In order to fulfill the above requirement, even if the node might be powered off once in a while, we need to store persistently how many hours the node has been in the state. This doesn’t necessarily need to happen every hour (thanks to the flexible duration range). The exact cadence will depend a lot on the ways that the node will be used and what kind of power source it has.

Since there is no single optimal answer, this configuration option allows specifying a divider, i.e. how many intervals the 96 hour minimum gets split into. After each interval the duration that the node has been in the current state gets stored to flash. E.g. the default value of 4 means that the state is saved every 24 hours (96 / 4).
Range:
  • from 2 to 96 if `CONFIG_BLE_MESH`

Default value:
  • 4 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_IVU_RECOVERY_IVI**

Recovery the IV index when the latest whole IV update procedure is missed

*Found in: Component config > CONFIG_BLE_MESH*

According to Section 3.10.5 of Mesh Specification v1.0.1. If a node in Normal Operation receives a Secure Network beacon with an IV index equal to the last known IV index+1 and the IV Update Flag set to 0, the node may update its IV without going to the IV Update in Progress state, or it may initiate an IV Index Recovery procedure (Section 3.10.6), or it may ignore the Secure Network beacon. The node makes the choice depending on the time since last IV update and the likelihood that the node has missed the Secure Network beacons with the IV update Flag. When the above situation is encountered, this option can be used to decide whether to perform the IV index recovery procedure.

Default value:
  • No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SAR_ENHANCEMENT**

Segmentation and reassembly enhancement

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to use the enhanced segmentation and reassembly mechanism introduced in Bluetooth Mesh Protocol 1.1.

Default value:
  • No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_TX_SEG_MSG_COUNT**

Maximum number of simultaneous outgoing segmented messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of simultaneous outgoing multi-segment and/or reliable messages. The default value is 1, which means the device can only send one segmented message at a time. And if another segmented message is going to be sent, it should wait for the completion of the previous one. If users are going to send multiple segmented messages at the same time, this value should be configured properly.

Range:
  • from 1 to if `CONFIG_BLE_MESH`

Default value:
  • 1 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_RX_SEG_MSG_COUNT**

Maximum number of simultaneous incoming segmented messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of simultaneous incoming multi-segment and/or reliable messages. The default value is 1, which means the device can only receive one segmented message at a time. And if another segmented message is going to be received, it should wait for the completion of the previous one. If users are going to receive multiple segmented messages at the same time, this value should be configured properly.

Range:
Chapter 2. API Reference

CONFIG_BLE_MESH_RX_SDU_MAX

Maximum incoming Upper Transport Access PDU length

*Found in: Component config > CONFIG_BLE_MESH*

Maximum incoming Upper Transport Access PDU length. Leave this to the default value, unless you really need to optimize memory usage.

*Range:*
- from 36 to 384 if CONFIG_BLE_MESH

*Default value:*
- 384 if CONFIG_BLE_MESH

CONFIG_BLE_MESH_TX_SEG_MAX

Maximum number of segments in outgoing messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of segments supported for outgoing messages. This value should typically be fine-tuned based on what models the local node supports, i.e. what’s the largest message payload that the node needs to be able to send. This value affects memory and call stack consumption, which is why the default is lower than the maximum that the specification would allow (32 segments).

The maximum outgoing SDU size is 12 times this number (out of which 4 or 8 bytes is used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC and 52 bytes using an 8-byte MIC.

Be sure to specify a sufficient number of advertising buffers when setting this option to a higher value. There must be at least three more advertising buffers (BLE_MESH_ADV_BUF_COUNT) as there are outgoing segments.

*Range:*
- from 2 to 32 if CONFIG_BLE_MESH

*Default value:*
- 32 if CONFIG_BLE_MESH

CONFIG_BLE_MESH_RELAY

Relay support

*Found in: Component config > CONFIG_BLE_MESH*

Support for acting as a Mesh Relay Node. Enabling this option will allow a node to support the Relay feature, and the Relay feature can still be enabled or disabled by proper configuration messages. Disabling this option will let a node not support the Relay feature.

*Default value:*
- Yes (enabled) if CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH

CONFIG_BLE_MESH_RELAY_ADV_BUF

Use separate advertising buffers for relay packets

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY*

When selected, self-send packets will be put in a high-priority queue and relay packets will be put in a low-priority queue.
Default value:
• No (disabled) if `CONFIG_BLE_MESH_RELAY` && `CONFIG_BLE_MESH`  

**CONFIG_BLE_MESH_RELAY_ADV_BUF_COUNT**

Number of advertising buffers for relay packets

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY > CONFIG_BLE_MESH_RELAY_ADV_BUF*

Number of advertising buffers for relay packets available.

**Range:**
• from 6 to 256 if `CONFIG_BLE_MESH_RELAY_ADV_BUF` && `CONFIG_BLE_MESH_RELAY` && `CONFIG_BLE_MESH`

**Default value:**
• 60 if `CONFIG_BLE_MESH_RELAY_ADV_BUF` && `CONFIG_BLE_MESH_RELAY` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LOW_POWER**

Support for Low Power features

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to operate as a Low Power Node. If low power consumption is required by a node, this option should be enabled. And once the node enters the mesh network, it will try to find a Friend node and establish a friendship.

**CONFIG_BLE_MESH_LPN_ESTABLISHMENT**

Perform Friendship establishment using low power

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Perform the Friendship establishment using low power with the help of a reduced scan duty cycle. The downside of this is that the node may miss out on messages intended for it until it has successfully set up Friendship with a Friend node. When this option is enabled, the node will stop scanning for a period of time after a Friend Request or Friend Poll is sent, so as to reduce more power consumption.

**Default value:**
• No (disabled) if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_AUTO**

Automatically start looking for Friend nodes once provisioned

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Once provisioned, automatically enable LPN functionality and start looking for Friend nodes. If this option is disabled LPN mode needs to be manually enabled by calling `bt_mesh_lpn_set(true)`. When an unprovisioned device is provisioned successfully and becomes a node, enabling this option will trigger the node to send Friend Request at a certain period until it finds a proper Friend node.

**Default value:**
• No (disabled) if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_AUTO_TIMEOUT**

Time from last received message before going to LPN mode

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER > CONFIG_BLE_MESH_LPN_AUTO*
Time in seconds from the last received message, that the node waits out before starting to look for Friend nodes.

**Range:**
- from 0 to 3600 if `CONFIG_BLE_MESH_LPN_AUTO` && `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**
- 15 if `CONFIG_BLE_MESH_LPN_AUTO` && `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

---

**CONFIG_BLE_MESH_LPN_RETRY_TIMEOUT**

Retry timeout for Friend requests

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER`

Time in seconds between Friend Requests, if a previous Friend Request did not yield any acceptable Friend Offers.

**Range:**
- from 1 to 3600 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**
- 6 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

---

**CONFIG_BLE_MESH_LPN_RSSI_FACTOR**

RSSIFactor, used in Friend Offer Delay calculation

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER`

The contribution of the RSSI, measured by the Friend node, used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. RSSIFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**
- from 0 to 3 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**
- 0 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

---

**CONFIG_BLE_MESH_LPN_RECV_WIN_FACTOR**

ReceiveWindowFactor, used in Friend Offer Delay calculation

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER`

The contribution of the supported Receive Window used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. ReceiveWindowFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**
- from 0 to 3 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**
- 0 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

---

**CONFIG_BLE_MESH_LPN_MIN_QUEUE_SIZE**

Minimum size of the acceptable friend queue (MinQueueSizeLog)

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER`

The MinQueueSizeLog field is defined as \( \log_2(N) \), where \( N \) is the minimum number of maximum size Lower Transport PDUs that the Friend node can store in its Friend Queue. As an example, MinQueueSizeLog value 1 gives \( N = 2 \), and value 7 gives \( N = 128 \).
CONFIG_BLE_MESH_LPN_RECV_DELAY

Receive delay requested by the local node

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The ReceiveDelay is the time between the Low Power node sending a request and listening for a response. This delay allows the Friend node time to prepare the response. The value is in units of milliseconds.

**Range:**
- from 10 to 255 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**Default value:**
- 100 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPN_POLL_TIMEOUT

The value of the PollTimeout timer

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

PollTimeout timer is used to measure time between two consecutive requests sent by a Low Power node. If no requests are received the Friend node before the PollTimeout timer expires, then the friendship is considered terminated. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds. The smaller the value, the faster the Low Power node tries to get messages from corresponding Friend node and vice versa.

**Range:**
- from 10 to 244735 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**Default value:**
- 300 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPN_INIT_POLL_TIMEOUT

The starting value of the PollTimeout timer when Friendship is to be established for the first time. After this, the timeout gradually grows toward the actual PollTimeout, doubling in value for each iteration. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds.

**Range:**
- from 0 to if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**Default value:**
- if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPN_SCAN_LATENCY

Latency for enabling scanning

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

Latency (in milliseconds) is the time it takes to enable scanning. In practice, it means how much time in advance of the Receive Window, the request to enable scanning is made.

**Range:**
- from 0 to 50 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**Default value:**
• 10 if `CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH`
CONFIG_BLE_MESH_FRIEND_SUB_LIST_SIZE

Friend Subscription List Size

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND

Size of the Subscription List that can be supported by a Friend node for a Low Power node. And Low Power node can send Friend Subscription List Add or Friend Subscription List Remove messages to the Friend node to add or remove subscription addresses.

Range:
  • from 0 to 1023 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH

Default value:
  • 3 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH

CONFIG_BLE_MESH_FRIEND_LPN_COUNT

Number of supported LPN nodes

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND

Number of Low Power Nodes with which a Friend can have Friendship simultaneously. A Friend node can have friendship with multiple Low Power nodes at the same time, while a Low Power node can only establish friendship with only one Friend node at the same time.

Range:
  • from 1 to 1000 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH

Default value:
  • 2 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH

CONFIG_BLE_MESH_FRIEND_SEG_RX

Number of incomplete segment lists per LPN

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND

Number of incomplete segment lists tracked for each Friends LPN. In other words, this determines from how many elements can segmented messages destined for the Friend queue be received simultaneously.

Range:
  • from 1 to 1000 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH

Default value:
  • 1 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH

CONFIG_BLE_MESH_NO_LOG

Disable BLE Mesh debug logs (minimize bin size)

Found in: Component config > CONFIG_BLE_MESH

Select this to save the BLE Mesh related rodata code size. Enabling this option will disable the output of BLE Mesh debug log.

Default value:
  • No (disabled) if CONFIG_BLE_MESH && CONFIG_BLE_MESH

BLE Mesh STACK DEBUG LOG LEVEL

Contains:
  • CONFIG_BLE_MESH_STACK_TRACE_LEVEL
**CONFIG_BLE_MESH_STACK_TRACE_LEVEL**

**BLE_MESH_STACK**

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh Stack DEBUG LOG LEVEL*

Define BLE Mesh trace level for BLE Mesh stack.

Available options:

- NONE (CONFIG_BLE_MESH_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BLE_MESH_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BLE_MESH_TRACE_LEVEL_WARNING)
- INFO (CONFIG_BLE_MESH_TRACE_LEVEL_INFO)
- DEBUG (CONFIG_BLE_MESH_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BLE_MESH_TRACE_LEVEL_VERBOSE)

**BLE Mesh NET BUF DEBUG LOG LEVEL**  
Contains:

- **CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL**

**CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL**

**BLE_MESH_NET_BUF**

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh NET BUF DEBUG LOG LEVEL*

Define BLE Mesh trace level for BLE Mesh net buffer.

Available options:

- NONE (CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_WARNING)
- INFO (CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_INFO)
- DEBUG (CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_VERBOSE)

**CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT**

Timeout(ms) for client message response

*Found in: Component config > CONFIG_BLE_MESH*

Timeout value used by the node to get response of the acknowledged message which is sent by the client model. This value indicates the maximum time that a client model waits for the response of the sent acknowledged messages. If a client model uses 0 as the timeout value when sending acknowledged messages, then the default value will be used which is four seconds.

**Range:**
- from 100 to 1200000 if **CONFIG_BLE_MESH**

**Default value:**
- 4000 if **CONFIG_BLE_MESH**

**Support for BLE Mesh Foundation models**  
Contains:

- **CONFIG_BLE_MESH_BRC_CLI**
- **CONFIG_BLE_MESH_BRC_SRV**
- **CONFIG_BLE_MESH_CFG_CLI**
- **CONFIG_BLE_MESH_DF_CLI**
Chapter 2. API Reference

- `CONFIG_BLE_MESH_DF_SRV`
- `CONFIG_BLE_MESH_HEALTH_CLI`
- `CONFIG_BLE_MESH_HEALTH_SRV`

**CONFIG_BLE_MESH_CFG_CLI**

Configuration Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Configuration Client model.

**CONFIG_BLE_MESH_HEALTH_CLI**

Health Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Client model.

**CONFIG_BLE_MESH_HEALTH_SRV**

Health Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Server model.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_BRC_CLI**

Bridge Configuration Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Bridge Configuration Client model.

**CONFIG_BLE_MESH_BRC_SRV**

Bridge Configuration Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Bridge Configuration Server model.
Default value:
• No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_MAX_BRIDGING_TABLE_ENTRY_COUNT**

Maximum number of Bridging Table entries

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_BRC_SRV*

Maximum number of Bridging Table entries that the Bridge Configuration Server can support.

**Range:**
• from 16 to 65535 if `CONFIG_BLE_MESH_BRC_SRV` && `CONFIG_BLE_MESH`

**Default value:**
• 16 if `CONFIG_BLE_MESH_BRC_SRV` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_BRIDGE_CRPL**

Maximum capacity of bridge replay protection list

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_BRC_SRV*

This option specifies the maximum capacity of the bridge replay protection list. The bridge replay protection list is used to prevent a bridged subnet from replay attack, which will store the source address and sequence number of the received bridge messages.

**Range:**
• from 1 to 255 if `CONFIG_BLE_MESH_BRC_SRV` && `CONFIG_BLE_MESH`

**Default value:**
• 5 if `CONFIG_BLE_MESH_BRC_SRV` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PRB_CLI**

Mesh Private Beacon Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Mesh Private Beacon Client model.

**CONFIG_BLE_MESH_PRB_SRV**

Mesh Private Beacon Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Mesh Private Beacon Server model.

**CONFIG_BLE_MESH_ODP_CLI**

On-Demand Private Proxy Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for On-Demand Private Proxy Client model.

**CONFIG_BLE_MESH_ODP_SRV**

On-Demand Private Proxy Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for On-Demand Private Proxy Server model.
Chapter 2. API Reference

CONFIG_BLE_MESH_SRPL_CLI
Solicitation PDU RPL Configuration Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Solicitation PDU RPL Configuration Client model.

CONFIG_BLE_MESH_SRPL_SRV
Solicitation PDU RPL Configuration Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Solicitation PDU RPL Configuration Server model. Note: This option depends on the functionality of receiving Solicitation PDU. If the device doesn’t support receiving Solicitation PDU, then there is no need to enable this server model.

CONFIG_BLE_MESH_AGG_CLI
Opcoes Aggregator Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Opcoes Aggregator Client model.

CONFIG_BLE_MESH_AGG_SRV
Opcoes Aggregator Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Opcoes Aggregator Server model.

CONFIG_BLE_MESH_SAR_CLI
SAR Configuration Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for SAR Configuration Client model.

CONFIG_BLE_MESH_SAR_SRV
SAR Configuration Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for SAR Configuration Server model.

CONFIG_BLE_MESH_COMP_DATA_1
Support Composition Data Page 1

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Composition Data Page 1 contains information about the relationships among models. Each model either can be a root model or can extend other models.
CONFIG_BLE_MESH_COMP_DATA_128

Support Composition Data Page 128

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Composition Data Page 128 is used to indicate the structure of elements, features, and models of a node after the successful execution of the Node Address Refresh procedure or the Node Composition Refresh procedure, or after the execution of the Node Removal procedure followed by the provisioning process. Composition Data Page 128 shall be present if the node supports the Remote Provisioning Server model; otherwise it is optional.

CONFIG_BLE_MESH_MODELS_METADATA_0

Support Models Metadata Page 0

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

The Models Metadata state contains metadata of a node’s models. The Models Metadata state is composed of a number of pages of information. Models Metadata Page 0 shall be present if the node supports the Large Composition Data Server model.

CONFIG_BLE_MESH_MODELS_METADATA_128

Support Models Metadata Page 128

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_MODELS_METADATA_0*

The Models Metadata state contains metadata of a node’s models. The Models Metadata state is composed of a number of pages of information. Models Metadata Page 128 contains metadata for the node’s models after the successful execution of the Node Address Refresh procedure or the Node Composition Refresh procedure, or after the execution of the Node Removal procedure followed by the provisioning process. Models Metadata Page 128 shall be present if the node supports the Remote Provisioning Server model and the node supports the Large Composition Data Server model.

CONFIG_BLE_MESH_LCD_CLI

Large Composition Data Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Large Composition Data Client model.

CONFIG_BLE_MESH_LCD_SRV

Large Composition Data Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Large Composition Data Server model.

CONFIG_BLE_MESH_RPR_CLI

Remote Provisioning Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Remote Provisioning Client model
### CONFIG_BLE_MESH_RPR_CLI_PROV_SAME_TIME

Maximum number of PB-Remote running at the same time by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_RPR_CLI*

This option specifies how many devices can be provisioned at the same time using PB-REMOTE. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-REMOTE at the same time.

**Range:**
- from 1 to 5 if `CONFIG_BLE_MESH_RPR_CLI` && `CONFIG_BLE_MESH`

**Default value:**
- 2 if `CONFIG_BLE_MESH_RPR_CLI` && `CONFIG_BLE_MESH`

### CONFIG_BLE_MESH_RPR_SRV

Remote Provisioning Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Remote Provisioning Server model

### CONFIG_BLE_MESH_RPR_SRV_MAX_SCANNED_ITEMS

Maximum number of device information can be scanned

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_RPR_SRV*

This option specifies how many device information can a Remote Provisioning Server store each time while scanning.

**Range:**
- from 4 to 255 if `CONFIG_BLE_MESH_RPR_SRV` && `CONFIG_BLE_MESH`

**Default value:**
- 10 if `CONFIG_BLE_MESH_RPR_SRV` && `CONFIG_BLE_MESH`

### CONFIG_BLE_MESH_RPR_SRV_ACTIVE_SCAN

Support Active Scan for remote provisioning

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_RPR_SRV*

Enable this option to support Active Scan for remote provisioning.

### CONFIG_BLE_MESH_RPR_SRV_MAX_EXT_SCAN

Maximum number of extended scan procedures

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_RPR_SRV*

This option specifies how many extended scan procedures can be started by the Remote Provisioning Server.

**Range:**
- from 1 to 10 if `CONFIG_BLE_MESH_RPR_SRV` && `CONFIG_BLE_MESH`

**Default value:**
- 1 if `CONFIG_BLE_MESH_RPR_SRV` && `CONFIG_BLE_MESH`
**CONFIG_BLE_MESH_DF_CLI**

Directed Forwarding Configuration Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Directed Forwarding Configuration Client model.

**CONFIG_BLE_MESH_DF_SRV**

Directed Forwarding Configuration Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Directed Forwarding Configuration Server model.

**CONFIG_BLE_MESH_MAX_DISC_TABLE_ENTRY_COUNT**

Maximum number of discovery table entries in a given subnet

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_DF_SRV*

Maximum number of Discovery Table entries supported by the node in a given subnet.

**Range:**
- from 2 to 255 if `CONFIG_BLE_MESH_DF_SRV` && `CONFIG_BLE_MESH`

**Default value:**
- 2 if `CONFIG_BLE_MESH_DF_SRV` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_MAX_FORWARD_TABLE_ENTRY_COUNT**

Maximum number of forward table entries in a given subnet

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_DF_SRV*

Maximum number of Forward Table entries supported by the node in a given subnet.

**Range:**
- from 2 to 64 if `CONFIG_BLE_MESH_DF_SRV` && `CONFIG_BLE_MESH`

**Default value:**
- 2 if `CONFIG_BLE_MESH_DF_SRV` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_MAX_DEPS_NODES_PER_PATH**

Maximum number of dependent nodes per path

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_DF_SRV*

Maximum size of dependent nodes list supported by each forward table entry.

**Range:**
- from 2 to 64 if `CONFIG_BLE_MESH_DF_SRV` && `CONFIG_BLE_MESH`

**Default value:**
- 2 if `CONFIG_BLE_MESH_DF_SRV` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PATH_MONITOR_TEST**

Enable Path Monitoring test mode

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_DF_SRV*
The option only removes the Path Use timer; all other behavior of the device is not changed. If Path Monitoring test mode is going to be used, this option should be enabled.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_DF_SRV` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SUPPORT_DIRECTED_PROXY**

Enable Directed Proxy functionality

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_DF_SRV*

Support Directed Proxy functionality.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH_DF_SRV` && `CONFIG_BLE_MESH`

**Support for BLE Mesh Client/Server models**

Contains:

- `CONFIG_BLE_MESH_MBT_CLI`
- `CONFIG_BLE_MESH_MBT_SRV`
- `CONFIG_BLE_MESH_GENERIC_BATTERY_CLI`
- `CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI`
- `CONFIG_BLE_MESH_GENERIC_LEVEL_CLI`
- `CONFIG_BLE_MESH_GENERIC_LOCATION_CLI`
- `CONFIG_BLE_MESH_GENERIC_ONOFF_CLI`
- `CONFIG_BLE_MESH_GENERIC_POWER_LEVEL_CLI`
- `CONFIG_BLE_MESH_GENERIC_POWER_ONOFF_CLI`
- `CONFIG_BLE_MESH_GENERIC_PROPERTY_CLI`
- `CONFIG_BLE_MESH_GENERIC_SERVER`
- `CONFIG_BLE_MESH_LIGHT_CTL_CLI`
- `CONFIG_BLE_MESH_LIGHT_HSL_CLI`
- `CONFIG_BLE_MESH_LIGHT_LC_CLI`
- `CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI`
- `CONFIG_BLE_MESH_LIGHT_XYL_CLI`
- `CONFIG_BLE_MESH_LIGHTING_SERVER`
- `CONFIG_BLE_MESH_SCENE_CLI`
- `CONFIG_BLE_MESH_SCHEDULER_CLI`
- `CONFIG_BLE_MESH_SENSOR_CLI`
- `CONFIG_BLE_MESH_SENSOR_SERVER`
- `CONFIG_BLE_MESH_TIME_SCENE_SERVER`
- `CONFIG_BLE_MESH_TIME_CLI`

**CONFIG_BLE_MESH_GENERIC_ONOFF_CLI**

Generic OnOff Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic OnOff Client model.

**CONFIG_BLE_MESH_GENERIC_LEVEL_CLI**

Generic Level Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Level Client model.
CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI
Generic Default Transition Time Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic Default Transition Time Client model.

CONFIG_BLE_MESH_GENERIC_POWER_ONOFF_CLI
Generic Power OnOff Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic Power OnOff Client model.

CONFIG_BLE_MESH_GENERIC_POWER_LEVEL_CLI
Generic Power Level Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic Power Level Client model.

CONFIG_BLE_MESH_GENERIC_BATTERY_CLI
Generic Battery Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic Battery Client model.

CONFIG_BLE_MESH_GENERIC_LOCATION_CLI
Generic Location Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic Location Client model.

CONFIG_BLE_MESH_GENERIC_PROPERTY_CLI
Generic Property Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic Property Client model.

CONFIG_BLE_MESH_SENSOR_CLI
Sensor Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Sensor Client model.

CONFIG_BLE_MESH_TIME_CLI
Time Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Time Client model.
CONFIG_BLE_MESH_SCENE_CLI

Scene Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Scene Client model.

CONFIG_BLE_MESH_SCHEDULER_CLI

Scheduler Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Scheduler Client model.

CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI

Light Lightness Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light Lightness Client model.

CONFIG_BLE_MESH_LIGHT_CTL_CLI

Light CTL Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light CTL Client model.

CONFIG_BLE_MESH_LIGHT_HSL_CLI

Light HSL Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light HSL Client model.

CONFIG_BLE_MESH_LIGHT_XYL_CLI

Light XYL Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light XYL Client model.

CONFIG_BLE_MESH_LIGHT_LC_CLI

Light LC Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light LC Client model.

CONFIG_BLE_MESH_GENERIC_SERVER

Generic server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic server models.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH
CONFIG_BLE_MESH_SENSOR_SERVER
Sensor server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Sensor server models.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_TIME_SCENE_SERVER
Time and Scenes server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Time and Scenes server models.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_LIGHTING_SERVER
Lighting server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Lighting server models.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_MBT_CLI
BLOB Transfer Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for BLOB Transfer Client model.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_MAX_BLOB_RECEIVERS
Maximum number of simultaneous blob receivers

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models > CONFIG_BLE_MESH_MBT_CLI*

Maximum number of BLOB Transfer Server models that can participating in the BLOB transfer with a BLOB Transfer Client model.

**Range:**
- from 1 to 255 if CONFIG_BLE_MESH_MBT_CLI & & CONFIG_BLE_MESH

**Default value:**
- 2 if CONFIG_BLE_MESH_MBT_CLI & & CONFIG_BLE_MESH

CONFIG_BLE_MESH_MBT_SRV
BLOB Transfer Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for BLOB Transfer Server model.
Default value:
- Yes (enabled) if `CONFIG_BLE_MESH

**CONFIG_BLE_MESH_IV_UPDATE_TEST**

Test the IV Update Procedure

*Found in: Component config > CONFIG_BLE_MESH*

This option removes the 96 hour limit of the IV Update Procedure and lets the state to be changed at any time. If IV Update test mode is going to be used, this option should be enabled.

Default value:
- No (disabled) if `CONFIG_BLE_MESH`

**BLE Mesh specific test option**  Contains:

- `CONFIG_BLE_MESH_DEBUG`
- `CONFIG_BLE_MESH_SHELL`
- `CONFIG_BLE_MESH_BQB_TEST`
- `CONFIG_BLE_MESH_SELF_TEST`
- `CONFIG_BLE_MESH_TEST_AUTO_ENTER_NETWORK`
- `CONFIG_BLE_MESH_TEST_USE_WHITE_LIST`

**CONFIG_BLE_MESH_SELF_TEST**

Perform BLE Mesh self-tests

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

This option adds extra self-tests which are run every time BLE Mesh networking is initialized.

Default value:
- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_BQB_TEST**

Enable BLE Mesh specific internal test

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

This option is used to enable some internal functions for auto-pts test.

Default value:
- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_TEST_AUTO_ENTER_NETWORK**

Unprovisioned device enters mesh network automatically

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

With this option enabled, an unprovisioned device can automatically enters mesh network using a specific test function without the provisioning procedure. And on the Provisioner side, a test function needs to be invoked to add the node information into the mesh stack.

Default value:
- Yes (enabled) if `CONFIG_BLE_MESH_SELF_TEST` & `CONFIG_BLE_MESH`
CONFIG_BLE_MESH_TEST_USE_WHITE_LIST

Use white list to filter mesh advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

With this option enabled, users can use white list to filter mesh advertising packets while scanning.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH_SELF_TEST && CONFIG_BLE_MESH

CONFIG_BLE_MESH_SHELL

Enable BLE Mesh shell

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

Activate shell module that provides BLE Mesh commands to the console.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_DEBUG

Enable BLE Mesh debug logs

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

Enable debug logs for the BLE Mesh functionality.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_DEBUG_NET

Network layer debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Network layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_TRANS

Transport layer debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Transport layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_BEACON

Beacon debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Beacon-related debug logs for the BLE Mesh functionality.
CONFIG_BLE_MESH_DEBUG_CRYPTO

Crypto debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable cryptographic debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_PROV

Provisioning debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Provisioning debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_ACCESS

Access layer debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Access layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_MODEL

Foundation model debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Foundation Models debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_ADV

Advertising debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable advertising debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_LOW_POWER

Low Power debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Low Power debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_FRIEND

Friend debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Friend debug logs for the BLE Mesh functionality.
CONFIG_BLE_MESH_DEBUG_PROXY

Proxy debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Proxy protocol debug logs for the BLE Mesh functionality.

Driver Configurations

Contains:

- Analog Comparator Configuration
- DAC Configuration
- I2C Configuration
- I2S Configuration
- LEDC Configuration
- Legacy ADC Configuration
- MCPWM Configuration
- Parallel IO Configuration
- RMT Configuration
- Sigma Delta Modulator Configuration
- SPI Configuration
- Temperature sensor Configuration
- TWAI Configuration
- UART Configuration
- USB Serial/JTAG Configuration

 Legacy ADC Configuration

Contains:

- CONFIG_ADC_DISABLE_DAC
- Legacy ADC Calibration Configuration
- CONFIG_ADC_SUPPRESS_DEPRECATE_WARN

CONFIG_ADC_DISABLE_DAC

Disable DAC when ADC2 is used on GPIO 25 and 26

Found in: Component config > Driver Configurations > Legacy ADC Configuration

If this is set, the ADC2 driver will disable the output of the DAC corresponding to the specified channel. This is the default value.

For testing, disable this option so that we can measure the output of DAC by internal ADC.

Default value:

- Yes (enabled)

CONFIG_ADC_SUPPRESS_DEPRECATE_WARN

Suppress legacy driver deprecated warning

Found in: Component config > Driver Configurations > Legacy ADC Configuration

Whether to suppress the deprecation warnings when using legacy adc driver (driver/adc.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

Default value:

- No (disabled)
Legacy ADC Calibration Configuration  Contains:
  - `CONFIG_ADC_CALI_SUPPRESS_DEPRECATE_WARN`

`CONFIG_ADC_CALI_SUPPRESS_DEPRECATE_WARN`
Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > Legacy ADC Configuration > Legacy ADC Calibration Configuration*

Whether to suppress the deprecation warnings when using legacy adc calibration driver (esp_adc_cal.h).
If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

SPI Configuration  Contains:
  - `CONFIG_SPI_MASTER_ISR_IN_IRAM`
  - `CONFIG_SPI_SLAVE_ISR_IN_IRAM`
  - `CONFIG_SPI_MASTER_IN_IRAM`
  - `CONFIG_SPI_SLAVE_IN_IRAM`

`CONFIG_SPI_MASTER_IN_IRAM`
Place transmitting functions of SPI master into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*

Normally only the ISR of SPI master is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there’s some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue_trans`, `get_trans_result` and `transmit` functions into the IRAM to avoid possible cache miss.

This configuration won’t be available if `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH` is enabled.
During unit test, this is enabled to measure the ideal case of api.

`CONFIG_SPI_MASTER_ISR_IN_IRAM`
Place SPI master ISR function into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*

Place the SPI master ISR in to IRAM to avoid possible cache miss.

Enabling this configuration is possible only when `HEAP_PLACE_FUNCTION_INTO_FLASH` is disabled since the spi master uses can allocate transactions buffers into DMA memory section using the heap component API that ipso facto has to be placed in IRAM.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

`CONFIG_SPI_SLAVE_IN_IRAM`
Place transmitting functions of SPI slave into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*
Normally only the ISR of SPI slave is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there’s some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put queue_trans, get_trans_result and transmit functions into the IRAM to avoid possible cache miss.

**Default value:**
- No (disabled)

**CONFIG_SPI_SLAVE_ISR_IN_IRAM**

Place SPI slave ISR function into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*

Place the SPI slave ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add ESP_INTR_FLAG_IRAM when initializing the driver.

**Default value:**
- Yes (enabled)

**TWAI Configuration**

Contains:
- `CONFIG_TWAI_ERRATA_FIX_LISTEN_ONLY_DOM`
- `CONFIG_TWAI_ISR_IN_IRAM`

**CONFIG_TWAI_ISR_IN_IRAM**

Place TWAI ISR function into IRAM

*Found in: Component config > Driver Configurations > TWAI Configuration*

Place the TWAI ISR in to IRAM. This will allow the ISR to avoid cache misses, and also be able to run whilst the cache is disabled (such as when writing to SPI Flash). Note that if this option is enabled:
- Users should also set the ESP_INTR_FLAG_IRAM in the driver configuration structure when installing the driver (see docs for specifics).
- Alert logging (i.e., setting of the TWAI_ALERT_AND_LOG flag) will have no effect.

**Default value:**
- No (disabled)

**CONFIG_TWAI_ERRATA_FIX_LISTEN_ONLY_DOM**

Add SW workaround for listen only transmits dominant bit errata

*Found in: Component config > Driver Configurations > TWAI Configuration*

When in the listen only mode, the TWAI controller must not influence the TWAI bus (i.e., must not send any dominant bits). However, while in listen only mode on the ESP32/ESP32-S2/ESP32-S3/ESP32-C3, the TWAI controller will still transmit dominant bits when it detects an error (i.e., as part of an active error frame). Enabling this option will add a workaround that forces the TWAI controller into an error passive state on initialization, thus preventing any dominant bits from being sent.

**Default value:**
- Yes (enabled)

**Temperature sensor Configuration**

Contains:
- `CONFIG_TEMP_SENSOR_ENABLE_DEBUG_LOG`
- `CONFIG_TEMP_SENSOR_SUPPRESS_DEPRECAT𝗘_warn`
- `CONFIG_TEMP_SENSOR_ISR_IRAM_SAFE`
CONFIG_TEMP_SENSOR_SUPPRESS_DEPRECATE_WARN
Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > Temperature sensor Configuration*

Whether to suppress the deprecation warnings when using legacy temperature sensor driver (driver/temp_sensor.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

CONFIG_TEMP_SENSOR_ENABLE_DEBUG_LOG
Enable debug log

*Found in: Component config > Driver Configurations > Temperature sensor Configuration*

Whether to enable the debug log message for temperature sensor driver. Note that, this option only controls the temperature sensor driver log, won’t affect other drivers.

**Default value:**
- No (disabled)

CONFIG_TEMP_SENSOR_ISR_IRAM_SAFE
Temperature sensor ISR IRAM-Safe

*Found in: Component config > Driver Configurations > Temperature sensor Configuration*

Ensure the Temperature Sensor interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
- No (disabled) if SOC_TEMPERATURE_SENSOR_INTR_SUPPORT

UART Configuration Contains:
- CONFIG_UART_ISR_IN_IRAM

CONFIG_UART_ISR_IN_IRAM
Place UART ISR function into IRAM

*Found in: Component config > Driver Configurations > UART Configuration*

If this option is not selected, UART interrupt will be disabled for a long time and may cause data lost when doing spi flash operation.

Sigma Delta Modulator Configuration Contains:
- CONFIG_SDM_ENABLE_DEBUG_LOG
- CONFIG_SDM_CTRL_FUNC_IN_IRAM
- CONFIG_SDM_SUPPRESS_DEPRECATE_WARN

CONFIG_SDM_CTRL_FUNC_IN_IRAM
Place SDM control functions into IRAM

*Found in: Component config > Driver Configurations > Sigma Delta Modulator Configuration*
Place SDM control functions (like set_duty) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

Default value:
- No (disabled)

**CONFIG_SDM_SUPPRESS_DEPRECATE_WARN**

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > Sigma Delta Modulator Configuration*

Whether to suppress the deprecation warnings when using legacy sigma delta driver. If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

Default value:
- No (disabled)

**CONFIG_SDM_ENABLE_DEBUG_LOG**

Enable debug log

*Found in: Component config > Driver Configurations > Sigma Delta Modulator Configuration*

Whether to enable the debug log message for SDM driver. Note that, this option only controls the SDM driver log, won’t affect other drivers.

Default value:
- No (disabled)

**Analog Comparator Configuration**

Contains:
- `CONFIG_ANA_CMPR_ISR_IRAM_SAFE`
- `CONFIG_ANA_CMPR_ENABLE_DEBUG_LOG`
- `CONFIG_ANA_CMPR_CTRL.Func.IN_IRAM`

**CONFIG_ANA_CMPR_ISR_IRAM_SAFE**

Analog comparator ISR IRAM-Safe

*Found in: Component config > Driver Configurations > Analog Comparator Configuration*

Ensure the Analog Comparator interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

Default value:
- No (disabled) if SOC_ANA_CMPR_SUPPORTED

**CONFIG_ANA_CMPR_CTRL.Func.IN_IRAM**

Place Analog Comparator control functions into IRAM

*Found in: Component config > Driver Configurations > Analog Comparator Configuration*

Place Analog Comparator control functions (like ana_cmpr_set_internal_reference) into IRAM, so that these functions can be IRAM-safe and able to be called in an IRAM interrupt context. Enabling this option can improve driver performance as well.

Default value:
- No (disabled) if SOC_ANA_CMPR_SUPPORTED
## CONFIG_ANA_CMPR_ENABLE_DEBUG_LOG

Enable debug log

*Found in: Component config > Driver Configurations > Analog Comparator Configuration*

Wether to enable the debug log message for Analog Comparator driver. Note that, this option only controls the Analog Comparator driver log, won’t affect other drivers.

**Default value:**
- No (disabled) if SOC_ANA_CMPR_SUPPORTED

## RMT Configuration

Contains:
- CONFIG_RMT_ENABLE_DEBUG_LOG
- CONFIG_RMT_RECV_FUNC_IN_IRAM
- CONFIG_RMT_ISR_IRAM_SAFE
- CONFIG_RMT_SUPPRESS_DEPRECATE_WARN

## CONFIG_RMT_ISR_IRAM_SAFE

RMT ISR IRAM-Safe

*Found in: Component config > Driver Configurations > RMT Configuration*

Ensure the RMT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
- No (disabled)

## CONFIG_RMT_RECV_FUNC_IN_IRAM

Place RMT receive function into IRAM

*Found in: Component config > Driver Configurations > RMT Configuration*

Place RMT receive function into IRAM, so that the receive function can be IRAM-safe and able to be called when the flash cache is disabled. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled)

## CONFIG_RMT_SUPPRESS_DEPRECATE_WARN

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > RMT Configuration*

Wether to suppress the deprecation warnings when using legacy rmt driver (driver/rmt.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

## CONFIG_RMT_ENABLE_DEBUG_LOG

Enable debug log

*Found in: Component config > Driver Configurations > RMT Configuration*

Wether to enable the debug log message for RMT driver. Note that, this option only controls the RMT driver log, won’t affect other drivers.
**MCPWM Configuration**  
Contains:

- `CONFIG_MCPWM_ENABLE_DEBUG_LOG`
- `CONFIG_MCPWM_CTRL_FUNC_IN_IRAM`
- `CONFIG_MCPWM_ISR_IRAM_SAFE`
- `CONFIG_MCPWM_SUPPRESS_DEPRECATE_WARN`

**CONFIG_MCPWM_ISR_IRAM_SAFE**
Place MCPWM ISR function into IRAM

*Found in: Component config > Driver Configurations > MCPWM Configuration*

This will ensure the MCPWM interrupt handle is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write)

**Default value:**
- No (disabled) if SOC_MCPWM_SUPPORTED

**CONFIG_MCPWM_CTRL_FUNC_IN_IRAM**
Place MCPWM control functions into IRAM

*Found in: Component config > Driver Configurations > MCPWM Configuration*

Place MCPWM control functions (like set_compare_value) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled) if SOC_MCPWM_SUPPORTED

**CONFIG_MCPWM_SUPPRESS_DEPRECATE_WARN**
Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > MCPWM Configuration*

Whether to suppress the deprecation warnings when using legacy MCPWM driver (driver/mcpwm.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled) if SOC_MCPWM_SUPPORTED

**CONFIG_MCPWM_ENABLE_DEBUG_LOG**
Enable debug log

*Found in: Component config > Driver Configurations > MCPWM Configuration*

Whether to enable the debug log message for MCPWM driver. Note that, this option only controls the MCPWM driver log, won’t affect other drivers.

**Default value:**
- No (disabled) if SOC_MCPWM_SUPPORTED
**I2S Configuration**  
Contains:

- `CONFIG_I2S_ENABLE_DEBUG_LOG`
- `CONFIG_I2S_ISR_IRAM_SAFE`
- `CONFIG_I2S_SUPPRESS_DEPRECATE_WARN`

**CONFIG_I2S_ISR_IRAM_SAFE**

I2S ISR IRAM-Safe

*Found in: Component config > Driver Configurations > I2S Configuration*

Ensure the I2S interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled)

**CONFIG_I2S_SUPPRESS_DEPRECATE_WARN**

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > I2S Configuration*

Enable this option will suppress the deprecation warnings of using APIs in legacy I2S driver.

**Default value:**

- No (disabled)

**CONFIG_I2S_ENABLE_DEBUG_LOG**

Enable I2S debug log

*Found in: Component config > Driver Configurations > I2S Configuration*

Whether to enable the debug log message for I2S driver. Note that, this option only controls the I2S driver log, will not affect other drivers.

**Default value:**

- No (disabled)

**DAC Configuration**  
Contains:

- `CONFIG_DAC_DMA_AUTO_16BIT_ALIGN`
- `CONFIG_DAC_ISR_IRAM_SAFE`
- `CONFIG_DAC_ENABLE_DEBUG_LOG`
- `CONFIG_DAC_CTRL_FUNC_IN_IRAM`
- `CONFIG_DAC_SUPPRESS_DEPRECATE_WARN`

**CONFIG_DAC_CTRL_FUNC_IN_IRAM**

Place DAC control functions into IRAM

*Found in: Component config > Driver Configurations > DAC Configuration*

Place DAC control functions (e.g. ‘dac_oneshot_output_voltage’) into IRAM, so that this function can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)
CONFIG_DAC_ISR_IRAM_SAFE

DAC ISR IRAM-Safe

Found in: Component config > Driver Configurations > DAC Configuration

Ensure the DAC interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

Default value:
• No (disabled)

CONFIG_DAC_SUPPRESS_DEPRECATE_WARN

Suppress legacy driver deprecated warning

Found in: Component config > Driver Configurations > DAC Configuration

Whether to suppress the deprecation warnings when using legacy DAC driver (driver/dac.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

Default value:
• No (disabled)

CONFIG_DAC_ENABLE_DEBUG_LOG

Enable debug log

Found in: Component config > Driver Configurations > DAC Configuration

Whether to enable the debug log message for DAC driver. Note that, this option only controls the DAC driver log, won’t affect other drivers.

Default value:
• No (disabled)

CONFIG_DAC_DMA_AUTO_16BIT_ALIGN

Align the continuous data to 16 bit automatically

Found in: Component config > Driver Configurations > DAC Configuration

Whether to left shift the continuous data to align every bytes to 16 bits in the driver. On ESP32, although the DAC resolution is only 8 bits, the hardware requires 16 bits data in continuous mode. By enabling this option, the driver will left shift 8 bits for the input data automatically. Only disable this option when you decide to do this step by yourself. Note that the driver will allocate a new piece of memory to save the converted data.

Default value:
• Yes (enabled) if SOC_DAC_DMA_16BIT_ALIGN

USB Serial/JTAG Configuration

Contains:

• CONFIG_USJ_NO_AUTO_LS_ON_CONNECTION

CONFIG_USJ_NO_AUTO_LS_ON_CONNECTION

Don’t enter the automatic light sleep when USB Serial/JTAG port is connected

Found in: Component config > Driver Configurations > USB Serial/JTAG Configuration

If enabled, the chip will constantly monitor the connection status of the USB Serial/JTAG port. As long as the USB Serial/JTAG is connected, a ESP_PM_NO_LIGHT_SLEEP power management lock will be acquired to prevent the system from entering light sleep. This option can be useful if serial monitoring
is needed via USB Serial/JTAG while power management is enabled, as the USB Serial/JTAG cannot work under light sleep and after waking up from light sleep. Note. This option can only control the automatic Light-Sleep behavior. If esp_light_sleep_start() is called manually from the program, enabling this option will not prevent light sleep entry even if the USB Serial/JTAG is in use.

Parallel IO Configuration  Contains:

- `CONFIG_PARLIO_ENABLE_DEBUG_LOG`
- `CONFIG_PARLIO_ISR_IRAM_SAFE`

**CONFIG_PARLIO_ENABLE_DEBUG_LOG**

Enable debug log

*Found in: Component config > Driver Configurations > Parallel IO Configuration*

Wether to enable the debug log message for parallel IO driver. Note that, this option only controls the parallel IO driver log, won’t affect other drivers.

**Default value:**
- No (disabled) if SOC_PARLIO_SUPPORTED

**CONFIG_PARLIO_ISR_IRAM_SAFE**

Parallel IO ISR IRAM-Safe

*Found in: Component config > Driver Configurations > Parallel IO Configuration*

Ensure the Parallel IO interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
- No (disabled) if SOC_PARLIO_SUPPORTED

**LEDC Configuration**  Contains:

- `CONFIG_LEDC_CTRL_FUNC_IN_IRAM`

**CONFIG_LEDC_CTRL_FUNC_IN_IRAM**

Place LEDC control functions into IRAM

*Found in: Component config > Driver Configurations > LEDC Configuration*

Place LEDC control functions (ledc_update_duty and ledc_stop) into IRAM, so that these functions can be IRAM-safe and able to be called in an IRAM context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled)

**I2C Configuration**  Contains:

- `CONFIG_I2C_ENABLE_DEBUG_LOG`
- `CONFIG_I2C_ISR_IRAM_SAFE`
**CONFIG_I2C_ISR_IRAM_SAFE**

I2C ISR IRAM-Safe

*Found in: Component config > Driver Configurations > I2C Configuration*

Ensure the I2C interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write). note: This cannot be used in the I2C legacy driver.

**Default value:**
- No (disabled)

**CONFIG_I2C_ENABLE_DEBUG_LOG**

Enable I2C debug log

*Found in: Component config > Driver Configurations > I2C Configuration*

Whether to enable the debug log message for I2C driver. Note that this option only controls the I2C driver log, will not affect other drivers.

note: This cannot be used in the I2C legacy driver.

**Default value:**
- No (disabled)

**eFuse Bit Manager**  
Contains:
- **CONFIG_EFUSE_VIRTUAL**
- **CONFIG_EFUSE_CUSTOM_TABLE**

**CONFIG_EFUSE_CUSTOM_TABLE**

Use custom eFuse table

*Found in: Component config > eFuse Bit Manager*

Allows to generate a structure for eFuse from the CSV file.

**Default value:**
- No (disabled)

**CONFIG_EFUSE_CUSTOM_TABLE_FILENAME**

Custom eFuse CSV file

*Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_CUSTOM_TABLE*

Name of the custom eFuse CSV filename. This path is evaluated relative to the project root directory.

**Default value:**
- “main/esp_efuse_custom_table.csv” if **CONFIG_EFUSE_CUSTOM_TABLE**

**CONFIG_EFUSE_VIRTUAL**

Simulate eFuse operations in RAM

*Found in: Component config > eFuse Bit Manager*

If “n” - No virtual mode. All eFuse operations are real and use eFuse registers. If “y” - The virtual mode is enabled and all eFuse operations (read and write) are redirected to RAM instead of eFuse registers, all permanent changes (via eFuse) are disabled. Log output will state changes that would be applied, but they will not be.

If it is “y”, then **SECURE_FLASH_ENCRYPTION_MODE_RELEASE** cannot be used. Because the EFUSE VIRT mode is for testing only.
During startup, the eFuses are copied into RAM. This mode is useful for fast tests.

**Default value:**
- No (disabled)

**CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH**

Keep eFuses in flash

*Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_VIRTUAL*

In addition to the “Simulate eFuse operations in RAM” option, this option just adds a feature to keep eFuses after reboots in flash memory. To use this mode the partition_table should have the efuse partition.

```
partition_table: efuse_em, data, efuse, 0x2000
```

During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This mode is useful when need to keep changes after reboot (testing secure_boot and flash_encryption).

**CONFIG_EFUSE_VIRTUAL_LOG_ALL_WRITES**

Log all virtual writes

*Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_VIRTUAL*

If enabled, log efuse burns. This shows changes that would be made.

**ESP-TLS**

Contains:

- `CONFIG_ESP_TLS_INSECURE`
- `CONFIG_ESP_TLS_SERVER_CERT_SELECT_HOOK`
- `CONFIG_ESP_TLS_LIBRARY_CHOOSE`
- `CONFIG_ESP_TLS_CLIENT_SESSION_TICKETS`
- `CONFIG_ESP_DEBUG_WOLFSSL`
- `CONFIG_ESP_TLS_PSK_VERIFICATION`
- `CONFIG_ESP_TLS_SERVER_SESSION_TICKETS`
- `CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY`
- `CONFIG_ESP_TLS_SERVER_MIN_AUTH_MODE_OPTIONAL`
- `CONFIG_ESP_TLS_USE_DS_PERIPHERAL`

**CONFIG_ESP_TLS_LIBRARY_CHOOSE**

Choose SSL/TLS library for ESP-TLS (See help for more Info)

*Found in: Component config > ESP-TLS*

The ESP-TLS APIs support multiple backend TLS libraries. Currently mbedTLS and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

Available options:

- mbedTLS (`CONFIG_ESP_TLS_USING_MBEDTLS`)
- wolfSSL (License info in wolfSSL directory README) (`CONFIG_ESP_TLS_USING_WOLFSSL`)
**CONFIG_ESP_TLS_USE_DS_PERIPHERAL**

Use Digital Signature (DS) Peripheral with ESP-TLS

*Found in: Component config > ESP-TLS*

Enable use of the Digital Signature Peripheral for ESP-TLS. The DS peripheral can only be used when it is appropriately configured for TLS. Consult the ESP-TLS documentation in ESP-IDF Programming Guide for more details.

*Default value:*
- Yes (enabled)

**CONFIG_ESP_TLS_CLIENT_SESSION_TICKETS**

Enable client session tickets

*Found in: Component config > ESP-TLS*

Enable session ticket support as specified in RFC5077.

**CONFIG_ESP_TLS_SERVER_SESSION_TICKETS**

Enable server session tickets

*Found in: Component config > ESP-TLS*

Enable session ticket support as specified in RFC5077

**CONFIG_ESP_TLS_SERVER_SESSION_TICKET_TIMEOUT**

Server session ticket timeout in seconds

*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_SERVER_SESSION_TICKETS*

Sets the session ticket timeout used in the tls server.

*Default value:*
- 86400 if CONFIG_ESP_TLS_SERVER_SESSION_TICKETS

**CONFIG_ESP_TLS_SERVER_CERT_SELECT_HOOK**

Certificate selection hook

*Found in: Component config > ESP-TLS*

Ability to configure and use a certificate selection callback during server handshake, to select a certificate to present to the client based on the TLS extensions supplied in the client hello (alpn, sni, etc).

**CONFIG_ESP_TLS_SERVER_MIN_AUTH_MODE_OPTIONAL**

ESP-TLS Server: Set minimum Certificate Verification mode to Optional

*Found in: Component config > ESP-TLS*

When this option is enabled, the peer (here, the client) certificate is checked by the server, however the handshake continues even if verification failed. By default, the peer certificate is not checked and ignored by the server.

mbedtls_ssl_get_verify_result() can be called after the handshake is complete to retrieve status of verification.
CONFIG_ESP_TLS_PSK_VERIFICATION
Enable PSK verification
*Found in: Component config > ESP-TLS*
Enable support for pre shared key ciphers, supported for both mbedTLS as well as wolfSSL TLS library.

CONFIG_ESP_TLS_INSECURE
Allow potentially insecure options
*Found in: Component config > ESP-TLS*
You can enable some potentially insecure options. These options should only be used for testing purposes. Only enable these options if you are very sure.

CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY
Skip server certificate verification by default (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)
*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_INSECURE*
After enabling this option the esp-tls client will skip the server certificate verification by default. Note that this option will only modify the default behaviour of esp-tls client regarding server cert verification. The default behaviour should only be applicable when no other option regarding the server cert verification is opted in the esp-tls config (e.g. crt_bundle_attach, use_global_ca_store etc.). WARNING : Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca_store etc.

CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY
Enable SMALL_CERT_VERIFY
*Found in: Component config > ESP-TLS*
Enables server verification with Intermediate CA cert, does not authenticate full chain of trust upto the root CA cert (After Enabling this option client only needs to have Intermediate CA certificate of the server to authenticate server, root CA cert is not necessary).

**Default value:**
- Yes (enabled) if CONFIG_ESP_TLS_USING_WOLFSSL

CONFIG_ESP_DEBUG_WOLFSSL
Enable debug logs for wolfSSL
*Found in: Component config > ESP-TLS*
Enable detailed debug prints for wolfSSL SSL library.

ADC and ADC Calibration  Contains:
- *ADC Calibration Configurations*
- CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE
- CONFIG_ADC_DISABLE_DAC_OUTPUT
- CONFIG_ADC_ENABLE_DEBUG_LOG
- CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM
**CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM**

Place ISR version ADC oneshot mode read function into IRAM

*Found in: Component config > ADC and ADC Calibration*

Place ISR version ADC oneshot mode read function into IRAM.

**Default value:**
- No (disabled)

**CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE**

ADC continuous mode driver ISR IRAM-Safe

*Found in: Component config > ADC and ADC Calibration*

Ensure the ADC continuous mode ISR is IRAM-Safe. When enabled, the ISR handler will be available when the cache is disabled.

**Default value:**
- No (disabled)

**ADC Calibration Configurations**

**CONFIG_ADC_DISABLE_DAC_OUTPUT**

Disable DAC when ADC2 is in use

*Found in: Component config > ADC and ADC Calibration*

By default, this is set. The ADC oneshot driver will disable the output of the corresponding DAC channels: ESP32: IO25 and IO26 ESP32S2: IO17 and IO18

Disable this option so as to measure the output of DAC by internal ADC, for test usage.

**Default value:**
- Yes (enabled)

**CONFIG_ADC_ENABLE_DEBUG_LOG**

Enable ADC debug log

*Found in: Component config > ADC and ADC Calibration*

Whether to enable the debug log message for ADC driver. Note that this option only controls the ADC driver log, will not affect other drivers.

*note:* This cannot be used in the ADC legacy driver.

**Default value:**
- No (disabled)

**Wireless Coexistence** Contains:

- **CONFIG_ESP_COEX_EXTERNAL_COEXIST_ENABLE**
- **CONFIG_ESP_COEX_SW_COEXIST_ENABLE**
Chapter 2. API Reference

**CONFIG_ESP_COEX_SW_COEXIST_ENABLE**

Software controls WiFi/Bluetooth coexistence

*Found in: Component config > Wireless Coexistence*

If enabled, WiFi & Bluetooth coexistence is controlled by software rather than hardware. Recommended for heavy traffic scenarios. Both coexistence configuration options are automatically managed, no user intervention is required. If only Bluetooth is used, it is recommended to disable this option to reduce binary file size.

**Default value:**
- Yes (enabled) if CONFIG_BT_ENABLED

**CONFIG_ESP_COEX_EXTERNAL_COEXIST_ENABLE**

External Coexistence

*Found in: Component config > Wireless Coexistence*

If enabled, HW External coexistence arbitration is managed by GPIO pins. It can support three types of wired combinations so far which are 1-wired/2-wired/3-wired. User can select GPIO pins in application code with configure interfaces.

This function depends on BT-off because currently we do not support external coex and internal coex simultaneously.

**Common ESP-related**

**Contains:**
- **CONFIG_ESP_ERR_TO_NAME_LOOKUP**

**CONFIG_ESP_ERR_TO_NAME_LOOKUP**

Enable lookup of error code strings

*Found in: Component config > Common ESP-related*

Functions esp_err_to_name() and esp_err_to_name_r() return string representations of error codes from a pre-generated lookup table. This option can be used to turn off the use of the look-up table in order to save memory but this comes at the price of sacrificing distinguishable (meaningful) output string representations.

**Default value:**
- Yes (enabled)

**ESP-Driver:GPIO Configurations**

**Contains:**
- **CONFIG_GPIO_CTRL_FUNC_IN_IRAM**

**CONFIG_GPIO_CTRL_FUNC_IN_IRAM**

Place GPIO control functions into IRAM

*Found in: Component config > ESP-Driver:GPIO Configurations*

Place GPIO control functions (like intr_disable/set_level) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.

**Default value:**
- No (disabled)
ESP-Driver: GPTimer Configurations  Contains:

- **CONFIG_GPTIMER_ENABLE_DEBUG_LOG**
- **CONFIG_GPTIMER_ISR_IRAM_SAFE**
- **CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM**
- **CONFIG_GPTIMER_ISR_HANDLER_IN_IRAM**
- **CONFIG_GPTIMER_SUPPRESS_DEPRECATE_WARN**

### CONFIG_GPTIMER_ISR_HANDLER_IN_IRAM

Place GPTimer ISR handler into IRAM

*Found in: Component config > ESP-Driver: GPTimer Configurations*

Place GPTimer ISR handler into IRAM for better performance and fewer cache misses.

**Default value:**
- Yes (enabled)

### CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM

Place GPTimer control functions into IRAM

*Found in: Component config > ESP-Driver: GPTimer Configurations*

Place GPTimer control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled)

### CONFIG_GPTIMER_ISR_IRAM_SAFE

GPTimer ISR IRAM-Safe

*Found in: Component config > ESP-Driver: GPTimer Configurations*

Ensure the GPTimer interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
- No (disabled)

### CONFIG_GPTIMER_SUPPRESS_DEPRECATE_WARN

Suppress legacy driver deprecated warning

*Found in: Component config > ESP-Driver: GPTimer Configurations*

Wether to suppress the deprecation warnings when using legacy timer group driver (driver/timer.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

### CONFIG_GPTIMER_ENABLE_DEBUG_LOG

Enable debug log

*Found in: Component config > ESP-Driver: GPTimer Configurations*

Wether to enable the debug log message for GPTimer driver. Note that, this option only controls the GPTimer driver log, won’t affect other drivers.
Default value:
- No (disabled)

ESP-Driver:PCNT Configurations  Contains:
- CONFIG_PCNT_ENABLE_DEBUG_LOG
- CONFIG_PCNT_ISR_IRAM_SAFE
- CONFIG_PCNT_CTRL_FUNC_IN_IRAM
- CONFIG_PCNT_SUPPRESS_DEPRECATE_WARN

CONFIG_PCNT_CTRL_FUNC_IN_IRAM
Place PCNT control functions into IRAM

Found in: Component config > ESP-Driver:PCNT Configurations

Place PCNT control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

Default value:
- No (disabled)

CONFIG_PCNT_ISR_IRAM_SAFE
PCNT ISR IRAM-Safe

Found in: Component config > ESP-Driver:PCNT Configurations

Ensure the PCNT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

Default value:
- No (disabled)

CONFIG_PCNT_SUPPRESS_DEPRECATE_WARN
Suppress legacy driver deprecated warning

Found in: Component config > ESP-Driver:PCNT Configurations

Whether to suppress the deprecation warnings when using legacy PCNT driver (driver/pcnt.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

Default value:
- No (disabled)

CONFIG_PCNT_ENABLE_DEBUG_LOG
Enable debug log

Found in: Component config > ESP-Driver:PCNT Configurations

Whether to enable the debug log message for PCNT driver. Note that, this option only controls the PCNT driver log, won’t affect other drivers.

Default value:
- No (disabled)
Ethernet  Contains:
  - CONFIG_ETH_TRANSMIT_MUTEX
  - CONFIG_ETH_USE_OPENETH
  - CONFIG_ETH_USE_SPI_ETHERNET

CONFIG_ETH_USE_SPI_ETHERNET
Support SPI to Ethernet Module
*Found in: Component config > Ethernet*
ESP-IDF can also support some SPI-Ethernet modules.

**Default value:**
- Yes (enabled)

Contains:
  - CONFIG_ETH_SPI_ETHERNET_DM9051
  - CONFIG_ETH_SPI_ETHERNET_KSZ8851SNL
  - CONFIG_ETH_SPI_ETHERNET_W5500

CONFIG_ETH_SPI_ETHERNET_DM9051
Use DM9051
*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*
DM9051 is a fast Ethernet controller with an SPI interface. It’s also integrated with a 10/100M PHY and MAC. Select this to enable DM9051 driver.

CONFIG_ETH_SPI_ETHERNET_W5500
Use W5500 (MAC RAW)
*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*
W5500 is a HW TCP/IP embedded Ethernet controller. TCP/IP stack, 10/100 Ethernet MAC and PHY are embedded in a single chip. However the driver in ESP-IDF only enables the RAW MAC mode, making it compatible with the software TCP/IP stack. Say yes to enable W5500 driver.

CONFIG_ETH_SPI_ETHERNET_KSZ8851SNL
Use KSZ8851SNL
*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*
The KSZ8851SNL is a single-chip Fast Ethernet controller consisting of a 10/100 physical layer transceiver (PHY), a MAC, and a Serial Peripheral Interface (SPI). Select this to enable KSZ8851SNL driver.

CONFIG_ETH_USE_OPENETH
Support OpenCores Ethernet MAC (for use with QEMU)
*Found in: Component config > Ethernet*
OpenCores Ethernet MAC driver can be used when an ESP-IDF application is executed in QEMU. This driver is not supported when running on a real chip.

**Default value:**
- No (disabled)

Contains:
• `CONFIG_ETH_OPENETH_DMA_RX_BUFFER_NUM`
• `CONFIG_ETH_OPENETH_DMA_TX_BUFFER_NUM`

**CONFIG_ETH_OPENETH_DMA_RX_BUFFER_NUM**

Number of Ethernet DMA Rx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_OPENETH*

Number of DMA receive buffers, each buffer is 1600 bytes.

*Range:*
  • from 1 to 64 if `CONFIG_ETH_USE_OPENETH`

*Default value:*
  • 4 if `CONFIG_ETH_USE_OPENETH`

**CONFIG_ETH_OPENETH_DMA_TX_BUFFER_NUM**

Number of Ethernet DMA Tx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_OPENETH*

Number of DMA transmit buffers, each buffer is 1600 bytes.

*Range:*
  • from 1 to 64 if `CONFIG_ETH_USE_OPENETH`

*Default value:*
  • 1 if `CONFIG_ETH_USE_OPENETH`

**CONFIG_ETH_TRANSMIT_MUTEX**

Enable Transmit Mutex

*Found in: Component config > Ethernet*

Prevents multiple accesses when Ethernet interface is used as shared resource and multiple functionalities might try to access it at a time.

*Default value:*
  • No (disabled)

**Event Loop Library**

Contains:

• `CONFIG_ESP_EVENT_LOOP_PROFILING`
• `CONFIG_ESP_EVENT_POST_FROM_ISR`

**CONFIG_ESP_EVENT_LOOP_PROFILING**

Enable event loop profiling

*Found in: Component config > Event Loop Library*

Enables collections of statistics in the event loop library such as the number of events posted to/recieved by an event loop, number of callbacks involved, number of events dropped to to a full event loop queue, run time of event handlers, and number of times/run time of each event handler.

*Default value:*
  • No (disabled)
CONFIG_ESP_EVENT_POST_FROM_ISR
Support posting events from ISRs

*Found in: Component config > Event Loop Library*

Enable posting events from interrupt handlers.

**Default value:**
- Yes (enabled)

CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR
Support posting events from ISRs placed in IRAM

*Found in: Component config > Event Loop Library > CONFIG_ESP_EVENT_POST_FROM_ISR*

Enable posting events from interrupt handlers placed in IRAM. Enabling this option places API functions esp_event_post and esp_event_post_to in IRAM.

**Default value:**
- Yes (enabled)

**GDB Stub**

Contains:

- CONFIG_ESP_GDBSTUB_SUPPORT_TASKS
- CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME

CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME
GDBStub at runtime

*Found in: Component config > GDB Stub*

Enable builtin GDBStub. This allows to debug the target device using serial port: - Run ‘idf.py monitor’.
- Wait for the device to initialize. - Press Ctrl+C to interrupt the execution and enter GDB attached to your device for debugging. NOTE: all UART input will be handled by GDBStub.

CONFIG_ESP_GDBSTUB_SUPPORT_TASKS
Enable listing FreeRTOS tasks through GDB Stub

*Found in: Component config > GDB Stub*

If enabled, GDBStub can supply the list of FreeRTOS tasks to GDB. Thread list can be queried from GDB using ‘info threads’ command. Note that if GDB task lists were corrupted, this feature may not work. If GDBStub fails, try disabling this feature.

CONFIG_ESP_GDBSTUB_MAX_TASKS
Maximum number of tasks supported by GDB Stub

*Found in: Component config > GDB Stub > CONFIG_ESP_GDBSTUB_SUPPORT_TASKS*

Set the number of tasks which GDB Stub will support.

**Default value:**
- 32 if CONFIG_ESP_GDBSTUB_SUPPORT_TASKS

**ESP HTTP client**

Contains:

- CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH
- CONFIG_ESP_HTTP_CLIENT_ENABLE_DIGEST_AUTH
- CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS
Chapter 2. API Reference

**CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS**
Enable https

*Found in: Component config > ESP HTTP client*

This option will enable https protocol by linking esp-tls library and initializing SSL transport

**Default value:**
- Yes (enabled)

**CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH**
Enable HTTP Basic Authentication

*Found in: Component config > ESP HTTP client*

This option will enable HTTP Basic Authentication. It is disabled by default as Basic auth uses unencrypted encoding, so it introduces a vulnerability when not using TLS

**Default value:**
- No (disabled)

**CONFIG_ESP_HTTP_CLIENT_ENABLE_DIGEST_AUTH**
Enable HTTP Digest Authentication

*Found in: Component config > ESP HTTP client*

This option will enable HTTP Digest Authentication. It is enabled by default, but use of this configuration is not recommended as the password can be derived from the exchange, so it introduces a vulnerability when not using TLS

**Default value:**
- No (disabled)

**HTTP Server**
Contains:

- **CONFIG_HTTPD_QUEUE_WORK_BLOCKING**
- **CONFIG_HTTPD_PURGE_BUF_LEN**
- **CONFIG_HTTPD_LOG_PURGE_DATA**
- **CONFIG_HTTPD_MAX_REQ_HDR_LEN**
- **CONFIG_HTTPD_MAX_URI_LEN**
- **CONFIG_HTTPD_ERR_RESP_NO_DELAY**
- **CONFIG_HTTPD_WS_SUPPORT**

**CONFIG_HTTPD_MAX_REQ_HDR_LEN**
Max HTTP Request Header Length

*Found in: Component config > HTTP Server*

This sets the maximum supported size of headers section in HTTP request packet to be processed by the server

**Default value:**
- 512

**CONFIG_HTTPD_MAX_URI_LEN**
Max HTTP URI Length

*Found in: Component config > HTTP Server*

This sets the maximum supported size of HTTP request URI to be processed by the server
CONFIG_HTTPD_ERR_RESP_NO_DELAY
Use TCP_NODELAY socket option when sending HTTP error responses

* Default value:
  * 512

Found in: Component config > HTTP Server

Using TCP_NODELAY socket option ensures that HTTP error response reaches the client before the underlying socket is closed. Please note that turning this off may cause multiple test failures

Default value:
  * Yes (enabled)

CONFIG_HTTPD_PURGE_BUF_LEN
Length of temporary buffer for purging data

* Default value:
  * 32

Found in: Component config > HTTP Server

This sets the size of the temporary buffer used to receive and discard any remaining data that is received from the HTTP client in the request, but not processed as part of the server HTTP request handler.

If the remaining data is larger than the available buffer size, the buffer will be filled in multiple iterations. The buffer should be small enough to fit on the stack, but large enough to avoid excessive iterations.

Default value:
  * No (disabled)

CONFIG_HTTPD_LOG_PURGE_DATA
Log purged content data at Debug level

* Default value:

Found in: Component config > HTTP Server

Enabling this will log discarded binary HTTP request data at Debug level. For large content data this may not be desirable as it will clutter the log.

Default value:
  * No (disabled)

CONFIG_HTTPD_WS_SUPPORT
WebSocket server support

* Default value:

Found in: Component config > HTTP Server

This sets the WebSocket server support.

Default value:
  * No (disabled)

CONFIG_HTTPD_QUEUE_WORK_BLOCKING
httpd_queue_work as blocking API

* Default value:

Found in: Component config > HTTP Server

This makes httpd_queue_work() API to wait until a message space is available on UDP control socket. It internally uses a counting semaphore with count set to LWIP_UDP_RECVMBOX_SIZE to achieve this. This config will slightly change API behavior to block until message gets delivered on control socket.
ESP HTTPS OTA  Contains:

- CONFIG_ESP_HTTPS_OTA_ALLOW_HTTP
- CONFIG_ESP_HTTPS_OTA_DECRYPT_CB

CONFIG_ESP_HTTPS_OTA_DECRYPT_CB

Provide decryption callback

*Found in: Component config > ESP HTTPS OTA*

Exposes an additional callback whereby firmware data could be decrypted before being processed by OTA update component. This can help to integrate external encryption related format and removal of such encapsulation layer from firmware image.

**Default value:**
- No (disabled)

CONFIG_ESP_HTTPS_OTA_ALLOW_HTTP

Allow HTTP for OTA (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

*Found in: Component config > ESP HTTPS OTA*

It is highly recommended to keep HTTPS (along with server certificate validation) enabled. Enabling this option comes with potential risk of:
- Non-encrypted communication channel with server
- Accepting firmware upgrade image from server with fake identity

**Default value:**
- No (disabled)

ESP HTTPS server  Contains:

- CONFIG_ESP_HTTPS_SERVER_ENABLE

CONFIG_ESP_HTTPS_SERVER_ENABLE

Enable ESP_HTTPS_SERVER component

*Found in: Component config > ESP HTTPS server*

Enable ESP HTTPS server component

Hardware Settings  Contains:

- Chip revision
- Crypto DPA Protection
- ESP_SLEEP_WORKAROUND
- ETM Configuration
- GDMA Configuration
- MAC Config
- Main XTAL Config
- Peripheral Control
- RTC Clock Config
- Sleep Config

Chip revision  Contains:

- CONFIG_ESP_REV_NEW_CHIP_TEST
- CONFIG_ESP32S2_REV_MIN
CONFIG_ESP32S2_REV_MIN

Minimum Supported ESP32-S2 Revision

`Found in: Component config > Hardware Settings > Chip revision`

Required minimum chip revision. ESP-IDF will check for it and reject to boot if the chip revision fails the check. This ensures the chip used will have some modifications (features, or bugfixes).

The compiled binary will only support chips above this revision, this will also help to reduce binary size.

Available options:

- Rev v0.0 (ECO0) (CONFIG_ESP32S2_REV_MIN_0)
- Rev v1.0 (ECO1) (CONFIG_ESP32S2_REV_MIN_1)

CONFIG_ESP_REV_NEW_CHIP_TEST

Internal test mode

`Found in: Component config > Hardware Settings > Chip revision`

For internal chip testing, a small number of new versions chips didn’t update the version field in eFuse, you can enable this option to force the software recognize the chip version based on the rev selected in menuconfig.

`Default value:`

- No (disabled)

MAC Config Contains:

- `CONFIG_ESP32S2_UNIVERSAL_MAC_ADDRESSES`

CONFIG_ESP32S2_UNIVERSAL_MAC_ADDRESSES

Number of universally administered (by IEEE) MAC address

`Found in: Component config > Hardware Settings > MAC Config`

Configure the number of universally administered (by IEEE) MAC addresses. During initialization, MAC addresses for each network interface are generated or derived from a single base MAC address. If the number of universal MAC addresses is Two, all interfaces (WiFi station, WiFi softap) receive a universally administered MAC address. They are generated sequentially by adding 0, and 1 (respectively) to the final octet of the base MAC address. If the number of universal MAC addresses is one, only WiFi station receives a universally administered MAC address. It’s generated by adding 0 to the base MAC address. The WiFi softap receives local MAC addresses. It’s derived from the universal WiFi station MAC addresses. When using the default (Espressif-assigned) base MAC address, either setting can be used. When using a custom universal MAC address range, the correct setting will depend on the allocation of MAC addresses in this range (either 1 or 2 per device.)

Available options:

- One (CONFIG_ESP32S2_UNIVERSAL_MAC_ADDRESSES_ONE)
- Two (CONFIG_ESP32S2_UNIVERSAL_MAC_ADDRESSES_TWO)

Sleep Config Contains:

- `CONFIG_ESP_SLEEP_GPIO_ENABLE_INTERNAL_RESISTORS`
- `CONFIG_ESP_SLEEP_CACHE_SAFE_ASSERTION`
- `CONFIG_ESP_SLEEP_EVENT_CALLBACKS`
- `CONFIG_ESP_SLEEP_DEBUG`
Chapter 2. API Reference

- **CONFIG_ESP_SLEEP_GPIO_RESET_WORKAROUND**
- **CONFIG_ESP_SLEEP_POWER_DOWN_FLASH**
- **CONFIG_ESP_SLEEP_MSPI_NEED_ALL_IO_PU**
- **CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND**
- **CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND**

**CONFIG_ESP_SLEEP_POWER_DOWN_FLASH**

Power down flash in light sleep when there is no SPI RAM.

*Found in: Component config > Hardware Settings > Sleep Config*

If enabled, chip will try to power down flash as part of esp_light_sleep_start(), which costs more time when chip wakes up. Can only be enabled if there is no SPI RAM configured.

This option will power down flash under a strict but relatively safe condition. Also, it is possible to power down flash under a relaxed condition by using esp_sleep_pd_config() to set ESP_PD_DOMAIN_VDSDIO to ESP_PD_OPTION_OFF. It should be noted that there is a risk in powering down flash, you can refer ESP-IDF Programming Guide/API Reference/System API/Sleep Modes/Power-down of Flash for more details.

**CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND**

Pull-up Flash CS pin in light sleep.

*Found in: Component config > Hardware Settings > Sleep Config*

All IOs will be set to isolate(floating) state by default during sleep. Since the power supply of SPI Flash is not lost during lightsleep, if its CS pin is recognized as low level(selected state) in the floating state, there will be a large current leakage, and the data in Flash may be corrupted by random signals on other SPI pins. Select this option will set the CS pin of Flash to PULL-UP state during sleep, but this will increase the sleep current about 10 uA. If you are developing with esp32xx modules, you must select this option, but if you are developing with chips, you can also pull up the CS pin of SPI Flash in the external circuit to save power consumption caused by internal pull-up during sleep. (!!! Don’t deselect this option if you don’t have external SPI Flash CS pin pullups.)

**CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND**

Pull-up PSRAM CS pin in light sleep.

*Found in: Component config > Hardware Settings > Sleep Config*

All IOs will be set to isolate(floating) state by default during sleep. Since the power supply of PSRAM is not lost during light sleep, if its CS pin is recognized as low level(selected state) in the floating state, there will be a large current leakage, and the data in PSRAM may be corrupted by random signals on other SPI pins. Select this option will set the CS pin of PSRAM to PULL-UP state during sleep, but this will increase the sleep current about 10 uA. If you are developing with esp32xx modules, you must select this option, but if you are developing with chips, you can also pull up the CS pin of PSRAM in the external circuit to save power consumption caused by internal pull-up during sleep. (!!! Don’t deselect this option if you don’t have external PSRAM CS pin pullups.)

**Default value:**

- Yes (enabled) if **CONFIG_SPIRAM**

**CONFIG_ESP_SLEEP_MSPI_NEED_ALL_IO_PU**

Pull-up all SPI pins in light sleep.

*Found in: Component config > Hardware Settings > Sleep Config*
To reduce leakage current, some types of SPI Flash/RAM only need to pull up the CS pin during light sleep. But there are also some kinds of SPI Flash/RAM that need to pull up all pins. It depends on the SPI Flash/RAM chip used.

**CONFIG_ESP_SLEEP_GPIO_RESET_WORKAROUND**

light sleep GPIO reset workaround

*Found in: Component config > Hardware Settings > Sleep Config*

esp32c2, esp32c3, esp32s3, esp32c6 and esp32h2 will reset at wake-up if GPIO is received a small electrostatic pulse during light sleep, with specific condition

- GPIO needs to be configured as input-mode only
- The pin receives a small electrostatic pulse, and reset occurs when the pulse voltage is higher than 6 V

For GPIO set to input mode only, it is not a good practice to leave it open/floating. The hardware design needs to controlled it with determined supply or ground voltage is necessary.

This option provides a software workaround for this issue. Configure to isolate all GPIO pins in sleep state.

**CONFIG_ESP_SLEEP_CACHE_SAFE_ASSERTION**

Check the cache safety of the sleep wakeup code in sleep process

*Found in: Component config > Hardware Settings > Sleep Config*

Enabling it will check the cache safety of the code before the flash power is ready after light sleep wakeup, and check PM_SLP_IRAM_OPT related code cache safety. This option is only for code quality inspection. Enabling it will increase the time overhead of entering and exiting sleep. It is not recommended to enable it in the release version.

**Default value:**
- No (disabled)

**CONFIG_ESP_SLEEP_DEBUG**

esp sleep debug

*Found in: Component config > Hardware Settings > Sleep Config*

Enable esp sleep debug.

**Default value:**
- No (disabled)

**CONFIG_ESP_SLEEP_GPIO_ENABLE_INTERNAL_RESISTORS**

Allow to enable internal pull-up/downs for the Deep-Sleep wakeup IOs

*Found in: Component config > Hardware Settings > Sleep Config*

When using rtc gpio wakeup source during deepsleep without external pull-up/downs, you may want to make use of the internal ones.

**Default value:**
- Yes (enabled)
**CONFIG_ESP_SLEEP_EVENT_CALLBACKS**

Enable registration of sleep event callbacks

*Found in: Component config > Hardware Settings > Sleep Config*

If enabled, it allows user to register sleep event callbacks. It is primarily designed for internal developers and customers can use PM_LIGHT_SLEEP_CALLBACKS as an alternative.

NOTE: These callbacks are executed from the IDLE task context hence you cannot have any blocking calls in your callbacks.

NOTE: Enabling these callbacks may change sleep duration calculations based on time spent in callback and hence it is highly recommended to keep them as short as possible.

**Default value:**
- No (disabled) if CONFIG_FREERTOS_USE_TICKLESS_IDLE

**ESP_SLEEP_WORKAROUND**

**RTC Clock Config**

Contains:
- CONFIG_RTC_XTAL_CAL_RETRY
- CONFIG_RTC_CLK_CAL_CYCLES
- CONFIG_RTC_CLK_SRC

**CONFIG_RTC_CLK_SRC**

RTC clock source

*Found in: Component config > Hardware Settings > RTC Clock Config*

Choose which clock is used as RTC clock source.

- **“Internal 90kHz oscillator” option provides lowest deep sleep current** consumption, and does not require extra external components. However frequency stability with respect to temperature is poor, so time may drift in deep/light sleep modes.
- **“External 32kHz crystal” provides better frequency stability, at the expense of slightly higher (1uA) deep sleep current consumption.**
- **“External 32kHz oscillator” allows using 32kHz clock generated by an external circuit. In this case, external clock signal must be connected to 32K_XP pin. Amplitude should be <1.2V in case of sine wave signal, and <1V in case of square wave signal. Common mode voltage should be 0.1 < Vcm < 0.5Vamp, where Vamp is the signal amplitude.**
- **“Internal 8MHz oscillator divided by 256” option results in higher deep sleep current (by 5uA) but has better frequency stability than the internal 90kHz oscillator. It does not require external components.**

Available options:

- Internal 90kHz RC oscillator (CONFIG_RTC_CLK_SRC_INT_RC)
- External 32kHz crystal (CONFIG_RTC_CLK_SRC_EXT_CRYSTAL)
- External 32kHz oscillator at 32K_XN pin (CONFIG_RTC_CLK_SRC_EXT_OSC)
- Internal 8MHz oscillator, divided by 256 (~32kHz) (CONFIG_RTC_CLK_SRC_INT_8MD256)

**CONFIG_RTC_CLK_CAL_CYCLES**

Number of cycles for RTC_SLOW_CLK calibration

*Found in: Component config > Hardware Settings > RTC Clock Config*
When the startup code initializes RTC_SLOW_CLK, it can perform calibration by comparing the RTC_SLOW_CLK frequency with main XTAL frequency. This option sets the number of RTC_SLOW_CLK cycles measured by the calibration routine. Higher numbers increase calibration precision, which may be important for applications which spend a lot of time in deep sleep. Lower numbers reduce startup time.

When this option is set to 0, clock calibration will not be performed at startup, and approximate clock frequencies will be assumed:

- 90000 Hz if internal RC oscillator is used as clock source. For this use value 1024.
- 32768 Hz if the 32k crystal oscillator is used. For this use value 3000 or more. In case more value will help improve the definition of the launch of the crystal. If the crystal could not start, it will be switched to internal RC.

Range:
- from 0 to 125000

Default value:
- 3000 if CONFIG_RTC_CLK_SRC_EXT_Crys || CONFIG_RTC_CLK_SRC_EXT_Osc || CONFIG_RTC_CLK_SRC_INT_8MD256
- 576

**CONFIG_RTC_XTAL_CAL_RETRY**

Number of attempts to repeat 32k XTAL calibration

*Found in: Component config > Hardware Settings > RTC Clock Config*

Number of attempts to repeat 32k XTAL calibration before giving up and switching to the internal RC. Increase this option if the 32k crystal oscillator does not start and switches to internal RC.

Default value:
- 3 if CONFIG_RTC_CLK_SRC_EXT_Crys

**Peripheral Control**  
Contains:
- **CONFIG_PERIPH_CTRL_FUNC_IN_IRAM**

**CONFIG_PERIPH_CTRL_FUNC_IN_IRAM**

Place peripheral control functions into IRAM

*Found in: Component config > Hardware Settings > Peripheral Control*

Place peripheral control functions (e.g. periph_module_reset) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.

Default value:
- No (disabled)

**ETM Configuration**  
Contains:
- **CONFIG_ETM_ENABLE_DEBUG_LOG**

**CONFIG_ETM_ENABLE_DEBUG_LOG**

Enable debug log

*Found in: Component config > Hardware Settings > ETM Configuration*

Wether to enable the debug log message for ETM core driver. Note that, this option only controls the ETM related driver log, won’t affect other drivers.

Default value:
• No (disabled) if SOC_ETM_SUPPORTED

GDMA Configuration Contains:

• CONFIG_GDMA_ENABLE_DEBUG_LOG
• CONFIG_GDMA_ISR_IRAM_SAFE
• CONFIG_GDMA_CTRL_FUNC_IN_IRAM

CONFIG_GDMA_CTRL_FUNC_IN_IRAM
Place GDMA control functions into IRAM

Default value:
• No (disabled) if SOC_GDMA_SUPPORTED

CONFIG_GDMA_ISR_IRAM_SAFE
GDMA ISR IRAM-Safe

This will ensure the GDMA interrupt handler is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write).

Default value:
• No (disabled) if SOC_GDMA_SUPPORTED

CONFIG_GDMA_ENABLE_DEBUG_LOG
Enable debug log

Default value:
• No (disabled) if SOC_GDMA_SUPPORTED

Main XTAL Config Contains:

• CONFIG_XTAL_FREQ_SEL

CONFIG_XTAL_FREQ_SEL
Main XTAL frequency

Note: The XTAL_FREQ_AUTO option allows the ESP target to automatically estimating XTAL clock’s operating frequency. However, this feature is only supported on the ESP32. The ESP32 uses the internal 8MHZ as a reference when estimating. Due to the internal oscillator’s frequency being temperature dependent, usage of the XTAL_FREQ_AUTO is not recommended in applications that operate in high ambient temperatures or use high-temperature qualified chips and modules.
Available options:

- 24 MHz (CONFIG_XTAL_FREQ_24)
- 26 MHz (CONFIG_XTAL_FREQ_26)
- 32 MHz (CONFIG_XTAL_FREQ_32)
- 40 MHz (CONFIG_XTAL_FREQ_40)
- Autodetect (CONFIG_XTAL_FREQ_AUTO)

**Crypto DPA Protection**

Contains:

- `CONFIG_ESP_CRYPTO_DPA_PROTECTION_AT_STARTUP`

**CONFIG_ESP_CRYPTO_DPA_PROTECTION_AT_STARTUP**

Enable crypto DPA protection at startup

*Found in: Component config > Hardware Settings > Crypto DPA Protection*

This config controls the DPA (Differential Power Analysis) protection knob for the crypto peripherals. DPA protection dynamically adjusts the clock frequency of the crypto peripheral. DPA protection helps to make it difficult to perform SCA attacks on the crypto peripherals. However, there is also associated performance impact based on the security level set. Please refer to the TRM for more details.

**Default value:**

- Yes (enabled) if SOC_CRYPTO_DPA_PROTECTION_SUPPORTED

**CONFIG_ESP_CRYPTO_DPA_PROTECTION_LEVEL**

DPA protection level

*Found in: Component config > Hardware Settings > Crypto DPA Protection > CONFIG_ESP_CRYPTO_DPA_PROTECTION_AT_STARTUP*

Configure the DPA protection security level

Available options:

- Security level low (CONFIG_ESP_CRYPTO_DPA_PROTECTION_LEVEL_LOW)
- Security level medium (CONFIG_ESP_CRYPTO_DPA_PROTECTION_LEVEL_MEDIUM)
- Security level high (CONFIG_ESP_CRYPTO_DPA_PROTECTION_LEVEL_HIGH)

**LCD and Touch Panel**

Contains:

- `LCD Peripheral Configuration`

**LCD Peripheral Configuration**

Contains:

- `CONFIG_LCD_ENABLE_DEBUG_LOG`
- `CONFIG_LCD_PANEL_IO_FORMAT_BUF_SIZE`
- `CONFIG_LCD_RGB_RESTART_IN_VSYNC`
- `CONFIG_LCD_RGB_ISR_IRAM_SAFE`
CONFIG_LCD_PANEL_IO_FORMAT_BUF_SIZE

LCD panel io format buffer size

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

LCD driver allocates an internal buffer to transform the data into a proper format, because of the endian order mismatch. This option is to set the size of the buffer, in bytes.

**Default value:**
- 32

CONFIG_LCD_ENABLE_DEBUG_LOG

Enable debug log

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

Whether to enable the debug log message for LCD driver. Note that, this option only controls the LCD driver log, won’t affect other drivers.

**Default value:**
- No (disabled)

CONFIG_LCD_RGB_ISR_IRAM_SAFE

RGB LCD ISR IRAM-Safe

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

Ensure the LCD interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write). If you want the LCD driver to keep flushing the screen even when cache ops disabled, you can enable this option. Note, this will also increase the IRAM usage.

**Default value:**
- No (disabled) if SOC_LCD_RGB_SUPPORTED

CONFIG_LCD_RGB_RESTART_IN_VSYNC

Restart transmission in VSYNC

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

Reset the GDMA channel every VBlank to stop permanent desyncs from happening. Only need to enable it when in your application, the DMA can’t deliver data as fast as the LCD consumes it.

**Default value:**
- No (disabled) if SOC_LCD_RGB_SUPPORTED

ESP NETIF Adapter  Contains:

- CONFIG_ESP_NETIF_BRIDGE_EN
- CONFIG_ESP_NETIF_L2_TAP
- CONFIG_ESP_NETIF_IP_LOST_TIMER_INTERVAL
- CONFIG_ESP_NETIF_USE_TCPIP_STACK_LIB
- CONFIG_ESP_NETIF_RECEIVE_REPORT_ERRORS

CONFIG_ESP_NETIF_IP_LOST_TIMER_INTERVAL

IP Address lost timer interval (seconds)

*Found in: Component config > ESP NETIF Adapter*

The value of 0 indicates the IP lost timer is disabled, otherwise the timer is enabled.
The IP address may be lost because of some reasons, e.g. when the station disconnects from soft-AP, or when DHCP IP renew fails etc. If the IP lost timer is enabled, it will be started everytime the IP is lost. Event SYSTEM_EVENT_STA_LOST_IP will be raised if the timer expires. The IP lost timer is stopped if the station get the IP again before the timer expires.

**Range:**
- from 0 to 65535

**Default value:**
- 120

**CONFIG_ESP_NETIF_USE_TCP_IP_STACK_LIB**

TCP/IP Stack Library

*Found in: Component config > ESP NETIF Adapter*

Choose the TCP/IP Stack to work, for example, LwIP, uIP, etc.

**Available options:**

- LwIP (CONFIG_ESP_NETIF_TCP_IP_LWIP)
  lwIP is a small independent implementation of the TCP/IP protocol suite.
- Loopback (CONFIG_ESP_NETIF_LOOPBACK)
  Dummy implementation of esp-netif functionality which connects driver transmit to receive function. This option is for testing purpose only

**CONFIG_ESP_NETIF_RECEIVE_REPORT_ERRORS**

Use esp_err_t to report errors from esp_netif_receive

*Found in: Component config > ESP NETIF Adapter*

Enable if esp_netif_receive() should return error code. This is useful to inform upper layers that packet input to TCP/IP stack failed, so the upper layers could implement flow control. This option is disabled by default due to backward compatibility and will be enabled in v6.0 (IDF-7194)

**Default value:**
- No (disabled)

**CONFIG_ESP_NETIF_L2_TAP**

Enable netif L2 TAP support

*Found in: Component config > ESP NETIF Adapter*

A user program can read/write link layer (L2) frames from/to ESP TAP device. The ESP TAP device can be currently associated only with Ethernet physical interfaces.

**CONFIG_ESP_NETIF_L2_TAP_MAX_FDS**

Maximum number of opened L2 TAP File descriptors

*Found in: Component config > ESP NETIF Adapter > CONFIG_ESP_NETIF_L2_TAP*

Maximum number of opened File descriptors (FD’s) associated with ESP TAP device. ESP TAP FD’s take up a certain amount of memory, and allowing fewer FD’s to be opened at the same time conserves memory.

**Range:**
- from 1 to 10 if CONFIG_ESP_NETIF_L2_TAP

**Default value:**
- 5 if CONFIG_ESP_NETIF_L2_TAP
CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE

Size of L2 TAP Rx queue

*Found in:* Component config > ESP NETIF Adapter > CONFIG_ESP_NETIF_L2_TAP

Maximum number of frames queued in opened File descriptor. Once the queue is full, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

**Range:**
- from 1 to 100 if `CONFIG_ESP_NETIF_L2_TAP`

**Default value:**
- 20 if `CONFIG_ESP_NETIF_L2_TAP`

CONFIG_ESP_NETIF_BRIDGE_EN

Enable LwIP IEEE 802.1D bridge

*Found in:* Component config > ESP NETIF Adapter

Enable LwIP IEEE 802.1D bridge support in ESP-NETIF. Note that “Number of clients store data in netif” (LWIP_NUM_NETIF_CLIENT_DATA) option needs to be properly configured to be LwIP bridge available!

**Default value:**
- No (disabled)

**Partition API Configuration**

**PHY**

Contains:
- `CONFIG_ESP_PHY_CALIBRATION_MODE`
- `CONFIG_ESP_PHY_ENABLE_USB`
- `CONFIG_ESP_PHY_IMPROVE_RX_11B`
- `CONFIG_ESP_PHY_MAX_WIFI_TX_POWER`
- `CONFIG_ESP_PHY_MAC_BB_PD`
- `CONFIG_ESP_PHY_REDUCE_TX_POWER`
- `CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE`
- `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`

CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE

Store phy calibration data in NVS

*Found in:* Component config > PHY

If this option is enabled, NVS will be initialized and calibration data will be loaded from there. PHY calibration will be skipped on deep sleep wakeup. If calibration data is not found, full calibration will be performed and stored in NVS. Normally, only partial calibration will be performed. If this option is disabled, full calibration will be performed.

If it’s easy that your board calibrate bad data, choose ‘n’. Two cases for example, you should choose ‘n’: 1.If your board is easy to be booted up with antenna disconnected. 2.Because of your board design, each time when you do calibration, the result are too unstable. If unsure, choose ‘y’.

**Default value:**
- Yes (enabled)
CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION

Use a partition to store PHY init data

*Found in: Component config > PHY*

If enabled, PHY init data will be loaded from a partition. When using a custom partition table, make sure that PHY data partition is included (type: ‘data’, subtype: ‘phy’). With default partition tables, this is done automatically. If PHY init data is stored in a partition, it has to be flashed there, otherwise runtime error will occur.

If this option is not enabled, PHY init data will be embedded into the application binary.

*Default value:*

- No (disabled)

*Contains:*

- CONFIG_ESP_PHY_DEFAULT_INIT_IF_INVALID
- CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN

CONFIG_ESP_PHY_DEFAULT_INIT_IF_INVALID

Reset default PHY init data if invalid

*Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION*

If enabled, PHY init data will be restored to default if it cannot be verified successfully to avoid endless bootloops.

If unsure, choose ‘n’.

*Default value:*

- No (disabled) if CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION

CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN

Support multiple PHY init data bin

*Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION*

If enabled, the corresponding PHY init data type can be automatically switched according to the country code. China’s PHY init data bin is used by default. Can be modified by country information in API esp_wifi_set_country(). The priority of switching the PHY init data type is: 1. Country configured by API esp_wifi_set_country() and the parameter policy is WIFI_COUNTRY_POLICY_MANUAL. 2. Country notified by the connected AP. 3. Country configured by API esp_wifi_set_country() and the parameter policy is WIFI_COUNTRY_POLICY_AUTO.

*Default value:*

- No (disabled) if CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION && CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN

CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN_EMBED

Support embedded multiple phy init data bin to app bin

*Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION > CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN*

If enabled, multiple phy init data bin will embedded into app bin. If not enabled, multiple phy init data bin will still leave alone, and need to be flashed by users.

*Default value:*

- No (disabled) if CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN && CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION
**CONFIG_ESP_PHY_INIT_DATA_ERROR**

Terminate operation when PHY init data error

*Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION > CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN*

If enabled, when an error occurs while the PHY init data is updated, the program will terminate and restart. If not enabled, the PHY init data will not be updated when an error occurs.

**Default value:**
- No (disabled) if `CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN` && `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`

**CONFIG_ESP_PHY_MAX_WIFI_TX_POWER**

Max WiFi TX power (dBm)

*Found in: Component config > PHY*

Set maximum transmit power for WiFi radio. Actual transmit power for high data rates may be lower than this setting.

**Range:**
- from 10 to 20

**Default value:**
- 20

**CONFIG_ESP_PHY_MAC_BB_PD**

Power down MAC and baseband of Wi-Fi and Bluetooth when PHY is disabled

*Found in: Component config > PHY*

If enabled, the MAC and baseband of Wi-Fi and Bluetooth will be powered down when PHY is disabled. Enabling this setting reduces power consumption by a small amount but increases RAM use by approximately 4 KB(Wi-Fi only), 2 KB(Bluetooth only) or 5.3 KB(Wi-Fi + Bluetooth).

**Default value:**
- No (disabled) if `SOC_PM_SUPPORT_MAC_BB_PD` && `CONFIG_FREERTOS_USE_TICKLESS_IDLE`

**CONFIG_ESP_PHY_REDUCE_TX_POWER**

Reduce PHY TX power when brownout reset

*Found in: Component config > PHY*

When brownout reset occurs, reduce PHY TX power to keep the code running.

**Default value:**
- No (disabled)

**CONFIG_ESP_PHY_ENABLE_USB**

Enable USB when phy init

*Found in: Component config > PHY*

When using USB Serial/JTAG/OTG/CDC, PHY should enable USB, otherwise USB module can not work properly. Notice: Enabling this configuration option will slightly impact wifi performance.

**Default value:**
- No (disabled)
CONFIG_ESP_PHY_CALIBRATION_MODE

Calibration mode

Found in: Component config > PHY

Select PHY calibration mode. During RF initialization, the partial calibration method is used by default for RF calibration. Full calibration takes about 100ms more than partial calibration. If boot duration is not critical, it is suggested to use the full calibration method. No calibration method is only used when the device wakes up from deep sleep.

Available options:

- Calibration partial (CONFIG_ESP_PHY_RF_CAL_PARTIAL)
- Calibration none (CONFIG_ESP_PHY_RF_CAL_NONE)
- Calibration full (CONFIG_ESP_PHY_RF_CAL_FULL)

CONFIG_ESP_PHY_IMPROVE_RX_11B

Improve Wi-Fi receive 11b pkts

Found in: Component config > PHY

This is a workaround to improve Wi-Fi receive 11b pkts for some modules using AC-DC power supply with high interference, enable this option will sacrifice Wi-Fi OFDM receive performance. But to guarantee 11b receive performance serves as a bottom line in this case.

Default value:
- No (disabled) if SOC_PHY_IMPROVE_RX_11B

Power Management Contains:

- CONFIG_PM_LIGHTSLEEP_RTC_OSC_CAL_INTERVAL
- CONFIG_PM_SLP_DISABLE_GPIO
- CONFIG_PM_LIGHT_SLEEP_CALLBACKS
- CONFIG_PM_POWER_DOWN_CPU_IN_LIGHT_SLEEP
- CONFIG_PM_POWER_DOWN_PERIPHERAL_IN_LIGHT_SLEEP
- CONFIG_PM_SLP_IRAM_OPT
- CONFIG_PM_RTOS_IDLE_OPT
- CONFIG_PM_ENABLE

CONFIG_PM_ENABLE

Support for power management

Found in: Component config > Power Management

If enabled, application is compiled with support for power management. This option has run-time overhead (increased interrupt latency, longer time to enter idle state), and it also reduces accuracy of RTOS ticks and timers used for timekeeping. Enable this option if application uses power management APIs.

Default value:
- No (disabled) if __DOXYGEN__

CONFIG_PM_DFS_INIT_AUTO

Enable dynamic frequency scaling (DFS) at startup

Found in: Component config > Power Management > CONFIG_PM_ENABLE
If enabled, startup code configures dynamic frequency scaling. Max CPU frequency is set to DEFAULT_CPU_FREQ_MHZ setting, min frequency is set to XTAL frequency. If disabled, DFS will not be active until the application configures it using esp_pm_configure function.

**Default value:**
- No (disabled) if CONFIG_PM_ENABLE

**CONFIG_PM_PROFILING**
Enable profiling counters for PM locks

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, esp_pm_* functions will keep track of the amount of time each of the power management locks has been held, and esp_pm_dump_locks function will print this information. This feature can be used to analyze which locks are preventing the chip from going into a lower power state, and see what time the chip spends in each power saving mode. This feature does incur some run-time overhead, so should typically be disabled in production builds.

**Default value:**
- No (disabled) if CONFIG_PM_ENABLE

**CONFIG_PM_TRACE**
Enable debug tracing of PM using GPIOs

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, some GPIOs will be used to signal events such as RTOS ticks, frequency switching, entry/exit from idle state. Refer to pm_trace.c file for the list of GPIOs. This feature is intended to be used when analyzing/debugging behavior of power management implementation, and should be kept disabled in applications.

**Default value:**
- No (disabled) if CONFIG_PM_ENABLE

**CONFIG_PM_SLP_IRAM_OPT**
Put lightsleep related codes in internal RAM

*Found in: Component config > Power Management*

If enabled, about 2.1KB of lightsleep related source code would be in IRAM and chip would sleep longer for 310us at 160MHz CPU frequency most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

**CONFIG_PM_RTOS_IDLE_OPT**
Put RTOS_IDLE related codes in internal RAM

*Found in: Component config > Power Management*

If enabled, about 180Bytes of RTOS_IDLE related source code would be in IRAM and chip would sleep longer for 20us at 160MHz CPU frequency most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

**CONFIG_PM_SLP_DISABLE_GPIO**
Disable all GPIO when chip at sleep

*Found in: Component config > Power Management*
This feature is intended to disable all GPIO pins at automatic sleep to get a lower power mode. If enabled, chips will disable all GPIO pins at automatic sleep to reduce about 200~300 uA current. If you want to specifically use some pins normally as chip wakes when chip sleeps, you can call `gpio_sleep_sel_dis` to disable this feature on those pins. You can also keep this feature on and call `gpio_sleep_set_direction` and `gpio_sleep_set_pull_mode` to have a different GPIO configuration at sleep. Warning: If you want to enable this option on ESP32, you should enable `GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL` at first, otherwise you will not be able to switch pullup/pulldown mode.

CONFIG_PM_LIGHTSLEEP_RTC_OSC_CAL_INTERVAL
Calibrate the RTC_FAST/SLOW clock every N times of light sleep

*Found in:* Component config > Power Management

The value of this option determines the calibration interval of the RTC_FAST/SLOW clock during sleep when power management is enabled. When it is configured as N, the RTC_FAST/SLOW clock will be calibrated every N times of lightsleep. Decreasing this value will increase the time the chip is in the active state, thereby increasing the average power consumption of the chip. Increasing this value can reduce the average power consumption, but when the external environment changes drastically and the chip RTC_FAST/SLOW oscillator frequency drifts, it may cause system instability.

*Range:*
* • from 1 to 128 if CONFIG_PM_ENABLE

*Default value:*
* • 1 if CONFIG_PM_ENABLE

CONFIG_PM_POWER_DOWN_CPU_IN_LIGHT_SLEEP
Power down CPU in light sleep

*Found in:* Component config > Power Management

If enabled, the CPU will be powered down in light sleep. On esp32c3 soc, enabling this option will consume 1.68 KB of internal RAM and will reduce sleep current consumption by about 100 uA. On esp32s3 soc, enabling this option will consume 8.58 KB of internal RAM and will reduce sleep current consumption by about 650 uA.

*Default value:*
* • Yes (enabled) if SOC_PM_SUPPORT_CPU_PD

CONFIG_PM_POWER_DOWN_PERIPHERAL_IN_LIGHT_SLEEP
Power down Digital Peripheral in light sleep (EXPERIMENTAL)

*Found in:* Component config > Power Management

If enabled, digital peripherals will be powered down in light sleep, it will reduce sleep current consumption by about 100 uA. Chip will save/restore register context at sleep/wake time to keep the system running. Enabling this option will increase static RAM and heap usage, the actual cost depends on the peripherals you have initialized. In order to save/restore the context of the necessary hardware for FreeRTOS to run, it will need at least 4.55 KB free heap at sleep time. Otherwise sleep will not power down the peripherals.

*Note1:* Please use this option with caution, the current IDF does not support the retention of all peripherals. When the digital peripherals are powered off and a sleep and wake-up is completed, the peripherals that have not saved the running context are equivalent to performing a reset. !!! Please confirm the peripherals used in your application and their sleep retention support status before enabling this option, peripherals sleep retention driver support status is tracked in power_management.rst

*Note2:* When this option is enabled simultaneously with FREERTOS_USE_TICKLESS_IDLE, since the UART will be powered down, the uart FIFO will be flushed before sleep to avoid data loss, however,
this has the potential to block the sleep process and cause the wakeup time to be skipped, which will cause the tick of freertos to not be compensated correctly when returning from sleep and cause the system to crash. To avoid this, you can increase FREERTOS_IDLE_TIME_BEFORE_SLEEP threshold in menuconfig.

**Default value:**
- No (disabled) if SOC_PAU_SUPPORTED

**CONFIG_PM_LIGHT_SLEEP_CALLBACKS**
Enable registration of pm light sleep callbacks

*Found in: Component config > Power Management*

If enabled, it allows user to register entry and exit callbacks which are called before and after entering auto light sleep.

NOTE: These callbacks are executed from the IDLE task context hence you cannot have any blocking calls in your callbacks.

NOTE: Enabling these callbacks may change sleep duration calculations based on time spent in callback and hence it is highly recommended to keep them as short as possible

**Default value:**
- No (disabled) if CONFIG_FREERTOS_USE_TICKLESS_IDLE

**ESP PSRAM**  Contains:
- **CONFIG_SPIRAM**

**CONFIG_SPIRAM**
Support for external, SPI-connected RAM

*Found in: Component config > ESP PSRAM*

This enables support for an external SPI RAM chip, connected in parallel with the main SPI flash chip.

**SPI RAM config**  Contains:
- **CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY**
- **CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY**
- **CONFIG_SPIRAM_BOOT_INIT**
- **CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL**
- **CONFIG_SPIRAM_FETCH_INSTRUCTIONS**
- **CONFIG_SPIRAM_RODATA**
- **CONFIG_SPIRAM_MALLOC_reserve_INTERNAL**
- **CONFIG_SPIRAM_MEMTEST**
- **CONFIG_SPIRAM_SPEED**
- **CONFIG_SPIRAM_USE**
- **CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP**
- **CONFIG_SPIRAM_TYPE**

**CONFIG_SPIRAM_TYPE**
Type of SPI RAM chip in use

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

Available options:
Chapter 2. API Reference

- Auto-detect (CONFIG_SPIRAM_TYPE_AUTO)
- ESP-PSRAM16 or APS1604 (CONFIG_SPIRAM_TYPE_ESPPSRAM16)
- ESP-PSRAM32 (CONFIG_SPIRAM_TYPE_ESPPSRAM32)
- ESP-PSRAM64 or LY68L6400 (CONFIG_SPIRAM_TYPE_ESPPSRAM64)

**CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY**

Allow external memory as an argument to xTaskCreateStatic

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

Accessing memory in SPIRAM has certain restrictions, so task stacks allocated by xTaskCreate are by default allocated from internal RAM.

This option allows for passing memory allocated from SPIRAM to be passed to xTaskCreateStatic. This should only be used for tasks where the stack is never accessed while the cache is disabled.

**CONFIG_SPIRAM_FETCH_INSTRUCTIONS**

Move Instructions in Flash to PSRAM

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

If enabled, instructions in flash will be moved into PSRAM on startup. If SPIRAM_RODATA is also enabled, code that requires execution during an SPI1 Flash operation can forgo being placed in IRAM, thus optimizing RAM usage (see External RAM documentation for more details).

**CONFIG_SPIRAM_RODATA**

Move Read-Only Data in Flash to PSRAM

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

If enabled, rodata in flash will be moved into PSRAM on startup. If SPIRAM_FETCH_INSTRUCTIONS is also enabled, code that requires execution during an SPI1 Flash operation can forgo being placed in IRAM, thus optimizing RAM usage (see External RAM documentation for more details).

**CONFIG_SPIRAM_SPEED**

Set RAM clock speed

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

Select the speed for the SPI RAM chip.

Available options:

- 80MHz clock speed (CONFIG_SPIRAM_SPEED_80M)
- 40Mhz clock speed (CONFIG_SPIRAM_SPEED_40M)
- 26Mhz clock speed (CONFIG_SPIRAM_SPEED_26M)
- 20Mhz clock speed (CONFIG_SPIRAM_SPEED_20M)

**CONFIG_SPIRAM_BOOT_INIT**

Initialize SPI RAM during startup

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

If this is enabled, the SPI RAM will be enabled during initial boot. Unless you have specific requirements, you’ll want to leave this enabled so memory allocated during boot-up can also be placed in SPI RAM.
**CONFIG_SPIRAM_IGNORE_NOTFOUND**

Ignore PSRAM when not found

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > CONFIG_SPIRAM_BOOT_INIT

Normally, if psram initialization is enabled during compile time but not found at runtime, it is seen as an error making the CPU panic. If this is enabled, booting will complete but no PSRAM will be available.

**CONFIG_SPIRAM_USE**

SPI RAM access method

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

The SPI RAM can be accessed in multiple methods: by just having it available as an unmanaged memory region in the CPU’s memory map, by integrating it in the heap as ‘special’ memory needing heap_caps_malloc to allocate, or by fully integrating it making malloc() also able to return SPI RAM pointers.

Available options:

- Integrate RAM into memory map (CONFIG_SPIRAM_USE_MEMMAP)
- Make RAM allocatable using heap_caps_malloc(…, MALLOC_CAP_SPIRAM) (CONFIG_SPIRAM_USE_CAPS_ALLOC)
- Make RAM allocatable using malloc() as well (CONFIG_SPIRAM_USE_MALLOC)

**CONFIG_SPIRAM_MEMTEST**

Run memory test on SPI RAM initialization

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

Runs a rudimentary memory test on initialization. Aborts when memory test fails. Disable this for slightly faster startup.

**CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL**

Maximum malloc() size, in bytes, to always put in internal memory

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

If malloc() is capable of also allocating SPI-connected ram, its allocation strategy will prefer to allocate chunks less than this size in internal memory, while allocations larger than this will be done from external RAM. If allocation from the preferred region fails, an attempt is made to allocate from the non-preferred region instead, so malloc() will not suddenly fail when either internal or external memory is full.

**CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP**

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, allocate internal memory

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, try to allocate internal memory then.
**CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL**

Reserve this amount of bytes for data that specifically needs to be in DMA or internal memory

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

Because the external/internal RAM allocation strategy is not always perfect, it sometimes may happen that the internal memory is entirely filled up. This causes allocations that are specifically done in internal memory, for example the stack for new tasks or memory to service DMA or have memory that’s also available when SPI cache is down, to fail. This option reserves a pool specifically for requests like that; the memory in this pool is not given out when a normal malloc() is called.

Set this to 0 to disable this feature.

Note that because FreeRTOS stacks are forced to internal memory, they will also use this memory pool; be sure to keep this in mind when adjusting this value.

Note also that the DMA reserved pool may not be one single contiguous memory region, depending on the configured size and the static memory usage of the app.

**CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY**

Allow .bss segment placed in external memory

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

If enabled, variables with EXT_RAM_BSS_ATTR attribute will be placed in SPIRAM instead of internal DRAM. BSS section of lwip, net80211, pp, bt libraries will be automatically placed in SPIRAM. BSS sections from other object files and libraries can also be placed in SPIRAM through linker fragment scheme extram_bss.

Note that the variables placed in SPIRAM using EXT_RAM_BSS_ATTR will be zero initialized.

**ESP Ringbuf**  
Contains:

- **CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH**

**CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH**

Place non-ISR ringbuf functions into flash

*Found in: Component config > ESP Ringbuf*

Place non-ISR ringbuf functions (like xRingbufferCreate/xRingbufferSend) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled.

**Default value:**

- No (disabled)

**CONFIG_RINGBUF_PLACE_ISR_FUNCTIONS_INTO_FLASH**

Place ISR ringbuf functions into flash

*Found in: Component config > ESP Ringbuf > CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH*

Place ISR ringbuf functions (like xRingbufferSendFromISR/xRingbufferReceiveFromISR) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled or from an IRAM interrupt context.

This option is not compatible with ESP-IDF drivers which are configured to run the ISR from an IRAM context, e.g. CONFIG_UART_ISR_IN_IRAM.

**Default value:**

- No (disabled) if **CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH**
ESP System Settings  Contains:

- `CONFIG_ESP_SYSTEM_RTC_EXT_XTAL_BOOTSTRAP_CYCLES`
- `Brownout Detector`
- `Cache config`
- `CONFIG_ESP_CONSOLE_UART`
- `CONFIG_ESP_CONSOLE_SECONDARY`
- `CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ`
- `CONFIG_ESP_CONSOLE_USB_CDC_SUPPORT_ETS_PRINTF`
- `CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP`
- `CONFIG_ESP_TASK_WDT_EN`
- `CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE`
- `CONFIG_ESP_SYSTEM_HW_STACK_GUARD`
- `CONFIG_ESP_XT_WDT`
- `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL`
- `CONFIG_ESP_INT_WDT`
- `CONFIG_ESP32S2_KEEP_USB_ALIVE`
- `CONFIG_ESP_MAIN_TASK_AFFINITY`
- `CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ`
- `CONFIG_ESP_CONSOLE_USB_CDC_RX_BUF_SIZE`
- `CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE`
- `CONFIG_ESP_DEBUG_OCDAWARE`
- `Memory`
- `Memory protection`
- `CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE`
- `CONFIG_ESP_DEBUG_STUBS_ENABLE`
- `CONFIG_ESP_SYSTEM_PANIC`
- `CONFIG_ESP_SYSTEM_PANIC_REBOOT_DELAY_SECONDS`
- `CONFIG_ESP_PANIC_HANDLER_IRAM`
- `CONFIG_ESP_CONSOLE_UART_BAUDRATE`
- `CONFIG_ESP_CONSOLE_UART_NUM`
- `CONFIG_ESP_CONSOLE_UART_RX_GPIO`
- `CONFIG_ESP_CONSOLE_UART_TX_GPIO`

**CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ**

CPU frequency

*Found in: Component config > ESP System Settings*

CPU frequency to be set on application startup.

Available options:

- 40 MHz (CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ_40)
- 80 MHz (CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ_80)
- 160 MHz (CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ_160)
- 240 MHz (CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ_240)

**Cache config**  Contains:

- `CONFIG_ESP32S2_DATA_CACHE_LINE_SIZE`
- `CONFIG_ESP32S2_DATA_CACHE_SIZE`
- `CONFIG_ESP32S2_DATA_CACHE_WRAP`
- `CONFIG_ESP32S2_INSTRUCTION_CACHE_WRAP`
- `CONFIG_ESP32S2_INSTRUCTION_CACHE_LINE_SIZE`
- `CONFIG_ESP32S2_INSTRUCTION_CACHE_SIZE`
Chapter 2. API Reference

**CONFIG_ESP32S2_INSTRUCTION_CACHE_SIZE**

Instruction cache size

*Found in: Component config > ESP System Settings > Cache config*

Instruction cache size to be set on application startup. If you use 8KB instruction cache rather than 16KB instruction cache, then the other 8KB will be added to the heap.

Available options:

- 8KB (CONFIG_ESP32S2_INSTRUCTION_CACHE_8KB)
- 16KB (CONFIG_ESP32S2_INSTRUCTION_CACHE_16KB)

**CONFIG_ESP32S2_INSTRUCTION_CACHE_LINE_SIZE**

Instruction cache line size

*Found in: Component config > ESP System Settings > Cache config*

Instruction cache line size to be set on application startup.

Available options:

- 16 Bytes (CONFIG_ESP32S2_INSTRUCTION_CACHE_LINE_16B)
- 32 Bytes (CONFIG_ESP32S2_INSTRUCTION_CACHE_LINE_32B)

**CONFIG_ESP32S2_DATA_CACHE_SIZE**

Data cache size

*Found in: Component config > ESP System Settings > Cache config*

Data cache size to be set on application startup. If you use 0KB data cache, the other 16KB will be added to the heap. If you use 8KB data cache rather than 16KB data cache, the other 8KB will be added to the heap.

Available options:

- 0KB (CONFIG_ESP32S2_DATA_CACHE_0KB)
- 8KB (CONFIG_ESP32S2_DATA_CACHE_8KB)
- 16KB (CONFIG_ESP32S2_DATA_CACHE_16KB)

**CONFIG_ESP32S2_DATA_CACHE_LINE_SIZE**

Data cache line size

*Found in: Component config > ESP System Settings > Cache config*

Data cache line size to be set on application startup.

Available options:

- 16 Bytes (CONFIG_ESP32S2_DATA_CACHE_LINE_16B)
- 32 Bytes (CONFIG_ESP32S2_DATA_CACHE_LINE_32B)
**CONFIG_ESP32S2_INSTRUCTION_CACHE_WRAP**

Enable instruction cache wrap

*Found in: Component config > ESP System Settings > Cache config*

If enabled, instruction cache will use wrap mode to read spi flash (maybe spiram). The wrap length equals to INSTRUCTION_CACHE_LINE_SIZE. However, it depends on complex conditions.

**Default value:**
- No (disabled)

**CONFIG_ESP32S2_DATA_CACHE_WRAP**

Enable data cache wrap

*Found in: Component config > ESP System Settings > Cache config*

If enabled, data cache will use wrap mode to read spiram (maybe spi flash). The wrap length equals to DATA_CACHE_LINE_SIZE. However, it depends on complex conditions.

**Default value:**
- No (disabled)

**Memory** Contains:

- **CONFIG_ESP32S2_RTCDATA_IN_FAST_MEM**
- **CONFIG_ESP32S2_USE_FIXED_STATIC_RAM_SIZE**

**CONFIG_ESP32S2_RTCDATA_IN_FAST_MEM**

Place RTC_DATA_ATTR and RTC_RODATA_ATTR variables into RTC fast memory segment

*Found in: Component config > ESP System Settings > Memory*

This option allows to place .rtc_data and .rtc_rodata sections into RTC fast memory segment to free the slow memory region for ULP programs.

**Default value:**
- No (disabled)

**CONFIG_ESP32S2_USE_FIXED_STATIC_RAM_SIZE**

Use fixed static RAM size

*Found in: Component config > ESP System Settings > Memory*

If this option is disabled, the DRAM part of the heap starts right after the .bss section, within the dram0_0 region. As a result, adding or removing some static variables will change the available heap size.

If this option is enabled, the DRAM part of the heap starts right after the dram0_0 region, where its length is set with ESP32S2_FIXED_STATIC_RAM_SIZE

**Default value:**
- No (disabled)

**CONFIG_ESP32S2_FIXED_STATIC_RAM_SIZE**

Fixed Static RAM size

*Found in: Component config > ESP System Settings > Memory > CONFIG_ESP32S2_USE_FIXED_STATIC_RAM_SIZE*
RAM size dedicated for static variables (.data & .bss sections). This value is less than the chips total memory, as not all of it can be used for this purpose. E.g. parts are used by the software bootloader, and will only be available as heap memory after app startup.

Range:
- from 0 to 0x34000 if `CONFIG_ESP32S2_USE_FIXED_STATIC_RAM_SIZE`

Default value:
- “0x10000” if `CONFIG_ESP32S2_USE_FIXED_STATIC_RAM_SIZE`

Trace memory Contains:
- `CONFIG_ESP32S2_TRAX`

`CONFIG_ESP32S2_TRAX`

Use TRAX tracing feature

*Found in: Component config > ESP System Settings > Trace memory*

The ESP32S2 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that can’t be used for general purposes anymore. Disable this if you do not know what this is.

Default value:
- No (disabled)

`CONFIG_ESP_SYSTEM_PANIC`

Panic handler behaviour

*Found in: Component config > ESP System Settings*

If FreeRTOS detects unexpected behaviour or an unhandled exception, the panic handler is invoked. Configure the panic handler’s action here.

Available options:

- Print registers and halt (`CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT`) Outputs the relevant registers over the serial port and halt the processor. Needs a manual reset to restart.
- Print registers and reboot (`CONFIG_ESP_SYSTEM_PANIC_PRINT_REBOOT`) Outputs the relevant registers over the serial port and immediately reset the processor.
- Silent reboot (`CONFIG_ESP_SYSTEM_PANIC_SILENT_REBOOT`) Just resets the processor without outputting anything
- GDBStub on panic (`CONFIG_ESP_SYSTEM_PANIC_GDBSTUB`) Invoke gdbstub on the serial port, allowing for gdb to attach to it to do a postmortem of the crash.

`CONFIG_ESP_SYSTEM_PANIC_REBOOT_DELAY_SECONDS`

Panic reboot delay (Seconds)

*Found in: Component config > ESP System Settings*

After the panic handler executes, you can specify a number of seconds to wait before the device reboots.

**Range:**
- from 0 to 99

**Default value:**
- 0
CONFIG_ESP_SYSTEM_RTC_EXT_XTAL_BOOTSTRAP_CYCLES

Bootstrap cycles for external 32kHz crystal

*Found in:* Component config > ESP System Settings

To reduce the startup time of an external RTC crystal, we bootstrap it with a 32kHz square wave for a fixed number of cycles. Setting 0 will disable bootstrapping (if disabled, the crystal may take longer to start up or fail to oscillate under some conditions).

If this value is too high, a faulty crystal may initially start and then fail. If this value is too low, an otherwise good crystal may not start.

To accurately determine if the crystal has started, set a larger “Number of cycles for RTC_SLOW_CLK calibration” (about 3000).

CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP

Enable RTC fast memory for dynamic allocations

*Found in:* Component config > ESP System Settings

This config option allows to add RTC fast memory region to system heap with capability similar to that of DRAM region but without DMA. This memory will be consumed first per heap initialization order by early startup services and scheduler related code. Speed wise RTC fast memory operates on APB clock and hence does not have much performance impact.

**Default value:**
- Yes (enabled)

Memory protection  
Contains:

- CONFIG_ESP_SYSTEM_PMP_IDRAM_SPLIT
- CONFIG_ESP_SYSTEM_MEMPROT_FEATURE

CONFIG_ESP_SYSTEM_PMP_IDRAM_SPLIT

Enable IRAM/DRAM split protection

*Found in:* Component config > ESP System Settings > Memory protection

If enabled, the CPU watches all the memory access and raises an exception in case of any memory violation. This feature automatically splits the SRAM memory, using PMP, into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

**Default value:**
- Yes (enabled) if SOC_CPU_IDRAM_SPLIT_USING_PMP

CONFIG_ESP_SYSTEM_MEMPROT_FEATURE

Enable memory protection

*Found in:* Component config > ESP System Settings > Memory protection

If enabled, the permission control module watches all the memory access and fires the panic handler if a permission violation is detected. This feature automatically splits the SRAM memory into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

**Default value:**
- Yes (enabled)
CONFIG_ESP_SYSTEM_MEMPROT_FEATURE_LOCK

Lock memory protection settings

Found in: Component config > ESP System Settings > Memory protection > CONFIG_ESP_SYSTEM_MEMPROT_FEATURE

Once locked, memory protection settings cannot be changed anymore. The lock is reset only on the chip startup.

Default value:
• Yes (enabled)

CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE

System event queue size

Found in: Component config > ESP System Settings

Config system event queue size in different application.

Default value:
• 32

CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE

Event loop task stack size

Found in: Component config > ESP System Settings

Config system event task stack size in different application.

Default value:
• 2304

CONFIG_ESP_MAIN_TASK_STACK_SIZE

Main task stack size

Found in: Component config > ESP System Settings

Configure the “main task” stack size. This is the stack of the task which calls app_main(). If app_main() returns then this task is deleted and its stack memory is freed.

Default value:
• 3584

CONFIG_ESP_MAIN_TASK_AFFINITY

Main task core affinity

Found in: Component config > ESP System Settings

Configure the “main task” core affinity. This is the used core of the task which calls app_main(). If app_main() returns then this task is deleted.

Available options:

• CPU0 (CONFIG_ESP_MAIN_TASK_AFFINITY_CPU0)
• CPU1 (CONFIG_ESP_MAIN_TASK_AFFINITY_CPU1)
• No affinity (CONFIG_ESP_MAIN_TASK_AFFINITY_NO_AFFINITY)
CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE

Minimal allowed size for shared stack

*Found in: Component config > ESP System Settings*

Minimal value of size, in bytes, accepted to execute a expression with shared stack.

**Default value:**
- 2048

CONFIG_ESP_CONSOLE_UART

Channel for console output

*Found in: Component config > ESP System Settings*

Select where to send console output (through stdout and stderr).

- Default is to use UART0 on pre-defined GPIOs.
- If “Custom” is selected, UART0 or UART1 can be chosen, and any pins can be selected.
- If “None” is selected, there will be no console output on any UART, except for initial output from ROM bootloader. This ROM output can be suppressed by GPIO strapping or EFUSE, refer to chip datasheet for details.
- On chips with USB OTG peripheral, “USB CDC” option redirects output to the CDC port. This option uses the CDC driver in the chip ROM. This option is incompatible with TinyUSB stack.
- On chips with an USB serial/JTAG debug controller, selecting the option for that redirects output to the CDC/ACM (serial port emulation) component of that device.

**Available options:**

- Default: UART0 (CONFIG_ESP_CONSOLE_UART_DEFAULT)
- USB CDC (CONFIG_ESP_CONSOLE_USB_CDC)
- USB Serial/JTAG Controller (CONFIG_ESP_CONSOLE_USB_SERIAL_JTAG)
- Custom UART (CONFIG_ESP_CONSOLE_UART_CUSTOM)
- None (CONFIG_ESP_CONSOLE_NONE)

CONFIG_ESP_CONSOLE_SECONDARY

Channel for console secondary output

*Found in: Component config > ESP System Settings*

This secondary option supports output through other specific port like USB_SERIAL_JTAG when UART0 port as a primary is selected but not connected. This secondary output currently only supports non-blocking mode without using REPL. If you want to output in blocking mode with REPL or input through this secondary port, please change the primary config to this port in *Channel for console output* menu.

**Available options:**

- No secondary console (CONFIG_ESP_CONSOLE_SECONDARY_NONE)
- USB_SERIAL_JTAG PORT (CONFIG_ESP_CONSOLE_SECONDARY_USB_SERIAL_JTAG)
  This option supports output through USB_SERIAL_JTAG port when the UART0 port is not connected. The output currently only supports non-blocking mode without using the console. If you want to output in blocking mode with REPL or input through USB_SERIAL_JTAG port, please change the primary config to ESP_CONSOLE_USB_SERIAL_JTAG above.
CONFIG_ESP_CONS weaknesses

UART peripheral to use for console output (0-1)

*Found in: Component config > ESP System Settings*

This UART peripheral is used for console output from the ESP-IDF Bootloader and the app. If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

Due to an ESP32 ROM bug, UART2 is not supported for console output via esp_rom_printf. Available options:

- UART0 (CONFIG_ESP_CONSOLE_UART_CUSTOM_NUM_0)
- UART1 (CONFIG_ESP_CONSOLE_UART_CUSTOM_NUM_1)

CONFIG_ESP_CONSOLE_UART_TX_GPIO

UART TX on GPIO#

*Found in: Component config > ESP System Settings*

This GPIO is used for console UART TX output in the ESP-IDF Bootloader and the app (including boot log output and default standard output and standard error of the app).

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**

- from 0 to 46 if CONFIG_ESP_CONSOLE_UART_CUSTOM

**Default value:**

- 43 if CONFIG_ESP_CONSOLE_UART_CUSTOM

CONFIG_ESP_CONSOLE_UART_RX_GPIO

UART RX on GPIO#

*Found in: Component config > ESP System Settings*

This GPIO is used for UART RX input in the ESP-IDF Bootloader and the app (including default default standard input of the app).

Note: The default ESP-IDF Bootloader configures this pin but doesn’t read anything from the UART.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**

- from 0 to 46 if CONFIG_ESP_CONSOLE_UART_CUSTOM

**Default value:**

- 44 if CONFIG_ESP_CONSOLE_UART_CUSTOM

CONFIG_ESP_CONSOLE_UART_BAUDRATE

UART console baud rate

*Found in: Component config > ESP System Settings*

This baud rate is used by both the ESP-IDF Bootloader and the app (including boot log output and default standard input/output/error of the app).

The app’s maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently
If Power Management is enabled, REF_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**
- from 1200 to 1000000 if `CONFIG_PM_ENABLE`

**Default value:**
- 115200

**CONFIG_ESP_CONSOLE_USB_CDC_RX_BUF_SIZE**

Size of USB CDC RX buffer

**Found in:** Component config > ESP System Settings

Set the size of USB CDC RX buffer. Increase the buffer size if your application is often receiving data over USB CDC.

**Range:**
- from 4 to 16384 if `CONFIG_ESP_CONSOLE_USB_CDC`

**Default value:**
- 64 if `CONFIG_ESP_CONSOLE_USB_CDC`

**CONFIG_ESP_CONSOLE_USB_CDC_SUPPORT_ETS_PRINTF**

Enable esp_rom_printf / ESP_EARLY_LOG via USB CDC

**Found in:** Component config > ESP System Settings

If enabled, esp_rom_printf and ESP_EARLY_LOG output will also be sent over USB CDC. Disabling this option saves about 1kB or RAM.

**Default value:**
- No (disabled) if `CONFIG_ESP_CONSOLE_USB_CDC`

**CONFIG_ESP_INT_WDT**

Interrupt watchdog

**Found in:** Component config > ESP System Settings

This watchdog timer can detect if the FreeRTOS tick interrupt has not been called for a certain time, either because a task turned off interrupts and did not turn them on for a long time, or because an interrupt handler did not return. It will try to invoke the panic handler first and failing that reset the SoC.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_INT_WDT_TIMEOUT_MS**

Interrupt watchdog timeout (ms)

**Found in:** Component config > ESP System Settings > `CONFIG_ESP_INT_WDT`

The timeout of the watchdog, in milliseconds. Make this higher than the FreeRTOS tick rate.

**Range:**
- from 10 to 10000

**Default value:**
- 300
**CONFIG_ESP_INT_WDT_CHECK_CPU1**

Also watch CPU1 tick interrupt

*Found in: Component config > ESP System Settings > CONFIG_ESP_INT_WDT*

Also detect if interrupts on CPU 1 are disabled for too long.

**CONFIG_ESP_TASK_WDT_EN**

Enable Task Watchdog Timer

*Found in: Component config > ESP System Settings*

The Task Watchdog Timer can be used to make sure individual tasks are still running. Enabling this option will enable the Task Watchdog Timer. It can be either initialized automatically at startup or initialized after startup (see Task Watchdog Timer API Reference)

**Default value:**
- Yes (enabled)

**CONFIG_ESP_TASK_WDT_INIT**

Initialize Task Watchdog Timer on startup

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT_EN*

Enabling this option will cause the Task Watchdog Timer to be initialized automatically at startup.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_TASK_WDT_PANIC**

Invoke panic handler on Task Watchdog timeout

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT_EN > CONFIG_ESP_TASK_WDT_INIT*

If this option is enabled, the Task Watchdog Timer will be configured to trigger the panic handler when it times out. This can also be configured at run time (see Task Watchdog Timer API Reference)

**Default value:**
- No (disabled)

**CONFIG_ESP_TASK_WDT_TIMEOUT_S**

Task Watchdog timeout period (seconds)

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT_EN > CONFIG_ESP_TASK_WDT_INIT*

Timeout period configuration for the Task Watchdog Timer in seconds. This is also configurable at run time (see Task Watchdog Timer API Reference)

**Range:**
- from 1 to 60

**Default value:**
- 5
CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0
Watch CPU0 Idle Task

*Found in:* Component config > ESP System Settings > CONFIG_ESP_TASK_WDT_EN > CONFIG_ESP_TASK_WDT_INIT

If this option is enabled, the Task Watchdog Timer will watch the CPU0 Idle Task. Having the Task Watchdog watch the Idle Task allows for detection of CPU starvation as the Idle Task not being called is usually a symptom of CPU starvation. Starvation of the Idle Task is detrimental as FreeRTOS household tasks depend on the Idle Task getting some runtime every now and then.

**Default value:**

- Yes (enabled)

CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU1
Watch CPU1 Idle Task

*Found in:* Component config > ESP System Settings > CONFIG_ESP_TASK_WDT_EN > CONFIG_ESP_TASK_WDT_INIT

If this option is enabled, the Task Watchdog Timer will watch the CPU1 Idle Task.

CONFIG_ESP_XT_WDT
Initialize XTAL32K watchdog timer on startup

*Found in:* Component config > ESP System Settings

This watchdog timer can detect oscillation failure of the XTAL32K_CLK. When such a failure is detected the hardware can be set up to automatically switch to BACKUP32K_CLK and generate an interrupt.

CONFIG_ESP_XT_WDT_TIMEOUT
XTAL32K watchdog timeout period

*Found in:* Component config > ESP System Settings > CONFIG_ESP_XT_WDT

Timeout period configuration for the XTAL32K watchdog timer based on RTC_CLK.

**Range:**

- from 1 to 255 if CONFIG_ESP_XT_WDT

**Default value:**

- 200 if CONFIG_ESP_XT_WDT

CONFIG_ESP_XT_WDT_BACKUP_CLK_ENABLE
Automatically switch to BACKUP32K_CLK when timer expires

*Found in:* Component config > ESP System Settings > CONFIG_ESP_XT_WDT

Enable this to automatically switch to BACKUP32K_CLK as the source of RTC_SLOW_CLK when the watchdog timer expires.

**Default value:**

- Yes (enabled) if CONFIG_ESP_XT_WDT
**CONFIG_ESP_PANIC_HANDLER_IRAM**

Place panic handler code in IRAM

*Found in: Component config > ESP System Settings*

If this option is disabled (default), the panic handler code is placed in flash not IRAM. This means that if ESP-IDF crashes while flash cache is disabled, the panic handler will automatically re-enable flash cache before running GDB Stub or Core Dump. This adds some minor risk, if the flash cache status is also corrupted during the crash.

If this option is enabled, the panic handler code (including required UART functions) is placed in IRAM. This may be necessary to debug some complex issues with crashes while flash cache is disabled (for example, when writing to SPI flash) or when flash cache is corrupted when an exception is triggered.

**Default value:**
- No (disabled)

**CONFIG_ESP_DEBUG_STUBS_ENABLE**

OpenOCD debug stubs

*Found in: Component config > ESP System Settings*

Debug stubs are used by OpenOCD to execute pre-compiled onboard code which does some useful debugging stuff, e.g. GCOV data dump.

**CONFIG_ESP_DEBUG_OCDAWARE**

Make exception and panic handlers JTAG/OCD aware

*Found in: Component config > ESP System Settings*

The FreeRTOS panic and unhandled exception handlers can detect a JTAG OCD debugger and instead of panicking, have the debugger stop on the offending instruction.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL**

Interrupt level to use for Interrupt Watchdog and other system checks

*Found in: Component config > ESP System Settings*

Interrupt level to use for Interrupt Watchdog, IPC_ISR and other system checks.

Available options:

- Level 5 interrupt (CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL_5)
  Using level 5 interrupt for Interrupt Watchdog, IPC_ISR and other system checks.
- Level 4 interrupt (CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL_4)
  Using level 4 interrupt for Interrupt Watchdog, IPC_ISR and other system checks.

**Brownout Detector**  Contains:

- CONFIG_ESP_BROWNOUT_DET
**CONFIG_ESP_BROWNOUT_DET**

Hardware brownout detect & reset

*Found in: Component config > ESP System Settings > Brownout Detector*

The ESP32-S2 has a built-in brownout detector which can detect if the voltage is lower than a specific value. If this happens, it will reset the chip in order to prevent unintended behaviour.

**Default value:**

- Yes (enabled)

**CONFIG_ESP_BROWNOUT_DET_LVL_SEL**

Brownout voltage level

*Found in: Component config > ESP System Settings > Brownout Detector > CONFIG_ESP_BROWNOUT_DET*

The brownout detector will reset the chip when the supply voltage is approximately below this level. Note that there may be some variation of brownout voltage level between each ESP3-S2 chip.

#The voltage levels here are estimates, more work needs to be done to figure out the exact voltages of the brownout threshold levels.

**Available options:**

- 2.44V (CONFIG_ESP_BROWNOUT_DET_LVL_SEL_7)
- 2.56V (CONFIG_ESP_BROWNOUT_DET_LVL_SEL_6)
- 2.67V (CONFIG_ESP_BROWNOUT_DET_LVL_SEL_5)
- 2.84V (CONFIG_ESP_BROWNOUT_DET_LVL_SEL_4)
- 2.98V (CONFIG_ESP_BROWNOUT_DET_LVL_SEL_3)
- 3.19V (CONFIG_ESP_BROWNOUT_DET_LVL_SEL_2)
- 3.30V (CONFIG_ESP_BROWNOUT_DET_LVL_SEL_1)

**CONFIG_ESP32S2_KEEP_USB_ALIVE**

Keep USB peripheral enabled at startup

*Found in: Component config > ESP System Settings*

During the application initialization process, all the peripherals except UARTs and timers are reset. Enable this option to keep USB peripheral enabled. This option is automatically enabled if “USB CDC” console is selected.

**Default value:**

- Yes (enabled) if CONFIG_ESP_CONSOLE_USB_CDC

**CONFIG_ESP_SYSTEM_HW_STACK_GUARD**

Hardware stack guard

*Found in: Component config > ESP System Settings*

This config allows to trigger a panic interrupt when Stack Pointer register goes out of allocated stack memory bounds.

**Default value:**

- Yes (enabled) if SOC_ASSIST_DEBUG_SUPPORTED
Chapter 2. API Reference

IPC (Inter-Processor Call) Contains:

- CONFIG_ESP_IPC_TASK_STACK_SIZE
- CONFIG_ESP_IPC_USES_CALLERS_PRIORITY

**CONFIG_ESP_IPC_TASK_STACK_SIZE**

Inter-Processor Call (IPC) task stack size

*Found in: Component config > IPC (Inter-Processor Call)*

Configure the IPC tasks stack size. An IPC task runs on each core (in dual core mode), and allows for cross-core function calls. See IPC documentation for more details. The default IPC stack size should be enough for most common simple use cases. However, users can increase/decrease the stack size to their needs.

**Range:**
- from 512 to 65536

**Default value:**
- 1024

**CONFIG_ESP_IPC_USES_CALLERS_PRIORITY**

IPC runs at caller’s priority

*Found in: Component config > IPC (Inter-Processor Call)*

If this option is not enabled then the IPC task will keep behavior same as prior to that of ESP-IDF v4.0, hence IPC task will run at (configMAX_PRIORITIES - 1) priority.

**High resolution timer (esp_timer) Contains:**

- CONFIG_ESP_TIMER_PROFILING
- CONFIG_ESP_TIMER_TASK_AFFINITY
- CONFIG_ESP_TIMER_TASK_STACK_SIZE
- CONFIG_ESP_TIMER_INTERRUPT_LEVEL
- CONFIG_ESP_TIMER_SHOW_EXPERIMENTAL
- CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD
- CONFIG_ESP_TIMER_ISR_AFFINITY

**CONFIG_ESP_TIMER_PROFILING**

Enable esp_timer profiling features

*Found in: Component config > High resolution timer (esp_timer)*

If enabled, esp_timer_dump will dump information such as number of times the timer was started, number of times the timer has triggered, and the total time it took for the callback to run. This option has some effect on timer performance and the amount of memory used for timer storage, and should only be used for debugging/testing purposes.

**Default value:**
- No (disabled)

**CONFIG_ESP_TIMER_TASK_STACK_SIZE**

High-resolution timer task stack size

*Found in: Component config > High resolution timer (esp_timer)*

Configure the stack size of “timer_task” task. This task is used to dispatch callbacks of timers created using ets_timer and esp_timer APIs. If you are seeing stack overflow errors in timer task, increase this value.
Note that this is not the same as FreeRTOS timer task. To configure FreeRTOS timer task size, see “FreeRTOS timer task stack size” option in “FreeRTOS”.

**Range:**
- from 2048 to 65536

**Default value:**
- 3584

**CONFIG_ESP_TIMER_INTERRUPT_LEVEL**

Interrupt level

*Found in: Component config > High resolution timer (esp_timer)*

It sets the interrupt level for esp_timer ISR in range 1..3. A higher level (3) helps to decrease the ISR esp_timer latency.

**Range:**
- from 1 to 1

**Default value:**
- 1

**CONFIG_ESP_TIMER_SHOW_EXPERIMENTAL**

show esp_timer’s experimental features

*Found in: Component config > High resolution timer (esp_timer)*

This shows some hidden features of esp_timer. Note that they may break other features, use them with care.

**CONFIG_ESP_TIMER_TASK_AFFINITY**

esp_timer task core affinity

*Found in: Component config > High resolution timer (esp_timer)*

The default settings: timer TASK on CPU0 and timer ISR on CPU0. Other settings may help in certain cases, but note that they may break other features, use them with care. - “CPU0” : (default) esp_timer task is processed by CPU0. - “CPU1” : esp_timer task is processed by CPU1. - “No affinity” : esp_timer task can be processed by any CPU.

**Available options:**

- CPU0 (CONFIG_ESP_TIMER_TASK_AFFINITY_CPU0)
- CPU1 (CONFIG_ESP_TIMER_TASK_AFFINITY_CPU1)
- No affinity (CONFIG_ESP_TIMER_TASK_AFFINITY_NO_AFFINITY)

**CONFIG_ESP_TIMER_ISR_AFFINITY**

timer interrupt core affinity

*Found in: Component config > High resolution timer (esp_timer)*

The default settings: timer TASK on CPU0 and timer ISR on CPU0. Other settings may help in certain cases, but note that they may break other features, use them with care. - “CPU0” : (default) timer interrupt is processed by CPU0. - “CPU1” : timer interrupt is processed by CPU1. - “No affinity” : timer interrupt can be processed by any CPU. It helps to reduce latency but there is a disadvantage it leads to the timer ISR running on every core. It increases the CPU time usage for timer ISRs by N on an N-core system.

**Available options:**
Chapter 2. API Reference

- CPU0 (CONFIG_ESP_TIMER_ISR_AFFINITY_CPU0)
- CPU1 (CONFIG_ESP_TIMER_ISR_AFFINITY_CPU1)
- No affinity (CONFIG_ESP_TIMER_ISR_AFFINITY_NO_AFFINITY)

CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD

Support ISR dispatch method

*Found in: Component config > High resolution timer (esp_timer)*

Allows using ESP_TIMER_ISR dispatch method (ESP_TIMER_TASK dispatch method is also available). - ESP_TIMER_TASK - Timer callbacks are dispatched from a high-priority esp_timer task. - ESP_TIMER_ISR - Timer callbacks are dispatched directly from the timer interrupt handler. The ISR dispatch can be used, in some cases, when a callback is very simple or need a lower-latency.

*Default value:*
- No (disabled)

**Wi-Fi**  Contains:

- CONFIG_ESP_WIFI_TESTING_OPTIONS
- CONFIG_ESP_WIFI_WPS_SOFTAP_REGISTRAR
- CONFIG_ESP_WIFI_11KV_SUPPORT
- CONFIG_ESP_WIFI_11R_SUPPORT
- CONFIG_ESP_WIFI_DPP_SUPPORT
- CONFIG_ESP_WIFI_ENTERPRISE_SUPPORT
- CONFIG_ESP_WIFI_MBO_SUPPORT
- CONFIG_ESP_WIFI_SUITE_B_192
- CONFIG_ESP_WIFI_ENABLE_WPA3_OWE_STA
- CONFIG_ESP_WIFI_WAPI_PSK
- CONFIG_ESP_WIFI_ENABLE_WIFI_RX_STATS
- CONFIG_ESP_WIFI_ENABLE_WIFI_TX_STATS
- CONFIG_ESP_WIFI_ENABLE_WPA3_SAE

• CONFIG_ESP_WIFI_NVS_ENABLED
• CONFIG_ESP_WIFI_RX_IRAM_OPT
• CONFIG_ESP_WIFI_SLP_Beacon_Lost_OPT
• CONFIG_ESP_WIFI_SLP_IRAM_OPT
• CONFIG_ESP_WIFI_SOFTAP_SUPPORT
• CONFIG_ESP_WIFI_TASK_CORE_ID
• WPS Configuration Options

CONFIG_ESP_WIFI_STATIC_RX_BUFFER_NUM

Max number of WiFi static RX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi static RX buffers. Each buffer takes approximately 1.6KB of RAM. The static rx buffers are allocated when esp_wifi_init is called, they are not freed until esp_wifi_deinit is called.

WiFi hardware use these buffers to receive all 802.11 frames. A higher number may allow higher throughput but increases memory use. If ESP_WIFI_AMPDU_RX_ENABLE is enabled, this value is recommended to set equal or bigger than ESP_WIFI_RX_BA_WIN in order to achieve better throughput and compatibility with both stations and APs.

*Range:*
  • from 2 to 128 if SOC_WIFI_HE_SUPPORT

*Default value:*
  • 16 if CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP

CONFIG_ESP_WIFI_DYNAMIC_RX_BUFFER_NUM

Max number of WiFi dynamic RX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi dynamic RX buffers, 0 means unlimited RX buffers will be allocated (provided sufficient free RAM). The size of each dynamic RX buffer depends on the size of the received data frame.

For each received data frame, the WiFi driver makes a copy to an RX buffer and then delivers it to the high layer TCP/IP stack. The dynamic RX buffer is freed after the higher layer has successfully received the data frame.

For some applications, WiFi data frames may be received faster than the application can process them. In these cases we may run out of memory if RX buffer number is unlimited (0).

If a dynamic RX buffer limit is set, it should be at least the number of static RX buffers.

*Range:*
  • from 0 to 1024 if CONFIG_LWIP_WND_SCALE

*Default value:*
  • 32

CONFIG_ESP_WIFI_TX_BUFFER

Type of WiFi TX buffers

*Found in: Component config > Wi-Fi*

Select type of WiFi TX buffers:

If “Static” is selected, WiFi TX buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static TX buffer is fixed to about 1.6KB.

If “Dynamic” is selected, each WiFi TX buffer is allocated as needed when a data frame is delivered to the WiFi driver from the TCP/IP stack. The buffer is freed after the data frame has been sent by the
WiFi driver. The size of each dynamic TX buffer depends on the length of each data frame sent by the TCP/IP layer.

If PSRAM is enabled, “Static” should be selected to guarantee enough WiFi TX buffers. If PSRAM is disabled, “Dynamic” should be selected to improve the utilization of RAM.

Available options:

- Static (CONFIG_ESP_WIFI_STATIC_TX_BUFFER)
- Dynamic (CONFIG_ESP_WIFI_DYNAMIC_TX_BUFFER)

**CONFIG_ESP_WIFI_STATIC_TX_BUFFER_NUM**
Max number of WiFi static TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi static TX buffers. Each buffer takes approximately 1.6KB of RAM. The static RX buffers are allocated when esp_wifi_init() is called, they are not released until esp_wifi_deinit() is called.

For each transmitted data frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

*Range:*
- from 1 to 64 if `CONFIG_ESP_WIFI_STATIC_TX_BUFFER`
*Default value:*
- 16 if `CONFIG_ESP_WIFI_STATIC_TX_BUFFER`

**CONFIG_ESP_WIFI_CACHE_TX_BUFFER_NUM**
Max number of WiFi cache TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi cache TX buffer number.

For each TX packet from uplayer, such as LWIP etc, WiFi driver needs to allocate a static TX buffer and makes a copy of uplayer packet. If WiFi driver fails to allocate the static TX buffer, it caches the uplayer packets to a dedicated buffer queue, this option is used to configure the size of the cached TX queue.

*Range:*
- from 16 to 128 if `CONFIG_SPIRAM`
*Default value:*
- 32 if `CONFIG_SPIRAM`

**CONFIG_ESP_WIFI_DYNAMIC_TX_BUFFER_NUM**
Max number of WiFi dynamic TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi dynamic TX buffers. The size of each dynamic TX buffer is not fixed, it depends on the size of each transmitted data frame.

For each transmitted frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications, especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

*Range:*
- from 1 to 128
Default value:
  • 32

**CONFIG_ESP_WIFI_MGMT_RX_BUFFER**

Type of WiFi RX MGMT buffers

*Found in: Component config > Wi-Fi*

Select type of WiFi RX MGMT buffers:

If “Static” is selected, WiFi RX MGMT buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static RX MGMT buffer is fixed to about 500 Bytes.

If “Dynamic” is selected, each WiFi RX MGMT buffer is allocated as needed when a MGMT data frame is received. The MGMT buffer is freed after the MGMT data frame has been processed by the WiFi driver.

Available options:

  • Static (CONFIG_ESP_WIFI_STATIC_RX_MGMT_BUFFER)
  • Dynamic (CONFIG_ESP_WIFI_DYNAMIC_RX_MGMT_BUFFER)

**CONFIG_ESP_WIFI_RX_MGMT_BUF_NUM_DEF**

Max number of WiFi RX MGMT buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi RX_MGMT buffers.

For Management buffers, the number of dynamic and static management buffers is the same. In order to prevent memory fragmentation, the management buffer type should be set to static first.

**Range:**

  • from 1 to 10

**Default value:**

  • 5

**CONFIG_ESP_WIFI_CSI_ENABLED**

WiFi CSI (Channel State Information)

*Found in: Component config > Wi-Fi*

Select this option to enable CSI (Channel State Information) feature. CSI takes about CONFIG_ESP_WIFI_STATIC_RX_BUFFER_NUM KB of RAM. If CSI is not used, it is better to disable this feature in order to save memory.

**Default value:**

  • No (disabled)

**CONFIG_ESP_WIFI_AMPDU_TX_ENABLED**

WiFi AMPDU TX

*Found in: Component config > Wi-Fi*

Select this option to enable AMPDU TX feature

**Default value:**

  • Yes (enabled)
CONFIG_ESP_WIFI_TX_BA_WIN

WiFi AMPDU TX BA window size

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_AMPDU_TX_ENABLED*

Set the size of WiFi Block Ack TX window. Generally a bigger value means higher throughput but more memory. Most of the time we should NOT change the default value unless special reason, e.g. test the maximum UDP TX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12.

**Range:**
- from 2 to 64 if SOC_WIFI_HE_SUPPORT && CONFIG_ESP_WIFI_AMPDU_TX_ENABLED

**Default value:**
- 6

CONFIG_ESP_WIFI_AMPDU_RX_ENABLED

WiFi AMPDU RX

*Found in: Component config > Wi-Fi*

Select this option to enable AMPDU RX feature

**Default value:**
- Yes (enabled)

CONFIG_ESP_WIFI_RX_BA_WIN

WiFi AMPDU RX BA window size

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_AMPDU_RX_ENABLED*

Set the size of WiFi Block Ack RX window. Generally a bigger value means higher throughput and better compatibility but more memory. Most of the time we should NOT change the default value unless special reason, e.g. test the maximum UDP RX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12. If PSRAM is used and WiFi memory is prefered to allocat in PSRAM first, the default and minimum value should be 16 to achieve better throughput and compatibility with both stations and APs.

**Range:**
- from 2 to 64 if SOC_WIFI_HE_SUPPORT && CONFIG_ESP_WIFI_AMPDU_RX_ENABLED

**Default value:**
- 16 if CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP && CONFIG_ESP_WIFI_AMPDU_RX_ENABLED

CONFIG_ESP_WIFI_AMSDU_TX_ENABLED

WiFi AMSDU TX

*Found in: Component config > Wi-Fi*

Select this option to enable AMSDU TX feature

**Default value:**
- No (disabled) if CONFIG_SPIRAM

CONFIG_ESP_WIFI_NVS_ENABLED
WiFi NVS flash

*Found in:* Component config > Wi-Fi

Select this option to enable WiFi NVS flash

**Default value:**
- Yes (enabled)

**CONFIG_ESP_WIFI_TASK_CORE_ID**

WiFi Task Core ID

*Found in:* Component config > Wi-Fi

Pinned WiFi task to core 0 or core 1.

**Available options:**
- Core 0 (CONFIG_ESP_WIFI_TASK_PINNED_TO_CORE_0)
- Core 1 (CONFIG_ESP_WIFI_TASK_PINNED_TO_CORE_1)

**CONFIG_ESP_WIFI_SOFTAP_BEACON_MAX_LEN**

Max length of WiFi SoftAP Beacon

*Found in:* Component config > Wi-Fi

ESP-MESH utilizes beacon frames to detect and resolve root node conflicts (see documentation). However the default length of a beacon frame can simultaneously hold only five root node identifier structures, meaning that a root node conflict of up to five nodes can be detected at one time. In the occurrence of more root nodes conflict involving more than five root nodes, the conflict resolution process will detect five of the root nodes, resolve the conflict, and re-detect more root nodes. This process will repeat until all root node conflicts are resolved. However this process can generally take a very long time.

To counter this situation, the beacon frame length can be increased such that more root nodes can be detected simultaneously. Each additional root node will require 36 bytes and should be added ontop of the default beacon frame length of 752 bytes. For example, if you want to detect 10 root nodes simultaneously, you need to set the beacon frame length as 932 (752+36*5).

Setting a longer beacon length also assists with debugging as the conflicting root nodes can be identified more quickly.

**Range:**
- from 752 to 1256

**Default value:**
- 752

**CONFIG_ESP_WIFI_MGMT_SBUF_NUM**

WiFi mgmt short buffer number

*Found in:* Component config > Wi-Fi

Set the number of WiFi management short buffer.

**Range:**
- from 6 to 32

**Default value:**
- 32
CONFIG_ESP_WIFI_IRAM_OPT
WiFi IRAM speed optimization

*Found in: Component config > Wi-Fi*

Select this option to place frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 10Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

**Default value:**
- Yes (enabled)

CONFIG_ESP_WIFI_EXTRA_IRAM_OPT
WiFi EXTRA IRAM speed optimization

*Found in: Component config > Wi-Fi*

Select this option to place additional frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 5Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

**Default value:**
- No (disabled)

CONFIG_ESP_WIFI_RX_IRAM_OPT
WiFi RX IRAM speed optimization

*Found in: Component config > Wi-Fi*

Select this option to place frequently called Wi-Fi library RX functions in IRAM. When this option is disabled, more than 17Kbytes of IRAM memory will be saved but Wi-Fi performance will be reduced.

**Default value:**
- Yes (enabled)

CONFIG_ESP_WIFI_ENABLE_WPA3_SAE
Enable WPA3-Personal

*Found in: Component config > Wi-Fi*

Select this option to allow the device to establish a WPA3-Personal connection with eligible AP’s. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

**Default value:**
- Yes (enabled)

CONFIG_ESP_WIFI_ENABLE_SAE_PK
Enable SAE-PK

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_WPA3_SAE*

Select this option to enable SAE-PK

**Default value:**
- Yes (enabled)
**CONFIG_ESP_WIFI_SOFTAP_SAE_SUPPORT**

Enable WPA3 Personal(SAE) SoftAP

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_WPA3_SAE*

Select this option to enable SAE support in softAP mode.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_WIFI_ENABLE_WPA3_OWE_STA**

Enable OWE STA

*Found in: Component config > Wi-Fi*

Select this option to allow the device to establish OWE connection with eligible AP’s. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_WIFI_SLP_IRAM_OPT**

WiFi SLP IRAM speed optimization

*Found in: Component config > Wi-Fi*

Select this option to place called Wi-Fi library TBTT process and receive beacon functions in IRAM. Some functions can be put in IRAM either by ESP_WIFI_IRAM_OPT and ESP_WIFI_RX_IRAM_OPT, or this one. If already enabled ESP_WIFI_IRAM_OPT, the other 7.3KB IRAM memory would be taken by this option. If already enabled ESP_WIFI_RX_IRAM_OPT, the other 1.3KB IRAM memory would be taken by this option. If neither of them are enabled, the other 7.4KB IRAM memory would be taken by this option. Wi-Fi power-save mode average current would be reduced if this option is enabled.

**CONFIG_ESP_WIFI_SLP_DEFAULT_MIN_ACTIVE_TIME**

Minimum active time

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_IRAM_OPT*

The minimum timeout for waiting to receive data, unit: milliseconds.

**Range:**
- from 8 to 60 if `CONFIG_ESP_WIFI_SLP_IRAM_OPT`

**Default value:**
- 50 if `CONFIG_ESP_WIFI_SLP_IRAM_OPT`

**CONFIG_ESP_WIFI_SLP_DEFAULT_MAX_ACTIVE_TIME**

Maximum keep alive time

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_IRAM_OPT*

The maximum time that wifi keep alive, unit: seconds.

**Range:**
- from 10 to 60 if `CONFIG_ESP_WIFI_SLP_IRAM_OPT`

**Default value:**
- 10 if `CONFIG_ESP_WIFI_SLP_IRAM_OPT`
CONFIG_ESP_WIFI_FTM_ENABLE

WiFi FTM

*Found in: Component config > Wi-Fi*

Enable feature Fine Timing Measurement for calculating WiFi Round-Trip-Time (RTT).

**Default value:**
- No (disabled)

CONFIG_ESP_WIFI_FTM_INITIATOR_SUPPORT

FTM Initiator support

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_FTM_ENABLE*

**Default value:**
- Yes (enabled) if CONFIG_ESP_WIFI_FTM_ENABLE

CONFIG_ESP_WIFI_FTM_RESPONDER_SUPPORT

FTM Responder support

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_FTM_ENABLE*

**Default value:**
- Yes (enabled) if CONFIG_ESP_WIFI_FTM_ENABLE

CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE

Power Management for station at disconnected

*Found in: Component config > Wi-Fi*

Select this option to enable power_management for station when disconnected. Chip will do modem-sleep when rf module is not in use any more.

**Default value:**
- Yes (enabled)

CONFIG_ESP_WIFI_GCMP_SUPPORT

WiFi GCMP Support(GCMP128 and GCMP256)

*Found in: Component config > Wi-Fi*

Select this option to enable GCMP support. GCMP support is compulsory for WiFi Suite-B support.

**Default value:**
- No (disabled) if SOC_WIFI_GCMP_SUPPORT

CONFIG_ESP_WIFI_GMAC_SUPPORT

WiFi GMAC Support(GMAC128 and GMAC256)

*Found in: Component config > Wi-Fi*

Select this option to enable GMAC support. GMAC support is compulsory for WiFi 192 bit certification.

**Default value:**
- No (disabled)
**CONFIG_ESP_WIFI_SOFTAP_SUPPORT**

WiFi SoftAP Support

*Found in: Component config > Wi-Fi*

WiFi module can be compiled without SoftAP to save code size.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_WIFI_ENHANCED_LIGHT_SLEEP**

WiFi modem automatically receives the beacon

*Found in: Component config > Wi-Fi*

The wifi modem automatically receives the beacon frame during light sleep.

**Default value:**
- No (disabled) if `CONFIG_ESP_PHY_MAC_BB_PD` && `SOC_PM_SUPPORT_BEACON_WAKEUP`

**CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT**

Wifi sleep optimize when beacon lost

*Found in: Component config > Wi-Fi*

Enable wifi sleep optimization when beacon loss occurs and immediately enter sleep mode when the WiFi module detects beacon loss.

**CONFIG_ESP_WIFI_SLP_BEACON_LOST_TIMEOUT**

Beacon loss timeout

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT*

Timeout time for close rf phy when beacon loss occurs, Unit: 1024 microsecond.

**Range:**
- from 5 to 100 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

**Default value:**
- 10 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

**CONFIG_ESP_WIFI_SLP_BEACON_LOST_THRESHOLD**

Maximum number of consecutive lost beacons allowed

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT*

Maximum number of consecutive lost beacons allowed, WiFi keeps Rx state when the number of consecutive beacons lost is greater than the given threshold.

**Range:**
- from 0 to 8 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

**Default value:**
- 3 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`
CONFIG_ESP_WIFI_SLP_PHY_ON_DELTA_EARLY_TIME
Delta early time for RF PHY on

Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

Delta early time for rf phy on. When the beacon is lost, the next rf phy on will be earlier the time specified by the configuration item. Unit: 32 microsecond.

Range:
- from 0 to 100 if CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

Default value:
- 2 if CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

CONFIG_ESP_WIFI_SLP_PHY_OFF_DELTA_TIMEOUT_TIME
Delta timeout time for RF PHY off

Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

Delta timeout time for rf phy off. When the beacon is lost, the next rf phy off will be delayed for the time specified by the configuration item. Unit: 1024 microsecond.

Range:
- from 0 to 8 if CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

Default value:
- 2 if CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM
Maximum espnow encrypt peers number

Found in: Component config > Wi-Fi

Maximum number of encrypted peers supported by espnow. The number of hardware keys for encryption is fixed. And the espnow and SoftAP share the same hardware keys. So this configuration will affect the maximum connection number of SoftAP. Maximum espnow encrypted peers number + maximum number of connections of SoftAP = Max hardware keys number. When using ESP mesh, this value should be set to a maximum of 6.

Range:
- from 0 to 17

Default value:
- 7

CONFIG_ESP_WIFI_NAN_ENABLE
WiFi Aware

Found in: Component config > Wi-Fi

Enable WiFi Aware (NAN) feature.

Default value:
- No (disabled)

CONFIG_ESP_WIFI_ENABLE_WIFI_TX_STATS
Enable Wi-Fi transmission statistics

Found in: Component config > Wi-Fi

Enable Wi-Fi transmission statistics. Total support 4 access category. Each access category will use 346 bytes memory.
Default value:
  • Yes (enabled) if SOC_WIFI_HE_SUPPORT

CONFIG_ESP_WIFI_MBEDTLS_CRYPTO

Use MbedTLS crypto APIs

*Found in: Component config > Wi-Fi*

Select this option to enable the use of MbedTLS crypto APIs. The internal crypto support within the supplicant is limited and may not suffice for all new security features, including WPA3.

It is recommended to always keep this option enabled. Additionally, note that MbedTLS can leverage hardware acceleration if available, resulting in significantly faster cryptographic operations.

Default value:
  • Yes (enabled)

CONFIG_ESP_WIFI_MBEDTLS_TLS_CLIENT

Use MbedTLS TLS client for WiFi Enterprise connection

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_MBEDTLS_CRYPTO*

Select this option to use MbedTLS TLS client for WPA2 enterprise connection. Please note that from MbedTLS-3.0 onwards, MbedTLS does not support SSL-3.0 TLS-v1.0, TLS-v1.1 versions. Incase your server is using one of these version, it is advisable to update your server. Please disable this option for compatibility with older TLS versions.

Default value:
  • Yes (enabled)

CONFIG_ESP_WIFI_WAPI_PSK

Enable WAPI PSK support

*Found in: Component config > Wi-Fi*

Select this option to enable WAPI-PSK which is a Chinese National Standard Encryption for Wireless LANs (GB 15629.11-2003).

Default value:
  • No (disabled)

CONFIG_ESP_WIFI_SUITE_B_192

Enable NSA suite B support with 192 bit key

*Found in: Component config > Wi-Fi*

Select this option to enable 192 bit NSA suite-B. This is necessary to support WPA3 192 bit security.

Default value:
  • No (disabled) if SOC_WIFI_GCMP_SUPPORT

CONFIG_ESP_WIFI_11KV_SUPPORT

Enable 802.11k, 802.11v APIs Support

*Found in: Component config > Wi-Fi*

Select this option to enable 802.11k 802.11v APIs (RRM and BTM support). Only APIs which are helpful for network assisted roaming are supported for now. Enable this option with BTM and RRM enabled in sta config to make device ready for network assisted roaming. BTM: BSS transition management enables an AP to request a station to transition to a specific AP, or to indicate to a station a
set of preferred APs. RRM: Radio measurements enable STAs to understand the radio environment, it enables STAs to observe and gather data on radio link performance and on the radio environment. Current implementation adds beacon report, link measurement, neighbor report.

**Default value:**
- No (disabled)

### CONFIG_ESP_WIFI_SCAN_CACHE

Keep scan results in cache

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_11KV_SUPPORT*

Keep scan results in cache, if not enabled, those will be flushed immediately.

**Default value:**
- No (disabled) if CONFIG_ESP_WIFI_11KV_SUPPORT

### CONFIG_ESP_WIFI_MBO_SUPPORT

Enable Multi Band Operation Certification Support

*Found in: Component config > Wi-Fi*

Select this option to enable WiFi Multiband operation certification support.

**Default value:**
- No (disabled)

### CONFIG_ESP_WIFI_DPP_SUPPORT

Enable DPP support

*Found in: Component config > Wi-Fi*

Select this option to enable WiFi Easy Connect Support.

**Default value:**
- No (disabled)

### CONFIG_ESP_WIFI_11R_SUPPORT

Enable 802.11R (Fast Transition) Support

*Found in: Component config > Wi-Fi*

Select this option to enable WiFi Fast Transition Support.

**Default value:**
- No (disabled)

### CONFIG_ESP_WIFI_WPS_SOFTAP_REGISTRAR

Add WPS Registrar support in SoftAP mode

*Found in: Component config > Wi-Fi*

Select this option to enable WPS registrar support in softAP mode.

**Default value:**
- No (disabled)
CONFIG_ESP_WIFI_ENABLE_WIFI_RX_STATS
Enable Wi-Fi reception statistics

*Found in:* Component config > Wi-Fi

Enable Wi-Fi reception statistics. Total support 2 access category. Each access category will use 190 bytes memory.

*Default value:*
  - Yes (enabled) if SOC_WIFI_HE_SUPPORT

CONFIG_ESP_WIFI_ENABLE_WIFI_RX_MU_STATS
Enable Wi-Fi DL MU-MIMO and DL OFDMA reception statistics

*Found in:* Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_WIFI_RX_STATS

Enable Wi-Fi DL MU-MIMO and DL OFDMA reception statistics. Will use 10932 bytes memory.

*Default value:*
  - Yes (enabled) if CONFIG_ESP_WIFI_ENABLE_WIFI_RX_STATS

WPS Configuration Options
Contains:

- CONFIG_ESP_WIFI_WPS_PASSPHRASE
- CONFIG_ESP_WIFI_WPS_STRICT

CONFIG_ESP_WIFI_WPS_STRICT
Strictly validate all WPS attributes

*Found in:* Component config > Wi-Fi > WPS Configuration Options

Select this option to enable validate each WPS attribute rigorously. Disabling this add the workarounds with various APs. Enabling this may cause inter operability issues with some APs.

*Default value:*
  - No (disabled)

CONFIG_ESP_WIFI_WPS_PASSPHRASE
Get WPA2 passphrase in WPS config

*Found in:* Component config > Wi-Fi > WPS Configuration Options

Select this option to get passphrase during WPS configuration. This option fakes the virtual display capabilities to get the configuration in passphrase mode. Not recommended to be used since WPS credentials should not be shared to other devices, making it in readable format increases that risk, also passphrase requires pbkdf2 to convert in psk.

*Default value:*
  - No (disabled)

CONFIG_ESP_WIFI_DEBUG_PRINT
Print debug messages from WPA Supplicant

*Found in:* Component config > Wi-Fi

Select this option to print logging information from WPA supplicant, this includes handshake information and key hex dumps depending on the project logging level.

Enabling this could increase the build size ~60kb depending on the project logging level.

*Default value:*

CONFIG_ESP_WIFI_TESTING_OPTIONS

Add DPP testing code

*Found in: Component config > Wi-Fi*

Select this to enable unity test for DPP.

**Default value:**

- No (disabled)

CONFIG_ESP_WIFI_ENTERPRISE_SUPPORT

Enable enterprise option

*Found in: Component config > Wi-Fi*

Select this to enable/disable enterprise connection support.

Disabling this will reduce binary size. Disabling this will disable the use of any esp_wifi_sta_wpa2_ent_*
(as APIs will be meaningless)

**Default value:**

- Yes (enabled)

**Core dump**

Contains:

- CONFIG_ESP_COREDUMP_CHECK_BOOT
- CONFIG_ESP_COREDUMP_DATA_FORMAT
- CONFIG_ESP_COREDUMP_CHECKSUM
- CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART
- CONFIG_ESP_COREDUMP_UART_DELAY
- CONFIG_ESP_COREDUMP_FLASH_NO_OVERWRITE
- CONFIG_ESP_COREDUMP_LOGS
- CONFIG_ESP_COREDUMP_CODEC
- CONFIG_ESP_COREDUMP_MAX_TASKS_NUM
- CONFIG_ESP_COREDUMP_STACK_SIZE

CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART

Data destination

*Found in: Component config > Core dump*

Select place to store core dump: flash, uart or none (to disable core dumps generation).

Core dumps to Flash are not available if PSRAM is used for task stacks.

If core dump is configured to be stored in flash and custom partition table is used add corresponding entry to your CSV. For examples, please see predefined partition table CSV descriptions in the components/partition_table directory.

**Available options:**

- Flash (CONFIG_ESP_COREDUMP_ENABLE_TO_FLASH)
- UART (CONFIG_ESP_COREDUMP_ENABLE_TO_UART)
- None (CONFIG_ESP_COREDUMP_ENABLE_TO_NONE)
**CONFIG_ESP_COREDUMP_DATA_FORMAT**

Core dump data format

*Found in: Component config > Core dump*

Select the data format for core dump.

Available options:

- Binary format (CONFIG_ESP_COREDUMP_DATA_FORMAT_BIN)
- ELF format (CONFIG_ESP_COREDUMP_DATA_FORMAT_ELF)

**CONFIG_ESP_COREDUMP_CHECKSUM**

Core dump data integrity check

*Found in: Component config > Core dump*

Select the integrity check for the core dump.

Available options:

- Use CRC32 for integrity verification (CONFIG_ESP_COREDUMP_CHECKSUM_CRC32)
- Use SHA256 for integrity verification (CONFIG_ESP_COREDUMP_CHECKSUM_SHA256)

**CONFIG_ESP_COREDUMP_CHECK_BOOT**

Check core dump data integrity on boot

*Found in: Component config > Core dump*

When enabled, if any data are found on the flash core dump partition, they will be checked by calculating their checksum.

**Default value:**

- Yes (enabled) if CONFIG_ESP_COREDUMP_ENABLE_TO_FLASH

**CONFIG_ESP_COREDUMP_LOGS**

Enable coredump logs for debugging

*Found in: Component config > Core dump*

Enable/disable coredump logs. Logs strings from espcoredump component are placed in DRAM. Disabling these helps to save ~5KB of internal memory.

**CONFIG_ESP_COREDUMP_MAX_TASKS_NUM**

Maximum number of tasks

*Found in: Component config > Core dump*

Maximum number of tasks snapshots in core dump.

**CONFIG_ESP_COREDUMP_UART_DELAY**

Delay before print to UART

*Found in: Component config > Core dump*

Config delay (in ms) before printing core dump to UART. Delay can be interrupted by pressing Enter key.
**Default value:**
- 0 if `CONFIG_ESP_COREDUMP_ENABLE_TO_UART`

**CONFIG_ESP_COREDUMP_FLASH_NO_OVERWRITE**

Don’t overwrite existing core dump

*Found in: Component config > Core dump*

Don’t overwrite an existing core dump already present in flash. Enable this option to only keep the first of multiple core dumps.

If enabled, the core dump partition must be erased before the first core dump can be written.

**Default value:**
- No (disabled) if `CONFIG_ESP_COREDUMP_ENABLE_TO_FLASH`

**CONFIG_ESP_COREDUMP_STACK_SIZE**

Reserved stack size

*Found in: Component config > Core dump*

Size of the memory to be reserved for core dump stack. If 0 core dump process will run on the stack of crashed task/ISR, otherwise special stack will be allocated. To ensure that core dump itself will not overflow task/ISR stack set this to the value above 800. NOTE: It eats DRAM.

**CONFIG_ESP_COREDUMP_DECODE**

Handling of UART core dumps in IDF Monitor

*Found in: Component config > Core dump*

Available options:

- Decode and show summary (info_corefile) (CONFIG_ESP_COREDUMP_DECODE_INFO)
- Don’t decode (CONFIG_ESP_COREDUMP_DECODE_DISABLE)

**FAT Filesystem support**

Contains:

- `CONFIG_FATFS_API_ENCODING`
- `CONFIG_FATFS_VFS_FSTAT_BLKSIZE`
- `CONFIG_FATFS_IMMEDIATE_FSYNC`
- `CONFIG_FATFS_USE_FASTSEEK`
- `CONFIG_FATFS_LONG_FILENAMES`
- `CONFIG_FATFS_MAX_LFN`
- `CONFIG_FATFS_FS_LOCK`
- `CONFIG_FATFS_VOLUME_COUNT`
- `CONFIG_FATFS_CHOOSE_CODEPAGE`
- `CONFIG_FATFS_ALLOC_PREFER_EXTRAM`
- `CONFIG_FATFS_SECTOR_SIZE`
- `CONFIG_FATFS_TIMEOUT_MS`
- `CONFIG_FATFS_PER_FILE_CACHE`

**CONFIG_FATFS_VOLUME_COUNT**
Number of volumes

*Found in: Component config > FAT Filesystem support*

Number of volumes (logical drives) to use.

**Range:**
- from 1 to 10

**Default value:**
- 2

**CONFIG_FATFS_LONG_FILENAMES**

Long filename support

*Found in: Component config > FAT Filesystem support*

Support long filenames in FAT. Long filename data increases memory usage. FATFS can be configured to store the buffer for long filename data in stack or heap.

Available options:

- No long filenames (CONFIG_FATFS_LFN_NONE)
- Long filename buffer in heap (CONFIG_FATFS_LFN_HEAP)
- Long filename buffer on stack (CONFIG_FATFS_LFN_STACK)

**CONFIG_FATFS_SECTOR_SIZE**

Sector size

*Found in: Component config > FAT Filesystem support*

Specify the size of the sector in bytes for FATFS partition generator.

Available options:

- 512 (CONFIG_FATFS_SECTOR_512)
- 4096 (CONFIG_FATFS_SECTOR_4096)

**CONFIG_FATFS_CHOOSE_CODEPAGE**

OEM Code Page

*Found in: Component config > FAT Filesystem support*

OEM code page used for file name encodings.

If “Dynamic” is selected, code page can be chosen at runtime using f_setcp function. Note that choosing this option will increase application size by ~480kB.

Available options:

- Dynamic (all code pages supported) (CONFIG_FATFS_CODEPAGE_DYNAMIC)
- US (CP437) (CONFIG_FATFS_CODEPAGE_437)
- Arabic (CP720) (CONFIG_FATFS_CODEPAGE_720)
- Greek (CP737) (CONFIG_FATFS_CODEPAGE_737)
- KBL (CP771) (CONFIG_FATFS_CODEPAGE_771)
- Baltic (CP775) (CONFIG_FATFS_CODEPAGE_775)
- Latin 1 (CP850) (CONFIG_FATFS_CODEPAGE_850)
- Latin 2 (CP852) (CONFIG_FATFS_CODEPAGE_852)
- Cyrillic (CP855) (CONFIG_FATFS_CODEPAGE_855)
• Turkish (CP857) (CONFIG_FATFS_CODEPAGE_857)
• Portuguese (CP860) (CONFIG_FATFS_CODEPAGE_860)
• Icelandic (CP861) (CONFIG_FATFS_CODEPAGE_861)
• Hebrew (CP862) (CONFIG_FATFS_CODEPAGE_862)
• Canadian French (CP863) (CONFIG_FATFS_CODEPAGE_863)
• Arabic (CP864) (CONFIG_FATFS_CODEPAGE_864)
• Nordic (CP865) (CONFIG_FATFS_CODEPAGE_865)
• Russian (CP866) (CONFIG_FATFS_CODEPAGE_866)
• Greek 2 (CP869) (CONFIG_FATFS_CODEPAGE_869)
• Japanese (DBCS) (CP932) (CONFIG_FATFS_CODEPAGE_932)
• Simplified Chinese (DBCS) (CP936) (CONFIG_FATFS_CODEPAGE_936)
• Korean (DBCS) (CP949) (CONFIG_FATFS_CODEPAGE_949)
• Traditional Chinese (DBCS) (CP950) (CONFIG_FATFS_CODEPAGE_950)

CONFIG_FATFS_MAX_LFN
Max long filename length

* Found in: Component config > FAT Filesystem support

Maximum long filename length. Can be reduced to save RAM.

CONFIG_FATFS_API_ENCODING
API character encoding

* Found in: Component config > FAT Filesystem support

Choose encoding for character and string arguments/returns when using FATFS APIs. The encoding of arguments will usually depend on text editor settings.

Available options:

• API uses ANSI/OEM encoding (CONFIG_FATFS_API_ENCODING_ANSI_OEM)
• API uses UTF-8 encoding (CONFIG_FATFS_API_ENCODING_UTF_8)

CONFIG_FATFS_FS_LOCK
Number of simultaneously open files protected by lock function

* Found in: Component config > FAT Filesystem support

This option sets the FATFS configuration value _FS_LOCK. The option _FS_LOCK switches file lock function to control duplicated file open and illegal operation to open objects.

* 0: Disable file lock function. To avoid volume corruption, application should avoid illegal open, remove and rename to the open objects.

* >0: Enable file lock function. The value defines how many files/sub-directories can be opened simultaneously under file lock control.

Note that the file lock control is independent of re-entrancy.

Range:

• from 0 to 65535

Default value:

• 0
CONFIG_FATFS_TIMEOUT_MS

Timeout for acquiring a file lock, ms

*Found in: Component config > FAT Filesystem support*

This option sets FATFS configuration value _FS_TIMEOUT, scaled to milliseconds. Sets the number of milliseconds FATFS will wait to acquire a mutex when operating on an open file. For example, if one task is performing a lengthy operation, another task will wait for the first task to release the lock, and timeout after amount of time set by this option.

**Default value:**
- 10000

CONFIG_FATFS_PER_FILE_CACHE

Use separate cache for each file

*Found in: Component config > FAT Filesystem support*

This option affects FATFS configuration value _FS_TINY.

If this option is set, _FS_TINY is 0, and each open file has its own cache, size of the cache is equal to the _MAX_SS variable (512 or 4096 bytes). This option uses more RAM if more than 1 file is open, but needs less reads and writes to the storage for some operations.

If this option is not set, _FS_TINY is 1, and single cache is used for all open files, size is also equal to _MAX_SS variable. This reduces the amount of heap used when multiple files are open, but increases the number of read and write operations which FATFS needs to make.

**Default value:**
- Yes (enabled)

CONFIG_FATFS_ALLOC_PREFER_EXTRAM

Perfer external RAM when allocating FATFS buffers

*Found in: Component config > FAT Filesystem support*

When the option is enabled, internal buffers used by FATFS will be allocated from external RAM. If the allocation from external RAM fails, the buffer will be allocated from the internal RAM. Disable this option if optimizing for performance. Enable this option if optimizing for internal memory size.

**Default value:**
- Yes (enabled) if CONFIG_SPIRAM_USE_CAPS_ALLOC || CONFIG_SPIRAM_USE_MALLOC

CONFIG_FATFS_USE_FASTSEEK

Enable fast seek algorithm when using lseek function through VFS FAT

*Found in: Component config > FAT Filesystem support*

The fast seek feature enables fast backward/long seek operations without FAT access by using an in-memory CLMT (cluster link map table). Please note, fast-seek is only allowed for read-mode files, if a file is opened in write-mode, the seek mechanism will automatically fallback to the default implementation.

**Default value:**
- No (disabled)
CONFIG_FATFS_FASTSEEK_BUFFER_SIZE

Fast seek CLMT buffer size

*Found in: Component config > FAT Filesystem support > CONFIG_FATFS_USE_FASTSEEK*

If fast seek algorithm is enabled, this defines the size of CLMT buffer used by this algorithm in 32-bit word units. This value should be chosen based on prior knowledge of maximum elements of each file entry would store.

**Default value:**
- 64 if CONFIG_FATFS_USE_FASTSEEK

CONFIG_FATFS_VFS_FSTAT_BLKSIZE

Default block size

*Found in: Component config > FAT Filesystem support*

If set to 0, the ‘newlib’ library’s default size (BLKSIZ) is used (128 B). If set to a non-zero value, the value is used as the block size. Default file buffer size is set to this value and the buffer is allocated when first attempt of reading/writing to a file is made. Increasing this value improves fread() speed, however the heap usage is increased as well.

**NOTE:** The block size value is shared by all the filesystem functions accessing target media for given file descriptor! See ‘Improving I/O performance’ section of ‘Maximizing Execution Speed’ documentation page for more details.

**Default value:**
- 0

CONFIG_FATFS_IMMEDIATE_FSYNC

Enable automatic f_sync

*Found in: Component config > FAT Filesystem support*

Enables automatic calling of f_sync() to flush recent file changes after each call of vfs_fat_write(), vfs_fat_pwrite(), vfs_fat_link(), vfs_fat_truncate() and vfs_fat_ftruncate() functions. This feature improves file-consistency and size reporting accuracy for the FatFS, at a price on decreased performance due to frequent disk operations.

**Default value:**
- No (disabled)

FreeRTOS Contains:

- *Kernel*
- *Port*

Kernel Contains:

- CONFIG_FREERTOS_CHECK_STACKOVERFLOW
- CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY
- CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS
- CONFIG_FREERTOS_MAX_TASK_NAME_LEN
- CONFIG_FREERTOS_IDLE_TASK_STACKSIZE
- CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS
- CONFIG_FREERTOS_QUEUE_REGISTRY_SIZE
- CONFIG_FREERTOS_TASK_NOTIFICATION_ARRAY_ENTRIES
- CONFIG_FREERTOS_HZ
- CONFIG_FREERTOS_TIMER_QUEUE_LENGTH
- CONFIG_FREERTOS_TIMER_SERVICE_TASK_NAME
Chapter 2. API Reference

- `CONFIG_FREERTOS_TIMER_TASK_PRIORITY`
- `CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH`
- `CONFIG_FREERTOS_USE_IDLE_HOOK`
- `CONFIG_FREERTOS_OPTIMIZED_SCHEDULER`
- `CONFIG_FREERTOS_USE_TICK_HOOK`
- `CONFIG_FREERTOS_USE_TICKLESS_IDLE`
- `CONFIG_FREERTOS_USE_TRACE_FACILITY`
- `CONFIG_FREERTOS_UNICORE`
- `CONFIG_FREERTOS_SMP`
- `CONFIG_FREERTOS_USE_MINIMAL_IDLE_HOOK`

**CONFIG_FREERTOS_SMP**

Run the Amazon SMP FreeRTOS kernel instead (FEATURE UNDER DEVELOPMENT)

*Found in: Component config > FreeRTOS > Kernel*

Amazon has released an SMP version of the FreeRTOS Kernel which can be found via the following link: https://github.com/FreeRTOS/FreeRTOS-Kernel/tree/smp

IDF has added an experimental port of this SMP kernel located in components/freertos/FreeRTOS-Kernel-SMP. Enabling this option will cause IDF to use the Amazon SMP kernel. Note that THIS FEATURE IS UNDER ACTIVE DEVELOPMENT, users use this at their own risk.

Leaving this option disabled will mean the IDF FreeRTOS kernel is used instead, which is located in: components/freertos/FreeRTOS-Kernel. Both kernel versions are SMP capable, but differ in their implementation and features.

*Default value:*
  - No (disabled)

**CONFIG_FREERTOS_UNICORE**

Run FreeRTOS only on first core

*Found in: Component config > FreeRTOS > Kernel*

This version of FreeRTOS normally takes control of all cores of the CPU. Select this if you only want to start it on the first core. This is needed when e.g. another process needs complete control over the second core.

*Default value:*
  - Yes (enabled)

**CONFIG_FREERTOS_HZ**

`configTICK_RATE_HZ`

*Found in: Component config > FreeRTOS > Kernel*

Sets the FreeRTOS tick interrupt frequency in Hz (see `configTICK_RATE_HZ` documentation for more details).

*Range:*
  - from 1 to 1000

*Default value:*
  - 100

**CONFIG_FREERTOS_OPTIMIZED_SCHEDULER**

`configUSE_PORT_OPTIMISED_TASK_SELECTION`

*Found in: Component config > FreeRTOS > Kernel*
Chapter 2. API Reference

Enables port specific task selection method. This option can speed up the search of ready tasks when scheduling (see configUSE_PORT_OPTIMISED_TASK_SELECTION documentation for more details).

**CONFIG_FREERTOS_CHECK_STACKOVERFLOW**

`configCHECK_FOR_STACK_OVERFLOW`

*Found in: Component config > FreeRTOS > Kernel*

Enables FreeRTOS to check for stack overflows (see configCHECK_FOR_STACK_OVERFLOW documentation for more details).

Note: If users do not provide their own `vApplicationStackOverflowHook()` function, a default function will be provided by ESP-IDF.

Available options:

- No checking (CONFIG_FREERTOS_CHECK_STACKOVERFLOW_NONE)
  Do not check for stack overflows (configCHECK_FOR_STACK_OVERFLOW = 0)
- Check by stack pointer value (Method 1) (CONFIG_FREERTOS_CHECK_STACKOVERFLOW_PTRVAL)
  Check for stack overflows on each context switch by checking if the stack pointer is in a valid range. Quick but does not detect stack overflows that happened between context switches (configCHECK_FOR_STACK_OVERFLOW = 1)
- Check using canary bytes (Method 2) (CONFIG_FREERTOS_CHECK_STACKOVERFLOW_CANARY)
  Places some magic bytes at the end of the stack area and on each context switch, check if these bytes are still intact. More thorough than just checking the pointer, but also slightly slower. (configCHECK_FOR_STACK_OVERFLOW = 2)

**CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS**

`configNUM_THREAD_LOCAL_STORAGE_POINTERS`

*Found in: Component config > FreeRTOS > Kernel*

Set the number of thread local storage pointers in each task (see configNUM_THREAD_LOCAL_STORAGE_POINTERS documentation for more details).

Note: In ESP-IDF, this value must be at least 1. Index 0 is reserved for use by the pthreads API thread-local-storage. Other indexes can be used for any desired purpose.

**Range:**

- from 1 to 256

**Default value:**

- 1

**CONFIG_FREERTOS_IDLE_TASK_STACKSIZE**

`configMINIMAL_STACK_SIZE(Idletaskstacksize)`

*Found in: Component config > FreeRTOS > Kernel*

Sets the idle task stack size in bytes (see configMINIMAL_STACK_SIZE documentation for more details).

Note:

- ESP-IDF specifies stack sizes in bytes instead of words.
- The default size is enough for most use cases.
• The stack size may need to be increased above the default if the app installs idle or thread local storage cleanup hooks that use a lot of stack memory.
• Conversely, the stack size can be reduced to the minimum if none of the idle features are used.

**Range:**

• from 768 to 32768

**Default value:**

• 1536

**CONFIG_FREERTOS_USE_IDLE_HOOK**

configUSE_IDLE_HOOK

*Found in: Component config > FreeRTOS > Kernel*

Enables the idle task application hook (see configUSE_IDLE_HOOK documentation for more details).

**Note:**

• The application must provide the hook function `void vApplicationIdleHook( void );`
• `vApplicationIdleHook()` is called from FreeRTOS idle task(s)
• The FreeRTOS idle hook is NOT the same as the ESP-IDF Idle Hook, but both can be enabled simultaneously.

**Default value:**

• No (disabled)

**CONFIG_FREERTOS_USE_MINIMAL_IDLE_HOOK**

Use FreeRTOS minimal idle hook

*Found in: Component config > FreeRTOS > Kernel*

Enables the minimal idle task application hook (see configUSE_IDLE_HOOK documentation for more details).

**Note:**

• The application must provide the hook function `void vApplicationMinimalIdleHook( void );`
• `vApplicationMinimalIdleHook()` is called from FreeRTOS minimal idle task(s)

**Default value:**

• No (disabled) if `CONFIG_FREERTOS_SMP`

**CONFIG_FREERTOS_USE_TICK_HOOK**

configUSE_TICK_HOOK

*Found in: Component config > FreeRTOS > Kernel*

Enables the tick hook (see configUSE_TICK_HOOK documentation for more details).

**Note:**

• The application must provide the hook function `void vApplicationTickHook( void );`
• `vApplicationTickHook()` is called from FreeRTOS’ s tick handling function `xTaskIncrementTick()`
• The FreeRTOS tick hook is NOT the same as the ESP-IDF Tick Interrupt Hook, but both can be enabled simultaneously.

**Default value:**

• No (disabled)
Chapter 2. API Reference

**CONFIG_FREERTOS_MAX_TASK_NAME_LEN**

```c
configMAX_TASK_NAME_LEN
```

*Found in: Component config > FreeRTOS > Kernel*

Sets the maximum number of characters for task names (see `configMAX_TASK_NAME_LEN` documentation for more details).

*Note:* For most uses, the default of 16 characters is sufficient.

*Range:*
  - from 1 to 256

*Default value:*
  - 16

**CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY**

```c
configENABLE_BACKWARD_COMPATIBILITY
```

*Found in: Component config > FreeRTOS > Kernel*

Enable backward compatibility with APIs prior to FreeRTOS v8.0.0. (see `configENABLE_BACKWARD_COMPATIBILITY` documentation for more details).

*Default value:*
  - No (disabled)

**CONFIG_FREERTOS_TIMER_SERVICE_TASK_NAME**

```c
configTIMER_SERVICE_TASK_NAME
```

*Found in: Component config > FreeRTOS > Kernel*

Sets the timer task’s name (see `configTIMER_SERVICE_TASK_NAME` documentation for more details).

*Default value:*
  - “Tmr Svc”

**CONFIG_FREERTOS_TIMER_TASK_PRIORITY**

```c
configTIMER_TASK_PRIORITY
```

*Found in: Component config > FreeRTOS > Kernel*

Sets the timer task’s priority (see `configTIMER_TASK_PRIORITY` documentation for more details).

*Range:*
  - from 1 to 25

*Default value:*
  - 1

**CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH**

```c
configTIMER_TASK_STACK_DEPTH
```

*Found in: Component config > FreeRTOS > Kernel*

Set the timer task’s stack size (see `configTIMER_TASK_STACK_DEPTH` documentation for more details).

*Range:*
  - from 1536 to 32768

*Default value:*
  - 2048
**CONFIG_FREERTOS_TIMER_QUEUE_LENGTH**

configTIMER_QUEUE_LENGTH

*Found in: Component config > FreeRTOS > Kernel*

Set the timer task’s command queue length (see configTIMER_QUEUE_LENGTH documentation for more details).

**Range:**
- from 5 to 20

**Default value:**
- 10

**CONFIG_FREERTOS_QUEUE_REGISTRY_SIZE**

configQUEUE_REGISTRY_SIZE

*Found in: Component config > FreeRTOS > Kernel*

Set the size of the queue registry (see configQUEUE_REGISTRY_SIZE documentation for more details).

**Note:** A value of 0 will disable queue registry functionality

**Range:**
- from 0 to 20

**Default value:**
- 0

**CONFIG_FREERTOS_TASK_NOTIFICATION_ARRAY_ENTRIES**

configTASK_NOTIFICATION_ARRAY_ENTRIES

*Found in: Component config > FreeRTOS > Kernel*

Set the size of the task notification array of each task. When increasing this value, keep in mind that this means additional memory for each and every task on the system. However, task notifications in general are more lightweight compared to alternatives such as semaphores.

**Range:**
- from 1 to 32

**Default value:**
- 1

**CONFIG_FREERTOS_USE_TRACE_FACILITY**

configUSE_TRACE_FACILITY

*Found in: Component config > FreeRTOS > Kernel*

Enables additional structure members and functions to assist with execution visualization and tracing (see configUSE_TRACE_FACILITY documentation for more details).

**Default value:**
- No (disabled)

**CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS**

configUSE_STATS_FORMATTING_FUNCTIONS

*Found in: Component config > FreeRTOS > Kernel > CONFIG_FREERTOS_USE_TRACE_FACILITY*
Set configUSE_TRACE_FACILITY and configUSE_STATS_FORMATTING_FUNCTIONS to 1 to include the vTaskList() and vTaskGetRunTimeStats() functions in the build (see configUSE_STATS_FORMATTING_FUNCTIONS documentation for more details).

**Default value:**
- No (disabled) if CONFIG_FREERTOS_USE_TRACE_FACILITY

**CONFIG_FREERTOS_VTASKLIST_INCLUDE_COREID**

Enable display of xCoreID in vTaskList

*Found in: Component config > FreeRTOS > Kernel > CONFIG_FREERTOS_VTASKLIST_INCLUDE_COREID*

If enabled, this will include an extra column when vTaskList is called to display the CoreID the task is pinned to (0,1) or -1 if not pinned.

**CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS**

configGENERATE_RUN_TIME_STATS

*Found in: Component config > FreeRTOS > Kernel*

Enables collection of run time statistics for each task (see configGENERATE_RUN_TIME_STATS documentation for more details).

**Default value:**
- No (disabled)

**CONFIG_FREERTOS_RUN_TIME_COUNTER_TYPE**

configRUN_TIME_COUNTER_TYPE

*Found in: Component config > FreeRTOS > Kernel > CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS*

Sets the data type used for the FreeRTOS run time stats. A larger data type can be used to reduce the frequency of the counter overflowing.

**Available options:**
- uint32_t (CONFIG_FREERTOS_RUN_TIME_COUNTER_TYPE_U32)
- uint64_t (CONFIG_FREERTOS_RUN_TIME_COUNTER_TYPE_U64)

**CONFIG_FREERTOS_USE_TICKLESS_IDLE**

configUSE_TICKLESS_IDLE

*Found in: Component config > FreeRTOS > Kernel*

If power management support is enabled, FreeRTOS will be able to put the system into light sleep mode when no tasks need to run for a number of ticks. This number can be set using FREERTOS_IDLE_TIME_BEFORE_SLEEP option. This feature is also known as “automatic light sleep”.

Note that timers created using esp_timer APIs may prevent the system from entering sleep mode, even when no tasks need to run. To skip unnecessary wake-up initialize a timer with the “skip_unhandled_events” option as true.
If disabled, automatic light sleep support will be disabled.

**Default value:**

- No (disabled) if `CONFIG_PM_ENABLE`

**CONFIG_FREERTOS_IDLE_TIME_BEFORE_SLEEP**

`configEXPECTED_IDLE_TIME_BEFORE_SLEEP`

*Found in: Component config > FreeRTOS > Kernel > CONFIG_FREERTOS_USE_TICKLESS_IDLE*

FreeRTOS will enter light sleep mode if no tasks need to run for this number of ticks. You can enable `PM_PROFILING` feature in esp_pm components and dump the sleep status with `esp_pm_dump_locks`, if the proportion of rejected sleeps is too high, please increase this value to improve scheduling efficiency.

**Range:**

- from 2 to 4294967295 if `CONFIG_FREERTOS_USE_TICKLESS_IDLE`

**Default value:**

- 3 if `CONFIG_FREERTOS_USE_TICKLESS_IDLE`

**Port**

Contains:

- `CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER`
- `CONFIG_FREERTOS_RUN_TIME_STATS_CLK`
- `CONFIG_FREERTOS_INTERRUPT_BACKTRACE`
- `CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK`
- `CONFIG_FREERTOS_ENABLE_STATIC_TASK_CLEAN_UP`
- `CONFIG_FREERTOS_ISR_STACKSIZE`
- `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH`
- `CONFIG_FREERTOS_CHECK_PORT_CRITICAL_COMPLIANCE`
- `CONFIG_FREERTOS_CORETIMER`
- `CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER`

**CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER**

Wrap task functions

*Found in: Component config > FreeRTOS > Port*

If enabled, all FreeRTOS task functions will be enclosed in a wrapper function. If a task function mistakenly returns (i.e. does not delete), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application. This option is also required for GDB backtraces and C++ exceptions to work correctly inside top-level task functions.

**Default value:**

- Yes (enabled)

**CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK**

Enable stack overflow debug watchpoint

*Found in: Component config > FreeRTOS > Port*

FreeRTOS can check if a stack has overflown its bounds by checking either the value of the stack pointer or by checking the integrity of canary bytes. (See `FREERTOS_CHECK_STACKOVERFLOW` for more information.) These checks only happen on a context switch, and the situation that caused the stack overflow may already be long gone by then. This option will use the last debug memory watchpoint to allow breaking into the debugger (or panic’ing) as soon as any of the last 32 bytes on the stack of a task are overwritten. The side effect is that using gdb, you effectively have one hardware watchpoint less because the last one is overwritten as soon as a task switch happens.
Another consequence is that due to alignment requirements of the watchpoint, the usable stack size decreases by up to 60 bytes. This is because the watchpoint region has to be aligned to its size and the size for the stack watchpoint in IDF is 32 bytes.

This check only triggers if the stack overflow writes within 32 bytes near the end of the stack, rather than overshooting further, so it is worth combining this approach with one of the other stack overflow check methods.

When this watchpoint is hit, gdb will stop with a SIGTRAP message. When no JTAG OCD is attached, esp-idf will panic on an unhandled debug exception.

Default value:
- No (disabled)

**CONFIG_FREERTOS TLSP DELETION CALLBACKS**

Enable thread local storage pointers deletion callbacks

*Found in: Component config > FreeRTOS > Port*

ESP-IDF provides users with the ability to free TLSP memory by registering TLSP deletion callbacks. These callbacks are automatically called by FreeRTOS when a task is deleted. When this option is turned on, the memory reserved for TLSPs in the TCB is doubled to make space for storing the deletion callbacks. If the user does not wish to use TLSP deletion callbacks then this option could be turned off to save space in the TCB memory.

Default value:
- Yes (enabled)

**CONFIG_FREERTOS TASK PRE DELETION HOOK**

Enable task pre-deletion hook

*Found in: Component config > FreeRTOS > Port*

Enable this option to make FreeRTOS call a user provided hook function right before it deletes a task (i.e., frees/releases a dynamically/statically allocated task’s memory). This is useful if users want to know when a task is actually deleted (in case the task’s deletion is delegated to the IDLE task).

If this config option is enabled, users must define a `void vTaskPreDeletionHook( void *pxTCB )` hook function in their application.

**CONFIG_FREERTOS ENABLE STATIC TASK CLEAN UP**

Enable static task cleanup hook (DEPRECATED)

*Found in: Component config > FreeRTOS > Port*

THIS OPTION IS DEPRECATED. Use FREERTOS TASK PRE DELETION HOOK instead.

Enable this option to make FreeRTOS call the static task cleanup hook when a task is deleted.

Note: Users will need to provide a `void vPortCleanUpTCB ( void *pxTCB )` callback

Default value:
- No (disabled)

**CONFIG_FREERTOS CHECK_MUTEX GIVEN BY OWNER**

Check that mutex semaphore is given by owner task

*Found in: Component config > FreeRTOS > Port*

If enabled, assert that when a mutex semaphore is given, the task giving the semaphore is the task which is currently holding the mutex.
**CONFIG_FREERTOS_ISR_STACKSIZE**

ISR stack size

*Found in: Component config > FreeRTOS > Port*

The interrupt handlers have their own stack. The size of the stack can be defined here. Each processor has its own stack, so the total size occupied will be twice this.

**Range:**
- from 2096 to 32768 if `CONFIG_ESP_COREDUMP_DATA_FORMAT_ELF`
- from 1536 to 32768

**Default value:**
- 2096 if `CONFIG_ESP_COREDUMP_DATA_FORMAT_ELF`
- 1536

**CONFIG_FREERTOS_INTERRUPT_BACKTRACE**

Enable backtrace from interrupt to task context

*Found in: Component config > FreeRTOS > Port*

If this option is enabled, interrupt stack frame will be modified to point to the code of the interrupted task as its return address. This helps the debugger (or the panic handler) show a backtrace from the interrupt to the task which was interrupted. This also works for nested interrupts: higher level interrupt stack can be traced back to the lower level interrupt. This option adds 4 instructions to the interrupt dispatching code.

**Default value:**
- Yes (enabled)

**CONFIG_FREERTOS_CORETIMER**

Tick timer source (Xtensa Only)

*Found in: Component config > FreeRTOS > Port*

FreeRTOS needs a timer with an associated interrupt to use as the main tick source to increase counters, run timers and do pre-emptive multitasking with. There are multiple timers available to do this, with different interrupt priorities.

**Available options:**
- Timer 0 (int 6, level 1) (CONFIG_FREERTOS_CORETIMER_0)
  - Select this to use timer 0
- Timer 1 (int 15, level 3) (CONFIG_FREERTOS_CORETIMER_1)
  - Select this to use timer 1
- SYSTIMER 0 (level 1) (CONFIG_FREERTOS_CORETIMER_SYSTIMER_LVL1)
  - Select this to use systimer with the 1 interrupt priority.
- SYSTIMER 0 (level 3) (CONFIG_FREERTOS_CORETIMER_SYSTIMER_LVL3)
  - Select this to use systimer with the 3 interrupt priority.

**CONFIG_FREERTOS_RUN_TIME_STATS_CLK**

Choose the clock source for run time stats

*Found in: Component config > FreeRTOS > Port*

Choose the clock source for FreeRTOS run time stats. Options are CPU0’s CPU Clock or the ESP Timer. Both clock sources are 32 bits. The CPU Clock can run at a higher frequency hence provide a finer resolution but will overflow much quicker. Note that run time stats are only valid until the clock source overflows.
Available options:

- Use ESP Timer for run time stats (CONFIG_FREERTOS_Run_TIME_STATS_USING_ESP_TIMER)
  ESP Timer will be used as the clock source for FreeRTOS run time stats. The ESP Timer
  runs at a frequency of 1MHz regardless of Dynamic Frequency Scaling. Therefore the
  ESP Timer will overflow in approximately 4290 seconds.
- Use CPU Clock for run time stats (CONFIG_FREERTOS_Run_TIME_STATS_USING_CPU_CLK)
  CPU Clock will be used as the clock source for the generation of run time stats. The
  CPU Clock has a frequency dependent on ESP_DEFAULT_CPU_FREQ_MHZ and
  Dynamic Frequency Scaling (DFS). Therefore the CPU Clock frequency can fluctuate
  between 80 to 240MHz. Run time stats generated using the CPU Clock represents the
  number of CPU cycles each task is allocated and DOES NOT reflect the amount of
  time each task runs for (as CPU clock frequency can change). If the CPU clock consistently
  runs at the maximum frequency of 240MHz, it will overflow in approximately 17
  seconds.

CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH
Place FreeRTOS functions into Flash

Found in: Component config > FreeRTOS > Port

When enabled the selected Non-ISR FreeRTOS functions will be placed into Flash memory instead of
IRAM. This saves up to 8KB of IRAM depending on which functions are used.

Default value:
- No (disabled)

CONFIG_FREERTOS_CHECK_PORT_CRITICAL_COMPLIANCE
Tests compliance with Vanilla FreeRTOS port*_CRITICAL calls

Found in: Component config > FreeRTOS > Port

If enabled, context of port*_CRITICAL calls (ISR or Non-ISR) would be checked to be in compliance
with Vanilla FreeRTOS. e.g Calling port*_CRITICAL from ISR context would cause assert failure

Default value:
- No (disabled)

Hardware Abstraction Layer (HAL) and Low Level (LL) Contains:

- CONFIG_HAL_DEFAULT_ASSERTION_LEVEL
- CONFIG_HAL_LOG_LEVEL
- CONFIG_HAL_SYSTIMER_USE_ROM_IMPL
- CONFIG_HAL_WDT_USE_ROM_IMPL

CONFIG_HAL_DEFAULT_ASSERTION_LEVEL
Default HAL assertion level

Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)

Set the assert behavior / level for HAL component. HAL component assert level can be set separately,
but the level can’t exceed the system assertion level. e.g. If the system assertion is disabled, then the
HAL assertion can’t be enabled either. If the system assertion is enable, then the HAL assertion can
still be disabled by this Kconfig option.

Available options:
Chapter 2. API Reference

- Same as system assertion level (CONFIG_HAL_ASSERTION_EQUALS_SYSTEM)
- Disabled (CONFIG_HAL_ASSERTION_DISABLE)
- Silent (CONFIG_HAL_ASSERTION_SILENT)
- Enabled (CONFIG_HAL_ASSERTION_ENABLE)

CONFIG_HAL_LOG_LEVEL

HAL layer log verbosity

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Specify how much output to see in HAL logs.

Available options:

- No output (CONFIG_HAL_LOG_LEVEL_NONE)
- Error (CONFIG_HAL_LOG_LEVEL_ERROR)
- Warning (CONFIG_HAL_LOG_LEVEL_WARN)
- Info (CONFIG_HAL_LOG_LEVEL_INFO)
- Debug (CONFIG_HAL_LOG_LEVEL_DEBUG)
- Verbose (CONFIG_HAL_LOG_LEVEL_VERBOSE)

CONFIG_HAL_SYSTIMER_USE_ROM_IMPL

Use ROM implementation of SysTimer HAL driver

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Enable this flag to use HAL functions from ROM instead of ESP-IDF.

If keeping this as "on" in your project, you will have less free IRAM. If making this as "off" in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**

- Yes (enabled) if ESP_ROM_HAS_HAL_SYSTIMER

CONFIG_HAL_WDT_USE_ROM_IMPL

Use ROM implementation of WDT HAL driver

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Enable this flag to use HAL functions from ROM instead of ESP-IDF.

If keeping this as "on" in your project, you will have less free IRAM. If making this as "off" in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**

- Yes (enabled) if ESP_ROM_HAS_HAL_WDT

Heap memory debugging

Contains:

- CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS
- CONFIG HEAP_TASK_TRACKING
- CONFIG HEAP_PLACE_FUNCTION INTO FLASH
- CONFIG HEAP_CORRUPTION_DETECTION
- CONFIG HEAP_TRACING_DEST
- CONFIG HEAP_TRACING_STACK_DEPTH
- CONFIG HEAP_USE_HOOKS
- CONFIG HEAP_TRACE_HASH_MAP
CONFIG_HEAP_CORRUPTION_DETECTION

Heap corruption detection

Found in: Component config > Heap memory debugging

Enable heap poisoning features to detect heap corruption caused by out-of-bounds access to heap memory.

See the “Heap Memory Debugging” page of the IDF documentation for a description of each level of heap corruption detection.

Available options:

- Basic (no poisoning) (CONFIG_HEAP_POISONING_DISABLED)
- Light impact (CONFIG_HEAP_POISONING_LIGHT)
- Comprehensive (CONFIG_HEAP_POISONING_COMPREHENSIVE)

CONFIG_HEAP_TRACING_DEST

Heap tracing

Found in: Component config > Heap memory debugging

Enables the heap tracing API defined in esp_heap_trace.h.

This function causes a moderate increase in IRAM code side and a minor increase in heap function (malloc/free/realloc) CPU overhead, even when the tracing feature is not used. So it’s best to keep it disabled unless tracing is being used.

Available options:

- Disabled (CONFIG_HEAP_TRACING_OFF)
- Standalone (CONFIG_HEAP_TRACING_STANDALONE)
- Host-based (CONFIG_HEAP_TRACING_TOHOST)

CONFIG_HEAP_TRACING_STACK_DEPTH

Heap tracing stack depth

Found in: Component config > Heap memory debugging

Number of stack frames to save when tracing heap operation callers.

More stack frames uses more memory in the heap trace buffer (and slows down allocation), but can provide useful information.

CONFIG_HEAP_USE_HOOKS

Use allocation and free hooks

Found in: Component config > Heap memory debugging

Enable the user to implement function hooks triggered for each successful allocation and free.
**CONFIG_HEAP_TASK_TRACKING**

Enable heap task tracking

*Found in: Component config > Heap memory debugging*

Enables tracking the task responsible for each heap allocation.

This function depends on heap poisoning being enabled and adds four more bytes of overhead for each block allocated.

**CONFIG_HEAP_TRACE_HASH_MAP**

Use hash map mechanism to access heap trace records

*Found in: Component config > Heap memory debugging*

Enable this flag to use a hash map to increase performance in handling heap trace records.

Heap trace standalone supports storing records as a list, or a list + hash map.

Using only a list takes less memory, but calls to ‘free’ will get slower as the list grows. This is particularly affected when using HEAP_TRACE_ALL mode.

By using a list + hash map, calls to ‘free’ remain fast, at the cost of additional memory to store the hash map.

**Default value:**
- No (disabled) if `CONFIG_HEAP_TRACING_STANDALONE`

**CONFIG_HEAP_TRACE_HASH_MAP_IN_EXT_RAM**

Place hash map in external RAM

*Found in: Component config > Heap memory debugging > CONFIG_HEAP_TRACE_HASH_MAP*

When enabled this configuration forces the hash map to be placed in external RAM.

**Default value:**
- No (disabled) if `CONFIG_HEAP_TRACE_HASH_MAP`

**CONFIG_HEAP_TRACE_HASH_MAP_SIZE**

The number of entries in the hash map

*Found in: Component config > Heap memory debugging > CONFIG_HEAP_TRACE_HASH_MAP*

Defines the number of entries in the heap trace hashmap. Each entry takes 8 bytes. The bigger this number is, the better the performance. Recommended range: 200 - 2000.

**Default value:**
- 512 if `CONFIG_HEAP_TRACE_HASH_MAP`

**CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILURES**

Abort if memory allocation fails

*Found in: Component config > Heap memory debugging*

When enabled, if a memory allocation operation fails it will cause a system abort.

**Default value:**
- No (disabled)
**CONFIG_HEAP_TLSF_USE_ROM_IMPL**

Use ROM implementation of heap tlsf library

*Found in: Component config > Heap memory debugging*

Enable this flag to use heap functions from ROM instead of ESP-IDF.

If keeping this as “n” in your project, you will have less free IRAM. If making this as “y” in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

*Default value:*
- Yes (enabled) if ESP_ROM_HAS_HEAP_TLSF

**CONFIG_HEAP_PLACE_FUNCTION_INTO_FLASH**

Force the entire heap component to be placed in flash memory

*Found in: Component config > Heap memory debugging*

Enable this flag to save up RAM space by placing the heap component in the flash memory

Note that it is only safe to enable this configuration if no functions from esp_heap_caps.h or esp_heap_trace.h are called from ISR.

---

**IEEE 802.15.4**

Contains:

- CONFIG_IEEE802154_CCA_THRESHOLD
- CONFIG_IEEE802154_CCA_MODE
- CONFIG_IEEE802154_DEBUG
- CONFIG_IEEE802154_SLEEP_ENABLE
- CONFIG_IEEE802154_MULTI_PAN_ENABLE
- CONFIG_IEEE802154_TIMING_OPTIMIZATION
- CONFIG_IEEE802154_PENDING_TABLE_SIZE
- CONFIG_IEEE802154_RX_BUFFER_SIZE

**CONFIG_IEEE802154_RX_BUFFER_SIZE**

The number of 802.15.4 receive buffers

*Found in: Component config > IEEE 802.15.4*

The number of 802.15.4 receive buffers

**CONFIG_IEEE802154_CCA_MODE**

Clear Channel Assessment (CCA) mode

*Found in: Component config > IEEE 802.15.4*

configure the CCA mode

Available options:

- Carrier sense only (CONFIG_IEEE802154_CCA_CARRIER)
- Energy above threshold (CONFIG_IEEE802154_CCA_ED)
- Carrier sense OR Energy above threshold (CONFIG_IEEE802154_CCA_CARRIER_OR_ED)

configure the CCA mode to Carrier sense OR energy above threshold
• Carrier sense AND energy above threshold (CONFIG_IEEE802154_CCA_CARRIER_AND_ED)
  configure the CCA mode to Carrier sense AND energy above threshold

**CONFIG_IEEE802154_CCA_THRESHOLD**

CCA detection threshold

*Found in: Component config > IEEE 802.15.4*

set the CCA threshold, in dB

**Range:**
- from -120 to 0

**Default value:**
- “-60”

**CONFIG_IEEE802154_PENDING_TABLE_SIZE**

Pending table size

*Found in: Component config > IEEE 802.15.4*

set the pending table size

**Range:**
- from 1 to 100

**Default value:**
- 20

**CONFIG_IEEE802154_MULTI_PAN_ENABLE**

Enable multi-pan feature for frame filter

*Found in: Component config > IEEE 802.15.4*

Enable IEEE802154 multi-pan

**Default value:**
- No (disabled)

**CONFIG_IEEE802154_TIMING_OPTIMIZATION**

Enable throughput optimization

*Found in: Component config > IEEE 802.15.4*

Enabling this option increases throughput by ~5% at the expense of ~2.1k IRAM code size increase.

**Default value:**
- No (disabled)

**CONFIG_IEEE802154_SLEEP_ENABLE**

Enable IEEE802154 light sleep

*Found in: Component config > IEEE 802.15.4*

Enabling this option allows the IEEE802.15.4 module to be powered down during automatic light sleep, which reduces current consumption.

**Default value:**
- No (disabled) if `CONFIG_PM_ENABLE` & `CONFIG_PM_POWER_DOWN_PERIPHERAL_IN_LIGHT_SLEEP`
**CONFIG_IEEE802154_DEBUG**

Enable IEEE802154 Debug

*Found in: Component config > IEEE 802.15.4*

Enabling this option allows different kinds of IEEE802154 debug output. All IEEE802154 debug features increase the size of the final binary.

**Default value:**
- No (disabled)

Contains:
- `CONFIG_IEEE802154_RECORD_ABORT`
- `CONFIG_IEEE802154_RECORD_CMD`
- `CONFIG_IEEE802154_RECORD_EVENT`
- `CONFIG_IEEE802154_RECORD_STATE`
- `CONFIG_IEEE802154_ASSERT`

**CONFIG_IEEE802154_ASSERT**

Enrich the assert information with IEEE802154 state and event

*Found in: Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG*

Enabling this option to add some probe codes in the driver, and these informations will be printed when assert.

**Default value:**
- No (disabled) if `CONFIG_IEEE802154_DEBUG`

**CONFIG_IEEE802154_RECORD_EVENT**

Enable record event information for debugging

*Found in: Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG*

Enabling this option to record event, when assert, the recorded event will be printed.

**Default value:**
- No (disabled) if `CONFIG_IEEE802154_DEBUG`

**CONFIG_IEEE802154_RECORD_EVENT_SIZE**

Record event table size

*Found in: Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD_EVENT*

set the record event table size

**Range:**
- from 1 to 50 if `CONFIG_IEEE802154_RECORD_EVENT`

**Default value:**
- 30 if `CONFIG_IEEE802154_RECORD_EVENT`

**CONFIG_IEEE802154_RECORD_STATE**

Enable record state information for debugging

*Found in: Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG*

Enabling this option to record state, when assert, the recorded state will be printed.

**Default value:**
• No (disabled) if `CONFIG_IEEE802154_DEBUG`

**CONFIG_IEEE802154_RECORD_STATE_SIZE**

Record state table size

*Found in:* Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD_STATE

set the record state table size

**Range:**

• from 1 to 50 if `CONFIG_IEEE802154_RECORD_STATE`

**Default value:**

• 10 if `CONFIG_IEEE802154_RECORD_STATE`

**CONFIG_IEEE802154_RECORD_CMD**

Enable record command information for debugging

*Found in:* Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG

Enabling this option to record the command, when assert, the recorded command will be printed.

**Default value:**

• No (disabled) if `CONFIG_IEEE802154_DEBUG`

**CONFIG_IEEE802154_RECORD_CMD_SIZE**

Record command table size

*Found in:* Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD_CMD

set the record command table size

**Range:**

• from 1 to 50 if `CONFIG_IEEE802154_RECORD_CMD`

**Default value:**

• 10 if `CONFIG_IEEE802154_RECORD_CMD`

**CONFIG_IEEE802154_RECORD_ABORT**

Enable record abort information for debugging

*Found in:* Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG

Enabling this option to record the abort, when assert, the recorded abort will be printed.

**Default value:**

• No (disabled) if `CONFIG_IEEE802154_DEBUG`

**CONFIG_IEEE802154_RECORD_ABORT_SIZE**

Record abort table size

*Found in:* Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD_ABORT

set the record abort table size

**Range:**

• from 1 to 50 if `CONFIG_IEEE802154_RECORD_ABORT`

**Default value:**

• 10 if `CONFIG_IEEE802154_RECORD_ABORT`
Log output  Contains:

• `CONFIG_LOG_DEFAULT_LEVEL`
• `CONFIG_LOG_MASTER_LEVEL`
• `CONFIG_LOG_TIMESTAMP_SOURCE`
• `CONFIG_LOG_MAXIMUM_LEVEL`
• `CONFIG_LOG_COLORS`

**CONFIG_LOG_DEFAULT_LEVEL**

Default log verbosity

*Found in: Component config > Log output*

Specify how much output to see in logs by default. You can set lower verbosity level at runtime using esp_log_level_set function.

By default, this setting limits which log statements are compiled into the program. For example, selecting “Warning” would mean that changing log level to “Debug” at runtime will not be possible. To allow increasing log level above the default at runtime, see the next option.

Available options:

• No output (CONFIG_LOG_DEFAULT_LEVEL_NONE)
• Error (CONFIG_LOG_DEFAULT_LEVEL_ERROR)
• Warning (CONFIG_LOG_DEFAULT_LEVEL_WARN)
• Info (CONFIG_LOG_DEFAULT_LEVEL_INFO)
• Debug (CONFIG_LOG_DEFAULT_LEVEL_DEBUG)
• Verbose (CONFIG_LOG_DEFAULT_LEVEL_VERBOSE)

**CONFIG_LOG_MAXIMUM_LEVEL**

Maximum log verbosity

*Found in: Component config > Log output*

This config option sets the highest log verbosity that it’s possible to select at runtime by calling esp_log_level_set(). This level may be higher than the default verbosity level which is set when the app starts up.

This can be used to enable debugging output only at a critical point, for a particular tag, or to minimize startup time but then enable more logs once the firmware has loaded.

Note that increasing the maximum available log level will increase the firmware binary size.

This option only applies to logging from the app, the bootloader log level is fixed at compile time to the separate “Bootloader log verbosity” setting.

Available options:

• Same as default (CONFIG_LOG_MAXIMUM_EQUALS_DEFAULT)
• Error (CONFIG_LOG_MAXIMUM_LEVEL_ERROR)
• Warning (CONFIG_LOG_MAXIMUM_LEVEL_WARN)
• Info (CONFIG_LOG_MAXIMUM_LEVEL_INFO)
• Debug (CONFIG_LOG_MAXIMUM_LEVEL_DEBUG)
• Verbose (CONFIG_LOG_MAXIMUM_LEVEL_VERBOSE)
CONFIG_LOG_MASTER_LEVEL

Enable global master log level

*Found in: Component config > Log output*

Enables an additional global “master” log level check that occurs before a log tag cache lookup. This is useful if you want to compile a lot of logs that are selectable at runtime, but avoid the performance hit during periods where you don’t want log output. Examples include remote log forwarding, or disabling logs during a time-critical or CPU-intensive section and re-enabling them later. Results in larger program size depending on number of logs compiled in.

If enabled, defaults to LOG_DEFAULT_LEVEL and can be set using esp_log_set_level_master(). This check takes precedence over ESP_LOG_LEVEL_LOCAL.

**Default value:**
- No (disabled)

CONFIG_LOG_COLORS

Use ANSI terminal colors in log output

*Found in: Component config > Log output*

Enable ANSI terminal color codes in bootloader output.

In order to view these, your terminal program must support ANSI color codes.

**Default value:**
- Yes (enabled)

CONFIG_LOG_TIMESTAMP_SOURCE

Log Timestamps

*Found in: Component config > Log output*

Choose what sort of timestamp is displayed in the log output:

- Milliseconds since boot is calculated from the RTOS tick count multiplied by the tick period. This time will reset after a software reboot. e.g. (90000)
- System time is taken from POSIX time functions which use the chip’s RTC and high resolution timers to maintain an accurate time. The system time is initialized to 0 on startup, it can be set with an SNTP sync, or with POSIX time functions. This time will not reset after a software reboot. e.g. (00:01:30.000)
- NOTE: Currently this will not get used in logging from binary blobs (i.e WiFi & Bluetooth libraries), these will always print milliseconds since boot.

**Available options:**
- Milliseconds Since Boot (CONFIG_LOG_TIMESTAMP_SOURCE_RTOS)
- System Time (CONFIG_LOG_TIMESTAMP_SOURCE_SYSTEM)

LWIP  Contains:

- CONFIG_LWIP_CHECK_THREAD_SAFETY
- Checksums
- CONFIG_LWIP_DHCP_COARSE_TIMER_SECS

• CONFIG_LWIP_TCPIP_TASK_AFFINITY
• CONFIG_LWIP_TCPIP_TASK_STACK_SIZE
• CONFIG_LWIP_TCPIP_RECVMBOX_SIZE
• CONFIG_LWIP_IP_REASS_MAX_PBUFS
• UDP
• CONFIG_LWIP_IPV6_RDNSS_MAX_DNS_SERVERS
CONFIG_LWIP_ENABLE
Enable LwIP stack

*Found in: Component config > LWIP*

Builds normally if selected. Excludes LwIP from build if unselected, even if it is a dependency of a component or application. Some applications can switch their IP stacks, e.g., when switching between chip and Linux targets (LwIP stack vs. Linux IP stack). Since the LwIP dependency cannot easily be excluded based on a Kconfig option, it has to be a dependency in all cases. This switch allows the LwIP stack to be built selectively, even if it is a dependency.

**Default value:**
- Yes (enabled)

CONFIG_LWIP_LOCAL_HOSTNAME
Local netif hostname

*Found in: Component config > LWIP*

The default name this device will report to other devices on the network. Could be updated at runtime with esp_netif_set_hostname()

**Default value:**
- “espressif”

CONFIG_LWIP_NETIF_API
Enable usage of standard POSIX APIs in LWIP

*Found in: Component config > LWIP*

If this feature is enabled, standard POSIX APIs: if_indextoname(), if_nametoindex() could be used to convert network interface index to name instead of IDF specific esp-netif APIs (such as esp_netif_get_netif_impl_name())

**Default value:**
- No (disabled)

CONFIG_LWIP_TCPIP_TASK_PRIO
LWIP TCP/IP Task Priority

*Found in: Component config > LWIP*

LWIP tcpip task priority. In case of high throughput, this parameter could be changed up to (config-MAX_PRIORITIES-1).

**Range:**
- from 1 to 24

**Default value:**
- 18

CONFIG_LWIP_TCPIP_CORE_LOCKING
Enable tcpip core locking

*Found in: Component config > LWIP*

If Enable tcpip core locking, creates a global mutex that is held during TCPIP thread operations. Can be locked by client code to perform lwIP operations without changing into TCPIP thread using callbacks. See LOCK_TCPIP_CORE() and UNLOCK_TCPIP_CORE().

If disable tcpip core locking, TCP IP will perform tasks through context switching.
Default value:
• No (disabled)

CONFIG_LWIP_TCPIP_CORE_LOCKING_INPUT
Enable tcpip core locking input

Found in: Component config > LWIP > CONFIG_LWIP_TCPIP_CORE_LOCKING

when LWIP_TCPIP_CORE_LOCKING is enabled, this lets tcpip_input() grab the mutex for input packets as well, instead of allocating a message and passing it to tcpip_thread.

Default value:
• No (disabled) if CONFIG_LWIP_TCPIP_CORE_LOCKING

CONFIG_LWIP_CHECK_THREAD_SAFETY
Checks that lwip API runs in expected context

Found in: Component config > LWIP

Enable to check that the project does not violate lwip thread safety. If enabled, all lwip functions that require thread awareness run an assertion to verify that the TCP/IP core functionality is either locked or accessed from the correct thread.

Default value:
• No (disabled)

CONFIG_LWIP_DNS_SUPPORT_MDNS_QUERIES
Enable mDNS queries in resolving host name

Found in: Component config > LWIP

If this feature is enabled, standard API such as gethostbyname support .local addresses by sending one shot multicast mDNS query

Default value:
• Yes (enabled)

CONFIG_LWIP_L2_TO_L3_COPY
Enable copy between Layer2 and Layer3 packets

Found in: Component config > LWIP

If this feature is enabled, all traffic from layer2(WIFI Driver) will be copied to a new buffer before sending it to layer3(LWIP stack), freeing the layer2 buffer. Please be notified that the total layer2 receiving buffer is fixed and ESP32 currently supports 25 layer2 receiving buffer, when layer2 buffer runs out of memory, then the incoming packets will be dropped in hardware. The layer3 buffer is allocated from the heap, so the total layer3 receiving buffer depends on the available heap size, when heap runs out of memory, no copy will be sent to layer3 and packet will be dropped in layer2. Please make sure you fully understand the impact of this feature before enabling it.

Default value:
• No (disabled)

CONFIG_LWIP_IRAM_OPTIMIZATION
Enable LWIP IRAM optimization

Found in: Component config > LWIP
If this feature is enabled, some functions relating to RX/TX in LWIP will be put into IRAM, it can improve UDP/TCP throughput by >10% for single core mode, it doesn’t help too much for dual core mode. On the other hand, it needs about 10KB IRAM for these optimizations.

If this feature is disabled, all lwip functions will be put into FLASH.

**Default value:**
- No (disabled)

**CONFIG_LWIP_EXTRA_IRAM_OPTIMIZATION**

Enable LWIP IRAM optimization for TCP part

*Found in: Component config > LWIP*

If this feature is enabled, some tcp part functions relating to RX/TX in LWIP will be put into IRAM, it can improve TCP throughput. On the other hand, it needs about 17KB IRAM for these optimizations.

**Default value:**
- No (disabled)

**CONFIG_LWIP_TIMERS_ONDEMAND**

Enable LWIP Timers on demand

*Found in: Component config > LWIP*

If this feature is enabled, IGMP and MLD6 timers will be activated only when joining groups or receiving QUERY packets.

This feature will reduce the power consumption for applications which do not use IGMP and MLD6.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_ND6**

LWIP NDP6 Enable/Disable

*Found in: Component config > LWIP*

This option is used to disable the Network Discovery Protocol (NDP) if it is not required. Please use this option with caution, as the NDP is essential for IPv6 functionality within a local network.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_MAX_SOCKETS**

Max number of open sockets

*Found in: Component config > LWIP*

Sockets take up a certain amount of memory, and allowing fewer sockets to be open at the same time conserves memory. Specify the maximum amount of sockets here. The valid value is from 1 to 16.

**Range:**
- from 1 to 16

**Default value:**
- 10
**CONFIG_LWIP_USE_ONLY_LWIP_SELECT**
Support LWIP socket select() only (DEPRECATED)

*Found in: Component config > LWIP*

This option is deprecated. Do not use this option, use VFS_SUPPORT_SELECT instead.

**Default value:**
- No (disabled)

**CONFIG_LWIP_SO_LINGER**
Enable SO_LINGER processing

*Found in: Component config > LWIP*

Enabling this option allows SO_LINGER processing. l_onoff = 1, l linger can set the timeout.

If llinger=0, When a connection is closed, TCP will terminate the connection. This means that TCP will discard any data packets stored in the socket send buffer and send an RST to the peer.

If llinger!=0, Then closesocket() calls to block the process until the remaining data packets has been sent or timed out.

**Default value:**
- No (disabled)

**CONFIG_LWIP_SO_REUSE**
Enable SO_REUSEADDR option

*Found in: Component config > LWIP*

Enabling this option allows binding to a port which remains in TIME_WAIT.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_SO_REUSE_RXTOALL**
SO_REUSEADDR copies broadcast/multicast to all matches

*Found in: Component config > LWIP > CONFIG_LWIP_SO_REUSE*

Enabling this option means that any incoming broadcast or multicast packet will be copied to all of the local sockets that it matches (may be more than one if SO_REUSEADDR is set on the socket.)

This increases memory overhead as the packets need to be copied, however they are only copied per matching socket. You can safely disable it if you don’t plan to receive broadcast or multicast traffic on more than one socket at a time.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_SO_RCVBUF**
Enable SO_RCVBUF option

*Found in: Component config > LWIP*

Enabling this option allows checking for available data on a netconn.

**Default value:**
- No (disabled)
CONFIG_LWIP_NETBUF_RECVINFO
Enable IP_PKTINFO option
 FOUND in: Component config > LWIP
Enabling this option allows checking for the destination address of a received IPv4 Packet.
Default value:
• No (disabled)

CONFIG_LWIP_IP4_FRAG
Enable fragment outgoing IP4 packets
 FOUND in: Component config > LWIP
Enabling this option allows fragmenting outgoing IP4 packets if their size exceeds MTU.
Default value:
• Yes (enabled)

CONFIG_LWIP_IP6_FRAG
Enable fragment outgoing IP6 packets
 FOUND in: Component config > LWIP
Enabling this option allows fragmenting outgoing IP6 packets if their size exceeds MTU.
Default value:
• Yes (enabled)

CONFIG_LWIP_IP4_REASSEMBLY
Enable reassembly incoming fragmented IP4 packets
 FOUND in: Component config > LWIP
Enabling this option allows reassembling incoming fragmented IP4 packets.
Default value:
• No (disabled)

CONFIG_LWIP_IP6_REASSEMBLY
Enable reassembly incoming fragmented IP6 packets
 FOUND in: Component config > LWIP
Enabling this option allows reassembling incoming fragmented IP6 packets.
Default value:
• No (disabled)

CONFIG_LWIP_IP_REASS_MAX_PBUFS
The maximum amount of pbufs waiting to be reassembled
 FOUND in: Component config > LWIP
Set the maximum amount of pbufs waiting to be reassembled.
Range:
• from 10 to 100
Default value:
• 10
CONFIG_LWIP_IP_FORWARD

Enable IP forwarding

*Found in: Component config > LWIP*

Enabling this option allows packets forwarding across multiple interfaces.

**Default value:**
- No (disabled)

CONFIG_LWIP_IPV4_NAPT

Enable NAT (new/experimental)

*Found in: Component config > LWIP > CONFIG_LWIP_IP_FORWARD*

Enabling this option allows Network Address and Port Translation.

**Default value:**
- No (disabled) if CONFIG_LWIP_IP_FORWARD

CONFIG_LWIP_IPV4_NAPT_PORTMAP

Enable NAT Port Mapping (new/experimental)

*Found in: Component config > LWIP > CONFIG_LWIP_IP_FORWARD > CONFIG_LWIP_IPV4_NAPT*

Enabling this option allows Port Forwarding or Port mapping.

**Default value:**
- Yes (enabled) if CONFIG_LWIP_IPV4_NAPT

CONFIG_LWIP_STATS

Enable LWIP statistics

*Found in: Component config > LWIP*

Enabling this option allows LWIP statistics

**Default value:**
- No (disabled)

CONFIG_LWIP_ESP_GRATUITOUS_ARP

Send gratuitous ARP periodically

*Found in: Component config > LWIP*

Enable this option allows to send gratuitous ARP periodically.

This option solve the compatibility issues. If the ARP table of the AP is old, and the AP doesn’t send ARP request to update its ARP table, this will lead to the STA sending IP packet fail. Thus we send gratuitous ARP periodically to let AP update its ARP table.

**Default value:**
- Yes (enabled)

CONFIG_LWIP_GARP_TMR_INTERVAL

GARP timer interval(seconds)

*Found in: Component config > LWIP > CONFIG_LWIP_ESP_GRATUITOUS_ARP*

Set the timer interval for gratuitous ARP. The default value is 60s
Default value:
  • 60

**CONFIG_LWIP_ESP_MLDV6_REPORT**

Send mldv6 report periodically

*Found in: Component config > LWIP*

Enable this option allows to send mldv6 report periodically.

This option solve the issue that failed to receive multicast data. Some routers fail to forward multicast packets. To solve this problem, send multicast mldv6 report to routers regularly.

Default value:
  • Yes (enabled)

**CONFIG_LWIP_MLDV6_TMR_INTERVAL**

mldv6 report timer interval(seconds)

*Found in: Component config > LWIP > CONFIG_LWIP_ESP_MLDV6_REPORT*

Set the timer interval for mldv6 report. The default value is 30s

Default value:
  • 40

**CONFIG_LWIP_TCPIP_RECVMBOX_SIZE**

TCPIP task receive mail box size

*Found in: Component config > LWIP*

Set TCPIP task receive mail box size. Generally bigger value means higher throughput but more memory. The value should be bigger than UDP/TCP mail box size.

Range:
  • from 6 to 1024 if **CONFIG_LWIP_WND_SCALE**

Default value:
  • 32

**CONFIG_LWIP_DHCP_DOES_ARP_CHECK**

DHCP: Perform ARP check on any offered address

*Found in: Component config > LWIP*

Enabling this option performs a check (via ARP request) if the offered IP address is not already in use by another host on the network.

Default value:
  • Yes (enabled)

**CONFIG_LWIP_DHCP_DISABLE_CLIENT_ID**

DHCP: Disable Use of HW address as client identification

*Found in: Component config > LWIP*

This option could be used to disable DHCP client identification with its MAC address. (Client id is used by DHCP servers to uniquely identify clients and are included in the DHCP packets as an option 61) Set this option to “y” in order to exclude option 61 from DHCP packets.

Default value:
• No (disabled)

**CONFIG_LWIP_DHCP_DISABLE_VENDOR_CLASS_ID**

DHCP: Disable Use of vendor class identification

*Found in: Component config > LWIP*

This option could be used to disable DHCP client vendor class identification. Set this option to “y” in order to exclude option 60 from DHCP packets.

**Default value:**
• Yes (enabled)

**CONFIG_LWIP_DHCP_RESTORE_LAST_IP**

DHCP: Restore last IP obtained from DHCP server

*Found in: Component config > LWIP*

When this option is enabled, DHCP client tries to re-obtain last valid IP address obtained from DHCP server. Last valid DHCP configuration is stored in nvs and restored after reset/power-up. If IP is still available, there is no need for sending discovery message to DHCP server and save some time.

**Default value:**
• No (disabled)

**CONFIG_LWIP_DHCP_OPTIONS_LEN**

DHCP total option length

*Found in: Component config > LWIP*

Set total length of outgoing DHCP option msg. Generally bigger value means it can carry more options and values. If your code meets LWIP_ASSERT due to option value is too long. Please increase the LWIP_DHCP_OPTIONS_LEN value.

**Range:**
• from 68 to 255

**Default value:**
• 68

**CONFIG_LWIP_NUM_NETIF_CLIENT_DATA**

Number of clients store data in netif

*Found in: Component config > LWIP*

Number of clients that may store data in client_data member array of struct netif.

**Range:**
• from 0 to 256

**Default value:**
• 0

**CONFIG_LWIP_DHCP_COARSE_TIMER_SECS**

DHCP coarse timer interval(s)

*Found in: Component config > LWIP*

Set DHCP coarse interval in seconds. A higher value will be less precise but cost less power consumption.

**Range:**
• from 1 to 10
Default value:
• 1

DHCP server  Contains:
• CONFIG_LWIP_DHCPS

CONFIG_LWIP_DHCPS

DHCP: Enable IPv4 Dynamic Host Configuration Protocol Server (DHCPs)

*Found in: Component config > LWIP > DHCP server*

Enabling this option allows the device to run the DHCP server (to dynamically assign IPv4 addresses to clients).

Default value:
• Yes (enabled)

CONFIG_LWIP_DHCPSLEASE_UNIT

Multiplier for lease time, in seconds

*Found in: Component config > LWIP > DHCP server > CONFIG_LWIP_DHCPS*

The DHCP server is calculating lease time multiplying the sent and received times by this number of seconds per unit. The default is 60, that equals one minute.

Range:
• from 1 to 3600

Default value:
• 60

CONFIG_LWIP_DHCPS_MAX_STATION_NUM

Maximum number of stations

*Found in: Component config > LWIP > DHCP server > CONFIG_LWIP_DHCPS*

The maximum number of DHCP clients that are connected to the server. After this number is exceeded, DHCP server removes of the oldest device from its address pool, without notification.

Range:
• from 1 to 64

Default value:
• 8

CONFIG_LWIP_DHCPS_STATIC_ENTRIES

Enable ARP static entries

*Found in: Component config > LWIP > DHCP server > CONFIG_LWIP_DHCPS*

Enabling this option allows DHCP server to support temporary static ARP entries for DHCP Client. This will help the DHCP server to send the DHCP OFFER and DHCP ACK using IP unicast.

Default value:
• Yes (enabled)
**CONFIG_LWIP_AUTOIP**

Enable IPV4 Link-Local Addressing (AUTOIP)

*Found in: Component config > LWIP*

Enabling this option allows the device to self-assign an address in the 169.256/16 range if none is assigned statically or via DHCP.

See RFC 3927.

**Default value:**
- No (disabled)

**Contains:**
- `CONFIG_LWIP_AUTOIP_TRIES`
- `CONFIG_LWIP_AUTOIP_MAX_CONFLICTS`
- `CONFIG_LWIP_AUTOIP_RATE_LIMIT_INTERVAL`

**CONFIG_LWIP_AUTOIP_TRIES**

DHCP Probes before self-assigning IPv4 LL address

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

DHCP client will send this many probes before self-assigning a link local address.

From LWIP help: "This can be set as low as 1 to get an AutoIP address very quickly, but you should be prepared to handle a changing IP address when DHCP overrides AutoIP." (In the case of ESP-IDF, this means multiple SYSTEM_EVENT_STA_GOT_IP events.)

**Range:**
- from 1 to 100 if `CONFIG_LWIP_AUTOIP`

**Default value:**
- 2 if `CONFIG_LWIP_AUTOIP`

**CONFIG_LWIP_AUTOIP_MAX_CONFLICTS**

Max IP conflicts before rate limiting

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

If the AUTOIP functionality detects this many IP conflicts while self-assigning an address, it will go into a rate limited mode.

**Range:**
- from 1 to 100 if `CONFIG_LWIP_AUTOIP`

**Default value:**
- 9 if `CONFIG_LWIP_AUTOIP`

**CONFIG_LWIP_AUTOIP_RATE_LIMIT_INTERVAL**

Rate limited interval (seconds)

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

If rate limiting self-assignment requests, wait this long between each request.

**Range:**
- from 5 to 120 if `CONFIG_LWIP_AUTOIP`

**Default value:**
- 20 if `CONFIG_LWIP_AUTOIP`
Chapter 2. API Reference

CONFIG_LWIP_IPV4
Enable IPv4

*Found in: Component config > LWIP*

Enable IPv4 stack. If you want to use IPv6 only TCP/IP stack, disable this.

**Default value:**
- Yes (enabled)

CONFIG_LWIP_IPV6
Enable IPv6

*Found in: Component config > LWIP*

Enable IPv6 function. If not use IPv6 function, set this option to n. If disabling LWIP_IPV6 then some other components (coap and asio) will no longer be available.

**Default value:**
- Yes (enabled)

CONFIG_LWIP_IPV6_AUTOCONFIG
Enable IPv6 stateless address autoconfiguration (SLAAC)

*Found in: Component config > LWIP > CONFIG_LWIP_IPV6*

Enabling this option allows the devices to IPV6 stateless address autoconfiguration (SLAAC).

See RFC 4862.

**Default value:**
- No (disabled)

CONFIG_LWIP_IPV6_NUM_ADDRESSES
Number of IPv6 addresses on each network interface

*Found in: Component config > LWIP > CONFIG_LWIP_IPV6*

The maximum number of IPv6 addresses on each interface. Any additional addresses will be discarded.

**Default value:**
- 3

CONFIG_LWIP_IPV6_FORWARD
Enable IPv6 forwarding between interfaces

*Found in: Component config > LWIP > CONFIG_LWIP_IPV6*

Forwarding IPv6 packets between interfaces is only required when acting as a router.

**Default value:**
- No (disabled)

CONFIG_LWIP_IPV6_RDNS_MAX_DNS_SERVERS
Use IPv6 Router Advertisement Recursive DNS Server Option

*Found in: Component config > LWIP*

Use IPv6 Router Advertisement Recursive DNS Server Option (as per RFC 6106) to copy a defined maximum number of DNS servers to the DNS module. Set this option to a number of desired DNS servers advertised in the RA protocol. This feature is disabled when set to 0.
Default value:
  • 0 if `CONFIG_LWIP_IPV6_AUTOCONFIG`

**CONFIG_LWIP_IPV6_DHCP6**

Enable DHCPv6 stateless address autoconfiguration

*Found in: Component config > LWIP*

Enable DHCPv6 for IPv6 stateless address autoconfiguration. Note that the dhcpv6 client has to be started using `dhcp6_enable_stateless(netif)`; Note that the stateful address autoconfiguration is not supported.

Default value:
  • No (disabled) if `CONFIG_LWIP_IPV6_AUTOCONFIG`

**CONFIG_LWIP_NETIF_STATUS_CALLBACK**

Enable status callback for network interfaces

*Found in: Component config > LWIP*

Enable callbacks when the network interface is up/down and addresses are changed.

Default value:
  • No (disabled)

**CONFIG_LWIP_NETIF_LOOPBACK**

Support per-interface loopback

*Found in: Component config > LWIP*

Enabling this option means that if a packet is sent with a destination address equal to the interface’s own IP address, it will “loop back” and be received by this interface. Disabling this option disables support of loopback interface in lwIP

Default value:
  • Yes (enabled)

Contains:

  • `CONFIG_LWIP_LOOPBACK_MAX_PBUFS`

**CONFIG_LWIP_LOOPBACK_MAX_PBUFS**

Max queued loopback packets per interface

*Found in: Component config > LWIP > CONFIG_LWIP_NETIF_LOOPBACK*

Configure the maximum number of packets which can be queued for loopback on a given interface. Reducing this number may cause packets to be dropped, but will avoid filling memory with queued packet data.

Range:
  • from 0 to 16

Default value:
  • 8
TCP Contains:

- CONFIG_LWIP_TCP_WND_DEFAULT
- CONFIG_LWIP_TCP_SND_BUF_DEFAULT
- CONFIG_LWIP_TCP_RECVMBOX_SIZE
- CONFIG_LWIP_TCP_RTO_TIME
- CONFIG_LWIP_MAX_ACTIVE_TCP
- CONFIG_LWIP_TCP_FIN_WAIT_TIMEOUT
- CONFIG_LWIP_MAX_LISTENING_TCP
- CONFIG_LWIP_TCP_MAXRTX
- CONFIG_LWIP_TCP_SYNMAXRTX
- CONFIG_LWIP_TCP_MSL
- CONFIG_LWIP_TCP_MSS
- CONFIG_LWIP_TCP_OVERSIZE
- CONFIG_LWIP_TCP_QUEUE_OOSEQ
- CONFIG_LWIP_WND_SCALE
- CONFIG_LWIP_TCP_HIGH_SPEED_RETRANSMISSION
- CONFIG_LWIP_TCP_TMR_INTERVAL

**CONFIG_LWIP_MAX_ACTIVE_TCP**

Maximum active TCP Connections

*Found in: Component config > LWIP > TCP*

The maximum number of simultaneously active TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new TCP connections after the limit is reached.

**Range:**
- from 1 to 1024

**Default value:**
- 16

**CONFIG_LWIP_MAX_LISTENING_TCP**

Maximum listening TCP Connections

*Found in: Component config > LWIP > TCP*

The maximum number of simultaneously listening TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new listening TCP connections after the limit is reached.

**Range:**
- from 1 to 1024

**Default value:**
- 16

**CONFIG_LWIP_TCP_HIGH_SPEED_RETRANSMISSION**

TCP high speed retransmissions

*Found in: Component config > LWIP > TCP*

Speed up the TCP retransmission interval. If disabled, it is recommended to change the number of SYN retransmissions to 6, and TCP initial rto time to 3000.

**Default value:**
• Yes (enabled)

**CONFIG_LWIP_TCP_MAXRTX**

Maximum number of retransmissions of data segments

*Found in: Component config > LWIP > TCP*

Set maximum number of retransmissions of data segments.

**Range:**

• from 3 to 12

**Default value:**

• 12

**CONFIG_LWIP_TCP_SYNMAXRTX**

Maximum number of retransmissions of SYN segments

*Found in: Component config > LWIP > TCP*

Set maximum number of retransmissions of SYN segments.

**Range:**

• from 3 to 12

**Default value:**

• 12

**CONFIG_LWIP_TCP_MSS**

Maximum Segment Size (MSS)

*Found in: Component config > LWIP > TCP*

Set maximum segment size for TCP transmission.

Can be set lower to save RAM, the default value 1460(ipv4)/1440(ipv6) will give best throughput. IPv4 TCP_MSS Range: 576 <= TCP_MSS <= 1460 IPv6 TCP_MSS Range: 1220 <= TCP_MSS <= 1440

**Range:**

• from 536 to 1460

**Default value:**

• 1440

**CONFIG_LWIP_TCP_TMR_INTERVAL**

TCP timer interval(ms)

*Found in: Component config > LWIP > TCP*

Set TCP timer interval in milliseconds.

Can be used to speed connections on bad networks. A lower value will redeliver unacked packets faster.

**Default value:**

• 250

**CONFIG_LWIP_TCP_MSL**

Maximum segment lifetime (MSL)

*Found in: Component config > LWIP > TCP*

Set maximum segment lifetime in milliseconds.

**Default value:**
Chapter 2. API Reference

- 60000

CONFIG_LWIP_TCP_FIN_WAIT_TIMEOUT

Maximum FIN segment lifetime

*Found in:* Component config > LWIP > TCP

Set maximum segment lifetime in milliseconds.

**Default value:**
- 20000

CONFIG_LWIP_TCP_SND_BUF_DEFAULT

Default send buffer size

*Found in:* Component config > LWIP > TCP

Set default send buffer size for new TCP sockets.

Per-socket send buffer size can be changed at runtime with lwip_setsockopt(s, TCP_SNDBUF, ...).

This value must be at least 2x the MSS size, and the default is 4x the default MSS size.

Setting a smaller default SNDBUF size can save some RAM, but will decrease performance.

**Range:**
- from 2440 to 1024000 if `CONFIG_LWIP_WND_SCALE`

**Default value:**
- 5760

CONFIG_LWIP_TCP_WND_DEFAULT

Default receive window size

*Found in:* Component config > LWIP > TCP

Set default TCP receive window size for new TCP sockets.

Per-socket receive window size can be changed at runtime with lwip_setsockopt(s, TCP_WINDOW, ...).

Setting a smaller default receive window size can save some RAM, but will decrease performance.

**Range:**
- from 2440 to 1024000 if `CONFIG_LWIP_WND_SCALE`

**Default value:**
- 5760

CONFIG_LWIP_TCP_RECVMBOX_SIZE

Default TCP receive mail box size

*Found in:* Component config > LWIP > TCP

Set TCP receive mail box size. Generally bigger value means higher throughput but more memory. The recommended value is: LWIP_TCP_WND_DEFAULT/TCP_MSS + 2, e.g. if LWIP_TCP_WND_DEFAULT=14360, TCP_MSS=1436, then the recommended receive mail box size is (14360/1436 + 2) = 12.

TCP receive mail box is a per socket mail box, when the application receives packets from TCP socket, LWIP core firstly posts the packets to TCP receive mail box and the application then fetches the packets from mail box. It means LWIP can caches maximum LWIP_TCP_RECVMBOX_SIZE packets for each TCP socket, so the maximum possible cached TCP packets for all TCP sockets is
LWIP_TCP_RECCVMBOX_SIZE multiples the maximum TCP socket number. In other words, the bigger LWIP_TCP_RECCVMBOX_SIZE means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the TCP receive mail box is big enough to avoid packet drop between LWIP core and application.

Range:
- from 6 to 1024 if CONFIG_LWIP_WND_SCALE

Default value:
- 6

**CONFIG_LWIP_TCP_QUEUE_OOSEQ**

Queue incoming out-of-order segments

*Found in: Component config > LWIP > TCP*

Queue incoming out-of-order segments for later use.

Disable this option to save some RAM during TCP sessions, at the expense of increased retransmissions if segments arrive out of order.

Default value:
- Yes (enabled)

**CONFIG_LWIP_TCP_OOSEQ_TIMEOUT**

Timeout for each pbuf queued in TCP OOSEQ, in RTOs.

*Found in: Component config > LWIP > TCP > CONFIG_LWIP_TCP_QUEUE_OOSEQ*

The timeout value is TCP_OOSEQ_TIMEOUT * RTO.

Range:
- from 1 to 30

Default value:
- 6

**CONFIG_LWIP_TCP_OOSEQ_MAX_PBUFS**

The maximum number of pbufs queued on OOSEQ per pcb

*Found in: Component config > LWIP > TCP > CONFIG_LWIP_TCP_QUEUE_OOSEQ*

If LWIP_TCP_OOSEQ_MAX_PBUFS = 0, TCP will not control the number of OOSEQ pbufs.

In a poor network environment, many out-of-order tcp pbufs will be received. These out-of-order pbufs will be cached in the TCP out-of-order queue which will cause Wi-Fi/Ethernet fail to release RX buffer in time. It is possible that all RX buffers for MAC layer are used by OOSEQ.

Control the number of out-of-order pbufs to ensure that the MAC layer has enough RX buffer to receive packets.

In the Wi-Fi scenario, recommended OOSEQ PBUFS Range: 0 <= TCP_OOSEQ_MAX_PBUFS <= CONFIG_ESP_WIFI_DYNAMIC_RX_BUFFER_NUM/(MAX_TCP_NUMBER + 1)

In the Ethernet scenario, recommended Ethernet OOSEQ PBUFS Range: 0 <= TCP_OOSEQ_MAX_PBUFS <= CONFIG_ETH_DMA_RX_BUFFER_NUM/(MAX_TCP_NUMBER + 1)

Within the recommended value range, the larger the value, the better the performance.

MAX_TCP_NUMBER represent Maximum number of TCP connections in Wi-Fi(STA+SoftAP) and Ethernet scenario.

Range:
• from 0 to 12
**Default value:**
• 4

**CONFIG_LWIP_TCP_SACK_OUT**
Support sending selective acknowledgements

*Found in: Component config > LWIP > TCP > CONFIG_LWIP_TCP_QUEUE_OOSEQ*

TCP will support sending selective acknowledgements (SACKs).

**Default value:**
• No (disabled)

**CONFIG_LWIP_TCP_OVERSIZE**
Pre-allocate transmit PBUF size

*Found in: Component config > LWIP > TCP*

Allows enabling “oversize” allocation of TCP transmission pbufs ahead of time, which can reduce the length of pbuf chains used for transmission.

This will not make a difference to sockets where Nagle’s algorithm is disabled.

Default value of MSS is fine for most applications, 25% MSS may save some RAM when only transmitting small amounts of data. Disabled will have worst performance and fragmentation characteristics, but uses least RAM overall.

Available options:

• MSS (CONFIG_LWIP_TCP_OVERSIZE_MSS)
• 25% MSS (CONFIG_LWIP_TCP_OVERSIZE_QUARTER_MSS)
• Disabled (CONFIG_LWIP_TCP_OVERSIZE_DISABLE)

**CONFIG_LWIP_WND_SCALE**
Support TCP window scale

*Found in: Component config > LWIP > TCP*

Enable this feature to support TCP window scaling.

**Default value:**
• No (disabled) if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`

**CONFIG_LWIP_TCP_RCV_SCALE**
Set TCP receiving window scaling factor

*Found in: Component config > LWIP > TCP > CONFIG_LWIP_WND_SCALE*

Enable this feature to support TCP window scaling.

**Range:**
• from 0 to 14 if `CONFIG_LWIP_WND_SCALE`

**Default value:**
• 0 if `CONFIG_LWIP_WND_SCALE`
**CONFIG_LWIP_TCP_RTO_TIME**

Default TCP rto time

*Found in: Component config > LWIP > TCP*

Set default TCP rto time for a reasonable initial rto. In bad network environment, recommend set value of rto time to 1500.

**Default value:**
- 1500

**UDP** Contains:
- `CONFIG_LWIP_UDP_RECVMBOX_SIZE`
- `CONFIG_LWIP_MAX_UDP_PCBS`

**CONFIG_LWIP_MAX_UDP_PCBS**

Maximum active UDP control blocks

*Found in: Component config > LWIP > UDP*

The maximum number of active UDP connections (i.e., UDP sockets sending/receiving data). The practical maximum limit is determined by available heap memory at runtime.

**Range:**
- from 1 to 1024

**Default value:**
- 16

**CONFIG_LWIP_UDP_RECVMBOX_SIZE**

Default UDP receive mail box size

*Found in: Component config > LWIP > UDP*

Set UDP receive mail box size. The recommended value is 6.

UDP receive mail box is a per socket mail box, when the application receives packets from UDP socket, LWIP core firstly posts the packets to UDP receive mail box and the application then fetches the packets from mail box. It means LWIP can caches maximum UDP_RECVMBOX_SIZE packets for each UDP socket, so the maximum possible cached UDP packets for all UDP sockets is UDP_RECVMBOX_SIZE multiples the maximum UDP socket number. In other words, the bigger UDP_RECVMBOX_SIZE means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the UDP receive mail box is big enough to avoid packet drop between LWIP core and application.

**Range:**
- from 6 to 64

**Default value:**
- 6

**Checksums** Contains:
- `CONFIG_LWIP_CHECKSUM_CHECK_ICMP`
- `CONFIG_LWIP_CHECKSUM_CHECK_IP`
- `CONFIG_LWIP_CHECKSUM_CHECK_UDP`
CONFIG_LWIP_CHECKSUM_CHECK_IP
Enable LWIP IP checksums

*Found in: Component config > LWIP > Checksums*

Enable checksum checking for received IP messages

**Default value:**
- No (disabled)

CONFIG_LWIP_CHECKSUM_CHECK_UDP
Enable LWIP UDP checksums

*Found in: Component config > LWIP > Checksums*

Enable checksum checking for received UDP messages

**Default value:**
- No (disabled)

CONFIG_LWIP_CHECKSUM_CHECK_ICMP
Enable LWIP ICMP checksums

*Found in: Component config > LWIP > Checksums*

Enable checksum checking for received ICMP messages

**Default value:**
- Yes (enabled)

CONFIG_LWIP_TCPIP_TASK_STACK_SIZE
TCP/IP Task Stack Size

*Found in: Component config > LWIP*

Configure TCP/IP task stack size, used by LWIP to process multi-threaded TCP/IP operations. Setting this stack too small will result in stack overflow crashes.

**Range:**
- from 2048 to 65536

**Default value:**
- 3072

CONFIG_LWIP_TCPIP_TASK_AFFINITY
TCP/IP task affinity

*Found in: Component config > LWIP*

Allows setting LwIP tasks affinity, i.e. whether the task is pinned to CPU0, pinned to CPU1, or allowed to run on any CPU. Currently this applies to “TCP/IP” task and “Ping” task.

**Available options:**
- No affinity (CONFIG_LWIP_TCPIP_TASKAFFINITY_NO_AFFINITY)
- CPU0 (CONFIG_LWIP_TCPIP_TASKAFFINITY_CPU0)
- CPU1 (CONFIG_LWIP_TCPIP_TASKAFFINITY_CPU1)
CONFIG_LWIP_PPP_SUPPORT

Enable PPP support

Found in: Component config > LWIP

Enable PPP stack. Now only PPP over serial is possible.

Default value:
  • No (disabled)

Contains:
  • CONFIG_LWIP_PPP_ENABLE_IPV6

CONFIG_LWIP_PPP_ENABLE_IPV6

Enable IPv6 support for PPP connections (IPV6CP)

Found in: Component config > LWIP > CONFIG_LWIP_PPP_SUPPORT

Enable IPv6 support in PPP for the local link between the DTE (processor) and DCE (modem). There are some modems which do not support the IPv6 addressing in the local link. If they are requested for IPv6CP negotiation, they may time out. This would in turn fail the configuration for the whole link. If your modem is not responding correctly to PPP Phase Network, try to disable IPv6 support.

Default value:
  • Yes (enabled) if CONFIG_LWIP_PPP_SUPPORT && CONFIG_LWIP_IPV6

CONFIG_LWIP_IPV6_MEMP_NUM_ND6_QUEUE

Max number of IPv6 packets to queue during MAC resolution

Found in: Component config > LWIP

Config max number of IPv6 packets to queue during MAC resolution.

Range:
  • from 3 to 20

Default value:
  • 3

CONFIG_LWIP_IPV6_ND6_NUM_NEIGHBORS

Max number of entries in IPv6 neighbor cache

Found in: Component config > LWIP

Config max number of entries in IPv6 neighbor cache

Range:
  • from 3 to 10

Default value:
  • 5

CONFIG_LWIP_PPP_NOTIFY_PHASE_SUPPORT

Enable Notify Phase Callback

Found in: Component config > LWIP

Enable to set a callback which is called on change of the internal PPP state machine.

Default value:
  • No (disabled) if CONFIG_LWIP_PPP_SUPPORT
CONFIG_LWIP_PPP_PAP_SUPPORT
Enable PAP support
*Found in: Component config > LWIP*
Enable Password Authentication Protocol (PAP) support
**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

CONFIG_LWIP_PPP_CHAP_SUPPORT
Enable CHAP support
*Found in: Component config > LWIP*
Enable Challenge Handshake Authentication Protocol (CHAP) support
**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

CONFIG_LWIP_PPP_MSCHAP_SUPPORT
Enable MSCHAP support
*Found in: Component config > LWIP*
Enable Microsoft version of the Challenge-Handshake Authentication Protocol (MSCHAP) support
**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

CONFIG_LWIP_PPP_MPPE_SUPPORT
Enable MPPE support
*Found in: Component config > LWIP*
Enable Microsoft Point-to-Point Encryption (MPPE) support
**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

CONFIG_LWIP_ENABLE_LCP_ECHO
Enable LCP ECHO
*Found in: Component config > LWIP*
Enable LCP echo keepalive requests
**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

CONFIG_LWIP_LCP_ECHOINTERVAL
Echo interval (s)
*Found in: Component config > LWIP > CONFIG_LWIP_ENABLE_LCP_ECHO*
Interval in seconds between keepalive LCP echo requests, 0 to disable.
**Range:**
- from 0 to 1000000 if `CONFIG_LWIP_ENABLE_LCP_ECHO`
**Default value:**
- 3 if `CONFIG_LWIP_ENABLE_LCP_ECHO`
**CONFIG_LWIP_LCP_MAXECHOFAILS**

Maximum echo failures

*Found in: Component config > LWIP > CONFIG_LWIP_ENABLE_LCP_ECHO*

Number of consecutive unanswered echo requests before failure is indicated.

*Range:*

- from 0 to 100000 if `CONFIG_LWIP_ENABLE_LCP_ECHO`

*Default value:*

- 3 if `CONFIG_LWIP_ENABLE_LCP_ECHO`

**CONFIG_LWIP_PPP_DEBUG_ON**

Enable PPP debug log output

*Found in: Component config > LWIP*

Enable PPP debug log output

*Default value:*

- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

**CONFIG_LWIP_SLIP_SUPPORT**

Enable SLIP support (new/experimental)

*Found in: Component config > LWIP*

Enable SLIP stack. Now only SLIP over serial is possible.

SLIP over serial support is experimental and unsupported.

*Default value:*

- No (disabled)

Contains:

- `CONFIG_LWIP_SLIP_DEBUG_ON`

**CONFIG_LWIP_SLIP_DEBUG_ON**

Enable SLIP debug log output

*Found in: Component config > LWIP > CONFIG_LWIP_SLIP_SUPPORT*

Enable SLIP debug log output

*Default value:*

- No (disabled) if `CONFIG_LWIP_SLIP_SUPPORT`

**ICMP**

Contains:

- `CONFIG_LWIP_ICMP`
- `CONFIG_LWIP_BROADCAST_PING`
- `CONFIG_LWIP_MULTICAST_PING`

**CONFIG_LWIP_ICMP**

ICMP: Enable ICMP

*Found in: Component config > LWIP > ICMP*

Enable ICMP module for check network stability

*Default value:
Chapter 2. API Reference

- Yes (enabled)

**CONFIG_LWIP_MULTICAST_PING**

Respond to multicast pings

*Found in: Component config > LWIP > ICMP*

**Default value:**
- No (disabled)

**CONFIG_LWIP_BROADCAST_PING**

Respond to broadcast pings

*Found in: Component config > LWIP > ICMP*

**Default value:**
- No (disabled)

**LWIP RAW API**  Contains:

- **CONFIG_LWIP_MAX_RAW_PCBS**

**CONFIG_LWIP_MAX_RAW_PCBS**

Maximum LWIP RAW PCBs

*Found in: Component config > LWIP > LWIP RAW API*

The maximum number of simultaneously active LWIP RAW protocol control blocks. The practical maximum limit is determined by available heap memory at runtime.

**Range:**
- from 1 to 1024

**Default value:**
- 16

**SNTP**  Contains:

- **CONFIG_LWIP_SNTP_MAX_SERVERS**
- **CONFIG_LWIP_SNTP_UPDATE_DELAY**
- **CONFIG_LWIP_DHCP_GET_NTP_SRV**

**CONFIG_LWIP_SNTP_MAX_SERVERS**

Maximum number of NTP servers

*Found in: Component config > LWIP > SNTP*

Set maximum number of NTP servers used by LwIP SNTP module. First argument of sntp_setserver/sntp_setservername functions is limited to this value.

**Range:**
- from 1 to 16

**Default value:**
- 1
CONFIG_LWIP_DHCP_GET_NTP_SRV

Request NTP servers from DHCP

*Found in: Component config > LWIP > SNTP*

If enabled, LWIP will add ‘NTP’ to Parameter-Request Option sent via DHCP-request. DHCP server might reply with an NTP server address in option 42. SNTP callback for such replies should be set accordingly (see `snntp_servermode_dhcp()` func.)

**Default value:**
- No (disabled)

CONFIG_LWIP_DHCP_MAX_NTP_SERVERS

Maximum number of NTP servers acquired via DHCP

*Found in: Component config > LWIP > SNTP > CONFIG_LWIP_DHCP_GET_NTP_SRV*

Set maximum number of NTP servers acquired via DHCP-offer. Should be less or equal to “Maximum number of NTP servers”, any extra servers would be just ignored.

**Range:**
- from 1 to 16 if `CONFIG_LWIP_DHCP_GET_NTP_SRV`

**Default value:**
- 1 if `CONFIG_LWIP_DHCP_GET_NTP_SRV`

CONFIG_LWIP_SNTP_UPDATE_DELAY

Request interval to update time (ms)

*Found in: Component config > LWIP > SNTP*

This option allows you to set the time update period via SNTP. Default is 1 hour. Must not be below 15 seconds by specification. (SNTPv4 RFC 4330 enforces a minimum update time of 15 seconds).

**Range:**
- from 15000 to 4294967295

**Default value:**
- 3600000

CONFIG_LWIP_BRIDGEIF_MAX_PORTS

Maximum number of bridge ports

*Found in: Component config > LWIP*

Set maximum number of ports a bridge can consist of.

**Range:**
- from 1 to 63

**Default value:**
- 7

CONFIG_LWIP_ESP_LWIP_ASSERT

Enable LWIP ASSERT checks

*Found in: Component config > LWIP*

Enable this option keeps LWIP assertion checks enabled. It is recommended to keep this option enabled. If asserts are disabled for the entire project, they are also disabled for LWIP and this option is ignored.
Hooks

Contains:

- `CONFIG_LWIP_HOOK_ND6_GET_GW`
- `CONFIG_LWIP_HOOK_IP6_INPUT`
- `CONFIG_LWIP_HOOK_IP6_ROUTE`
- `CONFIG_LWIP_HOOK_IP6_SELECT_SRC_ADDR`
- `CONFIG_LWIP_HOOK_NETCONN_EXTERNAL_RESOLVE`
- `CONFIG_LWIP_HOOK_TCP_ISN`

### CONFIG_LWIP_HOOK_TCP_ISN

TCP ISN Hook

*Found in: Component config > LWIP > Hooks*

Enables to define a TCP ISN hook to randomize initial sequence number in TCP connection. The default TCP ISN algorithm used in IDF (standardized in RFC 6528) produces ISN by combining an MD5 of the new TCP id and a stable secret with the current time. This is because the lwIP implementation (`tcp_next_iss`) is not very strong, as it does not take into consideration any platform specific entropy source.

Set to LWIP_HOOK_TCP_ISN_CUSTOM to provide custom implementation. Set to LWIP_HOOK_TCP_ISN_NONE to use lwIP implementation.

Available options:

- No hook declared (CONFIG_LWIP_HOOK_TCP_ISN_NONE)
- Default implementation (CONFIG_LWIP_HOOK_TCP_ISN_DEFAULT)
- Custom implementation (CONFIG_LWIP_HOOK_TCP_ISN_CUSTOM)

### CONFIG_LWIP_HOOK_IP6_ROUTE

IPv6 route Hook

*Found in: Component config > LWIP > Hooks*

Enables custom IPv6 route hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

Available options:

- No hook declared (CONFIG_LWIP_HOOK_IP6_ROUTE_NONE)
- Default (weak) implementation (CONFIG_LWIP_HOOK_IP6_ROUTE_DEFAULT)
- Custom implementation (CONFIG_LWIP_HOOK_IP6_ROUTE_CUSTOM)

### CONFIG_LWIP_HOOK_ND6_GET_GW

IPv6 get gateway Hook

*Found in: Component config > LWIP > Hooks*

Enables custom IPv6 route hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

Available options:

- No hook declared (CONFIG_LWIP_HOOK_ND6_GET_GW_NONE)
- Default (weak) implementation (CONFIG_LWIP_HOOK_ND6_GET_GW_DEFAULT)
• Custom implementation (CONFIG_LWIP_HOOK_ND6_GET_GW_CUSTOM)

CONFIG_LWIP_HOOK_IP6_SELECT_SRC_ADDR
IPv6 source address selection Hook

*Found in: Component config > LWIP > Hooks*

Enables custom IPv6 source address selection. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

Available options:

• No hook declared (CONFIG_LWIP_HOOK_IP6_SELECT_SRC_ADDR_NONE)
• Default (weak) implementation (CONFIG_LWIP_HOOK_IP6_SELECT_SRC_ADDR_DEFAULT)
• Custom implementation (CONFIG_LWIP_HOOK_IP6_SELECT_SRC_ADDR_CUSTOM)

CONFIG_LWIP_HOOK_NETCONN_EXTERNAL_RESOLVE
Netconn external resolve Hook

*Found in: Component config > LWIP > Hooks*

Enables custom DNS resolve hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

Available options:

• No hook declared (CONFIG_LWIP_HOOK_NETCONN_EXT_RESOLVE_NONE)
• Default (weak) implementation (CONFIG_LWIP_HOOK_NETCONN_EXT_RESOLVE_DEFAULT)
• Custom implementation (CONFIG_LWIP_HOOK_NETCONN_EXT_RESOLVE_CUSTOM)

CONFIG_LWIP_HOOK_IP6_INPUT
IPv6 packet input

*Found in: Component config > LWIP > Hooks*

Enables custom IPv6 packet input. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

Available options:

• No hook declared (CONFIG_LWIP_HOOK_IP6_INPUT_NONE)
• Default (weak) implementation (CONFIG_LWIP_HOOK_IP6_INPUT_DEFAULT)
• Custom implementation (CONFIG_LWIP_HOOK_IP6_INPUT_CUSTOM)

CONFIG_LWIP_DEBUG
Enable LWIP Debug

*Found in: Component config > LWIP*

Enabling this option allows different kinds of lwIP debug output.

All lwIP debug features increase the size of the final binary.

**Default value:**
Contains:

- **CONFIG_LWIP_API_LIB_DEBUG**
- **CONFIG_LWIP_BIDGEIF_FDB_DEBUG**
- **CONFIG_LWIP_BIDGEIF_FW_DEBUG**
- **CONFIG_LWIP_BIDGEIF_DEBUG**
- **CONFIG_LWIP_DHCP_DEBUG**
- **CONFIG_LWIP_DHCP_STATE_DEBUG**
- **CONFIG_LWIP_DNS_DEBUG**
- **CONFIG_LWIP_ETHARP_DEBUG**
- **CONFIG_LWIP_ICMP_DEBUG**
- **CONFIG_LWIP_ICMP6_DEBUG**
- **CONFIG_LWIP_IP_DEBUG**
- **CONFIG_LWIP_IP6_DEBUG**
- **CONFIG_LWIP_NAPT_DEBUG**
- **CONFIG_LWIP_NETIF_DEBUG**
- **CONFIG_LWIP_PBUF_DEBUG**
- **CONFIG_LWIP_SNTP_DEBUG**
- **CONFIG_LWIP_SOCKETS_DEBUG**
- **CONFIG_LWIP_TCP_DEBUG**
- **CONFIG_LWIP_UDP_DEBUG**
- **CONFIG_LWIP_DEBUG_ESP_LOG**

**CONFIG_LWIP_DEBUG_ESP_LOG**

Route LWIP debugs through ESP_LOG interface

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

Enabling this option routes all enabled LWIP debugs through ESP_LOGD.

**Default value:**
- No (disabled) if **CONFIG_LWIP_DEBUG**

**CONFIG_LWIP_NETIF_DEBUG**

Enable netif debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if **CONFIG_LWIP_DEBUG**

**CONFIG_LWIP_PBUF_DEBUG**

Enable pbuf debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if **CONFIG_LWIP_DEBUG**

**CONFIG_LWIP_ETHARP_DEBUG**

Enable etharp debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if **CONFIG_LWIP_DEBUG**
CONFIG_LWIP_API_LIB_DEBUG
Enable API Lib debug messages

*Default value:*
- No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_SOCKETS_DEBUG
Enable socket debug messages

*Default value:*
- No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_IP_DEBUG
Enable IP debug messages

*Default value:*
- No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_ICMP_DEBUG
Enable ICMP debug messages

*Default value:*
- No (disabled) if CONFIG_LWIP_DEBUG & & CONFIG_LWIP_ICMP

CONFIG_LWIP_DHCP_STATE_DEBUG
Enable DHCP state tracking

*Default value:*
- No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_DHCP_DEBUG
Enable DHCP debug messages

*Default value:*
- No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_IP6_DEBUG
Enable IP6 debug messages

*Default value:*
- No (disabled) if CONFIG_LWIP_DEBUG
CONFIG_LWIP_ICMP6_DEBUG

Enable ICMP6 debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

CONFIG_LWIP_TCP_DEBUG

Enable TCP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

CONFIG_LWIP_UDP_DEBUG

Enable UDP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

CONFIG_LWIP_SNTP_DEBUG

Enable SNTP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

CONFIG_LWIP_DNS_DEBUG

Enable DNS debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

CONFIG_LWIP_NAPT_DEBUG

Enable NAPT debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG` & `CONFIG_LWIP_IPV4_NAPT`

CONFIG_LWIP_BRIDGEIF_DEBUG

Enable bridge generic debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`
**CONFIG_LWIP_BRIDGEIF_FDB_DEBUG**

Enable bridge FDB debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

**Default value:**
- No (disabled) if **CONFIG_LWIP_DEBUG**

**CONFIG_LWIP_BRIDGEIF_FW_DEBUG**

Enable bridge forwarding debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

**Default value:**
- No (disabled) if **CONFIG_LWIP_DEBUG**

**mbedTLS** Contains:

- **CONFIG_MBEDTLSASYMMETRICCONTENTLEN**
  - Certificate Bundle
  - Certificates
- **CONFIG_MBEDTLSCHACHA20_C**

    • CONFIG_MBEDTLS_ROM_MD5
    • CONFIG_MBEDTLS_USE_CRYPTO_ROM_IMPL
    • CONFIG_MBEDTLS_DYNAMIC_BUFFER

CONFIG_MBEDTLS_MEM_ALLOC_MODE

Memory allocation strategy

Found in: Component config > mbedTLS

Allocation strategy for mbedTLS, essentially provides ability to allocate all required dynamic allocations from,

• Internal DRAM memory only
• External SPIRAM memory only
• Either internal or external memory based on default malloc() behavior in ESP-IDF
• Custom allocation mode, by overwriting calloc()/free() using mbedtls_platform_set_calloc_free() function
• Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

Available options:

• Internal memory (CONFIG_MBEDTLS_INTERNAL_MEM_ALLOC)
• External SPIRAM (CONFIG_MBEDTLS_EXTERNAL_MEM_ALLOC)
• Default alloc mode (CONFIG_MBEDTLS_DEFAULT_MEM_ALLOC)
• Custom alloc mode (CONFIG_MBEDTLS_CUSTOM_MEM_ALLOC)
• Internal IRAM (CONFIG_MBEDTLS_IRAM_8BIT_MEM_ALLOC)

Allows to use IRAM memory region as 8bit accessible region.

TLS input and output buffers will be allocated in IRAM section which is 32bit aligned memory. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

CONFIG_MBEDTLS_SSL_MAX_CONTENT_LEN

TLS maximum message content length

Found in: Component config > mbedTLS

Maximum TLS message length (in bytes) supported by mbedTLS.
16384 is the default and this value is required to comply fully with TLS standards.

However you can set a lower value in order to save RAM. This is safe if the other end of the connection supports Maximum Fragment Length Negotiation Extension (max_fragment_length, see RFC6066) or you know for certain that it will never send a message longer than a certain number of bytes.

If the value is set too low, symptoms are a failed TLS handshake or a return value of MBEDTLS_ERR_SSL_INVALID_RECORD (-0x7200).

**CONFIG_MBEDTLSASYMMETRICCONTENTLEN**

Asymmetric in/out fragment length

*Found in: Component config > mbedTLS*

If enabled, this option allows customizing TLS in/out fragment length in asymmetric way. Please note that enabling this with default values saves 12KB of dynamic memory per TLS connection.

**Default value:**

- Yes (enabled)

**CONFIG_MBEDTLS_SSL_IN_CONTENT_LEN**

TLS maximum incoming fragment length

*Found in: Component config > mbedTLS > CONFIG_MBEDTLSASYMMETRICCONTENTLEN*

This defines maximum incoming fragment length, overriding default maximum content length (MBEDTLS_SSL_MAX_CONTENT_LEN).

**Range:**

- from 512 to 16384

**Default value:**

- 16384

**CONFIG_MBEDTLS_SSL_OUT_CONTENT_LEN**

TLS maximum outgoing fragment length

*Found in: Component config > mbedTLS > CONFIG_MBEDTLSASYMMETRICCONTENTLEN*

This defines maximum outgoing fragment length, overriding default maximum content length (MBEDTLS_SSL_MAX_CONTENT_LEN).

**Range:**

- from 512 to 16384

**Default value:**

- 4096

**CONFIG_MBEDTLS_DYNAMIC_BUFFER**

Using dynamic TX/RX buffer

*Found in: Component config > mbedTLS*

Using dynamic TX/RX buffer. After enabling this option, mbedTLS will allocate TX buffer when need to send data and then free it if all data is sent, allocate RX buffer when need to receive data and then free it when all data is used or read by upper layer.

By default, when SSL is initialized, mbedTLS also allocate TX and RX buffer with the default value of “MBEDTLS_SSL_OUT_CONTENT_LEN” or “MBEDTLS_SSL_IN_CONTENT_LEN”, so to save more heap, users can set the options to be an appropriate value.
**CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA**

Free private key and DHM data after its usage

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER*

Free private key and DHM data after its usage in handshake process. The option will decrease heap cost when handshake, but also lead to problem: Because all certificate, private key and DHM data are freed so users should register certificate and private key to ssl config object again.

**Default value:**
- No (disabled) if `CONFIG_MBEDTLS_DYNAMIC_BUFFER`

**CONFIG_MBEDTLS_DYNAMIC_FREE_CA_CERT**

Free SSL CA certificate after its usage

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER > CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA*

Free CA certificate after its usage in the handshake process. This option will decrease the heap footprint for the TLS handshake, but may lead to a problem: If the respective ssl object needs to perform the TLS handshake again, the CA certificate should once again be registered to the ssl object.

**Default value:**
- Yes (enabled) if `CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA`

**CONFIG_MBEDTLS_DEBUG**

Enable mbedTLS debugging

*Found in: Component config > mbedTLS*

Enable mbedTLS debugging functions at compile time. If this option is enabled, you can include “mbedtls/esp_debug.h” and call mbedtls_esp_enable_debug_log() at runtime in order to enable mbedTLS debug output via the ESP log mechanism.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_DEBUG_LEVEL**

Set mbedTLS debugging level

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DEBUG*

Set mbedTLS debugging level

Available options:

- Warning (CONFIG_MBEDTLS_DEBUG_LEVEL_WARN)
- Info (CONFIG_MBEDTLS_DEBUG_LEVEL_INFO)
- Debug (CONFIG_MBEDTLS_DEBUG_LEVEL_DEBUG)
- Verbose (CONFIG_MBEDTLS_DEBUG_LEVEL_VERBOSE)
Chapter 2. API Reference

mbedTLS v3.x related  Contains:

- DTLS-based configurations
- CONFIG_MBEDTLS_PKS7_C
- CONFIG_MBEDTLS_SSL_CONTEXT.Serialization
- CONFIG_MBEDTLS_X509_TRUSTED_CERT_CALLBACK
- CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE
- CONFIG_MBEDTLS_SSL_CID_PADDING_GRANULARITY
- CONFIG_MBEDTLS_SSL_PROTO_TLS1_3
- CONFIG_MBEDTLS_ECDH_LEGACY_CONTEXT
- CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH

CONFIG_MBEDTLS_SSL_PROTO_TLS1_3

Support TLS 1.3 protocol

Found in: Component config > mbedTLS > mbedTLS v3.x related

TLS 1.3 related configurations  Contains:

- CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_EPHEMERAL
- CONFIG_MBEDTLS_SSL_TLS1_3_COMPATIBILITY_MODE
- CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_PSK_EPHEMERAL
- CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_PSK

CONFIG_MBEDTLS_SSL_TLS1_3_COMPATIBILITY_MODE

TLS 1.3 middlebox compatibility mode

Found in: Component config > mbedTLS > mbedTLS v3.x related > CONFIG_MBEDTLS_SSL_PROTO_TLS1_3 > TLS 1.3 related configurations

Default value:
- Yes (enabled) if CONFIG_MBEDTLS_SSL_PROTO_TLS1_3

CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_PSK

TLS 1.3 PSK key exchange mode

Found in: Component config > mbedTLS > mbedTLS v3.x related > CONFIG_MBEDTLS_SSL_PROTO_TLS1_3 > TLS 1.3 related configurations

Default value:
- Yes (enabled) if CONFIG_MBEDTLS_SSL_PROTO_TLS1_3

CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_EPHEMERAL

TLS 1.3 ephemeral key exchange mode

Found in: Component config > mbedTLS > mbedTLS v3.x related > CONFIG_MBEDTLS_SSL_PROTO_TLS1_3 > TLS 1.3 related configurations

Default value:
- Yes (enabled) if CONFIG_MBEDTLS_SSL_PROTO_TLS1_3

CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_PSK_EPHEMERAL

TLS 1.3 PSK ephemeral key exchange mode

Found in: Component config > mbedTLS > mbedTLS v3.x related > CONFIG_MBEDTLS_SSL_PROTO_TLS1_3 > TLS 1.3 related configurations
Default value:
  • Yes (enabled) if `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`

**CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH**

Variable SSL buffer length

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

This enables the SSL buffer to be resized automatically based on the negotiated maximum fragment length in each direction.

Default value:
  • No (disabled)

**CONFIG_MBEDTLS_ECDH_LEGACY_CONTEXT**

Use a backward compatible ECDH context (Experimental)

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

Use the legacy ECDH context format. Define this option only if you enable `MBEDTLS_ECP_RESTARTABLE` or if you want to access ECDH context fields directly.

Default value:
  • No (disabled) if `CONFIG_MBEDTLS_ECDH_C` && `CONFIG_MBEDTLS_ECP_RESTARTABLE`

**CONFIG_MBEDTLS_X509_TRUSTED_CERT_CALLBACK**

Enable trusted certificate callbacks

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

Enables users to configure the set of trusted certificates through a callback instead of a linked list.

See mbedTLS documentation for required API and more details.

Default value:
  • No (disabled)

**CONFIG_MBEDTLS_SSL_CONTEXT.Serialization**

Enable serialization of the TLS context structures

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

Enable serialization of the TLS context structures. This is a local optimization in handling a single, potentially long-lived connection.

See mbedTLS documentation for required API and more details. Disabling this option will save some code size.

Default value:
  • No (disabled)

**CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE**

Keep peer certificate after handshake completion

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

Keep the peer’s certificate after completion of the handshake. Disabling this option will save about 4kB of heap and some code size.

See mbedTLS documentation for required API and more details.
CONFIG_MBEDTLS_PKCS7_C

Enable PKCS #7

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

Enable PKCS #7 core for using PKCS #7-formatted signatures.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_SSL_CID_PADDING_GRANULARITY

Record plaintext padding

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

Controls the use of record plaintext padding in TLS 1.3 and when using the Connection ID extension in DTLS 1.2.

The padding will always be chosen so that the length of the padded plaintext is a multiple of the value of this option.

**Notes:** A value of 1 means that no padding will be used for outgoing records. On systems lacking division instructions, a power of two should be preferred.

**Range:**
- from 0 to 32 if CONFIG_MBEDTLS_SSL_PROTO_TLS1_3 || CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

**Default value:**
- 16 if CONFIG_MBEDTLS_SSL_PROTO_TLS1_3 || CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

DTLS-based configurations

Contains:
- CONFIG_MBEDTLS_SSL_DTLS_SRTP
- CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

Support for the DTLS Connection ID extension

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations*

Enable support for the DTLS Connection ID extension which allows to identify DTLS connections across changes in the underlying transport.

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_SSL_PROTO DTLS

CONFIG_MBEDTLS_SSL_CID_IN_LEN_MAX

Maximum length of CIDs used for incoming DTLS messages

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID*

Maximum length of CIDs used for incoming DTLS messages

**Range:**
- from 0 to 32 if CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID && CONFIG_MBEDTLS_SSL_PROTO DTLS

**Default value:**
- 32 if CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID && CONFIG_MBEDTLS_SSL_PROTO DTLS
CONFIG_MBEDTLS_SSL_CID_OUT_LEN_MAX

Maximum length of CIDs used for outgoing DTLS messages

*Found in:* Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

Maximum length of CIDs used for outgoing DTLS messages

**Range:**
- from 0 to 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**Default value:**
- 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

CONFIG_MBEDTLS_SSL_DTLS_SRTP

Enable support for negotiation of DTLS-SRTP (RFC 5764)

*Found in:* Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations

Enable support for negotiation of DTLS-SRTP (RFC 5764) through the use_srtp extension.

See mbedTLS documentation for required API and more details. Disabling this option will save some code size.

**Default value:**
- No (disabled) if `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

Certificate Bundle Contains:

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`

CONFIG_MBEDTLS_CERTIFICATE_BUNDLE

Enable trusted root certificate bundle

*Found in:* Component config > mbedTLS > Certificate Bundle

Enable support for large number of default root certificates

When enabled this option allows user to store default as well as customer specific root certificates in compressed format rather than storing full certificate. For the root certificates the public key and the subject name will be stored.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE

Default certificate bundle options

*Found in:* Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE

Available options:

- Use the full default certificate bundle (CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_FULL)
- Use only the most common certificates from the default bundles (CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_CMN)
  Use only the most common certificates from the default bundles, reducing the size with 50%, while still having around 99% coverage.
• Do not use the default certificate bundle (CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_NONE)

CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE

Add custom certificates to the default bundle

Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE

Default value:
• No (disabled)

CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH

Custom certificate bundle path

Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE > CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE

Name of the custom certificate directory or file. This path is evaluated relative to the project root directory.

CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_DEPRECATED_LIST

Add deprecated root certificates

Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE

Include the deprecated list of root certificates in the bundle. This list gets updated when a certificate is removed from the Mozilla’s NSS root certificate store. This config can be enabled if you would like to ensure that none of the certificates that were deployed in the product are affected because of the update to bundle. In turn, enabling this config keeps expired, retracted certificates in the bundle and it may pose a security risk.

• Deprecated cert list may grow based on sync with upstream bundle
• Deprecated certs would be be removed in ESP-IDF (next) major release

CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_MAX_CERTS

Maximum no of certificates allowed in certificate bundle

Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE

Default value:
• 200

CONFIG_MBEDTLS_ECP_RESTARTABLE

Enable mbedTLS ecp restartable

Found in: Component config > mbedTLS

Enable “non-blocking” ECC operations that can return early and be resumed.

Default value:
• No (disabled)
CONFIG_MBEDTLS_CMAC_C
Enable CMAC mode for block ciphers

*Found in: Component config > mbedTLS*
Enable the CMAC (Cipher-based Message Authentication Code) mode for block ciphers.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_HARDWARE_AES
Enable hardware AES acceleration

*Found in: Component config > mbedTLS*
Enable hardware accelerated AES encryption & decryption.

Note that if the ESP32 CPU is running at 240MHz, hardware AES does not offer any speed boost over software AES.

CONFIG_MBEDTLS_AES_USE_INTERRUPT
Use interrupt for long AES operations

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HARDWARE_AES*
Use an interrupt to coordinate long AES operations.

This allows other code to run on the CPU while an AES operation is pending. Otherwise the CPU busy-waits.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_AES_INTERRUPT_LEVEL
AES hardware interrupt level

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HARDWARE_AES > CONFIG_MBEDTLS_AES_USE_INTERRUPT*
This config helps to set the interrupt priority level for the AES peripheral. Value 0 (default) means that there is no preference regarding the interrupt priority level and any level from 1 to 3 can be selected (based on the availability). Note: Higher value indicates high interrupt priority.

**Range:**
- from 0 to 3

**Default value:**
- 0

CONFIG_MBEDTLS_HARDWARE_GCM
Enable partially hardware accelerated GCM

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HARDWARE_AES*
Enable partially hardware accelerated GCM. GHASH calculation is still done in software.

If MBEDTLS_HARDWARE_GCM is disabled and MBEDTLS_HARDWARE_AES is enabled then mbedTLS will still use the hardware accelerated AES block operation, but on a single block at a time.

**Default value:**
- Yes (enabled)
**CONFIG_MBEDTLS_HARDWARE_MPI**

Enable hardware MPI (bignum) acceleration

*Found in: Component config > mbedTLS*

Enable hardware accelerated multiple precision integer operations. Hardware accelerated multiplication, modulo multiplication, and modular exponentiation for up to SOC_RSA_MAX_BIT_LEN bit results.

These operations are used by RSA.

**CONFIG_MBEDTLS_MPI_USE_INTERRUPT**

Use interrupt for MPI exp-mod operations

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HARDWARE_MPI*

Use an interrupt to coordinate long MPI operations.

This allows other code to run on the CPU while an MPI operation is pending. Otherwise the CPU busy-waits.

*Default value:*
  - Yes (enabled)

**CONFIG_MBEDTLS_MPI_INTERRUPT_LEVEL**

MPI hardware interrupt level

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HARDWARE_MPI > CONFIG_MBEDTLS_MPI_USE_INTERRUPT*

This config helps to set the interrupt priority level for the MPI peripheral. Value 0 (default) means that there is no preference regarding the interrupt priority level and any level from 1 to 3 can be selected (based on the availability). Note: Higher value indicates high interrupt priority.

*Range:*
  - from 0 to 3

*Default value:*
  - 0

**CONFIG_MBEDTLS_HARDWARE_SHA**

Enable hardware SHA acceleration

*Found in: Component config > mbedTLS*

Enable hardware accelerated SHA1, SHA256, SHA384 & SHA512 in mbedTLS.

Due to a hardware limitation, on the ESP32 hardware acceleration is only guaranteed if SHA digests are calculated one at a time. If more than one SHA digest is calculated at the same time, one will be calculated fully in hardware and the rest will be calculated (at least partially calculated) in software. This happens automatically.

SHA hardware acceleration is faster than software in some situations but slower in others. You should benchmark to find the best setting for you.

**CONFIG_MBEDTLS_HARDWARE_ECC**

Enable hardware ECC acceleration

*Found in: Component config > mbedTLS*
Enable hardware accelerated ECC point multiplication and point verification for points on curve SECP192R1 and SECP256R1 in mbedTLS

**Default value:**
- Yes (enabled) if SOC_ECC_SUPPORTED

**CONFIG_MBEDTLS_ECC_OTHER_CURVES_SOFT_FALLBACK**

Fallback to software implementation for curves not supported in hardware

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HARDWARE_ECC*

Fallback to software implementation of ECC point multiplication and point verification for curves not supported in hardware.

**Default value:**
- Yes (enabled) if CONFIG_MBEDTLS_HARDWARE_ECC

**CONFIG_MBEDTLS_ROM_MD5**

Use MD5 implementation in ROM

*Found in: Component config > mbedTLS*

Use ROM MD5 in mbedTLS.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_HARDWARE_ECDSA_SIGN**

Enable ECDSA signing using on-chip ECDSA peripheral

*Found in: Component config > mbedTLS*

Enable hardware accelerated ECDSA peripheral to sign data on curve SECP192R1 and SECP256R1 in mbedTLS.

Note that for signing, the private key has to be burnt in an efuse key block with key purpose set to ECDSA_KEY. If no key is burnt, it will report an error.

The key should be burnt in little endian format. espfuse.py utility handles it internally but care needs to be taken while burning using esp_efuse APIs

**Default value:**
- No (disabled) if SOC_ECDSA_SUPPORTED

**CONFIG_MBEDTLS_HARDWARE_ECDSA_VERIFY**

Enable ECDSA signature verification using on-chip ECDSA peripheral

*Found in: Component config > mbedTLS*

Enable hardware accelerated ECDSA peripheral to verify signature on curve SECP192R1 and SECP256R1 in mbedTLS.

**Default value:**
- Yes (enabled) if SOC_ECDSA_SUPPORTED
CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN
Enable hardware ECDSA sign acceleration when using ATECC608A

*Found in: Component config > mbedTLS*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

*Default value:*
  - No (disabled)

CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY
Enable hardware ECDSA verify acceleration when using ATECC608A

*Found in: Component config > mbedTLS*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

*Default value:*
  - No (disabled)

CONFIG_MBEDTLS_HAVE_TIME
Enable mbedTLS time support

*Found in: Component config > mbedTLS*

Enable use of time.h functions (time() and gmtime()) by mbedTLS.

This option doesn’t require the system time to be correct, but enables functionality that requires relative timekeeping - for example periodic expiry of TLS session tickets or session cache entries.

Disabling this option will save some firmware size, particularly if the rest of the firmware doesn’t call any standard timekeeping functions.

*Default value:*
  - Yes (enabled)

CONFIG_MBEDTLS_PLATFORM_TIME_ALT
Enable mbedTLS time support: platform-specific

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HAVE_TIME*

Enabling this config will provide users with a function `mbedtls_platform_set_time()` that allows to set an alternative time function pointer.

*Default value:*
  - No (disabled)

CONFIG_MBEDTLS_HAVE_TIME_DATE
Enable mbedTLS certificate expiry check

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HAVE_TIME*

Enables X.509 certificate expiry checks in mbedTLS.

If this option is disabled (default) then X.509 certificate “valid from” and “valid to” timestamp fields are ignored.

If this option is enabled, these fields are compared with the current system date and time. The time is retrieved using the standard time() and gmtime() functions. If the certificate is not valid for the
current system time then verification will fail with code MBEDTLS_X509_BADCERT_FUTURE or MBEDTLS_X509_BADCERT_EXPIRED.

Enabling this option requires adding functionality in the firmware to set the system clock to a valid timestamp before using TLS. The recommended way to do this is via ESP-IDF’s SNTP functionality, but any method can be used.

In the case where only a small number of certificates are trusted by the device, please carefully consider the tradeoffs of enabling this option. There may be undesired consequences, for example if all trusted certificates expire while the device is offline and a TLS connection is required to update. Or if an issue with the SNTP server means that the system time is invalid for an extended period after a reset.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_ECDSA_DETERMINISTIC**

Enable deterministic ECDSA

*Found in: Component config > mbedTLS*

Standard ECDSA is “fragile” in the sense that lack of entropy when signing may result in a compromise of the long-term signing key.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_SHA512_C**

Enable the SHA-384 and SHA-512 cryptographic hash algorithms

*Found in: Component config > mbedTLS*

Enable MBEDTLS_SHA512_C adds support for SHA-384 and SHA-512.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_TLS_MODE**

TLS Protocol Role

*Found in: Component config > mbedTLS*

mbedTLS can be compiled with protocol support for the TLS server, TLS client, or both server and client.

Reducing the number of TLS roles supported saves code size.

Available options:

- Server & Client (CONFIG_MBEDTLS_TLS_SERVER_AND_CLIENT)
- Server (CONFIG_MBEDTLS_TLS_SERVER_ONLY)
- Client (CONFIG_MBEDTLS_TLS_CLIENT_ONLY)
- None (CONFIG_MBEDTLS_TLS_DISABLED)

**TLS Key Exchange Methods**

Contains:

- CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA
- CONFIG_MBEDTLS_KEY_EXCHANGE_ECJPAKE
- CONFIG_MBEDTLS_PSK_MODES
- CONFIG_MBEDTLS_KEY_EXCHANGE_RSA
- CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE
Chapter 2. API Reference

**CONFIG_MBEDTLS_PSK_MODES**

Enable pre-shared-key ciphersuites

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*

Enable to show configuration for different types of pre-shared-key TLS authentication methods. Leaving this option disabled will save code size if they are not used.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_PSK**

Enable PSK based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*

Enable to support symmetric key PSK (pre-shared-key) TLS key exchange modes.

**Default value:**
- No (disabled) if `CONFIG_MBEDTLS_PSK_MODES`

**CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_PSK**

Enable DHE-PSK based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*

Enable to support Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

**Default value:**
- Yes (enabled) if `CONFIG_MBEDTLS_PSK_MODES` && `CONFIG_MBEDTLS_DHM_C`

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_PSK**

Enable ECDHE-PSK based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*

Enable to support Elliptic-Curve-Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

**Default value:**
- Yes (enabled) if `CONFIG_MBEDTLS_PSK_MODES` && `CONFIG_MBEDTLS_ECDH_C`

**CONFIG_MBEDTLS_KEY_EXCHANGE_RSA_PSK**

Enable RSA-PSK based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*

Enable to support RSA PSK (pre-shared-key) TLS authentication modes.

**Default value:**
- Yes (enabled) if `CONFIG_MBEDTLS_PSK_MODES`
**CONFIG_MBEDTLS_KEY_EXCHANGE_RSA**

Enable RSA-only based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*

Enable to support ciphersuites with prefix TLS-RSA-WITH-

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA**

Enable DHE-RSA based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*

Enable to support ciphersuites with prefix TLS-DHE-RSA-WITH-

**Default value:**
- Yes (enabled) if `CONFIG_MBEDTLS_DHM_C`

**CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE**

Support Elliptic Curve based ciphersuites

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*

Enable to show Elliptic Curve based ciphersuite mode options.

Disabling all Elliptic Curve ciphersuites saves code size and can give slightly faster TLS handshakes, provided the server supports RSA-only ciphersuite modes.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_RSA**

Enable ECDHE-RSA based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE*

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_ECDSA**

Enable ECDHE-ECDSA based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE*

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**
- Yes (enabled)
**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_ECDSA**

Enable ECDH-ECDH based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE*

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_RSA**

Enable ECDH-RSA based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE*

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECJPAKE**

Enable ECJPAKE based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*

Enable to support ciphersuites with prefix TLS-ECJPAKE-WITH-

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_ECJPAKE_C && CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED

**CONFIG_MBEDTLS_SSL_RENEGOTIATION**

Support TLS renegotiation

*Found in: Component config > mbedTLS*

The two main uses of renegotiation are (1) refresh keys on long-lived connections and (2) client authentication after the initial handshake. If you don’t need renegotiation, disabling it will save code size and reduce the possibility of abuse/vulnerability.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_SSL_PROTO_TLS1_2**

Support TLS 1.2 protocol

*Found in: Component config > mbedTLS*

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_SSL_PROTO_GMTSSL1_1**

Support GM/T SSL 1.1 protocol

*Found in: Component config > mbedTLS*

Provisions for GM/T SSL 1.1 support
**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_SSL_PROTO_DTLS**
Support DTLS protocol (all versions)

*Found in: Component config > mbedTLS*
Requires TLS 1.2 to be enabled for DTLS 1.2

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_SSL_ALPN**
Support ALPN (Application Layer Protocol Negotiation)

*Found in: Component config > mbedTLS*
Disabling this option will save some code size if it is not needed.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS**
TLS: Client Support for RFC 5077 SSL session tickets

*Found in: Component config > mbedTLS*
Client support for RFC 5077 session tickets. See mbedTLS documentation for more details. Disabling this option will save some code size.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS**
TLS: Server Support for RFC 5077 SSL session tickets

*Found in: Component config > mbedTLS*
Server support for RFC 5077 session tickets. See mbedTLS documentation for more details. Disabling this option will save some code size.

**Default value:**
- Yes (enabled)

**Symmetric Ciphers**
Contains:

- `CONFIG_MBEDTLS_AES_C`
- `CONFIG_MBEDTLS_BLOWFISH_C`
- `CONFIG_MBEDTLS_CAMELLIA_C`
- `CONFIG_MBEDTLS_CCM_C`
- `CONFIG_MBEDTLS_DES_C`
- `CONFIG_MBEDTLS_GCM_C`
- `CONFIG_MBEDTLS_NIST_KW_C`
- `CONFIG_MBEDTLS_XTEA_C`
CONFIG_MBEDTLS_AES_C

AES block cipher

*Found in: Component config > mbedTLS > Symmetric Ciphers*

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_CAMELLIA_C

Camellia block cipher

*Found in: Component config > mbedTLS > Symmetric Ciphers*

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_DES_C

DES block cipher (legacy, insecure)

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enables the DES block cipher to support 3DES-based TLS ciphersuites.

3DES is vulnerable to the Sweet32 attack and should only be enabled if absolutely necessary.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_BLOWFISH_C

Blowfish block cipher (read help)

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enables the Blowfish block cipher (not used for TLS sessions.)

The Blowfish cipher is not used for mbedTLS TLS sessions but can be used for other purposes. Read up on the limitations of Blowfish (including Sweet32) before enabling.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_XTEA_C

XTEA block cipher

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enables the XTEA block cipher.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_CCM_C

CCM (Counter with CBC-MAC) block cipher modes

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enable Counter with CBC-MAC (CCM) modes for AES and/or Camellia ciphers.

Disabling this option saves some code size.

**Default value:**
• Yes (enabled)

**CONFIG_MBEDTLS_GCM_C**

GCM (Galois/Counter) block cipher modes

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enable Galois/Counter Mode for AES and/or Camellia ciphers. This option is generally faster than CCM.

**Default value:**

• Yes (enabled)

**CONFIG_MBEDTLS_NIST_KW_C**

NIST key wrapping (KW) and KW padding (KWP)

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enable NIST key wrapping and key wrapping padding.

**Default value:**

• No (disabled)

**CONFIG_MBEDTLS_RIPEMD160_C**

Enable RIPEMD-160 hash algorithm

*Found in: Component config > mbedTLS*

Enable the RIPEMD-160 hash algorithm.

**Default value:**

• No (disabled)

**Certificates**

Contains:

• **CONFIG_MBEDTLS_PEM_PARSE_C**
• **CONFIG_MBEDTLS_PEM_WRITE_C**
• **CONFIG_MBEDTLS_X509_CRLPARSE_C**
• **CONFIG_MBEDTLS_X509_CSPARSE_C**

**CONFIG_MBEDTLS_PEMPARSE_C**

Read & Parse PEM formatted certificates

*Found in: Component config > mbedTLS > Certificates*

Enable decoding/parsing of PEM formatted certificates. If your certificates are all in the simpler DER format, disabling this option will save some code size.

**Default value:**

• Yes (enabled)

**CONFIG_MBEDTLS_PEMWRITE_C**

Write PEM formatted certificates

*Found in: Component config > mbedTLS > Certificates*

Enable writing of PEM formatted certificates. If writing certificate data only in DER format, disabling this option will save some code size.
**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_X509_CRL_PARSE_C**

X.509 CRL parsing

*Found in: Component config > mbedTLS > Certificates*

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_X509_CSR_PARSE_C**

X.509 CSR parsing

*Found in: Component config > mbedTLS > Certificates*

Support for parsing X.509 Certificate Signing Requests

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_ECP_C**

Elliptic Curve Ciphers

*Found in: Component config > mbedTLS*

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_DHM_C**

Diffie-Hellman-Merkle key exchange (DHM)

*Found in: Component config > mbedTLS*

Enable DHM. Needed to use DHE-xxx TLS ciphersuites.

Note that the security of Diffie-Hellman key exchanges depends on a suitable prime being used for the exchange. Please see detailed warning text about this in file `mbedtls/dhm.h` file.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_ECDH_C**

Elliptic Curve Diffie-Hellman (ECDH)

*Found in: Component config > mbedTLS*

Enable ECDH. Needed to use ECDHE-xxx TLS ciphersuites.

**Default value:**
- Yes (enabled)
CONFIG_MBEDTLS_ECDSA_C

Elliptic Curve DSA

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECDH_C*

Enable ECDSA. Needed to use ECDSA-xxx TLS ciphersuites.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_ECJPAKE_C

Elliptic curve J-PAKE

*Found in: Component config > mbedTLS*

Enable ECJPAKE. Needed to use ECJPAKE-xxx TLS ciphersuites.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_ECP_DP_SECP192R1_ENABLED

Enable SECP192R1 curve

*Found in: Component config > mbedTLS*

Enable support for SECP192R1 Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_SECP224R1_ENABLED

Enable SECP224R1 curve

*Found in: Component config > mbedTLS*

Enable support for SECP224R1 Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED

Enable SECP256R1 curve

*Found in: Component config > mbedTLS*

Enable support for SECP256R1 Elliptic Curve.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_ECP_DP_SECP384R1_ENABLED

Enable SECP384R1 curve

*Found in: Component config > mbedTLS*

Enable support for SECP384R1 Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_SECP521R1_ENABLED

Enable SECP521R1 curve

*Found in: Component config > mbedTLS*

Enable support for SECP521R1 Elliptic Curve.
CONFIG_MBEDTLS_ECP_DP_SECP192K1_ENABLED
Enable SECP192K1 curve
Found in: Component config > mbedTLS
Enable support for SECP192K1 Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_SECP224K1_ENABLED
Enable SECP224K1 curve
Found in: Component config > mbedTLS
Enable support for SECP224K1 Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_SECP256K1_ENABLED
Enable SECP256K1 curve
Found in: Component config > mbedTLS
Enable support for SECP256K1 Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_BP256R1_ENABLED
Enable BP256R1 curve
Found in: Component config > mbedTLS
Support for DP Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_BP384R1_ENABLED
Enable BP384R1 curve
Found in: Component config > mbedTLS
Support for DP Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_BP512R1_ENABLED
Enable BP512R1 curve
Found in: Component config > mbedTLS
Support for DP Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_CURVE25519_ENABLED
Enable CURVE25519 curve
Found in: Component config > mbedTLS
Enable support for CURVE25519 Elliptic Curve.

CONFIG_MBEDTLS_ECP_NIST_OPTIM
NIST ‘modulo p’ optimisations
Found in: Component config > mbedTLS
NIST ‘modulo p’ optimisations increase Elliptic Curve operation performance.
Disabling this option saves some code size.
Default value:
• Yes (enabled)

**CONFIG_MBEDTLS_ECP_FIXED_POINT_OPTIM**

Enable fixed-point multiplication optimisations

*Found in: Component config > mbedTLS*

This configuration option enables optimizations to speedup (about 3 ~ 4 times) the ECP fixed point multiplication using pre-computed tables in the flash memory. Disabling this configuration option saves flash footprint (about 29KB if all Elliptic Curves selected) in the application binary.

# end of Elliptic Curve options

Default value:
• Yes (enabled)

**CONFIG_MBEDTLS_POLY1305_C**

Poly1305 MAC algorithm

*Found in: Component config > mbedTLS*

Enable support for Poly1305 MAC algorithm.

Default value:
• No (disabled)

**CONFIG_MBEDTLS_CHACHA20_C**

Chacha20 stream cipher

*Found in: Component config > mbedTLS*

Enable support for Chacha20 stream cipher.

Default value:
• No (disabled)

**CONFIG_MBEDTLS_CHACHAPOLY_C**

ChaCha20-Poly1305 AEAD algorithm

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_CHACHA20_C*

Enable support for ChaCha20-Poly1305 AEAD algorithm.

Default value:
• No (disabled) if `CONFIG_MBEDTLS_CHACHA20_C` && `CONFIG_MBEDTLS_POLY1305_C`

**CONFIG_MBEDTLS_HKDF_C**

HKDF algorithm (RFC 5869)

*Found in: Component config > mbedTLS*

Enable support for the Hashed Message Authentication Code (HMAC)-based key derivation function (HKDF).

Default value:
• No (disabled)
CONFIG_MBEDTLS_THREADING_C

Enable the threading abstraction layer

Found in: Component config > mbedTLS

If you do intend to use contexts between threads, you will need to enable this layer to prevent race conditions.

Default value:
- No (disabled)

CONFIG_MBEDTLS_THREADING_ALT

Enable threading alternate implementation

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_THREADING_C

Enable threading alt to allow your own alternate threading implementation.

Default value:
- Yes (enabled) if CONFIG_MBEDTLS_THREADING_C

CONFIG_MBEDTLS_THREADING_PTHREAD

Enable threading pthread implementation

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_THREADING_C

Enable the pthread wrapper layer for the threading layer.

Default value:
- No (disabled) if CONFIG_MBEDTLS_THREADING_C

CONFIG_MBEDTLS_LARGE_KEY_SOFTWARE_MPI

Fallback to software implementation for larger MPI values

Found in: Component config > mbedTLS

Fallback to software implementation for RSA key lengths larger than SOC_RSA_MAX_BIT_LEN. If this is not active then the ESP will be unable to process keys greater than SOC_RSA_MAX_BIT_LEN.

Default value:
- No (disabled)

CONFIG_MBEDTLS_USE_CRYPTO_ROM_IMPL

Use ROM implementation of the crypto algorithm

Found in: Component config > mbedTLS

Enable this flag to use mbedtls crypto algorithm from ROM instead of ESP-IDF.

This configuration option saves flash footprint in the application binary. Note that the version of mbedtls crypto algorithm library in ROM is v2.16.12. We have done the security analysis of the mbedtls revision in ROM (v2.16.12) and ensured that affected symbols have been patched (removed). If in the future mbedtls revisions there are security issues that also affects the version in ROM (v2.16.12) then we shall patch the relevant symbols. This would increase the flash footprint and hence care must be taken to keep some reserved space for the application binary in flash layout.

Default value:
- No (disabled) if ESP_ROM_HAS_MBEDTLS_CRYPTO_LIB && CONFIG_IDF_EXPERIMENTAL_FEATURES
ESP-MQTT Configurations  Contains:

- `CONFIG_MQTT_CUSTOM_OUTBOX`
- `CONFIG_MQTT_TRANSPORT_SSL`
- `CONFIG_MQTT_TRANSPORT_WEBSOCKET`
- `CONFIG_MQTT_PROTOCOL_311`
- `CONFIG_MQTT_PROTOCOL_5`
- `CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED`
- `CONFIG_MQTT_USE_CUSTOM_CONFIG`
- `CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS`
- `CONFIG_MQTT_REPORT_DELETED_MESSAGES`
- `CONFIG_MQTT_SKIP_PUBLISH_IF_DISCONNECTED`
- `CONFIG_MQTT_OUTBOX_DATA_ON_EXTERNAL_MEMORY`
- `CONFIG_MQTT_MSG_ID_INCREMENTAL`

**CONFIG_MQTT_PROTOCOL_311**

Enable MQTT protocol 3.1.1

*Found in: Component config > ESP-MQTT Configurations*

If not, this library will use MQTT protocol 3.1

**Default value:**
- Yes (enabled)

**CONFIG_MQTT_PROTOCOL_5**

Enable MQTT protocol 5.0

*Found in: Component config > ESP-MQTT Configurations*

If not, this library will not support MQTT 5.0

**Default value:**
- No (disabled)

**CONFIG_MQTT_TRANSPORT_SSL**

Enable MQTT over SSL

*Found in: Component config > ESP-MQTT Configurations*

Enable MQTT transport over SSL with mbedtls

**Default value:**
- Yes (enabled)

**CONFIG_MQTT_TRANSPORT_WEBSOCKET**

Enable MQTT over Websocket

*Found in: Component config > ESP-MQTT Configurations*

Enable MQTT transport over Websocket.

**Default value:**
- Yes (enabled)
CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE

Enable MQTT over Websocket Secure

*Found in:* Component config > ESP-MQTT Configurations > CONFIG_MQTT_TRANSPORT_WEBSOCKET

Enable MQTT transport over Websocket Secure.

**Default value:**

- Yes (enabled)

CONFIG_MQTT_MSG_ID_INCREMENTAL

Use Incremental Message Id

*Found in:* Component config > ESP-MQTT Configurations

Set this to true for the message id (2.3.1 Packet Identifier) to be generated as an incremental number rather then a random value (used by default)

**Default value:**

- No (disabled)

CONFIG_MQTT_SKIP_PUBLISH_IF_DISCONNECTED

Skip publish if disconnected

*Found in:* Component config > ESP-MQTT Configurations

Set this to true to avoid publishing (enqueueing messages) if the client is disconnected. The MQTT client tries to publish all messages by default, even in the disconnected state (where the qos1 and qos2 packets are stored in the internal outbox to be published later) The MQTT_SKIP_PUBLISH_IF_DISCONNECTED option allows applications to override this behaviour and not enqueue publish packets in the disconnected state.

**Default value:**

- No (disabled)

CONFIG_MQTT_REPORT_DELETED_MESSAGES

Report deleted messages

*Found in:* Component config > ESP-MQTT Configurations

Set this to true to post events for all messages which were deleted from the outbox before being correctly sent and confirmed.

**Default value:**

- No (disabled)

CONFIG_MQTT_USE_CUSTOM_CONFIG

MQTT Using custom configurations

*Found in:* Component config > ESP-MQTT Configurations

Custom MQTT configurations.

**Default value:**

- No (disabled)
Chapter 2. API Reference

**CONFIG_MQTT_TCP_DEFAULT_PORT**
Default MQTT over TCP port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default MQTT over TCP port

*Default value:*
  - 1883 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**CONFIG_MQTT_SSL_DEFAULT_PORT**
Default MQTT over SSL port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default MQTT over SSL port

*Default value:*
  - 8883 if `CONFIG_MQTT_USE_CUSTOM_CONFIG` & `CONFIG_MQTT_TRANSPORT_SSL`

**CONFIG_MQTT_WS_DEFAULT_PORT**
Default MQTT over Websocket port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default MQTT over Websocket port

*Default value:*
  - 80 if `CONFIG_MQTT_USE_CUSTOM_CONFIG` & `CONFIG_MQTT_TRANSPORT_WEBSOCKET`

**CONFIG_MQTT_WSS_DEFAULT_PORT**
Default MQTT over Websocket Secure port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default MQTT over Websocket Secure port

*Default value:*
  - 443 if `CONFIG_MQTT_USE_CUSTOM_CONFIG` & `CONFIG_MQTT_TRANSPORT_WEBSOCKET` & `CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE`

**CONFIG_MQTT_BUFFER_SIZE**
Default MQTT Buffer Size

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

This buffer size using for both transmit and receive

*Default value:*
  - 1024 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**CONFIG_MQTT_TASK_STACK_SIZE**
MQTT task stack size

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

MQTT task stack size

*Default value:*
  - 6144 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`
**CONFIG_MQTT_DISABLE_API_LOCKS**

Disable API locks

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default config employs API locks to protect internal structures. It is possible to disable these locks if the user code doesn’t access MQTT API from multiple concurrent tasks

*Default value:*

- No (disabled) if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**CONFIG_MQTT_TASK_PRIORITY**

MQTT task priority

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

MQTT task priority. Higher number denotes higher priority.

*Default value:*

- 5 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**CONFIG_MQTT_POLL_READ_TIMEOUT_MS**

MQTT transport poll read timeout

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Timeout when polling underlying transport for read.

*Default value:*

- 1000 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**CONFIG_MQTT_EVENT_QUEUE_SIZE**

Number of queued events.

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

A value higher than 1 enables multiple queued events.

*Default value:*

- 1 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED**

Enable MQTT task core selection

*Found in: Component config > ESP-MQTT Configurations*

This will enable core selection

**CONFIG_MQTT_TASK_CORE_SELECTION**

Core to use?

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED*

Available options:

- Core 0 (CONFIG_MQTT_USE_CORE_0)
- Core 1 (CONFIG_MQTT_USE_CORE_1)
**CONFIG_MQTT_OUTBOX_DATA_ON_EXTERNAL_MEMORY**

Use external memory for outbox data

*Found in: Component config > ESP-MQTT Configurations*

Set to true to use external memory for outbox data.

**Default value:**
- No (disabled) if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**CONFIG_MQTT_CUSTOM_OUTBOX**

Enable custom outbox implementation

*Found in: Component config > ESP-MQTT Configurations*

Set to true if a specific implementation of message outbox is needed (e.g. persistent outbox in NVM or similar). Note: Implementation of the custom outbox must be added to the mqtt component. These CMake commands could be used to append the custom implementation to lib-mqtt sources:

`idf_component_get_property(mqtt mqtt COMPONENT_LIB)set_property(TARGET $[mqtt] PROPERTY SOURCES $[PROJECT_DIR]/custom_outbox.c APPEND)`

**Default value:**
- No (disabled)

**CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS**

Outbox message expired timeout[ms]

*Found in: Component config > ESP-MQTT Configurations*

Messages which stays in the outbox longer than this value before being published will be discarded.

**Default value:**
- 30000 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**Newlib**

Contains:

- `CONFIG_NEWLIB_NANO_FORMAT`
- `CONFIG_NEWLIB_STDIN_LINE_ENDING`
- `CONFIG_NEWLIB_STDOUT_LINE_ENDING`
- `CONFIG_NEWLIB_TIME_SYSCALL`

**CONFIG_NEWLIB_STDOUT_LINE_ENDING**

Line ending for UART output

*Found in: Component config > Newlib*

This option allows configuring the desired line endings sent to UART when a newline (‘n’, LF) appears on stdout. Three options are possible:

CRLF: whenever LF is encountered, prepend it with CR

LF: no modification is applied, stdout is sent as is

CR: each occurrence of LF is replaced with CR

This option doesn’t affect behavior of the UART driver (drivers/uart.h).

Available options:

- CRLF (CONFIG_NEWLIB_STDOUT_LINE_ENDING_CRLF)
- LF (CONFIG_NEWLIB_STDOUT_LINE_ENDING_LF)
Chapter 2. API Reference

- CR (CONFIG_NEWLIB_STDOUT_LINE_ENDING_CR)

**CONFIG_NEWLIB_STDIN_LINE_ENDING**

Line ending for UART input

*Found in: Component config > Newlib*

This option allows configuring which input sequence on UART produces a newline (‘n’, LF) on stdin.

Three options are possible:

CRLF: CRLF is converted to LF

LF: no modification is applied, input is sent to stdin as is

CR: each occurrence of CR is replaced with LF

This option doesn’t affect behavior of the UART driver (drivers/uart.h).

Available options:

- CRLF (CONFIG_NEWLIB_STDIN_LINE_ENDING_CRLF)
- LF (CONFIG_NEWLIB_STDIN_LINE_ENDING_LF)
- CR (CONFIG_NEWLIB_STDIN_LINE_ENDING_CR)

**CONFIG_NEWLIB_NANO_FORMAT**

Enable ‘nano’ formatting options for printf/scanf family

*Found in: Component config > Newlib*

In most chips the ROM contains parts of newlib C library, including printf/scanf family of functions. These functions have been compiled with so-called “nano” formatting option. This option doesn’t support 64-bit integer formats and C99 features, such as positional arguments.

For more details about “nano” formatting option, please see newlib readme file, search for ‘-enable-newlib-nano-formatted-io’: https://sourceware.org/newlib/README

If this option is enabled and the ROM contains functions from newlib-nano, the build system will use functions available in ROM, reducing the application binary size. Functions available in ROM run faster than functions which run from flash. Functions available in ROM can also run when flash instruction cache is disabled.

Some chips (e.g. ESP32-C6) has the full formatting versions of printf/scanf in ROM instead of the nano versions and in this building with newlib nano might actually increase the size of the binary. Which functions are present in ROM can be seen from ROM caps: ESP_ROM_HAS_NEWLIB_NANO_FORMAT and ESP_ROM_HAS_NEWLIB_NORMAL_FORMAT.

If you need 64-bit integer formatting support or C99 features, keep this option disabled.

**CONFIG_NEWLIB_TIME_SYSCALL**

Timers used for gettimeofday function

*Found in: Component config > Newlib*

This setting defines which hardware timers are used to implement ‘gettimeofday’ and ‘time’ functions in C library.

- If both high-resolution (systimer for all targets except ESP32) and RTC timers are used, timekeeping will continue in deep sleep. Time will be reported at 1 microsecond resolution. This is the default, and the recommended option.
• If only high-resolution timer (systimer) is used, `gettimeofday` will provide time at microsecond resolution. Time will not be preserved when going into deep sleep mode.
• If only RTC timer is used, `timekeeping` will continue in deep sleep, but time will be measured at 6.6 microsecond resolution. Also the `gettimeofday` function itself may take longer to run.
• If no timers are used, `gettimeofday and time functions` return -1 and set errno to ENOSYS.
• When RTC is used for timekeeping, two RTC_STORE registers are used to keep time in deep sleep mode.

Available options:

- RTC and high-resolution timer (CONFIG_NEWLIB_TIME_SYSCALL_USE_RTC_HRT)
- RTC (CONFIG_NEWLIB_TIME_SYSCALL_USE_RTC)
- High-resolution timer (CONFIG_NEWLIB_TIME_SYSCALL_USE_HRT)
- None (CONFIG_NEWLIB_TIME_SYSCALL_USE_NONE)

**CONFIG_NVS_ENCRYPTION**

Enable NVS encryption

*Found in: Component config > NVS*

This option enables encryption for NVS. When enabled, XTS-AES is used to encrypt the complete NVS data, except the page headers. It requires XTS encryption keys to be stored in an encrypted partition (enabling flash encryption is mandatory here) or to be derived from an HMAC key burnt in eFuse.

**Default value:**
- Yes (enabled) if `CONFIG_SECURE_FLASH_ENC_ENABLED`

**CONFIG_NVS_COMPATIBLE_PRE_V4_3_ENCRYPTION_FLAG**

NVS partition encrypted flag compatible with ESP-IDF before v4.3

*Found in: Component config > NVS*

Enabling this will ignore “encrypted” flag for NVS partitions. NVS encryption scheme is different than hardware flash encryption and hence it is not recommended to have “encrypted” flag for NVS partitions. This was not being checked in pre v4.3 IDF. Hence, if you have any devices where this flag is kept enabled in partition table then enabling this config will allow to have same behavior as pre v4.3 IDF.

**CONFIG_NVS_ASSERT_ERROR_CHECK**

Use assertions for error checking

*Found in: Component config > NVS*

This option switches error checking type between assertions (y) or return codes (n).

**Default value:**
- No (disabled)
CONFIG_NVS_LEGACY_DUP_KEYS_COMPATIBILITY

Enable legacy nvs_set function behavior when same key is reused with different data types

*Found in: Component config > NVS*

Enabling this option will switch the nvs_set() family of functions to the legacy mode: when called repeatedly with the same key but different data type, the existing value in the NVS remains active and the new value is just stored, actually not accessible through corresponding nvs_get() call for the key given. Use this option only when your application relies on such NVS API behaviour.

**Default value:**
- No (disabled)

NVS Security Provider  
Contains:
- CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID
- CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME

CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME

NVS Encryption: Key Protection Scheme

*Found in: Component config > NVS Security Provider*

This choice defines the default NVS encryption keys protection scheme; which will be used for the default NVS partition. Users can use the corresponding scheme registration APIs to register other schemes for the default as well as other NVS partitions.

**Available options:**

- Using Flash Encryption (CONFIG_NVS_SEC_KEY_PROTECT_USING_FLASH_ENC)  
  Protect the NVS Encryption Keys using Flash Encryption Requires a separate ‘nvs_keys’ partition (which will be encrypted by flash encryption) for storing the NVS encryption keys
- Using HMAC peripheral (CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC)  
  Derive and protect the NVS Encryption Keys using the HMAC peripheral Requires the specified eFuse block (NVS_SEC_HMAC_EFUSE_KEY_ID or the v2 API argument) to be empty or pre-written with a key with the purpose ESP_EFUSE_KEY_PURPOSE_HMAC_UP

CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID

eFuse key ID storing the HMAC key

*Found in: Component config > NVS Security Provider*

eFuse block key ID storing the HMAC key for deriving the NVS encryption keys

**Note:** The eFuse block key ID required by the HMAC scheme (CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC) is set using this config when the default NVS partition is initialized with nvs_flash_init(). The eFuse block key ID can also be set at runtime by passing the appropriate value to the NVS security scheme registration APIs.

**Range:**
- from 0 to 6 if CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC

**Default value:**
- 6 if CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC
OpenThread  Contains:

- `CONFIG_OPENTHREAD_PLATFORM_MSGPOOL_MANAGEMENT`
- `CONFIG_OPENTHREAD_DEVICE_TYPE`
- `CONFIG_OPENTHREAD_RADIO_TYPE`
- `CONFIG_OPENTHREAD_BORDER_ROUTER`
- `CONFIG_OPENTHREAD_COMMISSIONER`
- `CONFIG_OPENTHREAD_CSL_DEBUG_ENABLE`
- `CONFIG_OPENTHREAD_CSL_ENABLE`
- `CONFIG_OPENTHREAD_DIAG`
- `CONFIG_OPENTHREAD_DUA_CLIENT`
- `CONFIG_OPENTHREAD_DUA_ENABLE`
- `CONFIG_OPENTHREAD_JOINER`
- `CONFIG_OPENTHREAD_LINK_METRICS`
- `CONFIG_OPENTHREAD_MACFILTER_ENABLE`
- `CONFIG_OPENTHREAD_CLI`
- `CONFIG_OPENTHREAD_RADIO_STATS_ENABLE`
- `CONFIG_OPENTHREAD_SRP_CLIENT`
- `CONFIG_OPENTHREAD_TIME_SYNC`
- `CONFIG_OPENTHREAD_ENABLED`
- `CONFIG_OPENTHREAD_XTAL_ACCURACY`
- `CONFIG_OPENTHREAD_CSL_UNCERTAIN`
- `CONFIG_OPENTHREAD_CSL_ACCURACY`
- `CONFIG_OPENTHREAD_NUM_MESSAGE_BUFFERS`
- `CONFIG_OPENTHREAD_RCP_TRANSPORT`
- `CONFIG_OPENTHREAD_MLE_MAX_CHILDREN`
- `CONFIG_OPENTHREAD_TMF_ADDR_CACHE_ENTRIES`
- `CONFIG_OPENTHREAD_SPINEL_RX_FRAME_BUFFER_SIZE`
- `CONFIG_OPENTHREAD_UART_BUFFER_SIZE`
- `Thread Operational Dataset`
- `CONFIG_OPENTHREAD_DNS64_CLIENT`

### `CONFIG_OPENTHREAD_ENABLED`

OpenThread

*Found in: Component config > OpenThread*

Select this option to enable OpenThread and show the submenu with OpenThread configuration choices.

**Default value:**
- No (disabled)

### `CONFIG_OPENTHREAD_LOG_LEVEL_DYNAMIC`

Enable dynamic log level control

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable dynamic log level control for OpenThread

**Default value:**
- Yes (enabled) if `CONFIG_OPENTHREAD_ENABLED`

### `CONFIG_OPENTHREAD_CONSOLE_TYPE`

OpenThread console type

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select OpenThread console type

Available options:
• OpenThread console type UART (CONFIG_OPENTHREAD_CONSOLE_TYPE_UART)
• OpenThread console type USB Serial/JTAG Controller (CONFIG_OPENTHREAD_CONSOLE_TYPE_USB_SERIAL_JTAG)

CONFIG_OPENTHREAD_LOG_LEVEL

OpenThread log verbosity

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select OpenThread log level.

Available options:

- No logs (CONFIG_OPENTHREAD_LOG_LEVEL_NONE)
- Error logs (CONFIG_OPENTHREAD_LOG_LEVEL_CRIT)
- Warning logs (CONFIG_OPENTHREAD_LOG_LEVEL_WARN)
- Notice logs (CONFIG_OPENTHREAD_LOG_LEVEL_NOTE)
- Info logs (CONFIG_OPENTHREAD_LOG_LEVEL_INFO)
- Debug logs (CONFIG_OPENTHREAD_LOG_LEVEL_DEBUG)

Thread Operational Dataset Contains:

- CONFIG_OPENTHREAD_NETWORK_EXTPANID
- CONFIG_OPENTHREAD_MESH_LOCAL_PREFIX
- CONFIG_OPENTHREAD_NETWORK_CHANNEL
- CONFIG_OPENTHREAD_NETWORK_MASTERKEY
- CONFIG_OPENTHREAD_NETWORK_NAME
- CONFIG_OPENTHREAD_NETWORK_PANID
- CONFIG_OPENTHREAD_NETWORK_PSKC

CONFIG_OPENTHREAD_NETWORK_NAME

OpenThread network name

*Found in: Component config > OpenThread > Thread Operational Dataset*

Default value:

- “OpenThread-ESP”

CONFIG_OPENTHREAD_MESH_LOCAL_PREFIX

OpenThread mesh local prefix, format <address>/<plen>

*Found in: Component config > OpenThread > Thread Operational Dataset*

A string in the format “<address>/<plen>”, where <address> is an IPv6 address and <plen> is a prefix length. For example “fd00:db8:a0:0:0:0:64”

Default value:

- “fd00:db8:a0:0:0:0:64”

CONFIG_OPENTHREAD_NETWORK_CHANNEL

OpenThread network channel

*Found in: Component config > OpenThread > Thread Operational Dataset*

Range:

- from 11 to 26
Default value:
• 15

CONFIG_OPENTHREAD_NETWORK_PANID
OpenThread network pan id

*Found in: Component config > OpenThread > Thread Operational Dataset*

Range:
• from 0 to 0xFFFFE

Default value:
• “0x1234”

CONFIG_OPENTHREAD_NETWORK_EXTPANID
OpenThread extended pan id

*Found in: Component config > OpenThread > Thread Operational Dataset*

The OpenThread network extended pan id in hex string format

Default value:
• dead00beef00cafe

CONFIG_OPENTHREAD_NETWORK_MASTERKEY
OpenThread network key

*Found in: Component config > OpenThread > Thread Operational Dataset*

The OpenThread network network key in hex string format

Default value:
• 00112233445566778899aabbccddeeFF

CONFIG_OPENTHREAD_NETWORK_PSKC
OpenThread pre-shared commissioner key

*Found in: Component config > OpenThread > Thread Operational Dataset*

The OpenThread pre-shared commissioner key in hex string format

Default value:
• 104810e2315100afdf6be9215adafa53

CONFIG_OPENTHREAD_RADIO_TYPE
Config the Thread radio type

*Found in: Component config > OpenThread*

Configure how OpenThread connects to the 15.4 radio

Available options:

• Native 15.4 radio (CONFIG_OPENTHREAD_RADIO_NATIVE)
  Select this to use the native 15.4 radio.
• Connect via UART (CONFIG_OPENTHREAD_RADIO_SPINEL_UART)
  Select this to connect to a Radio Co-Processor via UART.
• Connect via SPI (CONFIG_OPENTHREAD_RADIO_SPINEL_SPI)
  Select this to connect to a Radio Co-Processor via SPI.
CONFIG_OPENTHREAD_DEVICE_TYPE

Config the Thread device type

*Found in: Component config > OpenThread*

OpenThread can be configured to different device types (FTD, MTD, Radio)

Available options:

- Full Thread Device (CONFIG_OPENTHREAD_FTD)
  Select this to enable Full Thread Device which can act as router and leader in a Thread network.
- Minimal Thread Device (CONFIG_OPENTHREAD_MTD)
  Select this to enable Minimal Thread Device which can only act as end device in a Thread network. This will reduce the code size of the OpenThread stack.
- Radio Only Device (CONFIG_OPENTHREAD_RADIO)
  Select this to enable Radio Only Device which can only forward 15.4 packets to the host. The OpenThread stack will be run on the host and OpenThread will have minimal footprint on the radio only device.

CONFIG_OPENTHREAD_RCP_TRANSPORT

The RCP transport type

*Found in: Component config > OpenThread*

Available options:

- UART RCP (CONFIG_OPENTHREAD_RCP_UART)
  Select this to enable UART connection to host.
- SPI RCP (CONFIG_OPENTHREAD_RCP_SPI)
  Select this to enable SPI connection to host.

CONFIG_OPENTHREAD_CLI

Enable Openthread Command-Line Interface

*Found in: Component config > OpenThread*

Select this option to enable Command-Line Interface in OpenThread.

**Default value:**

- Yes (enabled) if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_DIAG

Enable diag

*Found in: Component config > OpenThread*

Select this option to enable Diag in OpenThread. This will enable diag mode and a series of diag commands in the OpenThread command line. These commands allow users to manipulate low-level features of the storage and 15.4 radio.

**Default value:**

- Yes (enabled) if `CONFIG_OPENTHREAD_ENABLED`
CONFIG_OPENTHREAD_COMMISSIONER

Enable Commissioner

*Found in: Component config > OpenThread*

Select this option to enable commissioner in OpenThread. This will enable the device to act as a commissioner in the Thread network. A commissioner checks the pre-shared key from a joining device with the Thread commissioning protocol and shares the network parameter with the joining device upon success.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_COMM_MAX_JOINER_ENTRIES

The size of max commissioning joiner entries

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_COMMISSIONER*

**Range:**
- from 2 to 50 if `CONFIG_OPENTHREAD_COMMISSIONER`

**Default value:**
- 2 if `CONFIG_OPENTHREAD_COMMISSIONER`

CONFIG_OPENTHREAD_JOINER

Enable Joiner

*Found in: Component config > OpenThread*

Select this option to enable Joiner in OpenThread. This allows a device to join the Thread network with a pre-shared key using the Thread commissioning protocol.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_SR_P_CLIENT

Enable SRP Client

*Found in: Component config > OpenThread*

Select this option to enable SRP Client in OpenThread. This allows a device to register SRP services to SRP Server.

**Default value:**
- Yes (enabled) if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_SR_P_CLIENT_MAX_SERVICES

Specifies number of service entries in the SRP client service pool

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_SR_P_CLIENT*

Set the max buffer size of service entries in the SRP client service pool.

**Range:**
- from 2 to 20 if `CONFIG_OPENTHREAD_SR_P_CLIENT`

**Default value:**
- 5 if `CONFIG_OPENTHREAD_SR_P_CLIENT`
CONFIG_OPENTHREAD_DNS_CLIENT
Enable DNS Client

*Found in: Component config > OpenThread*

Select this option to enable DNS Client in OpenThread.

**Default value:**
- Yes (enabled) if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_BORDER_ROUTER
Enable Border Router

*Found in: Component config > OpenThread*

Select this option to enable border router features in OpenThread.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_PLATFORM_MSGPOOL_MANAGEMENT
Allocate message pool buffer from PSRAM

*Found in: Component config > OpenThread*

If enabled, the message pool is managed by platform defined logic.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED` && (`CONFIG_SPIRAM_USE_CAPS_ALLOC` || `CONFIG_SPIRAM_USE_MALLOC`)

CONFIG_OPENTHREAD_NUM_MESSAGE_BUFFERS
The number of openthread message buffers

*Found in: Component config > OpenThread*

**Range:**
- from 10 to 8191 if `CONFIG_OPENTHREAD_PLATFORM_MSGPOOL_MANAGEMENT` && `CONFIG_OPENTHREAD_ENABLED`

**Default value:**
- 65 if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_SPINEL_RX_FRAME_BUFFER_SIZE
The size of openthread spinel rx frame buffer

*Found in: Component config > OpenThread*

**Range:**
- from 512 to 8192 if `CONFIG_OPENTHREAD_ENABLED`

**Default value:**
- 1024 if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_MLE_MAX_CHILDREN
The size of max MLE children entries

*Found in: Component config > OpenThread*

**Range:**
- from 5 to 50 if `CONFIG_OPENTHREAD_ENABLED`
Chapter 2. API Reference

Default value:
  • 10 if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG_OPENTHREAD_TMF_ADDR_CACHE_ENTRIES**

The size of max TMF address cache entries

*Found in: Component config > OpenThread*

*Range:*
  • from 5 to 50 if `CONFIG_OPENTHREAD_ENABLED`

*Default value:*
  • 20 if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG_OPENTHREAD_DNS64_CLIENT**

Use dns64 client

*Found in: Component config > OpenThread*

Select this option to acquire NAT64 address from dns servers.

*Default value:*
  • No (disabled) if `CONFIG_OPENTHREAD_ENABLED` && `CONFIG_LWIP_IPV4`

**CONFIG_OPENTHREAD_DNS_SERVER_ADDR**

DNS server address (IPv4)

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_DNS64_CLIENT*

Set the DNS server IPv4 address.

*Default value:*
  • “8.8.8.8” if `CONFIG_OPENTHREAD_DNS64_CLIENT`

**CONFIG_OPENTHREAD_UART_BUFFER_SIZE**

The uart received buffer size of openthread

*Found in: Component config > OpenThread*

Set the OpenThread UART buffer size.

*Range:*
  • from 128 to 1024 if `CONFIG_OPENTHREAD_ENABLED`

*Default value:*
  • 256 if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG_OPENTHREAD_LINK_METRICS**

Enable link metrics feature

*Found in: Component config > OpenThread*

Select this option to enable link metrics feature

*Default value:*
  • No (disabled) if `CONFIG_OPENTHREAD_ENABLED`
CONFIG_OPENTHREAD_MACFILTER_ENABLE
Enable mac filter feature
*Found in: Component config > OpenThread*
Select this option to enable mac filter feature
**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_CSL_ENABLE
Enable CSL feature
*Found in: Component config > OpenThread*
Select this option to enable CSL feature
**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_XTAL_ACCURACY
The accuracy of the XTAL
*Found in: Component config > OpenThread*
The device’s XTAL accuracy, in ppm.
**Default value:**
- 130

CONFIG_OPENTHREAD_CSL_ACCURACY
The current CSL rx/tx scheduling drift, in units of ± ppm
*Found in: Component config > OpenThread*
The current accuracy of the clock used for scheduling CSL operations
**Default value:**
- 1 if `CONFIG_OPENTHREAD_CSL_ENABLE`

CONFIG_OPENTHREAD_CSL_UNCERTAIN
The CSL Uncertainty in units of 10 us.
*Found in: Component config > OpenThread*
The fixed uncertainty of the Device for scheduling CSL Transmissions in units of 10 microseconds.
**Default value:**
- 1 if `CONFIG_OPENTHREAD_CSL_ENABLE`

CONFIG_OPENTHREAD_CSL_DEBUG_ENABLE
Enable CSL debug
*Found in: Component config > OpenThread*
Select this option to set rx on when sleep in CSL feature, only for debug
**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_CSL_ENABLE`
CONFIG_OPENTHREAD_DUA_ENABLE

Enable Domain Unicast Address feature

*Found in:* Component config > OpenThread

Only used for Thread1.2 certification

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_TIME_SYNC

Enable the time synchronization service feature

*Found in:* Component config > OpenThread

Select this option to enable time synchronization feature, the devices in the same Thread network could sync to the same network time.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_RADIO_STATS_ENABLE

Enable Radio Statistics feature

*Found in:* Component config > OpenThread

Select this option to enable the radio statistics feature, you can use radio command to print some radio Statistics informations.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_FTD || CONFIG_OPENTHREAD_MTD`

**Protocomm** Contains:

- `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0`
- `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1`
- `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2`

CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0

Support protocomm security version 0 (no security)

*Found in:* Component config > Protocomm

Enable support of security version 0. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

**Default value:**
- Yes (enabled)

CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1

Support protocomm security version 1 (Curve25519 key exchange + AES-CTR encryption/decryption)

*Found in:* Component config > Protocomm

Enable support of security version 1. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

**Default value:**
• Yes (enabled)

**CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2**

Support protocomm security version 2 (SRP6a-based key exchange + AES-GCM encryption/decryption)

*Found in: Component config > Protocomm*

Enable support of security version 2. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

**Default value:**

• Yes (enabled)

**PThreads**  
Contains:

• CONFIG_PTHREAD_TASK_NAME_DEFAULT  
• CONFIG_PTHREAD_TASK_CORE_DEFAULT  
• CONFIG_PTHREAD_TASK_PRIO_DEFAULT  
• CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT  
• CONFIG_PTHREAD_STACK_MIN

**CONFIG_PTHREAD_TASK_PRIO_DEFAULT**

Default task priority

*Found in: Component config > PThreads*

Priority used to create new tasks with default pthread parameters.

**Range:**

• from 0 to 255

**Default value:**

• 5

**CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT**

Default task stack size

*Found in: Component config > PThreads*

Stack size used to create new tasks with default pthread parameters.

**Default value:**

• 3072

**CONFIG_PTHREAD_STACK_MIN**

Minimum allowed pthread stack size

*Found in: Component config > PThreads*

Minimum allowed pthread stack size set in attributes passed to pthread_create

**Default value:**

• 768
CONFIG_PTHREAD_TASK_CORE_DEFAULT
Default pthread core affinity

*Found in: Component config > PThreads*

The default core to which pthreads are pinned.

Available options:

- No affinity (CONFIG_PTHREAD_DEFAULT_CORE_NO_AFFINITY)
- Core 0 (CONFIG_PTHREAD_DEFAULT_CORE_0)
- Core 1 (CONFIG_PTHREAD_DEFAULT_CORE_1)

CONFIG_PTHREAD_TASK_NAME_DEFAULT
Default name of pthreads

*Found in: Component config > PThreads*

The default name of pthreads.

**Default value:**
- “pthread”

SoC Settings  Contains:

- **MMU Config**

MMU Config

Main Flash configuration  Contains:

- **Optional and Experimental Features (READ DOCS FIRST)**
- **SPI Flash behavior when brownout**

SPI Flash behavior when brownout  Contains:

- **CONFIG_SPI_FLASH_BROWNOUT_RESET_XMC**

CONFIG_SPI_FLASH_BROWNOUT_RESET_XMC
Enable sending reset when brownout for XMC flash chips

*Found in: Component config > Main Flash configuration > SPI Flash behavior when brownout*

When this option is selected, the patch will be enabled for XMC. Follow the recommended flow by XMC for better stability.

**DO NOT DISABLE UNLESS YOU KNOW WHAT YOU ARE DOING.**

Optional and Experimental Features (READ DOCS FIRST)  Contains:

- **CONFIG_SPI_FLASH_AUTO_SUSPEND**
- **CONFIG_SPI_FLASH_SUSPEND_TSUS_VAL_US**
- **CONFIG_SPI_FLASH_HPM_DC**
CONFIG_SPI_FLASH_HPM_DC

Support HPM using DC (READ DOCS FIRST)

Found in: Component config > Main Flash configuration > Optional and Experimental Features (READ DOCS FIRST)

This feature needs your bootloader to be compiled DC-aware (BOOT-LOADER_FLASH_HPM_DC_AWARE=y). Otherwise the chip will not be able to boot after a reset.

Available options:

- Auto (Enable when bootloader support enabled (BOOT-LOADER_FLASH_HPM_DC_AWARE)) (CONFIG_SPI_FLASH_HPM_DC_AUTO)
- Disable (READ DOCS FIRST) (CONFIG_SPI_FLASH_HPM_DC_DISABLE)

CONFIG_SPI_FLASH_AUTO_SUSPEND

Auto suspend long erase/write operations (READ DOCS FIRST)

Found in: Component config > Main Flash configuration > Optional and Experimental Features (READ DOCS FIRST)

This option is disabled by default because it is supported only for specific flash chips and for specific Espressif chips. To evaluate if you can use this feature refer to Optional Features for Flash > Auto Suspend & Resume of the ESP-IDF Programming Guide.

CAUTION: If you want to OTA to an app with this feature turned on, please make sure the bootloader has the support for it. (later than IDF v4.3)

If you are using an official Espressif module, please contact Espressif Business support to check if the module has the flash that support this feature installed. Also refer to Concurrency Constraints for Flash on SPII > Flash Auto Suspend Feature before enabling this option.

CONFIG_SPI_FLASH_SUSPEND_TSUS_VAL_US

SPI flash tSUS value (refer to chapter AC CHARACTERISTICS)

Found in: Component config > Main Flash configuration > Optional and Experimental Features (READ DOCS FIRST)

This config is used for setting Tsus parameter. Tsus means CS# high to next command after suspend. You can refer to the chapter of AC CHARACTERISTICS of flash datasheet.

SPI Flash driver Contains:

- Auto-detect flash chips
- CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE
- CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE
- CONFIG_SPI_FLASH_ENABLE_COUNTERS
- CONFIG_SPI_FLASH_ROM_DRIVER_PATCH
- CONFIG_SPI_FLASH_YIELD DURING_ERASE
- CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED
- CONFIG_SPI_FLASH_WRITE CHUNK_SIZE
- CONFIG_SPI_FLASH_OVERRIDE CHIP DRIVER LIST
- CONFIG_SPI_FLASH_SIZE OVERRIDE
- CONFIG_SPI_FLASH_ROM_IMPL
- CONFIG_SPI_FLASH_VERIFY_WRITE
- CONFIG_SPI_FLASH_DANGEROUS_WRITE
CONFIG_SPI_FLASH_VERIFY_WRITE
Verify SPI flash writes

*Found in: Component config > SPI Flash driver*

If this option is enabled, any time SPI flash is written then the data will be read back and verified. This can catch hardware problems with SPI flash, or flash which was not erased before verification.

CONFIG_SPI_FLASH_LOG_FAILED_WRITE
Log errors if verification fails

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_VERIFY_WRITE*

If this option is enabled, if SPI flash write verification fails then a log error line will be written with the address, expected & actual values. This can be useful when debugging hardware SPI flash problems.

CONFIG_SPI_FLASH_WARN_SETTING_ZERO_TO_ONE
Log warning if writing zero bits to ones

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_VERIFY_WRITE*

If this option is enabled, any SPI flash write which tries to set zero bits in the flash to ones will log a warning. Such writes will not result in the requested data appearing identically in flash once written, as SPI NOR flash can only set bits to one when an entire sector is erased. After erasing, individual bits can only be written from one to zero.

Note that some software (such as SPIFFS) which is aware of SPI NOR flash may write one bits as an optimisation, relying on the data in flash becoming a bitwise AND of the new data and any existing data. Such software will log spurious warnings if this option is enabled.

CONFIG_SPI_FLASH_ENABLE_COUNTERS
Enable operation counters

*Found in: Component config > SPI Flash driver*

This option enables the following APIs:

- esp_flash_reset_counters
- esp_flash_dump_counters
- esp_flash_get_counters

These APIs may be used to collect performance data for spi_flash APIs and to help understand behaviour of libraries which use SPI flash.

CONFIG_SPI_FLASH_ROM_DRIVER_PATCH
Enable SPI flash ROM driver patched functions

*Found in: Component config > SPI Flash driver*

Enable this flag to use patched versions of SPI flash ROM driver functions. This option should be enabled, if any one of the following is true: (1) need to write to flash on ESP32-D2WD; (2) main SPI flash is connected to non-default pins; (3) main SPI flash chip is manufactured by ISSI.

CONFIG_SPI_FLASH_ROM_IMPL
Use esp_flash implementation in ROM

*Found in: Component config > SPI Flash driver*

Enable this flag to use new SPI flash driver functions from ROM instead of ESP-IDF.
If keeping this as “n” in your project, you will have less free IRAM. But you can use all of our flash features.

If making this as “y” in your project, you will increase free IRAM. But you may miss out on some flash features and support for new flash chips.

Currently the ROM cannot support the following features:

- SPI_FLASH_AUTO_SUSPEND (C3, S3)

**CONFIG_SPI_FLASH_DANGEROUS_WRITE**

Writing to dangerous flash regions

*Found in: Component config > SPI Flash driver*

SPI flash APIs can optionally abort or return a failure code if erasing or writing addresses that fall at the beginning of flash (covering the bootloader and partition table) or that overlap the app partition that contains the running app.

It is not recommended to ever write to these regions from an IDF app, and this check prevents logic errors or corrupted firmware memory from damaging these regions.

Note that this feature *does not* check calls to the esp_rom_xxx SPI flash ROM functions. These functions should not be called directly from IDF applications.

Available options:

- Aborts (CONFIG_SPI_FLASH_DANGEROUS_WRITE_ABORTS)
- Fails (CONFIG_SPI_FLASH_DANGEROUS_WRITE_FAILS)
- Allowed (CONFIG_SPI_FLASH_DANGEROUS_WRITE_ALLOWED)

**CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE**

Bypass a block erase and always do sector erase

*Found in: Component config > SPI Flash driver*

Some flash chips can have very high “max” erase times, especially for block erase (32KB or 64KB). This option allows to bypass “block erase” and always do sector erase commands. This will be much slower overall in most cases, but improves latency for other code to run.

**CONFIG_SPI_FLASH_YIELD_DURING_ERASE**

Enables yield operation during flash erase

*Found in: Component config > SPI Flash driver*

This allows to yield the CPUs between erase commands. Prevents starvation of other tasks. Please use this configuration together with SPI\_FLASH\_ERASE\_YIELD\_DURATION\_MS and SPI\_
FLASH\_ERASE\_YIELD\_TICKS after carefully checking flash datasheet to avoid a watchdog timeout. For more information, please check SPI Flash API reference document under section OS Function.

**CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS**

Duration of erasing to yield CPUs (ms)

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_YIELD_DURING_ERASE*

If a duration of one erase command is large then it will yield CPUs after finishing a current command.
**CONFIG_SPI_FLASH_ERASE_YIELD_TICKS**

CPU release time (tick) for an erase operation

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_YIELD_DURING_ERASE*

Defines how many ticks will be before returning to continue a erasing.

**CONFIG_SPI_FLASH_WRITE_CHUNK_SIZE**

Flash write chunk size

*Found in: Component config > SPI Flash driver*

Flash write is broken down in terms of multiple (smaller) write operations. This configuration options helps to set individual write chunk size, smaller value here ensures that cache (and non-IRAM resident interrupts) remains disabled for shorter duration.

**CONFIG_SPI_FLASH_SIZE OVERRIDE**

Override flash size in bootloader header by ESPTOOLPY_FLASHSIZE

*Found in: Component config > SPI Flash driver*

SPI Flash driver uses the flash size configured in bootloader header by default. Enable this option to override flash size with latest ESPTOOLPY_FLASHSIZE value from the app header if the size in the bootloader header is incorrect.

**CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED**

Flash timeout checkout disabled

*Found in: Component config > SPI Flash driver*

This option is helpful if you are using a flash chip whose timeout is quite large or unpredictable.

**CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST**

Override default chip driver list

*Found in: Component config > SPI Flash driver*

This option allows the chip driver list to be customized, instead of using the default list provided by ESP-IDF.

When this option is enabled, the default list is no longer compiled or linked. Instead, the default_registered_chips structure must be provided by the user.

See example: custom_chip_driver under examples/storage for more details.

**Auto-detect flash chips**

Contains:

- `CONFIG_SPI_FLASH_SUPPORT_BOYA_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_GD_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_TH_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_WINBOND_CHIP`
CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP

ISSI

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of ISSI chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP

MXIC

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of MXIC chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

CONFIG_SPI_FLASH_SUPPORT_GD_CHIP

GigaDevice

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of GD (GigaDevice) chips if chip vendor not directly given by `chip_drv` member of the chip struct. If you are using Wrover modules, please don’t disable this, otherwise your flash may not work in 4-bit mode.

This adds support for variant chips, however will extend detecting time and image size. Note that the default chip driver supports the GD chips with product ID 60H.

CONFIG_SPI_FLASH_SUPPORT_WINBOND_CHIP

Winbond

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of Winbond chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

CONFIG_SPI_FLASH_SUPPORT_BOYA_CHIP

BOYA

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of BOYA chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

CONFIG_SPI_FLASH_SUPPORT_TH_CHIP

TH

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of TH chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.
CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE

Enable encrypted partition read/write operations

*Found in: Component config > SPI Flash driver*

This option enables flash read/write operations to encrypted partition/s. This option is kept enabled irrespective of state of flash encryption feature. However, in case application is not using flash encryption feature and is in need of some additional memory from IRAM region (~1KB) then this config can be disabled.

**SPIFFS Configuration**  Contains:

- `Debug Configuration`
- `CONFIG_SPIFFS_USE_MAGIC`
- `CONFIG_SPIFFS_GC_STATS`
- `CONFIG_SPIFFS_PAGE_CHECK`
- `CONFIG_SPIFFS_FOLLOW_SYMLINKS`
- `CONFIG_SPIFFS_MAX_PARTITIONS`
- `CONFIG_SPIFFS_USE_MTIME`
- `CONFIG_SPIFFS_GC_MAX_RUNS`
- `CONFIG_SPIFFS_OBJ_NAME_LEN`
- `CONFIG_SPIFFS_META_LENGTH`
- SPIFFS Cache Configuration
  - `CONFIG_SPIFFS_PAGE_SIZE`
  - `CONFIG_SPIFFS_MTIME_WIDE_64_BITS`

**CONFIG_SPIFFS_MAX_PARTITIONS**

Maximum Number of Partitions

*Found in: Component config > SPIFFS Configuration*

Define maximum number of partitions that can be mounted.

**Range:**

- from 1 to 10

**Default value:**

- 3

**SPIFFS Cache Configuration**  Contains:

- `CONFIG_SPIFFS_CACHE`

**CONFIG_SPIFFS_CACHE**

Enable SPIFFS Cache

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration*

Enables/disable memory read caching of nucleus file system operations.

**Default value:**

- Yes (enabled)

**CONFIG_SPIFFS_CACHE_WR**

Enable SPIFFS Write Caching

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration > CONFIG_SPIFFS_CACHE*

Enables memory write caching for file descriptors in hydrogen.
Default value:
• Yes (enabled)

**CONFIG_SPIFFS_CACHE_STATS**

Enable SPIFFS Cache Statistics

*Found in:* Component config > SPIFFS Configuration > SPIFFS Cache Configuration > CONFIG_SPIFFS_CACHE

Enable/disable statistics on caching. Debug/test purpose only.

**Default value:**
• No (disabled)

**CONFIG_SPIFFS_PAGE_CHECK**

Enable SPIFFS Page Check

*Found in:* Component config > SPIFFS Configuration

Always check header of each accessed page to ensure consistent state. If enabled it will increase number of reads from flash, especially if cache is disabled.

**Default value:**
• Yes (enabled)

**CONFIG_SPIFFS_GC_MAX_RUNS**

Set Maximum GC Runs

*Found in:* Component config > SPIFFS Configuration

Define maximum number of GC runs to perform to reach desired free pages.

**Range:**
• from 1 to 10000

**Default value:**
• 10

**CONFIG_SPIFFS_GC_STATS**

Enable SPIFFS GC Statistics

*Found in:* Component config > SPIFFS Configuration

Enable/disable statistics on gc. Debug/test purpose only.

**Default value:**
• No (disabled)

**CONFIG_SPIFFS_PAGE_SIZE**

SPIFFS logical page size

*Found in:* Component config > SPIFFS Configuration

Logical page size of SPIFFS partition, in bytes. Must be multiple of flash page size (which is usually 256 bytes). Larger page sizes reduce overhead when storing large files, and improve filesystem performance when reading large files. Smaller page sizes reduce overhead when storing small (< page size) files.

**Range:**
• from 256 to 1024

**Default value:**
• 256
Chapter 2. API Reference

**CONFIG_SPIFFS_OBJ_NAME_LEN**

Set SPIFFS Maximum Name Length

*Found in: Component config > SPIFFS Configuration*

Object name maximum length. Note that this length include the zero-termination character, meaning maximum string of characters can at most be SPIFFS_OBJ_NAME_LEN - 1.

SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.

**Range:**

- from 1 to 256

**Default value:**

- 32

**CONFIG_SPIFFS_FOLLOW_SYMLINKS**

Enable symbolic links for image creation

*Found in: Component config > SPIFFS Configuration*

If this option is enabled, symbolic links are taken into account during partition image creation.

**Default value:**

- No (disabled)

**CONFIG_SPIFFS_USE_MAGIC**

Enable SPIFFS Filesystem Magic

*Found in: Component config > SPIFFS Configuration*

Enable this to have an identifiable spiffs filesystem. This will look for a magic in all sectors to determine if this is a valid spiffs system or not at mount time.

**Default value:**

- Yes (enabled)

**CONFIG_SPIFFS_USE_MAGIC.LENGTH**

Enable SPIFFS Filesystem Length Magic

*Found in: Component config > SPIFFS Configuration > CONFIG_SPIFFS_USE_MAGIC*

If this option is enabled, the magic will also be dependent on the length of the filesystem. For example, a filesystem configured and formatted for 4 megabytes will not be accepted for mounting with a configuration defining the filesystem as 2 megabytes.

**Default value:**

- Yes (enabled)

**CONFIG_SPIFFS_META_LENGTH**

Size of per-file metadata field

*Found in: Component config > SPIFFS Configuration*

This option sets the number of extra bytes stored in the file header. These bytes can be used in an application-specific manner. Set this to at least 4 bytes to enable support for saving file modification time.

SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.
Chapter 2. API Reference

**CONFIG_SPIFFS_USE_MTIME**

Save file modification time

*Found in: Component config > SPIFFS Configuration*

If enabled, then the first 4 bytes of per-file metadata will be used to store file modification time (mtime), accessible through stat/fstat functions. Modification time is updated when the file is opened.

*Default value:*

• Yes (enabled)

**CONFIG_SPIFFS_MTIME_WIDE_64_BITS**

The time field occupies 64 bits in the image instead of 32 bits

*Found in: Component config > SPIFFS Configuration*

If this option is not set, the time field is 32 bits (up to 2106 year), otherwise it is 64 bits and make sure it matches SPIFFS_META_LENGTH. If the chip already has the spiffs image with the time field = 32 bits then this option cannot be applied in this case. Erase it first before using this option. To resolve the Y2K38 problem for the spiffs, use a toolchain with 64-bit time_t support.

*Default value:*

• No (disabled) if `CONFIG_SPIFFS_META_LENGTH >= 8`

**Debug Configuration**

Contains:

• `CONFIG_SPIFFS_DBG`
• `CONFIG_SPIFFS_API_DBG`
• `CONFIG_SPIFFS_CACHE_DBG`
• `CONFIG_SPIFFS_CHECK_DBG`
• `CONFIG_SPIFFS_TEST_VISUALISATION`
• `CONFIG_SPIFFS_GC_DBG`

**CONFIG_SPIFFS_DBG**

Enable general SPIFFS debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print general debug mesages to the console.

*Default value:*

• No (disabled)

**CONFIG_SPIFFS_API_DBG**

Enable SPIFFS API debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print API debug mesages to the console.

*Default value:*

• No (disabled)
Chapter 2. API Reference

CONFIG_SPIFFS_GC_DBG
Enable SPIFFS Garbage Cleaner debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print GC debug messages to the console.

**Default value:**
- No (disabled)

CONFIG_SPIFFS_CACHE_DBG
Enable SPIFFS Cache debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print cache debug messages to the console.

**Default value:**
- No (disabled)

CONFIG_SPIFFS_CHECK_DBG
Enable SPIFFS Filesystem Check debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print Filesystem Check debug messages to the console.

**Default value:**
- No (disabled)

CONFIG_SPIFFS_TEST_VISUALISATION
Enable SPIFFS Filesystem Visualization

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enable this option to enable SPIFFS_vis function in the API.

**Default value:**
- No (disabled)

TCP Transport
Contains:
- Websocket

Websocket
Contains:
- CONFIG_WS_TRANSPORT

CONFIG_WS_TRANSPORT
Enable Websocket Transport

*Found in: Component config > TCP Transport > Websocket*

Enable support for creating websocket transport.

**Default value:**
- Yes (enabled)
CONFIG_WS_BUFFER_SIZE

Websocket transport buffer size

*Found in: Component config > TCP Transport > Websocket > CONFIG_WS_TRANSPORT*

Size of the buffer used for constructing the HTTP Upgrade request during connect

**Default value:**
- 1024

CONFIG_WS_DYNAMIC_BUFFER

Using dynamic websocket transport buffer

*Found in: Component config > TCP Transport > Websocket > CONFIG_WS_TRANSPORT*

If enable this option, websocket transport buffer will be freed after connection succeed to save more heap.

**Default value:**
- No (disabled)

Ultra Low Power (ULP) Co-processor  Contains:

- CONFIG_ULP_COPROC_ENABLED
- ULP RISC-V Settings

CONFIG_ULP_COPROC_ENABLED

Enable Ultra Low Power (ULP) Co-processor

*Found in: Component config > Ultra Low Power (ULP) Co-processor*

Enable this feature if you plan to use the ULP Co-processor. Once this option is enabled, further ULP co-processor configuration will appear in the menu.

**Default value:**
- No (disabled)

CONFIG_ULP_COPROC_TYPE

ULP Co-processor type

*Found in: Component config > Ultra Low Power (ULP) Co-processor > CONFIG_ULP_COPROC_ENABLED*

Choose the ULP Coprocessor type: ULP FSM (Finite State Machine) or ULP RISC-V.

Available options:

- ULP FSM (Finite State Machine) (CONFIG_ULP_COPROC_TYPE_FSM)
- ULP RISC-V (CONFIG_ULP_COPROC_TYPE_RISCV)
- LP core RISC-V (CONFIG_ULP_COPROC_TYPE_LP_CORE)

CONFIG_ULP_COPROC_RESERVE_MEM

RTC slow memory reserved for coprocessor

*Found in: Component config > Ultra Low Power (ULP) Co-processor > CONFIG_ULP_COPROC_ENABLED*

Bytes of memory to reserve for ULP Co-processor firmware & data. Data is reserved at the beginning of RTC slow memory.
Range:
- from 32 to 8176 if `CONFIG_ULP_COPROC_ENABLED`

Default value:
- 4096 if `CONFIG_ULP_COPROC_ENABLED`

**ULP RISC-V Settings** Contains:
- `CONFIG_ULP_RISCV_UART_BAUDRATE`
- `CONFIG_ULP_RISCV_I2C_RW_TIMEOUT`

**CONFIG_ULP_RISCV_UART_BAUDRATE**

Baudrate used by the bitbanged ULP RISC-V UART driver

*Found in: Component config > Ultra Low Power (ULP) Co-processor > ULP RISC-V Settings*

The accuracy of the bitbanged UART driver is limited, it is not recommend to increase the value above 19200.

Default value:
- 9600 if `CONFIG_ULP_COPROC_TYPE_RISCV`

**CONFIG_ULP_RISCV_I2C_RW_TIMEOUT**

Set timeout for ULP RISC-V I2C transaction timeout in ticks.

*Found in: Component config > Ultra Low Power (ULP) Co-processor > ULP RISC-V Settings*

Set the ULP RISC-V I2C read/write timeout. Set this value to -1 if the ULP RISC-V I2C read and write APIs should wait forever. Please note that the tick rate of the ULP co-processor would be different than the OS tick rate of the main core and therefore can have different timeout value depending on which core the API is invoked on.

Range:
- from -1 to 4294967295 if `CONFIG_ULP_COPROC_TYPE_RISCV`

Default value:
- 500 if `CONFIG_ULP_COPROC_TYPE_RISCV`

**Unity unit testing library** Contains:
- `CONFIG_UNITY_ENABLE_COLOR`
- `CONFIG_UNITY_ENABLE_IDF_TEST_RUNNER`
- `CONFIG_UNITY_ENABLE_FIXTURE`
- `CONFIG_UNITY_ENABLE_BACKTRACE_ON_FAIL`
- `CONFIG_UNITY_ENABLE_64BIT`
- `CONFIG_UNITY_ENABLE_DOUBLE`
- `CONFIG_UNITY_ENABLE_FLOAT`

**CONFIG_UNITY_ENABLE_FLOAT**

Support for float type

*Found in: Component config > Unity unit testing library*

If not set, assertions on float arguments will not be available.

Default value:
- Yes (enabled)
CONFIG_UNITY_ENABLE_DOUBLE

Support for double type

*Found in:* Component config > Unity unit testing library

If not set, assertions on double arguments will not be available.

**Default value:**
- Yes (enabled)

CONFIG_UNITY_ENABLE_64BIT

Support for 64-bit integer types

*Found in:* Component config > Unity unit testing library

If not set, assertions on 64-bit integer types will always fail. If this feature is enabled, take care not to pass pointers (which are 32 bit) to UNITY_ASSERT_EQUAL, as that will cause pointer-to-int-cast warnings.

**Default value:**
- No (disabled)

CONFIG_UNITY_ENABLE_COLOR

Colorize test output

*Found in:* Component config > Unity unit testing library

If set, Unity will colorize test results using console escape sequences.

**Default value:**
- No (disabled)

CONFIG_UNITY_ENABLE_IDF_TEST_RUNNER

Include ESP-IDF test registration/running helpers

*Found in:* Component config > Unity unit testing library

If set, then the following features will be available:
- TEST_CASE macro which performs automatic registration of test functions
- Functions to run registered test functions: unity_run_all_tests, unity_run_tests_with_filter, unity_run_single_test_by_name.
- Interactive menu which lists test cases and allows choosing the tests to be run, available via unity_run_menu function.

Disable if a different test registration mechanism is used.

**Default value:**
- Yes (enabled)

CONFIG_UNITY_ENABLE_FIXTURE

Include Unity test fixture

*Found in:* Component config > Unity unit testing library

If set, unity_fixture.h header file and associated source files are part of the build. These provide an optional set of macros and functions to implement test groups.

**Default value:**
- No (disabled)
**CONFIG_UNITY_ENABLE_BACKTRACE_ON_FAIL**

Print a backtrace when a unit test fails

*Found in: Component config > Unity unit testing library*

If set, the unity framework will print the backtrace information before jumping back to the test menu. The jumping is usually occurs in assert functions such as TEST_ASSERT, TEST_FAIL etc.

**Default value:**
- No (disabled)

**USB-OTG**  Contains:
- CONFIG_USB_HOST_HW_BUFFER_BIAS
- CONFIG_USB_HOST_CONTROL_TRANSFER_MAX_SIZE
- Root Hub configuration

**CONFIG_USB_HOST_CONTROL_TRANSFER_MAX_SIZE**

Largest size (in bytes) of transfers to/from default endpoints

*Found in: Component config > USB-OTG*

Each USB device attached is allocated a dedicated buffer for its OUT/IN transfers to/from the device’s control endpoint. The maximum size of that buffer is determined by this option. The limited size of the transfer buffer have the following implications: - The maximum length of control transfers is limited - Device’s with configuration descriptors larger than this limit cannot be supported

**Default value:**
- 256

**CONFIG_USB_HOST_HW_BUFFER_BIAS**

Hardware FIFO size biasing

*Found in: Component config > USB-OTG*

The underlying hardware has size adjustable FIFOs to cache USB packets on reception (IN) or for transmission (OUT). The size of these FIFOs will affect the largest MPS (maximum packet size) and the maximum number of packets that can be cached at any one time. The hardware contains the following FIFOs: RX (for all IN packets), Non-periodic TX (for Bulk and Control OUT packets), and Periodic TX (for Interrupt and Isochronous OUT packets). This configuration option allows biasing the FIFO sizes towards a particular use case, which may be necessary for devices that have endpoints with large MPS. The MPS limits for each biasing are listed below:

Balanced: - IN (all transfer types), 408 bytes - OUT non-periodic (Bulk/Control), 192 bytes (i.e., 3 x 64 byte packets) - OUT periodic (Interrupt/Isochronous), 192 bytes

Bias IN: - IN (all transfer types), 600 bytes - OUT non-periodic (Bulk/Control), 64 bytes (i.e., 1 x 64 byte packets) - OUT periodic (Interrupt/Isochronous), 128 bytes

Bias Periodic OUT: - IN (all transfer types), 128 bytes - OUT non-periodic (Bulk/Control), 64 bytes (i.e., 1 x 64 byte packets) - OUT periodic (Interrupt/Isochronous), 600 bytes

Available options:
- Balanced (CONFIG_USB_HOST_HW_BUFFER_BIAS_BALANCED)
- Bias IN (CONFIG_USB_HOST_HW_BUFFER_BIAS_IN)
- Periodic OUT (CONFIG_USB_HOST_HW_BUFFER_BIAS_PERIODIC_OUT)
Root Hub configuration  Contains:

- `CONFIG_USB_HOST_DEBOUNCE_DELAY_MS`
- `CONFIG_USB_HOST_RESET_HOLD_MS`
- `CONFIG_USB_HOST_RESET_RECOVERY_MS`
- `CONFIG_USB_HOST_SET_ADDR_RECOVERY_MS`

`CONFIG_USB_HOST_DEBOUNCE_DELAY_MS`
Debounce delay in ms

*Found in: Component config > USB-OTG > Root Hub configuration*

On connection of a USB device, the USB 2.0 specification requires a “debounce interval with a minimum duration of 100ms” to allow the connection to stabilize (see USB 2.0 chapter 7.1.7.3 for more details). During the debounce interval, no new connection/disconnection events are registered.

The default value is set to 250 ms to be safe.

**Default value:**

- 250

`CONFIG_USB_HOST_RESET_HOLD_MS`
Reset hold in ms

*Found in: Component config > USB-OTG > Root Hub configuration*

The reset signaling can be generated on any Hub or Host Controller port by request from the USB System Software. The USB 2.0 specification requires that “the reset signaling must be driven for a minimum of 10ms” (see USB 2.0 chapter 7.1.7.5 for more details). After the reset, the hub port will transition to the Enabled state (refer to Section 11.5).

The default value is set to 30 ms to be safe.

**Default value:**

- 30

`CONFIG_USB_HOST_RESET_RECOVERY_MS`
Reset recovery delay in ms

*Found in: Component config > USB-OTG > Root Hub configuration*

After a port stops driving the reset signal, the USB 2.0 specification requires that the USB System Software guarantees a minimum of 10ms for reset recovery” before the attached device is expected to respond to data transfers (see USB 2.0 chapter 7.1.7.3 for more details). The device may ignore any data transfers during the recovery interval.

The default value is set to 30 ms to be safe.

**Default value:**

- 30

`CONFIG_USB_HOST_SET_ADDR_RECOVERY_MS`
SetAddress() recovery time in ms

*Found in: Component config > USB-OTG > Root Hub configuration*

“After successful completion of the Status stage, the device is allowed a SetAddress() recovery interval of 2 ms. At the end of this interval, the device must be able to accept Setup packets addressed to the new address. Also, at the end of the recovery interval, the device must not respond to tokens sent to the old address (unless, of course, the old and new address is the same).” See USB 2.0 chapter 9.2.6.3 for more details.
The default value is set to 10 ms to be safe.

**Default value:**
- 10

**Virtual file system**  
Contains:
- **CONFIG_VFS_SUPPORT_IO**

**CONFIG_VFS_SUPPORT_IO**

Provide basic I/O functions

*Found in: Component config > Virtual file system*

If enabled, the following functions are provided by the VFS component.
- open, close, read, write, pread, pwrite, lseek, fstat, fsync, ioctl, fcntl

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

Note that the following functions can still be used with socket file descriptors when this option is disabled:
- close, read, write, ioctl, fcntl.

**Default value:**
- Yes (enabled)

**CONFIG_VFS_SUPPORT_DIR**

Provide directory related functions

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO*

If enabled, the following functions are provided by the VFS component.
- stat, link, unlink, rename, utime, access, truncate, rmdir, mkdir, opendir, closedir, readdir, readdir_r, seekdir, telldir, rewinddir

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

**Default value:**
- Yes (enabled)

**CONFIG_VFS_SUPPORT_SELECT**

Provide select function

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO*

If enabled, select function is provided by the VFS component, and can be used on peripheral file descriptors (such as UART) and sockets at the same time.

If disabled, the default select implementation will be provided by LWIP for sockets only.

Disabling this option can reduce code size if support for “select” on UART file descriptors is not required.
CONFIG_VFS_SUPPRESS_SELECT_DEBUG_OUTPUT

Suppress select() related debug outputs

*Found in:* Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > CONFIG_VFS_SUPPORT_SELECT

Select() related functions might produce an unconveniently lot of debug outputs when one sets the default log level to DEBUG or higher. It is possible to suppress these debug outputs by enabling this option.

**Default value:**
- Yes (enabled)

CONFIG_VFS_SELECT_IN_RAM

Make VFS driver select() callbacks IRAM-safe

*Found in:* Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > CONFIG_VFS_SUPPORT_SELECT

If enabled, VFS driver select() callback function will be placed in IRAM.

**Default value:**
- No (disabled)

CONFIG_VFS_SUPPORT_TERMIOS

Provide termios.h functions

*Found in:* Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO

Disabling this option can save memory when the support for termios.h is not required.

**Default value:**
- Yes (enabled)

CONFIG_VFS_MAX_COUNT

Maximum Number of Virtual Filesystems

*Found in:* Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO

Define maximum number of virtual filesystems that can be registered.

**Range:**
- from 1 to 20

**Default value:**
- 8

Host File System I/O (Semihosting) Contains:

- CONFIG_VFS_SEMIHOSTFS_MAX_MOUNT_POINTS

CONFIG_VFS_SEMIHOSTFS_MAX_MOUNT_POINTS

Host FS: Maximum number of the host filesystem mount points

*Found in:* Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > Host File System I/O (Semihosting)

Define maximum number of host filesystem mount points.

**Default value:**
- 1
**Wear Levelling** Contains:

- `CONFIG_WL_SECTOR_MODE`
- `CONFIG_WL_SECTOR_SIZE`

**CONFIG_WL_SECTOR_SIZE**

Wear Levelling library sector size

*Found in: Component config > Wear Levelling*

Sector size used by wear levelling library. You can set default sector size or size that will fit to the flash device sector size.

With sector size set to 4096 bytes, wear levelling library is more efficient. However if FAT filesystem is used on top of wear levelling library, it will need more temporary storage: 4096 bytes for each mounted filesystem and 4096 bytes for each opened file.

With sector size set to 512 bytes, wear levelling library will perform more operations with flash memory, but less RAM will be used by FAT filesystem library (512 bytes for the filesystem and 512 bytes for each file opened).

Available options:

- 512 (CONFIG_WL_SECTOR_SIZE_512)
- 4096 (CONFIG_WL_SECTOR_SIZE_4096)

**CONFIG_WL_SECTOR_MODE**

Sector store mode

*Found in: Component config > Wear Levelling*

Specify the mode to store data into flash:

- In Performance mode a data will be stored to the RAM and then stored back to the flash. Compared to the Safety mode, this operation is faster, but if power will be lost when erase sector operation is in progress, then the data from complete flash device sector will be lost.
- In Safety mode data from complete flash device sector will be read from flash, modified, and then stored back to flash. Compared to the Performance mode, this operation is slower, but if power is lost during erase sector operation, then the data from full flash device sector will not be lost.

Available options:

- Performance (CONFIG_WL_SECTOR_MODE_PERF)
- Safety (CONFIG_WL_SECTOR_MODE_SAFE)

**Wi-Fi Provisioning Manager** Contains:

- `CONFIG_WIFI_PROV_BLE_BONDING`
- `CONFIG_WIFI_PROV_BLE_SEC_CONN`
- `CONFIG_WIFI_PROV_BLE_FORCE_ENCRYPTION`
- `CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV`
- `CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES`
- `CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT`
- `CONFIG_WIFI_PROV_STA_SCAN_METHOD`
CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES
Max Wi-Fi Scan Result Entries

*Found in: Component config > Wi-Fi Provisioning Manager*

This sets the maximum number of entries of Wi-Fi scan results that will be kept by the provisioning manager.

**Range:**
- from 1 to 255

**Default value:**
- 16

CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT
Provisioning auto-stop timeout

*Found in: Component config > Wi-Fi Provisioning Manager*

Time (in seconds) after which the Wi-Fi provisioning manager will auto-stop after connecting to a Wi-Fi network successfully.

**Range:**
- from 5 to 600

**Default value:**
- 30

CONFIG_WIFI_PROV_BLE_BONDING
Enable BLE bonding

*Found in: Component config > Wi-Fi Provisioning Manager*

This option is applicable only when provisioning transport is BLE.

CONFIG_WIFI_PROV_BLE_SEC_CONN
Enable BLE Secure connection flag

*Found in: Component config > Wi-Fi Provisioning Manager*

Used to enable Secure connection support when provisioning transport is BLE.

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_ENABLED

CONFIG_WIFI_PROV_BLE_FORCE_ENCRYPTION
Force Link Encryption during characteristic Read / Write

*Found in: Component config > Wi-Fi Provisioning Manager*

Used to enforce link encryption when attempting to read / write characteristic

CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV
Keep BT on after provisioning is done

*Found in: Component config > Wi-Fi Provisioning Manager*
CONFIG_WIFI_PROV_DISCONNECT_AFTER_PROV

Terminate connection after provisioning is done

*Found in:* Component config > Wi-Fi Provisioning Manager

*Default value:* Yes (enabled) if CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV

CONFIG_WIFI_PROV_STA_SCAN_METHOD

Wifi Provisioning Scan Method

*Found in:* Component config > Wi-Fi Provisioning Manager

*Available options:*

- All Channel Scan (CONFIG_WIFI_PROV_STA_ALL_CHANNEL_SCAN)
  Scan will end after scanning the entire channel. This option is useful in Mesh WiFi Systems.
- Fast Scan (CONFIG_WIFI_PROV_STA_FAST_SCAN)
  Scan will end after an AP matching with the SSID has been detected.

CONFIG_IDF.Experimental_FEATURES

Make experimental features visible

*Found in:*

By enabling this option, ESP-IDF experimental feature options will be visible.

Note you should still enable a certain experimental feature option to use it, and you should read the corresponding risk warning and known issue list carefully.

*Current experimental feature list:*

- CONFIG_ESPTOOLPY_FLASHFREQ_120M && CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE_DTR
- CONFIG_SPIRAM_SPEED_120M && CONFIG_SPIRAM_MODE_OCT
- CONFIG_BOOTLOADER_CACHE_32BIT_ADDR_QUAD_FLASH
- CONFIGMBEDTLS_USE_CRYPTO_ROM_IMPL

*Default value:* No (disabled)

Deprecated options and their replacements

## 2.7 Provisioning API

### 2.7.1 Protocol Communication

**Overview**

The Protocol Communication (protocomm) component manages secure sessions and provides the framework for multiple transports. The application can also use the protocomm layer directly to have application-specific extensions for the provisioning or non-provisioning use cases.

Following features are available for provisioning:

- Communication security at the application level
  - protocomm_security0 (no security)
  - protocomm_security1 (Curve25519 key exchange + AES-CTR encryption/decryption)
Chapter 2. API Reference

- protocomm_security2 (SRP6a-based key exchange + AES-GCM encryption/decryption)
  • Proof-of-possession (support with protocomm_security1 only)
  • Salt and Verifier (support with protocomm_security2 only)

Protocomm internally uses protobuf (protocol buffers) for secure session establishment. Users can choose to implement their own security (even without using protobuf). Protocomm can also be used without any security layer.

Protocomm provides the framework for various transports:

- Wi-Fi (SoftAP + HTTPD)
- Console, in which case the handler invocation is automatically taken care of on the device side. See Transport Examples below for code snippets.

Note that for protocomm_security1 and protocomm_security2, the client still needs to establish sessions by performing the two-way handshake. See Unified Provisioning for more details about the secure handshake logic.

Enabling Protocomm Security Version

The protocomm component provides a project configuration menu to enable/disable support of respective security versions. The respective configuration options are as follows:

- Support protocomm_security0, with no security: CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0, this option is enabled by default.
- Support protocomm_security1 with Curve25519 key exchange + AES-CTR encryption/decryption: CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1, this option is enabled by default.
- Support protocomm_security2 with SRP6a-based key exchange + AES-GCM encryption/decryption: CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2.

Note: Enabling multiple security versions at once offers the ability to control them dynamically but also increases the firmware size.

SoftAP + HTTP Transport Example with Security 2

For sample usage, see wifi_provisioning/src/scheme_softap.c.

```c
/* The endpoint handler to be registered with protocomm. This simply echoes back the received data. */
esp_err_t echo_req_handler (uint32_t session_id,
                         const uint8_t *inbuf, ssize_t inlen,
                         uint8_t **outbuf, ssize_t *outlen,
                         void *priv_data)
{
    /* Session ID may be used for persistence. */
    printf("Session ID : %d", session_id);

    /* Echo back the received data. */
    *outlen = inlen; /* Output the data length updated. */
    *outbuf = malloc(inlen); /* This is to be deallocated outside. */
    memcpy(*outbuf, inbuf, inlen);

    /* Private data that was passed at the time of endpoint creation. */
    uint32_t *priv = (uint32_t *) priv_data;
    if (priv) {
        printf("Private data : %d", *priv);
    }
    return ESP_OK;
}
```

(continues on next page)
\[ \text{static const char sec2_salt[]} = \{0x7f, 0x5f, 0xe2, 0xbe, 0xba, 0x7c, 0x81, 0xcd\}; \]

\[ \text{static const char sec2_verifier[]} = \{0xb2, 0x86, 0xce, 0x63, 0xa8, 0xbb, 0xe7\}; \]

}
```

### API Reference

**Header File**

- components/protocomm/include/common/protocomm.h
- This header file can be included with:
  ```c
  #include "protocomm.h"
  ```
- This header file is a part of the API provided by the protocomm component. To declare that your component depends on protocomm, add the following to your CMakeLists.txt:
  ```cmake
  REQUIRES protocomm
  
  or
  
  PRIV_REQUIRES protocomm
  ```

**Functions**

- protocomm_t *protocomm_new(void)
  Create a new protocomm instance.
  
  This API will return a new dynamically allocated protocomm instance with all elements of the protocomm_t structure initialized to NULL.
  
  **Returns**
  - protocomm_t*: On success
  - NULL: No memory for allocating new instance

- void protocomm_delete (protocomm_t *pc)
  Delete a protocomm instance.
  
  This API will deallocate a protocomm instance that was created using protocomm_new().

  **Parameters**
  - pc [in] Pointer to the protocomm instance to be deleted

- esp_err_t protocomm_add_endpoint (protocomm_t *pc, const char *ep_name, protocomm_req_handler_t h, void *priv_data)
  Add endpoint request handler for a protocomm instance.
  
  This API will bind an endpoint handler function to the specified endpoint name, along with any private data that needs to be pass to the handler at the time of call.

  **Note:**
  - An endpoint must be bound to a valid protocomm instance, created using protocomm_new().
This function internally calls the registered `add_endpoint()` function of the selected transport which is a member of the `protocomm_t` instance structure.

**Parameters**
- `pc` - [in] Pointer to the `protocomm` instance
- `ep_name` - [in] Endpoint identifier (name) string
- `h` - [in] Endpoint handler function
- `priv_data` - [in] Pointer to private data to be passed as a parameter to the handler function on call. Pass NULL if not needed.

**Returns**
- ESP_OK: Success
- ESP_FAIL: Error adding endpoint/Endpoint with this name already exists
- ESP_ERR_NO_MEM: Error allocating endpoint resource
- ESP_ERR_INVALID_ARG: Null instance/name/handler arguments

`esp_err_t protocomm_remove_endpoint(protocomm_t *pc, const char *ep_name)`

Remove endpoint request handler for a `protocomm` instance.

This API will remove a registered endpoint handler identified by an endpoint name.

**Note:**
- This function internally calls the registered `remove_endpoint()` function which is a member of the `protocomm_t` instance structure.

**Parameters**
- `pc` - [in] Pointer to the `protocomm` instance
- `ep_name` - [in] Endpoint identifier (name) string

**Returns**
- ESP_OK: Success
- ESP_ERR_NOT_FOUND: Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG: Null instance/name arguments

`esp_err_t protocomm_open_session(protocomm_t *pc, uint32_t session_id)`

Allocates internal resources for new transport session.

**Note:**
- An endpoint must be bound to a valid `protocomm` instance, created using `protocomm_new()`.

**Parameters**
- `pc` - [in] Pointer to the `protocomm` instance
- `session_id` - [in] Unique ID for a communication session

**Returns**
- ESP_OK: Request handled successfully
- ESP_ERR_NO_MEM: Error allocating internal resource
- ESP_ERR_INVALID_ARG: Null instance/name arguments

`esp_err_t protocomm_close_session(protocomm_t *pc, uint32_t session_id)`

Frees internal resources used by a transport session.

**Note:**
- An endpoint must be bound to a valid `protocomm` instance, created using `protocomm_new()`.
### Parameters
- **pc** - [in] Pointer to the protocomm instance
- **session_id** - [in] Unique ID for a communication session

### Returns
- ESP_OK : Request handled successfully
- ESP_ERR_INVALID_ARG : Null instance/name arguments

```c
esp_err_t protocomm_req_handle (protocomm_t *pc, const char *ep_name, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)
```

Calls the registered handler of an endpoint session for processing incoming data and generating the response.

**Note:**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- Resulting output buffer must be deallocated by the caller.

### Parameters
- **pc** - [in] Pointer to the protocomm instance
- **ep_name** - [in] Endpoint identifier (name) string
- **session_id** - [in] Unique ID for a communication session
- **inbuf** - [in] Input buffer contains input request data which is to be processed by the registered handler
- **inlen** - [in] Length of the input buffer
- **outbuf** - [out] Pointer to internally allocated output buffer, where the resulting response data output from the registered handler is to be stored
- **outlen** - [out] Buffer length of the allocated output buffer

### Returns
- ESP_OK : Request handled successfully
- ESP_FAIL : Internal error in execution of registered handler
- ESP_ERR_NO_MEM : Error allocating internal resource
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

```c
esp_err_t protocomm_set_security (protocomm_t *pc, const char *ep_name, const protocomm_security_t *sec, const void *sec_params)
```

Add endpoint security for a protocomm instance.

This API will bind a security session establisher to the specified endpoint name, along with any proof of possession that may be required for authenticating a session client.

**Note:**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- The choice of security can be any `protocomm_security_t` instance. Choices `protocomm_security0` and `protocomm_security1` and `protocomm_security2` are readily available.

### Parameters
- **pc** - [in] Pointer to the protocomm instance
- **ep_name** - [in] Endpoint identifier (name) string
- **sec** - [in] Pointer to endpoint security instance
- **sec_params** - [in] Pointer to security params (NULL if not needed) The pointer should contain the security params struct of appropriate security version. For protocomm security version 1 and 2 `sec_params` should contain pointer to struct of type `protocomm_security1_params_t` and `protocomm_security2_params_t` respectively. The con-
tents of this pointer must be valid till the security session has been running and is not closed.

Returns
- ESP_OK : Success
- ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_INVALID_STATE : Security endpoint already set
- ESP_ERR_NO_MEM : Error allocating endpoint resource
- ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

```
esp_err_t protocomm_unset_security (protocomm_t *pc, const char *ep_name)
```

Remove endpoint security for a protocomm instance.

This API will remove a registered security endpoint identified by an endpoint name.

Parameters
- pc - [in] Pointer to the protocomm instance
- ep_name - [in] Endpoint identifier(name) string

Returns
- ESP_OK : Success
- ESP_ERR_NOT_FOUND: Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG: Null instance/name arguments

```
esp_err_t protocomm_set_version (protocomm_t *pc, const char *ep_name, const char *version)
```

Set endpoint for version verification.

This API can be used for setting an application specific protocol version which can be verified by clients through the endpoint.

Note:
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

```
Parameters
- pc - [in] Pointer to the protocomm instance
- ep_name - [in] Endpoint identifier(name) string
- version - [in] Version identifier(name) string

Returns
- ESP_OK : Success
- ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_INVALID_STATE : Version endpoint already set
- ESP_ERR_NO_MEM : Error allocating endpoint resource
- ESP_ERR_INVALID_ARG : Null instance/name/handler arguments
```

```
esp_err_t protocomm_unset_version (protocomm_t *pc, const char *ep_name)
```

Remove version verification endpoint from a protocomm instance.

This API will remove a registered version endpoint identified by an endpoint name.

Parameters
- pc - [in] Pointer to the protocomm instance
- ep_name - [in] Endpoint identifier(name) string

Returns
- ESP_OK : Success
- ESP_ERR_NOT_FOUND: Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG: Null instance/name arguments

Type Definitions
typedef esp_err_t (*protocomm_req_handler_t)(uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)

Function prototype for protocomm endpoint handler.

typedef struct protocomm protocomm_t

This structure corresponds to a unique instance of protocomm returned when the API `protocomm_new()` is called. The remaining Protocomm APIs require this object as the first parameter.

**Note:** Structure of the protocomm object is kept private

**Header File**

- components/protocomm/include/security/protocomm_security.h
- This header file can be included with:

  ```
  #include "protocomm_security.h"
  ```
- This header file is a part of the API provided by the protocomm component. To declare that your component depends on protocomm, add the following to your CMakeLists.txt:

  ```
  REQUIRES protocomm
  or
  PRIV_REQUIRES protocomm
  ```

**Structures**

struct protocomm_security1_params

Protocomm Security 1 parameters: Proof Of Possession.

**Public Members**

const uint8_t *data

Pointer to buffer containing the proof of possession data

uint16_t len

Length (in bytes) of the proof of possession data

struct protocomm_security2_params

Protocomm Security 2 parameters: Salt and Verifier.

**Public Members**

const char *salt

Pointer to the buffer containing the salt

uint16_t salt_len

Length (in bytes) of the salt
Chapter 2. API Reference

const char *verifier
    Pointer to the buffer containing the verifier

uint16_t verifier_len
    Length (in bytes) of the verifier

struct protocomm_security
    Protocomm security object structure.
    The member functions are used for implementing secure protocomm sessions.

Note: This structure should not have any dynamic members to allow re-entrancy

Public Members

int ver
    Unique version number of security implementation

esp_err_t (*init)(protocomm_security_handle_t *handle)
    Function for initializing/allocating security infrastructure

esp_err_t (*cleanup)(protocomm_security_handle_t handle)
    Function for deallocating security infrastructure

esp_err_t (*new_transport_session)(protocomm_security_handle_t handle, uint32_t session_id)
    Starts new secure transport session with specified ID

esp_err_t (*close_transport_session)(protocomm_security_handle_t handle, uint32_t session_id)
    Closes a secure transport session with specified ID

esp_err_t (*security_req_handler)(protocomm_security_handle_t handle, const void *sec_params,
    uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)
    Handler function for authenticating connection request and establishing secure session

esp_err_t (*encrypt)(protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf,
    ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)
    Function which implements the encryption algorithm

esp_err_t (*decrypt)(protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf,
    ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)
    Function which implements the decryption algorithm

Type Definitions

typedef struct protocomm_security1_params protocomm_security1_params_t
    Protocomm Security 1 parameters: Proof Of Possession.

typedef protocomm_security1_params_t protocomm_security_pop_t
typedef struct protocomm_security2_params protocomm_security2_params_t
   Protocomm Security 2 parameters: Salt and Verifier.

typedef void *protocomm_security_handle_t

typedef struct protocomm_security protocomm_security_t
   Protocomm security object structure.
   The member functions are used for implementing secure protocomm sessions.

Note: This structure should not have any dynamic members to allow re-entrancy

Enumerations

enum protocomm_security_session_event_t
   Events generated by the protocomm security layer.
   These events are generated while establishing secured session.
   Values:

   enumerator PROTOCOL_SECURITY_SESSION_SETUP_OK
      Secured session established successfully

   enumerator PROTOCOL_SECURITY_SESSION_INVALID_SECURITY_PARAMS
      Received invalid (NULL) security parameters (username / client public-key)

   enumerator PROTOCOL_SECURITY_SESSION_CREDENTIALS_MISMATCH
      Received incorrect credentials (username / PoP)

```cmake
REQUIRES protocomm

or

PRIV_REQUIRES protocomm
```

Functions

**esp_err_t protocomm_httpd_start**(protocomm_t *pc, const protocomm_httpd_config_t *config)

Start HTTPD protocomm transport.

This API internally creates a framework to allow endpoint registration and security configuration for the protocomm.

**Note:** This is a singleton. ie. Protocomm can have multiple instances, but only one instance can be bound to an HTTP transport layer.

**Parameters**

- **pc** - [in] Protocomm instance pointer obtained from protocomm_new()
- **config** - [in] Pointer to config structure for initializing HTTP server

**Returns**

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_NOT_SUPPORTED : Transport layer bound to another protocomm instance
- ESP_ERR_INVALID_STATE : Transport layer already bound to this protocomm instance
- ESP_ERR_NO_MEM : Memory allocation for server resource failed
- ESP_ERR_HTTPD_* : HTTP server error on start

**esp_err_t protocomm_httpd_stop**(protocomm_t *pc)

Stop HTTPD protocomm transport.

This API cleans up the HTTPD transport protocomm and frees all the handlers registered with the protocomm.

**Parameters**

- **pc** - [in] Same protocomm instance that was passed to protocomm_httpd_start()

**Returns**

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null / incorrect protocomm instance pointer

Unions

```c
union protocomm_httpd_config_data_t
```

```c
#include <protocomm_httpd.h>
```

Protocomm HTTPD Configuration Data
Public Members

void *handle
HTTP Server Handle, if ext_handle_provided is set to true

protocomm_http_server_config_t config
HTTP Server Configuration, if a server is not already active

Structures

struct protocomm_http_server_config_t
Config parameters for protocomm HTTP server.

Public Members

uint16_t port
Port on which the HTTP server will listen

size_t stack_size
Stack size of server task, adjusted depending upon stack usage of endpoint handler

unsigned task_priority
Priority of server task

struct protocomm_httpd_config_t
Config parameters for protocomm HTTP server.

Public Members

bool ext_handle_provided
Flag to indicate of an external HTTP Server Handle has been provided. In such as case, protocomm will use the same HTTP Server and not start a new one internally.

protocomm_httpd_config_data_t data
Protocomm HTTPD Configuration Data

Macros

PROTOCOMM_HTTPD_DEFAULT_CONFIG()
### Functions

**esp_err_t protocomm_ble_start (protocomm_t *pc, const protocomm_ble_config_t *config)**

Start Bluetooth Low Energy based transport layer for provisioning. Initialize and start required BLE service for provisioning. This includes the initialization for characteristics/service for BLE.

#### Parameters
- `pc` - [in] Protocomm instance pointer obtained from protocomm_new()
- `config` - [in] Pointer to config structure for initializing BLE

#### Returns
- ESP_OK: Success
- ESP_FAIL: Simple BLE start error
- ESP_ERR_NO_MEM: Error allocating memory for internal resources
- ESP_ERR_INVALID_STATE: Error in ble config
- ESP_ERR_INVALID_ARG: Null arguments

**esp_err_t protocomm_ble_stop (protocomm_t *pc)**

Stop Bluetooth Low Energy based transport layer for provisioning. Stops service/task responsible for BLE based interactions for provisioning.

#### Note:
You might want to optionally reclaim memory from Bluetooth. Refer to the documentation of esp_bt_mem_release in that case.

#### Parameters
- `pc` - [in] Same protocomm instance that was passed to protocomm_ble_start()

#### Returns
- ESP_OK: Success
- ESP_FAIL: Simple BLE stop error
- ESP_ERR_INVALID_ARG: Null / incorrect protocomm instance

### Structures

**struct name_uuid**

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

#### Public Members

- `const char *name`
  
  Name of the handler, which is passed to protocomm layer

- `uint16_t uuid`
  
  UUID to be assigned to the BLE characteristic which is mapped to the handler

**struct protocomm_ble_event_t**

Structure for BLE events in Protocomm.
Public Members

uint16_t `evt_type`
This field indicates the type of BLE event that occurred.

uint16_t `conn_handle`
The handle of the relevant connection.

uint16_t `conn_status`
The status of the connection attempt; 0: the connection was successfully established. BLE host error code: the connection attempt failed for the specified reason.

uint16_t `disconnect_reason`
Return code indicating the reason for the disconnect.

struct `protocomm_ble_config`
Config parameters for protocomm BLE service.

Public Members

char `device_name`[MAX_BLE_DEVNAME_LEN + 1]
BLE device name being broadcast at the time of provisioning

uint8_t `service_uuid`[BLE_UUID128_VAL_LENGTH]
128 bit UUID of the provisioning service

uint8_t* `manufacturer_data`
BLE device manufacturer data pointer in advertisement

ssize_t `manufacturer_data_len`
BLE device manufacturer data length in advertisement

ssize_t `nu_lookup_count`
Number of entries in the Name-UUID lookup table

`protocomm_ble_name_uuid_t`* `nu_lookup`
Pointer to the Name-UUID lookup table

unsigned `ble_bonding`
BLE bonding

unsigned `ble_sm_sc`
BLE security flag

unsigned `ble_link_encryption`
BLE security flag
Chapter 2. API Reference

Macros

**MAX_BLE_DEVNAME_LEN**

BLE device name cannot be larger than this value 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes

**BLE_UUID128_VAL_LENGTH**

Theoretically, the limit for max manufacturer length remains same as BLE device name i.e. 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes However, manufacturer data goes along with BLE device name in scan response. So, it is important to understand the actual length should be smaller than (29 - (BLE device name length) - 2).

**Type Definitions**

typedef struct *name_uuid* protocomm_ble_name_uuid_t

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

typedef struct *protocomm_ble_config* protocomm_ble_config_t

Config parameters for protocomm BLE service.

**Enumerations**

eenum protocomm_transport_ble_event_t

Events generated by BLE transport.

These events are generated when the BLE transport is paired and disconnected.

*Values:*

enumerator PROTOCOL_TRANSPORT_BLE_CONNECTED

enumerator PROTOCOL_TRANSPORT_BLE_DISCONNECTED

2.7.2 Unified Provisioning

**Overview**

The unified provisioning support in the ESP-IDF provides an extensible mechanism to the developers to configure the device with the Wi-Fi credentials and/or other custom configuration using various transports and different security schemes. Depending on the use case, it provides a complete and ready solution for Wi-Fi network provisioning along with example iOS and Android applications. The developers can choose to extend the device-side and phone-app side implementations to accommodate their requirements for sending additional configuration data. The followings are the important features of this implementation:

1. **Extensible Protocol**

   The protocol is completely flexible and it offers the ability for the developers to send custom configuration in the provisioning process. The data representation is also left to the application to decide.

2. **Transport Flexibility**
The protocol can work on Wi-Fi (SoftAP + HTTP server) or on Bluetooth LE as a transport protocol. The framework provides an ability to add support for any other transport easily as long as command-response behavior can be supported on the transport.

3. Security Scheme Flexibility

It is understood that each use case may require different security scheme to secure the data that is exchanged in the provisioning process. Some applications may work with SoftAP that is WPA2 protected or Bluetooth LE with the “just-works” security. Or the applications may consider the transport to be insecure and may want application-level security. The unified provisioning framework allows the application to choose the security as deemed suitable.

4. Compact Data Representation

The protocol uses Google Protobufs as a data representation for session setup and Wi-Fi provisioning. They provide a compact data representation and ability to parse the data in multiple programming languages in native format. Please note that this data representation is not forced on application-specific data and the developers may choose the representation of their choice.

Typical Provisioning Process

Deciding on Transport

The unified provisioning subsystem supports Wi-Fi (SoftAP+HTTP server) and Bluetooth LE (GATT based) transport schemes. The following points need to be considered while selecting the best possible transport for provisioning:

1. The Bluetooth LE-based transport has the advantage of maintaining an intact communication channel between the device and the client during the provisioning, which ensures reliable provisioning feedback.
2. The Bluetooth LE-based provisioning implementation makes the user experience better from the phone apps as on Android and iOS both, the phone app can discover and connect to the device without requiring the user to go out of the phone app.
3. However, the Bluetooth LE transport consumes about 110 KB memory at runtime. If the product does not use the Bluetooth LE or Bluetooth functionality after provisioning is done, almost all the memory can be reclaimed and added into the heap.
4. The SoftAP-based transport is highly interoperable. However, there are a few considerations:
   - The device uses the same radio to host the SoftAP and also to connect to the configured AP. Since these could potentially be on different channels, it may cause connection status updates not to be reliably received by the phone
   - The phone (client) has to disconnect from its current AP in order to connect to the SoftAP. The original network will get restored only when the provisioning process is complete, and the softAP is taken down.
5. The SoftAP transport does not require much additional memory for the Wi-Fi use cases.
6. The SoftAP-based provisioning requires the phone-app user to go to System Settings to connect to the Wi-Fi network hosted by the device in the iOS system. The discovery (scanning) as well as connection APIs are not available for the iOS applications.

Deciding on Security

Depending on the transport and other constraints, the security scheme needs to be selected by the application developers. The following considerations need to be given from the provisioning-security perspective:

1. The configuration data sent from the client to the device and the response have to be secured.
2. The client should authenticate the device that it is connected to.
3. The device manufacturer may choose proof-of-possession (PoP), a unique per-device secret to be entered on the provisioning client as a security measure to make sure that only the user can provision the device in their possession.

There are two levels of security schemes, of which the developer may select one or a combination, depending on requirements.

1. Transport Security
Fig. 38: Typical Provisioning Process

1. Transport-specific discovery and connection
   - Some form of beaconing
   - Client connects

2. Session Establishment
   - Get Version Request
   - Get Version Response
   - Session Setup Request
   - Session Setup Response
   - One or multiple steps as per protocol

3. Configuration
   - App-specific Set Config (optional)
   - Set Config Response (optional)
   - Wi-Fi Set Config (SSID, Passphrase...)
   - Wi-Fi Set Config response
   - Wi-Fi Apply Config cmd
   - Wi-Fi Apply Config resp
   - Wi-Fi Get Status cmd (repeated)
   - Wi-Fi Get Status resp (repeated)

4. Close connection
   - Close Connection
For SoftAP provisioning, developers may choose WPA2-protected security with unique per-device passphrase. Unique per-device passphrase can also act as a proof-of-possession. For Bluetooth LE, the “just-works” security can be used as a transport-level security after assessing its provided level of security.

2. Application Security

The unified provisioning subsystem provides the application-level security (Security 1 Scheme) that provides data protection and authentication through PoP, if the application does not use the transport-level security, or if the transport-level security is not sufficient for the use case.

Device Discovery

The advertisement and device discovery is left to the application and depending on the protocol chosen, the phone apps and device-firmware application can choose appropriate method for advertisement and discovery.

For the SoftAP+HTTP transport, typically the SSID (network name) of the AP hosted by the device can be used for discovery.

For the Bluetooth LE transport, device name or primary service included in the advertisement or a combination of both can be used for discovery.

Architecture

The below diagram shows the architecture of unified provisioning:

![Unified Provisioning Architecture](image)

It relies on the base layer called Protocol Communication (protocomm) which provides a framework for security schemes and transport mechanisms. The Wi-Fi Provisioning layer uses protocomm to provide simple callbacks to the application for setting the configuration and getting the Wi-Fi status. The application has control over implementation of these callbacks. In addition, the application can directly use protocomm to register custom handlers.

The application creates a protocomm instance which is mapped to a specific transport and specific security scheme. Each transport in the protocomm has a concept of an “end-point” which corresponds to the logical channel for
communication for specific type of information. For example, security handshake happens on a different endpoint from the Wi-Fi configuration endpoint. Each end-point is identified using a string and depending on the transport internal representation of the end-point changes. In case of the SoftAP+HTTP transport, the end-point corresponds to URI, whereas in case of Bluetooth LE, the end-point corresponds to the GATT characteristic with specific UUID. Developers can create custom end-points and implement handler for the data that is received or sent over the same end-point.

Security Schemes

At present, the unified provisioning supports the following security schemes:

1. Security 0
No security (No encryption).

2. Security 1
Curve25519-based key exchange, shared key derivation and AES256-CTR mode encryption of the data. It supports two modes:
   a. Authorized - Proof of Possession (PoP) string used to authorize session and derive shared key.
   b. No Auth (Null PoP) - Shared key derived through key exchange only.

3. Security 2
SRP6a-based shared key derivation and AES256-GCM mode encryption of the data.

Note: The respective security schemes need to be enabled through the project configuration menu. Please refer to Enabling Protocomm Security Version for more details.

Security 1 Scheme

The Security 1 scheme details are shown in the below sequence diagram:

Security 2 Scheme

The Security 2 scheme is based on the Secure Remote Password (SRP6a) protocol, see RFC 5054. The protocol requires the Salt and Verifier to be generated beforehand with the help of the identifying username \( I \) and the plaintext password \( p \). The Salt and Verifier are then stored on ESP32-S2.

- The password \( p \) and the username \( I \) are to be provided to the Phone App (Provisioning entity) by suitable means, e.g., QR code sticker.

Details about the Security 2 scheme are shown in the below sequence diagram:

Sample Code

Please refer to Protocol Communication and Wi-Fi Provisioning for API guides and code snippets on example usage. Application implementation can be found as an example under provisioning.

Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- Android:
  - Bluetooth LE Provisioning app on Play Store.
  - SoftAP Provisioning app on Play Store.

Chapter 2. API Reference

– Source code on GitHub: esp-idf-provisioning-android.

• iOS:
  – Bluetooth LE Provisioning app on App Store.
  – SoftAP Provisioning app on App Store.
  – Source code on GitHub: esp-idf-provisioning-ios.

• Linux/macOS/Windows: tools/esp_prov, a Python-based command line tool for provisioning.

The phone applications offer simple UI and are thus more user centric, while the command-line application is useful as a debugging tool for developers.

2.7.3 Wi-Fi Provisioning

Overview

This component provides APIs that control the Wi-Fi provisioning service for receiving and configuring Wi-Fi credentials over SoftAP or Bluetooth LE transport via secure Protocol Communication sessions. The set of wifi_prov_mgr_ APIs help quickly implement a provisioning service that has necessary features with minimal amount of code and sufficient flexibility.

Initialization

`wifi_prov_mgr_init()` is called to configure and initialize the provisioning manager, and thus must be called prior to invoking any other `wifi_prov_mgr_` APIs. Note that the manager relies on other components of ESP-IDF, namely NVS, TCP/IP, Event Loop and Wi-Fi, and optionally mDNS, hence these components must be initialized beforehand. The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

```
wifi_prov_mgr_config_t config = {
  .scheme = wifi_prov_scheme_ble,
  .scheme_event_handler = WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
};
ESP_ERROR_CHECK( wifi_prov_mgr_init(config) );
```

The configuration structure `wifi_prov_mgr_config_t` has a few fields to specify the desired behavior of the manager:

- `wifi_prov_mgr_config_t::scheme` - This is used to specify the provisioning scheme. Each scheme corresponds to one of the modes of transport supported by protocomm. Hence, support the following options:
  - `wifi_prov_scheme_ble` - Bluetooth LE transport and GATT Server for handling the provisioning commands.
  - `wifi_prov_scheme_softap` - Wi-Fi SoftAP transport and HTTP Server for handling the provisioning commands.
  - `wifi_prov_scheme_console` - Serial transport and console for handling the provisioning commands.

- `wifi_prov_mgr_config_t::scheme_event_handler`: An event handler defined along with the scheme. Choosing the appropriate scheme-specific event handler allows the manager to take care of certain matters automatically. Presently, this option is not used for either the SoftAP or Console-based provisioning, but is very convenient for Bluetooth LE. To understand how, we must recall that Bluetooth requires a substantial amount of memory to function, and once the provisioning is finished, the main application may want to reclaim back this memory (or part of it) if it needs to use either Bluetooth LE or classic Bluetooth. Also, upon every future reboot of a provisioned device, this reclamation of memory needs to be performed again. To reduce this complication in using `wifi_prov_scheme_ble`, the scheme-specific handlers have been defined, and depending upon the chosen handler, the Bluetooth LE/classic Bluetooth/BTDM memory is freed automatically when the provisioning manager is de-initialized. The available options are:
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM - Free both classic Bluetooth and Bluetooth LE/BTDM memory. Used when the main application does not require Bluetooth at all.
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE - Free only Bluetooth LE memory. Used when main application requires classic Bluetooth.
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT - Free only classic Bluetooth. Used when main application requires Bluetooth LE. In this case freeing happens right when the manager is initialized.
- WIFI_PROV_EVENT_HANDLER_NONE - Do not use any scheme specific handler. Used when the provisioning scheme is not Bluetooth LE, i.e., using SoftAP or Console, or when main application wants to handle the memory reclaiming on its own, or needs both Bluetooth LE and classic Bluetooth to function.

* wifi_prov_mgr_config_t::app_event_handler (Deprecated) - It is now recommended to catch WIFI_PROV_EVENT that is emitted to the default event loop handler. See definition of wifi_prov_cb_event_t for the list of events that are generated by the provisioning service. Here is an excerpt showing some of the provisioning events:

```c
static void event_handler(void* arg, esp_event_base_t event_base, int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT) {
        switch (event_id) {
        case WIFI_PROV_START:
            ESP_LOGI(TAG, "Provisioning started");
            break;
        case WIFI_PROV_CRED_RECV:
            wifi_sta_config_t* wifi_sta_cfg = (wifi_sta_config_t*)event_data;
            ESP_LOGI(TAG, "Received Wi-Fi credentials \nSSID : %s \nPassword : %s",
                     (const char*) wifi_sta_cfg->ssid,
                     (const char*) wifi_sta_cfg->password);
            break;
        }  
        case WIFI_PROV_CRED_FAIL:
            wifi_prov_sta_fail_reason_t* reason = (wifi_prov_sta_fail_reason_t*)event_data;
            ESP_LOGE(TAG, "Provisioning failed!\nReason : %s\nPlease reset to factory and retry\naccess-point not found";
                 (*reason == WIFI_PROV_STA_AUTH_ERROR) ? "Wi-Fi station authentication failed" : "Wi-Fi",
            break;
        }  
        case WIFI_PROV_CRED_SUCCESS:
            ESP_LOGI(TAG, "Provisioning successful");
            break;
        case WIFI_PROV_END:
            /* De-initialize manager once provisioning is finished */
            wifi_prov_mgr_deinit();
            break;
        default:
            break;
        }
    }
}
```

The manager can be de-initialized at any moment by making a call to wifi_prov_mgr_deinit().
Chapter 2. API Reference

Check the Provisioning State  Whether the device is provisioned or not can be checked at runtime by calling `wifi_prov_mgr_is_provisioned()`. This internally checks if the Wi-Fi credentials are stored in NVS.

Note that presently the manager does not have its own NVS namespace for storage of Wi-Fi credentials, instead it relies on the `esp_wifi_` APIs to set and get the credentials stored in NVS from the default location.

If the provisioning state needs to be reset, any of the following approaches may be taken:

- The associated part of NVS partition has to be erased manually
- The main application must implement some logic to call `esp_wifi_` APIs for erasing the credentials at runtime
- The main application must implement some logic to force start the provisioning irrespective of the provisioning state

```c
bool provisioned = false;
ESP_ERROR_CHECK( wifi_prov_mgr_is_provisioned(&provisioned) );
```

Start the Provisioning Service  At the time of starting provisioning we need to specify a service name and the corresponding key, that is to say:

- A Wi-Fi SoftAP SSID and a passphrase, respectively, when the scheme is `wifi_prov_scheme_softap`
- Bluetooth LE device name with the service key ignored when the scheme is `wifi_prov_scheme_ble`

Also, since internally the manager uses `protocomm`, we have the option of choosing one of the security features provided by it:

- Security 1 is secure communication which consists of a prior handshake involving X25519 key exchange along with authentication using a proof of possession `pop`, followed by AES-CTR for encryption or decryption of subsequent messages.
- Security 0 is simply plain text communication. In this case the `pop` is simply ignored.

See Unified Provisioning for details about the security features.

```c
const char *service_name = "my_device";
const char *service_key = "password";

wifi_prov_security_t security = WIFI_PROV_SECURITY_1;
const char *pop = "abcd1234";
ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_name, service_key) );
```

The provisioning service automatically finishes only if it receives valid Wi-Fi AP credentials followed by successful connection of device to the AP with IP obtained. Regardless of that, the provisioning service can be stopped at any moment by making a call to `wifi_prov_mgr_stop_provisioning()`.

Note: If the device fails to connect with the provided credentials, it does not accept new credentials anymore, but the provisioning service keeps on running, only to convey failure to the client, until the device is restarted. Upon restart, the provisioning state turns out to be true this time, as credentials are found in NVS, but the device does fail again to connect with those same credentials, unless an AP with the matching credentials somehow does become available. This situation can be fixed by resetting the credentials in NVS or force starting the provisioning service. This has been explained above in Check the Provisioning State.

Waiting for Completion  Typically, the main application waits for the provisioning to finish, then de-initializes the manager to free up resources, and finally starts executing its own logic.

There are two ways for making this possible. The simpler way is to use a blocking call to `wifi_prov_mgr_wait()`.
The other way is to use the default event loop handler to catch WIFI_PROV_EVENT and call wifi_prov_mgr_deinit() when event ID is WIFI_PROV_END:

```c
static void event_handler(void* arg, esp_event_base_t event_base, int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT && event_id == WIFI_PROV_END) {
        /* De-initialize the manager once the provisioning is finished */
        wifi_prov_mgr_deinit();
    }
}
```

User Side Implementation  When the service is started, the device to be provisioned is identified by the advertised service name, which, depending upon the selected transport, is either the Bluetooth LE device name or the SoftAP SSID.

When using SoftAP transport, for allowing service discovery, mDNS must be initialized before starting provisioning. In this case, the host name set by the main application is used, and the service type is internally set to _esp_wifi_prov.

When using Bluetooth LE transport, a custom 128-bit UUID should be set using wifi_prov_scheme_ble_set_service_uuid(). This UUID is to be included in the Bluetooth LE advertisement and corresponds to the primary GATT service that provides provisioning endpoints as GATT characteristics. Each GATT characteristic is formed using the primary service UUID as the base, with different auto-assigned 12th and 13th bytes, presumably counting from the 0th byte. Since an endpoint characteristic UUID is auto-assigned, it should not be used to identify the endpoint. Instead, client-side applications should identify the endpoints by reading the User Characteristic Description (0x2901) descriptor for each characteristic, which contains the endpoint name of the characteristic. For example, if the service UUID is set to 55cc035e-fb27-4f80-be02-3c60828b7451, each endpoint characteristic is assigned a UUID like 55cc____-fb27-4f80-be02-3c60828b7451, with unique values at the 12th and 13th bytes.

Once connected to the device, the provisioning-related protocomm endpoints can be identified as follows:

<table>
<thead>
<tr>
<th>Endpoint Name i.e., Bluetooth LE + GATT Server</th>
<th>URI, i.e., SoftAP + HTTP Server + mDNS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prov-session</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-session</td>
<td>Security endpoint used for session establishment</td>
</tr>
<tr>
<td>prov-scan</td>
<td><a href="http://wifi-prov.local/prov-scan">http://wifi-prov.local/prov-scan</a></td>
<td>the endpoint used for starting Wi-Fi scan and receiving scan results</td>
</tr>
<tr>
<td>prov-ctrl</td>
<td><a href="http://wifi-prov.local/prov-ctrl">http://wifi-prov.local/prov-ctrl</a></td>
<td>the endpoint used for controlling Wi-Fi provisioning state</td>
</tr>
<tr>
<td>prov-config</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-config</td>
<td>the endpoint used for configuring Wi-Fi credentials on device</td>
</tr>
<tr>
<td>proto-ver</td>
<td>http://&lt;mdns-hostname&gt;.local/proto-ver</td>
<td>the endpoint for retrieving version info</td>
</tr>
</tbody>
</table>

Immediately after connecting, the client application may fetch the version/capabilities information from the
proto-ver endpoint. All communications to this endpoint are unencrypted, hence necessary information, which may be relevant for deciding compatibility, can be retrieved before establishing a secure session. The response is in JSON format and looks like:

```
prov: { ver: v1.1, cap: [no_pop] }, my_app: { ver: 1.345, cap: [cloud, local_ctrl] }, ...
```

Here label `prov` provides provisioning service version `ver` and capabilities `cap`. For now, only the `no_pop` capability is supported, which indicates that the service does not require proof of possession for authentication. Any application-related version or capabilities are given by other labels, e.g., `my_app` in this example. These additional fields are set using `wifi_prov_mgr_set_app_info()`.

User side applications need to implement the signature handshaking required for establishing and authenticating secure protocomm sessions as per the security scheme configured for use, which is not needed when the manager is configured to use protocomm security 0.

See [Unified Provisioning](#) for more details about the secure handshake and encryption used. Applications must use the `.proto` files found under `protocomm/proto`, which define the Protobuf message structures supported by `prov-session` endpoint.

Once a session is established, Wi-Fi credentials are configured using the following set of `wifi_config` commands, serialized as Protobuf messages with the corresponding `.proto` files that can be found under `wifi_provisioning/proto`:

- **get_status** - For querying the Wi-Fi connection status. The device responds with a status which is one of connecting, connected or disconnected. If the status is disconnected, a disconnection reason is also to be included in the status response.
- **set_config** - For setting the Wi-Fi connection credentials.
- **apply_config** - For applying the credentials saved during `set_config` and starting the Wi-Fi station.

After session establishment, the client can also request Wi-Fi scan results from the device. The results returned is a list of AP SSIDs, sorted in descending order of signal strength. This allows client applications to display APs nearby at the device at the time of provisioning, and users can select one of the SSIDs and provide the password which is then sent using the `wifi_config` commands described above. The `wifi_scan` endpoint supports the following protobuf commands:

- **scan_start** - For starting Wi-Fi scan with various options:
  - `blocking` (input) - If true, the command returns only when the scanning is finished.
  - `passive` (input) - If true, the scan is started in passive mode, which may be slower, instead of active mode.
  - `group_channels` (input) - This specifies whether to scan all channels in one go when zero, or perform scanning of channels in groups, with 120 ms delay between scanning of consecutive groups, and the value of this parameter sets the number of channels in each group. This is useful when transport mode is SoftAP, where scanning all channels in one go may not give the Wi-Fi driver enough time to send out beacons, and hence may cause disconnection with any connected stations. When scanning in groups, the manager waits for at least 120 ms after completing the scan on a group of channels, and thus allows the driver to send out the beacons. For example, given that the total number of Wi-Fi channels is 14, then setting `group_channels` to 3 creates 5 groups, with each group having 3 channels, except the last one which has 14 % 3 = 2 channels. So, when the scan is started, the first 3 channels will be scanned, followed by a 120 ms delay, and then the next 3 channels, and so on, until all the 14 channels have been scanned. One may need to adjust this parameter as having only a few channels in a group may increase the overall scan time, while having too many may again cause disconnection. Usually, a value of 4 should work for most cases. Note that for any other mode of transport, e.g., Bluetooth LE, this can be safely set to 0, and hence achieve the shortest overall scanning time.
  - `period_ms` (input) - The scan parameter specifying how long to wait on each channel.
- **scan_status** - It gives the status of scanning process:
  - `scan_finished` (output) - When the scan has finished, this returns true.
  - `result_count` (output) - This gives the total number of results obtained till now. If the scan is yet happening, this number keeps on updating.
- **scan_result** - For fetching the scan results. This can be called even if the scan is still on going.
  - `start_index` (input) - Where the index starts from to fetch the entries from the results list.
  - `count` (input) - The number of entries to fetch from the starting index.
  - `entries` (output) - The list of entries returned. Each entry consists of `ssid`, `channel` and `rssi` information.

The client can also control the provisioning state of the device using `wifi_ctrl` endpoint. The `wifi_ctrl`
Chapter 2. API Reference

Endpoints support the following protobuf commands:

- **ctrl_reset** - Resets internal state machine of the device and clears provisioned credentials only in case of provisioning failures.
- **ctrl_reprov** - Resets internal state machine of the device and clears provisioned credentials only in case the device is to be provisioned again for new credentials after a previous successful provisioning.

**Additional Endpoints**  In case users want to have some additional protocomm endpoints customized to their requirements, this is done in two steps. First is creation of an endpoint with a specific name, and the second step is the registration of a handler for this endpoint. See Protocol Communication for the function signature of an endpoint handler. A custom endpoint must be created after initialization and before starting the provisioning service. Whereas, the protocomm handler is registered for this endpoint only after starting the provisioning service.

```c
wifi_prov_mgr_init(config);
wifi_prov_mgr_endpoint_create("custom-endpoint");
wifi_prov_mgr_start_provisioning(security, pop, service_name, service_→key);
wifi_prov_mgr_endpoint_register("custom-endpoint", custom_ep_handler,␣
→custom_ep_data);
```

When the provisioning service stops, the endpoint is unregistered automatically.

One can also choose to call `wifi_prov_mgr_endpoint_unregister()` to manually deactivate an endpoint at runtime. This can also be used to deactivate the internal endpoints used by the provisioning service.

**When/How to Stop the Provisioning Service?**  The default behavior is that once the device successfully connects using the Wi-Fi credentials set by the `apply_config` command, the provisioning service stops, and Bluetooth LE or SoftAP turns off, automatically after responding to the next `get_status` command. If `get_status` command is not received by the device, the service stops after a 30 s timeout.

On the other hand, if device is not able to connect using the provided Wi-Fi credentials, due to incorrect SSID or passphrase, the service keeps running, and `get_status` keeps responding with disconnected status and reason for disconnection. Any further attempts to provide another set of Wi-Fi credentials, are to be rejected. These credentials are preserved, unless the provisioning service is force started, or NVS erased.

If this default behavior is not desired, it can be disabled by calling `wifi_prov_mgr_disable_auto_stop()`. Now the provisioning service stops only after an explicit call to `wifi_prov_mgr_stop_provisioning()`, which returns immediately after scheduling a task for stopping the service. The service stops after a certain delay and WIFI_PROV_END event gets emitted. This delay is specified by the argument to `wifi_prov_mgr_disable_auto_stop()`.

The customized behavior is useful for applications which want the provisioning service to be stopped some time after the Wi-Fi connection is successfully established. For example, if the application requires the device to connect to some cloud service and obtain another set of credentials, and exchange these credentials over a custom protocomm endpoint, then after successfully doing so, stop the provisioning service by calling `wifi_prov_mgr_stop_provisioning()` inside the protocomm handler itself. The right amount of delay ensures that the transport resources are freed only after the response from the protocomm handler reaches the client side application.

**Application Examples**

For complete example implementation see `provisioning/wifi_prov_mgr`.

**Provisioning Tools**

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - Bluetooth LE Provisioning app on Play Store.
– SoftAP Provisioning app on Play Store.
– Source code on GitHub: esp-idf-provisioning-android.

• iOS:
– Bluetooth LE Provisioning app on App Store.
– SoftAP Provisioning app on App Store.
– Source code on GitHub: esp-idf-provisioning-ios.

• Linux/MacOS/Windows: tools/esp_prov, a Python-based command-line tool for provisioning.

The phone applications offer simple UI and are thus more user centric, while the command-line application is useful as a debugging tool for developers.

API Reference

Header File

• components/wifi_provisioning/include/wifi_provisioning/manager.h
This header file can be included with:

```cpp
#include "wifi_provisioning/manager.h"
```

• This header file is a part of the API provided by the wifi_provisioning component. To declare that your component depends on wifi_provisioning, add the following to your CMakeLists.txt:

```cmake
REQUIRES wifi_provisioning
```

or

```cmake
PRIV_REQUIRES wifi_provisioning
```

Functions

```c
esp_err_t wifi_prov_mgr_init (wifi_prov_mgr_config_t config)
```

Initialize provisioning manager instance.

Configures the manager and allocates internal resources

Configuration specifies the provisioning scheme (transport) and event handlers

Event WIFI_PROV_INIT is emitted right after initialization is complete

**Parameters** config -[in] Configuration structure

**Returns**

- ESP_OK : Success
- ESP_FAIL : Fail

```c
void wifi_prov_mgr_deinit (void)
```

Stop provisioning (if running) and release resource used by the manager.

Event WIFI_PROV_DEINIT is emitted right after de-initialization is finished

If provisioning service is still active when this API is called, it first stops the service, hence emitting WIFI_PROV_END, and then performs the de-initialization

```c
esp_err_t wifi_prov_mgr_is_provisioned (bool *provisioned)
```

Checks if device is provisioned.

This checks if Wi-Fi credentials are present on the NVS

The Wi-Fi credentials are assumed to be kept in the same NVS namespace as used by esp_wifi component

If one were to call esp_wifi_set_config() directly instead of going through the provisioning process, this function will still yield true (i.e. device will be found to be provisioned)
Calling `wifi_prov_mgr_start_provisioning()` automatically resets the provision state, irrespective of what the state was prior to making the call.

**Parameters**

- `provisioned` - [out] True if provisioned, else false

**Returns**

- ESP_OK: Retrieved provision state successfully
- ESP_FAIL: Wi-Fi not initialized
- ESP_ERR_INVALID_ARG: Null argument supplied

```c
esp_err_t wifi_prov_mgr_start_provisioning (wifi_prov_security_t security, const void *
  *wifi_prov_sec_params, const char *service_name, const char *service_key)
```

Start provisioning service.

This starts the provisioning service according to the scheme configured at the time of initialization. For scheme:

- `wifi_prov_scheme_ble`: This starts protocomm_ble, which internally initializes BLE transport and starts GATT server for handling provisioning requests
- `wifi_prov_scheme_softap`: This activates SoftAP mode of Wi-Fi and starts protocomm_httpd, which internally starts an HTTP server for handling provisioning requests (If mDNS is active it also starts advertising service with type _esp_wifi_prov._tcp)

Event WIFI_PROV_START is emitted right after provisioning starts without failure

**Note:** This API will start provisioning service even if device is found to be already provisioned, i.e. `wifi_prov_mgr_is_provisioned()` yields true

**Parameters**

- `security` - [in] Specify which protocomm security scheme to use:
  - WIFI_PROV_SECURITY_0: For no security
  - WIFI_PROV_SECURITY_1: x25519 secure handshake for session establishment followed by AES-CTR encryption of provisioning messages
  - WIFI_PROV_SECURITY_2: SRP6a based authentication and key exchange followed by AES-GCM encryption/decryption of provisioning messages
- `wifi_prov_sec_params` - [in] Pointer to security params (NULL if not needed). This is not needed for protocomm security 0 This pointer should hold the struct of type wifi_prov_security1_params_t for protocomm security 1 and wifi_prov_security2_params_t for protocomm security 2 respectively. This pointer and its contents should be valid till the provisioning service is running and has not been stopped or de-inited.
- `service_name` - [in] Unique name of the service. This translates to:
  - Wi-Fi SSID when provisioning mode is softAP
  - Device name when provisioning mode is BLE
- `service_key` - [in] Key required by client to access the service (NULL if not needed). This translates to:
  - Wi-Fi password when provisioning mode is softAP
  - ignored when provisioning mode is BLE

**Returns**

- ESP_OK: Provisioning started successfully
- ESP_FAIL: Failed to start provisioning service
- ESP_ERR_INVALID_STATE: Provisioning manager not initialized or already started

```c
void wifi_prov_mgr_stop_provisioning (void)
```

Stop provisioning service.
If provisioning service is active, this API will initiate a process to stop the service and return. Once the service actually stops, the event WIFI_PROV_END will be emitted.

If wifi_prov_mgr_deinit() is called without calling this API first, it will automatically stop the provisioning service and emit the WIFI_PROV_END, followed by WIFI_PROV_DEINIT, before returning.

This API will generally be used along with wifi_prov_mgr_disable_auto_stop() in the scenario when the main application has registered its own endpoints, and wishes that the provisioning service is stopped only when some protocomm command from the client side application is received.

Calling this API inside an endpoint handler, with sufficient cleanup_delay, will allow the response / acknowledgment to be sent successfully before the underlying protocomm service is stopped.

Cleanup_delay is set when calling wifi_prov_mgr_disable_auto_stop(). If not specified, it defaults to 1000ms.

For straightforward cases, using this API is usually not necessary as provisioning is stopped automatically once WIFI_PROV_CRED_SUCCESS is emitted. Stopping is delayed (maximum 30 seconds) thus allowing the client side application to query for Wi-Fi state, i.e. after receiving the first query and sending Wi-Fi state connected response the service is stopped immediately.

void wifi_prov_mgr_wait (void)

Wait for provisioning service to finish.

Calling this API will block until provisioning service is stopped i.e. till event WIFI_PROV_END is emitted.

This will not block if provisioning is not started or not initialized.

esp_err_t wifi_prov_mgr_disable_auto_stop (uint32_t cleanup_delay)

Disable auto stopping of provisioning service upon completion.

By default, once provisioning is complete, the provisioning service is automatically stopped, and all endpoints (along with those registered by main application) are deactivated.

This API is useful in the case when main application wishes to close provisioning service only after it receives some protocomm command from the client side app. For example, after connecting to Wi-Fi, the device may want to connect to the cloud, and only once that is successfully, the device is said to be fully configured. But, then it is upto the main application to explicitly call wifi_prov_mgr_stop_provisioning() later when the device is fully configured and the provisioning service is no longer required.

Note: This must be called before executing wifi_prov_mgr_start_provisioning()

Parameters cleanup_delay [in] Sets the delay after which the actual cleanup of transport related resources is done after a call to wifi_prov_mgr_stop_provisioning() returns. Minimum allowed value is 100ms. If not specified, this will default to 1000ms.

Returns
- ESP_OK : Success
- ESP_ERR_INVALID_STATE : Manager not initialized or provisioning service already started

esp_err_t wifi_prov_mgr_set_app_info (const char *label, const char *version, const char **capabilities, size_t total_capabilities)

Set application version and capabilities in the JSON data returned by proto-ver endpoint.

This function can be called multiple times, to specify information about the various application specific services running on the device, identified by unique labels.

The provisioning service itself registers an entry in the JSON data, by the label “prov”, containing only provisioning service version and capabilities. Application services should use a label other than “prov” so as not to overwrite this.

Note: This must be called before executing wifi_prov_mgr_start_provisioning()
### Parameters

- **label** - [in] String indicating the application name.
- **version** - [in] String indicating the application version. There is no constraint on format.
- **capabilities** - [in] Array of strings with capabilities. These could be used by the client side app to know the application registered endpoint capabilities.
- **total_capabilities** - [in] Size of capabilities array.

### Returns

- ESP_OK: Success
- ESP_ERR_INVALID_STATE: Manager not initialized or provisioning service already started.
- ESP_ERR_NO_MEM: Failed to allocate memory for version string.
- ESP_ERR_INVALID_ARG: Null argument.

#### esp_err_t wifi_prov_mgr_endpoint_create (const char *ep_name)

Create an additional endpoint and allocate internal resources for it.

This API is to be called by the application if it wants to create an additional endpoint. All additional endpoints will be assigned UUIDs starting from 0xFF54 and so on in the order of execution.

Protocomm handler for the created endpoint is to be registered later using wifi_prov_mgr_endpoint_register() after provisioning has started.

**Note:** This API can only be called BEFORE provisioning is started.

**Note:** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application.

**Note:** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered.

### Parameters

- **ep_name** - [in] unique name of the endpoint.

### Returns

- ESP_OK: Success
- ESP_FAIL: Failure

#### esp_err_t wifi_prov_mgr_endpoint_register (const char *ep_name, protocomm_req_handler_t handler, void *user_ctx)

Register a handler for the previously created endpoint.

This API can be called by the application to register a protocomm handler to any endpoint that was created using wifi_prov_mgr_endpoint_create().

**Note:** This API can only be called AFTER provisioning has started.

**Note:** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application.

**Note:** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped.
stopped and hence all endpoints are unregistered

Parameters
- `ep_name` [in] Name of the endpoint
- `handler` [in] Endpoint handler function
- `user_ctx` [in] User data

Returns
- ESP_OK : Success
- ESP_FAIL : Failure

void wifi_prov_mgr_endpoint_unregister (const char *ep_name)

Unregister the handler for an endpoint.

This API can be called if the application wants to selectively unregister the handler of an endpoint while the provisioning is still in progress.

All the endpoint handlers are unregistered automatically when the provisioning stops.

Parameters `ep_name` [in] Name of the endpoint

esp_err_t wifi_prov_mgr_get_wifi_state (wifi_prov_sta_state_t *state)

Get state of Wi-Fi Station during provisioning.

Parameters `state` [out] Pointer to wifi_prov_sta_state_t variable to be filled

Returns
- ESP_OK : Successfully retrieved Wi-Fi state
- ESP_FAIL : Provisioning app not running

esp_err_t wifi_prov_mgr_get_wifi_disconnect_reason (wifi_prov_sta_fail_reason_t *reason)

Get reason code in case of Wi-Fi station disconnection during provisioning.

Parameters `reason` [out] Pointer to wifi_prov_sta_fail_reason_t variable to be filled

Returns
- ESP_OK : Successfully retrieved Wi-Fi disconnect reason
- ESP_FAIL : Provisioning app not running

esp_err_t wifi_prov_mgr_configure_sta (wifi_config_t *wifi_cfg)

Runs Wi-Fi as Station with the supplied configuration.

Configures the Wi-Fi station mode to connect to the AP with SSID and password specified in config structure and sets Wi-Fi to run as station.

This is automatically called by provisioning service upon receiving new credentials.

If credentials are to be supplied to the manager via a different mode other than through protocomm, then this API needs to be called.

Event WIFI_PROV_CRED_RECV is emitted after credentials have been applied and Wi-Fi station started

Parameters `wifi_cfg` [in] Pointer to Wi-Fi configuration structure

Returns
- ESP_OK : Wi-Fi configured and started successfully
- ESP_FAIL : Failed to set configuration

esp_err_t wifi_prov_mgr_reset_provisioning (void)

Reset Wi-Fi provisioning config.

Calling this API will restore WiFi stack persistent settings to default values.

Returns
- ESP_OK : Reset provisioning config successfully
- ESP_FAIL : Failed to reset provisioning config
**esp_err_t wifi_prov_mgr_reset_sm_state_on_failure (void)**
Reset internal state machine and clear provisioned credentials.

This API should be used to restart provisioning ONLY in the case of provisioning failures without rebooting the device.

**Returns**
- ESP_OK: Reset provisioning state machine successfully
- ESP_FAIL: Failed to reset provisioning state machine
- ESP_ERR_INVALID_STATE: Manager not initialized

**esp_err_t wifi_prov_mgr_reset_sm_state_for_reprovision (void)**
Reset internal state machine and clear provisioned credentials.

This API can be used to restart provisioning ONLY in case the device is to be provisioned again for new credentials after a previous successful provisioning without rebooting the device.

**Note:** This API can be used only if provisioning auto-stop has been disabled using wifi_prov_mgr_disable_auto_stop()

**Returns**
- ESP_OK: Reset provisioning state machine successfully
- ESP_FAIL: Failed to reset provisioning state machine
- ESP_ERR_INVALID_STATE: Manager not initialized

**Structures**

**struct wifi_prov_event_handler_t**
Event handler that is used by the manager while provisioning service is active.

**Public Members**

**wifi_prov_cb_func_t event_cb**
Callback function to be executed on provisioning events

**void *user_data**
User context data to pass as parameter to callback function

**struct wifi_prov_scheme**
Structure for specifying the provisioning scheme to be followed by the manager.

**Note:** Ready to use schemes are available:
- wifi_prov_scheme_ble: for provisioning over BLE transport + GATT server
- wifi_prov_scheme_softap: for provisioning over SoftAP transport + HTTP server
- wifi_prov_scheme_console: for provisioning over Serial UART transport + Console (for debugging)

**Public Members**

**esp_err_t (**prov_start**)(protocomm_t *pc, void *config)**
Function which is to be called by the manager when it is to start the provisioning service associated with a protocomm instance and a scheme specific configuration
**Chapter 2. API Reference**

```c
esp_err_t (*prov_stop)(protocomm_t *pc)
Function which is to be called by the manager to stop the provisioning service previously associated with a protocomm instance
```

```c
void *(*new_config)(void)
Function which is to be called by the manager to generate a new configuration for the provisioning service, that is to be passed to prov_start()
```

```c
void (*delete_config)(void *config)
Function which is to be called by the manager to delete a configuration generated using new_config()
```

```c
esp_err_t (*set_config_service)(void *config, const char *service_name, const char *service_key)
Function which is to be called by the manager to set the service name and key values in the configuration structure
```

```c
esp_err_t (*set_config_endpoint)(void *config, const char *endpoint_name, uint16_t uuid)
Function which is to be called by the manager to set a protocomm endpoint with an identifying name and UUID in the configuration structure
```

```c
wifi_mode_t wifi_mode
Sets mode of operation of Wi-Fi during provisioning This is set to:
- WIFI_MODE_APSTA for SoftAP transport
- WIFI_MODE_STA for BLE transport
```

```c
struct wifi_prov_mgr_config_t
Structure for specifying the manager configuration.
```

**Public Members**

```c
wifi_prov_scheme_t scheme
Provisioning scheme to use. Following schemes are already available:
- wifi_prov_scheme_ble : for provisioning over BLE transport + GATT server
- wifi_prov_scheme_softap : for provisioning over SoftAP transport + HTTP server + mDNS (optional)
- wifi_prov_scheme_console : for provisioning over Serial UART transport + Console (for debugging)
```

```c
wifi_prov_event_handler_t scheme_event_handler
Event handler required by the scheme for incorporating scheme specific behavior while provisioning manager is running. Various options may be provided by the scheme for setting this field. Use WIFI_prov_event_handler_NONE when not used. When using scheme wifi_prov_scheme_ble, the following options are available:
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT
```

```c
wifi_prov_event_handler_t app_event_handler
Event handler that can be set for the purpose of incorporating application specific behavior. Use WIFI_PROV_EVENT_HANDLER_NONE when not used.
```
Chapter 2. API Reference

Macros

WIFI_PROV_EVENT_HANDLER_NONE
   Event handler can be set to none if not used.

Type Definitions

typedef void (\*wifi_prov_cb_func_t) (void *user_data, wifi_prov_cb_event_t event, void *event_data)

typedef struct wifi_prov_scheme wifi_prov_scheme_t
   Structure for specifying the provisioning scheme to be followed by the manager.

Note: Ready to use schemes are available:
   • wifi_prov_scheme_ble: for provisioning over BLE transport + GATT server
   • wifi_prov_scheme_softap: for provisioning over SoftAP transport + HTTP server
   • wifi_prov_scheme_console: for provisioning over Serial UART transport + Console (for debugging)

typedef enum wifi_prov_security wifi_prov_security_t
   Security modes supported by the Provisioning Manager.
   These are same as the security modes provided by protocomm

typedef protocomm_security2_params_t wifi_prov_security2_params_t
   Security 2 params structure This needs to be passed when using WIFI_PROV_SECURITY_2.

Enumerations

enum wifi_prov_cb_event_t
   Events generated by manager.
   These events are generated in order of declaration and, for the stretch of time between initialization and de-initialization of the manager, each event is signaled only once
   Values:

   enumerator WIFI_PROV_INIT
      Emitted when the manager is initialized

   enumerator WIFI_PROV_START
      Indicates that provisioning has started

   enumerator WIFI_PROV_CRED_RECV
      Emitted when Wi-Fi AP credentials are received via protocomm endpoint wifi_config. The event data in this case is a pointer to the corresponding wifi_sta_config_t structure

   enumerator WIFI_PROV_CRED_FAIL
      Emitted when device fails to connect to the AP of which the credentials were received earlier on event WIFI_PROV_CRED_RECV. The event data in this case is a pointer to the disconnection reason code with type wifi_prov_sta_fail_reason_t

   enumerator WIFI_PROV_CRED_SUCCESS
      Emitted when device successfully connects to the AP of which the credentials were received earlier on event WIFI_PROV_CRED_RECV
Chapter 2. API Reference

enumerator WIFI_PROV_END
Signals that provisioning service has stopped

enumerator WIFI_PROV_DEINIT
Signals that manager has been de-initialized

enum wifi_prov_security
Security modes supported by the Provisioning Manager.
These are same as the security modes provided by protocomm

Values:

enumerator WIFI_PROV_SECURITY_0
No security (plain-text communication)

enumerator WIFI_PROV_SECURITY_1
This secure communication mode consists of X25519 key exchange
• proof of possession (pop) based authentication
• AES-CTR encryption

enumerator WIFI_PROV_SECURITY_2
This secure communication mode consists of SRP6a based authentication and key exchange
• AES-GCM encryption/decryption

Header File

• components/wifi_provisioning/include/wifi_provisioning/scheme_ble.h
This header file can be included with:

```
#include "wifi_provisioning/scheme_ble.h"
```

• This header file is a part of the API provided by the wifi_provisioning component. To declare that your component depends on wifi_provisioning, add the following to your CMakeLists.txt:

```
REQUIRES wifi_provisioning
```
or

```
PRIV_REQUIRES wifi_provisioning
```

Functions

```c
void wifi_prov_scheme_ble_event_cb_free_btdm (void *user_data, wifi_prov_cb_event_t event, void *event_data)
```

```c
void wifi_prov_scheme_ble_event_cb_free_ble (void *user_data, wifi_prov_cb_event_t event, void *event_data)
```

```c
void wifi_prov_scheme_ble_event_cb_free_bt (void *user_data, wifi_prov_cb_event_t event, void *event_data)
```

```c
esp_err_t wifi_prov_scheme_ble_set_service_uuid (uint8_t *uuid128)
```
Set the 128 bit GATT service UUID used for provisioning.

This API is used to override the default 128 bit provisioning service UUID, which is 0000fff0-0000-1000-8000-00805f9b34fb.
This must be called before starting provisioning, i.e. before making a call to wifi_prov_mgr_start_provisioning(), otherwise the default UUID will be used.

**Note:** The data being pointed to by the argument must be valid atleast till provisioning is started. Upon start, the manager will store an internal copy of this UUID, and this data can be freed or invalidated afterwords.

**Parameters**

- **uuid128**  
  - **[in]** A custom 128 bit UUID

**Returns**

- **ESP_OK** : Success
- **ESP_ERR_INVALID_ARG** : Null argument

**esp_err_t wifi_prov_scheme_ble_set_mfg_data**(uint8_t *mfg_data, ssize_t mfg_data_len)

Set manufacturer specific data in scan response.

This must be called before starting provisioning, i.e. before making a call to wifi_prov_mgr_start_provisioning().

**Note:** It is important to understand that length of custom manufacturer data should be within limits. The manufacturer data goes into scan response along with BLE device name. By default, BLE device name length is of 11 Bytes, however it can vary as per application use case. So, one has to honour the scan response data size limits i.e. 

\[(\text{mfg\_data\_len} + 2) < 31 - (\text{device\_name\_length} + 2)\]

If the mfg\_data length exceeds this limit, the length will be truncated.

**Parameters**

- **mfg_data**  
  - **[in]** Custom manufacturer data
- **mfg_data_len**  
  - **[in]** Manufacturer data length

**Returns**

- **ESP_OK** : Success
- **ESP_ERR_INVALID_ARG** : Null argument

**Macros**

- **WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM**
- **WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE**
- **WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT**

**Header File**

- **components/wifi_provisioning/include/wifi_provisioning/scheme_softap.h**
- This header file can be included with:

```c
#include "wifi_provisioning/scheme_softap.h"
```

- This header file is a part of the API provided by the wifi_provisioning component. To declare that your component depends on wifi_provisioning, add the following to your CMakeLists.txt:

```cmake
REQUIRES wifi_provisioning
```

or

```cmake
PRIV_REQUIRES wifi_provisioning
```
Functions

void wifi_prov_scheme_softap_set_httpd_handle (void *handle)

Provide HTTPD Server handle externally.

Useful in cases wherein applications need the webserver for some different operations, and do not want the wifi provisioning component to start/stop a new instance.

Note: This API should be called before wifi_prov_mgr_start_provisioning()

Parameters handle –[in] Handle to HTTPD server instance

Header File

• components/wifi_provisioning/include/wifi_provisioning/scheme_console.h
• This header file can be included with:

```
#include "wifi_provisioning/scheme_console.h"
```

• This header file is a part of the API provided by the wifi_provisioning component. To declare that your component depends on wifi_provisioning, add the following to your CMakeLists.txt:

```
REQUIRES wifi_provisioning
```

or

```
PRIV_REQUIRES wifi_provisioning
```

Functions

esp_err_t wifi_prov_config_data_handler (uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)

Handler for receiving and responding to requests from master.

This is to be registered as the wifi_config endpoint handler (protocomm proto-comm_req_handler_t) using protocomm_add_endpoint()

Structures

struct wifi_prov_sta_conn_info_t

WiFi STA connected status information.
Public Members

char **ip_addr**[IP4ADDR_STRLLEN_MAX]
   IP Address received by station

char **bssid**[6]
   BSSID of the AP to which connection was established

char **ssid**[33]
   SSID of the AP to which connection was established

uint8_t **channel**
   Channel of the AP

uint8_t **auth_mode**
   Authorization mode of the AP

struct **wifi_prov_config_get_data_t**
   WiFi status data to be sent in response to get_status request from master.

Public Members

**wifi_prov_sta_state_t wifi_state**
   WiFi state of the station

**wifi_prov_sta_fail_reason_t fail_reason**
   Reason for disconnection (valid only when wifi_state is WIFI_STATION_DISCONNECTED)

**wifi_prov_sta_conn_info_t conn_info**
   Connection information (valid only when wifi_state is WIFI_STATION_CONNECTED)

struct **wifi_prov_config_set_data_t**
   WiFi config data received by slave during set_config request from master.

Public Members

char **ssid**[33]
   SSID of the AP to which the slave is to be connected

char **password**[64]
   Password of the AP

char **bssid**[6]  
   BSSID of the AP

uint8_t **channel**
   Channel of the AP
struct wifi_prov_config_handlers

Internal handlers for receiving and responding to protocomm requests from master.
This is to be passed as priv_data for protocomm request handler (refer to
wifi_prov_config_data_handler()) when calling protocomm_add_endpoint().

Public Members

esp_err_t (*get_status_handler)(wifi_prov_config_get_data_t *resp_data, wifi_prov_ctx_t **ctx)

Handler function called when connection status of the slave (in WiFi station mode) is requested

esp_err_t (*set_config_handler)(const wifi_prov_config_set_data_t *req_data, wifi_prov_ctx_t **ctx)

Handler function called when WiFi connection configuration (eg. AP SSID, password, etc.) of the slave
(in WiFi station mode) is to be set to user provided values

esp_err_t (*apply_config_handler)(wifi_prov_ctx_t **ctx)

Handler function for applying the configuration that was set in set_config_handler. After apply-
ing the station may get connected to the AP or may fail to connect. The slave must be ready to convey the
updated connection status information when get_status_handler is invoked again by the master.

wifi_prov_ctx_t *ctx

Context pointer to be passed to above handler functions upon invocation

Type Definitions

typedef struct wifi_prov_ctx wifi_prov_ctx_t

Type of context data passed to each get/set/apply handler function set in wifi_prov_config_handlers
structure.

This is passed as an opaque pointer, thereby allowing it be defined later in application code as per requirements.

typedef struct wifi_prov_config_handlers wifi_prov_config_handlers_t

Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as priv_data for protocomm request handler (refer to
wifi_prov_config_data_handler()) when calling protocomm_add_endpoint().

Enumerations

enum wifi_prov_sta_state_t

WiFi STA status for conveying back to the provisioning master.

Values:

enumerator WIFI_PROV_STA_CONNECTING

enumerator WIFI_PROV_STA_CONNECTED

enumerator WIFI_PROV_STA_DISCONNECTED
### 2.8 Storage API

This section contains reference of the high-level storage APIs. They are based on low-level drivers such as SPI flash, SD/MMC.

- **Partitions API** allow block based access to SPI flash according to the Partition Tables.
- **Non-Volatile Storage library (NVS)** implements a fault-tolerant wear-levelled key-value storage in SPI NOR flash.
- **Virtual File System (VFS)** library provides an interface for registration of file system drivers. SPIFFS, FAT and various other file system libraries are based on the VFS.
- **SPIFFS** is a wear-levelled file system optimized for SPI NOR flash, well suited for small partition sizes and low throughput
- **FAT** is a standard file system which can be used in SPI flash or on SD/MMC cards
- **Wear Levelling** library implements a flash translation layer (FTL) suitable for SPI NOR flash. It is used as a container for FAT partitions in flash.

**Note:** It is suggested to use high-level APIs (esp_partition or file system) instead of low-level driver APIs to access the SPI NOR flash.

Due to the restriction of NOR flash and ESP hardware, accessing the main flash will affect the performance of the whole system. See **SPI Flash API** to learn more about the limitations.

#### 2.8.1 FAT Filesystem Support

ESP-IDF uses the FatFs library to work with FAT filesystems. FatFs resides in the fatfs component. Although the library can be used directly, many of its features can be accessed via VFS using the C standard library and POSIX API functions.

Additionally, FatFs has been modified to support the runtime pluggable disk I/O layer. This allows mapping of FatFs drives to physical disks at runtime.

**Using FatFs with VFS**

The header file fatfs/vfs/esp_vfs_fat.h defines the functions for connecting FatFs and VFS.

The function esp_vfs_fat_register() allocates a FATFS structure and registers a given path prefix in VFS. Subsequent operations on files starting with this prefix are forwarded to FatFs APIs.
Chapter 2. API Reference

The function `esp_vfs_fat_unregister_path()` deletes the registration with VFS, and frees the FATFS structure.

Most applications use the following workflow when working with `esp_vfs_fat_` functions:

1. **Call `esp_vfs_fat_register()` to specify:**
   - Path prefix where to mount the filesystem (e.g., "/sdcard", "/spiflash")
   - FatFs drive number
   - A variable which receives the pointer to the FATFS structure

2. **Call `ff_diskio_register()` to register the disk I/O driver for the drive number used in Step 1.**
3. **Call the FatFs function `f_mount()`, and optionally `f_fdisk()`, `f_mkfs()`, to mount the filesystem using the same drive number which was passed to `esp_vfs_fat_register()`**. For more information, see FatFs documentation.
4. **Call the C standard library and POSIX API functions to perform such actions on files as open, read, write, erase, copy, etc. Use paths starting with the path prefix passed to `esp_vfs_fat_register()` (for example, "/sdcard/hello.txt"). The filesystem uses 8.3 filenames format (SFN) by default. If you need to use long filenames (LFN), enable the `CONFIG_FATFS_LONG_FILENAMES` option. More details on the FatFs filenames are available here.
5. Optionally, by enabling the option `CONFIG_FATFS_USE_FASTSEEK`, you can use the POSIX lseek function to perform it faster. The fast seek does not work for files in write mode, so to take advantage of fast seek, you should open (or close and then reopen) the file in read-only mode.
6. Optionally, by enabling the option `CONFIG_FATFS_IMMEDIATE_FSYNC`, you can enable automatic calling of `f_sync()` to flush recent file changes after each call of `vfs_fat_write()`, `vfs_fat_link()`, `vfs_fat_truncate()` and `vfs_fat_ftruncate()` functions. This feature improves file-consistency and size reporting accuracy for the FatFs, at a price on decreased performance due to frequent disk operations.
7. Optionally, call the FatFs library functions directly. In this case, use paths without a VFS prefix, for example, "/hello.txt".
8. Close all open files.
9. **Call the FatFs function `f_mount()` for the same drive number with NULL FATFS* argument to unmount the filesystem.**
10. Call the FatFs function `ff_diskio_register()` with NULL `ff_diskio_impl_t*` argument and the same drive number to unregister the disk I/O driver.
11. **Call `esp_vfs_fat_unregister_path()` with the path where the file system is mounted to remove FatFs from VFS, and free the FATFS structure allocated in Step 1.**

The convenience functions `esp_vfs_fat_sdmmc_mount()`, `esp_vfs_fat_sdspi_mount()`, and `esp_vfs_fat_sdcardUnmount()` wrap the steps described above and also handle SD card initialization. These functions are described in the next section.

**Using FatFs with VFS and SD Cards**

The header file `fatfs/vfs/esp_vfs_fat.h` defines convenience functions `esp_vfs_fat_sdmmc_mount()`, `esp_vfs_fat_sdspi_mount()`, and `esp_vfs_fat_sdcardUnmount()`. These functions perform Steps 1–3 and 7–9 respectively and handle SD card initialization, but provide only limited error handling. Developers are encouraged to check its source code and incorporate more advanced features into production applications.

The convenience function `esp_vfs_fat_sdmmc_unmount()` unmounts the filesystem and releases the resources acquired by `esp_vfs_fat_sdmmc_mount()`.

**Using FatFs with VFS in Read-Only Mode**

The header file `fatfs/vfs/esp_vfs_fat.h` also defines the convenience functions `esp_vfs_fat_spiflash_mount_ro()` and `esp_vfs_fat_spiflashUnmount_ro()`. These functions perform Steps 1-3 and 7-9 respectively for read-only FAT partitions. These are particularly helpful for data partitions written only once during factory provisioning, which will not be changed by production application throughout the lifetime of the hardware.
FatFS Disk IO Layer

FatFs has been extended with API functions that register the disk I/O driver at runtime.

These APIs provide implementation of disk I/O functions for SD/MMC cards and can be registered for the given FatFs drive number using the function `ff_diskio_register_sdmmc()`.

```c
void ff_diskio_register(BYTE pdrv, const ff_diskio_impl_t *discio_impl)
```

Register or unregister diskio driver for given drive number.

When FATFS library calls one of disk_xxx functions for driver number pdrv, corresponding function in discio_impl for given pdrv will be called.

- **Parameters**
  - `pdrv` - drive number
  - `discio_impl` - pointer to `ff_diskio_impl_t` structure with diskio functions or NULL to unregister and free previously registered drive

```c
struct ff_diskio_impl_t
```

Structure of pointers to disk IO driver functions.

See FatFs documentation for details about these functions

### Public Members

- `DSTATUS (*init)(unsigned char pdrv)`
  - disk initialization function

- `DSTATUS (*status)(unsigned char pdrv)`
  - disk status check function

- `DRESULT (*read)(unsigned char pdrv, unsigned char *buff, uint32_t sector, unsigned count)`
  - sector read function

- `DRESULT (*write)(unsigned char pdrv, const unsigned char *buff, uint32_t sector, unsigned count)`
  - sector write function

- `DRESULT (*ioctl)(unsigned char pdrv, unsigned char cmd, void *buff)`
  - function to get info about disk and do some misc operations

```c
void ff_diskio_register_sdmmc(unsigned char pdrv, sdmmc_card_t *card)
```

Register SD/MMC diskio driver

- **Parameters**
  - `pdrv` - drive number
  - `card` - pointer to `sdmmc_card_t` structure describing a card; card should be initialized before calling f_mount.

```c
esp_err_t ff_diskio_register wl_partition(unsigned char pdrv, wl_handle_t flash_handle)
```

Register spi flash partition

- **Parameters**
  - `pdrv` - drive number
  - `flash_handle` - handle of the wear levelling partition.
\textbf{esp_err_t \texttt{ff_diskio_register_raw_partition}} (unsigned char pdrv, const \texttt{esp_partition_t *part_handle})

Register spi flash partition

\textbf{Parameters}

- \texttt{pdrv} - drive number
- \texttt{part_handle} - pointer to raw flash partition.

\textbf{FatFs Partition Generator}

We provide a partition generator for FatFs (\texttt{wl_fatfsgen.py}) which is integrated into the build system and could be easily used in the user project.

The tool is used to create filesystem images on a host and populate it with content of the specified host folder.

The script is based on the partition generator (\texttt{fatfsgen.py}). Apart from generating partition, it can also initialize wear levelling.

The latest version supports both short and long file names, FAT12 and FAT16. The long file names are limited to 255 characters and can contain multiple periods (.) characters within the filename and additional characters +, , , , =, [ and ].

An in-depth description of the FatFs partition generator and analyzer can be found at Generating and parsing FAT partition on host.

\textbf{Build System Integration with FatFs Partition Generator} It is possible to invoke FatFs generator directly from the CMake build system by calling \texttt{fatfs_create_spiflash_image}:

\begin{verbatim}
fatfs_create_spiflash_image(<partition> <base_dir> [FLASH_IN_PROJECT])
\end{verbatim}

If you prefer generating partition without wear levelling support, you can use \texttt{fatfs_create_rawflash_image}:

\begin{verbatim}
fatfs_create_rawflash_image(<partition> <base_dir> [FLASH_IN_PROJECT])
\end{verbatim}

\texttt{fatfs_create_spiflash_image} respectively \texttt{fatfs_create_rawflash_image} must be called from project’s CMakeLists.txt.

If you decide for any reason to use \texttt{fatfs_create_rawflash_image} (without wear levelling support), beware that it supports mounting only in read-only mode in the device.

The arguments of the function are as follows:

1. \texttt{partition} - the name of the partition as defined in the partition table (e.g., \texttt{storage/fatfsgen/partitions_example.csv}).
2. \texttt{base_dir} - the directory that will be encoded to FatFs partition and optionally flashed into the device. Beware that you have to specify the suitable size of the partition in the partition table.
3. \texttt{flag FLASH_IN_PROJECT} - optionally, users can have the image automatically flashed together with the app binaries, partition tables, etc. on \texttt{idf.py flash -p <PORT>} by specifying \texttt{FLASH_IN_PROJECT}.
4. \texttt{flag PRESERVE_TIME} - optionally, users can force preserving the timestamps from the source folder to the target image. Without preserving the time, every timestamp will be set to the FATFS default initial time (1st January 1980).

For example:

\begin{verbatim}
fatfs_create_spiflash_image(my_fatfs_partition my_folder FLASH_IN_PROJECT)
\end{verbatim}

If \texttt{FLASH_IN_PROJECT} is not specified, the image will still be generated, but you will have to flash it manually using \texttt{esptool.py} or a custom build system target.

For an example, see \texttt{storage/fatfsgen}.

Release v5.3-dev-277-gc8243465e4
**FatFs Partition Analyzer**

(fatfsparse.py) is a partition analyzing tool for FatFs.

It is a reverse tool of (fatfsgen.py), i.e., it can generate the folder structure on the host based on the FatFs image.

Usage:

```
./fatfsparse.py [-h] [--wl-layer {detect,enabled,disabled}] fatfs_image.img
```

**High-level API Reference**

**Header File**

- components/fatfs/vfs/esp_vfs_fat.h
- This header file can be included with:

  ```
  #include "esp_vfs_fat.h"
  ```

- This header file is a part of the API provided by the fatfs component. To declare that your component depends on fatfs, add the following to your CMakeLists.txt:

  ```
  REQUIRES fatfs
  ```
  or
  ```
  PRIV_REQUIRES fatfs
  ```

**Functions**

- `esp_err_t esp_vfs_fat_register` (const char *base_path, const char *fat_drive, size_t max_files, FATFS **out_fs)

  Register FATFS with VFS component.

  This function registers given FAT drive in VFS, at the specified base path. If only one drive is used, fat_drive argument can be an empty string. Refer to FATFS library documentation on how to specify FAT drive. This function also allocates FATFS structure which should be used for f_mount call.

  **Note:** This function doesn’t mount the drive into FATFS, it just connects POSIX and C standard library IO function with FATFS. You need to mount desired drive into FATFS separately.

  **Parameters**
  - `base_path` – path prefix where FATFS should be registered
  - `fat_drive` – FATFS drive specification; if only one drive is used, can be an empty string
  - `max_files` – maximum number of files which can be open at the same time
  - `out_fs` – [out] pointer to FATFS structure which can be used for FATFS f_mount call is returned via this argument.

  **Returns**
  - ESP_OK on success
  - ESP_ERR_INVALID_STATE if esp_vfs_fat_register was already called
  - ESP_ERR_NO_MEM if not enough memory or too many VFSes already registered

- `esp_err_t esp_vfs_fat_unregister_path` (const char *base_path)

  Un-register FATFS from VFS.

  **Note:** FATFS structure returned by esp_vfs_fat_register is destroyed after this call. Make sure to call f_mount function to unmount it before calling esp_vfs_fat_unregister_ctx. Difference between this function and the one above is that this one will release the correct drive, while the one above will release the last registered one.
Chapter 2. API Reference

Parameters `base_path` - path prefix where FATFS is registered. This is the same used when `esp_vfs_fat_register` was called.

Returns
- ESP_OK on success
- ESP_ERR_INVALID_STATE if FATFS is not registered in VFS

```c
esp_err_t esp_vfs_fat_sdmmc_mount(const char* base_path, const sdmmc_host_t *host_config, const void *slot_config, const esp_vfs_fat_mount_config_t *mount_config, sdmmc_card_t **out_card)
```

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:
- initializes SDMMC driver or SPI driver with configuration in host_config
- initializes SD card with configuration in slot_config
- mounts FAT partition on SD card using FATFS library, with configuration in mount_config
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

**Note:** Use this API to mount a card through SDSPI is deprecated. Please call `esp_vfs_fat_sdspi_mount()` instead for that case.

Parameters
- `base_path` - path where partition should be registered (e.g. `/sdcard`)
- `host_config` - Pointer to structure describing SDMMC host. When using SD-MMC peripheral, this structure can be initialized using `SDMMC_HOST_DEFAULT()` macro. When using SPI peripheral, this structure can be initialized using `SPI_HOST_DEFAULT()` macro.
- `slot_config` - Pointer to structure with slot configuration. For SDMMC peripheral, pass a pointer to `sdmmc_slot_config_t` structure initialized using `SDMMC_SLOT_CONFIG_DEFAULT`.
- `mount_config` - pointer to structure with extra parameters for mounting FATFS
- `out_card` - [out] if not NULL, pointer to the card information structure will be returned via this argument

Returns
- ESP_OK on success
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_sdmmc_mount` was already called
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition can be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

```c
esp_err_t esp_vfs_fat_sdspi_mount(const char *base_path, const sdmmc_host_t *host_config_input, const sdspi_device_config_t *slot_config, const esp_vfs_fat_mount_config_t *mount_config, sdmmc_card_t **out_card)
```

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:
- initializes an SPI Master device based on the SPI Master driver with configuration in slot_config, and attach it to an initialized SPI bus.
- initializes SD card with configuration in host_config_input
- mounts FAT partition on SD card using FATFS library, with configuration in mount_config
- registers FATFS library with VFS, with prefix given by base_prefix variable
This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

**Note:** This function try to attach the new SD SPI device to the bus specified in host_config. Make sure the SPI bus specified in host_config->slot have been initialized by spi_bus_initialize() before.

### Parameters
- **base_path** – path where partition should be registered (e.g. “/sdcard”)
- **host_config_input** – Pointer to structure describing SDMMC host. This structure can be initialized using SDSPI_HOST_DEFAULT() macro.
- **slot_config** – Pointer to structure with slot configuration. For SPI peripheral, pass a pointer to sdspi_device_config_t structure initialized using SDSPI_DEVICE_CONFIG_DEFAULT().
- **mount_config** – pointer to structure with extra parameters for mounting FATFS
- **out_card** – [out] If not NULL, pointer to the card information structure will be returned via this argument. It is suggested to hold this handle and use it to unmount the card later if needed. Otherwise it’s not suggested to use more than one card at the same time and unmount one of them in your application.

### Returns
- **ESP_OK** on success
- **ESP_ERR_INVALID_STATE** if esp_vfs_fat_sdmmc_mount was already called
- **ESP_ERR_NO_MEM** if memory cannot be allocated
- **ESP_FAIL** if partition cannot be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

```c
esp_err_t esp_vfs_fat_sdmmc_unmount (void)
```

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_sdmmc_mount.

**Deprecated:**
Use esp_vfs_fat_sdcard_unmount() instead.

### Returns
- **ESP_OK** on success
- **ESP_ERR_INVALID_STATE** if esp_vfs_fat_sdmmc_mount hasn’t been called

```c
esp_err_t esp_vfs_fat_sdcard_unmount (const char*base_path, sdmmc_card_t *card)
```

Unmount an SD card from the FAT filesystem and release resources acquired using esp_vfs_fat_sdmmc_mount() or esp_vfs_fat_sdspi_mount()

### Returns
- **ESP_OK** on success
- **ESP_ERR_INVALID_ARG** if the card argument is unregistered
- **ESP_ERR_INVALID_STATE** if esp_vfs_fat_sdmmc_mount hasn’t been called

```c
esp_err_t esp_vfs_fat_sdcard_format (const char*base_path, sdmmc_card_t *card)
```

Format FAT filesystem.

**Note:** This API should be only called when the FAT is already mounted.

### Parameters
- **base_path** – Path where partition should be registered (e.g. “/sdcard”)
- **card** – Pointer to the card handle, which should be initialised by calling esp_vfs_fat_sdspi_mount first
Chapter 2. API Reference

Returns

• ESP_OK
• ESP_ERR_INVALID_STATE: FAT partition isn’t mounted, call esp_vfs_fat_sdmmc_mount or esp_vfs_fat_sdspi_mount first
• ESP_ERR_NO_MEM: if memory cannot be allocated
• ESP_FAIL: fail to format it, or fail to mount back

\[ \text{esp_err_t } \text{esp_vfs_fat_spiflash_mount_rw_wl} \text{ (const char *base_path, const char *partition_label, const esp_vfs_fat_mount_config_t *mount_config, wl_handle_t *wl_handle)} \]

Convenience function to initialize FAT filesystem in SPI flash and register it in VFS.

This is an all-in-one function which does the following:

• finds the partition with defined partition_label. Partition label should be configured in the partition table.
• initializes flash wear levelling library on top of the given partition
• mounts FAT partition using FATFS library on top of flash wear levelling library
• registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact.

Parameters

• base_path – path where FATFS partition should be mounted (e.g. “/spiflash”)
• partition_label – label of the partition which should be used
• mount_config – pointer to structure with extra parameters for mounting FATFS
• wl_handle – [out] wear levelling driver handle

Returns

• ESP_OK on success
• ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
• ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_rw_wl was already called
• ESP_ERR_NO_MEM if memory cannot be allocated
• ESP_FAIL if partition cannot be mounted
• other error codes from wear levelling library, SPI flash driver, or FATFS drivers

\[ \text{esp_err_t } \text{esp_vfs_fat_spiflash_unmount_rw_wl} \text{ (const char *base_path, wl_handle_t *wl_handle)} \]

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_spiflash_mount_rw_wl.

Parameters

• base_path – path where partition should be registered (e.g. “/spiflash”)
• wl_handle – wear levelling driver handle returned by esp_vfs_fat_spiflash_mount_rw_wl

Returns

• ESP_OK on success
• ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_rw_wl hasn’t been called

\[ \text{esp_err_t } \text{esp_vfs_fat_spiflash_format_rw_wl} \text{ (const char *base_path, const char *partition_label)} \]

Format FAT filesystem.

Note: This API can be called when the FAT is mounted / not mounted. If this API is called when the FAT isn’t mounted (by calling esp_vfs_fat_spiflash_mount_rw_wl), this API will first mount the FAT then format it, then restore back to the original state.
• ESP_ERR_NO_MEM: if memory cannot be allocated
• Other errors from esp_vfs_fat_spiflash_mount_rw_wl

`esp_err_t esp_vfs_fat_spiflash_mount_ro(const char *base_path, const char *partition_label, const esp_vfs_fat_mount_config_t *mount_config)`

Convenience function to initialize read-only FAT filesystem and register it in VFS.

This is an all-in-one function which does the following:

• finds the partition with defined partition_label. Partition label should be configured in the partition table.
• mounts FAT partition using FATFS library
• registers FATFS library with VFS, with prefix given by base_prefix variable

**Note:** Wear levelling is not used when FAT is mounted in read-only mode using this function.

**Parameters**

- `base_path` – path where FATFS partition should be mounted (e.g. “/spiflash”)
- `partition_label` – label of the partition which should be used
- `mount_config` – pointer to structure with extra parameters for mounting FATFS

**Returns**

- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_ro was already called for the same partition
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition cannot be mounted
- other error codes from SPI flash driver, or FATFS drivers

`esp_err_t esp_vfs_fat_spiflash_unmount_ro(const char* base_path, const char* partition_label)`

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_spiflash_mount_ro.

**Parameters**

- `base_path` – path where partition should be registered (e.g. “/spiflash”)
- `partition_label` – label of partition to be unmounted

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_ro hasn’t been called

`esp_err_t esp_vfs_fat_info (const char *base_path, uint64_t *out_total_bytes, uint64_t *out_free_bytes)`

Get information for FATFS partition.

**Parameters**

- `base_path` – Base path of the partition examined (e.g. “/spiflash”)
- `out_total_bytes` –[out] Size of the file system
- `out_free_bytes` –[out] Free bytes available in the file system

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if partition not found
- ESP_FAIL if another FRESULT error (saved in errno)

**Structures**

`struct esp_vfs_fat_mount_config_t`  
Configuration arguments for esp_vfs_fat_sdmmc_mount and esp_vfs_fat_spiflash_mount_rw_wl functions.
Public Members

bool format_if_mount_failed
If FAT partition can not be mounted, and this parameter is true, create partition table and format the
filesystem.

int max_files
Max number of open files.

size_t allocation_unit_size
If format_if_mount_failed is set, and mount fails, format the card with given allocation unit size. Must
be a power of 2, between sector size and 128 * sector size. For SD cards, sector size is always 512 bytes.
For wear levelling, sector size is determined by CONFIG_WL_SECTOR_SIZE option.
Using larger allocation unit size will result in higher read/write performance and higher overhead when
storing small files.
Setting this field to 0 will result in allocation unit set to the sector size.

bool disk_status_check_enable
Enables real ff_disk_status function implementation for SD cards (ff_sdmmc_status). Possibly slows
down IO performance.
Try to enable if you need to handle situations when SD cards are not unmounted properly before physical
removal or you are experiencing issues with SD cards.
Doesn’t do anything for other memory storage media.

Type Definitions
typedef esp_vfs_fat_mount_config_t esp_vfs_fat_sdmmc_mount_config_t

2.8.2 Manufacturing Utility

Introduction

This utility is designed to create instances of factory NVS partition images on a per-device basis for mass manufac-
turing purposes. The NVS partition images are created from CSV files containing user-provided configurations and
values.

Please note that this utility only creates manufacturing binary images which then need to be flashed onto your devices
using:
• esptool.py
• Flash Download tool (available on Windows only)
  -- Download and unzip it, and follow the instructions inside the doc folder.
• Direct flash programming using custom production tools.

Prerequisites

This utility is dependent on ESP-IDF’s NVS Partition Generator Utility.
• Operating System requirements:
  -- Linux / MacOS / Windows (standard distributions)
The following packages are needed to use this utility:

- Python

Note: Before using this utility, please make sure that:

- The path to Python is added to the PATH environment variable.
- You have installed the packages from `requirements.txt`, the file in the root of the ESP-IDF directory.

Workflow

CSV Configuration File

This file contains the configuration of the device to be flashed.

The data in the configuration file has the following format (the `REPEAT` tag is optional):

```plaintext
name1,namespace,  <-- First entry should be of type "namespace"
key1,type1,encoding1
key2,type2,encoding2,REPEAT
name2,namespace,
key3,type3,encoding3
key4,type4,encoding4
```

Note: The first line in this file should always be the namespace entry.

Each line should have three parameters: `key,type,encoding`, separated by a comma. If the `REPEAT` tag is present, the value corresponding to this key in the master value CSV file will be the same for all devices.

*Please refer to README of the NVS Partition Generator Utility for detailed description of each parameter.*

Below is a sample example of such a configuration file:

```plaintext
app,namespace,
firmware_key,data,hex2bin
serial_no,data,string,REPEAT
device_no,data,i32
```

Note: Make sure there are no spaces:

- before and after ",`
- at the end of each line in a CSV file
Master Value CSV File

This file contains details of the devices to be flashed. Each line in this file corresponds to a device instance.

The data in the master value CSV file has the following format:

```
key1,key2,key3,.....
value1,value2,value3,....
```

**Note:** The first line in the file should always contain the key names. All the keys from the configuration file should be present here in the **same order**. This file can have additional columns (keys). The additional keys will be treated as metadata and would not be part of the final binary files.

Each line should contain the value of the corresponding keys, separated by a comma. If the key has the REPEAT tag, its corresponding value must be entered in the second line only. Keep the entry empty for this value in the following lines.

The description of this parameter is as follows:

**value** Data value

Data value is the value of data corresponding to the key.

Below is a sample example of a master value CSV file:

```
id,firmware_key,serial_no,device_no
1,1a2b3c4d5e6faabb,A1,101
2,1a2b3c4d5e6fccdd,,102
3,1a2b3c4d5e6feeff,,103
```

**Note:** If the `REPEAT` tag is present, a new master value CSV file will be created in the same folder as the input Master CSV File with the values inserted at each line for the key with the `REPEAT` tag.

This utility creates intermediate CSV files which are used as input for the NVS partition utility to generate the binary files.

The format of this intermediate CSV file is as follows:

```
key,type,encoding,value
key,namespace, ,
key1,type1,encoding1,value1
key2,type2,encoding2,value2
```

An instance of an intermediate CSV file will be created for each device on an individual basis.

Running the utility

**Usage:**

```
python mfg_gen.py [-h] {generate,generate-key} ...
```

**Optional Arguments:**

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>-h/--help</td>
<td>Show the help message and exit</td>
</tr>
</tbody>
</table>
Run `mfg_gen.py {command} -h` for additional help

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>generate</td>
<td>Generate NVS partition</td>
</tr>
<tr>
<td>2</td>
<td>generate-key</td>
<td>Generate keys for encryption</td>
</tr>
</tbody>
</table>

To generate factory images for each device (Default):

**Usage:**

```
python mfg_gen.py generate [-h] [--fileid FILEID] [--version {1,2}] [--keygen]
[--inputkey INPUTKEY] [--outdir OUTDIR]
[--key_protect_hmac] [--kp_hmac_keygen]
[--kp_hmac_keyfile KP_HMAC_KEYFILE] [--kp_hmac_key]
```

**Positional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conf</td>
<td>Path to configuration csv file to parse</td>
</tr>
<tr>
<td>values</td>
<td>Path to values csv file to parse</td>
</tr>
<tr>
<td>prefix</td>
<td>Unique name for each output filename prefix</td>
</tr>
<tr>
<td>size</td>
<td>Size of NVS partition in bytes (must be multiple of 4096)</td>
</tr>
</tbody>
</table>

**Optional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h/-h</td>
<td>Show the help message and exit</td>
</tr>
<tr>
<td>--fileid FILEID</td>
<td>Unique file identifier (any key in values file) for each filename suffix (Default: numeric value(1,2,3…))</td>
</tr>
<tr>
<td>--keygen</td>
<td>Generates key for encrypting NVS partition</td>
</tr>
<tr>
<td>--inputkey INPUTKEY</td>
<td>File having key for encrypting NVS partition</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>Output directory to store files created (Default: current directory)</td>
</tr>
<tr>
<td>--key_protect_hmac</td>
<td>If set, the NVS encryption key protection scheme based on HMAC peripheral is used; else the default scheme based on Flash Encryption is used</td>
</tr>
<tr>
<td>--kp_hmac_keygen</td>
<td>Generate the HMAC key for HMAC-based encryption scheme</td>
</tr>
<tr>
<td>--kp_hmac_keyfile KP_HMAC_KEYFILE</td>
<td>Path to output HMAC key file</td>
</tr>
<tr>
<td>--kp_hmac_inputkey KP_HMAC_INPUTKEY</td>
<td>File having the HMAC key for generating the NVS encryption keys</td>
</tr>
</tbody>
</table>

You can run the utility to generate factory images for each device using the command below. A sample CSV file is provided with the utility:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_singlepage_blob.csv Sample 0x3000
```

The master value CSV file should have the path in the `file` type relative to the directory from which you are running the utility.

To generate encrypted factory images for each device:
You can run the utility to encrypt factory images for each device using the command below. A sample CSV file is provided with the utility:

• Encrypt by allowing the utility to generate encryption keys:

```bash
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_--singlepage_blob.csv Sample 0x3000 --keygen
```

**Note:** Encryption key of the following format `<outdir>/keys/keys-<prefix>-<fileid>.bin` is created. This newly created file having encryption keys in `keys/` directory is compatible with NVS key-partition structure. Refer to [NVS Key Partition](#) for more details.

• To generate an encrypted image using the HMAC-based scheme, the above command can be used along with some additional parameters.
  – Encrypt by allowing the utility to generate encryption keys and the HMAC-key:

```bash
python mfg_gen.py generate samples/sample_config.csv samples/--sample_values_singlepage_blob.csv Sample 0x3000 --keygen --key_--protect_hmac --kp_hmac_keygen
```

**Note:** Encryption key of the format `<outdir>/keys/keys-<timestamp>.bin` and HMAC key of the format `<outdir>/keys/hmac-keys-<timestamp>.bin` are created.

• Encrypt by allowing the utility to generate encryption keys with user-provided HMAC-key:

```bash
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_--singlepage_blob.csv Sample 0x3000 --keygen --key_protect_hmac --kp_hmac--inputkey testdata/sample_hmac_key.bin
```

**Note:** You can provide the custom filename for the HMAC key as well as the encryption key as a parameter.

• Encrypt by providing the encryption keys as input binary file:

```bash
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_--singlepage_blob.csv Sample 0x3000 --inputkey keys/sample_keys.bin
```

To generate only encryption keys:

**Usage:** `python mfg_gen.py generate-key [-h] [-keyfile KEYFILE] [-outdir OUTDIR]`

**Optional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-h / --help</code></td>
<td>Show the help message and exit</td>
</tr>
<tr>
<td><code>--keyfile KEYFILE</code></td>
<td>Path to output encryption keys file</td>
</tr>
<tr>
<td><code>--outdir OUTDIR</code></td>
<td>Output directory to store files created. (Default: current directory)</td>
</tr>
<tr>
<td><code>--key_protect_hmac</code></td>
<td>If set, the NVS encryption key protection scheme based on HMAC peripheral is used; else the default scheme based on Flash Encryption is used</td>
</tr>
<tr>
<td><code>--kp_hmac_keygen</code></td>
<td>Generate the HMAC key for HMAC-based encryption scheme</td>
</tr>
<tr>
<td><code>--kp_hmac_keyfile KP_HMAC_KEYFILE</code></td>
<td>Path to output HMAC key file</td>
</tr>
<tr>
<td><code>--kp_hmac_inputkey KP_HMAC_INPUTKEY</code></td>
<td>File having the HMAC key for generating the NVS encryption keys</td>
</tr>
</tbody>
</table>

You can run the utility to generate only encryption keys using the command below:

```bash
python mfg_gen.py generate-key
```
Chapter 2. API Reference

Note: Encryption key of the following format <outdir>/keys/keys-<timestamp>.bin is created. Timestamp format is: %m-%d_%H-%M. To provide custom target filename use the --keyfile argument.

For generating encryption key for the HMAC-based scheme, the following commands can be used:

- Generate the HMAC key and the NVS encryption keys:

  ```
  python mfg_gen.py generate-key --key Protect_hmac --kp_hmac_keygen
  ```

Note: Encryption key of the format <outdir>/keys/keys-<timestamp>.bin and HMAC key of the format <outdir>/keys/hmac-keys-<timestamp>.bin are created.

- Generate the NVS encryption keys, given the HMAC-key:

  ```
  python mfg_gen.py generate-key --key Protect_hmac --kp_hmac_inputkey testdata/sample_hmac_key.bin
  ```

Note: You can provide the custom filename for the HMAC key as well as the encryption key as a parameter.

Generated encryption key binary file can further be used to encrypt factory images created on the per device basis.

The default numeric value: 1,2,3…of the fileId argument corresponds to each line bearing device instance values in the master value CSV file.

While running the manufacturing utility, the following folders will be created in the specified outdir directory:

- bin/ for storing the generated binary files
- csv/ for storing the generated intermediate CSV files
- keys/ for storing encryption keys (when generating encrypted factory images)

2.8.3 Non-Volatile Storage Library

Introduction

Non-volatile storage (NVS) library is designed to store key-value pairs in flash. This section introduces some concepts used by NVS.

Underlying Storage  
Currently, NVS uses a portion of main flash memory through the `esp_partition` API. The library uses all the partitions with `data` type and `nvs` subtype. The application can choose to use the partition with the label `nvs` through the `nvs_open()` API function or any other partition by specifying its name using the `nvs_open_from_partition()` API function.

Future versions of this library may have other storage backends to keep data in another flash chip (SPI or I2C), RTC, FRAM, etc.

Note: if an NVS partition is truncated (for example, when the partition table layout is changed), its contents should be erased. ESP-IDF build system provides a `idf.py erase-flash` target to erase all contents of the flash chip.
Chapter 2. API Reference

Note: NVS works best for storing many small values, rather than a few large values of the type ‘string’ and ‘blob’. If you need to store large blobs or strings, consider using the facilities provided by the FAT filesystem on top of the wear levelling library.

Keys and Values  NVS operates on key-value pairs. Keys are ASCII strings; the maximum key length is currently 15 characters. Values can have one of the following types:

- integer types: uint8_t, int8_t, uint16_t, int16_t, uint32_t, int32_t, uint64_t, int64_t
- zero-terminated string
- variable length binary data (blob)

Note: String values are currently limited to 4000 bytes. This includes the null terminator. Blob values are limited to 508,000 bytes or 97.6% of the partition size - 4000 bytes, whichever is lower.

Keys are required to be unique. Assigning a new value to an existing key replaces the old value and data type specified by a write operation.

A data type check is performed when reading a value. An error is returned if the data type expected by read operation does not match the data type of entry found for the key provided.

Namespaces  To mitigate potential conflicts in key names between different components, NVS assigns each key-value pair to one of namespaces. Namespace names follow the same rules as key names, i.e., the maximum length is 15 characters. Furthermore, there can be no more than 254 different namespaces in one NVS partition. Namespace name is specified in the nvs_open() or nvs_open_from_partition call. This call returns an opaque handle, which is used in subsequent calls to the nvs_get_* , nvs_set_* , and nvs_commit() functions. This way, a handle is associated with a namespace, and key names will not collide with same names in other namespaces. Please note that the namespaces with the same name in different NVS partitions are considered as separate namespaces.

NVS Iterators  Iterators allow to list key-value pairs stored in NVS, based on specified partition name, namespace, and data type.

There are the following functions available:

- nvs_entry_find() creates an opaque handle, which is used in subsequent calls to the nvs_entry_next() and nvs_entry_info() functions.
- nvs_entry_next() advances an iterator to the next key-value pair.
- nvs_entry_info() returns information about each key-value pair

In general, all iterators obtained via nvs_entry_find() have to be released using nvs_release_iterator(), which also tolerates NULL iterators.

nvs_entry_find() and nvs_entry_next() set the given iterator to NULL or a valid iterator in all cases except a parameter error occurred (i.e., return ESP_ERR_NVS_NOT_FOUND). In case of a parameter error, the given iterator will not be modified. Hence, it is best practice to initialize the iterator to NULL before calling nvs_entry_find() to avoid complicated error checking before releasing the iterator.

Security, Tampering, and Robustness  NVS is not directly compatible with the ESP32-S2 flash encryption system. However, data can still be stored in encrypted form if NVS encryption is used together with ESP32-S2 flash encryption or with the help of the HMAC peripheral. Please refer to NVS Encryption for more details.

If NVS encryption is not used, it is possible for anyone with physical access to the flash chip to alter, erase, or add key-value pairs. With NVS encryption enabled, it is not possible to alter or add a key-value pair and get recognized
as a valid pair without knowing corresponding NVS encryption keys. However, there is no tamper-resistance against the erase operation.

The library does try to recover from conditions when flash memory is in an inconsistent state. In particular, one should be able to power off the device at any point and time and then power it back on. This should not result in loss of data, except for the new key-value pair if it was being written at the moment of powering off. The library should also be able to initialize properly with any random data present in flash memory.

**NVS Encryption**

Please refer to the *NVS Encryption* guide for more details.

**NVS Partition Generator Utility**

This utility helps generate NVS partition binary files which can be flashed separately on a dedicated partition via a flashing utility. Key-value pairs to be flashed onto the partition can be provided via a CSV file. For more details, please refer to *NVS Partition Generator Utility*.

Instead of calling the `nvs_partition_gen.py` tool manually, the creation of the partition binary files can also be done directly from CMake using the function `nvs_create_partition_image`:

```
nvs_create_partition_image(<partition> <csv> [FLASH_IN_PROJECT] [DEPENDS dep dep...])
```

**Positional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>partition</td>
<td>Name of the NVS partition</td>
</tr>
<tr>
<td>csv</td>
<td>Path to CSV file to parse</td>
</tr>
</tbody>
</table>

**Optional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FLASH_IN_PROJECT</td>
<td>Name of the NVS partition</td>
</tr>
<tr>
<td>DEPENDS</td>
<td>Specify files on which the command depends</td>
</tr>
</tbody>
</table>

If `FLASH_IN_PROJECT` is not specified, the image will still be generated, but you will have to flash it manually using `idf.py <partition>-flash` (e.g., if your partition name is `nvs`, then use `idf.py nvs-flash`).

`nvs_create_partition_image` must be called from one of the component `CMakeLists.txt` files. Currently, only non-encrypted partitions are supported.

**Application Example**

You can find code examples in the `storage` directory of ESP-IDF examples:

- `storage/nvs_rw_value`
  
  Demonstrates how to read a single integer value from, and write it to NVS.

  The value checked in this example holds the number of the ESP32-S2 module restarts. The value’s function as a counter is only possible due to its storing in NVS.

  The example also shows how to check if a read/write operation was successful, or if a certain value has not been initialized in NVS. The diagnostic procedure is provided in plain text to help you track the program flow and capture any issues on the way.

- `storage/nvs_rw_blob`
Demonstrates how to read a single integer value and a blob (binary large object), and write them to NVS to preserve this value between ESP32-S2 module restarts.

- value - tracks the number of the ESP32-S2 module soft and hard restarts.
- blob - contains a table with module run times. The table is read from NVS to dynamically allocated RAM. A new run time is added to the table on each manually triggered soft restart, and then the added run time is written to NVS. Triggering is done by pulling down GPIO0.

The example also shows how to implement the diagnostic procedure to check if the read/write operation was successful.

```
storage/nvs_rw_value_cxx
```

This example does exactly the same as `storage/nvs_rw_value`, except that it uses the C++ NVS handle class.

**Internals**

**Log of Key-Value Pairs** NVS stores key-value pairs sequentially, with new key-value pairs being added at the end. When a value of any given key has to be updated, a new key-value pair is added at the end of the log and the old key-value pair is marked as erased.

**Pages and Entries** NVS library uses two main entities in its operation: pages and entries. Page is a logical structure which stores a portion of the overall log. Logical page corresponds to one physical sector of flash memory. Pages which are in use have a sequence number associated with them. Sequence numbers impose an ordering on pages. Higher sequence numbers correspond to pages which were created later. Each page can be in one of the following states:

- **Empty/uninitialized** Flash storage for the page is empty (all bytes are 0xFF). Page is not used to store any data at this point and does not have a sequence number.
- **Active** Flash storage is initialized, page header has been written to flash, page has a valid sequence number. Page has some empty entries and data can be written there. No more than one page can be in this state at any given moment.
- **Full** Flash storage is in a consistent state and is filled with key-value pairs. Writing new key-value pairs into this page is not possible. It is still possible to mark some key-value pairs as erased.
- **Erasing** Non-erased key-value pairs are being moved into another page so that the current page can be erased. This is a transient state, i.e., page should never stay in this state at the time when any API call returns. In case of a sudden power off, the move-and-erase process will be completed upon the next power-on.
- **Corrupted** Page header contains invalid data, and further parsing of page data was canceled. Any items previously written into this page will not be accessible. The corresponding flash sector will not be erased immediately and will be kept along with sectors in uninitialized state for later use. This may be useful for debugging.

Mapping from flash sectors to logical pages does not have any particular order. The library will inspect sequence numbers of pages found in each flash sector and organize pages in a list based on these numbers.

| +--------+ +--------+ +--------+ +--------+ |
| Page 1 | Page 2 | Page 3 | Page 4 |
| Full | Full | Active | Empty | +/- states |
| #11 | #12 | #14 | | +/- sequence numbers |
| +--------+ +--------+ +--------+ +--------+ |
| | | | |
| | | | |
| +--------+ +--------+ +--------+ +--------+ |
| Sector 3 | Sector 0 | Sector 2 | Sector 1 | +/- physical sectors |

**Structure of a Page** For now, we assume that flash sector size is 4096 bytes and that ESP32-S2 flash encryption hardware operates on 32-byte blocks. It is possible to introduce some settings configurable at compile-time (e.g., via
menuconfig) to accommodate flash chips with different sector sizes (although it is not clear if other components in
the system, e.g., SPI flash driver and SPI flash cache can support these other sizes).

Page consists of three parts: header, entry state bitmap, and entries themselves. To be compatible with ESP32-S2
flash encryption, the entry size is 32 bytes. For integer types, an entry holds one key-value pair. For strings and blobs,
an entry holds part of key-value pair (more on that in the entry structure description).

The following diagram illustrates the page structure. Numbers in parentheses indicate the size of each part in bytes.

```
+---------------------+---------------------+---------------------+---------------------+---------------------+---------------------+
| State (4) | Seq. no. (4) | version (1) | Unused (19) | CRC32 (4) | Header (32) |
+---------------------+---------------------+---------------------+---------------------+---------------------+---------------------+
| Entry state bitmap (32) |
+---------------------+---------------------+---------------------+---------------------+---------------------+---------------------+
| Entry 0 (32) |
+---------------------+---------------------+---------------------+---------------------+---------------------+---------------------+
| Entry 1 (32) |
+---------------------+---------------------+---------------------+---------------------+---------------------+---------------------+
| / |
+---------------------+---------------------+---------------------+---------------------+---------------------+---------------------+
| Entry 125 (32) |
+---------------------+---------------------+---------------------+---------------------+---------------------+---------------------+
```

Page header and entry state bitmap are always written to flash unencrypted. Entries are encrypted if flash encryption
feature of ESP32-S2 is used.

Page state values are defined in such a way that changing state is possible by writing 0 into some of the bits. Therefore
it is not necessary to erase the page to change its state unless that is a change to the erased state.

The version field in the header reflects the NVS format version used. For backward compatibility reasons, it is
decremented for every version upgrade starting at 0xff (i.e., 0xff for version-1, 0xfe for version-2 and so on).

CRC32 value in the header is calculated over the part which does not include a state value (bytes 4 to 28). The unused
part is currently filled with 0xff bytes.

The following sections describe the structure of entry state bitmap and entry itself.

**Entry and Entry State Bitmap** Each entry can be in one of the following three states represented with two bits in
the entry state bitmap. The final four bits in the bitmap (256 - 2 * 126) are not used.

**Empty (2’ b11)** Nothing is written into the specific entry yet. It is in an uninitialized state (all bytes are 0xff).

**Written (2’ b10)** A key-value pair (or part of key-value pair which spans multiple entries) has been written into
the entry.

**Erased (2’ b00)** A key-value pair in this entry has been discarded. Contents of this entry will not be parsed any-
more.

**Structure of Entry** For values of primitive types (currently integers from 1 to 8 bytes long), entry holds one key-
value pair. For string and blob types, entry holds part of the whole key-value pair. For strings, in case when a
key-value pair spans multiple entries, all entries are stored in the same page. Blobs are allowed to span over multiple
pages by dividing them into smaller chunks. For tracking these chunks, an additional fixed length metadata entry is
stored called “blob index”. Earlier formats of blobs are still supported (can be read and modified). However, once
the blobs are modified, they are stored using the new format.

```
+---------------------+---------------------+---------------------+---------------------+---------------------+---------------------+
| NS (1) | Type (1) | Span (1) | ChunkIndex (1) | CRC32 (4) | Key (16) | Data... |
+---------------------+---------------------+---------------------+---------------------+---------------------+---------------------+---------------------|
| (8) |
+---------------------+---------------------+---------------------+---------------------+---------------------+---------------------+---------------------|
+---------------------+---------------------+---------------------+---------------------+---------------------+---------------------+
```

(continues on next page)
Individual fields in entry structure have the following meanings:

**NS** Namespace index for this entry. For more information on this value, see the section on namespaces implementation.

**Type** One byte indicating the value data type. See the `ItemType` enumeration in `nvs_flash/include/nvs_handle.hpp` for possible values.

**Span** Number of entries used by this key-value pair. For integer types, this is equal to 1. For strings and blobs, this depends on value length.

**ChunkIndex** Used to store the index of a blob-data chunk for blob types. For other types, this should be 0xff.

**CRC32** Checksum calculated over all the bytes in this entry, except for the CRC32 field itself.

**Key** Zero-terminated ASCII string containing a key name. Maximum string length is 15 bytes, excluding a zero terminator.

**Data** For integer types, this field contains the value itself. If the value itself is shorter than 8 bytes, it is padded to the right, with unused bytes filled with 0xff.

For “blob index” entry, these 8 bytes hold the following information about data-chunks:

- **Size** (Only for blob index.) Size, in bytes, of complete blob data.
- **ChunkCount** (Only for blob index.) Total number of blob-data chunks into which the blob was divided during storage.
- **ChunkStart** (Only for blob index.) ChunkIndex of the first blob-data chunk of this blob. Subsequent chunks have ChunkIndex incrementally allocated (step of 1).

For string and blob data chunks, these 8 bytes hold additional data about the value, which are described below:

- **Size** (Only for strings and blobs.) Size, in bytes, of actual data. For strings, this includes zero terminators.
- **CRC32** (Only for strings and blobs.) Checksum calculated over all bytes of data.

Variable length values (strings and blobs) are written into subsequent entries, 32 bytes per entry. The Span field of the first entry indicates how many entries are used.

**Namespaces** As mentioned above, each key-value pair belongs to one of the namespaces. Namespace identifiers (strings) are stored as keys of key-value pairs in namespace with index 0. Values corresponding to these keys are indexes of these namespaces.

| NS-0 Type-uint8_t Key="wifi" Value-1 | Entry describing namespace "wifi" |
| NS-1 Type-uint32_t Key="channel" Value-6 | Key "channel" in namespace "wifi" |
| NS-0 Type-uint8_t Key="pwm" Value-2 | Entry describing namespace "pwm" |
| NS-2 Type-uint16_t Key="channel" Value-20 | Key "channel" in namespace "pwm" |
Item Hash List

To reduce the number of reads from flash memory, each member of the Page class maintains a list of pairs: item index; item hash. This list makes searches much quicker. Instead of iterating over all entries, reading them from flash one at a time, `Page::findItem` first performs a search for the item hash in the hash list. This gives the item index within the page if such an item exists. Due to a hash collision, it is possible that a different item is found. This is handled by falling back to iteration over items in flash.

Each node in the hash list contains a 24-bit hash and 8-bit item index. Hash is calculated based on item namespace, key name, and ChunkIndex. CRC32 is used for calculation; the result is truncated to 24 bits. To reduce the overhead for storing 32-bit entries in a linked list, the list is implemented as a double-linked list of arrays. Each array holds 29 entries, for the total size of 128 bytes, together with linked list pointers and a 32-bit count field. The minimum amount of extra RAM usage per page is therefore 128 bytes; maximum is 640 bytes.

API Reference

Header File

- components/nvs_flash/include/nvs_flash.h
- This header file can be included with:

```c
#include "nvs_flash.h"
```
- This header file is a part of the API provided by the `nvs_flash` component. To declare that your component depends on `nvs_flash`, add the following to your CMakeLists.txt:

```cmake
REQUIRES nvs_flash
```

or

```cmake
PRIV_REQUIRES nvs_flash
```

Functions

`esp_err_t nvs_flash_init (void)`

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

When “NVS_ENCRYPTION” is enabled in the menuconfig, this API enables the NVS encryption for the default NVS partition as follows

a. Read security configurations from the first NVS key partition listed in the partition table. (NVS key partition is any “data” type partition which has the subtype value set to “nvs_keys”)

b. If the NVS key partition obtained in the previous step is empty, generate and store new keys in that NVS key partition.

c. Internally call “nvs_flash_secure_init()” with the security configurations obtained/generated in the previous steps.

Post initialization NVS read/write APIs remain the same irrespective of NVS encryption.

Returns

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver
- error codes from `nvs_flash_read_security_cfg` API (when “NVS_ENCRYPTION” is enabled).
- error codes from `nvs_flash_generate_keys` API (when “NVS_ENCRYPTION” is enabled).
• error codes from nvs_flash_secure_init_partition API (when “NVS_ENCRYPTION” is enabled).

```c
esp_err_t nvs_flash_init_partition (const char *partition_label)
```
Initialize NVS flash storage for the specified partition.

**Parameters** `partition_label` – **[in]** Label of the partition. Must be no longer than 16 characters.

**Returns**
- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

```c
esp_err_t nvs_flash_init_partition_ptr (const esp_partition_t *partition)
```
Initialize NVS flash storage for the partition specified by partition pointer.

**Parameters** `partition` – **[in]** pointer to a partition obtained by the ESP partition API.

**Returns**
- ESP_OK if storage was successfully initialized
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_INVALID_ARG in case partition is NULL
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

```c
esp_err_t nvs_flash_deinit (void)
```
Deinitialize NVS storage for the default NVS partition.

Default NVS partition is the partition with “nvs” label in the partition table.

**Returns**
- ESP_OK on success (storage was deinitialized)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage was not initialized prior to this call

```c
esp_err_t nvs_flash_deinit_partition (const char *partition_label)
```
Deinitialize NVS storage for the given NVS partition.

**Parameters** `partition_label` – **[in]** Label of the partition

**Returns**
- ESP_OK on success
- ESP_ERR_NVS_NOT_INITIALIZED if the storage for given partition was not initialized prior to this call

```c
esp_err_t nvs_flash_erase (void)
```
Erase the default NVS partition.

Erases all contents of the default NVS partition (one with label “nvs”).

**Note:** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

**Returns**
- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no NVS partition labeled “nvs” in the partition table
- different error in case de-initialization fails (shouldn’t happen)
**esp_err_t nvs_flash_erase_partition**(const char *part_name)

Erase specified NVS partition.
Erase all content of a specified NVS partition

**Note:** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

**Parameters**  
**part_name** - [in] Name (label) of the partition which should be erased

**Returns**  
- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no NVS partition with the specified name in the partition table
- different error in case de-initialization fails (shouldn’t happen)

**esp_err_t nvs_flash_erase_partition_ptr**(const esp_partition_t *partition)

Erase custom partition.
Erase all content of specified custom partition.

**Note:** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

**Parameters**  
**partition** - [in] pointer to a partition obtained by the ESP partition API.

**Returns**  
- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no partition with the specified parameters in the partition table
- ESP_ERR_INVALID_ARG in case partition is NULL
- one of the error codes from the underlying flash storage driver

**esp_err_t nvs_flash_secure_init**(nvs_sec_cfg_t *cfg)

Initialize the default NVS partition.
This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

**Parameters**  
**cfg** - [in] Security configuration (keys) to be used for NVS encryption/decryption. If cfg is NULL, no encryption is used.

**Returns**  
- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVSD_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

**esp_err_t nvs_flash_secure_init_partition**(const char *partition_label, nvs_sec_cfg_t *cfg)

Initialize NVS flash storage for the specified partition.

**Parameters**  
- **partition_label** - [in] Label of the partition. Note that internally, a reference to passed value is kept and it should be accessible for future operations
- **cfg** - [in] Security configuration (keys) to be used for NVS encryption/decryption. If cfg is null, no encryption/decryption is used.

**Returns**  
- ESP_OK if storage has been initialized successfully.
• ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
• ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
• ESP_ERR_NVS_NO_MEM in case memory could not be allocated for the internal structures
  one of the error codes from the underlying flash storage driver

\[
\text{esp_err_t nvs_flash_generate_keys (const esp_partition_t *partition, nvs_sec_cfg_t *cfg)}
\]
Generate and store NVS keys in the provided esp partition.

**Parameters**
- **partition** – [in] Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- **cfg** – [out] Pointer to nvs security configuration structure. Pointer must be non-NULL. Generated keys will be populated in this structure.

**Returns**
- ESP_OK, if cfg was read successfully;
- ESP_ERR_INVALID_ARG, if partition or cfg is NULL;
- or error codes from esp_partition_write/erase APIs.

\[
\text{esp_err_t nvs_flash_read_security_cfg (const esp_partition_t *partition, nvs_sec_cfg_t *cfg)}
\]
Read NVS security configuration from a partition.

**Note:** Provided partition is assumed to be marked ‘encrypted’.

**Parameters**
- **partition** – [in] Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- **cfg** – [out] Pointer to nvs security configuration structure. Pointer must be non-NULL.

**Returns**
- ESP_OK, if cfg was read successfully;
- ESP_ERR_INVALID_ARG, if partition or cfg is NULL;
- ESP_ERR_NVS_KEYS_NOT_INITIALIZED, if the partition is not yet written with keys.
- ESP_ERR_NVS_CORRUPT_KEY_PART, if the partition containing keys is found to be corrupt
- or error codes from esp_partition_read API.

\[
\text{esp_err_t nvs_flash_register_security_scheme (nvs_sec_scheme_t *scheme_cfg)}
\]
Registers the given security scheme for NVS encryption. The scheme registered with sec_scheme_id by this API is used as the default security scheme for the “nvs” partition. Users will have to call this API explicitly in their application.

**Parameters**
- **scheme_cfg** – [in] Pointer to the security scheme configuration structure that the user (or the nvs_key_provider) wants to register.

**Returns**
- ESP_OK, if security scheme registration succeeds;
- ESP_ERR_INVALID_ARG, if scheme_cfg is NULL;
- ESP_FAIL, if security scheme registration fails

\[
\text{nvs_sec_scheme_t *nvs_flash_get_default_security_scheme (void)}
\]
Fetch the configuration structure for the default active security scheme for NVS encryption.

**Returns**
- Pointer to the default active security scheme configuration (NULL if no scheme is registered yet i.e. active)

\[
\text{esp_err_t nvs_flash_generate_keys_v2 (nvs_sec_scheme_t *scheme_cfg, nvs_sec_cfg_t *cfg)}
\]
Generate (and store) the NVS keys using the specified key-protection scheme.

**Parameters**
• 
• 

\textbf{Returns}
\begin{itemize}
  \item ESP_OK, if cfg was populated successfully with generated encryption keys;
  \item ESP_ERR_INVALID_ARG, if scheme\_cfg or \textit{cfg} is NULL;
  \item ESP_FAIL, if the key generation process fails
\end{itemize}

\texttt{esp\_err\_t nvs\_flash\_read\_security\_cfg\_v2 (nvs\_sec\_scheme\_t *scheme\_cfg, nvs\_sec\_cfg\_t *\textit{cfg})}

Read NVS security configuration set by the specified security scheme.

\textbf{Parameters}
\begin{itemize}
  \item \textbf{scheme\_cfg} – \textbf{[in]} Security scheme specific configuration
  \item \textbf{\textit{cfg}} – \textbf{[out]} Security configuration (encryption keys)
\end{itemize}

\textbf{Returns}
\begin{itemize}
  \item ESP_OK, if \textit{cfg} was read successfully;
  \item ESP_ERR_INVALID_ARG, if \textit{scheme\_cfg} or \textit{\textit{cfg}} is NULL;
  \item ESP_FAIL, if the key reading process fails
\end{itemize}

\textbf{Structures}

\textbf{struct nvs\_sec\_cfg\_t}

Key for encryption and decryption.

\textbf{Public Members}

\begin{itemize}
  \item \texttt{uint8\_t eky[NVS\_KEY\_SIZE]}
    XTS encryption and decryption key
  \item \texttt{uint8\_t tky[NVS\_KEY\_SIZE]}
    XTS tweak key
\end{itemize}

\textbf{struct nvs\_sec\_scheme\_t}

NVS encryption: Security scheme configuration structure.

\textbf{Public Members}

\begin{itemize}
  \item \texttt{int scheme\_id}
    Security Scheme ID (E.g. HMAC)
  \item \texttt{\*scheme\_data}
    Scheme-specific data (E.g. eFuse block for HMAC-based key generation)
\end{itemize}

\textbf{nvs\_flash\_generate\_keys\_t nvs\_flash\_key\_gen}

Callback for the \texttt{nvs\_flash\_key\_gen} implementation

\textbf{nvs\_flash\_read\_cfg\_t nvs\_flash\_read\_cfg}

Callback for the \texttt{nvs\_flash\_read\_keys} implementation

\textbf{Macros}

\texttt{NVS\_KEY\_SIZE}
Type Definitions

typedef esp_err_t (*nvs_flash_generate_keys_t)(const void *scheme_data, nvs_sec_cfg_t *cfg)
    Callback function prototype for generating the NVS encryption keys.

typedef esp_err_t (*nvs_flash_read_cfg_t)(const void *scheme_data, nvs_sec_cfg_t *cfg)
    Callback function prototype for reading the NVS encryption keys.

Header File

- components/nvs_flash/include/nvs.h
- This header file can be included with:

```c
#include "nvs.h"
```
- This header file is a part of the API provided by the nvs_flash component. To declare that your component depends on nvs_flash, add the following to your CMakeLists.txt:

```cmake
REQUIRES nvs_flash
```
or

```cmake
PRIV_REQUIRES nvs_flash
```

Functions

**esp_err_t nvs_set_i8** (nvs_handle_t handle, const char *key, int8_t value)
set int8_t value for given key

Set value for the key, given its name. Note that the actual storage will not be updated until nvs_commit is called. Regardless whether key-value pair is created or updated, function always requires at least one nvs available entry. See nvs_get_stats. After create type of operation, the number of available entries is decreased by one. After update type of operation, the number of available entries remains the same.

**Parameters**

- **handle** -[in] Handle obtained from nvs_open function. Handles that were opened read only cannot be used.
- **key** -[in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- **value** -[in] The value to set.

**Returns**

- ESP_OK if value was set successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation didn’t fail again.

**esp_err_t nvs_set_u8** (nvs_handle_t handle, const char *key, uint8_t value)
set uint8_t value for given key

This function is the same as nvs_set_i8 except for the data type.

**esp_err_t nvs_set_i16** (nvs_handle_t handle, const char *key, int16_t value)
set int16_t value for given key

This function is the same as nvs_set_i8 except for the data type.
`esp_err_t nvs_set_u16(nvs_handle_t handle, const char *key, uint16_t value)`  
set uint16_t value for given key  
This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_i32(nvs_handle_t handle, const char *key, int32_t value)`  
set int32_t value for given key  
This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_u32(nvs_handle_t handle, const char *key, uint32_t value)`  
set uint32_t value for given key  
This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_i64(nvs_handle_t handle, const char *key, int64_t value)`  
set int64_t value for given key  
This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_u64(nvs_handle_t handle, const char *key, uint64_t value)`  
set uint64_t value for given key  
This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_str(nvs_handle_t handle, const char *key, const char *value)`  
set string for given key  
Sets string value for the key. Function requires whole space for new data to be available as contiguous entries in same nvs page. Operation consumes 1 overhead entry and 1 entry per each 32 characters of new string including zero character to be set. In case of value update for existing key, entries occupied by the previous value and overhead entry are returned to the pool of available entries. Note that storage of long string values can fail due to fragmentation of nvs pages even if `available_entries` returned by `nvs_get_stats` suggests enough overall space available. Note that the underlying storage will not be updated until `nvs_commit` is called.

**Parameters**

- `handle` — [in] Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- `key` — [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- `value` — [in] The value to set. For strings, the maximum length (including null character) is 4000 bytes, if there is one complete page free for writing. This decreases, however, if the free space is fragmented.

**Returns**

- ESP_OK if value was set successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.
- ESP_ERR_NVS_VALUE_TOO_LONG if the string value is too long

`esp_err_t nvs_get_i8(nvs_handle_t handle, const char *key, int8_t *out_value)`  
get int8_t value for given key  
These functions retrieve value for the key, given its name. If key does not exist, or the requested variable type doesn’t match the type which was used when setting a value, an error is returned.

In case of any error, `out_value` is not modified.

`out_value` has to be a pointer to an already allocated variable of the given type.
// Example of using nvs_get_i32:
int32_t max_buffer_size = 4096; // default value
esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
// if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
// have its default value.

Parameters
- **handle** – [in] Handle obtained from nvs_open function.
- **key** – [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- **out_value** – Pointer to the output value. May be NULL for nvs_get_str and nvs_get_blob, in this case required length will be returned in length argument.

Returns
- ESP_OK if the value was retrieved successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data

```c
esp_err_t nvs_get_u8 (nvs_handle_t handle, const char *key, uint8_t *out_value)
get uint8_t value for given key
This function is the same as nvs_get_i8 except for the data type.
```

```c
esp_err_t nvs_get_i16 (nvs_handle_t handle, const char *key, int16_t *out_value)
get int16_t value for given key
This function is the same as nvs_get_i8 except for the data type.
```

```c
esp_err_t nvs_get_u16 (nvs_handle_t handle, const char *key, uint16_t *out_value)
get uint16_t value for given key
This function is the same as nvs_get_i8 except for the data type.
```

```c
esp_err_t nvs_get_i32 (nvs_handle_t handle, const char *key, int32_t *out_value)
get int32_t value for given key
This function is the same as nvs_get_i8 except for the data type.
```

```c
esp_err_t nvs_get_u32 (nvs_handle_t handle, const char *key, uint32_t *out_value)
get uint32_t value for given key
This function is the same as nvs_get_i8 except for the data type.
```

```c
esp_err_t nvs_get_i64 (nvs_handle_t handle, const char *key, int64_t *out_value)
get int64_t value for given key
This function is the same as nvs_get_i8 except for the data type.
```

```c
esp_err_t nvs_get_u64 (nvs_handle_t handle, const char *key, uint64_t *out_value)
get uint64_t value for given key
This function is the same as nvs_get_i8 except for the data type.
```

```c
esp_err_t nvs_get_str (nvs_handle_t handle, const char *key, char *out_value, size_t *length)
get string value for given key
These functions retrieve the data of an entry, given its key. If key does not exist, or the requested variable type doesn’t match the type which was used when setting a value, an error is returned.
```
Chapter 2. API Reference

In case of any error, out_value is not modified.

All functions expect out_value to be a pointer to an already allocated variable of the given type.

nvs_get_str and nvs_get_blob functions support WinAPI-style length queries. To get the size necessary to store the value, call nvs_get_str or nvs_get_blob with zero out_value and non-zero pointer to length. Variable pointed to by length argument will be set to the required length. For nvs_get_str, this length includes the zero terminator. When calling nvs_get_str and nvs_get_blob with non-zero out_value, length has to be non-zero and has to point to the length available in out_value. It is suggested that nvs_get/set_str is used for zero-terminated C strings, and nvs_get/set_blob used for arbitrary data structures.

// Example (without error checking) of using nvs_get_str to get a string into a dynamic array:
size_t required_size;
nvs_get_str(my_handle, "server_name", NULL, &required_size);
char * server_name = malloc(required_size);
nvs_get_str(my_handle, "server_name", server_name, &required_size);

// Example (without error checking) of using nvs_get_blob to get a binary data into a static array:
uint8_t mac_addr[6];
size_t size = sizeof(mac_addr);
nvs_get_blob(my_handle, "dst_mac_addr", mac_addr, &size);

Parameters

- **handle** - [in] Handle obtained from nvs_open function.
- **key** - [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- **out_value** - [out] Pointer to the output value. May be NULL for nvs_get_str and nvs_get_blob, in this case required length will be returned in length argument.
- **length** - [inout] A non-zero pointer to the variable holding the length of out_value. In case out_value a zero, will be set to the length required to hold the value. In case out_value is not zero, will be set to the actual length of the value written. For nvs_get_str this includes zero terminator.

Returns

- ESP_OK if the value was retrieved successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data

```
esp_err_t nvs_get_blob(nvs_handle_t handle, const char *key, void *out_value, size_t *length)
get blob value for given key
```

This function behaves the same as nvs_get_str, except for the data type.

```
esp_err_t nvs_open(const char *namespace_name, nvs_open_mode_t open_mode, nvs_handle_t *out_handle)
Open non-volatile storage with a given namespace from the default NVS partition.
```

Multiple internal ESP-IDF and third party application modules can store their key-value pairs in the NVS module. In order to reduce possible conflicts on key names, each module can use its own namespace. The default NVS partition is the one that is labelled “nvs” in the partition table.

Parameters

- **namespace_name** - [in] Namespace name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- **open_mode** - [in] NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
• **out_handle**  [out] If successful (return code is zero), handle will be returned in this argument.

**Returns**

- ESP_OK if storage handle was opened successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with label “nvs” is not found
- ESP_ERR_NVS_NOT_FOUND id namespace doesn’t exist yet and mode is NVS_READONLY
- ESP_ERR_NVS_INVALID_NAME if namespace name doesn’t satisfy constraints
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is no space for a new entry or there are too many different namespaces (maximum allowed different namespaces: 254)
- ESP_ERR_NOT_ALLOWED if the NVS partition is read-only and mode is NVS_READWRITE
- ESP_ERR_INVALID_ARG if out_handle is equal to NULL
- other error codes from the underlying storage driver

```c
esp_err_t nvs_open_from_partition(const char* part_name, const char* namespace_name,
                                  nvs_open_mode_t open_mode, nvs_handle_t *out_handle)
```

Open non-volatile storage with a given namespace from specified partition.

The behaviour is same as nvs_open() API. However this API can operate on a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using nvs_flash_init_partition() API.

**Parameters**

- **part_name**  [in] Label (name) of the partition of interest for object read/write/erase
- **namespace_name**  [in] Namespace name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- **open_mode**  [in] NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- **out_handle**  [out] If successful (return code is zero), handle will be returned in this argument.

**Returns**

- ESP_OK if storage handle was opened successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with specified name is not found
- ESP_ERR_NVS_NOT_FOUND id namespace doesn’t exist yet and mode is NVS_READONLY
- ESP_ERR_NVS_INVALID_NAME if namespace name doesn’t satisfy constraints
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is no space for a new entry or there are too many different namespaces (maximum allowed different namespaces: 254)
- ESP_ERR_NOT_ALLOWED if the NVS partition is read-only and mode is NVS_READWRITE
- ESP_ERR_INVALID_ARG if out_handle is equal to NULL
- other error codes from the underlying storage driver

```c
esp_err_t nvs_set_blob(nvs_handle_t handle, const char *key, const void *value, size_t length)
```

Sets variable length binary value for given key

Sets variable length binary value for the key. Function uses 2 overhead and 1 entry per each 32 bytes of new data from the pool of available entries. See nvs_get_stats. In case of value update for existing key, space occupied by the existing value and 2 overhead entries are returned to the pool of available entries. Note that the underlying storage will not be updated until nvs_commit is called.

**Parameters**
• **handle** – [in] Handle obtained from nvs_open function. Handles that were opened read only cannot be used.

• **key** – [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.

• **value** – [in] The value to set.

• **length** – [in] length of binary value to set, in bytes; Maximum length is 508000 bytes or (97.6% of the partition size - 4000) bytes whichever is lower.

**Returns**

- ESP_OK if value was set successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.
- ESP_ERR_NVS_VALUE_TOO_LONG if the value is too long

```c
esp_err_t nvs_erase_key (nvs_handle_t handle, const char *key)
```

Erase key-value pair with given key name.

Note that actual storage may not be updated until nvs_commit function is called.

**Parameters**

- **handle** – [in] Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.

- **key** – [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.

**Returns**

- ESP_OK if erase operation was successful
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if handle was opened as read only
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
- other error codes from the underlying storage driver

```c
esp_err_t nvs_erase_all (nvs_handle_t handle)
```

Erase all key-value pairs in a namespace.

Note that actual storage may not be updated until nvs_commit function is called.

**Parameters**

- **handle** – [in] Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.

**Returns**

- ESP_OK if erase operation was successful
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if handle was opened as read only
- other error codes from the underlying storage driver

```c
esp_err_t nvs_commit (nvs_handle_t handle)
```

Write any pending changes to non-volatile storage.

After setting any values, nvs_commit() must be called to ensure changes are written to non-volatile storage. Individual implementations may write to storage at other times, but this is not guaranteed.
### Chapter 2. API Reference

#### Parameters

**handle**  - [in] Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.

#### Returns

- ESP_OK if the changes have been written successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- other error codes from the underlying storage driver

#### void nvs_close(nvs_handle_t handle)

Close the storage handle and free any allocated resources.

This function should be called for each handle opened with nvs_open once the handle is not in use any more. Closing the handle may not automatically write the changes to nonvolatile storage. This has to be done explicitly using nvs_commit function. Once this function is called on a handle, the handle should no longer be used.

##### Parameters

**handle**  - [in] Storage handle to close

#### esp_err_t nvs_get_stats(const char* part_name, nvs_stats_t *nvs_stats)

Fill structure `nvs_stats_t`. It provides info about memory used by NVS.

This function calculates the number of used entries, free entries, available entries, total entries and number of namespaces in partition.

```c
// Example of nvs_get_stats() to get overview of actual statistics of data...

nvs_stats_t nvs_stats;
nvs_get_stats(NULL, &nvs_stats);
printf("Count: UsedEntries = (%lu), FreeEntries = (%lu), AvailableEntries = (%lu), AllEntries = (%lu)\n",
        nvs_stats.used_entries, nvs_stats.free_entries, nvs_stats.available_entries, nvs_stats.total_entries);
```

##### Parameters

- **part_name**  - [in] Partition name NVS in the partition table. If pass a NULL than will use NVS_DEFAULT_PART_NAME( "nvs" ).
- **nvs_stats**  - [out] Returns filled structure nvs_states_t. It provides info about used memory the partition.

##### Returns

- ESP_OK if the changes have been written successfully. Return param nvs_stats will be filled.
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with label “name” is not found. Return param nvs_stats will be filled 0.
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return param nvs_stats will be filled 0.
- ESP_ERR_INVALID_ARG if nvs_stats is equal to NULL.
- ESP_ERR_INVALID_STATE if there is page with the status of INVALID. Return param nvs_stats will be filled not with correct values because not all pages will be counted. Counting will be interrupted at the first INVALID page.

#### esp_err_t nvs_get_used_entry_count(nvs_handle_t handle, size_t *used_entries)

Calculate all entries in a namespace.

An entry represents the smallest storage unit in NVS. Strings and blobs may occupy more than one entry. Note that to find out the total number of entries occupied by the namespace, add one to the returned value `used_entries` (if err is equal to ESP_OK). Because the name space entry takes one entry.

```c
// Example of nvs_get_used_entry_count() to get amount of all key-value pairs...

nvs_handle_t handle;
```
nvs_open("namespace1", NVS_READWRITE, &handle);
...
size_t used_entries;
size_t total_entries_namespace;
if(nvs_get_used_entry_count(handle, &used_entries) == ESP_OK){
    // the total number of entries occupied by the namespace
    total_entries_namespace = used_entries + 1;
}

Parameters
- **handle** [in] Handle obtained from nvs_open function.
- **used_entries** [out] Returns amount of used entries from a namespace.

Returns
- ESP_OK if the changes have been written successfully. Return param used_entries will be filled valid value.
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return param used_entries will be filled 0.
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL. Return param used_entries will be filled 0.
- ESP_ERR_NVS_INVALID_ARG if used_entries is equal to NULL.
- Other error codes from the underlying storage driver. Return param used_entries will be filled 0.

**esp_err_t nvs_entry_find**

*(const char *part_name, const char *namespace_name, nvs_type_t type, nvs_iterator_t *output_iterator)*

Create an iterator to enumerate NVS entries based on one or more parameters.

```c
// Example of listing all the key-value pairs of any type under specified partition and namespace
nvs_iterator_t it = NULL;
esp_err_t res = nvs_entry_find(<nvs_partition_name>, <namespace>, NVS_TYPE_ANY, &it);
while(res == ESP_OK) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info); // Can omit error check if parameters are guaranteed to be non-NULL
    printf("key '%s', type '%d' \n", info.key, info.type);
    res = nvs_entry_next(&it);
}
```

Parameters
- **part_name** [in] Partition name
- **namespace_name** [in] Set this value if looking for entries with a specific namespace. Pass NULL otherwise.
- **type** [in] One of nvs_type_t values.
- **output_iterator** [out] Set to a valid iterator to enumerate all the entries found. Set to NULL if no entry for specified criteria was found. If any other error except ESP_ERR_INVALID_ARG occurs, output_iterator is NULL, too. If ESP_ERR_INVALID_ARG occurs, output_iterator is not changed. If a valid iterator is obtained through this function, it has to be released using nvs_release_iterator when not used any more, unless ESP_ERR_INVALID_ARG is returned.

Returns
- ESP_OK if no internal error or programming error occurred.
- ESP_ERR_NVS_NOT_FOUND if no element of specified criteria has been found.
• ESP_ERR_NO_MEM if memory has been exhausted during allocation of internal structures.
• ESP_ERR_INVALID_ARG if any of the parameters is NULL. Note: don’t release output_iterator in case ESP_ERR_INVALID_ARG has been returned.

```
esp_err_t nvs_entry_find_in_handle(nvs_handle_t handle, nvs_type_t type, nvs_iterator_t *output_iterator)
```

Create an iterator to enumerate NVS entries based on a handle and type.

```
// Example of listing all the key-value pairs of any type under specified handle (which defines a partition and namespace)
nvs_iterator_t it = NULL;
esp_err_t res = nvs_entry_find_in_handle(<nvs_handle>, NVS_TYPE_ANY, &it);
while(res == ESP_OK) {
  nvs_entry_info_t info;
  nvs_entry_info(it, &info); // Can omit error check if parameters are guaranteed to be non-NULL
  printf("key '%s', type '%d' \n", info.key, info.type);
  res = nvs_entry_next(&it);
}
nvs_release_iterator(it);
```

**Parameters**

- **handle** - [in] Handle obtained from nvs_open function.
- **type** - [in] One of nvs_type_t values.
- **output_iterator** - [out] Set to a valid iterator to enumerate all the entries found. Set to NULL if no entry for specified criteria was found. If any other error except ESP_ERR_INVALID_ARG occurs, output_iterator is NULL, too. If ESP_ERR_INVALID_ARG occurs, output_iterator is not changed. If a valid iterator is obtained through this function, it has to be released using nvs_release_iterator when not used any more, unless ESP_ERR_INVALID_ARG is returned.

**Returns**

- ESP_OK if no internal error or programming error occurred.
- ESP_ERR_NVS_NOT_FOUND if no element of specified criteria has been found.
- ESP_ERR_NO_MEM if memory has been exhausted during allocation of internal structures.
- ESP_ERR_NVS_INVALID_HANDLE if unknown handle was specified.
- ESP_ERR_INVALID_ARG if output_iterator parameter is NULL. Note: don’t release output_iterator in case ESP_ERR_INVALID_ARG has been returned.

```
esp_err_t nvs_entry_next(nvs_iterator_t *iterator)
```

Advances the iterator to next item matching the iterator criteria.

**Note** that any copies of the iterator will be invalid after this call.

**Parameters**

- **iterator** - [inout] Iterator obtained from nvs_entry_find or nvs_entry_find_in_handle function. Must be non-NULL. If any error except ESP_ERR_INVALID_ARG occurs, iterator is set to NULL. If ESP_ERR_INVALID_ARG occurs, iterator is not changed.

**Returns**

- ESP_OK if no internal error or programming error occurred.
- ESP_ERR_NVS_NOT_FOUND if no next element matching the iterator criteria.
- ESP_ERR_INVALID_ARG if iterator is NULL.
- Possibly other errors in the future for internal programming or flash errors.

```
esp_err_t nvs_entry_info(const nvs_iterator_t iterator, nvs_entry_info_t *out_info)
```

Fills nvs_entry_info_t structure with information about entry pointed to by the iterator.
Parameters

- **iterator** [in] Iterator obtained from `nvs_entry_find` or `nvs_entry_find_in_handle` function. Must be non-NULL.

- **out_info** [out] Structure to which entry information is copied.

Returns

- ESP_OK if all parameters are valid; current iterator data has been written to `out_info`
- ESP_ERR_INVALID_ARG if one of the parameters is NULL.

```c
void nvs_release_iterator (nvs_iterator_t iterator)
```

Release iterator.

Parameters **iterator** [in] Release iterator obtained from `nvs_entry_find` or `nvs_entry_find_in_handle` or `nvs_entry_next` function. NULL argument is allowed.

Structures

```c
struct nvs_entry_info_t
```

Information about entry obtained from `nvs_entry_info` function

Public Members

```c
char namespace_name[NVS_NS_NAME_MAX_SIZE]
```

Namespace to which key-value belong

```c
char key[NVS_KEY_NAME_MAX_SIZE]
```

Key of stored key-value pair

```c
nvs_type_t type
```

Type of stored key-value pair

```c
struct nvs_stats_t
```

Note: Info about storage space NVS.

Public Members

```c
size_t used_entries
```

Number of used entries.

```c
size_t free_entries
```

Number of free entries. It includes also reserved entries.

```c
size_t available_entries
```

Number of entries available for data storage.

```c
size_t total_entries
```

Number of all entries.

```c
size_t namespace_count
```

Number of namespaces.
Chapter 2. API Reference

**Macros**

**ESP_ERR_NVS_BASE**
Starting number of error codes

**ESP_ERR_NVS_NOT_INITIALIZED**
The storage driver is not initialized

**ESP_ERR_NVS_NOT_FOUND**
A requested entry couldn’t be found or namespace doesn’t exist yet and mode is NVS_READONLY

**ESP_ERR_NVS_TYPE_MISMATCH**
The type of set or get operation doesn’t match the type of value stored in NVS

**ESP_ERR_NVS_READ_ONLY**
Storage handle was opened as read only

**ESP_ERR_NVS_NOT_ENOUGH_SPACE**
There is not enough space in the underlying storage to save the value

**ESP_ERR_NVS_INVALID_NAME**
Namespace name doesn’t satisfy constraints

**ESP_ERR_NVS_INVALID_HANDLE**
Handle has been closed or is NULL

**ESP_ERR_NVS_REMOVE_FAILED**
The value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

**ESP_ERR_NVS_KEY_TOO_LONG**
Key name is too long

**ESP_ERR_NVS_PAGE_FULL**
Internal error; never returned by nvs API functions

**ESP_ERR_NVS_INVALID_STATE**
NVS is in an inconsistent state due to a previous error. Call nvs_flash_init and nvs_open again, then retry.

**ESP_ERR_NVS_INVALID_LENGTH**
String or blob length is not sufficient to store data

**ESP_ERR_NVS_NO_FREE_PAGES**
NVS partition doesn’t contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs_flash_init again.

**ESP_ERR_NVS_VALUE_TOO_LONG**
Value doesn’t fit into the entry or string or blob length is longer than supported by the implementation

**ESP_ERR_NVS_PART_NOT_FOUND**
Partition with specified name is not found in the partition table
**ESP_ERR_NVS_NEW_VERSION_FOUND**
NVS partition contains data in new format and cannot be recognized by this version of code

**ESP_ERR_NVS_XTS_ENCR_FAILED**
XTS encryption failed while writing NVS entry

**ESP_ERR_NVS_XTS_DECR_FAILED**
XTS decryption failed while reading NVS entry

**ESP_ERR_NVS_XTS_CFG_FAILED**
XTS configuration setting failed

**ESP_ERR_NVS_XTS_CFG_NOT_FOUND**
XTS configuration not found

**ESP_ERR_NVS_ENCR_NOT_SUPPORTED**
NVS encryption is not supported in this version

**ESP_ERR_NVS_KEYS_NOT_INITIALIZED**
NVS key partition is uninitialized

**ESP_ERR_NVS_CORRUPT_KEY_Part**
NVS key partition is corrupt

**ESP_ERR_NVS_WRONG_ENCRYPTION**
NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

**ESP_ERR_NVS_CONTENT_DIFFERS**
Internal error; never returned by nvs API functions. NVS key is different in comparison

**NVS_DEFAULT_PART_NAME**
Default partition name of the NVS partition in the partition table

**NVS_PART_NAME_MAX_SIZE**
maximum length of partition name (excluding null terminator)

**NVS_KEY_NAME_MAX_SIZE**
Maximum length of NVS key name (including null terminator)

**NVS_NS_NAME_MAX_SIZE**
Maximum length of NVS namespace name (including null terminator)

**Type Definitions**

typedef uint32_t nvs_handle_t
Opaque pointer type representing non-volatile storage handle

typedef nvs_handle_t nvs_handle
typedef nvs_open_mode_t nvs_open_mode

typedef struct nvs_opaque_iterator_t *nvs_iterator_t

Opaque pointer type representing iterator to nvs entries

Enumerations

enum nvs_open_mode_t

Mode of opening the non-volatile storage.

Values:

enumerator NVS_READONLY

Read only

enumerator NVS_READWRITE

Read and write

denum nvs_type_t

Types of variables.

Values:

enumerator NVS_TYPE_U8

Type uint8_t

enumerator NVS_TYPE_I8

Type int8_t

enumerator NVS_TYPE_U16

Type uint16_t

enumerator NVS_TYPE_I16

Type int16_t

enumerator NVS_TYPE_U32

Type uint32_t

enumerator NVS_TYPE_I32

Type int32_t

enumerator NVS_TYPE_U64

Type uint64_t

enumerator NVS_TYPE_I64

Type int64_t

enumerator NVS_TYPE_STR

Type string
2.8.4 NVS Encryption

Overview

This guide provides an overview of the NVS encryption feature. NVS encryption helps to achieve secure storage on the device flash memory.

Data stored in NVS partitions can be encrypted using XTS-AES in the manner similar to the one mentioned in disk encryption standard IEEE P1619. For the purpose of encryption, each entry is treated as one sector and relative address of the entry (w.r.t., partition-start) is fed to the encryption algorithm as sector-number.

NVS encryption can be facilitated by enabling CONFIG_NVS_ENCRYPTION and CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME > CONFIG_NVS_SEC_KEY_PROTECT_USING_FLASH_ENC or CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC depending on the scheme to be used.

NVS Encryption: Flash Encryption-Based Scheme

In this scheme, the keys required for NVS encryption are stored in yet another partition, which is protected using Flash Encryption. Therefore, enabling Flash Encryption becomes a prerequisite for NVS encryption here.

NVS encryption is enabled by default when Flash Encryption is enabled. This is done because Wi-Fi driver stores credentials (like SSID and passphrase) in the default NVS partition. It is important to encrypt them as default choice if platform level encryption is already enabled.

For using NVS encryption using this scheme, the partition table must contain the NVS Key Partition. Two partition tables containing the NVS Key Partition are provided for NVS encryption under the partition table option (menuconfig>Partition Table). They can be selected with the project configuration menu (idf.py menuconfig). Please refer to the example security/flash_encryption for how to configure and use the NVS encryption feature.

NVS Key Partition

An application requiring NVS encryption support (using the Flash Encryption-based scheme) needs to be compiled with a key-partition of the type data and subtype key. This partition should be marked as encrypted and its size should be the minimum partition size (4 KB). Refer to Partition Tables for more details. Two additional partition tables which contain the NVS Key Partition are provided under the partition table option (menuconfig>Partition Table). They can be directly used for NVS encryption. The structure of these partitions is depicted below:

```
+-----------+--------------+-------------+----+
| XTS encryption key (32) |
+---------------------------------------------+
| XTS tweak key (32) |
+---------------------------------------------+
| CRC32 (4) |
+---------------------------------------------+
```

The XTS encryption keys in the NVS Key Partition can be generated in one of the following two ways.

Generate the keys on ESP32-S2 chip itself
• When NVS encryption is enabled, the `nvs_flash_init()` API function can be used to initialize the encrypted default NVS partition. The API function internally generates the XTS encryption keys on the ESP chip. The API function finds the first NVS Key Partition.

• Then the API function automatically generates and stores the NVS keys in that partition by making use of the `nvs_flash_generate_keys()` API function provided by `nvs_flash/include/nvs_flash.h`. New keys are generated and stored only when the respective key partition is empty. The same key partition can then be used to read the security configurations for initializing a custom encrypted NVS partition with help of `nvs_flash_secure_init_partition()`.

• The API functions `nvs_flash_secure_init()` and `nvs_flash_secure_init_partition()` do not generate the keys internally. When these API functions are used for initializing encrypted NVS partitions, the keys can be generated after startup using the `nvs_flash_generate_keys()` API function provided by `nvs_flash.h`. The API function then writes those keys onto the key-partition in encrypted form.

**Note:** Please note that `nvs_keys` partition must be completely erased before you start the application in this approach. Otherwise, the application may generate the ESP_ERR_NVS_CORRUPT_KEY_PART error code assuming that `nvs_keys` partition is not empty and contains malformed data. You can use the following command for this:

```
parttool.py --port PORT --partition-table-file=PARTITION_TABLE_FILE --
--partition-table-offset PARTITION_TABLE_OFFSET erase_partition --
--partition-type=data --partition-subtype=nvs_keys
```

**Use a pre-generated NVS key partition**

This option will be required by the user when keys in the NVS Key Partition are not generated by the application. The NVS Key Partition containing the XTS encryption keys can be generated with the help of NVS Partition Generator Utility. Then the user can store the pre-generated key partition on the flash with help of the following two commands:

1. Build and flash the partition table

```
idf.py partition-table partition-table-flash
```

2. Store the keys in the NVS Key Partition (on the flash) with the help of `parttool.py` (see Partition Tool section in `partition-tables` for more details)

```
parttool.py --port PORT --partition-table-offset PARTITION_TABLE_OFFSET --
--write_partition --partition-name="name of nvs_key partition" --input
--NVS_KEY_PARTITION_FILE
```

**Note:** If the device is encrypted in flash encryption development mode and you want to renew the NVS key partition, you need to tell `parttool.py` to encrypt the NVS key partition and you also need to give it a pointer to the unencrypted partition table in your build directory (build/partition_table) since the partition table on the device is encrypted, too. You can use the following command:

```
parttool.py --esptool-write-args encrypt --port PORT --partition-table--
file=PARTITION_TABLE_FILE --partition-table-offset PARTITION_TABLE--
OFFSET write_partition --partition-name="name of nvs_key partition" --
input NVS_KEY_PARTITION_FILE
```

Since the key partition is marked as encrypted and Flash Encryption is enabled, the bootloader will encrypt this partition using flash encryption key on the first boot.

It is possible for an application to use different keys for different NVS partitions and thereby have multiple key-partitions. However, it is a responsibility of the application to provide the correct key-partition and keys for encryption.
NVS Encryption: HMAC Peripheral-Based Scheme

In this scheme, the XTS keys required for NVS encryption are derived from an HMAC key programmed in eFuse with the purpose `esp_efuse_purpose_t::ESP_EFUSE_KEY_PURPOSE_HMAC_UP`. Since the encryption keys are derived at runtime, they are not stored anywhere in the flash. Thus, this feature does not require a separate NVS Key Partition.

**Note:** This scheme enables us to achieve secure storage on ESP32-S2 without enabling flash encryption.

**Important:** Please take note that this scheme uses one eFuse block for storing the HMAC key required for deriving the encryption keys.

- When NVS encryption is enabled, the `nvs_flash_init()` API function can be used to initialize the encrypted default NVS partition. The API function first checks whether an HMAC key is present at `CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID`.

  **Note:** The valid range for the config `CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID` is from 0 (`hmac_key_id_t::HMAC_KEY0`) to 5 (`hmac_key_id_t::HMAC_KEY5`). By default, the config is set to 6 (`hmac_key_id_t::HMAC_KEY_MAX`), which have to be configured before building the user application.

- If no key is found, a key is generated internally and stored at the eFuse block specified at `CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID`.
- If a key is found with the purpose `esp_efuse_purpose_t::ESP_EFUSE_KEY_PURPOSE_HMAC_UP`, the same is used for the derivation of the XTS encryption keys.
- If the specified eFuse block is found to be occupied with a key with a purpose other than `esp_efuse_purpose_t::ESP_EFUSE_KEY_PURPOSE_HMAC_UP`, an error is thrown.
- The API `nvs_flash_init()` then automatically generates the NVS keys on demand by using the `nvs_flash_generate_keys_v2()` API function provided by the `nvs_flash/include/nvs_flash.h`. The same keys can also be used to read the security configurations (see `nvs_flash_read_security_cfg_v2()` for initializing a custom encrypted NVS partition with help of `nvs.flash_secure_init_partition()`).
- The API functions `nvs_flash_secure_init()` and `nvs_flash_secure_init_partition()` do not generate the keys internally. When these API functions are used for initializing encrypted NVS partitions, the keys can be generated after startup using the `nvs_flash_generate_keys_v2()` API function or take and populate the NVS security configuration structure `nvs_sec_cfg_t` with `nvs_flash_read_security_cfg_v2()` and feed them into the above APIs.

**Note:** Users can program their own HMAC key in eFuse block beforehand by using the following command:

```
espefuse.py -p PORT burn_key <BLOCK_KEYN> <hmac_key_file.bin> HMAC_UP
```

**Encrypted Read/Write**

The same NVS API functions `nvs_get_*` or `nvs_set_*` can be used for reading of, and writing to an encrypted NVS partition as well.

**Encrypt the default NVS partition**
To enable encryption for the default NVS partition, no additional step is necessary. When `CONFIG_NVS_ENCRYPTION` is enabled, the `nvs_flash_init()` API function internally performs some additional steps to enable encryption for the default NVS partition depending on the scheme being used (set by `CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME`).

For the flash encryption-based scheme, the first NVS Key Partition found is used to generate the encryption keys while for the HMAC one, keys are generated using the HMAC key burnt in eFuse at `CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID` (refer to the API documentation for more details).

Alternatively, `nvs_flash_secure_init()` API function can also be used to enable encryption for the default NVS partition.

**Encrypt a custom NVS partition**

- To enable encryption for a custom NVS partition, `nvs_flash_secure_init_partition()` API function is used instead of `nvs_flash_init_partition()`.
- When `nvs_flash_secure_init()` and `nvs_flash_secure_init_partition()` API functions are used, the applications are expected to follow the steps below in order to perform NVS read/write operations with encryption enabled:
  1. Populate the NVS security configuration structure `nvs_sec_cfg_t`
     - For the Flash Encryption-based scheme
       * Find key partition and NVS data partition using `esp_partition_find*` API functions.
       * Populate the `nvs_sec_cfg_t` struct using the `nvs_flash_read_security_cfg()` or `nvs_flash_generate_keys()` API functions.
     - For the HMAC-based scheme
       * Set the scheme-specific config data with `nvs_sec_config_hmac_t` and register the HMAC-based scheme with the API `nvs_sec_provider_register_hmac()` which will also populate the scheme-specific handle (see `nvs_sec_scheme_t`).
       * Populate the `nvs_sec_cfg_t` struct using the `nvs_flash_read_security_cfg_v2()` or `nvs_flash_generate_keys_v2()` API functions.

```c
nvs_sec_cfg_t cfg = {};
nvs_sec_scheme_t *sec_scheme_handle = NULL;
nvs_sec_config_hmac_t sec_scheme_cfg = {};
hmac_key_id_t hmac_key = HMAC_KEY0;
sec_scheme_cfg.hmac_key_id = hmac_key;
ret = nvs_sec_provider_register_hmac(&sec_scheme_cfg, &sec_scheme_handle);
if (ret != ESP_OK) {
    return ret;
}
ret = nvs_flash_read_security_cfg_v2(sec_scheme_handle, &cfg);
if (ret != ESP_OK) {
    if (ret == ESP_ERR_NVS_SEC_HMAC_KEY_NOT_FOUND) {
        ret = nvs_flash_generate_keys_v2(sec_scheme_handle, &cfg);
        if (ret != ESP_OK) {
            ESP_LOGE(TAG, "Failed to generate NVS encr-keys!");
            return ret;
        }
    } else {
        ESP_LOGE(TAG, "Failed to read NVS security cfg!");
        return ret;
    }
}
```

2. Initialise NVS flash partition using the `nvs_flash_secure_init()` or `nvs_flash_secure_init_partition()` API functions.
3. Open a namespace using the `nvs_open()` or `nvs_open_from_partition()` API functions.
4. Perform NVS read/write operations using `nvs_get_*` or `nvs_set_*`.
5. Deinitialise an NVS partition using `nvs_flash_deinit()`.

**Note:** While using the HMAC-based scheme, the above workflow can be used without enabling any of the config options for NVS encryption - `CONFIG_NVS_ENCRYPTION`, `CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME` -> `CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC` and `CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID` to encrypt the default as well as custom NVS partitions with `nvs_flash_secure_init()` API.

### NVS Security Provider

The component `nvs_sec_provider` stores all the implementation-specific code for the NVS encryption schemes and would also accommodate any future schemes. This component acts as an interface to the `nvs_flash` component for the handling of encryption keys. `nvs_sec_provider` has a configuration menu of its own, based on which the selected security scheme and the corresponding settings are registered for the `nvs_flash` component.

This component offers factory functions with which a particular security scheme can be registered without having to worry about the APIs to generate and read the encryption keys (e.g., `nvs_sec_provider_register_hmac()`). Refer to the `security/nvs_encryption_hmac` example for API usage.

### API Reference

#### Header File

- `components/nvs_sec_provider/include/nvs_sec_provider.h`
- This header file can be included with:

  ```c
  #include "nvs_sec_provider.h"
  ```

- This header file is a part of the API provided by the `nvs_sec_provider` component. To declare that your component depends on `nvs_sec_provider`, add the following to your CMakeLists.txt:

  ```cmake
  REQUIRES nvs_sec_provider
  ```

  or

  ```cmake
  PRIV_REQUIRES nvs_sec_provider
  ```

#### Functions

- `esp_err_t nvs_sec_provider_register_flash_enc(const nvs_sec_config_flash_enc_t *sec_scheme_cfg, nvs_sec_scheme_t **sec_scheme_handle_out)`

  Register the Flash-Encryption based scheme for NVS Encryption.

  **Parameters**

  - `sec_scheme_cfg` - [in] Security scheme specific configuration data
  - `sec_scheme_handle_out` - [out] Security scheme specific configuration handle

  **Returns**

  - `ESP_OK`, if `sec_scheme_handle_out` was populated successfully with the scheme configuration;
  - `ESP_ERR_INVALID_ARG`, if `sec_scheme_cfg_hmac` is NULL;
  - `ESP_ERR_NO_MEM`, No memory for the scheme-specific handle `sec_scheme_handle_out`
  - `ESP_ERR_NOT_FOUND`, if no `nvs_keys` partition is found

- `esp_err_t nvs_sec_provider_register_hmac(const nvs_sec_config_hmac_t *sec_scheme_cfg, nvs_sec_scheme_t **sec_scheme_handle_out)`

  Register the HMAC-based scheme for NVS Encryption.
Chapter 2. API Reference

Parameters

- `sec_scheme_cfg` - [in] Security scheme specific configuration data
- `sec_scheme_handle_out` - [out] Security scheme specific configuration handle

Returns

- ESP_OK, if `sec_scheme_handle_out` was populated successfully with the scheme configuration;
- ESP_ERR_INVALID_ARG, if `scheme_cfg_hmac` is NULL;
- ESP_ERR_NO_MEM, No memory for the scheme-specific handle

```c
esp_err_t nvs_sec_provider_deregister(nvs_sec_scheme_t *sec_scheme_handle)
```

Deregister the NVS encryption scheme registered with the given handle.

Parameters `sec_scheme_handle` - [in] Security scheme specific configuration handle

Returns

- ESP_OK, if the scheme registered with `sec_scheme_handle` was deregistered successfully
- ESP_ERR_INVALID_ARG, if `sec_scheme_handle` is NULL;

Structures

struct `nvs_sec_config_flash_enc_t`

Flash encryption-based scheme specific configuration data.

Public Members

```c
const esp_partition_t *nvs_keys_part
```

Partition of subtype `nvs_keys` holding the NVS encryption keys

struct `nvs_sec_config_hmac_t`

HMAC-based scheme specific configuration data.

Public Members

```c
hmac_key_id_t hmac_key_id
```

HMAC Key ID used for generating the NVS encryption keys

Macros

```c
ESP_ERR_NVS_SEC_BASE
```

Starting number of error codes

```c
ESP_ERR_NVS_SEC_HMAC_KEY_NOT_FOUND
```

HMAC Key required to generate the NVS encryption keys not found

```c
ESP_ERR_NVS_SEC_HMAC_KEY_BLK_ALREADY_USED
```

Provided eFuse block for HMAC key generation is already in use

```c
ESP_ERR_NVS_SEC_HMAC_KEYGENERATION_FAILED
```

Failed to generate/write the HMAC key to eFuse
**ESP_ERR_NVS_SEC_HMAC_XTS_KEYS_DERIV_FAILED**
Failed to derive the NVS encryption keys based on the HMAC-based scheme

**NVS_SEC_PROVIDER_CFG_FLASH_ENC_DEFAULT ()**
Helper for populating the Flash encryption-based scheme specific configuration data.

**NVS_SEC_PROVIDER_CFG_HMAC_DEFAULT ()**
Helper for populating the HMAC-based scheme specific configuration data.

### Enumerations

enum **nvs_sec_scheme_id_t**
NVS Encryption Keys Protection Scheme.

Values:

- **NVS_SEC_SCHEME_FLASH_ENC**
  Protect NVS encryption keys using Flash Encryption

- **NVS_SEC_SCHEME_HMAC**
  Protect NVS encryption keys using HMAC peripheral

- **NVS_SEC_SCHEME_MAX**

### 2.8.5 NVS Partition Generator Utility

**Introduction**

The utility `nvs_flash/nvs_partition_generator/nvs_partition_gen.py` creates a binary file, compatible with the NVS architecture defined in *Non-Volatile Storage Library*, based on the key-value pairs provided in a CSV file.

This utility is ideally suited for generating a binary blob, containing data specific to ODM/OEM, which can be flashed externally at the time of device manufacturing. This allows manufacturers to generate many instances of the same application firmware with customized parameters for each device, such as a serial number.

**Prerequisites**

To use this utility in encryption mode, install the following packages:

- **cryptography**

All the required packages are included in `requirements.txt` in the root of the ESP-IDF directory.

**CSV File Format** Each line of a CSV file should contain 4 parameters, separated by a comma. The table below describes each of these parameters.
### Chapter 2. API Reference

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Key</td>
<td>Key of the data. The data can be accessed later from an application using this key.</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>Type</td>
<td>Supported values are file, data, and namespace.</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Encoding</td>
<td>Supported values are: u8, i8, u16, i16, u32, i32, u64, i64, string, hex2bin, base64, and binary. This specifies how actual data values are encoded in the resulting binary file. The difference between the string and binary encoding is that string data is terminated with a NULL character, whereas binary data is not.</td>
<td>As of now, for the file type, only hex2bin, base64, string, and binary encoding is supported.</td>
</tr>
<tr>
<td>4</td>
<td>Value</td>
<td>Data value</td>
<td>Encoding and Value cells for the namespace field type should be empty. Encoding and Value of namespace are fixed and are not configurable. Any values in these cells are ignored.</td>
</tr>
</tbody>
</table>

**Note:** The first line of the CSV file should always be the column header and it is not configurable.

Below is an example dump of such a CSV file:

```
key,type,encoding,value        <-- column header
namespace_name,namespace,,     <-- First entry should be of type "namespace"
key1,data,u8,1
key2,file,string,/path/to/file
```

**Note:**

**Make sure there are no spaces:**
- before and after ','
- at the end of each line in a CSV file

### NVS Entry and Namespace Association

When a namespace entry is encountered in a CSV file, each following entry will be treated as part of that namespace until the next namespace entry is found. At this point, all the following entries will be treated as part of the new namespace.

**Note:** First entry in a CSV file should always be a namespace entry.

### Multipage Blob Support

By default, binary blobs are allowed to span over multiple pages and are written in the format mentioned in Section Structure of Entry. If you intend to use the older format, the utility provides an option to disable this feature.
**Encryption-Decryption Support**

The NVS Partition Generator utility also allows you to create an encrypted binary file and decrypt an encrypted one. The utility uses the XTS-AES encryption. Please refer to *NVS Encryption* for more details.

**Running the Utility**

**Usage:**

```bash
python nvs_partition_gen.py [-h] (generate,generate-key,encrypt,decrypt) ...
```

**Optional Arguments:**

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>-h/--help</td>
<td>Show the help message and exit</td>
</tr>
</tbody>
</table>

**Commands:**

Run `nvs_partition_gen.py {command} -h` for additional help

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>generate</td>
<td>Generate NVS partition</td>
</tr>
<tr>
<td>2</td>
<td>generate-key</td>
<td>Generate keys for encryption</td>
</tr>
<tr>
<td>3</td>
<td>encrypt</td>
<td>Generate NVS encrypted partition</td>
</tr>
<tr>
<td>4</td>
<td>decrypt</td>
<td>Decrypt NVS encrypted partition</td>
</tr>
</tbody>
</table>

**Generate NVS Partition (Default) Usage:**

```bash
python nvs_partition_gen.py generate [-h] [--version {1,2}] [--outdir OUTDIR]--input input output size
```

**Positional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Path to CSV file to parse</td>
</tr>
<tr>
<td>output</td>
<td>Path to output NVS binary file</td>
</tr>
<tr>
<td>size</td>
<td>Size of NVS partition in bytes (must be multiple of 4096)</td>
</tr>
</tbody>
</table>

**Optional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h/--help</td>
<td>Show the help message and exit</td>
</tr>
<tr>
<td>--version</td>
<td>Set multipage blob version (Default: Version 2)</td>
</tr>
<tr>
<td>{1,2}</td>
<td>Version 1 - Multipage blob support disabled</td>
</tr>
<tr>
<td></td>
<td>Version 2 - Multipage blob support enabled</td>
</tr>
<tr>
<td>--outdir</td>
<td>Output directory to store file created (Default: current directory)</td>
</tr>
</tbody>
</table>

You can run the utility to generate NVS partition using the command below. A sample CSV file is provided with the utility:

```bash
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000
```
Generate Encryption Keys Partition

Usage:

```python
```

Optional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h/--help</td>
<td>Show the help message and exit</td>
</tr>
<tr>
<td>--keyfile KEYFILE</td>
<td>Path to output encryption keys file</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>Output directory to store files created. (Default: current directory)</td>
</tr>
</tbody>
</table>

Optional Arguments (HMAC scheme-specific):

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--key_protect_hmac</td>
<td>If set, the NVS encryption key protection scheme based on HMAC peripheral is used; else the default scheme based on flash encryption is used</td>
</tr>
<tr>
<td>--kp_hmac_keygen</td>
<td>Generate the HMAC key for HMAC-based encryption scheme</td>
</tr>
<tr>
<td>--kp_hmac_keyfile KP_HMAC_KEYFILE</td>
<td>Path to output the HMAC key file</td>
</tr>
<tr>
<td>--kp_hmac_inputkey KP_HMAC_INPUTKEY</td>
<td>File having the HMAC key for generating the NVS encryption keys</td>
</tr>
</tbody>
</table>

You can run the utility to generate only the encryption key partition using the command below:

```python
python nvs_partition_gen.py generate-key
```

For generating encryption key for the HMAC-based scheme, the following commands can be used:

- Generate the HMAC key and the NVS encryption keys:

  ```python
  python nvs_partition_gen.py generate-key --key_protect_hmac --kp_hmac_keygen
  ```

  **Note:** Encryption key of the format `<outdir>/keys/keys-<timestamp>.bin` and HMAC key of the format `<outdir>/keys/hmac-keys-<timestamp>.bin` are created.

- Generate the NVS encryption keys, given the HMAC key:

  ```python
  python nvs_partition_gen.py generate-key --key_protect_hmac --kp_hmac_inputkey --testdata/sample_hmac_key.bin
  ```

  **Note:** You can provide the custom filename for the HMAC key as well as the encryption key as a parameter.

Generate Encrypted NVS Partition

Usage:

```python
```

```python
input output size
```
Chapter 2. API Reference

Positional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Path to CSV file to parse</td>
</tr>
<tr>
<td>output</td>
<td>Path to output NVS binary file</td>
</tr>
<tr>
<td>size</td>
<td>Size of NVS partition in bytes (must be multiple of 4096)</td>
</tr>
</tbody>
</table>

Optional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h/--help</td>
<td>Show the help message and exit</td>
</tr>
<tr>
<td>--version</td>
<td>Set multipage blob version (Default: Version 2)</td>
</tr>
<tr>
<td></td>
<td>Version 1 - Multipage blob support disabled</td>
</tr>
<tr>
<td></td>
<td>Version 2 - Multipage blob support enabled</td>
</tr>
<tr>
<td>--keygen</td>
<td>Generates key for encrypting NVS partition</td>
</tr>
<tr>
<td>--keyfile</td>
<td>Path to output encryption keys file</td>
</tr>
<tr>
<td>--inputkey</td>
<td>Path to input key for encrypting NVS partition</td>
</tr>
<tr>
<td>--outdir</td>
<td>Output directory to store file created (Default: current directory)</td>
</tr>
</tbody>
</table>

Optional Arguments (HMAC scheme-specific):

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--key_protect_hmac</td>
<td>If set, the NVS encryption key protection scheme based on HMAC peripheral is used; else the default scheme based on flash encryption is used</td>
</tr>
<tr>
<td>--kp_hmac_keygen</td>
<td>Generate the HMAC key for HMAC-based encryption scheme</td>
</tr>
<tr>
<td>--kp_hmac_keyfile</td>
<td>Path to output HMAC key file</td>
</tr>
<tr>
<td>--kp_hmac_inputkey</td>
<td>File having the HMAC key for generating the NVS encryption keys</td>
</tr>
</tbody>
</table>

You can run the utility to encrypt NVS partition using the command below. A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

  ```
  python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin_0x3000 --keygen
  ```

  **Note:** Encryption key of the format `<outdir>/keys/keys-<timestamp>.bin` is created.

- To generate an encrypted partition using the HMAC-based scheme, the above command can be used along with some additional parameters.
  - Encrypt by allowing the utility to generate encryption keys and the HMAC-key:

    ```
    python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin 0x3000 --keygen --key_protect_hmac --kp_hmac_keygen
    ```

    **Note:** Encryption key of the format `<outdir>/keys/keys-<timestamp>.bin` and HMAC key of the format `<outdir>/keys/hmac-keys-<timestamp>.bin` are created.

    - Encrypt by allowing the utility to generate encryption keys with user-provided HMAC-key:
Chapter 2. API Reference

```python
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin 0x3000 --keygen --key_protect_hmac --kp_hmac_inputkey testdata/sample_hmac_key.bin
```

**Note:** You can provide the custom filename for the HMAC key as well as the encryption key as a parameter.

- Encrypt by allowing the utility to generate encryption keys and store it in provided custom filename:

```python
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin 0x3000 --keygen --keyfile sample_keys.bin
```

**Note:**
- Encryption key of the format `<outdir>/keys/sample_keys.bin` is created.
- This newly created file having encryption keys in `keys/` directory is compatible with NVS key-partition structure. Refer to [NVS Key Partition](#) for more details.

- Encrypt by providing the encryption keys as input binary file:

```python
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin 0x3000 --inputkey sample_keys.bin
```

**Decrypt Encrypted NVS Partition**

**Usage:**

```python
python nvs_partition_gen.py decrypt [-h] [--outdir OUTDIR] input key output
```

**Positional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Path to encrypted NVS partition file to parse</td>
</tr>
<tr>
<td>key</td>
<td>Path to file having keys for decryption</td>
</tr>
<tr>
<td>output</td>
<td>Path to output decrypted binary file</td>
</tr>
</tbody>
</table>

**Optional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h/--help</td>
<td>Show the help message and exit</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>Output directory to store files created. (Default: current directory)</td>
</tr>
</tbody>
</table>

You can run the utility to decrypt encrypted NVS partition using the command below:

```python
python nvs_partition_gen.py decrypt sample_encr.bin sample_keys.bin sample_decr.bin
```

You can also provide the format version number:

- Multipage blob support disabled (Version 1)
- Multipage blob support enabled (Version 2)

**Multipage Blob Support Disabled (Version 1)**

You can run the utility in this format by setting the version parameter to 1, as shown below. A sample CSV file for the same is provided with the utility:

```python
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000 --version 1
```
Multipage Blob Support Enabled (Version 2)  You can run the utility in this format by setting the version parameter to 2, as shown below. A sample CSV file for the same is provided with the utility:

```
python nvs_partition_gen.py generate sample_multipage_blob.csv sample.bin 0x4000 --version 2
```

Note:
- Minimum NVS Partition Size needed is 0x3000 bytes.
- When flashing the binary onto the device, make sure it is consistent with the application’s sdkconfig.

Caveats
- Utility does not check for duplicate keys and will write data pertaining to both keys. You need to make sure that the keys are distinct.
- Once a new page is created, no data will be written in the space left on the previous page. Fields in the CSV file need to be ordered in such a way as to optimize memory.
- 64-bit datatype is not yet supported.

2.8.6 NVS Partition Parser Utility

Introduction
The utility `nvs_flash/nvs_partition_tool/nvs_tool.py` loads and parses an NVS storage partition for easier debugging and data extraction. The utility also features integrity check which scans the partition for potential errors. Data blobs are encoded in base64 format.

Encrypted Partitions
This utility does not support decryption. To decrypt the NVS partition, please use the `NVS Partition Generator Utility` which does support NVS partition encryption and decryption.

Usage
There are two output format styles available with the `-f` or `--format` option:
- `json` - All of the output is printed as a JSON.
- `text` - The output is printed as a human-readable text with different selectable output styles mentioned below.

For the text output format, the utility provides six different output styles with the `-d` or `--dump` option:
- `all` (default) - Prints all entries with metadata.
- `written` - Prints only written entries with metadata.
- `minimal` - Prints written `namespace:key = value` pairs.
- `namespaces` - Prints all written namespaces
- `blobs` - Prints all blobs and strings (reconstructs them if they are chunked).
- `storage_info` - Prints entry states count for every page.

Note: There is also a `none` option which will not print anything. This can be used with the integrity check option if the NVS partition contents are irrelevant.
The utility also provides an integrity check feature via the `-i` or `--integrity-check` option (available only with the `text` format as it would invalidate the `json` output). This feature scans through the entire partition and prints potential errors. It can be used with the `-d none` option which will print only the potential errors.

## 2.8.7 SD/SDIO/MMC Driver

### Overview

The SD/SDIO/MMC driver currently supports SD memory, SDIO cards, and eMMC chips. This is a protocol level driver built on top of SDMMC and SD SPI host drivers.

SDMMC and SD SPI host drivers ([driver/sdmmc/include/driver/sdmmc_host.h](#) and [driver/spi/include/driver/sdspi_host.h](#)) provide API functions for:

- Sending commands to slave devices
- Sending and receiving data
- Handling error conditions within the bus

For functions used to initialize and configure:

- SD SPI host, see [SD SPI Host API](#)

### Pin Configurations

`.only:: SOC_SDMMC_USE_IOMUX and not SOC_SDMMC_USE_GPIO_MATRIX`

SDMMC pins are dedicated, you don’t have to configure the pins.

`.only:: SOC_SDMMC_USE_GPIO_MATRIX and not SOC_SDMMC_USE_IOMUX`

SDMMC pin signals are routed via GPIO Matrix, so you will need to configure the pins in `sdmmc_slot_config_t`.

`.only:: esp32p4`

SDMMC have two slots:

- slot 0 pins are dedicated for UHS-I mode. This is not yet supported in the driver.
- slot 1 pins are routed via GPIO Matrix, and it’s for non UHS-I usage. You will need to configure the pins in `sdmmc_slot_config_t` to use the slot 1.

### Application Example

An example which combines the SDMMC driver with the FATFS library is provided in the `storage/sd_card` directory of ESP-IDF examples. This example initializes the card, then writes and reads data from it using POSIX and C library APIs. See README.md file in the example directory for more information.

### Combo (Memory + IO) Cards

The driver does not support SD combo cards. Combo cards are treated as IO cards.

### Thread Safety

Most applications need to use the protocol layer only in one task. For this reason, the protocol layer does not implement any kind of locking on the `sdmmc_card_t` structure, or when accessing SDMMC or SD SPI host drivers. Such locking is usually implemented on a higher layer, e.g., in the filesystem driver.
Chapter 2. API Reference

API Reference

Header File

- components/sdmmc/include/sdmmc_cmd.h
- This header file can be included with:

```c
#include "sdmmc_cmd.h"
```

- This header file is a part of the API provided by the sdmmc component. To declare that your component depends on sdmmc, add the following to your CMakeLists.txt:

```cmake
REQUIRES sdmmc
```

or

```cmake
PRIV_REQUIRES sdmmc
```

Functions

**esp_err_t sdmmc_card_init** (const sdmmc_host_t *host, sdmmc_card_t *out_card)

Probe and initialize SD/MMC card using given host

**Note:** Only SD cards (SDSC and SDHC/SDXC) are supported now. Support for MMC/eMMC cards will be added later.

**Parameters**

- `host` - pointer to structure defining host controller
- `out_card` - pointer to structure which will receive information about the card when the function completes

**Returns**

- ESP_OK on success
- One of the error codes from SDMMC host controller

**void sdmmc_card_print_info** (FILE *stream, const sdmmc_card_t *card)

Print information about the card to a stream.

**Parameters**

- `stream` - stream obtained using fopen or fdopen
- `card` - card information structure initialized using sdmmc_card_init

**esp_err_t sdmmc_get_status** (sdmmc_card_t *card)

Get status of SD/MMC card

**Parameters**

- `card` - pointer to card information structure previously initialized using sdmmc_card_init

**Returns**

- ESP_OK on success
- One of the error codes from SDMMC host controller

**esp_err_t sdmmc_write_sectors** (sdmmc_card_t *card, const void *src, size_t start_sector, size_t sector_count)

Write given number of sectors to SD/MMC card

**Parameters**

- `card` - pointer to card information structure previously initialized using sdmmc_card_init
- `src` - pointer to data buffer to read data from; data size must be equal to sector_count * card->csd.sector_size
- `start_sector` - sector where to start writing
- `sector_count` - number of sectors to write

**Returns**
• ESP_OK on success or sector_count equal to 0
• One of the error codes from SDMMC host controller

**esp_err_t** `sdmmc_read_sectors` *(sdmmc_card_t *card, void *dst, size_t start_sector, size_t sector_count)*

Read given number of sectors from the SD/MMC card

**Parameters**
- `card` — pointer to card information structure previously initialized using `sdmmc_card_init`
- `dst` — pointer to data buffer to write into; buffer size must be at least `sector_count * card->csd.sector_size`
- `start_sector` — sector where to start reading
- `sector_count` — number of sectors to read

**Returns**
- ESP_OK on success or sector_count equal to 0
- One of the error codes from SDMMC host controller

**esp_err_t** `sdmmc_erase_sectors` *(sdmmc_card_t *card, size_t start_sector, size_t sector_count, sdmmc_erase_arg_t arg)*

Erase given number of sectors from the SD/MMC card

**Note:** When `sdmmc_erase_sectors` used with cards in SDSPi mode, it was observed that card requires re-init after erase operation.

**Parameters**
- `card` — pointer to card information structure previously initialized using `sdmmc_card_init`
- `start_sector` — sector where to start erase
- `sector_count` — number of sectors to erase
- `arg` — erase command (CMD38) argument

**Returns**
- ESP_OK on success or sector_count equal to 0
- One of the error codes from SDMMC host controller

**esp_err_t** `sdmmc_can_discard` *(sdmmc_card_t *card)*

Check if SD/MMC card supports discard

**Parameters** `card` — pointer to card information structure previously initialized using `sdmmc_card_init`

**Returns**
- ESP_OK if supported by the card/device
- ESP_FAIL if not supported by the card/device

**esp_err_t** `sdmmc_can_trim` *(sdmmc_card_t *card)*

Check if SD/MMC card supports `trim`

**Parameters** `card` — pointer to card information structure previously initialized using `sdmmc_card_init`

**Returns**
- ESP_OK if supported by the card/device
- ESP_FAIL if not supported by the card/device

**esp_err_t** `sdmmc_mmc_cansanitize` *(sdmmc_card_t *card)*

Check if SD/MMC card supports sanitize

**Parameters** `card` — pointer to card information structure previously initialized using `sdmmc_card_init`

**Returns**
- ESP_OK if supported by the card/device
- ESP_FAIL if not supported by the card/device
**esp_err_t sdmmc_mmc_sanitize (sdmmc_card_t *card, uint32_t timeout_ms)**

Sanitize the data that was unmapped by a Discard command

**Note:** Discard command has to precede sanitize operation. To discard, use MMC_DISCARD_ARG with sdmmc_erase_sectors argument

**Parameters**
- **card** - pointer to card information structure previously initialized using sdmmc_card_init
- **timeout_ms** - timeout value in milliseconds required to sanitize the selected range of sectors.

**Returns**
- ESP_OK on success
- One of the error codes from SDMMC host controller

**esp_err_t sdmmc_full_erase (sdmmc_card_t *card)**

Erase complete SD/MMC card

**Parameters**
- **card** - pointer to card information structure previously initialized using sdmmc_card_init

**Returns**
- ESP_OK on success
- One of the error codes from SDMMC host controller

**esp_err_t sdmmc_io_read_byte (sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t *out_byte)**

Read one byte from an SDIO card using IO_RW_DIRECT (CMD52)

**Parameters**
- **card** - pointer to card information structure previously initialized using sdmmc_card_init
- **function** - IO function number
- **reg** - byte address within IO function
- **out_byte** - [out] output, receives the value read from the card

**Returns**
- ESP_OK on success
- One of the error codes from SDMMC host controller

**esp_err_t sdmmc_io_write_byte (sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t in_byte, uint8_t *out_byte)**

Write one byte to an SDIO card using IO_RW_DIRECT (CMD52)

**Parameters**
- **card** - pointer to card information structure previously initialized using sdmmc_card_init
- **function** - IO function number
- **reg** - byte address within IO function
- **in_byte** - value to be written
- **out_byte** - [out] if not NULL, receives new byte value read from the card (read-after-write).

**Returns**
- ESP_OK on success
- One of the error codes from SDMMC host controller

**esp_err_t sdmmc_io_read_bytes (sdmmc_card_t *card, uint32_t function, uint32_t addr, void *dst, size_t size)**

Read multiple bytes from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in byte mode. For block mode, see sdmmc_io_read_blocks.

**Parameters**
- **card** - pointer to card information structure previously initialized using sdmmc_card_init
Chapter 2. API Reference

- **function** - IO function number
- **addr** - byte address within IO function where reading starts
- **dst** - buffer which receives the data read from card
- **size** - number of bytes to read

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_iowrite_bytes (sdmmc_card_t *card, uint32_t function, uint32_t addr, const void *src, size_t size)
```

Write multiple bytes to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in byte mode. For block mode, see sdmmc_iowrite_blocks.

**Parameters**
- **card** - pointer to card information structure previously initialized using sdmmc_card_init
- **function** - IO function number
- **addr** - byte address within IO function where writing starts
- **src** - data to be written
- **size** - number of bytes to write

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_ioread_blocks (sdmmc_card_t *card, uint32_t function, uint32_t addr, void *dst, size_t size)
```

Read blocks of data from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in block mode. For byte mode, see sdmmc_ioread_bytes.

**Parameters**
- **card** - pointer to card information structure previously initialized using sdmmc_card_init
- **function** - IO function number
- **addr** - byte address within IO function where writing starts
- **dst** - buffer which receives the data read from card
- **size** - number of bytes to read, must be divisible by the card block size.

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_iowrite_blocks (sdmmc_card_t *card, uint32_t function, uint32_t addr, const void *src, size_t size)
```

Write blocks of data to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in block mode. For byte mode, see sdmmc_iowrite_bytes.

**Parameters**
- **card** - pointer to card information structure previously initialized using sdmmc_card_init
- **function** - IO function number
- **addr** - byte address within IO function where writing starts
- **src** - data to be written
- **size** - number of bytes to read, must be divisible by the card block size.

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller
**esp_err_t sdmmc_io_enable_int (sdmmc_card_t *card)**

Enable SDIO interrupt in the SDMMC host

**Parameters**
- `card` - pointer to card information structure previously initialized using `sdmmc_card_init`

**Returns**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts

**esp_err_t sdmmc_io_wait_int (sdmmc_card_t *card, TickType_t timeout_ticks)**

Block until an SDIO interrupt is received

Slave uses D1 line to signal interrupt condition to the host. This function can be used to wait for the interrupt.

**Parameters**
- `card` - pointer to card information structure previously initialized using `sdmmc_card_init`
- `timeout_ticks` - time to wait for the interrupt, in RTOS ticks

**Returns**
- ESP_OK if the interrupt is received
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts
- ESP_ERR_TIMEOUT if the interrupt does not happen in `timeout_ticks`

**esp_err_t sdmmc_io_get_cis_data (sdmmc_card_t *card, uint8_t*out_buffer, size_t buffer_size, size_t *inout_cis_size)**

Get the data of CIS region of an SDIO card.

You may provide a buffer not sufficient to store all the CIS data. In this case, this function stores as much data into your buffer as possible. Also, this function will try to get and return the size required for you.

**Parameters**
- `card` - pointer to card information structure previously initialized using `sdmmc_card_init`
- `out_buffer` - Output buffer of the CIS data
- `buffer_size` - Size of the buffer.
- `inout_cis_size` - Mandatory, pointer to a size, input and output.
  - input: Limitation of maximum searching range, should be 0 or larger than `buffer_size`. The function searches for CIS_CODE_END until this range. Set to 0 to search infinitely.
  - output: The size required to store all the CIS data, if CIS_CODE_END is found.

**Returns**
- ESP_OK: on success
- ESP_ERR_INVALID_RESPONSE: if the card does not (correctly) support CIS.
- ESP_ERR_INVALID_SIZE: CIS_CODE_END found, but `buffer_size` is less than required size, which is stored in the `inout_cis_size` then.
- ESP_ERR_NOT_FOUND: if the CIS_CODE_END not found. Increase input value of `inout_cis_size` or set it to 0, if you still want to search for the end; output value of `inout_cis_size` is invalid in this case.
- and other error code return from `sdmmc_io_read_bytes`

**esp_err_t sdmmc_io_print_cis_info (uint8_t*buffer, size_t buffer_size, FILE *fp)**

Parse and print the CIS information of an SDIO card.

**Note:** Not all the CIS codes and all kinds of tuples are supported. If you see some unresolved code, you can add the parsing of these code in `sdmmc_io.c` and contribute to the IDF through the Github repository.

```c
using sdmmc_card_init
```

**Parameters**
- `buffer` - Buffer to parse
- `buffer_size` - Size of the buffer.
Chapter 2. API Reference

- **fp** - File pointer to print to, set to NULL to print to stdout.

**Returns**
- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: if the value from the card is not supported to be parsed.
- ESP_ERR_INVALID_SIZE: if the CIS size fields are not correct.

**Header File**
- `components/driver/sdmmc/include/driver/sdmmc_types.h`
- This header file can be included with:

```c
#include "driver/sdmmc_types.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```cmake
REQUIRES driver
```

or

```cmake
PRIV_REQUIRES driver
```

**Structures**

**struct sdmmc_csd_t**
Decoded values from SD card Card Specific Data register

**Public Members**

- int `csd_ver`
  CSD structure format

- int `mmc_ver`
  MMC version (for CID format)

- int `capacity`
  total number of sectors

- int `sector_size`
  sector size in bytes

- int `read_block_len`
  block length for reads

- int `card_command_class`
  Card Command Class for SD

- int `tr_speed`
  Max transfer speed

**struct sdmmc_cid_t**
Decoded values from SD card Card IDentification register
Public Members

int mfg_id
    manufacturer identification number

int oem_id
    OEM/product identification number

char name[8]
    product name (MMC v1 has the longest)

int revision
    product revision

int serial
    product serial number

int date
    manufacturing date

struct sdmmc_scr_t
    Decoded values from SD Configuration Register Note: When new member is added, update reserved bits accordingly

Public Members

uint32_t sd_spec
    SD Physical layer specification version, reported by card

uint32_t erase_mem_state
    data state on card after erase whether 0 or 1 (card vendor dependent)

uint32_t bus_width
    bus widths supported by card: BIT(0) — 1-bit bus, BIT(2) — 4-bit bus

uint32_t reserved
    reserved for future expansion

uint32_t rsvd_mnf
    reserved for manufacturer usage

struct sdmmc_ssr_t
    Decoded values from SD Status Register Note: When new member is added, update reserved bits accordingly

Public Members

uint32_t alloc_unit_kb
    Allocation unit of the card, in multiples of kB (1024 bytes)
Chapter 2. API Reference

uint32_t erase_size_au
   Erase size for the purpose of timeout calculation, in multiples of allocation unit

uint32_t cur_bus_width
   SD current bus width

uint32_t discard_support
   SD discard feature support

uint32_t fule_support
   SD FULE (Full User Area Logical Erase) feature support

uint32_t erase_timeout
   Timeout (in seconds) for erase of a single allocation unit

uint32_t erase_offset
   Constant timeout offset (in seconds) for any erase operation

uint32_t reserved
   reserved for future expansion

struct sdmmc_ext_csd_t
   Decoded values of Extended Card Specific Data

   Public Members

   uint8_t rev
      Extended CSD Revision

   uint8_t power_class
      Power class used by the card

   uint8_t erase_mem_state
      Data state on card after erase whether 0 or 1 (card vendor dependent)

   uint8_t sec_feature
      Secure data management features supported by the card

struct sdmmc_switch_func_rsp_t
   SD SWITCH_FUNC response buffer

   Public Members

   uint32_t data[512 / 8 / sizeof(uint32_t)]
      Response data

struct sdmmc_command_t
   SD/MMC command information
Public Members

uint32_t opcode
   SD or MMC command index

uint32_t arg
   SD/MMC command argument

sdmmc_response_t response
   response buffer

void *data
   buffer to send or read into

size_t datalen
   length of data in the buffer

size_t buflen
   length of the buffer

size_t blklen
   block length

int flags
   see below

esp_err_t error
   error returned from transfer

uint32_t timeout_ms
   response timeout, in milliseconds

struct sdmmc_host_t
   SD/MMC Host description
   This structure defines properties of SD/MMC host and functions of SD/MMC host which can be used by upper layers.

Public Members

uint32_t flags
   flags defining host properties

int slot
   slot number, to be passed to host functions

int max_freq_khz
   max frequency supported by the host
Chapter 2. API Reference

float io_voltage
I/O voltage used by the controller (voltage switching is not supported)

esp_err_t (*init)(void)
Host function to initialize the driver

esp_err_t (*set_bus_width)(int slot, size_t width)
host function to set bus width

size_t (*get_bus_width)(int slot)
host function to get bus width

esp_err_t (*set_bus_ddr_mode)(int slot, bool ddr_enable)
host function to set DDR mode

esp_err_t (*set_card_clk)(int slot, uint32_t freq_khz)
host function to set card clock frequency

esp_err_t (*set_cclk_always_on)(int slot, bool cclk_always_on)
host function to set whether the clock is always enabled

esp_err_t (*do_transaction)(int slot, sdmmc_command_t *cmdinfo)
host function to do a transaction

esp_err_t (*deinit)(void)
host function to deinitialize the driver

esp_err_t (*deinit_p)(int slot)
host function to deinitialize the driver, called with the slot

esp_err_t (*io_int_enable)(int slot)
Host function to enable SDIO interrupt line

esp_err_t (*io_int_wait)(int slot, TickType_t timeout_ticks)
Host function to wait for SDIO interrupt line to be active

int command_timeout_ms
timeout, in milliseconds, of a single command. Set to 0 to use the default value.

esp_err_t (*get_real_freq)(int slot, int *real_freq)
Host function to provide real working freq, based on SDMMC controller setup

sdmmc_delay_phase_t input_delay_phase
input delay phase, this will only take into effect when the host works in SDMMC_FREQ_HIGHSPEED or SDMMC_FREQ_52M. Driver will print out how long the delay is

esp_err_t (*set_input_delay)(int slot, sdmmc_delay_phase_t delay_phase)
set input delay phase
struct sdmmc_card_t
SD/MMC card information structure

Public Members

sdmmc_host_t host
Host with which the card is associated

uint32_t ocr
OCR (Operation Conditions Register) value

sdmmc_cid_t cid
decoded CID (Card IDentification) register value

sdmmc_response_t raw_cid
raw CID of MMC card to be decoded after the CSD is fetched in the data transfer mode

sdmmc_csd_t csd
decoded CSD (Card-Specific Data) register value

sdmmc_scr_t scr
decoded SCR (SD card Configuration Register) value

sdmmc_ssr_t ssr
decoded SSR (SD Status Register) value

sdmmc_ext_csd_t ext_csd
decoded EXT_CSD (Extended Card Specific Data) register value

uint16_t rca
RCA (Relative Card Address)

uint16_t max_freq_khz
Maximum frequency, in kHz, supported by the card

int real_freq_khz
Real working frequency, in kHz, configured on the host controller

uint32_t is_mem
Bit indicates if the card is a memory card

uint32_t is_sdio
Bit indicates if the card is an IO card

uint32_t is_mmc
Bit indicates if the card is MMC
Chapter 2. API Reference

uint32_t num_io_functions
    If is_sdio is 1, contains the number of IO functions on the card

uint32_t log_bus_width
    \log_2(bus\ width\ supported\ by\ card)

uint32_t is_ddr
    Card supports DDR mode

uint32_t reserved
    Reserved for future expansion

Macros

SDMMC_HOST_FLAG_1BIT
    host supports 1-line SD and MMC protocol

SDMMC_HOST_FLAG_4BIT
    host supports 4-line SD and MMC protocol

SDMMC_HOST_FLAG_8BIT
    host supports 8-line MMC protocol

SDMMC_HOST_FLAG_SPI
    host supports SPI protocol

SDMMC_HOST_FLAG_DDR
    host supports DDR mode for SD/MMC

SDMMC_HOST_FLAG_DEINIT_ARG
    host deinit function called with the slot argument

SDMMC_FREQ_DEFAULT
    SD/MMC Default speed (limited by clock divider)

SDMMC_FREQ_HIGHSPEED
    SD High speed (limited by clock divider)

SDMMC_FREQ_PROBING
    SD/MMC probing speed

SDMMC_FREQ_52M
    MMC 52MHz speed

SDMMC_FREQ_26M
    MMC 26MHz speed

Type Definitions

typedef uint32_t sdmmc_response_t[4]
    SD/MMC command response buffer
Enumerations

enum sdmmc_delay_phase_t
SD/MMC Host clock timing delay phases

This will only take effect when the host works in SDMMC_FREQ_HIGH_SPEED or SDMMC_FREQ_52M.
Driver will print out how long the delay is, in picosecond (ps).

Values:

counter SDMMC_DELAY_PHASE_0
Delay phase 0

counter SDMMC_DELAY_PHASE_1
Delay phase 1

counter SDMMC_DELAY_PHASE_2
Delay phase 2

counter SDMMC_DELAY_PHASE_3
Delay phase 3

enum sdmmc_erase_arg_t
SD/MMC erase command(38) arguments SD: ERASE: Erase the write blocks, physical/hard erase.
DISCARD: Card may deallocate the discarded blocks partially or completely. After discard operation the
previously written data may be partially or fully read by the host depending on card implementation.
MMC: ERASE: Does TRIM, applies erase operation to write blocks instead of Erase Group.
DISCARD: The Discard function allows the host to identify data that is no longer required so that the device
can erase the data if necessary during background erase events. Applies to write blocks instead of Erase Group
After discard operation, the original data may be remained partially or fully accessible to the host dependent
on device.

Values:

counter SDMMC_ERASE_ARG
Erase operation on SD, Trim operation on MMC

counter SDMMC_DISCARD_ARG
Discard operation for SD/MMC

2.8.8 Partitions API

Overview

The esp_partition component has higher-level API functions which work with partitions defined in the Partition
Tables. These APIs are based on lower level API provided by SPI Flash API.
Partition Table API

ESP-IDF projects use a partition table to maintain information about various regions of SPI flash memory (bootloader, various application binaries, data, filesystems). More information can be found in Partition Tables.

This component provides API functions to enumerate partitions found in the partition table and perform operations on them. These functions are declared in esp_partition.h:

- `esp_partition_find()` checks a partition table for entries with specific type, returns an opaque iterator.
- `esp_partition_get()` returns a structure describing the partition for a given iterator.
- `esp_partition_next()` shifts the iterator to the next found partition.
- `esp_partition_iterator_release()` releases iterator returned by `esp_partition_find()`.
- `esp_partition_find_first()` is a convenience function which returns the structure describing the first partition found by `esp_partition_find()`.
- `esp_partition_read()`, `esp_partition_write()`, `esp_partition_erase_range()` are equivalent to `esp_flash_read()`, `esp_flash_write()`, `esp_flash_erase_region()`, but operate within partition boundaries.

See Also

- Partition Tables
- Over The Air Updates (OTA) provides high-level API for updating applications stored in flash.
- Non-Volatile Storage Library provides a structured API for storing small pieces of data in SPI flash.

API Reference - Partition Table

Header File

- components/esp_partition/include/esp_partition.h

This header file can be included with:

```c
#include "esp_partition.h"
```

This header file is a part of the API provided by the esp_partition component. To declare that your component depends on esp_partition, add the following to your CMakeLists.txt:

```c
REQUIRES esp_partition
```

or

```c
PRIV_REQUIRES esp_partition
```

Functions

`esp_partition_iterator_t esp_partition_find(esp_partition_type_t type, esp_partition_subtype_t subtype, const char *label)`

Find partition based on one or more parameters.

Parameters

- **type**  – Partition type, one of esp_partition_type_t values or an 8-bit unsigned integer. To find all partitions, no matter the type, use ESP_PARTITION_TYPE_ANY, and set subtype argument to ESP_PARTITION_SUBTYPE_ANY.
- **subtype**  – Partition subtype, one of esp_partition_subtype_t values or an 8-bit unsigned integer. To find all partitions of given type, use ESP_PARTITION_SUBTYPE_ANY.
- **label**  – (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

Returns iterator which can be used to enumerate all the partitions found, or NULL if no partitions were found. Iterator obtained through this function has to be released using esp_partition_iterator_release when not used any more.
const esp_partition_t *esp_partition_find_first (esp_partition_type_t type, esp_partition_subtype_t subtype, const char *label)

Find first partition based on one or more parameters.

Parameters
• **type** – Partition type, one of esp_partition_type_t values or an 8-bit unsigned integer. To find all partitions, no matter the type, use ESP_PARTITION_TYPE_ANY, and set subtype argument to ESP_PARTITION_SUBTYPE_ANY.
• **subtype** – Partition subtype, one of esp_partition_subtype_t values or an 8-bit unsigned integer. To find all partitions of given type, use ESP_PARTITION_SUBTYPE_ANY.
• **label** – (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

Returns pointer to esp_partition_t structure, or NULL if no partition is found. This pointer is valid for the lifetime of the application.

cnst esp_partition_t *esp_partition_get (esp_partition_iterator_t iterator)

Get esp_partition_t structure for given partition.

Parameters **iterator** – Iterator obtained using esp_partition_find. Must be non-NULL.

Returns pointer to esp_partition_t structure. This pointer is valid for the lifetime of the application.

esp_partition_iterator_t esp_partition_next (esp_partition_iterator_t iterator)

Move partition iterator to the next partition found.

Any copies of the iterator will be invalid after this call.

Parameters **iterator** – Iterator obtained using esp_partition_find. Must be non-NULL.

Returns NULL if no partition was found, valid esp_partition_iterator_t otherwise.

void esp_partition_iterator_release (esp_partition_iterator_t iterator)

Release partition iterator.

Parameters **iterator** – Iterator obtained using esp_partition_find. The iterator is allowed to be NULL, so it is not necessary to check its value before calling this function.

cnst esp_partition_t *esp_partition_verify (const esp_partition_t *partition)

Verify partition data.

Given a pointer to partition data, verify this partition exists in the partition table (all fields match.)

This function is also useful to take partition data which may be in a RAM buffer and convert it to a pointer to the permanent partition data stored in flash.

Pointers returned from this function can be compared directly to the address of any pointer returned from esp_partition_get(), as a test for equality.

Parameters **partition** – Pointer to partition data to verify. Must be non-NULL. All fields of this structure must match the partition table entry in flash for this function to return a successful match.

Returns
• If partition not found, returns NULL.
• If found, returns a pointer to the esp_partition_t structure in flash. This pointer is always valid for the lifetime of the application.

esp_err_t esp_partition_read (const esp_partition_t *partition, size_t src_offset, void *dst, size_t size)

Read data from the partition.

Partitions marked with an encryption flag will automatically be be read and decrypted via a cache mapping.

Parameters
• **partition** – Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
• **dst** – Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
• **src_offset** – Address of the data to be read, relative to the beginning of the partition.
Chapter 2. API Reference

• **size** – Size of data to be read, in bytes.

**Returns** ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if src_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

```c
esp_err_t esp_partition_read_raw(const esp_partition_t *partition, size_t src_offset, void *dst, size_t size)
```

Read data from the partition without any transformation/decryption.

**Note:** This function is essentially the same as `esp_partition_read()` above. It just never decrypts data but returns it as is.

**Parameters**

• **partition** – Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.

• **dst_offset** – Address where the data should be written, relative to the beginning of the partition.

• **src** – Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.

• **size** – Size of data to be written, in bytes.

**Returns** ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; ESP_ERR_NOT_ALLOWED, if partition is read-only; or one of error codes from lower-level flash driver.

```c
esp_err_t esp_partition_write_raw(const esp_partition_t *partition, size_t dst_offset, const void *src, size_t size)
```

Write data to the partition without any transformation/encryption.

**Note:** Prior to writing to flash memory, make sure it has been erased with `esp_partition_erase_range` call.

**Parameters**

• **partition** – Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.

• **dst_offset** – Address where the data should be written, relative to the beginning of the partition.

• **src_offset** – Address of the data to be read, relative to the beginning of the partition.

• **size** – Size of data to be read, in bytes.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `esp_partition_erase_range` function.
**Note:** This function is essentially the same as `esp_partition_write()` above. It just never encrypts data but writes it as is.

**Note:** Prior to writing to flash memory, make sure it has been erased with `esp_partition_erase_range` call.

### Parameters

- **partition** – Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **dst_offset** – Address where the data should be written, relative to the beginning of the partition.
- **src** – Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- **size** – Size of data to be written, in bytes.

### Returns

ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; ESP_ERR_NOT_ALLOWED, if partition is read-only; or one of the error codes from lower-level flash driver.

```c
esp_err_t esp_partition_erase_range(const esp_partition_t *partition, size_t offset, size_t size)
```

Erase part of the partition.

### Parameters

- **partition** – Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **offset** – Offset from the beginning of partition where erase operation should start. Must be aligned to partition->erase_size.
- **size** – Size of the range which should be erased, in bytes. Must be divisible by partition->erase_size.

### Returns

ESP_OK, if the range was erased successfully; ESP_ERR_INVALID_ARG, if iterator or dst are NULL; ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition; ESP_ERR_NOT_ALLOWED, if partition is read-only; or one of the error codes from lower-level flash driver.

```c
esp_err_t esp_partition_mmap(const esp_partition_t *partition, size_t offset, size_t size, esp_partition_mmap_memory_t memory, const void **out_ptr, esp_partition_mmap_handle_t *out_handle)
```

Configure MMU to map partition into data memory.

Unlike `spi_flash_mmap` function, which requires a 64kB aligned base address, this function doesn’t impose such a requirement. If offset results in a flash address which is not aligned to 64kB boundary, address will be rounded to the lower 64kB boundary, so that mapped region includes requested range. Pointer returned via `out_ptr` argument will be adjusted to point to the requested offset (not necessarily to the beginning of mmap-ed region).

To release mapped memory, pass handle returned via `out_handle` argument to `esp_partition_munmap` function.

### Parameters

- **partition** – Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **offset** – Offset from the beginning of partition where mapping should start.
- **size** – Size of the area to be mapped.
- **memory** – Memory space where the region should be mapped
- **out_ptr** – Output, pointer to the mapped memory region
- **out_handle** – Output, handle which should be used for `esp_partition_munmap` call

### Returns

ESP_OK, if successful
void esp_partition_munmap(esp_partition_mmap_handle_t handle)

Release region previously obtained using esp_partition_mmap.

Note: Calling this function will not necessarily unmap memory region. Region will only be unmapped when there are no other handles which reference this region. In case of partially overlapping regions it is possible that memory will be unmapped partially.

Parameters handle – Handle obtained from spi_flash_mmap

esp_err_t esp_partition_get_sha256 (const esp_partition_t *partition, uint8_t* sha_256)

Get SHA-256 digest for required partition.

For apps with SHA-256 appended to the app image, the result is the appended SHA-256 value for the app image content. The hash is verified before returning, if app content is invalid then the function returns ESP_ERR_IMAGE_INVALID. For apps without SHA-256 appended to the image, the result is the SHA-256 of all bytes in the app image. For other partition types, the result is the SHA-256 of the entire partition.

Parameters
• partition – [in] Pointer to info for partition containing app or data. (fields: address, size and type, are required to be filled).
• sha_256 – [out] Returned SHA-256 digest for a given partition.

Returns
• ESP_OK: In case of successful operation.
• ESP_ERR_INVALID_ARG: The size was 0 or the sha_256 was NULL.
• ESP_ERR_NO_MEM: Cannot allocate memory for sha256 operation.
• ESP_ERR_IMAGE_INVALID: App partition doesn’t contain a valid app image.
• ESP_FAIL: An allocation error occurred.

bool esp_partition_check_identity (const esp_partition_t *partition_1, const esp_partition_t *partition_2)

Check for the identity of two partitions by SHA-256 digest.

Parameters
• partition_1 – [in] Pointer to info for partition 1 containing app or data. (fields: address, size and type, are required to be filled).
• partition_2 – [in] Pointer to info for partition 2 containing app or data. (fields: address, size and type, are required to be filled).

Returns
• True: In case of the two firmware is equal.
• False: Otherwise

esp_err_t esp_partition_register_external (esp_flash_t *flash_chip, size_t offset, size_t size, const char *label, esp_partition_type_t type, esp_partition_subtype_t subtype, const esp_partition_t **out_partition)

Register a partition on an external flash chip.

This API allows designating certain areas of external flash chips (identified by the esp_flash_t structure) as partitions. This allows using them with components which access SPI flash through the esp_partition API.

Parameters
• flash_chip – Pointer to the structure identifying the flash chip
• offset – Address in bytes, where the partition starts
• size – Size of the partition in bytes
• label – Partition name
• type – One of the partition types (ESP_PARTITION_TYPE_*), or an integer. Note that applications cannot be booted from external flash chips, so using ESP_PARTITION_TYPE_APP is not supported.
• **subtype**—One of the partition subtypes (ESP_PARTITION_SUBTYPE_*), or an integer.

• **out_partition**—[out] Output, if non-NULL, receives the pointer to the resulting esp_partition_t structure

**Returns**

- ESP_OK on success
- ESP_ERR_NO_MEM if memory allocation has failed
- ESP_ERR_INVALID_ARG if the new partition overlaps another partition on the same flash chip
- ESP_ERR_INVALID_SIZE if the partition doesn’t fit into the flash chip size

```c
esp_err_t esp_partition_deregister_external(const esp_partition_t *partition)
```

Deregister the partition previously registered using esp_partition_register_external.

**Parameters**

- **partition**—pointer to the partition structure obtained from esp_partition_register_external,

**Returns**

- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition pointer is not found
- ESP_ERR_INVALID_ARG if the partition comes from the partition table
- ESP_ERR_INVALID_ARG if the partition was not registered using esp_partition_register_external function.

**Structures**

```c
struct esp_partition_t
```

partition information structure

This is not the format in flash, that format is esp_partition_info_t.

However, this is the format used by this API.

**Public Members**

```c
esp_flash_t *flash_chip
```

SPI flash chip on which the partition resides

```c
esp_partition_type_t type
```

partition type (app/data)

```c
esp_partition_subtype_t subtype
```

partition subtype

```c
uint32_t address
```

starting address of the partition in flash

```c
uint32_t size
```

size of the partition, in bytes

```c
uint32_t erase_size
```

size the erase operation should be aligned to

```c
char label[17]
```

partition label, zero-terminated ASCII string
bool encrypted
flag is set to true if partition is encrypted

bool readonly
flag is set to true if partition is read-only

Macros

ESP_PARTITION_SUBTYPE_OTA (i)
Convenience macro to get esp_partition_subtype_t value for the i-th OTA partition.

Type Definitions

typedef uint32_t esp_partition_mmap_handle_t
Opaque handle for memory region obtained from esp_partition_mmap.

typedef struct esp_partition_iterator_opaque *esp_partition_iterator_t
Opaque partition iterator type.

Enumerations

enum esp_partition_mmap_memory_t
Enumeration which specifies memory space requested in an mmap call.

Values:

enumerator ESP_PARTITION_MMAP_DATA
map to data memory (Vaddr0), allows byte-aligned access, 4 MB total

enumerator ESP_PARTITION_MMAP_INST
map to instruction memory (Vaddr1-3), allows only 4-byte-aligned access, 11 MB total

enum esp_partition_type_t
Partition type.

Note: Partition types with integer value 0x00-0x3F are reserved for partition types defined by ESP-IDF. Any other integer value 0x40-0xFE can be used by individual applications, without restriction.

Values:

enumerator ESP_PARTITION_TYPE_APP
Opaque handle for memory region obtained from esp_partition_mmap.

enumerator ESP_PARTITION_TYPE_DATA
Data partition type.

enumerator ESP_PARTITION_TYPE_ANY
Used to search for partitions with any type.
enum esp_partition_subtype_t

    Partition subtype.

    Application-defined partition types (0x40-0xFE) can set any numeric subtype value.

    **Note:** These ESP-IDF-defined partition subtypes apply to partitions of type ESP_PARTITION_TYPE_APP
    and ESP_PARTITION_TYPE_DATA.

    **Values:**

    enumerator ESP_PARTITION_SUBTYPE_APP_FACTORY
        Factory application partition.

    enumerator ESP_PARTITION_SUBTYPE_APP_OTA_MIN
        Base for OTA partition subtypes.

    enumerator ESP_PARTITION_SUBTYPE_APP_OTA_0
        OTA partition 0.

    enumerator ESP_PARTITION_SUBTYPE_APP_OTA_1
        OTA partition 1.

    enumerator ESP_PARTITION_SUBTYPE_APP_OTA_2
        OTA partition 2.

    enumerator ESP_PARTITION_SUBTYPE_APP_OTA_3
        OTA partition 3.

    enumerator ESP_PARTITION_SUBTYPE_APP_OTA_4
        OTA partition 4.

    enumerator ESP_PARTITION_SUBTYPE_APP_OTA_5
        OTA partition 5.

    enumerator ESP_PARTITION_SUBTYPE_APP_OTA_6
        OTA partition 6.

    enumerator ESP_PARTITION_SUBTYPE_APP_OTA_7
        OTA partition 7.

    enumerator ESP_PARTITION_SUBTYPE_APP_OTA_8
        OTA partition 8.

    enumerator ESP_PARTITION_SUBTYPE_APP_OTA_9
        OTA partition 9.

    enumerator ESP_PARTITION_SUBTYPE_APP_OTA_10
        OTA partition 10.
enumerator \texttt{ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_11}
OTA partition 11.

enumerator \texttt{ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_12}
OTA partition 12.

enumerator \texttt{ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_13}
OTA partition 13.

enumerator \texttt{ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_14}
OTA partition 14.

enumerator \texttt{ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_15}
OTA partition 15.

enumerator \texttt{ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MAX}
Max subtype of OTA partition.

enumerator \texttt{ESP\_PARTITION\_SUBTYPE\_APP\_TEST}
Test application partition.

enumerator \texttt{ESP\_PARTITION\_SUBTYPE\_DATA\_OTA}
OTA selection partition.

enumerator \texttt{ESP\_PARTITION\_SUBTYPE\_DATA\_PHY}
PHY init data partition.

enumerator \texttt{ESP\_PARTITION\_SUBTYPE\_DATA\_NVS}
NVS partition.

enumerator \texttt{ESP\_PARTITION\_SUBTYPE\_DATA\_COREDUMP}
COREDUMP partition.

enumerator \texttt{ESP\_PARTITION\_SUBTYPE\_DATA\_NVS\_KEYS}
Partition for NVS keys.

enumerator \texttt{ESP\_PARTITION\_SUBTYPE\_DATA\_EFUSE\_EM}
Partition for emulate eFuse bits.

enumerator \texttt{ESP\_PARTITION\_SUBTYPE\_DATA\_UNDEFINED}
Undefined (or unspecified) data partition.

enumerator \texttt{ESP\_PARTITION\_SUBTYPE\_DATA\_ESPHTTPD}
ESPHTTPD partition.

enumerator \texttt{ESP\_PARTITION\_SUBTYPE\_DATA\_FAT}
FAT partition.
Chapter 2. API Reference

enumerator ESP_PARTITION_SUBTYPE_DATA_SPIFFS
    SPIFFS partition.

enumerator ESP_PARTITION_SUBTYPE_DATA_LITTLEFS
    LITTLEFS partition.

enumerator ESP_PARTITION_SUBTYPE_ANY
    Used to search for partitions with any subtype.

2.8.9 SPIFFS Filesystem

Overview

SPIFFS is a file system intended for SPI NOR flash devices on embedded targets. It supports wear levelling, file system consistency checks, and more.

Notes

• Currently, SPIFFS does not support directories, it produces a flat structure. If SPIFFS is mounted under /spiffs, then creating a file with the path /spiffs/tmp/myfile.txt will create a file called /tmp/myfile.txt in SPIFFS, instead of myfile.txt in the directory /spiffs/tmp.
• It is not a real-time stack. One write operation might take much longer than another.
• For now, it does not detect or handle bad blocks.
• SPIFFS is able to reliably utilize only around 75% of assigned partition space.
• When the filesystem is running out of space, the garbage collector is trying to find free space by scanning the filesystem multiple times, which can take up to several seconds per write function call, depending on required space. This is caused by the SPIFFS design and the issue has been reported multiple times (e.g., here) and in the official SPIFFS github repository. The issue can be partially mitigated by the SPIFFS configuration.
• Deleting a file does not always remove the whole file, which leaves unusable sections throughout the filesystem.
• When the chip experiences a power loss during a file system operation it could result in SPIFFS corruption. However the file system still might be recovered via esp_spiffs_check function. More details in the official SPIFFS FAQ.

Tools

spiffsgen.py  spiffsgen.py is a write-only Python SPIFFS implementation used to create filesystem images from the contents of a host folder. To use spiffsgen.py, open Terminal and run:

```
python spiffsgen.py <image_size> <base_dir> <output_file>
```

The required arguments are as follows:

• **image_size**: size of the partition onto which the created SPIFFS image will be flashed.
• **base_dir**: directory for which the SPIFFS image needs to be created.
• **output_file**: SPIFFS image output file.

There are also other arguments that control image generation. Documentation on these arguments can be found in the tool’s help:

```
python spiffsgen.py --help
```
These optional arguments correspond to a possible SPIFFS build configuration. To generate the right image, please make sure that you use the same arguments/configuration as were used to build SPIFFS. As a guide, the help output indicates the SPIFFS build configuration to which the argument corresponds. In cases when these arguments are not specified, the default values shown in the help output will be used.

When the image is created, it can be flashed using `esptool.py` or `parttool.py`.

Aside from invoking the `spiffsgen.py` standalone by manually running it from the command line or a script, it is also possible to invoke `spiffsgen.py` directly from the build system by calling `spiffs_create_partition_image`:

```python
spiffs_create_partition_image(<partition> <base_dir> [FLASH_IN_PROJECT] [DEPENDS... --dep dep dep...])
```

This is more convenient as the build configuration is automatically passed to the tool, ensuring that the generated image is valid for that build. An example of this is while the `image_size` is required for the standalone invocation, only the `partition` name is required when using `spiffs_create_partition_image` - the image size is automatically obtained from the project’s partition table.

`spiffs_create_partition_image` must be called from one of the component CMakeLists.txt files.

Optionally, users can opt to have the image automatically flashed together with the app binaries, partition tables, etc. on `idf.py flash` by specifying `FLASH_IN_PROJECT` For example:

```python
spiffs_create_partition_image(my_spiffs_partition my_folder FLASH_IN_PROJECT)
```

If `FLASH_IN_PROJECT/SPIFFS_IMAGE_FLASH_IN_PROJECT` is not specified, the image will still be generated, but you will have to flash it manually using `esptool.py`, `parttool.py`, or a custom build system target.

There are cases where the contents of the base directory itself is generated at build time. Users can use `DEPENDS/SPIFFS_IMAGE_DEPENDS` to specify targets that should be executed before generating the image:

```python
add_custom_target(dep COMMAND ...) 
spiffs_create_partition_image(my_spiffs_partition my_folder DEPENDS dep)
```

For an example, see `storage/spiffsgen`.

**mkspiffs** Another tool for creating SPIFFS partition images is `mkspiffs`. Similar to `spiffsgen.py`, it can be used to create an image from a given folder and then flash that image using `esptool.py`

For that, you need to obtain the following parameters:

- **Block Size**: 4096 (standard for SPI Flash)
- **Page Size**: 256 (standard for SPI Flash)
- **Image Size**: Size of the partition in bytes (can be obtained from a partition table)
- **Partition Offset**: Starting address of the partition (can be obtained from a partition table)

To pack a folder into a 1-Megabyte image, run:

```
mkspiffs -c [src_folder] -b 4096 -p 256 -s 0x100000 spiffs.bin
```

To flash the image onto ESP32-S2 at offset 0x110000, run:

```
python esptool.py --chip esp32s2 --port [port] --baud [baud] write_flash -z --0x110000 spiffs.bin
```

**Notes on Which SPIFFS Tool to Use** The two tools presented above offer very similar functionality. However, there are reasons to prefer one over the other, depending on the use case.

Use `spiffsgen.py` in the following cases:
1. If you want to simply generate a SPIFFS image during the build, `spiffsgen.py` makes it very convenient by providing functions/commands from the build system itself.

2. If the host has no C/C++ compiler available, because `spiffsgen.py` does not require compilation.

Use `mkspiffs` in the following cases:

1. If you need to unpack SPIFFS images in addition to image generation. For now, it is not possible with `spiffsgen.py`.

2. If you have an environment where a Python interpreter is not available, but a host compiler is available. Otherwise, a pre-compiled `mkspiffs` binary can do the job. However, there is no build system integration for `mkspiffs` and the user has to do the corresponding work: compiling `mkspiffs` during build (if a pre-compiled binary is not used), creating build rules/targets for the output files, passing proper parameters to the tool, etc.

- Partition Table documentation

Application Example

An example of using SPIFFS is provided in the `storage/spiffs` directory. This example initializes and mounts a SPIFFS partition, then writes and reads data from it using POSIX and C library APIs. See the README.md file in the example directory for more information.

High-level API Reference

Header File

- components/spiffs/include/esp_spiffs.h
- This header file can be included with:

  ```
  #include "esp_spiffs.h"
  ```

- This header file is a part of the API provided by the `spiffs` component. To declare that your component depends on `spiffs`, add the following to your CMakeLists.txt:

  ```
  REQUIRE spiffs
  ```

  or

  ```
  PRIV_REQUIRES spiffs
  ```

Functions

```
esp_err_t esp_vfs_spiffs_register (const esp_vfs_spiffs_conf_t *conf)
```  
Register and mount SPIFFS to VFS with given path prefix.

- **Parameters**
  - `conf` - Pointer to `esp_vfs_spiffs_conf_t` configuration structure

- **Returns**
  - ESP_OK if success
  - ESP_ERR_NO_MEM if objects could not be allocated
  - ESP_ERR_INVALID_STATE if already mounted or partition is encrypted
  - ESP_ERR_NOT_FOUND if partition for SPIFFS was not found
  - ESP_FAIL if mount or format fails

```
esp_err_t esp_vfs_spiffs_unregister (const char *partition_label)
```  
Unregister and unmount SPIFFS from VFS

- **Parameters**
  - `partition_label` - Same label as passed to `esp_vfs_spiffs_register`.

- **Returns**
bool esp_spiffs_mounted(const char *partition_label)

Check if SPIFFS is mounted

Parameters partition_label – Optional, label of the partition to check. If not specified, first partition with subtype=spiffs is used.

Returns
• true if mounted
• false if not mounted

esp_err_t esp_spiffs_format(const char *partition_label)

Format the SPIFFS partition

Parameters partition_label – Same label as passed to esp_vfs_spiffs_register.

Returns
• ESP_OK if successful
• ESP_FAIL on error

esp_err_t esp_spiffs_info(const char *partition_label, size_t* total_bytes, size_t* used_bytes)

Get information for SPIFFS

Parameters
• partition_label – Same label as passed to esp_vfs_spiffs_register
• total_bytes – [out] Size of the file system
• used_bytes – [out] Current used bytes in the file system

Returns
• ESP_OK if success
• ESP_ERR_INVALID_STATE if not mounted

esp_err_t esp_spiffs_check(const char *partition_label)

Check integrity of SPIFFS

Parameters partition_label – Same label as passed to esp_vfs_spiffs_register

Returns
• ESP_OK if successful
• ESP_ERR_INVALID_STATE if not mounted
• ESP_FAIL on error

esp_err_t esp_spiffs_gc(const char *partition_label, size_t size_to_gc)

Perform garbage collection in SPIFFS partition.

Call this function to run GC and ensure that at least the given amount of space is available in the partition. This function will fail with ESP_ERR_NOT_FINISHED if it is not possible to reclaim the requested space (that is, not enough free or deleted pages in the filesystem). This function will also fail if it fails to reclaim the requested space after CONFIG_SPIFFS_GC_MAX_RUNS number of GC iterations. On one GC iteration, SPIFFS will erase one logical block (4kB). Therefore the value of CONFIG_SPIFFS_GC_MAX_RUNS should be set at least to the maximum expected size_to_gc, divided by 4096. For example, if the application expects to make room for a 1MB file and calls esp_spiffs_gc(label, 1024 * 1024), CONFIG_SPIFFS_GC_MAX_RUNS should be set to at least 256. On the other hand, increasing CONFIG_SPIFFS_GC_MAX_RUNS value increases the maximum amount of time for which any SPIFFS GC or write operation may potentially block.

Parameters
• partition_label – Label of the partition to be garbage-collected. The partition must be already mounted.
• size_to_gc – The number of bytes that the GC process should attempt to make available.

Returns
• ESP_OK on success
• ESP_ERR_NOT_FINISHED if GC fails to reclaim the size given by size_to_gc
• ESP_ERR_INVALID_STATE if the partition is not mounted
• ESP_FAIL on all other errors
Structures

struct esp_vfs_spiffs_conf_t
    Configuration structure for esp_vfs_spiffs_register.

Public Members

const char *base_path
    File path prefix associated with the filesystem.

const char *partition_label
    Optional, label of SPIFFS partition to use. If set to NULL, first partition with subtype=spiffs will be used.

size_t max_files
    Maximum files that could be open at the same time.

bool format_if_mount_failed
    If true, it will format the file system if it fails to mount.

2.8.10 Virtual Filesystem Component

Overview

Virtual filesystem (VFS) component provides a unified interface for drivers which can perform operations on file-like objects. These can be real filesystems (FAT, SPIFFS, etc.) or device drivers which provide a file-like interface.

This component allows C library functions, such as fopen and fprintf, to work with FS drivers. At a high level, each FS driver is associated with some path prefix. When one of C library functions needs to open a file, the VFS component searches for the FS driver associated with the file path and forwards the call to that driver. VFS also forwards read, write, and other calls for the given file to the same FS driver.

For example, one can register a FAT filesystem driver with the /fat prefix and call fopen("/fat/file.txt", "w"). Then the VFS component calls the function open of the FAT driver and pass the argument /file.txt to it together with appropriate mode flags. All subsequent calls to C library functions for the returned FILE* stream will also be forwarded to the FAT driver.

FS Registration

To register an FS driver, an application needs to define an instance of the esp_vfs_t structure and populate it with function pointers to FS APIs:

```
esp_vfs_t myfs = {
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
    .open = &myfs_open,
    .fstat = &myfs_fstat,
    .close = &myfs_close,
    .read = &myfs_read,
};

ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```
Depending on the way how the FS driver declares its API functions, either read, write, etc., or read_p, write_p, etc., should be used.

Case 1: API functions are declared without an extra context pointer (the FS driver is a singleton):

```c
ssize_t myfs_write(int fd, const void * data, size_t size);
```

```c
// In definition of esp_vfs_t:
flags = ESP_VFS_FLAG_DEFAULT,
.write = &myfs_write,
// ... other members initialized

// When registering FS, context pointer (third argument) is NULL:
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

Case 2: API functions are declared with an extra context pointer (the FS driver supports multiple instances):

```c
ssize_t myfs_write(myfs_t * fs, int fd, const void * data, size_t size);
```

```c
// In definition of esp_vfs_t:
flags = ESP_VFS_FLAG_CONTEXT_PTR,
.write_p = &myfs_write,
// ... other members initialized

// When registering FS, pass the FS context pointer into the third argument
// (hypothetical myfs_mount function is used for illustrative purposes)
myfs_t * myfs_inst1 = myfs_mount(partition1->offset, partition1->size);
ESP_ERROR_CHECK(esp_vfs_register("/data1", &myfs, myfs_inst1));

// Can register another instance:
myfs_t * myfs_inst2 = myfs_mount(partition2->offset, partition2->size);
ESP_ERROR_CHECK(esp_vfs_register("/data2", &myfs, myfs_inst2));
```

**Synchronous Input/Output Multiplexing**  
Synchronous input/output multiplexing by `select()` is supported in the VFS component. The implementation works in the following way.

1. `select()` is called with file descriptors which could belong to various VFS drivers.
2. The file descriptors are divided into groups each belonging to one VFS driver.
3. The file descriptors belonging to non-socket VFS drivers are handed over to the given VFS drivers by `start_select()` described later on this page. This function represents the driver-specific implementation of `select()` for the given driver. This should be a non-blocking call which means the function should immediately return after setting up the environment for checking events related to the given file descriptors.
4. The file descriptors belonging to the socket VFS driver are handed over to the socket driver by `socket_select()` described later on this page. This is a blocking call which means that it will return only if there is an event related to socket file descriptors or a non-socket driver signals `socket_select()` to exit.
5. Results are collected from each VFS driver and all drivers are stopped by de-initialization of the environment for checking events.
6. The `select()` call ends and returns the appropriate results.

**Non-Socket VFS Drivers**  
If you want to use `select()` with a file descriptor belonging to a non-socket VFS driver, then you need to register the driver with functions `start_select()` and `end_select()` similarly to the following example:

```c
// In definition of esp_vfs_t:
.start_select = &uart_start_select,
.end_select = &uart_end_select,
// ... other members initialized
```
start_select() is called for setting up the environment for detection of read/write/error conditions on file descriptors belonging to the given VFS driver.

dest_select() is called to stop/deinitialize/free the environment which was setup by start_select().

**Note:** end_select() might be called without a previous start_select() call in some rare circumstances.
end_select() should fail gracefully if this is the case (i.e., should not crash but return an error instead).

Please refer to the reference implementation for the UART peripheral in vfs/vfs_uart.c and most particularly to the functions esp_vfs_dev_uart_register(), uart_start_select(), and uart_end_select() for more information.

Please check the following examples that demonstrate the use of select() with VFS file descriptors:

- peripherals/uart/uart_select
- system/select

**Socket VFS Drivers**  
A socket VFS driver is using its own internal implementation of select() and non-socket VFS drivers notify it upon read/write/error conditions.

A socket VFS driver needs to be registered with the following functions defined:

```c
// In definition of esp_vfs_t:
.socket_select = lwip_select,
.get_socket_select_semaphore = lwip_get_socket_select_semaphore,
.stop_socket_select = lwip_stop_socket_select,
.stop_socket_select_isr = lwip_stop_socket_select_isr,
// ... other members initialized
```

socket_select() is the internal implementation of select() for the socket driver. It works only with file descriptors belonging to the socket VFS.

get_socket_select_semaphore() returns the signalization object (semaphore) which is used in non-socket drivers to stop the waiting in socket_select().

stop_socket_select() call is used to stop the waiting in socket_select() by passing the object returned by get_socket_select_semaphore().

stop_socket_select_isr() has the same functionality as stop_socket_select() but it can be used from ISR.

Please see lwip/port/esp32xx/vfs_lwip.c for a reference socket driver implementation using LWIP.

**Note:** If you use select() for socket file descriptors only then you can disable the CONFIG_VFS_SUPPORT_SELECT option to reduce the code size and improve performance. You should not change the socket driver during an active select() call or you might experience some undefined behavior.

**Paths**

Each registered FS has a path prefix associated with it. This prefix can be considered as a “mount point” of this partition.

In case when mount points are nested, the mount point with the longest matching path prefix is used when opening the file. For instance, suppose that the following filesystems are registered in VFS:

- FS 1 on /data
- FS 2 on /data/static

Then:

- FS 1 will be used when opening a file called /data/log.txt
- FS 2 will be used when opening a file called /data/static/index.html
- Even if /index.html" does not exist in FS 2, FS 1 will not be searched for /static/index.html.

As a general rule, mount point names must start with the path separator (/) and must contain at least one character after path separator. However, an empty mount point name is also supported and might be used in cases when an application needs to provide a “fallback” filesystem or to override VFS functionality altogether. Such filesystem will be used if no prefix matches the path given.

VFS does not handle dots (.) in path names in any special way. VFS does not treat .. as a reference to the parent directory. In the above example, using a path /data/static/../log.txt will not result in a call to FS 1 to open /log.txt. Specific FS drivers (such as FATFS) might handle dots in file names differently.

When opening files, the FS driver receives only relative paths to files. For example:

1. The myfs driver is registered with /data as a path prefix.
2. The application calls fopen("/data/config.json", ...).
3. The VFS component calls myfs_open("/config.json", ...).
4. The myfs driver opens the /config.json file.

VFS does not impose any limit on total file path length, but it does limit the FS path prefix to ESP_VFS_PATH_MAX characters. Individual FS drivers may have their own filename length limitations.

**File Descriptors**

File descriptors are small positive integers from 0 to FD_SETSIZE - 1, where FD_SETSIZE is defined in sys/select.h. The largest file descriptors (configured by CONFIG_LWIP_MAX_SOCKETS) are reserved for sockets. The VFS component contains a lookup-table called s_fd_table for mapping global file descriptors to VFS driver indexes registered in the s_vfs array.

**Standard IO Streams (stdin, stdout, stderr)**

If the menuconfig option UART for console output is not set to None, then stdin, stdout, and stderr are configured to read from, and write to, a UART. It is possible to use UART0 or UART1 for standard IO. By default, UART0 is used with 115200 baud rate; TX pin is GPIO1; RX pin is GPIO3. These parameters can be changed in menuconfig.

Writing to stdout or stderr sends characters to the UART transmit FIFO. Reading from stdin retrieves characters from the UART receive FIFO.

By default, VFS uses simple functions for reading from and writing to UART. Writes busy-wait until all data is put into UART FIFO, and reads are non-blocking, returning only the data present in the FIFO. Due to this non-blocking read behavior, higher level C library calls, such as fscanf("%d\n", &var);, might not have desired results.

Applications which use the UART driver can instruct VFS to use the driver’s interrupt driven, blocking read and write functions instead. This can be done using a call to the esp_vfs_dev_uart_use_driver function. It is also possible to revert to the basic non-blocking functions using a call to esp_vfs_dev_uart_use_nonblocking.

VFS also provides an optional newline conversion feature for input and output. Internally, most applications send and receive lines terminated by the LF (‘n’) character. Different terminal programs may require different line termination, such as CR or CRLF. Applications can configure this separately for input and output either via menuconfig, or by calls to the functions esp_vfs_dev_uart_port_set_rx_line_endings and esp_vfs_dev_uart_port_set_tx_line_endings.

**Standard Streams and FreeRTOS Tasks** FILE objects for stdin, stdout, and stderr are shared between all FreeRTOS tasks, but the pointers to these objects are stored in per-task struct _reent.

The following code is transferred to fprintf(__getreent()->_stderr, "42\n") by the preprocessor:

```c
fprintf(stderr, "42\n");
```
The __getreent() function returns a per-task pointer to struct _reent in newlib libc. This structure is allocated on the TCB of each task. When a task is initialized, _stdin, _stdout, and _stderr members of struct _reent are set to the values of _stdin, _stdout, and _stderr of _GLOBAL_REENT (i.e., the structure which is used before FreeRTOS is started).

Such a design has the following consequences:

- It is possible to set stdin, stdout, and stderr for any given task without affecting other tasks, e.g., by doing stdin = fopen("/dev/uart/1", "r").
- Closing default stdin, stdout, or stderr using fclose closes the FILE stream object, which will affect all other tasks.
- To change the default stdin, stdout, stderr streams for new tasks, modify _GLOBAL_REENT->stdin(_stdout, _stderr) before creating the task.

**eventfd()**

eventfd() call is a powerful tool to notify a select() based loop of custom events. The eventfd() implementation in ESP-IDF is generally the same as described in man(2) eventfd except for:

- esp_vfs_eventfd_register() has to be called before calling eventfd()
- Options EFD_CLOEXEC, EFD_NONBLOCK and EFD_SEMAPHORE are not supported in flags.
- Option EFD_SUPPORT_ISR has been added in flags. This flag is required to read and write the eventfd in an interrupt handler.

Note that creating an eventfd with EFD_SUPPORT_ISR will cause interrupts to be temporarily disabled when reading, writing the file and during the beginning and the ending of the select() when this file is set.

**API Reference**

**Header File**

- components/vfs/include/esp_vfs.h

This header file can be included with:

```c
#include "esp_vfs.h"
```

- This header file is a part of the API provided by the vfs component. To declare that your component depends on vfs, add the following to your CMakeLists.txt:

```cmake
REQUIRES vfs
```

or

```cmake
PRIV_REQUIRES vfs
```

**Functions**

- ssize_t esp_vfs_write (struct _reent *r, int fd, const void *data, size_t size)
  
  These functions are to be used in newlib syscall table. They will be called by newlib when it needs to use any of the syscalls.

- off_t esp_vfs_lseek (struct _reent *r, int fd, off_t size, int mode)

- ssize_t esp_vfs_read (struct _reent *r, int fd, void *dst, size_t size)

- int esp_vfs_open (struct _reent *r, const char *path, int flags, int mode)

- int esp_vfs_close (struct _reent *r, int fd)

- int esp_vfs_fstat (struct _reent *r, int fd, struct stat *st)

- int esp_vfs_stat (struct _reent *r, const char *path, struct stat *st)

int \texttt{esp\_vfs\_link} (struct \_reent *r, const char *n1, const char *n2)

int \texttt{esp\_vfs\_unlink} (struct \_reent *r, const char *path)

int \texttt{esp\_vfs\_rename} (struct \_reent *r, const char *src, const char *dst)

int \texttt{esp\_vfs\_utime} (const char *path, const struct utimbuf *times)

\texttt{esp\_err\_t} \texttt{esp\_vfs\_register} (const char *base\_path, const \texttt{esp\_vfs\_t} *vfs, void *ctx)

Register a virtual filesystem for given path prefix.

\begin{itemize}
  \item \texttt{base\_path} – file path prefix associated with the filesystem. Must be a zero-terminated C string, may be empty. If not empty, must be up to ESP\_VFS\_PATH\_MAX characters long, and at least 2 characters long. Name must start with a “/” and must not end with “/”. For example, “/data” or “/dev/spi” are valid. These VFSes would then be called to handle file paths such as “/data/myfile.txt” or “/dev/spi/0”. In the special case of an empty base\_path, a “fallback” VFS is registered. Such VFS will handle paths which are not matched by any other registered VFS.
  \item \texttt{vfs} – Pointer to \texttt{esp\_vfs\_t}, a structure which maps syscalls to the filesystem driver functions. VFS component doesn’t assume ownership of this pointer.
  \item \texttt{ctx} – If vfs->flags has ESP\_VFS\_FLAG\_CONTEXT\_PTR set, a pointer which should be passed to VFS functions. Otherwise, NULL.
\end{itemize}

\texttt{Returns} ESP\_OK if successful, ESP\_ERR\_NO\_MEM if too many VFSes are registered.

\texttt{esp\_err\_t} \texttt{esp\_vfs\_register\_fd\_range} (const \texttt{esp\_vfs\_t} *vfs, void *ctx, int min\_fd, int max\_fd)

Special case function for registering a VFS that uses a method other than open() to open new file descriptors from the interval \texttt{<min\_fd; max\_fd>}. This is a special-purpose function intended for registering LWIP sockets to VFS.

\begin{itemize}
  \item \texttt{vfs} – Pointer to \texttt{esp\_vfs\_t}. Meaning is the same as for \texttt{esp\_vfs\_register}().
  \item \texttt{ctx} – Pointer to context structure. Meaning is the same as for \texttt{esp\_vfs\_register}().
  \item \texttt{min\_fd} – The smallest file descriptor this VFS will use.
  \item \texttt{max\_fd} – Upper boundary for file descriptors this VFS will use (the biggest file descriptor plus one).
\end{itemize}

\texttt{Returns} ESP\_OK if successful, ESP\_ERR\_NO\_MEM if too many VFSes are registered, ESP\_ERR\_INVALID\_ARG if the file descriptor boundaries are incorrect.

\texttt{esp\_err\_t} \texttt{esp\_vfs\_register\_with\_id} (const \texttt{esp\_vfs\_t} *vfs, void *ctx, \texttt{esp\_vfs\_id\_t} *vfs\_id)

Special case function for registering a VFS that uses a method other than open() to open new file descriptors. In comparison with \texttt{esp\_vfs\_register\_fd\_range}, this function doesn’t pre-registers an interval of file descriptors. File descriptors can be registered later, by using \texttt{esp\_vfs\_register\_fd}.

\begin{itemize}
  \item \texttt{vfs} – Pointer to \texttt{esp\_vfs\_t}. Meaning is the same as for \texttt{esp\_vfs\_register}().
  \item \texttt{ctx} – Pointer to context structure. Meaning is the same as for \texttt{esp\_vfs\_register}().
  \item \texttt{vfs\_id} – Here will be written the VFS ID which can be passed to \texttt{esp\_vfs\_register\_fd} for registering file descriptors.
\end{itemize}

\texttt{Returns} ESP\_OK if successful, ESP\_ERR\_NO\_MEM if too many VFSes are registered, ESP\_ERR\_INVALID\_ARG if the file descriptor boundaries are incorrect.

\texttt{esp\_err\_t} \texttt{esp\_vfs\_unregister} (const char *base\_path)

Unregister a virtual filesystem for given path prefix.

\begin{itemize}
  \item \texttt{base\_path} – file prefix previously used in \texttt{esp\_vfs\_register} call
\end{itemize}

\texttt{Returns} ESP\_OK if successful, ESP\_ERR\_INVALID\_STATE if VFS for given prefix hasn’t been registered.

\texttt{esp\_err\_t} \texttt{esp\_vfs\_unregister\_with\_id} (\texttt{esp\_vfs\_id\_t} vfs\_id)

Unregister a virtual filesystem with the given index.
Chapter 2. API Reference

**Parameters**
- `vfs_id` - The VFS ID returned by `esp_vfs_register_with_id`

**Returns**
- `ESP_OK` if successful, `ESP_ERR_INVALID_STATE` if VFS for the given index hasn’t been registered

---

**esp_err_t esp_vfs_register_fd** *(esp_vfs_id_t vfs_id, int *fd)*

Special function for registering another file descriptor for a VFS registered by `esp_vfs_register_with_id`.

**Parameters**
- `vfs_id` - VFS identifier returned by `esp_vfs_register_with_id`.
- `fd` - The registered file descriptor will be written to this address.

**Returns**
- `ESP_OK` if the registration is successful, `ESP_ERR_NO_MEM` if too many file descriptors are registered, `ESP_ERR_INVALID_ARG` if the arguments are incorrect.

---

**esp_err_t esp_vfs_register_fd_with_local_fd** *(esp_vfs_id_t vfs_id, int local_fd, bool permanent, int *fd)*

Special function for registering another file descriptor with given `local_fd` for a VFS registered by `esp_vfs_register_with_id`.

**Parameters**
- `vfs_id` - VFS identifier returned by `esp_vfs_register_with_id`.
- `local_fd` - The fd in the local vfs. Passing -1 will set the local fd as the (*fd) value.
- `permanent` - Whether the fd should be treated as permanent (not removed after close())
- `fd` - The registered file descriptor will be written to this address.

**Returns**
- `ESP_OK` if the registration is successful, `ESP_ERR_NO_MEM` if too many file descriptors are registered, `ESP_ERR_INVALID_ARG` if the arguments are incorrect.

---

**esp_err_t esp_vfs_unregister_fd** *(esp_vfs_id_t vfs_id, int fd)*

Special function for unregistering a file descriptor belonging to a VFS registered by `esp_vfs_register_with_id`.

**Parameters**
- `vfs_id` - VFS identifier returned by `esp_vfs_register_with_id`.
- `fd` - File descriptor which should be unregistered.

**Returns**
- `ESP_OK` if the registration is successful, `ESP_ERR_INVALID_ARG` if the arguments are incorrect.

---

**int esp_vfs_select** *(int nfds, fd_set* readfds, fd_set* writefds, fd_set* errorfds, struct timeval* timeout)*

Synchronous I/O multiplexing which implements the functionality of POSIX select() for VFS.

**Parameters**
- `nfds` - Specifies the range of descriptors which should be checked. The first nfds descriptors will be checked in each set.
- `readfds` - If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to read, and on output indicates which descriptors are ready to read.
- `writefds` - If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to write, and on output indicates which descriptors are ready to write.
- `errorfds` - If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for error conditions, and on output indicates which descriptors have error conditions.
- `timeout` - If not NULL, then points to timeval structure which specifies the time period after which the functions should time-out and return. If it is NULL, then the function will not time-out. Note that the timeout period is rounded up to the system tick and incremented by one.

**Returns**
- The number of descriptors set in the descriptor sets, or -1 when an error (specified by `errno`) have occurred.

---

**void esp_vfs_select_triggered** *(esp_vfs_select_sem_t sem)*

Notification from a VFS driver about a read/write/error condition.

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to `start_select`.
**Parameters**

- `sem` — semaphore structure which was passed to the driver by the `start_select` call

**esp_vfs_select_triggered_isr**

```c
void esp_vfs_select_triggered_isr(esp_vfs_select_sem_t sem, BaseType_t *woken)
```

Notification from a VFS driver about a read/write/error condition (ISR version)

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to `start_select`.

**Parameters**

- `sem` — semaphore structure which was passed to the driver by the `start_select` call
- `woken` — is set to pdTRUE if the function wakes up a task with higher priority

**ssize_t esp_vfs_pread**

```c
ssize_t esp_vfs_pread(int fd, void *dst, size_t size, off_t offset)
```

Implements the VFS layer of POSIX `pread()`

**Parameters**

- `fd` — File descriptor used for read
- `dst` — Pointer to the buffer where the output will be written
- `size` — Number of bytes to be read
- `offset` — Starting offset of the read

**Returns**

A positive return value indicates the number of bytes read. -1 is return on failure and `errno` is set accordingly.

**ssize_t esp_vfs_pwrite**

```c
ssize_t esp_vfs_pwrite(int fd, const void *src, size_t size, off_t offset)
```

Implements the VFS layer of POSIX `pwrite()`

**Parameters**

- `fd` — File descriptor used for write
- `src` — Pointer to the buffer from where the output will be read
- `size` — Number of bytes to write
- `offset` — Starting offset of the write

**Returns**

A positive return value indicates the number of bytes written. -1 is return on failure and `errno` is set accordingly.

**Structures**

**struct esp_vfs_select_sem_t**

VFS semaphore type for `select()`

**Public Members**

```c
bool is_sem_local
```

Type of "sem" is `SemaphoreHandle_t` when true, defined by socket driver otherwise

```c
void *sem
```

Semaphore instance

**struct esp_vfs_t**

VFS definition structure.

This structure should be filled with pointers to corresponding FS driver functions.

VFS component will translate all FDs so that the filesystem implementation sees them starting at zero. The caller sees a global FD which is prefixed with an pre-filesystem-implementation.

Some FS implementations expect some state (e.g. pointer to some structure) to be passed in as a first argument. For these implementations, populate the members of this structure which have _p suffix, set flags member to `ESP_VFS_FLAG_CONTEXT_PTR` and provide the context pointer to `esp_vfs_register` function. If the
implementation doesn’t use this extra argument, populate the members without _p suffix and set flags member to ESP_VFS_FLAG_DEFAULT.

If the FS driver doesn’t provide some of the functions, set corresponding members to NULL.

**Public Members**

```c
int flags
    ESP_VFS_FLAG_CONTEXT_PTR and/or ESP_VFS_FLAG_READONLY_FS or
    ESP_VFS_FLAG_DEFAULT
```

```c
ssize_t (*write_p)(void *p, int fd, const void *data, size_t size)
    Write with context pointer
```

```c
ssize_t (*write)(int fd, const void *data, size_t size)
    Write without context pointer
```

```c
off_t (*lseek_p)(void *p, int fd, off_t size, int mode)
    Seek with context pointer
```

```c
off_t (*lseek)(int fd, off_t size, int mode)
    Seek without context pointer
```

```c
ssize_t (*read_p)(void *ctx, int fd, void *dst, size_t size)
    Read with context pointer
```

```c
ssize_t (*read)(int fd, void *dst, size_t size)
    Read without context pointer
```

```c
ssize_t (*pread_p)(void *ctx, int fd, void *dst, size_t size, off_t offset)
    pread with context pointer
```

```c
ssize_t (*pread)(int fd, void *dst, size_t size, off_t offset)
    pread without context pointer
```

```c
ssize_t (*pwrite_p)(void *ctx, int fd, const void *src, size_t size, off_t offset)
    pwrite with context pointer
```

```c
ssize_t (*pwrite)(int fd, const void *src, size_t size, off_t offset)
    pwrite without context pointer
```

```c
int (*open_p)(void *ctx, const char *path, int flags, int mode)
    open with context pointer
```

```c
int (*open)(const char *path, int flags, int mode)
    open without context pointer
```

```c
int (*close_p)(void *ctx, int fd)
    close with context pointer
```
int (*close)(int fd)
    close without context pointer

int (*fstat_p)(void *ctx, int fd, struct stat *st)
    fstat with context pointer

int (*fstat)(int fd, struct stat *st)
    fstat without context pointer

int (*stat_p)(void *ctx, const char *path, struct stat *st)
    stat with context pointer

int (*stat)(const char *path, struct stat *st)
    stat without context pointer

int (*link_p)(void *ctx, const char *n1, const char *n2)
    link with context pointer

int (*link)(const char *n1, const char *n2)
    link without context pointer

int (*unlink_p)(void *ctx, const char *path)
    unlink with context pointer

int (*unlink)(const char *path)
    unlink without context pointer

int (*rename_p)(void *ctx, const char *src, const char *dst)
    rename with context pointer

int (*rename)(const char *src, const char *dst)
    rename without context pointer

DIR *(*opendir_p)(void *ctx, const char *name)
    opendir with context pointer

DIR *(*opendir)(const char *name)
    opendir without context pointer

struct dirent *(*readdir_p)(void *ctx, DIR *pdir)
    readdir with context pointer

struct dirent *(*readdir)(DIR *pdir)
    readdir without context pointer

int (*readdir_r_p)(void *ctx, DIR *pdir, struct dirent *entry, struct dirent **out_dirent)
    readdir_r with context pointer
int (*readdir_r)(DIR *pdir, struct dirent *entry, struct dirent **out_dirent)
    readdir_r without context pointer

long (*telldir_p)(void *ctx, DIR *pdir)
    telldir with context pointer

long (*telldir)(DIR *pdir)
    telldir without context pointer

void (*seekdir_p)(void *ctx, DIR *pdir, long offset)
    seekdir with context pointer

void (*seekdir)(DIR *pdir, long offset)
    seekdir without context pointer

int (*closedir_p)(void *ctx, DIR *pdir)
    closedir with context pointer

int (*closedir)(DIR *pdir)
    closedir without context pointer

int (*mkdir_p)(void *ctx, const char *name, mode_t mode)
    mkdir with context pointer

int (*mkdir)(const char *name, mode_t mode)
    mkdir without context pointer

int (*rmdir_p)(void *ctx, const char *name)
    rmdir with context pointer

int (*rmdir)(const char *name)
    rmdir without context pointer

int (*fcntl_p)(void *ctx, int fd, int cmd, int arg)
    fcntl with context pointer

int (*fcntl)(int fd, int cmd, int arg)
    fcntl without context pointer

int (*ioctl_p)(void *ctx, int fd, int cmd, va_list args)
    ioctl with context pointer

int (*ioctl)(int fd, int cmd, va_list args)
    ioctl without context pointer

int (*fsync_p)(void *ctx, int fd)
    fsync with context pointer

    fsync with context pointer
int (*fsync) (int fd)
    fsync without context pointer

int (*access_p) (void *ctx, const char *path, int amode)
    access with context pointer

int (*access) (const char *path, int amode)
    access without context pointer

int (*truncate_p) (void *ctx, const char *path, off_t length)
    truncate with context pointer

int (*truncate) (const char *path, off_t length)
    truncate without context pointer

int (*ftruncate_p) (void *ctx, int fd, off_t length)
    ftruncate with context pointer

int (*ftruncate) (int fd, off_t length)
    ftruncate without context pointer

int (*utime_p) (void *ctx, const char *path, const struct utimbuf *times)
    utime with context pointer

int (*utime) (const char *path, const struct utimbuf *times)
    utime without context pointer

int (*tcsetattr_p) (void *ctx, int fd, int optional_actions, const struct termios *p)
    tcsetattr with context pointer

int (*tcsetattr) (int fd, int optional_actions, const struct termios *p)
    tcsetattr without context pointer

int (*tcgetattr_p) (void *ctx, int fd, struct termios *p)
    tcgetattr with context pointer

int (*tcgetattr) (int fd, struct termios *p)
    tcgetattr without context pointer

int (*tcdrain_p) (void *ctx, int fd)
    tcdrain with context pointer

int (*tcdrain) (int fd)
    tcdrain without context pointer

int (*tcflush_p) (void *ctx, int fd, int select)
    tcflush with context pointer

int (*tcflush) (int fd, int select)
    tcflush without context pointer
int (*tcflush)(int fd, int select)
tcflush without context pointer

int (*tcflow_p)(void *ctx, int fd, int action)
tcflow with context pointer

int (*tcflow)(int fd, int action)
tcflow without context pointer

pid_t (*tcgetsid_p)(void *ctx, int fd)
tcgetsid with context pointer

pid_t (*tcgetsid)(int fd)
tcgetsid without context pointer

int (*tcsendbreak_p)(void *ctx, int fd, int duration)
tcsendbreak with context pointer

int (*tcsendbreak)(int fd, int duration)
tcsendbreak without context pointer

esp_err_t (*start_select)(int nfds, fd_set *readfds, fd_set *writefds, fd_set *exceptfds,
esp_vfs_select_sem_t sem, void **end_select_args)
start_select is called for setting up synchronous I/O multiplexing of the desired file descriptors in the
given VFS

int (*socket_select)(int nfds, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval
*timeout)
socket select function for socket FDs with the functionality of POSIX select(); this should be set only for
the socket VFS

void (*stop_socket_select)(void *sem)
called by VFS to interrupt the socket_select call when select is activated from a non-socket VFS driver;
set only for the socket driver

void (*stop_socket_select_isr)(void *sem, BaseType_t *woken)
stop_socket_select which can be called from ISR; set only for the socket driver

void *(get_socket_select_semaphore)(void)
end_select is called to stop the I/O multiplexing and deinitialize the environment created by start_select
for the given VFS

esp_err_t (*end_select)(void *end_select_args)
get_socket_select_semaphore returns semaphore allocated in the socket driver; set only for the socket
driver

Macros

MAX_fds
Maximum number of (global) file descriptors.
Chapter 2. API Reference

ESP_VFS_PATH_MAX
Maximum length of path prefix (not including zero terminator)

ESP_VFS_FLAG_DEFAULT
Default value of flags member in esp_vfs_t structure.

ESP_VFS_FLAG_CONTEXT_PTR
Flag which indicates that FS needs extra context pointer in syscalls.

ESP_VFS_FLAG_READONLY_FS
Flag which indicates that FS is located on read-only partition.

Type Definitions
typedef int esp_vfs_id_t

Header File
- components/vfs/include/esp_vfs_dev.h
- This header file can be included with:
  
  ```
  #include "esp_vfs_dev.h"
  ```
- This header file is a part of the API provided by the vfs component. To declare that your component depends on vfs, add the following to your CMakeLists.txt:
  
  ```
  REQUIRE vfs
  ```
  or
  
  ```
  PRIV_REQUIRE vfs
  ```

Functions
void esp_vfs_dev_uart_register (void)
  
  This function is called from startup code to enable serial output

void esp_vfs_dev_uart_set_rx_line_endings (esp_line_endings_t mode)
  
  Set the line endings expected to be received on UART.

  This specifies the conversion between line endings received on UART and newlines (’
  ’, LF) passed into stdin:

  - ESP_LINE_ENDINGS_CRLF: convert CRLF to LF
  - ESP_LINE_ENDINGS_CR: convert CR to LF
  - ESP_LINE_ENDINGS_LF: no modification

  **Note:** this function is not thread safe w.r.t. reading from UART

  **Parameters mode** – line endings expected on UART
void esp_vfs_dev_uart_set_tx_line_endings (esp_line_endings_t mode)
Set the line endings to sent to UART.

This specifies the conversion between newlines (’
’ , LF) on stdout and line endings sent over UART:

• ESP_LINE_ENDINGS_CRLF: convert LF to CRLF
• ESP_LINE_ENDINGS_CR: convert LF to CR
• ESP_LINE_ENDINGS_LF: no modification

Note: this function is not thread safe w.r.t. writing to UART

Parameters

mode – line endings to send to UART

int esp_vfs_dev_uart_port_set_rx_line_endings (int uart_num, esp_line_endings_t mode)
Set the line endings expected to be received on specified UART.

This specifies the conversion between line endings received on UART and newlines (’
’ , LF) passed into stdin:

• ESP_LINE_ENDINGS_CRLF: convert CRLF to LF
• ESP_LINE_ENDINGS_CR: convert CR to LF
• ESP_LINE_ENDINGS_LF: no modification

Note: this function is not thread safe w.r.t. reading from UART

Parameters

• uart_num – the UART number
• mode – line endings to send to UART

Returns
0 if succeeded, or -1 when an error (specified by errno) have occurred.

int esp_vfs_dev_uart_port_set_tx_line_endings (int uart_num, esp_line_endings_t mode)
Set the line endings to sent to specified UART.

This specifies the conversion between newlines (’
’ , LF) on stdout and line endings sent over UART:

• ESP_LINE_ENDINGS_CRLF: convert LF to CRLF
• ESP_LINE_ENDINGS_CR: convert LF to CR
• ESP_LINE_ENDINGS_LF: no modification

Note: this function is not thread safe w.r.t. writing to UART

Parameters

• uart_num – the UART number
• **mode** - line endings to send to UART

Returns 0 if succeeded, or -1 when an error (specified by errno) have occurred.

```c
void esp_vfs_dev_uart_use_nonblocking(int uart_num)
```

set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

**Parameters**
- `uart_num` - UART peripheral number

```c
void esp_vfs_dev_uart_use_driver(int uart_num)
```

set VFS to use UART driver for reading and writing

**Note:** application must configure UART driver before calling these functions. With these functions, read and write are blocking and interrupt-driven.

**Parameters**
- `uart_num` - UART peripheral number

```c
void esp_vfs_usb_serial_jtag_use_driver(void)
```

set VFS to use USB-SERIAL-JTAG driver for reading and writing

**Note:** application must configure USB-SERIAL-JTAG driver before calling these functions. With these functions, read and write are blocking and interrupt-driven.

```c
void esp_vfs_usb_serial_jtag_use_nonblocking(void)
```

set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

**Header File**

```c
#include "esp_vfs_eventfd.h"
```

This header file is a part of the API provided by the vfs component. To declare that your component depends on vfs, add the following to your CMakeLists.txt:

```c
REQUIRES vfs
```

or

```c
PRIV_REQUIRES vfs
```

**Functions**

```c
esp_err_t esp_vfs_eventfd_register(const esp_vfs_eventfd_config_t *config)
```

Registers the event vfs.

**Returns** ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered.

```c
esp_err_t esp_vfs_eventfd_unregister(void)
```

Unregisters the event vfs.

**Returns** ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn’t been registered

```c
int eventfd(unsigned int initial, int flags)
```

### Structures

struct esp_vfs_eventfd_config_t

Eventfd vfs initialization settings.

#### Public Members

size_t max_fds

The maximum number of eventfds supported

#### Macros

EFD_SUPPORT_ISR

ESP_VFS_EVENTD_CONFIG_DEFAULT()

### 2.8.11 Wear Levelling API

#### Overview

Most of flash memory and especially SPI flash that is used in ESP32-S2 has a sector-based organization and also has a limited number of erase/modification cycles per memory sector. The wear levelling component helps to distribute wear and tear among sectors more evenly without requiring any attention from the user.

The wear levelling component provides API functions related to reading, writing, erasing, and memory mapping of data in external SPI flash through the partition component. The component also has higher-level API functions which work with the FAT filesystem defined in FAT filesystem.

The wear levelling component, together with the FAT FS component, uses FAT FS sectors of 4096 bytes, which is a standard size for flash memory. With this size, the component shows the best performance but needs additional memory in RAM.

To save internal memory, the component has two additional modes which both use sectors of 512 bytes:

- **Performance mode.** Erase sector operation data is stored in RAM, the sector is erased, and then data is copied back to flash memory. However, if a device is powered off for any reason, all 4096 bytes of data is lost.
- **Safety mode.** The data is first saved to flash memory, and after the sector is erased, the data is saved back. If a device is powered off, the data can be recovered as soon as the device boots up.

The default settings are as follows:

- Sector size is 512 bytes
- Performance mode

You can change the settings through the configuration menu.

The wear levelling component does not cache data in RAM. The write and erase functions modify flash directly, and flash contents are consistent when the function returns.

#### Wear Levelling access API functions

This is the set of API functions for working with data in flash:

- `wl_mount` - initializes the wear levelling module and mounts the specified partition
- `wl_unmount` - unmounts the partition and deinitializes the wear levelling module
- `wl_erase_range` - erases a range of addresses in flash
• `wl_write` - writes data to a partition
• `wl_read` - reads data from a partition
• `wl_size` - returns the size of available memory in bytes
• `wl_sector_size` - returns the size of one sector

As a rule, try to avoid using raw wear levelling functions and use filesystem-specific functions instead.

Memory Size

The memory size is calculated in the wear levelling module based on partition parameters. The module uses some sectors of flash for internal data.

See Also

• FAT Filesystem Support
• Partition Tables

Application Example

An example that combines the wear levelling driver with the FATFS library is provided in the storage/wear_levelling directory. This example initializes the wear levelling driver, mounts FatFs partition, as well as writes and reads data from it using POSIX and C library APIs. See storage/wear_levelling/README.md for more information.

High-level API Reference

Header Files

• fatfs/vfs/esp_vfs_fat.h

High-level wear levelling functions `esp_vfsFatSpiflashMountRwWl()`, `esp_vfsFatSpiflashUnmountRwWl()` and struct `esp_vfsFatMountConfig_t` are described in FAT Filesystem Support.

Mid-level API Reference

Header File

• components/wear_levelling/include/wear_levelling.h

This header file can be included with:

```
#include "wear_levelling.h"
```

This header file is a part of the API provided by the wear_levelling component. To declare that your component depends on wear_levelling, add the following to your CMakeLists.txt:

```
REQUIRES wear_levelling
```

or

```
PRIV_REQUIRES wear_levelling
```

Functions

`esp_err_t wl_mount(const esp_partition_t *partition, wl_handle_t *out_handle)`

Mount WL for defined partition.

Parameters

• `partition` – that will be used for access
Chapter 2. API Reference

- **out_handle** – handle of the WL instance

  **Returns**
  - ESP_OK, if the WL allocation is successful;
  - ESP_ERR_INVALID_ARG, if the arguments for WL configuration are not valid;
  - ESP_ERR_NO_MEM, if the WL allocation fails because of insufficient memory;

  \[ \text{esp_err_t} \text{ wl_unmount} (\text{wl_handle_t} \ handle) \]

 Unmount WL for defined partition.

  **Parameters**
  - `handle` – WL partition handle

  **Returns**
  - ESP_OK, if the operation is successful;
  - or one of error codes from lower-level flash driver.

  \[ \text{esp_err_t} \text{ wl_erase_range} (\text{wl_handle_t} \ handle, \text{size_t} \ start_addr, \text{size_t} \ size) \]

  Erase part of the WL storage.

  **Parameters**
  - `handle` – WL handle that are related to the partition
  - `start_addr` – Address from where erase operation should start. Must be aligned to the result of function `wl_sector_size(…)`.
  - `size` – Size of the range which should be erased, in bytes. Must be divisible by the result of function `wl_sector_size(…)`.

  **Returns**
  - ESP_OK, if the given range was erased successfully;
  - ESP_ERR_INVALID_ARG, if iterator or dst are NULL;
  - ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition;
  - or one of error codes from lower-level flash driver.

  \[ \text{esp_err_t} \text{ wl_write} (\text{wl_handle_t} \ handle, \text{size_t} \ dest_addr, \text{const void*} \ src, \text{size_t} \ size) \]

  Write data to the WL storage.

  Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `wl_erase_range` function.

  **Note:** Prior to writing to WL storage, make sure it has been erased with `wl_erase_range` call.

  **Parameters**
  - `handle` – WL handle corresponding to the WL partition
  - `dest_addr` – Address where the data should be written, relative to the beginning of the partition.
  - `src` – Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least `size` bytes long.
  - `size` – Size of data to be written, in bytes.

  **Returns**
  - ESP_OK, if data was written successfully;
  - ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size;
  - ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition;
  - or one of error codes from lower-level flash driver.

  \[ \text{esp_err_t} \text{ wl_read} (\text{wl_handle_t} \ handle, \text{size_t} \ src_addr, \text{void*} \ dest, \text{size_t} \ size) \]

  Read data from the WL storage.

  **Parameters**
  - `handle` – WL module instance that was initialized before
  - `dest` – Pointer to the buffer where data should be stored. The Pointer must be non-NULL and the buffer must be at least `size` bytes long.
  - `src_addr` – Address of the data to be read, relative to the beginning of the partition.
  - `size` – Size of data to be read, in bytes.

  **Returns**
- ESP_OK, if data was read successfully;
- ESP_ERR_INVALID_ARG, if src_offset exceeds partition size;
- ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

```c
size_t wl_size(wl_handle_t handle)
```

Get the actual flash size in use for the WL storage partition.

Parameters
- `handle` – WL module handle that was initialized before

Returns
- usable size, in bytes

```c
size_t wl_sector_size(wl_handle_t handle)
```

Get sector size of the WL instance.

Parameters
- `handle` – WL module handle that was initialized before

Returns
- sector size, in bytes

**Macros**

WL_INVALID_HANDLE

**Type Definitions**

```c
typedef int32_t wl_handle_t
```

wear levelling handle

Code examples for this API section are provided in the storage directory of ESP-IDF examples.

## 2.9 System API

### 2.9.1 App Image Format

**Application Image Structures**

An application image consists of the following:

1. The `esp_image_header_t` structure describes the mode of SPI flash and the count of memory segments.
2. The `esp_image_segment_header_t` structure describes each segment, its length, and its location in ESP32-S2’s memory, followed by the data with a length of `data_len`. The data offset for each segment in the image is calculated in the following way:
   - offset for 0 Segment = `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t)`
   - offset for 1 Segment = offset for 0 Segment + length of 0 Segment + `sizeof(esp_image_segment_header_t)`
   - offset for 2 Segment = offset for 1 Segment + length of 1 Segment + `sizeof(esp_image_segment_header_t)`
   - ...

The count of each segment is defined in the `segment_count` field that is stored in `esp_image_header_t`. The count cannot be more than `ESP_IMAGE_MAX_SEGMENTS`.

To get the list of your image segments, please run the following command:
You can also see the information on segments in the ESP-IDF logs while your application is booting:

```
I (443) esp_image: segment 0: paddr=0x00020020 vaddr=0x3f400020 size=0x13ce0 ...
  (81120) map
I (489) esp_image: segment 1: paddr=0x00033d08 vaddr=0x3ff80000 size=0x0000000 (0)
  load
I (530) esp_image: segment 2: paddr=0x00033d10 vaddr=0x3ff80000 size=0x0000000 (0)
  load
I (571) esp_image: segment 3: paddr=0x00033d18 vaddr=0x3ff80000 size=0x028e0 (0)
  (10464) load
I (612) esp_image: segment 4: paddr=0x00036600 vaddr=0x3ff828e0 size=0x0000000 (0)
  load
I (654) esp_image: segment 5: paddr=0x00036608 vaddr=0x40080000 size=0x00400 (0)
  (1024) load
I (695) esp_image: segment 6: paddr=0x00036a10 vaddr=0x40080400 size=0x09600 (0)
  (38400) load
I (737) esp_image: segment 7: paddr=0x00040018 vaddr=0x400d0018 size=0x62e4c...
  (405068) map
I (847) esp_image: segment 8: paddr=0x000a2e6c vaddr=0x40089a00 size=0x06cec (0)
  (27884) load
I (888) esp_image: segment 9: paddr=0x000a9b60 vaddr=0x400c0000 size=0x00000 (0)
  load
I (929) esp_image: segment 10: paddr=0x000a9b68 vaddr=0x50000000 size=0x00004 (4)
  load
I (971) esp_image: segment 11: paddr=0x000a9b74 vaddr=0x50000004 size=0x00000 (0)
  load
I (1012) esp_image: segment 12: paddr=0x000a9b7c vaddr=0x50000004 size=0x00000 (0)
  load
```

For more details on the type of memory segments and their address ranges, see ESP32-S2 Technical Reference Manual > System and Memory > Internal Memory [PDF].

3. The image has a single checksum byte after the last segment. This byte is written on a sixteen byte padded boundary, so the application image might need padding.

4. If the hash appended field from esp_image_header_t is set then a SHA256 checksum will be appended. The value of the SHA256 hash is calculated on the range from the first byte and up to this field. The length of this field is 32 bytes.

5. If the option CONFIG_SECURE_SIGNED_APPS_SCHEME is set to ECDSA then the application image will
have an additional 68 bytes for an ECDSA signature, which includes:

- version word (4 bytes)
- signature data (64 bytes)

6. If the option `CONFIG_SECURE_SIGNED_APPS_SCHEME` is set to RSA or ECDSA (V2) then the application image will have an additional signature sector of 4 KB in size. For more details on the format of this signature sector, please refer to `Signature Block Format`.

**Application Description**

The DROM segment of the application binary starts with the `esp_app_desc_t` structure which carries specific fields describing the application:

- `magic_word`: the magic word for the `esp_app_desc_t` structure
- `secure_version`: see `Anti-rollback`
- `version`: see `App version`
- `project_name`: filled from `PROJECT_NAME`
- `time and date`: compile time and date
- `idf_ver`: version of ESP-IDF
- `app_elf_sha256`: contains SHA256 hash for the application ELF file

This structure is useful for identification of images uploaded via Over-the-Air (OTA) updates because it has a fixed offset = `sizeof(esp_image_header_t)` + `sizeof(esp_image_segment_header_t)` + `sizeof(esp_app_desc_t)`. As soon as a device receives the first fragment containing this structure, it has all the information to determine whether the update should be continued with or not.

To obtain the `esp_app_desc_t` structure for the currently running application, use `esp_app_get_description()`.

To obtain the `esp_app_desc_t` structure for another OTA partition, use `esp_ota_get_partition_description()`.

**Adding a Custom Structure to an Application**

Users also have the opportunity to have similar structure with a fixed offset relative to the beginning of the image.

The following pattern can be used to add a custom structure to your image:

```c
const __attribute__((section(".rodata_custom_desc"))) esp_custom_app_desc_t custom_app_desc = { ... }
```

Offset for custom structure is `sizeof(esp_image_header_t)` + `sizeof(esp_image_segment_header_t)` + `sizeof(esp_app_desc_t)`.

To guarantee that the custom structure is located in the image even if it is not used, you need to add `target_link_libraries(${COMPONENT_TARGET} "-u custom_app_desc")` into `CMakeLists.txt`.

**API Reference**

**Header File**

- `components/bootloader_support/include/esp_app_format.h`

This header file can be included with:

```c
#include "esp_app_format.h"
```

This header file is a part of the API provided by the `bootloader_support` component. To declare that your component depends on `bootloader_support`, add the following to your `CMakeLists.txt`:

---

1 The maximum length is 32 characters, including null-termination character. For example, if the length of `PROJECT_NAME` exceeds 31 characters, the excess characters will be disregarded.
REQUIRES bootloader_support

or

PRIV_REQUIRES bootloader_support

**Structures**

```c
struct esp_image_header_t
{
    uint8_t magic; // Magic word ESP_IMAGE_HEADER_MAGIC
    uint8_t segment_count; // Count of memory segments
    uint8_t spi_mode; // flash read mode (esp_image_spi_mode_t as uint8_t)
    uint8_t spi_speed; // flash frequency (esp_image_spi_freq_t as uint8_t)
    uint8_t spi_size; // flash chip size (esp_image_flash_size_t as uint8_t)
    uint32_t entry_addr; // Entry address
    uint8_t wp_pin; // WP pin when SPI pins set via efuse (read by ROM bootloader, the IDF bootloader uses software to configure the WP pin and sets this field to 0xEE=disabled)
    uint8_t spi_pin_drv[3]; // Drive settings for the SPI flash pins (read by ROM bootloader)
    esp_chip_id_t chip_id; // Chip identification number
    uint8_t min_chip_rev; // Minimal chip revision supported by image. After the Major and Minor revision eFuses were introduced into the chips, this field is no longer used. But for compatibility reasons, we keep this field and the data in it. Use min_chip_rev_full instead. The software interprets this as a Major version for most of the chips and as a Minor version for the ESP32-C3.
    uint16_t min_chip_rev_full; // Minimal chip revision supported by image, in format: major * 100 + minor
};
```
uint16_t `max_chip_rev_full`  
Maximal chip revision supported by image, in format: major * 100 + minor

uint8_t `reserved[4]`  
Reserved bytes in additional header space, currently unused

uint8_t `hash_appended`  
If 1, a SHA256 digest “simple hash” (of the entire image) is appended after the checksum. Included in image length. This digest is separate to secure boot and only used for detecting corruption. For secure boot signed images, the signature is appended after this (and the simple hash is included in the signed data).

struct `esp_image_segment_header_t`  
Header of binary image segment.

**Public Members**

uint32_t `load_addr`  
Address of segment

uint32_t `data_len`  
Length of data

**Macros**

`ESP_IMAGE_HEADER_MAGIC`  
The magic word for the `esp_image_header_t` structure.

`ESP_IMAGE_MAX_SEGMENTS`  
Max count of segments in the image.

**Enumerations**

enum `esp_chip_id_t`  
ESP chip ID.  

*Values:*

enumerator `ESP_CHIP_ID_ESP32`  
chip ID: ESP32

enumerator `ESP_CHIP_ID_ESP32S2`  
chip ID: ESP32-S2

enumerator `ESP_CHIP_ID_ESP32C3`  
chip ID: ESP32-C3

enumerator `ESP_CHIP_ID_ESP32S3`  
chip ID: ESP32-S3
Chapter 2  API Reference

enumerator ESP_CHIP_ID_ESP32C2
  chip ID: ESP32-C2

enumerator ESP_CHIP_ID_ESP32C6
  chip ID: ESP32-C6

enumerator ESP_CHIP_ID_ESP32H2
  chip ID: ESP32-H2

enumerator ESP_CHIP_ID_ESP32P4
  chip ID: ESP32-P4

enumerator ESP_CHIP_ID_INVALID
  Invalid chip ID (we defined it to make sure the esp_chip_id_t is 2 bytes size)

enum esp_image_spi_mode_t
  SPI flash mode, used in esp_image_header_t.
  Values:

  enumerator ESP_IMAGE_SPI_MODE_QIO
    SPI mode QIO

  enumerator ESP_IMAGE_SPI_MODE_QOUT
    SPI mode QOUT

  enumerator ESP_IMAGE_SPI_MODE_DIO
    SPI mode DIO

  enumerator ESP_IMAGE_SPI_MODE_DOUT
    SPI mode DOUT

  enumerator ESP_IMAGE_SPI_MODE_FAST_READ
    SPI mode FAST_READ

  enumerator ESP_IMAGE_SPI_MODE_SLOW_READ
    SPI mode SLOW_READ

enum esp_image_spi_freq_t
  SPI flash clock division factor.
  Values:

  enumerator ESP_IMAGE_SPI_SPEED_DIV_2
    The SPI flash clock frequency is divided by 2 of the clock source

  enumerator ESP_IMAGE_SPI_SPEED_DIV_3
    The SPI flash clock frequency is divided by 3 of the clock source

  enumerator ESP_IMAGE_SPI_SPEED_DIV_4
    The SPI flash clock frequency is divided by 4 of the clock source
enumerator ESP_IMAGE_SPI_SPEED_DIV_1
  The SPI flash clock frequency equals to the clock source

enum esp_image_flash_size_t
  Supported SPI flash sizes.
  Values:

  enumerator ESP_IMAGE_FLASH_SIZE_1MB
    SPI flash size 1 MB

  enumerator ESP_IMAGE_FLASH_SIZE_2MB
    SPI flash size 2 MB

  enumerator ESP_IMAGE_FLASH_SIZE_4MB
    SPI flash size 4 MB

  enumerator ESP_IMAGE_FLASH_SIZE_8MB
    SPI flash size 8 MB

  enumerator ESP_IMAGE_FLASH_SIZE_16MB
    SPI flash size 16 MB

  enumerator ESP_IMAGE_FLASH_SIZE_32MB
    SPI flash size 32 MB

  enumerator ESP_IMAGE_FLASH_SIZE_64MB
    SPI flash size 64 MB

  enumerator ESP_IMAGE_FLASH_SIZE_128MB
    SPI flash size 128 MB

  enumerator ESP_IMAGE_FLASH_SIZE_MAX
    SPI flash size MAX

2.9.2 Bootloader Image Format

The bootloader image consists of the same structures as the application image, see Application Image Structures. The only difference is in the Bootloader Description structure.

To get information about the bootloader image, please run the following command:

```
esptool.py --chip esp32s2 image_info build/bootloader/bootloader.bin --version 2
```

Bootloader information

---

Bootloader version: 1
ESP-IDF: v5.1-dev-4304-gcb51a3b.dirty
Compile time: Mar 30 2023 19:14:17

---

**Bootloader Description**

The DRAM0 segment of the bootloader binary starts with the `esp_bootloader_desc_t` structure which carries specific fields describing the bootloader. This structure is located at a fixed offset = sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t).

- **magic_byte** - the magic byte for the esp_bootloader_desc structure.
- **reserved** - reserved for the future IDF use.
- **version** - bootloader version, see CONFIG_BOOTLOADER_PROJECT_VER
- **idf_ver** - ESP-IDF version. *
- **date and time** - compile date and time.
- **reserved2** - reserved for the future IDF use.

* - The maximum length is 32 characters, including null-termination character.

To get the `esp_bootloader_desc_t` structure from the running bootloader, use `esp_bootloader_get_description()`.

To get the `esp_bootloader_desc_t` structure from a running application, use `esp_ota_get_bootloader_description()`.

---

**API Reference**

**Header File**

- components/esp_bootloader_format/include/esp_bootloader_desc.h

This header file can be included with:
#include "esp_bootloader_desc.h"

- This header file is a part of the API provided by the esp_bootloader_format component. To declare that your component depends on esp_bootloader_format, add the following to your CMakeLists.txt:

```
REQUIRES esp_bootloader_format
```

or

```
PRIV_REQUIRES esp_bootloader_format
```

## Functions

```c
const esp_bootloader_desc_t *esp_bootloader_get_description (void)
```

Returns esp_bootloader_desc structure.

Intended for use by the bootloader.

**Returns** Pointer to esp_bootloader_desc structure.

## Structures

```c
struct esp_bootloader_desc_t
```

Bootloader description structure.

### Public Members

```c
uint8_t magic_byte
```

Magic byte ESP_BOOTLOADER_DESC_MAGIC_BYTE

```c
uint8_t reserved[3]
```

reserved for IDF

```c
uint32_t version
```

Bootloader version

```c
char idf_ver[32]
```

Version IDF

```c
char date_time[24]
```

Compile date and time

```c
uint8_t reserved2[16]
```

reserved for IDF

## Macros

```c
ESP_BOOTLOADER_DESC_MAGIC_BYTE
```

The magic byte for the esp_bootloader_desc structure that is in DRAM.

### 2.9.3 Application Level Tracing
Overview

ESP-IDF provides a useful feature for application behavior analysis called Application Level Tracing. The feature can be enabled in menuconfig and allows transfer of arbitrary data between the host and ESP32-S2 via JTAG interface with minimal overhead on program execution.

Developers can use this library to send application specific state of execution to the host, and receive commands or other types of information in the opposite direction at runtime. The main use cases of this library are:

1. Collecting application specific data, see Application Specific Tracing.
2. Lightweight logging to the host, see Logging to Host.
3. System behaviour analysis, see System Behavior Analysis with SEGGER SystemView.

API Reference

Header File

- components/app_trace/include/esp_app_trace.h
- This header file can be included with:

```c
#include "esp_app_trace.h"
```

- This header file is a part of the API provided by the app_trace component. To declare that your component depends on app_trace, add the following to your CMakeLists.txt:

```cmake
REQUIRES app_trace
```

or

```cmake
PRIV_REQUIRES app_trace
```

Functions

**esp_err_t esp_apptrace_init (void)**

Initializes application tracing module.

**Note:** Should be called before any esp_apptrace_xxx call.

**Returns** ESP_OK on success, otherwise see esp_err_t

**void esp_apptrace_down_buffer_config (uint8_t* buf, uint32_t size)**

Configures down buffer.

**Note:** Needs to be called before attempting to receive any data using esp_apptrace_down_buffer_get and esp_apptrace_read. This function does not protect internal data by lock.

**Parameters**

- **buf** — Address of buffer to use for down channel (host to target) data.
- **size** — Size of the buffer.

**uint8_t** *esp_apptrace_buffer_get (esp_apptrace_dest_t dest, uint32_t size, uint32_t tmo)**

Allocates buffer for trace data. Once the data in the buffer is ready to be sent, esp_apptrace_buffer_put must be called to indicate it.

**Parameters**

- **dest** — Indicates HW interface to send data.
- **size** — Size of data to write to trace buffer.
• **tmo** – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

Returns non-NULL on success, otherwise NULL.

```c
esp_err_t esp_apptrace_buffer_put(esp_apptrace_dest_t dest, uint8_t *ptr, uint32_t tmo)
```

Indicates that the data in the buffer is ready to be sent. This function is a counterpart of and must be preceded by esp_apptrace_buffer_get.

Parameters
- **dest** – Indicates HW interface to send data. Should be identical to the same parameter in call to esp_apptrace_buffer_get.
- **ptr** – Address of trace buffer to release. Should be the value returned by call to esp_apptrace_buffer_get.
- **tmo** – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

Returns [ESP_OK](#) on success, otherwise see [esp_err_t](#)

```c
esp_err_t esp_apptrace_write(esp_apptrace_dest_t dest, const void *data, uint32_t size, uint32_t tmo)
```

Writes data to trace buffer.

Parameters
- **dest** – Indicates HW interface to send data.
- **data** – Address of data to write to trace buffer.
- **size** – Size of data to write to trace buffer.
- **tmo** – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

Returns [ESP_OK](#) on success, otherwise see [esp_err_t](#)

```c
int esp_apptrace_vprintf_to(esp_apptrace_dest_t dest, uint32_t tmo, const char *fmt, va_list ap)
```

vprintf-like function to send log messages to host via specified HW interface.

Parameters
- **dest** – Indicates HW interface to send data.
- **tmo** – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.
- **fmt** – Address of format string.
- **ap** – List of arguments.

Returns Number of bytes written.

```c
int esp_apptrace_vprintf(const char *fmt, va_list ap)
```

vprintf-like function to send log messages to host.

Parameters
- **fmt** – Address of format string.
- **ap** – List of arguments.

Returns Number of bytes written.

```c
esp_err_t esp_apptrace_flush(esp_apptrace_dest_t dest, uint32_t tmo)
```

Flushes remaining data in trace buffer to host.

Parameters
- **dest** – Indicates HW interface to flush data on.
- **tmo** – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

Returns [ESP_OK](#) on success, otherwise see [esp_err_t](#)

```c
esp_err_t esp_apptrace_flush_nolock(esp_apptrace_dest_t dest, uint32_t min_sz, uint32_t tmo)
```

Flushes remaining data in trace buffer to host without locking internal data. This is a special version of esp_apptrace_flush which should be called from panic handler.

Parameters
- **dest** – Indicates HW interface to flush data on.
Chapter 2. API Reference

- **min_sz** – Threshold for flushing data. If current filling level is above this value, data will be flushed. TRAX destinations only.
- **tmo** – Timeout for operation (in us). Use ESP_APPTTRACE_TMO_INFINITE to wait indefinitely.

Returns ESP_OK on success, otherwise see esp_err_t

```c
esp_err_t esp_apptrace_read(esp_apptrace_dest_t dest, void *data, uint32_t *size, uint32_t tmo)
```

Reads host data from trace buffer.

Parameters
- **dest** – Indicates HW interface to read the data on.
- **data** – Address of buffer to put data from trace buffer.
- **size** – Pointer to store size of read data. Before call to this function pointed memory must hold requested size of data
- **tmo** – Timeout for operation (in us). Use ESP_APPTTRACE_TMO_INFINITE to wait indefinitely.

Returns ESP_OK on success, otherwise see esp_err_t

```c
uint8_t *esp_apptrace_down_buffer_get(esp_apptrace_dest_t dest, uint32_t *size, uint32_t tmo)
```

Retrieves incoming data buffer if any. Once data in the buffer is processed, esp_apptrace_down_buffer_put must be called to indicate it.

Parameters
- **dest** – Indicates HW interface to receive data.
- **size** – Address to store size of available data in down buffer. Must be initialized with requested value.
- **tmo** – Timeout for operation (in us). Use ESP_APPTTRACE_TMO_INFINITE to wait indefinitely.

Returns non-NULL on success, otherwise NULL.

```c
esp_err_t esp_apptrace_down_buffer_put(esp_apptrace_dest_t dest, uint8_t *ptr, uint32_t tmo)
```

Indicates that the data in the down buffer is processed. This function is a counterpart of and must be preceded by esp_apptrace_down_buffer_get.

Parameters
- **dest** – Indicates HW interface to receive data. Should be identical to the same parameter in call to esp_apptrace_down_buffer_get.
- **ptr** – Address of trace buffer to release. Should be the value returned by call to esp_apptrace_down_buffer_get.
- **tmo** – Timeout for operation (in us). Use ESP_APPTTRACE_TMO_INFINITE to wait indefinitely.

Returns ESP_OK on success, otherwise see esp_err_t

```c
bool esp_apptrace_host_is_connected(esp_apptrace_dest_t dest)
```

Checks whether host is connected.

Parameters **dest** – Indicates HW interface to use.

Returns true if host is connected, otherwise false

```c
void *esp_apptrace_fopen(esp_apptrace_dest_t dest, const char *path, const char *mode)
```

Opens file on host. This function has the same semantic as `fopen` except for the first argument.

Parameters
- **dest** – Indicates HW interface to use.
- **path** – Path to file.
- **mode** – Mode string. See fopen for details.

Returns non zero file handle on success, otherwise 0

```c
int esp_apptrace_fclose(esp_apptrace_dest_t dest, void *stream)
```

Closes file on host. This function has the same semantic as `fclose` except for the first argument.

Parameters
- **dest** – Indicates HW interface to use.
size_t esp_apptrace_fwrite(esp_apptrace_dest_t dest, const void *ptr, size_t size, size_t nmemb, void *stream)

Writesto file on host. This function has the same semantic as ‘fwrite’ except for the first argument.

Parameters
- **dest** – Indicators HW interface to use.
- **ptr** – Address of data to write.
- **size** – Size of an item.
- **nmemb** – Number of items to write.
- **stream** – File handle returned by esp_apptrace_fopen.

Returns Number of written items. See fwrite for details.

size_t esp_apptrace_fread(esp_apptrace_dest_t dest, void *ptr, size_t size, size_t nmemb, void *stream)

Read file on host. This function has the same semantic as ‘fread’ except for the first argument.

Parameters
- **dest** – Indicators HW interface to use.
- **ptr** – Address to store read data.
- **size** – Size of an item.
- **nmemb** – Number of items to read.
- **stream** – File handle returned by esp_apptrace_fopen.

Returns Number of read items. See fread for details.

int esp_apptrace_fseek(esp_apptrace_dest_t dest, void *stream, long offset, int whence)

Set position indicator in file on host. This function has the same semantic as ‘fseek’ except for the first argument.

Parameters
- **dest** – Indicators HW interface to use.
- **stream** – File handle returned by esp_apptrace_fopen.
- **offset** – Offset. See fseek for details.
- **whence** – Position in file. See fseek for details.

Returns Zero on success, otherwise non-zero. See fseek for details.

int esp_apptrace_ftell(esp_apptrace_dest_t dest, void *stream)

Get current position indicator for file on host. This function has the same semantic as ‘ftell’ except for the first argument.

Parameters
- **dest** – Indicators HW interface to use.
- **stream** – File handle returned by esp_apptrace_fopen.

Returns Current position in file. See ftell for details.

int esp_apptrace_fstop(esp_apptrace_dest_t dest)

Indicatesto the host that all file operations are complete. This function should be called after all file operations are finished and indicate to the host that it can perform cleanup operations (close open files etc.).

Parameters **dest** – Indicators HW interface to use.

Returns ESP_OK on success, otherwise see esp_err_t

int esp_apptrace_feof(esp_apptrace_dest_t dest, void *stream)

Test end-of-file indicator on a stream. This function has the same semantic as ‘feof’ except for the first argument.

Parameters
- **dest** – Indicators HW interface to use.
- **stream** – File handle returned by esp_apptrace_fopen.

Returns Non-Zero if end-of-file indicator is set for stream. See feof for details.
void esp_gcov_dump (void)

    Triggers gcov info dump. This function waits for the host to connect to target before dumping data.

Enumerations

enum esp_apptrace_dest_t

    Application trace data destinations bits.
    Values:

    enumerator ESP_APTRACE_DEST_JTAG
        JTAG destination.

    enumerator ESP_APTRACE_DEST_TRAX
        xxx_TRAX name is obsolete, use more common xxx_JTAG

    enumerator ESP_APTRACE_DEST_UART
        UART destination.

    enumerator ESP_APTRACE_DEST_MAX

    enumerator ESP_APTRACE_DEST_NUM

Header File

    • components/app_trace/include/esp_sysview_trace.h
    • This header file can be included with:

        #include "esp_sysview_trace.h"

    • This header file is a part of the API provided by the app_trace component. To declare that your component
      depends on app_trace, add the following to your CMakeLists.txt:

        REQUIRES app_trace
        or

        PRIV_REQUIRES app_trace

Functions

    static inline esp_err_t esp_sysview_flush (uint32_t tmo)

        Flushes remaining data in SystemView trace buffer to host.

        Parameters tmo - Timeout for operation (in us). Use ESP_APTRACE_TMO_INFINITE to
                        wait indefinitely.

        Returns ESP_OK.

    int esp_sysview_vprintf (const char *format, va_list args)

        vprintf-like function to sent log messages to the host.

        Parameters
        • format - Address of format string.
        • args - List of arguments.

        Returns Number of bytes written.
Chapter 2. API Reference

```c
esp_err_t esp_sysview_heap_trace_start(uint32_t tmo)
Starts SystemView heap tracing.

Parameters
  tmo - Timeout (in us) to wait for the host to be connected. Use -1 to wait forever.

Returns
  ESP_OK on success, ESP_ERR_TIMEOUT if operation has been timed out.
```

```c
esp_err_t esp_sysview_heap_trace_stop(void)
Stops SystemView heap tracing.

Returns
  ESP_OK.
```

```c
void esp_sysview_heap_trace_alloc(void* addr, uint32_t size, const void* callers)
Sends heap allocation event to the host.

Parameters
  • addr - Address of allocated block.
  • size - Size of allocated block.
  • callers - Pointer to array with callstack addresses. Array size must be CONFIG_HEAP_TRACING_STACK_DEPTH.
```

```c
void esp_sysview_heap_trace_free(void* addr, const void* callers)
Sends heap de-allocation event to the host.

Parameters
  • addr - Address of de-allocated block.
  • callers - Pointer to array with callstack addresses. Array size must be CONFIG_HEAP_TRACING_STACK_DEPTH.
```

### 2.9.4 Call Function with External Stack

#### Overview

A given function can be executed with a user-allocated stack space which is independent of current task stack. This mechanism can be used to save stack space wasted by tasks which call a common function with intensive stack usage such as `printf`. The given function can be called inside the shared stack space, which is a callback function deferred by calling `esp_execute_shared_stack_function()`, passing that function as a parameter.

#### Usage

`esp_execute_shared_stack_function()` takes four arguments:

- a mutex object allocated by the caller, which is used to protect if the same function shares its allocated stack
- a pointer to the top of stack used for that function
- the size of stack in bytes
- a pointer to the shared stack function

The user-defined function is deferred as a callback and can be called using the user-allocated space without taking space from current task stack.

The usage may look like the code below:

```c
void external_stack_function(void)
{
    printf("Executing this printf from external stack! \n");
}

//Let us suppose we want to call printf using a separated stack space
//allowing the app to reduce its stack size.
```

(continues on next page)
void app_main() {
    //Allocate a stack buffer, from heap or as a static form:
    StackType_t *shared_stack = malloc(8192 * sizeof(StackType_t));
    assert(shared_stack != NULL);

    //Allocate a mutex to protect its usage:
    SemaphoreHandle_t printf_lock = xSemaphoreCreateMutex();
    assert(printf_lock != NULL);

    //Call the desired function using the macro helper:
    esp_execute_shared_stack_function(printf_lock,
                                         shared_stack,
                                         8192,
                                         external_stack_function);

    vSemaphoreDelete(printf_lock);
    free(shared_stack);
}

API Reference

Header File

• components/esp_system/include/esp_expression_with_stack.h
• This header file can be included with:

```
#include "esp_expression_with_stack.h"
```

Functions

void esp_execute_shared_stack_function (SemaphoreHandle_t lock, void *stack, size_t stack_size,
                                         shared_stack_function function)

Calls user defined shared stack space function.

Note: if either lock, stack or stack size is invalid, the expression will be called using the current stack.

Parameters

• lock  – Mutex object to protect in case of shared stack
• stack – Pointer to user allocated stack
• stack_size – Size of current stack in bytes
• function – Pointer to the shared stack function to be executed

Macros

ESP_EXECUTE_EXPRESSION_WITH_STACK (lock, stack, stack_size, expression)

Type Definitions

typedef void (*shared_stack_function)(void)

2.9.5 Chip Revision
Overview

ESP32-S2 may have different revisions. These revisions mainly fix some issues, and sometimes also bring new features to the chip. Versioning Scheme describes the versioning of these chip revisions, and the APIs to read the versions at runtime.

There are some considerations of compatibility among application, ESP-IDF version, and chip revisions:

- Applications may depend on some fixes/features provided by a chip revision.
- When using updated version of hardware, the hardware may be incompatible with earlier versions of ESP-IDF.

Compatibility Checks of ESP-IDF describes how the application can specify its chip revision requirements, and the way ESP-IDF checks the compatibility. After that, there is troubleshooting information for this mechanism.

Versioning Scheme

A chip’s revision number is typically expressed as vX.Y, where:

- X means a Major wafer version. If it is changed, it means that the current software version is not compatible with this released chip and the software must be updated to use this chip.
- Y means a Minor wafer version. If it is changed that means the current software version is compatible with the released chip, and there is no need to update the software.

If a newly released chip does not contain breaking changes, the chip can run the same software as the previous chip. As such, the new chip’s revision number will only increment the minor version while keeping the major version the same (e.g., v1.1 to v1.2).

Conversely, if a newly released chip contains breaking changes, the chip cannot run the same software as the previous chip. As such, the new chip’s revision number will increment the major version and set the minor version to 0 (e.g., v1.1 to v2.0).

This versioning scheme was selected to indicate the derivation relationship of chip revisions, and clearly distinguish changes in chips between breaking changes and non-breaking changes.

ESP-IDF is designed to execute seamlessly on future chip minor revisions with the same logic as the chip’s nearest previous minor revision. Thus, users can directly port their compiled binaries to newer MINOR chip revisions without upgrading their ESP-IDF version and re-compile the whole project.

When a binary is executed on a chip revision of unexpected MAJOR revision, the software is also able to report issues according to the MAJOR revision. The major and minor versioning scheme also allows hardware changes to be branchable.

Note: The current chip revision scheme using major and minor versions was introduced from ESP-IDF v5.0 onwards. Thus bootloaders built using earlier versions of ESP-IDF will still use the legacy chip revision scheme of wafer versions.

EFuse Bits for Chip Revisions

Chips have several eFuse version fields:

- Major wafer version (WAFER_VERSION_MAJOR eFuse)
- Minor wafer version (WAFER_VERSION_MINOR eFuse)
- Ignore maximum revision (DISABLE_WAFER_VERSION_MAJOR eFuse). See Compatibility Checks of ESP-IDF on how this is used.

Note: The previous versioning logic was based on a single eFuse version field (WAFER_VERSION). This approach makes it impossible to mark chips as breaking or non-breaking changes, and the versioning logic becomes linear.
Chip Revision APIs These APIs helps to get chip revision from eFuses:

- `efuse_hal_chip_revision()`. It returns revision in the major * 100 + minor format.
- `efuse_hal_get_major_chip_version()`. It returns Major revision.
- `efuse_hal_get_minor_chip_version()`. It returns Minor revision.

The following Kconfig definitions (in major * 100 + minor format) that can help add the chip revision dependency to the code:

- `CONFIG_ESP32S2_REV_MIN_FULL`
- `CONFIG_ESP32S2_REV_MAX_FULL`
- `CONFIG_ESP_REV_MIN_FULL`
- `CONFIG_ESP_REV_MAX_FULL`

Compatibility Checks of ESP-IDF

When building an application that needs to support multiple revisions of a particular chip, the minimum and maximum chip revision numbers supported by the build are specified via Kconfig.

The minimum chip revision can be configured via the `CONFIG_ESP32S2_REV_MIN` option. Specifying the minimum chip revision will limit the software to only run on a chip revisions that are high enough to support some features or bugfixes.

The maximum chip revision cannot be configured and is automatically determined by the current ESP-IDF version being used. ESP-IDF will refuse to boot any chip revision exceeding the maximum chip revision. Given that it is impossible for a particular ESP-IDF version to foresee all future chip revisions, the maximum chip revision is usually set to maximum supported MAJOR version + 99. The “Ignore Maximum Revision” eFuse can be set to bypass the maximum revision limitation. However, the software is not guaranteed to work if the maximum revision is ignored.

Below is the information about troubleshooting when the chip revision fails the compatibility check. Then there are technical details of the checking and software behavior on earlier version of ESP-IDF.

Troubleshooting

1. If the 2nd stage bootloader is run on a chip revision smaller than minimum revision specified in the image (i.e., the application), a reboot occurs. The following message will be printed:

   Image requires chip rev >= v3.0, but chip is v1.0

   To resolve this issue,
   - Use a chip with the required minimum revision or higher.
   - Lower the `CONFIG_ESP32S2_REV_MIN` value and rebuild the image so that it is compatible with the chip revision being used.

2. If application does not match minimum and maximum chip revisions, a reboot occurs. The following message will be printed:

   Image requires chip rev <= v2.99, but chip is v3.0

   To resolve this issue, update ESP-IDF to a newer version that supports the chip’s revision (CONFIG_ESP32S2_REV_MAX_FULL). Alternatively, set the Ignore maximal revision bit in eFuse or use a chip revision that is compatible with the current version of ESP-IDF.

Representing Revision Requirements of a Binary Image The 2nd stage bootloader and the application binary images contain the `esp_image_header_t` header, which stores information specifying the chip revisions that the image is permitted to run on. This header has 3 fields related to revisions:

- `min_chip_rev` - Minimum chip MAJOR revision required by image (but for ESP32-C3 it is MINOR revision). Its value is determined by `CONFIG_ESP32S2_REV_MIN`.
• min_chip_rev_full - Minimum chip MINOR revision required by image in format: major * 100 + minor. Its value is determined by CONFIG_ESP32S2_REV_MIN.
• max_chip_rev_full - Maximum chip revision required by image in format: major * 100 + minor. Its value is determined by CONFIG_ESP32S2_REV_MAX_FULL. It cannot be changed by user. Only Espressif can change it when a new version will be supported in ESP-IDF.

Maximum And Minimum Revision Restrictions  The order for checking the minimum and maximum revisions during application boot up is as follows:

1. The 1st stage bootloader (ROM bootloader) does not check minimum and maximum revision fields from esp_image_header_t before running the 2nd stage bootloader.
2. The initialization phase of the 2nd stage bootloader checks that the 2nd stage bootloader itself can be launched on the chip of this revision. It extracts the minimum revision from the header of the bootloader image and checks against the chip revision from eFuses. If the chip revision is less than the minimum revision, the bootloader refuses to boot up and aborts. The maximum revision is not checked at this phase.
3. Then the 2nd stage bootloader checks the revision requirements of the application. It extracts the minimum and maximum revisions from the header of the application image and checks against the chip revision from eFuses. If the chip revision is less than the minimum revision or higher than the maximum revision, the bootloader refuses to boot up and aborts. However, if the Ignore maximum revision bit is set, the maximum revision constraint can be ignored. The ignore bit is set by the customer themselves when there is confirmation that the software is able to work with this chip revision.
4. Furthermore, at the OTA update stage, the running application checks if the new software matches the chip revision. It extracts the minimum and maximum revisions from the header of the new application image and checks against the chip revision from eFuses. It checks for revision matching in the same way that the bootloader does, so that the chip revision is between the min and max revisions (logic of ignoring max revision also applies).

Backward Compatibility with Bootloaders Built by Older ESP-IDF Versions  The old bootloaders (ESP-IDF < v5.0) do not know about Major and Minor wafer version eFuses. They use one single eFuse for this - wafer version. ESP32-S2 chip support was added in ESP-IDF v4.2. ESP32-S2 chips have rev_min in esp_image_header_t header set to 0 because Minimum Supported ESP32-S2 Revision Kconfig option was not introduced, which means that the old bootloader does not check the chip revision. Any app can be loaded by such bootloader in range v0.0 to v3.15.

Please check the chip version using esptool chip_id command.

void efuse_hal_get_mac (uint8_t *mac)
get factory mac address
2.9.6 Console

ESP-IDF provides console component, which includes building blocks needed to develop an interactive console over serial port. This component includes the following features:

- Line editing, provided by linenoise library. This includes handling of backspace and arrow keys, scrolling through command history, command auto-completion, and argument hints.
- Splitting of command line into arguments.
- Argument parsing, provided by argtable3 library. This library includes APIs used for parsing GNU style command line arguments.
- Functions for registration and dispatching of commands.
- Functions to establish a basic REPL (Read-Evaluate-Print-Loop) environment.

Note: These features can be used together or independently. For example, it is possible to use line editing and command registration features, but use getopt or custom code for argument parsing, instead of argtable3. Likewise, it is possible to use simpler means of command input (such as fgets) together with the rest of the means for command splitting and argument parsing.

Note: When using a console application on a chip that supports a hardware USB serial interface, we suggest to disable the secondary serial console output. The secondary output will be output-only and consequently does not make sense in an interactive application.

Line Editing

Line editing feature lets users compose commands by typing them, erasing symbols using the backspace key, navigating within the command using the left/right keys, navigating to previously typed commands using the up/down keys, and performing autocompletion using the tab key.
Note: This feature relies on ANSI escape sequence support in the terminal application. As such, serial monitors which display raw UART data cannot be used together with the line editing library. If you see [6n or similar escape sequence when running system/console example instead of a command prompt (e.g., esp>), it means that the serial monitor does not support escape sequences. Programs which are known to work are GNU screen, minicom, and esp-idf-monitor (which can be invoked using idf.py monitor from project directory).

Here is an overview of functions provided by linenoise library.

Configuration
Linenoise library does not need explicit initialization. However, some configuration defaults may need to be changed before invoking the main line editing function.

- **linenoiseClearScreen()**
  Clear terminal screen using an escape sequence and position the cursor at the top left corner.

- **linenoiseSetMultiLine()**
  Switch between single line and multi line editing modes. In single line mode, if the length of the command exceeds the width of the terminal, the command text is scrolled within the line to show the end of the text. In this case the beginning of the text is hidden. Single line mode needs less data to be sent to refresh screen on each key press, so exhibits less glitching compared to the multi line mode. On the flip side, editing commands and copying command text from terminal in single line mode is harder. Default is single line mode.

- **linenoiseAllowEmpty()**
  Set whether linenoise library returns a zero-length string (if `true`) or `NULL` (if `false`) for empty lines. By default, zero-length strings are returned.

- **linenoiseSetMaxLineLen()**
  Set maximum length of the line for linenoise library. Default length is 4096 bytes. The default value can be updated to optimize RAM memory usage.

Main Loop

- **linenoise()**
  In most cases, console applications have some form of read/eval loop. `linenoise()` is the single function which handles user’s key presses and returns the completed line once the enter key is pressed. As such, it handles the read part of the loop.

- **linenoiseFree()**
  This function must be called to release the command line buffer obtained from `linenoise()` function.

Hints and Completions

- **linenoiseSetCompletionCallback()**
  When the user presses the tab key, linenoise library invokes the completion callback. The callback should inspect the contents of the command typed so far and provide a list of possible completions using calls to `linenoiseAddCompletion()` function. `linenoiseSetCompletionCallback()` function should be called to register this completion callback, if completion feature is desired.
  `console` component provides a ready made function to provide completions for registered commands, `esp_console_get_completion()` (see below).

- **linenoiseAddCompletion()**
  Function to be called by completion callback to inform the library about possible completions of the currently typed command.

- **linenoiseSetHintsCallback()**
  Whenever user input changes, linenoise invokes the hints callback. This callback can inspect the command line typed so far, and provide a string with hints (which can include list of command arguments, for example). The library then displays the hint text on the same line where editing happens, possibly with a different color.

- **linenoiseSetFreeHintsCallback()**
  If the hint string returned by hints callback is dynamically allocated or needs to be otherwise recycled, the function which performs such cleanup should be registered via `linenoiseSetFreeHintsCallback()`.
Chapter 2. API Reference

History

- `linenoiseHistorySetMaxLen()`
  This function sets the number of most recently typed commands to be kept in memory. Users can navigate the history using the up/down arrows keys.
- `linenoiseHistoryAdd()`
  Linenoise does not automatically add commands to history. Instead, applications need to call this function to add command strings to the history.
- `linenoiseHistorySave()`
  Function saves command history from RAM to a text file, for example on an SD card or on a filesystem in flash memory.
- `linenoiseHistoryLoad()`
  Counterpart to `linenoiseHistorySave()`, loads history from a file.
- `linenoiseHistoryFree()`
  Releases memory used to store command history. Call this function when done working with linenoise library.

Splitting of Command Line into Arguments

`console` component provides `esp_console_split_argv()` function to split command line string into arguments. The function returns the number of arguments found (`argc`) and fills an array of pointers which can be passed as `argv` argument to any function which accepts arguments in `argc, argv` format.

The command line is split into arguments according to the following rules:

- Arguments are separated by spaces
- If spaces within arguments are required, they can be escaped using `\` (backslash) character.
- Other escape sequences which are recognized are `\` (which produces literal backslash) and `\"`, which produces a double quote.
- Arguments can be quoted using double quotes. Quotes may appear only in the beginning and at the end of the argument. Quotes within the argument must be escaped as mentioned above. Quotes surrounding the argument are stripped by `esp_console_split_argv` function.

Examples:

- `abc def 1 20 .3` → `[abc, def, 1, 20, .3]`
- `abc "123 456" def` → `[abc, 123, 456, def]`
- `\a\ b\\c\"` → `[a b\c"]`

Argument Parsing

For argument parsing, `console` component includes `argtable3` library. Please see tutorial for an introduction to `argtable3`. Github repository also includes examples.

Command Registration and Dispatching

`console` component includes utility functions which handle registration of commands, matching commands typed by the user to registered ones, and calling these commands with the arguments given on the command line.

Application first initializes command registration module using a call to `esp_console_init()`, and calls `esp_console_cmd_register()` function to register command handlers.

For each command, application provides the following information (in the form of `esp_console_cmd_t` structure):

- Command name (string without spaces)
- Help text explaining what the command does
- Optional hint text listing the arguments of the command. If application uses Argtable3 for argument parsing, hint text can be generated automatically by providing a pointer to argtable argument definitions structure instead.
- The command handler function.
A few other functions are provided by the command registration module:

- **esp_console_run()**
  This function takes the command line string, splits it into argc/argv argument list using esp_console_split_argv(), looks up the command in the list of registered components, and if it is found, executes its handler.

- **esp_console_register_help_command()**
  Adds help command to the list of registered commands. This command prints the list of all the registered commands, along with their arguments and help texts.

- **esp_console_get_completion()**
  Callback function to be used with linenoiseSetCompletionCallback() from linenoise library. Provides completions to linenoise based on the list of registered commands.

- **esp_console_get_hint()**
  Callback function to be used with linenoiseSetHintsCallback() from linenoise library. Provides argument hints for registered commands to linenoise.

**Initialize Console REPL Environment**

To establish a basic REPL environment, **console** component provides several useful APIs, combining those functions described above.

In a typical application, you only need to call **esp_console_new_repl_uart()** to initialize the REPL environment based on UART device, including driver install, basic console configuration, spawning a thread to do REPL task and register several useful commands (e.g., help).

After that, you can register your own commands with **esp_console_cmd_register()**. The REPL environment keeps in init state until you call **esp_console_start_repl()**.

**Application Example**

Example application illustrating usage of the **console** component is available in **system/console** directory. This example shows how to initialize UART and VFS functions, set up linenoise library, read and handle commands from UART, and store command history in Flash. See README.md in the example directory for more details.

Besides that, ESP-IDF contains several useful examples which are based on the **console** component and can be treated as “tools” when developing applications. For example, **peripherals/i2c/i2c_tools**, **wifi/iperf**.

**API Reference**

**Header File**

- **components/console/esp_console.h**
  This header file can be included with:

  ```c
  #include "esp_console.h"
  ```

  This header file is a part of the API provided by the **console** component. To declare that your component depends on **console**, add the following to your CMakeLists.txt:

  ```cmake
  requires console
  ```

  or

  ```cmake
  privrequires console
  ```

**Functions**
**esp_err_t esp_console_init** (const esp_console_config_t *config)

initialize console module

**Note:** Call this once before using other console module features

**Parameters**
config – console configuration

**Returns**
- ESP_OK on success
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_STATE if already initialized
- ESP_ERR_INVALID_ARG if the configuration is invalid

**esp_err_t esp_console_deinit** (void)

de-initialize console module

**Note:** Call this once when done using console module functions

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized yet

**esp_err_t esp_console_cmd_register** (const esp_console_cmd_t *cmd)

Register console command.

**Parameters**
- cmd – pointer to the command description; can point to a temporary value

**Returns**
- ESP_OK on success
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_ARG if command description includes invalid arguments

**esp_err_t esp_console_run** (const char *cmdline, int *cmd_ret)

Run command line.

**Parameters**
- cmdline – command line (command name followed by a number of arguments)
- cmd_ret – [out] return code from the command (set if command was run)

**Returns**
- ESP_OK, if command was run
- ESP_ERR_INVALID_ARG, if the command line is empty, or only contained whitespace
- ESP_ERR_NOT_FOUND, if command with given name wasn’t registered
- ESP_ERR_INVALID_STATE, if esp_console_init wasn’t called

**size_t esp_console_split_argv** (char *line, char **argv, size_t argv_size)

Split command line into arguments in place.

---

* - This function finds whitespace-separated arguments in the given input line.
* - 'abc def 1 20 .3' -> ['abc', 'def', '1', '20', '.3']
* - Argument which include spaces may be surrounded with quotes. In this case spaces are preserved and quotes are stripped.
* - 'abc "123 456" def' -> ['abc', '123 456', 'def']
* - Escape sequences may be used to produce backslash, double quote, and space.
Chapter 2. API Reference

Note: Points to at most argv_size - 1 arguments are returned in argv array. The pointer after the last one (i.e. argv[argc]) is set to NULL.

Parameters
- **line** - pointer to buffer to parse; it is modified in place
- **argv** - array where the pointers to arguments are written
- **argv_size** - number of elements in argv_array (max. number of arguments)

Returns number of arguments found (argc)

```c
void esp_console_get_completion(const char* buf, linenoiseCompletions *lc)
```

Callback which provides command completion for linenoise library.

When using linenoise for line editing, command completion support can be enabled like this:

```c
linenoiseSetCompletionCallback(&esp_console_get_completion);
```

Parameters
- **buf** - the string typed by the user
- **lc** - linenoiseCompletions to be filled in

```c
const char *esp_console_get_hint(const char* buf, int*color, int*bold)
```

Callback which provides command hints for linenoise library.

When using linenoise for line editing, hints support can be enabled as follows:

```c
linenoiseSetHintsCallback((linenoiseHintsCallback*)&esp_console_get_hint);
```

The extra cast is needed because linenoiseHintsCallback is defined as returning a char* instead of const char*.

Parameters
- **buf** - line typed by the user
- **color** - [out] ANSI color code to be used when displaying the hint
- **bold** - [out] set to 1 if hint has to be displayed in bold

Returns string containing the hint text. This string is persistent and should not be freed (i.e. linenoiseSetFreeHintsCallback should not be used).

```c
esp_err_t esp_console_register_help_command(void)
```

Register a ‘help’ command.

Default ‘help’ command prints the list of registered commands along with hints and help strings if no additional argument is given. If an additional argument is given, the help command will look for a command with the same name and only print the hints and help strings of that command.

Returns
- ESP_OK on success
- ESP_ERR_INVALID_STATE, if esp_console_init wasn’t called

```c
esp_err_t esp_console_new_repl_uart(const esp_console_dev_uart_config_t *dev_config, const esp_console_repl_config_t *repl_config, esp_console_repl_t **ret_repl)
```

Establish a console REPL environment over UART driver.

Attention This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying linenoise and esp_console functions.
Note: This is an all-in-one function to establish the environment needed for REPL, includes:
- Install the UART driver on the console UART (8n1, 115200, REF_TICK clock source)
- Configures the stdin/stdout to go through the UART driver
- Initializes linenoise
- Spawn new thread to run REPL in the background

**Parameters**
- `dev_config` - in] UART device configuration
- `repl_config` - in] REPL configuration
- `ret_repl` - out] return REPL handle after initialization succeed, return NULL otherwise

**Returns**
- ESP_OK on success
- ESP_FAIL Parameter error

`esp_err_t esp_console_new_repl_usb_cdc(const esp_console_dev_usb_cdc_config_t *dev_config, const esp_console_repl_config_t *repl_config, esp_console_repl_t **ret_repl)`

Establish a console REPL environment over USB CDC.

**Attention** This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying linenoise and esp_console functions.

Note: This is a all-in-one function to establish the environment needed for REPL, includes:
- Initializes linenoise
- Spawn new thread to run REPL in the background

**Parameters**
- `dev_config` - in] USB CDC configuration
- `repl_config` - in] REPL configuration
- `ret_repl` - out] return REPL handle after initialization succeed, return NULL otherwise

**Returns**
- ESP_OK on success
- ESP_FAIL Parameter error

`esp_err_t esp_console_start_repl(esp_console_repl_t *repl)`

Start REPL environment.

**Note:** Once the REPL gets started, it won’t be stopped until the user calls repl->del(repl) to destroy the REPL environment.

**Parameters** `repl` - [in] REPL handle returned from esp_console_new_repl_xxx

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_STATE, if repl has started already

**Structures**
struct esp_console_config_t
Parameters for console initialization.

Public Members

size_t max_cmdline_length
length of command line buffer, in bytes

size_t max_cmdline_args
maximum number of command line arguments to parse

uint32_t heap_alloc_caps
where to (e.g. MALLOC_CAP_SPIRAM) allocate heap objects such as cmds used by esp_console

int hint_color
ASCII color code of hint text.

int hint_bold
Set to 1 to print hint text in bold.

struct esp_console_repl_config_t
Parameters for console REPL (Read Eval Print Loop)

Public Members

uint32_t max_history_len
maximum length for the history

const char *history_save_path
file path used to save history commands, set to NULL won’t save to file system

uint32_t task_stack_size
repl task stack size

uint32_t task_priority
repl task priority

const char *prompt
prompt (NULL represents default: “esp> “)

size_t max_cmdline_length
maximum length of a command line. If 0, default value will be used

struct esp_console_dev_uart_config_t
Parameters for console device: UART.
Public Members

int channel
    UART channel number (count from zero)

int baud_rate
    Communication baud rate.

int tx_gpio_num
    GPIO number for TX path, -1 means using default one.

int rx_gpio_num
    GPIO number for RX path, -1 means using default one.

struct esp_console_dev_usb_cdc_config_t
    Parameters for console device: USB CDC.

Note: It’s an empty structure for now, reserved for future

struct esp_console_cmd_t
    Console command description.

Public Members

const char *command
    Command name. Must not be NULL, must not contain spaces. The pointer must be valid until the call to esp_console_deinit.

const char *help
    Help text for the command, shown by help command. If set, the pointer must be valid until the call to esp_console_deinit. If not set, the command will not be listed in ‘help’ output.

const char *hint
    Hint text, usually lists possible arguments. If set to NULL, and ‘argtable’ field is non-NULL, hint will be generated automatically

esp_console_cmd_func_t func
    Pointer to a function which implements the command.

void *argtable
    Array or structure of pointers to arg_xxx structures, may be NULL. Used to generate hint text if ‘hint’ is set to NULL. Array/structure which this field points to must end with an arg_end. Only used for the duration of esp_console_cmd_register call.

struct esp_console_repl_s
    Console REPL base structure.
Chapter 2. API Reference

Public Members

\[ \text{esp_err_t \ (*del)(esp_console_repl_t *repl)} \]
Delete console REPL environment.

**Param repl** [in] REPL handle returned from esp_console_new_repl_xxx

**Return**
- ESP_OK on success
- ESP_FAIL on errors

Macros

**ESP_CONSOLE_CONFIG_DEFAULT** ()
Default console configuration value.

**ESP_CONSOLE_REPL_CONFIG_DEFAULT** ()
Default console repl configuration value.

**ESP_CONSOLE_DEV_UART_CONFIG_DEFAULT** ()

**ESP_CONSOLE_DEV_CDC_CONFIG_DEFAULT** ()

Type Definitions

typedef struct linenoiseCompletions linenoiseCompletions

typedef int (*esp_console_cmd_func_t)(int argc, char **argv)
Console command main function.

**Param argc** number of arguments

**Param argv** array with argc entries, each pointing to a zero-terminated string argument

**Return** console command return code, 0 indicates “success”

typedef struct esp_console_repl_s esp_console_repl_t
Type defined for console REPL.

2.9.7 eFuse Manager

Introduction

The eFuse Manager library is designed to structure access to eFuse bits and make using these easy. This library operates eFuse bits by a structure name which is assigned in eFuse table. This sections introduces some concepts used by eFuse Manager.

Hardware Description

The ESP32-S2 has a number of eFuses which can store system and user parameters. Each eFuse is a one-bit field which can be programmed to 1 after which it cannot be reverted back to 0. Some of system parameters are using these eFuse bits directly by hardware modules and have special place (for example EFUSE_BLK0).

For more details, see ESP32-S2 Technical Reference Manual > eFuse Controller (eFuse) [PDF]. Some eFuse bits are available for user applications.

ESP32-S2 has 11 eFuse blocks each of the size of 256 bits (not all bits are available):

- EFUSE_BLK0 is used entirely for system purposes;
Each block is divided into 8 32-bits registers.

**eFuse Manager Component**

The component has API functions for reading and writing fields. Access to the fields is carried out through the structures that describe the location of the eFuse bits in the blocks. The component provides the ability to form fields of any length and from any number of individual bits. The description of the fields is made in a CSV file in a table form. To generate from a tabular form (CSV file) in the C-source uses the tool `efuse_table_gen.py`. The tool checks the CSV file for uniqueness of field names and bit intersection, in case of using a custom file from the user’s project directory, the utility checks with the *common* CSV file.

**CSV files:**

- **common** (esp_efuse_table.csv) - contains eFuse fields which are used inside the ESP-IDF. C-source generation should be done manually when changing this file (run command `idf.py efuse-common-table`). Note that changes in this file can lead to incorrect operation.
- **custom** - (optional and can be enabled by `CONFIG_EFUSE_CUSTOM_TABLE`) contains eFuse fields that are used by the user in their application. C-source generation should be done manually when changing this file and running `idf.py efuse-custom-table`.

**Description CSV File**

The CSV file contains a description of the eFuse fields. In the simple case, one field has one line of description. Table header:

```
# field_name, efuse_block(EFUSE_BLK0..EFUSE_BLK10), bit_start(0..255), bit_count(1..256), comment
```

Individual params in CSV file the following meanings:

**field_name**

Name of field. The prefix `ESP_EFUSE_` is added to the name, and this field name is available in the code. This name is used to access the fields. The name must be unique for all fields. If the line has an empty name, then this line is combined with the previous field. This allows you to set an arbitrary order of bits in the field, and expand the field as well (see `MAC_FACTORY` field in the common table). The `field_name` supports structured format using . to show that the field belongs to another field (see `WR_DIS` and `RD_DIS` in the common table).

**efuse_block**

Block number. It determines where the eFuse bits are placed for this field. Available `EFUSE_BLK0..EFUSE_BLK10`. 
bit_start

Start bit number (0..255). The bit_start field can be omitted. In this case, it is set to bit_start + bit_count from the previous record, if it has the same efuse_block. Otherwise (if efuse_block is different, or this is the first entry), an error will be generated.

bit_count

The number of bits to use in this field (1..-). This parameter cannot be omitted. This field also may be MAX_BLK_LEN in this case, the field length has the maximum block length.

comment

This param is using for comment field, it also move to C-header file. The comment field can be omitted.

If a non-sequential bit order is required to describe a field, then the field description in the following lines should be continued without specifying a name, indicating that it belongs to one field. For example two fields MAC_FACTORY and MAC_FACTORY_CRC:

<table>
<thead>
<tr>
<th># Factory MAC address #</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC_FACTORY,</td>
</tr>
<tr>
<td>EFUSE_BLK0, 72, 8,</td>
</tr>
<tr>
<td>Factory MAC addr [0]</td>
</tr>
<tr>
<td>,</td>
</tr>
<tr>
<td>EFUSE_BLK0, 64, 8,</td>
</tr>
<tr>
<td>Factory MAC addr [1]</td>
</tr>
<tr>
<td>,</td>
</tr>
<tr>
<td>EFUSE_BLK0, 56, 8,</td>
</tr>
<tr>
<td>Factory MAC addr [2]</td>
</tr>
<tr>
<td>,</td>
</tr>
<tr>
<td>EFUSE_BLK0, 48, 8,</td>
</tr>
<tr>
<td>Factory MAC addr [3]</td>
</tr>
<tr>
<td>,</td>
</tr>
<tr>
<td>EFUSE_BLK0, 40, 8,</td>
</tr>
<tr>
<td>Factory MAC addr [4]</td>
</tr>
<tr>
<td>,</td>
</tr>
<tr>
<td>EFUSE_BLK0, 32, 8,</td>
</tr>
<tr>
<td>Factory MAC addr [5]</td>
</tr>
<tr>
<td>MAC_FACTORY_CRC,</td>
</tr>
<tr>
<td>EFUSE_BLK0, 80, 8,</td>
</tr>
<tr>
<td>CRC8 for factory MAC address</td>
</tr>
</tbody>
</table>

This field is available in code as ESP_EFUSE_MAC_FACTORY and ESP_EFUSE_MAC_FACTORY_CRC.

Structured eFuse Fields

| WR_DIS,                     |
| WR_DIS.RD_DIS,             |
| ~RD_DIS                    |
| WR_DIS.FIELD_1,           |
| ~FIELD_1                   |
| WR_DIS.FIELD_2,           |
| ~FIELD_2 (includes B1 and B2) |
| WR_DIS.FIELD_2.B1,        |
| ~FIELD_2.B1                |
| WR_DIS.FIELD_2.B2,        |
| ~FIELD_2.B2                |
| WR_DIS.FIELD_3,           |
| ~FIELD_3                   |
| WR_DIS.FIELD_3.ALIAS,     |
| ~FIELD_3 (just a alias for WR_DIS.FIELD_3) |
| WR_DIS.FIELD_4,           |
| ~FIELD_4                   |

The structured eFuse field looks like WR_DIS.RD_DIS where the dot points that this field belongs to the parent field - WR_DIS and cannot be out of the parent’s range.

It is possible to use some levels of structured fields as WR_DIS.FIELD_2.B1 and B2. These fields should not be crossed each other and should be in the range of two fields: WR_DIS and WR_DIS.FIELD_2.

It is possible to create aliases for fields with the same range, see WR_DIS.FIELD_3 and WR_DIS.FIELD_3.ALIAS.

The ESP-IDF names for structured eFuse fields should be unique. The efuse_table_gen tool generates the final names where the dot is replaced by _. The names for using in ESP-IDF are ESP_EFUSE_WR_DIS, ESP_EFUSE_WR_DIS_RD_DIS, ESP_EFUSE_WR_DIS_FIELD_2_B1, etc.
The efuse_table_gen tool checks that the fields do not overlap each other and must be within the range of a field if there is a violation, then throws the following error:

Field at USER_DATA, EFUSE_BLK3, 0, 256 intersected with SERIAL_NUMBER, EFUSE_BLK3, 0, 32

Solution: Describe SERIAL_NUMBER to be included in USER_DATA. (USER_DATA.SERIAL_NUMBER).

Field at FIELD, EFUSE_BLK3, 0, 50 out of range FIELD.MAJOR_NUMBER, EFUSE_BLK3, 60, 32

Solution: Change bit_start for FIELD.MAJOR_NUMBER from 60 to 0, so MAJOR_NUMBER is in the FIELD range.

efuse_table_gen.py Tool

The tool is designed to generate C-source files from CSV file and validate fields. First of all, the check is carried out on the uniqueness of the names and overlaps of the field bits. If an additional custom file is used, it will be checked with the existing common file (esp_efuse_table.csv). In case of errors, a message will be displayed and the string that caused the error. C-source files contain structures of type esp_efuse_desc_t.

To generate a common files, use the following command idf.py efuse-common-table or:

```
cd $IDF_PATH/components/efuse/./efuse_table_gen.py --idf_target esp32s2 esp32s2/esp_efuse_table.csv
```

After generation in the folder $IDF_PATH/components/efuse/esp32s2 create:

- esp_efuse_table.c file.
- In include folder esp_efuse_table.c file.

To generate a custom files, use the following command idf.py efuse-custom-table or:

```
cd $IDF_PATH/components/efuse/./efuse_table_gen.py --idf_target esp32s2 esp32s2/esp_efuse_table.csv PROJECT_PATH/main/esp_efuse_custom_table.csv
```

After generation in the folder PROJECT_PATH/main create:

- esp_efuse_custom_table.c file.
- In include folder esp_efuse_custom_table.c file.

To use the generated fields, you need to include two files:

```
#include "esp_efuse.h"
#include "esp_efuse_table.h" // or "esp_efuse_custom_table.h"
```

Supported Coding Scheme

Coding schemes are used to protect against data corruption. ESP32-S2 supports two coding schemes:

- None. EFUSE_BLK0 is stored with four backups, meaning each bit is stored four times. This backup scheme is automatically applied by the hardware and is not visible to software. EFUSE_BLK0 can be written many times.
- RS. EFUSE_BLK1 - EFUSE_BLK10 use Reed-Solomon coding scheme that supports up to 5 bytes of automatic error correction. Software encodes the 32-byte EFUSE_BLKx using RS (44, 32) to generate a 12-byte check code, and then burn the EFUSE_BLKx and the check code into eFuse at the same time. The eFuse Controller automatically decodes the RS encoding and applies error correction when reading back the eFuse block. Because the RS check codes are generated across the entire 256-bit eFuse block, each block can only be written to one time.
To write some fields into one block, or different blocks in one time, you need to use the batch writing mode. Firstly set this mode through `esp_efuse_batch_write_begin()` function then write some fields as usual using the `esp_efuse_write_...` functions. At the end to burn them, call the `esp_efuse_batch_write_commit()` function. It burns prepared data to the eFuse blocks and disables the batch recording mode.

**Note:** If there is already pre-written data in the eFuse block using the Reed-Solomon encoding scheme, then it is not possible to write anything extra (even if the required bits are empty) without breaking the previous encoding data. This encoding data will be overwritten with new encoding data and completely destroyed (however, the payload eFuses are not damaged). It can be related to: CUSTOM_MAC, SPI_PAD_CONFIG_HD, SPI_PAD_CONFIG_CS, etc. Please contact Espressif to order the required pre-burnt eFuses.

FOR TESTING ONLY (NOT RECOMMENDED): You can ignore or suppress errors that violate encoding scheme data in order to burn the necessary bits in the eFuse block.

### eFuse API

Access to the fields is via a pointer to the description structure. API functions have some basic operation:

- `esp_efuse_read_field_blob()` - returns an array of read eFuse bits.
- `esp_efuse_read_field_cnt()` - returns the number of bits programmed as “1”.
- `esp_efuse_write_field_blob()` - writes an array.
- `esp_efuse_write_field_cnt()` - writes a required count of bits as “1”.
- `esp_efuse_get_field_size()` - returns the number of bits by the field name.
- `esp_efuse_write_field_register()` - writes value to eFuse register.
- `esp_efuse_get_register()` - returns value of eFuse register.
- `esp_efuse_get_coding_scheme()` - returns eFuse encoding scheme for blocks.
- `esp_efuse_read_block()` - reads key to eFuse block starting at the offset and the required size.
- `esp_efuse_write_block()` - writes key to eFuse block starting at the offset and the required size.
- `esp_efuse_batch_write_begin()` - sets the batch mode of writing fields.
- `esp_efuse_batch_write_commit()` - writes all prepared data for batch writing mode and reset the batch writing mode.
- `esp_efuse_batch_write_cancel()` - reset the batch writing mode and prepared data.
- `esp_efuse_get_key_dis_read()` - Returns a read protection for the key block.
- `esp_efuse_set_key_dis_read()` - Sets a read protection for the key block.
- `esp_efuse_get_key_dis_write()` - Returns a write protection for the key block.
- `esp_efuse_set_key_dis_write()` - Sets a write protection for the key block.
- `esp_efuse_get_key_purpose()` - Returns the current purpose set for an eFuse key block.
- `esp_efuse_write_key()` - Programs a block of key data to an eFuse block.
- `esp_efuse_write_keys()` - Programs keys to unused eFuse blocks.
- `esp_efuse_find_purpose()` - Finds a key block with the particular purpose set.
- `esp_efuse_get_keypurpose_dis_write()` - Returns a write protection of the key purpose field for an eFuse key block (for esp32 always true).
- `esp_efuse_key_block_unused()` - Returns true if the key block is unused, false otherwise.

For frequently used fields, special functions are made, like this `esp_efuse_get_pkg_ver()`.

### eFuse API for Keys

EFUSE_BLK_KEY0 - EFUSE_BLK_KEY5 are intended to keep up to 6 keys with a length of 256-bits. Each key has an `ESP_EFUSE_KEY_PURPOSE_x` field which defines the purpose of these keys. The purpose field is described in `esp_efuse_purpose_t`.

The purposes like `ESP_EFUSE_KEY_PURPOSE_XTS_AES_...` are used for flash encryption.

The purposes like `ESP_EFUSE_KEY_PURPOSE_SECURE_BOOT_DIGEST_...` are used for secure boot.

There are some eFuse APIs useful to work with states of keys.
• `esp_efuse_get_purpose_field()` - Returns a pointer to a key purpose for an eFuse key block.
• `esp_efuse_get_key()` - Returns a pointer to a key block.
• `esp_efuse_set_key_purpose()` - Sets a key purpose for an eFuse key block.
• `esp_efuse_set_keypurpose_dis_write()` - Sets a write protection of the key purpose field for an eFuse key block.
• `esp_efuse_find_unused_key_block()` - Search for an unused key block and return the first one found.
• `esp_efuse_count_unused_key_blocks()` - Returns the number of unused eFuse key blocks in the range `EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX`
• `esp_efuse_get_digest_revoke()` - Returns the status of the Secure Boot public key digest revocation bit.
• `esp_efuse_set_digest_revoke()` - Sets the Secure Boot public key digest revocation bit.
• `esp_efuse_get_write_protect_of_digest_revoke()` - Returns a write protection of the Secure Boot public key digest revocation bit.
• `esp_efuse_set_write_protect_of_digest_revoke()` - Sets a write protection of the Secure Boot public key digest revocation bit.

How to Add a New Field

1. Find a free bits for field. Show `esp_efuse_table.csv` file or run `idf.py show-efuse-table` or the next command:

   `$ ./efuse_table_gen.py esp32s2/esp_efuse_table.csv --info`

Parsing efuse CSV input file $IDF_PATH/components/efuse/esp32s2/esp_efuse_table.
-> csv ...
Verifying efuse table...
Max number of bits in BLK 256
Sorted efuse table:

Used bits in efuse table:

| EFUSE_BLK0 | [0 31] [0 0] [2 2] ... [32 38] [40 47] [49 51] [56 60] [68 70] [80 111] [116 117]... [124 130] [132 154] [160 161] |
| EFUSE_BLK1 | [0 122] [124 134] |
| EFUSE_BLK10 | [0 255] |
| EFUSE_BLK2 | (continues on next page) |
The number of bits not included in square brackets is free (some bits are reserved for Espressif). All fields are checked for overlapping.

To add fields to an existing field, use the Structured efuse fields technique. For example, adding the fields: SERIAL_NUMBER, MODEL_NUMBER and HARDWARE REV to an existing USER_DATA field. Use . (dot) to show an attachment in a field.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>EFUSE Block</th>
<th>Bit Start</th>
<th>Bit Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>USER_DATA.SERIAL_NUMBER</td>
<td>EFUSE_BLK3</td>
<td>0</td>
<td>32</td>
</tr>
<tr>
<td>USER_DATA.MODEL_NUMBER</td>
<td>EFUSE_BLK3</td>
<td>32</td>
<td>10</td>
</tr>
<tr>
<td>USER_DATA.HARDWARE_REV</td>
<td>EFUSE_BLK3</td>
<td>42</td>
<td>10</td>
</tr>
</tbody>
</table>

2. Fill a line for field: field_name, efuse_block, bit_start, bit_count, comment.
3. Run a show_efuse_table command to check eFuse table. To generate source files run efuse_common_table or efuse_custom_table command.

You may get errors such as intersects with or out of range. Please see how to solve them in the Structured efuse fields article.

Bit Order

The eFuses bit order is little endian (see the example below), it means that eFuse bits are read and written from LSB to MSB:

```
$ espefuse.py dump

USER_DATA (BLOCK3) [3] read_regs: 03020100 07060504 0B0A0908
  -0F0E0D0C 13121111 17161514 1B1A1918 1F1E1D1C
BLOCK4 (BLOCK4) [4] read_regs: 03020100 07060504 0B0A0908
  -0F0E0D0C 13121111 17161514 1B1A1918 1F1E1D1C
```

where is the register representation:

```
EFUSE_RD_USR_DATA0_REG = 0x03020100
EFUSE_RD_USR_DATA1_REG = 0x07060504
EFUSE_RD_USR_DATA2_REG = 0x0B0A0908
EFUSE_RD_USR_DATA3_REG = 0x0F0E0D0C
EFUSE_RD_USR_DATA4_REG = 0x13121111
EFUSE_RD_USR_DATA5_REG = 0x17161514
EFUSE_RD_USR_DATA6_REG = 0x1B1A1918
EFUSE_RD_USR_DATA7_REG = 0x1F1E1D1C
```

where is the byte representation:
byte[0] = 0x00, byte[1] = 0x01, ... byte[3] = 0x03, byte[4] = 0x04, ..., byte[31] = 0x1F

For example, csv file describes the USER_DATA field, which occupies all 256 bits (a whole block).

| USER_DATA,          | EFUSE_BLK3, 0, 256, User data |
| USER_DATA.FIELD1,   | EFUSE_BLK3, 16, 16, Field1    |
| ID,                 | EFUSE_BLK4, 8, 3, ID bit[0..2] |
|                     | EFUSE_BLK4, 16, 2, ID bit[3..4] |
|                     | EFUSE_BLK4, 32, 3, ID bit[5..7] |

Thus, reading the eFuse USER_DATA block written as above gives the following results:

```c
uint8_t buf[32] = { 0 };
esp_efuse_read_field_blob(ESP_EFUSE_USER_DATA, &buf, sizeof(buf) * 8);
// buf[0] = 0x00, buf[1] = 0x01, ... buf[31] = 0x1F

uint32_t field1 = 0;
size_t field1_size = ESP_EFUSE_USER_DATA[0]->bit_count; // can be used for this case because it only consists of one entry
esp_efuse_read_field_blob(ESP_EFUSE_USER_DATA, &field1, field1_size);
// field1 = 0x0302

uint32_t field1_1 = 0;
esp_efuse_read_field_blob(ESP_EFUSE_USER_DATA, &field1_1, 2); // reads only first 2 bits
// field1 = 0x0002

uint8_t id = 0;
size_t id_size = esp_efuse_get_field_size(ESP_EFUSE_ID); // returns 6
// size_t id_size = ESP_EFUSE_USER_DATA[0]->bit_count; // cannot be used because it consists of 3 entries. It returns 3 not 6.
esp_efuse_read_field_blob(ESP_EFUSE_ID, &id, id_size);
// id = 0x91
// b'100 10 001
// [3] [2] [3]

uint8_t id_1 = 0;
esp_efuse_read_field_blob(ESP_EFUSE_ID, &id_1, 3);
// id = 0x01
// b'001
```

Get eFuses During Build

There is a way to get the state of eFuses at the build stage of the project. There are two cmake functions for this:

- `espefuse_get_json_summary()` - It calls the espefuse.py summary --format json command and returns a json string (it is not stored in a file).
- `espefuse_get_efuse()` - It finds a given eFuse name in the json string and returns its property.

The json string has the following properties:

```json
{
  "MAC": {
    "bit_len": 48,
    "block": 0,
    "category": "identity",
    "description": "Factory MAC Address",
  }
}```
"efuse_type": "bytes:6",
"name": "MAC",
"pos": 0,
"readable": true,
"value": "94:b9:7e:5a:6e:58 (CRC 0xe2 OK)",
"word": 1,
"writeable": true
},

These functions can be used from a top-level project CMakeLists.txt (get-started/hello_world/CMakeLists.txt):

```c
# ...
project(hello_world)

espefuse_get_json_summary(efuse_json)
espefuse_get_efuse(ret_data ${efuse_json} "MAC" "value")
message("MAC:" ${ret_data})
```

The format of the value property is the same as shown in espefuse.py summary.

MAC:94:b9:7e:5a:6e:58 (CRC 0xe2 OK)

There is an example test system/efuse/CMakeLists.txt which adds a custom target efuse-summary. This allows you to run the idf.py efuse-summary command to read the required eFuses (specified in the efuse_names list) at any time, not just at project build time.

Debug eFuse & Unit Tests

Virtual eFuses  The Kconfig option `CONFIG_EFUSE_VIRTUAL` virtualizes eFuse values inside the eFuse Manager, so writes are emulated and no eFuse values are permanently changed. This can be useful for debugging app and unit tests. During startup, the eFuses are copied to RAM. All eFuse operations (read and write) are performed with RAM instead of the real eFuse registers.

In addition to the `CONFIG_EFUSE_VIRTUAL` option there is `CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH` option that adds a feature to keep eFuses in flash memory. To use this mode the partition_table should have the `efuse` partition. partition.csv: "efuse_em, data, efuse, , 0x2000,". During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This option allows keeping eFuses after reboots (possible to test secure_boot and flash_encryption features with this option).

Flash Encryption Testing  Flash Encryption (FE) is a hardware feature that requires the physical burning of eFuses: key and FLASH_CRYPT_CNT. If FE is not actually enabled then enabling the `CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH` option just gives testing possibilities and does not encrypt anything in the flash, even though the logs say encryption happens. The `bootloader_flash_write()` is adapted for this purpose. But if FE is already enabled on the chip and you run an application or bootloader created with the `CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH` option then the flash encryption/decryption operations will work properly (data are encrypted as it is written into an encrypted flash partition and decrypted when they are read from an encrypted partition).

`espefuse.py`  esp tool includes a useful tool for reading/writing ESP32-S2 eFuse bits - espefuse.py.

```
espefuse.py -p PORT summary
espefuse.py v4.6-dev
Connecting....
Detecting chip type... Unsupported detection protocol, switching and trying again..
```

(continues on next page)
Detecting chip type... ESP32-S2

WDT_DELAY_SEL (BLOCK0) RTC watchdog timeout threshold; in unit of slow clock cycle = 40000 R/W (0b0)

Flash voltage (VDD_SPI) determined by GPIO45 on reset (GPIO45=High: VDD_SPI pin is powered from internal 1.8V LDO
GPIO45=Low or NC: VDD_SPI pin is powered directly from VDD3P3_RTC_IO via resistor Rspi. Typically this voltage is 3.3 V).

To get a dump for all eFuse registers.

**Enumerations**

**enum esp_efuse_block_t**

Type of eFuse blocks ESP32S2.

*Values:*

- enumerator **EFUSE_BLK0**
  - Number of eFuse BLOCK0. REPEAT_DATA

- enumerator **EFUSE_BLK1**
  - Number of eFuse BLOCK1. MAC_SPI_8M_SYS

- enumerator **EFUSE_BLK2**
  - Number of eFuse BLOCK2. SYS_DATA_PART1

- enumerator **EFUSE_BLK_SYS_DATA_PART1**
Chapter 2. API Reference

Number of eFuse BLOCK2. SYS_DATA_PART1

enumerator **EFUSE_BLK3**
  Number of eFuse BLOCK3. USER_DATA

enumerator **EFUSE_BLK_USER_DATA**
  Number of eFuse BLOCK3. USER_DATA

enumerator **EFUSE_BLK4**
  Number of eFuse BLOCK4. KEY0

enumerator **EFUSE_BLK_KEY0**
  Number of eFuse BLOCK4. KEY0

enumerator **EFUSE_BLK5**
  Number of eFuse BLOCK5. KEY1

enumerator **EFUSE_BLK_KEY1**
  Number of eFuse BLOCK5. KEY1

enumerator **EFUSE_BLK6**
  Number of eFuse BLOCK6. KEY2

enumerator **EFUSE_BLK_KEY2**
  Number of eFuse BLOCK6. KEY2

enumerator **EFUSE_BLK7**
  Number of eFuse BLOCK7. KEY3

enumerator **EFUSE_BLK_KEY3**
  Number of eFuse BLOCK7. KEY3

enumerator **EFUSE_BLK8**
  Number of eFuse BLOCK8. KEY4

enumerator **EFUSE_BLK_KEY4**
  Number of eFuse BLOCK8. KEY4

enumerator **EFUSE_BLK9**
  Number of eFuse BLOCK9. KEY5

enumerator **EFUSE_BLK_KEY5**
  Number of eFuse BLOCK9. KEY5

enumerator **EFUSE_BLK_KEY_MAX**

enumerator **EFUSE_BLK10**
  Number of eFuse BLOCK10. SYS_DATA_PART2
enumerator \texttt{EFUSE\_BLK\_SYS\_DATA\_PART2}

Number of eFuse BLOCK10. SYS\_DATA\_PART2

enumerator \texttt{EFUSE\_BLK\_MAX}

enum \texttt{esp\_efuse\_coding\_scheme\_t}

Type of coding scheme.

Values:

enumerator \texttt{EFUSE\_CODING\_SCHEME\_NONE}
None

enumerator \texttt{EFUSE\_CODING\_SCHEME\_RS}
Reed-Solomon coding

enum \texttt{esp\_efuse\_purpose\_t}

Type of key purpose.

Values:

enumerator \texttt{ESP\_EFUSE\_KEY\_PURPOSE\_USER}
User purposes (software-only use)

enumerator \texttt{ESP\_EFUSE\_KEY\_PURPOSE\_RESERVED}
Reserve

enumerator \texttt{ESP\_EFUSE\_KEY\_PURPOSE\_XTS\_AES\_256\_KEY\_1}
XTS\_AES\_256\_KEY\_1 (flash/PSRAM encryption)

enumerator \texttt{ESP\_EFUSE\_KEY\_PURPOSE\_XTS\_AES\_256\_KEY\_2}
XTS\_AES\_256\_KEY\_2 (flash/PSRAM encryption)

enumerator \texttt{ESP\_EFUSE\_KEY\_PURPOSE\_XTS\_AES\_128\_KEY}
XTS\_AES\_128\_KEY (flash/PSRAM encryption)

enumerator \texttt{ESP\_EFUSE\_KEY\_PURPOSE\_HMAC\_DOWN\_ALL}
HMAC Downstream mode

enumerator \texttt{ESP\_EFUSE\_KEY\_PURPOSE\_HMAC\_DOWN\_JTAG}
JTAG soft enable key (uses HMAC Downstream mode)

enumerator \texttt{ESP\_EFUSE\_KEY\_PURPOSE\_HMAC\_DOWN\_DIGITAL\_SIGNATURE}
Digital Signature peripheral key (uses HMAC Downstream mode)

enumerator \texttt{ESP\_EFUSE\_KEY\_PURPOSE\_HMAC\_UP}
HMAC Upstream mode

enumerator \texttt{ESP\_EFUSE\_KEY\_PURPOSE\_SECURE\_BOOT\_DIGEST0}
SECURE\_BOOT\_DIGEST0 (Secure Boot key digest)
enumerator ESP_EFUSE_KEY_PURPOSE_SECURE_BOOT_DIGEST1
SECURE_BOOT_DIGEST1 (Secure Boot key digest)

enumerator ESP_EFUSE_KEY_PURPOSE_SECURE_BOOT_DIGEST2
SECURE_BOOT_DIGEST2 (Secure Boot key digest)

enumerator ESP_EFUSE_KEY_PURPOSE_MAX
MAX PURPOSE

Functions

`esp_err_t esp_efuse_read_field_blob(const esp_efuse_desc_t *field[], void *dst, size_t dst_size_bits)`

Reads bits from EFUSE field and writes it into an array.

The number of read bits will be limited to the minimum value from the description of the bits in “field” structure or “dst_size_bits” required size. Use “esp_efuse_get_field_size()” function to determine the length of the field.

**Note:** Please note that reading in the batch mode does not show uncommitted changes.

**Parameters**

- `field` [in] A pointer to the structure describing the fields of efuse.
- `dst` [out] A pointer to array that will contain the result of reading.
- `dst_size_bits` [in] The number of bits required to read. If the requested number of bits is greater than the field, the number will be limited to the field size.

**Returns**

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

`bool esp_efuse_read_field_bit(const esp_efuse_desc_t *field[])`

Read a single bit eFuse field as a boolean value.

**Note:** The value must exist and must be a single bit wide. If there is any possibility of an error in the provided arguments, call esp_efuse_read_field_blob() and check the returned value instead.

**Note:** If assertions are enabled and the parameter is invalid, execution will abort.
Note: Please note that reading in the batch mode does not show uncommitted changes.

**Parameters** field - [in] A pointer to the structure describing the fields of efuse.

**Returns**
- true: The field parameter is valid and the bit is set.
- false: The bit is not set, or the parameter is invalid and assertions are disabled.

`esp_err_t esp_efuse_read_field_cnt (const esp_efuse_desc_t *field[], size_t *out_cnt)`

Reads bits from EFUSE field and returns number of bits programmed as “1”.

If the bits are set not sequentially, they will still be counted.

Note: Please note that reading in the batch mode does not show uncommitted changes.

**Parameters**
- `field` - [in] A pointer to the structure describing the fields of efuse.
- `out_cnt` - [out] A pointer that will contain the number of programmed as “1” bits.

**Returns**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

`esp_err_t esp_efuse_write_field_blob (const esp_efuse_desc_t *field[], const void *src, size_t src_size_bits)`

Writes array to EFUSE field.

The number of write bits will be limited to the minimum value from the description of the bits in “field” structure or “src_size_bits” required size. Use “esp_efuse_get_field_size()” function to determine the length of the field. After the function is completed, the writing registers are cleared.

**Parameters**
- `field` - [in] A pointer to the structure describing the fields of efuse.
- `src` - [in] A pointer to array that contains the data for writing.
- `src_size_bits` - [in] The number of bits required to write.

**Returns**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

`esp_err_t esp_efuse_write_field_cnt (const esp_efuse_desc_t *field[], size_t cnt)`

Writes a required count of bits as “1” to EFUSE field.

If there are no free bits in the field to set the required number of bits to “1”, ESP_ERR_EFUSE_CNT_IS_FULL error is returned, the field will not be partially recorded. After the function is completed, the writing registers are cleared.

**Parameters**
- `field` - [in] A pointer to the structure describing the fields of efuse.
- `cnt` - [in] Required number of programmed as “1” bits.

**Returns**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.
**esp_err_t esp_efuse_write_field_bit (const esp_efuse_desc_t *field[])**

Write a single bit eFuse field to 1.

For use with eFuse fields that are a single bit. This function will write the bit to value 1 if it is not already set, or does nothing if the bit is already set.

This is equivalent to calling esp_efuse_write_field_cnt() with the cnt parameter equal to 1, except that it will return ESP_OK if the field is already set to 1.

**Parameters**
field [in] Pointer to the structure describing the eFuse field.

**Returns**
- ESP_OK: The operation was successfully completed, or the bit was already set to value 1.
- ESP_ERR_INVALID_ARG: Error in the passed arguments, including if the eFuse field is not 1 bit wide.

**esp_err_t esp_efuse_set_write_protect (esp_efuse_block_t blk)**

Sets a write protection for the whole block.

After that, it is impossible to write to this block. The write protection does not apply to block 0.

**Parameters**
blk [in] Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)

**Returns**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.
- ESP_ERR_NOT_SUPPORTED: The block does not support this command.

**esp_err_t esp_efuse_set_read_protect (esp_efuse_block_t blk)**

Sets a read protection for the whole block.

After that, it is impossible to read from this block. The read protection does not apply to block 0.

**Parameters**
blk [in] Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)

**Returns**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.
- ESP_ERR_NOT_SUPPORTED: The block does not support this command.

**int esp_efuse_get_field_size (const esp_efuse_desc_t *field[])**

Returns the number of bits used by field.

**Parameters**
field [in] A pointer to the structure describing the fields of eFuse.

**Returns**
Returns the number of bits used by field.

**uint32_t esp_efuse_read_reg (esp_efuse_block_t blk, unsigned int num_reg)**

Returns value of eFuse register.

This is a thread-safe implementation. Example: EFUSE_BLK2_RDATA3_REG where (blk=2, num_reg=3)

**Note:** Please note that reading in the batch mode does not show uncommitted changes.
### esp_err_t esp_efuse_write_reg

**Description:**
Write value to efuse register.

**Parameters**
- `blk` - [in] Block number of EFuse.
- `num_reg` - [in] The register number in the block.
- `val` - [in] Value to write.

**Returns**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.

**Example:**
```
EFUSE_BLK3_WDATA0_REG where (blk=3, num_reg=0)
```

### esp_efuse_coding_scheme_t esp_efuse_get_coding_scheme

**Description:**
Return efuse coding scheme for blocks.

**Parameters**
- `blk` - [in] Block number of EFuse.

**Returns**
Return efuse coding scheme for blocks.

**Note:** The coding scheme is applicable only to 1, 2 and 3 blocks. For 0 block, the coding scheme is always NONE.

### esp_err_t esp_efuse_read_block

**Description:**
Read key to efuse block starting at the offset and the required size.

**Parameters**
- `blk` - [in] Block number of EFuse.
- `dst_key` - [in] A pointer to array that will contain the result of reading.
- `size_bits` - [in] The number of bits required to read.

**Returns**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

**Note:** Please note that reading in the batch mode does not show uncommitted changes.

### esp_err_t esp_efuse_write_block

**Description:**
Write key to efuse block starting at the offset and the required size.

**Parameters**
- `blk` - [in] Block number of EFuse.
- `src_key` - [in] A pointer to array that contains the key for writing.
- `size_bits` - [in] The number of bits required to write.

**Returns**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits.

### uint32_t esp_efuse_get_pkg_ver

**Description:**
Returns chip package from efuse.

**Returns**
chip package
void esp_efuse_reset (void)

Reset efuse write registers.
Efuse write registers are written to zero, to negate any changes that have been staged here.

**Note:** This function is not threadsafe, if calling code updates efuse values from multiple tasks then this is caller’s responsibility to serialise.

```
void esp_efuse_disable_rom_download_mode (void)

Disable ROM Download Mode via eFuse.
Permanently disables the ROM Download Mode feature. Once disabled, if the SoC is booted with strapping
pins set for ROM Download Mode then an error is printed instead.

**Note:** Not all SoCs support this option. An error will be returned if called on an ESP32 with a silicon revision
lower than 3, as these revisions do not support this option.

**Note:** If ROM Download Mode is already disabled, this function does nothing and returns success.

**Returns**

- ESP_OK If the eFuse was successfully burned, or had already been burned.
- ESP_ERR_NOT_SUPPORTED (ESP32 only) This SoC is not capable of disabling
  UART download mode
- ESP_ERR_INVALID_STATE (ESP32 only) This eFuse is write protected and cannot be
  written

```

```

esp_err_t esp_efuse_set_rom_log_scheme (esp_efuse_rom_log_scheme_t log_scheme)

Set boot ROM log scheme via eFuse.

**Note:** By default, the boot ROM will always print to console. This API can be called to set the log scheme
only once per chip, once the value is changed from the default it can’t be changed again.

**Parameters**

log_scheme – Supported ROM log scheme

**Returns**

- ESP_OK If the eFuse was successfully burned, or had already been burned.
- ESP_ERR_NOT_SUPPORTED (ESP32 only) This SoC is not capable of setting ROM
  log scheme
- ESP_ERR_INVALID_STATE This eFuse is write protected or has been burned already

```

```

esp_err_t esp_efuse_enable_rom_secure_download_mode (void)

Switch ROM Download Mode to Secure Download mode via eFuse.
Permanently enables Secure Download mode. This mode limits the use of ROM Download Mode functions
to simple flash read, write and erase operations, plus a command to return a summary of currently enabled
security features.

**Note:** If Secure Download mode is already enabled, this function does nothing and returns success.

**Note:** Disabling the ROM Download Mode also disables Secure Download Mode.

Returns
• ESP_OK If the eFuse was successfully burned, or had already been burned.
• ESP_ERR_INVALID_STATE ROM Download Mode has been disabled via eFuse, so Secure Download mode is unavailable.

uint32_t esp_efuse_read_secure_version (void)
Return secure_version from eFuse field.

Returns
Secure version from eFuse field

bool esp_efuse_check_secure_version (uint32_t secure_version)
Check secure_version from app and secure_version and from eFuse field.

Parameters
secure_version – Secure version from app.

Returns
• True: If version of app is equal or more than secure_version from eFuse.

esp_err_t esp_efuse_update_secure_version (uint32_t secure_version)
Write eFuse field by secure_version value.

Update the secure_version value is available if the coding scheme is None. Note: Do not use this function in your applications. This function is called as part of the other API.

Parameters

Returns
• ESP_OK: Successful.
• ESP_FAIL: secure_version of app cannot be set to eFuse field.
• ESP_ERR_NOT_SUPPORTED: Anti rollback is not supported with the 3/4 and Repeat coding scheme.

esp_err_t esp_efuse_batch_write_begin (void)
Set the batch mode of writing fields.

This mode allows you to write the fields in the batch mode when need to burn several efuses at one time. To enable batch mode call begin() then perform as usually the necessary operations read and write and at the end call commit() to actually burn all written efuses. The batch mode can be used nested. The commit will be done by the last commit() function. The number of begin() functions should be equal to the number of commit() functions.

Note: If batch mode is enabled by the first task, at this time the second task cannot write/read efuses. The second task will wait for the first task to complete the batch operation.

// Example of using the batch writing mode.

// set the batch writing mode
esp_efuse_batch_write_begin();

// use any writing functions as usual
esp_efuse_write_field_blob(ESP_EFUSE_...);
esp_efuse_write_field_cnt(ESP_EFUSE_...);
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_write_reg(EFUSE_BLKx, ...);
esp_efuse_write_block(EFUSE_BLKx, ...);
esp_efuse_write(ESP_EFUSE_1, 3); // ESP_EFUSE_1 == 1, here we write a new...
value = 3. The changes will be burn by the commit() function.
esp_efuse_read...(ESP_EFUSE_1); // this function returns ESP_EFUSE_1 == 1...
because uncommitted changes are not readable, it will be available only...
after commit.

...
// esp_efuse_batch_write APIs can be called recursively.
esp_efuse_batch_write_begin();
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_batch_write_commit(); // the burn will be skipped here, it will be...
...done in the last commit()).
...

// Write all of these fields to the efuse registers
esp_efuse_batch_write_commit();
esp_efuse_read...(ESP_EFUSE_1); // this function returns ESP_EFUSE_1 == 3.

Note: Please note that reading in the batch mode does not show uncommitted changes.

Returns
- ESP_OK: Successful.

`esp_err_t esp_efuse_batch_write_cancel (void)`
Reset the batch mode of writing fields.
It will reset the batch writing mode and any written changes.

Returns
- ESP_OK: Successful.
- ESP_ERR_INVALID_STATE: The batch mode was not set.

`esp_err_t esp_efuse_batch_write_commit (void)`
Writes all prepared data for the batch mode.
Must be called to ensure changes are written to the efuse registers. After this the batch writing mode will be reset.

Returns
- ESP_OK: Successful.
- ESP_ERR_INVALID_STATE: The deferred writing mode was not set.

`bool esp_efuse_block_is_empty (esp_efuse_block_t block)`
Checks that the given block is empty.

Returns
- True: The block is empty.
- False: The block is not empty or was an error.

`bool esp_efuse_get_key_dis_read (esp_efuse_block_t block)`
Returns a read protection for the key block.

Parameters
- `block` [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

Returns
- True: The key block is read protected
- False: The key block is readable.

`esp_err_t esp_efuse_set_key_dis_read (esp_efuse_block_t block)`
Sets a read protection for the key block.

Parameters
- `block` [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

Returns
- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.
bool esp_efuse_get_key_dis_write (esp_efuse_block_t block)

Returns a write protection for the key block.

Parameters block - [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

Returns  True: The key block is write protected False: The key block is writeable.

esp_err_t esp_efuse_set_key_dis_write (esp_efuse_block_t block)

Sets a write protection for the key block.

Parameters block - [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

Returns
- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed
  bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

bool esp_efuse_key_block_unused (esp_efuse_block_t block)

Returns true if the key block is unused, false otherwise.

An unused key block is all zero content, not read or write protected, and has purpose 0
(ESP_EFUSE_KEY_PURPOSE_USER)

Parameters block - [key block to check.

Returns
- True if key block is unused,
- False if key block is used or the specified block index is not a key block.

bool esp_efuse_find_purpose (esp_efuse_purpose_t purpose, esp_efuse_block_t *block)

Find a key block with the particular purpose set.

Parameters
- purpose - [in] Purpose to search for.
- block - [out] Pointer in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

which will be set to the key block if found. Can be NULL, if only need to test the key
block exists.

Returns
- True: If found,
- False: If not found (value at block pointer is unchanged).

bool esp_efuse_get_keypurpose_dis_write (esp_efuse_block_t block)

Returns a write protection of the key purpose field for an efuse key block.

Note: For ESP32: no keypurpose, it returns always True.

Parameters block - [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

Returns True: The key purpose is write protected False: The key purpose is writeable.

esp_efuse_purpose_t esp_efuse_get_key_purpose (esp_efuse_block_t block)

Returns the current purpose set for an efuse key block.

Parameters block - [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

Returns
- Value: If Successful, it returns the value of the purpose related to the given key block.
- ESP_EFUSE_KEY_PURPOSE_MAX: Otherwise.

const esp_efuse_desc_t **esp_efuse_get_purpose_field (esp_efuse_block_t block)

Returns a pointer to a key purpose for an efuse key block.

To get the value of this field use esp_efuse_read_field_blob() or esp_efuse_get_key_purpose().
**Parameters**
- `block` [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

**Returns**
- Pointer: If successful returns a pointer to the corresponding efuse field otherwise NULL.

```c
const esp_efuse_desc_t **esp_efuse_get_key(esp_efuse_block_t block)
```

Returns a pointer to a key block.

**Parameters**
- `block` [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

**Returns**
- Pointer: If successful returns a pointer to the corresponding efuse field otherwise NULL.

```c
esp_err_t esp_efuse_set_key_purpose(esp_efuse_block_t block, esp_efuse_purpose_t purpose)
```

Sets a key purpose for an efuse key block.

**Parameters**
- `block` [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
- `purpose` [in] Key purpose.

**Returns**
- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

```c
esp_err_t esp_efuse_set_keypurpose_dis_write(esp_efuse_block_t block)
```

Sets a write protection of the key purpose field for an efuse key block.

**Parameters**
- `block` [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

**Returns**
- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

```c
esp_efuse_block_t esp_efuse_find_unused_key_block(void)
```

Search for an unused key block and return the first one found.

See esp_efuse_key_block_unused for a description of an unused key block.

**Returns**
- First unused key block, or EFUSE_BLK_KEY_MAX if no unused key block is found.

```c
unsigned esp_efuse_count_unused_key_blocks(void)
```

Return the number of unused efuse key blocks in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX.

```c
bool esp_efuse_get_digest_revoke(unsigned num_digest)
```

Returns the status of the Secure Boot public key digest revocation bit.

**Parameters**
- `num_digest` [in] The number of digest in range 0..2

**Returns**
- True: If key digest is revoked,
- False: If key digest is not revoked.

```c
esp_err_t esp_efuse_set_digest_revoke(unsigned num_digest)
```

Sets the Secure Boot public key digest revocation bit.

**Parameters**
- `num_digest` [in] The number of digest in range 0..2

**Returns**
- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.
bool esp_efuse_get_write_protect_of_digest_revoke(unsigned num_digest)

Returns a write protection of the Secure Boot public key digest revocation bit.

Parameters num_digest -[in] The number of digest in range 0..2

Returns True: The revocation bit is write protected. False: The revocation bit is writeable.

esp_err_t esp_efuse_set_write_protect_of_digest_revoke(unsigned num_digest)

Sets a write protection of the Secure Boot public key digest revocation bit.

Parameters num_digest -[in] The number of digest in range 0..2

Returns

• ESP_OK: Successful.
• ESP_ERR_INVALID_ARG: Error in the passed arguments.
• ESP_ERR_Efuse_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
• ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_err_t esp_efuse_write_key(esp_efuse_block_t block, esp_efuse_purpose_t purpose, const void *key,
size_t key_size_bytes)

Program a block of key data to an efuse block.

The burn of a key, protection bits, and a purpose happens in batch mode.

Parameters

• block -[in] Block to read purpose for. Must be in range EFUSE_BLK_KEY0 to
EFUSE_BLK_KEY_MAX. Key block must be unused (esp_efuse_key_block_unused).
• purpose -[in] Purpose to set for this key. Purpose must be already unset.
• key -[in] Pointer to data to write.
• key_size_bytes -[in] Bytes length of data to write.

Returns

• ESP_OK: Successful.
• ESP_ERR_INVALID_ARG: Error in the passed arguments.
• ESP_ERR_INVALID_STATE: Error in efuses state, unused block not found.
• ESP_ERR_Efuse_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
• ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_err_t esp_efuse_write_keys(const esp_efuse_purpose_t purposes[], uint8_t keys[][32], unsigned
number_of_keys)

Program keys to unused efuse blocks.

The burn of keys, protection bits, and purposes happens in batch mode.

Parameters

• purposes -[in] Array of purposes (purpose[number_of_keys]).
• keys -[in] Array of keys (uint8_t keys[number_of_keys][32]). Each key is 32 bytes long.
• number_of_keys -[in] The number of keys to write (up to 6 keys).

Returns

• ESP_OK: Successful.
• ESP_ERR_INVALID_ARG: Error in the passed arguments.
• ESP_ERR_INVALID_STATE: Error in efuses state, unused block not found.
• ESP_ERR_Efuse_NOT_ENOUGH_UNUSED_KEY_BLOCKS: Error not enough unused key blocks available
• ESP_ERR_Efuse_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
• ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_err_t esp_secure_boot_read_key_digests(esp_secure_boot_key_digests_t *trusted_key_digests)

Read key digests from efuse. Any revoked/missing digests will be marked as NULL.
### Parameters

**trusted_key_digests** – [out] Trusted keys digests, stored in this parameter after successfully completing this function. The number of digests depends on the SOC’s capabilities.

### Returns

- ESP_OK: Successful.
- ESP_FAIL: If trusted_keys is NULL or there is no valid digest.

#### esp_err_t esp_efuse_check_errors (void)

Checks eFuse errors in BLOCK0.

It does a BLOCK0 check if eFuse EFUSE_ERR_RST_ENABLE is set. If BLOCK0 has an error, it prints the error and returns ESP_FAIL, which should be treated as esp_restart.

---

**Note:** Refers to ESP32-C3 only.

---

### Structures

**struct esp_efuse_desc_t**

Type definition for an eFuse field.

### Public Members

**esp_efuse_block_t efuse_block**

Block of eFuse

**uint8_t bit_start**

Start bit [0..255]

**uint16_t bit_count**

Length of bit field [1..-]

**struct esp_secure_boot_key_digests_t**

Pointers to the trusted key digests.

The number of digests depends on the SOC’s capabilities.

### Public Members

**const void *key_digests[3]**

Pointers to the key digests

### Macros

**ESP_ERR_EFUSE**

Base error code for efuse api.
Chapter 2. API Reference

**ESP_OK_EFUSE_CNT**
OK the required number of bits is set.

**ESP_ERR_EFUSE_CNT_IS_FULL**
Error field is full.

**ESP_ERR_EFUSE_REPEATED_PROG**
Error repeated programming of programmed bits is strictly forbidden.

**ESP_ERR_CODING**
Error while a encoding operation.

**ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS**
Error not enough unused key blocks available

**ESP_ERR_DAMAGED_READING**
Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.

### Enumerations

enum **esp_efuse_rom_log_scheme_t**
Type definition for ROM log scheme.

*Values*:

- enumerator **ESP_EFUSE_ROM_LOG_ALWAYS_ON**
  Always enable ROM logging

- enumerator **ESP_EFUSE_ROM_LOG_ON_GPIO_LOW**
  ROM logging is enabled when specific GPIO level is low during startup

- enumerator **ESP_EFUSE_ROM_LOG_ON_GPIO_HIGH**
  ROM logging is enabled when specific GPIO level is high during startup

- enumerator **ESP_EFUSE_ROM_LOG_ALWAYS_OFF**
  Disable ROM logging permanently

### 2.9.8 Error Code and Helper Functions

This section lists definitions of common ESP-IDF error codes and several helper functions related to error handling.

For general information about error codes in ESP-IDF, see *Error Handling*.

For the full list of error codes defined in ESP-IDF, see *Error Codes Reference*.

### API Reference

**Header File**
- components/esp_common/include/esp_check.h
Macros

ESP_RETURN_ON_ERROR (x, log_tag, format, ...)
Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message and
returns. In the future, we want to switch to C++20. We also want to become compatible with clang. Hence,
we provide two versions of the following macros. The first one is using the GNU extension ##__VA_ARGS__.
The second one is using the C++20 feature VA_OPT(.). This allows users to compile their code with standard
C++20 enabled instead of the GNU extension. Below C++20, we haven’t found any good alternative to using
##__VA_ARGS___. Macro which can be used to check the error code. If the code is not ESP_OK, it prints
the message and returns.

ESP_RETURN_ON_ERROR_ISR (x, log_tag, format, ...)
A version of ESP_RETURN_ON_ERROR() macro that can be called from ISR.

ESP_GOTO_ON_ERROR (x, goto_tag, log_tag, format, ...)
Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message, sets the
local variable ‘ret’ to the code, and then exits by jumping to ‘goto_tag’.

ESP_GOTO_ON_ERROR_ISR (x, goto_tag, log_tag, format, ...)
A version of ESP_GOTO_ON_ERROR() macro that can be called from ISR.

ESP_RETURN_ON_FALSE (a, err_code, log_tag, format, ...)
Macro which can be used to check the condition. If the condition is not ‘true’, it prints the message and
returns with the supplied ‘err_code’.

ESP_RETURN_ON_FALSE_ISR (a, err_code, log_tag, format, ...)
A version of ESP_RETURN_ON_FALSE() macro that can be called from ISR.

ESP_GOTO_ON_FALSE (a, err_code, goto_tag, log_tag, format, ...)
Macro which can be used to check the condition. If the condition is not ‘true’, it prints the message, sets the
local variable ‘ret’ to the supplied ‘err_code’, and then exits by jumping to ‘goto_tag’.

ESP_GOTO_ON_FALSE_ISR (a, err_code, goto_tag, log_tag, format, ...)
A version of ESP_GOTO_ON_FALSE() macro that can be called from ISR.

Header File
• components/esp_common/include/esp_err.h
• This header file can be included with:

#include "esp_err.h"

Functions

const char* esp_err_to_name (esp_err_t code)
Returns string for esp_err_t error codes.

This function finds the error code in a pre-generated lookup-table and returns its string representation.
The function is generated by the Python script tools/gen_esp_err_to_name.py which should be run each time
an esp_err_t error is modified, created or removed from the IDF project.

Parameters code –esp_err_t error code
Returns string error message
const char *esp_err_to_name_r (esp_err_t code, char *buf, size_t buflen)

Returns string for esp_err_t and system error codes.

This function finds the error code in a pre-generated lookup-table of esp_err_t errors and returns its string representation. If the error code is not found then it is attempted to be found among system errors.

The function is generated by the Python script tools/gen_esp_err_to_name.py which should be run each time an esp_err_t error is modified, created or removed from the IDF project.

**Parameters**

- **code** - esp_err_t error code
- **buf** - [out] buffer where the error message should be written
- **buflen** - Size of buffer buf. At most buflen bytes are written into the buf buffer (including the terminating null byte).

**Returns** buf containing the string error message

**Macros**

ESP_OK

esp_err_t value indicating success (no error)

ESP_FAIL

Generic esp_err_t code indicating failure

ESP_ERR_NO_MEM

Out of memory

ESP_ERR_INVALID_ARG

Invalid argument

ESP_ERR_INVALID_STATE

Invalid state

ESP_ERR_INVALID_SIZE

Invalid size

ESP_ERR_NOT_FOUND

Requested resource not found

ESP_ERR_NOT_SUPPORTED

Operation or feature not supported

ESP_ERR_TIMEOUT

Operation timed out

ESP_ERR_INVALID_RESPONSE

Received response was invalid

ESP_ERR_INVALID_CRC

CRC or checksum was invalid

ESP_ERR_INVALID_VERSION

Version was invalid
ESP_ERR_INVALID_MAC
MAC address was invalid

ESP_ERR_NOT_FINISHED
Operation has not fully completed

ESP_ERR_NOT_ALLOWED
Operation is not allowed

ESP_ERR_WIFI_BASE
Starting number of WiFi error codes

ESP_ERR_MESH_BASE
Starting number of MESH error codes

ESP_ERR_FLASH_BASE
Starting number of flash error codes

ESP_ERR_HW_CRYPTO_BASE
Starting number of HW cryptography module error codes

ESP_ERR_MEMPROT_BASE
Starting number of Memory Protection API error codes

ESP_ERROR_CHECK(x)
Macro which can be used to check the error code, and terminate the program in case the code is not ESP_OK.
Prints the error code, error location, and the failed statement to serial output.
Disabled if assertions are disabled.

ESP_ERROR_CHECK_WITHOUT_ABORT(x)
Macro which can be used to check the error code. Prints the error code, error location, and the failed statement
to serial output. In comparison with ESP_ERROR_CHECK(), this prints the same error message but isn’t
terminating the program.

Type Definitions
typedef int esp_err_t

2.9.9 ESP HTTPS OTA

Overview

esp_https_ota provides simplified APIs to perform firmware upgrades over HTTPS. It is an abstraction layer
over the existing OTA APIs.

Application Example
esp_err_t do_firmware_upgrade()
{
    esp_http_client_config_t config = {
        .url = CONFIG_FIRMWARE_UPGRADE_URL,
        .cert_pem = (char*)server_cert_pem_start,
    };
    esp_https_ota_config_t ota_config = {
        .http_config = &config,
    };
    esp_err_t ret = esp_https_ota(&ota_config);
    if (ret == ESP_OK) {
        esp_restart();
    } else {
        return ESP_FAIL;
    }
    return ESP_OK;
}

Server Verification

Please refer to \textit{ESP-TLS: TLS Server Verification} for more information on server verification. The root certificate in PEM format needs to be provided to the \texttt{esp_http_client_config_t::cert_pem} member.

\textbf{Note:} The server-endpoint root certificate should be used for verification instead of any intermediate ones from the certificate chain. The reason is that the root certificate has the maximum validity and usually remains the same for a long period of time. Users can also use the \texttt{esp_http_client_config_t::crt_bundle_attach} member for verification by the ESP x509 Certificate Bundle feature, which covers most of the trusted root certificates.

Partial Image Download over HTTPS

To use the partial image download feature, enable \texttt{partial_http_download} configuration in \texttt{esp_https_ota_config_t}. When this configuration is enabled, firmware image will be downloaded in multiple HTTP requests of specified sizes. Maximum content length of each request can be specified by setting \texttt{max_http_request_size} to the required value.

This option is useful while fetching image from a service like AWS S3, where mbedTLS Rx buffer size (\texttt{CONFIGMBEDTLS_SSL_IN_CONTENT_LEN}) can be set to a lower value which is not possible without enabling this configuration.

Default value of mbedTLS Rx buffer size is set to 16 KB. By using \texttt{partial_http_download} with \texttt{max_http_request_size} of 4 KB, size of mbedTLS Rx buffer can be reduced to 4 KB. With this configuration, memory saving of around 12 KB is expected.

Signature Verification

For additional security, signature of OTA firmware images can be verified. For more information, please refer to \textit{Secure OTA Updates Without Secure Boot}.

Advanced APIs

\texttt{esp_https OTA} also provides advanced APIs which can be used if more information and control is needed during the OTA process.

Example that uses advanced ESP_HTTPS OTA APIs: system/ota/advanced_https_ota.
OTA Upgrades with Pre-Encrypted Firmware

To perform OTA upgrades with pre-encrypted firmware, please enable `CONFIG_ESP_HTTPS_OTA_DECRYPT_CB` in component menuconfig.

Example that performs OTA upgrade with pre-encrypted firmware: `system/ota/pre_encrypted_ota`.

OTA System Events

ESP HTTPS OTA has various events for which a handler can be triggered by the Event Loop Library when the particular event occurs. The handler has to be registered using `esp_event_handler_register()`. This helps the event handling for ESP HTTPS OTA.

`esp_https_ota_event_t` has all the events which can happen when performing OTA upgrade using ESP HTTPS OTA.

Event Handler Example

```c
/* Event handler for catching system events */
static void event_handler(void* arg, esp_event_base_t event_base, int32_t event_id, void* event_data)
{
    if (event_base == ESP_HTTPS_OTA_EVENT) {
        switch (event_id) {
            case ESP_HTTPS_OTA_START:
                ESP_LOGI(TAG, "OTA started");
                break;
            case ESP_HTTPS_OTA_CONNECTED:
                ESP_LOGI(TAG, "Connected to server");
                break;
            case ESP_HTTPS_OTA_GET_IMG_DESC:
                ESP_LOGI(TAG, "Reading Image Description");
                break;
            case ESP_HTTPS_OTA_VERIFY_CHIP_ID:
                ESP_LOGI(TAG, "Verifying chip id of new image: %d", *(esp_chip_id_t *)event_data);
                break;
            case ESP_HTTPS_OTA_DECRYPT_CB:
                ESP_LOGI(TAG, "Callback to decrypt function");
                break;
            case ESP_HTTPS_OTA_WRITE_FLASH:
                ESP_LOGD(TAG, "Writing to flash: %d written", *(int*)event_data);
                break;
            case ESP_HTTPS_OTA_UPDATE_BOOT_PARTITION:
                ESP_LOGI(TAG, "Boot partition updated. Next Partition: %d", *(esp_partition_subtype_t *)event_data);
                break;
            case ESP_HTTPS_OTA_FINISH:
                ESP_LOGI(TAG, "OTA finish");
                break;
            case ESP_HTTPS_OTA_ABORT:
                ESP_LOGI(TAG, "OTA abort");
                break;
        }
    }
}
```

Expected data type for different ESP HTTPS OTA events in the system event loop:

- `ESP_HTTPS_OTA_START`: NULL
- `ESP_HTTPS_OTA_CONNECTED`: NULL
Chapter 2. API Reference

- ESP_HTTPS_OTA_GET_IMG_DESC: NULL
- ESP_HTTPS_OTA_VERIFY_CHIP_ID: esp_chip_id_t
- ESP_HTTPS_OTA_DECRYPT_CB: NULL
- ESP_HTTPS_OTA_WRITE_FLASH: int
- ESP_HTTPS_OTA_UPDATE_BOOT_PARTITION: esp_partition_subtype_t
- ESP_HTTPS_OTA_FINISH: NULL
- ESP_HTTPS_OTA_ABORT: NULL

API Reference

Header File

- components/esp_https_ota/include/esp_https_ota.h
- This header file can be included with:

  ```
  #include "esp_https_ota.h"
  ```

- This header file is a part of the API provided by the esp_https_ota component. To declare that your component depends on esp_https_ota, add the following to your CMakeLists.txt:

  ```
  REQUIRES esp_https_ota
  ```

  or

  ```
  PRIV_REQUIRES esp_https_ota
  ```

Functions

**esp_err_t esp_https_ota** (const esp_https_ota_config_t *ota_config)

HTTPS OTA Firmware upgrade.

This function allocates HTTPS OTA Firmware upgrade context, establishes HTTPS connection, reads image data from HTTP stream and writes it to OTA partition and finishes HTTPS OTA Firmware upgrade operation. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to cert_pem member of ota_config->http_config.

**Note:** This API handles the entire OTA operation, so if this API is being used then no other APIs from esp_https_ota component should be called. If more information and control is needed during the HTTPS OTA process, then one can use esp_https_ota_begin and subsequent APIs. If this API returns successfully, esp_restart() must be called to boot from the new firmware image.

**Parameters**

ota_config - [in] pointer to esp_https_ota_config_t structure.

**Returns**

- ESP_OK: OTA data updated, next reboot will use specified partition.
- ESP_FAIL: For generic failure.
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_HTTPS_OA_VALIDATE_FAILED: Invalid app image
- ESP_ERR_HTTPS_OA_NO_MEM: Cannot allocate memory for OTA operation.
- ESP_ERR_HTTPS_OA_FLASH_OP_TIMEOUT or ESP_ERR_HTTPS_OA_FLASH_OP_FAIL: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf’s app_update component.

**esp_err_t esp_https_ota_begin** (const esp_https_ota_config_t *ota_config, esp_https_ota_handle_t *handle)

Start HTTPS OTA Firmware upgrade.

This function initializes ESP HTTPS OTA context and establishes HTTPS connection. This function must be invoked first. If this function returns successfully, then esp_https_ota_perform should be called to continue with the OTA process and there should be a call to esp_https_ota_finish on completion of OTA operation or on failure in subsequent operations. This API supports URL redirection, but if CA cert
of URLs differ then it should be appended to cert.pem member of http_config, which is a part of ota_config. In case of error, this API explicitly sets handle to NULL.

**Note:** This API is blocking, so setting is_async member of http_config structure will result in an error.

### Parameters
- **ota_config** [in] pointer to esp_https_ota_config_t structure
- **handle** [out] pointer to an allocated data of type esp_https_ota_handle_t which will be initialised in this function

### Returns
- ESP_OK: HTTPS OTA Firmware upgrade context initialised and HTTPS connection established
- ESP_FAIL: For generic failure.
- ESP_ERR_INVALID_ARG: Invalid argument (missing/incorrect config, certificate, etc.)
- For other return codes, refer documentation in app_update component and esp_http_client component in esp-idf.

```c
esp_err_t esp_https_ota_perform(esp_https_ota_handle_t https_ota_handle)
```

Read image data from HTTP stream and write it to OTA partition.

This function reads image data from HTTP stream and writes it to OTA partition. This function must be called only if esp_https_ota_begin() returns successfully. This function must be called in a loop since it returns after every HTTP read operation thus giving you the flexibility to stop OTA operation midway.

### Parameters
- **https_ota_handle** [in] pointer to esp_https_ota_handle_t structure

### Returns
- ESP_ERR_HTTPS_OTA_IN_PROGRESS: OTA update is in progress, call this API again to continue.
- ESP_OK: OTA update was successful
- ESP_FAIL: OTA update failed
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_INVALID_VERSION: Invalid chip revision in image header
- ESP_ERR_OTA_VALIDATE_FAILED: Invalid app image
- ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf’s app_update component.

```c
bool esp_https_ota_is_complete_data_received(esp_https_ota_handle_t https_ota_handle)
```

Checks if complete data was received or not.

**Note:** This API can be called just before esp_https_ota_finish() to validate if the complete image was indeed received.

### Parameters
- **https_ota_handle** [in] pointer to esp_https_ota_handle_t structure

### Returns
- false
- true

```c
esp_err_t esp_https_ota_finish(esp_https_ota_handle_t https_ota_handle)
```

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context. This function switches the boot partition to the OTA partition containing the new firmware image.
Note: If this API returns successfully, esp_restart() must be called to boot from the new firmware image. esp_https_ota_finish should not be called after calling esp_https_ota_abort.

**Parameters**

- `https_ota_handle` - [in] pointer to esp_https_ota_handle_t structure

**Returns**

- ESP_OK: Clean-up successful
- ESP_ERR_INVALID_STATE: Invalid ESP HTTPS OTA state
- ESP_FAIL: OTA not started
- ESP_ERR_NOT_FOUND: OTA handle not found
- ESP_ERR_INVALID_ARG: Invalid argument

**esp_err_t esp_https_ota_abort(esp_https_ota_handle_t https_ota_handle)**

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context.

Note: esp_https_ota_abort should not be called after calling esp_https_ota_finish.

**Parameters**

- `https_ota_handle` - [in] pointer to esp_https_ota_handle_t structure

**Returns**

- ESP_OK: Clean-up successful
- ESP_ERR_INVALID_STATE: Invalid ESP HTTPS OTA state
- ESP_FAIL: OTA not started
- ESP_ERR_NOT_FOUND: OTA handle not found
- ESP_ERR_INVALID_ARG: Invalid argument

**esp_err_t esp_https_ota_get_img_desc(esp_https_ota_handle_t https_ota_handle, esp_app_desc_t *new_app_info)**

Reads app description from image header. The app description provides information like the “Firmware version” of the image.

Note: This API can be called only after esp_https_ota_begin() and before esp_https_ota_perform(). Calling this API is not mandatory.

**Parameters**

- `https_ota_handle` - [in] pointer to esp_https_ota_handle_t structure
- `new_app_info` - [out] pointer to an allocated esp_app_desc_t structure

**Returns**

- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_INVALID_STATE: Invalid state to call this API. esp_https_ota_begin() not called yet.
- ESP_FAIL: Failed to read image descriptor
- ESP_OK: Successfully read image descriptor

**int esp_https_ota_get_image_len_read(esp_https_ota_handle_t https_ota_handle)**

This function returns OTA image data read so far.

Note: This API should be called only if esp_https_ota_perform() has been called at least once or if esp_https_ota_get_img_desc has been called before.

**Parameters**

- `https_ota_handle` - [in] pointer to esp_https_ota_handle_t structure

**Returns**

- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_INVALID_STATE: Invalid state to call this API. esp_https_ota_begin() not called yet.
- ESP_FAIL: Failed to read image descriptor
- ESP_OK: Successfully read image descriptor
Chapter 2. API Reference

-1 On failure
- total bytes read so far

```c
int esp_https_ota_get_image_size(esp_https_ota_handle_t https_ota_handle)
```

This function returns OTA image total size.

**Note:** This API should be called after esp_https_ota_begin() has been already called. This can be used to create some sort of progress indication (in combination with esp_https_ota_get_image_len_read())

**Parameters**

`https_ota_handle` - [in] pointer to esp_https_ota_handle_t structure

**Returns**

-1 On failure or chunked encoding
- total bytes of image

**Structures**

```c
struct esp_https_ota_config_t
```

ESP HTTPS OTA configuration.

**Public Members**

```c
const esp_http_client_config_t *http_config
```

ESP HTTP client configuration

```c
http_client_init_cb_t http_client_init_cb
```

Callback after ESP HTTP client is initialised

```c
bool bulk_flash_erase
```

Erase entire flash partition during initialization. By default flash partition is erased during write operation and in chunk of 4K sector size

```c
bool partial_http_download
```

Enable Firmware image to be downloaded over multiple HTTP requests

```c
int max_http_request_size
```

Maximum request size for partial HTTP download

**Macros**

`ESP_ERR_HTTPS_OTA_BASE`

`ESP_ERR_HTTPS_OTA_IN_PROGRESS`

**Type Definitions**

```c
typedef void *esp_https_ota_handle_t
```

```c
typedef esp_err_t (*http_client_init_cb_t)(esp_http_client_handle_t)
```

Submit Document Feedback
Enumerations

enum esp_https_ota_event_t

Events generated by OTA process.

Values:

enumerator ESP_HTTPS_OTA_START
OTA started

enumerator ESP_HTTPS_OTA_CONNECTED
Connected to server

enumerator ESP_HTTPS_OTA_GET_IMG_DESC
Read app description from image header

enumerator ESP_HTTPS_OTAVERIFY_CHIP_ID
Verify chip id of new image

enumerator ESP_HTTPS_OTA_DECRYPT_CB
Callback to decrypt function

enumerator ESP_HTTPS_OTA_WRITE_FLASH
Flash write operation

enumerator ESP_HTTPS_OTA_UPDATE_BOOT_PARTITION
Boot partition update after successful ota update

enumerator ESP_HTTPS_OTA_FINISH
OTA finished

enumerator ESP_HTTPS_OTA_ABORT
OTA aborted

2.9.10 Event Loop Library

Overview

The event loop library allows components to declare events so that other components can register handlers – codes that executes when those events occur. This allows loosely-coupled components to attach desired behavior to state changes of other components without application involvement. This also simplifies event processing by serializing and deferring code execution to another context.

One common case is, if a high-level library is using the Wi-Fi library: it may subscribe to ESP32 Wi-Fi Programming Model directly and act on those events.
Using esp_event APIs

There are two objects of concern for users of this library: events and event loops.

An event indicates an important occurrence, such as a successful Wi-Fi connection to an access point. A two-part identifier should be used when referencing events, see declaring and defining events for details. The event loop is the bridge between events and event handlers. The event source publishes events to the event loop using the APIs provided by the event loop library, and event handlers registered to the event loop respond to specific types of events.

Using this library roughly entails the following flow:

1. The user defines a function that should run when an event is posted to a loop. This function is referred to as the event handler, and should have the same signature as esp_event_handler_t.
2. An event loop is created using esp_event_loop_create(), which outputs a handle to the loop of type esp_event_loop_handle_t. Event loops created using this API are referred to as user event loops. There is, however, a special type of event loop called the default event loop which is discussed in default event loop.
3. Components register event handlers to the loop using esp_event_handler_register_with(). Handlers can be registered with multiple loops, see notes on handler registration.
4. Event sources post an event to the loop using esp_event_post_to().
5. Components wanting to remove their handlers from being called can do so by unregistering from the loop using esp_event_handler_unregister_with().
6. Event loops that are no longer needed can be deleted using esp_event_loop_delete().

In code, the flow above may look like as follows:

```
// 1. Define the event handler
void run_on_event (void *handler_arg, esp_event_base_t base, int32_t id, void *event_data)
{
    // Event handler logic
}

void app_main()
{
    // 2. A configuration structure of type esp_event_loop_args_t is needed to specify the properties of the loop to be created. A handle of type esp_event_loop_handle_t is obtained, which is needed by the other APIs to reference the loop to perform their operations.
    esp_event_loop_args_t loop_args = {
        .queue_size = ...,
        .task_name = ...
        .task_priority = ...
        .task_stack_size = ...
        .task_core_id = ...
    };
    esp_event_loop_handle_t loop_handle;
    esp_event_loop_create(&loop_args, &loop_handle);

    // 3. Register event handler defined in (1). MY_EVENT_BASE and MY_EVENT_ID specify a hypothetical event that handler run_on_event should execute when it gets posted to the loop.
    esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event, ...);

    ...

    // 4. Post events to the loop. This queues the event on the event loop. At some point, the event loop executes the event handler registered to the posted event, in this case, run_on_event. To simplify the process, this example calls esp_event_post_to from app_main, but posting can be done from any other task (which is the more interesting use case).
```
Declaring and Defining Events

As mentioned previously, events consist of two-part identifiers: the event base and the event ID. The event base identifies an independent group of events; the event ID identifies the event within that group. Think of the event base and event ID as a person’s last name and first name, respectively. A last name identifies a family, and the first name identifies a person within that family.

The event loop library provides macros to declare and define the event base easily.

Event base declaration:

```c
ESP_EVENT_DECLARE_BASE(EVENT_BASE)
```

Event base definition:

```c
ESP_EVENT_DEFINE_BASE(EVENT_BASE)
```

**Note:** In ESP-IDF, the base identifiers for system events are uppercase and are postfixed with _EVENT. For example, the base for Wi-Fi events is declared and defined as WIFI_EVENT, the Ethernet event base ETHERNET_EVENT, and so on. The purpose is to have event bases look like constants (although they are global variables considering the definitions of macros ESP_EVENT_DECLARE_BASE and ESP_EVENT_DEFINE_BASE).

For event IDs, declaring them as enumerations is recommended. Once again, for visibility, these are typically placed in public header files.

Event ID:

```c
enum {
    EVENT_ID_1,
    EVENT_ID_2,
    EVENT_ID_3,
    ...
}
```

Default Event Loop

The default event loop is a special type of loop used for system events (Wi-Fi events, for example). The handle for this loop is hidden from the user, and the creation, deletion, handler registration/deregistration, and posting of events are done through a variant of the APIs for user event loops. The table below enumerates those variants, and the user event loops equivalent.
Chapter 2. API Reference

User Event Loops

<table>
<thead>
<tr>
<th>Function</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_event_loop_create()</td>
<td>esp_event_loop_create_default()</td>
</tr>
<tr>

<td>esp_event_handler_unregister_with()</td>
<td>esp_event_handler_unregister()</td>
</tr>
<tr>
<td>esp_event_post_to()</td>
<td>esp_event_post()</td>
</tr>
</tbody>
</table>

Default Event Loops

If you compare the signatures for both, they are mostly similar except for the lack of loop handle specification for the default event loop APIs.

Other than the API difference and the special designation to which system events are posted, there is no difference in how default event loops and user event loops behave. It is even possible for users to post their own events to the default event loop, should the user opt to not create their own loops to save memory.

Notes on Handler Registration

It is possible to register a single handler to multiple events individually by using multiple calls to esp_event_handler_register_with(). For those multiple calls, the specific event base and event ID can be specified with which the handler should execute.

However, in some cases, it is desirable for a handler to execute on the following situations:

1. all events that get posted to a loop
2. all events of a particular base identifier

This is possible using the special event base identifier ESP_EVENT_ANY_BASE and special event ID ESP_EVENT_ANY_ID. These special identifiers may be passed as the event base and event ID arguments for esp_event_handler_register_with().

Therefore, the valid arguments to esp_event_handler_register_with() are:

1. <event base>, <event ID> - handler executes when the event with base <event base> and event ID <event ID> gets posted to the loop
2. <event base>, ESP_EVENT_ANY_ID - handler executes when any event with base <event base> gets posted to the loop
3. ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID - handler executes when any event gets posted to the loop

As an example, suppose the following handler registrations were performed:

```c
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event_1, ...);
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, ESP_EVENT_ANY_ID, run_on_event_2, ...);
esp_event_handler_register_with(loop_handle, ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID, run_on_event_3, ...);
```

If the hypothetical event MY_EVENT_BASE, MY_EVENT_ID is posted, all three handlers run_on_event_1, run_on_event_2, and run_on_event_3 would execute.

If the hypothetical event MY_EVENT_BASE, MY_OTHER_EVENT_ID is posted, only run_on_event_2 and run_on_event_3 would execute.

If the hypothetical event MY_OTHER_EVENT_BASE, MY_OTHER_EVENT_ID is posted, only run_on_event_3 would execute.

Handler Un-Registering Itself  In general, an event handler run by an event loop is not allowed to do any registering/unregistering activity on that event loop. There is one exception, though: un-registering itself is allowed for the handler. E.g., it is possible to do the following:
void run_on_event(void* handler_arg, esp_event_base_t base, int32_t id, void* event_data)
{
    esp_event_loop_handle_t *loop_handle = (esp_event_loop_handle_t*) handler_arg;
    esp_event_handler_unregister_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event);
}

void app_main(void)
{
    esp_event_loop_handle_t loop_handle;
    esp_event_loop_create(&loop_args, &loop_handle);
    esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event, &loop_handle);
    // ... post-event MY_EVENT_BASE, MY_EVENT_ID and run loop at some point
}

Handler Registration and Handler Dispatch Order

The general rule is that, for handlers that match a certain posted event during dispatch, those which are registered first also get executed first. The user can then control which handlers get executed first by registering them before other handlers, provided that all registrations are performed using a single task. If the user plans to take advantage of this behavior, caution must be exercised if there are multiple tasks registering handlers. While the ‘first registered, first executed’ behavior still holds true, the task which gets executed first also gets its handlers registered first. Handlers registered one after the other by a single task are still dispatched in the order relative to each other, but if that task gets pre-empted in between registration by another task that also registers handlers; then during dispatch those handlers also get executed in between.

Event Loop Profiling

A configuration option CONFIG_ESP_EVENT_LOOP_PROFILING can be enabled in order to activate statistics collection for all event loops created. The function esp_event_dump() can be used to output the collected statistics to a file stream. More details on the information included in the dump can be found in the esp_event_dump() API Reference.

Application Example

Examples of using the esp_event library can be found in system/esp_event. The examples cover event declaration, loop creation, handler registration and deregistration, and event posting.

Other examples which also adopt esp_event library:

• NMEA Parser, which decodes the statements received from GPS.

API Reference

Header File

• components/esp_event/include/esp_event.h
• This header file can be included with:
  
  #include "esp_event.h"

• This header file is a part of the API provided by the esp_event component. To declare that your component depends on esp_event, add the following to your CMakeLists.txt:

  REQUIREES esp_event

or
Chapter 2. API Reference

```
PRIV_REQUIRES esp_event
```

**Functions**

`esp_err_t esp_event_loop_create(const esp_event_loop_args_t *event_loop_args, esp_event_loop_handle_t *event_loop)`

Create a new event loop.

**Parameters**

- `event_loop_args` - [in] configuration structure for the event loop to create
- `event_loop` - [out] handle to the created event loop

**Returns**

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: event_loop_args or event_loop was NULL
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- ESP_FAIL: Failed to create task loop
- Others: Fail

`esp_err_t esp_event_loop_delete(esp_event_loop_handle_t event_loop)`

Delete an existing event loop.

**Parameters**

- `event_loop` - [in] event loop to delete, must not be NULL

**Returns**

- ESP_OK: Success
- Others: Fail

`esp_err_t esp_event_loop_create_default(void)`

Create default event loop.

**Returns**

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- ESP_ERR_INVALID_STATE: Default event loop has already been created
- ESP_FAIL: Failed to create task loop
- Others: Fail

`esp_err_t esp_event_loop_delete_default(void)`

Delete the default event loop.

**Returns**

- ESP_OK: Success
- Others: Fail

`esp_err_t esp_event_loop_run(esp_event_loop_handle_t event_loop, TickType_t ticks_to_run)`

Dispatch events posted to an event loop.

This function is used to dispatch events posted to a loop with no dedicated task, i.e. task name was set to NULL in event_loop_args argument during loop creation. This function includes an argument to limit the amount of time it runs, returning control to the caller when that time expires (or some time afterwards). There is no guarantee that a call to this function will exit at exactly the time of expiry. There is also no guarantee that events have been dispatched during the call, as the function might have spent all the allotted time waiting on the event queue. Once an event has been dequeued, however, it is guaranteed to be dispatched. This guarantee contributes to not being able to exit exactly at time of expiry as (1) blocking on internal mutexes is necessary for dispatching the dequeued event, and (2) during dispatch of the dequeued event there is no way to control the time occupied by handler code execution. The guaranteed time of exit is therefore the allotted time + amount of time required to dispatch the last dequeued event.

In cases where waiting on the queue times out, ESP_OK is returned and not ESP_ERR_TIMEOUT, since it is normal behavior.
**Chapter 2. API Reference**

**Note:** encountering an unknown event that has been posted to the loop will only generate a warning, not an error.

**Parameters**
- **event_loop** [in] event loop to dispatch posted events from, must not be NULL
- **ticks_to_run** [in] number of ticks to run the loop

**Returns**
- ESP_OK: Success
- Others: Fail

```c
esp_err_t esp_event_handler_register(esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler, void *event_handler_arg)
```

Register an event handler to the system event loop (legacy).

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

- specific events: specify exact event_base and event_id
- all events of a certain base: specify exact event_base and use ESP_EVENT_ANY_ID as the event_id
- all events known by the loop: use ESP_EVENT_ANY_BASE for event_base and ESP_EVENT_ANY_ID as the event_id

Registering multiple handlers to events is possible. Registering a single handler to multiple events is also possible. However, registering the same handler to the same event multiple times would cause the previous registrations to be overwritten.

**Note:** the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

**Parameters**
- **event_base** [in] the base ID of the event to register the handler for
- **event_id** [in] the ID of the event to register the handler for
- **event_handler** [in] the handler function which gets called when the event is dispatched
- **event_handler_arg** [in] data, aside from event data, that is passed to the handler when it is called

**Returns**
- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```c
esp_err_t esp_event_handler_register_with(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler, void *event_handler_arg)
```

Register an event handler to a specific loop (legacy).

This function behaves in the same manner as esp_event_handler_register, except the additional specification of the event loop to register the handler to.

**Note:** the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called
## Parameters
- `event_loop` - [in] the event loop to register this handler function to, must not be NULL
- `event_base` - [in] the base ID of the event to register the handler for
- `event_id` - [in] the ID of the event to register the handler for
- `event_handler` - [in] the handler function which gets called when the event is dispatched
- `event_handler_arg` - [in] data, aside from event data, that is passed to the handler when it is called

## Returns
- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```c
esp_err_t esp_event_handler_instance_register_with(esp_event_loop_handle_t event_loop,
                                             esp_event_base_t event_base, int32_t event_id,
                                             esp_event_handler_t event_handler, void* event_handler_arg,
                                             esp_event_handler_instance_t *instance)
```

Register an instance of event handler to a specific loop.

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

- specific events: specify exact event_base and event_id
- all events of a certain base: specify exact event_base and use ESP_EVENT_ANY_ID as the event_id
- all events known by the loop: use ESP_EVENT_ANY_BASE for event_base and ESP_EVENT_ANY_ID as the event_id

Besides the error, the function returns an instance object as output parameter to identify each registration. This is necessary to remove (unregister) the registration before the event loop is deleted.

Registering multiple handlers to events, registering a single handler to multiple events as well as registering the same handler to the same event multiple times is possible. Each registration yields a distinct instance object which identifies it over the registration lifetime.

**Note:** the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called
• ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID or instance is NULL
• Others: Fail

```
esp_err_t esp_event_handler_instance_register(esp_event_base_t event_base, int32_t event_id,
                                          esp_event_handler_t event_handler, void *
                                          event_handler_arg,
                                          esp_event_handler_instance_t *instance)
```

Register an instance of event handler to the default loop.

This function does the same as esp_event_handler_instance_register_with, except that it registers the handler to the default event loop.

**Note:** the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

**Parameters**
- `event_base` *[in]* the base ID of the event to register the handler for
- `event_id` *[in]* the ID of the event to register the handler for
- `event_handler` *[in]* the handler function which gets called when the event is dispatched
- `event_handler_arg` *[in]* data, aside from event data, that is passed to the handler when it is called
- `instance` *[out]* An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed, but the handler should be deleted when the event loop is deleted, instance can be NULL.

**Returns**
- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID or instance is NULL
- Others: Fail

```
esp_err_t esp_event_handler_unregister(esp_event_base_t event_base, int32_t event_id,
                                       esp_event_handler_t event_handler)
```

Unregister a handler with the system event loop (legacy).

Unregisters a handler, so it will no longer be called during dispatch. Handlers can be unregistered for any combination of event_base and event_id which were previously registered. To unregister a handler, the `event_base` and `event_id` arguments must match exactly the arguments passed to esp_event_handler_register() when that handler was registered. Passing ESP_EVENT_ANY_BASE and/or ESP_EVENT_ANY_ID will only unregister handlers that were registered with the same wildcard arguments.

**Note:** When using ESP_EVENT_ANY_ID, handlers registered to specific event IDs using the same base will not be unregistered. When using ESP_EVENT_ANY_BASE, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

**Parameters**
- `event_base` *[in]* the base of the event with which to unregister the handler
- `event_id` *[in]* the ID of the event with which to unregister the handler
- `event_handler` *[in]* the handler to unregister

**Returns** ESP_OK success
Returns ESP_ERR_INVALID_ARG invalid combination of event base and event ID
Returns others fail

\texttt{esp_err_t esp_event_handler_unregister_with(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler)}

Unregister a handler from a specific event loop (legacy).
This function behaves in the same manner as \texttt{esp_event_handler_unregister}, except the additional specification of the event loop to unregister the handler with.

Parameters
• \texttt{event_loop} [in] the event loop with which to unregister this handler function, must not be NULL
• \texttt{event_base} [in] the base of the event with which to unregister the handler
• \texttt{event_id} [in] the ID of the event with which to unregister the handler
• \texttt{event_handler} [in] the handler to unregister

Returns
• ESP_OK: Success
• ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
• Others: Fail

\texttt{esp_err_t esp_event_handler_instance_unregister_with(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_instance_t instance)}

Unregister a handler instance from a specific event loop.
Unregisters a handler instance, so it will no longer be called during dispatch. Handler instances can be unregistered for any combination of \texttt{event_base} and \texttt{event_id} which were previously registered. To unregister a handler instance, the \texttt{event_base} and \texttt{event_id} arguments must match exactly the arguments passed to \texttt{esp_event_handler_instance_register()} when that handler instance was registered. Passing ESP_EVENT_ANY_BASE and/or ESP_EVENT_ANY_ID will only unregister handler instances that were registered with the same wildcard arguments.

\textbf{Note:} When using ESP_EVENT_ANY_ID, handlers registered to specific event IDs using the same base will not be unregistered. When using ESP_EVENT_ANY_BASE, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

Parameters
• \texttt{event_loop} [in] the event loop with which to unregister this handler function, must not be NULL
• \texttt{event_base} [in] the base of the event with which to unregister the handler
• \texttt{event_id} [in] the ID of the event with which to unregister the handler
• \texttt{instance} [in] the instance object of the registration to be unregistered

Returns
• ESP_OK: Success
• ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
• Others: Fail

\texttt{esp_err_t esp_event_handler_instance_unregister(esp_event_base_t event_base, int32_t event_id, esp_event_handler_instance_t instance)}

Unregister a handler from the system event loop.
This function does the same as \texttt{esp_event_handler_instance_unregister_with}, except that it unregisters the handler instance from the default event loop.

Parameters
• \texttt{event_base} [in] the base of the event with which to unregister the handler
• **event_id** [in] the ID of the event with which to unregister the handler
• **instance** [in] the instance object of the registration to be unregistered

**Returns**
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

### esp_err_t esp_event_post

**Function Definition:**

```
esp_err_t esp_event_post(esp_event_base_t event_base, int32_t event_id, const void *event_data, size_t event_data_size, TickType_t ticks_to_wait)
```

**Description:**
Posts an event to the system default event loop. The event loop library keeps a copy of event_data and manages the copy’s lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

**Parameters**
- **event_base** [in] the event base that identifies the event
- **event_id** [in] the event ID that identifies the event
- **event_data** [in] the data, specific to the event occurrence, that gets passed to the handler
- **event_data_size** [in] the size of the event data
- **ticks_to_wait** [in] number of ticks to block on a full event queue

**Returns**
- ESP_OK: Success
- ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

### esp_err_t esp_event_post_to

**Function Definition:**

```
esp_err_t esp_event_post_to(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, const void *event_data, size_t event_data_size, TickType_t ticks_to_wait)
```

**Description:**
Posts an event to the specified event loop. The event loop library keeps a copy of event_data and manages the copy’s lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

This function behaves in the same manner as esp_event_post_to, except the additional specification of the event loop to post the event to.

**Parameters**
- **event_loop** [in] the event loop to post to, must not be NULL
- **event_base** [in] the event base that identifies the event
- **event_id** [in] the event ID that identifies the event
- **event_data** [in] the data, specific to the event occurrence, that gets passed to the handler
- **event_data_size** [in] the size of the event data
- **ticks_to_wait** [in] number of ticks to block on a full event queue

**Returns**
- ESP_OK: Success
- ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

### esp_err_t esp_event_isr_post

**Function Definition:**

```
esp_err_t esp_event_isr_post(esp_event_base_t event_base, int32_t event_id, const void *event_data, size_t event_data_size, BaseType_t *task_unblocked)
```

**Description:**
Special variant of esp_event_post for posting events from interrupt handlers.

**Note:** this function is only available when CONFIG_ESP_EVENT_POST_FROM_ISR is enabled
Parameters

- `event_base` - [in] the event base that identifies the event
- `event_id` - [in] the event ID that identifies the event
- `event_data` - [in] the data, specific to the event occurrence, that gets passed to the handler
- `event_data_size` - [in] the size of the event data; max is 4 bytes
- `task_unblocked` - [out] an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

Returns

- ESP_OK: Success
- ESP_FAIL: Event queue for the default event loop full
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID, data size of more than 4 bytes
- Others: Fail

```c
esp_err_t esp_event_isr_post_to(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, const void* event_data, size_t event_data_size, BaseType_t* task_unblocked)
```

Special variant of esp_event_post_to for posting events from interrupt handlers.

**Note:** this function is only available when CONFIG_ESP_EVENT_POST_FROM_ISR is enabled

**Note:** when this function is called from an interrupt handler placed in IRAM, this function should be placed in IRAM as well by enabling CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR

Parameters

- `event_loop` - [in] the event loop to post to, must not be NULL
- `event_base` - [in] the event base that identifies the event
- `event_id` - [in] the event ID that identifies the event
- `event_data` - [in] the data, specific to the event occurrence, that gets passed to the handler
- `event_data_size` - [in] the size of the event data
- `task_unblocked` - [out] an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

Returns

- ESP_OK: Success
- ESP_FAIL: Event queue for the loop full
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID, data size of more than 4 bytes
- Others: Fail

```c
esp_err_t esp_event_dump(FILE* file)
```

Dumps statistics of all event loops.

Dumps event loop info in the format:
event loop
  handler
  handler
...

event loop
  handler
  handler
...

where:

event loop
  format: address, name rx:total_received dr:total_dropped
  where:
  address - memory address of the event loop
  name - name of the event loop, 'none' if no dedicated task
  total_received - number of successfully posted events
  total_dropped - number of events unsuccessfully posted due to queue being full

handler
  format: address ev:base, id inv:total_invoked run:total_runtime
  where:
  address - address of the handler function
  base, id - the event specified by event base and ID this handler executes
  total_invoked - number of times this handler has been invoked
  total_runtime - total amount of time used for invoking this handler

Note: this function is a noop when CONFIG_ESP_EVENT_LOOP_PROFILING is disabled

Parameters file - [in] the file stream to output to

Returns

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- Others: Fail

Structures

struct esp_event_loop_args_t
  Configuration for creating event loops.

Public Members

int32_t queue_size
  size of the event loop queue

const char *task_name
  name of the event loop task; if NULL, a dedicated task is not created for event loop

UBaseType_t task_priority
  priority of the event loop task, ignored if task name is NULL
**uint32_t task_stack_size**

stack size of the event loop task, ignored if task name is NULL

**BaseType_t task_core_id**

core to which the event loop task is pinned to, ignored if task name is NULL

---

**Header File**

- components/esp_event/include/esp_event_base.h
- This header file can be included with:

  ```
  #include "esp_event_base.h"
  ```

- This header file is a part of the API provided by the esp_event component. To declare that your component depends on esp_event, add the following to your CMakeLists.txt:

  ```
  REQUIRES esp_event
  or
  PRIV_REQUIRES esp_event
  ```

---

**Macros**

- **ESP_EVENT_DECLARE_BASE (id)**
- **ESP_EVENT_DEFINE_BASE (id)**

- **ESP_EVENT_ANY_BASE**
  
  register handler for any event base

- **ESP_EVENT_ANY_ID**
  
  register handler for any event id

---

**Type Definitions**

- **typedef void *esp_event_loop_handle_t**
  
  a number that identifies an event with respect to a base

- **typedef void (*esp_event_handler_t)(void *event_handler_arg, esp_event_base_t event_base, int32_t event_id, void *event_data)**
  
  function called when an event is posted to the queue

- **typedef void (*esp_event_handler_instance_t)**
  
  context identifying an instance of a registered event handler

**2.9.11  FreeRTOS Overview**
Overview

FreeRTOS is an open source RTOS (real-time operating system) kernel that is integrated into ESP-IDF as a component. Thus, all ESP-IDF applications and many ESP-IDF components are written based on FreeRTOS. The FreeRTOS kernel is ported to all architectures (i.e., Xtensa and RISC-V) available of ESP chips.

Furthermore, ESP-IDF provides different implementations of FreeRTOS in order to support SMP (Symmetric Multiprocessing) on multi-core ESP chips. This document provides an overview of the FreeRTOS component, the different FreeRTOS implementations offered by ESP-IDF, and the common aspects across all implementations.

Implementations

The official FreeRTOS (henceforth referred to as Vanilla FreeRTOS) is a single-core RTOS. In order to support the various multi-core ESP targets, ESP-IDF supports different FreeRTOS implementations as listed below:

**ESP-IDF FreeRTOS** ESP-IDF FreeRTOS is a FreeRTOS implementation based on Vanilla FreeRTOS v10.5.1, but contains significant modifications to support SMP. ESP-IDF FreeRTOS only supports two cores at most (i.e., dual core SMP), but is more optimized for this scenario by design. For more details regarding ESP-IDF FreeRTOS and its modifications, please refer to the FreeRTOS (ESP-IDF) document.

**Note:** ESP-IDF FreeRTOS is currently the default FreeRTOS implementation for ESP-IDF.

**Amazon SMP FreeRTOS** Amazon SMP FreeRTOS is an SMP implementation of FreeRTOS that is officially supported by Amazon. Amazon SMP FreeRTOS is able to support N-cores (i.e., more than two cores). Amazon SMP FreeRTOS can be enabled via the CONFIG_FREERTOS_SMP option. For more details regarding Amazon SMP FreeRTOS, please refer to the official Amazon SMP FreeRTOS documentation.

**Warning:** The Amazon SMP FreeRTOS implementation (and its port in ESP-IDF) are currently in experimental/beta state. Therefore, significant behavioral changes and breaking API changes can occur.

Configuration

**Kernel Configuration** Vanilla FreeRTOS requires that ports and applications configure the kernel by adding various #define config... macro definitions to the FreeRTOSConfig.h header file. Vanilla FreeRTOS supports a list of kernel configuration options which allow various kernel behaviors and features to be enabled or disabled.

However, for all FreeRTOS ports in ESP-IDF, the FreeRTOSConfig.h header file is considered private and must not be modified by users. A large number of kernel configuration options in FreeRTOSConfig.h are hard-coded as they are either required/not supported by ESP-IDF. All kernel configuration options that are configurable by the user are exposed via menuconfig under Component Config/FreeRTOS/Kernel.

For the full list of user configurable kernel options, see Project Configuration. The list below highlights some commonly used kernel configuration options:

- **CONFIG_FREERTOS_UNICORE** runs FreeRTOS only on CPU0. Note that this is not equivalent to running Vanilla FreeRTOS. Furthermore, this option may affect behavior of components other than freertos. For more details regarding the effects of running FreeRTOS on a single core, refer to ESP-IDF FreeRTOS Single Core (if using ESP-IDF FreeRTOS) or the official Amazon SMP FreeRTOS documentation.Alternatively, users can also search for occurrences of CONFIG_FREERTOS_UNICORE in the ESP-IDF components.

**Note:** As ESP32-S2 is a single core SoC, the CONFIG_FREERTOS_UNICORE configuration is always set.
Chapter 2. API Reference

- `CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY` enables backward compatibility with some FreeRTOS macros/types/functions that were deprecated from v8.0 onwards.

**Port Configuration** All other FreeRTOS related configuration options that are not part of the kernel configuration are exposed via menuconfig under Component Config/FreeRTOS/Port. These options configure aspects such as:

- The FreeRTOS ports themselves (e.g., tick timer selection, ISR stack size)
- Additional features added to the FreeRTOS implementation or ports

**Using FreeRTOS**

**Application Entry Point** Unlike Vanilla FreeRTOS, users of FreeRTOS in ESP-IDF must never call `vTaskStartScheduler()` and `vTaskEndScheduler()`. Instead, ESP-IDF starts FreeRTOS automatically. Users must define a `void app_main(void)` function which acts as the entry point for user’s application and is automatically invoked on ESP-IDF startup.

- Typically, users would spawn the rest of their application’s task from `app_main`
- The `app_main` function is allowed to return at any point (i.e., before the application terminates).
- The `app_main` function is called from the main task.

**Background Tasks** During startup, ESP-IDF and the FreeRTOS kernel automatically create multiple tasks that run in the background (listed in the the table below).

### Table 10: List of Tasks Created During Startup

<table>
<thead>
<tr>
<th>Task Name</th>
<th>Description</th>
<th>Stack Min</th>
<th>Priority</th>
</tr>
</thead>
<tbody>
<tr>
<td>Idle Tasks (IDLEX)</td>
<td>An idle task (IDLEX) is created for (and pinned to) each CPU core, where x is the CPU core’s number. The x is dropped when single-core configuration is enabled.</td>
<td>CONFIG_FREERTOS_IDLE_TASK_STACKSIZE Core x</td>
<td>0</td>
</tr>
<tr>
<td>FreeRTOS Timer Task (Tmr Svc)</td>
<td>FreeRTOS will create the Timer Service/Daemon Task if any FreeRTOS Timer APIs are called by the application</td>
<td>CONFIG_FREERTOS_TIMER_TASK_STACK_SIZE Core x</td>
<td>0</td>
</tr>
<tr>
<td>Main Task (main)</td>
<td>Task that simply calls <code>app_main</code>. This task will self delete when <code>app_main</code> returns</td>
<td>CONFIG_ESP_MAIN_TASK_STACK_SIZE CONFIG_ESP_MAIN_TASK_AFFINITY</td>
<td>1</td>
</tr>
<tr>
<td>IPC Tasks (ipcx)</td>
<td>When <code>CONFIG_FREERTOS_UNICORE</code> is false, an IPC task (ipcx) is created for (and pinned to) each CPU core. IPC tasks are used to implement the Inter-processor Call (IPC) feature</td>
<td>CONFIG_ESP_IPC_TASK_STACK_SIZE Core x</td>
<td>24</td>
</tr>
<tr>
<td>ESP Timer Task (esp_timer)</td>
<td>ESP-IDF creates the ESP Timer Task used to process ESP Timer callbacks</td>
<td>CONFIG_ESP_TIMER_TASK_STACK_SIZE Core x</td>
<td>22</td>
</tr>
</tbody>
</table>

**Note:** Note that if an application uses other ESP-IDF features (e.g., Wi-Fi or Bluetooth), those features may create their own background tasks in addition to the tasks listed in the table above.
Chapter 2. API Reference

FreeRTOS Additions

ESP-IDF provides some supplemental features to FreeRTOS such as Ring Buffers, ESP-IDF style Tick and Idle Hooks, and TLSP deletion callbacks. See FreeRTOS (Supplemental Features) for more details.

FreeRTOS Heap

Vanilla FreeRTOS provides its own selection of heap implementations. However, ESP-IDF already implements its own heap (see Heap Memory Allocation), thus ESP-IDF does not make use of the heap implementations provided by Vanilla FreeRTOS. All FreeRTOS ports in ESP-IDF map FreeRTOS memory allocation or free calls (e.g., pvPortMalloc() and pvPortFree()) to ESP-IDF heap API (i.e., heap_caps_malloc() and heap_caps_free()). However, the FreeRTOS ports ensure that all dynamic memory allocated by FreeRTOS is placed in internal memory.

Note: If users wish to place FreeRTOS tasks/objects in external memory, users can use the following methods:

- Allocate the task or object using one of the ...CreateWithCaps() API, such as xTaskCreateWithCaps() and xQueueCreateWithCaps() (see IDF Additional API for more details).
- Manually allocate external memory for those objects using heap_caps_malloc(), then create the objects from the allocated memory using on of the ...CreateStatic() FreeRTOS functions.

2.9.12 FreeRTOS (ESP-IDF)

Overview

The original FreeRTOS (hereinafter referred to as Vanilla FreeRTOS) is a compact and efficient real-time operating system supported on many single-core MCUs and SoCs. However, to support numerous dual-core ESP targets, such as ESP32, ESP32-S3, and ESP32-P4, ESP-IDF provides an implementation of FreeRTOS with dual-core symmetric multiprocessing (SMP) capabilities (hereinafter referred to as ESP-IDF FreeRTOS).

ESP-IDF FreeRTOS is based on Vanilla FreeRTOS v10.5.1 but contains significant modifications to both API and kernel behavior in order to support dual-core SMP. This document describes the API and behavioral differences between Vanilla FreeRTOS and ESP-IDF FreeRTOS.

Note: This document assumes that the reader has a requisite understanding of Vanilla FreeRTOS, i.e., its features, behavior, and API usage. Refer to the Vanilla FreeRTOS documentation for more details.

Note: ESP-IDF FreeRTOS can be built for a single core by enabling the CONFIG_FREERTOS_UNICORE configuration option. ESP targets that are single core always have the CONFIG_FREERTOS_UNICORE option enabled. However, note that building with CONFIG_FREERTOS_UNICORE enabled does not equate to building with Vanilla FreeRTOS, as some of the behavioral and API changes of ESP-IDF are still present. For more details, see ESP-IDF FreeRTOS Single Core.

This document is split into the following parts.

Contents

- FreeRTOS (ESP-IDF)
  - Overview
Symmetric Multiprocessing

Basic Concepts Symmetric multiprocessing is a computing architecture where two or more identical CPUs (cores) are connected to a single shared main memory and controlled by a single operating system. In general, an SMP system:

• has multiple cores running independently. Each core has its own register file, interrupts, and interrupt handling.
• presents an identical view of memory to each core. Thus, a piece of code that accesses a particular memory address has the same effect regardless of which core it runs on.

The main advantages of an SMP system compared to single-core or asymmetric multiprocessing systems are that:

• the presence of multiple CPUs allows for multiple hardware threads, thus increasing overall processing throughput.
• having symmetric memory means that threads can switch cores during execution. This, in general, can lead to better CPU utilization.

Although an SMP system allows threads to switch cores, there are scenarios where a thread must or should only run on a particular core. Therefore, threads in an SMP system also have a core affinity that specifies which particular core the thread is allowed to run on.

• A thread that is pinned to a particular core is only able to run on that core.
• A thread that is unpinned will be allowed to switch between cores during execution instead of being pinned to a particular core.

SMP on an ESP Target ESP targets such as ESP32, ESP32-S3, and ESP32-P4 are dual-core SMP SoCs. These targets have the following hardware features that make them SMP-capable:

• Two identical cores are known as CPU0 and CPU1. This means that the execution of a piece of code is identical regardless of which core it runs on.
• Symmetric memory (with some small exceptions).
  • If multiple cores access the same memory address simultaneously, their access will be serialized by the memory bus.
  • True atomic access to the same memory address is achieved via an atomic compare-and-swap instruction provided by the ISA.
• Cross-core interrupts that allow one CPU to trigger an interrupt on another CPU. This allows cores to signal each other.

**Note:** CPU0 is also known as Protocol CPU or PRO_CPU and CPU1 is also known as Application CPU or APP_CPU. The PRO_CPU and APP_CPU aliases for CPU0 and CPU1 exist in ESP-IDF as they reflect how typical ESP-IDF applications utilize the two CPUs. Typically, the tasks responsible for handling wireless networking (e.g., Wi-Fi or Bluetooth) are pinned to CPU0, thus the name PRO_CPU; whereas the tasks handling the remainder of the application are pinned to CPU1, thus the name APP_CPU.

Tasks

Creation Vanilla FreeRTOS provides the following functions to create a task:

• `xTaskCreate()` creates a task. The task’s memory is dynamically allocated.
• `xTaskCreateStatic()` creates a task. The task’s memory is statically allocated, i.e., provided by the user.
However, in an SMP system, tasks need to be assigned a particular affinity. Therefore, ESP-IDF provides a PinnedToCore version of Vanilla FreeRTOS’s task creation functions:

- `xTaskCreatePinnedToCore()` creates a task with a particular core affinity. The task’s memory is dynamically allocated.
- `xTaskCreateStaticPinnedToCore()` creates a task with a particular core affinity. The task’s memory is statically allocated, i.e., provided by the user.

The PinnedToCore versions of the task creation function API differ from their vanilla counterparts by having an extra `xCoreID` parameter that is used to specify the created task’s core affinity. The valid values for core affinity are:

- 0, which pins the created task to CPU0
- 1, which pins the created task to CPU1
- `tskNO_AFFINITY`, which allows the task to be run on both CPUs

Note that ESP-IDF FreeRTOS still supports the vanilla versions of the task creation functions. However, these standard functions have been modified to essentially invoke their respective PinnedToCore counterparts while setting the core affinity to `tskNO_AFFINITY`.

---

**Note:** ESP-IDF FreeRTOS also changes the units of `ulStackDepth` in the task creation functions. Task stack sizes in Vanilla FreeRTOS are specified in a number of words, whereas in ESP-IDF FreeRTOS, the task stack sizes are specified in bytes.

---

**Execution**

The anatomy of a task in ESP-IDF FreeRTOS is the same as in Vanilla FreeRTOS. More specifically, ESP-IDF FreeRTOS tasks:

- Can only be in one of the following states: Running, Ready, Blocked, or Suspended.
- Task functions are typically implemented as an infinite loop.
- Task functions should never return.

**Deletion**

Task deletion in Vanilla FreeRTOS is called via `vTaskDelete()`. The function allows deletion of another task or the currently running task if the provided task handle is `NULL`. The actual freeing of the task’s memory is sometimes delegated to the idle task if the task being deleted is the currently running task.

ESP-IDF FreeRTOS provides the same `vTaskDelete()` function. However, due to the dual-core nature, there are some behavioral differences when calling `vTaskDelete()` in ESP-IDF FreeRTOS:

- When deleting a task that is currently running on the other core, a yield is triggered on the other core, and the task’s memory is freed by one of the idle tasks.
- A deleted task’s memory is freed immediately if it is not running on either core.

Please avoid deleting a task that is running on another core as it is difficult to determine what the task is performing, which may lead to unpredictable behavior such as:

- Deleting a task that is holding a mutex.
- Deleting a task that has yet to free memory it previously allocated.

Where possible, please design your own application so that when calling `vTaskDelete()`, the deleted task is in a known state. For example:

- Tasks self-deleting via `vTaskDelete(NULL)` when their execution is complete and have also cleaned up all resources used within the task.
- Tasks placing themselves in the suspend state via `vTaskSuspend()` before being deleted by another task.

**SMP Scheduler**

The Vanilla FreeRTOS scheduler is best described as a **fixed priority preemptive scheduler with time slicing** meaning that:
• Each task is given a constant priority upon creation. The scheduler executes the highest priority ready-state task.
• The scheduler can switch execution to another task without the cooperation of the currently running task.
• The scheduler periodically switches execution between ready-state tasks of the same priority in a round-robin fashion. Time slicing is governed by a tick interrupt.

The ESP-IDF FreeRTOS scheduler supports the same scheduling features, i.e., Fixed Priority, Preemption, and Time Slicing, albeit with some small behavioral differences.

**Fixed Priority** In Vanilla FreeRTOS, when the scheduler selects a new task to run, it always selects the current highest priority ready-state task. In ESP-IDF FreeRTOS, each core independently schedules tasks to run. When a particular core selects a task, the core will select the highest priority ready-state task that can be run by the core. A task can be run by the core if:

• The task has a compatible affinity, i.e., is either pinned to that core or is unpinned.
• The task is not currently being run by another core.

However, please do not assume that the two highest priority ready-state tasks are always run by the scheduler, as a task’s core affinity must also be accounted for. For example, given the following tasks:

• Task A of priority 10 pinned to CPU0
• Task B of priority 9 pinned to CPU0
• Task C of priority 8 pinned to CPU1

The resulting schedule will have Task A running on CPU0 and Task C running on CPU1. Task B is not run even though it is the second-highest priority task.

**Preemption** In Vanilla FreeRTOS, the scheduler can preempt the currently running task if a higher priority task becomes ready to execute. Likewise in ESP-IDF FreeRTOS, each core can be individually preempted by the scheduler if the scheduler determines that a higher-priority task can run on that core.

However, there are some instances where a higher-priority task that becomes ready can be run on multiple cores. In this case, the scheduler only preempts one core. The scheduler always gives preference to the current core when multiple cores can be preempted. In other words, if the higher priority ready task is unpinned and has a higher priority than the current priority of both cores, the scheduler will always choose to preempt the current core. For example, given the following tasks:

• Task A of priority 8 currently running on CPU0
• Task B of priority 9 currently running on CPU1
• Task C of priority 10 that is unpinned and was unblocked by Task B

The resulting schedule will have Task A running on CPU0 and Task C preempting Task B given that the scheduler always gives preference to the current core.

**Time Slicing** The Vanilla FreeRTOS scheduler implements time slicing, which means that if the current highest ready priority contains multiple ready tasks, the scheduler will switch between those tasks periodically in a round-robin fashion.

However, in ESP-IDF FreeRTOS, it is not possible to implement perfect Round Robin time slicing due to the fact that a particular task may not be able to run on a particular core due to the following reasons:

• The task is pinned to another core.
• For unpinned tasks, the task is already being run by another core.

Therefore, when a core searches the ready-state task list for a task to run, the core may need to skip over a few tasks in the same priority list or drop to a lower priority in order to find a ready-state task that the core can run.

The ESP-IDF FreeRTOS scheduler implements a Best Effort Round Robin time slicing for ready-state tasks of the same priority by ensuring that tasks that have been selected to run are placed at the back of the list, thus giving unselected tasks a higher priority on the next scheduling iteration (i.e., the next tick interrupt or yield).

The following example demonstrates the Best Effort Round Robin time slicing in action. Assume that:
- There are four ready-state tasks of the same priority AX, B0, C1, and D1 where:
  - The priority is the current highest priority with ready-state.
  - The first character represents the task’s name, i.e., A, B, C, D.
  - The second character represents the task’s core pinning, and X means unpinned.
- The task list is always searched from the head.

<table>
<thead>
<tr>
<th>Starting state. None of the ready-state tasks have been selected to run.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Head [ AX, B0, C1, D0 ] Tail</td>
</tr>
<tr>
<td>----------------------------------------------------------</td>
</tr>

</tr>
</tbody>
</table>

(continues on next page)
The implications to users regarding the Best Effort Round Robin time slicing:

- Users cannot expect multiple ready-state tasks of the same priority to run sequentially as is the case in Vanilla FreeRTOS. As demonstrated in the example above, a core may need to skip over tasks.
- However, given enough ticks, a task will eventually be given some processing time.
- If a core cannot find a task runnable at the highest ready-state priority, it will drop to a lower priority to search for tasks.
- To achieve ideal round-robin time slicing, users should ensure that all tasks of a particular priority are pinned to the same core.

**Tick Interrupts**  
Vanilla FreeRTOS requires that a periodic tick interrupt occurs. The tick interrupt is responsible for:

- Incrementing the scheduler’s tick count
- Unblocking any blocked tasks that have timed out
- Checking if time slicing is required, i.e., triggering a context switch
- Executing the application tick hook

In ESP-IDF FreeRTOS, each core receives a periodic interrupt and independently runs the tick interrupt. The tick interrupts on each core are of the same period but can be out of phase. However, the tick responsibilities listed above are not run by all cores:

- CPU0 executes all of the tick interrupt responsibilities listed above
- CPU1 only checks for time slicing and executes the application tick hook

**Note:** CPU0 is solely responsible for keeping time in ESP-IDF FreeRTOS. Therefore, anything that prevents CPU0 from incrementing the tick count, such as suspending the scheduler on CPU0, will cause the entire scheduler’s timekeeping to lag behind.

**Idle Tasks**  
Vanilla FreeRTOS will implicitly create an idle task of priority 0 when the scheduler is started. The idle task runs when no other task is ready to run, and it has the following responsibilities:

- Freeing the memory of deleted tasks
- Executing the application idle hook

In ESP-IDF FreeRTOS, a separate pinned idle task is created for each core. The idle tasks on each core have the same responsibilities as their vanilla counterparts.

**Scheduler Suspension**  
Vanilla FreeRTOS allows the scheduler to be suspended/resumed by calling `vTaskSuspendAll()` and `xTaskResumeAll()` respectively. While the scheduler is suspended:

- Task switching is disabled but interrupts are left enabled.
- Calling any blocking/yielding function is forbidden, and time slicing is disabled.
- The tick count is frozen, but the tick interrupt still occurs to execute the application tick hook.

On scheduler resumption, `xTaskResumeAll()` catches up all of the lost ticks and unblock any timed-out tasks.

In ESP-IDF FreeRTOS, suspending the scheduler across multiple cores is not possible. Therefore when `vTaskSuspendAll()` is called on a particular core (e.g., core A):

- Task switching is disabled only on core A but interrupts for core A are left enabled.
- Calling any blocking/yielding function on core A is forbidden. Time slicing is disabled on core A.
- If an interrupt on core A unblocks any tasks, tasks with affinity to core A will go into core A’s own pending ready task list. Unpinned tasks or tasks with affinity to other cores can be scheduled on cores with the scheduler running.
• If the scheduler is suspended on all cores, tasks unblocked by an interrupt will be directed to the pending ready task lists of their pinned cores. For unpinned tasks, they will be placed in the pending ready list of the core where the interrupt occurred.
• If core A is CPU0, the tick count is frozen, and a pended tick count is incremented instead. However, the tick interrupt will still occur in order to execute the application tick hook.

When `xTaskResumeAll()` is called on a particular core (e.g., core A):

• Any tasks added to core A’s pending ready task list will be resumed.
• If core A is CPU0, the pended tick count is unwound to catch up with the lost ticks.

**Warning:** Given that scheduler suspension on ESP-IDF FreeRTOS only suspends scheduling on a particular core, scheduler suspension is **NOT** a valid method ensuring mutual exclusion between tasks when accessing shared data. Users should use proper locking primitives such as mutexes or spinlocks if they require mutual exclusion.

### Disabling Interrupts

Vanilla FreeRTOS allows interrupts to be disabled and enabled by calling `taskDISABLE_INTERRUPTS` and `taskENABLE_INTERRUPTS` respectively.

ESP-IDF FreeRTOS provides the same API, however, interrupts are only disabled or enabled on the current core.

**Warning:** Disabling interrupts is a valid method of achieving mutual exclusion in Vanilla FreeRTOS (and single-core systems in general). However, in an SMP system, disabling interrupts is **NOT** a valid method ensuring mutual exclusion. Refer to Critical Sections for more details.

### Critical Sections

#### API Changes

Vanilla FreeRTOS implements critical sections by disabling interrupts, which prevents preemptive context switches and the servicing of ISRs during a critical section. Thus a task/ISR that enters a critical section is guaranteed to be the sole entity to access a shared resource. Critical sections in Vanilla FreeRTOS have the following API:

- `taskENTER_CRITICAL()` enters a critical section by disabling interrupts
- `taskEXIT_CRITICAL()` exits a critical section by reenabling interrupts
- `taskENTER_CRITICAL_FROM_ISR()` enters a critical section from an ISR by disabling interrupt nesting
- `taskEXIT_CRITICAL_FROM_ISR()` exits a critical section from an ISR by reenabling interrupt nesting

However, in an SMP system, merely disabling interrupts does not constitute a critical section as the presence of other cores means that a shared resource can still be concurrently accessed. Therefore, critical sections in ESP-IDF FreeRTOS are implemented using spinlocks. To accommodate the spinlocks, the ESP-IDF FreeRTOS critical section APIs contain an additional spinlock parameter as shown below:

- Spinlocks are of `portMUX_TYPE` (**not to be confused to FreeRTOS mutexes**)
- `taskENTER_CRITICAL(&spinlock)` enters a critical section from a task context
- `taskEXIT_CRITICAL(&spinlock)` exits a critical section from a task context
- `taskENTER_CRITICAL_ISR(&spinlock)` enters a critical section from an interrupt context
- `taskEXIT_CRITICAL_ISR(&spinlock)` exits a critical section from an interrupt context

**Note:** The critical section API can be called recursively, i.e., nested critical sections. Entering a critical section multiple times recursively is valid so long as the critical section is exited the same number of times it was entered. However, given that critical sections can target different spinlocks, users should take care to avoid deadlocking when entering critical sections recursively.

Spinlocks can be allocated statically or dynamically. As such, macros are provided for both static and dynamic initialization of spinlocks, as demonstrated by the following code snippets.

- Allocating a static spinlock and initializing it using `portMUX_INITIALIZER_UNLOCKED:`
Chapter 2. API Reference

// Statically allocate and initialize the spinlock
static portMUX_TYPE my_spinlock = portMUX_INITIALIZER_UNLOCKED;

void some_function(void)
{
    taskENTER_CRITICAL(&my_spinlock);
    // We are now in a critical section
    taskEXIT_CRITICAL(&my_spinlock);
}

• Allocating a dynamic spinlock and initializing it using portMUX_INITIALIZE():

    // Allocate the spinlock dynamically
    portMUX_TYPE *my_spinlock = malloc(sizeof(portMUX_TYPE));
    // Initialize the spinlock dynamically
    portMUX_INITIALIZE(my_spinlock);

    ...

    taskENTER_CRITICAL(my_spinlock);
    // Access the resource
    taskEXIT_CRITICAL(my_spinlock);

Implementation In ESP-IDF FreeRTOS, the process of a particular core entering and exiting a critical section is as follows:

• For taskENTER_CRITICAL(&spinlock) or taskENTER_CRITICAL_ISR(&spinlock)
  1. The core disables its interrupts or interrupt nesting up to config-MAX_SYSCALL_INTERRUPT_PRIORITY.
  2. The core then spins on the spinlock using an atomic compare-and-set instruction until it acquires the lock.
     A lock is acquired when the core is able to set the lock’s owner value to the core’s ID.
  3. Once the spinlock is acquired, the function returns. The remainder of the critical section runs with interrupts or interrupt nesting disabled.
• For taskEXIT_CRITICAL(&spinlock) or taskEXIT_CRITICAL_ISR(&spinlock)
  1. The core releases the spinlock by clearing the spinlock’s owner value.
  2. The core re-enables interrupts or interrupt nesting.

Restrictions and Considerations Given that interrupts (or interrupt nesting) are disabled during a critical section, there are multiple restrictions regarding what can be done within critical sections. During a critical section, users should keep the following restrictions and considerations in mind:

• Critical sections should be kept as short as possible
  – The longer the critical section lasts, the longer a pending interrupt can be delayed.
  – A typical critical section should only access a few data structures and/or hardware registers.
  – If possible, defer as much processing and/or event handling to the outside of critical sections.
• FreeRTOS API should not be called from within a critical section
• Users should never call any blocking or yielding functions within a critical section

Misc

ESP-IDF FreeRTOS Single Core Although ESP-IDF FreeRTOS is an SMP scheduler, some ESP targets are single-core (such as ESP32-S2 and ESP32-C3). When building ESP-IDF applications for these targets, ESP-IDF FreeRTOS is still used but the number of cores will be set to 1 (i.e., the CONFIG_FREERTOS_UNICORE will always be enabled for single-core targets).

For multicore targets (such as ESP32 and ESP32-S3), CONFIG_FREERTOS_UNICORE can also be set. This results in ESP-IDF FreeRTOS only running on CPU0, and all other cores will be inactive.
Note: Users should bear in mind that enabling `CONFIG_FREERTOS_UNICORE` is NOT equivalent to running Vanilla FreeRTOS. The additional APIs of ESP-IDF FreeRTOS can still be called, and the behavior changes of ESP-IDF FreeRTOS incur a small amount of overhead even when compiled for only a single core.

API Reference

This section introduces FreeRTOS types, functions, and macros. It is automatically generated from FreeRTOS header files.

Task API

Header File

- `components/freertos/FreRTOS-Kernel/include/freertos/task.h`

This header file can be included with:

```c
#include "freertos/task.h"
```

Functions

```c
static inline BaseType_t xTaskCreate(
    TaskFunction_t pxTaskCode, const char *const pcName, const configSTACK_DEPTH_TYPE usStackDepth, void *const pvParameters, UBaseType_t uxPriority, TaskHandle_t *const pxCreatedTask)
```

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task’s data structures. The second block is used by the task as its stack. If a task is created using `xTaskCreate()` then both blocks of memory are automatically dynamically allocated inside the `xTaskCreate()` function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a task is created using `xTaskCreateStatic()` then the application writer must provide the required memory. `xTaskCreateStatic()` therefore allows a task to be created without using any dynamic memory allocation.

See `xTaskCreateStatic()` for a version that does not use any dynamic memory allocation.

`xTaskCreate()` can only be used to create a task that has unrestricted access to the entire microcontroller memory map. Systems that include MPU support can alternatively create an MPU constrained task using `xTaskCreateRestricted()`.

Example usage:

```c
// Task to be created.
void vTaskCode( void * pvParameters )
{
    for( ;; )
        // Task code goes here.
}

// Function that creates a task.
void vOtherFunction( void )
{
    static uint8_t ucParameterToPass;
    TaskHandle_t xHandle = NULL;
}
```

(continues on next page)
// Create the task, storing the handle. Note that the passed parameter.ucParameterToPass
// must exist for the lifetime of the task, so in this case is declared.static. If it was just an
// an automatic stack variable it might no longer exist, or at least have been corrupted, by the time
// the new task attempts to access it.
xTaskCreate( vTaskCode, "NAME", STACK_SIZE, &ucParameterToPass, tskIDLE_
-- PRIORITY, &xHandle );
configASSERT( xHandle );

// Use the handle to delete the task.
if( xHandle != NULL )
{
    vTaskDelete( xHandle );
}
}

Note: If configNUMBER_OF_CORES > 1, this function will create an unpinned task (see tskNO_AFFINITY for more details).

Note: If program uses thread local variables (ones specified with "__thread" keyword) then storage for them will be allocated on the task’s stack.

Parameters
• pxTaskCode – Pointer to the task entry function. Tasks must be implemented to never
  return (i.e. continuous loop).
• pcName – A descriptive name for the task. This is mainly used to facilitate debugging.
  Max length defined by configMAX_TASK_NAME_LEN - default is 16.
• usStackDepth – The size of the task stack specified as the NUMBER OF BYTES. Note that this differs from vanilla FreeRTOS.
• pvParameters – Pointer that will be used as the parameter for the task being created.
• uxPriority – The priority at which the task should run. Systems that include MPU
  support can optionally create tasks in a privileged (system) mode by setting bit portPRIV-
  ILEGEBIT of the priority parameter. For example, to create a privileged task at priority
  2 the uxPriority parameter should be set to ( 2 | portPRIVILEGE_BIT ).
• pxCreatedTask – Used to pass back a handle by which the created task can be refer-
  enced.

Returns pdPASS if the task was successfully created and added to a ready list, otherwise an error
code defined in the file projdefs.h

static inline TaskHandle_t xTaskCreateStatic(TaskFunction_t pxTaskCode, const char *const pcName,
 const uint32_t ulStackDepth, void *const pvParameters,
 UBaseType_t uxPriority, StackType_t *const pxuStackBuffer, StaticTask_t *const pxTaskBuffer)

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to
hold the task’s data structures. The second block is used by the task as its stack. If a task is created using
xTaskCreate() then both blocks of memory are automatically dynamically allocated inside the xTaskCreate() function. (see https://www.FreeRTOS.org/a00111.html). If a task is created using xTaskCreateStatic() then
the application writer must provide the required memory. xTaskCreateStatic() therefore allows a task to be
created without using any dynamic memory allocation.
Example usage:

```c
// Dimensions of the buffer that the task being created will use as its stack.
// NOTE: This is the number of words the stack will hold, not the number of bytes. For example, if each stack item is 32-bits, and this is set to 100,
// then 400 bytes (100 * 32-bits) will be allocated.
#define STACK_SIZE 200

// Structure that will hold the TCB of the task being created.
StaticTask_t xTaskBuffer;

// Buffer that the task being created will use as its stack. Note this is an array of StackType_t variables. The size of StackType_t is dependent on the RTOS port.
StackType_t xStack[STACK_SIZE];

// Function that implements the task being created.
void vTaskCode(void * pvParameters)
{
    // The parameter value is expected to be 1 as 1 is passed in the pvParameters value in the call to xTaskCreateStatic().
    configASSERT((uint32_t)pvParameters == 1UL);

    for(;;)
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction()
{
    TaskHandle_t xHandle = NULL;

    // Create the task without using any dynamic memory allocation.
    xHandle = xTaskCreateStatic(
        vTaskCode,   // Function that implements the task.
        "NAME",      // Text name for the task.
        STACK_SIZE,  // Stack size in words, not bytes.
        (void *) 1,  // Parameter passed into the task.
        tskIDLE_PRIORITY, // Priority at which the task is created.
        &xTaskBuffer ); // Variable to hold the task's data.

    // puxStackBuffer and pxTaskBuffer were not NULL, so the task will have been created, and xHandle will be the task's handle. Use the handle to suspend the task.
    vTaskSuspend( xHandle );
}
```

**Note:** If `configNUMBER_OF_CORES > 1`, this function will create an unpinned task (see `tskNO_AFFINITY` for more details).

**Note:** If program uses thread local variables (ones specified with "__thread" keyword) then storage for them will be allocated on the task’s stack.
Parameters

- **pxTaskCode** - Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop).
- **pcName** - A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX_TASK_NAME_LEN in FreeRTOSConfig.h.
- **ulStackDepth** - The size of the task stack specified as the NUMBER OF BYTES. Note that this differs from vanilla FreeRTOS.
- **pvParameters** - Pointer that will be used as the parameter for the task being created.
- **uxPriority** - The priority at which the task will run.
- **puxStackBuffer** - Must point to a StackType_t array that has at least ulStackDepth indexes - the array will then be used as the task’s stack, removing the need for the stack to be allocated dynamically.
- **pxTaskBuffer** - Must point to a variable of type StaticTask_t, which will then be used to hold the task’s data structures, removing the need for the memory to be allocated dynamically.

Returns If neither puxStackBuffer nor pxTaskBuffer are NULL, then the task will be created and a handle to the created task is returned. If either puxStackBuffer or pxTaskBuffer are NULL then the task will not be created and NULL is returned.

```c
void vTaskAllocateMPURegions (TaskHandle_t xTask, const MemoryRegion_t *const pxRegions)
```

Memory regions are assigned to a restricted task when the task is created by a call to xTaskCreateRestricted(). These regions can be redefined using vTaskAllocateMPURegions().

Example usage:

```c
// Define an array of MemoryRegion_t structures that configures an MPU region
// allowing read/write access for 1024 bytes starting at the beginning of the
// ucOneKByte array. The other two of the maximum 3 definable regions are
// unused so set to zero.
static const MemoryRegion_t xAltRegions[portNUM_CONFIGURABLE_REGIONS] = {
    // Base address  Length  Parameters
    { ucOneKByte, 1024, portMPU_REGION_READ_WRITE },
    { 0, 0, 0 },
    { 0, 0, 0 }
};

void vATask( void *pvParameters )
{
    // This task was created such that it has access to certain regions of
    // memory as defined by the MPU configuration. At some point it is
    // desired that these MPU regions are replaced with that defined in the
    // xAltRegions const struct above. Use a call to vTaskAllocateMPURegions()
    // for this purpose. NULL is used as the task handle to indicate that this
    // function should modify the MPU regions of the calling task.
    vTaskAllocateMPURegions( NULL, xAltRegions );

    // Now the task can continue its function, but from this point on can only
    // access its stack and the ucOneKByte array (unless any other statically
    // defined or shared regions have been declared elsewhere).
}
```

Parameters

- **xTask** - The handle of the task being updated.
- **pxRegions** - A pointer to a MemoryRegion_t structure that contains the new memory region definitions.
**void vTaskDelete (TaskHandle_t xTaskToDelete)**

INCLUDEx_vTaskDelete must be defined as 1 for this function to be available. See the configuration section for more information.

Remove a task from the RTOS real time kernel’s management. The task being deleted will be removed from all ready, blocked, suspended and event lists.

NOTE: The idle task is responsible for freeing the kernel allocated memory from tasks that have been deleted. It is therefore important that the idle task is not starved of microcontroller processing time if your application makes any calls to vTaskDelete(). Memory allocated by the task code is not automatically freed, and should be freed before the task is deleted.

See the demo application file death.c for sample code that utilises vTaskDelete().

Example usage:

```c
void vOtherFunction() {
    TaskHandle_t xHandle;

    // Create the task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle );

    // Use the handle to delete the task.
    vTaskDelete( xHandle );
}
```

**Parameters xTaskToDelete** – The handle of the task to be deleted. Passing NULL will cause the calling task to be deleted.

**void vTaskDelay (const TickType_t xTicksToDelay)**

Delay a task for a given number of ticks. The actual time that the task remains blocked depends on the tick rate. The constant portTICK_PERIOD_MS can be used to calculate real time from the tick rate - with the resolution of one tick period.

INCLUDEx_vTaskDelay must be defined as 1 for this function to be available. See the configuration section for more information.

vTaskDelay() specifies a time at which the task wishes to unblock relative to the time at which vTaskDelay() is called. For example, specifying a block period of 100 ticks will cause the task to unblock 100 ticks after vTaskDelay() is called. vTaskDelay() does not therefore provide a good method of controlling the frequency of a periodic task as the path taken through the code, as well as other task and interrupt activity, will affect the frequency at which vTaskDelay() gets called and therefore the time at which the task next executes. See xTaskDelayUntil() for an alternative API function designed to facilitate fixed frequency execution. It does this by specifying an absolute time (rather than a relative time) at which the calling task should unblock.

Example usage:

```c
void vTaskFunction( void * pvParameters ) {
    // Block for 500ms.
    const TickType_t xDelay = 500 / portTICK_PERIOD_MS;

    for( ;; ) {
        // Simply toggle the LED every 500ms, blocking between each toggle.
        vToggleLED();
        vTaskDelay( xDelay );
    }
}
```
Parameters `xTicksToDelay`—The amount of time, in tick periods, that the calling task should block.

```c
BaseType_t xTaskDelayUntil (TickType_t *const pxPreviousWakeTime, const TickType_t xTimeIncrement)
```

INCLUDE_xTaskDelayUntil must be defined as 1 for this function to be available. See the configuration section for more information.

Delay a task until a specified time. This function can be used by periodic tasks to ensure a constant execution frequency.

This function differs from `vTaskDelay()` in one important aspect: `vTaskDelay()` will cause a task to block for the specified number of ticks from the time `vTaskDelay()` is called. It is therefore difficult to use `vTaskDelay()` by itself to generate a fixed execution frequency as the time between a task starting to execute and that task calling `vTaskDelay()` may not be fixed [the task may take a different path though the code between calls, or may get interrupted or preempted a different number of times each time it executes].

Whereas `vTaskDelay()` specifies a wake time relative to the time at which the function is called, `xTaskDelayUntil()` specifies the absolute (exact) time at which it wishes to unblock.

The macro `pdMS_TO_TICKS()` can be used to calculate the number of ticks from a time specified in milliseconds with a resolution of one tick period.

Example usage:

```c
// Perform an action every 10 ticks.
void vTaskFunction( void * pvParameters )
{
    TickType_t xLastWakeTime;
    const TickType_t xFrequency = 10;
    BaseType_t xWasDelayed;

    // Initialise the xLastWakeTime variable with the current time.
    xLastWakeTime = xTaskGetTickCount ();
    for( ;; )
    {
        // Wait for the next cycle.
        xWasDelayed = xTaskDelayUntil( &xLastWakeTime, xFrequency );

        // Perform action here. xWasDelayed value can be used to determine
        // whether a deadline was missed if the code here took too long.
    }
}
```

Parameters

- `pxPreviousWakeTime`—Pointer to a variable that holds the time at which the task was last unblocked. The variable must be initialized with the current time prior to its first use (see the example below). Following this the variable is automatically updated within `xTaskDelayUntil()`.

- `xTimeIncrement`—The cycle time period. The task will be unblocked at time `*pxPreviousWakeTime + xTimeIncrement`. Calling `xTaskDelayUntil` with the same `xTimeIncrement` parameter value will cause the task to execute with a fixed interface period.

Returns Value which can be used to check whether the task was actually delayed. Will be `pdTRUE` if the task was delayed and `pdFALSE` otherwise. A task will not be delayed if the next expected wake time is in the past.
BaseType_t xTaskAbortDelay ( TaskHandle_t xTask )

INCLUDE_xTaskAbortDelay must be defined as 1 in FreeRTOSConfig.h for this function to be available.

A task will enter the Blocked state when it is waiting for an event. The event it is waiting for can be a temporal event (waiting for a time), such as when vTaskDelay() is called, or an event on an object, such as when xQueueReceive() or ulTaskNotifyTake() is called. If the handle of a task that is in the Blocked state is used in a call to xTaskAbortDelay() then the task will leave the Blocked state, and return from whichever function call placed the task into the Blocked state.

There is no ‘FromISR’ version of this function as an interrupt would need to know which object a task was blocked on in order to know which actions to take. For example, if the task was blocked on a queue the interrupt handler would then need to know if the queue was locked.

Parameters xTask - The handle of the task to remove from the Blocked state.

Returns If the task referenced by xTask was not in the Blocked state then pdFAIL is returned. Otherwise pdPASS is returned.

UBaseType_t uxTaskPriorityGet ( const TaskHandle_t xTask )

INCLUDE_uxTaskPriorityGet must be defined as 1 for this function to be available. See the configuration section for more information.

Obtain the priority of any task.

Example usage:

```c
void vAFunction ( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle );

    // ...

    // Use the handle to obtain the priority of the created task.
    // It was created with tskIDLE_PRIORITY, but may have changed // it itself.
    if ( uxTaskPriorityGet( xHandle ) != tskIDLE_PRIORITY )
    {
        // The task has changed it's priority.
    }

    // ...

    // Is our priority higher than the created task?
    if ( uxTaskPriorityGet( xHandle ) < uxTaskPriorityGet( NULL ) )
    {
        // Our priority (obtained using NULL handle) is higher.
    }
}
```

Parameters xTask - Handle of the task to be queried. Passing a NULL handle results in the priority of the calling task being returned.

Returns The priority of xTask.

UBaseType_t uxTaskPriorityGetFromISR ( const TaskHandle_t xTask )

A version of uxTaskPriorityGet() that can be used from an ISR.
Chapter 2. API Reference

**eTaskState eTaskGetState** *(TaskHandle_t xTask)*

INCLUDE_eTaskGetState must be defined as 1 for this function to be available. See the configuration section for more information.

Obtain the state of any task. States are encoded by the eTaskState enumerated type.

**Parameters**
- **xTask** - Handle of the task to be queried.

**Returns**
The state of xTask at the time the function was called. Note the state of the task might change between the function being called, and the functions return value being tested by the calling task.

**void vTaskGetInfo** *(TaskHandle_t xTask, TaskStatus_t *pxTaskStatus, BaseType_t xGetFreeStackSpace, eTaskState eState)*

cfgUSE_TRACE_FACILITY must be defined as 1 for this function to be available. See the configuration section for more information.

Populates a TaskStatus_t structure with information about a task.

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;
    TaskStatus_t xTaskDetails;

    // Obtain the handle of a task from its name.
    xHandle = xTaskGetHandle( "Task_Name" );

    // Check the handle is not NULL.
    configASSERT( xHandle );

    // Use the handle to obtain further information about the task.
    vTaskGetInfo( xHandle,
                  &xTaskDetails,
                  pdTRUE, // Include the high water mark in xTaskDetails.
                  eInvalid ); // Include the task state in xTaskDetails.
}
```

**Parameters**
- **xTask** - Handle of the task being queried. If xTask is NULL then information will be returned about the calling task.
- **pxTaskStatus** - A pointer to the TaskStatus_t structure that will be filled with information about the task referenced by the handle passed using the xTask parameter.
- **xGetFreeStackSpace** - The TaskStatus_t structure contains a member to report the stack high water mark of the task being queried. Calculating the stack high water mark takes a relatively long time, and can make the system temporarily unresponsive - so the xGetFreeStackSpace parameter is provided to allow the high water mark checking to be skipped. The high watermark value will only be written to the TaskStatus_t structure if xGetFreeStackSpace is not set to pdFALSE;
- **eState** - The TaskStatus_t structure contains a member to report the state of the task being queried. Obtaining the task state is not as fast as a simple assignment - so the eState parameter is provided to allow the state information to be omitted from the TaskStatus_t structure. To obtain state information then set eState to eInvalid - otherwise the value passed in eState will be reported as the task state in the TaskStatus_t structure.

**void vTaskPrioritySet** *(TaskHandle_t xTask, UBaseType_t uxNewPriority)*

INCLUDE_vTaskPrioritySet must be defined as 1 for this function to be available. See the configuration section for more information.

Set the priority of any task.
A context switch will occur before the function returns if the priority being set is higher than the currently executing task.

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle, ...);

    // ...

    // Use the handle to raise the priority of the created task.
    vTaskPrioritySet( xHandle, tskIDLE_PRIORITY + 1 );

    // ...

    // Use a NULL handle to raise our priority to the same value.
    vTaskPrioritySet( NULL, tskIDLE_PRIORITY + 1 );
}
```

**Parameters**

- `xTask` – Handle to the task for which the priority is being set. Passing a NULL handle results in the priority of the calling task being set.
- `uxNewPriority` – The priority to which the task will be set.

void **vTaskSuspend** (TaskHandle_t xTaskToSuspend)

INCLUDE_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.

Suspend any task. When suspended a task will never get any microcontroller processing time, no matter what its priority.

Calls to **vTaskSuspend** are not accumulative - i.e. calling **vTaskSuspend** () twice on the same task still only requires one call to **vTaskResume** () to ready the suspended task.

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle, ...);

    // ...

    // Use the handle to suspend the created task.
    vTaskSuspend( xHandle );

    // ...

    // The created task will not run during this period, unless // another task calls vTaskResume( xHandle ).
}
```
// Suspend ourselves.
vTaskSuspend( NULL );

// We cannot get here unless another task calls vTaskResume
// with our handle as the parameter.

Parameters xTaskToSuspend – Handle to the task being suspended. Passing a NULL handle will cause the calling task to be suspended.

void vTaskResume ( TaskHandle_t xTaskToResume )

INCLUDE_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.

Resumes a suspended task.

A task that has been suspended by one or more calls to vTaskSuspend () will be made available for running again by a single call to vTaskResume ()

Example usage:

void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle );

    // ...

    // Use the handle to suspend the created task.
    vTaskSuspend( xHandle );

    // ...

    // The created task will not run during this period, unless
    // another task calls vTaskResume( xHandle ).

    // ...

    // Resume the suspended task ourselves.
    vTaskResume( xHandle );

    // The created task will once again get microcontroller processing
    // time in accordance with its priority within the system.
}

Parameters xTaskToResume – Handle to the task being readied.

BaseType_t xTaskResumeFromISR ( TaskHandle_t xTaskToResume )

INCLUDE_xTaskResumeFromISR must be defined as 1 for this function to be available. See the configuration section for more information.

An implementation of vTaskResume() that can be called from within an ISR.
A task that has been suspended by one or more calls to vTaskSuspend() will be made available for running again by a single call to xTaskResumeFromISR().

xTaskResumeFromISR() should not be used to synchronise a task with an interrupt if there is a chance that the interrupt could arrive prior to the task being suspended - as this can lead to interrupts being missed. Use of a semaphore as a synchronisation mechanism would avoid this eventuality.

**Parameters**  
xTaskToResume – Handle to the task being readied.

**Returns**  
pdTRUE if resuming the task should result in a context switch, otherwise pdFALSE. This is used by the ISR to determine if a context switch may be required following the ISR.

```c
void vTaskSuspendAll (void)
```

Suspends the scheduler without disabling interrupts. Context switches will not occur while the scheduler is suspended.

After calling vTaskSuspendAll() the calling task will continue to execute without risk of being swapped out until a call to xTaskResumeAll() has been made.

API functions that have the potential to cause a context switch (for example, xTaskDelayUntil(), xQueueSend(), etc.) must not be called while the scheduler is suspended.

Example usage:

```c
void vTask1( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.
        // ...
        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // taskENTER_CRITICAL() / taskEXIT_CRITICAL() as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.
        // Prevent the real time kernel swapping out the task.
        vTaskSuspendAll();
        // Perform the operation here. There is no need to use critical
        // sections as we have all the microcontroller processing time.
        // During this time interrupts will still operate and the kernel
        // tick count will be maintained.
        // ...
        // The operation is complete. Restart the kernel.
        xTaskResumeAll();
    }
}
```

```c
BaseType_t xTaskResumeAll (void)
```

Resumes scheduler activity after it was suspended by a call to vTaskSuspendAll().

xTaskResumeAll() only resumes the scheduler. It does not unsuspend tasks that were previously suspended by a call to vTaskSuspend().

Example usage:

```c
void vTask1( void * pvParameters )
{
    // (continues on next page)
}
for(;;)
{
    // Task code goes here.
    
    // ...

    // At some point the task wants to perform a long operation during
    // which it does not want to get swapped out. It cannot use
    // taskENTER_CRITICAL() / taskEXIT_CRITICAL() as the length of the
    // operation may cause interrupts to be missed - including the
    // ticks.

    // Prevent the real time kernel swapping out the task.
    vTaskSuspendAll();

    // Perform the operation here. There is no need to use critical
    // sections as we have all the microcontroller processing time.
    // During this time interrupts will still operate and the real
    // time kernel tick count will be maintained.

    // ...

    // The operation is complete. Restart the kernel. We want to force
    // a context switch - but there is no point if resuming the scheduler
    // caused a context switch already.
    if(!xTaskResumeAll())
    {
        taskYIELD();
    }
}

Returns If resuming the scheduler caused a context switch then pdTRUE is returned, otherwise
pdFALSE is returned.

TickType_t xTaskGetTickCount (void)

Returns The count of ticks since vTaskStartScheduler was called.

TickType_t xTaskGetTickCountFromISR (void)

This is a version of xTaskGetTickCount() that is safe to be called from an ISR - provided that TickType_t is
the natural word size of the microcontroller being used or interrupt nesting is either not supported or not being
used.

Returns The count of ticks since vTaskStartScheduler was called.

UBaseType_t uxTaskGetNumberOfTasks (void)

Returns The number of tasks that the real time kernel is currently managing. This includes all
ready, blocked and suspended tasks. A task that has been deleted but not yet freed by the idle
task will also be included in the count.

char *pcTaskGetName (TaskHandle_t xTaskToQuery)

Returns The text (human readable) name of the task referenced by the handle xTaskToQuery. A
task can query its own name by either passing in its own handle, or by setting xTaskToQuery
to NULL.

TaskHandle_t xTaskGetHandle (const char *pcNameToQuery)

NOTE: This function takes a relatively long time to complete and should be used sparingly.
Returns The handle of the task that has the human readable name pcNameToQuery. NULL is returned if no matching name is found. INCLUDE_xTaskGetHandle must be set to 1 in FreeRTOSConfig.h for pcTaskGetHandle() to be available.

BaseType_t xTaskGetStaticBuffers (TaskHandle_t xTask, StackType_t **ppuxStackBuffer, StaticTask_t **ppxTaskBuffer)

Retrieve pointers to a statically created task’s data structure buffer and stack buffer. These are the same buffers that are supplied at the time of creation.

Parameters
- xTask – The task for which to retrieve the buffers.
- ppuxStackBuffer – Used to return a pointer to the task’s stack buffer.
- ppxTaskBuffer – Used to return a pointer to the task’s data structure buffer.

Returns pdTRUE if buffers were retrieved, pdFALSE otherwise.

UBaseType_t uxTaskGetStackHighWaterMark (TaskHandle_t xTask)

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there has been (in words, so on a 32 bit machine a value of 1 means 4 bytes) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their return type. Using configSTACK_DEPTH_TYPE allows the user to determine the return type. It gets around the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications that expect an 8-bit return type.

Parameters xTask – Handle of the task associated with the stack to be checked. Set xTask to NULL to check the stack of the calling task.

Returns The smallest amount of free stack space there has been (in words, so actual spaces on the stack rather than bytes) since the task referenced by xTask was created.

configSTACK_DEPTH_TYPE uxTaskGetStackHighWaterMark2 (TaskHandle_t xTask)

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there has been (in words, so on a 32 bit machine a value of 1 means 4 bytes) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their return type. Using configSTACK_DEPTH_TYPE allows the user to determine the return type. It gets around the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications that expect an 8-bit return type.

Parameters xTask – Handle of the task associated with the stack to be checked. Set xTask to NULL to check the stack of the calling task.

Returns The smallest amount of free stack space there has been (in words, so actual spaces on the stack rather than bytes) since the task referenced by xTask was created.

void vTaskSetApplicationTaskTag (TaskHandle_t xTask, TaskHookFunction_t pxHookFunction)

Sets pxHookFunction to be the task hook function used by the task xTask. Passing xTask as NULL has the effect of setting the calling tasks hook function.

TaskHookFunction_t xTaskGetApplicationTaskTag (TaskHandle_t xTask)

Returns the pxHookFunction value assigned to the task xTask. Do not call from an interrupt service routine - call xTaskGetApplicationTaskTagFromISR() instead.

TaskHookFunction_t xTaskGetApplicationTaskTagFromISR (TaskHandle_t xTask)

Returns the pxHookFunction value assigned to the task xTask. Can be called from an interrupt service routine.
Chapter 2. API Reference

```c
void vTaskSetThreadLocalStoragePointer(TaskHandle_t xTaskToSet, BaseType_t xIndex, void *pvValue)
```

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish. The following two functions are used to set and query a pointer respectively.

```c
void *pvTaskGetThreadLocalStoragePointer(TaskHandle_t xTaskToQuery, BaseType_t xIndex)
```

```c
void vApplicationGetIdleTaskMemory(StaticTask_t **ppxIdleTaskTCBBuffer, StackType_t **ppxIdleTaskStackBuffer, uint32_t *pulIdleTaskStackSize)
```

This function is used to provide a statically allocated block of memory to FreeRTOS to hold the Idle Task TCB. This function is required when configSUPPORT_STATIC_ALLOCATION is set. For more information see this URI: https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION

**Parameters**

- ppxIdleTaskTCBBuffer – A handle to a statically allocated TCB buffer
- ppxIdleTaskStackBuffer – A handle to a statically allocated Stack buffer for the idle task
- pulIdleTaskStackSize – A pointer to the number of elements that will fit in the allocated stack buffer

```c
BaseType_t xTaskCallApplicationTaskHook(TaskHandle_t xTask, void *pvParameter)
```

Calls the hook function associated with xTask. Passing xTask as NULL has the effect of calling the Running tasks (the calling task) hook function.

pvParameter is passed to the hook function for the task to interpret as it wants. The return value is the value returned by the task hook function registered by the user.

```c
TaskHandle_t xTaskGetIdleTaskHandle(void)
```

xTaskGetIdleTaskHandle() is only available if INCLUDE_xTaskGetIdleTaskHandle is set to 1 in FreeRTOSConfig.h.

Simply returns the handle of the idle task of the current core. It is not valid to call xTaskGetIdleTaskHandle() before the scheduler has been started.

```c
UBaseType_t uxTaskGetSystemState(TaskStatus_t *pxTaskStatusArray, const UBaseType_t uxArraySize, configRUN_TIME_COUNTER_TYPE *const pulTotalRunTime)
```

configUSE_TRACE_FACILITY must be defined as 1 in FreeRTOSConfig.h for uxTaskGetSystemState() to be available.

uxTaskGetSystemState() populates a TaskStatus_t structure for each task in the system. TaskStatus_t structures contain, among other things, members for the task handle, task name, task priority, task state, and total amount of run time consumed by the task. See the TaskStatus_t structure definition in this file for the full member list.

**NOTE:** This function is intended for debugging use only as its use results in the scheduler remaining suspended for an extended period.

Example usage:

```c
// This example demonstrates how a human readable table of run time stats // information is generated from raw data provided by uxTaskGetSystemState(). // The human readable table is written to pcWriteBuffer
void vTaskGetRunTimeStats(char *pcWriteBuffer)
{
    TaskStatus_t *pxTaskStatusArray;
    volatile UBaseType_t uxArraySize, x;
    configRUN_TIME_COUNTER_TYPE ulTotalRunTime, ulStatsAsPercentage;

    // (continues on next page)
```
// Make sure the write buffer does not contain a string.
pCWriteBuffer = 0x00;

// Take a snapshot of the number of tasks in case it changes while this
// function is executing.
uxArraySize = uxTaskGetNumberOfTasks();

// Allocate a TaskStatus_t structure for each task. An array could be
// allocated statically at compile time.
pxTaskStatusArray = pvPortMalloc( uxArraySize * sizeof( TaskStatus_t ) );

if( pxTaskStatusArray != NULL )
{
    // Generate raw status information about each task.
    uxArraySize = uxTaskGetSystemState( pxTaskStatusArray, uxArraySize, &ulTotalRunTime );

    // For percentage calculations.
    ulTotalRunTime /= 100UL;

    // Avoid divide by zero errors.
    if( ulTotalRunTime > 0 )
    {
        // For each populated position in the pxTaskStatusArray array,
        // format the raw data as human readable ASCII data
        for( x = 0; x < uxArraySize; x++ )
        {
            // What percentage of the total run time has the task used?
            // This will always be rounded down to the nearest integer.
            // ulTotalRunTimeDiv100 has already been divided by 100.
            ulStatsAsPercentage = pxTaskStatusArray[ x ].ulRunTimeCounter / ulTotalRunTime;

            if( ulStatsAsPercentage > 0UL )
            {
                sprintf( pcWriteBuffer, "%s\t%lu\t%lu\%\r\n",
                pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter,
                ulStatsAsPercentage );
            }
            else
            {
                // If the percentage is zero here then the task has
                // consumed less than 1% of the total run time.
                sprintf( pcWriteBuffer, "%s\t%lu\t%<1\%\r\n",
                pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter );
            }
            pcWriteBuffer += strlen( (char *) pcWriteBuffer );
        }
    }

    // The array is no longer needed, free the memory it consumes.
vPortFree( pxTaskStatusArray );
}

Parameters

- pxTaskStatusArray - A pointer to an array of TaskStatus_t structures. The array must contain at least one TaskStatus_t structure for each task that is under the control of the RTOS. The number of tasks under the control of the RTOS can be determined using the uxTaskGetNumberOfTasks() API function.
• **uxArraySize** – The size of the array pointed to by the pxTaskStatusArray parameter. The size is specified as the number of indexes in the array, or the number of TaskStatus_t structures contained in the array, not by the number of bytes in the array.

• **pulTotalRunTime** – If configGENERATE_RUN_TIME_STATS is set to 1 in FreeRTOSConfig.h then *pulTotalRunTime is set by uxTaskGetSystemState() to the total run time (as defined by the run time stats clock, see [https://www.FreeRTOS.org/rtos-run-time-stats.html](https://www.FreeRTOS.org/rtos-run-time-stats.html)) since the target booted. pulTotalRunTime can be set to NULL to omit the total run time information.

**Returns** The number of TaskStatus_t structures that were populated by uxTaskGetSystemState(). This should equal the number returned by the uxTaskGetNumberOfTasks() API function, but will be zero if the value passed in the uxArraySize parameter was too small.

```c
void vTaskList (char *pcWriteBuffer)
```

configUSE_TRACE_FACILITY and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. See the configuration section of the FreeRTOS.org website for more information.

**NOTE 1:** This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Lists all the current tasks, along with their current state and stack usage high water mark.

Tasks are reported as blocked (‘B’), ready (‘R’), deleted (‘D’) or suspended (‘S’).

**PLEASE NOTE:**

This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

vTaskList() calls uxTaskGetSystemState(), then formats part of the uxTaskGetSystemState() output into a human readable table that displays task: names, states, priority, stack usage and task number. Stack usage specified as the number of unused StackType_t words stack can hold on top of stack - not the number of bytes.

vTaskList() has a dependency on the sprintf() C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of sprintf() is provided in many of the FreeRTOS/Demo sub-directories in a file called printf-stdarg.c (note printf-stdarg.c does not provide a full snprintf() implementation!).

It is recommended that production systems call uxTaskGetSystemState() directly to get access to raw stats data, rather than indirectly through a call to vTaskList().

**Parameters pcWriteBuffer** – A buffer into which the above mentioned details will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

```c
void vTaskGetRunTimeStats (char *pcWriteBuffer)
```

configGENERATE_RUN_TIME_STATS and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. The application must also then provide definitions for portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() to configure a peripheral timer/counter and return the timer’s current count value respectively. The counter should be at least 10 times the frequency of the tick count.

**NOTE 1:** This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Setting configGENERATE_RUN_TIME_STATS to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() macro. Calling vTaskGetRunTimeStats() writes the total execution time of each task into a buffer, both as an absolute count value and as a percentage of the total system execution time.

**NOTE 2:**

This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.
vTaskGetRunTimeStats() calls uxTaskGetSystemState(), then formats part of the uxTaskGetSystemState() output into a human readable table that displays the amount of time each task has spent in the Running state in both absolute and percentage terms.

vTaskGetRunTimeStats() has a dependency on the sprintf() C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of sprintf() is provided in many of the FreeRTOS/Demo sub-directories in a file called printf-stdarg.c (note printf-stdarg.c does not provide a full snprintf() implementation!).

It is recommended that production systems call uxTaskGetSystemState() directly to get access to raw stats data, rather than indirectly through a call to vTaskGetRunTimeStats().

**Parameters**

- **pcWriteBuffer** - A buffer into which the execution times will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

```
Parameters pcWriteBuffer – A buffer into which the execution times will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.
```

configRUN_TIME_COUNTER_TYPE ulTaskGetIdleRunTimeCounter (void)

The function configGENERATE_RUN_TIME_STATS, configUSE_STATS_FORMATTING_FUNCTIONS and INCLUDE_xTaskGetIdleTaskHandle must all be defined as 1 for these functions to be available. The application must also then provide definitions for portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() to configure a peripheral timer/counter and return the timers current count value respectively. The counter should be at least 10 times the frequency of the tick count.

Setting configGENERATE_RUN_TIME_STATS to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() macro. While uxTaskGetSystemState() and vTaskGetRunTimeStats() writes the total execution time of each task into a buffer, ulTaskGetIdleRunTimeCounter() returns the total execution time of just the idle task and ulTaskGetIdleRunTimePercent() returns the percentage of the CPU time used by just the idle task.

Note the amount of idle time is only a good measure of the slack time in a system if there are no other tasks executing at the idle priority, tickless idle is not used, and configIDLE_SHOULD_YIELD is set to 0.

**Note:** If configNUMBER_OF_CORES > 1, calling this function will query the idle task of the current core.

```
Note: If configNUMBER_OF_CORES > 1, calling this function will query the idle task of the current core.
```

Returns The total run time of the idle task or the percentage of the total run time consumed by the idle task. This is the amount of time the idle task has actually been executing. The unit of time is dependent on the frequency configured using the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() macros.

```
Returns The total run time of the idle task or the percentage of the total run time consumed by the idle task. This is the amount of time the idle task has actually been executing. The unit of time is dependent on the frequency configured using the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() macros.
```

```
configRUN_TIME_COUNTER_TYPE ulTaskGetIdleRunTimePercent (void)

BaseType_t xTaskGenericNotifyWait (UBaseType_t uxIndexToWaitOn, uint32_t ulBitsToClearOnEntry, uint32_t ulBitsToClearOnExit, uint32_t *pulNotificationValue, TickType_t xTicksToWait)

Waits for a direct to task notification to be pending at a given index within an array of direct to task notifications. See https://www.FreeRTOS.org/RTOS-task-notifications.html for details.

```
Waits for a direct to task notification to be pending at a given index within an array of direct to task notifications. See https://www.FreeRTOS.org/RTOS-task-notifications.html for details.
```

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this function to be available.

Each task has a private array of ‘notification values’ (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.
A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyWait() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling xTaskNotifyWait() is equivalent to calling xTaskNotifyWaitIndexed() with the uxIndexToWaitOn parameter set to 0.

**Parameters**

- **uxIndexToWaitOn** - The index within the calling task’s array of notification values on which the calling task will wait for a notification to be received. uxIndexToWaitOn must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyWait() does not have this parameter and always waits for notifications on index 0.

- **ulBitsToClearOnEntry** - Bits that are set in ulBitsToClearOnEntry value will be cleared in the calling task’s notification value before the task checks to see if any notifications are pending, and optionally blocks if no notifications are pending. Setting ulBitsToClearOnEntry to ULONG_MAX (if limits.h is included) or 0xffffffffUL (if limits.h is not included) will have the effect of resetting the task’s notification value to 0. Setting ulBitsToClearOnEntry to 0 will leave the task’s notification value unchanged.

- **ulBitsToClearOnExit** - If a notification is pending or received before the calling task exits the xTaskNotifyWait() function then the task’s notification value (see the xTaskNotify() API function) is passed out using the pulNotificationValue parameter. Then any bits that are set in ulBitsToClearOnExit will be cleared in the task’s notification value (note *pulNotificationValue is set before any bits are cleared). Setting ulBitsToClearOnExit to ULONG_MAX (if limits.h is included) or 0xffffffffUL (if limits.h is not included) will have the effect of resetting the task’s notification value to 0 before the function exits. Setting ulBitsToClearOnExit to 0 will leave the task’s notification value unchanged when the function exits (in which case the value passed out in pulNotificationValue will match the task’s notification value).

- **pulNotificationValue** - Used to pass the task’s notification value out of the function. Note the value passed out will not be effected by the clearing of any bits caused by ulBitsToClearOnExit being non-zero.

- **xTicksToWait** - The maximum amount of time that the task should wait in the Blocked state for a notification to be received, should a notification not already be pending when xTaskNotifyWait() was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro pdMS_TO_TICKS( value_in_ms ) can be used to convert a time specified in milliseconds to a time specified in ticks.

**Returns** If a notification was received (including notifications that were already pending when xTaskNotifyWait was called) then pdPASS is returned. Otherwise pdFAIL is returned.

```c
void vTaskGenericNotifyGiveFromISR( TaskHandle_t xTaskToNotify, UBaseType_t uxIndexToNotify, BaseType_t *pxHigherPriorityTaskWoken )
```

A version of xTaskNotifyGiveIndexed() that can be called from an interrupt service routine (ISR).

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this macro to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

vTaskNotifyGiveIndexedFromISR() is intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given from an ISR using the xSemaphoreGiveFromISR() API function, the equivalent action that instead uses a task notification is vTaskNotifyGiveIndexedFromISR().

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the uTaskNotifyTakeIndexed() API function rather than the xTaskNotifyWaitIndexed() API function.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyFromISR() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling xTaskNotifyGiveFromISR() is equivalent to calling xTaskNotifyGiveIndexedFromISR() with the uxIndexToNotify parameter set to 0.

Parameters

- xTaskToNotify – The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- uxIndexToNotify – The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyGiveFromISR() does not have this parameter and always sends notifications to index 0.
- pxHigherPriorityTaskWoken – vTaskNotifyGiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If vTaskNotifyGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

BaseType_t xTaskGenericNotifyStateClear(TaskHandle_t xTask, UBasetype_t uxIndexToClear)

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyStateClear() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling xTaskNotifyStateClear() is equivalent to calling xTaskNotifyStateClearIndexed() with the uxIndexToNotify parameter set to 0.

**Parameters**

- **xTask** – The handle of the RTOS task that will have a notification state cleared. Set xTask to NULL to clear a notification state in the calling task. To obtain a task’s handle create the task using xTaskCreate() and make use of the pxCreatedTask parameter, or create the task using xTaskCreateStatic() and store the returned value, or use the task’s name in a call to xTaskGetHandle().
- **uxIndexToClear** – The index within the target task’s array of notification values to act upon. For example, setting uxIndexToClear to 1 will clear the state of the notification at index 1 within the array. uxIndexToClear must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. ulTaskNotifyStateClear() does not have this parameter and always acts on the notification at index 0.

**Returns** pdTRUE if the task’s notification state was set to eNotWaitingNotification, otherwise pdFALSE.

```c
uint32_t ulTaskGenericNotifyValueClear(TaskHandle_t xTask, UBaseType_t uxIndexToClear, uint32_t ulBitsToClear)
```

Each task has a private array of “notification values” (or ‘notifications’) , each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

ulTaskNotifyValueClearIndexed() clears the bits specified by the ulBitsToClear bit mask in the notification value at array index uxIndexToClear of the task referenced by xTask.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. ulTaskNotifyValueClear() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling ulTaskNotifyValueClear() is equivalent to calling ulTaskNotifyValueClearIndexed() with the uxIndexToClear parameter set to 0.

**Parameters**

- **xTask** – The handle of the RTOS task that will have bits in one of its notification values cleared. Set xTask to NULL to clear bits in a notification value of the calling task. To obtain a task’s handle create the task using xTaskCreate() and make use of the pxCreatedTask parameter, or create the task using xTaskCreateStatic() and store the returned value, or use the task’s name in a call to xTaskGetHandle().
- **uxIndexToClear** – The index within the target task’s array of notification values in which to clear the bits. uxIndexToClear must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. ulTaskNotifyValueClear() does not have this parameter and always clears bits in the notification value at index 0.
- **ulBitsToClear** – Bit mask of the bits to clear in the notification value of xTask. Set a bit to 1 to clear the corresponding bits in the task’s notification value. Set ulBitsToClear to 0xffffffff (UINT_MAX on 32-bit architectures) to clear the notification value to 0. Set ulBitsToClear to 0 to query the task’s notification value without clearing any bits.

**Returns** The value of the target task’s notification value before the bits specified by ulBitsToClear were cleared.

```c
uint32_t ulTaskGenericNotifyValueClear(TaskHandle_t xTask, UBaseType_t uxIndexToClear, uint32_t ulBitsToClear)
```

Each task has a private array of “notification values” (or ‘notifications’) , each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

ulTaskNotifyValueClearIndexed() clears the bits specified by the ulBitsToClear bit mask in the notification value at array index uxIndexToClear of the task referenced by xTask.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. ulTaskNotifyValueClear() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling ulTaskNotifyValueClear() is equivalent to calling ulTaskNotifyValueClearIndexed() with the uxIndexToClear parameter set to 0.

**Parameters**

- **xTask** – The handle of the RTOS task that will have bits in one of its notification values cleared. Set xTask to NULL to clear bits in a notification value of the calling task. To obtain a task’s handle create the task using xTaskCreate() and make use of the pxCreatedTask parameter, or create the task using xTaskCreateStatic() and store the returned value, or use the task’s name in a call to xTaskGetHandle().
- **uxIndexToClear** – The index within the target task’s array of notification values in which to clear the bits. uxIndexToClear must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. ulTaskNotifyValueClear() does not have this parameter and always clears bits in the notification value at index 0.
- **ulBitsToClear** – Bit mask of the bits to clear in the notification value of xTask. Set a bit to 1 to clear the corresponding bits in the task’s notification value. Set ulBitsToClear to 0xffffffff (UINT_MAX on 32-bit architectures) to clear the notification value to 0. Set ulBitsToClear to 0 to query the task’s notification value without clearing any bits.

**Returns** The value of the target task’s notification value before the bits specified by ulBitsToClear were cleared.

```c
void vTaskSetTimeOutState(TimeOut_t *const pxTimeOut)
```

Capture the current time for future use with xTaskCheckForTimeOut().
**Parameters pxTimeOut** – Pointer to a timeout object into which the current time is to be captured. The captured time includes the tick count and the number of times the tick count has overflowed since the system first booted.

**BaseType_t xTaskCheckForTimeOut** (TimeOut_t *const pxTimeOut, TickType_t *const pxTicksToWait)
Determines if pxTicksToWait ticks has passed since a time was captured using a call to vTaskSetTimeOutState(). The captured time includes the tick count and the number of times the tick count has overflowed.

Example Usage:

```c
size_t xUART_Receive(uint8_t *pucBuffer, size_t uxWantedBytes)
{
    size_t uxReceived = 0;
    TickType_t xTicksToWait = MAX_TIME_TO_WAIT;
    TimeOut_t xTimeOut;

    // Initialize xTimeOut. This records the time at which this function was entered.
    vTaskSetTimeOutState(&xTimeOut);

    // Loop until the buffer contains the wanted number of bytes, or a timeout occurs.
    while (UART_bytes_in_rx_buffer(pxUARTInstance) < uxWantedBytes)
    {
        // The buffer didn’t contain enough data so this task is going to enter the Blocked state. Adjusting xTicksToWait to account for any time that has been spent in the Blocked state within this function so far to ensure the total amount of time spent in the Blocked state does not exceed MAX_TIME_TO_WAIT.
        if (xTaskCheckForTimeOut(&xTimeOut, &xTicksToWait) != pdFALSE)
        {
            // Timed out before the wanted number of bytes were available, exit the loop.
            break;
        }

        // Wait for a maximum of xTicksToWait ticks to be notified that the receive interrupt has placed more data into the buffer.
        ulTaskNotifyTake(pdTRUE, xTicksToWait);
    }

    // Attempt to read uxWantedBytes from the receive buffer into pucBuffer.
    // The actual number of bytes read (which might be less than uxWantedBytes) is returned.
    uxReceived = UART_read_from_receive_buffer(pxUARTInstance, pucBuffer, uxWantedBytes);

    return uxReceived;
}
```

(continues on next page)
See also:
https://www.FreeRTOS.org/xTaskCheckForTimeOut.html

Parameters

- `pxTimeOut` – The time status as captured previously using `vTaskSetTimeOutState`. If the timeout has not yet occurred, it is updated to reflect the current time status.
- `pxTicksToWait` – The number of ticks to check for timeout i.e. if `pxTicksToWait` ticks have passed since `pxTimeOut` was last updated (either by `vTaskSetTimeOutState()` or `xTaskCheckForTimeOut()`), the timeout has occurred. If the timeout has not occurred, `pxTicksToWait` is updated to reflect the number of remaining ticks.

Returns
If timeout has occurred, `pdTRUE` is returned. Otherwise `pdFALSE` is returned and `pxTicksToWait` is updated to reflect the number of remaining ticks.

```c
BaseType_t xTaskCheckForTimeOut(TickType_t pxTicksToWait, const TaskHandle_t xTaskToCheck)
```

This function checks if a task has timed out.

This function is similar to `vTaskStepTick()`, however, unlike `vTaskStepTick()`, `xTaskCheckForTimeOut()` may move the tick count forward past a time at which a task should be removed from the blocked state. That means tasks may have to be removed from the blocked state as the tick count is moved.

Parameters

- `pxTicksToWait` – The number of tick interrupts that have been missed due to interrupts being disabled. Its value is not computed automatically, so must be computed by the application writer.

Returns
If moving the tick count forward resulted in a task leaving the blocked state and a context switch being performed. Otherwise `pdFALSE`.

```c
 BaseType_t xTaskCatchUpTicks(TickType_t xTicksToCatchUp)
```

This function corrects the tick count value after the application code has held interrupts disabled for an extended period resulting in tick interrupts having been missed.

This function is similar to `vTaskStepTick()`, however, unlike `vTaskStepTick()`, `xTaskCatchUpTicks()` may move the tick count forward past a time at which a task should be removed from the blocked state. That means tasks may have to be removed from the blocked state as the tick count is moved.

Parameters

- `xTicksToCatchUp` – The number of tick interrupts that have been missed due to interrupts being disabled. Its value is not computed automatically, so must be computed by the application writer.

Returns
`pdTRUE` if moving the tick count forward resulted in a task leaving the blocked state and a context switch being performed. Otherwise `pdFALSE`.

Structures

```c
struct xTASK_STATUS
```

Used with the `uxTaskGetSystemState()` function to return the state of each task in the system.

Public Members

```c
TaskHandle_t xHandle
```

The handle of the task to which the rest of the information in the structure relates.

```c
const char *pcTaskName
```

A pointer to the task’s name. This value will be invalid if the task was deleted since the structure was populated!

```c
UBaseType_t xTaskNumber
```

A number unique to the task.

```c
eTaskState eCurrentState
```

The state in which the task existed when the structure was populated.

```c
UBaseType_t uxCurrentPriority
```

The priority at which the task was running (may be inherited) when the structure was populated.
Chapter 2. API Reference

**UBaseType_t uxBasePriority**

The priority to which the task will return if the task’s current priority has been inherited to avoid unbounded priority inversion when obtaining a mutex. Only valid if configUSE_MUTEXES is defined as 1 in FreeRTOSConfig.h.

**configRUN_TIME_COUNTER_TYPE ulRunTimeCounter**

The total run time allocated to the task so far, as defined by the run time stats clock. See [https://www.FreeRTOS.org/rtos-run-time-stats.html](https://www.FreeRTOS.org/rtos-run-time-stats.html). Only valid when configGENERATE_RUN_TIME_STATS is defined as 1 in FreeRTOSConfig.h.

**StackType_t* pxStackBase**

Points to the lowest address of the task’s stack area.

**configSTACK_DEPTH_TYPE usStackHighWaterMark**

The minimum amount of stack space that has remained for the task since the task was created. The closer this value is to zero the closer the task has come to overflowing its stack.

**BaseType_t xCoreID**

Core this task is pinned to (0, 1, or tskNO_AFFINITY). If configNUMBER_OF_CORES == 1, this will always be 0.

**Macros**

**tskIDLE_PRIORITY**

Defines the priority used by the idle task. This must not be modified.

**tskNO_AFFINITY**

Macro representing and unpinned (i.e., “no affinity”) task in xCoreID parameters

**taskYIELD()**

Macro for forcing a context switch.

**taskENTER_CRITICAL(x)**

Macro to mark the start of a critical code region. Preemptive context switches cannot occur when in a critical region.

**NOTE:** This may alter the stack (depending on the portable implementation) so must be used with care!

**taskENTER_CRITICAL_FROM_ISR()**

**taskENTER_CRITICAL_ISR(x)**

**taskEXIT_CRITICAL(x)**

Macro to mark the end of a critical code region. Preemptive context switches cannot occur when in a critical region.

**NOTE:** This may alter the stack (depending on the portable implementation) so must be used with care!

**taskEXIT_CRITICAL_FROM_ISR(x)**

**taskDISABLE_INTERRUPTS()**

Macro to disable all maskable interrupts.

**taskENABLE_INTERRUPTS()**

Macro to enable microcontroller interrupts.
taskSCHEDULER_SUSPENDED

Definitions returned by xTaskGetSchedulerState(). taskSCHEDULER_SUSPENDED is 0 to generate more optimal code when configASSERT() is defined as the constant is used in assert() statements.

taskSCHEDULER_NOT_STARTED

taskSCHEDULER_RUNNING

xTaskNotifyIndexed(xTaskToNotify, uxIndexToNotify, ulValue, eAction)

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

Sends a direct to task notification to a task, with an optional value and action.

Each task has a private array of “notification values” (or “notifications”), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A task can use xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification to be pending. The task does not consume any CPU time while it is in the Blocked state.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value” , and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotify() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling xTaskNotify() is equivalent to calling xTaskNotifyIndexed() with the uxIndexToNotify parameter set to 0.

eSetBits - The target notification value is bitwise ORed with ulValue. xTaskNotifyIndexed() always returns pdPASS in this case.

eIncrement - The target notification value is incremented. ulValue is not used and xTaskNotifyIndexed() always returns pdPASS in this case.

eSetValueWithOverwrite - The target notification value is set to the value of ulValue, even if the task being notified had not yet processed the previous notification at the same array index (the task already had a notification pending at that index). xTaskNotifyIndexed() always returns pdPASS in this case.

eSetValueWithoutOverwrite - If the task being notified did not already have a notification pending at the same array index then the target notification value is set to ulValue and xTaskNotifyIndexed() will return pdPASS. If the task being notified already had a notification pending at the same array index then no action is performed and pdFAIL is returned.
eNoAction - The task receives a notification at the specified array index without the notification value at that index being updated. ulValue is not used and xTaskNotifyIndexed() always returns pdPASS in this case.

pulPreviousNotificationValue - Can be used to pass out the subject task’s notification value before any bits are modified by the notify function.

Parameters

- **xTaskToNotify** – The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- **uxIndexToNotify** – The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than config-TASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotify() does not have this parameter and always sends notifications to index 0.
- **ulValue** – Data that can be sent with the notification. How the data is used depends on the value of the eAction parameter.
- **eAction** – Specifies how the notification updates the task’s notification value, if at all. Valid values for eAction are as follows:

Returns

Dependent on the value of eAction. See the description of the eAction parameter.

xTaskNotifyAndQueryIndexed(xTaskToNotify, uxIndexToNotify, ulValue, eAction, pulPreviousNotifyValue)

xTaskNotifyAndQueryIndexed() performs the same operation as xTaskNotifyIndexed() with the addition that it also returns the subject task’s prior notification value (the notification value at the time the function is called rather than when the function returns) in the additional pulPreviousNotifyValue parameter.

xTaskNotifyAndQuery() performs the same operation as xTaskNotify() with the addition that it also returns the subject task’s prior notification value (the notification value as it was at the time the function is called, rather than when the function returns) in the additional pulPreviousNotifyValue parameter.

xTaskNotifyIndexedFromISR(xTaskToNotify, uxIndexToNotify, ulValue, eAction, pxHigherPriorityTaskWoken)

cfgUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

A version of xTaskNotifyIndexed() that can be used from an interrupt service routine (ISR).

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.
Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyFromISR() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling xTaskNotifyFromISR() is equivalent to calling xTaskNotifyIndexedFromISR() with the uxIndexToNotify parameter set to 0.

**eSetBits** - The task’s notification value is bitwise ORed with ulValue. xTaskNotify() always returns pdPASS in this case.

**eIncrement** - The task’s notification value is incremented. ulValue is not used and xTaskNotify() always returns pdPASS in this case.

**eSetValueWithOverwrite** - The task’s notification value is set to the value of ulValue, even if the task being notified had not yet processed the previous notification (the task already had a notification pending). xTaskNotify() always returns pdPASS in this case.

**eSetValueWithoutOverwrite** - If the task being notified did not already have a notification pending then the task’s notification value is set to ulValue and xTaskNotify() will return pdPASS. If the task being notified already had a notification pending then no action is performed and pdFAIL is returned.

**eNoAction** - The task receives a notification without its notification value being updated. ulValue is not used and xTaskNotify() always returns pdPASS in this case.

**Parameters**

- **uxIndexToNotify** - The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyFromISR() does not have this parameter and always sends notifications to index 0.
- **xTaskToNotify** - The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- **ulValue** - Data that can be sent with the notification. How the data is used depends on the value of the eAction parameter.
- **eAction** - Specifies how the notification updates the task’s notification value, if at all. Valid values for eAction are as follows:
  - **pxHigherPriorityTaskWoken** - xTaskNotifyFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If xTaskNotifyFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited. A context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

**Returns** - Dependent on the value of eAction. See the description of the eAction parameter.

xTaskNotifyAndQueryIndexedFromISR() performs the same operation as xTaskNotifyIndexedFromISR() with the addition that it also returns the subject task’s prior notification value (the notification value at the time the function is called rather than at the time the function returns) in the additional pulPreviousNotificationValue parameter.

xTaskNotifyAndQueryFromISR() performs the same operation as xTaskNotifyFromISR() with the addition that it also returns the subject task’s prior notification value (the notification value at the time the function is called rather than at the time the function returns) in the additional pulPreviousNotificationValue parameter.

**xTaskNotifyWait** (ulBitsToClearOnEntry, ulBitsToClearOnExit, pulNotificationValue, xTicksToWait)
**xTaskNotifyWaitIndexed** ([uxIndexToWaitOn, ulBitsToClearOnEntry, ulBitsToClearOnExit, pulNotificationValue, xTicksToWait])

**xTaskNotifyGiveIndexed** (xTaskToNotify, uxIndexToNotify)

Sends a direct to task notification to a particular index in the target task’s notification array in a manner similar to giving a counting semaphore.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for these macros to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

`xTaskNotifyGiveIndexed()` is a helper macro intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given using the `xSemaphoreGive()` API function, the equivalent action that instead uses a task notification is `xTaskNotifyGiveIndexed()`.

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the `uTaskNotifyTakeIndexed()` API function rather than the `xTaskNotifyWaitIndexed()` API function.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyGive()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling `xTaskNotifyGive()` is equivalent to calling `xTaskNotifyGiveIndexed()` with the `uxIndexToNotify` parameter set to 0.

**Parameters**

- **xTaskToNotify** - The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.
- **uxIndexToNotify** - The index within the target task’s array of notification values to which the notification is to be sent. `uxIndexToNotify` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotifyGive()` does not have this parameter and always sends notifications to index 0.

**Returns** `xTaskNotifyGive()` is a macro that calls `xTaskNotify()` with the `eAction` parameter set to `eIncrement` - so `pdPASS` is always returned.

**vTaskNotifyGiveFromISR** (xTaskToNotify, pxHigherPriorityTaskWoken)

**vTaskNotifyGiveIndexedFromISR** (xTaskToNotify, uxIndexToNotify, pxHigherPriorityTaskWoken)

**uTaskNotifyTakeIndexed** (uxIndexToWaitOn,xClearCountOnExit,xTicksToWait)

Waits for a direct to task notification on a particular index in the calling task’s notification array in a manner similar to taking a counting semaphore.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for this function to be available.
Each task has a private array of "notification values" (or "notifications"), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

ulTaskNotifyTakeIndexed() is intended for use when a task notification is used as a faster and lighter weight binary or counting semaphore alternative. Actual FreeRTOS semaphores are taken using the xSemaphoreTake() API function, the equivalent action that instead uses a task notification is ulTaskNotifyTakeIndexed().

When a task is using its notification value as a binary or counting semaphore other tasks should send notifications to it using the xTaskNotifyGiveIndexed() macro, or xTaskNotifyIndex() function with the eAction parameter set to eIncrement.

ulTaskNotifyTakeIndexed() can either clear the task’s notification value at the array index specified by the uxIndexToWaitOn parameter to zero on exit, in which case the notification value acts like a binary semaphore, or decrement the notification value on exit, in which case the notification value acts like a counting semaphore.

A task can use ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification. The task does not consume any CPU time while it is in the Blocked state.

Where as xTaskNotifyWaitIndexed() will return when a notification is pending, ulTaskNotifyTakeIndexed() will return when the task’s notification value is not zero.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. ulTaskNotifyTake() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling ulTaskNotifyTake() is equivalent to calling ulTaskNotifyTakeIndexed() with the uxIndexToWaitOn parameter set to 0.

Parameters

- **uxIndexToWaitOn** - The index within the calling task’s array of notification values on which the calling task will wait for a notification to be non-zero. uxIndexToWaitOn must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyTake() does not have this parameter and always waits for notifications on index 0.

- **xClearCountOnExit** - if xClearCountOnExit is pdFALSE then the task’s notification value is decremented when the function exits. In this way the notification value acts like a counting semaphore. If xClearCountOnExit is not pdFALSE then the task’s notification value is cleared to zero when the function exits. In this way the notification value acts like a binary semaphore.

- **xTicksToWait** - The maximum amount of time that the task should wait in the Blocked state for the task’s notification value to be greater than zero, should the count not already be greater than zero when ulTaskNotifyTake() was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro pdMS_TO_TICKS( value_in_ms ) can be used to convert a time specified in milliseconds to a time specified in ticks.

Returns The task’s notification count before it is either cleared to zero or decremented (see the xClearCountOnExit parameter).

xTaskNotifyStateClear (xTask)
**Chapter 2. API Reference**

- `xTaskNotifyStateClearIndexed(xTask, uxIndexToClear)`
- `ulTaskNotifyValueClear(xTask, ulBitsToClear)`
- `ulTaskNotifyValueClearIndexed(xTask, uxIndexToClear, ulBitsToClear)`

**Type Definitions**

typedef struct tskTaskControlBlock *`TaskHandle_t`

typedef BaseType_t (*`TaskHookFunction_t`)(void*)

Defines the prototype to which the application task hook function must conform.

typedef struct `xTASK_STATUS TaskStatus_t`

Used with the `uxTaskGetSystemState()` function to return the state of each task in the system.

**Enumerations**

enum `eTaskState`

Task states returned by `eTaskGetState`.

Values:

- enumerator `eRunning`
  A task is querying the state of itself, so must be running.

- enumerator `eReady`
  The task being queried is in a ready or pending ready list.

- enumerator `eBlocked`
  The task being queried is in the Blocked state.

- enumerator `eSuspended`
  The task being queried is in the Suspended state, or is in the Blocked state with an infinite time out.

- enumerator `eDeleted`
  The task being queried has been deleted, but its TCB has not yet been freed.

- enumerator `eInvalid`
  Used as an ‘invalid state’ value.

enum `eNotifyAction`

Actions that can be performed when `vTaskNotify()` is called.

Values:

- enumerator `eNoAction`
  Notify the task without updating its notify value.

- enumerator `eSetBits`
  Set bits in the task’s notification value.
enumerator **eIncrement**

Increment the task’s notification value.

enumerator **eSetValueWithOverwrite**

Set the task’s notification value to a specific value even if the previous value has not yet been read by the task.

enumerator **eSetValueWithoutOverwrite**

Set the task’s notification value if the previous value has been read by the task.

enum **eSleepModeStatus**

Possible return values for `eTaskConfirmSleepModeStatus()`.

**Values:**

enumerator **eAbortSleep**

A task has been made ready or a context switch pended since `portSUPPRESS_TICKS_AND_SLEEP()` was called - abort entering a sleep mode.

enumerator **eStandardSleep**

Enter a sleep mode that will not last any longer than the expected idle time.

### Queue API

**Header File**

- `components/freertos/FreeRTOS-Kernel/include/freertos/queue.h`
- This header file can be included with:

```c
#include "freertos/queue.h"
```

**Functions**

- `BaseType_t xQueueGenericSend(QueueHandle_t xQueue, const void *const pvItemToQueue, TickType_t xTicksToWait, const BaseType_t xCopyPosition)`

It is preferred that the macros `xQueueSend()`, `xQueueSendToFront()` and `xQueueSendToBack()` are used in place of calling this function directly.

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See `xQueueSendFromISR()` for an alternative which may be used in an ISR.

**Example usage:**

```c
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    (continues on next page)
```
struct AMessage *pxMessage;

// Create a queue capable of containing 10 uint32_t values.
uint32_t xQueue1 = xQueueCreate(10, sizeof(uint32_t));

// Create a queue capable of containing 10 pointers to AMessage structures.
// These should be passed by pointer as they contain a lot of data.
uint32_t xQueue2 = xQueueCreate(10, sizeof(struct AMessage *));

// ...

if (xQueue1 != 0)
{
    // Send an uint32_t. Wait for 10 ticks for space to become
    // available if necessary.
    if (xQueueGenericSend(xQueue1, (void *)&ulVar, (TickType_t)10, queueSEND_TO_BACK) != pdPASS)
    {
        // Failed to post the message, even after 10 ticks.
    }
}

if (xQueue2 != 0)
{
    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = &xMessage;
    xQueueGenericSend(xQueue2, (void *)&pxMessage, (TickType_t)0, queueSEND_TO_BACK);
}

// ... Rest of task code.

Parameters

- **xQueue** - The handle to the queue on which the item is to be posted.
- **pvItemToQueue** - A pointer to the item that is to be placed on the queue. The size of
  the items the queue will hold was defined when the queue was created, so this many bytes
  will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** - The maximum amount of time the task should block waiting for space
  to become available on the queue, should it already be full. The call will return immediately
  if this is set to 0 and the queue is full. The time is defined in tick periods so the constant
  portTICK_PERIOD_MS should be used to convert to real time if this is required.
- **xCopyPosition** - Can take the value queueSEND_TO_BACK to place the item at the
  back of the queue, or queueSEND_TO_FRONT to place the item at the front of the queue
  (for high priority messages).

Returns  pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

```
BaseType_t xQueuePeek(QueueHandle_t xQueue, void *const pvBuffer, TickType_t xTicksToWait)
```

Receive an item from a queue without removing the item from the queue. The item is received by copy so a
buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the
queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to
xQueueReceive().

This macro must not be used in an interrupt service routine. See xQueuePeekFromISR() for an alternative that
can be called from an interrupt service routine.
Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }
    // ...

    // Send a pointer to a struct AMessage object. Don’t block if the
    // queue is already full.
    pxMessage = &xMessage;
    xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );

    // ... Rest of task code.
}

// Task to peek the data from the queue.
void vADifferentTask( void *pvParameters )
{
    struct AMessage *pxRxedMessage;

    if( xQueue != 0 )
    {
        // Peek a message on the created queue. Block for 10 ticks if a
        // message is not immediately available.
        if( xQueuePeek( xQueue, &pxRxedMessage, ( TickType_t ) 10 ) )
        {
            // pcRxedMessage now points to the struct AMessage variable posted
            // by vATask, but the item still remains on the queue.
        }
    }

    // ... Rest of task code.
}
```

**Parameters**

- `xQueue` - The handle to the queue from which the item is to be received.
- `pvBuffer` - Pointer to the buffer into which the received item will be copied.
- `xTicksToWait` - The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required. `xQueuePeek()` will return immediately if `xTicksToWait` is 0 and the queue is empty.

**Returns** `pdTRUE` if an item was successfully received from the queue, otherwise `pdFALSE`. 
BaseType_t `xQueuePeekFromISR` *(QueueHandle_t xQueue, void *const pvBuffer)*

A version of `xQueuePeek()` that can be called from an interrupt service routine (ISR).

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to `xQueueReceive()`.

**Parameters**

- **xQueue** - The handle to the queue from which the item is to be received.
- **pvBuffer** - Pointer to the buffer into which the received item will be copied.

**Returns**
pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

BaseType_t `xQueueReceive` *(QueueHandle_t xQueue, void *const pvBuffer, TickType_t xTicksToWait)*

Receive an item from a queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items are removed from the queue.

This function must not be used in an interrupt service routine. See `xQueueReceiveFromISR` for an alternative that can.

**Example usage:**

```
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;
QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
        // ...
        // Send a pointer to a struct AMessage object. Don't block if the
        // queue is already full.
        pxMessage = &xMessage;
        xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );
        // ... Rest of task code.
    }

    // Task to receive from the queue.
    void vADifferentTask( void *pvParameters )
    {
        struct AMessage *pxRxedMessage;
    }
```

(continues on next page)
```c
if (xQueue != 0) {
    // Receive a message on the created queue. Block for 10 ticks if a
    // message is not immediately available.
    if (xQueueReceive(xQueue, &pxRxedMessage, (TickType_t)10)) {
        // pcRxedMessage now points to the struct AMessage variable posted
        // by vATask.
    }
}

// ... Rest of task code.
```

**Parameters**

- `xQueue` - The handle to the queue from which the item is to be received.
- `pvBuffer` - Pointer to the buffer into which the received item will be copied.
- `xTicksToWait` - The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. `xQueueReceive()` will return immediately if `xTicksToWait` is zero and the queue is empty. The time is defined in tick periods so the constant `portTICK_PERIOD_MS` should be used to convert to real time if this is required.

**Returns**  
`pdTRUE` if an item was successfully received from the queue, otherwise `pdFALSE`.

```c
UBaseType_t uxQueueMessagesWaiting(const QueueHandle_t xQueue)
```

Return the number of messages stored in a queue.

**Parameters**  
`xQueue` - A handle to the queue being queried.

**Returns**  
The number of messages available in the queue.

```c
UBaseType_t uxQueueSpacesAvailable(const QueueHandle_t xQueue)
```

Return the number of free spaces available in a queue. This is equal to the number of items that can be sent to the queue before the queue becomes full if no items are removed.

**Parameters**  
`xQueue` - A handle to the queue being queried.

**Returns**  
The number of spaces available in the queue.

```c
void vQueueDelete(QueueHandle_t xQueue)
```

Delete a queue - freeing all the memory allocated for storing of items placed on the queue.

**Parameters**  
`xQueue` - A handle to the queue to be deleted.

```c
BaseType_t xQueueGenericSendFromISR(QueueHandle_t xQueue, const void *const pvItemToQueue, 
                                    BaseType_t *const pxHigherPriorityTaskWoken, const 
                                    BaseType_t xCopyPosition)
```

It is preferred that the macros `xQueueSendFromISR()`, `xQueueSendToFrontFromISR()` and `xQueueSendToBackFromISR()` be used in place of calling this function directly. `xQueueGiveFromISR()` is an equivalent for use by semaphores that don’t actually copy any data.

Post an item on a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR(void)
{
    char cIn;
}
```
BaseType_t xHigherPriorityTaskWokenByPost;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWokenByPost = pdFALSE;

    // Loop until the buffer is empty.
    do {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post each byte.
        xQueueGenericSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWokenByPost,
           queueSEND_TO_BACK );
    } while ( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary. Note that the
    // name of the yield function required is port specific.
    if( xHigherPriorityTaskWokenByPost )
    {
        portYIELD_FROM_ISR();
    }

Parameters

• xQueue - The handle to the queue on which the item is to be posted.
• pvItemToQueue - A pointer to the item that is to be placed on the queue. The size of
  the items the queue will hold was defined when the queue was created, so this many bytes
  will be copied from pvItemToQueue into the queue storage area.
• pxHigherPriorityTaskWoken - xQueueGenericSendFromISR() will set *px-
  HigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock,
  and the unblocked task has a priority higher than the currently running task. If xQueue-
  GenericSendFromISR() sets this value to pdTRUE then a context switch should be re-
  quested before the interrupt is exited.
• xCopyPosition - Can take the value queueSEND_TO_BACK to place the item at
  the back of the queue, or queueSEND_TO_FRONT to place the item at the front of the queue
  (for high priority messages).

Returns  pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

BaseType_t xQueueGiveFromISR (QueueHandle_t xQueue, BaseType_t *const pxHigherPriorityTaskWoken)

BaseType_t xQueueReceiveFromISR (QueueHandle_t xQueue, void *const pvBuffer, BaseType_t *const
  pxHigherPriorityTaskWoken)

Receive an item from a queue. It is safe to use this function from within an interrupt service routine.

Example usage:

QueueHandle_t xQueue;

// Function to create a queue and post some values.
void vAFunction ( void *pvParameters )
{
    char cValueToPost;
    const TickType_t xTicksToWait = ( TickType_t )0xff;

    // Create a queue capable of containing 10 characters.
    xQueue = xQueueCreate( 10, sizeof( char ) );

    // Post to the queue.
    cValueToPost = 'a';
    xQueueSend( xQueue, &cValueToPost, &xHigherPriorityTaskWokenByPost, queueSEND_TO_BACK );
if( xQueue == 0 )
{
    // Failed to create the queue.
}

// ...

// Post some characters that will be used within an ISR. If the queue is full then this task will block for xTicksToWait ticks.
char cValueToPost = 'a';
xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );
cValueToPost = 'b';
xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );

// ... keep posting characters ... this task may block when the queue becomes full.
cValueToPost = 'c';
xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );

// ISR that outputs all the characters received on the queue.
void vISR_Routine( void )
{
    BaseType_t xTaskWokenByReceive = pdFALSE;
    char cRxedChar = 0;
    while( xQueueReceiveFromISR( xQueue, ( void * ) &cRxedChar, & xTaskWokenByReceive) )
    {
        // A character was received. Output the character now.
        vOutputCharacter( cRxedChar );

        // If removing the character from the queue woke the task that was posting onto the queue xTaskWokenByReceive will have been set to pdTRUE. No matter how many times this loop iterates only one task will be woken.
    }

    if( xTaskWokenByReceive != ( char ) pdFALSE;)
    {
        taskYIELD();
    }
}

Parameters
• xQueue - The handle to the queue from which the item is to be received.
• pvBuffer - Pointer to the buffer into which the received item will be copied.
• pxHigherPriorityTaskWoken - A task may be blocked waiting for space to become available on the queue. If xQueueReceiveFromISR causes such a task to unblock *pxTaskWoken will get set to pdTRUE, otherwise *pxTaskWoken will remain unchanged.

Returns pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.
Chapter 2. API Reference

**Parameters** xQueue - The handle of the queue being queried
**Returns** pdFALSE if the queue is not full, or pdTRUE if the queue is full.

UBaseType_t uxQueueMessagesWaitingFromISR (const QueueHandle_t xQueue)
A version of uxQueueMessagesWaiting() that can be called from an ISR. Return the number of messages stored in a queue.

**Parameters** xQueue - A handle to the queue being queried.
**Returns** The number of messages available in the queue.

void vQueueAddToRegistry (QueueHandle_t xQueue, const char* pcQueueName)
The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call vQueueAddToRegistry() add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger. If you are not using a kernel aware debugger then this function can be ignored.

configQUEUE_REGISTRY_SIZE defines the maximum number of handles the registry can hold. configQUEUE_REGISTRY_SIZE must be greater than 0 within FreeRTOSConfig.h for the registry to be available. Its value does not affect the number of queues, semaphores and mutexes that can be created - just the number that the registry can hold.

If vQueueAddToRegistry is called more than once with the same xQueue parameter, the registry will store the pcQueueName parameter from the most recent call to vQueueAddToRegistry.

**Parameters**
- xQueue - The handle of the queue being added to the registry. This is the handle returned by a call to xQueueCreate(). Semaphore and mutex handles can also be passed in here.
- pcQueueName - The name to be associated with the handle. This is the name that the kernel aware debugger will display. The queue registry only stores a pointer to the string - so the string must be persistent (global or preferably in ROM/Flash), not on the stack.

void vQueueUnregisterQueue (QueueHandle_t xQueue)
The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call vQueueAddToRegistry() add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger, and vQueueUnregisterQueue() to remove the queue, semaphore or mutex from the register. If you are not using a kernel aware debugger then this function can be ignored.

**Parameters** xQueue - The handle of the queue being removed from the registry.

const char* pcQueueGetName (QueueHandle_t xQueue)
The queue registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call pcQueueGetName() to look up and return the name of a queue in the queue registry from the queue’s handle.

**Parameters** xQueue - The handle of the queue the name of which will be returned.
**Returns** If the queue is in the registry then a pointer to the name of the queue is returned. If the queue is not in the registry then NULL is returned.

QueueSetHandle_t xQueueCreateSet (const UBaseType_t uxEventQueueLength)
Queue sets provide a mechanism to allow a task to block (pend) on a read operation from multiple queues or semaphores simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

A queue set must be explicitly created using a call to xQueueCreateSet() before it can be used. Once created, standard FreeRTOS queues and semaphores can be added to the set using calls to xQueueAddToSet(). xQueueSelectFromSet() is then used to determine which, if any, of the queues or semaphores contained in the set is in a state where a queue read or semaphore take operation would be successful.

Note 1: See the documentation on https://www.FreeRTOS.org/RTOS-queue-sets.html for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.
Note 3: An additional 4 bytes of RAM is required for each space in a every queue added to a queue set. Therefore counting semaphores that have a high maximum count value should not be added to a queue set.

Note 4: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

Parameters `uxEventQueueLength` - Queue sets store events that occur on the queues and semaphores contained in the set. `uxEventQueueLength` specifies the maximum number of events that can be queued at once. To be absolutely certain that events are not lost `uxEventQueueLength` should be set to the total sum of the length of the queues added to the set, where binary semaphores and mutexes have a length of 1, and counting semaphores have a length set by their maximum count value. Examples:

- If a queue set is to hold a queue of length 5, another queue of length 12, and a binary semaphore, then `uxEventQueueLength` should be set to \((5 + 12 + 1)\), or 18.
- If a queue set is to hold three binary semaphores then `uxEventQueueLength` should be set to \((1 + 1 + 1)\), or 3.
- If a queue set is to hold a counting semaphore that has a maximum count of 5, and a counting semaphore that has a maximum count of 3, then `uxEventQueueLength` should be set to \((5 + 3)\), or 8.

Returns If the queue set is created successfully then a handle to the created queue set is returned. Otherwise NULL is returned.

```
BaseType_t xQueueAddToSet (QueueSetMemberHandle_t xQueueOrSemaphore, QueueSetHandle_t xQueueSet)
```

Adds a queue or semaphore to a queue set that was previously created by a call to xQueueCreateSet().

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Note 1: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

Parameters

- `xQueueOrSemaphore` - The handle of the queue or semaphore being added to the queue set (cast to an QueueSetMemberHandle_t type).
- `xQueueSet` - The handle of the queue set to which the queue or semaphore is being added.

Returns If the queue or semaphore was successfully added to the queue set then pdPASS is returned. If the queue could not be successfully added to the queue set because it is already a member of a different queue set then pdFAIL is returned.

```
BaseType_t xQueueRemoveFromSet (QueueSetMemberHandle_t xQueueOrSemaphore, QueueSetHandle_t xQueueSet)
```

Removes a queue or semaphore from a queue set. A queue or semaphore can only be removed from a set if the queue or semaphore is empty.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Parameters

- `xQueueOrSemaphore` - The handle of the queue or semaphore being removed from the queue set (cast to an QueueSetMemberHandle_t type).
- `xQueueSet` - The handle of the queue set in which the queue or semaphore is included.

Returns If the queue or semaphore was successfully removed from the queue set then pdPASS is returned. If the queue was not in the queue set, or the queue (or semaphore) was not empty, then pdFAIL is returned.

```
QueueSetMemberHandle_t xQueueSelectFromSet (QueueHandle_t xQueue, const TickType_t xTicksToWait)
```

xQueueSelectFromSet() selects from the members of a queue set a queue or semaphore that either contains data (in the case of a queue) or is available to take (in the case of a semaphore). xQueueSelectFromSet()
effectively allows a task to block (pend) on a read operation on all the queues and semaphores in a queue set simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Note 1: See the documentation on https://www.FreeRTOS.org/RTOS-queue-sets.html for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

**Parameters**
- `xQueueSet` – The queue set on which the task will (potentially) block.
- `xTicksToWait` – The maximum time, in ticks, that the calling task will remain in the Blocked state (with other tasks executing) to wait for a member of the queue set to be ready for a successful queue read or semaphore take operation.

**Returns**
- `xQueueSelectFromSet()` will return the handle of a queue (cast to a QueueSetMemberHandle_t type) contained in the queue set that contains data, or the handle of a semaphore (cast to a QueueSetMemberHandle_t type) contained in the queue set that is available, or NULL if no such queue or semaphore exists before before the specified block time expires.

**QueueSetMemberHandle_t**

A version of xQueueSelectFromSet() that can be used from an ISR.

**Macros**

`xQueueCreate(uxQueueLength, uxItemSize)`

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue’s data structures. The second block is used to hold items placed into the queue. If a queue is created using `xQueueCreate()` then both blocks of memory are automatically dynamically allocated inside the `xQueueCreate()` function. (see https://www.FreeRTOS.org/a00111.html). If a queue is created using `xQueueCreateStatic()` then the application writer must provide the memory that will get used by the queue. `xQueueCreateStatic()` therefore allows a queue to be created without using any dynamic memory allocation.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
};

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );
    if( xQueue1 == 0 )
    {
        // Queue was not created and must not be used.
    }

    // Create a queue capable of containing 10 pointers to AMessage structures.
    (continues on next page)
```
// These should be passed by pointer as they contain a lot of data.

xQueue2 = xQueueCreate(10, sizeof(struct AMessage *));
if(xQueue2 == 0)
{
    // Queue was not created and must not be used.
}

// ... Rest of task code.

Parameters

- **uxQueueLength** - The maximum number of items that the queue can contain.
- **uxItemSize** - The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.

Returns

If the queue is successfully created then a handle to the newly created queue is returned. If the queue cannot be created then 0 is returned.

**xQueueCreateStatic** (uxQueueLength, uxItemSize, pucQueueStorage, pxQueueBuffer)

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue’s data structures. The second block is used to hold items placed into the queue. If a queue is created using `xQueueCreate()` then both blocks of memory are automatically dynamically allocated inside the `xQueueCreate()` function. (see https://www.FreeRTOS.org/a00111.html). If a queue is created using `xQueueCreateStatic()` then the application writer must provide the memory that will get used by the queue. `xQueueCreateStatic()` therefore allows a queue to be created without using any dynamic memory allocation.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
};

#define QUEUE_LENGTH 10
#define ITEM_SIZE sizeof( uint32_t )

// xQueueBuffer will hold the queue structure.
StaticQueue_t xQueueBuffer;

// ucQueueStorage will hold the items posted to the queue. Must be at least
// [(queue length) * (queue item size)] bytes long.
uint8_t ucQueueStorage[ QUEUE_LENGTH * ITEM_SIZE ];

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( QUEUE_LENGTH, // The number of items the queue can...

    ITEM_SIZE       // The size of each item in the queue...

    & ucQueueStorage[0], // The buffer that will...

    &xQueueBuffer ); // The buffer that will hold the...
```

(continues on next page)
// The queue is guaranteed to be created successfully as no dynamic memory // allocation is used. Therefore xQueue1 is now a handle to a valid queue.

// ... Rest of task code.

Parameters

- **uxQueueLength** – The maximum number of items that the queue can contain.
- **uxItemSize** – The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.
- **pucQueueStorage** – If uxItemSize is not zero then pucQueueStorage must point to a uint8_t array that is at least large enough to hold the maximum number of items that can be in the queue at any one time - which is (uxQueueLength * uxItemsSize) bytes. If uxItemSize is zero then pucQueueStorage can be NULL.
- **pxQueueBuffer** – Must point to a variable of type StaticQueue_t, which will be used to hold the queue’s data structure.

Returns If the queue is created then a handle to the created queue is returned. If pxQueueBuffer is NULL then NULL is returned.

xQueueGetStaticBuffers(xQueue, ppucQueueStorage, ppxStaticQueue)

Retrieve pointers to a statically created queue’s data structure buffer and storage area buffer. These are the same buffers that are supplied at the time of creation.

Parameters

- **xQueue** – The queue for which to retrieve the buffers.
- **ppucQueueStorage** – Used to return a pointer to the queue’s storage area buffer.
- **ppxStaticQueue** – Used to return a pointer to the queue’s data structure buffer.

Returns pdTRUE if buffers were retrieved, pdFALSE otherwise.

xQueueSendToFront(xQueue, pvItemToQueue, xTicksToWait)

Post an item to the front of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR() for an alternative which may be used in an ISR.

Example usage:

```c
struct AMessage {
  char ucMessageID;
  char ucData[20];
} xMessage;

uint32_t ulVar = 10UL;

void vATask(void *pvParameters) {
  QueueHandle_t xQueue1, xQueue2;
  struct AMessage *pxMessage;

  // Create a queue capable of containing 10 uint32_t values.
  xQueue1 = xQueueCreate(10, sizeof(uint32_t));

  // Create a queue capable of containing 10 pointers to AMessage structures.
  // These should be passed by pointer as they contain a lot of data.
  xQueue2 = xQueueCreate(10, sizeof(struct AMessage *));
}
```

(continues on next page)
// ...

if( xQueue1 != 0 )
{
    // Send an uint32_t. Wait for 10 ticks for space to become
    // available if necessary.
    if( xQueueSendToFront( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
    {
        // Failed to post the message, even after 10 ticks.
    }
}

if( xQueue2 != 0 )
{
    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = & xMessage;
    xQueueSendToFront( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
}

// ... Rest of task code.

Parameters

- xQueue - The handle to the queue on which the item is to be posted.
- pvItemToQueue - A pointer to the item that is to be placed on the queue. The size of
  the items the queue will hold was defined when the queue was created, so this many bytes
  will be copied from pvItemToQueue into the queue storage area.
- xTicksToWait - The maximum amount of time the task should block waiting for space
  to become available on the queue, should it already be full. The call will return immediately
  if this is set to 0 and the queue is full. The time is defined in tick periods so the constant
  portTICK_PERIOD_MS should be used to convert to real time if this is required.

Returns  pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

xQueueSendToBack( xQueue, pvItemToQueue, xTicksToWait )

This is a macro that calls xQueueGenericSend().

Post an item to the back of a queue. The item is queued by copy, not by reference. This function must not be
called from an interrupt service routine. See xQueueSendFromISR() for an alternative which may be used in
an ISR.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;
    // ...
    // Task code
    // ...
}```
// Create a queue capable of containing 10 uint32_t values.
xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

// Create a queue capable of containing 10 pointers to AMessage structures.
// These should be passed by pointer as they contain a lot of data.
xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

// ...
if( xQueue1 != 0 )
{
    // Send an uint32_t. Wait for 10 ticks for space to become
    // available if necessary.
    if( xQueueSendToBack( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) !=
        pdPASS )
    {
        // Failed to post the message, even after 10 ticks.
    }
}

if( xQueue2 != 0 )
{
    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = & xMessage;
    xQueueSendToBack( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
}

// ... Rest of task code.

Parameters

- **xQueue** - The handle to the queue on which the item is to be posted.
- **pvItemToQueue** - A pointer to the item that is to be placed on the queue. The size of
  the items the queue will hold was defined when the queue was created, so this many bytes
  will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** - The maximum amount of time the task should block waiting for space
to become available on the queue, should it already be full. The call will return immediately
if this is set to 0 and the queue is full. The time is defined in tick periods so the constant
portTICK_PERIOD_MS should be used to convert to real time if this is required.

Returns

- **pdTRUE** if the item was successfully posted, otherwise **errQUEUE_FULL**.

### xQueueSend

(xQueue, pvItemToQueue, xTicksToWait)

This is a macro that calls xQueueGenericSend(). It is included for backward compatibility with versions of
FreeRTOS.org that did not include the xQueueSendToFront() and xQueueSendToBack() macros. It is equivalent
 to xQueueSendToBack().

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from
an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;
```

(continues on next page)
uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    // ...

    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become available if necessary.
        if( xQueueSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the queue is already full.
        pxMessage = & pxMessage;
        xQueueSend( xQueue2, ( void * ) & pxMessage, ( TickType_t ) 0 );
    }

    // ... Rest of task code.
}

Parameters

- xQueue - The handle to the queue on which the item is to be posted.
- pvItemToQueue - A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- xTicksToWait - The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

Returns
pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

xQueueOverwrite(xQueue, pvItemToQueue)

Only for use with queues that have a length of one - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

This function must not be called from an interrupt service routine. See xQueueOverwriteFromISR () for an alternative which may be used in an ISR.

Example usage:
# Chapter 2. API Reference

```c
void vFunction( void *pvParameters )
{
QueueHandle_t xQueue;
uint32_t ulVarToSend, ulValReceived;

// Create a queue to hold one uint32_t value. It is strongly
// recommended *not* to use xQueueOverwrite() on queues that can
// contain more than one value, and doing so will trigger an assertion
// if configASSERT() is defined.
xQueue = xQueueCreate( 1, sizeof( uint32_t ) );

// Write the value 10 to the queue using xQueueOverwrite().
ulVarToSend = 10;
xQueueOverwrite( xQueue, &ulVarToSend );

// Peeking the queue should now return 10, but leave the value 10 in
// the queue. A block time of zero is used as it is known that the
// queue holds a value.
ulValReceived = 0;
xQueuePeek( xQueue, &ulValReceived, 0 );

if( ulValReceived != 10 )
{
    // Error unless the item was removed by a different task.
}

// The queue is still full. Use xQueueOverwrite() to overwrite the
// value held in the queue with 100.
ulVarToSend = 100;
xQueueOverwrite( xQueue, &ulVarToSend );

// This time read from the queue, leaving the queue empty once more.
// A block time of 0 is used again.
xQueueReceive( xQueue, &ulValReceived, 0 );

// The value read should be the last value written, even though the
// queue was already full when the value was written.
if( ulValReceived != 100 )
{
    // Error!
}

// ...
}
```

**Parameters**
- `xQueue` - The handle of the queue to which the data is being sent.
- `pvItemToQueue` - A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.

**Returns**
- `xQueueOverwrite()` is a macro that calls `xQueueGenericSend()`, and therefore has the same return values as `xQueueSendToFront()`. However, `pdPASS` is the only value that can be returned because `xQueueOverwrite()` will write to the queue even when the queue is already full.

### xQueueSendToFrontFromISR

```c
xQueueSendToFrontFromISR( xQueue, pvItemToQueue, pxHigherPriorityTaskWoken )
```

This is a macro that calls `xQueueGenericSendFromISR()`.

Post an item to the front of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called
from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendToFrontFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
    {
        taskYIELD();
    }
}
```

**Parameters**

- `xQueue` - The handle to the queue on which the item is to be posted.
- `pvItemToQueue` - A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from `pvItemToQueue` into the queue storage area.
- `pxHigherPriorityTaskWoken` - `xQueueSendToFrontFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE` if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If `xQueueSendToFromFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited.

**Returns**

- `pdTRUE` if the data was successfully sent to the queue, otherwise `errQUEUE_FULL`.

**Example usage for buffered IO (where the ISR can obtain more than one value per call):**

```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Obtain a byte from the buffer.
    cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

    // Post the byte.
    xQueueSendToFrontFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendToFrontFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
    {
        taskYIELD();
    }
}
```
// Loop until the buffer is empty.
do{
    // Obtain a byte from the buffer.
    cIn = portINPUT_BYTE(RX_REGISTER_ADDRESS);
    // Post the byte.
    xQueueSendToBackFromISR(xRxQueue, &cIn, &xHigherPriorityTaskWoken);
} while(portINPUT_BYTE(BUFFER_COUNT));
// Now the buffer is empty we can switch context if necessary.
if(xHigherPriorityTaskWoken){
taskYIELD();
}

Parameters
- xQueue - The handle to the queue on which the item is to be posted.
- pvItemToQueue - A pointer to the item that is to be placed on the queue. The size of
  the items the queue will hold was defined when the queue was created, so this many bytes
  will be copied from pvItemToQueue into the queue storage area.
- pxHigherPriorityTaskWoken - xQueueSendToBackFromISR() will set *px-
  HigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock,
  and the unblocked task has a priority higher than the currently running task. If xQueue-
  SendToBackFromISR() sets this value to pdTRUE then a context switch should be re-
  quested before the interrupt is exited.

Returns  pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

xQueueOverwriteFromISR(xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)
A version of xQueueOverwrite() that can be used in an interrupt service routine (ISR).
Only for use with queues that can hold a single item - so the queue is either empty or full.
Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is
queued by copy, not by reference.

Example usage:

```c
QueueHandle_t xQueue;

void vFunction( void *pvParameters )
{
    // Create a queue to hold one uint32_t value. It is strongly
    // recommended *not* to use xQueueOverwriteFromISR() on queues that can
    // contain more than one value, and doing so will trigger an assertion
    // if configASSERT() is defined.
    xQueue = xQueueCreate( 1, sizeof( uint32_t ) );
}

void vAnInterruptHandler( void )
{
    // xHigherPriorityTaskWoken must be set to pdFALSE before it is used.
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;
    uint32_t ulVarToSend, ulValReceived;
    // (continues on next page)
```
// Write the value 10 to the queue using xQueueOverwriteFromISR().
ulVarToSend = 10;
xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

// The queue is full, but calling xQueueOverwriteFromISR() again will still
// pass because the value held in the queue will be overwritten with the
// new value.
ulVarToSend = 100;
xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

// Reading from the queue will now return 100.

if( xHigherPriorityTaskWoken == pdTRUE )
{
    // Writing to the queue caused a task to unblock and the unblocked task
    // has a priority higher than or equal to the priority of the currently
    // executing task (the task this interrupt interrupted). Perform a-
    // context switch so this interrupt returns directly to the unblocked task.
    portYIELD_FROM_ISR(); // or portEND_SWITCHING_ISR() depending on the port.
}

Parameters

- **xQueue** - The handle to the queue on which the item is to be posted.
- **pvItemToQueue** - A pointer to the item that is to be placed on the queue. The size of
  the items the queue will hold was defined when the queue was created, so this many bytes
  will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** - xQueueOverwriteFromISR() will set *pxHigher-
  PriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the
  unblocked task has a priority higher than the currently running task. If xQueueOverwrite-
  FromISR() sets this value to pdTRUE then a context switch should be requested before
  the interrupt is exited.

Returns xQueueOverwriteFromISR() is a macro that calls xQueueGenericSendFromISR(), and
therefore has the same return values as xQueueSendToFrontFromISR(). However, pdPASS
is the only value that can be returned because xQueueOverwriteFromISR() will write to the
queue even when the queue is already full.

**xQueueSendFromISR** (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR(). It is included for backward compatibility with
versions of FreeRTOS.org that did not include the xQueueSendToBackFromISR() and xQueueSendToFront-
FromISR() macros.

Post an item to the back of a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called
from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;
    // We have not woken a task at the start of the ISR.
```
xHigherPriorityTaskWoken = pdFALSE;

// Loop until the buffer is empty.
do
{
    // Obtain a byte from the buffer.
    cIn = portINPUT_BYTE(RX_REGISTER_ADDRESS);

    // Post the byte.
    xQueueSendFromISR(xRxQueue, &cIn, &xHigherPriorityTaskWoken);
}
while(portINPUT_BYTE(BUFFER_COUNT));

// Now the buffer is empty we can switch context if necessary.
if(xHigherPriorityTaskWoken)
{
    // Actual macro used here is port specific.
    portYIELD_FROM_ISR();
}

Parameters

• xQueue – The handle to the queue on which the item is to be posted.
• pvItemToQueue – A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
• pxHigherPriorityTaskWoken – xQueueSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

Returns

pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

xQueueReset(xQueue)

Reset a queue back to its original empty state. The return value is now obsolete and is always set to pdPASS.

Type Definitions

typedef struct QueueDefinition *QueueHandle_t

typedef struct QueueDefinition *QueueSetHandle_t

Type by which queue sets are referenced. For example, a call to xQueueCreateSet() returns an xQueueSet variable that can then be used as a parameter to xQueueSelectFromSet(), xQueueAddToSet(), etc.

typedef struct QueueDefinition *QueueSetMemberHandle_t

Queue sets can contain both queues and semaphores, so the QueueSetMemberHandle_t is defined as a type to be used where a parameter or return value can be either an QueueHandle_t or an SemaphoreHandle_t.

Semaphore API

Header File

• components/freertos/FreeRTOS-Kernel/include/freertos/semphr.h
• This header file can be included with:
```c
#include "freertos/semphr.h"
```

## Macros

- `semBINARY_SEMAPHORE_QUEUE_LENGTH`
- `semSEMAPHORE_QUEUE_ITEM_LENGTH`
- `semGIVE_BLOCK_TIME`

### `vSemaphoreCreateBinary` (xSemaphore)

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! [https://www.FreeRTOS.org/RTOS-task-notifications.html](https://www.FreeRTOS.org/RTOS-task-notifications.html)

This old `vSemaphoreCreateBinary()` macro is now deprecated in favour of the `xSemaphoreCreateBinary()` function. Note that binary semaphores created using the `vSemaphoreCreateBinary()` macro are created in a state such that the first call to ‘take’ the semaphore would pass, whereas binary semaphores created using `xSemaphoreCreateBinary()` are created in a state such that the semaphore must first be ‘given’ before it can be ‘taken’.

**Macro** that implements a semaphore by using the existing queue mechanism. The queue length is 1 as this is a binary semaphore. The data size is 0 as we don’t want to actually store any data - we just want to know if the queue is empty or full.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see `xSemaphoreCreateMutex()`.

### Example usage:

```c
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to vSemaphoreCreateBinary().
    // This is a macro so pass the variable in directly.
    vSemaphoreCreateBinary( xSemaphore );

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

### Parameters

- `xSemaphore` - Handle to the created semaphore. Should be of type `SemaphoreHandle_t`.

### `xSemaphoreCreateBinary()`

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! [https://www.FreeRTOS.org/RTOS-task-notifications.html](https://www.FreeRTOS.org/RTOS-task-notifications.html)
Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using xSemaphoreCreateBinary() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateBinary() function. (see https://www.FreeRTOS.org/a00111.html). If a binary semaphore is created using xSemaphoreCreateBinaryStatic() then the application writer must provide the memory. xSemaphoreCreateBinaryStatic() therefore allows a binary semaphore to be created without using any dynamic memory allocation.

The old vSemaphoreCreateBinary() macro is now deprecated in favour of this xSemaphoreCreateBinary() function. Note that binary semaphores created using the vSemaphoreCreateBinary() macro are created in a state such that the first call to ‘take’ the semaphore would pass, whereas binary semaphores created using xSemaphoreCreateBinary() are created in a state such that the the semaphore must first be ‘given’ before it can be ‘taken’.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see xSemaphoreCreateMutex().

Example usage:

```c
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateBinary().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateBinary();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**Returns** Handle to the created semaphore, or NULL if the memory required to hold the semaphore’s data structures could not be allocated.

**xSemaphoreCreateBinaryStatic** (pxStaticSemaphore)

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

NOTE: In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! [https://www.FreeRTOS.org/RTOS-task-notifications.html](https://www.FreeRTOS.org/RTOS-task-notifications.html)

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using xSemaphoreCreateBinary() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateBinary() function. (see https://www.FreeRTOS.org/a00111.html). If a binary semaphore is created using xSemaphoreCreateBinaryStatic() then the application writer must provide the memory. xSemaphoreCreateBinaryStatic() therefore allows a binary semaphore to be created without using any dynamic memory allocation.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see xSemaphoreCreateMutex().

Example usage:
SemaphoreHandle_t xSemaphore = NULL;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateBinary().
    // The semaphore's data structures will be placed in the xSemaphoreBuffer
    // variable, the address of which is passed into the function. The
    // function's parameter is not NULL, so the function will not attempt any
    // dynamic memory allocation, and therefore the function will not return
    // return NULL.
    xSemaphore = xSemaphoreCreateBinary( &xSemaphoreBuffer );

    // Rest of task code goes here.
}

Parameters

- **pxStaticSemaphore**—Must point to a variable of type StaticSemaphore_t, which will
  then be used to hold the semaphore’s data structure, removing the need for the memory
to be allocated dynamically.

Returns If the semaphore is created then a handle to the created semaphore is returned. If
pxSemaphoreBuffer is NULL then NULL is returned.

**xSemaphoreTake(xSemaphore, xBlockTime)**

Macro to obtain a semaphore. The semaphore must have previously been created with a call to xSemaphoreCreateBinary(), xSemaphoreCreateMutex() or xSemaphoreCreateCounting().

Example usage:

```c
SemaphoreHandle_t xSemaphore = NULL;

// A task that creates a semaphore.
void vATask( void * pvParameters )
{
    // Create the semaphore to guard a shared resource.
    xSemaphore = xSemaphoreCreateBinary();
}

// A task that uses the semaphore.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.
    if( xSemaphore != NULL )
    {
        // See if we can obtain the semaphore. If the semaphore is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTake( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the semaphore and can now access the
            // shared resource.
            // ...
            // We have finished accessing the shared resource. Release the
            // semaphore.
            xSemaphoreGive( xSemaphore );
        }
    }
    else
    
(continues on next page)```
{  
    // We could not obtain the semaphore and can therefore not access  
    // the shared resource safely.  
}

### Parameters

- **xSemaphore** - A handle to the semaphore being taken - obtained when the semaphore was created.
- **xBlockTime** - The time in ticks to wait for the semaphore to become available. The macro portTICK_PERIOD_MS can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. A block time of portMAX_DELAY can be used to block indefinitely (provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h).

### Returns

- **pdTRUE** if the semaphore was obtained. **pdFALSE** if xBlockTime expired without the semaphore becoming available.

#### xSemaphoreTakeRecursive(xMutex, xBlockTime)

Macro to recursively obtain, or ‘take’, a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex();

- configUSE_RECURSIVE_MUTEXES must be set to 1 in FreeRTOSConfig.h for this macro to be available.

This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

### Example usage:

```c
SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
    xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.

    if( xMutex != NULL )
    {
        // See if we can obtain the mutex. If the mutex is not available  
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTakeRecursive( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the mutex and can now access the  
            // shared resource.
            // ...  
            // For some reason due to the nature of the code further calls to  
            // xSemaphoreTakeRecursive() are made on the same mutex. In real  
            // code these would not be just sequential calls as this would make
```

(continues on next page)
// no sense. Instead the calls are likely to be buried inside
// a more complex call structure.
xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

// The mutex has now been 'taken' three times, so will not be
// available to another task until it has also been given back
// three times. Again it is unlikely that real code would have
// these calls sequentially, but instead buried in a more complex
// call structure. This is just for illustrative purposes.
xSemaphoreGiveRecursive( xMutex );
xSemaphoreGiveRecursive( xMutex );
xSemaphoreGiveRecursive( xMutex );

// Now the mutex can be taken by other tasks.
} else
{
  // We could not obtain the mutex and can therefore not access
  // the shared resource safely.
}
}

Parameters
• **xMutex** —A handle to the mutex being obtained. This is the handle returned by
  xSemaphoreCreateRecursiveMutex();
• **xBlockTime** —The time in ticks to wait for the semaphore to become available. The
  macro portTICK_PERIOD_MS can be used to convert this to a real time. A block time
  of zero can be used to poll the semaphore. If the task already owns the semaphore then
  xSemaphoreTakeRecursive() will return immediately no matter what the value of xBlock-
  Time.

Returns pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without
the semaphore becoming available.

**xSemaphoreGive** (xSemaphore)

Macro to release a semaphore. The semaphore must have previously been created with a call to
xSemaphoreCreateBinary(), xSemaphoreCreateMutex() or xSemaphoreCreateCounting(). and obtained using xSemaphoreTake().

This macro must not be used from an ISR. See xSemaphoreGiveFromISR () for an alternative which can be
used from an ISR.

This macro must also not be used on semaphores created using xSemaphoreCreateRecursiveMutex().

Example usage:

```c
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
  // Create the semaphore to guard a shared resource.
  xSemaphore = vSemaphoreCreateBinary();

  if( xSemaphore != NULL )
  {
    if( xSemaphoreGive( xSemaphore ) != pdTRUE )
    {
    (continues on next page)```
// We would expect this call to fail because we cannot give
// a semaphore without first "taking" it!
}

// Obtain the semaphore - don't block if the semaphore is not
// immediately available.
if( xSemaphoreTake( xSemaphore, ( TickType_t ) 0 ) )
{
    // We now have the semaphore and can access the shared resource.
    // ...

    // We have finished accessing the shared resource so can free the
    // semaphore.
    if( xSemaphoreGive( xSemaphore ) != pdTRUE )
    {
        // We would not expect this call to fail because we must have
        // obtained the semaphore to get here.
    }
}

Parameters

* xSemaphore - A handle to the semaphore being released. This is the handle returned
  when the semaphore was created.

Returns pdTRUE if the semaphore was released. pdFALSE if an error occurred. Semaphores
  are implemented using queues. An error can occur if there is no space on the queue to post a
  message - indicating that the semaphore was not first obtained correctly.

xSemaphoreGiveRecursive (xMutex)

Macro to recursively release, or ‘give’ , a mutex type semaphore. The mutex must have previously been
created using a call to xSemaphoreCreateRecursiveMutex();

configUSE_RECURSIVE_MUTEXES must be set to 1 in FreeRTOSConfig.h for this macro to be available.
This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available
again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example,
if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task
until it has also ‘given’ the mutex back exactly five times.

Example usage:

SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
    xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.
if( xMutex != NULL )
{
    // See if we can obtain the mutex. If the mutex is not available
    // wait 10 ticks to see if it becomes free.
    if( xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 ) == pdTRUE )
    {
        // We were able to obtain the mutex and can now access the
        // shared resource.
        // ...
        // For some reason due to the nature of the code further calls to
        // xSemaphoreTakeRecursive() are made on the same mutex. In real
        // code these would not be just sequential calls as this would make
        // no sense. Instead the calls are likely to be buried inside
        // a more complex call structure.
        xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
        xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
        xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
        // The mutex has now been 'taken' three times, so will not be
        // available to another task until it has also been given back
        // three times. Again it is unlikely that real code would have
        // these calls sequentially, it would be more likely that the calls
        // to xSemaphoreGiveRecursive() would be called as a call stack
        // unwound. This is just for demonstrative purposes.
        xSemaphoreGiveRecursive( xMutex );
        xSemaphoreGiveRecursive( xMutex );
        xSemaphoreGiveRecursive( xMutex );
        // Now the mutex can be taken by other tasks.
    }
    else
    {
        // We could not obtain the mutex and can therefore not access
        // the shared resource safely.
    }
}

Parameters
- xMutex - A handle to the mutex being released, or ‘given’. This is the handle returned
  by xSemaphoreCreateMutex();

Returns  pdTRUE if the semaphore was given.

xSemaphoreGiveFromISR(xSemaphore, pxHigherPriorityTaskWoken)

Macro to release a semaphore. The semaphore must have previously been created with a call to
xSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this
macro. This macro can be used from an ISR.

Example usage:

#define LONG_TIME 0xffff
#define TICKS_TO_WAIT 10
SemaphoreHandle_t xSemaphore = NULL;

// Repetitive task.
```c
void vATask( void * pvParameters )
{
    for( ;; )
    {
        // We want this task to run every 10 ticks of a timer. The semaphore
        // was created before this task was started.

        // Block waiting for the semaphore to become available.
        if( xSemaphoreTake( xSemaphore, LONG_TIME ) == pdTRUE )
        {
            // It is time to execute.
            // ...

            // We have finished our task. Return to the top of the loop where
            // we will block on the semaphore until it is time to execute
            // again. Note when using the semaphore for synchronisation with an
            // ISR in this manner there is no need to 'give' the semaphore back.
        }
    }
}

// Timer ISR
void vTimerISR( void * pvParameters )
{
    static uint8_t ucLocalTickCount = 0;
    static BaseType_t xHigherPriorityTaskWoken;

    // A timer tick has occurred.
    // ... Do other time functions.

    // Is it time for vATask () to run?
    xHigherPriorityTaskWoken = pdFALSE;
    ucLocalTickCount++;
    if( ucLocalTickCount >= TICKS_TO_WAIT )
    {
        // Unblock the task by releasing the semaphore.
        xSemaphoreGiveFromISR( xSemaphore, &xHigherPriorityTaskWoken );

        // Reset the count so we release the semaphore again in 10 ticks time.
        ucLocalTickCount = 0;
    }

    if( xHigherPriorityTaskWoken != pdFALSE )
    {
        // We can force a context switch here. Context switching from an
        // ISR uses port specific syntax. Check the demo task for your port
        // to find the syntax required.
    }
}
```

**Parameters**

- `xSemaphore` - A handle to the semaphore being released. This is the handle returned when the semaphore was created.

- `pxHigherPriorityTaskWoken` - `xSemaphoreGiveFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE` if giving the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If `xSemaphoreGiveFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited.

**Returns** `pdTRUE` if the semaphore was successfully given, otherwise `errQUEUE_FULL`.
**xSemaphoreTakeFromISR (xSemaphore, pxHigherPriorityTaskWoken)**

Macro to take a semaphore from an ISR. The semaphore must have previously been created with a call to xSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this macro.

This macro can be used from an ISR, however taking a semaphore from an ISR is not a common operation. It is likely to only be useful when taking a counting semaphore when an interrupt is obtaining an object from a resource pool (when the semaphore count indicates the number of resources available).

**Parameters**

- **xSemaphore** - A handle to the semaphore being taken. This is the handle returned when the semaphore was created.
- **pxHigherPriorityTaskWoken** - xSemaphoreTakeFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if taking the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreTakeFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**Returns**

pdTRUE if the semaphore was successfully taken, otherwise pdFALSE

---

**xSemaphoreCreateMutex()**

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see https://www.FreeRTOS.org/a00111.html). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provided the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

**Example usage:**

```c
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateMutex();

    if( xSemaphore !- NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**Returns**

If the mutex was successfully created then a handle to the created semaphore is returned.

If there was not enough heap to allocate the mutex data structures then NULL is returned.
xSemaphoreCreateMutexStatic(pxMutexBuffer)

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see https://www.FreeRTOS.org/a00111.html). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provided the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```c
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void * pvParameters )
{
    // A mutex cannot be used before it has been created. xMutexBuffer is
    // into xSemaphoreCreateMutexStatic() so no dynamic memory allocation is
    // attempted.
    xSemaphore = xSemaphoreCreateMutexStatic( &xMutexBuffer );

    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
    // so there is no need to check it.
}
```

Parameters

• **pxMutexBuffer** – Must point to a variable of type StaticSemaphore_t, which will be used to hold the mutex’s data structure, removing the need for the memory to be allocated dynamically.

Returns

If the mutex was successfully created then a handle to the created mutex is returned. If pxMutexBuffer was NULL then NULL is returned.

xSemaphoreCreateRecursiveMutex()

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using xSemaphoreCreateRecursiveMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateRecursiveMutex() function. (see https://www.FreeRTOS.org/a00111.html). If a recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic() then the application writer must provide the memory that will get used by the mutex. xSemaphoreCreateRecursiveMutexStatic() therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros. The xSemaphoreTake() and xSemaphoreGive() macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example,
if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```c
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateRecursiveMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

Returns xSemaphore Handle to the created mutex semaphore. Should be of type SemaphoreHandle_t.

**xSemaphoreCreateRecursiveMutexStatic**(pxStaticSemaphore)

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using xSemaphoreCreateRecursiveMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateRecursiveMutex() function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic() then the application writer must provide the memory that will get used by the mutex. xSemaphoreCreateRecursiveMutexStatic() therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros. The xSemaphoreTake() and xSemaphoreGive() macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.
Example usage:

```c
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask ( void * pvParameters )
{
    // A recursive semaphore cannot be used before it is created. Here a
    // recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic().
    // The address of xMutexBuffer is passed into the function, and will hold
    // the mutexes data structures - so no dynamic memory allocation will be
    // attempted.
    xSemaphore = xSemaphoreCreateRecursiveMutexStatic( &xMutexBuffer );

    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
    // so there is no need to check it.
}
```

**Parameters**

- `pxStaticSemaphore` - Must point to a variable of type `StaticSemaphore_t`, which will then be used to hold the recursive mutex’s data structure, removing the need for the memory to be allocated dynamically.

**Returns**

If the recursive mutex was successfully created then a handle to the created recursive mutex is returned. If `pxStaticSemaphore` was NULL then NULL is returned.

### `xSemaphoreCreateCounting` *(uxMaxCount, uxInitialCount)*

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! [https://www.FreeRTOS.org/RTOS-task-notifications.html](https://www.FreeRTOS.org/RTOS-task-notifications.html)

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using `xSemaphoreCreateCounting()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateCounting()` function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a counting semaphore is created using `xSemaphoreCreateCountingStatic()` then the application writer can instead optionally provide the memory that will get used by the counting semaphore. `xSemaphoreCreateCountingStatic()` therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will ‘give’ a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will ‘take’ a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it ‘gives’ the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

Example usage:
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    SemaphoreHandle_t xSemaphore = NULL;

    // Semaphore cannot be used before a call to xSemaphoreCreateCounting().
    // The max value to which the semaphore can count should be 10, and the
    // initial value assigned to the count should be 0.
    xSemaphore = xSemaphoreCreateCounting( 10, 0 );

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}

Parameters

• uxMaxCount – The maximum count value that can be reached. When the semaphore
  reaches this value it can no longer be ‘given’.
• uxInitialCount – The count value assigned to the semaphore when it is created.

Returns Handle to the created semaphore. Null if the semaphore could not be created.

xSemaphoreCreateCountingStatic(uxMaxCount, uxInitialCount, pxSemaphoreBuffer)

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can
be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the
counting semaphore structure is stored. If a counting semaphore is created using xSemaphoreCreateCount-
ing() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateCount-
ing() function. (see https://www.FreeRTOS.org/a00111.html). If a counting semaphore is created using
xSemaphoreCreateCountingStatic() then the application writer must provide the memory. xSemaphoreCre-
ateCountingStatic() therefore allows a counting semaphore to be created without using any dynamic memory
allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will ‘give’ a semaphore each time an event occurs (incrementing
the semaphore count value), and a handler task will ‘take’ a semaphore each time it processes an event
(decrementing the semaphore count value). The count value is therefore the difference between the number of
events that have occurred and the number that have been processed. In this case it is desirable for the initial
count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a
resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value
reaches zero there are no free resources. When a task finishes with the resource it ‘gives’ the semaphore back
- incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to
the maximum count value, indicating that all resources are free.

Example usage:
Chapter 2. API Reference

SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )
{
    SemaphoreHandle_t xSemaphore = NULL;

    // Counting semaphore cannot be used before they have been created. Create
    // a counting semaphore using xSemaphoreCreateCountingStatic(). The max
    // value to which the semaphore can count is 10, and the initial value
    // assigned to the count will be 0. The address of xSemaphoreBuffer is
    // passed in and will be used to hold the semaphore structure, so no dynamic
    // memory allocation will be used.
    xSemaphore = xSemaphoreCreateCounting( 10, 0, &xSemaphoreBuffer );

    // No memory allocation was attempted so xSemaphore cannot be NULL, so there
    // is no need to check its value.
}

vSemaphoreDelete( xSemaphore )
Delete a semaphore. This function must be used with care. For example, do not delete a mutex type semaphore
if the mutex is held by a task.

Parameters
• xSemaphore - A handle to the semaphore to be deleted.

xSemaphoreGetMutexHolder( xSemaphore )
If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type
semaphore, or the mutex is available (not held by a task), return NULL.

Note: This is a good way of determining if the calling task is the mutex holder, but not a good way of deter-
mining the identity of the mutex holder as the holder may change between the function exiting and the returned
value being tested.

xSemaphoreGetMutexHolderFromISR( xSemaphore )
If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type
semaphore, or the mutex is available (not held by a task), return NULL.

uxSemaphoreGetCount( xSemaphore )
If the semaphore is a counting semaphore then uxSemaphoreGetCount() returns its current count value. If the
semaphore is a binary semaphore then uxSemaphoreGetCount() returns 1 if the semaphore is available, and 0
if the semaphore is not available.

uxSemaphoreGetCountFromISR( xSemaphore )
semphr.h

UBaseType_t uxSemaphoreGetCountFromISR( SemaphoreHandle_t xSemaphore );

If the semaphore is a counting semaphore then uxSemaphoreGetCountFromISR() returns its current count
value. If the semaphore is a binary semaphore then uxSemaphoreGetCountFromISR() returns 1 if the
semaphore is available, and 0 if the semaphore is not available.
xSemaphoreGetStaticBuffer (xSemaphore, ppxSemaphoreBuffer)
Retrieve pointer to a statically created binary semaphore, counting semaphore, or mutex semaphore’s data structure buffer. This is the same buffer that is supplied at the time of creation.

Parameters
• xSemaphore – The semaphore for which to retrieve the buffer.
• ppxSemaphoreBuffer – Used to return a pointer to the semaphore’s data structure buffer.

Returns pdTRUE if buffer was retrieved, pdFALSE otherwise.

Type Definitions
typedef QueueHandle_t SemaphoreHandle_t

Timer API

Header File
• components/freertos/FreeRTOS-Kernel/include/freertos/timers.h
• This header file can be included with:

```
#include "freertos/timers.h"
```

Functions
TimerHandle_t xTimerCreate (const char *const pcTimerName, const TickType_t xTimerPeriodInTicks, const BaseType_t xAutoReload, void *const pvTimerID, TimerCallbackFunction_t pxCallbackFunction)
Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using xTimerCreate() then the required memory is automatically dynamically allocated inside the xTimerCreate() function. (see https://www.FreeRTOS.org/a00111.html). If a software timer is created using xTimerCreateStatic() then the application writer must provide the memory that will get used by the software timer. xTimerCreateStatic() therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:
```
* #define NUM_TIMERS 5
* 
* // An array to hold handles to the created timers.
* TimerHandle_t xTimers[ NUM_TIMERS ];
* 
* // An array to hold a count of the number of times each timer expires.
* int32_t lExpireCounters[ NUM_TIMERS ] = { 0 };
* 
* // Define a callback function that will be used by multiple timer instances.
* // The callback function does nothing but count the number of times the
* // associated timer expires, and stop the timer once the timer has expired
* // 10 times.
* void vTimerCallback( TimerHandle_t pxTimer )

(continues on next page)
* { int32_t lArrayIndex;
  const int32_t xMaxExpiryCountBeforeStopping = 10;

  // Optionally do something if the pxTimer parameter is NULL.
  configASSERT( pxTimer );

  // Which timer expired?
  lArrayIndex = ( int32_t ) pvTimerGetTimerID( pxTimer );

  // Increment the number of times that pxTimer has expired.
  lExpireCounters[ lArrayIndex ] += 1;

  // If the timer has expired 10 times then stop it from running.
  if( lExpireCounters[ lArrayIndex ] == xMaxExpiryCountBeforeStopping )
  {
    // Do not use a block time if calling a timer API function from a
    // timer callback function, as doing so could cause a deadlock!
    xTimerStop( pxTimer, 0 );
  }
}

void main( void )
{
  int32_t x;

  // Create then start some timers. Starting the timers before the
  // scheduler
  // has been started means the timers will start running immediately that
  // the scheduler starts.
  for( x = 0; x < NUM_TIMERS; x++ )
  {
    xTimers[ x ] = xTimerCreate( "Timer", // Just a text
    // name, not used by the kernel.
    ( 100 * ( x + 1 ) ), // The timer
    // period in ticks.
    pdTRUE, // The timers
    // will auto-reload themselves when they expire.
    ( void * ) x, // Assign each
    // timer a unique id equal to its array index.
    vTimerCallback // Each timer
    // calls the same callback when it expires.
    );

    if( xTimers[ x ] == NULL )
    {
      // The timer was not created.
    }
    else
    {
      // Start the timer. No block time is specified, and even if one
      // was
      // it would be ignored because the scheduler has not yet been
      // started.
      if( xTimerStart( xTimers[ x ], 0 ) != pdPASS )
      {
        // The timer could not be set into the Active state.
      }
    }
  }
}
---

* // Starting the scheduler will start the timers running as they have already been set into the active state.
* vTaskStartScheduler();
* // Should not reach here.
* for( ;; );
* }

### Parameters

- **pcTimerName** – A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.
- **xTimerPeriodInTicks** – The timer period. The time is defined in tick periods so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000. Time timer period must be greater than 0.
- **xAutoReload** – If xAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the xTimerPeriodInTicks parameter. If xAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.
- **pvTimerID** – An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.
- **pxCallbackFunction** – The function to call when the timer expires. Callback functions must have the prototype defined by TimerCallbackFunction_t, which is “void vCallbackFunction(TimerHandle_t xTimer);”.

### Returns

If the timer is successfully created then a handle to the newly created timer is returned. If the timer cannot be created because there is insufficient FreeRTOS heap remaining to allocate the timer structures then NULL is returned.

```c
TimerHandle_t xTimerCreateStatic(const char *const pcTimerName, const TickType_t xTimerPeriodInTicks, const BaseType_t xAutoReload, void *const pvTimerID, TimerCallbackFunction_t pxCallbackFunction, StaticTimer_t *pxTimerBuffer)
```

Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using xTimerCreate() then the required memory is automatically dynamically allocated inside the xTimerCreate() function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a software timer is created using xTimerCreateStatic() then the application writer must provide the memory that will get used by the software timer. xTimerCreateStatic() therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:
The buffer used to hold the software timer's data structure.
static StaticTimer_t xTimerBuffer;

A variable that will be incremented by the software timer's callback function.
UBaseType_t uxVariableToIncrement = 0;

A software timer callback function that increments a variable passed to it when the software timer was created. After the 5th increment the callback function stops the software timer.
static void prvTimerCallback( TimerHandle_t xExpiredTimer )
{
    UBaseType_t *pxuVariableToIncrement;
    BaseType_t xReturned;

    // Obtain the address of the variable to increment from the timer ID.
    pxuVariableToIncrement = ( UBaseType_t *) pvTimerGetTimerID(xExpiredTimer);

    // Increment the variable to show the timer callback has executed.
    (*pxuVariableToIncrement)++;

    // If this callback has executed the required number of times, stop the timer.
    if (*pxuVariableToIncrement == 5)
    {
        // This is called from a timer callback so must not block.
        xTimerStop( xExpiredTimer, staticDONT_BLOCK );
    }
}

void main( void )
{
    // Create the software time. xTimerCreateStatic() has an extra parameter
    // than the normal xTimerCreate() API function. The parameter is a pointer
    // to the StaticTimer_t structure that will hold the software timer
    // structure. If the parameter is passed as NULL then the structure
    // will be allocated dynamically, just as if xTimerCreate() had been called.
    xTimer = xTimerCreateStatic( "T1", // Text name for the task.
    xTimerPeriod, // The period of the timer in ticks.
    pdTRUE, // This is an auto-reload timer.
    ( void * ) &uxVariableToIncrement, // A variable incremented by the software timer's callback function
    prvTimerCallback, // The function to execute when the timer expires.
    &xTimerBuffer ); // The buffer that will hold the software timer structure.

    // The scheduler has not started yet so a block time is not used.
    xReturned = xTimerStart( xTimer, 0 );

    // ...
    // Create tasks here.
    // ...

(continues on next page)
// Starting the scheduler will start the timers running as they have already been set into the active state.
void vTaskStartScheduler();

// Should not reach here.
for(;;);
}

Parameters

- **pcTimerName** – A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.

- **xTimerPeriodInTicks** – The timer period. The time is defined in tick periods so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to \((500 / \text{portTICK\_PERIOD\_MS})\) provided configTICK\_RATE\_HZ is less than or equal to 1000. The timer period must be greater than 0.

- **xAutoReload** – If xAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the xTimerPeriodInTicks parameter. If xAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.

- **pvTimerID** – An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.

- **pxCallbackFunction** – The function to call when the timer expires. Callback functions must have the prototype defined by TimerCallbackFunction_t, which is "void vCallbackFunction(TimerHandle_t xTimer);".

- **pxTimerBuffer** – Must point to a variable of type StaticTimer_t, which will be then be used to hold the software timer’s data structures, removing the need for the memory to be allocated dynamically.

Returns If the timer is created then a handle to the created timer is returned. If pxTimerBuffer was NULL then NULL is returned.

```c
void *pvTimerGetTimerID(const TimerHandle_t xTimer)
{
    // Get the ID assigned to the timer.
    //IDs are assigned to timers using the pvTimerID parameter of the call to xTimerCreated() that was used to create the timer, and by calling the vTimerSetTimerID() API function.

    // If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

    Example usage:

    See the xTimerCreate() API function example usage scenario.

    **Parameters**
    - **xTimer** – The timer being queried.

    **Returns**
    The ID assigned to the timer being queried.

void vTimerSetTimerID(TimerHandle_t xTimer, void *pvNewID)
{
    // Set the ID assigned to the timer.
    //IDs are assigned to timers using the pvTimerID parameter of the call to xTimerCreated() that was used to create the timer.
```
If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:
See the xTimerCreate() API function example usage scenario.

**Parameters**

- `xTimer` - The timer being updated.
- `pvNewID` - The ID to assign to the timer.

**BaseType_t xTimerIsTimerActive (TimerHandle_t xTimer)**

Queries a timer to see if it is active or dormant.

A timer will be dormant if: 1) It has been created but not started, or 2) It is an expired one-shot timer that has not been restarted.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:
```
* // This function assumes xTimer has already been created.
* void vAFunction( TimerHandle_t xTimer )
* {
*   if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and
*     // equivalently "if( xTimerIsTimerActive( xTimer ) )"
*   {
*     // xTimer is active, do something.
*   } else
*   {
*     // xTimer is not active, do something else.
*   }
* }
```

**Parameters** `xTimer` - The timer being queried.

**Returns** `pdFALSE` will be returned if the timer is dormant. A value other than `pdFALSE` will be returned if the timer is active.

**TaskHandle_t xTimerGetTimerDaemonTaskHandle (void)**

Simply returns the handle of the timer service/daemon task. It it not valid to call xTimerGetTimerDaemonTaskHandle() before the scheduler has been started.

**BaseType_t xTimerPendFunctionCallFromISR (PendedFunction_t xFunctionToPend, void**

*pvParameter1, uint32_t ulParameter2, BaseType_t**

*pxHigherPriorityTaskWoken)

Used from application interrupt service routines to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in timers.c and is prefixed with ‘Timer’).

Ideally an interrupt service routine (ISR) is kept as short as possible, but sometimes an ISR either has a lot of processing to do, or needs to perform processing that is not deterministic. In these cases xTimerPendFunctionCallFromISR() can be used to defer processing of a function to the RTOS daemon task.

A mechanism is provided that allows the interrupt to return directly to the task that will subsequently execute the pended callback function. This allows the callback function to execute contiguously in time with the interrupt - just as if the callback had executed in the interrupt itself.
Example usage:

```c
* // The callback function that will execute in the context of the daemon...
* //task.
* // Note callback functions must all use this same prototype.
* void vProcessInterface( void *pvParameter1, uint32_t ulParameter2 )
* {
*     BaseType_t xInterfaceToService;
*     
*     // The interface that requires servicing is passed in the second
*     // parameter. The first parameter is not used in this case.
*     xInterfaceToService = ( BaseType_t ) ulParameter2;
*     
*     // ...Perform the processing here...
* }
* 
* // An ISR that receives data packets from multiple interfaces
* void vAnISR( void )
* {
*     BaseType_t xInterfaceToService, xHigherPriorityTaskWoken;
*     
*     // Query the hardware to determine which interface needs processing.
*     xInterfaceToService = prvCheckInterfaces();
*     
*     // The actual processing is to be deferred to a task. Request the
*     // vProcessInterface() callback function is executed, passing in the
*     // number of the interface that needs processing. The interface to
*     // service is passed in the second parameter. The first parameter is
*     // not used in this case.
*     xHigherPriorityTaskWoken = pdFALSE;
*     xTimerPendFunctionCallFromISR( vProcessInterface, NULL, ( uint32_t )
*                                   xInterfaceToService, &xHigherPriorityTaskWoken );
*     
*     // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
*     // switch should be requested. The macro used is port specific and will
*     // be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() - refer to
*     // the documentation page for the port being used.
*     portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
* }
```:

### Parameters

- **xFunctionToPend** - The function to execute from the timer service/daemon task. The function must conform to the PendedFunction_t prototype.
- **pvParameter1** - The value of the callback function’s first parameter. The parameter has a void * type to allow it to be used to pass any type. For example, unsigned longs can be cast to a void *, or the void * can be used to point to a structure.
- **ulParameter2** - The value of the callback function’s second parameter.
- **pxHigherPriorityTaskWoken** - As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task (which is set using configTIMER_TASK_PRIORITY in FreeRTOSConfig.h) is higher than the priority of the currently running task (the task the interrupt interrupted) then *pxHigherPriorityTaskWoken will be set to pdTRUE within xTimerPendFunctionCallFromISR(), indicating that a context switch should be requested before the interrupt exits. For that reason *pxHigherPriorityTaskWoken must be initialised to pdFALSE. See the example code below.

### Returns

pdPASS is returned if the message was successfully sent to the timer daemon task, otherwise pdFALSE is returned.
**Chapter 2. API Reference**

**BaseType_t xTimerPendFunctionCall**(PendedFunction_t xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, TickType_t xTicksToWait)

Used to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in timers.c and is prefixed with mTimer).

**Parameters**

- **xFunctionToPend** - The function to execute from the timer service/daemon task. The function must conform to the PendedFunction_t prototype.
- **pvParameter1** - The value of the callback function’s first parameter. The parameter has a void * type to allow it to be used to pass any type. For example, unsigned longs can be cast to a void *, or the void * can be used to point to a structure.
- **ulParameter2** - The value of the callback function’s second parameter.
- **xTicksToWait** - Calling this function will result in a message being sent to the timer daemon task on a queue. xTicksToWait is the amount of time the calling task should remain in the Blocked state (so not using any processing time) for space to become available on the timer queue if the queue is found to be full.

**Returns**

pdPASS is returned if the message was successfully sent to the timer daemon task, otherwise pdFALSE is returned.

**const char* pcTimerGetName**(TimerHandle_t xTimer)

Returns the name that was assigned to a timer when the timer was created.

**Parameters**

- **xTimer** - The handle of the timer being queried.

**Returns**

The name assigned to the timer specified by the xTimer parameter.

**void vTimerSetReloadMode**(TimerHandle_t xTimer, BaseType_t xAutoReload)

Updates a timer to be either an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

**Parameters**

- **xTimer** - The handle of the timer being updated.
- **xAutoReload** - If xAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the timer’s period (see the xTimerPeriodInTicks parameter of the xTimerCreate() API function). If xAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.

**BaseType_t xTimerGetReloadMode**(TimerHandle_t xTimer)

Queries a timer to determine if it is an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

**Parameters**

- **xTimer** - The handle of the timer being queried.

**Returns**

If the timer is an auto-reload timer then pdTRUE is returned, otherwise pdFALSE is returned.

**UBaseType_t uxTimerGetReloadMode**(TimerHandle_t xTimer)

Queries a timer to determine if it is an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

**Parameters**

- **xTimer** - The handle of the timer being queried.

**Returns**

If the timer is an auto-reload timer then pdTRUE is returned, otherwise pdFALSE is returned.

**TickType_t xTimerGetPeriod**(TimerHandle_t xTimer)

Returns the period of a timer.

**Parameters**

- **xTimer** - The handle of the timer being queried.

**Returns**

The period of the timer in ticks.

**TickType_t xTimerGetExpiryTime**(TimerHandle_t xTimer)

Returns the time in ticks at which the timer will expire. If this is less than the current tick count then the expiry time has overflowed from the current time.
**Parameters**

- **xTimer** - The handle of the timer being queried.

**Returns**

- If the timer is running then the time in ticks at which the timer will next expire is returned.
- If the timer is not running then the return value is undefined.

```c
BaseType_t xTimerGetStaticBuffer(TimerHandle_t xTimer, StaticTimer_t **ppxTimerBuffer)
```

Retrieve pointer to a statically created timer’s data structure buffer. This is the same buffer that is supplied at the time of creation.

**Parameters**

- **xTimer** - The timer for which to retrieve the buffer.
- **ppxTimerBuffer** - Used to return a pointer to the timer’s data structure buffer.

**Returns**

- pdTRUE if the buffer was retrieved, pdFALSE otherwise.

```c
void vApplicationGetTimerTaskMemory(StaticTask_t **ppxTimerTaskTCBBuffer, StackType_t **ppxTimerTaskStackBuffer, uint32_t *pulTimerTaskStackSize)
```

This function is used to provide a statically allocated block of memory to FreeRTOS to hold the Timer Task TCB. This function is required when configSUPPORT_STATIC_ALLOCATION is set. For more information see this URI: https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION

**Parameters**

- **ppxTimerTaskTCBBuffer** - A handle to a statically allocated TCB buffer
- **ppxTimerTaskStackBuffer** - A handle to a statically allocated Stack buffer for the idle task
- **pulTimerTaskStackSize** - A pointer to the number of elements that will fit in the allocated stack buffer

### Macros

**xTimerStart** (xTimer, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerStart() starts a timer that was previously created using the xTimerCreate() API function. If the timer had already been started and was already in the active state, then xTimerStart() has equivalent functionality to the xTimerReset() API function.

Starting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called ‘n’ ticks after xTimerStart() was called, where ‘n’ is the timers defined period.

It is valid to call xTimerStart() before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when xTimerStart() was called.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerStart() to be available.

Example usage:

See the xTimerCreate() API function example usage scenario.

**Parameters**

- **xTimer** - The handle of the timer being started/restarted.
- **xTicksToWait** - Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the start command to be successfully sent to the timer command queue, should the queue already be full when xTimerStart() was called. xTicksToWait is ignored if xTimerStart() is called before the scheduler is started.

**Returns**

- pdFAIL will be returned if the start command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed
will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStart() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

**xTimerStop(xTimer, xTicksToWait)**

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerStop() stops a timer that was previously started using either of the The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() or xTimerChangePeriodFromISR() API functions.

Stopping a timer ensures the timer is not in the active state.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerStop() to be available.

Example usage:

See the xTimerCreate() API function example usage scenario.

**Parameters**

- **xTimer** - The handle of the timer being stopped.
- **xTicksToWait** - Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the stop command to be successfully sent to the timer command queue, should the queue already be full when xTimerStop() was called. xTicksToWait is ignored if xTimerStop() is called before the scheduler is started.

**Returns** pdFAIL will be returned if the stop command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

**xTimerChangePeriod(xTimer, xNewPeriod, xTicksToWait)**

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerChangePeriod() changes the period of a timer that was previously created using the xTimerCreate() API function.

xTimerChangePeriod() can be called to change the period of an active or dormant state timer.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerChangePeriod() to be available.

Example usage:

```c
void vAFunction( TimerHandle_t xTimer )
{
    if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and equivalently "if( xTimerIsTimerActive( xTimer ) )"
    {
        // This function assumes xTimer has already been created. If the timer referenced by xTimer is already active when it is called, then the timer is deleted. If the timer referenced by xTimer is not active when it is called, then the period of the timer is set to 500ms and the timer is started.
    }
}
```

(continues on next page)

Parameters

- **xTimer** - The handle of the timer that is having its period changed.
- **xNewPeriod** - The new period for xTimer. Timer periods are specified in tick periods, so the constant `portTICK_PERIOD_MS` can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xNewPeriod should be set to 100. Alternatively, if the timer must expire after 500ms, then xNewPeriod can be set to `(500 / portTICK_PERIOD_MS)` provided `configTICK_RATE_HZ` is less than or equal to 1000.
- **xTicksToWait** - Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the change period command to be successfully sent to the timer command queue. Should the queue already be full when `xTimerChangePeriod()` was called, xTicksToWait is ignored if xTimerChangePeriod() is called before the scheduler is started.

Returns

`pdFAIL` will be returned if the change period command could not be sent to the timer command queue even after xTicksToWait ticks had passed. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

**xTimerDelete** (xTimer, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the `configTIMER_QUEUE_LENGTH` configuration constant.

xTimerDelete() deletes a timer that was previously created using the xTimerCreate() API function.

The `configUSE_TIMERS` configuration constant must be set to 1 for xTimerDelete() to be available.

Example usage:

See the xTimerChangePeriod() API function example usage scenario.

Parameters
• **xTimer** - The handle of the timer being deleted.
• **xTicksToWait** - Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the delete command to be successfully sent to the timer command queue, should the queue already be full when xTimerDelete() was called. xTicksToWait is ignored if xTimerDelete() is called before the scheduler is started.

**Returns** `pdFAIL` will be returned if the delete command could not be sent to the timer command queue even after xTicksToWait ticks had passed. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

**xTimerReset** (xTimer, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the `configTIMER_QUEUE_LENGTH` configuration constant.

xTimerReset() re-starts a timer that was previously created using the xTimerCreate() API function. If the timer had already been started and was already in the active state, then xTimerReset() will cause the timer to re-evaluate its expiry time so that it is relative to when xTimerReset() was called. If the timer was in the dormant state then xTimerReset() has equivalent functionality to the xTimerStart() API function.

Resetting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called ‘n’ ticks after xTimerReset() was called, where ‘n’ is the timers defined period.

It is valid to call xTimerReset() before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when xTimerReset() was called.

The `configUSE_TIMERS` configuration constant must be set to 1 for xTimerReset() to be available.

**Example usage:**

```c
* // When a key is pressed, an LCD back-light is switched on. If 5 seconds pass
* // without a key being pressed, then the LCD back-light is switched off. In this case, the timer is a one-shot timer.
* TimerHandle_t xBacklightTimer = NULL;
* // The callback function assigned to the one-shot timer. In this case the parameter is not used.
* void vBacklightTimerCallback( TimerHandle_t pxTimer )
* {
*     // The timer expired, therefore 5 seconds must have passed since a key
*     // was pressed. Switch off the LCD back-light.
*     vSetBacklightState( BACKLIGHT_OFF );
* }
* // The key press event handler.
* void vKeyPressEventHandler( char cKey )
* {
*     // Ensure the LCD back-light is on, then reset the timer that is
*     // responsible for turning the back-light off after 5 seconds of
*     // key inactivity. Wait 10 ticks for the command to be successfully sent
*     // if it cannot be sent immediately.
*     vSetBacklightState( BACKLIGHT_ON );
*     if( xTimerReset( xBacklightTimer, 100 ) != pdPASS )
*     {
```

(continues on next page)
* // The reset command was not executed successfully. Take appropriate
* // action here.
* }
* }
* // Perform the rest of the key processing here.
* }
* void main( void )
* {
* int32_t x;
* // Create then start the one-shot timer that is responsible for turning
* // the back-light off if no keys are pressed within a 5 second period.
* xBacklightTimer = xTimerCreate( "BacklightTimer",     // Just a_
* text name, not used by the kernel.
* ( 5000 / portTICK_PERIOD_MS), // The_
* timer period in ticks.
* pdFALSE,    // The timer_
* is a one-shot timer.
* 0,                // The id is_
* not used by the callback so can take any value.
* vBacklightTimerCallback // The_
* callback function that switches the LCD back-light off.
* }
* if( xBacklightTimer == NULL )
* {
* // The timer was not created.
* }
* else
* {
* // Start the timer. No block time is specified, and even if one was
* // it would be ignored because the scheduler has not yet been
* // started.
* if( xTimerStart( xBacklightTimer, 0 ) != pdPASS )
* {
* // The timer could not be set into the Active state.
* }
* }
* // ...
* // Create tasks here.
* // ...
* // Starting the scheduler will start the timer running as it has already
* // been set into the active state.
* vTaskStartScheduler();
* // Should not reach here.
* for( ;; );
* }
*

Parameters

- **xTimer** - The handle of the timer being reset/started/restarted.
- **xTicksToWait** - Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the reset command to be successfully sent to the timer command queue, should the queue already be full when xTimerReset() was called. xTicksToWait is ignored if xTimerReset() is called before the scheduler is started.

Returns pdFAIL will be returned if the reset command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command
was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStart() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

**xTimerStartFromISR** (xTimer, pxHigherPriorityTaskWoken)

A version of xTimerStart() that can be called from an interrupt service routine.

Example usage:

```c
* // This scenario assumes xBacklightTimer has already been created. When a
* // key is pressed, an LCD back-light is switched on. If 5 seconds pass
* // without a key being pressed, then the LCD back-light is switched off. In
* // this case, the timer is a one-shot timer, and unlike the example given for
* // the xTimerReset() function, the key press event handler is an interrupt
* // service routine.
* //
* // The callback function assigned to the one-shot timer. In this case the
* // parameter is not used.
* void vBacklightTimerCallback( TimerHandle_t pxTimer )
* {
*     /∗ The timer expired, therefore 5 seconds must have passed since a key ∗
*     /∗ was pressed. Switch off the LCD back-light. ∗
*     vSetBacklightState( BACKLIGHT_OFF );
* }
* //
* // The key press interrupt service routine.
* void vKeyPressEventInterruptHandler( void )
* {
*    BaseType_t xHigherPriorityTaskWoken = pdFALSE;
*    /∗
*    /∗ Ensure the LCD back-light is on, then restart the timer that is ∗
*    /∗ responsible for turning the back-light off after 5 seconds of ∗
*    /∗ key inactivity. This is an interrupt service routine so can only ∗
*    /∗ call FreeRTOS API functions that end in "FromISR". ∗
*    vSetBacklightState( BACKLIGHT_ON );
*    ∗
*    if( xTimerStartFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) !=
*        pdPASS )
*    {
*        /∗ The start command was not executed successfully. Take appropriate ∗
*        /∗ action here. ∗
*    }
*    /∗
*    /∗ Perform the rest of the key processing here. ∗
*    ∗
*    if xHigherPriorityTaskWoken equals pdTRUE, then a context switch
*    should be performed. The syntax required to perform a context switch
*    from inside an ISR varies from port to port, and from compiler to
*    compiler. Inspect the demos for the port you are using to find the
*    actual syntax required.
*    if( xHigherPriorityTaskWoken != pdFALSE )
*    {
*        // Call the interrupt safe yield function here (actual function
*        // depends on the FreeRTOS port being used).
```
Parameters

- **xTimer** - The handle of the timer being started/restarted.
- **pxHigherPriorityTaskWoken** - The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling `xTimerStartFromISR()` writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling `xTimerStartFromISR()` causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the `xTimerStartFromISR()` function. If `xTimerStartFromISR()` sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

Returns  
pdFAIL will be returned if the start command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when `xTimerStartFromISR()` is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

### xTimerStopFromISR (xTimer, pxHigherPriorityTaskWoken)

A version of `xTimerStop()` that can be called from an interrupt service routine.

Example usage:

```c
/* // This scenario assumes xTimer has already been created and started. When
  * // an interrupt occurs, the timer should be simply stopped.
  *
  * // The interrupt service routine that stops the timer.
  * void vAnExampleInterruptServiceRoutine( void )
  *
  * BaseType_t xHigherPriorityTaskWoken = pdFALSE;
  *
  * // The interrupt has occurred - simply stop the timer.
  * // xHigherPriorityTaskWoken was set to pdFALSE where it was defined
  * // (within this function). As this is an interrupt service routine, only
  * // FreeRTOS API functions that end in "FromISR" can be used.
  * if( xTimerStopFromISR( xTimer, &xHigherPriorityTaskWoken ) != pdPASS )
  * {
  *   // The stop command was not executed successfully. Take appropriate
  *   // action here.
  *   }
  *
  * // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
  * // should be performed. The syntax required to perform a context switch
  * // from inside an ISR varies from port to port, and from compiler to
  * // compiler. Inspect the demos for the port you are using to find the
  * // actual syntax required.
  * if( xHigherPriorityTaskWoken != pdFALSE )
  * {
  *   // Call the interrupt safe yield function here (actual function
  *   // depends on the FreeRTOS port being used).
  *   }
  */
```
**Parameters**
- **xTimer** - The handle of the timer being stopped.
- **pxHigherPriorityTaskWoken** - The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling `xTimerStopFromISR()` writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling `xTimerStopFromISR()` causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then `*pxHigherPriorityTaskWoken` will get set to `pdTRUE` internally within the `xTimerStopFromISR()` function. If `xTimerStopFromISR()` sets this value to `pdTRUE` then a context switch should be performed before the interrupt exits.

**Returns** `pdFAIL` will be returned if the stop command could not be sent to the timer command queue. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

---

**xTimerChangePeriodFromISR** `(xTimer, xNewPeriod, pxHigherPriorityTaskWoken)`
A version of `xTimerChangePeriod()` that can be called from an interrupt service routine.

Example usage:

```c
/* // This scenario assumes xTimer has already been created and started. When
  // an interrupt occurs, the period of xTimer should be changed to 500ms.
  */
/* // The interrupt service routine that changes the period of xTimer.
  */
void vAnExampleInterruptServiceRoutine( void )
{
  BaseType_t xHigherPriorityTaskWoken = pdFALSE;

  /* // The interrupt has occurred - change the period of xTimer to 500ms.
  * // xHigherPriorityTaskWoken was set to pdFALSE where it was defined
  * // (within this function). As this is an interrupt service routine, only
  * // FreeRTOS API functions that end in "FromISR" can be used.
  * if( xTimerChangePeriodFromISR( xTimer, &xHigherPriorityTaskWoken ) !=
  *    pdPASS )
  *  {
  *    // The command to change the timers period was not executed
  *    // successfully. Take appropriate action here.
  *    }
  *  
  *  // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
  *  // should be performed. The syntax required to perform a context switch
  *  // from inside an ISR varies from port to port, and from compiler to
  *  // compiler. Inspect the demos for the port you are using to find the
  *  // actual syntax required.
  *  if( xHigherPriorityTaskWoken != pdFALSE )
  *  {
  *    // Call the interrupt safe yield function here (actual function
  *    // depends on the FreeRTOS port being used).
  *    }
  *  }
  */
```

**Parameters**
- **xTimer** - The handle of the timer that is having its period changed.
- **xNewPeriod** - The new period for `xTimer`. Timer periods are specified in tick periods, so the constant `portTICK_PERIOD_MS` can be used to convert a time that has been spec-
ified in milliseconds. For example, if the timer must expire after 100 ticks, then xNewPer-
period should be set to 100. Alternatively, if the timer must expire after 500ms, then xNew-
Period can be set to (500/portTICK_PERIOD_MS) provided configTICK_RATE_HZ
is less than or equal to 1000.

• pxHigherPriorityTaskWoken - The timer service/daemon task spends most of its
time in the Blocked state, waiting for messages to arrive on the timer command queue.
Calling xTimerChangePeriodFromISR() writes a message to the timer command queue,
so has the potential to transition the timer service/daemon task out of the Blocked state.
If calling xTimerChangePeriodFromISR() causes the timer service/daemon task to leave
the Blocked state, and the timer service/daemon task has a priority equal to or greater
than the currently executing task (the task that was interrupted), then *pxHigherPriority-
TaskWoken will get set to pdTRUE internally within the xTimerChangePeriodFromISR() function. If xTimerChangePeriodFromISR() sets this value to pdTRUE then a context
switch should be performed before the interrupt exits.

Returns pdFAIL will be returned if the command to change the timers period could not be sent
to the timer command queue. pdPASS will be returned if the command was successfully sent
to the timer command queue. When the command is actually processed will depend on the
priority of the timer service/daemon task relative to other tasks in the system. The timer ser-
vice/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration con-
stant.

xTimerResetFromISR(xTimer, pxHigherPriorityTaskWoken)
A version of xTimerReset() that can be called from an interrupt service routine.

Example usage:

```c
/* // This scenario assumes xBacklightTimer has already been created. When a
  // key is pressed, an LCD back-light is switched on. If 5 seconds pass
  // without a key being pressed, then the LCD back-light is switched off. In
  // this case, the timer is a one-shot timer, and unlike the example given for
  // the xTimerReset() function, the key press event handler is an interrupt
  // service routine.
  */

/* // The callback function assigned to the one-shot timer. In this case the
  // parameter is not used.
  * void vBacklightTimerCallback( TimerHandle_t pxTimer )
  * {
  // The timer expired, therefore 5 seconds must have passed since a key
  // was pressed. Switch off the LCD back-light.
  * vSetBacklightState( BACKLIGHT_OFF );
  * }
  */

/* // The key press interrupt service routine.
  * void vKeyPressEventInterruptHandler( void )
  * {
  BaseType_t xHigherPriorityTaskWoken = pdFALSE;
  *
  // Ensure the LCD back-light is on, then reset the timer that is
  // responsible for turning the back-light off after 5 seconds of
  // key inactivity. This is an interrupt service routine so can only
  // call FreeRTOS API functions that end in "FromISR".
  * vSetBacklightState( BACKLIGHT_ON );
  *
  // xTimerStartFromISR() or xTimerResetFromISR() could be called here
  // as both cause the timer to re-calculate its expiry time.
  // xHigherPriorityTaskWoken was initialised to pdFALSE when it was
  // declared (in this function).
  * if( xTimerResetFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) !=
  /* pdPASS )
```
The reset command was not executed successfully. Take appropriate action here.

Perform the rest of the key processing here.

If xHigherPriorityTaskWoken equals pdTRUE, then a context switch should be performed. The syntax required to perform a context switch from inside an ISR varies from port to port, and from compiler to compiler. Inspect the demos for the port you are using to find the actual syntax required.

if (xHigherPriorityTaskWoken != pdFALSE)
{
    // Call the interrupt safe yield function here (actual function depends on the FreeRTOS port being used).
}

Parameters

- xTimer - The handle of the timer that is to be started, reset, or restarted.
- pxHigherPriorityTaskWoken - The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerResetFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerResetFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerResetFromISR() function. If xTimerResetFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

Returns

pdFAIL will be returned if the reset command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerResetFromISR() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

Type Definitions

typedef struct tmrTimerControl *TimerHandle_t

typedef void (*TimerCallbackFunction_t)(TimerHandle_t xTimer)

Defines the prototype to which timer callback functions must conform.

typedef void (*PendedFunction_t)(void*, uint32_t)

Defines the prototype to which functions used with the xTimerPendFunctionCallFromISR() function must conform.

Event Group API

Header File

- components/freertos/FreeRTOS-Kernel/include/freertos/event_groups.h
- This header file can be included with:
#include "freertos/event_groups.h"

## Functions

### EventGroupHandle_t xEventGroupCreate (void)

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group’s structure is stored. If an event groups is created using xEventGroupCreate() then the required memory is automatically dynamically allocated inside the xEventGroupCreate() function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If an event group is created using xEventGroupCreateStatic() then the application writer must instead provide the memory that will get used by the event group. xEventGroupCreateStatic() therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the configUSE_16_BIT_TICKS setting in FreeRTOSConfig.h. If configUSE_16_BIT_TICKS is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If configUSE_16_BIT_TICKS is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The EventBits_t type is used to store event bits within an event group.

**Example usage:**

```c
// Declare a variable to hold the created event group.
EventGroupHandle_t xCreatedEventGroup;

// Attempt to create the event group.
xCreatedEventGroup = xEventGroupCreate();

// Was the event group created successfully?
if ( xCreatedEventGroup == NULL )
{
    // The event group was not created because there was insufficient
    // FreeRTOS heap available.
}
else
{
    // The event group was created.
}
```

**Returns** If the event group was created then a handle to the event group is returned. If there was insufficient FreeRTOS heap available to create the event group then NULL is returned. See [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)

### EventGroupHandle_t xEventGroupCreateStatic (StaticEventGroup_t *pxEventGroupBuffer)

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group’s structure is stored. If an event groups is created using xEventGroupCreate() then the required memory is automatically dynamically allocated inside the xEventGroupCreate() function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If an event group is created using xEventGroupCreateStatic() then the application writer must instead provide the memory that will get used by the event group. xEventGroupCreateStatic() therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the configUSE_16_BIT_TICKS setting in FreeRTOSConfig.h. If configUSE_16_BIT_TICKS is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If configUSE_16_BIT_TICKS is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The EventBits_t type is used to store event bits within an event group.
Example usage:

```c
// StaticEventGroup_t is a publicly accessible structure that has the same
// size and alignment requirements as the real event group structure. It is
// provided as a mechanism for applications to know the size of the event
// group (which is dependent on the architecture and configuration file
// settings) without breaking the strict data hiding policy by exposing the
// real event group internals. This StaticEventGroup_t variable is passed
// into the xSemaphoreCreateEventGroupStatic() function and is used to store
// the event group’s data structures
StaticEventGroup_t xEventGroupBuffer;

// Create the event group without dynamically allocating any memory.
xEventGroup = xEventGroupCreateStatic(&xEventGroupBuffer);
```

**Parameters pxEventGroupBuffer** - pxEventGroupBuffer must point to a variable of type
StaticEventGroup_t, which will be then be used to hold the event group’s data structures,
removing the need for the memory to be allocated dynamically.

**Returns** If the event group was created then a handle to the event group is returned. If pxEventGroupBuffer was NULL then NULL is returned.

```c
EventBits_t xEventGroupWaitBits(EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToWaitFor, const BaseType_t xClearOnExit, const BaseType_t xWaitForAllBits, TickType_t xTicksToWait)
```

[Potentially] block to wait for one or more bits to be set within a previously created event group.

This function cannot be called from an interrupt.

Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;
    const TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

    // Wait a maximum of 100ms for either bit 0 or bit 4 to be set within
    // the event group. Clear the bits before exiting.
    uxBits = xEventGroupWaitBits(
        xEventGroup, // The event group being tested.
        BIT_0 | BIT_4, // The bits within the event group to wait...
        pdFALSE, // Don't wait for both bits, either bit will...
        xTicksToWait ); // Wait a maximum of 100ms for either bit to...

    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
        // xEventGroupWaitBits() returned because both bits were set.
    }
    else if( ( uxBits & BIT_0 ) != 0 )
    {
        // xEventGroupWaitBits() returned because just BIT_0 was set.
    }
    else if( ( uxBits & BIT_4 ) != 0 )
```
Parameters

- **xEventGroup** – The event group in which the bits are being tested. The event group must have previously been created using a call to xEventGroupCreate().

- **uxBitsToWaitFor** – A bitwise value that indicates the bit or bits to test inside the event group. For example, to wait for bit 0 and/or bit 2 set uxBitsToWaitFor to 0x05. To wait for bits 0 and/or bit 1 and/or bit 2 set uxBitsToWaitFor to 0x07. Etc.

- **xClearOnExit** – If xClearOnExit is set to pdTRUE then any bits within uxBitsToWaitFor that are set within the event group will be cleared before xEventGroupWaitBits() returns if the wait condition was met (if the function returns for a reason other than a timeout). If xClearOnExit is set to pdFALSE then the bits set in the event group are not altered when the call to xEventGroupWaitBits() returns.

- **xWaitForAllBits** – If xWaitForAllBits is set to pdTRUE then xEventGroupWaitBits() will return when either all the bits in uxBitsToWaitFor are set or the specified block time expires. If xWaitForAllBits is set to pdFALSE then xEventGroupWaitBits() will return when any one of the bits set in uxBitsToWaitFor is set or the specified block time expires. The block time is specified by the xTicksToWait parameter.

- **xTicksToWait** – The maximum amount of time (specified in ‘ticks’) to wait for one/all (depending on the xWaitForAllBits value) of the bits specified by uxBitsToWaitFor to become set. A value of portMAX_DELAY can be used to block indefinitely (provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h).

Returns

The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If xEventGroupWaitBits() returned because its timeout expired then not all the bits being waited for will be set. If xEventGroupWaitBits() returned because the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared in the case that xClearOnExit parameter was set to pdTRUE.

```c
EventBits_t xEventGroupClearBits( EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToClear )
```

Clear bits within an event group. This function cannot be called from an interrupt.

Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;

    // Clear bit 0 and bit 4 in xEventGroup.
    uxBits = xEventGroupClearBits( 
        xEventGroup, // The event group being updated.
        BIT_0 | BIT_4 ); // The bits being cleared.

    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
        // xEventGroupWaitBits() returned because just BIT_4 was set.
    }
    else
    {
        // xEventGroupWaitBits() returned because xTicksToWait ticks passed
        // without either BIT_0 or BIT_4 becoming set.
    }
}
```

(continues on next page)
Both bit 0 and bit 4 were set before xEventGroupClearBits() was called. Both will now be clear (not set).
}  
else if( (uxBits & BIT_0 ) != 0 )  
{  
    // Bit 0 was set before xEventGroupClearBits() was called. It will now be clear.  
}  
else if( (uxBits & BIT_4 ) != 0 )  
{  
    // Bit 4 was set before xEventGroupClearBits() was called. It will now be clear.  
}  
else  
{  
    // Neither bit 0 nor bit 4 were set in the first place.  
}

Parameters

- **xEventGroup** – The event group in which the bits are to be cleared.
- **uxBitsToClear** – A bitwise value that indicates the bit or bits to clear in the event group. For example, to clear bit 3 only, set uxBitsToClear to 0x08. To clear bit 3 and bit 0 set uxBitsToClear to 0x09.

Returns

The value of the event group before the specified bits were cleared.

**EventBits_t xEventGroupSetBits(EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToSet)**

Set bits within an event group. This function cannot be called from an interrupt. xEventGroupSetBits-FromISR() is a version that can be called from an interrupt.

Setting bits in an event group will automatically unblock tasks that are blocked waiting for the bits.

Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;
    
    // Set bit 0 and bit 4 in xEventGroup.
    uxBits = xEventGroupSetBits(   
        xEventGroup,   // The event group being updated.
        BIT_0 | BIT_4 );// The bits being set.
    
    if( (uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {  
        // Both bit 0 and bit 4 remained set when the function returned.  
    }
    else if( (uxBits & BIT_0 ) != 0 )
    {  
        // Bit 0 remained set when the function returned, but bit 4 was cleared. It might be that bit 4 was cleared automatically as a task that was waiting for bit 4 was removed from the Blocked state.  
    }
    else if( (uxBits & BIT_4 ) != 0 )
    {  
```

(continues on next page)
// Bit 4 remained set when the function returned, but bit 0 was // cleared. It might be that bit 0 was cleared automatically as a // task that was waiting for bit 0 was removed from the Blocked // state.
}  
else  
{  
  // Neither bit 0 nor bit 4 remained set. It might be that a task // was waiting for both of the bits to be set, and the bits were // cleared as the task left the Blocked state.  
}

Parameters

* `xEventGroup` – The event group in which the bits are to be set.
* `uxBitsToSet` – A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set `uxBitsToSet` to 0x08. To set bit 3 and bit 0 set `uxBitsToSet` to 0x09.

Returns The value of the event group at the time the call to `xEventGroupSetBits()` returns. There are two reasons why the returned value might have the bits specified by the `uxBitsToSet` parameter cleared. First, if setting a bit results in a task that was waiting for the bit leaving the blocked state then it is possible the bit will be cleared automatically (see the `xClearBitOnExit` parameter of `xEventGroupWaitBits()`). Second, any unblocked (or otherwise Ready state) task that has a priority above that of the task that called `xEventGroupSetBits()` will execute and may change the event group value before the call to `xEventGroupSetBits()` returns.

```c
EventBits_t xEventGroupSync( EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToSet, const EventBits_t uxBitsToWaitFor, TickType_t xTicksToWait )
```

Atomically set bits within an event group, then wait for a combination of bits to be set within the same event group. This functionality is typically used to synchronise multiple tasks, where each task has to wait for the other tasks to reach a synchronisation point before proceeding.

This function cannot be used from an interrupt.

The function will return before its block time expires if the bits specified by the `uxBitsToWait` parameter are set, or become set within that time. In this case all the bits specified by `uxBitsToWait` will be automatically cleared before the function returns.

Example usage:

```c
// Bits used by the three tasks.
#define TASK_0_BIT ( 1 << 0 )
#define TASK_1_BIT ( 1 << 1 )
#define TASK_2_BIT ( 1 << 2 )

#define ALL_SYNC_BITS ( TASK_0_BIT | TASK_1_BIT | TASK_2_BIT )

// Use an event group to synchronise three tasks. It is assumed this event // group has already been created elsewhere.
EventGroupHandle_t xEventBits;

void vTask0( void *pvParameters )
{
  EventBits_t uxReturn;
  TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

  for( ;; )
  {
    // Perform task functionality here.
  }
```

(continues on next page)
Set bit 0 in the event flag to note this task has reached the sync point. The other two tasks will set the other two bits defined by ALL_SYNC_BITS. All three tasks have reached the synchronisation point when all the ALL_SYNC_BITS are set. Wait a maximum of 100ms for this to happen.

```c
uxReturn = xEventGroupSync( xEventBits, TASK_0_BIT, ALL_SYNC_BITS, xTicksToWait );
```

If ( uxReturn & ALL_SYNC_BITS ) == ALL_SYNC_BITS 

All three tasks reached the synchronisation point before the call to xEventGroupSync() timed out.

```c
void vTask1( void *pvParameters )
{
    for( ;; )
    {
        // Perform task functionality here.
        // Set bit 1 in the event flag to note this task has reached the
        // synchronisation point. The other two tasks will set the other two
        // bits defined by ALL_SYNC_BITS. All three tasks have reached the
        // synchronisation point when all the ALL_SYNC_BITS are set. Wait
        // indefinitely for this to happen.
        xEventGroupSync( xEventBits, TASK_1_BIT, ALL_SYNC_BITS, portMAX_DELAY );
        // xEventGroupSync() was called with an indefinite block time, so
        // this task will only reach here if the synchronisation was made by all
        // three tasks, so there is no need to test the return value.
    }
}
```

```c
void vTask2( void *pvParameters )
{
    for( ;; )
    {
        // Perform task functionality here.
        // Set bit 2 in the event flag to note this task has reached the
        // synchronisation point. The other two tasks will set the other two
        // bits defined by ALL_SYNC_BITS. All three tasks have reached the
        // synchronisation point when all the ALL_SYNC_BITS are set. Wait
        // indefinitely for this to happen.
        xEventGroupSync( xEventBits, TASK_2_BIT, ALL_SYNC_BITS, portMAX_DELAY );
        // xEventGroupSync() was called with an indefinite block time, so
        // this task will only reach here if the synchronisation was made by all
        // three tasks, so there is no need to test the return value.
    }
}
```

### Parameters
- **xEventGroup** – The event group in which the bits are being tested. The event group must have previously been created using a call to xEventGroupCreate().
- **uxBitsToSet** – The bits to set in the event group before determining if, and possibly waiting for, all the bits specified by the uxBitsToWorld parameter are set.
- **uxBitsToWorld** – A bitwise value that indicates the bit or bits to test inside the event
group. For example, to wait for bit 0 and bit 2 set uxBitsToWaitFor to 0x05. To wait for bits 0 and bit 1 and bit 2 set uxBitsToWaitFor to 0x07. Etc.

- **xBitsToWait** - The maximum amount of time (specified in ‘ticks’) to wait for all of the bits specified by uxBitsToWaitFor to become set.

**Returns**  The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If xEventGroupSync() returned because its timeout expired then not all the bits being waited for will be set. If xEventGroupSync() returned because all the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared.

### EventBits_t xEventGroupGetBitsFromISR (EventGroupHandle_t xEventGroup)

A version of xEventGroupGetBits() that can be called from an ISR.

**Parameters**  xEventGroup  - The event group being queried.

**Returns**  The event group bits at the time xEventGroupGetBitsFromISR() was called.

### void vEventGroupDelete (EventGroupHandle_t xEventGroup)

Delete an event group that was previously created by a call to xEventGroupCreate(). Tasks that are blocked on the event group will be unblocked and obtain 0 as the event group’s value.

**Parameters**  xEventGroup  - The event group being deleted.

### BaseType_t xEventGroupGetStaticBuffer (EventGroupHandle_t xEventGroup, StaticEventGroup_t **ppxEventGroupBuffer)

Retrieve a pointer to a statically created event groups’ data structure buffer. It is the same buffer that is supplied at the time of creation.

**Parameters**

- xEventGroup  - The event group for which to retrieve the buffer.
- **ppxEventGroupBuffer**  - Used to return a pointer to the event groups’ data structure buffer.

**Returns**  pdTRUE if the buffer was retrieved, pdFALSE otherwise.

### Macros

**xEventGroupClearBitsFromISR** (xEventGroup, uxBitsToClear)

A version of xEventGroupClearBits() that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed while interrupts are disabled, so protects event groups that are accessed from tasks by suspending the scheduler rather than disabling interrupts. As a result event groups cannot be accessed directly from an interrupt service routine. Therefore xEventGroupClearBitsFromISR() sends a message to the timer task to have the clear operation performed in the context of the timer task.

#### Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

// An event group which it is assumed has already been created by a call to // xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
    // Clear bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupClearBitsFromISR( xEventGroup, // The event group being updated.
       BIT_0 | BIT_4 ); // The bits being set.
}
```

(continues on next page)
if ( xResult == pdPASS )
{
    // The message was posted successfully.
    portYIELD_FROM_ISR(pdTRUE);
}

Note: If this function returns pdPASS then the timer task is ready to run and a portYIELD_FROM_ISR(pdTRUE) should be executed to perform the needed clear on the event group. This behavior is different from xEventGroupSetBitsFromISR because the parameter xHigherPriorityTaskWoken is not present.

Parameters

- **xEventGroup** - The event group in which the bits are to be cleared.
- **uxBitsToClear** - A bitwise value that indicates the bit or bits to clear. For example, to clear bit 3 only, set uxBitsToClear to 0x08. To clear bit 3 and bit 0 set uxBitsToClear to 0x09.

Returns

If the request to execute the function was posted successfully then pdPASS is returned, otherwise pdFALSE is returned. pdFALSE will be returned if the timer service queue was full.

**xEventGroupSetBitsFromISR** (xEventGroup, uxBitsToSet, pxHigherPriorityTaskWoken)

A version of xEventGroupSetBits() that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed in interrupts or from critical sections. Therefore xEventGroupSetBitsFromISR() sends a message to the timer task to have the set operation performed in the context of the timer task - where a scheduler lock is used in place of a critical section.

Example usage:

```c
#define BIT_0  ( 1 << 0 )
#define BIT_4  ( 1 << 4 )

// An event group which it is assumed has already been created by a call to
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
    BaseType_t xHigherPriorityTaskWoken, xResult;

    // xHigherPriorityTaskWoken must be initialised to pdFALSE.
    xHigherPriorityTaskWoken = pdFALSE;

    // Set bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupSetBitsFromISR( xEventGroup,          // The event group being updated.
                                            BIT_0 | BIT_4         // The bits being set.
                                            &xHigherPriorityTaskWoken );

    // Was the message posted successfully?
    if ( xResult == pdPASS )
    {
        // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
        ...
    }
}
```
// switch should be requested. The macro used is port specific and
// will be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() -
// refer to the documentation page for the port being used.
portYIELD_FROM_ISR( xHigherPriorityTaskWoken );

Parameters

• xEventGroup - The event group in which the bits are to be set.
• uxBitsToSet - A bitwise value that indicates the bit or bits to set. For example, to set
  bit 3 only, set uxBitsToSet to 0x08. To set bit 3 and bit 0 set uxBitsToSet to 0x09.
• pxHigherPriorityTaskWoken - As mentioned above, calling this function will re-
  sult in a message being sent to the timer daemon task. If the priority of the timer daemon
  task is higher than the priority of the currently running task (the task the interrupt inter-
  rupted) then *pxHigherPriorityTaskWoken will be set to pdTRUE by xEventGroupSet-
  BitsFromISR(), indicating that a context switch should be requested before the interrupt
  exits. For that reason *pxHigherPriorityTaskWoken must be initialised to pdFALSE. See
  the example code below.

Returns If the request to execute the function was posted successfully then pdPASS is returned,
otherwise pdFALSE is returned. pdFALSE will be returned if the timer service queue was
full.

xEventGroupGetBits (xEventGroup)
Returns the current value of the bits in an event group. This function cannot be used from an interrupt.

Parameters

• xEventGroup - The event group being queried.

Returns The event group bits at the time xEventGroupGetBits() was called.

Type Definitions
typedef struct EventGroupDef_t *EventGroupHandle_t
typedef TickType_t EventBits_t

Stream Buffer API

Header File

• components/freertos/FreeRTOS-Kernel/include/freertos/stream_buffer.h
• This header file can be included with:

```
#include "freertos/stream_buffer.h"
```

Functions

BaseType_t xStreamBufferGetStaticBuffers (StreamBufferHandle_t xStreamBuffer, uint8_t **ppucStreamBufferStorageArea, StaticStreamBuffer_t **ppxStaticStreamBuffer)

Retrieve pointers to a statically created stream buffer’s data structure buffer and storage area buffer. These
are the same buffers that are supplied at the time of creation.

Parameters

• xStreamBuffer - The stream buffer for which to retrieve the buffers.
• ppucStreamBufferStorageArea - Used to return a pointer to the stream buffer’s
  storage area buffer.
• **ppxStaticStreamBuffer** – Used to return a pointer to the stream buffer’s data structure buffer.

Returns: `pdTRUE` if buffers were retrieved, `pdFALSE` otherwise.

```
size_t xStreamBufferSend(StreamBufferHandle_t xStreamBuffer, const void *pvTxData, size_t xDataLengthBytes, TickType_t xTicksToWait)
```

Sends bytes to a stream buffer. The bytes are copied into the stream buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as `xStreamBufferSend()`) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as `xStreamBufferReceive()`) inside a critical section and set the receive block time to 0.

Use `xStreamBufferSend()` to write to a stream buffer from a task. Use `xStreamBufferSendFromISR()` to write to a stream buffer from an interrupt service routine (ISR).

Example use:

```c
void vAFunction( StreamBufferHandle_t xStreamBuffer )
{
size_t xBytesSent;

uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
char *pcStringToSend = "String to send";
const TickType_t x100ms = pdMS_TO_TICKS( 100 );

// Send an array to the stream buffer, blocking for a maximum of 100ms to
// wait for enough space to be available in the stream buffer.

xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) ucArrayToSend, _
--sizeof( ucArrayToSend ), x100ms );

if( xBytesSent != sizeof( ucArrayToSend ) )
{
    // The call to xStreamBufferSend() times out before there was enough
    // space in the buffer for the data to be written, but it did
    // successfully write xBytesSent bytes.
}

// Send the string to the stream buffer. Return immediately if there is not
// enough space in the buffer.

xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) pcStringToSend, _
--strlen( pcStringToSend ), 0 );

if( xBytesSent != strlen( pcStringToSend ) )
{
    // The entire string could not be added to the stream buffer because
    // there was not enough free space in the buffer, but xBytesSent bytes
    // were sent. Could try again to send the remaining bytes.
}
}
```

Parameters:

- **xStreamBuffer** – The handle of the stream buffer to which a stream is being sent.
- **pvTxData** – A pointer to the buffer that holds the bytes to be copied into the stream buffer.
- **xDataLengthBytes** – The maximum number of bytes to copy from `pvTxData` into the stream buffer.
• **xTicksToWait** - The maximum amount of time the task should remain in the Blocked state to wait for enough space to become available in the stream buffer, should the stream buffer contain too little space to hold another `xDataLengthBytes` bytes. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro `pdMS_TO_TICKS()` can be used to convert a time specified in milliseconds into a time specified in ticks. Setting `xTicksToWait` to `portMAX_DELAY` will cause the task to wait indefinitely (without timing out), provided `INCCLUE_vTaskSuspend` is set to 1 in `FreeRTOSConfig.h`. If a task times out before it can write all `xDataLengthBytes` into the buffer it will still write as many bytes as possible. A task does not use any CPU time when it is in the blocked state.

**Returns** The number of bytes written to the stream buffer. If a task times out before it can write all `xDataLengthBytes` into the buffer it will still write as many bytes as possible.

```c
size_t xStreamBufferSendFromISR(StreamBufferHandle_t xStreamBuffer, const void *pvTxData, size_t xDataLengthBytes, BaseType_t *const pxHigherPriorityTaskWoken)
```

Interrupt safe version of the API function that sends a stream of bytes to the stream buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as `xStreamBufferSend()`) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as `xStreamBufferReceive()`) inside a critical section and set the receive block time to 0.

Use `xStreamBufferSend()` to write to a stream buffer from a task. Use `xStreamBufferSendFromISR()` to write to a stream buffer from an interrupt service routine (ISR).

**Example use:**

```c
// A stream buffer that has already been created.
StreamBufferHandle_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
  size_t xBytesSent;
  char *pcStringToSend = "String to send";
  BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

  // Attempt to send the string to the stream buffer.
  xBytesSent = xStreamBufferSendFromISR( xStreamBuffer,
                                          ( void * ) pcStringToSend,
                                          strlen( pcStringToSend ),
                                          &xHigherPriorityTaskWoken );

  if( xBytesSent != strlen( pcStringToSend ) )
  {
    // There was not enough free space in the stream buffer for the entire
    // string to be written, ut xBytesSent bytes were written.
  }

  // If xHigherPriorityTaskWoken was set to pdTRUE inside
  // xStreamBufferSendFromISR() then a task that has a priority above the
  // priority of the currently executing task was unblocked and a context
  // switch should be performed to ensure the ISR returns to the unblocked
  // task. In most FreeRTOS ports this is done by simply passing
  // xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
```
// variables value, and perform the context switch if necessary. Check the
// documentation for the port in use for port specific instructions.
portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}

Parameters

- **xStreamBuffer** - The handle of the stream buffer to which a stream is being sent.
- **pvTxData** - A pointer to the data that is to be copied into the stream buffer.
- **xDataLengthBytes** - The maximum number of bytes to copy from pvTxData into the
  stream buffer.
- **pxHigherPriorityTaskWoken** - It is possible that a stream buffer will have a task
  blocked on it waiting for data. Calling xStreamBufferSendFromISR can make data available,
  and so cause a task that was waiting for data to leave the Blocked state. If calling
  xStreamBufferSendFromISR causes a task to leave the Blocked state, and the unblocked
  task has a priority higher than the currently executing task (the task that was interrupted),
  then, internally, xStreamBufferSendFromISR will set *pxHigherPriorityTaskWoken to
  pdTRUE. If xStreamBufferSendFromISR sets this value to pdTRUE, then normally a
  context switch should be performed before the interrupt is exited. This will ensure that
  the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken
  should be set to pdFALSE before it is passed into the function. See the
  example code below for an example.

Returns

The number of bytes actually written to the stream buffer, which will be less than xDataLengthBytes if the stream buffer didn’t have enough free space for all the bytes to be written.

```c
size_t xStreamBufferReceive ( StreamBufferHandle_t xStreamBuffer, void *pvRxData, size_t xBufferLengthBytes, TickType_t xTicksToWait )
```

Receives bytes from a stream buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferReceive() to read from a stream buffer from a task. Use xStreamBufferReceiveFromISR() to read from a stream buffer from an interrupt service routine (ISR).

Example use:

```c
void vAFunction( StreamBuffer_t xStreamBuffer )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    const TickType_t xBlockTime = pdMS_TO_TICKS( 20 );

    // Receive up to another sizeof( ucRxData ) bytes from the stream buffer.  //
    // Wait in the Blocked state (so not using any CPU processing time) for a  //
    // maximum of 100ms for the full sizeof( ucRxData ) number of bytes to be  //
    // available.
    xReceivedBytes = xStreamBufferReceive( xStreamBuffer,
        ( void * ) ucRxData,
        sizeof( ucRxData ),
        xBlockTime );
}
```

(continues on next page)
# xStreamBufferReceive

## Description

If `xReceivedBytes > 0`:

```c
if( xReceivedBytes > 0 )
{
    // A ucRxData contains another xReceivedBytes bytes of data, which can
    // be processed here....
}
```

## Parameters

- **xStreamBuffer** - The handle of the stream buffer from which bytes are to be received.
- **pvRxData** - A pointer to the buffer into which the received bytes will be copied.
- **xBufferLengthBytes** - The length of the buffer pointed to by the pvRxData parameter. This sets the maximum number of bytes to receive in one call. `xStreamBufferReceive` will return as many bytes as possible up to a maximum set by `xBufferLengthBytes`.
- **xTicksToWait** - The maximum amount of time the task should remain in the Blocked state to wait for data to become available if the stream buffer is empty. `xStreamBufferReceive()` will return immediately if `xTicksToWait` is zero. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro `pdMS_TO_TICKS()` can be used to convert a time specified in milliseconds into a time specified in ticks. Setting `xTicksToWait` to `portMAX_DELAY` will cause the task to wait indefinitely (without timing out), provided `INCLUDE_vTaskSuspend` is set to 1 in `FreeRTOSConfig.h`. A task does not use any CPU time when it is in the Blocked state.

## Returns

The number of bytes actually read from the stream buffer, which will be less than `xBufferLengthBytes` if the call to `xStreamBufferReceive()` timed out before `xBufferLengthBytes` were available.

## Example use:

```c
// A stream buffer that has already been created.
StreamBuffer_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;  // Initialised to pdFALSE.

    // Receive the next stream from the stream buffer.
    xReceivedBytes = xStreamBufferReceiveFromISR( StreamBuffer_t xStreamBuffer,
        (void *) ucRxData,
        sizeof( ucRxData ),
        &xHigherPriorityTaskWoken );

    if( xReceivedBytes > 0 )
    {
        // ucRxData contains xReceivedBytes read from the stream buffer.
        // Process the stream here....
    }
}
```

---

### xStreamBufferReceiveFromISR

An interrupt-safe version of the API function that receives bytes from a stream buffer.

Use `xStreamBufferReceive()` to read bytes from a stream buffer from a task. Use `xStreamBufferReceiveFromISR()` to read bytes from a stream buffer from an interrupt service routine (ISR).

Example use:

```c
// A stream buffer that has already been created.
StreamBuffer_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;  // Initialised to pdFALSE.

    // Receive the next stream from the stream buffer.
    xReceivedBytes = xStreamBufferReceiveFromISR( StreamBuffer_t xStreamBuffer,
        (void *) ucRxData,
        sizeof( ucRxData ),
        &xHigherPriorityTaskWoken );

    if( xReceivedBytes > 0 )
    {
        // ucRxData contains xReceivedBytes read from the stream buffer.
        // Process the stream here....
    }
}
```
If xHigherPriorityTaskWoken was set to pdTRUE inside xStreamBufferReceiveFromISR() then a task that has a priority above the priority of the currently executing task was unblocked and a context switch should be performed to ensure the ISR returns to the unblocked task. In most FreeRTOS ports this is done by simply passing xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the variables value, and perform the context switch if necessary. Check the documentation for the port in use for port specific instructions.

```c
portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
```

### Parameters

- **xStreamBuffer** – The handle of the stream buffer from which a stream is being received.
- **pvRxData** – A pointer to the buffer into which the received bytes are copied.
- **xBUFFERLengthBytes** – The length of the buffer pointed to by the pvRxData parameter. This sets the maximum number of bytes to receive in one call. xStreamBufferReceive will return as many bytes as possible up to a maximum set by xBUFFERLengthBytes.
- **pxHigherPriorityTaskWoken** – It is possible that a stream buffer will have a task blocked on it waiting for space to become available. Calling xStreamBufferReceiveFromISR() can make space available, and so cause a task that is waiting for space to leave the Blocked state. If calling xStreamBufferReceiveFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xStreamBufferReceiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xStreamBufferReceiveFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. That will ensure the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

### Returns

The number of bytes read from the stream buffer, if any.

void vStreamBufferDelete (StreamBufferHandle_t xStreamBuffer)

Deletes a stream buffer that was previously created using a call to xStreamBufferCreate() or xStreamBufferCreateStatic(). If the stream buffer was created using dynamic memory (that is, by xStreamBufferCreate()), then the allocated memory is freed.

A stream buffer handle must not be used after the stream buffer has been deleted.

### Parameters

- **xStreamBuffer** – The handle of the stream buffer to be deleted.

BaseType_t xStreamBufferIsFull (StreamBufferHandle_t xStreamBuffer)

Queries a stream buffer to see if it is full. A stream buffer is full if it does not have any free space, and therefore cannot accept any more data.

### Parameters

- **xStreamBuffer** – The handle of the stream buffer being queried.

Returns If the stream buffer is full then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t xStreamBufferIsEmpty (StreamBufferHandle_t xStreamBuffer)

Queries a stream buffer to see if it is empty. A stream buffer is empty if it does not contain any data.

### Parameters

- **xStreamBuffer** – The handle of the stream buffer being queried.

Returns If the stream buffer is empty then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t xStreamBufferReset (StreamBufferHandle_t xStreamBuffer)

Resets a stream buffer to its initial, empty, state. Any data that was in the stream buffer is discarded. A stream buffer can only be reset if there are no tasks blocked waiting to either send to or receive from the stream buffer.

### Parameters

- **xStreamBuffer** – The handle of the stream buffer being reset.
Returns If the stream buffer is reset then pdPASS is returned. If there was a task blocked waiting to send to or read from the stream buffer then the stream buffer is not reset and pdFAIL is returned.

### size_t xStreamBufferSpacesAvailable (StreamBufferHandle_t xStreamBuffer)
Queries a stream buffer to see how much free space it contains, which is equal to the amount of data that can be sent to the stream buffer before it is full.

**Parameters**
- **xStreamBuffer** – The handle of the stream buffer being queried.

**Returns**
- The number of bytes that can be written to the stream buffer before the stream buffer would be full.

### size_t xStreamBufferBytesAvailable (StreamBufferHandle_t xStreamBuffer)
Queries a stream buffer to see how much data it contains, which is equal to the number of bytes that can be read from the stream buffer before the stream buffer would be empty.

**Parameters**
- **xStreamBuffer** – The handle of the stream buffer being queried.

**Returns**
- The number of bytes that can be read from the stream buffer before the stream buffer would be empty.

### BaseType_t xStreamBufferSetTriggerLevel (StreamBufferHandle_t xStreamBuffer, size_t xTriggerLevel)
A stream buffer’s trigger level is the number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task’s block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task’s block time expires. If a reading task’s block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.

A trigger level is set when the stream buffer is created, and can be modified using xStreamBufferSetTriggerLevel().

**Parameters**
- **xStreamBuffer** – The handle of the stream buffer being updated.
- **xTriggerLevel** – The new trigger level for the stream buffer.

**Returns**
- If xTriggerLevel was less than or equal to the stream buffer’s length then the trigger level will be updated and pdTRUE is returned. Otherwise pdFALSE is returned.

### BaseType_t xStreamBufferSendCompletedFromISR (StreamBufferHandle_t xStreamBuffer, BaseType_t *pxHigherPriorityTaskWoken)
For advanced users only.

The sbSEND_COMPLETED() macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbSEND_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xStreamBufferSendCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbSEND_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

**Parameters**
- **xStreamBuffer** – The handle of the stream buffer to which data was written.
- **pxHigherPriorityTaskWoken** – *pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xStreamBufferSendCompletedFromISR(). If calling xStreamBufferSendCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.
Returns If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t xStreamBufferReceiveCompletedFromISR (StreamBufferHandle_t xStreamBuffer, BaseType_t *pxHigherPriorityTaskWoken)

For advanced users only.

The sbRECEIVE_COMPLETED() macro is called from within the FreeRTOS APIs when data is read out of a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbRECEIVE_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xStreamBufferReceiveCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbRECEIVE_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

Parameters
- xStreamBuffer – The handle of the stream buffer from which data was read.
- pxHigherPriorityTaskWoken – pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xStreamBufferReceiveCompletedFromISR(). If calling xStreamBufferReceiveCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *px-HigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

Returns If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

Macros

xStreamBufferCreateWithCallback (xBufferSizeBytes, xTriggerLevelBytes, pxSendCompletedCallback, pxReceiveCompletedCallback)

Creates a new stream buffer using dynamically allocated memory. See xStreamBufferCreateStatic() for a version that uses statically allocated memory (memory that is allocated at compile time).

configSUPPORT_DYNAMIC_ALLOCATION must be set to 1 or left undefined in FreeRTOSConfig.h for xStreamBufferCreate() to be available.

Example use:

```c
void vAFunction( void )
{
StreamBufferHandle_t xStreamBuffer;
const size_t xStreamBufferSizeBytes = 100, xTriggerLevel = 10;

// Create a stream buffer that can hold 100 bytes. The memory used to hold
// both the stream buffer structure and the data in the stream buffer is
// allocated dynamically.
xStreamBuffer = xStreamBufferCreate( xStreamBufferSizeBytes, xTriggerLevel );

if( xStreamBuffer == NULL )
{
    // There was not enough heap memory space available to create the
    // stream buffer.
}
else
{
    // The stream buffer was created successfully and can now be used.
}
}
```

Parameters
• **xBufferSizeBytes** – The total number of bytes the stream buffer will be able to hold at any one time.

• **xTriggerLevelBytes** – The number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task’s block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task’s block time expires. If a reading task’s block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.

• **pxSendCompletedCallback** – Callback invoked when number of bytes at least equal to trigger level is sent to the stream buffer. If the parameter is NULL, it will use the default implementation provided by sbSEND_COMPLETED macro. To enable the callback, configUSE_SB_COMPLETED_CALLBACK must be set to 1 in FreeRTOSConfig.h.

• **pxReceiveCompletedCallback** – Callback invoked when more than zero bytes are read from a stream buffer. If the parameter is NULL, it will use the default implementation provided by sbRECEIVE_COMPLETED macro. To enable the callback, configUSE_SB_COMPLETED_CALLBACK must be set to 1 in FreeRTOSConfig.h.

**Returns**

If NULL is returned, then the stream buffer cannot be created because there is insufficient heap memory available for FreeRTOS to allocate the stream buffer data structures and storage area. A non-NULL value being returned indicates that the stream buffer has been created successfully - the returned value should be stored as the handle to the created stream buffer.

**xStreamBufferCreateStaticWithCallback**

```c
(xBufferSizeBytes, xTriggerLevelBytes, 
pucStreamBufferStorageArea, pxStaticStreamBuffer, 
pxSendCompletedCallback, 
pxReceiveCompletedCallback)
```

Creates a new stream buffer using statically allocated memory. See `xStreamBufferCreate()` for a version that uses dynamically allocated memory.

```c
configSUPPORT_STATIC_ALLOCATION must be set to 1 in FreeRTOSConfig.h for xStreamBufferCreateStatic() to be available.
```

Example use:

```c
// Used to dimension the array used to hold the streams. The available space // will actually be one less than this, so 999.
#define STORAGE_SIZE_BYTES 1000

// Defines the memory that will actually hold the streams within the stream buffer.
static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];

// The variable used to hold the stream buffer structure.
StaticStreamBuffer_t xStreamBufferStruct;

void MyFunction( void )
{
StreamBufferHandle_t xStreamBuffer;
const size_t xTriggerLevel = 1;

xStreamBuffer = xStreamBufferCreateStatic( sizeof( ucStorageBuffer ),
xTriggerLevel,
ucStorageBuffer,
&xStreamBufferStruct );
```

(continues on next page)
// As neither the pucStreamBufferStorageArea or pxStaticStreamBuffer parameters were NULL, xStreamBuffer will not be NULL, and can be used to reference the created stream buffer in other stream buffer API calls.

// Other code that uses the stream buffer can go here.
}

### Parameters

- **xBufferSizeBytes** – The size, in bytes, of the buffer pointed to by the pucStreamBufferStorageArea parameter.
- **xTriggerLevelBytes** – The number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task’s block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task’s block time expires. If a reading task’s block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.
- **pucStreamBufferStorageArea** – Must point to a uint8_t array that is at least xBufferSizeBytes big. This is the array to which streams are copied when they are written to the stream buffer.
- **pxStaticStreamBuffer** – Must point to a variable of type StaticStreamBuffer_t, which will be used to hold the stream buffer’s data structure.
- **pxSendCompletedCallback** – Callback invoked when number of bytes at least equal to trigger level is sent to the stream buffer. If the parameter is NULL, it will use the default implementation provided by sbSEND_COMPLETED macro. To enable the callback, configUSE_SB_COMPLETED_CALLBACK must be set to 1 in FreeRTOSConfig.h.
- **pxReceiveCompletedCallback** – Callback invoked when more than zero bytes are read from a stream buffer. If the parameter is NULL, it will use the default implementation provided by sbRECEIVE_COMPLETED macro. To enable the callback, configUSE_SB_COMPLETED_CALLBACK must be set to 1 in FreeRTOSConfig.h.

### Returns

If the stream buffer is created successfully then a handle to the created stream buffer is returned. If either pucStreamBufferStorageArea or pxStaticstreamBuffer are NULL then NULL is returned.

### Type Definitions

typedef struct StreamBufferDef_t *StreamBufferHandle_t

typedef void (*StreamBufferCallbackFunction_t)(StreamBufferHandle_t xStreamBuffer, BaseType_t xIsInsideISR, BaseType_t *const pxHigherPriorityTaskWoken)

Type used as a stream buffer’s optional callback.

### Message Buffer API

#### Header File

- components/freertos/FreeRTOS-Kernel/include/freertos/message_buffer.h
- This header file can be included with:
#include "freertos/message_buffer.h"

Macros

**xMessageBufferCreateWithCallback** *(xBufferSizeBytes, pxSendCompletedCallback, pxReceiveCompletedCallback)*

Creates a new message buffer using dynamically allocated memory. See **xMessageBufferCreateStatic()** for a version that uses statically allocated memory (memory that is allocated at compile time).

configSUPPORT_DYNAMIC_ALLOCATION must be set to 1 or left undefined in FreeRTOSConfig.h for xMessageBufferCreate() to be available.

Example use:

```c
void vAFunction( void )
{
    MessageBufferHandle_t xMessageBuffer;
    const size_t xMessageBufferSizeBytes = 100;

    // Create a message buffer that can hold 100 bytes. The memory used to hold
    // both the message buffer structure and the messages themselves is allocated
    // dynamically. Each message added to the buffer consumes an additional 4
    // bytes which are used to hold the length of the message.
    xMessageBuffer = xMessageBufferCreate( xMessageBufferSizeBytes );

    if( xMessageBuffer == NULL )
    {
        // There was not enough heap memory space available to create the
        // message buffer.
    }
    else
    {
        // The message buffer was created successfully and can now be used.
    }
}
```

**Parameters**

- **xBufferSizeBytes** - The total number of bytes (not messages) the message buffer will be able to hold at any one time. When a message is written to the message buffer an additional sizeof( size_t ) bytes are also written to store the message’s length. sizeof( size_t ) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architectures a 10 byte message will take up 14 bytes of message buffer space.
- **pxSendCompletedCallback** - Callback invoked when a send operation to the message buffer is complete. If the parameter is NULL or xMessageBufferCreate() is called without the parameter, then it will use the default implementation provided by sbSEND_COMPLETED macro. To enable the callback, configUSE_SB_COMPLETED_CALLBACK must be set to 1 in FreeRTOSConfig.h.
- **pxReceiveCompletedCallback** - Callback invoked when a receive operation from the message buffer is complete. If the parameter is NULL or xMessageBufferCreate() is called without the parameter, it will use the default implementation provided by sbRECEIVE_COMPLETED macro. To enable the callback, configUSE_SB_COMPLETED_CALLBACK must be set to 1 in FreeRTOSConfig.h.

**Returns**

If NULL is returned, then the message buffer cannot be created because there is insufficient heap memory available for FreeRTOS to allocate the message buffer data structures and storage area. A non-NULL value being returned indicates that the message buffer has been created successfully - the returned value should be stored as the handle to the created message buffer.
**xMessageBufferCreateStaticWithCallback**

(xBufferSizeBytes, pucMessageBufferStorageArea, pxStaticMessageBuffer, pxSendCompletedCallback, pxReceiveCompletedCallback)

Creates a new message buffer using statically allocated memory. See xMessageBufferCreate() for a version that uses dynamically allocated memory.

Example use:

```c
#define STORAGE_SIZE_BYTES 1000

static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];

StaticMessageBuffer_t xMessageBufferStruct;

void MyFunction( void ) {
    MessageBufferHandle_t xMessageBuffer;

    xMessageBuffer = xMessageBufferCreateStatic(
        sizeof( ucStorageBuffer ),
        ucStorageBuffer,
        &xMessageBufferStruct );

    // As neither the pucMessageBufferStorageArea or pxStaticMessageBuffer
    // parameters were NULL, xMessageBuffer will not be NULL, and can be used to
    // reference the created message buffer in other message buffer API calls.

    // Other code that uses the message buffer can go here.
}
```

**Parameters**

- **xBufferSizeBytes** – The size, in bytes, of the buffer pointed to by the pucMessageBufferStorageArea parameter. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message’s length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture a 10 byte message will take up 14 bytes of message buffer space. The maximum number of bytes that can be stored in the message buffer is actually (xBufferSizeBytes - 1).

- **pucMessageBufferStorageArea** – Must point to a uint8_t array that is at least xBufferSizeBytes big. This is the array to which messages are copied when they are written to the message buffer.

- **pxStaticMessageBuffer** – Must point to a variable of type StaticMessageBuffer_t, which will be used to hold the message buffer’s data structure.

- **pxSendCompletedCallback** – Callback invoked when a new message is sent to the message buffer. If the parameter is NULL or xMessageBufferCreate() is called without the parameter, then it will use the default implementation provided by sbSEND_COMPLETED macro. To enable the callback, configUSE_SB_COMPLETED_CALLBACK must be set to 1 in FreeRTOSConfig.h.

- **pxReceiveCompletedCallback** – Callback invoked when a message is read from a message buffer. If the parameter is NULL or xMessageBufferCreate() is called without the parameter, it will use the default implementation provided by sbRECEIVE_COMPLETED macro. To enable the callback, configUSE_SB_COMPLETED_CALLBACK must be set to 1 in FreeRTOSConfig.h.

**Returns**

If the message buffer is created successfully then a handle to the created message buffer is returned. If either pucMessageBufferStorageArea or pxStaticMessageBuffer are NULL then NULL is returned.
**xMessageBufferGetStaticBuffers** (xMessageBuffer, ppucMessageBufferStorageArea, ppxStaticMessageBuffer)

Retrieve pointers to a statically created message buffer’s data structure buffer and storage area buffer. These are the same buffers that are supplied at the time of creation.

**Parameters**
- **xMessageBuffer** – The message buffer for which to retrieve the buffers.
- **ppucMessageBufferStorageArea** – Used to return a pointer to the message buffer’s storage area buffer.
- **pxxStaticMessageBuffer** – Used to return a pointer to the message buffer’s data structure buffer.

**Returns** pdTRUE if buffers were retrieved, pdFALSE otherwise.

**xMessageBufferSend** (xMessageBuffer, pvTxData, xDataLengthBytes, xTicksToWait)

Sends a discrete message to the message buffer. The message can be any length that fits within the buffer’s free space, and is copied into the buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferSend() to write to a message buffer from a task. Use xMessageBufferSendFromISR() to write to a message buffer from an interrupt service routine (ISR).

Example use:

```c
void vAFun( MessageBufferHandle_t xMessageBuffer )
{
    size_t xBytesSent;
    uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
    char *pcStringToSend = "String to send";
    const TickType_t x100ms = pdMS_TO_TICKS( 100 );

    // Send an array to the message buffer, blocking for a maximum of 100ms to
    // wait for enough space to be available in the message buffer.
    xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) ucArrayToSend, // sizeof( ucArrayToSend ), x100ms );

    if( xBytesSent != sizeof( ucArrayToSend ) )
    {
        // The call to xMessageBufferSend() times out before there was enough
        // space in the buffer for the data to be written.
    }

    // Send the string to the message buffer. Return immediately if there is
    // not enough space in the buffer.
    xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) pcStringToSend, // strlen( pcStringToSend ), 0 );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // The string could not be added to the message buffer because there was
        // not enough free space in the buffer.
    }
}
```
Parameters

- **xMessageBuffer** - The handle of the message buffer to which a message is being sent.
- **pvTxData** - A pointer to the message that is to be copied into the message buffer.
- **xDATALENGTHBytes** - The length of the message. That is, the number of bytes to copy from pvTxData into the message buffer. When a message is written to the message buffer, an additional sizeof( size_t ) bytes are also written to store the message’s length. sizeof( size_t ) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architectures setting xDATALENGTHBytes to 20 will reduce the free space in the message buffer by 24 bytes (20 bytes of message data and 4 bytes to hold the message length).
- **xTicksToWait** - The maximum amount of time the calling task should remain in the Blocked state to wait for enough space to become available in the message buffer, should the message buffer have insufficient space when xMessageBufferSend() is called. The calling task will never block if xTicksToWait is zero. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. Tasks do not use any CPU time when they are in the Blocked state.

Returns

The number of bytes written to the message buffer. If the call to xMessageBufferSend() times out before there was enough space to write the message into the message buffer then zero is returned. If the call did not time out then xDATALENGTHBytes is returned.

xMessageBufferSendFromISR (xMessageBuffer, pvTxData, xDATALENGTHBytes, pxHigherPriorityTaskWoken)

Interrupt safe version of the API function that sends a discrete message to the message buffer. The message can be any length that fits within the buffer’s free space, and is copied into the buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferSend() to write to a message buffer from a task. Use xMessageBufferSendFromISR() to write to a message buffer from an interrupt service routine (ISR).

Example use:

```c
// A message buffer that has already been created.  
MessageBufferHandle_t xMessageBuffer;

void vAnInterruptServiceRoutine( void )
{
    size_t xBytesSent;
    char *pcStringToSend = "String to send";
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Attempt to send the string to the message buffer.
    xBytesSent = xMessageBufferSendFromISR( xMessageBuffer,
                                        ( void * ) pcStringToSend,
                                        strlen( pcStringToSend ),
                                        &xHigherPriorityTaskWoken );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // Error:
    }
```

(continues on next page)
// The string could not be added to the message buffer because there was not enough free space in the buffer.
} // If xHigherPriorityTaskWoken was set to pdTRUE inside xMessageBufferSendFromISR() then a task that has a priority above the priority of the currently executing task was unblocked and a context switch should be performed to ensure the ISR returns to the unblocked task. In most FreeRTOS ports this is done by simply passing xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the variables value, and perform the context switch if necessary. Check the documentation for the port in use for port specific instructions.
portYIELD_FROM_ISR( xHigherPriorityTaskWoken );

Parameters
• xMessageBuffer – The handle of the message buffer to which a message is being sent.
• pvTxData – A pointer to the message that is to be copied into the message buffer.
• xDataLengthBytes – The length of the message. That is, the number of bytes to copy from pvTxData into the message buffer. When a message is written to the message buffer an additional sizeof( size_t ) bytes are also written to store the message’s length. sizeof( size_t ) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture setting xDataLengthBytes to 20 will reduce the free space in the message buffer by 24 bytes (20 bytes of message data and 4 bytes to hold the message length).
• pxHigherPriorityTaskWoken – It is possible that a message buffer will have a task blocked on it waiting for data. Calling xMessageBufferSendFromISR() can make data available, and so cause a task that was waiting for data to leave the Blocked state. If calling xMessageBufferSendFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xMessageBufferSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xMessageBufferSendFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. This will ensure that the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

Returns The number of bytes actually written to the message buffer. If the message buffer didn’t have enough free space for the message to be stored then 0 is returned, otherwise xDataLengthBytes is returned.

xMessageBufferReceive (xMessageBuffer, pvRxData, xBufferLengthBytes, xTicksToWait)
Receives a discrete message from a message buffer. Messages can be of variable length and are copied out of the buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferReceive() to read from a message buffer from a task. Use xMessageBufferReceiveFromISR() to read from a message buffer from an interrupt service routine (ISR).

Example use:
```c
void vAFunction( MessageBuffer_t xMessageBuffer )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    const TickType_t xBlockTime = pdMS_TO_TICKS( 20 );

    // Receive the next message from the message buffer. Wait in the Blocked
    // state (so not using any CPU processing time) for a maximum of 100ms for
    // a message to become available.
    xReceivedBytes = xMessageBufferReceive( xMessageBuffer,
        ( void * ) ucRxData,
        sizeof( ucRxData ),
        xBlockTime );

    if( xReceivedBytes > 0 )
    {
        // A ucRxData contains a message that is xReceivedBytes long. Process
        // the message here....
    }
}
```

### Parameters

- **xMessageBuffer** – The handle of the message buffer from which a message is being received.
- **pvRxData** – A pointer to the buffer into which the received message is to be copied.
- **xBufferLengthBytes** – The length of the buffer pointed to by the pvRxData parameter. This sets the maximum length of the message that can be received. If xBufferLengthBytes is too small to hold the next message then the message will be left in the message buffer and 0 will be returned.
- **xTicksToWait** – The maximum amount of time the task should remain in the Blocked state to wait for a message, should the message buffer be empty. xMessageBufferReceive() will return immediately if xTicksToWait is zero and the message buffer is empty. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. Tasks do not use any CPU time when they are in the Blocked state.

### Returns

The length, in bytes, of the message read from the message buffer, if any. If xMessageBufferReceive() times out before a message became available then zero is returned. If the length of the message is greater than xBufferLengthBytes then the message will be left in the message buffer and zero is returned.

### xMessageBufferReceiveFromISR

(xMessageBuffer, pvRxData, xBufferLengthBytes, pxHigherPriorityTaskWoken)

An interrupt safe version of the API function that receives a discrete message from a message buffer. Messages can be of variable length and are copied out of the buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferReceive() to read from a message buffer from a task. Use xMessageBufferReceive-
FromISR() to read from a message buffer from an interrupt service routine (ISR).

Example use:

```c
// A message buffer that has already been created.
MessageBuffer_t xMessageBuffer;

void vAnInterruptServiceRoutine( void )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;  // Initialised to pdFALSE.

    // Receive the next message from the message buffer.
    xReceivedBytes = xMessageBufferReceiveFromISR( xMessageBuffer,
        ( void * ) ucRxData,
        sizeof( ucRxData ),
        &xHigherPriorityTaskWoken );

    if( xReceivedBytes > 0 )
    {
        // A ucRxData contains a message that is xReceivedBytes long. Process
        // the message here....
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xMessageBufferReceiveFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary. Check the
    // documentation for the port in use for port specific instructions.
    portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

Parameters

- `xMessageBuffer` - The handle of the message buffer from which a message is being received.
- `pvRxData` - A pointer to the buffer into which the received message is to be copied.
- `xBufferLengthBytes` - The length of the buffer pointed to by the `pvRxData` parameter. This sets the maximum length of the message that can be received. If `xBufferLengthBytes` is too small to hold the next message then the message will be left in the message buffer and 0 will be returned.
- `pxHigherPriorityTaskWoken` - It is possible that a message buffer will have a task blocked on it waiting for space to become available. Calling `xMessageBufferReceiveFromISR()` can make space available, and so cause a task that is waiting for space to leave the Blocked state. If calling `xMessageBufferReceiveFromISR()` causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, `xMessageBufferReceiveFromISR()` will set `pxHigherPriorityTaskWoken` to `pdTRUE`. If `xMessageBufferReceiveFromISR()` sets this value to `pdTRUE`, then normally a context switch should be performed before the interrupt is exited. That will ensure the interrupt returns directly to the highest priority Ready state task. `pxHigherPriorityTaskWoken` should be set to `pdFALSE` before it is passed into the function. See the code example below for an example.

Returns

The length, in bytes, of the message read from the message buffer, if any.

`vMessageBufferDelete(xMessageBuffer)`

Deletes a message buffer that was previously created using a call to `xMessageBufferCreate()` or `xMessage-
BufferCreateStatic(). If the message buffer was created using dynamic memory (that is, by `xMessageBufferCreate()`), then the allocated memory is freed.

A message buffer handle must not be used after the message buffer has been deleted.

**Parameters**

- `xMessageBuffer` - The handle of the message buffer to be deleted.

**xMessageBufferIsFull (xMessageBuffer)**

Tests to see if a message buffer is full. A message buffer is full if it cannot accept any more messages, of any size, until space is made available by a message being removed from the message buffer.

**Parameters**

- `xMessageBuffer` - The handle of the message buffer being queried.

**Returns**

If the message buffer referenced by `xMessageBuffer` is full then `pdTRUE` is returned. Otherwise `pdFALSE` is returned.

**xMessageBufferIsEmpty (xMessageBuffer)**

Tests to see if a message buffer is empty (does not contain any messages).

**Parameters**

- `xMessageBuffer` - The handle of the message buffer being queried.

**Returns**

If the message buffer referenced by `xMessageBuffer` is empty then `pdTRUE` is returned. Otherwise `pdFALSE` is returned.

**xMessageBufferReset (xMessageBuffer)**

Resets a message buffer to its initial empty state, discarding any message it contained.

A message buffer can only be reset if there are no tasks blocked on it.

**Parameters**

- `xMessageBuffer` - The handle of the message buffer being reset.

**Returns**

If the message buffer was reset then `pdPASS` is returned. If the message buffer could not be reset because either there was a task blocked on the message queue to wait for space to become available, or to wait for a message to be available, then `pdFAIL` is returned.

**xMessageBufferSpaceAvailable (xMessageBuffer)**

```
size_t xMessageBufferSpaceAvailable( MessageBufferHandle_t xMessageBuffer );
```

Returns the number of bytes of free space in the message buffer.

**Parameters**

- `xMessageBuffer` - The handle of the message buffer being queried.

**Returns**

The number of bytes that can be written to the message buffer before the message buffer would be full. When a message is written to the message buffer an additional `sizeof(size_t)` bytes are also written to store the message’s length. `sizeof(size_t)` is typically 4 bytes on a 32-bit architecture, so if `xMessageBufferSpaceAvailable()` returns 10, then the size of the largest message that can be written to the message buffer is 6 bytes.

**xMessageBufferSpacesAvailable (xMessageBuffer)**

**xMessageBufferNextLengthBytes (xMessageBuffer)**

Returns the length (in bytes) of the next message in a message buffer. Useful if `xMessageBufferReceive()` returned 0 because the size of the buffer passed into `xMessageBufferReceive()` was too small to hold the next message.

**Parameters**

- `xMessageBuffer` - The handle of the message buffer being queried.

**Returns**

The length (in bytes) of the next message in the message buffer, or 0 if the message buffer is empty.
**xMessageBufferSendCompletedFromISR (xMessageBuffer, pxHigherPriorityTaskWoken)**

For advanced users only.

The sbSEND_COMPLETED() macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbSEND_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xMessageBufferSendCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbSEND_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

**Parameters**

- `xMessageBuffer` – The handle of the stream buffer to which data was written.
- `pxHigherPriorityTaskWoken` – `pxHigherPriorityTaskWoken` should be initialised to `pdFALSE` before it is passed into xMessageBufferSendCompletedFromISR(). If calling xMessageBufferSendCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then `pxHigherPriorityTaskWoken` will get set to `pdTRUE` indicating that a context switch should be performed before exiting the ISR.

**Returns**

If a task was removed from the Blocked state then `pdTRUE` is returned. Otherwise `pdFALSE` is returned.

**xMessageBufferReceiveCompletedFromISR (xMessageBuffer, pxHigherPriorityTaskWoken)**

For advanced users only.

The sbRECEIVE_COMPLETED() macro is called from within the FreeRTOS APIs when data is read out of a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbRECEIVE_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xMessageBufferReceiveCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbRECEIVE_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

**Parameters**

- `xMessageBuffer` – The handle of the stream buffer from which data was read.
- `pxHigherPriorityTaskWoken` – `pxHigherPriorityTaskWoken` should be initialised to `pdFALSE` before it is passed into xMessageBufferReceiveCompletedFromISR(). If calling xMessageBufferReceiveCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then `pxHigherPriorityTaskWoken` will get set to `pdTRUE` indicating that a context switch should be performed before exiting the ISR.

**Returns**

If a task was removed from the Blocked state then `pdTRUE` is returned. Otherwise `pdFALSE` is returned.

**Type Definitions**

typedef StreamBufferHandle_t MessageBufferHandle_t

Type by which message buffers are referenced. For example, a call to xMessageBufferCreate() returns an MessageBufferHandle_t variable that can then be used as a parameter to xMessageBufferSend(), xMessageBufferReceive(), etc. Message buffer is essentially built as a stream buffer hence its handle is also set to same type as a stream buffer handle.

### 2.9.13 FreeRTOS (Supplemental Features)
ESP-IDF provides multiple features to supplement the features offered by FreeRTOS. These supplemental features are available on all FreeRTOS implementations supported by ESP-IDF (i.e., ESP-IDF FreeRTOS and Amazon SMP FreeRTOS). This document describes these supplemental features and is split into the following sections:

### Overview

ESP-IDF adds various new features to supplement the capabilities of FreeRTOS as follows:

- **Ring buffers**: Ring buffers provide a FIFO buffer that can accept entries of arbitrary lengths.
- **ESP-IDF Tick and Idle Hooks**: ESP-IDF provides multiple custom tick interrupt hooks and idle task hooks that are more numerous and more flexible when compared to FreeRTOS tick and idle hooks.
- **Thread Local Storage Pointer (TLSP) Deletion Callbacks**: TLSP Deletion callbacks are run automatically when a task is deleted, thus allowing users to clean up their TLSPs automatically.
- **IDF Additional API**: ESP-IDF specific functions added to augment the features of FreeRTOS.
- **Component Specific Properties**: Currently added only one component specific property ORIG_INCLUDE_PATH.

### Ring Buffers

FreeRTOS provides stream buffers and message buffers as the primary mechanisms to send arbitrarily sized data between tasks and ISRs. However, FreeRTOS stream buffers and message buffers have the following limitations:

- Strictly single sender and single receiver
- Data is passed by copy
- Unable to reserve buffer space for a deferred send (i.e., send acquire)

Therefore, ESP-IDF provides a separate ring buffer implementation to address the issues above.

ESP-IDF ring buffers are strictly FIFO buffers that supports arbitrarily sized items. Ring buffers are a more memory efficient alternative to FreeRTOS queues in situations where the size of items is variable. The capacity of a ring buffer is not measured by the number of items it can store, but rather by the amount of memory used for storing items.

The ring buffer provides APIs to send an item, or to allocate space for an item in the ring buffer to be filled manually by the user. For efficiency reasons, **items are always retrieved from the ring buffer by reference**. As a result, all retrieved items **must also be returned** to the ring buffer by using `vRingbufferReturnItem()` or `vRingbufferReturnItemFromISR()`, in order for them to be removed from the ring buffer completely.

The ring buffers are split into the three following types:

- **No-Split buffers** guarantee that an item is stored in contiguous memory and does not attempt to split an item under any circumstances. Use No-Split buffers when items must occupy contiguous memory. **Only this buffer type allows reserving buffer space for deferred sending.** Refer to the documentation of the functions `xRingbufferSendAcquire()` and `xRingbufferSendComplete()` for more details.

- **Allow-Split buffers** allow an item to be split in two parts when wrapping around the end of the buffer if there is enough space at the tail and the head of the buffer combined to store the item. Allow-Split buffers are more memory efficient than No-Split buffers but can return an item in two parts when retrieving.
Byte buffers do not store data as separate items. All data is stored as a sequence of bytes, and any number of bytes can be sent or retrieved each time. Use byte buffers when separate items do not need to be maintained, e.g., a byte stream.

**Note:** No-Split buffers and Allow-Split buffers always store items at 32-bit aligned addresses. Therefore, when retrieving an item, the item pointer is guaranteed to be 32-bit aligned. This is useful especially when you need to send some data to the DMA.

**Note:** Each item stored in No-Split or Allow-Split buffers requires an additional 8 bytes for a header. Item sizes are also rounded up to a 32-bit aligned size, i.e., multiple of 4 bytes. However the true item size is recorded within the header. The sizes of No-Split and Allow-Split buffers will also be rounded up when created.

**Usage** The following example demonstrates the usage of `xRingbufferCreate()` and `xRingbufferSend()` to create a ring buffer and then send an item to it:

```c
#include "freertos/ringbuf.h"
static char tx_item[] = "test_item";
...

//Create ring buffer
RingbufHandle_t buf_handle;
buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
if (buf_handle == NULL) {
    printf("Failed to create ring buffer\n");
}

//Send an item
UBaseType_t res = xRingbufferSend(buf_handle, tx_item, sizeof(tx_item), pdMS_TO_TICKS(1000));
if (res != pdTRUE) {
    printf("Failed to send item\n");
}
```

The following example demonstrates the usage of `xRingbufferSendAcquire()` and `xRingbufferSendComplete()` instead of `xRingbufferSend()` to acquire memory on the ring buffer (of type `RINGBUF_TYPE_NOSPLIT`) and then send an item to it. This adds one more step, but allows getting the address of the memory to write to, and writing to the memory yourself.

```c
#include "freertos/ringbuf.h"
#include "soc/lldesc.h"

typedef struct {
    lldesc_t dma_desc;
    uint8_t buf[];
} dma_item_t;

#define DMA_ITEM_SIZE(N) (sizeof(lldesc_t)+(((N)+3)&(~3)))
...

//Retrieve space for DMA descriptor and corresponding data buffer
//This has to be done with SendAcquire, or the address may be different when we copy
dma_item_t item;
UBaseType_t res = xRingbufferSendAcquire(buf_handle,
    &item, DMA_ITEM_SIZE(buffer_size), pdMS_TO_TICKS(1000));
```
The following example demonstrates retrieving and returning an item from a No-Split ring buffer using `xRingbufferReceive()` and `vRingbufferReturnItem()`.

```c
//Receive an item from no-split ring buffer
size_t item_size;
char *item = (char *)xRingbufferReceive(buf_handle, &item_size, pdMS_TO_TICKS(1000));

//Check received item
if (item != NULL) {
    //Print item
    for (int i = 0; i < item_size; i++) {
        printf("%c", item[i]);
    }
    printf("\n");
    //Return Item
    vRingbufferReturnItem(buf_handle, (void *)item);
} else {
    //Failed to receive item
    printf("Failed to receive item\n");
}
```

The following example demonstrates retrieving and returning an item from an Allow-Split ring buffer using `xRingbufferReceiveSplit()` and `vRingbufferReturnItem()`.

```c
//Receive an item from allow-split ring buffer
size_t item_size1, item_size2;
char *item1, *item2;
 BaseType_t ret = xRingbufferReceiveSplit(buf_handle, (void **)item1, (void **)item2, &item_size1, &item_size2, pdMS_TO_TICKS(1000));

//Check received item
if (ret == pdTRUE && item1 != NULL) {
    for (int i = 0; i < item_size1; i++) {
        printf("%c", item1[i]);
    }
    vRingbufferReturnItem(buf_handle, (void *)item1);
    //Check if item was split
    if (item2 != NULL) {
        for (int i = 0; i < item_size2; i++) {
            printf("%c", item2[i]);
        }
    }
}
```

The following example demonstrates retrieving and returning an item from a byte buffer using `xRingbufferReceiveUpTo()` and `vRingbufferReturnItem()`...

```
//Receive data from byte buffer
size_t item_size;
char *item = (char *)xRingbufferReceiveUpTo(buf_handle, &item_size, pdMS_TO_TICKS(1000), sizeof(tx_item));

//Check received data
if (item != NULL) {
    //Print item
    for (int i = 0; i < item_size; i++) {
        printf("%c", item[i]);
    }
    printf("\n");
    //Return Item
    vRingbufferReturnItem(buf_handle, (void *)item);
} else {
    //Failed to receive item
    printf("Failed to receive item\n");
}
```

For ISR safe versions of the functions used above, call `xRingbufferSendFromISR()`, `xRingbufferReceiveFromISR()`, `xRingbufferReceiveSplitFromISR()`, `xRingbufferReceiveUpToFromISR()`, and `vRingbufferReturnItemFromISR()`.

**Note:** Two calls to `RingbufferReceive[UpTo][FromISR]()` are required if the bytes wraps around the end of the ring buffer.

### Sending to Ring Buffer

The following diagrams illustrate the differences between No-Split and Allow-Split buffers as compared to byte buffers with regard to sending items or data. The diagrams assume that three items of sizes 18, 3, and 27 bytes are sent respectively to a buffer of 128 bytes:

![Sending items to No-Split or Allow-Split ring buffers](image)

For No-Split and Allow-Split buffers, a header of 8 bytes precedes every data item. Furthermore, the space occupied by each item is **rounded up to the nearest 32-bit aligned size** in order to maintain overall 32-bit alignment.
However, the true size of the item is recorded inside the header which will be returned when the item is retrieved.

Referring to the diagram above, the 18, 3, and 27 byte items are rounded up to 20, 4, and 28 bytes respectively. An 8 byte header is then added in front of each item.

![Diagram](image)

Fig. 43: Sending items to byte buffers

Byte buffers treat data as a sequence of bytes and does not incur any overhead (no headers). As a result, all data sent to a byte buffer is merged into a single item.

Referring to the diagram above, the 18, 3, and 27 byte items are sequentially written to the byte buffer and merged into a single item of 48 bytes.

**Using SendAcquire and SendComplete** Items in No-Split buffers are acquired (by SendAcquire) in strict FIFO order and must be sent to the buffer by SendComplete for the data to be accessible by the consumer. Multiple items can be sent or acquired without calling SendComplete, and the items do not necessarily need to be completed in the order they were acquired. However, the receiving of data items must occur in FIFO order, therefore not calling SendComplete for the earliest acquired item prevents the subsequent items from being received.

The following diagrams illustrate what will happen when SendAcquire and SendComplete do not happen in the same order. At the beginning, there is already a data item of 16 bytes sent to the ring buffer. Then SendAcquire is called to acquire space of 20, 8, 24 bytes on the ring buffer.

![Diagram](image)

Fig. 44: SendAcquire/SendComplete items in No-Split ring buffers

After that, we fill (use) the buffers, and send them to the ring buffer by SendComplete in the order of 8, 24, 20. When 8 bytes and 24 bytes data are sent, the consumer still can only get the 16 bytes data item. Hence, if SendComplete is not called for the 20 bytes, it will not be available, nor will the data items following the 20 bytes item.

When the 20 bytes item is finally completed, all the 3 data items can be received now, in the order of 20, 8, 24 bytes, right after the 16 bytes item existing in the buffer at the beginning.

Allow-Split buffers and byte buffers do not allow using SendAcquire or SendComplete since acquired buffers are required to be complete (not wrapped).

**Wrap Around** The following diagrams illustrate the differences between No-Split, Allow-Split, and byte buffers when a sent item requires a wrap around. The diagrams assume a buffer of 128 bytes with 56 bytes of free space that wraps around and a sent item of 28 bytes.
No-Split buffers only store an item in continuous free space and do not split an item under any circumstances. When the free space at the tail of the buffer is insufficient to completely store the item and its header, the free space at the tail will be marked as dummy data. The buffer will then wrap around and store the item in the free space at the head of the buffer.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore, the 16 bytes is marked as dummy data and the item is written to the free space at the head of the buffer instead.

Allow-Split buffers will attempt to split the item into two parts when the free space at the tail of the buffer is insufficient to store the item data and its header. Both parts of the split item will have their own headers, therefore incurring an extra 8 bytes of overhead.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore, the item is split into two parts (8 and 20 bytes) and written as two parts to the buffer.

Note: Allow-Split buffers treat both parts of the split item as two separate items, therefore call xRingbufferReceiveSplit() instead of xRingbufferReceive() to receive both parts of a split item in a thread safe manner.

Byte buffers store as much data as possible into the free space at the tail of buffer. The remaining data will then be stored in the free space at the head of the buffer. No overhead is incurred when wrapping around in byte buffers.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to completely store the 28 bytes of data. Therefore, the 16 bytes of free space is filled with data, and the remaining 12 bytes are written...
to the free space at the head of the buffer. The buffer now contains data in two separate continuous parts, and each continuous part is treated as a separate item by the byte buffer.

**Retrieving/Returning** The following diagrams illustrate the differences between No-Split and Allow-Split buffers as compared to byte buffers in retrieving and returning data:

![Fig. 48: Retrieving/Returning items in No-Split and Allow-Split ring buffers](image)

Items in No-Split buffers and Allow-Split buffers are **retrieved in strict FIFO order and must be returned** for the occupied space to be freed. Multiple items can be retrieved before returning, and the items do not necessarily need to be returned in the order they were retrieved. However, the freeing of space must occur in FIFO order, therefore not returning the earliest retrieved item prevents the space of subsequent items from being freed.

Referring to the diagram above, the **16, 20, and 8 byte items are retrieved in FIFO order**. However, the items are not returned in the order they were retrieved. First, the 20 byte item is returned followed by the 8 byte and the 16 byte items. The space is not freed until the first item, i.e., the 16 byte item is returned.

![Fig. 49: Retrieving/Returning data in byte buffers](image)

Byte buffers **do not allow multiple retrievals before returning** (every retrieval must be followed by a return before another retrieval is permitted). When using `xRingbufferReceive()` or `xRingbufferReceiveFromISR()`, all continuous stored data will be retrieved. `xRingbufferReceiveUpTo()` or `xRingbufferReceiveUpToFromISR()` can be used to restrict the maximum number of bytes retrieved. Since every retrieval must be followed by a return, the space is freed as soon as the data is returned.

Referring to the diagram above, the 38 bytes of continuous stored data at the tail of the buffer is retrieved, returned, and freed. The next call to `xRingbufferReceive()` or `xRingbufferReceiveFromISR()` then wraps around and does the same to the 30 bytes of continuous stored data at the head of the buffer.

**Ring Buffers with Queue Sets** Ring buffers can be added to FreeRTOS queue sets using `xRingbufferAddToQueueSetRead()` such that every time a ring buffer receives an item or data, the queue set is notified. Once
added to a queue set, every attempt to retrieve an item from a ring buffer should be preceded by a call to `xQueueSelectFromSet()`. To check whether the selected queue set member is the ring buffer, call `xRingbufferCanRead()`.

The following example demonstrates queue set usage with ring buffers:

```c
#include "freertos/queue.h"
#include "freertos/ringbuf.h"
...

// Create ring buffer and queue set
RingbufHandle_t buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
QueueSetHandle_t queue_set = xQueueCreateSet(3);

// Add ring buffer to queue set
if (xRingbufferAddToQueueSetRead(buf_handle, queue_set) != pdTRUE) {
    printf("Failed to add to queue set\n");
}
...

// Block on queue set
QueueSetMemberHandle_t member = xQueueSelectFromSet(queue_set, pdMS_TO_TICKS(1000));

// Check if member is ring buffer
if (member != NULL && xRingbufferCanRead(buf_handle, member) == pdTRUE) {
    // Member is ring buffer, receive item from ring buffer
    size_t item_size;
    char *item = (char *)xRingbufferReceive(buf_handle, &item_size, 0);
    // Handle item...
} else {
    ...
}
```

Ring Buffers with Static Allocation  The `xRingbufferCreateStatic()` can be used to create ring buffers with specific memory requirements (such as a ring buffer being allocated in external RAM). All blocks of memory used by a ring buffer must be manually allocated beforehand, then passed to the `xRingbufferCreateStatic()` to be initialized as a ring buffer. These blocks include the following:

- The ring buffer’s data structure of type `StaticRingbuffer_t`.
- The ring buffer’s storage area of size `xBufferSize`. Note that `xBufferSize` must be 32-bit aligned for No-Split and Allow-Split buffers.

The manner in which these blocks are allocated depends on the users requirements (e.g., all blocks being statically declared, or dynamically allocated with specific capabilities such as external RAM).

Note: When deleting a ring buffer created via `xRingbufferCreateStatic()`, the function `vRingbufferDelete()` will not free any of the memory blocks. This must be done manually by the user after `vRingbufferDelete()` is called.

The code snippet below demonstrates a ring buffer being allocated entirely in external RAM.

```c
#include "freertos/ringbuf.h"
#include "freertos/semphr.h"
#include "esp_heap_caps.h"
(continues on next page)
```
#define BUFFER_SIZE 400 //32-bit aligned size
#define BUFFER_TYPE RINGBUF_TYPE_NOSPLIT
...

//Allocate ring buffer data structure and storage area into external RAM
StaticRingbuffer_t *buffer_struct = (StaticRingbuffer_t *)heap_caps_malloc(sizeof(StaticRingbuffer_t), MALLOC_CAP_SPIRAM);
uint8_t *buffer_storage = (uint8_t *)heap_caps_malloc(sizeof(uint8_t) * BUFFER_SIZE, MALLOC_CAP_SPIRAM);

//Create a ring buffer with manually allocated memory
RingbufHandle_t handle = xRingbufferCreateStatic(BUFFER_SIZE, BUFFER_TYPE, buffer_storage, buffer_struct);
...

//Delete the ring buffer after used
vRingbufferDelete(handle);

//Manually free all blocks of memory
free(buffer_struct);
free(buffer_storage);

### ESP-IDF Tick and Idle Hooks

FreeRTOS allows applications to provide a tick hook and an idle hook at compile time:

- FreeRTOS tick hook can be enabled via the `CONFIG_FREERTOS_USE_TICK_HOOK` option. The application must provide the `void vApplicationTickHook( void )` callback.
- FreeRTOS idle hook can be enabled via the `CONFIG_FREERTOS_USE_IDLE_HOOK` option. The application must provide the `void vApplicationIdleHook( void )` callback.

However, the FreeRTOS tick hook and idle hook have the following drawbacks:

- The FreeRTOS hooks are registered at compile time
- Only one of each hook can be registered
- On multi-core targets, the FreeRTOS hooks are symmetric, meaning each core’s tick interrupt and idle tasks ends up calling the same hook

Therefore, ESP-IDF tick and idle hooks are provided to supplement the features of FreeRTOS tick and idle hooks. The ESP-IDF hooks have the following features:

- The hooks can be registered and deregistered at run-time
- Multiple hooks can be registered (with a maximum of 8 hooks of each type per core)
- On multi-core targets, the hooks can be asymmetric, meaning different hooks can be registered to each core

ESP-IDF hooks can be registered and deregistered using the following APIs:

- For tick hooks:
  - Register using `esp_register_freertos_tick_hook()` or `esp_register_freertos_tick_hook_for_cpu()` 
  - Deregister using `esp_deregister_freertos_tick_hook()` or `esp_deregister_freertos_tick_hook_for_cpu()`
- For idle hooks:
  - Register using `esp_register_freertos_idle_hook()` or `esp_register_freertos_idle_hook_for_cpu()` 
  - Deregister using `esp_deregister_freertos_idle_hook()` or `esp_deregister_freertos_idle_hook_for_cpu()`
Chapter 2. API Reference

**Note:** The tick interrupt stays active while the cache is disabled, therefore any tick hook (FreeRTOS or ESP-IDF) functions must be placed in internal RAM. Please refer to the *SPI flash API documentation* for more details.

**TLSP Deletion Callbacks**

Vanilla FreeRTOS provides a Thread Local Storage Pointers (TLSP) feature. These are pointers stored directly in the Task Control Block (TCB) of a particular task. TLSPs allow each task to have its own unique set of pointers to data structures. Vanilla FreeRTOS expects users to:

- set a task’s TLSPs by calling `vTaskSetThreadLocalStoragePointer()` after the task has been created.
- get a task’s TLSPs by calling `pvTaskGetThreadLocalStoragePointer()` during the task’s lifetime.
- free the memory pointed to by the TLSPs before the task is deleted.

However, there can be instances where users may want the freeing of TLSP memory to be automatic. Therefore, ESP-IDF provides the additional feature of TLSP deletion callbacks. These user-provided deletion callbacks are called automatically when a task is deleted, thus allowing the TLSP memory to be cleaned up without needing to add the cleanup logic explicitly to the code of every task.

The TLSP deletion callbacks are set in a similar fashion to the TLSPs themselves.

- `vTaskSetThreadLocalStoragePointerAndDelCallback()` sets both a particular TLSP and its associated callback.
- Calling the Vanilla FreeRTOS function `vTaskSetThreadLocalStoragePointer()` simply sets the TLSP’s associated Deletion Callback to `NULL`, meaning that no callback is called for that TLSP during task deletion.

When implementing TLSP callbacks, users should note the following:

- The callback **must never attempt to block or yield** and critical sections should be kept as short as possible.
- The callback is called shortly before a deleted task’s memory is freed. Thus, the callback can either be called from `vTaskDelete()` itself, or from the idle task.

**IDF Additional API**

The `freetos.esp_additions/include/freertos/idf_additions.h` header contains FreeRTOS-related helper functions added by ESP-IDF. Users can include this header via `#include "frietos/idf_additions.h"`.

**Component Specific Properties**

Besides standard component variables that are available with basic cmake build properties, FreeRTOS component also provides arguments (only one so far) for simpler integration with other modules:

- `ORIG_INCLUDE_PATH` - contains an absolute path to freertos root include folder. Thus instead of `#include “frietos/FreeRTOS.h”` you can refer to headers directly: `#include “FreeRTOS.h”`.

**API Reference**

**Ring Buffer API**

**Header File**

- `components/esp_ringbuf/include/freertos/ringbuf.h`
- This header file can be included with:
This header file is a part of the API provided by the esp_ringbuf component. To declare that your component depends on esp_ringbuf, add the following to your CMakeLists.txt:

```cmake
#requires esp_ringbuf
```
or

```cmake
#privRequires esp_ringbuf
```

## Functions

**RingbufHandle_t xRingbufferCreate**(size_t xBufferSize, RingbufferType_t xBufferType)

Create a ring buffer.

**Parameters**

- xBufferSize – [in] Size of the buffer in bytes. Note that items require space for a header in no-split/allow-split buffers.  
- xBufferType – [in] Type of ring buffer, see documentation.

**Returns** A handle to the created ring buffer, or NULL in case of error.

**RingbufHandle_t xRingbufferCreateNoSplit**(size_t xItemSize, size_t xItemNum)

Create a ring buffer of type RINGBUF_TYPE_NOSPLIT for a fixed item size. This API is similar to xRingbufferCreate(), but it will internally allocate additional space for the headers.

**Parameters**

- xItemSize – [in] Size of each item to be put into the ring buffer  
- xItemNum – [in] Maximum number of items the buffer needs to hold simultaneously

**Returns** A RingbufHandle_t handle to the created ring buffer, or NULL in case of error.

**RingbufHandle_t xRingbufferCreateStatic**(size_t xBufferSize, RingbufferType_t xBufferType, uint8_t *pucRingbufferStorage, StaticRingbuffer_t *pxStaticRingbuffer)

Create a ring buffer but manually provide the required memory.

**Parameters**

- xBufferType – [in] Type of ring buffer, see documentation  
- pucRingbufferStorage – [in] Pointer to the ring buffer’s storage area. Storage area must have the same size as specified by xBufferSize  
- pxStaticRingbuffer – [in] Pointer to a struct of type StaticRingbuffer_t which will be used to hold the ring buffer’s data structure

**Returns** A handle to the created ring buffer

** BaseType_t xRingbufferSend**(RingbufHandle_t xRingbuffer, const void *pvItem, size_t xItemSize, TickType_t xTicksToWait)

Insert an item into the ring buffer.

Attempt to insert an item into the ring buffer. This function will block until enough free space is available or until it times out.
**Note:** For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

**Note:** For no-split/allow-split buffers, an xItemSize of 0 will result in an item with no data being set (i.e., item only contains the header). For byte buffers, an xItemSize of 0 will simply return pdTRUE without copying any data.

### Parameters
- `xRingbuffer` [in] Ring buffer to insert the item into
- `pvItem` [in] Pointer to data to insert. NULL is allowed if xItemSize is 0.
- `xItemSize` [in] Size of data to insert.
- `xTicksToWait` [in] Ticks to wait for room in the ring buffer.

### Returns
- pdTRUE if succeeded
- pdFALSE on time-out or when the data is larger than the maximum permissible size of the buffer

**BaseType_t** `xRingbufferSendFromISR(RingbufHandle_t xRingbuffer, const void *pvItem, size_t xItemSize, BaseType_t *pxHigherPriorityTaskWoken)`

Insert an item into the ring buffer in an ISR.

Attempt to insert an item into the ring buffer from an ISR. This function will return immediately if there is insufficient free space in the buffer.

**Note:** For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

**Note:** For no-split/allow-split buffers, an xItemSize of 0 will result in an item with no data being set (i.e., item only contains the header). For byte buffers, an xItemSize of 0 will simply return pdTRUE without copying any data.

### Parameters
- `xRingbuffer` [in] Ring buffer to insert the item into
- `pvItem` [in] Pointer to data to insert. NULL is allowed if xItemSize is 0.
- `xItemSize` [in] Size of data to insert.
- `pxHigherPriorityTaskWoken` [out] Value pointed to will be set to pdTRUE if the function woke up a higher priority task.

### Returns
- pdTRUE if succeeded
- pdFALSE when the ring buffer does not have space.

**BaseType_t** `xRingbufferSendAcquire(RingbufHandle_t xRingbuffer, void **ppvItem, size_t xItemSize, TickType_t xTicksToWait)`

Acquire memory from the ring buffer to be written to by an external source and to be sent later.

Attempt to allocate buffer for an item to be sent into the ring buffer. This function will block until enough free space is available or until it times out.

The item, as well as the following items SendAcquire or Send after it, will not be able to be read from the ring buffer until this item is actually sent into the ring buffer.

**Note:** Only applicable for no-split ring buffers now, the actual size of memory that the item will occupy will
be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

**Note:** An xItemSize of 0 will result in a buffer being acquired, but the buffer will have a size of 0.

### Parameters
- **xRingbuffer** - [in] Ring buffer to allocate the memory
- **ppvItem** - [out] Double pointer to memory acquired (set to NULL if no memory were retrieved)
- **xItemSize** - [in] Size of item to acquire.
- **xTicksToWait** - [in] Ticks to wait for room in the ring buffer.

### Returns
- pdTRUE if succeeded
- pdFALSE on time-out or when the data is larger than the maximum permissible size of the buffer

**BaseType_t xRingbufferSendComplete (RingbufHandle_t xRingbuffer, void *pvItem)**
Actually send an item into the ring buffer allocated before by xRingbufferSendAcquire.

**Note:** Only applicable for no-split ring buffers. Only call for items allocated by xRingbufferSendAcquire.

### Parameters
- **xRingbuffer** - [in] Ring buffer to insert the item into
- **pvItem** - [in] Pointer to item in allocated memory to insert.

### Returns
- pdTRUE if succeeded
- pdFALSE if fail for some reason.

**void *xRingbufferReceive (RingbufHandle_t xRingbuffer, size_t* pxItemSize, TickType_t xTicksToWait)**
Retrieve an item from the ring buffer.

Attempt to retrieve an item from the ring buffer. This function will block until an item is available or until it times out.

**Note:** A call to vRingbufferReturnItem() is required after this to free the item retrieved.

**Note:** It is possible to receive items with a pxItemSize of 0 on no-split/allow split buffers.

### Parameters
- **xRingbuffer** - [in] Ring buffer to retrieve the item from
- **pxItemSize** - [out] Pointer to a variable to which the size of the retrieved item will be written.
- **xTicksToWait** - [in] Ticks to wait for items in the ring buffer.

### Returns
- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL on timeout, *pxItemSize is untouched in that case.

**void *xRingbufferReceiveFromISR (RingbufHandle_t xRingbuffer, size_t *pxItemSize)**
Retrieve an item from the ring buffer in an ISR.
Attempt to retrieve an item from the ring buffer. This function returns immediately if there are no items available for retrieval.

**Note:** A call to `vRingbufferReturnItemFromISR()` is required after this to free the item retrieved.

**Note:** Byte buffers do not allow multiple retrievals before returning an item.

**Note:** Two calls to `RingbufferReceiveFromISR()` are required if the bytes wrap around the end of the ring buffer.

**Note:** It is possible to receive items with a `pxItemSize` of 0 on no-split/allow split buffers.

**Parameters**
- `xRingbuffer` - [in] Ring buffer to retrieve the item from
- `pxItemSize` - [out] Pointer to a variable to which the size of the retrieved item will be written.

**Returns**
- Pointer to the retrieved item on success; `*pxItemSize` filled with the length of the item.
- NULL when the ring buffer is empty, `*pxItemSize` is untouched in that case.

```c
BaseType_t xRingbufferReceiveSplit(RingbufHandle_t xRingbuffer, void**ppvHeadItem, void**ppvTailItem, size_t*pxHeadItemSize, size_t*pxTailItemSize, TickType_t xTicksToWait)
```

Retrieve a split item from an allow-split ring buffer. Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retrieved. If the item is split, both parts will be retrieved. This function will block until an item is available or until it times out.

**Note:** Call(s) to `vRingbufferReturnItem()` is required after this to free up the item(s) retrieved.

**Note:** This function should only be called on allow-split buffers.

**Note:** It is possible to receive items with a `pxItemSize` of 0 on allow split buffers.

**Parameters**
- `xRingbuffer` - [in] Ring buffer to retrieve the item from
- `ppvHeadItem` - [out] Double pointer to first part (set to NULL if no items were retrieved)
- `ppvTailItem` - [out] Double pointer to second part (set to NULL if item is not split)
- `pxHeadItemSize` - [out] Pointer to size of first part (unmodified if no items were retrieved)
- `pxTailItemSize` - [out] Pointer to size of second part (unmodified if item is not split)
- `xTicksToWait` - [in] Ticks to wait for items in the ring buffer.

**Returns**
- `pdTRUE` if an item (split or unsplit) was retrieved
- `pdFALSE` when no item was retrieved
BaseType_t xRingbufferReceiveSplitFromISR(RingbufHandle_t xRingbuffer, void **ppvHeadItem, void **ppvTailItem, size_t *pxHeadItemSize, size_t *pxTailItemSize)

Retrieve a split item from an allow-split ring buffer in an ISR.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retrieved. If the item is split, both parts will be retrieved. This function returns immediately if there are no items available for retrieval.

Note: Calls to vRingbufferReturnItemFromISR() is required after this to free up the item(s) retrieved.

Note: This function should only be called on allow-split buffers

Note: It is possible to receive items with a pxItemSize of 0 on allow split buffers.

Parameters
- **xRingbuffer** [in] Ring buffer to retrieve the item from
- **ppvHeadItem** [out] Double pointer to first part (set to NULL if no items were retrieved)
- **ppvTailItem** [out] Double pointer to second part (set to NULL if item is not split)
- **pxHeadItemSize** [out] Pointer to size of first part (unmodified if no items were retrieved)
- **pxTailItemSize** [out] Pointer to size of second part (unmodified if item is not split)

Returns
- pdTRUE if an item (split or unsplit) was retrieved
- pdFALSE when no item was retrieved

void *xRingbufferReceiveUpTo(RingbufHandle_t xRingbuffer, size_t *pxItemSize, TickType_t xTicksToWait, size_t xMaxSize)

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve.

Attempt to retrieve data from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will block until there is data available for retrieval or until it times out.

Note: A call to vRingbufferReturnItem() is required after this to free up the data retrieved.

Note: This function should only be called on byte buffers

Note: Byte buffers do not allow multiple retrievals before returning an item

Note: Two calls to RingbufferReceiveUpTo() are required if the bytes wrap around the end of the ring buffer.

Parameters
- **xRingbuffer** [in] Ring buffer to retrieve the item from
- **pxItemSize** [out] Pointer to a variable to which the size of the retrieved item will be written.
- **xTicksToWait** [in] Ticks to wait for items in the ring buffer.
- **xMaxSize** [in] Maximum number of bytes to return.
Returns

• Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
• NULL on timeout, *pxItemSize is untouched in that case.

void *xRingbufferReceiveUpToFromISR (RingbufHandle_t xRingbuffer, size_t *pxItemSize, size_t xMaxSize)

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve. Call this from an ISR.
Attempt to retrieve bytes from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will return immediately if there is no data available for retrieval.

Note: A call to vRingbufferReturnItemFromISR() is required after this to free up the data received.

Note: This function should only be called on byte buffers

Note: Byte buffers do not allow multiple retrievals before returning an item

Parameters

• xRingbuffer –[in] Ring buffer to retrieve the item from
• pxItemSize –[out] Pointer to a variable to which the size of the retrieved item will be written.
• xMaxSize –[in] Maximum number of bytes to return. Size of 0 simply returns NULL.

Returns

• Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
• NULL when the ring buffer is empty, *pxItemSize is untouched in that case.

void vRingbufferReturnItem (RingbufHandle_t xRingbuffer, void *pvItem)

Return a previously-retrieved item to the ring buffer.

Note: If a split item is retrieved, both parts should be returned by calling this function twice

Parameters

• xRingbuffer –[in] Ring buffer the item was retrieved from
• pvItem –[in] Item that was received earlier

void vRingbufferReturnItemFromISR (RingbufHandle_t xRingbuffer, void *pvItem, BaseType_t *pxHigherPriorityTaskWoken)

Return a previously-retrieved item to the ring buffer from an ISR.

Note: If a split item is retrieved, both parts should be returned by calling this function twice

Parameters

• xRingbuffer –[in] Ring buffer the item was retrieved from
• pvItem –[in] Item that was received earlier
• pxHigherPriorityTaskWoken –[out] Value pointed to will be set to pdTRUE if the function woke up a higher priority task.
**vRingbufferDelete** *(RingbufHandle_t xRingbuffer)*

Delete a ring buffer.

**Note:** This function will not deallocate any memory if the ring buffer was created using `xRingbufferCreateStatic()`.Deallocation must be done manually by the user.

**Parameters**
- `xRingbuffer` *(in)* Ring buffer to delete

**size_t xRingbufferGetMaxItemSize** *(RingbufHandle_t xRingbuffer)*

Get maximum size of an item that can be placed in the ring buffer.

This function returns the maximum size an item can have if it was placed in an empty ring buffer.

**Note:** The max item size for a no-split buffer is limited to `((buffer_size/2)-header_size)`. This limit is imposed so that an item of max item size can always be sent to an empty no-split buffer regardless of the internal positions of the buffer’s read/write/free pointers.

**Parameters**
- `xRingbuffer` *(in)* Ring buffer to query

**Returns** Maximum size, in bytes, of an item that can be placed in a ring buffer.

**size_t xRingbufferGetCurFreeSize** *(RingbufHandle_t xRingbuffer)*

Get current free size available for an item/data in the buffer.

This gives the real time free space available for an item/data in the ring buffer. This represents the maximum size an item/data can have if it was currently sent to the ring buffer.

**Note:** An empty no-split buffer has a max current free size for an item that is limited to `((buffer_size/2)-header_size)`. See API reference for `xRingbufferGetMaxItemSize()`.

**Warning:** This API is not thread safe. So, if multiple threads are accessing the same ring buffer, it is the application’s responsibility to ensure atomic access to this API and the subsequent Send.

**Parameters**
- `xRingbuffer` *(in)* Ring buffer to query

**Returns** Current free size, in bytes, available for an entry

**BaseType_t xRingbufferAddToQueueSetRead** *(RingbufHandle_t xRingbuffer, QueueSetHandle_t xQueueSet)*

Add the ring buffer to a queue set. Notified when data has been written to the ring buffer.

This function adds the ring buffer to a queue set, thus allowing a task to block on multiple queues/ring buffers. The queue set is notified when the new data becomes available to read on the ring buffer.

**Parameters**
- `xRingbuffer` *(in)* Ring buffer to add to the queue set
- `xQueueSet` *(in)* Queue set to add the ring buffer to

**Returns**
- `pdTRUE` on success, `pdFALSE` otherwise

**static inline BaseType_t xRingbufferCanRead** *(RingbufHandle_t xRingbuffer, QueueSetMemberHandle_t xMember)*

Check if the selected queue set member is a particular ring buffer.

This API checks if queue set member returned from `xQueueSelectFromSet()` is a particular ring buffer. If so, this indicates the ring buffer has items waiting to be retrieved.
Parameters
• \texttt{xRingbuffer} – [in] Ring buffer to check
• \texttt{xMember} – [in] Member returned from \texttt{xQueueSelectFromSet}

Returns
• \texttt{pdTRUE} when selected set member is the ring buffer
• \texttt{pdFALSE} otherwise.

\texttt{BaseType_t \bf{xRingbufferRemoveFromQueueSetRead} (Ringbuf\Handle_t xRingbuffer, QueueSetHandle_t xQueueSet)}

Remove the ring buffer from a queue set.

This function removes a ring buffer from a queue set. The ring buffer must have been previously added to the queue set using \texttt{xRingbufferAddToQueueSetRead()}.

Parameters
• \texttt{xRingbuffer} – [in] Ring buffer to remove from the queue set
• \texttt{xQueueSet} – [in] Queue set to remove the ring buffer from

Returns
• \texttt{pdTRUE} on success
• \texttt{pdFALSE} otherwise

\texttt{void \bf{vRingbufferGetInfo} (Ringbuf\Handle_t xRingbuffer, UBaseType_t*uxFree, UBaseType_t*uxRead, UBaseType_t*uxWrite, UBaseType_t*uxAcquire, UBaseType_t*uxItemsWaiting)}

Get information about ring buffer status.

Get information of a ring buffer’s current status such as free/read/write/acquire pointer positions, and number of items waiting to be retrieved. Arguments can be set to NULL if they are not required.

Parameters
• \texttt{xRingbuffer} – [in] Ring buffer to remove from the queue set
• \texttt{uxFree} – [out] Pointer use to store free pointer position
• \texttt{uxRead} – [out] Pointer use to store read pointer position
• \texttt{uxWrite} – [out] Pointer use to store write pointer position
• \texttt{uxAcquire} – [out] Pointer use to store acquire pointer position
• \texttt{uxItemsWaiting} – [out] Pointer use to store number of items (bytes for byte buffer) waiting to be retrieved

\texttt{void \bf{xRingbufferPrintInfo} (Ringbuf\Handle_t xRingbuffer)}

Debugging function to print the internal pointers in the ring buffer.

Parameters \texttt{xRingbuffer} – Ring buffer to show

\texttt{BaseType_t \bf{xRingbufferGetStaticBuffer} (Ringbuf\Handle_t xRingbuffer, uint8_t**ppucRingbufferStorage, StaticRingbuffer_t**pxStaticRingbuffer)}

Retrieve the pointers to a statically created ring buffer.

Parameters
• \texttt{xRingbuffer} – [in] Ring buffer
• \texttt{ppucRingbufferStorage} – [out] Used to return a pointer to the queue’s storage area buffer
• \texttt{pxStaticRingbuffer} – [out] Used to return a pointer to the queue’s data structure buffer

Returns \texttt{pdTRUE} if buffers were retrieved, \texttt{pdFALSE} otherwise.

\texttt{Ringbuf\Handle_t \bf{xRingbufferCreateWithCaps} (size_t xBufferSize, RingbufType_t xBufferType, UBaseType_t uxMemoryCaps)}

Creates a ring buffer with specific memory capabilities.

This function is similar to \texttt{xRingbufferCreate()}, except that it allows the memory allocated for the ring buffer to have specific capabilities (e.g., \texttt{MALLOCS_CAP\_INTERNAL}).
Chapter 2. API Reference

Note: A queue created using this function must only be deleted using vRingbufferDeleteWithCaps()

Parameters

- **xBufferSize** – [in] Size of the buffer in bytes
- **xBufferType** – [in] Type of ring buffer, see documentation.
- **uxMemoryCaps** – [in] Memory capabilities of the queue’s memory (see esp_heap_caps.h)

Returns Handle to the created ring buffer or NULL on failure.

```c
void vRingbufferDeleteWithCaps (RingbufHandle_t xRingbuffer)
```

Deletes a ring buffer previously created using xRingbufferCreateWithCaps()

Parameters **xRingbuffer** – Ring buffer

Structures

```c
struct xSTATIC_RINGBUFFER
```

Struct that is equivalent in size to the ring buffer’s data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer’s control data structure.

Type Definitions

typedef void *RingbufHandle_t

Type by which ring buffers are referenced. For example, a call to xRingbufferCreate() returns a RingbufHandle_t variable that can then be used as a parameter to xRingbufferSend(), xRingbufferReceive(), etc.

typedef struct xSTATIC_RINGBUFFER StaticRingbuffer_t

Struct that is equivalent in size to the ring buffer’s data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer’s control data structure.

Enumerations

```c
enum RingbufferType_t
```

Values:

- **RINGBUF_TYPE_NOSPLIT**
  
  No-split buffers will only store an item in contiguous memory and will never split an item. Each item requires an 8-byte overhead for a header and will always internally occupy a 32-bit aligned size of space.

- **RINGBUF_TYPE_ALLOWSPLIT**
  
  Allow-split buffers will split an item into two parts if necessary in order to store it. Each item requires an 8-byte overhead for a header, splitting incurs an extra header. Each item will always internally occupy a 32-bit aligned size of space.

- **RINGBUF_TYPE_BYTEBUF**
  
  Byte buffers store data as a sequence of bytes and do not maintain separate items, therefore byte buffers have no overhead. All data is stored as a sequence of byte and any number of bytes can be sent or retrieved each time.
Hooks API

Header File

- components/esp_system/include/esp_freertos_hooks.h
- This header file can be included with:

  ```
  #include "esp_freertos_hooks.h"
  ```

Functions

```c
esp_err_t esp_register_freertos_idle_hook_for_cpu(esp_freertos_idle_cb_t new_idle_cb, UBaseType_t cpuid)
```

Register a callback to be called from the specified core’s idle hook. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

**Warning:** Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

**Parameters**

- `new_idle_cb` - [in] Callback to be called
- `cpuid` - [in] id of the core

**Returns**

- ESP_OK: Callback registered to the specified core’s idle hook
- ESP_ERR_NO_MEM: No more space on the specified core’s idle hook to register callback
- ESP_ERR_INVALID_ARG: cpuid is invalid

```c
esp_err_t esp_register_freertos_idle_hook(esp_freertos_idle_cb_t new_idle_cb)
```

Register a callback to the idle hook of the core that calls this function. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

**Warning:** Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

**Parameters**

- `new_idle_cb` - [in] Callback to be called

**Returns**

- ESP_OK: Callback registered to the calling core’s idle hook
- ESP_ERR_NO_MEM: No more space on the calling core’s idle hook to register callback

```c
esp_err_t esp_register_freertos_tick_hook_for_cpu(esp_freertos_tick_cb_t new_tick_cb, UBaseType_t cpuid)
```

Register a callback to be called from the specified core’s tick hook.

**Parameters**

- `new_tick_cb` - [in] Callback to be called
- `cpuid` - [in] id of the core

**Returns**

- ESP_OK: Callback registered to specified core’s tick hook
**Chapter 2. API Reference**

- ESP_ERR_NO_MEM: No more space on the specified core’s tick hook to register the callback
- ESP_ERR_INVALID_ARG: cpuid is invalid

```c
esp_err_t esp_register_freertos_tick_hook(esp_freertos_tick_cb_t new_tick_cb)
```

Register a callback to be called from the calling core’s tick hook.

**Parameters**
- `new_tick_cb` **[in]** Callback to be called

**Returns**
- ESP_OK: Callback registered to the calling core’s tick hook
- ESP_ERR_NO_MEM: No more space on the calling core’s tick hook to register the callback

```c
void esp_deregister_freertos_idle_hook_for_cpu(esp_freertos_idle_cb_t old_idle_cb, UBaseType_t cpuid)
```

Unregister an idle callback from the idle hook of the specified core.

**Parameters**
- `old_idle_cb` **[in]** Callback to be unregistered
- `cpuid` **[in]** id of the core

```c
void esp_deregister_freertos_idle_hook(esp_freertos_idle_cb_t old_idle_cb)
```

Unregister an idle callback. If the idle callback is registered to the idle hooks of both cores, the idle hook will be unregistered from both cores.

**Parameters**
- `old_idle_cb` **[in]** Callback to be unregistered

```c
void esp_deregister_freertos_tick_hook_for_cpu(esp_freertos_tick_cb_t old_tick_cb, UBaseType_t cpuid)
```

Unregister a tick callback from the tick hook of the specified core.

**Parameters**
- `old_tick_cb` **[in]** Callback to be unregistered
- `cpuid` **[in]** id of the core

```c
void esp_deregister_freertos_tick_hook(esp_freertos_tick_cb_t old_tick_cb)
```

Unregister a tick callback. If the tick callback is registered to the tick hooks of both cores, the tick hook will be unregistered from both cores.

**Parameters**
- `old_tick_cb` **[in]** Callback to be unregistered

---

**Type Definitions**

- `typedef bool (*esp_freertos_idle_cb_t)(void)`
- `typedef void (*esp_freertos_tick_cb_t)(void)`

---

**Additional API**

**Header File**

- `components/freertos/esp_additions/include/freertos/idf_additions.h`
- This header file can be included with:

```c
#include "freertos/idf_additions.h"
```
Functions

**BaseType_t xTaskCreatePinnedToCore** (TaskFunction_t pxTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, TaskHandle_t *const pxCreatedTask, const BaseType_t xCoreID)

Create a new task that is pinned to a particular core.

This function is similar to xTaskCreate(), but allows the creation of a pinned task. The task’s pinned core is specified by the xCoreID argument. If xCoreID is set to tskNO_AFFINITY, then the task is unpinned and can run on any core.

**Note:** If (configNUM_CORES == 1), xCoreID is ignored.

**Parameters**

- **pxTaskCode** - Pointer to the task entry function.
- **pcName** - A descriptive name for the task.
- **ulStackDepth** - The size of the task stack specified as the NUMBER OF BYTES. Note that this differs from vanilla FreeRTOS.
- **pvParameters** - Pointer that will be used as the parameter for the task being created.
- **uxPriority** - The priority at which the task should run.
- **pxCreatedTask** - Used to pass back a handle by which the created task can be referenced.
- **xCoreID** - The core to which the task is pinned to, or tskNO_AFFINITY if the task has no core affinity

**Returns** pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

**TaskHandle_t xTaskCreateStaticPinnedToCore** (TaskFunction_t pxTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, StackType_t *const puxStackBuffer, StaticTask_t *const pxTaskBuffer, const BaseType_t xCoreID)

Create a new static task that is pinned to a particular core.

This function is similar to xTaskCreateStatic(), but allows the creation of a pinned task. The task’s pinned core is specified by the xCoreID argument. If xCoreID is set to tskNO_AFFINITY, then the task is unpinned and can run on any core.

**Note:** If (configNUM_CORES == 1), xCoreID is ignored.

**Parameters**

- **pxTaskCode** - Pointer to the task entry function.
- **pcName** - A descriptive name for the task.
- **ulStackDepth** - The size of the task stack specified as the NUMBER OF BYTES. Note that this differs from vanilla FreeRTOS.
- **pvParameters** - Pointer that will be used as the parameter for the task being created.
- **uxPriority** - The priority at which the task should run.
- **puxStackBuffer** - Must point to a StackType_t array that has at least ulStackDepth indexes
- **pxTaskBuffer** - Must point to a variable of type StaticTask_t, which will then be used to hold the task’s data structures.
- **xCoreID** - The core to which the task is pinned to, or tskNO_AFFINITY if the task has no core affinity

**Returns** The task handle if the task was created, NULL otherwise.
Chapter 2. API Reference

BaseType_t xTaskGetCoreID (TaskHandle_t xTask)
Get the current core ID of a particular task.

Helper function to get the core ID of a particular task. If the task is pinned to a particular core, the core ID is returned. If the task is not pinned to a particular core, tskNO_AFFINITY is returned.

If CONFIG_FREERTOS_UNICORE is enabled, this function simply returns 0.
[refactor-todo] See if this needs to be deprecated (IDF-8145)/(IDF-8164)

Note: If CONFIG_FREERTOS_SMP is enabled, please call vTaskCoreAffinityGet() instead.

Note: In IDFFreertos when configNUMBER_OF_CORES == 1, this function will always return 0,

Parameters xTask -The task to query
Returns The task’s core ID or tskNO_AFFINITY

TaskHandle_t xTaskGetIdleTaskHandleForCore (BaseType_t xCoreID)
Get the handle of idle task for the given core.
[refactor-todo] See if this needs to be deprecated (IDF-8145)

Note: If CONFIG_FREERTOS_SMP is enabled, please call xTaskGetIdleTaskHandle() instead.

Parameters xCoreID -The core to query
Returns Handle of the idle task for the queried core

TaskHandle_t xTaskGetCurrentTaskHandleForCore (BaseType_t xCoreID)
Get the handle of the task currently running on a certain core.
Because of the nature of SMP processing, there is no guarantee that this value will still be valid on return and should only be used for debugging purposes.
[refactor-todo] See if this needs to be deprecated (IDF-8145)

Note: If CONFIG_FREERTOS_SMP is enabled, please call xTaskGetCurrentTaskHandleCPU() instead.

Parameters xCoreID -The core to query
Returns Handle of the current task running on the queried core

uint8_t* pxTaskGetStackStart (TaskHandle_t xTask)
Returns the start of the stack associated with xTask.
Returns the lowest stack memory address, regardless of whether the stack grows up or down.
[refactor-todo] Change return type to StackType_t (IDF-8158)

Parameters xTask - Handle of the task associated with the stack returned. Set xTask to NULL to return the stack of the calling task.
Returns A pointer to the start of the stack.

void vTaskSetThreadLocalStoragePointerAndDelCallback (TaskHandle_t xTaskToSet, BaseType_t xIndex, void *pvValue, TlsDeleteCallbackFunction_t pvDelCallback)
Set local storage pointer and deletion callback.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Local storage pointers set for a task can reference dynamically allocated resources. This function is similar to vTaskSetThreadLocalStoragePointer, but provides a way to release these resources when the task gets deleted. For each pointer, a callback function can be set. This function will be called when task is deleted, with the local storage pointer index and value as arguments.

**Parameters**
- **xTaskToSet** – Task to set thread local storage pointer for
- **xIndex** – The index of the pointer to set, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.
- **pvValue** – Pointer value to set.
- **pvDelCallback** – Function to call to dispose of the local storage pointer when the task is deleted.

BaseType_t xTaskCreatePinnedToCoreWithCaps(TaskFunction_t pvTaskCode, const char *const pcName, const configSTACK_DEPTH_TYPE usStackDepth, void *const pvParameters, UBaseType_t uxPriority, TaskHandle_t *const pvCreatedTask, const BaseType_t xCoreID, UBaseType_t uxMemoryCaps)

Creates a pinned task where its stack has specific memory capabilities.

This function is similar to xTaskCreatePinnedToCore(), except that it allows the memory allocated for the task’s stack to have specific capabilities (e.g., MALLOC_CAP_SPIRAM).

However, the specified capabilities will NOT apply to the task’s TCB as a TCB must always be in internal RAM.

**Parameters**
- **pvTaskCode** – Pointer to the task entry function
- **pcName** – A descriptive name for the task
- **usStackDepth** – The size of the task stack specified as the number of bytes
- **pvParameters** – Pointer that will be used as the parameter for the task being created.
- **uxPriority** – The priority at which the task should run.
- **pvCreatedTask** – Used to pass back a handle by which the created task can be referenced.
- **xCoreID** – Core to which the task is pinned to, or tskNO_AFFINITY if unpinned.
- **uxMemoryCaps** – Memory capabilities of the task stack’s memory (see esp_heap_caps.h)

**Returns**
- pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

static inline BaseType_t xTaskCreateWithCaps(TaskFunction_t pvTaskCode, const char *const pcName, configSTACK_DEPTH_TYPE usStackDepth, void *const pvParameters, BaseType_t uxPriority, TaskHandle_t *pvCreatedTask, BaseType_t uxMemoryCaps)

Creates a task where its stack has specific memory capabilities.

This function is similar to xTaskCreate(), except that it allows the memory allocated for the task’s stack to have specific capabilities (e.g., MALLOC_CAP_SPIRAM).

However, the specified capabilities will NOT apply to the task’s TCB as a TCB must always be in internal RAM.

**Note:** A task created using this function must only be deleted using vTaskDeleteWithCaps()
Parameters
- **pvTaskCode** - Pointer to the task entry function
- **pcName** - A descriptive name for the task
- **usStackDepth** - The size of the task stack specified as the number of bytes
- **pvParameters** - Pointer that will be used as the parameter for the task being created.
- **uxPriority** - The priority at which the task should run.
- **pvCreatedTask** - Used to pass back a handle by which the created task can be referenced.
- **uxMemoryCaps** - Memory capabilities of the task stack’s memory (see esp_heap_caps.h)

Returns  pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

```c
void vTaskDeleteWithCaps (TaskHandle_t xTaskToDelete)

Deletes a task previously created using xTaskCreateWithCaps() or xTaskCreatePinnedToCoreWithCaps()
```

Parameters  
- **xTaskToDelete** - A handle to the task to be deleted

```c
QueueHandle_t xQueueCreateWithCaps (UBaseType_t uxQueueLength, UBaseType_t uxItemSize,
                                        UBaseType_t uxMemoryCaps)

Creates a queue with specific memory capabilities.

This function is similar to xQueueCreate(), except that it allows the memory allocated for the queue to have specific capabilities (e.g., MALLOC_CAP_INTERNAL).

Note:  A queue created using this function must only be deleted using vQueueDeleteWithCaps()
```

Parameters
- **uxQueueLength** - The maximum number of items that the queue can contain.
- **uxItemSize** - The number of bytes each item in the queue will require.
- **uxMemoryCaps** - Memory capabilities of the queue’s memory (see esp_heap_caps.h)

Returns  Handle to the created queue or NULL on failure.

```c
void vQueueDeleteWithCaps (QueueHandle_t xQueue)

Deletes a queue previously created using xQueueCreateWithCaps()
```

Parameters  
- **xQueue** - A handle to the queue to be deleted.

```c
static inline SemaphoreHandle_t xSemaphoreCreateBinaryWithCaps (UBaseType_t uxMemoryCaps)

Creates a binary semaphore with specific memory capabilities.

This function is similar to vSemaphoreCreateBinary(), except that it allows the memory allocated for the binary semaphore to have specific capabilities (e.g., MALLOC_CAP_INTERNAL).

Note:  A binary semaphore created using this function must only be deleted using vSemaphoreDeleteWithCaps()
```

Parameters  
- **uxMemoryCaps** - Memory capabilities of the binary semaphore’s memory (see esp_heap_caps.h)

Returns  Handle to the created binary semaphore or NULL on failure.

```c
static inline SemaphoreHandle_t xSemaphoreCreateCountingWithCaps (UBaseType_t uxMaxCount,
                                                                      UBaseType_t uxInitialCount,
                                                                      UBaseType_t uxMemoryCaps)

Creates a counting semaphore with specific memory capabilities.
This function is similar to `xSemaphoreCreateCounting()`, except that it allows the memory allocated for the counting semaphore to have specific capabilities (e.g., MALLOC_CAP_INTERNAL).

**Note:** A counting semaphore created using this function must only be deleted using `vSemaphoreDeleteWithCaps()`.

### Parameters

- `uxMaxCount` - The maximum count value that can be reached.
- `uxInitialCount` - The count value assigned to the semaphore when it is created.
- `uxMemoryCaps` - Memory capabilities of the counting semaphore’s memory (see esp_heap_caps.h)

### Returns

Handle to the created counting semaphore or NULL on failure.

```c
static inline SemaphoreHandle_t xSemaphoreCreateMutexWithCaps (UBaseType_t uxMemoryCaps)
```

Creates a mutex semaphore with specific memory capabilities.

This function is similar to `xSemaphoreCreateMutex()`, except that it allows the memory allocated for the mutex semaphore to have specific capabilities (e.g., MALLOC_CAP_INTERNAL).

**Note:** A mutex semaphore created using this function must only be deleted using `vSemaphoreDeleteWithCaps()`.

### Parameters

- `uxMemoryCaps` - Memory capabilities of the mutex semaphore’s memory (see esp_heap_caps.h)

### Returns

Handle to the created mutex semaphore or NULL on failure.

```c
static inline SemaphoreHandle_t xSemaphoreCreateRecursiveMutexWithCaps (UBaseType_t uxMemoryCaps)
```

Creates a recursive mutex with specific memory capabilities.

This function is similar to `xSemaphoreCreateRecursiveMutex()`, except that it allows the memory allocated for the recursive mutex to have specific capabilities (e.g., MALLOC_CAP_INTERNAL).

**Note:** A recursive mutex created using this function must only be deleted using `vSemaphoreDeleteWithCaps()`.

### Parameters

- `uxMemoryCaps` - Memory capabilities of the recursive mutex’s memory (see esp_heap_caps.h)

### Returns

Handle to the created recursive mutex or NULL on failure.

```c
void vSemaphoreDeleteWithCaps (SemaphoreHandle_t xSemaphore)
```

Deletes a semaphore previously created using one of the `xSemaphoreCreate … WithCaps()` functions.

### Parameters

- `xSemaphore` - A handle to the semaphore to be deleted.

```c
static inline StreamBufferHandle_t xStreamBufferCreateWithCaps (size_t xBufferSizeBytes, size_t xTriggerLevelBytes, UBaseType_t uxMemoryCaps)
```

Creates a stream buffer with specific memory capabilities.

This function is similar to `xStreamBufferCreate()`, except that it allows the memory allocated for the stream buffer to have specific capabilities (e.g., MALLOC_CAP_INTERNAL).

**Note:** A stream buffer created using this function must only be deleted using `vStreamBufferDeleteWithCaps()`.
Chapter 2. API Reference

Parameters

• **xBufferSizeBytes** - The total number of bytes the stream buffer will be able to hold at any one time.
• **xTriggerLevelBytes** - The number of bytes that must be in the stream buffer before unblocking
• **uxMemoryCaps** - Memory capabilities of the stream buffer’s memory (see esp_heap_caps.h)

Returns Handle to the created stream buffer or NULL on failure.

static inline void **vStreamBufferDeleteWithCaps** (StreamBufferHandle_t xStreamBuffer)

Deletes a stream buffer previously created using xStreamBufferCreateWithCaps()

Parameters **xStreamBuffer** - A handle to the stream buffer to be deleted.

static inline MessageBufferHandle_t **xMessageBufferCreateWithCaps** (size_t xBufferSizeBytes, UBaseType_t uxMemoryCaps)

Creates a message buffer with specific memory capabilities.
This function is similar to xMessageBufferCreate(), except that it allows the memory allocated for the message buffer to have specific capabilities (e.g., MALLOC_CAP_INTERNAL).

**Note:** A message buffer created using this function must only be deleted using vMessageBufferDeleteWithCaps()

Parameters

• **xBufferSizeBytes** - The total number of bytes (not messages) the message buffer will be able to hold at any one time.
• **uxMemoryCaps** - Memory capabilities of the message buffer’s memory (see esp_heap_caps.h)

Returns Handle to the created message buffer or NULL on failure.

static inline void **vMessageBufferDeleteWithCaps** (MessageBufferHandle_t xMessageBuffer)

Deletes a stream buffer previously created using xMessageBufferCreateWithCaps()

Parameters **xMessageBuffer** - A handle to the message buffer to be deleted.

**EventGroupHandle_t** **xEventGroupCreateWithCaps** (UBaseType_t uxMemoryCaps)

Creates an event group with specific memory capabilities.
This function is similar to xEventGroupCreate(), except that it allows the memory allocated for the event group to have specific capabilities (e.g., MALLOC_CAP_INTERNAL).

**Note:** An event group created using this function must only be deleted using vEventGroupDeleteWithCaps()

Parameters **uxMemoryCaps** - Memory capabilities of the event group’s memory (see esp_heap_caps.h)

Returns Handle to the created event group or NULL on failure.

void **vEventGroupDeleteWithCaps** (EventGroupHandle_t xEventGroup)

Deletes an event group previously created using xEventGroupCreateWithCaps()

Parameters **xEventGroup** - A handle to the event group to be deleted.

**Type Definitions**

typedef void (*TlsDeleteCallbackFunction_t)(int, void*)

Prototype of local storage pointer deletion callback.
2.9.14 Heap Memory Allocation

Stack and Heap

ESP-IDF applications use the common computer architecture patterns of stack (dynamic memory allocated by program control flow), heap (dynamic memory allocated by function calls), and static memory (memory allocated at compile time).

Because ESP-IDF is a multi-threaded RTOS environment, each RTOS task has its own stack. By default, each of these stacks is allocated from the heap when the task is created. See `xTaskCreateStatic()` for the alternative where stacks are statically allocated.

Because ESP32-S2 uses multiple types of RAM, it also contains multiple heaps with different capabilities. A capabilities-based memory allocator allows apps to make heap allocations for different purposes.

For most purposes, the C Standard Library’s `malloc()` and `free()` functions can be used for heap allocation without any special consideration. However, in order to fully make use of all of the memory types and their characteristics, ESP-IDF also has a capabilities-based heap memory allocator. If you want to have a memory with certain properties (e.g., DMA-Capable Memory or executable-memory), you can create an OR-mask of the required capabilities and pass that to `heap_caps_malloc()`.

Memory Capabilities

The ESP32-S2 contains multiple types of RAM:

- DRAM (Data RAM) is memory that is connected to CPU’s data bus and is used to hold data. This is the most common kind of memory accessed as a heap.
- IRAM (Instruction RAM) is memory that is connected to the CPU’s instruction bus and usually holds executable data only (i.e., instructions). If accessed as generic memory, all accesses must be aligned to 32-Bit Accessible Memory.
- D/IRAM is RAM that is connected to CPU’s data bus and instruction bus, thus can be used either Instruction or Data RAM.

For more details on these internal memory types, see Memory Types.

It is also possible to connect external SPI RAM to the ESP32-S2. The external RAM is integrated into the ESP32-S2’s memory map via the cache, and accessed similarly to DRAM.

All DRAM memory is single-byte accessible, thus all DRAM heaps possess the MALLOC_CAP_8BIT capability. Users can call `heap_caps_get_free_size(MALLOC_CAP_8BIT)` to get the free size of all DRAM heaps.

If ran out of MALLOC_CAP_8BIT, the users can use MALLOC_CAP_IRAM_8BIT instead. In that case, IRAM can still be used as a “reserve” pool of internal memory if the users only access it in a 32-bit aligned manner, or if they enable CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY).

When calling `malloc()`, the ESP-IDF `malloc()` internally calls `heap_caps_malloc_default(size)`. This will allocate memory with the capability MALLOC_CAP_DEFAULT, which is byte-addressable.

Because `malloc()` uses the capabilities-based allocation system, memory allocated using `heap_caps_malloc()` can be freed by calling the standard `free()` function.

Available Heap

DRAM  At startup, the DRAM heap contains all data memory that is not statically allocated by the app. Reducing statically-allocated buffers increases the amount of available free heap.

To find the amount of statically allocated memory, use the `idf.py size` command.
**Note:** At runtime, the available heap DRAM may be less than calculated at compile time, because, at startup, some memory is allocated from the heap before the FreeRTOS scheduler is started (including memory for the stacks of initial FreeRTOS tasks).

**IRAM** At startup, the IRAM heap contains all instruction memory that is not used by the app executable code. The `idf.py size` command can be used to find the amount of IRAM used by the app.

**D/IRAM** Some memory in the ESP32-S2 is available as either DRAM or IRAM. If memory is allocated from a D/IRAM region, the free heap size for both types of memory will decrease.

**Heap Sizes** At startup, all ESP-IDF apps log a summary of all heap addresses (and sizes) at level Info:

<table>
<thead>
<tr>
<th>Heap Address</th>
<th>Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>00001920</td>
<td>6 KiB</td>
</tr>
<tr>
<td>0002D138</td>
<td>180 KiB</td>
</tr>
<tr>
<td>00003AE0</td>
<td>14 KiB</td>
</tr>
<tr>
<td>0001BCB0</td>
<td>111 KiB</td>
</tr>
<tr>
<td>00016BB4</td>
<td>90 KiB</td>
</tr>
</tbody>
</table>

Finding Available Heap See Heap Information.

**Special Capabilities**

**DMA-Capable Memory** Use the `MALLOC_CAP_DMA` flag to allocate memory which is suitable for use with hardware DMA engines (for example SPI and I2S). This capability flag excludes any external PSRAM.

**32-Bit Accessible Memory** If a certain memory structure is only addressed in 32-bit units, for example, an array of ints or pointers, it can be useful to allocate it with the `MALLOC_CAP_32BIT` flag. This also allows the allocator to give out IRAM memory, which is sometimes unavailable for a normal `malloc()` call. This can help to use all the available memory in the ESP32-S2.

Memory allocated with `MALLOC_CAP_32BIT` can only be accessed via 32-bit reads and writes, any other type of access will generate a fatal LoadStoreError exception.

**External SPI Memory** When external RAM is enabled, external SPI RAM under 4 MiB in size can be allocated using standard `malloc()` calls, or via `heap_caps_malloc(MALLOC_CAP_SPIRAM)`, depending on the configuration. See Configuring External RAM for more details.

**Thread Safety**

Heap functions are thread-safe, meaning they can be called from different tasks simultaneously without any limitations.

It is technically possible to call `malloc`, `free`, and related functions from interrupt handler (ISR) context (see Calling Heap-Related Functions from ISR). However, this is not recommended, as heap function calls may delay other interrupts. It is strongly recommended to refactor applications so that any buffers used by an ISR are pre-allocated outside of the ISR. Support for calling heap functions from ISRs may be removed in a future update.
Chapter 2. API Reference

Calling Heap-Related Functions from ISR

The following functions from the heap component can be called from the interrupt handler (ISR):

- `heap_caps_malloc()`
- `heap_caps_malloc_default()`
- `heap_caps_realloc_default()`
- `heap_caps_malloc_prefer()`
- `heap_caps_realloc_prefer()`
- `heap_caps_calloc_prefer()`
- `heap_caps_free()`
- `heap_caps_realloc()`
- `heap_caps_calloc()`
- `heap_caps_aligned_alloc()`
- `heap_caps_aligned_free()`

**Note:** However, this practice is strongly discouraged.

Heap Tracing & Debugging

The following features are documented on the Heap Memory Debugging page:

- **Heap Information** (free space, etc.)
- **Heap Allocation and Free Function Hooks**
- **Heap Corruption Detection**
- **Heap Tracing** (memory leak detection, monitoring, etc.)

Implementation Notes

Knowledge about the regions of memory in the chip comes from the “SoC” component, which contains memory layout information for the chip, and the different capabilities of each region. Each region’s capabilities are prioritized, so that (for example) dedicated DRAM and IRAM regions are used for allocations ahead of the more versatile D/IRAM regions.

Each contiguous region of memory contains its own memory heap. The heaps are created using the `multi_heap` functionality. `multi_heap` allows any contiguous region of memory to be used as a heap.

The heap capabilities allocator uses knowledge of the memory regions to initialize each individual heap. Allocation functions in the heap capabilities API will find the most appropriate heap for the allocation based on desired capabilities, available space, and preferences for each region’s use, and then calling `multi_heap_malloc()` for the heap situated in that particular region.

Calling `free()` involves finding the particular heap corresponding to the freed address, and then call `multi_heap_free()` on that particular `multi_heap` instance.

API Reference - Heap Allocation

Header File

- `components/heap/include/esp_heap_caps.h`
- This header file can be included with:

```c
#include "esp_heap_caps.h"
```
Functions

```c
esp_err_t heap_caps_register_failed_alloc_callback (esp_alloc_failed_hook_t callback)
```
registers a callback function to be invoked if a memory allocation operation fails.

- **Parameters**
  - `callback`: caller defined callback to be invoked
- **Returns**
  - ESP_OK if callback was registered.

```c
void *heap_caps_malloc (size_t size, uint32_t caps)
```
Allocate a chunk of memory which has the given capabilities.

- **Equivalent semantics to libc malloc(), for capability-aware memory.**
- **Parameters**
  - `size`: Size, in bytes, of the amount of memory to allocate
  - `caps`: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned
- **Returns**
  - A pointer to the memory allocated on success, NULL on failure

```c
void heap_caps_free (void *ptr)
```
Free memory previously allocated via heap_caps_malloc() or heap_caps_realloc().

- **Equivalent semantics to libc free(), for capability-aware memory.**
- **In IDF,** `free(p)` is equivalent to `heap_caps_free(p)`.
- **Parameters**
  - `ptr`: Pointer to memory previously returned from heap_caps_malloc() or heap_caps_realloc(). Can be NULL.

```c
void *heap_caps_realloc (void *ptr, size_t size, uint32_t caps)
```
Reallocates memory previously allocated via heap_caps_malloc() or heap_caps_realloc().

- **Equivalent semantics to libc realloc(), for capability-aware memory.**
- **In IDF,** `realloc(p, s)` is equivalent to `heap_caps_realloc(p, s, MALLOC_CAP_8BIT)`.
- **Parameters**
  - `ptr`: Pointer to previously allocated memory, or NULL for a new allocation.
  - `size`: Size of the new buffer requested, or 0 to free the buffer.
  - `caps`: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory desired for the new allocation.
- **Returns**
  - Pointer to a new buffer of size `size` with capabilities `caps`, or NULL if allocation failed.

```c
void *heap_caps_aligned_alloc (size_t alignment, size_t size, uint32_t caps)
```
Allocate an aligned chunk of memory which has the given capabilities.

- **Equivalent semantics to libc aligned_alloc(), for capability-aware memory.**
- **Parameters**
  - `alignment`: How the pointer received needs to be aligned must be a power of two
  - `size`: Size, in bytes, of the amount of memory to allocate
  - `caps`: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned
- **Returns**
  - A pointer to the memory allocated on success, NULL on failure

```c
void heap_caps_aligned_free (void *ptr)
```
Used to deallocate memory previously allocated with heap_caps_aligned Alloc.

**Note:** This function is deprecated, please consider using heap_caps_free() instead

- **Parameters**
  - `ptr`: Pointer to the memory allocated
Chapter 2. API Reference

```c
void *heap_caps_aligned_calloc(size_t alignment, size_t n, size_t size, uint32_t caps)
```
Allocate an aligned chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

**Parameters**
- `alignment` – How the pointer received needs to be aligned must be a power of two
- `n` – Number of continuing chunks of memory to allocate
- `size` – Size, in bytes, of a chunk of memory to allocate
- `caps` – Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

**Returns** A pointer to the memory allocated on success, NULL on failure.

```c
void *heap_caps_calloc(size_t n, size_t size, uint32_t caps)
```
Allocate a chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

Equivalent semantics to `libc alloc()`, for capability-aware memory.

In IDF, `calloc(p)` is equivalent to `heap_caps_calloc(p, MALLOC_CAP_8BIT)`.

**Parameters**
- `n` – Number of continuing chunks of memory to allocate
- `size` – Size, in bytes, of a chunk of memory to allocate
- `caps` – Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

**Returns** A pointer to the memory allocated on success, NULL on failure.

```c
size_t heap_caps_get_total_size(uint32_t caps)
```
Get the total size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the total space they have.

**Parameters** `caps` – Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

**Returns** Total size in bytes.

```c
size_t heap_caps_get_free_size(uint32_t caps)
```
Get the total free size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the free space they have.

**Note:** Note that because of heap fragmentation it is probably not possible to allocate a single block of memory of this size. Use `heap_caps_get_largest_free_block()` for this purpose.

**Parameters** `caps` – Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

**Returns** Amount of free bytes in the regions.

```c
size_t heap_caps_get_minimum_free_size(uint32_t caps)
```
Get the total minimum free memory of all regions with the given capabilities.

This adds all the low watermarks of the regions capable of delivering the memory with the given capabilities.

**Note:** Note the result may be less than the global all-time minimum available heap of this kind, as “low watermarks” are tracked per-region. Individual regions’ heaps may have reached their “low watermarks” at different points in time. However, this result still gives a “worst case” indication for all-time minimum free heap.

**Parameters** `caps` – Bitwise OR of MALLOC_CAP_* flags indicating the type of memory
**API Reference**

**Returns** Amount of free bytes in the regions

```c
size_t heap_caps_get_largest_free_block (uint32_t caps)
```

Get the largest free block of memory able to be allocated with the given capabilities.

Returns the largest value of \( s \) for which \( \text{heap_caps_malloc}(s, \text{caps}) \) will succeed.

**Parameters**
- `caps` – bitwise OR of MALLOC_CAP_* flags indicating the type of memory

**Returns** Size of the largest free block in bytes.

```c
void heap_caps_get_info (multi_heap_info_t *info, uint32_t caps)
```

Get heap info for all regions with the given capabilities.

Calls `multi_heap_info()` on all heaps which share the given capabilities. The information returned is an aggregate across all matching heaps. The meanings of fields are the same as defined for `multi_heap_info_t`, except that `minimum_free_bytes` has the same caveats described in `heap_caps_get_minimum_free_size()`.

**Parameters**
- `info` – Pointer to a structure which will be filled with relevant heap metadata.
- `caps` – bitwise OR of MALLOC_CAP_* flags indicating the type of memory

```c
void heap_caps_print_heap_info (uint32_t caps)
```

Print a summary of all memory with the given capabilities.

Calls `multi_heap_info()` on all heaps which share the given capabilities, and prints a two-line summary for each, then a total summary.

**Parameters**
- `caps` – bitwise OR of MALLOC_CAP_* flags indicating the type of memory

```c
bool heap_caps_check_integrity_all (bool print_errors)
```

Check integrity of all heap memory in the system.

Calls `multi_heap_check` on all heaps. Optionally print errors if heaps are corrupt.

Calling this function is equivalent to calling `heap_caps_check_integrity` with the `caps` argument set to MALLOC_CAP_INVALID.

**Note:** Please increase the value of `CONFIG_ESP_INT_WDT_TIMEOUT_MS` when using this API with PSRAM enabled.

**Parameters**
- `print_errors` – Print specific errors if heap corruption is found.

**Returns** True if all heaps are valid, False if at least one heap is corrupt.

```c
bool heap_caps_check_integrity (uint32_t caps, bool print_errors)
```

Check integrity of all heaps with the given capabilities.

Calls `multi_heap_check` on all heaps which share the given capabilities. Optionally print errors if the heaps are corrupt.

See also `heap_caps_check_integrity_all` to check all heap memory in the system and `heap_caps_check_integrity_addr` to check memory around a single address.

**Note:** Please increase the value of `CONFIG_ESP_INT_WDT_TIMEOUT_MS` when using this API with PSRAM capability flag.

**Parameters**
- `caps` – bitwise OR of MALLOC_CAP_* flags indicating the type of memory
- `print_errors` – Print specific errors if heap corruption is found.

**Returns** True if all heaps are valid, False if at least one heap is corrupt.
Chapter 2. API Reference

bool heap_caps_check_integrity_addr (intptr_t addr, bool print_errors)
Check integrity of heap memory around a given address.

This function can be used to check the integrity of a single region of heap memory, which contains the given address.

This can be useful if debugging heap integrity for corruption at a known address, as it has a lower overhead than checking all heap regions. Note that if the corrupt address moves around between runs (due to timing or other factors) then this approach won’t work, and you should call heap_caps_check_integrity or heap_caps_check_integrity_all instead.

**Note:** The entire heap region around the address is checked, not only the adjacent heap blocks.

---

**Parameters**
- **addr** – Address in memory. Check for corruption in region containing this address.
- **print_errors** – Print specific errors if heap corruption is found.

**Returns** True if the heap containing the specified address is valid, False if at least one heap is corrupt or the address doesn’t belong to a heap region.

---

void heap_caps_malloc_extmem_enable (size_t limit)
Enable malloc() in external memory and set limit below which malloc() attempts are placed in internal memory.

When external memory is in use, the allocation strategy is to initially try to satisfy smaller allocation requests with internal memory and larger requests with external memory. This sets the limit between the two, as well as generally enabling allocation in external memory.

**Parameters**
- **limit** – Limit, in bytes.

---

void *heap_caps_malloc_prefer (size_t size, size_t num, ...)
Allocate a chunk of memory as preference in decreasing order.

**Attention** The variable parameters are bitwise OR of MALLOC_CAP_* flags indicating the type of memory. This API prefers to allocate memory with the first parameter. If failed, allocate memory with the next parameter. It will try in this order until allocating a chunk of memory successfully or fail to allocate memories with any of the parameters.

**Parameters**
- **size** – Size, in bytes, of the amount of memory to allocate
- **num** – Number of variable parameters

**Returns** A pointer to the memory allocated on success, NULL on failure

---

void *heap_caps_realloc_prefer (void *ptr, size_t size, size_t num, ...)
Reallocate a chunk of memory as preference in decreasing order.

**Parameters**
- **ptr** – Pointer to previously allocated memory, or NULL for a new allocation.
- **size** – Size of the new buffer requested, or 0 to free the buffer.
- **num** – Number of variable parameters

**Returns** Pointer to a new buffer of size ‘size’, or NULL if allocation failed.

---

void *heap_caps_calloc_prefer (size_t n, size_t size, size_t num, ...)
Allocate a chunk of memory as preference in decreasing order.

**Parameters**
- **n** – Number of continuing chunks of memory to allocate
- **size** – Size, in bytes, of a chunk of memory to allocate
- **num** – Number of variable parameters

**Returns** A pointer to the memory allocated on success, NULL on failure
void heap_caps_dump (uint32_t caps)

Dump the full structure of all heaps with matching capabilities.

Prints a large amount of output to serial (because of locking limitations, the output bypasses stdout/stdio).
For each (variable sized) block in each matching heap, the following output is printed on a single line:

• Block address (the data buffer returned by malloc is 4 bytes after this if heap debugging is set to Basic,
or 8 bytes otherwise).
• Data size (the data size may be larger than the size requested by malloc, either due to heap fragmentation
or because of heap debugging level).
• Address of next block in the heap.
• If the block is free, the address of the next free block is also printed.

Parameters caps – Bitwise OR of MALLOC_CAP_"* flags indicating the type of memory

void heap_caps_dump_all (void)

Dump the full structure of all heaps.

Covers all registered heaps. Prints a large amount of output to serial.

Output is the same as for heap_caps_dump.

size_t heap_caps_get_allocated_size (void *ptr)

Return the size that a particular pointer was allocated with.

Note: The app will crash with an assertion failure if the pointer is not valid.

Parameters ptr – Pointer to currently allocated heap memory. Must be a pointer value previously
returned by heap_caps_malloc, malloc, calloc, etc. and not yet freed.

Returns Size of the memory allocated at this block.

Macros

HEAP_IRAM_ATTR

MALLOC_CAP_EXEC

Flags to indicate the capabilities of the various memory systems.

Memory must be able to run executable code

MALLOC_CAP_32BIT

Memory must allow for aligned 32-bit data accesses.

MALLOC_CAP_8BIT

Memory must allow for 8/16/…-bit data accesses.

MALLOC_CAP_DMA

Memory must be able to be accessed by DMA.

MALLOC_CAP_PID2

Memory must be mapped to PID2 memory space (PIDs are not currently used)

MALLOC_CAP_PID3

Memory must be mapped to PID3 memory space (PIDs are not currently used)
MALLOC_CAP_PID4
Memory must be mapped to PID4 memory space (PIDs are not currently used)

MALLOC_CAP_PID5
Memory must be mapped to PID5 memory space (PIDs are not currently used)

MALLOC_CAP_PID6
Memory must be mapped to PID6 memory space (PIDs are not currently used)

MALLOC_CAP_PID7
Memory must be mapped to PID7 memory space (PIDs are not currently used)

MALLOC_CAP_SPIRAM
Memory must be in SPI RAM.

MALLOC_CAP_INTERNAL
Memory must be internal; specifically it should not disappear when flash/spiram cache is switched off.

MALLOC_CAP_DEFAULT
Memory can be returned in a non-capability-specific memory allocation (e.g. malloc(), calloc()) call.

MALLOC_CAP_IRAM_8BIT
Memory must be in IRAM and allow unaligned access.

MALLOC_CAP_RETENTION
Memory must be able to accessed by retention DMA.

MALLOC_CAP_RTCRAM
Memory must be in RTC fast memory.

MALLOC_CAP_TCM
Memory must be in TCM memory.

MALLOC_CAP_INVALID
Memory can’t be used / list end marker.

Type Definitions

typedef void (*esp_alloc_failed_hook_t)(size_t size, uint32_t caps, const char* function_name)
callback called when an allocation operation fails, if registered

  Param size in bytes of failed allocation
  Param caps capabilities requested of failed allocation
  Param function_name function which generated the failure

API Reference - Initialisation

Header File

- components/heap/include/esp_heap_caps_init.h

This header file can be included with:
# include "esp_heap_caps_init.h"

## Functions

**void heap_caps_init (void)**

Initialize the capability-aware heap allocator.

This is called once in the IDF startup code. Do not call it at other times.

**void heap_caps_enable_nonos_stack_heaps (void)**

Enable heap(s) in memory regions where the startup stacks are located.

On startup, the pro/app CPUs have a certain memory region they use as stack, so we cannot do allocations in the regions these stack frames are. When FreeRTOS is completely started, they do not use that memory anymore and heap(s) there can be enabled.

**esp_err_t heap_caps_add_region (intptr_t start, intptr_t end)**

Add a region of memory to the collection of heaps at runtime.

Most memory regions are defined in soc_memory_layout.c for the SoC, and are registered via heap_caps_init(). Some regions cannot be used immediately and are later enabled via heap_caps_enable_nonos_stack_heaps().

Call this function to add a region of memory to the heap at some later time.

This function does not consider any of the "reserved" regions or other data in soc_memory_layout, caller needs to consider this themselves.

All memory within the region specified by start & end parameters must be otherwise unused.

The capabilities of the newly registered memory will be determined by the start address, as looked up in the regions specified in soc_memory_layout.c.

Use heap_caps_add_region_with_caps() to register a region with custom capabilities.

**Note:** Please refer to following example for memory regions allowed for addition to heap based on an existing region (address range for demonstration purpose only):

<table>
<thead>
<tr>
<th>Existing region: 0x1000 &lt;-&gt; 0x3000</th>
</tr>
</thead>
<tbody>
<tr>
<td>New region: 0x1000 &lt;-&gt; 0x3000 (Allowed)</td>
</tr>
<tr>
<td>New region: 0x1000 &lt;-&gt; 0x2000 (Allowed)</td>
</tr>
<tr>
<td>New region: 0x0000 &lt;-&gt; 0x1000 (Allowed)</td>
</tr>
<tr>
<td>New region: 0x3000 &lt;-&gt; 0x4000 (Allowed)</td>
</tr>
<tr>
<td>New region: 0x0000 &lt;-&gt; 0x2000 (NOT Allowed)</td>
</tr>
<tr>
<td>New region: 0x0000 &lt;-&gt; 0x4000 (NOT Allowed)</td>
</tr>
<tr>
<td>New region: 0x1000 &lt;-&gt; 0x4000 (NOT Allowed)</td>
</tr>
<tr>
<td>New region: 0x2000 &lt;-&gt; 0x4000 (NOT Allowed)</td>
</tr>
</tbody>
</table>

**Parameters**

- **start** – Start address of new region.
- **end** – End address of new region.

**Returns** ESP_OK on success, ESP_ERR_INVALID_ARG if a parameter is invalid, ESP_ERR_NOT_FOUND if the specified start address doesn’t reside in a known region, or any error returned by heap_caps_add_region_with_caps().

**esp_err_t heap_caps_add_region_with_caps (const uint32_t caps[], intptr_t start, intptr_t end)**

Add a region of memory to the collection of heaps at runtime, with custom capabilities.

Similar to heap_caps_add_region(), only custom memory capabilities are specified by the caller.

**Note:** Please refer to following example for memory regions allowed for addition to heap based on an existing region (address range for demonstration purpose only):
### Parameters

- **caps** - Ordered array of capability masks for the new region, in order of priority. Must have length SOC_MEMORY_TYPE_NO_PRIOS. Does not need to remain valid after the call returns.
- **start** - Start address of new region.
- **end** - End address of new region.

### Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if a parameter is invalid
- ESP_ERR_NO_MEM if no memory to register new heap.
- ESP_ERR_INVALID_SIZE if the memory region is too small to fit a heap
- ESP_FAIL if region overlaps the start and/or end of an existing region

---

**API Reference - Multi-Heap API**

(Note: The multi-heap API is used internally by the heap capabilities allocator. Most ESP-IDF programs never need to call this API directly.)

**Header File**

- components/heap/include/multi_heap.h

This header file can be included with:

```c
#include "multi_heap.h"
```

**Functions**

- `multi_heap_aligned_alloc` *(multi_heap_handle_t heap, size_t size, size_t alignment)*
  
  allocate a chunk of memory with specific alignment

  **Parameters**

  - **heap** - Handle to a registered heap.
  - **size** - size in bytes of memory chunk
  - **alignment** - how the memory must be aligned

  **Returns**

  Pointer to the memory allocated, NULL on failure

- `multi_heap_malloc` *(multi_heap_handle_t heap, size_t size)*
  
  malloc() a buffer in a given heap

  Semantics are the same as standard malloc(), only the returned buffer will be allocated in the specified heap.

  **Parameters**

  - **heap** - Handle to a registered heap.
  - **size** - Size of desired buffer.

  **Returns**

  Pointer to new memory, or NULL if allocation fails.
void **multi_heap_aligned_free**(multi_heap_handle_t heap, void *p)

free() a buffer aligned in a given heap.

**Note:** This function is deprecated, consider using multi_heap_free() instead

**Parameters**

- **heap** - Handle to a registered heap.
- **p** - NULL, or a pointer previously returned from multi_heap_aligned_alloc() for the same heap.

void **multi_heap_free**(multi_heap_handle_t heap, void *p)

free() a buffer in a given heap.

Semantics are the same as standard free(), only the argument ‘p’ must be NULL or have been allocated in the specified heap.

**Parameters**

- **heap** - Handle to a registered heap.
- **p** - NULL, or a pointer previously returned from multi_heap_malloc() or multi_heap_realloc() for the same heap.

void *multi_heap_realloc**(multi_heap_handle_t heap, void *p, size_t size)

realloc() a buffer in a given heap.

Semantics are the same as standard realloc(), only the argument ‘p’ must be NULL or have been allocated in the specified heap.

**Parameters**

- **heap** - Handle to a registered heap.
- **p** - NULL, or a pointer previously returned from multi_heap_malloc() or multi_heap_realloc() for the same heap.
- **size** - Desired new size for buffer.

**Returns** New buffer of ‘size’ containing contents of ‘p’, or NULL if reallocation failed.

size_t **multi_heap_get_allocated_size**(multi_heap_handle_t heap, void *p)

Return the size that a particular pointer was allocated with.

**Parameters**

- **heap** - Handle to a registered heap.
- **p** - Pointer, must have been previously returned from multi_heap_malloc() or multi_heap_realloc() for the same heap.

**Returns** Size of the memory allocated at this block. May be more than the original size argument, due to padding and minimum block sizes.

multi_heap_handle_t **multi_heap_register**(void *start, size_t size)

Register a new heap for use.

This function initialises a heap at the specified address, and returns a handle for future heap operations.

There is no equivalent function for deregistering a heap - if all blocks in the heap are free, you can immediately start using the memory for other purposes.

**Parameters**

- **start** - Start address of the memory to use for a new heap.
- **size** - Size (in bytes) of the new heap.

**Returns** Handle of a new heap ready for use, or NULL if the heap region was too small to be initialised.

void **multi_heap_set_lock**(multi_heap_handle_t heap, void *lock)

Associate a private lock pointer with a heap.
The lock argument is supplied to the MULTI_HEAP_LOCK() and MULTI_HEAP_UNLOCK() macros, defined in multi_heap_platform.h.

The lock in question must be recursive.

When the heap is first registered, the associated lock is NULL.

Parameters
- heap: Handle to a registered heap.
- lock: Optional pointer to a locking structure to associate with this heap.

void multi_heap_dump (multi_heap_handle_t heap)
Dump heap information to stdout.

For debugging purposes, this function dumps information about every block in the heap to stdout.

Parameters heap – Handle to a registered heap.

bool multi_heap_check (multi_heap_handle_t heap, bool print_errors)
Check heap integrity.

Walks the heap and checks all heap data structures are valid. If any errors are detected, an error-specific message can be optionally printed to stderr. Print behaviour can be overridden at compile time by defining MULTI_CHECK_FAIL_PRINTF in multi_heap_platform.h.

Note: This function is not thread-safe as it sets a global variable with the value of print_errors.

Parameters
- heap: Handle to a registered heap.
- print_errors: If true, errors will be printed to stderr.

Returns true if heap is valid, false otherwise.

size_t multi_heap_free_size (multi_heap_handle_t heap)
Return free heap size.

Returns the number of bytes available in the heap.

Equivalent to the total_free_bytes member returned by multi_heap_get_heap_info().

Note that the heap may be fragmented, so the actual maximum size for a single malloc() may be lower. To know this size, see the largest_free_block member returned by multi_heap_get_heap_info().

Parameters heap – Handle to a registered heap.

Returns Number of free bytes.

size_t multi_heap_minimum_free_size (multi_heap_handle_t heap)
Return the lifetime minimum free heap size.

Equivalent to the minimum_free_bytes member returned by multi_heap_get_info().

Returns the lifetime “low watermark” of possible values returned from multi_free_heap_size(), for the specified heap.

Parameters heap – Handle to a registered heap.

Returns Number of free bytes.

void multi_heap_get_info (multi_heap_handle_t heap, multi_heap_info_t *info)
Return metadata about a given heap.

Fills a multi_heap_info_t structure with information about the specified heap.

Parameters
- heap: Handle to a registered heap.
- info: Pointer to a structure to fill with heap metadata.
Structures

```c
struct multi_heap_info_t

  Structure to access heap metadata via multi_heap_get_info.
```

**Public Members**

```c
size_t total_free_bytes

  Total free bytes in the heap. Equivalent to multi_free_heap_size().
```

```c
size_t total_allocated_bytes

  Total bytes allocated to data in the heap.
```

```c
size_t largest_free_block

  Size of the largest free block in the heap. This is the largest malloc-able size.
```

```c
size_t minimum_free_bytes

  Lifetime minimum free heap size. Equivalent to multi_minimum_free_heap_size().
```

```c
size_t allocated_blocks

  Number of (variable size) blocks allocated in the heap.
```

```c
size_t free_blocks

  Number of (variable size) free blocks in the heap.
```

```c
size_t total_blocks

  Total number of (variable size) blocks in the heap.
```

**Type Definitions**

```c
typedef struct multi_heap_info *multi_heap_handle_t

  Opaque handle to a registered heap.
```

### 2.9.15 Memory Management for MMU Supported Memory

**Introduction**

ESP32-S2 Memory Management Unit (MMU) is relatively simple. It can do memory address translation between physical memory addresses and virtual memory addresses. So CPU can access physical memories via virtual addresses. There are multiple types of virtual memory addresses, which have different capabilities.

ESP-IDF provides a memory mapping driver that manages the relation between these physical memory addresses and virtual memory addresses, so as to achieve some features such as reading from SPI flash via a pointer.

Memory mapping driver is actually a capabilities-based virtual memory address allocator that allows applications to make virtual memory address allocations for different purposes. In the following chapters, we call this driver esp_mmap driver.

ESP-IDF also provides a memory synchronization driver which can be used for potential memory desynchronization scenarios.
Physical Memory Types

Memory mapping driver currently supports mapping to following physical memory type(s):

- SPI flash
- PSRAM

Virtual Memory Capabilities

- **MMU_MEM_CAP_EXEC**: This capability indicates that the virtual memory address has the execute permission. Note this permission scope is within the MMU hardware.
- **MMU_MEM_CAP_READ**: This capability indicates that the virtual memory address has the read permission. Note this permission scope is within the MMU hardware.
- **MMU_MEM_CAP_WRITE**: This capability indicates that the virtual memory address has the write permission. Note this permission scope is within the MMU hardware.
- **MMU_MEM_CAP_32BIT**: This capability indicates that the virtual memory address allows for 32 bits or multiples of 32 bits access.
- **MMU_MEM_CAP_8BIT**: This capability indicates that the virtual memory address allows for 8 bits or multiples of 8 bits access.

4 MB external memory addresses (from 0x40400000 to 0x40800000) which have the **MMU_MEM_CAP_EXEC** and **MMU_MEM_CAP_READ** capabilities are not available for users to allocate, due to hardware limitations.

You can call `esp_mmu_map_get_max_consecutive_free_block_size()` to know the largest consecutive mappable block size with certain capabilities.

Memory Management Drivers

Driver Concept

Terminology  The virtual memory pool is made up with one or multiple virtual memory regions, see below figure:

- A virtual memory pool stands for the whole virtual address range that can be mapped to physical memory.
- A virtual memory region is a range of virtual address with same attributes.
- A virtual memory block is a piece of virtual address range that is dynamically mapped.
- A slot is the virtual address range between two virtual memory blocks.
- A physical memory block is a piece of physical address range that is to-be-mapped or already mapped to a virtual memory block.
- Dynamical mapping is done by calling `esp_mmap` driver API `esp_mmu_map()`. This API maps the given physical memory block to a virtual memory block which is allocated by the `esp_mmap` driver.

Relation Between Memory Blocks  When mapping a physical memory block A, block A can have one of the following relations with another previously mapped physical memory block B:

- Enclosed: block A is completely enclosed within block B, see figure below:
Identical: block A is completely the same as block B, see figure below:

Note that \texttt{esp\_mmap} driver considers the identical scenario \textit{the same as the enclosed scenario}.

Overlapped: block A is overlapped with block B, see figure below:

There is a special condition, when block A entirely encloses block B, see figure below:

Note that \texttt{esp\_mmap} driver considers this scenario \textit{the same as the overlapped scenario}.
Memory Map  You can call `esp_mmu_map()` to do a dynamical mapping. This API can allocate a certain size of virtual memory block according to the virtual memory capabilities you selected, then map this virtual memory block to the physical memory block as you requested. The esp_mmap driver supports mapping to one or more types of physical memory, so you should specify the physical memory target when mapping.

By default, physical memory blocks and virtual memory blocks are one-to-one mapped. This means, when calling `esp_mmu_map()`:

• If it is the enclosed scenario, this API will return an ESP_ERR_INVALID_STATE. The out_ptr will be assigned to the start virtual memory address of the previously mapped one which encloses the to-be-mapped one.
• If it is the identical scenario, this API will behaves exactly the same as the enclosed scenario.
• If it is the overlapped scenario, this API will by default return an ESP_ERR_INVALID_ARG. This means, esp_mmap driver by default does not allow mapping a physical memory address to multiple virtual memory addresses.

Specially, you can use `ESP_MMU_MMAP_FLAG_PADDR_SHARED`. This flag stands for one-to-multiple mapping between a physical address and multiple virtual addresses:

• If it is the overlapped scenario, this API will allocate a new virtual memory block as requested, then map to the given physical memory block.

Memory Unmap  You can call `esp_mmu_unmap()` to unmap a previously mapped memory block. This API returns an ESP_ERR_NOT_FOUND if you are trying to unmap a virtual memory block that is not mapped to any physical memory block yet.

Memory Address Conversion  The esp_mmap driver provides two helper APIs to do the conversion between virtual memory address and physical memory address:

• `esp_mmu_vaddr_to_paddr()` converts virtual address to physical address.
• `esp_mmu_paddr_to_vaddr()` converts physical address to virtual address.

Memory Synchronization  MMU supported physical memories can be accessed by one or multiple methods.

SPI flash can be accessed by SPI1 (ESP-IDF esp_flash driver APIs), or by pointers. ESP-IDF esp_flash driver APIs have already considered the memory synchronization, so users do not need to worry about this.

PSRAM can be accessed by pointers, hardware guarantees the data consistency when PSRAM is only accessed via pointers.

Thread Safety

APIs in esp_mmu_map.h are not guaranteed to be thread-safe.
APIs in esp_cache.h are guaranteed to be thread-safe.

```

• This header file is a part of the API provided by the esp_mm component. To declare that your component depends on esp_mm, add the following to your CMakeLists.txt:
Chapter 2. API Reference

REQUIRES esp_mm

or

PRIV_REQUIRES esp_mm

### Functions

**esp_err_t esp_mmu_map** *(esp_paddr_t paddr_start, size_t size, mmu_target_t target, mmu_mem_caps_t caps, int flags, void **out_ptr)*

Map a physical memory block to external virtual address block, with given capabilities.

**Note:** This API does not guarantee thread safety

#### Parameters

- **paddr_start** [in] Start address of the physical memory block
- **size** [in] Size to be mapped. Size will be rounded up by to the nearest multiple of MMU page size
- **target** [in] Physical memory target you’re going to map to, see `mmu_target_t`
- **caps** [in] Memory capabilities, see `mmu_mem_caps_t`
- **flags** [in] Mmap flags
- **out_ptr** [out] Start address of the mapped virtual memory

#### Returns

- **ESP_OK**
- **ESP_ERR_INVALID_ARG:** Invalid argument, see printed logs
- **ESP_ERR_NOT_SUPPORTED:** Only on ESP32, PSRAM is not a supported physical memory target
- **ESP_ERR_NOT_FOUND:** No enough size free block to use
- **ESP_ERR_NO_MEM:** Out of memory, this API will allocate some heap memory for internal usage
- **ESP_ERR_INVALID_STATE:** Paddr is mapped already, this API will return corresponding vaddr_start of the previously mapped block. Only to-be-mapped paddr block is totally enclosed by a previously mapped block will lead to this error. (Identical scenario will behave similarly) new_block_start new_block_end ——&#8212; New Block ——&#8212;|Block ———&#8212; Block_start block_end

**esp_err_t esp_mmu_unmap** *(void *ptr)*

Unmap a previously mapped virtual memory block.

**Note:** This API does not guarantee thread safety

#### Parameters

- **ptr** [in] Start address of the virtual memory

#### Returns

- **ESP_OK**
- **ESP_ERR_INVALID_ARG:** Null pointer
- **ESP_ERR_NOT_FOUND:** Vaddr is not in external memory, or it’s not mapped yet

**esp_err_t esp_mmu_map_get_max_consecutive_free_block_size** *(mmu_mem_caps_t caps, mmu_target_t target, size_t *out_len)*

Get largest consecutive free external virtual memory block size, with given capabilities and given physical target.

#### Parameters

- **caps** [in] Bitwise OR of MMU_MEM_CAP_* flags indicating the memory block
Chapter 2. API Reference

- **target**  – [in] Physical memory target you’re going to map to, see `mmu_target_t`.
- **out_len**  – [out] Largest free block length, in bytes.

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG: Invalid arguments, could be null pointer

### `esp_mmu_map_dumpMappedBlocks (FILE *stream)`

Dump all the previously mapped blocks

**Note:** This API shall not be called from an ISR.

**Note:** This API does not guarantee thread safety

**Parameters**
- `stream`  – stream to print information to; use stdout or stderr to print to the console;
  use fnmopen/open_memstream to print to a string buffer.

**Returns**
- ESP_OK

### `esp_mmu_vaddr_to_paddr (void *vaddr, esp_paddr_t *out_paddr, mmu_target_t *out_target)`

Convert virtual address to physical address.

**Parameters**
- `vaddr`  – [in] Virtual address
- `out_paddr`  – [out] Physical address
- `out_target`  – [out] Physical memory target, see `mmu_target_t`

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG: Null pointer, or vaddr is not within external memory
- ESP_ERR_NOT_FOUND: Vaddr is not mapped yet

### `esp_mmu_paddr_to_vaddr (esp_paddr_t paddr, mmu_target_t target, mmu_vaddr_t type, void **out_vaddr)`

Convert physical address to virtual address.

**Parameters**
- `paddr`  – [in] Physical address
- `target`  – [in] Physical memory target, see `mmu_target_t`
- `type`  – [in] Virtual address type, could be either instruction or data
- `out_vaddr`  – [out] Virtual address

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG: Null pointer
- ESP_ERR_NOT_FOUND: Paddr is not mapped yet

### `esp_mmu_paddr_findCaps (const esp_paddr_t paddr, mmu_mem_caps_t *out_caps)`

If the physical address is mapped, this API will provide the capabilities of the virtual address where the physical address is mapped to.

**Note:** Only return value is ESP_OK (which means physically address is successfully mapped), then caps you get make sense.

**Note:** This API only check one page (see CONFIG_MMU_PAGE_SIZE), starting from the `paddr`

**Parameters**
Chapter 2. API Reference

- **paddr** - [in] Physical address
- **out_caps** - [out] Bitwise OR of MMU_MEM_CAP_* flags indicating the capabilities of a virtual address where the physical address is mapped to.

**Returns**
- ESP_OK: Physical address successfully mapped.
- ESP_ERR_INVALID_ARG: Null pointer
- ESP_ERR_NOT_FOUND: Physical address is not mapped successfully.

**Macros**

**ESP_MMU_MMAP_FLAG_PADDR_SHARED**

Share this mapping.

MMU Memory Mapping Driver APIs for MMU supported memory

**Driver Backgrounds:**

**Type Definitions**

typedef uint32_t esp_paddr_t

Physical memory type.

### 2.9.16 Memory Synchronization

**Introduction**

ESP32-S2 can access its connected PSRAM via these ways:

- CPU
- DMA

By default, CPU accesses the above mentioned memory via cache. Whereas DMA accesses the memory directly, without going through cache.

This leads to potential cache data coherence issue:

- When a DMA transaction changes the content of a piece of memory, and the content has been cached already. Under this condition:
  - CPU may read stale data.
  - The stale data in the cache may be written back to the memory. The new data updated by the previous DMA transaction will be overwritten.
- CPU changes the content of an address. The content is in the cache, but not in the memory yet (cache will write back the content to the memory according to its own strategy). Under this condition:
  - The next DMA transactions to read this content from the memory will get stale data.

There are three common methods to address such cache data coherence issue:

1. Hardware based cache Coherent Interconnect, ESP32-S2 does not have such ability.
2. Use the DMA buffer from non-cacheable memory. Memory that CPU access it without going through cache is called non-cacheable memory.
3. Explicitly call a memory synchronization API to write back the content in the cache back to the memory, or invalidate the content in the cache.

**Memory Synchronisation Driver**

The suggested way to deal with such cache data coherence issue is by using the memory synchronization API `esp_cache_msync()` provided by ESP-IDF `esp_mm` component.
**Driver Concept**  Direction of the cache memory synchronization:

- `ESP_CACHE_MSYNC_FLAG_DIR_C2M`, for synchronization from cache to memory.
- `ESP_CACHE_MSYNC_FLAG_DIR_M2C`, for synchronization from memory to cache.

Type of the cache memory synchronization:

- `ESP_CACHE_MSYNC_FLAG_TYPE_DATA`, for synchronization to a data address region.
- `ESP_CACHE_MSYNC_FLAG_TYPE_INST`, for synchronization to an instruction address region.

**Driver Behaviour**  Calling `esp_cache_msync()` will do a synchronization between cache and memory. The first parameter `addr` and the second parameter `size` together describe the memory region that is to be synchronized. About the third parameter `flags`:

- `ESP_CACHE_MSYNC_FLAG_DIR_C2M`. With this flag, content in the specified address region is written back to the memory. This direction is usually used after the content of an address is updated by the CPU, e.g. a memset to the address. Operation in this direction should happen before a DMA operation to the same address.
- `ESP_CACHE_MSYNC_FLAG_DIR_M2C`. With this flag, content in the specified address region is invalidated from the cache. This direction is usually used after the content of an address is updated by the DMA. Operation in this direction should happen before a CPU read operation to the same address.

The above two flags help select the synchronization direction. Specially, if neither of these two flags are used, `esp_cache_msync()` will by default select the `ESP_CACHE_MSYNC_FLAG_DIR_C2M` direction. Users are not allowed to set both of the two flags at the same time.

- `ESP_CACHE_MSYNC_FLAG_TYPE_DATA`.
- `ESP_CACHE_MSYNC_FLAG_TYPE_INST`.

The above two flags help select the type of the synchronization address. Specially, if neither of these two flags are used, `esp_cache_msync()` will by default select the `ESP_CACHE_MSYNC_FLAG_TYPE_DATA` direction. Users are not allowed to set both of the two flags at the same time.

- `ESP_CACHE_MSYNC_FLAG_INVALIDATE`. This flag is used to trigger a cache invalidation to the specified address region, after the region is written back to the memory. This flag is mainly used for `ESP_CACHE_MSYNC_FLAG_DIR_C2M` direction. For `ESP_CACHE_MSYNC_FLAG_DIR_M2C` direction, behaviour is the same as if the `ESP_CACHE_MSYNC_FLAG_INVALIDATE` flag is not set.
- `ESP_CACHE_MSYNC_FLAG_UNALIGNED`. This flag force the `esp_cache_msync()` API to do synchronization without checking the address and size alignment. For more details, see chapter `Address Alignment Requirement` following.

**Address Alignment Requirement**

There is address and size alignment requirement (in bytes) for using `esp_cache_msync()`. The alignment requirement comes from cache.

- An address region whose start address and size both meet the cache memory synchronization alignment requirement is defined as an *aligned address region*.
- An address region whose start address or size does not meet the cache memory synchronization alignment requirement is defined as an *unaligned address region*.

By default, if you specify an unaligned address region, `esp_cache_msync()` will return an `ESP_ERR_INVALID_ARG` error, together with the required alignment.
### Memory Allocation Helper

Cache memory synchronization is usually considered when DMA is involved. ESP-IDF provides an API to do memory allocation that can meet the alignment requirement from both the cache and the DMA.

- `esp_dma_malloc()`, this API allocates a chunk of memory that meets the alignment requirement from both the cache and the DMA.
- `esp_dma_calloc()`, this API allocates a chunk of memory that meets the alignment requirement from both the cache and the DMA. The initialized value in the memory is set to zero.

You can also use `ESP_DMA_MALLOC_FLAG_PSRAM` to allocate from the PSRAM.

### Warning for Address Alignment Requirement

You can set the `ESP_CACHE_MSYNC_FLAG_UNALIGNED` flag to bypass such check. Note you should be very careful about using this flag. Cache memory synchronization to an unaligned address region may silently corrupt the memory.

For example, assume:

- alignment requirement is 0x40 bytes.
- a call to `esp_cache_msync()`, with `ESP_CACHE_MSYNC_FLAG_DIR_M2C | ESP_CACHE_MSYNC_FLAG_UNALIGNED` flags, the specified address region is 0x4000_0020 ~ 0x4000_0060 (see data C in below graph).

Above settings will trigger a cache invalidation to the address region 0x4000_0000 ~ 0x4000_0080, see sync item 0 and sync item 1 in the below graph.

If the content in 0x4000_0000 ~ 0x4000_0020 (data A in the below graph) or 0x4000_0060 ~ 0x4000_0080 (data B in the below graph) are not written back to the memory yet, then these data A and data B will be discarded.
Chapter 2. API Reference

Header File

- components/esp_mm/include/esp_cache.h
- This header file can be included with:

  ```
#include "esp_cache.h"
  ```
- This header file is a part of the API provided by the esp_mm component. To declare that your component depending on esp_mm, add the following to your CMakeLists.txt:

  ```
REQUIRES esp_mm
  ```
or

  ```
PRIV_REQUIRES esp_mm
  ```

Functions

`esp_err_t esp_cache_msync` (void *addr, size_t size, int flags)

Memory sync between Cache and storage memory.

For cache-to-memory (C2M) direction:

- For cache writeback supported chips (you can refer to SOC_CACHE_WRITEBACK_SUPPORTED in soc_caps.h)
  - This API will do a writeback to synchronise between cache and storage memory
  - With ESP_CACHE_MSYNC_FLAG_INVALIDATE, this API will also invalidate the values that just written
  - Note: although ESP32 is with PSRAM, but cache writeback isn’t supported, so this API will do nothing on ESP32
- For other chips, this API will do nothing. The out-of-sync should be already dealt by the SDK

For memory-to-cache (M2C) direction:

- This API will by default do an invalidation

This API is cache-safe and thread-safe

**Note:** If you don’t set direction (ESP_CACHE_MSYNC_FLAG_DIR_x flags), this API is by default C2M direction

---

**Note:** If you don’t set type (ESP_CACHE_MSYNC_FLAG_TYPE_x flags), this API is by default doing msync for data

---

**Note:** You should not call this during any Flash operations (e.g. esp_flash APIs, nvs and some other APIs that are based on esp_flash APIs)

---

**Note:** If XIP_From_PSRAM is enabled (by enabling both CONFIG_SPIRAM_FETCH_INSTRUCTIONS and CONFIG_SPIRAM_RODATA), you can call this API during Flash operations

**Parameters**

- `addr` [-in] Starting address to do the msync
- `size` [-in] Size to do the msync
- `flags` [-in] Flags, see ESP_CACHE_MSYNC_FLAG_x

**Returns**

- ESP_OK:
  - Successful msync
– For C2M direction, if this chip doesn’t support cache writeback, if the input addr is a cache supported one, this API will return ESP_OK
  • ESP_ERR_INVALID_ARG: Invalid argument, not cache supported addr, see printed logs

Macros

ESP_CACHE_MSYNC_FLAG_INVALIDATE
  Do an invalidation.
  Cache msync flags
  • For cache-to-memory (C2M) direction: setting this flag will start an invalidation after the cache writeback operation
  • For memory-to-cache (M2C) direction: setting / unsetting this flag will behave similarly, trigger an invalidation

ESP_CACHE_MSYNC_FLAG_UNALIGNED
  Allow msync to a address block that are not aligned to the data cache line size.

ESP_CACHE_MSYNC_FLAG_DIR_C2M
  Cache msync direction: from Cache to memory.

  Note: If you don’t set direction (ESP_CACHE_MSYNC_FLAG_DIR_x flags), it is by default cache-to-memory (C2M) direction

ESP_CACHE_MSYNC_FLAG_DIR_M2C
  Cache msync direction: from memory to Cache.

ESP_CACHE_MSYNC_FLAG_TYPE_DATA
  Cache msync type: data.

  Note: If you don’t set type (ESP_CACHE_MSYNC_FLAG_TYPE_x flags), it is by default data type

ESP_CACHE_MSYNC_FLAG_TYPE_INST
  Cache msync type: instruction.

API Reference - ESP DMA Utils

Header File

  • components/esp_hw_support/include/esp_dma_utils.h
  • This header file can be included with:

  #include "esp_dma_utils.h"

Functions

esp_err_t esp_dma_malloc (size_t size, uint32_t flags, void **out_ptr, size_t *actual_size)
  Helper function for malloc a DMA capable memory buffer.

Parameters

  • size – [in] Size in bytes, the amount of memory to allocate
  • flags – [in] Flags, see ESP_DMA_MALLOC_FLAG_x
Chapter 2. API Reference

• **out_ptr** – [out] A pointer to the memory allocated successfully
• **actual_size** – [out] Actual size for allocation in bytes, when the size you specified
doesn’t meet the DMA alignment requirements, this value might be bigger than the size
you specified. Set null if you don’t care this value.

**Returns**
• ESP_OK:
• ESP_ERR_INVALID_ARG: Invalid argument
• ESP_ERR_NO_MEM: No enough memory for allocation

```c
esp_err_t esp_dmacalloc(size_t n, size_t size, uint32_t flags, void **out_ptr, size_t *actual_size)
```
Helper function for calloc a DMA capable memory buffer.

**Parameters**
• **n** – [in] Number of continuing chunks of memory to allocate
• **size** – [in] Size of one chunk, in bytes
• **flags** – [in] Flags, see ESP_DMA_MALLOC_FLAG_x
• **out_ptr** – [out] A pointer to the memory allocated successfully
• **actual_size** – [out] Actual size for allocation in bytes, when the size you specified
doesn’t meet the cache alignment requirements, this value might be bigger than the size
you specified. Set null if you don’t care this value.

**Returns**
• ESP_OK:
• ESP_ERR_INVALID_ARG: Invalid argument
• ESP_ERR_NO_MEM: No enough memory for allocation

```c
bool esp_dma_is_buffer_aligned(const void *ptr, size_t size, esp_dma_buf_location_t location)
```
Helper function to check if a buffer meets DMA alignment requirements.

**Parameters**
• **ptr** – [in] Pointer to the buffer
• **size** – [in] Size of the buffer
• **location** – [in] Location of the DMA buffer, see esp_dma_buf_location_t

**Returns**
• True: Buffer is aligned
• False: Buffer is not aligned, or buffer is not DMA capable

**Macros**

ESP_DMA_MALLOC_FLAG_PSRAM
Memory is in PSRAM.

DMA malloc flags

**Enumerations**

enum esp_dma_buf_location_t
DMA buffer location.

*Values:*

enumerator ESP_DMA_BUF_LOCATION_INTERNAL
DMA buffer is in internal memory.

enumerator ESP_DMA_BUF_LOCATION_PSRAM
DMA buffer is in PSRAM.
2.9.17 Heap Memory Debugging

Overview

ESP-IDF integrates tools for requesting heap information, heap corruption detection, and heap tracing. These can help track down memory-related bugs.

For general information about the heap memory allocator, see Heap Memory Allocation.

Heap Information

To obtain information about the state of the heap, call the following functions:

- `heap_caps_get_free_size()` can be used to return the current free memory for different memory capabilities.
- `heap_caps_get_largest_free_block()` can be used to return the largest free block in the heap, which is also the largest single allocation currently possible. Tracking this value and comparing it to the total free heap allows you to detect heap fragmentation.
- `heap_caps_get_minimum_free_size()` can be used to track the heap “low watermark” since boot.
- `heap_caps_get_info()` returns a `multi_heap_info_t` structure, which contains the information from the above functions, plus some additional heap-specific data (number of allocations, etc.).
- `heap_caps_print_heap_info()` prints a summary of the information returned by `heap_caps_get_info()` to stdout.
- `heap_caps_dump()` and `heap_caps_dump_all()` output detailed information about the structure of each block in the heap. Note that this can be a large amount of output.

Heap Allocation and Free Function Hooks

Heap allocation and free detection hooks allow you to be notified of every successful allocation and free operation:

- Providing a definition of `esp_heap_trace_alloc_hook()` allows you to be notified of every successful memory allocation operation
- Providing a definition of `esp_heap_trace_free_hook()` allows you to be notified of every successful memory-free operations

This feature can be enabled by setting the `CONFIG_HEAP_USE_HOOKS` option. `esp_heap_trace_alloc_hook()` and `esp_heap_trace_free_hook()` have weak declarations (e.g., `__attribute__((weak))`), thus it is not necessary to provide declarations for both hooks. Given that it is technically possible to allocate and free memory from an ISR (though strongly discouraged from doing so), the `esp_heap_trace_alloc_hook()` and `esp_heap_trace_free_hook()` can potentially be called from an ISR.

It is not recommended to perform (or call API functions to perform) blocking operations or memory allocation/free operations in the hook functions. In general, the best practice is to keep the implementation concise and leave the heavy computation outside of the hook functions.

The example below shows how to define the allocation and free function hooks:

```c
#include "esp_heap_caps.h"

void esp_heap_trace_alloc_hook(void* ptr, size_t size, uint32_t caps) {
    ...
}

void esp_heap_trace_free_hook(void* ptr) {
    ...
}
```

(continues on next page)
Heap Corruption Detection

Heap corruption detection allows you to detect various types of heap memory errors:

- Out-of-bound writes & buffer overflows
- Writes to freed memory
- Reads from freed or uninitialized memory

Assertions The heap implementation (heap/multi_heap.c, etc.) includes numerous assertions that will fail if the heap memory is corrupted. To detect heap corruption most effectively, ensure that assertions are enabled in the project configuration via the `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL` option.

If a heap integrity assertion fails, a line will be printed like `CORRUPT HEAP: multi_heap.c:225 detected at 0x3ffbb71c`. The memory address printed is the address of the heap structure that has corrupt content.

It is also possible to manually check heap integrity by calling `heap_caps_check_integrity_all()` or related functions. This function checks all of the requested heap memory for integrity and can be used even if assertions are disabled. If the integrity checks detects an error, it will print the error along with the address(es) of corrupt heap structures.

Memory Allocation Failed Hook Users can use `heap_caps_register_failed_alloc_callback()` to register a callback that is invoked every time an allocation operation fails.

Additionally, users can enable the `CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS`, which will automatically trigger a system abort if any allocation operation fails.

The example below shows how to register an allocation failure callback:

```c
#include "esp_heap_caps.h"

void heap_caps_alloc_failed_hook(size_t requested_size, uint32_t caps, const char *function_name) {
    printf("%s was called but failed to allocate %d bytes with 0x%X capabilities. \n", function_name, requested_size, caps);
}

void app_main() {
    ...  
    esp_err_t error = heap_caps_register_failed_alloc_callback(heap_caps_alloc_failed_hook);
    ...  
    void *ptr = heap_caps_malloc(allocation_size, MALLOC_CAP_DEFAULT);
    ...
}
```

Finding Heap Corruption Memory corruption can be one of the hardest classes of bugs to find and fix, as the source of the corruption could be completely unrelated to the symptoms of the corruption. Here are some tips:
• A crash with a **CORRUPT HEAP** message usually includes a stack trace, but this stack trace is rarely useful. The crash is the symptom of memory corruption when the system realizes the heap is corrupt. But usually, the corruption happens elsewhere and earlier in time.

• Increasing the heap memory debugging **Configuration** level to “Light impact” or “Comprehensive” gives you a more accurate message with the first corrupt memory address.

• Adding regular calls to `heap_caps_check_integrity_all()` or `heap_caps_check_integrity_addr()` in your code helps you pin down the exact time that the corruption happened. You can move these checks around to “close in on” the section of code that corrupted the heap.

• Based on the memory address that has been corrupted, you can use **JTAG debugging** to set a watchpoint on this address and have the CPU halt when it is written to.

• If you do not have JTAG, but you do know roughly when the corruption happens, set a watchpoint in software just beforehand via `esp_cpu_set_watchpoint()`. A fatal exception will occur when the watchpoint triggers. The following is an example of how to use the function - `esp_cpu_set_watchpoint(0, (void *)addr, 4, ESP_WATCHPOINT_STORE)`. Note that watchpoints are per-CPU and are set on the current running CPU only. So if you do not know which CPU is corrupting memory, call this function on both CPUs.

• For buffer overflows, **heap tracing** in **HEAP_TRACE_ALL** mode tells which callers are allocating which addresses from the heap. See Heap Tracing To Find Heap Corruption for more details. You can try to find the function that allocates memory with an address immediately before the corrupted address, since it is probably the function that overflows the buffer.

• Calling `heap_caps_dump()` or `heap_caps_dump_all()` can give an indication of what heap blocks are surrounding the corrupted region and may have overflowed or underflowed, etc.

**Configuration** Temporarily increasing the heap corruption detection level can give more detailed information about heap corruption errors.

In the project configuration menu, under Component config, there is a menu **Heap memory debugging**. The option **CONFIG_HEAP_CORRUPTION_DETECTION** can be set to one of the following three levels:

**Basic (No Poisoning)** This is the default level. By default, no special heap corruption features are enabled, but the provided assertions are enabled. A heap corruption error will be printed if any of the heap’s internal data structures appear overwritten or corrupted. This usually indicates a buffer overrun or out-of-bounds write.

If assertions are enabled, an assertion will also trigger if a double-free occurs (the same memory is freed twice).

Calling `heap_caps_check_integrity()` in Basic mode checks the integrity of all heap structures, and print errors if any appear to be corrupted.

**Light Impact** At this level, heap memory is additionally “poisoned” with head and tail “canary bytes” before and after each block that is allocated. If an application writes outside the bounds of allocated buffers, the canary bytes will be corrupted, and the integrity check will fail.

The head canary word is `0xABBA1234` (`3412BAAB` in byte order), and the tail canary word is `0xBAAD5678` (`7856ADBA` in byte order).

With basic heap corruption checks, most out-of-bound writes can be detected and the number of overrun bytes before a failure is detected depends on the properties of the heap. However, the Light Impact mode is more precise as even a single-byte overrun can be detected.

Enabling light-impact checking increases the memory usage. Each individual allocation uses 9 to 12 additional bytes of memory depending on alignment.

Each time `heap_caps_free()` is called in Light Impact mode, the head and tail canary bytes of the buffer being freed are checked against the expected values.

When `heap_caps_check_integrity()` is called, all allocated blocks of heap memory have their canary bytes checked against the expected values.
In both cases, the functions involve checking that the first 4 bytes of an allocated block (before the buffer is returned to the user) should be the word 0xABBA1234, and the last 4 bytes of the allocated block (after the buffer is returned to the user) should be the word 0xBAAD5678.

Different values usually indicate buffer underrun or overrun. Overrun indicates that when writing to memory, the data written exceeds the size of the allocated memory, resulting in writing to an unallocated memory area; underrun indicates that when reading memory, the data read exceeds the allocated memory and reads data from an unallocated memory area.

**Comprehensive** This level incorporates the “light impact” detection features plus additional checks for uninitialized-access and use-after-free bugs. In this mode, all freshly allocated memory is filled with the pattern 0xCE, and all freed memory is filled with the pattern 0xFE.

Enabling Comprehensive mode has a substantial impact on runtime performance, as all memory needs to be set to the allocation patterns each time a `heap_caps_malloc()` or `heap_caps_free()` completes, and the memory also needs to be checked each time. However, this mode allows easier detection of memory corruption bugs which are much more subtle to find otherwise. It is recommended to only enable this mode when debugging, not in production.

**Crashes in Comprehensive Mode** If an application crashes when reading or writing an address related to 0xCE-CECECE in Comprehensive mode, it indicates that it has read uninitialized memory. The application should be changed to either use `heap_caps_calloc()` (which zeroes memory), or initialize the memory before using it. The value 0xCECECECE may also be seen in stack-allocated automatic variables, because, in ESP-IDF, most task stacks are originally allocated from the heap, and in C, stack memory is uninitialized by default.

If an application crashes, and the exception register dump indicates that some addresses or values were 0xFEFE-FEFE, this indicates that it is reading heap memory after it has been freed, i.e., a “use-after-free bug”. The application should be changed to not access heap memory after it has been freed.

If a call to `heap_caps_malloc()` or `heap_caps_realloc()` causes a crash because it was expected to find the pattern 0xFEFEFEFE in free memory and a different pattern was found, it indicates that the app has a use-after-free bug where it is writing to memory that has already been freed.

**Manual Heap Checks in Comprehensive Mode** Calls to `heap_caps_check_integrity()` may print errors relating to 0xFEFEFEFE, 0xABBA1234, or 0xBAAD5678. In each case the checker is expected to find a given pattern, and will error out if not found:

- For free heap blocks, the checker expects to find all bytes set to 0xFE. Any other values indicate a use-after-free bug where free memory has been incorrectly overwritten.
- For allocated heap blocks, the behavior is the same as for the Light Impact mode. The canary bytes 0xABBA1234 and 0xBAAD5678 are checked at the head and tail of each allocated buffer, and any variation indicates a buffer overrun or underrun.

**Heap Task Tracking**

Heap Task Tracking can be used to get per-task info for heap memory allocation. The application has to specify the heap capabilities for which the heap allocation is to be tracked.

Example code is provided in `system/heap_task_tracking`.

**Heap Tracing**

Heap Tracing allows the tracing of code which allocates or frees memory. Two tracing modes are supported:

- Standalone. In this mode, traced data are kept on-board, so the size of the gathered information is limited by the buffer assigned for that purpose, and the analysis is done by the on-board code. There are a couple of APIs available for accessing and dumping collected info.
- Host-based. This mode does not have the limitation of the standalone mode, because traced data are sent to the host over JTAG connection using app_trace library. Later on, they can be analyzed using special tools.
Heap tracing can perform two functions:

- Leak checking: find memory that is allocated and never freed.
- Heap use analysis: show all functions that are allocating or freeing memory while the trace is running.

**How to Diagnose Memory Leaks** If you suspect a memory leak, the first step is to figure out which part of the program is leaking memory. Use the `heap_caps_get_free_size()` or related functions in `heap information` to track memory use over the life of the application. Try to narrow the leak down to a single function or sequence of functions where free memory always decreases and never recovers.

**Standalone Mode** Once you have identified the code which you think is leaking:

- Enable the `CONFIG_HEAP_TRACING_DEST` option.
- Call the function `heap_trace_init_standalone()` early in the program, to register a buffer that can be used to record the memory trace.
- Call the function `heap_trace_start()` to begin recording all mallocs or frees in the system. Call this immediately before the piece of code which you suspect is leaking memory.
- Call the function `heap_trace_stop()` to stop the trace once the suspect piece of code has finished executing.
- Call the function `heap_trace_dump()` to dump the results of the heap trace.

The following code snippet demonstrates how application code would typically initialize, start, and stop heap tracing:

```c
#include "esp_heap_trace.h"

#define NUM_RECORDS 100
static heap_trace_record_t trace_record[NUM_RECORDS]; // This buffer must be in...
    "internal RAM"
...

void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_standalone(trace_record, NUM_RECORDS) );
    ...
}

void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );
    do_something_you_suspect_is_leaking();
    ESP_ERROR_CHECK( heap_trace_stop() );
    heap_trace_dump();
    ...
}
```

The output from the heap trace has a similar format to the following example:

```
2 allocations trace (100 entry buffer)
32 bytes (@ 0x3ffaf214) allocated CPU 0 ccount 0x2e9b7384 caller...
    ->0x400d276d:0x400d27c1
0x400d276d: leak_some_memory at /path/to/idf/examples/get-started/blink/main/./
    ->blink.c:27

0x400d27c1: blink_task at /path/to/idf/examples/get-started/blink/main/./blink.c:52
8 bytes (@ 0x3ffaf804) allocated CPU 0 ccount 0x2e9b79c0 caller...
    ->0x400d2776:0x400d27c1
```

(continues on next page)
Chapter 2. API Reference

(continued from previous page)

0x400d2776: leak_some_memory at /path/to/idf/examples/get-started/blink/main./blink.c:29
0x400d27c1: blink_task at /path/to/idf/examples/get-started/blink/main./blink.c:52

40 bytes 'leaked' in trace (2 allocations)
total allocations 2 total frees 0

Note: The above example output uses IDF Monitor to automatically decode PC addresses to their source files and line numbers.

The first line indicates how many allocation entries are in the buffer, compared to its total size.

In HEAP_TRACE_LEAKS mode, for each traced memory allocation that has not already been freed, a line is printed with:

- XX bytes is the number of bytes allocated.
- @ 0x... is the heap address returned from heap_caps_malloc() or heap_caps_calloc().
- Internal or PSRAM is the general location of the allocated memory.
- CPU x is the CPU (0 or 1) running when the allocation was made.
- ccount 0x... is the CCOUNT (CPU cycle count) register value the allocation was made. The value is different for CPU 0 vs CPU 1.
- caller 0x... gives the call stack of the call to heap_caps_malloc() or heap_caps_free(), as a list of PC addresses. These can be decoded to source files and line numbers, as shown above.

The depth of the call stack recorded for each trace entry can be configured in the project configuration menu, under Heap Memory Debugging > Enable heap tracing > CONFIG_HEAP_TRACING_STACK_DEPTH. Up to 32 stack frames can be recorded for each allocation (the default is 2). Each additional stack frame increases the memory usage of each heap_trace_record_t record by eight bytes.

Finally, the total number of the ‘leaked’ bytes (bytes allocated but not freed while the trace is running) is printed together with the total number of allocations it represents.

A warning will be printed if the trace buffer was not large enough to hold all the allocations happened. If you see this warning, consider either shortening the tracing period or increasing the number of records in the trace buffer.

Host-Based Mode Once you have identified the code which you think is leaking:

- In the project configuration menu, navigate to Component settings > Heap Memory Debugging > CONFIG_HEAP_TRACING_DEST and select Host-Based.
- In the project configuration menu, navigate to Component settings > Application Level Tracing > CONFIG_APPTRACE_DESTINATION and select Trace memory.
- In the project configuration menu, navigate to Component settings > Application Level Tracing > FreeRTOS SystemView Tracing and enable CONFIG_APPTRACE_SV_ENABLE.
- Call the function heap_trace_init_tohost() early in the program, to initialize the JTAG heap tracing module.
- Call the function heap_trace_start() to begin recording all memory allocation and free calls in the system. Call this immediately before the piece of code which you suspect is leaking memory.
- In host-based mode, the argument to this function is ignored, and the heap tracing module behaves like HEAP_TRACE_ALL is passed, i.e., all allocations and deallocations are sent to the host.
- Call the function heap_trace_stop() to stop the trace once the suspect piece of code has finished executing.

The following code snippet demonstrates how application code would typically initialize, start, and stop host-based mode heap tracing:
```c
#include "esp_heap_trace.h"
...

void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_tohost() );
    ...
}

void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );
    do_something_you_suspect_is_leaking();
    ESP_ERROR_CHECK( heap_trace_stop() );
    ...
}
```

To gather and analyze heap trace, do the following on the host:

1. Build the program and download it to the target as described in Step 5. First Steps on ESP-IDF.
2. Run OpenOCD (see JTAG Debugging).

**Note:** In order to use this feature, you need OpenOCD version v0.10.0-esp32-20181105 or later.

3. You can use GDB to start and/or stop tracing automatically. To do this you need to prepare a special `gdbinit` file:

```
target remote :3333
mon reset halt
maintenance flush register cache
tb heap_trace_start commands
mon esp sysview start file:///tmp/heap.svdat
c end
tb heap_trace_stop commands
mon esp sysview stop end
c
```

Using this file GDB can connect to the target, reset it, and start tracing when the program hits breakpoint at `heap_trace_start()`. Tracing will be stopped when the program hits breakpoint at `heap_trace_stop()`. Traced data will be saved to `/tmp/heap_log.svdat`.

4. Run GDB using `xtensa-esp32s2-elf-gdb -x gdbinit /path/to/program/elf`.
5. Quit GDB when the program stops at `heap_trace_stop()`. Traced data are saved in `/tmp/heap.svdat`.
6. Run processing script `$IDF_PATH/tools/esp_app_trace/sysviewtrace_proc.py -p -b /path/to/program/elf /tmp/heap_log.svdat`.

The output from the heap trace has a similar format to the following example:
Parse trace from '/tmp/heap.svdat'...
Stop parsing trace. (Timeout 0.000000 sec while reading 1 bytes!)
Process events from '[/tmp/heap.svdat]'...

(continues on next page)
Heap Tracing To Find Heap Corruption

Heap tracing can also be used to help track down heap corruption. When a region in the heap is corrupted, it may be from some other part of the program that allocated memory at a nearby address.

If you have an approximate idea of when the corruption occurred, enabling heap tracing in `HEAP_TRACE_ALL` mode allows you to record all the memory allocation functions used and the corresponding allocation addresses.

Using heap tracing in this way is very similar to memory leak detection as described above. For memories that are allocated and not freed, the output is the same. However, records will also be shown for memory that has been freed.

Performance Impact

Enabling heap tracing in menuconfig increases the code size of your program, and has a very small negative impact on the performance of heap allocation or free operations even when heap tracing is not running.

When heap tracing is running, heap allocation or free operations are substantially slower than when heap tracing is stopped. Increasing the depth of stack frames recorded for each allocation (see above) also increases this performance impact.

To mitigate the performance loss when the heap tracing is enabled and active, enable `CONFIG_HEAP_TRACE_HASH_MAP`. With this configuration enabled, a hash map mechanism will be used to handle the heap trace records, thus considerably decreasing the heap allocation or free execution time. The size of the hash map can be modified by setting the value of `CONFIG_HEAP_TRACE_HASH_MAP_SIZE`. 
By default, the hash map is placed into internal RAM. It can also be placed into external RAM if `CONFIG_HEAP_TRACE_HASH_MAP_IN_EXT_RAM` is enabled. In order to enable this configuration, make sure to enable `CONFIG_SPIRAM` and `CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY`.

**False-Positive Memory Leaks** Not everything printed by `heap_trace_dump()` is necessarily a memory leak. The following cases may also be printed:

- Any memory that is allocated after `heap_trace_start()` but freed after `heap_trace_stop()` appears in the leaked dump.
- Allocations may be made by other tasks in the system. Depending on the timing of these tasks, it is quite possible that this memory is freed after `heap_trace_stop()` is called.
- The first time a task uses `stdio` - e.g., when it calls `heap_caps_printf()` - a lock, i.e., RTOS mutex semaphore, is allocated by the libc. This allocation lasts until the task is deleted.
- Certain uses of `heap_caps_printf()`, such as printing floating point numbers and allocating some memory from the heap on demand. These allocations last until the task is deleted.
- The Bluetooth, Wi-Fi, and TCP/IP libraries allocate heap memory buffers to handle incoming or outgoing data. These memory buffers are usually short-lived, but some may be shown in the heap leak trace if the data has been received or transmitted by the lower levels of the network during the heap tracing.
- TCP connections retain some memory even after they are closed due to the `TIME_WAIT` state. Once the `TIME_WAIT` period is completed, this memory will be freed.

One way to differentiate between “real” and “false positive” memory leaks is to call the suspect code multiple times while tracing is running, and look for patterns (multiple matching allocations) in the heap trace output.

**API Reference - Heap Tracing**

**Header File**

- `components/heap/include/esp_heap_trace.h`
- This header file can be included with:

```
#include "esp_heap_trace.h"
```

**Functions**

`esp_err_t heap_trace_init_standalone(esp_heap_trace_record_t *record_buffer, size_t num_records)`

Initialise heap tracing in standalone mode.

This function must be called before any other heap tracing functions.

To disable heap tracing and allow the buffer to be freed, stop tracing and then call `heap_trace_init_standalone(NULL, 0);`

**Parameters**

- `record_buffer` – Provide a buffer to use for heap trace data. Note: External RAM is allowed, but it prevents recording allocations made from ISR’s.
- `num_records` – Size of the heap trace buffer, as number of record structures.

**Returns**

- `ESP_ERR_NOT_SUPPORTED` Project was compiled without heap tracing enabled in menuconfig.
- `ESP_ERR_INVALID_STATE` Heap tracing is currently in progress.
- `ESP_OK` Heap tracing initialised successfully.

`esp_err_t heap_trace_init_tohost (void)`

Initialise heap tracing in host-based mode.

This function must be called before any other heap tracing functions.

**Returns**

- `ESP_ERR_INVALID_STATE` Heap tracing is currently in progress.
- `ESP_OK` Heap tracing initialised successfully.
\textbf{esp_err_t} \texttt{heap_trace_start (heap_trace_mode_t mode)}

Start heap tracing. All heap allocations & frees will be traced, until \texttt{heap_trace_stop()} is called.

\textbf{Note:} \texttt{heap_trace_init_standalone()} must be called to provide a valid buffer, before this function is called.

\textbf{Note:} Calling this function while heap tracing is running will reset the heap trace state and continue tracing.

\textbf{Parameters} \texttt{mode} – Mode for tracing.

\begin{itemize}
  \item \texttt{HEAP_TRACE_ALL} means all heap allocations and frees are traced.
  \item \texttt{HEAP_TRACE_LEAKS} means only suspected memory leaks are traced. (When memory is freed, the record is removed from the trace buffer.)
\end{itemize}

\textbf{Returns}

\begin{itemize}
  \item ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
  \item ESP_ERR_INVALID_STATE A non-zero-length buffer has not been set via \texttt{heap_trace_init_standalone()}.
  \item ESP_OK Tracing is started.
\end{itemize}

\textbf{esp_err_t} \texttt{heap_trace_stop (void)}

Stop heap tracing.

\textbf{Returns}

\begin{itemize}
  \item ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
  \item ESP_ERR_INVALID_STATE Heap tracing was not in progress.
  \item ESP_OK Heap tracing stopped.
\end{itemize}

\textbf{esp_err_t} \texttt{heap_trace_resume (void)}

Resume heap tracing which was previously stopped.

Unlike \texttt{heap_trace_start()}, this function does not clear the buffer of any pre-existing trace records.

The heap trace mode is the same as when \texttt{heap_trace_start()} was last called (or \texttt{HEAP_TRACE_ALL} if \texttt{heap_trace_start()} was never called).

\textbf{Returns}

\begin{itemize}
  \item ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
  \item ESP_ERR_INVALID_STATE Heap tracing was already started.
  \item ESP_OK Heap tracing resumed.
\end{itemize}

\textbf{size_t} \texttt{heap_trace_get_count (void)}

Return number of records in the heap trace buffer.

It is safe to call this function while heap tracing is running.

\textbf{esp_err_t} \texttt{heap_trace_get (size_t index, heap_trace_record_t *record)}

Return a raw record from the heap trace buffer.

\textbf{Note:} It is safe to call this function while heap tracing is running, however in \texttt{HEAP_TRACE_LEAK} mode record indexing may skip entries unless heap tracing is stopped first.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{index} – Index (zero-based) of the record to return.
  \item \texttt{record} – [out] Record where the heap trace record will be copied.
\end{itemize}

\textbf{Returns}
Chapter 2. API Reference

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was not initialised.
- ESP_ERR_INVALID_ARG Index is out of bounds for current heap trace record count.
- ESP_OK Record returned successfully.

```c
void heap_trace_dump (void)
    Dump heap trace record data to stdout.
```

**Note:** It is safe to call this function while heap tracing is running, however in HEAP_TRACE_LEAK mode the dump may skip entries unless heap tracing is stopped first.

```c
void heap_trace_dump_caps (const uint32_t caps)
    Dump heap trace from the memory of the capabilities passed as parameter.
```

**Parameters caps** – Capability(ies) of the memory from which to dump the trace. Set MAL-LOC_CAP_INTERNAL to dump heap trace data from internal memory. Set MAL-LOC_CAP_SPIRAM to dump heap trace data from PSRAM. Set both to dump both heap trace data.

```c
esp_err_t heap_trace_summary (heap_trace_summary_t *summary)
    Get summary information about the result of a heap trace.
```

**Note:** It is safe to call this function while heap tracing is running.

**Structures**

```c
struct heap_trace_record_t
    Trace record data type. Stores information about an allocated region of memory.
```

**Public Members**

```c
uint32_t ccount
    CCOUNT of the CPU when the allocation was made. LSB (bit value 1) is the CPU number (0 or 1).
```

```c
void **address
    Address which was allocated. If NULL, then this record is empty.
```

```c
size_t size
    Size of the allocation.
```

```c
void **allocated_by[CONFIG_HEAP_TRACING_STACK_DEPTH]
    Call stack of the caller which allocated the memory.
```

```c
void **freed_by[CONFIG_HEAP_TRACING_STACK_DEPTH]
    Call stack of the caller which freed the memory (all zero if not freed.)
```

```c
struct heap_trace_summary_t
    Stores information about the result of a heap trace.
```
Public Members

_heap_trace_mode_t mode

The heap trace mode we just completed / are running.

size_t total_allocations

The total number of allocations made during tracing.

size_t total_frees

The total number of frees made during tracing.

size_t count

The number of records in the internal buffer.

size_t capacity

The capacity of the internal buffer.

size_t high_water_mark

The maximum value that 'count' got to.

size_t has_overflowed

True if the internal buffer overflowed at some point.

Macros

CONFIG_HEAP_TRACING_STACK_DEPTH

Type Definitions

typedef struct heap_trace_record_t heap_trace_record_t

Trace record data type. Stores information about an allocated region of memory.

Enumerations

enum heap_trace_mode_t

Values:

enumerator HEAP_TRACE_ALL

enumerator HEAP_TRACE_LEAKS

2.9.18 High Resolution Timer (ESP Timer)
Overview

Although FreeRTOS provides software timers, FreeRTOS software timers have a few limitations:

- Maximum resolution is equal to the RTOS tick period
- Timer callbacks are dispatched from a low-priority timer service (i.e., daemon) task. This task can be preempted by other tasks, leading to decreased precision and accuracy.

Although hardware timers are not subject to the limitations mentioned, they may not be as user-friendly. For instance, application components may require timer events to be triggered at specific future times, but hardware timers typically have only one “compare” value for interrupt generation. This necessitates the creation of an additional system on top of the hardware timer to keep track of pending events and ensure that callbacks are executed when the corresponding hardware interrupts occur.

**esp_timer** set of APIs provides one-shot and periodic timers, microsecond time resolution, and 64-bit range.

Internally, **esp_timer** uses a 64-bit hardware timer. The exact hardware timer implementation used depends on the target, where SYSTIMER is used for ESP32-S2.

Timer callbacks can be dispatched by two methods:

- **ESP_TIMER_TASK**. Timercallbacksaredispatchedfromahigh-priority **esp_timer** task. Because all the callbacks are dispatched from the same task, it is recommended to only do the minimal possible amount of work from the callback itself, posting an event to a lower-priority task using a queue instead.

- **ESP_TIMER_ISR**. Timercallbacksaredispatcheddirectlyfromthetimerinterrupthandler. This method is useful for some simple callbacks which aim for lower latency.

Creating and starting a timer, and dispatching the callback takes some time. Therefore, there is a lower limit to the timeout value of one-shot **esp_timer**. If **esp_timer_start_once()** is called with a timeout value of less than 20 us, the callback will be dispatched only after approximately 20 us.

Periodic **esp_timer** also imposes a 50 us restriction on the minimal timer period. Periodic software timers with a period of less than 50 us are not practical since they would consume most of the CPU time. Consider using dedicated hardware peripherals or DMA features if you find that a timer with a small period is required.

Using **esp_timer** APIs

A single timer is represented by **esp_timer_handle_t** type. Each timer has a callback function associated with it. This callback function is called from the **esp_timer** task each time the timer elapses.

- To create a timer, call **esp_timer_create()**.
- To delete the timer when it is no longer needed, call **esp_timer_delete()**.

The timer can be started in one-shot mode or in periodic mode.

- To start the timer in one-shot mode, call **esp_timer_start_once()**, passing the time interval after which the callback should be called. When the callback gets called, the timer is considered to be stopped.
- To start the timer in periodic mode, call **esp_timer_start_periodic()**, passing the period with which the callback should be called. The timer keeps running until **esp_timer_stop()** is called.

Note that the timer must not be running when **esp_timer_start_once()** or **esp_timer_start_periodic()** is called. To restart a running timer, call **esp_timer_stop()** first, then call one of the start functions.
Chapter 2. API Reference

Callback Functions

Note: Keep the callback functions as short as possible. Otherwise, it will affect all timers.

Timer callbacks that are processed by the ESP_TIMER_ISR method should not call the context switch call portYIELD_FROM_ISR(). Instead, use the esp_timer_isr_dispatch_need_yield() function. The context switch will be done after all ISR dispatch timers have been processed if required by the system.

**esp_timer During Light-sleep**

During Light-sleep, the esp_timer counter stops and no callback functions are called. Instead, the time is counted by the RTC counter. Upon waking up, the system gets the difference between the counters and calls a function that advances the esp_timer counter. Since the counter has been advanced, the system starts calling callbacks that were not called during sleep. The number of callbacks depends on the duration of the sleep and the period of the timers. It can lead to the overflow of some queues. This only applies to periodic timers, since one-shot timers are only called once.

This behavior can be changed by calling esp_timer_stop() before sleeping. In some cases, this can be inconvenient, and instead of the stop function, you can use the skip_unhandled_events option during esp_timer_create(). When the skip_unhandled_events is true, if a periodic timer expires one or more times during Light-sleep, then only one callback is called on wake.

Using the skip_unhandled_events option with automatic Light-sleep (see Power Management APIs) helps to reduce the power consumption of the system when it is in Light-sleep. The duration of Light-sleep is also in part determined by the next event occurs. Timers with skip_unhandled_events option does not wake up the system.

**Handling Callbacks**

esp_timer is designed to achieve a high-resolution and low-latency timer with the ability to handle delayed events. If the timer is late, then the callback will be called as soon as possible, and it will not be lost. In the worst case, when the timer has not been processed for more than one period (for periodic timers), the callbacks will be called one after the other without waiting for the set period. This can be bad for some applications, and the skip_unhandled_events option is introduced to eliminate this behavior. If skip_unhandled_events is set, then a periodic timer that has expired multiple times without being able to call the callback will still result in only one callback event once processing is possible.

**Obtaining Current Time**

esp_timer also provides a convenience function to obtain the time passed since start-up, with microsecond precision: esp_timer_get_time(). This function returns the number of microseconds since esp_timer was initialized, which usually happens shortly before app_main function is called.

Unlike gettimeofday function, values returned by esp_timer_get_time():

- Start from zero after the chip wakes up from Deep-sleep
- Do not have timezone or DST adjustments applied

**Application Example**

The following example illustrates the usage of esp_timer APIs: system/esp_timer.
API Reference

Header File

• components/esp_timer/include/esp_timer.h
• This header file can be included with:

```c
#include "esp_timer.h"
```
• This header file is a part of the API provided by the esp_timer component. To declare that your component depends on esp_timer, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_timer
or
PRIV_REQUIRES esp_timer
```

Functions

`esp_err_t esp_timer_early_init (void)`
Minimal initialization of esp_timer.

This function can be called very early in startup process, after this call only esp_timer_get_time function can be used.

**Note:** This function is called from startup code. Applications do not need to call this function before using other esp_timer APIs.

**Returns**

- ESP_OK on success

`esp_err_t esp_timer_init (void)`
Initialize esp_timer library.

This function will be called from startup code on every core if CONFIG_ESP_TIMER_ISR_AFFINITY_NO_AFFINITY is enabled. It allocates the timer ISR on MULTIPLE cores and creates the timer task which can be run on any core.

**Note:** This function is called from startup code. Applications do not need to call this function before using other esp_timer APIs. Before calling this function, esp_timer_early_init must be called by the startup code.

**Returns**

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_STATE if already initialized
- other errors from interrupt allocator

`esp_err_t esp_timer_deinit (void)`
De-initialize esp_timer library.

**Note:** Normally this function should not be called from applications

**Returns**
• ESP_OK on success
• ESP_ERR_INVALID_STATE if not yet initialized

`esp_err_t esp_timer_create` (const `esp_timer_create_args_t *create_args`, `esp_timer_handle_t *out_handle`)
Create an esp_timer instance.

**Note:** When done using the timer, delete it with `esp_timer_delete` function.

**Parameters**
- `create_args` – Pointer to a structure with timer creation arguments. Not saved by the library, can be allocated on the stack.
- `out_handle` [out] Output, pointer to `esp_timer_handle_t` variable which will hold the created timer handle.

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if some of the `create_args` are not valid
- ESP_ERR_INVALID_STATE if esp_timer library is not initialized yet
- ESP_ERR_NO_MEM if memory allocation fails

`esp_err_t esp_timer_start_once` (`esp_timer_handle_t timer`, `uint64_t timeout_us`)
Start one-shot timer.

Timer should not be running when this function is called.

**Parameters**
- `timer` – timer handle created using `esp_timer_create`
- `timeout_us` – timer timeout, in microseconds relative to the current moment

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if the timer is already running

`esp_err_t esp_timer_start_periodic` (`esp_timer_handle_t timer`, `uint64_t period`)
Start a periodic timer.

Timer should not be running when this function is called. This function will start the timer which will trigger every `period` microseconds.

**Parameters**
- `timer` – timer handle created using `esp_timer_create`
- `period` – timer period, in microseconds

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if the timer is already running

`esp_err_t esp_timer_restart` (`esp_timer_handle_t timer`, `uint64_t timeout_us`)
Restart a currently running timer.

If the given timer is a one-shot timer, the timer is restarted immediately and will timeout once in `timeout_us` microseconds. If the given timer is a periodic timer, the timer is restarted immediately with a new period of `timeout_us` microseconds.

**Parameters**
- `timer` – timer handle created using `esp_timer_create`
- `timeout_us` – Timeout, in microseconds relative to the current time. In case of a periodic timer, also represents the new period.

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
Chapter 2. API Reference

- ESP_ERR_INVALID_STATE if the timer is not running

```c
void esp_timer_stop(esp_timer_handle_t timer);
```

Stop the timer.

This function stops the timer previously started using `esp_timer_start_once` or `esp_timer_start_periodic`.

**Parameters**
- `timer` - timer handle created using `esp_timer_create`

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if the timer is not running

```c
void esp_timer_delete(esp_timer_handle_t timer);
```

Delete an `esp_timer` instance.

The timer must be stopped before deleting. A one-shot timer which has expired does not need to be stopped.

**Parameters**
- `timer` - timer handle allocated using `esp_timer_create`

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if the timer is running

```c
int64_t esp_timer_get_time(void);
```

Get time in microseconds since boot.

**Returns**
- number of microseconds since underlying timer has been started

```c
int64_t esp_timer_get_next_alarm(void);
```

Get the timestamp when the next timeout is expected to occur.

**Returns**
- Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by `esp_timer_get_time`.

```c
int64_t esp_timer_get_next_alarm_for_wake_up(void);
```

Get the timestamp when the next timeout is expected to occur skipping those which have `skip_unhandled_events` flag.

**Returns**
- Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by `esp_timer_get_time`.

```c
esp_err_t esp_timer_get_period(esp_timer_handle_t timer, uint64_t *period);
```

Get the period of a timer.

This function fetches the timeout period of a timer.

**Note:** The timeout period is the time interval with which a timer restarts after expiry. For one-shot timers, the period is 0 as there is no periodicity associated with such timers.

**Parameters**
- `timer` - timer handle allocated using `esp_timer_create`
- `period` - memory to store the timer period value in microseconds

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the arguments are invalid

```c
esp_err_t esp_timer_get_expiry_time(esp_timer_handle_t timer, uint64_t *expiry);
```

Get the expiry time of a one-shot timer.

This function fetches the expiry time of a one-shot timer.
Note: This API returns a valid expiry time only for a one-shot timer. It returns an error if the timer handle passed to the function is for a periodic timer.

**Parameters**
- **timer** — timer handle allocated using esp_timer_create
- **expiry** — memory to store the timeout value in microseconds

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the arguments are invalid
- ESP_ERR_NOT_SUPPORTED if the timer type is periodic

```c
esp_err_t esp_timer_dump(FILE *stream)
```

Dump the list of timers to a stream.

If CONFIG_ESP_TIMER_PROFILING option is enabled, this prints the list of all the existing timers. Otherwise, only the list active timers is printed.

The format is:

```
name period alarm times_armed times_triggered total_callback_run_time
```

where:

- **name** — timer name (if CONFIG_ESP_TIMER_PROFILING is defined), or timer pointer
- **period** — period of timer, in microseconds, or 0 for one-shot timer
- **alarm-time** — time of the next alarm, in microseconds since boot, or 0 if the timer is not started

The following fields are printed if CONFIG_ESP_TIMER_PROFILING is defined:

- **times_armed** — number of times the timer was armed via esp_timer_start_X
- **times_triggered** — number of times the callback was called
- **total_callback_run_time** — total time taken by callback to execute, across all calls

**Parameters**
- **stream** — stream (such as stdout) to dump the information to

**Returns**
- ESP_OK on success
- ESP_ERR_NO_MEM if cannot allocate temporary buffer for the output

```c
void esp_timer_isr_dispatch_need_yield(void)
```

Requests a context switch from a timer callback function.

This only works for a timer that has an ISR dispatch method. The context switch will be called after all ISR dispatch timers have been processed.

```c
bool esp_timer_is_active(esp_timer_handle_t timer)
```

Returns status of a timer, active or not.

This function is used to identify if the timer is still active or not.

**Parameters**
- **timer** — timer handle created using esp_timer_create

**Returns**
- 1 if timer is still active
- 0 if timer is not active.

```c
esp_err_t esp_timer_new_etm_alarm_event(esp_etm_event_handle_t *out_event)
```

Get the ETM event handle of esp_timer underlying alarm event.

Note: The created ETM event object can be deleted later by calling esp_etm_del_event.
Note: The ETM event is generated by the underlying hardware—systimer, therefore, if the esp_timer is not clocked by systimer, then no ETM event will be generated.

Parameters

- `out_event` - [out] Returned ETM event handle

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Structures

`struct esp_timer_create_args_t`

Timer configuration passed to `esp_timer_create`.

Public Members

- `esp_timer_cb_t callback`
  Function to call when timer expires.

- `void *arg`
  Argument to pass to the callback.

- `esp_timer_dispatch_t dispatch_method`
  Call the callback from task or from ISR.

- `const char *name`
  Timer name, used in `esp_timer_dump` function.

- `bool skip_unhandled_events`
  Skip unhandled events for periodic timers.

Type Definitions

- `typedef struct esp_timer *esp_timer_handle_t`
  Opaque type representing a single esp_timer.

- `typedef void (*esp_timer_cb_t)(void *arg)`
  Timer callback function type.
  *Param arg*  pointer to opaque user-specific data

Enumerations

- `enum esp_timer_dispatch_t`
  Method for dispatching timer callback.
  *Values:*

  - `enum ESP_TIMER_TASK`
    Callback is called from timer task.
enumerator **ESP_TIMER_MAX**

Count of the methods for dispatching timer callback.

### 2.9.19 Internal and Unstable APIs

This section is listing some APIs that are internal or likely to be changed or removed in the next releases of ESP-IDF.

**API Reference**

**Header File**

- components/esp_rom/include/esp_rom_sys.h
- This header file can be included with:

  ```
  #include "esp_rom_sys.h"
  ```

**Functions**

- **void esp_rom_software_reset_system (void)**
  
  Software Reset digital core include RTC.

  It is not recommended to use this function in esp-idf, use esp_restart() instead.

- **void esp_rom_software_reset_cpu (int cpu_no)**
  
  Software Reset cpu core.

  It is not recommended to use this function in esp-idf, use esp_restart() instead.

  **Parameters**

  - **cpu_no**: The CPU to reset, 0 for PRO CPU, 1 for APP CPU.

- **int esp_rom_printf (const char* fmt, ...)**
  
  Print formatted string to console device.

  **Note:** float and long long data are not supported!

  **Parameters**

  - **fmt**: Format string
  - **...**: Additional arguments, depending on the format string

  **Returns**

  - **int**: Total number of characters written on success; A negative number on failure.

- **void esp_rom_delay_us (uint32_t us)**
  
  Pauses execution for us microseconds.

  **Parameters**

  - **us**: Number of microseconds to pause

- **void esp_rom_install_channel_putc (int channel, void (*putc)(char c))**
  
  esp_rom_printf can print message to different channels simultaneously. This function can help install the low level putc function for esp_rom_printf.

  **Parameters**

  - **channel**: Channel number (starting from 1)
  - **putc**: Function pointer to the putc implementation. Set NULL can disconnect esp_rom_printf with putc.

- **void esp_rom_install_uart_printf (void)**
  
  Install UART1 as the default console channel, equivalent to esp_rom_install_channel_putc(1, esp_rom_uart_putc)
Chapter 2. API Reference

soc_reset_reason_t esp_rom_get_reset_reason (int cpu_no)
Get reset reason of CPU.

Parameters cpu_no – CPU number
Returns Reset reason code (see in soc/reset_reasons.h)

void esp_rom_route_intr_matrix (int cpu_core, uint32_t periph_intr_id, uint32_t cpu_intr_num)
Route peripheral interrupt sources to CPU’s interrupt port by matrix.

Usually there’re 4 steps to use an interrupt:
a. Route peripheral interrupt source to CPU. e.g. esp_rom_route_intr_matrix(0, ETS_WIFI_MAC_INTR_SOURCE, ETS_WMAC_INUM)
b. Set interrupt handler for CPU
c. Enable CPU interrupt
d. Enable peripheral interrupt

Parameters
• cpu_core – The CPU number, which the peripheral interrupt will inform to
• periph_intr_id – The peripheral interrupt source number
• cpu_intr_num – The CPU (external) interrupt number. On targets that use CLIC as

their interrupt controller, this number represents the external interrupt number. For example, passing cpu_intr_num = i to this function would in fact bind peripheral source to CPU interrupt CLIC_EXT_INTR_NUM_OFFSET + i.

uint32_t esp_rom_get_cpu_ticks_per_us (void)
Get the real CPU ticks per us.

Returns CPU ticks per us

void esp_rom_set_cpu_ticks_per_us (uint32_t ticks_per_us)
Set the real CPU tick rate.

Note: Call this function when CPU frequency is changed, otherwise the esp_rom_delay_us can be inaccurate.

Parameters ticks_per_us – CPU ticks per us

2.9.20 Interrupt Allocation

Overview

The ESP32-S2 has one core, with 32 interrupts. Each interrupt has a fixed priority, most (but not all) interrupts are connected to the interrupt matrix.

Because there are more interrupt sources than interrupts, sometimes it makes sense to share an interrupt in multiple drivers. The esp_intr_alloc() abstraction exists to hide all these implementation details.

A driver can allocate an interrupt for a certain peripheral by calling esp_intr_alloc() (or esp_intr_alloc_intrstatus()). It can use the flags passed to this function to specify the type, priority, and trigger method of the interrupt to allocate. The interrupt allocation code will then find an applicable interrupt, use the interrupt matrix to hook it up to the peripheral, and install the given interrupt handler and ISR to it.

The interrupt allocator presents two different types of interrupts, namely shared interrupts and non-shared interrupts, both of which require different handling. Non-shared interrupts will allocate a separate interrupt for every esp_intr_alloc() call, and this interrupt is use solely for the peripheral attached to it, with only one ISR that
will get called. Shared interrupts can have multiple peripherals triggering them, with multiple ISRs being called when one of the peripherals attached signals an interrupt. Thus, ISRs that are intended for shared interrupts should check the interrupt status of the peripheral they service in order to check if any action is required.

Non-shared interrupts can be either level- or edge-triggered. Shared interrupts can only be level interrupts due to the chance of missed interrupts when edge interrupts are used.

To illustrate why shared interrupts can only be level-triggered, take the scenario where peripheral A and peripheral B share the same edge-triggered interrupt. Peripheral B triggers an interrupt and sets its interrupt signal high, causing a low-to-high edge, which in turn latches the CPU’s interrupt bit and triggers the ISR. The ISR executes, checks that peripheral A did not trigger an interrupt, and proceeds to handle and clear peripheral B’s interrupt signal. Before the ISR returns, the CPU clears its interrupt bit latch. Thus, during the entire interrupt handling process, if peripheral A triggers an interrupt, it will be missed due the CPU clearing the interrupt bit latch.

**IRAM-Safe Interrupt Handlers**

The `ESP_INTR_FLAG_IRAM` flag registers an interrupt handler that always runs from IRAM (and reads all its data from DRAM), and therefore does not need to be disabled during flash erase and write operations.

This is useful for interrupts which need a guaranteed minimum execution latency, as flash write and erase operations can be slow (erasers can take tens or hundreds of milliseconds to complete).

It can also be useful to keep an interrupt handler in IRAM if it is called very frequently, to avoid flash cache misses.

Refer to the **SPI flash API documentation** for more details.

**Multiple Handlers Sharing A Source**

Several handlers can be assigned to a same source, given that all handlers are allocated using the `ESP_INTR_FLAG_SHARED` flag. They will all be allocated to the interrupt, which the source is attached to, and called sequentially when the source is active. The handlers can be disabled and freed individually. The source is attached to the interrupt (enabled), if one or more handlers are enabled, otherwise detached. A handler will never be called when disabled, while its source may still be triggered if any one of its handler enabled.

Sources attached to non-shared interrupt do not support this feature.

By default, when `ESP_INTR_FLAG_SHARED` flag is specified, the interrupt allocator will allocate only priority level 1 interrupts. Use `ESP_INTR_FLAG_SHARED | ESP_INTR_FLAG_LOWMED` to also allow allocating shared interrupts at priority levels 2 and 3.

Though the framework supports this feature, you have to use it **very carefully**. There usually exist two ways to stop an interrupt from being triggered: **disable the source or mask peripheral interrupt status**. ESP-IDF only handles enabling and disabling of the source itself, leaving status and mask bits to be handled by users.

**Status bits shall either be masked before the handler responsible for it is disabled, or be masked and then properly handled in another enabled interrupt.**

**Note:** Leaving some status bits unhandled without masking them, while disabling the handlers for them, will cause the interrupt(s) to be triggered indefinitely, resulting therefore in a system crash.

**Troubleshooting Interrupt Allocation**

On most Espressif SoCs, CPU interrupts are a limited resource. Therefore it is possible for a program to run out of CPU interrupts, for example by initializing several peripheral drivers. Typically, this will result in the driver initialization function returning `ESP_ERR_NOT_FOUND` error code.

If this happens, you can use `esp_intr_dump()` function to print the list of interrupts along with their status. The output of this function typically looks like this:
CPU interrupt status:

<table>
<thead>
<tr>
<th>Int</th>
<th>Level</th>
<th>Type</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>Level</td>
<td>Reserved</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>Level</td>
<td>Reserved</td>
</tr>
<tr>
<td>2</td>
<td>1</td>
<td>Level</td>
<td>Used: RTC_CORE</td>
</tr>
<tr>
<td>3</td>
<td>1</td>
<td>Level</td>
<td>Used: TG0_LACT_LEVEL</td>
</tr>
</tbody>
</table>

The columns of the output have the following meaning:

- **Int**: CPU interrupt input number. This is typically not used in software directly, and is provided for reference only.
- **Level**: Interrupt priority (1-7) of the CPU interrupt. This priority is fixed in hardware, and cannot be changed.
- **Type**: Interrupt type (Level or Edge) of the CPU interrupt. This type is fixed in hardware, and cannot be changed.
- **Status**: One of the possible statuses of the interrupt:
  - **Reserved**: The interrupt is reserved either at hardware level, or by one of the parts of ESP-IDF. It cannot be allocated using `esp_intr_alloc()`.
  - **Used**: `<source>`: The interrupt is allocated and connected to a single peripheral.
  - **Shared**: `<source1> <source2> ...`: The interrupt is allocated and connected to multiple peripherals. See Multiple Handlers Sharing A Source above.
  - **Free**: The interrupt is not allocated and can be used by `esp_intr_alloc()`.
- **Free (not general-use)**: The interrupt is not allocated, but is either a high-priority interrupt (priority 4-7) or an edge-triggered interrupt. High-priority interrupts can be allocated using `esp_intr_alloc()` but requires the handlers to be written in Assembly, see High Priority Interrupts. Edge-triggered low- and medium-priority interrupts can also be allocated using `esp_intr_alloc()`, but are not used often since most peripheral interrupts are level-triggered.

If you have confirmed that the application is indeed running out of interrupts, a combination of the following suggestions can help resolve the issue:

- Determine the interrupts which can tolerate higher latency, and allocate them using `ESP_INTR_FLAG_SHARED` flag (optionally ORed with `ESP_INTR_FLAG_LOWMED`). Using this flag for two or more peripherals will let them use a single interrupt input, and therefore save interrupt inputs for other peripherals. See Multiple Handlers Sharing A Source above.
- Some peripheral driver may default to allocating interrupts with `ESP_INTR_FLAG_LEVEL1` flag, so priority 2 and 3 interrupts do not get used by default. If `esp_intr_dump()` shows that some priority 2 or 3 interrupts are available, try changing the interrupt allocation flags when initializing the driver to `ESP_INTR_FLAG_LEVEL2` or `ESP_INTR_FLAG_LEVEL3`.
- Check if some of the peripheral drivers do not need to be used all the time, and initialize or deinitialize them on demand. This can reduce the number of simultaneously allocated interrupts.

**API Reference**

**Header File**

- `components/esp_hw_support/include/esp_intr_types.h`
- This header file can be included with:

  ```c
  #include "esp_intr_types.h"
  ```

**Macros**

- `ESP_INTR_CPU_AFFINITY_TO_CORE_ID` (cpu_affinity)
  
  Convert esp_intr_cpu_affinity_t to CPU core ID.
Chapter 2. API Reference

**Type Definitions**

typedef void (*intr_handler_t)(void *arg)
Function prototype for interrupt handler function

typedef struct intr_handle_data_t *intr_handle_t
Handle to an interrupt handler

**Enumerations**

enum esp_intr_cpu_affinity_t
Interrupt CPU core affinity.
This type specify the CPU core that the peripheral interrupt is connected to.

**Values:**

- enumerator ESP_INTR_CPU_AFFINITY_AUTO
  Install the peripheral interrupt to ANY CPU core, decided by on which CPU the interrupt allocator is running.

- enumerator ESP_INTR_CPU_AFFINITY_0
  Install the peripheral interrupt to CPU core 0.

- enumerator ESP_INTR_CPU_AFFINITY_1
  Install the peripheral interrupt to CPU core 1.

**Header File**

- components/esp_hw_support/include/esp_intr_alloc.h
- This header file can be included with:

```c
#include "esp_intr_alloc.h"
```

**Functions**

- `esp_err_t esp_intr_mark_shared(int intno, int cpu, bool is_in_iram)`
Mark an interrupt as a shared interrupt.

This will mark a certain interrupt on the specified CPU as an interrupt that can be used to hook shared interrupt handlers to.

**Parameters**

- `intno` - The number of the interrupt (0-31)
- `cpu` - CPU on which the interrupt should be marked as shared (0 or 1)
- `is_in_iram` - Shared interrupt is for handlers that reside in IRAM and the int can be left enabled while the flash cache is disabled.

**Returns**

ESP_ERR_INVALID_ARG if cpu or intno is invalid ESP_OK otherwise

- `esp_err_t esp_intr_reserve(int intno, int cpu)`
Reserve an interrupt to be used outside of this framework.

This will mark a certain interrupt on the specified CPU as reserved, not to be allocated for any reason.

**Parameters**

- `intno` - The number of the interrupt (0-31)
- `cpu` - CPU on which the interrupt should be marked as shared (0 or 1)

**Returns**

ESP_ERR_INVALID_ARG if cpu or intno is invalid ESP_OK otherwise
**ESP_ERR_T esp_intr_alloc** (int source, int flags, intr_handler_t handler, void *arg, intr_handle_t *ret_handle)

Allocate an interrupt with the given parameters.

This finds an interrupt that matches the restrictions as given in the flags parameter, maps the given interrupt source to it and hooks up the given interrupt handler (with optional argument) as well. If needed, it can return a handle for the interrupt as well.

The interrupt will always be allocated on the core that runs this function.

If ESP_INTR_FLAG_IRAM flag is used, and handler address is not in IRAM or RTC_FAST_MEM, then ESP_ERR_INVALID_ARG is returned.

**Parameters**

- **source** – The interrupt source. One of the ETS_*_INTR_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS_INTERNAL_*_INTR_SOURCE sources as defined in this header.
- **flags** – An ORed mask of the ESP_INTR_FLAG_* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP_INTR_FLAG_SHARED, it will allocate a shared interrupt of level 1. Setting ESP_INTR_FLAG_INTRDISABLED will return from this function with the interrupt disabled.
- **handler** – The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren’t C-callable.
- **arg** – Optional argument for passed to the interrupt handler
- **ret_handle** – Pointer to an intr_handle_t to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

**Returns**

- ESP_ERR_INVALID_ARG if the combination of arguments is invalid.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_OK otherwise

**ESP_ERR_T esp_intr_alloc_intrstatus** (int source, int flags, uint32_t intrstatusreg, uint32_t intrstatusmask, intr_handler_t handler, void *arg, intr_handle_t *ret_handle)

Allocate an interrupt with the given parameters.

This essentially does the same as esp_intr_alloc, but allows specifying a register and mask combo. For shared interrupts, the handler is only called if a read from the specified register, ANDed with the mask, returns non-zero. By passing an interrupt status register address and a fitting mask, this can be used to accelerate interrupt handling in the case a shared interrupt is triggered; by checking the interrupt statuses first, the code can decide which ISRs can be skipped.

**Parameters**

- **source** – The interrupt source. One of the ETS_*_INTR_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS_INTERNAL_*_INTR_SOURCE sources as defined in this header.
- **flags** – An ORed mask of the ESP_INTR_FLAG_* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP_INTR_FLAG_SHARED, it will allocate a shared interrupt of level 1. Setting ESP_INTR_FLAG_INTRDISABLED will return from this function with the interrupt disabled.
- **intrstatusreg** – The address of an interrupt status register
- **intrstatusmask** – A mask. If a read of address intrstatusreg has any of the bits that are 1 in the mask set, the ISR will be called. If not, it will be skipped.
- **handler** – The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren’t C-callable.
- **arg** – Optional argument for passed to the interrupt handler
- **ret_handle** – Pointer to an intr_handle_t to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

**Returns**

- ESP_ERR_INVALID_ARG if the combination of arguments is invalid.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_OK otherwise
**esp_err_t esp_intr_free (intr_handle_t handle)**

Disable and free an interrupt.

Use an interrupt handle to disable the interrupt and release the resources associated with it. If the current core is not the core that registered this interrupt, this routine will be assigned to the core that allocated this interrupt, blocking and waiting until the resource is successfully released.

**Note:** When the handler shares its source with other handlers, the interrupt status bits it’s responsible for should be managed properly before freeing it. See `esp_intr_disable` for more details. Please do not call this function in `esp_ipc_call_blocking`.

**Parameters**
- handle: The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

**Returns**
- ESP_ERR_INVALID_ARG the handle is NULL
- ESP_FAIL failed to release this handle
- ESP_OK otherwise

**int esp_intr_get_cpu (intr_handle_t handle)**

Get CPU number an interrupt is tied to.

**Parameters**
- handle: The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

**Returns**
- The core number where the interrupt is allocated

**int esp_intr_get_intno (intr_handle_t handle)**

Get the allocated interrupt for a certain handle.

**Parameters**
- handle: The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

**Returns**
- The interrupt number

**esp_err_t esp_intr_disable (intr_handle_t handle)**

Disable the interrupt associated with the handle.

**Note:**
- For local interrupts (ESP_INTERNAL_* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.
- When several handlers sharing a same interrupt source, interrupt status bits, which are handled in the handler to be disabled, should be masked before the disabling, or handled in other enabled interrupts properly. Miss of interrupt status handling will cause infinite interrupt calls and finally system crash.

**Parameters**
- handle: The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

**Returns**
- ESP_ERR_INVALID_ARG if the combination of arguments is invalid.
- ESP_OK otherwise

**esp_err_t esp_intr_enable (intr_handle_t handle)**

Enable the interrupt associated with the handle.

**Note:** For local interrupts (ESP_INTERNAL_* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.

**Parameters**
- handle: The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

**Returns**
- ESP_ERR_INVALID_ARG if the combination of arguments is invalid.
- ESP_OK otherwise
esp_err_t esp_intr_set_in_iram (intr_handle_t handle, bool is_in_iram)
Set the “in IRAM” status of the handler.

Note: Does not work on shared interrupts.

Parameters
• handle - The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus
• is_in_iram - Whether the handler associated with this handle resides in IRAM. Handlers residing in IRAM can be called when cache is disabled.

Returns ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise

void esp_intr_noniram_disable (void)
Disable interrupts that aren’t specifically marked as running from IRAM.

void esp_intr_noniram_enable (void)
Re-enable interrupts disabled by esp_intr_noniram_disable.

void esp_intr_enable_source (int inum)
enable the interrupt source based on its number

Parameters inum - interrupt number from 0 to 31

void esp_intr_disable_source (int inum)
disable the interrupt source based on its number

Parameters inum - interrupt number from 0 to 31

static inline int esp_intr_flags_to_level (int flags)
Get the lowest interrupt level from the flags.

Parameters flags - The same flags that pass to esp_intr_alloc_intrstatus API

static inline int esp_intr_level_to_flags (int level)
Get the interrupt flags from the supplied level (priority)

Parameters level - The interrupt priority level

esp_err_t esp_intr_dump (FILE *stream)
Dump the status of allocated interrupts.

Parameters stream - The stream to dump to, if NULL then stdout is used
Returns ESP_OK on success

Macros

ESP_INTR_FLAG_LEVEL1
Interrupt allocation flags.
These flags can be used to specify which interrupt qualities the code calling esp_intr_alloc* needs. Accept a Level 1 interrupt vector (lowest priority)

ESP_INTR_FLAG_LEVEL2
Accept a Level 2 interrupt vector.

ESP_INTR_FLAG_LEVEL3
Accept a Level 3 interrupt vector.
Chapter 2. API Reference

**ESP_INTR_FLAG_LEVEL4**
Accept a Level 4 interrupt vector.

**ESP_INTR_FLAG_LEVEL5**
Accept a Level 5 interrupt vector.

**ESP_INTR_FLAG_LEVEL6**
Accept a Level 6 interrupt vector.

**ESP_INTR_FLAG_NMI**
Accept a Level 7 interrupt vector (highest priority)

**ESP_INTR_FLAG_SHARED**
Interrupt can be shared between ISRs.

**ESP_INTR_FLAG_EDGE**
Edge-triggered interrupt.

**ESP_INTR_FLAG_IRAM**
ISR can be called if cache is disabled.

**ESP_INTR_FLAG_INTRDISABLED**
Return with this interrupt disabled.

**ESP_INTR_FLAG_LOWMED**
Low and medium priority interrupts. These can be handled in C.

**ESP_INTR_FLAG_HIGH**
High level interrupts. Need to be handled in assembly.

**ESP_INTR_FLAG_LEVELMASK**
Mask for all level flags.

**ETS_INTERNAL_TIMER0_INTR_SOURCE**
Platform timer 0 interrupt source.

The esp_intr_alloc* functions can allocate an int for all ETS_*_INTR_SOURCE interrupt sources that are routed through the interrupt mux. Apart from these sources, each core also has some internal sources that do not pass through the interrupt mux. To allocate an interrupt for these sources, pass these pseudo-sources to the functions.

**ETS_INTERNAL_TIMER1_INTR_SOURCE**
Platform timer 1 interrupt source.

**ETS_INTERNAL_TIMER2_INTR_SOURCE**
Platform timer 2 interrupt source.

**ETS_INTERNAL_SW0_INTR_SOURCE**
Software int source 1.
Chapter 2. API Reference

ETS_INTERNAL_SW1_INTR_SOURCE
Software int source 2.

ETS_INTERNAL_PROFILING_INTR_SOURCE
Int source for profiling.

ETS_INTERNAL_UNUSED_INTR_SOURCE
Interrupt is not assigned to any source.

ETS_INTERNAL_INTR_SOURCE_OFF
Provides SystemView with positive IRQ IDs, otherwise scheduler events are not shown properly.

ESP_INTR_ENABLE (inum)
Enable interrupt by interrupt number

ESP_INTR_DISABLE (inum)
Disable interrupt by interrupt number

2.9.21 Logging library

Overview

The logging library provides three ways for setting log verbosity:

- **At compile time**: in menuconfig, set the verbosity level using the option `CONFIG_LOG_DEFAULT_LEVEL`. Optionally, also in menuconfig, set the maximum verbosity level using the option `CONFIG_LOG_MAXIMUM_LEVEL`. By default, this is the same as the default level, but it can be set higher in order to compile more optional logs into the firmware.
- **At runtime**: all logs for verbosity levels lower than `CONFIG_LOG_DEFAULT_LEVEL` are enabled by default. The function `esp_log_level_set()` can be used to set a logging level on a per-module basis. Modules are identified by their tags, which are human-readable ASCII zero-terminated strings.
- **At runtime**: if `CONFIG_LOG_MASTER_LEVEL` is enabled then a Master logging level can be set using `esp_log_set_level_master()`. This option adds an additional logging level check for all compiled logs. Note that this will increase application size. This feature is useful if you want to compile in a lot of logs that are selectable at runtime, but also want to avoid the performance hit from looking up the tags and their log level when you don’t want log output.

There are the following verbosity levels:

- Error (lowest)
- Warning
- Info
- Debug
- Verbose (highest)

---

**Note:** The function `esp_log_level_set()` cannot set logging levels higher than specified by `CONFIG_LOG_MAXIMUM_LEVEL`. To increase log level for a specific file above this maximum at compile time, use the macro `LOG_LOCAL_LEVEL` (see the details below).

---

How to use this library

In each C file that uses logging functionality, define the TAG variable as shown below:
**Chapter 2. API Reference**

```c
static const char* TAG = "MyModule";
```

Then use one of the logging macros to produce output, e.g:

```c
ESP_LOGW(TAG, "Baud rate error %.1f%%. Requested: %d baud, actual: %d baud", error_→ * 100, baud_req, baud_real);
```

Several macros are available for different verbosity levels:

- ESP_LOGE - error (lowest)
- ESP_LOGW - warning
- ESP_LOGI - info
- ESP_LOGD - debug
- ESP_LOGV - verbose (highest)

Additionally, there are ESP_EARLY_LOGx versions for each of these macros, e.g. ESP_EARLY_LOGE. These versions have to be used explicitly in the early startup code only, before heap allocator and syscalls have been initialized. Normal ESP_LOGx macros can also be used while compiling the bootloader, but they will fall back to the same implementation as ESP_EARLY_LOGx macros.

There are also ESP_DRAM_LOGx versions for each of these macros, e.g. ESP_DRAM_LOGE. These versions are used in some places where logging may occur with interrupts disabled or with flash cache inaccessible. Use of this macros should be as sparing as possible, as logging in these types of code should be avoided for performance reasons.

**Note:** Inside critical sections interrupts are disabled so it’s only possible to use ESP_DRAM_LOGx (preferred) or ESP_EARLY_LOGx. Even though it’s possible to log in these situations, it’s better if your program can be structured not to require it.

To override default verbosity level at file or component scope, define the LOG_LOCAL_LEVEL macro.

At file scope, define it before including esp_log.h, e.g:

```c
#define LOG_LOCAL_LEVEL ESP_LOG_VERBOSE
#include "esp_log.h"
```

At component scope, define it in the component CMakeLists:

```cmake
target_compile_definitions(${COMPONENT_LIB} PUBLIC "-DLOG_LOCAL_LEVEL=ESP_LOG__VERBOSE")
```

To configure logging output per module at runtime, add calls to the function `esp_log_level_set()` as follows:

```c
esp_log_level_set("*", ESP_LOG_ERROR);  // set all components to ERROR level
esp_log_level_set("wifi", ESP_LOG_WARN); // enable WARN logs from WiFi stack
esp_log_level_set("dhcpc", ESP_LOG_INFO); // enable INFO logs from DHCP client
```

**Note:** The “DRAM” and “EARLY” log macro variants documented above do not support per module setting of log verbosity. These macros will always log at the “default” verbosity level, which can only be changed at runtime by calling `esp_log_level("*", level)`.

Even when logs are disabled by using a tag name they will still require a processing time of around 10.9 microseconds per entry.

**Master Logging Level** To enable the Master logging level feature, the `CONFIG_LOG_MASTER_LEVEL` option must be enabled. It adds an additional level check for ESP_LOGx macros before calling `esp_log_write()`. This allows to set a higher `CONFIG_LOG_MAXIMUM_LEVEL`, but not inflict a performance hit during normal operation (only when directed). An application may set the master logging level (`esp_log_level_set_level_master()`) globally to enforce a maximum log level. ESP_LOGx macros above this level will be skipped immediately, rather than

Espressif Systems 1642 Release v5.3-dev-277-gc8243465e4
calling `esp_log_write()` and doing a tag lookup. It is recommended to only use this in an top-level application and not in shared components as this would override the global log level for any user using the component. By default, at startup, the Master logging level is `CONFIG_LOG_DEFAULT_LEVEL`.

Note that this feature increases application size because the additional check is added into all ESP_LOGx macros.

The snippet below shows how it works. Setting the Master logging level to `ESP_LOG_NONE` disables all logging globally. `esp_log_level_set()` does not currently affect logging. But after the Master logging level is released, the logs will be printed as set by `esp_log_level_set()`.

```c
// Master logging level is CONFIG_LOG_DEFAULT_LEVEL at start up and = ESP_LOG_INFO
ESP_LOGI("lib_name", "Message for print"); // prints a INFO message
esp_log_level_set("lib_name", ESP_LOG_WARN); // enables WARN logs from lib_

esp_log_set_level_master(ESP_LOG_NONE); // disables all logs globally...

ESP_LOGW("lib_name", "Message for print"); // no print, Master logging...

esp_log_set_level_master(ESP_LOG_INFO); // enables all INFO logs...

ESP_LOGI("lib_name", "Message for print"); // prints a INFO message
```

**Logging to Host via JTAG**  By default, the logging library uses the `vprintf`-like function to write formatted output to the dedicated UART. By calling a simple API, all log output may be routed to JTAG instead, making logging several times faster. For details, please refer to Section *Logging to Host*.

**Thread Safety**  The log string is first written into a memory buffer and then sent to the UART for printing. Log calls are thread-safe, i.e., logs of different threads do not conflict with each other.

**Application Example**

The logging library is commonly used by most ESP-IDF components and examples. For demonstration of log functionality, check ESP-IDF’s examples directory. The most relevant examples that deal with logging are the following:

- system/ota
- storage/sd_card
- protocols/https_request

**API Reference**

**Header File**

- components/log/include/esp_log.h
- This header file can be included with:

```c
#include "esp_log.h"
```

**Functions**
void `esp_log_set_level_master` *(esp_log_level_t level)*

Master log level.

Optional master log level to check against for ESP_LOGx macros before calling esp_log_write. Allows one to set a higher CONFIG_LOG_MAXIMUM_LEVEL but not impose a performance hit during normal operation (only when instructed). An application may set `esp_log_set_level_master(level)` to globally enforce a maximum log level. ESP_LOGx macros above this level will be skipped immediately, rather than calling esp_log_write and doing a cache hit.

The tradeoff is increased application size.

Parameters

- `level` – Master log level

`esp_log_level_t esp_log_get_level_master` *(void)*

Returns master log level.

**Returns**

Master log level

void `esp_log_level_set` *(const char *tag, esp_log_level_t level)*

Set log level for given tag.

If logging for given component has already been enabled, changes previous setting.

**Note:** Note that this function can not raise log level above the level set using CONFIG_LOG_MAXIMUM_LEVEL setting in menuconfig. To raise log level above the default one for a given file, define LOG_LOCAL_LEVEL to one of the ESP_LOG_* values, before including esp_log.h in this file.

Parameters

- `tag` – Tag of the log entries to enable. Must be a non-NULL zero terminated string. Value "*" resets log level for all tags to the given value.
- `level` – Selects log level to enable. Only logs at this and lower verbosity levels will be shown.

`esp_log_level_t esp_log_level_get` *(const char *tag)*

Get log level for a given tag, can be used to avoid expensive log statements.

Parameters

- `tag` – Tag of the log to query current level. Must be a non-NULL zero terminated string.

Returns

The current log level for the given tag

`vprintf_like_t esp_log_set_vprintf` *(vprintf_like_t func)*

Set function used to output log entries.

By default, log output goes to UART0. This function can be used to redirect log output to some other destination, such as file or network. Returns the original log handler, which may be necessary to return output to the previous destination.

**Note:** Please note that function callback here must be re-entrant as it can be invoked in parallel from multiple thread context.

Parameters

- `func` – new Function used for output. Must have same signature as vprintf.

Returns

func old Function used for output.

`uint32_t esp_log_timestamp` *(void)*

Function which returns timestamp to be used in log output.

This function is used in expansion of ESP_LOGx macros. In the 2nd stage bootloader, and at early application startup stage this function uses CPU cycle counter as time source. Later when FreeRTOS scheduler start running, it switches to FreeRTOS tick count.
For now, we ignore millisecond counter overflow.

**Returns** timestamp, in milliseconds

`char *esp_log_system_timestamp (void)`

Function which returns system timestamp to be used in log output.

This function is used in expansion of ESP_LOGx macros to print the system time as “HH:MM:SS.sss”. The system time is initialized to 0 on startup, this can be set to the correct time with an SNTP sync, or manually with standard POSIX time functions.

Currently, this will not get used in logging from binary blobs (i.e. Wi-Fi & Bluetooth libraries), these will still print the RTOS tick time.

**Returns** timestamp, in “HH:MM:SS.sss”

`uint32_t esp_log_early_timestamp (void)`

Function which returns timestamp to be used in log output.

This function uses HW cycle counter and does not depend on OS, so it can be safely used after application crash.

**Returns** timestamp, in milliseconds

`void esp_log_write (esp_log_level_t level, const char*tag,const char*format,...)`

Write message into the log.

This function is not intended to be used directly. Instead, use one of ESP_LOGE, ESP_LOGW, ESP_LOGI, ESP_LOGD, ESP_LOGV macros.

This function or these macros should not be used from an interrupt.

`void esp_log_writev (esp_log_level_t level, const char*tag, const char*format, va_list args)`

Write message into the log, va_list variant.

This function is provided to ease integration toward other logging framework, so that esp_log can be used as a log sink.

**See also:**

esp_log_write()

**Macros**

**ESP_LOG_BUFFER_HEX_LEVEL** (tag, buffer, buff_len, level)

Log a buffer of hex bytes at specified level, separated into 16 bytes each line.

**Parameters**

- `tag` – description tag
- `buffer` – Pointer to the buffer array
- `buff_len` – length of buffer in bytes
- `level` – level of the log

**ESP_LOG_BUFFER_CHAR_LEVEL** (tag, buffer, buff_len, level)

Log a buffer of characters at specified level, separated into 16 bytes each line. Buffer should contain only printable characters.

**Parameters**

- `tag` – description tag
- `buffer` – Pointer to the buffer array
- `buff_len` – length of buffer in bytes
- `level` – level of the log
**ESP_LOG_BUFFER.HEXDUMP** (tag, buffer, buff_len, level)

Dump a buffer to the log at specified level.

The dump log shows just like the one below:

<table>
<thead>
<tr>
<th>W (195) log_example: 0x3ffb4280</th>
<th>45 53 50 32 20 69 73 20 67 72 65 61 74...</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP32 is great,</td>
<td></td>
</tr>
<tr>
<td>W (195) log_example: 0x3ffb4290</td>
<td>77 6f 72 6b 69 6e 67 20 61 6c 6f 6e 67 20...</td>
</tr>
<tr>
<td>working along with the IDF...</td>
<td></td>
</tr>
<tr>
<td>W (205) log_example: 0x3ffb42a0</td>
<td>74 68 20 74 68 65 20 49 44 46 00 77 69...</td>
</tr>
</tbody>
</table>

It is highly recommended to use terminals with over 102 text width.

**Parameters**

- **tag** – description tag
- **buffer** – Pointer to the buffer array
- **buff_len** – length of buffer in bytes
- **level** – level of the log

**ESP_LOG_BUFFER.HEX** (tag, buffer, buff_len)

Log a buffer of hex bytes at Info level.

See also:

- esp_log_buffer_hex_level

**Parameters**

- **tag** – description tag
- **buffer** – Pointer to the buffer array
- **buff_len** – length of buffer in bytes

**ESP_LOG_BUFFER.CHAR** (tag, buffer, buff_len)

Log a buffer of characters at Info level. Buffer should contain only printable characters.

See also:

- esp_log_buffer_char_level

**Parameters**

- **tag** – description tag
- **buffer** – Pointer to the buffer array
- **buff_len** – length of buffer in bytes

**ESP_EARLY_LOGE** (tag, format,...)

Macro to output logs in startup code, before heap allocator and syscalls have been initialized. Log at ESP_LOG_ERROR level.

See also:

- printf,ESP_LOGE,ESP_DRAM_LOGE

In the future, we want to become compatible with clang. Hence, we provide two versions of the following macros which are using variadic arguments. The first one is using the GNU extension `##__VA_ARGS__`. The second one is using the C++20 feature `VA_OPT(,)`. This allows users to compile their code with standard C++20 enabled instead of the GNU extension. Below C++20, we haven’t found any good alternative to using `##__VA_ARGS__`.

**ESP_EARLY_LOGW** (tag, format,...)

Macro to output logs in startup code at ESP_LOG_WARN level.
See also:
ESP_EARLY_LOGE,ESP_LOGE,printf

**ESP_EARLY_LOGI** (tag, format, ...)
macro to output logs in startup code at ESP_LOG_INFO level.

See also:
ESP_EARLY_LOGE,ESP_LOGE,printf

**ESP_EARLY_LOGD** (tag, format, ...)
macro to output logs in startup code at ESP_LOG_DEBUG level.

See also:
ESP_EARLY_LOGE,ESP_LOGE,printf

**ESP_EARLY_LOGV** (tag, format, ...)
macro to output logs in startup code at ESP_LOG_VERBOSE level.

See also:
ESP_EARLY_LOGE,ESP_LOGE,printf

**ESP_LOG_EARLY_ENABLED** (log_level)

**ESP_LOG_EARLY_IMPL** (tag, format, log_level, log_tag_letter, ...)

**ESP_LOGE** (tag, format, ...)

**ESP_LOGW** (tag, format, ...)

**ESP_LOGI** (tag, format, ...)

**ESP_LOGD** (tag, format, ...)

**ESP_LOGV** (tag, format, ...)

**ESP_LOG_LEVEL** (level, tag, format, ...)
runtime macro to output logs at a specified level.

See also:
printf

### Parameters

- **tag** – tag of the log, which can be used to change the log level by `esp_log_level_set` at runtime.
- **level** – level of the output log.
- **format** – format of the output log. See `printf`
- **...** – variables to be replaced into the log. See `printf`

**ESP_LOG_LEVEL_LOCAL** (level, tag, format, ...)
runtime macro to output logs at a specified level. Also check the level with `LOG_LOCAL_LEVEL`. If `CONFIG_LOG_MASTER_LEVEL` set, also check first against `esp_log_get_level_master()`.
See also:
printf, ESP_LOG_LEVEL

ESP_DRAM_LOGE (tag, format, ...)
Macro to output logs when the cache is disabled. Log at ESP_LOG_ERROR level.

Similar to
Usage: ESP_DRAM_LOGE(DRAM_STR("my_tag"), "format", ...), or ESP_DRAM_LOGE(TAG, "format", ...), where TAG is a char* that points to a str in the DRAM.

See also:
ESP_EARLY_LOGE, the log level cannot be changed per-tag, however esp_log_level_set("*", level) will set the default level which controls these log lines also.

See also:
esp_rom_printf, ESP_LOGE

Note: Unlike normal logging macros, it’s possible to use this macro when interrupts are disabled or inside an ISR.

Note: Placing log strings in DRAM reduces available DRAM, so only use when absolutely essential.

ESP_DRAM_LOGW (tag, format, ...)
Macro to output logs when the cache is disabled at ESP_LOG_WARN level.

See also:
ESP_DRAM_LOGW, ESP_LOGW, esp_rom_printf

ESP_DRAM_LOGI (tag, format, ...)
Macro to output logs when the cache is disabled at ESP_LOG_INFO level.

See also:
ESP_DRAM_LOGI, ESP_LOGI, esp_rom_printf

ESP_DRAM_LOGD (tag, format, ...)
Macro to output logs when the cache is disabled at ESP_LOG_DEBUG level.

See also:
ESP_DRAM_LOGD, ESP_LOGD, esp_rom_printf

ESP_DRAM_LOGV (tag, format, ...)
Macro to output logs when the cache is disabled at ESP_LOG_VERBOSE level.

See also:
ESP_DRAM_LOGV, ESP_LOGV, esp_rom_printf
Type Definitions

typedef int (*vprintf_like_t)(const char*, va_list)

Enumerations

defined enum esp_log_level_t

Log level.

Values:

enumerator ESP_LOG_NONE

No log output

enumerator ESP_LOG_ERROR

Critical errors, software module can not recover on its own

enumerator ESP_LOG_WARN

Error conditions from which recovery measures have been taken

enumerator ESP_LOG_INFO

Information messages which describe normal flow of events

enumerator ESP_LOG_DEBUG

Extra information which is not necessary for normal use (values, pointers, sizes, etc).

enumerator ESP_LOG_VERBOSE

Bigger chunks of debugging information, or frequent messages which can potentially flood the output.

2.9.22 Miscellaneous System APIs

Software Reset

To perform software reset of the chip, the esp_restart() function is provided. When the function is called, execution of the program stops, the CPU is reset, the application is loaded by the bootloader and starts execution again.

Additionally, the esp_register_shutdown_handler() function can register a routine that will be automatically called before a restart (that is triggered by esp_restart()) occurs. This is similar to the functionality of atexit POSIX function.

Reset Reason

ESP-IDF applications can be started or restarted due to a variety of reasons. To get the last reset reason, call esp_reset_reason() function. See description of esp_reset_reason_t for the list of possible reset reasons.
Heap Memory

Two heap-memory-related functions are provided:

- `esp_get_free_heap_size()` returns the current size of free heap memory.
- `esp_get_minimum_free_heap_size()` returns the minimum size of free heap memory that has ever been available (i.e., the smallest size of free heap memory in the application’s lifetime).

Note that ESP-IDF supports multiple heaps with different capabilities. The functions mentioned in this section return the size of heap memory that can be allocated using the `malloc` family of functions. For further information about heap memory, see *Heap Memory Allocation*.

MAC Address

These APIs allow querying and customizing MAC addresses for different supported network interfaces (e.g., Wi-Fi, Bluetooth, Ethernet).

To fetch the MAC address for a specific network interface (e.g., Wi-Fi, Bluetooth, Ethernet), call the function `esp_read_mac()`.

In ESP-IDF, the MAC addresses for the various network interfaces are calculated from a single *base MAC address*. By default, the Espressif base MAC address is used. This base MAC address is pre-programmed into the ESP32-S2 eFuse in the factory during production.

<table>
<thead>
<tr>
<th>Interface</th>
<th>MAC Address (2 universally administered, default)</th>
<th>MAC Address (1 universally administered)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wi-Fi Station</td>
<td><code>base_mac</code></td>
<td><code>base_mac</code></td>
</tr>
<tr>
<td>Wi-Fi SoftAP</td>
<td><code>base_mac, +1 to the last octet</code></td>
<td><em>Local MAC</em> (derived from Wi-Fi Station MAC)</td>
</tr>
<tr>
<td>Ethernet</td>
<td><em>Local MAC</em> (derived from Wi-Fi SoftAP MAC)</td>
<td><em>Local MAC</em> (derived from base_mac with +1 to last octet. Not recommended.)</td>
</tr>
</tbody>
</table>

Note: The *configuration* configures the number of universally administered MAC addresses that are provided by Espressif.

Note: Although ESP32-S2 has no integrated Ethernet MAC, it is still possible to calculate an Ethernet MAC address. However, this MAC address can only be used with an external ethernet interface such as an SPI-Ethernet device. See *Ethernet*.

Custom Interface MAC

Sometimes you may need to define custom MAC addresses that are not generated from the base MAC address. To set a custom interface MAC address, use the `esp_iface_mac_addr_set()` function. This function allows you to overwrite the MAC addresses of interfaces set (or not yet set) by the base MAC address. Once a MAC address has been set for a particular interface, it will not be affected when the base MAC address is changed.

Custom Base MAC

The default base MAC is pre-programmed by Espressif in eFuse BLK1. To set a custom base MAC instead, call the function `esp_iface_mac_addr_set()` with the `ESP_MAC_BASE` argument (or `esp_base_mac_addr_set()`) before initializing any network interfaces or calling the `esp_read_mac()` function. The custom MAC address can be stored in any supported storage device (e.g., flash, NVS).

The custom base MAC addresses should be allocated such that derived MAC addresses will not overlap. Based on the table above, users can configure the option `CONFIG_ESP32S2_UNIVERSAL_MAC_ADDRESSES` to set the number of valid universal MAC addresses that can be derived from the custom base MAC.
Note: It is also possible to call the function `esp_netif_set_mac()` to set the specific MAC used by a network interface after network initialization. But it is recommended to use the base MAC approach documented here to avoid the possibility of the original MAC address briefly appearing on the network before being changed.

**Custom MAC Address in eFuse** When reading custom MAC addresses from eFuse, ESP-IDF provides a helper function `esp_efuse_mac_get_custom()`. Users can also use `esp_read_mac()` with the `ESP_MAC_EFUSE_CUSTOM` argument. This loads the MAC address from eFuse BLK3. The `esp_efuse_mac_get_custom()` function assumes that the custom base MAC address is stored in the following format:

<table>
<thead>
<tr>
<th>Field</th>
<th># of bits</th>
<th>Range of bits</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC address</td>
<td>48</td>
<td>200:248</td>
</tr>
</tbody>
</table>

Note: The eFuse BLK3 uses RS-coding during burning, which means that all eFuse fields in this block must be burnt at the same time.

Once custom eFuse MAC address has been obtained (using `esp_efuse_mac_get_custom()` or `esp_read_mac()`), you need to set it as the base MAC address. There are two ways to do it:

1. Use an old API: call `esp_base_mac_addr_set()`.
2. Use a new API: call `esp_iface_mac_addr_set()` with the `ESP_MAC_BASE` argument.

**Local Versus Universal MAC Addresses** ESP32-S2 comes pre-programmed with enough valid Espressif universally administered MAC addresses for all internal interfaces. The table above shows how to calculate and derive the MAC address for a specific interface according to the base MAC address.

When using a custom MAC address scheme, it is possible that not all interfaces can be assigned with a universally administered MAC address. In these cases, a locally administered MAC address is assigned. Note that these addresses are intended for use on a single local network only. See this article for the definition of locally and universally administered MAC addresses.

Function `esp_derive_local_mac()` is called internally to derive a local MAC address from a universal MAC address. The process is as follows:

1. The U/L bit (bit value 0x2) is set in the first octet of the universal MAC address, creating a local MAC address.
2. If this bit is already set in the supplied universal MAC address (i.e., the supplied “universal” MAC address was in fact already a local MAC address), then the first octet of the local MAC address is XORed with 0x4.

**Chip Version**

`esp_chip_info()` function fills `esp_chip_info_t` structure with information about the chip. This includes the chip revision, number of CPU cores, and a bit mask of features enabled in the chip.

**SDK Version**

`esp_get_idf_version()` returns a string describing the ESP-IDF version which is used to compile the application. This is the same value as the one available through `IDF_VER` variable of the build system. The version string generally has the format of `git describe` output.

To get the version at build time, additional version macros are provided. They can be used to enable or disable parts of the program depending on the ESP-IDF version.

- `ESP_IDF_VERSION_MAJOR`, `ESP_IDF_VERSION_MINOR`, `ESP_IDF_VERSION_PATCH` are defined to integers representing major, minor, and patch version.
• \texttt{ESP_IDF_VERSION\_VAL} and \texttt{ESP_IDF\_VERSION} can be used when implementing version checks:

```
#include "esp_idf_version.h"
#if ESP_IDF_VERSION >= ESP_IDF_VERSION\_VAL(4, 0, 0)
  // enable functionality present in ESP-IDF v4.0
#endif
```

### App Version

The application version is stored in \texttt{esp\_app\_desc\_t} structure. It is located in DROM sector and has a fixed offset from the beginning of the binary file. The structure is located after \texttt{esp\_image\_header\_t} and \texttt{esp\_image\_segment\_header\_t} structures. The type of the field version is string and it has a maximum length of 32 chars.

To set the version in your project manually, you need to set the \texttt{PROJECT\_VER} variable in the \texttt{CMakeLists.txt} of your project. In application \texttt{CMakeLists.txt}, put `set\(\text{PROJECT\_VER} \ "0.1.0.1"\)` before including \texttt{project.cmake}.

If the \texttt{CONFIG\_APP\_PROJECT\_VER\_FROM\_CONFIG} option is set, the value of \texttt{CONFIG\_APP\_PROJECT\_VER} will be used. Otherwise, if the \texttt{PROJECT\_VER} variable is not set in the project, it will be retrieved either from the $(\text{PROJECT\_PATH})/version.txt file (if present) or using \texttt{git describe} command. If neither is available, \texttt{PROJECT\_VER} will be set to “1”. Application can make use of this by calling \texttt{esp\_app\_get\_description()} or \texttt{esp\_ota\_get\_partition\_description()} functions.

### API Reference

#### Header File

- \texttt{components/esp\_system/include/esp\_system.h}
- This header file can be included with:

```
#include "esp\_system.h"
```

#### Functions

**\texttt{esp\_err\_t esp\_register\_shutdown\_handler(\text{shutdown\_handler\_t \ handle})}**

Register shutdown handler.

This function allows you to register a handler that gets invoked before the application is restarted using \texttt{esp\_restart} function.

**Parameters** \texttt{handle} – function to execute on restart

**Returns**

- \texttt{ESP\_OK} on success
- \texttt{ESP\_ERR\_INVALID\_STATE} if the handler has already been registered
- \texttt{ESP\_ERR\_NO\_MEM} if no more shutdown handler slots are available

**\texttt{esp\_err\_t esp\_unregister\_shutdown\_handler(\text{shutdown\_handler\_t \ handle})}**

Unregister shutdown handler.

This function allows you to unregister a handler which was previously registered using \texttt{esp\_register\_shutdown\_handler} function.

- \texttt{ESP\_OK} on success
- \texttt{ESP\_ERR\_INVALID\_STATE} if the given handler hasn’t been registered before

**\texttt{void esp\_restart(\text{void})}**

Restart PRO and APP CPUs.
This function can be called both from PRO and APP CPUs. After successful restart, CPU reset reason will be SW_CPU_RESET. Peripherals (except for Wi-Fi, BT, UART0, SPI1, and legacy timers) are not reset. This function does not return.

```c
esp_reset_reason_t esp_reset_reason(void)
```
Get reason of last reset.

---

**Returns** See description of esp_reset_reason_t for explanation of each value.

```c
uint32_t esp_get_free_heap_size(void)
```
Get the size of available heap.

---

**Note:** Note that the returned value may be larger than the maximum contiguous block which can be allocated.

---

**Returns** Available heap size, in bytes.

```c
uint32_t esp_get_free_internal_heap_size(void)
```
Get the size of available internal heap.

---

**Note:** Note that the returned value may be larger than the maximum contiguous block which can be allocated.

---

**Returns** Available internal heap size, in bytes.

```c
uint32_t esp_get_minimum_free_heap_size(void)
```
Get the minimum heap that has ever been available.

---

**Returns** Minimum free heap ever available

```c
void esp_system_abort(const char *details)
```
Trigger a software abort.

---

**Parameters** details – Details that will be displayed during panic handling.

---

### Type Definitions

typedef void (*shutdown_handler_t)(void)

− Shutdown handler type

---

### Enumerations

```c
enum esp_reset_reason_t
```
Reset reasons.

---

**Values:**

- enumerator **ESP_RST_UNKNOWN**
  − Reset reason cannot be determined.

- enumerator **ESP_RST_POWERON**
  − Reset due to power-on event.

- enumerator **ESP_RST_EXT**
  − Reset by external pin (not applicable for ESP32)
enumerator **ESP_RST_SW**
   Software reset via esp_restart.

enumerator **ESP_RST_PANIC**
   Software reset due to exception/panic.

enumerator **ESP_RST_INT_WDT**
   Reset (software or hardware) due to interrupt watchdog.

enumerator **ESP_RST_TASK_WDT**
   Reset due to task watchdog.

enumerator **ESP_RST_WDT**
   Reset due to other watchdogs.

enumerator **ESP_RST_DEEPSLEEP**
   Reset after exiting deep sleep mode.

enumerator **ESP_RST_BROWNOUT**
   Brownout reset (software or hardware)

enumerator **ESP_RST_SDIIO**
   Reset over SDIO.

enumerator **ESP_RST_USB**
   Reset by USB peripheral.

enumerator **ESP_RST_JTAG**
   Reset by JTAG.

### Header File

* components/esp_common/include/esp_idf_version.h
* This header file can be included with:

```c
#include "esp_idf_version.h"
```

### Functions

**const char* esp_get_idf_version (void)**

Return full IDF version string, same as ‘git describe’ output.

**Note:** If you are printing the ESP-IDF version in a log file or other information, this function provides more information than using the numerical version macros. For example, numerical version macros don’t differentiate between development, pre-release and release versions, but the output of this function does.

**Returns** constant string from IDF_VER
Macros

ESP_IDF_VERSION_MAJOR
Major version number (X.x.x)

ESP_IDF_VERSION_MINOR
Minor version number (x.X.x)

ESP_IDF_VERSION_PATCH
Patch version number (x.x.X)

ESP_IDF_VERSION_VAL (major, minor, patch)
Macro to convert IDF version number into an integer
To be used in comparisons, such as ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)

ESP_IDF_VERSION
Current IDF version, as an integer
To be used in comparisons, such as ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)

Header File

- components/esp_hw_support/include/esp_mac.h
- This header file can be included with:
  ```
  #include "esp_mac.h"
  ```

Functions

`esp_err_t esp_base_mac_addr_set (const uint8_t *mac)`
Set base MAC address with the MAC address which is stored in BLK3 of EFUSE or external storage e.g. flash
and EEPROM.
Base MAC address is used to generate the MAC addresses used by network interfaces.
If using a custom base MAC address, call this API before initializing any network interfaces. Refer to the
ESP-IDF Programming Guide for details about how the Base MAC is used.

| Note: | Base MAC must be a unicast MAC (least significant bit of first byte must be zero). |

| Note: | If not using a valid OUI, set the “locally administered” bit (bit value 0x02 in the first byte) to avoid collisions. |

| Parameters mac | base MAC address, length: 6 bytes. length: 6 bytes for MAC-48 |
| Returns | ESP_OK on success ESP_ERR_INVALID_ARG If mac is NULL or is not a unicast MAC |

`esp_err_t esp_base_mac_addr_get (uint8_t *mac)`
Return base MAC address which is set using esp_base_mac_addr_set.

| Note: | If no custom Base MAC has been set, this returns the pre-programmed Espressif base MAC address. |

| Parameters mac | base MAC address, length: 6 bytes. length: 6 bytes for MAC-48 |
Chapter 2. API Reference

Returns ESP_OK on success ESP_ERR_INVALID_ARG mac is NULL ESP_ERR_INVALID_MAC base MAC address has not been set

**esp_err_t esp_efuse_mac_get_custom**(uint8_t *mac)

Return base MAC address which was previously written to BLK3 of EFUSE.
Base MAC address is used to generate the MAC addresses used by the networking interfaces. This API returns the custom base MAC address which was previously written to EFUSE BLK3 in a specified format.
Writing this EFUSE allows setting of a different (non-Esspressif) base MAC address. It is also possible to store a custom base MAC address elsewhere, see esp_base_mac_addr_set() for details.

**Note:** This function is currently only supported on ESP32.

### Parameters
- **mac** - base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64 (used for IEEE 802.15.4, if CONFIG_SOC_IEEE802154_SUPPORTED=y)

### Returns
- ESP_OK on success ESP_ERR_INVALID_ARG mac is NULL ESP_ERR_INVALID_MAC CUSTOM_MAC address has not been set, all zeros (for esp32-xx) ESP_ERR_INVALID_VERSION An invalid MAC version field was read from BLK3 of EFUSE (for esp32) ESP_ERR_INVALID_CRC An invalid MAC CRC was read from BLK3 of EFUSE (for esp32)

**esp_err_t esp_efuse_mac_get_default**(uint8_t *mac)

Return base MAC address which is factory-programmed by Espressif in EFUSE.

### Parameters
- **mac** - base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64 (used for IEEE 802.15.4, if CONFIG_SOC_IEEE802154_SUPPORTED=y)

### Returns
- ESP_OK on success ESP_ERR_INVALID_ARG mac is NULL

**esp_err_t esp_read_mac**(uint8_t *mac, esp_mac_type_t type)

Read base MAC address and set MAC address of the interface.
This function first get base MAC address using esp_base_mac_addr_get(). Then calculates the MAC address of the specific interface requested, refer to ESP-IDF Programming Guide for the algorithm.
The MAC address set by the esp_iface_mac_addr_set() function will not depend on the base MAC address.

### Parameters
- **mac** - base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64 (used for IEEE 802.15.4, if CONFIG_SOC_IEEE802154_SUPPORTED=y)
- **type** - Type of MAC address to return

### Returns
- ESP_OK on success

**esp_err_t esp_derive_local_mac**(uint8_t *local_mac, const uint8_t *universal_mac)

Derive local MAC address from universal MAC address.
This function copies a universal MAC address and then sets the “locally administered” bit (bit 0x2) in the first octet, creating a locally administered MAC address.
If the universal MAC address argument is already a locally administered MAC address, then the first octet is XORed with 0x4 in order to create a different locally administered MAC address.

### Parameters
- **local_mac** - base MAC address, length: 6 bytes. length: 6 bytes for MAC-48
- **universal_mac** - Source universal MAC address, length: 6 bytes.

### Returns
- ESP_OK on success
**esp_err_t esp_iface_mac_addr_set** (const uint8_t *mac, esp_mac_type_t type)

Set custom MAC address of the interface. This function allows you to overwrite the MAC addresses of the interfaces set by the base MAC address.

**Parameters**
- **mac** – MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64 (used for ESP_MAC_IEEE802154 type, if CONFIG_SOC_IEEE802154_SUPPORTED=y)
- **type** – Type of MAC address

**Returns** 
ESP_OK on success

**size_t esp_mac_addr_len_get** (esp_mac_type_t type)

Return the size of the MAC type in bytes.

If CONFIG_SOC_IEEE802154_SUPPORTED is set then for these types:
- ESP_MAC_IEEE802154 is 8 bytes.
- ESP_MAC_BASE, ESP_MAC_EFUSE_FACTORY and ESP_MAC_EFUSE_CUSTOM the MAC size is 6 bytes.
- ESP_MAC_EFUSE_EXT is 2 bytes. If CONFIG_SOC_IEEE802154_SUPPORTED is not set then for all types it returns 6 bytes.

**Parameters**
- **type** – Type of MAC address

**Returns** 
0 MAC type not found (not supported) 6 bytes for MAC-48. 8 bytes for EUI-64.

**Macros**

MAC2STR (a)

MACSTR

**Enumerations**

enum esp_mac_type_t

**Values:**

- enumerator ESP_MAC_WIFI_STA
  
  MAC for WiFi Station (6 bytes)

- enumerator ESP_MAC_WIFI_SOFTAP
  
  MAC for WiFi Soft-AP (6 bytes)

- enumerator ESP_MAC_BT
  
  MAC for Bluetooth (6 bytes)

- enumerator ESP_MAC_ETH
  
  MAC for Ethernet (6 bytes)

- enumerator ESP_MAC_IEEE802154
  
  if CONFIG_SOC_IEEE802154_SUPPORTED=y, MAC for IEEE802154 (8 bytes)

- enumerator ESP_MAC_BASE
  
  Base MAC for that used for other MAC types (6 bytes)
enumerator **ESP_MAC_EFUSE_FACTORY**

MAC_FACTORY eFuse which was burned by Espressif in production (6 bytes)

enumerator **ESP_MAC_EFUSE_CUSTOM**

MAC_CUSTOM eFuse which was can be burned by customer (6 bytes)

enumerator **ESP_MAC_EFUSE_EXT**

if CONFIG_SOC_IEEE802154_SUPPORTED=y, MAC_EXT eFuse which is used as an extender for IEEE802154 MAC (2 bytes)

### Header File

- components/esp_hw_support/include/esp_chip_info.h

This header file can be included with:

```
#include "esp_chip_info.h"
```

### Functions

```c
void esp_chip_info (esp_chip_info_t *out_info)
```

Fill an `esp_chip_info_t` structure with information about the chip.

**Parameters**

- `out_info` - [out] structure to be filled

### Structures

```c
struct esp_chip_info_t
```

The structure represents information about the chip.

#### Public Members

- `esp_chip_model_t` **model**
  
  chip model, one of esp_chip_model_t

- `uint32_t` **features**
  
  bit mask of CHIP_FEATURE_x feature flags

- `uint16_t` **revision**
  
  chip revision number (in format MXX; where M - wafer major version, XX - wafer minor version)

- `uint8_t` **cores**
  
  number of CPU cores

### Macros

- **CHIP_FEATURE_EMB_FLASH**
  
  Chip has embedded flash memory.

- **CHIP_FEATURE_WIFI_BGN**
  
  Chip has 2.4GHz WiFi.
CHIP_FEATURE_BLE
   Chip has Bluetooth LE.

CHIP_FEATURE_BT
   Chip has Bluetooth Classic.

CHIP_FEATURE_IEEE802154
   Chip has IEEE 802.15.4.

CHIP_FEATURE_EMB_PSRAM
   Chip has embedded psram.

Enumerations

enum esp_chip_model_t
   Chip models.
   Values:

   enumerator CHIP_ESP32
      ESP32.

   enumerator CHIP_ESP32S2
      ESP32-S2.

   enumerator CHIP_ESP32S3
      ESP32-S3.

   enumerator CHIP_ESP32C3
      ESP32-C3.

   enumerator CHIP_ESP32C2
      ESP32-C2.

   enumerator CHIP_ESP32C6
      ESP32-C6.

   enumerator CHIP_ESP32H2
      ESP32-H2.

   enumerator CHIP_ESP32P4
      ESP32-P4.

   enumerator CHIP_POSIX_LINUX
      The code is running on POSIX/Linux simulator.

Header File

- components/esp_hw_support/include/esp_cpu.h
- This header file can be included with:
#include "esp_cpu.h"

## Functions

### void esp_cpu_stall (int core_id)
Stall a CPU core.

**Parameters**
- `core_id` - The core’s ID

### void esp_cpu_unstall (int core_id)
Resume a previously stalled CPU core.

**Parameters**
- `core_id` - The core’s ID

### void esp_cpu_reset (int core_id)
Reset a CPU core.

**Parameters**
- `core_id` - The core’s ID

### void esp_cpu_wait_for_intr (void)
Wait for Interrupt.

This function causes the current CPU core to execute its Wait For Interrupt (WFI or equivalent) instruction. After executing this function, the CPU core will stop execution until an interrupt occurs.

### int esp_cpu_get_core_id (void)
Get the current core’s ID.

This function will return the ID of the current CPU (i.e., the CPU that calls this function).

**Returns**
- The current core’s ID [0..SOC_CPU_CORES_NUM - 1]

### void* esp_cpu_get_sp (void)
Read the current stack pointer address.

**Returns**
- Stack pointer address

### esp_cpu_cycle_count_t esp_cpu_get_cycle_count (void)
Get the current CPU core’s cycle count.

Each CPU core maintains an internal counter (i.e., cycle count) that increments every CPU clock cycle.

**Returns**
- Current CPU’s cycle count, 0 if not supported.

### void esp_cpu_set_cycle_count (esp_cpu_cycle_count_t cycle_count)
Set the current CPU core’s cycle count.

Set the given value into the internal counter that increments every CPU clock cycle.

**Parameters**
- `cycle_count` - CPU cycle count

### void* esp_cpu_pc_to_addr (uint32_t pc)
Convert a program counter (PC) value to address.

If the architecture does not store the true virtual address in the CPU’s PC or return addresses, this function will convert the PC value to a virtual address. Otherwise, the PC is just returned.

**Parameters**
- `pc` - PC value

**Returns**
- Virtual address

### void esp_cpu_intr_get_desc (int core_id, int intr_num, esp_cpu_intr_desc_t *intr_desc_ret)
Get a CPU interrupt’s descriptor.

Each CPU interrupt has a descriptor describing the interrupt’s capabilities and restrictions. This function gets the descriptor of a particular interrupt on a particular CPU.

**Parameters**
• core_id – [in] The core’s ID  
• intr_num – [in] Interrupt number  
• intr_desc_ret – [out] The interrupt’s descriptor

void esp_cpu_intr_set_ivt_addr (const void *ivt_addr)
Set the base address of the current CPU’s Interrupt Vector Table (IVT)

Parameters ivt_addr – Interrupt Vector Table’s base address

bool esp_cpu_intr_has_handler (int intr_num)
Check if a particular interrupt already has a handler function.
Check if a particular interrupt on the current CPU already has a handler function assigned.

Note: This function simply checks if the IVT of the current CPU already has a handler assigned.

Parameters intr_num – Interrupt number (from 0 to 31)
Returns True if the interrupt has a handler function, false otherwise.

void esp_cpu_intr_set_handler (int intr_num, esp_cpu_intr_handler_t handler, void *handler_arg)
Set the handler function of a particular interrupt.
Assign a handler function (i.e., ISR) to a particular interrupt on the current CPU.

Note: This function simply sets the handler function (in the IVT) and does not actually enable the interrupt.

Parameters
• intr_num – Interrupt number (from 0 to 31)  
• handler – Handler function  
• handler_arg – Argument passed to the handler function

void *esp_cpu_intr_get_handler_arg (int intr_num)
Get a handler function’s argument of.
Get the argument of a previously assigned handler function on the current CPU.

Parameters intr_num – Interrupt number (from 0 to 31)
Returns The argument passed to the handler function

void esp_cpu_intr_enable (uint32_t intr_mask)
Enable particular interrupts on the current CPU.

Parameters intr_mask – Bit mask of the interrupts to enable

void esp_cpu_intr_disable (uint32_t intr_mask)
Disable particular interrupts on the current CPU.

Parameters intr_mask – Bit mask of the interrupts to disable

uint32_t esp_cpu_intr_get_enabled_mask (void)
Get the enabled interrupts on the current CPU.

Returns Bit mask of the enabled interrupts

void esp_cpu_intr_edge_ack (int intr_num)
Acknowledge an edge interrupt.

Parameters intr_num – Interrupt number (from 0 to 31)
void esp_cpu_configure_region_protection (void)
Configure the CPU to disable access to invalid memory regions.

esp_err_t esp_cpu_set_breakpoint (int bp_num, const void *bp_addr)
Set and enable a hardware breakpoint on the current CPU.

Note: This function is meant to be called by the panic handler to set a breakpoint for an attached debugger during a panic.

Note: Overwrites previously set breakpoint with same breakpoint number.

Parameters
- **bp_num** – Hardware breakpoint number [0..SOC_CPU_BREAKPOINTS_NUM - 1]
- **bp_addr** – Address to set a breakpoint on

Returns ESP_OK if breakpoint is set. Failure otherwise

esp_err_t esp_cpu_clear_breakpoint (int bp_num)
Clear a hardware breakpoint on the current CPU.

Note: Clears a breakpoint regardless of whether it was previously set

Parameters **bp_num** – Hardware breakpoint number [0..SOC_CPU_BREAKPOINTS_NUM - 1]

Returns ESP_OK if breakpoint is cleared. Failure otherwise

esp_err_t esp_cpu_set_watchpoint (int wp_num, const void *wp_addr, size_t size, esp_cpu_watchpoint_trigger_t trigger)
Set and enable a hardware watchpoint on the current CPU.
Set and enable a hardware watchpoint on the current CPU, specifying the memory range and trigger operation. Watchpoints will break/panic the CPU when the CPU accesses (according to the trigger type) on a certain memory range.

Note: Overwrites previously set watchpoint with same watchpoint number.

Parameters
- **wp_num** – Hardware watchpoint number [0..SOC_CPU_WATCHPOINTS_NUM - 1]
- **wp_addr** – Watchpoint’s base address
- **size** – Size of the region to watch. Must be one of 2^n, with n in [0..6].
- **trigger** – Trigger type

Returns ESP_ERR_INVALID_ARG on invalid arg, ESP_OK otherwise

esp_err_t esp_cpu_clear_watchpoint (int wp_num)
Clear a hardware watchpoint on the current CPU.

Note: Clears a watchpoint regardless of whether it was previously set

Parameters **wp_num** – Hardware watchpoint number [0..SOC_CPU_WATCHPOINTS_NUM - 1]

Returns ESP_OK if watchpoint was cleared. Failure otherwise.
bool esp_cpu_dbgr_is_attached (void)
Check if the current CPU has a debugger attached.

Returns True if debugger is attached, false otherwise

void esp_cpu_dbgr_break (void)
Trigger a call to the current CPU’s attached debugger.

intptr_t esp_cpu_get_call_addr (intptr_t return_address)
Given the return address, calculate the address of the preceding call instruction. This is typically used to answer the question "where was the function called from?".

Parameters return_address – The value of the return address register. Typically set to the value of __builtin_return_address(0).

Returns Address of the call instruction preceding the return address.

bool esp_cpu_compare_and_set (volatile uint32_t *addr, uint32_t compare_value, uint32_t new_value)
Atomic compare-and-set operation.

Parameters
• addr – Address of atomic variable
• compare_value – Value to compare the atomic variable to
• new_value – New value to set the atomic variable to

Returns Whether the atomic variable was set or not

Structures

struct esp_cpu_intr_desc_t
CPU interrupt descriptor.

Each particular CPU interrupt has an associated descriptor describing that particular interrupt’s characteristics. Call esp_cpu_intr_get_desc() to get the descriptors of a particular interrupt.

Public Members

int priority
Priority of the interrupt if it has a fixed priority, (-1) if the priority is configurable.

esp_cpu_intr_type_t type
Whether the interrupt is an edge or level type interrupt, ESP_CPU_INTR_TYPE_NA if the type is configurable.

uint32_t flags
Flags indicating extra details.

Macros

ESP_CPU_INTR_DESC_FLAG_SPECIAL
Interrupt descriptor flags of esp_cpu_intr_desc_t.

The interrupt is a special interrupt (e.g., a CPU timer interrupt)

ESP_CPU_INTR_DESC_FLAG_RESVD
The interrupt is reserved for internal use
Type Definitions

typedef uint32_t esp_cpu_cycle_count_t  
    CPU cycle count type.
    This data type represents the CPU’s clock cycle count

typedef void (*esp_cpu_intr_handler_t)(void *arg)  
    CPU interrupt handler type.

Enumerations

enum esp_cpu_intr_type_t
    CPU interrupt type.
    Values:

    enumerator ESP_CPU_INTR_TYPE_LEVEL
    enumerator ESP_CPU_INTR_TYPE_EDGE
    enumerator ESP_CPU_INTR_TYPE_NA

enum esp_cpu_watchpoint_trigger_t
    CPU watchpoint trigger type.
    Values:

    enumerator ESP_CPU_WATCHPOINT_LOAD
    enumerator ESP_CPU_WATCHPOINT_STORE
    enumerator ESP_CPU_WATCHPOINT_ACCESS

Header File

• components/esp_app_format/include/esp_app_desc.h
• This header file can be included with:

```c
#include "esp_app_desc.h"
```

• This header file is a part of the API provided by the esp_app_format component. To declare that your component depends on esp_app_format, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_app_format
```

or

```cmake
PRIV_REQUIRES esp_app_format
```

Functions

cnst esp_app_desc_t *esp_app_get_description (void)

    Return esp_app_desc structure. This structure includes app version.
    Return description for running app.

    Returns  Pointer to esp_app_desc structure.
int esp_app_get_elf_sha256 (char *dst, size_t size)
    Fill the provided buffer with SHA256 of the ELF file, formatted as hexadecimal, null-terminated. If the buffer size is not sufficient to fit the entire SHA256 in hex plus a null terminator, the largest possible number of bytes will be written followed by a null.

    Parameters
    • dst – Destination buffer
    • size – Size of the buffer

    Returns Number of bytes written to dst (including null terminator)

char *esp_app_get_elf_sha256_str (void)
    Return SHA256 of the ELF file which is already formatted as hexadecimal, null-terminated included. Can be used in panic handler or core dump during when cache is disabled. The length is defined by CONFIG_APP RETRIEVE_LEN_ELF_SHA option.

    Returns Hexadecimal SHA256 string

Structures

struct esp_app_desc_t
    Description about application.

Public Members

uint32_t magic_word
    Magic word ESP_APP_DESC_MAGIC_WORD

uint32_t secure_version
    Secure version

uint32_t reserved[2]
    reserved

char version[32]
    Application version

char project_name[32]
    Project name

char time[16]
    Compile time

char date[16]
    Compile date

char idf_ver[32]
    Version IDF

uint8_t app_elf_sha256[32]
    sha256 of elf file

uint32_t reserved[20]
    reserved
Chapter 2. API Reference

Macros

ESP_APP_DESC_MAGIC_WORD
The magic word for the esp_app_desc structure that is in DROM.

2.9.23 Over The Air Updates (OTA)

OTA Process Overview

The OTA update mechanism allows a device to update itself based on data received while the normal firmware is running (for example, over Wi-Fi or Bluetooth.)

OTA requires configuring the Partition Tables of the device with at least two OTA app slot partitions (i.e., ota_0 and ota_1) and an OTA Data Partition.

The OTA operation functions write a new app firmware image to whichever OTA app slot that is currently not selected for booting. Once the image is verified, the OTA Data partition is updated to specify that this image should be used for the next boot.

OTA Data Partition

An OTA data partition (type data, subtype ota) must be included in the Partition Tables of any project which uses the OTA functions.

For factory boot settings, the OTA data partition should contain no data (all bytes erased to 0xFF). In this case, the ESP-IDF software bootloader will boot the factory app if it is present in the partition table. If no factory app is included in the partition table, the first available OTA slot (usually ota_0) is booted.

After the first OTA update, the OTA data partition is updated to specify which OTA app slot partition should be booted next.

The OTA data partition is two flash sectors (0x2000 bytes) in size, to prevent problems if there is a power failure while it is being written. Sectors are independently erased and written with matching data, and if they disagree a counter field is used to determine which sector was written more recently.

App Rollback

The main purpose of the application rollback is to keep the device working after the update. This feature allows you to roll back to the previous working application in case a new application has critical errors. When the rollback process is enabled and an OTA update provides a new version of the app, one of three things can happen:

- The application works fine, esp_ota_mark_app_valid_cancel_rollback() marks the running application with the state ESP_OTA_IMG_VALID. There are no restrictions on booting this application.
- The application has critical errors and further work is not possible, a rollback to the previous application is required, esp_ota_mark_app_invalid_rollback_and_reboot() marks the running application with the state ESP_OTA_IMG_INVALID and reset. This application will not be selected by the bootloader for boot and will boot the previously working application.
- If the CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE option is set, and a reset occurs without calling either function then the application is rolled back.

Note: The state is not written to the binary image of the application but rather to the otadata partition. The partition contains a ota_seq counter, which is a pointer to the slot (ota_0, ota_1, ...) from which the application will be selected for boot.
Chapter 2. API Reference

**App OTA State**  States control the process of selecting a boot app:

<table>
<thead>
<tr>
<th>States</th>
<th>Restriction of selecting a boot app in bootloader</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP_OTA_IMG_VALID</td>
<td>No restriction. Will be selected.</td>
</tr>
<tr>
<td>ESP_OTA_IMG_UNDEFINED</td>
<td>No restriction. Will be selected.</td>
</tr>
<tr>
<td>ESP_OTA_IMG_INVALID</td>
<td>Will not be selected.</td>
</tr>
<tr>
<td>ESP_OTA_IMG_ABORTED</td>
<td>Will not be selected.</td>
</tr>
<tr>
<td><strong>ESP_OTA_IMG_NEW</strong></td>
<td>If <code>CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE</code> option is set it will be selected only once. In bootloader the state immediately changes to ESP_OTA_IMG_PENDING_VERIFY.</td>
</tr>
<tr>
<td><strong>ESP_OTA_IMG_PENDING_VERIFY</strong></td>
<td>If <code>CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE</code> option is set it will not be selected, and the state will change to ESP_OTA_IMG_ABORTED.</td>
</tr>
</tbody>
</table>

If `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is not enabled (by default), then the use of the following functions `esp_ota_mark_app_valid_cancel_rollback()` and `esp_ota_mark_app_invalid_rollback_and_reboot()` are optional, and ESP_OTA_IMG_NEW and ESP_OTA_IMG_PENDING_VERIFY states are not used.

An option in Kconfig `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` allows you to track the first boot of a new application. In this case, the application must confirm its operability by calling `esp_ota_mark_app_valid_cancel_rollback()` function, otherwise the application will be rolled back upon reboot. It allows you to control the operability of the application during the boot phase. Thus, a new application has only one attempt to boot successfully.

**Rollback Process**  The description of the rollback process when `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled:

- The new application is successfully downloaded and `esp_ota_set_boot_partition()` function makes this partition bootable and sets the state ESP_OTA_IMG_NEW. This state means that the application is new and should be monitored for its first boot.
- Reboot `esp_restart()`.
- The bootloader checks for the ESP_OTA_IMG_PENDING_VERIFY state if it is set, then it will be written to ESP_OTA_IMG_ABORTED.
- The bootloader selects a new application to boot so that the state is not set as ESP_OTA_IMG_INVALID or ESP_OTA_IMG_ABORTED.
- The bootloader checks the selected application for ESP_OTA_IMG_NEW state if it is set, then it will be written to ESP_OTA_IMG_PENDING_VERIFY. This state means that the application requires confirmation of its operability, if this does not happen and a reboot occurs, this state will be overwritten to ESP_OTA_IMG_ABORTED (see above) and this application will no longer be able to start, i.e., there will be a rollback to the previous working application.
- A new application has started and should make a self-test.
- If the self-test has completed successfully, then you must call the function `esp_ota_mark_app_valid_cancel_rollback()` because the application is awaiting confirmation of operability (ESP_OTA_IMG_PENDING_VERIFY state).
- If the self-test fails, then call `esp_ota_mark_app_invalid_rollback_and_reboot()` function to roll back to the previous working application, while the invalid application is set ESP_OTA_IMG_INVALID state.
- If the application has not been confirmed, the state remains ESP_OTA_IMG_PENDING_VERIFY, and the next boot it will be changed to ESP_OTA_IMG_ABORTED, which prevents re-boot of this application. There will be a rollback to the previous working application.

**Unexpected Reset**  If a power loss or an unexpected crash occurs at the time of the first boot of a new application, it will roll back the application.

Recommendation: Perform the self-test procedure as quickly as possible, to prevent rollback due to power loss.

Only OTA partitions can be rolled back. Factory partition is not rolled back.
### Booting Invalid/aborted Apps

Booting an application which was previously set to `ESP_OTA_IMG_INVALID` or `ESP_OTA_IMG_ABORTED` is possible:

- Get the last invalid application partition `esp_ota_get_last_invalid_partition()`.
- Pass the received partition to `esp_ota_set_boot_partition()`, this will update the otadata.
- Restart `esp_restart()`. The bootloader will boot the specified application.

To determine if self-tests should be run during startup of an application, call the `esp_ota_get_state_partition()` function. If result is `ESP_OTA_IMG_PENDING_VERIFY` then self-testing and subsequent confirmation of operability is required.

### Where the States Are Set

A brief description of where the states are set:

- `ESP_OTA_IMG_VALID` state is set by `esp_ota_mark_app_valid_cancel_rollback()` function.
- `ESP_OTA_IMG_UNDEFINED` state is set by `esp_ota_set_boot_partition()` function if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is not enabled.
- `ESP_OTA_IMG_NEW` state is set by `esp_ota_set_boot_partition()` function if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled.
- `ESP_OTA_IMG_INVALID` state is set by `esp_ota_mark_app_invalid_rollback_and_reboot()` function.
- `ESP_OTA_IMG_ABORTED` state is set if there was no confirmation of the application operability and occurs reboots (if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled).
- `ESP_OTA_IMG_PENDING_VERIFY` state is set in a bootloader if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled and selected app has `ESP_OTA_IMG_NEW` state.

### Anti-rollback

Anti-rollback prevents rollback to application with security version lower than one programmed in eFuse of chip.

This function works if set `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK` option. In the bootloader, when selecting a bootable application, an additional security version check is added which is on the chip and in the application image. The version in the bootable firmware must be greater than or equal to the version in the chip.

`CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK` and `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` options are used together. In this case, rollback is possible only on the security version which is equal or higher than the version in the chip.

### A Typical Anti-rollback Scheme Is

- New firmware released with the elimination of vulnerabilities with the previous version of security.
- After the developer makes sure that this firmware is working. He can increase the security version and release a new firmware.
- Download new application.
- To make it bootable, run the function `esp_ota_set_boot_partition()`. If the security version of the new application is smaller than the version in the chip, the new application will be erased. Update to new firmware is not possible.
- Reboot.
- In the bootloader, an application with a security version greater than or equal to the version in the chip will be selected. If otadata is in the initial state, and one firmware was loaded via a serial channel, whose secure version is higher than the chip, then the secure version of efuse will be immediately updated in the bootloader.
- New application booted. Then the application should perform diagnostics of the operation and if it is completed successfully, you should call `esp_ota_mark_app_valid_cancel_rollback()` function to mark the running application with the `ESP_OTA_IMG_VALID` state and update the secure version on chip. Note that if was called `esp_ota_mark_app_invalid_rollback_and_reboot()` function a rollback may not happen as the device may not have any bootable apps. It will then return `ESP_ERR_OTA_ROLLBACK_FAILED` error and stay in the `ESP_OTA_IMG_PENDING_VERIFY` state.
- The next update of app is possible if a running app is in the `ESP_OTA_IMG_VALID` state.
Recommendation:

If you want to avoid the download/erase overhead in case of the app from the server has security version lower than the running app, you have to get new_app_info.secure_version from the first package of an image and compare it with the secure version of efuse. Use esp_efuse_check_secure_version(new_app_info.secure_version) function if it is true then continue downloading otherwise abort.

```c
....
bool image_header_was_checked = false;
while (1) {
    int data_read = esp_http_client_read(client, ota_write_data, BUFFSIZE);
    ...
    if (data_read > 0) {
        if (image_header_was_checked == false) {
            esp_app_desc_t new_app_info;
            if (data_read > sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t) + sizeof(esp_app_desc_t)) {
                // check current version with downloading
                if (esp_efuse_check_secure_version(new_app_info.secure_version) == false) {
                    ESP_LOGE(TAG, "This a new app can not be downloaded due to a secure version is lower than stored in efuse.");
                    http_cleanup(client);
                    task_fatal_error();
                }
                image_header_was_checked = true;
                esp_ota_begin(update_partition, OTA_SIZE_UNKNOWN, &update_handle);
            }
        }
        esp_ota_write(update_handle, (const void *)ota_write_data, data_read);
    }
}
...
```

Restrictions:

- The number of bits in the secure_version field is limited to 16 bits. This means that only 16 times you can do an anti-rollback. You can reduce the length of this efuse field using CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD option.
- Factory and Test partitions are not supported in anti rollback scheme and hence partition table should not have partition with SubType set to factory or test.

security_version:

- In application image it is stored in esp_app_desc structure. The number is set CONFIG_BOOTLOADER_APP_SECURE_VERSION.

Secure OTA Updates Without Secure Boot

The verification of signed OTA updates can be performed even without enabling hardware secure boot. This can be achieved by setting CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT and CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT.

OTA Tool otatool.py

The component app_update provides a tool app_update/otatool.py for performing OTA partition-related operations on a target device. The following operations can be performed using the tool:
Chapter 2. API Reference

- read contents of otadata partition (read_otadata)
- erase otadata partition, effectively resetting device to factory app (erase_otadata)
- switch OTA partitions (switch_ota_partition)
- erasing OTA partition (erase_ota_partition)
- write to OTA partition (write_ota_partition)
- read contents of OTA partition (read_ota_partition)

The tool can either be imported and used from another Python script or invoked from shell script for users wanting to perform operation programmatically. This is facilitated by the tool’s Python API and command-line interface, respectively.

**Python API** Before anything else, make sure that the otatool module is imported.

```python
import sys
import os

idf_path = os.environ["IDF_PATH"]  # get value of IDF_PATH from environment
otatool_dir = os.path.join(idf_path, "components", "app_update")  # otatool.py _lives in $IDF_PATH/components/app_update
sys.path.append(otatool_dir)  # this enables Python to find otatool module
from otatool import *  # import all names inside otatool module
```

The starting point for using the tool’s Python API to do is create a `OtatoolTarget` object:

```python
# Create a partool.py target device connected on serial port /dev/ttyUSB1
target = OtatoolTarget("/dev/ttyUSB1")
```

The created object can now be used to perform operations on the target device:

```python
# Erase otadata, resetting the device to factory app
target.erase_otadata()

# Erase contents of OTA app slot 0
target.erase_ota_partition(0)

# Switch boot partition to that of app slot 1
target.switch_ota_partition(1)

# Read OTA partition 'ota_3' and save contents to a file named 'ota_3.bin'
target.read_ota_partition("ota_3", "ota_3.bin")
```

The OTA partition to operate on is specified using either the app slot number or the partition name. More information on the Python API is available in the docstrings for the tool.

**Command-line Interface** The command-line interface of `otatool.py` has the following structure:

```bash
otatool.py [command-args] [subcommand] [subcommand-args]
```

- `command-args` - these are arguments that are needed for executing the main...
- `subcommand` (`parttool.py`), mostly pertaining to the target device
- `subcommand` - this is the operation to be performed
- `subcommand-args` - these are arguments that are specific to the chosen operation

```bash
# Erase otadata, resetting the device to factory app
otatool.py --port "/dev/ttyUSB1" erase_otadata

# Erase contents of OTA app slot 0
otatool.py --port "/dev/ttyUSB1" erase_ota_partition --slot 0
```

(continues on next page)
# Switch boot partition to that of app slot 1
```
otatool.py --port "/dev/ttyUSB1" switch_ota_partition --slot 1
```
# Read OTA partition 'ota_3' and save contents to a file named 'ota_3.bin'
```
otatool.py --port "/dev/ttyUSB1" read_ota_partition --name=ota_3 --output=ota_3.bin
```

More information can be obtained by specifying `--help` as argument:
```
# Display possible subcommands and show main command argument descriptions
otatool.py --help

# Show descriptions for specific subcommand arguments
otatool.py [subcommand] --help
```

### Application Example

End-to-end example of OTA firmware update workflow: system/ota.

### API Reference

#### Header File
- `components/app_update/include/esp_ota_ops.h`

This header file can be included with:
```
#include "esp_ota_ops.h"
```

This header file is a part of the API provided by the `app_update` component. To declare that your component depends on `app_update`, add the following to your CMakeLists.txt:
```
REQUIRES app_update
```

or
```
PRIV_REQUIRES app_update
```

#### Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>const esp_app_desc_t *esp_ota_get_app_description (void)</code></td>
<td>Return esp_app_desc structure. This structure includes app version.</td>
</tr>
</tbody>
</table>

**Note:** This API is present for backward compatibility reasons. Alternative function with the same functionality is `esp_app_get_description`

**Returns** Pointer to esp_app_desc structure.
int esp_ota_get_app_elf_sha256 (char* dst, size_t size)

Fill the provided buffer with SHA256 of the ELF file, formatted as hexadecimal, null-terminated. If the buffer size is not sufficient to fit the entire SHA256 in hex plus a null terminator, the largest possible number of bytes will be written followed by a null.

Note: This API is present for backward compatibility reasons. Alternative function with the same functionality is esp_app_get_elf_sha256

Parameters
- **dst** - Destination buffer
- **size** - Size of the buffer

Returns Number of bytes written to dst (including null terminator)

esp_err_t esp_ota_begin (const esp_partition_t* partition, size_t image_size, esp_ota_handle_t* out_handle)

Commence an OTA update writing to the specified partition.

The specified partition is erased to the specified image size.

If image size is not yet known, pass OTA_SIZE_UNKNOWN which will cause the entire partition to be erased.

On success, this function allocates memory that remains in use until esp_ota_end() is called with the returned handle.

Note: If the rollback option is enabled and the running application has the ESP_OTA_IMG_PENDING_VERIFY state then it will lead to the ESP_ERR_OTA_ROLLBACK_INVALID_STATE error. Confirm the running app before to run download a new app, use esp_ota_mark_app_valid_cancel_rollback() function for it (this should be done as early as possible when you first download a new application).

Parameters
- **partition** - Pointer to info for partition which will receive the OTA update. Required.
- **image_size** - Size of new OTA app image. Partition will be erased in order to receive this size of image. If 0 or OTA_SIZE_UNKNOWN, the entire partition is erased.
- **out_handle** - On success, returns a handle which should be used for subsequent esp_ota_write() and esp_ota_end() calls.

Returns
- ESP_OK: OTA operation commenced successfully.
- ESP_ERR_INVALID_ARG: partition or out_handle arguments were NULL, or partition doesn’t point to an OTA app partition.
- ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
- ESP_ERR_OTA_PARTITION_CONFLICT: Partition holds the currently running firmware, cannot update in place.
- ESP_ERR_NOT_FOUND: Partition argument not found in partition table.
- ESP_ERR_OTA_SELECT_INFO_INVALID: The OTA data partition contains invalid data.
- ESP_ERR_OTA_PARTITION_CONFLICT: Partition doesn’t fit in configured flash size.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- ESP_ERR_OTA_ROLLBACK_INVALID_STATE: If the running app has not confirmed state. Before performing an update, the application must be valid.

esp_err_t esp_ota_write (esp_ota_handle_t handle, const void* data, size_t size)

Write OTA update data to partition.

This function can be called multiple times as data is received during the OTA operation. Data is written sequentially to the partition.

Parameters
- **handle** - Handle obtained from esp_ota_begin
- **data** - Data buffer to write
Chapter 2. API Reference

• **size** - Size of data buffer in bytes.

**Returns**

- ESP_OK: Data was written to flash successfully.
- ESP_ERR_INVALID_ARG: handle is invalid.
- ESP_ERR_OTA_VALIDATE_FAILED: First byte of image contains invalid app image magic byte.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- ESP_ERR_OTA_SELECT_INFO_INVALID: OTA data partition has invalid contents

```c
esp_err_t esp_ota_write_with_offset (esp_ota_handle_t handle, const void* data, size_t size, uint32_t offset)
```

Write OTA update data to partition at an offset.

This function can write data in non-contiguous manner. If flash encryption is enabled, data should be 16 bytes aligned.

**Note:** While performing OTA, if the packets arrive out of order, esp_ota_write_with_offset() can be used to write data in non-contiguous manner. Use of esp_ota_write_with_offset() in combination with esp_ota_write() is not recommended.

**Parameters**

- **handle** - Handle obtained from esp_ota_begin
- **data** - Data buffer to write
- **size** - Size of data buffer in bytes
- **offset** - Offset in flash partition

**Returns**

- ESP_OK: Data was written to flash successfully.
- ESP_ERR_INVALID_ARG: handle is invalid.
- ESP_ERR_OTA_VALIDATE_FAILED: First byte of image contains invalid app image magic byte.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- ESP_ERR_OTA_SELECT_INFO_INVALID: OTA data partition has invalid contents

```c
esp_err_t esp_ota_end (esp_ota_handle_t handle)
```

Finish OTA update and validate newly written app image.

**Note:** After calling esp_ota_end(), the handle is no longer valid and any memory associated with it is freed (regardless of result).

**Parameters**

- **handle** - Handle obtained from esp_ota_begin().

**Returns**

- ESP_OK: Newly written OTA app image is valid.
- ESP_ERR_NOT_FOUND: OTA handle was not found.
- ESP_ERR_INVALID_ARG: Handle was never written to.
- ESP_ERR_OTA_VALIDATE_FAILED: OTA image is invalid (either not a valid app image, or - if secure boot is enabled - signature failed to verify.)
- ESP_ERR_INVALID_STATE: If flash encryption is enabled, this result indicates an internal error writing the final encrypted bytes to flash.

```c
esp_err_t esp_ota_abort (esp_ota_handle_t handle)
```

Abort OTA update, free the handle and memory associated with it.

**Parameters**

- **handle** - obtained from esp_ota_begin().

**Returns**

- ESP_OK: OTA update is aborted.
- ESP_ERR_NOT_FOUND: OTA handle was not found.
- ESP_ERR_INVALID_ARG: Handle was never written to.
- ESP_ERR_OTA_VALIDATE_FAILED: OTA image is invalid (either not a valid app image, or - if secure boot is enabled - signature failed to verify.)
- ESP_ERR_INVALID_STATE: If flash encryption is enabled, this result indicates an internal error writing the final encrypted bytes to flash.
• ESP_OK: Handle and its associated memory is freed successfully.
• ESP_ERR_NOT_FOUND: OTA handle was not found.

`esp_err_t esp_ota_set_boot_partition (const esp_partition_t *partition)`
Configure OTA data for a new boot partition.

**Note:** If this function returns ESP_OK, calling esp_restart() will boot the newly configured app partition.

**Parameters partition** – Pointer to info for partition containing app image to boot.

**Returns**
- ESP_OK: OTA data updated, next reboot will use specified partition.
- ESP_ERR_INVALID_ARG: partition argument was NULL or didn’t point to a valid OTA partition of type “app”.
- ESP_ERR_OTA_VALIDATE_FAILED: Partition contained invalid app image. Also returned if secure boot is enabled and signature validation failed.
- ESP_ERR_NOT_FOUND: OTA data partition not found.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash erase or write failed.

`const esp_partition_t *esp_ota_get_boot_partition (void)`
Get partition info of currently configured boot app.

If esp_ota_set_boot_partition() has been called, the partition which was set by that function will be returned.

If esp_ota_set_boot_partition() has not been called, the result is usually the same as esp_ota_get_running_partition(). The two results are not equal if the configured boot partition does not contain a valid app (meaning that the running partition will be an app that the bootloader chose via fallback).

If the OTA data partition is not present or not valid then the result is the first app partition found in the partition table. In priority order, this means: the factory app, the first OTA app slot, or the test app partition.

Note that there is no guarantee the returned partition is a valid app. Use esp_image_verify(ESP_IMAGE_VERIFY, ...) to verify if the returned partition contains a bootable image.

**Returns** Pointer to info for partition structure, or NULL if partition table is invalid or a flash read operation failed. Any returned pointer is valid for the lifetime of the application.

`const esp_partition_t *esp_ota_get_running_partition (void)`
Get partition info of currently running app.

This function is different to esp_ota_get_boot_partition() in that it ignores any change of selected boot partition caused by esp_ota_set_boot_partition(). Only the app whose code is currently running will have its partition information returned.

The partition returned by this function may also differ from esp_ota_get_boot_partition() if the configured boot partition is somehow invalid, and the bootloader fell back to a different app partition at boot.

**Returns** Pointer to info for partition structure, or NULL if no partition is found or flash read operation failed. Returned pointer is valid for the lifetime of the application.

`const esp_partition_t *esp_ota_get_next_update_partition (const esp_partition_t *start_from)`
Return the next OTA app partition which should be written with a new firmware.

Call this function to find an OTA app partition which can be passed to esp_ota_begin().

Finds next partition round-robin, starting from the current running partition.

**Parameters start_from** – If set, treat this partition info as describing the current running partition. Can be NULL, in which case esp_ota_get_running_partition() is used to find the currently running partition. The result of this function is never the same as this argument.
Returns Pointer to info for partition which should be updated next. NULL result indicates invalid OTA data partition, or that no eligible OTA app slot partition was found.

```c
esp_err_t esp_ota_get_partition_description(const esp_partition_t *partition, esp_app_desc_t *app_desc)
```
Returns esp_app_desc structure for app partition. This structure includes app version.
Returns a description for the requested app partition.

**Parameters**
- `partition` - [in] Pointer to app partition. (only app partition)
- `app_desc` - [out] Structure of info about app.

**Returns**
- ESP_OK Successful.
- ESP_ERR_NOT_FOUND app_desc structure is not found. Magic word is incorrect.
- ESP_ERR_NOT_SUPPORTED Partition is not application.
- ESP_ERR_INVALID_ARG Arguments is NULL or if partition’s offset exceeds partition size.
- ESP_ERR_INVALID_SIZE Read would go out of bounds of the partition.
- or one of error codes from lower-level flash driver.

```c
esp_err_t esp_ota_get_bootloader_description(const esp_partition_t *bootloader_partition, esp_bootloader_desc_t *desc)
```
Returns the description structure of the bootloader.

**Parameters**
- `bootloader_partition` - [in] Pointer to bootloader partition. If NULL, then the current bootloader is used (the default location). offset = CONFIG_BOOTLOADER_OFFSET_IN_FLASH, size = CONFIG_PARTITION_TABLE_OFFSET - CONFIG_BOOTLOADER_OFFSET_IN_FLASH,
- `desc` - [out] Structure of info about bootloader.

**Returns**
- ESP_OK Successful.
- ESP_ERR_NOT_FOUND Description structure is not found in the bootloader image. Magic byte is incorrect.
- ESP_ERR_INVALID_ARG Arguments is NULL.
- ESP_ERR_INVALID_SIZE Read would go out of bounds of the partition.
- or one of error codes from lower-level flash driver.

```c
uint8_t esp_ota_get_app_partition_count (void)
```
Returns number of ota partitions provided in partition table.

**Returns**
- Number of OTA partitions

```c
esp_err_t esp_ota_mark_app_valid_cancel.Rollback (void)
```
This function is called to indicate that the running app is working well.

**Returns**
- ESP_OK: if successful.

```c
esp_err_t esp_ota_mark_app_invalid.Rollback_and_reboot (void)
```
This function is called to roll back to the previously workable app with reboot.
If rollback is successful then device will reset else API will return with error code. Checks applications on a flash drive that can be booted in case of rollback. If the flash does not have at least one app (except the running app) then rollback is not possible.

**Returns**
- ESP_FAIL: if not successful.
- ESP_ERR_OTA_ROLLBACK_FAILED: The rollback is not possible due to flash does not have any apps.
const esp_partition_t *esp_ota_get_last_invalid_partition (void)
    Returns last partition with invalid state (ESP_OTA_IMG_INVALID or ESP_OTA_IMG_ABORTED).

Returns partition.

esp_err_t esp_ota_get_state_partition (const esp_partition_t *partition, esp_ota_img_states_t *ota_state)
    Returns state for given partition.

Parameters
    • partition – [in] Pointer to partition.
    • ota_state – [out] state of partition (if this partition has a record in otadata).

Returns
    • ESP_OK: Successful.
    • ESP_ERR_INVALID_ARG: partition or ota_state arguments were NULL.
    • ESP_ERR_NOT_SUPPORTED: partition is not ota.
    • ESP_ERR_NOT_FOUND: Partition table does not have otadata or state was not found for given partition.

esp_err_t esp_ota_erase_last_boot_app_partition (void)
    Erase previous boot app partition and corresponding otadata select for this partition.

When current app is marked to as valid then you can erase previous app partition.

Returns
    • ESP_OK: Successful, otherwise ESP_ERR.

bool esp_ota_check_rollback_is_possible (void)
    Checks applications on the slots which can be booted in case of rollback.

These applications should be valid (marked in otadata as not UNDEFINED, INVALID or ABORTED and crc is good) and be able booted, and secure_version of app >= secure_version of efuse (if anti-rollback is enabled).

Returns
    • True: Returns true if the slots have at least one app (except the running app).
    • False: The rollback is not possible.

esp_err_t esp_ota_revoke_secure_boot_public_key (esp_ota_secure_boot_public_key_index_t index)
    Revokes the signature digest denoted by the given index. This should be called in the application only after the rollback logic otherwise the device may end up in unrecoverable state.

Relevant for Secure boot v2 on ESP32-S2, ESP32-S3, ESP32-C3, ESP32-C6, ESP32-H2 where up to 3 key digests can be stored (Key #N-1, Key #N, Key #N+1). When a key used to sign an app is invalidated, an OTA update is to be sent with an app signed with at least one of the other two keys which has not been revoked already. After successfully booting the OTA app should call this function to revoke Key #N-1.

Parameters index – The index of the signature block to be revoked

Returns
    • ESP_OK: If revocation is successful.
    • ESP_ERR_INVALID_ARG: If the index of the public key to be revoked is incorrect.
    • ESP_FAIL: If secure boot v2 has not been enabled.

Macros

OTA_SIZE_UNKNOWN
    Used for esp_ota_begin() if new image size is unknown

OTA_WITH_SEQUENTIAL_WRITES
    Used for esp_ota_begin() if new image size is unknown and erase can be done in incremental manner (assuming write operation is in continuous sequence)
Chapter 2. API Reference

ESP_ERR_OTA_BASE
Base error code for ota_ops api

ESP_ERR_OTA_PARTITION_CONFLICT
Error if request was to write or erase the current running partition

ESP_ERR_OTA_SELECT_INFO_INVALID
Error if OTA data partition contains invalid content

ESP_ERR_OTA_VALIDATE_FAILED
Error if OTA app image is invalid

ESP_ERR_OTA_SMALL_SEC_VER
Error if the firmware has a secure version less than the running firmware.

ESP_ERR_OTA_ROLLBACK_FAILED
Error if flash does not have valid firmware in passive partition and hence rollback is not possible

ESP_ERR_OTA_ROLLBACK_INVALID_STATE
Error if current active firmware is still marked in pending validation state (ESP_OTA_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

Type Definitions

typedef uint32_t esp_ota_handle_t
Opaque handle for an application OTA update.

esp_ota_begin() returns a handle which is then used for subsequent calls to esp_ota_write() and esp_ota_end().

Enumerations

enum esp_ota_secure_boot_public_key_index_t
Secure Boot V2 public key indexes.

Values:

enumerator SECURE_BOOT_PUBLIC_KEY_INDEX_0
Points to the 0th index of the Secure Boot v2 public key

enumerator SECURE_BOOT_PUBLIC_KEY_INDEX_1
Points to the 1st index of the Secure Boot v2 public key

enumerator SECURE_BOOT_PUBLIC_KEY_INDEX_2
Points to the 2nd index of the Secure Boot v2 public key

Debugging OTA Failure

2.9.24 Performance Monitor
Fig. 50: How to Debug When OTA Fails (click to enlarge)
The Performance Monitor component provides APIs to use ESP32-S2 internal performance counters to profile functions and applications.

**Application Example**

An example which combines performance monitor is provided in `examples/system/perfmon` directory. This example initializes the performance monitor structure and execute them with printing the statistics.

**High-Level API Reference**

**Header Files**

- perfmon/include/perfmon.h

**API Reference**

**Header File**

- components/perfmon/include/xtensa_perfmon_access.h
  
  This header file can be included with:

  ```
  #include "xtensa_perfmon_access.h"
  ```

  This header file is a part of the API provided by the perfmon component. To declare that your component depends on perfmon, add the following to your CMakeLists.txt:

  ```
  REQUIRES perfmon
  ```

  or

  ```
  PRIV_REQUIRES perfmon
  ```

**Functions**

*esp_err_t* `xtensa_perfmon_init` (int id, uint16_t select, uint16_t mask, int kernelcnt, int tracelevel)

Init Performance Monitor.

Initialize performance monitor register with define values

**Parameters**

- `id` - [in] performance counter number
- `select` - [in] select value from PMCTRLx register
- `mask` - [in] mask value from PMCTRLx register
- `kernelcnt` - [in] kernelcnt value from PMCTRLx register
- `tracelevel` - [in] tracelevel value from PMCTRLx register

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if one of the arguments is not correct

*esp_err_t* `xtensa_perfmon_reset` (int id)

Reset PM counter.

Reset PM counter. Writes 0 to the PMx register.

**Parameters**

- `id` - [in] performance counter number

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if id out of range
void xtensa_perfmon_start (void)
    Start PM counters.
    Start all PM counters synchronously. Write 1 to the PGM register

void xtensa_perfmon_stop (void)
    Stop PM counters.
    Stop all PM counters synchronously. Write 0 to the PGM register

uint32_t xtensa_perfmon_value (int id)
    Read PM counter.
    Read value of defined PM counter.

    Parameters id –[in] performance counter number
    Returns
        • Performance counter value

esp_err_t xtensa_perfmon_overflow (int id)
    Read PM overflow state.
    Read overflow value of defined PM counter.

    Parameters id –[in] performance counter number
    Returns
        • ESP_OK if there is no overflow (overflow = 0)
        • ESP_FAIL if overflow occur (overflow = 1)

void xtensa_perfmon_dump (void)
    Dump PM values.
    Dump all PM register to the console.

Header File

• components/perfmon/include/xtensa_perfmon_apis.h
• This header file can be included with:

    #include "xtensa_perfmon_apis.h"

• This header file is a part of the API provided by the perfmon component. To declare that your component depends on perfmon, add the following to your CMakeLists.txt:

    REQUIRES perfmon

    or

    PRIV_REQUIRES perfmon

Functions

esp_err_t xtensa_perfmon_exec (const xtensa_perfmon_config_t *config)
    Execute PM.
    Execute performance counter for dedicated function with defined parameters

    Parameters config –[in] pointer to the configuration structure
    Returns
        • ESP_OK if no errors
        • ESP_ERR_INVALID_ARG if one of the required parameters not defined
        • ESP_FAIL - counter overflow
void xtensa_perfmon_view_cb (void *params, uint32_t select, uint32_t mask, uint32_t value)
    Dump PM results.
    Callback to dump perfmon result to a FILE* stream specified in perfmon_config_t::callback_params. If callback_params is set to NULL, will print to stdout.

Parameters

• *params [in] used parameters passed from configuration (callback_params). This parameter expected as FILE* hanle, where data will be stored. If this parameter NULL, then data will be stored to the stdout.
• *select [in] select value for current counter
• *mask [in] mask value for current counter
• *value [in] counter value for current counter

Structures

struct xtensa_perfmon_config
    Performance monitor configuration structure.
    Structure to configure performance counter to measure dedicated function

Public Members

int repeat_count
    how much times function will be called before the callback will be repeated

float max_deviation
    Difference between min and max counter number 0..1, 0 - no difference, 1 - not used

void *call_params
    This pointer will be passed to the call_function as a parameter

void (*call_function)(void *params)
    pointer to the function that have to be called

void (*callback)(void *params, uint32_t select, uint32_t mask, uint32_t value)
    pointer to the function that will be called with result parameters

void *callback_params
    parameter that will be passed to the callback

int tracelevel
    trace level for all counters. In case of negative value, the filter will be ignored. If it’s >=0, then the perfmon will count only when interrupt level > tracelevel. It’s useful to monitor interrupts.

uint32_t counters_size
    amount of counter in the list

const uint32_t *select_mask
    list of the select/mask parameters
2.9.25 Power Management

Overview

Power management algorithm included in ESP-IDF can adjust the advanced peripheral bus (APB) frequency, CPU frequency, and put the chip into Light-sleep mode to run an application at smallest possible power consumption, given the requirements of application components.

Application components can express their requirements by creating and acquiring power management locks.

For example:

- Driver for a peripheral clocked from APB can request the APB frequency to be set to 80 MHz while the peripheral is used.
- RTOS can request the CPU to run at the highest configured frequency while there are tasks ready to run.
- A peripheral driver may need interrupts to be enabled, which means it has to request disabling Light-sleep.

Since requesting higher APB or CPU frequencies or disabling Light-sleep causes higher current consumption, please keep the usage of power management locks by components to a minimum.

Configuration

Power management can be enabled at compile time, using the option `CONFIG_PM_ENABLE`.

Enabling power management features comes at the cost of increased interrupt latency. Extra latency depends on a number of factors, such as the CPU frequency, single/dual core mode, whether or not frequency switch needs to be done. Minimum extra latency is 0.2 us (when the CPU frequency is 240 MHz and frequency scaling is not enabled). Maximum extra latency is 40 us (when frequency scaling is enabled, and a switch from 40 MHz to 80 MHz is performed on interrupt entry).

Dynamic frequency scaling (DFS) and automatic Light-sleep can be enabled in an application by calling the function `esp_pm_configure()`. Its argument is a structure defining the frequency scaling settings, `esp_pm_config_t`. In this structure, three fields need to be initialized:

- `max_freq_mhz`: Maximum CPU frequency in MHz, i.e., the frequency used when the `ESP_PM_CPU_FREQ_MAX` lock is acquired. This field is usually set to the default CPU frequency.
- `min_freq_mhz`: Minimum CPU frequency in MHz, i.e., the frequency used when only the `ESP_PM_APB_FREQ_MAX` lock is acquired. This field can be set to the XTAL frequency value, or the XTAL frequency divided by an integer. Note that 10 MHz is the lowest frequency at which the default REF_TICK clock of 1 MHz can be generated.
- `light_sleep_enable`: Whether the system should automatically enter Light-sleep when no locks are acquired (true/false).

Alternatively, if you enable the option `CONFIG_PM_DFS_INIT_AUTO` in menuconfig, the maximum CPU frequency will be determined by the `CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ` setting, and the minimum CPU frequency will be locked to the XTAL frequency.

Note: Automatic Light-sleep is based on FreeRTOS Tickless Idle functionality. If automatic Light-sleep is requested while the option `CONFIG_FREERTOS_USE_TICKLESS_IDLE` is not enabled in menuconfig, `esp_pm_configure()` will return the error `ESP_ERR_NOT_SUPPORTED`. 
**Note:** In Light-sleep, peripherals are clock gated, and interrupts (from GPIOs and internal peripherals) will not be generated. A wakeup source described in the *Sleep Modes* documentation can be used to trigger wakeup from the Light-sleep state.

For example, the EXT0 and EXT1 wakeup sources can be used to wake up the chip via a GPIO.

**Power Management Locks**

Applications have the ability to acquire/release locks in order to control the power management algorithm. When an application acquires a lock, the power management algorithm operation is restricted in a way described below. When the lock is released, such restrictions are removed.

Power management locks have acquire/release counters. If the lock has been acquired a number of times, it needs to be released the same number of times to remove associated restrictions.

ESP32-S2 supports three types of locks described in the table below.

<table>
<thead>
<tr>
<th>Lock</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP_PM_CPU_FREQ_MAX</td>
<td>Requests CPU frequency to be at the maximum value set with <code>esp_pm_configure()</code> for ESP32-S2, this value can be set to 80 MHz, 160 MHz, or 240 MHz.</td>
</tr>
<tr>
<td>ESP_PM_APB_FREQ_MAX</td>
<td>Requests the APB frequency to be at the maximum supported value. For ESP32-S2, this is 80 MHz.</td>
</tr>
<tr>
<td>ESP_PM_NO_LIGHT_SLEEP</td>
<td>Disables automatic switching to Light-sleep.</td>
</tr>
</tbody>
</table>

**ESP32-S2 Power Management Algorithm**

The table below shows how CPU and APB frequencies will be switched if dynamic frequency scaling is enabled. You can specify the maximum CPU frequency with either `esp_pm_configure()` or `CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ`. 
Max CPU Frequency Set| Lock Acquisition| CPU and APB Frequencies
---|---|---
240| ESP\_PM\_CPU\_FREQ\_MAX acquired| CPU: 240 MHz
| ESP\_PM\_APB\_FREQ\_MAX acquired, ESP\_PM\_CPU\_FREQ\_MAX not acquired| APB: 80 MHz
| None| Min values for both frequencies set with esp\_pm\_configure()|
160| ESP\_PM\_CPU\_FREQ\_MAX acquired| CPU: 160 MHz
| ESP\_PM\_APB\_FREQ\_MAX acquired, ESP\_PM\_CPU\_FREQ\_MAX not acquired| APB: 80 MHz
| None| Min values for both frequencies set with esp\_pm\_configure()|
80| Any of ESP\_PM\_CPU\_FREQ\_MAX or ESP\_PM\_APB\_FREQ\_MAX acquired| CPU: 80 MHz
| None| Min values for both frequencies set with esp\_pm\_configure()|

If none of the locks are acquired, and Light-sleep is enabled in a call to `esp_pm_configure()`, the system will go into Light-sleep mode. The duration of Light-sleep will be determined by:

- FreeRTOS tasks blocked with finite timeouts
- Timers registered with High resolution timer APIs

Light-sleep duration is chosen to wake up the chip before the nearest event (task being unblocked, or timer elapses). To skip unnecessary wake-up, you can consider initializing an `esp_timer` with the `skip_unhandled_events` option as `true`. Timers with this flag will not wake up the system and it helps to reduce consumption.

**Dynamic Frequency Scaling and Peripheral Drivers**

When DFS is enabled, the APB frequency can be changed multiple times within a single RTOS tick. The APB frequency change does not affect the operation of some peripherals, while other peripherals may have issues. For example, Timer Group peripheral timers keeps counting, however, the speed at which they count changes proportionally to the APB frequency.

Peripheral clock sources such as `REF\_TICK`, `XTAL`, `RC\_FAST` (i.e., `RTC\_8M`), their frequencies will not be influenced by APB frequency. And therefore, to ensure the peripheral behaves consistently during DFS, it is recommended to select one of these clocks as the peripheral clock source. For more specific guidelines, please refer to the “Power Management” section of each peripheral’s “API Reference > Peripherals API” page.

Currently, the following peripheral drivers are aware of DFS and use the `ESP\_PM\_APB\_FREQ\_MAX` lock for the duration of the transaction:
Chapter 2. API Reference

- SPI master
- I2C
- I2S (If the APPLL clock is used, then it will use the ESP_PM_NO_LIGHT_SLEEP lock)
- SDMMC

The following drivers hold the ESP_PM_APB_FREQ_MAX lock while the driver is enabled:

- **SPI slave**: between calls to spi_slave_initialize() and spi_slave_free().
- **GPTimer**: between calls to gptimer_enable() and gptimer_disable().
- **Ethernet**: between calls to esp_eth_driver_install() and esp_eth_driver_uninstall().
- **WiFi**: between calls to esp_wifi_start() and esp_wifi_stop(). If modem sleep is enabled, the lock will be released for the periods of time when radio is disabled.
- **TWAI**: between calls to twai_driver_install() and twai_driver_uninstall() (only when the clock source is set to TWAI_CLK_SRC_APB).

The following peripheral drivers are not aware of DFS yet. Applications need to acquire/release locks themselves, when necessary:

- PCNT
- Sigma-delta
- The legacy timer group driver

**Light-sleep Peripheral Power Down**

**API Reference**

**Header File**

- components/esp_pm/include/esp_pm.h
  - This header file can be included with:
    ```
    #include "esp_pm.h"
    ```
  - This header file is a part of the API provided by the esp_pm component. To declare that your component depends on esp_pm, add the following to your CMakeLists.txt:
    ```
    REQUIRES esp_pm
    ```
    or
    ```
    PRIV_REQUIRES esp_pm
    ```

**Functions**

`esp_err_t esp_pm_configure (const void *config)`

Set implementation-specific power management configuration.

**Parameters**

- `config` - pointer to implementation-specific configuration structure (e.g. esp_pm_config_esp32)

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the configuration values are not correct
- ESP_ERR_NOT_SUPPORTED if certain combination of values is not supported, or if CONFIG_PM_ENABLE is not enabled in sdkconfig

`esp_err_t esp_pm_get_configuration (void *config)`

Get implementation-specific power management configuration.

**Parameters**

- `config` - pointer to implementation-specific configuration structure (e.g. esp_pm_config_esp32)
Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the pointer is null

```
esp_err_t esp_pm_lock_create (esp_pm_lock_type_t lock_type, int arg, const char *name,
                             esp_pm_lock_handle_t *out_handle)
```

Initialize a lock handle for certain power management parameter.

When lock is created, initially it is not taken. Call esp_pm_lock_acquire to take the lock.

This function must not be called from an ISR.

Parameters

- `lock_type` - Power management constraint which the lock should control
- `arg` - Argument, value depends on `lock_type`, see esp_pm_lock_type_t
- `name` - Arbitrary string identifying the lock (e.g., “wifi” or “spi”). Used by the esp_pm_dump_locks function to list existing locks. May be set to NULL. If not set to NULL, must point to a string which is valid for the lifetime of the lock.
- `out_handle` - [out] handle returned from this function. Use this handle when calling esp_pm_lock_delete, esp_pm_lock_acquire, esp_pm_lock_release. Must not be NULL.

Returns

- ESP_OK on success
- ESP_ERR_NO_MEM if the lock structure cannot be allocated
- ESP_ERR_INVALID_ARG if `out_handle` is NULL or type argument is not valid
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

```
esp_err_t esp_pm_lock_acquire (esp_pm_lock_handle_t handle)
```

Take a power management lock.

Once the lock is taken, power management algorithm will not switch to the mode specified in a call to esp_pm_lock_create, or any of the lower power modes (higher numeric values of ‘mode’).

The lock is recursive, in the sense that if esp_pm_lock_acquire is called a number of times, esp_pm_lock_release has to be called the same number of times in order to release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other esp_pm_lock_* functions for the same handle.

Parameters `handle` - Handle obtained from esp_pm_lock_create function

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

```
esp_err_t esp_pm_lock_release (esp_pm_lock_handle_t handle)
```

Release the lock taken using esp_pm_lock_acquire.

Call to this functions removes power management restrictions placed when taking the lock.

Locks are recursive, so if esp_pm_lock_acquire is called a number of times, esp_pm_lock_release has to be called the same number of times in order to actually release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other esp_pm_lock_* functions for the same handle.

Parameters `handle` - Handle obtained from esp_pm_lock_create function

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if lock is not acquired
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig
**esp_err_t esp_pm_lock_delete (esp_pm_lock_handle_t handle)**

Delete a lock created using esp_pm_lock.

The lock must be released before calling this function.

This function must not be called from an ISR.

**Parameters**
- handle – handle obtained from esp_pm_lock_create function

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle argument is NULL
- ESP_ERR_INVALID_STATE if the lock is still acquired
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

**esp_err_t esp_pm_dump_locks (FILE *stream)**

Dump the list of all locks to stdout.

This function dumps debugging information about locks created using esp_pm_lock_create to an output stream. This function must not be called from an ISR. If esp_pm_lock_acquire/release are called while this function is running, inconsistent results may be reported.

**Parameters**
- stream – stream to print information to; use stdout or stderr to print to the console; use fmemopen/open_memstream to print to a string buffer.

**Returns**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

**Structures**

```c
struct esp_pm_config_t
```

Power management config.

Pass a pointer to this structure as an argument to esp_pm_configure function.

**Public Members**

```c
int max_freq_mhz
```

Maximum CPU frequency, in MHz

```c
int min_freq_mhz
```

Minimum CPU frequency to use when no locks are taken, in MHz

```c
bool light_sleep_enable
```

Enter light sleep when no locks are taken

**Type Definitions**

```c
typedef esp_pm_config_t esp_pm_config_ESP32_t
```

backward compatibility newer chips no longer require this typedef

```c
typedef esp_pm_config_t esp_pm_config_ESP32S2_t
```

```c
typedef esp_pm_config_t esp_pm_config_ESP32S3_t
```

```c
typedef esp_pm_config_t esp_pm_config_ESP32C3_t
```

---

**Chapter 2. API Reference**

---

Submit Document Feedback
typedef `esp_pm_config_t esp_pm_config_esp32c2_t`

typedef `esp_pm_config_t esp_pm_config_esp32c6_t`

typedef `struct esp_pm_lock * esp_pm_lock_handle_t`

Opaque handle to the power management lock.

**Enumerations**

```c
enum esp_pm_lock_type_t
```

Power management constraints.

**Values:**

- `ESP_PM_CPU_FREQ_MAX`
  - Require CPU frequency to be at the maximum value set via `esp_pm_configure`. Argument is unused and should be set to 0.

- `ESP_PM_APB_FREQ_MAX`
  - Require APB frequency to be at the maximum value supported by the chip. Argument is unused and should be set to 0.

- `ESP_PM_NO_LIGHT_SLEEP`
  - Prevent the system from going into light sleep. Argument is unused and should be set to 0.

### 2.9.26 POSIX Threads Support

#### Overview

ESP-IDF is based on FreeRTOS but offers a range of POSIX-compatible APIs that allow easy porting of third-party code. This includes support for common parts of the POSIX Threads pthread API.

POSIX Threads are implemented in ESP-IDF as wrappers around equivalent FreeRTOS features. The runtime memory or performance overhead of using the pthreads API is quite low, but not every feature available in either pthreads or FreeRTOS is available via the ESP-IDF pthreads support.

Pthreads can be used in ESP-IDF by including standard `pthread.h` header, which is included in the toolchain libc. An additional ESP-IDF specific header, `esp_pthread.h`, provides additional non-POSIX APIs for using some ESP-IDF features with pthreads.

C++ Standard Library implementations for `std::thread`, `std::mutex`, `std::condition_variable`, etc., are realized using pthreads (via GCC libstdc++). Therefore, restrictions mentioned here also apply to the equivalent C++ standard library functionality.

#### RTOS Integration

Unlike many operating systems using POSIX Threads, ESP-IDF is a real-time operating system with a real-time scheduler. This means that a thread will only stop running if a higher priority task is ready to run, the thread blocks on an OS synchronization structure like a mutex, or the thread calls any of the functions `sleep`, `vTaskDelay()`, or `usleep`. 
Chapter 2. API Reference

**Note:** When calling a standard libc or C++ sleep function, such as `usleep` defined in `unistd.h`, the task will only block and yield the core if the sleep time is longer than one *FreeRTOS tick period*. If the time is shorter, the thread will busy-wait instead of yielding to another RTOS task.

By default, all POSIX Threads have the same RTOS priority, but it is possible to change this by calling a custom API.

**Standard Features**

The following standard APIs are implemented in ESP-IDF.

Refer to standard POSIX Threads documentation, or `pthread.h`, for details about the standard arguments and behaviour of each function. Differences or limitations compared to the standard APIs are noted below.

**Thread APIs**

- `pthread_create()`
  - The `attr` argument is supported for setting stack size and detach state only. Other attribute fields are ignored.
  - Unlike FreeRTOS task functions, the `start_routine` function is allowed to return. A detached type thread is automatically deleted if the function returns. The default joinable type thread will be suspended until `pthread_join()` is called on it.
    - `pthread_join()`
    - `pthread_detach()`
    - `pthread_exit()`
    - `sched_yield()`
    - `pthread_self()`
      - An assert will fail if this function is called from a FreeRTOS task which is not a pthread.
    - `pthread_equal()`

**Thread Attributes**

- `pthread_attr_init()`
- `pthread_attr_destroy()`
  - This function does not need to free any resources and instead resets the `attr` structure to defaults.
    - The implementation is the same as `pthread_attr_init()`.
- `pthread_attr_getstacksize()` / `pthread_attr_setstacksize()`
- `pthread_attr_getdetachstate()` / `pthread_attr_setdetachstate()`

**Once**

- `pthread_once()`

Static initializer constant `PTHREAD_ONCE_INIT` is supported.

**Note:** This function can be called from tasks created using either pthread or FreeRTOS APIs.

**Mutexes** POSIX Mutexes are implemented as FreeRTOS Mutex Semaphores (normal type for “fast” or “error check” mutexes, and Recursive type for “recursive” mutexes). This means that they have the same priority inheritance behavior as mutexes created with `xSemaphoreCreateMutex()`.

- `pthread_mutex_init()`
- `pthread_mutex_destroy()`
- `pthread_mutex_lock()`
- `pthread_mutex_timedlock()`
Chapter 2. API Reference

- pthread_mutex_trylock()
- pthread_mutex_unlock()
- pthread_mutexattr_init()
- pthread_mutexattr_destroy()
- pthread_mutexattr_gettype()/pthread_mutexattr_settype()

Static initializer constant PTHREAD_MUTEX_INITIALIZER is supported, but the non-standard static initializer constants for other mutex types are not supported.

Note: These functions can be called from tasks created using either pthread or FreeRTOS APIs.

Condition Variables

- pthread_cond_init()
  - The attr argument is not implemented and is ignored.
- pthread_cond_destroy()
- pthread_cond_signal()
- pthread_cond_broadcast()
- pthread_cond_wait()
- pthread_cond_timedwait()

Static initializer constant PTHREAD_COND_INITIALIZER is supported.

- The resolution of pthread_cond_timedwait() timeouts is the RTOS tick period (see CONFIG_FREERTOS_HZ). Timeouts may be delayed up to one tick period after the requested timeout.

Note: These functions can be called from tasks created using either pthread or FreeRTOS APIs.

Semaphore In ESP-IDF, POSIX unnamed semaphores are implemented. The accessible API is described below. It implements semaphores as specified in the POSIX standard, unless specified otherwise.

- sem_init()
- sem_destroy()
  - pshared is ignored. Semaphores can always be shared between FreeRTOS tasks.
- sem_post()
  - If the semaphore has a value of SEM_VALUE_MAX already, -1 is returned and errno is set to EAGAIN.
- sem_wait()
- sem_trywait()
- sem_timedwait()
  - The time value passed by abstime will be rounded up to the next FreeRTOS tick.
  - The actual timeout happens after the tick that the time was rounded to and before the following tick.
  - It is possible, though unlikely, that the task is preempted directly after the timeout calculation, delaying the timeout of the following blocking operating system call by the duration of the preemption.
- sem_getvalue()

Read/Write Locks The following API functions of the POSIX reader-writer locks specification are implemented:

- pthread_rwlock_init()
  - The attr argument is not implemented and is ignored.
- pthread_rwlock_destroy()
- pthread_rwlock_rdlock()
- pthread_rwlock_tryrdlock()
- pthread_rwlock_wrlock()
- pthread_rwlock_trywrlock()
- pthread_rwlock_unlock()
Chapter 2. API Reference

The static initializer constant PTHREAD_RWLOCK_INITIALIZER is supported.

**Note:** These functions can be called from tasks created using either pthread or FreeRTOS APIs.

**Thread-Specific Data**

- **pthread_key_create()**
  - The `destr_function` argument is supported and will be called if a thread function exits normally, calls `pthread_exit()`, or if the underlying task is deleted directly using the FreeRTOS function `vTaskDelete()`.
- **pthread_key_delete()**
- **pthread_setspecific() / pthread_getspecific()**

**Note:** These functions can be called from tasks created using either pthread or FreeRTOS APIs. When calling these functions from tasks created using FreeRTOS APIs, `CONFIG_FREERTOS_TLSP_DELETION_CALLBACKS` config option must be enabled to ensure the thread-specific data is cleaned up before the task is deleted.

**Note:** There are other options for thread local storage in ESP-IDF, including options with higher performance. See *Thread Local Storage*.

**Not Implemented**

The `pthread.h` header is a standard header and includes additional APIs and features which are not implemented in ESP-IDF. These include:

- **pthread_cancel()** returns ENOSYS if called.
- **pthread_condattr_init()** returns ENOSYS if called.

Other POSIX Threads functions (not listed here) are not implemented and will produce either a compiler or a linker error if referenced from an ESP-IDF application. If you identify a useful API that you would like to see implemented in ESP-IDF, please open a feature request on GitHub with the details.

**ESP-IDF Extensions**

The API `esp_pthread_set_cfg()` defined in the `esp_pthreads.h` header offers custom extensions to control how subsequent calls to `pthread_create()` behaves. Currently, the following configuration can be set:

- Default stack size of new threads, if not specified when calling `pthread_create()` (overrides `CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT`).
- RTOS priority of new threads (overrides `CONFIG_PTHREAD_TASK_PRIO_DEFAULT`).
- FreeRTOS task name for new threads (overrides `CONFIG_PTHREAD_TASK_NAME_DEFAULT`).

This configuration is scoped to the calling thread (or FreeRTOS task), meaning that `esp_pthread_set_cfg()` can be called independently in different threads or tasks. If the `inherit_cfg` flag is set in the current configuration then any new thread created will inherit the creator’s configuration (if that thread calls `pthread_create()` recursively), otherwise the new thread will have the default configuration.

**Examples**

- `system/pthread` demonstrates using the pthreads API to create threads.
- `cxx/pthread` demonstrates using C++ Standard Library functions with threads.
API Reference

Header File

- components/pthread/include/esp_pthread.h
- This header file can be included with:

```c
#include "esp_pthread.h"
```

- This header file is a part of the API provided by the pthread component. To declare that your component depends on pthread, add the following to your CMakeLists.txt:

```cmake
REQUIRES pthread
```
or

```cmake
PRIV_REQUIRES pthread
```

Functions

### `esp_pthread_cfg_t` `esp_pthread_get_default_config` (void)

Creates a default pthread configuration based on the values set via menuconfig.

- **Returns**
  - A default configuration structure.

### `esp_err_t` `esp_pthread_set_cfg` (const `esp_pthread_cfg_t` *cfg)

Configure parameters for creating pthread.

- This API allows you to configure how the subsequent pthread_create() call will behave. This call can be used to setup configuration parameters like stack size, priority, configuration inheritance etc.
- If the `inherit` flag in the configuration structure is enabled, then the same configuration is also inherited in the thread subtree.

- **Note:** Passing non-NULL attributes to pthread_create() will override the stack_size parameter set using this API

- **Parameters**
  - `cfg` - The pthread config parameters

- **Returns**
  - ESP_OK if configuration was successfully set
  - ESP_ERR_NO_MEM if out of memory
  - ESP_ERR_INVALID_ARG if stack_size is less than PTHREAD_STACK_MIN

### `esp_err_t` `esp_pthread_get_cfg` (`esp_pthread_cfg_t` *p)

Get current pthread creation configuration.

- This will retrieve the current configuration that will be used for creating threads.

- **Parameters**
  - `p` - Pointer to the pthread config structure that will be updated with the currently configured parameters

- **Returns**
  - ESP_OK if the configuration was available
  - ESP_ERR_NOT_FOUND if a configuration wasn’t previously set

### `esp_err_t` `esp_pthread_init` (void)

Initialize pthread library.

- **Structures**

- `struct esp_pthread_cfg_t`

  pthread configuration structure that influences pthread creation
Public Members

- **size_t stack_size**
  - The stack size of the pthread.

- **size_t prio**
  - The thread’s priority.

- **bool inherit_cfg**
  - Inherit this configuration further.

- **const char* thread_name**
  - The thread name.

- **int pin_to_core**
  - The core id to pin the thread to. Has the same value range as xCoreId argument of xTaskCreatePinnedToCore.

Macros

- **PTHREAD_STACK_MIN**

2.9.27 Random Number Generation

ESP32-S2 contains a hardware random number generator, values from it can be obtained using the APIs `esp_random()` and `esp_fill_random()`.

The hardware RNG produces true random numbers under any of the following conditions:

- RF subsystem is enabled (i.e., Wi-Fi is enabled).
- An internal entropy source has been enabled by calling `bootloader_random_enable()` and not yet disabled by calling `bootloader_random_disable()`.
- While the ESP-IDF Second Stage Bootloader is running. This is because the default ESP-IDF bootloader implementation calls `bootloader_random_enable()` when the bootloader starts, and `bootloader_random_disable()` before executing the app.

When any of these conditions are true, samples of physical noise are continuously mixed into the internal hardware RNG state to provide entropy. Consult the [ESP32-S2 Technical Reference Manual > Random Number Generator (RNG) [PDF]](https://www.espressif.com/sites/default/files/documentation/esp32-s2_trm_en.pdf) chapter for more details.

If none of the above conditions are true, the output of the RNG should be considered pseudo-random only.

Startup

During startup, ESP-IDF bootloader temporarily enables a non-RF entropy source (internal reference voltage noise) that provides entropy for any first boot key generation. However, after the app starts executing then normally only pseudo-random numbers are available until Wi-Fi is initialized.

To re-enable the entropy source temporarily during app startup, or for an application that does not use Wi-Fi, call the function `bootloader_random_enable()` to re-enable the internal entropy source. The function `bootloader_random_disable()` must be called to disable the entropy source again before using ADC, Wi-Fi.

**Note:** The entropy source enabled during the boot process by the ESP-IDF Second Stage Bootloader seeds the internal RNG state with some entropy. However, the internal hardware RNG state is not large enough to provide a...
continuous stream of true random numbers. This is why a continuous entropy source must be enabled whenever true random numbers are required.

---

**Note:** If an application requires a source of true random numbers but it is not possible to permanently enable a hardware entropy source, consider using a strong software DRBG implementation such as the mbedTLS CTR-DRBG or HMAC-DRBG, with an initial seed of entropy from hardware RNG true random numbers.

---

### Secondary Entropy

ESP32-S2 RNG contains a secondary entropy source, based on sampling an asynchronous 8 MHz internal oscillator (see the Technical Reference Manual for details). This entropy source is always enabled in ESP-IDF and continuously mixed into the RNG state by hardware. In testing, this secondary entropy source was sufficient to pass the Dieharder random number test suite without the main entropy source enabled (test input was created by concatenating short samples from a continuously resetting ESP32-S2). However, it is currently only guaranteed that true random numbers are produced when the main entropy source is also enabled as described above.

---

### API Reference

#### Header File

- **components/esp_hw_support/include/esp_random.h**
- This header file can be included with:

  ```
  #include "esp_random.h"
  ```

#### Functions

- **`uint32_t esp_random ()`**
  
  Get one random 32-bit word from hardware RNG.

  If Wi-Fi or Bluetooth are enabled, this function returns true random numbers. In other situations, if true random numbers are required then consult the ESP-IDF Programming Guide “Random Number Generation” section for necessary prerequisites.

  This function automatically busy-waits to ensure enough external entropy has been introduced into the hardware RNG state, before returning a new random number. This delay is very short (always less than 100 CPU cycles).

  **Returns** Random value between 0 and UINT32_MAX

- **`void esp_fill_random (void *buf, size_t len)`**
  
  Fill a buffer with random bytes from hardware RNG.

  **Note:** This function is implemented via calls to esp_random(), so the same constraints apply.

  **Parameters**
  
  - **buf** – Pointer to buffer to fill with random numbers.
  - **len** – Length of buffer in bytes

  **Header File**

  - **components/bootloader_support/include/bootloader_random.h**
  - This header file can be included with:

    ```
    #include "bootloader_random.h"
    ```
This header file is a part of the API provided by the bootloader_support component. To declare that your component depends on bootloader_support, add the following to your CMakeLists.txt:

```cmake
REQUIRES bootloader_support
```

or

```cmake
PRIV_REQUIRES bootloader_support
```

## Functions

**void bootloader_random_enable**(void)

Enable an entropy source for RNG if RF subsystem is disabled.

The exact internal entropy source mechanism depends on the chip in use but all SoCs use the SAR ADC to continuously mix random bits (an internal noise reading) into the HWRNG. Consult the SoC Technical Reference Manual for more information.

Can also be called from app code, if true random numbers are required without initialized RF subsystem. This might be the case in early startup code of the application when the RF subsystem has not started yet or if the RF subsystem should not be enabled for power saving.

**Warning:** This function is not safe to use if any other subsystem is accessing the RF subsystem or the ADC at the same time!

**void bootloader_random_disable**(void)

Disable entropy source for RNG.

Disables internal entropy source. Must be called after bootloader_random_enable() and before RF subsystem features, ADC, or I2S (ESP32 only) are initialized.

Consult the ESP-IDF Programming Guide “Random Number Generation” section for details.

**void bootloader_fill_random**(void *buffer, size_t length)

Fill buffer with ‘length’ random bytes.

**Note:** If this function is being called from app code only, and never from the bootloader, then it’s better to call esp_fill_random().

**Parameters**

- **buffer** - Pointer to buffer
- **length** - This many bytes of random data will be copied to buffer

**getrandom()**

A compatible version of the Linux getrandom() function is also provided for ease of porting:

```c
#include <sys/random.h>
ssize_t getrandom(void *buf, size_t buflen, unsigned int flags);
```

This function is implemented by calling esp_fill_random() internally.

The flags argument is ignored, this function is always non-blocking but the strength of any random numbers is dependent on the same conditions described above.

Return value is -1 (with errno set to EFAULT) if the buf argument is NULL, and equal to buflen otherwise.
**getentropy()**

A compatible version of the Linux `getentropy()` function is also provided for ease of porting:

```c
#include <unistd.h>

int getentropy(void *buffer, size_t length);
```

This function is implemented by calling `getrandom()` internally.

Strength of any random numbers is dependent on the same conditions described above.

**Return value is 0 on success and -1 otherwise with `errno` set to:**
- EFAULT if the `buffer` argument is NULL.
- EIO if the `length` is more than 256.

### 2.9.28 Sleep Modes

**Overview**

ESP32-S2 supports two major power saving modes: Light-sleep and Deep-sleep. According to the features used by an application, there are some sub sleep modes. See [Sleep Modes](#) for these sleep modes and sub sleep modes. Additionally, there are some power-down options that can be configured to further reduce the power consumption. See [Power-down Options](#) for more details.

There are several wakeup sources in the sleep modes. These sources can also be combined so that the chip will wake up when any of the sources are triggered. [Wakeup Sources](#) describes these wakeup sources and configuration APIs in detail.

The configuration of power-down options and wakeup sources are optional. They can be configured at any moment before entering the sleep modes.

Then the application can call sleep start APIs to enter one of the sleep modes. See [Entering Sleep](#) for more details. When the wakeup condition is met, the application is awoken from sleep. See [Checking Sleep Wakeup Cause](#) on how to get the wakeup cause, and [Disable Sleep Wakeup Source](#) on how to handle the wakeup sources after wakeup.

**Sleep Modes**

In Light-sleep mode, the digital peripherals, most of the RAM, and CPUs are clock-gated and their supply voltage is reduced. Upon exit from Light-sleep, the digital peripherals, RAM, and CPUs resume operation and their internal states are preserved.

In Deep-sleep mode, the CPUs, most of the RAM, and all digital peripherals that are clocked from APB_CLK are powered off. The only parts of the chip that remain powered on are:

- RTC controller
- ULP coprocessor
- RTC FAST memory
- RTC SLOW memory

**Wi-Fi and Sleep Modes**  In Deep-sleep and Light-sleep modes, the wireless peripherals are powered down. Before entering Deep-sleep or Light-sleep modes, applications must disable Wi-Fi using the appropriate calls (`esp_wifi_stop()`). Wi-Fi connections are not maintained in Deep-sleep or Light-sleep mode, even if these functions are not called.
If Wi-Fi connections need to be maintained, enable Wi-Fi Modem-sleep mode and automatic Light-sleep feature (see Power Management APIs). This will allow the system to wake up from sleep automatically when required by the Wi-Fi driver, thereby maintaining a connection to the AP.

**Sub Sleep Modes**  Tables below list the sub sleep modes in the first row and the features they support in the first column. Modes that support more features may consume more power during sleep mode. The sleep system automatically selects the mode that satisfies all the features required by the user while consuming least power.

### Deep-sleep:

<table>
<thead>
<tr>
<th>ULP/Touch sensor (ESP32-S2 and ESP32-S3 only)</th>
<th>DSLP_ULTRA_LOW</th>
<th>DSLP_DEFAULT</th>
<th>DSLP_8MD256/DSLP_ADC_TSENS</th>
</tr>
</thead>
<tbody>
<tr>
<td>RTC IO input/RTC memory at high temperature</td>
<td>Y</td>
<td>Y</td>
<td>Y</td>
</tr>
<tr>
<td>ADC_TSEN_MONITOR</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>8MD256 as the clock source for RTC_SLOW_CLK</td>
<td></td>
<td>Y</td>
<td></td>
</tr>
</tbody>
</table>

Features:
1. RTC IO input/RTC memory at high temperature (experimental): Use RTC IO as input pins, or use RTC memory at high temperature. The chip can go into ultra low power mode when these features are disabled. Controlled by API `rtc_sleep_enable_ultra_low()`.
2. ADC_TSEN_MONITOR: Use ADC/Temperature Sensor in monitor mode (controlled by ULP). Enabled by API `ulp_adc_init()` or its higher level APIs. Only available for ESP32-S2 and ESP32-S3 chips with monitor mode.
3. 8MD256 as the clock source for RTC_SLOW_CLK: When 8MD256 is selected as the clock source for RTC_SLOW_CLK using the Kconfig option `CONFIG_RTC_CLK_SRC_INT_8MD256`, the chip will automatically enter this sub sleep mode during Deep-sleep mode.

### Light-sleep:

<table>
<thead>
<tr>
<th>ULP/Touch sensor (ESP32-S2 and ESP32-S3 only)</th>
<th>DSLP_DEFAULT</th>
<th>DSLP_ADC_TSENS</th>
<th>DSLP_8MD256/SLLP_LEDC8M/SLLP_XTAL_FPU</th>
</tr>
</thead>
<tbody>
<tr>
<td>RTC IO input/RTC memory at high temperature</td>
<td>Y</td>
<td>Y</td>
<td>Y</td>
</tr>
<tr>
<td>ADC_TSEN_MONITOR</td>
<td></td>
<td>Y</td>
<td>Y</td>
</tr>
<tr>
<td>8MD256 as the clock source for RTC_SLOW_CLK</td>
<td></td>
<td>Y</td>
<td>Y</td>
</tr>
<tr>
<td>8 MHz RC clock source used by digital peripherals</td>
<td></td>
<td></td>
<td>Y</td>
</tr>
<tr>
<td>Keep the XTAL clock on</td>
<td></td>
<td></td>
<td>Y</td>
</tr>
</tbody>
</table>

Features: (Also see 8MD256 and ADC_TSEN_MONITOR features for Deep-sleep mode above)
1. 8 MHz RC clock source used by digital peripherals: Currently, only LEDC uses this clock source during Light-sleep mode. When LEDC selects this clock source, this feature is automatically enabled.
2. Keep the XTAL clock on: Keep the XTAL clock on during Light-sleep mode. Controlled by `ESP_PD_DOMAIN_XTAL` power domain.

ESP32-S2 uses the same power mode for LSLP_8MD256, LSLP_LEDC8M, and LSLP_XTAL_FPU features.
Wakeup Sources

Wakeup sources can be enabled using `esp_sleep_enable_X_wakeup` APIs. Wakeup sources are not disabled after wakeup, you can disable them using `esp_sleep_disable_wakeup_source()` API if you do not need them any more. See Disable Sleep Wakeup Source.

Following are the wakeup sources supported on ESP32-S2.

**Timer**  The RTC controller has a built-in timer which can be used to wake up the chip after a predefined amount of time. Time is specified at microsecond precision, but the actual resolution depends on the clock source selected for RTC_SLOW_CLK.

For details on RTC clock options, see ESP32-S2 Technical Reference Manual > ULP Coprocessor [PDF].

RTC peripherals or RTC memories do not need to be powered on during sleep in this wakeup mode.

`esp_sleep_enable_timer_wakeup()` function can be used to enable sleep wakeup using a timer.

**Touchpad**  The RTC IO module contains the logic to trigger wakeup when a touch sensor interrupt occurs. To wakeup from a touch sensor interrupt, users need to configure the touch pad interrupt before the chip enters Deep-sleep or Light-sleep modes.

`esp_sleep_enable_touchpad_wakeup()` function can be used to enable this wakeup source.

**External Wakeup (ext0)**  The RTC IO module contains the logic to trigger wakeup when one of RTC GPIOs is set to a predefined logic level. RTC IO is part of the RTC peripherals power domain, so RTC peripherals will be kept powered on during Deep-sleep if this wakeup source is requested.

The RTC IO module is enabled in this mode, so internal pullup or pulldown resistors can also be used. They need to be configured by the application using `rtc_gpio_pullup_en()` and `rtc_gpio_pulldown_en()` functions before calling `esp_deep_sleep_start()`.

`esp_sleep_enable_ext0_wakeup()` function can be used to enable this wakeup source.

---

**Warning:** After waking up from sleep, the IO pad used for wakeup will be configured as RTC IO. Therefore, before using this pad as digital GPIO, users need to reconfigure it using `rtc_gpio_deinit()` function.

---

**External Wakeup (ext1)**  The RTC controller contains the logic to trigger wakeup using multiple RTC GPIOs. One of the following two logic functions can be used to trigger general ext1 wakeup:

- wake up if any of the selected pins is high (ESP_EXT1_WAKEUP_ANY_HIGH)
- wake up if any of the selected pins is low (ESP_EXT1_WAKEUP_ANY_LOW)

This wakeup source is controlled by the RTC controller. Unlike ext0, this wakeup source supports wakeup even when the RTC peripheral is powered down. Although the power domain of the RTC peripheral, where RTC IOs are located, is powered down during sleep modes, ESP-IDF will automatically lock the state of the wakeup pin before the system enters sleep modes and unlock upon exiting sleep modes. Therefore, the internal pull-up or pull-down resistors can still be configured for the wakeup pin:

```c
esp_sleep_pd_config(ESP_PD_DOMAIN_RTC_PERIPH, ESP_PD_OPTION_ON);
rtc_gpio_pullup_dis(gpio_num);
rtc_gpio_pulldown_en(gpio_num);
```

If we turn off the RTC_PERIPH domain, we will use the HOLD feature to maintain the pull-up and pull-down on the pins during sleep. HOLD feature will be acted on the pin internally before the system enters sleep modes, and this can further reduce power consumption:

```c
rtc_gpio_pullup_dis(gpio_num);
rtc_gpio_pulldown_en(gpio_num);
```
If certain chips lack the RTC_PERIPH domain, we can only use the HOLD feature to maintain the pull-up and pull-down on the pins during sleep modes:

```c
gpio_pullup_dis(gpio_num);
gpio_pulldown_en(gpio_num);
```

`esp_sleep_enable_ext1_wakeup()` function can be used to enable this wakeup source for general ext1 wakeup.

**Warning:**
- To use the EXT1 wakeup, the IO pad(s) are configured as RTC IO. Therefore, before using these pads as digital GPIOs, users need to reconfigure them by calling the `rtc_gpio_deinit()` function.
- If the RTC peripherals are configured to be powered down (which is by default), the wakeup IOs will be set to the holding state before entering sleep. Therefore, after the chip wakes up from Light-sleep, please call `rtc_gpio_hold_dis` to disable the hold function to perform any pin re-configuration. For Deep-sleep wakeup, this is already being handled at the application startup stage.

**ULP Coprocessor Wakeup** ULP coprocessor can run while the chip is in sleep mode, and may be used to poll sensors, monitor ADC or touch sensor values, and wake up the chip when a specific event is detected. ULP coprocessor is part of the RTC peripherals power domain, and it runs the program stored in RTC SLOW memory. RTC SLOW memory will be powered on during sleep if this wakeup mode is requested. RTC peripherals will be automatically powered on before ULP coprocessor starts running the program; once the program stops running, RTC peripherals are automatically powered down again.

`esp_sleep_enable_ulp_wakeup()` function can be used to enable this wakeup source.

**GPIO Wakeup (Light-sleep Only)** In addition to EXT0 and EXT1 wakeup sources described above, one more method of wakeup from external inputs is available in Light-sleep mode. With this wakeup source, each pin can be individually configured to trigger wakeup on high or low level using `gpio_wakeup_enable()` function. Unlike EXT0 and EXT1 wakeup sources, which can only be used with RTC IOs, this wakeup source can be used with any IO (RTC or digital).

`esp_sleep_enable_gpio_wakeup()` function can be used to enable this wakeup source.

**Warning:** Before entering Light-sleep mode, check if any GPIO pin to be driven is part of the VDD_SPI power domain. If so, this power domain must be configured to remain ON during sleep.

For example, on ESP32-WROOM-32 board, GPIO16 and GPIO17 are linked to VDD_SPI power domain. If they are configured to remain high during Light-sleep, the power domain should be configured to remain powered ON. This can be done with `esp_sleep_pd_config()`:

```c
esp_sleep_pd_config(ESP_PD_DOMAIN_VDDSDIO, ESP_PD_OPTION_ON);
```

**UART Wakeup (Light-sleep Only)** When ESP32-S2 receives UART input from external devices, it is often necessary to wake up the chip when input data is available. The UART peripheral contains a feature which allows waking up the chip from Light-sleep when a certain number of positive edges on RX pin are seen. This number of positive edges can be set using `uart_set_wakeup_threshold()` function. Note that the character which triggers wakeup (and any characters before it) will not be received by the UART after wakeup. This means that the external device typically needs to send an extra character to the ESP32-S2 to trigger wakeup before sending the data.

`esp_sleep_enable_uart_wakeup()` function can be used to enable this wakeup source.

**Disable Sleep Wakeup Source** Previously configured wakeup sources can be disabled later using `esp_sleep_disable_wakeup_source()` API. This function deactivates trigger for the given wakeup source. Additionally, it can disable all triggers if the argument is `ESP_SLEEP_WAKEUP_ALL`. 
Chapter 2. API Reference

Power-down Options

The application can force specific powerdown modes for RTC peripherals and RTC memories. In Deep-sleep mode, we can also isolate some IOs to further reduce current consumption.

Power-down of RTC Peripherals and Memories

By default, `esp_deep_sleep_start()` and `esp_light_sleep_start()` functions power down all RTC power domains which are not needed by the enabled wake-up sources. To override this behaviour, `esp_sleep_pd_config()` function is provided.

If some variables in the program are placed into RTC SLOW memory (for example, using `RTC_DATA_ATTR` attribute), RTC SLOW memory will be kept powered on by default. This can be overridden using `esp_sleep_pd_config()` function, if desired.

Power-down of Flash

By default, to avoid potential issues, `esp_light_sleep_start()` function does not power down flash. To be more specific, it takes time to power down the flash and during this period the system may be woken up, which then actually powers up the flash before this flash could be powered down completely. As a result, there is a chance that the flash may not work properly.

So, in theory, it is ok if you only wake up the system after the flash is completely powered down. However, in reality, the flash power-down period can be hard to predict (for example, this period can be much longer when you add filter capacitors to the flash’s power supply circuit) and uncontrollable (for example, the asynchronous wake-up signals make the actual sleep time uncontrollable).

**Warning:** If a filter capacitor is added to your flash power supply circuit, please do everything possible to avoid powering down flash.

Therefore, it is recommended not to power down flash when using ESP-IDF. For power-sensitive applications, it is recommended to use Kconfig option `CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND` to reduce the power consumption of the flash during Light-sleep, instead of powering down the flash.

It is worth mentioning that PSRAM has a similar Kconfig option `CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND`.

However, for those who have fully understood the risk and are still willing to power down the flash to further reduce the power consumption, please check the following mechanisms:

- Setting Kconfig option `CONFIG_ESP_SLEEP_POWER_DOWN_FLASH` only powers down the flash when the RTC timer is the only wake-up source and the sleep time is longer than the flash power-down period.
- Calling `esp_sleep_pd_config(ESP_PD_DOMAIN_VDDSDIO, ESP_PD_OPTION_OFF)` powers down flash when the RTC timer is not enabled as a wake-up source or the sleep time is longer than the flash power-down period.

**Note:**

- ESP-IDF does not provide any mechanism that can power down the flash in all conditions when Light-sleep.
- `esp_deep_sleep_start()` function forces power down flash regardless of user configuration.

Configuring IOs (Deep-sleep Only)

Some ESP32-S2 IOs have internal pullups or pulldowns, which are enabled by default. If an external circuit drives this pin in Deep-sleep mode, current consumption may increase due to current flowing through these pullups and pulldowns.

To isolate a pin to prevent extra current draw, call `rtc_gpio_isolate()` function.
For example, on ESP32-WROVER module, GPIO12 is pulled up externally, and it also has an internal pulldown in the ESP32 chip. This means that in Deep-sleep, some current flows through these external and internal resistors, increasing Deep-sleep current above the minimal possible value.

Add the following code before `esp_deep_sleep_start()` to remove such extra current:

```c
rtc_gpio_isolate(GPIO_NUM_12);
```

### Entering Sleep

`esp_light_sleep_start()` or `esp_deep_sleep_start()` functions can be used to enter Light-sleep or Deep-sleep modes correspondingly. After that, the system configures the parameters of RTC controller according to the requested wakeup sources and power-down options.

It is also possible to enter sleep modes with no wakeup sources configured. In this case, the chip will be in sleep modes indefinitely until external reset is applied.

### UART Output Handling

Before entering sleep mode, `esp_deep_sleep_start()` will flush the contents of UART FIFOs.

When entering Light-sleep mode using `esp_light_sleep_start()`, UART FIFOs will not be flushed. Instead, UART output will be suspended, and remaining characters in the FIFO will be sent out after wakeup from Light-sleep.

### Checking Sleep Wakeup Cause

`esp_sleep_get_wakeup_cause()` function can be used to check which wakeup source has triggered wakeup from sleep mode.

For touchpad, it is possible to identify which touch pin has caused wakeup using `esp_sleep_get_touchpad_wakeup_status()` functions.

For ext1 wakeup sources, it is possible to identify which touch pin has caused wakeup using `esp_sleep_get_ext1_wakeup_status()` functions.

### Application Example

- `protocols/sntp`: the implementation of basic functionality of Deep-sleep, where ESP module is periodically waken up to retrieve time from NTP server.
- `wifi/power_save`: the usage of Wi-Fi Modem-sleep mode and automatic Light-sleep feature to maintain Wi-Fi connections.
- `system/deep_sleep`: the usage of various Deep-sleep wakeup triggers and ULP coprocessor programming.

### API Reference

#### Header File

- `components/esp_hw_support/include/esp_sleep.h`

This header file can be included with:

```c
#include "esp_sleep.h"
```
Functions

**esp_err_t esp_sleep_disable_wakeup_source** *(esp_sleep_source_t source)*

Disable wakeup source.

This function is used to deactivate wake up trigger for source defined as parameter of the function.

See docs/sleep-modes.rst for details.

**Note:** This function does not modify wake up configuration in RTC. It will be performed in esp_deep_sleep_start/esp_light_sleep_start function.

**Parameters**

- **source** -- number of source to disable of type esp_sleep_source_t

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if trigger was not active

**esp_err_t esp_sleep_enable_ulp_wakeup** *(void)*

Enable wakeup by ULP coprocessor.

**Note:** On ESP32, ULP wakeup source cannot be used when RTC_PERIPH power domain is forced, to be powered on (ESP_PD_OPTION_ON) or when ext0 wakeup source is used.

**Returns**

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if additional current by touch (CONFIG_RTC_EXT_CRYST_ADDIT_CURRENT) is enabled.
- ESP_ERR_INVALID_STATE if ULP co-processor is not enabled or if wakeup triggers conflict

**esp_err_t esp_sleep_enable_timer_wakeup** *(uint64_t time_in_us)*

Enable wakeup by timer.

**Parameters**

- **time_in_us** -- time before wakeup, in microseconds

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if value is out of range (TBD)

**esp_err_t esp_sleep_enable_touchpad_wakeup** *(void)*

Enable wakeup by touch sensor.

**Note:** On ESP32, touch wakeup source cannot be used when RTC_PERIPH power domain is forced to be powered on (ESP_PD_OPTION_ON) or when ext0 wakeup source is used.

**Note:** The FSM mode of the touch button should be configured as the timer trigger mode.

**Returns**

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if additional current by touch (CONFIG_RTC_EXT_CRYST_ADDIT_CURRENT) is enabled.
- ESP_ERR_INVALID_STATE if wakeup triggers conflict
Chapter 2. API Reference

```c
void esp_sleep_get_touchpad_wakeup_status(void)
Get the touch pad which caused wakeup.

If wakeup was caused by another source, this function will return TOUCH_PAD_MAX;

Returns touch pad which caused wakeup
```

```c
bool esp_sleep_is_valid_wakeup_gpio(gpio_num_t gpio_num)
Returns true if a GPIO number is valid for use as wakeup source.
```

**Note:** For SoCs with RTC IO capability, this can be any valid RTC IO input pin.

**Parameters**
- `gpio_num` – Number of the GPIO to test for wakeup source capability

**Returns**
- True if this GPIO number will be accepted as a sleep wakeup source.

```c
esp_err_t esp_sleep_enable_ext0_wakeup(gpio_num_t gpio_num, int level)
Enable wakeup using a pin.
This function uses external wakeup feature of RTC IO peripheral. It will work only if RTC peripherals are
kept on during sleep.
This feature can monitor any pin which is an RTC IO. Once the pin transitions into the state given by level
argument, the chip will be woken up.

**Note:** This function does not modify pin configuration. The pin is configured in
`esp_deep_sleep_start/esp_light_sleep_start`, immediately before entering sleep mode.

**Note:** ESP32: ext0 wakeup source can not be used together with touch or ULP wakeup sources.

**Parameters**
- `gpio_num` – GPIO number used as wakeup source. Only GPIOs with the RTC functionality
can be used. For different SoCs, the related GPIOs are:
  - ESP32: 0, 2, 4, 12-15, 25-27, 32-39;
  - ESP32-S2: 0-21;
  - ESP32-S3: 0-21.
- `level` – input level which will trigger wakeup (0=low, 1=high)

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the selected GPIO is not an RTC GPIO, or the mode is
  invalid
- ESP_ERR_INVALID_STATE if wakeup triggers conflict

```c
esp_err_t esp_sleep_enable_ext1_wakeup(uint64_t io_mask, esp_sleep_ext1_wakeup_mode_t level_mode)
Enable wakeup using multiple pins.
This function uses external wakeup feature of RTC controller. It will work even if RTC peripherals are shut
down during sleep.
This feature can monitor any number of pins which are in RTC IOs. Once selected pins go into the state given
by level_mode argument, the chip will be woken up.

**Note:** This function does not modify pin configuration. The pins are configured in
`esp_deep_sleep_start/esp_light_sleep_start`, immediately before entering sleep mode.
```
Note: Internal pullups and pulldowns don’t work when RTC peripherals are shut down. In this case, external resistors need to be added. Alternatively, RTC peripherals (and pullups/pulldowns) may be kept enabled using esp_sleep_pd_config function. If we turn off the RTC_PERIPH domain or certain chips lack the RTC_PERIPH domain, we will use the HOLD feature to maintain the pull-up and pull-down on the pins during sleep. HOLD feature will be acted on the pin internally before the system entering sleep, and this can further reduce power consumption.

Parameters

- **io_mask** – Bit mask of GPIO numbers which will cause wakeup. Only GPIOs which have RTC functionality can be used in this bit map. For different SoCs, the related GPIOs are:
  - ESP32: 0, 2, 4, 12-15, 25-27, 32-39
  - ESP32-S2: 0-21
  - ESP32-S3: 0-21
  - ESP32-C6: 0-7
  - ESP32-H2: 7-14

- **level_mode** – Select logic function used to determine wakeup condition: When target chip is ESP32:
  - ESP_EXT1_WAKEUP_ALL_LOW: wake up when all selected GPIOs are low
  - ESP_EXT1_WAKEUP_ANY_HIGH: wake up when any of the selected GPIOs is high
When target chip is ESP32-S2, ESP32-S3, ESP32-C6 or ESP32-H2:
  - ESP_EXT1_WAKEUP_ANY_LOW: wake up when any of the selected GPIOs is low
  - ESP_EXT1_WAKEUP_ANY_HIGH: wake up when any of the selected GPIOs is high

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if any of the selected GPIOs is not an RTC GPIO, or mode is invalid

```c
esp_err_t esp_sleep_enable_gpio_wakeup (void)
```

Enable wakeup from light sleep using GPIOs.

Each GPIO supports wakeup function, which can be triggered on either low level or high level. Unlike EXT0 and EXT1 wakeup sources, this method can be used both for all IOs: RTC IOs and digital IOs. It can only be used to wakeup from light sleep though.

To enable wakeup, first call gpio_wakeup_enable, specifying gpio number and wakeup level, for each GPIO which is used for wakeup. Then call this function to enable wakeup feature.

Note: On ESP32, GPIO wakeup source can not be used together with touch or ULP wakeup sources.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if wakeup triggers conflict

```c
esp_err_t esp_sleep_enable_uart_wakeup (int uart_num)
```

Enable wakeup from light sleep using UART.

Use uart_set_wakeup_threshold function to configure UART wakeup threshold.

Wakeup from light sleep takes some time, so not every character sent to the UART can be received by the application.

Note: ESP32 does not support wakeup from UART2.

Parameters **uart_num** – UART port to wake up from
Chapter 2. API Reference

Returns
- ESP_OK on success
- ESP_ERR_INVALID_ARG if wakeup from given UART is not supported

`esp_err_t esp_sleep_enable_bt_wakeup(void)`
Enable wakeup by bluetooth.

Returns
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if wakeup from bluetooth is not supported

`esp_err_t esp_sleep_disable_bt_wakeup(void)`
Disable wakeup by bluetooth.

Returns
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if wakeup from bluetooth is not supported

`esp_err_t esp_sleep_enable_wifi_wakeup(void)`
Enable wakeup by WiFi MAC.

Returns
- ESP_OK on success

`esp_err_t esp_sleep_disable_wifi_wakeup(void)`
Disable wakeup by WiFi MAC.

Returns
- ESP_OK on success

`esp_err_t esp_sleep_enable_wifi_beacon_wakeup(void)`
Enable beacon wakeup by WiFi MAC, it will wake up the system into modem state.

Returns
- ESP_OK on success

`esp_err_t esp_sleep_disable_wifi_beacon_wakeup(void)`
Disable beacon wakeup by WiFi MAC.

Returns
- ESP_OK on success

`uint64_t esp_sleep_get_ext1_wakeup_status(void)`
Get the bit mask of GPIOs which caused wakeup (ext1)
If wakeup was caused by another source, this function will return 0.

Returns
bit mask, if GPIOn caused wakeup, BIT(n) will be set

`esp_err_t esp_sleep_pd_config(esp_sleep_pd_domain_t domain, esp_sleep_pd_option_t option)`
Set power down mode for an RTC power domain in sleep mode.
If not set set using this API, all power domains default to ESP_PD_OPTION_AUTO.

Parameters
- `domain` - power domain to configure
- `option` - power down option (ESP_PD_OPTION_OFF, ESP_PD_OPTION_ON, or ESP_PD_OPTION_AUTO)

Returns
- ESP_OK on success
- ESP_ERR_INVALID_ARG if either of the arguments is out of range
**esp_err_t** esp_deep_sleep_try_to_start (void)

Enter deep sleep with the configured wakeup options.

The reason for the rejection can be such as a short sleep time.

**Note:** In general, the function does not return, but if the sleep is rejected, then it returns from it.

Returns

- No return - If the sleep is not rejected.
- ESP_ERR_SLEEP_REJECT sleep request is rejected (wakeup source set before the sleep request)

**void** esp_deep_sleep_start (void)

Enter deep sleep with the configured wakeup options.

**Note:** The function does not do a return (no rejection). Even if wakeup source set before the sleep request it goes to deep sleep anyway.

**esp_err_t** esp_light_sleep_start (void)

Enter light sleep with the configured wakeup options.

**Returns**

- ESP_OK on success (returned after wakeup)
- ESP_ERR_SLEEP_REJECT sleep request is rejected (wakeup source set before the sleep request)
- ESP_ERR_SLEEP_TOO_SHORT_SLEEP_DURATION after deducting the sleep flow overhead, the final sleep duration is too short to cover the minimum sleep duration of the chip, when rtc timer wakeup source enabled

**esp_err_t** esp_deep_sleep_try (uint64_t time_in_us)

Enter deep-sleep mode.

The device will automatically wake up after the deep-sleep time. Upon waking up, the device calls deep sleep wake stub, and then proceeds to load application.

Call to this function is equivalent to a call to esp_deep_sleep_enable_timer_wakeup followed by a call to esp_deep_sleep_start.

The reason for the rejection can be such as a short sleep time.

**Note:** In general, the function does not return, but if the sleep is rejected, then it returns from it.

**Parameters**

- **time_in_us** ~deep-sleep time, unit: microsecond

**Returns**

- No return - If the sleep is not rejected.
- ESP_ERR_SLEEP_REJECT sleep request is rejected (wakeup source set before the sleep request)

**void** esp_deep_sleep (uint64_t time_in_us)

Enter deep-sleep mode.

The device will automatically wake up after the deep-sleep time. Upon waking up, the device calls deep sleep wake stub, and then proceeds to load application.
Call to this function is equivalent to a call to esp_deep_sleep_enable_timer_wakeup followed by a call to esp_deep_sleep_start.

**Note:** The function does not do a return (no rejection). Even if wakeup source set before the sleep request it goes to deep sleep anyway.

<table>
<thead>

<td>deep-sleep time, unit: microsecond</td>
</tr>
</tbody>
</table>

```c
esp_err_t esp_deep_sleep_register_hook(esp_deep_sleep_cb_t new_dslp_cb)
```

Register a callback to be called from the deep sleep prepare.

**Warning:** deepsleep callbacks should without parameters, and MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>new_dslp_cb</strong></td>
<td>Callback to be called</td>
</tr>
</tbody>
</table>

```c
void esp_deep_sleep_deregister_hook(esp_deep_sleep_cb_t old_dslp_cb)
```

Unregister an deepsleep callback.

<table>
<thead>
<tr>

```c
esp_sleep_wakeup_cause_t esp_sleep_get_wakeup_cause(void)
```

Get the wakeup source which caused wakeup from sleep.

<table>
<thead>
<tr>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cause of wake up from last sleep (deep sleep or light sleep)</td>
<td></td>
</tr>
</tbody>
</table>

```c
void esp_wake_deep_sleep(void)
```

Default stub to run on wake from deep sleep.

- Allows for executing code immediately on wake from sleep, before the software bootloader or ESP-IDF app has started up.
- This function is weak-linked, so you can implement your own version to run code immediately when the chip wakes from sleep.

See docs/deep-sleep-stub.rst for details.

```c
void esp_set_deep_sleep_wake_stub(esp_deep_sleep_wake_stub_fn_t new_stub)
```

Install a new stub at runtime to run on wake from deep sleep.

If implementing esp_wake_deep_sleep() then it is not necessary to call this function.

However, it is possible to call this function to substitute a different deep sleep stub. Any function used as a deep sleep stub must be marked RTC_IRAM_ATTR, and must obey the same rules given for esp_wake_deep_sleep().

```c
void esp_set_deep_sleep_wake_stub_default_entry(void)
```

Set wake stub entry to default esp_wake_stub_entry

```c
esp_deep_sleep_wake_stub_fn_t esp_get_deep_sleep_wake_stub(void)
```

Get current wake from deep sleep stub.

<table>
<thead>
<tr>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return current wake from deep sleep stub, or NULL if no stub is installed</td>
<td></td>
</tr>
</tbody>
</table>

```c
void esp_default_wake_deep_sleep(void)
```

The default esp-idf-provided esp_wake_deep_sleep() stub.

See docs/deep-sleep-stub.rst for details.
void `esp_deep_sleep_disable_rom_logging` (void)
Disable logging from the ROM code after deep sleep.
Using LSB of RTC_STORE4.

void `esp_sleep_config_gpio_isolate` (void)
Configure to isolate all GPIO pins in sleep state.

void `esp_sleep_enable_gpio_switch` (bool enable)
Enable or disable GPIO pins status switching between slept status and waked status.

Parameters enable – decide whether to switch status or not

**Macros**

`ESP_PD_DOMAIN_RTC8M`

**Type Definitions**

typedef void (*`esp_deep_sleep_cb_t`) (void)
typedef `esp_sleep_source_t` `esp_sleep_wakeup_cause_t`
typedef void (*`esp_deep_sleep_wake_stub_fn_t`) (void)
   Function type for stub to run on wake from sleep.

**Enumerations**

enum `esp_sleep_ext1_wakeup_mode_t`
Logic function used for EXT1 wakeup mode.

   Values:

   enumerator `ESP_EXT1_WAKEUP_ANY_LOW`
   Wake the chip when any of the selected GPIOs go low.

   enumerator `ESP_EXT1_WAKEUP_ANY_HIGH`
   Wake the chip when any of the selected GPIOs go high.

   enumerator `ESP_EXT1_WAKEUP_ALL_LOW`

enum `esp_sleep_pd_domain_t`
Power domains which can be powered down in sleep mode.

   Values:

   enumerator `ESP_PD_DOMAIN_RTC_PERIPH`
   RTC IO, sensors and ULP co-processor.

   enumerator `ESP_PD_DOMAIN_RTC_SLOW_MEM`
   RTC slow memory.

   enumerator `ESP_PD_DOMAIN_RTC_FAST_MEM`
   RTC fast memory.
enumerator ESP_PD_DOMAIN_XTAL
    XTAL oscillator.

enumerator ESP_PD_DOMAIN_RC_FAST
    Internal Fast oscillator.

enumerator ESP_PD_DOMAIN_VDDSDIO
    VDD_SDIO.

enumerator ESP_PD_DOMAIN_MAX
    Number of domains.

enum esp_sleep_pd_option_t
    Power down options.
Values:

enumerator ESP_PD_OPTION_OFF
    Power down the power domain in sleep mode.

enumerator ESP_PD_OPTION_ON
    Keep power domain enabled during sleep mode.

enumerator ESP_PD_OPTION_AUTO
    Keep power domain enabled in sleep mode, if it is needed by one of the wakeup options. Otherwise
    power it down.

enum esp_sleep_source_t
    Sleep wakeup cause.
Values:

enumerator ESP_SLEEP_WAKEUP_UNDEFINED
    In case of deep sleep, reset was not caused by exit from deep sleep.

enumerator ESP_SLEEP_WAKEUP_ALL
    Not a wakeup cause, used to disable all wakeup sources with esp_sleep_disable_wakeup_source.

enumerator ESP_SLEEP_WAKEUP_EXT0
    Wakeup caused by external signal using RTC_IO.

enumerator ESP_SLEEP_WAKEUP_EXT1
    Wakeup caused by external signal using RTC_CNTL.

enumerator ESP_SLEEP_WAKEUP_TIMER
    Wakeup caused by timer.

enumerator ESP_SLEEP_WAKEUP_TOUCHPAD
    Wakeup caused by touchpad.
enumerator `ESP_SLEEP_WAKEUP_ULP`
   Wakeup caused by ULP program.

enumerator `ESP_SLEEP_WAKEUP_GPIO`
   Wakeup caused by GPIO (light sleep only on ESP32, S2 and S3)

enumerator `ESP_SLEEP_WAKEUP_UART`
   Wakeup caused by UART (light sleep only)

enumerator `ESP_SLEEP_WAKEUP_WIFI`
   Wakeup caused by WIFI (light sleep only)

enumerator `ESP_SLEEP_WAKEUP_COCPU`
   Wakeup caused by COCPU int.

enumerator `ESP_SLEEP_WAKEUP_COCPU_TRAP_TRIG`
   Wakeup caused by COCPU crash.

enumerator `ESP_SLEEP_WAKEUP_BT`
   Wakeup caused by BT (light sleep only)

enum `esp_sleep_mode_t`
   Sleep mode.
   Values:

   enumerator `ESP_SLEEP_MODE_LIGHT_SLEEP`
      light sleep mode

   enumerator `ESP_SLEEP_MODE_DEEP_SLEEP`
      deep sleep mode

enum [anonymous]
   Values:

   enumerator `ESP_ERR_SLEEP_REJECT`

   enumerator `ESP_ERR_SLEEP_TOO_SHORT_SLEEP_DURATION`

2.9.29 SoC Capabilities

This section lists the macro definitions of the ESP32-S2’s SoC hardware capabilities. These macros are commonly used by conditional-compilation directives (e.g., `#if`) in ESP-IDF to determine which hardware-dependent features are supported, thus control what portions of code are compiled.

**Warning:** These macro definitions are currently not considered to be part of the public API, and may be changed in a breaking manner (see ESP-IDF Versions for more details).

2.9.30 System Time

Overview

ESP32-S2 uses two hardware timers for the purpose of keeping system time. System time can be kept by using either one or both of the hardware timers depending on the application’s purpose and accuracy requirements for system time. The two hardware timers are:

- **RTC timer**: This timer allows time keeping in various sleep modes, and can also persist time keeping across any resets (with the exception of power-on resets which reset the RTC timer). The frequency deviation depends on the RTC Timer Clock Sources and affects the accuracy only in sleep modes, in which case the time will be measured at 6.6667 μs resolution.

- **High-resolution timer**: This timer is not available in sleep modes and will not persist over a reset, but has greater accuracy. The timer uses the APB_CLK clock source (typically 80 MHz), which has a frequency deviation of less than ±10 ppm. Time will be measured at 1 μs resolution.

The possible combinations of hardware timers used to keep system time are listed below:

- RTC and high-resolution timer (default)
- RTC
- High-resolution timer
- None

It is recommended that users stick to the default option as it provides the highest accuracy. However, users can also select a different setting via the `CONFIG_NEWLIB_TIME_SYSCALL` configuration option.
RTC Timer Clock Sources

The RTC timer has the following clock sources:

- **Internal 90 kHz RC oscillator** (default): Features the lowest Deep-sleep current consumption and no dependence on any external components. However, the frequency stability of this clock source is affected by temperature fluctuations, so time may drift in both Deep-sleep and Light-sleep modes.
- **External 32 kHz crystal**: Requires a 32 kHz crystal to be connected to the XTAL_32K_P and XTAL_32K_N pins. This source provides a better frequency stability at the expense of a slightly higher (by 1 μA) Deep-sleep current consumption.
- **External 32 kHz oscillator at XTAL_32K_P pin**: Allows using a 32 kHz clock generated by an external circuit. The external clock signal must be connected to the XTAL_32K_P pin. The amplitude should be less than 1.2 V for sine wave signal and less than 1 V for square wave signal. Common mode voltage should be in the range of 0.1 < Vcm < 0.5xVamp, where Vamp stands for signal amplitude. In this case, the XTAL_32K_P pin cannot be used as a GPIO pin.
- **Internal 8.5 MHz oscillator, divided by 256 (about 33 kHz)**: Provides better frequency stability than the Internal 90 kHz RC oscillator at the expense of a higher (by 5 μA) Deep-sleep current consumption. It also does not require external components.

The choice depends on your requirements for system time accuracy and power consumption in sleep modes. To modify the RTC clock source, set `CONFIG_RTC_CLK_SRC` in project configuration.

More details about the wiring requirements for the external crystal or external oscillator, please refer to [ESP32-S2 Hardware Design Guidelines](#).

Get Current Time

To get the current time, use the POSIX function `gettimeofday()`. Additionally, you can use the following standard C library functions to obtain time and manipulate it:

```c
gettimeofday
time
time
asctime
clock
time
dftime
gmtime
localtime
mktime
strftime
adjtime
```

To stop smooth time adjustment and update the current time immediately, use the POSIX function `settimeofday()`.

If you need to obtain time with one second resolution, use the following code snippet:

```c
time_t now;
char strftime_buf[64];
struct tm timeinfo;
time(&now);
// Set timezone to China Standard Time
setenv("TZ", "CST-8", 1);
tzset();
localtime_r(&now, &timeinfo);
strftime(strftime_buf, sizeof(strftime_buf), "%c", &timeinfo);
ESP_LOGI(TAG, "The current date/time in Shanghai is: \%s", strftime_buf);
```
If you need to obtain time with one microsecond resolution, use the code snippet below:

```c
struct timeval tv_now;
gettimeofday(&tv_now, NULL);
int64_t time_us = (int64_t)tv_now.tv_sec * 1000000L + (int64_t)tv_now.tv_usec;
```

### SNTP Time Synchronization

To set the current time, you can use the POSIX functions `settimeofday()` and `adjtime()`. They are used internally in the lwIP SNTP library to set current time when a response from the NTP server is received. These functions can also be used separately from the lwIP SNTP library.

Some lwIP APIs, including SNTP functions, are not thread safe, so it is recommended to use `esp_netif component` when interacting with SNTP module.

To initialize a particular SNTP server and also start the SNTP service, simply create a default SNTP server configuration with a particular server name, then call `esp_netif_snntp_init()` to register that server and start the SNTP service.

```c
esp_snntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG("pool.ntp.org");
esp_netif_snntp_init(&config);
```

This code automatically performs time synchronization once a reply from the SNTP server is received. Sometimes it is useful to wait until the time gets synchronized, `esp_netif_snntp_sync_wait()` can be used for this purpose:

```c
if (esp_netif_snntp_sync_wait(pdMS_TO_TICKS(10000)) != ESP_OK) {
    printf("Failed to update system time within 10s timeout\n");
}
```

To configure multiple NTP servers (or use more advanced settings, such as DHCP provided NTP servers), please refer to the detailed description of SNTP API in espr例if documentation.

The lwIP SNTP library could work in one of the following sync modes:

- `SNTP_SYNC_MODE_IMMED` (default): Updates system time immediately upon receiving a response from the SNTP server after using `settimeofday()`.
- `SNTP_SYNC_MODE_SMOOTH`: Updates time smoothly by gradually reducing time error using the function `adjtime()`. If the difference between the SNTP response time and system time is more than 35 minutes, update system time immediately by using `settimeofday()`.

If you want to choose the `SNTP_SYNC_MODE_SMOOTH` mode, please set the `esp_snntp_config::smooth` to `true` in the SNTP configuration struct. Otherwise (and by default) the `SNTP_SYNC_MODE_IMMED` mode will be used.

For setting a callback function that is called when time gets synchronized, use the `esp_snntp_config::sync_cb` field in the configuration struct.

An application with this initialization code periodically synchronizes the time. The time synchronization period is determined by `CONFIG_LWIP_SNTP_UPDATE_DELAY` (the default value is one hour). To modify the variable, set `CONFIG_LWIP_SNTP_UPDATE_DELAY` in project configuration.

A code example that demonstrates the implementation of time synchronization based on the lwIP SNTP library is provided in the `protocols/sntp` directory.

Note that it is also possible to use lwIP API directly, but care must be taken to thread safety. Here we list the thread-safe APIs:

- `sntp_set_time_sync_notification_cb()` can be used to set a callback function that notifies of the time synchronization process.
- `sntp_get_sync_status()` and `sntp_set_sync_status()` can be used to get/set time synchronization status.
- `sntp_set_sync_mode()` can be used to set the synchronization mode.
Chapter 2. API Reference

- `esp_sntp_setoperatingmode()` sets the preferred operating mode: `ESP_SNTP_OPMODE_POLL` and `esp_sntp_init()` initializes SNTP module.
- `esp_sntp_setservername()` configures one SNTP server.

**Timezones**

To set the local timezone, use the following POSIX functions:

1. Call `setenv()` to set the `TZ` environment variable to the correct value based on the device location. The format of the time string is the same as described in the GNU libc documentation (although the implementation is different).
2. Call `tzset()` to update C library runtime data for the new timezone.

Once these steps are completed, call the standard C library function `localtime()`, and it returns the correct local time taking into account the timezone offset and daylight saving time.

**Year 2036 and 2038 Overflow Issues**

**SNTP/NTP 2036 Overflow** SNTP/NTP timestamps are represented as 64-bit unsigned fixed point numbers, where the first 32 bits represent the integer part, and the last 32 bits represent the fractional part. The 64-bit unsigned fixed point number represents the number of seconds since 00:00 on 1st of January 1900, thus SNTP/NTP times will overflow in the year 2036.

To address this issue, lifetime of the SNTP/NTP timestamps has been extended by convention by using the MSB (bit 0 by convention) of the integer part to indicate time ranges between years 1968 to 2104 (see RFC2030 for more details). This convention is implemented in lwIP library SNTP module. Therefore SNTP-related functions in ESP-IDF are future-proof until year 2104.

**Unix Time 2038 Overflow** Unix time (type `time_t`) was previously represented as a 32-bit signed integer, leading to an overflow in year 2038 (i.e., Y2K38 issue). To address the Y2K38 issue, ESP-IDF uses a 64-bit signed integer to represent `time_t` starting from release v5.0, thus deferring `time_t` overflow for another 292 billion years.

**API Reference**

**Header File**

- `components/lwip/include/apps/esp_sntp.h`

This header file can be included with:

```c
#include "esp_sntp.h"
```

- This header file is a part of the API provided by the lwip component. To declare that your component depends on lwip, add the following to your CMakeLists.txt:

```cmake
REQUIRES lwip
```

or

```cmake
PRIV_REQUIRES lwip
```

**Functions**

```c
void sntp_sync_time (struct timeval *tv)
```

This function updates the system time.

This is a weak-linked function. It is possible to replace all SNTP update functionality by placing a `sntp_sync_time()` function in the app firmware source. If the default implementation is used, calling `sntp_set_sync_mode()` allows the time synchronization mode to be changed to instant or smooth. If a callback
function is registered via sntp_set_time_sync_notification_cb(), it will be called following time synchroniza-

Parameters  tv  –Time received from SNTP server.

```c
void sntp_set_sync_mode (sntp_sync_mode_t sync_mode)
```

Set the sync mode.

Modes allowed: SNTP_SYNC_MODE_IMMED and SNTP_SYNC_MODE_SMOOTH.

Parameters  sync_mode  –Sync mode.

```c
sntp_sync_mode_t sntp_get_sync_mode (void)
```

Get set sync mode.

Returns  SNTP_SYNC_MODE_IMMED: Update time immediately.
SNTP_SYNC_MODE_SMOOTH: Smooth time updating.

```c
sntp_sync_status_t sntp_get_sync_status (void)
```

Get status of time sync.

After the update is completed, the status will be returned as SNTP_SYNC_STATUS_COMPLETED. After that, the status will be reset to SNTP_SYNC_STATUS_RESET. If the update operation is not completed yet, the status will be SNTP_SYNC_STATUS_RESET. If a smooth mode was chosen and the synchronization is still continuing (adjtime works), then it will be SNTP_SYNC_STATUS_IN_PROGRESS.

Returns  SNTP_SYNC_STATUS_RESET: Reset status. SNTP_SYNC_STATUS_COMPLETED: Time is synchronized. SNTP_SYNC_STATUS_IN_PROGRESS: Smooth time sync in progress.

```c
void sntp_set_sync_status (sntp_sync_status_t sync_status)
```

Set status of time sync.

Parameters  sync_status  –status of time sync (see sntp_sync_status_t)

```c
void sntp_set_time_sync_notification_cb (sntp_time_change_t callback)
```

Set a callback function for time synchronization notification.

Parameters  callback  –a callback function

```c
void sntp_set_sync_interval (uint32_t interval_ms)
```

Set the sync interval of SNTP operation.

Note: SNTPv4 RFC 4330 enforces a minimum sync interval of 15 seconds. This sync interval will be used in the next attempt update time through SNTP. To apply the new sync interval call the sntp_restart() function, otherwise, it will be applied after the last interval expired.

Parameters  interval_ms  –The sync interval in ms. It cannot be lower than 15 seconds, otherwise 15 seconds will be set.

```c
uint32_t sntp_get_sync_interval (void)
```

Get the sync interval of SNTP operation.

Returns  the sync interval

```c
bool sntp_restart (void)
```

Restart SNTP.

Returns  True - Restart False - SNTP was not initialized yet

```c
void esp_sntp_setoperatingmode (esp_sntp_operatingmode_t operating_mode)
```

Sets SNTP operating mode. The mode has to be set before init.

Parameters  operating_mode  –Desired operating mode

```c
void esp_sntp_init (void)
```

Init and start SNTP service.
void esp_sntp_stop (void)
  Stops SNTP service.

void esp_sntp_setserver (u8_t idx, const ip_addr_t *addr)
  Sets SNTP server address.

    Parameters
      • \textit{idx} – Index of the server
      • \textit{addr} – IP address of the server

void esp_sntp_setservername (u8_t idx, const char *server)
  Sets SNTP hostname.

    Parameters
      • \textit{idx} – Index of the server
      • \textit{server} – Name of the server

const char * esp_sntp_getservername (u8_t idx)
  Gets SNTP server name.

    Parameters \textit{idx} – Index of the server
    Returns Name of the server

const ip_addr_t * esp_sntp_getserver (u8_t idx)
  Get SNTP server IP.

    Parameters \textit{idx} – Index of the server
    Returns IP address of the server

bool esp_sntp_enabled (void)
  Checks if sntp is enabled.

    Returns true if sntp module is enabled

static inline void sntp_setoperatingmode (u8_t operating_mode)
  if not build within lwip, provide translating inlines, that will warn about thread safety

static inline void sntp_servermode_dhcp (int set_servers_from_dhcp)

static inline void sntp_setservername (u8_t idx, const char *server)

static inline void sntp_init (void)

static inline const char *sntp_getservername (u8_t idx)

static inline const ip_addr_t *sntp_getserver (u8_t idx)

\textbf{Macros}

\textbf{esp_sntp_sync_time}
  Aliases for esp_sntp prefixed API (inherently thread safe)

\textbf{esp_sntp_set_sync_mode}

\textbf{esp_sntp_get_sync_mode}

\textbf{esp_sntp_get_sync_status}

\textbf{esp_sntp_set_sync_status}
### Chapter 2. API Reference

- `esp_sntp_set_time_sync_notification_cb`
- `esp_sntp_set_sync_interval`
- `esp_sntp_get_sync_interval`
- `esp_sntp_restart`

#### Type Definitions

```c
typedef void (*sntp_sync_time_cb_t)(struct timeval *tv)
```

SNTP callback function for notifying about time sync event.

**Param tv** Time received from SNTP server.

#### Enumerations

- **Enum** `sntp_sync_mode_t`
  
  SNTP time update mode.
  
  **Values**:
  
  - **Enumerator** `SNTP_SYNC_MODE_IMMED`
    
    Update system time immediately when receiving a response from the SNTP server.
  
  - **Enumerator** `SNTP_SYNC_MODE_SMOOTH`
    
    Smooth time updating. Time error is gradually reduced using adjtime function. If the difference between SNTP response time and system time is large (more than 35 minutes) then update immediately.

- **Enum** `sntp_sync_status_t`
  
  SNTP sync status.
  
  **Values**:
  
  - **Enumerator** `SNTP_SYNC_STATUS_RESET`
  
  - **Enumerator** `SNTP_SYNC_STATUS_COMPLETED`
  
  - **Enumerator** `SNTP_SYNC_STATUS_IN_PROGRESS`

- **Enum** `esp_sntp_operatingmode_t`
  
  SNTP operating modes per lwip SNTP module.
  
  **Values**:
  
  - **Enumerator** `ESP_Sntp_OPMODE_POLL`
  
  - **Enumerator** `ESP_Sntp_OPMODE_LISTENONLY`
2.9.31 Asynchronous Memory Copy

**Overview**

ESP32-S2 has a DMA engine which can help to offload internal memory copy operations from the CPU in an asynchronous way.

The async memcpy API wraps all DMA configurations and operations. The signature of `esp_async_memcpy()` is almost the same as the standard libc `memcpy` function.

The DMA allows multiple memory copy requests to be queued up before the first one is completed, which allows overlap of computation and memory copy. Moreover, it is still possible to know the exact time when a memory copy request is completed by registering an event callback.

**Configure and Install Driver**

There are several ways to install the async memcpy driver, depending on the underlying DMA engine:

- `esp_async_memcpy_install_cpdma()` is used to install the async memcpy driver based on the CP DMA engine.
- `esp_async_memcpy_install()` is a generic API to install the async memcpy driver with a default DMA engine. If the SoC has the CP DMA engine, the default DMA engine is CP DMA. Otherwise, the default DMA engine is AHB GDMA.

Driver configuration is described in `async_memcpy_config_t`:

- `backlog`: This is used to configure the maximum number of memory copy transactions that can be queued up before the first one is completed. If this field is set to zero, then the default value 4 will be applied.
- `sram_trans_align`: Declare SRAM alignment for both data address and copy size, set to zero if the data has no restriction in alignment. If set to a quadruple value (i.e., 4X), the driver will enable the burst mode internally, which is helpful for some performance related application.
- `psram_trans_align`: Declare PSRAM alignment for both data address and copy size. User has to give it a valid value (only 16, 32, 64 are supported) if the destination of memcpy is located in PSRAM. The default alignment (i.e., 16) will be applied if it is set to zero. Internally, the driver configures the size of block used by DMA to access PSRAM, according to the alignment.
- `flags`: This is used to enable some special driver features.

```c
async_memcpy_config_t config = ASYNC_MEMCPY_DEFAULT_CONFIG();
// update the maximum data stream supported by underlying DMA engine
config.backlog = 8;
async_memcpy_handle_t driver = NULL;
ESP_ERROR_CHECK(esp_async_memcpy_install(&config, &driver)); // install driver—
--with default DMA engine
```

**Send Memory Copy Request**

`esp_async_memcpy()` is the API to send memory copy request to DMA engine. It must be called after driver is installed successfully. This API is thread safe, so it can be called from different tasks.

Different from the libc version of memcpy, you can optionally pass a callback to `esp_async_memcpy()`, so that you can be notified when the memory copy is finished. Note that the callback is executed in the ISR context, please make sure you will not call any blocking functions in the callback.

The prototype of the callback function is `async_memcpy_isr_cb_t`. The callback function should only return true if it wakes up a high priority task by RTOS APIs like `xSemaphoreGiveFromISR()`.
// Callback implementation, running in ISR context
static bool my_async_memcpy_cb(async_memcpy_handle_t mcp_hdl, async_memcpy_event_t *event, void *cb_args)
{
    SemaphoreHandle_t sem = (SemaphoreHandle_t)cb_args;
    BaseType_t high_task_wakeup = pdFALSE;
    xSemaphoreGiveFromISR(semphr, &high_task_wakeup); // high_task_wakeup set to pdTRUE if some high priority task unblocked
    return high_task_wakeup == pdTRUE;
}

// Create a semaphore used to report the completion of async memcpy
SemaphoreHandle_t semphr = xSemaphoreCreateBinary();

// Called from user's context
ESP_ERROR_CHECK(esp_async_memcpy(driver_handle, to, from, copy_len, my_async_memcpy_cb, my_semaphore));
// Do something else here
xSemaphoreTake(my_semaphore, portMAX_DELAY); // Wait until the buffer copy is done

Uninstall Driver

esp_async_memcpy_uninstall() is used to uninstall asynchronous memcpy driver. It is not necessary to uninstall the driver after each memcpy operation. If you know your application will not use this driver anymore, then this API can recycle the memory and other hardware resources for you.

API Reference

Header File

- components/esp_hw_support/include/esp_async_memcpy.h
- This header file can be included with:

```c
#include "esp_async_memcpy.h"
```

Functions

`esp_err_t esp_async_memcpy_install_cpdma(const async_memcpy_config_t *config, async_memcpy_handle_t *mcp)`

Install async memcpy driver, with CPDMA as the backend.

**Note:** CPDMA is a CPU peripheral, aiming for memory copy.

**Parameters**
- `config` - [in] Configuration of async memcpy
- `mcp` - [out] Returned driver handle

**Returns**
- ESP_OK: Install async memcpy driver successfully
- ESP_ERR_INVALID_ARG: Install async memcpy driver failed because of invalid argument
- ESP_ERR_NO_MEM: Install async memcpy driver failed because out of memory
- ESP_FAIL: Install async memcpy driver failed because of other error

`esp_err_t esp_async_memcpy_install(const async_memcpy_config_t *config, async_memcpy_handle_t *mcp)`
Chapter 2. API Reference

Install async memcpy driver with the default DMA backend.

**Note:** On chip with CPDMA support, CPDMA is the default choice. On chip with AHB-GDMA support, AHB-GDMA is the default choice.

### Parameters

- **config** -in Configuration of async memcpy
- **mcp** -out Returned driver handle

### Returns

- ESP_OK: Install async memcpy driver successfully
- ESP_ERR_INVALID_ARG: Install async memcpy driver failed because of invalid argument
- ESP_ERR_NO_MEM: Install async memcpy driver failed because out of memory
- ESP_FAIL: Install async memcpy driver failed because of other error

```c
esp_err_t esp_async_memcpy_uninstall (async_memcpy_handle_t mcp)
```

Uninstall async memcpy driver.

**Parameters** mcp -in Handle of async memcpy driver that returned from esp_async_memcpy_install

**Returns**

- ESP_OK: Uninstall async memcpy driver successfully
- ESP_ERR_INVALID_ARG: Uninstall async memcpy driver failed because of invalid argument
- ESP_FAIL: Uninstall async memcpy driver failed because of other error

```c
esp_err_t esp_async_memcpy (async_memcpy_handle_t mcp, void *dst, void *src, size_t n, async_memcpy_isr_cb_t cb_isr, void *cb_args)
```

Send an asynchronous memory copy request.

**Note:** The callback function is invoked in interrupt context, never do blocking jobs in the callback.

### Parameters

- **mcp** -in Handle of async memcpy driver that returned from esp_async_memcpy_install
- **dst** -in Destination address (copy to)
- **src** -in Source address (copy from)
- **n** -in Number of bytes to copy
- **cb_isr** -in Callback function, which got invoked in interrupt context. Set to NULL can bypass the callback.
- **cb_args** -in User defined argument to be passed to the callback function

### Returns

- ESP_OK: Send memory copy request successfully
- ESP_ERR_INVALID_ARG: Send memory copy request failed because of invalid argument
- ESP_FAIL: Send memory copy request failed because of other error

### Structures

```c
struct async_memcpy_event_t
```

Async memory copy event data.
Public Members

void *data
   Event data

struct async_memcpy_config_t
   Type of async memcpy configuration.

Public Members

uint32_t backlog
   Maximum number of transactions that can be prepared in the background

size_t sram_trans_align
   DMA transfer alignment (both in size and address) for SRAM memory

size_t psram_trans_align
   DMA transfer alignment (both in size and address) for PSRAM memory

uint32_t flags
   Extra flags to control async memcpy feature

Macros

ASYNC_MEMCPY_DEFAULT_CONFIG()
   Default configuration for async memcpy.

Type Definitions

typedef struct async_memcpy_context_t *async_memcpy_handle_t
   Async memory copy driver handle.

typedef bool (*async_memcpy_isr_cb_t)(async_memcpy_handle_t mcp_hdl, async_memcpy_event_t *event, void *cb_args)
   Type of async memcpy interrupt callback function.

Note: User can call OS primitives (semaphore, mutex, etc) in the callback function. Keep in mind, if any OS primitive wakes high priority task up, the callback should return true.

Param mcp_hdl Handle of async memcpy
Param event Event object, which contains related data, reserved for future
Param cb_args User defined arguments, passed from esp_async_memcpy function
Return Whether a high priority task is woken up by the callback function

2.9.32 ULP Coprocessor Programming

The Ultra Low Power (ULP) coprocessor is a simple finite state machine (FSM) which is designed to perform measurements using the ADC, temperature sensor, and external I2C sensors, while the main processors are in Deep-sleep mode. The ULP coprocessor can access the RTC_SLOW_MEM memory region, and registers in the RTC_CNTL,
Chapter 2. API Reference

RTC_IO, and SARADC peripherals. The ULP coprocessor uses fixed-width 32-bit instructions, 32-bit memory addressing, and has 4 general-purpose 16-bit registers. This coprocessor is referred to as ULP FSM in ESP-IDF.

ESP32-S2 provides a second type of ULP coprocessor which is based on a RISC-V instruction set architecture. For details regarding ULP RISC-V refer ULP-RISC-V Coprocessor.

Installing the Toolchain

The ULP FSM coprocessor code is written in assembly and compiled using the binutils-esp32ulp toolchain. If you have already set up ESP-IDF with CMake build system according to the Getting Started Guide, then the ULP FSM toolchain will already be installed.

Programming ULP FSM

The ULP FSM can be programmed using the supported instruction set. Alternatively, the ULP FSM coprocessor can also be programmed using C Macros on the main CPU. Theses two methods are described in the following section:

ESP32-S2 ULP Coprocessor Instruction Set  This document provides details about the instructions used by ESP32-S2 ULP FSM coprocessor assembler.

ULP FSM coprocessor has 4 16-bit general purpose registers, labeled R0, R1, R2, R3. It also has an 8-bit counter register (stage_cnt) which can be used to implement loops. Stage count register is accessed using special instructions.

ULP coprocessor can access 8 K bytes of RTC_SLOW_MEM memory region. Memory is addressed in 32-bit word units. It can also access peripheral registers in RTC_CNTL, RTC_IO, and SENS peripherals.

All instructions are 32-bit. Jump instructions, ALU instructions, peripheral register and memory access instructions are executed in 1 cycle. Instructions which work with peripherals (TSENS, ADC, I2C) take variable number of cycles, depending on peripheral operation.

The instruction syntax is case insensitive. Upper and lower case letters can be used and intermixed arbitrarily. This is true both for register names and instruction names.

Note About Addressing  ESP32-S2 ULP FSM coprocessor’s JUMP, ST, LD family of instructions expect the address argument to be expressed in the following way depending on the type of address argument used:

- When the address argument is presented as a label then the instruction expects the address to be expressed as 32-bit words.

Consider the following example program:

```
entry:
  NOP
  NOP
  NOP
  NOP
loop:
  MOVE R1, loop
  JUMP R1
```

When this program is assembled and linked, address of label loop will be equal to 16 (expressed in bytes). However JUMP instruction expects the address stored in register R1 to be expressed in 32-bit words. To account for this common use case, the assembler will convert the address of label loop from bytes to words when generating the MOVE instruction. Hence, the code generated code will be equivalent to:

```
0000  NOP
0004  NOP
0008  NOP
000c  NOP
```

(continues on next page)
The other case is when the argument of MOVE instruction is not a label but a constant. In this case, assembler will use the value as is, without any conversion:

```
.set   val, 0x10
MOVE   R1, val
```

In this case, value loaded into R1 will be 0x10. However, when an immediate value is used as an offset in LD and ST instructions, the assembler considers the address argument in bytes and converts it to 32-bit words before executing the instruction:

```
ST R1, R2, 4 // offset = 4 bytes; Mem[R2 + 4 / 4] = R1
```

In this case, the value in R1 is stored at the memory location pointed by [R2 + offset / 4]

Consider the following code:

```
.global array
array: .long 0
      .long 0
      .long 0
      .long 0

MOVE R1, array
MOVE R2, 0x1234
ST R2, R1, 0 // write value of R2 into the first array element, i.e., array[0]
ST R2, R1, 4 // write value of R2 into the second array element (4 byte offset), i.e., array[1]
ADD R1, R1, 2 // this increments address by 2 words (8 bytes)
ST R2, R1, 0 // write value of R2 into the third array element, i.e., array[2]
```

### Note About Instruction Execution Time

ULP coprocessor is clocked from RTC_FAST_CLK, which is normally derived from the internal 8MHz oscillator. Applications which need to know exact ULP clock frequency can calibrate it against the main XTAL clock:

```c
#include "soc/rtc.h"

// calibrate 8M/256 clock against XTAL, get 8M/256 clock period
uint32_t rtc_8md256_period = rtc_clk_cal(RTC_CAL_8MD256, 100);
uint32_t rtc_fast_freq_hz = 1000000ULL * (1 << RTC_CLK_CAL_FRACT) * 256 / rtc_
   ~8md256_period;
```

ULP coprocessor needs certain number of clock cycles to fetch each instruction, plus certain number of cycles to execute it, depending on the instruction. See description of each instruction below for details on the execution time.

Instruction fetch time is:

- 2 clock cycles — for instructions following ALU and branch instructions.
- 4 clock cycles — in other cases.

Note that when accessing RTC memories and RTC registers, ULP coprocessor has lower priority than the main CPUs. This means that ULP coprocessor execution may be suspended while the main CPUs access same memory region as the ULP.

The detailed description of all instructions is presented below:
**Difference Between ESP32 ULP and ESP32-S2 ULP Instruction Sets**  Compared to the ESP32 ULP FSM coprocessor, the ESP32-S2 ULP FSM coprocessor has an extended instruction set. The ESP32-S2 ULP FSM is not binary compatible with ESP32 ULP FSM, but a ESP32 ULP FSM assembled program is expected to work on the ESP32-S2 ULP FSM after rebuilding. The list of the new instructions that was added to the ESP32-S2 ULP FSM is: LDL, LDH, STL, STH, ST32, STO, STI, STI32.

**NOP - No Operation**  
**Syntax**

NOP

**Operands**

None

**Cycles**

2 cycle to execute, 4 cycles to fetch next instruction

**Description**

No operation is performed. Only the PC is incremented.

**Example:**

1: NOP

**ADD - Add to Register**  
**Syntax**

ADD Rdst, Rsrl, Rsr2  
ADD Rdst, Rsrl, imm

**Operands**

- **Rdst** - Register R[0..3]
- **Rsrl** - Register R[0..3]
- **Rsr2** - Register R[0..3]
- **Imm** - 16-bit signed value

**Cycles**

2 cycles to execute, 4 cycles to fetch next instruction

**Description**

The instruction adds source register to another source register or to a 16-bit signed value and stores the result in the destination register.

**Examples:**

1: ADD R1, R2, R3  // R1 = R2 + R3
2: Add R1, R2, 0x1234  // R1 = R2 + 0x1234
3: .set value1, 0x03  // constant value1=0x03  
Add R1, R2, value1   // R1 = R2 + value1
4: .global label     // declaration of variable label  
add R1, R2, label   // R1 = R2 + label  
...  
label: nop          // definition of variable label
**SUB** - Subtract from Register

**Syntax**

```
SUB Rdst, Rsre1, Rsre2
SUB Rdst, Rsre1, imm
```

**Operands**
- `Rdst` - Register R[0..3]
- `Rsre1` - Register R[0..3]
- `Rsre2` - Register R[0..3]
- `Imm` - 16-bit signed value

**Cycles**
2 cycles to execute, 4 cycles to fetch next instruction

**Description**
The instruction subtracts the source register from another source register or subtracts a 16-bit signed value from a source register, and stores the result to the destination register.

**Examples**:
1. SUB R1, R2, R3 // R1 = R2 - R3
2. sub R1, R2, 0x1234 // R1 = R2 - 0x1234
3. .set value1, 0x03 // constant value1=0x03
   SUB R1, R2, value1 // R1 = R2 - value1
4. .global label // declaration of variable label
   SUB R1, R2, label // R1 = R2 - label
   ... // definition of variable label

**AND** - Bitwise Logical AND of Two Operands

**Syntax**

```
AND Rdst, Rsre1, Rsre2
AND Rdst, Rsre1, imm
```

**Operands**
- `Rdst` - Register R[0..3]
- `Rsre1` - Register R[0..3]
- `Rsre2` - Register R[0..3]
- `Imm` - 16-bit signed value

**Cycles**
2 cycles to execute, 4 cycles to fetch next instruction

**Description**
The instruction does a bitwise logical AND of a source register and another source register or a 16-bit signed value and stores the result to the destination register.

**Examples**:
1. AND R1, R2, R3 // R1 = R2 & R3
2. AND R1, R2, 0x1234 // R1 = R2 & 0x1234
3. .set value1, 0x03 // constant value1=0x03
   AND R1, R2, value1 // R1 = R2 & value1
4. .global label // declaration of variable label
   ... // definition of variable label

(continues on next page)
AND R1, R2, label   // R1 = R2 & label
...
label: nop           // definition of variable label

OR - Bitwise Logical OR of Two Operands  Syntax

OR Rdst, Rsr1, Rsr2

OR Rdst, Rsr1, imm

Operands

- Rdst - Register R[0..3]
- Rsr1 - Register R[0..3]
- Rsr2 - Register R[0..3]
- Imm - 16-bit signed value

Cycles

2 cycles to execute, 4 cycles to fetch next instruction

Description

The instruction does a bitwise logical OR of a source register and another source register or a 16-bit signed value and stores the result to the destination register.

Examples:

1:  OR R1, R2, R3    // R1 = R2 || R3
2:  OR R1, R2, 0x1234 // R1 = R2 || 0x1234
3:  .set value1, 0x03 // constant value1=0x03
    OR R1, R2, value1 // R1 = R2 || value1
4:  .global label    // declaration of variable label
    OR R1, R2, label  // R1 = R2 || label
    ...
    label: nop       // definition of variable label

LSH - Logical Shift Left  Syntax

LSH Rdst, Rsr1, Rsr2

LSH Rdst, Rsr1, imm

Operands

- Rdst - Register R[0..3]
- Rsr1 - Register R[0..3]
- Rsr2 - Register R[0..3]
- Imm - 16-bit signed value

Cycles

2 cycles to execute, 4 cycles to fetch next instruction

Description

The instruction does a logical shift to left of the source register by the number of bits from another source register or a 16-bit signed value and stores the result to the destination register.

Note: Shift operations which are greater than 15 bits have undefined results.
Examples:

1: LSH R1, R2, R3 // R1 = R2 << R3
2: LSH R1, R2, 0x03 // R1 = R2 << 0x03
3: .set value1, 0x03 // constant value1=0x03
   LSH R1, R2, value1 // R1 = R2 << value1
4: .global label // declaration of variable label
   LSH R1, R2, label // R1 = R2 << label
   label: nop // definition of variable label

RSH - Logical Shift Right  Syntax

RSH Rdst, Rscl, Rscl2  
RSH Rdst, Rscl, imm

Operands  
Rdst - Register R[0..3] Rscl - Register R[0..3] Rscl2 - Register R[0..3] Imm - 16-bit signed value

Cycles  
2 cycles to execute, 4 cycles to fetch next instruction

Description  
The instruction does a logical shift to right of a source register by the number of bits from another source register or a 16-bit signed value and stores the result to the destination register.

Note:  Shift operations which are greater than 15 bits have undefined results.

Examples:

1: RSH R1, R2, R3 // R1 = R2 >> R3
2: RSH R1, R2, 0x03 // R1 = R2 >> 0x03
3: .set value1, 0x03 // constant value1=0x03
   RSH R1, R2, value1 // R1 = R2 >> value1
4: .global label // declaration of variable label
   RSH R1, R2, label // R1 = R2 >> label
   label: nop // definition of variable label

MOVE –Move to Register  Syntax

MOVE Rdst, Rscl  
MOVE Rdst, imm

Operands  
• Rdst –Register R[0..3]
• Rscl –Register R[0..3]
• Imm –16-bit signed value

Cycles  
2 cycles to execute, 4 cycles to fetch next instruction
Description

The instruction moves the value from the source register or a 16-bit signed value to the destination register.

Note: Note that when a label is used as an immediate, the address of the label will be converted from bytes to words. This is because LD, ST, and JUMP instructions expect the address register value to be expressed in words rather than bytes. See the section Note About Addressing for more details.

Examples:

1:   MOVE   R1, R2   // R1 = R2
2:   MOVE   R1, 0x03  // R1 = 0x03
3:   .set   value1, 0x03  // constant value1=0x03
     MOVE   R1, value1  // R1 = value1
4:   .global  label  // declaration of label
     MOVE   R1, label  // R1 = address_of(label) / 4
     label: nop  // definition of label

ST –Store Data to the Memory  Syntax

ST Rsr, Rdst, offset

Operands

- Rsr – Register R[0..3], holds the 16-bit value to store
- Rdst – Register R[0..3], address of the destination, in 32-bit words
- Offset – 13-bit signed value, offset in bytes

Cycles

4 cycles to execute, 4 cycles to fetch next instruction

Description

The instruction stores the 16-bit value of Rsr to the lower half-word of memory with address Rdst+offset. The upper half-word is written with the current program counter (PC) (expressed in words, shifted left by 5 bits) OR’d with Rdst (0..3):

\[
\text{Mem}[\text{Rdst} + \text{offset} / 4\{31:0\}] = (\text{PC}[10:0], 3'b0, \text{Rdst}, \text{Rsrc}[15:0])
\]

The application can use the higher 16 bits to determine which instruction in the ULP program has written any particular word into memory.

Note: Note that the offset specified in bytes is converted to a 32-bit word offset before execution. See the section Note About Addressing for more details.

Examples:

1:   ST   R1, R2, 0x12  // MEM[R2 + 0x12 / 4] = R1
2:   .data  // Data section definition
   Addr1:  .word   123  // Define label Addr1 16 bit
   .set    offs, 0x00  // Define constant offs
   .text   // Text section definition
   MOVE   R1, 1  // R1 = 1

(continues on next page)
**STL – Store Data to the Lower 16 Bits of 32-bit Memory**  
**Syntax**

STL Rsrс, Rdst, offset, Label

**Operands**

- **Rsrc** – Register R[0..3], holds the 16-bit value to store
- **Rdst** – Register R[0..3], address of the destination, in 32-bit words
- **Offset** – 11-bit signed value, offset in bytes
- **Label** – 2-bit user defined unsigned value

**Cycles**

4 cycles to execute, 4 cycles to fetch next instruction

**Description**

The instruction stores the 16-bit value of Rsrc to the lower half-word of the memory with address [Rdst + offset / 4]:

```
Mem[Rdst + offset / 4]{15:0} = {Rsrc[15:0]}
Mem[Rdst + offset / 4]{15:0} = {Label[1:0], Rsrc[13:0]}
```

The ST and the STL commands can be used interchangeably and have been provided to maintain backward compatibility with previous versions of the ULP core.

**Note:** Note that the offset specified in bytes is converted to a 32-bit word offset before execution. See the section *Note About Addressing* for more details.

**Examples:**

1:  
```
STL R1, R2, 0x12  // MEM[R2 + 0x12 / 4] = R1
```

2:  
```
.data
Addr1: .word 123  // Data section definition
        .set offs, 0x00  // Define label Addr1 16 bit
        .text  // Text section definition
        MOVE R1, 1  // R1 = 1
        MOVE R2, Addr1  // R2 = Addr1
        STL R1, R2, offs  // MEM[R2 + 0 / 4] = R1
        // MEM[Addr1 + 0] will be 32'hxxxx0001
```

3:  
```
MOVE R1, 1  // R1 = 1
STL R1, R2, 0x12, 1  // MEM[R2 + 0x12 / 4] = 0xxxx4001
```

**STH – Store data to the higher 16 bits of 32-bit memory**  
**Syntax**

STH Rsrс, Rdst, offset, Label

**Operands**

- **Rsrc** – Register R[0..3], holds the 16-bit value to store
- **Rdst** – Register R[0..3], address of the destination, in 32-bit words
- **Offset** – 11-bit signed value, offset in bytes
- **Label** – 2-bit user defined unsigned value

**Cycles**

The ST and the STL commands can be used interchangeably and have been provided to maintain backward compatibility with previous versions of the ULP core.

**Examples:**

1:  
```
STL R1, R2, 0x12  // MEM[R2 + 0x12 / 4] = R1
```

2:  
```
.data
Addr1: .word 123  // Data section definition
        .set offs, 0x00  // Define label Addr1 16 bit
        .text  // Text section definition
        MOVE R1, 1  // R1 = 1
        MOVE R2, Addr1  // R2 = Addr1
        STL R1, R2, offs  // MEM[R2 + 0 / 4] = R1
        // MEM[Addr1 + 0] will be 32'hxxxx0001
```

3:  
```
MOVE R1, 1  // R1 = 1
STL R1, R2, 0x12, 1  // MEM[R2 + 0x12 / 4] = 0xxxx4001
```
4 cycles to execute, 4 cycles to fetch next instruction

**Description**

The instruction stores the 16-bit value of Rsrc to the upper half-word of memory with address [Rdst + offset / 4]:

\[
\text{Mem}[\text{Rdst} + \text{offset} / 4](31:16) = \{\text{Rsrc}[15:0]\}
\]

\[
\text{Mem}[\text{Rdst} + \text{offset} / 4](31:16) = \{\text{Label}[1:0], \text{Rsrc}[13:0]\}
\]

**Note:** Note that the offset specified in bytes is converted to a 32-bit word offset before execution. See the section *Note About Addressing* for more details.

**Examples:**

1: STH R1, R2, 0x12 // MEM[R2 + 0x12 / 4](31:16) = R1

2: .data // Data section definition

Addr1: .word 123 // Define label Addr1 16 bit
.set offs, 0x00 // Define constant offs
.text // Text section definition

MOVE R1, 1 // R1 = 1
MOVE R2, Addr1 // R2 = Addr1
STH R1, R2, offs // MEM[R2 + 0 / 4] = R1
// MEM[Addr1 + 0] will be 32'h0001xxxx

3: MOVE R1, 1 // R1 = 1
STH R1, R2, 0x12, 1 // MEM[R2 + 0x12 / 4] 0x4001xxxx

---

**ST32 – Store 32-bits data to the 32-bits memory**  
**Syntax**

ST32 Rsrc, Rdst, offset, Label

**Operands**

- **Rsrc** – Register R[0..3], holds the 16-bit value to store
- **Rdst** – Register R[0..3], address of the destination, in 32-bit words
- **Offset** – 11-bit signed value, offset in bytes
- **Label** – 2-bit user defined unsigned value

**Cycles**

4 cycles to execute, 4 cycles to fetch next instruction

**Description**

The instruction stores 11 bits of the PC value, label value and the 16-bit value of Rsrc to the 32-bit memory with address [Rdst + offset / 4]:

\[
\text{Mem}[\text{Rdst} + \text{offset} / 4](31:0) = \{\text{PC}[10:0], 0[2:0], \text{Label}[1:0], \text{Rsrc}[15:0]\}
\]

**Note:** Note that the offset specified in bytes is converted to a 32-bit word offset before execution. See the section *Note About Addressing* for more details.

**Examples:**

1: ST32 R1, R2, 0x12, 0 // MEM[R2 + 0x12 / 4](31:0) = (PC[10:0], 0[2:0], Label[1:0], Rsrc[15:0])

2: .data // Data section definition

(continues on next page)
Chapter 2. API Reference

(continued from previous page)

```
Addr1: .word 123        // Define label Addr1 16 bit
.set offs, 0x00        // Define constant offs
.text                  // Text section definition
MOVE R1, 1             // R1 = 1
MOVE R2, Addr1         // R2 = Addr1
STM2 R1, R2, offs, 1   // MEM[R2 + 0] = {PC[10:0],0[2:0],
                        // Label[1:0],Rsrc[15:0]}
                      // MEM[Addr1 + 0] will be 32'h00010001
```

STO –Set offset value for auto increment operation  Syntax

STO offset

Operands

  • Offset –11-bit signed value, offset in bytes

Cycles

  4 cycles to execute, 4 cycles to fetch next instruction

Description

The instruction sets the 16-bit value to the offset register:

```
offset = value / 4
```

Note:  Note that the offset specified in bytes is converted to a 32-bit word offset before execution. See the section Note About Addressing for more details.

Examples:

```
1:  STO 0x12         // Offset = 0x12 / 4

2:  .data            // Data section definition
    Addr1: .word 123   // Define label Addr1 16 bit
                        // Define constant offs
    .set offs, 0x00    // Define constant offs
    .text              // Text section definition
    STO offs           // Offset = 0x00
```

STI –Store data to the 32-bits memory with auto increment of predefined offset address  Syntax

STI Rsr, Rdst, Label

Operands

  • Rsr –Register R[0..3], holds the 16-bit value to store
  • Rdst –Register R[0..3], address of the destination, in 32-bit words
  • Label –2-bit user defined unsigned value

Cycles

  4 cycles to execute, 4 cycles to fetch next instruction

Description

The instruction stores the 16-bit value of Rsr to the lower and upper half-word of memory with address [Rdst + offset / 4].

The offset value is auto incremented when the STI instruction is called twice. Make sure to execute the STO instruction to set the offset value before executing the STI instruction:
**Examples:**

1:  
STO 4  // Set offset to 4  
STI R1, R2  // MEM[R2 + 4 / 4][15:0] = R1  
STI R1, R2  // MEM[R2 + 4 / 4][31:16] = R1  
-1 word  
STI R1, R2  // MEM[R2 + 8 / 4][15:0] = R1  
STI R1, R2  // MEM[R2 + 8 / 4][31:16] = R1  

**STI32** – Store 32-bits data to the 32-bits memory with auto increment of adress offset  

**STI32** Rsrc, Rdst, Label

**Operands**

- **Rsrc** – Register R[0..3], holds the 16-bit value to store  
- **Rdst** – Register R[0..3], address of the destination, in 32-bit words  
- **Label** – 2-bit user defined unsigned value

**Cycles**

4 cycles to execute, 4 cycles to fetch next instruction

**Description**

The instruction stores 11 bits of the PC value, label value and the 16-bit value of Rsrc to the 32-bit memory with address [Rdst + offset / 4].

The offset value is auto incremented each time the STI32 instruction is called. Make sure to execute the STO instruction to set the offset value before executing the STI32 instruction:

```
Mem[Rdst + offset / 4]{31:0} = {PC[10:0],0[2:0],Label[1:0],Rsrc[15:0]}
```

**Examples:**

1:  
STO 0x12  
STI32 R1, R2, 0  // MEM[R2 + 0x12 / 4][31:0] = {PC[10:0],0[2:0],Label[1:0],Rsrc[15:0]}  
-1 word  
STI32 R1, R2, 0  // MEM[R2 + 0x16 / 4][31:0] = {PC[10:0],0[2:0],Label[1:0],Rsrc[15:0]}

**LD** – Load Data from the Memory  

**LD** Rdst, Rsrc, offset

**Operands**

- **Rdst** – Register R[0..3], destination  
- **Rsrc** – Register R[0..3], holds address of destination, in 32-bit words  
- **Offset** – 13-bit signed value, offset in bytes

**Cycles**

4 cycles to execute, 4 cycles to fetch next instruction

**Description**

The instruction loads the lower 16-bit half-word from memory with address [Rsrc + offset / 4] into the destination register Rdst:
Rdst[15:0] = Mem[Rsrc + offset / 4][15:0]

Note: Note that the offset specified in bytes is converted to a 32-bit word offset before execution. See the section Note About Addressing for more details.

Examples:

<table>
<thead>
<tr>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1: LDL R1, R2, 0x12 // R1 = MEM[R2 + 0x12 / 4]</td>
<td></td>
</tr>
</tbody>
</table>
| 2: .data // Data section definition  
  Addr1: .word 123 // Define label Addr1 16 bit  
  .set offs, 0x00 // Define constant offs  
  .text // Text section definition  
  MOVE R1, 1 // R1 = 1  
  MOVE R2, Addr1 // R2 = Addr1 / 4 (address of label is converted into words)  
  LDL R1, R2, offs // R1 = MEM[R2 + 0] // R1 will be 123 |

LDL – Load Data from the Lower Half-Word of the 32-bit Memory Syntax

LDL Rdst, Rsrc, offset

Operands

- **Rdst** – Register R[0..3], destination
- **Rsrc** – Register R[0..3], holds address of destination, in 32-bit words
- **Offset** – 13-bit signed value, offset in bytes

Cycles

4 cycles to execute, 4 cycles to fetch next instruction

Description

The instruction loads the lower 16-bit half-word from memory with address [Rsrc + offset / 4] into the destination register Rdst:

Rdst[15:0] = Mem[Rsrc + offset / 4][15:0]

The LD and the LDL commands can be used interchangeably and have been provided to maintain backward compatibility with previous versions of the ULP core.

Note: Note that the offset specified in bytes is converted to a 32-bit word offset before execution. See the section Note About Addressing for more details.

Examples:

<table>

<tbody>
<tr>
<td>1: LDL R1, R2, 0x12 // R1 = MEM[R2 + 0x12 / 4]</td>
<td></td>
</tr>
</tbody>
</table>
| 2: .data // Data section definition  
  Addr1: .word 123 // Define label Addr1 16 bit  
  .set offs, 0x00 // Define constant offs  
  .text // Text section definition  
  MOVE R1, 1 // R1 = 1  
  MOVE R2, Addr1 // R2 = Addr1 / 4 (address of label is converted into words)  
  LDL R1, R2, offs // R1 = MEM[R2 + 0] // R1 will be 123 |
**Chapter 2. API Reference**

**LDH – Load data from upper half-word of the 32-bit memory**

**Syntax**

\[ \text{LDH Rdst, Rsrd, offset} \]

**Operands**

- *Rdst* – Register R[0..3], destination
- *Rsrc* – Register R[0..3], holds address of destination, in 32-bit words
- *Offset* – 13-bit signed value, offset in bytes

**Cycles**

4 cycles to execute, 4 cycles to fetch next instruction

**Description**

The instruction loads the upper 16-bit half-word from memory with address \([\text{Rsrc + offset} / 4]\) into the destination register *Rdst*:

\[
\text{Rdst}_{[15:0]} = \text{Mem}[\text{Rsrc + offset} / 4]_{[15:0]}
\]

**Note:** Note that the offset specified in bytes is converted to a 32-bit word offset before execution. See the section *Note About Addressing* for more details.

**Examples:**

```
1:    \text{LDH R1, R2, 0x12}     \quad // \text{R1 = MEM[R2 + 0x12 / 4]}
2:    \text{.data}                \quad // \text{Data section definition}
    \text{Addr1: \_word 0x12345678} // \text{Define label Addr1 16 bit}
    \text{.set offs, 0x00}         // \text{Define constant offs}
    \text{.text}                 \quad // \text{Text section definition}
    \text{MOVE R1, 1}            \quad // \text{R1 = 1}
    \text{MOVE R2, Addr1}        \quad // \text{R2 = Addr1 / 4} (address of label is... converted into words)
    \text{LDH R1, R2, offs}      // \text{R1 = MEM[R2 + 0]}
                                 \quad // \text{R1 will be 0x1234}
```

**JUMP – Jump to an Absolute Address**

**Syntax**

- \( \text{JUMP Rdst} \)
- \( \text{JUMP ImmAddr} \)
- \( \text{JUMP Rdst, Condition} \)
- \( \text{JUMP ImmAddr, Condition} \)

**Operands**

- *Rdst* – Register R[0..3] containing address to jump to (expressed in 32-bit words)
- *ImmAddr* – 13 bits address (expressed in bytes), aligned to 4 bytes
- *Condition*:
  - \( \text{EQ} \) – jump if last ALU operation result was zero
  - \( \text{OV} \) – jump if last ALU has set overflow flag

**Cycles**

2 cycles to execute, 2 cycles to fetch next instruction

**Description**

The instruction makes jump to the specified address. Jump can be either unconditional or based on an ALU flag.

**Examples:**
1: JUMP R1 // Jump to address in R1 (address in R1 is in 32-bit words)
2: JUMP 0x120, EQ // Jump to address 0x120 (in bytes) if ALU result is zero
3: JUMP label // Jump to label
label: nop // Definition of label
4: .global label // Declaration of global label
MOVE R1, label // R1 = label (value loaded into R1 is in words)
JUMP R1 // Jump to label
label: nop // Definition of label

JUMPR – Jump to a Relative Offset (Condition Based on R0) Syntax

JUMPR Step, Threshold, Condition

Operands
- Step – relative shift from current position, in bytes
- Threshold – threshold value for branch condition
- Condition:
  - EQ (equal) – jump if value in R0 == threshold
  - LT (less than) – jump if value in R0 < threshold
  - LE (less or equal) – jump if value in R0 <= threshold
  - GT (greater than) – jump if value in R0 > threshold
  - GE (greater or equal) – jump if value in R0 >= threshold

Cycles

Conditions EQ, GT and LT: 2 cycles to execute, 2 cycles to fetch next instruction
Conditions LE and GE are implemented in the assembler using two JUMPR instructions:

// JUMPR target, threshold, LE is implemented as:
JUMPR target, threshold, EQ
JUMPR target, threshold, LT

// JUMPR target, threshold, GE is implemented as:
JUMPR target, threshold, EQ
JUMPR target, threshold, GT

Therefore the execution time depends on the branches taken: either 2 cycles to execute + 2 cycles to fetch, or 4 cycles to execute + 4 cycles to fetch.

Description
The instruction makes a jump to a relative address if condition is true. Condition is the result of comparison of R0 register value and the threshold value.

Examples:

1: pos: JUMPR 16, 20, GE // Jump to address (position + 16 bytes) if in R0 >= 20
2: // Down counting loop using R0 register
   MOVE R0, 16 // load 16 into R0

(continues on next page)
Chapter 2. API Reference

(continued from previous page)

| label: SUB R0, R0, 1  // R0-- |
| NOP // do something |
| JUMPR label, 1, GE // jump to label if R0 >= 1 |

**JUMPS – Jump to a Relative Address (Condition Based on Stage Count)**

**Syntax**

JUMPS Step, Threshold, Condition

**Operands**
- **Step** – relative shift from current position, in bytes
- **Threshold** – threshold value for branch condition
- **Condition**: 
  - EQ (equal) – jump if value in stage_cnt == threshold
  - LT (less than) – jump if value in stage_cnt < threshold
  - LE (less or equal) – jump if value in stage_cnt <= threshold
  - GT (greater than) – jump if value in stage_cnt > threshold
  - GE (greater or equal) – jump if value in stage_cnt >= threshold

**Cycles**
2 cycles to execute, 2 cycles to fetch next instruction

**Description**
The instruction makes a jump to a relative address if condition is true. Condition is the result of comparison of count register value and threshold value.

**Examples:**

1: pos: JUMPS 16, 20, EQ // Jump to (position + 16 bytes) if stage_cnt == 20

2: // Up counting loop using stage count register
   STAGE_RST // set stage_cnt to 0
   label: STAGE_INC 1 // stage_cnt++
   NOP // do something
   JUMPS label, 16, LT // jump to label if stage_cnt < 16

**STAGE_RST – Reset Stage Count Register**

**Syntax**

STAGE_RST

**Operands**
No operands

**Description**
The instruction sets the stage count register to 0

**Cycles**
2 cycles to execute, 4 cycles to fetch next instruction

**Examples:**

1: STAGE_RST // Reset stage count register

**STAGE_INC – Increment Stage Count Register**

**Syntax**

STAGE_INC Value

**Operands**
Chapter 2. API Reference

- **Value** - 8 bits value

**Cycles**
2 cycles to execute, 4 cycles to fetch next instruction

**Description**
The instruction increments the stage count register by the given value.

**Examples**:

```
1:       STAGE_INC        10       // stage_cnt += 10
2:       // Up counting loop example:
          STAGE_RST       // set stage_cnt to 0
          label: STAGE_INC 1       // stage_cnt++
          NOP          // do something
          JUMPS label, 16, LT      // jump to label if stage_cnt < 16
```

**STAGE_DEC** - Decrement Stage Count Register

**Syntax** STAGE_DEC Value

**Operands**
- **Value** - 8 bits value

**Cycles**
2 cycles to execute, 4 cycles to fetch next instruction

**Description**
The instruction decrements the stage count register by the given value.

**Examples**:

```
1:       STAGE_DEC        10       // stage_cnt -= 10
2:       // Down counting loop example
          STAGE_RST       // set stage_cnt to 0
          STAGE_INC       16       // increment stage_cnt to 16
          label: STAGE_DEC       1   // stage_cnt--;
          NOP          // do something
          JUMPS label, 0, GT      // jump to label if stage_cnt > 0
```

**HALT** - End the Program

**Syntax**

**HALT**

**Operands**
No operands

**Cycles**
2 cycles to execute

**Description**
The instruction halts the ULP coprocessor and restarts the ULP wakeup timer, if it is enabled.

**Examples**:

```
1:       HALT          // Halt the coprocessor
```
Chapter 2. API Reference

WAKE – Wake up the Chip  Syntax

WAKE

Operands
No operands

Cycles
2 cycles to execute, 4 cycles to fetch next instruction

Description
The instruction sends an interrupt from the ULP coprocessor to the RTC controller.

- If the SoC is in deep sleep mode, and ULP wakeup is enabled, this causes the SoC to wake up.
- If the SoC is not in deep sleep mode, and ULP interrupt bit (RTC_CNTL_ULP_CP_INT_ENA) is set in RTC_CNTL_INT_ENA_REG register, RTC interrupt will be triggered.

Note: Note that before using WAKE instruction, ULP program may need to wait until RTC controller is ready to wake up the main CPU. This is indicated using RTC_CNTL_RDY_FOR_WAKEUP bit of RTC_CNTL_LOW_POWER_ST_REG register. If WAKE instruction is executed while RTC_CNTL_RDY_FOR_WAKEUP is zero, it has no effect (wake up does not occur). If the WAKE instruction is intended to be used while the main CPU is not in sleep mode then the RTC_CNTL_MAIN_STATE_IN_IDLE (bit 27) of RTC_CNTL_LOW_POWER_ST_REG can be used to check whether main CPU is in normal mode or sleep mode.

Examples:

1: is_rdy_for_wakeup:
   // Read RTC_CNTL_RDY_FOR_WAKEUP bit
   READ_RTC_FIELD(RTC_CNTL_LOW_POWER_ST_REG, RTC_CNTL_RDY_FOR_WAKEUP)
   AND r0, r0, 1
   JUMP is_rdy_for_wakeup, eq // Retry until the bit is set
   WAKE // Trigger wake up
   REG_WR 0x006, 24, 24, 0 // Stop ULP timer (clear RTC_CNTL_ULP_CP_→SLP_TIMER_EN)
   HALT // Stop the ULP program
   // After these instructions, SoC will wake up,
   // and ULP will not run again until started by the main program.

1: check_wakeup:
   // Read RTC_CNTL_RDY_FOR_WAKEUP and RTC_CNTL_MAIN_STATE_IN_IDLE bit
   READ_RTC_REG(RTC_CNTL_LOW_POWER_ST_REG, 27, 1)
   MOVE r1, r0 // Copy result in to r1
   READ_RTC_FIELD(RTC_CNTL_LOW_POWER_ST_REG, RTC_CNTL_RDY_FOR_WAKEUP)
   OR r0, r0, r1
   JUMP check_wakeup, eq // Retry until either of the bit are set
   WAKE // Trigger wake up
   HALT // Stop the ULP program

WAIT – Wait Some Number of Cycles  Syntax

WAIT Cycles

Operands
- Cycles – number of cycles for wait

Cycles
2 + Cycles cycles to execute, 4 cycles to fetch next instruction

Description
The instruction delays for given number of cycles.

**Examples:**

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1: WAIT 10</td>
<td>Do nothing for 10 cycles</td>
</tr>
<tr>
<td>2: .set wait_cnt, 10</td>
<td>Set a constant</td>
</tr>
<tr>
<td></td>
<td>wait for 10 cycles</td>
</tr>
</tbody>
</table>

**TSENS – Do Measurement with Temperature Sensor**

**Syntax**

- TSENS Rdst, Wait_Delay

**Operands**

- **Rdst** – Destination Register R[0..3], result will be stored to this register
- **Wait_Delay** – number of cycles used to perform the measurement

**Cycles**

2 + Wait_Delay + 3 * TSENS_CLK to execute, 4 cycles to fetch next instruction

**Description**

The instruction performs measurement using TSENS and stores the result into a general purpose register.

**Examples:**

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1: TSENS R1, 1000</td>
<td>Measure temperature sensor for 1000 cycles, and store result to R1</td>
</tr>
</tbody>
</table>

**ADC – Do Measurement with ADC**

**Syntax**

- ADC Rdst, Sar_sel, Mux
- ADC Rdst, Sar_sel, Mux, 0 -- deprecated form

**Operands**

- **Rdst** – Destination Register R[0..3], result will be stored to this register
- **Sar_sel** – Select ADC: 0 = SARADC1, 1 = SARADC2
- **Mux** - selected PAD, SARADC Pad[Mux-1] is enabled. If the user passes Mux value 1, then ADC pad 0 gets used.

**Cycles**

23 + max(1, SAR_amp_wait1) + max(1, SAR_amp_wait2) + max(1, SAR_amp_wait3) + sarx_sample_cycle + sarx_sample_bit cycles to execute, 4 cycles to fetch next instruction

**Description**

The instruction makes measurements from ADC.

**Examples:**

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>.. only:: esp32</td>
<td></td>
</tr>
<tr>
<td>1: ADC R1, 0, 1</td>
<td>Measure value using ADC1 channel 0 and store result into R1</td>
</tr>
<tr>
<td>1: ADC R1, 0, 1</td>
<td>Measure value using ADC1 pad 2 and store result into R1</td>
</tr>
</tbody>
</table>
**REG_RD – Read from Peripheral Register**  
**Syntax**

(REG_RD Addr, High, Low)

**Operands**
- **Addr** – Register address, in 32-bit words
- **High** – Register end bit number
- **Low** – Register start bit number

**Cycles**

4 cycles to execute, 4 cycles to fetch next instruction

**Description**

The instruction reads up to 16 bits from a peripheral register into a general purpose register:  
\[ R0 = \text{REG}[\text{Addr}][\text{High:Low}] \]

This instruction can access registers in RTC_CNTL, RTC_IO, SENS, and RTC_I2C peripherals. Address of the register, as seen from the ULP, can be calculated from the address of the same register on the PeriBUS1 as follows:

\[ \text{addr_ulp} = (\text{addr_peribus1} - \text{DR_REG_RTCCNTL_BASE}) / 4 \]

**Examples:**

1: REG_RD 0x120, 7, 4 // load 4 bits: R0 = (12'b0, REG[0x120][7:4])

**REG_WR – Write to Peripheral Register**  
**Syntax**

(REG_WR Addr, High, Low, Data)

**Operands**
- **Addr** – Register address, in 32-bit words.
- **High** – Register end bit number
- **Low** – Register start bit number
- **Data** – Value to write, 8 bits

**Cycles**

8 cycles to execute, 4 cycles to fetch next instruction

**Description**

The instruction writes up to 8 bits from an immediate data value into a peripheral register:  
\[ \text{REG}[\text{Addr}][\text{High:Low}] = \text{data} \]

This instruction can access registers in RTC_CNTL, RTC_IO, SENS, and RTC_I2C peripherals. Address of the register, as seen from the ULP, can be calculated from the address of the same register on the PeriBUS1 as follows:

\[ \text{addr_ulp} = (\text{addr_peribus1} - \text{DR_REG_RTCCNTL_BASE}) / 4 \]

**Examples:**

1: REG_WR 0x120, 7, 0, 0x10 // set 8 bits: REG[0x120][7:0] = 0x10

**Convenience Macros for Peripheral Registers Access**

ULP source files are passed through C preprocessor before the assembler. This allows certain macros to be used to facilitate access to peripheral registers.

Some existing macros are defined in `soc/soc_ulp.h` header file. These macros allow access to the fields of peripheral registers by their names. Peripheral registers names which can be used with these macros are the ones defined in `soc/rtc_cntl_reg.h`, `soc/rtc_io_reg.h`, `soc/sens_reg.h`, and `soc/rtc_i2c_reg.h`. 
READ_RTC_REG(rtc_reg, low_bit, bit_width) Read up to 16 bits from rtc_reg[low_bit + bit_width - 1 : low_bit] into R0. For example:

```c
#include "soc/soc_ulp.h"
#include "soc/rtc_cntl_reg.h"

/* Read 16 lower bits of RTC_CNTL_TIME0_REG into R0 */
READ_RTC_REG(RTC_CNTL_TIME0_REG, 0, 16)
```

READ_RTC_FIELD(rtc_reg, field) Read from a field in rtc_reg into R0, up to 16 bits. For example:

```c
#include "soc/soc_ulp.h"
#include "soc/sens_reg.h"

/* Read 8-bit SENS_TSENS_OUT field of SENS_SAR_SLAVE_ADDR3_REG into R0 */
READ_RTC_FIELD(SENS_SAR_SLAVE_ADDR3_REG, SENS_TSENS_OUT)
```

WRITE_RTC_REG(rtc_reg, low_bit, bit_width, value) Write immediate value into rtc_reg[low_bit + bit_width - 1 : low_bit], bit_width <= 8. For example:

```c
#include "soc/soc_ulp.h"
#include "soc/rtc_io_reg.h"

/* Set BIT(2) of RTC_GPIO_OUT_DATA_W1TS field in RTC_GPIO_OUT_W1TS_REG */
WRITE_RTC_REG(RTC_GPIO_OUT_W1TS_REG, RTC_GPIO_OUT_DATA_W1TS_S + 2, 1, 1)
```

WRITE_RTC_FIELD(rtc_reg, field, value) Write immediate value into a field in rtc_reg, up to 8 bits. For example:

```c
#include "soc/soc_ulp.h"
#include "soc/rtc_cntl_reg.h"

/* Set RTC_CNTL_ULP_CP_SLP_TIMER_EN field of RTC_CNTL_STATE0_REG to 0 */
WRITE_RTC_FIELD(RTC_CNTL_STATE0_REG, RTC_CNTL_ULP_CP_SLP_TIMER_EN, 0)
```

Programming ULP FSM Coprocessor Using C Macros (Legacy) In addition to the existing binutils port for the ESP32-S2 ULP coprocessor, it is possible to generate programs for the ULP FSM coprocessor by embedding assembly-like macros into an ESP32-S2 application. Here is an example how this can be done:

```c
const ulp_insn_t program[] = {
    I_MOVI(R3, 16), // R3 < - 16
    I_LD(R0, R3, 0), // R0 <- RTC_SLOW_MEM[R3 + 0]
    I_LD(R1, R3, 1), // R1 <- RTC_SLOW_MEM[R3 + 1]
    I_ADDR(R2, R0, R1), // R2 <- R0 + R1
    I_ST(R2, R3, 2), // R2 -> RTC_SLOW_MEM[R2 + 2]
    I_HALT()
};
size_t load_addr = 0;
size_t size = sizeof(program)/sizeof(ulp_insn_t);
ulp_process_macros_and_load(load_addr, program, &size);
ulp_run(load_addr);
```

The program array is an array of ulp_insn_t, i.e., ULP coprocessor instructions. Each I_XXX preprocessor define translates into a single 32-bit instruction. Arguments of these preprocessor defines can be register numbers (R0 — R3) and literal constants. See the API reference section at the end of this guide for descriptions of instructions and arguments they take.

**Note:** Because some of the instruction macros expand to inline function calls, defining such array in global scope will cause the compiler to produce an “initializer element is not constant” error. To fix this error, move the definition of instructions array into local scope.
To generate branch instructions, special M_ preprocessor defines are used. M_LABEL define can be used to define a branch target. Label identifier is a 16-bit integer. M_Bxxx defines can be used to generate branch instructions with target set to a particular label.

Implementation note: these M_ preprocessor defines will be translated into two ulp_insn_t values: one is a token value which contains label number, and the other is the actual instruction. ulp_process_macros_and_load function resolves the label number to the address, modifies the branch instruction to use the correct address, and removes the extra ulp_insn_t token which contains the label numer.

Here is an example of using labels and branches:

```c
const ulp_insn_t program[] = {
    I_MOVI(R0, 34), // R0 <- 34
    M_LABEL(1), // label_1
    I_MOVI(R1, 32), // R1 <- 32
    I_LD(R1, R1, 0), // R1 <- RTC_SLOW_MEM[R1]
    I_MOVI(R2, 33), // R2 <- 33
    I_LD(R2, R2, 0), // R2 <- RTC_SLOW_MEM[R2]
    I_SUBR(R3, R1, R2), // R3 <- R1 - R2
    I_ST(R3, R0, 0), // R3 -> RTC_SLOW_MEM[R0 + 0]
    I_ADDI(R0, R0, 1), // R0++
    M_BL(1, 64), // if (R0 < 64) goto label_1
    I_HALT(),
};
RTC_SLOW_MEM[32] = 42;
RTC_SLOW_MEM[33] = 18;
size_t load_addr = 0;
size_t size = sizeof(program)/sizeof(ulp_insn_t);
ulp_process_macros_and_load(load_addr, program, &size);
ulp_run(load_addr);
```

**API Reference**

**Header File**

- components/ulp/ulp_fsm/include/esp32s2/ulp.h
- This header file can be included with:

  ```c
  #include "ulp.h"
  ```

- This header file is a part of the API provided by the ulp component. To declare that your component depends on ulp, add the following to your CMakeLists.txt:

  ```cmake
  REQUIRE ulp
  ```

  or

  ```cmake
  PRIV_REQUIRE ulp
  ```

**Functions**

static inline uint32_t SOC_REG_TO_ULT_PERIPH_SEL(uint32_t reg)

Map SoC peripheral register to perih_sel field of RD_REG and WR_REG instructions.

**Parameters**

- `reg` - peripheral register in RTC_CNTL_, RTC_IO_, SENS_, RTC_I2C peripherals.
Returns periph_sel value for the peripheral to which this register belongs.

Unions

union ulp_insn

#include <ulp.h> Instruction format structure.

All ULP instructions are 32 bit long. This union contains field layouts used by all of the supported instructions. This union also includes a special “macro” instruction layout. This is not a real instruction which can be executed by the CPU. It acts as a token which is removed from the program by the ulp_process_macros_and_load function.

These structures are not intended to be used directly. Preprocessor definitions provided below fill the fields of these structure with the right arguments.

Public Members

uint32_t cycles

Number of cycles to sleep
TBD, cycles used for measurement

uint32_t unused

Unused

uint32_t opcode

Opcode (OPCODE_DELAY)
Opcode (OPCODE_ST)
Opcode (OPCODE_LD)
Opcode (OPCODE_HALT)
Opcode (OPCODE_BRANCH)
Opcode (OPCODE_ALU)
Opcode (OPCODE_WR_REG)
Opcode (OPCODE_RD_REG)
Opcode (OPCODE_ADC)
Opcode (OPCODE_TSENS)
Opcode (OPCODE_I2C)
Opcode (OPCODE_END)
Opcode (OPCODE_MACRO)

struct ulp_insn::[anonymous] delay

Format of DELAY instruction

uint32_t dreg

Register which contains data to store
Register where the data should be loaded to
Register which contains target PC, expressed in words (used if .reg == 1)
Destination register
Register where to store ADC result
Register where to store temperature measurement result

\texttt{uint32_t sreg}
Register which contains address in RTC memory (expressed in words)
Register with operand A

\texttt{uint32_t label}
Data label, 2-bit user defined unsigned value
Label number

\texttt{uint32_t upper}
0: write the low half-word; 1: write the high half-word

\texttt{uint32_t wr_way}
0: write the full-word; 1: with the label; 3: without the label

\texttt{uint32_t unused1}
Unused

\texttt{uint32_t offset}
Offset to add to sreg
Absolute value of target PC offset w.r.t. current PC, expressed in words

\texttt{uint32_t unused2}
Unused

\texttt{uint32_t sub_opcode}
Sub opcode (SUB_OPCODE_ST)
Sub opcode (SUB_OPCODE_BX)
Sub opcode (SUB_OPCODE_B)
Sub opcode (SUB_OPCODE_ALU_REG)
Sub opcode (SUB_OPCODE_ALU_IMM)
Sub opcode (SUB_OPCODE_ALU_CNT)
Sub opcode (SUB_OPCODE_WAKEUP)
SUB_OPCODE_MACRO_LABEL or SUB_OPCODE_MACRO_BRANCH

\texttt{struct ulp_insn::[anonymous] st}
Format of ST instruction

\texttt{uint32_t rd_upper}
0: read the high half-word; 1: read the low half-word

\texttt{struct ulp_insn::[anonymous] ld}
Format of LD instruction
struct ulp_insn::[anonymous] halt

Format of HALT instruction

uint32_t addr

Target PC, expressed in words (used if .reg == 0)
Address within either RTC_CNTL, RTC_IO, or SARADC

uint32_t reg

Target PC in register (1) or immediate (0)

uint32_t type

Jump condition (BX_JUMP_TYPE_xxx)

struct ulp_insn::[anonymous] bx

Format of BRANCH instruction (absolute address)

uint32_t imm

Immediate value to compare against
Immediate value of operand B
Immediate value

uint32_t cmp

Comparison to perform: B_CMP_L or B_CMP_GE

uint32_t sign

Sign of target PC offset: 0: positive, 1: negative

struct ulp_insn::[anonymous] b

Format of BRANCH instruction (relative address)

uint32_t treg

Register with operand B

uint32_t sel

Operation to perform, one of ALU_SEL_xxx

struct ulp_insn::[anonymous] alu_reg

Format of ALU instruction (both sources are registers)

struct ulp_insn::[anonymous] alu_imm

Format of ALU instruction (one source is an immediate)

uint32_t unused3

Unused

struct ulp_insn::[anonymous] alu_cnt

Format of ALU instruction with stage count register and an immediate
uint32_t periph_sel
    Select peripheral: RTC_CNTL (0), RTC_IO(1), SARADC(2)

uint32_t data
    8 bits of data to write
    Data to read or write

uint32_t low
    Low bit

uint32_t high
    High bit

struct ulp_insn::[anonymous] wr_reg
    Format of WR_REG instruction

struct ulp_insn::[anonymous] rd_reg
    Format of RD_REG instruction

uint32_t mux
    Select SARADC pad (mux + 1)

uint32_t sar_sel
    Select SARADC0 (0) or SARADC1 (1)

struct ulp_insn::[anonymous] adc
    Format of ADC instruction

uint32_t wait_delay
    Cycles to wait after measurement is done

uint32_t reserved
    Reserved, set to 0

struct ulp_insn::[anonymous] tsens
    Format of TSENS instruction

uint32_t i2c_addr
    I2C slave address

uint32_t low_bits
    TBD

uint32_t high_bits
    TBD

uint32_t i2c_sel
    TBD, select reg_i2c_slave_address[7:0]
uint32_t rw
    Write (1) or read (0)

struct ulp_insn::[anonymous] i2c
    Format of I2C instruction

uint32_t wakeup
    Set to 1 to wake up chip

struct ulp_insn::[anonymous] end
    Format of END instruction with wakeup

struct ulp_insn::[anonymous] macro
    Format of tokens used by LABEL and BRANCH macros

**Macros**

R0
    general purpose register 0

R1
    general purpose register 1

R2
    general purpose register 2

R3
    general purpose register 3

**OPCODE_WR_REG**
    Instruction: write peripheral register (RTC_CNTL/RTC_IO/SARADC) (not implemented yet)

**OPCODE_RD_REG**
    Instruction: read peripheral register (RTC_CNTL/RTC_IO/SARADC) (not implemented yet)

**RD_REG_PERIPH_RTC_CNTL**
    Identifier of RTC_CNTL peripheral for RD_REG and WR_REG instructions

**RD_REG_PERIPH_RTC_IO**
    Identifier of RTC_IO peripheral for RD_REG and WR_REG instructions

**RD_REG_PERIPH_SENS**
    Identifier of SARADC peripheral for RD_REG and WR_REG instructions

**RD_REG_PERIPH_RTC_I2C**
    Identifier of RTC_I2C peripheral for RD_REG and WR_REG instructions

**OPCODE_I2C**
    Instruction: read/write I2C (not implemented yet)
OPCODE_DELAY
Instruction: delay (nop) for a given number of cycles

OPCODE_ADC
Instruction: SAR ADC measurement (not implemented yet)

OPCODE_ST
Instruction: store indirect to RTC memory

SUB_OPCODE_ST_AUTO
Automatic Storage Mode - Access continuous addresses. Use SUB_OPCODE_ST_OFFSET to configure the initial address before using this instruction.

SUB_OPCODE_ST_OFFSET
Automatic Storage Mode - Configure the initial address.

SUB_OPCODE_ST
Manual Storage Mode. Store 32 bits, 16 MSBs contain PC, 16 LSBs contain value from source register

OPCODE_ALU
Arithmetic instructions

SUB_OPCODE_ALU_REG
Arithmetic instruction, both source values are in register

SUB_OPCODE_ALU_IMM
Arithmetic instruction, one source value is an immediate

SUB_OPCODE_ALU_CNT
Arithmetic instruction between counter register and an immediate (not implemented yet)

ALU_SEL_ADD
Addition

ALU_SEL_SUB
Subtraction

ALU_SEL_AND
Logical AND

ALU_SEL_OR
Logical OR

ALU_SEL_MOV
Copy value (immediate to destination register or source register to destination register)

ALU_SEL_LSH
Shift left by given number of bits
**Chapter 2. API Reference**

**ALU_SEL_RSH**
Shift right by given number of bits

**ALU_SEL_STAGE_INC**
Increment stage count register

**ALU_SEL_STAGE_DEC**
Decrement stage count register

**ALU_SEL_STAGE_RST**
Reset stage count register

**OPCODE_BRANCH**
Branch instructions

**SUB_OPCODE_B**
Branch to a relative offset

**SUB_OPCODE_BX**
Branch to absolute PC (immediate or in register)

**SUB_OPCODE_BS**
Branch to a relative offset by comparing the stage_cnt register

**BX_JUMP_TYPE_DIRECT**
Unconditional jump

**BX_JUMP_TYPE_ZERO**
Branch if last ALU result is zero

**BX_JUMP_TYPE_OVF**
Branch if last ALU operation caused and overflow

**B_CMP_L**
Branch if R0 is less than an immediate

**B_CMP_G**
Branch if R0 is greater than an immediate

**B_CMP_E**
Branch if R0 is equal to an immediate

**BS_CMP_L**
Branch if stage_cnt is less than an immediate

**BS_CMP_GE**
Branch if stage_cnt is greater than or equal to an immediate
Chapter 2. API Reference

**BS_CMP_LE**
Branch if stage_cnt is less than or equal to an immediate

**OPCODE_END**
Stop executing the program

**SUB_OPCODE_END**
Stop executing the program and optionally wake up the chip

**SUB_OPCODE_SLEEP**
Stop executing the program and run it again after selected interval

**OPCODE_TSENS**
Instruction: temperature sensor measurement (not implemented yet)

**OPCODE_HALT**
Halt the coprocessor

**OPCODE_LD**
Indirect load lower 16 bits from RTC memory

**OPCODE_MACRO**
Not a real opcode. Used to identify labels and branches in the program

**SUB_OPCODE_MACRO_LABEL**
Label macro

**SUB_OPCODE_MACRO_BRANCH**
Branch macro

**SUB_OPCODE_MACRO_LABELPC**
Label pointer macro

**I_DELAY (cycles_)**
Delay (nop) for a given number of cycles

**I_HALT ()**
Halt the coprocessor.
This instruction halts the coprocessor, but keeps ULP timer active. As such, ULP program will be restarted again by timer. To stop the program and prevent the timer from restarting the program, use I_END(0) instruction.

**I_WR_REG (reg, low_bit, high_bit, val)**
Write literal value to a peripheral register
reg[high_bit : low_bit] = val This instruction can access RTC_CNTL_, RTC_IO_, SENS_, and RTC_I2C peripheral registers.

**I_RD_REG (reg, low_bit, high_bit)**
Read from peripheral register into R0
R0 = reg[high_bit : low_bit] This instruction can access RTC_CNTL_, RTC_IO_, SENS_, and RTC_I2C peripheral registers.
**I_WR_REG_BIT** (reg, shift, val)
Set or clear a bit in the peripheral register.

Sets bit (1 << shift) of register reg to value val. This instruction can access RTC_CNTL_, RTC_IO_, SENS_, and RTC_I2C peripheral registers.

**I_WAKE**
Wake the SoC from deep sleep.

This instruction initiates wake up from deep sleep. Use esp_deep_sleep_enable_ulp_wakeup to enable deep sleep wakeup triggered by the ULP before going into deep sleep. Note that ULP program will still keep running until the I_HALT instruction, and it will still be restarted by timer at regular intervals, even when the SoC is woken up.

To stop the ULP program, use I_HALT instruction.

To disable the timer which start ULP program, use I_END() instruction. I_END instruction clears the RTC_CNTL_ULP_CP_SLP_TIMER_EN_S bit of RTC_CNTL_ULP_CP_TIMER_REG register, which controls the ULP timer.

**I_END**
Stop ULP program timer.

This is a convenience macro which disables the ULP program timer. Once this instruction is used, ULP program will not be restarted anymore until ulp_run function is called.

ULP program will continue running after this instruction. To stop the currently running program, use I_HALT().

**I_TESENS** (reg_dest, delay)
Perform temperature sensor measurement and store it into reg_dest.

Delay can be set between 1 and ((1 << 14) - 1). Higher values give higher measurement resolution.

**I_ADC** (reg_dest, adc_idx, pad_idx)
Perform ADC measurement and store result in reg_dest.

adc_idx selects ADC (0 or 1). pad_idx selects ADC pad (0 - 7).

**I_ST_MANUAL** (reg_val, reg_addr, offset_, label_, upper_, wr_way_)
Store lower half-word, upper half-word or full-word data from register reg_val into RTC memory address.

This instruction can be used to write data to discontinuous addresses in the RTC_SLOW_MEM. The value is written to an offset calculated by adding the value of reg_addr register and offset_field (this offset is expressed in 32-bit words). The storage method is dictated by the wr_way and upper field settings as summarized in the following table:

<table>
<thead>
<tr>
<th>wr_way</th>
<th>upper</th>
<th>data</th>
<th>operation</th>
<th>data</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>X</td>
<td>RTC_SLOW_MEM<a href="">addr + offset_</a> = {insn_PC[10:0], 3'b0, label_[1:0], reg_val[15:0]}</td>
<td>the PC and the data</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>RTC_SLOW_MEM<a href="">addr + offset_</a> = {label_[1:0], reg_val[13:0]}</td>
<td>in the low half-word</td>
<td></td>
</tr>
</tbody>
</table>

(continues on next page)
SUB_OPCODE_ST = manual_en:1, offset_set:0, wr_auto:0

**I_ST** (reg_val, reg_addr, offset_)
Stores value from register reg_val into RTC memory.

*I_ST()* instruction provides backward compatibility for code written for esp32 to be run on esp32s2. This instruction is equivalent to calling *I_ST_MANUAL()* instruction with label = 0, upper = 0 and wr_way = 3.

**I_STL** (reg_val, reg_addr, offset_)
Stores value from register reg_val to lower 16 bits of the RTC memory address.

This instruction is equivalent to calling *I_ST_MANUAL()* instruction with label = 0, upper = 0 and wr_way = 3.

**I_STH** (reg_val, reg_addr, offset_)
Stores value from register reg_val to upper 16 bits of the RTC memory address.

This instruction is equivalent to calling *I_ST_MANUAL()* instruction with label = 0, upper = 1 and wr_way = 3.

**I_ST32** (reg_val, reg_addr, offset_, label_)
Stores value from register reg_val to full 32 bit word of the RTC memory address.

This instruction is equivalent to calling *I_ST_MANUAL()* instruction with wr_way = 0.

**I_STL_LABEL** (reg_val, reg_addr, offset_, label_)
Stores value from register reg_val with label to lower 16 bits of RTC memory address.

This instruction is equivalent to calling *I_ST_MANUAL()* instruction with label = label_, upper = 0 and wr_way = 1.

**I_STH_LABEL** (reg_val, reg_addr, offset_, label_)
Stores value from register reg_val with label to upper 16 bits of RTC memory address.

This instruction is equivalent to calling *I_ST_MANUAL()* instruction with label = label_, upper = 1 and wr_way = 1.

**I_ST_AUTO** (reg_val, reg_addr, label_, wr_way_)
Stores lower half-word, upper half-word or full-word data from register reg_val into RTC memory address with auto-increment of the offset value.
This instruction can be used to write data to continuous addresses in the RTC_SLOW_MEM. The initial address must be set using the SUB_OPCODE_ST_OFFSET instruction before the auto store instruction is called. The data written to the RTC memory address could be written to the full 32 bit word or to the lower half-word or the upper half-word. The storage method is dictated by the wr_way field and the number of times the SUB_OPCODE_ST_AUTO instruction is called. write_cnt indicates the later. The following table summarizes the storage method:

<table>
<thead>
<tr>
<th>wr_way</th>
<th>write_cnt</th>
<th>data operation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Write full-word, including</td>
</tr>
<tr>
<td>0</td>
<td>X</td>
<td>RTC_SLOW_MEM[addr + offset_]{31:0} = {insn_PC[10:0], 3’b0, label_[1:0], reg_val[15:0]}</td>
</tr>
<tr>
<td>1</td>
<td>odd</td>
<td>RTC_SLOW_MEM[addr + offset_]{15:0} = {label_[1:0], reg_val[13:0]}</td>
</tr>
<tr>
<td>1</td>
<td>even</td>
<td>RTC_SLOW_MEM[addr + offset_]{31:16} = {label_[1:0], reg_val[13:0]}</td>
</tr>
<tr>
<td>3</td>
<td>odd</td>
<td>RTC_SLOW_MEM[addr + offset_]{15:0} = reg_val[15:0]</td>
</tr>
<tr>
<td>3</td>
<td>even</td>
<td>RTC_SLOW_MEM[addr + offset_]{31:16} = reg_val[15:0]</td>
</tr>
</tbody>
</table>

The initial address offset is incremented after each store operation as follows:

- When a full-word is written, the offset is automatically incremented by 1 after each SUB_OPCODE_ST_AUTO operation.
- When a half-word is written (lower half-word first), the offset is automatically incremented by 1 after two SUB_OPCODE_ST_AUTO operations.

SUB_OPCODE_ST_AUTO = manual_en:0, offset_set:0, wr_auto:1

I_STO(offset_)

Set the initial address offset for auto-store operation

This instruction sets the initial address of the RTC_SLOW_MEM to be used by the auto-store operation. The offset is incremented automatically. Refer I_ST_AUTO() for detailed explanation.

SUB_OPCODE_ST_OFFSET = manual_en:0, offset_set:1, wr_auto:1
Chapter 2. API Reference

I_STI (reg_val, reg_addr)
Store value from register reg_val to 32 bit word of the RTC memory address.

This instruction is equivalent to calling I_ST_AUTO() instruction with label = 0 and wr_way = 3. The data in reg_val will be either written to the lower half-word or the upper half-word of the RTC memory address depending on the count of the number of times the I_STI() instruction is called. The initial offset is automatically incremented with I_STI() is called twice. Refer I_ST_AUTO() for detailed explanation.

I_STI_LABEL (reg_val, reg_addr, label_)
Store value from register reg_val with label to 32 bit word of the RTC memory address.

This instruction is equivalent to calling I_ST_AUTO() instruction with label = label_ and wr_way = 1. The data in reg_val will be written to the RTC memory address along with the label and the PC. The initial offset is automatically incremented each time the I_STI32() instruction is called. Refer I_ST_AUTO() for detailed explanation.

I_STI32 (reg_val, reg_addr, label_)
Store value from register reg_val to full 32 bit word of the RTC memory address.

This instruction is equivalent to calling I_ST_AUTO() instruction with label = label_ and wr_way = 0. The data in reg_val will be written to the RTC memory address along with the label and the PC. The initial offset is automatically incremented each time the I_STI32() instruction is called. Refer I_ST_AUTO() for detailed explanation.

I_LD_MANUAL (reg_dest, reg_addr, offset_, rd_upper_)
Load lower half-word, upper half-word or full-word data from RTC memory address into the register reg_dest.

This instruction reads the lower half-word or upper half-word of the RTC memory address depending on the value of rd_upper_. The following table summarizes the loading method:

<table>
<thead>
<tr>
<th>rd_upper</th>
<th>data</th>
<th>operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

I_LD (reg_dest, reg_addr, offset_)
Load lower 16 bits value from RTC memory into reg_dest register.

Loads 16 LSBs (rd_upper = 1) from RTC memory word given by the sum of value in reg_addr and value of offset_. I_LD() instruction provides backward compatibility for code written for esp32 to be run on esp32s2.

I_LDL (reg_dest, reg_addr, offset_)
Load lower 16 bits value from RTC memory into reg_dest register.
I_LDL() instruction and I_LD() instruction can be used interchangably.
**I\_LDH** (reg\_dest, reg\_addr, offset\_)
Load upper 16 bits value from RTC memory into reg\_dest register.
Loads 16 MSBs (rd\_upper = 0) from RTC memory word given by the sum of value in reg\_addr and value of offset\_.

**I\_BL** (pc\_offset, imm\_value)
Branch relative if R0 register less than the immediate value.

pc\_offset is expressed in words, and can be from -127 to 127 imm\_value is a 16-bit value to compare R0 against

**I\_BG** (pc\_offset, imm\_value)
Branch relative if R0 register greater than the immediate value.

pc\_offset is expressed in words, and can be from -127 to 127 imm\_value is a 16-bit value to compare R0 against

**I\_BE** (pc\_offset, imm\_value)
Branch relative if R0 register is equal to the immediate value.

pc\_offset is expressed in words, and can be from -127 to 127 imm\_value is a 16-bit value to compare R0 against

**I\_BXR** (reg\_pc)
Unconditional branch to absolute PC, address in register.

reg\_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

**I\_BXI** (imm\_pc)
Unconditional branch to absolute PC, immediate address.

Address imm\_pc is expressed in 32-bit words.

**I\_BXZR** (reg\_pc)
Branch to absolute PC if ALU result is zero, address in register.

reg\_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

**I\_BXZI** (imm\_pc)
Branch to absolute PC if ALU result is zero, immediate address.

Address imm\_pc is expressed in 32-bit words.

**I\_BXFR** (reg\_pc)
Branch to absolute PC if ALU overflow, address in register

reg\_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

**I\_BXF1** (imm\_pc)
Branch to absolute PC if ALU overflow, immediate address

Address imm\_pc is expressed in 32-bit words.

**I\_BSLE** (pc\_offset, imm\_value)
Branch relative if stage\_cnt is less than or equal to the immediate value.

pc\_offset is expressed in words, and can be from -127 to 127 imm\_value is a 16-bit value to compare R0 against

**I\_BSGE** (pc\_offset, imm\_value)
Branch relative, if stage\_cnt register is greater than or equal to the immediate value.

pc\_offset is expressed in words, and can be from -127 to 127 imm\_value is a 16-bit value to compare R0 against
Chapter 2. API Reference

_I_BSL_ (pc_offset, imm_value)
   Branch relative if stage_cnt register is less than the immediate value.
   pc_offset is expressed in words, and can be from -127 to 127 imm_value is a 16-bit value to compare R0 against

_I_ADDR_ (reg_dest, reg_src1, reg_src2)
   Addition: dest = src1 + src2

_I_SUBR_ (reg_dest, reg_src1, reg_src2)
   Subtraction: dest = src1 - src2

_I_ANDR_ (reg_dest, reg_src1, reg_src2)
   Logical AND: dest = src1 & src2

_I_ORR_ (reg_dest, reg_src1, reg_src2)
   Logical OR: dest = src1 | src2

_I_MOVR_ (reg_dest, reg_src)
   Copy: dest = src

_I_LSHR_ (reg_dest, reg_src, reg_shift)
   Logical shift left: dest = src << shift

_I_RSHR_ (reg_dest, reg_src, reg_shift)
   Logical shift right: dest = src >> shift

_I_ADDI_ (reg_dest, reg_src, imm_)
   Add register and an immediate value: dest = src1 + imm

_I_SUBI_ (reg_dest, reg_src, imm_)
   Subtract register and an immediate value: dest = src - imm

_I_ANDI_ (reg_dest, reg_src, imm_)
   Logical AND register and an immediate value: dest = src & imm

_I_ORI_ (reg_dest, reg_src, imm_)
   Logical OR register and an immediate value: dest = src | imm

_I_MOVI_ (reg_dest, imm_)
   Copy an immediate value into register: dest = imm

_I_LSHI_ (reg_dest, reg_src, imm_)
   Logical shift left register value by an immediate: dest = src << imm

_I_RSHI_ (reg_dest, reg_src, imm_)
   Logical shift right register value by an immediate: dest = src >> imm

_I_STAGE_INC_ (reg_dest, reg_src, imm_)
   Increment stage_cnt register by an immediate: stage_cnt = stage_cnt + imm

_I_STAGE_DEC_ (reg_dest, reg_src, imm_)
   Decrement stage_cnt register by an immediate: stage_cnt = stage_cnt - imm

_I_STAGE_RST_ (reg_dest, reg_src, imm_)
   Reset stage_cnt register by an immediate: stage_cnt = 0

_M_LABEL_ (label_num)
   Define a label with number label_num.
   This is a macro which doesn’t generate a real instruction. The token generated by this macro is removed by ulp_process_macros_and_load function. Label defined using this macro can be used in branch macros defined below.
**M_BRANCH** (label_num)

Token macro used by M_B and M_BX macros. Not to be used directly.

**M.BL** (label_num, imm_value)

Macro: branch to label label_num if R0 is less than immediate value.

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

**M_BG** (label_num, imm_value)

Macro: branch to label label_num if R0 is greater than immediate value.

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

**M_BE** (label_num, imm_value)

Macro: branch to label label_num if R0 equal to the immediate value.

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

**M_BX** (label_num)

Macro: unconditional branch to label

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

**M_BXZ** (label_num)

Macro: branch to label if ALU result is zero.

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

**M_BXF** (label_num)

Macro: branch to label if ALU overflow.

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

---

**Compiling the ULP Code**

To compile the ULP FSM code as part of the component, the following steps must be taken:

1. The ULP FSM code, written in assembly, must be added to one or more files with .S extension. These files must be placed into a separate directory inside the component directory, for instance, ulp/.

**Note:** When registering the component (via `idf_component_register`), this directory should not be added to the **SRC_DIRS** argument. The logic behind this is that the ESP-IDF build system will compile files found in **SRC_DIRS** based on their extensions. For .S files, `xtensa-esp32s2-elf-as` assembler is used. This is not desirable for ULP FSM assembly files, so the easiest way to achieve the distinction is by placing ULP FSM assembly files into a separate directory. The ULP FSM assembly source files should also **not** be added to **SRCS** for the same reason. See the steps below for how to properly add ULP FSM assembly source files.

2. Call `ulp_embed_binary` from the component CMakeLists.txt after registration. For example:
The first argument to `ulp_embed_binary` specifies the ULP FSM binary name. The name specified here will also be used by other generated artifacts such as the ELF file, map file, header file and linker export file. The second argument specifies the ULP FSM assembly source files. Finally, the third argument specifies the list of component source files which include the header file to be generated. This list is needed to build the dependencies correctly and ensure that the generated header file will be created before any of these files are compiled. See the section below for the concept of generated header files for ULP applications.

3. Build the application as usual (e.g., `idf.py app`).

Inside, the build system will take the following steps to build ULP FSM program:

1. **Run each assembly file** (`foo.S`) **through the C preprocessor**. This step generates the preprocessed assembly files (`foo.ulp.S`) in the component build directory. This step also generates dependency files (`foo.ulp.d`).
2. **Run preprocessed assembly sources through the assembler**. This produces object (`foo.ulp.o`) and listing (`foo.ulp.lst`) files. Listing files are generated for debugging purposes and are not used at later stages of the build process.
3. **Run the linker script template through the C preprocessor**. The template is located in `components/ulp/ld` directory.
4. **Link the object files into an output ELF file** (`ulp_app_name.elf`). The Map file (`ulp_app_name.map`) generated at this stage may be useful for debugging purposes.
5. **Dump the contents of the ELF file into a binary** (`ulp_app_name.bin`) which can then be embedded into the application.
6. **Generate a list of global symbols** (`ulp_app_name.sym`) in the ELF file using `esp32ulp-elf-nm`.
7. **Create an LD export script and a header file** (`ulp_app_name.ld` and `ulp_app_name.h`) containing the symbols from `ulp_app_name.sym`. This is done using the `esp32ulp_mapgen.py` utility.
8. **Add the generated binary to the list of binary files** to be embedded into the application.

### Accessing the ULP FSM Program Variables

Global symbols defined in the ULP FSM program may be used inside the main program.

For example, the ULP FSM program may define a variable `measurement_count` which will define the number of ADC measurements the program needs to make before waking up the chip from Deep-sleep:

```
.globl measurement_count
measurement_count:
    .long 0

// later, use measurement_count
move r3, measurement_count
ld r3, r3, 0
```

The main program needs to initialize this variable before the ULP program is started. The build system makes this possible by generating the `$(${ULP_APP_NAME}).h` and `$(${ULP_APP_NAME}).ld` files which define the global symbols present in the ULP program. Each global symbol defined in the ULP program is included in these files and are prefixed with `ulp_`.

The header file contains the declaration of the symbol:

```
extern uint32_t ulp_measurement_count;
```
Chapter 2. API Reference

Note that all symbols (variables, arrays, functions) are declared as `uint32_t`. For functions and arrays, take the address of the symbol and cast it to the appropriate type.

The generated linker script file defines the locations of symbols in RTC_SLOW_MEM:

```c
PROVIDE ( ulp_measurement_count = 0x50000060 );
```

To access the ULP program variables from the main program, the generated header file should be included using an `include` statement. This will allow the ULP program variables to be accessed as regular variables:

```c
#include "ulp_app_name.h"
// later
void init_ulp_vars() {
    ulp_measurement_count = 64;
}
```

Starting the ULP FSM Program

To run a ULP FSM program, the main application needs to load the ULP program into RTC memory using the `ulp_load_binary()` function, and then start it using the `ulp_run()` function.

Note that the Enable Ultra Low Power (ULP) Coprocessor option must be enabled in menuconfig to work with ULP. To select the type of ULP to be used, the ULP Co-processor type option must be set. To reserve memory for the ULP, the RTC slow memory reserved for coprocessor option must be set to a value big enough to store ULP code and data. If the application components contain multiple ULP programs, then the size of the RTC memory must be sufficient to hold the largest one.

Each ULP program is embedded into the ESP-IDF application as a binary blob. The application can reference this blob and load it in the following way (suppose ULP_APP_NAME was defined to `ulp_app_name`):

```c
extern const uint8_t bin_start[] asm("_binary_ulp_app_name_bin_start");
extern const uint8_t bin_end[] asm("_binary_ulp_app_name_bin_end");
void start_ulp_program() {
    ESP_ERROR_CHECK( ulp_load_binary(
        0 // load address, set to 0 when using default linker scripts
        bin_start,
        (bin_end - bin_start) / sizeof(uint32_t)) );
}
```

Once the program is loaded into RTC memory, the application can start it by passing the address of the entry point to the `ulp_run` function:

```c
ESP_ERROR_CHECK( ulp_run(&ulp_entry - RTC_SLOW_MEM) );
```

Declaration of the entry point symbol comes from the generated header file mentioned above, `ulp_app_name.h`. In the assembly source of the ULP FSM application, this symbol must be marked as `.global`:

```asm
.globl entry
entry:
    // code starts here
```

ESP32-S2 ULP Program Flow

ESP32-S2 ULP coprocessor is started by a timer. The timer is started once `ulp_run()` is called. The timer counts a number of RTC_SLOW_CLK ticks (by default, produced by an internal 90 kHz RC oscillator). The number of ticks is set using `RTC_CNTL_ULP_CP_TIMER_1_REG` register.
The application can set ULP timer period values by `ulp_set_wakeup_period()` function.

Once the timer counts the number of ticks set in the selected `RTC_CNTL_ULP_CP_TIMER_1_REG` register, ULP coprocessor powers up and starts running the program from the entry point set in the call to `ulp_run()`.

The program runs until it encounters a `halt` instruction or an illegal instruction. Once the program halts, ULP coprocessor powers down, and the timer is started again.

To disable the timer (effectively preventing the ULP program from running again), clear the `RTC_CNTL_ULP_CP_SLP_TIMER_EN` bit in the `RTC_CNTL_ULP_CP_TIMER_REG` register. This can be done both from ULP code and from the main program.

**Application Examples**

- ULP FSM Coprocessor counts pulses on an IO while main CPU is in Deep-sleep: `system/ulp/ulp_fsm/ulp`.
- ULP FSM Coprocessor polls ADC in while main CPU is in Deep-sleep: `system/ulp/ulp_fsm/ulp_adc`.

**API Reference**

**Header File**

- `components/ulp/ulp_fsm/include/ulp_fsm_common.h`
- This header file can be included with:
  
  ```
  #include "ulp_fsm_common.h"
  ```

- This header file is a part of the API provided by the `ulp` component. To declare that your component depends on `ulp`, add the following to your `CMakeLists.txt`:
  
  ```
  REQUIRES ulp
  ```
  
  or
  
  ```
  PRIV_REQUIRES ulp
  ```

**Functions**

`esp_err_t ulp_isr_register (intr_handler_t fn, void *arg)`

Register ULP wakeup signal ISR.

**Note:** The ISR routine will only be active if the main CPU is not in deepsleep

**Parameters**

- `fn` - ISR callback function
- `arg` - ISR callback function arguments

**Returns**

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if callback function is NULL
- `ESP_ERR_NO_MEM` if heap memory cannot be allocated for the interrupt

`esp_err_t ulp_isr_deregister (intr_handler_t fn, void *arg)`

Deregister ULP wakeup signal ISR.

**Parameters**

- `fn` - ISR callback function
- `arg` - ISR callback function arguments

**Returns**

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if callback function is NULL
Chapter 2. API Reference

- ESP_ERR_INVALID_STATE if a handler matching both callback function and its arguments isn’t registered

\texttt{esp_err_t upl_process_macros_and_load} (uint32_t load_addr, const upl_insn_t *program, size_t *psize)

Resolve all macro references in a program and load it into RTC memory.

\textbf{Parameters}
- \texttt{load_addr} – address where the program should be loaded, expressed in 32-bit words
- \texttt{program} – upl_insn_t array with the program
- \texttt{psize} – size of the program, expressed in 32-bit words

\textbf{Returns}
- ESP_OK on success
- ESP_ERR_NO_MEM if auxiliary temporary structure cannot be allocated
- one of ESP_ERR_ULP_xxx if program is not valid or cannot be loaded

\texttt{esp_err_t upl_load_binary} (uint32_t load_addr, const uint8_t *program_binary, size_t program_size)

Load ULP program binary into RTC memory.

ULP program binary should have the following format (all values little-endian):

\begin{itemize}
  \item MAGIC, (value 0x00706c75, 4 bytes)
  \item TEXT_OFFSET, offset of .text section from binary start (2 bytes)
  \item TEXT_SIZE, size of .text section (2 bytes)
  \item DATA_SIZE, size of .data section (2 bytes)
  \item BSS_SIZE, size of .bss section (2 bytes)
  \item (TEXT_OFFSET - 12) bytes of arbitrary data (will not be loaded into RTC memory)
  \item .text section
  \item .data section
\end{itemize}

Linker script in components/upl/ld/esp32.ulp.ld produces ELF files which correspond to this format. This linker script produces binaries with load_addr == 0.

\textbf{Parameters}
- \texttt{load_addr} – address where the program should be loaded, expressed in 32-bit words
- \texttt{program_binary} – pointer to program binary
- \texttt{program_size} – size of the program binary

\textbf{Returns}
- ESP_OK on success
- ESP_ERR_INVALID_ARG if load_addr is out of range
- ESP_ERR_INVALID_SIZE if program_size doesn’t match (TEXT_OFFSET + TEXT_SIZE + DATA_SIZE)
- ESP_ERR_NOT_SUPPORTED if the magic number is incorrect

\texttt{esp_err_t upl_run} (uint32_t entry_point)

Run the program loaded into RTC memory.

\textbf{Parameters} entry_point – entry point, expressed in 32-bit words

\textbf{Returns} ESP_OK on success

\textbf{Macros}

\textbf{ESP_ERR_ULP_BASE}

Offset for ULP-related error codes

\textbf{ESP_ERR_ULP_SIZE_TOO_BIG}

Program doesn’t fit into RTC memory reserved for the ULP

\textbf{ESP_ERR_ULP_INVALID_LOAD_ADDR}

Load address is outside of RTC memory reserved for the ULP
Chapter 2. API Reference

ESP_ERR ULP DUPLICATE LABEL
More than one label with the same number was defined

ESP_ERR ULP UNDEFINED LABEL
Branch instructions references an undefined label

ESP_ERR ULP BRANCH OUT OF RANGE
Branch target is out of range of B instruction (try replacing with BX)

Type Definitions

typedef union ulp_insn ulp_insn_t

Header File

• components/ulp/ulp_common/include/ulp_common.h
• This header file can be included with:

    #include "ulp_common.h"

• This header file is a part of the API provided by the ulp component. To declare that your component depends on ulp, add the following to your CMakeLists.txt:

    REQUIRE ulp

    or

    PRIV_REQUIRES ulp

Functions

esp_err_t ulp_set_wakeup_period(size_t period_index, uint32_t period_us)
Set one of ULP wakeup period values.

ULP coprocessor starts running the program when the wakeup timer counts up to a given value (called period). There are 5 period values which can be programmed into SENS_ULP_CP_SLEEP_CYCx_REG registers, x = 0..4 for ESP32, and one period value which can be programmed into RTC_CNTL_ULP_CP_TIMER_1_REG register for ESP32-S2/S3. By default, for ESP32, wakeup timer will use the period set into SENS_ULP_CP_SLEEP_CYC0_REG, i.e. period number 0. ULP program code can use SLEEP instruction to select which of the SENS_ULP_CP_SLEEP_CYCx_REG should be used for subsequent wakeups.

However, please note that SLEEP instruction issued (from ULP program) while the system is in deep sleep mode does not have effect, and sleep cycle count 0 is used.

For ESP32-S2/S3 the SLEEP instruction not exist. Instead a WAKE instruction will be used.

Note: The ULP FSM requires two clock cycles to wakeup before being able to run the program. Then additional 16 cycles are reserved after wakeup waiting until the 8M clock is stable. The FSM also requires two more clock cycles to go to sleep after the program execution is halted. The minimum wakeup period that may be set up for the ULP is equal to the total number of cycles spent on the above internal tasks. For a default configuration of the ULP running at 150kHz it makes about 133us.

Parameters

• period_index – wakeup period setting number (0 - 4)
• period_us – wakeup period, us

Returns

• ESP_OK on success
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG if period_index is out of range

```c
void ulp_timer_stop (void)
    Stop the ULP timer.
```

**Note:** This will stop the ULP from waking up if halted, but will not abort any program currently executing on the ULP.

```c
void ulp_timer_resume (void)
    Resume the ULP timer.
```

**Note:** This will resume an already configured timer, but does no other configuration.

**Header File**

- components/ulp/ulp_common/include/esp32s2/ulp_common_defs.h
- This header file can be included with:

  ```
  #include "ulp_common_defs.h"
  ```

- This header file is a part of the API provided by the ulp component. To declare that your component depends on ulp, add the following to your CMakeLists.txt:

  ```
  REQUIRES ulp
  ```

  or

  ```
  PRIV_REQUIRES ulp
  ```

**Macros**

**RTC_SLOW_MEM**

  RTC slow memory, 8k size

### 2.9.33 ULP RISC-V Coprocessor Programming

The ULP RISC-V coprocessor is a variant of the ULP present in ESP32-S2. Similar to ULP FSM, the ULP RISC-V coprocessor can perform tasks such as sensor readings while the main CPU stays in low power modes. The main difference between ULP FSM and ULP RISC-V is that the latter can be programmed in C using standard GNU tools. The ULP RISC-V coprocessor can access the RTC_SLOW_MEM memory region, and registers in RTC_CNTL, RTC_IO, and SARADC peripherals. The RISC-V processor is a 32-bit fixed point machine. Its instruction set is based on RV32IMC which includes hardware multiplication and division, and compressed code.

**Installing the ULP RISC-V Toolchain**

The ULP RISC-V coprocessor code is written in C (assembly is also possible) and compiled using the RISC-V toolchain based on GCC.

If you have already set up ESP-IDF with CMake build system according to the *Getting Started Guide*, then the toolchain should already be installed.

**Note:** In earlier versions of ESP-IDF, RISC-V toolchain had a different prefix: `riscv-none-embed-gcc`. 
Compiling the ULP RISC-V Code

To compile the ULP RISC-V code as part of the component, the following steps must be taken:

1. The ULP RISC-V code, written in C or assembly (must use the .S extension), must be placed in a separate directory inside the component directory, for instance, ulp/.

   **Note:** When registering the component (via `idf_component_register`), this directory should not be added to the SRC_DIRS argument as it is currently done for the ULP FSM. See the step below for how to properly add ULP source files.

2. Call `ulp_embed_binary` from the component CMakeLists.txt after registration. For example:

   ```
   ...
   idf_component_register()
   set(ulp_app_name ulp_${COMPONENT_NAME})
   set(ulp_sources "ulp/ulp_c_source_file.c" "ulp/ulp_assembly_source_file.S")
   set(ulp_exp_dep_srcs "ulp_c_source_file.c")
   ulp_embed_binary(${ulp_app_name} "${ulp_sources}" "${ulp_exp_dep_srcs}"
   
   The first argument to `ulp_embed_binary` specifies the ULP binary name. The name specified here will also be used by other generated artifacts such as the ELF file, map file, header file, and linker export file. The second argument specifies the ULP source files. Finally, the third argument specifies the list of component source files which include the header file to be generated. This list is needed to build the dependencies correctly and ensure that the generated header file will be created before any of these files are compiled. See the section below for the concept of generated header files for ULP applications.

3. Build the application as usual (e.g., `idf.py app`). Inside, the build system will take the following steps to build ULP program:

   1. **Run each source file through the C compiler and assembler.** This step generates the object files (.obj.c or .obj.S depending of source file processed) in the component build directory.
   2. **Run the linker script template through the C preprocessor.** The template is located in components/ulp/ld directory.
   3. **Link the object files into an output ELF file** (`ulp_app_name.elf`). The Map file (`ulp_app_name.map`) generated at this stage may be useful for debugging purposes.
   4. **Dump the contents of the ELF file into a binary** (`ulp_app_name.bin`) which can then be embedded into the application.
   5. **Generate a list of global symbols** (`ulp_app_name.sym`) in the ELF file using `riscv32-esp-elf-nm`.
   6. **Create an LD export script and a header file** (`ulp_app_name.ld` and `ulp_app_name.h`) containing the symbols from `ulp_app_name.sym`. This is done using the `esp32ulp_mapgen.py` utility.
   7. **Add the generated binary to the list of binary files** to be embedded into the application.

Accessing the ULP RISC-V Program Variables

Global symbols defined in the ULP RISC-V program may be used inside the main program. For example, the ULP RISC-V program may define a variable `measurement_count` which will define the number of ADC measurements the program needs to make before waking up the chip from deep sleep.

```
volatile int measurement_count;

int some_function()
{
    //read the measurement count for later use.
```
int temp = measurement_count;
...do something.

The main program can access the global ULP RISC-V program variables as the build system makes this possible by generating the ${ULP_APP_NAME}.h and ${ULP_APP_NAME}.ld files which define the global symbols present in the ULP RISC-V program. Each global symbol defined in the ULP RISC-V program is included in these files and are prefixed with ulp_.

The header file contains the declaration of the symbol:

```c
extern uint32_t ulp_measurement_count;
```

Note that all symbols (variables, arrays, functions) are declared as uint32_t. For functions and arrays, take the address of the symbol and cast it to the appropriate type.

The generated linker script file defines the locations of symbols in RTC_SLOW_MEM:

```c
PROVIDE ( ulp_measurement_count = 0x50000060 );
```

To access the ULP RISC-V program variables from the main program, the generated header file should be included using an include statement. This will allow the ULP RISC-V program variables to be accessed as regular variables.

```c
#include "ulp_app_name.h"

void init_ulp_vars() {
    ulp_measurement_count = 64;
}
```

**Mutual Exclusion** If mutual exclusion is needed when accessing a variable shared between the main program and ULP, then this can be achieved by using the ULP RISC-V lock API:

- `ulp_riscv_lock_acquire()`
- `ulp_riscv_lock_release()`

The ULP does not have any hardware instructions to facilitate mutual exclusion, so the lock API achieves this through a software algorithm (Peterson’s algorithm).

The locks are intended to only be called from a single thread in the main program, and will not provide mutual exclusion if used simultaneously from multiple threads.

**Starting the ULP RISC-V Program**

To run a ULP RISC-V program, the main application needs to load the ULP program into RTC memory using the `ulp_riscv_load_binary()` function, and then start it using the `ulp_riscv_run()` function.

Note that the `CONFIG_ULP_COPROC_ENABLED` and `CONFIG_ULP_COPROC_TYPE_RISCV` options must be enabled in menuconfig to work with ULP RISC-V. To reserve memory for the ULP, the RTC slow memory reserved for coprocessor option must be set to a value big enough to store ULP RISC-V code and data. If the application components contain multiple ULP programs, then the size of the RTC memory must be sufficient to hold the largest one.

Each ULP RISC-V program is embedded into the ESP-IDF application as a binary blob. The application can reference this blob and load it in the following way (suppose ULP_APP_NAME was defined to ulp_app_name):

```c
extern const uint8_t bin_start[] asm("_binary_ulp_app_name_bin_start");
extern const uint8_t bin_end[] asm("_binary_ulp_app_name_bin_end");

void start_ulp_program() {

(continues on next page)
Once the program is loaded into RTC memory, the application can start it by calling the `ulp_riscv_run()` function:

```c
ESP_ERROR_CHECK( ulp_riscv_run() );
```

### ULP RISC-V Program Flow

The ULP RISC-V coprocessor is started by a timer. The timer is started once `ulp_riscv_run()` is called. The timer counts the number of RTC_SLOW_CLK ticks (by default, produced by an internal 90 kHz RC oscillator). The number of ticks is set using `RTC_CNTL_ULP_CP_TIMER_1_REG` register. When starting the ULP, `RTC_CNTL_ULP_CP_TIMER_1_REG` will be used to set the number of timer ticks.

The application can set ULP timer period values (`RTC_CNTL_ULP_CP_TIMER_1_REG`) using the `ulp_set_wakeup_period()` function.

Once the timer counts the number of ticks set in the `RTC_CNTL_ULP_CP_TIMER_1_REG` register, the ULP RISC-V coprocessor will power up and start running the program from the entry point set in the call to `ulp_riscv_run()`.

The program runs until the field `RTC_CNTL_COCPU_DONE` in register `RTC_CNTL_COCPU_CTRL_REG` gets written or when a trap occurs due to illegal processor state. Once the program halts, the ULP RISC-V coprocessor will power down, and the timer will be started again.

To disable the timer (effectively preventing the ULP program from running again), please clear the `RTC_CNTL_ULP_CP_SLP_TIMER_EN` bit in the `RTC_CNTL_ULP_CP_TIMER_REG` register. This can be done both from the ULP code and from the main program.

### ULP RISC-V Peripheral Support

To enhance the capabilities of the ULP RISC-V coprocessor, it has access to peripherals which operate in the low-power (RTC) domain. The ULP RISC-V coprocessor can interact with these peripherals when the main CPU is in sleep mode, and can wake up the main CPU once a wakeup condition is reached. The following peripherals are supported.

#### RTC I2C

The RTC I2C controller provides I2C master functionality in the RTC domain. The ULP RISC-V coprocessor can read from or write to I2C slave devices using this controller. To use the RTC I2C peripheral, call the `ulp_riscv_i2c_master_init()` from your application running on the main core before initializing the ULP RISC-V core and going to sleep.

Once the RTC I2C controller is initialized, the I2C slave device address must be programmed via the `ulp_riscv_i2c_master_set_slave_addr()` API before any read or write operation is performed.

Note: The RTC I2C peripheral always expects a slave sub-register address to be programmed via the `ulp_riscv_i2c_master_set_slave_reg_addr()` API. If it is not, the I2C peripheral uses the `SENS_SAR_I2C_CTRL_REG[18:11]` as the sub-register address for the subsequent read or write operations. This could make the RTC I2C peripheral incompatible with certain I2C devices or sensors which do not need any sub-register to be programmed.

Note: There is no hardware atomicity protection in accessing the RTC I2C peripheral between the main CPU and the ULP RISC-V core. Therefore, care must be taken that both cores are not accessing the peripheral simultaneously.
In case your RTC I2C based ULP RISC-V program is not working as expected, the following sanity checks can help in debugging the issue:

- Incorrect SDA/SCL pin selection: The SDA pin can only be set up as GPIO1 or GPIO3 and SCL pin can only be set up as GPIO0 or GPIO2. Make sure that the pin configuration is correct.
- Incorrect I2C timing parameters: The RTC I2C bus timing configuration is limited by the I2C standard bus specification. Any timing parameters which violate the standard I2C bus specifications would result in an error. For details on the timing parameters, please read the standard I2C bus specifications.
- If the I2C slave device or sensor does not require a sub-register address to be programmed, it may not be compatible with the RTC I2C peripheral. Please refer the notes above.
- If the RTC driver reports a Write Failed! or Read Failed! error log when running on the main CPU, then make sure:
  - The I2C slave device or sensor works correctly with the standard I2C master on Espressif SoCs. This would rule out any problems with the I2C slave device itself.
  - If the RTC I2C interrupt status log reports a TIMEOUT error or ACK error, it could typically mean that the I2C device did not respond to a START condition sent out by the RTC I2C controller. This could happen if the I2C slave device is not connected properly to the controller pins or if the I2C slave device is in a bad state. Make sure that the I2C slave device is in a good state and connected properly before continuing.
  - If the RTC I2C interrupt log does not report any error status, it could mean that the driver is not fast enough in receiving data from the I2C slave device. This could happen as the RTC I2C controller does not have a TX/RX FIFO to store multiple bytes of data but rather, it depends on single byte transmissions using an interrupt status polling mechanism. This could be mitigated to some extent by making sure that the SCL clock of the peripheral is running as fast as possible. This can be tweaked by configuring the SCL low period and SCL high period values in the initialization config parameters for the peripheral.
- Other methods of debugging problems would be to ensure that the RTC I2C controller is operational only on the main CPU without any ULP RISC-V code interfering and without any sleep mode being activated. This is the basic configuration under which the RTC I2C peripheral must work. This way you can rule out any potential issues due to the ULP or sleep modes.

**Debugging Your ULP RISC-V Program**

When programming the ULP RISC-V, it can sometimes be challenging to figure out why the program is not behaving as expected. Due to the simplicity of the core, many of the standard methods of debugging, e.g., JTAG or printf, are simply not available.

Keeping this in mind, here are some ways that may help you debug you ULP RISC-V program:

- Share program state through shared variables: as described in [Accessing the ULP RISC-V Program Variables](#), both the main CPU and the ULP core can easily access global variables in RTC memory. Writing state information to such a variable from the ULP and reading it from the main CPU can help you discern what is happening on the ULP core. The downside of this approach is that it requires the main CPU to be awake, which will not always be the case. Keeping the main CPU awake might even, in some cases, mask problems, as some issues may only occur when certain power domains are powered down.
- Use the bit-banged UART driver to print: the ULP RISC-V component comes with a low-speed bit-banged UART TX driver that can be used for printing information independently of the main CPU state. See `system/ulp/ulp_riscv/uart_print` for an example of how to use this driver.
- Trap signal: the ULP RISC-V has a hardware trap that will trigger under certain conditions, e.g., illegal instruction. This will cause the main CPU to be woken up with the wake-up cause `ESP_SLEEP_WAKEUP_COCPU_TRAP_TRIG`.

**Application Examples**

- ULP RISC-V Coprocessor polls GPIO while main CPU is in deep sleep: `system/ulp/ulp_riscv/gpio`.
- ULP RISC-V Coprocessor uses bit-banged UART driver to print: `system/ulp/ulp_riscv/uart_print`.
- ULP RISC-V Coprocessor reads external temperature sensor while main CPU is in deep sleep: `system/ulp/ulp_riscv/ds18b20_onewire`.
ULP RISC-V Coprocessor reads external I2C temperature and humidity sensor (BMP180) while the main CPU is in Deep-sleep and wakes up the main CPU once a threshold is met: system/ulp/ulp_riscv/i2c.

API Reference

Header File

- components/ulp/ulp_riscv/include/ulp_riscv.h
  - This header file can be included with:

```c
#include "ulp_riscv.h"
```

- This header file is a part of the API provided by the ulp component. To declare that your component depends on ulp, add the following to your CMakeLists.txt:

```cmake
REQUIRES ulp
```

or

```
PRIV_REQUIRES ulp
```

Functions

```c
esp_err_t ulp_riscv_isr_register (intr_handler_t fn, void *arg, uint32_t mask)
```

Register ULP signal ISR.

**Note:** The ISR routine will only be active if the main CPU is not in deepsleep

- **Parameters**
  - `fn` - ISR callback function
  - `arg` - ISR callback function arguments
  - `mask` - Bit mask to enable the required ULP RISC-V interrupt signals

- **Returns**
  - ESP_OK on success
  - ESP_ERR_INVALID_ARG if callback function is NULL or if the interrupt bits are invalid
  - ESP_ERR_NO_MEM if heap memory cannot be allocated for the interrupt
  - other errors returned by esp_intr_alloc

```c
esp_err_t ulp_riscv_isr_deregister (intr_handler_t fn, void *arg, uint32_t mask)
```

Deregister ULP signal ISR.

- **Parameters**
  - `fn` - ISR callback function
  - `arg` - ISR callback function arguments
  - `mask` - Bit mask to enable the required ULP RISC-V interrupt signals

- **Returns**
  - ESP_OK on success
  - ESP_ERR_INVALID_ARG if callback function is NULL or if the interrupt bits are invalid
  - ESP_ERR_INVALID_STATE if a handler matching both callback function and its arguments isn’t registered

```c
esp_err_t ulp_riscv_config_and_run (ulp_riscv_cfg_t *cfg)
```

Configure the ULP and run the program loaded into RTC memory.

- **Parameters**
  - `cfg` - pointer to the config struct

- **Returns**
  - ESP_OK on success
**esp_err_t ulp_riscv_run** (void)

Configure the ULP with default settings and run the program loaded into RTC memory.

**Returns** ESP_OK on success

**esp_err_t ulp_riscv_load_binary** (const uint8_t *program_binary, size_t program_size_bytes)

Load ULP-RISC-V program binary into RTC memory.

Different than ULP FSM, the binary program has no special format, it is the ELF file generated by RISC-V toolchain converted to binary format using objcopy.

Linker script in components/ulp/ld/ulp_riscv.ld produces ELF files which correspond to this format. This linker script produces binaries with load_addr == 0.

**Parameters**
- `program_binary` - pointer to program binary
- `program_size_bytes` - size of the program binary

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if program_size_bytes is more than 8KiB

**void ulp_riscv_timer_stop** (void)

Stop the ULP timer.

**Note:** This will stop the ULP from waking up if halted, but will not abort any program currently executing on the ULP.

**void ulp_riscv_timer_resume** (void)

Resumes the ULP timer.

**Note:** This will resume an already configured timer, but does no other configuration

**void ulp_riscv_halt** (void)

Halts the program currently running on the ULP-RISC-V.

**Note:** Program will restart at the next ULP timer trigger if timer is still running. If you want to stop the ULP from waking up then call ulp_riscv_timer_stop() first.

**void ulp_riscv_reset** (void)

Resets the ULP-RISC-V core from the main CPU.

**Note:** This will reset the ULP core from the main CPU. It is intended to be used when the ULP is in a bad state and cannot run as intended due to a corrupt firmware or any other reason. The main core can reset the ULP core with this API and then re-initialize the ULP.

**Structures**

```c
struct ulp_riscv_cfg_t
```

ULP riscv init parameters.

ULP wants to enter the critical sections

bool critical_section_flag_main_cpu

Main CPU wants to enter the critical sections

ulp_riscv_lock_turn_t turn

Which CPU is allowed to enter the critical section
Enumerations

enum ulp_riscv_lock_turn_t

Enum representing which processor is allowed to enter the critical section.

Values:

enumerator ULP_RISCV_LOCK_TURN_ULP
ULP’s turn to enter the critical section

enumerator ULP_RISCV_LOCK_TURN_MAIN_CPU
Main CPU’s turn to enter the critical section

Header File

- components/ulp/ulp_riscv/include/ulp_riscv_lock.h
- This header file can be included with:

```
#include "ulp_riscv_lock.h"
```

- This header file is a part of the API provided by the ulp component. To declare that your component depends on ulp, add the following to your CMakeLists.txt:

```
REQUIRES ulp
```

or

```
PRIV_REQUIRES ulp
```

Functions

void ulp_riscv_lock_acquire (ulp_riscv_lock_t *lock)

Locks are based on the Peterson’s algorithm, https://en.wikipedia.org/wiki/Peterson%27s_algorithm.

Acquire the lock, preventing the ULP from taking until released. Spins until lock is acquired.

**Note:** The lock is only designed for being used by a single thread on the main CPU, it is not safe to try to acquire it from multiple threads.

**Parameters**
lock – Pointer to lock struct, shared with ULP

void ulp_riscv_lock_release (ulp_riscv_lock_t *lock)

Release the lock.

**Parameters**
lock – Pointer to lock struct, shared with ULP

Header File

- components/ulp/ulp_riscv/include/ulp_riscv_i2c.h
- This header file can be included with:

```
#include “ulp_riscv_i2c.h”
```

- This header file is a part of the API provided by the ulp component. To declare that your component depends on ulp, add the following to your CMakeLists.txt:

```
REQUIRES ulp
```

or
### Functions

*void ulp_riscv_i2c_master_set_slave_addr (uint8_t slave_addr)*

Set the I2C slave device address.

---

*Parameters*

- `slave_addr` - I2C slave address (7 bit)

*void ulp_riscv_i2c_master_set_slave_reg_addr (uint8_t slave_reg_addr)*

Set the I2C slave device sub register address.

---

**Note:** The RTC I2C peripheral always expects a slave sub register address to be programmed. If it is not, the I2C peripheral uses the SENS_SAR_I2C_CTRL_REG[18:11] as the sub register address for the subsequent read or write operation.

---

*Parameters*

- `slave_reg_addr` - I2C slave sub register address

---

*void ulp_riscv_i2c_master_read_from_device (uint8_t *data_rd, size_t size)*

Read from I2C slave device.

---

**Note:** The I2C slave device address must be configured at least once before invoking this API.

---

*Parameters*

- `data_rd` - Buffer to hold data to be read
- `size` - Size of data to be read in bytes

*void ulp_riscv_i2c_master_write_to_device (uint8_t *data_wr, size_t size)*

Write to I2C slave device.

---

**Note:** The I2C slave device address must be configured at least once before invoking this API.

---

*Parameters*

- `data_wr` - Buffer which holds the data to be written
- `size` - Size of data to be written in bytes

*esp_err_t ulp_riscv_i2c_master_init (const ulp_riscv_i2c_cfg_t *cfg)*

Initialize and configure the RTC I2C for use by ULP RISC-V. Currently RTC I2C can only be used in master mode.

---

*Parameters*

- `cfg` - Configuration parameters

*Returns* esp_err_t ESP_OK when successful

### Structures

*struct ulp_riscv_i2c_pin_cfg_t*

ULP RISC-V RTC I2C pin config.

### Public Members

**Chapter 2. API Reference**

```c
uint32_t sda_io_num
    GPIO pin for SDA signal. Only GPIO#1 or GPIO#3 can be used as the SDA pin.

uint32_t scl_io_num
    GPIO pin for SCL signal. Only GPIO#0 or GPIO#2 can be used as the SCL pin.

bool sda_pullup_en
    SDA line enable internal pullup. Can be configured if external pullup is not used.

bool scl_pullup_en
    SCL line enable internal pullup. Can be configured if external pullup is not used.

struct ulp_riscv_i2c_timing_cfg_t
    ULP RISC-V RTC I2C timing config.

Public Members

float scl_low_period
    SCL low period in micro seconds

float scl_high_period
    SCL high period in micro seconds

float sda_duty_period
    Period between the SDA switch and the falling edge of SCL in micro seconds

float scl_start_period
    Waiting time after the START condition in micro seconds

float scl_stop_period
    Waiting time before the END condition in micro seconds

float i2c_trans_timeout
    I2C transaction timeout in micro seconds

struct ulp_riscv_i2c_cfg_t
    ULP RISC-V RTC I2C init parameters.

Public Members

**ulp_riscv_i2c_pin_cfg_t i2c_pin_cfg**
    RTC I2C pin configuration

**ulp_riscv_i2c_timing_cfg_t i2c_timing_cfg**
    RTC I2C timing configuration
```

2.9.34 Watchdogs

Overview

ESP-IDF supports multiple types of watchdogs:

- Interrupt Watchdog Timer (IWDT)
- Task Watchdog Timer (TWDT)
- XTAL32K Watchdog Timer (Crystal 32K Watchdog Timer, i.e., XTWDT)

The Interrupt Watchdog is responsible for ensuring that ISRs (Interrupt Service Routines) are not blocked for a prolonged period of time. The TWDT is responsible for detecting instances of tasks running without yielding for a prolonged period.

The various watchdog timers can be enabled using the Project Configuration Menu. However, the TWDT can also be enabled during runtime.

Interrupt Watchdog Timer (IWDT)

The purpose of the IWDT is to ensure that interrupt service routines (ISRs) are not blocked from running for a prolonged period of time (i.e., the IWDT timeout period). Preventing ISRs from running in a timely manner is undesirable as it can increase ISR latency, and also prevent task switching (as task switching is executed form an ISR). The things that can block ISRs from running include:

- Disabling interrupts
- Critical Sections (also disables interrupts)
- Other same/higher priority ISRs which block same/lower priority ISRs from running

The IWDT utilizes the watchdog timer in Timer Group 1 as its underlying hardware timer and leverages the FreeRTOS tick interrupt on each CPU to feed the watchdog timer. If the tick interrupt on a particular CPU is not run at within the IWDT timeout period, it is indicative that something is blocking ISRs from being run on that CPU (see the list of reasons above).

When the IWDT times out, the default action is to invoke the panic handler and display the panic reason as Interrupt wdt timeout on CPU0 or Interrupt wdt timeout on CPU1 (as applicable). Depending on the panic handler’s configured behavior (see CONFIG_ESP_SYSTEM_PANIC), users can then debug the source of the IWDT timeout (via the backtrace, OpenOCD, gdbstub etc) or simply reset the chip (which may be preferred in a production environment).

If for whatever reason the panic handler is unable to run after an IWDT timeout, the IWDT has a second stage timeout that will hard-reset the chip (i.e., a system reset).

Configuration

- The IWDT is enabled by default via the CONFIG_ESP_INT_WDT option.
- The IWDT’s timeout is configured by setting the CONFIG_ESP_INT_WDT_TIMEOUT_MS option.
  - Note that the default timeout is higher if PSRAM support is enabled, as a critical section or interrupt routine that accesses a large amount of PSRAM takes longer to complete in some circumstances.
The timeout should always at least twice longer than the period between FreeRTOS ticks (see `CONFIG_FREERTOS_HZ`).

**Tuning** If you find the IWDT timeout is triggered because an interrupt or critical section is running longer than the timeout period, consider rewriting the code:

- Critical sections should be made as short as possible. Any non-critical code/computation should be placed outside the critical section.
- Interrupt handlers should also perform the minimum possible amount of computation. Users can consider deferring any computation to a task by having the ISR push data to a task using queues.

Neither critical sections or interrupt handlers should ever block waiting for another event to occur. If changing the code to reduce the processing time is not possible or desirable, it is possible to increase the `CONFIG_ESP_INT_WDT_TIMEOUT_MS` setting instead.

**Task Watchdog Timer (TWDT)**

The Task Watchdog Timer (TWDT) is used to monitor particular tasks, ensuring that they are able to execute within a given timeout period. The TWDT primarily watches the Idle Tasks of each CPU, however any task can subscribe to be watched by the TWDT. By watching the Idle Tasks of each CPU, the TWDT can detect instances of tasks running for a prolonged period of time without yielding. This can be an indicator of poorly written code that spinloops on a peripheral, or a task that is stuck in an infinite loop.

The TWDT is built around the Hardware Watchdog Timer in Timer Group 0. When a timeout occurs, an interrupt is triggered.

Users can define the function `esp_task_wdt_isr_user_handler` in the user code, in order to receive the timeout event and extend the default behavior.

**Usage** The following functions can be used to watch tasks using the TWDT:

- `esp_task_wdt_init()` to initialize the TWDT and subscribe the idle tasks.
- `esp_task_wdt_add()` subscribes other tasks to the TWDT.
- Once subscribed, `esp_task_wdt_reset()` should be called from the task to feed the TWDT.
- `esp_task_wdt_delete()` unsubscribes a previously subscribed task.
- `esp_task_wdt_deinit()` unsubscribes the idle tasks and deinitializes the TWDT.

In the case where applications need to watch at a more granular level (i.e., ensure that a particular functions/stub/code-path is called), the TWDT allows subscription of users.

- `esp_task_wdt_add_user()` to subscribe an arbitrary user of the TWDT. This function returns a user handle to the added user.
- `esp_task_wdt_reset_user()` must be called using the user handle in order to prevent a TWDT timeout.
- `esp_task_wdt_delete_user()` unsubscribes an arbitrary user of the TWDT.

**Configuration** The default timeout period for the TWDT is set using config item `CONFIG_ESP_TASK_WDT_TIMEOUT_S`. This should be set to at least as long as you expect any single task needs to monopolize the CPU (for example, if you expect the app will do a long intensive calculation and should not yield to other tasks). It is also possible to change this timeout at runtime by calling `esp_task_wdt_init()`.

**Note:** Erasing large flash areas can be time consuming and can cause a task to run continuously, thus triggering a TWDT timeout. The following two methods can be used to avoid this:

- Increase `CONFIG_ESP_TASK_WDT_TIMEOUT_S` in menuconfig for a larger watchdog timeout period.
- You can also call `esp_task_wdt_init()` to increase the watchdog timeout period before erasing a large flash area.
For more information, you can refer to *SPI Flash API*.

The following config options control TWDT configuration. They are all enabled by default:

- **CONFIG_ESP_TASK_WDT_EN** - enables TWDT feature. If this option is disabled, TWDT cannot be used, even if initialized at runtime.
- **CONFIG_ESP_TASK_WDT_INIT** - the TWDT is initialized automatically during startup. If this option is disabled, it is still possible to initialize the Task WDT at runtime by calling `esp_task_wdt_init()`.
- **CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0** - Idle task is subscribed to the TWDT during startup. If this option is disabled, it is still possible to subscribe the idle task by calling `esp_task_wdt_init()` again.

**Note:** On a TWDT timeout the default behaviour is to simply print a warning and a backtrace before continuing running the app. If you want a timeout to cause a panic and a system reset then this can be configured through **CONFIG_ESP_TASK_WDT_PANIC**.

### XTAL32K Watchdog Timer (XTWDT)

One of the optional clock inputs to the ESP32-S2 is an external 32 kHz crystal oscillator (XTAL32K) that is used as a clock source (XTAL32K_CLK) to various subsystems (such as the RTC).

The XTWDT is a dedicated watchdog timer used to ensure that the XTAL32K is functioning correctly. When XTAL32K_CLK works as the clock source of RTC_SLOW_CLK and stops oscillating, the XTWDT will detect this and generate an interrupt. It also provides functionality for automatically switching over to the internal, but less accurate oscillator as the RTC_SLOW_CLK source.

Since the switch to the backup clock is done in hardware it can also happen during Deep Sleep. This means that even if XTAL32K_CLK stops functioning while the chip is in Deep Sleep, waiting for a timer to expire, it is still able to wake-up as planned.

If the XTAL32K_CLK starts functioning normally again, you can call `esp_xt_wdt_restore_clk` to switch back to this clock source and re-enable the watchdog timer.

**Configuration**

- When the external 32 KHz crystal or oscillator is selected (*CONFIG_RTC_CLK_SRC*) the XTWDT can be enabled via the **CONFIG_ESP_XT_WDT** configuration option.
- The timeout is configured by setting the **CONFIG_ESP_XT_WDT_TIMEOUT** option.
- The automatic backup clock functionality is enabled via the ref: **CONFIG_ESP_XT_WDT_BACKUP_CLK_ENABLE** configuration option.

### JTAG & Watchdogs

While debugging using OpenOCD, the CPUs are halted every time a breakpoint is reached. However if the watchdog timers continue to run when a breakpoint is encountered, they will eventually trigger a reset making it very difficult to debug code. Therefore OpenOCD will disable the hardware timers of both the interrupt and task watchdogs at every breakpoint. Moreover, OpenOCD will not reenable them upon leaving the breakpoint. This means that interrupt watchdog and task watchdog functionality will essentially be disabled. No warnings or panics from either watchdogs will be generated when the ESP32-S2 is connected to OpenOCD via JTAG.

**API Reference**

**Task Watchdog**  A full example using the Task Watchdog is available in esp-idf: `system/task_watchdog`
Header File

- components/esp_system/include/esp_task_wdt.h
- This header file can be included with:

```c
#include "esp_task_wdt.h"
```

Functions

`esp_err_t esp_task_wdt_init(const esp_task_wdt_config_t *config)`

Initialize the Task Watchdog Timer (TWDT)

This function configures and initializes the TWDT. This function will subscribe the idle tasks if configured to do so. For other tasks, users can subscribe them using `esp_task_wdt_add()` or `esp_task_wdt_add_user()`. This function won’t start the timer if no task have been registered yet.

**Note:** `esp_task_wdt_init()` must only be called after the scheduler is started. Moreover, it must not be called by multiple tasks simultaneously.

**Parameters**

- `config` – [in] Configuration structure

**Returns**

- ESP_OK: Initialization was successful
- ESP_ERR_INVALID_STATE: Already initialized
- Other: Failed to initialize TWDT

`esp_err_t esp_task_wdt_reconfigure(const esp_task_wdt_config_t *config)`

Reconfigure the Task Watchdog Timer (TWDT)

The function reconfigures the running TWDT. It must already be initialized when this function is called.

**Note:** `esp_task_wdt_reconfigure()` must not be called by multiple tasks simultaneously.

**Parameters**

- `config` – [in] Configuration structure

**Returns**

- ESP_OK: Reconfiguring was successful
- ESP_ERR_INVALID_STATE: TWDT not initialized yet
- Other: Failed to initialize TWDT

`esp_err_t esp_task_wdt_deinit(void)`

Deinitialize the Task Watchdog Timer (TWDT)

This function will deinitialize the TWDT, and unsubscribe any idle tasks. Calling this function whilst other tasks are still subscribed to the TWDT, or when the TWDT is already deinitialized, will result in an error code being returned.

**Note:** `esp_task_wdt_deinit()` must not be called by multiple tasks simultaneously.

**Returns**

- ESP_OK: TWDT successfully deinitialized
- Other: Failed to deinitialize TWDT

`esp_err_t esp_task_wdt_add(TaskHandle_t task_handle)`

Subscribe a task to the Task Watchdog Timer (TWDT)

This function subscribes a task to the TWDT. Each subscribed task must periodically call `esp_task_wdt_reset()` to prevent the TWDT from elapsing its timeout period. Failure to do so will result in a TWDT timeout.
### Parameters `task_handle` – Handle of the task. Input NULL to subscribe the current running task to the TWDT.

### Returns
- ESP_OK: Successfully subscribed the task to the TWDT
- Other: Failed to subscribe task

#### esp_err_t esp_task_wdt_add_user (const char *user_name, esp_task_wdt_user_handle_t *user_handle_ret)

Subscribe a user to the Task Watchdog Timer (TWDT)

This function subscribes a user to the TWDT. A user of the TWDT is usually a function that needs to run periodically. Each subscribed user must periodically call `esp_task_wdt_reset_user()` to prevent the TWDT from elapsing its timeout period. Failure to do so will result in a TWDT timeout.

#### Parameters
- `user_name` – [in] String to identify the user
- `user_handle_ret` – [out] Handle of the user

#### Returns
- ESP_OK: Successfully subscribed the user to the TWDT
- Other: Failed to subscribe user

#### esp_err_t esp_task_wdt_reset (void)

Reset the Task Watchdog Timer (TWDT) on behalf of the currently running task.

This function will reset the TWDT on behalf of the currently running task. Each subscribed task must periodically call this function to prevent the TWDT from timing out. If one or more subscribed tasks fail to reset the TWDT on their own behalf, a TWDT timeout will occur.

#### Returns
- ESP_OK: Successfully reset the TWDT on behalf of the currently running task
- Other: Failed to reset

#### esp_err_t esp_task_wdt_reset_user (esp_task_wdt_user_handle_t user_handle)

Reset the Task Watchdog Timer (TWDT) on behalf of a user.

This function will reset the TWDT on behalf of a user. Each subscribed user must periodically call this function to prevent the TWDT from timing out. If one or more subscribed users fail to reset the TWDT on their own behalf, a TWDT timeout will occur.

#### Parameters `user_handle` – [in] User handle
- ESP_OK: Successfully reset the TWDT on behalf of the user
- Other: Failed to reset

#### esp_err_t esp_task_wdt_delete (TaskHandle_t task_handle)

Unsubscribes a task from the Task Watchdog Timer (TWDT)

This function will unsubscribe a task from the TWDT. After being unsubscribed, the task should no longer call `esp_task_wdt_reset()`.

#### Parameters `task_handle` – [in] Handle of the task. Input NULL to unsubscribe the current running task.

#### Returns
- ESP_OK: Successfully unsubscribed the task from the TWDT
- Other: Failed to unsubscribe task

#### esp_err_t esp_task_wdt_delete_user (esp_task_wdt_user_handle_t user_handle)

Unsubscribes a user from the Task Watchdog Timer (TWDT)

This function will unsubscribe a user from the TWDT. After being unsubscribed, the user should no longer call `esp_task_wdt_reset_user()`.

#### Parameters `user_handle` – [in] User handle

#### Returns
- ESP_OK: Successfully unsubscribed the user from the TWDT
Chapter 2. API Reference

- Other: Failed to unsubscribe user

`esp_err_t esp_task_wdt_status(TaskHandle_t task_handle)`

Query whether a task is subscribed to the Task Watchdog Timer (TWDT).

This function will query whether a task is currently subscribed to the TWDT, or whether the TWDT is initialized.

**Parameters**

- `task_handle` [in] Handle of the task. Input NULL to query the current running task.

**Returns**

- ESP_OK: The task is currently subscribed to the TWDT
- ESP_ERR_NOT_FOUND: The task is not subscribed
- ESP_ERR_INVALID_STATE: TWDT was never initialized

`void esp_task_wdt_isr_user_handler(void)`

User ISR callback placeholder.

This function is called by task_wdt_isr function (ISR for when TWDT times out). It can be defined in user code to handle TWDT events.

**Note:** It has the same limitations as the interrupt function. Do not use ESP_LOGx functions inside.

**Structures**

`struct esp_task_wdt_config_t`  
Task Watchdog Timer (TWDT) configuration structure.

**Public Members**

- `uint32_t timeout_ms`
  
  TWDT timeout duration in milliseconds

- `idle_core_mask`
  
  Bitmask of the core whose idle task should be subscribed on initialization where 1 << i means that core i’s idle task will be monitored by the TWDT

- `bool trigger_panic`
  
  Trigger panic when timeout occurs

**Type Definitions**

`typedef struct esp_task_wdt_user_handle_s *esp_task_wdt_user_handle_t`  
Task Watchdog Timer (TWDT) user handle.

Code examples for this API section are provided in the system directory of ESP-IDF examples.

API Guides

4.1 Application Level Tracing Library

4.1.1 Overview

ESP-IDF provides a useful feature for program behavior analysis: application level tracing. It is implemented in the corresponding library and can be enabled in menuconfig. This feature allows to transfer arbitrary data between host and ESP32-S2 via JTAG, UART, or USB interfaces with small overhead on program execution. It is possible to use JTAG and UART interfaces simultaneously. The UART interface is mostly used for connection with SEGGER SystemView tool (see SystemView).

Developers can use this library to send application-specific state of execution to the host and receive commands or other types of information from the opposite direction at runtime. The main use cases of this library are:

1. Collecting application-specific data. See Application Specific Tracing.
2. Lightweight logging to the host. See Logging to Host.

Tracing components used when working over JTAG interface are shown in the figure below.

4.1.2 Modes of Operation

The library supports two modes of operation:

**Post-mortem mode:** This is the default mode. The mode does not need interaction with the host side. In this mode, tracing module does not check whether the host has read all the data from HW UP BUFFER, but directly overwrites old data with the new ones. This mode is useful when only the latest trace data is interesting to the user, e.g., for analyzing program’s behavior just before the crash. The host can read the data later on upon user request, e.g., via special OpenOCD command in case of working via JTAG interface.

**Streaming mode:** Tracing module enters this mode when the host connects to ESP32-S2. In this mode, before writing new data to HW UP BUFFER, the tracing module checks that whether there is enough space in it and if necessary, waits for the host to read data and free enough memory. Maximum waiting time is controlled via timeout values passed by users to corresponding API routines. So when application tries to write data to the trace buffer using the finite value of the maximum waiting time, it is possible that this data will be dropped. This is especially true for tracing from time critical code (ISRs, OS scheduler code, etc.) where infinite timeouts can lead to system malfunction. In order to avoid loss of such critical data, developers can enable additional data buffering via menuconfig option.
**CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX.** This macro specifies the size of data which can be buffered in above conditions. The option can also help to overcome situation when data transfer to the host is temporarily slowed down, e.g., due to USB bus congestions. But it will not help when the average bitrate of the trace data stream exceeds the hardware interface capabilities.

### 4.1.3 Configuration Options and Dependencies

Using of this feature depends on two components:

1. **Host side:** Application tracing is done over JTAG, so it needs OpenOCD to be set up and running on host machine. For instructions on how to set it up, please see [JTAG Debugging](#) for details.

2. **Target side:** Application tracing functionality can be enabled in menuconfig. Please go to `Component config > Application Level Tracing` menu, which allows selecting destination for the trace data (hardware interface for transport: JTAG or/and UART). Choosing any of the destinations automatically enables the `CONFIG_APPTRACE_ENABLE` option. For UART interfaces, users have to define baud rate, TX and RX pins numbers, and additional UART-related parameters.

**Note:** In order to achieve higher data rates and minimize the number of dropped packets, it is recommended to optimize the setting of JTAG clock frequency, so that it is at maximum and still provides stable operation of JTAG. See [Optimize JTAG Speed](#).

There are two additional menuconfig options not mentioned above:

1. **Threshold for flushing last trace data to host on panic (CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH).** This option is necessary due to the nature of working over JTAG. In this mode, trace data is exposed to the host in 16 KB blocks. In post-mortem mode, when one block is filled, it is exposed to the host and the previous one becomes unavailable. In other words, the trace data is overwritten in 16 KB granularity. On panic, the latest data from the current input block is exposed to the host and the host can read them for post-analysis. System panic may occur when a very small amount of data are not exposed to the host yet. In this case, the previous 16 KB of collected data will be lost and the host will see the latest, but very small piece of the trace.
Chapter 4. API Guides

It can be insufficient to diagnose the problem. This menuconfig option allows avoiding such situations. It controls the threshold for flushing data in case of panic. For example, users can decide that it needs no less than 512 bytes of the recent trace data, so if there is less then 512 bytes of pending data at the moment of panic, they will not be flushed and will not overwrite the previous 16 KB. The option is only meaningful in post-mortem mode and when working over JTAG.

2. **Timeout for flushing last trace data to host on panic (CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO).** The option is only meaningful in streaming mode and it controls the maximum time that the tracing module will wait for the host to read the last data in case of panic.

3. **UART RX/TX ring buffer size (CONFIG_APPTRACE_UART_TX_BUFF_SIZE).** The size of the buffer depends on the amount of data transferred through the UART.

4. **UART TX message size (CONFIG_APPTRACE_UART_TX_MSG_SIZE).** The maximum size of the single message to transfer.

### 4.1.4 How to Use This Library

This library provides APIs for transferring arbitrary data between the host and ESP32-S2. When enabled in menuconfig, the target application tracing module is initialized automatically at the system startup, so all what the user needs to do is to call corresponding APIs to send, receive or flush the data.

**Application Specific Tracing**

In general, users should decide what type of data should be transferred in every direction and how these data must be interpreted (processed). The following steps must be performed to transfer data between the target and the host:

1. On the target side, users should implement algorithms for writing trace data to the host. Piece of code below shows an example on how to do this.

```c
#include "esp_app_trace.h"
...
char buf[] = "Hello World!";
esp_err_t res = esp_apptrace_write(ESP_APPTRACE_DEST_TRAX, buf, strlen(buf), ESP_APPTRACE_TMO_INFINITE);
if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to write data to host!");
    return res;
}
```

`esp_apptrace_write()` function uses memcpy to copy user data to the internal buffer. In some cases, it can be more optimal to use `esp_apptrace_buffer_get()` and `esp_apptrace_buffer_put()` functions. They allow developers to allocate buffer and fill it themselves. The following piece of code shows how to do this.

```c
#include "esp_app_trace.h"
...
int number = 10;
char *ptr = (char *)esp_apptrace_buffer_get(ESP_APPTRACE_DEST_TRAX, 32, 100/*tmo in us*/);
if (ptr == NULL) {
    ESP_LOGE(TAG, "Failed to get buffer!");
    return ESP_FAIL;
}
sprintf(ptr, "Here is the number %d", number);
esp_err_t res = esp_apptrace_buffer_put(ESP_APPTRACE_DEST_TRAX, ptr, 100/*tmo in us*/);
if (res != ESP_OK) {
    /* in case of error host tracing tool (e.g., OpenOCD) will report...
    
    in complete user buffer */
    ESP_LOGE(TAG, "Failed to put buffer!");
    return res;
}
```
Also according to his needs, the user may want to receive data from the host. Piece of code below shows an example on how to do this.

```c
#include "esp_app_trace.h"
...
char buf[32];
char down_buf[32];
size_t sz = sizeof(buf);

/* config down buffer */
esp_apptrace_down_buffer_config(down_buf, sizeof(down_buf));
/* check for incoming data and read them if any */
esp_err_t res = esp_apptrace_read(ESP_APPTRACE_DEST_TRAX, buf, &sz, 0/
~do not wait!/);
if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to read data from host!");
    return res;
}
if (sz > 0) {
    /* we have data, process them */
    ...
}
```

`esp_apptrace_read()` function uses `memcpy` to copy host data to user buffer. In some cases it can be more optimal to use `esp_apptrace_down_buffer_get()` and `esp_apptrace_down_buffer_put()` functions. They allow developers to occupy chunk of read buffer and process it in-place. The following piece of code shows how to do this.

```c
#include "esp_app_trace.h"
...
char down_buf[32];
uint32_t *number;
size_t sz = 32;

/* config down buffer */
esp_apptrace_down_buffer_config(down_buf, sizeof(down_buf));
char *ptr = (char *)esp_apptrace_down_buffer_get(ESP_APPTRACE_DEST_/
~TRAX, &sz, 100/*tmo in us*/);
if (ptr == NULL) {
    ESP_LOGE(TAG, "Failed to get buffer!");
    return ESP_FAIL;
}
if (sz > 4) {
    number = (uint32_t *)ptr;
    printf("Here is the number %d", *number);
} else {
    printf("No data");
}
esp_err_t res = esp_apptrace_down_buffer_put(ESP_APPTRACE_DEST_TRAX,/
~ptr, 100/*tmo in us*/);
if (res != ESP_OK) {
    /* in case of error host tracing tool (e.g., OpenOCD) will report/
~incomplete user buffer */
    ESP_LOGE(TAG, "Failed to put buffer!");
    return res;
}
```

2. The next step is to build the program image and download it to the target as described in the **Getting Started Guide**.

3. Run OpenOCD (see **JTAG Debugging**).

4. Connect to OpenOCD telnet server. It can be done using the following command in terminal:
   ```
telnet <oocd_host> 4444
   ```
   If telnet session is opened on the same machine which runs OpenOCD, you can use `localhost` as `<oocd_host>` in the command above.
5. Start trace data collection using special OpenOCD command. This command will transfer tracing data and redirect them to the specified file or socket (currently only files are supported as trace data destination). For description of the corresponding commands, see *OpenOCD Application Level Tracing Commands*.

6. The final step is to process received data. Since the format of data is defined by users, the processing stage is out of the scope of this document. Good starting points for data processor are python scripts in `$IDF_PATH/tools/esp_app_trace: apptrace_proc.py (used for feature tests) and logtrace_proc.py (see more details in section Logging to Host).*

**OpenOCD Application Level Tracing Commands**

*HW UP BUFFER* is shared between user data blocks and the filling of the allocated memory is performed on behalf of the API caller (in task or ISR context). In multithreading environment, it can happen that the task/ISR which fills the buffer is preempted by another high priority task/ISR. So it is possible that the user data preparation process is not completed at the moment when that chunk is read by the host. To handle such conditions, the tracing module prepends all user data chunks with header which contains the allocated user buffer size (2 bytes) and the length of the actually written data (2 bytes). So the total length of the header is 4 bytes. OpenOCD command which reads trace data reports error when it reads incomplete user data chunk, but in any case, it puts the contents of the whole user chunk (including unfilled area) to the output file.

Below is the description of available OpenOCD application tracing commands.

---

**Note:** Currently, OpenOCD does not provide commands to send arbitrary user data to the target.

---

**Command usage:**

```
esp aptrace [start <options>] | [stop] | [status] | [dump <cores_num> <outfile>]
```

Sub-commands:

- **start** Start tracing (continuous streaming).
- **stop** Stop tracing.
- **status** Get tracing status.
- **dump** Dump all data from (post-mortem dump).

Start command syntax:

```
start <outfile> [poll_period [trace_size [stop_tmo [wait4halt [skip_size]]]]]
```

- **outfile** Path to file to save data from both CPUs. This argument should have the following format: file://path/to/file.
- **poll_period** Data polling period (in ms) for available trace data. If greater than 0, then command runs in non-blocking mode. By default, 1 ms.
- **trace_size** Maximum size of data to collect (in bytes). Tracing is stopped after specified amount of data is received. By default, -1 (trace size stop trigger is disabled).
- **stop_tmo** Idle timeout (in sec). Tracing is stopped if there is no data for specified period of time. By default, -1 (disable this stop trigger). Optionally set it to value longer than longest pause between tracing commands from target.
- **wait4halt** If 0, start tracing immediately, otherwise command waits for the target to be halted (after reset, by breakpoint etc.) and then automatically resumes it and starts tracing. By default, 0.
- **skip_size** Number of bytes to skip at the start. By default, 0.

---

**Note:** If **poll_period** is 0, OpenOCD telnet command line will not be available until tracing is stopped. You must stop it manually by resetting the board or pressing Ctrl+C in OpenOCD window (not one with the telnet session). Another option is to set **trace_size** and wait until this size of data is collected. At this point, tracing stops automatically.

---

Command usage examples:
1. Collect 2048 bytes of tracing data to the file `trace.log`. The file will be saved in the `openocd-esp32` directory.

```bash
esp aptrace start file://trace.log 1 2048 5 0 0
```

The tracing data will be retrieved and saved in non-blocking mode. This process will stop automatically after 2048 bytes are collected, or if no data are available for more than 5 seconds.

**Note:** Tracing data is buffered before it is made available to OpenOCD. If you see “Data timeout!” message, then it is likely that the target is not sending enough data to empty the buffer to OpenOCD before the timeout. Either increase the timeout or use the function `esp_aptrace_flush()` to flush the data on specific intervals.

2. Retrieve tracing data indefinitely in non-blocking mode.

```bash
esp aptrace start file://trace.log 1 -1 -1 0 0
```

There is no limitation on the size of collected data and there is no data timeout set. This process may be stopped by issuing `esp aptrace stop` command on OpenOCD telnet prompt, or by pressing Ctrl+C in OpenOCD window.

3. Retrieve tracing data and save them indefinitely.

```bash
esp aptrace start file://trace.log 0 -1 -1 0 0
```

OpenOCD telnet command line prompt will not be available until tracing is stopped. To stop tracing, press Ctrl+C in the OpenOCD window.

4. Wait for the target to be halted. Then resume the target’s operation and start data retrieval. Stop after collecting 2048 bytes of data:

```bash
esp aptrace start file://trace.log 0 2048 -1 1 0
```

To configure tracing immediately after reset, use the OpenOCD `reset halt` command.

### Logging to Host

ESP-IDF implements a useful feature: logging to the host via application level tracing library. This is a kind of semihosting when all `ESP_LOGx` calls send strings to be printed to the host instead of UART. This can be useful because “printing to host” eliminates some steps performed when logging to UART. Most part of the work is done on the host.

By default, ESP-IDF’s logging library uses vprintf-like function to write formatted output to dedicated UART. In general, it involves the following steps:

1. Format string is parsed to obtain type of each argument.
2. According to its type, every argument is converted to string representation.
3. Format string combined with converted arguments is sent to UART.

Though the implementation of the vprintf-like function can be optimized to a certain level, all steps above have to be performed in any case and every step takes some time (especially item 3). So it frequently occurs that with additional log added to the program to identify the problem, the program behavior is changed and the problem cannot be reproduced. And in the worst cases, the program cannot work normally at all and ends up with an error or even hangs.

Possible ways to overcome this problem are to use higher UART bitrates (or another faster interface) and/or to move string formatting procedure to the host.

The application level tracing feature can be used to transfer log information to the host using `esp_aptrace_vprintf` function. This function does not perform full parsing of the format string and arguments. Instead, it just calculates the number of arguments passed and sends them along with the format string address to the host. On the host, log data is processed and printed out by a special Python script.

### Limitations

Current implementation of logging over JTAG has some limitations:
1. No support for tracing from ESP_EARLY_LOGx macros.
2. No support for printf arguments whose size exceeds 4 bytes (e.g., double and uint64_t).
3. Only strings from the .rodata section are supported as format strings and arguments.
4. The maximum number of printf arguments is 256.

How To Use It  In order to use logging via trace module, users need to perform the following steps:

1. On the target side, the special vprintf-like function esp_apptrace_vprintf() needs to be installed. It sends log data to the host. An example is esp_log_set_vprintf(esp_apptrace_vprintf);. To send log data to UART again, use esp_log_set_vprintf(vprintf);.
2. Follow instructions in items 2-5 in Application Specific Tracing.
3. To print out collected log records, run the following command in terminal: $IDF_PATH/tools/esp_app_trace/logtrace_proc.py /path/to/trace/file /path/to/program/elf/file.

Log Trace Processor Command Options  Command usage:

logtrace_proc.py [-h] [--no-errors] <trace_file> <elf_file>

Positional arguments:

trace_file Path to log trace file.
elf_file Path to program ELF file.

Optional arguments:

-h, --help Show this help message and exit.
--no-errors, -n Do not print errors.

System Behavior Analysis with SEGGER SystemView

Another useful ESP-IDF feature built on top of application tracing library is the system level tracing which produces traces compatible with SEGGER SystemView tool (see SystemView). SEGGER SystemView is a real-time recording and visualization tool that allows to analyze runtime behavior of an application. It is possible to view events in real-time through the UART interface.

How To Use It  Support for this feature is enabled by Component config > Application Level Trac-
ing > FreeRTOS SystemView Tracing (CONFIG_APPTRACE_SV_ENABLE) menuconfig option. There are several other options enabled under the same menu:

1. SystemView destination. Select the destination interface: JTAG or UART. In case of UART, it will be possible to connect SystemView application to the ESP32-S2 directly and receive data in real-time.
2. ESP32-S2 timer to use as SystemView timestamp source: (CONFIG_APPTRACE_SV_TS_SOURCE) selects the source of timestamps for SystemView events. In the single core mode, timestamps are generated using ESP32-S2 internal cycle counter running at maximum 240 MHz (about 4 ns granularity). In the dual-core mode, external timer working at 40Mhz is used, so the timestamp granularity is 25 ns.
3. Individually enabled or disabled collection of SystemView events (CONFIG_APPTRACE_SV_EVT_XXX):
   • Trace Buffer Overflow Event
   • ISR Enter Event
   • ISR Exit Event
   • ISR Exit to Scheduler Event
   • Task Start Execution Event
   • Task Stop Execution Event
   • Task Start Ready State Event
   • Task Stop Ready State Event
   • Task Create Event
   • Task Terminate Event
   • System Idle Event
   • Timer Enter Event
• Timer Exit Event

ESP-IDF has all the code required to produce SystemView compatible traces, so users can just configure necessary project options (see above), build, download the image to target, and use OpenOCD to collect data as described in the previous sections.

4. Select Pro or App CPU in menu config options Component config > Application Level Tracing > FreeRTOS SystemView Tracing to trace over the UART interface in real-time.

OpenOCD SystemView Tracing Command Options

Command usage:
```
esp sysview [start <options>] | [stop] | [status]
```

Sub-commands:
- **start** Start tracing (continuous streaming).
- **stop** Stop tracing.
- **status** Get tracing status.

Start command syntax:
```
start <outfile1> [outfile2] [poll_period [trace_size [stop_tmo]]]
```

- **outfile1** Path to file to save data from PRO CPU. This argument should have the following format: `file://path/to/file`.
- **outfile2** Path to file to save data from APP CPU. This argument should have the following format: `file://path/to/file`.
- **poll_period** Data polling period (in ms) for available trace data. If greater than 0, then command runs in non-blocking mode. By default, 1 ms.
- **trace_size** Maximum size of data to collect (in bytes). Tracing is stopped after specified amount of data is received. By default, -1 (trace size stop trigger is disabled).
- **stop_tmo** Idle timeout (in sec). Tracing is stopped if there is no data for specified period of time. By default, -1 (disable this stop trigger).

**Note:** If **poll_period** is 0, OpenOCD telnet command line will not be available until tracing is stopped. You must stop it manually by resetting the board or pressing Ctrl+C in the OpenOCD window (not the one with the telnet session). Another option is to set **trace_size** and wait until this size of data is collected. At this point, tracing stops automatically.

Command usage examples:

1. Collect SystemView tracing data to files `pro-cpu.SVDat` and `app-cpu.SVDat`. The files will be saved in `openocd-esp32` directory.
   ```
   esp sysview start file://pro-cpu.SVDat file://app-cpu.SVDat
   ```
   The tracing data will be retrieved and saved in non-blocking mode. To stop this process, enter `esp sysview stop` command on OpenOCD telnet prompt, optionally pressing Ctrl+C in the OpenOCD window.

2. Retrieve tracing data and save them indefinitely.
   ```
   esp sysview start file://pro-cpu.SVDat file://app-cpu.SVDat 0 -1 -1
   ```
   OpenOCD telnet command line prompt will not be available until tracing is stopped. To stop tracing, press Ctrl+C in the OpenOCD window.

Data Visualization

After trace data are collected, users can use a special tool to visualize the results and inspect behavior of the program.

It is uneasy and awkward to analyze data for every core in separate instance of the tool. Fortunately, there is an Eclipse plugin called Impulse which can load several trace files, thus making it possible to inspect events from both cores in one view. Also, this plugin has no limitation of 1,000,000 events as compared to the free version of SystemView.

Good instructions on how to install, configure, and visualize data in Impulse from one core can be found [here](#).
Note: ESP-IDF uses its own mapping for SystemView FreeRTOS events IDs, so users need to replace the original file mapping `$/SYSVIEW_INSTALL_DIR/Description/SYSVIEW_FreeRTOS.txt` with `$/IDF_PATH/tools/esp_app_trace/SYSVIEW_FreeRTOS.txt`. Also, contents of that ESP-IDF-specific file should be used when configuring SystemView serializer using the above link.

Gcov (Source Code Coverage)

Basics of Gcov and Gcovr  Source code coverage is data indicating the count and frequency of every program execution path that has been taken within a program’s runtime. Gcov is a GCC tool that, when used in concert with the compiler, can generate log files indicating the execution count of each line of a source file. The Gcovr tool is a utility for managing Gcov and generating summarized code coverage results.

Generally, using Gcov to compile and run programs on the host will undergo these steps:

1. Compile the source code using GCC with the `--coverage` option enabled. This will cause the compiler to generate a `.gcno` notes files during compilation. The notes files contain information to reconstruct execution path block graphs and map each block to source code line numbers. Each source file compiled with the `--coverage` option should have their own `.gcno` file of the same name (e.g., a `main.c` will generate a `main.gcno` when compiled).
2. Execute the program. During execution, the program should generate `.gcda` data files. These data files contain the counts of the number of times an execution path was taken. The program will generate a `.gcda` file for each source file compiled with the `--coverage` option (e.g., `main.c` will generate a `main.gcda`).
3. Gcov or Gcovr can be used to generate a code coverage report based on the `.gcno`, `.gcda`, and source files. Gcov will generate a text-based coverage report for each source file in the form of a `.gcov` file, whilst Gcovr will generate a coverage report in HTML format.

Gcov and Gcovr in ESP-IDF  Using Gcov in ESP-IDF is complicated due to the fact that the program is running remotely from the host (i.e., on the target). The code coverage data (i.e., the `.gcda` files) is initially stored on the target itself. OpenOCD is then used to dump the code coverage data from the target to the host via JTAG during runtime. Using Gcov in ESP-IDF can be split into the following steps.

1. Setting Up a Project for Gcov
2. Dumping Code Coverage Data
3. Generating Coverage Report

Setting Up a Project for Gcov

Compiler Option  In order to obtain code coverage data in a project, one or more source files within the project must be compiled with the `--coverage` option. In ESP-IDF, this can be achieved at the component level or the individual source file level:

   - To cause all source files in a component to be compiled with the `--coverage` option, you can add `target_compile_options(${COMPONENT_LIB} PRIVATE --coverage)` to the CMakeLists.txt file of the component.
   - To cause a select number of source files (e.g., `source1.c` and `source2.c`) in the same component to be compiled with the `--coverage` option, you can add `set_source_files_properties(source1.c source2.c PROPERTIES COMPILER_FLAGS --coverage) to the CMakeLists.txt file of the component.

When a source file is compiled with the `--coverage` option (e.g., `gcov_example.c`), the compiler will generate the `gcov_example.gcno` file in the project’s build directory.

Project Configuration  Before building a project with source code coverage, make sure that the following project configuration options are enabled by running `idf.py menuconfig`. 
Chapter 4. API Guides

- Enable the application tracing module by selecting `Trace Memory` for the `CONFIG_APPTRACE_DESTINATION` option.
- Enable Gcov to the host via the `CONFIG_APPTRACE_GCOV_ENABLE`.

**Dumping Code Coverage Data** Once a project has been compiled with the `--coverage` option and flashed onto the target, code coverage data will be stored internally on the target (i.e., in trace memory) whilst the application runs. The process of transferring code coverage data from the target to the host is known as dumping.

The dumping of coverage data is done via OpenOCD (see *JTAG Debugging* on how to setup and run OpenOCD). A dump is triggered by issuing commands to OpenOCD, therefore a telnet session to OpenOCD must be opened to issue such commands (run `telnet localhost 4444`). Note that GDB could be used instead of telnet to issue commands to OpenOCD, however all commands issued from GDB will need to be prefixed as `mon <oocd_command>`.

When the target dumps code coverage data, the `.gcda` files are stored in the project’s build directory. For example, if `gcov_example_main.c` of the main component is compiled with the `--coverage` option, then dumping the code coverage data would generate `gcov_example_main.gcda` in `build/esp-idf/main/CMakeFiles/__idf_main.dir/gcov_example_main.c.gcda`. Note that the `.gcno` files produced during compilation are also placed in the same directory.

The dumping of code coverage data can be done multiple times throughout an application’s lifetime. Each dump will simply update the `.gcda` file with the newest code coverage information. Code coverage data is accumulative, thus the newest data will contain the total execution count of each code path over the application’s entire lifetime.

ESP-IDF supports two methods of dumping code coverage data form the target to the host:

- **Instant Run-Time Dump**
- **Hard-coded Dump**

**Instant Run-Time Dump** An Instant Run-Time Dump is triggered by calling the `ESP32-S2 gcov` OpenOCD command (via a telnet session). Once called, OpenOCD will immediately preempt the ESP32-S2’s current state and execute a built-in ESP-IDF Gcov debug stub function. The debug stub function will handle the dumping of data to the host. Upon completion, the ESP32-S2 will resume its current state.

**Hard-coded Dump** A Hard-coded Dump is triggered by the application itself by calling `esp_gcov_dump()` from somewhere within the application. When called, the application will halt and wait for OpenOCD to connect and retrieve the code coverage data. Once `esp_gcov_dump()` is called, the host must execute the `esp gcov dump` OpenOCD command (via a telnet session). The `esp gcov dump` command will cause OpenOCD to connect to the ESP32-S2, retrieve the code coverage data, then disconnect from the ESP32-S2, thus allowing the application to resume. Hard-coded Dumps can also be triggered multiple times throughout an application’s lifetime.

Hard-coded dumps are useful if code coverage data is required at certain points of an application’s lifetime by placing `esp_gcov_dump()` where necessary (e.g., after application initialization, during each iteration of an application’s main loop).

GDB can be used to set a breakpoint on `esp_gcov_dump()`, then call `mon esp gcov dump` automatically via the use a `gdbinit` script (see Using GDB from *Command Line*).

The following GDB script will add a breakpoint at `esp_gcov_dump()`, then call the `mon esp gcov dump` OpenOCD command.

```gdb
b esp_gcov_dump
commands
mon esp gcov dump
end
```

**Note:** Note that all OpenOCD commands should be invoked in GDB as: `mon <oocd_command>`.
Generating Coverage Report  Once the code coverage data has been dumped, the .gcno, .gcda and the source files can be used to generate a code coverage report. A code coverage report is simply a report indicating the number of times each line in a source file has been executed.

Both Gcov and Gcovr can be used to generate code coverage reports. Gcov is provided along with the Xtensa toolchain, whilst Gcovr may need to be installed separately. For details on how to use Gcov or Gcovr, refer to Gcov documentation and Gcovr documentation.

Adding Gcov Build Target to Project  To make report generation more convenient, users can define additional build targets in their projects such that the report generation can be done with a single build command.

Add the following lines to the CMakeLists.txt file of your project.

```cmake
include($ENV{IDF_PATH}/tools/cmake/gcov.cmake)
idf_create_coverage_report(${CMAKE_CURRENT_BINARY_DIR}/coverage_report)
idf_clean_coverage_report(${CMAKE_CURRENT_BINARY_DIR}/coverage_report)
```

The following commands can now be used:

- `cmake --build build/ --target gcovr-report` will generate an HTML coverage report in $(BUILD_DIR_BASE)/coverage_report/html directory.
- `cmake --build build/ --target cov-data-clean` will remove all coverage data files.

4.2 Application Startup Flow

This note explains various steps which happen before app_main function of an ESP-IDF application is called. The high level view of startup process is as follows:

1. **First Stage Bootloader** in ROM loads second-stage bootloader image to RAM (IRAM & DRAM) from flash offset 0x1000.
2. **Second Stage Bootloader** loads partition table and main app image from flash. Main app incorporates both RAM segments and read-only segments mapped via flash cache.
3. **Application Startup** executes. At this point the second CPU and RTOS scheduler are started.

This process is explained in detail in the following sections.

4.2.1 First Stage Bootloader

After SoC reset, the CPU will start running immediately to perform initialization. The reset vector code is located in the mask ROM of the ESP32-S2 chip and cannot be modified.

Startup code called from the reset vector determines the boot mode by checking GPIO_STRAP_REG register for bootstrap pin states. Depending on the reset reason, the following takes place:

1. Reset from deep sleep: if the value in RTC_CNTL_STORE6_REG is non-zero, and CRC value of RTC memory in RTC_CNTL_STORE7_REG is valid, use RTC_CNTLgetStore6_REG as an entry point address and jump immediately to it. If RTC_CNTL_STORE6_REG is zero, or RTC_CNTL_STORE7_REG contains invalid CRC, or once the code called via RTC_CNTL_STORE6_REG returns, proceed with boot as if it was a power-on reset. **Note**: to run customized code at this point, a deep sleep stub mechanism is provided. Please see deep sleep documentation for this.
2. For power-on reset, software SoC reset, and watchdog SoC reset: check the GPIO_STRAP_REG register if a custom boot mode (such as UART Download Mode) is requested. If this is the case, this custom loader mode is executed from ROM. Otherwise, proceed with boot as if it was due to software CPU reset. Consult ESP32-S2 datasheet for a description of SoC boot modes and how to execute them.
3. For software CPU reset and watchdog CPU reset: configure SPI flash based on EFUSE values, and attempt to load the code from flash. This step is described in more detail in the next paragraphs.

Note: During normal boot modes the RTC watchdog is enabled when this happens, so if the process is interrupted or stalled then the watchdog will reset the SOC automatically and repeat the boot process. This may cause the SoC to strap into a new boot mode, if the strapping GPIOs have changed.

Second stage bootloader binary image is loaded from flash starting at address 0x1000. The 4 kB sector of flash before this address is unused.

4.2.2 Second Stage Bootloader

In ESP-IDF, the binary image which resides at offset 0x1000 in flash is the second stage bootloader. Second stage bootloader source code is available in components/bootloader directory of ESP-IDF. Second stage bootloader is used in ESP-IDF to add flexibility to flash layout (using partition tables), and allow for various flows associated with flash encryption, secure boot, and over-the-air updates (OTA) to take place.

When the first stage bootloader is finished checking and loading the second stage bootloader, it jumps to the second stage bootloader entry point found in the binary image header.

Second stage bootloader reads the partition table found by default at offset 0x8000 (configurable value). See partition tables documentation for more information. The bootloader finds factory and OTA app partitions. If OTA app partitions are found in the partition table, the bootloader consults the otadata partition to determine which one should be booted. See Over The Air Updates (OTA) for more information.

For a full description of the configuration options available for the ESP-IDF bootloader, see Bootloader.

For the selected partition, second stage bootloader reads the binary image from flash one segment at a time:

- For segments with load addresses in internal IRAM (Instruction RAM) or DRAM (Data RAM), the contents are copied from flash to the load address.
- For segments which have load addresses in DROM (Data Stored in flash) or IROM (Code Executed from flash) regions, the flash MMU is configured to provide the correct mapping from the flash to the load address.

Once all segments are processed - meaning code is loaded and flash MMU is set up, second stage bootloader verifies the integrity of the application and then jumps to the application entry point found in the binary image header.

4.2.3 Application Startup

Application startup covers everything that happens after the app starts executing and before the app_main function starts running inside the main task. This is split into three stages:

- Port initialization of hardware and basic C runtime environment.
- System initialization of software services and FreeRTOS.
- Running the main task and calling app_main.

Note: Understanding all stages of ESP-IDF app initialization is often not necessary. To understand initialization from the application developer’s perspective only, skip forward to Running the Main Task.

Port Initialization

ESP-IDF application entry point is call_start_cpu0 function found in components/esp_system/port/cpu_start.c. This function is executed by the second stage bootloader, and never returns.

This port-layer initialization function initializes the basic C Runtime Environment (“CRT”) and performs initial configuration of the SoC’s internal hardware:
• Reconfigure CPU exceptions for the app (allowing app interrupt handlers to run, and causing Fatal Errors to be handled using the options configured for the app rather than the simpler error handler provided by ROM).
• If the option CONFIG_BOOTLOADER_WDT_ENABLE is not set then the RTC watchdog timer is disabled.
• Initialize internal memory (data & bss).
• Finish configuring the MMU cache.
• Enable PSRAM if configured.
• Set the CPU clocks to the frequencies configured for the project.
• Initialize memory protection if configured.

Once call_start_cpu0 completes running, it calls the “system layer” initialization function start_cpu0 found in components/esp_system/startup.c.

System Initialization

The main system initialization function is start_cpu0. By default, this function is weak-linked to the function start_cpu0_default. This means that it is possible to override this function to add some additional initialization steps.

The primary system initialization stage includes:

• Log information about this application (project name, App Version, etc.) if default log level enables this.
• Initialize the heap allocator (before this point all allocations must be static or on the stack).
• Initialize newlib component syscalls and time functions.
• Configure the brownout detector.
• Setup libc stdin, stdout, and stderr according to the serial console configuration.
• Perform any security-related checks, including burning efuses that should be burned for this configuration (including permanently limiting ROM download modes).
• Initialize SPI flash API support.
• Call global C++ constructors and any C functions marked with __attribute__((constructor)).

Secondary system initialization allows individual components to be initialized. If a component has an initialization function annotated with the ESP_SYSTEM_INIT_FN macro, it will be called as part of secondary initialization. Component initialization functions have priorities assigned to them to ensure the desired initialization order. The priorities are documented in esp_system/system_init_fn.txt and ESP_SYSTEM_INIT_FN definition in source code are checked against this file.

Running the Main Task

After all other components are initialized, the main task is created and the FreeRTOS scheduler starts running.

After doing some more initialization tasks (that require the scheduler to have started), the main task runs the application-provided function app_main in the firmware.

The main task that runs app_main has a fixed RTOS priority (one higher than the minimum) and a configurable stack size.

Unlike normal FreeRTOS tasks (or embedded C main functions), the app_main task is allowed to return. If this happens, The task is cleaned up and the system will continue running with other RTOS tasks scheduled normally. Therefore, it is possible to implement app_main as either a function that creates other application tasks and then returns, or as a main application task itself.

4.3 Bootloader

The ESP-IDF Software Bootloader performs the following functions:

1. Minimal initial configuration of internal modules;
Chapter 4. API Guides

2. Initialize Flash Encryption and/or Secure features, if configured;
3. Select the application partition to boot, based on the partition table and ota_data (if any);
4. Load this image to RAM (IRAM & DRAM) and transfer management to the image that was just loaded.

Bootloader is located at the address 0x1000 in the flash.

For a full description of the startup process including the ESP-IDF bootloader, see Application Startup Flow.

4.3.1 Bootloader Compatibility

It is recommended to update to newer versions of ESP-IDF: when they are released. The OTA (over the air) update process can flash new apps in the field but cannot flash a new bootloader. For this reason, the bootloader supports booting apps built from newer versions of ESP-IDF.

The bootloader does not support booting apps from older versions of ESP-IDF. When updating ESP-IDF manually on an existing product that might need to downgrade the app to an older version, keep using the older ESP-IDF bootloader binary as well.

Note: If testing an OTA update for an existing product in production, always test it using the same ESP-IDF bootloader binary that is deployed in production.

SPI Flash Configuration

Each ESP-IDF application or bootloader.bin file contains a header with CONFIG_ESPTOOLPY_FLASHMODE, CONFIG_ESPTOOLPY_FLASHFREQ, CONFIG_ESPTOOLPY_FLASHSIZE embedded in it. These are used to configure the SPI flash during boot.

The First Stage Bootloader in ROM reads the Second Stage Bootloader header information from flash and uses this information to load the rest of the Second Stage Bootloader from flash. However, at this time the system clock speed is lower than configured and not all flash modes are supported. When the Second Stage Bootloader then runs, it will reconfigure the flash using values read from the currently selected app binary’s header (and NOT from the Second Stage Bootloader header). This allows an OTA update to change the SPI flash settings in use.

4.3.2 Log Level

The default bootloader log level is “Info”. By setting the CONFIG_BOOTLOADER_LOG_LEVEL option, it is possible to increase or decrease this level. This log level is separate from the log level used in the app (see Logging library).

Reducing bootloader log verbosity can improve the overall project boot time by a small amount.

4.3.3 Factory Reset

Sometimes it is desirable to have a way for the device to fall back to a known-good state, in case of some problem with an update.

To roll back to the original “factory” device configuration and clear any user settings, configure the config item CONFIG_BOOTLOADER_FACTORY_RESET in the bootloader.

The factory reset mechanism allows the device to be factory reset in two ways:

- Clear one or more data partitions. The CONFIG_BOOTLOADER_DATA_FACTORY_RESET option allows users to specify which data partitions will be erased when the factory reset is executed.

  Users can specify the names of partitions as a comma-delimited list with optional spaces for readability. (Like this: nvs, phy_init, nvs_custom).

  Make sure that the names of partitions specified in the option are the same as those found in the partition table. Partitions of type “app” cannot be specified here.
• Boot from “factory” app partition. Enabling the CONFIG_BOOTLOADEROTA_DATA_ERASE option will cause the device to boot from the default “factory” app partition after a factory reset (or if there is no factory app partition in the partition table then the default ota app partition is selected instead). This reset process involves erasing the OTA data partition which holds the currently selected OTA partition slot. The “factory” app partition slot (if it exists) is never updated via OTA, so resetting to this allows reverting to a “known good” firmware application.

Either or both of these configuration options can be enabled independently.

In addition, the following configuration options control the reset condition:

- CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET - The input GPIO number used to trigger a factory reset. This GPIO must be pulled low or high (configurable) on reset to trigger this.
- CONFIG_BOOTLOADER_HOLD_TIME_GPIO - this is hold time of GPIO for reset/test mode (by default 5 seconds). The GPIO must be held continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.
- CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LEVEL - configure whether a factory reset should trigger on a high or low level of the GPIO. If the GPIO has an internal pullup then this is enabled before the pin is sampled, consult the ESP32-S2 datasheet for details on pin internal pullups.

If an application needs to know if the factory reset has occurred, users can call the function bootloader_common_get_rtc_retain_mem_factory_reset_state().

• If the status is read as true, the function will return the status, indicating that the factory reset has occurred. The function then resets the status to false for subsequent factory reset judgement.
• If the status is read as false, the function will return the status, indicating that the factory reset has not occurred, or the memory where this status is stored is invalid.

Note that this feature reserves some RTC FAST memory (the same size as the CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP feature).

4.3.4 Boot from Test Firmware

It is possible to write a special firmware app for testing in production, and boot this firmware when needed. The project partition table will need a dedicated app partition entry for this testing app, type app and subtype test (see Partition Tables).

Implementing a dedicated test app firmware requires creating a totally separate ESP-IDF project for the test app (each project in ESP-IDF only builds one app). The test app can be developed and tested independently of the main project, and then integrated at production testing time as a pre-compiled .bin file which is flashed to the address of the main project’s test app partition.

To support this functionality in the main project’s bootloader, set the configuration item CONFIG_BOOTLOADER_APP_TEST and configure the following three items:

- CONFIG_BOOTLOADER_NUM_PIN_APP_TEST - GPIO number to boot test partition. The selected GPIO will be configured as an input with internal pull-up enabled. This GPIO must be pulled low or high (configurable) on reset to trigger this. Once the GPIO input is released and the device has been rebooted, the default boot sequence will be enabled again to boot the factory partition or any OTA app partition slot.
- CONFIG_BOOTLOADER_HOLD_TIME_GPIO - this is the hold time of GPIO for reset/test mode (by default 5 seconds). The GPIO must be held continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.
- CONFIG_BOOTLOADER_APP_TEST_PIN_LEVEL - configure whether a test partition boot should trigger on a high or low level of the GPIO. If the GPIO has an internal pull-up, then this is enabled before the pin is sampled. Consult the ESP32-S2 datasheet for details on pin internal pull-ups.

4.3.5 Rollback

Rollback and anti-rollback features must be configured in the bootloader as well.
Consult the App Rollback and Anti-rollback sections in the OTA API reference document.

### 4.3.6 Watchdog

By default, the hardware RTC Watchdog timer remains running while the bootloader is running and will automatically reset the chip if no app has successfully started after 9 seconds.

- The timeout period can be adjusted by setting `CONFIG_BOOTLOADER_WDT_TIME_MS` and recompiling the bootloader.
- The app’s behaviour can be adjusted so the RTC Watchdog remains enabled after app startup. The Watchdog would need to be explicitly reset (i.e., fed) by the app to avoid a reset. To do this, set the `CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE` option, modify the app as needed, and then recompile the app.
- The RTC Watchdog can be disabled in the bootloader by disabling the `CONFIG_BOOTLOADER_WDT_ENABLE` setting and recompiling the bootloader. This is not recommended.

### 4.3.7 Bootloader Size

When enabling additional bootloader functions, including Flash Encryption or Secure Boot, and especially if setting a high `CONFIG_BOOTLOADER_LOG_LEVEL` level, then it is important to monitor the bootloader .bin file’s size. When using the default `CONFIG_PARTITION_TABLE_OFFSET` value 0x8000, the size limit is 0x8000 bytes.

If the bootloader binary is too large, then the bootloader build will fail with an error “Bootloader binary size [...] is too large for partition table offset”. If the bootloader binary is flashed anyhow then the ESP32-S2 will fail to boot - errors will be logged about either invalid partition table or invalid bootloader checksum.

Options to work around this are:

- Set `bootloader compiler optimization` back to “Size” if it has been changed from this default value.
- Reduce `bootloader log level`. Setting log level to Warning, Error or None all significantly reduce the final binary size (but may make it harder to debug).
- Set `CONFIG_PARTITION_TABLE_OFFSET` to a higher value than 0x8000, to place the partition table later in the flash. This increases the space available for the bootloader. If the partition table CSV file contains explicit partition offsets, they will need changing so no partition has an offset lower than `CONFIG_PARTITION_TABLE_OFFSET + 0x1000`. (This includes the default partition CSV files supplied with ESP-IDF.)

When Secure Boot V2 is enabled, there is also an absolute binary size limit of 64 KB (0x10000 bytes) (excluding the 4 KB signature), because the bootloader is first loaded into a fixed size buffer for verification.

### 4.3.8 Fast Boot from Deep-Sleep

The bootloader has the `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP` option which allows the wake-up time from Deep-sleep to be reduced (useful for reducing power consumption). This option is available when `CONFIG_SECURE_BOOT` option is disabled. Reduction of time is achieved due to the lack of image verification. During the first boot, the bootloader stores the address of the application being launched in the RTC FAST memory. And during the awakening, this address is used for booting without any checks, thus fast loading is achieved.

### 4.3.9 Custom Bootloader

The current bootloader implementation allows a project to extend it or modify it. There are two ways of doing it: by implementing hooks or by overriding it. Both ways are presented in `custom_bootloader` folder in ESP-IDF examples:

- `bootloader_hooks` which presents how to connect some hooks to the bootloader initialization
- `bootloader_override` which presents how to override the bootloader implementation
In the bootloader space, you cannot use the drivers and functions from other components. If necessary, then the required functionality should be placed in the project’s `bootloader_components` directory (note that this will increase its size).

If the bootloader grows too large then it can collide with the partition table, which is flashed at offset 0x8000 by default. Increase the `partition table offset` value to place the partition table later in the flash. This increases the space available for the bootloader.

### 4.4 Build System

This document explains the implementation of the ESP-IDF build system and the concept of “components”. Read this document if you want to know how to organize and build a new ESP-IDF project or component.

#### 4.4.1 Overview

An ESP-IDF project can be seen as an amalgamation of a number of components. For example, for a web server that shows the current humidity, there could be:

- The ESP-IDF base libraries (libc, ROM bindings, etc)
- The Wi-Fi drivers
- A TCP/IP stack
- The FreeRTOS operating system
- A web server
- A driver for the humidity sensor
- Main code tying it all together

ESP-IDF makes these components explicit and configurable. To do that, when a project is compiled, the build system will look up all the components in the ESP-IDF directories, the project directories and (optionally) in additional custom component directories. It then allows the user to configure the ESP-IDF project using a text-based menu system to customize each component. After the components in the project are configured, the build system will compile the project.

**Concepts**

- A “project” is a directory that contains all the files and configuration to build a single “app” (executable), as well as additional supporting elements such as a partition table, data/filesystem partitions, and a bootloader.
- “Project configuration” is held in a single file called `sdkconfig` in the root directory of the project. This configuration file is modified via `idf.py menuconfig` to customize the configuration of the project. A single project contains exactly one project configuration.
- An “app” is an executable that is built by ESP-IDF. A single project will usually build two apps - a “project app” (the main executable, ie your custom firmware) and a “bootloader app” (the initial bootloader program which launches the project app).
- “Components” are modular pieces of standalone code that are compiled into static libraries (.a files) and linked to an app. Some are provided by ESP-IDF itself, others may be sourced from other places.
- “Target” is the hardware for which an application is built. A full list of supported targets in your version of ESP-IDF can be seen by running `idf.py list-targets`.

Some things are not part of the project:

- “ESP-IDF” is not part of the project. Instead, it is standalone, and linked to the project via the `IDF_PATH` environment variable which holds the path of the `esp-idf` directory. This allows the ESP-IDF framework to be decoupled from your project.
- The toolchain for compilation is not part of the project. The toolchain should be installed in the system command line PATH.
Chapter 4. API Guides

4.4.2 Using the Build System

idf.py

The idf.py command-line tool provides a front-end for easily managing your project builds. It manages the following tools:

- **CMake**, which configures the project to be built
- **Ninja** which builds the project
- **esptool.py** for flashing the target.

You can read more about configuring the build system using idf.py [here](#).

Using CMake Directly

idf.py is a wrapper around CMake for convenience. However, you can also invoke CMake directly if you prefer.

When idf.py does something, it prints each command that it runs for easy reference. For example, the idf.py build command is the same as running these commands in a bash shell (or similar commands for Windows Command Prompt):

```bash
mkdir -p build
cd build
cmake .. -G Ninja  # or 'Unix Makefiles'
ninja
```

In the above list, the cmake command configures the project and generates build files for use with the final build tool. In this case, the final build tool is Ninja: running ninja actually builds the project.

It’s not necessary to run cmake more than once. After the first build, you only need to run ninja each time. ninja will automatically re-invoke cmake if the project needs reconfiguration.

If using CMake with ninja or make, there are also targets for more of the idf.py sub-commands. For example, running make menuconfig or ninja menuconfig in the build directory will work the same as idf.py menuconfig.

**Note:** If you’re already familiar with CMake, you may find the ESP-IDF CMake-based build system unusual because it wraps a lot of CMake’s functionality to reduce boilerplate. See [writing pure CMake components](#) for some information about writing more “CMake style” components.

Flashing with Ninja or Make

It’s possible to build and flash directly from ninja or make by running a target like:

```
ninja flash
```

Or:

```
make app-flash
```

Available targets are: flash, app-flash (app only), bootloader-flash (bootloader only).

When flashing this way, optionally set the ESPPORT and ESPBAUD environment variables to specify the serial port and baud rate. You can set environment variables in your operating system or IDE project. Alternatively, set them directly on the command line:

```
ESPPORT=/dev/ttyUSB0 ninja flash
```
Chapter 4. API Guides

**Note:** Providing environment variables at the start of the command like this is Bash shell Syntax. It will work on Linux and macOS. It won’t work when using Windows Command Prompt, but it will work when using Bash-like shells on Windows.

Or:

```
make -j3 app-flash ESPPORT=COM4 ESPBAUD=2000000
```

**Note:** Providing variables at the end of the command line is make syntax, and works for make on all platforms.

**Using CMake in an IDE**

You can also use an IDE with CMake integration. The IDE will want to know the path to the project’s CMake-Lists.txt file. IDEs with CMake integration often provide their own build tools (CMake calls these “generators”) to build the source files as part of the IDE.

When adding custom non-build steps like “flash” to the IDE, it is recommended to execute idf.py for these “special” commands.

For more detailed information about integrating ESP-IDF with CMake into an IDE, see [Build System Metadata](#).

**Setting up the Python Interpreter**

ESP-IDF works well with Python version 3.8+.

idf.py and other Python scripts will run with the default Python interpreter, i.e., python. You can switch to a different one like `python3 $IDF_PATH/tools/idf.py ...`, or you can set up a shell alias or another script to simplify the command.

If using CMake directly, running `cmake -D PYTHON=python3 ...` will cause CMake to override the default Python interpreter.

If using an IDE with CMake, setting the PYTHON value as a CMake cache override in the IDE UI will override the default Python interpreter.

To manage the Python version more generally via the command line, check out the tools `pyenv` or `virtualenv`. These let you change the default Python version.

**4.4.3 Example Project**

An example project directory tree might look like this:

```
- myProject/
  - CMakeLists.txt
  - sdkconfig
  - bootloader_components/
    - boot_component/
      - CMakeLists.txt
      - Kconfig
      - src1.c
  - components/
    - component1/
      - CMakeLists.txt
      - Kconfig
      - src1.c
    - component2/
      - CMakeLists.txt
      - Kconfig
      - src1.c
      - include/
        - component2.h
  - main/
    - CMakeLists.txt
```

(continues on next page)
This example “myProject” contains the following elements:

- A top-level project CMakeLists.txt file. This is the primary file which CMake uses to learn how to build the project; and may set project-wide CMake variables. It includes the file /tools/cmake/project.cmake which implements the rest of the build system. Finally, it sets the project name and defines the project.
- “sdkconfig” project configuration file. This file is created/updated when idf.py menuconfig runs, and holds the configuration for all of the components in the project (including ESP-IDF itself). The sdkconfig file may or may not be added to the source control system of the project.
- Optional “bootloader_components” directory contains components that need to be compiled and linked inside the bootloader project. A project does not have to contain custom bootloader components of this kind, but it can be useful in case the bootloader needs to be modified to embed new features.
- Optional “components” directory contains components that are part of the project. A project does not have to contain custom components of this kind, but it can be useful for structuring reusable code or including third-party components that aren’t part of ESP-IDF. Alternatively, EXTRA_COMPONENT_DIRS can be set in the top-level CMakeLists.txt to look for components in other places.
- “main” directory is a special component that contains source code for the project itself. “main” is a default name, the CMake variable COMPONENT_DIRS includes this component but you can modify this variable. See the renaming main section for more info. If you have a lot of source files in your project, we recommend grouping most into components instead of putting them all in “main”.
- “build” directory is where the build output is created. This directory is created by idf.py if it doesn’t already exist. CMake configures the project and generates interim build files in this directory. Then, after the main build process is run, this directory will also contain interim object files and libraries as well as final binary output files. This directory is usually not added to source control or distributed with the project source code.

Component directories each contain a component CMakeLists.txt file. This file contains variable definitions to control the build process of the component, and its integration into the overall project. See Component CMakeLists Files for more details.

Each component may also include a Kconfig file defining the component configuration options that can be set via menuconfig. Some components may also include Kconfig.projbuild and project_include.cmake files, which are special files for overriding parts of the project.

4.4.4 Project CMakeLists File

Each project has a single top-level CMakeLists.txt file that contains build settings for the entire project. By default, the project CMakeLists can be quite minimal.

Minimal Example CMakeLists

Minimal project:

```cmake
cmake_minimum_required(VERSION 3.16)
include($ENV{IDF_PATH}/tools/cmake/project.cmake)
project(myProject)
```

Mandatory Parts

The inclusion of these three lines, in the order shown above, is necessary for every project:

- cmake_minimum_required(VERSION 3.16) tells CMake the minimum version that is required to build the project. ESP-IDF is designed to work with CMake 3.16 or newer. This line must be the first line in the CMakeLists.txt file.
**Chapter 4. API Guides**

- `include($ENV{IDF_PATH}/tools/cmake/project.cmake)` pulls in the rest of the CMake functionality to configure the project, discover all the components, etc.
- `project(myProject)` creates the project itself, and specifies the project name. The project name is used for the final binary output files of the app - i.e. `myProject.elf, myProject.bin`. Only one project can be defined per CMakeLists file.

**Optional Project Variables**

These variables all have default values that can be overridden for custom behavior. Look in `/tools/cmake/project.cmake` for all of the implementation details.

- **COMPONENT_DIRS**: Directories to search for components. Defaults to `IDF_PATH/components, PROJECT_DIR/components, and EXTRA_COMPONENT_DIRS`. Override this variable if you don’t want to search for components in these places.
- **EXTRA_COMPONENT_DIRS**: Optional list of additional directories to search for components. Paths can be relative to the project directory, or absolute.
- **COMPONENTS**: A list of component names to build into the project. Defaults to all components found in the COMPONENT_DIRS directories. Use this variable to “trim down” the project for faster build times. Note that any component which “requires” another component via the REQUIRES or PRIV_REQUIRES arguments on component registration will automatically have it added to this list, so the COMPONENTS list can be very short.
- **BOOTLOADER_IGNORE_EXTRA_COMPONENT**: A list of components, placed in bootloader_components/, that should be ignored by the bootloader compilation. Use this variable if a bootloader component needs to be included conditionally inside the project.

Any paths in these variables can be absolute paths, or set relative to the project directory.

To set these variables, use the `cmake set command` i.e `set(VARIABLE "VALUE")`. The `set()` commands should be placed after the `cmake_minimum(...) line but before the include(...) line.

**Renaming main Component**

The build system provides special treatment to the main component. It is a component that gets automatically added to the build provided that it is in the expected location, PROJECT_DIR/main. All other components in the build are also added as its dependencies, saving the user from hunting down dependencies and providing a build that works right out of the box. Renaming the main component causes the loss of these behind-the-scenes heavy lifting, requiring the user to specify the location of the newly renamed component and manually specify its dependencies. Specifically, the steps to renaming main are as follows:

1. Rename main directory.
2. Set EXTRA_COMPONENT_DIRS in the project CMakeLists.txt to include the renamed main directory.
3. Specify the dependencies in the renamed component’s CMakeLists.txt file via REQUIRES or PRIV_REQUIRES arguments on component registration.

**Overriding Default Build Specifications**

The build sets some global build specifications (compile flags, definitions, etc.) that gets used in compiling all sources from all components.

For example, one of the default build specifications set is the compile option `-Wextra`. Suppose a user wants to use override this with `-Wno-extra`, it should be done after `project()`:  

```cmake
cmake_minimum_required(VERSION 3.16)
include($ENV{IDF_PATH}/tools/cmake/project.cmake)
project(myProject)

idf_build_set_property(COMPILERS_OPTIONS "-Wno-error" APPEND)
```
This ensures that the compile options set by the user won’t be overridden by the default build specifications, since the latter are set inside `project()`.

### 4.4.5 Component CMakeLists Files

Each project contains one or more components. Components can be part of ESP-IDF, part of the project’s own components directory, or added from custom component directories *(see above)*.

A component is any directory in the `COMPONENT_DIRS` list which contains a `CMakeLists.txt` file.

#### Searching for Components

The list of directories in `COMPONENT_DIRS` is searched for the project’s components. Directories in this list can either be components themselves (i.e., they contain a `CMakeLists.txt` file), or they can be top-level directories whose sub-directories are components.

When CMake runs to configure the project, it logs the components included in the build. This list can be useful for debugging the inclusion/exclusion of certain components.

#### Multiple Components with the Same Name

When ESP-IDF is collecting all the components to compile, it will do this in the order specified by `COMPONENT_DIRS`: by default, this means ESP-IDF’s internal components first (`IDF_PATH/components`), then any components in directories specified in `EXTRA_COMPONENT_DIRS`, and finally the project’s components (`PROJECT_DIR/components`). If two or more of these directories contain component sub-directories with the same name, the component in the last place searched is used. This allows, for example, overriding ESP-IDF components with a modified version by copying that component from the ESP-IDF components directory to the project components directory and then modifying it there. If used in this way, the ESP-IDF directory itself can remain untouched.

**Note:** If a component is overridden in an existing project by moving it to a new location, the project will not automatically see the new component path. Run `idf.py reconfigure` (or delete the project build folder) and then build again.

#### Minimal Component CMakeLists

The minimal component `CMakeLists.txt` file simply registers the component to the build system using `idf_component_register`:

```cpp
idf_component_register(
    SRCS "foo.c" "bar.c"
    INCLUDE_DIRS "include"
    REQUIRES mbedtls)
```

- `SRCS` is a list of source files (`*.c`, `*.cpp`, `*.cc`, `*.S`). These source files will be compiled into the component library.
- `INCLUDE_DIRS` is a list of directories to add to the global include search path for any component which requires this component, and also the main source files.
- `REQUIRES` is not actually required, but it is very often required to declare what other components this component will use. See *component requirements*.

A library with the name of the component will be built and linked to the final app.

Directories are usually specified relative to the `CMakeLists.txt` file itself, although they can be absolute.

There are other arguments that can be passed to `idf_component_register`. These arguments are discussed [here](#).
Chapter 4. API Guides

See example component requirements and example component CMakeLists for more complete component CMakeLists.txt examples.

Preset Component Variables

The following component-specific variables are available for use inside component CMakeLists, but should not be modified:

- COMPONENT_DIR: The component directory. Evaluates to the absolute path of the directory containing CMakeLists.txt. The component path cannot contain spaces. This is the same as the CMAKE_CURRENT_SOURCE_DIR variable.
- COMPONENT_NAME: Name of the component. Same as the name of the component directory.
- COMPONENT_ALIAS: Alias of the library created internally by the build system for the component.
- COMPONENT_LIB: Name of the library created internally by the build system for the component.

The following variables are set at the project level, but available for use in component CMakeLists:

- CONFIG_*: Each value in the project configuration has a corresponding variable available in cmake. All names begin with CONFIG_. More information here.
- ESP_PLATFORM: Set to 1 when the CMake file is processed within the ESP-IDF build system.

Build/Project Variables

The following are some project/build variables that are available as build properties and whose values can be queried using idf_build_get_property from the component CMakeLists.txt:

- PROJECT_NAME: Name of the project, as set in project CMakeLists.txt file.
- PROJECT_DIR: Absolute path of the project directory containing the project CMakeLists. Same as the CMAKE_SOURCE_DIR variable.
- COMPONENTS: Names of all components that are included in this build, formatted as a semicolon-delimited CMake list.
- IDF_VER: Git version of ESP-IDF (produced by git describe)
- IDF_VERSION_MAJOR, IDF_VERSION_MINOR, IDF_VERSION_PATCH: Components of ESP-IDF version, to be used in conditional expressions. Note that this information is less precise than that provided by IDF_VER variable. v4.0-dev-*, v4.0-beta1, v4.0-rc1 and v4.0 will all have the same values of IDF_VERSION_* variables, but different IDF_VER values.
- IDF_TARGET: Name of the target for which the project is being built.
- PROJECT_VER: Project version.
  - If CONFIG_APP_PROJECT_VER_FROM_CONFIG option is set, the value of CONFIG_APP_PROJECT_VER will be used.
  - Else, if PROJECT_VER variable is set in project CMakeLists.txt file, its value will be used.
  - Else, if the PROJECT_DIR/version.txt exists, its contents will be used as PROJECT_VER.
  - Else, if the project is located inside a Git repository, the output of git description will be used.
  - Otherwise, PROJECT_VER will be “I”.
- EXTRA_PARTITION_SUBTYPES: CMake list of extra partition subtypes. Each subtype description is a comma-separated string with type_name, subtype_name, numeric_value format. Components may add new subtypes by appending them to this list.

Other build properties are listed here.

Controlling Component Compilation

To pass compiler options when compiling source files belonging to a particular component, use the target_compile_options function:

```
target_compile_options(${COMPONENT_LIB} PRIVATE -Wno-unused-variable)
```

To apply the compilation flags to a single source file, use the CMake set_source_files_properties command:
Chapter 4. API Guides

```c
set_source_files_properties(mysrc.c
    PROPERTIES COMPILE_FLAGS
    -Wno-unused-variable
)
```

This can be useful if there is upstream code that emits warnings.

**Note:** CMake `set_source_files_properties` command is not applicable when the source files have been populated with help of the `SRC_DIRS` variable in `idf_component_register`. See *File Globbing & Incremental Builds* for more details.

When using these commands, place them after the call to `idf_component_register` in the component CMakeLists file.

### 4.4.6 Component Configuration

Each component can also have a Kconfig file, alongside `CMakeLists.txt`. This contains configuration settings to add to the configuration menu for this component.

These settings are found under the “Component Settings” menu when menuconfig is run.

To create a component Kconfig file, it is easiest to start with one of the Kconfig files distributed with ESP-IDF.

For an example, see *Adding conditional configuration*.

### 4.4.7 Preprocessor Definitions

The ESP-IDF build system adds the following C preprocessor definitions on the command line:

- `ESP_PLATFORM`: Can be used to detect that build happens within ESP-IDF.
- `IDF_VER`: Defined to a git version string. E.g. `v2.0` for a tagged release or `v1.0-275-g0efaa4f` for an arbitrary commit.

### 4.4.8 Component Requirements

When compiling each component, the ESP-IDF build system recursively evaluates its dependencies. This means each component needs to declare the components that it depends on ("requires").

When Writing a Component

```c
idf_component_register(...
    REQUIRES mbedtls
    PRIV_REQUIRES console spiffs)
```

- `REQUIRES` should be set to all components whose header files are #included from the `public` header files of this component.
- `PRIV_REQUIRES` should be set to all components whose header files are #included from any source files in this component, unless already listed in `REQUIRES`. Also, any component which is required to be linked in order for this component to function correctly.
- The values of `REQUIRES` and `PRIV_REQUIRES` should not depend on any configuration choices (`CONFIG_xxx` macros). This is because requirements are expanded before the configuration is loaded. Other component variables (like include paths or source files) can depend on configuration choices.
- Not setting either or both `REQUIRES` variables is fine. If the component has no requirements except for the *Common component requirements* needed for RTOS, libc, etc.
If a component only supports some target chips (values of \texttt{IDF\_TARGET}) then it can specify \texttt{REQUIRED\_IDF\_TARGETS} in the \texttt{idf\_component\_register} call to express these requirements. In this case, the build system will generate an error if the component is included in the build, but does not support the selected target.

\textbf{Note:} In CMake terms, \texttt{REQUIRES} \\& \texttt{PRIV\_REQUIRES} are approximate wrappers around the CMake functions \texttt{target\_link\_libraries(... PUBLIC ...)} and \texttt{target\_link\_libraries(... PRIVATE ...)}.

\section*{Example of Component Requirements}

Imagine there is a car component, which uses the engine component, which uses the spark\_plug component:

- autoProject/
  - CMakeLists.txt
  - components/ - car/ - CMakeLists.txt
    - car.c
    - car.h
  - engine/ - CMakeLists.txt
    - engine.c
    - include/ - engine.h
  - spark\_plug/ - CMakeLists.txt
    - spark\_plug.c
    - spark\_plug.h

\paragraph*{Car Component} The \texttt{car.h} header file is the public interface for the \texttt{car} component. This header includes \texttt{engine.h} directly because it uses some declarations from this header:

```c
/* car.h */
#include "engine.h"
#endif ENGINE_IS_HYBRID
#define CAR\_MODEL "Hybrid"
#endif
```

And \texttt{car.c} includes \texttt{car.h} as well:

```c
/* car.c */
#include "car.h"
```

This means the \texttt{car/CMakeLists.txt} file needs to declare that \texttt{car} requires \texttt{engine}:

```c
idf\_component\_register(SRCS "car.c"
  INCLUDE\_DIRS "."
  REQUIRES engine)
```

- \texttt{SRCS} gives the list of source files in the \texttt{car} component.
- \texttt{INCLUDE\_DIRS} gives the list of public include directories for this component. Because the public interface is \texttt{car.h}, the directory containing \texttt{car.h} is listed here.
- \texttt{REQUIRES} gives the list of components required by the public interface of this component. Because \texttt{car.h} is a public header and includes a header from \texttt{engine}, we include \texttt{engine} here. This makes sure that any other component which includes \texttt{car.h} will be able to recursively include the required \texttt{engine.h} also.

\paragraph*{Engine Component} The \texttt{engine} component also has a public header file \texttt{include/engine.h}, but this header is simpler:
/* engine.h */
#define ENGINE_IS_HYBRID

void engine_start(void);

The implementation is in engine.c:

/* engine.c */
#include "engine.h"
#include "spark_plug.h"
...

In this component, engine depends on spark_plug but this is a private dependency. spark_plug.h is needed to compile engine.c, but not needed to include engine.h.

This means that the engine/CMakeLists.txt file can use PRIV_REQUIRES:

```c
idf_component_register(SRCS "engine.c"
  INCLUDE_DIRS "include"
  PRIV_REQUIRES spark_plug)
```

As a result, source files in the car component don’t need the spark_plug include directories added to their compiler search path. This can speed up compilation, and stops compiler command lines from becoming longer than necessary.

**Spark Plug Component** The spark_plug component doesn’t depend on anything else. It has a public header file spark_plug.h, but this doesn’t include headers from any other components.

This means that the spark_plug/CMakeLists.txt file doesn’t need any REQUIRES or PRIV_REQUIRES clauses:

```c
idf_component_register(SRCS "spark_plug.c"
  INCLUDE_DIRS ".")
```

**Source File Include Directories**

Each component’s source file is compiled with these include path directories, as specified in the passed arguments to idf_component_register:

```c
idf_component_register(.
  INCLUDE_DIRS "include"
  PRIV_INCLUDE_DIRS "other")
```

- The current component’s INCLUDE_DIRS and PRIV_INCLUDE_DIRS.
- The INCLUDE_DIRS belonging to all other components listed in the REQUIRES and PRIV_REQUIRES parameters (ie all the current component’s public and private dependencies).
- Recursively, all of the INCLUDE_DIRS of those components REQUIRES lists (ie all public dependencies of this component’s dependencies, recursively expanded).

**Main Component Requirements**

The component named main is special because it automatically requires all other components in the build. So it’s not necessary to pass REQUIRES or PRIV_REQUIRES to this component. See renaming main for a description of what needs to be changed if no longer using the main component.
Common Component Requirements

To avoid duplication, every component automatically requires some “common” IDF components even if they are not mentioned explicitly. Headers from these components can always be included.

The list of common components is: cxx, newlib, freertos, esp_hw_support, heap, log, soc, hal, esp_rom, esp_common, esp_system, xtensa/riscv.

Including Components in the Build

• By default, every component is included in the build.
• If you set the COMPONENTS variable to a minimal list of components used directly by your project, then the build will expand to also include required components. The full list of components will be:
  – Components mentioned explicitly in COMPONENTS.
  – Those components’ requirements (evaluated recursively).
  – The “common” components that every component depends on.
• Setting COMPONENTS to the minimal list of required components can significantly reduce compile times.

Circular Dependencies

It’s possible for a project to contain Component A that requires (REQUIRES or PRIV_REQUIRES) Component B, and Component B that requires Component A. This is known as a dependency cycle or a circular dependency.

CMake will usually handle circular dependencies automatically by repeating the component library names twice on the linker command line. However this strategy doesn’t always work, and the build may fail with a linker error about “Undefined reference to …”, referencing a symbol defined by one of the components inside the circular dependency. This is particularly likely if there is a large circular dependency, i.e., A > B > C > D > A.

The best solution is to restructure the components to remove the circular dependency. In most cases, a software architecture without circular dependencies has desirable properties of modularity and clean layering and will be more maintainable in the long term. However, removing circular dependencies is not always possible.

To bypass a linker error caused by a circular dependency, the simplest workaround is to increase the CMake LINK_INTERFACE_MULTIPLICITY property of one of the component libraries. This causes CMake to repeat this library and its dependencies more than two times on the linker command line.

For example:

```
set_property(TARGET ${COMPONENT_LIB} APPEND PROPERTY LINK_INTERFACE_MULTIPLICITY 3)
```

• This line should be placed after idf_component_register in the component CMakeLists.txt file.
• If possible, place this line in the component that creates the circular dependency by depending on a lot of other components. However, the line can be placed inside any component that is part of the cycle. Choosing the component that owns the source file shown in the linker error message, or the component that defines the symbol(s) mentioned in the linker error message, is a good place to start.
• Usually increasing the value to 3 (default is 2) is enough, but if this doesn’t work then try increasing the number further.
• Adding this option will make the linker command line longer, and the linking stage slower.

Advanced Workaround: Undefined Symbols If only one or two symbols are causing a circular dependency, and all other dependencies are linear, then there is an alternative method to avoid linker errors: Specify the specific symbols required for the “reverse” dependency as undefined symbols at link time.

For example, if component A depends on component B but component B also needs to reference reverse_ops from component A (but nothing else), then you can add a line like the following to the component B CMakeLists.txt to resolve the cycle at link time:

```
# This symbol is provided by 'Component A' at link time
target_link_libraries(${COMPONENT_LIB} INTERFACE "-u reverse_ops")
```
• The \texttt{-u} argument means that the linker will always include this symbol in the link, regardless of dependency ordering.
• This line should be placed after \texttt{idf_component_register} in the component \texttt{CMakeLists.txt} file.
• If “Component B” doesn’t need to access any headers of “Component A”, only link to a few symbol(s), then this line can be used instead of any \texttt{REQUIRES} from B to A. This further simplifies the component structure in the build system.

See the \texttt{target_link_libraries} documentation for more information about this CMake function.

Requirements in the Build System Implementation

• Very early in the CMake configuration process, the script \texttt{expand_requirements.cmake} is run. This script does a partial evaluation of all component \texttt{CMakeLists.txt} files and builds a graph of component requirements (this \textit{graph may have cycles}). The graph is used to generate a file \texttt{component_depends.cmake} in the build directory.
• The main CMake process then includes this file and uses it to determine the list of components to include in the build (internal \texttt{BUILD_COMPONENTS} variable). The \texttt{BUILD_COMPONENTS} variable is sorted so dependencies are listed first, however, as the component dependency graph has cycles this cannot be guaranteed for all components. The order should be deterministic given the same set of components and component dependencies.
• The value of \texttt{BUILD_COMPONENTS} is logged by CMake as “Component names: “
• Configuration is then evaluated for the components included in the build.
• Each component is included in the build normally and the \texttt{CMakeLists.txt} file is evaluated again to add the component libraries to the build.

Component Dependency Order

The order of components in the \texttt{BUILD_COMPONENTS} variable determines other orderings during the build:
• Order that \texttt{Project_include.cmake} files are included in the project.
• Order that the list of header paths is generated for compilation (via \texttt{-I} argument). (Note that for a given component’s source files, only that component’s dependency’s header paths are passed to the compiler.)

Adding Link-Time Dependencies

The ESP-IDF CMake helper function \texttt{idf_component_add_link_dependency} adds a link-only dependency between one component and another. In almost all cases, it is better to use the \texttt{PRIV_REQUIRES} feature in \texttt{idf_component_register} to create a dependency. However, in some cases, it’s necessary to add the link-time dependency of another component to this component, i.e., the reverse order to \texttt{PRIV_REQUIRES} (for example: \textit{Overriding Default Chip Drivers}).

To make another component depend on this component at link time:

\begin{verbatim}
idf_component_add_link_dependency(FROM other_component)
\end{verbatim}

Place this line after the line with \texttt{idf_component_register}.
It’s also possible to specify both components by name:

\begin{verbatim}
idf_component_add_link_dependency(FROM other_component TO that_component)
\end{verbatim}

4.4.9 Overriding Parts of the Project

\texttt{Project_include.cmake}

For components that have build requirements that must be evaluated before any component \texttt{CMakeLists.txt} files are evaluated, you can create a file called \texttt{project_include.cmake} in the component directory. This CMake file is included when \texttt{project.cmake} is evaluating the entire project.

\texttt{project_include.cmake} files are used inside ESP-IDF, for defining project-wide build features such as \texttt{esptool.py} command line arguments and the bootloader “special app”.

Unlike component `CMakeLists.txt` files, when including a `project_include.cmake` file the current source directory (`CMAKE_CURRENT_SOURCE_DIR` and working directory) is the project directory. Use the variable `COMPONENT_DIR` for the absolute directory of the component.

Note that `project_include.cmake` isn’t necessary for the most common component uses, such as adding include directories to the project, or `LDFLAGS` to the final linking step. These values can be customized via the `CMakeLists.txt` file itself. See *Optional Project Variables* for details.

`project_include.cmake` files are included in the order given in `BUILD_COMPONENTS` variable (as logged by CMake). This means that a component’s `project_include.cmake` file will be included after it’s all dependencies’ `project_include.cmake` files, unless both components are part of a dependency cycle. This is important if a `project_include.cmake` file relies on variables set by another component. See also above.

Take great care when setting variables or targets in a `project_include.cmake` file. As the values are included in the top-level project CMake pass, they can influence or break functionality across all components!

**KConfig.projbuild**

This is an equivalent to `project_include.cmake` for *Component Configuration* KConfig files. If you want to include configuration options at the top level of menuconfig, rather than inside the “Component Configuration” sub-menu, then these can be defined in the KConfig.projbuild file alongside the `CMakeLists.txt` file.

Take care when adding configuration values in this file, as they will be included across the entire project configuration. Where possible, it’s generally better to create a KConfig file for *Component Configuration*.

`project_include.cmake` files are used inside ESP-IDF, for defining project-wide build features such as `esp_tool.py` command line arguments and the bootloader “special app”.

**Wrappers to Redefine or Extend Existing Functions**

Thanks to the linker’s wrap feature, it is possible to redefine or extend the behavior of an existing ESP-IDF function. To do so, you will need to provide the following CMake declaration in your project’s `CMakeLists.txt` file:

```cmake
target_link_libraries(${COMPONENT_LIB} INTERFACE "-Wl,--wrap=function_to_redefine")
```

Where `function_to_redefine` is the name of the function to redefine or extend. This option will let the linker replace all the calls to `function_to_redefine` functions in the binary libraries with calls to `__wrap_function_to_redefine` function. Thus, you must define this new symbol in your application.

The linker will provide a new symbol named `__real_function_to_redefine` which points to the former implementation of the function to redefine. It can be called from the new implementation, making it an extension of the former one.

This mechanism is shown in the example `build_system/wrappers`. Check examples/build_system/wrappers/README.md for more details.

**Override the Default Bootloader**

Thanks to the optional `bootloader_components` directory present in your ESP-IDf project, it is possible to override the default ESP-IDF bootloader. To do so, a new `bootloader_components/main` component should be defined, which will make the project directory tree look like the following:

- **myProject/**
  - `CMakeLists.txt`
  - `sdkconfig`
  - `bootloader_components/` - `main/` - `CMakeLists.txt`
    - `Kconfig`
    - `my_bootloader.c`
  - `main/` - `CMakeLists.txt`
    - `app_main.c`
Here the `my_bootloader.c` file becomes source code for the new bootloader, which means that it will need to perform all the required operations to set up and load the main application from flash.

It is also possible to conditionally replace the bootloader depending on a certain condition, such as the target for example. This can be achieved thanks to the `BOOTLOADER_IGNORE_EXTRA_COMPONENT` CMake variable. This list can be used to tell the ESP-IDF bootloader project to ignore and not compile the given components present in `bootloader_components`. For example, if one wants to use the default bootloader for ESP32 target, then `myProject/CMakeLists.txt` should look like the following:

```cmake
include($ENV{IDF_PATH}/tools/cmake/project.cmake)
if(${IDF_TARGET} STREQUAL "esp32")
  set(BOOTLOADER_IGNORE_EXTRA_COMPONENT "main")
endif()
project(main)
```

It is important to note that this can also be used for any other bootloader components than `main`. In all cases, the prefix `bootloader_component` must not be specified.

See `custom_bootloader/bootloader_override` for an example of overriding the default bootloader.

### 4.4.10 Configuration-Only Components

Special components which contain no source files, only `Kconfig.projbuild` and `KConfig`, can have a one-line `CMakeLists.txt` file which calls the function `idf_component_register()` with no arguments specified. This function will include the component in the project build, but no library will be built and no header files will be added to any included paths.

### 4.4.11 Debugging CMake

For full details about CMake and CMake commands, see the [CMake v3.16 documentation](https://cmake.org/cmake-docs-html/).

Some tips for debugging the ESP-IDF CMake-based build system:

- When CMake runs, it prints quite a lot of diagnostic information including lists of components and component paths.
- Running `cmake -DDEBUG=1` will produce more verbose diagnostic output from the IDF build system.
- Running `cmake` with the `--trace` or `--trace-expand` options will give a lot of information about control flow. See the `cmake command line documentation`.

When included from a project `CMakeLists` file, the `project.cmake` file defines some utility modules and global variables and then sets `IDF_PATH` if it was not set in the system environment.

It also defines an overridden custom version of the built-in `CMake project` function. This function is overridden to add all of the ESP-IDF specific project functionality.

#### Warning On Undefined Variables

By default, the function of warnings on undefined variables is disabled.

To enable this function, we can pass the `--warn-uninitialized` flag to CMake or pass the `--cmake-warn-uninitialized` flag to `idf.py` so it will print a warning if an undefined variable is referenced in the build. This can be very useful to find buggy CMake files.

Browse the `/tools/cmake/project.cmake` file and supporting functions in `/tools/cmake/` for more details.
4.4.12 Example Component CMakeLists

Because the build environment tries to set reasonable defaults that will work most of the time, component CMakeLists.txt can be very small or even empty (see Minimal Component CMakeLists). However, overriding preset_component_variables is usually required for some functionality.

Here are some more advanced examples of component CMakeLists files.

Adding Conditional Configuration

The configuration system can be used to conditionally compile some files depending on the options selected in the project configuration.

Kconfig:

```config
FOO_ENABLE_BAR
  bool "Enable the BAR feature."
  help
    This enables the BAR feature of the FOO component.
```

CMakeLists.txt:

```cmake
set(srcs "foo.c" "more_foo.c")
if(CONFIG_FOO_ENABLE_BAR)
  list(APPEND srcs "bar.c")
endif()
```

```cmake
idf_component_register(SRCS "${srcs}"
  ...
)
```

This example makes use of the CMake if function and list APPEND function.

This can also be used to select or stub out an implementation, as such:

Kconfig:

```config
ENABLE_LCD_OUTPUT
  bool "Enable LCD output."
  help
    Select this if your board has an LCD.
config ENABLE_LCD_CONSOLE
  bool "Output console text to LCD"
  depends on ENABLE_LCD_OUTPUT
  help
    Select this to output debugging output to the LCD
config ENABLE_LCD_PLOT
  bool "Output temperature plots to LCD"
  depends on ENABLE_LCD_OUTPUT
  help
    Select this to output temperature plots
```

CMakeLists.txt:

```cmake
if(CONFIG_ENABLE_LCD_OUTPUT)
  set(srcs lcd-real.c lcd-spi.c)
else()
  set(srcs lcd-dummy.c)
endif()
```

(continues on next page)
# We need font if either console or plot is enabled
if(CONFIG_ENABLE_LCD_CONSOLE OR CONFIG_ENABLE_LCD_PLOT)
    list(APPEND srcs "font.c")
endif()

idf_component_register(SRCS "${srcs}"

## Conditions Which Depend on the Target

The current target is available to CMake files via IDF_TARGET variable.

In addition to that, if target xyz is used (IDF_TARGET=xyz), then Kconfig variable CONFIG_IDF_TARGET_XYZ will be set.

Note that component dependencies may depend on IDF_TARGET variable, but not on Kconfig variables. Also one cannot use Kconfig variables in include statements in CMake files, but IDF_TARGET can be used in such context.

## Source Code Generation

Some components will have a situation where a source file isn’t supplied with the component itself but has to be generated from another file. Say our component has a header file that consists of the converted binary data of a BMP file, converted using a hypothetical tool called bmp2h. The header file is then included in as C source file called graphics_lib.c:

```cmake
add_custom_command(OUTPUT logo.h COMMAND bmp2h -i ${COMPONENT_DIR}/logo.bmp -o logo.h DEPENDS ${COMPONENT_DIR}/logo.bmp VERBATIM)
add_custom_target(logo DEPENDS logo.h)
add_dependencies(${COMPONENT_LIB} logo)
set_property(DIRECTORY "${COMPONENT_DIR}" APPEND PROPERTY ADDITIONAL_CLEAN_FILES logo.h)
```

This answer is adapted from the CMake FAQ entry, which contains some other examples that will also work with ESP-IDF builds.

In this example, logo.h will be generated in the current directory (the build directory) while logo.bmp comes with the component and resides under the component path. Because logo.h is a generated file, it should be cleaned when the project is cleaned. For this reason, it is added to the ADDITIONAL_CLEAN_FILES property.

**Note:** If generating files as part of the project CMakeLists.txt file, not a component CMakeLists.txt, then use build property PROJECT_DIR instead of ${COMPONENT_DIR} and ${PROJECT_NAME}.elf instead of ${COMPONENT_LIB}.

If a source file from another component included logo.h, then add_dependencies would need to be called to add a dependency between the two components, to ensure that the component source files were always compiled in the correct order.

## Embedding Binary Data

Sometimes you have a file with some binary or text data that you’d like to make available to your component, but you don’t want to reformat the file as a C source.
You can specify argument `EMBED_FILES` in the component registration, giving space-delimited names of the files to embed:

```c
idf_component_register(...
    EMBED_FILES server_root_cert.der)
```

Or if the file is a string, you can use the variable `EMBED_TXTFILES`. This will embed the contents of the text file as a null-terminated string:

```c
idf_component_register(...
    EMBED_TXTFILES server_root_cert.pem)
```

The file’s contents will be added to the .rodata section in flash, and are available via symbol names as follows:

```c
extern const uint8_t server_root_cert_pem_start[] asm("_binary_server_root_cert_pem_start");
extern const uint8_t server_root_cert_pem_end[] asm("_binary_server_root_cert_pem_end");
```

The names are generated from the full name of the file, as given in `EMBED_FILES`. Characters /, ., etc. are replaced with underscores. The `_binary` prefix in the symbol name is added by objcopy and is the same for both text and binary files.

To embed a file into a project, rather than a component, you can call the function `target_add_binary_data` like this:

```c
target_add_binary_data(myproject.elf "main/data.bin" TEXT)
```

Place this line after the `project()` line in your project CMakeLists.txt file. Replace `myproject.elf` with your project name. The final argument can be `TEXT` to embed a null-terminated string, or `BINARY` to embed the content as-is.

For an example of using this technique, see the “main” component of the file_serving example `protocols/http_server/file_serving/main/CMakeLists.txt` - two files are loaded at build time and linked into the firmware.

It is also possible to embed a generated file:

```c
add_custom_command(OUTPUT my_processed_file.bin COMMAND my_process_file_cmd my_unprocessed_file.bin)
target_add_binary_data(my_target "my_processed_file.bin" BINARY)
```

In the example above, `my_processed_file.bin` is generated from `my_unprocessed_file.bin` through some command `my_process_file_cmd`, then embedded into the target.

To specify a dependence on a target, use the `DEPENDS` argument:

```c
add_custom_target(my_process COMMAND ...)
target_add_binary_data(my_target "my_embed_file.bin" BINARY DEPENDS my_process)
```

The `DEPENDS` argument to `target_add_binary_data` ensures that the target executes first.

**Code and Data Placements**

ESP-IDF has a feature called linker script generation that enables components to define where its code and data will be placed in memory through linker fragment files. These files are processed by the build system, and is used to augment the linker script used for linking app binary. See `Linker Script Generation` for a quick start guide as well as a detailed discussion of the mechanism.
Fully Overriding the Component Build Process

Obviously, there are cases where all these recipes are insufficient for a certain component, for example when the component is basically a wrapper around another third-party component not originally intended to be compiled under this build system. In that case, it’s possible to forego the ESP-IDF build system entirely by using a CMake feature called ExternalProject. Example component CMakeLists:

```cmake
# External build process for quirc, runs in source dir and # produces libquirc.a
externalproject_add(quirc_build
  PREFIX ${COMPONENT_DIR}
  SOURCE_DIR ${COMPONENT_DIR}/quirc
  CONFIGURE_COMMAND ""
  BUILD_IN_SOURCE 1
  BUILD_COMMAND make CC=${CMAKE_C_COMPILER} libquirc.a
  INSTALL_COMMAND ""
)

# Add libquirc.a to the build process
add_library(quirc STATIC IMPORTED GLOBAL)
add_dependencies(quirc quirc_build)

set_target_properties(quirc PROPERTIES IMPORTED_LOCATION
  ${COMPONENT_DIR}/quirc/libquirc.a)
set_target_properties(quirc PROPERTIES INTERFACE_INCLUDE_DIRECTORIES
  ${COMPONENT_DIR}/quirc/lib)
set_directory_properties( PROPERTIES ADDITIONAL_CLEAN_FILES
  "${COMPONENT_DIR}/quirc/libquirc.a")
```

(The above CMakeLists.txt can be used to create a component named quirc that builds the quirc project using its own Makefile.)

- `externalproject_add` defines an external build system.
  - `SOURCE_DIR`, `CONFIGURE_COMMAND`, `BUILD_COMMAND` and `INSTALL_COMMAND` should always be set. `CONFIGURE_COMMAND` can be set to an empty string if the build system has no “configure” step. `INSTALL_COMMAND` will generally be empty for ESP-IDF builds.
  - Setting `BUILD_IN_SOURCE` means the build directory is the same as the source directory. Otherwise, you can set `BUILD_DIR`.
  - Consult the ExternalProject documentation for more details about `externalproject_add()`
- The second set of commands adds a library target, which points to the “imported” library file built by the external system. Some properties need to be set in order to add include directories and tell CMake where this file is.
- Finally, the generated library is added to `ADDITIONAL_CLEAN_FILES`. This means `make clean` will delete this library. (Note that the other object files from the build won’t be deleted.)

ExternalProject Dependencies and Clean Builds

CMake has some unusual behavior around external project builds:

- `ADDITIONAL_CLEAN_FILES` only works when “make” or “ninja” is used as the build system. If an IDE build system is used, it won’t delete these files when cleaning.
- However, the ExternalProject configure & build commands will always be re-run after a clean is run.
- Therefore, there are two alternative recommended ways to configure the external build command:
  1. Have the external `BUILD_COMMAND` run a full clean compile of all sources. The build command will be run if any of the dependencies passed to `externalproject_add` with `DEPENDS` have changed, or if this is a clean build (ie any of `idf.py clean`, `ninja clean`, or `make clean` ran.)
  2. Have the external `BUILD_COMMAND` be an incremental build command. Pass the parameter `BUILD_ALWAYS 1` to `externalproject_add`. This means the external project will be built each time a build is run, regardless of dependencies. This is only recommended if the external project has correct incremental build behavior, and doesn’t take too long to run.
Chapter 4. API Guides

The best of these approaches for building an external project will depend on the project itself, its build system, and whether you anticipate needing to frequently recompile the project.

4.4.13 Custom Sdkconfig Defaults

For example projects or other projects where you don’t want to specify a full sdkconfig configuration, but you do want to override some key values from the ESP-IDF defaults, it is possible to create a file sdkconfig.defaults in the project directory. This file will be used when creating a new config from scratch, or when any new config value hasn’t yet been set in the sdkconfig file.

To override the name of this file or to specify multiple files, set the SDKCONFIG_DEFAULTS environment variable or set SDKCONFIG_DEFAULTS in top-level CMakeLists.txt. File names that are not specified as full paths are resolved relative to current project’s directory.

When specifying multiple files, use a semicolon as the list separator. Files listed first will be applied first. If a particular key is defined in multiple files, the definition in the latter file will override definitions from former files.

Some of the IDF examples include a sdkconfig.ci file. This is part of the continuous integration (CI) test framework and is ignored by the normal build process.

Target-dependent Sdkconfig Defaults

If and only if an sdkconfig.defaults file exists, the build system will also attempt to load defaults from an sdkconfig.defaults.TARGET_NAME file, where TARGET_NAME is the value of IDF_TARGET. For example, for esp32 target, default settings will be taken from sdkconfig.defaults first, and then from sdkconfig.defaults.esp32. If there are no generic default settings, an empty sdkconfig.defaults still needs to be created if the build system should recognize any additional target-dependent sdkconfig.defaults.TARGET_NAME files.

If SDKCONFIG_DEFAULTS is used to override the name of defaults file/files, the name of target-specific defaults file will be derived from SDKCONFIG_DEFAULTS value/values using the rule above. When there are multiple files in SDKCONFIG_DEFAULTS, target-specific file will be applied right after the file bringing it in, before all latter files in SDKCONFIG_DEFAULTS.

For example, if SDKCONFIG_DEFAULTS="sdkconfig.defaults;sdkconfig_devkit1", and there is a file sdkconfig.defaults.esp32 in the same folder, then the files will be applied in the following order: (1) sdkconfig.defaults (2) sdkconfig.defaults.esp32 (3) sdkconfig_devkit1.

4.4.14 Flash Arguments

There are some scenarios that we want to flash the target board without IDF. For this case we want to save the built binaries, esptool.py and esptool write_flash arguments. It’s simple to write a script to save binaries and esptool.py.

After running a project build, the build directory contains binary output files (.bin files) for the project and also the following flashing data files:

- flash_project_args contains arguments to flash the entire project (app, bootloader, partition table, PHY data if this is configured).
- flash_app_args contains arguments to flash only the app.
- flash_bootloader_args contains arguments to flash only the bootloader.

You can pass any of these flasher argument files to esptool.py as follows:

```
python esptool.py --chip esp32 write_flash @build/flash_project_args
```

Alternatively, it is possible to manually copy the parameters from the argument file and pass them on the command line.
The build directory also contains a generated file `flasher_args.json` which contains project flash information, in JSON format. This file is used by `idf.py` and can also be used by other tools which need information about the project build.

### 4.4.15 Building the Bootloader

The bootloader is a special “subproject” inside `/components/bootloader/subproject`. It has its own project CMake-Lists.txt file and builds separate .ELF and .BIN files to the main project. However, it shares its configuration and build directory with the main project.

The subproject is inserted as an external project from the top-level project, by the file `/components/bootloader/project_include.cmake`. The main build process runs CMake for the subproject, which includes discovering components (a subset of the main components) and generating a bootloader-specific config (derived from the main `sdkconfig`).

### 4.4.16 Writing Pure CMake Components

The ESP-IDF build system “wraps” CMake with the concept of “components”, and helper functions to automatically integrate these components into a project build.

However, underneath the concept of “components” is a full CMake build system. It is also possible to make a component which is pure CMake.

Here is an example minimal “pure CMake” component CMakeLists file for a component named `json`:

```cmake
add_library(json STATIC
    cJSON/cJSON.c
    cJSON/cJSON_Utils.c)
target_include_directories(json PUBLIC cJSON)
```

- This is actually an equivalent declaration to the IDF `json` component `/components/json/CMakeLists.txt`.
- This file is quite simple as there are not a lot of source files. For components with a large number of files, the globbing behavior of ESP-IDF’s component logic can make the component CMakeLists style simpler.
- Any time a component adds a library target with the component name, the ESP-IDF build system will automatically add this to the build, expose public include directories, etc. If a component wants to add a library target with a different name, dependencies will need to be added manually via CMake commands.

### 4.4.17 Using Third-Party CMake Projects with Components

CMake is used for a lot of open-source C and C++ projects — code that users can tap into for their applications. One of the benefits of having a CMake build system is the ability to import these third-party projects, sometimes even without modification! This allows for users to be able to get functionality that may not yet be provided by a component, or use another library for the same functionality.

Importing a library might look like this for a hypothetical library `foo` to be used in the `main` component:

```cmake
# Register the component
idf_component_register(...)

# Set values of hypothetical variables that control the build of 'foo'
set(FOO_BUILD_STATIC OFF)
set(FOO_BUILD_TESTS OFF)

# Create and import the library targets
add_subdirectory(foo)

# Publicly link 'foo' to 'main' component
target_link_libraries(main PUBLIC foo)
```
For an actual example, take a look at `build_system/cmake/import_lib`. Take note that what needs to be done in order to import the library may vary. It is recommended to read up on the library’s documentation for instructions on how to import it from other projects. Studying the library’s `CMakeLists.txt` and build structure can also be helpful.

It is also possible to wrap a third-party library to be used as a component in this manner. For example, the `mbedtls` component is a wrapper for Espressif’s fork of `mbedtls`. See its component `CMakeLists.txt`.

The CMake variable `ESP_PLATFORM` is set to 1 whenever the ESP-IDF build system is being used. Tests such as `if (ESP_PLATFORM)` can be used in generic CMake code if special IDF-specific logic is required.

### Using ESP-IDF Components from External Libraries

The above example assumes that the external library `foo` (or `tinyxml` in the case of the `import_lib` example) doesn’t need to use any ESP-IDF APIs apart from common APIs such as `libc`, `libstdc++`, etc. If the external library needs to use APIs provided by other ESP-IDF components, this needs to be specified in the external CMakeLists.txt file by adding a dependency on the library target `idf::<componentname>`.

For example, in the `foo/CMakeLists.txt` file:

```cmake
add_library(foo bar.c fizz.cpp buzz.cpp)
if (ESP_PLATFORM)
  # On ESP-IDF, bar.c needs to include esp_flash.h from the spi_flash component
  target_link_libraries(foo PRIVATE idf::spi_flash)
endif()
```

#### 4.4.18 Using Prebuilt Libraries with Components

Another possibility is that you have a prebuilt static library (`.a` file), built by some other build process.

The ESP-IDF build system provides a utility function `add_prebuilt_library` for users to be able to easily import and use prebuilt libraries:

```cmake
add_prebuilt_library(target_name lib_path [REQUIRES req1 req2 ...] [PRIV_REQUIRES req1 req2 ...])
```

where:

- `target_name`- name that can be used to reference the imported library, such as when linking to other targets
- `lib_path`- path to prebuilt library; may be an absolute or relative path to the component directory

Optional arguments `REQUIRES` and `PRIV_REQUIRES` specify dependency on other components. These have the same meaning as the arguments for `idf_component_register`.

Take note that the prebuilt library must have been compiled for the same target as the consuming project. Configuration relevant to the prebuilt library must also match. If not paid attention to, these two factors may contribute to subtle bugs in the app.

For an example, take a look at `build_system/cmake/import_prebuilt`.

#### 4.4.19 Using ESP-IDF in Custom CMake Projects

ESP-IDF provides a template CMake project for easily creating an application. However, in some instances the user might already have an existing CMake project or may want to create a custom one. In these cases it is desirable to be able to consume IDF components as libraries to be linked to the user’s targets (libraries/executables).

It is possible to do so by using the `build system APIs provided` by `tools/cmake/idf.cmake`. For example:
cmake_minimum_required(VERSION 3.16)
project(my_custom_app C)

# Include CMake file that provides ESP-IDF CMake build system APIs.
include(${ENV-IDF_PATH}/tools/cmake/idf.cmake)

# Include ESP-IDF components in the build, may be thought as an equivalent of
# add_subdirectory() but with some additional processing and magic for ESP-IDF_...build
# specific build processes.
idf_build_process(esp32)

# Create the project executable and plainly link the newlib component to it using
# its alias, idf::newlib.
add_executable(${CMAKE_PROJECT_NAME}.elf main.c)
target_link_libraries(${CMAKE_PROJECT_NAME}.elf idf::newlib)

# Let the build system know what the project executable is to attach more targets,...dependencies, etc.
idf_build_executable(${CMAKE_PROJECT_NAME}.elf)

The example in build_system/cmake/idf_as_lib demonstrates the creation of an application equivalent to hello world application using a custom CMake project.

## 4.4.20 ESP-IDF CMake Build System API

### Idf-build-commands

idf_build_get_property(var property [GENERATOR_EXPRESSION])

Retrieve a build property property and store it in var accessible from the current scope. Specifying GENERATOR_EXPRESSION will retrieve the generator expression string for that property, instead of the actual value, which can be used with CMake commands that support generator expressions.

idf_build_set_property(property val [APPEND])

Set a build property property with value val. Specifying APPEND will append the specified value to the current value of the property. If the property does not previously exist or it is currently empty, the specified value becomes the first element/member instead.

idf_build_component(component_dir)

Present a directory component_dir that contains a component to the build system. Relative paths are converted to absolute paths with respect to current directory. All calls to this command must be performed before idf_build_process.

This command does not guarantee that the component will be processed during build (see the COMPONENTS argument description for idf_build_process)

idf_build_process(target
  [PROJECT_DIR project_dir]
  [PROJECT_VER project_ver]
  [PROJECT_NAME project_name]
  [SDKCONFIG sdkconfig]
  [SDKCONFIG_DEFAULTS sdkconfig_defaults]
  [BUILD_DIR build_dir]
  [COMPONENTS component1 component2 ...])

Performs the bulk of the behind-the-scenes magic for including ESP-IDF components such as component configuration, libraries creation, dependency expansion and resolution. Among these functions, perhaps the most important from a user’s perspective is the libraries creation by calling each component’s idf_component_register.
This command creates the libraries for each component, which are accessible using aliases in the form `idf::component_name`. These aliases can be used to link the components to the user’s own targets, either libraries or executables.

The call requires the target chip to be specified with `target` argument. Optional arguments for the call include:

- `PROJECT_DIR` - directory of the project; defaults to `CMAKE_SOURCE_DIR`
- `PROJECT_NAME` - name of the project; defaults to `CMAKE_PROJECT_NAME`
- `PROJECT_VER` - version/revision of the project; defaults to “1”
- `SDKCONFIG` - output path of generated sdkconfig file; defaults to `PROJECT_DIR/sdkconfig` or `CMAKE_SOURCE_DIR/sdkconfig` depending if `PROJECT_DIR` is set
- `SDKCONFIG_DEFAULTS` - list of files containing default config to use in the build (list must contain full paths); defaults to empty. For each value `filename` in the list, the config from file `filename.target`, if it exists, is also loaded.
- `BUILD_DIR` - directory to place ESP-IDF build-related artifacts, such as generated binaries, text files, components; defaults to `CMAKE_BINARY_DIR`
- `COMPONENTS` - select components to process among the components known by the build system (added via `idf_build_component`). This argument is used to trim the build. Other components are automatically added if they are required in the dependency chain, i.e., the public and private requirements of the components in this list are automatically added, and in turn the public and private requirements of those requirements, so on and so forth. If not specified, all components known to the build system are processed.

```
idf_buildExecutable(executable)
```

Specify the executable `executable` for ESP-IDF build. This attaches additional targets such as dependencies related to flashing, generating additional binary files, etc. Should be called after `idf_build_process`.

```
idf_buildGetConfig(var config [GENERATOR_EXPRESSION])
```

Get the value of the specified config. Much like build properties, specifying `GENERATOR_EXPRESSION` will retrieve the generator expression string for that config, instead of the actual value, which can be used with CMake commands that support generator expressions. Actual config values are only known after call to `idf_build_process`, however.

**Idf-build-properties**

These are properties that describe the build. Values of build properties can be retrieved by using the build command `idf_build_get_property`. For example, to get the Python interpreter used for the build:

```
idf_build_get_property(python PYTHON)
message(STATUS "The Python interpreter is: ${python}")
```

- `BUILD_DIR` - build directory; set from `idf_build_process BUILD_DIR` argument
- `BUILD_COMPONENTS` - list of components included in the build; set by `idf_build_process`
- `BUILD_COMPONENT_ALIASES` - list of library alias of components included in the build; set by `idf_build_process`
- `C_COMPILE_OPTIONS` - compile options applied to all components’ C source files
- `COMPILE_OPTIONS` - compile options applied to all components’ source files, regardless of it being C or C++
- `COMPILE_DEFINITIONS` - compile definitions applied to all component source files
- `CXX_COMPILE_OPTIONS` - compile options applied to all components’ C++ source files
- `DEPENDENCIES_LOCK` - lock file path used in component manager. The default value is `dependencies.lock` under the project path.
- `EXECUTABLE` - project executable; set by call to `idf_build_executable`
- `EXECUTABLE_NAME` - name of project executable without extension; set by call to `idf_build_executable`
- `EXECUTABLE_DIR` - path containing the output executable
- `IDF_COMPONENT_MANAGER` - the component manager is enabled by default, but if this property is set to 0 it was disabled by the `IDF_COMPONENT_MANAGER` environment variable
• IDF_PATH - ESP-IDF path; set from IDF_PATH environment variable, if not, inferred from the location of idf.cmake
• IDF_TARGET - target chip for the build; set from the required target argument for idf_build_process
• IDF_VER - ESP-IDF version; set from either a version file or the Git revision of the IDF_PATH repository
• INCLUDE_DIRECTORIES - include directories for all component source files
• KCONFIGS - list of Kconfig files found in components in build; set by idf_build_process
• KCONFIG_PROJBUILDS - list of Kconfig.projobuild files found in components in build; set by idf_build_process
• PROJECT_NAME - name of the project; set from idf_build_process PROJECT_NAME argument
• PROJECT_DIR - directory of the project; set from idf_build_process PROJECT_DIR argument
• PROJECT_VER - version of the project; set from idf_build_process PROJECT_VER argument
• PYTHON - Python interpreter used for the build; set from PYTHON environment variable if available, if not “python” is used
• SDKCONFIG - full path to output config file; set from idf_build_process SDKCONFIG argument
• SDKCONFIG_DEFAULTS - list of files containing default config to use in the build; set from idf_build_process SDKCONFIG_DEFAULTS argument
• SDKCONFIG_HEADER - full path to C/C++ header file containing component configuration; set by idf_build_process
• SDKCONFIG_CMAKE - full path to CMake file containing component configuration; set by idf_build_process
• SDKCONFIG_JSON - full path to JSON file containing component configuration; set by idf_build_process
• SDKCONFIG_JSON_MENUS - full path to JSON file containing config menus; set by idf_build_process

**Idf-component-commands**

```cmake
idf_component_get_property(var component property [GENERATOR_EXPRESSION])
```

Retrieve a specified component’s component property, property and store it in var accessible from the current scope. Specifying GENERATOR_EXPRESSION will retrieve the generator expression string for that property, instead of the actual value, which can be used with CMake commands that support generator expressions.

```cmake
idf_component_set_property(component property val [APPEND])
```

Set a specified component’s component property, property with value val. Specifying APPEND will append the specified value to the current value of the property. If the property does not previously exist or it is currently empty, the specified value becomes the first element/member instead.

```cmake
idf_component_register([[[SRCS src1 src2 ...] | [[SRC_DIRS dir1 dir2 ...]] [EXCLUDE_-
SRCS src1 src2 ...]]
[INCLUDE_DIRS dir1 dir2 ...]
[PRIV_INCLUDE_DIRS dir1 dir2 ...]
[REQUIRES component1 component2 ...]
[PRIV_REQUIRES component1 component2 ...]
[LDFRAGMENTS ldfragment1 ldfragment2 ...]
[REQUIRED_IDF_TARGETS target1 target2 ...]
[EMBED_FILES file1 file2 ...]
[EMBED_TXTFILES file1 file2 ...]
[KCONFIG kconfig]
[KCONFIG_PROJOBUILD kconfig_projobuild]
[WHOLE_ARCHIVE])
```

Register a component to the build system. Much like the project() CMake command, this should be called from the component’s CMakeLists.txt directly (not through a function or macro) and is recommended to be called before any other command. Here are some guidelines on what commands can not be called before idf_component_register:

- commands that are not valid in CMake script mode
• custom commands defined in project_include.cmake
• build system API commands except `idf_build_get_property`; although consider whether the property may not have been set yet

Commands that set and operate on variables are generally okay to call before `idf_component_register`.

The arguments for `idf_component_register` include:

• SRCS - component source files used for creating a static library for the component; if not specified, component is a treated as a config-only component and an interface library is created instead.
• SRC_DIRS, EXCLUDE_SRCS - used to glob source files (.c, .cpp, .S) by specifying directories, instead of specifying source files manually via SRCS. Note that this is subject to the limitations of globbing in CMake. Source files specified in EXCLUDE_SRCS are removed from the globbed files.
• INCLUDE_DIRS - paths, relative to the component directory, which will be added to the include search path for all other components which require the current component
• PRIV_INCLUDE_DIRS - directory paths, must be relative to the component directory, which will be added to the include search path for this component’s source files only
• REQUIRES - public component requirements for the component
• PRIV_REQUIRES - private component requirements for the component; ignored on config-only components
• LDFRAGMENTS - component linker fragment files
• REQUIRED_IDF_TARGETS - specify the only target the component supports
• KCONFIG - override the default Kconfig file
• KCONFIG_PROJBUILD - override the default Kconfig.projbuild file
• WHOLE_ARCHIVE - if specified, the component library is surrounded by `-Wl,--whole-archive, -Wl,--no-whole-archive` when linked. This has the same effect as setting `WHOLE_ARCHIVE` component property.

The following are used for embedding data into the component, and is considered as source files when determining if a component is config-only. This means that even if the component does not specify source files, a static library is still created internally for the component if it specifies either:

• EMBED_FILES - binary files to be embedded in the component
• EMBED_TXTFILES - text files to be embedded in the component

**Idf-component-properties**

These are properties that describe a component. Values of component properties can be retrieved by using the build command `idf_component_get_property`. For example, to get the directory of the freertos component:

```cmake
idf_component_get_property(dir freertos COMPONENT_DIR)
message(STATUS "The 'freertos' component directory is: ${dir}")
```

• COMPONENT_ALIAS - alias for COMPONENT_LIB used for linking the component to external targets; set by `idf_build_component` and alias library itself is created by `idf_component_register`
• COMPONENT_DIR - component directory; set by `idf_build_component`
• COMPONENT_OVERRIDEN_DIR - contains the directory of the original component if this component overrides another component
• COMPONENT_LIB - name for created component static/interface library; set by `idf_build_component` and library itself is created by `idf_component_register`
• COMPONENT_NAME - name of the component; set by `idf_build_component` based on the component directory name
• COMPONENT_TYPE - type of the component, whether LIBRARY or CONFIG_ONLY. A component is of type LIBRARY if it specifies source files or embeds a file
• EMBED_FILES - list of files to embed in component; set from `idf_component_register` EMBED_FILES argument
• EMBED_TXTFILES - list of text files to embed in component; set from `idf_component_register` EMBED_TXTFILES argument
• INCLUDE_DIRS - list of component include directories; set from `idf_component_register` INCLUDE_DIRS argument
• KCONFIG - component Kconfig file; set by `idf_build_component`
• KCONFIG_PROJBUILD - component Kconfig.projbuild; set by idf_build_component
• LDFFRAGMENTS - list of component linker fragment files; set from idf_component_register LD-FRAGMENTS argument
• MANAGED_PRIV_REQUIRES - list of private component dependencies added by the IDF component manager from dependencies in idf_component.yml manifest file
• MANAGED_REQUIRES - list of public component dependencies added by the IDF component manager from dependencies in idf_component.yml manifest file
• PRIV_INCLUDE_DIRS - list of component private include directories; set from idf_component_register PRIV_INCLUDE_DIRS on components of type LIBRARY
• PRIV_REQUIRES - list of private component dependencies; set from value of idf_component_register PRIV_REQUIRES argument and dependencies in idf_component.yml manifest file
• REQUIRED_IDF_TARGETS - list of targets the component supports; set from idf_component_register EMBED_TXTFILES argument
• REQUIRES - list of public component dependencies; set from value of idf_component_register REQUIRES argument and dependencies in idf_component.yml manifest file
• SRCS - list of component source files; set from SRCS or SRC_DIRS/EXCLUDE_SRCS argument of idf_component_register
• WHOLE_ARCHIVE - if this property is set to TRUE (or any boolean “true” CMake value: 1, ON, YES, Y), the component library is surrounded by `-Wl,-whole-archive, -Wl,-no-whole-archive` when linked. This can be used to force the linker to include every object file into the executable, even if the object file doesn’t resolve any references from the rest of the application. This is commonly used when a component contains plugins or modules which rely on link-time registration. This property is FALSE by default. It can be set to TRUE from the component CMakeLists.txt file.

4.4.21 File Globbing & Incremental Builds

The preferred way to include source files in an ESP-IDF component is to list them manually via SRCS argument to idf_component_register:

```cmake
idf_component_register(SRCS library/a.c library/b.c platform/platform.c ...
```

This preference reflects the CMake best practice of manually listing source files. This could, however, be inconvenient when there are lots of source files to add to the build. The ESP-IDF build system provides an alternative way for specifying source files using SRC_DIRS:

```cmake
idf_component_register(SRC_DIRS library platform ...
```

This uses globbing behind the scenes to find source files in the specified directories. Be aware, however, that if a new source file is added and this method is used, then CMake won’t know to automatically re-run and this file won’t be added to the build.

The trade-off is acceptable when you’re adding the file yourself, because you can trigger a clean build or run `idf.py reconfigure` to manually re-run CMake. However, the problem gets harder when you share your project with others who may check out a new version using a source control tool like Git…

For components which are part of ESP-IDF, we use a third party Git CMake integration module (`/tools/cmake/third_party/GetGitRevisionDescription.cmake`) which automatically re-runs CMake any time the repository commit changes. This means if you check out a new ESP-IDF version, CMake will automatically re-run.

For project components (not part of ESP-IDF), there are a few different options:

• If keeping your project file in Git, ESP-IDF will automatically track the Git revision and re-run CMake if the revision changes.
• If some components are kept in a third git repository (not the project repository or ESP-IDF repository), you can add a call to the `git_describe` function in a component CMakeLists file in order to automatically trigger re-runs of CMake when the Git revision changes.
4.4.22 Build System Metadata

For integration into IDEs and other build systems, when CMake runs the build process generates a number of metadata files in the `build/` directory. To regenerate these files, run `cmake` or `idf.py reconfigure` (or any other `idf.py` build command).

- `compile_commands.json` is a standard format JSON file which describes every source file which is compiled in the project. A CMake feature generates this file, and many IDEs know how to parse it.
- `project_description.json` contains some general information about the ESP-IDF project, configured paths, etc.
- `flasher_args.json` contains `esptool.py` arguments to flash the project’s binary files. There are also `flash_*_args` files which can be used directly with `esptool.py`. See Flash arguments.
- `CMakeCache.txt` is the CMake cache file which contains other information about the CMake process, toolchain, etc.
- `config/sdkconfig.json` is a JSON-formatted version of the project configuration values.
- `config/kconfig_menus.json` is a JSON-formatted version of the menus shown in menuconfig, for use in external IDE UIs.

JSON Configuration Server

A tool called `kconfserver` is provided to allow IDEs to easily integrate with the configuration system logic. `kconfserver` is designed to run in the background and interact with a calling process by reading and writing JSON over process stdin & stdout.

You can run `kconfserver` from a project via `idf.py confserver` or `ninja kconfserver`, or a similar target triggered from a different build generator.

For more information about `kconfserver`, see the esp-idf-kconfig documentation.

4.4.23 Build System Internals

Build Scripts

The list files for the ESP-IDF build system reside in `/tools/cmake`. The modules which implement core build system functionality are as follows:

- `build.cmake` - Build related commands i.e., build initialization, retrieving/setting build properties, build processing.
- `component.cmake` - Component related commands i.e., adding components, retrieving/setting component properties, registering components.
- `kconfig.cmake` - Generation of configuration files (sdkconfig, sdkconfig.h, sdkconfig.cmake, etc.) from Kconfig files.
- `ldgen.cmake` - Generation of final linker script from linker fragment files.
- `target.cmake` - Setting build target and toolchain file.
- `utilities.cmake` - Miscellaneous helper commands.

Aside from these files, there are two other important CMake scripts in `/tools/cmake`:

- `idf.cmake` - Sets up the build and includes the core modules listed above. Included in CMake projects in order to access ESP-IDF build system functionality.
- `project.cmake` - Includes `idf.cmake` and provides a custom `project()` command that takes care of all the heavy lifting of building an executable. Included in the top-level `CMakeLists.txt` of standard ESP-IDF projects.
The rest of the files in `/tools/cmake` are support or third-party scripts used in the build process.

**Build Process**

This section describes the standard ESP-IDF application build process. The build process can be broken down roughly into four phases:

**Initialization**  This phase sets up necessary parameters for the build.

- Upon inclusion of `idf_cmake` in `project.cmake`, the following steps are performed:
  - Set `IDF_PATH` from environment variable or inferred from path to `project.cmake` included in the top-level `CMakeLists.txt`.
  - Add `/tools/cmake` to `CMAKE_MODULE_PATH` and include core modules plus the various helper/third-party scripts.
  - Set build tools/executables such as default Python interpreter.
  - Get ESP-IDF git revision and store as `IDF_VER`.
  - Set global build specifications i.e., compile options, compile definitions, include directories for all components in the build.
  - Add components in `components` to the build.

- The initial part of the custom `project()` command performs the following steps:
  - Set `IDF_TARGET` from environment variable or CMake cache and the corresponding `CMAKE_TOOLCHAIN_FILE` to be used.
  - Add components in `EXTRA_COMPONENT_DIRS` to the build.
  - Prepare arguments for calling command `idf_build_process()` from variables such as `COMPONENTS/EXCLUDE_COMPONENTS`, `SDKCONFIG`, `SDKCONFIG_DEFAULTS`.

The call to `idf_build_process()` command marks the end of this phase.

**Enumeration**

This phase builds a final list of components to be processed in the build, and is performed in the first half of `idf_build_process()`.

- Retrieve each component’s public and private requirements. A child process is created which executes each component’s `CMakeLists.txt` in script mode. The values of `idf_component_register` REQUIRE and PRIV REQUIRE argument is returned to the parent build process. This is called early expansion. The variable `CMAKE_BUILD_EARLY_EXPANSION` is defined during this step.
- Recursively include components based on public and private requirements.

**Processing**

This phase processes the components in the build, and is the second half of `idf_build_process()`.

- Load project configuration from `sdkconfig` file and generate an `sdkconfig.cmake` and `sdkconfig.h` header. These define configuration variables/macros that are accessible from the build scripts and C/C++ source/header files, respectively.
- Include each component’s `project_include.cmake`. 
• Add each component as a subdirectory, processing its CMakeLists.txt. The component CMakeLists.txt calls the registration command, `idf_component_register` which adds source files, include directories, creates component library, links dependencies, etc.

**Finalization**

This phase is everything after `idf_build_process()`.

• Create executable and link the component libraries to it.
• Generate project metadata files such as `project_description.json` and display relevant information about the project built.

Browse `/tools/cmake/project.cmake` for more details.

### 4.4.24 Migrating from ESP-IDF GNU Make System

Some aspects of the CMake-based ESP-IDF build system are very similar to the older GNU Make-based system. The developer needs to provide values the include directories, source files etc. There is a syntactical difference, however, as the developer needs to pass these as arguments to the registration command, `idf_component_register`.

**Automatic Conversion Tool**

An automatic project conversion tool is available in `tools/cmake/convert_to_cmake.py` in ESP-IDF v4.x releases. The script was removed in v5.0 because of its `make` build system dependency.

**No Longer Available in CMake**

Some features are significantly different or removed in the CMake-based system. The following variables no longer exist in the CMake-based build system:

• `COMPONENT_BUILD_DIR`: Use `CMAKE_CURRENT_BINARY_DIR` instead.
• `COMPONENT_LIBRARY`: Defaulted to `${COMPONENT_NAME}.a`, but the library name could be overridden by the component. The name of the component library can no longer be overridden by the component.
• `CC, LD, AR, OBJCOPY, HOSTCC, HOSTLD, HOSTAR`: Full paths to each tool from the gcc xtensa cross-toolchain. Use `CMAKE_C_COMPILER`, `CMAKE_C_LINK_EXECUTABLE`, `CMAKE_OBJCOPY`, etc instead. Full list here.
• `COMPONENT_ADD_LDFLAGS`: Used to override linker flags. Use the CMake `target_link_libraries` command instead.
• `COMPONENT_ADD_LINKER_DEPS`: List of files that linking should depend on. `target_link_libraries` will usually infer these dependencies automatically. For linker scripts, use the provided custom CMake function `target_linker_scripts`.
• `COMPONENT_SUBMODULES`: No longer used, the build system will automatically enumerate all submodules in the ESP-IDF repository.
• `COMPONENT_EXTRA_INCLUDES`: Used to be an alternative to `COMPONENT_PRIV_INCLUDEDIRS` for absolute paths. Use `PRIV_INCLUDE_DIRS` argument to `idf_component_register` for all cases now (can be relative or absolute).
• `COMPONENT_OBJS`: Previously, component sources could be specified as a list of object files. Now they can be specified as a list of source files via `SRCS` argument to `idf_component_register`.
• `COMPONENT_OBJEXCLUDE`: Has been replaced with `EXCLUDE_SRCS` argument to `idf_component_register`. Specify source files (as absolute paths or relative to component directory), instead.
• `COMPONENT_EXTRA_CLEAN`: Set property `ADDITIONAL_CLEAN_FILES` instead but note CMake has some restrictions around this functionality.
• `COMPONENT_OWNBUildTARGET & COMPONENT_OWNCLEANTARGET`: Use CMake `ExternalProject` instead. See Fully Overriding the Component Build Process for full details.
Chapter 4. API Guides

- **COMPONENT_CONFIG_ONLY**: Call `idf_component_register` without any arguments instead. See *Configuration-Only Components*.
- **CFLAGS, CPPFLAGS, CXXFLAGS**: Use equivalent CMake commands instead. See *Controlling Component Compilation*.

**No Default Values**

Unlike in the legacy Make-based build system, the following have no default values:

- Source directories (**COMPONENT_SRCDIRS** variable in Make, **SRC_DIRS** argument to `idf_component_register` in CMake)
- Include directories (**COMPONENT_ADD_INCLUDEDIRS** variable in Make, **INCLUDE_DIRS** argument to `idf_component_register` in CMake)

**No Longer Necessary**

- In the legacy Make-based build system, it is required to also set **COMPONENT_SRCDIRS** if **COMPONENT_SRCS** is set. In CMake, the equivalent is not necessary i.e., specifying **SRC_DIRS** to `idf_component_register` if **SRCS** is also specified (in fact, **SRCS** is ignored if **SRC_DIRS** is specified).

**Flashing from Make**

`make flash` and similar targets still work to build and flash. However, project `sdkconfig` no longer specifies serial port and baud rate. Environment variables can be used to override these. See *Flashing with Ninja or Make* for more details.

### 4.5 Core Dump

#### 4.5.1 Overview

A core dump is a set of software state information that is automatically saved by the panic handler when a fatal error occurs. Core dumps are useful for conducting post-mortem analysis of the software’s state at the moment of failure. ESP-IDF provides support for generating core dumps.

A core dump contains snapshots of all tasks in the system at the moment of failure, where each snapshot includes a task’s control block (TCB) and stack. By analyzing the task snapshots, it is possible to find out what task, at what instruction (line of code), and what call stack of that task lead to the crash. It is also possible to dump the contents of variables on demand, provided those variables are assigned special core dump attributes.

Core dump data is saved to a core dump file according to a particular format, see *Core dump internals* for more details. However, ESP-IDF’s `idf.py` command provides special subcommands to decode and analyze the core dump file.

#### 4.5.2 Configurations

**Destination**

The **CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART** option enables or disables core dump, and selects the core dump destination if enabled. When a crash occurs, the generated core dump file can either be saved to flash, or output to a connected host over UART.
**Format & Size**

The `CONFIG_ESP_COREDUMP_DATA_FORMAT` option controls the format of the core dump file, namely ELF format or Binary format.

The ELF format contains extended features and allows more information regarding erroneous tasks and crashed software to be saved. However, using the ELF format causes the core dump file to be larger. This format is recommended for new software designs and is flexible enough to be extended in future revisions to save more information.

The Binary format is kept for compatibility reasons. Binary format core dump files are smaller while provide better performance.

The `CONFIG_ESP_COREDUMP_MAX_TASKS_NUM` option configures the number of task snapshots saved by the core dump.

Core dump data integrity checking is supported via the `Components > Core dump > Core dump data integrity check` option.

**Reserved Stack Size**

Core dump routines run from a separate stack due to core dump itself needing to parse and save all other task stacks. The `CONFIG_ESP_COREDUMP_STACK_SIZE` option controls the size of the core dump’s stack in number of bytes.

Setting this option to 0 bytes will cause the core dump routines to run from the ISR stack, thus saving a bit of memory. Setting the option greater than zero will cause a separate stack to be instantiated.

**Note:** If a separate stack is used, the recommended stack size should be larger than 800 bytes to ensure that the core dump routines themselves do not cause a stack overflow.

**4.5.3 Core Dump to Flash**

When the core dump file is saved to flash, the file is saved to a special core dump partition in flash. Specifying the core dump partition will reserve space on the flash chip to store the core dump file. The core dump partition is automatically declared when using the default partition table provided by ESP-IDF. However, when using a custom partition table, you need to declare the core dump partition, as illustrated below:

```plaintext
# Name, Type, SubType, Offset, Size
# Note: if you have increased the bootloader size, make sure to update the offsets...
--- to avoid overlap
nvs, data, nvs, 0x9000, 0x6000
phy_init, data, phy, 0xf000, 0x1000
factory, app, factory, 0x10000, 1M
coredump, data, coredump,, 64K
```

**Important:** If `Flash Encryption` is enabled on the device, please add an `encrypted` flag to the core dump partition declaration.

```plaintext
coredump, data, coredump,, 64K, encrypted
```

There are no special requirements for the partition name. It can be chosen according to the application’s needs, but the partition type should be `data` and the sub-type should be `coredump`. Also, when choosing partition size, note that the core dump file introduces a constant overhead of 20 bytes and a per-task overhead of 12 bytes. This overhead does not include the size of TCB and stack for every task. So the partition size should be at least 20 + max tasks number x (12 + TCB size + max task stack size) bytes.

An example of the generic command to analyze core dump from flash is:
4.5.4 Core Dump to UART

When the core dump file is output to UART, the output file is Base64-encoded. The `CONFIG_ESP_COREDUMP_DECODE` option allows for selecting whether the output file is automatically decoded by the ESP-IDF monitor or kept encoded for manual decoding.

**Automatic Decoding**

If `CONFIG_ESP_COREDUMP_DECODE` is set to automatically decode the UART core dump, ESP-IDF monitor will automatically decode the data, translate any function addresses to source code lines, and display it in the monitor. The output to ESP-IDF monitor would resemble the following output:

```
===============================================================
============== ESP32 CORE DUMP START =======================
Crashed task handle: 0x3ffc5640, name: 'main', GDB name: 'process 1073501760'
```

(continues on next page)
Manual Decoding

If you set `CONFIG_ESP_COREDUMP_DECODE` to no decoding, then the raw Base64-encoded body of core dump is output to UART between the following header and footer of the UART output:

```
================= CORE DUMP START =================
<body of Base64-encoded core dump, save it to file on disk>
================= CORE DUMP END ==================
```

It is advised to manually save the core dump text body to a file. The `CORE DUMP START` and `CORE DUMP END` lines must not be included in a core dump text file. The saved text can be decoded using the following command:

```
idf.py coredump-info -c </path/to/saved/base64/text>
```

or

```
idf.py coredump-debug -c </path/to/saved/base64/text>
```

### 4.5.5 Core Dump Commands

ESP-IDF provides special commands to help to retrieve and analyze core dumps:

- `idf.py coredump-info` - prints crashed task’s registers, call stack, list of available tasks in the system, memory regions, and contents of memory stored in core dump (TCBs and stacks).
- `idf.py coredump-debug` - creates core dump ELF file and runs GDB debug session with this file. You can examine memory, variables, and task states manually. Note that since not all memory is saved in the core dump, only the values of variables allocated on the stack are meaningful.

### 4.5.6 ROM Functions in Backtraces

It is a possible that at the moment of a crash, some tasks and/or the crashed task itself have one or more ROM functions in their call stacks. Since ROM is not part of the program ELF, it is impossible for GDB to parse such call stacks due to GDB analyzing functions’ prologues to decode backtraces. Thus, call stack parsing will break with an error message upon the first ROM function that is encountered.

To overcome this issue, the ROM ELF provided by Espressif is loaded automatically by ESP-IDF monitor based on the target and its revision. More details about ROM ELFs can be found in `esp-rom-elfs`.

### 4.5.7 Dumping Variables on Demand

Sometimes you want to read the last value of a variable to understand the root cause of a crash. Core dump supports retrieving variable data over GDB by applying special attributes to declared variables.
Supported Notations and RAM Regions

- COREDUMP_DRAM_ATTR places the variable into the DRAM area, which is included in the dump.
- COREDUMP_RTC_ATTR places the variable into the RTC area, which is included in the dump.
- COREDUMP_RTC_FAST_ATTR places the variable into the RTC_FAST area, which is included in the dump.

Example

1. In Project Configuration Menu, enable COREDUMP TO FLASH, then save and exit.
2. In your project, create a global variable in the DRAM area, such as:

```c
// uint8_t global_var;
COREDUMP_DRAM_ATTR uint8_t global_var;
```

3. In the main application, set the variable to any value and `assert(0)` to cause a crash.

```c
global_var = 25;
assert(0);
```

4. Build, flash, and run the application on a target device and wait for the dumping information.
5. Run the command below to start core dumping in GDB, where PORT is the device USB port:

```bash
idf.py coredump-debug
```

6. In GDB shell, type `p global_var` to get the variable content:

```gdb
(gdb) p global_var
$1 = 25 '"031'
```

4.5.8 Running `idf.py coredump-info` and `idf.py coredump-debug`

`idf.py coredump-info --help` and `idf.py coredump-debug --help` commands can be used to get more details on usage.

Anatomy of Core Dump Image

A core dump file’s format can be configured to use the ELF format, or a legacy binary format. The ELF format is recommended for all new designs as it provides more information regarding the software’s state at the moment the crash occurs, e.g., CPU registers and memory contents.

The memory state embeds a snapshot of all tasks mapped in the memory space of the program. The CPU state contains register values when the core dump has been generated. The core dump file uses a subset of the ELF structures to register this information.

Loadable ELF segments are used to store the process’ memory state, while ELF notes (ELF.PT_NOTE) are used to store the process’ metadata (e.g., PID, registers, signal etc). In particular, the CPU’s status is stored in a note with a special name and type (CORE, NT_PRSTATUS type).

Here is an overview of the core dump layout:

**Note:** The format of the image file shown in the above pictures represents the current version of the image and can be changed in future releases.
Fig. 3: Core Dump ELF Image Format

Fig. 4: Core Dump Binary Image Format
Overview of Implementation

The figure below describes some basic aspects related to the implementation of the core dump:

![Core Dump Implementation Overview Diagram]

Note: The diagram above hides some details and represents the current implementation of the core dump which can be changed later.

4.6 C++ Support

ESP-IDF is primarily written in C and provides C APIs. However, ESP-IDF supports development of applications in C++. This document covers various topics relevant to C++ development.

The following C++ features are supported:

- Exception Handling
- Multithreading
- Runtime Type Information (RTTI)
- Thread Local Storage (thread_local keyword)
- All C++ features implemented by GCC, except for some Limitations. See GCC documentation for details on features implemented by GCC.

4.6.1 esp-idf-cxx Component

esp-idf-cxx component provides higher-level C++ APIs for some of the ESP-IDF features. This component is available from the ESP-IDF Component Registry.
4.6.2 C++ Language Standard

By default, ESP-IDF compiles C++ code with C++23 language standard with GNU extensions (-std=gnu++23).

To compile the source code of a certain component using a different language standard, set the desired compiler flag in the component’s CMakeLists.txt file:

```cpp
idf_component_register( ... )
target_compile_options(${(COMPONENT_LIB) PRIVATE -std=gnu++11})
```

Use PUBLIC instead of PRIVATE if the public header files of the component also need to be compiled with the same language standard.

4.6.3 Multithreading

C++ threads, mutexes, and condition variables are supported. C++ threads are built on top of pthreads, which in turn wrap FreeRTOS tasks.

See cxx/pthread for an example of creating threads in C++.

**Note:** The destructor of `std::jthread` can only safely be called from a task that has been created by Thread APIs or by the C++ threading library API.

4.6.4 Exception Handling

Support for C++ Exceptions in ESP-IDF is disabled by default, but can be enabled using the `CONFIG_COMPILER_CXX_EXCEPTIONS` option.

If an exception is thrown, but there is no catch block, the program is terminated by the abort function, and the backtrace is printed. See Fatal Errors for more information about backtraces.

C++ Exceptions should only be used for exceptional cases, i.e., something happening unexpectedly and occurs rarely, such as events that happen less frequently than 1/100 times. Do not use them for control flow (see also the section about resource usage below). For more information on how to use C++ Exceptions, see the ISO C++ FAQ and CPP Core Guidelines.

See cxx/exceptions for an example of C++ exception handling.

C++ Exception Handling and Resource Usage

Enabling exception handling normally increases application binary size by a few KB.

Additionally, it may be necessary to reserve some amount of RAM for the exception emergency memory pool. Memory from this pool is used if it is not possible to allocate an exception object from the heap.

The amount of memory in the emergency pool can be set using the `CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE` variable.

Some additional stack memory (around 200 bytes) is also used if and only if a C++ Exception is actually thrown, because it requires calling some functions from the top of the stack to initiate exception handling.

The run time of code using C++ exceptions depends on what actually happens at run time.

- If no exception is thrown, the code tends to be somewhat faster since there is no need to check error codes.
- If an exception is thrown, the run time of the code that handles exceptions is orders of magnitude slower than code returning an error code.
If an exception is thrown, the runtime of the code that unwinds the stack is orders of magnitude slower than code returning an error code. The significance of the increased runtime will depend on the application’s requirements and implementation of error handling (e.g., requiring user input or messaging to a cloud). As a result, exception-throwing code should never be used in real-time critical code paths.

### 4.6.5 Runtime Type Information (RTTI)

Support for RTTI in ESP-IDF is disabled by default, but can be enabled using `CONFIG_COMPILER_CXX_RTTI` option.

Enabling this option compiles all C++ files with RTTI support enabled, which allows using `dynamic_cast` conversion and `typeid` operator. Enabling this option typically increases the binary size by tens of kB.

See `cxx/rtti` for an example of using RTTI in ESP-IDF.

### 4.6.6 Developing in C++

The following sections provide tips on developing ESP-IDF applications in C++.

#### Combining C and C++ Code

When an application is developed using both C and C++, it is important to understand the concept of language linkage.

In order for a C++ function to be callable from C code, it has to be both `declared` and `defined` with C linkage (`extern "C"`):

```c
// declaration in the .h file:
#ifdef __cplusplus
extern "C" {
#endif

void my_cpp_func(void);

#ifdef __cplusplus
}
#endif

// definition in a .cpp file:
extern "C" void my_cpp_func(void) {
    // ...
}
```

In order for a C function to be callable from C++, it has to be `declared` with C linkage:

```c
// declaration in .h file:
#ifdef __cplusplus
extern "C" {
#endif

void my_c_func(void);

#ifdef __cplusplus
}
#endif

// definition in a .c file:
void my_c_func(void) {
    // ...
}
```
Defining `app_main` in C++

ESP-IDF expects the application entry point, `app_main`, to be defined with C linkage. When `app_main` is defined in a `.cpp` source file, it has to be designated as `extern "C"`:

```cpp
extern "C" void app_main()
{
}
```

Designated Initializers

Many of the ESP-IDF components use `Configuration Structures` as arguments to the initialization functions. ESP-IDF examples written in C routinely use designated initializers to fill these structures in a readable and maintainable way.

C and C++ languages have different rules with regards to the designated initializers. For example, C++23 (currently the default in ESP-IDF) does not support out-of-order designated initialization, nested designated initialization, mixing of designated initializers and regular initializers, and designated initialization of arrays. Therefore, when porting ESP-IDF C examples to C++, some changes to the structure initializers may be necessary. See the `C++ aggregate initialization reference` for more details.

**iostream**

`iostream` functionality is supported in ESP-IDF, with a couple of caveats:

1. Normally, ESP-IDF build process eliminates the unused code. However, in the case of iostreams, simply including `<iostream>` header in one of the source files significantly increases the binary size by about 200 kB.
2. By default, ESP-IDF uses a simple non-blocking implementation of the standard input stream (`stdin`). To get the usual behavior of `std::cin`, the application has to initialize the UART driver and enable the blocking mode as shown in `common_components/protocol_examples_common/stdin_out.c`.

**4.6.7 Limitations**

- Linker script generator does not support function level placements for functions with C++ linkage.
- Various section attributes (such as `IRAM_ATTR`) are ignored when used with template functions.
- Vtables are placed into Flash and are not accessible when the flash cache is disabled. Therefore, virtual function calls should be avoided in `IRAM-Safe Interrupt Handlers`. Placement of Vtables cannot be adjusted using the linker script generator, yet.
- C++ filesystem (`std::filesystem`) features are not supported.

**4.6.8 What to Avoid**

Do not use `setjmp/longjmp` in C++. `longjmp` blindly jumps up the stack without calling any destructors, easily introducing undefined behavior and memory leaks. Use C++ exceptions instead, they guarantee correctly calling destructors. If you cannot use C++ exceptions, use alternatives (except `setjmp/longjmp` themselves) such as simple return codes.

**4.7 Current Consumption Measurement of Modules**

You may want to know the current consumption of a module in deep-sleep mode, other power-saving modes, and active mode to develop some applications sensitive to power consumption. This section introduces how to measure the current consumption of a module running such an application.
4.7.1 Notes to Measurement

Can We Use a Development Board?

For ESP32-S2, using a development board directly to measure current consumption of the corresponding module is not recommended, as some circuits still consume power on the board even when you flash the chip with the `deep_sleep` example. Therefore, you need to cut off the power supply circuit to the module to measure the module’s current. This method is inconvenient and increases measurement costs.

How to Choose an Appropriate Ammeter?

In the `deep_sleep` example, the module will be woken up every 20 seconds. In deep-sleep mode, the current in the module is just several microamps (μA), while in active mode, the current is in the order of milliamps (mA). The high dynamic current range makes accurate measurement difficult. Ordinary ammeters cannot dynamically switch the measurement range fast enough.

Additionally, ordinary ammeters have a relatively high internal resistance, resulting in a significant voltage drop. This may cause the module to enter an unstable state, as it is powered by a voltage smaller than the minimum required voltage supply.

Therefore, an ammeter suitable for measuring current in deep-sleep mode should have low internal resistance and, ideally, switch current ranges dynamically. We recommend two options: the Joulescope ammeter and the Power Profiler Kit II from Nordic.

**Joulescope Ammeter**  The Joulescope ammeter combines high-speed sampling and rapid dynamic current range switching to provide accurate and seamless current and energy measurements, even for devices with rapidly varying current consumption. Joulescope accurately measures electrical current over nine orders of magnitude from amps down to nanoamps. This wide range allows for accurate and precise current measurements for devices. Additionally, Joulescope has a total voltage drop of 25 mV at 1 A, which keeps the module running normally. These two features make Joulescope a perfect option for measuring the module switching between deep-sleep mode and wake-up mode.

Joulescope has no display screen. You need to connect it to a PC to visualize the current waveforms of the measured module. For specific instructions, please follow the documentation provided by the manufacturer.

**Nordic Power Profiler Kit II**  The Nordic Power Profiler Kit II has an advanced analog measurement unit with a high dynamic measurement range. This allows for accurate power consumption measurements for the entire range typically seen in low-power embedded applications, all the way from single μAs to 1 A. The resolution varies between 100 nA and 1 mA, depending on the measurement range, and is high enough to detect small spikes often seen in low-power optimized systems.

4.7.2 Hardware Connection

To measure the power consumption of a bare module, you need an ESP-Prog to flash the `deep_sleep` example to the module and power the module during measurement, a suitable ammeter (here we use the Joulescope ammeter), a computer, and of course a bare module with necessary jumper wires. For the connection, please refer to the following figure.

Please connect the pins of UART TX, UART RX, SPI Boot, Enable, and Ground on the measured module with corresponding pins on ESP-Prog, and connect the VPROG pin on ESP-Prog with the IN+ port on the Joulescope ammeter and connect its OUT+ port with the Power supply (3V3) pin on the measured module. For the specific names of these pins in different modules, please refer to the list below.
Fig. 6: Hardware Connection (click to enlarge)
4.7.3 Measurement Steps

ESP32-S3-WROOM-1 is used as an example in the measurement, and other modules can be measured similarly. For the specific current consumption of chips in different modes, please refer to the Current Consumption subsection in the corresponding chip datasheet.

You can refer to the following steps to measure the current in deep-sleep mode.

- Connect the aforementioned devices according to the hardware connection.
- Flash the deep_sleep example to the module. For details, please refer to Start a Project on Linux and macOS for a computer with Linux or macOS system or Start a Project on Windows for a computer with Windows system.
- By default, the module will be woken up every 20 seconds (you can change the timing by modifying the code of this example). To check if the example runs as expected, you can monitor the module operation by running `idf.py -p PORT monitor` (please replace PORT with your serial port name).
- Open the Joulescope software to see the current waveform as shown in the image below.

From the waveforms, you can obtain that the current of the module in deep-sleep mode is 8.14 μA. In addition, you can also see the current of the module in active mode, which is about 23.88 mA. The waveforms also show that the average power consumption during deep-sleep mode is 26.85 μW, and the average power consumption during active mode is 78.32 mW.

The figure below shows the total power consumption of one cycle is 6.37 mW.

By referring to these power consumption in different modes, you can estimate the power consumption of your applications and choose the appropriate power source.

4.8 Deep Sleep Wake Stubs

ESP32-S2 supports running a “deep sleep wake stub” when coming out of deep sleep. This function runs immediately as soon as the chip wakes up - before any normal initialisation, bootloader, or ESP-IDF code has run. After the wake stub runs, the SoC can go back to sleep or continue to start ESP-IDF normally.

Deep sleep wake stub code is loaded into “RTC Fast Memory” and any data which it uses must also be loaded into RTC memory. RTC memory regions hold their contents during deep sleep.

4.8.1 Rules for Wake Stubs

Wake stub code must be carefully written:

- As the SoC has freshly woken from sleep, most of the peripherals are in reset states. The SPI flash is unmapped.
- The wake stub code can only call functions implemented in ROM or loaded into RTC Fast Memory (see below.)

---

Table 1: Pin Names of Modules Based on ESP32-S2 Chip

<table>
<thead>
<tr>
<th>Function of Module Pin</th>
<th>Pin Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>UART TX</td>
<td>TXD0</td>
</tr>
<tr>
<td>UART RX</td>

</tr>
</tbody>
</table>

For details of the pin names, please refer to the datasheet of specific module.
Fig. 7: Current Waveform of ESP32-S3-WROOM-1 (click to enlarge)
Fig. 8: Power Consumption of ESP32-S3-WROOM-1 (click to enlarge)
• The wake stub code can only access data loaded in RTC memory. All other RAM will be unintialized and have random contents. The wake stub can use other RAM for temporary storage, but the contents will be overwritten when the SoC goes back to sleep or starts ESP-IDF.
• RTC memory must include any read-only data (.rodata) used by the stub.
• Data in RTC memory is initialized whenever the SoC restarts, except when waking from deep sleep. When waking from deep sleep, the values which were present before going to sleep are kept.
• Wake stub code is a part of the main esp-idf app. During normal running of esp-idf, functions can call the wake stub functions or access RTC memory. It is as if these were regular parts of the app.

### 4.8.2 Implementing A Stub

The wake stub in esp-idf is called `esp_wake_deep_sleep()`. This function runs whenever the SoC wakes from deep sleep. There is a default version of this function provided in esp-idf, but the default function is weak-linked so if your app contains a function named `esp_wake_deep_sleep()` then this will override the default.

If supplying a custom wake stub, the first thing it should be to call `esp_default_wake_deep_sleep()`. It is not necessary to implement `esp_wake_deep_sleep()` in your app in order to use deep sleep. It is only necessary if you want to have special behaviour immediately on wake.

If you want to swap between different deep sleep stubs at runtime, it is also possible to do this by calling the `esp_set_deep_sleep_wake_stub()` function. This is not necessary if you only use the default `esp_wake_deep_sleep()` function.

All of these functions are declared in the `esp_sleep.h` header under components/esp32s2.

### 4.8.3 Loading Code Into RTC Memory

Wake stub code must be resident in RTC Fast Memory. This can be done in one of two ways.

The first way is to use the `RTC_IRAM_ATTR` attribute to place a function into RTC memory:

```c
void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    // Add additional functionality here
}
```

The second way is to place the function into any source file whose name starts with `rtc_wake_stub`. Files names `rtc_wake_stub*` have their contents automatically put into RTC memory by the linker.

The first way is simpler for very short and simple code, or for source files where you want to mix “normal” and “RTC” code. The second way is simpler when you want to write longer pieces of code for RTC memory.

### 4.8.4 Loading Data Into RTC Memory

Data used by stub code must be resident in RTC memory.

The data can be placed in RTC Fast memory or in RTC Slow memory which is also used by the ULP.

Specifying this data can be done in one of two ways:

The first way is to use the `RTC_DATA_ATTR` and `RTC_RODATA_ATTR` to specify any data (writeable or read-only, respectively) which should be loaded into RTC memory:

```c
RTC_DATA_ATTR int wake_count;
void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    static RTC_RODATA_ATTR const char fmt_str[] = "Wake count %d\n";
    esp_rom_printf(fmt_str, wake_count);
}
```
The RTC memory area where this data will be placed can be configured via menuconfig option named CONFIG_ESP32S2_RTCDATA_IN_FAST_MEM. This option allows to keep slow memory area for ULP programs and once it is enabled the data marked with RTC_DATA_ATTR and RTC_RODATA_ATTR are placed in the RTC fast memory segment otherwise it goes to RTC slow memory (default option). This option depends on the CONFIG_FREERTOS_UNICORE because RTC fast memory can be accessed only by PRO_CPU.

The attributes RTC_FAST_ATTR and RTC_SLOW_ATTR can be used to specify data that will be force placed into RTC_FAST and RTC_SLOW memory respectively. Any access to data marked with RTC_FAST_ATTR is allowed by PRO_CPU only and it is responsibility of user to make sure about it.

Unfortunately, any string constants used in this way must be declared as arrays and marked with RTC_RODATA_ATTR, as shown in the example above.

The second way is to place the data into any source file whose name starts with rtc_wake_stub.

For example, the equivalent example in rtc_wake_stub_counter.c:

```c
int wake_count;

void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
  esp_default_wake_deep_sleep();
  esp_rom_printf("Wake count %d\n", wake_count++);
}
```

The second way is a better option if you need to use strings, or write other more complex code.

To reduce wake-up time use the CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP Kconfig option, see more information in Fast boot from Deep Sleep.

4.8.5 CRC Check For Wake Stubs

During deep sleep, all RTC Fast memory areas will be validated with CRC. When ESP32-S2 wakes up from deep sleep, the RTC fast memory will be validated with CRC again. If the validation passes, the wake stubs code will be executed. Otherwise, the normal initialization, bootloader and esp-idf codes will be executed.

**Note:** When the CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP option is enabled, all the RTC fast memory except the wake stubs area is added to the heap.

4.8.6 Example

ESP-IDF provides an example to show how to implement the Deep-sleep wake stub.

- system/deep_sleep_wake_stub

4.9 Device Firmware Upgrade via USB

Typically, the firmware of the ESP32-S2 is flashed via the chip’s serial port. However, flashing via the serial port requires a USB to serial converter chip (e.g., CP210x or FTDI) to be connected to the ESP32-S2 (see Establish Serial Connection with ESP32-S2 for more details). The ESP32-S2 contains a USB OTG peripheral making it possible to connect the ESP32-S2 to the host directly via USB (thus not requiring a USB to serial converter chip).

Device Firmware Upgrade (DFU) is a mechanism for upgrading the firmware of the ESP32-S2 directly via the Universal Serial Bus (USB). However, enabling Secure Boot or flash encryption disables the USB-OTG USB stack in the ROM, disallowing updates via the serial emulation or DFU on that port.

- Software of the Getting Started Guide introduces the software requirements of DFU.
Section Building the DFU Image describes how to build firmware for DFU with ESP-IDF.

Section Flashing the DFU Image deals with flashing the firmware.

### 4.9.1 USB Connection

The necessary connections for the ESP32-S2’s internal USB PHY (transceiver) are shown in the following table:

<table>
<thead>
<tr>
<th>GPIO</th>
<th>USB</th>
</tr>
</thead>
<tbody>
<tr>
<td>20</td>
<td>D+ (green)</td>
</tr>
<tr>
<td>19</td>
<td>D- (white)</td>
</tr>
<tr>
<td>GND</td>
<td>GND (black)</td>
</tr>
<tr>
<td>+5V</td>
<td>+5V (red)</td>
</tr>
</tbody>
</table>

**Warning:** Some cables are wired up with non-standard colors and some drivers are able to work with swapped D+ and D- connections. Please try to swap the cables connecting to D+ and D- if your device is not detected.

**Note:** The ESP32-S2 chip needs to be in bootloader mode before it can be detected as a DFU device and flash. This can be achieved by pulling GPIO0 down (e.g., pressing the BOOT button), pulling RESET down for a moment, and releasing GPIO0.

### 4.9.2 Building the DFU Image

The command below will create a DFU image named `dfu.bin` that is placed in the project’s `build` directory:

```
idf.py dfu
```

**Note:** Do not forget to set the target chip by `idf.py set-target` before running `idf.py dfu`. Otherwise, you might create an image for a different chip or receive an error message like `unknown target 'dfu'`.

### 4.9.3 Flashing the DFU Image

The command below will download the DFU image into the ESP32-S2:

```
idf.py dfu-flash
```

The command relies on `dfu-util`. Please see Software for installing `dfu-util`. `dfu-util` needs additional setup for **USB Drivers (Windows Only)** or setting up an **Udev Rule (Linux Only)**. macOS users should be able to use `dfu-util` without further setup.

If there are more boards with the same chip connected then `idf.py dfu-list` can be used to list the available devices, for example:

```
Found Runtime: [303a:0002] ver=0723, devnum=4, cfg=1, intf=2, path="1-10", alt=0,˓→name="UNKNOWN", serial="0"
Found Runtime: [303a:0002] ver=0723, devnum=6, cfg=1, intf=2, path="1-2", alt=0,˓→name="UNKNOWN", serial="0"
```

Consequently, the desired device can be selected for flashing by the `--path` argument. For example, the devices listed above can be flashed individually by the following commands:
Chapter 4. API Guides

```
idf.py dfu-flash --path 1-10
idf.py dfu-flash --path 1-2
```

**Note:** The vendor and product identificators are set based on the selected chip target by the `idf.py set-target` command and they are not selectable during the `idf.py dfu-flash` call.

See *Common Errors and Known Issues* and their solutions.

### 4.9.4 Udev Rule (Linux Only)

Udev is a device manager for the Linux kernel. It allows us to run `dfu-util` (and `idf.py dfu-flash`) without `sudo` for gaining access to the chip.

Create file `/etc/udev/rules.d/40-dfuse.rules` with the following content:

```
SUBSYSTEMS=='usb', ATTRS{idVendor}=='303a', ATTRS{idProduct}=='00??', GROUP='plugdev', MODE='0666'
```

**Note:** Please check the output of the command `groups`. The user has to be a member of the `GROUP` specified above. You may use some other existing groups for this purpose (e.g., `uucp` on some systems instead of `plugdev`) or create a new group for this purpose.

Restart your computer so the previous setting could take into affect or run `sudo udevadm trigger` to force manually udev to trigger your new rule.

### 4.9.5 USB Drivers (Windows Only)

`dfu-util` uses `libusb` to access the device. You have to register on Windows the device with the *WinUSB* driver.

Please see the [libusb wiki](https://www.libusb.org/) for more details.

The drivers can be installed by the [Zadig tool](https://www.plex四周.com/download/zadig). Please make sure that the device is in download mode before you run the tool and that it detects the ESP32-S2 device before you install the drivers. The Zadig tool might detect several USB interfaces of ESP32-S2. Please install the WinUSB driver only for the interface where there is no driver installed (probably it is Interface 2) and do not re-install the driver for the other interface.

**Warning:** The manual installation of the driver in Device Manager of Windows is not recommended because the flashing might not work properly.

### 4.9.6 Common Errors and Known Issues

- `dfu-util: command not found` might indicate that the tool has not been installed or is not available from the terminal. An easy way of checking the tool is running `dfu-util --version`. Please see [Software](https://github.com/espressif) for installing `dfu-util`.
- The reason for `No DFU capable USB device available` could be that the USB driver was not properly installed on Windows (see *USB Drivers (Windows Only)*), udev rule was not setup on Linux (see *Udev Rule (Linux Only)*) or the device is not in bootloader mode.
- Flashing with `dfu-util` on Windows fails on the first attempt with error `Lost device after RESET?`. Please retry the flashing and it should succeed the next time.
4.9.7 Secure Download Mode

When Secure Download Mode is enabled, DFU is no longer possible. Please see Flash Encryption guide for more details.

4.10 Error Handling

4.10.1 Overview

Identifying and handling run-time errors is important for developing robust applications. There can be multiple kinds of run-time errors:

- Recoverable errors:
  - Errors indicated by functions through return values (error codes)
  - C++ exceptions, thrown using throw keyword
- Unrecoverable (fatal) errors:
  - Failed assertions (using assert macro and equivalent methods, see Assertions) and abort() calls.
  - CPU exceptions: access to protected regions of memory, illegal instruction, etc.
  - System level checks: watchdog timeout, cache access error, stack overflow, stack smashing, heap corruption, etc.

This guide explains ESP-IDF error handling mechanisms related to recoverable errors, and provides some common error handling patterns.

For instructions on diagnosing unrecoverable errors, see Fatal Errors.

4.10.2 Error Codes

The majority of ESP-IDF-specific functions use esp_err_t type to return error codes. esp_err_t is a signed integer type. Success (no error) is indicated with ESP_OK code, which is defined as zero.

Various ESP-IDF header files define possible error codes using preprocessor defines. Usually these defines start with ESP_ERR_ prefix. Common error codes for generic failures (out of memory, timeout, invalid argument, etc.) are defined in esp_err.h file. Various components in ESP-IDF may define additional error codes for specific situations.

For the complete list of error codes, see Error Code Reference.

4.10.3 Converting Error Codes to Error Messages

For each error code defined in ESP-IDF components, esp_err_t value can be converted to an error code name using esp_err_to_name() or esp_err_to_name_r() functions. For example, passing 0x101 to esp_err_to_name() will return “ESP_ERR_NO_MEM” string. Such strings can be used in log output to make it easier to understand which error has happened.

Additionally, esp_err_to_name_r() function will attempt to interpret the error code as a standard POSIX error code, if no matching ESP_ERR_ value is found. This is done using strerror_r function. POSIX error codes (such as ENOENT, ENOMEM) are defined in errno.h and are typically obtained from errno variable. In ESP-IDF this variable is thread-local: multiple FreeRTOS tasks have their own copies of errno. Functions which set errno only modify its value for the task they run in.

This feature is enabled by default, but can be disabled to reduce application binary size. See CONFIG_ESP_ERR_TO_NAME_LOOKUP. When this feature is disabled, esp_err_to_name() and esp_err_to_name_r() are still defined and can be called. In this case, esp_err_to_name() will
return UNKNOWN ERROR, and esp_err_to_name_r() will return Unknown error 0xXXXX(YYYYY), where 0xXXXX and YYYYY are the hexadecimal and decimal representations of the error code, respectively.

### 4.10.4 ESP_ERROR_CHECK Macro

ESP_ERROR_CHECK macro serves similar purpose as assert, except that it checks esp_err_t value rather than a bool condition. If the argument of ESP_ERROR_CHECK is not equal ESP_OK, then an error message is printed on the console, and abort() is called.

Error message will typically look like this:

```
ESP_ERROR_CHECK failed: esp_err_t 0x107 (ESP_ERR_TIMEOUT) at 0x400d1fdf
file:  "'/Users/user/esp/example/main/main.c" line 20
func: app_main
expression: sdmmc_card_init(host, &card)
Backtrace: 0x40086e7c:0x3ffb4ff0 0x40087328:0x3ffb5010 0x400d1fdf:0x3ffb5030:→ 0x400d0816:0x3ffb5050
```

**Note:** If ESP-IDF monitor is used, addresses in the backtrace will be converted to file names and line numbers.

- The first line mentions the error code as a hexadecimal value, and the identifier used for this error in source code. The latter depends on CONFIG_ESP_ERR_TO_NAME_LOOKUP option being set. Address in the program where error has occurred is printed as well.
- Subsequent lines show the location in the program where ESP_ERROR_CHECK macro was called, and the expression which was passed to the macro as an argument.
- Finally, backtrace is printed. This is part of panic handler output common to all fatal errors. See Fatal Errors for more information about the backtrace.

### 4.10.5 ESP_ERROR_CHECK_WITHOUT_ABORT Macro

ESP_ERROR_CHECK_WITHOUT_ABORT macro serves similar purpose as ESP_ERROR_CHECK, except that it will not call abort().

### 4.10.6 ESP_RETURN_ON_ERROR Macro

ESP_RETURN_ON_ERROR macro checks the error code, if the error code is not equal ESP_OK, it prints the message and returns.

### 4.10.7 ESP_GOTO_ON_ERROR Macro

ESP_GOTO_ON_ERROR macro checks the error code, if the error code is not equal ESP_OK, it prints the message, sets the local variable ret to the code, and then exits by jumping to goto_tag.

### 4.10.8 ESP_RETURN_ON_FALSE Macro

ESP_RETURN_ON_FALSE macro checks the condition, if the condition is not equal true, it prints the message and returns with the supplied err_code.
4.10.9 ESP_GOTO_ON_FALSE Macro

ESP_GOTO_ON_FALSE macro checks the condition, if the condition is not equal true, it prints the message, sets the local variable ret to the supplied err_code, and then exits by jumping to goto_tag.

4.10.10 CHECK MACROS Examples

Some examples:

```c
static const char* TAG = "Test";

esp_err_t test_func(void) {
    esp_err_t ret = ESP_OK;
    ESP_ERROR_CHECK(x);          // err message, printed if `x` is not `ESP_OK`, and then `abort()`.
    ESP_ERROR_CHECK WITHOUT_ABORT(x); // err message, printed if `x` is not `ESP_OK`, without `abort()`.
    ESP_RETURN_ON_ERROR(x, TAG, "fail reason 1"); // err message, printed if `x` is not `ESP_OK`, and then function returns with code `x`.
    ESP_GOTO_ON_ERROR(x, err, TAG, "fail reason 2"); // err message, printed if `x` is not `ESP_OK`, `ret` is set to `x`, and then jumps to `err`.
    ESP_RETURN_ON_FALSE(a, err_code, TAG, "fail reason 3"); // err message, printed if `a` is not `true`, and then function returns with code `err_code`.
    ESP_GOTO_ON_FALSE(a, err_code, err, TAG, "fail reason 4"); // err message, printed if `a` is not `true`, `ret` is set to `err_code`, and then jumps to `err`.
}
```

Note: If the option CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT in Kconfig is enabled, the err message will be discarded, while the other action works as is.

The ESP_RETURN_XX and ESP_GOTO_XX macros cannot be called from ISR. While there are xx_ISR versions for each of them, e.g., ESP_RETURN_ON_ERROR_ISR, these macros could be used in ISR.

4.10.11 Error Handling Patterns

1. Attempt to recover. Depending on the situation, we may try the following methods:
   • retry the call after some time;
   • attempt to de-initialize the driver and re-initialize it again;
   • fix the error condition using an out-of-band mechanism (e.g., reset an external peripheral which is not responding).

Example:

```c
esp_err_t err;
{ do {
    err = sdio_slave_send_queue(addr, len, arg, timeout);
    // keep retrying while the sending queue is full
} while (err == ESP_ERR_TIMEOUT);
if (err != ESP_OK) {
    // handle other errors
}
```
2. Propagate the error to the caller. In some middleware components this means that a function must exit with the same error code, making sure any resource allocations are rolled back.

Example:

```c
sdmmc_card_t* card = calloc(1, sizeof(sdmmc_card_t));
if (card == NULL) {
    return ESP_ERR_NO_MEM;
}
esp_err_t err = sdmmc_card_init(host, &card);
if (err != ESP_OK) {
    // Clean up
    free(card);
    // Propagate the error to the upper layer (e.g., to notify the user).
    // Alternatively, application can define and return custom error code.
    return err;
}
```

3. Convert into unrecoverable error, for example using ESP_ERROR_CHECK. See ESP_ERROR_CHECK macro section for details.

Terminating the application in case of an error is usually undesirable behavior for middleware components, but is sometimes acceptable at application level.

Many ESP-IDF examples use ESP_ERROR_CHECK to handle errors from various APIs. This is not the best practice for applications, and is done to make example code more concise.

Example:

```c
ESP_ERROR_CHECK(spi_bus_initialize(host, bus_config, dma_chan));
```

4.10.12 C++ Exceptions

See Exception Handling.

4.11 ESP-WIFI-MESH

This guide provides information regarding the ESP-WIFI-MESH protocol. Please see the ESP-WIFI-MESH API Reference for more information about API usage.

4.11.1 Overview

ESP-WIFI-MESH is a networking protocol built atop the Wi-Fi protocol. ESP-WIFI-MESH allows numerous devices (henceforth referred to as nodes) spread over a large physical area (both indoors and outdoors) to be interconnected under a single WLAN (Wireless Local-Area Network). ESP-WIFI-MESH is self-organizing and self-healing meaning the network can be built and maintained autonomously.

The ESP-WIFI-MESH guide is split into the following sections:

1. Introduction
2. ESP-WIFI-MESH Concepts
3. Building a Network
4. Managing a Network
5. Data Transmission
6. Channel Switching
7. Performance
8. Further Notes
4.11.2 Introduction

A traditional infrastructure Wi-Fi network is a point-to-multipoint network where a single central node known as the access point (AP) is directly connected to all other nodes known as stations. The AP is responsible for arbitrating and forwarding transmissions between the stations. Some APs also relay transmissions to/from an external IP network via a router. Traditional infrastructure Wi-Fi networks suffer the disadvantage of limited coverage area due to the requirement that every station must be in range to directly connect with the AP. Furthermore, traditional Wi-Fi networks are susceptible to overloading as the maximum number of stations permitted in the network is limited by the capacity of the AP.

ESP-WIFI-MESH differs from traditional infrastructure Wi-Fi networks in that nodes are not required to connect to a central node. Instead, nodes are permitted to connect with neighboring nodes. Nodes are mutually responsible for relaying each others transmissions. This allows an ESP-WIFI-MESH network to have much greater coverage area as nodes can still achieve interconnectivity without needing to be in range of the central node. Likewise, ESP-WIFI-
MESH is also less susceptible to overloading as the number of nodes permitted on the network is no longer limited by a single central node.

### 4.11.3 ESP-WIFI-MESH Concepts

#### Terminology

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node</td>
<td>Any device that is or can be part of an ESP-WIFI-MESH network</td>
</tr>
<tr>
<td>Root Node</td>
<td>The top node in the network</td>
</tr>
<tr>
<td>Child Node</td>
<td>A node X is a child node when it is connected to another node Y where the connection makes node X more distant from the root node than node Y (in terms of number of connections).</td>
</tr>
<tr>
<td>Parent Node</td>
<td>The converse notion of a child node</td>
</tr>
<tr>
<td>Descendant Node</td>
<td>Any node reachable by repeated proceeding from parent to child</td>
</tr>
<tr>
<td>Sibling Nodes</td>
<td>Nodes that share the same parent node</td>
</tr>
<tr>
<td>Connection</td>
<td>A traditional Wi-Fi association between an AP and a station. A node in ESP-WIFI-MESH will use its station interface to associate with the softAP interface of another node, thus forming a connection. The connection process includes the authentication and association processes in Wi-Fi.</td>
</tr>
<tr>
<td>Upstream Connection</td>
<td>The connection from an node to its parent node</td>
</tr>
<tr>
<td>Downstream Connection</td>
<td>The connection from an node to one of its child nodes</td>
</tr>
<tr>
<td>Wireless Hop</td>
<td>The portion of the path between source and destination nodes that corresponds to a single wireless connection. A data packet that traverses a single connection is known as <strong>single-hop</strong> whereas traversing multiple connections is known as <strong>multi-hop</strong>.</td>
</tr>
<tr>
<td>Subnetwork</td>
<td>A subnetwork is subdivision of an ESP-WIFI-MESH network which consists of a node and all of its descendant nodes. Therefore the subnetwork of the root node consists of all nodes in an ESP-WIFI-MESH network.</td>
</tr>
<tr>
<td>MAC Address</td>
<td>Media Access Control Address used to uniquely identify each node or router within an ESP-WIFI-MESH network.</td>
</tr>
<tr>
<td>DS</td>
<td>Distribution System (External IP Network)</td>
</tr>
</tbody>
</table>

#### Tree Topology

ESP-WIFI-MESH is built atop the infrastructure Wi-Fi protocol and can be thought of as a networking protocol that combines many individual Wi-Fi networks into a single WLAN. In Wi-Fi, stations are limited to a single connection with an AP (upstream connection) at any time, whilst an AP can be simultaneously connected to multiple stations (downstream connections). However ESP-WIFI-MESH allows nodes to simultaneously act as a station and an AP. Therefore a node in ESP-WIFI-MESH can have **multiple downstream connections using its softAP interface**, whilst simultaneously having a **single upstream connection using its station interface**. This naturally results in a tree network topology with a parent-child hierarchy consisting of multiple layers.

ESP-WIFI-MESH is a multiple hop (multi-hop) network meaning nodes can transmit packets to other nodes in the network through one or more wireless hops. Therefore, nodes in ESP-WIFI-MESH not only transmit their own packets, but simultaneously serve as relays for other nodes. Provided that a path exists between any two nodes on the physical layer (via one or more wireless hops), any pair of nodes within an ESP-WIFI-MESH network can communicate.

**Note:** The size (total number of nodes) in an ESP-WIFI-MESH network is dependent on the maximum number of layers permitted in the network, and the maximum number of downstream connections each node can have. Both of these variables can be configured to limit the size of the network.
Chapter 4. API Guides

Fig. 11: ESP-WIFI-MESH Tree Topology

Fig. 12: ESP-WIFI-MESH Node Types
Node Types

Root Node: The root node is the top node in the network and serves as the only interface between the ESP-WIFI-MESH network and an external IP network. The root node is connected to a conventional Wi-Fi router and relays packets to/from the external IP network to nodes within the ESP-WIFI-MESH network. **There can only be one root node within an ESP-WIFI-MESH network** and the root node’s upstream connection may only be with the router. Referring to the diagram above, node A is the root node of the network.

Leaf Nodes: A leaf node is a node that is not permitted to have any child nodes (no downstream connections). Therefore a leaf node can only transmit or receive its own packets, but cannot forward the packets of other nodes. If a node is situated on the network’s maximum permitted layer, it will be assigned as a leaf node. This prevents the node from forming any downstream connections thus ensuring the network does not add an extra layer. Some nodes without a softAP interface (station only) will also be assigned as leaf nodes due to the requirement of a softAP interface for any downstream connections. Referring to the diagram above, nodes L/M/N are situated on the network’s maximum permitted layer hence have been assigned as leaf nodes.

Intermediate Parent Nodes: Connected nodes that are neither the root node or a leaf node are intermediate parent nodes. An intermediate parent node must have a single upstream connection (a single parent node), but can have zero to multiple downstream connections (zero to multiple child nodes). Therefore an intermediate parent node can transmit and receive packets, but also forward packets sent from its upstream and downstream connections. Referring to the diagram above, nodes B to J are intermediate parent nodes. **Intermediate parent nodes without downstream connections such as nodes E/F/G/I/J are not equivalent to leaf nodes** as they are still permitted to form downstream connections in the future.

Idle Nodes: Nodes that have yet to join the network are assigned as idle nodes. Idle nodes will attempt to form an upstream connection with an intermediate parent node or attempt to become the root node under the correct circumstances (see Automatic Root Node Selection). Referring to the diagram above, nodes K and O are idle nodes.

Beacon Frames & RSSI Thresholding

Every node in ESP-WIFI-MESH that is able to form downstream connections (i.e., has a softAP interface) will periodically transmit Wi-Fi beacon frames. A node uses beacon frames to allow other nodes to detect its presence and know of its status. Idle nodes will listen for beacon frames to generate a list of potential parent nodes, one of which the idle node will form an upstream connection with. ESP-WIFI-MESH uses the Vendor Information Element to store metadata such as:

- Node Type (Root, Intermediate Parent, Leaf, Idle)
- Current layer of Node
- Maximum number of layers permitted in the network
- Current number of child nodes
- Maximum number of downstream connections to accept

The signal strength of a potential upstream connection is represented by RSSI (Received Signal Strength Indication) of the beacon frames of the potential parent node. To prevent nodes from forming a weak upstream connection, ESP-WIFI-MESH implements an RSSI threshold mechanism for beacon frames. If a node detects a beacon frame with an RSSI below a preconfigured threshold, the transmitting node will be disregarded when forming an upstream connection.

**Panel A** of the illustration above demonstrates how the RSSI threshold affects the number of parent node candidates an idle node has.

**Panel B** of the illustration above demonstrates how an RF shielding object can lower the RSSI of a potential parent node. Due to the RF shielding object, the area in which the RSSI of node X is above the threshold is significantly reduced. This causes the idle node to disregard node X even though node X is physically adjacent. The idle node will instead form an upstream connection with the physically distant node Y due to a stronger RSSI.

**Note:** Nodes technically still receive all beacon frames on the MAC layer. The RSSI threshold is an ESP-WIFI-MESH feature that simply filters out all received beacon frames that are below the preconfigured threshold.
Preferred Parent Node

When an idle node has multiple parent nodes candidates (potential parent nodes), the idle node will form an upstream connection with the preferred parent node. The preferred parent node is determined based on the following criteria:

- Which layer the parent node candidate is situated on
- The number of downstream connections (child nodes) the parent node candidate currently has

The selection of the preferred parent node will always prioritize the parent node candidate on the shallowest layer of the network (including the root node). This helps minimize the total number of layers in an ESP-WIFI-MESH network when upstream connections are formed. For example, given a second layer node and a third layer node, the second layer node will always be preferred.

If there are multiple parent node candidates within the same layer, the parent node candidate with the least child nodes will be preferred. This criteria has the effect of balancing the number of downstream connections amongst nodes of the same layer.

Panel A of the illustration above demonstrates an example of how the idle node G selects a preferred parent node given the five parent node candidates B/C/D/E/F. Nodes on the shallowest layer are preferred, hence nodes B/C are prioritized since they are second layer nodes whereas nodes D/E/F are on the third layer. Node C is selected as the preferred parent node due it having fewer downstream connections (fewer child nodes) compared to node B.

Panel B of the illustration above demonstrates the case where the root node is within range of the idle node G. In other words, the root node’s beacon frames are above the RSSI threshold when received by node G. The root node is always the shallowest node in an ESP-WIFI-MESH network hence is always the preferred parent node given multiple parent node candidates.

Note: Users may also define their own algorithm for selecting a preferred parent node, or force a node to only connect with a specific parent node (see the Mesh Manual Networking Example).

Routing Tables

Each node within an ESP-WIFI-MESH network will maintain its individual routing table used to correctly route ESP-WIFI-MESH packets (see ESP-WIFI-MESH Packet) to the correct destination node. The routing table of a particular node will consist of the MAC addresses of all nodes within the particular node’s subnetwork (including the
MAC address of the particular node itself). Each routing table is internally partitioned into multiple subtables with each subtable corresponding to the subnetwork of each child node.

Using the diagram above as an example, the routing table of node B would consist of the MAC addresses of nodes B to I (i.e., equivalent to the subnetwork of node B). Node B’s routing table is internally partitioned into two subtables containing of nodes C to F and nodes G to I (i.e., equivalent to the subnetworks of nodes C and G respectively).

ESP-WIFI-MESH utilizes routing tables to determine whether an ESP-WIFI-MESH packet should be forwarded upstream or downstream based on the following rules.

1. If the packet’s destination MAC address is within the current node’s routing table and is not the current node, select the subtable that contains the destination MAC address and forward the data packet downstream to the child node corresponding to the subtable.
2. If the destination MAC address is not within the current node’s routing table, forward the data packet upstream.
to the current node’s parent node. Doing so repeatedly will result in the packet arriving at the root node where the routing table should contain all nodes within the network.

**Note:** Users can call `esp_mesh_get_routing_table()` to obtain a node’s routing table, or `esp_mesh_get_routing_table_size()` to obtain the size of a node’s routing table. `esp_mesh_get_subnet_nodes_list()` can be used to obtain the corresponding subtable of a specific child node. Likewise `esp_mesh_get_subnet_nodes_num()` can be used to obtain the size of the subtable.

### 4.11.4 Building a Network

**General Process**

**Warning:** Before the ESP-WIFI-MESH network building process can begin, certain parts of the configuration must be uniform across each node in the network (see `mesh_cfg_t`). Each node must be configured with the same Mesh Network ID, router configuration, and softAP configuration.

An ESP-WIFI-MESH network building process involves selecting a root node, then forming downstream connections layer by layer until all nodes have joined the network. The exact layout of the network can be dependent on factors such as root node selection, parent node selection, and asynchronous power-on reset. However, the ESP-WIFI-MESH network building process can be generalized into the following steps:

1. **Root Node Selection**  
The root node can be designated during configuration (see section on User Designated Root Node), or dynamically elected based on the signal strength between each node and the router (see Automatic Root Node Selection). Once selected, the root node will connect with the router and begin allowing downstream connections to form. Referring to the figure above, node A is selected to be the root node hence node A forms an upstream connection with the router.

2. **Second Layer Formation**  
Once the root node has connected to the router, idle nodes in range of the root node will begin connecting with the root node thereby forming the second layer of the network. Once connected,
the second layer nodes become intermediate parent nodes (assuming maximum permitted layers > 2) hence the next layer to form. Referring to the figure above, nodes B to D are in range of the root node. Therefore nodes B to D form upstream connections with the root node and become intermediate parent nodes.

3. Formation of Remaining Layers  
The remaining idle nodes will connect with intermediate parent nodes within range thereby forming a new layer in the network. Once connected, the idle nodes become intermediate parent node or leaf nodes depending on the networks maximum permitted layers. This step is repeated until there are no more idle nodes within the network or until the maximum permitted layer of the network has been reached. Referring to the figure above, nodes E/F/G connect with nodes B/C/D respectively and become intermediate parent nodes themselves.

4. Limiting Tree Depth  
To prevent the network from exceeding the maximum permitted number of layers, nodes on the maximum layer will automatically become leaf nodes once connected. This prevents any other idle node from connecting with the leaf node thereby prevent a new layer from forming. However if an idle node has no other potential parent node, it will remain idle indefinitely. Referring to the figure above, the network’s number of maximum permitted layers is set to four. Therefore when node H connects, it becomes a leaf node to prevent any downstream connections from forming.

Automatic Root Node Selection

The automatic selection of a root node involves an election process amongst all idle nodes based on their signal strengths with the router. Each idle node will transmit their MAC addresses and router RSSI values via Wi-Fi beacon frames. The MAC address is used to uniquely identify each node in the network whilst the router RSSI is used to indicate a node’s signal strength with reference to the router.

Each node will then simultaneously scan for the beacon frames from other idle nodes. If a node detects a beacon frame with a stronger router RSSI, the node will begin transmitting the contents of that beacon frame (i.e., voting for the node with the stronger router RSSI). The process of transmission and scanning will repeat for a preconfigured minimum number of iterations (10 iterations by default) and result in the beacon frame with the strongest router RSSI being propagated throughout the network.

After all iterations, each node will individually check for its vote percentage (number of votes/number of nodes participating in election) to determine if it should become the root node. If a node has a vote percentage larger than a preconfigured threshold (90% by default), the node will become a root node.

The following diagram demonstrates how an ESP-WIFI-MESH network is built when the root node is automatically selected.

1. On power-on reset, each node begins transmitting beacon frames consisting of their own MAC addresses and their router RSSIs.

2. Over multiple iterations of transmission and scanning, the beacon frame with the strongest router RSSI is propagated throughout the network. Node C has the strongest router RSSI (-10 dB) hence its beacon frame is propagated throughout the network. All nodes participating in the election vote for node C thus giving node C a vote percentage of 100%. Therefore node C becomes a root node and connects with the router.

3. Once Node C has connected with the router, nodes A/B/D/E connect with node C as it is the preferred parent node (i.e., the shallowest node). Nodes A/B/D/E form the second layer of the network.

4. Node F and G connect with nodes D and E respectively and the network building process is complete.

Note:  
The minimum number of iterations for the election process can be configured using esp_mesh_set_attempts(). Users should adjust the number of iterations based on the number of nodes within the network (i.e., the larger the network the larger number of scan iterations required).

Warning:  
Vote percentage threshold can also be configured using esp_mesh_set_vote_percentage(). Setting a low vote percentage threshold can result in two or more nodes becoming root nodes within the same ESP-WIFI-MESH network leading to the building of
multiple networks. If such is the case, ESP-WIFI-MESH has internal mechanisms to autonomously resolve the root node conflict. The networks of the multiple root nodes will be combined into a single network with a single root node. However, root node conflicts where two or more root nodes have the same router SSID but different router BSSID are not handled.

**User Designated Root Node**

The root node can also be designated by user which will entail the designated root node to directly connect with the router and forgo the election process. When a root node is designated, all other nodes within the network must also forgo the election process to prevent the occurrence of a root node conflict. The following diagram demonstrates how an ESP-WIFI-MESH network is built when the root node is designated by the user.

1. Node A is designated the root node by the user therefore directly connects with the router. All other nodes forgo the election process.
2. Nodes C/D connect with node A as their preferred parent node. Both nodes form the second layer of the network.
3. Likewise, nodes B/E connect with node C, and node F connects with node D. Nodes B/E/F form the third layer of the network.
4. Node G connects with node E, forming the fourth layer of the network. However the maximum permitted number of layers in this network is configured as four, therefore node G becomes a leaf node to prevent any new layers from forming.

**Note:** When designating a root node, the root node should call `esp_mesh_set_parent()` in order to directly connect with the router. Likewise, all other nodes should call `esp_mesh_fix_root()` to forgo the election process.
Parent Node Selection

By default, ESP-WIFI-MESH is self-organizing meaning that each node will autonomously select which potential parent node to form an upstream connection with. The autonomously selected parent node is known as the preferred parent node. The criteria used for selecting the preferred parent node is designed to reduce the number of layers in the ESP-WIFI-MESH network and to balance the number of downstream connections between potential parent nodes (see section on Preferred Parent Node).

However ESP-WIFI-MESH also allows users to disable self-organizing behavior which will allow users to define their own criteria for parent node selection, or to configure nodes to have designated parent nodes (see the Mesh Manual Networking Example).

Asynchronous Power-on Reset

ESP-WIFI-MESH network building can be affected by the order in which nodes power-on. If certain nodes within the network power-on asynchronously (i.e., separated by several minutes), the final structure of the network could differ from the ideal case where all nodes are powered on synchronously. Nodes that are delayed in powering on will adhere to the following rules:

**Rule 1:** If a root node already exists in the network, the delayed node will not attempt to elect a new root node, even if it has a stronger RSSI with the router. The delayed node will instead join the network like any other idle node by connecting with a preferred parent node. If the delayed node is the designated root node, all other nodes in the network will remain idle until the delayed node powers-on.

**Rule 2:** If a delayed node forms an upstream connection and becomes an intermediate parent node, it may also become the new preferred parent of other nodes (i.e., being a shallower node). This will cause the other nodes to switch their upstream connections to connect with the delayed node (see Parent Node Switching).

**Rule 3:** If an idle node has a designated parent node which is delayed in powering-on, the idle node will not attempt to form any upstream connections in the absence of its designated parent node. The idle node will remain idle indefinitely until its designated parent node powers-on.

The following example demonstrates the effects of asynchronous power-on with regards to network building.
Fig. 19: Network Building with Asynchronous Power On Example
1. Nodes A/C/D/F/G/H are powered-on synchronously and begin the root node election process by broadcasting their MAC addresses and router RSSIs. Node A is elected as the root node as it has the strongest RSSI.

2. Once node A becomes the root node, the remaining nodes begin forming upstream connections layer by layer with their preferred parent nodes. The result is a network with five layers.

3. Node B/E are delayed in powering-on but neither attempt to become the root node even though they have stronger router RSSIs (-20 dB and -10 dB) compared to node A. Instead both delayed nodes form upstream connections with their preferred parent nodes A and C respectively. Both nodes B/E become intermediate parent nodes after connecting.

4. Nodes D/G switch their upstream connections as node B is the new preferred parent node due to it being on a shallower layer (second layer node). Due to the switch, the resultant network has three layers instead of the original five layers.

**Synchronous Power-On:** Had all nodes powered-on synchronously, node E would have become the root node as it has the strongest router RSSI (-10 dB). This would result in a significantly different network layout compared to the network formed under the conditions of asynchronous power-on. **However the synchronous power-on network layout can still be reached if the user manually switches the root node** (see `esp_mesh_waive_root()`).

**Note:** Differences in parent node selection caused by asynchronous power-on are autonomously corrected for to some extent in ESP-WIFI-MESH (see Parent Node Switching).

---

**Loop-back Avoidance, Detection, and Handling**

A loop-back is the situation where a particular node forms an upstream connection with one of its descendant nodes (a node within the particular node’s subnetwork). This results in a circular connection path thereby breaking the tree topology. ESP-WIFI-MESH prevents loop-back during parent selection by excluding nodes already present in the selecting node’s routing table (see Routing Tables) thus prevents a particular node from attempting to connect to any node within its subnetwork.

In the event that a loop-back occurs, ESP-WIFI-MESH utilizes a path verification mechanism and energy transfer mechanism to detect the loop-back occurrence. The parent node of the upstream connection that caused the loop-back will then inform the child node of the loop-back and initiate a disconnection.

---

**4.11.5 Managing a Network**

ESP-WIFI-MESH is a self-healing network meaning it can detect and correct for failures in network routing. Failures occur when a parent node with one or more child nodes breaks down, or when the connection between a parent node and its child nodes becomes unstable. Child nodes in ESP-WIFI-MESH will autonomously select a new parent node and form an upstream connection with it to maintain network interconnectivity. ESP-WIFI-MESH can handle both Root Node Failures and Intermediate Parent Node Failures.

**Root Node Failure**

If the root node breaks down, the nodes connected with it (second layer nodes) will promptly detect the failure of the root node. The second layer nodes will initially attempt to reconnect with the root node. However after multiple failed attempts, the second layer nodes will initialize a new round of root node election. **The second layer node with the strongest router RSSI will be elected as the new root node** whilst the remaining second layer nodes will form an upstream connection with the new root node (or a neighboring parent node if not in range).

If the root node and multiple downstream layers simultaneously break down (e.g., root node, second layer, and third layer), the shallowest layer that is still functioning will initialize the root node election. The following example illustrates an example of self healing from a root node break down.

1. Node C is the root node of the network. Nodes A/B/D/E are second layer nodes connected to node C.
2. Node C breaks down. After multiple failed attempts to reconnect, the second layer nodes begin the election process by broadcasting their router RSSIs. Node B has the strongest router RSSI.

3. Node B is elected as the root node and begins accepting downstream connections. The remaining second layer nodes A/D/E form upstream connections with node B thus the network is healed and can continue operating normally.

**Note:** If a designated root node breaks down, the remaining nodes will not autonomously attempt to elect a new root node as an election process will never be attempted whilst a designated root node is used.

### Intermediate Parent Node Failure

If an intermediate parent node breaks down, the disconnected child nodes will initially attempt to reconnect with the parent node. After multiple failed attempts to reconnect, each child node will begin to scan for potential parent nodes (see *Beacon Frames & RSSI Thresholding*).

If other potential parent nodes are available, each child node will individually select a new preferred parent node (see *Preferred Parent Node*) and form an upstream connection with it. If there are no other potential parent nodes for a particular child node, it will remain idle indefinitely.

The following diagram illustrates an example of self healing from an Intermediate Parent Node break down.

1. The following branch of the network consists of nodes A to G.
2. Node C breaks down. Nodes F/G detect the break down and attempt to reconnect with node C. After multiple failed attempts to reconnect, nodes F/G begin to select a new preferred parent node.

3. Node G is out of range from any other parent node hence remains idle for the time being. Node F is in range of nodes B/E, however node B is selected as it is the shallower node. Node F becomes an intermediate parent node after connecting with Node B thus node G can connect with node F. The network is healed, however the network routing as been affected and an extra layer has been added.

**Note:** If a child node has a designated parent node that breaks down, the child node will make no attempt to connect with a new parent node. The child node will remain idle indefinitely.

### Root Node Switching

ESP-WIFI-MESH does not automatically switch the root node unless the root node breaks down. Even if the root node’s router RSSI degrades to the point of disconnection, the root node will remain unchanged. Root node switching is the act of explicitly starting a new election such that a node with a stronger router RSSI will be elected as the new root node. This can be a useful method of adapting to degrading root node performance.

To trigger a root node switch, the current root node must explicitly call `esp_mesh_waive_root()` to trigger a new election. The current root node will signal all nodes within the network to begin transmitting and scanning for beacon frames (see **Automatic Root Node Selection** whilst remaining connected to the network (i.e., not idle). If another node receives more votes than the current root node, a root node switch will be initiated. **The root node will remain unchanged otherwise.**

A newly elected root node sends a switch request to the current root node which in turn will respond with an acknowledgment signifying both nodes are ready to switch. Once the acknowledgment is received, the newly elected root node will disconnect from its parent and promptly form an upstream connection with the router thereby becoming the new root node of the network. The previous root node will disconnect from the router whilst maintaining all of its downstream connections and enter the idle state. The previous root node will then begin scanning for potential parent nodes and selecting a preferred parent.

The following diagram illustrates an example of a root node switch.

---

**Fig. 22: Root Node Switch Example**
Chapter 4. API Guides

1. Node C is the current root node but has degraded signal strength with the router (-85db). The node C triggers a new election and all nodes begin transmitting and scanning for beacon frames **whilst still being connected**.

2. After multiple rounds of transmission and scanning, node B is elected as the new root node. Node B sends node C a **switch request** and node C responds with an acknowledgment.

3. Node B disconnects from its parent and connects with the router becoming the network’s new root node. Node C disconnects from the router, enters the idle state, and begins scanning for and selecting a new preferred parent node. **Node C maintains all its downstream connections throughout this process.**

4. Node C selects node B as its preferred parent node, forms an upstream connection, and becomes a second layer node. The network layout is similar after the switch as node C still maintains the same subnetwork. However each node in node C’s subnetwork has been placed one layer deeper as a result of the switch. **Parent Node Switching** may adjust the network layout afterwards if any nodes have a new preferred parent node as a result of the root node switch.

---

**Note:** Root node switching must require an election hence is only supported when using a self-organized ESP-WIFI-MESH network. In other words, root node switching cannot occur if a designated root node is used.

---

**Parent Node Switching**

Parent Node Switching entails a child node switching its upstream connection to another parent node of a shallower layer. **Parent Node Switching occurs autonomously** meaning that a child node will change its upstream connection automatically if a potential parent node of a shallower layer becomes available (i.e., due to a **Asynchronous Power-on Reset**).

All potential parent nodes periodically transmit beacon frames (see **Beacon Frames & RSSI Thresholding**) allowing for a child node to scan for the availability of a shallower parent node. Due to parent node switching, a self-organized ESP-WIFI-MESH network can dynamically adjust its network layout to ensure each connection has a good RSSI and that the number of layers in the network is minimized.

---

### 4.11.6 Data Transmission

**ESP-WIFI-MESH Packet**

ESP-WIFI-MESH network data transmissions use ESP-WIFI-MESH packets. ESP-WIFI-MESH packets are **entirely contained within the frame body of a Wi-Fi data frame**. A multi-hop data transmission in an ESP-WIFI-MESH network will involve a single ESP-WIFI-MESH packet being carried over each wireless hop by a different Wi-Fi data frame.

The following diagram shows the structure of an ESP-WIFI-MESH packet and its relation with a Wi-Fi data frame.

![Fig. 23: ESP-WIFI-MESH Packet](image)

The **header** of an ESP-WIFI-MESH packet contains the MAC addresses of the source and destination nodes. The options field contains information pertaining to the special types of ESP-WIFI-MESH packets such as a group transmission or a packet originating from the external IP network (see **MESH_OPT_SEND_GROUP** and **MESH_OPT_RECV_DS_ADDR**).
The payload of an ESP-WIFI-MESH packet contains the actual application data. This data can be raw binary data, or encoded under an application layer protocol such as HTTP, MQTT, and JSON (see \texttt{meshproto_t}).

\textbf{Note:} When sending an ESP-WIFI-MESH packet to the external IP network, the destination address field of the header will contain the IP address and port of the target server rather than the MAC address of a node (see \texttt{meshaddr_t}). Furthermore the root node will handle the formation of the outgoing TCP/IP packet.

\section*{Group Control & Multicasting}

Multicasting is a feature that allows a single ESP-WIFI-MESH packet to be transmitted simultaneously to multiple nodes within the network. Multicasting in ESP-WIFI-MESH can be achieved by either specifying a list of target nodes, or specifying a preconfigured group of nodes. Both methods of multicasting are called via \texttt{esp_mesh_send()}. To multicast by specifying a list of target nodes, users must first set the ESP-WIFI-MESH packet’s destination address to the \textbf{Multicast-Group Address} (01:00:5E:xx:xx:xx). This signifies that the ESP-WIFI-MESH packet is a multicast packet with a group of addresses, and that the address should be obtained from the header options. Users must then list the MAC addresses of the target nodes as options (see \texttt{meshopt_t} and \texttt{MESH_OPT_SEND_GROUP}). This method of multicasting requires no prior setup but can incur a large amount of overhead data as each target node’s MAC address must be listed in the options field of the header.

Multicasting by group allows a ESP-WIFI-MESH packet to be transmitted to a preconfigured group of nodes. Each grouping is identified by a unique ID, and a node can be placed into a group via \texttt{esp_mesh_set_group_id()}. Multicasting to a group involves setting the destination address of the ESP-WIFI-MESH packet to the target group ID. Furthermore, the \texttt{MESH_DATA_GROUP} flag must set. Using groups to multicast incurs less overhead, but requires nodes to previously added into groups.

\textbf{Note:} During a multicast, all nodes within the network still receive the ESP-WIFI-MESH packet on the MAC layer. However, nodes not included in the MAC address list or the target group will simply filter out the packet.

\section*{Broadcasting}

Broadcasting is a feature that allows a single ESP-WIFI-MESH packet to be transmitted simultaneously to all nodes within the network. Each node essentially forwards a broadcast packet to all of its upstream and downstream connections such that the packet propagates throughout the network as quickly as possible. However, ESP-WIFI-MESH utilizes the following methods to avoid wasting bandwidth during a broadcast.

1. When an intermediate parent node receives a broadcast packet from its parent, it will forward the packet to each of its child nodes whilst storing a copy of the packet for itself.
2. When an intermediate parent node is the source node of the broadcast, it will transmit the broadcast packet upstream to its parent node and downstream to each of its child nodes.
3. When an intermediate parent node receives a broadcast packet from one of its child nodes, it will forward the packet to its parent node and each of its remaining child nodes whilst storing a copy of the packet for itself.
4. When a leaf node is the source node of a broadcast, it will directly transmit the packet to its parent node.
5. When the root node is the source node of a broadcast, the root node will transmit the packet to all of its child nodes.
6. When the root node receives a broadcast packet from one of its child nodes, it will forward the packet to each of its remaining child nodes whilst storing a copy of the packet for itself.
7. When a node receives a broadcast packet with a source address matching its own MAC address, the node will discard the broadcast packet.
8. When an intermediate parent node receives a broadcast packet from its parent node which was originally transmitted from one of its child nodes, it will discard the broadcast packet.
Upstream Flow Control

ESP-WIFI-MESH relies on parent nodes to control the upstream data flow of their immediate child nodes. To prevent a parent node’s message buffer from overflowing due to an overload of upstream transmissions, a parent node will allocate a quota for upstream transmissions known as a **receiving window** for each of its child nodes. **Each child node must apply for a receiving window before it is permitted to transmit upstream.** The size of a receiving window can be dynamically adjusted. An upstream transmission from a child node to the parent node consists of the following steps:

1. Before each transmission, the child node sends a window request to its parent node. The window request consists of a sequence number which corresponds to the child node’s data packet that is pending transmission.

2. The parent node receives the window request and compares the sequence number with the sequence number of the previous packet sent by the child node. The comparison is used to calculate the size of the receiving window which is transmitted back to the child node.

3. The child node transmits the data packet in accordance with the window size specified by the parent node. If the child node depletes its receiving window, it must obtain another receiving window by sending a request before it is permitted to continue transmitting.

**Note:** ESP-WIFI-MESH does not support any downstream flow control.

**Warning:** Due to **Parent Node Switching**, packet loss may occur during upstream transmissions.

Due to the fact that the root node acts as the sole interface to an external IP network, it is critical that downstream nodes are aware of the root node’s connection status with the external IP network. Failing to do so can lead to nodes attempting to pass data upstream to the root node whilst it is disconnected from the IP network. This results in unnecessary transmissions and packet loss. ESP-WIFI-MESH address this issue by providing a mechanism to stabilize the throughput of outgoing data based on the connection status between the root node and the external IP network. The root node can broadcast its external IP network connection status to all other nodes by calling `esp_mesh_post_toDS_state()`.

Bi-Directional Data Stream

The following diagram illustrates the various network layers involved in an ESP-WIFI-MESH Bidirectional Data Stream.

![Bi-Directional Data Stream Diagram](image)

**Fig. 24:** ESP-WIFI-MESH Bidirectional Data Stream

Due to the use of **Routing Tables**, ESP-WIFI-MESH is able to handle pack forwarding entirely on the mesh layer. A TCP/IP layer is only required on the root node when it transmits/receives a packet to/from an external IP
network.

4.11.7 Channel Switching

Background

In traditional Wi-Fi networks, channels are predetermined frequency ranges. In an infrastructure basic service set (BSS), the serving AP and its connected stations must be on the same operating channels (1 to 14) in which beacons are transmitted. Physically adjacent BSS (Basic Service Sets) operating on the same channel can lead to interference and degraded performance.

In order to allow a BSS adapt to changing physical layer conditions and maintain performance, Wi-Fi contains mechanisms for network channel switching. A network channel switch is an attempt to move a BSS to a new operating channel whilst minimizing disruption to the BSS during this process. However it should be recognized that a channel switch may be unsuccessful in moving all stations to the new operating channel.

In an infrastructure Wi-Fi network, network channel switches are triggered by the AP with the aim of having the AP and all connected stations synchronously switch to a new channel. Network channel switching is implemented by embedding a Channel Switch Announcement (CSA) element within the AP’s periodically transmitted beacon frames. The CSA element is used to advertise to all connected stations regarding an upcoming network channel switch and will be included in multiple beacon frames up until the switch occurs.

A CSA element contains information regarding the New Channel Number and a Channel Switch Count which indicate the number of beacon frame intervals (TBTTs) remaining until the network channel switch occurs. Therefore, the Channel Switch Count is decremented every beacon frame and allows connected stations to synchronize their channel switch with the AP.

ESP-WIFI-MESH Network Channel Switching

ESP-WIFI-MESH Network Channel Switching also utilize beacon frames that contain a CSA element. However, being a multi-hop network makes the switching process in ESP-WIFI-MESH is more complex due to the fact that a beacon frame might not be able to reach all nodes within the network (i.e., in a single hop). Therefore, an ESP-WIFI-MESH network relies on nodes to forward the CSA element so that it is propagated throughout the network.

When an intermediate parent node with one or more child nodes receives a beacon frame containing a CSA, the node will forward the CSA element by including the element in its next transmitted beacon frame (i.e., with the same New Channel Number and Channel Switch Count). Given that all nodes within an ESP-WIFI-MESH network receive the same CSA, the nodes can synchronize their channel switches using the Channel Switch Count, albeit with a short delay due to CSA element forwarding.

An ESP-WIFI-MESH network channel switch can be triggered by either the router or the root node.

Root Node Triggered  A root node triggered channel switch can only occur when the ESP-WIFI-MESH network is not connected to a router. By calling esp_mesh_switch_channel(), the root node will set an initial Channel Switch Count value and begin including a CSA element in its beacon frames. Each CSA element is then received by second layer nodes, and forwarded downstream in their own beacon frames.

Router Triggered  When an ESP-WIFI-MESH network is connected to a router, the entire network must use the same channel as the router. Therefore, the root node will not be permitted to trigger a channel switch when it is connected to a router.

When the root node receives beacon frame containing a CSA element from the router, the root node will set Channel Switch Count value in the CSA element to a custom value before forwarding it downstream via beacon frames. It will also decrement the Channel Switch Count of subsequent CSA elements relative to the custom value. This custom value can be based on factors such as the number of network layers, the current number of nodes etc.

The setting the Channel Switch Count value to a custom value is due to the fact that the ESP-WIFI-MESH network and its router may have a different and varying beacon intervals. Therefore, the Channel Switch Count value provided by
Chapter 4. API Guides

the router is irrelevant to an ESP-WIFI-MESH network. By using a custom value, nodes within the ESP-WIFI-MESH network are able to switch channels synchronously relative to the ESP-WIFI-MESH network’s beacon interval. However, this will also result in the ESP-WIFI-MESH network’s channel switch being unsynchronized with the channel switch of the router and its connected stations.

**Impact of Network Channel Switching**

- **Due to the ESP-WIFI-MESH network channel switch being unsynchronized with the router’s channel switch, there will be a temporary channel discrepancy between the ESP-WIFI-MESH network and the router.**
  - The ESP-WIFI-MESH network’s channel switch time is dependent on the ESP-WIFI-MESH network’s beacon interval and the root node’s custom Channel Switch Count value.
  - The channel discrepancy prevents any data exchange between the root node and the router during that ESP-WIFI-MESH network’s switch.
  - In the ESP-WIFI-MESH network, the root node and intermediate parent nodes will request their connected child nodes to stop transmissions until the channel switch takes place by setting the Channel Switch Mode field in the CSA element to 1.
  - Frequent router triggered network channel switches can degrade the ESP-WIFI-MESH network’s performance. Note that this can be caused by the ESP-WIFI-MESH network itself (e.g., due to wireless medium contention with ESP-WIFI-MESH network). If this is the case, users should disable the automatic channel switching on the router and use a specified channel instead.

- **When there is a temporary channel discrepancy, the root node remains technically connected to the router.**
  - Disconnection occurs after the root node fails to receive any beacon frames or probe responses from the router over a fixed number of router beacon intervals.
  - Upon disconnection, the root node will automatically re-scan all channels for the presence of a router.

- **If the root node is unable to receive any of the router’s CSA beacon frames (e.g., due to short switch time given by the router),**
  - After the router switches channels, the root node will no longer be able to receive the router’s beacon frames and probe responses and result in a disconnection after a fixed number of beacon intervals.
  - The root node will re-scan all channels for the router after disconnection.
  - The root node will maintain downstream connections throughout this process.

**Note:** Although ESP-WIFI-MESH network channel switching aims to move all nodes within the network to a new operating channel, it should be recognized that a channel switch might not successfully move all nodes (e.g., due to reasons such as node failures).

**Channel and Router Switching Configuration**

ESP-WIFI-MESH allows for autonomous channel switching to be enabled/disabled via configuration. Likewise, autonomous router switching (i.e., when a root node autonomously connects to another router) can also be enabled/disabled by configuration. Autonomous channel switching and router switching is dependent on the following configuration parameters and run-time conditions.

**Allow Channel Switch:** This parameter is set via the allow_channel_switch field of the `mesh_cfg_t` structure and permits an ESP-WIFI-MESH network to dynamically switch channels when set.

**Preset Channel:** An ESP-WIFI-MESH network can have a preset channel by setting the channel field of the `mesh_cfg_t` structure to the desired channel number. If this field is unset, the allow_channel_switch parameter is overridden such that channel switches are always permitted.

**Allow Router Switch:** This parameter is set via the allow_router_switch field of the `mesh_router_t` structure and permits an ESP-WIFI-MESH network to dynamically switch to a different router when set.

**Preset Router BSSID:** An ESP-WIFI-MESH network can have a preset router by setting the bssid field of the `mesh_router_t` structure to the BSSID of the desired router. If this field is unset, the allow_router_switch parameter is overridden such that router switches are always permitted.
**Root Node Present:** The presence of a root node will can also affect whether or a channel or router switch is permitted.

The following table illustrates how the different combinations of parameters/conditions affect whether channel switching and/or router switching is permitted. Note that $X$ represents a “do not care” for the parameter.
