APIs that are internal or likely to be changed or removed in the next releases of ESP-IDF.

API Reference

Header File

- [components/esp_rom/include/esp_rom_sys.h](#)
- This header file can be included with:

```
#include "esp_rom_sys.h"
```

Functions

void **esp_rom_software_reset_system** (void)

Software Reset digital core include RTC.

It is not recommended to use this function in esp-idf, use esp_restart() instead.

void **esp_rom_software_reset_cpu** (int cpu_no)

Software Reset cpu core.

It is not recommended to use this function in esp-idf, use esp_restart() instead.

Parameters **cpu_no** -- : The CPU to reset, 0 for PRO CPU, 1 for APP CPU.

int **esp_rom_printf** (const char *fmt, ...)

Print formatted string to console device.

Note: float and long long data are not supported!

Parameters

- **fmt** -- Format string
 - ... -- Additional arguments, depending on the format string
- Returns** int: Total number of characters written on success; A negative number on failure.

int **esp_rom_vprintf** (const char *fmt, va_list ap)

Print formatted string to console device.

Note: float and long long data are not supported!

Parameters

- **fmt** -- Format string
- **ap** -- List of arguments.

Returns int: Total number of characters written on success; A negative number on failure.

void **esp_rom_delay_us** (uint32_t us)

Pauses execution for us microseconds.

Parameters **us** -- Number of microseconds to pause

void **esp_rom_install_channel_putc** (int channel, void (*putc)(char c))

esp_rom_printf can print message to different channels simultaneously. This function can help install the low level putc function for esp_rom_printf.

Parameters

- **channel** -- Channel number (starting from 1)
- **putc** -- Function pointer to the putc implementation. Set NULL can disconnect esp_rom_printf with putc.

void **esp_rom_output_to_channels** (char c)

It outputs a character to different channels simultaneously. This function is used by esp_rom_printf/esp_rom_vprintf.

Parameters **c** -- Char to output.

void **esp_rom_install_uart_printf** (void)

Install UART1 as the default console channel, equivalent to esp_rom_install_channel_putc(1, esp_rom_output_putc)

soc_reset_reason_t **esp_rom_get_reset_reason** (int cpu_no)

Get reset reason of CPU.

Parameters **cpu_no** -- CPU number

Returns Reset reason code (see in soc/reset_reasons.h)

void **esp_rom_route_intr_matrix** (int cpu_core, uint32_t periph_intr_id, uint32_t cpu_intr_num)

Route peripheral interrupt sources to CPU's interrupt port by matrix.

Usually there're 4 steps to use an interrupt:

- a. Route peripheral interrupt source to CPU. e.g. esp_rom_route_intr_matrix(0, ETS_WIFI_MAC_INTR_SOURCE, ETS_WMAC_INUM)
- b. Set interrupt handler for CPU
- c. Enable CPU interrupt
- d. Enable peripheral interrupt

Parameters

- **cpu_core** -- The CPU number, which the peripheral interrupt will inform to
- **periph_intr_id** -- The peripheral interrupt source number

- **cpu_intr_num** -- The CPU (external) interrupt number. On targets that use CLIC as their interrupt controller, this number represents the external interrupt number. For example, passing `cpu_intr_num = i` to this function would in fact bind peripheral source to CPU interrupt `CLIC_EXT_INTR_NUM_OFFSET + i`.

`uint32_t esp_rom_get_cpu_ticks_per_us` (void)

Get the real CPU ticks per us.

Returns CPU ticks per us

void `esp_rom_set_cpu_ticks_per_us` (uint32_t ticks_per_us)

Set the real CPU tick rate.

Note: Call this function when CPU frequency is changed, otherwise the `esp_rom_delay_us` can be inaccurate.

Parameters `ticks_per_us` -- CPU ticks per us

2.9.19 Interrupt Allocation

Overview

The ESP32-C5 has one core, with 32 external asynchronous interrupts. Each interrupt's priority is independently programmable. In addition, there are also 3 core local interrupt sources (CLINT). For details, see **ESP32-C5 Technical Reference Manual > High-Performance CPU [PDF]**.

Because there are more interrupt sources than interrupts, sometimes it makes sense to share an interrupt in multiple drivers. The `esp_intr_alloc()` abstraction exists to hide all these implementation details.

A driver can allocate an interrupt for a certain peripheral by calling `esp_intr_alloc()` (or `esp_intr_alloc_intrstatus()`). It can use the flags passed to this function to specify the type, priority, and trigger method of the interrupt to allocate. The interrupt allocation code will then find an applicable interrupt, use the interrupt matrix to hook it up to the peripheral, and install the given interrupt handler and ISR to it.

The interrupt allocator presents two different types of interrupts, namely shared interrupts and non-shared interrupts, both of which require different handling. Non-shared interrupts will allocate a separate interrupt for every `esp_intr_alloc()` call, and this interrupt is use solely for the peripheral attached to it, with only one ISR that will get called. Shared interrupts can have multiple peripherals triggering them, with multiple ISRs being called when one of the peripherals attached signals an interrupt. Thus, ISRs that are intended for shared interrupts should check the interrupt status of the peripheral they service in order to check if any action is required.

Non-shared interrupts can be either level- or edge-triggered. Shared interrupts can only be level interrupts due to the chance of missed interrupts when edge interrupts are used.

To illustrate why shared interrupts can only be level-triggered, take the scenario where peripheral A and peripheral B share the same edge-triggered interrupt. Peripheral B triggers an interrupt and sets its interrupt signal high, causing a low-to-high edge, which in turn latches the CPU's interrupt bit and triggers the ISR. The ISR executes, checks that peripheral A did not trigger an interrupt, and proceeds to handle and clear peripheral B's interrupt signal. Before the ISR returns, the CPU clears its interrupt bit latch. Thus, during the entire interrupt handling process, if peripheral A triggers an interrupt, it will be missed due the CPU clearing the interrupt bit latch.

IRAM-Safe Interrupt Handlers

When performing write and erase operations on SPI flash, ESP32-C5 will disable the cache, making SPI flash and SPIRAM inaccessible for interrupt handlers. This is why there are two types of interrupt handlers in ESP-IDF, which

have their advantages and disadvantages:

IRAM-safe interrupt handlers - only access code and data in internal memory (IRAM for code, DRAM for data).

- **+ Latency:** They execute relatively fast and with low latency, since they are not blocked by slow flash write and erase operations (erases can take tens or hundreds of milliseconds to complete). This is useful for interrupts which need a guaranteed minimum execution latency.
- **- Internal memory use:** They consume precious internal memory that could otherwise be used for something else.
- **+ Cache misses:** They do not rely on the cache with potential cache misses since the code and data are in internal memory already.
- **Usage:** To register such an interrupt via the interrupt allocator API, use the `ESP_INTR_FLAG_IRAM` flag.

Non-IRAM-safe interrupt handlers - may access code and (read-only) data in flash.

- **- Latency:** In case of flash operations, these interrupt handlers are postponed, which makes their average latency longer and less predictable.
- **+ Internal memory use:** They do not use any or not as much memory in internal RAM as IRAM-safe interrupts.
- **Usage:** To register such an interrupt via the interrupt allocator API, do *not* use the `ESP_INTR_FLAG_IRAM` flag.

Note that there is nothing that explicitly marks an interrupt handler as IRAM-safe. An interrupt handler is IRAM-safe implicitly if and only if the code and data it may access are placed in internal memory. The term "IRAM-safe" is actually a bit misleading, since there are more requirements than just placing the handler's code in IRAM memory. Examples of interrupt handlers that are **not** IRAM-safe include:

- A handler that has some of its code placed in flash memory.
- A handler that is placed in IRAM but calls functions placed in flash memory.
- A handler that accesses a read-only variable placed in flash, even though the handler's code is actually placed in IRAM.

For details on placing code and data in IRAM or DRAM, see [How to Place Code in IRAM](#).

For more details about SPI flash operations and their interactions with interrupt handlers, see the [SPI flash API documentation](#).

Note: Never register an interrupt handler with `ESP_INTR_FLAG_IRAM` flag if you are not 100% sure that all the code and data that the interrupt ever accesses are in IRAM (code) or DRAM (data). Disregarding this will lead to (sometimes spurious) *cache errors*. This must also be true for code and data accessed indirectly through function calls.

Multiple Handlers Sharing A Source

Several handlers can be assigned to a same source, given that all handlers are allocated using the `ESP_INTR_FLAG_SHARED` flag. They will all be allocated to the interrupt, which the source is attached to, and called sequentially when the source is active. The handlers can be disabled and freed individually. The source is attached to the interrupt (enabled), if one or more handlers are enabled, otherwise detached. A handler will never be called when disabled, while **its source may still be triggered** if any one of its handler enabled.

Sources attached to non-shared interrupt do not support this feature.

Though the framework supports this feature, you have to use it **very carefully**. There usually exist two ways to stop an interrupt from being triggered: **disable the source** or **mask peripheral interrupt status**. ESP-IDF only handles enabling and disabling of the source itself, leaving status and mask bits to be handled by users.

Status bits shall either be masked before the handler responsible for it is disabled, or be masked and then properly handled in another enabled interrupt.

Note: Leaving some status bits unhandled without masking them, while disabling the handlers for them, will cause the interrupt(s) to be triggered indefinitely, resulting therefore in a system crash.

Troubleshooting Interrupt Allocation

On most Espressif SoCs, CPU interrupts are a limited resource. Therefore it is possible for a program to run out of CPU interrupts, for example by initializing several peripheral drivers. Typically, this will result in the driver initialization function returning `ESP_ERR_NOT_FOUND` error code.

If this happens, you can use `esp_intr_dump()` function to print the list of interrupts along with their status. The output of this function typically looks like this:

```
CPU 0 interrupt status:
Int  Level  Type   Status
0    1      Level Reserved
1    1      Level Reserved
2    1      Level Used:  RTC_CORE
3    1      Level Used:  TGO_LACT_LEVEL
...
```

The columns of the output have the following meaning:

- **Int:** CPU interrupt input number. This is typically not used in software directly, and is provided for reference only.
- **Level:** For interrupts which have been allocated, the priority of the interrupt. For free interrupts * is printed.
- **Type:** For interrupts which have been allocated, the type (Level or Edge) of the interrupt. For free interrupts * is printed.
- **Status: One of the possible statuses of the interrupt:**
 - **Reserved:** The interrupt is reserved either at hardware level, or by one of the parts of ESP-IDF. It can not be allocated using `esp_intr_alloc()`.
 - **Used: <source>:** The interrupt is allocated and connected to a single peripheral.
 - **Shared: <source1> <source2> . . .:** The interrupt is allocated and connected to multiple peripherals. See *Multiple Handlers Sharing A Source* above.
 - **Free:** The interrupt is not allocated and can be used by `esp_intr_alloc()`.

If you have confirmed that the application is indeed running out of interrupts, a combination of the following suggestions can help resolve the issue:

- Determine the interrupts which can tolerate higher latency, and allocate them using `ESP_INTR_FLAG_SHARED` flag (optionally ORed with `ESP_INTR_FLAG_LOWMED`). Using this flag for two or more peripherals will let them use a single interrupt input, and therefore save interrupt inputs for other peripherals. See *Multiple Handlers Sharing A Source* above.
- Check if some of the peripheral drivers do not need to be used all the time, and initialize or deinitialize them on demand. This can reduce the number of simultaneously allocated interrupts.

API Reference

Header File

- `components/esp_hw_support/include/esp_intr_types.h`
- This header file can be included with:

```
#include "esp_intr_types.h"
```

Macros

ESP_INTR_CPU_AFFINITY_TO_CORE_ID (cpu_affinity)

Convert `esp_intr_cpu_affinity_t` to CPU core ID.

Type Definitions

typedef void (***intr_handler_t**)(void *arg)

Function prototype for interrupt handler function

typedef struct intr_handle_data_t ***intr_handle_t**

Handle to an interrupt handler

Enumerations

enum **esp_intr_cpu_affinity_t**

Interrupt CPU core affinity.

This type specify the CPU core that the peripheral interrupt is connected to.

Values:

enumerator **ESP_INTR_CPU_AFFINITY_AUTO**

Install the peripheral interrupt to ANY CPU core, decided by on which CPU the interrupt allocator is running.

enumerator **ESP_INTR_CPU_AFFINITY_0**

Install the peripheral interrupt to CPU core 0.

enumerator **ESP_INTR_CPU_AFFINITY_1**

Install the peripheral interrupt to CPU core 1.

Header File

- [components/esp_hw_support/include/esp_intr_alloc.h](#)
- This header file can be included with:

```
#include "esp_intr_alloc.h"
```

Functions

esp_err_t **esp_intr_mark_shared** (int intno, int cpu, bool is_in_iram)

Mark an interrupt as a shared interrupt.

This will mark a certain interrupt on the specified CPU as an interrupt that can be used to hook shared interrupt handlers to.

Parameters

- **intno** -- The number of the interrupt (0-31)
- **cpu** -- CPU on which the interrupt should be marked as shared (0 or 1)
- **is_in_iram** -- Shared interrupt is for handlers that reside in IRAM and the int can be left enabled while the flash cache is disabled.

Returns ESP_ERR_INVALID_ARG if cpu or intno is invalid ESP_OK otherwise

esp_err_t **esp_intr_reserve** (int intno, int cpu)

Reserve an interrupt to be used outside of this framework.

This will mark a certain interrupt on the specified CPU as reserved, not to be allocated for any reason.

Parameters

- **intno** -- The number of the interrupt (0-31)
- **cpu** -- CPU on which the interrupt should be marked as shared (0 or 1)

Returns ESP_ERR_INVALID_ARG if cpu or intno is invalid ESP_OK otherwise

esp_err_t **esp_intr_alloc** (int source, int flags, *intr_handler_t* handler, void *arg, *intr_handle_t* *ret_handle)

Allocate an interrupt with the given parameters.

This finds an interrupt that matches the restrictions as given in the flags parameter, maps the given interrupt source to it and hooks up the given interrupt handler (with optional argument) as well. If needed, it can return a handle for the interrupt as well.

The interrupt will always be allocated on the core that runs this function.

If ESP_INTR_FLAG_IRAM flag is used, and handler address is not in IRAM or RTC_FAST_MEM, then ESP_ERR_INVALID_ARG is returned.

Parameters

- **source** -- The interrupt source. One of the ETS*_INTR_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS_INTERNAL*_INTR_SOURCE sources as defined in this header.
- **flags** -- An ORred mask of the ESP_INTR_FLAG_* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP_INTR_FLAG_SHARED, it will allocate a shared interrupt of level 1. Setting ESP_INTR_FLAG_INTRDISABLED will return from this function with the interrupt disabled.
- **handler** -- The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren't C-callable.
- **arg** -- Optional argument for passed to the interrupt handler
- **ret_handle** -- Pointer to an intr_handle_t to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

Returns ESP_ERR_INVALID_ARG if the combination of arguments is invalid.
ESP_ERR_NOT_FOUND No free interrupt found with the specified flags ESP_OK otherwise

esp_err_t **esp_intr_alloc_intrstatus** (int source, int flags, uint32_t intrstatusreg, uint32_t intrstatusmask, *intr_handler_t* handler, void *arg, *intr_handle_t* *ret_handle)

Allocate an interrupt with the given parameters.

This essentially does the same as esp_intr_alloc, but allows specifying a register and mask combo. For shared interrupts, the handler is only called if a read from the specified register, ANDed with the mask, returns non-zero. By passing an interrupt status register address and a fitting mask, this can be used to accelerate interrupt handling in the case a shared interrupt is triggered; by checking the interrupt statuses first, the code can decide which ISRs can be skipped

Parameters

- **source** -- The interrupt source. One of the ETS*_INTR_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS_INTERNAL*_INTR_SOURCE sources as defined in this header.
- **flags** -- An ORred mask of the ESP_INTR_FLAG_* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP_INTR_FLAG_SHARED, it will allocate a shared interrupt of level 1. Setting ESP_INTR_FLAG_INTRDISABLED will return from this function with the interrupt disabled.
- **intrstatusreg** -- The address of an interrupt status register

- **intrstatusmask** -- A mask. If a read of address intrstatusreg has any of the bits that are 1 in the mask set, the ISR will be called. If not, it will be skipped.
- **handler** -- The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren't C-callable.
- **arg** -- Optional argument for passed to the interrupt handler
- **ret_handle** -- Pointer to an intr_handle_t to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

Returns ESP_ERR_INVALID_ARG if the combination of arguments is invalid.
ESP_ERR_NOT_FOUND No free interrupt found with the specified flags ESP_OK otherwise

esp_err_t **esp_intr_free** (*intr_handle_t* handle)

Disable and free an interrupt.

Use an interrupt handle to disable the interrupt and release the resources associated with it. If the current core is not the core that registered this interrupt, this routine will be assigned to the core that allocated this interrupt, blocking and waiting until the resource is successfully released.

Note: When the handler shares its source with other handlers, the interrupt status bits it's responsible for should be managed properly before freeing it. see `esp_intr_disable` for more details. Please do not call this function in `esp_ipc_call_blocking`.

Parameters **handle** -- The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`
Returns ESP_ERR_INVALID_ARG the handle is NULL ESP_FAIL failed to release this handle
ESP_OK otherwise

int **esp_intr_get_cpu** (*intr_handle_t* handle)

Get CPU number an interrupt is tied to.

Parameters **handle** -- The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`
Returns The core number where the interrupt is allocated

int **esp_intr_get_intno** (*intr_handle_t* handle)

Get the allocated interrupt for a certain handle.

Parameters **handle** -- The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`
Returns The interrupt number

esp_err_t **esp_intr_disable** (*intr_handle_t* handle)

Disable the interrupt associated with the handle.

Note:

- a. For local interrupts (ESP_INTERNAL_* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.
 - b. When several handlers sharing a same interrupt source, interrupt status bits, which are handled in the handler to be disabled, should be masked before the disabling, or handled in other enabled interrupts properly. Miss of interrupt status handling will cause infinite interrupt calls and finally system crash.
-

Parameters **handle** -- The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`
Returns ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise

esp_err_t **esp_intr_enable** (*intr_handle_t* handle)

Enable the interrupt associated with the handle.

Note: For local interrupts (ESP_INTERNAL_* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.

Parameters **handle** -- The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`
Returns ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise

esp_err_t **esp_intr_set_in_iram** (*intr_handle_t* handle, bool is_in_iram)

Set the "in IRAM" status of the handler.

Note: Does not work on shared interrupts.

Parameters

- **handle** -- The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`
- **is_in_iram** -- Whether the handler associated with this handle resides in IRAM. Handlers residing in IRAM can be called when cache is disabled.

Returns ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise

void **esp_intr_noniram_disable** (void)

Disable interrupts that aren't specifically marked as running from IRAM.

void **esp_intr_noniram_enable** (void)

Re-enable interrupts disabled by `esp_intr_noniram_disable`.

void **esp_intr_enable_source** (int inum)

enable the interrupt source based on its number

Parameters **inum** -- interrupt number from 0 to 31

void **esp_intr_disable_source** (int inum)

disable the interrupt source based on its number

Parameters **inum** -- interrupt number from 0 to 31

static inline int **esp_intr_flags_to_level** (int flags)

Get the lowest interrupt level from the flags.

Parameters **flags** -- The same flags that pass to `esp_intr_alloc_intrstatus` API

static inline int **esp_intr_level_to_flags** (int level)

Get the interrupt flags from the supplied level (priority)

Parameters **level** -- The interrupt priority level

esp_err_t **esp_intr_dump** (FILE *stream)

Dump the status of allocated interrupts.

Parameters **stream** -- The stream to dump to, if NULL then stdout is used

Returns ESP_OK on success

bool **esp_intr_ptr_in_isr_region** (void *ptr)

Check if the given pointer is in the safe ISR area. In other words, make sure that the pointer's content is accessible at any time, regardless of the cache status.

Parameters **ptr** -- Pointer to check

Returns true if `ptr` points to ISR area, false else

Macros**ESP_INTR_FLAG_LEVEL1**

Interrupt allocation flags.

These flags can be used to specify which interrupt qualities the code calling `esp_intr_alloc*` needs. Accept a Level 1 interrupt vector (lowest priority)

ESP_INTR_FLAG_LEVEL2

Accept a Level 2 interrupt vector.

ESP_INTR_FLAG_LEVEL3

Accept a Level 3 interrupt vector.

ESP_INTR_FLAG_LEVEL4

Accept a Level 4 interrupt vector.

ESP_INTR_FLAG_LEVEL5

Accept a Level 5 interrupt vector.

ESP_INTR_FLAG_LEVEL6

Accept a Level 6 interrupt vector.

ESP_INTR_FLAG_NMI

Accept a Level 7 interrupt vector (highest priority)

ESP_INTR_FLAG_SHARED

Interrupt can be shared between ISRs.

ESP_INTR_FLAG_EDGE

Edge-triggered interrupt.

ESP_INTR_FLAG_IRAM

ISR can be called if cache is disabled.

ESP_INTR_FLAG_INTRDISABLED

Return with this interrupt disabled.

ESP_INTR_FLAG_LOWMED

Low and medium prio interrupts. These can be handled in C.

ESP_INTR_FLAG_HIGH

High level interrupts. Need to be handled in assembly.

ESP_INTR_FLAG_LEVELMASK

Mask for all level flags

ETS_INTERNAL_TIMER0_INTR_SOURCE

Platform timer 0 interrupt source.

The `esp_intr_alloc*` functions can allocate an int for all `ETS_*_INTR_SOURCE` interrupt sources that are routed through the interrupt mux. Apart from these sources, each core also has some internal sources that do

not pass through the interrupt mux. To allocate an interrupt for these sources, pass these pseudo-sources to the functions.

ETS_INTERNAL_TIMER1_INTR_SOURCE

Platform timer 1 interrupt source.

ETS_INTERNAL_TIMER2_INTR_SOURCE

Platform timer 2 interrupt source.

ETS_INTERNAL_SW0_INTR_SOURCE

Software int source 1.

ETS_INTERNAL_SW1_INTR_SOURCE

Software int source 2.

ETS_INTERNAL_PROFILING_INTR_SOURCE

Int source for profiling.

ETS_INTERNAL_UNUSED_INTR_SOURCE

Interrupt is not assigned to any source.

ETS_INTERNAL_INTR_SOURCE_OFF

Provides SystemView with positive IRQ IDs, otherwise scheduler events are not shown properly

ESP_INTR_ENABLE (inum)

Enable interrupt by interrupt number

ESP_INTR_DISABLE (inum)

Disable interrupt by interrupt number

2.9.20 Logging library

Overview

The logging library provides three ways for setting log verbosity:

- **At compile time:** in menuconfig, set the verbosity level using the option [CONFIG_LOG_DEFAULT_LEVEL](#).
- Optionally, also in menuconfig, set the maximum verbosity level using the option [CONFIG_LOG_MAXIMUM_LEVEL](#). By default, this is the same as the default level, but it can be set higher in order to compile more optional logs into the firmware.
- **At runtime:** all logs for verbosity levels lower than [CONFIG_LOG_DEFAULT_LEVEL](#) are enabled by default. The function `esp_log_level_set()` can be used to set a logging level on a per-module basis. Modules are identified by their tags, which are human-readable ASCII zero-terminated strings. Note that the ability to change the log level at runtime depends on [CONFIG_LOG_DYNAMIC_LEVEL_CONTROL](#).
- **At runtime:** if [CONFIG_LOG_MASTER_LEVEL](#) is enabled then a Master logging level can be set using `esp_log_set_level_master()`. This option adds an additional logging level check for all compiled logs. Note that this will increase application size. This feature is useful if you want to compile a lot of logs that are selectable at runtime, but also want to avoid the performance hit from looking up the tags and their log level when you don't want log output.

There are the following verbosity levels:

- Error (lowest)

- Warning
- Info
- Debug
- Verbose (highest)

Note: The function `esp_log_level_set()` cannot set logging levels higher than specified by `CONFIG_LOG_MAXIMUM_LEVEL`. To increase log level for a specific file above this maximum at compile time, use the macro `LOG_LOCAL_LEVEL` (see the details below).

How to Use Logging Library

In each C file that uses logging functionality, define the TAG variable as shown below:

```
static const char* TAG = "MyModule";
```

Then use one of logging macros to produce output, e.g:

```
ESP_LOGW(TAG, "Baud rate error %.1f%%. Requested: %d baud, actual: %d baud", error_↵  
↵* 100, baud_req, baud_real);
```

Several macros are available for different verbosity levels:

- `ESP_LOGE` - Error (lowest)
- `ESP_LOGW` - Warning
- `ESP_LOGI` - Info
- `ESP_LOGD` - Debug
- `ESP_LOGV` - Verbose (highest)

Additionally, there are `ESP_EARLY_LOGx` versions for each of these macros, e.g. `ESP_EARLY_LOGE`. These versions have to be used explicitly in the early startup code only, before heap allocator and syscalls have been initialized. Normal `ESP_LOGx` macros can also be used while compiling the bootloader, but they will fall back to the same implementation as `ESP_EARLY_LOGx` macros.

There are also `ESP_DRAM_LOGx` versions for each of these macros, e.g. `ESP_DRAM_LOGE`. These versions are used in some places where logging may occur with interrupts disabled or with flash cache inaccessible. Use of this macros should be as sparse as possible, as logging in these types of code should be avoided for performance reasons.

Note: Inside critical sections interrupts are disabled so it's only possible to use `ESP_DRAM_LOGx` (preferred) or `ESP_EARLY_LOGx`. Even though it's possible to log in these situations, it's better if your program can be structured not to require it.

To override default verbosity level at file or component scope, define the `LOG_LOCAL_LEVEL` macro.

At file scope, define it before including `esp_log.h`, e.g.:

```
#define LOG_LOCAL_LEVEL ESP_LOG_VERBOSE  
#include "esp_log.h"
```

At component scope, define it in the component CMakeLists:

```
target_compile_definitions(${COMPONENT_LIB} PUBLIC "-DLOG_LOCAL_LEVEL=ESP_LOG_↵  
↵VERBOSE")
```

Dynamic Log Level Control

To configure logging output per module at runtime, add calls to the function `esp_log_level_set()` as follows:

```
esp_log_level_set("*", ESP_LOG_ERROR); // set all components to ERROR level
esp_log_level_set("wifi", ESP_LOG_WARN); // enable WARN logs from WiFi stack
esp_log_level_set("dhcpc", ESP_LOG_INFO); // enable INFO logs from DHCP client
```

Note: The "DRAM" and "EARLY" log macro variants documented above do not support per module setting of log verbosity. These macros will always log at the "default" verbosity level, which can only be changed at runtime by calling `esp_log_level("*", level)`.

Even when logs are disabled by using a tag name, they will still require a processing time of around 10.9 microseconds per entry.

The log component provides several options to better adjust the system to your needs, reducing memory usage and speeding up operations. The `CONFIG_LOG_TAG_LEVEL_IMPL` option sets the method of tag level checks:

- "None". This option disables the ability to set the log level per tag. The ability to change the log level at runtime depends on `CONFIG_LOG_DYNAMIC_LEVEL_CONTROL`. If disabled, changing the log level at runtime using `esp_log_level_set()` is not possible. This implementation is suitable for highly constrained environments.
- "Linked list" (no cache). This option enables the ability to set the log level per tag. This approach searches the linked list of all tags for the log level, which may be slower for a large number of tags but may have lower memory requirements than the cache approach.
- (Default) "Cache + Linked List". This option enables the ability to set the log level per tag. This hybrid approach offers a balance between speed and memory usage. The cache stores recently accessed log tags and their corresponding log levels, providing faster lookups for frequently used tags.

When the `CONFIG_LOG_DYNAMIC_LEVEL_CONTROL` option is enabled, log levels to be changed at runtime via `esp_log_level_set()`. Dynamic log levels increase flexibility but also incurs additional code size. If your application does not require dynamic log level changes and you do not need to control logs per module using tags, consider disabling `CONFIG_LOG_DYNAMIC_LEVEL_CONTROL`. It reduces IRAM usage by approximately 260 bytes, DRAM usage by approximately 264 bytes, and flash usage by approximately 1 KB compared to the default option. It is not only streamlines logs for memory efficiency but also contributes to speeding up log operations in your application about 10 times.

Note: The "Linked list" and "Cache + Linked List" options will automatically enable `CONFIG_LOG_DYNAMIC_LEVEL_CONTROL`.

Master Logging Level To enable the Master logging level feature, the `CONFIG_LOG_MASTER_LEVEL` option must be enabled. It adds an additional level check for `ESP_LOGx` macros before calling `esp_log_write()`. This allows to set a higher `CONFIG_LOG_MAXIMUM_LEVEL`, but not inflict a performance hit during normal operation (only when directed). An application may set the master logging level (`esp_log_set_level_master()`) globally to enforce a maximum log level. `ESP_LOGx` macros above this level will be skipped immediately, rather than calling `esp_log_write()` and doing a tag lookup. It is recommended to only use this in a top-level application and not in shared components as this would override the global log level for any user using the component. By default, at startup, the Master logging level is `CONFIG_LOG_DEFAULT_LEVEL`.

Note that this feature increases application size because the additional check is added into all `ESP_LOGx` macros.

The snippet below shows how it works. Setting the Master logging level to `ESP_LOG_NONE` disables all logging globally. `esp_log_level_set()` does not currently affect logging. But after the Master logging level is released, the logs will be printed as set by `esp_log_level_set()`.

```
// Master logging level is CONFIG_LOG_DEFAULT_LEVEL at start up and = ESP_LOG_INFO
ESP_LOGI("lib_name", "Message for print"); // prints a INFO message
esp_log_level_set("lib_name", ESP_LOG_WARN); // enables WARN logs from lib_
↪name
```

(continues on next page)

(continued from previous page)

```

esp_log_set_level_master(ESP_LOG_NONE);           // disables all logs globally.↳
↳esp_log_level_set has no effect at the moment

ESP_LOGW("lib_name", "Message for print");       // no print, Master logging↳
↳level blocks it
esp_log_level_set("lib_name", ESP_LOG_INFO);     // enable INFO logs from lib_
↳name
ESP_LOGI("lib_name", "Message for print");       // no print, Master logging↳
↳level blocks it

esp_log_set_level_master(ESP_LOG_INFO);         // enables all INFO logs↳
↳globally
ESP_LOGI("lib_name", "Message for print");       // prints a INFO message

```

Logging to Host via JTAG By default, the logging library uses the `vprintf`-like function to write formatted output to the dedicated UART. By calling a simple API, all log output may be routed to JTAG instead, making logging several times faster. For details, please refer to Section [Logging to Host](#).

Thread Safety The log string is first written into a memory buffer and then sent to the UART for printing. Log calls are thread-safe, i.e., logs of different threads do not conflict with each other.

Application Example

The logging library is commonly used by most ESP-IDF components and examples. For demonstration of log functionality, check ESP-IDF's [examples](#) directory. The most relevant examples that deal with logging are the following:

- [system/ota](#)
- [storage/sd_card](#)
- [protocols/https_request](#)

API Reference

Header File

- [components/log/include/esp_log.h](#)
- This header file can be included with:

```
#include "esp_log.h"
```

Functions

vprintf_like_t `esp_log_set_vprintf` (*vprintf_like_t* func)

Set function used to output log entries.

By default, log output goes to UART0. This function can be used to redirect log output to some other destination, such as file or network. Returns the original log handler, which may be necessary to return output to the previous destination.

Note: Please note that function callback here must be re-entrant as it can be invoked in parallel from multiple thread context.

Parameters `func` -- new Function used for output. Must have same signature as `vprintf`.

Returns `func` old Function used for output.

void **esp_log_write** (*esp_log_level_t* level, const char *tag, const char *format, ...)

Write message into the log.

This function is not intended to be used directly. Instead, use one of ESP_LOGE, ESP_LOGW, ESP_LOGI, ESP_LOGD, ESP_LOGV macros.

This function or these macros should not be used from an interrupt.

void **esp_log_writev** (*esp_log_level_t* level, const char *tag, const char *format, va_list args)

Write message into the log, va_list variant.

This function is provided to ease integration toward other logging framework, so that esp_log can be used as a log sink.

See also:

esp_log_write()

Macros

ESP_EARLY_LOGE (tag, format, ...)

macro to output logs in startup code, before heap allocator and syscalls have been initialized. Log at ESP_LOG_ERROR level.

See also:

printf,ESP_LOGE,ESP_DRAM_LOGE In the future, we want to become compatible with clang. Hence, we provide two versions of the following macros which are using variadic arguments. The first one is using the GNU extension `##_VA_ARGS__`. The second one is using the C++20 feature `VA_OPT(,)`. This allows users to compile their code with standard C++20 enabled instead of the GNU extension. Below C++20, we haven't found any good alternative to using `##_VA_ARGS__`.

ESP_EARLY_LOGW (tag, format, ...)

macro to output logs in startup code at ESP_LOG_WARN level.

See also:

ESP_EARLY_LOGE,ESP_LOGE,printf

ESP_EARLY_LOGI (tag, format, ...)

macro to output logs in startup code at ESP_LOG_INFO level.

See also:

ESP_EARLY_LOGE,ESP_LOGE,printf

ESP_EARLY_LOGD (tag, format, ...)

macro to output logs in startup code at ESP_LOG_DEBUG level.

See also:

ESP_EARLY_LOGE,ESP_LOGE,printf

ESP_EARLY_LOGV (tag, format, ...)

macro to output logs in startup code at ESP_LOG_VERBOSE level.

See also:

ESP_EARLY_LOGE,ESP_LOGE,printf

ESP_LOG_EARLY_IMPL (tag, format, log_level, log_tag_letter, ...)

ESP_LOGE (tag, format, ...)

ESP_LOGW (tag, format, ...)

ESP_LOGI (tag, format, ...)

ESP_LOGD (tag, format, ...)

ESP_LOGV (tag, format, ...)

ESP_LOG_LEVEL (level, tag, format, ...)
runtime macro to output logs at a specified level.

See also:

`printf`

Parameters

- **tag** -- tag of the log, which can be used to change the log level by `esp_log_level_set` at runtime.
- **level** -- level of the output log.
- **format** -- format of the output log. See `printf`
- ... -- variables to be replaced into the log. See `printf`

ESP_LOG_LEVEL_LOCAL (level, tag, format, ...)
runtime macro to output logs at a specified level. Also check the level with `LOG_LOCAL_LEVEL`. If `CONFIG_LOG_MASTER_LEVEL` set, also check first against `esp_log_get_level_master()`.

See also:

`printf`, `ESP_LOG_LEVEL`

ESP_DRAM_LOGE (tag, format, ...)
Macro to output logs when the cache is disabled. Log at `ESP_LOG_ERROR` level.

Similar to

Usage: `ESP_DRAM_LOGE(DRAM_STR("my_tag"), "format", or ESP_DRAM_LOGE(TAG, "format", ...)`, where `TAG` is a `char*` that points to a `str` in the DRAM.

See also:

`ESP_EARLY_LOGE`, the log level cannot be changed per-tag, however `esp_log_level_set("*", level)` will set the default level which controls these log lines also.

See also:

`esp_rom_printf`, `ESP_LOGE`

Note: Unlike normal logging macros, it's possible to use this macro when interrupts are disabled or inside an ISR.

Note: Placing log strings in DRAM reduces available DRAM, so only use when absolutely essential.

ESP_DRAM_LOGW (tag, format, ...)

macro to output logs when the cache is disabled at ESP_LOG_WARN level.

See also:

ESP_DRAM_LOGW,ESP_LOGW, esp_rom_printf

ESP_DRAM_LOGI (tag, format, ...)

macro to output logs when the cache is disabled at ESP_LOG_INFO level.

See also:

ESP_DRAM_LOGI,ESP_LOGI, esp_rom_printf

ESP_DRAM_LOGD (tag, format, ...)

macro to output logs when the cache is disabled at ESP_LOG_DEBUG level.

See also:

ESP_DRAM_LOGD,ESP_LOGD, esp_rom_printf

ESP_DRAM_LOGV (tag, format, ...)

macro to output logs when the cache is disabled at ESP_LOG_VERBOSE level.

See also:

ESP_DRAM_LOGV,ESP_LOGV, esp_rom_printf

Type Definitions

```
typedef int (*vprintf_like_t)(const char*, va_list)
```

Header File

- [components/log/include/esp_log_level.h](#)
- This header file can be included with:

```
#include "esp_log_level.h"
```

Functions

```
static inline esp_log_level_t esp_log_get_default_level (void)
```

Get the default log level.

This function returns the default log level. The default log level is used by the definition of ESP_LOGx macros and can be overridden for specific tags using `esp_log_level_set ("*", level)`. If CONFIG_LOG_DYNAMIC_LEVEL_CONTROL=n, changing the default log level is not possible.

Returns The default log level.

```
void esp_log_set_level_master (esp_log_level_t level)
```

Master log level.

Optional master log level to check against for ESP_LOGx macros before calling `esp_log_write`. Allows one to set a higher CONFIG_LOG_MAXIMUM_LEVEL but not impose a performance hit during normal operation (only when instructed). An application may set `esp_log_set_level_master(level)` to globally enforce a maximum log level. ESP_LOGx macros above this level will be skipped immediately, rather than calling `esp_log` or `esp_log_write` and doing a cache hit.

Note: The tradeoff is increased application size.

Parameters `level` -- Master log level

`esp_log_level_t esp_log_get_level_master` (void)

Returns master log level.

Returns Master log level

void `esp_log_level_set` (const char *tag, `esp_log_level_t` level)

Set log level for given tag.

If logging for given component has already been enabled, changes previous setting.

To raise log level above the default one for a given file, define `LOG_LOCAL_LEVEL` to one of the `ESP_LOG_*` values, before including `esp_log.h` in this file.

If `CONFIG_LOG_DYNAMIC_LEVEL_CONTROL` is not selected the static (no-op) implementation of log level is used. Changing the log level is not possible, `esp_log_level_set` does not work.

Note: Note that this function can not raise log level above the level set using `CONFIG_LOG_MAXIMUM_LEVEL` setting in `menuconfig`.

Parameters

- **tag** -- Tag of the log entries to enable. Must be a non-NULL zero terminated string. Value "*" resets log level for all tags to the given value. If the tag is NULL then a silent return happens.
- **level** -- Selects log level to enable. Only logs at this and lower verbosity levels will be shown.

`esp_log_level_t esp_log_level_get` (const char *tag)

Get log level for a given tag, can be used to avoid expensive log statements.

If `CONFIG_LOG_DYNAMIC_LEVEL_CONTROL` is not selected the static (no-op) implementation of log level is used. Changing the log level is not possible, `esp_log_level_set` does not work. This function returns the default log level.

Parameters `tag` -- Tag of the log to query current level. Must be a zero terminated string. If tag is NULL then the default log level is returned (see `esp_log_get_default_level()`).

Returns The current log level for the given tag.

Enumerations

enum `esp_log_level_t`

Log level.

Values:

enumerator `ESP_LOG_NONE`

No log output

enumerator `ESP_LOG_ERROR`

Critical errors, software module can not recover on its own

enumerator **ESP_LOG_WARN**

Error conditions from which recovery measures have been taken

enumerator **ESP_LOG_INFO**

Information messages which describe normal flow of events

enumerator **ESP_LOG_DEBUG**

Extra information which is not necessary for normal use (values, pointers, sizes, etc).

enumerator **ESP_LOG_VERBOSE**

Bigger chunks of debugging information, or frequent messages which can potentially flood the output.

enumerator **ESP_LOG_MAX**

Number of levels supported

Header File

- [components/log/include/esp_log_buffer.h](#)
- This header file can be included with:

```
#include "esp_log_buffer.h"
```

Functions

void **esp_log_buffer_hex_internal** (const char *tag, const void *buffer, uint16_t buff_len, *esp_log_level_t* level)

Logs a buffer of hexadecimal bytes at the specified log level.

This function logs a buffer of hexadecimal bytes with 16 bytes per line. The log level determines the severity of the log message.

Note: This function does not check the log level against the `ESP_LOCAL_LEVEL`. The log level comparison should be done in `esp_log.h`.

Parameters

- **tag** -- Description tag to identify the log.
- **buffer** -- Pointer to the buffer array containing the data to be logged.
- **buff_len** -- Length of the buffer in bytes.
- **level** -- Log level indicating the severity of the log message.

void **esp_log_buffer_char_internal** (const char *tag, const void *buffer, uint16_t buff_len, *esp_log_level_t* level)

This function logs a buffer of characters with 16 characters per line. The buffer should contain only printable characters. The log level determines the severity of the log message.

Note: This function does not check the log level against the `ESP_LOCAL_LEVEL`. The log level comparison should be done in `esp_log.h`.

Parameters

- **tag** -- Description tag to identify the log.
- **buffer** -- Pointer to the buffer array containing the data to be logged.
- **buff_len** -- Length of the buffer in bytes.

- **level** -- Log level indicating the severity of the log message.

void **esp_log_buffer_hexdump_internal** (const char *tag, const void *buffer, uint16_t buff_len, *esp_log_level_t* log_level)

This function dumps a buffer to the log in a formatted hex dump style, displaying both the memory address and the corresponding hex and ASCII values of the bytes. The log level determines the severity of the log message.

Note: This function does not check the log level against the `ESP_LOCAL_LEVEL`. The log level comparison should be done in `esp_log.h`.

Note: It is recommended to use terminals with a width of at least 102 characters to display the log dump properly.

Parameters

- **tag** -- Description tag to identify the log.
- **buffer** -- Pointer to the buffer array containing the data to be logged.
- **buff_len** -- Length of the buffer in bytes.
- **log_level** -- Log level indicating the severity of the log message.

Macros

ESP_LOG_BUFFER_HEX_LEVEL (tag, buffer, buff_len, level)

Log a buffer of hex bytes at specified level, separated into 16 bytes each line.

The hex log shows just like the one below:

```
I (954) log_example: 54 68 65 20 77 61 79 20 74 6f 20 67 65 74 20 73
I (962) log_example: 74 61 72 74 65 64 20 69 73 20 74 6f 20 71 75 69
I (969) log_example: 74 20 74 61 6c 6b 69 6e 67 20 61 6e 64 20 62 65
I (977) log_example: 67 69 6e 20 64 6f 69 6e 67 2e 20 2d 20 57 61 6c
I (984) log_example: 74 20 44 69 73 6e 65 79 00
```

Parameters

- **tag** -- Description tag to identify the log.
- **buffer** -- Pointer to the buffer array containing the data to be logged.
- **buff_len** -- Length of the buffer in bytes.
- **level** -- Log level

ESP_LOG_BUFFER_CHAR_LEVEL (tag, buffer, buff_len, level)

Log a buffer of characters at specified level, separated into 16 bytes each line. Buffer should contain only printable characters.

The char log shows just like the one below:

```
I (980) log_example: The way to get s
I (985) log_example: tarted is to qui
I (989) log_example: t talking and be
I (994) log_example: gin doing. - Wal
I (999) log_example: t Disney
```

Parameters

- **tag** -- Description tag to identify the log.
- **buffer** -- Pointer to the buffer array containing the data to be logged.
- **buff_len** -- Length of the buffer in bytes.
- **level** -- Log level.

ESP_LOG_BUFFER_HEXDUMP (tag, buffer, buff_len, level)

Dump a buffer to the log at specified level.

The dump log shows just like the one below:

```
I (1013) log_example: 0x3ffb5bc0 54 68 65 20 77 61 79 20 74 6f 20 67 65 74_
↪20 73 |The way to get s|
I (1024) log_example: 0x3ffb5bd0 74 61 72 74 65 64 20 69 73 20 74 6f 20 71_
↪75 69 |tarded is to qui|
I (1034) log_example: 0x3ffb5be0 74 20 74 61 6c 6b 69 6e 67 20 61 6e 64 20_
↪62 65 |t talking and be|
I (1044) log_example: 0x3ffb5bf0 67 69 6e 20 64 6f 69 6e 67 2e 20 2d 20 57_
↪61 6c |gin doing. - Wal|
I (1054) log_example: 0x3ffb5c00 74 20 44 69 73 6e 65 79 00 _
↪ |t Disney.|
```

Note: It is highly recommended to use terminals with over 102 text width.

Parameters

- **tag** -- Description tag to identify the log.
- **buffer** -- Pointer to the buffer array containing the data to be logged.
- **buff_len** -- Length of the buffer in bytes.
- **level** -- Log level.

ESP_LOG_BUFFER_HEX (tag, buffer, buff_len)

Log a buffer of hex bytes at Info level.

See also:

ESP_LOG_BUFFER_HEX_LEVEL

Parameters

- **tag** -- Description tag to identify the log.
- **buffer** -- Pointer to the buffer array containing the data to be logged.
- **buff_len** -- Length of the buffer in bytes.

ESP_LOG_BUFFER_CHAR (tag, buffer, buff_len)

Log a buffer of characters at Info level. Buffer should contain only printable characters.

See also:

ESP_LOG_BUFFER_CHAR_LEVEL

Parameters

- **tag** -- Description tag to identify the log.
- **buffer** -- Pointer to the buffer array containing the data to be logged.
- **buff_len** -- Length of the buffer in bytes.

Header File

- [components/log/include/esp_log_timestamp.h](#)
- This header file can be included with:

```
#include "esp_log_timestamp.h"
```

Functions

`uint32_t esp_log_timestamp (void)`

Function which returns timestamp to be used in log output.

This function is used in expansion of `ESP_LOGx` macros. In the 2nd stage bootloader, and at early application startup stage this function uses CPU cycle counter as time source. Later when FreeRTOS scheduler start running, it switches to FreeRTOS tick count.

For now, we ignore millisecond counter overflow.

Returns timestamp, in milliseconds

`char *esp_log_system_timestamp (void)`

Function which returns system timestamp to be used in log output.

This function is used in expansion of `ESP_LOGx` macros to print the system time as "HH:MM:SS.sss". The system time is initialized to 0 on startup, this can be set to the correct time with an SNTP sync, or manually with standard POSIX time functions.

Currently, this will not get used in logging from binary blobs (i.e. Wi-Fi & Bluetooth libraries), these will still print the RTOS tick time.

Returns timestamp, in "HH:MM:SS.sss"

`uint32_t esp_log_early_timestamp (void)`

Function which returns timestamp to be used in log output.

This function uses HW cycle counter and does not depend on OS, so it can be safely used after application crash.

Returns timestamp, in milliseconds

Header File

- [components/log/include/esp_log_color.h](#)
- This header file can be included with:

```
#include "esp_log_color.h"
```

2.9.21 Miscellaneous System APIs

Software Reset

To perform software reset of the chip, the `esp_restart()` function is provided. When the function is called, execution of the program stops, the CPU is reset, the application is loaded by the bootloader and starts execution again.

Additionally, the `esp_register_shutdown_handler()` function can register a routine that will be automatically called before a restart (that is triggered by `esp_restart()`) occurs. This is similar to the functionality of `atexit` POSIX function.

Reset Reason

ESP-IDF applications can be started or restarted due to a variety of reasons. To get the last reset reason, call `esp_reset_reason()` function. See description of `esp_reset_reason_t` for the list of possible reset reasons.

Heap Memory

Two heap-memory-related functions are provided:

- `esp_get_free_heap_size()` returns the current size of free heap memory.
- `esp_get_minimum_free_heap_size()` returns the minimum size of free heap memory that has ever been available (i.e., the smallest size of free heap memory in the application's lifetime).

Note that ESP-IDF supports multiple heaps with different capabilities. The functions mentioned in this section return the size of heap memory that can be allocated using the `malloc` family of functions. For further information about heap memory, see [Heap Memory Allocation](#).

MAC Address

These APIs allow querying and customizing MAC addresses for different supported network interfaces (e.g., Wi-Fi, Bluetooth, Ethernet).

To fetch the MAC address for a specific network interface (e.g., Wi-Fi, Bluetooth, Ethernet), call the function `esp_read_mac()`.

In ESP-IDF, the MAC addresses for the various network interfaces are calculated from a single **base MAC address**. By default, the Espressif base MAC address is used. This base MAC address is pre-programmed into the ESP32-C5 eFuse in the factory during production.

Interface	MAC Address (4 universally administered, default)	MAC Address (2 universally administered)
Wi-Fi Station	<code>base_mac</code>	<code>base_mac</code>
Wi-Fi SoftAP	<code>base_mac</code> , +1 to the last octet	<i>Local MAC</i> (derived from Wi-Fi Station MAC)
Bluetooth	<code>base_mac</code> , +2 to the last octet	<code>base_mac</code> , +1 to the last octet
Ethernet	<code>base_mac</code> , +3 to the last octet	<i>Local MAC</i> (derived from Bluetooth MAC)

Note: The [configuration](#) configures the number of universally administered MAC addresses that are provided by Espressif.

Note: Although ESP32-C5 has no integrated Ethernet MAC, it is still possible to calculate an Ethernet MAC address. However, this MAC address can only be used with an external ethernet interface such as an SPI-Ethernet device. See [Ethernet](#).

Custom Interface MAC Sometimes you may need to define custom MAC addresses that are not generated from the base MAC address. To set a custom interface MAC address, use the `esp_iface_mac_addr_set()` function. This function allows you to overwrite the MAC addresses of interfaces set (or not yet set) by the base MAC address. Once a MAC address has been set for a particular interface, it will not be affected when the base MAC address is changed.

Custom Base MAC The default base MAC is pre-programmed by Espressif in eFuse BLK1. To set a custom base MAC instead, call the function `esp_iface_mac_addr_set()` with the `ESP_MAC_BASE` argument (or `esp_base_mac_addr_set()`) before initializing any network interfaces or calling the `esp_read_mac()` function. The custom MAC address can be stored in any supported storage device (e.g., flash, NVS).

The custom base MAC addresses should be allocated such that derived MAC addresses will not overlap. Based on the table above, users can configure the option `CONFIG_ESP32C5_UNIVERSAL_MAC_ADDRESSES` to set the number of valid universal MAC addresses that can be derived from the custom base MAC.

Note: It is also possible to call the function `esp_netif_set_mac()` to set the specific MAC used by a network interface after network initialization. But it is recommended to use the base MAC approach documented here to avoid the possibility of the original MAC address briefly appearing on the network before being changed.

Custom MAC Address in eFuse When reading custom MAC addresses from eFuse, ESP-IDF provides a helper function `esp_efuse_mac_get_custom()`. Users can also use `esp_read_mac()` with the `ESP_MAC_EFUSE_CUSTOM` argument. This loads the MAC address from eFuse BLK3. The `esp_efuse_mac_get_custom()` function assumes that the custom base MAC address is stored in the following format:

Field	# of bits	Range of bits
MAC address	48	200:248

Note: The eFuse BLK3 uses RS-coding during burning, which means that all eFuse fields in this block must be burnt at the same time.

Once custom eFuse MAC address has been obtained (using `esp_efuse_mac_get_custom()` or `esp_read_mac()`), you need to set it as the base MAC address. There are two ways to do it:

1. Use an old API: call `esp_base_mac_addr_set()`.
2. Use a new API: call `esp_iface_mac_addr_set()` with the `ESP_MAC_BASE` argument.

Local Versus Universal MAC Addresses ESP32-C5 comes pre-programmed with enough valid Espressif universally administered MAC addresses for all internal interfaces. The table above shows how to calculate and derive the MAC address for a specific interface according to the base MAC address.

When using a custom MAC address scheme, it is possible that not all interfaces can be assigned with a universally administered MAC address. In these cases, a locally administered MAC address is assigned. Note that these addresses are intended for use on a single local network only.

See [this article](#) for the definition of locally and universally administered MAC addresses.

Function `esp_derive_local_mac()` is called internally to derive a local MAC address from a universal MAC address. The process is as follows:

1. The U/L bit (bit value 0x2) is set in the first octet of the universal MAC address, creating a local MAC address.
2. If this bit is already set in the supplied universal MAC address (i.e., the supplied "universal" MAC address was in fact already a local MAC address), then the first octet of the local MAC address is XORed with 0x4.

Chip Version

`esp_chip_info()` function fills `esp_chip_info_t` structure with information about the chip. This includes the chip revision, number of CPU cores, and a bit mask of features enabled in the chip.

SDK Version

`esp_get_idf_version()` returns a string describing the ESP-IDF version which is used to compile the application. This is the same value as the one available through `IDF_VER` variable of the build system. The version string generally has the format of `git describe` output.

To get the version at build time, additional version macros are provided. They can be used to enable or disable parts of the program depending on the ESP-IDF version.

- `ESP_IDF_VERSION_MAJOR`, `ESP_IDF_VERSION_MINOR`, `ESP_IDF_VERSION_PATCH` are defined to integers representing major, minor, and patch version.

- `ESP_IDF_VERSION_VAL` and `ESP_IDF_VERSION` can be used when implementing version checks:

```
#include "esp_idf_version.h"

#if ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)
    // enable functionality present in ESP-IDF v4.0
#endif
```

App Version

The application version is stored in `esp_app_desc_t` structure. It is located in DROM sector and has a fixed offset from the beginning of the binary file. The structure is located after `esp_image_header_t` and `esp_image_segment_header_t` structures. The type of the field version is string and it has a maximum length of 32 chars.

To set the version in your project manually, you need to set the `PROJECT_VER` variable in the `CMakeLists.txt` of your project. In application `CMakeLists.txt`, put `set (PROJECT_VER "0.1.0.1")` before including `project.cmake`.

If the `CONFIG_APP_PROJECT_VER_FROM_CONFIG` option is set, the value of `CONFIG_APP_PROJECT_VER` will be used. Otherwise, if the `PROJECT_VER` variable is not set in the project, it will be retrieved either from the `$(PROJECT_PATH)/version.txt` file (if present) or using `git describe` command. If neither is available, `PROJECT_VER` will be set to "1". Application can make use of this by calling `esp_app_get_description()` or `esp_ota_get_partition_description()` functions.

Application Examples

- `system/base_mac_address` demonstrates how to retrieve, set, and derive the base MAC address for each network interface on ESP32-C5 from non-volatile memory, using either the eFuse blocks or external storage.

API Reference

```

Functions

`esp_err_t esp_register_shutdown_handler (shutdown_handler_t handle)`

Register shutdown handler.

This function allows you to register a handler that gets invoked before the application is restarted using `esp_restart` function.

Parameters `handle` -- function to execute on restart

Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if the handler has already been registered
- `ESP_ERR_NO_MEM` if no more shutdown handler slots are available

`esp_err_t esp_unregister_shutdown_handler (shutdown_handler_t handle)`

Unregister shutdown handler.

This function allows you to unregister a handler which was previously registered using `esp_register_shutdown_handler` function.

- `ESP_OK` on success

- `ESP_ERR_INVALID_STATE` if the given handler hasn't been registered before

void **esp_restart** (void)

Restart PRO and APP CPUs.

This function can be called both from PRO and APP CPUs. After successful restart, CPU reset reason will be `SW_CPU_RESET`. Peripherals (except for Wi-Fi, BT, UART0, SPI1, and legacy timers) are not reset. This function does not return.

esp_reset_reason_t **esp_reset_reason** (void)

Get reason of last reset.

Returns See description of `esp_reset_reason_t` for explanation of each value.

uint32_t **esp_get_free_heap_size** (void)

Get the size of available heap.

Note: Note that the returned value may be larger than the maximum contiguous block which can be allocated.

Returns Available heap size, in bytes.

uint32_t **esp_get_free_internal_heap_size** (void)

Get the size of available internal heap.

Note: Note that the returned value may be larger than the maximum contiguous block which can be allocated.

Returns Available internal heap size, in bytes.

uint32_t **esp_get_minimum_free_heap_size** (void)

Get the minimum heap that has ever been available.

Returns Minimum free heap ever available

void **esp_system_abort** (const char *details)

Trigger a software abort.

Parameters `details` -- Details that will be displayed during panic handling.

Type Definitions

typedef void (***shutdown_handler_t**)(void)

Shutdown handler type

Enumerations

enum **esp_reset_reason_t**

Reset reasons.

Values:

enumerator **ESP_RST_UNKNOWN**

Reset reason can not be determined.

enumerator **ESP_RST_POWERON**

Reset due to power-on event.

enumerator **ESP_RST_EXT**

Reset by external pin (not applicable for ESP32)

enumerator **ESP_RST_SW**

Software reset via esp_restart.

enumerator **ESP_RST_PANIC**

Software reset due to exception/panic.

enumerator **ESP_RST_INT_WDT**

Reset (software or hardware) due to interrupt watchdog.

enumerator **ESP_RST_TASK_WDT**

Reset due to task watchdog.

enumerator **ESP_RST_WDT**

Reset due to other watchdogs.

enumerator **ESP_RST_DEEPSLEEP**

Reset after exiting deep sleep mode.

enumerator **ESP_RST_BROWNOUT**

Brownout reset (software or hardware)

enumerator **ESP_RST_SDIO**

Reset over SDIO.

enumerator **ESP_RST_USB**

Reset by USB peripheral.

enumerator **ESP_RST_JTAG**

Reset by JTAG.

enumerator **ESP_RST_EFUSE**

Reset due to efuse error.

enumerator **ESP_RST_PWR_GLITCH**

Reset due to power glitch detected.

enumerator **ESP_RST_CPU_LOCKUP**

Reset due to CPU lock up (double exception)

Header File

- [components/esp_common/include/esp_idf_version.h](#)
- This header file can be included with:

```
#include "esp_idf_version.h"
```

Functions

const char ***esp_get_idf_version** (void)

Return full IDF version string, same as 'git describe' output.

Note: If you are printing the ESP-IDF version in a log file or other information, this function provides more information than using the numerical version macros. For example, numerical version macros don't differentiate between development, pre-release and release versions, but the output of this function does.

Returns constant string from IDF_VER

Macros

ESP_IDF_VERSION_MAJOR

Major version number (X.x.x)

ESP_IDF_VERSION_MINOR

Minor version number (x.X.x)

ESP_IDF_VERSION_PATCH

Patch version number (x.x.X)

ESP_IDF_VERSION_VAL (major, minor, patch)

Macro to convert IDF version number into an integer

To be used in comparisons, such as `ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)`

ESP_IDF_VERSION

Current IDF version, as an integer

To be used in comparisons, such as `ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)`

Header File

- [components/esp_hw_support/include/esp_mac.h](#)
- This header file can be included with:

```
#include "esp_mac.h"
```

Functions

esp_err_t **esp_base_mac_addr_set** (const uint8_t *mac)

Set base MAC address with the MAC address which is stored in BLK3 of EFUSE or external storage e.g. flash and EEPROM.

Base MAC address is used to generate the MAC addresses used by network interfaces.

If using a custom base MAC address, call this API before initializing any network interfaces. Refer to the ESP-IDF Programming Guide for details about how the Base MAC is used.

Note: Base MAC must be a unicast MAC (least significant bit of first byte must be zero).

Note: If not using a valid OUI, set the "locally administered" bit (bit value 0x02 in the first byte) to avoid collisions.

Parameters **mac** -- base MAC address, length: 6 bytes. length: 6 bytes for MAC-48

Returns ESP_OK on success ESP_ERR_INVALID_ARG If mac is NULL or is not a unicast MAC

esp_err_t **esp_base_mac_addr_get** (uint8_t *mac)

Return base MAC address which is set using esp_base_mac_addr_set.

Note: If no custom Base MAC has been set, this returns the pre-programmed Espressif base MAC address.

Parameters **mac** -- base MAC address, length: 6 bytes. length: 6 bytes for MAC-48

Returns ESP_OK on success ESP_ERR_INVALID_ARG mac is NULL
ESP_ERR_INVALID_MAC base MAC address has not been set

esp_err_t **esp_efuse_mac_get_custom** (uint8_t *mac)

Return base MAC address which was previously written to BLK3 of EFUSE.

Base MAC address is used to generate the MAC addresses used by the networking interfaces. This API returns the custom base MAC address which was previously written to EFUSE BLK3 in a specified format.

Writing this EFUSE allows setting of a different (non-Espressif) base MAC address. It is also possible to store a custom base MAC address elsewhere, see esp_base_mac_addr_set() for details.

Note: This function is currently only supported on ESP32.

Parameters **mac** -- base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64(used for IEEE 802.15.4, if CONFIG_SOC_IEEE802154_SUPPORTED=y)

Returns ESP_OK on success ESP_ERR_INVALID_ARG mac is NULL
ESP_ERR_INVALID_MAC CUSTOM_MAC address has not been set, all zeros (for esp32-xx)
ESP_ERR_INVALID_VERSION An invalid MAC version field was read from BLK3 of EFUSE (for esp32)
ESP_ERR_INVALID_CRC An invalid MAC CRC was read from BLK3 of EFUSE (for esp32)

esp_err_t **esp_efuse_mac_get_default** (uint8_t *mac)

Return base MAC address which is factory-programmed by Espressif in EFUSE.

Parameters **mac** -- base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64(used for IEEE 802.15.4, if CONFIG_SOC_IEEE802154_SUPPORTED=y)

Returns ESP_OK on success ESP_ERR_INVALID_ARG mac is NULL

esp_err_t **esp_read_mac** (uint8_t *mac, *esp_mac_type_t* type)

Read base MAC address and set MAC address of the interface.

This function first get base MAC address using esp_base_mac_addr_get(). Then calculates the MAC address of the specific interface requested, refer to ESP-IDF Programming Guide for the algorithm.

The MAC address set by the esp_iface_mac_addr_set() function will not depend on the base MAC address.

Parameters

- **mac** -- base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64(used for IEEE 802.15.4, if CONFIG_SOC_IEEE802154_SUPPORTED=y)
- **type** -- Type of MAC address to return

Returns ESP_OK on success

esp_err_t **esp_derive_local_mac** (uint8_t *local_mac, const uint8_t *universal_mac)

Derive local MAC address from universal MAC address.

This function copies a universal MAC address and then sets the "locally administered" bit (bit 0x2) in the first octet, creating a locally administered MAC address.

If the universal MAC address argument is already a locally administered MAC address, then the first octet is XORed with 0x4 in order to create a different locally administered MAC address.

Parameters

- **local_mac** -- base MAC address, length: 6 bytes. length: 6 bytes for MAC-48
- **universal_mac** -- Source universal MAC address, length: 6 bytes.

Returns ESP_OK on success

esp_err_t **esp_iface_mac_addr_set** (const uint8_t *mac, *esp_mac_type_t* type)

Set custom MAC address of the interface. This function allows you to overwrite the MAC addresses of the interfaces set by the base MAC address.

Parameters

- **mac** -- MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64(used for ESP_MAC_IEEE802154 type, if CONFIG_SOC_IEEE802154_SUPPORTED=y)
- **type** -- Type of MAC address

Returns ESP_OK on success

size_t **esp_mac_addr_len_get** (*esp_mac_type_t* type)

Return the size of the MAC type in bytes.

If CONFIG_SOC_IEEE802154_SUPPORTED is set then for these types:

- ESP_MAC_IEEE802154 is 8 bytes.
- ESP_MAC_BASE, ESP_MAC_EFUSE_FACTORY and ESP_MAC_EFUSE_CUSTOM the MAC size is 6 bytes.
- ESP_MAC_EFUSE_EXT is 2 bytes. If CONFIG_SOC_IEEE802154_SUPPORTED is not set then for all types it returns 6 bytes.

Parameters **type** -- Type of MAC address

Returns 0 MAC type not found (not supported) 6 bytes for MAC-48. 8 bytes for EUI-64.

Macros

MAC2STR (a)

MACSTR

Enumerations

enum **esp_mac_type_t**

Values:

enumerator **ESP_MAC_WIFI_STA**

MAC for WiFi Station (6 bytes)

enumerator **ESP_MAC_WIFI_SOFTAP**

MAC for WiFi Soft-AP (6 bytes)

enumerator **ESP_MAC_BT**

MAC for Bluetooth (6 bytes)

enumerator **ESP_MAC_ETH**

MAC for Ethernet (6 bytes)

enumerator **ESP_MAC_IEEE802154**

if CONFIG_SOC_IEEE802154_SUPPORTED=y, MAC for IEEE802154 (8 bytes)

enumerator **ESP_MAC_BASE**

Base MAC for that used for other MAC types (6 bytes)

enumerator **ESP_MAC_EFUSE_FACTORY**

MAC_FACTORY eFuse which was burned by Espressif in production (6 bytes)

enumerator **ESP_MAC_EFUSE_CUSTOM**

MAC_CUSTOM eFuse which was can be burned by customer (6 bytes)

enumerator **ESP_MAC_EFUSE_EXT**

if CONFIG_SOC_IEEE802154_SUPPORTED=y, MAC_EXT eFuse which is used as an extender for IEEE802154 MAC (2 bytes)

Header File

- [components/esp_hw_support/include/esp_chip_info.h](#)
- This header file can be included with:

```
#include "esp_chip_info.h"
```

Functions

void **esp_chip_info** (*esp_chip_info_t* *out_info)

Fill an *esp_chip_info_t* structure with information about the chip.

Parameters *out_info* -- [out] structure to be filled

Structures

struct **esp_chip_info_t**

The structure represents information about the chip.

Public Members

esp_chip_model_t **model**

chip model, one of *esp_chip_model_t*

uint32_t **features**

bit mask of CHIP_FEATURE_x feature flags

uint16_t **revision**

chip revision number (in format MXX; where M - wafer major version, XX - wafer minor version)

uint8_t **cores**

number of CPU cores

Macros

CHIP_FEATURE_EMB_FLASH

Chip has embedded flash memory.

CHIP_FEATURE_WIFI_BGN

Chip has 2.4GHz WiFi.

CHIP_FEATURE_BLE

Chip has Bluetooth LE.

CHIP_FEATURE_BT

Chip has Bluetooth Classic.

CHIP_FEATURE_IEEE802154

Chip has IEEE 802.15.4.

CHIP_FEATURE_EMB_PSRAM

Chip has embedded psram.

Enumerations

enum **esp_chip_model_t**

Chip models.

Values:

enumerator **CHIP_ESP32**

ESP32.

enumerator **CHIP_ESP32S2**

ESP32-S2.

enumerator **CHIP_ESP32S3**

ESP32-S3.

enumerator **CHIP_ESP32C3**

ESP32-C3.

enumerator **CHIP_ESP32C2**

ESP32-C2.

enumerator **CHIP_ESP32C6**

ESP32-C6.

enumerator **CHIP_ESP32H2**

ESP32-H2.

enumerator **CHIP_ESP32P4**

ESP32-P4.

enumerator **CHIP_ESP32C61**

ESP32-C61.

enumerator **CHIP_ESP32C5**

ESP32-C5.

enumerator **CHIP_POSIX_LINUX**

The code is running on POSIX/Linux simulator.

Header File

- [components/esp_hw_support/include/esp_cpu.h](#)
- This header file can be included with:

```
#include "esp_cpu.h"
```

Functions

void **esp_cpu_stall** (int core_id)

Stall a CPU core.

Parameters **core_id** -- The core's ID

void **esp_cpu_unstall** (int core_id)

Resume a previously stalled CPU core.

Parameters **core_id** -- The core's ID

void **esp_cpu_reset** (int core_id)

Reset a CPU core.

Parameters **core_id** -- The core's ID

void **esp_cpu_wait_for_intr** (void)

Wait for Interrupt.

This function causes the current CPU core to execute its Wait For Interrupt (WFI or equivalent) instruction. After executing this function, the CPU core will stop execution until an interrupt occurs.

int **esp_cpu_get_core_id** (void)

Get the current core's ID.

This function will return the ID of the current CPU (i.e., the CPU that calls this function).

Returns The current core's ID [0..SOC_CPU_CORES_NUM - 1]

void ***esp_cpu_get_sp** (void)

Read the current stack pointer address.

Returns Stack pointer address

esp_cpu_cycle_count_t **esp_cpu_get_cycle_count** (void)

Get the current CPU core's cycle count.

Each CPU core maintains an internal counter (i.e., cycle count) that increments every CPU clock cycle.

Returns Current CPU's cycle count, 0 if not supported.

void **esp_cpu_set_cycle_count** (*esp_cpu_cycle_count_t* cycle_count)

Set the current CPU core's cycle count.

Set the given value into the internal counter that increments every CPU clock cycle.

Parameters **cycle_count** -- CPU cycle count

void ***esp_cpu_pc_to_addr** (uint32_t pc)

Convert a program counter (PC) value to address.

If the architecture does not store the true virtual address in the CPU's PC or return addresses, this function will convert the PC value to a virtual address. Otherwise, the PC is just returned

Parameters **pc** -- PC value

Returns Virtual address

void **esp_cpu_intr_get_desc** (int core_id, int intr_num, *esp_cpu_intr_desc_t* *intr_desc_ret)

Get a CPU interrupt's descriptor.

Each CPU interrupt has a descriptor describing the interrupt's capabilities and restrictions. This function gets the descriptor of a particular interrupt on a particular CPU.

Parameters

- **core_id** -- [in] The core's ID
- **intr_num** -- [in] Interrupt number
- **intr_desc_ret** -- [out] The interrupt's descriptor

void **esp_cpu_intr_set_ivt_addr** (const void *ivt_addr)

Set the base address of the current CPU's Interrupt Vector Table (IVT)

Parameters **ivt_addr** -- Interrupt Vector Table's base address

void **esp_cpu_intr_set_mtvvt_addr** (const void *mtvt_addr)

Set the base address of the current CPU's Interrupt Vector Table (MTVVT)

Note: The MTVVT table is only applicable when CLIC is supported

Parameters **mtvt_addr** -- Interrupt Vector Table's base address

void **esp_cpu_intr_set_type** (int intr_num, *esp_cpu_intr_type_t* intr_type)

Set the interrupt type of a particular interrupt.

Set the interrupt type (Level or Edge) of a particular interrupt on the current CPU.

Parameters

- **intr_num** -- Interrupt number (from 0 to 31)
- **intr_type** -- The interrupt's type

esp_cpu_intr_type_t **esp_cpu_intr_get_type** (int intr_num)

Get the current configured type of a particular interrupt.

Get the currently configured type (i.e., level or edge) of a particular interrupt on the current CPU.

Parameters **intr_num** -- Interrupt number (from 0 to 31)

Returns Interrupt type

void **esp_cpu_intr_set_priority** (int intr_num, int intr_priority)

Set the priority of a particular interrupt.

Set the priority of a particular interrupt on the current CPU.

Parameters

- **intr_num** -- Interrupt number (from 0 to 31)
- **intr_priority** -- The interrupt's priority

int **esp_cpu_intr_get_priority** (int intr_num)

Get the current configured priority of a particular interrupt.

Get the currently configured priority of a particular interrupt on the current CPU.

Parameters **intr_num** -- Interrupt number (from 0 to 31)

Returns Interrupt's priority

bool **esp_cpu_intr_has_handler** (int intr_num)

Check if a particular interrupt already has a handler function.

Check if a particular interrupt on the current CPU already has a handler function assigned.

Note: This function simply checks if the IVT of the current CPU already has a handler assigned.

Parameters **intr_num** -- Interrupt number (from 0 to 31)

Returns True if the interrupt has a handler function, false otherwise.

void **esp_cpu_intr_set_handler** (int intr_num, *esp_cpu_intr_handler_t* handler, void *handler_arg)

Set the handler function of a particular interrupt.

Assign a handler function (i.e., ISR) to a particular interrupt on the current CPU.

Note: This function simply sets the handler function (in the IVT) and does not actually enable the interrupt.

Parameters

- **intr_num** -- Interrupt number (from 0 to 31)
- **handler** -- Handler function
- **handler_arg** -- Argument passed to the handler function

void ***esp_cpu_intr_get_handler_arg** (int intr_num)

Get a handler function's argument of.

Get the argument of a previously assigned handler function on the current CPU.

Parameters **intr_num** -- Interrupt number (from 0 to 31)

Returns The the argument passed to the handler function

void **esp_cpu_intr_enable** (uint32_t intr_mask)

Enable particular interrupts on the current CPU.

Parameters **intr_mask** -- Bit mask of the interrupts to enable

void **esp_cpu_intr_disable** (uint32_t intr_mask)

Disable particular interrupts on the current CPU.

Parameters **intr_mask** -- Bit mask of the interrupts to disable

uint32_t **esp_cpu_intr_get_enabled_mask** (void)

Get the enabled interrupts on the current CPU.

Returns Bit mask of the enabled interrupts

void **esp_cpu_intr_edge_ack** (int intr_num)

Acknowledge an edge interrupt.

Parameters **intr_num** -- Interrupt number (from 0 to 31)

void **esp_cpu_configure_region_protection** (void)

Configure the CPU to disable access to invalid memory regions.

esp_err_t **esp_cpu_set_breakpoint** (int bp_num, const void *bp_addr)

Set and enable a hardware breakpoint on the current CPU.

Note: This function is meant to be called by the panic handler to set a breakpoint for an attached debugger during a panic.

Note: Overwrites previously set breakpoint with same breakpoint number.

Parameters

- **bp_num** -- Hardware breakpoint number [0..SOC_CPU_BREAKPOINTS_NUM - 1]
- **bp_addr** -- Address to set a breakpoint on

Returns ESP_OK if breakpoint is set. Failure otherwise

esp_err_t **esp_cpu_clear_breakpoint** (int bp_num)

Clear a hardware breakpoint on the current CPU.

Note: Clears a breakpoint regardless of whether it was previously set

Parameters **bp_num** -- Hardware breakpoint number [0..SOC_CPU_BREAKPOINTS_NUM - 1]

Returns ESP_OK if breakpoint is cleared. Failure otherwise

esp_err_t **esp_cpu_set_watchpoint** (int wp_num, const void *wp_addr, size_t size, *esp_cpu_watchpoint_trigger_t* trigger)

Set and enable a hardware watchpoint on the current CPU.

Set and enable a hardware watchpoint on the current CPU, specifying the memory range and trigger operation. Watchpoints will break/panic the CPU when the CPU accesses (according to the trigger type) on a certain memory range.

Note: Overwrites previously set watchpoint with same watchpoint number. On RISC-V chips, this API uses method0(Exact matching) and method1(NAPOT matching) according to the riscv-debug-spec-0.13 specification for address matching. If the watch region size is 1byte, it uses exact matching (method 0). If the watch region size is larger than 1byte, it uses NAPOT matching (method 1). This mode requires the watching region start address to be aligned to the watching region size.

Parameters

- **wp_num** -- Hardware watchpoint number [0..SOC_CPU_WATCHPOINTS_NUM - 1]
- **wp_addr** -- Watchpoint's base address, must be naturally aligned to the size of the region
- **size** -- Size of the region to watch. Must be one of 2^n and in the range of [1 ... SOC_CPU_WATCHPOINT_MAX_REGION_SIZE]
- **trigger** -- Trigger type

Returns ESP_ERR_INVALID_ARG on invalid arg, ESP_OK otherwise

esp_err_t **esp_cpu_clear_watchpoint** (int wp_num)

Clear a hardware watchpoint on the current CPU.

Note: Clears a watchpoint regardless of whether it was previously set

Parameters **wp_num** -- Hardware watchpoint number [0..SOC_CPU_WATCHPOINTS_NUM - 1]

Returns ESP_OK if watchpoint was cleared. Failure otherwise.

bool **esp_cpu_dbggr_is_attached** (void)

Check if the current CPU has a debugger attached.

Returns True if debugger is attached, false otherwise

void **esp_cpu_dbggr_break** (void)

Trigger a call to the current CPU's attached debugger.

intptr_t **esp_cpu_get_call_addr** (intptr_t return_address)

Given the return address, calculate the address of the preceding call instruction This is typically used to answer the question "where was the function called from?".

Parameters **return_address** -- The value of the return address register. Typically set to the value of `__builtin_return_address(0)`.

Returns Address of the call instruction preceding the return address.

bool **esp_cpu_compare_and_set** (volatile uint32_t *addr, uint32_t compare_value, uint32_t new_value)

Atomic compare-and-set operation.

Parameters

- **addr** -- Address of atomic variable
- **compare_value** -- Value to compare the atomic variable to
- **new_value** -- New value to set the atomic variable to

Returns Whether the atomic variable was set or not

void **esp_cpu_branch_prediction_enable** (void)

Enable branch prediction.

void **esp_cpu_branch_prediction_disable** (void)

Disable branch prediction.

Structures

struct **esp_cpu_intr_desc_t**

CPU interrupt descriptor.

Each particular CPU interrupt has an associated descriptor describing that particular interrupt's characteristics. Call `esp_cpu_intr_get_desc()` to get the descriptors of a particular interrupt.

Public Members

int **priority**

Priority of the interrupt if it has a fixed priority, (-1) if the priority is configurable.

esp_cpu_intr_type_t **type**

Whether the interrupt is an edge or level type interrupt, `ESP_CPU_INTR_TYPE_NA` if the type is configurable.

uint32_t **flags**

Flags indicating extra details.

Macros

ESP_CPU_INTR_DESC_FLAG_SPECIAL

Interrupt descriptor flags of *esp_cpu_intr_desc_t*.

The interrupt is a special interrupt (e.g., a CPU timer interrupt)

ESP_CPU_INTR_DESC_FLAG_RESVD

The interrupt is reserved for internal use

Type Definitions

typedef uint32_t **esp_cpu_cycle_count_t**

CPU cycle count type.

This data type represents the CPU's clock cycle count

typedef void (***esp_cpu_intr_handler_t**)(void *arg)

CPU interrupt handler type.

Enumerations

enum **esp_cpu_intr_type_t**

CPU interrupt type.

Values:

enumerator **ESP_CPU_INTR_TYPE_LEVEL**

enumerator **ESP_CPU_INTR_TYPE_EDGE**

enumerator **ESP_CPU_INTR_TYPE_NA**

enum **esp_cpu_watchpoint_trigger_t**

CPU watchpoint trigger type.

Values:

enumerator **ESP_CPU_WATCHPOINT_LOAD**

enumerator **ESP_CPU_WATCHPOINT_STORE**

enumerator **ESP_CPU_WATCHPOINT_ACCESS**

Header File

- `components/esp_app_format/include/esp_app_desc.h`
- This header file can be included with:

```
#include "esp_app_desc.h"
```

- This header file is a part of the API provided by the `esp_app_format` component. To declare that your component depends on `esp_app_format`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_app_format
```

or

```
PRIV_REQUIRES esp_app_format
```

Functions

const `esp_app_desc_t` *`esp_app_get_description` (void)

Return `esp_app_desc` structure. This structure includes app version.

Return description for running app.

Returns Pointer to `esp_app_desc` structure.

int `esp_app_get_elf_sha256` (char *dst, size_t size)

Fill the provided buffer with SHA256 of the ELF file, formatted as hexadecimal, null-terminated. If the buffer size is not sufficient to fit the entire SHA256 in hex plus a null terminator, the largest possible number of bytes will be written followed by a null.

Parameters

- **dst** -- Destination buffer
- **size** -- Size of the buffer

Returns Number of bytes written to dst (including null terminator)

char *`esp_app_get_elf_sha256_str` (void)

Return SHA256 of the ELF file which is already formatted as hexadecimal, null-terminated included. Can be used in panic handler or core dump during when cache is disabled. The length is defined by `CONFIG_APP_RETRIEVE_LEN_ELF_SHA` option.

Returns Hexadecimal SHA256 string

Structures

struct `esp_app_desc_t`

Description about application.

Public Members

uint32_t `magic_word`

Magic word `ESP_APP_DESC_MAGIC_WORD`

uint32_t `secure_version`

Secure version

uint32_t `reserv1`[2]

reserv1

char `version`[32]

Application version

char `project_name`[32]

Project name

char `time`[16]

Compile time

char `date`[16]

Compile date

char `idf_ver`[32]

Version IDF

uint8_t **app_elf_sha256**[32]

sha256 of elf file

uint16_t **min_efuse_blk_rev_full**

Minimal eFuse block revision supported by image, in format: major * 100 + minor

uint16_t **max_efuse_blk_rev_full**

Maximal eFuse block revision supported by image, in format: major * 100 + minor

uint8_t **mmu_page_size**

MMU page size in log base 2 format

uint8_t **reserv3**[3]

reserv3

uint32_t **reserv2**[18]

reserv2

Macros

ESP_APP_DESC_MAGIC_WORD

The magic word for the `esp_app_desc` structure that is in DRAM.

2.9.22 Over The Air Updates (OTA)

OTA Process Overview

The OTA update mechanism allows a device to update itself based on data received while the normal firmware is running (for example, over Wi-Fi, Bluetooth or Ethernet).

The following modes support OTA updates for certain partitions:

- **Safe update mode.** The update process for certain partitions is designed to be resilient, ensuring that even if the power is cut off during the update, the chip will remain operational and capable of booting the current application. The following partitions support this mode:
 - Application. OTA requires configuring the *Partition Tables* of the device with at least two OTA app slot partitions (i.e., `ota_0` and `ota_1`) and an OTA Data Partition. The OTA operation functions write a new app firmware image to whichever OTA app slot that is currently not selected for booting. Once the image is verified, the OTA Data partition is updated to specify that this image should be used for the next boot.
- **Unsafe update mode.** The update process is vulnerable, meaning that a power interruption during the update can cause issues that prevent the current application from loading, potentially leading to an unrecoverable state. The temporary partition receives the new image, and once it is fully downloaded, the image is copied to the final destination partition. If an interruption occurs during this final copying process, it can lead to issues. The following partitions support this mode:
 - Bootloader.
 - Partition table.
 - other data partitions like `nvs`, `fat`, etc.

OTA Data Partition

An OTA data partition (type `data`, subtype `ota`) must be included in the *Partition Tables* of any project which uses the OTA functions.

For factory boot settings, the OTA data partition should contain no data (all bytes erased to `0xFF`). In this case, the ESP-IDF second stage bootloader boots the factory app if it is present in the partition table. If no factory app is included in the partition table, the first available OTA slot (usually `ota_0`) is booted.

After the first OTA update, the OTA data partition is updated to specify which OTA app slot partition should be booted next.

The OTA data partition is two flash sectors (`0x2000` bytes) in size, to prevent problems if there is a power failure while it is being written. Sectors are independently erased and written with matching data, and if they disagree a counter field is used to determine which sector was written more recently.

App Rollback

The main purpose of the application rollback is to keep the device working after the update. This feature allows you to roll back to the previous working application in case a new application has critical errors. When the rollback process is enabled and an OTA update provides a new version of the app, one of three things can happen:

- The application works fine, `esp_ota_mark_app_valid_cancel_rollback()` marks the running application with the state `ESP_OTA_IMG_VALID`. There are no restrictions on booting this application.
- The application has critical errors and further work is not possible, a rollback to the previous application is required, `esp_ota_mark_app_invalid_rollback_and_reboot()` marks the running application with the state `ESP_OTA_IMG_INVALID` and reset. This application will not be selected by the bootloader for boot and will boot the previously working application.
- If the `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is set, and a reset occurs without calling either function then the application is rolled back.

The following code serves detect the initial boot for an application after the OTA update. Upon the first boot, the application checks its state and performs diagnostics. If the diagnostics are successful, the application should call `esp_ota_mark_app_valid_cancel_rollback()` to confirm the operability of the application. If the diagnostics fail, the application should call `esp_ota_mark_app_invalid_rollback_and_reboot()` to roll back to the previous working application.

If the application is not able to boot or execute this code due to an abort/reboot/power loss error, the bootloader marks this application as `ESP_OTA_IMG_INVALID` in the next booting attempt and rolls back to the previous working application.

```
const esp_partition_t *running = esp_ota_get_running_partition();
esp_ota_img_states_t ota_state;
if (esp_ota_get_state_partition(running, &ota_state) == ESP_OK) {
    if (ota_state == ESP_OTA_IMG_PENDING_VERIFY) {
        // run diagnostic function ...
        bool diagnostic_is_ok = diagnostic();
        if (diagnostic_is_ok) {
            ESP_LOGI(TAG, "Diagnostics completed successfully! Continuing_
↪execution ...");
            esp_ota_mark_app_valid_cancel_rollback();
        } else {
            ESP_LOGE(TAG, "Diagnostics failed! Start rollback to the previous_
↪version ...");
            esp_ota_mark_app_invalid_rollback_and_reboot();
        }
    }
}
```

For the example incorporating the above code snippet, see the [system/ota/native_ota_example](#) example.

Note: The state is not written to the binary image of the application but rather to the `otadata` partition. The partition contains a `ota_seq` counter, which is a pointer to the slot (`ota_0`, `ota_1`, ...) from which the application will be selected for boot.

App OTA State States control the process of selecting a boot app:

States	Restriction of selecting a boot app in bootloader
ESP_OTA_IMG_VALID	No restriction. Will be selected.
ESP_OTA_IMG_UNDEFINED	No restriction. Will be selected.
ESP_OTA_IMG_INVALID	Will not be selected.
ESP_OTA_IMG_ABORTED	Will not be selected.
ESP_OTA_IMG_NEW	If <code>CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE</code> option is set it will be selected only once. In bootloader the state immediately changes to ESP_OTA_IMG_PENDING_VERIFY.
ESP_OTA_IMG_PENDING_VERIFY	If <code>CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE</code> option is set it will not be selected, and the state will change to ESP_OTA_IMG_ABORTED.

If `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is not enabled (by default), then the use of the following functions `esp_ota_mark_app_valid_cancel_rollback()` and `esp_ota_mark_app_invalid_rollback_and_reboot()` are optional, and ESP_OTA_IMG_NEW and ESP_OTA_IMG_PENDING_VERIFY states are not used.

An option in Kconfig `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` allows you to track the first boot of a new application. In this case, the application must confirm its operability by calling `esp_ota_mark_app_valid_cancel_rollback()` function, otherwise the application will be rolled back upon reboot. It allows you to control the operability of the application during the boot phase. Thus, a new application has only one attempt to boot successfully.

Rollback Process The description of the rollback process when `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled:

- The new application is successfully downloaded and `esp_ota_set_boot_partition()` function makes this partition bootable and sets the state ESP_OTA_IMG_NEW. This state means that the application is new and should be monitored for its first boot.
- Reboot `esp_restart()`.
- The bootloader checks for the ESP_OTA_IMG_PENDING_VERIFY state if it is set, then it will be written to ESP_OTA_IMG_ABORTED.
- The bootloader selects a new application to boot so that the state is not set as ESP_OTA_IMG_INVALID or ESP_OTA_IMG_ABORTED.
- The bootloader checks the selected application for ESP_OTA_IMG_NEW state if it is set, then it will be written to ESP_OTA_IMG_PENDING_VERIFY. This state means that the application requires confirmation of its operability, if this does not happen and a reboot occurs, this state will be overwritten to ESP_OTA_IMG_ABORTED (see above) and this application will no longer be able to start, i.e., there will be a rollback to the previous working application.
- A new application has started and should make a self-test.
- If the self-test has completed successfully, then you must call the function `esp_ota_mark_app_valid_cancel_rollback()` because the application is awaiting confirmation of operability (ESP_OTA_IMG_PENDING_VERIFY state).
- If the self-test fails, then call `esp_ota_mark_app_invalid_rollback_and_reboot()` function to roll back to the previous working application, while the invalid application is set ESP_OTA_IMG_INVALID state.
- If the application has not been confirmed, the state remains ESP_OTA_IMG_PENDING_VERIFY, and the next boot it will be changed to ESP_OTA_IMG_ABORTED, which prevents re-boot of this application. There will be a rollback to the previous working application.

Unexpected Reset If a power loss or an unexpected crash occurs at the time of the first boot of a new application, it will roll back the application.

Recommendation: Perform the self-test procedure as quickly as possible, to prevent rollback due to power loss.

Only OTA partitions can be rolled back. Factory partition is not rolled back.

Bootimg Invalid/aborted Apps Booting an application which was previously set to `ESP_OTA_IMG_INVALID` or `ESP_OTA_IMG_ABORTED` is possible:

- Get the last invalid application partition `esp_ota_get_last_invalid_partition()`.
- Pass the received partition to `esp_ota_set_boot_partition()`, this will update the `otadata`.
- Restart `esp_restart()`. The bootloader will boot the specified application.

To determine if self-tests should be run during startup of an application, call the `esp_ota_get_state_partition()` function. If result is `ESP_OTA_IMG_PENDING_VERIFY` then self-testing and subsequent confirmation of operability is required.

Where the States Are Set A brief description of where the states are set:

- `ESP_OTA_IMG_VALID` state is set by `esp_ota_mark_app_valid_cancel_rollback()` function.
- `ESP_OTA_IMG_UNDEFINED` state is set by `esp_ota_set_boot_partition()` function if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is not enabled.
- `ESP_OTA_IMG_NEW` state is set by `esp_ota_set_boot_partition()` function if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled.
- `ESP_OTA_IMG_INVALID` state is set by `esp_ota_mark_app_invalid_rollback_and_reboot()` function.
- `ESP_OTA_IMG_ABORTED` state is set if there was no confirmation of the application operability and occurs reboots (if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled).
- `ESP_OTA_IMG_PENDING_VERIFY` state is set in a bootloader if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled and selected app has `ESP_OTA_IMG_NEW` state.

Anti-rollback

Anti-rollback prevents rollback to application with security version lower than one programmed in eFuse of chip.

This function works if set `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK` option. In the bootloader, when selecting a bootable application, an additional security version check is added which is on the chip and in the application image. The version in the bootable firmware must be greater than or equal to the version in the chip.

`CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK` and `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` options are used together. In this case, rollback is possible only on the security version which is equal or higher than the version in the chip.

A Typical Anti-rollback Scheme Is

- New firmware released with the elimination of vulnerabilities with the previous version of security.
- After the developer makes sure that this firmware is working. He can increase the security version and release a new firmware.
- Download new application.
- To make it bootable, run the function `esp_ota_set_boot_partition()`. If the security version of the new application is smaller than the version in the chip, the new application will be erased. Update to new firmware is not possible.
- Reboot.
- In the bootloader, an application with a security version greater than or equal to the version in the chip will be selected. If `otadata` is in the initial state, and one firmware was loaded via a serial channel, whose secure version is higher than the chip, then the secure version of efuse will be immediately updated in the bootloader.

- New application booted. Then the application should perform diagnostics of the operation and if it is completed successfully, you should call `esp_ota_mark_app_valid_cancel_rollback()` function to mark the running application with the `ESP_OTA_IMG_VALID` state and update the secure version on chip. Note that if was called `esp_ota_mark_app_invalid_rollback_and_reboot()` function a rollback may not happen as the device may not have any bootable apps. It will then return `ESP_ERR_OTA_ROLLBACK_FAILED` error and stay in the `ESP_OTA_IMG_PENDING_VERIFY` state.
- The next update of app is possible if a running app is in the `ESP_OTA_IMG_VALID` state.

Recommendation:

If you want to avoid the download/erase overhead in case of the app from the server has security version lower than the running app, you have to get `new_app_info.secure_version` from the first package of an image and compare it with the secure version of efuse. Use `esp_efuse_check_secure_version(new_app_info.secure_version)` function if it is true then continue downloading otherwise abort.

```

....
bool image_header_was_checked = false;
while (1) {
    int data_read = esp_http_client_read(client, ota_write_data, BUFFSIZE);
    ...
    if (data_read > 0) {
        if (image_header_was_checked == false) {
            esp_app_desc_t new_app_info;
            if (data_read > sizeof(esp_image_header_t) + sizeof(esp_image_segment_
↪header_t) + sizeof(esp_app_desc_t)) {
                // check current version with downloading
                if (esp_efuse_check_secure_version(new_app_info.secure_version) ==_
↪false) {
                    ESP_LOGE(TAG, "This a new app can not be downloaded due to a_
↪secure version is lower than stored in efuse.");
                    http_cleanup(client);
                    task_fatal_error();
                }

                image_header_was_checked = true;

                esp_ota_begin(update_partition, OTA_SIZE_UNKNOWN, &update_handle);
            }
        }
        esp_ota_write( update_handle, (const void *)ota_write_data, data_read);
    }
}
....

```

Restrictions:

- The number of bits in the `secure_version` field is limited to 16 bits. This means that only 16 times you can do an anti-rollback. You can reduce the length of this efuse field using `CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD` option.
- Factory and Test partitions are not supported in anti rollback scheme and hence partition table should not have partition with SubType set to `factory` or `test`.

`security_version`:

- In application image it is stored in `esp_app_desc` structure. The number is set `CONFIG_BOOTLOADER_APP_SECURE_VERSION`.

Secure OTA Updates Without Secure Boot

The verification of signed OTA updates can be performed even without enabling hardware secure boot. This can be achieved by setting `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT` and `CON-`

*FIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT***Tuning OTA Performance**

- Erasing the update partition at once instead of sequential erasing (default mechanism) while write operation might help in reducing the overall time taken for firmware upgrade. To enable this, set `esp_https_ota_config_t::bulk_flash_erase` to `true` in `esp_https_ota_config_t` structure. If the partition to be erased is too large, task watchdog could be triggered. It is advised to increase the watchdog timeout in such cases.

```
esp_https_ota_config_t ota_config = {
    .bulk_flash_erase = true,
}
```

- Tuning the `esp_https_ota_config_t::http_config::buffer_size` can also help in improving the OTA performance.
- `esp_https_ota_config_t` has a member `esp_https_ota_config_t::buffer_caps` which can be used to specify the memory type to use when allocating memory to the OTA buffer. Configuring this value to `MALLOC_CAP_INTERNAL` might help in improving the OTA performance when SPIRAM is enabled.
- For optimizing network performance, please refer to **Improving Network Speed** section in the *Speed Optimization* for more details.

OTA Tool `otatool.py`

The component `app_update` provides a tool `app_update/otatool.py` for performing OTA partition-related operations on a target device. The following operations can be performed using the tool:

- read contents of otadata partition (`read_otadata`)
- erase otadata partition, effectively resetting device to factory app (`erase_otadata`)
- switch OTA partitions (`switch_ota_partition`)
- erasing OTA partition (`erase_ota_partition`)
- write to OTA partition (`write_ota_partition`)
- read contents of OTA partition (`read_ota_partition`)

The tool can either be imported and used from another Python script or invoked from shell script for users wanting to perform operation programmatically. This is facilitated by the tool's Python API and command-line interface, respectively.

Python API Before anything else, make sure that the `otatool` module is imported.

```
import sys
import os

idf_path = os.environ["IDF_PATH"] # get value of IDF_PATH from environment
otatool_dir = os.path.join(idf_path, "components", "app_update") # otatool.py_
↳ lives in $IDF_PATH/components/app_update

sys.path.append(otatool_dir) # this enables Python to find otatool module
from otatool import * # import all names inside otatool module
```

The starting point for using the tool's Python API to do is create a `OtatoolTarget` object:

```
# Create a parttool.py target device connected on serial port /dev/ttyUSB1
target = OtatoolTarget("/dev/ttyUSB1")
```

The created object can now be used to perform operations on the target device:

```
# Erase otadata, resetting the device to factory app
target.erase_otadata()

# Erase contents of OTA app slot 0
target.erase_ota_partition(0)

# Switch boot partition to that of app slot 1
target.switch_ota_partition(1)

# Read OTA partition 'ota_3' and save contents to a file named 'ota_3.bin'
target.read_ota_partition("ota_3", "ota_3.bin")
```

The OTA partition to operate on is specified using either the app slot number or the partition name.

More information on the Python API is available in the docstrings for the tool.

Command-line Interface The command-line interface of `otatool.py` has the following structure:

```
otatool.py [command-args] [subcommand] [subcommand-args]

- command-args - these are arguments that are needed for executing the main_
  ↪command (parttool.py), mostly pertaining to the target device
- subcommand - this is the operation to be performed
- subcommand-args - these are arguments that are specific to the chosen operation
```

```
# Erase otadata, resetting the device to factory app
otatool.py --port "/dev/ttyUSB1" erase_otadata

# Erase contents of OTA app slot 0
otatool.py --port "/dev/ttyUSB1" erase_ota_partition --slot 0

# Switch boot partition to that of app slot 1
otatool.py --port "/dev/ttyUSB1" switch_ota_partition --slot 1

# Read OTA partition 'ota_3' and save contents to a file named 'ota_3.bin'
otatool.py --port "/dev/ttyUSB1" read_ota_partition --name=ota_3 --output=ota_3.bin
```

More information can be obtained by specifying `--help` as argument:

```
# Display possible subcommands and show main command argument descriptions
otatool.py --help

# Show descriptions for specific subcommand arguments
otatool.py [subcommand] --help
```

Application Examples

- [system/ota/native_ota_example](#) demonstrates how to use the `app_update` component's APIs for native over-the-air (OTA) updates on ESP32-C5. For applicable SoCs, please refer to [system/ota/native_ota_example/README.md](#).

- [system/ota/otatool](#) demonstrates how to use the OTA tool to perform operations such as reading, writing, and erasing OTA partitions, switching boot partitions, and switching to factory partition. For more information, please refer to [system/ota/otatool/README.md](#).

API Reference

Header File

- [components/app_update/include/esp_ota_ops.h](#)
- This header file can be included with:

```
#include "esp_ota_ops.h"
```

- This header file is a part of the API provided by the `app_update` component. To declare that your component depends on `app_update`, add the following to your `CMakeLists.txt`:

```
REQUIRES app_update
```

or

```
PRIV_REQUIRES app_update
```

Functions

const [esp_app_desc_t](#) ***esp_ota_get_app_description** (void)

Return `esp_app_desc` structure. This structure includes app version.

Return description for running app.

Note: This API is present for backward compatibility reasons. Alternative function with the same functionality is `esp_app_get_description`

Returns Pointer to `esp_app_desc` structure.

int **esp_ota_get_app_elf_sha256** (char *dst, size_t size)

Fill the provided buffer with SHA256 of the ELF file, formatted as hexadecimal, null-terminated. If the buffer size is not sufficient to fit the entire SHA256 in hex plus a null terminator, the largest possible number of bytes will be written followed by a null.

Note: This API is present for backward compatibility reasons. Alternative function with the same functionality is `esp_app_get_elf_sha256`

Parameters

- **dst** -- Destination buffer
- **size** -- Size of the buffer

Returns Number of bytes written to `dst` (including null terminator)

[esp_err_t](#) **esp_ota_begin** (const [esp_partition_t](#) *partition, size_t image_size, [esp_ota_handle_t](#) *out_handle)

Commence an OTA update writing to the specified partition.

The specified partition is erased to the specified image size.

If image size is not yet known, pass `OTA_SIZE_UNKNOWN` which will cause the entire partition to be erased.

On success, this function allocates memory that remains in use until `esp_ota_end()` is called with the returned handle.

Note: If the rollback option is enabled and the running application has the `ESP_OTA_IMG_PENDING_VERIFY` state then it will lead to the `ESP_ERR_OTA_ROLLBACK_INVALID_STATE` error. Confirm the running app before to run download a new app, use `esp_ota_mark_app_valid_cancel_rollback()` function for it (this should be done as early as possible when you first download a new application).

Note: Rollback is applicable only for app type partitions.

Parameters

- **partition** -- Pointer to info for partition which will receive the OTA update. Required. This is considered as the staging partition (where OTA is downloaded), by default this also considered as the final partition which supposed to be updated. The final partition can be overwritten using `esp_ota_set_final_partition()` after calling `esp_ota_begin()` to relocate contents to the final destination partition.
- **image_size** -- Size of new OTA app image. Partition will be erased in order to receive this size of image. If 0 or `OTA_SIZE_UNKNOWN`, the entire partition is erased.
- **out_handle** -- On success, returns a handle which should be used for subsequent `esp_ota_write()` and `esp_ota_end()` calls.

Returns

- `ESP_OK`: OTA operation commenced successfully.
- `ESP_ERR_INVALID_ARG`: partition or `out_handle` arguments were NULL, or partition doesn't point to an OTA app partition.
- `ESP_ERR_NO_MEM`: Cannot allocate memory for OTA operation.
- `ESP_ERR_OTA_PARTITION_CONFLICT`: Partition holds the currently running firmware, cannot update in place.
- `ESP_ERR_NOT_FOUND`: Partition argument not found in partition table.
- `ESP_ERR_OTA_SELECT_INFO_INVALID`: The OTA data partition contains invalid data.
- `ESP_ERR_INVALID_SIZE`: Partition doesn't fit in configured flash size.
- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash write failed.
- `ESP_ERR_OTA_ROLLBACK_INVALID_STATE`: If the running app has not confirmed state. Before performing an update, the application must be valid.

esp_err_t **esp_ota_set_final_partition** (*esp_ota_handle_t* handle, const *esp_partition_t* *final, bool finalize_with_copy)

Set the final destination partition for OTA update.

This function configures the specified final partition as the destination for the OTA update. It also allows setting a flag to indicate if the image should be copied from the staging partition to the final partition after the OTA update completes. Otherwise, copying will need to be handled by custom code using `esp_partition_copy()`.

Note: This can be called after `esp_ota_begin()` and before the OTA update has started (before `esp_ota_write()`).

Parameters

- **handle** -- OTA update handle obtained from `esp_ota_begin()`.
- **final** -- Pointer to the final destination partition where the new image will be verified and potentially finalized. This partition must not be NULL.
- **finalize_with_copy** -- Boolean flag indicating if the downloaded image should be copied from the staging partition to the final partition upon completion. Set to False if you intend to perform the final copy process manually later.

Returns

- `ESP_OK`: final destination partition set successfully.
- `ESP_ERR_INVALID_STATE`: Once the OTA update has started, changing the final destination partition is prohibited.
- `ESP_ERR_INVALID_ARG`: Invalid arguments were passed (e.g., final partition is NULL).

- `ESP_ERR_NOT_FOUND`: OTA handle not found or final partition verification failed.

`esp_err_t esp_ota_write(esp_ota_handle_t handle, const void *data, size_t size)`

Write OTA update data to partition.

This function can be called multiple times as data is received during the OTA operation. Data is written sequentially to the partition.

Parameters

- **handle** -- Handle obtained from `esp_ota_begin`
- **data** -- Data buffer to write
- **size** -- Size of data buffer in bytes.

Returns

- `ESP_OK`: Data was written to flash successfully, or `size = 0`
- `ESP_ERR_INVALID_ARG`: handle is invalid.
- `ESP_ERR_OTA_VALIDATE_FAILED`: First byte of image contains invalid image magic byte.
- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash write failed.
- `ESP_ERR_INVALID_SIZE`: if write would go out of bounds of the partition
- or one of error codes from lower-level flash driver.

`esp_err_t esp_ota_write_with_offset(esp_ota_handle_t handle, const void *data, size_t size, uint32_t offset)`

Write OTA update data to partition at an offset.

This function can write data in non-contiguous manner. If flash encryption is enabled, data should be 16 bytes aligned.

Note: While performing OTA, if the packets arrive out of order, `esp_ota_write_with_offset()` can be used to write data in non-contiguous manner. Use of `esp_ota_write_with_offset()` in combination with `esp_ota_write()` is not recommended.

Parameters

- **handle** -- Handle obtained from `esp_ota_begin`
- **data** -- Data buffer to write
- **size** -- Size of data buffer in bytes
- **offset** -- Offset in flash partition

Returns

- `ESP_OK`: Data was written to flash successfully.
- `ESP_ERR_INVALID_ARG`: handle is invalid.
- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash write failed.

`esp_err_t esp_ota_end(esp_ota_handle_t handle)`

Finish OTA update and validate newly written app image.

If the `finalize_with_copy` option is set, the staging partition will be copied to the final partition at the end of this function. Otherwise, copying will need to be handled by custom code using `esp_partition_copy()`.

Note: After calling `esp_ota_end()`, the handle is no longer valid and any memory associated with it is freed (regardless of result).

Note: If either the final or staging partitions were for the bootloader, then at the end of this function, the bootloader is reset to its default offset:

`esp_image_bootloader_offset_set(ESP_PRIMARY_BOOTLOADER_OFFSET)`

Parameters `handle` -- Handle obtained from `esp_ota_begin()`.

Returns

- `ESP_OK`: Newly written OTA app image is valid.
- `ESP_ERR_NOT_FOUND`: OTA handle was not found.
- `ESP_ERR_INVALID_ARG`: Handle was never written to.
- `ESP_ERR_OTA_VALIDATE_FAILED`: OTA image is invalid (either not a valid app image, or - if secure boot is enabled - signature failed to verify.)
- `ESP_ERR_INVALID_STATE`: If flash encryption is enabled, this result indicates an internal error writing the final encrypted bytes to flash.

`esp_err_t esp_ota_abort(esp_ota_handle_t handle)`

Abort OTA update, free the handle and memory associated with it.

Parameters `handle` -- obtained from `esp_ota_begin()`.

Returns

- `ESP_OK`: Handle and its associated memory is freed successfully.
- `ESP_ERR_NOT_FOUND`: OTA handle was not found.

`esp_err_t esp_ota_set_boot_partition(const esp_partition_t *partition)`

Configure OTA data for a new boot partition.

Note: If this function returns `ESP_OK`, calling `esp_restart()` will boot the newly configured app partition.

Parameters `partition` -- Pointer to info for partition containing app image to boot.

Returns

- `ESP_OK`: OTA data updated, next reboot will use specified partition.
- `ESP_ERR_INVALID_ARG`: partition argument was `NULL` or didn't point to a valid OTA partition of type "app".
- `ESP_ERR_OTA_VALIDATE_FAILED`: Partition contained invalid app image. Also returned if secure boot is enabled and signature validation failed.
- `ESP_ERR_NOT_FOUND`: OTA data partition not found.
- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash erase or write failed.

`const esp_partition_t *esp_ota_get_boot_partition(void)`

Get partition info of currently configured boot app.

If `esp_ota_set_boot_partition()` has been called, the partition which was set by that function will be returned.

If `esp_ota_set_boot_partition()` has not been called, the result is usually the same as `esp_ota_get_running_partition()`. The two results are not equal if the configured boot partition does not contain a valid app (meaning that the running partition will be an app that the bootloader chose via fallback).

If the OTA data partition is not present or not valid then the result is the first app partition found in the partition table. In priority order, this means: the factory app, the first OTA app slot, or the test app partition.

Note that there is no guarantee the returned partition is a valid app. Use `esp_image_verify(ESP_IMAGE_VERIFY, ...)` to verify if the returned partition contains a bootable image.

Returns Pointer to info for partition structure, or `NULL` if partition table is invalid or a flash read operation failed. Any returned pointer is valid for the lifetime of the application.

const *esp_partition_t* ***esp_ota_get_running_partition** (void)

Get partition info of currently running app.

This function is different to `esp_ota_get_boot_partition()` in that it ignores any change of selected boot partition caused by `esp_ota_set_boot_partition()`. Only the app whose code is currently running will have its partition information returned.

The partition returned by this function may also differ from `esp_ota_get_boot_partition()` if the configured boot partition is somehow invalid, and the bootloader fell back to a different app partition at boot.

Returns Pointer to info for partition structure, or NULL if no partition is found or flash read operation failed. Returned pointer is valid for the lifetime of the application.

const *esp_partition_t* ***esp_ota_get_next_update_partition** (const *esp_partition_t* *start_from)

Return the next OTA app partition which should be written with a new firmware.

Call this function to find an OTA app partition which can be passed to `esp_ota_begin()`.

Finds next partition round-robin, starting from the current running partition.

Parameters **start_from** -- If set, treat this partition info as describing the current running partition. Can be NULL, in which case `esp_ota_get_running_partition()` is used to find the currently running partition. The result of this function is never the same as this argument.

Returns Pointer to info for partition which should be updated next. NULL result indicates invalid OTA data partition, or that no eligible OTA app slot partition was found.

esp_err_t **esp_ota_get_partition_description** (const *esp_partition_t* *partition, *esp_app_desc_t* *app_desc)

Returns `esp_app_desc` structure for app partition. This structure includes app version.

Returns a description for the requested app partition.

Parameters

- **partition** -- [in] Pointer to app partition. (only app partition)
- **app_desc** -- [out] Structure of info about app.

Returns

- ESP_OK Successful.
- ESP_ERR_NOT_FOUND `app_desc` structure is not found. Magic word is incorrect.
- ESP_ERR_NOT_SUPPORTED Partition is not application.
- ESP_ERR_INVALID_ARG Arguments is NULL or if partition's offset exceeds partition size.
- ESP_ERR_INVALID_SIZE Read would go out of bounds of the partition.
- or one of error codes from lower-level flash driver.

esp_err_t **esp_ota_get_bootloader_description** (const *esp_partition_t* *bootloader_partition, *esp_bootloader_desc_t* *desc)

Returns the description structure of the bootloader.

Parameters

- **bootloader_partition** -- [in] Pointer to bootloader partition. If NULL, then the PRIMARY bootloader is used (the default location).
offset = CONFIG_BOOTLOADER_OFFSET_IN_FLASH,
size = CONFIG_PARTITION_TABLE_OFFSET - CONFIG_BOOTLOADER_OFFSET_IN_FLASH,
- **desc** -- [out] Structure of info about bootloader.

Returns

- ESP_OK Successful.
- ESP_ERR_NOT_FOUND Description structure is not found in the bootloader image. Magic byte is incorrect.
- ESP_ERR_INVALID_ARG Arguments is NULL.
- ESP_ERR_INVALID_SIZE Read would go out of bounds of the partition.
- or one of error codes from lower-level flash driver.

`uint8_t esp_ota_get_app_partition_count` (void)

Returns number of ota partitions provided in partition table.

Returns

- Number of OTA partitions

`esp_err_t esp_ota_mark_app_valid_cancel_rollback` (void)

This function is called to indicate that the running app is working well.

Returns

- ESP_OK: if successful.

`esp_err_t esp_ota_mark_app_invalid_rollback_and_reboot` (void)

This function is called to roll back to the previously workable app with reboot.

If rollback is successful then device will reset else API will return with error code. Checks applications on a flash drive that can be booted in case of rollback. If the flash does not have at least one app (except the running app) then rollback is not possible.

Returns

- ESP_FAIL: if not successful.
- ESP_ERR_OTA_ROLLBACK_FAILED: The rollback is not possible due to flash does not have any apps.

`const esp_partition_t *esp_ota_get_last_invalid_partition` (void)

Returns last partition with invalid state (ESP_OTA_IMG_INVALID or ESP_OTA_IMG_ABORTED).

Returns partition.

`esp_err_t esp_ota_get_state_partition` (const `esp_partition_t` *partition, `esp_ota_img_states_t` *ota_state)

Returns state for given partition.

Parameters

- **partition** -- [in] Pointer to partition.
- **ota_state** -- [out] state of partition (if this partition has a record in otadata).

Returns

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: partition or ota_state arguments were NULL.
- ESP_ERR_NOT_SUPPORTED: partition is not ota.
- ESP_ERR_NOT_FOUND: Partition table does not have otadata or state was not found for given partition.

`esp_err_t esp_ota_erase_last_boot_app_partition` (void)

Erase previous boot app partition and corresponding otadata select for this partition.

When current app is marked to as valid then you can erase previous app partition.

Returns

- ESP_OK: Successful, otherwise ESP_ERR.

`bool esp_ota_check_rollback_is_possible` (void)

Checks applications on the slots which can be booted in case of rollback.

These applications should be valid (marked in otadata as not UNDEFINED, INVALID or ABORTED and crc is good) and be able booted, and secure_version of app >= secure_version of efuse (if anti-rollback is enabled).

Returns

- True: Returns true if the slots have at least one app (except the running app).
- False: The rollback is not possible.

`esp_err_t esp_ota_revoke_secure_boot_public_key` (`esp_ota_secure_boot_public_key_index_t` index)

Revokes the signature digest denoted by the given index. This should be called in the application only after the rollback logic otherwise the device may end up in unrecoverable state.

Relevant for Secure boot v2 on ESP32-S2, ESP32-S3, ESP32-C3, ESP32-C6, ESP32-H2 where up to 3 key digests can be stored (Key #N-1, Key #N, Key #N+1). When a key used to sign an app is invalidated, an OTA update is to be sent with an app signed with at least one of the other two keys which has not been revoked already. After successfully booting the OTA app should call this function to revoke Key #N-1.

Parameters `index` -- - The index of the signature block to be revoked

Returns

- `ESP_OK`: If revocation is successful.
- `ESP_ERR_INVALID_ARG`: If the index of the public key to be revoked is incorrect.
- `ESP_FAIL`: If secure boot v2 has not been enabled.

Macros

`OTA_SIZE_UNKNOWN`

Used for `esp_ota_begin()` if new image size is unknown

`OTA_WITH_SEQUENTIAL_WRITES`

Used for `esp_ota_begin()` if new image size is unknown and erase can be done in incremental manner (assuming write operation is in continuous sequence)

`ESP_ERR_OTA_BASE`

Base error code for `ota_ops` api

`ESP_ERR_OTA_PARTITION_CONFLICT`

Error if request was to write or erase the current running partition

`ESP_ERR_OTA_SELECT_INFO_INVALID`

Error if OTA data partition contains invalid content

`ESP_ERR_OTA_VALIDATE_FAILED`

Error if OTA app image is invalid

`ESP_ERR_OTA_SMALL_SEC_VER`

Error if the firmware has a secure version less than the running firmware.

`ESP_ERR_OTA_ROLLBACK_FAILED`

Error if flash does not have valid firmware in passive partition and hence rollback is not possible

`ESP_ERR_OTA_ROLLBACK_INVALID_STATE`

Error if current active firmware is still marked in pending validation state (`ESP_OTA_IMG_PENDING_VERIFY`), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

Type Definitions

```
typedef uint32_t esp_ota_handle_t
```

Opaque handle for an application OTA update.

`esp_ota_begin()` returns a handle which is then used for subsequent calls to `esp_ota_write()` and `esp_ota_end()`.

Enumerations

enum `esp_ota_secure_boot_public_key_index_t`

Secure Boot V2 public key indexes.

Values:

enumerator `SECURE_BOOT_PUBLIC_KEY_INDEX_0`

Points to the 0th index of the Secure Boot v2 public key

enumerator `SECURE_BOOT_PUBLIC_KEY_INDEX_1`

Points to the 1st index of the Secure Boot v2 public key

enumerator `SECURE_BOOT_PUBLIC_KEY_INDEX_2`

Points to the 2nd index of the Secure Boot v2 public key

Debugging OTA Failure

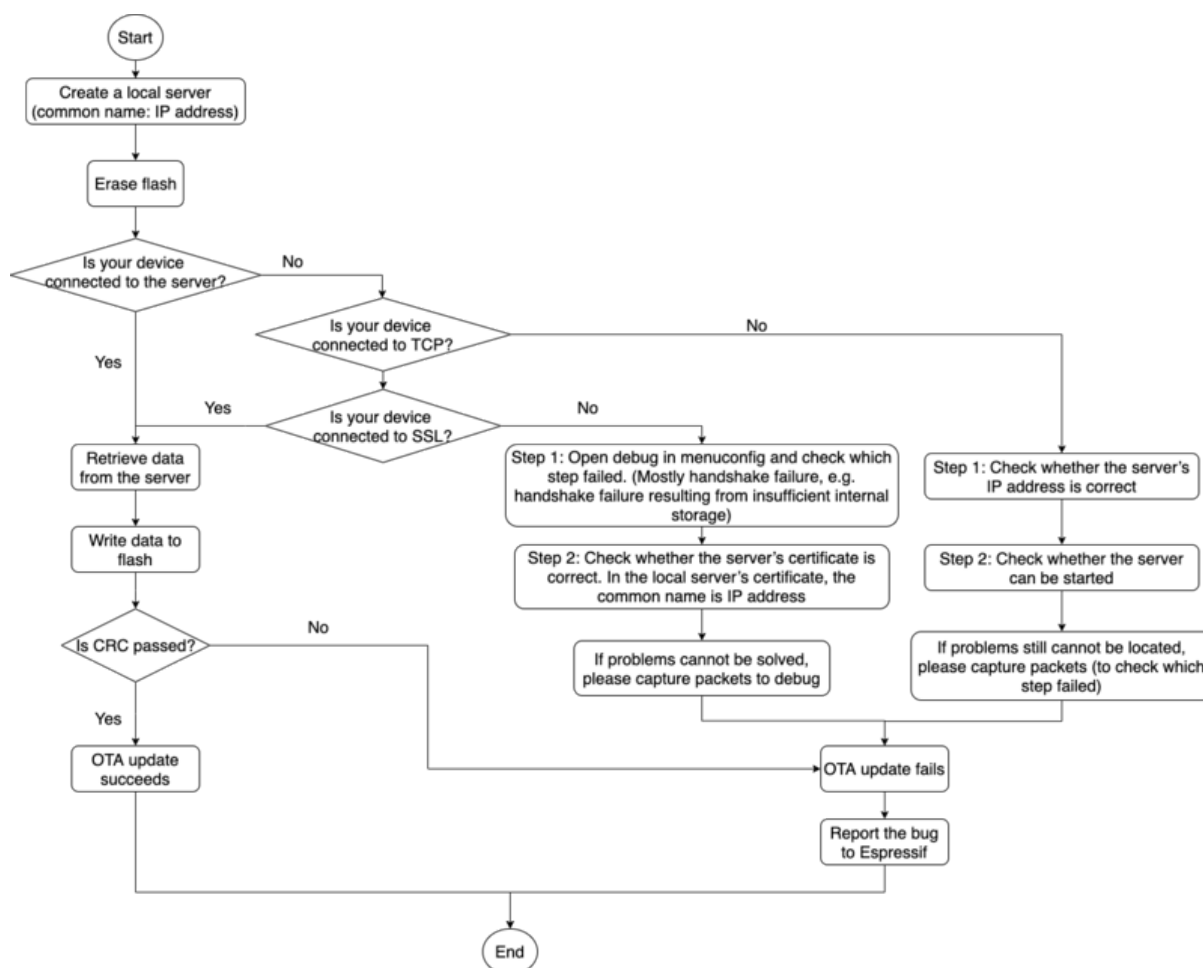

Fig. 41: How to Debug When OTA Fails (click to enlarge)

Warning: This document is not updated for ESP32C5 yet, so some of the content may not be correct.

This warning was automatically inserted due to the source file being in the `add_warnings_pages` list.

2.9.23 Power Management

Overview

Power management algorithm included in ESP-IDF can adjust the advanced peripheral bus (APB) frequency, CPU frequency, and put the chip into Light-sleep mode to run an application at smallest possible power consumption, given the requirements of application components.

Application components can express their requirements by creating and acquiring power management locks.

For example:

- Driver for a peripheral clocked from APB can request the APB frequency to be set to 80 MHz while the peripheral is used.
- RTOS can request the CPU to run at the highest configured frequency while there are tasks ready to run.
- A peripheral driver may need interrupts to be enabled, which means it has to request disabling Light-sleep.

Since requesting higher APB or CPU frequencies or disabling Light-sleep causes higher current consumption, please keep the usage of power management locks by components to a minimum.

Configuration

Power management can be enabled at compile time, using the option `CONFIG_PM_ENABLE`.

Enabling power management features comes at the cost of increased interrupt latency. Extra latency depends on a number of factors, such as the CPU frequency, single/dual core mode, whether or not frequency switch needs to be done. Minimum extra latency is 0.2 us (when the CPU frequency is 240 MHz and frequency scaling is not enabled). Maximum extra latency is 40 us (when frequency scaling is enabled, and a switch from 40 MHz to 80 MHz is performed on interrupt entry).

Dynamic frequency scaling (DFS) and automatic Light-sleep can be enabled in an application by calling the function `esp_pm_configure()`. Its argument is a structure defining the frequency scaling settings, `esp_pm_config_t`. In this structure, three fields need to be initialized:

- `max_freq_mhz`: Maximum CPU frequency in MHz, i.e., the frequency used when the `ESP_PM_CPU_FREQ_MAX` lock is acquired. This field is usually set to the default CPU frequency.
- `min_freq_mhz`: Minimum CPU frequency in MHz, indicating the frequency used when not holding the power management lock.
 - `light_sleep_enable`: Whether the system should automatically enter Light-sleep when no locks are acquired (`true/false`).

Alternatively, if you enable the option `CONFIG_PM_DFS_INIT_AUTO` in menuconfig, the maximum CPU frequency will be determined by the `CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ` setting, and the minimum CPU frequency will be locked to the XTAL frequency.

Note: Automatic Light-sleep is based on FreeRTOS Tickless Idle functionality. If automatic Light-sleep is requested while the option `CONFIG_FREERTOS_USE_TICKLESS_IDLE` is not enabled in menuconfig, `esp_pm_configure()` will return the error `ESP_ERR_NOT_SUPPORTED`.

Note: In Light-sleep, peripherals are clock gated, and interrupts (from GPIOs and internal peripherals) will not be generated. A wakeup source described in the [Sleep Modes](#) documentation can be used to trigger wakeup from the Light-sleep state.

For example, the EXT0 and EXT1 wakeup sources can be used to wake up the chip via a GPIO.

Power Management Locks

Applications have the ability to acquire/release locks in order to control the power management algorithm. When an application acquires a lock, the power management algorithm operation is restricted in a way described below. When the lock is released, such restrictions are removed.

Power management locks have acquire/release counters. If the lock has been acquired a number of times, it needs to be released the same number of times to remove associated restrictions.

ESP32-C5 supports three types of locks described in the table below.

Lock	Description
ESP_PM_CPU_FREQ_MAX	Requests CPU frequency to be at the maximum value set with <code>esp_pm_configure()</code> . For ESP32-C5, this value can be set to Not updated yet.
ESP_PM_APB_FREQ_MAX	Requests the APB frequency to be at the maximum supported value. For ESP32-C5, this is 80 MHz.
ESP_PM_NO_LIGHT_SLEEP	Disables automatic switching to Light-sleep.

ESP32-C5 Power Management Algorithm

The table below shows how CPU and APB frequencies will be switched if dynamic frequency scaling is enabled. You can specify the maximum CPU frequency with either `esp_pm_configure()` or `CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ`.

Max CPU Frequency Set	Lock Acquisition	CPU and APB Frequencies
-----------------------	------------------	-------------------------

If none of the locks are acquired, and Light-sleep is enabled in a call to `esp_pm_configure()`, the system will go into Light-sleep mode. The duration of Light-sleep will be determined by:

- FreeRTOS tasks blocked with finite timeouts
- Timers registered with *High resolution timer* APIs

Light-sleep duration is chosen to wake up the chip before the nearest event (task being unblocked, or timer elapses).

To skip unnecessary wake-up, you can consider initializing an `esp_timer` with the `skip_unhandled_events` option as `true`. Timers with this flag will not wake up the system and it helps to reduce consumption.

Dynamic Frequency Scaling and Peripheral Drivers

When DFS is enabled, the APB frequency can be changed multiple times within a single RTOS tick. The APB frequency change does not affect the operation of some peripherals, while other peripherals may have issues. For example, Timer Group peripheral timers keeps counting, however, the speed at which they count changes proportionally to the APB frequency.

Peripheral clock sources such as `REF_TICK`, `XTAL`, `RC_FAST` (i.e., `RTC_8M`), their frequencies will not be influenced by APB frequency. And therefore, to ensure the peripheral behaves consistently during DFS, it is recommended to select one of these clocks as the peripheral clock source. For more specific guidelines, please refer to the "Power Management" section of each peripheral's "API Reference > Peripherals API" page.

Currently, the following peripheral drivers are aware of DFS and use the `ESP_PM_APB_FREQ_MAX` lock for the duration of the transaction:

- SPI master
- I2C
- I2S (If the APLL clock is used, then it will use the `ESP_PM_NO_LIGHT_SLEEP` lock)
- SDMMC

The following drivers hold the `ESP_PM_APB_FREQ_MAX` lock while the driver is enabled:

- **SPI slave:** between calls to `spi_slave_initialize()` and `spi_slave_free()`.
- **GPTimer:** between calls to `gptimer_enable()` and `gptimer_disable()`.
- **Ethernet:** between calls to `esp_eth_driver_install()` and `esp_eth_driver_uninstall()`.
- **WiFi:** between calls to `esp_wifi_start()` and `esp_wifi_stop()`. If modem sleep is enabled, the lock will be released for the periods of time when radio is disabled.
- **Bluetooth:** between calls to `esp_bt_controller_enable()` and `esp_bt_controller_disable()`. If Bluetooth Modem-sleep is enabled, the `ESP_PM_APB_FREQ_MAX` lock will be released for the periods of time when radio is disabled. However the `ESP_PM_NO_LIGHT_SLEEP` lock will still be held.
- **PCNT:** between calls to `pcnt_unit_enable()` and `pcnt_unit_disable()`.
- **Sigma-delta:** between calls to `sdm_channel_enable()` and `sdm_channel_disable()`.
- **MCPWM:** between calls to `mcpwm_timer_enable()` and `mcpwm_timer_disable()`, as well as `mcpwm_capture_timer_enable()` and `mcpwm_capture_timer_disable()`.

The following peripheral drivers are not aware of DFS yet. Applications need to acquire/release locks themselves, when necessary:

- The legacy PCNT driver
- The legacy Sigma-delta driver
- The legacy timer group driver
- The legacy MCPWM driver

Light-sleep Peripheral Power Down

ESP32-C5 supports power-down peripherals during Light-sleep.

If `CONFIG_PM_POWER_DOWN_PERIPHERAL_IN_LIGHT_SLEEP` is enabled, when the driver initializes the peripheral, the driver will register the working register context of the peripheral to the sleep retention link. Before entering sleep, the `REG_DMA` peripheral reads the configuration in the sleep retention link, and back up the register context to memory according to the configuration. `REG_DMA` also restores context from memory to peripheral registers on wakeup.

Currently ESP-IDF supports Light-sleep context retention for the following peripherals. Their context is automatically restored, or they provide some option for the user to enable this feature and goes into peripheral power down mode.

- INT_MTX
- TEE/APM
- IO_MUX / GPIO
- MSPI (SPI0/1)
- SYSTIMER
- GPTimer
- RMT
- ETM
- LEDC
- I2C
- I2S
- MCPWM
- All UARTs
- Temperature Sensor
- PARL_IO
- All GPSPIs

Some peripherals haven't support Light-sleep context retention, or it cannot survive from the register lose. They will prevent the power-down of peripherals even when the feature is enabled.

The following peripherals (and those not listed in any group of this section) are not yet supported. If your application uses these peripherals, they may not work well after waking up from sleep.

- ASSIST_DEBUG
- Trace
- Crypto: AES/ECC/HMAC/RSA/SHA/DS/XTA_AES/ECDSA
- PCNT
- USB-Serial-JTAG
- SARADC

Note: When the peripheral power domain is powered down during sleep, both the IO_MUX and GPIO modules are inactive, meaning the chip pins' state is not maintained by these modules. To preserve the state of an IO during sleep, it's essential to call `gpio_hold_dis()` and `gpio_hold_en()` before and after configuring the GPIO state. This action ensures that the IO configuration is latched and prevents the IO from becoming floating while in sleep mode.

API Reference

Header File

- [components/esp_pm/include/esp_pm.h](#)
- This header file can be included with:

```
#include "esp_pm.h"
```

- This header file is a part of the API provided by the `esp_pm` component. To declare that your component depends on `esp_pm`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_pm
```

or

```
PRIV_REQUIRES esp_pm
```

Functions

esp_err_t **esp_pm_configure** (const void *config)

Set implementation-specific power management configuration.

Parameters `config` -- pointer to implementation-specific configuration structure (e.g. `esp_pm_config_esp32`)

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the configuration values are not correct
- ESP_ERR_NOT_SUPPORTED if certain combination of values is not supported, or if CONFIG_PM_ENABLE is not enabled in `sdkconfig`

esp_err_t **esp_pm_get_configuration** (void *config)

Get implementation-specific power management configuration.

Parameters `config` -- pointer to implementation-specific configuration structure (e.g. `esp_pm_config_esp32`)

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the pointer is null

esp_err_t **esp_pm_lock_create** (*esp_pm_lock_type_t* lock_type, int arg, const char *name, *esp_pm_lock_handle_t* *out_handle)

Initialize a lock handle for certain power management parameter.

When lock is created, initially it is not taken. Call `esp_pm_lock_acquire` to take the lock.

This function must not be called from an ISR.

Note: If the `lock_type` argument is not valid, it will cause an abort.

Parameters

- **lock_type** -- Power management constraint which the lock should control
- **arg** -- argument, value depends on `lock_type`, see `esp_pm_lock_type_t`
- **name** -- arbitrary string identifying the lock (e.g. "wifi" or "spi"). Used by the `esp_pm_dump_locks` function to list existing locks. May be set to NULL. If not set to NULL, must point to a string which is valid for the lifetime of the lock.
- **out_handle** -- [out] handle returned from this function. Use this handle when calling `esp_pm_lock_delete`, `esp_pm_lock_acquire`, `esp_pm_lock_release`. Must not be NULL.

Returns

- ESP_OK on success
- ESP_ERR_NO_MEM if the lock structure can not be allocated
- ESP_ERR_INVALID_ARG if `out_handle` is NULL
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in `sdkconfig`

esp_err_t **esp_pm_lock_acquire** (*esp_pm_lock_handle_t* handle)

Take a power management lock.

Once the lock is taken, power management algorithm will not switch to the mode specified in a call to `esp_pm_lock_create`, or any of the lower power modes (higher numeric values of 'mode').

The lock is recursive, in the sense that if `esp_pm_lock_acquire` is called a number of times, `esp_pm_lock_release` has to be called the same number of times in order to release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other `esp_pm_lock_*` functions for the same handle.

Parameters **handle** -- handle obtained from `esp_pm_lock_create` function

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in `sdkconfig`

esp_err_t **esp_pm_lock_release** (*esp_pm_lock_handle_t* handle)

Release the lock taken using `esp_pm_lock_acquire`.

Call to this functions removes power management restrictions placed when taking the lock.

Locks are recursive, so if `esp_pm_lock_acquire` is called a number of times, `esp_pm_lock_release` has to be called the same number of times in order to actually release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other `esp_pm_lock_*` functions for the same handle.

Parameters **handle** -- handle obtained from `esp_pm_lock_create` function

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if lock is not acquired
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in `sdkconfig`

esp_err_t **esp_pm_lock_delete** (*esp_pm_lock_handle_t* handle)

Delete a lock created using `esp_pm_lock`.

The lock must be released before calling this function.

This function must not be called from an ISR.

Parameters `handle` -- handle obtained from `esp_pm_lock_create` function

Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if the handle argument is NULL
- `ESP_ERR_INVALID_STATE` if the lock is still acquired
- `ESP_ERR_NOT_SUPPORTED` if `CONFIG_PM_ENABLE` is not enabled in `sdkconfig`

esp_err_t **esp_pm_dump_locks** (FILE *stream)

Dump the list of all locks to `stderr`.

This function dumps debugging information about locks created using `esp_pm_lock_create` to an output stream.

This function must not be called from an ISR. If `esp_pm_lock_acquire/release` are called while this function is running, inconsistent results may be reported.

Parameters `stream` -- stream to print information to; use `stdout` or `stderr` to print to the console; use `fmemopen/open_memstream` to print to a string buffer.

Returns

- `ESP_OK` on success
- `ESP_ERR_NOT_SUPPORTED` if `CONFIG_PM_ENABLE` is not enabled in `sdkconfig`

Structures

struct **esp_pm_config_t**

Power management config.

Pass a pointer to this structure as an argument to `esp_pm_configure` function.

Public Members

int **max_freq_mhz**

Maximum CPU frequency, in MHz

int **min_freq_mhz**

Minimum CPU frequency to use when no locks are taken, in MHz

bool **light_sleep_enable**

Enter light sleep when no locks are taken

Type Definitions

typedef *esp_pm_config_t* **esp_pm_config_esp32_t**

backward compatibility newer chips no longer require this typedef

typedef *esp_pm_config_t* **esp_pm_config_esp32s2_t**

typedef *esp_pm_config_t* **esp_pm_config_esp32s3_t**

typedef *esp_pm_config_t* **esp_pm_config_esp32c3_t**

```
typedef esp_pm_config_t esp_pm_config_esp32c2_t
```

```
typedef esp_pm_config_t esp_pm_config_esp32c6_t
```

```
typedef struct esp_pm_lock *esp_pm_lock_handle_t
```

Opaque handle to the power management lock.

Enumerations

```
enum esp_pm_lock_type_t
```

Power management constraints.

Values:

```
enumerator ESP_PM_CPU_FREQ_MAX
```

Require CPU frequency to be at the maximum value set via `esp_pm_configure`. Argument is unused and should be set to 0.

```
enumerator ESP_PM_APB_FREQ_MAX
```

Require APB frequency to be at the maximum value supported by the chip. Argument is unused and should be set to 0.

```
enumerator ESP_PM_NO_LIGHT_SLEEP
```

Prevent the system from going into light sleep. Argument is unused and should be set to 0.

```
enumerator ESP_PM_LOCK_MAX
```

2.9.24 POSIX Support (Including POSIX Threads Support)

Overview

ESP-IDF is based on FreeRTOS but offers a range of POSIX-compatible APIs that allow easy porting of third-party code. This includes support for common parts of the POSIX Threads `pthread` API.

POSIX Threads are implemented in ESP-IDF as wrappers around equivalent FreeRTOS features. The runtime memory or performance overhead of using the `threads` API is quite low, but not every feature available in either `threads` or FreeRTOS is available via the ESP-IDF `threads` support.

`threads` can be used in ESP-IDF by including standard `pthread.h` header, which is included in the toolchain `libc`. An additional ESP-IDF specific header, `esp_pthread.h`, provides additional non-POSIX APIs for using some ESP-IDF features with `threads`.

Besides POSIX Threads, ESP-IDF also supports *POSIX message queues*.

C++ Standard Library implementations for `std::thread`, `std::mutex`, `std::condition_variable`, etc., are realized using `threads` and other POSIX APIs (via GCC `libstdc++`). Therefore, restrictions mentioned here also apply to the equivalent C++ standard library functionality.

If you identify a useful API that you would like to see implemented in ESP-IDF, please open a [feature request on GitHub](#) with the details.

RTOS Integration

Unlike many operating systems using POSIX Threads, ESP-IDF is a real-time operating system with a real-time scheduler. This means that a thread will only stop running if a higher priority task is ready to run, the thread blocks on an OS synchronization structure like a mutex, or the thread calls any of the functions `sleep`, `vTaskDelay()`, or `usleep`.

Note: When calling a standard libc or C++ sleep function, such as `usleep` defined in `unistd.h`, the task will only block and yield the core if the sleep time is longer than *one FreeRTOS tick period*. If the time is shorter, the thread will busy-wait instead of yielding to another RTOS task.

Note: The POSIX `errno` is provided by `newlib` in ESP-IDF. Thus the configuration `configUSE_POSIX_ERRNO` is not used and should stay disabled.

By default, all POSIX Threads have the same RTOS priority, but it is possible to change this by calling a *custom API*.

Standard Features

The following standard APIs are implemented in ESP-IDF.

Refer to [standard POSIX Threads documentation](#), or `pthread.h`, for details about the standard arguments and behaviour of each function. Differences or limitations compared to the standard APIs are noted below.

Thread APIs

- **`pthread_create()`**
 - The `attr` argument is supported for setting stack size and detach state only. Other attribute fields are ignored.
 - Unlike FreeRTOS task functions, the `start_routine` function is allowed to return. A detached type thread is automatically deleted if the function returns. The default joinable type thread will be suspended until `pthread_join()` is called on it.
- `pthread_join()`
- `pthread_detach()`
- `pthread_exit()`
- `sched_yield()`
- **`pthread_self()`**
 - An assert will fail if this function is called from a FreeRTOS task which is not a pthread.
- `pthread_equal()`

Thread Attributes

- `pthread_attr_init()`
- **`pthread_attr_destroy()`**
 - This function does not need to free any resources and instead resets the `attr` structure to defaults. The implementation is the same as `pthread_attr_init()`.
- `pthread_attr_getstacksize()` / `pthread_attr_setstacksize()`
- `pthread_attr_getdetachstate()` / `pthread_attr_setdetachstate()`

Once

- `pthread_once()`

Static initializer constant `PTHREAD_ONCE_INIT` is supported.

Note: This function can be called from tasks created using either pthread or FreeRTOS APIs.

Mutexes POSIX Mutexes are implemented as FreeRTOS Mutex Semaphores (normal type for "fast" or "error check" mutexes, and Recursive type for "recursive" mutexes). This means that they have the same priority inheritance behavior as mutexes created with `xSemaphoreCreateMutex()`.

- `pthread_mutex_init()`
- `pthread_mutex_destroy()`
- `pthread_mutex_lock()`
- `pthread_mutex_timedlock()`
- `pthread_mutex_trylock()`
- `pthread_mutex_unlock()`
- `pthread_mutexattr_init()`
- `pthread_mutexattr_destroy()`
- `pthread_mutexattr_gettype()` / `pthread_mutexattr_settype()`

Static initializer constant `PTHREAD_MUTEX_INITIALIZER` is supported, but the non-standard static initializer constants for other mutex types are not supported.

Note: These functions can be called from tasks created using either pthread or FreeRTOS APIs.

Condition Variables

- `pthread_cond_init()`
 - The `attr` argument is not implemented and is ignored.
- `pthread_cond_destroy()`
- `pthread_cond_signal()`
- `pthread_cond_broadcast()`
- `pthread_cond_wait()`
- `pthread_cond_timedwait()`

Static initializer constant `PTHREAD_COND_INITIALIZER` is supported.

- The resolution of `pthread_cond_timedwait()` timeouts is the RTOS tick period (see [CONFIG_FREERTOS_HZ](#)). Timeouts may be delayed up to one tick period after the requested timeout.

Note: These functions can be called from tasks created using either pthread or FreeRTOS APIs.

Semaphores In ESP-IDF, POSIX **unnamed** semaphores are implemented. The accessible API is described below. It implements [semaphores as specified in the POSIX standard](#), unless specified otherwise.

- `sem_init()`
- `sem_destroy()`
 - `pshared` is ignored. Semaphores can always be shared between FreeRTOS tasks.
- `sem_post()`
 - If the semaphore has a value of `SEM_VALUE_MAX` already, `-1` is returned and `errno` is set to `EAGAIN`.
- `sem_wait()`
- `sem_trywait()`
- `sem_timedwait()`
 - The time value passed by `abstime` will be rounded up to the next FreeRTOS tick.
 - The actual timeout happens after the tick that the time was rounded to and before the following tick.
 - It is possible, though unlikely, that the task is preempted directly after the timeout calculation, delaying the timeout of the following blocking operating system call by the duration of the preemption.
- `sem_getvalue()`

Read/Write Locks The following API functions of the POSIX reader-writer locks specification are implemented:

- [pthread_rwlock_init\(\)](#)
 - The `attr` argument is not implemented and is ignored.
- [pthread_rwlock_destroy\(\)](#)
- [pthread_rwlock_rdlock\(\)](#)
- [pthread_rwlock_tryrdlock\(\)](#)
- [pthread_rwlock_wrlock\(\)](#)
- [pthread_rwlock_trywrlock\(\)](#)
- [pthread_rwlock_unlock\(\)](#)

The static initializer constant `PTHREAD_RWLOCK_INITIALIZER` is supported.

Note: These functions can be called from tasks created using either pthread or FreeRTOS APIs.

Thread-Specific Data

- [pthread_key_create\(\)](#)
 - The `destr_function` argument is supported and will be called if a thread function exits normally, calls `pthread_exit()`, or if the underlying task is deleted directly using the FreeRTOS function `vTaskDelete()`.
- [pthread_key_delete\(\)](#)
- [pthread_setspecific\(\)](#) / [pthread_getspecific\(\)](#)

Note: These functions can be called from tasks created using either pthread or FreeRTOS APIs. When calling these functions from tasks created using FreeRTOS APIs, [CONFIG_FREERTOS_TLSP_DELETION_CALLBACKS](#) config option must be enabled to ensure the thread-specific data is cleaned up before the task is deleted.

Note: There are other options for thread local storage in ESP-IDF, including options with higher performance. See [Thread Local Storage](#).

Message Queues The message queue implementation is based on the [FreeRTOS-Plus-POSIX](#) project. Message queues are not made available in any filesystem on ESP-IDF. Message priorities are not supported.

The following API functions of the POSIX message queue specification are implemented:

- [mq_open\(\)](#)
 - **The name argument has, besides the POSIX specification, the following additional restrictions:**
 - * It has to begin with a leading slash.
 - * It has to be no more than 255 + 2 characters long (including the leading slash, excluding the terminating null byte). However, memory for `name` is dynamically allocated internally, so the shorter it is, the fewer memory it will consume.
 - The `mode` argument is not implemented and is ignored.
 - Supported `oflags`: `O_RDWR`, `O_CREAT`, `O_EXCL`, and `O_NONBLOCK`.
- [mq_close\(\)](#)
- [mq_unlink\(\)](#)
- [mq_receive\(\)](#)
 - Since message priorities are not supported, `msg_prio` is unused.
- [mq_timedreceive\(\)](#)
 - Since message priorities are not supported, `msg_prio` is unused.
- [mq_send\(\)](#)
 - Since message priorities are not supported, `msg_prio` has no effect.
- [mq_timedsend\(\)](#)
 - Since message priorities are not supported, `msg_prio` has no effect.

- `mq_getattr()`

`mq_notify()` and `mq_setattr()` are not implemented.

Building To use the POSIX message queue API, please add `rt` as a requirement in your component's `CMakeLists.txt`.

Note: If you have used [FreeRTOS-Plus-POSIX](#) in another FreeRTOS project before, please note that the include paths in IDF are POSIX-like. Hence, applications include `mqueue.h` directly instead of using the subdirectory include `FreeRTOS_POSIX/mqueue.h`.

Not Implemented

The `pthread.h` header is a standard header and includes additional APIs and features which are not implemented in ESP-IDF. These include:

- `pthread_cancel()` returns `ENOSYS` if called.
- `pthread_condattr_init()` returns `ENOSYS` if called.
- `mq_notify()` returns `ENOSYS` if called.
- `mq_setattr()` returns `ENOSYS` if called.

Other POSIX Threads functions (not listed here) are not implemented and will produce either a compiler or a linker error if referenced from an ESP-IDF application.

ESP-IDF Extensions

The API `esp_thread_set_cfg()` defined in the `esp_pthreads.h` header offers custom extensions to control how subsequent calls to `pthread_create()` behaves. Currently, the following configuration can be set:

- Default stack size of new threads, if not specified when calling `pthread_create()` (overrides [CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT](#)).
- Stack memory capabilities determine which kind of memory is used for allocating pthread stacks. The field takes ESP-IDF heap capability flags, as defined in [heap/include/esp_heap_caps.h](#). The memory must be 8-bit accessible (`MALLOC_CAP_8BIT`), besides other custom flags the user can choose from. The user is responsible for ensuring the correctness of the stack memory capabilities. For more information about memory locations, refer to the documentation of [Memory Capabilities](#).
- RTOS priority of new threads (overrides [CONFIG_PTHREAD_TASK_PRIO_DEFAULT](#)).
- FreeRTOS task name for new threads (overrides [CONFIG_PTHREAD_TASK_NAME_DEFAULT](#)).

This configuration is scoped to the calling thread (or FreeRTOS task), meaning that `esp_thread_set_cfg()` can be called independently in different threads or tasks. If the `inherit_cfg` flag is set in the current configuration then any new thread created will inherit the creator's configuration (if that thread calls `pthread_create()` recursively), otherwise the new thread will have the default configuration.

Application Examples

- [system/pthread](#) demonstrates using the pthreads API to create threads.
- [cxx/pthread](#) demonstrates using C++ Standard Library functions with threads.

API Reference

Header File

- [components/pthread/include/esp_pthread.h](#)

- This header file can be included with:

```
#include "esp_pthread.h"
```

- This header file is a part of the API provided by the pthread component. To declare that your component depends on pthread, add the following to your CMakeLists.txt:

```
REQUIRES pthread
```

or

```
PRIV_REQUIRES pthread
```

Functions

esp_pthread_cfg_t **esp_pthread_get_default_config** (void)

Creates a default pthread configuration based on the values set via menuconfig.

Returns A default configuration structure.

esp_err_t **esp_pthread_set_cfg** (const *esp_pthread_cfg_t* *cfg)

Configure parameters for creating pthread.

This API allows you to configure how the subsequent pthread_create() call will behave. This call can be used to setup configuration parameters like stack size, priority, configuration inheritance etc.

If the 'inherit' flag in the configuration structure is enabled, then the same configuration is also inherited in the thread subtree.

Note: If `cfg->stack_alloc_caps` is 0, it is automatically set to valid default stack memory capabilities. If `cfg->stack_alloc_caps` is non-zero, the developer is responsible for its correctness. This function only checks that the capabilities are `MALLOC_CAP_8BIT`, the rest is unchecked.

Note: Passing non-NULL attributes to pthread_create() will override the `stack_size` parameter set using this API

Parameters `cfg` -- The pthread config parameters

Returns

- ESP_OK if configuration was successfully set
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_ARG if `cfg` is NULL
- ESP_ERR_INVALID_ARG if `stack_size` is less than `PTHREAD_STACK_MIN`
- ESP_ERR_INVALID_ARG if `stack_alloc_caps` does not include `MALLOC_CAP_8BIT`

esp_err_t **esp_pthread_get_cfg** (*esp_pthread_cfg_t* *p)

Get current pthread creation configuration.

This will retrieve the current configuration that will be used for creating threads.

Parameters `p` -- Pointer to the pthread config structure that will be updated with the currently configured parameters

Returns

- ESP_OK if the configuration was available
- ESP_ERR_INVALID_ARG if `p` is NULL
- ESP_ERR_NOT_FOUND if a configuration wasn't previously set

esp_err_t **esp_pthread_init** (void)

Initialize pthread library.

Structures

struct **esp_pthread_cfg_t**

pthread configuration structure that influences pthread creation

Public Members

size_t **stack_size**

The stack size of the pthread

size_t **prio**

The thread's priority

bool **inherit_cfg**

Inherit this configuration further

const char ***thread_name**

The thread name.

int **pin_to_core**

The core id to pin the thread to. Has the same value range as xCoreId argument of xTaskCreatePinnedToCore.

uint32_t **stack_alloc_caps**

A bit mask of memory capabilities (MALLOC_CAPS*) to use when allocating the stack. The memory must be 8 bit accessible (MALLOC_CAP_8BIT). The developer is responsible for the correctness of stack_alloc_caps.

Macros

PTHREAD_STACK_MIN

2.9.25 Random Number Generation

ESP32-C5 contains a hardware random number generator (RNG). You can use the APIs [esp_random\(\)](#) and [esp_fill_random\(\)](#) to obtain random values from it.

The hardware RNG produces true random numbers so long as one or more of the following conditions are met:

- RF subsystem is enabled. i.e., Wi-Fi or Bluetooth or 802.15.4 Thread/Zigbee are enabled.
- The internal entropy source (SAR ADC) has been enabled by calling [bootloader_random_enable\(\)](#) and not yet disabled by calling [bootloader_random_disable\(\)](#).
- While the ESP-IDF *Second Stage Bootloader* is running. This is because the default ESP-IDF bootloader implementation calls [bootloader_random_enable\(\)](#) when the bootloader starts, and [bootloader_random_disable\(\)](#) before executing the application.

When any of these conditions are true, samples of physical noise are continuously mixed into the internal hardware RNG state to provide entropy. Consult the **ESP32-C5 Technical Reference Manual > Random Number Generator (RNG)** [\[PDF\]](#) chapter for more details.

If none of the above conditions are true, the output of the RNG should be considered as pseudo-random only.

Startup

During startup, the ESP-IDF bootloader temporarily enables the non-RF internal entropy source (SAR ADC using internal reference voltage noise) that provides entropy for any first boot key generation.

However, after the application starts executing, then normally only pseudo-random numbers are available until Wi-Fi or Bluetooth or 802.15.4 Thread/Zigbee are initialized or until the internal entropy source has been enabled again.

To re-enable the entropy source temporarily during application startup, or for an application that does not use Wi-Fi or Bluetooth or 802.15.4 Thread/Zigbee, call the function `bootloader_random_enable()` to re-enable the internal entropy source. The function `bootloader_random_disable()` must be called to disable the entropy source again before using any of the following features:

- ADC
- Wi-Fi or Bluetooth or 802.15.4 Thread/Zigbee

Note: The entropy source enabled during the boot process by the ESP-IDF Second Stage Bootloader seeds the internal RNG state with some entropy. However, the internal hardware RNG state is not large enough to provide a continuous stream of true random numbers. This is why a continuous entropy source must be enabled whenever true random numbers are required.

Note: If an application requires a source of true random numbers but cannot permanently enable a hardware entropy source, consider using a strong software DRBG implementation such as the mbedTLS CTR-DRBG or HMAC-DRBG, with an initial seed of entropy from hardware RNG true random numbers.

Secondary Entropy

ESP32-C5 RNG contains a secondary entropy source, based on sampling an asynchronous 8 MHz internal oscillator (see the Technical Reference Manual for details). This entropy source is always enabled in ESP-IDF and is continuously mixed into the RNG state by hardware. In testing, this secondary entropy source was sufficient to pass the [Dieharder](#) random number test suite without the main entropy source enabled (test input was created by concatenating short samples from continuously resetting ESP32-C5). However, it is currently only guaranteed that true random numbers are produced when the main entropy source is also enabled as described above.

API Reference

Header File

- [components/esp_hw_support/include/esp_random.h](#)
- This header file can be included with:

```
#include "esp_random.h"
```

Functions

uint32_t **esp_random** (void)

Get one random 32-bit word from hardware RNG.

If Wi-Fi or Bluetooth are enabled, this function returns true random numbers. In other situations, if true random numbers are required then consult the ESP-IDF Programming Guide "Random Number Generation" section for necessary prerequisites.

This function automatically busy-waits to ensure enough external entropy has been introduced into the hardware RNG state, before returning a new random number. This delay makes sure the reading frequency does not

exceed 15-75 KHz. The actual value is dependent on the specific chip. More information on this can be found in components/esp_hw_support/hw_random.c.

Returns Random value between 0 and UINT32_MAX

void **esp_fill_random** (void *buf, size_t len)

Fill a buffer with random bytes from hardware RNG.

Note: This function is implemented via calls to esp_random(), so the same constraints apply.

Parameters

- **buf** -- Pointer to buffer to fill with random numbers.
- **len** -- Length of buffer in bytes

Header File

- [components/bootloader_support/include/bootloader_random.h](#)
- This header file can be included with:

```
#include "bootloader_random.h"
```

- This header file is a part of the API provided by the `bootloader_support` component. To declare that your component depends on `bootloader_support`, add the following to your `CMakeLists.txt`:

```
REQUIRES bootloader_support
```

or

```
PRIV_REQUIRES bootloader_support
```

Functions

void **bootloader_random_enable** (void)

Enable an entropy source for RNG if RF subsystem is disabled.

The exact internal entropy source mechanism depends on the chip in use but all SoCs use the SAR ADC to continuously mix random bits (an internal noise reading) into the HWRNG. Consult the SoC Technical Reference Manual for more information.

Can also be called from app code, if true random numbers are required without initialized RF subsystem. This might be the case in early startup code of the application when the RF subsystem has not started yet or if the RF subsystem should not be enabled for power saving.

Consult ESP-IDF Programming Guide "Random Number Generation" section for details.

Warning: This function is not safe to use if any other subsystem is accessing the RF subsystem or the ADC at the same time!

void **bootloader_random_disable** (void)

Disable entropy source for RNG.

Disables internal entropy source. Must be called after `bootloader_random_enable()` and before RF subsystem features, ADC, or I2S (ESP32 only) are initialized.

Consult the ESP-IDF Programming Guide "Random Number Generation" section for details.

void **bootloader_fill_random** (void *buffer, size_t length)

Fill buffer with 'length' random bytes.

Note: If this function is being called from app code only, and never from the bootloader, then it's better to call `esp_fill_random()`.

Parameters

- **buffer** -- Pointer to buffer
- **length** -- This many bytes of random data will be copied to buffer

getrandom()

A compatible version of the Linux `getrandom()` function is also provided for ease of porting:

```
#include <sys/random.h>

ssize_t getrandom(void *buf, size_t buflen, unsigned int flags);
```

This function is implemented by calling `esp_fill_random()` internally.

The `flags` argument is ignored. This function is always non-blocking but the strength of any random numbers is dependent on the same conditions described above.

Return value is -1 (with `errno` set to `EFAULT`) if the `buf` argument is `NULL`, and equal to `buflen` otherwise.

getentropy()

A compatible version of the Linux `getentropy()` function is also provided for easy porting:

```
#include <unistd.h>

int getentropy(void *buffer, size_t length);
```

This function is implemented by calling `getrandom()` internally.

The strength of any random numbers is dependent on the same conditions described above.

Return value is 0 on success and -1 otherwise with `errno` set to:

- `EFAULT` if the `buffer` argument is `NULL`.
- `EIO` if the `length` is more than 256.

Warning: This document is not updated for ESP32C5 yet, so some of the content may not be correct.

This warning was automatically inserted due to the source file being in the `add_warnings_pages` list.

2.9.26 Sleep Modes

Overview

ESP32-C5 supports two major power saving modes: Light-sleep and Deep-sleep. According to the features used by an application, there are some sub sleep modes. See [Sleep Modes](#) for these sleep modes and sub sleep modes. Additionally, there are some power-down options that can be configured to further reduce the power consumption. See [Power-down Options](#) for more details.

There are several wakeup sources in the sleep modes. These sources can also be combined so that the chip will wake up when any of the sources are triggered. [Wakeup Sources](#) describes these wakeup sources and configuration APIs in detail.

The configuration of power-down options and wakeup sources are optional. They can be configured at any moment before entering the sleep modes.

Then the application can call sleep start APIs to enter one of the sleep modes. See [Entering Sleep](#) for more details. When the wakeup condition is met, the application is awoken from sleep. See [Checking Sleep Wakeup Cause](#) on how to get the wakeup cause, and [Disable Sleep Wakeup Source](#) on how to handle the wakeup sources after wakeup.

Sleep Modes

In Light-sleep mode, the digital peripherals, most of the RAM, and CPUs are clock-gated and their supply voltage is reduced. Upon exit from Light-sleep, the digital peripherals, RAM, and CPUs resume operation and their internal states are preserved.

In Deep-sleep mode, the CPUs, most of the RAM, and all digital peripherals that are clocked from APB_CLK are powered off. The only parts of the chip that remain powered on are:

- RTC controller
- ULP coprocessor
- RTC FAST memory

Wi-Fi/Bluetooth and Sleep Modes In Deep-sleep and Light-sleep modes, the wireless peripherals are powered down. Before entering Deep-sleep or Light-sleep modes, the application must disable Wi-Fi and Bluetooth using the appropriate calls (i.e., `nimble_port_stop()`, `nimble_port_deinit()`, `esp_bluedroid_disable()`, `esp_bluedroid_deinit()`, `esp_bt_controller_disable()`, `esp_bt_controller_deinit()`, `esp_wifi_stop()`). Wi-Fi and Bluetooth connections are not maintained in Deep-sleep or Light-sleep mode, even if these functions are not called.

If Wi-Fi/Bluetooth connections need to be maintained, enable Wi-Fi/Bluetooth Modem-sleep mode and automatic Light-sleep feature (see [Power Management APIs](#)). This allows the system to wake up from sleep automatically when required by the Wi-Fi/Bluetooth driver, thereby maintaining the connection.

Wakeup Sources

Wakeup sources can be enabled using `esp_sleep_enable_X_wakeup` APIs. Wakeup sources are not disabled after wakeup, you can disable them using `esp_sleep_disable_wakeup_source()` API if you do not need them any more. See [Disable Sleep Wakeup Source](#).

Following are the wakeup sources supported on ESP32-C5.

Timer The RTC controller has a built-in timer which can be used to wake up the chip after a predefined amount of time. Time is specified at microsecond precision, but the actual resolution depends on the clock source selected for RTC_SLOW_CLK.

For details on RTC clock options, see [ESP32-C5 Technical Reference Manual > ULP Coprocessor \[PDF\]](#).

RTC peripherals or RTC memories do not need to be powered on during sleep in this wakeup mode.

`esp_sleep_enable_timer_wakeup()` function can be used to enable sleep wakeup using a timer.

External Wakeup (ext1) The RTC controller contains the logic to trigger wakeup using multiple RTC GPIOs. One of the following two logic functions can be used to trigger ext1 wakeup:

- wake up if any of the selected pins is high (ESP_EXT1_WAKEUP_ANY_HIGH)
- wake up if any of the selected pins is low (ESP_EXT1_WAKEUP_ANY_LOW)

This wakeup source is controlled by the RTC controller. Unlike `ext0`, this wakeup source supports wakeup even when the RTC peripheral is powered down. Although the power domain of the RTC peripheral, where RTC IOs are located, is powered down during sleep modes, ESP-IDF will automatically lock the state of the wakeup pin before the system enters sleep modes and unlock upon exiting sleep modes. Therefore, the internal pull-up or pull-down resistors can still be configured for the wakeup pin:

```
esp_sleep_pd_config(ESP_PD_DOMAIN_RTC_PERIPH, ESP_PD_OPTION_ON);
rtc_gpio_pullup_dis(gpio_num);
rtc_gpiopulldown_en(gpio_num);
```

If we turn off the `RTC_PERIPH` domain, we will use the HOLD feature to maintain the pull-up and pull-down on the pins during sleep. HOLD feature will be acted on the pin internally before the system enters sleep modes, and this can further reduce power consumption:

```
rtc_gpio_pullup_dis(gpio_num);
rtc_gpiopulldown_en(gpio_num);
```

If certain chips lack the `RTC_PERIPH` domain, we can only use the HOLD feature to maintain the pull-up and pull-down on the pins during sleep modes:

```
gpio_pullup_dis(gpio_num);
gpio_pulldown_en(gpio_num);
```

`esp_sleep_enable_ext1_wakeup_io()` function can be used to append ext1 wakeup IO and set corresponding wakeup level.

`esp_sleep_disable_ext1_wakeup_io()` function can be used to remove ext1 wakeup IO.

The RTC controller also supports triggering wakeup, allowing configurable IO to use different wakeup levels simultaneously. This can be configured with `esp_sleep_enable_ext1_wakeup_io()`.

Warning:

- To use the EXT1 wakeup, the IO pad(s) are configured as RTC IO. Therefore, before using these pads as digital GPIOs, users need to reconfigure them by calling the `rtc_gpio_deinit()` function.
- If the RTC peripherals are configured to be powered down (which is by default), the wakeup IOs will be set to the holding state before entering sleep. Therefore, after the chip wakes up from Light-sleep, please call `rtc_gpio_hold_dis` to disable the hold function to perform any pin re-configuration. For Deep-sleep wakeup, this is already being handled at the application startup stage.

ULP Coprocessor Wakeup ULP coprocessor can run while the chip is in sleep mode, and may be used to poll sensors, monitor ADC or touch sensor values, and wake up the chip when a specific event is detected. ULP coprocessor is part of the RTC peripherals power domain, and it runs the program stored in RTC SLOW memory. RTC SLOW memory will be powered on during sleep if this wakeup mode is requested. RTC peripherals will be automatically powered on before ULP coprocessor starts running the program; once the program stops running, RTC peripherals are automatically powered down again.

`esp_sleep_enable_ulp_wakeup()` function can be used to enable this wakeup source.

GPIO Wakeup (Light-sleep Only) In addition to EXT0 and EXT1 wakeup sources described above, one more method of wakeup from external inputs is available in Light-sleep mode. With this wakeup source, each pin can be individually configured to trigger wakeup on high or low level using `gpio_wakeup_enable()` function. Unlike EXT0 and EXT1 wakeup sources, which can only be used with RTC IOs, this wakeup source can be used with any IO (RTC or digital).

`esp_sleep_enable_gpio_wakeup()` function can be used to enable this wakeup source.

Warning: Before entering Light-sleep mode, check if any GPIO pin to be driven is part of the VDD_SPI power domain. If so, this power domain must be configured to remain ON during sleep.

For example, on ESP32-WROOM-32 board, GPIO16 and GPIO17 are linked to VDD_SPI power domain. If they are configured to remain high during Light-sleep, the power domain should be configured to remain powered ON. This can be done with `esp_sleep_pd_config()`:

```
esp_sleep_pd_config(ESP_PD_DOMAIN_VDDSDIO, ESP_PD_OPTION_ON);
```

Note: In Light-sleep mode, if you set Kconfig option `CONFIG_PM_POWER_DOWN_PERIPHERAL_IN_LIGHT_SLEEP`, to continue using `gpio_wakeup_enable()` for GPIO wakeup, you need to first call `rtc_gpio_init()` and `rtc_gpio_set_direction()`, setting the RTCIO to input mode.

Alternatively, you can use `esp_deep_sleep_enable_gpio_wakeup()` directly in that condition for GPIO wakeup, because the digital IO power domain is being powered off, where the situation is the same as entering Deep-sleep.

UART Wakeup (Light-sleep Only) When ESP32-C5 receives UART input from external devices, it is often necessary to wake up the chip when input data is available. The UART peripheral contains a feature which allows waking up the chip from Light-sleep when a certain number of positive edges on RX pin are seen. This number of positive edges can be set using `uart_set_wakeup_threshold()` function. Note that the character which triggers wakeup (and any characters before it) will not be received by the UART after wakeup. This means that the external device typically needs to send an extra character to the ESP32-C5 to trigger wakeup before sending the data.

`esp_sleep_enable_uart_wakeup()` function can be used to enable this wakeup source.

After waking-up from UART, you should send some extra data through the UART port in Active mode, so that the internal wakeup indication signal can be cleared. Otherwise, the next UART wake-up would trigger with two less rising edges than the configured threshold value.

Note: In Light-sleep mode, setting Kconfig option `CONFIG_PM_POWER_DOWN_PERIPHERAL_IN_LIGHT_SLEEP` will invalidate UART wakeup.

Disable Sleep Wakeup Source Previously configured wakeup sources can be disabled later using `esp_sleep_disable_wakeup_source()` API. This function deactivates trigger for the given wakeup source. Additionally, it can disable all triggers if the argument is `ESP_SLEEP_WAKEUP_ALL`.

Power-down Options

The application can force specific powerdown modes for RTC peripherals and RTC memories. In Deep-sleep mode, we can also isolate some IOs to further reduce current consumption.

Power-down of RTC Peripherals and Memories By default, `esp_deep_sleep_start()` and `esp_light_sleep_start()` functions power down all RTC power domains which are not needed by the enabled wakeup sources. To override this behaviour, `esp_sleep_pd_config()` function is provided.

In ESP32-C5, there is only RTC FAST memory, so if some variables in the program are marked by `RTC_DATA_ATTR`, `RTC_SLOW_ATTR` or `RTC_FAST_ATTR` attributes, all of them go to RTC FAST memory. It will be kept powered on by default. This can be overridden using `esp_sleep_pd_config()` function, if desired.

Power-down of Flash By default, to avoid potential issues, `esp_light_sleep_start()` function does **not** power down flash. To be more specific, it takes time to power down the flash and during this period the system may be woken up, which then actually powers up the flash before this flash could be powered down completely. As a result, there is a chance that the flash may not work properly.

So, in theory, it is ok if you only wake up the system after the flash is completely powered down. However, in reality, the flash power-down period can be hard to predict (for example, this period can be much longer when you add filter capacitors to the flash's power supply circuit) and uncontrollable (for example, the asynchronous wake-up signals make the actual sleep time uncontrollable).

Warning: If a filter capacitor is added to your flash power supply circuit, please do everything possible to avoid powering down flash.

Therefore, it is recommended not to power down flash when using ESP-IDF. For power-sensitive applications, it is recommended to use Kconfig option `CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND` to reduce the power consumption of the flash during Light-sleep, instead of powering down the flash.

It is worth mentioning that PSRAM has a similar Kconfig option `CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND`.

However, for those who have fully understood the risk and are still willing to power down the flash to further reduce the power consumption, please check the following mechanisms:

- Setting Kconfig option `CONFIG_ESP_SLEEP_POWER_DOWN_FLASH` only powers down the flash when the RTC timer is the only wake-up source **and** the sleep time is longer than the flash power-down period.
- Calling `esp_sleep_pd_config(ESP_PD_DOMAIN_VDDSDIO, ESP_PD_OPTION_OFF)` powers down flash when the RTC timer is not enabled as a wakeup source **or** the sleep time is longer than the flash power-down period.

Note:

- ESP-IDF does not provide any mechanism that can power down the flash in all conditions when Light-sleep.
 - `esp_deep_sleep_start()` function forces power down flash regardless of user configuration.
-

Configuring IOs (Deep-sleep Only) Some ESP32-C5 IOs have internal pullups or pulldowns, which are enabled by default. If an external circuit drives this pin in Deep-sleep mode, current consumption may increase due to current flowing through these pullups and pulldowns.

To isolate a pin to prevent extra current draw, call `rtc_gpio_isolate()` function.

For example, on ESP32-WROVER module, GPIO12 is pulled up externally, and it also has an internal pulldown in the ESP32 chip. This means that in Deep-sleep, some current flows through these external and internal resistors, increasing Deep-sleep current above the minimal possible value.

Add the following code before `esp_deep_sleep_start()` to remove such extra current:

```
rtc_gpio_isolate(GPIO_NUM_12);
```

Entering Sleep

`esp_light_sleep_start()` or `esp_deep_sleep_start()` functions can be used to enter Light-sleep or Deep-sleep modes correspondingly. After that, the system configures the parameters of RTC controller according to the requested wakeup sources and power-down options.

It is also possible to enter sleep modes with no wakeup sources configured. In this case, the chip will be in sleep modes indefinitely until external reset is applied.

UART Output Handling Before entering sleep mode, `esp_deep_sleep_start()` will flush the contents of UART FIFOs.

When entering Light-sleep mode using `esp_light_sleep_start()`, UART FIFOs will not be flushed. Instead, UART output will be suspended, and remaining characters in the FIFO will be sent out after wakeup from Light-sleep.

Checking Sleep Wakeup Cause

`esp_sleep_get_wakeup_cause()` function can be used to check which wakeup source has triggered wakeup from sleep mode.

For ext1 wakeup sources, it is possible to identify which touch pin has caused wakeup using `esp_sleep_get_ext1_wakeup_status()` functions.

Application Examples

- [protocols/sntp](#) demonstrates the implementation of basic functionality of Deep-sleep, where ESP module is periodically waken up to retrieve time from NTP server.
- [wifi/power_save](#) demonstrates the usage of Wi-Fi Modem-sleep mode and automatic Light-sleep feature to maintain Wi-Fi connections.
- [bluetooth/nimble/power_save](#) demonstrates the usage of Bluetooth Modem-sleep mode and automatic Light-sleep feature to maintain Bluetooth connections.
- [system/deep_sleep](#) demonstrates the usage of various Deep-sleep wakeup triggers and ULP coprocessor programming.
- [system/light_sleep](#) demonstrates the usage of Light-sleep wakeup triggered by various sources, such as the timer, GPIOs, the touch sensor, supported by ESP32-C5.

Header File

- `components/esp_hw_support/include/esp_sleep.h`
- This header file can be included with:

```
#include "esp_sleep.h"
```

Functions

`esp_err_t esp_sleep_disable_wakeup_source(esp_sleep_source_t source)`

Disable wakeup source.

This function is used to deactivate wake up trigger for source defined as parameter of the function.

See docs/sleep-modes.rst for details.

Note: This function does not modify wake up configuration in RTC. It will be performed in `esp_deep_sleep_start/esp_light_sleep_start` function.

Parameters `source` -- - number of source to disable of type `esp_sleep_source_t`

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if trigger was not active

esp_err_t **esp_sleep_enable_ulp_wakeup** (void)

Enable wakeup by ULP coprocessor.

Note: On ESP32, ULP wakeup source cannot be used when RTC_PERIPH power domain is forced, to be powered on (ESP_PD_OPTION_ON) or when ext0 wakeup source is used.

Returns

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if additional current by touch (CONFIG_RTC_EXT_CRYST_ADDIT_CURRENT) is enabled.
- ESP_ERR_INVALID_STATE if ULP co-processor is not enabled or if wakeup triggers conflict

esp_err_t **esp_sleep_enable_timer_wakeup** (uint64_t time_in_us)

Enable wakeup by timer.

Parameters *time_in_us* -- time before wakeup, in microseconds

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if value is out of range (TBD)

bool **esp_sleep_is_valid_wakeup_gpio** (gpio_num_t gpio_num)

Returns true if a GPIO number is valid for use as wakeup source.

Note: For SoCs with RTC IO capability, this can be any valid RTC IO input pin.

Parameters *gpio_num* -- Number of the GPIO to test for wakeup source capability

Returns True if this GPIO number will be accepted as a sleep wakeup source.

esp_err_t **esp_sleep_enable_ext1_wakeup** (uint64_t io_mask, *esp_sleep_ext1_wakeup_mode_t* level_mode)

Enable wakeup using multiple pins.

This function uses external wakeup feature of RTC controller. It will work even if RTC peripherals are shut down during sleep.

This feature can monitor any number of pins which are in RTC IOs. Once selected pins go into the state given by level_mode argument, the chip will be woken up.

Note: This function does not modify pin configuration. The pins are configured in esp_deep_sleep_start/esp_light_sleep_start, immediately before entering sleep mode.

Note: Internal pullups and pulldowns don't work when RTC peripherals are shut down. In this case, external resistors need to be added. Alternatively, RTC peripherals (and pullups/pulldowns) may be kept enabled using esp_sleep_pd_config function. If we turn off the RTC_PERIPH domain or certain chips lack the RTC_PERIPH domain, we will use the HOLD feature to maintain the pull-up and pull-down on the pins during sleep. HOLD feature will be acted on the pin internally before the system entering sleep, and this can further reduce power consumption.

Note: Call this func will reset the previous ext1 configuration.

Note: This function will be deprecated in release/v6.0. Please switch to use `esp_sleep_enable_ext1_wakeup_io` and `esp_sleep_disable_ext1_wakeup_io`

Parameters

- **io_mask** -- Bit mask of GPIO numbers which will cause wakeup. Only GPIOs which have RTC functionality can be used in this bit map. For different SoCs, the related GPIOs are:
 - ESP32: 0, 2, 4, 12-15, 25-27, 32-39
 - ESP32-S2: 0-21
 - ESP32-S3: 0-21
 - ESP32-C6: 0-7
 - ESP32-H2: 7-14
- **level_mode** -- Select logic function used to determine wakeup condition: When target chip is ESP32:
 - `ESP_EXT1_WAKEUP_ALL_LOW`: wake up when all selected GPIOs are low
 - `ESP_EXT1_WAKEUP_ANY_HIGH`: wake up when any of the selected GPIOs is highWhen target chip is ESP32-S2, ESP32-S3, ESP32-C6 or ESP32-H2:
 - `ESP_EXT1_WAKEUP_ANY_LOW`: wake up when any of the selected GPIOs is low
 - `ESP_EXT1_WAKEUP_ANY_HIGH`: wake up when any of the selected GPIOs is high

Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if `io_mask` is zero,, or `mode` is invalid

esp_err_t `esp_sleep_enable_ext1_wakeup_io` (*uint64_t* io_mask, *esp_sleep_ext1_wakeup_mode_t* level_mode)

Enable ext1 wakeup pins with IO masks.

This will append selected IOs to the wakeup IOs, it will not reset previously enabled IOs. To reset specific previously enabled IOs, call `esp_sleep_disable_ext1_wakeup_io` with the `io_mask`. To reset all the enabled IOs, call `esp_sleep_disable_ext1_wakeup_io(0)`.

This function uses external wakeup feature of RTC controller. It will work even if RTC peripherals are shut down during sleep.

This feature can monitor any number of pins which are in RTC IOs. Once selected pins go into the state given by `level_mode` argument, the chip will be woken up.

Note: This function does not modify pin configuration. The pins are configured in `esp_deep_sleep_start/esp_light_sleep_start`, immediately before entering sleep mode.

Note: Internal pullups and pulldowns don't work when RTC peripherals are shut down. In this case, external resistors need to be added. Alternatively, RTC peripherals (and pullups/pulldowns) may be kept enabled using `esp_sleep_pd_config` function. If we turn off the `RTC_PERIPH` domain or certain chips lack the `RTC_PERIPH` domain, we will use the HOLD feature to maintain the pull-up and pull-down on the pins during sleep. HOLD feature will be acted on the pin internally before the system entering sleep, and this can further reduce power consumption.

Parameters

- **io_mask** -- Bit mask of GPIO numbers which will cause wakeup. Only GPIOs which have RTC functionality can be used in this bit map. For different SoCs, the related GPIOs are:
 - ESP32: 0, 2, 4, 12-15, 25-27, 32-39
 - ESP32-S2: 0-21
 - ESP32-S3: 0-21

- ESP32-C6: 0-7
- ESP32-H2: 7-14
- **level_mode** -- Select logic function used to determine wakeup condition: When target chip is ESP32:
 - ESP_EXT1_WAKEUP_ALL_LOW: wake up when all selected GPIOs are low
 - ESP_EXT1_WAKEUP_ANY_HIGH: wake up when any of the selected GPIOs is highWhen target chip is ESP32-S2, ESP32-S3, ESP32-C6 or ESP32-H2:
 - ESP_EXT1_WAKEUP_ANY_LOW: wake up when any of the selected GPIOs is low
 - ESP_EXT1_WAKEUP_ANY_HIGH: wake up when any of the selected GPIOs is high

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if any of the selected GPIOs is not an RTC GPIO, or mode is invalid
- ESP_ERR_NOT_ALLOWED when wakeup level will become different between ext1 IOs if !SOC_PM_SUPPORT_EXT1_WAKEUP_MODE_PER_PIN

esp_err_t **esp_sleep_disable_ext1_wakeup_io** (uint64_t io_mask)

Disable ext1 wakeup pins with IO masks. This will remove selected IOs from the wakeup IOs.

Parameters **io_mask** -- Bit mask of GPIO numbers which will cause wakeup. Only GPIOs which have RTC functionality can be used in this bit map. If value is zero, this func will remove all previous ext1 configuration. For different SoCs, the related GPIOs are:

- ESP32: 0, 2, 4, 12-15, 25-27, 32-39
- ESP32-S2: 0-21
- ESP32-S3: 0-21
- ESP32-C6: 0-7
- ESP32-H2: 7-14

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if any of the selected GPIOs is not an RTC GPIO.

esp_err_t **esp_sleep_enable_ext1_wakeup_with_level_mask** (uint64_t io_mask, uint64_t level_mask)

Enable wakeup using multiple pins, allows different trigger mode per pin.

This function uses external wakeup feature of RTC controller. It will work even if RTC peripherals are shut down during sleep.

This feature can monitor any number of pins which are in RTC IOs. Once selected pins go into the state given by level_mode argument, the chip will be woken up.

Note: This function does not modify pin configuration. The pins are configured in esp_deep_sleep_start/esp_light_sleep_start, immediately before entering sleep mode.

Note: Internal pullups and pulldowns don't work when RTC peripherals are shut down. In this case, external resistors need to be added. Alternatively, RTC peripherals (and pullups/pulldowns) may be kept enabled using esp_sleep_pd_config function. If we turn off the RTC_PERIPH domain or certain chips lack the RTC_PERIPH domain, we will use the HOLD feature to maintain the pull-up and pull-down on the pins during sleep. HOLD feature will be acted on the pin internally before the system entering sleep, and this can further reduce power consumption.

Parameters

- **io_mask** -- Bit mask of GPIO numbers which will cause wakeup. Only GPIOs which have RTC functionality can be used in this bit map. For different SoCs, the related GPIOs are:
 - ESP32-C6: 0-7.
 - ESP32-H2: 7-14.

- **level_mask** -- Select logic function used to determine wakeup condition per pin. Each bit of the level_mask corresponds to the respective GPIO. Each bit's corresponding position is set to 0, the wakeup level will be low, on the contrary, each bit's corresponding position is set to 1, the wakeup level will be high.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if any of the selected GPIOs is not an RTC GPIO, or mode is invalid

```
esp_err_t esp_deep_sleep_enable_gpio_wakeup (uint64_t gpio_pin_mask,  
                                             esp_deepsleep_gpio_wake_up_mode_t mode)
```

Enable wakeup using specific gpio pins.

This function enables an IO pin to wake up the chip from deep sleep.

Note: This function does not modify pin configuration. The pins are configured inside `esp_deep_sleep_start`, immediately before entering sleep mode.

Note: You don't need to worry about pull-up or pull-down resistors before using this function because the `ESP_SLEEP_GPIO_ENABLE_INTERNAL_RESISTORS` option is enabled by default. It will automatically set pull-up or pull-down resistors internally in `esp_deep_sleep_start` based on the wakeup mode. However, when using external pull-up or pull-down resistors, please be sure to disable the `ESP_SLEEP_GPIO_ENABLE_INTERNAL_RESISTORS` option, as the combination of internal and external resistors may cause interference. BTW, when you use low level to wake up the chip, we strongly recommend you to add external resistors (pull-up).

Parameters

- **gpio_pin_mask** -- Bit mask of GPIO numbers which will cause wakeup. Only GPIOs which have RTC functionality (pads that powered by `VDD3P3_RTC`) can be used in this bit map.
- **mode** -- Select logic function used to determine wakeup condition:
 - `ESP_GPIO_WAKEUP_GPIO_LOW`: wake up when the gpio turn to low.
 - `ESP_GPIO_WAKEUP_GPIO_HIGH`: wake up when the gpio turn to high.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the mask contains any invalid deep sleep wakeup pin or wakeup mode is invalid

```
esp_err_t esp_sleep_enable_gpio_wakeup (void)
```

Enable wakeup from light sleep using GPIOs.

Each GPIO supports wakeup function, which can be triggered on either low level or high level. Unlike `EXT0` and `EXT1` wakeup sources, this method can be used both for all IOs: RTC IOs and digital IOs. It can only be used to wakeup from light sleep though.

To enable wakeup, first call `gpio_wakeup_enable`, specifying gpio number and wakeup level, for each GPIO which is used for wakeup. Then call this function to enable wakeup feature.

Note: On ESP32, GPIO wakeup source can not be used together with touch or ULP wakeup sources.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if wakeup triggers conflict

esp_err_t **esp_sleep_enable_uart_wakeup** (int uart_num)

Enable wakeup from light sleep using UART.

Use `uart_set_wakeup_threshold` function to configure UART wakeup threshold.

Wakeup from light sleep takes some time, so not every character sent to the UART can be received by the application.

Note: ESP32 does not support wakeup from UART2.

Parameters `uart_num` -- UART port to wake up from

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if wakeup from given UART is not supported

esp_err_t **esp_sleep_enable_bt_wakeup** (void)

Enable wakeup by bluetooth.

Returns

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if wakeup from bluetooth is not supported

esp_err_t **esp_sleep_disable_bt_wakeup** (void)

Disable wakeup by bluetooth.

Returns

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if wakeup from bluetooth is not supported

esp_err_t **esp_sleep_enable_wifi_wakeup** (void)

Enable wakeup by WiFi MAC.

Returns

- ESP_OK on success

esp_err_t **esp_sleep_disable_wifi_wakeup** (void)

Disable wakeup by WiFi MAC.

Returns

- ESP_OK on success

esp_err_t **esp_sleep_enable_wifi_beacon_wakeup** (void)

Enable beacon wakeup by WiFi MAC, it will wake up the system into modem state.

Returns

- ESP_OK on success

esp_err_t **esp_sleep_disable_wifi_beacon_wakeup** (void)

Disable beacon wakeup by WiFi MAC.

Returns

- ESP_OK on success

uint64_t **esp_sleep_get_ext1_wakeup_status** (void)

Get the bit mask of GPIOs which caused wakeup (ext1)

If wakeup was caused by another source, this function will return 0.

Returns bit mask, if GPIO n caused wakeup, BIT(n) will be set

`uint64_t esp_sleep_get_gpio_wakeup_status` (void)

Get the bit mask of GPIOs which caused wakeup (gpio)

If wakeup was caused by another source, this function will return 0.

Returns bit mask, if GPIO caused wakeup, BIT(n) will be set

`esp_err_t esp_sleep_pd_config` (`esp_sleep_pd_domain_t` domain, `esp_sleep_pd_option_t` option)

Set power down mode for an RTC power domain in sleep mode.

If not set using this API, all power domains default to ESP_PD_OPTION_AUTO.

Parameters

- **domain** -- power domain to configure
- **option** -- power down option (ESP_PD_OPTION_OFF, ESP_PD_OPTION_ON, or ESP_PD_OPTION_AUTO)

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if either of the arguments is out of range

`esp_err_t esp_deep_sleep_try_to_start` (void)

Enter deep sleep with the configured wakeup options.

The reason for the rejection can be such as a short sleep time.

Note: In general, the function does not return, but if the sleep is rejected, then it returns from it.

Returns

- No return - If the sleep is not rejected.
- ESP_ERR_SLEEP_REJECT sleep request is rejected(wakeup source set before the sleep request)

void `esp_deep_sleep_start` (void)

Enter deep sleep with the configured wakeup options.

Note: The function does not do a return (no rejection). Even if wakeup source set before the sleep request it goes to deep sleep anyway.

`esp_err_t esp_light_sleep_start` (void)

Enter light sleep with the configured wakeup options.

Returns

- ESP_OK on success (returned after wakeup)
- ESP_ERR_SLEEP_REJECT sleep request is rejected(wakeup source set before the sleep request)
- ESP_ERR_SLEEP_TOO_SHORT_SLEEP_DURATION after deducting the sleep flow overhead, the final sleep duration is too short to cover the minimum sleep duration of the chip, when rtc timer wakeup source enabled

`esp_err_t esp_deep_sleep_try` (`uint64_t` time_in_us)

Enter deep-sleep mode.

The device will automatically wake up after the deep-sleep time Upon waking up, the device calls deep sleep wake stub, and then proceeds to load application.

Call to this function is equivalent to a call to `esp_deep_sleep_enable_timer_wakeup` followed by a call to `esp_deep_sleep_start`.

The reason for the rejection can be such as a short sleep time.

Note: In general, the function does not return, but if the sleep is rejected, then it returns from it.

Parameters `time_in_us` -- deep-sleep time, unit: microsecond

Returns

- No return - If the sleep is not rejected.
- `ESP_ERR_SLEEP_REJECT` sleep request is rejected(wakeup source set before the sleep request)

void `esp_deep_sleep` (uint64_t time_in_us)

Enter deep-sleep mode.

The device will automatically wake up after the deep-sleep time. Upon waking up, the device calls deep sleep wake stub, and then proceeds to load application.

Call to this function is equivalent to a call to `esp_deep_sleep_enable_timer_wakeup` followed by a call to `esp_deep_sleep_start`.

Note: The function does not do a return (no rejection).. Even if wakeup source set before the sleep request it goes to deep sleep anyway.

Parameters `time_in_us` -- deep-sleep time, unit: microsecond

`esp_err_t` `esp_deep_sleep_register_hook` (`esp_deep_sleep_cb_t` new_dslp_cb)

Register a callback to be called from the deep sleep prepare.

<p>Warning: deepsleep callbacks should without parameters, and MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.</p>
--

Parameters `new_dslp_cb` -- Callback to be called

Returns

- `ESP_OK`: Callback registered to the deepsleep `misc_modules_sleep_prepare`
- `ESP_ERR_NO_MEM`: No more hook space for register the callback

void `esp_deep_sleep_deregister_hook` (`esp_deep_sleep_cb_t` old_dslp_cb)

Unregister an deepsleep callback.

Parameters `old_dslp_cb` -- Callback to be unregistered

`esp_sleep_wakeup_cause_t` `esp_sleep_get_wakeup_cause` (void)

Get the wakeup source which caused wakeup from sleep.

Returns cause of wake up from last sleep (deep sleep or light sleep)

void `esp_wake_deep_sleep` (void)

Default stub to run on wake from deep sleep.

Allows for executing code immediately on wake from sleep, before the software bootloader or ESP-IDF app has started up.

This function is weak-linked, so you can implement your own version to run code immediately when the chip wakes from sleep.

See docs/deep-sleep-stub.rst for details.

void **esp_set_deep_sleep_wake_stub** (*esp_deep_sleep_wake_stub_fn_t* new_stub)

Install a new stub at runtime to run on wake from deep sleep.

If implementing `esp_wake_deep_sleep()` then it is not necessary to call this function.

However, it is possible to call this function to substitute a different deep sleep stub. Any function used as a deep sleep stub must be marked `RTC_IRAM_ATTR`, and must obey the same rules given for `esp_wake_deep_sleep()`.

void **esp_set_deep_sleep_wake_stub_default_entry** (void)

Set wake stub entry to default `esp_wake_stub_entry`

esp_deep_sleep_wake_stub_fn_t **esp_get_deep_sleep_wake_stub** (void)

Get current wake from deep sleep stub.

Returns Return current wake from deep sleep stub, or NULL if no stub is installed.

void **esp_default_wake_deep_sleep** (void)

The default esp-idf-provided `esp_wake_deep_sleep()` stub.

See docs/deep-sleep-stub.rst for details.

void **esp_deep_sleep_disable_rom_logging** (void)

Disable logging from the ROM code after deep sleep.

Using LSB of `RTC_STORE4`.

esp_err_t **esp_sleep_cpu_retention_init** (void)

CPU Power down initialize.

Returns

- `ESP_OK` on success
- `ESP_ERR_NO_MEM` not enough retention memory

esp_err_t **esp_sleep_cpu_retention_deinit** (void)

CPU Power down de-initialize.

Release system retention memory.

Returns

- `ESP_OK` on success

void **esp_sleep_config_gpio_isolate** (void)

Configure to isolate all GPIO pins in sleep state.

void **esp_sleep_enable_gpio_switch** (bool enable)

Enable or disable GPIO pins status switching between slept status and waked status.

Parameters `enable` -- decide whether to switch status or not

Macros

`ESP_PD_DOMAIN_RTC8M`

`ESP_SLEEP_POWER_DOWN_CPU`

Type Definitions

typedef void (***esp_deep_sleep_cb_t**)(void)

typedef *esp_sleep_source_t* **esp_sleep_wakeup_cause_t**

typedef void (***esp_deep_sleep_wake_stub_fn_t**)(void)

Function type for stub to run on wake from sleep.

Enumerations

enum **esp_sleep_ext1_wakeup_mode_t**

Logic function used for EXT1 wakeup mode.

Values:

enumerator **ESP_EXT1_WAKEUP_ANY_LOW**

Wake the chip when any of the selected GPIOs go low.

enumerator **ESP_EXT1_WAKEUP_ANY_HIGH**

Wake the chip when any of the selected GPIOs go high.

enumerator **ESP_EXT1_WAKEUP_ALL_LOW**

enum **esp_deepsleep_gpio_wake_up_mode_t**

Values:

enumerator **ESP_GPIO_WAKEUP_GPIO_LOW**

enumerator **ESP_GPIO_WAKEUP_GPIO_HIGH**

enum **esp_sleep_pd_domain_t**

Power domains which can be powered down in sleep mode.

Values:

enumerator **ESP_PD_DOMAIN_RTC_PERIPH**

RTC IO, sensors and ULP co-processor.

enumerator **ESP_PD_DOMAIN_XTAL**

XTAL oscillator.

enumerator **ESP_PD_DOMAIN_XTAL32K**

External 32 kHz XTAL oscillator.

enumerator **ESP_PD_DOMAIN_RC32K**

Internal 32 kHz RC oscillator.

enumerator **ESP_PD_DOMAIN_RC_FAST**

Internal Fast oscillator.

enumerator **ESP_PD_DOMAIN_CPU**

CPU core.

enumerator **ESP_PD_DOMAIN_VDDSDIO**

VDD_SDIO.

enumerator **ESP_PD_DOMAIN_MODEM**

MODEM, includes WiFi, Bluetooth and IEEE802.15.4.

enumerator **ESP_PD_DOMAIN_TOP**

SoC TOP.

enumerator **ESP_PD_DOMAIN_MAX**

Number of domains.

enum **esp_sleep_pd_option_t**

Power down options.

Values:

enumerator **ESP_PD_OPTION_OFF**

Power down the power domain in sleep mode.

enumerator **ESP_PD_OPTION_ON**

Keep power domain enabled during sleep mode.

enumerator **ESP_PD_OPTION_AUTO**

Keep power domain enabled in sleep mode, if it is needed by one of the wakeup options. Otherwise power it down.

enum **esp_sleep_source_t**

Sleep wakeup cause.

Values:

enumerator **ESP_SLEEP_WAKEUP_UNDEFINED**

In case of deep sleep, reset was not caused by exit from deep sleep.

enumerator **ESP_SLEEP_WAKEUP_ALL**

Not a wakeup cause, used to disable all wakeup sources with `esp_sleep_disable_wakeup_source`.

enumerator **ESP_SLEEP_WAKEUP_EXT0**

Wakeup caused by external signal using `RTC_IO`.

enumerator **ESP_SLEEP_WAKEUP_EXT1**

Wakeup caused by external signal using `RTC_CNTL`.

enumerator **ESP_SLEEP_WAKEUP_TIMER**

Wakeup caused by timer.

enumerator **ESP_SLEEP_WAKEUP_TOUCHPAD**

Wakeup caused by touchpad.

enumerator **ESP_SLEEP_WAKEUP_ULP**

Wakeup caused by ULP program.

enumerator **ESP_SLEEP_WAKEUP_GPIO**

Wakeup caused by GPIO (light sleep only on ESP32, S2 and S3)

enumerator **ESP_SLEEP_WAKEUP_UART**

Wakeup caused by UART (light sleep only)

enumerator **ESP_SLEEP_WAKEUP_WIFI**

Wakeup caused by WIFI (light sleep only)

enumerator **ESP_SLEEP_WAKEUP_COCPU**

Wakeup caused by COCPU int.

enumerator **ESP_SLEEP_WAKEUP_COCPU_TRAP_TRIG**

Wakeup caused by COCPU crash.

enumerator **ESP_SLEEP_WAKEUP_BT**

Wakeup caused by BT (light sleep only)

enumerator **ESP_SLEEP_WAKEUP_VAD**

Wakeup caused by VAD.

enum **esp_sleep_mode_t**

Sleep mode.

Values:

enumerator **ESP_SLEEP_MODE_LIGHT_SLEEP**

light sleep mode

enumerator **ESP_SLEEP_MODE_DEEP_SLEEP**

deep sleep mode

enum **[anonymous]**

Values:

enumerator **ESP_ERR_SLEEP_REJECT**

enumerator **ESP_ERR_SLEEP_TOO_SHORT_SLEEP_DURATION**

2.9.27 SoC Capabilities

This section lists the macro definitions of the ESP32-C5's SoC hardware capabilities. These macros are commonly used by conditional-compilation directives (e.g., `#if`) in ESP-IDF to determine which hardware-dependent features are supported, thus control what portions of code are compiled.

<p>Warning: These macro definitions are currently not considered to be part of the public API, and may be changed in a breaking manner (see ESP-IDF Versions for more details).</p>

SOC_CPU_WATCHPOINT_MAX_REGION_SIZE

SOC_CPU_HAS_PMA

SOC_CPU_IDRAM_SPLIT_USING_PMP

SOC_CPU_PMP_REGION_GRANULARITY

SOC_CPU_HAS_LOCKUP_RESET

SOC_DS_SIGNATURE_MAX_BIT_LEN

The maximum length of a Digital Signature in bits.

SOC_DS_KEY_PARAM_MD_IV_LENGTH

Initialization vector (IV) length for the RSA key parameter message digest (MD) in bytes.

SOC_DS_KEY_CHECK_MAX_WAIT_US

Maximum wait time for DS parameter decryption key. If overdue, then key error. See TRM DS chapter for more details

SOC_DMA_CAN_ACCESS_FLASH

DMA can access Flash memory

SOC_AHB_GDMA_VERSION

SOC_GDMA_NUM_GROUPS_MAX

SOC_GDMA_PAIRS_PER_GROUP_MAX

SOC_GDMA_SUPPORT_ETM

SOC_MMU_LINEAR_ADDRESS_REGION_NUM

SOC_MMU_DI_VADDR_SHARED

D/I vaddr are shared

SOC_PCNT_GROUPS

SOC_PCNT_UNITS_PER_GROUP

SOC_PCNT_CHANNELS_PER_UNIT

SOC_PCNT_THRES_POINT_PER_UNIT

SOC_PCNT_SUPPORT_RUNTIME_THRES_UPDATE

SOC_PCNT_SUPPORT_CLEAR_SIGNAL

SOC_PCNT_SUPPORT_STEP_NOTIFY

SOC_PCNT_SUPPORT_SLEEP_RETENTION

The sleep retention feature can help back up PCNT registers before sleep

SOC_RMT_GROUPS

One RMT group

SOC_RMT_TX_CANDIDATES_PER_GROUP

Number of channels that capable of Transmit

SOC_RMT_RX_CANDIDATES_PER_GROUP

Number of channels that capable of Receive

SOC_RMT_CHANNELS_PER_GROUP

Total 4 channels

SOC_RMT_MEM_WORDS_PER_CHANNEL

Each channel owns 48 words memory (1 word = 4 Bytes)

SOC_RMT_SUPPORT_RX_PINGPONG

Support Ping-Pong mode on RX path

SOC_RMT_SUPPORT_RX_DEMODULATION

Support signal demodulation on RX path (i.e. remove carrier)

SOC_RMT_SUPPORT_TX_ASYNC_STOP

Support stop transmission asynchronously

SOC_RMT_SUPPORT_TX_LOOP_COUNT

Support transmit specified number of cycles in loop mode

SOC_RMT_SUPPORT_TX_LOOP_AUTO_STOP

Hardware support of auto-stop in loop mode

SOC_RMT_SUPPORT_TX_SYNCHRO

Support coordinate a group of TX channels to start simultaneously

SOC_RMT_SUPPORT_TX_CARRIER_DATA_ONLY

TX carrier can be modulated to data phase only

SOC_RMT_SUPPORT_XTAL

Support set XTAL clock as the RMT clock source

SOC_RMT_SUPPORT_SLEEP_RETENTION

The sleep retention feature can help back up RMT registers before sleep

SOC_MCPWM_GROUPS

1 MCPWM groups on the chip (i.e., the number of independent MCPWM peripherals)

SOC_MCPWM_TIMERS_PER_GROUP

The number of timers that each group has.

SOC_MCPWM_OPERATORS_PER_GROUP

The number of operators that each group has.

SOC_MCPWM_COMPARATORS_PER_OPERATOR

The number of comparators that each operator has.

SOC_MCPWM_GENERATORS_PER_OPERATOR

The number of generators that each operator has.

SOC_MCPWM_EVENT_COMPARATORS_PER_OPERATOR

The number of event comparators that each operator has.

SOC_MCPWM_TRIGGERS_PER_OPERATOR

The number of triggers that each operator has.

SOC_MCPWM_GPIO_FAULTS_PER_GROUP

The number of fault signal detectors that each group has.

SOC_MCPWM_CAPTURE_TIMERS_PER_GROUP

The number of capture timers that each group has.

SOC_MCPWM_CAPTURE_CHANNELS_PER_TIMER

The number of capture channels that each capture timer has.

SOC_MCPWM_GPIO_SYNCHROS_PER_GROUP

The number of GPIO synchros that each group has.

SOC_MCPWM_SWSYNC_CAN_PROPAGATE

Software sync event can be routed to its output.

SOC_MCPWM_SUPPORT_ETM

Support ETM (Event Task Matrix)

SOC_MCPWM_SUPPORT_EVENT_COMPARATOR

Support event comparator (based on ETM)

SOC_MCPWM_CAPTURE_CLK_FROM_GROUP

Capture timer shares clock with other PWM timers.

SOC_MCPWM_SUPPORT_SLEEP_RETENTION

Support back up registers before sleep.

SOC_PARLIO_GROUPS

Number of parallel IO peripherals

SOC_PARLIO_TX_UNITS_PER_GROUP

number of TX units in each group

SOC_PARLIO_RX_UNITS_PER_GROUP

number of RX units in each group

SOC_PARLIO_TX_UNIT_MAX_DATA_WIDTH

Number of data lines of the TX unit

SOC_PARLIO_RX_UNIT_MAX_DATA_WIDTH

Number of data lines of the RX unit

SOC_PARLIO_TX_CLK_SUPPORT_GATING

Support gating TX clock

SOC_PARLIO_RX_CLK_SUPPORT_GATING

Support gating RX clock

SOC_PARLIO_RX_CLK_SUPPORT_OUTPUT

Support output RX clock to a GPIO

SOC_PARLIO_TRANS_BIT_ALIGN

Support bit alignment in transaction

SOC_PARLIO_TX_SIZE_BY_DMA

Transaction length is controlled by DMA instead of indicated by register

SOC_PARLIO_SUPPORT_SLEEP_RETENTION

Support back up registers before sleep

SOC_MPI_MEM_BLOCKS_NUM

SOC_MPI_OPERATIONS_NUM

SOC_RSA_MAX_BIT_LEN

SOC_SHA_DMA_MAX_BUFFER_SIZE

SOC_SHA_SUPPORT_DMA

SOC_EFUSE_SECURE_BOOT_KEY_DIGESTS

SOC_EFUSE_REVOKE_BOOT_KEY_DIGESTS

SOC_SUPPORT_SECURE_BOOT_REVOKE_KEY

SOC_FLASH_ENCRYPTED_XTS_AES_BLOCK_MAX

SOC_FLASH_ENCRYPTION_XTS_AES

SOC_FLASH_ENCRYPTION_XTS_AES_128

SOC_APM_CTRL_FILTER_SUPPORTED

Support for APM control filter

SOC_APM_LP_APM0_SUPPORTED

Support for LP APM0 control filter

SOC_CRYPTO_DPA_PROTECTION_SUPPORTED

SOC_UART_NUM

SOC_UART_HP_NUM

SOC_UART_LP_NUM

SOC_UART_FIFO_LEN

The UART hardware FIFO length

SOC_LP_UART_FIFO_LEN

The LP UART hardware FIFO length

SOC_UART_BITRATE_MAX

Max bit rate supported by UART

SOC_UART_SUPPORT_PLL_F80M_CLK

Support PLL_F80M as the clock source

SOC_UART_SUPPORT_RTC_CLK

Support RTC clock as the clock source

SOC_UART_SUPPORT_XTAL_CLK

Support XTAL clock as the clock source

SOC_UART_SUPPORT_WAKEUP_INT

Support UART wakeup interrupt

SOC_UART_HAS_LP_UART

Support LP UART

SOC_UART_SUPPORT_SLEEP_RETENTION

Support back up registers before sleep

SOC_UART_SUPPORT_FSM_TX_WAIT_SEND

SOC_COEX_HW_PTI

SOC_EXTERNAL_COEX_ADVANCE

HARDWARE EXTERNAL COEXISTENCE CAPS

SOC_EXTERNAL_COEX_LEADER_TX_LINE

EXTERNAL COEXISTENCE TX LINE CAPS

SOC_WIFI_LIGHT_SLEEP_CLK_WIDTH

SOC_PM_SUPPORT_WIFI_WAKEUP

SOC_PM_SUPPORT_BEACON_WAKEUP

SOC_PM_SUPPORT_BT_WAKEUP

SOC_PM_SUPPORT_EXT1_WAKEUP

SOC_PM_SUPPORT_EXT1_WAKEUP_MODE_PER_PIN

Supports one bit per pin to configure the EXT1 trigger level

SOC_PM_SUPPORT_CPU_PD

SOC_PM_SUPPORT_MODEM_PD

SOC_PM_SUPPORT_XTAL32K_PD

SOC_PM_SUPPORT_RC32K_PD

SOC_PM_SUPPORT_RC_FAST_PD

SOC_PM_SUPPORT_RTC_PERIPH_PD

SOC_PM_SUPPORT_PMU_MODEM_STATE

MAC_SUPPORT_PMU_MODEM_STATE

SOC_PM_SUPPORT_DEEPSLEEP_CHECK_STUB_ONLY

Supports CRC only the stub code in RTC memory

SOC_PM_CPU_RETENTION_BY_SW

SOC_PM_MODEM_RETENTION_BY_REGDMA

SOC_EXT_MEM_CACHE_TAG_IN_CPU_DOMAIN

SOC_PM_PAU_LINK_NUM

SOC_PM_PAU_REGDMA_LINK_CONFIGURABLE

SOC_PM_PAU_REGDMA_LINK_IDX_WIFIMAC

SOC_PM_PAU_REGDMA_UPDATE_CACHE_BEFORE_WAIT_COMPARE

SOC_CLK_RC_FAST_SUPPORT_CALIBRATION

SOC_MODEM_CLOCK_IS_INDEPENDENT

SOC_CLK_XTAL32K_SUPPORTED

Support to connect an external low frequency crystal

SOC_CLK_OSC_SLOW_SUPPORTED

Support to connect an external oscillator, not a crystal

SOC_CLK_LP_FAST_SUPPORT_XTAL

Support XTAL clock as the LP_FAST clock source

SOC_CLK_LP_FAST_SUPPORT_XTAL_D2

Support XTAL_D2 clock as the LP_FAST clock source

SOC_RCC_IS_INDEPENDENT

Reset and Clock Control is independent, thanks to the PCR registers

SOC_CLK_ANA_I2C_MST_HAS_ROOT_GATE

Any regi2c operation needs enable the analog i2c master clock first

SOC_TEMPERATURE_SENSOR_SUPPORT_FAST_RC

SOC_TEMPERATURE_SENSOR_SUPPORT_XTAL

SOC_TEMPERATURE_SENSOR_INTR_SUPPORT

SOC_TEMPERATURE_SENSOR_SUPPORT_SLEEP_RETENTION

SOC_TEMPERATURE_SENSOR_UNDER_PD_TOP_DOMAIN

SOC_WIFI_HW_TSF

Support hardware TSF

SOC_WIFI_FTM_SUPPORT

SOC_WIFI_GCMP_SUPPORT

Support GCMP(GCMP128 and GCMP256)

SOC_WIFI_WAPI_SUPPORT

Support WAPI

SOC_WIFI_CSI_SUPPORT

Support CSI

SOC_WIFI_MESH_SUPPORT

Support WIFI MESH

SOC_WIFI_HE_SUPPORT

Support Wi-Fi 6

SOC_WIFI_SUPPORT_5G

Support 5G

SOC_WIFI_MAC_VERSION_NUM

Wi-Fi MAC version num is 3

SOC_BLE_SUPPORTED

Support Bluetooth Low Energy hardware

SOC_BLE_MESH_SUPPORTED

Support BLE MESH

SOC_ESP_NIMBLE_CONTROLLER

Support BLE EMBEDDED controller V1

SOC_BLE_50_SUPPORTED

Support Bluetooth 5.0

SOC_BLE_DEVICE_PRIVACY_SUPPORTED

Support BLE device privacy mode

SOC_BLE_POWER_CONTROL_SUPPORTED

Support Bluetooth Power Control

SOC_BLE_MULTI_CONN_OPTIMIZATION

Support multiple connections optimization

SOC_BLE_PERIODIC_ADV_ENH_SUPPORTED

Support For BLE Periodic Adv Enhancements

SOC_LP_CORE_SINGLE_INTERRUPT_VECTOR

LP Core interrupts all map to a single entry in vector table

SOC_LP_CORE_SUPPORT_ETM

LP Core supports ETM

2.9.28 System Time

Overview

ESP32-C5 uses two hardware timers for the purpose of keeping system time. System time can be kept by using either one or both of the hardware timers depending on the application's purpose and accuracy requirements for system time. The two hardware timers are:

- **RTC timer:** This timer allows time keeping in various sleep modes, and can also persist time keeping across any resets (with the exception of power-on resets which reset the RTC timer). The frequency deviation depends on the *RTC Timer Clock Sources* and affects the accuracy only in sleep modes, in which case the time will be measured at 6.6667 μ s resolution.
- **High-resolution timer:** This timer is not available in sleep modes and will not persist over a reset, but has greater accuracy. The timer uses the APB_CLK clock source (typically 80 MHz), which has a frequency deviation of less than ± 10 ppm. Time will be measured at 1 μ s resolution.

The possible combinations of hardware timers used to keep system time are listed below:

- RTC and high-resolution timer (default)
- RTC
- High-resolution timer
- None

It is recommended that users stick to the default option as it provides the highest accuracy. However, users can also select a different setting via the *CONFIG_NEWLIB_TIME_SYSCALL* configuration option.

RTC Timer Clock Sources

The RTC timer has the following clock sources:

- `Internal 136 kHz RC oscillator (default):` Features the lowest Deep-sleep current consumption and no dependence on any external components. However, the frequency stability of this clock source is affected by temperature fluctuations, so time may drift in both Deep-sleep and Light-sleep modes.
- `External 32 kHz crystal:` Requires a 32 kHz crystal to be connected to the XTAL_32K_P and XTAL_32K_N pins. This source provides a better frequency stability at the expense of a slightly higher (by 1 μ A) Deep-sleep current consumption.
- `External 32 kHz oscillator at XTAL_32K_P pin:` Allows using 32 kHz clock generated by an external circuit. The external clock signal must be connected to the XTAL_32K_P pin. The amplitude should be less than 1.2 V for sine wave signal and less than 1 V for square wave signal. Common mode voltage should be in the range of $0.1 < V_{cm} < 0.5 \times V_{amp}$, where V_{amp} stands for signal amplitude. In this case, the XTAL_32K_P pin cannot be used as a GPIO pin.
- `Internal 32 kHz RC oscillator`

The choice depends on your requirements for system time accuracy and power consumption in sleep modes. To modify the RTC clock source, set *CONFIG_RTC_CLK_SRC* in project configuration.

More details about the wiring requirements for the external crystal or external oscillator, please refer to the [Hardware Design Guidelines](#).

Get Current Time

To get the current time, use the POSIX function `gettimeofday()`. Additionally, you can use the following standard C library functions to obtain time and manipulate it:

```
gettimeofday
time
asctime
clock
ctime
difftime
gmtime
localtime
mktime
strftime
adjtime*
```

To stop smooth time adjustment and update the current time immediately, use the POSIX function `settimeofday()`.

If you need to obtain time with one second resolution, use the following code snippet:

```
time_t now;
char strftime_buf[64];
struct tm timeinfo;

time(&now);
// Set timezone to China Standard Time
setenv("TZ", "CST-8", 1);
tzset();

localtime_r(&now, &timeinfo);
strftime(strftime_buf, sizeof(strftime_buf), "%c", &timeinfo);
ESP_LOGI(TAG, "The current date/time in Shanghai is: %s", strftime_buf);
```

If you need to obtain time with one microsecond resolution, use the code snippet below:

```
struct timeval tv_now;
gettimeofday(&tv_now, NULL);
int64_t time_us = (int64_t)tv_now.tv_sec * 1000000L + (int64_t)tv_now.tv_usec;
```

SNTP Time Synchronization

To set the current time, you can use the POSIX functions `settimeofday()` and `adjtime()`. They are used internally in the lwIP SNTP library to set current time when a response from the NTP server is received. These functions can also be used separately from the lwIP SNTP library.

Some lwIP APIs, including SNTP functions, are not thread safe, so it is recommended to use *esp_netif component* when interacting with SNTP module.

To initialize a particular SNTP server and also start the SNTP service, simply create a default SNTP server configuration with a particular server name, then call `esp_netif_sntp_init()` to register that server and start the SNTP service.

```
esp_sntp_config_t config = ESP_NETIF_Sntp_DEFAULT_CONFIG("pool.ntp.org");
esp_netif_sntp_init(&config);
```

This code automatically performs time synchronization once a reply from the SNTP server is received. Sometimes it is useful to wait until the time gets synchronized, `esp_netif_sntp_sync_wait()` can be used for this purpose:

```
if (esp_netif_sntp_sync_wait(pdMS_TO_TICKS(10000)) != ESP_OK) {
    printf("Failed to update system time within 10s timeout");
}
```

To configure multiple NTP servers (or use more advanced settings, such as DHCP provided NTP servers), please refer to the detailed description of *SNTP Service* in *esp_netif* documentation.

The lwIP SNTP library could work in one of the following sync modes:

- `SNTP_SYNC_MODE_IMMED` (default): Updates system time immediately upon receiving a response from the SNTP server after using `settimeofday()`.
- `SNTP_SYNC_MODE_SMOOTH`: Updates time smoothly by gradually reducing time error using the function `adjtime()`. If the difference between the SNTP response time and system time is more than 35 minutes, update system time immediately by using `settimeofday()`.

If you want to choose the `SNTP_SYNC_MODE_SMOOTH` mode, please set the `esp_sntp_config::smooth` to `true` in the SNTP configuration struct. Otherwise (and by default) the `SNTP_SYNC_MODE_IMMED` mode will be used.

For setting a callback function that is called when time gets synchronized, use the `esp_sntp_config::sync_cb` field in the configuration struct.

An application with this initialization code periodically synchronizes the time. The time synchronization period is determined by `CONFIG_LWIP_SNTP_UPDATE_DELAY` (the default value is one hour). To modify the variable, set `CONFIG_LWIP_SNTP_UPDATE_DELAY` in project configuration.

A code example that demonstrates the implementation of time synchronization based on the lwIP SNTP library is provided in the `protocols/sntp` directory.

Note that it is also possible to use lwIP API directly, but care must be taken to thread safety. Here we list the thread-safe APIs:

- `sntp_set_time_sync_notification_cb()` can be used to set a callback function that notifies of the time synchronization process.
- `sntp_get_sync_status()` and `sntp_set_sync_status()` can be used to get/set time synchronization status.
- `sntp_set_sync_mode()` can be used to set the synchronization mode.
- `esp_sntp_setoperatingmode()` sets the preferred operating mode.:cpp:enumerator:ESP_SNTP_OPMODE_POLL and `esp_sntp_init()` initializes SNTP module.
- `esp_sntp_setservername()` configures one SNTP server.

Timezones

To set the local timezone, use the following POSIX functions:

1. Call `setenv()` to set the TZ environment variable to the correct value based on the device location. The format of the time string is the same as described in the [GNU libc documentation](#) (although the implementation is different).
2. Call `tzset()` to update C library runtime data for the new timezone.

Once these steps are completed, call the standard C library function `localtime()`, and it returns the correct local time taking into account the timezone offset and daylight saving time.

Year 2036 and 2038 Overflow Issues

SNTP/NTP 2036 Overflow SNTP/NTP timestamps are represented as 64-bit unsigned fixed point numbers, where the first 32 bits represent the integer part, and the last 32 bits represent the fractional part. The 64-bit unsigned fixed point number represents the number of seconds since 00:00 on 1st of January 1900, thus SNTP/NTP times will overflow in the year 2036.

To address this issue, lifetime of the SNTP/NTP timestamps has been extended by convention by using the MSB (bit 0 by convention) of the integer part to indicate time ranges between years 1968 to 2104 (see [RFC2030](#) for more details). This convention is implemented in lwIP library SNTP module. Therefore SNTP-related functions in ESP-IDF are future-proof until year 2104.

Unix Time 2038 Overflow Unix time (type `time_t`) was previously represented as a 32-bit signed integer, leading to an overflow in year 2038 (i.e., [Y2K38 issue](#)). To address the Y2K38 issue, ESP-IDF uses a 64-bit signed integer to represent `time_t` starting from release v5.0, thus deferring `time_t` overflow for another 292 billion years.

API Reference

Header File

- [components/lwip/include/apps/esp_sntp.h](#)
- This header file can be included with:

```
#include "esp_sntp.h"
```

- This header file is a part of the API provided by the `lwip` component. To declare that your component depends on `lwip`, add the following to your `CMakeLists.txt`:

```
REQUIRES lwip
```

or

```
PRIV_REQUIRES lwip
```

Functions

void **sntp_sync_time** (struct timeval *tv)

This function updates the system time.

This is a weak-linked function. It is possible to replace all SNTP update functionality by placing a `sntp_sync_time()` function in the app firmware source. If the default implementation is used, calling `sntp_set_sync_mode()` allows the time synchronization mode to be changed to instant or smooth. If a callback function is registered via `sntp_set_time_sync_notification_cb()`, it will be called following time synchronization.

Parameters `tv` -- Time received from SNTP server.

void **sntp_set_sync_mode** (*sntp_sync_mode_t* sync_mode)

Set the sync mode.

Modes allowed: `SNTP_SYNC_MODE_IMMED` and `SNTP_SYNC_MODE_SMOOTH`.

Parameters `sync_mode` -- Sync mode.

sntp_sync_mode_t **sntp_get_sync_mode** (void)

Get set sync mode.

Returns `SNTP_SYNC_MODE_IMMED`: Update time immediately.
`SNTP_SYNC_MODE_SMOOTH`: Smooth time updating.

sntp_sync_status_t **sntp_get_sync_status** (void)

Get status of time sync.

After the update is completed, the status will be returned as `SNTP_SYNC_STATUS_COMPLETED`. After that, the status will be reset to `SNTP_SYNC_STATUS_RESET`. If the update operation is not completed yet, the status will be `SNTP_SYNC_STATUS_RESET`. If a smooth mode was chosen and the synchronization is still continuing (adjtime works), then it will be `SNTP_SYNC_STATUS_IN_PROGRESS`.

Returns `SNTP_SYNC_STATUS_RESET`: Reset status. `SNTP_SYNC_STATUS_COMPLETED`: Time is synchronized. `SNTP_SYNC_STATUS_IN_PROGRESS`: Smooth time sync in progress.

void **sntp_set_sync_status** (*sntp_sync_status_t* sync_status)

Set status of time sync.

Parameters `sync_status` -- status of time sync (see `sntp_sync_status_t`)

void **sntp_set_time_sync_notification_cb** (*sntp_sync_time_cb_t* callback)

Set a callback function for time synchronization notification.

Parameters `callback` -- a callback function

void **sntp_set_sync_interval** (uint32_t interval_ms)

Set the sync interval of SNTP operation.

Note: SNTPv4 RFC 4330 enforces a minimum sync interval of 15 seconds. This sync interval will be used in the next attempt update time through SNTP. To apply the new sync interval call the `sntp_restart()` function, otherwise, it will be applied after the last interval expired.

Parameters `interval_ms` -- The sync interval in ms. It cannot be lower than 15 seconds, otherwise 15 seconds will be set.

uint32_t **sntp_get_sync_interval** (void)

Get the sync interval of SNTP operation.

Returns the sync interval

bool **sntp_restart** (void)

Restart SNTP.

Returns True - Restart False - SNTP was not initialized yet

void **esp_sntp_setoperatingmode** (*esp_sntp_operatingmode_t* operating_mode)

Sets SNTP operating mode. The mode has to be set before init.

Parameters `operating_mode` -- Desired operating mode

void **esp_sntp_init** (void)

Init and start SNTP service.

void **esp_sntp_stop** (void)

Stops SNTP service.

void **esp_sntp_setserver** (u8_t idx, const ip_addr_t *addr)

Sets SNTP server address.

Parameters

- `idx` -- Index of the server
- `addr` -- IP address of the server

void **esp_sntp_setservername** (u8_t idx, const char *server)

Sets SNTP hostname.

Parameters

- `idx` -- Index of the server
- `server` -- Name of the server

const char ***esp_sntp_getservername** (u8_t idx)

Gets SNTP server name.

Parameters `idx` -- Index of the server

Returns Name of the server

const ip_addr_t ***esp_sntp_getserver** (u8_t idx)

Get SNTP server IP.

Parameters `idx` -- Index of the server

Returns IP address of the server

bool **esp_sntp_enabled** (void)

Checks if sntp is enabled.

Returns true if sntp module is enabled

uint8_t **esp_sntp_getreachability** (uint8_t idx)

Gets the server reachability shift register as described in RFC 5905.

Parameters `idx` -- Index of the SNTP server

Returns reachability shift register

esp_sntp_operatingmode_t **esp_sntp_getoperatingmode** (void)

Get the configured operating mode.

Returns operating mode enum

static inline void **sntp_setoperatingmode** (u8_t operating_mode)

if not build within lwip, provide translating inlines, that will warn about thread safety

static inline void **sntp_servermode_dhcp** (int set_servers_from_dhcp)

static inline void **sntp_setservername** (u8_t idx, const char *server)

static inline void **sntp_init** (void)

static inline const char ***sntp_getservername** (u8_t idx)

static inline const ip_addr_t ***sntp_getserver** (u8_t idx)

static inline uint8_t **sntp_getreachability** (uint8_t idx)

static inline *esp_sntp_operatingmode_t* **sntp_getoperatingmode** (void)

Macros

esp_sntp_sync_time

Aliases for esp_sntp prefixed API (inherently thread safe)

esp_sntp_set_sync_mode

esp_sntp_get_sync_mode

esp_sntp_get_sync_status

esp_sntp_set_sync_status

esp_sntp_set_time_sync_notification_cb

esp_sntp_set_sync_interval

esp_sntp_get_sync_interval

esp_sntp_restart

SNTP_OPMODE_POLL

Type Definitions

typedef void (***sntp_sync_time_cb_t**)(struct timeval *tv)

SNTP callback function for notifying about time sync event.

Param tv Time received from SNTP server.

Enumerations

enum **sntp_sync_mode_t**

SNTP time update mode.

Values:

enumerator **SNTP_SYNC_MODE_IMMED**

Update system time immediately when receiving a response from the SNTP server.

enumerator **SNTP_SYNC_MODE_SMOOTH**

Smooth time updating. Time error is gradually reduced using adjtime function. If the difference between SNTP response time and system time is large (more than 35 minutes) then update immediately.

enum **sntp_sync_status_t**

SNTP sync status.

Values:

enumerator **SNTP_SYNC_STATUS_RESET**

enumerator **SNTP_SYNC_STATUS_COMPLETED**

enumerator **SNTP_SYNC_STATUS_IN_PROGRESS**

enum **esp_sntp_operatingmode_t**

SNTP operating modes per lwip SNTP module.

Values:

enumerator **ESP_SNTP_OPMODE_POLL**

enumerator **ESP_SNTP_OPMODE_LISTENONLY**

This warning was automatically inserted due to the source file being in the *add_warnings_pages* list.

2.9.29 Asynchronous Memory Copy

Overview

ESP32-C5 has a DMA engine which can help to offload internal memory copy operations from the CPU in an asynchronous way.

The async memcpy API wraps all DMA configurations and operations. The signature of *esp_async_memcpy()* is almost the same as the standard libc *memcpy()* function.

The DMA allows multiple memory copy requests to be queued up before the first one is completed, which allows overlap of computation and memory copy. Moreover, it is still possible to know the exact time when a memory copy request is completed by registering an event callback.

Configure and Install Driver

There are several ways to install the async memcopy driver, depending on the underlying DMA engine:

- `esp_async_memcopy_install_gdma_ahb()` is used to install the async memcopy driver based on the AHB GDMA engine.
- `esp_async_memcopy_install()` is a generic API to install the async memcopy driver with a default DMA engine. If the SoC has the CP DMA engine, the default DMA engine is CP DMA. Otherwise, the default DMA engine is AHB GDMA.

Driver configuration is described in `async_memcopy_config_t`:

- `backlog`: This is used to configure the maximum number of memory copy transactions that can be queued up before the first one is completed. If this field is set to zero, then the default value 4 will be applied.
- `dma_burst_size`: Set the burst size in a DMA burst transfer.
- `flags`: This is used to enable some special driver features.

```

async_memcopy_config_t config = ASYNC_MEMCOPY_DEFAULT_CONFIG();
// update the maximum data stream supported by underlying DMA engine
config.backlog = 8;
async_memcopy_handle_t driver = NULL;
ESP_ERROR_CHECK(esp_async_memcopy_install(&config, &driver)); // install driver
↳with default DMA engine

```

Send Memory Copy Request

`esp_async_memcopy()` is the API to send memory copy request to DMA engine. It must be called after driver is installed successfully. This API is thread safe, so it can be called from different tasks.

Different from the libc version of `memcpy`, you can optionally pass a callback to `esp_async_memcopy()`, so that you can be notified when the memory copy is finished. Note that the callback is executed in the ISR context, please make sure you will not call any blocking functions in the callback.

The prototype of the callback function is `async_memcopy_isr_cb_t`. The callback function should only return true if it wakes up a high priority task by RTOS APIs like `xSemaphoreGiveFromISR()`.

```

// Callback implementation, running in ISR context
static bool my_async_memcopy_cb(async_memcopy_handle_t mcp_hdl, async_memcopy_event_t
↳*event, void *cb_args)
{
    SemaphoreHandle_t sem = (SemaphoreHandle_t)cb_args;
    BaseType_t high_task_wakeup = pdFALSE;
    xSemaphoreGiveFromISR(sem, &high_task_wakeup); // high_task_wakeup set to
↳pdTRUE if some high priority task unblocked
    return high_task_wakeup == pdTRUE;
}

// Create a semaphore used to report the completion of async memcpy
SemaphoreHandle_t semphr = xSemaphoreCreateBinary();

// Called from user's context
ESP_ERROR_CHECK(esp_async_memcopy(driver_handle, to, from, copy_len, my_async_
↳memcpy_cb, my_semaphore));
// Do something else here
xSemaphoreTake(my_semaphore, portMAX_DELAY); // Wait until the buffer copy is done

```

Uninstall Driver

`esp_async_memcpy_uninstall()` is used to uninstall asynchronous memcpy driver. It is not necessary to uninstall the driver after each memcpy operation. If you know your application will not use this driver anymore, then this API can recycle the memory and other hardware resources for you.

ETM Event

Async memory copy is able to generate an event when one async memcpy operation is done. This event can be used to interact with the *ETM* module. You can call `esp_async_memcpy_new_etm_event()` to get the ETM event handle.

For how to connect the event to an ETM channel, please refer to the *ETM* documentation.

API Reference

Header File

- `components/esp_hw_support/include/esp_async_memcpy.h`
- This header file can be included with:

```
#include "esp_async_memcpy.h"
```

Functions

`esp_err_t esp_async_memcpy_install_gdma_ahb` (const `async_memcpy_config_t` *config, `async_memcpy_handle_t` *mcp)

Install async memcpy driver, with AHB-GDMA as the backend.

Parameters

- **config** -- [in] Configuration of async memcpy
- **mcp** -- [out] Returned driver handle

Returns

- ESP_OK: Install async memcpy driver successfully
- ESP_ERR_INVALID_ARG: Install async memcpy driver failed because of invalid argument
- ESP_ERR_NO_MEM: Install async memcpy driver failed because out of memory
- ESP_FAIL: Install async memcpy driver failed because of other error

`esp_err_t esp_async_memcpy_install` (const `async_memcpy_config_t` *config, `async_memcpy_handle_t` *mcp)

Install async memcpy driver with the default DMA backend.

Note: On chip with CPDMA support, CPDMA is the default choice. On chip with AHB-GDMA support, AHB-GDMA is the default choice.

Parameters

- **config** -- [in] Configuration of async memcpy
- **mcp** -- [out] Returned driver handle

Returns

- ESP_OK: Install async memcpy driver successfully
- ESP_ERR_INVALID_ARG: Install async memcpy driver failed because of invalid argument
- ESP_ERR_NO_MEM: Install async memcpy driver failed because out of memory
- ESP_FAIL: Install async memcpy driver failed because of other error

esp_err_t **esp_async_memcpy_uninstall** (*async_memcpy_handle_t* mcp)

Uninstall async memcpy driver.

Parameters **mcp** -- **[in]** Handle of async memcpy driver that returned from `esp_async_memcpy_install`

Returns

- **ESP_OK**: Uninstall async memcpy driver successfully
- **ESP_ERR_INVALID_ARG**: Uninstall async memcpy driver failed because of invalid argument
- **ESP_FAIL**: Uninstall async memcpy driver failed because of other error

esp_err_t **esp_async_memcpy** (*async_memcpy_handle_t* mcp, void *dst, void *src, size_t n, *async_memcpy_isr_cb_t* cb_isr, void *cb_args)

Send an asynchronous memory copy request.

Note: The callback function is invoked in interrupt context, never do blocking jobs in the callback.

Parameters

- **mcp** -- **[in]** Handle of async memcpy driver that returned from `esp_async_memcpy_install`
- **dst** -- **[in]** Destination address (copy to)
- **src** -- **[in]** Source address (copy from)
- **n** -- **[in]** Number of bytes to copy
- **cb_isr** -- **[in]** Callback function, which got invoked in interrupt context. Set to NULL can bypass the callback.
- **cb_args** -- **[in]** User defined argument to be passed to the callback function

Returns

- **ESP_OK**: Send memory copy request successfully
- **ESP_ERR_INVALID_ARG**: Send memory copy request failed because of invalid argument
- **ESP_FAIL**: Send memory copy request failed because of other error

esp_err_t **esp_async_memcpy_new_etm_event** (*async_memcpy_handle_t* mcp, *async_memcpy_etm_event_t* event_type, *esp_etm_event_handle_t* *out_event)

Get the ETM event handle for async memcpy done signal.

Note: The created ETM event object can be deleted later by calling `esp_etm_del_event`

Parameters

- **mcp** -- **[in]** Handle of async memcpy driver that returned from `esp_async_memcpy_install`
- **event_type** -- **[in]** ETM event type
- **out_event** -- **[out]** Returned ETM event handle

Returns

- **ESP_OK**: Get ETM event successfully
- **ESP_ERR_INVALID_ARG**: Get ETM event failed because of invalid argument
- **ESP_ERR_NOT_SUPPORTED**: Get ETM event failed because the DMA hardware doesn't support ETM submodule
- **ESP_FAIL**: Get ETM event failed because of other error

Structures

struct **async_memcpy_event_t**

Async memory copy event data.

Public Members

void ***data**

Event data

struct **async_memcpy_config_t**

Type of async memcpy configuration.

Public Members

uint32_t **backlog**

Maximum number of transactions that can be prepared in the background

size_t **sram_trans_align**

DMA transfer alignment (both in size and address) for SRAM memory

size_t **psram_trans_align**

DMA transfer alignment (both in size and address) for PSRAM memory

size_t **dma_burst_size**

DMA transfer burst size, in bytes

uint32_t **flags**

Extra flags to control async memcpy feature

Macros

ASYNC_MEMCPY_DEFAULT_CONFIG ()

Default configuration for async memcpy.

Type Definitions

typedef struct async_memcpy_context_t ***async_memcpy_handle_t**

Async memory copy driver handle.

typedef bool (***async_memcpy_isr_cb_t**)(*async_memcpy_handle_t* mcp_hdl, *async_memcpy_event_t* *event, void *cb_args)

Type of async memcpy interrupt callback function.

Note: User can call OS primitives (semaphore, mutex, etc) in the callback function. Keep in mind, if any OS primitive wakes high priority task up, the callback should return true.

Param mcp_hdl Handle of async memcpy

Param event Event object, which contains related data, reserved for future

Param cb_args User defined arguments, passed from esp_async_memcpy function

Return Whether a high priority task is woken up by the callback function

Enumerations

enum **async_memcpy_etm_event_t**

Async memory copy specific events that supported by the ETM module.

Values:

enumerator **ASYNC_MEMCPY_ETM_EVENT_COPY_DONE**

memory copy finished

2.9.30 ULP LP Core Coprocessor Programming

The ULP LP core (Low-power core) coprocessor is a variant of the ULP present in ESP32-C5. It features ultra-low power consumption while also being able to stay powered on while the main CPU stays in low-power modes. This enables the LP core coprocessor to handle tasks like GPIO or sensor readings while the main CPU is in sleep mode, resulting in significant overall power savings for the entire system.

The ULP LP core coprocessor has the following features:

- A RV32I (32-bit RISC-V ISA) processor, with the multiplication/division (M), atomic (A), and compressed (C) extensions.
- Interrupt controller.
- Includes a debug module that supports external debugging via JTAG.
- Can access all of the High-power (HP) SRAM and peripherals when the entire system is active.
- Can access the Low-power (LP) SRAM and peripherals when the HP system is in sleep mode.

Compiling Code for the ULP LP Core

The ULP LP core code is compiled together with your ESP-IDF project as a separate binary and automatically embedded into the main project binary. There are two ways to achieve this:

Using `ulp_embed_binary`

1. Place the ULP LP core code, written in C or assembly (with the `.S` extension), in a dedicated directory within the component directory, such as `ulp/`.
2. After registering the component in the `CMakeLists.txt` file, call the `ulp_embed_binary` function.

Here is an example:

```
idf_component_register()

set(ulp_app_name ulp_${COMPONENT_NAME})
set(ulp_sources "ulp/ulp_c_source_file.c" "ulp/ulp_assembly_source_file.S")
set(ulp_exp_dep_srcs "ulp_c_source_file.c")

ulp_embed_binary(${ulp_app_name} "${ulp_sources}" "${ulp_exp_dep_srcs}")
```

The first argument to `ulp_embed_binary` specifies the ULP binary name. The name specified here is also used by other generated artifacts such as the ELF file, map file, header file, and linker export file. The second argument specifies the ULP source files. Finally, the third argument specifies the list of component source files which include the header file to be generated. This list is needed to build the dependencies correctly and ensure that the generated header file is created before any of these files are compiled. See the section below for the concept of generated header files for ULP applications.

Using a Custom CMake Project It is also possible to create a custom CMake project for the LP core. This gives more control over the build process and allows you to set compile options, link external libraries and all other things that are possible with a regular CMake project.

To do this, add the ULP project as an external project in your component `CMakeLists.txt` file:

```
ulp_add_project("ULP_APP_NAME" "${CMAKE_SOURCE_DIR}/PATH_TO_DIR_WITH_ULP_PROJECT_
↳FILE/")
```

Create a folder which contains your ULP project files and a `CMakeLists.txt` file, located at the path given to `ulp_add_project`. The `CMakeLists.txt` file should look like this:

```
cmake_minimum_required(VERSION 3.16)

# Project/target name is passed from the main project to allow IDF to have a
↳dependency on this target
# as well as embed the binary into the main app
project(${ULP_APP_NAME})
add_executable(${ULP_APP_NAME} main.c)

# Import the ULP project helper functions
include(IDFULPProject)

# Apply default compile options
ulp_apply_default_options(${ULP_APP_NAME})

# Apply default sources provided by the IDF ULP component
ulp_apply_default_sources(${ULP_APP_NAME})

# Add targets for building the binary, as well as the linkerscript which exports
↳ULP shared variables to the main app
ulp_add_build_binary_targets(${ULP_APP_NAME})

# Everything below this line is optional and can be used to customize the build
↳process

# Create a custom library
set(lib_path "${CMAKE_CURRENT_LIST_DIR}/lib")
add_library(custom_lib STATIC "${lib_path}/lib_src.c")
target_include_directories(custom_lib PUBLIC "${lib_path}/")

# Link the library
target_link_libraries(${ULP_APP_NAME} PRIVATE custom_lib)

# Set custom compile flags
target_compile_options(${ULP_APP_NAME} PRIVATE -msave-restore)
```

Building Your Project To compile and build your project:

1. Enable both `CONFIG_ULP_COPROC_ENABLED` and `CONFIG_ULP_COPROC_TYPE` in `menuconfig`, and set `CONFIG_ULP_COPROC_TYPE` to `CONFIG_ULP_COPROC_TYPE_LP_CORE`. The `CONFIG_ULP_COPROC_RESERVE_MEM` option reserves RTC memory for the ULP, and must be set to a value big enough to store both the ULP LP core code and data. If the application components contain multiple ULP programs, then the size of the RTC memory must be sufficient to hold the largest one.
2. Build the application as usual (e.g., `idf.py app`).

During the build process, the following steps are taken to build ULP program:

1. **Run each source file through the C compiler and assembler.** This step generates the object files `.obj.c` or `.obj.S` in the component build directory depending on the source file processed.
2. **Run the linker script template through the C preprocessor.** The template is located in `components/ulp/ld` directory.
3. **Link the object files into an output ELF file** (`ulp_app_name.elf`). The Map file `ulp_app_name.map` generated at this stage may be useful for debugging purposes.
4. **Dump the contents of the ELF file into a binary** (`ulp_app_name.bin`) which can then be embedded into the application.

5. **Generate a list of global symbols** (`ulp_app_name.sym`) in the ELF file using `riscv32-esp-elf-nm`.
6. **Create an LD export script and a header file** `ulp_app_name.ld` and `ulp_app_name.h` containing the symbols from `ulp_app_name.sym`. This is done using the `esp32ulp_mapgen.py` utility.
7. **Add the generated binary to the list of binary files** to be embedded into the application.

Accessing the ULP LP Core Program Variables

Global symbols defined in the ULP LP core program may be used inside the main program.

For example, the ULP LP core program may define a variable `measurement_count` which defines the number of GPIO measurements the program needs to make before waking up the chip from Deep-sleep.

```
volatile int measurement_count;

int some_function()
{
    //read the measurement count for later use.
    int temp = measurement_count;

    ...do something.
}
```

The main program can access the global ULP LP core program variables as the build system makes this possible by generating the `_${ULP_APP_NAME}.h` and `_${ULP_APP_NAME}.ld` files which define the global symbols present in the ULP LP core program. Each global symbol defined in the ULP LP core program is included in these files and are prefixed with `ulp_`.

The header file contains the declaration of the symbol:

```
extern uint32_t ulp_measurement_count;
```

Note that all symbols (variables, arrays, functions) are declared as `uint32_t`. For functions and arrays, take the address of the symbol and cast it to the appropriate type.

The generated linker script file defines the locations of symbols in `LP_MEM`:

```
PROVIDE ( ulp_measurement_count = 0x50000060 );
```

To access the ULP LP core program variables from the main program, the generated header file should be included using an `include` statement. This allows the ULP LP core program variables to be accessed as regular variables.

```
#include "ulp_app_name.h"

void init_ulp_vars() {
    ulp_measurement_count = 64;
}
```

Note: Variables declared in the global scope of the LP core program reside in either the `.bss` or `.data` section of the binary. These sections are initialized when the LP core binary is loaded and executed. Accessing these variables from the main program on the HP-Core before the first LP core run may result in undefined behavior.

Starting the ULP LP Core Program

To run a ULP LP core program, the main application needs to load the ULP program into RTC memory using the `ulp_lp_core_load_binary()` function, and then start it using the `ulp_lp_core_run()` function.

Each ULP LP core program is embedded into the ESP-IDF application as a binary blob. The application can reference this blob and load it in the following way (supposed `ULP_APP_NAME` was defined to `ulp_app_name`):

```
extern const uint8_t bin_start[] asm("_binary_ulp_app_name_bin_start");
extern const uint8_t bin_end[]   asm("_binary_ulp_app_name_bin_end");

void start_ulp_program() {
    ESP_ERROR_CHECK( ulp_lp_core_load_binary( bin_start,
        (bin_end - bin_start)) );
}
```

Once the program is loaded into LP memory, the application can be configured and started by calling `ulp_lp_core_run()`:

```
ulp_lp_core_cfg_t cfg = {
    .wakeup_source = ULP_LP_CORE_WAKEUP_SOURCE_LP_TIMER, // LP core will be woken_
    ↪up periodically by LP timer
    .lp_timer_sleep_duration_us = 10000,
};

ESP_ERROR_CHECK( ulp_lp_core_run(&cfg) );
```

ULP LP Core Program Flow

How the ULP LP core coprocessor is started depends on the wake-up source selected in `ulp_lp_core_cfg_t`. The most common use-case is for the ULP to periodically wake up, do some measurements before either waking up the main CPU or going back to sleep again.

The ULP has the following wake-up sources:

- `ULP_LP_CORE_WAKEUP_SOURCE_HP_CPU` - LP core can be woken up by the HP CPU.
- `ULP_LP_CORE_WAKEUP_SOURCE_LP_TIMER` - LP core can be woken up by the LP timer.
- `ULP_LP_CORE_WAKEUP_SOURCE_ETM` - LP core can be woken up by a ETM event. (Not yet supported)
- `ULP_LP_CORE_WAKEUP_SOURCE_LP_IO` - LP core can be woken up when LP IO level changes. (Not yet supported)
- `ULP_LP_CORE_WAKEUP_SOURCE_LP_UART` - LP core can be woken up after receiving a certain number of UART RX pulses. (Not yet supported)

When the ULP is woken up, it will go through the following steps:

1. Initialize system feature, e.g., interrupts
2. Call user code `main()`
3. Return from `main()`
4. If `lp_timer_sleep_duration_us` is specified, then configure the next wake-up alarm
5. Call `ulp_lp_core_halt()`

ULP LP Core Peripheral Support

To enhance the capabilities of the ULP LP core coprocessor, it has access to peripherals that operate in the low-power domain. The ULP LP core coprocessor can interact with these peripherals when the main CPU is in sleep mode, and can wake up the main CPU once a wake-up condition is reached. The following peripherals are supported:

- LP IO
- LP I2C
- LP UART

ULP LP Core Interrupts

The LP core coprocessor can be configured to handle interrupts from various sources. Examples of such interrupts could be LP IO low/high or LP timer interrupts. To register a handler for an interrupt, simply override any of the weak handlers provided by IDF. A complete list of handlers can be found in [ulp_lp_core_interrupts.h](#). For details on which interrupts are available on a specific target, please consult **ESP32-C5 Technical Reference Manual [PDF]**.

For example, to override the handler for the LP IO interrupt, you can define the following function in your ULP LP core code:

```
void LP_CORE_ISR_ATTR ulp_lp_core_lp_io_intr_handler(void)
{
    // Handle the interrupt and clear the interrupt source
}
```

`LP_CORE_ISR_ATTR` is a macro that is used to define the interrupt handler function. This macro ensures that registers are saved and restored correctly when the interrupt handler is called.

In addition to configuring the interrupt related registers for the interrupt source you want to handle, you also need to enable the interrupts globally in the LP core interrupt controller. This can be done using the `ulp_lp_core_intr_enable()` function.

ULP LP Core Clock Configuration

The ULP LP Core clock source is based on the system clock `LP_FAST_CLK`, see [TRM](#) > Reset and Clock for more details.

On ESP32-C5, `LP_FAST_CLK` supports using the external 48 MHz crystal (XTAL) as its clock source. This allows the ULP LP Core to run at a higher frequency than with the default `RTC_FAST_CLOCK`, which runs at around 20 MHz. However, there is a trade-off: this clock is normally powered down during sleep to reduce power consumption, but if XTAL is selected as the source, it will remain powered up during sleep, which increases power consumption. If you only plan to use the LP Core as a coprocessor while the HP Core is active, then selecting XTAL can enhance both the performance and frequency stability of the LP Core.

To enable this feature, set `CONFIG_RTC_FAST_CLK_SRC` to `CONFIG_RTC_FAST_CLK_SRC_XTAL`.

Debugging ULP LP-Core Applications

When programming the LP core, it can sometimes be challenging to figure out why the program is not behaving as expected. Here are some strategies to help you debug your LP core program:

- Use the LP-UART to print: the LP core has access to the LP-UART peripheral, which can be used for printing information independently of the main CPU sleep state. See [system/ulp/lp_core/lp_uart/lp_uart_print](#) for an example of how to use this driver.
- Routing `lp_core_printf()` to the HP-Core console UART with `CONFIG_ULP_HP_UART_CONSOLE_PRINT`. This allows you to easily print LP core information to the already connected HP-Core console UART. The drawback of this approach is that it requires the main CPU to be awake and since there is no synchronization between the LP and HP cores, the output may be interleaved.
- Share program state through shared variables: as described in [Accessing the ULP LP Core Program Variables](#), both the main CPU and the ULP core can easily access global variables in RTC memory. Writing state information to such a variable from the ULP and reading it from the main CPU can help you discern what is happening on the ULP core. The downside of this approach is that it requires the main CPU to be awake, which will not always be the case. Keeping the main CPU awake might even, in some cases, mask problems, as some issues may only occur when certain power domains are powered down.
- Panic handler: the LP core has a panic handler that can dump the state of the LP core registers by the LP-UART when an exception is detected. To enable the panic handler, set the `CONFIG_ULP_PANIC_OUTPUT_ENABLE` option to `y`. This option can be kept disabled to reduce LP-RAM usage by the LP core application. To recover a backtrace from the panic dump, it is possible to use [esp-idf-monitor](#)., e.g.:

```
python -m esp_idf_monitor --toolchain-prefix riscv32-esp-elf- --target_
↳ESP32-C5 --decode-panic backtrace PATH_TO_ULP_ELF_FILE
```

Debugging ULP LP Core Applications with GDB and OpenOCD

It is also possible to debug code running on LP core using GDB and OpenOCD as you usually do for HP cores, but it has some specifics and limitations.

Debugging Session Run OpenOCD with special config file for LP core debugging support. And then run GDB with special gdbinit file.

```
openocd -f board/esp32c5-lpcore-builtin.cfg
riscv32-esp-elf-gdb -x gdbinit <path to main program ELF>
```

Below is the gdbinit file content with inline comments. For more details, see the next section.

```
# connect to target
target extended-remote :3333
# reset chip
mon reset halt
maintenance flush register-cache
# add symbols and debugging info for ULP program
add-symbol <path to ULP program ELF>
# temporary HW breakpoint to setup breakpoints
# if you need more than HW supports
thb main
commands
# set breakpoints here
# At this moment ULP program is loaded into RAM and when there are
# no free HW breakpoints slots available GDB will set SW ones
b func1
b func2
b func3
# resume execution
c
end
# start main program after reset
c
```

LP Core Debugging Specifics

1. For convenient debugging, you may need to add `-O0` compile option for ULP app in its `CMakeLists.txt`. See [system/ulp/lp_core/debugging/](#) on how to do this.
2. LP core supports limited set of HW exceptions, so, for example, writing at address `0x0` will not cause a panic as it would be for the code running on HP core. This can be overcome to some extent by enabling undefined behavior sanitizer for LP core application, so `ubsan` can help to catch some errors. But note that it will increase code size significantly and it can happen that application won't fit into RTC RAM. To enable `ubsan` for ULP app, add `-fsanitize=undefined -fno-sanitize=shift-base` compile option to its `CMakeLists.txt`. See [system/ulp/lp_core/debugging/](#) on how to do this.
3. To be able to debug program running on LP core, debugging information and symbols need to be loaded to GDB. It can be done via GDB command line or in `gdbinit` file. See section above.
4. Upon startup, LP core application is loaded into RAM, so all SW breakpoints set before that moment will get overwritten. The best moment to set breakpoints for LP core application is to do this when LP core program reaches `main` function.
5. When using IDEs, it may lack support for configuring breakpoint actions or commands shown in `gdbinit` above. Consequently, you have to preset all breakpoints before debug session start and disable all of them except for `main`. When program stops at `main`, enable the remaining breakpoints and resume execution manually.

Limitations

1. Currently, debugging is not supported when either HP or LP core enters any sleep mode. So it limits available debugging scenarios.
2. FreeRTOS support in OpenOCD is disabled when debugging LP core, so you won't be able to see tasks running in the system. Instead, there will be several threads representing HP and LP cores:

```
(gdb) info thread
      Id      Target Id                                     Frame
   * 1      Thread 1 "esp32c5.cpu0" (Name: esp32c5.cpu0, state: debug-request)
↳0x40803772  in esp_cpu_wait_for_intr ()
      at /home/user/projects/esp/esp-idf/components/esp_hw_support/cpu.c:64
   * 2      Thread 2 "esp32c5.cpu1" (Name: esp32c5.cpu1, state: breakpoint)
↳things (max=1000000000)
      at /home/user/projects/esp/esp-idf/examples/system/ulp/lp_core/debugging/
↳main/lp_core/main.c:21
```

1. When setting HW breakpoint in GDB, it is set on both cores, so the number of available HW breakpoints is limited to the number of them supported by LP core (4 for ESP32-C5).
2. OpenOCD flash support is disabled. It does not matter for LP core application because it is run completely from RAM and GDB can use SW breakpoints for it. But if you want to set a breakpoint on function from flash used by the code running on HP core (e.g., *app_main*), you should request to set HW breakpoint explicitly via `hb` and `thb` GDB commands.
3. Since the main and ULP programs are linked as separate binaries, it is possible for them to have global symbols (such as functions or variables) with the same name. If you set a breakpoint using the function name, GDB will apply it to all instances of that function. This can cause issues if one of the functions is located in the flash, as OpenOCD currently doesn't support flash when debugging the LP core. In such cases, you can set breakpoints using the source line or the function's memory address instead.

Application Examples

- `system/ulp/lp_core/gpio` polls GPIO while main CPU is in Deep-sleep.
- `system/ulp/lp_core/lp_uart/lp_uart_echo` reads data written to a serial console and echoes it back. This example demonstrates the usage of the LP UART driver running on the LP core.
- `system/ulp/lp_core/lp_uart/lp_uart_print` shows how to print various statements from a program running on the LP core.
- `system/ulp/lp_core/interrupt` shows how to register an interrupt handler on the LP core to receive an interrupt triggered by the main CPU.
- `system/ulp/lp_core/gpio_intr_pulse_counter` shows how to use GPIO interrupts to count pulses while the main CPU is in Deep-sleep mode.
- `system/ulp/lp_core/build_system/` demonstrates how to include custom `CMakeLists.txt` file for the ULP app.
- `system/ulp/lp_core/debugging` shows how to debug code running on LP core using GDB and OpenOCD.

Main CPU API Reference

Header File

- `components/ulp/lp_core/include/ulp_lp_core.h`
- This header file can be included with:

```
#include "ulp_lp_core.h"
```

- This header file is a part of the API provided by the `ulp` component. To declare that your component depends on `ulp`, add the following to your `CMakeLists.txt`:

REQUIRES ulp

or

PRIV_REQUIRES ulp

Functions

esp_err_t **ulp_lp_core_run** (*ulp_lp_core_cfg_t* *cfg)

Configure the ULP and run the program loaded into RTC memory.

Returns ESP_OK on success

esp_err_t **ulp_lp_core_load_binary** (const uint8_t *program_binary, size_t program_size_bytes)

Load the program binary into RTC memory.

Parameters

- **program_binary** -- pointer to program binary
- **program_size_bytes** -- size of the program binary

Returns

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if program_size_bytes is more than KiB

void **ulp_lp_core_stop** (void)

Puts the ulp to sleep and disables all wakeup sources. To restart the ULP call `ulp_lp_core_run()` with the desired wake up trigger.

void **ulp_lp_core_sw_intr_trigger** (void)

Trigger a SW interrupt to the LP CPU from the PMU.

Note: This is the same SW trigger that is used to wake up the LP CPU

Structures

struct **ulp_lp_core_cfg_t**

ULP LP core init parameters.

Public Members

uint32_t **wakeup_source**

Wakeup source flags

uint32_t **lp_timer_sleep_duration_us**

Sleep duration when ULP_LP_CORE_WAKEUP_SOURCE_LP_TIMER is specified. Measurement unit: us

Macros

ULP_LP_CORE_WAKEUP_SOURCE_HP_CPU

ULP_LP_CORE_WAKEUP_SOURCE_LP_UART

ULP_LP_CORE_WAKEUP_SOURCE_LP_IO

ULP_LP_CORE_WAKEUP_SOURCE_ETM

ULP_LP_CORE_WAKEUP_SOURCE_LP_VAD

Header File

- `components/ulp/lp_core/include/lp_core_i2c.h`
- This header file can be included with:

```
#include "lp_core_i2c.h"
```

- This header file is a part of the API provided by the `ulp` component. To declare that your component depends on `ulp`, add the following to your `CMakeLists.txt`:

```
REQUIRES ulp
```

or

```
PRIV_REQUIRES ulp
```

Functions

`esp_err_t lp_core_i2c_master_init` (`i2c_port_t` lp_i2c_num, const `lp_core_i2c_cfg_t` *cfg)

Initialize and configure the LP I2C for use by the LP core. Currently LP I2C can only be used in master mode.

Note: The internal pull-up resistors for SDA and SCL pins, if enabled, will provide a weak pull-up value of about 30-50 kOhm. Users are advised to enable external pull-ups for better performance at higher SCL frequencies.

Parameters

- `lp_i2c_num` -- LP I2C port number
- `cfg` -- Configuration parameters

Returns `esp_err_t` ESP_OK when successful

Structures

struct `lp_core_i2c_pin_cfg_t`

LP Core I2C pin config parameters.

Public Members

`gpio_num_t` `sda_io_num`

GPIO pin for SDA signal. Only GPIO#6 can be used as the SDA pin.

`gpio_num_t` `scl_io_num`

GPIO pin for SCL signal. Only GPIO#7 can be used as the SCL pin.

bool `sda_pullup_en`

SDA line enable internal pullup. Can be configured if external pullup is not used.

bool **scl_pullup_en**

SCL line enable internal pullup. Can be configured if external pullup is not used.

struct **lp_core_i2c_timing_cfg_t**

LP Core I2C timing config parameters.

Public Members

uint32_t **clk_speed_hz**

LP I2C clock speed for master mode

struct **lp_core_i2c_cfg_t**

LP Core I2C config parameters.

Public Members

lp_core_i2c_pin_cfg_t **i2c_pin_cfg**

LP I2C pin configuration

lp_core_i2c_timing_cfg_t **i2c_timing_cfg**

LP I2C timing configuration

soc_periph_lp_i2c_clk_src_t **i2c_src_clk**

LP I2C source clock type

Macros

LP_I2C_DEFAULT_GPIO_CONFIG()

LP_I2C_FAST_MODE_CONFIG()

LP_I2C_STANDARD_MODE_CONFIG()

LP_I2C_DEFAULT_SRC_CLK()

LP_CORE_I2C_DEFAULT_CONFIG()

```
REQUIRES ulp
```

or

```
PRIV_REQUIRES ulp
```

Functions

esp_err_t **lp_core_uart_init** (const *lp_core_uart_cfg_t* *cfg)

Initialize and configure the LP UART to be used from the LP core.

Note: The LP UART initialization must be called from the main core (HP CPU)

Parameters *cfg* -- Configuration parameters

Returns *esp_err_t* ESP_OK when successful

Structures

struct **lp_core_uart_pin_cfg_t**

LP UART IO pins configuration.

Public Members

gpio_num_t **tx_io_num**

GPIO pin for UART Tx signal. Only GPIO#5 can be used as the UART Tx pin

gpio_num_t **rx_io_num**

GPIO pin for UART Rx signal. Only GPIO#4 can be used as the UART Rx pin

gpio_num_t **rts_io_num**

GPIO pin for UART RTS signal. Only GPIO#2 can be used as the UART RTS pin

gpio_num_t **cts_io_num**

GPIO pin for UART CTS signal. Only GPIO#3 can be used as the UART CTS pin

struct **lp_core_uart_proto_cfg_t**

LP UART protocol configuration.

Public Members

int **baud_rate**

LP UART baud rate

uart_word_length_t **data_bits**

LP UART byte size

uart_parity_t **parity**

LP UART parity mode

uart_stop_bits_t **stop_bits**

LP UART stop bits

uart_hw_flowcontrol_t **flow_ctrl**

LP UART HW flow control mode (cts/rts)

`uint8_t rx_flow_ctrl_thresh`

LP UART HW RTS threshold

struct `lp_core_uart_cfg_t`

LP UART configuration parameters.

Public Members

lp_core_uart_pin_cfg_t `uart_pin_cfg`

LP UART pin configuration

lp_core_uart_proto_cfg_t `uart_proto_cfg`

LP UART protocol configuration

lp_uart_sclk_t `lp_uart_source_clk`

LP UART source clock selection

Macros

`LP_UART_DEFAULT_TX_GPIO_NUM`

Default LP_IO Mux pins for LP UART

Header File

- `components/ulp/lp_core/include/lp_core_etm.h`
- This header file can be included with:

```
#include "lp_core_etm.h"
```

- This header file is a part of the API provided by the `ulp` component. To declare that your component depends on `ulp`, add the following to your `CMakeLists.txt`:

```
REQUIRES ulp
```

or

```
PRIV_REQUIRES ulp
```

Functions

esp_err_t **lp_core_new_etm_event** (const *lp_core_etm_event_config_t* *config, *esp_etm_event_handle_t* *out_event)

Create a ETM event for LP-Core.

Note: The created ETM event object can be deleted later by calling `esp_etm_del_event`

Parameters

- **config** -- [in] LP-Core ETM event configuration
- **out_event** -- [out] Returned ETM event handle

Returns

- ESP_OK: Get ETM event successfully
- ESP_ERR_INVALID_ARG: Get ETM event failed because of invalid argument
- ESP_FAIL: Get ETM event failed because of other error

esp_err_t **lp_core_new_etm_task** (const *lp_core_etm_task_config_t* *config, *esp_etm_task_handle_t* *out_task)

Create a ETM task for LP-Core.

Note: The created ETM task object can be deleted later by calling `esp_etm_del_task`

Parameters

- **config** -- [in] LP-Core ETM task configuration
- **out_task** -- [out] Returned ETM task handle

Returns

- ESP_OK: Get ETM task successfully
- ESP_ERR_INVALID_ARG: Get ETM task failed because of invalid argument
- ESP_FAIL: Get ETM task failed because of other error

Structures

struct **lp_core_etm_event_config_t**

LP-Core ETM event configuration.

Public Members

lp_core_etm_event_type_t **event_type**

LP-Core ETM event type

struct **lp_core_etm_task_config_t**

LP-Core ETM task configuration.

Public Members

lp_core_etm_task_type_t **task_type**

LP-Core ETM task type

Header File

- [components/hal/include/hal/lp_core_types.h](#)
- This header file can be included with:

```
#include "hal/lp_core_types.h"
```

Enumerations

enum **lp_core_etm_event_type_t**

LP-Core event types enum.

Values:

enumerator **LP_CORE_EVENT_ERR_INTR**

Exception triggered on LP-Core

enumerator **LP_CORE_EVENT_START_INTR**

LP-Core clock has been turned on

enumerator **LP_CORE_EVENT_MAX**

Maximum number of LP-Core events

enum **lp_core_etm_task_type_t**

LP-Core task types enum.

Values:

enumerator **LP_CORE_TASK_WAKEUP_CPU**

LP-Core wake-up task

enumerator **LP_CORE_TASK_MAX**

Maximum number of LP-Core tasks

LP Core API Reference

Header File

- [components/ulp/lp_core/lp_core/include/ulp_lp_core_utils.h](#)

Functions

void **ulp_lp_core_update_wakeup_cause** (void)

Traverse all possible wake-up sources and update the wake-up cause so that `ulp_lp_core_get_wakeup_cause` can obtain the bitmap of the wake-up reasons.

uint32_t **ulp_lp_core_get_wakeup_cause** (void)

Get the wakeup source which caused LP_CPU to wakeup from sleep.

Returns Wakeup cause in bit map, for the meaning of each bit, refer to the definition of wakeup source in `lp_core_ll.h`

void **ulp_lp_core_wakeup_main_processor** (void)

Wakeup main CPU from sleep or deep sleep.

This raises a software interrupt signal, if the main CPU has configured the ULP as a wakeup source calling this function will make the main CPU to exit from sleep or deep sleep.

void **ulp_lp_core_delay_us** (uint32_t us)

Makes the co-processor busy wait for a certain number of microseconds.

Parameters us -- Number of microseconds to busy-wait for

void **ulp_lp_core_delay_cycles** (uint32_t cycles)

Makes the co-processor busy wait for a certain number of cycles.

Parameters cycles -- Number of cycles to busy-wait for

void **ulp_lp_core_halt** (void)

Finishes the ULP program and powers down the ULP until next wakeup.

Note: This function does not return. After called it will fully reset the ULP.

Note: The program will automatically call this function when returning from main().

Note: To stop the ULP from waking up, call `ulp_lp_core_lp_timer_disable()` before halting.

void **ulp_lp_core_stop_lp_core** (void)

The LP core puts itself to sleep and disables all wakeup sources.

void **ulp_lp_core_abort** (void)

Abort LP core operation.

void **ulp_lp_core_sw_intr_enable** (bool enable)

Enable the SW triggered interrupt from the PMU.

Note: This is the same SW trigger interrupt that is used to wake up the LP CPU

Parameters enable -- true to enable, false to disable

void **ulp_lp_core_sw_intr_clear** (void)

Clear the interrupt status for the SW triggered interrupt from the PMU.

void **ulp_lp_core_wait_for_intr** (void)

Puts the CPU into a wait state until an interrupt is triggered.

Note: The CPU will draw less power when in this state compared to actively running

Header File

- [components/ulp/lp_core/lp_core/include/ulp_lp_core_gpio.h](#)

Functions

static inline void **ulp_lp_core_gpio_init** (*lp_io_num_t* lp_io_num)

Initialize a rtcio pin.

Note: If IO is used in LP application, `rtc_gpio_init` must be called at least once for the using IO before loading LP core firmware in HP Code.

Parameters `lp_io_num` -- The rtc io pin to initialize

```
static inline void ulp_lp_core_gpio_output_enable (lp_io_num_t lp_io_num)
```

Enable output.

Parameters `lp_io_num` -- The rtc io pin to enable output for

```
static inline void ulp_lp_core_gpio_output_disable (lp_io_num_t lp_io_num)
```

Disable output.

Parameters `lp_io_num` -- The rtc io pin to disable output for

```
static inline void ulp_lp_core_gpio_input_enable (lp_io_num_t lp_io_num)
```

Enable input.

Parameters `lp_io_num` -- The rtc io pin to enable input for

```
static inline void ulp_lp_core_gpio_input_disable (lp_io_num_t lp_io_num)
```

Disable input.

Parameters `lp_io_num` -- The rtc io pin to disable input for

```
static inline void ulp_lp_core_gpio_set_level (lp_io_num_t lp_io_num, uint8_t level)
```

Set rtcio output level.

Parameters

- `lp_io_num` -- The rtc io pin to set the output level for
- `level` -- 0: output low; 1: output high.

```
static inline uint32_t ulp_lp_core_gpio_get_level (lp_io_num_t lp_io_num)
```

Get rtcio output level.

Parameters `lp_io_num` -- The rtc io pin to get the output level for

```
static inline void ulp_lp_core_gpio_set_output_mode (lp_io_num_t lp_io_num, rtcio_ll_out_mode_t mode)
```

Set rtcio output mode.

Parameters

- `lp_io_num` -- The rtc io pin to set the output mode for
- `mode` -- RTCIO_LL_OUTPUT_NORMAL: normal, RTCIO_LL_OUTPUT_OD: open drain

```
static inline void ulp_lp_core_gpio_pullup_enable (lp_io_num_t lp_io_num)
```

Enable internal pull-up resistor.

Parameters `lp_io_num` -- The rtc io pin to enable pull-up for

```
static inline void ulp_lp_core_gpio_pullup_disable (lp_io_num_t lp_io_num)
```

Disable internal pull-up resistor.

Parameters `lp_io_num` -- The rtc io pin to disable pull-up for

```
static inline void ulp_lp_core_gpio_pulldown_enable (lp_io_num_t lp_io_num)
```

Enable internal pull-down resistor.

Parameters `lp_io_num` -- The rtc io pin to enable pull-down for

```
static inline void ulp_lp_core_gpio_pulldown_disable (lp_io_num_t lp_io_num)
```

Disable internal pull-down resistor.

Parameters `lp_io_num` -- The rtc io pin to disable pull-down for

```
static inline void ulp_lp_core_gpio_intr_enable (lp_io_num_t lp_io_num, lp_io_intr_type_t intr_type)
```

Enable interrupt for lp io pin.

Parameters

- **lp_io_num** -- The lp io pin to enable interrupt for
- **intr_type** -- The interrupt type to enable

static inline void **ulp_lp_core_gpio_clear_intr_status** (void)

Clear interrupt status for all lp io.

Macros

RTCIO_OUTPUT_NORMAL

RTCIO_OUTPUT_OD

Enumerations

enum **lp_io_num_t**

Values:

enumerator **LP_IO_NUM_0**
GPIO0, input and output

enumerator **LP_IO_NUM_1**
GPIO1, input and output

enumerator **LP_IO_NUM_2**
GPIO2, input and output

enumerator **LP_IO_NUM_3**
GPIO3, input and output

enumerator **LP_IO_NUM_4**
GPIO4, input and output

enumerator **LP_IO_NUM_5**
GPIO5, input and output

enumerator **LP_IO_NUM_6**
GPIO6, input and output

enumerator **LP_IO_NUM_7**
GPIO7, input and output

enum **lp_io_intr_type_t**

Values:

enumerator **LP_IO_INTR_DISABLE**
Disable GPIO interrupt

enumerator **LP_IO_INTR_POSEDGE**
GPIO interrupt type : rising edge

enumerator `LP_IO_INTR_NEGEDGE`

GPIO interrupt type : falling edge

enumerator `LP_IO_INTR_ANYEDGE`

GPIO interrupt type : both rising and falling edge

enumerator `LP_IO_INTR_LOW_LEVEL`

GPIO interrupt type : input low level trigger

enumerator `LP_IO_INTR_HIGH_LEVEL`

GPIO interrupt type : input high level trigger

Header File

- [components/ulp/lp_core/lp_core/include/ulp_lp_core_i2c.h](#)

Functions

esp_err_t `lp_core_i2c_master_read_from_device` (*i2c_port_t* lp_i2c_num, uint16_t device_addr, uint8_t *data_rd, size_t size, int32_t ticks_to_wait)

Read from I2C device.

Note: The LP I2C must have been initialized from the HP core using the `lp_core_i2c_master_init()` API before invoking this API.

Note: the LP I2C does not support 10-bit I2C device addresses.

Note: the LP I2C port number is ignored at the moment.

Parameters

- `lp_i2c_num` -- LP I2C port number
- `device_addr` -- I2C device address (7-bit)
- `data_rd` -- Buffer to hold data to be read
- `size` -- Size of data to be read in bytes
- `ticks_to_wait` -- Operation timeout in CPU cycles. Set to -1 to wait forever.

Returns `esp_err_t` ESP_OK when successful

esp_err_t `lp_core_i2c_master_write_to_device` (*i2c_port_t* lp_i2c_num, uint16_t device_addr, const uint8_t *data_wr, size_t size, int32_t ticks_to_wait)

Write to I2C device.

Note: The LP I2C must have been initialized from the HP core using the `lp_core_i2c_master_init()` API before invoking this API.

Note: the LP I2C does not support 10-bit I2C device addresses.

Note: the LP I2C port number is ignored at the moment.

Parameters

- **lp_i2c_num** -- LP I2C port number
- **device_addr** -- I2C device address (7-bit)
- **data_wr** -- Buffer which holds the data to be written
- **size** -- Size of data to be written in bytes
- **ticks_to_wait** -- Operation timeout in CPU cycles. Set to -1 to wait forever.

Returns esp_err_t ESP_OK when successful

```
esp_err_t lp_core_i2c_master_write_read_device (i2c_port_t lp_i2c_num, uint16_t device_addr,
                                               const uint8_t *data_wr, size_t write_size,
                                               uint8_t *data_rd, size_t read_size, int32_t
                                               ticks_to_wait)
```

Write to and then read from an I2C device in a single transaction.

Note: The LP I2C must have been initialized from the HP core using the lp_core_i2c_master_init() API before invoking this API.

Note: the LP I2C does not support 10-bit I2C device addresses.

Note: the LP I2C port number is ignored at the moment.

Parameters

- **lp_i2c_num** -- LP I2C port number
- **device_addr** -- I2C device address (7-bit)
- **data_wr** -- Buffer which holds the data to be written
- **write_size** -- Size of data to be written in bytes
- **data_rd** -- Buffer to hold data to be read
- **read_size** -- Size of data to be read in bytes
- **ticks_to_wait** -- Operation timeout in CPU cycles. Set to -1 to wait forever.

Returns esp_err_t ESP_OK when successful

```
void lp_core_i2c_master_set_ack_check_en (i2c_port_t lp_i2c_num, bool ack_check_en)
```

Enable or disable ACK checking by the LP_I2C controller during write operations.

When ACK checking is enabled, the hardware will check the ACK/NACK level received during write operations against the expected ACK/NACK level. If the received ACK/NACK level does not match the expected ACK/NACK level then the hardware will generate the I2C_NACK_INT and a STOP condition will be generated to stop the data transfer.

Note: ACK checking is enabled by default

Note: the LP I2C port number is ignored at the moment.

Parameters

- **lp_i2c_num** -- LP I2C port number
- **ack_check_en** -- true: enable ACK check false: disable ACK check

Header File

- [components/ulp/lp_core/lp_core/include/ulp_lp_core_uart.h](#)

Functions

int **lp_core_uart_tx_chars** (*uart_port_t* lp_uart_num, const void *src, size_t size)

Send data to the LP UART port if there is space available in the Tx FIFO.

This function will not wait for enough space in the Tx FIFO to be available. It will just fill the available Tx FIFO slots and return when the FIFO is full. If there are no empty slots in the Tx FIFO, this function will not write any data.

Parameters

- **lp_uart_num** -- LP UART port number
- **src** -- data buffer address
- **size** -- data length to send

Returns

- (-1) Error
- OTHERS (>=0) The number of bytes pushed to the Tx FIFO

esp_err_t **lp_core_uart_write_bytes** (*uart_port_t* lp_uart_num, const void *src, size_t size, int32_t timeout)

Write data to the LP UART port.

This function will write data to the Tx FIFO. If a timeout value is configured, this function will timeout once the number of CPU cycles expire.

Parameters

- **lp_uart_num** -- LP UART port number
- **src** -- data buffer address
- **size** -- data length to send
- **timeout** -- Operation timeout in CPU cycles. Set to -1 to wait forever.

Returns

esp_err_t ESP_OK when successful

int **lp_core_uart_read_bytes** (*uart_port_t* lp_uart_num, void *buf, size_t size, int32_t timeout)

Read data from the LP UART port.

This function will read data from the Rx FIFO. If a timeout value is configured, then this function will timeout once the number of CPU cycles expire.

Parameters

- **lp_uart_num** -- LP UART port number
- **buf** -- data buffer address
- **size** -- data length to send
- **timeout** -- Operation timeout in CPU cycles. Set to -1 to wait forever.

Returns

- (-1) Error
- OTHERS (>=0) The number of bytes read from the Rx FIFO

void **lp_core_uart_tx_flush** (*uart_port_t* lp_uart_num)

Flush LP UART Tx FIFO.

This function is automatically called before the LP core powers down once the main() function returns. It can also be called manually in the application to flush the Tx FIFO.

Parameters **lp_uart_num** -- LP UART port number

Header File

- [components/ulp/lp_core/lp_core/include/ulp_lp_core_print.h](#)

Functions

void **lp_core_printf** (const char *format, ...)

Print from the LP core.

Note: This function uses the LP UART peripheral to enable prints. The LP UART must be initialized with `lp_core_uart_init()` before using this function.

Note: This function is not a standard `printf` function and may not support all format specifiers or special characters.

Parameters

- **format** -- string to be printed
- ... -- variable argument list

void **lp_core_print_char** (char c)

Print a single character from the LP core.

Parameters **c** -- character to be printed

void **lp_core_print_str** (const char *str)

Print a null-terminated string from the LP core.

Parameters **str** -- null-terminated string to be printed

void **lp_core_print_hex** (int h)

Print a hex value from the LP core.

Note: Does not print '0x', only the digits (will always print 8 digits)

Parameters **h** -- hex value to be printed

void **lp_core_print_dec_two_digits** (int d)

Print a two digit integer from the LP-Core.

Parameters **d** -- integer to be printed

Header File

- [components/ulp/lp_core/lp_core/include/ulp_lp_core_interrupts.h](#)

Functions

void **ulp_lp_core_intr_enable** (void)

Enables interrupts globally for the low power core.

Available interrupt handlers for the low power core are as follows:

<code>ulp_lp_core_lp_io_intr_handler(void);</code>	<code>ulp_lp_core_lp_i2c_intr_handler(void);</code>
<code>ulp_lp_core_lp_uart_intr_handler(void);</code>	<code>ulp_lp_core_lp_timer_intr_handler(void);</code>
<code>ulp_lp_core_lp_pmu_intr_handler(void);</code>	<code>ulp_lp_core_lp_spi_intr_handler(void);</code>
<code>ulp_lp_core_trng_intr_handler(void);</code>	<code>ulp_lp_core_lp_adc_intr_handler(void);</code>
<code>ulp_lp_core_lp_touch_intr_handler(void);</code>	<code>ulp_lp_core_tsens_intr_handler(void);</code>
<code>ulp_lp_core_efuse_intr_handler(void);</code>	<code>ulp_lp_core_lp_sysreg_intr_handler(void);</code>
<code>ulp_lp_core_lp_ana_peri_intr_handler(void);</code>	<code>ulp_lp_core_mailbox_intr_handler(void);</code>
<code>ulp_lp_core_lp_wdt_intr_handler(void);</code>	<code>ulp_lp_core_lp_rtc_intr_handler(void);</code>
<code>ulp_lp_core_sw_intr_handler(void);</code>	

Not all handlers are available on all chips. Please refer to the Technical Reference Manual for your chip for more information.

void `ulp_lp_core_intr_disable` (void)

Disables interrupts globally for the low power core.

Macros

`LP_CORE_ISR_ATTR`

2.9.31 Watchdogs

Overview

ESP-IDF supports multiple types of watchdogs:

- Hardware Watchdog Timers
- Interrupt Watchdog Timer (IWDT)
- Task Watchdog Timer (TWDT)

The Interrupt Watchdog is responsible for ensuring that ISRs (Interrupt Service Routines) are not blocked for a prolonged period of time. The TWDT is responsible for detecting instances of tasks running without yielding for a prolonged period.

The various watchdog timers can be enabled using the [Editing the Configuration](#). However, the TWDT can also be enabled during runtime.

Hardware Watchdog Timers

The chips have two groups of watchdog timers:

- Main System Watchdog Timer (MWDT_WDT) - used by Interrupt Watchdog Timer (IWDT) and Task Watchdog Timer (TWDT).
- RTC Watchdog Timer (RTC_WDT) - used to track the boot time from power-up until the user's main function (by default RTC Watchdog is disabled immediately before the user's main function).

Refer to the [Watchdog](#) section to understand how watchdogs are utilized in the bootloader.

The app's behaviour can be adjusted so the RTC Watchdog remains enabled after app startup. The Watchdog would need to be explicitly reset (i.e., fed) or disabled by the app to avoid the chip reset. To do this, set the `CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE` option, modify the app as needed, and then recompile the app. In this case, the following APIs should be used:

- `wdt_hal_disable()`: see [To Disable RTC_WDT](#)
- `wdt_hal_feed()`: see [To Reset the RTC_WDT Counter](#)

If RTC_WDT is not reset/disabled in time, the chip will be automatically reset. See [RTC Watchdog Timeout](#) for more information.

Interrupt Watchdog Timer (IWDT)

The purpose of the IWDT is to ensure that interrupt service routines (ISRs) are not blocked from running for a prolonged period of time (i.e., the IWDT timeout period). Preventing ISRs from running in a timely manner is undesirable as it can increase ISR latency, and also prevent task switching (as task switching is executed from an ISR). The things that can block ISRs from running include:

- Disabling interrupts
- Critical Sections (also disables interrupts)
- Other same/higher priority ISRs which block same/lower priority ISRs from running

The IWDT utilizes the MWDT_WDT watchdog timer in Timer Group 1 as its underlying hardware timer and leverages the FreeRTOS tick interrupt on each CPU to feed the watchdog timer. If the tick interrupt on a particular CPU is not run at within the IWDT timeout period, it is indicative that something is blocking ISRs from being run on that CPU (see the list of reasons above).

When the IWDT times out, the default action is to invoke the panic handler and display the panic reason as `Interrupt wdt timeout on CPU0` or `Interrupt wdt timeout on CPU1` (as applicable). Depending on the panic handler's configured behavior (see [CONFIG_ESP_SYSTEM_PANIC](#)), users can then debug the source of the IWDT timeout (via the backtrace, OpenOCD, gdbstub etc) or simply reset the chip (which may be preferred in a production environment).

If for whatever reason the panic handler is unable to run after an IWDT timeout, the IWDT has a second stage timeout that will hard-reset the chip (i.e., a system reset).

Configuration

- The IWDT is enabled by default via the [CONFIG_ESP_INT_WDT](#) option.
- The IWDT's timeout is configured by setting the [CONFIG_ESP_INT_WDT_TIMEOUT_MS](#) option.
 - Note that the default timeout is higher if PSRAM support is enabled, as a critical section or interrupt routine that accesses a large amount of PSRAM takes longer to complete in some circumstances.
 - The timeout should always be at least twice longer than the period between FreeRTOS ticks (see [CONFIG_FREERTOS_HZ](#)).

Tuning If you find the IWDT timeout is triggered because an interrupt or critical section is running longer than the timeout period, consider rewriting the code:

- Critical sections should be made as short as possible. Any non-critical code/computation should be placed outside the critical section.
- Interrupt handlers should also perform the minimum possible amount of computation. Users can consider deferring any computation to a task by having the ISR push data to a task using queues.

Neither critical sections or interrupt handlers should ever block waiting for another event to occur. If changing the code to reduce the processing time is not possible or desirable, it is possible to increase the [CONFIG_ESP_INT_WDT_TIMEOUT_MS](#) setting instead.

Task Watchdog Timer (TWDT)

The Task Watchdog Timer (TWDT) is used to monitor particular tasks, ensuring that they are able to execute within a given timeout period. The TWDT primarily watches the Idle Tasks of each CPU, however any task can subscribe to be watched by the TWDT. By watching the Idle Tasks of each CPU, the TWDT can detect instances of tasks running for a prolonged period of time without yielding. This can be an indicator of poorly written code that spinloops on a peripheral, or a task that is stuck in an infinite loop.

The TWDT is built around the MWDT_WDT watchdog timer in Timer Group 0. When a timeout occurs, an interrupt is triggered.

Users can define the function `esp_task_wdt_isr_user_handler` in the user code, in order to receive the timeout event and extend the default behavior.

Usage The following functions can be used to watch tasks using the TWDT:

- `esp_task_wdt_init()` to initialize the TWDT and subscribe the idle tasks.
- `esp_task_wdt_add()` subscribes other tasks to the TWDT.
- Once subscribed, `esp_task_wdt_reset()` should be called from the task to feed the TWDT.
- `esp_task_wdt_delete()` unsubscribes a previously subscribed task.
- `esp_task_wdt_deinit()` unsubscribes the idle tasks and deinitializes the TWDT.

In the case where applications need to watch at a more granular level (i.e., ensure that a particular functions/stub/code-path is called), the TWDT allows subscription of users.

- `esp_task_wdt_add_user()` to subscribe an arbitrary user of the TWDT. This function returns a user handle to the added user.
- `esp_task_wdt_reset_user()` must be called using the user handle in order to prevent a TWDT timeout.
- `esp_task_wdt_delete_user()` unsubscribes an arbitrary user of the TWDT.

Configuration The default timeout period for the TWDT is set using config item `CONFIG_ESP_TASK_WDT_TIMEOUT_S`. This should be set to at least as long as you expect any single task needs to monopolize the CPU (for example, if you expect the app will do a long intensive calculation and should not yield to other tasks). It is also possible to change this timeout at runtime by calling `esp_task_wdt_init()`.

Note: Erasing large flash areas can be time consuming and can cause a task to run continuously, thus triggering a TWDT timeout. The following two methods can be used to avoid this:

- Increase `CONFIG_ESP_TASK_WDT_TIMEOUT_S` in menuconfig for a larger watchdog timeout period.
- You can also call `esp_task_wdt_init()` to increase the watchdog timeout period before erasing a large flash area.

For more information, you can refer to *SPI Flash API*.

The following config options control TWDT configuration. They are all enabled by default:

- `CONFIG_ESP_TASK_WDT_EN` - enables TWDT feature. If this option is disabled, TWDT cannot be used, even if initialized at runtime.
- `CONFIG_ESP_TASK_WDT_INIT` - the TWDT is initialized automatically during startup. If this option is disabled, it is still possible to initialize the Task WDT at runtime by calling `esp_task_wdt_init()`.
- `CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0` - Idle task is subscribed to the TWDT during startup. If this option is disabled, it is still possible to subscribe the idle task by calling `esp_task_wdt_init()` again.

Note: On a TWDT timeout the default behaviour is to simply print a warning and a backtrace before continuing running the app. If you want a timeout to cause a panic and a system reset then this can be configured through `CONFIG_ESP_TASK_WDT_PANIC`.

JTAG & Watchdogs

While debugging using OpenOCD, the CPUs are halted every time a breakpoint is reached. However if the watchdog timers continue to run when a breakpoint is encountered, they will eventually trigger a reset making it very difficult to debug code. Therefore OpenOCD will disable the hardware timers of both the interrupt and task watchdogs at every breakpoint. Moreover, OpenOCD will not re-enable them upon leaving the breakpoint. This means that interrupt watchdog and task watchdog functionality will essentially be disabled. No warnings or panics from either watchdogs will be generated when the ESP32-C5 is connected to OpenOCD via JTAG.

Application Examples

- [system/task_watchdog](#) demonstrates how to initialize, subscribe and unsubscribe tasks and users to the task watchdog, and how tasks and users can reset (feed) the task watchdog.

API Reference

Header File

- [components/esp_system/include/esp_task_wdt.h](#)
- This header file can be included with:

```
#include "esp_task_wdt.h"
```

Functions

esp_err_t **esp_task_wdt_init** (const *esp_task_wdt_config_t* *config)

Initialize the Task Watchdog Timer (TWDT)

This function configures and initializes the TWDT. This function will subscribe the idle tasks if configured to do so. For other tasks, users can subscribe them using [esp_task_wdt_add\(\)](#) or [esp_task_wdt_add_user\(\)](#). This function won't start the timer if no task have been registered yet.

Note: [esp_task_wdt_init\(\)](#) must only be called after the scheduler is started. Moreover, it must not be called by multiple tasks simultaneously.

Parameters *config* -- [in] Configuration structure

Returns

- ESP_OK: Initialization was successful
- ESP_ERR_INVALID_STATE: Already initialized
- Other: Failed to initialize TWDT

esp_err_t **esp_task_wdt_reconfigure** (const *esp_task_wdt_config_t* *config)

Reconfigure the Task Watchdog Timer (TWDT)

The function reconfigures the running TWDT. It must already be initialized when this function is called.

Note: [esp_task_wdt_reconfigure\(\)](#) must not be called by multiple tasks simultaneously.

Parameters *config* -- [in] Configuration structure

Returns

- ESP_OK: Reconfiguring was successful
- ESP_ERR_INVALID_STATE: TWDT not initialized yet
- Other: Failed to initialize TWDT

esp_err_t **esp_task_wdt_deinit** (void)

Deinitialize the Task Watchdog Timer (TWDT)

This function will deinitialize the TWDT, and unsubscribe any idle tasks. Calling this function whilst other tasks are still subscribed to the TWDT, or when the TWDT is already deinitialized, will result in an error code being returned.

Note: [esp_task_wdt_deinit\(\)](#) must not be called by multiple tasks simultaneously.

Returns

- ESP_OK: TWDT successfully deinitialized
- Other: Failed to deinitialize TWDT

esp_err_t **esp_task_wdt_add** (*TaskHandle_t* task_handle)

Subscribe a task to the Task Watchdog Timer (TWDT)

This function subscribes a task to the TWDT. Each subscribed task must periodically call `esp_task_wdt_reset()` to prevent the TWDT from elapsing its timeout period. Failure to do so will result in a TWDT timeout.

Parameters **task_handle** -- Handle of the task. Input NULL to subscribe the current running task to the TWDT

Returns

- ESP_OK: Successfully subscribed the task to the TWDT
- Other: Failed to subscribe task

esp_err_t **esp_task_wdt_add_user** (const char *user_name, *esp_task_wdt_user_handle_t* *user_handle_ret)

Subscribe a user to the Task Watchdog Timer (TWDT)

This function subscribes a user to the TWDT. A user of the TWDT is usually a function that needs to run periodically. Each subscribed user must periodically call `esp_task_wdt_reset_user()` to prevent the TWDT from elapsing its timeout period. Failure to do so will result in a TWDT timeout.

Parameters

- **user_name** -- **[in]** String to identify the user
- **user_handle_ret** -- **[out]** Handle of the user

Returns

- ESP_OK: Successfully subscribed the user to the TWDT
- Other: Failed to subscribe user

esp_err_t **esp_task_wdt_reset** (void)

Reset the Task Watchdog Timer (TWDT) on behalf of the currently running task.

This function will reset the TWDT on behalf of the currently running task. Each subscribed task must periodically call this function to prevent the TWDT from timing out. If one or more subscribed tasks fail to reset the TWDT on their own behalf, a TWDT timeout will occur.

Returns

- ESP_OK: Successfully reset the TWDT on behalf of the currently running task
- Other: Failed to reset

esp_err_t **esp_task_wdt_reset_user** (*esp_task_wdt_user_handle_t* user_handle)

Reset the Task Watchdog Timer (TWDT) on behalf of a user.

This function will reset the TWDT on behalf of a user. Each subscribed user must periodically call this function to prevent the TWDT from timing out. If one or more subscribed users fail to reset the TWDT on their own behalf, a TWDT timeout will occur.

Parameters **user_handle** -- **[in]** User handle

- ESP_OK: Successfully reset the TWDT on behalf of the user
- Other: Failed to reset

esp_err_t **esp_task_wdt_delete** (*TaskHandle_t* task_handle)

Unsubscribes a task from the Task Watchdog Timer (TWDT)

This function will unsubscribe a task from the TWDT. After being unsubscribed, the task should no longer call `esp_task_wdt_reset()`.

Parameters **task_handle** -- **[in]** Handle of the task. Input NULL to unsubscribe the current running task.

Returns

- ESP_OK: Successfully unsubscribed the task from the TWDT
- Other: Failed to unsubscribe task

esp_err_t **esp_task_wdt_delete_user** (*esp_task_wdt_user_handle_t* user_handle)

Unsubscribes a user from the Task Watchdog Timer (TWDT)

This function will unsubscribe a user from the TWDT. After being unsubscribed, the user should no longer call `esp_task_wdt_reset_user()`.

Parameters **user_handle** -- [in] User handle

Returns

- ESP_OK: Successfully unsubscribed the user from the TWDT
- Other: Failed to unsubscribe user

esp_err_t **esp_task_wdt_status** (*TaskHandle_t* task_handle)

Query whether a task is subscribed to the Task Watchdog Timer (TWDT)

This function will query whether a task is currently subscribed to the TWDT, or whether the TWDT is initialized.

Parameters **task_handle** -- [in] Handle of the task. Input NULL to query the current running task.

Returns :

- ESP_OK: The task is currently subscribed to the TWDT
- ESP_ERR_NOT_FOUND: The task is not subscribed
- ESP_ERR_INVALID_STATE: TWDT was never initialized

void **esp_task_wdt_isr_user_handler** (void)

User ISR callback placeholder.

This function is called by `task_wdt_isr` function (ISR for when TWDT times out). It can be defined in user code to handle TWDT events.

Note: It has the same limitations as the interrupt function. Do not use ESP_LOGx functions inside.

esp_err_t **esp_task_wdt_print_triggered_tasks** (*task_wdt_msg_handler* msg_handler, void *opaque, int *cpus_fail)

Prints or retrieves information about tasks/users that triggered the Task Watchdog Timeout.

This function provides various operations to handle tasks/users that did not reset the Task Watchdog in time. It can print detailed information about these tasks/users, such as their names, associated CPUs, and whether they have been reset. Additionally, it can retrieve the total length of the printed information or the CPU affinity of the failing tasks.

Note:

- If `msg_handler` is not provided, the information will be printed to console using `ESP_EARLY_LOGE`.
 - If `msg_handler` is provided, the function will send the printed information to the provided message handler function.
 - If `cpus_fail` is provided, the function will store the CPU affinity of the failing tasks in the provided integer.
 - During the execution of this function, logging is allowed in critical sections, as TWDT timeouts are considered fatal errors.
-

Parameters

- **msg_handler** -- [in] Optional message handler function that will be called for each printed line.
- **opaque** -- [in] Optional pointer to opaque data that will be passed to the message handler function.
- **cpus_fail** -- [out] Optional pointer to an integer where the CPU affinity of the failing tasks will be stored.

Returns

- **ESP_OK**: The function executed successfully.
- **ESP_FAIL**: No triggered tasks were found, and thus no information was printed or retrieved.

Structures

struct **esp_task_wdt_config_t**

Task Watchdog Timer (TWDT) configuration structure.

Public Members

uint32_t **timeout_ms**

TWDT timeout duration in milliseconds

uint32_t **idle_core_mask**

Bitmask of the core whose idle task should be subscribed on initialization where $1 \ll i$ means that core i 's idle task will be monitored by the TWDT

bool **trigger_panic**

Trigger panic when timeout occurs

Type Definitions

typedef struct esp_task_wdt_user_handle_s ***esp_task_wdt_user_handle_t**

Task Watchdog Timer (TWDT) user handle.

typedef void (***task_wdt_msg_handler**)(void *opaque, const char *msg)

Code examples for this API section are provided in the [system](#) directory of ESP-IDF examples.

2.10 Configuration Options Reference

Subsequent sections contain the list of available ESP-IDF options automatically generated from Kconfig files. Note that due to dependencies between options, some options listed here may not be visible by default in `menuconfig`.

By convention, all option names are upper-case letters with underscores. When Kconfig generates `sdkconfig` and `sdkconfig.h` files, option names are prefixed with `CONFIG_`. So if an option `ENABLE_FOO` is defined in a Kconfig file and selected in `menuconfig`, then the `sdkconfig` and `sdkconfig.h` files will have `CONFIG_ENABLE_FOO` defined. In the following sections, option names are also prefixed with `CONFIG_`, same as in the source code.

2.10.1 Build type

Contains:

- `CONFIG_APP_BUILD_TYPE`
- `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`
- `CONFIG_APP_REPRODUCIBLE_BUILD`
- `CONFIG_APP_NO_BLOBS`

CONFIG_APP_BUILD_TYPE

Application build type

Found in: [Build type](#)

Select the way the application is built.

By default, the application is built as a binary file in a format compatible with the ESP-IDF bootloader. In addition to this application, 2nd stage bootloader is also built. Application and bootloader binaries can be written into flash and loaded/executed from there.

Another option, useful for only very small and limited applications, is to only link the .elf file of the application, such that it can be loaded directly into RAM over JTAG or UART. Note that since IRAM and DRAM sizes are very limited, it is not possible to build any complex application this way. However for some kinds of testing and debugging, this option may provide faster iterations, since the application does not need to be written into flash.

Note: when APP_BUILD_TYPE_RAM is selected and loaded with JTAG, ESP-IDF does not contain all the startup code required to initialize the CPUs and ROM memory (data/bss). Therefore it is necessary to execute a bit of ROM code prior to executing the application. A gdbinit file may look as follows (for ESP32):

```
# Connect to a running instance of OpenOCD target remote :3333 # Reset and halt the target
mon reset halt # Run to a specific point in ROM code, # where most of initialization is
complete. thb *0x40007d54 c # Load the application into RAM load # Run till app_main tb
app_main c
```

Execute this gdbinit file as follows:

```
xtensa-esp32-elf-gdb build/app-name.elf -x gdbinit
```

Example gdbinit files for other targets can be found in tools/test_apps/system/gdb_loadable_elf/

When loading the BIN with UART, the ROM will jump to ram and run the app after finishing the ROM startup code, so there's no additional startup initialization required. You can use the *load_ram* in esptool.py to load the generated .bin file into ram and execute.

Example: `esptool.py --chip {chip} -p {port} -b {baud} --no-stub load_ram {app.bin}`

Recommended sdkconfig.defaults for building loadable ELF files is as follows. CONFIG_APP_BUILD_TYPE_RAM is required, other options help reduce application memory footprint.

```
CONFIG_APP_BUILD_TYPE_RAM=y CONFIG_VFS_SUPPORT_TERMIOS= CON-
FIG_NEWLIB_NANO_FORMAT=y CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT=y
CONFIG_ESP_DEBUG_STUBS_ENABLE= CONFIG_ESP_ERR_TO_NAME_LOOKUP=
```

Available options:

- Default (binary application + 2nd stage bootloader) (CONFIG_APP_BUILD_TYPE_APP_2NDBOOT)
- Build app runs entirely in RAM (EXPERIMENTAL) (CONFIG_APP_BUILD_TYPE_RAM)

CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

Build app without SPI_FLASH/PSRAM support (saves ram)

Found in: [Build type](#)

If this option is enabled, external memory and related peripherals, such as Cache, MMU, Flash and PSRAM, won't be initialized. Corresponding drivers won't be introduced either. Components that depend on the spi_flash component will also be unavailable, such as app_update, etc. When this option is enabled, about 26KB of RAM space can be saved.

CONFIG_APP_REPRODUCIBLE_BUILD

Enable reproducible build

Found in: [Build type](#)

If enabled, all date, time, and path information would be eliminated. A .gdbinit file would be create automatically. (or will be append if you have one already)

Default value:

- No (disabled)

CONFIG_APP_NO_BLOBS

No Binary Blobs

Found in: [Build type](#)

If enabled, this disables the linking of binary libraries in the application build. Note that after enabling this Wi-Fi/Bluetooth will not work.

Default value:

- No (disabled)

2.10.2 Bootloader config

Contains:

- [Application Rollback](#)
- [Bootloader manager](#)
- [CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION](#)
- [Bootloader Rollback](#)
- [CONFIG_BOOTLOADER_REGION_PROTECTION_ENABLE](#)
- [CONFIG_BOOTLOADER_APP_TEST](#)
- [CONFIG_BOOTLOADER_FACTORY_RESET](#)
- [CONFIG_BOOTLOADER_HOLD_TIME_GPIO](#)
- [Log](#)
- [CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC](#)
- [Serial Flash Configurations](#)
- [CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS](#)
- [CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON](#)
- [CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP](#)
- [CONFIG_BOOTLOADER_WDT_ENABLE](#)
- [CONFIG_BOOTLOADER_VDDSDIO_BOOST](#)

Bootloader manager

Contains:

- [CONFIG_BOOTLOADER_PROJECT_VER](#)
- [CONFIG_BOOTLOADER_COMPILE_TIME_DATE](#)

CONFIG_BOOTLOADER_COMPILE_TIME_DATE

Use time/date stamp for bootloader

Found in: [Bootloader config](#) > [Bootloader manager](#)

If set, then the bootloader will be built with the current time/date stamp. It is stored in the bootloader description structure. If not set, time/date stamp will be excluded from bootloader image. This can be useful for getting the same binary image files made from the same source, but at different times.

CONFIG_BOOTLOADER_PROJECT_VER

Project version

Found in: [Bootloader config](#) > [Bootloader manager](#)

Project version. It is placed in "version" field of the esp_bootloader_desc structure. The type of this field is "uint32_t".

Range:

- from 0 to 4294967295

Default value:

- 1

Application Rollback

Contains:

- [CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE](#)

CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE

Enable app rollback support

Found in: [Bootloader config](#) > [Application Rollback](#)

After updating the app, the bootloader runs a new app with the "ESP_OTA_IMG_PENDING_VERIFY" state set. This state prevents the re-run of this app. After the first boot of the new app in the user code, the function should be called to confirm the operability of the app or vice versa about its non-operability. If the app is working, then it is marked as valid. Otherwise, it is marked as not valid and rolls back to the previous working app. A reboot is performed, and the app is booted before the software update. Note: If during the first boot a new app the power goes out or the WDT works, then roll back will happen. Rollback is possible only between the apps with the same security versions.

Default value:

- No (disabled)

CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

Enable app anti-rollback support

Found in: [Bootloader config](#) > [Application Rollback](#) > [CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE](#)

This option prevents rollback to previous firmware/application image with lower security version.

Default value:

- No (disabled) if [CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE](#)

CONFIG_BOOTLOADER_APP_SECURE_VERSION

eFuse secure version of app

Found in: [Bootloader config](#) > [Application Rollback](#) > [CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE](#) > [CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK](#)

The secure version is the sequence number stored in the header of each firmware. The security version is set in the bootloader, version is recorded in the eFuse field as the number of set ones. The allocated number of bits in the efuse field for storing the security version is limited (see [BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD](#) option).

Bootloader: When bootloader selects an app to boot, an app is selected that has a security version greater or equal that recorded in eFuse field. The app is booted with a higher (or equal) secure version.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.

Your partition table should has a scheme with ota_0 + ota_1 (without factory).

Default value:

- 0 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD

Size of the efuse secure version field

Found in: `Bootloader config` > `Application Rollback` > `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` > `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

The size of the efuse secure version field. Its length is limited to 32 bits for ESP32 and 16 bits for ESP32-S2. This determines how many times the security version can be increased.

Range:

- from 1 to 16 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

Default value:

- 16 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

CONFIG_BOOTLOADER_EFUSE_SECURE_VERSION_EMULATE

Emulate operations with efuse secure version(only test)

Found in: `Bootloader config` > `Application Rollback` > `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` > `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

This option allows to emulate read/write operations with all eFuses and efuse secure version. It allows to test anti-rollback implementation without permanent write eFuse bits. There should be an entry in partition table with following details: `emul_efuse, data, efuse, , 0x2000`.

This option enables: `EFUSE_VIRTUAL` and `EFUSE_VIRTUAL_KEEP_IN_FLASH`.

Default value:

- No (disabled) if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

Bootloader Rollback

Contains:

- `CONFIG_BOOTLOADER_ANTI_ROLLBACK_ENABLE`

CONFIG_BOOTLOADER_ANTI_ROLLBACK_ENABLE

Enable bootloader rollback support

Found in: `Bootloader config` > `Bootloader Rollback`

This option prevents rollback to previous bootloader image with lower security version.

Default value:

- No (disabled) if `SOC_RECOVERY_BOOTLOADER_SUPPORTED`

CONFIG_BOOTLOADER_SECURE_VERSION

Secure version of bootloader

Found in: `Bootloader config` > `Bootloader Rollback` > `CONFIG_BOOTLOADER_ANTI_ROLLBACK_ENABLE`

The secure version is the sequence number stored in the header of each bootloader.

The ROM Bootloader which runs the 2nd stage bootloader (PRIMARY or RECOVERY) checks that the security version is greater or equal that recorded in the eFuse field. Bootloaders that have a secure version in the image < secure version in efuse will not boot.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.

Range:

- from 0 to 4 if `CONFIG_BOOTLOADER_ANTI_ROLLBACK_ENABLE`

Default value:

- 0 if `CONFIG_BOOTLOADER_ANTI_ROLLBACK_ENABLE`

CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION

Bootloader optimization Level

Found in: *Bootloader config*

This option sets compiler optimization level (gcc -O argument) for the bootloader.

- The default "Size" setting will add the -Os (-Oz with clang) flag to CFLAGS.
- The "Debug" setting will add the -Og flag to CFLAGS.
- The "Performance" setting will add the -O2 flag to CFLAGS.

Note that custom optimization levels may be unsupported.

Available options:

- Size (-Os with GCC, -Oz with Clang) (`CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION_SIZE`)
- Debug (-Og) (`CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION_DEBUG`)
- Optimize for performance (-O2) (`CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION_PERF`)
- Debug without optimization (-O0) (Deprecated, will be removed in IDF v6.0) (`CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION_NONE`)

Log

Contains:

- `CONFIG_BOOTLOADER_LOG_LEVEL`
- *Format*

CONFIG_BOOTLOADER_LOG_LEVEL

Bootloader log verbosity

Found in: *Bootloader config* > *Log*

Specify how much output to see in bootloader logs.

Available options:

- No output (`CONFIG_BOOTLOADER_LOG_LEVEL_NONE`)
- Error (`CONFIG_BOOTLOADER_LOG_LEVEL_ERROR`)
- Warning (`CONFIG_BOOTLOADER_LOG_LEVEL_WARN`)
- Info (`CONFIG_BOOTLOADER_LOG_LEVEL_INFO`)
- Debug (`CONFIG_BOOTLOADER_LOG_LEVEL_DEBUG`)
- Verbose (`CONFIG_BOOTLOADER_LOG_LEVEL_VERBOSE`)

Format Contains:

- [CONFIG_BOOTLOADER_LOG_COLORS](#)
- [CONFIG_BOOTLOADER_LOG_TIMESTAMP_SOURCE](#)

CONFIG_BOOTLOADER_LOG_COLORS

Color

Found in: Bootloader config > Log > Format

Use ANSI terminal colors in log output Enable ANSI terminal color codes. In order to view these, your terminal program must support ANSI color codes.

Default value:

- No (disabled)

CONFIG_BOOTLOADER_LOG_TIMESTAMP_SOURCE

Timestamp

Found in: Bootloader config > Log > Format

Choose what sort of timestamp is displayed in the log output:

- "None" - The log will only contain the actual log messages themselves without any time-related information. Avoiding timestamps can help conserve processing power and memory. It might be useful when you perform log analysis or debugging, sometimes it's more straightforward to work with logs that lack timestamps, especially if the time of occurrence is not critical for understanding the issues. "I log_test: info message"
- "Milliseconds since boot" is calculated from the RTOS tick count multiplied by the tick period. This time will reset after a software reboot. "I (112500) log_test: info message"

Available options:

- None (CONFIG_BOOTLOADER_LOG_TIMESTAMP_SOURCE_NONE)
- Milliseconds Since Boot (CONFIG_BOOTLOADER_LOG_TIMESTAMP_SOURCE_CPU_TICKS)

Serial Flash Configurations

Contains:

- [CONFIG_BOOTLOADER_FLASH_DC_AWARE](#)
- [CONFIG_BOOTLOADER_CACHE_32BIT_ADDR_QUAD_FLASH](#)
- [CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT](#)

CONFIG_BOOTLOADER_FLASH_DC_AWARE

Allow app adjust Dummy Cycle bits in SPI Flash for higher frequency (READ HELP FIRST)

Found in: Bootloader config > Serial Flash Configurations

This will force 2nd bootloader to be loaded by DOUT mode, and will restore Dummy Cycle setting by resetting the Flash

CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT

Enable the support for flash chips of XMC (READ DOCS FIRST)

Found in: Bootloader config > Serial Flash Configurations

Perform the startup flow recommended by XMC. Please consult XMC for the details of this flow. XMC chips will be forbidden to be used, when this option is disabled.

DON'T DISABLE THIS UNLESS YOU KNOW WHAT YOU ARE DOING.

comment "Features below require specific hardware (READ DOCS FIRST!)"

Default value:

- Yes (enabled)

CONFIG_BOOTLOADER_CACHE_32BIT_ADDR_QUAD_FLASH

Enable cache access to 32-bit-address (over 16MB) range of SPI Flash (READ DOCS FIRST)

Found in: [Bootloader config](#) > [Serial Flash Configurations](#)

Enabling this option allows the CPU to access 32-bit-address flash beyond 16M range. 1. This option only valid for 4-line flash. Octal flash doesn't need this. 2. This option is experimental, which means it can't use on all flash chips stable, for more information, please contact Espressif Business support.

CONFIG_BOOTLOADER_VDDSDIO_BOOST

VDDSDIO LDO voltage

Found in: [Bootloader config](#)

If this option is enabled, and VDDSDIO LDO is set to 1.8V (using eFuse or MTDI bootstrapping pin), bootloader will change LDO settings to output 1.9V instead. This helps prevent flash chip from browning out during flash programming operations.

This option has no effect if VDDSDIO is set to 3.3V, or if the internal VDDSDIO regulator is disabled via eFuse.

Available options:

- 1.8V (CONFIG_BOOTLOADER_VDDSDIO_BOOST_1_8V)
- 1.9V (CONFIG_BOOTLOADER_VDDSDIO_BOOST_1_9V)

CONFIG_BOOTLOADER_FACTORY_RESET

GPIO triggers factory reset

Found in: [Bootloader config](#)

Allows to reset the device to factory settings: - clear one or more data partitions; - boot from "factory" partition. The factory reset will occur if there is a GPIO input held at the configured level while device starts up. See settings below.

Default value:

- No (disabled)

CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET

Number of the GPIO input for factory reset

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_FACTORY_RESET](#)

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a factory reset, this GPIO must be held high or low (as configured) on startup.

Note that on some SoCs not all pins have an internal pull-up and certain pins are already used by ROM bootloader as bootstrapping. Refer to the technical reference manual for further details on the selected SoC.

Range:

- from 0 to 28 if *CONFIG_BOOTLOADER_FACTORY_RESET*

Default value:

- 4 if *CONFIG_BOOTLOADER_FACTORY_RESET*

CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LEVEL

Factory reset GPIO level

Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET

Pin level for factory reset, can be triggered on low or high.

Available options:

- Reset on GPIO low (*CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LOW*)
- Reset on GPIO high (*CONFIG_BOOTLOADER_FACTORY_RESET_PIN_HIGH*)

CONFIG_BOOTLOADER_OTA_DATA_ERASE

Clear OTA data on factory reset (select factory partition)

Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET

The device will boot from "factory" partition (or OTA slot 0 if no factory partition is present) after a factory reset.

CONFIG_BOOTLOADER_DATA_FACTORY_RESET

Comma-separated names of partitions to clear on factory reset

Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET

Allows customers to select which data partitions will be erased while factory reset.

Specify the names of partitions as a comma-delimited with optional spaces for readability. (Like this: "nvs, phy_init, ...") Make sure that the name specified in the partition table and here are the same. Partitions of type "app" cannot be specified here.

Default value:

- "nvs" if *CONFIG_BOOTLOADER_FACTORY_RESET*

CONFIG_BOOTLOADER_APP_TEST

GPIO triggers boot from test app partition

Found in: Bootloader config

Allows to run the test app from "TEST" partition. A boot from "test" partition will occur if there is a GPIO input pulled low while device starts up. See settings below.

CONFIG_BOOTLOADER_NUM_PIN_APP_TEST

Number of the GPIO input to boot TEST partition

Found in: Bootloader config > CONFIG_BOOTLOADER_APP_TEST

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the old application will boot. (factory or OTA[x]).
